

# COVID-19 Vaccine Drug Reactions: Blood Clots

Preliminary Notes – Reactions Listings Start on Page 2 Below

1. Blood clot cases Reported through June 4, 2021 in the United States to the Vaccine Adverse Event Reporting System (VAERS).
2. In order to understand the two charts above:
  - a. The VAERS COVID-19 vaccine drug reported cases + backlogged cases **versus** the flu vaccine reported cases
  - b. The VAERS reported cases versus the total cases in the United States

It is **crucial** to at least one time, carefully read through the two answers in the FAQs related to backlogged cases and then the VAERS reporting rate:

[https://www.covid19vaccinefacts.net/VAERS\\_FAQ.shtml#Backlog](https://www.covid19vaccinefacts.net/VAERS_FAQ.shtml#Backlog)

[https://www.covid19vaccinefacts.net/VAERS\\_FAQ.shtml#ReportingRate](https://www.covid19vaccinefacts.net/VAERS_FAQ.shtml#ReportingRate)

3. The cases listed below were pulled from the VAERS raw data files with a query that looked for clots and thrombosis. As you read through the cases below, it is possible that there will be an occasional erroneous case not related to blood clots. The exact query is as follows:  
(symptom\_text like "clot\*" or symptom\_text like "\* clot\*" or symptom\_text like "\* thrombosis\*" or symptom\_text like "\*thrombi\*") and symptom\_text not like "\*cloth\*" and symptom\_text not like "\*clotting\*"

## Blood Clots: COVID-19 Vaccine Drugs

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
1373779	6/4/2021	PA	57	M	2/25/2021	4/15/2021	a blood clot; blockage in the Left Anterior Descending artery; symptoms of shortness of breath; This is a spontaneous report from a non-contactable consumer or other non hcp. A 58-year-old male patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration on 25Feb2021 17:30 (at the age of 57-years-old) as 2nd dose, single for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient previously took first dose of bnt162b2 on 02Feb2021 and experienced cardiac blockage. The patient did not take any other vaccines within 4 weeks prior to the COVID vaccine. On 15Apr2021 the patient experienced a blood clot, blockage in the left anterior descending artery and symptoms of shortness of breath. The events were reported as serious (life threatening). It was reported that 15Apr2021, emergency trip to ER, blockage in the Left Anterior Descending artery. This blockage was only 40% blocked in Feb2021, and suddenly in April became 99% blocked. Dr suspected a blood clot when symptoms of shortness of breath appeared suddenly. The events resulted in Doctor or other healthcare professional office/clinic visit and Emergency room/department or urgent care. Blockage in the Left Anterior Descending artery was treated with cardiac stents. The patient underwent lab tests and procedures which included COVID-19 test tested performed on an unspecified date (result not reported). The outcome of events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021600543 same patient, different vaccine dose/events

1374300	6/4/2021	WI	51	F	5/13/2021	6/3/2021	On May 15th, she got the J&J vaccine. Then on May 17th, while she was walking, she tripped on a curb and fell and then landed on her left knee. Then, this past Thursday on May 20th, she noticed swelling and pain in the left leg. She presented to urgent care the following day on Friday and had an ultrasound done that revealed blood clot in the superficial veins. Patient recalls of had a similar episode of superficial vein clot about 6 years ago. Referred to vascular and second ultrasound done revealing DVT
1374298	6/4/2021	TX		F			Presented with clots; This spontaneous case was reported by a consumer and describes the occurrence of THROMBOSIS (Presented with clots) in a female patient of an unknown age who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. No Medical History information was reported. On an unknown date, the patient received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) .5 milligram. On an unknown date, the patient experienced THROMBOSIS (Presented with clots) (seriousness criterion medically significant). At the time of the report, THROMBOSIS (Presented with clots) outcome was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. No concomitant medications was provided by the reporter. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not applicable. Company comment: Very limited information regarding this event has been provided at this time. Further information cannot be requested.; Sender's Comments: Very limited information regarding this event has been provided at this time. Further information cannot be requested.

							<p>pain that comes and goes) and ARTHRALGIA (shoulder pain). On an unknown date, the patient experienced VACCINATION COMPLICATION (The vaccine is affecting young people). At the time of the report, THROMBOSIS (On Saturday his legs were very heavy and had pain, like he had blood clots or thrombosis in his veins), ANEURYSM (My son felt like he had an aneurysm in his neck/He had pain in the large artery on the right side of his neck like a myocardial inflammation or something), VACCINATION COMPLICATION (The vaccine is affecting young people), PAIN IN EXTREMITY (On Saturday his legs were very heavy and had pain), NECK PAIN (The right side of his neck, between the shoulder and neck, on the inside, he felt swelling, pressure pain, dull pain that comes and goes), SWELLING (On Tuesday, on the right side of his neck, between the shoulder and neck, on the inside, he felt swelling, pressure pain, dull pain that comes and goes), FEELING COLD (feeling cold), ARTHRALGIA (shoulder pain) and FATIGUE (On Saturday night he was feeling tired and cold) outcome was unknown. No treatment information was provided. Company comment: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. This case was linked to MOD-2021-182543 (Patient Link).; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.</p>
1374182	6/4/2021	IL	47	F	2/11/2021	2/13/2021	<p>I had a strong reaction to the second dose (fever over 101 after taking Ibuprophen that lasted 2 days). Then I had abnormal uterine bleeding that prompted me to contact my doctor who ordered a pelvic ultrasound. The ultrasound showed what looked like possibly a clot or a cyst in the uterus. I then had a hysteroscope to further examine it and it was no longer there so it has been a clot that subsequently passed. Since then, my periods have returned to a normal timing pattern, but remain heavier than before.</p>

1373773	6/4/2021	OK		M	3/23/2021	3/1/2021	50% hearing loss; He is on the verge of suicide; insomnia; I cant live with this; can't think; it's driving me crazy; driving me insane; He is desperate; spike headaches; rash under my eyes/rash in his eyes appeared in the right eye and then got to the left eye; incredible ringing in my ears and a spike headache/high pitched ringing in my ears; This is a spontaneous report from a Pfizer-sponsored program via a contactable male consumer (patient himself). A male patient of an unspecified age received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Batch/Lot number was not reported), via an unspecified route of administration on 23Mar2021 as 1st dose, single for COVID-19 immunization. The patient medical history and concomitant medications were not reported. It was reported that, caller and his 20y/o son received their first dose of the Pfizer BioNTech COVID 19 Vaccine on 23 Mar 2021. His son had a runny nose for 10 days but was fine after. However, 4 days later, on an unspecified date in Mar2021, the patient developed a rash under his eyes and he woke up with an "incredible ringing in my ears and a spike headache". Caller claims that he has never experienced that in his life. He also reported a rash under one of his eye that later on spread to the other eye, as well as insomnia on an unspecified date. He has seen his HCP and was referred to an Audiologist, who he has visited 3 times since then. He was diagnosed with 3 times % loss of hearing and 10500 Hertz tinnitus, which the Audiologist mentioned is "really high". It was also reported that, this high pitched ringing in his ears that just won't go away and its driving him crazy. He was prescribed with high dose Prednisone for 7 days, but caller mentioned "it did not help and had no effect whatsoever". His HCP wanted to be "super cautious" and recommended a brain scan this week just to make sure he didn't develop a blood clot. Caller is upset that no one can give him answers. He has reached out to CDC and asked for medical advice, but he stated that everyone is giving him the same answers - there is not enough data. He is on the verge of suicide and said, "I can't live with this for the rest of my life. I can't sleep and can't think, it's driving me crazy" on an unspecified date. Patient stated "I'm just trying to get to the end of this. I cant live like this its driving me crazy." Patient went on to mention "I'm at

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

my wits end with this it is truly driving me insane on an unspecified date. I'm not kidding. I can't sleep, I can't think, I cant function with this ringing. The rash didn't even go away under my, I've been to the dermatologist twice and they just don't know..." Patient wanted to speak to someone because "I cant spend my life with this high pitch ringing in my ears it is driving me crazy". On an unspecified date, he was desperate for answers and even tried reporting to Vaccine Adverse Event Reporting System (VAERS) but there was no way to submit it. The patient also asked about what in the vaccine could affect the auditory complex. He added that he did not get the second dose of the Pfizer covid vaccine, that the rash in his eyes appeared in the right eye and then got to the left eye. Also he mentions that this is "all over the internet and you just have to google it", that the percentage that reported this is above 10% for both Moderna and Pfizer vaccines and he estimates that is about 17% all over the world and that the DNA vaccines started since the 90's. He also mentions that he knows at least 15 more persons affected with the same side effects as him and he lives in a small town and a CEO just committed suicide because of this. Sometimes he refers at it as "tinnitus". He says that he feels miserable and this is driving him crazy. He wants to make this public and that Pfizer acknowledges this. The patient underwent lab tests and procedures which included tinnitus: 10500 Hertz which the Audiologist mentioned is "really high". The outcome of the events, incredible ringing in my ears and a rash under eyes was not recovered and for other events was unknown.

1373764	6/4/2021	CA	60	F	4/13/2021	4/13/2021	experienced the same excruciating pain in my right knee this time; two Baker's Cysts were visible, one in each leg, only visible on the back of my right knee, but no trace of any blood clots; This is a spontaneous report from a contactable consumer (patient). A 60-year-old non-pregnant female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Solution for injection, lot number: unknown) via an unspecified route of administration, administered in left arm on 13Apr2021 at 07:00 (at the age of 60-year-old) as 1st dose single and second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Solution for injection, lot number: unknown) via an unspecified route of administration on 04May2021 (at the age of 60-year-old) as 2nd dose, single both for covid-19 immunization. Medical history included undiagnosed arthritis. The patient did not receive any other concomitant medications within 2 weeks of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Patient was not diagnosed with COVID 19 prior to vaccination. On 13Apr2021 at 20:00, patient started experiencing the events. It was reported that, for twenty days, patient needed help to accomplish anything. On the 21st day, patient went out but the steps were extraordinarily painful in left knee. Her plan was to wait it out until she had the 2nd dose on 04May. Again, six days later, patient experienced the same excruciating pain in right knee this time. Two doses, both knees, unbelievable pain. The patient finally went the ER on Friday, 14May2021. After the first dose, patient suspected a Baker's Cyst. After the second dose, it measured the size of a golf ball cut in half. Trusted her research skills, she confirmed what she already knew, with an MRI scheduled and two ultrasounds done on both knees, two Baker's Cysts were visible, one in each leg, only visible on the back of right knee, but no trace of any blood clots. The patient underwent lab tests and procedures which included MRI: unknown and ultrasounds done on both knees: two baker's cysts were visible, one in each leg: size of a golf ball cut in half on an unspecified date. The adverse event resulted patient to visit the Physician Office Visit and Emergency Room Visit. The patient received treatment for the adverse event. Therapeutic measures were taken as a result of both events and treatment included with 10 mg

1373739	6/4/2021	CA		M	4/16/2021	4/17/2021	<p>Collapsed day after vaccine first dose/Collapsed day after vaccine second dose; His left side still feels paralyzed and can't walk; legs wouldn't move, couldn't turn around; He had compression fractures L1 to L3 that were noticed on his x-ray; he collapsed and had a hard time getting up/felt bad; General malaise; His left side still feels paralyzed and can't walk; bedridden; Pain; Half of back is black from incident; Mobility got worse after first shot and then after second dose his mobility got even worse; felt like what I would call the flu; Collapsed day after vaccine first dose/Collapsed day after vaccine second dose; This is a spontaneous report received from a Pfizer sponsored program. A 72-years-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Solution for injection), via an unspecified route of administration, administered in Arm Left on 16Apr2021 (Batch/Lot Number: EP7533) as 1st dose, single dose and second dose via an unspecified route of administration, administered in Arm Left on 07May2021 14:00 (Batch/Lot Number: EW0182) as 2nd dose, single dose for covid-19 immunisation. Medical history included L1 to L3 compression fractures somewhere around 2008 to 2010, ongoing gout (from about 35 years ago) (pain in both hips and right shoulder, left shoulder some times), gouty arthritis (30 years constant pain), ongoing moderate emphysema (since 20 years ago), stroke (happened in 2010). States he was taking Warfarin at the time of the stroke and the stroke was permanent, cholesterol, smoker (20 years), excess uric acid, allergy in right sinus, cough uncontrollably, perirectal abscess and low blood pressure. Family medical history was none. States he is adopted. Concomitant medications included atorvastatin taken for blood cholesterol from an unspecified start date to unspecified date in 2021 (Taking for about 5 years, not sure if the dose is 30mg, 50mg, or 300mg, stopped after adverse event with covid vaccine), zolpidem tartrate (AMBIEN) taken for sleeping from an unspecified start date to unspecified date in 2021 at 10mg (taking for couple of decades, stopped after adverse event with covid vaccine, stated it may cause drowsiness) and allopurinol taken for gout at a dose of 300 mg, (taking for 6 or 7 years) and azelastine hydrochloride nasal spray taken for uncontrollable coughing via nasal route as 2 shots each nostril twice a day (uncontrollable coughing</p>

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

caused perirectal abscess, had scope done, diagnosed as allergy. Azelastine works for cough). The patient previously took pneumonia shot and stated that it hurt like hell for a week, flu shot and got sick and also took warfarin. The patient reported that he received his first dose on 16Apr2021, then the next day he collapsed and had a hard time getting up. He also reports general malaise, "just felt bad", and "felt like what I would call the flu" for the next 5 days. On 07May2021 he received his second dose, and the same thing happened where he collapsed the next day. This time, he was not able to get up on his own and had to call 911. He was admitted to the hospital and "had 2 X-rays and a CT scan", CT of torso he reports his CT scan showed compression fractures at L1, L2, and L3 on his x-ray. He is taking a lot of Norco to treat his pain. States the music on hold is so uplifting that he wants to go cut his throat. Caller stated he was bedridden. He reported "I can't walk, I used to be able to, and now I can't". He spent 5 years in a computer testing laboratory and he knows a little about testing. He states a lot of the rules apply to conductors and automobiles. Caller stated he wants to know what happened to him. He says if he dies as a result of this, there will be mountains of paperwork. He also said if his condition is permanent, there will also be mountains of paperwork. He can't go to the bathroom and this is an issue. He was falling down and collapsing several times with both shots. He says this is a major problem. He declined being admitted to assisted living saying "if I'm going to die I'm going to die at home". Caller would like to know if anything like this has been reported before, if they got better, and what treatment they received to get better? He also asked if there were any reported deaths after vaccination? Events paralyzed, bedridden, can't walk, legs wouldn't move, couldn't turn around was reported as worsened, half of back is black from incident. The patient was taking Pfizer Covid Vaccine as needs to show he had vaccine to travel. He hasn't measured his height since compression fractures. Lost 20% on 3 vertebrae, so he might only be 5 feet 10 inches. He figures 20% would be an inch lost with his calculation. He can't reach around 180 degrees to measure himself. When asked to provide NDC, lot number and expiration date from vaccine card, caller stated he needed to use magnifying glass. He then stated that his vision is good.

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

He stated that he collapsed several times after his second shot. He says this happened approximately 2 to 3 days after the second shot. He called his doctor and was told to call 911. He went to the hospital. He was in the ER, but confirmed he was not admitted to the hospital. Outcome for collapsing after both doses, had worsened as mentioned by patient. Caller stated after the first vaccine, he noticed his left leg did not work very well. After first dose, he had trouble walking after 5 days. When he would try to move his left leg forward it would shake, not move and he had to slide it sideways across the floor. Right now he can get up and turn around before he pees all over himself and could not get to the bathroom before. Now he pees in a cooking pot. He asked to be excused while on call and stated he had to urinate again. Mobility got worse after first shot and then after second dose his mobility got even worse. Confirmed his compression fractures are an existing condition from 10 to 12 years ago. Reported he has gouty arthritis and it has been going on over 30 years and has constant pain for over 30 years but has always been able to walk and feed himself. The pain is not our fault. Reported that the malaise was better after 5 days, but his mobility went down. He has trouble walking. Sometimes knees would give out and he collapses. Caller states he now uses a walker, cane, and a wheelchair. If he has to go more than 10 feet, he has to have assistance. Treatment for Event: Norco 10-325: Takes up to 3 times per day. States the other day he had 45mg but was still in pain. This is discrepant but details were documented as provided. Caller states he is still in pain, but he can't get more without going to pain specialist. His doctor stopped atorvastatin and Ambien after adverse events with the covid vaccine. ER doctor wanted his primary doctor to review his medications since the ER doctor thought he was on too many medications. Caller tried to explain the reasons he was on the different medications. When talking about his gout: He has a picture after incident and half of his back is black, not blue, it is black. He was not in pain for about 2 years. Then he had the test to determine what was going on and that is when the pain got really bad. He has had bad pain for 35 years with gout in his hips especially, and in right shoulder. He cannot reach if something is in his right back pocket. Left shoulder sometimes. All the time with both hips. Also in

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

right shoulder but if he does not use right shoulder then there is no problem. He was even thinking about getting a hip transplant due to the pain. His doctor did blood tests to find out that he had excess uric acid. He was on a medication called Uloric and it worked wonders but it is no longer made. Then it was found out that some people had bad reactions with it harming their heart and that was the end of Uloric. Then he started taking Allopurinol, states it does work but it works so little that it is almost worth not taking. When the pain is at 10 or 11 on pain scale, states what is the difference. He has an allergy in right sinus that caused to cough uncontrollably and his uncontrollable cough let to a perirectal abscess. He suggested to his doctor to stop his coughing and not worry about the abscess. He then went to ENT and stuck a scope down his nose and told him his sinus is inflamed and there is no infection, there is an allergy and cannot tell what the allergy is and will probably never find out what the allergy is, and prescribed him the Azelastine hydrochloride nasal spray. The pharmacist thinks the nasal spray is too much but states the pharmacist is not a physician and ENT doctor prescribed it. The two sprays a day works and he has not had uncontrollable coughing since then. Out of an abundance of caution he was sent to a lung doctor to get breathing test. Testing: He had two x-rays and CT scan of the torso. He does not know what x-rays showed. CT scan shows kidneys, liver, pancreas, and gall bladder are normal. Everything is normal except for the heart. It did not explain what was wrong with him. Clarifies he had the same CT scan at another facility a couple of years ago and he was told that calcium around the heart is normal. He knows that he has low blood pressure normally. Attempted to clarify if x-rays were off his chest, stated they stuck something under his back. States nothing was mentioned about his x-rays and if they looked at the x-rays they could see he has a broken back. No other vaccinations was done within four weeks prior to the first administration date of the suspect vaccine. Got sick the next day after the flu shot twice. Will never take again (unspecified flu shot). Patient reported about 4 years ago he let his doctor give him a pneumonia shot and his arm hurt like hell for a week, states he is never doing that again. When discussing Allopurinol, caller stated it was not working very well, but it had positive effect and he will continue taking it as long as his

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

doctor will let him. States when taking it, the gout does not get better, it gets worse. Allopurinol, states it does work but it works so little that it is almost worth not taking. When the pain is at 10 or 11 on pain scale, states what is the difference. Caller states he was on a different medication before that worked better, but he could not continue to take it. Caller stated that microprint was difficult to read. He was able to give NDC number using magnifying glass. Product strength and count size dispensed: 300mg, 90 count. Expiration Date: Dec 2021. The sample of the product was available to be returned, if requested. Packaging was sealed and intact. Treatment for event was Norco 10-325: Takes up to 3 times per day. Caller states he is still in pain, but he can't get more without going to pain specialist. Confirms he has been in chronic pain for over 30 years due to gouty arthritis. Advised caller to retain sample of product in the event he receives Mailer within 3-10 business days for the return. Swap. Caller took 1st dose of Covid vaccine 16Apr2021 and collapsed the next day and then for the next 5 days he felt general malaise and weakness. On 07May2021 he took 2nd dose, 21 days after 1st dose, and again collapsed the next day. Stated that he needed to call 911 to help him get up and they took him to hospital where they did a scan of his torso and said he was fine. Doctor also told him that he did not have stroke, blood clot or aneurysm. Caller thinks it is neurological as he is still having trouble standing and walking and his left side feels paralyzed. He is wondering if these side effects were documented during clinical trials. Therapeutic measures were taken as a result of pain. The outcome of the events experienced collapsed day after vaccine first dose/collapsed day after vaccine second dose, legs wouldn't move, couldn't turn around, he had compression fractures L1 to L3 that were noticed on his x-ray, pain, half of back is black from incident, mobility got worse after first shot and then after second dose his mobility got even worse, felt like what i would call the flu was unknown, for the events his left side still feels paralyzed and can't walk, he collapsed and had a hard time getting up/felt bad, his left side still feels paralyzed and can't walk, bedridden the outcome was not resolved, for the event general malaise the outcome was resolving. Follow-up attempts are needed. Further information is expected.

1373734	6/4/2021	IL	51	F	4/11/2021	4/20/2021	States her cholesterol is always 75 and is now 200; facial droop or pain in her face; noticed her arms started getting numb and swelling up; noticed her arms started getting numb and swelling up; facial droop or pain in her face; talk with the slur; tingling in her fingers; ended up in the emergency room and had a stroke; she had blood clots on the brain from the stroke; she went into the ER her blood pressure was 200/180; This is a spontaneous report from a contactable consumer (patient) and a contactable physician. A 51-year-old female patient received bnt162b2 (Lot Number: ER8730; Expiration Date: 31Jul2021), second dose via an unspecified route of administration, administered in left arm on 11Apr2021 (early in the morning) at the age of 51-year-old as 2nd dose, single for covid-19 immunization. Medical history included ventricular septal defect from an unknown date and unknown if ongoing (she was born with a hole in her heart but that had closed up and when she had the stroke, the hole opened back up and they told her she had blood clots on the brain from the stroke). There were no concomitant medications. The patient previous received first dose of bnt162b2 (Batch/Lot Number: ER2613; Expiration Date: 31Jul2021), via an unspecified route of administration, administered in left arm on 21Mar2021 single dose for covid-19 immunization. The patient experienced stroke on 20Apr2021, she had blood clots on the brain from the stroke on 20Apr2021, blood pressure was 200/180 on 20Apr2021, her cholesterol is always 75 and is now 200 on an unspecified date, facial droop on an unspecified date, her arms started getting numb and swelling up on an unspecified date, pain in her face on an unspecified date, talk with the slur/ slurred speech on an unspecified date. The events her arms started getting numb and swelling up, pain in her face and talk with the slur/ slurred speech were serious per hospitalization; stroke, she had blood clots on the brain from the stroke, blood pressure was 200/180, her cholesterol is always 75 and is now 200 and facial droop were serious per hospitalization, medically significant. The patient was hospitalized for from 20Apr2021 to an unknown date. The events require a visit to emergency room and physician office. Caller states she is calling about the Pfizer shot and had the 2nd dose on 11Apr2021 and noticed her arms started getting numb and swelling up and she did not do anything about it but

----------	-------	-------	---------	-----	----------	------------	--------------

2 days after that she called the facility where she had the Pfizer shot and they said to call her HCP and the HCP was out of town so she spoke with a nurse and was told to go to urgent care at that time. States she went to urgent care and they said her arm was swollen and to rub alcohol on it and she did that and a couple of days after that ended up in the emergency room and had a stroke. States the numbness and swelling was just the whole left side of her body and she went to the emergency room at the hospital on 20Apr2021 but on 16Apr2021 she went to the urgent care; states the numbness and swelling is better but comes and goes with the tingling in her fingers and the numbness, but her face is doing much better and she does not have the facial droop or pain in her face anymore; states her speech is back and she does not talk with the slur anymore. States the facial droop, face pain and slurred speech began when she went to the ER and that was on 20Apr2021 and is now completely resolved. Caller states the 1st dose of her Pfizer Vaccine was administered on 21Mar2021 with lot ER2613, the 2nd dose was administered on 11Apr2021 with lot ER8730; states both doses of the Pfizer Vaccine were administered in her left arm and her patient card does not have the NDC written on it but the expiry date for both doses of the vaccine is 31Jul2021. States the whole year of 2020 she was doing fine till she took the Pfizer Vaccine and that shot everything up regarding her cholesterol levels and Blood pressure which are all high; states her cholesterol is always 75 and is now 200; states she has high blood pressure and when she went into the ER her blood pressure was 200/180; states she was born with a hole in her heart but that had closed up and when she had the stroke, the hole opened back up and they told her she had blood clots on the brain from the stroke. The patient underwent lab tests and procedures which included cholesterol: 200 on 10May2021 (her cholesterol is always 75 and is now 200), blood pressure: 200/180 on 20Apr2021. The outcome of events for stroke, she had blood clots on the brain from the stroke, her blood pressure was 200/180, her cholesterol is always 75 and is now 200, tingling in her fingers were unknown, for other events was resolved on an unspecified date. Vaccination Facility Type: school. No Additional Vaccines Administered on Same Date of the Pfizer Suspect. No Prior Vaccinations (within 4 weeks).

1373703	6/4/2021	MO	43	F	3/22/2021	3/1/2021	Has not had any energy; it's hard to breath with no oxygen in her blood; it's hard to breath with no oxygen in her blood; Had been checked for anemia in Apr2021 and told she was anemic/ iron has been low; period still ongoing and strong, really heavy bleeding with clots; prolonged bleeding with periods; This is a spontaneous report from contactable consumer (patient). A 43-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration, administered in arm left on 22Mar2021 09:00 at the age of 43-years-old (Lot Number: EN6204) as single dose for COVID-19 immunization. Historical vaccine included BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) as first dose on 01Mar2021 at the age of 43-years-old for COVID-19 immunization (Lot Number: EN6198, Anatomical Location: left arm); started period couple days early after first vaccine from Mar2021, caller reported she got the first Pfizer BioNTech vaccine and shortly afterwards she started her period, which was a couple days early, but it didn't stop for 10 days. It was really, really heavy bleeding along with clots and things. Medical history was none. The patient's concomitant medications were not reported. The caller asked if prolonged bleeding with periods was a side effect of the vaccine. She stated she had both doses of the vaccine and had this issue with both. She stated she knows there has been other woman who have come forward saying they have these things. At the time, her doctor had not heard anything about any reactions to it. Her iron has been low and she got tested for anemia and was anemic now. She has had her second period since the vaccine and was on day 16 of period. It was still going on strong and she was wondering if this was something that Pfizer has heard of happening after the vaccine. She had first BionTech vaccine on 01Mar2021 and her period started a day or two after that. It had gotten worse, but did subside. She was normally super regular and super normal with her periods. Stated she did have another small period in between the first and second vaccine, but that only lasted for a day, which was really weird for her and did not usually happen. Had the second dose 3 weeks after the first dose on 22Mar2021 and a couple days after that her period started and she was now on her period and on Day 16 and it's gotten worse. This one started early May,

----------	-------	-------	---------	-----	----------	------------	--------------

03May2021 and was also still going strong and really wants this to be resolved since going on her honeymoon soon. Caller clarified event of periods. She had been checked for anemia in Apr2021 and told she was anemic. Has also gone to specialist to see what's going on. They suggested a biopsy to rule out that there was nothing else going on. If nothing else works they are talking about doing an ablation to stop the bleeding or a partial hysterectomy, where they just take the uterus, since they know that's causing her anemia and since the bleeding won't stop long enough for her to get her blood supply back up where she needs it. Has not had any energy and it's hard to breath with no oxygen in her blood. Physician office was for period still ongoing and strong, really heavy bleeding with clots, iron low, anemic, no energy, hard to breath with low oxygen in blood, saw a specialist. The patient experienced period still ongoing and strong, really heavy bleeding with clots in Mar2021; prolonged bleeding with periods in Mar2021; had been checked for anemia in Apr2021 and told she was anemic/ iron has been low; Has not had any energy; it's hard to breath with no oxygen in her blood. The outcome of events was not recovered.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021568087 same patient/drug and different dose/event.

1371119	6/3/2021	FL	53	M	4/10/2021	4/19/2021	I went to Pharmacy on Aril 10 2021, after the vaccine I got fever for three days in a row, then four days with pain in my left leg. On the 19 I was not able to move my left leg with a lot of pain and a little discomfort on my right leg. Rush to the hospital and right away the found blood clots on my left leg, The ER did not check my right leg and two weeks later they found clots on the bottom part of my right leg. They gave me blood thinner and now Im taking Eliquis twice a day. Symptoms continue, I have the same pain, I dont see any improvent. I did went to work yesterday and I realize that I can do any lifting or be sitting down for at least one hour.
1372572	6/3/2021	OR	41	F	4/8/2021	4/17/2021	Tingly/numbness in right arm immediately with injection. Lasted about an hour. Fatigue and achiness the following day. 4/17-4/19 tingly and soreness in neck and shoulders. Virtual visit with doctor on 4/19 to discuss if symptoms were related to blood clots and/or vaccine. Week of 4/25 extremely swollen and sore lymph nodes. 5/4 -5/6 fever (101). COVID test 5/5 and negative result received 5/7. Fever returned higher (102.9) on 5/8. Virtual visit with doctor 5/10 to discuss fever and fatigue symptoms. 5/13 UTI test. No infection but blood in urine. Off and on fever and extreme fatigue continue along with loss of appetite and weight loss. 5/18 in person doctor visit to check symptoms, another UTI test and bloodwork. Blood work came back normal, UTI normal, still blood in urine. 5/20 X-ray to check for pneumonia (none found) and ultrasound on kidneys and bladder to check for infection, kidneys stones (none found). Also had more blood work done that day to check for mono (had as a teen with similar symptoms). 5/24 confirmed reactivated mono. Symptoms have slowly improved since 5/23. Another test is scheduled for the future to check the blood in urine again.

1372065	6/3/2021	TX	47	F	4/27/2021	4/28/2021	Blurry vision and( flashing light in peripheral vision )right eye the next day after receiving the second dose on April 27,2021. Flashing light lasted for a week. Afterwards just blurry vision until May 30th vision became distorted and dark. Visited eye specialist 06/04/2021 and was advised to report to the CDC that blood clot was found in right eye. Treatment is now needed that involves injections to the right eye . (3 treatments in span of 10 weeks) with possible laser treatment if injections are not as effective. Eye Specialist -
1371903	6/3/2021	MI	33	F	4/28/2021	5/7/2021	Irregular menstruation and menorrhagia following COVID-19 vaccine on 4/28/2021. Had irregular breakthrough bleeding on 5/7 that lasted 3 days and then again on 5/20 - 5/27 that lasted greater than 7 days with very heavy clots which is irregular for patient. Patient convinced that it is due to COVID-19 vaccine. She reports compliance with daily OCP.
1371851	6/3/2021	OH	29	F	6/2/2021	6/2/2021	06/02/21 - Moderna vaccine administered at 3:30pm. Waited 15 mins at the HD without any reported side effects. When driving home, client states she felt dizzy. Developed fatigue around 5pm. At 8pm went to have a bowel movement and large amounts of red blood with small clots passed from rectum. Client states she had to flush 3 times d/ t the amount of blood. No stool passed. No other episodes reported. Client does state that around 2-3 am she was up to use the restroom and noted small amount of dried blood spots in her undergarment. Client states that she does have a h/o hemorrhoids since the birth of her baby but states this "definitely" was not related. Client reported feeling hot during the night with mild abdominal cramping but states she is to start her menstrual cycle soon. PHN questioned if she felt this was her menstrual cycle and client clearly states the blood was coming from her rectum. No further episodes of passing blood reported and states that she is feeling better today. Client states that she does not have a h/o of blood in stool except on occasion scant amounts from hemorrhoids. PHN encouraged client to report this finding to her PCP as well and that the PHN was going to report this to VAERS. No other s/s of bleeding reported to the PHN.

1371845	6/3/2021	CA	48	F	4/9/2021	4/10/2021	I had the vaccine and around midnight I had fever and I thought that was normal but a week later I had a very intense headache and I still thought that was normal but I was worried because that was the time they had discontinued the Janssen vaccine. After that I had a very intense pain on my legs and some big and purple veins appeared from my knees down to my legs and some red veins on my thighs. The pain was unbearable, and I could not walk. I bought some creams and medicine but they did not help relieve the pain and I felt like my legs were burning and I decided to go to the ER. They did some vein exams and said I did not have thrombosis; they also did a blood test and a urine test and everything was normal. My legs still hurt until today and I really regret having the vaccine.
1371732	6/3/2021	NC	43	F	12/18/2020	1/29/2021	I began to have reddened areas as well as blanched (reynaud-like) areas on my hand as well as areas of what appeared to be micro vascular clots. I had swelling on one fingertip. Fingers were painful. I had something similar on my big toes
1371683	6/3/2021	WA	38	F	4/8/2021	4/9/2021	The day after, I woke up with a bad headache and I had the headache for a good 19 days. The doctors thought I was over-reacting. It was a bad headache on left side of head. I was just not feeling well. On the 19th day, it went away. I still from time to time I do still feel pain in the head on the left side. I had a lot of tightness in my left leg. In previous years, I have had blood clot in my leg and after birth in my stomachs - so with the pain in calf I called a doctor and went. They did a visual. After a lump appearing in my leg, an ultrasound was scheduled. I went Urgent care on May 10 - she ordered an ultrasound but her office didn't ever follow up with me. On 17th, I saw my Primary care and she sent me straight to get an Ultrasound - on the 18th, it revealed I had a blood clot.
1371668	6/3/2021	FL	49	F	5/7/2021	5/15/2021	Pain, swelling, stiffness and blood clot in left arm

1371561	6/3/2021	MD	23	F	5/17/2021	5/17/2021	The first day, I was in a lot of pain all over my body, the normal aches and flu-like symptoms. I was in so much pain that I cried. Because I have fibromyalgia, my doctor advised that I go to the hospital because it hurt to touch my skin. I was sent to the ER a week later because my symptoms had lasted so long, I had a persistent headache, and they wanted to check for thrombosis.
1371455	6/3/2021	CA	54	F	3/8/2021	3/8/2021	The first vaccination dose when we went to the car we sat in the car for 15-30min. After about an hour I started to have Paraoxysmal dyskinesia and seizures (they are secondary condition to the MS). And I began to have this in the car. I started to have paralyze in both legs but my left leg began to hurt. And I began to have terrible diarrhea and I have Chron's disease and I have a Ileospomy bag (and I've had this since March of 2017). A week later after vaccination I had an infusion of Entyvio (biologic) which is regularly scheduled and happened to be a week after the shot. It helped the diarrhea. I contacted my GI doctor to ask if they could move up my infusion to so it could be after my next dose. They said all their patients are seeing diarrhea after vaccination and no they couldn't move it up. I continued to have pain in my legs, fatigue even after going up stairs, difficulty walking. In 2014 I had Sciatic in that leg and a blood clot so I thought it was due to that and never assumed it was a blood clot. And the pain was getting worse each day but I assumed it was all related to the Chron's and not a blood clot.

1370660	6/3/2021	TX		F			Blood clot disorder; This is a spontaneous report from Pfizer sponsored program. A contactable female consumer (patient) reported for herself that she received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 on an unspecified date and dose 2 on 19May2021, both via an unspecified route of administration (Batch/Lot number was not reported) as single dose for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. Caller went on her 2nd dose today 19May2021, she was asked a question if she had a blood clot disorder, she was not asked about this on the 1st dose, and apparently, she was having a blood clot disorder on an unspecified date. She asked the people in the facility if she needed to be concerned, and they said that she didn't need to worry about it, however she wanted to make sure that everything was fine or should she watch out for something. Outcome of event was unknown. No follow-up attempts are possible. Information about lot/batch number cannot be obtained.

1370626	6/3/2021			F	3/31/2021		stroke; blood clots on her legs, lungs and head; blood clots on her legs, lungs and head; blood clots on her legs, lungs and head; This is a spontaneous report from a contactable consumer (patient son). A 77-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration on 31Mar2021 (Batch/Lot number was not reported) as single dose for COVID-19 immunization. Medical history was none. Historical vaccine included BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) as 1st dose on 10Mar2021 for Covid-19 immunization. After having the first dose she told him that she could not make a whole 20 minute walk as she used to, she could for 10 minutes as she felt tired. She presented a consistent cough, that was not "bad". The patient's concomitant medications were not reported. Caller stated that he would like to consult about side effects of the Pfizer Covid-19 vaccine that may have caused his mother to be passing away right now. Stated that they both received the first dose on 10Mar2021 and the second dose on 31Mar2021. A month and a week later she went to her sister's house and this Tuesday he received a phone call where they stated that she had a stroke due to blood clots on her legs, lungs and head. They just left the hospital and the nurse stated that she could have hours or a couple of days left. He would like to consult if there are any reports of these side effects. The outcome of events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021568883 same patient, different dose/events

1370597	6/3/2021	CO	72	F	5/14/2021	5/1/2021	Slight puffiness on her left cheek; Swollen lymph nodes; Light tightness in her throat; Her lymph nodes remain just a little tender but are no longer swollen; This is a spontaneous report from a contactable consumer (patient). A 72-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EW0179), via an unspecified route of administration in arm left on 14May2021 08:00 at single dose for COVID-19 immunisation. Medical history included triple coronary artery bypass graft (CABG) on 20Apr2019, and deep vein thrombosis (DVT) and pulmonary embolism (PE) blood clots following a surgery 2 years before. Concomitant medications included simvastatin taking for a year and a half at 100 mg one time per day for blood cholesterol, fenofibrate taking for years at 145 mg tablet one time a day by mouth for blood cholesterol, apixaban (ELIQUIS) at 5 mg tablet twice a day by mouth for blood clots from 20Apr2019, alendronate sodium (FOSAMAX) taking for about 6 months or so at 35 mg one tablet on Mondays for bone density abnormal, eicosapentaenoic acid ethyl ester (VASCEPA) at 1VM capsule, 2 capsules in the morning and 2 capsules at night, and a lot of vitamins taking for years. The patient experienced a slight puffiness on her left cheek, very swollen lymph nodes, and light tightness in her throat when she woke up on 15May2021. She said she took diphenhydramine hydrochloride (BENADRYL) which helped make her feel better. She thought she only had a mild reaction since she did not feel the need to call (with held). Patient wanted to know if she should still receive the 2nd dose based on the reaction she had with the 1st dose. They told her if she had a reaction she would have within a few minutes or an hour of getting the vaccine, she was just different, she would have reactions to some things the next day. Within a day the lymph nodes went down and she felt like it had cleared up, her lymph nodes remained just a little tender but were no longer swollen. Outcome of the events was resolving.

1370583	6/3/2021	WI	64	F	3/22/2021	4/24/2021	<p>did get a positive COVID case after receiving the Pfizer, both of them, a month later; did get a positive COVID case after receiving the Pfizer, both of them, a month later; This is a spontaneous report from a contactable nurse (patient). A 64-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), on 24Feb2021 15:00 (Lot: EM9810) as 1 st dose, single then on 22Mar2021 10:00 (Lot: ER2613) as 2 nd dose, single; both via an unspecified route of administration in right deltoid (at the age of 64-years-old) for covid-19 immunisation. The vaccination facility type was a clinic and was not administered at a military facility. No additional vaccines administered on same date of bnt162b2 and no prior vaccinations (within 4 weeks). No events following prior vaccination. Medical history included ongoing hypertension (diagnosed more than 15 years ago), ongoing arthritis reactive (diagnosed probably 10 years ago, maybe 15 years ago), obesity (thinks too heavy for her height, not severely obese) and non-smoker (not former smoker). No family medical history. Concomitant medication included methotrexate for arthritis. On 24Apr2021, the patient experienced sore throat, severe cough, headache, body aches and fatigue which were considered non-serious. The cough lingered and she was a little bit more tired than normal, but she has some of that anyway. The patient recovered completely from everything except the fatigue, still having a little bit of fatigue, it was ongoing, not bad, improved. On 26Apr2021, the patient did get a positive COVID (Covid 19 PCR) case after receiving the Pfizer, both of them, a month later which was considered non-serious. No antibody testing and antigen test done. The patient stated that when she called her doctor, they did advise that she get the Monoclonal antibody infusion. Therapies for COVID-19 included monoclonal antibody infusion, it was a 2 to 3 hour procedure at the hospital. It was an experimental thing, she signed all the forms, it was supposed to boost all her antibodies, hopefully it boosted hers between Covid and that she should be good she was hoping. The patient went to her physician's office for a COVID test. The patient got her first symptom on 24Apr2021. The patient had been contacted that she had been exposed to somebody else who also had been immunized. The patient was with her, she contacted her</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

and then developed symptoms on 24Apr2021 and she didn't go in to get tested until Monday, 26Apr2021. The patient considered it very mild, but she did get the antibody infusion also when she got it. All of the events required a visit to the physician's office but not on emergency room. The patient was not hospitalized, not admitted to an intensive care unit. The patient did not display clinical signs at rest indicative of severe systemic illness. The patient monitored her oxygen levels twice a day and they were fine. They sent her a home monitoring set up, she took her vital signs twice a day for two weeks and everything was fine. The patient did not require supplemental oxygen (including high flow or ECMO) or receive mechanical ventilation. The new or worsened symptoms/signs during the COVID-19 illness experienced was cough but no on the following: multiorgan failure, respiratory, dyspnea, tachypnea, hypoxemia, COVID pneumonia, respiratory failure, acute respiratory distress syndrome. On cardiovascular, no heart failure, cardiogenic shock, acute myocardial infarction, arrhythmia, myocarditis and other. On Gastrointestinal/Hepatic, no vomiting, diarrhea, abdominal pain, jaundice, acute liver failure and other. On vascular, no deep vein thrombosis, pulmonary embolism, limb ischemia, vasculitis and other. On renal, no acute kidney injury, renal failure and other. On neurological, no altered consciousness, convulsions/seizures, encephalopathy, meningitis, cerebrovascular accident and other. On hematological, no thrombocytopenia, disseminated intravascular coagulation and other. On dermatological, no chilblains, erythema multiforme and other. The events did not require initiation of new medication or other treatment or procedure. No pre-existing diseases worsened during the SARS-COV2 infection. The patient was retired now, but she worked as an RN. The outcome of the events was recovered in 2021. The patient considered the events "did get a positive COVID case after receiving the Pfizer, both of them, a month later" were unrelated to bnt162b2. Follow-up attempts are needed. Further information is expected.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation.

A 43-year-old female patient received bnt162b2 (Pfizer-BioNTech COVID-19 vaccine), dose 2 via an unspecified route of administration on 11Jan2021 20:10 (Batch/Lot Number: EK9231, NDC numbe: 59267-1000-01) as 2nd dose, single and first dose (Lot number: EK5730) on 21Dec2020 in the left arm for Covid-19 immunization. Medical history included rheumatoid arthritis from 2007 and ongoing (diagnosed with rheumatoid arthritis when she was 27 years old, in 2007 or 2008) and ongoing immunosuppression which is related to rheumatoid arthritis. Concomitant medications included hydroxychloroquine sulfate (PLAQUENIL S); bioflavonoids nos, calcium ascorbate, hesperidin, rutoside, sodium ascorbate, zinc amino acid chelate (VITAMIN C 1000 PLUS ZINC & BIOFLAVONIDS); zinc chloride; calcium carbonate, colecalciferol (VITAMIN D 2000); naphazoline hydrochloride (EYE DROPS [NAPHAZOLINE HYDROCHLORIDE]); progesterone (PROGESTERONE) all taken for an unspecified indication, start and stop date were not reported. On 07May2021, the patient got Covid-19 after getting Covid-19 vaccine. The patient went to the Emergency Room and got an infusion by Regeneron (endevimir and casevimir) which her symptoms started improving within 5 minutes of receiving the infusion. The patient was not hospitalized/admitted to ICU. The patient did not require supplemental oxygen or receive mechanical ventilation. Patient reported that she got Covid-19 from somebody when she was in an open-air environment and her mask was off. During her Covid-19 infection, she took Benadryl 25 mg at night and Sudafed every 4 to 6 hours throughout the day. She received no sinus relief from the Benadryl or Sudafed prior to receiving the monoclonal antibody infusion. The patient display signs at rest indicative of severe systemic illness which is fever of 102 and symptoms/signs during the Covid-19 illness experience which includes dyspnea, mostly at night and had difficulty breathing due to extreme sinus congestion; diarrhea and nausea; leg pain and thought that she was getting a clot or something which patient started taking blood thinner the day after she was diagnosed with Covid-19; Covid fog where she feels really spacey and out of it

1370524	6/3/2021	MD	37	M	5/1/2021	5/2/2021	chest pains; shortness of breath, will walk up 3 stairs and gets winded; This is a spontaneous report from a contactable consumer(patient's wife). A 37-year-old male patient received second dose of bnt162b2(BNT162b2 PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Batch/Lot Number: EW0172), via an unspecified route of administration in right upper arm on 01May2021 at around like 11:00 or so as a single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient received first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Batch/Lot Number: UNKNOWN), Reporter stated the lot number for the first dose of the vaccine is either ER8734 or EK8734, she can't read the person's handwriting on the vaccine record card) via an unspecified route of administration in right upper arm on 10Apr2021 as a single dose for covid-19 immunisation. Reporter stated after the first dose of COVID 19 vaccine, her husband was pretty much out of it, like completely out of it. She was concerned and was like "are you going to wake up today?". The fatigue was very real and then his neck was super swollen on one side. and said that was the only side effects from the first one, it was nothing horrible. She confirms the fatigue was either 2 or 3 days after her husband received the first dose of the vaccine and it lasted a good 3 to 4 days where he was beyond fatigued. His neck being super swollen started pretty soon after the first dose, either the next day or 2 days later and lasted for a week or so was really sore when he touched it. The reporter stated Family Medical History Relevant to AE includes her husband mother had a heart attack in her 50s and his paternal grandpa died of hardening of arteries when he was 32 years old. On 02May2021 it was reported that patient started having chest pain really bad which it has not improved whatsoever. He was told to go to the urgent care on 03May2021 night and also reported the shortness of breath; will walk up 3 stairs and gets winded or walks across the room and his whole chest is in so much pain. The AE resulted in the visit of emergency room. The reporter reports concern and asks if she was supposed to report this to Pfizer or if any other patients have had really bad, painful chest issues. The patient underwent lab tests and procedures that included:

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

1371386	6/3/2021	OH	30	F	4/24/2021	6/1/2021	30yof, 36w pregnant, came to clinic on 6/1 with 2 week history of lower leg tenderness and edema. Doppler confirmed on 6/1 that patient had an acute proximal DVT in the left lower extremity, with occlusive thrombus within the distal femoral vein. She denies personal history of clot; this is her 2nd pregnancy; she notes no family history of clot; this pregnancy is complicated by excessive weight gain (current BMI 32.28 kg/m2). Pt received Pfizer COVID vaccine on 4/24/21.
1371727	6/3/2021	CA	68	F	4/6/2021	5/27/2021	Patient is a 69 year old female who was admitted on 5/27/2021 for CEREBRAL VENOUS SINUS THROMBOSIS. Patient is a 69 year old female "who lives at home with husband. Patient with a h/o DM2, hyperlipidemia, epilepsy followed by Dr. neurology outpatient, hypertension. Patient on keppra and tegretol with some episodes of partial seizures, sensitive to being off medications. Patient was in usual state of health until today. Daughter noticed around 6 PM patient was confused, altered, dizzy, not able to walk, and had left arm weakness. The patient's sister had a stroke in the past and they were concerned for this and so brought her in for evaluation when she didn't improve. Daughter thinks patient might have started having symptoms around 1 PM. Daughter reports patient was not taking her aspirin, and they never picked up the lisinopril that was prescribed for blood pressure in the past. She did have the J&J covid vaccine 6 weeks ago.

1367226	6/2/2021	MO	43	F	3/1/2021	3/1/2021	<p>started period couple days early after first vaccine, second period since the vaccine and is on Day 16 of period; heavy bleeding along with clots and things; This is a spontaneous report from a contactable consumer. A 43-years-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Solution for injection, Batch/Lot Number: EN6198), via an unspecified route of administration, administered in Arm Left on 01Mar2021 as 1st dose, single dose for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient had no history of all previous immunization with the Pfizer vaccine considered as suspect. On Mar2021 the patient experienced heavy bleeding along with clots and things and started period couple days early after first vaccine, second period since the vaccine and was on Day 16 of period. It had gotten worse but did subside. States she had another small period in between the first and second vaccine, but that only lasted for a day. She had the second dose 3 weeks after the first dose on 22Mar2021 and a couple days after that her period started early on 03May2021 and she is now on her period and on Day 16 and it's gotten worse. She had issues with both doses and enquired if prolonged bleeding with periods was a side effect of the vaccine and how long these periods last and if they ever end. She stated she knew there were other women with these things. She got the first Pfizer BioNTech vaccine in 01Mar2021 and shortly a day or two afterwards her period started, which was a couple days early and did not stop for 10 days. It was really, really heavy bleeding along with clots and things. She was tested for anemia in Apr2021 and her iron was low and was found to be anemic. She went to a specialist and was suggested a biopsy to rule out that there was nothing else going on. They suggested for doing an ablation to stop the bleeding or a partial hysterectomy if nothing else worked. She did not had any energy and it was hard to breath with no oxygen in blood. The outcome of the event heavy bleeding along with clots and things and started period couple days early after first vaccine, second period since the vaccine and is on Day 16 of period was unknown.</p>

1367204	6/2/2021			F	5/14/2021	5/16/2021	<p>headache, get a little and eyes hurt. She went to work Wednesday, she had a horrible feeling and felt like the walls were crawling in. She is supposed to go in three weeks for second dose. The second shot would be worse, and she feels like that will be a danger. She expressed her concerns about the second shot as she read in the paper that the second one is more stronger. She doesn't plan to get the second one. Something could happen to her with the second shot. The paper said the second shot would have side effects. The people that have done the second shot got sleepy, dizzy, and weak. She want to make sure she can get to work but was still experiencing the adverse events. The outcome of eyes are hurting was not recovered, while with other events was unknown. No follow-up attempts are needed; information about lot/batch number cannot be obtained.</p> <p>felt like a little fuzzy; Lot of discomfort; warm spots on her skin; Headache; Blood clots; itchy red rash; This is a spontaneous report from a contactable consumer (parent of the patient). A 13-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EW0185), via an unspecified route of administration on 14May2021 as 1st dose, single for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. On an unspecified date the patient experienced blood clots, really warm spots on her skin in one of her legs, front of her thigh and her knees, her arms the tip part between her elbow and wrist on both of them, like where you can feel it's warm to the touch, lot of discomfort, headache and she kind of feel like a little fuzzy like in her thinking, she said she felt like she was forgetting things like what you guys were saying. On 16May2021, she developed an itchy red rash on her legs and over her knees and on the tops of her arms from her wrist to her elbows. She has taken Benadryl to treat but it did not help. She is calling to see if this has been reported before. The outcome of events was unknown.</p>

<i>VAERS_ID</i>	<i>RECVDATE</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1367190	6/2/2021	OR	67	F	2/18/2021	2/28/2021	bradycardia and tachycardia episodes; bradycardia and tachycardia episodes; sudden onset chest pain; small vessel stroke in her brain stem; diagnosed with dysautonomia; diagnosed with POTS; Shortness of breath; fine hand tremors; burning hand syndrome; GI burning and belching / burning abdomen; GI burning and belching; blood pressure issues; chest discomfort; exercise intolerance; little waves of hot flashes; O2 sat variations; not well; light headedness and profound weakness; light headedness and profound weakness; This is a spontaneous report from a contactable nurse (patient). A 67-year-old female patient received BNT162B2 (lot number: EM9809 or EM9509) second dose on 18Feb2021 (vaccination age 67-year-old) on left arm at single dose for COVID-19 immunization. Medical history included ongoing Trigeminal neuralgia from Dec2020 (diagnosed 5 month ago after shingles vaccine), continuously being worked up by her primary for autoimmune disorders, she had a stroke in her brainstem. Concomitant medications included carbamazepine (TEGRETOL) for Trigeminal neuralgia (Has been taking for 5 months since being diagnosed with trigeminal neuralgia. She mentions its the only thing that calms the nerve down). Historical vaccine included BNT162B2 (lot number: EN5318) first dose on 25Jan2021 (vaccination age 67-year-old) on forearm left deltoid for Covid-19 immunization and shingles vaccine Shingrix on 17Dec2020 (vaccination age 67-year-old) for immunization and developed a neuropathy (3-4 days later) and trigeminal neuralgia 4 days post-shingles vaccine. 10 days post second dose of Covid vaccine (28Feb2021), she developed sudden onset of chest pain and lightheadedness and profound weakness. She was driving to her son's house and got to the nearest hospital and she was worked up for a blood clot and a heart attack. Everything came up negative but she had bradycardia. So, she was put on a 20 day monitor and she had signs of tachycardia, bradycardic episodes with activity and exercise intolerance. She is still continuing with the chest pain and she ended up in the emergency room two more times, hospitalized once, and she had a angiogram. The cardiologist gave her a diagnosis of POTS and the internal medicine gave her a diagnosis of dysautonomia. She is continuously being worked up by her primary for autoimmune disorders. Finally, her

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

primary doctor threw up her hands and said "I don't know" because she continued to have other symptoms like light headedness, and shortness of breath. Of course, it is all linked to random surges of fine hand tremors and her heart would start racing where she may just be standing at the sink. Cardiology didn't want to do anything with her because she was in normal sinus rhythm. The caller explains she was told they saw a lot of tachycardia and bradycardia but she was in normal sinus rhythm, she didn't belong with a cardiologist. Five months ago, she got the shingles vaccine and developed trigeminal neuralgia 4 days post-shingles vaccine. At that point they did an MRI of the brain, thinking maybe she had MS because that is one of the side effects of MS, but she didn't. She had a normal MRI. She has been to neurology and has had a lot of testing done. She knows the long hauler's with COVID are coming up with dysautonomia. However, she has had multiple Covid tests and is very, very safe. She does not believe that she had Covid, but she does believe this may be a reaction to both the shingles vaccine with the trigeminal neuralgia and the Covid vaccine. Before these vaccines, she was on absolutely no medications and was completely healthy. These 2 vaccines, whether it's in her genetic system or whatever, but she continues to have GI burning, belching and burning hands. They did another MRI and found she had a small vessel stroke in her brain stem. There are so many things that are happening to her right now. She is also seeing rheumatology. She just is not well. Though the CDC doesn't know about her newer symptoms, she reported to the CDC what she had at the time. They haven't gotten back to her on either of them. Five months ago was the shingles vaccine and she would have thought they would have reached back out to her because it is truly too coincidental that she takes a shingles vaccine and 3-4 days later develop a neuropathy, and the shingles vaccine is supposed to prevent neuropathy. She is so active. She walked coast to coast, and now literally just even walking up a flight of stairs, her heart rate goes up to 115 to 120. She can be at rest and her heart rate can be in the 40's. She is also having blood pressure issues as well. Her blood pressure can be 89/46 and then be 152/90, so she is just kind of an "autonomic nervous system mess". Her primary care referred her to a neurologist and a rheumatologist whom

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

she will be seeing Wednesday. She doesn't know what other specialties she may ended up seeing. The MRI was supposed to help find reasons for all these symptoms, but in fact, all it did was add another condition to her already perplexing condition. She submitted one report via CDC for the shingles vaccine on 17Dec2020, which three days later, she had trigeminal neuralgia. Her symptoms are ongoing and it's not disappearing like she had hoped. It keeps progressing and she keeps getting new symptoms. Sudden onset chest pain: Was 10 days after the vaccine, while driving to her son's house. She also developed light headedness and profound weakness. She went to the hospital (ER) and was sent home. 3 days later, she was still having significant chest pain so she went back into the ER. She was on a monitor that was showing all of these tachycardic and bradycardic episodes. She wasn't getting contacted but she was still having pain. The third time she went into the ER, she was admitted to the hospital. They transported her to cardiac care and they did an angiogram, which is when she was given the diagnosis of dysautonomia and POTS. The neurologist says that she does not have POTS because she is not presenting with consistent orthostatic hypotension and tachycardia when he does the TILT test. However, she has a lot of autonomic symptoms, so the doctor decided to do an MRI. Her previous doctor was doing all of this autoimmune testing that was coming back negative. She was tested for an adrenal tumor and had urine tests which got ruled out because she is surging, it is obvious she is having adrenal surges. The caller doesn't believe her doctor was convinced he would see anything on the MRI, so when he called her and told her she had a small vessel stroke in the pons/ medulla area, he thought maybe it could attribute to the symptoms. However, these new GI symptoms she is having does not fit. Therefore, they are continuing to do more studies like gastric emptying, a skin biopsy, CAT scan and an angiogram. She is meeting with a rheumatologist on Wednesday. She also adds she will probably do an MRI of the abdomen because she is having such a burning abdomen. She is waking up in the middle of the night with her abdomen just on fire. It seems like she is continuing to just add new symptoms. The chest pain goes away and she only gets it when she gets tachycardia or when she is taking a walk- it's not

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

having it continuously. She had burning hand syndrome, it was burning hands in a bath, which that that lasted an hour when she was getting out of the bath and she hasn't had that since. Everything is kind of a weird conglomerate of dysfunction, like the blood pressure variations, O2 sat variations. She just wants answers. She is adjusting and adapting. But, she does want to bring this to Pfizer's attention because maybe genetically there is something in her that even though the COVID vaccine is not a live virus, the idea is to mimic the live virus to give you immunity, and long hauler's are experiencing some of these symptoms that she is having. Not that Pfizer is going to do anything differently- she is still encouraging vaccines and she is not telling many people because she doesn't want people to use this as an excuse to not get the Covid vaccine. Caller confirms the dates of all of these events were reported to the CDC. Her doctor would have all of the dates including the dates of the angiogram, ER visits, the findings, and then the testing dates. Dates are unknown by the caller. She confirms she was in the emergency room 3 times, she was admitted and transferred to Cardiac care on the third time. She believes she was admitted for 3 days. She believes she was admitted in the evening, they did the angiogram the next day and she was discharged the following day. The MRI that was sent in 01 Dec 2020 was negative for anything. The MRI that was done last Thursday, 07 May or 09May2021 showed an infarct. So, she did have an MRI that was clear in December and then the recent MRI showed the stroke. They are doing a CAT scan angiogram 28May2021. She explains she has no lifestyle history for developing a stroke. She wasn't even on baby aspirin or any statins. Now, they are now wanting to put her on statins. Before this, she had no history. She confirms her ER visits and one hospitalization were after the COVID vaccine and was all based on chest pain. The caller confirms the only thing that happened to her after the shingles vaccine was that she was in excruciating pain and then the doctor got an MRI going and determined she had trigeminal neuralgia. She was never hospitalized or went to the ER for the shingles vaccine. The chest pain she still gets on and off. Last night, she had it. She can get chest pain when she is walking. The chest pain is not continuous and consistent, it's more based on activity. Last night, her

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

whole intestines were burning and she noticed "oh I'm feeling some chest discomfort". She is not worried about the chest pain anymore because she knows it is either a bradycardia that her chest is unhappy with or tachycardia that her heart is unhappy with and it's giving her discomfort. Her heart rate can literally go from 50 (which is bradycardic) to 120 in less than 5 -10 seconds. Her heart just goes racing like she is having a marathon, that's how fast it goes. It will last this way for a minute and her heart rate will eventually meander it's way down so that's why she thinks she is getting chest pain. She works with elders and wanted to keep the world and community safe. She wanted to get back into the world and see her mother who is in a nursing home. Caller mentions she was taking 200mg twice a day of the Tegretol (before the COVID vaccine). She had to up her dosage because she had another outbreak so now her dose is 300mg, twice a day. She clarifies a tooth infection flared up her trigeminal neuralgia. All of the auto immune results were negative, except the MRI, which she thinks is the only thing that was positive. She is doing an autonomic test in September. At this point, her doctor has given a diagnosis of dysautonomia and she is presenting as such. Her neurologist is needing verification and so he is not giving her a diagnosis even though she has all of the symptoms of dysautonomia. Vaccination Facility Type: administered it to their elder care home. The event chest pain required a visit to Emergency Room and Physician Office (has weekly telephone visits because she keeps getting different symptoms. They are scratching their heads trying to figure out what other testing is needed. She is now developing little waves of hot flashes and is not having a fun time. She was living a very healthy lifestyle and was always energetic previous to this). The patient was hospitalized for 3 days. Family Medical History Relevant to AEs was No, other than her mother has hereditary angioedema. She hasn't been tested so does not even know if that is significant. She knows she has been reading about long hauler's having dysautonomia and a whole array of neurological symptoms. It is kind of intriguing as well as kind of suspicious. Everything is being managed well by her primary doctor who is very concerned and is doing everything she can to try and find and answer. The caller is very curious if there is a lot of

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

funding, would she be put into a link and a pool to be involved in some studies or something? Is it something genetic? There is certainly enough money out to do this work. Caller is questioning if she would get a booster given that she is questioning if she should get a booster because she doesn't know. She doesn't know if she is going to get the second shingles vaccine. She does not know what it could result in for her given these 2 complications with these 2 vaccines. Causality: Because she had the shingles vaccine and developed trigeminal neuralgia, which is a neuropathic, and then getting the Covid vaccine and having all of these symptoms, it is just too coincidental. She is going to talk to her doctor about MS since she is presenting with gut things which is more "MS-ish". MS is hard to diagnose so she doesn't know, they are still testing. At this point, because all the boxes checked besides the last MRI, she is leaning towards the COVID vaccine being the cause of her symptoms. The causality for event sudden onset chest pain was related. The outcome of the events was unknown. Information about batch/lot number has been requested.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events bradycardia, tachycardia, chest pain and brain stem stroke cannot be excluded. The available information upon initial assessment is limited, especially as a definitive diagnosis was not available. The patient was reported to have pre-existing trigeminal neuralgia and previous brainstem stroke and is being worked up for autoimmune disorders; the role of these conditions in the development of the symptoms also cannot be ruled out. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

----------	-------	-------	---------	-----	----------	------------	--------------

thought because it was so swollen it was a bite. Caller did Benadryl and RICE treatment. As the day progressed, she had pain all up the arm on 17May2021. She had an appointment with physical therapy. They said to get to the hospital. Her nurse met her for lunch and caller's arm was warm in May2021 and her nurse said to get to the ER. They wanted to rule out a blood clot. They didn't want to admit her, but she had severe issue with her arm that day. She was given pain medication, Benadryl, and had CT scan to rule out blood clot in ER. She couldn't move her neck to the left. She was there 8 hours. While there, her left ear was burning (on 12May2021) to the point it felt someone was ripping it off. In her left eye she had floater on 12May2021, like black fuzzy lines. Everything was on the left side. She didn't hit anything in the time between receiving the injection and 6 days later. She had not done nothing out of her normal routine. It is too much of a coincidence that this is the only thing she has had in the left arm. For 2 or 3 days since last Wednesday the entire arm where the vaccine was given was red and swollen in May2021. She didn't have an immediate side effect, but 6 days later she had a great amount of side effects. She can't say it is the vaccine. She has had a flu shot every year and pneumonia shot every 5 years with no side effect. She is anaphylactic or resistant to every oral antibiotic. Even with IV antibiotics there are only certain ones that can be use, but she has to be pretreated with 50mg of IV Benadryl. She was on Doxycycline all last summer oral and IV. After 4 weeks on it she was sent home with a temp medline for IV infusion. Within 3 hours of her giving herself the next dose she had an anaphylactic reaction. Her body does not immediately react to any side effects or adverse reaction. It can be days out and it hits all of a sudden. On last Wednesday she woke up around 7AM. She felt like it woke her up because of the swelling. She couldn't even bend her knuckles at all. As time passed the pain progressed up her arm. She couldn't straighten arm at all. Everything was on that Wednesday and on the left side. She had full range of motion on the right side. The hospital said it was intramuscular and she read that could possibly be side effect. This was her first dose. Left hand and wrist were double the size of right hand: It resolved. She noticed it around 7AM as the day progressed the swelling went down a little bit. That is

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

when the arm started hurting and the swelling would come back. The swelling wasn't as significant as it was first thing in the morning. She has pictures she can provide if needed. Pain all up the arm: the pain has resolved except for the top of the arm where she received the vaccine. When she lifts her arm up, it is still sore. It wasn't sore the first 2 to 3 days or immediately following the inoculation. It is still very mildly sore. They also did an ultrasound when in the ER. At home she takes, not for this issue, Gabapentin 3 times a day. It was just filled and is in the pharmacy vial and she doesn't have NDC, lot, and expiry. Caller clarified that it is Neurontin 300mg not Gabapentin. She has been on Neurontin since Mar2021. She takes it for left knee nerve pain. For the pain meds she was given in the ER and the Benadryl she doesn't have NDC, lot, or expiry. The hospital administered 100mg of Benadryl. When they did the CT scan they did it with contrast. 40 years ago she had a reaction to IVP dye for kidney scan where her eyes started swelling. Anytime she has contrast solution she is always treated with 50mg of IV Benadryl. She has a slightly topical itch reaction to Morphine. In the ER, they gave her 40mg of IM morphine because they couldn't get a line going. She basically has no veins. They gave her 50mg of Benadryl subcutaneously in the inner area. Then before the CT with contrast, they gave her another 50mg of Benadryl. What she took at home was off brand. It is called Banophen Diphenhydramine HCl 25mg antihistamine. She took one when the reaction happened. The manufacturer is Major. NDC: 09045551-59. When providing NDC caller states, "Come on eyes." Lot number: P121325. Expiry: Aug 2022. Caller just found a sugar cookie from Panera Bread to eat. She was in (withheld) in mid October to late October. Unfortunately when she was down there with her best friend her cat scratched her and caller ended up in the hospital because of cat scratch infection. Even though they were very cautious and following all the CDC guidelines and wearing mask when she came home for 5 days she had many COVID symptoms. She went for a rapid test and it came up negative. She has been tested 15 times since last year because she has had so many surgeries. The reason she got the vaccine was with her underlying health conditions she doesn't want to die. What is interesting is her husband and son both after she

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

felt ill coming home had the same symptoms she did. She is scheduled to get her next dose 27May2021. Is that normal to be scheduled 3 weeks apart? Her greatest concern is her nurse provider is not familiar with her. Her GI doctor and orthopedic surgeon said she should be ok. She wants to receive both as recommended. Her concern with the second vaccine is if the side effects that she experienced could be dramatically worse or result in a horrible outcome. When she spoke to the physician and the nurses and the medical care team they said there are no studies or reports where the vaccine is causing blood clots and what she was experiencing was not associated with the vaccine. When she looked up the vaccine, it said that intramuscular issues could be a rare side effects. Her thought was that it wasn't reported that it hasn't happened. Could intramuscular issues be a rare side effect? Caller clarified that she does not have the Doxycycline or any other antibiotics that she is resistant to or had reaction with to provide NDC, lot, and expiry. The last time she had it was when she had the temp medline put in. She had the reaction and spoke to the infectious disease doctor only in hospital. She threw all the vials and all the bags away. She torn up the lot numbers. The actual bottles she soaked them and then flushed the labels down the toilet. She has chronic anemia. It has been brought to her attention lately that she has critically low iron saturation. Low saturation should be 18 and her iron saturation level was a three. She had the blood test on the same day of the vaccine on 06May2021. On the 7th she had iron infusion. The vaccine was given at 10:40AM. The blood work was drawn at 02:40PM. The iron infusion was at 9:30AM on 07May2021. She received one unit. Adds she previously reported she had gotten the Pfizer COVID 19 vaccine and six days later she had severe side effects. States she was encouraged by her health care professional to go to the ER to rule out a blood clot which she did and the result was negative. Adds when she had the first dose of the vaccine 06May2021, intramuscular in the left shoulder; she had no side effects or anything. Six days later her left hand was swollen to double the size of the right had. She took a 25mg Benadryl that did nothing, which she previously reported. Adds at lunch yesterday she spoke to a friend who is an in home care nurse who has taken care of her before because of her other

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

medical problems; and she encouraged the caller to do RICE treatment; rest, ice, compression and elevation for her wrists. This friend saw the hand at lunch and noticed that the caller was unable to straighten the left elbow and arm; she had great pain in the left elbow and from the hand up the arm. All of these events were previously reported. Caller mentions she is in so much pain and her symptoms are getting worse. New events reported today include the pain has started to increase in her left arm wrist; swelling in her left arm has increased. Caller mentions the physical therapist saw the edema especially on the left shoulder at the vaccination (inoculation) site on 17May2021 and said there is still swelling and she had not noticed this before. Caller clarifies later that day around 1700PM 17May2021, the caller attended a physical therapy treatment and the therapist noticed swelling at the injection site on 17May2021 which was not previously reported. Adds as the day went on yesterday, her right arm wrist also has pain; since yesterday through last night and today it has been at a 10. Adds she has cried in May2021. Mentions she feels she has limited use of her fingers that she noticed yesterday when she had the wrist pain; even picking up things or trying to chop chicken, she can't; she doesn't think she mentioned particularly the left wrist yesterday. Her main concern today is that the pain in her left wrist has increased and now she also has pain in her right wrist on 17May2021. Caller adds she put muscle rubs on; and ice. Her pain in her wrists has not responded to the Gabapentin. She applied three different topical solutions with no improvement in her pain: Generic muscle rub from store; Natureplex Ultra Strength muscle rub; NDC 67324002-01; Jul2022; Topical 5% pure lidocaine cream; Lot 20G13C1; Jul2022; OTC from the pharmacy, no box. Voltaren Gel; Dec2019; lot WN791; unable to locate NDC due to pain in her wrist. Adds the swelling on both wrists is minimal but the pain is incredible; excruciating. Just the edema is minimal; she has kept ice on it on and off; 20 minutes on and off. Adds she has never had pain like this before. Caller mention she did speak with doctor yesterday. Adds she was greatly upset when they told her after she had explained all of her symptoms, that intramuscular joint pain had been detected in May2021. The events results in Emergency Room Visit. The patient underwent lab tests included blood test: unknown results

							on 06May2021, Iron saturation: low (Low saturation should be 18 and her iron saturation level was a three) on unknown date, CT scan (to rule out blood clot): unknown results, ultrasound: Unknown results, COVID test: negative. The outcome of event left ear was burning and left eye had floater was recovered on 12May2021, the outcome of event Swelling of wrists, Vaccination site oedema and Wrist pain was not recovered and other events was unknown.
1367382	6/2/2021	PA	57	M	2/2/2021	2/1/2021	high blood pressure; blockage / two cardiac stents placed; This is a spontaneous report from a non-contactable consumer (patient). This 57 years old male patient received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 02Feb2021 at 05:00 (at 57 years of age) for COVID-19 immunisation. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient's medical history was not reported. Prior to vaccination, the patient was not diagnosed with COVID-19. The patient's concomitant medications were not reported. The patient experienced high blood pressure on 11Feb2021. The event required ER visit on 11Feb2021, physician office visit and was reported as serious per hospitalization for 3 days and as life-threatening. Cardiac cath lab was performed on 12Feb2021 and blockage was found, resulting in two cardiac stents placed. Device date: 25May2021. High blood pressure resolved with sequel on an unspecified date in 2021. Blockage outcome was unknown. On 25Feb2021 at 05:30 the patient received the second vaccination. On 15Apr2021, the patient had another emergency trip to ER, another blockage in the left anterior descending artery. This blockage was only 40% blocked in Feb2021 and suddenly in Apr2021 became 99% blocked. Dr suspected a blood clot when symptoms of shortness of breath appeared suddenly. Since the vaccination, the patient had been tested for COVID-19 (on an unknown date in 2021, with unknown results). No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021601862 same patient, different vaccine dose/events

1367352	6/2/2021	GA	65	F	4/14/2021	4/16/2021	Made her gout flare up in her whole right leg and she couldn't move it so she had to go to the emergency room; Made her gout flare up in her whole right leg and she couldn't move it so she had to go to the emergency room; Ankle pain; This is a spontaneous report received from a contactable consumer (reporting on herself). A 65-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Formulation: Solution for injection, Lot Number: EW0161; Expiration Date was not reported) via an unspecified route of administration in Arm Left on 14Apr2021, as 1st dose, single dose for COVID-19 immunization. Medical history included drug hypersensitivity from an unknown date and unknown if ongoing. There were no concomitant medications. On 16Apr2021 she was in the emergency room be-cause they were checking to be sure that she had no blood clots or a stroke. The COVID vaccine caused a reaction to her gout. Caller clarifies that the COVID vaccine made her gout flare up in her whole right leg and she couldn't move it so she had to go to the emergency room. She used to see Dr. but he retired so now she sees another Dr. She had called her doctor on 16Apr2021 about what she was experiencing and the doctor told the caller that she needed to go to the emergency room so that they could rule out a blood clot and whatever else they do in the emergency room. Probed for when this ended and caller says it ended shortly after they gave her some Tylenol. That was how she knew it was a reaction to the COVID vaccine because gout medicine takes 3 to 4 days to work but they gave her Tylenol and a prescription for ibuprofen therefore she knew what she was experiencing didnt have anything to do with gout. When she was rolled out she saw that they put that she was in there for ankle pain and they didnt put anything about gout. They also did a survey on her and said not to take the second COVID vaccine. Also the COVID nurse said for the caller to not take the second dose, too. Her doctor told her to take it because otherwise she wasnt going to get it because she knows that everyone was just a guinea pig right now. But her doctor suggested that she get it, so she did. She just wants this DSU agent to put in her report she was getting sick from it. She was allergic to penicillin and it will kill her. That was her question before going and having the COVID vaccine. But when they show you the ingredients, no one can read , no one can

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							read those ingredients. Probed for NDC, lot number and expiry date for the previous penicillin and caller declined to provide and said that this was when she was a baby and she hasnt been able to take it since then, they put on her medical records for her to not have it or she will die. The out-come for event ankle pain was unknown and for events The patient experienced made her gout flare up in her whole right leg and she couldn't move it so she had to go to the emergency room was recovered on 16Apr2021. Follow up needed, further information has been requested.
1367764	6/2/2021	WV	12	M	5/21/2021	5/25/2021	He got a superficial blood clot in left arm ?He's got the shot May 21 and I noticed he had two hard knots on left arm and there was probably about a half inch between them and as hard as a rock on that following Monday may 24,2021 , he said it was sore some more when you touched it we was told to keep an ion it make sure it didn't get any worse, turn red, swell, feel hot to the touch, and then to put a warm compresses on it ??
1367971	6/2/2021	PA	51	M	4/4/2021	4/9/2021	Exactly 5 days after the second dose of the Pfizer covid-19 vaccine, I suffered an ischemic stroke. There was a blood clot in my brain that was broken up after tPA was administered about 2 hours after the symptoms of the stroke set in. To date (May 30) I have had many tests, including 2 MRIs, CT scans, TEE, heart monitoring etc. So far, it has been called a "cryptogenic stroke" because there is no cause. The only thing different was the vaccine I received 5 days before the stroke.

1368322	6/2/2021	GA	70	F	1/8/2021	1/20/2021	I woke up and 1/2 my mouth and my tongue felt numb and tingling as if I had Novocain and it was wearing off. Woke up the next day and it was still there so I called the NP. She said to go and get a CAT scan in the morning and it didn't show anything. Later in the afternoon I noticed I was dropping things and dragging my feet and got concerned it was a stroke so I drove down to a larger medical center and they did a contrast CAT scan and that showed nothing. So then they did an MRI and they found a clot. So they put me on Plavix, blood thinner and all that stuff. After a couple of days my hand and foot were fine but the numbness and tingling in my mouth is still there till now. All of this wasn't real pronounced so I didn't think it was a stroke but it was. They sent me to a Neurologist and Cardiologist.
1368387	6/2/2021	FL	46	F	4/28/2021	6/2/2021	Two blood clots.
1368447	6/2/2021	WA	47	F	5/4/2021	5/7/2021	3 days after receiving my 2nd Covid shot I had sharp pains in my chest that progressed to constant pressure. I went to Urgent Care when I also became light-headed and my left hand was going numb. They immediately did and EKG, which was abnormal, and sent me to the ER. I continued to have episodes of blood pressure and heart rate spiking with continuous chest pain. They did bloodwork, a chest X-ray, a CT scan of my lungs as well as 2 more EKG's. My bloodwork was elevated for heart enzymes and possible blood clot. 2 days later I was back in the ER for the same issues, 2 more abnormal EKG's and a chest X-ray. I saw a cardiologist 3 days later, he sent me to the ER right from his office and I had a cardiac catheterization later that same day. This whole time I'd been having chest pain and pressure, shortness of breath, fatigue, high blood pressure episodes. I was allowed to go home but have continued to have chest pain ever since with no explanation. I had bloodwork drawn again yesterday, now testing for myocarditis.

1368486	6/2/2021	IA	61	M	4/16/2021	5/19/2021	Moderna Dose 1 3/5/21 (029A21A) Moderna Dose 2 4/16/21 (027B21A) COVID Positive 5/20/21 5/20/21: Presented to ED. The patient presents with fever. 61 year old male presents to the emergency department for a fever with an onset of 1 day. Patient was diagnosed with pancreatic cancer in April 2021. Patient states he has had 2 rounds of chemotherapy but states he could not have his 3 round last week because his white count was too low. Patient is also complaining of dull chest pain that is exacerbated with deep breathing, cough, and a headache but denies vomiting, diarrhea, neck pain, dysuria, hematuria, and nausea. Patient was diagnosed with blood clots on 05/09/2021 but states that he is not having similar symptoms to when he was diagnosed with blood clots. Patient is taking Xarelto. He has never had COVID but is vaccinated. Patient sees Dr. (Name) at the UI Oncology clinic. 5/25/21: 61-year-old male on chemotherapy for pancreatic cancer, also recently diagnosed pulmonary embolism on rivaroxaban, presents with 1 day of fever. Initially, did not have any cough or shortness of breath, was admitted to the hospital, where a chest x-ray, urinalysis and examination failed to reveal an exact source of the fever. His absolute neutrophil count was less than 500, so he was admitted for neutropenic fever. Cultures were obtained. IV antibiotics started. COVID-19 was tested and, surprisingly, came back positive. The patient has actually had both of his COVID-19 vaccines and basically, does not have pneumonia, shortness of breath, or hypoxemia. We did not use any medications for COVID while in the hospital, watching for any signs of respiratory compromise, but none developed. Blood cultures were negative. He was switched from ceftazidime to doxycycline at time of discharge. Will follow up with Dr. (Name) for his next cycle of chemotherapy. Because of his COVID-19 positivity, we will not schedule any immediate followup appointments, although the patient will call if he has persistent fever, dyspnea, or signs of hypoxemia. For the past 2 days, the T- max has been 99.9, and most the time 98.6. He was seen the day of discharge, doing quite well. Blood pressure 153/80, pulse 90, regular, oximetry 95% on room air. Glucose was 210. Discharged on Rivaroxaban 15 mg b.i.d., doxycycline 100 mg b.i.d., Robitussin AC as needed for cough, Lantus 28 units at bedtime, atorvastatin 80 mg daily, aspirin 81 mg daily.

1366886	6/2/2021	NH	80	M	2/12/2021	2/16/2021	<p>did not get second dose due to side effects from first dose; blood clot in lung; Really bad back pain; breathing was difficult; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of PULMONARY EMBOLISM (blood clot in lung) in an 80-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 031M20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 12-Feb-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 16-Feb-2021, the patient experienced PULMONARY EMBOLISM (blood clot in lung) (seriousness criterion medically significant), BACK PAIN (Really bad back pain) and DYSPNOEA (breathing was difficult). On an unknown date, the patient experienced PRODUCT DOSE OMISSION ISSUE (did not get second dose due to side effects from first dose). The patient was treated with APIXABAN at an unspecified dose and frequency. At the time of the report, PULMONARY EMBOLISM (blood clot in lung), BACK PAIN (Really bad back pain), DYSPNOEA (breathing was difficult) and PRODUCT DOSE OMISSION ISSUE (did not get second dose due to side effects from first dose) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Concomitant products information was not provided. Patient experienced "really bad back pain" and "breathing was difficult". Went to see his doctor who then stated he had a blood clot in his lung. Caller stated he was then put on Eliquis and the doctor said he would have to take it for the rest of his life. Caller wanted to know if this was true or if he can eventually stop taking the Eliquis. He also wanted to know what caused him to get a blood clot. Company comment: Very limited information regarding the events has been provided at this time. Further information is expected.; Sender's Comments: Very limited information regarding the events has been provided at this time. Further information is expected.</p>

1366580	6/2/2021	CO	72	M	3/6/2021	3/7/2021	My ankles swelled up a day later on March 7th and they are still swelled up now both ankles and up into my calves. Skin is so tight. Have had the following done on April 12th - Heart test along with Kidney and Liver test which were all good. Also had a blood test and for 73 years old I had a perfect blood test with cholesterol number at 150 and my HDH and LDL and triglycerides were all 2 to 3 times better than recommended. 12-weeks later my ankles and calves are still swelled up. On May 25th I had an Ultra Sound on both legs from the groin down and it came back with NO blood clots.
1367807	6/2/2021	MI	27	F	4/9/2021	4/9/2021	I started to feel a little intoxicated 20 minutes after the vaccine. After about 30 minutes I had rashes on my face. I was unable to walk in a straight line. I was also very emotional. I took a nap and woke up with a headache, chills and sweating, I had body aches and pain in my back. My skin was hot to the touch. I was nauseous and weak with no fever. The next day I was having shortness of breath and I thought I had blood clots.

hydrochlorothiazide, pantoprazole, and rosuvastatin. On day 18 after vaccine, the patient experienced dyspnea and was hospitalized. On an unknown date the same month, the patient had computed tomography (CT) angiogram and complete blood count (CBC) with unknown results. The patient was diagnosed with thrombocytopenia (no platelet value reported) and pulmonary embolism. Although the underlying obesity may have contributed, based on evolving knowledge of Thrombosis with Thrombocytopenia Syndrome (TTS, per definition from source) and considering the thrombocytopenia and temporal relationship to vaccination, the events are assessed to have a plausible relationship with vaccination.

1367326	6/2/2021	PA	63	M	5/19/2021	5/1/2021	<p>Arthritis pain in back, hips, shoulders and hands; Sore arm; He is not doing anything to cause the pain; This is a program spontaneous report from a contactable consumer or other non hcp (patient himself). A 63-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE solution for injection, Batch/Lot Number: EW0185; Expiration Date: 31Aug2021), via an unspecified route of administration, administered in left arm on 19May2021 08:00AM as 1st dose, single for covid-19 immunization and would scheduled to receive the second dose on 10Jun2021. The patient's medical history included bad Arthritis, Allergic to Penicillin from an unknown date. The patient's concomitant medication included Apixaban (ELIQUIS) 25mg tablets a day patient was taking blood thinner this since he was 48-year-old. On 19 May2021 after the vaccination the patient experienced with a Sore arm, on 20May2021 then the second day after the vaccination the arthritis started for no reason and had more pain in back, hips, shoulders and hands and prior to vaccine he would had minor pain here and there, every day, but now his arthritis had really flared up badly, had to take the pain medication every day. Patient stated that He was not doing anything to cause the pain. It had stayed the same since the pain started, since patient got the vaccination, his arthritis had been getting worse. could not take arthritis medications because he had 2 blood clots for that he was on blood thinners. Patient had a type of arthritis called DISH, which was in his back and was the worst rheumatoid arthritis and osteoarthritis a person can have. Patient was in a lot of pain and took just pain killers and pain medicine as treatment as prescribed Norco by his doctor, 7.5-325 tablets to take as needed. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient did not test COVID-19 positive prior to vaccination. The patient had not been tested for COVID-19 since the vaccination. The outcome of the event pain in back, hips, shoulders and hands was not recovered, and the other events was unknown. Follow-up (24May2021): This is a follow-up spontaneous report from a Pfizer sponsored program. A contactable 63-year-old male consumer (patient) reported that included patient weight, age, concomitant medication, treatment received, outcome of events. No follow-up attempts are needed. No further information is expected.</p>

1366884	6/2/2021	CT	68	F	2/20/2021	4/9/2021	<p>Fever; Permanent vision loss/ Permanent vision loss in the right eye; Another eye episode; This spontaneous case was reported by a consumer and describes the occurrence of BLINDNESS (Permanent vision loss/ Permanent vision loss in the right eye) in a 68-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 002B21A and 023M20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No medical history was provided by the reporter. Concomitant products included PANTOPRAZOLE, METOPROLOL SUCCINATE (TOPROL), AMLODIPINE and ALPRAZOLAM (ZOLAX [ALPRAZOLAM]) for an unknown indication. On 20-Feb-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 20-Mar-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 09-Apr-2021, the patient experienced BLINDNESS (Permanent vision loss/ Permanent vision loss in the right eye) (seriousness criteria disability and medically significant) and EYE DISORDER (Another eye episode). On an unknown date, the patient experienced PYREXIA (Fever). At the time of the report, BLINDNESS (Permanent vision loss/ Permanent vision loss in the right eye) and EYE DISORDER (Another eye episode) had not resolved and PYREXIA (Fever) outcome was unknown.</p> <p>DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On an unknown date, Biopsy: normal (normal) Biopsy of artery leading to right eye. Treatment provided included Prednisone. After the second dose patient had an eye episode that did not go away after few minutes. It continued over the weekend and the patient visited a primary physician who was concerned about a stroke even though there were no stroke symptoms. From there patient was referred to cardiologist, rheumatologist and retinal specialist. Patient had shorter eye episode which began 22 days after the first vaccine and permanent vision loss began 20 days after the second dose. After six weeks of test and physician visits, a biopsy of the artery leading to right eye, the consulted cardiologist and found no problem in the heart, vascular specialist found no issues in the arteries, rheumatologist found no systemic inflammation</p>

A 34-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; Batch/Lot number and Expiration date were not reported), via an unspecified route of administration (administered on the right arm) on 03Apr2021 10:15 (at the age of 34-years-old) as 1st dose, single dose for COVID-19 immunisation. The patient's medical history was not reported. Concomitant medications included alprazolam (XANAX) and propranolol both taken for an unspecified indication, start and stop date were not reported. The patient previously took PERCOCET and experienced mild allergy. The patient didn't receive any other vaccines within 4 weeks prior to COVID vaccine. Prior to vaccination, the patient has not been diagnosed with COVID-19. The patient experienced swelling and tenderness in lower right leg / vasculitis on 06Apr2021 15:00. It was reported that 3 days after vaccination the patient experienced swelling and tenderness in lower right leg and was initially misdiagnosed as infection. After symptoms persisted for 1.5 weeks and antibiotics had no effect, it was diagnosed as vasculitis. No rheumatological issues in blood test or blood clot. PCP determined likely an immune response to the vaccine. The adverse event resulted in emergency room/department or urgent care and doctor or other healthcare professional office/clinic visit. Therapeutic measures were taken as a result of the event included antibiotics and antiinflammatory. Since the vaccination the patient has not been tested for COVID-19. The outcome of the event was recovering.

1367379	6/2/2021	OK		M	3/23/2021	3/1/2021	runny nose; This is a spontaneous report from a contactable consumer or other non hcp. A 20-years-old male patient received BNT162B2 (: PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration on 23Mar2021 (Batch/Lot number was not reported) as a Single dose for covid-19 immunization. The patient past medical history and concomitant medications were not reported. The patient experienced runny nose 10 days but was fine after on Mar2021. However, 4 days later he woke up with an incredible ringing in my ears and a spike headache that he has never experienced that in his life. He also reported a rash under one of his eyes that later spread to the other eye, as well as insomnia. He has seen his HCP and was referred to an Audiologist, who he has visited 3 times since then. He was diagnosed with 50% loss of hearing and 10500 Hertz tinnitus, which the Audiologist mentioned is high. He was prescribed with high dose Prednisone for 7 days, but caller mentioned it did not help and had no effect whatsoever. His HCP wanted to be super cautious and recommended a brain scan this week just to make sure he didn't develop a blood clot. He has reached out to CDC and asked for medical advice, but he stated that everyone is giving him the same answers - there is not enough data. He is on the verge of suicide and said, I can't live with this for the rest of my life. I can't sleep and can't think, its driving me crazy. The event outcome was recovered on Apr2021. He is desperate for answers and even tried reporting to VAERS but there was no way to submit it. No follow-up attempts are needed; information about lot/batch number cannot be obtained.

(seriousness criterion hospitalization) and CONDITION AGGRAVATED (After 1st vaccine my right arm was little bigger than left arm but after 2nd vaccine it got worst) (seriousness criterion hospitalization). The patient was hospitalized on 17-Apr-2021 due to CONDITION AGGRAVATED and PERIPHERAL SWELLING. At the time of the report, PERIPHERAL SWELLING (Right arm is bigger than left arm.) and CONDITION AGGRAVATED (After 1st vaccine my right arm was little bigger than left arm but after 2nd vaccine it got worst) outcome was unknown. The patient also reported taking an unspecified birth control pill concomitantly. The patient reported going to the ER on 17-Apr-2021 due to possible blood clot in right arm. The doctor did not find any blood clot, and the patient was not prescribed anything. The patient received both scheduled doses of mRNA-1273 prior to the events therefore, action taken with the drug in response to the event is not applicable. 1369355	6/2/2021	OH	41	F	4/1/2021	4/1/2021	Immediate dizziness. Arm felt like dead weight. Had trouble driving to waiting area. Within 20 minutes, chest, neck, arms, and face tightened, I couldn't move my arms, paramedics found blood pressure to be very high. Was light headed for 48 hours after. Almost fell over multiple times. Arms and legs very heavy and tired easily. On 4/21/2021 my leg cramped up and went numb. Week later my chest constricted with same issue from injection day. Went to hospital. Blood pressure again elevated. Concerned of a blood clot, did chest mri and ultrasound of blood vessel in leg. No blood clot found, but new lesions in chest were found and no explanation of leg issues. As of today's date, no one can figure out why my right leg is numb from mid thigh down, but has major pain and causing me not to be able to walk and go up stairs. Feels like a constant charley horse in my calf with pain radiating through my knee and up my thigh. No injury was sustained. It happened all of the sudden while laying on the couch reading. I've seen regular doc, pt specialist, sports med doc, headed to a spine specialist next. No explanation of strange pain and numbness.
1367971	6/2/2021	PA	51	M	4/4/2021	4/9/2021	Exactly 5 days after the second dose of the Pfizer covid-19 vaccine, I suffered an ischemic stroke. There was a blood clot in my brain that was broken up after tPA was administered about 2 hours after the symptoms of the stroke set in. To date (May 30) I have had many tests, including 2 MRIs, CT scans, TEE, heart monitoring etc. So far, it has been called a "cryptogenic stroke" because there is no cause. The only thing different was the vaccine I received 5 days before the stroke.

1367723	6/2/2021	WY	63	F	5/3/2021	5/4/2021	Less than 24 hours after receiving 2nd COVID vaccine my mother develop a weird rash that mirrors a pair of socks reaching to the knees that is red in appearance bilaterally. Then her feet began to swell to roughly triple the size of her feet. They then turned and angry red and her toes turned purple. Her feet have been sore and she at times is not able to walk on them because they are extremely sore. My mother developed what the medical professionals are calling COVID toe. She was taken to the ED 3 times in the course of 3 weeks and had appt's with PCP 2 times 1st PCP on day #4 was given a course of Fexeril which she finished as directed by PCP. Enormous swelling and redness and was treated for cellulitis and peripheral edema via ED on day #6. She has had 2 ultrasounds which have turned negative for blood clots She has had blood work that has returned negative for any concerns. She is currently waiting on results from a CT. This is still ongoing for my mom.
1369944	6/2/2021	NJ	55	F	4/21/2021	5/9/2021	Patient presented to the emergency room on 5/9/2021, approximately 3 weeks after receiving the J&J vaccine due to progressively worsening shortness of breath. She also had noted pain and swelling in the left calf and leg. In the ED she underwent CTA of the chest showing severe burden of acute PE (pulmonary embolism) with severe right heart strain, small early infarct posteromedial LLL, hepatic steatosis. Venous doppler 5/10/21 showed complete thrombosis left femoral, popliteal, posterior tibial, peroneal and anterior tibial veins, partial thrombosis of left common femoral vein. She underwent urgent thrombectomy, however, the next morning she became more hypoxic and hypotensive. She was intubated and was urgently placed on ECMO. She developed multi-organ failure. She was started on CVVH for oliguric renal failure. CT scan of her head done 3 days later showed diffuse diffuse cerebral edema, which is most likely a result of hypoxic encephalopathy. With no improvement in her mental status over the course of the next few days, she was taken off life support and died on 5/15/2021

1369341	6/2/2021	CA	28	F	4/9/2021	4/18/2021	Review of ED notes show she received IV infusion of normal saline, and IV push of benadryl and compazine after going to the ER for severe headache on 04/17/2021. She first noticed pain when stretching the arm shortly after the IV infusion but didn't pay attention to it, then 5 day later she noticed localized swelling and redness. Patient was sent for US doppler which left cephalic vein thrombus detected on duplex US. Was treated with aspirin and had follow up doppler of UE for follow up on LUE cephalic vein thrombosis-negative 5/13/21.
1369331	6/2/2021	IL	61	M	5/12/2021	5/28/2021	Dose #1 received on 4/21/21. Dose #2 received on 5/12/21. Difficulty breathing beginning on 5/5/28/21. Diagnosed with multiple blood clots in right lung on 5/30/21.
1369298	6/2/2021	NY	45	F	5/22/2021	5/28/2021	lower extremity deep venous thrombosis
1368563	6/2/2021	CO	35	F	4/6/2021	5/6/2021	I went to the ER on 05/14/2021 because I had swelling in one ankle. I am pregnant so I was concerned. I was tested and a Deep Vein Thrombosis in my right leg. The swelling was in my left leg. There is no redness or swelling in that leg. I am taking subcutaneous injection of Lovenox 0.8 ml twice daily. I was 27 weeks pregnant at the time. I am currently experiencing injection site pain and I am seeing a maternal Fetal Medicine Specialist monthly. A birth plan has to made for when I deliver because of the medication. The diagnosis states Right Popliteal and Proximal calf DVT. Due-Date-08-09-2021 Pregnancy-First Pregnancy

1369289	6/2/2021	AZ	56	M	5/18/2021	5/29/2021	Patient called 6/2/21 and stated that he had a blood clot on his leg and was asking if it was because of the covid vaccine that he had received on 5/18/21. Patient had self-diagnosed and at time of call, had not sought medical attention. Described as a huge, red spot on his thigh that was about the size of his hand. Located on right thigh, on top, almost by inner thigh. Stated appearance was red/rose colored, and was getting darker like a sunburn. Approximately 10 inches long and 4 inches wide. Hurts when he stands up, and rated a 5/10 for pain level. Vaccine administered 5/18/21 and symptoms appeared 5/29/21. Advised patient to seek medical care. Patient asked for contact numbers and provided Pfizer and CDC. Patient called Pfizer and representative stated that a report would be made. Noted that patient was prescribed anastrozole and this may cause venous thromboembolism in about 3% of patients. Patient was informed of this during a follow up call and advised to call prescriber, and again to seek medical attention. Prescriber was notified 6/2/21 in regards to the symptoms reported, and advised regarding possible adverse drug event.
1369075	6/2/2021	PA	69	F	5/5/2021	5/19/2021	patient reported a couple weeks after 1st moderna vaccine (she was unsure of date, I guessed on the first page of the report because I had to put an exact date). she began to feel short of breath. eventually went to hospital where she was diagnosed with blood clots in both the legs and lungs. she said dr is saying it was due to the vaccine and told her not to get the second dose. she stayed 5 days in the hospital according to her. had surgery to place a filter for the clots and is now home on oxygen around the clock.
1369067	6/2/2021	FL	68	M	3/16/2021	5/30/2021	30 May 2021 I was diagnosed as an otherwise healthy male with pulmonary embolism in the lower right lung. No predispositions to blood clots.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1368877	6/2/2021	CT	39	M	5/3/2021	5/10/2021	1 week after the second dose, I was exercising in the early morning when suddenly my vision and hand-eye coordination were flashing, my hand appeared in a different position than where I thought it was. I tried to tell my sons to get help, but I couldn't say any words, just some repetitive mumbling. I was able to walk upstairs but couldn't speak for about 10 mins, and then everything was coming out slowly. It was about an hour before I could resume normal talking. I went to the hospital, where they gave me a CT scan, MRI, heart echo, and eventually a TEE. They said that I had a Transient Ischemic Attack, and they found a PFO in my heart that probably allowed a blood clot to travel to my brain. They also did an ultrasound of my legs when I mentioned the timing of the vaccine, to make sure there were no other clots. I am taking baby aspirin and crestor, and have an heart event monitor now for 30 days. I am also scheduled for more bloodwork and a pelvic scan. They say it is likely that they will want to close my PFO, but want to see all the test results first to rule out any other possible causes.
1368820	6/2/2021	MI	45	F	4/10/2021	4/12/2021	I started a very heavy period that lasted 25 days. I usually have a light 2 day period like clockwork. No birth control.. very normal my whole life until my shot. I had heavy bleeding along with clots of blood.
1368813	6/2/2021	OR	32	F	5/5/2021	5/6/2021	I had the vaccine and at 2 o'clock in the morning I woke with excruciating pain it felt like I broke both my legs and they swelled, more the right one than the left, I could barely walk, Tylenol did not help, the swelling got worse for over a week, the pain was the same for over a week, I still have some pain but the swelling is still there. I did not go into Urgent care until a week because I was at work and my left leg was swollen and discolored and my heart rate. They drew my blood checked my heart rate which was in the high 90s and jumped to 163. They did not know what was going on but did not think it was a blood clot so they sent me home. They did not prescribe any medications.
1368760	6/2/2021	NY	47	M	5/1/2021	5/1/2021	Blood clots right leg from calf to groin.pulmonary embolism

1364001	6/1/2021	NJ	39	M	5/7/2021	5/13/2021	<p>pain in calf; Deep vein thrombosis; Blood Clot; This spontaneous case was reported by a physician (subsequently medically confirmed) and describes the occurrence of DEEP VEIN THROMBOSIS (Deep vein thrombosis) and THROMBOSIS (Blood Clot) in a 39-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 immunisation. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Deep vein thrombosis. On 07-May-2021, the patient received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 13-May-2021, the patient experienced DEEP VEIN THROMBOSIS (Deep vein thrombosis) (seriousness criterion medically significant) and THROMBOSIS (Blood Clot) (seriousness criterion medically significant). On an unknown date, the patient experienced PAIN IN EXTREMITY (pain in calf). The patient was treated with APIXABAN (ELIQUIS) for Clot blood, at a dose of 1 dosage form. At the time of the report, DEEP VEIN THROMBOSIS (Deep vein thrombosis), THROMBOSIS (Blood Clot) and PAIN IN EXTREMITY (pain in calf) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 14-May-2021, Scan: blood clot (abnormal) blood clot. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Concomitant medications included unspecified anti-coagulant and antibiotic. Company comment Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.</p>

1364279	6/1/2021	NM	76	F	3/3/2021	3/3/2021	<p>Outbreak, looked like hives, on her torso and stomach area, after the first vaccine;; Chills, after first and second vaccine; Injection site sore after first and second vaccine; Arm was numb, tingley and painful from the shoulder to the fingertips, after the first and second vaccine; Arm was numb, tingley and painful from the shoulder to the fingertips, after the first and second vaccine; Arm was numb, tingley and painful from the shoulder to the fingertips, after the first and second vaccine; This is a spontaneous report received from a contactable consumer (patient). A 76-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Batch/Lot Number: EN6204, Expiration date was not reported), via an unspecified route of administration on 03Mar2021 14:00 as 1st dose, single dose for COVID-19 immunisation. Medical history and concomitant medications were reported as none. On 03Mar2021, the patient experienced outbreak, looked like hives, on her torso and stomach area, with sequelae after the first dose, chills after first and second vaccine, injection site sore after first and second vaccine, Arm was numb, tingley and painful from the shoulder to the fingertips, after the first and second vaccine (Patient visited office). she would like to know about percentages in age groups who have experienced any numbness and tingling, and if there are any correlation with developing blood clots of this, and also, she wanted to know if she needs further medical attention and to prevent a serious outcome. The outcome of the event was recovered for urticaria on 21Mar2021, the outcome of chills was unknown. Vaccination site pain, Hypoaesthesia Paraesthesia was not recovered. No follow-up attempts are needed. No further information is expected.</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1364281	6/1/2021			M	4/21/2021	4/22/2021	two blood clots inside his brain, and one on the outside/ three blood clots in and near his brain; two blood clots inside his brain, and one on the outside/ three blood clots in and near his brain; pulled neck muscle; neck pain; fevers/ fever; severe headaches/incessant headaches; swollen lymph nodes; extreme migraines/ migraine headaches; could not move his neck without the assistance of his hands/ unable to freely move his neck; eyes are still swollen; Neck swelling; The initial case was missing the following minimum criteria: no identifiable reporter. Upon receipt of follow-up information on 24May2021, this case now contains all required information to be considered valid. This is a spontaneous report from a Pfizer-sponsored program. A contactable consumer, physician and non-contactable consumers reported that a 17-year-old male patient (also reported as 18 years old) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 21Apr2021 (Batch/Lot number was not reported) as 1st dose, single dose for COVID-19 immunisation. Medical history included prior COVID-19 infection. Before the shot, the patient was 100 percent healthy, playing and practicing basketball. There was nothing wrong with him. He didn't have a sore throat (or) any injury. The patient's concomitant medications were not reported. On an unspecified date, the patient was hospitalized with three blood clots in and near his brain that developed after he received the first dose of Pfizer-BioNTech COVID vaccine. The symptoms started after getting his first COVID-19 vaccination dose, and symptoms were initially dismissed as a pulled neck muscle. He received the vaccine on 21Apr2021 and began experiencing neck pain, fever and severe headaches on an unspecified date (also reported as "one day later"). The patient's pediatrician initially dismissed the symptoms as a pulled neck muscle. However, the patient's mother was convinced it was something else. After more than a week of symptoms and being unable to freely move his neck, the family got this diagnosis: two blood clots inside his brain, and one on the outside. The patient was healthy and well before. It was unclear how long the patient will be in the hospital. It was also stated that the patient experienced swollen lymph nodes and migraine headaches. Further reported that the day after his COVID-19 vaccine shot (on 22Apr2021), the patient

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

felt his neck swelling. In the coming days, he suffered from severe headaches. He also could not move his neck without the assistance of his hands few days after the shot (unknown date). Patient suffered from fevers and incessant headaches. He started to feel swelling and pain in his neck ("that night"). Days later, he got extreme migraines, so the patient's mother took him to the emergency room. It was reported that the patient plays competitive basketball seven days a week, which means high contact physical activity that could have possibly aggravated the swelling caused by the vaccine. On Thursday (unknown date), the patient left the ICU, but his eyes are still swollen and the road ahead is uncertain. On an unspecified date, the patient was out of intensive care unit (ICU) but the clots aren't gone. He has an magnetic resonance imaging (MRI, unknown date, unknown results) to see if they shrunk. The patient is currently at home recovering (as reported). Doctor recommended that patient have a COVID Nucleocapsid antibody level drawn to determine if he had been exposed previously to the Corona virus. On an unspecified date, the patient underwent test for nucleocapsid antibodies, patient is POSITIVE for SARS-CoV-2 nucleocapsid antibodies. This indicates that he had been previously infected with Corona virus prior to his receiving the BNT162 vaccine. There is a very serious concern that previously infected persons may be at higher risk of developing post-vaccine complications that un-immune persons. The doctor believed that the prior infection in combination with the vaccine led to the blood clots in the brain. Outcome of event "two blood clots inside his brain, and one on the outside/ three blood clots in and near his brain" was not recovered, while other events were unknown. Information on the lot/batch number had been requested.

1364304	6/1/2021	FL	77	F	2/25/2021	4/19/2021	major bleed; GI bleed; This is a spontaneous report from a contactable consumer. A 77-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection) via an unspecified route of administration, administered in Arm Left on 25Feb2021 (at the age of 77-year-old) (Lot Number: EN6200) as 2ND DOSE, SINGLE DOSE for covid-19 immunization. Medical history included first time she experienced bleeding was in 2013 because of aspirin. Stated that she decided it was a good idea to take baby aspirin so she took it on her own. She was told don't ever take aspirin ever again and she didn't have any problem until Nov2020. That was the first incident, in 2013, that told her she should not take blood thinner. They took her off the blood thinner in Nov2020. She had been taking aspirin. She lost half her blood; she lost it two settings. She sat down to take a bowel movement and was told she lost half of her blood. Not sure when she started Aspirin but she stopped it in 2013. It was mentioned that she could take aspirin. She was on a low dose of Eliquis for atrial fibrillation for prevention of a blood clots or heart attack. she had bleeding in the last year. The one that was the most was back in Nov2020; it was more pronounced. Mentioned that she went in on 12Nov2020 for the bleeding and then had to go back in because her legs were swelling. She stopped taking Eliquis in Nov2020 and from then until Apr2021 she had no bleeding. It was several years ago when she was diagnosed. She was riding her bike in the neighborhood, and felt too tired so she stopped at the doctor and went in and told them she felt weird, they couldn't get her BP and took her to the hospital and her heart rate was sky high like 250. They said she might had to have electric. She didn't have any pain but states she was psychologically freaked out by everyone running around. Mentioned that, she was first placed on dronedarone (MILTAC) 400mg twice daily to treat her atrial fibrillation; she can't remember the year. After taking it as prescribed for some time she got atrial fibrillation again. She was told by the doctor it had lost its efficacy. Concomitant medications included Fenofibrate taken for blood cholesterol, Metoprolol succinate taken for blood pressure, Vitamins NOS, Ferrous Sulfate taken for anemia, Vitamin D3 all are ongoing. The patient previously took first dose of BNT162B2 (COMIRNATY, Solution for injection, lot

immunization and experienced severe pain in her left knee. The patient received the second vaccine on 17Feb2021. A week out or so she started having pain in her feet and she was very fatigued 19Mar2021; both still ongoing, both on a week. The patient had had 2 stints at the hospital, and 2 rehabs. Both of these have very slightly improved. The patient went to the hospital due to the pain in her feet that moved up to her hands, she was very fatigued, and she couldn't walk; she was bedridden on 19Mar2021. Weeks after the shot it continued day after day after day up until 19Mar2021 where she was admitted to the hospital. The patient just had her last stint in rehab this past 2 weeks and could get up with physical therapy. Hospitalization was from 19Mar2021 to 27Mar2021. The patient could not urinate properly, she couldn't void all the way and that this occurred some time between after the second vaccine up until 19Mar2021. Those few weeks things progressed. Now she was incontinent and had to wear diapers. She urinates in diapers and defecates in diapers. The incontinence started sometime during 19Mar2021 to 27Mar2021 and it is ongoing, persisting. In the hospital they could not find anything seriously wrong with her. The patient had total fatigue and the caller begged them to give her mother a (vitamin) B12 shot. They gave it to her but there was no improvement with patient's energy. They put a catheter in her to get her kidney function back to her normal level. It was because she was not urinating properly. They ran a bunch of tests and there was not anything wrong with her. They did cardiac tests, lung tests, and XRays. The patient's breathing was labored. Started sometime after the second shot leading up to the hospital and that the patient had to be on oxygen. She said she was still on oxygen and that the labored breathing was ongoing, persisting. Reporter said all of these above listed were from 25Apr2021 to 03May2021. They did more tests but there were no answers and patient was at this point bedridden all this time; she had no strength at all, all the same symptoms were ongoing, there were no diagnoses, they were switching her meds around. The patient was on oxygen 24/7, all day when she was walking, sitting in a room in her wheelchair. The caller said she was hoping patient could get up and walk around but she was still weak. She said with time she hoped she got better on feet, got back to her normal. The outcome of the events

were not resolved. Information on the lot/batch number has been requested.

Pulmonary embolism/ two large blood clots, one in each lung; This is a spontaneous report from a contactable consumer (patient). A 64-year-old male patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration, administered in arm right on an unspecified date (Lot Number: EP6955) as single dose for COVID-19 immunisation. Medical history included high blood pressure and cholesterol abnormal, both from an unknown date and unknown if ongoing. Prior to vaccination the patient was not diagnosed with COVID-19 and since the vaccination the patient has not been tested for COVID-19. The patient's concomitant medications were not reported. The patient previously received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration, administered in arm right on 28Feb2021 at 08:00 (Lot Number: EN6202) as single dose for COVID-19 immunization. On 29Apr2021 at 07:00, roughly one month after second dose of vaccine, the patient couldn't breathe, sweating profusely, accelerated heart rate and chest tightness. He was diagnosed with a pulmonary embolism. He had two large blood clots, one in each lung. The events were serious, it required emergency surgery to save his life. The patient spent 2 days in ICU (Intensive Care Unit) and 3 additional days in the hospital. The doctors told to the patient that they had never seen blood clots like those and that large. The patient reported that he is now on blood thinners. The patient outcome of the event was recovering.

1364553	6/1/2021	MD	32	M	5/22/2021	5/25/2021	<p>from 5/25/21 note: 32 y.o. male with a history of DVT (left leg; on Xarelto), recurrent PE, EtOH abuse, anxiety, and depression presents to the emergency department complaining of right leg pain since the last two days. He reports to receiving his Moderna COVID-19 vaccination three days ago. Thereafter, he noticed his leg pain to occurs. He also notes to intermittent pleuritic chest pain, but not currently. He notes that his leg is not as swollen compared to his previous DVT. He has full sensation and motor control of his digits. He admits to dizziness. He denies changes in breathing, abdominal pain, recent surgeries, recent travels, recent hospitalizations, or family history of blood clots. History is from the patient</p> <p>Old records reviewed. Last ED visit on 3/2/21 for pleuritic chest pain. Recent hospitalization 2/8 to 2/9 for pulmonary embolism in the setting of Xarelto non-compliance. US LLE Dplx (9/26/2020) DVT in the left popliteal, posterior tibial, peroneal and anterior tibial veins. US LLE Dplx (2/8/21) Nonocclusive thrombus in the left popliteal and posterior tibial veins. US RLE Dplx (5/25/21; today) DVT in the right femoral and popliteal veins.</p> <p>from 5/27/21 note: Patient is a 32 y.o. male with history of EtOH abuse and recurrent DVT/PE known to be noncompliant with Xarelto presenting to the ED with altered mental status. Of note patient was discharged from the hospital this afternoon where he was treated for DVT with heparin, previously on Xarelto but due to noncompliance was discharged with plan for Lovenox. Patient is alert and oriented x3, however intermittently not responding appropriately to questions and does not appear to be the best historian. Per EMS patient was found down, unresponsive in a bush. Patient admits that when he left hospital he went to gas station and drank "18 ounces of wine." EMS states when they arrived to scene patient had unsteady gait, frequent falls, no signs of significant head trauma. Patient was tachycardic in route and noted to be hypoxic in route. Patient currently complaining of mild headache but denies chest pain, shortness of breath, nausea, vomiting, diarrhea, abdominal pain, back pain or any further symptoms once again believe patient to be a poor historian.</p>

1364809	6/1/2021	MI	61	M	4/21/2021	4/26/2021	Had shortness of breath and admitted to hospital for blood clot/pulmonary embolism on 4/28/21 * Hematologist suggested I should report for information purposes. Not stating this is believed to be the cause of the event - just reporting as requested
1364705	6/1/2021	NJ	57	F	1/6/2021	1/7/2021	24 hours after receiving the vaccine I experienced tachycardia. My oxygen level dropped into the 80's. I was told to get a chest x-ray. I went to urgent care on 01/07/2021 and Dr. office called me 01/08/2021 and told me to go to the Hospital. A blood clot was ruled out. I had an EKG, chest x-ray, bloodwork including a D-Dimer test and CTA scan with dye. The main concern was my low oxygen level with a high heart rate. I was in the ER on 01/08/2021 for most of the day. The hospital performed a D-Dimer test and it was elevated. After some time in the hospital my oxygen level rose and my heart rate regulated. I still have moments where my oxygen levels will drop and my heart rate will incline while resting.

1364956	6/1/2021	MD	66	M	4/24/2021	5/18/2021	Patient admitted to referring hospital on 5/18/2021 for fatigue and SOB, found to have pulmonary embolism (CT with central pulmonary emboli with right heart strain), alteplase was given at referring hospital and was admitted to ICU for continued monitoring. Venous duplex done also revealed bilateral DVTs. Patient was doing well after fibrinolytic with heparin anticoagulation, but had sudden decompensation on 5/21 (hypotension and respiratory failure requiring intubation). Transferred to current institution for ECMO evaluation due to severe cardiopulmonary compromise. Patient deemed not ECMO candidate based on co-morbid conditions based on CT findings. He underwent mechanical thrombectomy with improvement. He was continued on heparin infusion, then had sudden decrease in platelet on 5/25 with worsening cardiopulmonary status. HITT was suspected and heparin was transitioned to argatroban. Results of heparin induced platelet antibodies (PF4 ELISA assay) and Serotonin Release assay was negative. Repeat imaging revealed increase clot burden and therefore patient underwent catheter directed thrombolysis followed by aspiration suction thrombectomy. Due to high clinical suspicion of HITT, repeat heparin induced platelet and SRA sent and pending at the time of report. Of note, patient still in hospital at the time of this report

1364723	6/1/2021	MI	48	F	5/19/2021	5/19/2021	<p>She got her vaccine, they had her wait an additional 15 minutes. She had tingling sensation the entire time and she went home. Around 5:27 she looked at her arm, it was bruised, it felt like alligator skin, rough to touch when she touched it and started to get little blisters around it. It looks like her skin is burnt like she had been in a fire. She went to the Medical Center and they told her that it was a local reaction and outlined it with a marker, and gave her an ice pack, which seemed to make it worse. They gave her Naproxen and then she decided to leave as they didn't do anything, and said that she said it was a local reaction and that was going to get the second vaccine. She went home so on 5/20/21 she went to Hospital. She saw DO in the ER. She had chest pain, shortness of breath and two very large blisters on her arm with fluid in it when she was seen there. She was informed that whoever gave her the vaccine did not go in far enough and that they gave her the vaccine in the tissue and not the muscle. They did EKG, and they did blood work to see that it was no blood clots or in her lymph nodes, and said that it was a severe reaction from the vaccination, and that they had never seen anything like that before. On 5/21/21 she went to her PCP, she drained the numerous blisters that she had on her arm, she prescribed her Clindamycin, Motrin 600 mg, a skin cream Kenalog, she also gave her some aquaphor cream as well. She does not feel that this has helped much. Even after she drained the blisters, which the fluid was clear. She has been taking numerous pictures. The blisters came back, not as large but came back. The blisters would drain when she would take a shower and it was tannish in color and she called her PCP who told her to continue to take the antibiotics. She also bought some OTC cream, and an aloe vera plant which seems to be helping. She says that the dark skin has peeled off and the skin is pinkish and raw looking, which is a large area on her arm where every bump was. She said that the area is really really bad and is embarrassed to show her arm.</p>

1363987	6/1/2021	MN	56	F	5/10/2021	5/10/2021	<p>blood clot from ankle the groin; flu like symptoms; difficulty walking; soreness in Left arm; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of THROMBOSIS (blood clot from ankle the groin) in a 56-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 005C21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 10-May-2021, the patient received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On an unknown date, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 10-May-2021, the patient experienced THROMBOSIS (blood clot from ankle the groin) (seriousness criterion medically significant), INFLUENZA LIKE ILLNESS (flu like symptoms), GAIT DISTURBANCE (difficulty walking) and MYALGIA (soreness in Left arm). The patient was treated with RIVAROXABAN (XARELTO) ongoing since an unknown date for Clot blood, at an unspecified dose and frequency. At the time of the report, THROMBOSIS (blood clot from ankle the groin), INFLUENZA LIKE ILLNESS (flu like symptoms), GAIT DISTURBANCE (difficulty walking) and MYALGIA (soreness in Left arm) outcome was unknown. No concomitant medications were provided. The patient went to the ER after experiencing the blood clot (from her ankle to the groin area) and was provided treatment with Xarelto. The patient's height, and weight were not reported. The patient's concurrent conditions included pre-diabetic. It was unknown if patient was taking any prescriptions, over-the-counter medications, dietary supplements, or herbal remedies at the time of vaccination. No allergies to medications, food, or other products was reported. The patient was not pregnant at the time of vaccination. The patient did not have an adverse event following any previous vaccine. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1805020, and batch number: 1805020 expiry: UNKNOWN) dose was not reported, administered on 20-MAR-2021 (also reported as 27-MAR-2021) for prophylactic vaccination. Anatomical vaccination site were not reported. No concomitant medications were reported. On 03-APR-2021, one week after vaccination, the patient had headache and vomiting. On 05-APR-2021, the patient had seizure due to hemorrhagic stroke. On an unspecified date, the patient experienced brain compression, brain stem haemorrhage, brain stem syndrome, cerebral haemorrhage, hemiplegia, possible cerebral venous sinus thrombosis, biopsy soft tissue, and brain scan abnormal, and was hospitalized. On 06-APR-2021, the patient had a surgery to remove pressure on brain and brain stem (craniectomy). The surgeon noted alarmingly low platelet counts (results unspecified). The patient had platelet transfusion. The patient was hospitalized for '4 days'. The patient continued to bleed on 06-APR-2021 and 07-APR-2021. The patient was removed from life support on 08-APR-2021. The patient died on 08-APR-2021. It was unknown if autopsy was performed. Laboratory data reported following: Brain scan was abnormal and showed abnormal, multi-focal</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

brain bleeds and increased compression of brain. On 07-APR-2021, Brain scan abnormal which showed increased bleeding and brain stem injury. On 08-APR-2021, the patient died from possible cerebral venous sinus thrombosis. Laboratory data (dates unspecified) included: Biopsy soft tissue (NR: not provided) unknown, Pathology test (NR: not provided) unknown. On 08-APR-2021, the subject died from possible cerebral venous sinus thrombosis. It was unknown if an autopsy was performed. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient died of possible cerebral venous sinus thrombosis, brain compression, brain stem haemorrhage, brain stem syndrome, cerebral haemorrhage, hemiplegia, seizure, haemorrhagic stroke and continued to bleed on 08-APR-2021, had not recovered from headache, vomiting, and platelet count decreased, and the outcome of biopsy soft tissue and brain scan abnormal was not reported. This report was serious (Death, and Hospitalization Caused / Prolonged). This case, involving the same patient is linked to 20210441454. Additional information was received on 24-MAY-2021. Following information was added and incorporated into the narrative. Additional events of haemorrhagic stroke and continued to bleed were added, seriousness of events platelet count, vomiting, and headache was updated, additional reference numbers were added, additional vaccination date added in narrative, labeling updated, and course of event and laboratory data updated. It was determined that Manufacturer Case Number 20210441454 was a duplicate of this case. All relevant information regarding this case will be submitted under Manufacturer Case Number 20210500861. Upon review, the following information was amended: events biopsy soft tissue and brain scan abnormal was updated from non-serious to serious as this was on the earlier VAERS report.; Sender's Comments: V2: Additional information received regarding updates in seriousness of events, labeling, course of events, case identifier; and additional events of hemorrhagic stroke and "continued to bleed" did not alter prior assessment. This fatal spontaneous report (VAERS ID 1244328) concerned a 59- year- old female who experienced vomiting, headache and seizures and was hospitalized for brain compression, brain stem hemorrhage, brain stem syndrome, cerebral hemorrhage,

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

hemorrhagic stroke, hemiplegia, possible cerebral venous sinus thrombosis 16 days after Janssen COVID-19 vaccine was administered for prevention of symptomatic SARS-CoV-2 virus infection. The patient's height, and weight were not reported. The patient was pre-diabetic with no known allergies. Concomitant medications were not reported. Biopsy soft tissue was done (results not reported) and brain scan showed multifocal brain bleeds and increased compression of brain; the patient underwent neurosurgery. The platelet count was decreased (result not reported) and received platelet transfusion. Follow-up scan next day showed increased/continued bleeding and brain stem injury and a day later she died from possible cerebral venous sinus thrombosis. It was unknown if an autopsy was performed. Although the subject's pre-diabetic status may have contributed, based on evolving knowledge of Thrombosis with Thrombocytopenia Syndrome (TTS, per definition from Brighton Collaboration - BC) and considering the low platelet count and temporal relationship to vaccination (BC Criteria level 5), the events are assessed to have a plausible relationship with vaccination.; Reported Cause(s) of Death: POSSIBLE CEREBRAL VENOUS SINUS THROMBOSIS

1363774	6/1/2021	MN	61	F	3/12/2021		<p>PLATELET COUNT INCREASED; EXCRUCIATING HEADACHE; INTRAOCULAR PRESSURE DECREASED; ANGIOGRAM NORMAL; ARTERIOGRAM CAROTID NORMAL; THROMBOCYTOPENIA; ARTERY BURST BEHIND HER EYE; OCULAR DISCOMFORT; PERIORBITAL SWELLING; EYE PAIN; ACHES AND PAINS; This spontaneous report received from a patient concerned a 61 year old female, ethnicity unknown. The patient's height, and weight were not reported. The patient's past medical history included hypertension, hypothyroidism, and intermittent pancytopenia, and concurrent conditions included metronidazole allergy, hashimoto's disease, and microscopic colitis. The patient was previously treated with metronidazole. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, intramuscular, batch number: 1805018, and expiry: UNKNOWN) dose was not reported, administered on 09-MAR-2021 for prophylactic vaccination. Concomitant medications included amlodipine, levothyroxine, losartan, rosuvastatin calcium, and ubidecarenone. On 09-Mar-2021, the patient got the vaccine and after few days she had aches and pains (very mild reaction) and went to bed early. The patient thought she was fine. On 18-Mar-2021, 04:00, she woke up with an excruciating headache above her left eye in her eyebrow. The patient wondered if it was an aneurysm and took 2 tablets of extra strength Tylenol and it helped. The patient stated that after every 5-6 hours, excruciating headache came back. The patient had the same headache for over a week. The patient got tested for Covid-19 and it was negative. The patient thought she had sinus problems but had no other symptoms. On 30-Mar-2021, the patient woke up with headache. Her eye was killing her, was sore and swollen, and felt like it was going to burst and her left eye was swollen shut in a couple of hours. The patient narrated it was excruciatingly painful. The patient's husband drove her to urgent care, where ophthalmology tested the pressure: right eye was normal (she thinks it was 18-normal) and the left eye was 51 (normal is 14-19), units unspecified (intraocular pressure decreased). The eye doctor started prednisone and the patient had a CT scan and lab work done. MRI was also ordered but they were unable to do it right away. On unspecified date in Dec/2020 the platelets were 349 in December and came</p>

down to 64, which was very low (low threshold was 150) (thrombocytopenia). The CT scan was performed, they thought she had a cavernous carotid fistula and she was scheduled for an angiogram for a further diagnosis on 01-Apr-2021. The angiogram determined she did not have fistula. The patient was admitted to the hospital after the angiogram and on 02-April-2021, MRI was done. All throughout the process, the ophthalmologist, radiologist and internist all thought it was related to the Janssen COVID-19 vaccine. The prednisone started working and the pressure started dropping in her eye. The patient states that doctors think an artery burst behind her eye. After discharge, the patient was taking prednisone which was helping. On the 13th, she was watching television and saw that the vaccine was being put on hold due to the women with clots whose progression matched hers exactly (severe headaches, low platelets, and required attention). She was on prednisone for a month. Laboratory data (dates unspecified) included: COVID-19 virus test negative (NR: not provided) negative, CT scan (NR: not provided) Not reported, and Platelet count (NR: not provided) 64 (units unspecified). Treatment medications (dates unspecified) included: prednisone, and paracetamol. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from thrombocytopenia, intraocular pressure decreased, ocular discomfort, periorbital swelling, and eye pain, excruciating headache on 02-APR-2021, and aches and pains on 12-MAR-2021, and the outcome of artery burst behind her eye was not reported. This report was serious (Hospitalization Caused / Prolonged, and Disability or Permanent Damage). Additional information was received on 25-MAY-2021 following information was updated and incorporated into case narrative: Other identification number, patient contact details, events- Aches and pains, artery burst behind her eyes, excruciating headache, Tylenol drug was added, hospital details was added and narrative was updated accordingly.; Sender's Comments: V1: Additional information updated identification number,hospital details,events- Aches and pains, artery burst behind her eyes, excruciating headache,This updated information does not change the causality of previously reported events. 20210502268-COVID-19 VACCINE AD26.COV2.S-Artery burst behind her eye. Follow-up

1363777	6/1/2021	OR	64	F	5/4/2021		<p>BLOOD CLOT IN BRAIN; BLOOD CLOT IN RIGHT LUNG; BLOOD CLOT IN STOMACH AND NECK; This spontaneous report received from a patient concerned a 64-year-old, female. The patient's height, and weight were not reported. The patient's past medical history included tendonitis in right shoulder, surgeries on right shoulder and concurrent conditions included arthritis in right shoulder, non-smoker, abstains from alcohol, and seasonal allergies, and other pre-existing medical conditions included the normal wear and tear on her body at the time of this report. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: Unknown) dose was not reported, one total, administered on 04-MAY-2021 at the right arm for prophylactic vaccination. The batch number was not reported and has been requested. No concomitant medications were reported. The Patient reported that on 04-MAY-2021, after vaccination, she began feeling unwell with a low grade fever, her highest body temperature was 102F. She experienced headache that she initially felt on the right side of her head but could not determine the source for sure. On 14-MAY-2021, she coughed up blood, but she didn't think anything of it and continued her normal routine then on 15-MAY-2021, she coughed up more blood but it had some phlegm in it, so she went to the ER (emergency room) on 18-MAY-2021. She received a Computerized axial tomography (CAT) scan of her chest which showed blood clots in her right lung. She got a secondary CAT scan and blood clots were found in her stomach, brain and in her neck. She was admitted to hospital on 19-MAY-2021. The Patient was reportedly hospitalized for 6 days and was supposedly discharged on 24/May/2021. For treatment, she was receiving an Intravenous (IV) blood thinner but later changed to an oral blood thinner. She was also receiving Tramadol for pain. She was receiving other medications when first admitted but could not recall specific names. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient had not recovered from blood clot in brain, blood clot in right lung, and blood clot in stomach and neck. This report was serious (Hospitalization Caused / Prolonged).; Sender's Comments: V0: 20210546778-covid-19 vaccine ad26.cov2.s- blood clot in brain, blood clot in right lung, and blood clot in stomach and neck. 1363784	6/1/2021	NY	65	F	4/6/2021		SUBACUTE PULMONARY EMBOLISM IN LEFT AND RIGHT LUNG; DVT IN LEFT CALF; UNABLE TO DRIVE; EXTREME EXHAUSTION; HEADACHE; SHARP SHOOTING PAIN IN RIGHT LEG; This spontaneous report received from a patient concerned a 65 year old female. The patient's height, and weight were not reported. The patient's pre-existing medical conditions included patient had no known previous medical conditions and had no known allergies. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 041A21A, expiry: 21-JUN-2021) dose was not reported, once total administered on 06-APR-2021 15:00 in Left Arm for prophylactic vaccination. Concomitant medications included amlodipine, hydrochlorothiazide and losartan for which indication was not provided. On 06-APR-2021, the patient experienced headache while driving back to home and was not sure if it was due to vaccine or traffic conditions. At 18:30, patient got up to walk across the room and felt a strong sharp pain in her right and left leg described as incredible cramping type of pain which her husband had to help sit down to a chair. Patient states that although the pain was in both legs, the left leg felt as though someone had took a knife to her thigh, the pain lasted approximately 15 minutes. On 07-Apr-2021, patient states that she went for a routine doctors visit to her family care physician who wrote her a prescription for routine blood work. On 14-Apr-2021, patient went to get the blood work done and states at this time, she felt extremely exhausted and that due to a bloodwork mix up which required her to drive back to the lab, she was not able to drive back so her husband had to drive her. Around 17-Apr-2021 to 18-Apr-2021 patient had to chase the dog and found that she couldn't catch her breath and that she started coughing. Her daughter who happened to be there asked her why she was coughing and thought that it was not normal and that she should contact her doctor. On 19-Apr-2021, patient called the doctor. On 21-Apr-2021 patient saw the doctor and during examination, patient was instructed to run a D-Dimer test to rule out blood clots. On 22-Apr-2021, doctor stated patient to go to the Emergency Room as the result for the D-Dimer test came positive. The patient was immediately hospitalized where Doppler and CT scan was performed on her and was diagnosed with Deep

Vein Thrombosis and Pulmonary Embolism on both the lungs. Patient mentioned that she was treated with Heparin drip from 22-Apr-2021 to 24-Apr-2021 and then she was given Xarelto. On 25-Apr-2021, the patient was discharged from the hospital after 4 days of hospitalization. Patient reports that she was still experiencing extreme exhaustion and that the pulmonologist states that this is the normal course of blood clots and it could take anywhere from 60-90 days for the body to clear up the blood clots. She states she still has bouts of shortness of breath but showing signs of improvement. Patient stated that she was scheduled for another Doppler on 19-Jun-2021 which was recommended by her primary care physician. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from sharp shooting pain in right leg on 06-APR-2021, had not recovered from extreme exhaustion, and the outcome of pulmonary embolism in left and right lung, dvt in left calf, headache and unable to drive was not reported. This report was serious (Hospitalization Caused / Prolonged).; Sender's Comments: V0:20210550248-COVID-19 VACCINE AD26.COV2.S, The case concerns with a Caucasian female. 1365741	6/1/2021	OH	40	F	1/30/2021	1/31/2021	After the 1st vaccine, a week later I started my cycle. I thought it was normal. I bled for approximately 5 days, which is normal for me. Less than a week later, I was having weird, long, stringy clots. It reminded me of an abruption since the blood was burgundy in color. It was 3 days, but it still required a tampon. Then a week and 3 days later, I started bleeding again, but that time was for 8 days. At that point, that's when I called my OB and reported it on my V-safe. I didn't have the usual premenstrual symptoms. They did a pregnancy test, an ultrasound, lab work and a speculum pap exam, which including swabbing. The tests revealed nothing, so they told me that I'm getting old and maybe I'm just changing. After that, it didn't happen again and I've had my normal cycle since then. With exception of a sore arm, I didn't have any other side effects from the vaccine.
1365955	6/1/2021	OH	32	F	4/13/2021	4/14/2021	Significant vaginal bleeding and vaginal blood clots. Extremely heavy bleeding during mid-cycle (between periods). No prior history of heavy bleeding nor any vaginal blood clots. Started approx 24 hours after first shot and continued for several days, with bleeding and clots. Scheduled virtual doctors visit immediately and followed up with in-person pelvic exam and ultrasound. Normal ultrasound results. Stopped birth control pills for several days, then restarted, then soon after changed to new birth control.
1366347	6/1/2021	MD	42	M	5/15/2021	5/20/2021	This is not very clear that the Pfizer vaccine is actually the cause of the patient's Cerebral thrombosis, however, we are reporting to VAERS as this is a unique first case where the patient has Dural venous thrombosis within 2 weeks period of getting 2nd dose of Pfizer vaccine. 05/25/2021: CT HEAD/BRAIN W/ IV CONTRAST showed dural venous sinus thrombosis involving the superior sagittal sinus, right transverse, and sigmoid sinuses, extending into the proximal right internal jugular vein.
1364796	6/1/2021	CA	36	F	5/26/2021	5/27/2021	Mild Chest pain shortness of breath 24 hrs after shot. Went way with Tylenol and rest. Returned next day worse. Emergency room tests ruled out heart, lung issues, and blood clot. Following up with primary care.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1362416	5/31/2021	CT	17	M	5/26/2021	5/27/2021	Thursday started with sore throat, fever, chills, stuffy nose and headache. We gave him Acetaminophen. Fever continued into Friday with the same symptoms. Hives began Saturday morning and gradually got worse. We gave him Benadryl at that time and the fever went up to 102.5 F. Wheezing in his chest began. Sunday morning the hives were worse and we decided to go to the doctor. We went to a walk in clinic who after an EKG wanted us to go to the Emergency room due to a "blip" and a concern for myocarditis. At the ER they administered Prednisone and more Benadryl through an IV. They decided to do a CT Scan to look for blood clots. (the ER doctor mentioned he was glad that we brought him into the ER...) No blood clots were found thankfully and they eventually released him, with a prescription for 4 days for Prednisone, more Benadryl and Pepcid. The hives continue today, the day after, and are barely under control by the Benadryl.
1362428	5/31/2021	PA	40	F	4/12/2021	5/28/2021	On 5/28/2021 I started to develop shortness of breath. It continued to worsen and I went to the hospital on 5/30/2021 and it was discovered that I had a pulmonary embolism and after additional ultrasounds 3 DVT blood clots in my right leg.
1362445	5/31/2021	CA	41	F	4/8/2021	4/8/2021	I had chest pains a few days after receiving the vaccine and went to see my Doctor who referred to the ER to check to see if I had a blood clot.

1362569	5/31/2021	IL	48	F	4/9/2021	4/9/2021	There was extreme pain in the injection site immediately. Twelve hours after the shot, I had terrible chills and flu like symptoms that lasted for several days. I then started getting strange pulsing in my legs that moved around and was more prominent at night. I was somewhat short of breath when exerting myself for about a month. Then I had pain that would travel throughout my legs and in my groin. 2 1/2 weeks later it was so bad that I went to the emergency room to be tested for blood clots, which were negative. The pain in my arm dissipated gradually, but 7 weeks later it still hurts enough to wake me up in the middle of the night. The pulsing in my legs has for the most part finally dissipated, but continues from time to time.

1362571	5/31/2021	WA	44	M	5/7/2021	5/31/2021	Initially, the patient had dizziness, lightheadedness and a syncopal episode within 5 minutes of the vaccine. He returned to normal fairly quickly and went home by report. He presented to the ER shortly after with palpitations and shortness of breath and required a dose of IM epinephrine. Patient since had intermittent fatigue, dizziness, blurred and vision changes as well as tinnitus. On May 31, 2021, patient presented to the ER with headache, lethargy, weakness, diaphoresis and dizziness. Additionally, noted to have slurred speech by his wife. MRI of the brain done at 4 am on 5/31/21 showed the following "1. Acute bilateral cerebellar infarcts are seen with a right posterior 4.3 mm focus a left middle cerebellar peduncle 3.2 mm focus and a left superior cerebellar 7.9 mm linear focus. 2. Occlusion of the left vertebral artery extending into the basilar artery with reconstitution of the basilar artery via bilateral posterior communicating arteries. Findings are concerning for acute dissection occlusion. Consider further evaluation with MRA head and neck. 3. Question subtle area of restricted diffusion seen within the left dorsal medulla better appreciated on the maps measuring approximately 4.9 mm. Left lateral pontine 7.3 mm focus of restricted diffusion versus artifact. These infarcts are not definite and could be artifactual asymmetry.'. He required admission, heparin drip and neurology consult at that time, as well as permissive hypertension. shortly after 1 pm on May 31, he developed chest pain with ischemic changes on EKG requiring cardiology consult with possible intervention, though this was being coordinated with interventional neurology, as he also required basilar angiogram for his MRI findings. as cardiology and interventional neurology were coordinating taking patient for intervention, he became further unresponsive, though maintained his pulse, and required intubation and transfer to ICU, as well as repeat CT of the head to evaluate for continued thrombosis of his basilar system. Work up is still on going
1362592	5/31/2021	LA	53	F	3/6/2021	3/20/2021	Constant cramps in right calf. I start taking aspirin and natural blood thinners suspecting it may be a blood clot.

1362381	5/31/2021	FL	64	F	5/10/2021	5/21/2021	5/21 started feeling poorly, fatigue, shortness of breath, evening headaches 5/24 Fatigue, shortness of breath, unable to complete any task, low grade fever 99.8, unable to eat or drink well 5/25 severe heartburn, shortness of breath continued, extreme fatigue 5/28 went to ER with continued extreme shortness of breath and fatigue. CT scan revealed multiple clots in lungs and was admitted for needing oxygen and to start anticoagulation.
1362673	5/31/2021	AZ	18	M	4/5/2021	5/11/2021	Developed clots in both right and left lungs. Wedge shaped infarction in left lung. Extreme headaches. Pulmonary emboli and plural infusion.
1362310	5/31/2021	NJ	45	F	4/9/2021	4/10/2021	I had a completely normal evening after receiving the vaccine. I woke up the next morning and didn't feel quite well. I started washing my hands and I woke to my husband calling an ambulance. I had passed out. I refused to go to the hospital per their request because of worries about COVID. I called my PCP and I discussed the situation with him and he told me to get rest and stay hydrated. I met him a couple days later for a virtual appointment. At this point the vaccine had been paused and I was very concerned about the potential of blood clots. I was still feeling fatigue after my episode, but I was feeling better. He told me to take a baby aspirin, once daily for a month, to help prevent any blood clots. After 5-6 weeks of receiving the vaccine, I started coughing, gagging and choking and had to get my daughter to get my husband. My husband gave me an alavert and I was able to breathe better around 10 minutes later. We think it was a severe reaction to possible pollen, or something in the air, but that has never happened before.

1362608	5/31/2021	NJ	56	F	1/27/2021	1/30/2021	On 1/27/21, Patient took the 1st Moderna vaccine. She had flu like symptoms after for 3 days and then she broke out in hives. She continued to have flu like symptoms, and she felt very week. On 2/3/21 we took her to Hospital where the doctors indicated that she had a heart attached They released her from the hospital on 2/4/21. When she came home she was very tired and was disoriented. The following morning, she was running a fever and her eyes rolled back in her head. We called the ambulance who took her back to Hospital. The doctors indicated that had a stroke. They indicated that blood clots ?showered? her brain. She has lost her peripheral vision on the right side. She has issues with her memory and executive decision making and reasoning.
1362340	5/31/2021	CA	45	F	4/28/2021	4/29/2021	After my terrible chills and fever were gone I got my period 2 weeks early. It was a normal period however only 5 days later I got ANOTHER period. This was much heavier than normal with done quarter sized blood clots. It lasted 7 days.
1362330	5/31/2021	PA	64	F	1/5/2021	2/15/2021	Spinal fusion on January 12, 2021 one week after first vaccine. Second vaccine on Feb 2, 2021. Developed blood clot in right calf & pulmonary embolism in right lung the week of Feb 15th. May have been post op problem but I had no issue until after the 2nd vaccine. Surgeon felt that post op pts usually get a blood clot within 2 weeks after surgery- that's why I feel it was from the 2nd vaccine.
1362296	5/31/2021	LA	61	M	3/16/2021	4/21/2021	Patient went to Emergency room at local hospital with leg pain. Evaluated and discovered clot in left leg and is being treated with Eloquis

1362257	5/31/2021	MS	53	M	1/4/2021	1/12/2021	<p>The following is an email the patient wrote to us describing his events: I received Moderna Covid Vaccine on January 4, 2021 and February 1, 2021 at Medical Center in On the evening of January 12, 2021, I arrived home from working as a Pharmacist following a 13 hour shift at Medical Center with no medical complaints. Later that night I experienced a severe coughing, sneezing episode where I was gagging on the mucous. I spit out a bunch of stuff and did a nasal rinse. I took some cold medicine like Certrazine and Mucinex-D. Simultaneously with the coughing episode I developed a tingling sensation on the right side of my body from my neck to my toes. I also noticed that my temperature sensations on my right hand was different from my Left hand. I had gotten a water bottle from my refrigerator that felt room temp to my right hand but was cold when held in the left hand. I was feeling dizzy or drunk and was walking funny. When I tried to walk straight forward I actually drifted to the left as I walked. I was having difficulty swallowing medications, food or liquids. I wondered if was experiencing the onset of Covid Symptoms. I was well enough versed on stroke symptoms to be worried about one sided tingling and altered gait being from a stroke. The flu like nasal symptoms and altered right sided pain and temperature sensations persisted through the night, so I went to the ER at Medical Center the morning of January 13th. The ER worked me over with multiple Covid/Strept/Flu tests, evaluation for possible stroke (with multiple scans and stroke score.) The ERP also evaluated the possibility of Bells Palsy or Guillain Barre secondary to Covid vaccine the week before. The Covid Testing was Negative. The stroke score was low enough NOT to have warranted thrombolytic therapy. The neurological issues did not appear to be Bells palsy or Guillain barre. After the ER Visit I attempted to see a neurologist. May 25, 2021 was the earliest available appointment that I could obtain. The symptoms were not severe enough to prevent me working as a Pharmacist. The altered pain and temperature sensations remain without much improvement even now 4 months later. The Neurologist diagnosed me as having had a stroke, specifically left sided Lateral Medullary Infarct, also known as Wallenburg Syndrome. There have been reports from the other vaccines having caused blood clot issues since my event.</p>

1362156	5/31/2021	FL	35	M	5/8/2021	5/8/2021	The night after receiving the vaccine I started to develop a fever and headache. It lasted 3 days for the fever. On Tuesday I felt something different in my body. On Thursday I went to see an Optometrist. While there he found that there was something going on in my eyes. He noticed there was blood clot in the back of my right eye. I did go to the ER because of the blood clot. At the ER I had a CT scan and bloodwork completed. I was told that everything looked normal and I was told to go to a different hospital. I was transferred to Medical Center. While I was there they performed an MRI, CAT scan and Lumbar function test. I was told that everything looked fine from the neurology point of view. I need to follow up with an Ophthalmologist. I have gone completely blind in my right eye and my left eye is not clear anymore. On 05/20 I had an appointment with the ophthalmologist. There was something wrong with my optic nerve as well. There was a test performed 05/21. I went back to the doctor on 05/26 he said that the reports he received are not making sense to him. My next f/u appointment with Dr. is 06/09 because the doctor asked to have 2 weeks to read through my hospital reports. I saw a different doctor instead on 05/27, Dr. , and he said that this can happen from the vaccine. He said that there is a swelling and I need to see a different doctor about my retina. I was told that I need to see another physician. I saw Dr. . on 05/27 and he said that there are fluids there, but no one can confirm that this is because of the vaccine. He gave me the option to take prednisone 10mg and I feel that it is working, but it is very slow. It was moved to 3x per day. I can see objects now even though it's still not clear. I have a f/u with Dr. 06/03.
1362140	5/31/2021	NJ	34	F	4/26/2021	5/26/2021	Acute superficial vein thrombosis. Nodule formed on the back of the right leg which decreased in size after 2 days after initial symptoms. A bruise was formed in the surrounding area the next day. Four days later the bruise became larger so I decided to go to the ER where they did an ultrasound. Deep vein thrombosis was ruled out. I was sent home and recommended to wait for the symptoms to go away, no medications were given. I'm still recovering.

1362130	5/31/2021	MA	64	F	3/17/2021	4/13/2021	Acute onset stroke symptoms the afternoon of 4/13/21 after returning home from room. EMS transported pt to local hospital. Dx with aortic arch/proximal subclavian artery thrombus, migration into axillary artery. Treated at local hospital with TNK for aortic arch clot & ischemic stroke. Transferred to tertiary medical center. Pt had massive stroke (left & right side) with brain stem herniation. Pt CMO after 16hrs and expired on 4/14, <32 hrs after symptom onset.
1362092	5/31/2021	MA	50	F	5/10/2021	5/12/2021	Acute Horrible abdominal pain, vomiting, went to ER they did a CT scan without contrast and diagnosed me with severe constipation. Sent me home with bowel clear plan. Did not really work and pain continued. Went back to ER on that Friday had another CT scan WITH contrast where they saw a blood clot to the spleen resulting in an infarction as well as a blood clot to the right kidney. Stayed in hospital overnight and placed on blood thinners.
1362334	5/31/2021	CO	48	F	5/9/2021	5/29/2021	Ten minutes after I received the vaccine, my left arm and leg felt very heavy, like I was uneven. I started to feel very dizzy and my left eye became very blurry. I started feeling nauseous, as well. On the car ride home I noticed a rash. We thought it was an allergic reaction. After I got out of the car I noticed it went away. It came back later again, around my neck that evening, but it only lasted 5 minutes. It was a rash with white bumps and then it went away. At night I experienced chills. When I woke up I had a blistering headache with neck pain that lasted a couple days. The nausea and balance picked up and got worse. I spent two weeks being unable to see, walk, read or drive safely. I have had to take time off of work. I cannot view a computer screen without feeling nauseous. Most of the first week I spent on the floor because of the nausea and spinning issues. I sought medical treatment. I had a CAT scan and they ruled out a blood clot. I still have low grade nausea. I have regained peripheral vision in my left eye, which was missing for three weeks. I have been off work for more than 2 weeks. I still cannot work at my normal capacity. I still have a very strong chemical taste in my mouth. It is getting less and less, but I can still taste it. I've have a lot of swelling at the base of my skull, that has not resolved.

1360535	5/29/2021	NC	50	F	4/17/2021	4/1/2021	<p>Her throat was swollen; Bruise under chin/Her throat had bruising; She had an allergic reaction; Strep throat.; She couldn't swallow water; she would jerk if she swallowed water and it was a hurting feeling going down. Her throat was so swollen she could hardly eat; Lip, Jaw and face swollen; Lip, Jaw and face swollen; Throat was going to close; This is a spontaneous report from a contactable consumer reporting for herself. A 50-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EW0150) 17Apr2021 at single dose via an unspecified route of administration on arm left for COVID-19 immunization. Relevant medical history included ongoing hypertension, ongoing from 2016 Blood clot on her right kidney, ongoing from 2016 high cholesterol. The patient received first dose of BNT162B2 (Lot Number: ER8730) on 21Mar2021 around 11:00am on left arm and experienced allergic reaction, Face swollen, she was like the Nutty Professor doing the clump (as reported). Concomitant medications included warfarin for Blood clot on her right kidney and an unspecified product for cholesterol control. Patient reported her lip, jaw, and whole face were swollen around 19Apr2021 or 20Apr2021 until 22Apr2021. She says she went to Urgent Care, they gave her Benadryl, and admitted her to the hospital because they thought her throat was going to close starting from 20Apr2021 or 21Apr2021 until 21Apr2021. Starting from 09May2021 in the afternoon until 10May2021 in the night patient reported she couldn't swallow water; she would jerk if she swallowed water and it was a hurting feeling going down, she thought it was strep throat. Patient also reported under her chin was like a frog out on a log when they inhale and exhale (as such). Starting from Sunday night on 10May2021 her throat was so big and she presented a bruise under chin like someone put their hands up in there and choked her (as reported). Patient informed that her chin was swollen also. Patient went to the hospital where they tested her for strep and released her out of the hospital around 4:00pm. Patient reported she was admitted for one day on 10May2021 and they gave her Benadryl again, another medicine, throughout the day they even did a CAT scan. She says through the day she could start swallowing again. Patient got up Monday (11May2021) and went to the emergency room. She reported that</p>

1360590	5/29/2021	NE	54	F	5/19/2021		DVT and PE; DVT and PE; This is a spontaneous report from a contactable Physician. This Physician reported that a 54-year-old female patient (not pregnant) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot No.unknown) at single dose for COVID-19 immunisation on unknown date. Relevant medical history included Migraines, CAD, CKD III, morbid obesity, and allergy to sulfa. Relevant concomitant drugs included escitalopram oxalate (LEXAPRO), levothyroxine sodium (SYNTHROID), topiramate (TOPAMAX), metoprolol succinate (TOPROL-XL). No other vaccine was admitted in four weeks. The patient experienced DVT (deep vein thrombosis) and PE (pulmonary embolism) on 19May2021. Doctor or other healthcare professional office/clinic was visited. Emergency room/department or urgent care required. The patient was hospitalized for 2 days. Treatment therapy included anticoagulation. The outcome of events was resolving. The events were reported as serious (hospitalization and life-threatening). The patient did not have COVID tested post vaccination. Information on the lot/batch number has been requested; Sender's Comments: The reported deep vein thrombosis and pulmonary embolism are considered unrelated to BNT162B2 vaccine. No details on the administration date of vaccine were provided. The presence of morbid obesity and chronic kidney disease (CKD) are considered possible contributory factors for the events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1360642	5/29/2021			U	4/20/2021	5/24/2021	I didn't know if this could be a blood clot forming as result of the vaccination or this just regard could still be a blood clot.; I have too swelling in my lower left leg just below the knee; This is a spontaneous report from a contactable consumer (patient). A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Batch/Lot Number: EW0162; NDC / UPC number of COVID Vaccine: Unknown; Expiration Date: 31Jul2021), via an unspecified route of administration on 20Apr2021 as 2nd dose, single for covid-19 immunisation. Medical history included blood clot and stated as I do have blood clot in my past case history. My mother died at blood clot to the heart. Concomitant medications were not reported. Historical vaccine included first dose of BNT162B2 (Lot Number: ER8734; Expiration date: 31Jul2021) for COVID-19 immunisation. On 24May2021, the patient experienced i didn't know if this could be a blood clot forming as result of the vaccination or this just regard could still be a blood clot and i have too swelling in my lower left leg just below the knee. Additional Context was received as, I was calling in regard to my vaccination did I had. The first shot I had on 30Mar2021 and then the second one was on 20Apr2021. Further patient stated, that's what I am really not sure about I am not sure of this, if this is a COVID related vaccine issue or not. I have swelling too in my lower left leg just below the knee. I noticed this first time yesterday and notice this again today few minutes ago looking better and I didn't know if this could be a blood clot forming as result of the vaccination or this just regard could still be a blood clot and I wasn't sure if there was any relation to the vaccine. Patient stated, I am going to try to see my doctor tomorrow, helps to get into see him tomorrow. Like I said I am trying to see my doctor tomorrow. I am trying to see him hopefully he will able to help me. I have concerned about the swelling because I do have blood clot in my past case history. My mother died at blood clot to the heart I had in never and stroke and that is why I concerned. So that's why I go to the doctor tomorrow. Outcome of the events was recovering. Further probing could not be done as consumer was not willing to complete the report. Hence limited information available over the call.

1360608	5/29/2021	GA		F	5/16/2021	5/1/2021	she said she developed superficial phlebitis; This is a spontaneous report received from a contactable consumer (patient) via a Pfizer sponsored program COVAX US support. A 61-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, solution for injection, Batch/Lot number was not reported), via an unspecified route of administration on 16May2021 as single dose for COVID-19 immunization. Medical history included Blood clots. The patient's concomitant medications were not reported. On May2021, she developed superficial phlebitis. Stated, she received the 1st dose of the Pfizer-BioNTech Covid-19 Vaccine on 16May2021. Afterwards, she said she developed superficial phlebitis. She said she previously had issues with blood clots so when she heard that there were reports of blood clots with the Johnson and Johnson vaccine, she specifically selected the Pfizer Covid vaccine. She wants to know if the reaction she had is a known side effect of the vaccine, what she should do, and if there are any protocols on how to treat it. The outcome of the event was unknown.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1361194	5/29/2021	MO	65	M	3/23/2021	3/29/2021	Blood clots causing pulmonary embolism on 3/29 . Hospitalized on 4/6-4/8. Clots also caused a mild stroke on 5/5. Hospitalized 5/5-5/6
1360548	5/29/2021	TN	66	M	3/26/2021		3 clots were discovered on the groin area of the left leg; patient has two stunts in the right leg (1 in thigh and 1 in calf) and reported that it had been uncomfortable but not painful; This is a spontaneous report from a contactable pharmacist. A 66-year-old male patient received the second dose of BNT162B2 (Pfizer-BioNTech COVID-19 vaccine, Lot Number: ER8732), via an unspecified route of administration, administered in the right deltoid (reported as right arm) on 26Mar2021 at 03:55 as a single dose for COVID-19 immunization. Medical history included two stunts in the right leg (1 in thigh and 1 in calf) on an unknown date. The patient had no allergies. The patient's concomitant medications were not reported. The patient previously received the first dose of BNT162B2 on 24Feb2021 (lot number:EN6201), intramuscular in the right arm at 65 years of age. The patient went to his vascular doctor on an unspecified date (reported as 05Oct2021) and 3 clots were discovered on the groin area of the left leg. The MD said it did not warrant going to the ER. The patient has two stunts in the right leg (1 in thigh and 1 in calf) and reported that it had been uncomfortable but not painful. The MD placed him on Eliquis 10 mg, BID for 7 days then reduced the dose at 5 mg BID thereafter for about 5 months. The outcome of the events was unknown.; Sender's Comments: "The causal association of the events of 'clots on the groin area of the left leg' and 'leg uncomfortable' with the suspect drug BNT162B2 cannot be excluded due to limited information in the case. The case will be reassessed once new information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.~~

1358343	5/28/2021	NC	38	F	5/20/2021	5/26/2021	Patient found unresponsive due to unknown cause on 5/26 (6 days post-vaccination). Transferred, noted to be COVID + by NP swab with high cycle threshold on admission, tracheal aspirate was COVID neg. Patient had prior COVID infection in Nov. 2020. Workup for encephalopathy included MRI (5/27) which revealed thrombosis of left transverse/sigmoid sinuses and proximal jugular vein. However, platelets were normal 245 x 10 <sup>9</sup> /L (5/26).
1358358	5/28/2021	IL	50	F	4/26/2021	5/5/2021	I became dizzy, short of breath and chest tightness on May 5th in the afternoon. I first called my DR who told me to go to the ER. They did the CAT Scan, Blood test. CAT scan showed all clots resolved. I was admitted since the reason for my symptoms could not be identified. They did chemical stress test which came back normal. They sent me home on the following day, the 6th. I followed up with my PCP and pulmonologist. I am also going to follow up with a cardiologist.
1358413	5/28/2021	MD	29	F	4/28/2021	5/22/2021	Patient was found unresponsive at home on 5/22, admitted to another institution, found to be in DKA, multisystem organ failure (renal failure, liver failure), new R femoral DVT, elevation of ferritin, LDH and CRP. Over the course, platelet count continues to drop while on anticoagulation, and continued progression of thrombi, and transferred to our institution for further workup, including hepatic failure, concern for HLH and Castro trophic antiphospholipid syndrome. Based on chart review, patient had non-specific symptoms for a few weeks prior to the presentation, including GI distress, dysphagia and neck/sinus pain. CTH done with cerebral edema but not intracranial venous thrombosis. CT chest and abdomen with no PE, but presence of R popliteal vein thrombus, and portal vein thrombus. Heparin Ab (PF4 -ELISA test) was negative (at both referring hospital and current hospital). Serotonin release assay is pending at the time of report. While the symptoms are not consistent VITT that were reported (Heparin ab negative, received mRNA vaccines), however this possibility cannot be ruled out. IVIG was started on 5/27 - 5/28 to treat empirically for concern for heparin induced thrombocytopenia vs VITT.

On 28 Apr 2021, post second dose of vaccination patient experienced chest pains and went to emergency room. Patient reports a chest scan, chest X-ray, bloodwork, EKG, echocardiogram, and various tests were performed at the hospital. Patient was diagnosed with a blood clot in lungs. Patient reports being hospitalized several days and doctors indicated "she dodged a bullet". Patient reports the treating physicians could not determine the cause of the clot, nor determine if it was vaccine related. Patient reports concomitant medication, losartan dose was recently increased from 50mg to 100mg once daily. Patient attributes that the increased blood pressure was the worry related to being placed on blood thinners [Eliquis]. Treatment information included eliquis. Company Comment: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. This case was linked to MOD-2021-138094 (Patient Link).; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

Medical history included ongoing high cholesterol and ongoing prostate [having to go to the bathroom frequently] (prostatic disorder). The patient received the first dose of bnt162b2 (BNT162B2 reported as PFIZER COVID-19 VACCINE) at vaccination age of 61-year-old on 26Mar2021 3:45 pm for covid-19 immunisation. Concomitant medications included (LIPITOR) ongoing since unspecified date (reported as 3 or 4 years ago) for blood cholesterol increased, and tamsulosin on an unspecified therapy dates (reported as he has been taking it for years now) for prostate/having to go to the bathroom frequently (prostatic disorder). The patient did not receive other vaccine in the last four weeks prior to vaccination. The patient received the vaccine from a pharmacy. The patient reported that one week after getting the second vaccine, he had pain in his right leg (28Apr2021). He stated that he did know what was going on, but he continued to work. He added that last Monday (10May2021) it got worse, so he contacted his primary care doctor and he went today (12May2021) because his leg was swollen, red and he had pain. His doctor sent him to the ER (emergency room). The patient mentioned that the ER did a CAT scan on 12May2021 and found that he had a blood clot in his right leg (reported as 10May2021). The patient's wife comes on the line and stated the reason her husband called to report was because it could be from the vaccine, but they are not sure. The wife added that her husband went to the pharmacy to pick up the blood thinner and they told him to report this. She also stated that all the side effects could happen, but he did know the side effects and he just wanted to report because the pharmacy told him to report. She mentioned that her husband started complaining his leg hurt because he has to do yard work. She states that it got worse and worse and she saw his

The wife mentioned that the leg is more swollen and painful, but is the same, her husband cannot walk, he is limping on an unspecified date in 2021. She stated that her husband has just started taking medication, yesterday and today. The outcome of the event thrombosis leg was not recovered while the outcome of the other events was unknown.
							large blood clots during menstruation; irregular menstrual cycle; This is a spontaneous report from a contactable consumer (patient). A 34-year-old female patient received BNT162B2 (Lot Number: er8731), via an unspecified route of administration in Apr2021 as single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. The patient experienced irregular menstrual cycle and large blood clots during menstruation, both on 04May2021. The events resulted in Doctor or other healthcare professional office/clinic visit. The outcome of the events was recovering.

1357247	5/28/2021	WI	68	F	2/4/2021	5/1/2021	Stroke/in her head on her left side; Blockage in her head, there was a blood clot in her head; Arm doesn't work; All she could say was I cant/still needs speech therapy; Really bad headaches; This is a spontaneous report from a Pfizer-sponsored program. A contactable consumer (patient) reported that a 68-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot Number: EL9269; Expiration date was not reported) on the left arm on 04Feb2021 (13:21) as a 2nd dose, single dose, with route of administration unspecified, for COVID-19 immunization at the public health department (not a military facility). The patient had a family history of five heart bypass surgeries (father); stroke (father); and stents (mother). There were no concomitant medications. The patient had previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number: EL3249; Expiration date was not reported) on 14Jan2021 (when the patient was 68 years old) for COVID-19 immunization, and had hypersensitivity, rash and cerebrovascular accident. On 07May2021, the patient had a stroke (in her head on the left side). The patient was hospitalized from 07May2021 to 10May2021 due to the stroke. In May2021, the patient had a blockage in her head/there was a blood clot in her head; her arm did not work; all she could say was "I can't", and still needed speech therapy; and had really bad headaches. The events had resulted into an emergency room visit. The patient had received clopidogrel (PLAVIX) as treatment for stroke and blockage in her head/there was a blood clot in her head; and duloxetine ACL as treatment for the really bad headaches. The outcome of the events was recovering for 'stroke' and 'all she could say was "I can't", and still needed speech therapy'; was not recovered for 'really bad headaches'; and was unknown for all the other events. Information on lot/batch number was available. Additional information has been requested.

1357267	5/28/2021	MA	68	F	1/25/2021		portal vein thrombosis; This is a spontaneous report received from a contactable physician. A 68-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 25Jan2021 (Batch/Lot number was not reported) as unknown single for covid-19 immunisation. Medical history included on hormone replacement therapy (HRT). No known allergies. The patient's concomitant medications were not reported. The patient experienced portal vein thrombosis (seriousness criteria: medically significant) on an unspecified date. The adverse event resulted in doctor or other healthcare professional office/clinic visit. AE treatment including lovenox. No covid prior vaccination. Unknown if covid tested post vaccination. The event outcome was unknown. Information about lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of BNT162B2 vaccine can not be excluded for the reported event of portal vein thrombosis due to temporal relationship. Case will be re-assessed upon the additional information provided. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.
1358060	5/28/2021	AZ	49	F	4/2/2021	5/24/2021	Patient does not report pain. I am her sister and Legal Guardian and I believe she had symptoms prior to 5/24/21. On 5/24/21, she did not report feeling sick or having a headache and threw up around 11 am. Throwing up was the only way I knew to ask her how she was feeling. She said, I think I threw up because my head hurt. I asked her where it hurt and she said, in the back. I took her to the ED and she had a brain bleed and 5 blood clots in the major veins and sinuses of the left hemisphere of her brain. Her medical team said this is a very rare part of the brain to have blood clots. I would like further investigation into whether this was related to the vaccine.

1359309	5/28/2021	CO	47	F	5/8/2021	5/12/2021	left eye stroke (blood clot), Central Retinal Vein Occlusion, no treatment, vision foggy
1358512	5/28/2021	CA	68	M	2/25/2021	2/25/2021	After 4-5 hours of the 2nd dose of Moderna I start to get pain in the arms and legs, feel weir at night time like light headache, dizziness and uncomfortable in breathing that wake me up at the middle of the night. Blood pressure elevated higher than normal. After a week the arm's pain getting better, but the legs' pain gets worse. Since then my legs pain and join pain getting worse and worse, its hurts with activities and no pain at rest while seat or lay down. I've been through many doctors visits including the Urgent Care, ER, Neurology and rheumatology doctors and had many kinds of testing and found nothing wrong with my heart, lung, blood clots in the legs, Both of my legs are just progressively getting worse, both legs are getting more pain and weaker, that make me hard to lift them up for walking. I almost can't work now. I also feel so tired, dizzy and headache for 2-3 days each time that come and go since the 2nd dose of the vaccine. I'll have the MRI tests on 06/05/2021 and 06/06/2021.
1358042	5/28/2021	NC	47	F	4/24/2021	4/27/2021	I got my vaccine while being on my minstrel cycle. My period lasted for 4 weeks and it was very heavy. I experienced blood clots the size of a silver dollar. I had serve headaches.

1359513	5/28/2021	MI	51	F	5/7/2021	5/7/2021	Patient stated that shortly after getting the Pfizer vaccine she started having unexpected menstrual bleeding which continued for 7 days. She also had abdominal cramping that was 100X worse than her previous menstrual cramps. The cramps went on for 3 days. She discharged clots while bleeding and she also states that she had really bad "medical smelling" gas for about 2 weeks. She did have diarrhea and lasted for about 2 weeks as well.
1359313	5/28/2021	NJ	66	M	1/14/2021	1/25/2021	My husband had a stroke on 01/25/2021, with one large blood clot and many small blood clots. He was put on a ventilator until 02/06/2021 when I asked to have it removed. I died within 5 minutes after it being removed.
1358789	5/28/2021	OH	26	F	4/8/2021	4/9/2021	I woke up at three AM feeling like I had a fever. I had body aches. The next morning when I woke up I felt like I had a tourniquet on my arms and legs. I was also short of breath. I went to the ER and they checked for blood clots. I started to get lower extremity cramps and muscle spasms. Two days after I started to have some shortness of breath and I was out of breath if I walked any length. One week after the vaccine I ended up with an ear infection in my right ear. The muscle spasms continued especially in my right lower legs with twitching which lasted for five weeks. Two weeks after the shot my Asthma, which is normally controlled, got very severe. My inhalers didn't seem to work. Three weeks after the vaccine my Asthma got worse and I was having trouble breathing. I went to the ER again and there were more tests done. I was prescribed Prednisone, and I took one week off work. After multiple treatments I was prescribed antibiotics and switched my inhaler which helped. I have been trying to do some Cardio activity this week and I feel better after six weeks. I don't have to use my Nebulizer as much as I had been.

1354626	5/27/2021	ME	44	F	4/27/2021	4/27/2021	with this 1st of 2 shots I began getting a headache that began within 1 hour after the shot. The headache immediately became intense and stayed. Advil did not do anything for it. That same evening I began having intense abdominal pain on my right side, it became so bad I was scared my appendix was going to burst. I had my son on standby to take me to the hospital. It was so severe I could not stand. The only way that I can describe the pain would be: after natural birth and you begin nursing, the insanely intense contractions of the uterus to shed the afterbirth is how intense the pain was. I then started my menstrual cycle but was not supposed to for another week and 1/2. The pain stayed, but did dull some, it wasn't as sharp but still intense. My flow was extraordinarily heavy and I lost count of how many huge blood clots I passed. Some clots were the size of my palm. This cycle lasted a full 7 days. My normal cycle starts with a little spotting, then 1 or 2 days of medium flow, then a couple days of spotting. I also do not have my cycle every 30 days, more like 38-40. I figure its pre-menopause.

1352781	5/27/2021	AZ	20	F	4/27/2021	5/23/2021	Headache onset 3-4 days after vaccine on 4/27/21. Subsequently developed visual changes (right homonymous hemianopsia/visual field cut) on 5/23/21 and presented to ED, diagnosed with cerebral venous thrombosis (left transverse, sigmoid and internal jugular thrombosis). On initial labs also had thrombocytopenia and mild leukocytosis.
1354522	5/27/2021	CT	38	F	5/17/2021	5/20/2021	Patient is a 30-year-old previously healthy Mediterranean woman complaining substernal squeezing chest pain for 2 days in the setting of 2nd Pfizer COVID vaccine 2 days ago. The chest pain is pleuritic but otherwise has no exacerbating or relieving factors. It does not radiate. She has never had this pain before. The patient is worried about myocarditis or blood clot as she has heard the can be reactions from the vaccine. The pain is associated with shortness of breath. She denies vomiting, diarrhea. She has had some fever, chills and myalgias over the past few days. She denies cough. She denies history of VTE, hemoptysis, history of immobilization or trauma, estrogen birth control. She denies family history of early cardiac death or MI. 38y/o woman with no significant past medical history who had her second Pfizer vaccine on Monday and later that day developed low grade fever/ diffuse myalgias/ pleuritic and positional central dull 5/10 chest pain. On Tuesday and Wednesday she remained bedridden with same sx. Thursday morning felt improved except had persistent chest pain for which she presented to the ED for evaluation. She had tachycardia, +troponins, and +DDimer. EKG was negative for acute changes. She was admitted to the cardiology service for suspected myocarditis. She was started on colchicine, standing ibuprofen, and metoprolol. Echocardiogram complete on 5/21 was normal with an EF of 60%. She was evaluated again after her echo. She continued to feel significantly improved on medical therapy and was discharged home on 05/21/21. She will continue medical therapy as listed. She will follow-up with as arranged on 5/25/21.

1354599	5/27/2021	AL	65	M	4/12/2021	4/17/2021	About a week after the shot, I started getting redness, tenderness, discoloration, and swelling of my right arm. The discoloration began to spread and I went to the doctor on the 21st. The doctor said there was inflammation and because it was warm to the touch, was concerned about blood clots. I was sent for an ultrasound and prescribed an anti-inflammatory medication and advised to take aspirin. Everything cleared up about a week later.
1353017	5/27/2021	TX		F			BLOOD CLOTS; HEADACHE; This spontaneous report received from a consumer who reported by seeing a news report concerned a 14 female of unspecified age. The patient's height, and weight were not reported. No past medical history or concurrent conditions were reported. The patients received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported) 1 total, dose, start therapy date were not reported for prophylactic vaccination. The batch number was not reported and has been requested. No concomitant medications were reported. It was reported that, on an unspecified date, 14 patients had blood clots, and headaches The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of the headache and blood clots was not reported. This report was serious (Other Medically Important Condition). This case, from the same reporter is linked to 20210540327.; Sender's Comments: V0:20210547453-covid-19 vaccine ad26.cov2.s-This case concerns to 14 female of unspecified age. Blood clots. This event(s) is considered unassessable. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the event(s).

1354634	5/27/2021	NY	32	M	3/31/2021	5/7/2021	33 year old healthy man presented with seizure to Hospital ER on 5/7/2021. He required intubation. CT scan and MRI of brain showed dural venous sinus thrombosis along the anterior to mid aspects of the sagittal sinus. CBC was normal at presentation with WBC 13.9, HGB 16.1 and PLT 367k. He was admitted on unfractionated heparin. Repeat platelet count on 5/8/2021 was 153k. HIPA was negative. Patient was extubated and continued to improve. He was put on warfarin and sent home. He has some mild personality change in the immediate weeks of discharge. Hypercoagulable workup had normal Prot S & C activity, normal ATIII activity. The Factor V Leiden and Prothrombin Gene were negative. The homocysteine level was elevated at 16.3.
1354669	5/27/2021	ID	42	F	5/16/2021	5/17/2021	Low grade fever for 5 days. Extreme nausea for 24 hours. Diarrhea for 72 hours. 24 hours after the injection the lymph node under my left arm swelled up to about the size of a baseball, it was extremely hot and painful. It stayed that size for 4 days, and then finally started getting a little smaller each day. It's officially been 10 days and I would say that lymph node is about golf ball sized now. I did see my doctor and she said it can be a normal side effect and as long as it's going down not to worry. I also was having pain in my back and the doctor suspected a possible pe, my d-dimer test came back positive twice but my platelets remained in the normal range. The second d-dimer was only 513 and considered barely out of range so we assume whatever clot I had dissolved on its own.
1354724	5/27/2021	MI	77	M	5/9/2021	5/14/2021	bi-lateral leg pain within 1 week of shot. then severe back pain after 2 weeks. difficulty breathing week 3. Admitted to hospital for multiple blood clots in legs & lungs.

1353521	5/27/2021	TX	73	M	5/8/2021	5/1/2021	developed right upper extremity DVT; 1st dose, 25Feb2021/ 2nd dose, 08May2021; 1st dose, 25Feb2021/ 2nd dose, 08May2021; This is a spontaneous report from a contactable physician. A 73-year-old male patient received bnt162b2, via an unspecified route of administration on 08May2021 (Batch/Lot number was not reported) as 2nd dose, single for covid-19 immunization. Medical history included Chronic A fib, COPD, CVA with residual weakness, Known allergies: erythromycin. The patient's concomitant medications were not reported. The patient previously received the bnt162b2, at the age of 73-year-old, via an unspecified route of administration on 25Feb2021 (Batch/Lot number was not reported) as 1st dose, single for covid-19 immunization and experienced acute respiratory failure due to COVID like pneumonia, small PE and right lower extremity DVT. Within few days (May2021) she developed right upper extremity DVT despite being on Apixaban and being compliant with it. This event resulted in Emergency room/department or urgent care, Hospitalization (4 days). The patient received the Enoxiparin as treatment for this event. The outcome of the event Deep venous thrombosis arm was recovering. Information on the lot/batch number has been requested.; Sender's Comments: As there is limited information in the case provided, the causal association between the Deep vein thrombosis and the vaccine (BNT162B2 )cannot be excluded. The case will be reassessed once new information is available. "The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.~~
1354801	5/27/2021	TX	50	F	4/1/2021	4/7/2021	About 1 week after vaccination. I had pain in my legs and swelling in my feet, it made it difficult to walk. It was like I was carrying around a dead leg. I did have blood clots in leg. I ended up up being hospitalized 3 days to receive blood transfusions due to anemia after taking blood thinners.

1354849	5/27/2021	IN	44	F	5/19/2021	5/20/2021	Started with chills, fever, body aches, shortness of breath and headache for about 36 hours. The shortness of breath didn't subside so went in to see the NP at my family doctors office. She had me go get some blood work and chest x-ray. My d-dimer was over 2000 so she sent me to the ER where they did a CT Scan and found blood clots in my lungs. They then admitted me for the night on a heparin drip and then discharged me with Eliquis blood thinners. Meeting with my family doctor next week for more information.
1354875	5/27/2021	NY	73	M	5/11/2021	5/13/2021	Acute limb ischemia- with left internal iliac, common femoral, popliteal artery occlusive thrombosis- underwent emergent Fem-Fem bypass with fasciotomy. Patient subsequently developed respiratory failure with shock and encephalopathy- remains undertreatment.
1354901	5/27/2021	NJ	33	M	4/30/2021	5/10/2021	I woke up the morning after my second dose experiencing the common symptoms related to the vaccine -- persistent headache, body ache, fever, cold shivers, and fatigue. These symptoms lasted for approximately 24 hours, and I continued to have a headache for a total of approximately 48 hours. However, I then developed pain in my left calf approximately 10 days after the second dose and on three consecutive evenings at approximately 9pm I developed an all-body itchy rash (big red raised welts) that would disappear by the time I woke up the next morning. The rash only occurred on these three evenings, but the pain in my calf persisted. I went to see my primary care doctor the following Monday (05/17/21) who gave me a referral for an ultrasound to rule out a DVT, although he said that it was not urgent that I go as I didn't have the other regular symptoms of a DVT (swelling, redness, warm to the touch) and I was too young and healthy to be at risk for one. My doctor said that if the pain didn't subside by the end of the week I should go for the ultrasound. The pain got worse and so I went for an ultrasound on Saturday (05/22/2021). I WAS SUBSEQUENTLY DIAGNOSED WITH A BLOOD CLOT (DVT), and sent to the emergency department.
1354753	5/27/2021	KY	51	F	3/25/2021	3/26/2021	Day after second vaccine blood clots in legs and lungs, mesh inserted, started bleeding vaginally and now in intensive care almost on life support.

1353524	5/27/2021	CA	90	M	2/16/2021	2/16/2021	<p>The pain went down his left shoulder and back/he developed pain down his right side of his shoulder, and down in his hips/His left ankle, right side heel, and shoulders also hurt.; The pain went down his left shoulder and back; he was having problems breathing/difficulty breathing; possibly a swollen lymph node on his trachea; His left ankle, right side heel, and shoulders also hurt.; He has had pains in different parts of his body that last for 2-3 days and then some place else starts to hurt.; chills; His wife took his temperature and it was 100.3./He has weird fevers for one day with no other symptoms.; jaw pain; Dates for COVID vaccine: (Start: 5Feb2021 Stop: 16Feb2021), first dose on 5Feb2021 and second dose on 16Feb2021; Dates for COVID vaccine: (Start: 5Feb2021 Stop: 16Feb2021), first dose on 5Feb2021 and second dose on 16Feb2021; This is a spontaneous report from a contactable consumer (patient). A 90-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration, administered in Arm Right on 16Feb2021 (Lot Number: EL9267) (at age of 90-year-old) as 2ND DOSE SINGLE for covid-19 immunisation. Medical history included ongoing atrial fibrillation, stent placement from 19Jun2020 and ongoing (successful in the descending aorta), and ongoing Heart problems. The patient's concomitant medications were not reported. The patient received the first dose of BNT162B2, administered in Arm Right on 05Feb2021(Lot: EL9263) (at age of 89-year-old) for covid-19 immunisation. The patient would like to talk to an individual regarding his side effects he has been having since his two COVID vaccinations in Feb 2021. Ten days after the second inoculation on 26Feb2021, he woke in the middle of the night with jaw pain. He was in great pain. The pain went down his left shoulder and back . His wife said that morning that those were signs of heart problems. He does have Atrial Fibrillation, and he had a stent placed 19 Jun 2020. He went to the emergency room where they checked him out for heart problems. He had a clean bill of health. They sent him home, and told him to take Tylenol for the pain. The Tylenol certainly helps. It took whatever number of days for it to subside. It subsided for 2 weeks, but then he developed pain down his right side of his shoulder, and down in his hips. Once again they figured they better</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

get back to the ER. They did EKG and a X-ray. There was absolutely nothing wrong with his stent. They told him just to continue with Tylenol to control the pain. He went a third time to the emergency room because he was having problems breathing. The emergency room put him through the COVID entry at Kaiser because of the difficulty breathing. They re did all the previous work, and did a scan of his lung to check for blood clots. He thinks they did that because 6 people died from blood clots from Johnsons and Johnson. They wanted to see if there were blood clots, but there were no blood clots. They told him he needed to make an appointment with his primary who then referred him to a Cardiologist. On 11May2021, he saw his primary doctor who ordered another scan because they found possibly a swollen lymph node on his trachea. The doctor measured that, and said to wait a month to do that again. To see any change in it. On the 26 May 2021, he has his next appointment to get that rechecked. He hasn't had a comfortable day since this started. He has had pains in different parts of his body that last for 2-3 days and then some place else starts to hurt. His left ankle, right side heel, and shoulders also hurt. The pain was under control if he takes ibuprofen, but his doctor advised him against too much of that because of his kidneys. It was very effective. The Tylenol works to some extent, but not like the Ibuprofen. He is just living with it day to day. He can play tennis some days. One day he played tennis and came home with chills. His wife took his temperature and it was 100.3. In the last week and half this has happened two times. After the second shot this has happened probably four times. He has weird fevers for one day with no other symptoms. Ever since 26Feb2021, it has been on a daily basis that some place else hurts. One subsides , but another pain starts up elsewhere. If that is not happening, then his whole demeanor is dead. He is just not comfortable and sitting around he feels like he was wasting what life he has left. He used to be a PE teacher. He has always been in good physical condition. He was 5k and walking 5ks every 4th of Jul. He would compete. He prepared for this 90 birthday/ His goal was to do a 5k in under 60 minutes. He worked out like always , and played tennis 3 days a week to prepare. He also played ball. He likes to walk run 2-3 miles most days. He did his 5k in 52minutes, and he was celebrating. Then ten days

1354324	5/27/2021	NJ	28	F	4/3/2021	4/19/2021	On .4/19 I started to feel fatigue in my legs 04/20 it got worse in the legs 04/21 I came to work I worked through out the day with pain in my legs it hurt to walk it hurt to sit down the pain in my leg was getting worse 04/22 the pain got really bad I got up in the middle of the night to use the bathroom and I could feel my legs , my legs got really heavy and it felt like I had Charlie horses from my ankles up to the top of my thigh and I could not stand up. So I went to the ER and I got blood work done and I was told something about my CK levels were extremely high and that's when I was admitted. The day that I got the vaccine I got really dizzy during that 15mins that they make us wait and I felt very sick While I was admitted my CK levels kept going up the doctors told me that I had something rhabdomyositis , the pain got worse and the doctor increased my level of fluids and they did an ultra sound on my legs to check for blood clots and they kept increasing my levels of fluids and once I was let go from the doctor I did have to keep going back to keep getting my blood check. I did continue to feel muscle weakness in my legs while I was home. I did go back to the doctor 05/14 for muscle weakness I was given a bag of fluid.. After that any time I stand too long or I am working out I can no longer work out for as long as I can. I can no longer work out for longer than 15mins because of the pain in my legs. I suffer at night time now with muscle spasms now they happen all throughout the night. I had very low potassium

1353501	5/27/2021			M	4/21/2021	5/3/2021	Patient was diagnosed with blood clots confirmed by Ultrasound; This is a spontaneous report received from a contactable physician. A 48-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EW0164), on 21Apr2021 as 2nd dose, single for COVID-19 immunization. The patient's medical history included colon cancer (patient had a history of colon cancer 2 years removed) from unspecified date. The patient's concomitant medications were not reported. The patient previously received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number not reported), on 30Mar2021 as 1st dose, single for COVID-19 immunization. It was reported that patient was diagnosed with blood clots confirmed by ultrasound during the emergency room visit on 03May2021. Patient was placed on apixaban (ELIQUIS) 5 mg, twice a day. Patient had history of colon cancer 2 years removed, and recent colonoscopy on 13Apr2021 was clear. The event was reported as non-serious. The outcome of the event was unknown.; Sender's Comments: The event of blood clot is assessed as possibly related to the suspect BNT162B2 based on temporal association, but medical history of colon cancer was confounder. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Committees, and Investigators, as appropriate.
1354236	5/27/2021	CA	57	F	4/9/2021	4/9/2021	Ran a fever for about 1 week. Had extreme pain in left leg beginning the day after vaccine. Visited emergency room 1 week later based on guidance from physician but little was done- they seemed unsure of what to do. They ran blood tests but since I had no swelling, they assumed no blood clots and did no more testing. Released after about 3 to 4 hours. Pain continued so contacted my doctor a 2nd time. She indicated other patients were reporting the same and suggested continuing aspirin or tylenol. After about 4 weeks pain resolved.

1353119	5/27/2021	IL	70	M	1/28/2021	2/18/2021	lower leg was swollen and started to get bigger and bigger; blood clot in the right leg; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of THROMBOSIS (blood clot in the right leg) in a 70-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 02AL20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No medical history were reported. Concomitant products included PANTOPRAZOLE for GERD, TRAZODONE for Sleeplessness, SIMVASTATIN and CHLORMEZANONE (RESTORIL [CHLORMEZANONE]) for an unknown indication. On 28-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 18-Feb-2021, after starting mRNA-1273 (Moderna COVID-19 Vaccine), the patient experienced THROMBOSIS (blood clot in the right leg) (seriousness criterion medically significant). On an unknown date, the patient experienced PERIPHERAL SWELLING (lower leg was swollen and started to get bigger and bigger). The patient was treated with RIVAROXABAN (XARELTO) for Thrombosis, at an unspecified dose and frequency. At the time of the report, THROMBOSIS (blood clot in the right leg) and PERIPHERAL SWELLING (lower leg was swollen and started to get bigger and bigger) outcome was unknown. Not Provided The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Concomitant medication includes Benapraxine for to simmer down. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Further information has been requested.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Further information has been requested.

1353762	5/27/2021			F			<p>BLOOD CLOT; DISTURBING CHANGES IN MENSTRUAL CYCLES; EARLY PERIODS; UNUSUALLY HEAVY PERIODS; OTHER IRREGULARITIES; This spontaneous report via social media received from a patient concerned multiple patients. The patient's height and weight was not reported. No past medical history or concurrent conditions were reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: Unknown) dose, start therapy date were not reported for prophylactic vaccination. The batch number was not reported. Per procedure, no follow-up will be requested for this case. No concomitant medications were reported. The reporter shared from a news article stating that blood clots were not the only vaccine side effects and that women experienced several weird side effects including disturbing changes in menstrual cycles, early and unusually heavy periods and other irregularities. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of the other irregularities, early periods, unusually heavy periods, blood clot and disturbing changes in menstrual cycles was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: 20210545709-COVID-19 VACCINE AD26.CO2.S-blood clots. This event(s) is considered unassessable. The event(s) has an unknown/unclear temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the event(s).</p>

1353559	5/27/2021	GA	81	U	3/22/2021	3/22/2021	<p>my doctor immediately said you know we want to rule out a blood clot so blood was drawn to the lab; Right ankle was swollen; There is some problem down with the leg not as bad I say but having the same pain I feel a sensation in my feet when I stand; This is a spontaneous report from a contactable consumer (patient). An 81-year-old patient of an unspecified gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection) (at 81 years of age), via an unspecified route of administration on 22Mar2021 (Batch/Lot Number: EN6206) as 2ND DOSE, SINGLE for COVID-19 immunisation; amlodipine besilate (manufacturer unknown), via an unspecified route of administration from an unspecified date (Batch/Lot number was not reported) to an unspecified date, at 10 mg, 1x/day for blood pressure management and valsartan via an unspecified route of administration from an unspecified date (Batch/Lot number was not reported) to an unspecified date, at 80 mg, 1x/day at bed time (anywhere between 9 and 10:15 PM) as blood pressure medication. Medical history included glaucoma and hypertension (Blood pressure) from an unknown date and unknown if ongoing; additional medical condition reported as felt at times like he/she want to itch ('felt itching but never scratch myself or anything like that'). Concomitant medication included bimatoprost (LUMIGAN) taken for glaucoma, start and stop date were not reported. Historical vaccine included BNT162B2 dose 1 on 01Mar2021 (at 81 years of age) for COVID-19 immunisation. The patient took the two treatments of the Pfizer vaccine. The patient had a problem from the second vaccination administered on 22Mar2021 with the LOT# EN6206. The patient took the last treatment on 22Mar2021 at the health department, which was the one that had created problems for him/her. The patient mentioned that there was no problem at all with the first treatment. The patient stated that first of all, he/she was on the blood pressure medications and one of the medications was valsartan 80 mg and the other one was amlodipine 10 mg, once a day; the patient take valsartan at bed time (anywhere between 9 and 10:15 [something like] that PM). The patient was taking amlodipine 10 mg for blood pressure, and then from reading what he/she got from the pharmacist on the valsartan, it was supposed to work by relaxing blood vessel so the blood</p>

---

can flow more easily lowering high blood pressure to help prevent stroke, heart attack and kidney problems; so the patient had been taking those two. It was reported that after the patient took the second Pfizer vaccine on 22Mar2021, in the evening he/she noticed that his/her right ankle was swollen not in the morning but in the evening say by anywhere from 6 to 7 PM to 8:00 PM, it was swollen occasionally and then it looked like there was some problem down with the leg not as bad he/she said but having the same pain he/she felt a sensation in the feet when he/she stands. So the patient saw his/her doctor, had an appointment with him on 20Apr2021 and at the time of the appointment which was at 2:45 in the afternoon, there was no swelling; the patient did tell him that he/she had this reaction and it started the same day he/she got the treatment but it was in the evening that she/he noticed it, not in the morning, not the afternoon but the evening, late evening. The patient did not take any treatment for these adverse events which the doctor immediately said that they want to rule out a blood clot, so blood was drawn to the lab. The patient saw the doctor on the 20th about a week later and called his office and was told report had not come in and the patient had not heard from his office since that time. The patient was making assumption right or wrong that had there been a blood clot, the office would have called him/her okay. But the doctor said that he wanted to rule that out then he said they might have need to lower the dosage of amlodipine, those were the things he remembered him saying so. But the patient's concern was not it was because the ankle does swell and then when he/she went to bed and lie down of course it stopped it did not swell, when he/she got up in the morning it was normal ankle so but the patient did not know what was going on and did not know if this was the reaction that no one else had; he/she was not sure what to do about it at this point. The patient wondered if the symptoms were direct result of his/her mixed medications that he/she had taken with the Pfizer vaccine and commented that he/she certainly had no problem with the first. The patient added concern whether there was a causal relation between the medication he/she was taking and that second vaccine, he/she does not know what. The patient's main concern was to get his/her ankle un-swollen which what happened since the last dose, no problem with the first

---

dose but the last dose that was where it was. The patient did not know what the diagnosis that was causing the problem as he/she said the doctor had taken the had blood drawn to send to the lab to rule out the blood clot. The patient underwent lab tests and procedures which included blood test: unknown results on an unspecified date. The action taken in response to the events for amlodipine besilate and valsartan was unknown. The outcome of the events was unknown. Pfizer is a marketing authorization holder of Amlodipine Besilate in the country of incidence or the country where the product was purchased (if different). This may be a duplicate report if another marketing authorization holder of Amlodipine Besilate has submitted the same report to the regulatory authorities. No follow-up attempts are needed. No further information is expected.

1353513	5/27/2021	NY	74	F	2/5/2021	4/15/2021	<p>she did not feel good; Migraine after second dose; her heart was pounding; felt palpitations in her chest; potassium was low; dimer test that showed 0.30 clot; slight mitral regurgitation; breathing problems; shingles; This is a spontaneous report received from Pfizer sponsored program. A 74-year old contactable female consumer (patient) reported for herself that she received the second dose of BNT162B2 (Lot No. unknown) at single dose for Covid-19 immunization on 05Feb2021 at 17:30. Relevant history included Shingles when she was 42, Chicken pox. Relevant concomitant drug was unknown. The patient received the first dose of BNT162B2 (Lot No. EL3247) at 0.3 ML single dose for Covid-19 immunization on 15Jan2021, experienced Left arm Pain at injection site. Prior Vaccinations (within 4 weeks): none. The patient went to Urgent care and was diagnosed with Shingles on 15Apr2021, which was started with pain in her side, and on 30Apr2021, she was having breathing problems/ breathing was not well at 15:30-16:00. She said shingles were from the shot. The patient started shrinking before she got the vaccine. It was years before. There was no prescriber. She did not have the pain from the Shingles any longer. The pain was gone for a couple of days now. She had it for 2 1/2 weeks. She was cooking and the next day, she said she did not feel good, her heart was pounding and breathing was difficult. She went to ER and they did dimer test. They took 12 vials of blood. They told her she had .30 clot. She later stated the Dimer result was 0.30. They did chest x-ray and nothing showed. They looked at her legs too. That is why they did the sonogram. They wanted her to stay, but he gave her a sonogram of her heart. It is not enlarged and there is no fluid around it. She thought he gave referral for outpatient. She has been calling ER for an appointment. She then found that the doctor was not able to refer to an Echo cardiogram. She needs to go to the one in her home state and she is still in a different state visiting her daughter. She goes home next week and will get it then. She went for stress test Apr 2019 and emailed results said she had slight mitral regurgitation, so maybe that is where the blood is coming from. Her sister called and she told her she did not feel well. Breathing problem only lasted a day. She was cooking again and was not doing anything strenuous and felt palpitations in her chest and felt breathing issues again.</p>

----------	-------	-------	---------	-----	----------	------------	--------------

It is better, but every now and then she gets palpitations. She had a migraine after second dose at 16:00 (unknown date). She went to bed at 4pm and woke up at 1am. She thought she took an Ibuprofen and did not know if it would affect vaccine or not. When she woke up, she was fine. She had shingles prior. She assumes she must have had COVID and did not know. She had the antibodies present in May 2020, when she was tested. When she googled, the people in another country were getting Shingles. She had the chicken pox when she was young. If you get the Chicken pox and the COVID, you are susceptible to shingles. She does not have any information on those people in other country to report. Her brother and sister both received the Moderna COVID vaccine. Her brother did not have any issues an her sister already reported her issues to them. No further details provided. Separate report completed for her sister. When looking up an address, she stated she needs a magnifying glass. She needed this before the vaccine. She always has her glasses to read with. ER visited on 15Apr2001 and 01May2021. On 15 They gave her ketorolac and ondansetron, potassium chloride. because her potassium was low. The outcome of event shingles, breathing problems was resolving, the outcome of other events was unknown. Follow-up attempts are needed. Information about batch/lot number is expected.

1353495	5/27/2021	IA	77	F	3/21/2021		<p>getting lightheaded; Excessive hypertension/ 180/88 to 94; This is spontaneous report from a contactable nurse reported for herself. A 77-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration, administered in left arm on 21Mar2021 (Batch/Lot Number: ER8727) as 2ND DOSE SINGLE for covid-19 immunisation. Medical history included hypertension, paroxysmal atrial tachycardia, stroke when she was 40, had COVID in Mar2020 (Her cardiologist believes she had COVID too but never did a test) and broke her ankle. Concomitant medication included warfarin sodium (COUMADIN) because she had a stroke and broke her ankle and got a clot from her ankle to her groin; ongoing diltiazem hydrochloride (DILTIAZEM HYDROCHLORIDE) taken for paroxysmal atrial tachycardia and hypertension; Chlorthalidone taken for polyuria and hypertension; verapamil hydrochloride (VERAPAMIL) taken for paroxysmal atrial tachycardia for years. Patient received first dose of bnt162b2 on 28Feb2021 in left upper arm. Patient was a retired nurse and stated about a month after the second dose of the vaccine she started getting lightheaded, she went to Urgent Care because her daughter who is a nurse insisted. Her blood pressure at Urgent Care was really, really high, she was having excessive hypertension. Before the vaccine she was on a blood pressure medication for several years and had no issues. She went to see her cardiologist and they moved her from one medication to 3 medications (then add Losartan, Diltiazem) to get this controlled. In the morning she was lightheaded and her blood pressure is high before her morning medication. Diltiazem is 24 hours. She gets up at 3AM and once she takes the medication it seems to be ok. Her blood pressure is reasonable now. It is not like it was initially when elevated. Initially it was 180/88 to 94 when she first went to see the cardiologist after second COVID19 Vaccine. Currently her blood pressure in the morning is usually 154/ 77. That was when she first takes it when she gets up. Later in the morning it is running 110/77. The event outcome was unknown. She was feeling that it had to do with the second injection. Patient considered it was medically significant for high blood pressure and lightheaded, and considered both events related to COVID19 Vaccine.; Sender's Comments:</p>

A 48-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot Number: EW0164) via an unspecified route of administration, administered in left shoulder on 20Apr2021 at age of 48-year-old at single dose for COVID-19 immunization. The patient had no medical history (including any illness at time of vaccination). No family medical history relevant to AE(s). The patient did not receive any concomitant medications (reported as "the patient did not receive other products"). No relevant tests. No prior vaccinations (within 4 weeks). The patient previously took the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EW0150) via an unspecified route of administration in his left shoulder on 30Mar2021 at age of 48-year-old for COVID-19 immunization and experienced no adverse event. Caller stated he was calling about the COVID 19 vaccine. Caller stated he got the second dose about 3 weeks ago and about 10 days or 11 days after the second dose (01May2021) his arm starting swelling specifically in his wrist and forearm. Caller stated he went to the emergency room and there was a blood clot found in his left arm. Caller stated he was diagnosed with a deep vein thrombosis since the clot was in his vein. Caller stated everything was going better but the emergency room doctor told him he should probably report this to Pfizer to let Pfizer know. Caller clarified that he was released from the emergency room and was never admitted to the hospital. Treatment received for the event included blood thinner. The event required a visit to emergency room, and the caller stated he went to physician office today. The outcome of the event was recovering.

can flow more easily lowering high blood pressure to help prevent stroke, heart attack and kidney problems; so the patient had been taking those two. It was reported that after the patient took the second Pfizer vaccine on 22Mar2021, in the evening he/she noticed that his/her right ankle was swollen not in the morning but in the evening say by anywhere from 6 to 7 PM to 8:00 PM, it was swollen occasionally and then it looked like there was some problem down with the leg not as bad he/she said but having the same pain he/she felt a sensation in the feet when he/she stands. So the patient saw his/her doctor, had an appointment with him on 20Apr2021 and at the time of the appointment which was at 2:45 in the afternoon, there was no swelling; the patient did tell him that he/she had this reaction and it started the same day he/she got the treatment but it was in the evening that she/he noticed it, not in the morning, not the afternoon but the evening, late evening. The patient did not take any treatment for these adverse events which the doctor immediately said that they want to rule out a blood clot, so blood was drawn to the lab. The patient saw the doctor on the 20th about a week later and called his office and was told report had not come in and the patient had not heard from his office since that time. The patient was making assumption right or wrong that had there been a blood clot, the office would have called him/her okay. But the doctor said that he wanted to rule that out then he said they might have need to lower the dosage of amlodipine, those were the things he remembered him saying so. But the patient's concern was not it was because the ankle does swell and then when he/she went to bed and lie down of course it stopped it did not swell, when he/she got up in the morning it was normal ankle so but the patient did not know what was going on and did not know if this was the reaction that no one else had; he/she was not sure what to do about it at this point. The patient wondered if the symptoms were direct result of his/her mixed medications that he/she had taken with the Pfizer vaccine and commented that he/she certainly had no problem with the first. The patient added concern whether there was a causal relation between the medication he/she was taking and that second vaccine, he/she does not know what. The patient's main concern was to get his/her ankle un-swollen which what happened since the last dose, no problem with the first

1355263	5/27/2021	UT	30	F	5/14/2021	5/18/2021	Menstrual cycle started again a week after my normal cycle ended. Abnormal menstrual cycle is still on going (started 18May2021) today is 27May2021, no sign of stopping any time soon. This abnormal menstrual cycle is extremely heavy where it is causing concern. There is a lot of blood clots.
1356050	5/27/2021	UT	34	F	5/6/2021	5/7/2021	pt said the day after she had the covid shot she started seeing an increased amount of bleeding. She said she was about 6 weeks postpartum and she was bleeding normally but increased after shot., no blood clots though just an increased amount. She had as must rest as she could and drank plenty of fluids and water. She talked to md at 6 week appointment, which was shortly thereafter, and he examined her and told her to drink plenty of fluids and rest. He just told her to monitor the bleeding for increased amounts and if need be call him. The doctor said was beneficial to get second shot she seems ok now and said she has what is normal bleeding now. she said she has regularly bleeding to me now when I asked is it back to normal she told me yes. She opted to get another vaccine shot knowing all this.
1355177	5/27/2021	FL	20	M	5/23/2021	5/26/2021	At approximately 12:30 PM on May 26, 2021, Pt. began vomiting while he was at school. Prior to vomiting, school staff reported that he seemed unwell (pt. is severely disabled and has very limited speech). The first episode of vomiting was followed by multiple (4-5) episodes of vomiting blood. School staff including the school nurse report observing clots in the blood, bright red blood, and brown coffee ground type blood in the vomit. The school staff called 911 and pt. was transported to Hospital. In the ambulance pt. vomited again and the paramedic reported observing blood in the vomit. Pt. was observed in the ER and given Zofran and liquids. Blood tests and a CT scan with and without contrast were performed. Neither tests explained the bloody vomiting. Pt has since stopped vomiting and is resting quietly at home and eating normally. The hospital referred Noah to a Gastroenterologist for follow up.

1355276	5/27/2021	NV	40	M	4/3/2021	4/17/2021	April 17th, felt chest pain and fatigue and shortness of breath. After about two weeks of it, I went to ER on the 26th. I was diagnosed with blood clot on my heart. I spent a week at the hospital Heparin blood thinners and antibiotics - discharged on May 2, 2021. They sent me home with Warfarin regiment. I am still on that. I still have some days where I'm good but some days, I can barely stand and get out of bed due to short of breath, fatigue but not as much chest pain. I think the blood thinners are working. I just have to take it easy and make sure to have some calm days. It could take weeks to months to have the blood clot totally dissolve from the system.
1355286	5/27/2021	FL	68	M	1/24/2021	1/24/2021	He got his vaccine, and had to go from the roof to the parking lot. He was in his car and thought he had put his car in park, but it was in neutral and he hit another car, which he thought he was hit. The gentleman informed him that he was the one that hit him as he had watched him slowly advance to hitting him. He did not know or was aware that he was even moving. He has headaches normally but they have gotten worse since then. He also has motion sickness but has learned to deal with it and get used to the side effects. He also has blurry vision and just not feeling normal. He did go see his PCP and she put him on Meclizine for the dizziness, which works about 50%, but not completely. He did have the 2nd vaccine on 2/22/21 and still had the symptoms, which have stayed since then as well. He then saw his PCP a week ago and she is scheduling for a CT scan to see if he has any blood clots. He did have an aneurysm in his brain 28 years ago and they felt that he would not be able to survive it and deemed that he would be left as a vegetable, but has survived that and does have a little residual headache, but nothing severe. He now is still having these three symptoms that he did not have prior to the vaccine.

1355297	5/27/2021	TX	43	M	4/30/2021	5/3/2021	Three days after my second shot (on 05/03/2021) I started to feel pain in my left arm, tightness in chest, and I became very light headed. I tried to go to shower but I could not walk and laid down. My ears felt very tingly and I thought I was going to pass out but as far as I know, I did not. I went to my primary care doctor and he has me taking baby aspirin daily (in case blood clot) and wanted to see if it got better I am going to follow up with a cardiologist. I've never had a problem with heart before and get an annual physical at work.
1355298	5/27/2021	VA	76	F	4/7/2021	5/9/2021	Had noises in my ears like a clock ticking. I have titinus but this was not a ringing noise. A couple of weeks later I woke up with my right eyelid all swollen and bruised and went to the ER where there they did a CT scan to make sure I didn't have a blood clot and I did not. Also my platelets were in the normal range. It took a good week for the swelling and bruising to go down and the bruising even went down my face somewhat. I had an appointment with my eye doctor and he didn't know why it happened, but may have had something to do with my taking low dose aspirin. I did not have any contusion to the eye and it was not hit by anything.
1355300	5/27/2021	CT	51	F	4/7/2021	4/7/2021	I was still having chest pain and breathing problems prior to getting it, so they wanted me to get the vaccine because if I got COVID, it would kill me. Over the weeks, my breathing worsened and I had terrible chest pains. They did another CT Scan to make sure I didn't have another embolism. The symptoms of my other conditions flared as well. I got the vaccine 3 or 4 days before the news was released about the blood clots. I'm still experiencing breathing issues, chest pains and dizziness. I'm now on additional meds for my lupus: Cymbalta and Lyrica. They're trying to help with the chest pain and polymyalgia. I was also given a Lidoderm patch to help with my chest pain. It just seems like everything got worse afterwards. I'm not sure if my lungs will ever function at 100% due to everything going on.

Treatment team Acute nonintractable headache, unspecified headache type Clinical impression Headache Chief complaint Triage Note: To ED c/o severe HA behind R ear since being dx w COVID 4/30. Denies cough, dyspnea, fevers. Reporting he has had 1 round of COVID vaccines. Has taken "alieve, tylenol, and advil" w/o relief. Last doses all "early this morning." pt awake and alert in triage. History of Present Illness Patient is a 54 y.o. yo male presenting to the ED with severe headache behind the right ear since 4/30. Patient was diagnosed with Covid at that time and has taken 1 round of the Covid vaccine. He has tried Aleve, Tylenol and Advil without relief. He states that his last dose were all early this morning. Denies any numbness or tingling, visual disturbances, ataxia, photophobia. He has no history of strokes, MI or blood clots. He states that prior to his Covid diagnosis he is otherwise healthy. ED Discharged 5/8/2021 (4 hours) Last attending ? Treatment team COVID-19 Clinical impression Fever Chief complaint Medical Decision Making 54-year-old male who presents today due to uncontrolled fever, diagnosed with Covid on April 30. Symptomatic for about 2 weeks now. On exam appears to be uncomfortable, is febrile and tachycardic, however remaining vitals are stable. Physical exam is also reassuring. Patient not complaining of any chest pain, shortness of breath, lightheadedness. Will provide patient with symptomatic relief including fluids and ibuprofen, if able to improve patient's symptomatology will have him discharged home. His labs also show some slight hyponatremia, he will likely improve from fluids as I believe this is secondary to his diarrhea that he has been having over the last few days. CK also slightly elevated, would likely benefit from fluids. After a single liter of fluids, patient symptoms improved, fever and tachycardia also improved, continues to endorse some generalized weakness, will give second liter of fluid and Tylenol at this time as he is due for this. After receiving a second liter, the patient states that his symptoms have greatly improved at this time, comfortable returning home. I advised the patient that she should take ibuprofen and Tylenol on 6-hour cycles very regularly, he can take it in a pattern where he takes Tylenol followed by ibuprofen 3 hours later followed by Tylenol again 3

1351174	5/26/2021	NJ	36	F	4/8/2021	4/15/2021	<p>hours later, as long as he keeps 6 hours in between doses, explained to him that he should not take this any sooner than this however he should be sure to take these regularly as these will help control his fever. Also encouraged him to hydrate appropriately as this will likely prevent him from feeling poorly. He is agreeable with this plan, I provided him with appropriate return precautions.</p> <p>Over the week after my shot I started to get a headache which isn't abnormal for me but by Sunday April 18 I was having the worst headache I have ever had in my life. I was bed ridden and in tears and unable to function. I went to the ER to make sure I was not having the blood clot issue seen after some j&amp;j shots. I was not having one they said and I was sent home to have further testing done and visit a neurologist. By Tuesday April 20 I began having neurological symptoms such as pain and numbness in my left side. I feared I was having a stroke so I went back to the Er where I was admitted and they ran many tests including multiple brain MRI. They found nothing and said that I was having a complex migraine. I saw a neurologist shortly after my hospital visit and he has been treating my headache with gabapentin and fiorecet for emergency medication. The whole duration of symptoms lasted weeks after my shot and I still struggle with this headache episode today.</p>

1350390	5/26/2021	SD	56	M	3/31/2021	4/16/2021	Patient received first dose Moderna vaccine on 3/31/2021. Approximately two weeks after receiving the first Moderna vaccine patient states he started to have pain in the lower leg which was not normal. Pain increased to a point that patient sought care and was evaluated for a blood clot which he was told was "negative" as no clot was initially found. On 4/28/2021 Patient presented to pharmacy to receive second dose. Pharmacist asked how patient tolerated first dose to which he replied he had no issues, so the second dose was administered. AFTER the second dose, patient did state he was seen by a CNP for leg pain but a clot was ruled out. Approximately 3 weeks after the second dose of Moderna vaccine the patients leg pain increased to a point that he presented to the local ER and it was determined at that visit that he did indeed have a large blood clot in the leg and a second smaller clot in the upper thigh. He was sent home on Eliquis. He subsequently presented to another ER approximately one week later for uncontrolled leg pain due to massive size of blood clot in leg. At this point, patient is at home recovering.
1350400	5/26/2021		68	M	3/19/2021	4/30/2021	Patient presented to the ED for bradycardia and dyspnea present for one week prior to admission, he was found to have a second degree AV block. He underwent a procedure to correct atrial lead dislodging/placement of pacemaker. Patient was also started on anticoagulation therapy for a clot in lung. Discharged after 5 days inpatient.

1350433	5/26/2021	MI	50	F	4/8/2021	5/8/2021	Presented 5/13 to Hospital. Presented to Hospital on 5/13 with one week of symptoms including cough, dyspnea, diarrhea. COVID-19 testing was positive on 5/8. Treatments prior to arrival included remdesivir and dexamethasone, started 5/13. She was also placed on pulse dose steroids 1000 mg/day methylprednisolone given her history of ground glass lung opacities in 2018. Progressed to high-flow nasal cannula, then BiPAP on 5/14, and was intubated on 5/17. Paralysis and proning initiated. Transferred to another hospital for possible VV ECMO candidacy. Patient with severe acute respiratory failure d/t covid who has failed treatment with the ventilator despite paralysis and proning. CTS asked to place patient on VV ECMO. 5/20/21 1135am initiated ECMO Patient is a 50yr old female with past medical history of hypertension, asthma, OSA and obesity BMI 41.5 who presented to hospital on 5/13 with progressive cough and shortness of breath for about a week. Of note, patient also has a history of respiratory failure presenting with ground glass opacities on CT scan in 2018 with unclear etiology despite bronchoscopy and serologic studies which resolved with high dose corticosteroids. Patient recently tested positive for COVID on 5/8 and received johnson and johnson vaccine in April. Patient was admitted on 5/13 and treated with decadron, remdesivir and tocilizumab. Course complicated by progressive respiratory failure requiring HFNC followed by Bipap and ultimately intubation on 5/17. Due to elevated d-dimer, lower extremity dopplers were obtained which were negative, however a heparin gtt was initiated. Course further complicated by cold left lower extremity; arterial duplex demonstrated distal popliteal artery thrombus extending into the peroneal, anterior tibial and dorsalis pedis arteries. therefore heparin was switched to argatroban and a HIT panel was sent. On 5/19 patient continued to decline despite paralytic and proning. Patient transferred to ICU for further level of care and VV ECMO evaluation. On arrival patient was started on velettri; however due to continued respiratory decline a shock call was placed for VV ECMO and patient cannulated for VV @ 1200. Cannulation was difficult and patient was felt to have an IVC thrombus as clot was seen going into the ECMO circuit during cannulation. Post cannulation she developed worsening septic shock and DIC. She received 2uprbc, 1unit cryo, 1

1349623	5/26/2021	TX	66	F	5/9/2021	5/9/2021	get sore arm; Anaphylactic reaction; Shortness of breath; look miserable; This is a spontaneous report from a contactable consumer (patient). A 66-year-old female patient received bnt162b2 (BNT162B2), via an unspecified route of administration, administered in Arm Right on 09May2021 (Lot Number: EW0177; Expiration Date: Aug2021) at single dose for COVID-19 immunization. Medical history included asthma since she was 8 years old, when she was a child her asthma was really bad and then she would say after 2004, she would say she went to chemotherapy and then 2005 her asthma got a lot better, didn't have it really bad as she used to, one doctor said he had heard that from patient they go through the chemo and their immune system change, she carried her little inhaler, but she don't have (incomplete sentence), she had asthma but not really bad, she was not like walking around every day with asthma packs but she have asthma and she keep little inhaler, for eg; if there is lot of pollen in air then she will need to take out her inhaler; breast cancer; seizure; hypertension, high cholesterol. Concomitant medications included zonisamide taken for seizure, lacosamide (VIMPAT) taken for seizure, losartan taken for hypertension, atorvastatin taken for high cholesterol, all start and stop date were not reported. Some years ago when she in 2005 when she was on the end like she said its 2005 and she was right on the end of being treated for breast cancer. she was taking, the doctor put her on Tamoxifen and she woke up one morning to really short of her breath and she thought it was her asthma, so the lady she was staying with said you look miserable and she said let her get back on the store and have her take her to the ER she said call now and it turned she had a blood clot in her lungs but 'Dr PRIVACY' (not spelled) who was treating her, he was a cancer specialist he said PRIVACY she was so proud of her, he said that she got to take you off the Tamoxifen, it was that Tamoxifen that caused blood clot in your lung. A blood clot in the lungs was the side effect of the Tamoxifen. Tamoxifen was one of the drug they give women who have had breast cancer and are right at the end of the treatment and put us on Tamoxifen and she ended up with a little bit of blood clot in her lungs. He said that was one of the effects of Tamoxifen. So, that was like in 2008, 2009 it was 12 years ago, could have 11 years ago but this goes to

----------	-------	-------	---------	-----	----------	------------	--------------

show her body may have potency for allergic reaction. The patient stated she had short of her breath because she did have allergic reaction shortness of breath with Pfizer Vaccine first dose at a pharmacy yesterday 09May2021, had been given Prednisone so. She did shortness of breath about 45 minutes after she took it because we had to sit there about she would say we were sitting there about 20 minutes and he finally said well you all can get up and leave and then about say 15 minutes later she start getting shorter and shorter of her breath. " The patient stated, she just needed to Pfizer certainly reporting acting as if this was just a completely safe vaccine there are unsafe reaction to this vaccine so she wanted to get this going okay, she was 66 years old she end up going to the ER, they didn't give her Epipen' (not clarified further) so that's when she started to get sore arm, she had an anaphylactic reaction to this drug. Now if this was the wrong number to report it to then she would call to get to agency she needed to report it to. she was on the Prednisone now. Sometimes it was difficult for she to breathe, so the emergency room they 'have' (not clear) she up with enough medication now, so she had got plenty of medication now." She stated it just happened yesterday, when she saw on the news that they had approved it to be for children and it bothers me that they, this was just a break simple drug no very safe. Yesterday when she first started getting short of her breath she was in denial and didn't want to because she was really started shorter of my breath and the pharmacist that administered he even said he knew that it was the reaction to the drug because she was full animated before he administered the vaccine because she was sitting there talking to the two ladies and you know jabbering and remember the days because of flu shots and how the government used it, they didn't wanted knowledge when people talked about how the flu shot (Unspecified Shot) made them sick and she was just jabbering so he knew it was reaction to the vaccine. Here was this lady 'who was so animated and talking and now she can barely hold her head up' (not clarified further). Patient confirmed Prednisone as treatment. As for the treatment patient stated, "Took the 2 Prednisone and what happened was, if I wasn't even going to go get Prednisone, but the shortness of breath was going transient, what I mean is first of all I talk and I do fine and

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

then all of a sudden I get short of my breath again and then looked like I had a good night and then I woke up and my lungs tightened up again and then earlier this evening I called on phone and tell them I have to take Prednisone because my breath was getting short again." Prednisone details were 10 mg 4 tablet by mouth every day for 5 days then 2 tablet every day for 3 days, so 1 every day for 2 days. As for other medications: patient stated she was on seizure medications daily. She was on treatment for asthma, she had a little inhaler she keep in her purse for eg; if there's pollen in the air, when she got out and then maybe get short of her breath if there's pollen in the air yeah she need her little inhaler, but she was on daily treatment for her seizures she was on 800 mg a day for the seizures, Zonisamide and Vimpat. In fact that day she wouldn't take any other medication because she thought well she was not taking any other medication' (not clarified further) to mix it with this vaccine. Normally she take the 25 mg for high blood pressure but she won't take it that day she think it's called Losartan or something. Little bit of high blood pressure they cut that down because her blood pressure had gotten, she had some high blood pressure yes it's called 25 mg of Losartan. Yeah she thought, she won't take it that morning because she though well just lay off all of that stuff that day and so we can take the vaccine, 'mix none of that with vaccine' (not clear), that day the only medication that she was taking was her seizure medication (Zonisamide and Vimpat) because you can't skip medication but the Losartan and Atorvastatin that's for high cholesterol she won't take that either that day. The asthma now, she did have asthma but it's a kind of that's one the things that you have it but you are not on daily medication for it. She do keep her inhaler with because sometimes she go in buildings where they have air condition on really high and it gets to her lungs. In fact when this happened and the guy wanted to call 911 we decide well let's see if new inhaler (Unspecified Medication) worked and it wasn't quite rescuing her lungs like it should." For Vimpat details patient stated, it's a pill (formulation not clarified further), it's 100 mg so she took one in the morning and one in the evening. For Zonisamide details patient stated, Each capsule was 100 mg, so she take two 100 in the morning and two 100 before she go to bed." As for lab Test patient sated, "Just

							had a MRI but no dye just the plain MRI with no dye or anything. Had MRI without dye, no dye." hen probed for the MRI result, consumer stated, "No because this was the seizure doctor ordering that." As for date of MRI patient stated, "That was on the 4th I think, but what was the MRI have to do with having a reaction to this vaccine, because the MRI. Doctor want specifically had no dyes it was just no dyes but that was the doctors that treat me for seizure he wanted the MRI done, yeah this was the 4th of May." When probed if adverse events are improved, worsened or persisting, consumer stated, "today you know just a short of the breath I am really short of my breath but now when I have taken the Prednisone I am breathing a lot better, breathing so much better yes, you can mark improve (not clarified further)." The outcome of the event shortness of breath was recovering, of other events was not recovered.
1350574	5/26/2021	TN	51	F	3/16/2021	3/30/2021	Both sides of my neck were very swollen. There was extreme pain on my right arm. The pain was severe and numbness in my finger. I went to the ER and they said I have radial thrombus, a clot in the radial artery. Before the shot, my heart was checked multiple times and I was fine. After the shot, my coronary arteries are now very small. There are now luminal changes inside my coronary arteries which are still now very small. I now have been diagnosed with CAD. I had a heart cath on March 29. My arm is still in a lot of pain. My neck is still swollen.
1350684	5/26/2021	NE	58	F	4/22/2021	5/18/2021	Patient seen in ER with pulmonary embolism , (L) lower extremity blood clot

1350702	5/26/2021	CA	31	F	5/11/2021	5/20/2021	A 31-year-old female received the first dose of mRNA Covid-19 vaccine (EW0179, Pfizer) IM on May 11th, 2021, without any reported clinical problem. Patient has no known medical illness and no previous history of DVT or PE. Patient had negative COVID-19 PCR on April 16th, 2021. She had 3 healthy pregnancies and no miscarriages. She did not have any long flights or car rides for the last several months, except for over 2 months ago. Patient denies any allergic problems, smoking tobacco or use any oral contraceptives. However, patient stated patient's father has a history of unprovoked DVT. On May 20th, 2021 patient experienced worsening of left-sided chest pain and shortness and visit ED on May 22nd, 2021. At the ED, physical examination was unremarkable. Blood tests (renal, hepatic function) were normal and labs resulted in D-dimer 0.86 mcg (FEU)/mL and platelet count 288k (Baseline of 200-250k). CT showed suspected very subtle segmental and subsegmental PE involving the left lower lobe. Duplex did not show evidence of DVT in either lower extremity. Given the family history of DVT, hypercoagulable workup was done with the following results: homocysteine level 5.5, thrombin time 14.9, negative factor II and V mutations, cardiolipin Ab IgG < 1.6 GPL (normal range < 20 GPL), lupus anticoagulant with reflex indeterminate, protein C activity 92 (normal range 70-130%) and protein S activity 67 (normal range 65-140%). Patient was admitted to the hospital. At the ED, enoxaparin 60 mg x 1 and morphine 4 mg x 1 were given. Later, it was switched to apixaban 10 mg BID on the floor and patient was discharged with apixaban 5 mg BID x 7 days and once daily BID. Patient is scheduled to follow up with her PCP in regards to the duration of therapy.

1350849	5/26/2021	TX	56	F	3/7/2021	3/29/2021	Two weeks after receiving the vaccine my legs started swelling. I went to my PCP and he measured my legs and sent me to hospital because he said that it looked like I had blood clots. While in the ER, they started performing tests, and they found a DVT in the left leg and to PE's, one on each lung. I was under observation because I was given Lovonex to thin my blood. While in the hospital the swelling started to go down and that is when I was discharged. I am now seeing a vein specialist and a pulmonary doctor. I was given Eloquis 5mg 2x per day. I am still having pain and swelling in both legs, but the leg with the DVT is worse. It is very hard to walk around because my left leg will swell a lot.
1350963	5/26/2021	CA	47	F	4/3/2021	4/15/2021	Twelve days after the vaccine I got a severe headache with blurry vision. I was also short of breath and my legs were swollen. I was dizzy and had body aches mostly on my left side. My left kidney was inflamed. The pain went all the way on the left side of my body from my ribs to my legs. My left leg was the most swollen. Many of the symptoms lasted for two and a half weeks. The headache lasted for three days. The first week was the worst. When I went to the ER after a week they did not find any blood clots. The aches pains and swelling in my legs came and went over the course of three weeks. I was very tired when the symptoms were present.

1349025	5/26/2021		30	M	4/1/2021		<p>THROMBOSIS/MORE MILD CLOT ONE IN THE LEG/BLOOD CLOT DISORDER; THROMBOCYTOPENIA; INCREASING LOWER BACK; LEG PAIN; This spontaneous report received from a company representative Via social media concerned a 30 year old male. The patient's weight, height, and medical history were not reported. The patient received Covid-19 vaccine (suspension for injection, route of admin not reported, batch number: Unknown) dose was not reported, 1 total dose was administered on 08-APR-2021 for prophylactic vaccination. The batch number was not reported. The Company was unable to perform follow-up to request batch/lot numbers. No concomitant medications were reported. On unknown date in APR-2021, the patient experienced increasing low back pain and leg pain (around one week) after vaccination. The patient was hospitalized (date unspecified) and was treated for vaccine-induced thrombotic thrombocytopenia (VITT) (coded as thrombosis and thrombocytopenia). The patient received treatment, which includes intravenous immune globulin, the anticoagulant argatroban and prednisone. Doctors stated, patient was responding well to treatment and should be released soon (discharge details unspecified). It was reported that, patient had more mild clot, and one in the leg. But certainly it was a real clot, and as patient was in his early 30's, so it was likely and could be linked to the vaccine. The action taken with covid-19 vaccine was not applicable. The patient was recovering from thrombocytopenia, thrombosis, low back pain and leg pain. This report was serious (Hospitalization Caused / Prolonged). This is a spontaneous report concerning a 30 year old male, unknown ethnicity, patient who experienced increasing low back pain and leg pain around one week after receiving the Covid-19 vaccine. The patient was hospitalized on an unspecified date and was treated for vaccine-induced thrombotic thrombocytopenia (VITT). The patient was responding well to treatment, which included intravenous immune globulin, an anticoagulant (argatroban) and prednisone. The patient's weight, height, and medical history were not reported. There is mention of patient having vaccine-induced thrombotic thrombocytopenia but information is limited in this case. A relationship with Janssen Covid-19 vaccine cannot be ruled out; thus the relationship is considered</p>

are provided in parenthesis if available): On 02-May-2021, Blood pressure measurement: low (Low) low. On 10-May-2021, Full blood count: wbc very high (High) WBC very high. On an unknown date, Full blood count: normal (normal) normal. On an unknown date, Ultrasound scan: multiple blood clots in the red area (abnormal) Multiple Blood Clots in the Red area under the injection site. The patient did not have a medical history of blood clots. On 25APR2021 the patient experienced fever, chills, and her arm hurt. On 26APR2021 her left arm hurt really bad and was swollen 1/2 inch below the injection site (3 inches wide and 4-5" long) and also had a red band wrapped around the left arm below the injection site. On 27Apr2021 the patient's entire arm from under the Injection site to her fingers became swollen and purple. The patient visited the emergency room (ER) and was told to elevate it and place ice on the area and was prescribed Advil. On 28APR2021 the patients veins were protruding, were red and hot to the touch and she experienced spider veins started going to her chest. On 30Apr2021, she went back to the ER. The doctor gave her a steroid and suggested an ultrasound. 02MAY2021 she started experiencing labored breathing, dizziness, and low blood pressure. She visited the ER again. The doctor performed an ultrasound, an EKG, a chest x-ray, and a hot scan of the heart. The ultrasound of the left arm showed multiple blood clots in the red area under the injection site. The doctor started her on Eliquis. On 10May2021 the symptoms were returning. A complete blood count (CBC) showed white blood cells (WBC) were very high but a second blood level showed, on an unknown date showed normal WBC. On 14May2021, the swelling on the arm had come down and her arm was still purple but a lighter color purple with dark protruding veins and spider veins still visible. The patient continued taking Eliquis. Most recent FOLLOW-UP information incorporated above includes: On 14-May-2021: Significant F/U Case & Email ID Add. 1349508	5/26/2021	CA	71	M	4/14/2021	4/14/2021	This is a spontaneous report from a contactable consumer(patient). A 71-year-old male patient received first dose BNT162B2 (Pfizer BioNTech COVID-19 vaccine, lot number EP7533), via an unspecified route of administration at Arm Left on 14-APR-2021 at the 71 years old at single dose for COVID-19 immunization. The medical history was ongoing Diabetes, he did have the COVID-19 virus in Dec 2020 and not ongoing, pneumonia and not ongoing. The concomitant medications were none. The Historical Vaccine was pneumonia vaccine for pneumonia immunization. There was no Prior Vaccinations within 4 weeks.The patient experienced soreness of arm after getting the dose of the vaccine in Apr2021. It happens every time he moves his arm. He went to Emergency Room last 30Apr2021 due to cough, phlegm, and congestion in Apr 2021. He tested negative for COVID. He wants to know if this is a normal side effect of the vaccine and how long it usually last and 2nd dose would be given on 12May2021.He saw that the other COVID-19 vaccine, the Johnson and Johnson COVID-19 vaccine was taken off the market because of blood clots. He reports that his arm where he received his COVID-19 vaccine injection stayed sore on 15Apr2021. It did get better but came back worse and he cant get rid of the soreness in his left arm. He's tried heating pads and everything. Its his left arm.If he moves a certain way his arm hurts. Is this something to worry about. He's read that some people who received the Johnson and Johnson vaccine had blood clots. The sore arm never actually went away but it was easier for him to put up with. Then all of a sudden it came back worse. It's not affecting him unless he moves a certain way and that's when his arm starts acting up and it started getting worse. He had gone to the emergency department recently because he was having congestion, spitting out phlegm, and a cough in Apr 2021. He was tested for the Covid 19 virus there. The doctor that saw him told him he had some other kind of virus in Apr 2021 and that the virus would take time to go away. He went to the emergency department on 30Apr2021. He received his negative Covid 19 results on 03May2021. In Apr 2021 He started feeling bad a couple days before 30Apr2021. He has had pneumonia in the past and he did not want to get pneumonia because once he gets pneumonia it's bad. The last time he's had pneumonia was about 2

years ago. He reports he has had the pneumonia vaccine. He still has the cough and it's a little bit congested but it's better. He's not spitting out the phlegm anymore so he figures it's going away. He didn't even go inside the emergency department. He had the COVID-19 virus test outside and the doctor came outside and checked his breathing and stuff and told him he had a virus but the doctor will go ahead and do the COVID-19 virus test just in case. He did not have pneumonia. When probing concomitant medications and medical history, he states he has diabetes. He does not add any medications. He does report he did have the COVID-19 virus in Dec 2020 and he was laid up for a while but his case wasn't severe. The events cough, congestion, spitting out phlegm require a visit to Emergency Room. The patient underwent lab tests and procedures, which included COVID-19 test on 30-APR-2021: Negative (He received his negative COVID-19 results on 03-May-2021). The outcome of the events cough, Phlegm, congestion was recovering, the events Pain in arm, Vaccination site pain was not recovered, the others was unknown. Information on Lot/Batch number was available. Additional information has been requested.

----------	-------	-------	---------	-----	----------	------------	--------------

19 vaccination. On 31Jan2021, the patient underwent lab test and procedures which include blood work: unknown result, did not show heart attack or blood clot, apple watch as abnormal, heart rate was 144 at rest and x-ray as normal. The patient stated that she had ER trip after vaccination. Doctor though she had an embolism and wanted to do a CT. Because of her breast cancer she wanted to avoid heavy radiation and instead she did her x-ray and blood work. On 31Jan2021, the patient experienced two cardiac events. Heart racing was major, so she went to emergency response center. Her oxygen was 90, her heart rate was 144 at rest. Second time lasted a few minutes. On the same day (31Jan201), the patient stated that both events wake her from sleep and took her breath away and also felt that dermal filling around mouth felt numb right after 1st vaccine around 20 min after which lasted a while ago. On unknown date in Feb2021, the patient experienced stroke like headpain, felt like having stroke then heart racing, fever wiped her out, rapid heart rate, chills, pain, fatigue for a few weeks. She also experienced arm felt it was beaten with a bat. These events were presented for nighttime for 2 days. The seriousness of the events considered as disability and the event arm felt like it was beaten with a bat was assessed as non-serious. Therapeutic measures such as heated blanket was taken to chills and fever. The patient took treatment medication such Tylenol, Xanax to slow heart rate and electrolytes for the resulted events. The outcome of the events was recovered for all events in Feb2021 and unknown for the event arm felt like it was beaten with a bat.

1349588	5/26/2021	FL	78	M	2/27/2021	3/12/2021	<p>Pulmonary embolism; DVT; This is a spontaneous report from a contactable nurse (patient's wife). A 78-year-old male patient received the first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EN6201; Expiration Date: 30Jun2021), via an unspecified route of administration on 27Feb2021 (at the age of 78-year-old) as single dose for COVID-19 immunization. Medical history included diabetes mellitus, Liver cirrhosis, thrombocytopenia, kidney stone, sarcoidosis, blood pressure (unspecified condition) and high cholesterol and a pacemaker (cardiac pacemaker insertion). Concomitant medications included insulin (manufacturer unknown), simvastatin (manufacturer unknown), hydrochlorothiazide (manufacturer unknown), carvedilol (COREG) taken for blood pressure, and omeprazole (PROTONIX). On 12Mar2021, the patient developed pulmonary embolism and DVT (deep vein thrombosis) that requiring a hospitalization on 12Mar2021. The nurse reported, "He went into the hospital 12Mar2021 that's when they find out he had pulmonary embolism and DVT. They putted the IVC filter for blood clot." On 12Mar2021, the patient was hospitalized for pulmonary embolism and DVT. Therapeutic measures were taken as a result of pulmonary embolism and DVT. The clinical outcome of the events pulmonary embolism and DVT was unknown. Additional information has been requested and will be provided as it becomes available.; Sender's Comments: Based on available information and known drug profile it is unlikely that the reported pulmonary embolism and DVT (deep vein thrombosis) were causally related to BNT162b2. These are intercurrent medical conditions. Case will be reassessed if additional information is received. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.;Linked Report(s) : US-PFIZER INC-2021528357 same patient/reporter, different vaccine dose with different events separated by time gap.</p>

1349617	5/26/2021	PA		F	4/19/2021	4/1/2021	Chills; sick; Fever; hard for me to walk; Atrial fibrillation; blood clot in her finger; thumb right now is real cold; the tip of my thumb is numb; tip was numb and real cold- there was no circulation going on; Irregular heartbeat; Blood pressure high; Headache; Muscle ache; This is a spontaneous report from a contactable consumer, the patient, via the Pfizer-sponsored program. A female patient of an unspecified age received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot: Unknown), via an unspecified route of administration on 19Apr2021 as a single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. The patient previously received the first dose BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) on 19Mar2021 for COVID-19 immunization and felt fine (no adverse event). On an unspecified date in Apr2021, four days after the second vaccination, the patient was sick for seven days with chills. On an unspecified date in 2021, the patient had terrible side effects such as muscle ache and fever ("99 something") for 7 days. On an unspecified date in 2021, the patient experienced headache, blood pressure high, irregular heartbeat, atrial fibrillation and the calf was "real bad"- it was hard for the patient to walk. The patient called her doctor and got tested for COVID-19 two weeks after the vaccination, in May2021, with negative results. The doctor stated that the patient got so sick from the shot. On an unspecified date in 2021, the patient's thumb was like a blood clot to the thumb (blood clot in her finger), the tip was numb and real cold- there was no circulation going on. The patient went to the emergency room where an ultrasound was performed on the arm to see if there were any blood clots in there, with unknown results. The patient was treated with an unspecified "pill" for irregular heartbeat. The patient was scheduled for an echocardiogram and heart monitor. The clinical outcome of atrial fibrillation, blood clot in her finger, thumb right now is real cold, the tip of my thumb is numb, "tip was numb and real cold- there was no circulation going on", irregular heartbeat, blood pressure high, headache, muscle ache, chills, sick, fever, "hard for me to walk" was unknown. Information on the lot/batch number has been requested

1349543	5/26/2021		49	F	4/29/2021	5/3/2021	acute DVT of left peroneal vein (in the left calf); This is a spontaneous report from a non-contactable consumer (patient). This 49-year-old female patient (not pregnant) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number not provided), via an unknown route, on 29Apr2021 11:30 (at the age of 49-year-old) at single dose in the left arm for COVID-19 immunisation. No relevant medical history was provided. No other vaccine was received in four weeks. Relevant concomitant medications included ibuprofen (ADVIL 12 HOUR). From 03May2021, the patient developed sharp, piercing pain in my left calf over several days. The frequency increased the early morning (06:00-09:00) of 09May2021 so she contacted her primary care physician to discuss what she thought might be an indicator of deep vein thrombosis (DVT). She presented to the Emergency Room the morning of 09May2021 and was diagnosed with acute DVT of left peroneal vein (in the left calf). She was given blood thinner. Pre-vaccination and post-vaccination COVID tests were not performed. The patient was recovering from the events. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

1349560	5/26/2021	IL	66	M	4/20/2021	5/9/2021	Pinched middle finger, got a 1/4 diameter blood clot under skin.; This is a spontaneous report from a contactable consumer (patient). A 66-years-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in arm left on 20Apr2021 12:00 (Batch/Lot Number: er8735) as single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. Patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. No other medications the patient received within 2 weeks of vaccination. Prior to vaccination, patient was not diagnosed with COVID-19. Since the vaccination, patient has been tested for COVID-19. The most recent COVID-19 vaccine was administered in facility. The patient experienced pinched middle finger, got a 1/4 diameter blood clot under skin on 09May2021 13:00. Patient was scheduled to go there tomorrow for the second dose. Had an accident yesterday and pinched the right middle finger. Usually when that happens, he gets a boil and it fills with a clear liquid pus. This time, it turned into a giant blood clot, well not giant but about a quarter inch in diameter in the tip of his finger. He has never had that happen before. He may have never damaged his finger in that way before. That is why it turned into a blood clot and not clear fluid. Patient was worried a little with the blood clot because he knew it has been an issue. When he first got a little worried about the blood clot, he thought he would take 2 aspirin and it might thin the blood a little bit. Patient ate some pineapple because he heard that was a blood thinner too. No treatment received for event. The patient underwent lab tests and procedures which included nasal swab: negative on 10Jun2020. Outcome of the event was unknown. Information on lot/batch number was available. Additional information has been requested.

							right calf, non-occipital was recovered in Apr2021. Since the vaccination, the patient had not been tested for COVID-19. Follow-up needed, further information has been requested.
1352154	5/26/2021	MD	47	M	4/20/2021	4/28/2021	The Covid vaccine was given April 20 of 21 within eight days of having the vaccine I started to develop shortness of breath fatigue chest pain, I ended up at our local emergency room and was admitted with pulmonary embolism, blood clots in both lungs I stayed a total of three days hospitalized.
1352115	5/26/2021	CA	42	F	5/8/2021	5/10/2021	1 day after shot I had flu symptoms and was basically out of the whole day. 2 days after my fever cleared and I noticed a pain in my left leg calf. I thought it was because of my shot but that it was just body aches. The pain increased and eventually spread to my inside thigh. I went to the urgent care on 5/17/21 and an ultrasound discovered blood clots (Deep Vein Thrombosis) Please note that I also had traveled 5 hours on a flight on 5/6/21 but I was stretching on the flight and have never had a DVT before.

1351683	5/26/2021	CA	65	F	1/19/2021	1/26/2021	Dose 1 - 1/19/21 - On 1/26/21, I got developed a bad case of SOB. I called my cardiologist and she told me to get tested for COVID. I went to the county facility to get tested and it took 3 days for results, which finally came back negative. During my wait, I went to a Urgent care and they did a Chest Xray, EKG and another COVID test, which was negative and the other tests were normal. I was sent back to cardiologist. She scheduled a stress test on 2/11 and everything was fine. I was also feeling fine by then. Dose 2 - 2/16/21 - The next day, I had a headache, aches, pain, fever and basically felt like I had the flu. I took Tylenol and that lasted about 36 hours. On 2/25, I was doing my 2 mile walk and I start experiencing the SOB again. So, I relaxed and figured it would go away. On 3/1, we drove to a park and back home 3 days later. On 3/3, I was really exhausted, so I took a nap for 3 hours and awakened with calf pain and a low grade fever. That lasted for 3 days, so I went to the ER on 3/6. They did an ultrasound on my leg and found a DVT in my right leg. They did CT Scan of my lung and found several clots (pulmonary emboli). I was in the hospital overnight and put me on a blood thinner, Eliquis 5mg, twice a day. Since then, I've continued to take the Eliquis and I'm following up with a hematologist on June 21. The hematologist has already tested me for two factors came negative and he will test me for the third one at my next visit.
1351668	5/26/2021	NV	46	F	4/20/2021	4/26/2021	Extreme aching in the arm for 5 weeks. So much it's painful. At my second dose, May 11th, I informed the tech that my arm still hurt from the first dose which she replied, "that is odd. we'll just do the injection in your other arm". I went another week in pain before calling my dr to inform him of the pain. They took my information over the phone and asked me to keep them updated. Two days ago was just too much pain to bear so i went to the pharmacy and spoke with the pharmacist. she suggested i get an X-ray. I called my dr and yesterday went it to have it checked out. they did an X-ray and found nothing out of the normal. they also ruled out a blood clot since i didn't have any of the symptoms.

1351549	5/26/2021	FL	58	M	4/20/2021	5/11/2021	after receiving the vaccine 4/20 and three weeks later I couldn't breath and called 911 and went to hospital and diagnosed with pericarditis. But the day before I felt like I had a fractured rib and it intensified that evening and I took pain medication, then the pain in the left side intensified and I could not breath it felt like a knife piercing and had to breath with very shallow breath into my upper chest and the pain was so intense. I called 911 and they did an EKG, my heart rate went down to 30. One doctor gave me morphine to help me, they did test to check for blood clots and EKG's and blood test. I was also given Oxycodone. Test showed that there was a virus that got into it that caused pericarditis. I'm taking Ibuprofen and anti-inflammatories to help. I'm very active and never had health issues and believe this was a response to the vaccine. First dose was given on 3/23/2021 Lot 047A21A and experienced Molluscum contagion a few days later, and this is a virus. I was prescribe a topical cream, Imiquimod a topical cream to put on it to break down the virus. Triamcinolone Acetonide cream was prescribed later and I'm still taking it now and the site was oozing puss and bleeding.
1351506	5/26/2021	KY	36	F	4/7/2021	4/28/2021	I was taking a shower the night of 04/28/21 and I had a bad pain in my right leg. It felt like it could be a blood clot. The area was swollen and I was in a lot of pain. My blood pressure started getting high and it kept going up. On the way to the hospital, I started getting a headache and shortness of breath. I tried to elevate my leg on the way there. I took an aspirin. I had to sit in the waiting room for 2 1/2 hours and my pain in my leg and headache continued. Once I was taken back, they ran a few tests. I was told that my D-Dimer was elevated which indicates a blood clot. I was checked for a pulmonary embolism and that was negative. I was given a blood thinner because an ultrasound technician was not on duty. I went home at 4 am. I went back for an ultrasound the next day for my entire leg. Everything came back normal. The pain slowly went away.
1351485	5/26/2021	NJ	42	F	4/12/2021	4/25/2021	About two weeks later, I started to get a headache. The pain was massive and it was on one side of my head. I thought I was having a stoke. I took Excedrin and went to sleep and woke up and it was a vain popping out of my head. I had blood clot in my leg.

1351400	5/26/2021	MN	67	F	5/18/2021	5/25/2021	was at work inside in air conditioning on 5/25/2021 when she noticed she had blurry vision and felt dizzy. called PHN who referred her to call her doctor or go to the emergency room as these could be signs of a blood clot. PHN spoke with on 5/26/2021 and informed PHN that she went home yesterday from work and declined to go to an emergency room or doctor's office, as she has not seen a doctor in the last 10 years. was offered rides from friends and coworkers to a hospital or clinic, but declined. She went home and drank a lot of water, ate some bananas and sat still. She felt better after and that and has not had any reoccurring symptoms. See CONTINUATION PAGE. PHN expressed continued concern for her and recommended considering going to an emergency room or contacting a doctor. PHN reiterated that if she has another episode like that she should go to the hospital or clinic to be checked out.
1351364	5/26/2021	NY	65	F	4/6/2021	4/6/2021	pt stated about 4 hours after taking the vax she had a terrible headache. pt laid down but when she got up she had very sharp pains shooting from her toes up to her legs. pt said she had a stabbing pain in her left mid thigh. This episode lasted about 15 minutes. the next day she went to a routine exam but her PCP did not seem to think there was anything to worry about. pt had to have blood test 10 days later. She stated she was so tired she could barely get to the lab to get the test. The following weekend on 5/17/2021 she started having SOB and a coughing spell. On 5/19/21 she called to make an appt w/ PCP on 5/21/21. She saw a different physician and she was ordered a D-Dimer test. On 5/22/21 the pt got a phone call stating she needed to get to an Emergency Room since the lab test proved she had a blood clot. She went to ER. They did a US Doppler and CT of lungs. She had 2 pulmonary thrombosis. One in left lung and one in right lung. She had one DVT in left calf. Pt was admitted. She was given heparin IV for 3 days. She was then put on Xarelto and discharged on 5/25/2021. she has to take Xarelto for 90 days and scheduled to have another US on 7/19/2021 to see if the clots are dissolved.
1352386	5/26/2021	ME	46	F	4/30/2021	5/25/2021	Extremely heavy bleeding and clots in period

1347141	5/25/2021	CA	41	F	5/18/2021	5/22/2021	Heavy menstrual cycle bleeding; discharged was gushy and with clots.
1346767	5/25/2021	OH	63	F	4/8/2021	5/17/2021	Patient presents with 7 day history of shortness of breath. Ct angiogram showed multiple pulmonary embolism with ventricular strain. Patient required EKOS procedure for clot dissolution and bridging from Lovenox to warfarin.
1346484	5/25/2021	VA	63	M	5/1/2021	5/8/2021	<p>He got his vaccine, he had no reactions. The next morning he woke up his arm was sore, and it was that was for 2 days. Then his breathing starting getting worse. He started coughing, couldn't lay down, could not sleep due to that. He went to the ER and they told him that there was nothing wrong and that it was just allergies. They told him to go home and take some OTC cold medicine and that everything would be okay. A week later he went to another ER for the same thing as he continued not to be able to breath, they did a bunch of tests and said that nothing was wrong and that it was just a call. He then went to Hospital ER and they released him stating it had just a cold. He then called his cardiologist and they told him to go back to Hospital, was admitted on 5/11/21 and they did more tests and said that he had a blood clot in his left lung and said that it had nothing to do with the vaccine. He was discharged on 5/13/21. They put him on Heparin while in the hospital and sent him home as a disgruntled patient. They also told him that he had fluid around his heart and gave him medicine to get that taken away. They sent him home on Lasix and Eliquis. He then went to another hospital on Friday 5/14/21 as he was going crazy about the blood clot and went there and was kept there for 3 days and discharged on 5/16/21 with the same medications, Lasix and Eliquis. He was also told that he had fluid around his heart again. Before the vaccine he was very healthy, and was able to jog around his neighborhood and now he's not able to do so, and they told him that he was now having heart failure and is having trouble breathing because his heart is swelling up. He went to see his cardiologist last Friday and that's when she told him about his heart failure.</p> <p>ADMISSIONS: ADMITTED 5/11/21 TO 5/13/21; 5/14/21 to 5/16/21.</p>

1346571	5/25/2021		74	F	3/9/2021	4/22/2021	Patient went to the ED on 5/22/21. She had been having pain and swelling in her R lower extremity for approximately 1 month prior. She was diagnosed with a deep vein thrombosis. She did not have any other known risk factors for DVT.
1346600	5/25/2021	GA	31	F	4/3/2021	4/6/2021	The Tuesday after vaccination, I had physical discomfort and pain inside like period cramps. It felt like there was a tampon inserted weirdly, I tried a yeast infection solution with yogurt on a tampon. Later that week I had pelvic bone pain like I had strained to hard using the bathroom. Friday I got a hyper sensitive spot on upper right thigh, diagnosed as paresthesia, the swelling and discomfort around pelvis was still there. Saturday the swelling and discomfort on the insides started going down, both legs experienced pain, It felt as if I had done a workout and pulled my muscle. I typically have a high threshold for pain, No change on Sunday. Monday the back of right knee stated aching, sensitivity in left thigh. Both muscles on outside of legs felt like I had done a workout and needed stretched, On the 13th the aching traveled from the back of knees to calves I went to the Hospital. Myalgia and paresthesia and acute vaginitis. Shot of Toradol in left arm, which did nothing. Did ultrasound with normal results, no blood clots. The 14th my legs were comfortable as long as I was moving, started having a sharp stinging in left calf. The soles of my feet felt blistered but no visible blisters. Significant headache. I wore compression socks. I got a weird Charlie horse in left foot toes, top of right foot got really sensitive also. Volotal is a topical pain cream that I had I used it on specific areas, of pain. Thursday the 15th the left outside of my foot was still sore, my calves had gotten better, the outside of the calf still had hypersensitivity. The muscles on the back of my knee's and calves were still sore. While driving my Hip and thighs for aching. Ankles are popping a lot. Fri-Sun following I had leg stiffening and muscle soreness mainly in the left side, went for a walk that weekend and while walking they felt ok, until I stopped walking. Mon-tue after I had a headache that felt like my brain was burning near the left temple area.

1346653	5/25/2021	FL	51	F	4/25/2021	4/27/2021	On and off numbness and tingling in my left arm and hand (primarily) and also in my right hand (a few times) during the day for about 3 weeks. Involuntary movements in my fingers in both hands. My arms and hands still fall asleep at night and this did not happen to me before except on some rare occasion that I slept on my hand or arm. I have been awoken by a limb that is asleep about 4 times since my vaccine. Intermittent headaches for about two week after the vaccine and a very unusual, heavy and somewhat painful period with several large clots the size of a half dollar and lasting much longer than a normal period. I felt dizzy and lightheaded for about a day. I have never had these kinds of periods before.
1346717	5/25/2021	FL	30	F	5/21/2021	5/21/2021	Adverse events experienced and are they still occurring now: Patient called in stating she received the vaccine on Friday 5/21/21 @10:30 am and later she started to experience soreness at the injection site and about the evening time at 6pm she felt nauseous and started throwing up shortly after. She vomited about 5-6 times on Friday night. Saturday morning she woke up with soreness of the body in neck, shoulder body (extreme body aches), fever also started on Saturday. Patient also c/o headache, rash on left wrist (only area), and she also feels fatigued, and chills. **Patient does have a history of blood clots and anemia** She stated as of Monday 5/24/21 @7:26pm she had a fever in the day but that subsided after taking Tylenol. Last time the patient took Tylenol was on 5/24/21 at 2pm.

1346784	5/25/2021	CO	45	F	4/12/2021	4/17/2021	I experienced chest pain/pressure, shortness of breath, rapid/irregular heartbeat approximately 5 days after receiving my first dose of the Moderna shot. I had been exercising outdoors (as I normally do) when it came on. It subsided some and returned in intensity the following day following a long walk. It was mostly mild pain and pressure during the week. However, on 4/24, following exercise, I had pronounced symptoms and acknowledged that I needed to go to the emergency room, as I thought I was having a heart attack. They admitted me and ran various heart tests and ruled out a heart attack or blood clot.
1346790	5/25/2021		24	F	5/11/2021	5/20/2021	I got the second dose of the vaccine on May 11th 2020. I am currently on my second week for completing the vaccine. When it all started I was just laying down on my couch watching Netflix with my laptop on my lap (this was Thursday night, May 20th). My leg fell asleep but I didn't think anything of it because once I started walking around it went back fine. However, On May 21st, Friday morning I was having serious pain in my left thigh. I believed it was a muscle strain. I did a cold compress, warm bath and took Tylenol from Friday to Saturday. I thought it got better but however by May 23rd, Sunday night I was incapable of walking on my own and needed assistance just to go to the bathroom. On May 24th I went to Urgent Care and they stated that I may have a blood clot so I went to the ER. While at the ER they stated I had a massive blood clot that would need a procedure done to remove it and was later admitted into the hospital and scheduled for the procedure. The blood clot travels from my groin to my ankle on my left thigh. They stated the reason for my blood clot would of been because of my birth control. And it's possible reaction to me also taking the Pfizer vaccine. I have been on birth control for over 5 years and have not had any problems until now. I also do not have any history or family history of blood clots. I did not hit my thigh or have done any exercises for this to occur.
1346853	5/25/2021	WA	46	F	5/7/2021	5/23/2021	2 weeks after receiving johnson and johnson vaccine I began a second period in one month. I am very regular with my menstrual cycle so it was weird. And what is very strange it has large clots and not alot of bleeding. I have never had an period like that since I am 11 years old.

1346862	5/25/2021	CA	41	F	4/15/2021	4/21/2021	On 4/16-4/18 minor soreness and fatigue that temporarily disappeared. Then on 4/21, I experienced High Fever (103.8), Body aches, headache, extreme fatigue that lasted through Monday 4/26. Through that time I went and got a Covid test on Friday 4/23 and it came back negative. On Thursday 4/29, I started having pain on the right upper side of my abdomen. Friday evening, the pain grew even more intense which I could not lay down to sleep and no pain meds were taking it away. Saturday, 4/30 at 6 am ended up in ER at Facility. They were testing me for blood clots due to the chest pain and sever right side pain and the results showed no blood clots and my heart was fine. CT scan showed pneumonia, scarring in my lungs and a nodule growth on my lung. The doctor asked me if I was in the dessert recently if I had ever had valley fever. Valley Fever came back negative, another Covid 19 test came back negative. I completed taking 2 antibiotics and now on 5/25 (day 40) I am still feeling bouts of fatigue, wheezing in my lung and pain in my lung. I was healthy prior to getting the 2nd dose of Moderna and can't help but feel the vaccine triggered something in my system. Reporting this just in case it is an adverse effect from the vaccine.
1346470	5/25/2021	IL	27	F	4/8/2021	4/29/2021	Three weeks after J& J vaccine abnormally heavy vaginal bleeding with large clots.
1347136	5/25/2021	KS	30	F	4/29/2021	5/6/2021	Flu-like symptoms for the first 3 days: fever, chills, body aches, headache, itchy skin, pain in injection site (left arm). A few days later I started my period. It was irregular with severe PMS, panic attacks, anxiety and depression, severe cramping, more bleeding and blood clots than usual, period lasted longer than usual. Every day since I have been having PMS symptoms (anxiety, depression, panic attacks) and cramping. The cramping feels like period cramps but I am no longer on my period. The cramps last all day long and are not going away. I also had severe eye pain in my right eye about 1 week after the injection. The pain lasted for about 2 days, and was a throbbing pain behind my eyeball. I have never experienced any issues with my eyes before. I also had covid January 2021 and did not experience any of these symptoms then.

1345674	5/25/2021	NJ	62	F	4/1/2021		<p>COMPUTERISED TOMOGRAM; ELECTROCARDIOGRAM; LABORATORY TEST; PULMONARY EMBOLISM; X-RAY; PAIN ON THE RIGHT-HAND SIDE UNDER MY RIBS; MYALGIA; ULTRASOUND SCAN; LUNG COLLAPSED; FLUID IN THE BOTTOM OF HER LUNG; This spontaneous report received from a patient via Regulatory Authority VAERS (Vaccine Adverse Event Reporting System) and concerned a 62-year-old female patient. The patient's height, and weight were not reported. The patient's concurrent conditions included depression, and penicillin allergy. The patient had no current illness. The patient had no heart problems, no pulmonary problem and diabetes. The patient experienced drug allergy when treated with paracetamol. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, intramuscular, batch number: 206A21A expiry: UNKNOWN) dose was not reported, 1 total, administered on 11-APR-2021 to left arm for prophylactic vaccination. Concomitant medications included levomilnacipran hydrochloride for depression, and quetiapine fumarate for depression. On an unspecified date in APR/2021, little more than a week after single-dose coronavirus vaccine at hospital facility the patient felt general malaise and minor pain in her right side. The patient had shortness of breath, and she looked anxious and her heart rate was very fast. The vital signs were not stable. The physician suspected that patient had developed pulmonary embolism blood clots in her lungs. When combined with her vitals, the doctor knew it was an emergency. The patient also began to feel mildly ill. She was experienced general malaise, soreness on her right side, and while she was not struggling to breathe, it hurt when she took a deep breath, her right-hand side, like under her ribs, she felt some pain. It was not a bad pain, not enough to take anything for it but just noticed it. The symptoms seemed minor, and at the time. It was reported that by 21-APR-2021, she still was not feeling well and decided to make an appointment at the urgent care center. The patient visited emergency room or department/urgent care facility for treatment of the events. The patient soon learned she had developed blood clots (pulmonary embolism) in both lungs due to the vaccine, a doctor at the hospital told her. One of her lungs also had collapsed. She had developed blood clots in both lungs</p>

due to the vaccine, she was there for 10 hours (undergoing tests). The patient underwent a computerized tomography scan and an X-ray. They did everything and got the results of the CAT scan, with pulmonary embolism in both lungs. They immediately gave her some blood thinner and was as hospitalized (date unspecified). It was reported that she would spend five days in the hospital. According to the doctors this was from the vaccine. The patient was also experiencing the pain on the right-hand side and also started getting myalgia, muscle aches just in different parts of her body. The patient's legs also felt weird. So they rushed her down and gave a sonogram in her legs to check for deep vein thrombosis. The pain on her right side grew worse for a day or two, and she was treated with morphine. The doctors surmised the patient had fluid in the bottom of her lung, which her body eventually absorbed. The patient was still on a blood thinner and continued to recover. Laboratory data included: Heart rate (NR: not provided) very fast, and Sonogram (NR: not provided) Not provided. On an unspecified date in APR-2021, Laboratory data included: Computerised tomogram (NR: not provided) pulmonary embolisms in both lungs, Electrocardiogram (NR: not provided) Not provided, Laboratory test (NR: not provided) Not provided, Ultrasound scan (NR: not provided) Not provided, and X-ray (NR: not provided) Not provided. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient was recovering from pulmonary embolism, had not recovered from computerised tomogram, electrocardiogram, laboratory test, ultrasound scan, and x-ray, and the outcome of myalgia, fluid in the bottom of her lung, lung collapsed and pain on the right-hand side under my ribs was not reported. This report was serious (Hospitalization Caused / Prolonged, and Other Medically Important Condition). Additional information was received from company representative via social media on 18-MAY-2021. The following information was updated and incorporated into the case narrative: patient's city added, events added (pain on the right-hand side under my ribs, myalgia, lung collapsed, fluid in the bottom of her lung), CT scan result updated, lab data updated (Heart rate and Sonogram).; Sender's Comments: V1: The follow up information in this version updates Patient's city, events (pain on the right-hand side under my ribs,

MALNUTRITION (protein calorie malnutrition), HYPERURICAEMIA (Hyperuricemia), HYPERPHOSPHATAEMIA (Hyperphosphatemia), HYPONATRAEMIA (Hyponatremia), ANAEMIA (Anemia), CHEST PAIN (Substernal chest pain aggravated), WAIST CIRCUMFERENCE INCREASED (increasing abdominal girth), ABDOMINAL PAIN (Abdominal Pain), ASTHENIA (Weakness) and NAUSEA (Nausea). The patient was hospitalized on 09-Mar-2021 due to DYSPNOEA and LETHARGY. The patient died on 13-Mar-2021. The reported cause of death was Multiorgan failure. It is unknown if an autopsy was performed. At the time of death, DYSPNOEA (Shortness of breath increasing), LETHARGY (lethargy), HYPERKALAEMIA (Hyperkalemia), ACUTE KIDNEY INJURY (Acute kidney injury), METABOLIC ENCEPHALOPATHY (metabolic encephalopathy), AZOTAEMIA (Uremia), METABOLIC ACIDOSIS (metabolic acidosis), MALNUTRITION (protein calorie malnutrition), HYPERURICAEMIA (Hyperuricemia), HYPERPHOSPHATAEMIA (Hyperphosphatemia), HYPONATRAEMIA (Hyponatremia), ANAEMIA (Anemia), CHEST PAIN (Substernal chest pain aggravated), WAIST CIRCUMFERENCE INCREASED (increasing abdominal girth), ABDOMINAL PAIN (Abdominal Pain), ASTHENIA (Weakness) and NAUSEA (Nausea) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 12-Mar-2021, Blood culture: negative (Negative) Negative. On 12-Mar-2021, Blood gases: abnormal (abnormal) Compensated mixed respiratory and Metabolic alkalosis. On 12-Mar-2021, Blood pressure measurement: 96/52 (Inconclusive) 96/52 mmHg, 100/50 (Inconclusive) 100/50 mmHg and 88/58 (Inconclusive) 88/58 mmHg. On 12-Mar-2021, Blood test: normal (normal) WBC-2.9 Normal, Hg-Normal, Platelet count-Normal. On 12-Mar-2021, Body temperature: 36.1 (Inconclusive) 36.1degrees Celsius, 35.9 (Inconclusive) 35.9 degrees Celsius and 36.2 (Inconclusive) 36.2degrees Celsius. On 12-Mar-2021, Brain natriuretic peptide: normal (normal) normal. On 12-Mar-2021, Chest X-ray: normal (normal) No acute thoracic pathology. On 12-Mar-2021, Computerised tomogram: abnormal (abnormal) revealed a right sided pleural effusion bony metastatic disease and hepatic metastatic disease, as

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

well as small amount of ascites in the upper abdomen. On 12-Mar-2021, Echocardiogram: inconclusive (Inconclusive) Ejection fraction 60-65% and otherwise no significant findings. On 12-Mar-2021, Heart rate: 92 heart beats per minute (Inconclusive) 92, 86 heart beats per minute (Inconclusive) 86 and 90 heart beats per minute (Inconclusive) 90. On 12-Mar-2021, Oxygen saturation: 96 (Inconclusive) 96 percent, 93 (Inconclusive) 93 percent and 98 (Inconclusive) 98 percent. On 12-Mar-2021, Prothrombin time: normal (normal) normal. On 12-Mar-2021, Respiratory rate: 16 (Inconclusive) breaths per minute, 18 (Inconclusive) breaths per minute and 19 (Inconclusive) breaths per minute. On 12-Mar-2021, SARS-CoV-2 test: negative (Negative) Negative. On 12-Mar-2021, Troponin: normal (normal) normal. On 12-Mar-2021, Urine analysis: normal (normal) normal. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter considered MULTIPLE ORGAN DYSFUNCTION SYNDROME (multiorgan failure), DYSPNOEA (Shortness of breath increasing), LETHARGY (lethargy), HYPERKALAEMIA (Hyperkalemia), METABOLIC ENCEPHALOPATHY (metabolic encephalopathy), AZOTAEMIA (Uremia), METABOLIC ACIDOSIS (metabolic acidosis), MALNUTRITION (protein calorie malnutrition), HYPERURICAEMIA (Hyperuricemia), HYPERPHOSPHATAEMIA (Hyperphosphatemia), HYPONATRAEMIA (Hyponatremia), ANAEMIA (Anemia), CHEST PAIN (Substernal chest pain aggravated), WAIST CIRCUMFERENCE INCREASED (increasing abdominal girth), ABDOMINAL PAIN (Abdominal Pain), ASTHENIA (Weakness) and NAUSEA (Nausea) to be possibly related. No further causality assessment was provided for ACUTE KIDNEY INJURY (Acute kidney injury). Concomitant medications were not provided. Treatment for the events included proton pump inhibitors, oxygen, Tylenol, and comfort care. Company comment: Based on current available information and the temporal association between product use and the start date of the events a causal relationship cannot be excluded.; Sender's Comments: Based on current available information and the temporal association between product use and the start date of the events a causal relationship cannot be excluded.; Reported Cause(s) of Death: multiorgan failure

1347829	5/25/2021	HI	43	F	3/23/2021	3/24/2021	Janssen COVID-19 Vaccine EUA I got the vaccine the evening of 03/23/21. Overnight I noticed my body starting to hurt and felt chills. The morning of 03/24/21 I woke up with full body aches, chills, and fever over 100 F. These symptoms lasted all day. Fever went up to 102 F. Recently I have noticed a change in my menses since having the vaccine and I wonder if it is linked. I have been on birth control since last year to control heavy bleeding. It was helping very well. The period I had in April and May were like it was before I started the pill. It was heavy and I had numerous large clots. I will be scheduling an appt with my ob/gyn regarding this change.

1347505	5/25/2021	PA	50	F	4/9/2021	4/20/2021	4/20/21 5:57 PM Patient contacted RN 4/20/21 6:24 PM Note Developed cough, chest heaviness, and headache today. Midsternal chest heaviness has been present all day. Uses symbicort inhaler daily. Has not relieved Sx. Denies trouble breathing. Will go to ED for evaluation. Reason for Disposition ? SEVERE or constant chest pain or pressure (Exception: mild central chest pain, present only when coughing) Protocols used: CORONAVIRUS (COVID-19) DIAGNOSED OR SUSPECTED-A-AH ED Discharged 4/20/2021 (46 minutes) Treatment team Providers Additional Orders and Documentation Results Meds Orders Flowsheets Encounter Info: History, Allergies, Detailed Report, Vitals Media From this encounter EKG-Encounter - Scan on 4/21/2021 5:06 AM ED Discharged 4/25/2021 (1 hours) Last attending ? Treatment team COVID-19 Clinical impression Shortness of Breath Chief complaint ED Provider Notes (Resident) ? ? Emergency Medicine Cosigned by: DO at 4/25/2021 9:27 PM Expand AllCollapse All ED PROVIDER NOTE Patient: MRN: This note was partially completed using voice recognition technology, and was scanned for gross errors; however some errors may still exist. Please contact the author with any questions or requests for clarification. CC/HPI Patient is a 50 y.o. female presenting to the ED with chief complaint of persistent cough and shortness of breath in the setting of Covid infection. This is a patient with pertinent medical history of asthma. Patient comes in for evaluation today mainly concerned that her asthma medications have not been helping with her breathing ever since being diagnosed with Covid. She was diagnosed about a week ago. She is not having some mild fevers as well as general achiness and fatigue. She is most concerned because she has been having persistent cough and some shortness of breath particularly over the past couple days. She is compliant with her daily Symbicort but has also been using her albuterol inhaler quite frequently. She reports she usually does not have to use her albuterol inhaler nearly as much. She also reports some lightheadedness which is mainly associated with position changes when she gets out of bed too quickly. Patient otherwise denies any previous history of blood clots; she has not had any recent calf swelling/tenderness. She feels that the shortness of breath has been progressively gotten worse

1347569	5/25/2021		72	F	3/1/2021	3/2/2021	3/2 MHC, admitted day after covid vaccine with arterial clot. Patient seen for left lower extremity arterial occlusion with critical limb ischemia. The patient was transferred immediately post-operatively to the Progressive Care Unit for observation. The next morning the patient was discharged home with stable vital signs, clean, dry, and intact wounds, good pain control, and vascular exam of +BLE PT and DP doppler signals.
1347697	5/25/2021	NY	40	F	4/17/2021	5/14/2021	Blood Clots (2 PE in right lung) Chills Memory Loss Numbness in limbs Tingling in limbs Muscle weakness Rapid Heart Beat
1347702	5/25/2021	OH	68	F	5/5/2021	5/6/2021	On 05/05/2021 Pt received the Pfizer vaccine. The next day she got chills, headache, muscle aches. These symptoms lasted until 05/08/2021. "I was feeling much better and started working in my garden, suddenly I felt on my right calf, and I noticed a "big knot". Daughter of the patient took her to the ER on 05/08/2020, where she was scheduled to a diagnostic test on 05/12/2021. On May 12, pt also received the phone call of her PCP, who diagnosed her over the phone: "blood clot" and prescribed her with Xarelto (Rivaroxaban), a blood thinner. A doppler test was performed to the patient that day and a blood clot was found. On May 21 Pt had an appt with her PCP, and PCP advised to report this to the CHD. Pt currently walks with a cane. her next appt is with an Hematologist to find out for how long she will be taking blood thinners.

1347719	5/25/2021	MD	60	F	5/15/2021	5/18/2021	05/15/2021 1300: Received first dose of Moderna COVID vaccine. No issues. 05/16/2021: No issues. 05/17/2021: No issues. 05/18/2021 0800: Some occasional vision blurriness as if my reading/computer glasses were smudged. I kept wiping my glasses all day. That evening, I was anxious and unable to settle down. I did not go to bed until 1:00 AM. 05/19/2021 0500: Brief strange chest sensation (not pain; not pressure; just a strange sensation). 05/19/2021 0800: Dizziness and more noticeable blurred vision which continued throughout the day. 1st BP at home 122/81 2nd BP at home 117/77 05/19/2021 0940: Brief strange chest sensation (not pain; not pressure; just a strange sensation) while driving to doctor's office. 05/19/2021 1015: I happened to have scheduled an annual wellness visit for May 19 at 10:15 AM with a new primary care physician because my previous PCP (in the same practice) has been on a very long medical leave of absence. I was dizzy and having some balance problems walking from the parking lot to the office. 1st BP 143/88 Temperature 97.2 Weight 222.1 EKG good 2nd BP 130/76 Heart: soft murmur Thyroid: symmetrical The blurred vision and dizziness were getting much worse during my appointment. Dr. said he thought the symptoms were likely a side effect of the vaccine but wanted to order an MRI to make sure my brain was OK. Dr. arranged a same day appointment at a Clinic for 3:00 PM. Dr. advised me to rest, stay well hydrated, and not skip meals. My balance was very bad leaving the office and remained bad for about 6 hours. Dr. called me with the results of the MRI and said there was no stroke or clot, and that he thought the symptoms would slowly dissipate. 05/20/2021 0800: I woke up with ringing in my left ear that sounded like a combination of soft static coupled with soft sounds at a higher pitch. The ringing lasted about 1 hour. I had dizziness and blurred vision throughout the day, but it was less severe than the previous day. 05/21/2021 through 05/25/2021: I have had much less dizziness and it usually occurs only in the morning. I still have occasional vision blurriness throughout the day. It is most noticeable when I am working at the computer. I feel as if I have a little brain fog because it takes me longer to figure out how to type some things such as my email address, passwords, etc.

1343522	5/24/2021	MO	43	F	4/9/2021	4/9/2021	After the 15 minute waiting period, I felt fine. I did my grocery shopping while I was at the store, went home and worked the rest of the day at my desk. We ran errands in the evening like normal. I hadn't really noticed because we were busy, but my heart rate had been steadily increasing all afternoon and into the evening. My watch tracks my pulse rate and reports on screen. After I took a shower at 9:30, I noticed that my pulse felt high. I laid down, thinking it was just from taking a hot shower and it would go back down to normal. That's when I looked at my watch report and it looked like a stair step, with my heart rate increasing steadily every few hours, starting at 4 p.m. It was currently 110-120 (my normal RHR is 60, and drops into the 50s when I'm asleep). I went to bed, hoping I was just in my own head about this and it would be fine. I woke at 2 a.m. and my heart rate had not dropped below 100 while I was asleep and was at 130. I went to the ER at 2:00 a.m. because it was alarming. There were points where it spiked to 150 while sitting still. The ER ran an EKG, full blood and urine labs, monitored my heart rate and BP - my BP was in the normal range the whole time. The doctor who saw me in the ER was awesome. Her husband is still dealing with lingering neurological damage from having COVID last year. She informed me that I was not in a-fib or any type of cardiac distress and my labs were all normal, but was likely having an immune response to the vaccine. They did a chest x-ray and CT to check for blood clots and both came back negative. My platelet count was well within normal range as well. I returned home about 6 a.m. and my heart rate was still higher than normal, but had already started to work its way down. It stair-stepped down just like it went up and by 4 p.m., my RHR was back down to 70 and it was down in the 50s overnight. Aside from that, I had the typical headache, low-grade temp and overall body aches. Everything had subsided by Sunday afternoon. I did make an appointment see my PCP as instructed by the ER doctor on Tuesday, April 13. She had read all reports from the ER and was pleased with how my heart rate had come back down to normal. This was the same day that the authorities stopped use of the Jannsen shot due to the blood clot concerns. Dr ran another platelet count for my own peace of mind and it was a little higher than it was when I was in the ER, so she was confident that I was not in any danger, but did

1344671	5/24/2021	NY	48	F	3/13/2021	4/3/2021	On 4/5, I started with upper stomach pain and then two days later I had a fever and a very rapid pulse. I went the walk-in clinic on 4/7 and they performed COVID (negative), an EKG and CT Scan of abdomen (both were normal). The fever went away, the stomach pain eased but I still had SOB, fatigue and rapid pulse. Three days later, the symptoms remained, so I saw a gastro doctor and he said it could be COVID or blood clots, then sent me to hospital on Monday, 4/12 and 4/13. They did 2 more EKGs, COVID tests and bloodwork. I still had SOB and pain in my upper stomach towards my chest. On 4/14, I woke up with a massive headache and saw the news about the vaccine, so I went back to the ER to get checked for blood clots. They did an EKG, CT Scan of the abdomen and head, along with more bloodwork. Everything was normal, but my bloodwork showed an elevation of something that indicated that I have an infection, but they weren't sure what. They sent me home with no diagnosis. Over the next two days, I rested and I gradually started to get my strength back. I went back to work that Friday for the first time since 4/7.
1343336	5/24/2021	NV	59	M	3/29/2021	4/6/2021	shortness of breath, arrhythmia. Referred to Cardiologist. Recommended scope to check the heart for clots, shocked heart back to normal sinus rhythm.
1343331	5/24/2021	VA	23	F	1/26/2021	2/20/2021	On 2/20/2021 participant went into Urgent Care for routine ultrasound for the liver due to being on Strattera medication. The ultrasound also found a blood clot in the inferior vena cava right above the liver superior hepatic. Participant was sent to the ER for CT scan to confirm the ultrasound findings. Participant was put on blood thinners (Enoxaprin injection twice a day for 1 week). Participant was switch to oral blood thinner Pradaxa 150mg twice a day. Participant is currently still on Pradaxa. She has a CT scan schedule for this Friday to conclude to clot and decide to continue medication.

1343269	5/24/2021	OH	62	F	5/5/2021	5/5/2021	She got her vaccine in the left arm, and felt fine. She went shopping in the store and noticed that she was short winded when she was leaving, but felt that it was possibly asthma and left. She had a temperature between 102 and 103 for a couple of days and having fever and chills as well. She continued with the shortness windedness, and had company and on 5/9/21 they left and she started having severe pain, felt like it was either on the right side kidney or the lung, and was spasming horribly and knocking her down with the pain. She went to the ER and they did a CAT Scan thinking it was kidney stones, but told her that she had three blood clots in her lungs, lower base right and lower base left and mid right and part of her lung has apparently died due to this. They put her on blood thinners, Xarelto. She was admitted on 5/10 early morning and released on 5/12/21. The doctor in the hospital said that it did not make sense that she had blood clots in her lungs, but nothing in her legs. She told her that she was short winded, and he told her to report her reaction. Since being home she has been coughing a lot due to possibly the blood clots. She was told that she will be on the Xarelto for a very long time. She was also informed that she had lymph node enlargement as well.
1343126	5/24/2021	PA	60	M	5/10/2021	5/18/2021	On 5/18/21 AM, woke to pain in my right side under my shoulder blade. Went to ER. They performed many blood test, chest Xray, Chest CTA. Determined Pulmonary embolism and infarction. I was admitted, more blood tests, Echocardiogram, Venous Doppler study( No evidence of DVT). Released 5/20/21. Prescribed Eliquis to thin blood for easier natural clot dissolve. No Known cause of PE, yet. Follow up scheduled with my PCP.
1343040	5/24/2021	WA	41	F	3/20/2021	3/24/2021	I went in for a scheduled MRI of my foot and the MRI found that I have a 7mm blood clot on my foot. It was found on my left foot plantar region (bottom of my foot). A few days after the vaccine I had swelling on the top and bottom of my left foot. I got two vascular images completed and the MRI was never sent to the vascular department. My podiatrist confirmed the blood clot on an ultrasound. I'm still experiencing swelling.
1342992	5/24/2021	MA	32	F	4/30/2021	5/3/2021	Period clots that resemble miscarriage every 20 minutes for 4+ days

1343794	5/24/2021	NV	52	M	4/10/2021	4/13/2021	1st day of vaccine; I felt very tired and fatigued and my joints started to hurt and I could not walk due to the pain in my joints. 3rd and 4th day of vaccine; I started to experience numbness sensation to my hands. I also had numbness sensation to my face, right side and lips and also to my head. I went to Urgent Care where lab work was performed as well as a CT scan of the head to check for blood clots and results came back normal. Also an U/S of the right leg to check for any blood clots was performed which came back normal. I then went to see my PCP who performed more tests and exams, again did lab work to check for blood coagulation and still continued with the numbness sensation to my hands and all to my body. After about 10 days of my vaccine, I noticed that my oxygen level was 87, 96, 86, 92 and where my oxygen level has always been around 98 or 99. I will be also having heart studies in a few weeks. I have not recovered from my symptoms and feel very fatigued and tired all the days.
1342589	5/24/2021	OR	23	M	5/7/2021	5/21/2021	Patient presented with chest pain and found to have bilateral pulmonary emboli. He was 2 weeks post 2nd dose of Moderna vaccine. 1343374	5/24/2021	OH	43	M	4/1/2021	4/23/2021	Blood clot in superficial vein behind right knee as well as vertigo and nausea. Currently on 30mg/day of XARELTO blood thinner (I've been taking since diagnosis on 5/5/21). Will continue to take 20mg/day for the next 30 days. Background: I started to notice my right calf get tight and sore approximately ~3 weeks following my vaccination. I had been doing a lot of running and hill training so I assumed it was a muscle strain/aggravation. After approximately 1-2 weeks I noticed the tightness worsen and also noticed significant swelling around my lower calf/ankle. I went to the doctor on 5/4/21 and was given a D Dimer blood test which came back 1.27 mcg/mL FEU (over the recommended 0.5 mcg/mL). The next day I had an ultrasound of my right leg where they discovered the SVT clot behind my right knee in a superficial vein (but near a major/deep vein intersection). I was immediately prescribed XARELTO blood thinner - to be taken for ~51 days. ~21 days of 30mg/day (15mg twice/day) followed by ~30 days of 20mg/day 1x per day. The morning of 5/20/21 around 6:30am I started to feel nausea and vertigo after returning home from walking my dog. I finished a low-intensity exercise routine at my home and around ~7:15am my symptoms worsened. I went upstairs to my bedroom to lay down on my bed and the room started spinning. I then went to the bathroom and vomited clear fluid. I started feeling a little better after vomiting but was still slightly dizzy and light-headed. I made an appointment and went to the doctor around 10:30am. The doctor suggested doing further bloodwork and a CT scan of my head. Both tests came back normal. The doctor suggested the vertigo and nausea were inner ear related and that I should continue taking XARELTO and to also start wearing a compression sock (especially during exercise/activity).
1343212	5/24/2021	IA	33	M	4/24/2021	5/22/2021	He got a COVID vaccine (location unknown to me) and called a few weeks after vaccine to report symptoms of blood clot was diagnosed this past weekend at emergency room.

1343883	5/24/2021	NC	28	F	5/2/2021	5/17/2021	Adverse Events: I went to the emergency room on 5/18 after experiencing major back pain, sharp pain in ribs, chest pains, difficulty breathing, shortness of breath and chronic coughing. Outcome: After x-rays, EKG, D-Dimer Test and a CT scan the doctor determined that I have Pulmonary Embolism (blood clots in my lungs). I've never had any symptoms prior to receiving the covid vaccine. Today is 5/24 and I am still experiencing most of the same symptoms despite taking my medications as prescribed. The worst symptoms are difficulty breathing and chronic coughing. Treatment: -No longer taking birth control (Azurette) since that can cause blood cots - Xarelto (to treat and prevent blood clots) -Gabapentin 100MG 3x Day (for pain) -Benzonatate 200MG 3x Day (for cough) -Tizanidine 2MG 1X day (for pain) -Albuterol Inhaler Every 4 hours

1342339	5/23/2021	CA	24	F	2/18/2021	2/18/2021	Epileptic Encephalopathy. Severe increase in seizures (number and intensity). Some of the worse ones she has ever had. Started within 3 hours of receiving her vaccine. For 4 days she had some other weird odd side effects besides significant increase in seizures. Weird reactions and increase in seizures with movement of any kind (in wheelchair, in car, carrying her from chair to bed, etc). Never had this before. Looked odd in her face, glassy eyes for a few days, weird movements. Her doctor called it a cytokine storm type reaction at first but then she never went back down to her baseline for her seizures as they kept getting worse and worse. Finally on March 24th we did a medication infusion via IV to try to break the cycle and then on April 1st we started her on another seizure medication. On April 28 we increased the new seizure medication trying to get her back down to her baseline. She has never gone back down to her baseline, she is still dealing with an increase in seizures. She has days where she is just seizing all day long off and on for no other reason. Her team of doctors and I are 110% (yes 110%) sure this is a reaction to the vaccine. They called off the second dose, considered J&J vaccine but then with the risk of clots and her not 100% stable due to the first vaccine reaction we decided to hold off. This is horrible because for the last year I lived for the day to get her vaccinated to be protected from COVID and now she can't be. I am devastated and so afraid for her life because as you see in her dx she is very high risk for COVID death. We love to travel and just started cruising as she loves it and now we can't because she isn't vaccinated. She can't go back to her life the way she knew it before the pandemic because of the vaccine not being safe for her. :(
1341496	5/23/2021	CA	63	M	4/7/2021	4/10/2021	Leg pain initially, diagnosed with blood clots may 17. receiving treatment currently 15mg xarelto twice daily.

1342132	5/23/2021	MI	42	F	5/12/2021	5/13/2021	10 Hours after, fever, sweating, very thirsty. 3 Days after vaccination, heaviness in my chest, breathing problems, very tired. Thought it would get better did not. Went to Hospital Emergency Room on May 22, 2021. D-dimer was elevated. Dr was concerned about blood clots. The hospital did a CT Scan of my chest with dye. Did not find any evidence of clots. I was released and told this could be a side effect of the Johnson & Johnson vaccination. I was told to monitor if it doesn't go away or get worse follow-up on further investigation. Was also told to report this side effect. I still have the heaviness and pressure in my chest as well as a bit of breathing problems.
1340421	5/22/2021		52	F	4/30/2021	5/1/2021	transverse sinus thrombosis; This is a spontaneous report from a non-contactable pharmacist. A 52-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 30Apr2021 (Batch/Lot number was not reported) as unknown, single for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient experienced transverse sinus thrombosis on 01May2021 which caused hospitalization. Therapeutic measures were taken as a result of transverse sinus thrombosis. The outcome of the event was unknown. No follow-up attempts are possible, information about lot number cannot be obtained. No further information is expected.
1340811	5/22/2021	MI	30	F	5/5/2021	5/6/2021	Started feeling terrible the day after the vaccine. Very tired, not feeling well, off balance. Symptoms got so back she had to go to the ER. She ended up being transferred to another hospital because they couldn't treat her. She has a blood clot in the carotid artery and acute strokes and brain tissue damage and numbness and loss of strength to right arm and hand

1340758	5/22/2021	WY	71	M	4/9/2021	5/1/2021	My dad started having breathing problems and heart fluttering shortly after getting his first covid vaccination on April 9, 2021. He had contracted Covid back in October 2020. He never told us he was getting the vaccination until we got a call on his cell phone from Public Health the day after he died of a pulmonary embolism. When he started complaining of symptoms, his doctor referred him to a cardiologist at a Clinic. He had an appointment with them a few days before he died. Apparently, they didn't find any blood clots, possibly because they were looking for heart issues. Either way, I believe that my dad died from side effects of the Moderna vaccine. My dad died on May 1, 2021 of a pulmonary embolism. The coroner and County Sheriff both said it was one of the biggest blood clots they had ever seen. Since he had no history of blood clots, I thought it important that I report it.
1340690	5/22/2021	PA	67	M	4/7/2021	4/11/2021	03/09/21(2:00PM):received dose 1 moderna vaccine - no ill effects; 04/07/21 (10:00AM): received dose 2 Moderna vaccine; 04/11/21 (11:00PM): experienced what seemed muscle cramp in left upper calf muscle; 04/19/21: cramp diminished, some swelling left upper calf, slight swelling left inner ankle; 04/22/21: swelling entire left ankle and top left foot; 04/22/21: visited primary care, diagnosed possible Baker's cyst or venous thrombosis - sent to hospital for ultrasound; 04/22/21: ultrasound revealed deep venous thrombosis, upper left calf vicinity (popliteal vein); 04/22/21: hospital performed blood tests, prescribed Xarelto 15mg (2 daily) for 21 days; 04/26/21: primary care follow up, prescribed Xarelto20mg (once daily) for 90 days. 05/22/21: slight swelling inner left ankle persists, slight fullness upper left calf persists, otherwise no other ill effects; 05/22/21: further blood tests pending (as per primary care physician): cbc with differential, pcrp, ante, esr, 83891, cmbp, tshr, ptp, leid, misc, acab, lupus; NOTE: Moderna dose 1: lot # 048A21A, intramuscular, left arm

1340517	5/22/2021	PA	77	F	3/31/2021	5/17/2021	Had a stroke from blood clot; she lost weight; This is a spontaneous report from a contactable consumer (mother) that: A 77-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: ER8272) via an unspecified route of administration on 31Mar2021, as a single for COVID-19 immunization. Previously patient received first dose of BNT162B2 (covid-19 vaccine, Batch/Lot Number: not clear) via an unspecified route of administration on 10Mar2021 as single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. Reporter stated, "I don't know so I just was try to find out or who I report or ask about. I convinced my mother to get her Covid vaccine, so she got her second shot on 31Mar we got it together. Yesterday (17May2021 ) my mom had a stroke from blood clot, and I was just asking myself if it could have had anything to do with from Pfizer shot as she never had any problem like that and now, she was in the hospital from the stroke, and I was just wondering if me talking her and getting her vaccine could possibly had to do with this. Reporter further stated, Absolutely, I have question as far as if that was the cause, was there any special treatment that she should be getting maybe I can at least inform the doctor about that anything. I am out of my mind right now because I felt that I talk to her getting the vaccine because I want to her to be safe, she was 77 yrs. old (Not clarified) she never had any medical problem I feel guilty. Height and weight: Reporter stated, She was approximately 5'6. I don't know the weight as she lost weight, she was not obese or anything like that, but I honestly don't know her weight. The outcome for the events was unknown.

1340506	5/22/2021	GA	46	F	4/14/2021	5/10/2021	I started having shortness of breath and went to the emergency room. It was determined I had blood clots in both lungs based on a CT Scan; This is a spontaneous report from a contactable consumer (patient). A 46-years-old female patient (not pregnant) received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration, administered in Arm Right on 14Apr2021 (Lot Number: EW0153) as 2ND DOSE, SINGLE for covid-19 immunisation. Medical history included Sleep apnoea. No other vaccine in four weeks. No COVID prior vaccination. Concomitant medication(s) included phentermine hydrochloride (LOMAIRA); fluoxetine; loratadine (CLARITIN); diphenhydramine and Charlotte24 (unspecified). The patient previously took morphine and tetracycline and experienced drug allergy. Patient took the first dose of bnt162b2 (lot number EN6207) in right arm on 17Mar2021 for covid-19 immunisation. The patient started having shortness of breath and went to the emergency room on 10May2021. It was determined she had blood clots in both lungs based on a CT Scan. AE resulted in Emergency room/department or urgent care, Hospitalization, Life threatening illness (immediate risk of death from the event), Disability or permanent damage. The patient hospitalized for two days. Patient received blood thinners as treatment. The patient had covid test type post vaccination nasal swab on 14May2021 with negative result. The outcome was recovering.

1340492	5/22/2021	NY	51	M	4/23/2021	5/1/2021	allergic reaction to the Covid 19 vaccine; nerves in his right wrist are bothering him, feels the nerves moving up and down and his arms, and feeling like the nerves in his right arm were jumping; right hand won't relax, can't bend the fingers on his right hand, can't make a fist with his right hand; like he has no control of his arm; right wrist feels like needles and pins; right hand blew up with inflammation; His fingers on his right hand were swollen, right hand looked like it was going to explode; Like his right arm was agitated, right arm was still very uncomfortable; pain in his hand; This is a spontaneous report from a contactable consumer (patient). A 52-year-old male patient received the second dose of BNT162B2 (PFIZER COVID-19 VACCINE, lot number: EW0164), at the age of 51 years old, in right arm at single dose on 23Apr2021 16:30 for covid-19 immunization. Medical history included sleep apnea, congestive heart failure, high blood pressure and type 2 diabetes, seasonal allergy and covid-19 in May2020. The patient reported he had symptoms of the covid-19 virus in May2020. He had a positive covid-19 virus test and did quarantine. The patient reported he's never been allergic to any kind of medication. Concomitant medications included atenolol 50-25 mg at one tablet a day. The patient didn't know the name of the other medication combined with the atenolol. The patient reported one was for the heart and one was for the blood. He also took medication for seasonal allergies but declined to provide the name. The patient previously received a flu vaccine (NDC/Lot/Expiry: unknown) on 2020 that made him feel bad with a head cold. The patient previously received the first dose of BNT162B2 (lot number: EP7534), at the age of 51 years old, in right arm at single dose on 02Apr2021 16:30 for covid-19 immunization. The patient started having some problems maybe a week after that. He started feeling like the nerves in his right arm were jumping. Like his right arm was agitated. His finger on his right hand were swollen. The patient did get his vaccine in the right arm. He thought his arm was going to bother him after he got the vaccine. The nerves in his right wrist are bothering him. Like he felt the nerves moving up and down and his arms, like he had no control of his arm. His right hand blew up with inflammation. His right hand looked like it was going to explode. His right hand won't relax. On 01May2021 was when he noticed his arm acting funny.

---

He would say that the swelling had gone down from taking the antibiotics but his right arm was still very uncomfortable and he couldn't bend the fingers on his right hand and he couldn't make a fist with his right hand. His right wrist felt like needle and pins. The patient went to the emergency room at a hospital two nights in a row on 04May2021 and 05May2021. The first time he had x-rays done. The second time he had x-rays and a sonogram of his right arm to check for blood clots and he had some blood work done. All of that came back negative. The emergency room doctor asked him what arm did receive BNT162B2 in, he told the doctor his right arm, the doctor told him he's having an allergic reaction to BNT162B2. The emergency room doctor prescribed him an antibiotic to take. He'd already finished the antibiotic and didn't recall the name, the bottle had been thrown away. The patient followed up with his primary care doctor on 13May2021 and was given a prescription for a muscle relaxer and motrin 600 mg to help bring the swelling and pain down in his hand. In the emergency department he had a right arm and right wrist x-ray. The doctor was trying to figure out why his right hand looked like a balloon. The only conclusion the emergency room doctor came up with was that he was having a reaction to BNT162B2. The outcome of events nerve in wrist bothering, felt nerve moving, feeling nerves jumping, right arm agitated, no control of arm, right hand won't relax and couldn't bend fingers was not recovered. The outcome of events hand blew up with inflammation, fingers on right hand swollen, right hand explode and pain in hand was recovering. The outcome of events wrist felt like needles and pins and allergic reaction to vaccine was unknown. No follow-up attempts are needed. No further information is expected.

1340455	5/22/2021	IL	61	F	2/2/2021	2/1/2021	BNP just went up and up; Congestive heart failure; She couldn't walk up the stairs; This is a spontaneous report from a contactable nurse (patient). A 61-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration on 02Feb2021 (Lot Number: EL8982) as SINGLE DOSE for covid-19 immunisation, in the afternoon around 4 or 5 o'clock. Vaccination Facility Type was Nursing home/Rehabilitation Center. Medical history included psoriasis from 1986 and ongoing; stent in 2016, the doctor was sure the heart failure was not related to her stent; swollen leg from Jun2020 to an unknown date. She went to her Cardiologist, they said she has no heart failure. The Cardiologist told her the fluid from her knee drained down into her ankle that was why it was swollen, her BNP indicator was 165 at the doctor then. Concomitant medications included atorvastatin (LIPITOR) taken for cholesterol, coronary artery disease, cardiac disorder from 2016 and ongoing; clopidogrel bisulfate (PLAVIX) taken for blood viscosity decreased from 2016 to 14Apr2021, patient reported when she went to the hospital they checked for a PE or Pulmonary Embolism or blood clot, they found nothing, the cardiologist said her blood was flowing beautifully so he discontinued the Plavix; acetylsalicylic acid (BABY ASPIRIN) taken for blood thinner from 2016 and ongoing; ezetimibe (ZETIA) taken for blood thinner, start and stop date were not reported. The patient previously took the first dose of bnt162b2 on 11Jan2021 (lot number: EL0142), also at age of 61 years old, at left deltoid for covid-19 immunization; tremfya injection 100 mg every 60 days for psoriasis. The patient experienced congestive heart failure (CHF) (hospitalization, disability, medically significant) in Feb2021 with outcome of not recovered, she couldn't walk up the stairs (hospitalization) in 2021 with outcome of unknown, bnp just went up and up (hospitalization) in Apr2021 with outcome of unknown. The patient was hospitalized for events from Apr2021 to 16Apr2021. Patient report she got short of breath, which she didn't attribute heart failure, she thought it was something with her lungs. And had a cough. She reported she was so short of breath she couldn't walk up the stairs. At the beginning of the month, she was better, but she couldn't go up the stairs, and she was taking cough syrup and things which didn't

----------	-------	-------	---------	-----	----------	------------	--------------

help. Then she was in the emergency room either on 13Apr2021 or 14Apr2021 and then she was admitted to the hospital, and then she had CHF. This started 2-3 weeks after getting the 2nd vaccine the shortness of breath, heart congestion and wheezing. Her husband said she needs to go pulmonologist to be seen. Patient confirmed she went into the hospital on the 13Apr2021 but, it was midnight and it could have been the next day also, it varies, the time. The shortness of breath and things started in February or March started, they started slowly. She could not breath at all, it started around 2-3 weeks after the vaccine. It was so bad she could not walk around, her husband was worried he went to get the car and she waited on a bench. She could not breath. These things started before 16Mar2021, maybe, between the 15Feb2021 to 21Feb2021. Patient said CHF was heart didn't pump sufficiently anymore. She was now on disability and has a Life-Vest. She was on tons of medications. She wears Life Vest for 3 months then will get echocardiogram or MRI to see what is going on. When she went to the hospital for the CHF, her BNP was 2700 and then it went to 3500. They gave her IV diuretics in the hospital but her BNP just went up and up. This was all on the same day she went to the ER, she spent 13 hours in the emergency room. They drew labs and cardiologics then. Patient got IV diuretics in the hospital, she believed it was Lasix or Furosemide. When she was discharged for the hospital at night on the 16th, her BNP was 518, so they let her go because the diuretics worked. The diuretic was change to oral Torsemide at her discharge. Investigations included chemistry, BNP, a blood count, a metabolic panel.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events, Cardiac failure congestive, gait disturbance, brain natriuretic peptide increased cannot be completely ruled out. The impact of this report on benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethic committees, and Investigators, as appropriate.

1340433	5/22/2021	CA	82	M			<p>This is a spontaneous report from a contactable consumer (patient's wife). A male patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration on an unspecified date (Batch/Lot Number: Unknown) as single dose for COVID-19 immunization. Medical history included dementia and he shrunk he is 5'9" or 5'8". Concomitant medication(s) included warfarin sodium (COUMADIN), at 4 mg once daily in the evening 6 days per week, On Fridays he takes 6 mg once in the evening. Patient's wife says her husband had one vaccination, the Pfizer vaccine and a week later her ended up in the hospital. They had to postpone his second dose because he ended up in the hospital but they have the second one coming up on the 14May2021 and she is scared for him to get it, he is adamant he is going to take it. He was taking her to the doctor for a problem she had and he told her he could not go to the bathroom and she was like what, because he has a stoma bag and she looked and it was plugged with a blood clot, he couldn't open it and drain it so she told him to get in the shower and take it off and put a new one on and she was pulling it off, it was full of blood and there was a big huge, like real liver sized clot came out of his stoma bag. She went to get the stoma bag after the thing came off she grabbed it and got it in the bag and took it out. He was taken to the hospital by the paramedics and he spent 3 days in the hospital. He is 83 now but this happened the week before his birthday, he was 82 when they noticed the blood in his stoma bag, he was a week away from 83. She provides his height and says he shrunk he is 5'9" or 5'8". She does not remember the date of the first dose. She says his birthday was 18Apr2021. She thinks he was admitted to the hospital on 12Apr2021 and he got the first dose the week before that. She thinks it was 12Apr2021 that he was admitted because it was just before birthday first dose week prior to that. They never made the connection. She thinks he ended up in the hospital on a Tuesday and she is trying to count from his birthday 18Apr2021, she thinks he got to come home on Thursday, 15Apr2021. She believes he went in on 12Apr2021 and was discharged on 15Apr2021, he was there 3 days. No further information provided. Her husband is not there with her. She does not have his</p>

vaccine card to provide NDC lot expiration or dose amount. he may not even have his vaccine card because he has dementia. No further information provided. He hardly takes any mediation He takes Coumadin he takes 1 per day except Fridays he takes 2, she thinks it's 4 mg and he takes 2 at night everyday except Friday he takes 3. she was guessing. She has one there called Atorvastatin that says it is for Lipitor, so that is not it. She sees Glipizide. No further information provided. She says she found the Coumadin, they are 2mg tablets and he takes 2 at night. She says the dose is not written on there because they call him every 3 weeks because he has to have a blood draw. He takes 2 tablets at night 6 days per week. She clarifies he takes 4 mg once daily in the evening 6 days per week and on Friday he takes 6 mg once in the evening. They just got report for that and it was 1.8 which is a little bit low but he lost blood and had to have a transfusion while in the hospital. It is in a white plastic bottle they got it from (Name). NDC 0093-1713-01 she does not see anything else. She thinks the pharmacy label is wrapped almost all the way around the bottle but she does not see lot number expiration. She sees they ordered it 11Feb2021 and she has a quantity that is it. Treatment received and outcome was unknown. Information on the lot/batch number has been requested.

1340403	5/22/2021	KY	82	F	3/4/2021	3/4/2021	leg swelling; ultrasound showed an occlusive clot in her femoral artery; femoral vein clot; had pneumonia; fever; developed chills; then chest pain; shortness of breath; This is a spontaneous report from a contactable physician. An 82-year-old non-pregnant female patient received bnt162b2 (BNT162B2 reported as PFIZER CORONA VIRUS VACCINES-COVID-19), dose 2 intramuscularly administered in the right arm on 04Mar2021 (Batch/Lot number was not reported) as 2nd dose, single for covid-19 immunization. Medical history included hypertension, hypothyroidism and osteoporosis. The patient was not diagnosed with COVID-19 prior to vaccination. The patient received the first dose of bnt162b2 (BNT162B2 reported as PFIZER CORONA VIRUS VACCINES-COVID-19) on an unspecified date for Covid-19 immunisation. Concomitant medications included levothyroxine sodium (SYNTHROID); calcium; acetylcysteine, calcium levomefolate, mecobalamin (METAFOLBIC PLUS); losartan; hydrochlorothiazide; denosumab (PROLIA) and trazodone; all indication, start and stop date were not reported. It was unknown if the patient receive any other vaccines within 4 weeks prior to the COVID vaccine. It was reported that in the evening of the vaccination (04Mar2021), she developed chills and fever, then chest pain and shortness of breath. The physician obtained a CXR (chest x-ray) on the patient on 04Mar2021 and found that she had pneumonia. She was treated with levofloxacin and prednisone. The physician rechecked her in one week and gave her Kenalog injection and Rocephin injection. The physician rechecked her on 22Mar2021 and she was improved, but she returned to the office 12Apr2021 with left leg swelling. The ultrasound on 12Apr2021 showed an occlusive clot in her femoral artery. The patient was admitted to the hospital (Apr2021) for 1 day and placed on heparin, then sent home on Eliquis. The adverse events resulted in doctor or other healthcare professional office/clinic visit and the patient received treatment which included antibiotics and steroids for pneumonia and blood thinners for the femoral vein clot. The patient has not been tested for COVID-19 since the vaccination. The outcome of the events leg swelling, occlusive clot in her femoral artery and femoral vein clot were recovered on Apr2021 while the outcome of the other events was recovered on 22Mar2021. Information about lot/batch

1340399	5/22/2021	AZ	35	M	3/31/2021	4/27/2021	<p>This is a spontaneous report from a contactable consumer (patient). A 35-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration administered in left arm on 31Mar2021 09:00 (at the age of 35-year-old) (Batch/Lot Number: ER8730) as 2ND DOSE, SINGLE for COVID-19 immunization. The patient did not receive any other vaccines within four weeks prior to the COVID-19 vaccine. The patient was not diagnosed with COVID-19 prior to vaccination. Medical history included hypertension. Concomitant medication included ascorbic acid, beta carotene, biotin, boron, calcium, calcium pantothenate, chloride, chromium, colesticalferol, copper, cyanocobalamin, folic acid, iodine, iron, lycopene, magnesium, manganese, molybdenum, nickel, nicotinamide, phosphorus, potassium, pyridoxine hydrochloride, retinol, riboflavin, selenium, silicon dioxide, thiamine, tin, tocopheryl acetate, vanadium, vitamin k nos, zinc (CENTRUM MEN). The patient previously took bactrim and experienced allergies. Historical vaccine includes BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number: EN 6206), administered in left arm on 10Mar2021 at 08:45 AM (at the age of 35-year-old) as 1ST DOSE, SINGLE for COVID-19 immunization. On 27Apr2021 at 08:00 AM, the patient experienced bilateral embolisms (blood clots in lungs) and also had blood clot in left leg. Symptoms before diagnosis included dry cough, coughing up blood, chills, fever, body aches, and body pains. The events caused hospitalization. The events resulted in doctor or other healthcare professional office/clinic visit and emergency room/department or urgent care. The patient underwent lab tests and procedures which included COVID-19 test via nasal swab post vaccination which was negative on 29Apr2021 and on 07May2021. Therapeutic measures were taken as a result of bilateral pulmonary embolisms and had blood clot in left leg, chills, and body aches/body pains which included Lovenox injection (blood thinner) and Tylenol for pain. The patient was recovering from all events.</p>

1340349	5/22/2021	FL	55	M	4/17/2021	4/1/2021	Cellulitis; Chills; scaling; his leg started leaking; redness; sweating; had a crack in his skin; This is a spontaneous report from a contactable consumer (patient) from a Pfizer-sponsored program. A 56-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 intramuscular administered in arm left on 17Apr2021 (Lot Number: ER8737) at the age of 55-year-old as single dose for covid-19 immunisation. He was allergic to milk. He said it gave him sniffles and stuffs his nose but he drinks it anyways. The patient's concomitant medications were not reported. His 2nd shot of the Pfizer COVID Vaccine tomorrow and was asking if the vaccine would just be as effective if he delays the shot a week or 2 later because he was getting treatment for cellulitis on 26Apr2021 and he knew that the side effects of the vaccine and treatment are similar and he does not want to get "double whammed". He has heard that the vaccine would still be effective if delayed for up to 60 days and would like to confirm that. He confirmed that he had cellulitis and chills but said none of that was from the shot. He said that if he got the second shot he was worried about them double teaming his immune system. He said he had athletes foot and had a crack in his skin in Apr2021, and it got into him that way. He said the chills were from the cellulitis. The caller said that the events started shortly after his shot, oddly enough. He said he went to the hospital. He said he was at work. He said he went to the doctor on 29Apr2021 for the chills a week or two before that. He said on 26Apr2021 his leg started leaking. He said he was on antibiotics and it was going down but he still had redness and scaling that he wasn't able to get rid of. He said he got them at the same time, the leaking, the chills started that night. He said he noticed the cellulitis in the morning and he let it go for a couple of days. He went to the doctor on Thursday. He should have gone earlier. He said no more winter coat in the sun. He said his wife and his roommate were sweating and he had a sweater on; he had it bad. He said he didn't remember the days but he was tested for a blood clot which was negative and they checked out his heart. He did not provide the result of them checking out his heart. He says any doctor who knows about cellulitis knows to check these things. He also says they checked his blood pressure and other things: see formal field. He said after the emergency

room they sent him home and told him to follow up with his primary care provider and a podiatrist, which he has done. He says he saw his primary care provider the following Monday 03MAY2021 and the podiatrist he didn't see until Wednesday 05MAY2021. He says he was supposed to see both of them within 2 days but he couldn't get in. Those events resulted emergency room and physician office. The patient was not hospitalized. He said his family had skin problems like eczema and such but he said it not relevant. The patient underwent lab tests and procedures on 29Apr2021 which included blood pressure: 110/63, temperature: 97.2, pulse: 84, oxygen saturation: 99%, respiration: 16. Outcome of event cellulitis, chills, his leg started leaking, redness was recovering; of sweating was recovered in 2021, of other events was unknown.

<i>VAERS_ID</i>	<i>RECVDATE</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1340343	5/22/2021			F	5/5/2021	5/5/2021	<p>This is a spontaneous report from a contactable consumer (patient). A female patient of an unspecified age received the first dose of BNT162B2 (Pfizer-BioNTech COVID-19 vaccine, lot number and expiry date unknown), via an unspecified route of administration on 05May2021 as a single dose for COVID-19 immunization. Medical history included lupus, high blood pressure and severe pancreatitis wherein she had surgery all on unknown dates and unknown if ongoing. The patient's concomitant medications were not reported. The patient reported some adverse effects after the first dose of the Pfizer COVID-19 vaccine. The patient reported stomach pain and nausea from an unknown date and fears it may be a blood clot and wants to know if these are common side effects. The patient reported having stomach pain on an unspecified date and she doesn't know if it is normal. At first she thought it was because she was so nauseous, but the nausea went away. Then she thought maybe it was like a bowel thing and she was going to have issues like diarrhea, but that was not the case. The pain is pretty bad. She is wondering if that can be a side effect. She is just wondering if she should follow up with a doctor or go to the hospital, because it hurts pretty bad in 3 different sections of her stomach. Her stomach feels like her arm felt when she got the shot. It feels like she had bruising, not exactly stabbing but it is pretty painful and she is kind of concerned. She doesn't know if her doctor would have information on the vaccine for what to do, and they would probably send her to the hospital. She hopes it's not something serious. She is worried something went wrong. Her entire family got the same shot and were fine. The pain is just like where her pancreas and gallbladder are. Since she had severe pancreatitis last summer, and it hurts where she had surgery. She wants to know if it is related to the shot or something else. The outcome of the event nausea/so nauseous was recovered while the outcome of the other events was unknown. Information on the lot/batch number has been requested. Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported blood clot cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern</p>

1340277	5/22/2021	IA	60	M	4/5/2021	4/30/2021	Stroke; Patient received his first dose of Moderna COVID19 Vaccine on 05-APR-2021 and second dose on 30-APR-2021; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of CEREBROVASCULAR ACCIDENT (Stroke) in a 60-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 041B21A and 020B21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 05-Apr-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 30-Apr-2021 at 10:30 AM, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 30-Apr-2021 at 10:30 AM, after starting mRNA-1273 (Moderna COVID-19 Vaccine), the patient experienced INAPPROPRIATE SCHEDULE OF PRODUCT ADMINISTRATION (Patient received his first dose of Moderna COVID19 Vaccine on 05-APR-2021 and second dose on 30-APR-2021). On 06-May-2021, the patient experienced CEREBROVASCULAR ACCIDENT (Stroke) (seriousness criterion medically significant). The patient was treated with Rehabilitation therapy for Cerebrovascular accident. On 30-Apr-2021 at 10:30 AM, INAPPROPRIATE SCHEDULE OF PRODUCT ADMINISTRATION (Patient received his first dose of Moderna COVID19 Vaccine on 05-APR-2021 and second dose on 30-APR-2021) had resolved. At the time of the report, CEREBROVASCULAR ACCIDENT (Stroke) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 01-May-2021, Blood test: normal (normal) Normal. On 01-May-2021, Computerised tomogram: normal (normal) Normal. On 01-May-2021, Electrocardiogram: normal (normal) Normal. Concomitant medications were not reported. On 30 Apr 2021, the patient's right arm was numb and he had no feeling in it. He went to the emergency room on 01 May 2021. They thought he had a blood clot. His EKG, blood tests and CAT scan were normal. The patient reported his arm was still numb on 04 May 2021. It's like it was limp; he couldn't coordinate his hand when he tried to mow the law. He stated that he had no feeling in his arm

1340276	5/22/2021	NJ	67	M	1/21/2021	2/28/2021	<p>This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of THROMBOSIS (blood clot in each lung) in a 67-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 039K20A and 029L20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below.</p> <p>Concomitant products included CALCIUM FRUCTOBORATE, CHONDROITIN SULFATE SODIUM, GLUCOSAMINE HYDROCHLORIDE, HYALURONIC ACID (MOVE FREE JOINT HEALTH) for Joint disorder NOS, MINERALS NOS, VITAMINS NOS (ONE A DAY [MINERALS NOS;VITAMINS NOS]) for an unknown indication. On 21-Jan-2021 at 11:00 AM, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 18-Feb-2021 at 9:30 AM, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 28-Feb-2021, the patient experienced THROMBOSIS (blood clot in each lung) (seriousness criteria medically significant and life threatening). On 28-Feb-2021 at 6:00 PM, the patient experienced DYSPNOEA (shortness of breath). At the time of the report, THROMBOSIS (blood clot in each lung) outcome was unknown and DYSPNOEA (shortness of breath) had resolved with sequelae. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 28-Feb-2021, Computerised tomogram: blood clot (abnormal) Blood clot in both lung. On 21Jan2021, patient had received the first dose of Moderna Covid-19 vaccine and about 4-5 days later, he began to noticed that his breathing was labored. At the time of the report, the patient did not think much about the labored breathing since he was older in age and thought it was due to exercise. Patient received second dose of Moderna COVID-19 Vaccine on 18-Feb-2021 and he reported that his breathing became more laboring where he needed to stop walking to catch his breath. He had 2 scan which revealed that he have a blood clot at each lung and he was prescribed Xarelto 15 mg twice a day, then he will begin Xarelto 20mg once a day on 20-MAY-2021. Patient is on Kirkland C 500mg as a concomitant medication as well. Most recent FOLLOW-UP information incorporated above includes: On 13-May-2021: Significant FU- outcome of the event.</p>

1340994	5/22/2021	DC	49	F	3/31/2021	4/9/2021	<p>8 hr post vaccine, typical side fx (fever, headache), but also significant bi-lateral leg cramping and spasms that continued for 6-8 hours. Spasms were prominent in inner thigh/groin and down entire legs. Legs were not movable (heavy), difficult to get out of bed or walk. Very strange and nothing like this ever experienced before shot. Fine next day. Around 4/9, pain began in ball of R foot in the AM, hard to walk. Over next few days, pain extended up to medial posterior calf (very painful), back of knee and groin. Unexplained bruising on lateral calf. 4/20 woke to swelling of R leg (ankle, posterior knee, groin), went to Urgent Care that night and was sent directly to ER for DVT symptoms. ER Ultrasound showed no clot, was sent home. Pain continued to increase, with burning and difficulty walking. Second Ultrasound done 4/22. No clots found. Pain continued to worsen, with swelling/aching on front of calf and severe foot pain. Veins/skin tender. Painful groin spasms happen again, same as night of shot. PCP ordered ABI and spine Xray. ABI was normal. Xray showed same issue as 29 yrs ago (prior known L5S1 anterolisthesis; have not had back pain for many years...when I did, it was localised to spine and sciatic in the L hip, was not at all similar to these current issues in R leg. perhaps related if inflamed, but is vastly different in symptoms and unlike past history). Saw Vascular Surgeon 4/30, ordered abdominal CT Abdomen Pelvis w IV Contrast. results normal. arm bruising at IV and blood draw site. Saw second Vascular Surgeon 5/4 who felt pain related to inflammation response and ordered CBC. Platelets 178. (patient had requested this test starting on 4/20, this was the first doctor to order it). Pain continued but some relief found with compression socks. on 5/10 US Bilateral lower extremity venous duplex with reflux study was done on both legs. No DVTs, but damaged valves and reflux in the external iliac common femoral vein and femoral veins proximal segment (worse in R leg) and great saphenous vein at the sapheno-femoral junction (R only). These areas are where the spasms are happening but doctor not able to conclude relation, wants neuro consult, could be nerves causing spasms. Doctor prescribed compression socks for venous insufficiency concerns, to be rescanned annually for life. Vascular test results don't explain severe pain in calf and foot and referred to Neurologist for 5/28 visit. As of today, 5/22,</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							pain is persistent. Pain/swelling is reduced with use of compression socks but returns without them; walking is difficult in the AM and PM hours; night time spasms. Have also had shooting pains in L calf, both forearms, and ribs (back). These occur mostly in the evening (nerve?). Taking magnesium & extra vitamin D seems to help some. On strict anti-inflammatory diet. I'd really like some guidance for treatment and what to do about boosters - do I switch to an mRNA vaccine? I am a very healthy active 49 yr old woman who felt fine before the shot, and now I've been in a lot of pain, working greatly reduced hours for almost 4 weeks. Please advise on what can be done to help. Concerned about permanent damage and how to handle future vaccines. (also of note: first menstruation period was skipped after the shot, second period came a week late and was very heavy with bright red blood. I am normally extremely regular, mod-heavy flow; also, the J&J shot I had was a "last shot of the day" extra dose. I was offered it while having a routine physical. Could it have been improperly stored, as the last leftover dose? Very unlikely since it was a doctors office, but including this info)
1341216	5/22/2021	NY	70	F	2/22/2021	5/5/2021	Patient received Moderna Covid Vaccine on 01/25/2021 and second Moderna COVID vaccine on 02/22/2021 and was diagnosed with a left lower extremity deep vein thrombosis on 04/22/2021, patient was then subsequently admitted to the hospital on 05/05/2021 with acute on chronic respiratory failure and bilateral pneumonia requiring IV antibiotics and increased supplemental oxygen.
1341471	5/22/2021	NJ	46	F	4/6/2021	4/6/2021	The same day I took vaccine on April 6, 2021, I had pelvic pain and cramping that increase over the next two weeks. I made an appointment with my physician. On 4/29/2021 I was examined by my physician and was told to go to the ER. I had my appendix removed and the pathology report showed that I had a blood clot.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1340397	5/22/2021	MA	62	F	4/15/2021	4/1/2021	<p>This is a spontaneous report from a contactable Nurse (patient). A 62-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number is either EW0158 or EWD158), intramuscular, administered in Arm Left on 15Apr2021 as 1ST dose, single for COVID-19 immunization. Medical history included Lumpectomy over 20 years ago, High cholesterol over 20 years ago, seasonal allergy and asthma. She gets flu shot every year and has never had any issue with vaccines. No Additional Vaccines Administered on Same Date of the Pfizer Suspect. Prior Vaccinations (within 4 weeks) and AE(s) following prior vaccinations were none. Concomitant products included tocopherol (VITAMIN E); ascorbic acid (VITAMIN C) for the past six months to prevent COVID; colecalciferol (VITAMIN D); and acetylsalicylic acid (BABY ASPIRIN) for the cholesterol thing, takes it every day and has been on it about a year. She uses an inhaler for asthma she has had. Caller had experienced hypertension post first dose. Caller would like to know if she can or should get the second dose of vaccine on 20May2021. Caller has consulted with her PCP and states that she was not able to get answers. She had her first Pfizer COVID19 vaccine on 15Apr2021. That same week she was diagnosed with COVID. She had mild symptoms initially. She started having symptoms that afternoon and didn't know if was related to the vaccine. She had arm soreness, fatigue, foggy memory, and was not feeling right. She went to her internist on that Friday who said she was exhibiting symptoms of COVID. They tested her. She had been tested twice the week before for traveling and was negative. So she was tested a week before she boarded and five days before she left. On the afternoon of 15Apr2021 she had chills and didn't feel well and the symptoms were so similar she didn't know if it was coincidental. She did COVID test on Friday and got the results on Saturday morning. She got sick with fever, chills, malaise, and all of those things. She was in quarantine. Her blood pressure started escalating. She is very fit and an avid walker. She walks 7 to 8 miles per day. She had no issues before the vaccine with blood pressure. Her blood pressure runs 110/60 and heart rate in 60s in Apr 2021, but since the vaccine she has been hypertensive. She ended up in the ER last week because she was having chest tightness probably from COVID</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

and shortness of breath. She went to urgent care because the chest tightness got severe. They said her lungs looked good and she had resolving pneumonia. Her blood pressure was almost 170/110 in Apr 2021. It was very up and down and all over the place. They had said maybe it was related to chest tightness and shortness of breath. She is very concerned because of her blood pressure and she is still having some shortness of breath and tightness of chest. They said that could linger a while. All other symptoms are better, but the shortness of breath has not gotten better. Her blood pressure will be better, but if she walks it immediately shoots up. They had made a mistake and scheduled her to get her second vaccine on 05May2021. Callers internist said that they recommend waiting a little longer and there were lots of cases where patients get COVID in between vaccines. They said to wait until 20May2021 to get the second dose of the COVID19 vaccine. Should she get the vaccine if she is still having hypertension? She can't live like this if it is secondary to vaccine. Caller had EKG and all her cardio was good. She was checked for clots because post COVID people get clots. Her dimer was good and all of her results. She had no evidence of clots in the lungs. Caller runs a little high cholesterol. It has always been that way, but her other levels are good. Due to COVID caller cant be on statin. Caller clarified that she had never been on a statin for her cholesterol. The doctor never wanted to start on her a statin because her other levels were good. Her cholesterol is not causing the issue with her blood pressure. She dont know if she should get the second vaccine. She is in her 60's and looks like she is in her 40s. Caller knows the vaccine is directly related to the hypertension. It is not from COVID. The doctor said because she is over the other symptoms except shortness of breath and a little tightness. Her blood pressure is up and down. She knows she can get anxious if she continues to check it. In the morning she has pressure in the neck that she didn't have before. The elevated blood pressure happens all over the day. She didnt check it yesterday. Right now it is 130/80 and that is high for her. Her heart rate is in the 80s currently and usually she has a low pulse. She is getting back to trying to walk a little bit. She is pacing herself. Overall, she feels ok. Her appetite is still not better. She lost 7 to 8 pounds since COVID. She is about

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

119 pounds, but feels like it is muscle loss because she is not exercising. Can she safely take the other vaccine that is scheduled for 20May2021? Has it been long enough now? She knows she shouldn't do it before the 14th. Is this going to go away? Are there other reported cases? She did not want to go on blood pressure medication. She is in good health and just turned 63. She never had medical issues. The only issue she had was a lumpectomy over 20 years ago. weight: around 118 pounds. She was in the upper 120s, but since COVID she has not been able to get back to walking 7 to 8 miles per day. Caller was sick, but not as most cases. She didn't end up in the hospital from COVID. She went to hospital because of chest tightness and shortness of breath. Her blood pressure was up when she went to urgent care. All the other symptoms were gone. She is currently still having shortness of breath, chest tightness, and elevated blood pressure. Sometimes the blood pressure will stabilize in the 120s. She is finally sleeping better. She wakes up with a stiff neck, but it is not the bed because she has a nice bed and pillow. As a medical professional and after discussing it with her family that are medical professionals, she feels that it is a result from Pfizer. She just needs to know if it is safe for her to get it. Does she need it since she has antibodies from the first one? Arm soreness: it lasted a week. When she feels her arm now it is tender in the spot. The fatigue and foggy memory were disabling and she couldn't do anything. Hypertensive: Seriousness is hospitalization. She was in the ER for six or seven hours. After they removed her IV the discharge nurse checked her blood pressure again manually and it was 168 over 100. She asked if it was safe to send her home. They said that everything else looked good and that it was related to being cold and being in the hospital. They had ruled the other things out. She was still symptomatic and was still having shortness of breath and chest tightness when she was leaving the ER. The blood pressure hovered a lot in the 140s when she was laying in the bed. Her O2 sats were good, 98 or 99. Her blood pressure would shoot up to the 160s or 170s. The time they have for caller to go back is 05May2021 which is not 30 days. It is completely messed up. First, she went to the Urgent care on 30Apr2021 and they did x-ray. They couldn't check her for clots. She was having shortness of breath, chest

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

tightness, and elevated blood pressure. They sent her to the ER on 30Apr2021. Her main question is the hypertension. Blood pressure is related to the vaccine itself and is not from COVID. Does she need the second vaccine since she already had the first one and has antibodies from COVID? Is it safe to do the second vaccine having hypertension from the first? She doesn't want to escalate this more and have it linger for several months. She has to get to work and do her job. With hypertension she gets tightness in chest. They said her lungs look good except for the area of resolving pneumonia. When she gets short of breath it is related to high blood pressure and tightness of chest. Is it safe to get second vaccine? She is very concerned about getting the second vaccine. What will happen with her blood pressure being all over the place? Her blood pressure is not steady and stable. The chest tightness is still there and has not gone away. It has improved some. It wasn't even 30 days. Is it ok to take the second dose with the blood pressure issues? The onset date of events was Apr 2021. The outcome of the events was unknown. The nurse considered the COVID19 Vaccine was related to arm soreness, hypertensive, foggy memory and not feeling right. Information on Lot/Batch number was available. Additional information has been requested.; Sender's Comments: Based on the temporal association, there is a reasonable possibility that the administration of vaccination with BNT162B2 played a contributory role in triggering the onset of the events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities.

1340983	5/22/2021	CA	34	F	5/2/2021	5/3/2021	Sudden appearance of significant amount of eye floaters, flashes and blurriness in the right eye about 20 hours after the 2nd shot of Pfizer Covid-19 vaccine. First started to notice sporadic floaters and mild blurriness during the 3-week period between the 1st and the 2nd shot of Pfizer vaccine. Diagnosed with Central Retinal Vein Occlusion (CRVO) with macular edema in the right eye within 48 hours of the 2nd shot of the vaccine. Confirmed by second opinion. Right eye vision is currently 20/50. Received Eylea injection in the right eye. Antiphospholipid panel, Protein S, Protein C, Factor V, Homocysteine and Antithrombin all come back normal from lab testing. Blood pressure normal, no diabetes, no known systematic disease. 34 year old female.
1337514	5/21/2021	MO	43	F	4/6/2021	4/6/2021	severe persistent headache developed, went to ER on 4/20/2021, CT/MRI found cerebral vein thrombosis in lower left brain. treatment of blood thinner (warfarin) started. advised to delay second dose.
1338628	5/21/2021	NJ	68	M	4/2/2021	5/14/2021	Although I have heart disease, and had triple bypass surgery three years ago, I consistently take my blood pressure. My blood pressure has been in a normal range since the operation, and following receiving the first dose of the vaccine it became elevated and I needed to go back on an old medication. Even then, my blood pressure was erratic. Two weeks after my 2nd COVID shot I had a heart attack due to a blood clot. This clot was able to be removed by a heart cath-lab. This could be a coincidental flare up due to an old issue, but the timing aligns with both doses of the vaccine.
1337925	5/21/2021	WI	59	M	4/6/2021	4/13/2021	Client was seen by his doctor on April 13th related to severe headaches . He stated that he had headaches prevaccine and was given Tropicort for it which he only took for 2 days as it caused him dizziness. He had CT scan of Head and MRIs on April 13 and 14th and then again on April 27th. The scan on April 27th showed a blood clot with 80% blockage in carotid artery and was dx'd with a blood clot via CT scan. . He was told to get to Hospital where he was admitted to ICU for 4 days Client was also dx'd with Factor 5 Leiden at that time. Per client he has a stroke and is recovering. Per client still unable to work r/t poor balance and dizziness

1337924	5/21/2021	IL	32	F	3/18/2021	5/14/2021	Patient transferred from outlying hospital for higher level of care. Patient had previously presented to ED with complaint of localized pain in the right calf for 4-5 days. Patient also noticed swelling in R calf. CT chest showed acute pulmonary embolism within distal right pulmonary artery extending into the segmental arteries to both right upper and right lower lobes. Patient was treated with heparin drip. Echo showed EF 68% and hypokinetic free right ventricular wall and apex. Echo also showed reduced right ventricular function. Patient underwent bilateral lower extremity duplex ultrasound which showed acute right femoral, popliteal, posterior tibial and peroneal vein thrombosis. Patient was transitioned and discharged to home. Patient received J&J COVID-19 vaccine in March 2021. Patient denies cigarette smoking/vaping, illicit drug use, ETOH use. Denies recent travels or long distance travels. Denies use of oral contraceptives.
1337830	5/21/2021	CA	55	M	4/29/2021	4/29/2021	Patient presented with on 5/12/21 with headache, nausea and vomiting, malaise, and decreased responsiveness. Headache and malaise had been present on/off since late April after patient had received the second dose of Moderna COVID-19 vaccine. Head CT in ED revealed venous sinus thrombosis. MR venogram with near complete occlusion of the superior sagittal sinus, right transverse and sigmoid sinuses, right internal jugular vein), possible mastoiditis on the right side. Started on heparin drip, unasyn, and transferred to neurosurgical ICU. 5/13/21 underwent mechanical thrombectomy; of the superior sagittal sinus, bilateral transverse and sigmoid sinuses and the right vein of Labbe - flow has been restored. Partial clots remained in right internal jugular vein. Heparin drip was changed to antiXa goal 0.3-0.7. HNS consult - no strong evidence of mastoiditis. 5/14/21 repeat MRI/MRV - thrombus within the right transverse sinus, sigmoid sinus and right jugular bulb, no thrombi in the dominant left transverse sinus or SSS - anticoagulation was changed from heparin to enoxaparin 1 mg/kg every 12 hours 5/15/21 patient was observed in the ICU 5/16/21 discharged home in stable condition

1337813	5/21/2021	IL	59	F	2/8/2021	5/11/2021	Patient presented to emergency department on 5/11/21 with report of worsening of shortness of breath and chest pain for previous one week. Patient reports that she had COVID-19 3 weeks ago and at that time was diagnosed with community acquired pneumonia. CTA performed in ED noted bilateral pulmonary emboli greater on the right than on the left. There was an embolus in the right main pulmonary artery with some evidence of right heart strain with RV/LV ratio 1.1. Peripheral ground-glass opacity in right lower lobe also noted. Patient treated with heparin. No thrombectomy performed as clot burden had decreased after receiving heparin. Patient was transitioned to Eliquis and discharged to home.
1337718	5/21/2021	IN	21	F	4/28/2021	5/19/2021	patient developed a blood clot
1337708	5/21/2021	NY	39	F	5/20/2021	5/20/2021	The day before she got her vaccine she had started her menstruation cycle. She is not on any medications, everything was normal, went to work and went to get her vaccine. She got her vaccine and around 4:15 she started gushing, which is abnormal for her and having clots the size of a half dollar and covered in blood. This is not normal for her periods, and she is now in the bathroom every hour and a half and looks like a murder scene. Her normal menstrual cycle is heavy for one day and then gradually lessens and only lasts a few days. She does occasionally have small clots with hers, but this are large and bleeding profusely. The only side effect she has is that she is extremely tired. She slept from 4:30 yesterday to 2:00 AM and feels like she could sleep the rest of the day. Her arm is a little bit sore, but otherwise fine from the injection site. Is concerned due to the heavy volume of bleeding, which is extremely abnormal for her. She has taken Tylenol and drinking a lot of fluids.

1337662	5/21/2021	IA	47	M	5/19/2021	5/19/2021	Patient developed a nose bleed lasting from 7:10pm to 7:40pm on the evening that he received his vaccine. He coughed up a silver dollar sized blood clot around 7:35pm. He was feeling fine the following day, but had another nose bleed that started at bedtime the night after his vaccine. Patient's wife called on call doctor and was told to pinch his nose, which they'd been doing for 35 minutes and to go to ER if needed. Patient saw doctor, who told him to stop using Flonase for a few days.
1337553	5/21/2021	AZ	49	F	4/6/2021	4/12/2021	4/6 vaccination 4/12 HA 4/13 HA turned into migraine, legs started to tingle, achy. Zero sleep due to pain. 4/14 Both extremities very swollen. Rotating between Tylenol and Ibuprofen (started on Tues). I went to my PCM. BP 130/98. Prescribed water pill but only to take on Friday if symptoms got worse, not better. 4/15 Sick all day. By 5pm, I couldn't even focus, my legs were so swollen, my 'head was ready to explode' and I 'didn't feel right. I went to urgent care; 160/98 BP and referred to the ER. I went to the ER, BP was still elevated, legs still swollen. Checked my heart, ultra sound on my legs and x-ray. I was kind of 'out of it'. They did everything to check for blood clots and heart; everything came back clear. They gave me some medicine for my head thru IV. I still left with HA but didn't feel as bad. That helped my BP went down. I was at the ER 2-3 hours, drinking lots of water. The next day the swelling started to go down on the legs and migraine was subsided. By Sat., I felt fine.
1339044	5/21/2021	IN	37	F	5/7/2021	5/10/2021	At 8 AM on 5/10/21 I experienced extreme shortness of breath and an elevated heart rate. I could not catch my breath and my heart was ?resting? at approximately 145 beats per minute. I went to the local ER at which time I was taken back for testing, approximately 10 hours later I was diagnosed with bilateral pulmonary embolism. My legs were checked and they could not locate any other blood clots - just in my lungs.

1337216	5/21/2021	UT	43	F	5/13/2021	5/13/2021	I immediately felt sharp pain and burning in my arm while being injected. The burning in my arm lasted for about 20 minutes. I got a severe migraine about an hour after the vaccine that lasted for about ten hours. I broke out in hives all over my body later that night, the same day as the vaccine. I also had intense heartburn. I never get heartburn so this is not normal for me. The following day, I was still having hives and started also having chest pains. I was consistently taking antihistamines to keep the hives under control. On Saturday morning, 2 days after the vaccine, I was still breaking out in hives. My throat also started to swell and I was having a hard time breathing. My heartburn was also getting more severe. I ended up going to urgent care. There I was prescribed 2 stronger antihistamines and prednisone to help with my reaction. I was also given an epi pen. Later that night, I ended up going to the ER as I was having severe chest pain. I have a history of DVT so I was concerned about blood clots. I had several tests done along with a chest CT scan. Thankfully everything came back clear for blood clots and heart attack. The ER doctor could not explain why I was having chest pain and advised me to monitor it and to come back in if it got worse. The following day, I was still needing antihistamines for hives and difficulty breathing. I woke up in the middle of the night with severe stomach pain and cramping. I had intense vomiting and diarrhea. The diarrhea started to have a lot of blood in it. I went back urgent care and they sent me for a CT scan which showed I now had colitis. The bleeding lasted for about 3 days.
1337043	5/21/2021		18	M	5/8/2021	5/12/2021	Patient received dose 1 of Moderna vaccine on 5/8/2021 and had witnessed seizure 5/12/2021- (first time ever). He was admitted to ICU on 5/12/2021 and discharged 5/15/2021. He states he had one seizure while in the ICU and another seizure 5/16/2021- at home after discharge. He has since been placed on anti-seizure medications and is scheduled for follow up with neurology on 6/2/2021. Patient's mother states ICU doctors told her they found a blood clot in the brain picked up by MRI.

1333638	5/20/2021	CO	44	F	4/14/2021	4/16/2021	pt says she had a hot red swollen right leg that was very painful. On 4/16/21 she went to the Hospital ER. She had blood test and was given an US of the right leg where they found 2 blood clots. She was started on blood thinner. She was discharged and told to FU w/ PCP. On 4/21/21 she saw the doctor. She increased the blood thinner because she found a abdominal hematoma this size of two grapefruits. On 4/25/21 she was having trouble breathing and her leg was red and inflamed. She went back to the Hospital ER they thought she was having a pulmonary embolism. They did more blood work and chest x-ray. She was given Lovenox shots and took her off the blood thinner. She was discharged to go home and give herself these shots. On 4/27/21 she had a reaction to the Lovenox shot so she called her PCP. She saw the doctor on 4/29/21 she was told to continue using the Lovenox. She went back to Dr. on 5/4/21 and she was taken off Lovenox and put back on blood thinner Eliquis with doubled dosage. She was monitored. On 5/8/21 both of her legs were red and swollen and she went to her Doctors office. They did a blood test and was sent home. On 5/10/21 she went back to her PCP. Dr. office where she was sent to Hospital ER for direct admit. They did another US and a CT. They found she had blood clots in both legs. She was given IV fluids, antibiotics, was given heparin and taken off Eliquis. On 5/13/21 she was given warfarin along w/ heparin. She was discharged on 5/16/21. She still has pain and redness in both feet and legs and has been diagnosed w/ Cellulitis. She is now taking Oxycodone and Coumadin. She will see her PCP on 5/21/21.

1333699	5/20/2021	IL	35	F	4/30/2021	5/2/2021	2 days after vaccination (Sunday May 2) I began to feel slightly chest pain when I would breath on the upper left chest shooting downward to the bottom breast rib area. Every time I would take a deep breath I would feel the pain. Called loyola hotline to discuss and state worries I had. Pain continued the next day. Went to the loyola urgent care center Monday at about noon. Took EKG test there and everything seemed fine however they did mention my birth control and possible side effects. So they sent me to thenhospital for more test. Sent me to the ER. From the ER took several test and blood work. Another eck as well as D-dimer test, lots of blood work and a CT scan. Later that night I was told I had a pulmanary embolism (blood clot in my lung) and I needed to stay overnight. They continued to take addt. Exams the next day and more blood for test. Took a heart echo since pains were happening on my left side. As well as ultrasound on my leg to check for DVT and if more blood clots exist.. Addt. Test done that Tuesday, then was discharged Tuesday at about 5pm.
1333708	5/20/2021	FL	63	M	5/14/2021	5/14/2021	Patient presented to hospital emergency department on 5/19/2021 with complaints of headache, myalgia, nausea, vomiting with hematemesis and severe abdominal pain (rated 8/10) that began on the 5/16. Patient started on argatroban for treatment of mesenteric vein thrombosis. Treatment course pending.
1333734	5/20/2021	TX	74	M	4/9/2021	4/23/2021	Approximately two weeks after vaccination I noticed his left foot and leg swelling. Patient advised me that he needed to go to the hospital because he was not feeling well and his oxygen level was low. We called 911 and was taken to the hospital. After at the hospital I advised a male nurse that I was concerned about his leg being swollen cause he had been given the Jansen Covid vaccine and I was concerned about blood clots. Everyday I would tell someone in the hospital (never saw a doctor I could talk to) about his swollen leg but did not really get anyone interested. Before he was moved to a Veteran?s State Home, I overheard someone saying they were going to give him his anticoagulant. I?m filing this report in case the swollen leg was a result of blood clots due to the vaccine.

1333886	5/20/2021	UT	57	F	4/8/2021	4/10/2021	<p>Started out with what I thought were flu like symptoms - chills, then I was warm- extremely tired Then my chest started hurting- I thought this was the vaccine working- then I started getting short of breath- still thinking this is the vaccine working- then my chest started hurting extremely bad- and my ability to breathe became worse- finally I contacted my doctor-because I thought maybe I had gotten bronchitis- so she prescribed an inhaler in the mean time - I ordered a oxygen meter- and my oxygen was registering in the 80s- then my chest was getting more and more painful. And then a few days later, my oxygen started dropping down to the 70s and my body temp dropped to 95.1- I was passing out at home, although I didn't realize that is what was happening, I would just wake up and an hour would have passed and I didn't even realize I was out, and this kept happening especially during the time that my temperature kept dropping below 95. I rushed to the emergency room which after I had been there a long time- they found that I had a *****BLOOD CLOT- MASSIVE***** A SADDLE BLOOD CLOT ***** IN LUNGS They immediately admitted me, and immediately started me on Lovonox and Coumadin I am currently on oxygen and I will have to take Coumadin for the rest of my life. Due to the size of the clot (5-6 inches) they were concerned about my heart, the clot caused a strain on the right side of my heart, so they put me on a different beta blocker Coreg to slow my heart rate down, I will also have to take this medication for the rest of my life</p>

1334117	5/20/2021	MA	43	F	3/17/2021	3/29/2021	Started with the right arm turning purple or changing colors when elevated above the head. This continued for a few weeks. Then I started to get a tingling sensation in the elbow that went into the right pinky. I visited my primary doctor to see what was going on. She did an evaluation, prescribed Ibuprofen and physical therapy, and had a cervical spine x-ray done. The X-ray looked great when it came back. I could not get an appointment with PT for several weeks so I finally went to the chiropractor on 5/13. He worked on the shoulder area stretching it out. By the morning of 5/15 I was being taken to urgent care and eventually the ER because the arm was swelling and fingers were turning blue. They did blood tests, EKG, chest x-ray, and finally an ultrasound that showed a blood clot. It was DVT in the subclavian vein. I was given a blood thinner and sent home. I had a more thorough ultrasound on 5/17 that sent me back to the ER and with vascular surgeons to discuss immediate surgery with lysis therapy. It was decided that the blood clot had probably been there for weeks and the success rate of the surgery would not be as good.

1334510	5/20/2021	MA	41	M	4/23/2021	5/7/2021	After headaches and fatigue following the shot (within 24 hours) I began to notice slight shortness of breath 3-5 days following. I didn't give it much thought, but, roughly two weeks after my dose I began to experience severe intercostal pain and sharp pain in the lower lobe of my right lung upon inhalation. I thought this was musculoskeletal at first but after it didn't abate within days, I went to the hospital and was diagnosed with several distal pulmonary emboli. Luckily I survived and am currently on blood thinners while trying to determine the cause of this, having no history of blood clots personally or in extended family.
1333834	5/20/2021	NM	81	F	3/3/2021	5/5/2021	81 year old female admitted to healthcare facility for deep vein thrombosis and pulmonary emboli. Hospitalized x 14 days; treated by healthcare provider. Patient sought care after Chiropractor noted her right leg was swollen and he told her she should investigate this problem. Patient was then seen by healthcare provider who sent her for diagnostic testing - Doppler of lower extremities, and CT scan of Lungs. Pt was referred to a pulmonary specialist; Pt was hospitalized and treated with Heparin and Coumadin, and Oxygen.

1332754	5/20/2021	NC	71	M	4/24/2021	4/25/2021	felt unwell; took his oxygen level and it was at 80%; he had swelling; difficulty breathing; tachycardia; allergic reaction; tested Covid-19 positive; blood clots; he got very sick; This is a spontaneous report from a contactable consumer(patient's daughter). A 71-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration on 24Apr2021 (Batch/Lot number was not reported) at the age of 71-year-old as single dose for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient was fine and nothing happened until after the vaccine. The patient took the 1st dose on 24Apr2021 and the next day he got very sick, they thought it was just a reaction from the vaccine, then he was swelling said he was not feeling well. The day after the vaccine, the patient was rushed to the emergency room and confined to the ICU. He felt unwell and it got worse and worse, we took his oxygen level and it was at 80%, he had swelling, difficulty breathing and tachycardia. The reporter thought it was an allergic reaction but this morning the patient tested positive for covid, he didn't go out the only time he went out was to get the vaccine. The reporter asked If he didn't know he had covid and got the vaccine, will he get more sick. In the report they found blood clots and the doctors thought it was from the vaccine. He was diagnosed with blood clots and difficulty breathing and he tested Covid-19 positive. Events seriousness criteria reported as hospitalization. The outcome of the events was unknown. Information on the lot/ batch number has been requested.

1332359	5/20/2021	AR	62	M	3/1/2021		CARDIAC ARREST (SEVERE CHEST PAIN); CLOGGED VEIN; LEFT ARM GOES TO SLEEP; This spontaneous report received from a patient concerned a 62 year old white male. The patient's past medical history included blood clot, heart attack, lump in leg, and stents in main arteries, and concurrent conditions included heavy smoker, and heart issues. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1808025, expiry: UNKNOWN) dose was not reported, 1 total administered on 12-MAR-2021 to left arm as prophylactic vaccination. The patient was previously treated with clopidogrel bisulfate for blood clot. On an unspecified date in 2021, Laboratory data included: Echocardiogram (NR: not provided) unknown, and Lab test (full workup)(NR: not provided) unknown. On an unspecified date in Mar-2021, a week later vaccination, the patient experienced that left arm went to sleep which felt worse next day, on 25-APR-2021, patient experienced severe pain in chest, called ambulance and was taken to hospital. On same day patient was hospitalized. Patient went to full cardiac arrest twice same day. It was stated that vein that was 60 percent good earlier was 100 percent clogged (clogged vein) in one month after getting the vaccine. They tried to put stent in, clear vein out, and put piece of metal and expanded it, to make alley way for blood flow. Patient stated that patient would not take Plavix this time. According to patient, stent was reacting with Plavix, and decided to take something different. They did same job twice. It was stated that patient was discharged on 05-May-2021 from hospital. On 12-MAY-2021, patient went to consult the health care professional to make sure everything was okay. The patient gave lot number 1808025, then stated that, patient thinks it is 180, and then either 5 or 8, and next it was either D or O, and then after the space it is 25. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of the cardiac arrest (severe chest pain), left arm goes to sleep and clogged vein was not reported. This report was serious (Hospitalization Caused / Prolonged).; Sender's Comments: V0: 20210523134-COVID-19 VACCINE AD26.COV2.S-CARDIAC ARREST (SEVERE CHEST PAIN), CLOGGED VEIN. This event(s) is considered not related. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown

scientific plausibility. There are other factors more likely to be associated with the event(s) than the drug. Specifically: MEDICAL HISTORY, UNDERLYING DISEASE

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1332693	5/20/2021	MA	86	F	3/4/2021	3/1/2021	<p>blood clot; Sciatica; She then got sciatica in her leg and couldn't walk; charley horse in her lower leg while walking; soreness in arm / pain in her foot / lower leg/calf still hurt; This is a spontaneous report from a contactable nurse (patient). This 86 years old female patient received the second single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot EN6203) on 04Mar2021 at 11:00, in left arm, for COVID-19 immunisation. No other vaccines were administered on the same date. The patient received the first dose of BNT162B2 vaccine intramuscular, on 11Feb2021 at 18:30 (lot EN6201). The patient received some years ago an unspecified pneumonia vaccine and an unspecified tetanus vaccine experiencing after both headache, swollen arm and rash. She didn't react to the flu vaccine. Her body didn't want any more vaccine. Concomitant medications were none. On an unspecified date in Mar2021, maybe a week or two after the second vaccination, early to mid afternoon, the patient had what felt like a charley horse in her lower leg while walking, but didn't pay any attention to it, just put ice on the leg. She then got sciatica in her leg on 24Apr2021 and couldn't walk; that was what sent her to the hospital as it was getting worse and she went to the hospital because of the pain. She just ignored it for at least a week but she was still having pain after the second week and could hardly walk due to the sciatica in that leg. At the hospital they found she had a blood clot in the calf of her leg on 28Apr2021. She was hospitalized from 28Apr2021 to 02May2021. The doctors in the hospital recommended that she should report her experience even though they didn't know if it was due to the COVID vaccine due to the proximity. The hospital doctors took care of her but her primary care provider knew that she had been in the hospital. The doctors gave her medications in the hospital that helped the pain in her foot and the sciatica but her lower leg/calf still hurt so they decided to do an ultrasound and found a blood clot. The patient still had to give herself injections in the belly for blood thinner to treat the blood clot. The patient also experienced soreness in arm on an unspecified date in 2021. Sciatica required ER visit. Blood clot was resolving. The other events outcome was unknown. The doctor said that there was a possibility that the blood clot could be related to the COVID vaccine, but it may not be related at all.;</p>

Sender's Comments: Based on the information provided by the reporter, including a prolonged onset latency of nearly two months, it appears unlikely that BNT162B2 contributed to the reported events. These are likely intercurrent medical conditions in this elderly patient. This case will be reassessed upon receipt of additional information. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate. Linked Report(s) : PFIZER INC-2021501847 same patient/drug, different vaccine dose/AE

1332699	5/20/2021	TX	29	F	4/22/2021	4/26/2021	stroke-like symptoms; not being able to see out of my left eye; the left side of my body was numb; pounding headache on the left side of their head; shooting pain up and down my neck; could barely turn my head with shooting pain down my body; shingles; migraines; This is a spontaneous report from a contactable consumer (patient). A 29-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection) (at 29 years of age), via an unspecified route of administration, administered in arm left on 22Apr2021 10:15 (Batch/Lot number was not reported) as 1ST DOSE, SINGLE for COVID-19 immunisation. Medical history included autoimmune disorder from an unknown date and unknown if ongoing. Concomitant medication included levothyroxine taken for an unspecified indication, start and stop date were not reported. The patient was not pregnant. The patient had no known allergies. She was not diagnosed with COVID-19 prior to vaccination. She has not been tested for COVID-19 since the vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. It was reported that the patient had stroke-like symptoms, not being able to see out of her left eye, the left side of her body was numb, and she a pounding headache on the left side of their head. Upon being checked into the ER, she was immediately put on stroke alert. After a CAT-Scan and two MRIs, blood clots were ruled out. She stayed under close watch, and an IV was administered. All her blood work numbers checked out and the doctors were puzzled. After three to four hours, the symptoms reduced. After ten hours, they were almost gone. She went home and didn't have any more complications that day. Fast forward to the 1st, new symptoms. She now has shooting pain up and down her neck. At first, she thought she strained her neck, but the next day she could barely turn her head with shooting pain down her body. This morning they went to their PPC to get checked out. Luckily, a diagnosis was given. She had developed shingles. The events started on 26Apr2021 10:00 AM. The events resulted to Doctor or other healthcare professional office/clinic visit and Emergency room/department or urgent care. The patient was hospitalized for the events. Therapeutic measures were taken as a result of the events. She was given IV for migraines but it did nothing. The outcome of the

Information on the lot/batch number has been requested.</p> <p>My left arm is locked in a paralyzed stage where I haven't been able to lift it no more than a few inches since the second week that I got the Pfizer shot three weeks ago.; muscle spasm; The left side of my shoulder and neck was stiff; This is a spontaneous report from a contactable consumer (patient). A 55-year-old non-pregnant female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot Number: EL9269), via an unspecified route of administration, administered in arm left on 15Apr2021 at 13:00 (at the age of 55-years-old) as 1st dose, single for COVID-19 immunisation. Medical history included breast cancer, is diabetic and anemic, thyroid disorder, peripheral neuropathy, history of blood clot (reported as 'clog') in leg and pineapple and watermelon allergy, all from an unknown date and unknown if ongoing. On 23Apr2021 at 08:00, the patient's left arm is locked in a paralyzed stage where she hasn't been able to lift it no more than a few inches since the second week that she got the Pfizer shot three weeks ago. The left side of her shoulder and neck was stiff like she had a muscle spasm for about the whole second week. She will not be getting the second shot. The events resulted in doctor or other healthcare professional office/clinic visit. Therapeutic measures [acetaminophen (TYLENOL), heat on areas, move and rotate areas] were taken as a result of all events. The outcome of the events was not recovered.</p>

hypertension and sleep apnea who became febrile with shortness of breath over several days. Her PCP, Dr, ordered Covid test which was positive. She presented to Hospital on 4/1/2021 for further work-up. On admission she was found to be in hypoxic respiratory failure requiring high flow oxygen which progressed to requiring a nonrebreather and eventually intubation with ICU care. She received remdesivir, dexamethasone, and convalescent plasma. Patient also received IL-6 inhibitor Tocilizumab recommendation of pulmonary critical care. Procalcitonin level was 35.32. Because of concern of superimposed bacterial pneumonia she was also treated with broad-spectrum antibiotics. Patient had a prolonged complicated acute care hospital course. On 4/12/2021 ENT evaluation showed poor phonatory effort but mobile true vocal cord without lesions. Patient was found to have a fungemia from cultures of 4/12/2021 of C albicans with positive blood cultures with C. albicans on 4/17/2021. Patient was placed on IV micafungin for a total of 6-week course. TEE showed no evidence of acute valve pathology. Ophthalmology was consulted and there was no evidence of fungal endophthalmitis. Repeat blood cultures from 4/23/2021 showed no growth. Patient had PEG tube placed by Dr of GI on 5/7/2021. Repeat modified barium swallow on 5/14/2021 showed improvement of swallowing and the patient was upgraded to a dysphagia level 3 soft diet with double swallows and thin liquids via cup or straw with aspiration precautions. Patient was evaluated by therapies while at Hospital acute care. She requires supervision to rise from sit to stand using a rolling walker and contact-guard ambulate 45 feet using a rolling walker with wheelchair follow and verbal cues for walker management. She continues to have some knee buckling. She needs minimal assistance for bathing and min mod assistance for lower body dressing. She is able to perform toileting with contact-guard. Acute inpatient rehabilitation was recommended. Patient is being transferred to the Hospital for comprehensive inpatient rehabilitation program. Indication Pre-procedure diagnosis: Pharyngeal dysphagia Post-procedure diagnosis: See impression Preprocedure A history and physical has been performed, and patient medication allergies have been reviewed. The patient's tolerance of previous anesthesia has been reviewed. The risks and benefits of the procedure and the sedation options and risks were discussed with the patient. All questions were answered and informed consent obtained. Details of the Procedure The patient underwent monitored anesthesia care, which was administered by an anesthesia professional. The patient's blood pressure, heart rate, level of consciousness, oxygen, respirations, ETCO2 and ECG were monitored throughout the procedure. The scope was introduced through the mouth and advanced to the second part of the duodenum. Retroflexion was performed in the cardia, fundus and incisura. The patient experienced no blood loss. The procedure was not difficult. The patient tolerated the procedure well. There were no apparent complications. See anesthesia record for more information regarding anesthesia administered. Specimens \* No specimens in log \* Implants No implants documented in log. I attest the accuracy of any implant/graft nursing documentation. Findings The cricopharynx, upper third of the esophagus, middle third of the esophagus, lower third of the esophagus, GE junction, Z-line, cardia, fundus of the stomach, body of the stomach, greater curve of the stomach, lesser curve of the stomach, incisura, antrum, prepyloric region, pylorus, duodenal bulb, 1st part of the duodenum and 2nd part of the duodenum appeared normal. PEG-G tube successfully placed in the body of the stomach using a deformable internal bolster via the pull technique after the site was identified via transillumination, visualized indentation and needle passed through abdominal wall; distance from external bolster to external end of tube: 3 cm; scope reinserted to confirm placement Staff/Assistant(s) Staff Role RN Other CRNA Other Other MD Other Disposition: PACU - hemodynamically stable. Fluoroscopy assistance was provided to the speech pathology department. Multiple consistencies of barium and food products were administered to the patient. Fluoroscopy of the oral and pharyngeal region was performed. FLUOROSCOPY TIME: 1.1 minutes  
COMPARISON: Modified barium swallow of 4/12/2021.  
FINDINGS: Aspiration of thin and nectar thick fluid. Hypopharyngeal residue with all trials provided. Significant dry secretions in the oral cavity and pharynx. Please see speech pathologist's report for further details and recommendations. This report was created using Voice Recognition software. Thank you for allowing us to participate in the care of your patient. Fluoro NG long tube placement Result Date: 4/30/2021 FL NG LONG TUBE PLACEMENT IMPRESSION: Successful fluoroscopically guided Dobbhoff placement. END OF IMPRESSION: INDICATION: Dobbhoff placement. SUPERVISION: Procedure was performed by staff member under personal supervision by Dr..  
TECHNIQUE: Fluoroscopic guidance for nasogastric tube placement. FLUOROSCOPY TIME: 2.2 minutes  
COMPARISON: None available. FINDINGS: Using fluoroscopic guidance, a nasogastric tube was placed from the left nares into the stomach. Upon placement of the nasogastric tube, 10 cc of Omnipaque contrast material was injected to confirm placement. Opacification within the stomach was visualized confirming appropriate NG tube placement. There were no intraprocedural complications and the procedure was well tolerated by the patient. The patient was discharged from the imaging department in satisfactory condition. This report was created using Voice Recognition software. Thank you for allowing us to participate in the care of your patient. X-ray chest 1 view Result Date: 4/26/2021 XR CHEST 1 VW PORT IMPRESSION: NG tube in the fundus of stomach left upper abdomen. END OF IMPRESSION: INDICATION: SOB evaluate NGT placement following advancement.. TECHNIQUE: AP projection of the chest is acquired. COMPARISON: 4/26/2021 FINDINGS: NG tube in the fundus of stomach left upper abdomen. Stable diffuse patchy infiltrates both lungs in the upper, mid to lower zones and left effusion. No pneumothorax. The heart size is normal. Rib cage is unremarkable. This report was created using Voice Recognition software. Thank you for allowing us to participate in the care of

was performed with grayscale, color and duplex Doppler imaging. Compression and augmentation were performed where possible. Permanently recorded images were obtained and stored. FINDINGS: The internal jugular vein, subclavian vein, axillary vein, brachial veins, basilic vein are normal. They demonstrate normal flow and compressibility. There is a thrombus identified in the right cephalic vein at the mid arm through distal forearm. This report was created using Voice Recognition software. Thank you for allowing us to participate in the care of your patient. CT angiogram chest pulmonary embolism with and without contrast Result Date: 4/22/2021 CTA CHEST PULMONARY EMBOLISM W WO CONTRAST IMPRESSION: No evidence of pulmonary embolus or right heart strain. Extensive parenchymal consolidation in both lungs, left greater than right consistent with severe pneumonia such as Covid 19 pneumonia. Moderate left-sided small to moderate right sided pleural effusions are seen with associated compressive atelectasis. Enlarged main pulmonary artery which can be seen in the setting of chronic pulmonary hypertension. Interval development of large mediastinal adenopathy particularly in the right paratracheal region and subcarinal region. These may be reactive in nature in the setting of as diffuse pneumonia. Enterogastric tube with the tip extending to just within the stomach. END OF IMPRESSION: INDICATION: pneumonia. Assess for pulmonary artery embolism. TECHNIQUE: Enhanced helical CT scan of the chest was performed from the lung apices to below the diaphragm. 2mm axial reconstruction with MPR coronal, oblique and sagittal images were created. 3D shaded surface images also created on a separate workstation and permanently stored. CONTRAST: 100mL of IOHEXOL 350 MG IODINE/ML INTRAVENOUS SOLUTION administered INTRAVENOUS. Quality of contrast opacification was adequate. COMPARISON: July 22, 2013 FINDINGS: Lung windows demonstrate extensive consolidation involving the lungs, left greater than right. There is a moderate left-sided effusion and a small to moderate right sided effusion with associated compressive atelectasis. The trachea and bronchi are grossly unremarkable. No endobronchial lesions are seen. Soft tissue windows demonstrate a grossly unremarkable thoracic inlet. The thyroid is unremarkable. Moderate

bilateral axillary lymph nodes are seen with extensive bulky adenopathy in the mediastinum to include the right paratracheal region as well as the subcarinal region and to a lesser extent the hila. The largest lymph nodes are seen in the paratracheal chain demonstrating short axis of approximately 15 mm. Smaller lymph nodes are seen in the aortopulmonary window. These may be reactive in nature. The heart demonstrates a normal configuration. No right heart enlargement is seen. No pericardial effusion is seen. The thoracic aorta and great vessels demonstrate normal branching pattern. Normal course and caliber is seen. The pulmonary arteries demonstrate normal course. There is moderate dilation of the main pulmonary artery up to 3.2 cm. This can be seen in the setting of chronic pulmonary arterial hypertension. No filling defects are seen. Enterogastric tube is seen with the distal tip extending to just within the proximal stomach. The visualized portions of the upper abdomen are grossly unremarkable. The surrounding osseous structures demonstrate mild degenerative changes of the thoracic spine. This report was created using Voice Recognition software. Thank you for allowing us to participate in the care of your patient.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1332730	5/20/2021	NC	62	F	3/31/2021	3/1/2021	severe arm pain; Nausea; Dizziness; klebsiella pneumoniae, 50,000 to 100,000 cfu; Headache; Urine retention; blood and blood clots in her urine; blood and blood clots in her urine; tore or messed up a ligament in her hand; This is a spontaneous report received via a Pfizer-sponsored program, from a contactable nurse (patient). A 62-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot Number not reported), via an unspecified route of administration, administered in arm right on 31Mar2021 (at the age of 62-years-old) as 2nd dose, single for COVID-19 immunisation. Medical history included fibromyalgia from 1996 and ongoing, allergies from 1981 and ongoing, hypothyroidism and is pre-diabetic from 2012 and ongoing, Lyme disease from an unknown date and unknown if ongoing, concussion from Sep2019 to an unknown date, post-concussion syndrome from Sep2019 and ongoing , seasonal, food and chemical allergies from an unknown date and unknown if ongoing and had wisdom teeth extracted on an unknown date. The patient's concomitant medications were not reported. The patient previously took nalbuphine hydrochloride (NUBAIN) and experienced anaphylaxis. The patient previously received the first dose of BNT162B2 (Batch/Lot Number: EN6206), administered in right arm on 10Mar2021 for COVID-19 immunisation and experienced Face and ears became very flushed, red, and itchy, Headache, headache was more like a migraine/felt like a migraine, but worse, Post concussion syndrome was retriggered, not eating well and had lost some weight, feeling more worn out, she is allergic to alcohol and thought maybe it was the glycol in the COVID-19 vaccine that caused the reaction, flu like symptoms, achiness all over, pelvic pain and pressure, some burning during urination, did not have the energy level and stamina that she used to, blood in her urine and clots, she was not able to release the urine (urine retention), Nausea and Dizziness. About a week after receiving the second dose of the Covid-19 vaccine on 31Mar2021, she noticed the feeling again of retaining the urine. She was not swollen or anything and immediately went with increased fluids. The urine retention was not as severe at that point. It really showed up and intensified quickly with groin pain, pelvic pain, abdominal pain, and some back pain. She woke up the next morning after

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

being doubled over in pain the night before and there was so much blood in her urine that she couldn't see any urine. Her urine was the darkest burgundy and the color of the darkest wine. She did not have anything in her urine the night before when she was doubled over in pain. She was increasing fluids and even drinking Propel for the electrolytes to make sure she was not making things worse. She woke up around 5 AM and felt so sick to her stomach. She had nausea the night before, but she was really nauseated the morning that she discovered blood in her urine. She woke up with severe nausea last Friday, 30Apr2021. Her doctor performed a urine culture. The urine culture returned positive for Klebsiella Pneumoniae with 50,000 to 100,000 CFU/mL on 30Apr2021. She does not have the urine culture results from her first doctor visit. Her friend is an RN that is administering the Covid-19 vaccine, was talking to company representatives and told the caller that she needed to call company to make a report and see if anyone else has experienced the same adverse events. Urinary retention came back in Apr2021 following her second dose of the Covid-19 vaccine on 31Mar2021. She can really go to the bathroom, but she is still feeling the abdominal and pelvic pressure as well as some burning and pain. Her symptoms are improving but not enough. It feels like she always has a full bladder still. She tore or messed up a ligament in her hand and she has been going to occupational therapy. She can't seem to be able to handle a pain level like she used to. It seems like pain is triggering her feelings of nausea and dizziness. Her body is not doing things well right now. The day before, of, and after getting the Covid-19 vaccine, someone suggested taking electrolytes before the second dose of the Covid-19 vaccine, so she drank Powerade. She was expecting the symptoms following the second dose of the Covid-19 vaccine to be a lot worse and they were a walk in the park in comparison. She had a mild headache the first day, 31Mar2021. She woke up in the morning of 01Apr2021 and her headache was gone. Following the second dose of the Covid-19 vaccine, she had severe arm pain. It felt like she was walking around with someone constantly punching her. She was moving her arm all around trying to get it to stop hurting. She saw blood and blood clots in her urine for over 24 hours. The blood and clots were lessening over

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

the 24-hour time period. She probably saw in a 2-hour period at least 60 clots about the size of a quarter to a half dollar. The pain was excruciating. She was taking Phenazopyridine but is still feeling a sense of urgency, burning, and sometimes pain during urination. Her doctor did give her a prescription for phenazopyridine, but it was cheaper for her to buy over the counter and take the same dosage. She has been taking generic Macrobid, Nitrofurantoin Mono, 100 mg twice daily. It was dispensed in a pharmacy bottle. She is seeing a urogynecologist tomorrow, 06May2021. The patient underwent lab tests and procedures which included culture urine: unknown cfu on 26Mar2021 and culture urine: klebsiella pneumoniae, 50,000 to 100,000 cfu on 30Apr2021. The outcome of the event Headache was recovered on 01Apr2021 while of the rest was unknown. No follow-up attempts are possible. No further information is expected. Information on lot number already obtained.; Sender's Comments: Based on the compatible temporal association, there was a reasonable possibility that the vaccination with BNT162B2 played a contributory role in triggering the onset of the reported events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1332677	5/20/2021	CA	51	F	4/7/2021	4/30/2021	she had developed a blood clot in her lungs; coughing up blood; This is a spontaneous report from a contactable consumer (patient). A 51-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration (at the age of 51-years-old), administered in Deltoid Right (reported as "right upper arm shoulder") on 07Apr2021 09:45 (Lot Number: EW0150) as 2nd dose, single for COVID-19 immunization. Medical history included eosinophilic granulomatosis with polyangiitis (Churg Strauss syndrome) and asthma. The patient's concomitant medications were not reported. The patient previously received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in Right upper arm shoulder on 17Mar2021 (Lot Number: EN6208) as 1st dose, single for COVID-19 immunization. The second dose of the vaccine the patient received on 07Apr2021 and she had a great experience with it and nothing happened. Then on 30Apr2021, patient experienced coughing up blood, which required a visit to the Emergency Room. She was admitted in the hospital on 30Apr2021, and they discovered a clot in her lung she is surprised to find out because she is very healthy individual. She had got out of the hospital yesterday (03May2021) for a blood clot in her lungs where the hospital did a bronchoscopy, they cut it out. The blood clot was big and deep. They did a test to see if the blood clot is from her rare disease which it was not so the doctors have no idea what caused the blood clot. She did her research and the only thing that had changed was she got the vaccine and then she also just switched to a different inhaler for her asthma but she has taken it before. The doctors do not think it is any of the two things. The doctor does not know what caused the blood clot and she saw there has been 35 cases reported of a rare blood clot and according to her findings. She was hospitalized for 3 nights (when discovered a clot in her lung) from 30Apr2021 to 03May2021. The blood clot was removed Sunday 02May2021. She had blood work done prior to the vaccine and her count was excellent. The patient underwent lab tests and procedures which included blood test: her count was excellent prior to the vaccine, blood test: it was not (from her rare disease), bronchoscopy: blood clot, electrocardiogram: well, full

1332784	5/20/2021	CO	66	M	3/29/2021	4/1/2021	<p>Blood clot in leg; This is a spontaneous report from a contactable consumer (patient). A 66 year old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), dose 2 via an unspecified route of administration on 29Mar2021 at 12:45 (Batch/Lot Number: EN6198) as a single dose for COVID-19 immunisation. Medical history included COVID-19 from Nov2020 to an unknown date: came down with COVID virus in November and it felt like mild flu symptoms. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), dose 1 via an unspecified route of administration on 08Mar2021 at 12:45 (Batch/Lot Number: EN6198) as a single dose in the right shoulder for COVID-19 immunisation. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient did not have any adverse events following prior vaccinations. The patient's medical history included: father had a blood clot in his 50s. Concomitant medication (other medications taken in two weeks) were none. On an unspecified date in Apr2021, the patient experienced blood clot in leg. Relevant test included: ultrasound on 15Apr2021 showed blood clot. The clinical course was as follows: On 04Apr2021 or 05Apr2021 he started to notice a problem on his right leg. He went to see the doctor and it was determined he has a vascular problem. This problem got worse and ended up in the emergency room and was informed he had a blood clot in his leg. The clot started down by his ankle and had moved up towards half way to knee. Then moved up higher. He went to the emergency room on 15Apr2021 and was diagnosed with a blood clot with an ultrasound scan that was done. He was then prescribed a blood thinner. He was informed it is a superficial thrombosis. The patient clarified the problem he started to notice with his right leg as it was like a bump, and sore. He was not sure what it was. He thought at first he may have banged his leg. Then he noticed it was sore and getting higher. He went to see his physician who referred him to a vascular surgeon. It took a while to get in to be seen by the vascular surgeon because so busy. A few days after that he went to the hospital, the emergency room because he was not getting better. That is when he found out he had a blood clot. Treatment for the blood clot in leg included, patient was prescribed</p>

The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: Unknown, expiry date: UNKNOWN) dose was not reported, 1 total, administered on 16-APR-2021 for prophylactic vaccination. The batch number was not reported and has been requested. No concomitant medications were reported. On 16-APR-2021 after vaccination, the patient got tired, lethargic, was not "feeling well" and body and muscles started to ache and progressed further. The consumer reported that on 08-MAY-2021, the patient was feeling sick and drove herself into the hospital. On 11-MAY-2021, the patient had blood clots galore and was on dialysis. On 12-MAY-2021, the consumer had one note stating the patient was holding steady and during night the consumer stated there's no change in patient's condition. On 13-MAY-2021, patient was going through with computerised tomography scan and told later that patient would not make it and would be saying goodbye tomorrow. On 13-MAY-2021, Laboratory data included: CT scan (NR: not provided) unknown. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient had not recovered from blood clots galore, and the outcome of tired, lethargic, body aches, feeling sick (not feeling well) and muscle aches was not reported. This report was serious (Other Medically Important Condition).;</p> <p>Sender's Comments: V0. 20210529809 - Covid-19 vaccine ad26.cov2.s- blood clots galore. This event(s) is considered unassessable. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the event(s).</p>

1332727	5/20/2021	NC	62	F	3/10/2021	3/1/2021	<p>This is a spontaneous report received from a contactable nurse (patient) via a Pfizer-sponsored program. A 62-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN6206), via an unspecified route of administration in the right arm, on 10Mar2021, as 1st dose, single, for COVID-19 immunisation. Medical history included ongoing fibromyalgia (diagnosed in 1996), ongoing allergies from 1981, ongoing food allergies and chemical allergies, ongoing allergy to alcohol, ongoing hypothyroidism from 2012, ongoing pre-diabetic from 2012, Lyme disease for 11 years before being correctly diagnosed and treated, concussion in Sep2019, and post concussion syndrome in Sep2019. The patient previously took nalbuphine hydrochloride (NUBAIN) in 1981 and experienced anaphylaxis; and paracetamol (TYLENOL) and was very sensitive, had rash and high blood pressure. Within the first 15 to 20 minutes following the administration of the first dose of the Covid-19 vaccine, on 10Mar2021, the patient's face and ears got very red, flushed, and itchy. The patient reported that she is allergic to alcohol and thought maybe it was the glycol in the COVID-19 vaccine that caused the reaction. She reported that she has had glycol before and has never reacted quite like that. The flushing, redness, and itchiness of her face and ears subsided within an hour and were gone by 4 hours. Her allergist instructed her to take 2 Zyrtec before getting the second dose of the Covid-19 vaccine. After her face and ears became flushed, red, and itchy, she ended up having a really bad headache that continued until the next day. Her headache was severe for about 12 hours and continued for a total of a day and a half. She stated that her headache was more like a migraine during the 12 hours when it was severe. It felt like a migraine, but worse. On 10Mar2021, the patient reported that she experienced flu-like symptoms like being nauseous, had dizziness, achiness all over, and was not feeling well, her post-concussion syndrome was triggered and had more headaches, dizziness, nausea. She reported that things have been going awry in her body since she had the COVID-19 vaccine. She reported that the increase in headaches seemed to have improved, but the nausea and dizziness have in some ways improved and then some days it feels like "here we go again" when it hits. About a week after she received the first dose of the</p>

---

Covid-19 vaccine, in Mar2021, the patient noticed a change in her urination. It wasn't severe or anything at that point, she just felt like she was not able to release the urine (urine retention). She thought to increase her intake to see if it would help her urinate and it didn't seem to help much. She received a prescription on 26Mar2021, and during that week, she noticed that she was having more issues with some burning during urination and was developing pelvic pain and pressure. The patient stated that the scent and color of her urine looked fine. She reported that the frequency started to increase with not much urine coming out. When she finished her antibiotics about 7 days later, the urine retention had really improved and went away at the end of March. In the morning of 26Mar2021, when the patient woke up, she had blood in her urine and clots. The clots were about the size of a pea and a couple were about the size of a dime. The blood and blood clots in her urine were what made her go to the doctor. She reported she has never had blood in her urine that she remembers. She was put on Macrobid for 5 days. She reported that Macrobid wasn't relieving enough of her symptoms and her provider ended up adding a couple more days. The patient reported feeling more worn out in Mar2021, since she received the first dose of the COVID-19 vaccine. This did not improve and some days it was worse. The patient did not have the energy level and stamina that she used to (Mar2021). She reported that whether it's combined with the retriggering of her post-concussion syndrome, it is significant for her life. She was also not eating well and had lost some weight (Mar2021). She reported that her appetite is improving but it is still not normal for her. She mentioned it was harder for her to want to eat something because of feeling nauseated. The patient assessed the events "face and ears became very flushed, red, and itchy", headache, "headache was more like a migraine/felt like a migraine, but worse", "post concussion syndrome was retriggered", "blood in her urine and clots", "not eating well and had lost some weight" and "feeling more worn out" as serious (medically significant). The patient recovered from "face and ears became very flushed, red, and itchy" and "she is allergic to alcohol and thought maybe it was the glycol in the COVID-19 vaccine that caused the reaction" on 10Mar2021; headache, "headache was more like a

----------	-------	-------	---------	-----	----------	------------	--------------

migraine/felt like a migraine, but worse", "she was not able to release the urine (urine retention)", "blood in her urine and clots", "flu like symptoms", dizziness, "achiness all over", "pelvic pain and pressure", and "some burning during urination" in Mar2021; and was recovering from "not eating well and had lost some weight". The outcome of the remaining events was unknown. The patient assessed the causality of events headache, flu like symptoms, nausea, "face and ears became very flushed, red, and itchy", dizziness, "post concussion syndrome was retriggered", and "not eating well and had lost some weight" as related to BNT162B2.; Sender's Comments: Based on the information in the case report and a plausible temporal association, A possible causal relationship between urinary retention, hemorrhage urinary tract and suspect drug BNT162B2 cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

The occurrence of additional non-serious events is detailed below. No medical history was provided by the reporter. The patient's past medical history included Chronic kidney disease, Thrombus and Cancer. Concomitant products included SODIUM BICARBONATE (SODIUM BICARB.PED), HYDRALAZINE, Folic Acid, SEVELAMER CARBONATE (RENVELA), AMLODIPINE BESILATE (AMLODIPINE (ALS BESILAT) SANDOZ), FUROSEMIDE, POTASSIUM CHLORIDE (LASIX + K), PRAVASTATIN and MONTELUKAST for an unknown indication. On 21-Feb-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 27-Feb-2021, the patient experienced PULMONARY EMBOLISM (Blood Clot Left Lung) (seriousness criteria hospitalization and medically significant), OXYGEN SATURATION ABNORMAL (ow 90's and high 50s oxygen levels) and FEELING ABNORMAL (Feeling bad). On an unknown date, the patient experienced PRODUCT DOSE OMISSION ISSUE (Has not received 2nd dose). At the time of the report, PULMONARY EMBOLISM (Blood Clot Left Lung), OXYGEN SATURATION ABNORMAL (ow 90's and high 50s oxygen levels), FEELING ABNORMAL (Feeling bad) and PRODUCT DOSE OMISSION ISSUE (Has not received 2nd dose) outcome was unknown. Not Provided The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown), the reporter did not provide any causality assessments. Treatment with warfarin to treat the blood clot as provided by the patient. Based on current available information and the temporal association between product use and the start date of the events a causal relationship cannot be excluded. 1334551	5/20/2021	NH	67	F	3/6/2021	5/18/2021	I was going in for a heart ablation on 5/20/2021, had a CT scan on 5/18/21 and a blood clot was found in my heart. I am a pharmacy Technician and they wanted me to stay on eliquis and added plavix to that to help dissolve clot. I spoke to the pharmacist as I had concerns about taking both and in speaking with him he asked if I had had my covid shot, I said I had, he asked which one and told him the moderna. He then stated his brother had the moderna and developed a blood clot in his lung two wks after. So I thought I should report this, I was very surprised that I had a clot as I faithfully take my eliquis daily and never miss a dose. We don't know how long this clot has been in my heart so there is no way of knowing for sure. But I has noticed in April 2021, a heaviness in my chest, and just assumed it was the Afib.
1332801	5/20/2021			M			blood clots in his nose; White Spots on the Palm of Hand; allergic reaction; This is a spontaneous report from a contactable consumer (patient). A male patient of unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date (Batch/Lot number was not reported) as 1st single dose for covid-19 immunization. The patient medical history was not reported. The patient's concomitant medications were not reported. The patient was having allergic reaction he did have blood clots in his nose that did go after some days but now he did have white spots on the palms of his hands and he wanted to know if it was like common allergic reaction. Outcome of the events was unknown. No follow-up attempts are needed; information about lot/batch number cannot be obtained.

1334787	5/20/2021			F			<p>THROMBOTIC THROMBOCYTOPENIC PURPURA; ALTERED MENTAL STATUS; ACUTE KIDNEY INJURY; LIVER FUNCTION TEST ABNORMAL; EMESIS; This spontaneous report was received from literature dated 2021 May 02; 11-2. This report concerned a 62 year old female. The patient's height and weight were not reported. The patient's concurrent conditions included hypertension, hyperlipidemia, hypothyroidism and gastroesophageal reflux disease. On an unspecified date, the patient received COVID-19 vaccine Ad26.CoV2.S (suspension for injection, intramuscular, batch number unknown), dose, vaccination date and site of administration not reported, for prophylactic vaccination. The batch number was not reported and has been requested. No concomitant medications were reported. On an unspecified date (37 days post vaccination), the patient experienced thrombotic thrombocytopenic purpura (TTP), altered mental status, acute kidney injury, liver function test abnormal, and emesis, and was hospitalized (date unspecified). It was reported by emergency medical services that the patient was found altered in her bathroom combative and covered in faeces. The patient was unable to converse or provide any history. The patient's family reported she was last seen normal around 21:00 hours on an unspecified date and around midnight they heard a loud sound upstairs and went up to find the patient's room covered in emesis, faeces on the floor and she had torn her room apart and ripped things off the walls. It was reported that before going upstairs for bed she was in her normal state of good health and had eaten dinner with her family. The patient appeared altered, unwell and was spontaneously moving all extremities. Physical examination revealed temperature of 36.6 degrees Celsius, blood pressure of 154/131 mmHg, a pulse rate of 87 beats per minute, a respiratory rate of 32 breaths per minute, and pulse oximetry of 96% on room air. There were no signs of trauma; her pupils were 3 mm, equal and reactive. She had a full passive range of motion of her neck, normal heart sounds, tachypnoea with a few scattered wheezes, Glasgow Coma Scale of 12 and skin revealed scattered petechiae. Laboratory workup revealed the following abnormal results: elevated white blood cell count 19.25 k/mcL, absolute neutrophils 15.59 k/mcL, lactate 4 mmol/L, procalcitonin 13.21 ng/mL, and C-reactive</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

protein 6.4 mg/dL. Low fibrinogen 120 mg/dL and platelets 29 k/mL. Urinalysis revealed large haemoglobin and 11 - 25 red blood cells per high powered field. Other tests that included COVID-19 testing, drug screen, haptoglobin, prothrombin time and international normalized ratio were all normal. A complete metabolic was not able to be collected in the emergency department (ED) due to persistently haemolyzed specimens even from the central venous catheter. Computerized tomography (CT) of the brain and cervical spine revealed no acute abnormalities. Chest and pelvis x-ray were normal. The patient had an episode of emesis and there was a concern for aspiration. She was intubated for airway protection and admitted to the medical intensive care unit (ICU). During admission, haematology, neurology and infectious disease were consulted. She was found in the ICU to have acute kidney injury with a blood urea nitrogen of 26 mg/dL and creatinine of 2.19 mg/dL (NR not provided). On an unspecified date, (day 1 of the hospital) haptoglobin became low at below 10 mg/dL. On hospital day 2, her platelet count was reported as "11,000 k/uL", blood urea (BUN) was 66 mg/dL and creatinine was 6 mg/dL. The patient's liver function tests were abnormal with aspartate aminotransferase (AST) of 982 U/L and alanine aminotransferase (ALT) of 231 U/L. Her fibrinogen increased to 619 mg/dL, lactate hydrogenase was greater than 2500 U/L, and her high-sensitivity troponin was found to be 2408 ng/L. Haemoglobin had also dropped from 14 g/dL upon admission to 8.2 g/dL on day 2 of her hospitalisation (NR not provided for all). Her anti-platelet factor 4 test, double-stranded DNA antibody test, and "complement component 3" were normal. Direct coombs was negative and the patient was platelet factor 4 negative. "Compliment component 4" was slightly low at 12 mg/dL and "ADAMTS13" activity was less than 12%. Once in the medical ICU, plasma exchange and high dose steroids were initiated due to worsening platelets. When her haptoglobin and "ADAMTS13" results were abnormal, the diagnosis of TTP was confirmed. While hospitalized the patient required hemodialysis, packed red blood cells for anaemia, plasma exchange, and 10,000 mg of methylprednisolone daily. The action taken with COVID-19 vaccine Ad26.CoV2.S was not applicable. The outcomes of the

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT

thrombotic thrombocytopenic purpura, liver function test abnormal, emesis and acute kidney injury were not reported. This report was serious (Hospitalization Caused / Prolonged).; Sender's Comments: V0: This report from the literature describes a 62-year-old female who developed thrombotic thrombocytopenic purpura (TTP) 37 days after receiving the Janssen COVID-19 vaccine. She suddenly developed emesis and severe mental status changes; physical examination was significant for a blood pressure of 154/31, tachypnea, and scattered petechiae. Initial laboratory evaluation was significant for a platelet count of 29 k/mcl, hemoglobinuria, a BUN of 26 mg/dl and creatinine of 2.19 mg/dl. Computerized tomography of the brain revealed no abnormalities. She was intubated for airway protection and admitted to the intensive care unit. Follow-up labs included: haptoglobin low at 10 mg/dl, BUN 66 mg/dl, creatinine 6 mg/dl, elevated hepatic enzymes, anti-platelet factor 4 negative, and ADAMTS13 activity less than 12% (abnormal). Based on the low haptoglobin and ADAMTS13 activity level, a diagnosis of TTP was made. She underwent hemodialysis, plasma exchange, red blood cell transfusions, and daily methylprednisolone administration. The outcome was not reported. Thrombotic thrombocytopenic purpura is not a labeled event for the Janssen COVID-19 vaccine; however, based on the temporal relationship of the events to vaccination, a relationship with the vaccine cannot be ruled out. The relationship is considered indeterminate

1334756	5/20/2021	NY	56	F	3/25/2021		POSSIBLE CVA; HIGH BLOOD PRESSURE; HEADACHE; POTENTIAL BLOOD CLOT; STOMACH PAIN; LEG PAIN; This spontaneous report received from a patient concerned a 56 year old female. The patient's height, and weight were not reported. The patient's concurrent conditions included polycythemia, and Meniere's disease, and other pre-existing medical conditions included no known allergies. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, intramuscular, batch number: 1805022, expiry: 25-MAY-2021) dose was not reported,1 total administered on 10-MAR-2021 to right arm for prophylactic vaccination. No concomitant medications were reported. On 10-MAR-2021, the patient had no side effects right after the vaccination. On 25-MAR-2021, the patient felt a really bad leg pain in left leg behind the knee which had lasted for five days until 31-MAR-2021 or 01-APR-2021. On 31-MAR-2021, the patient had very bad stomach pain and felt if somebody was stabbing her until 11-APR-2021. On 23-APR-2021, the patient had pain in head, it woke the patient up in her sleep; the patient had no control over the right side of body and was not able to see, walk or talk. The patient did not know how long it lasted. On 24-APR-2021, the patient was lying in bed and felt that somebody taken the bottom of the bed and flipped her out; she also had blurred vision. On 26-APR-2021, patient went to the hospital. The patient underwent a CT (computed tomography) scan and found no bleeding in brain but a possible CVA (cerebrovascular accident-stroke). The patient was asked to admit in the hospital but the patient wanted to go back home. The patient's blood pressure was really high although she had a perfect blood pressure and never took medication before. The patient was scared to take the pill and left the hospital. On an unspecified date, after coming back home, the patient suddenly lost control over left side of the body while taking bath and had blurred vision. The patient was taken to the hospital and found no bleeding in her brain. On an unspecified date in MAY-2021, a week prior to this report, the patient undergone phlebotomy and had to draw 500 ml of blood because patient had polycythemia and her blood was super thick. The patient also had a CT (computed tomography) scan and the results were unknown. On 13-May-2021, the patient had MRI (magnetic resonance imaging) and all

were normal. On 14-MAY-2021, patient would be taking CT (computed tomography) angiography for finding out blood clot in brain. The patient was concerned about all events and was scared to find out if there would be blood clots in her brain. The PCP (primary care physician) of two hospitals she visited told her that she should not have taken the vaccine shot because of her polycythemia. On 14-MAY-2021, the patient's blood pressure was 175/112 (unit unspecified) and in the morning it was 156/117(unit unspecified). The patient was started with unspecified blood pressure medication and also acetylsalicylic acid (Aspirin) to thin her blood. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from stomach pain on 11-APR-2021, and leg pain on 31-MAR-2021, had not recovered from high blood pressure, and the outcome of headache, possible cva and potential blood clot was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0:20210530382-COVID-19 VACCINE AD26.COV2.S- Cerebrovascular accident, Thrombosis, Hypertension. This event(s) is considered not related. The event(s) has an unknown/unclear temporal relationship, is unlabeled, and has unknown scientific plausibility. There are other factors more likely to be associated with the event(s) than the drug. Specifically: MEDICAL HISTORY

1334555	5/20/2021	TX	40	M	4/8/2021	4/8/2021	I experienced ringing in my left ear , non stop since the J&J vaccine about 5 minutes. I also have ringing in my right ear also have had a pressure headache since the moment of vaccine. I seen doctors, had ears cleaned, hearing tests, have seen an ENT specialist and also have had an MRI. MRI was to make sure there was no tumors in my ears, my results were negative. Lab work done for blood clots which were also negative. Today I still continue to experience these symptoms.
1335964	5/20/2021	MI	45	M	3/1/2021		pain in his leg that felt like a clot; pain in his leg; This is a spontaneous report from a contactable consumer, the patient. A 45-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration in the right arm on Mar2021 at 11:15 (at the age of 45-years-old) as a single dose for COVID-19 immunization. Medical history included ongoing venous insufficiency since 2019. Concomitant medications were none. The patient did not receive any other vaccinations within 4 weeks of the vaccine. The patient stated that he received his first dose on 30Mar2021 or 31Mar2021. On an unspecified date, the next day after the first vaccination, the patient experienced pain in his leg that felt like a clot for the first week and a half to two weeks. Then, the patient got a little bit better, even though he had almost gone to the emergency room, but he got better after a couple weeks. The clinical outcome of "pain in his leg that felt like a clot " was resolved on Apr2021. Information on the lot/batch number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021507016 Same patient/drug, different dose/event

1330065	5/19/2021	MD	68	M	4/13/2021	4/23/2021	I had the Moderna COVID-19 vaccine shot one on March 16, 2021 and shot two April 13, 2021. I am not sure when the headaches started, but I estimated about two weeks, or about April 9, 2021. The headache on April 23, 2021 was bad enough that my wife called our PCP. My PCP asked me a lot of questions and said for me to get a blood draw and an MRI without contrast STAT. The report dated April 23, 2021 was ?a Large 1.5 cm thick right frontoparietal subdural hematoma with transfalcine right to left herniation measuring 1.0 cm. Tiny parafalcine and left frontoparietal subdural hematomas. Given recent vaccination, consider contrast enhanced MRV to rule out venous sinus thrombosis.? I was ordered to go to the ER where I was admitted the same day. A neurosurgery team performed an operation on April 27 to drain the internal bleeding that had occurred (possibly for over a month). As I was about to be released on April 28, 2021, my heart monitor recorded a ventricular tachycardia (vtac); I exhibited 17 beats of vtac where no Potassium and magnesium levels were present. A cardiology team then got involved. An EKG and ultrasound were taken April 29, 2021. Since there were no recurring issues, I was released on April 29, 2021. I do not know if the spontaneous subdural hematoma or the ventricular tachycardia could have been an adverse reaction to the COVID-19 vaccine, but I thought I should report it.

1329527	5/19/2021			M			<p>Had some blood clot in his urine; This is a spontaneous report received from a contactable consumer. A male patient with age reported as 52 (unknown unit) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number unknown), via unspecified route of administration on unspecified date in 2021 (reported as Monday or Tuesday) as 1st dose, single for COVID-19 immunisation. The patient's medical history included diabetic. The patient had not had COVID in the past. The patient's concomitant medications were not reported. Reporter stated that she had some questions. Her husband and she got the Pfizer shot and they didn't have anything, everything was fine. They had one family member and he was 52 and diabetic (history) and he worked in an area where he was out of range at the time of this report, so they could not talk to him for about like next half an hour. So, this week, he had the Pfizer shot and he was also put on two new medications (unspecified medications) right after that. He woke and he went to his work today and then he called, and he had some blood clot in his urine. The first thing they thought of was the company which they didn't had (further clarification unknown). So, they just need to know that new medication, also he was diabetic (history) and he had been on the same medication forever and there was no problem but the two new medication that he was put on (sentence incomplete). About lot number reporter stated that she did not have all that. They were just concerned, and reporter was kind of like, reporter asked if he should go to emergency room with the blood clot showed up in the urine or could that just be a urinary tract infection (UTI). It was his first COVID shot and he had not had COVID in the past. Reporter further stated, the two new drugs that he started, they just wanted to know if they need to worry about blood clot like if it could from the shot or it could be from the two drugs that he was taking. Reporter further asked if this was something that he should go to the emergency room. Reporter also asked if blood clot was possible due to Pfizer vaccine or it could be a urinary tract infection. She just wanted to know if Pfizer vaccine did cause blood clot like the Johnson and Johnson did (further clarification unknown). About vaccination date of second shot reporter stated in two weeks or something she did not know. The outcome of the event was unknown. Information about the</p>

1329544	5/19/2021	WV		U			<p>Blood Clot; right leg was red &amp; hot; right leg was red &amp; hot; itching; Pain; This is a spontaneous report from a contactable consumer. A 63-year-old patient of an unspecified gender received second dose of BNT162B2 (BNT162B2), via an unspecified route of administration on an unspecified date (Batch/Lot number was not reported) as SINGLE DOSE for covid-19 immunization. Medical history included covid-19 from 28Mar2021 to an unknown date. The patient's concomitant medications were not reported. The patient experienced blood clot, right leg was red &amp; hot, itching and pain all on unspecified date. On 28Mar2021 I caught covid-19. The staff next at united states penitentiary put me in quarantine until 14Apr2021. They did not do anything for me what so ever while I had covid-19. Shorty after I became better (on my own) I took the exist shot of the vaccine Pfizer. 3 weeks later in the end of this month I took the second vaccine shot. My right leg in my blood vein started burning me up. My right leg was red &amp; hot so I went to commissary to purchase ORAJEL to put my leg to kill the pain and itching. I then put a sick call in to the prison nurse, she came the next day and said you have a blood clot and if it moves to let her know. 3 days later or more she was back in the housing unit and I ask her what she was going to do about my blood clot. She said oh you found have a blood clot you just have the big viens. Outcome of the events was unknown. Information on the lot/batch number has been requested.</p>

1329556	5/19/2021	TN	67	F	4/9/2021	4/1/2021	<p>Sciatica with pain going down the back of her leg; This is a spontaneous report from a contactable Nurse (patient). A 68-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot Number: ER8731), an unspecified route of administration, in right arm on 09Apr2021 (at 67 years) at single dose for covid-19 immunisation. Medical history included ongoing rheumatoid arthritis (diagnosed about a year ago; an overlap with rheumatoid arthritis a year ago; she has been in remission from her rheumatoid arthritis and off medication since Aug2020), ongoing hypothyroidism (diagnosed 2 years before in 2019), ongoing osteoarthritis (for years) and ongoing Sjogren's disease (for years). Previously patient took methylprednisolone (MEDROL) that worked before. The patient's concomitant medications were not reported. The patient developed sciatica with pain going down the back of her leg in Apr2021, serious as medically significant and described as follows: patient had the first dose of the vaccine on 09Apr2021 and her symptoms started two weeks later in Apr2021; she went to her internist on 22Apr2021 because she was in such pain. Internist doctor said she had developed sciatica. Patient reported the pain was going down the back of her leg and knee was hurting, it was very painful, her foot was tingling, like when the foot was waking up from being asleep, has had this feeling before when she first got rheumatoid arthritis, stated behind her knee hurt so bad. Patient had a doppler done on an unknown date in 2021, that was negative for blood clots. Patient was put on a methylprednisolone (MEDROL) dose pack but it did not help at all, did nothing and made no difference whatsoever. Final outcome of the event was not recovered. Patient asked if there was any report of the first dose of the covid 19 vaccine that caused a flare or bring a person out of remission for persons with autoimmune disorders. Patient stated she was not sure if this sciatica was due to the vaccine revving up her autoimmune issues or if it was unrelated. Patient delayed the second dose by one week per the doctor's recommendation and second dose was administered on 07May2021 (at 68 years, lot ER8736) in right arm.; Sender's Comments: Based on available information, the contributory role of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot Number: ER8731), to the</p>

1329665	5/19/2021	NJ	62	F	4/1/2021		<p>BLOOD CLOTS IN BOTH LUNGS; LUNG COLLAPSED; PAIN, SORENESS ON RIGHT SIDE; HURT WHEN TOOK A DEEP BREATH; CONCERN CREEP IN (ANXIOUS); HEART RATE FAST; RIGHT HAND SIDE UNDER RIBS FELT SOME PAIN; GENERAL MALAISE, FELT MILDLY ILL; This spontaneous report received from a patient via a company representative concerned a 62 year old female of an unknown ethnicity and race. The patient's height, and weight were not reported. The patient had no heart problems, pulmonary problems and diabetes. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: Unknown and expiry date: Unknown) dose was not reported, 1 total administered on 11-APR-2021 for prophylactic vaccination. The batch number was not reported. The Company is unable to perform follow-up to request batch/lot numbers. No concomitant medications were reported. On an unspecified date in APR-2021, about a week later of vaccination patient felt mildly ill and experienced general malaise, soreness on right side, and while patient wasn't struggling to breathe, it hurt when took a deep breath. Patient stated that right-hand side, like under ribs, felt some pain; not a bad pain, not enough to took anything for it but just noticed it. The symptoms seemed minor, and at the time, no reports had linked the Johnson vaccine and blood clots. But the following week, when symptoms began cases started to emerge. The patient hadn't panic by reading the reports, but concern did creep in (anxious) and heart rate fast. The patient had never battled serious illness, certainly nothing related to blood clots. Patient thought, might have a reaction. On 21-APR-2021, patient still wasn't feeling well and decided to make an appointment at the urgent care center. Patient soon learned that she had developed blood clots in both lungs due to the vaccine, physician told one of the lungs also had collapsed. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of the general malaise, felt mildly ill, pain, soreness on right side, hurt when took a deep breath, concern creep in (anxious), heart rate fast, blood clots in both lungs, lung collapsed and right hand side under ribs felt some pain was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: 20210531023-Covid-19 vaccine ad26.cov2.s.Blood clots</p>

1329452	5/19/2021	TX	68	F	4/16/2021	4/27/2021	Had headaches and felt nauseated; Had headaches and felt nauseated; Had a blood clot in her lungs; she had tripped and fallen; This is a spontaneous report from a contactable consumer (patient). A 68-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; solution for injection; Lot Number: EN6206) via an unspecified route of administration on 16Apr2021 at 10:00 ("around 10:00 or so"; at the age of 68-years-old) as a single dose in the left arm for COVID-19 immunisation (the patient was "fearful of the new variants and wanted to be extra protected against those variants.") Medical history included COVID in Dec2020 and uses oxygen (normally used oxygen, but not all the time), from an unspecified date and unspecified if ongoing. Medical history was also reported as none. Relevant family history related to the adverse event was reported as none. Concomitant medications (other products) were reported as none. The patient did not receive prior vaccinations, within 4 weeks prior, or on the same date as the COVID-19 vaccine. The patient previously received iodine contrast dye on an unspecified date for an unspecified indication and experienced anaphylactic shock. The patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; solution for injection; Lot Number: EN6207) via an unspecified route of administration on (at the age of 68-years-old) as a single dose in the left arm for COVID-19 immunisation and experienced did not feel well, felt achy and nauseated (captured in AER: 2021495492). On 27Apr2021 the patient experienced had a blood clot in her lungs and she had tripped and fallen and on unspecified dates the patient experienced had headaches and felt nauseated. The course of events was reported as follows: "After the second dose of the vaccine the patient felt fine, she felt pretty much okay. She attributed that to her having had COVID back in Dec2020 based on her biological knowledge. She ran this idea past a pharmacist that said that generally people might take the first dose of the COVID vaccine and be fine and then be worse on the second dose. But since she had COVID in Dec2020 her second dose of the COVID vaccine was the problem like how people's antibodies were already built up and had that reaction so that is why she was fine. She was walking out of the hospital on 27Apr2021, there were people that had

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

crossed in front of them very quickly and her foot had hit the foot of a lady that was pushing a gurney. The patient tripped and fell down and she was taken to the emergency room. In the emergency room, a doctor did some tests and shockingly the doctor said that the patient had a blood clot in her lungs. A physician's assistant told the patient that she needed to have a computerized tomography (CT) scan done. The patient needed to go home to take care of responsibilities there, so she walked out of the hospital. She did not know if she had a blood clot in her lungs or not. Her doctor said that the blood clot in her lungs was based off of two blood values. One was the d-dimer that had a reference value of < 500 and her level was 1,079 and the other blood work was troponin-I but it looked like it should be in the normal range because her level was less than 0.03 and the reference range was 0-0.04, so she would think that she would fall into the normal range. The d-dimer one was kind of scary. She had other tests done. They did a regular complete blood count (CBC) on her, another kind of test and another set of blood values but from looking at the results she was only a little low on a couple of things. They did not do the test with the contrast, but they did take an x-ray of her lung. The technician had found out that she had not had a Computed axial tomography (CAT) scan in a while, since she apparently needed them periodically, and she felt uneasy because that technician was urging her to get a CAT scan. The patient she did not know if these results were relevant or from the COVID vaccine. She did not understand this but when she was looking at the lab notice there was a note that the patient should be monitored for B Type Natriuretic Peptide (b/np) levels. It had the reference range on that one but when she read it, it looked like hers lied within the normal range. After the second dose she just had a headache but did not feel sick, but a week later they were telling her that she had a possible blood clot in her lungs. The patient was concerned at this point because she had no reason as to why she would have a possible blood clot. When she gets exhausted her oxygen drops and sometimes it will without her being exhausted. She was scared to go back to that one hospital. She was thinking about going to another hospital that was 60 miles away. If they would need to keep her overnight, she would need to make arrangements for her animals. She has had

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							headaches, but they may be due to stress. She did not feel sick, other than she had been nauseated. The patient stated that she was not saying that what was reported on report 1 of 2 was due to the Pfizer COVID vaccine but why would they say that she had a blood clot too." The clinical outcomes of the events had a blood clot in her lungs, she had tripped and fallen, had headaches, and felt nauseated were all unknown.
1330193	5/19/2021	UT	63	F	3/6/2021	3/16/2021	I experienced usual side effects, fever and chills but the entire reason is that I have swelling and edema in both feet and ankles enough so to concern doctors. I went to clinic on 03-26-2021 for evaluation. They put me on 3 day steroids. I went back to First med which they put me on a 6 day course of medication of steroids. I then went to my podiatrist, of my right ankle, I was scanned for blood clots but no blood clots were found. My exams only identify swelling and edema. I can only take NSAID'S. I have to get up wait a few hours to move. My ankle swelling and edema nerve decreases and my feet hurt so bad when I apply pressure. I had an MRI done as well and I am very upset that they cant find why I can not walk without pain and swelling. My doctors at this point do not what to do for me and I would like some answers. To this day, I am still having swelling and edema to both of my feet and ankles.

1329018	5/19/2021			F		2/1/2021	<p>now was dealing with low iron count and getting infusions.; now was dealing with low iron count and getting infusions.; superficial blood clot to left lower leg found last week at dr office/blood clots pt no longer having issues with clots; This is a solicited report from a non-Pfizer sponsored program (marketing program name not available) from a contactable consumer, based on information received by Pfizer. This serious solicited report was reported to Amgen on 26/FEB/2021 by a consumer from a commercial program and involves a 72 year old female patient who had superficial blood clot to left lower leg [PT: thrombosis] while receiving Enbrel, Single Dose Prefilled Autoinjector. No historical medical condition was reported. The patient's current medical condition included rheumatoid arthritis. No concomitant medications were provided. No co-suspect medications were reported. The patient began Enbrel, Single Dose Prefilled Autoinjector on an unknown date. Last week on an unknown date in FEB/2021, the patient noticed a superficial blood clot to left lower leg at physician's office. The patient was treated with unspecified medications. The outcome of the event thrombosis was reported as unknown. Action taken with Enbrel and Single Dose Prefilled Autoinjector was reported as unknown for the event thrombosis. The causal relationship between the event thrombosis and Enbrel with Single Dose Prefilled Autoinjector was not provided by the consumer. The reporter declined to provide the lot number. The reporter declined consent for follow up. No follow up attempts are possible. No further information is expected Amgen comment: This individual case report does not change the safety profile of the product. Amgen Causality Assessment: The event thrombosis leg was assessed as related to etanercept by Amgen. The reporter's assessment of thrombosis leg with the suspect product was not provided at the time of this report. Since no determination has been received, the case is managed based on the company causality assessment. Follow-up (06May2021): This is a follow-up solicited report from a non-Pfizer sponsored program from a contactable consumer, based on information received by Pfizer from Amgen, license party for etanercept (ENBREL). ADDITIONAL INFORMATION RECEIVED ON 06/MAY/2021: In this follow up, it was reported that the patient experienced blood clots pt no longer having</p>

----------	-------	-------	---------	-----	----------	------------	--------------

issues with clots [PT: thrombosis] while receiving Enbrel, Single Dose Prefilled Autoinjector. The patient's current medical condition included low iron. The patient's concomitant medications included covid-19 (corona virus disease -2019) vaccine. On an unknown date, the patient received covid-19 (corona virus disease -2019) vaccine. On an unknown date in FEB/2021, the patient had blood clot (previously reported). Then on an unknown date in 2021, the patient stated that she had no longer having issues with clots. The patient stated that they thought it might be related to covid or covid vaccine. The patient stated that she now was dealing with low iron count and getting infusions. The patient stated she had low iron as a kid. The outcome of the event thrombosis was reported as recovered/resolved. The event thrombosis was resolved on an unknown date in 2021. The reporter declined consent for follow up. No follow up attempts are possible. No further information is expected. Amgen comment: This individual case report does not change the safety profile of the product. Amgen Causality Assessment Thrombosis leg is serious and related to etanercept. The reporter's assessment of thrombosis leg with the suspect product was not provided at the time of this report. Since no determination has been received, the case is managed based on the company causality assessment.; Sender's Comments: Based on the information currently available and the safety profile of the drug there is a reasonable possibility that suspect product etanercept contributed to the occurrence of the event, thrombosis leg. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

1329088	5/19/2021	PA	56	M	4/3/2021		<p>BLOOD IN THE STOOL; SHORTNESS OF BREATHE; TINGLING IN THE FINGERTIPS AND THE TOES; SORENESS IN THE RIBCAGE NEAR THE HEART/LEFT CALF SORENESS; PUMPING SENSATION IN RIGHT SIDE OF HEAD; TIREDNESS; RIGHT ARM SORENESS; COUGHING; LIGHT HEADEDNESS SENSATION; HEMORRHOIDS; This spontaneous report received from a patient concerned a 56 year old male. The patient's height, and weight were not reported. The patient had no relevant medical history and was not on regular medication. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1805022, and expiry: UNKNOWN) dose was not reported, once total administered on 01-APR-2021 on left arm for prophylactic vaccination. No concomitant medications were reported. Patient reported that, he received the vaccine on 01-APR-2021. Approximately 2 days after he coughed and felt lightheaded and noticed some lights around his eyes. Approximately 7 days after patient noticed a list of symptoms including a pumping sensation in the right side of his head, left calf soreness, soreness in the ribcage near the heart, a tingling sensation in the fingertips and toes (but not at the center), sense of tiredness, shortness of breath, blood in stool that he referred to repeatedly as clots, right arm soreness (although the injection was given in the left arm). Patient called his doctor twice and was told to go to the hospital. Patient went to the hospital on 04-MAY-2021. Arrived at 12 PM and discharged at 11 PM approximately. Conducted a chest x-ray, took a blood sample twice, and put some stuff on patient's chest. Patient was discharged on 04-MAY-2021 and given a prescription for Motrin 800 mg taken three times per day as needed, and for cyclobenzaprine 10 mg taken twice a day as needed for spasms. Patient decided not to take these medications as he was unsure if they were pain medications and felt apprehensive. He main concerns seemed to be the pumping sensation in the right side of his head and the blood in his stool which he repeatedly referred to as a clot. His family doctor is aware of the situation and says he thinks its hemorrhoids. He refers to the clot as darker red in colour and also mentions that there is regular red blood in stool alongside the darker clot. Patient notices this about 3 times per week. The action taken with covid-</p>

1329170	5/19/2021	NH	45	F	4/18/2021	4/22/2021	Small Pulmonary Embolism; blood clots in upper arm, arm pit, neck, across right side of chest; Opposite arm blew up like a balloon; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of PULMONARY EMBOLISM (Small Pulmonary Embolism) and THROMBOSIS (blood clots in upper arm, arm pit, neck, across right side of chest) in a 45-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 18-Apr-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 22-Apr-2021, the patient experienced PULMONARY EMBOLISM (Small Pulmonary Embolism) (seriousness criteria medically significant and life threatening), THROMBOSIS (blood clots in upper arm, arm pit, neck, across right side of chest) (seriousness criteria medically significant and life threatening) and PERIPHERAL SWELLING (Opposite arm blew up like a balloon). At the time of the report, PULMONARY EMBOLISM (Small Pulmonary Embolism), THROMBOSIS (blood clots in upper arm, arm pit, neck, across right side of chest) and PERIPHERAL SWELLING (Opposite arm blew up like a balloon) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. No concomitant medication information was provided by the reporter. Treatment medications for the events included Xarelto (rivaroxaban). Reporter states patient went to Urgent Care on 22-Apr-2021 due to the events and was then told to go to the Emergency Room. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

1329459	5/19/2021	TX	72	M	4/16/2021	4/16/2021	unresponsive; had a stroke in his temporal, frontal and parietal regions of his brain and he has even had prior strokes too; feverish; they all fell down, her brother, her and the rollator; rapid heartbeat/ his normal heartrate is in the 60s and it was going from 110 to 140s and it wasn't coming down; had some blood clots that were thrown into the frontal, temporal and parietal region in his brain; agonal breathing; stopped breathing but then he came back so that's when he was intubated; felt very bad/ malaise/ feeling ill; vomiting in the trash can/ had stuff that looked like had came out of his mouth and he had vomit on legs; he just said that he hurt; nauseated; fatigue; his head hurt; having no appetite/ he ate one bowl of soup that the caller had made for him but he wasn't really eating; This is a spontaneous report from a contactable consumer (patient's sister) via a Pfizer-sponsored program. A 72-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in the right arm on 16Apr2021 10:00 (batch/lot number: unknown) as 2nd dose, single for COVID-19 immunisation. Medical history included blood clot years ago, ongoing leukemia (in remission), coma, gout (he takes a gout medicine), neuropathic pain, pain, high blood pressure, thyroid (disorder), varicose veins and uses rollator (his wheelchair with a seat). Concomitant medications included metoprolol taken for high blood pressure from an unspecified start date and ongoing; levothyroxine sodium (THYROXINE) taken for thyroid from an unspecified start date and ongoing; hydrocodone taken for pain from an unspecified start date and ongoing; imatinib taken for leukemia in remission from an unspecified start date and ongoing; gabapentin taken for neuropathic pain from an unspecified start date and ongoing; iron taken for an unspecified indication, start and stop date were not reported; folic acid (FOLATE) taken for an unspecified indication, start and stop date were not reported; vitamin d nos (VITAMIN D) taken for an unspecified indication, start and stop date were not reported; and ongoing unspecified gout medicine. The patient previously took morphine; he had a shot of morphine in the emergency room sometime before his COVID vaccine. Historical vaccine included BNT162B2 on 25Mar2021 (batch/lot number: unknown) as 1st dose, single for COVID-19 immunisation. Vaccination facility

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

was PRIVACY she thinks. Prior vaccination (4 weeks prior) were none. The patient's sister reported that they both had their second dose and she forgot to tell the other woman she spoke to about herself because the caller's focus was on her elderly brother who was 72-years-old. They both received their COVID vaccines in the morning of 16Apr2021, a Friday, and within hours her brother felt very bad. She went downstairs and saw her brother vomiting in the trash can and he just said that he hurt and that he felt nauseated. This continued for a few days, in fact it continued for 4 days. He was beginning to feel better on Monday, but he was still not up to par. Then Tuesday she guesses her brother was feeling better. On Wednesday night she went downstairs and heard him around 2300 to midnight talking to the dogs and then the next morning she found him unresponsive (22Apr2021). Her first thought was that maybe her brother had a stroke so she called 911. In the emergency room he had a CAT (computerized tomography) scan and at first they said that he didn't have a stroke. But something very unusual was that her brother had a rapid heartbeat and his normal was around 60 but in the emergency room his heartrate was upwards to 120 to 130 to 140. He was then transferred to another hospital where they said the next evening that in fact he did have a stroke even though that first doctor said that he didn't have a stroke. The doctor didn't find any further information until 2 days later when the doctor thought her brother already had some blood clots that were thrown into the frontal, temporal and parietal region in his brain. She was a biologist so she can't say that the COVID vaccine caused this but she thought that Pfizer should be aware of his situation and then she was so focused on her brother that she forgot to tell the other woman the really bizarre things. She had asked certain questions to the doctor based on what her sister was telling her to ask. The caller asked the doctor if her brother was going to be seen by a neurologist and the doctor gave a rambling evasive answer and then turned on his heels and walked out and kicked her out of the hospital. They both had their COVID vaccines in the morning around 1000 or so and she doesn't know if he was vomiting still the next day or not but her brother felt really bad. He has chronic conditions and he generally just felt bad and he had thought that something was wrong with him. He felt

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

malaise, fatigue, his head hurt and he was nauseated. He ate one bowl of soup that the caller had made for him but he wasn't really eating. That lasted for about 4 days and then he started to feel better on Tuesday, confirmed to 20Apr2021, and then he felt even better on Wednesday, confirmed to 21Apr2021, because the caller did take him on some trips. He doesn't drive. Her brother said that he felt feverish and the caller says that he felt feverish to the touch as well but the thermometer said that he didn't have a fever because it had an error sign when she took his temperature. Unresponsive: Her brother was fine Wednesday night around 2300, maybe midnight, she had heard him downstairs talking to the dogs and she knew that he was okay. Then the next morning, 22Apr2021, she found him slumped into his rollator (his wheelchair with a seat) and he was slumped over and had stuff that looked like had came out of his mouth and he had vomit on legs. He was unresponsive so she called 911 and said that she thought her brother had a stroke. The operator said to lay him flat and the caller was finally able to get him up and then his arm got hung up and the operator said again to get her brother on the floor and get him flat. She understands that this was important and she was able to do it but they all fell down, her brother, her and the rollator. Shortly after this the ambulance had shown up. The ambulance took her brother to the emergency room in town and they said that her brother's heartrate was fast. She gave them all of the relevant information but she didn't think to tell them about the COVID vaccine. They said that her brother's heart was acting erradicate and it was very fast. Again, his normal heartrate is in the 60s and it was going from 110 to 140s and it wasn't coming down. She told them that when he was unresponsive that she thought he was having agonal breathing. In the emergency room, her brother's breathing was still not very good and she heard the doctor say that her brother had stopped breathing but then he came back so that's when he was intubated in the emergency room. They did a CAT scan of his head and his neck and the doctor comes back and said that her brother didn't have a stroke. But that was not the case according to a different doctor's later assessment. Approximately around 1430 to 1445 on that Thursday, 22Apr2021, they transferred him to PRIVACY, where he was in the ICU (Intensive Care Unit). His heartrate

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

conditioned to being very fast. He went from the emergency room to the ICU. Thursday when he got transferred to the ICU they didn't do any diagnostic tests that day, he was still intubated and his heartrate was still up into the next day, Friday, 23Apr2021. It wasn't until late in the afternoon that a doctor came in and said that her brother did have a stroke he has even had prior strokes too. They had done an MRI (Magnetic resonance imaging) on Friday of his brain, which was not what they did in the first emergency room, that showed that he had a stroke in his temporal, frontal and parietal regions of his brain. At first caller states that on Saturday, he opened his eyes but he was still unresponsive essentially but then she says that this statement was wrong because he actually didn't respond that quickly. He has gone into a coma once before and when he had came out of it a very unpleasant thing happened that was very personal so she was not going to tell it. On Saturday and Sunday the doctor didn't want to answer the callers questions, this was a different doctor than the first ICU doctor and this one didn't have good bedside manner. Finally on Monday, 26Apr2021, her brother started responding. He was moving his legs with purpose, he had tried to kick the nurse, and he had made some words. The day before this, on Sunday the caller had brought the priest in to bless her brother and he sort of nodded and he seemed to make movements but he was still not able to talk. Monday he said what sounded like words and then Tuesday he made, what seemed to her like, meaningful statements. She was told that he had an ultrasound of his neck to see if he had any clogged arteries or veins and the nurse said that the test results came back good that their were no clogs. But this was where the whole story just becomes awful. Caller discusses how there were issues with a cousin having power of attorney from 2015 that was supposedly no longer valid according to the caller and she had spoke with administration and then she got kicked out of the hospital on Tuesday because of a question she had asked the doctor about her brother seeing a neurologist. The doctor said that the neurologist makes his own schedule and it might be 10 days or more if he even decided he wanted to see her brother. When the doctor asked the caller how would she like her brother's care to be she mentioned that he was in a coma before and was being treated for similar circumstances

---

from PRIVACY and that he was seen by a neurologist and she said that maybe her brother should be seen by PRIVACY and the doctor walked out and within minutes she was being escorted out of the hospital for belittling the doctor and calling administration. Now they won't even let flowers be delivered to her brother. Unfortunately the person who has been involved with him the most, the caller, was now barred from him. She was not saying that this was all due to the Pfizer COVID vaccine but why were they saying that she has a blood clot too. She has had headaches but they may be due to stress. She didn't feel sick like her brother. She has a question and she was really scared about the answer. She was just now reading that if you're on immunosuppressant drugs then you're not supposed to have the COVID vaccine. She asked was that true. Well her brother was in remission for leukemia and he was on a cancer medication called imatinib. Caller declined to speak to medical information about this and says it was already too late because he was already taking it and she doesn't know why he didn't stop them. Her brother's friends have tried to call and they were all getting the same statement, which she believes the hospital was stone walling, but the hospital says that they don't have a patient by his name and they have even told the florist the same thing. So caller was unsure if her brother has been discharged or not. He didn't seem to be in the shape to be shipped to a care facility but she doesn't know. It was hard for her to piece it all together. The hospital wasn't feeding her brother enough before she left so for all she knows they could be starving him to death and holding nutrition from him. History/ Investigations: His medications were ones that he has been taking for years and she doesn't know exact start dates for any and if she needs to she can get the dosage information from the pharmacy. Her brother has hid his pills before and he puts them in different bottles, it was a nightmare. He takes a gout medicine and she doesn't know the name of it. Those were the main ones that he takes other than the cancer medicine she said earlier. And he also takes gabapentin for some of his neuropathic pain and he takes something at night and a few others she thinks. For medical conditions the only thing that she knows was that many years ago he had a blood clot but she can't really say what year it was. She does know that her brother wasn't on any blood thinners

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

to he knowledge and not long ago he had an ultrasound of his legs to determine if he had a blood clot but she was not 100 % sure if he had that but she thinks he did. Her brother told her that years ago he had blood clots that were due to weight lifting causing varicose veins and later they collateralized and they found out that the other secondary vessels took over for pumping his blood so it wasn't a problem. Her concern was can someone from Pfizer talk to her about what's going on with her brother, she knows Pfizer doesn't have his records but how will Pfizer be able to determine if this was from the COVID vaccine. She guesses that she was curious about what may of caused the blood clots. She mentioned the COVID vaccine to one doctor and he didn't seem like she respected her knowledge. She asked was there anything that can be done to help her brother if it was a blood clot. She was upset that the hospital and her wanting her brother to see a neurologist and beginning with a claim that he didn't have a stroke and then a claim that he did. She thinks that they were not doing enough for her brother and they were just saying oh well, it was all due to a fast heart rate which can happen as a result of the COVID vaccine. She was going to be honest, she was exhausted and she can't keep talking for a long time. She asked if she can call medical information back later when she was more refreshed. Consumer further stated that her brother had complaints of feeling ill, feverish and having no appetite. Caller stated that the next Thursday she found her brother unconscious, heart rate was elevated 120 to140 beats per minute and that her brother had a stroke. The outcome was recovered on 21Apr2021 for the events Malaise, Nauseated, Fatigue, Headache and Appetite absent; recovering for the event Vomiting; and unknown for the rest of the events. Information on lot/batch number has been requested.

<i>VAERS_ID</i>	<i>RECVDATE</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1329329	5/19/2021		41	F	1/11/2021	1/1/2021	Blood clot in neck; Shortness of breath (dyspnea); Pressure on her chest; Edema to her feet; Weight gain of 2 pounds overnight; Rash on chest; Rash on chest, possibly due to tape (dermatitis contact); Heart palpitations; Oxygen saturations dropped to 85% on room air; Diarrhea; This is a solicited report based on information received by Pfizer. A contactable consumer reported that a 41-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date: unknown), via an unspecified route of administration on 11Jan2021 at a single dose for COVID-19 immunization; treprostinil sodium (REMODULIN), intravenous from 03Mar2020 to an unspecified date at 0.041 ug/kg, then at 0.045 ug/kg with therapy dates unspecified, and then at 0.049 ug/kg with therapy dates unspecified, for primary pulmonary arterial hypertension; and macitentan (OPSUMIT) on 11Jan2021, orally from 11Jan2021 at 10 mg, 1x/day for primary pulmonary hypertension. Medical history included ongoing primary pulmonary arterial hypertension. Concomitant medication included sildenafil citrate. On 15Jan2021, the patient had a blood clot in neck. The patient was hospitalized from 15Jan2021 to 16Jan2021 due to the blood clot in neck. It was reported that on 15Jan2021, which is 10 months 13 days after initiating IV Remodulin, the patient was hospitalized due to blood clot in her neck. The patient went to the emergency room on 15Jan2021 and she was planned to be admitted to change her catheter, later she was hospitalized on the same day and her Remodulin central line was changed as per the prior plans of getting the catheter changed. The patient was discharged on 16Jan2021. The patient then had a rash to her chest (dermatitis contact previously reported) that started on 20Jan2021. The patient believed it was from the original dressing that was placed after her catheter was replaced. The rash to left chest around her Remodulin catheter line (dermatitis contact previously reported) was also reportedly itchy at night. On an unknown date in 2021, the patient's oxygen saturations dropped to 85% on room air (oxygen saturation decreased). The patient continued to have rash on her chest (dermatitis contact previously reported). On 29Jan2021, 10 months 27 days after initiating IV Remodulin, the patient was in the emergency room due to increased shortness of breath, pressure on

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

her chest, edema in her feet and a weight gain of 2 pounds overnight. All the tests were negative but during walking test, the patient's oxygen saturation dropped to 85% on room air. The patient was advised to wear mask continuously. 2 weeks after receiving the first COVID-19 vaccine, the patient had heart palpitations, shortness of breath, and chest pressure 2 weeks after receiving the first COVID-19 vaccine (dyspnoea and chest discomfort previously reported). The patient went to the ER (emergency room), had worked up and was seen by a pulmonologist, nothing was found, and the patient was released home. The prescribing physician's practice ordered her to wear oxygen (O2) continuously. The patient said that she only wears it when she leaves the house and at night and was fine. She felt this episode was related to the COVID-19 vaccine and was not receiving the second dose. The patient stated that her physician had took her off the Opsumit due to shortness of breath (dyspnoea previously reported). The events 'blood clot in neck', 'shortness of breath (dyspnea)', 'pressure on her chest', 'edema to her feet', 'weight gain of two pounds overnight' and 'heart palpitations', resulted in emergency room visit. The event, 'diarrhea', was controlled with diphenoxylate and atropine (LOMOTIL). The patient had a walking distance test on an unspecified date in 2021 (results were not provided) and weight was 209 lbs on an unspecified date in 2021. The events, shortness of breath (dyspnea)', 'pressure on her chest' and 'heart palpitations', was reported as serious (medically significant). The events rash on chest, and rash on chest possibly due to tape (dermatitis contact) had not resolved while the outcome of the rest of the events was unknown. The reporter's assessment of the causal relationship of the events with the suspect product was not provided at the time of this report. Since no determination has been received, the case is managed based on the company causality assessment. Follow-up (12Mar2021): This is a follow-up solicited report based on the information received by Pfizer. Additional information included medical history, suspect drug data, reaction details and clinical course details. Information on the batch/lot number has been requested. Follow-up (04May2021): This follow-up is being submitted to notify that the batch number is not available despite the follow-up attempts made. Follow-up attempts have been

1329437	5/19/2021	PA	34	F	2/7/2021	3/13/2021	<p>endometriosis; fibroids; I recently received my Covid vaccine and about a month later had a hospitalization due to abnormal uterine bleeding; This is a spontaneous report from a contactable consumer (patient). A 35-year-old female patient received her second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; lot number: EN5318, expiration date not reported), via an unspecified route of administration on 07Feb2021 09:00 (at the age of 34-years-old) at 2nd dose, single in the left arm for COVID-19 immunisation. Medical history included two C-sections (patient was over a year post-partum from having her last child). Concomitant medication included citalopram hydrobromide (CELEXA) for anxiety from Apr2020 to an unspecified date at 10mg, daily, and from Apr2020 and ongoing at 20mg, daily. Historical vaccine included first dose of BNT162B2 on 17Jan2021 09:30 given intramuscularly for COVID-19 immunisation. The patient reported that recently, she received her COVID vaccine and about a month later, on 13Mar2021, she was hospitalized due to abnormal uterine bleeding. The patient has no significant medical history gynecologically, so she wanted to see if there was any correlation with receiving the vaccine and her abnormal uterine bleeding. The patient further stated that she was bleeding heavier than normal and was hospitalized because she had a heavy uncontrollable bleeding that started on 16Mar2021, and also had larger than normal clots, started on 15Mar2021, which presented like fibroids or endometriosis, however, she does not have any of these. The patient had three episodes. On 16Mar2021, the patient went to the emergency room due to bleeding. The patient was there most of the day and was sent home later on. On 17Mar2021, she went to the emergency room by ambulance and was admitted to the hospital. The patient lost so much blood that she had to have five transfusions. The patient was also treated with blood pressure medications because everything was coming out. While in the hospital, the patient had a uterine artery embolization. After discharge, she followed up with the gynecologist who followed her through the hospital. She had no gynecological history of any kind prior to this. The doctors were unable to give a definite explanation as to why this happened. It may have been hormonal at this time in the patient's cycle. She was over a year post-</p>

partum from having her last child and she had two C-sections with no issues. The patient stated that this could be completely coincidental. At the hospital on Mar2021, the patient had labs and an ultrasound. The results were in her patient portal online. She had blood work drawn a few days after hospital discharge ordered by the gynecologist and another blood work several weeks later, ordered by her primary care provider. The patient was placed on Iron 325mg by mouth twice daily and was prescribed pain medication, but the patient never took it. The patient was currently taking doxycycline 100mg tablets every 12 hours for inflammation response from the uterine artery embolization procedure that she had. The patient was unsure if this was coincidence or related. The vaccine was the only thing she can think of that may have been a contributing factor. The patient went to emergency room and was hospitalized due to the events. The patient was discharged from the hospital on 21Mar2021. Outcome of the events abnormal uterine bleeding, and bleeding was recovered on 19Mar2021, for event clot blood was recovered on 18Mar2021, and for other events was unknown.

1329441	5/19/2021			M	2/24/2021		immune complex mediated response due to vaccine; portal vein thrombosis; experienced a 30 pound weight loss (over the past two months); night sweats; intermittent fever of unknown origin; chills; This is a spontaneous report from a contactable health care profession and follow up report from a contactable consumer via Pfizer-sponsored program. A 74-years-old male patient received the second dose bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; ), via an unspecified route of administration on 24Feb2021 (Batch/Lot Number: Not provided) as 2nd dose, single for covid-19 immunisation . Medical history included coronary artery, chronic obstructive pulmonary disease, chronic kidney disease, type II diabetes mellitus, hyperlipidaemia, hypertension. The patient's concomitant medications were not reported. The patient experienced immune complex mediated response due to vaccine, portal vein thrombosis, night sweats, intermittent fever, chills, experienced a 30 pound weight loss (over the past two months) on an unspecified date. The patient underwent lab tests and procedures which included ESR: 101 (elevated), CRP: 225 (elevated), White blood cell count elevated (18 today), Procalcitonin: 1.89 (elevated), Haptoglobin: 380, Quantitative IgG: 1.664 (elevated), Antinuclear Factor 1:320 ANA (at first came out negative then positive), Beta-2glycoprotein IgG: 33.4, Antiphospholipid panel: positive, Tumor marker CA 19-9: 46 (Mildly elevated) all on an unspecified date. Negative Lab results: Negative Cultures, Covid-19, RVP, TB, Hepatitis panel, dsDNA, EBV antigen, CMV, Lyme titers, quantitative IgA and IgM, beta 2 glyco IgA, venous duplex, white cell scan, nuclear scan of bone marrow, PNH panel all on an unspecified date. Reporter inquired Are there any reports on portal vein thrombosis after receiving both doses of the Pfizer Covid-19 vaccine? The clinical course was reported as follows Medical assistant stated that she has been treating a 74 year old male patient who received the first dose of the Pfizer Covid-19 vaccine on 02FEB2021 and the second dose on 24FEB2021 and after two weeks of receiving the second dose the patient started experiencing night sweats (2-3 times a night), intermittent fever of unknown origin and chills, he experienced a 30 pound weight loss (over the past two months) and portal vein thrombosis, at this point the differential includes an immune complex mediated

response due to vaccine. He has been admitted for two weeks (admitted on 20APR2021) and performed rheumatology, oncology, hematology panels and ruled out infectious causes. It was also reported They did a full work up but nothing came up except that PRIVACY has a portal vein thrombosis. They are wondering if it is related to the vaccine and if there are some reports regarding this side effects. First dose of the vaccine was given 02Feb or 03Feb (reporter is not sure). Second dose of the vaccine was given 24Feb2021. The clinical outcome of the events was unknown

This is a spontaneous report from a contactable consumer (patient). A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date: unknown), via an unspecified route of administration on 09Apr2021 as 1st dose, single; via an unspecified route of administration on 30Apr2021 as 2nd dose, single for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient experienced first signs of blood clot on 28Apr2021 and ended up in hospital from 30Apr2021 to 02May2021, getting blood thinner. The patient thought he/she should report this in case it is possibly connected to vaccine. The outcome of the event was unknown. Information on the lot/batch number has been requested.

1329453	5/19/2021	PA	64	M	4/2/2021	4/2/2021	fainted; fell and hit his head; fell and hit his head; felt lightheaded/Dizziness; blood clots in his lungs; he has a spot on his lung that they are monitoring; hypoacusis and has a new hearing aid; This is a spontaneous report from a contactable consumer (patient's wife). A 64-years-old male patient received the first dose bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; ), via an unspecified route of administration, administered in Arm Left on 02Apr2021 (at the age of 64 years old) (Batch/Lot Number: ER8733) as 1st SINGLE DOSE for covid-19 immunisation. Medical history included severe sleep apnea from 18Mar2021 (received a machine not long after), gout (diagnosed about four years ago) , ex-tobacco user from an unknown date to an unknown date (two pack a day smoker over thirty years). Concomitant medication included colchicine (COLCHICINE) 0.6 mg, 1x/day taken for gout, start date was not reported to Apr2021. The patient experienced blood clots in his lungs (hospitalization, medically significant) on 02Apr2021 (also reported as 02May2021). , fainted, fell and hit his head, felt lightheaded/dizziness on 02Apr2021, The patient was hospitalized from 2Apr2021 to 4Apr202. It was reported the patient experienced hypoacusis and has a new hearing aid on an unspecified date. Caller says her husband has new hearing aids, which is why he is not doing the report himself. Patient has a spot on his lung that they are monitoring on an unspecified date. The patient underwent lab tests and procedures which included blood test: results unavailable on an unspecified date , 'they did a couple tests' (details not provided) results unavailable on 02Apr2021, urine analysis: results unavailable on an unspecified date. Therapeutic measures were taken as a result of blood clots in his lungs included Thrombectomy on 02Apr2021. The clinical course was reported as follows on April 2nd her husband received his first dose of the Pfizer COVID-19 vaccine. Approximately an hour later they went to the market and he felt lightheaded, so instead of getting out of the car they sat there 20 minutes. He started to get out again then halfway out the door he fainted and fell down on the ground. She says he was out for, 5-10 minutes, clarified to not even a minute. Since he hit his head she called an ambulance, and they took him to PRIVACY in PRIVACY. They did a couple tests and said since it was so soon after getting the vaccine that they did not think

1330328	5/19/2021	PA	52	M	5/4/2021	5/13/2021	<p>the vaccine had to do with his blood clots. Caller also stated he fainted because that was one of the side effects of the vaccine, but they were glad he got there since he had several blood clots in his lungs. On the same day (02Apr2021) he had a thrombectomy to remove the blood clots and put him on a blood thinner. Patient was admitted to the hospital April 2nd and was discharged April 4th. He is doing better, he is on a blood thinner now. She says there were a few doctors that had to weigh in on whether he should get the second dose, they decided it wouldn't affect it since the vaccine goes into his muscle. No other vaccinations on the same days as his Pfizer COVID-19 vaccinations or during the four weeks prior. Once they placed him on a blood thinner, they took him off Colchicine 0.6mg. He stopped taking Colchicine because they said the blood thinner doesn't work with that particular medication. It was also reported The patient is to schedule an appointment with a rheumatologist and a hematologist, they did blood work and a urine test and said he has a spot on his lung that they are monitoring. The clinical outcome of the event blood clots in his lungs was Recovered/Resolved with Sequel while the remaining events was unknown. The second dose bnt162b2 was administered on April 29th. LOT: ER8751, caller hopes that is a 5, the writing is very bad on there. The patient had no side effects from his second dose of the Pfizer COVID-19 vaccine.</p> <p>On 5-13-21 the patient began complaining of dizziness, weakness, and left side chest pain. The patient was sent to a hospital via 911 ambulance and admitted to the hospital from 5-13-21 to 5-18-21. He was diagnosed with a Pulmonary Embolism, Acute Venous Thrombosis, and a Pulmonary Embolism.</p>

1329495	5/19/2021	OK	78	F	2/24/2021	2/28/2021	<p>numerous blood clots below the knee; left leg swelling/ It got so swollen/left foot swelling; pain with walking left leg; This is a spontaneous report from a contactable nurse reporting for herself. A 78-years-old female patient received bnt162b2 (BNT162B2), dose 2 via an unspecified route of administration, administered in Right Arm on 24Feb2021 (Batch/Lot Number: EN6202) as single dose for covid-19 immunisation (Age at vaccination 78 years). The patient medical history was not reported. On 04Feb2021 the patient received the first dose of BNT162B2 and experienced sore arm. The patient's concomitant medications were not reported. The patient experienced pain with walking left leg on 28Feb2021 with outcome of recovering , left leg swelling/ it got so swollen/left foot swelling on 03Mar2021 with outcome of not recovered , numerous blood clots below the knee on 04Apr2021 with outcome of not recovered. The patient underwent lab tests and procedures which included blood test: unknown results, ultrasound joint: numerous blood clots below the knee on 04Apr2021 , vital signs measurement: unknown results. Course of the event: The patient waited for the timeframe after the second dose and had no problems. 4 days after, she experienced pain with walking in her left leg. She took Aleve for a few days. It got so swollen, she should have gone then to her Primary Medical Doctor, but she did not go until 25Mar2021. She was sent to Hospital for an Ultrasound of her leg on 04Apr2021. After the Ultrasound, she was taken to the Emergency Department at the hospital. The doctor told her she had numerous blood clots below the knee. Was prescribed Eliquis 5mg. She was instructed to take 2 tablets or 10mg twice a day, 8hrs apart for 1 week and then 1 tablet twice a day for the remainder of the 74 tablets. She completed that. She was out of them and got a refill of Eliquis 5mg on 26Apr2021. She received 60 tablets and can refill for 5 times. She is really concerned. The swelling is still so bad and so that could that mean blood clots are still in there. The ER doctor told her that the medication is dangerous. It thins the blood and can cause bleeding and the blood clot can go to her heart. Follow up information has been requested.; Sender's Comments: The causality has been assessed as related to bnt162b2 (BNT162B2), dose 2 via an unspecified route of administration, administered in Right Arm on 24Feb2021</p>

Further information has been requested.; Sender's Comments: Very limited information regarding this event/s has been provided at this time. Further information has been requested.
1331012	5/19/2021	NC	72	M	3/19/2021	3/20/2021	Per client, "I received the second dose of Moderna in my right arm on 03/19/2021. The next morning on 03/20/2021 around 9:00 AM, I noticed my left arm swelling. I got to feeling real bad. On 03/25/2021, I was feeling so bad that I went to Family Medicine to see my doctor, MD. He sent me straight to the Emergency room. They gave me the clot buster for my left arm. I was in there for 3 or 4 days. I was discharged. I have blood clots in my lungs. I had a follow up appointment. I also started seeing a new doctor, a pulmonologist, for the blood clots in my lungs. I lost a lot of weight, 32 pounds.

1329329	5/19/2021		41	F	1/11/2021	1/1/2021	Blood clot in neck; Shortness of breath (dyspnea); Pressure on her chest; Edema to her feet; Weight gain of 2 pounds overnight; Rash on chest; Rash on chest, possibly due to tape (dermatitis contact); Heart palpitations; Oxygen saturations dropped to 85% on room air; Diarrhea; This is a solicited report based on information received by Pfizer. A contactable consumer reported that a 41-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date: unknown), via an unspecified route of administration on 11Jan2021 at a single dose for COVID-19 immunization; treprostinil sodium (REMODULIN), intravenous from 03Mar2020 to an unspecified date at 0.041 ug/kg, then at 0.045 ug/kg with therapy dates unspecified, and then at 0.049 ug/kg with therapy dates unspecified, for primary pulmonary arterial hypertension; and macitentan (OPSUMIT) on 11Jan2021, orally from 11Jan2021 at 10 mg, 1x/day for primary pulmonary hypertension. Medical history included ongoing primary pulmonary arterial hypertension. Concomitant medication included sildenafil citrate. On 15Jan2021, the patient had a blood clot in neck. The patient was hospitalized from 15Jan2021 to 16Jan2021 due to the blood clot in neck. It was reported that on 15Jan2021, which is 10 months 13 days after initiating IV Remodulin, the patient was hospitalized due to blood clot in her neck. The patient went to the emergency room on 15Jan2021 and she was planned to be admitted to change her catheter, later she was hospitalized on the same day and her Remodulin central line was changed as per the prior plans of getting the catheter changed. The patient was discharged on 16Jan2021. The patient then had a rash to her chest (dermatitis contact previously reported) that started on 20Jan2021. The patient believed it was from the original dressing that was placed after her catheter was replaced. The rash to left chest around her Remodulin catheter line (dermatitis contact previously reported) was also reportedly itchy at night. On an unknown date in 2021, the patient's oxygen saturations dropped to 85% on room air (oxygen saturation decreased). The patient continued to have rash on her chest (dermatitis contact previously reported). On 29Jan2021, 10 months 27 days after initiating IV Remodulin, the patient was in the emergency room due to increased shortness of breath, pressure on

her chest, edema in her feet and a weight gain of 2 pounds overnight. All the tests were negative but during walking test, the patient's oxygen saturation dropped to 85% on room air. The patient was advised to wear mask continuously. 2 weeks after receiving the first COVID-19 vaccine, the patient had heart palpitations, shortness of breath, and chest pressure 2 weeks after receiving the first COVID-19 vaccine (dyspnoea and chest discomfort previously reported). The patient went to the ER (emergency room), had worked up and was seen by a pulmonologist, nothing was found, and the patient was released home. The prescribing physician's practice ordered her to wear oxygen (O2) continuously. The patient said that she only wears it when she leaves the house and at night and was fine. She felt this episode was related to the COVID-19 vaccine and was not receiving the second dose. The patient stated that her physician had took her off the Opsumit due to shortness of breath (dyspnoea previously reported). The events 'blood clot in neck', 'shortness of breath (dyspnea)', 'pressure on her chest', 'edema to her feet', 'weight gain of two pounds overnight' and 'heart palpitations', resulted in emergency room visit. The event, 'diarrhea', was controlled with diphenoxylate and atropine (LOMOTIL). The patient had a walking distance test on an unspecified date in 2021 (results were not provided) and weight was 209 lbs on an unspecified date in 2021. The events, shortness of breath (dyspnea)', 'pressure on her chest' and 'heart palpitations', was reported as serious (medically significant). The events rash on chest, and rash on chest possibly due to tape (dermatitis contact) had not resolved while the outcome of the rest of the events was unknown. The reporter's assessment of the causal relationship of the events with the suspect product was not provided at the time of this report. Since no determination has been received, the case is managed based on the company causality assessment. Follow-up (12Mar2021): This is a follow-up solicited report based on the information received by Pfizer. Additional information included medical history, suspect drug data, reaction details and clinical course details. Information on the batch/lot number has been requested. Follow-up (04May2021): This follow-up is being submitted to notify that the batch number is not available despite the follow-up attempts made. Follow-up attempts have been

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT

completed and no further information is expected.;  
 Sender's Comments: Based on the available information the events are most likely related to an intercurrent or underlying condition which is not related to the subject drug. There is a reasonable possibility that the drug contributed to occurrence of the event rash. The follow-up information received does not alter the previous company clinical evaluation. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1331063	5/19/2021	LA	60	F	3/8/2021	3/10/2021	I woke up Wednesday and I felt like I was hit by a train. I felt like a wet dish rag hanging on the sink. Everything hurt, even taking a step, I just felt bad, tired like the flu but no respiratory issues. By the 14th I started getting short of breath, couldn't walk without SOB, my legs started to swell, joints were sore, I felt tired. Went to the doctor and my blood pressure was high, I was prescribed medication for my blood pressure and fluid pills. It hurt just to brush against the skin on my calf. An ultrasound revealed 4 blood clots in my left calf. Went to the ER at . Hospital in and sent to hematologist Dr. and there were no findings.
1330905	5/19/2021	WA	39	F	4/30/2021	5/5/2021	Wheezing in my chest and bad cough started on 5/5. Pain in my left calf began on 5/14. I went to the Emergency Room on 5/16 and was diagnosed pulmonary embolism in both lungs and deep vein thrombosis in my left leg.
1330734	5/19/2021	NE	78	M	3/3/2021	5/6/2021	Pulmonary Embolism, blood clot left lung. Put on Eliquis 10 mgs a day.

1330709	5/19/2021	IA	38	M	4/7/2021	4/7/2021	After my vaccine I experienced sweats, fever body aches and had stomach pain for three days. I had arm pain for about three weeks as well. On Monday afternoon, I still had stomach pains, fever and leg cramps. I went to see my doctor and he performed exams on me and was told I had swelling of my intestine. My digestive tract has been profusely slow since receiving the J&J vaccine. They also ran some tests to check if I had any blood clots. I still experiencing full digestive tract issues and slowness.

1327562	5/18/2021	AK	38	F	1/20/2021	1/20/2021	Right after injection, I got really hot and flushed. I thought I am not a fan of needles - so I thought it was anxiety. My throat got really dry. They gave me a Dixie cup of water and I asked for more. After I had finished the one cup, I was clearing my throat and it felt like I couldn't swallow and my tongue had swollen up and I couldn't swallow any water from next Dixie cup. I couldn't swallow - it felt like it would get stuck at the back of my throat. The nurse said she was going to stab me with the epi-pen but had me lay down first and my face started to feel slightly numb and I told her that and she stabbed me in right hip with the epi-pen. They called the ambulance to take me to hospital and after the epi-pen was given they had me sit up and put a mask on my face and I was in a state of panic. I wore an oxygen full face mask and was breathing into it. The paramedics came in and put me on stretcher - monitored for six hours. Because of the adrenaline from the epi- pen - I had high blood pressure and heart rates - everything was really high. After a few hours, she told me that my tongue was looking better and there was better color in my tongue. I was sitting there every six hours - I was monitoring as how to I was doing. They gave me Benadryl and I think they gave me something else but I can't remember what it was. I came home and it was late at night - 11:00 or 11:30 and from there until February 1st, I was extremely sick. I went back to ER on 23rd; and did telehealth visits - with my doctor (right after ER visit from Injection was first one; and then I went to the hospital on the 23rd; Telehealth on 24th or 25th and I - I was running fevers of 104, 103 and went up to 105 almost- on 23rd of January - 3 days after injection - I'm weak, I can't move - everything hurt. From head to toe. I couldn't sleep or do anything. I was so weak, I couldn't even move. It was difficult just to use the bathroom. I had the fevers that was causing my chills and my body aches were bad. I had been trying to alternate Tylenol and Ibuprofen; I was finally prescribed Hydro Codone just to sleep. I was told to take this during the day and the Tylenol and Ibuprofen combo at night. Shoulder surgery was about a month after the vaccine - 18th of February - And on the 22nd of February I went to the hospital again for left side chest pains. - I couldn't breathe - I was discharged February 25th - I was on blood thinners for three months. - the surgeon said that I developed clots and I developed these shortly after surgery and ended up

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							in the hospital for three days. The clots are unknown - blood clots started in the legs and then developed the fluid/clot issue in the lungs - I had a pulmonary embolism in my left lung. Surgeon said it could have been caused by vaccine as he did not work on the lower part of my body.
1326742	5/18/2021	VA	61	M	3/8/2021	3/9/2021	The day after the vaccine I was working and later in the day I started to feel dizzy. Within an hour and a half I could not stand up and I was very dizzy. My coworkers said my eyes rolled back in my head. The ambulance transported me to the ER and my Blood Pressure was at 80 Systolic. I was given fluids and I was discharged after five hours. I still couldn't work the next day and I was still really tired for the rest of the week. It seemed to take a couple of weeks to feel normal but the fatigue was extreme for the first week after the episode of dizziness. I have two autoimmune diseases and a history of blood clots so I might not have gotten the Janssen vaccine if the risk was known. The blood thinner I was taking at the time might have helped but my blood pressure on discharge was still only 110/60.
1326764	5/18/2021	WA	57	M	4/20/2021	5/8/2021	First vaccine dose administered on 4/20/21. Patient was admitted on 4/29/21 with shortness of breath and pleuritic chest pain. CT scan revealed pulmonary embolism and doppler showed vascular access (Hero graft) thrombosis. Patient was treated with heparin and warfarin, and was discharged on 5/5/2021 after being converted to apixaban. Patient missed scheduled dialysis treatment (no call/no show) on 5/8/21 and 5/11/21. Subsequent welfare check found the patient expired at home.
1326824	5/18/2021	FL	47	F	4/9/2021	5/1/2021	3 weeks plus 1 day following vaccine, i developed pain in my left calf. After having an ultrasound, two blood clots were discovered in my left leg (one DTV and one superficial). I was sent to the ER, a CT was performed, blood work was taken, and I was sent home with a prescription for Xarelto blood thinner. I have to be on this for 3 months, and we will evaluate to make sure I'm no longer at risk. My medical bills for the date of 5/3/21 were over \$11,000, and my portion so far is over \$3300 after insurance.

1327493	5/18/2021	CO	48	M	4/13/2021	4/17/2021	Strong shoulder pain started on Sat 4/17 in the early morning that woke me up. Went away by 10a after taking tylenol and having a coffee. Sun 4/18: pain again woke me up and was more severe. Had to get out of bed to move around as pain was pretty bad. Went to urgent care. Found nothing serious (not a heart attack or clots, etc). Referred me to go see my PCP if it did not resolve in a few days. Thu 4/22: went to PCP. Pain had subsided for the most part, but started having reduced range of motion when lifting arm straight forward...could not get past 90 degrees (straight out) without pain and a feeling of physical binding in the joint. Suspected bursitis. Prescribed a steroid pack and muscle relaxer. Sat: 4/24: my son noticed my shoulder blade sticking out when attempting to reach for a glass of water while seated. Decided to make appt with an orthopedic. Fri 4/30: went to orthopedic. Took xray. Found no physical damage, trauma, etc. Noticed winged scapula as reason for lack of range of motion. Prescribed physical therapy. Fir 5/14: still same lack of range of motion and no pain. Went to first PT appt. They took range of motion measurements and agreed I was limited. Tested for other pain or signs of trauma and found none. Prescribed a PT regimen. After my own research combined with symptoms, and no physical trauma as the source. My suspicion is Parsonage Turner Syndrome brought on by the vaccination.

1326170	5/18/2021	LA	63	F	4/14/2021	4/28/2021	D Dimer was high; Chest tightness; blood clots in the lungs; This is a spontaneous report from a contactable consumer. A 63-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), dose 2 via an unspecified route of administration, administered in Arm Right on 14Apr2021 10:30 (Lot Number: ER2613) as SINGLE DOSE for covid-19 immunization. Medical history included ongoing retinal tear from an unknown date (long ago, maybe 2005), Blood pressure, anxiety, reflux, irritable bowel syndrome, eye care. Three years ago, patient had a blood clot on the portal vein. She was treated with Eliquis, referring to Apixaban, for six months. Then they went into the D Dimer and found out she only had one gene for the blood clots, so they discontinued Eliquis, referring to Apixaban. The doctor said the protocol didn't call for it because she only had one gene. Eliquis, referring to Apixaban, was discontinued a year and half ago. The reporter mentioned the specifically didn't get the Johnson and Johnson shot due to blood clots. Family History included that her mother and sister had blood clots in the past unrelated to the vaccine, anxiety which her mom has. Concomitant medications included ramipril taken for blood pressure from an unspecified start date (for five to ten years) and ongoing; ongoing omeprazole taken for reflux; fluoxetine taken for anxiety (for what her mom has) taking for three years and ongoing; linaclotide (LINZESS) taken for irritable bowel syndrome taking for 3 year and ongoing; magnesium sulfate taken for eye care taking for 3 year and ongoing; latanoprost taken for retinal tear from 2005 and ongoing. Prior Vaccinations (within 4 weeks) was none. The patient previously received the first dose of the Pfizer COVID 19 vaccine on 26MAR2021 at 1000AM in the right upper arm (Lot number for first dose is ER8732; expiration date 31Jul2021). Last Wednesday she started to have tightness in her chest so they called an ambulance. She was admitted to the hospital 28Apr2021 and was discharged Saturday 01May2021. In the hospital they did a CT and it came out that she had bilateral blood clots in the lungs; the doctor said it was a shower of blood clots in the lungs, small enough not to occlude anything. They treated with a 72 hour heparin drip. They didn't do any more CT but they did put her on Eliquis, referring to Apixaban, for the rest of her life. For the Eliquis he

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							mentioned the generic Apixaban; unknown manufacturer; caller did not see NDC, lot, or expiration date on product dispensed in a pharmacy vial. Last time she was also on the Apixaban, not the brand Eliquis but they have discarded all the old product. The patient also did an X Ray; EKG (Electrocardiogram) was normal sinus; all the blood work including the CBC (Full blood count) was normal on an unknown date; her D Dimer was high on 01May2021. The events required a visit to Emergency Room. The outcome of the event chest pain was recovered with sequelae, of blood clots in the lungs was not recovered, of other events was unknown. Batch/Lot number had been obtained. Further information has been requested
1327483	5/18/2021	MO	32	F	4/8/2021	4/19/2021	I experienced chest pains, felt like hard time breathing, little cough that felt like an asthma attack but not quite. I've had PE blood clots I went to urgent care on 04-23-2021, where they did CT scans of the chest and upper abdomen and lab work and my exams were negative. I can say today that I have recovered from my symptoms.

1326142	5/18/2021	NM	76	M	3/10/2021		<p>developed a thrombosis on the left arm; varicose veins on the arm; whole arm is swollen; veins are swollen; burning pain in left lung, and it goes up to the breast and lymph nodes/ discomfort on left side Lung; burning pain in left lung, and it goes up to the breast and lymph nodes, it is sensitive there; burning pain in left lung, and it goes up to the breast and lymph nodes, it is sensitive there; has tenderness near the wrist and elbow, clarifying the inside of the elbow; felt numbness in the left arm; hot flashes; This is a spontaneous report from a contactable consumer (patient) and physician. A 76-years-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), second dose via an unspecified route of administration, administered in left arm on 10Mar2021 (Batch/Lot number was not reported) as single dose for covid-19 immunisation. Medical history included heart conditions, he has had 2 heart attacks in the past, the first one was 21 years ago, and the second was 2 years ago. Concomitant medications included all his regular medications, nothing new; (also reported as No other products). Patient previously received BNT162B2 first dose on 13Feb2021 administered in left arm for COVID-19 immunization. Patient developed varicose veins a month after he received both his shots for Pfizer's COVID vaccine. Caller stated veins are swollen. It's coming down some, but patient need to know what medications could take or not take. On the left arm right inside of his elbow, he started getting some pattern of varicose veins. It was tender to some degree and people told him to massage it and put a warm pad on it. Seems like the veins were going to pop out. Patient stated he received his vaccine at a hospital. On 03May2021, reported patient was calling in regards to a covid vaccine. He developed a thrombosis on the left arm, it was varicose veins on the arm and the whole arm is swollen, it was still swollen but it was coming down. He had been using a heat pad. Initially after 2 weeks from when he got the shot he wasn't concerned, he went to the doctor and they gave him Cat scan, Ultra sound, and blood test and did not find a blood clot. He added that he had discomfort on left side Lung, but he had discomfort several years ago, an MRI in the past that showed he has a spot in the lungs, but they didn't think it was progressing. With this thing in the past 3-5 weeks he has burning pain in left lung, and it went up to the breast and lymph nodes, it is</p>

----------	-------	-------	---------	-----	----------	------------	--------------

sensitive there, he has no idea what it is. Caller was asked to clarify since he stated that he had a thrombosis but all tests show no blood clot. Caller stated that he thought Thrombosis meant when the veins are popping out and gives impression of varicose veins. He had tenderness near the wrist and elbow, clarifying the inside of the elbow. If looking at the arm from the elbow up little, it looked like worms coming out, it was veins or arteries showing. The varicose veins appearance was more pronounced close to surface initially but is now minimizing. First dose date on 13Feb2021. He was not concerned after the first dose, he was fine, he thought it was a good product and it still is. Second dose date on 10Mar2021. After the second dose he felt numbness in the left arm and hot flashes, he looked down and saw the varicose veins. He did go see the primary care doctor. He also saw his heart doctor but that was an already scheduled appointment, he did not schedule it because of this situation. the heart doctor said to put a warm pad on the arm and lift the arm up over the head every so often. Caller did not have his covid vaccine card, caller stated that he has miss placed it. He found some paper but it only has his ID number and "LHDSER" on it. He received the vaccine in the left arm both times. All symptoms occurred on the left side. He recieved the vaccine in a hospital. Patient asked to refer to his primary care doctor as he has all the results for the tests. Investigation included CAT scan normal; Ultrasound normal; Blood test normal and MRI abnormal which showed spots in the lungs on unspecified date. The event outcome for all events was unknown. Information for batch/ lot number has been requested.

The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1808980, expiry: 20-JUN-2021) frequency 1 total, dose was not reported, administered to left deltoid on 07-APR-2021 for prophylactic vaccination. No concomitant medications were reported. One week later, on 14-APR-2021, patient began experiencing a severe headache, severe chills, abdominal pain, leg cramps, and a fever of up to 102 degrees. She reported no history of headache or migraines, yet along with the headache, she said she was seeing lines. She said that she called her doctor on 15-APR-2021 (the next day) who advised her to go to the hospital. On 16-APR-2021, patient went to the Hospital, where she was admitted for vaccine induced blood clots in both legs. After receiving the Janssen COVID vaccine, on 16-APR-2021, her platelet count was 27 (coded as platelet count decreased). While in the hospital, she was placed on a blood thinner drip, and her platelet count went as low as 9 (units unspecified). On 19-APR-2021, she was flown to another hospital. She remained in that hospital until 27-APR-2021 when she was discharged. Patient was hospitalized for a total of 11 days. She was currently taking Eliquis 5mg twice a day. She was still having leg pain, and could barely walk (coded as difficulty in walking). She was also concerned about her medical bills. She said that before getting the Janssen COVID vaccine, she was a healthy</p>

----------	-------	-------	---------	-----	----------	------------	--------------

individual and had not taken any birth control or estrogen. She was continuing to follow up with her physician. Treatment medications (dates unspecified) included: apixaban. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from severe chills on 27-APR-2021, was recovering from severe headache, and fever of up to 102 degrees, had not recovered from abdominal pain, leg cramps, and leg pain, and the outcome of blood clots in both legs, seeing lines, difficulty in walking and platelet count decreased was not reported. This report was serious (Hospitalization Caused / Prolonged).; Sender's Comments: V0: This spontaneous report received from a patient concerned a 40-year-old female (BMI 24.3 kg/m2), who experienced "blood clots in both legs" and platelet count decreased 9 days after vaccine. Past medical history included back surgery and kidney stone removal. Her baseline platelet count was 300,000 last checked 4 months before vaccine. The patient was not pregnant at the time of report. No concomitant medications were reported but she denied taking oral contraceptives or other forms of estrogen. Seven days after vaccine, the patient began experiencing a severe headache, severe chills, abdominal pain, leg cramps, and a fever of up to 102 degrees. She said that she called her doctor on day 8 who advised her to go to the hospital. On day 9, patient went to the hospital, where she was admitted for vaccine induced blood clots in both legs. No specific imaging modality or results were reported. Nine days after vaccine, her platelet count was 27,000. While in the hospital, she was placed on an unspecified blood thinner drip, and her platelet count went as low as 9,000. On day 12, she was flown to another hospital. She remained in that hospital until day 20 when she was discharged. She was started on Eliquis 5mg twice a day. As of this report, she was still having leg pain and difficulty walking. She was continuing to follow up with her physician. Based on evolving knowledge of Thrombosis with Thrombocytopenia Syndrome (TTS, per definition from Brighton Collaboration-BC), the low platelet count and temporal relationship to vaccination (BC Criteria level 5), the events are assessed to have a plausible relationship with vaccination.

1325853	5/18/2021	CA	31	F	4/9/2021		<p>BLOOD CLOTS IN LUNGS; COMPLICATED MIGRAINE; ANEMIA; INJECTION SITE PAIN; BODY PAIN; This spontaneous report received from a patient concerned a 31 year old African American and not Hispanic or Latino female. The patient's weight, height, and medical history were not reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported and batch number: 043A21A expiry: 20-JUN-2021) dose was not reported, 1 total administered on 09-APR-2021 to left arm for prophylactic vaccination. Concomitant medications included escitalopram oxalate. On 09-APR-2021, the patient experienced body pain, injection site pain on left arm as it had been injected incorrectly that lasted for 4 days. On 17-APR-2021, the patient experienced experienced chest pain, complicated migraine, shortness of breath, left arm numbness, anxiety and weakness. The patient took tylenol (paracetamol) to sleep at night. The patient went to the hospital on 18-APR-2021 and was hospitalized for 3 days. It was found that she had blood clots in her lungs. The patient was discharged on 20-APR-2021 and was put on treatment medications, 2 tablets of xarelto 15 milligram once daily for 3 weeks and it was decreased to 1 tablet 20 milligram daily for 6 months. The patient was put on topiramate 50 milligram daily for migraine, ferrous gluconate 195 milligram for anemia, hydroxyzine 50 milligram for anxiety due to chest pain and 2 tablets of tylenol (extra strength) for chest pain. The patient had no relevant medical history. The patient had a nuvaring for birth control. On 26- MAR-2021, she was also started on lexapro 10 milligram. The symptoms were not resolved except injection site pain and the doctor thought the left arm numbness was due to migraine. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from injection site pain on 12-APR-2021, was recovering from body pain, complicated migraine (left arm numbness and weakness) and the outcome blood clots in lungs (chest pain, shortness of breath and anxiety) and anemia was not reported. 1326254	5/18/2021			F			blood clot in her lung; lung problems; bronchial asthma; may have damaged her immune system; This is a spontaneous report from a Pfizer-sponsored program. A contactable consumer (patient, self report) A female consumer of unspecified age, reported that she received the second dose of BNT162B2 (Pfizer-BioNTech Covid-19 Vaccine, Solution for injection, Batch/Lot Number and Expiration date: UNKNOWN), via an unspecified route of administration on an unknown date as single dose for COVID-19 immunisation. Patient reported that after she received the 2nd dose of the Pfizer-BioNTech Covid-19 Vaccine, she developed lung problems. She also said she had blood clot in her lung, and had bronchial asthma. Patient wants to know if there have been many reports of this nature after vaccination. She said the vaccine may have damaged her immune system, and wants to know what Pfizer can do for her. She also said the vaccine was dangerous. Information on the lot/batch number has been requested.
1326136	5/18/2021	TX	37	F	3/30/2021	4/5/2021	thrombosis in left ovary vein; blood in her legs was not circulating well; pain; This is a spontaneous report from a contactable consumer (patient). A 37-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in arm left on 30Mar2021 (Batch/Lot Number: EN6204) as 2nd dose, single for covid-19 immunisation. The first dose was received on 10Mar2021 (lot number: EN6204). Medical history included allergy to cherry. Patient was not pregnant. The patient's concomitant medications were not reported. No other vaccines were received within 4 weeks prior. The patient previously took cortisone and experienced allergy. On 05Apr2021, patient was admitted to hospital with thrombosis in left ovary vein. Moreover, blood in her legs was not circulating well, causing her so much pain. The event resulted in emergency care. Patient was given anticoagulants as treatment for 6 months. Patient was discharged on 08Apr2021. Patient had not been diagnosed with COVID prior to vaccination and had been tested post vaccination on an unspecified date with negative results. Outcome of the events was not recovered. No follow-up attempts are needed. No further information is expected.

1326500	5/18/2021	NC	32	F	4/1/2021	4/24/2021	Two weeks after vaccine woke up with tingling running up and down left leg and being based in the left foot. Throughout the day tingling turned to numbness as if leg were asleep, and feeling in foot turned to strong pain. Had ultrasound in the leg to check for clots (although they did not check foot) and nothing was discovered. After this pain escalated and a week after I was unable to keep my foot still for more than a minute without the intense pain rushing back - the feeling was as if my foot were cramping to an extreme. Elevating helped somewhat but for the most part if I wasn't moving I was crying in pain. The numb feeling is still there as of over a month later but I'm able to hold still without feeling as if my foot is rapidly atrophying.

1326264	5/18/2021	MN	48	F	5/5/2021		<p>headache; fatigue; dyspnea; chest pain; RV infarction; a large amount of clot in the RCA; This is a spontaneous report from a contactable physician. A 48-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 05May2021 as single dose for COVID-19 immunization. Medical history included chronic smoker 2 packs per day. Patient was not pregnant at the time of vaccination. Concomitant medications within 2 weeks of vaccination included paracetamol (TYLENOL) and ibuprofen. Patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) as single dose for COVID-19 immunization. It was unknown if the patient received any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, it was unknown if the patient was diagnosed with COVID-19. Patient developed headache, fatigue, dyspnea, and chest pain for 3 days. She was admitted to hospital on 08May2021 with a completed right ventricular (RV) infarction. Angio in May2021 showed clean coronaries with the exception of a large amount of clot in the right coronary artery(RCA). Given correlation to vaccine administration, unclear if this was related (as reported). Device Date: 11May2021 (as reported). The adverse events resulted in emergency room/department or urgent care. The events were assessed as serious, hospitalization and life-threatening. Since the vaccination, the patient had not been tested for COVID-19. Outcome of events at the time of last observation was recovering. Information on Lot/Batch number has been requested.; Sender's Comments: As a cautionary measure and considering the drug-event temporal relationship of three days, the company cannot completely exclude a causal association between the administration of the PFIZER-BIONTECH COVID-19 VACCINE BNT162B2 and the onset of all the reported events. Medical history of chronic smoker (2 packs per day) cannot be also excluded as contributing factor and additional information of medical history and concomitant medications concerning possible risk factors for cardiovascular diseases, should be also useful for an overall assessment of the case. The impacts of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern</p>

1324020	5/17/2021	CA	30	F	4/19/2021	4/28/2021	About ten days after the vaccine I started to have intense cramping and I lost a blood clot. My belly was tightening up and I started to feel downward pressure. I also had back pain. I was checked out at the hospital, and they did not find anything wrong. I was 23 weeks pregnant at the time. I have not had any more cramping. I am also breast feeding my toddler and she was cranky and out of sorts after each dose of the vaccine. She was really irritable and she was running a low grade fever. My daughter is 22 months old. Pregnancy-second
1323625	5/17/2021	KY	65	M	5/4/2021	5/4/2021	Patient received vaccine on tuesday 5/4. Patient developed a rash surrounding both ankles. Patient and wife dismissed this as possible side effect of vaccine. The patient had difficulty breathing and dismissed it as a panic attack on 5/10. Symptoms continued for several days, went to walk-in clinic on Wednesday 5/12 for tests and inconclusive. Thursday 5/13 the patient continued to experience these symptoms and elevated pain, tightness and cramping in legs and went to the ER where he was diagnosed with bilateral pulmonary emboli. Patient was admitted for 2 days and treated for clots. Upon discharge the patient was instructed to discontinue meloxicam, carbidopa/levodopa and started on eliquis for 6 months. After 6 months the patient will follow-up with a hematologist.

1323709	5/17/2021	NC	17	M	5/5/2021	5/8/2021	<p>Pt was seen at ED on 5/8 for L sided weakness in the setting of a headache. Pt's mother reports that these symptoms began 2 days after receiving second dose of Pfizer COVID-19 vaccination in R deltoid. She says that on 5/6, pt complained of L arm weakness during cooking class at school, which was followed by a mild L sided headache later in the day. Symptoms resolved without intervention but recurred on 5/8 with associated L sided facial droop, slurred speech, L arm spasms, and L foot drag. Pt was seen at ED for this and had a HA (5/10 in severity) at that time -- workup was unremarkable with a normal head CT, laboratory workup, and resolution of symptoms. Pediatric Neurology evaluated the pt, deemed no further workup necessary, and advised outpatient follow up. Pt presented again to the ED on 5/10 with concern for full tonic/clonic seizure, witnessed by pt's mother. Mother reports that she heard pt fall and went upstairs to find pt seizing on his bed -- says that pt had shaking of bilateral upper extremities (in flexed position close to chest) and symmetric lower extremity shaking; eyes were closed without clear focality or eye deviation. Also some drooling, though no incontinence or tongue biting. Episode lasted for approximately 2 minutes; pt was confused and did not recall what happened immediately afterwards but improved within the next 8 minutes. He was taken to the ED by EMS. By the time he arrived in the ED, he had left sided weakness again. He was given Keppra 1g, placed on EEG, and was admitted. EEG overnight was read "normal" and additional workup was unremarkable. Pt had MRI brain completed showing cortical abnormalities in the R parietal lobe, suspected to be related to recent seizure. MRA showed patent intracranial cerebral vasculature. MRV showed no evidence of dural venous sinus thrombosis. Weakness resolved by the morning and pt was back to baseline on morning of 5/11/21. However, around 9 AM, L sided weakness (face, arm&gt;leg) with associated headache recurred. Mom says that this event was captured on EEG. He was then transferred to our facility. He was placed on pEEG and had repeat labs, imaging completed. Pt did have L sided facial droop, L arm weakness, and slurred speech on arrival, but this resolved within 24 hours. Pt had one additional episode of "wave" of L sided weakness including L sided facial droop and slurred speech at one other time during the</p>

							hospitalization, but no additional seizure like activity. He was discharged on 5/14 with a normal neuro exam--some labs (including labs of Rheum and Id workup were pending at time of discharge.) Primary and consulting teams elected to forgo steroids but reconsider should symptoms worsen or return. Pt was readmitted on 5/16--had an episode of expressive aphasia + headache while at a social gathering; states that he became overwhelmed by the noise. No additional seizure like activity.
1323725	5/17/2021	CA	36	F	4/11/2021	4/11/2021	The day of the vaccine I was told that my arm might be sore. I felt sore right away and as soon as I got in the car to drive home I was extremely tired and I slept for the entire six hour car ride home. I was very fatigued that night and then I got a bad headache, fever and it lasted for 48 hours. After that, the headache was less intense and they were intermittent but my arm still hurt and I couldn't lay on it. I was still fatigued for a week. On the fourth day I started to get a weird feeling of vibrations and twitching all over my body. It is especially worse in my temple. It has been a month but I still get the twitching in different parts of my body. My face, arms, legs and temples. It is in different places. It happens less often now, it is not all day but it is still daily and mostly in my head and my legs. I had it happen in my temples last night. I had my menstrual cycle since the vaccine and it was about three days later than expected. I had a lot of blood clots which was unusual for me. I have had flu like symptoms this week and I have a cough, runny nose and headaches but I am planning on trying to go to the doctor this week.
1323746	5/17/2021	CA	43	F	4/6/2021	4/6/2021	By 7:30, I felt drunk. My brain was not functioning normally and had a fever all night. By 7:15 I felt fine, with the exception for random joint pain. The following Friday, April 9th, I had bloodwork done. It felt like I had hit my funny bone. I had shooting pain up my arm and into my neck and down my spine. I thought it was just the blood draw, so I suffered all weekend. My husband made me go to the doctor on Monday. My doctor said I had the same symptoms of a blood clot. They sent me to the hospital for an ultrasound and blood tests recommended, but everything was negative. She told me to just watch out for any changes and it went away after a few days.

1325242	5/17/2021	AZ	91	F	3/1/2021	3/26/2021	J&J vaccine, extremely dizzy, fainting spells, vertigo started on March 26, 2021. Went to ER after reaction becoming worse on April 8, resulting in falling outside in yard. Dr advised going to ER after visit on April 13. Symptoms were stroke and or blood clots. At hospital they took multiple tests but inconclusive if she had a stroke or blood clots. Took CT scan of brain looking for bleeding on the brain. They have all test results. Today still has vertigo, weakness, and fainting spells.
1324507	5/17/2021	CA	86	F	5/12/2021	5/13/2021	Pulmonary blood clot
1324137	5/17/2021	TX	41	F	3/8/2021	3/10/2021	I did have leg injury in April - and ever since the vaccine, I now have an issue with swelling that won't stop - still have swelling. I was checked with blood clots - and it was elevated so they gave me an ultrasound in leg - no blood clot. Swelling on right leg was enlarged after the vaccine. Two missed menstrual cycles; now I have had the cycle but it's a longer cycle than I normally would have. It's abnormal - the length and flow is off. Spotted for a week before I started bleeding. I had slightly elevated blood pressure after the vaccine - 117/83 usual but it was elevated 141/95 - and it's never high ever like that before. So they had thought I had a potential blood clot. Have an upcoming doctor's appt scheduled.
1323958	5/17/2021	ND	46	F	3/31/2021	4/15/2021	Patient presented to the ED and was subsequently hospitalized within 6 weeks of receiving COVID vaccination. Diagnosis was thrombosis of AV fistula.

1324058	5/17/2021	CA	55	M	3/15/2021	3/28/2021	On March 28th, started noticing symptoms. There was pain in my entire right leg, shin swelling; calf- swelling and skin discoloration; and right foot - swelling. On 4/1, I went to Urgent Care where I was seen, evaluated and treated by Dr. She ordered blood tests and an ultrasound within 20 minutes. I had 4 blood clots in 3 veins in my right leg/DVT. My blood platelet value was 267 and the standard range is 130 to 400. They didn't consider it low, but it's still an issue. I was given an injection of Enoxaparin Sodium Injection--1 ml injection twice a day for 5 days, which was started in the ER. I then switched to Pradaxa 150mg pill twice a day. I took that until around the 6th of this month when I noticed my right leg had gotten worse. I was instructed to go back to the urgent care. Another ultrasound was ordered and it showed I still had the 4 blood clots in 3 veins that seems to have worsened, so the meds were not working. He consulted with a vascular surgeon and they put me back on the injection once a day, which I am currently still on. I was told to follow up with my PCP in two weeks and that appt is on Thursday with Dr.

1321852	5/16/2021	MA	80	F	3/12/2021	4/10/2021	<p>Patient is an 80 y/o right handed female who is totally independent at baseline who received her Pfizer vaccine out of the country (1st dose 2/19/21, 2nd dose 3/12/21). She was reactive to both shots, reporting arthralgias, headache, low grade fever, chills. She had a rise in blood pressure later during the day of her shot as well as the next day (up to 180/70, from baseline of 130/70). She also had an episode of epistaxis several days after her first shot. She traveled independently out of the country on 3/31/21 to visit her son on a leisure trip. On 4/5/21 she had headache, dizziness/lightheadedness, and did not feel well, and her systolic BP was 198, after which she took additional 40 mg of lisinopril. Her BP subsequently decreased to systolic BP of 130 mm Hg on 4/5/21, but over the next few days she had labile BP with a range of BP of 125 to 171/ 58 - 68. She was meticulous in checking and recording her BP several times a day, and she increased her lisinopril dose to 40 mg po qd from 20 mg po qd given the higher than usual blood pressure range. On 4/10/21 her BP was as follows: 6:30 am, 148/60 (she took her daily lisinopril 20 mg po); 11:30 am: 132/52; 3 pm: 171/69 (she took additional lisinopril 20 mg po) after which her systolic BP decreased to 130. Then around 6:20 pm the same day (4/10/21), she had acute onset of headache, vomiting, left sided weakness, SBP 220, and was witnessed to have rapid change in mental status. There was no antecedent trauma to the head. EMTs were called immediately and she had loss of consciousness during the ambulance ride to the ED, after about 20 minutes of symptom onset, with agonal breathing and bradycardia to the 40s, but never lost her pulse. Upon arrival to the ED out of the country, her Glasgow Coma Scale (GCS) was 6, she was rapidly intubated and stabilized. Head CT demonstrated massive intraparenchymal hemorrhage (140 cc) within the R temporal parietal and occipital lobes, with cerebral edema and 14 mm midline shift, associated with small subdural hematoma and small intraventricular hemorrhage within the temporal horn and body of the R lateral ventricle. They reported hyperdense "spot sign" within the intraparenchymal hematoma compatible with active hemorrhage, no evidence of venous thrombosis, no masses, no arteriovenous malformations. She had 2.5 mm aneurysm right that was thought to be incidental finding unrelated to her event. She was taken emergently</p>

1320281	5/15/2021	FL	61	F	4/9/2021	4/30/2021	Numerous blood clots in both lungs; This is a spontaneous report from a contactable consumer (patient reported for herself). A 61-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Solution for injection, Lot Number: ER8730, expiry date not reported), via an unspecified route of administration, administered in left arm on 09Apr2021 09:00 AM as 2ND DOSE, SINGLE for covid-19 immunization. Medical history included degenerative disc disease, fibromyalgia, hypothyroidism, migraines, known allergies to tape and anise allergy. The patient had negative nasal swab on 07Nov2020. The patient had no covid prior to vaccination. Concomitant medications included morphine at 15 mg, twice a day; oxycodone (XTAMPZA ER) at 36 mg; and heparin; all taken for an unspecified indication, start and stop date were not reported. The patient received the first dose of BNT162B2 as COVID-19 immunization on 19Mar2021 09:00 AM (at the age of 61 years old) (brand Pfizer, lot en6208) administered on the left arm. The patient had no other vaccine in four weeks. On 30Apr2021 09:00 AM, patient had numerous blood clots in both lungs. On 01May2021 to May2021, she was admitted to the hospital for 2 days with numerous blood clots in both lungs. After several tests (May2021), they could not find any reason for getting these clots. So, thinking the only other thing patient did different was get the covid vaccine. The event was reported as serious medically significant, life threatening, and had caused hospitalization from 01May2021 to an unspecified date in May2021. It resulted to emergency room/department or urgent care, hospitalization, life threatening illness (immediate risk of death from the event). Therapeutic measures were taken as a result of the event which included Heparin IV. The patient had not recovered from the event numerous blood clots in both lungs.

1320186	5/15/2021			M			<p>Blood clot; He was peeing a lot of blood; all of the joints went wondering in one another that was swelling up and it just so painful. Rheumatoid Arthritis layered up; leg swells up twice the size of the other leg; This is a spontaneous report from a contactable consumer reporting for his father. A male patient of an unspecified age received BNT162b2 (BNT162B2), via an unspecified route of administration on an unspecified date (Batch/Lot number was not reported) as single dose for Covid-19 immunisation. Medical history included rheumatoid arthritis. The patient's concomitant medications were not reported. The patient experienced blood clot on an unspecified date with outcome of unknown, he was peeing a lot of blood on an unspecified date with outcome of unknown, all of the joints went wondering in one another that was swelling up and it just so painful/ he is just swelling up, leg swells up twice the size of the other leg on an unspecified date with outcome of unknown. The patient underwent lab tests and procedures which included ultrasound scan: clot blood. The event thrombosis and hematuria were considered Important Medical Events. Course of the events: Reporter stated, "My father got the Pfizer Covid vaccine couple of weeks ago and it caused I think Rheumatoid Arthritis layered up in his joints one of the times started swelling up. He got a blood clot, his legs swelled up like twice the size of the other leg and they did ultrasound on it and got a blood clot. They put him up on blood thinners (Unspecified Medication) now today he had an appointment with the doctor in the room and when he was there he went to the bathroom and then he was peeing a lot of blood. Doctor told him that It should be okay if stop taking the blood thinners and she cleared up and that's it and I am like freaking out that why would they not got him to the hospital. He went to the hospital because it's the other blood clot. People saying this is on the blood thinner. I don't know why is they rolling up a lot. Nobody wants to say its from the vaccine but it is happen in half an hour within the vaccine, its started."</p> <p>Information about Lot number has been requested.</p>

1320189	5/15/2021	NY	66	F	2/25/2021	2/25/2021	visual and neurological issues; She says she got her phone and it affected her brain; her fever went down; She gives her height and says that she shrunk; hoarse was reported as worsened; hoarse; slept a lot; 12 to 16 hours for the next 5 days; trouble walking; trouble seeing; This is a spontaneous report from a contactable other nurse (patient). This nurse reported 2 reports for same patient, this is first of 2 reports. A 66-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), second dose via an unspecified route of administration, administered in left arm on 25Feb2021 11:00 (Batch/Lot number was not reported) as single dose for covid-19 immunisation. Medical history included ongoing asthma, she says she has been having respiratory problems and asthma since she was a teen; covid-19 from 06Feb2020 to 18Feb2021, She says she didn't see her doctor until the day she got better. She says she realized she was in big trouble and need help. She says she got her phone and it affected her brain. She says she she 5 sons and she flipped around her phone having trouble. She says he has had the same phone for 4 years. She says she was fine that day, 18FEB2021, that she had half of the symptoms, and her fever went down. She says the headache lasted a while; allergies; No thyroid gland, clots; thyroid cancer; tremors that started 7 years ago in one hand. She says she has no thyroid gland. She says she has been taking this since her surgery; she was around 33 years old, and she is 66 now, so for 33 years. She says she had clots. History: She says she takes a lot of medications, a lot of neurological medications. She says the only other pertinent thing is she does have tremors that started 7 years ago in the one hand. She says just before she got the COVID virus, a week before, tremors started in the other hand and progressed rapidly. It is remarked that she thinks she was infected when this started. She says the other one took 7 years to be once a day while this one progressed to be daily. She says she does not take anything for that, she is just trying to increase her activity levels. She says when she was 30 or 40 she was very active. She says the doctors think there is something wrong with her immune system. She says they are trying her on diff medications for asthma; they changed it, added more. She says Advair work beautifully and she doesn't use a breakthrough inhaler. She says ever since

----------	-------	-------	---------	-----	----------	------------	--------------

COVID in 2020, the first week of FEB2020 she thought it was the flu. She says she didn't get any medical help, she was in severe shape, and her headache was severe. She says she crawled to the bathroom once a day, she had a high fever and it felt like a snake effect of a cobra all over, squeezing. She says her pulmonologist gave her Spiriva and that has opened her up, once a day. Caller had gotten to the point she couldn't take 5 or 6 steps and couldn't breath. She gained a ton of weight cause she couldn't move related to this breathing issue. She thought she wouldn't recover, he gave samples once a month. She says she saw him a week ago, 10 days ago maybe. She says she had shortness of breath and couldn't walk. She clarifies she is talking about when she had COVID last year, not this current shot report. She says she didn't consider these current side effects a problem, she expected some side effects and they went away. She says the shortness of breath walking problem was due to shortness of breath; that was what happened with COVID. She says her hoarseness is related to spring allergies and is due to the climate and it is usually from 10APR to 16JUN. She says she gets a sinus drip and congestion and that she is on 5 different medications for that. She says she has more trouble with inhouse allergies. She says she gets trouble as soon as the trees pop. She has had hoarseness for about a year and the allergies have really started around 10Mar2021 for this year. Concomitant medication included ongoing levothyroxine sodium (SYNTHROID) taken for thyroid cancer. She says something new was 8 weeks out she got the flu shot. She says she has a lethal allergy to egg white so she has never had a flu shot her entire life. She says she asked her doctor why they didn't get the one without egg whites. She says they made one without egg white in the 1990's. She says 08DEC2020 was her first flu shot. She says everyone wants her to take more shots but she won't take any more. She says COVID and the flu shot are enough for one year. She says if they have the COVID booster then she will take that one but not any other. She says no but she was told don't ever have anything with egg white in it so she never had the flu shot, she refused. The patient took first dose of BNT162B2 on 04Feb2021 for COVID-19 immunisation and experienced headache. The patient experienced trouble walking (Disabling) on 25Feb2021 19:00 (about

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

7:00pm in the evening) with outcome of recovered on 25Feb2021, trouble seeing (Disabling) on 25Feb2021 19:00 (about 7:00pm in the evening) with outcome of recovered on 25Feb2021, hoarse was reported as worsened (medically significant) on Mar2021 with outcome of not recovered, hoarse (medically significant) on Mar2021 with outcome of not recovered, slept a lot; 12 to 16 hours for the next 5 days on 25Feb2021 22:00 (10:00pm at night) with outcome of recovered on 2Mar2021. The caller is calling about the COVID 19 vaccine. She says she had side effects but she would consider them mild. She says the shot was wonderful. She says she has put off reporting this. Caller remarks she has shrunk, when providing her height. Caller apologizing when clearing her throat, says sorry she is so hoarse today. She says the second dose they came and went away. She says the second shot was at 11:00 am. She says the second shot was on 25FEB2021. She says she had a lot of water to drink then 7 hours after the second shot, about 7:00pm in the evening, she had 45 minutes of visual and neurological issues. She says she had trouble walking, she was stumbling with her feet, she had trouble with eyesight, different sections of her vision was together. She says this was like when she had 5 children. She says her pregnancy during the first 3 months she had neurological visual experiences of shadows put together and at the end of the pregnancy, 2 months after delivery, it would go away. She says she is in an apartment and she sat down then it was 45 minutes total for both occurrences at the same time. She also reports that she slept a lot; 12 to 16 hours for the next 5 days. She says on the 6th day she was fine, no symptoms and no sleepiness. She says it occurred the evening at 10:00pm at night, then it went up through the 5th day afterwards. When asked seriousness of the sleeping event she says none of the above. She says she lives in a senior housing area, they all got it at the same time, that there was only one person who declines. She says almost everyone had sleepiness for at least 3 days afterwards. She says she is still battling the COVID after effects, it was disrupting her breathing. She says she was glad she got the shot, she is glad she was able to do it. She says her second dose seemed to be around 11:00am. For the second dose lot number she reads GL92 then AA or 00. She does not see an

----------	-------	-------	---------	-----	----------	------------	--------------

expiration date or NDC number for the first or second dose. She says her second dose was in her left arm up high near the shoulder, upper arm high. She says she didn't feel either of them. She says that she was put on BREZTRI Expiration date, lot number, and NDC number not provided. She says her doctors thought she had COPD but she didn't; it doesn't work for people over 70. She says the cardiac problem was with a respiratory medication. She says it was Trelegy. She does not have an expiration date, lot number, or NDC number for Trelegy. She says she is not sure where she put the container but she does have it somewhere. She says it affects the QRS. She says when she had COVID she was sneezing and in August her hair fell out. She says she had a fever for 4 days that week then she went away. She says she wondered if she had the long haul COVID. She says the doctor gave her something to make her lungs spring open. She says she is currently hoarse due to spring allergies, not because of the shot. A medication called Breeze didn't work for her. She says that she was put on BREZTRI Expiration date, lot number, and NDC number not provided. She says her doctors thought she had COPD but she didn't; it doesn't work for people over 70. No additional vaccines administered on same date of the Pfizer suspect. All events did not require a visit to Emergency Room or Physician Office. No family medical history relevant to AE. No relevant Tests. The reporter considered events trouble walking, trouble seeing, slept a lot; 12 to 16 hours for the next 5 days were related to covid 19 vaccine, event hoarse was unrelated to covid 19 vaccine. The outcome of other events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the available information there is not a reasonable possibility that the drug contributed to occurrence of the events, a possible contribution of the drug to the event pyrexia cannot be excluded. 1320198	5/15/2021	NY	84	F	3/26/2021	4/1/2021	<p>This is a spontaneous report from a contactable nurse (patient). An 84-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: ER8730), via an unspecified route of administration, administered in Deltoid Left on 26Mar2021 as 2nd dose, single for covid-19 immunisation. Medical history included cholesterol abnormal. Concomitant medications included cholesterol medication. The patient previously received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN6202), administered in left arm on 26Feb2021 for COVID-19 Immunization. The patient states she had no immediate side effects. She states that two weeks, after the second dose (in Apr2021), she developed unbearable body aches, specifically in her arms and legs. The patient states she was unable to pick up her right leg and put it over her left leg. She states she is not getting better. The patient is asking if this is a side effect of the Covid vaccine, or is it from something else? She states she was healthy, she walked and was active, before the vaccine. The patient answers as there is very minimal improvement. She states that maybe there is some improvement because she has been taking Ibuprofen and Tylenol. The patient states her event has improved with the medications but they start to come back once the medications wear off. The patient stated she received her Pfizer Covid vaccine first dose in Feb and second dose in march. She stated 2 weeks after the second dose (in Apr2021) she is having terrible muscle aches in her arm and leg (calf muscle) she has to take ibuprofen to get through the day. The patient wanted to know about reports of it. She stated she has seen her doctor and done some tests. She has gone off her cholesterol medication and got checked for clots (no clots). The patient stated, "I got the vaccine in couple of week, I had no problem when I got the vaccine not even a sore arm. couple of weeks later I have developed excruciating pain and aching in my leg and my left arm. I went to the doctor and had whole panel of test and they ruled everything out I don't have Lyme, they took me of my cholesterol medication, I bought a new mattress, I am not sleeping in new mattress. I only take one medication cholesterol medication which I stopped and I am in agony and I wanted to know, if this is possibly connected to the COVID vaccine because I was really really healthy</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							individual before they started." There is no additional Vaccines Administered on Same Date of the Pfizer Suspect, no prior Vaccinations (within 4 weeks), no AE following prior vaccinations, no patient's Medical History (including any illness at time of vaccination). The patient states she feels her medications are not relevant to the report. The outcome of the events was unknown.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events. There is limited information provided in this report. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1320172	5/15/2021	SC	57	F	4/14/2021	4/24/2021	Blood clot; Random bruise on knuckle; Joint pain; Rash; This is a spontaneous report received from a contactable consumer (patient). A 57-year-old female patient started to receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, LOT/Batch number and expiration date unknown) via an unspecified route of administration on 14Apr2021 at 04:00 PM at age of 57-year-old at single dose, unknown dose number for COVID-19 immunization. Patient was not pregnant at time of vaccination and at time of events onset. Medical history included known allergies (unspecified). Compound heft (pending clarification) was reported as other medical history. Prior to vaccination, it was unknown if patient was diagnosed with COVID-19. Since the vaccination, the patient wasn't tested for COVID-19. Concomitant medications included supplements in two weeks. Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. Patient had rash on day 10 on 24Apr2021 at 03:00 PM, joint pain on day 11 (25Apr2021), day 12 (26Apr2021), day 13 (27Apr2021) and a blood clot and random bruise on knuckle on day 14 (28Apr2021). Events didn't result in emergency room visit or physician office visit. No treatment received for the events. Outcome of events was recovering. Information about Lot/Batch number has been requested.

1320314	5/15/2021	MA	52	M	4/21/2021	4/21/2021	<p>Blood Clot in right leg; Severe pain in leg; cry; This is a spontaneous legal report (Marketing Program) from a contactable consumer (patient himself). A 52-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE solution for injection) dose 2 (Batch/Lot Number: EW0770) via an unspecified route of administration, on 21Apr2021 11:30, as single dose for covid-19 immunization. Medical history included Asthma ongoing, Diabetes had been on and off since 2018, Covid-19 in an unspecified date in Jan2021. The patient received dose 1 (Batch no/Lot Number: ER8732) via an unspecified route of administration, on 29 Mar 2021, as single dose for covid-19 immunization. The patient's concomitant medications were not reported. On 21Apr2021 around 11:30-12:00 in the night the patient experienced Blood clot in his right leg, had a severe pain and cannot walk, feels like he's being stabbed in the leg every time he gets up. He had to keep his legs up all the time and not put them down. He stated that his life was going to be upside down for 6 months because of the Covid vaccination. Stated that was unacceptable. Reporter also said that if the blood clot breaks off it could be dangerous. Said it was substantial; it was all the way up to his groin, not its down almost to his knee and goes all the way down to his ankle. Patient went to the hospital last Saturday due to pain in the back of his leg. The pain started 12 hours after the second Covid vaccine. He wanted to cry he was in so much pain. He could not take anything for it. Patient stated that if the clot breaks off, he was dead. So, he had to put everything on hold because he did the right thing which ended up being the wrong thing. Patient stated that the pain in his leg was a 13 or 14 on a scale of 1-10. Patient took Tylenol and Pain patches did not work on a blood clot. Patient stated that when he was in the hospital, 4 different doctors, told him the event was at least 50 if not 100 percent caused by the Covid dose of vaccine. Patient stated that after the first dose of vaccine he was sick as a dog and he said that the clot may have started with the first dose of vaccine, stated that he had a 102 degree fever a few minutes after the vaccination, felt dizzy and thought he was going to fall over. Patient stated that he got the vaccination dose to get his life back and now he could not, that what about in 6 months if he had to get a booster vaccine and probably go through it all over again;</p>

or to be on quarantine. Patient stated that he went with his 84-year-old mother to get the vaccine. Patient said that the only reason she didn't get a blood clot was because she was already on blood thinners and said that he is the one who takes care of his mom and now he cannot walk barely, he had Covid in January and that people who had Covid shouldn't be taking these vaccinations because they have immunity, he talked to a doctor and a woman yesterday who still have their antibodies a year after having Covid. He said that the vaccine was injuring people. He was hospitalized related to his leg pain and diagnosed with the blood clot from 24 Apr 2021 to 27 Apr 2021. In the hospital he was told to him take Oxycontin or Morphine. He said that he did not want to take those and end up addicted. He said after a motor vehicle accident he had in 2002 he took Naprosyn and it helped, he said could not take that now because he was on a blood thinner. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient had tested COVID-19 positive prior to vaccination. This is to notify that potential legal action from a reporter in the attached source document booked into AER 2021506757 and 2021506972. The outcome of the event Blood Clot in right leg and Severe pain in leg was not recovered, feels like he's being stabbed in the leg was recovered and cry was not recovered. Information on Lot/Batch number was available. Additional information has been requested.

1319778	5/15/2021	VA	66	F	4/28/2021	DEATH; BLOOD CLOT; This spontaneous report received from a health care professional concerned a 66 year old White and not Hispanic or Latino female. Initial information received from the health care professional on 05-MAY-2021 was processed with additional information obtained from live follow up with health care professional on 06-MAY-2021. The patient's height, and weight were not reported. The patient's concurrent conditions included high blood pressure, diabetes, high cholesterol, non smoker, non alcohol user and other pre-existing medical conditions included no known allergies, no drug abuse or illicit drug use. Lab work was done 3-4 months ago, the results of which were unavailable. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 202A21A, and expiry: Unknown) dose was not reported, 1 total, administered on 10-APR-2021 possibly left arm for prophylactic vaccination. Unspecified concomitant medications were reported. On 28-APR-2021, the patient developed right leg pain and right leg swelling also began around this time as well. On 04-MAY-2021, the patient died from blood clot. An autopsy was not performed. The reporter stated that the patient's death was related to Janssen covid-19 vaccination and blood clots. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient died of blood clot on 04-MAY-2021. This report was serious (Death).; Sender's Comments: V0:20210509157-JANSSEN COVID-19 VACCINE- Death, blood clot - These events are considered unassessable. The events have a compatible/suggestive temporal relationship, are unlabeled, and have unknown scientific plausibility. There is no information on any other factors potentially associated with the events.; Reported Cause(s) of Death: BLOOD CLOT

1319782	5/15/2021	WA	38	F	4/12/2021		LEG PAIN, ONE WORSE THAN THE OTHER; HEART BEATING FAST; COLD SWEAT; THROAT CLOSING UP; HANDS AND FEET SWOLLEN; BLOOD PRESSURE UP A LOT; BODY ACHE; DIZZY; FELT VERY BAD; This spontaneous report received from a patient concerned a 38 year old female. The patient's height, and weight were not reported. The patient had no known allergies. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, batch number: 202A21A, and expiry: 31-DEC-2069) dose was not reported, 1 total, administered on 12-APR-2021 for prophylactic vaccination on left arm. No concomitant medications were reported. On 12-APR-2021, the patient experienced heart beating fast, cold sweat, throat closing up, hands and feet swollen, blood pressure up a lot, body ache, dizzy and felt very bad shortly after vaccination approximately within 5 to 10 minutes. In the 15 minutes of post vaccine observation, emergency services were called and the ambulance/EMTs came and helped stabilize the patient. The patient conveyed when she had arrived home that day after receiving emergency services she did not felt well at all and felt very bad. The patient was still had same symptoms at home that experienced shortly after vaccination, the symptoms did not resolve. The symptoms had lasted for two weeks. On 19-APR-2021, the only symptom patient had was strong leg pain in both legs, one worse than the other and was hospitalized (date unspecified). The patient's legs get swollen still and the pain remained to be intense. The patient's HCP was aware and was monitoring the patient. On 04-MAY-2021, Laboratory data included: Diagnostic ultrasound (NR: not provided) Results pending to rule out blood clots in the leg. Laboratory data (dates unspecified) included: Blood test (NR: not provided) Cleared, CT scan (NR: not provided) Cyst, but she complained no pain there and Urinalysis (NR: not provided) Cleared. The patient was told to go to clinic and the patient had followed up with clinic, then the patient was told to visit hospital as no appointment. The patient needed to be seen at a hospital and that was when she returned back to hospital a couple days after. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from heart beating fast, cold sweat, throat closing up, blood pressure up a lot, and dizzy on 19-APR-2021, and body ache on APR-2021, had not

1320023	5/15/2021	NY	29	F	4/15/2021	4/22/2021	A retinal vein occlusion, and I noticed right away; I scheduled an appointment with a retina specialist, and I was told I had a small blood clot in my right away; Exactly seven days after, something happened to my right eye that caused me issues with my vision.; This is a spontaneous report from a contactable consumer (patient). A 29-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in arm left on 15Apr2021 18:15 (Batch/Lot Number: EW0162) as single dose for COVID-19 immunisation. Medical history included type 1 diabetes and thyroid issues, allergic to shellfish and to fluconazole. Concomitant medications included insulin and thyroid medication. Exactly seven days after (on 22Apr2021), something happened to patient's right eye that caused issues with her vision. Patient scheduled an appointment with a retina specialist and was told patient had a small blood clot in right away. A retinal vein occlusion and patient noticed right away because it was right in the middle of vision field/where the light enters through in the eye. Patient was type 1 diabetic with perfect control and patient had never had issues with vision (even got checked last year before COVID and no problems). Her endocrinologist did not think it was diabetes related either. The only different thing was the vaccine. Now patient was not sure if she should take the second dose and also her retina doctor wanted her to get checked for further blood clots to make sure she was okay. No treatment was received for the events. The events resulted in physician office visit and disability. Outcome of the events was not resolved.

1320179	5/15/2021	CA	76	F	2/23/2021	2/25/2021	<p>Left distal artery thrombus 2 days after receiving covid vaccination in left arm; This is a spontaneous report from a contactable physician. A 76-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), intramuscularly, administered in the left arm on 23Feb2021 (batch/lot number and expiration date were unknown) as an unknown dose number, single for COVID-19 immunization. Relevant medical history included chronic kidney disease (CKD), vitamin (vit) b12 deficiency, vit d deficiency, and hypertension (htn); all from an unknown date and unknown if ongoing. The patient received other unspecified medications for hormone replacement therapy within 2 weeks of vaccination. The patient previously took tramadol and gentamicin, from which the patient experienced known allergies. The facility where the most recent COVID-19 vaccine was administered was unknown. The patient was not pregnant at the time of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. On 25Feb2021, the patient experienced left distal artery thrombus 2 days after receiving COVID vaccination in left arm. The adverse event (AE) resulted in a doctor or other healthcare professional office/clinic visit and emergency room/department or urgent care, as well as hospitalization for 6 days. Therapeutic measures were taken as a result of left distal artery thrombus 2 days after receiving COVID vaccination in left arm, which included embolectomy and anticoagulation. The patient recovered from the event on an unspecified date. Information on the batch/lot number has been requested.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the event peripheral artery thrombosis cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. ---

sore, her whole body was sore for about five days, she had diarrhea for five days, and she for slept five days and was totally exhausted. The consumer then reported that on 22Feb2021, she developed a blood clot in her right leg. The reporter explained that her leg swelled up and turned dark blue, almost black. The consumer reported that the patient was immediately rushed to the hospital. Caller states they did all sorts of tests and confirmed she had a blood clot in her right leg. States she was hospitalized from 22Feb2021 through 26Feb2021, so for five days. Caller states the leg went back to normal color, the swelling went down and she felt good. Caller states they came home on 26Feb2021, and she was up moving around, and everything was wonderful. On an unspecified date in Feb2021, around the time of the first blood clot, the patient was diagnosed with high blood pressure. Caller states on 12Mar2021 she had a second blood clot that traveled to her brain which caused her to have a stroke. Caller states when they got to the hospital they said she had a stroke from a blood clot that was somewhere in her system and it traveled to her brain. Caller states she was hospitalized from 12Mar2021 through 16Mar2021 when she was released from the hospital. Caller states she was too sick to go home so she was transferred to Rehab Center. She was there from 16Mar2021-27Apr2021. Caller states on 27Apr2021, she was transferred for rehab. Caller states at the center they only give rehab once a day for 30 minutes and he only works five days a week. Now she gets three hours of physical therapy a day and it is seven days a week. States they are working to get her to walk again and she is receiving speech therapy. States she has to learn how to walk again. Caller states her lowest weight was 208lbs, and they weighed her in yesterday and she was at 214lbs. Caller states with the stroke when she was at the hospital, they put her on baby food because she was having problems swallowing. While at rehab center she went from baby food to mechanical food. On 27Apr2021 she went to regular food. Speech because of the stroke went down to 25% and now she is at 50% and she is also getting one hour of speech therapy at hospital. Caller states they recognized it is important to get as much therapy as possible in the first 90 days, they call it a boot camp and patients are limited to 90 days to repair the damage. After 90 days, that is it.

States that is why it was important to transfer her to hospital to heal and get back to normal. Caller states she is in a wheelchair and they are trying to get her to stand up. Caller states at the hospital they were able to get her to take 2 steps. At Hospital they were able to get her to do special training and he was able to get her to take 4 steps. Caller states he has no idea where she is with the walking right now. States she did not do anything on the 27Apr2021, because that was arrival date. Therapy started yesterday on 28Apr2021 at Hospital. The consumer also reported that the patient's current weight is 214 pounds, from 258 when she took the shot and down to 208 pounds on an unspecified date in 2021. Treatment for the events included occupational, physical and speech therapies, as well as apixaban (ELIQUIS), rivaroxaban (XARELTO), and spironolactone 25mg once a day; takes in the evening at 6:00p.m. ongoing from 12Mar2021 for hypertension. The outcome of the events arm was sore, body was sore, diarrhea, and slept and was totally exhausted and slept five days was recovered on 04Feb2021. The outcome of the event blood clot in right leg was recovered on 26Feb2021. The outcome of the event second blood clot that traveled to her brain which caused her to have a stroke was recovered with sequelae on an unspecified date in 2021. The outcome of the event Having Problems Swallowing from the Stoke was recovered on 27Apr2021. The outcome of the events speech went down to 25%, back up to 50%, and weight loss from 258 pounds, down to 208 pounds, back up to 214 pounds was recovering. The outcome of the event high blood pressure was unknown.; Sender's Comments: Linked Report(s) : PFIZER INC-2021484454 PFIZER (Same reporter/patient/different doses/events)

She said after an hour, the shooting pains moved from her left breast area to the center of her chest; This is a spontaneous report received from a contactable consumer (patient). A 37-year-old female patient received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, LOT number: EW0169, expiration date unknown) via an unspecified route of administration at arm left on 22Apr2021 between 07:00-07:30 at age of 37-year-old at single dose for COVID-19 immunization. Medical history was reported as none. Patient had no history of all previous immunization with the Pfizer vaccine considered as suspect and no additional vaccines administered on same date of the Pfizer suspect. The events required a visit to emergency room. Physician Office visit was not required. There was no prior vaccinations (within 4 weeks). Concomitant medications included acetylsalicylic acid (ASPIRIN (E.C.)), paracetamol (TYLENOL 8 HOUR). Patient had her first COVID-19 Vaccine dose one week and one day ago on 22Apr2021. She said she was rushed to the hospital last night on 29Apr2021 (at around 11:00 PM) because she thought she was having a heart attack. She said she had really bad chest pain that lasted about 30 minutes. She clarified when the chest pain first started, she couldn't move or breath. She said she took an aspirin before she went to the hospital. She said she still had a shooting pain in her chest, today on 30Apr2021. She said she wanted to know what was going on. She said while she was at the hospital (Emergency Room), she had blood work done on 29Apr2021, and she had no blood clots. She said she had a (chest) x-ray done on 29Apr2021, and the (chest) x-ray was fine. She said her heart was monitored, and her heart was fine, but her left chest still had pain. She said she was a healthy 37 year old, who had no types of problems. She said the only thing she had recently was the COVID-19 Vaccine. She said she wanted to know if she should get the second COVID-19 Vaccine, or if the second COVID-19 Vaccine would kill her. The caller was advised she would be transferred to Pfizer Medical Information for further</p>

assistance. Patient reported she liked to Google, and was not sure if anybody had called Pfizer to go and report if they experienced chest pain after getting the COVID-19 Vaccine. She said she was not sure if the hospital was going to report what happened to her. She said she asked the (emergency room) doctor last night about people experiencing chest pain after getting the COVID-19 Vaccine. She said the doctor told her people with COVID complain about chest pain. She said what the doctor said didn't mean anything because he was talking about the COVID-19 Virus, and not the COVID-19 Vaccine. She stated she took 1 Bayer brand Aspirin 81mg (Lot Number: N8A94D0 or O, Expiration Date: Sep2022) before she went to the hospital for chest pain. She stated the hospital gave her Ketorolac to treat her chest pain. She said the Ketorolac was given to her in an IV form through an IV access in her arm. She said she did not have the Ketorolac dose, NDC, Lot, and Expiration Date. She reported that on 29Apr2021, the hospital took some urine and blood tests, a chest x-ray, and an EKG which was normal. She said beside the Ketorolac that was all the hospital (emergency room) did. Patient reported she took Tylenol 500mg caplet (Lot Number: AAA103, Expiration Date: Sep2024) if she had a headache, but usually didn't take medication. Reported while waiting for the doctor to see her at the hospital (emergency room) on 29Apr2021, she had chest pain for about 5-10 minutes. She said the chest pain calmed down, but she had shooting pains in her left breast area. She said after an hour, the shooting pain moved from her left breast area to the center of her chest. She said the chest pain was not as bad today (30Apr2021), as it was last night. She said her chest didn't feel normal on 30Apr2021, and she still had the shooting pains. She said after she had been talking with the Pfizer agent, she had shooting "things" in her chest, and she felt weird. No further details provided. Events were serious as hospitalized. Outcome of chest pain was recovering, of the other events was unknown. Communication: The caller was provided with phone number of option 3, and hours of operation of Monday through Friday, 8AM to 8PM ET & Saturday and Sunday 9AM-3PM, prior to warm transfer. Follow-up attempts are needed. Further information is expected.

1320109	5/15/2021	NY	69	M	3/11/2021	3/1/2021	Blood clots; Delirious; Oxygen was down to 80%; Sepsis; E. coli/sepsis with cultures of E. coli; C-diff; sick; Shaking uncontrollably; Achy; Extremely high fever/a high fever of 103 F; Chills; Aneurysm in his leg; Bleeding from somewhere; weak; missed his second dose of the Pfizer COVID-19 vaccine; Caller says her husband's kidney was failing too while he was in the hospital; This is a spontaneous report from a contactable consumer reported for her husband. A 69-years-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in arm on 11Mar2021 18:00 (Lot Number: EV6206) as single dose for covid-19 immunization. Medical history included Kidney transplant from 1998, same kidney all these years, on immune medication, polycystic kidney disease from 1998, the transplant saved him in 1998, blood pressure high went along with the polycystic kidney disease, had it for a while, Type 2 diabetes mellitus this was diagnosed probably about four years ago and immunocompromised. There were no concomitant medications. The patient had the first dose of the Pfizer vaccine on 11Mar2021, "he felt okay first evening, Friday was okay, Saturday 13Mar2021 achy, Sunday running a high fever of 103 F, he started to get chills. Then Around 3am (Early Monday on the 15Mar2021) called the ambulance, oxygen was down to 80% he was shaking uncontrollably, temperature was still 103 F when they took it and even at the hospital was the same temperature. He was delirious on 15Mar2021. When he got to Emergency Room he was in critical section, had to put on BiPAP with 100% oxygen, When in the ambulance they tested for covid and was negative each time he was tested for covid he was negative. He was in the hospital from 15Mar2021 to 24Mar2021, in critical care unit. He Turned out having sepsis, E.coli, had to put him on strong antibiotics. He developed CDIFF on 15Mar2021, and an aneurysm in his leg in Mar2021 and needed a blood transfusion. They were trying to rule out blood clots and did sonogram and found it. His blood was going down, he was bleeding from somewhere and had to have a transfusion. They did a procedure on the leg to break up the aneurysm twice. On BiPAP for a few days and then did the medium one and then able to take off oxygen when he went home. He came home on antibiotics and tons of medication. Should he get the

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

second vaccine? Is it related? Is it to late to get the second vaccine? following Sunday he had an extremely high fever and was shaking uncontrollably on 14Mar2021. He was told to get the shot by his provider. She had to call an ambulance, he almost died, and she didn't know if it is related to her husband getting the vaccine. They put her husband on a BiPAP with 100% O2 when he went to the hospital by ambulance and was admitted on 15Mar2021, which he was on the BiPAP a couple days then went on to the second level, then right before he came home he was weaned off of oxygen. They kept testing him for COVID every day, because the symptoms were similar but they tests kept coming up negative. On 15Mar2021, the patient had sepsis, with cultures of E. Coli, and very contagious C-diff, he was sick from the 15th to the 24th for all those things. She didn't know if the vaccine brought it on if it was brewing in him before that, or if it had to nothing to do with vaccine. He also had an aneurysm in his leg and had a medical procedure where they had to go in and take care of it to break up the aneurysm. The patient's kidney was failing too while he was in the hospital. The patient missed his second dose of the Pfizer COVID-19 vaccine due to his hospitalization from 15Mar2021 to 24Mar2021. She would like to know if it would still be recommended for the patient to get the second shot of his COVID-19 vaccination since he is past the deadline to get it, is it going to be too late for him to get the second dose to be fully vaccinated and effective to get it after waiting this long? His first dose was injected about 06:00PM in unknown arm. The patient had a fever Saturday evening, clarified to being 13Mar2021, which was higher the next day on 14Mar2021 and reached 103 degrees Fahrenheit, and he went to the hospital by ambulance at 03:00AM 15Mar2021. His fever started getting higher late Saturday to Sunday and he got progressively worse. The patient had had serious complications before related to his health problems, but she had never had to call an ambulance before this. The patient had chills on Saturday 13Mar2021 and then Sunday evening he was shaking and it wouldn't stop so she gave him Tylenol, then she called the ambulance Monday morning. The patient can't take anything more than Tylenol, and he never usually takes anything. The patient's kidney function was getting bad while he was in the hospital, his

Creatinine went high and was 3.8, which is high for someone with a transplant. The patient was doing better, he was still very weak, he was under a doctor's care, he was on very strong antibiotics for a month, Vancomycin and other medications which also make him weak. The patient was on IV antibiotics at the hospital and then came home on oral. The 3.8 for the Creatinine was probably at the beginning when he went into the hospital. The outcome of the event Sepsis was Resolved with Sequel and the outcome of the other events was unknown.

an unspecified date patient contacted his primary care doctor and was told to take some extra Motrin, twice a day but Motrin was not effective for his headache. The patient was not feeling well he went to his primary care doctor. Caller states her husband was at his doctor on 07Apr2021, and he went to radiology for a Cat Scan on an unspecified date and the results was negative. He had lab work drawn and a CT of the head. Her husband was given a medication to help him sleep, medication not specified. Caller mentioned she rescheduled her husband's second vaccine. On 12Apr2021, in the evening when he was getting out of the shower, he developed numbness in his left hand, and added later in the report, numbness of his mouth. Patient went to the emergency room, where they performed several tests, Multiple Cat Scans. Results of the first Cat Scan, a blood clot was diagnosed, and an EKG because they thought he may be having a heart attack but it was confirmed he was not having a heart attack.. When her husband was in the emergency room, they did a Covid test and it was negative. The patient was diagnosed with a blood clot and got Tissue plasminogen activator. At 7:33 pm, when he was given tissue plasminogen activator. After the treatment, the headache went away, but she is not sure if he has lasting effects. He was admitted to the Intensive Care Unit and was in the hospital for two days and diagnosed with a stroke, but he was able to walk out of the hospital. The patient still gets an ache in his head, and it comes and goes. Caller states it seems that these events were not coincidental, as they all happened after he got the vaccine. Since her husband has been home from the hospital, he is sleeping better but normally does not get a full night of sleep, and he usually wakes up at night and husband gets constipated when he takes Motrin. Caller mentioned that her husband is not fully constipated anymore, but he feels that his system is not back to normal. Caller assumed the stroke has cleared up, but is not sure. Caller rescheduled her husband's second vaccine, and she is not sure her husband should get the second vaccine. Caller states if these events were caused from the Covid vaccine, what will happen in the future? The clinical outcome of the events Clot blood, Stroke, malaise and wakes up at night was unknown; Numbness of left hand and mouth was recovered on 12Apr2021, Fever was recovered on 04Apr2021, while

1321418	5/15/2021	NC	48	F	3/10/2021	4/10/2021	On Saturday, April 10, 2021, I had started having pain and swelling in my right calf that lasted for several days on and Tuesday, April 13th, I started having pain on the left side of my chest. On Thursday, April 15th, I went to the ER due to pain and swelling in my leg and it was discovered that I had 2 clots in my leg (on at my calf and a second one on the right side of my knee). Not realizing my chest pain was related, I discussed with my primary care at a follow up visit on Monday, April 19th, and a CT scan was performed confirming I have an pulmonary embolism (extensive pulmonary emboli in both lungs). I was immediately put on Xarelto blood thinner and sent home.
1320362	5/15/2021	MS	70	M	5/6/2021	5/7/2021	patient passed away, due to what was being told as possible blood clot in lungs; This is a spontaneous report from a contactable consumer. A 70-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 06May2021 (Lot Number: ER8633) (at the age of 70-year-old) as single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient did not experienced COVID-19 prior or post vaccination. The patient passed away, due to what was being told as possible blood clot in lungs (on 07May2021). The event was serious (fatal) and required emergency room visit. It was not reported if an autopsy was performed.; Reported Cause(s) of Death: blood clot in his lungs
1321295	5/15/2021	FL	88	F	4/17/2021	4/21/2021	patient said 4 to 5 days after the vaccine, she went to the hospital and had blood clots in the lungs and legs. she said she's ok now and dr told her to get her second vaccine today. she is now on Eliquis.
1320860	5/15/2021	WA	48	F	5/7/2021	5/10/2021	Got my second Pfizer Covid shot Friday, by Monday I had a huge blood clot in my neck and also a huge one in my left arm. I am now permanently on a blood thinner because of this.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1320834	5/15/2021	CO	63	F	3/6/2021	3/7/2021	Fever night of getting the shot. Severe abdominal pain for weeks. GI Dr. visit on April 7, 2021 and the PA ordered an abdominal CT with contrast. CT exam on April 13, 2021 which showed total occlusion of the superior mesenteric artery (SMA) and a clot in the thoracic aorta. Went to emergency room on April 14, 2021. Doctor determined that a SMA embolectomy is needed via exploratory laparotomy. Post operation had an event and returned to the ER but was released with all normal blood and heart values.
1320793	5/15/2021	UT	17	M	4/16/2021	4/27/2021	After 1st shot; Patient developed multiple blood clots (lungs and legs) about 10-11 days afterwards. All tests for cause of clots were inconclusive. Patient received his second dose and with in 48 hours was hospitalized for appendicitis. If it was a reaction after just one shot, I would normally think it was a coincidence. With him have severe reactions after both shots, it seems very suspicious!
1320700	5/15/2021	WA	31	M	5/4/2021	5/8/2021	The patient had first dose of Moderna COVID-19 vaccine on 05/04/2021. On 05/08/2021 the patient began having cramping abdominal pain. He was seen in his primary office and the ED once before ultimately being admitted with a portal vein thrombosis and mesenteric vein thrombus. His only risk factors for blood clots are obesity. He has no family history of significant blood clots (except for father who had PE in setting of COVID infection). He has no history of malignancy or family history of malignancy at a young age. He is now being admitted for anticoagulation.
1320522	5/15/2021	SC	46	F	2/1/2021	5/1/2021	Chills, fever , body aches the first few days. Next two periods not normal. Having extremely heavy menses with large blood clots that are not usual for me. Extreme fatigue due to blood loss. Still have not stopped bleeding
1320430	5/15/2021	MA	61	M	4/7/2021	4/8/2021	Chills at 12 hours after shot. Abdominal aches around the rib cage and gut starting 48 hours after shot. Aches were severe for 14 days, moderate for 12 additional days, mild for 10 additional days. Treated abdominal pain with Advil. Shortness of breath after mild exertion - like walking the dogs around the block. Shortness of breath still persists today after 5 weeks. I am concerned the shortness of breath may be due to a PE blood clot.

1320378	5/15/2021	FL	78	M	3/20/2021	3/1/2021	DVT was twice as bad; death/natural process; This is a spontaneous report from a contactable Nurse reporting for reporter's husband. A 78-year-old male patient received bnt162b2 (reported as COVID vaccine), dose 2 via an unspecified route of administration on 20Mar2021 (Lot Number: EN6201; Expiration Date: 30Jun2021) as 2nd dose, single (at the age of 78-year-old) for COVID-19 immunisation. Medical history included diabetes, Liver cirrhosis, thrombocytopenia, Kidney stone, sarcoidosis, blood pressure abnormal, high cholesterol, pacemaker and they putted the IVC filter for blood clot. Concomitant medications included insulin, simvastatin, hydrochlorothiazide and omeprazole (PROTONIX), all taken for an unspecified indication, start and stop date were not reported; and carvedilol (COREG) taken for blood pressure, start and stop date were not reported. The patient previously received the first dose of bnt162b2 (Lot Number: EN6201; Expiration Date: 30Jun2021) on 27Feb2021 at the age of 78-year-old for COVID-19 immunization and experienced pulmonary embolism and deep vein thrombosis (DVT) on 12Mar2021, and went into the hospital 12Mar2021. Then the patient had the second COVID shot on 20Mar2021 and the reporter had taken him right back into the hospital couple days later because the DVT got twice as worst. The patient experienced DVT was twice as bad on an unspecified date in Mar2021, which required hospitalization on 22Mar2021. The patient underwent lab tests, he had lab tests on 22Mar2021 when he went in and he probably had them on 23rd and 24th of Mar2021. The reporter didn't know what all the lab tests were done in the hospital. The patient died on 12Apr2021. The reporter stated they put Reason of death as natural process because she sent him in the Hospice. An autopsy was not performed. The outcome of event DVT was unknown. The reporter considered there was a causal relationship, when he got his second COVID shot on 20Mar2021 and then he went back in the hospital on 22Mar2021 and the DVT was twice as bad.; Sender's Comments: Based on a positive temporal association, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported DVT. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse

1316639	5/14/2021	MI	51	F	4/12/2021	4/12/2021	<p>She got her vaccine, she felt the burning sensation all the way down to her fingers and her wrist. I proceeded to go forward and wait the 15 minutes. She then started to have pain in the side of her neck on the right side, discomfort and pain in her arm. Within the hour she started to have headaches (has had COVID in the past). She went home and it was a nagging pain in her arm, not at the site but the whole arm was sore and limited using the arm due to the discomfort. That night is when she came on the news and started that the vaccine was being pulled from administration. That night it was like a pulling sensation right in her upper arm, up near the armpit and the fatty tissue from the breast and where you raise your arm. When she started noticing the discoloration started in her skin. Her hands started getting black, under both arms were black, the back of her legs was black, and she started feeling worsening fatigue. She started getting worried and was looking at how her veins turned purple blue/green just in the one arm. She was trying to figure out why she had limited use of her arm, and was holding it as if she had a sling on it as when it hung to her side it had the pulling sensation and a crawling sensation in her veins (that night and going into the next day). The next morning she was so exhausted and tired, as was her mother who had the vaccine at the same time, and was not feeling well. She was feeling that possibly due to the fibromyalgia she was have worsening symptoms than her mother. She then started bruises on her body, on the arm itself as if somebody grabbed and squeezed her arm, purplish/black bruising. It had her forearm develop 3 large pockets of swollen, almost as if the medicine was sitting in her arm. She was slowly getting the pulling sensation down to her hand, and she called the UC first and due to the high volume of COVID she wanted to know how long of a wait she would have. They instructed her to go to the ER due to the development of the blood clots on the news. There was no change in her symptoms, and got to the point that she could not move her arm, and the knots stayed in there and there was a reddish discoloration around them. Now she was having a pulling sensation in her chest and palpitations of pain near her heart. She was having soreness in her legs to the point that she was not able to walk, and felt it was in her nerves 3 days after the vaccine. She stayed in the bed the entire week just due to the exhaustion and</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							effects. Every time she would go to reach for something she would have the pulling sensation down to her hand, and the entire arm was swollen with the bruising all over. Her body started having purple and blue knots and also in the left leg. Her arm and fingers were swollen as well. She then started having itching of her arm, and her lips started swelling and got up and went to Hospital and was able to be seen. She was having problems with her stomach as well, having a knot in the stomach where it was protruding and started losing weight since the vaccine. The ER doctor told her she had a reaction to the vaccine, and did a Doppler to see if she had blood clots. They did not give her the results and didn't feel that she didn't have problems. She also went to the UC and back and forth to the ER, and still had the knots and finally looked at the knots and her jaw was swollen, and her arm was still swollen. The UC told her that she was having a fibromyalgia flare. She is still having the same symptoms green/blue and have started protruding. Due to the fatigue she has mainly just stayed in bed and knew that she was to have COVID symptoms, but knows that the crawling sensation and the knots sitting in her arm, and now her arm looks disfigured and the swelling is not going down. They told her that the test was negative for the blood clots. She had made an appointment with her neurologist and has an APT on Tuesday 5/25/21. She continues to lose weight no matter how much she consumes and still continues to have the knots and pain in the arm.

1316143	5/14/2021	NJ	58	F	3/14/2021	4/17/2021	they packed my nose to stop it from bleeding, clots were coming out, clots coming both ways,; nose bleed; my blood pressure went up; This is a spontaneous report from a contactable consumer (patient). A 58-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration on 14Mar2021 10:00 as 2nd dose ,single for covid-19 immunisation. The patient medical history was not reported. Concomitant medication included acetylsalicylic acid (ASPIRIN BAYER). The patient previously received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) on 28Feb2021 for COVID-19 Immunization. The patient received the Second dose of Pfizer on 14Mar2021, states, "On 17Apr2021, Saturday, nose bleed started, and my blood pressure went up. I Called ambulance took blood pressure and it was 210/107. I didn't go to hospital, nose bleed had stopped while they were there, I stayed in ambulance until blood pressure came down. Sunday I went to ER (emergency room) because my nose started bleeding again, it stopped Sunday, but they checked the nose, nothing was there. I stayed in the hotel, Monday morning I blood again, Tuesday I bled even more starting at 7am and it didn't stop. Went to the hospital to ER (emergency room), they packed my nose to stop it from bleeding, clots were coming out, clots coming both ways, they checked blood, not anemic, everything okay with blood. on 23rd they removed the pack from nose, ENT told me no vessels were broken, he said I was fine. That is when I received a phone call about someone else having this problem. A week later a class mate said her sister had the same reaction after getting the Pfizer vaccine." She was calling about the Covid 19 vaccine. She received her second vaccine on 14Mar2021 and had no problems during that time. On 17Apr2021 she called an ambulance because she had a nosebleed. Her blood pressure was also high at that time around 210/107mmHg. Her nosebleed stopped with emergency management technicians and her blood pressure came back down. She did not go to the emergency room at this time. On 18Apr2021 at around 3:00AM, she had another nosebleed and she did go to the emergency department at about 10:00AM. She has never had a nosebleed before. When she was examined in the emergency room on 18Apr2021, she had no blood in her nose that the

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

doctor could see. On 19Apr2021 around 7:00AM she had another nosebleed but the nosebleed stopped and she did not go back to the emergency room. On 20Apr2021, her nose started bleeding around 5:00AM and it didn't stop so she went back to the emergency room around 7:00AM and the doctor in the emergency room packed her left nostril and the blood was coming out of the right nostril and out of her mouth. She was bleeding for a few more minutes and then the bleeding stopped. Her blood pressure was fine. Her bloodwork was checked and everything was fine. She wasn't anemic or anything like that. She didn't have any bad effects from the nosebleeds. The emergency room told her to follow up with her primary care doctor on Thursday, 22Apr2021, but her primary care doctor no longer takes her insurance. She did go see an Ear, Nose, and Throat doctor on Friday, 23Apr2021. The Ear, Nose, and Throat doctor removed the nasal packing and examined the inside of her nose and told her that he could not see any broken vessels or any cause as to why she would be having nosebleeds. The patient's apartment is being renovated and she thought she might be having a reaction to the hotel she's staying in. She moved out of her apartment on 12Apr2021 and her nosebleeds started 17Apr2021. She has missed work because of her nosebleeds and she started back to work this week. When probing for her Covid 19 vaccine information she reports she does not have the vaccine record card with her. She received the second Covid 19 vaccine on 17Mar2021. NDC/Lot/Expiry not known. First Covid 19 vaccine date is in the suspect product field. She does not have the NDC/Lot/Expiry for the first date either. She reports she had a regular physical with her doctor in Nov2020. She received a tetanus vaccine at that visit. She reported she sometimes takes 2-3 regular Bayer Aspirin for minor pain. She took the Bayer Aspirin on Saturday, 17Apr2021, because she was going somewhere and she knew she would be sitting for a while at that place. She would like to report she experienced no discomfort, or aches or pains or headaches with her Covid 19 vaccine. There is no prior Vaccinations (within 4 weeks). The outcome of the events was unknown. Information about lot/batch number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021476976 same reporter/drug/event, different patient

clots were coming out; nose bleed; blood pressure went up; This is a spontaneous report from a contactable consumer (classmate's sister). This is the second of two reports. A 62-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; solution for injection) via an unspecified route of administration on an unspecified date (at an unspecified age) as a single dose for COVID-19 immunisation. Medical history and concomitant medications were not reported. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; solution for injection) via an unspecified route of administration on an unspecified date (at an unspecified age) as a single dose for COVID-19 immunization. On an unspecified date (almost a month after receiving the second COVID-19 vaccine) the patient experienced clots were coming out, nosebleed and blood pressure went up. The reporter called to report that she had received a phone call from an old classmate, who had a sister, who experienced the same reaction after getting the Pfizer vaccine. This patient experienced the same nosebleeds after the COVID-19 vaccine. This person's nosebleeds started almost a month after she received the second dose of the COVID-19 vaccine. That was when the reporter started trying to figure out where these nosebleeds were coming from. She did not have any further information on the person that she mentioned. The clinical outcomes of the events clots were coming out, nosebleed and blood pressure went up were unknown. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021476256 same reporter/drug/event, different patient

1316154	5/14/2021	IL	51	F	4/8/2021	4/23/2021	bleeding heavily with small clots; has not had menstrual cycle since 2018; started spotting; bleeding heavily with small clots; This is a spontaneous report from a contactable consumer, the patient. This 51-year-old (non-pregnant) female patient received the first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: ER8727), via an unspecified route of administration in the right arm on 08Apr2021 11:30 (at the age of 51-year-old) as a single dose for COVID-19 immunization. Medical history included endometriosis diagnosed in 1993 and subsequently she had laparoscopy twice by the age of 26-year-old; and ongoing menopause since 2018. History of Parity 1: the patient was pregnant with her daughter and have her naturally at 27 years old and never had another pregnancy again. The patient's concomitant medications were only women multi-vitamins. Prior to the vaccination, the patient was diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The patient reported that she has not had menstrual cycle since 2018. On 23Apr2021, the patient started spotting. Since 26Apr2021, she has been bleeding heavily with small clots. All day today (on 28Apr2021) she has been bleeding very very heavy with clots. She was planning to go to her doctor by morning, but she was following through with her second dose tomorrow (29Apr2021). The clinical outcome of the events "have not had menstrual cycle since 2018; started spotting; bleeding heavily with small clots" were not resolved. The lot number for the vaccine, BNT162b2, was not provided and will be requested during follow-up.

1316155	5/14/2021	MI		F			This is a spontaneous report from a Pfizer-sponsored program. A contactable consumer (Patient's relative) reported for a female patient of an unspecified age received BNT162B2 (PFIZER COVID 19 VACCINE, Lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date at unknown dose number, single for COVID-19 immunization. The patient's medical history and concomitant medication were not reported. The patient received the Pfizer Covid vaccine. The patient was fine and healthy after the shot. Subsequently she fell down, hurt her hip and broke her wrist. Last Monday, she went for a steroid shot that was given in her wrist. On Tuesday, she was flushed and threw up. They took her to the hospital, and she was diagnosed with blood clots in her brain. She has been in the hospital since that Tuesday (unspecified date) due to the reported events. She has since been admitted to the hospital with a swelling of her brain, and confusion. The events happened on unspecified dates. She is scheduled for a magnetic resonance imaging (MRI). The outcome of the events was unknown. Information on the batch number has been requested.
1316156	5/14/2021	PA		M	1/22/2021		resulted into blood clots in his throat and left side of his body; This is a spontaneous report from a contactable consumer via a Pfizer sponsored program. A male patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), first dose on 22Jan2021 (Batch/Lot Number: EL1283) as 1st dose, single, second dose on 16Feb2021 (Batch/Lot Number: EL9264) as 2nd dose, single; both via an unspecified route of administration for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient reported that he ended up in the hospital after receiving both covid vaccines which resulted into blood clots in his throat and left side of his body from the waist down on an unspecified date. The patient was hospitalized due to the event from 25Apr2021 to 27Apr2021. The outcome of the event was unknown.

1316174	5/14/2021	MI	77	M	3/30/2021		<p>Blood clot in leg - first dose; This is a spontaneous report received from a contactable consumer, the patient. A 77-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot: CR2613), via an unspecified route of administration in the left arm on 30Mar2021 (at the age of 77-years-old) as a single dose for COVID-19 immunization. Medical history included broke femur of right leg on 09Nov2020 and hospitalized from 09Nov2020 until 15Nov2020 or 16Nov2020, surgery to repair broken right femur on 12Nov2020, rehabilitation following hospital discharge and got out of the rehab facility on 14Dec2020, been in either a walker or a wheelchair and still not fully recovered (ongoing); chronic obstructive pulmonary disease (COPD), asthma diagnosed at least 13-14 years ago, bronchitis, all ongoing from an unspecified date diagnosed at least 13-14 years ago. Concomitant medications were not reported. There were no other vaccinations within 4 weeks of the vaccine. On an unspecified date, the patient experienced a blood clot in the leg. The clinical course was follows: After he was discharged from rehab, the patient went to his own family doctor on 30Mar2021 because his ankle and leg were still swollen. The physician sent him to have a vascular done, on an unspecified date after 30Mar2021, with unknown results. The patient reported that the physician determined that he had blood clots in his leg. The patient was sent to the emergency room and started "that stuff" for about a week until he went to a regular vascular doctor and the physician determined what the patient should be doing. The patient reported that he was diagnosed with the blood clots after he got out of rehab. The patient received apixaban (ELIQUIS) from Apr2021 for blood clot in leg. The clinical outcome of blood clot in leg was unknown.; Sender's Comments: Linked Report(s) : PFIZER INC-2021478767 same patient, different dose/event</p>

1316159	5/14/2021	FL	36	M	4/6/2021	4/6/2021	Cellulitis; immune system being weakened; fevers which came and went; chills; sweats; nausea; loss of appetite; light headedness; lack of energy; This is a spontaneous report from a contactable consumer (the patient). A 36-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot Number: EW0151) via an unspecified route of administration in left arm on 06Apr2021 12:30 at age of 36-year-old at single dose for COVID-19 immunisation. The patient had no relevant medical history. No known allergies. The patient's concomitant medications were not reported. The patient previously took the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EN6205) via an unspecified route of administration in left arm from 16Mar2021 12:30 at age of 36-year-old for COVID-19 immunization. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. No other medications the patient received within 2 weeks of vaccination. The patient did not diagnose with COVID-19 prior to vaccination. The patient had not been tested for COVID-19 since the vaccination. The patient was very sick for 4 days: fevers which came and went, chills, sweats, nausea, loss of appetite, light headedness, lack of energy. As a result of his immune system being weakened, he wound up with Cellulitis which he was still fighting over 3 weeks after the shot. As the patient was normally a healthy male, it was strange that he would wind up with a bacterial infection. The patient also stated that after the second dose he experienced cellulitis in his left leg to thigh area. He went to emergency room for scan and to rule out clot. He thought he was immunocompromised and that was why he got the cellulitis in the leg. Caller wanted to get the compensation information to help with the bills. The events onset date was 06Apr2021 17:00. 2 rounds of antibiotics was received for the events. The events result in doctor or other healthcare professional office/clinic visit and emergency room/departement or urgent care. The patient underwent lab tests and procedures which included ultrasound with unknown result. The outcome of the events was recovering.
1316521	5/14/2021	NY	66	M	1/30/2021	4/1/2021	I developed a severe blood clot in my left calf. I needed to be admitted in the hospital. I was there for 4 days.

1317316	5/14/2021	CO	60	M	12/17/2020	12/21/2020	About 1 week following first Pfizer vaccination, I began having achiness in left leg and thought this was possibly from sitting in a chair without enough cushion. I simply could not get leg comfortable. Over a couple days duration the leg continued to be achy and slightly swollen. On December 23rd at night I awoke due to such discomfort in leg and could not get comfortable enough to go to sleep. I went to ED where I was examined and found to be mildly short of breath and in pain. Ultrasound of leg showed large upper leg DVT. CT of chest showed submassive Pulmonary Horseshoe Embolus. I was placed on Heparin and anticoagulated. Hospitalized for several days while anticoagulated and observed for any clot progression or respiratory distress and discharged home on Xarelto for anticoagulation and follow up with PCP, Hematology, Pulmonary medicine.

1316170	5/14/2021	NC	55	M	4/19/2021	4/20/2021	<p>Pulmonary embolism in his left lung; Chills; Hard to breathe; shaking a lot; This is a spontaneous report received from a contactable consumer (patient). A 55-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; solution for injection; Lot Number: EW0164) via an unspecified route of administration on 19Apr2021 at 12:00 (at the age of 55-years-old) as a single dose in the left shoulder for COVID-19 immunisation. Medical history included chronic obstructive pulmonary disease (COPD) from an unspecified date and ongoing and urinary tract infection (UTI) from an unspecified date and unspecified if ongoing. Concomitant medications were reported as none. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; solution for injection; Lot Number: first letter is either a G or O but he thought it was OE8732) via an unspecified route of administration on 29Mar2021 at 11:45 (at the age of 55-years-old) as a single dose in the left shoulder for COVID-19 immunisation. Illness at vaccination was UTI. On 20Apr2021 the patient experienced pulmonary embolism in his left lung, chills, hard to breathe and shaking a lot. The patient was hospitalized for pulmonary embolism in his left lung (blood clot) from 20Apr2021 to 26Apr2021. The clinical course was reported as follows: The patient stated that he had the second Pfizer shot on 19Apr2021 and on the 20Apr2021 he had a really bad reaction to it. He had chills, it was hard to breathe, he was shaking a lot and had a UTI and COPD and had to call an ambulance to come get him. When he went to the emergency room, they did a CT (computerized tomography) scan of his chest and found a pulmonary embolism in his left lung and he was put on a Heparin drip for 7 days and stayed in the hospital for 7 days. The event hard to breathe ended shortly after he got to the emergency room since he was on oxygen. The patient had a history of COPD, so sometimes he had trouble breathing, but right now he did not. The event shaking a lot ended a little after he got to the emergency room. The patient also stated that he had a history of UTI in the past and had a UTI during the vaccine but was not treated for the UTI until he was at the hospital. The clinical outcomes of the event pulmonary embolism in his left lung was unknown; chills, hard to breathe and shaking a lot were all</p>

1317257	5/14/2021	NV	62	M	3/15/2021	3/22/2021	I started to get a weird feeling in my chest a week after the vaccine. It was a burning sensation and I thought it was vaping at first. It started to get worse and worse. A week later I went to the ER and they ran some tests. After testing it was confirmed that I was having a heart attack. I had blot clot in my OM1 discovered on 04/07/2021. I had had an angiogram in 2019 and there were no problems then. I was hospitalized for four days and I was given a Stent which ended up getting a blood clot. The original Stent was removed and a larger one was put in. I am now taking some blood thinners, Aspirin, Atorvastatin, Carvedilol 6mg, Prasugrel 10mg, and I am scheduled to see a cardiologist because I still have a little chest pain.
1318546	5/14/2021	AZ	42	M	4/23/2021	5/1/2021	Blood clot formed.
1317800	5/14/2021	PA	92	F	5/13/2021	5/14/2021	pt presented at store today with a bruise on her upper left calf. she did not remember hitting her leg. she noticed it after her janssen covid vaccine. I advised pt to seek medical attention due to the risk of low platelets/blood clots- under advisement of the EUA. Pt was going to get looked at Med Express.
1317621	5/14/2021	NY	58	F	4/21/2021	4/30/2021	58F w/o significant PMHx presenting to ER with arteriolar thrombosis. Two weeks prior, pt developed swelling and pain in left foot (~1 week post vaccine #2). She went to urgent care and was prescribed ketoconazole cream. She then developed multiple ulcers on her left foot. She presented to ED on 5/12/21. Arterial duplex reviewed complete occlusion of mid-distal SFA into the popliteal and posterior tibial arteries. Pt now returned and ready to be admitted. Of note, pt is a 20 year smoker, half pack a day. Denies any personal or family hx of previous clots. Arterial duplex reviewed complete occlusion of mid-distal SFA into the popliteal and posterior tibial arteries
1317607	5/14/2021	NC	36	F	4/7/2021	5/9/2021	Patient describes muscle pain and bruising/"blood clots" on left side. The onset was 5/9/2021. Describes as severe pain that increased till seen at healthcare provider's office by healthcare provider.

1317532	5/14/2021	ME	58	F	1/14/2021	5/13/2021	PULMONARY EMBOLISM in patient with no history of VTE or hypercoagulable state. Patient complaint of exertional dyspnea on exertion over past 2 weeks. She saw her PCP, D-dimer=3424, CT angiography with fairly extensive clot burden of pulmonary emboli throughout all lobes, beginning just distal to the main pulmonary arteries. Flattening of intraventricular septum is concerning for right heart strain. admitted with IV heparin for further studies. Dyspnea has significantly improved with anticoagulation and bed rest.
1317525	5/14/2021	CA	49	F	4/2/2021	4/23/2021	(4/23/21) Symptoms included intermittent (R) lower leg pain. After 3days, started myself on Aspirin which seemed to improve Sx somewhat. Stopped the Aspirin. Then learned of the link of J&J Vaccines to blood clots. Called my primary physician (5/6/21) who suggested testing to r/o DVT. (5/7) Venous ultrasound confirmed a DVT/ blood clot in (R) lower leg. Was then sent directly to ER for further exam and initiation of anti-coagulation therapy. Started on Eliquis starter pack: Initially 10mg BID, then 5mg BID.
1317434	5/14/2021	KY	45	F	4/3/2021	4/6/2021	Pt is a 45 y/o F who presents w/ epigastric pain and intermittent L arm numbness. She was found to have extensive clots in descending thoracic aorta with additional clot in L subclavian and axillary arteries. She denies any birth control and does not smoke. We have a hypercoaguable workup pending. Transthoracic echo 5/13 did not reveal a cardiac source nor PFO. She developed sx and saw PCP 4/6/21 which was 3d after second dose COVID vaccine, Moderna (administered 4/3/21). At the PCP 4/6 pt complained of some left arm numbness and a decreased pulse and the doctor noted that it was a little bit cooler to touch and ordered a arterial ultrasound and MRI of the brain. However, the patient did not feel like she needed it therefor did not have either test done. During her admission the pt has been evaluated by vascular surgery and cardiothoracic surgery. Surgically the patient is to have 5/14/21 Penumbra thrombectomy of L axillary and L subclavian artery. Then she will have 5/17/21 removal of thrombus in descending thoracic aorta via L thoracotomy/L heart bypass.

1317380	5/14/2021	TX	35	M	12/17/2020	5/7/2021	May 11th had the worse headache of my life. Went to ED. CT scan showed SAH in right frontal/parietal regions. MRA showed multifocal venous sinus thrombosis. Partial thrombosis of superior sagittal. Heparin gtt and sent home on Lovenox BID
1314584	5/13/2021	VA	58	F	3/3/2021	4/10/2021	On the day after my second Covid vaccine (03/26/2021) I had headache and fatigue. On 04/10/2021, I started noticing a lot of bruising all over my body (petechiae and a lot of other areas of bruising) and I had a lump and pain behind my left calf. I had some fatigue, but otherwise felt fine. I went to the Emergency Department on April 11th thinking that my INR was too high since I'm on a blood thinner medication. The ER did an ultrasound of my legs and no blood clots were found. They did a CBC and I had a platelet count of 6,000. They admitted me, gave me a platelet transfusion and a steroid injection. They discharged me from the hospital on 04/12/2021 on 60 mg of Prednisone and to follow up with my hematologist, MD. My platelet count has since returned to normal. I am having a CBC once a week and tapering off the Prednisone. Both Dr. and my Rheumatologist, MD believe that my severe drop in platelets were due to the Covid vaccine causing my Lupus to become very active and attack my platelets. Please feel free to contact me if you have any additional questions. Thanks you,
1314289	5/13/2021	CO	29	F	4/6/2021	4/27/2021	nonocclusive dural venous sinus thrombosis
1313691	5/13/2021	NV	58	F	4/26/2021	5/1/2021	Following the vaccination patient didn't feel well. Fever, chills, cold symptoms, incredibly irritable. 5/1 she awake with a terrible headache which continued all day. Around 9:30 pm she laid down and shortly after was unable to move her body. 5/4/21 at 4:19pm her time of death was called. Cause; brain death due to aneurysm and stroke due to passing blood clot in brain.

1313900	5/13/2021		80	M	3/4/2021	3/5/2021	Altered mental status, confusion, subdural hematoma. Was lifeflighted to Clinic and remained there about 5 weeks, developed a stage IV pressure ulcer on buttock. Diagnosed with multi organ failure. Went to a SNF for rehab after being discharged. Wife said then patient received 2nd dose of vaccine about 2 weeks ago and is currently at Hosptial in town for a GI bleed, passing frank blood and clots. He was admitted 5/9/21. Patient is still confused and lethargic. Before the vaccine, he was taking care of his farm and home. Now he doesn?t even know his wife or what is going on.
1314221	5/13/2021	OR	70	F	4/9/2021	4/27/2021	Patient got small blood clot show on skin 4 days after shot, it went away lighter red in 1.2 week, blood pressure went up and down suddently. Sunday was fine, Monday the 26 was fine, went to bed at 9:00 PM. Was not able to wake up, went to ER around 8:30 AM on 4/27 AM by daughter call 911. In ER for 28 hour and found out she got stroke. Pnewnewmia. ER gave antibootic around 3:00 PM, transfer to intensive care, MRI around 7:00 PM 4/27/2021 due to CT scan shown stroke. Lost Vision on right side and parcial on left side due to stroke.
1314231	5/13/2021	NC	41	M	3/25/2021	4/30/2021	April 30th began to notice dull ache in calf. At first assumed it was a muscle cramp. The pain began to increase through the weekend and into the following week. I went to urgent care on May 6th. They sent me to the ER to get an ultra sound as their preliminary evaluation was that it could be a blood clot. The ER ultrasound confirmed the presence of a superficial thrombosis in my left calf. No blood work was performed. I was told to take ibuprofen and use a heated compress and to wear compression stockings. If the pain grew worse, I was to return to the ER. I scheduled a follow-up with my Primary the next day. Blood tests show all values to be in normal range. I have no history of blood clots and perform cardiovascular exercise on a daily basis.

1314279	5/13/2021	KY	38	F	4/7/2021	4/12/2021	About a week after being vaccinated I started experiencing bad headaches, chest pains and pains in my leg. I went to the emergency department at Hospital to get checked out. They took blood and I had a high d dimer test result. They did an Ultrasound of both legs, and a CT with contrast of the lungs and a CT of the head. No blood clots were evident at the time. Over the next couple of weeks my left leg has continued to swell and hold fluid. On 5-11-2021 I had another ultrasound of the left leg again to rule out a possible blood clot. Again they did not find anything. After reviewing blood work from a coag profile all results were elevated but not worrisome per the dr. I continue to have more swelling in the left lower extremity, muscle aches and pains in that leg along with more busted blood vessels. I have experienced pains in places that I have never had before. Example a sharp pain started around my left pelvic area and shot up to the left shoulder and then burned for several minutes.
1313667	5/13/2021	FL	67	F	4/22/2021	5/6/2021	Before vaccine went for sonogram, no signs of blood clot Vein doctor did more advanced sonogram and was negative again for clots. A few days later clots started appearing on varicose veins. First clot started inside of knee, thought it was a boil, it was a big red figure with a dark center, doctor diagnosed with superficial blood clots (about 10 days after vaccine) On the 10th when seeing doctor blood pressure shot up, had to double lisinopril. Patient reports history of smoking.
1314349	5/13/2021	PA	49	M	4/9/2021	4/21/2021	Blood clot developed in the leg 10 days after the injection
1314351	5/13/2021	FL	43	F	5/12/2021	5/13/2021	PATIENT CAME TO THE PHARMACY WITH SWOLLEN LIPS AND END UP HAVING ANAPHYLATIC REACTION AND BLOOD CLOT
1314360	5/13/2021	IL	78	F	2/28/2021	4/26/2021	Patient stated she developed clots during hospital admission with the complaint of chest pain. Patient stated at hospital admission, they discovered blood clot in her right leg and right lung. Patient was treated with oxygen and medication. Patient was inpatient for two nights and sent home lovenox injections for one week and continuing with Eliquis. Patient is currently on Eliquis for unknown duration. Patient will see cardiologist in three weeks and reevaluate.

1313623	5/13/2021	OH	42	M	3/19/2021	3/29/2021	STEMI with 100% blockage in LAD with clot. Emergency cath lab with stents. Symptoms started at 330am on 3-29-21. Came to ED shortly after. Initial testing and labs were negative. Began to have severe symptoms shortly after. Multiple doses of nitro and morphine given for chest pain with no relief. Taken for emergency heart cath by 7am.
1314436	5/13/2021	RI	75	M	3/11/2021	4/19/2021	3/11/2021-- received dose of Pfizer vaccine. Soon after vaccination, had B/L anterior rib pain that he could not otherwise explain. No trauma, dyspnea, dizziness, fever, headache, N/V, falls, personal or family history of blood clots or autoimmune disease, recent smoking (quit 38 yrs ago), prolonged immobility or travel, history of bleeding, red/hot joints, known cancer, or cough/hemoptysis (and patient has outpatient medical follow-up including preventive measures like screening colonoscopy). 4/19/2021-- B/L rib pain got worse with new scant hemoptysis. Went to Urgent Care and diagnosed with "pneumonia"-- prescribed azithromycin, Augmentin; of which he took 2 doses the next two days. Due to persistent symptoms, he presented to the ER 4/21/2021 and was found to have B/L segmental and subsegmental PE's without R heart strain. He had a mild troponin elevation in the setting of known vascular disease. He was not hypoxemic or hemodynamically unstable. No residual DVT noted on imaging. He was transitioned to Eliquis on was discharged home after 1 day (4/22/2021) with outpatient follow-up with outpatient physicians (plus hematology referral) for pending hypercoaguable workup. His medications were adjusted accordingly (e.g. ASA dose decreased given his new DOAC use).

1313030	5/13/2021	MD	73	M	4/8/2021	4/27/2021	two blood clots in his right calf; It is painful; This is a spontaneous report from a contactable nurse. A 73-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), dose 1 via an unspecified route of administration, administered in arm left at 10 am on 16Mar2021 (Batch/Lot number was not reported) as 1st dose, single; dose 2 via an unspecified route of administration, administered in arm left at 10 am on 08Apr2021 (Batch/Lot number was not reported) as 2nd dose, single, both for covid-19 immunisation. Medical history included ongoing varicose vein (for years, barely noticeable). No history of all previous immunization with the Pfizer vaccine considered as suspect. No additional vaccines administered on same date of the Pfizer suspect. No prior vaccinations received within 4 weeks. The patient's concomitant medications were not reported. The patient experienced two blood clots in his right calf on 27Apr2021, it is painful. The event 'two blood clots in his right calf' was reported as serious and seriousness criteria were medically significant and disability. He said it is better today once he started apixaban (ELIQUIS). He did not know if that was physical or mental. The adverse event required a visit to physician office. The patient underwent lab tests and procedures which included sonogram on leg: unknown results. The outcome of events was recovering.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

1313038	5/13/2021	WA	53	M	4/20/2021	4/20/2021	possible thrombosis reaction; Unexpected bruising near injection site.; Bruise was purple and red splotches and has now progressed to mostly yellow/discoloration; Bruise was purple and red splotches and has now progressed to mostly yellow/discoloration; minimal pain/stiffness following the shot; minimal pain/stiffness following the shot; This is a spontaneous report from a contactable consumer (patient). A 53-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), at the age of 53-year-old via an unspecified route of administration, administered in Arm Left on 20Apr2021 11:15 (Lot Number: EW0153) at 1st dose, single for covid-19 immunisation. The patient medical history was not reported. The patient received no other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. Concomitant medication included famotidine (PEPCID AC). The patient previously took flu shot in Oct2020, prilosec [omeprazole magnesium] for seasonal allergy and experienced drug hypersensitivity. The patient experienced unexpected bruising near injection site. Bruise was the size of the bandaaid, approximately 1" x 2". Bruising had persisted for more than a week now. The patient had never experienced bruising like this with other vaccines. He would like to rule out possible thrombosis reaction before second shot. He did not have bruising at any other locations other than the injection site. Bruise was purple and red splotches and has now progressed to mostly yellow. He believed the discoloration was a reaction to the vaccine and not the result of the needle. The shot itself was painful but patient felt minimal pain/stiffness following the shot. The event start date was on 20Apr2021. No treatment was received. The outcome was unknown.

The patient recovered from thought having chest pains/heartburn on 22-APR-2021, had not recovered from blood clots both legs, and the outcome of swelling at injection site was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: 20210504455-COVID-19 VACCINE AD26.COV2.S-Blood clot both legs. This event(s) is considered unassessable. The event(s) has an unknown/unclear temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the event(s).
1314916	5/13/2021	CO	26	F		4/7/2021	4/7/2021 My symptoms starting the night I got the vaccine and lasted for 2 weeks after. I had a fever, chills, severe headache, nausea, shortness of breath, muscle aches, fatigue, and pain in my left leg. We ended up going to the emergency room the week after because of fear of blood clots.

1315855	5/13/2021	CO	48	F	3/31/2021	3/31/2021	Went hiking and got a blood clot; beyond 36 days since first dose without receiving second dose; Interfered with work; Glands got super swollen; Trunk Rash; Excruciating headaches for three days; Extremely fatigued; High temperature; Nauseous; Ringing in ears; Taste buds changed; This spontaneous case was reported by a consumer and describes the occurrence of THROMBOSIS (Went hiking and got a blood clot) in a 48-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 017B21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included Grover's disease. Concurrent medical conditions included Allergy NOS (allergies for which she has an epi pen) and Premenopausal symptoms (Rashes with premenopausal condition). On 31-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 31-Mar-2021, the patient experienced TINNITUS (Ringing in ears), TASTE DISORDER (Taste buds changed), LOSS OF PERSONAL INDEPENDENCE IN DAILY ACTIVITIES (Interfered with work), LYMPHADENOPATHY (Glands got super swollen), RASH (Trunk Rash), HEADACHE (Excruciating headaches for three days), FATIGUE (Extremely fatigued), PYREXIA (High temperature) and NAUSEA (Nauseous). On 30-Apr-2021, the patient experienced INTENTIONAL PRODUCT USE ISSUE (beyond 36 days since first dose without receiving second dose). On 01-May-2021, the patient experienced THROMBOSIS (Went hiking and got a blood clot) (seriousness criterion medically significant). On 30-Apr-2021, INTENTIONAL PRODUCT USE ISSUE (beyond 36 days since first dose without receiving second dose) had resolved. At the time of the report, THROMBOSIS (Went hiking and got a blood clot), TINNITUS (Ringing in ears), TASTE DISORDER (Taste buds changed), LOSS OF PERSONAL INDEPENDENCE IN DAILY ACTIVITIES (Interfered with work), LYMPHADENOPATHY (Glands got super swollen), RASH (Trunk Rash), HEADACHE (Excruciating headaches for three days), FATIGUE (Extremely fatigued), PYREXIA (High temperature) and NAUSEA (Nauseous) was resolving. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On an unknown date, SARS-CoV-2 test:

							negative (Negative) Negative. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Concomitant product use was not reported. Treatment information was not provided. Company Comment Very limited information regarding these events has been provided at this time. The events are probably related to the patient's comorbidities. A causal relationship cannot be excluded for the events of rash, fatigue, pyrexia, lymphadenopathy and headache.

This report was serious (Other Medically Important Condition).; Sender's Comments: V0: The case concerned a female patient of unspecified age (race and ethnicity not reported) who developed important medical events of a leg pain and numbness of foot unspecified time after receiving the Janssen Covid-19 vaccine, for prophylaxis of symptomatic SARS.CO2 S infection. The patient's height, and weight were not reported. The patient's concurrent condition included low platelet count. The outcome of the events leg pain and numbness on foot was not reported. Additional information (e.g. height, weight, full medical history, social history, family history, concomitant medications, specific platelet levels, peripheral smear, D-dimer, fibrinogen, anti-platelet factor 4 antibodies, radiologic diagnostic test results such as ultrasound, CT, MRI, angiogram, or venogram) was not provided. Based on evolving knowledge of Thrombosis with Thrombocytopenia Syndrome (TTS, per definition from Brighton Collaboration-BC), the relationship of leg pain and numbness of foot to vaccination is considered unclassifiable (BC Criteria level 5) due to insufficient information. Additional information has been requested for further assessment.</p>

1315726	5/13/2021			M			BLOOD CLOT IN LEFT CALF; This spontaneous report received from a patient via a company representative through social media concerned a male of unspecified age and ethnicity. The patient's weight, height, and medical history were not reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: Unknown and expiry: Unknown) dose, start therapy date were not reported, 1 total, administered for prophylactic vaccination. No concomitant medications were reported. On an unspecified date, the subject experienced blood clot in left calf. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of blood clot in left calf was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0;0210517568-covid-19 vaccine ad26.cov2.-Blood clot in left calf. This event is considered unassessable. The event has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the event.
1315015	5/13/2021	AZ	40	F	3/22/2021	3/22/2021	I noticed right away after the vaccine, I noticed nerve pain through my body. I noticed a headache. I had some weird stomach pain (kind of sharp, nerve pain) that was on my right side. It felt sudden and it startled me. It ended up going away - that happened four or five times the first day. The next day, I woke up with migraine headache - told doctor experienced nausea, vomiting, sweating. That migraine lasted three or four days. I was taking Imitrex (I take it as needed - 2 a day) and that was not helping. It was a horrible headache. I saw the PCP and the rheumatologist and they did a nerve block which helped. The nerve block was about a month ago. And that worked for about a month but now I'm having migraines again. I am still having a lot of the nerve pain. The doctor said that I have pre-anti-fossid lipid - syndrome (APS) - and was concerned about clots.

1310703	5/12/2021	MA	38	M	4/28/2021	5/1/2021	description from patient: 1.. On Wed, Apr 28, I got the JnJ vaccine. Other than fatigue the following day no major issues. 2. On Sat, May 1, I had an afib episode in the morning. Reset to sinus rhythm the next morning around 2:30am. I spoke with you during the episode. 3. On Mon, May 3, I had brain fog. I?m usually tired after an afib episode. But this seemed different. I?ve never experienced something like this before. But I chalked it out to the after effects of the afib and moved on. 4. On Fri, May 7, I started having the stiffness in my right calf. I checked in with you that weekend to make sure it wasn?t a clot. After we spoke I think we ruled out a clot. 5. In addition, I?ve developed some added symptoms since then: (i) Sweaty feet. (ii) Pins and needles sensation in feet. (iii) Tightness in the arch of the right foot. (iv) Feet and hands feel sensitive to cold. (v) Burning sensation in feet and left hand. (vi) Mild headache mostly felt in the left temple. (vii) A pulling feeling on the left side of the face. (viii) A feeling that if I close my eyes, I may faint.
1309754	5/12/2021	WV	56	M	5/10/2021	5/11/2021	Patient received Moderna on 05/10/2021. Patient stated that approximately 2 am on 05/11/2021 he started to experience pain in left calf. When patient awoke that morning left calf was red and swollen. Patient was sent to medical facility for US to rule out DVT. Blood clot noted and patient was sent to ER> Patient was sent home. Appt made with Dr., vascular, for 05/12/2021 at 10:30 am.

1310063	5/12/2021	IL	40	F	3/26/2021	4/29/2021	March 26th, 2021 I received the Moderna vaccine. After the Moderna vaccine, my arm felt very sore. I was dizzy and tired. On March 29,2021 I got a heavy menstrual cycle. It was the heaviest on March 31-April 2. (March 14th, 2021 I put in a new nuva ring, I should not have gotten my period) On March 29th, 2020 I went to the chiropractor. My lower back was hurting and I felt awful. On April 8th I woke up to bloody blisters in my mouth. The right side kept bleeding and wouldn't clot. On April 9th, I developed inflamed blood vessels all throughout my body from my head to my feet called purpura and petechiae. I called doctor immediately because bruises and red dots were spreading quickly. He sent to me immediately to get labs drawn at the hospital. My platelets were critically low and I was told to head to the ER. From there I was admitted. On April 9th, 2021, my blood platelets were 2,000. They are supposed to be 150,000-450,000 Prior to the vaccine, a full physical with labs were done by physician on March 22. My platelets were 210,000. Everything in my labs were perfect. Currently I am battling kidney stones. I had surgery on May 10th. I've never had a kidney stone in my life.

1310114	5/12/2021	NY	23	F	5/7/2021	5/9/2021	Central Venous Sinus Thrombosis in Superior Sagittal Sinus I arrived home at 12:38 on Sunday, 5/9, and opened the door to see my sister with facial droop, slurred speech and a contracted right hand/fingers. She was crying and immediately knew she was having a stroke. She had been trying to clasp some jewelry while getting ready for Mother's Day. She was able to walk down to the car with me no problem (no extremity involvement other than right hand/fingers). We arrived at the hospital within 10 minutes and she was a Code Stroke. A CT scan showed the clots as well as a tiny Subarachnoid bleed and she was admitted to NeuroICU. The symptoms waxed and waned for a few hours and at one point she developed the droop again, had headache and heartburn and vomited. A CT scan was repeated after some Heparin had entered her system and it was stable/not worse; subarach bleed was not changed and Heparin was continued. She has now been admitted for 3 days and the Heparin is complete. She is now being transitioned to oral Xaralto. She has no deficits whatsoever and has made a full recovery so far. We are still pending the results of her coagulation studies to see if she has a hereditary condition. The doctors believe the clot is due to her Nuvaring Estrogen, which is most likely. However, I would still like to report this event just in case.
1310142	5/12/2021	MD	68	F	4/1/2021	4/15/2021	On April 15 developed a rash on left arm that traveled to the elbow over three days. At that time the Stills disease flared up, this has been under control of over 15 years. I developed a pain in the right calf and had a scan to make sure it wasn't a blood clot. It was not a blood clot but continues to be a problem with undiagnosed pain. It was decided it would be better to hold off on the second shot. It feels like my body is now fighting itself again.

1309751	5/12/2021	NV		M	4/1/2021		<p>PAIN IN UPPER BACK; CLOT IN LUNG; CLOT IN CALF; DIZZINESS; FLU LIKE SYMPTOMS; JOINT PAIN; STOMACH ACHES; SWELLING IN CALF; This spontaneous report was received from a patient and concerned a 55 year old male. The patient's height and weight were not reported. The patient's past medical history included fractured ribs and T6, and concurrent conditions included drug allergy to Vicodin (causes rash). The patient was healthy before the vaccine. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, intramuscular, batch number: 042A21A expiry: 21-JUN-2021) dose was not reported, administered on and unknown date in APR-2021 (approximately "middle of April") in the left arm for prophylactic vaccination. There were no concomitant medications. The day after receiving the vaccine the patient started experiencing fever (no actual temp given), stomach aches, chills, joint pain, "flu-like symptoms" which lasted "4 to 5 days after getting the vaccine" (no actual dates given). He stated those symptoms went away. On the "10th day after getting the vaccine" he experienced pain in his calf and had a hard swollen spot which he assumed was cramps. This lasted until Sunday, 02-MAY-2021. On Monday, 03-MAY-2021 (also reported as 02-MAY-2021), the patient started experiencing pain in upper back which he felt "in his lungs". On Tuesday 04-MAY-2021, the pain was still present. On Wednesday, 05-MAY-2021, he started experiencing difficulty breathing, dizziness, and shortness of breath and went to the emergency room (ER). This pain was unlike anything he had ever experienced. While at the hospital, they performed an ultrasound and found a clot in his calf. They also performed a CAT scan and found a clot in his lungs. The patient was treated with heparin, but after he expressed concern with heparin, the hematologist changed it to Eliquis (apixaban). The patient was discharged on 05-MAY-2021 with Eliquis 20 mg, one tablet by mouth twice a day for two weeks. He will be on it for the next 6 months. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from flu like symptoms, and stomach aches on APR-2021, and joint pain on an unspecified date, and the outcome of pain in upper back, dizziness, clot in calf, clot in lung and swelling in calf was not reported. This report was serious (Hospitalization Caused / Prolonged).;</p>

1309626	5/12/2021	PA	40	M	4/28/2021	4/28/2021	part of my left kidney was no longer receiving blood; blood clot; placed on stroke protocols.; I developed severe abdominal pain in my left side during the evening; lack of appetite; bouts of severe discomfort; This is a spontaneous report from a contactable consumer (patient). A 40-years-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; Batch/Lot Number: EW0167) via an unspecified route of administration, administered in Arm Left on 28Apr2021 12:15 (40-years-old) as 2nd dose, single for COVID-19 immunization. The patient medical history was not reported. Vaccination Facility Type was clinic. Concomitant medications included ibuprofen (ADVIL); desloratadine (CLARINEX). The patient previously took first dose of BNT162B2 (lot number=EN6208) on 07Apr2021 01:15 PM (40-years-old) on Left arm for COVID-19 immunization. It was reported that the patient developed severe abdominal pain in my left side during the evening of Wednesday, 28Apr2021 19:00. The pain appeared sporadically throughout the evening and continued through Friday, April 30. During this time, he experienced a lack of appetite and bouts of severe discomfort. Tried treating with GasX and Tylenol. Duration of Hospitalization reported as 3 days. On Saturday, 01May2021, starting around 10:30 a.m., the pain in his left-side abdominal area intensified and did not diminish. After 6 hours, he visited the ER at hospital. After being admitted to the ER, a series of blood, urine and imaging tests were performed on me. The doctor on duty reported that a CT scan showed that part of my left kidney was no longer receiving blood (disability). He was placed on Heparin and admitted to the hospital. He was diagnosed with a blood clot and placed on stroke protocols. The adverse event result in Emergency room/department or urgent care. Treatment received for the adverse events was Heparin, fluids, blood work, urine analysis. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. The outcome of the events abdominal pain, lack of appetite, and bouts of severe discomfort was recovering; while other events was unknown. Events reported as serious due to hospitalization and life threatening.

A 49-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), dose 1 intramuscular, administered in left arm on 03Feb2021 (batch/lot number and expiration date not reported) at the age of 49 years old, as 1ST DOSE, SINGLE for COVID-19 immunisation. Medical history included COVID-19 from Dec2020 to an unknown date, vascular disease, bilateral stents placement, cataracts since he was born. Concomitant medication included gabapentin taken for an unspecified indication from an unspecified start date and ongoing. On 04Feb2021, the patient experienced left arm injection site pain. The patient experienced dizziness, falling, and couldn't go to work on unspecified date. He was treated by his (MD) physician, was given a CT scan, echocardiogram, and found to have some clots. He stated he has a history of vascular disease and had bilateral stents placed a year ago. He was placed back on an aspirin/Plavix regimen and referred to a neurologist because he has no motor skills anymore. He stated he failed all the tests for motor skills for his arms and legs. He was advised not to take the second dose of the vaccine and was diagnosed with neuropathy and autoimmune disorder (caller does not specify which disorder). He reported being positive for Covid-19 in Dec2020. He wanted to know what else he can do for his symptoms and is offering to be tested by Pfizer for treatment. The symptoms come in really hard seven days later. He actually had to go to the (ER) emergency and they worked on him and a whole string of doctors. He went to the emergency room and something was going on and wanted him to go to a family practitioner. They sent him to vascular, neurological and now they want to send him to a research center. It was a

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

whole week after receiving vaccine before he began having symptoms. With the neuropathy and autoimmune, he cannot work like he did. He can hardly walk. Unspecified autoimmune was diagnosed last week. He can't remember the name of it. They told him not to take second one because the first one did what it did to him. It hurt a little and it was quick. The next day (04Feb2021), he said his arm was sore a little. He is only taking 4 medications and they looked it up. He did not think they were relevant. He was disoriented and fell and hit his head a couple of times. They ran an MRI on his head trying to figure that part out. That was done last week. He doesn't know the date and said it may have been on Friday. Results were good. The date he was disoriented was Wednesday 03Feb2021, when he took the shot. He has been disoriented and has been that way ever since. They kept him for 15 minutes to make sure no one passed out. He has been disoriented since then. He could not think clearly, and he could not do his job. He tore tendons in between ribs. He first thought he actually broke his ribs, but did not. There were two different falls. He cannot feel feet or anything. His motor skills are OK but when they did neuropathy test, they put needles in and shocked him to make his motor fire. His reflexes were really bad. He fell and hit elbow to keep from falling on face and twisted going down hitting 3-4 ribs on left side. It has been over 3 weeks now for his ribs. They are tender but they are not like the initial blow. It feels like they are healing. He fell and hit head a week ago. He was unsure of the exact date. He did not go to the emergency room with this one because the bed caught him. He fell and hit his head. All he has left is scabs. He cannot walk or lift anything (11Feb2021). That next Wednesday, he got ready to go to work and was so delusional and could not go in. He slept from 5:30 all that day and all that night. Then Thursday, he gets up and goes to work and goes slower, just to see what happened on Wednesday. He had fatigue and was disoriented. He did not provide start date or outcome for fatigue. He walked in and said either call an ambulance or he would go home. He went home and that was the last day of work. He then stated he laid in the car for 30 minutes and he said he is going to the emergency room. He went straight there that day. He had stents put in lower part of his body a year before. The neuropathy and

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

the autoimmune kicked in 7 days later after the shot. The reason he went to the ER is because he thought it was his stent. He had bilateral, 4 of them. He was having chest pain and hurting all over on 11Feb2021. He thought he was having a heart attack. He was seen in the emergency room and released. It depends on how far he goes, how the chest pain worsens. Right now, he is ok, but when he gets up and moves around, it does the same thing. Within 2 months, he has lost 47 lbs and eats all the time and is still losing weight. He was about 200 something and was kind of built and now is skin and bones. He lost 6 (lbs) pounds within a week and is eating like crazy. Sensory nerves are all gone. If hit with a baseball bat and he would not feel it. It came on slowly almost that he did not know it was happening. That is why they want to send him to Privacy for a research center and he does not want to go. He never had this happen before. ER or physician's office required: 1st date was on Thursday, 11Feb2021, when he went to Privacy. He was having chest pain and hurting all over. He thought he was having a heart attack. He was released. The patient stated he wanted to change the information he had provided since he was not in his right mind since he had taken the wrong medication dose than the doctor had given him. He stated the medication dosage he wanted to change was for Amiripyin. He stated he wanted to say he told the representative the symptoms he had experienced was enhanced which they were yesterday because he was trying to fight everything and stay awake. COVID 19 vaccine: he stated the doctor did not want him to take the second dose of the vaccine. He stated one of the symptoms he had experienced after the vaccine that he wanted to change the outcome for is the neuropathy. He stated he is back to where he used to be and yesterday it was bad he could hardly walk or talk. He stated also the other symptoms he wanted to change the outcome for is the autoimmune. The patient has not recovered from neuropathy, autoimmune disorder, disoriented, can't walk or lift anything, chest pain, and sensory nerves all gone; while outcome of the remaining events was unknown. Information on the lot/batch number has been requested.

1311716	5/12/2021	IL	46	F	3/7/2021	3/7/2021	Reported feeling fatigue and contractions early on after the second vaccine dose. Then the next day had pain and welts at heparin injection sites as well as increased contractions. Two days after vaccine went in for weekly fetal ultrasound and a large subamniotic hematoma [up to 7 cm in the greatest diameter] was found that was not present on ultrasound the week prior. There was mild thrombocytopenia on testing. Because of the hematoma providers did not want to continue anticoagulation. However due to an elevated risk of thrombosis due to a compound thrombophilia and pregnancy prolonged pregnancy without anticoagulation would also have a high risk for adverse outcomes. The decision was made for preterm delivery at 35 weeks. The postpartum course was complicated by postpartum hypertension. The newborn required an intensive care unit admission due to hypoxia within the first day of life and was found to have neonatal pneumonia.
1311511	5/12/2021	MD	21	F	4/8/2021	4/19/2021	For thirty-six hours after the vaccine. I had body aches and chills and my eye sockets were sore and it hurt to look up. Ten days after the vaccine I was in the shower and a large blood clot came out of my nose. It was a large clot about the size of a quarter and there was no other blood with it. The clot came out of my left nostril but it was not like a nose bleed. I went to the Urgent Care but they did not do tests.

1311212	5/12/2021	WA	53	F	4/5/2021	4/6/2021	I had a severe case of Covid-19 in December of 2020 and was hospitalized for twenty days. The day after the vaccine I got swelling in my left leg which was severe and painful. Testing revealed that there were blood clots in my legs. I have been having problems with blood clots since having Covid-19. My blood Sugar was over 500 the day after the shot and my blood pressure was very high. My blood sugar has been under control for a long time, and it is never this high. I also started to get headaches daily which I am still getting but they are not as often. I now only get headaches two to three times a week especially toward the end of the work week. Before the vaccine I was getting the occasional headache, but they were controlled with Excedrin. The new headaches are only controlled with prescription medication. The swelling in my left leg is still happening on occasion. I had been experiencing Long Covid-19 symptoms before the vaccine but they were much improved and the vaccine seemed to cause all of the symptoms to regress.
1311083	5/12/2021	NY	28	F	4/10/2021	4/15/2021	persistent headache. mild headache ~7 days after vaccine. increased severity leading to two emergency room visits to check blood and have cat scan in order to rule out blood clot.
1310885	5/12/2021	IL	83	F	4/16/2021	4/27/2021	Pt suffered diarrhea for two days prior to collapsing . she could not move that morning to get out of bed and could barely talk. She mentioned chest pain and an ambulance was called. Following her vaccinations she was very confused and had fallen in the kitchen the Thursday (22nd) prior to her heart attack. They took her to ER noted she was in shock and had very low blood pressure enroute to hospital. Her pulse was very low. She was life flighted to the medical center. It was determined a blood clot had blocked a major artery into the right side of her heart and it was removed and a stent was placed. She remained at hospital 3 nights and was transferred to nursing home for recovery and therapy where she currently is being assessed for mental issues and is on 4 different heart medications to control blood pressure and prevent future heart attacks. There is not a family history of heart issues. Pt was very healthy in spite of being 83 years old.

1306594	5/11/2021	NY	30	F	4/2/2021	4/8/2021	7 days after first vaccine I started feeling like I pulled a muscle in my right bicep (shot was in right arm) I waited a few days and the pain got worse and spread to my forearm. It was extremely painful and swollen. I could not straighten my arm. Where the pain was in my forearm red blotchiness appeared and got bigger over a day. I did have an endoscopy the day before and had an IV in for a short time. I don't want this to be disregarded because both Birth control and having an IV can contribute to blood clots, I think it needs to be warned before getting the vaccine that those things can increase the risk of blood clots. So just avoid IVs around the time of the vaccine and maybe pause Birth Control.
1306670	5/11/2021	PA	75	F	3/17/2021	3/23/2021	On 3/23/21 pt had SOB so went to the Hospital ER. She had lab work, CT, Chest Xray, ECG 12 lead. DX is pneumonia of right lower lobe of the lung. She was given Augmentin and released after 7 hours and told to FU w/ PCP. On 3/31/21 pt went to see her PCP due to having SOB. She was given a Covid Test which was negative. She was sent home and told to breathe deeply and hopefully this symptom would go away. On 4/18/21 she went back to the Hospital ER for SOB. Pt was admitted with acute DVT and other blood clots as well as pleural effusion of the right lung. They did US on legs and Chest X-Rays. They found fluid around her right lung which they drained. She was prescribed Eliquis. Pt was discharged on 4/21/2021 and was told to FU w/ PCP. On 4/24/21 pt went back to the Hospital ER, because she had a bruising/blood clots in the groin area. She had 3 blood clots on the left side and one on the right side. They told her the bruising was from the Eliquis and they did a US. She was told she had the same blood clots that she had during her hospital stay and they were right where they were before. She was discharged. On 4/29/2021 she went back to her PCP due to SOB. She told her PCP about the DVT that was bothering her. She was sent to another Hospital. She had a stat Chest X-Ray- results were that her lungs were stable with inflammation around the right lung. She was told to FU w/ PCP in July 2021 and go back to ER if she had another episode w/ SOB.

1306312	5/11/2021			F			EXTENSIVE DEEP VEIN THROMBOSIS; This spontaneous report received from a consumer concerned a 59 year old female. The patient's height, and weight were not reported. The patient's past medical history included coronary artery disease. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: Unknown) dose, start therapy date were not reported for prophylactic vaccination. The batch number was not reported and has been requested. No concomitant medications were reported. On an unspecified date, the patient experienced extensive deep vein thrombosis after the vaccine was released to the public. She began feeling symptoms seven days after getting the shot. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of extensive deep vein thrombosis was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0 : 20210514131- COVID-19 VACCINE AD26.COV2.S -Extensive Deep Vein Thrombosis. This event is considered not related. The event has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There are other factors more likely to be associated with the event than the drug. Specifically: MEDICAL HISTORY.

1306864	5/11/2021	VA	85	F	4/9/2021	4/21/2021	<p>S/p pfizer vaccine 4/9/21. S/p fall. She presented last wk to the hospital in cardiogenic shock, anemia, acute RLE DVTs, AKI, and rib fractures. She was found to have a n intramuscular hematoma along her posterior right thigh and with an acute DVT in her leg - see imaging reports below. Her INR was in the 7 range. She was also found to be in cardiogenic shock as mentioned above, requiring pressors. Pressors were eventually weaned off. S/p PRBCs. Imaging studies were obtained. Findings are listed below. Her AKI resolved by day of discharge. Since hospital discharge: The swelling is improving along her right leg. She is not checking her weight on a daily basis. She has access to a scale. She needs a refill on iron and Fosamax. No bleeding. On day of discharge, her hemoglobin was 8.8. Her MCV was elevated at 100. Her platelet count was 132. Her INR was 1.4. Her calcium is mildly low at 8.3. Her coumadin is on hold at this time. 106/56 was her BP today. She's been resting well. She's doing some house chores. She has yet to schedule a follow-up visit with for an INR check and in office checkup apt since hospital discharge. 4/23/21 RLE CT: Postop changes from ACDF for right femoral neck fracture again noted with good alignment. Early healing process of the fracture noted. No acute osseous fracture or hardware fracture. Extensive muscular and subcutaneous edema in right thigh. Two elongated intramuscular hematomas also noted at the medial posterior right thigh as above. 4/23/21 CXR: Patchy bibasilar pleural parenchymal opacities and enlarged cardiac silhouette without interval change. Multiple thoracic compression deformities better characterize on recent CT. Postoperative changes as discussed. Stable hiatal hernia. 4/23/21 RUQ Ultrasound: Mild gallbladder prominence, nonspecific. Findings similar to reference CT. No gallbladder wall thickening. Negative sonographic Murphy sign. Trace ascites. Partially evaluated right pleural effusion. Increased renal echogenicity. Correlate for medical renal disease. -1.1 cm right renal cyst. 4/22/21 PVL Study: Acute non-occlusive deep vein thrombosis in the mid and distal femoral vein within the right lower extremity. Acute non-occlusive deep vein thrombosis in the distal femoral vein within the left lower extremity. 4/21/21 Chest/Abdomen/Pelvis CT: Age-indeterminate T1, T3, T8, and T9 compression deformities. Subacute or chronic right posterior 12th,</p>

1305836	5/11/2021	NY	65	F	4/20/2021	4/1/2021	Whole Leg Pain after second dose of Covid Vaccine; Lower back sore intermittently; This also occurred after both vaccines.; Leg pain making it hard to sleep; This is a spontaneous report from PPDi. A contactable nurse reported herself that a 65-years-old female patient received bnt162b2 (BNT162B2), dose 2 via an unspecified route of administration, administered in Deltoid Right on 20Apr2021 10:15 (Batch/Lot Number: ER8731) as 2ND DOSE, SINGLE for covid-19 immunization, with Age at Time of Vaccination at 65 years old. Medical history included ongoing blood cholesterol increased (Verbatim: High cholesterol. Stated she was diagnosed about 30 years ago. Said it was hereditary), ongoing autoimmune thyroiditis (Verbatim: Hashimoto's thyroiditis. Stated she was diagnosed about 20 years ago). Historical vaccine included first dose of Covid Vaccine (Batch/lot number: ER8727) on 29Mar2021 given at 1030, at Left Deltoid and experienced whole leg pain (about 2 weeks after the first vaccine she started having leg pain). Concomitant medications included rosuvastatin taken for blood cholesterol from an unspecified start date to Apr2021 (reported as Started medication about 3 years ago. Stopped a few weeks after the first dose of the vaccine, was not on any cholesterol medication at this time); levothyroxine sodium (UNITHROID) taken for autoimmune thyroiditis from an unspecified start date and ongoing. The patient experienced whole leg pain after second dose of covid vaccine (medically significant) on Apr2021 with outcome of not recovered, lower back sore intermittently (non-serious) on Apr2021 with outcome of not recovered, leg pain making it hard to sleep (non-serious) on Apr2021 with outcome of unknown. The patient underwent lab tests which included ultrasound doppler: no blood clots on Apr2021. Reported she went for her second vaccine and about 5 days later the leg pain came back. Said she took Tylenol and Motrin, nothing helps the pain. Said her legs have been hurting for about 4 days now. Stated that her pain seems unusual because it goes all the way down into her ankles and travels back and forth. Caller stated that she was a hiker and was in amazing shape. She had not done anything different, nothing that would have exacerbated this. Caller states she retired after being a Licensed Practical Nurse for 30 years in 2019. Caller stated that

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

the leg pain after her first vaccine started about 2 weeks after the vaccine and lasted for about a week. Said it ended a few days before she got the second vaccine. Caller stated that her leg pain after the second vaccine was ongoing. Said that she got the vaccine on a Tuesday and her legs started to hurt again around Friday. Said that was effecting her life. Her legs hurt in every position. It was making it hard for her to sleep. Stated she believed her symptoms were medically significant as she did not know for sure what was causing them. Later in the call the caller mentioned that she had issues with her back. Said she noticed something new. Her lower back was sometimes sore. It comes and goes intermittently; unlike the leg pain that was constant. Stated the back pain fluctuates from a pressure and mild ache to soreness. This also occurred after both vaccines. Treatment received included: Tylenol and Motrin that did not offer any relief for her leg pains: Tylenol Extra Strength 500mg; P121876; Expiration Date: Sep 2023. Stated she took 2 tablets at a time. Motrin 200mg; 0GE2545A; Expiration Date: Mar 2022. Stated she took 2 tablets at a time. Causality: Stated she was uncertain if her symptoms have been caused by the Covid Vaccine. Follow-up attempts have been completed.; Sender's Comments: Based on the temporal association, there is a reasonable possibility that the administration of vaccination BNT162B2 played a contributory role in triggering the onset of the event pain in extremity. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Committees and Investigators, as appropriate.,Linked Report(s) : 2021467913 same patient/drug, different vaccine dose/AE

1305769	5/11/2021	NY	56	F	4/22/2021	4/22/2021	she thinks may be blood clot or a muscle but not really sure; passed out; very anxious and nervous; her heart is beating fast and she is nervous.; burning sensation in her ear; tiredness; headache; heaviness on her back and chest on the left side; heaviness on her back and chest on the left side; no appetite; nauseous; diarrhea; throbbing is almost like a band-aid is too tight. If she rubbed her hand across her thigh she could feel crushing and throbbing; her heart is beating fast and she is nervous.; sharp pain in her thigh/pinching sensation on inner thigh; sick; throbbing; muscle pain; weird sensation; throbbing sensation to the left side of her belly button/It was like at her stomach; fever of 100.3F; had a feeling of heat on her neck, face, and ears; redness and itchiness at the injection site; redness and itchiness at the injection site; the injection was large, red, hot, and itchy; the injection was large/ the swelling went down; dizzy; This is a spontaneous report from a contactable consumer reported herself. A 56-years-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 22Apr2021 (Batch/Lot number was not reported) as 1st dose, single for covid-19 immunisation. Medical history included disability, obese, covid-19 when she was sick with COVID last year, she has never been that sick. she thinks she made it through because she owns a nebulizer and can say her lungs have never felt like they were full of fluid. If anything, they felt heavy. It was heavy in her back and chest. She also had a fever. She guesses she would be considered obese. Concomitant medications included paracetamol (TYLENOL). The patient received the first dose of the Pfizer COVID vaccine last week and she has experienced several side effects and is very anxious and nervous. She experienced redness and itchiness at the injection site, pinching sensation on inner thigh that she thinks may be blood clot or a muscle but not really sure, fever of 100.3F from 24Apr2021, burning sensation in her ear, tiredness, headache, heaviness on her back and chest on the left side, no appetite, nauseous, diarrhea, had a feeling of heat on her neck, face, and ears, throbbing sensation to the left side of her belly button from 26Apr2021 and she felt dizzy from 22Apr2021. The patient stated there was a bad connection and she was having difficulty hearing. The patient was a little nervous. Maybe this was a

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

psychosomatic issue and she was thinking of things too much. She was sick for 5 weeks. She was never in the hospital or intubated. The site where she had the injection was large, red, hot, and itchy. It was from 22Apr2021 (Thursday) for the next maybe 3 days. Now the color is diminishing, the color is going down more like to pink and smaller and it not itching anymore. Once in a while she got a pinching sensation on her inner thigh ever since she had the injection. In the last couple days, she has been feeling a that a little more. She wanted to make sure it was not a symptom of a blood clot. She doesn't feel short of breath. She was nervous talking the call handler so that is why she is talking fast. She doesn't want to feel so sick like she did last year when she had it in March or April. She wanted to know that it's not a symptom of a blood clot. It was a throbbing pinching pain that goes and doesn't come back for a little bit, but it might come back a little bit later. It happened when she woke up. She has no swelling in her legs or thighs or anything else. She says she would not be talking this fast, but her heart was beating fast and she was nervous. She tended to be an anxious and nervous person. The patient never had blood clot issues. She wanted to make sure with everything that she has heard about Pfizer she hasn't heard of anyone having blood clot issues. She had to read to calm herself down a bit. It is a sharp pain with throbbing that comes and goes. She didn't read where it could be a blot clot, she just wanted to know. She is horrible at running to the hospital when she feels something because she gets so nervous and she thinks knowing is better because she's a realist. It takes her a minute to go to the hospital to figure it out. If she continues to feel like this she and her daughter will go to the emergency room. It is 5 blocks away. It is a small little hospital and they will be able to ease her mind. It could be her nerves getting to her too. Her fever got up to 100.3 and that was only on Saturday, 48 hours after the vaccine. Once she took Tylenol it was gone and didn't return again. She took her temperature; it was a beeping one. She always says she would take like 2 out of 3, and every time she took it went up. She felt a weird sensation of burning in her ears, the same as when she first had Covid, feeling like a fever. It brought her back to a bad place and it freaked her out. She is on disability and has people go to the store for her. She did that for 3 to 4

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

months. She is not agoraphobic, but she hadn't gone out until she got the vaccine. It took her all day to get back home because she loves the outdoors. It is kind of sad, and she knows she is not the only one who experienced that. She was able to actually stay at home, and when she went out, she wanted to stay. She still has her second dose to take, not everyone in has this and she doesn't want to feel that sick again. Eventually she will perish away one day, from God knows what but a slow death of not being able to breathe she cannot picture for herself or anybody else. She tries not to watch the news, it was depressing, because it is all over the news, she tries to stay in the loop. She was tired and had a headache. She took Tylenol and slept for an hour or hour and half. When she woke up she felt heaviness on her back and chest on the left side, and as she moved around more it was on her back and less on her chest. It was the same as she felt when she had Covid. She didn't have any aches or pains. The other thing was she had no appetite for the next 3 days. Every time she woke up, she felt extremely nauseous but had nothing to vomit. For the next 3 days or 72 hours, she had diarrhea. If she ate anything, she was in the bathroom. On 24Apr2021 (Saturday) after 48 hours she started to feel the heat in her neck and face and ears like right on her ears. She was talking to her daughter and her daughter said these are normal. Where she got the injection was itchy and a little more red. She told herself not to scratch it in her sleep, she is one of those people if something itches, she scratches. What she would do is rub her arm up and down on the site. It was almost the size of an 8 ounce tomato sauce can or maybe the size of a baseball. Then the third day it got redder. In her sleep she was rubbing her arm because it got itchy. Today the swelling went down, the color is like a light pink, and the size is also minimized. The fever lasted that night. She took her temperature again the next day and it was 97.9. That is usually what it is when she wakes up. She is not just tired; she is exhausted and feels like she has to go to sleep. Her daughter came with her granddaughter who is a baby, and she didn't know how to tell them. She was happy to see them but so exhausted. She worries about the sharp pain in her thigh. The other thing is she started getting pain in the middle of her thigh, her inner thigh. A sharp pain with like a throbbing is almost like a band-aid

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

is too tight. If she rubbed her hand across her thigh, she could feel crushing and throbbing. She can feel it from touching the area. She had this before like when she is stretching. It started maybe 3 months ago and went away but then after she took the injection and heard about thing, she worried about a blood clot with Johnson & Johnson, not that she would know because she has never had a blood clot. It could be psychosomatic and all working in her head. It started the last 2 days when she woke up, she felt fine and as she was lying in bed, she started feeling a sharp throbbing pain that eventually goes away. She has no swelling of her legs or thighs, and her daughter said it looks fine. She is semi-terrified of hearing bad news. It takes her longer to go to the hospital. If she starts feeling worse, she will be there in no time. She does not want to wait until it is worse, but she does not want to spook herself into going. She suffers from anxiety. She definitely had the fever not like she was just tired it was like she was exhausted. She got up early and would take a little nap because she was doing a bunch of stuff. That hasn't happened, but that's her. It will be 2300 when she goes to sleep. She was doing a bunch of stuff and felt like she just needed to take a nap. Maybe it is part of that too, but usually she doesn't feel tired like this. After her daughter left, she read something on her phone and passed out. When she woke up, she saw she actually dropped her phone. Her thigh is now not a pinch but more a little bit of a muscle pain. Now it is not like the inner thigh, it is more behind the thigh now, but not below the knee, right behind the thigh, closest to the knee but not on the knee. It is the same thing as if the middle had gone behind her thigh a bit. The little pillow on her chair is not helping anything either. It feels like it maybe muscular, its deep feeling. It feels like it could be muscle, if she rubs it, she can feel it. When asked has it improved persisted or worsened, caller states it is there, but it is dull. She can say there is pain, but it is a little duller just because it is more in the muscle. It is hard to explain, it was not the same throbbing pain but there is a dull pain, it goes around the chunkier part of her thigh, like the inner thigh. When she rubs it there is pain but a dull pain. When she rubs it, it feels better but she can still feel the site where it hurts. When she rubs it, it is still located right in the lower middle going toward her knee but not at the knee, maybe

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

3 to 4 inches away from the fold of her knee, almost at the center of her thigh almost. Almost like a dull muscle ache, there is a bit of throbbing with it. She will go to the doctor if something weird happens and will call back when they have an idea of what happened to her. This will sound crazy. The next thing she felt was a light throbbing where her belly button is but more to the left side, but not at the belly button. It was like at her stomach, not right at the belly button but right on the same line as her belly button but more at her waist. It was a small throbbing started today about an hour ago. She is hoping it is gas. Her fever went away pretty fast. She was on the phone and took her temperature to tell what it was. The woman said to take some Tylenol. It went from 99.9 to 100 to 100.3. She thought oh no. That was the highest she saw. Then eventually it started going down to 99.4, and then by morning it was back to normal. She only took Tylenol the one time. She is thinking maybe it is from being nervous and causing her body to heat up. She doesn't know she is just thinking. She thinks the fever went away the same day within an hour to 2 hours. She also wasn't drinking enough water. When asked if her fever has recovered completely or with last effects, caller states that is fine now, her temperature today was 99.4 without the fan on, she says she thinks that was pretty normal. When she first wakes up it is 97.9 usually. There was also a 98.4. The redness and itching at the injection site started 3 hours after the injection. She took her 2 sons with her. She took it and then her son took it. They said to wait 15 minutes. As soon as she stepped out, she looked up and felt so dizzy. It looks like when in summer and it seems to be boiling hot, that is how it got for her. Things got blurry. It was not like she was going to black out, but she had to close her eyes because the room was going to spin. She knocked back on the door and took a seat, so she sat down because she was not feeling right. When she gets nervous, she chews gum as a coping mechanism. Her son got some gum for her. She felt better but kind of nervous waiting for 15 minutes to go by, what if she felt dizzy again. She let 20 minutes go by and she got up and was fine. She wanted to be out of there and in the cool air outside. That is the first reaction that she had. She is one of those people that feel so nervous she is sure that happens that they feel like, oh they are so nervous, and they read so

much, and it is in our faces everyday no matter what. Maybe it had nothing to do with the injection, maybe more that she was so nervous, but it was a weird sensation after. She knows when people first started getting the COVID vaccine, people were just like falling to the ground, she was like that would be terrible. She went with high expectations and was also nervous. Her heart was beating, and she could hear her own heartbeat. She still feels tired and like she can go take a nap now. She asks if that is normal. She would rather talk to Medical Information now. She is over this statistics part of it. She doesn't feel a release, she is just giving her information and she doesn't feel any better. Outcome of the event throbbing sensation to the left side of her belly button/it was like at her stomach was not recovered; of the event dizzy was recovered; of the events the injection was large, red, hot, and itchy/ the swelling went down, tiredness was recovering; of the other events was unknown. Information about lot/batch number has been requested.

Lost use of my right arm so I went to the hospital they checked for a clot I teated slightly positive with the blood test then the did an ultrasound and couldn't find one. The only explication for my Paralysis is a mini stroke.a Also besides the numbness and loss of use I have hyperreflexia.

1305011	5/11/2021	GA	89	F	1/16/2021	2/17/2021	<p>This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of ATRIAL FIBRILLATION (atrial fibrillation), PULMONARY EMBOLISM (blood clots in her lungs) and THROMBOSIS (blood clots everywhere) in an 89-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No medical history was provided by the reporter. Concomitant products included VITAMINS NOS for an unknown indication. On 16-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 17-Feb-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 17-Feb-2021, the patient experienced INFLUENZA LIKE ILLNESS (felt like she was getting the flu), DIARRHOEA (diarrhea), BLOOD PRESSURE ABNORMAL (no blood pressure), VACCINATION SITE PAIN (arm still hurts from time to time) and FATIGUE (felt tired). On 03-Mar-2021, the patient experienced ATRIAL FIBRILLATION (atrial fibrillation) (seriousness criterion hospitalization), PULMONARY EMBOLISM (blood clots in her lungs) (seriousness criterion hospitalization) and THROMBOSIS (blood clots everywhere) (seriousness criterion hospitalization). At the time of the report, ATRIAL FIBRILLATION (atrial fibrillation), PULMONARY EMBOLISM (blood clots in her lungs), THROMBOSIS (blood clots everywhere), INFLUENZA LIKE ILLNESS (felt like she was getting the flu), BLOOD PRESSURE ABNORMAL (no blood pressure) and FATIGUE (felt tired) outcome was unknown and DIARRHOEA (diarrhea) and VACCINATION SITE PAIN (arm still hurts from time to time) had not resolved. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On an unknown date, Computerised tomogram: normal (normal) haven't found anything. On an unknown date, Endoscopy: normal (normal) haven't found anything. Treatment medication included apixaban. Action taken with mRNA-1273 in response to the events was not Applicable. The patient had an endoscopy and CAT scan where they haven't found anything at when she was at the clinic. Consumer was vaccinated with first dose on 16JAN2021 (was not able to</p>

locate lot/expiration on vaccination card). She got her second dose on 17FEB2021 (was not able to locate lot/expiration on vaccination card) and she felt like she was getting the flu, felt tired and on 3MAR2021, she was rushed to the hospital because she had "no blood pressure" and presented atrial fibrillation and blood clots in her lungs and everywhere. Her arm still hurts from time to time and continues to have diarrhea. She states she is a fairly healthy person does not take any medications, only Centrum vitamins. Since then she has gone to the clinic, had an endoscopy and CAT scan where they haven't found anything. She is now on Eliquis. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. This case was linked to MOD-2021-101609 (Patient Link).; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

1305039	5/11/2021	AL	43	F	2/1/2021	2/1/2021	high blood pressure/blood pressure 167/93/Blood pressure 144/95; Racing pulse/pulse was 177/pulse was 163/Pulse 116/ rapid pulse; Her heart was pounding; she couldn't catch her breath; This is a spontaneous report from a contactable consumer (patient herself). A 43-year-old non-pregnant female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Lot number: EL8983, Expiration date: Unknown), via an unspecified route of administration in left arm on 01Feb2021 at 08:45 AM (at the age of 43-year-old) as a single dose for COVID-19 immunization. The patient's medical history included mitral valve prolapse (diagnosed at the age of 18). No known allergies. Concomitant medication included medroxyprogesterone acetate (DEPO PROVERA) from an unspecified date in 2020 and ongoing, received in two weeks within the vaccination. She took a Depo Provera shot on Saturday 30Jan2021, but she has been on this medication for a year now since either Feb2020 or Mar2020. The lot number and expiration date was unknown, since she has discarded the packaging. She usually picks up the drug, and her neighbour was a nurse, she usually just gives her the injection, since COVID has started. The patient previously received flu vaccine on an unspecified date in 2020 for immunisation and experienced feeling bad, didn't feel good. The patient previously received flu vaccine on an unspecified date for immunisation and experienced thrown up, chills, fever, body was sensitive. Caller was queried she if she had had any issues with vaccine in the past, caller states that she takes the flu vaccine every year, her body was sensitive to the flu vaccine, this year she had no issue, but last year (on an unspecified date in 2020) after the flu vaccine she started feeling bad, didn't feel good, years before she has thrown up and had chills and fever. Her body must be sensitive. However she has never had the heart issues. The patient did not receive other vaccine in four weeks. The patient was not diagnosed with COVID-19 prior vaccination. The patient has not been tested with COVID-19 post vaccination. It was reported that, she was calling about the COVID-19 vaccine. She received the vaccine yesterday at 8:45 AM, then at 12:30 PM she began to have a rapid pulse and high blood pressure. She went to the ER because of her pulse and blood pressure. In the

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

ER, she received an IV to calm the heart, she doesn't know what was in the IV. They did blood work and told her the blood work was fine, and the chest X-ray was fine. She went to a Cardiologist today, she does have a valve prolapse, but she has had no issues with that for many years. She states that her body had a weird response to the covid vaccine. Caller states that she need Pfizer to know what happened because it was real scary. She has her first dose on 01Feb2021 at 8:45 AM. The rapid pulse began while she was sitting at the computer working. Her heart was pounding on 01Feb2021, she couldn't catch her breath on 01Feb2021, and so she was a school teacher, so then she went to find the nurse, and even in that she was having trouble catching her breath to be able to even talk. The nurse took her into the office, and she put a pulse ox monitor on her finger. At 12:25 PM her pulse was 177, at 12:30 PM her pulse was 163 with blood pressure 167/93, at 12:40 PM pulse 116, blood pressure 144/95. The nurse then called the ambulance because it was alarming. Caller states that doesn't know what her readings were in the ambulance. She went to the ER at (institute name withheld) and they did an EKG, 2 of them. The regular ER doctor was not super helpful, he said that she was okay to take the second vaccine. Caller did not agree with him thinking that the 1st covid vaccine sent her to the ER. HCP: He was at (institute name withheld) Cardiology. He did an EKG today (on an unspecified date in Feb2021), she doesn't know results at the moment. He didn't say if it was normal or abnormal. They did an echocardiogram, she was also assuming nothing was alarming or she would have been told the results. He listened to the heart and said it sounded fine, there was nothing he could detect. She did have a rapid heart rate at the cardiologist office, both pulse and blood pressure were elevated. He said that she was going to do a stress test in a week, the doctor was also going to see what the blood work from the ER yesterday looks like, he would also check the thyroid. He told her that next week she would also wear a heart monitor. She was at the doctor's office today at 10:30 AM. Her biggest concern was which she talked to the cardiologist today about was the 2nd dose of the vaccine. She doesn't want a repeat of this event. The cardiologist said that she was supposed to get the second dose in 3 weeks, let's do testing and see

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

where we stand. Her 2nd dose was scheduled for 22Feb2021. She was concerned this happened. She doesn't know what could be done. This was bizarre. In the ER, the doctor said this wouldn't be considered an allergic reaction. Caller wonders what this was considered then. The ER doctors thing was that this didn't happen in first 15 to 30 minutes of receiving the vaccine, and that would be considered an allergic reaction if it did. She wants to know if this was an allergic reaction. Enquired was this allergic reaction. The adverse events resulted in emergency room/department or urgent care. She has no results for the tests that were performed at the ER, she was just told the chest X-ray was normal and so was the blood work, but she doesn't know what the blood work involved. They were looking for blood clots at the ER. She was not admitted into the hospital, she was sent home the same day. She has had no positive COVID test prior to the vaccine. She also has had no symptoms, and therefore no reason to get tested either. On 01Feb2021, the patient underwent lab tests and procedure which included chest X-ray: Normal, pulse rapid: 177 (at 12:25 PM), pulse rapid: 163 (at 12:30 PM), blood pressure: 167/93 (at 12:30 PM), pulse rapid: 116 (at 12:40 PM), blood pressure: 144/95 (at 12:40 PM). On an unspecified date in Feb2021, the patient underwent lab tests and procedures which included blood work: Unknown results (the doctor was also going to see what the blood work from the ER yesterday looks like. They were looking for blood clots at the ER), EKG: Unknown results, EKG: Unknown results, Echocardiogram: Unknown results. The patient was treated with IV for the adverse events. The outcome of the events she couldn't catch her breath, her heart was pounding was unknown and not recovered for the other events.

1305064	5/11/2021	IA	80	F	2/9/2021	2/1/2021	hands are tingly; My hands are tingly and so cold.; felt terrible everyday; Nauseated; Arms felt like they were asleep; so sick; Hurt all over; not moving too fast; I do not want food; I have not eaten, taken a shower or anything; This is a spontaneous report from a contactable consumer (Patient, self-reported). A 80-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Solution for injection, Batch/Lot number was not reported), dose 1 via an unspecified route of administration on 09Feb2021 09:45 (at the age of 80-years-old) as SINGLE DOSE for covid-19 immunisation. Medical history included immunodeficiency, atrial fibrillation. The patient got her shot last Tuesday morning at 9:45 and had been real sick after this. The patient had a bad reaction to it. Well after patient got the shot it was in the. And it said if she was on blood thinner (Unspecified Medications) or 'immune disorder' (not clarified further) she know and she was both of those and was just wondering what to expect and today from elbow. On unspecified date of Feb2021 , her arms felt like they were asleep and then now it was from elbow bit down and her hands got real cold. Now she had not ran a fever and she had not vomited, but she did not want food. She had hurt all over and she had been nauseated (on unspecified date of Feb2021) but not vomited. She had not eaten, taken a shower or anything, and she had been so sick (on unspecified date of Feb2021). Well let her see if she could see a pen that writes. She was not moving too fast (on unspecified date of Feb2021). She wanted to know if this was going to affect her blood, the thickness or the firmness. Since Tuesday, 09Feb2021, patient hands were tingly and so cold. The patient had felt terrible everyday. She had other relatives that got some aches and fatigue , but nothing like what she had. The patient was not currently not taking any immunosuppressant drugs. Patient was enquiring that was it ok to get her 2nd Pfizer vaccine vaccine dose in 4 weeks. The patient also enquiring about was it a problem, with getting the vaccine, if she take Blood thinners, she had atrial Fib and used to get a lot of blood clots. And was there any problem with being immunocompromised and getting the vaccine. Outcome of the events was unknown. Information on batch/lot number has been requested. Follow-up attempts are completed. No further information is expected.

1306306	5/11/2021	NY		F		4/1/2021	DEEP VEIN THROMBOSIS; This spontaneous report was received from 66-year-old, White, not Hispanic or Latino female patient. The patient's height, and weight were not reported. The patient's past medical history included Factor 5 Leiden positive (no clot issues since 1998 and did not take any standard medication for it as per guidelines), and anaphylaxis due to drug and shellfish allergies. The patient underwent a surgery (unspecified) and was immobilized and developed multiple clots in her right leg. Concurrent condition included shellfish allergy. The patient drinks alcohol socially (rarely), does not smoke and had no drug abuse or illicit drug use. The patient experienced drug allergy when treated with Aspirin (acetylsalicylic acid), and ibuprofen. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of administration was not reported, batch number: 1805022 and expiry: unknown) dose was not reported, 1 total, administered on left arm on 08-MAR-2021 for prophylactic vaccination. No concomitant medications were reported. On 15-APR-2021 (approximate date), the patient experienced persistent leg pains. On 29-APR-2021, the patient developed pitting edema, experienced ankle redness and ankle pain. On 01-May-2021, the patient saw a retired orthopedic surgeon who advised the patient to go to a doctor immediately. On 02-May-2021, the patient went to the primary care office, saw a nurse practitioner and was immediately sent to the Emergency room (ER). On the same day, many blood tests were done (including differential, routine chemistry and coagulation), all of which showed normal results and a computed tomography (CT) scan showed thrombus in left posterior tibial vein below the knee (blood clot in left calf) following which a diagnosis of deep vein thrombosis (DVT) was made. On 02-May-2021, the patient started with Xarelto (rivaroxaban) 15 mg twice daily for 21 days then decrease to once daily as part of treatment for DVT. The patient completed 6 doses of Xarelto at the time of report. Both the ER doctor and the primary care doctor stated that the cause of DVT was the vaccine. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of deep vein thrombosis was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0:20210509051- covid-19 vaccine ad26.cov2.s - Deep

1305834	5/11/2021	NY	65	F	3/29/2021	4/1/2021	Whole Leg Pain after first dose of Covid Vaccine/hurt in her thighs, knees, calves, and down into her ankles; Lower back sore intermittently/The back pain fluctuates from a pressure and mild ache to soreness; This is a spontaneous report from a contactable other nurse (patient). A 65-year-old female patient received bnt162b2 (Pfizer-BioNTech Covid-19 Vaccine), via an unspecified route of administration, administered in Deltoid Left on 29Mar2021 10:30 (Batch/Lot Number: ER8727) as First Dose; Left Deltoid for covid-19 immunization. Vaccination facility type was in pharmacy. No vaccines administered on same date of the Pfizer suspect. None prior vaccinations within 4 weeks. Family medical history relevant to AE was none. Medical history included ongoing high cholesterol diagnosed about 30 years ago (it was hereditary), ongoing Hashimoto's thyroiditis diagnosed about 20 years ago. Concomitant medications included rosuvastatin taken for blood cholesterol from about 3 years ago in 2018 to Apr2021 (a few weeks after the first dose of the vaccine); levothyroxine sodium (UNITHROID) taken for Hashimotos thyroiditis and ongoing. Patient was not on any other cholesterol medication currently. About 2 weeks after the first vaccine she started having leg pain. It was whole leg pain. It hurt in her thighs, knees, calves, and down into her ankles. She went to her doctor who did doppler studies and found no blood clots in Apr2021. Thought maybe it was the cholesterol medications that she had been on for years; so she stopped taking it. The pain in legs subsided a few days later and ended a few days before she got the second vaccine. She was a hiker and was in amazing shape. She had not done anything different, nothing that would have exacerbated this. She believed her symptoms are medically significant as she did not know for sure what was causing them. She was uncertain if her symptoms have been caused by the Covid Vaccine. The event whole leg pain after first dose of Covid Vaccine required a visit to physician office. No emergency room visited. She had issues with her back. She noticed something new. Her lower back was sometimes sore. It came and went intermittently; unlike the leg pain that was constant. The back pain fluctuates from a pressure and mild ache to soreness. This also occurred after both vaccines. The outcome of back pain was not recovered, of other event was recovered in

1306215	5/11/2021	MI	77	F	2/12/2021	2/23/2021	<p>Legs swelled up really bad ; it left blotches in my leg; Legs swelled up really bad ; it left blotches in my leg; Fever; Bladder infection; UTI; He gave me some medications and it is helping the rash; stomach even swelled up; This is a spontaneous report from a contactable consumer (patient). A 77-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), dose 2 via an unspecified route of administration on 12Feb2021 (Batch/Lot number was not reported) as SINGLE DOSE (at the age of 77 years old) for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. Historical vaccine information included BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, for COVID-19 immunization, dose 1 on 17Jan2021 at age of 77 years old. On 23Feb2021, the patient experienced legs swelled up really bad it left blotches in my leg and she went to the doctor, she had fever, bladder infection and Urinary tract infection (UTI). The legs swelled up real bad, her thighs from the waist, she just swelled up everywhere. Her stomach even swelled up but the right leg mostly. She experienced the blotching, it looks like a birth mark on my right leg and the left leg. It is blotchy, looks like a birth mark on the legs. The right one got really big. She did go to doctor and he said it was not a blood clot. He said people are getting swelled up with rash, some people are having rashes and swelling. Treatment included the physician gave her some medications and it is helping the rash and "cephalexin 500 mg, 3 times a day" for the UTI. Outcome of the events was unknown. No follow-up attempts are needed; information about lot/batch number cannot be obtained.</p>

1305114	5/11/2021	MT	56	F	2/14/2021	4/14/2021	Dear Sir or Madam: Writing to you to please refer me to VAERS for possible CVST s/p dose 2 of Moderna I am a retired APRN and just reviewed your article HPI: 57 y/o female (not obese, no hypothyroidism) H/O travel (February1-March 1 2021) with possible SARS Cov2 exposure; possible long COVID Big supporter of public health and COVID19 vaccine campaign with Moderna dose one 2/14/21 and dose 2 on 3/14/21 Mild to moderate sx after both doses Routine ophthalmology exam 4/8/21 Approximately 4/13/21 left sided facial pain, HA and swelling-self treated for blepharitis with warm compresses 4/15/21 returned to ophthalmologist: forceful lower lid compression applied and diagnosed with pre-septal cellulitis-Rxd Augmentin 875 and steroid dose pack-on return to home experienced severe projectile vomiting x2 and awakened with massive facial edema and ecchymosis-petechial hemorrhages-terrible sinus pain Went back to ophthalmology-they said I had a chalazion and black eye-referred back to PCP for r/o temporal arteritis. ESR and CRP neg Symptoms progressed to severe headache in left temporal lobe since 4/15/21-severe nausea, changes in speech, problems with word finding photophobia, global malaise, fatigue (seems like migraine) Went to see PCP 5/6/21 and transported via ambulance to ER for severe HA; HTN; neuro deficits, r/o stroke CBC CMP Etc wnl with CT of Head showing no stroke or aneurysm. Physician did state there may have been Micro thrombi not detected on CT. Neurology consult with plan to treat intractable HA and rxd Zofran and Sumatriptan -I do not recall anyone asking me about COVID19 vaccine timing or side effects. No PL4 As an APRN I would say I have never had migraines-now experience left sided head pain radiating from temporal lobe to jaw; this waxes and wanes; nausea; overall rapid onset of persistent speech deficit and organizational problems also noted by spouse (since dose 2 Moderna)-symptoms poorly controlled with migraine medication I think this needs further investigation as potential vaccine side effect

Patient is pleasant he has no active complaints other than some throat irritation bleeding in the throat and bruising that was nontraumatic to the legs. My physical examination reveals multiple rather large bruises to the bilateral lower extremities up to softball size worse on the right than left. Patient had some mild left upper quadrant discomfort. Very minimal bleeding in the posterior pharynx. I personally reviewed the labs and CBC revealed an anemia at 10.830.5 hemoglobin hematocrit respectively. Most notably a 9000 thrombocytopenia. CMP essentially unremarkable. INR 1.5 PTT normal. I added on Lyme disease and tick-borne illness as well as a Monospot type and screen. Patient did receive his 1st visor vaccine for COVID-19 on April 29, 2021. IV was established in the emergency department in consultation made to Pediatric Oncology. I spoke with pediatric oncology in regards to patient's history and present illness. He does agree that the patient should in fact be transferred under the pediatric care but recommended under the general hospitalist service. He did not advise to proceed with any active treatment in our emergency department such as gamma globulin, platelets or steroids. Awaited call back from pediatric hospitalist and spoke with Dr. She has agreed to accept the patient in transfer. Patient and family are comfortable disposition plan no further questions at this time. Impression: 1. ITP Disposition: Transfer ED on 5/10/2021

1307388	5/11/2021	CA	90	F	3/3/2021	3/3/2021	Patient had a stroke with clot on right MCA
1307481	5/11/2021	MI	48	M	4/3/2021	4/29/2021	Patient is a 48-year-old male with patient history significant for CAD, CHF, ICD, HTN, hyperlipidemia, and smoking who presented to the ED yesterday morning with 1 day history of chest pain. Patient described the CP as moderate aching in the substernal area that did not radiate. The pain was intermittent, with each episode lasting 1-2 minutes. The CP was associated with LUE numbness and SOB on exertion. The chest pain and LUE numbness have now resolved. Patient also reports a three week history of RUE swelling. The swelling gradually worsened and is now associated with pain and proximal RUE bruising. RUE pain is rated 5/10. In the ED, patient was found to have NSTEMI and small right lower lobe segmental pulmonary artery embolus. Venous Doppler was positive for occlusive thrombosis in the R subclavian, basilic, and cephalic veins. Patient was started on IV heparin. Patient is scheduled for cardiac cath today. Hematology is consulted regarding PE and RUE DVT. Patient denies personal or family history of blood clots or recent travel. Reports receiving COVID vaccine in LUE approximately three weeks ago. Also admits to being more sedentary recently due to being unemployed. Denies nausea, vomiting, bleeding, bowel changes, fever, or chills. Significant PE findings: RUE edema, firm and tender to palpation, ecchymosis on proximal RUE, distal sensation and active ROM intact
1308488	5/11/2021	IL	61	F	3/29/2021	5/11/2021	Patient called 5/11/21 stating today she blew a blood clot from her nose

1308074	5/11/2021	NC	40	F	4/6/2021	4/26/2021	Was diagnosed with a DVT 3.5 weeks after vaccination. Started experiencing symptoms of DVT 20 days after the vaccine. Symptoms were not atypical and were almost not checked for DVT at ER. Started with twinges in my right leg for several days. Then pain in my back right behind my heart. Then developed sporadic chest pain and heart palpitations. I was afraid to go to the ER because of COVID because my 12-year-old daughter has a heart condition. Then on April 30 mid-day my right thigh began to hurt like a pulled muscle although I had not injured it or pulled it. I couldn't walk on my leg the pain was so intense. My family was very worried about a blood clot because of the Johnson and Johnson vaccine. That night I had really sharp chest pains and my thigh pain was no better by the next morning. I went to the ER told them my symptoms. After the ER doctor examined me he said he was 99% sure I didn't have a blood clot because my pain was in my thigh and there was no redness or swelling. He told me my chest pain was probably due to anxiety. I asked if he would check my leg anyway. Once the ultrasound of my leg was done the DR came back and said I had a DVT. Then I had to have an MRI of my chest which he told me was a lot of radiation. I did not have a PE. They did not prescribe Heparin because they felt the DVT was from the vaccine. So I was giving Eliquis. Since then my family DR has run more tests and I do not have any genetic reason to have the DVT. I do not and have not taken birth control in the past 20 years. I am now on a blood thinner for at least 90 days if not longer and I am continuing to have twinges and chest pain twinges.
1309367	5/11/2021	CA	61	F	4/7/2021	4/12/2021	right leg pain started 5 days after vaccination. Went to the ER on 5-1-2021 x-rays, ultrasound and blood work done. Diagnosed with a deep vein thrombosis blood clot in the right leg. given Eliquis starter pack 2 tabs 10 mg each twice a day for 7 days, 1 5mg each tabs twice a day, ongoing Tramadol 50mg 1 every 6 hours for severe pain Acetaminophen 500mg 1 every 4 hours for pain Ondansetron 4mg as needed for nausea/vomiting

1307905	5/11/2021	TX	71	M	1/1/2021	2/1/2021	My name is patient, 71 year old. On 5/5/21 my Cardiologist told me to go to the ER to get a Chest CT. I was diagnosed with PE (Pulmonary Embolism). I was put in ICU under blood thinner Heparin drip treatment. On 5/09/21, I was discharged to go home to continue treatment with blood thinner Eliquis. I have always been an active healthy person with no major issues other than one Stent put in my Left Descending Artery by doctor in June of 2013. I've been playing Tennis (mostly singles) on weekends till last November and I've been playing Ping Pong on weekdays till end of April. Never expected to getting this PE. Could this blood clots be the result of Pfizer Covid Vaccine ?
1307839	5/11/2021	HI	33	F	5/6/2021	5/6/2021	Healthy 33-year-old female who denies any illness except for cord prolapse during her NSVD delivery. She got her first Pfizer COVID-19 vaccine today afterwards she felt dizzy, lightheaded, and some chest tightness. Also some air hunger. Symptoms have improved. She was advised to go to the nearest emergency department. She arrived to hospital w temperature 98.6 already 146 bpm. She received 2 L of saline 0.5 mg Ativan. Pt has never formally been diagnosed with anxiety but says she is an anxious person. She has received prior needle punctures without reaction. She is concerned about blood clots as the media has reported this with the Johnson and Johnson vaccine. Pt was admitted for observation overnight. Bilateral LE duplex US negative for DVT. Pt stable and discharged to home.
1307708	5/11/2021	DC	37	M	4/7/2021	5/10/2021	Two weeks of abdominal discomfort, followed by onset of extreme abdominal pain Followed by diagnosis of blood clot at kidney artery

1303206	5/10/2021	IL	87	M	4/1/2021	4/15/2021	The days after the shot the patient was sleeping 12-14 hours a day which was not normal. On 04/15 pt started to feel dizzy and signs of blurry vision began. They went their general physician ruled out stroke & clot, then recommended they see an eye dr since the vision was the worst symptom. By 04/21/2021 the pt lost 100% of their eye sight. They eye dr after doing a scan discovered the pt had temporal arteritis. They believe the vaccine could had caused the body to lose the fight against the temporal arteritis and pt eyesight was lost.

1301978	5/10/2021	PA	71	F	4/1/2021		SEVERE CHEST PAIN ON RIGHT RIBCAGE AND LEFT HAND SIDE; This spontaneous report received from a consumer concerned a 71 year old female. The patient's weight was 120 pounds, and height was 64 inches. The patient's concurrent conditions included rheumatoid arthritis since approximately 14 years, penicillin and IV contrast solution allergy, no alcohol use, and non-smoker, and other pre-existing medical conditions included the patient was not pregnant at the time of reporting and had no history of drug abuse or illicit drug use. The patient received covid-19 vaccine ad26.cov2. s (suspension for injection, intramuscular, batch number: Unknown, and expiry date: unknown) dose was not reported, 1 total administered on APR-2021 for prophylactic vaccination. The batch number was not reported and has been requested. Concomitant medications included adalimumab (Humira) for rheumatoid arthritis. On APR-2021, four to five days after the vaccination, the patient experienced mild soreness or discomfort initially and progressively worsened over time. Later the symptoms developed into a severe chest pain on right hand side of the ribcage, and it hurt to breath and move; the patient felt relieved only while lying flat. The patient had visited emergency room and physician room for severe chest pain on right ribcage and left-hand side. The patient went to the hospital after 6 to 7 days after the vaccination and got admitted. The patient was put on blood thinner immediately after the admission as the staff thought the patient had blood clot. On performing D-dimer test, the levels showed 3.49 (units unspecified) and was identified that the patient had no clots. The patient was discharged from the hospital on 28-APR-2021. The patient was pain free for 2 days; However, she started experiencing severe pain on left hand side of the chest on the day before reporting. The patient stated that the pain moved over. Rheumatologist suggested the patient to take Ibuprofen for the chest pain. The patient had reached out to her rheumatologist who advised the patient to take ibuprofen for the pain in her chest; However, the patient did not take before chest pain started. It was reported that the patient would be seeing the rheumatologist the next day of the report. The action taken with covid-19 vaccine ad26.cov2. s was not applicable. The patient had not recovered from severe chest pain on right ribcage and left-hand side. This report

1302520	5/10/2021	CA	59	F	4/19/2021	4/28/2021	developed abd pain days after 2nd dose of Pfizer vaccine, came in 3 wk later for PEA arrest with dead gut secondary to extensive bud chiari syndrome w thrombosis of the portal vein, splenic vein, and superior mesenteric vein. Admitted to ICU/OR for ischemic small bowel removal.
1300702	5/9/2021	UT	43	M	4/29/2021	5/2/2021	2-3 days after the first injection, I developed a blood clot in my lower right leg.
1301096	5/9/2021	MD	61	M	5/6/2021	5/7/2021	32 hours after the vaccine, he suffered a massive heart attack due to a blood clot and a massive clot in the right arm. He went to the hospital and under went surgery at 12 am on Saturday. The coronary surgeon mentioned that this was not from heart disease as all vessels were clear. Rather, this was due to an embolism due to an unknown origin. A further work up concluded that he also had blood clots throughout his body (both lungs, one kidney, heart, liver, legs, arms, and possibly brain). By 12 p.m. we were asked back to the hospital as he was worsening. Treatment options included a heparin drip, which caused a brain hemorrhage. He was just at the doctors two times this week, on Tuesday and Wednesday and was fine no issues found. They went through with the 2nd dose and came to our home on Thursday.
1301151	5/9/2021	CA	44	M	4/17/2021	4/24/2021	Developed Deep VEIN thrombosis (DVT) in the left leg and a Pulmonary Embolism. Was hospitalized for 5 days and had to have a surgical procedure to insert a screen into my inferior vena cava

1301254	5/9/2021	CA	36	M	3/7/2021	3/12/2021	For 2 days, typical arm soreness, flu-like symptoms with significant muscle pain and general weakness and malaise. However, on the 5th day, EXTREME abdominal pain, left side. Pain level up to 9. Incapacitating. Two visits to urgent care. This was in March before any info came out about adverse blood clot events for the J&J vaccine, so the doctors were not really interested at the time that I had just gotten my shot. They gave me antibiotics, thinking it may be diverticulitis (diagnosis based on symptoms only - no diagnostics - it was the doctor's "best guess"). Pain did not subside, only got worse. 4 days later I could barely move, abdominal pain was extreme. Went back to clinic and they did a PET scan to check for diverticulitis. There was none; PET scan revealed nothing out of the ordinary. So they told me they had no idea what it was and sent me home. PET scan reading by the doctor notes specifically that blood/vascular was not able to be observed because no contrast or dyes were used. Bottom line was over 10 days of extreme abdominal pain 5 days after receiving the shot. I've never experienced anything like that before.
1301256	5/9/2021	FL	61	F	3/31/2021	4/5/2021	Pain in right leg in knee area beginning on 4/6/2021. Pain worsened over the weekend. Went to the doctor on 4/14/2021. She sent me for a doppler on my legs where a blood clot was found behind my right knee. I started taking Xarelto that night - 15mg twice daily for 21 days. The pain increased considerable and by 4/20/2021 I could hardly walk. I went back to the doctor that day and she ordered a second doppler study. The blood clot was stable but there was no change. Continued on the Xarelto. Third visit to the doctor on 5/5/2021. Some lessening of the pain by then. Doctor changed the Xarelto dosage to 20 mg. one a day for the next two months. Then we'll schedule another doctor visit and probably another Doppler Study.
1301337	5/9/2021	NC	51	M	3/8/2021	5/2/2021	Blood clots in lungs was diagnosed after so many test. Treatment ongoing
1301483	5/9/2021	IN	44	F	3/24/2021	5/9/2021	Blood clots in lungs. Had trouble breathing for 3 days before it was diagnosed in the er.

1299176	5/8/2021	TN	64	F	4/5/2021	4/1/2021	feeling so bad; couldn't hold anything down/Vomiting that wouldn't stop/vomiting; Diarrhea; Nauseous; It was just bile coming up; Headache; Was passing clots/were clots/in the vaginal area; Was passing clots/were clots/in the vaginal area/vaginal bleeding; Being dehydrated; couldn't hold her own weight up; stomach pain; So sick; White blood cell count and kidney and liver function were all elevated; White blood cell count and kidney and liver function were all elevated; White blood cell count and kidney and liver function were all elevated; A sharp pain in her side; Stools were dark tarry stringy stuff; Stools were dark tarry stringy stuff; Passing blood in her urine; allergic internal reaction; Weighing 130 pounds but lost about 4 pounds during this illness, so 4 pounds lighter; This is a spontaneous report from a contactable consumer (patient herself). A 64-year-old female patient received BNT162B2 (PFIZER BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, at age 64 years, administered in left arm on 05Apr2021 10:30 (Batch/Lot Number: ER8734) as single dose, for COVID-19 immunization, in order to go back to normal, without a mask so she was told she had to have one. Medical history included hysterectomy, anxiety, disorder in thyroid and cholesterol. Patient had family history of dementia, had to stay home and take care of her mom who is a heart patient and has dementia. Patient had no history of previous immunizations. Patient's concomitant medication includes unspecified medications one is for thyroid, one is for cholesterol and the other 2 are for anxiety. Patient had no prior vaccinations within 4 weeks. No additional vaccines administered on the same date. Patient's symptoms started with a headache the morning after the shot (05Apr2021), was on and off for a couple of days, lasted 3 days or so for a couple days and she took paracetamol (TYLENOL). On 09Apr2021, Friday morning, patient woke up so nauseous she couldn't hold anything down. It was just bile coming up, and she had severe diarrhea and so sick vomiting that wouldn't stop, stomach pain, couldn't hold her own weight up. She got medication at a walk in clinic and that didn't stop it. She started out at acute/urgent care, where she was taken by her daughter on Sunday, 11Apr2021, because she was feeling so bad and was tested for COVID and they said if it does not get better to go to the Emergency Room and

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

she continued having problems. It was not COVID. They said she was dehydrated and send her home to push fluids and drink Pedialyte. Monday or Tuesday (Apr2021) she was in the ER all night (she does not remember the day because all of her days are mixed up). They did CAT scans on her abdomen and ran blood work. They didn't see anything in her abdomen. Her white blood cell count and kidney and liver function were all elevated and they said it was from being dehydrated from diarrhea and vomiting. They gave her fluids and sent her home. Within another 48 hours she still had vomiting and diarrhea, it was a clear bile and a sharp pain in her side. Her stools were dark tarry stringy stuff so she went back to the ER and waited in the lobby for 9 hours. In that 9 hours as she was waiting, she felt like she had to go to the bathroom. She was then wheeled into the bathroom and started passing blood. It wasn't coming from the urethra. It must have come form the vagina, she doesn't have a uterus. There were clots. She started passing blood in her urine but most was in the vaginal area but she has already had a hysterectomy. She was passing clots and her doctor who works in the healthcare field looked at it and said they were clots. Very shortly after, she passed the clot and the pain went away. The pain was passing clots/were clots/in the vaginal area at one point went away but she still have nausea and diarrhea and they gave her more fluids and sent her home. They didn't really want to address the vaginal bleeding. Patient have not been back and was not sure if she is still dehydrated. Patient was still pushing fluids and still not back to normal. Patient's daughter told her that since it was 5 days later it was not a reaction. Patient was thinking maybe it was an allergic internal severe reaction. Patient was weighing 130 pounds but lost about 4 pounds during this illness, so 4 pounds lighter. She stated her daughter-in-law was doing research and found a blog and there are woman the caller's age complaining of these symptoms (unexplained bleeding) after the vaccine. She asked if this was from the vaccine. She stated she was so sick that if there is even a chance then she doesn't want the second dose. She asked if this is a coincidence or has it been reported. She stated she is trying to make a decision on if she should get the second dose because she heard other people have symptoms and take the second shot. The outcome of the events passing

1299356	5/8/2021	KY	40	F	1/15/2021	2/22/2021	<p>blood clots in left lung which turned into an infarction; blood clots in left lung which turned into an infarction; This is a spontaneous report from a contactable other healthcare professional (patient). A 41-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE lot number: EL3248) via an unspecified route of administration, administered on the left arm on 15Jan2021 (at the age of 40-year-old) at a single dose for COVID-19 immunisation. Medical history included lupus. Concomitant medication included hydroxychloroquine sulfate (PLAQUENIL [HYDROXYCHLOROQUINE SULFATE]). The patient had blood clots in left lung which turned into an infarction on 22Feb2021. The event resulted in a doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care, Hospitalization, Life threatening illness (immediate risk of death from the event). The patient was hospitalized for the events for 3 days. Therapeutic measures were taken as a result of the events which included blood thinners and anti-inflammatory meds. COVID test post vaccination on 03Mar2021 Nasal Swab: Negative. Patient was not pregnant. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Outcome of the events was recovering.; Sender's Comments: Drug causality would seem unlikely for BNT162B2 since there is no plausible mechanism implicating the subject drug to the events. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer drug is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p>

1299345	5/8/2021	NV	71	M	2/28/2021	4/7/2021	cerebral hemorrhage; Multiple pulmonary embolism in both lung; He merely died twice; he was still tired; This is a spontaneous report from a contactable consumer (patient's wife). A 72-year-old male patient (patient's husband) received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Lot number: EN6203), via an unspecified route of administration on 28Feb2021 (at the age of 71-year-old) as a single dose for COVID-19 immunization. The patient's medical history included liver replacement from 29Nov (unspecified year), cold, sore shot. When probed for medical condition, reporter stated no, she could remember that he had a cold when he get the sore shot every year and get pneumonia vaccine. He had liver replacement on 29Nov (unspecified year), no side effects or anything, no blood clot. He walks every day. No diabetic no any other complicated factor. Concomitant medications were not reported. The patient previously received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Lot number: EL3249) on 07Feb2021 (at the age of 71-year-old) as a single dose for COVID-19 immunization and Pneumonia vaccine. It was reported that, reporter stated, she don't know how she just brief, but she would give the best she could. Reporter's husband has the Pfizer vaccine on 07Feb2021 and for the second does on 28Feb2021. He was 73-year-old now with no complicated factor, no history, and no adverse reaction anything like no allergy. Everything was fine, and on 07Apr2021 approximately five and half week after the second dose. He had to go to the emergency room as he could not breathe and he was diagnosed with multiple pulmonary embolism in both lung on 07Apr2021, no precipitating of event, no logical explanation that the doctors could tell, they put him on Eliquis to recover up the blood clots, 19 days later 26Apr2021 he was back in to ER. He was severe headache, nausea, vomiting. Side effects of the blood thinner. He was diagnosed with cerebral hemorrhage on 26Apr2021. We flight to hospital because we live in a small town no neuro surgeon available to get immediate surgery. The doctor told he was calm down, but they took him off from blood thinners and she don't know what she expect more blood clot, what going next, he feels fine, he still had some headache which doctor said it would leave

the month because of the blood in the brain. There was no after explaining and no logical explanation what have happen other than the blood thinner, he could take blood thinner. She don't know why the clots come back, that's why she want to report this because this all way comes on with the Pfizer. He was fine with the other vaccine that have five weeks after later. When probed any question regarding side effects, reporter stated, well she just kind a need to know, what to expect. If this going to be ongoing thing with in and out of ER. What to expect, we don't know. Doctor was following up. He has Hematology appointment on Wednesday to try to figure out the consequences. Reporter stated, she was on hold for 40 minutes and she could not even report this as a serious possible adverse reaction of the vaccine and to the drug. He merely died twice. When probed was patient still experiencing the side effects, reporter stated, well he was still tired. He still have the headache it's not severe. He went to the emergency room. We are watching him on helping here to follow up. He was taking medication of anti-seizure Keppra because body has strains body so that's making him tired. The outcome of the events was unknown. Information on Lot/Batch number was available. Additional information has been requested.

1299281	5/8/2021	PA	54	U	4/15/2021		<p>bad pain in the leg, near the calf/ confirmed the patient had blood clot in the leg; hurting in the arm; chills; This is a spontaneous report from a contactable consumer (patient). A 54-year-old patient of an unspecified gender received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), via an unspecified route of administration, administered in the right arm on 15Apr2021 (batch/lot number and expiration date were unknown) as a single dose for COVID-19 immunization. The patient had no medical history. The patient was taking other unspecified medications. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 19Mar2021 at the age of 54 years old for COVID-19 immunization. The patient reported having the normal side effect like the hurting in the arm, chills, and stuff on an unspecified date, but after that the patient got a really bad pain in the leg, near the calf and left it go for a week maybe, thinking it would go away, but didn't go away, so the patient went in to the emergency room and the emergency room work on it. That's what they did something to come up wrong with one of the blood test, so then they did an ultrasound and they confirmed the patient had blood clot in the leg, for which the patient was currently on a blood thinner. The patient didn't know if this was going to fix the problem or this was not going to fix the problem. The patient knew that some of the other vaccine caused blood clots, but the patient's doctor won't give any kind of pain medicine, and all they do was to give paracetamol (TYLENOL). They did start the patient on a pill called apixaban (ELIQUIS) taken at 25 mg tablet in the morning and 25 mg in the evening, and this was the thing the patient had never had; anything like this had never happened with the patient before, since the patient had been healthy in all his/her life, so the patient called to ask if there would be any relief as the patient didn't want this. Before the patient went into the emergency room, the patient had taken TYLENOL as treatment for all the events. The patient underwent lab tests and procedures on an unspecified date, which included blood test and chest x-ray with unknown results and an ultrasound, which revealed blood clot in the leg. The outcome of the events was unknown. Information on the batch/lot number has been requested.</p>

1299254	5/8/2021	WV	56	F	2/12/2021	3/29/2021	<p> bilateral pulmonary blood clots; This is a spontaneous report from a contactable consumer (patient). A 56-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot Number: EN6201, expiration date not reported) via an unspecified route of administration, administered in the right arm on 12Feb2021 as single dose for COVID-19 immunisation. Medical history included ongoing diabetes mellitus diagnosed 1.5-2 years ago, ongoing neuropathy peripheral diagnosed about two years ago, and ongoing glaucoma diagnosed about 9 months ago. Concomitant medications included metformin for diabetes mellitus; rosuvastatin calcium (CRESTOR) for neuropathy peripheral; dorzolamide for glaucoma; latanoprost for glaucoma; all ongoing. The patient previously took the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot Number: EL9261) administered on 21Jan2021 (at the age of 56 years old) for Covid-19 Immunization. No other vaccine was given within four weeks prior to the first administration date of the suspect vaccine. The patient experienced bilateral pulmonary blood clots on 29Mar2021 and will have to be on apixaban (ELIQUIS) for the rest of her life. She stated that she was fine before the shot and stated that it was not that long between the second dose and diagnosis. The patient was hospitalized for bilateral pulmonary blood clots from 29Mar2021 to 31Mar2021. The event required a visit to the emergency room. The outcome of the event was recovered with sequelae on an unspecified date. </p>

1299252	5/8/2021	WI	85	F	4/10/2021		<p>blood clot it is from my hip all the way down to my left leg to my ankle; blood clot but it is the big one from my hip all the way down to my foot; foot going down the swelling went up to my leg/foot and my leg is swelled my toes all over up to my leg swelled; This is a spontaneous report from a contactable consumer (patient). An 85-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection; Batch/Lot Number: EW0162), via an unspecified route of administration, administered in left upper arm on 10Apr2021 at the age of 85-years-old as single dose for COVID-19 immunization. The patient's medical history included ongoing arthritis and ongoing chronic obstructive pulmonary disease (COPD). The patient reported that she was not taking anything for arthritis, just some Tylenol once in a while over the counter (it was not prescription). The patient was taking an inhaler for COPD. The patient was taking unspecified concomitant medications. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection; Batch/Lot Number: ER2613), administered in left upper arm on 20Mar2021 at the age of 85-years-old for COVID-19 immunization and experienced bladder infection and viral infection. The patient got the first Pfizer vaccine on 20Mar2021 and was alright for a few days afterwards. Then all of a sudden, she started getting infections on 28Mar2021, 8 days after she had the first vaccine. She got a real bad bladder infection then she went to the doctor and she got medication for that. She was with bladder infection then she came down with the viral infection. The patient reported that she has not even been going anywhere because of the virus and she has been staying home. She just goes to the grocery store and clinic to the doctor, that was it. The patient had an antibiotic for the bladder infection. Sulfamethoxazole was the name of the medication that was for bladder infection. They didn't give the medication for the viral infection. The patient reported that it was just a viral infection, it was not the Covid. Since then, she had her second dose of the vaccine on 10Apr2021 and from an unspecified date in 2021, her foot started, her foot swelled up and she didn't know. She takes lot of retention pills, so she thought maybe it was that. So she took her pills and everything and washed and start getting but the next day instead of the foot</p>

							going down, the swelling went up to her leg and then the next day it went all away up to her hip. The swelling on the left side from the foot all away up to the hip. She went to urgent care on 21Apr2021 (reported as "21st") and saw a doctor and she was tested and she had blood clots. Regarding lab test, the patient reported she had two infections and then she got the blood clot that was from her hip all the way down to her left leg to her ankle. She could not figure out that they called the test and what they tested. But they had a lab work done then one has a test, veins, and everything. She can't remember. The patient reported that her foot and her leg was swelled, her toes all over up to her leg swelled. She had a fat foot and a fat leg just one side. She would say since she has started taking medicines for that, she took the first dose at the evening of 21st (21Apr2021), the day she went to the urgent care, and she would say it was not any worse. The medication was supposed to break up the blood clot, but it was the big one from her hip all the way down to her foot. Just a little bit better. The outcome of the events was recovering.
1299242	5/8/2021	CA		F	2/17/2021	2/20/2021	This is a spontaneous report from a contactable consumer(Patient). A 83-years-old non pregnant female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection Formulation, Batch/Lot Number: EN6200), via an unspecified route of administration on Arm left on 17Feb2021 10:00 AM as single dose for covid-19 immunisation. Medical history included colitis ulcerative. Concomitant medications included mesalamine (MESALAMINE). Patient had no past drug history. Prior to vaccination, the patient was not diagnosed with COVID-19. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. post Covid vaccine patient did not test for Covid. The Device Date given was 25Apr2021. The patient received treatment for raised blood thinner as Elequis 5mg. On 20Feb2021 at 10:00 (Three days after injection), the patient suffered severe pain in the right leg. She went to ER next day and blood clot was discovered behind right knee and later she subsequently had been seen by hematologist. The outcome of the events was not recovered. Follow-up attempts are required. Further information was expected.

1299222	5/8/2021	KY	83	F	2/3/2021	2/15/2021	<p>This is a spontaneous report from a contactable consumer (patient). An 83-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 03Feb2021 (Batch/Lot number was not reported) as a single dose (at the age of 83-years old) for COVID-19 immunisation. Medical history included the patient had known allergies (unspecified) and unspecified chronic health conditions from an unknown date. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient was not pregnant. The patient received unspecified concomitant medications. The patient did not receive any other vaccine within 4 weeks prior to the vaccine. On 15Feb2021 at 13:00 the patient experienced getting out of breath, three blood clots/clots were in my leg heart and lung, and cough. The events resulted in emergency room visit and the patient was hospitalized (from an unknown date) for the events getting out of breath, three blood clots/clots were in my leg heart and lung, and cough for 6 days. The clinical course is as follows: 2 or 3 weeks after the patient got the vaccine she started getting out of breath when she walked. Each day she got worse. Then the patient was taken to the hospital where they discovered the patient had three blood clots. The clots were in the patient's leg, heart and lung. The patient stated the Doctors do not understand where the clots came from. The patient was in the hospital 6 days. The patient stated they are still having breathing problem and still on oxygen as needed and they still cough at night. The patient asked if there have been any other reports of this happening to other people who got the vaccine as the patient never had blood clots before this. The patient underwent lab tests and procedures which included COVID test (nasal swab): negative on 15Mar2021. Therapeutic measures were taken as a result of getting out of breath, three blood clots/clots were in my leg heart and lung, and cough and included blood thinners and oxygen therapy and complete bed rest. The clinical outcome of the events getting out of breath, three blood clots/clots were in my leg heart and lung, and cough was not recovered. The batch/lot numbers for the vaccine, PFIZER-BIONTECH COVID-19 MRNA VACCINE, were not provided and will be requested during follow up.</p>

1299184	5/8/2021	NY	67	M	3/30/2021	3/1/2021	Right knee swelled and felt like it dislocated; Right knee swelled and felt like it dislocated; Pain in groin; Felt like a muscle cramp; Blood clot as well as fluid on that knee/blood clot right leg; Muscle tear; the pain went to his knee; Pain in the arm opposite that he received the injection; his other leg "got messed up"; Blood clot as well as fluid on that knee; Knee was stiff as a board; He could not walk on either of his knees for a couple of days; Inflammation in the calf; His leg was stiff; This is a spontaneous report from a contactable consumer (patient). A 67-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot Number: ER8730), via an unspecified route of administration, administered in left arm on 30Mar2021 10:45 as single dose for COVID-19 immunization. Medical history included knee surgery, dislocated shoulder (he has dislocated that shoulder in the past several times but had no recent issues), carpal tunnel syndrome and, rheumatoid arthritis, all from an unknown date and unknown if ongoing. There were no concomitant medications. In Mar2021, the patient experienced pain in the arm opposite where he received the injection. He reported he like had a muscle tear that it has an intense excruciating pain. He took three aspirin and put a heating pad on it that didn't touch it. He then reported that the pain went to his knee and it "got all blow up" and stated that that knee had to be drained. He then stated that the calf on his other leg "got messed up" and was found to have a blood clot as well as fluid on that knee. He reported that it was as stiff as a board and that he could not walk on either of his knees for a couple of days. He reported that he still has problems with the one knee that "blew up" and had to be drained but stated that the inflammation in the calf where blood clot was has receded and is back to normal. He stated that he had to visit the emergency room twice and see an orthopedic surgeon for these issues and has been prescribed Xarelto to take to treat the blood clot. In the morning his leg was stiff. It was also reported that the patient's right knee swelled and felt like it dislocated on 16Apr2021, blood clot on right leg on 12Apr2021, and pain in groin on 13Apr2021. The pain in his groin went down, but his calf swelled to twice the size and it felt like a horse because he was favoring it. It felt like a muscle cramp. The orthopedic saw him for his left knee and he was seen in

1299150	5/8/2021		46	M	3/31/2021	4/1/2021	He completely lost mobility on the left side of his body; Stroke; They found they clot, but could not extract it from what he understood; This is a spontaneous report from a contactable consumer. A 46-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), via an unspecified route of administration on 31Mar2021 (Batch/Lot number was not reported) as single dose (at the age of 46 years old) for COVID-19 immunisation. The patient has no medical history. Concomitant medications included aspirin [acetylsalicylic acid] (ASPIRIN [ACETYLSALICYLIC ACID]) taken for an unspecified indication, start and stop date were not reported. Since his stroke, he is doing better. He completely lost mobility on the left side of his body. His mobility on the left side of his body is slowly coming back. His job is in jeopardy. The doctors told him that there is no guarantee that he will regain full mobility. They did not give him a patient record card. If they did give him one, he left it at the house. He has been in the hospital ever since his stroke. They put him on blood thinners after his stroke. Whenever he was in the ambulance, he did not have high blood pressure. They were able to catch his stroke quick. They found they clot, but could not extract it from what he understood. Adverse events required Emergency Room. The patient was hospitalized on 01Apr2021. The outcome of clot was unknown and other events was recovering. Information on the lot/batch number has been requested.

1299360	5/8/2021	IN	40	M	4/26/2021	4/28/2021	This is a spontaneous report from a contactable consumer (patient). A 40-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration, administered in Arm Left on 26Apr2021 08:15 (Batch/Lot Number: EW0171) (at age 40 years old) as single dose for covid-19 immunisation. Medical history included high blood pressure, high cholesterol, carpal tunnel, absent vas deferens, all from unspecified dates. No COVID prior to vaccination. He underwent Covid test post vaccination (nasal swab) on 29Apr2021 with negative result. The patient's concomitant medications included unspecified prescribed and store-bought medications. No other vaccines in four weeks. On 28Apr2021 22:00, the patient experienced chest pains and shortness of breath testing of EKGs, echo, CT scan, and cardiac cath show- NSTEMI heart attack showing from damage to heart caused by blood clot. No problems with arteries or existing with heart. Also, lower lobe of left lung shows collapsed. The events resulted in doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care. The events were considered serious: hospitalization (2 days), life threatening illness (immediate risk of death from the event), disability or permanent damage. Treatment included blood thinners- apixaban (ELIQUIS) and metoprolol. The patient was recovering from the events.
1299873	5/8/2021	IN	72	M	3/3/2021	4/13/2021	Right leg burning, red, swollen. Doppler showed XL blood clot and numerous small clots in right leg. Put in Eliquis for 2-3 wk. brought to hospital on 5.6.21 with worse swelling, red, and right foot very painful. CT showed clots in legs and in lungs. Still in hospital as of 5.8.21

I could speak better my left lymph node was still sore; blood pressure went up; white blood cells count was really, really extremely high; This is a spontaneous report from a contactable consumer (patient). A 52-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), dose 1 via an unspecified route of administration, administered in left arm on 13Apr2021 (Lot Number: EW0153), at the age of 52 years, as single dose for COVID-19 immunization. Medical history included covid-19 in Sep2020. Concomitant medication was not reported. The patient experienced 24 hours later, after vaccination, her neck started swelling up, her left lymph node; abnormal mass in her neck which was her lymph node, which required hospitalization. The patient she developed a headache over the whole left side of her head. She could hardly move her neck. All of a sudden she kind of broke out in the sweat, left side of her head just went totally numb. Started feeling tingling in her left hand. She went to eat some yoghurt and she could not swallow at all, airway was being compromised by the swelling in her neck. She cannot walk her left leg was dragging, so she was lurking around having to hold on. Her voice was like had to whisper. Right side of her body started shaking, Later that evening the numbness subsided. She could speak better, her left lymph node was still sore. Blood pressure went up, white blood cells count was really, really extremely high. The patient was hospitalized from 14Apr2021 to 16Apr2021. The clinical course was reported by the patient as follows: When probed for the reason of hospitalization, consumer stated, "The symptoms I had was, I got the vaccination in my left arm, 24 hours after getting the COVID vaccination shot on 13Apr2021, almost exactly 24 hours later my</p>

neck started swelling up, my left lymph node, which I was expecting to have that problem. And I could hardly move my neck and then I developed a headache over the whole left side of my head and behind my eye and it was hurting and then it hurt my ear. So, I was having ear ache too. So, that went on for about an hour and a half and then all of a sudden I kind of broke out in the sweat and the left side of my head just went totally numb and then I started feeling tingling in my left hand and so I went to the bathroom to see if my face was numb, to see if I had any paralysis of my face which I did not have any at all, it was just numb. So, then I am concerned, so I decide I am going to take an Aspirin and so before I took the Aspirin I wanted to eat something because I had not had anything to eat that day. I went to eat some yoghurt and I could not swallow at all, I couldn't swallow the yoghurt. So, then I am concerned my airway is being compromised by the swelling in my neck. So, I got to call # and then I cannot walk my left leg is dragging, so I am lurking around having to hold on and then when I called # my voice was like had to whisper and it was hard to get an information where I was at. Finally they arrived and I was taken into the ambulance and when I was in the ambulance my blood pressure went up and also the right side of my body started shaking, they took me to the hospital. I was in the hospital. I had MRI, a CT scan and all of those things and it was negative for a blood clot or anything, heart problems or brain bleed. So, they ruled all of that out, my white blood cells count was really, really extremely high that is what the doctor said and anyway so I was admitted in the hospital and now I can talk better and the numbness is going away on the 14th a day later which went on for the symptom. So, later that evening the numbness subsided. I could speak better my left lymph node was still sore and everything and of course they did noticed that in the scan, MRI stuff about the abnormal mass in my neck which was my lymph node.". The patient stated, "I was hospitalized on 14Apr2021 and I was released the evening of 16Apr2021. Treatment: the patient stated they did not treat her for anything except for the high blood pressure when out there and that is it. The clinical outcome of Lymph node pain was not recovered. The clinical outcome of the remaining events was unknown.

1294675	5/7/2021	TX	36	F	4/4/2021	4/1/2021	<p>blood clot; anemia; knee down felt tingly/like her legs were falling asleep; knee down felt tingly/like her legs were falling asleep; could not sleep; She was feeling uncomfortable constantly/she did not feel well; Shortness of breath; Her arm started hurting/was just at the injection site; This is a spontaneous report from a contactable consumer. This consumer (patient) reported for herself that a 36-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EP7533) at the age of 36-years, via an unspecified route of administration in left arm on 04Apr2021 12:15 at single dose for COVID-19 immunisation. Medical history included had a pregnancy (a while ago, not ongoing). No other products. The patient stated that she experienced shortness of breath on 08Apr2021 (4 days after receiving the first dose), it got so severe on day 7 that she went to the ER on 11Apr2021. She started getting progressively more shortness of breath. Twice, she called the nurse line for her doctor and was advised to go to the emergency room. Added she could not catch her breath, and it was worse at night, could not sleep, so she went to the emergency room, she was in emergency room for 2 and a half hours and then went home. She wanted to know if the second dose could cause issues or if she should get it, added that the paperwork said that people should not get the vaccine if they received an adverse reaction to the first dose or any vaccination. She did not know if this was normal for it to get progressively worse and 2 to 14 days later. Patient wanted to know if the shortness of breath was something that can get worse, if this was a reaction to the vaccine even though it happened so many days later. Patient added it was the only thing she could think of and that her heart rate, oxygen levels, and everything was good minus she felt like she could not catch her breath. The doctor in the ER gave her anti-anxiety medicine, something with an L, but the doctor gave her that and it really seemed to help. It was kind of like, she did not know, it made her feel calm enough to fall asleep. Caller added that she has that and an salbutamol (ALBUTEROL) inhaler. She was not sure whether progressively worsening shortness of breath had gotten any better or was still going on, added that yesterday was the day she did not need either treatment medication. The day before, she took just the anxiety</p>

----------	-------	-------	---------	-----	----------	------------	--------------

medicine and not the albuterol. Yesterday, she took none. During the day on 11Apr2021 (Sunday), she had called because she was feeling uncomfortable constantly. She has two children and all day she did not feel well. She told her husband she did not feel well at all. Sunday when she went to lay down, she could not sleep. Patient reported that as her shortness of breath subsided, her arm started hurting again, thought this began on 19Apr2021 and was not sure, it went away completely and was just at the injection site, probably lasting half a day or so and then it went away, clarified as left arm, same as injection. Caller added that 15Apr2021 was after the ER visit, was that she was standing up doing things and from her knee down felt tingly. Stated that knee down felt tingly on 15Apr2021, which was after her ER visit occurred, she was standing up and doing things. She had not been doing things for long periods but her knee down felt tingly. Added not like numb, but like her legs were falling asleep. She was preparing dinner and moving around and felt tingling in both legs. This probably lasted about three hours. She just kind of took it easy and it started to subside and then it was gone. While mentioned investigations, patient stated the ER did an EKG, where they put stickers and monitor her heart. They did a chest x-ray, and they took blood. She believed they checked for blood clot tests and anemia. Patient did not know any results but stated the doctor came into the room and told her everything was clear and nothing came back with anything on it. She stated the date was either the night of 11Apr2021 or the morning of 12Apr2021 for the tests. Outcome of the events shortness of breath and arm hurting was recovered/resolved in Apr2021; of the event knee down felt tingly/like her legs were falling asleep was recovered/resolved on 15Apr2021; while of remain was unknown. No follow-up attempts are needed. No further information is expected.

1294744	5/7/2021	CA	63	M	2/18/2021	3/1/2021	<p>urinating blood; might be a UTI; arm pain; fatigue; blood clots; he started bleeding after the first shot; This is a spontaneous report from a contactable consumer, the patient. This 63-year-old male patient reported that he received the first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Lot Number: EL3249) on 18Feb2021 (also reported as 17Feb2021) (at the age of 63-years-old) via an unspecified route as a single dose for COVID-19 immunization. Medical history included enlarged prostate, urinary health issues (gets up in the middle of the night), and has glasses as he had cataract surgery last year (2020) so he lost his close-up vision. Concomitant medications were not reported. On 18Feb2021, the patient got his first shot. Three weeks later, he had an episode of urinating blood and blood clots profusely. The patient stated the amount of blood and blood clots was scary at best. The patient reached out to his daughter who is a nurse who advised him to go to the Emergency Room (ER). He reached out to the nurse hotline as well, which recommended that he go to the emergency room that day as well. He went to the ER (it was a Sunday). They did a blood test, a sonogram or some kind of sonogram, and a urine sample. They also flushed the patient's bladder out with a catheter. This emergency room visit determined that it might be a urinary tract infection (UTI) and started him on antibiotics. The patient confirmed he was not admitted to the hospital. The patient then made an appointment with his doctor because that was on a weekend. He saw his doctor who referred him to a urologist. The patient also reported that he did have the normal arm pain and fatigue the second day or the day after the shot. The patient reported 11Mar2021 or 12Mar2021 was when he started bleeding after the first shot, he was unsure of the exact date, and stated he went to the hospital on 14Mar2021. The patient reported he is going to the doctor today (21Apr2021), to see the urologist but the urologist is going to do a scope in his bladder because that is the only thing that they cannot see. The clinical outcome of events urinating blood, blood clots, UTI, bleeding, arm pain, and fatigue was unknown.; Sender's Comments: Linked Report(s) :PFIZER INC-2021471072 same patient/reporter, different AE/2nd dose</p>

1294515	5/7/2021	PA	54	F	4/23/2021	4/28/2021	After receiving the first dose on 4/1/21 Lot# ER8733, I had light spotting for 2 days. Second dose given 04/23/21 and by 04/28/2021 I started bleeding again And by the second day I was soaking through pads and huge clots were coming out. This has never happened to me before. After 7 days of bleeding heavily I woke up on May 5th at 4:00 a.m. with intense abdominal cramping The only way I can describe was labor. I felt back labor, pelvic pressure, frequent urination and intense pain. I reached out to my gynecologist And he immediately told me to remove my estrogen patch and later that morning he started me on progesterone treatment for 10 days to stop the bleeding. After 7 hours of pain on May 5th, I went to the emergency department and an ultrasound revealed a blood clot. From ultrasound results "there is a complex area in the area of the cervix measuring 5.7 x 3.6 x 2.6 cm." After several hours I was released from the emergency room taking toradol for pain. That evening I passed a huge blood clot! I'm very grateful it was where it was and I could expel it. But there's no doubt the second vaccine caused this issue that has never happened to me before. I still get my periods though irregular and very light. So this event was highly unusual and very painful

On 31-Mar-2021, the patient received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On an unknown date, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On an unknown date, the patient experienced DYSPNOEA (She had trouble breathing) (seriousness criterion hospitalization), ARTHRALGIA (pain in back of right shoulder) (seriousness criteria medically significant and life threatening), FATIGUE (very tired, slept all day) (seriousness criteria hospitalization, medically significant and life threatening), HYPERSOMNIA (slept all day) (seriousness criteria hospitalization, medically significant and life threatening), PULMONARY EMBOLISM (found two blood clots on lungs and two in legs) (seriousness criteria hospitalization and medically significant), DEEP VEIN THROMBOSIS (found two blood clots on lungs and two in legs) (seriousness criteria hospitalization and medically significant), CARDIAC DISORDER (there was damaged to his wife's heart too) (seriousness criterion hospitalization) and WEIGHT DECREASED (weighed 165 pounds initially and then went down to 145). At the time of the report, DYSPNOEA (She had trouble breathing), ARTHRALGIA (pain in back of right shoulder), FATIGUE (very tired, slept all day), HYPERSOMNIA (slept all day),</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							<p>PULMONARY EMBOLISM (found two blood clots on lungs and two in legs), DEEP VEIN THROMBOSIS (found two blood clots on lungs and two in legs), CARDIAC DISORDER (there was damaged to his wife's heart too) and WEIGHT DECREASED (weighed 165 pounds initially and then went down to 145) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On an unknown date, Computerised tomogram: two blood clots on lungs and two (abnormal) two blood clots on lungs and two in legs. On an unknown date, Weight: 145 (Low) weighed 165 pounds initially and then went down to 145. The patient was hospitalized for around four days. The patient size of clots as 10 cm and 9cm in the lungs. The reporter stated that Heparin was used in the hospital and after the discharge the patient was put on Eliquis for the next 6 months. The reporter reported that the patient weighed 165 pounds initially and then went down to 145 afterwards. Action taken with the mRNA-1273 is considered as not applicable. Company comment: Based on the information provided which includes a temporal association between the use of mRNA-1273 vaccine, the onset of the reported events, a causal relationship cannot be excluded.</p>
1295292	5/7/2021	FL	28	F	4/7/2021	4/14/2021	<p>When I got the vaccine I had an immediate sharp pain in my arm, almost like a nerve was pinched, and it went down my left leg. It lasted for about 20 minutes then went away. Seven days later I admitted myself to the hospital because my left leg was tingling. No blood clots in my leg were found and a head CT didn't show any abnormalities. I still have the tingling in my left leg that I am going to see a neurologist for and will be getting blood tests done to see what else could be going on.</p>
1295454	5/7/2021		28	F	4/24/2021	5/7/2021	<p>My period is not due for 2 more days and I am having heavy bleeding with visible blood clots from my vagina. I do NOT have blood clots in a typical menstrual cycle. I noticed the bleeding when I woke up this morning and it is still going.</p>

1295545	5/7/2021		19	F	4/10/2021	4/13/2021	Pt is a 19 YO female with NKA who received her J&J COVID-19 vaccination on 4/10/2021. On 4/13, she calls this instiution stating she has developed a severe headache, sores on her vagina, shortness of breath, is light-headed and tired. Pt was recommended to call 911 or go to the ER but declined. She had a Ob/Gyn appointment scheduled for the next day (4/14) and says she will discuss her symptoms with them. RN on the phone call reviewed signs and symptoms of blood clot and recommended immediate assessment. Unable to gather any additional information.

1295618	5/7/2021	VA	24	M	3/6/2021	3/15/2021	A week and a half approximately after the initial vaccination of the J+J covid vaccine I started having a course of strange symptoms. Insomnia, inability to focus on things directly in front of me (a hand in front of my face would go out of focus automatically after a second), blurred vision, short term/long term memory loss, severe emotional issues, difficulty breathing, anxiety. Shortness of breath at a certain point was so bad I thought I was not going to make it. One very troublesome symptom that culminated after weeks of 4 hours of sleep was that my brain started feeling "funny". The best way to describe it was a brain "orgasm" which I have never experienced before. At the same time I experienced dry heaving for several minutes, and severe shortness of breath. After this experience my symptoms gradually improved over the next week or two. Prior to this it felt like my brain was not getting enough oxygen/blood, which could have been feeding my insomnia. When I would try to sleep, I would wake up at 4 am gasping for air, as I felt like my breathing was labored when sleeping. I could not focus on my computer screen to do my job at home. Large amounts of melatonin seemed to help my brain feel better and get some rest. I took hydroxyzine for unrelated reasons prior to the vaccine injection as needed, however not too often. During March I did not take it, as I had experienced disruptions in circadian rhythm due to the medication. I feel it is possible I had a blood clot that has been described in the news, although now there may be no way to know for sure. I talked with my primary care physician about this, and he did not think this was the case because I was male. However I have a BMI of 18.7 and some issues females have such as TMJ and inability gain weight/anorexia diagnosis when younger. I also was recently diagnosed with an only recently described actual medical issue called R-CPD, which is the complete inability to burp or belch. I felt like during the time when I experienced the side effects, that this condition was heightened (bloating/loss of appetite). I lost quite a bit of weight during March, I usually weigh 135-140, and was down to 115 at a certain point. I am now back up to 130. I now take sertraline at 1/4 pill dosage to treat the anxiety I experienced as a result of these symptoms as well as some other personal issues. I experienced severe side effects from the sertraline taking it at full dosage, and still experience some at 1/4 pill dosage.

1293400	5/6/2021	CA	59	M	4/1/2021	4/7/2021	From Physician H&P: Patient is a 59-year-old man multiple medical chronic conditions, including known protein S deficiency not on anticoagulation, sinus bradycardia, hypercholesterolemia, chronic neuropathy of the lower extremities, who presented to the emergency room at the recommendation of his primary care office for possible stroke and persistent headache. He reports that his history of present illness begins on 4/7/2021, for which after he had received the COVID-19 Johnson & Johnson vaccine he started to have throbbing headache. He stated that it was diffuse and pounding in quality, up to 10 out of 10 pain. However this resolved on its own, and since then and has been intermittent with this type of headache. He did report 2 weeks ago, that he had a brief episode of tunnel vision as he describes it, where his vision seemed to narrow while he was looking at his phone. This only lasted no more than 10-30 minutes, and this resolved on its own as well. He continues to have intermittent headaches, again otherwise nonspecific with pounding quality however the intensity is improved. Humidifier regarding the Johnson & Johnson vaccine to report any side effects, for which she had notified his primary care doctor who then decided to proceed with MRI of the brain to evaluate for possible etiology. The MRI was done with and without contrast at facility on 5/4/2021, for which there was concern for possible left temporal posterior stroke, and if there was any concern for venous thrombosis, further imaging was necessary. He was then recommended to go to the emergency room for evaluation. He otherwise is in his regular state of health. He denies any recent fever or chills or cough, no chest pain or shortness of breath, nausea, vomiting, abdominal pain. No changes in bowel or bladder habits.

1293664	5/6/2021	CA	59	F	3/18/2021	3/18/2021	The day of the vaccine, in the evening, I got severe stomach cramps and then I got diarrhea really bad. The cramps went on all night into the next day. They were so painful - like labor pain. The next day, I had a GI hemorrhage - it was clots of blood coming out of the digestive system. I contacted my regular practitioner doctor and sent him a picture of the clots and he instructed me to go to ER. I ended up going to Urgent Care. I went to the Urgent Care on Saturday or Sunday. The Urgent Care doctor there thought I had food poisoning. But that day I didn't eat anything - I just had had ginger ale, cranberries and cashews. He was puzzled as to why I had these symptoms. He gave me medication to stop the cramping in my stomach. Medication is: Hyoscyamine. I used it even two weeks after the fact because I would occasionally get real bad stomach cramps. I was also referred to get a colonoscopy - haven't been able to get in yet. The GI hemorrhaging lasted two or three days and then disappeared.

1293009	5/6/2021	IA	32	F	4/20/2021	5/3/2021	Patient got her second dose of the Pfizer vaccine on 4/20 and started to feel a headache come on and believed it was due to a migraine. On 5/1 she went to her local ED and was given migraine treatment. She continued to have worse headaches and developed subsequent L homonomous hemianopsia, L sided weakness, and L sided neglect. She presented to the ED on 5/5 and was found to have cerebral venous sinus thrombosis confirmed by head CT. Other risk factors include active COVID-19 infection (unknown at time of vaccine administration) and OCP usage.
1293595	5/6/2021	FL	57	M	3/30/2021	3/30/2021	The evening of the shot I woke up with pain in my legs near my hips which lasted for a day. On 04/12/2021 my left leg was swollen and painful. I was already taking blood thinner. I went to the Emergency Room the next day and they found a blood clot in my leg. The Thrombosis was behind my left knee. My leg was swollen from the knee down and my ankle was very swollen. My Eliquis dosage has been increased from 2.5mg to 5mg twice daily. I did not have a repeat sonogram but my leg is no longer swollen.

1288955	5/5/2021	OH	51	M	4/8/2021	4/20/2021	Exactly 11 days after receiving the J&J vaccine my husband developed leg pain in his right lower inner leg, he was taken to the hospital on 04/20/2021 which a ultrasound was completed but resulted no blood clots, no other labs or treatment was performed that day, the next day he developed severe diarrhea and flu like symptoms with continued leg pain and difficulty breathing, He was then rushed to the hospital by ambulance where he was suffering from very low BP 41/31 was the lowest, a line was placed and he was put on pressors to increase his BP. He was transferred to the hospital where he was diagnosed with a flesh eating bacteria in the right leg where the pain was at and Sepsis. He was taken to surgery to debride the right leg and was started on CVVHD because his new kidney was now failing, he eventually was started back on Hemodialysis and taken to surgery 2 more times where he cardiac arrested on the table in surgery and died. A private autopsy is being performed but the preliminary results shows he had multi-system organ failure, including his liver which was NEVER a problem in the past.

1289333	5/5/2021	KY	80	F	3/2/2021	3/3/2021	<p>March 2 - second Moderna bruising appears March 3 - spontaneous bruising appears March 4 - visit with primary care doctor, blood work shows significant drop in platelets March 9 - first visit with oncologist/haematologist &amp; hospitalized March 9-19 - hospitalized for tests, treatment to increase platelets, &amp; many blood panels. No official diagnosis, treat as ITP. Follow up visits with oncologist/haematologist to keep an eye on platelets as they increase. March 30-Apr 4 - ER visit due to swelling of ankles, feet, and left arm. Tests show superficial blood clot, fluid on lungs, and pneumonia. Oncologist said that "we have no official diagnosis", that she's being treated for ITP. April 6-14 - follow up visit to oncologist/haematologist show elevated kidney enzymes, then later liver enzymes, low sodium. April 14 - decision to move to short term rehab for regular PT and OT. Continued swelling (fluid in third spaces.) April 21 - visit to cardiologist to perform cardioversion, successful (during first week of hospital stay, heart rhythm med had to stop). April 23 - facility nurse discovered significantly low Hemoglobin and a blood transfusion was ordered. April 24 - returned to short term rehab facility. April 25 - discovered my mother on O2 and state of health was different, extremely weak and not moving, arm hurting badly. I insisted that her oncologist is contacted. Transported to ER. Discovered her blood work abnormal. After stabilizing her, rushed to the hospital ICU. April 26 - Discussed with her ICU doctor the history of what you have read above. He explained that the covid-19 vaccination has a tendency to affect three proteins specifically that clot and thin blood. I begged him to "get it out of her system." Her bleeding was significant and platelets dropped, again. Still has her mental facilities. Responding well to aggressive treatment: albumin transfusion, plateletpheresis, and CRRT. Pleural catheter to remove fluid from the lungs. Mention of Sepsis. April 27 - Lifted her head up today, opened her eyes, making doctors very happy. Her cardiologist and the ICU doctor both said they were "confused" and everything happening to my mom was "a mystery." Though going in to the evening, her nurse expressed to me that she's worried. The ICU oncologist called me at home in the evening. He asked me if she had been having a fever on a regular basis. He said he thought it could be TTP or a rare disease called HTH, but both</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							results wouldn't be back for one week. He planned to consult with a doctor. He explained to me that the blood was attacking itself and "confused," and that her organs were shutting down. He indicated that the blood work wasn't indicating significant infection. He referenced how the vaccination has made her auto immune system "go crazy." April 28 - I get a call very early from the nurse that she has been fighting with my mother's blood pressure all night, trying to keep it elevated. She told me to come to the hospital, because she had taken a turn for the worse. I arrive to find my mother's eyes wide open, breathing shallow, and blood pressure steady, but drops without assistance from medication. She continues to have her mental facilities. She passed away, organs shutting down, and blood pressure dropped.
1289335	5/5/2021	TX	69	F	2/1/2021	3/7/2021	Blood clot(s) thrown by heart, admitted to hospital 3/8/21. I was in atrial flutter at the time. Resulted in kidney infarction. Eventually heart reset itself, however with a five second pause, resulting in the need for a pacemaker. Also, now on Eliquis for life.
1289628	5/5/2021	MI	34	F	4/22/2021	4/24/2021	Patient received Pfizer vaccine 4/22/2021. She developed severe headaches 48 hours later. She has loss of balance and difficulty with fine motor skills. She presented to an ED. Neuroimaging detected significant central venous thrombosis. Admitted to hospital and started on anticoagulation therapy. Neurology and Hematology/Oncology consulted.
1289783	5/5/2021	OH	71	M	4/7/2021	4/29/2021	Developed COVID symptoms for a "few" days. Called his physician who referred him to the local hospital for suspected COVID. Tested positive for COVID at the hospital and blood clots in the lungs were discovered by CT scan. Patient was admitted to ICU for treatment. Details reported to VAERS by hospital and the Health District

1289795	5/5/2021	CA	54	M	3/6/2021	3/8/2021	on 3/8/21 patient describes numbness which starts on left hip which goes down left leg. on 3/21/21 patient complains of 3 days of pain and swelling in left lower leg, calf, edema of the foot and ankle which is painful with movement. ultrasound negative. on 3/23/21 ultrasound shows Deep vein thrombosis is visualized in the left popliteal vein. progress note indicates no immobility or long car rides. No history of DVT or pulmonary embolus. Begin enoxaparin x5 days and then dabigatran.
1289927	5/5/2021	KS	78	F	4/12/2021	4/24/2021	Patient was discharged from the hospital after massive PE. She went to the hospital at 2am last Saturday. Patient described unbelievable pain from shoulder neck and arms. She could hardly walk to her car. Went to ER. There they ran tests and found many blood clots in lungs. Blood clots had stopped the blood in that area. They were not definitive but said it sounded like that. Got a breathing apparatus after because it's been hard to breathe and she has been shaky. Her shot was administered 04/12 during chemo. Hospital April 24. She was discharged and given a blood thinner and pain medication - Oxycodone & Eliquis.
1289024	5/5/2021	NY	57	F	4/2/2021	4/7/2021	5 days after shot, vision in left eye became blurry- went to primary eye doctors- sent to Surgeons- determined a blood clot in the back of the eye

1288388	5/5/2021	TN	18	M	4/5/2021	4/13/2021	Developed two blood clots in my left calf; This is a spontaneous report from a contactable consumer, the patient. An 18-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot unknown, first dose) solution for injection intramuscular in the right arm on 05Apr2021 at 10:00 (at the age of 18-years-old) as a single dose for COVID-19 vaccination. Medical history included ADD (attention deficit hyperactivity disorder). Concomitant medication included mirtazapine (AVANZA). The patient had no known allergies. The patient did not receive any other vaccine within 4 weeks prior to the vaccine. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient developed two blood clots in my left calf on 13Apr2021 at 14:00 which resulted in emergency room/department or urgent care visit. Treatment for the event blood clots included rivaroxaban (XARELTO). The outcome of the event blood clots was recovering. The patient was not tested for Covid post vaccination. Information on the lot/batch number has been requested.

1287929	5/5/2021		47	F	4/5/2021		CAVERNOUS SINUS THROMBOSIS; THROMBOCYTOPENIA; COMPUTERISED TOMOGRAM HEAD ABNORMAL; FIBRIN D DIMER INCREASED; MAGNETIC RESONANCE IMAGING HEAD ABNORMAL; PLATELET COUNT DECREASED; VENOGRAM ABNORMAL; FULL BLOOD COUNT; This spontaneous report received from a patient via a Regulatory Authority VAERS (Vaccine Adverse Event Reporting System) and concerned a 47 year old female. The patient's height, and weight were not reported. The patient's concurrent conditions included aspirin allergy, and hypertension. On 31-MAR-2021, the patient received covid-19 vaccine ad26.cov2.s (suspension for injection, intramuscular, batch number: Unknown) dose was not reported, administered in left arm for prophylactic vaccination. The batch number was not reported. The company was unable to perform follow up for Batch/lot numbers. The concomitant medications included unspecified natural pills. On 05-APR-2021, the patient was hospitalized for venous thrombotic cavern sinus and thrombocytopenia 25,000, computerised tomogram head abnormal, fibrin d dimer increased, magnetic resonance imaging head abnormal, and developed platelet count decreased, venogram abnormal. On 05-APR-2021, the subject experienced full blood count. The patient was hospitalized (date unspecified) for 12 days. The following laboratory data (dates unspecified) included: CT scan results not provided, Complete blood count results not reported, Fibrin D dimer was elevated (value not provided), MRI results were not reported and Venogram was abnormal. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of the cavernous sinus thrombosis, thrombocytopenia, computerised tomogram head abnormal, fibrin d dimer increased, magnetic resonance imaging head abnormal, platelet count decreased, venogram abnormal and full blood count was not reported. This report was serious (Hospitalization Caused / Prolonged, and Life Threatening). This case version (1) was created on 30-APR-2021 for the purpose of quality improvement the following corrections were made. The MAC was added to the pharmacovigilance narrative.; Sender's Comments: V1: This spontaneous report received from a patient via VAERS (ID: 1238777) concerned a 47-year-old woman who experienced cavernous sinus thrombosis with

thrombocytopenia 5 days after vaccine. Concurrent conditions included hypertension and concomitant medications included unspecified natural pills. Five days after vaccine, the patient was hospitalized for venous cavernous sinus thrombosis and thrombocytopenia (25,000) with an elevated D dimer (unspecified.) CT head and MRV were performed with results not provided. The patient was hospitalized for 12 days and treatment details were not provided. Based on evolving knowledge of Thrombosis with Thrombocytopenia Syndrome (TTS, per definition from Brighton Collaboration-BC), the low platelet count and temporal relationship to vaccination (BC Criteria level 1), the events are assessed to have a plausible relationship with vaccination. Reporter contact information was not provided which precludes meaningful additional information in this version.

1288120	5/5/2021	CA	56	F	3/25/2021	3/25/2021	Chest Pain; Dry mouth; Could not start hydrated; This spontaneous case was reported by a consumer and describes the occurrence of CHEST PAIN (Chest Pain) in a 56-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 008B21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 25-Mar-2021 at 1:45 PM, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 25-Mar-2021, the patient experienced DRY MOUTH (Dry mouth). 25-Mar-2021, the patient experienced DEHYDRATION (Could not start hydrated). On 28-Mar-2021, the patient experienced CHEST PAIN (Chest Pain) (seriousness criterion hospitalization). The patient was hospitalized from 09-Apr-2021 to 10-Apr-2021 due to CHEST PAIN. On 10-Apr-2021, DRY MOUTH (Dry mouth) and DEHYDRATION (Could not start hydrated) had resolved. On 12-Apr-2021, CHEST PAIN (Chest Pain) had resolved with sequelae. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 09-Apr-2021, Blood pressure measurement: 192/99 (abnormal) 192/99. On 09-Apr-2021, Troponin: elevated (Inconclusive) elevated troponin levels. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Concomitant medications were not reported. On 25Mar2021, the patient reported initial minor side effects of dry mouth while sitting in her car, but no other noteworthy side effects immediately following injection. Then, 2 or 3 days later the patient experienced chest pain that she reported started out as very mild, however, it grew in intensity over the following weeks, and she presented to the Emergency Room (ER) on Friday, 09Apr2021 per the caller's estimation. Blood pressure taken at the ER was 192/99mmHg. Full hospital work-up performed with the patient noted that she was negative for blood clots but had elevated troponin levels. She said the hospital staff evaluated her heart's condition and found no sign of a heart attack. On 10Apr2021, she was discharged with a new prescription of metoprolol. On the Monday after discharge, the patient had felt symptoms of chest pain again along with elevated blood pressure levels, so she returned to the ER where she was discharged without hospitalization

and given a clonidine patch for any future blood pressure fluctuations. Since then she had visited her Cardiologist and he has substituted her prescription metoprolol for amlodipine and losartan combination therapy, and to discontinue her prescription for clonidine patches. Patient indicated her cardiologist is hopeful that her blood pressure should normalize over time and instructed patient not to receive her second dose of the vaccine. Additionally, patient reported that, from the time she received her vaccination, until she was discharged, she could not start hydrated. She reported drinking large quantities of water, electrolyte replacement liquids, and Gatorade with no success. Event of chest pain was resolved with Sequelae of elevated blood pressure. Treatment included clonidine patches and metoprolol. On an unspecified date, the clonidine patches and metoprolol were stopped and amlodipine and losartan combination therapy was started.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

A 61-year-old female consumer (patient) reported for herself that she received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection; Lot number: unknown) via an unspecified route at a single dose for COVID-19 immunization. The patient had a history of shortness of breath often, had fatigue, muscle and body ache and headache, loss of taste and smell not that one. People had told her that so many people have died from it from blot clots. She also had a history of irritated bowel syndrome and had these side effects because she went through it anyways. She had a history of anxiety but had not had an attack in a long time. The patients niece broke out in hives (she did not know which vaccine). She had been high step and said that she was a hand washer at a restaurant and once she was done and got home and it started piling up at the end of the day when she layed down. She had heard that people were having heart attacks so must take a baby aspirin. The patients concomitant medications were not reported. After receiving the vaccine she passed out/fell out during court. Some people told her that some costumers died of covid 19 infection. On an unknown date she had covid-19 (she and her husband had covid and both got vaccinated with both shots) and had diarrhea for a month and got over. Someone had told her that they would chip her. The outcome of events was unknown for passed out and Covid-19 and recovered on unspecified date for diarrhea. Information about the Lot/batch number has been requested.</p>

1288353	5/5/2021	CA	83	F	2/22/2021	3/12/2021	may be blood clot; Something happened with my knee and it has just got worse; I was thinking maybe it is a pulled muscle or something but it is very bad now; This is a spontaneous report received from a contactable consumer (patient). An 83-year-old female patient (5 feet 1 inches, about 120 pounds) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EN6198, patient was not sure) via an unspecified route of administration at left arm on 22Feb2021 (83-year-old at time of vaccination), at single dose; the second dose of BNT162B2 (lot number: unknown) via an unspecified route of administration on 15Mar2021 (83-year-old at time of vaccination), at single dose, for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. Patient stated she has got both the shots of Pfizer (Covid-19 vaccine) and at the end of the first one or it is like eighteen days, just before the second shot, something happened with her knee and it has just got worse (from 12Mar2021). She did not connect that with the Pfizer shot and I was thinking maybe it is a pulled muscle or something but it is very bad now. She would like to know what she can do. Also, she is thinking may be blood clot at this point and she would like to have it checked. She thinks that she should be able to contact somebody to actually get some physical test on this. She tried heat and cold alternate and Absorbine Jr. and Aspirin. It varied with the days, she thinks she has taken Aspirin about twice a day and it is a tablet and it was 325 mg and she took two of those, orally. Therapeutic measures were taken as a result of the event and included "heat and cold alternate and Absorbine Jr. and Aspirin". The outcome of the event was not recovered. Information on the lot/batch number has been requested.

1288355	5/5/2021	NC	81	F	2/10/2021	2/10/2021	Blood clot in lungs and leg; Trouble breathing/Shortness of breath, but not as bad; didn't feel right; Chest tightness; Slightly ill; Sore arm, in left arm where the shot was; Slightly tired; This is a spontaneous report from a contactable consumer. An 81-year-old female patient received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in the left arm on 10Feb2021 (Batch/Lot Number: EN6201) as SINGLE DOSE for covid-19 immunization. Medical history included Type 2 Diabetes from 2004 and ongoing, High Blood Pressure from 2000 and ongoing (reporter stated she was 81; it's not very high, usually when she goes to the doctor). Concomitant medications not specified but reporter mentioned that everything she has been on she has been on long time; she takes blood pressure medication because sometimes it is high. She has not had started any new medication prior to starting vaccines or during both vaccines. The patient previously received flu shot (September). The patient received her first vaccine dose of bnt162b2 (Lot # EL9262, Expiry date UNKNOWN), on 20Jan2021, at 1:30-1:45, in the left arm and experienced sore arm and slightly tired. The reporter stated that after her second vaccine on 10Feb2021, she had a sore arm, (left, where shot was) and was slightly tired from 10Feb2021 until 12Feb2021. She confirmed she noticed this started the same day, 10Feb2021. On 31Mar2021, she felt slightly ill and had some slightly trouble breathing. She saw her doctor who did some tests. The next day 01Apr2021, her tests came back and the doctor told her to go to the hospital. While in the emergency room she had a CT of the lungs that showed blood clots in both lungs. She was admitted to the hospital where on 02Apr2021 they did a ultrasound of her legs. She was told she had blood clots in her right leg. She stated she had no symptoms of blood clots in her legs like redness, sore, swelling, or hot. She was asked if she had fallen suddenly, had an accident, or was sitting for a long time, traveled a long distances. On 02Apr2021 she had a Echocardiogram and was told her heart was ok. Caller stated she was given Lovenox shots in the hospital. She did not have Lot # or Expiry date on the Lovenox. She stated on 02Apr2021 after having two Lovenox shots that day, she met with a Vascular Surgeon who started her on Eliquis that evening. She

							<p>stated she started taking Eliquis that evening. She stated she took 2 tablets, twice a day, for a week. Now she takes one tablet, twice a day, ongoing. The Eliquis tablet says 5mg. She stated she was discharged on 03Apr2021, that evening. Patient went back to the emergency room on 10Apr2021 after speaking with a nurse at (university name withheld) because she had tightness in the chest but the shortness of breath, her breathing was not as bad. She just didn't felt right. She stated she was not admitted. Patient stated she saw a NP (name withheld) with (university name withheld) Pulmonary the day of 31Mar2021. When discussing the tests performed that day, Chest X-ray, D-Dimer, and Pro INT, CH asked caller the results from them. She did not provide results, just stated she had looked up her results in "EPIC mychart" while getting the result information from the office. Where she was instructed to go to the hospital. She went to the Clinic of the Vascular Surgeon at (Hospital withheld) on Wednesday 14Apr2021 and was feeling better. Her second appointment with them will be in July. Where they will do another ultrasound of her legs and talk about the medication. She has an appointment with her primary on 19Apr2021. The outcome of events Trouble breathing (recovered on 14Apr2021), Shortness of breath, but not as bad (recovered on 12Apr2021), Sore arm, in left arm where the shot was (recovered on 12Feb2021), Slightly tired (recovered on 12Feb2021) Chest tightness (recovered on 12Apr2021), and didn't feel right was recovered. The outcome of event Blood clot in lungs and leg was unknown.</p>

1288434	5/5/2021	OK	38	M	2/9/2021	2/11/2021	Cellulitis of the leg; This is a spontaneous report from a contactable physician. A 38-year-old male patient received first dose of BNT162B2 (Lot/batch number and expiry date was not reported), via an unspecified route of administration on 09Feb2021 as a single dose for COVID-19 immunization. Medical history included ongoing eczema (Topical steroids), deep vein thrombosis (DVT) since 10 years ago and stopped 6months after treatment, Fasciotomy for compartmental syndrome s/p gunshot wound (Stop date: After surgery) and ongoing Allergies (PRN medication), all on an unknown dates. Patient has history of gunshot wound subsequent compartment syndrome of DVTs status post treatment 10 years ago of the left lower extremity. Family medical history of gunshot wound of compartment syndrome DVT on this side following. Patient had cellulitis of the leg 1 month prior to "11Feb". The patient experienced cellulitis of the leg on 11Feb2021. The outcome of the event was recovered on an unknown date. The physician reported that the patient provided information regarding the reported adverse event with the use of the product. The physician considered that the Pfizer vaccine had no causal effect to the adverse event. The following information on the lot/batch number has been requested.; Sender's Comments: Based on information provided, the event cellulitis is an inter-current condition, thus unrelated to the suspect drug.

1288414	5/5/2021	PA		M	4/9/2021	4/11/2021	<p>bilateral pulmonary embolism; right DVT; sinus tachycardia; Afib with RVR.; This is a spontaneous report from a contactable physician. This report was received via a sales representative. A 68-year-old male patient received BNT162B2 (Pfizer COVID vaccine), dose 2 via an unspecified route of administration on 09Apr2021 (Batch/Lot Number: Unknown) as single dose for Covid-19 immunisation. Medical history included hypertension, gastroesophageal reflux disease (GERD), and deep vein thrombosis (DVT) original diagnosis from Jan2018. The patient previously received the first dose of BNT162B2 on 19Mar2021 for Covid-19 immunisation. The physician reported the patient had bilateral pulmonary embolism and a right DVT on 11Apr2021. The patient went to the ER on 11Apr2021. She confirms the pulmonary embolisms and the DVT were diagnosed 11Apr2021 when the patient went to the ER. She has more of the patient's story, caller does not think this would be linked to the vaccine but that is for someone else to decide she is reporting. The day of the event the patient's heart was racing, he passed out and went to the ER, he had sinus tachycardia and Afib with RVR (date/s unspecified). His heart rate was up to 140s and 150s. The patient has history of hypertension, GERD, and previous DVT, the original DVT that patient had was diagnosed in Jan2018 and he was placed on Xarelto at that time and he was on Xarelto until Jun2019. He has not been on anything for this since that time, until this episode. Caller says reporter did not provide any specific treatment information that the patient has received for the event she is reporting. Reporter provided the patient went to the emergency room, he did not say if the patient was admitted or had hospitalization. The outcome of events was unknown. Information about the Lot/batch number has been requested.; Sender's Comments: Drug causality would seem unlikely for BNT162B2. The reported events may be regarded as natural progression of patient's pre-existing conditions. The impact of this report on the benefit/risk profile of the Pfizer drug is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Committees and Investigators, as appropriate.</p>

1288423	5/5/2021			F			<p>Blood clots in her nose; Nose bleed; her arms are both numb on her; Couldn't move them; She feels lethargic; This is a spontaneous report from a contactable consumer (patient herself) via a medical information team. A female patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection), via an unspecified route of administration on an unspecified date as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that, enquired have people died from the vaccine or not. Enquired what do you know about the news in the media about reports of death in nursing home elderly patients. Response: Pfizer and BioNTech are aware of reported deaths following administration of Pfizer-BioNTech COVID-19 vaccine . We are working with the (withheld) to gather all the relevant information. (Withheld) Authorities have prioritized the immunization of residents in Nursing Homes, most of whom are very elderly with underlying medical conditions and some which are terminally ill. (Withheld) confirm the number of incidents so far was not alarming, and in line with expectations. All reported deaths would be thoroughly evaluated by (Withheld) to determine if these incidents are related to the vaccine. (Withheld) Health Authorities have now changed its recommendation in relation to vaccination of the terminally ill (Clinical Frailty Scale 8 or higher). Our immediate thoughts are with the bereaved families. The Global Advisory Committee on Vaccine Safety (GACVS) COVID-19 Vaccine Safety subcommittee met virtually on Tuesday, 19Jan2021, to review available information and data on deaths reported in frail, elderly individuals who had received the Pfizer BioNTech COVID-19 mRNA vaccine, BNT162b2 (hereafter, BNT162b2). Experts invited from the (Withheld) and the (Withheld) provided an overview of deaths reported in (Withheld) and in the WHO global database (VigiBase) following vaccination with BNT162b2." Based on a careful scientific review of the information made available, the subcommittee came to the following conclusions: The current reports do not suggest any unexpected or untoward increase in fatalities in frail, elderly individuals or any unusual characteristics of adverse events following administration of BNT162b2. Reports are in line with the expected, all-cause mortality</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

rates and causes of death in the sub-population of frail, elderly individuals, and the available information does not confirm a contributory role for the vaccine in the reported fatal events. In view of this, the committee considers that the benefit-risk balance of BNT162b2 remains favourable in the elderly, and does not suggest any revision, at present, to the recommendations around the safety of this vaccine." Enquired what was the efficacy after one dose. Caller had a terrible experience after her first dose of the Pfizer BioNTech COVID19 vaccine. She had blood clots in her nose, every time she blew her nose, blood clots would come out. She never had a nose bleed before. She also added that her arms are both numb on her. She couldn't move them, she feels lethargic. She's supposed to get her second dose next Friday. Enquired do we have any information regarding blood clots or not. Caller was upset and disconnected the call before some of the answers were given. Caller also asked the following questions: Has there been deaths reported from the vaccine or not, what was the efficacy after 1 dose, any guidance on getting the second dose after having side effects after the first dose. Response: Proposed response : CONS-Blood clots. Caller said "this was ridiculous" when I tried providing her with a long website with more information. She feels like we are withholding information from the public. She thinks the deaths should have been on the media. Caller hung up. Enquired do you have any guidance on getting the second dose after having side effects with the first dose. I had a side effect after the first dose of the vaccine. Should I get the second dose or not. Caller disconnected before agent could provide response. Response: Proposed response: As noted in the Fact Sheet for Recipients, you should not get the Pfizer-BioNTech COVID-19 Vaccine if you had a severe allergic reaction after a previous dose of the vaccine or if you had a severe allergic reaction to any ingredient of the vaccine. The decision to receive the second dose for any other reason could not be made by Pfizer. We refer you to speak to your healthcare provider about the risks of the vaccine compared to the risks of potentially not being fully protected against COVID-19 infection. Your healthcare provider knows your health situation and has access to information that can better help inform this decision. The outcome of the events was unknown. No follow-up attempts are needed. 1291268	5/5/2021	OH	59	M	3/22/2021	3/26/2021	<p>This is a spontaneous report from a contactable consumer (patient). A 59-year-old male patient received his first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: ER8732) at the age of 59-years-old, via an unspecified route of administration in left arm on 22Mar2021 at 15:00 at single dose for COVID-19 immunisation. The patient's medical history was reported as none. He has no known allergies and has COVID prior to vaccination. Concomitant medications included metoprolol, rosuvastatin, oxybutynin, and tamsulosin. There were no other vaccines in four weeks and no additional vaccines administered on the same date of the COVID-19 vaccine. The patient reported that he was having some wild effects from the vaccine and did not know what to do. On 26Mar2021 at 15:00, he was having neuropathy like effects. His hands, arms, legs, and feet were experiencing pain and burning sensations, they were burning like nerve damage; he also has a little burning sensation in his nose and cheeks. He has never had this before. The events resulted in doctor or other healthcare professional office/clinic visit and emergency room/department or urgent care. He was also having some weird sensations in his calf muscles, these sensations started within the past week and a half (Apr2021) which prompted physician office visit. The physician placed him on gabapentin 100 mg to start from 12Apr2021, but it was not enough, it was titrated up to 300 mg, three times a day and he is scheduled to see specialist soon. The patient mentioned that this vaccine has ruined his health. He also went to an urgent care center because his leg was bothering him, it was swelling on an unspecified date in 2021; he thought he had a blood clot; they did some kind of test where they looked at the leg and did not find anything. He didn't have a particular question. He would just like to talk to someone to see if this was going on with anyone else, if it will go away, or if this was permanent problem he will have. The patient was not tested for COVID post vaccination. He received his second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EW0161), via an unspecified route of administration in left arm on 13Apr2021 at 15:00 at single dose for COVID-19 immunisation. The outcome of the events was not recovered.</p>

1291184	5/5/2021	AZ	46	M	4/18/2021	4/19/2021	<p>This is a spontaneous report from a contactable consumer (patient's fiancé). A 46-year-old male patient received the first dose bnt162b2 (BNT162B2), via an unspecified route of administration, administered in Arm Left on 18Apr2021 11:20 (Lot Number: EW0162) (received at the age of 46-years-old) as SINGLE DOSE for COVID-19 immunisation. Medical history included right knee pain. Concomitant medications were not reported. The patient received the Pfizer 1st shot 18Apr2021 11:20 am. On 19Apr2021, at midnight, he had low grade fever then swelling right leg. On the day of the report, 20Apr2021, he had swelling to both legs. The patient had taken ibuprofen as treatment beside propping legs up. The reporter wanted more information on the swelling and if it's related to taking ibuprofen. It was further reported that the patient experienced severe swelling from the knees down to the calves on both legs on 19Apr2021. He also experienced night sweats, fever, lightheadedness and dizziness on 19Apr2021. They want to know if there are any reports regarding the swelling side effects and if it is from the vaccine. The first dose of the vaccine was given 2 days ago (18Apr2021) and the second dose is due on 09May2021. The patient got his first shot on 18Apr2021 about 11:20am. After about 15 hours he developed swelling in one leg, she later clarified this to be his right leg, and now reports that both of his legs are swollen at the time of report (20Apr2021). She noted that patient told her his legs are not painful. She doesn't know if it's a blood clot or if they needed to go to the hospital. She also wanted to know if there is information about this as a side effects or if other people are having this too. She then reported that the patient started experiencing a fever, profuse sweating, and was spacey about 12 hours after the vaccine, a little after midnight 19Apr2021. She doesn't know if the dehydration made it worse. His fever was low-grade 99.8 degrees and lasted 4 and a half to 5 hours and has now resolved. When asked if patient received any treatment for fever, caller said it was so recent, and that was listed as a common side effect that goes away. Reported the patient drank fluids and she kept an eye on him. Leg swelling was about 15 hours after the vaccine, early morning 19Apr2021. She noted that the swelling in the right leg got bigger and didn't go down, but the left leg did. But today the left was more swollen and more</p>

prominent today. She further clarified that the patient takes ibuprofen for pre-existing right knee pain. Caller also reported that the patient propped his legs to alleviate the swelling, it has improved some but the swelling did not go away. The adverse events did not require a visit to the physician office or emergency room. Outcome of the event fever was resolved on 19Apr2021 (lasted 4 and a half to 5 hours); outcome of the event "severe swelling from the knees down to the calves on both legs" was not resolved; outcome of the remaining events was unknown.

COVID (upper respiratory, less intense headache, shortness of breath, chest pain), dizzy, fatigue, vasovagal response, passed out, nausea, throwing up, tremor increased, chest pain & tightness to the point I could not move my arm to use my emergency inhaler prescribed after COVID/ I couldn't move, post COVID syndrome and orthostatic hypertension, tilt table testing confirmed COVID-induced POTS (postural orthostatic tachycardia syndrome) and lymph node pain, all on 05Feb2021 at 11:00. All events were serious disabling and required hospitalization. The patient underwent lab tests and procedures which included computerized tomogram (CT): unknown results on an unspecified date, D-dimer: 1300 is very elevated, it shows that I have a lot of inflammation in my body or I could have the clot, 1300, almost 3 times the normal value; magnetic resonance imaging head (MRI): unknown results on an unspecified date, SARS-COV-2 test (nasal swab): negative on 19Feb2021, tilt table test: COVID-induced pots on 05Feb2021 . Unspecified therapeutic measures were taken as a result of the events. The patient outcome of the event passed out was unknown and not recovered for all the other events.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of reported events cannot be excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1291246	5/5/2021	MO	65	F	3/9/2021	3/17/2021	leg was bruised; heart spasms; Diarrhea; inflammation along the major vein in her leg; heart palpitation; light headed/dizzy; severe muscle pain; tenderness and soreness in her inner thigh of the left leg/throbbing pain; Chills; This is a spontaneous report from a contactable consumer (patient, self-reported). A 65-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EN6208), via an unspecified route of administration in unspecified arm on 09Mar2021 (12:00) at single dose for Covid-19 immunization. The patient's medical history included ongoing hypothyroidism. Concomitant medication included levothyroxine been taking for 10-11 years for hypothyroidism. On 17Mar2021, Wednesday, the patient received the vaccine and had chills. On 18Mar2021, the patient had tenderness and soreness in her inner thigh of the left leg. On 19Mar2021, the patient had severe muscle pain on her calf of leg to inner thigh and it was throbbing so bad behind her knee on her left leg that she called her physician, and a sonogram was performed on 23Mar2021 which had found there was not a blood clot but there was severe inflammation along the major vein in her leg. On 20Mar2021, the patient had heart palpitation, her doctor told her to drink water and propel, she had heart spasms for 6 hours and felt lightheaded and dizzy. she thought she would go to the hospital, but she lives in a rural community and felt it did not make sense to go to the hospital. Palpitations and tenderness recovering. Her doctor and she was put on a heart monitor for her heart palpitations. She had heart palpitations with her hypothyroid but, this was totally different when she has had heart palpitations in the past. On an unknown date in Apr2021, the patient had diarrhea for 6 days. Patient had not been back to the doctor, but the nurse thought it was ok for her to take the second vaccine, but the patient was not comfortable with it. No prior vaccinations within the week. The patient never taken the flu shot. She had never received the flu vaccine or pneumonia nothing, so this was new for her getting the COVID vaccine. Caller clarified the chills started the week after she received the vaccine on Wednesday 17Mar2021. Severe muscle pain: Caller stated this happened on the 19, 20, 21, and 22 as well as the throbbing pain and then the next day on Monday

----------	-------	-------	---------	-----	----------	------------	--------------

22Mar2021 she went to call her doctor and had a sonogram that next day on Tuesday (23Mar2021). Caller stated she still had the muscle pain in her left leg on the inner thigh but it was more so when she was active and once in a while she felt like her leg was bruised for a day or two but then it went away and she did not have a blood clot. Left leg throbbing: Caller stated this continually got worse and then on Sunday she felt so bad she laid in bed with her knee up and it throbbed like crazy. Caller stated this stopped about 2 days after she got the sonogram and it was not that severe it was just really tender and sore. Heart palpitation: Caller clarified that the heart murmurs she referred to earlier was actually heart palpitations. Caller stated this started at 8 in the morning and then at 10 in the morning she started getting light-headed and thought about going to the emergency room and figured no she will get through this. Caller stated she called her physician for the heart palpitations on Monday and she saw her doctor the following Tuesday and that is when her doctor had given her the heart monitor. Caller stated for 6 hours she felt horrible on Saturday since she knows the difference from her normal heart palpitations from her thyroid. Diarrhea: Caller stated this last for 6 days and was last week or so. Treatment: Caller stated no she is not a medicine taker she does not even take Tylenol or Advil unless it is a necessity. Outcome of the event: Chills recovered on 18Mar2021, tenderness and soreness in her inner thigh of the left leg/throbbing pain was resolving, severe muscle pain and inflammation along the major vein in her leg was not resolved, heart palpitation was resolving, light headed/dizzy was resolved on 20Mar2021, diarrhea was resolved on Apr2021, leg was bruised was resolved, heart spasms was unknown. No follow-up attempts are needed. No further information is expected. follow up(20Apr2021): New information was reported from a contactable consumer (patient) included: new events (coronary spasm, pain in extremity, phlebitis lower limb and bruising of leg) and event details. Case is upgraded to serious upon this follow up. No follow-up attempts are needed. No further information is expected.

1290956	5/5/2021	WA	62	M	4/17/2021	4/17/2021	After the vaccination in the morning, Sa-04-17-2021, have been in Urgent Care in the afternoon for an ongoing kidney stones issue that had occurred earlier this week. Felt tightness and pain in both lower legs which continued the next day, and it became worse. Mentioned this issue to the primary physician the following Monday 04-19-2021, but predominance had been given to the Kidney stones issue. On 04-26-2021 mentioned again the pain predominantly in the left calf to the primary physician. The same day, blood clots were found in both lower legs by Urgent Care. Had received information for Deep Vein Thrombosis by physician who prescribed Lovenox (enoxaparin) injections and advised to report the findings to V-safe. Continued narrative: Being informed by Urgent Care on 04-30-2021 that blood clots were not only in both lower legs, but also in both upper legs, now, after complaining about more pain. Ultrasound checks. Being advised to move and rest moderately. Received again information about Deep Vein Thrombosis. Advised to consider to skip the second Pfizer vaccination. Being on sick leave since 04-13-2021. Had switched from Lovenox to Pradaxa per prescription starting from Sa-05-01-2021. Urgent Care, 05-03-2021 conducted another ultrasound check. Another blood clot had developed. Again advised to consider to skip the second Pfizer vaccination, on SA-05-08-2021, to avoid more complications and risks. Under continued observation. Being alerted that this condition can lead to permanent damage and can turn life-threatening. Continued sick leave, considering medical leave. Concerned about the decision to take the second Pfizer vaccination, on Sa-05-08-2021.

1290770	5/5/2021	CA		F	3/15/2021	3/15/2021	Blood clot; Couldn't breathe; Heart palpitations; Hives; vertigo; This spontaneous case was reported by a health care professional and describes the occurrence of THROMBOSIS (Blood clot) in a female patient of an unknown age who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Medical History not reported. On 15-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 15-Mar-2021, the patient experienced THROMBOSIS (Blood clot) (seriousness criterion medically significant), DYSPNOEA (Couldn't breathe), PALPITATIONS (Heart palpitations), URTICARIA (Hives) and VERTIGO (vertigo). At the time of the report, THROMBOSIS (Blood clot), DYSPNOEA (Couldn't breathe), PALPITATIONS (Heart palpitations), URTICARIA (Hives) and VERTIGO (vertigo) outcome was unknown. Not Provided The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. On 15 Mar 2021, within 1 hour of receiving first dose of the Moderna COVID-19 vaccine, the patient couldn't breathe, she had heart palpitations, hives, vertigo, and a blood clot. The patient stated that she was able to feel the blood clot. At the time of the report it was unclear if the patient had seen a physician for the events. Treatment for the event was cetirizine, and the patient stated that she has no hives when she takes cetirizine, but once she stops the cetirizine the hives return. Treatment provided with cetirizine for hives.

1290426	5/5/2021	UT	17	M	4/21/2021	4/21/2021	17-year-old male who presents with 8 days of headache. He received his first dose of the Pfizer vaccine on 4/21. He felt like he had the flu after getting the vaccine and developed right-sided neck pain and a temperature to 100. The patient did endorse being elbowed in the neck playing basketball during this time as well, as he played in a basketball tournament in right after this. He got his Covid vaccine in his right deltoid. He saw his pediatrician on 4/26 and a CT scan of his neck with IV contrast was done and this showed significant diffuse right-sided deep spatial neck edema and right-sided adenopathy. The pediatrician discussed the findings with ENT who recommended augmentin and a medrol dosepak. The patient developed a headache several days after this and went to urgent care for evaluation. There was concern that the augmentin and steroids had caused the headache, so the steroids were stopped and he was switched to keflex on 4/30. He was given phenergan and toradol at Urgent Care and discharged home. His mom notes that several days ago he had fevers of 101-104. He has not had a fever for several days now. His headache continued and he felt unwell at basketball practice so he returned to urgent care on 5/4. A CT scan of his head was done which showed right sigmoid and transverse sinus thrombosis as well as thrombophlebitis of the right IJ. He was sent to ED for further management at that time. In the ED, the patient was hemodynamically stable and well-appearing. The CTs were overread by our radiologists here. The patient had some labs done at the outside urgent care but PT/PTT/INR and a CRP were drawn here, which were unremarkable. A Covid PCR is negative. Neurosurgery, neurology, and hematology were consulted. Neurology recommended heparin and a hypercoagulable workup and hematology agreed with this plan. The patient was admitted to the ICU for neuro checks and monitoring during initiation of heparin.
1290340	5/5/2021	GA	39	M	4/12/2021	4/29/2021	Developed Bell's Palsy on morning of 4/29, with left side of face paralyzed. Was examined by emergency room physicians for stroke and blood clot, cleared and given prescription for Valacyclovir 1GM (3x day 7days) and Prednisone 50mg (1x day 5 days). As of 5/5 condition has improved significantly, though paralysis around mouth and neck areas persists.

1290307	5/5/2021	AZ	54	F	5/1/2021	5/2/2021	I woke up at approximately 9:30 AM the morning of Sunday May 2nd 2021 the day after getting my covid vaccine and had to rush to the bathroom. I proceeded to have blood and blood clots come out my urethra very urgently. I had abdominal pain and pressure. I proceeded to need to urinate blood and blood clots for approximately 4 hours urgently. I could not go far from the bathroom without having to return quickly to the toilet. I wet myself several times. The clots stopped coming around 1:30 PM. I proceeded to have to have no control over urination urge and could not leave the bathroom. Around approximately 2:00 PM I could leave the bathroom without fear of wetting myself. I continued to have a small amount of a mix of blood and normal urine passing for another hour or so. I have a picture of the blood and clots that came out of my urethra. I continue to have dull pain and pressure in my abdomen.
1290123	5/5/2021	KY	51	F	4/16/2021	4/23/2021	Received Moderna COVID 19 vaccine second dose on April 16th 2021 and days later began having chest pressure and shortness of breath. Was seen in doctor office and sent to ER. Was diagnosed with several blood clots in the lungs
1290301	5/5/2021	OH	61	F	5/1/2021	5/1/2021	Patient received Johnson and Johnson vaccine on Saturday May 1st. I administered the vaccine. Today, 5/5 she came to the pharmacy to show me the circle rash that had developed around injection site. It was also swollen and felt like a bruise. I counseled patient on "covid arm" and that it was likely her immune system activating. I explained this can be a common reaction after getting the COVID vaccine. Patient had no other symptoms. I went over things to look out for in relation to blood clots and any warning signs and when to reach out to her doctor. I suggested she fill out Vsafe and I told her I would report to VAERS.

1284864	5/4/2021	WV	96	F	1/29/2021	2/1/2021	blood clot in her leg; blood clot in her leg; Cardiac arrest; Heart attack; This is a spontaneous report from a contactable consumer (patient's daughter). A 96-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), dose 2 via an unspecified route of administration on 29Jan2021 (Lot Number: EL9265) as SINGLE DOSE for COVID-19 immunization. Medical history included blood clots in her legs from an unknown date and unknown if ongoing , diabetec, bone infection, surgery and anemic; all from an unknown date and unknown if ongoing; and a family history of gangrene from an unknown date and unknown if ongoing of her mother. Concomitant medications included apixaban (ELIQUIS) taken as blood thinner and furosemide (FUROSEMIDE) taken for an unspecified indication; both start and stop date were not reported. The patient previously had BNT162B2 (Lot Number: EL1283) dose 1 on 08Jan2021 for COVID-19 immunization. The facility where the most recent COVID-19 vaccine was administered was in the military facility. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 15Mar2021, the patient died due to a heart attack and cardiac arrest. The patient developed a blood clot in her leg and had to have her leg taken off. The date of surgery was 05Feb2021, not early Mar2021 like was originally stated at the hospital. The patient was admitted either on 01Feb2021 or 02Feb2021 and discharged on 23Feb2021. They had a bunch of bad weather and then they put the patient in the nursing facility for about a month and when she was brought home she had a heart attack and died due to cardiac arrest. She doesn't know about the blood clot and this being related to the COVID vaccines but the patient had surgery a week after she had her second shot. The heart attack was on 15Mar2021. The patient had a history of blood clots in her legs before and she had problems with that so that might of made it worse but she doesn't know for sure. The patient died on 15Mar2021. An autopsy was not performed. The outcome of the event blood clot in her leg was unknown. No follow-up attempts are possible; information about lot/batch number has been obtained.; Reported Cause(s) of Death: heart attack; cardiac arrest

1284857	5/4/2021	CT	86	M	4/8/2021	4/9/2021	small blood clot in brain; This is a spontaneous report from a contactable consumer (patient). A 86-year-old male patient received the second dose of bnt162b2, via an unspecified route of administration on 08Apr2021 (Batch/Lot number was not reported) as single dose for covid-19 immunisation. Medical history included Type two diabetes b, covid prior vaccination in 2021, blood clot in lung. Concomitant medication included exenatide (BYETTA). The patient previously received the first dose of bnt162b2, via an unspecified route of administration on unspecified date (Batch/Lot number was not reported) as single dose for covid-19 immunisation. The patient experienced small blood clot in brain on 09Apr2021. The event resulted in Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care, Hospitalization (4 days), Life threatening illness (immediate risk of death from the event), Disability or permanent damage. Patient received the treatment Heparin for event. Covid test post vaccination (Blood test) was negative on 12Apr2021. The outcome of the event was not recovered. Information on Lot/Batch number has been requested.

1285704	5/4/2021	VA	46	F	4/11/2021	4/11/2021	I had chills, fatigue, headache, and bilateral calf and thigh muscle pain that started about 6 hours after the vaccination and lasted about 36-48 hours. I took Tylenol 500mg after the onset of symptoms and three times a day. The symptoms went away by mid-day on 4/13/2021. Since then, I have been experiencing bilateral calf muscle pain off and on. I also had an enlarged axillary lymph node n the left side (side of vaccination). I reported it to urgent care on 4/18/2021 and was told the muscle pain was unlikely to be a clot since it was bilateral and there was no swelling or discoloration. I was told to hydrate and follow up with my primary care provider if it continues. The calf muscle pain has continued - almost every other day - and responds to Advil. I have an appointment to talk to an MD tomorrow (May 5th)

1285757	5/4/2021	PA	40	M	4/28/2021	4/28/2021	Developed severe abdominal cramps on my left side around 7 p.m. on Wednesday, April 28. Cramps were intermittent and in varying degrees of intensity. Cramps continued through Friday, April 30 with varying intensity. Attempted to treat with Tylenol and GasX. Starting around 10:30 a.m. on Saturday May, 1, the pain in my left side increased in intensity and was not waning. After consulting with a telehealth practitioner, I went to the emergency room and was quickly admitted. My blood and urine were tested, along with CT scans of my body. The CT scan revealed that blood was no longer reaching two parts of my left kidney and I was diagnosed with a arterial thrombosis. I was fully admitted to the hospital and a heparin drip was immediately started.
1285611	5/4/2021	OH	43	F	2/24/2021	3/3/2021	My periods since receiving the vaccination have had significantly more and larger clots than normal.
1286453	5/4/2021		23	F	3/30/2021	3/31/2021	I had a red, hard, spot on my arm that lasted over two weeks. I also had a bruise that was changing colors. My arm was painful and the redness was spreading. I was given antibiotics for ten days afterwards. My mother also had a rash at the injection site, and was given same shot as me on same day. The lot number for my shot is 1808609. I have many pictures of the reaction if you want me to upload. Furthermore, the doctor said that my reaction would be aligned with a "moderna" reaction but is NOT typical of a J and J reaction (which is the shot that I had received and obtained a record of receiving from the Pharmacy). I got an ultrasound and blood test around two weeks after vaccine, no blood clot found.
1284470	5/4/2021		46	F	4/10/2021	4/25/2021	Headache onset 2 weeks after vaccination. Brain MRI on 4/30/2021 showed subacute dural venous sinus thrombosis affecting the superior sagittal, left transverse and sigmoid sinuses.

1284516	5/4/2021	AK	41	F	1/7/2021	1/7/2021	<p>About 15 mins after vaccine I felt a sudden onset of lightheadedness and feeling as if i would pass out, told the nurse I was going to throw up. I was given zofran and Dr monitored Vs. I continued to experience waves of dizziness, nausea, abdominal pain. Shaking followed (I felt so cold), along with frequent need to urinate and urgency to have a BM (loose) for several hours. I was given fluids and monitored. They gave Ativan 0.5mg 2.5 hrs later? I was discharged home at 8:45p.m. by Dr and told not to get the 2nd Vaccine. Symptoms continued and worsened on day 3 with Shortness of breath, chest pain and tingling in my arms that spread to my legs, back and neck. The first week I could barley walk and was seen in the ER 2 times for chest pain, shortness of breath, dizziness, tingling, heart racing, diarrhea, nausea, muscle weakness, insomnia due to shortness of breath (gasping) with heart racing, &amp; unable to control my body temperature. Given Prednisone 40mg which exasperated symptoms. 1/13/21 In ER and given Benadryl 3 bags of fluids, potassium and sodium. Postural tachycardia was noticed. Referral to Neurologist. High D-dimer at ER on 1/16/21 CT scan performed to rule out blood clot in lungs. Referred to Cardiologist. Metoprolol and Colchicine was started in Jan by Cardiologist Dr . Weekly visits with Dr for the first couple months. More meds started to decrease inflammation. Furthur referrals to Immunologist, infectious disease, and Rheumatology. At 3 months worsening of tingling in my neck and headaches/burning that felt like shocks and shooting down neck and ears. Neurologist performed 3 view MRI to rule out transverse Myelitis. In ER early April for new onset of Petechiae, CBC labs normal. Immunologist states he felt i experienced an allergic reaction followed by secondary anaphalaxis. He is testing me for Mast cell activation syndrome (not diagnosed yet). Now almost 4 months later still unable to work. Waiting results to rule out POTS. Currently battle daily fatigue, chest pressure/pain, lung SOB, heavyness/pressure, with any exertion. I am limited with daily walking/normal activities. Symptoms that come and go are tingling, nausea, diarrhea, flushing of frequent urination, neck pain, regulating temperature.</p>

The patient's weight and height were not reported. The patient medical history included being 4 months post-partum. The patient had no drug, food or other product allergies, and had no chronic or long-standing conditions. The patient received COVID-19 vaccine Ad26.CoV2.S (suspension for injection, route of administration and batch number not reported), dose was not reported, administered on 23-MAR-2021 for prophylactic vaccination. No concomitant medications were reported. From an unspecified date, the patient had 2 weeks of headaches and blurry vision, 2 to 3 days of neck stiffness and nausea with 1 episode of vomiting and had been transferred to the current hospital from another. On 04-APR-2021 (12 days post-vaccination), the patient was diagnosed with dural venous sinus thrombosis (DVST), transverse/sigmoid (cerebral venous) sinus thrombus (CVST) with associated intraparenchymal hemorrhage in the right temporal lobe as well as thrombosis of the right internal jugular vein (thrombus). Magnetic resonance imaging (MRI) impressions showed there was a re-demonstrated of intraparenchymal hematoma in the right posterior temporal lobe measuring approximately 6.2 x 3.6 cm in maximal axial dimensions. There was surrounding edema and associated mass effect with effacement of the right temporal horn and right-to-left midline shift measuring 5 mm. There was medialization of the right uncus without transtentorial herniation. The basal cisterns were otherwise patent. There was dural thickening and hyperenhancement overlying the hemorrhage. There was prominent cortical veins along the right frontal temporoparietal convexity consistent with venous congestion. There was also a small are of vasogenic edema in the right anterior temporal lobe separate from the hematoma. There was a right mastoid effusion, but normal orbitals and the calvarium and skull base were unremarkable. Magnetic</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

resonance venography (MRV) results revealed non-opacification of the torcula, right transverse sinus, right sigmoid sinus and upper internal jugular vein compatible with occlusive thrombosis. A small amount of thrombus also extended into the left transverse sinus. The superior sagittal sinus, remainder of the left transverse sinus, left sigmoid sinus, left upper internal jugular vein, straight sinus, vein of Galen and bilateral internal cerebral veins demonstrated normal contrast opacification. The patient's platelet count was 126 upon admission (normal range [NR] not provided), with other workup laboratory test results reported as pending. The action taken with COVID-19 vaccine Ad26.CoV2.S was not applicable. The outcome of the right internal jugular thrombus, intraparenchymal hemorrhage, DVST, CVST, headache, blurry vision, neck stiffness, nausea and vomiting was reported as unknown. This report was serious (caused/prolonged hospitalization and other medically important condition).; Sender's Comments: V0: This case concerns a 34-year-old white female who experienced cerebral venous sinus thrombosis (CVST), dural venous sinus thrombosis, right internal jugular vein thrombosis, and cerebral hemorrhage 12 days after receiving covid-19 vaccine ad26.cov2.s for prevention of symptomatic SARS-CoV-2 virus infection. The patient was noted to be 4 months post-partum. She presented for medical assistance with a 2-week history of headaches, blurry vision, and neck stiffness for 2 to 3 days as well as nausea with 1 episode of vomiting. Magnetic resonance imaging showed a large hematoma in the right posterior temporal lobe with surrounding edema and associated mass effect resulting in effacement of the right temporal horn and right-to-left midline shift measuring 5 mm and occlusive thrombus within the torcula, right transverse sinus, right sigmoid sinus, and upper internal jugular vein. A small amount of thrombus extended into the medial aspect of the left transverse sinus. The platelet count on admission was 126,000. Although the post-partum status of the patient may have contributed, based on evolving knowledge of Thrombosis with Thrombocytopenia Syndrome (TTS, per definition from Brighton Collaboration) and considering the low platelet count and temporal relationship to vaccination, we consider the events to have a plausible relationship with vaccination.

1284654	5/4/2021	PA	71	F	4/1/2021		<p>BLOOD CLOT INSIDE THE BUMP (INJECTION SITE); WHEEZING; HIVES ON NECK; BLADDER INFECTION/ABDOMINAL PAIN TO GROIN; BLADDER INFECTION/ ABDOMINAL PAIN TO GROIN; INJECTOR PULLED THE NEEDLE BACK AND PUT IT IN AGAIN; COULD HARDLY WALK; COULDN'T TOUCH THE ARM; REDNESS IS STILL AS BIG AS A BASEBALL; NAUSEA; VOMITING; HALLUCINATIONS; DIARRHEA; This spontaneous report received from a consumer concerned a 71 year old white (Hispanic/Latino) female. The patient's height, and weight were not reported. The patient's past medical history included bladder infection, and concurrent conditions included high blood pressure, high cholesterol, and asthma/ bronchitis/ get asthma attacks often. The patient's other pre-existing medical conditions included that she had no history of heart attack or pain. The patient's family history included that her mother had bladder infection and lady part infections. The patient was not pregnant at the time of reporting. The patient received Covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 202A21A and expiry: 23-JUN-2021) dose was not reported, 1 total administered on 10-APR-2021 around 10:00 AM for prophylactic vaccination on right arm. No concomitant medications were reported. On 10-APR-2021, the patient almost passed out after she got the shot (vaccination), they (vaccine facility) had to take her out to the car, and she could hardly walk. The patient reported that injector pulled the needle back and put it in again (Wrong injection technique). It was reported that right after injection when she turns around her arm was big as baseball, mushy, swollen and it was painful (injection site). The mushiness was going down, but it was still mushy. The patient's arm was hard as a marble, redness was still as big as a baseball and she could not touch her arm. On 20-APR-2021, the patient had bladder infection/abdominal pain to groin and had infection from lady's problem and further stated it as bladder infection. The patient think that the bladder infection was not because of the Janssen vaccine. On 21-APR-2021, the patient experienced hives on the neck and she applied Benadryl cream on it. The patient went to her physician on 22-APR-2021 (Thursday) and Nurse looked at her arm and said that it was perfusion and there was blood clot inside the bump. The patient's physician told her to</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

take Benadryl and put ice and heating pad on it. The patient reported that she was already putting ice packs 3-4 times a day and heating pads 3 times a day. The patient also showed her hives to her physician and she was told to keep putting Benadryl on it. The patient had a follow up with her physician on 03-MAY-2021 for her arm checkup. On an unknown date in APR-2021 (reported as first night), she could see penguins walking around, marching up the stairs on first night (Hallucinations) and then no more penguins after the first night. On the same first night, the patient experienced nausea, diarrhea, and vomiting. On an unknown date, the patient experienced wheezing and she thinks that her wheezing was not related to the Janssen Covid-19 vaccine. According to patient her wheezing is related to her asthma. The patient did not have any trouble sleeping since she was taking the Benadryl. The patient stated that she could move her arm up and down, but she was scared to do so. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from hallucinations, bladder infection/abdominal pain to groin, diarrhea, vomiting, and nausea, and the outcome of almost passed out, hives on neck, couldn't touch the arm, blood clot inside the bump (injection site), wheezing, could hardly walk, injector pulled the needle back and put it in again and redness is still as big as a baseball was not reported. The reporter considered the causality between Covid-19 vaccine ad26.cov2.s and wheezing, and bladder infection as not related. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: 20210452551-covid-19 vaccine ad26.cov2.s- blood clot inside the bump (injection site), hallucinations. This event(s) is considered unassessable. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the event(s).

1284764	5/4/2021	CA		F	3/17/2021		<p>with right leg, severe pain and had DVT diagnosed/ diagnose with DVT (deep vein blood clot) in my leg; This is a spontaneous report from a contactable consumer (patient). A female patient (Age: 60; Unit: Unspecified) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in left arm on 17Mar2021 (Batch/Lot number was not reported) as single dose for COVID-19 immunisation. Medical history included COVID-19 from 02Oct2020 to an unknown date. Concomitant medications were not reported. The patient experienced with right leg, severe pain and had dvt diagnosed/ diagnose with dvt (deep vein blood clot) in my leg on an unspecified date in 2021 with outcome of unknown. Patient states she had COVID-19 on 02Oct2020. She received her first Pfizer vaccine dose in her left arm on 17Mar2021. On 01Apr2021, she went to the hospital ED with right leg, severe pain and had DVT diagnosed. She was sent home from the ED with Xarelto. On 07Apr2021, 2nd vaccine dose received by patient. Consumer stated, "I called the health department and I just wanted you to record that I called you guys back on 17Mar I've had my first COVID shot and then 01Apr, I went to the hospital (further details for the hospitalization not available hence not checked as seriousness criteria) and diagnose with DVT (deep vein blood clot) in my leg. I just felt, I just know that what going on right now with Johnson and Johnson but I am just trying to kind of understand that 2 weeks to the day that I had my first COVID shot I came down with the blood clot in my leg. So I just wanted to see if that's anything that I need to be concerned, it's very painful, fortunately I have been able to work from home but it's very painful and I did get my second round because level one I need to think about it. So, with everything going on. I never had blood clot now before that I have now." Information on the lot/batch number has been requested.</p>

1284725	5/4/2021	TN	69	M	3/3/2021	3/7/2021	<p>Diagnosed Two Pulmonary Embolism; DVT on left leg; Coughing; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of PULMONARY EMBOLISM (Diagnosed Two Pulmonary Embolism), DEEP VEIN THROMBOSIS (DVT on left leg) and COUGH (Coughing) in a 69-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. No Medical History information was reported. On 03-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 01-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 07-Mar-2021, the patient experienced PULMONARY EMBOLISM (Diagnosed Two Pulmonary Embolism) (seriousness criterion medically significant), DEEP VEIN THROMBOSIS (DVT on left leg) (seriousness criterion medically significant) and COUGH (Coughing) (seriousness criterion medically significant). At the time of the report, PULMONARY EMBOLISM (Diagnosed Two Pulmonary Embolism), DEEP VEIN THROMBOSIS (DVT on left leg) and COUGH (Coughing) outcome was unknown. After his 2nd dose of Moderna vaccine on 01-Apr-2021, the patient's coughing become worst again. His pulmonologist prescribed prednisone and his family physician prescribed him Azithromycin. No concomitant medications were not provided. Treatment included as Eliquis, Azithromycin, cough medicine, prednisone. Company comment: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. This case was linked to (Patient Link).</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1284855	5/4/2021	FL	49	M	3/16/2021	3/16/2021	DVT left lower extremity; Bilateral Pulmonary Emboli; first dose: 23Feb2021; second dose: 16Mar2021; first dose: 23Feb2021; second dose: 16Mar2021; This is a spontaneous report from a contactable nurse (patient). A 49-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN6199 and expiration date not provided) intramuscular, administered in the left arm on 16Mar2021 13:30 as a single dose for COVID-19 immunization. The patient has no relevant medical history. Family history included diabetes (mother). The patient's concomitant medications were not reported. The patient did not receive any other vaccine within 4 weeks prior to the COVID vaccine. The patient previously took the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN6200 and expiration date not provided) Injected intramuscularly in left upper arm on 23Feb2021, 13:30 for COVID-19 immunization and experienced DVT symptoms, soft tissue injury, muscle pull and ankle strain. The patient experienced DVT left lower extremity and bilateral pulmonary emboli on 23Apr2021. The patient called regarding the Pfizer COVID vaccine. He had adverse events to report. He has a DVT on his left calf, which he later clarified was left lower extremity. He is currently on double dose of apixaban (ELIQUIS) since Friday. He finally went and got it looked at. He is still being treated and will be seeing a hematologist. He stated that DVT symptoms occurred after first dose and was undiagnosed. He treated it as soft tissue injury and thought it was a muscle pull and ankle strain. Eliquis was started on 23Apr2021 and dose is 5 mg. He is taking two tablets twice daily for 7 days and then 1, 5mg tablet bid (twice a day) as well. No emergency room or physician's office required but Urgent care facility was visited on 23Apr2021. During this visit, they did Lab work, D Dimer results 1590 on 23Apr2021; Venous Doppler resulted in positive DVT in Left Lower Extremity. Chest CT resulted in positive peripheral defects in small branches of the lower lobes bilaterally, left greater than right, consistent with Pulmonary Emboli. Left sided pleural effusion and left basillary infiltrate, possibly atelectasis or developing infarct. Few pleural based nodular densities at right lung base, again atelectasis versus developing infarcts. The rest just states what was normal. Eliquis was prescribed on

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							23Apr2021, 5 mg two tablets twice daily for 7 days, then regular dose times 7 days. He is to report to hematologist on 29Apr2021. The outcome of the events deep vein thrombosis and pulmonary embolism was unknown. The reporter assessed the events as serious (life-threatening).; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events DVT of legs and Pulmonary embolism cannot be totally excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1284783	5/4/2021	FL	68	F	3/20/2021	3/1/2021	fever; fatigued; Did not have much energy/having no energy/low energy; Left Arm was painful and it got swollen a bit; Left arm painful; Foggy and not clear; extreme shortness of breath/cannot catch her breath; almost hyperventilating/Hyperventilation; This is a spontaneous report from two contactable consumers (including husband and patient self) and patient self. A 68-year-old female patient received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EN6204) at single dose on 20Mar2021 14:54 injected in left arm in the muscle for Covid-19 immunization. Medical history included shortness of breath, hypothyroidism and COVID-19 back in Dec2020. She had some food allergies that were diagnosed prior to getting the vaccine. Patient was tested positive for COVID on 21Dec2020 and negative on 20Jan2021. The symptoms followed for patient was a little coughing and no smell for 3 days and a little shortness of breath. Family medical history was none. Concomitant drug included levothyroxine 0.75 ug, once daily for hypothyroidism, which was taking for 15 years (as of 19Apr2021). No previous history of all previous immunization with the Pfizer vaccine considered as suspect. No Prior Vaccinations (within 4 weeks). No additional vaccines administered on same date of the Pfizer suspect. Patient experienced left arm painful on 20Mar2021 about an hour or two after she got the injection, did not have much energy on 21Mar2021 08:00, foggy and not clear from 21Mar2021 to 22Mar2021 08:00, shortness of breath started 24Mar2021 or 25Mar2021, and hyperventilation on an unknown date in Mar2021 (reported as a week or 9 days after receiving vaccine). The shortness of breath was what she referred to as hyperventilating. That came a week after the vaccine. The same date they took shot was when the arm pain started and the low energy was the day after. Foggy and not being clear was from 21Mar2021 to 22Mar2021. Shortness of breath started 24Mar2021 or 25Mar2021. In addition to shortness of breath, she had been hyperventilating. That began approximately a week or 9 days after receiving vaccine. Left arm was painful and it got swollen a bit and lasted for 48 hours. The husband experienced arm pain and said he almost had a fever and felt fatigued. The reporter thinks patient (his wife) felt the same. She had arm pain

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

and not much energy. They came out of that ok. About a week after the first injection, she just cannot catch her breath. She started hyperventilating to the point where the husband thought she would expire. She also experienced being foggy and not clear and having no energy. First, she went to a Cardiologist and he said there was nothing wrong. She then saw a lung doctor who send for respiratory chest and did chest CT scans and everything was clear on both test. He did not prescribe any medications. A week after she saw him, she went to the ER on 31Mar2021for hyperventilation and shortness of breath. They prescribed Xanax (AER 2021434900). She said it did not work and they prescribed something else. It was 25 mg twice a day which was in a pharmacy vial. They then prescribed Lorazepam. She was afraid to take it. She took one instead of two. The dose was 0.25 mg twice daily. The ER did CT scan of chest with Contrast. It was negative for thromboembolism (also reported as CAT scan's negative for blood clots). She had shortness of breath before the vaccination and it got worse. She was managing it though. Outcome of left arm painful, foggy and not clear, did not have much energy/having no energy/low energy was resolving. Outcome of shortness of breath and hyperventilation was not resolved. Outcome of the other events was unknown. Information about lot/batch number has been requested.

A 40-year-old female non-pregnant patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration, administered in Arm Left on 05Apr2021 10:30 (Batch/Lot Number: ER8734) as single dose for covid-19 immunisation. Facility type Vaccine: Other. Medical history included known allergies: Sulfa and Folate deficiency. The patient's concomitant medications were not reported. The patient previously received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number: EN6206) on 15Mar2021 10:30 AM in left arm for covid-19 immunisation and experienced vaginal bleeding/blood clots at mid-cycle on 15Mar2021 08:00 PM. If other vaccine in four weeks: No. Other medications in two weeks: No. If Covid prior vaccination: No. If Covid tested post vaccination: No. The patient experienced more than usual vaginal bleeding/with very dark blood with clots, menstrual cramps, sharp pelvic pain, all on Apr2021 with outcome of not recovered. Clinical course: After the first dose, the patient had vaginal bleeding/blood clots at mid-cycle. The same day after the 2nd dose, she started feeling menstrual cramps and sharp pelvic pain. After taking paracetamol (TYLENOL) and feeling a bit of relief, she stood up and started having more than usual vaginal bleeding at the level that it reached the floor as if it was a hemorrhage with very dark blood with clots. This lasted for 1 minute. This lasted for 5 days and 7 days later, she started bleeding again with dark blood clots for a period of 3 days. The events resulted in: Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care. No treatment received for events more than usual vaginal bleeding/with very dark blood with clots.

1284810	5/4/2021	KY	50	F	4/5/2021	4/1/2021	heart attack; tingling down left arm/tingling down right arm /tingling down left leg/tingling across back/tingling down right leg; burning sensation in her shoulder blade; muscle pain; muscle tightening; aching to left shoulder; This is a spontaneous report from a contactable consumer (patient). A 50-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) Lot number FR8732, on 05Apr2021 at single dose in left arm for COVID-19 immunisation. Medical history included blood clot in lung from 26Mar2021 (according to the chest X-ray she did not still have it but she had not been to her pulmonologist yet), complete hysterectomy in Jan2021, liver condition, high cholesterol and blood clot. Concomitant medications included apixaban (ELIQUIS) for blood clot, ursodiol for liver condition, and pravastatin for high cholesterol. The patient had the first dose on 05Apr2021. She began feeling muscle pain and a burning sensation in her shoulder blade the Thursday after receiving the vaccine (08Apr2021) and into Friday (09Apr2021). She had muscle tightening and aching in her left shoulder on 08Apr2021. By Monday mid morning (12Apr2021) she had tingling all down her left arm, across her back, down her right arm and into both legs. She began having tingling in her arms and legs bilaterally since last Monday (12Apr2021), however it was more prominent in her left extremities rather than the right. She wanted to know if this was a side effect of vaccine. She got the shot in her left arm. She went to the hospital and they admitted her. She had tests in the ER. She had MRIs, CTs and a battery of blood tests. They could only tell her what it was not and not what it was. It was not cancer, stroke, heart attack, aneurysm or a brain tumor. She was released and did not know what caused it. Again from the above that on Thursday (08Apr2021) her left shoulder muscle started aching and on Monday a week later she experienced tingling. She thought she was having a heart attack and was hospitalized for 4 days. She asked the doctor if this was a side effect and she was told to call the place where the vaccine was administered. She called the nurse and she could not give answers and recommended that she call Pfizer. Several conditions were ruled out but she was not given a reason for her symptoms. Her HCP has not been helpful. She stated she had a complete hysterectomy in January but doesn't

1284814	5/4/2021	VA	55	M	3/3/2021		<p>think that would have any effect. She had a CT on 12Apr2021, a MRI of her head and neck on 12Apr2021, a MRI with contrast on 14Apr2021 of her upper neck, a MRI of her lower back on 15Apr2021 and a bone scan on 15Apr2021. Stated that they all came back normal no abnormalities. The outcome of muscle tightening was resolving. The outcome of heart attack was unknown. The outcome of other events was not resolved.</p> <p>Afib; sometimes sharp and sometimes dull pains that would last 10-60 seconds throughout her body-calves, things, forearms, toes, finger and even his stomach; sometimes sharp and sometimes dull pains that would last 10-60 seconds throughout her body-calves, things, forearms, toes, finger and even his stomach; sometimes sharp and sometimes dull pains that would last 10-60 seconds throughout her body-calves, things, forearms, toes, finger and even his stomach; This is a spontaneous report from a contactable consumer (patient). A 55-years-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration, administered in Arm Left on 03Mar2021 (Batch/Lot Number: EN6198) (age at vaccination: 55-year-old) as SINGLE DOSE for covid-19 immunisation. The patient's medical history was not reported. Concomitant medications included nebivolol nebivolol hydrochloride (BYSTOLIC) taken for an unspecified indication from 2013 and ongoing; doxycycline (ORACEA) taken for an unspecified indication from Jul2020 and ongoing. Historical vaccine included first dose of bnt162b2 (Batch/Lot number: EC9269) on 02Feb2021 as single dose in Left arm for covid-19 immunisation. The patient had been experiencing pains on and off for about 5-6 days after his first slot. Then he read an article (he swear, he was not researching anything online) about a 56 year old man who developed ITP days after receiving Pfizer vaccine. since he had Afib this article worried him. He had no idea what blood clots felt like, but he was having sometimes sharp and sometimes dull pains that would last 10-60 seconds throughout her body-calves, things, forearms, toes, finger and even his stomach. The doppal came back negative. The doctor suggested symptoms finally disappeared for good about two days after his second dose. The outcome of the events was unknown.</p>

1284832	5/4/2021	NY	80	F	3/28/2021	4/17/2021	Big Blood Clot in left leg; This is a spontaneous report from a non-contactable consumer (Patient). A 80-years-old female patient (Non-pregnant) received bnt162b2 (Pfizer-Biontech COVID-19 vaccine, Solution for injection), via an unspecified route of administration on 28Mar2021 11:00 as single dose for COVID-19 immunisation. The patient medical history included allergies to Demerol. The patient's concomitant medications were not reported. On 17Apr2021 21:30 patient experienced big blood clot in left leg. Patient was hospitalized for 2 days. The patient underwent lab tests and procedures which included Nasal swab test results negative on 16Apr2021. Treatment received for the adverse event was blood thinners. The outcome of event was Not recovered. No follow-up attempts are possible; information about lot/batch number cannot be obtained
1284853	5/4/2021	NJ	46	M	4/10/2021	4/15/2021	I had a Stroke; Blood clot travelled to my brain; effected left side of my body; ability to speak; This is a spontaneous report from a contactable consumer (patient). A 46-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot: ER 8729), via an unspecified route of administration in left arm on 10Apr2021 (at the age of 46-years-old) as single dose for covid-19 immunisation. The vaccination facility type was a pharmacy/drug store. The patient's medical history and concomitant medications were not reported. The patient had no known allergies. The patient did not have covid prior vaccination. The patient had no other vaccine in four weeks and no other medications in two weeks. The patient had a stroke. Blood clot travelled to his brain and effected left side of his body and ability to speak on 15Apr2021 at 17:30. The events resulted to emergency room/department or urgent care, hospitalization for 3 days, life threatening illness (immediate risk of death from the event), disability or permanent damage. The patient received unspecified treatments for the event. Covid test post vaccination on 15Apr2021 with result of negative. The outcome of the events was recovering.

1284721	5/4/2021	MA	58	M	3/25/2021	4/23/2021	<p>Superficial blood clot; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of THROMBOSIS (Superficial blood clot) in a 58-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 014C21A and 018B21A) for COVID-19 vaccination. No Medical History information was reported. On 25-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 22-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 23-Apr-2021, the patient experienced THROMBOSIS (Superficial blood clot) (seriousness criterion medically significant). At the time of the report, THROMBOSIS (Superficial blood clot) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 24-Apr-2021, Ultrasound scan: abnormal (abnormal) Ultrasound of left arm was done and determined a blood clot in that arm.. Patient went to the emergency room on 24 Apr 2021, approximately 7 pm. The patient was a healthy individual and used to do bike ride 11 miles per day with average speed 16mph. He did bike ride the evening of his second covid shot. No relevant concomitant medications were reported. Treatment information included anti-inflammatory medicine. Action taken with mRNA-1273 in response to the events was not applicable. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Most recent FOLLOW-UP information incorporated above includes: On 26-Apr-2021: Additional information was received on 26 Apr 2021. Added lab data and treatment; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.</p>

1287662	5/4/2021	UT	67	M	4/10/2021	4/14/2021	A few days after the vaccine started feeling uncomfortable in the left leg. It did not get better with rest and time so went to the ER and an ultrasound and found a clot from the groin to the ankle. He had no injury to preclude this clot. He was put on an anticoagulant (Xarelto) and standing and walking is very painful. He has a follow up appointment set with his PCP 5/6/21 He was told he might have to be on this medication for months maybe longer.
1286382	5/4/2021	FL	53	F	4/1/2021	4/26/2021	portal vein thrombosis
1285795	5/4/2021	WA	75	F	4/9/2021		o Patient with several complaints that started after receiving her Johnson&Johnson COVID vaccine 3 weeks ago. She has swelling in her medial malleolar area with negative calf tenderness or Homans' sign. Due to recent findings with Johnson&Johnson vaccine, will send patient for doppler testing to look for the presence of a clot. Her swelling could be due to mild injury while working in her garden or varicose veins. o Will obtain CBC to evaluate platelets due to patient's concerns for recent vaccine. o Other complaints that may be related to the vaccine (visual change and fluid area on shin) have now resolved. Discussed with patient that based on the vaccines being new, difficult to know what side effects may be seen, but she should continue to watch for changes and encouraged her to see an eye specialist for an eye check. o Last vitamin D was normal and advised that no check necessary at this time and that she can take Vitamin D 1000-2000 units daily.

1287981	5/4/2021	TX	49	F	3/8/2021	3/8/2021	<p>Shortly after getting the shot she reported feeling "off" as she was driving she started feeling short of breath and her heart was racing. When she got home around 5 PM she was still feeling short of breath and reported that her heart was racing. She was unable to speak clearly, but was stating that it was due to be being short of breath. She also reported feeling lethargic and fell asleep until the next morning. She slept until approximately 12 pm the next day. When she woke up she reported feeling right sided cheek tingling. At that time she thought she had just slept wrong. When she attempted to walk down stairs she was limping and reported just feeling very weak on her left side. On Wednesday she slept in late again complaining of lethargy. When she awoke that Wednesday (3/10) her speech was markedly slurred. She was also saying things that didn't make sense. She was dragging her left leg when she tried to walk. We immediately took her to the ER and she was worked up for stroke. When she was triaged in the ER we mentioned that she had just had her COVID vaccine and voiced concerned that maybe she had a reaction to her COVID vaccine. She was admitted to hospital on 3/10 for a possible stroke. Her MRI was done later on 3/11, Her MRI showed that she has strokes on both sides of her brain in the frontal, parietal and occipital lobes. The doctor referred to her stroke as being caused by a "showering of clots". The doctor said this usually only happens to someone with cardiac issues. My mom has no cardiac history. Her doctor ordered an 2D Echo of her heart and no abnormalities were found (3/12). She is still disabled from her stroke. She was hospitalized from 3/10 - 3/16. She was discharged to other care facility from 3/16-3/26. She is currently needing outpatient rehab in a day neuro program. She attends this at outpatient facility. She has to walk with a cane due to persistent left leg weakness. Her speech has a slight slur, and she suffers from short term memory loss. She intermittently has trouble with her equilibrium and reports feeling dizzy. She sometimes has a hard time swallowing or says that it doesn't feel right when she swallows. She also trouble with word retrieval. She has left-sided neglect which correlates left eye visual deficits. She currently requires care from a general physician, neurologist, physical therapist, occupational therapist, speech therapist, neuro ophthalmologist and neuro psychologist. She was started</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1286668	5/4/2021	CA	34	M	3/31/2021	4/6/2021	After my J&J vaccine, I experienced fever, chills and a left sore arm and those symptoms resolved in 24 hours. On 04-06-2021 I experienced headaches on and off and on 04-07-2021, I had light headiness, an air-filled pressure sensation to my eyes, forehead, more like a sinus headache. On 04-14-2021, I went to see my PCP due to my headaches continuing, the doctor ran complete blood panel test were performed along with a D-dimmer test to rule out blood clots and he told me to take Advil as pain medication. My D-dimmer test was normal. I noticed when bending down my headaches became worse. On 04-20-2021, an MRI of the brain was performed. On 05-01-2021, I experienced muscle body aches, fever and continued with headaches. I went to a walk-in clinic, where a Covid-19 test was performed and it was negative. I started taking antibiotics and the fever and muscle bode aches started to go away. I still have to this day headaches and an air-filled pressure sensation around my eyes and eyebrows. As of today, my headaches are consistent, and they come and go.
1286548	5/4/2021	NC	75	F	2/9/2021	3/27/2021	The blood vessels to the pt's spleen burst due to a clot causing removal of her spleen. During surgery she was given 2 units of blood. Due to blood clots (albeit in other parts of the body) with other vaccines, the lack of splenic trauma preceeding this event, the pt's lack of history re: blood clots, and in the interest of furthering this emerging COVID-19 vaccine technology/progress, the pt's PCP and this POA thought it worth noting.
1286090	5/4/2021	MA	25	F	4/23/2021	4/26/2021	Heart felt like it was pounding out of my chest on Monday evening on April 26, 2012. On Wednesday morning, around 8:30, April 28, I collapsed at at kickboxing class and was sent by ambulance to Hospital Emergency Room as my heart rate was very high and my oxygen was low. In the ER I was diagnosed with blood clots in my lungs, pulmonary embolism, and was sent by ambulance to another facility where I had a procedure to try to break up the clots (catheter directed thrombolysis). I spent 24 hours in the ICU, and another 24 hours in Cardiac Care. I was released on Friday, April 30 at around 2:30 pm. I am now prescribed Eliquis, have a follow up with my PCP on Monday, , May 10, a follow up with cardiology on May 24, and a follow up on June 14 with the Pulmonary Embolism group.

1286545	5/4/2021	OR	81	F	4/7/2021	4/28/2021	<p>Pt received vaccine in her home state, unable to get details of vaccine administration such as date, site, lot #, etc. Per ED MD note : 81-year-old female with reported history of atrial fibrillation found down at hotel room. Patient states she has been on the ground in the room for 3 days, she was found covered in feces. Alert and oriented x4 however intermittently appears confused and has varying history. She does not know how she got on the ground, however denies fall or syncope. No significant current complaints. Slightly tachycardic and febrile, slightly hypertensive, exam without any significant acute findings, no obvious skin source of ulcer or infection, no focal neurological deficits, no pain. Initiated aggressive fluid hydration and sepsis work-up. EKG appears normal with no signs of ischemia or arrhythmia. Labs show slightly elevated troponin, low magnesium, metabolic/lactic acidosis. VBG relatively normal. Urine negative for infection chest x-ray without evidence of pneumonia, no clinical signs or symptoms to identify source of infection. Nothing to suggest meningitis at this time. CT head is negative. Unclear source of fever however empirically treated with antibiotics and fluids. Patient remains hemodynamically stable with no hypotension. She did arrive slightly hypoxic and with increased respiratory rate however clear lung sounds and no indications of heart failure, COPD/asthma. CT chest without evidence of pulmonary embolism, focal pneumonia, or fluid overload. Respiratory status possibly related to compensation for metabolic acidosis that is likely due to lack of fluid intake due to being on the ground. CK is normal and kidney function is normal. Consulted medicine for admission for further evaluation and treatment. Cardiology was also consulted for NSTEMI, agrees with current plan. per H&amp;P 4/28/21: Altered mental status (R41.82): Etiology is not clear. Patient states she had J&amp;J Covid vaccine about 3 weeks ago. Need to rule out cerebral venous sinus thrombosis. Get a CT scan of the brain with contrast. If negative will get CT venogram or MRV and MRI of the head. Neuro checks. Request PT OT and speech therapy evaluation. Check urine drug screen. Check blood alcohol level. Non-STEMI (non-ST elevated myocardial infarction) (I21.4): Start argatroban drip until cerebral vein sinus thrombosis is excluded then we can switch to heparin drip. Start aspirin and statin. Check fasting lipid panel.</p>

							clear but suspect GI source or endocarditis. Repeat blood culture from 4/30/2021 is positive for Enterococcus. PCP he is accepting to follow-up for IV antibiotics management: Will arrange home IV infusion through care . Antibiotics end date to be determined: Pending bacterial clearance. Repeat blood cultures pending. Infectious disease specialist following: Patient is currently on Unasyn. Will need 4 weeks of IV antibiotics.
1285984	5/4/2021	IL	83	F	3/1/2021	4/19/2021	She received her second COVID shot at the end of March first week of April. My mother had a stroke, several seizure and her lungs were filled with blood clots. She had to have a procedure to remove the largest one next to her heart. My mother has always been healthy and has never had any of the following issues in her life. She gets regular checkup and I spoke with her on April 19, 2021 at 12:00pm Central time and she was fine but at 1:20pm my brother who is staying at her house said she was having a seizure. I talk to my mother at least four times a day and she has never in 83yrs experienced anything like this. She doesn't remember right now where her shot was administered but my brother took her but he is mad at me because I have full power of attorney and he is not happy. Therefore, he will not give me the information that is needEd to give to your office. My mother was admitted to the ICU. She is now at their rehab center in a hospital. Once my mother is released from the hospital she is moving with me out of state. This is and unexpected expense that I will need assistance with but I don't mind because it is my mother and now someone has to be with her 24/7.

1283019	5/3/2021	WA	43	F	3/30/2021	4/29/2021	Patient present to ED on 5/3 with leg pain. found to have blood clot in left leg via ultrasound. started on rivaroxaban and discharged
1282845	5/3/2021	AZ	56	F	4/6/2021	4/7/2021	After my vaccine, I had a fever and my leg started to swell up. I also had pain in my right arm, injection site. I also had a covid test because of how I was feeling and the test was negative. I had an u/s of my right leg to check for blood clots. An x-ray of the chest was also performed. I also have had a bad cough since my vaccine which I can not get rid off. I am still not feeling 100% from the vaccine, still tired, fatigued and diarrhea. I do not have my lot #, but I will call back when I get that information.
1283397	5/3/2021	CA	32	F	4/24/2021	4/27/2021	got my vaccine Saturday morning 4/24/21 - woke up in the middle of the night on Tuesday morning around 2am to my lower left leg from the knee down cramped up. Woke up to the same pain and continued all day Tuesday to the point of not being able to walk well . Wednesday morning went to urgent care to be treated due to extreme pain. Did an ultrasound and they diagnosed me with DVT - found two blot clots in my left calf and back of the knee.
1283160	5/3/2021	CO	58	M	4/21/2021	4/29/2021	Patient is a 58-year-old male with history of DM2 on insulin, bovine aortic valve replacement, nonischemic cardiomyopathy (unknown EF), hypertension, obesity, presented to Medical Center on 4/26/21 for left leg pain and swelling. Symptoms began about 2 days ago when he drove to visit some friends and started to " feel under the weather" hence drove back yesterday. He then had acute onset of left leg swelling and pain which prompted him to present to the ED. He was reportedly concerned about " having a clot" as he just received the Johnson & Johnson Covid vaccine this past week.
1284449	5/3/2021	TX	82	F	4/12/2021	4/14/2021	Approximately 40 hours after second Pfizer vaccine, patient complained of pain in lower right leg, and a cold foot, lethargy, weakness, feeling unwell. 3 days later, shortness of breath, difficulty breathing, rapid heartbeat, and confusion began. Went to Medical center on 4/20/21, diagnosed with DVT, PE and clots in and around the heart and passed away on 4/21/21 of cardiac shock in the setting of pulmonary and arterial thrombosis.

1283479	5/3/2021	TN	32	F	4/9/2021	4/14/2021	On Day give I began having left leg pain, shooting pains starting at my knee going down my leg. As the next few days progressed my leg began to get numb and go cold as ice. I have lost my ability to walk and my leg still has shooting nerve pains, gets numb, and twitches. I have gone to the ER, the doctor twice, and a neurologist. Nobody seems to have any answers for me. It is not a blood clot but that is the only thing that has been ruled out.
1282626	5/3/2021	NJ	52	F	4/13/2021	4/13/2021	Within hours of my vaccination I got a headache, fatigue and within five days after my vaccination I got a severe migraine which lasted a total of eight days. I went to the hospital to get an MRI which was clear of a blood clot. All side effects have passed now.
1281071	5/3/2021	CA		F	1/14/2021	2/4/2021	had a stroke on 04Feb2021 that resulted in her left side being paralyzed; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of CEREBROVASCULAR ACCIDENT (had a stroke on 04Feb2021 that resulted in her left side being paralyzed) in a female patient of an unknown age who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. The patient's past medical history included Clot blood and Stroke in 2017. On 14-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 04-Feb-2021, the patient experienced CEREBROVASCULAR ACCIDENT (had a stroke on 04Feb2021 that resulted in her left side being paralyzed) (seriousness criteria hospitalization and medically significant). At the time of the report, CEREBROVASCULAR ACCIDENT (had a stroke on 04Feb2021 that resulted in her left side being paralyzed) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Concomitant medications and treatment information were not reported. Reporter did not allow further contact
1283410	5/3/2021	WI	85	F	3/10/2021	3/15/2021	Patient had a stroke on March 15, 2021 as described as a blood clot in her brain. Medical personnel were unable to correct it surgically and she passed away that evening in the hospital. Death was the final result.

1281053	5/3/2021			M	3/20/2021		ADVERSE EFFECT OF VACCINE; SHORTNESS OF BREATH; FATIGUE; HEADACHE; LOW PLATELETS; NIGHT SWEATS; DIAPHORESIS; BLURRED VISION; FEVER; BODY ACHES; This spontaneous report was received from a physician via a company representative and concerned a white nonhispanic or Latino 50 year old male. Initial information was received on 28-APR-2021, with additional information obtained via telephone follow up from a physician on 29-APR-2021. The patient's height was 73 inches and weighed 252 lbs; approximate body mass index was 32.68 kg/m2. Medical history included: lung infection in 2014 which led to aortic valve disease which required biologic aortic valve replacement (2014); prolapse of right coronary aortic valve cusp, severe aortic insufficiency. There was no history of hyperlipidemia and was positive for family history of cardiovascular disease. Concurrent conditions included attention deficit disorder (ADD), back and neck problem, other congenital anomaly of heart, hypertension, lumbago, shortness of breath and thyroid nodule. The patient received COVID-19 vaccine Ad26.CoV2.S (suspension for injection, intramuscular, batch number and expiry date unknown) on 19-MAR-2021 for prophylactic vaccination. The batch number was not reported and has been requested. Concomitant medications included: carvedilol, losartan and atorvastatin (all for aortic valve replacement). Also aspirin, Adderall (dextroamphetamine-amphetamine) both for unspecified indication. On 20-MAR-2021, the day after receiving the vaccine, the patient developed fevers, body aches and headache which resolved within 24 hours. Then a week on an unspecified date, he developed more symptoms which included fatigue, shortness of breath for the most part and some headaches. On 27-MAR-2021 the patient experienced a single episode of visual disturbance of blurred vision while driving. At a stoplight vision in both eyes were blurred and he had trouble see the road; he no longer could drive. The blurred vision resolved within a few minutes and not vertigo or headache occurred at that time; and there were no other reported visual changes. The patient visited his physician 28 days after receiving the vaccine on 16-APR-2021. He reported ongoing fatigue, body aches and headaches. No further visual changes or disturbances. He felt fatigue and shortness of

----------	-------	-------	---------	-----	----------	------------	--------------

breath were the most noticeable. He denied chest pains and fevers but has been experiencing night sweats (unspecified start date); and generally feels unwell and described himself as "feeling off". No leg edema or leg pain currently. Also no coughing, wheezing or bruising. His concentration was stable and there was no loss of memory. No other neurological symptoms. Physical exam was positive for chills diaphoresis, fatigue, fever and shortness of breath; cardiovascular examine revealed a murmur present, and pulmonary examine was normal breath sounds, no decreased breath sounds, wheezing, rhonchi or rales. Vital signs: blood pressure 104/68, pulse 93, temperature 98. The physician's assessment also included an adverse effect of vaccine. Laboratory results form 16-APR-2021 included: Creatinine (normal range 0.50 - 1.30 mg/dl) 1.09, white blood count (WBC) (normal range 3.8 - 10.8) 3.4, red blood cell count (RBC) (normal range 4.20 - 5.8) 4.92, hemoglobin (normal range 13.2-17.1 g/dL) 13.9, glucose (normal range 71-99mg/dL) 109, D-Dimer elevated at 286 (normal range <230), elevated C-Reactive Protein (CRP) (normal range 0 - 5 mg/L) 32.3, fibrinogen (results not reported), Covid-19 Antigen Antibody negative, platelet count 123,000 (lower limit of normal <140,000). The patient has a baseline platelet count of 200,000 from JAN-2021 and for the past 9 years had ranged from 180,000 - 240,000. A heparin-induced thrombocytopenia (HIT) was negative anti-PF4 antibody. On 20-APR-2021, the patient received Computerized tomogram (CT) of the head with and without contrast which was normal - no acute hemorrhage, mass effect or abnormal enhancement. The patient also had a CT chest with contrast with no evidence of pulmonary embolism to the segmental level; a 16 by 16 mm nodule with small calcification was noted, this was nonspecific but could reflect primary lung cancer, correlation with PET/CT is indicated. Additional laboratory results on 20-APR-2021 concerning serotonin release stated as follows: Positive, 6%, 40%, 37%. HIT panel negative with less than 0.6 antibody On 27-APR-2021 additional laboratory results were as follows: WBC 4.1, RBC 4.95, hemoglobin 14.0 g/dL, D-Dimer 275, fibrinogen 427 and HIT panel negative with less than 0.6 antibody. A hematologist was consulted and a complete blood count and HIT panel were performed on 28-APR-2021. Results were platelet

1281337	5/3/2021	NJ	79	F	4/7/2021	4/21/2021	<p>count of 159,000, D Dimer of 275, HIT negative anti-PF4 antibody screen and the SRA assay was pending. On 29-APR-2021 the duplex of left lower extremity was negative for deep vein thrombosis (DVT). Additional laboratory reports included a platelet factor 4 antibody test test methodology which used latex particle enhanced immunoassay to detect anti -pF4/heparin antibodies (reference range 0.0-9), with the patient's value was &lt;0.6 (negative). A COVID PCR test was not performed. An enzyme-linked immunosorbent assay (ELISA) test was ordered for 30-APR-2021 for anti-PF4 antibodies. The action taken with COVID-19 vaccine Ad26.CoV2.S was not applicable. The outcome of the event blurred vision and fever were resolved; the outcome of low platelets, adverse event of vaccine, shortness of breath, fatigue, headache, body aches, night sweats and diaphoresis were not reported. This report was serious (other medically important condition).; Sender's Comments: V0.20210456790-COVID-19 vaccine Ad26.CoV2.S -Low platelet counts,blurred vision,adverse affect of vaccination. This event(s) is considered unassessable. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the event(s).</p> <p>pt says she started having trouble breathing so went to an Urgent Care where she was told she had allergies and prescribed some allergy medication. She continued to decline so on 4/28/21 she went ER. They did Chest X-Rays and other test and was diagnosed w/ blood clots in both lungs. She was admitted and stayed overnight. She was released and told to FU w/ Pulmonologist on 5/4/2021 @ 1 PM.</p>

1280839	5/2/2021	TX	39	F	3/27/2021	4/7/2021	I had the first vaccine on March 27, that night just felt flu-like symptoms, and my left arm was sore. My left arm was still sore from the 27 through April 11. April 7, I was having a hard time breathing, and my left arm swelled up where the injection was given. My husband took me to Hospital, and they said I was having a reaction to the COVID vaccine and gave me prednisone to help with the reaction. I went back to the same ER on April 9 and April 11 with the same problem, but worse. April 14, I went to work and passed out in the bathroom and called my husband to come to pick me up from work. He said our primary doctor, and then I went to . There they discovered a blood clot in my lungs. The doctor said it was a combination of my birth control pill and the COVID vaccine.

1280289	5/2/2021	TN	33	F	4/9/2021	4/9/2021	I was very ill on Friday night after receiving the vaccination. Flu-like symptoms, high fever, shortness of breath, pain in my abdomen, horrible headache, nausea, dizziness, loss of consciousness and leg pain (both legs). The flu-like symptoms passed on Saturday, but by Tuesday, April 13 I was continuing to have a terrible headache, abdominal pain and leg pain. I saw my primary doctor on the 13th and was sent over to the hospital for an ultrasound of my leg. No clots were found and I was told to continue trying to recover at home unless it got worse. I was seen at the emergency room on April 14th for abdominal pain, leg pain, dizziness and headache. The nurse told me I was probably hysterical over the vaccination being pulled, and I told him this was not the case. They performed CT (without contrast) on my abdomen and head, then released me with instructions to return if I was worse. By the 16th I was unable to walk as my left side was completely numb. I went back to the ER. I had a CT of my abdomen and head with and without contrast. I had a lumbar puncture and several labs. I was given IV antibiotics for some infection they found in my urine. I was given fluids and pain meds, and my BP was shooting up to 145/94 (which is very high for me), when standing. My vision was blurry and I was unable to remember much of the last week. I was admitted from the 16th through the 20th and had an MRV, 2 MRIs, more lab work and medicine for my headache. I was released on the 20th and the headache was unbearable and I was still numb on my left side, going back to my doctor on the 22nd. He suggested the ER, and the ER admitted me back to the stroke unit. I was released on the 22nd with a diagnosis of a hemiplegic migraine that could cause stroke-like symptoms (ZERO history of headaches previously). I was sent home with a walker and home health services. PT visited on April 30th and ordered two visits per week for the next month. I am unable to walk without a walker. I cannot shower or use the stairs without assistance. My memory is still foggy. I am unable to concentrate for long. I often stutter and can't remember basic words. I have also stopped and forgotten where I am at a given moment. I am on Depakote nightly for the headaches, and they have lessened slightly, but when they flare up it is debilitating and I often vomit. I have instructions to follow up with my primary tomorrow morning and see

1279696	5/2/2021	SC	50	F	3/27/2021	4/19/2021	patient reported to the pharmacy that they had to go to ER for blood clot on 04/19/2021
1279430	5/2/2021	TX	100	F	1/11/2021	1/11/2021	episodes of 4.5 seconds with non pulse; she experienced a basal artery blood clot stroke; lightheaded; This is a spontaneous report from a contactable consumer (patient's son). A 100-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in Arm Left on 11Jan2021 14:30 (at the age of 100years) as single dose for Covid-19 immunization. The patient is not pregnant at the time of vaccination. The patient's medical history was not reported. Concomitant medication included furosemide taken for an unspecified indication, start and stop date were not reported. The patient was not diagnosed with COVID-19 prior to vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. It was reported that the patient had medical issues starting within hours of the first dose of Covid vaccine. Prior, the patient was in independent living, no medications (as reported), walking about 1/2 daily and completely lucid. Immediately thereafter (after the vaccine, 11Jan2021 16:00), she experienced lightheaded, a hospital stay, and episodes of 4.5 seconds with non-pulse. A pacemaker was installed. During rehab, the patient experienced a basal artery blood clot stroke. The patient is still in rehab. The adverse events resulted in Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care, Hospitalization, Life threatening illness (immediate risk of death from the event), Disability or permanent damage. The patient was hospitalized on an unspecified date for 8 days. Treatment received included pacemaker, numerous medicines (e.g. AFIB). The patient had Covid test post vaccination: Nasal Swab on 15Jan2021 with negative result. The outcome of events was recovering. Information about lot/batch number has been requested.

1280421	5/2/2021	MA	52	F	4/29/2021	4/30/2021	52F with no known PMH developed progressive chest pain on 4/30/2021, admitted to Medical Center 5/2/2021 and found with NSTEMI with 95% proximal LAD occlusion w/ moderate thrombus successfully treated with drug-eluting stent x1. Pt received Pfizer vaccine #1 on 4/29. Of note, pt has not seen a doctor in several years, but labs notable for leukocytosis (WBC 14.0), polycythemia (Hgb 16.9) and thrombocytosis (PLT 959) concerning for undiagnosed polycythemia vera. If so, it is not clear whether her NSTEMI was a coincidence or whether the vaccine increased her risk of thrombosis.
1279439	5/2/2021	CA	29	F	4/11/2021	4/12/2021	chills; fever; nausea; rapid heart rate; body aches; headaches; lose my mental capacity; I was incoherent; threw up; This is a spontaneous report from a contactable consumer (patient). A 29-Year-old female (pregnant: No) patient received 1st dose of BNT162B2 (COVID vaccine, lot number=ER8729) on 11Apr2021 11:45 AM on Left arm for covid-19 immunization. Medical history was hospitalizations for heat exhaustion in 2014 and 2017, Herpes Type 2, covid prior vaccination. No other vaccine in four weeks. Concomitant drugs included Vitamin D, One-A-Day Vitamin. Symptoms started at 12:00 am midnight on 12Apr2021 with chills and fever. The morning of 12Apr2021, symptoms progressed into nausea, rapid heart rate, body aches, headaches, and I started to lose my mental capacity. I didn't know my address when I called an ambulance. When at the hospital, I didn't recognize my wife and forgot my mother's name. I was incoherent. I threw up. I don't remember 7 hours of time from my first day at the hospital. I got a spinal tap to test for meningitis which came back negative. I had an MRV brain scan which came back clear (no blood clots). Hospitalized for 5 days (12Apr2021-16Apr2021). AE resulted in Emergency room/department or urgent care, Hospitalization, Life threatening illness (immediate risk of death from the event). Outcome of the event was recovering. AE treatment was IV fluids, sodium, spinal tap, MRV brain scan. No covid tested post vaccination. No follow-up attempts needed. No further information expected.

1276686	5/1/2021	NJ	68	M	1/14/2021	1/15/2021	<p>Blood Clot; left knee had red marks above it; pain in thigh; swelling from the knee up to the thigh; left knee was in pain tremendously; difficulty walking; This spontaneous case was reported by a consumer and describes the occurrence of THROMBOSIS (Blood Clot) in a 68-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 013620A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 14-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 15-Jan-2021, the patient experienced GAIT DISTURBANCE (difficulty walking) and ARTHRALGIA (left knee was in pain tremendously). On 16-Jan-2021, the patient experienced ERYTHEMA (left knee had red marks above it), PAIN IN EXTREMITY (pain in thigh) and JOINT SWELLING (swelling from the knee up to the thigh). On an unknown date, the patient experienced THROMBOSIS (Blood Clot) (seriousness criterion medically significant). At the time of the report, THROMBOSIS (Blood Clot), GAIT DISTURBANCE (difficulty walking), ERYTHEMA (left knee had red marks above it), PAIN IN EXTREMITY (pain in thigh), JOINT SWELLING (swelling from the knee up to the thigh) and ARTHRALGIA (left knee was in pain tremendously) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Concomitant medications like high blood pressure medication, cholesterol medication and medication for irregular heartbeat were reported. On 15 Jan2021, the patient said that his left knee was in pain tremendously and had difficulty walking. On 16 JAN 2021, the left knee had Red marks above it. He also had swelling from the knee up to the thigh. He also experienced pain in the thigh and knee. He went to the doctor on 20 JAN 2021 and was sent for an ultrasound. The doctor thought it could be related blood clot. No laboratory details were provided. On 20-Jan-2021, the patient was sent for an ultra sound, results unknown. Treatment included ibuprofen and paracetamol. Company comment: Based on the current available information and temporal</p>

1276549	5/1/2021	CA	58	F	4/23/2021		<p>LEFT SIGMOID SINUS VEIN THROMBOSIS; PORTAL VEIN THROMBOSIS; SPLENIC VEIN THROMBOSIS; SUPERIOR MESENTERIC VEIN THROMBOSIS; LEFT INTERNAL JUGULAR VEIN THROMBOSIS; THROMBOCYTOPENIA; ABDOMINAL PAIN; HEADACHE; This spontaneous report was received from a physician and concerned a 58-year-old white female. Initial information was received on 27-APR-2021, with additional information obtained via telephone follow up from the physician on 29-APR-2021. The patient's specific height and weight were not reported. The patient's past medical history included fatty liver, and the patient was overweight. Family history was significant for a deep venous thrombosis treated with anticoagulants in the patient's mother, and a history of unspecified blood clots in her maternal grandmother. The patient was on no medications, including no estrogen containing pharmaceutical products or supplements. She has never been exposed to heparin. The patient had no history of COVID-19 infection. The patient received COVID-19 VACCINE AD26.COV2.S (suspension for injection, route of administration not reported, batch number not reported) on 12-APR-2021. The batch number has been requested. No concomitant medications were reported. On 18-APR-2021, 6 days after receiving vaccine, the patient developed a headache. On 23-APR-2021, 11 days after receiving vaccine, the patient presented to the hospital with complaints of headache and abdominal pain. COVID test in the emergency room was negative. On 23-APR-2021, imaging of the head and abdomen revealed: left sigmoid sinus vein thrombosis, portal vein thrombosis, splenic vein thrombosis, superior mesenteric vein thrombosis, left internal jugular vein thrombosis. The patient also had thrombocytopenia, with platelet count on presentation 22,000 (units not provided). D-dimer was elevated at &gt;12.8 (units not provided), Fibrinogen was low at 103 (units not provided), HIT antibody test by ELISA was positive, and physicians made the diagnosis of Vaccine-induced Thrombotic Thrombocytopenia (VITT). The patient was hospitalized in the intensive care unit. Treatment medications included argatroban, steroids and IVIG. Following treatment, the platelet count remained low, with a nadir of 17,000. On 27-Apr-2021, she underwent thrombectomy and thrombolysis of the intra-abdominal clots. This was</p>

performed due to the potential for portal hypertension in the future, given the extent of the thromboses. Repeat CT venogram of the head on an unknown date, revealed resolution of the sigmoid sinus vein thrombosis; the internal jugular thrombosis persisted. The patient has steadily improved since the thrombectomy. Abdominal pain and headache are improving. Platelet count has steadily risen, to 138,000 on 29- Apr-2021. Her transaminases were slightly elevated on admission and have not worsened, and she appears to have no organ dysfunction. A dialysis catheter had been placed in the event she would require plasmapheresis, but this was never used. Additional laboratory data included: IgG and IgM antibodies against the SARS-COV2 nucleocapsid protein positive; Protein C deficiency negative; Protein S deficiency negative; Homocysteine level (NR: not provided) negative. Serotonin release assay, anticardiolipin panel and Factor V Leiden tests were pending. The plan was to transition the patient to an oral anticoagulant and remove the dialysis catheter on 30-APR-2021, with a possible discharge on 01-MAY-2021. The patient had not recovered from left sigmoid sinus vein thrombosis, portal vein thrombosis, splenic vein thrombosis, superior mesenteric vein thrombosis, and left internal jugular vein thrombosis, and was recovering from left sigmoid sinus vein thrombosis, thrombocytopenia, headache and abdominal pain. This report was serious (Hospitalization Caused / Prolonged, and Life Threatening). Additional information was received from physician on 29-APR-2021. The following information was updated and incorporated into the case narrative: patient history, disease course, events, outcome, lab data, concomitant drugs.; Sender's Comments: V0: This spontaneous report concerns a 58-year-old female patient who experienced left sigmoid sinus vein thrombosis, portal vein thrombosis, splenic vein thrombosis, superior mesenteric vein thrombosis, left internal jugular vein thrombosis, thrombocytopenia, headache and abdominal pain, 11 days after receiving COVID-19 VACCINE AD26.COV2.S. The patient is overweight and there is a family history of clots in her mother and maternal grandmother. Imaging of the head and abdomen revealed multiple sites of thrombus formation, platelet count was 22,000, D-dimer was elevated at >12.8 (units not provided), Fibrinogen was

low at 103 (units not provided), and HIT antibody test by ELISA was positive. Physicians made the diagnosis of Vaccine-induced Thrombotic Thrombocytopenia (VITT). The patient was treated with argatroban, IVIG, and steroids. Platelet counts remained low and she underwent thrombectomy of the intra-abdominal thrombi. Following thrombectomy the platelet counts rose and abdominal pain began to improve. Lab data included a positive test for IgG and IgM antibodies against the SARS-COV-2 nucleocapsid protein. Based on the evolving knowledge of Thrombosis with Thrombocytopenia Syndrome (TTS, per definition from Brighton Collaboration), the low platelet count and temporal relationship to vaccination, we consider the events to have a plausible relationship with vaccination.

BLOOD CLOTS; This spontaneous report received from a consumer (source: news report) concerned a female of age under 60. The patient's weight, height, and medical history were not reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: unknown, expiry: unknown) dose, start therapy date were not reported, 1 total administered for prophylactic vaccination. The batch number was not reported. Per procedure, no follow-up will be requested for this case No concomitant medications were reported. It was reported from a news story that, on an unspecified date, the patient experienced blood clots which was in investigation by an agency. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of blood clots was not reported. This report was serious (Other Medically Important Condition). This case, from the same reporter is linked to 20210454646.; Sender's Comments: V0:20210454446-covid-19 vaccine ad26.cov2.s- Blood clots. This event(s) is considered unassessable. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the event(s).

1276626	5/1/2021		49	M	4/19/2021		DEEP VEIN THROMBOSIS; This spontaneous report received from a consumer concerned a 49 year old male. The patient's weight was 80.3 kilograms, and height was 182.9 centimeters. The patient's past medical history included post-operative deep vein thrombosis (more than 30 years ago), depression, heart murmur, and back surgery, and his concurrent conditions included non-smoker, no alcohol use, and marijuana abuse. The patient had no history of known allergies. The patient's mother had a history of aneurysm. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: unknown, and expiry date: unknown) dose was not reported, administered on 08-APR-2021 for prophylactic vaccination. The batch number was not reported and has been requested. Concomitant medications included fexofenadine hydrochloride (Allegra) for allergy, rivaroxaban (Xarelto) for venous thromboembolism, and omeprazole (Prilosec) for unknown indication. About one and half weeks after vaccination, on 21-APR-2021, the patient was taken to the emergency department and was admitted with the complaints of leg pain since 2 days with suspected blood clot in leg. Over the last days, patient's left leg looked swollen compared to the right leg. The patient also had pain, initially started in groin area and radiated down across the anterior portion of the leg, then to posterior leg, and into toes. The patient also had some intermittent tingling in toes. The patient denied of weakness, numbness or persistent paresthesia. The patient was concerned regarding the pain as it felt similar to the post-operative deep vein thrombosis he had in the past. The patient had been anxious since vaccination when hearing about the development of blood clots. The patient also denied of fevers, chills, chest pain, shortness of breath abdominal pain, nausea, vomiting, diarrhea, and difficulty walking. On 21-APR-2021 16:25, the patient's laboratory data included: Blood pressure (148/66 mmHg), Body mass index (24), Body temperature (98.8 F), Oxygen saturation (100 %) Pulse rate (88), and Respiratory rate (16). On 21-APR-2021 16:32, laboratory data included: Blood pressure (148/66 mmHg), Body temperature (97.8 F), Oxygen saturation (100 %), Pulse rate (91), and Respiratory rate (15). Other general physical examinations included: General: Well-developed well-nourished in no acute distress. HEENT

----------	-------	-------	---------	-----	----------	------------	--------------

(Head, Eye, Ear, Nose, Throat) examination: normocephalic atraumatic extra ocular motions are intact. Neck examination: Supple without jugular vein distention or meningismus. Lung examination: Clear auscultation bilaterally without wheezes rales or rhonchi. Heart examination: Regular rate and rhythm without murmurs rubs or gallops. Abdomen examination: Soft no tender non-distended without rebound or guarding. Extremities: Without clubbing cyanosis edema, no lacerations or abrasions or ecchymosis noted, no appreciable size difference in the left leg compared to the right, the patient had some tenderness throughout palpation of the medial thigh on the left with radiation up into the left inguinal region, no calf tenderness or swelling, no erythema, palpable posterior tibialis pulse. Skin examination: Warm and dry and well perfused. Psych examination: Appropriate mood and affect. Neuro examination: Cranial nerves 2-12 are grossly intact, strength is 5/5 in upper and lower extremities, full distal sensation in the left lower extremity, full plantar and dorsiflexion of the left foot including the left great toe, sensation is grossly intact, awake, alert and oriented x3. On ultrasound Doppler venous lower extremity test, identified sub occlusive thrombus in the left superficial femoral veins, likely related to organizing/chronic thrombus, however no prior imaging was available at the institution for comparison, no evidence of occlusive deep vein thrombosis. The final diagnosis was made as Deep Vein Thrombosis (DVT). At no time the patient had ever endorsed any chest pain/pleuritic pain, shortness of breath or exertional dyspnea. Due to the nature of this clot, a course of anticoagulation was planned. Patient was prescribed with Xarelto at twice daily starting doses, with transition to 20 mg doses. During the initiation of treatment, the patient should be followed up by his primary care physician for further evaluation. The patient stated that he would call the primary care physician in the following morning for follow-up appointment. The patient was discharged from the hospital on APR-2021. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of deep vein thrombosis was not reported. This report was serious (Hospitalization Caused / Prolonged, and Other Medically Important Condition).; Sender's Comments: V0: 20210457179-Covid-19 vaccine ad26.cov2.s-deep vein thrombosis. This event is

1276541	5/1/2021	TN		F	4/3/2021		FACE WENT SOLID WHITE; UNABLE TO GET WORDS OUT; SWEATING OF THE PALMS AND FEET AND FACE; DIZZY/ VERY LIGHTHEADED; FATIGUE/FELT DRAINED/VERY TIRED/EXHAUSTED; ELEVATED D-DIMER; ELEVATED BLOOD PRESSURE; HEAVINESS IN THE CHEST; PINKY FINGER FELT TINGLE-Y AND NUMB; HEADACHE; This spontaneous report received from a patient concerned a 48 year old white, Not Hispanic or Latino female. The patient's height, and weight were not reported. The patient's past medical history included urinary tract infection, and concurrent conditions included occasional migraines. The patient was not pregnant at the time of this report. The patient had family history of heart problems and was doing exercise three times per week. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1805031, expiry: 26-MAY-2021) dose was not reported, 1 total administered on 30-MAR-2021 around 13:15 to the left arm for prophylactic vaccination. No concomitant medications were reported. On 03-APR-2021, she felt dizzy, had a headache which was a different kind of headache from her migraines and was very lightheaded. The patient was out riding motorcycles when the symptoms occurred, but she was drained so she had to leave early. On 04-APR-2021, on her way home from visiting her grandmother she felt the same type of headache. Her chest started feeling heavy, her pinky finger felt tingly and numb, and her palms and feet were sweaty. On 05-APR-2021, all of her symptoms kept magnifying and worsened, but she was not able to get in to see her physician. On 06-APR-2021, the patient went to the gym and had to get off the elliptical because she was so fatigued and had chest heaviness. She went to the MD later that day where they did an EKG (electrocardiogram) which showed an abnormal line, but nothing major and her CXR (chest X-ray) was clear, although her BP (blood pressure) was elevated. They wanted to do a stress echo at a later date. On 07-APR-2021, the patient symptoms got even worsened when she was at work. The patient's face turned solid white, her face, palms, and feet were sweaty, and she was dizzy. After the end of the episode, she was not able to get words to come out, like she was having a mini stroke, which had lasted 30 minutes. The patient then became

very tired and exhausted. The patient's coworkers drove her to the Emergency Room around 13.00. The patient was administered with heparin and also took an echocardiogram. They wanted her to do more tests including nuclear stress echo as an outpatient with her physician. The patient was discharged on 08-APR-2021. The episodes continued after her hospital visit. She went back to work on 12-APR-2021 and it happened again, so the patient was taken back to her doctor. The patient underwent a d-dimer test and it was slightly elevated. The patient also took an MRI (magnetic resonance imaging) and it was clear with no clots or bleeding, but the episodes were still happening. The patient was feeling better at the time of this report and would be going to meet her neurologist. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from unable to get words out on 07-APR-2021, and elevated blood pressure on APR-2021, had not recovered from dizzy/ very lightheaded, headache, fatigue/felt drained/very tired/exhausted, heaviness in the chest, and sweating of the palms and feet and face, and the outcome of pinky finger felt tingle-y and numb, face went solid white and elevated d-dimer was not reported. This report was serious (Hospitalization Caused / Prolonged).; Sender's Comments: V0: 20210454164-COVID-19 VACCINE AD26.COV2.Sweating of the palms and feet and face, face went solid white, Dizzy/very lightheaded. This event(s) is considered unassessable. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the event(s). 20210454164-COVID-19 VACCINE AD26.COV2.S-fatigue/felt drained/very tired/exhausted. 1276790	5/1/2021	NJ	56	F	2/12/2021	3/29/2021	having a blood clot down whole right leg / up right side into right chest / under right breast / several clots in her lower abdomen; she almost died; urinary tract infection; right leg is very swollen; Kept losing consciousness/Passed out; hard time walking; had to use a walker; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of THROMBOSIS (having a blood clot down whole right leg / up right side into right chest / under right breast / several clots in her lower abdomen), LOSS OF CONSCIOUSNESS (Kept losing consciousness/Passed out) and FEELING ABNORMAL (she almost died) in a 56-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 002b21a and 004m20a) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concomitant products included LEVOFLOXACIN, RIVAROXABAN (XARELTO), LISINAPRIL, HYDROCHLOROTHIAZIDE, OXYCODONE and LEVOTHYROXINE SODIUM (SYNTHROID) for an unknown indication. On 12-Feb-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 12-Mar-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 29-Mar-2021, the patient experienced GAIT DISTURBANCE (hard time walking) and WALKING AID USER (had to use a walker). On 12-Apr-2021, the patient experienced THROMBOSIS (having a blood clot down whole right leg / up right side into right chest / under right breast / several clots in her lower abdomen) (seriousness criteria hospitalization prolonged, medically significant, life threatening and intervention required) and LOSS OF CONSCIOUSNESS (Kept losing consciousness/Passed out) (seriousness criterion medically significant). 12-Apr-2021, the patient experienced FEELING ABNORMAL (she almost died) (seriousness criteria hospitalization and medically significant). On 26-Apr-2021, the patient experienced PERIPHERAL SWELLING (right leg is very swollen). On an unknown date, the patient experienced URINARY TRACT INFECTION (urinary tract infection). The patient was hospitalized from 12-Apr-2021 to 19-Apr-2021 due to FEELING ABNORMAL and THROMBOSIS. On 12-Apr-2021, LOSS OF CONSCIOUSNESS (Kept losing

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

consciousness/Passed out) had resolved. At the time of the report, THROMBOSIS (having a blood clot down whole right leg / up right side into right chest / under right breast / several clots in her lower abdomen) was resolving and FEELING ABNORMAL (she almost died), URINARY TRACT INFECTION (urinary tract infection), GAIT DISTURBANCE (hard time walking), PERIPHERAL SWELLING (right leg is very swollen) and WALKING AID USER (had to use a walker) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 12-Apr-2021, Computerised tomogram: blood clots (abnormal) blood clot. On 12-Apr-2021, Ultrasound scan: blood clots (abnormal) blood clots. Action taken with mRNA-1273 in response to the events was not applicable. Patient stated she was in the ICU24-48 hours then transferred to another area of the hospital where she spent another 5-6days. She is still having to use a walker. Her right leg is very swollen. She has to walk and keep her right leg elevated. Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. However, Further information has been requested. This case was linked to MOD-2021-090647 (Patient Link).; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. However, Further information has been requested.

1276281	5/1/2021	KY		M	1/28/2021	4/1/2021	Blood clot in the right eye; This is a spontaneous report from a contactable consumer(patient) based on information received by Pfizer, license party for apixaban (ELIQUIS). This spontaneous case was reported by a consumer and describes the occurrence of OPTHALMIC VEIN THROMBOSIS (Blood clot in the right eye) in male patient of an unknown age who received apixaban (Eliquis) for an unknown indication. CO-SUSPECT PRODUCTS included Covid-19 Vaccine for an unknown indication. On an unknown date, the patient started Eliquis (unknown route). On 07-Jan-2021, the patient started Covid-19 Vaccine (unknown route). In April 2021, the patient experienced OPTHALMIC VEIN THROMBOSIS (seriousness criterion medically significant). The action taken with Eliquis (Unknown) was unknown. At the time of the report, OPTHALMIC VEIN THROMBOSIS outcome was unknown. The consumer received his first Pfizer covid 19 shot on 07-Jan-2021 and the second one on 28-Jan- 2021, and 10 days prior to this report he got a blood clot in his right eye. He takes a blood thinner and remarks this should keep him from getting blood clots, should not it. Blood thinner provided was Eliquis. The event was related to covid 19 vaccine and causality with Eliquis was not provided. For Eliquis (Unknown), the reporter did not provide any causality assessments. This case was received via pfizer. BMS Medical Evaluation Comment: This patient had ophthalmic vein thrombosis while on therapy with apixaban and after taking covid 19 vaccine. Underlying thromboembolic risk as ascertained by the use of apixaban is a significant factor that likely predisposed the patient to develop ophthalmic vein thrombosis and considered not related to apixaban therapy. Causality Assessment: For apixaban: the causal relationship of the event Ophthalmic vein thrombosis with the suspect product apixaban was not provided Per Reporter; the causal relationship of the event Ophthalmic vein thrombosis with the suspect product apixaban was Not Related Per Company (Bristol-Myers Squibb)

1276794	5/1/2021	OH	67	F	2/26/2021	4/2/2021	Blood clot in leg; This spontaneous case was reported by a consumer and describes the occurrence of THROMBOSIS (Blood clot in leg) in a 67-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 002B21A and 002A21A) for COVID-19 vaccination. No Medical History information was reported. On 26-Feb-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 26-Mar-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 2 dosage form. On 02-Apr-2021, the patient experienced THROMBOSIS (Blood clot in leg) (seriousness criteria hospitalization and medically significant). The patient was hospitalized from 02-Apr-2021 to 06-Apr-2021 due to THROMBOSIS. The patient was treated with Surgery (Angioplasty) for Thrombosis. On 06-Apr-2021, THROMBOSIS (Blood clot in leg) had resolved. Not Provided Concomitant product use was not provided by the reporter. The patient received both scheduled doses of mRNA-1273 prior to the events; therefore, action taken with the mRNA-1273 in response to the events was not applicable.; Sender's Comments: Based on current available information and the temporal association between product use and the stat date of the events a causal relationship cannot be excluded.

1276425	5/1/2021	LA	35	F	3/1/2021		<p>DIFFICULTY BREATHING(LOW OXYGEN); ELEVATED D-DIMER; INABILITY TO MOVE; LOW BODY TEMPERATURE; TINGLY FACE; RED FACE; FELT BAD AND AWFUL; This spontaneous report received from a patient concerned a 35 year old female. The patient's height, and weight were not reported. The patient's past medical history included anaphylaxis reaction, and concurrent conditions included fibromyalgia. The patient did not had previous history of allergy to vaccine. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1605018,expiry: unknown) dose was not reported,1 total administered on 20-MAR-2021 to the right arm for prophylactic vaccination. No concomitant medications were reported. On 20-MAR-2021, 20 minutes after vaccination, the patient's felt her face red and tingly and it went away. On 29-APR-2021, nine days after receiving the vaccine, the patient woke up not able to breathe or move and had a temperature of 94 degree F. The patient went to hospital and had low oxygen, an elevated d-dimer and had no evidence of blood clots in CT (computed tomography) scan. The patient was treated in ER (emergency room) with epinephrine, steroids, diphenhydramine (Benadryl) and a unspecified nebulizer and then she could breathe. The patient's physician tested her d-dimer for second time following the patient's visit to the hospital and it was elevated, but not as high. The patient had history of fibromyalgia and mysterious health condition but it was reported that she did not have anything like what she experienced after vaccination and she felt really bad and super awful. The patient was not feeling great, but better and can breathe again at the time of this report; her oxygen level also was normal. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from difficulty breathing(low oxygen) on 2021, and red face, was recovering from felt bad and awful, had not recovered from elevated d-dimer, and the outcome of tingly face, inability to move and low body temperature was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: 20210446229- covid-19 vaccine ad26.cov2.s -Difficulty breathing(Oxygen).
