1276538	5/1/2021	TX		F		4/8/2021	<p>COLLAPSED LUNG; PAIN IN RIBS; PAIN IN BACK; PAINFUL BREATHING; COULDN'T FUNCTION; MASSIVE ALLERGIC REACTIONS; BUMPS; SORE ARM; SLEEPY; DIZZY; SHAKY; HURTS TO WALK; HURTS TO TALK; BURNING SENSATION ON RIB CAGE TO THE BACK; MASSIVE CHILLS AND TEETH CHATTERING; JOINT PAIN; MASSIVE HEADACHE;</p> <p>This spontaneous report received from a patient concerned a 55 year old female. The patient's weight, height, and medical history were not reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 042A21A, expiry: UNKNOWN) dose was not reported, administered on 08-APR-2021 for prophylactic vaccination. No concomitant medications were reported. On the night of 08-APR-2021, after her vaccination, patient had massive chills, teeth chattering, a massive headache, and her knees felt like they were going to break. The next day of the vaccination, 09-APR-2021, patient had a slight headache and felt really weak and not good at all. On 10-APR-2021, patient felt just fine but her arm was sore for like a week but thought that was normal. On 15-APR-2021, patient felt hurt to breath, walk and talk and patient had a burning sensation on her rib cage that went all the way to her back. The patient went to the Emergency Room(ER) and at the ER, they said she had a collapsed lung. At the ER, patient underwent computerized tomogram scan, Electrocardiogram, chest X-ray and lab work. No blood clots found in test reports. The patient was recommended to take deep breaths and drink lots of water by doctor at the ER, which she did. On the 22-APR-2021 patient saw her regular doctor who told her that she had a massive allergic reaction to the shot. The patient's doctor gave her gabapentin 100mg three times daily, along with tramadol. The patient had no relief hence the medication dose was increased to 300 mg of gabapentin in the morning and 300 mg at night. Patient took 300 mg at night and 300 mg morning of the reporting but by 11:00 on the day of reporting she was sleepy, shaky and dizzy, she couldn't function. Patient lay down for a while and got back up at 2:30pm. After waking up the pain was worse. It was hard to breathe while she was deep breathing. Every time she breathes there was a sharp pain between her lungs and chest. Patient was not able to drive because of the bumps. Laboratory data</p>

1278916	5/1/2021	MA	60	F	3/26/2021	3/27/2021	DVT blood clot; ankle was still swollen and uncomfortable; ankle was still swollen and uncomfortable/discomfort; nights were the worst for the pain; pulse ox was low; d-dimer was very high; fainted; Fracture of ankle/two fractures on her ankle; severely nauseous; Vomiting; Diarrhea; deathly sick; This is a spontaneous report from a contactable consumer, reporting for herself. A 60-year-old female patient received the first dose of the bnt162b2 (BNT162B2; Lot Number: ER8727), via an unspecified route of administration in the left arm on 26Mar2021 at 14:00 at a single dose for covid-19 immunisation. Medical history included osteoporosis at least 10 years, terrible nausea, mild case of covid from Nov2020 to an unknown date. There were no concomitant medications. The patient previously took alendronate from 2008 to an unknown date and experienced very sick, nausea, diarrhoea and zoledronic acid (RECLAST) from Dec2017 and experienced nausea and vomiting. On 27Mar2021 at 2:00, the patient experienced deathly sick, fainted, fracture of ankle/two fractures on her ankle, severely nauseous, vomiting, and diarrhea. On an unknown date, the patient experienced dvt blood clot, ankle was still swollen and uncomfortable/discomfort, the nights are the worst for the pain, pulse ox was low, and d-dimer was very high. The event, deathly sick, was life-threatening. The clinical course was as follows: the patient had the first dose of the vaccine on 26Mar2021 at 14:00 in the afternoon in her left arm. Twelve hours after the first dose, later in the night about 02:00 AM she woke up deathly sick; and severely nauseous. She remembered she was going to the bathroom then she must have fainted because they were taking her to the hospital. She went to the ER and they found she had a fractured ankle. She was not admitted to the hospital. She was in the ER from about 03:00 AM to noon the next day. There must have been something in there; she knew there must be something in the vaccine because of her reaction. Adds a few years ago, something like this happened before. She had osteoporosis and had similar reactions with other products she had tried for osteoporosis; she had terrible nausea. The other products she tried included: in 2008 she took alendronate, it made her very sick but not as severe as this time, she never fainted. She had nausea and diarrhea. Then in Dec2017 she had zoledronic acid.

----------	-------	-------	---------	-----	----------	------------	--------------

She went for an infusion at the hospital then went shopping, and was fine until the early morning, when she woke up with nausea and vomiting. In the ambulance, they gave her ondasetron (ZOFTRAN) for the nausea so the vomiting stopped. With regard to her ankle, first they thought it was a DVT blood clot. They did the xray and saw actually two fractures on her ankle but she does not need surgery. She saw the orthopedic doctor the other day and he said her ankle was healing but she still will have no weight bearing for 6 weeks and she was in a boot. Adds her ankle was still swollen and uncomfortable. She hated to take medications and they gave her oxy but she didn't want to take it. She was taking ibuprofen but that messed up her stomach. The nights are the worst for the pain and discomfort. Doctor at the hospital and primary care agreed she should not have the second dose. She did have mild case of COVID in Nov2020 and they are hoping she had antibodies from the infection and the first dose. Her primary care doctor was reviewing the blood work she had done at the hospital and told her they were surprised the hospital didn't admit her for observation because her pulse ox was low and there was another test that she was questioning because the d-dimer was very high. They did a chest x ray with unknown results. The doctor was questioning why they didn't do something else to rule out a blood clot. Therapeutic measures were taken as a result of the events, deathly sick, DVT blood clot, fainted, fracture of ankle/two fractures on her ankle, severely nauseous, vomiting, diarrhea, ankle was still swollen and uncomfortable/discomfort, nights were the worst for the pain, pulse ox was low, and d-dimer was very high. The clinical outcome of the events, deathly sick, fainted, severely nauseous, vomiting, diarrhea, was recovered on 27Mar2021. The clinical outcome of the events, DVT blood clot and nights were the worst for the pain, pulse ox was low, and d-dimer was very high, was unknown. The clinical outcome of the event, fracture of ankle/two fractures on her ankle, was recovering. The clinical outcome of the event, ankle was still swollen and uncomfortable/discomfort, was not recovered. No follow-up attempts are needed. No further information is expected.

This case was split from master case #2021402787 to capture a female patient taking BNT162B2 and experienced drug ineffective, COVID-19, and tongue disorder. A 77-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), dose 1 on an unspecified date (Batch/Lot number UNKNOWN) as single dose, dose 2 unknown on an unspecified date (Batch/Lot number UNKNOWN) as single dose for covid-19 immunisation. Medical history included ongoing rheumatoid arthritis with rheumatoid factor of right hand without organ or systems involvement. Concomitant medication(s) included etanercept (ENBREL) taken for rheumatoid arthritis,; fluticasone propionate, salmeterol xinafoate (ADVAIR HFA); citalopram hydrobromide (CITALOPRAM HYDROBROMIDE); clotrimazole (CLOTRIMAZOLE); levothyroxine sodium (LEVOTHYROXINE SODIUM); meclizine hcl (MECLIZINE HCL), methotrexate (METHOTREXATE); omeprazole, sodium bicarbonate (OMEPRAZOLE/SODIUM BICARBONATE); clopidogrel (CLOPIDOGREL); clorazepate dipotassium (CLORAZEPATE DIPOTASSIUM); doxycycline hyclate (DOXYCYCLINE HYCLATE). The patient stated she has had both the COVID vaccines and developed rash on tongue as a result. Since on an unknown date, the patient was feeling tired, decreased strength and difficulty walking. Patient was using walker. Patient stated she was unable to participate in exercise programs as she would like because of health. Recently, on an unknown date in 2021, the patient was diagnosed with COVID. The patient stated, along with recent COVID diagnosis has caused some anxiety. No treatment information was received. The outcome of the event covid-19 was reported as not recovered/not resolved. Action taken with Enbrel and Single Dose Prefilled Autoinjector was reported as unknown for the event covid-19. The causal relationship between the event covid-19 and Enbrel with Single Dose Prefilled Autoinjector was not provided by the consumer. The reporter declined consent for follow</p>

1278947	5/1/2021	IL	57	F	4/12/2021	4/1/2021	swollen submandibular lymph nodes; swelling/swelling went to the back, the shoulder blade up the left side of her neck; swelling/swelling went to the back, the shoulder blade up the left side of her neck; redness; pain started at injection site; pain went from her elbow to shoulder and then up her shoulder and up to the neck; pain went from her elbow to shoulder and then up her shoulder and up to the neck/she still has arthritic type pain in left arm socket.; couldn't lift her left arm at all; deep ache/ to her back; crying; This is a spontaneous report from a contactable nurse (patient). A 57-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration, administered in left arm on 12Apr2021 at 16:30 (lot number reported as "EN or W 0161, EN0161 or EW0161") at a single dose for COVID-19 immunisation. Medical history included diabetic from 2008, blood clots , COVID-19 (reported as April; year unknown), insulin dependent in 2014 , Protein S deficiency, genetic disorder that makes her have blood clots, neuropathy. Concomitant medications included warfarin sodium (COUMADIN) taken for Protein S deficiency, genetic disorder that makes her have blood clots from 2007 to an unspecified stop date; gabapentin taken for neuropathy from Sep2019. Patient stated that she gets a mild case of the flu when she gets the flu vaccine, but she doesn't remember back to childhood. She got an MMR booster about 20 years ago and had no problems then. Family Medical History: both parents had diabetes; mother has Protein S deficiency as well that causes blood clots. The vaccine was administered at healthcare facility. The patient did receive previous immunization with a Pfizer vaccine. The patient did not receive other vaccines within four weeks prior to COVID vaccination. The patient received her first shot on Monday 12Apr2021 and was fine until 12 hours later. Her arm swelled up and she couldn't lift it. Then the swelling went to the back, the shoulder blade up the left side of her neck. She could feel her lymph nodes and so she was icing it, taking Tylenol and the swelling has gone down. The redness was gone but she still has arthritic type pain in left arm socket. She can lift and move the left arm, but it hurts, and it also hurts when she turns her head to the right. She received the Pfizer COVID vaccine in her left arm. The pain started at injection site and then went from her

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

elbow to shoulder and then up her shoulder and up to the neck. Her family was commenting on her neck being swollen. She received her shot at 4:30 PM on 12Apr2021. The redness and swelling started at around 5:00 AM on 13Apr2021. A couple hours after Pfizer COVID vaccine injection the pain started. She waited for 30 minutes because she takes coumadin for a history of blood clots, nurse wanted to wait to make sure her arm wouldn't bleed. She has been taking Benadryl ointment and icing it for 3 days as treatment for the events. She got up at two this morning to go to the bathroom and noticed she could still feel the pain when she turns her head to the right. She had swollen submandibular lymph nodes and could feel two of them before. When she woke up, she could not feel her lymph nodes. Everything has recovered except for the pain. The patient stated that on the first day the symptoms were disabling, and she couldn't lift her left arm at all. They got better once she started icing it and rested instead of doing chores. She keeps popping Tylenol every 6 hours, Benadryl and refilling ice bag with one ice bag on neck and one ice bag on arm. There was a deep ache right now in the socket that goes up her neck and down the shoulder blade to her back. Right now, she doesn't like to be in any pain and would say the pain was mild compared to how it was, the pain was so bad she was rocking and crying. Her brother gave her one of her mother's pain pills, one Vicodin because she was in so much pain. She can control the pain now with the extra strength Tylenol. She got the Pfizer COVID vaccine for lots of reasons. She has a lot of health problems, she had COVID virus last April and that was why she was having this reaction since she already has antibodies. She takes care of her mother who was sicker than she was. She was out in the real world and she doesn't want to bring anything home or get anything herself. She thought gabapentin would have made it to where she did not have the arthritic pain from vaccine. She takes gabapentin for neuropathy. She was diabetic and that may have something to do with it too. Patient stated that everyone else in her family got Johnson and Johnson and nobody had reactions. She was supposed to get at the Johnson and Johnson shot first but with the shortage it was switched over the to Pfizer COVID vaccine. This was her first dose of the Pfizer COVID vaccine. Redness and swelling started at

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

around 5:00 AM 13Apr2021. Pain started around 6:30 PM. The events did not require emergency room visit or hospitalization. She was at the urgent care yesterday where she gets her INR checked and the nurse said she didn't see any swelling but believed she was in pain because she didn't want to lift the left arm. The reporter assessed the events swelling, redness, and pain were considered serious (disabling). Outcome of the events vaccination site pain, neck pain, arthralgia, and back pain was recovering, for event crying was unknown, for event swollen submandibular lymph nodes was recovered on unspecified date, while for events swelling, joint swelling and redness was recovered on 16Apr2021. Information on the lot/batch number has been requested.dft; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate

1278908	5/1/2021	MD	50	F	3/12/2021	4/5/2021	<p>A Blood clot was found; Cellulitis; Migraine started within 24 hours; left calf pain/Leg increased in swelling and burning pain; severe swelling and burning sensation; severe swelling and burning sensation; Leg increased in swelling and burning pain; Phlebitis; This is a spontaneous report from a contactable consumer (patient). A 50-year-old female patient received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number: EN6199/EN5318), via an unspecified route of administration administered in left arm at doctor's office/urgent care facility on 12Mar2021 15:00 as SINGLE DOSE for COVID-19 immunisation. The patient was not pregnant at the time of vaccination. The patient was not COVID tested post vaccination. The patient had no other vaccines in four weeks. Medical history included high blood pressure and sleep apnea. Concomitant medications included amoxicillin, valsartan, amlodipine, and vitamin d [vitamin d nos]. The patient previously took doxycycline and experienced allergies. Historical vaccine includes first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) on an unspecified date for COVID-19 immunisation. On 05Apr2021 at 03:00 PM, the patient experienced a blood clot was found, cellulitis, migraine started within 24 hours, left calf pain/leg increased in swelling and burning pain, severe swelling and burning sensation, leg increased in swelling and burning pain, and phlebitis. It was further reported that migraine started within 24 hours. 48 hour left calf pain that got increasingly worse leading to a severe swelling and burning sensation. The patient went to right time urgent care on Friday, 09Apr2021. The patient was diagnosed with cellulitis. It was also reported that pain increased swelling spread and went to emergency room (ER) on 10Apr2021 for ultrasound of leg. No clots and was advised if worsened to come back. The patient's leg increased in swelling and burning pain. The patient went to urgent care patient first on 11Apr2021 and then the doctor on Monday, 12Apr2021 where she was sent for a STAT ultrasound due to major pain and swelling. A blood clot was found. Phlebitis was diagnosis. The patient was sent to a vascular surgeon on 13Apr2021 and vein specialist on 15Apr2021. The patient was given Xarelto blood thinners and started taking them on 15Apr2021. All of this began 48 hours after taking the second vaccination (pending</p>

1279063	5/1/2021	MI	67	M			<p>Thrombocytopenia; He had clot in the legs and in the lungs; He had clot in the legs and in the lungs; Low platelet count; This is a spontaneous report from a contactable Other-HCP. A 67-years-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date (Batch/Lot number was not reported) as SINGLE DOSE for covid-19 immunisation (Age at vaccination: 67 years). Medical history included diabetes. Concomitant medication(s) included atorvastatin (LIPITOR [ATORVASTATIN]); colecalciferol (VITAMIN D [COLECALCIFEROL]); lisinopril; insulin taken for diabetes mellitus. The patient experienced thrombocytopenia, he had clot in the legs and in the lungs and have a low platelet count on an unspecified date. The patient was hospitalized for the events on an unspecified date. The patient underwent lab tests and procedures which included CBC: unknown result on 08Apr2021, Heparin associate antibody: unknown result, comprehensive metabolic panel (CMP): unknown result and platelet count: low on an unspecified date. Therapeutic measures were taken as a result of thrombosis included Heparin drip and Argatroban. Outcome of the events was unknown. Information about lot/batch number has been requested.; Sender's Comments: The reported events are considered unrelated to BNT162B2 vaccine, being rather intercurrent occurrences. Clots in the legs and in the lungs were likely favored by the mentioned diabetes and by a possible hyperlipidemia (the patient was taking atorvastatin) in a setting of possible arterial hypertension (the patient was taking lisinopril). The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p>

1279205	5/1/2021			U		4/1/2021	I got a blood clot in my varicose vein in my left leg; This is a spontaneous report from a contactable consumer(patient). A patient of unspecified age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot number was not reported), on an unspecified date at single dose for covid-19 immunisation. The patient medical history included varicose vein in the left leg. Concomitant medications were not reported. On an unspecified date in Apr2021, the patient developed a blood clot in the varicose vein in the left leg. Patient clarified that after talking to the doctor patient thought may had the adverse reaction to the first vaccine. Patient was supposed to get Pfizer Vaccine at the day of reporting but when talk to doctor and the urgent care where was supposed to be getting it, rescheduled it for 04May2021 because 3 days before (in Apr2021) patient got a blood clot in varicose vein in left leg so, they didn't want to go and get the vaccine and rescheduled it for 04May2021. Patient asked if he/she should even get the second vaccine.The final outcome of the event was unknown. Information on the lot/batch number has been requested

1279144	5/1/2021	NY	48	U	1/21/2021	1/31/2021	Passed out; Blood clots in lungs; almost died from the vaccine; Problem in breathing; This is a spontaneous report from a contactable consumer (patient) reported that a 48-year-old patient of an unspecified gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL3247), via an unspecified route of administration, administered in arm right on 21Jan2021 (at the age of 48-years-old) as a single dose for covid-19 immunisation. The patient was healthy and had no suffering from any medical condition. Concomitant medication included sertraline hydrochloride (ZOLOFT) taken for an unspecified indication, start and stop date were not reported. The patient had his/her shot on 21Jan2021 and about 10 days later he/she was having problem in breathing. When the patient went to work, he/she passed out at work and they sent him/her to the hospital and he/she wound up in the hospital on 12Feb2021 and they found out that he/she have blood clots in his/her lungs. The patient added that the matter of concern was he/she almost died from the vaccine. The patient was discharged on 14Feb2021 and he/she went in on 12Feb2021 and they did the catheter to remove the blood clot. The patient was hospitalized due to blood clots in his/her lungs and prior to going to the hospital, a week, and a half before that he/she was having breathing issues. The patient underwent lab tests and procedures which included blood test with unknown results on Feb2021. The patient was supposed to get the 2nd dose on 11Feb2021, but he/she never went because he/she wound up in hospital. The patient right now was taking blood thinner named Eliquis after he/she wind up with clot. The outcome of the events was unknown.

1276281	5/1/2021	KY		M	1/28/2021	4/1/2021	<p>Blood clot in the right eye; This is a spontaneous report from a contactable consumer(patient) based on information received by Pfizer, license party for apixaban (ELIQUIS). This spontaneous case was reported by a consumer and describes the occurrence of OPTHALMIC VEIN THROMBOSIS (Blood clot in the right eye) in male patient of an unknown age who received apixaban (Eliquis) for an unknown indication. CO-SUSPECT PRODUCTS included Covid-19 Vaccine for an unknown indication. On an unknown date, the patient started Eliquis (unknown route). On 07-Jan-2021, the patient started Covid-19 Vaccine (unknown route). In April 2021, the patient experienced OPTHALMIC VEIN THROMBOSIS (seriousness criterion medically significant). The action taken with Eliquis (Unknown) was unknown. At the time of the report, OPTHALMIC VEIN THROMBOSIS outcome was unknown. The consumer received his first Pfizer covid 19 shot on 07-Jan-2021 and the second one on 28-Jan- 2021, and 10 days prior to this report he got a blood clot in his right eye. He takes a blood thinner and remarks this should keep him from getting blood clots, should not it. Blood thinner provided was Eliquis. The event was related to covid 19 vaccine and causality with Eliquis was not provided. For Eliquis (Unknown), the reporter did not provide any causality assessments. This case was received via pfizer. BMS Medical Evaluation Comment: This patient had ophthalmic vein thrombosis while on therapy with apixaban and after taking covid 19 vaccine. Underlying thromboembolic risk as ascertained by the use of apixaban is a significant factor that likely predisposed the patient to develop ophthalmic vein thrombosis and considered not related to apixaban therapy. Causality Assessment: For apixaban: the causal relationship of the event Ophthalmic vein thrombosis with the suspect product apixaban was not provided Per Reporter; the causal relationship of the event Ophthalmic vein thrombosis with the suspect product apixaban was Not Related Per Company (Bristol-Myers Squibb)</p>

A 64-years-old male patient received bnt162b2 (BNT162B2), dose 1 via an unspecified route of administration, administered in Arm Left on 17Mar2021 11:30 (Batch/Lot Number: EN6207; Expiration Date: 31Jul2021) as SINGLE DOSE for covid-19 immunisation. Medical history included history of COPD treated by CPAP, high blood pressure, Cancerous tumors removed from bladder- He is cancer free, atrial fibrillation (From: 28Feb2021 To: Ongoing), In Feb2021, prior to receiving his first dose of the Covid 19 vaccine he had some heart problems. He had gone into atrial fibrillation. His doctor prescribed Eliquis and put him on a heart monitor. He took a nuclear stress test and that was ok and now he's wearing a heart monitor. Concomitant medication(s) included lisinopril (LISINOPRIL) taken for an unspecified indication from an unspecified start date and ongoing; metoprolol (METOPROLOL) taken for an unspecified indication from an unspecified start date and ongoing; apixaban (ELIQUIS) taken for atrial fibrillation from Feb2021 and ongoing. History of all previous immunization with the Pfizer vaccine considered as suspect (or patient age at first and subsequent immunizations if dates of birth or immunizations are not available) was none. No additional Administered Vaccines on same date with the Pfizer vaccine considered as suspect. No Prior Vaccinations (within 4 weeks). No AE(s) following prior vaccinations. The patient received the 1st dose of the Pfizer covid vaccine on 17Mar2021, he experienced a little bit of soreness, no complaints, no issues. He was scheduled for the 2nd shot on 09Apr2021 or somewhere. However, on 04Apr2021, he started having a runny nose, coughing up phlegm. He has a history of COPD treated by CPAP. He lost his sense of smell and taste. On 7 or 8Apr2021, he took a covid test. He did not get 2nd shot. Covid test results were negative: IgM and IgG (antibodies not detected) and stated that it does not preclude acute sars-cov 2 infection. The D-dimer part of the blood work came back as 0.44 (reference says it should be less than 0.5).</p>

At the end of Feb 2021, he had A-Fib treated by Eliquis. The doctor said it should be 0 if on Eliquis, but attributes that result to him taking the Pfizer vaccine and explained it as a higher blood clot risk. His 2nd shot is scheduled for tomorrow. He was told by the doctor to wait until mid May and start all over again with the [Redacted]. Caller would like to know whether increased blood risk has been reported as related to the covid vaccine. Referenced EUA Fact sheet for HCPs under section 6 OVERALL SAFETY SUMMARY, Unsolicited Adverse Events: There were no other notable patterns or numerical imbalances between treatment groups for specific categories of serious adverse events (including neurologic, neuro-inflammatory, and thrombotic events) that would suggest a causal relationship to Pfizer-BioNTech COVID-19 Vaccine. The patient wanted to know it is normal to test negative for antibodies after his initial dose. Caller requesting assistance interpreting his blood work results. Provided basic information and referred caller to his HCP for interpretation of his results. The patient had his first Covid 19 vaccine on 17Mar2021. He had no issues with the first vaccine. About 2 weeks after he received his first Covid 19 vaccine maybe around 01Apr2021 he started sneezing, having some phlegm, and coughing stuff up. He does use a CPAP machine at night. Around 09Apr2021 he lost his taste and he lost his smell. He was scheduled for his second Covid 19 vaccine on 10Apr2021 but thought his symptoms were worse than he originally thought. He went to his doctor on 09Apr2021. His doctor did the nasal swab for the Covid 19 virus. He never had a fever or chills. His doctor gave him some erythromycin. He also did some blood tests. His Covid 19 virus test came back negative. On the results of his blood tests on the first page, the first thing it says are that his Covid 19 results are negative. His doctor told him that his body showed no response to the Covid 19 vaccine. He doesn't see that this blood test is testing for antibodies. Later in his blood test paperwork he sees that it says "antibodies not detected, does not preclude acute Sars-Cov-2 infection". His paperwork says IgG and IgM were negative. He provides the following in a historical context. In Feb2021, prior to receiving his first dose of the Covid 19 vaccine he had some heart problems. He had gone into atrial fibrillation. His doctor prescribed Eliquis and put him on a

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>

1278466	5/1/2021	MO	77	F	2/6/2021	2/7/2021	stroke caused by a blood clot; stroke caused by a blood clot; right arm went completely numb; She is tired; shortness of breath; her eyes were blurry; her head felt like somebody put a spike in it on the right side; sore arm; This is a spontaneous report from a contactable consumer. A 77-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in Arm Left on 06Feb2021 13:15 (Lot Number: EM9809) (at age of 77-year-old) as single dose for COVID-19 immunisation. Medical history included colitis ulcerative from Oct2020 (dropped weight, she dropped from 127 pounds to 109 pounds) , cardiac disorder, atrial fibrillation, and osteoporosis, all were ongoing. Concomitant medications included carvedilol taken for cardiac disorder, atrial fibrillation from an unspecified start date and ongoing; cyanocobalamin (VITAMIN B12) taken for cardiac disorder from 2018 (reported as has taking it close to 3 years) and ongoing; denosumab (PROLIA) taken for osteoporosis from an unspecified start date and ongoing; ubidecarenone (Q10) taken for cardiac disorder from unknown start date and ongoing; calcium, colecalciferol (CALCIUM + D3) taken for osteoporosis from 2020 (reported as a year ago) and ongoing; influenza vaccine (FLU VACCINE VII) taken for an unspecified indication, start and stop date were not reported, and vitamins NOS (MULTIVITAMIN) from an unspecified start date and ongoing, the patient started taking it when she was a senior in high school and stated because she is not the best eater in the world. There was no prior vaccinations (within 4 weeks). AE(s) following prior vaccinations: The patient stated arm is sore with flu shot and probably did when she was little when she got the loaded shot, the mumps one. She wouldn't remember that because she was little. The patient experienced stroke caused by a blood clot on 20Feb202114:30 with seriousness criteria hospitalization, sore arm on 07Feb2021, and right arm went completely numb, tired, shortness of breath, her eyes were blurry, her head felt like somebody put a spike in it on the right side on an unspecified date. The event stroke caused by a blood clot result in emergency room visit. The patient was hospitalized for stroke caused by a blood clot from 23Feb2021 to 24Feb2021. The patient reported that she received the first dose and she is thankful she got it on

06Feb2021 and the only side effect she had was a sore arm. Stated on 20Feb2021 she had a stroke caused by a blood clot obviously, she ended up in the hospital. She didn't think at the time, doesn't fault the physicians that took care of her. She didn't think it was related and her eldest son thought it was related. The patient stated they thought it was a mild stroke and after they did the C scan the neurosurgeon, while she was lying in the hospital bed, looked at her assistant and said he couldn't believe that she was talking and walking. The patient stated part of it was ignorance on her part, everyone thought it was the left side that numbs, but hers was the right side. Stated she didn't fall, she dropped something and went down to get it and her right arm went completely numb and she couldn't get back up and she tried to push with legs and couldn't get up. Stated all of a sudden her eyes were blurry and then she never gets headaches and her head felt like somebody put a spike in it on the right side, stated it is supposed to affect the left side. stated she has a heart problem. The patient stated she had a sore arm for about a week, lasted for a few days. stated she gets a sore arm with the flu shot. stated when she would roll over to lay on her left side and roll over on that arm it was enough to wake her up. stated it lasted about 5 days. She couldn't figure out why it was lasting so long. Stated the second thing that happened was that she went to her son's home that night for dinner, hadn't told him about it and while she was eating dinner she asked am i she leaning to the left and he said yes, she was and that her words were being slurred and only lasted for about 10 mins. Stated she didn't call and ignorance is unreal with this stuff. She went to urgent care the next day and they didn't call the ambulance. When she went to the doctor on 23 Feb2021 she was sent immediately to Hospital so she could go through the ER and that's when the neurosurgeon became involved. Stated right now her balance isn't quite right but she is driving and she was taking care of herself and they didn't send anyone home to help her. She was not having any problem talking. Stated she was not going to get into this and will beat it and get back to normal. She was tired a lot, which they said it's normal. Stated she was a real dynamite. Stated it is improving slowly, she was extremely tired and not taking her long walk like she was used to and has shortness of breath, she was not trying to over do it.

-----------------	--------------	--------------	----------------	------------	-----------------	-------------------	---------------------

Stated she always gets a sore arm with the flu shot. Stated her pain level is lower than most people. The patient stated the sore arm started late evening but the next day was really hurting and the main thing was rolling over. The patient stated she didn't take anything for her sore arm, she won't even take an aspirin because some of these Advil medications will mix with the heart medications. Stated in the hospital they were giving her medications she had through an IV in her arm but doesn't know what was going through that. Stated they put her on a blood thinner and they were testing the blood thinner through the IV. She was so miserable, she just wanted to go home and get a good nights sleep. Stated they took all kinds of test, checked her oxygen and had to have a certain number before she could go home. The patient received treatment for event stroke caused by a blood clot and not received treatment for sore arm . The outcome of events stroke caused by a blood clot was resolving, of event sore arm was resolved on 12Feb2021, of other events was unknown.

1278470	5/1/2021	MA	42	F	3/18/2021	3/18/2021	Palpitations; a weird feeling under her skin; Shortness of breath; the chest pressure was in the middle of her chest. She said the chest pressure felt like something sitting on her lungs; Dizziness; At the time she was given her COVID-19 Vaccine shot, she had a warmth that went down her left arm (the arm she received her COVID-19 Vaccine in) to her left fingertips & to her left back; dry eyes; she was coughing more; the increase in coughing had made her voice huskier sounding; This is a spontaneous report from a contactable consumer (patient). This 42-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 18Mar2021 08:45 Arm Left (Lot Number: EP6955, Expiration Date: 30Jun2021) single dose for covid-19 immunisation. Medical history included ongoing Crohn's disease from 1999, ongoing Hidradenitis suppurativa at the end of 2019, ongoing Small Fiber Peripheral Neuropathy diagnosed at the end of 2019. She said her doctor was not sure of the Small Fiber Peripheral Neuropathy's cause, or if the Small Fiber Peripheral Neuropathy was associated with any of her other medical conditions. She said she had symptoms for sometime, and was diagnosed with a lot of things at the end of 2019 because she was finally able to see a specialist. Concomitant medications included adalimumab (HUMIRA AC) from in Feb2020 at 40mg injection pen once a week for her Crohn's disease. Reported she has had no reactions to flu or pneumonia vaccines for immunisation in the past. She said she had her first COVID-19 Vaccine dose on Thursday, 18Mar2021. She said on Saturday morning (20Mar2021), she had shortness of breath, dizziness, and chest pressure. She said her shortness of breath, dizziness, and chest pressure has been lasting for 20-something days, and she doesn't know why. She said she had taken two (different) week long prescriptions of Prednisone. She said she had 2 EKGs, 2 chest x-rays, and blood work, which were all normal on 13Apr2021 and 2021. She said her doctors don't know why she was having the shortness of breath, dizziness, and chest pressure. She said she was using inhalers, medications, and everything, and still had her symptoms. She asked if what she was experiencing was a side effect of the COVID-19 Vaccine, or due to her 2 autoimmune

---

diseases because her doctors were grasping at straws at this point. Reported she had so many medical conditions, and was taking so many different medications. Reported she has had shortness of breath and chest pressure every day, but the dizziness wasn't constant, and had lessened. She said she has never had the shortness of breath and chest pressure before. She said she has never had anything last that long either. She said she was wondering if her shortness of breath and chest pressure were caused by the COVID-19 Vaccine. Clarified the chest pressure was in the middle of her chest. She said the chest pressure felt like something sitting on her lungs, saying it was an odd feeling. Reported she was coughing more, and she believed the increase in coughing had made her voice huskier sounding in 2021. She said she had a cough associated with outdoor allergies, but the cough she had now didn't feel like her normal allergy cough. She said she had no mucus. She said she was not sneezing, or coughing out anything. She said the cough she had now was different. Reported at the time she was given her COVID-19 Vaccine shot 18Mar2021, she had a warmth that went down her left arm (the arm she received her COVID-19 Vaccine in) to her fingertips. She said the warmth feeling also went to the left side of her back. She said she was kept longer after she got her COVID-19 Vaccine for monitoring. She said the warmth feeling in her left arm, left fingertips, and left back didn't last long, and went away. Reported she had gone to the Emergency Room on Tuesday, 13Apr2021, because she had palpitations, and a weird feeling under her skin. She said while at the Emergency Room, she had an EKG, chest x-ray, and blood work. She said the doctor was looking for a blood clot. She said all her testing came back negative for a blood clot. She said earlier that day (13Apr2021) was her 3rd visit to her doctor since her symptoms had started. Reported she had started Restasis on 19Mar2021, the day after her first COVID-19 Vaccine. She said she was prescribed Restasis for dry eyes, and didn't have the dose, NDC, Lot, and Expiration Date because she was not at home. AEs require a visit to Emergency Room and Physician Office. Treatment included Stated she had taken 2 different week long doses of Prednisone to treat her symptoms. She said she first took Prednisone 40mg, once a day, for 7 days. She said she was off the

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

Prednisone 40mg for 2 days, and had instructions to call her doctor if she wasn't feeling better. She said she went back to her doctor, and was prescribed Prednisone 60mg for 3 days, then Prednisone 40mg for 3 days, and then Prednisone 20mg for 3 days. She said she did not have the 2 Prednisone prescription NDC, Lot, and Expiration Dates. She said she was also put on a 10-day Azithromycin 250mg tablet prescription. She said she took a Azithromycin 500mg (2-250mg tablets) dose the first day, and then Azithromycin 250mg, once a day, for the next 9 days. She said she did not have the Azithromycin 250mg tablet NDC, Lot, and Expiration Date. She said she was also prescribed an Albuterol (90mcg per actuation) inhaler, providing: NDC Number: 66993-019-68, Lot Number: A63H, Expiration Date: Jan2022. She said she didn't feel like the Albuterol inhaler was doing the rescue part, and that she could take the Albuterol inhaler every half hour. Reported she was prescribed an Albuterol inhaler (90mcg per actuation) for shortness of breath. Outcome of the event Shortness of breath, the chest pressure was in the middle of her chest. She said the chest pressure felt like something sitting on her lungs, coughing more, the increase in coughing had made her voice huskier sounding was not recovered. Outcome of the event Palpitations, a weird feeling under her skin was unknown. Outcome of the event Dizziness was recovering. Outcome of the event had a warmth that went down her left arm (the arm she received her COVID-19 Vaccine in) to her left fingertips & to her left back was recovered on 18Mar2021. No follow-up attempts are needed. No further information is expected.

1278551	5/1/2021	MA		F		4/9/2021	short of breath; chest pain; she had a blood clot and was diagnosed with a blood clot/diagnosed with DVT; Red splotches on leg; This is a spontaneous report from a contactable Nurse. A 62-year-old female patient received first dose of BNT162B2 (BNT162B2), via an unspecified route of administration, administered in Arm Right on an unspecified date (Batch/Lot Number: EW0150) as SINGLE DOSE for covid-19 immunization. Medical history included she had a blood clot after surgery 100 pounds ago, around 18 years ago, she had the heart attack at age 41 and thrombophlebitis from an unknown date and unknown if ongoing. Concomitant medications included aspirin [acetylsalicylic acid] (ASPIRIN [ACETYLSALICYLIC ACID]) taken for cardiac disorder from an unspecified start date and ongoing. The patient experienced she had a blood clot and was diagnosed with a blood clot/diagnosed with DVT on 10Apr2021 and red splotches on leg on 09Apr2021. She states she got the vaccine on Thursday 08Apr2021. She confirms that the painful red splotches showed up on 09Apr2021. The blood Clot was diagnosed on the 10Apr2021. She states that the doctors put her on Lovenox. She states that it is only significant if she gets short of breath and/or has chest pain. If it travels then it is significant. She states that her doctor said she had a good sized clot, but she didn't ask specifics. Outcome of the event was not recovered.; Sender's Comments: On the basis of the available information, the reported event DVT would seem most likely related to underlying medical conditions which is not related to BNT162B2.

1278527	5/1/2021	TN	43	F	4/1/2021	4/1/2021	problem with her cholesterol; pain on the top of my head and my hands hurt/headache; pain on the top of my head and my hands hurt; Nauseous; my hands and feet started going numb; they itch they burn; feet are painful; uncomfortable; blood clot/a clot or something in her legs; from the knees down I was having a lot pain/leg pain felt like it is really deep in the vein; she thought she was having a stroke; cramps; burning from my calf to my feet; pain in her neck then to her back; pain in her neck then to her back; different temperatures like hot and cold make it bad and irritating; can't sleep well because of her symptoms; Swelling in her Feet; can't think right; This is a spontaneous report from a contactable consumer. A 43-years-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), via an unspecified route of administration in the right arm in the morning of 01Apr2021 (Batch/Lot Number: ER8727) as a single dose for COVID-19 immunization. Medical history included ongoing complex regional pain syndrome, ongoing fibromyalgia, ongoing arthritis - all diagnosed 20 years ago. Her mother has lupus and rheumatoid arthritis and she can't have the vaccine, states she doesn't know if something could be genetic. Low potassium in the past and stated that she has a lot of allergies to medications, but she consulted with the pharmacist and he said it would be okay. There were no concomitant medications. No additional vaccine was administered on the same date of BNT162B2 and no prior vaccination within four weeks. The patient was having weird symptoms and she tried looking online and in different groups to find out if anyone has similar symptoms, but she hasn't been able to find anything. She began by saying she has health issues; she has Fibromyalgia and Complex Regional Pain Syndrome. She doesn't know if studies were performed on patients with those disorders that took the vaccine. It's been about 3 weeks since getting the vaccine (Apr2021) and she started having symptoms that she thought could be a blood clot. From the knees down, she was having a lot of pain, cramps, burning from her calf to her feet. She would keep rubbing them and massaging them. It was excruciating pain. She was having symptoms and she did go see her Nurse Practitioner on 14Apr2021 because she thought she was having a stroke or a clot or something in her legs or that

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

she was having a problem with her cholesterol. The nurse thought maybe it was her electrolytes, because she had low potassium in the past, but everything came back normal. Her feet were painful but not as bad in Apr2021. She felt like her condition but it's flaring up like 200% it's like over a 10 on the pain scale. She can't think right, she can't work, and was very uncomfortable in Apr2021. The leg pain felt like it is really deep in the vein, it doesn't feel like it is superficial, and she can feel stuff or liquid flowing. Her pain alternates from her head to her neck to her feet and it is very uncomfortable. Her hands and feet started to go numb, not completely numb but like when they fall asleep from sitting on them and then hit something and it hurts. Her arms were burning like crazy; they itch, they burn in Apr2021. Different temperatures like hot and cold make it painful, bad and irritating, and she can't sleep well because of her symptoms. She doesn't know the exact dates, but it has been about a week, but it is changing. It started with cramps in her legs from her knees down. That is where she had injuries and she thought it was her cholesterol. From her knees down, she has cramps and pain and it is very uncomfortable, she felt a really deep pain. She has pain in her neck then to her back, it started in her lower extremities and it is going up. It has stayed the same and she has to keep taking Tylenol to control the pain. Her symptoms got worse and she started taking Tylenol and that helped and then on 15Apr2021, her hands and feet started going numb and she had a headache and pain on the top portion of her head (reported as brain) and her hands hurt, and she was nauseous. She hasn't heard back from the nurse practitioner, so she decided not to go and get it done because she felt it is from the vaccine. She also has swelling of feet in Apr2021, and now she just woke up an hour ago and she slept somewhat okay, but she had to take Tylenol. Now that she is standing, it felt like her legs are starting to hurt again. Treatment included Tylenol, which helps a little and she has to keep taking it. If she doesn't take Tylenol, she can't even function. The events from the knees down I was having a lot pain/leg pain felt like it is really deep in the vein, cramps, my hands and feet started going numb, they itch they burn, feet are painful, uncomfortable, pain on the top of my head and my hands hurt/headache, swelling in her feet, nauseous, pain in her neck then to her back, different

1278730	5/1/2021	TX	52	F	4/5/2021	4/7/2021	big bump on arm; rash/red blotch on arm; nose bleed, blood clots coming out of nose; nose bleed, blood clots coming out of nose; This is a spontaneous report from a contactable consumer (patient). A 52-year-old female patient received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular, administered in the left arm on 05Apr2021 (Batch/Lot Number: EW0151) as single dose, for covid-19 immunization. Medical history included ongoing sjogren's syndrome and ongoing lupus. Concomitant medications included levothyroxine sodium (SYNTHROID) taken for an unspecified indication, start and stop date were not reported. 07Apr2021, she started having a nose bleed. She explains she wasn't doing anything in particular, just talking on the phone, and blood just started pouring out of her nose. Blood clots started coming out as well. She ended up calling 911 and they sent an ambulance. The EMS helped her stop the bleeding. She didn't go to the ER or anything. However, she is getting implants done for her upper teeth so she wanted to double check and make sure nothing was pressing against her nasal cavity because the nose bleeds were so off/random. The doctor said there was no pushing. The doctor completed a panoramic exam/x-ray and confirmed there was nothing pushing. The doctor did suggest she go to the ENT. She made an appointment with an ENT doctor for the following day, 08Apr2021, and the ENT put a camera down. She confirms she explained to them she just had the vaccine and she was googling information. She was told to not google anything and to let them check it out. The caller states she explained to the ENT the reason she was there was because she was concerned, she is not a nose bleeder and nose bleeds never happened to her. Once blood clots started coming out that way, she was terrified. They didn't see anything alarming, but they wanted to make sure and do further research, so basically they planned to do a CT/CAT scan. She was scheduled for a CT/CAT scan on Monday, 12Apr2021, but she was allergic to the contrast and was sent home because they were not prepared for pre-medication. She is waiting for the doctor to schedule another appointment so she can go back. She felt she needed to report these nose bleeds because she has been seeing Johnson & Johnson had severe blood clots, but she took Pfizer's vaccine, and was also getting blood clots. Her nose

							bleeds just happened right after both vaccines. On an unspecified date, she had a little bump that went away. She had this big bump on her arm and a big rash developed. At first, the bump was the size of a quarter and then grew double in size. The bump finally went down, but the rash she can still see. The rash hasn't grown, it's just there- there is just a red blotch on her arm. She has not had another nose bleed since the one that occurred on 07Apr2021. She just noticed when she had her first dose on 15Mar2021, the nose bleed happened within that week also. The outcome of events was unknown.
1277834	5/1/2021	PA	20	F	4/23/2021	4/26/2021	Initially presented with a headache 3 days past vaccine, presented to hospital now found to have dural venous sinus thrombosis. Currently stable on anticoagulation drip.
1278723	5/1/2021	OH	45	M	3/25/2021	4/9/2021	three blood clots in right leg; This is a spontaneous report from a contactable consumer. A 45-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot Number: ER2613, Expiry date not reported), via an unspecified route of administration, administered in the left arm on 25Mar2021 15:00 (age at vaccination was 45 years) as single dose for COVID-19 immunization. Medical history included drug hypersensitivity (sulfonamide allergy) from an unknown date and unknown if ongoing, and seasonal allergy from an unknown date and unknown if ongoing. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was vaccinated at a clinic. The patient was not diagnosed with COVID-19 prior to vaccination. Since the vaccination, the patient has not been tested for COVID-19. Concomitant medications included fluticasone propionate taken for an unspecified indication, start and stop date were not reported; olopatadine hydrochloride (PATADAY) taken for seasonal allergy, start and stop date were not reported. The patient experienced three blood clots in right leg on 09Apr2021 20:00 with outcome of recovering. Therapeutic measures were taken as a result of three blood clots in right leg (thrombosis) that included blood thinners (Eliquis). The event was reported as serious, medically significant. No follow-up attempts are possible. No further information is expected.

1274409	4/30/2021	CA	52	F	4/1/2021	4/11/2021	Sunday April 11 at about 11pm I started feeling extremely drained of energy and was experiencing some mild abdominal pain. I went to bed shortly after. Was woken at approximately 5am with severe abdominal pain, and extreme back pain in my left kidney. Kidney area was worse than abdominal pain but both were severe. I have had kidney stones in the past, the pain of this was way worse. Was unable to take a bowel movement. Suffered thru with pain increasing until unspecified date at around 2 am I drove myself to unspecified hospital. Was admitted to emergency room and given an in mild pain meds and anti nausea meds. Was given a ct scan of kidney, then a second ct scan with contrast, as well as blood test. After awhile they came back to re draw blood because they said my blood had clotted and they were unable to use it. I was released after 5 hours with no prescriptions or knowing what or why I was in so much pain. Pain lasted until unspecified date
1273263	4/30/2021	IL	52	F	4/12/2021	4/25/2021	Woke up April 25, 2021 at 9:00 am with left shoulder pain. Throughout the day the pain became intense and unbearable. It had also swelled considerably. I could not lift my arm at that point. At approximately 10:00 pm I went to the hospital. I was given an Ultrasound on left arm and shoulder to check for blood clots which was negative. I was also given an Xray on left shoulder to check for bone abnormalities which was negative. I was diagnosed with "COVID shoulder", released and given pain medication. Was told to follow up with family practitioner. Went to Dr. on Tuesday, April 27, 2021 who confirmed the diagnosis. Blood was taken which showed elevated white blood cells.
1273203	4/30/2021	CO	52	M	4/3/2021	4/13/2021	Severe headache followed by abdominal pain, eventually confirmed portal vein thrombosis (fully blocked), treated as TTS with hospitalization for 5 days

1273190	4/30/2021	OH		F	3/31/2021	4/26/2021	I recieved my second vaccination on 3/31/21 while I was still pregnant. I had my third scheduled c-section on 4/16/21 (due date of 4/21/21). All previous pregnancies and cesarians went well with no complications - including my most recent on 4/16. On 4/23/21 I was rushed to ER for a pulmonary embolism in my RT lung and potentially more blood clots in my legs. That day I was having a difficult time breathing and intense pain in my back at the bottom of my RT lung. I went to bed early, woke up soaked in sweat to stabbing pain in my back lower RT lung and could barely breath or move without intense pain, went by ambulance to Hospital, released at 9 PM 4/28 on blood thinner regimen
1273149	4/30/2021	GA	66	F	3/16/2021	4/26/2021	Patient presented to hospital with four days chest pain, dyspnea on exertion and weakness. Work up revealed an acute submassive pulmonary embolism without evidence of deep vein thrombosis in bilateral lower extremities.

1272645	4/30/2021	WA	58	F	3/31/2021	3/31/2021	03/31/2021: began feeling aches/pain/feverish about 10 hours after receiving the first Moderna vaccine and had a temperature of 100.3 F. 04/01/2021: continued feeling aches/pains/feverish and had a temperature of 99 F. 04/02/2021: aches/pains/fever subsided. 04/03/2021: left leg began to hurt and kept feeling worse throughout the day; took ibuprofen for pain. 04/04/2021: left leg continued to hurt; took ibuprofen for pain. 04/05/2021: visited Urgent Care clinic and an ultrasound confirmed the presence of a blood clot in the left leg. Urgent Care Doctor prescribed Eliquis for treatment. See Continuation Page for subsequent events/treatments. 04/07/2021: Meeting with Primary Care Physician (PCP). PCP changed treatment for the blood clot [acute deep vein thrombosis (DVT)] from Eliquis to Lovenox/Coumadin. Additional tests ordered: CBC with Differential; PTT; Comprehensive Metabolic Panel; Protime INR; Sedimentation Rate. 04/08/2021: Meeting with PCP to discuss DVT. PCP ordered Noninvasive Vascular Imaging - External Scan. 04/15/2021: Meeting with PCP to discuss DVT. PCP instructed to continue treatment with Lovenox and keep appointment with hematologist on 04/20/2021. PCP ordered the following tests: CBC no Differential; Comprehensive Metabolic Panel; Protime INR. 04/20/2021: PCP changed recommended treatment of DVT from Lovenox to Eliquis. 04/20/2021: Meeting with hematologist to discuss DVT. Dr. agreed with PCP to change treatment from Lovenox to Eliquis. Dr. ordered the following immediate tests: Antiphospholipid Ab Panel; CK Total; Comprehensive Metabolic Panel; Dilute Russel Viper Venom Confirm; Fibrinogen; Lupus Anticoagulant Profile; NT-PRO BNP; Phospholipid, Hexagonal Phase; VAS Porto Hepatic Duplex. Additional future tests were ordered as follows: Antiphospholipid Ab Panel, CK Total; Fibrinogen; Lupus Anticoagulant Profile; NT-PRO BNP. 04/23/2021: Meeting with hematologist to discuss DVT. Dr. suspects the DVT is related to pre-existing conditions (includes vitamin K deficiency) plus the effect of the first Moderna vaccine. Dr. concluded that vitamin deficiencies (due to malabsorption issues) are the root cause of several ills. Dr. ordered an injection of vitamin K and recommended continued treatment with Eliquis. Dr. also stated "I think no to second vaccination #2. She might be vaccinated later if vitamin def are resolved." Dr. plans to review the

							case in three months to determine if Eliquis treatment can be discontinued. Dr. also ordered an "ECHO Complete" to rule out additional clots in the heart/lungs.
1274172	4/30/2021	PA	70	M	4/1/2021	4/7/2021	Admitted to hospital on 04/07/2021 with acute Pulmonary Embolism ( no history of thrombosis in past)
1274347	4/30/2021	OR	31	F	4/10/2021	4/28/2021	On the 28th of April, 18 days from the shot, I went for a walk and came home around 6:30 p.m. to the outside of my right calf bright red and hot. I went to the ER where an ultrasound was performed and they found a DVT blood clot. I am now on an anticoagulant, Xarelto and have an appointment with my doctor on the 5th to schedule more imaging and blood work.
1274418	4/30/2021	MO	49	F	4/15/2021	4/20/2021	(1) Pulmonary embolism: Unclear whether there had been a provoking event. Reports symptoms for about a week. Left lower extremity VTE found on ultrasound requested by her PCP. She reports she may have had COVID-19 in December. She reports she had just completed second dose of COVID-19 vaccine on 4/15. Appears it would give about 7 days since the second dose, and onset of her symptoms. She does state she had been somewhat less mobile after her illness. She does not smoke. She is not on any hormone therapy. Not entirely clear that this is related to the vaccination, however, will discuss with pharmacy regarding whether this should be reported. We discussed anticoagulation. She started on Lovenox and ER. Discussed subsequently switching to oral anticoagulation. We will assess TTE. Monitor oxygenation, blood pressure, heart rates. Status: Acute (2) Deep vein thrombosis of lower extremity: Initiated on anticoagulation as above. Ultrasound reports VTE including common femoral vein. We will try to see if we can get a limited study to assess more proximal veins. Discussed with her in case of concern symptoms, iliofemoral VTE, consideration may be given as well to catheter directed TPA. She understands that this procedure is not available at the current facility. We discussed also regarding possibility of post phlebitis syndrome, especially with more proximal VTE. Discussed strategies going forward to reduce the symptoms.

1273764	4/30/2021	AR	60	F	3/1/2021	4/23/2021	Cerebral venous sinus thrombosis Patient received vaccine in March (exact date is unknown but around March 8-12 per husband); in mid-April patient started reporting intermittent low intensity headaches. On April 23, patient had severe headache and vomiting, went to urgent care and was thought to have sinusitis and started on antibiotics and discharged home. On April 24th, patient became more drowsy with worsening headache and unresponsive. On April 25, she was taken to outside hospital and was noted to have abnormal brain MRI. She was transferred to our facility on April 26 after clinical worsening. Imaging revealed venous sinus thrombosis in deep cerebral veins and patient was intubated due to worsening mentation. Imaging also revealed a venous stroke with hemorrhage in her left thalamus and diffuse brain edema. Treatment includes extraventricular drain placement, anticoagulation (heparin), hypertonic saline to manage brain edema. We also did extensive workup but no history of hormone therapy, contraceptive pills, underlying cancers. Tumor markers are negative. Hypercoagulable panel and rheumatologic panel are negative. Body imaging did reveal multiple uterine fibroids but no other cancer. Patient remains in the ICU, on the ventilator, heavily sedated for management of refractory intracranial hypertension.
1274572	4/30/2021	NY	30	F	4/3/2021	4/13/2021	On April 16, 2021 (Day 13 after Vaccine) I was diagnosed with acute deep vein thrombosis (DVT) of my femoral vein in my left leg by Hospital. In other words, I was diagnosed with a blood clot in my upper left leg. Pain in both my legs had started on April 13, 2021 (Day 10 after Vaccine). On April 16, I had a virtual appointment with my doctor who prescribed an ultrasound to rule out DVT. I went to an ultrasound appointment at Radiology at 3:30pm where a blood clot was found in my left leg. I was admitted into the emergency room at Hospital and prescribed medication and follow ups from there...

1273705	4/30/2021	TX	55	F	3/11/2021	3/30/2021	Early in the morning I started developing a headache. I typically have migraines and thought this was just what I was getting. I took Excedrin Migraine to try to keep it from getting worse, but it continued to get worse and worse and worse. About noon I found that I could not stand any light or sound - this is not typical for me as I can usually listen to things during a headache even if I can't open my eyes. I ended up spending all the rest of the day and the night alone in a dark noiseless room. I told my husband it was the worse headache I had ever had. It was only later that we found out the shot caused blood clots in the head. I did not correlate the two because it had been so long - almost 3 weeks - since my vaccination.
1273816	4/30/2021	NC	24	M	4/7/2021	4/21/2021	24-year-old male patient with no past medical history received Johnson & Johnson Covid vaccine on April 7 presented to ED with abdominal pain and was found to have portal vein, splenic vein, superior mesenteric vein thrombosis. Did brain MRI and found a blood clot. Pt currently in rehab.
1274722	4/30/2021		45	M	4/20/2021	4/28/2021	Pt presented to the hospital after a cardiac arrest. Work up showed renal artery thrombosis b/l causing renal failure and hyperkalemia. ROSC was achieved and pt coded multiple times after. We were unable to obtain CT A 2/2 to pt being unstable so only U/S imaging with doppler was used for diagnosis. Pt was treated with heparin gtt., hematology work up was sent but cause not identified. ECHO did not show thrombosis in the heart. CCRT was attempted but pt expired.
1274672	4/30/2021	NY	51	F	3/13/2021	3/20/2021	Body aches, fever, nose blister, headaches swollen and arm diarrhea. On 3/2021 I statdetedbtonget pain on my left foot and calf. I went to the hospital and on 3/22/2021 I had a ultrasound and the results showed that I have a blood clot.
1275047	4/30/2021	NY	69	M	2/26/2021	2/27/2021	About 6 ? 7 days w/ side effects ? Significant Malaise, tiredness. Unable to function or concentrate. Likely a "self inflicted" situation by unknowingly sitting in chair in a daze ultimately developing blood clots (pulmonary edema), blood clots in legs, leading to mild heart attack, hospitalization. I believe there may be a direct connection to a medical procedure (vedolizumab (Entyvio) 300 mg intravenously infusion) that preceded the vaccination on the previous Friday (2/19/21).

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1269773	4/29/2021	MA	53	F	2/24/2021	3/13/2021	cardiac arrest; on the ground turning purple and lifeless/ immediate risk of death from the event; she had no pulse; on the ground turning purple and lifeless; This is a spontaneous report received from a contactable consumer. A 53-year-old female patient (reporter's mother) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EN6200), administered in left arm on 24Feb2021 (at the age of 53-year-old) at single dose for COVID-19 immunisation. The vaccination facility type was reported as other. The patient was not pregnant. The patient's medical history was reported as none. No known allergies were reported. The patient had not had COVID prior vaccination. The patient's concomitant medications were not reported. No other vaccine was administered in four weeks. It was reported that on 13Mar2021 08:15 exactly 17 days after reporter's mother received her first Pfizer vaccine she had a cardiac arrest, luckily reporter was with her when this happened and he/she called immediately and followed the steps of cardiopulmonary resuscitation (CPR) etc. When the emergency team arrived she had no pulse and they used the defibrillator on her 4 times. The entire day they did not know if she would survive. She was sedated and tested, they got the news that she had survived and there was not brain damage. The doctors had no clue what the cardiac arrest was caused by, she had no prior health conditions and the tests show nothing to what could have caused this event (no blood clots, no clogged arteries etc.). The only thing that changed leading up to the event was her receiving her first vaccine. Luckily reporter was there when this happened or else she would in fact be dead. She now had a defibrillator implanted and reporter had a post-traumatic stress from the traumatic event and witnessing his/her mom on the ground turning purple and lifeless. They need answers. The events resulted in emergency room/department or urgent care. The events were reported as serious since resulted in hospitalization and life-threatening illness (immediate risk of death from the event). Treatments were received for the events and they were reported as multiple lifesaving treatments, tests, and defibrillator implant. The patient underwent lab tests and procedure which included COVID test (negative) on unspecified date post vaccination. The outcome of the events was resolved for the event "she had no pulse" and

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1269796	4/29/2021	VA	67	F	2/25/2021	3/1/2021	resolved with sequel (reported as recovered with lasting effects) for all other events.  I developed severe lower back/flank pain about 4 days after receiving my 2nd Moderna vaccination. The pain was most pronounced while lying supine and , while in that position, manifested a creeping , fluid nature, i.e. migrating from my lower back to my shoulder. I was unable to lie down comfortably. In thinking about the nature of this pain, I determined that it was possibly/probably from a PE as it seemed as if pain was migrating from my lower back to my shoulder. I'm "not a doctor but play one on TV" (LOL ) so surmised that it was something serious that decided that this was something needing attention. I presented to a hospital ER for care and was ultimately told I had 2 small PE blood clots - 1 in the base of each lung. My diagnosis was confirmed by a CT scan and I was subsequently admitted for observation. I was discharged the following day with blood thinners and blood pressure medication.

1269934	4/29/2021	TN	64	M	4/8/2021		<p>BLOODSHOT IN EYE/EYES WERE RED; KNOT IN CENTER OF RIGHT ARCH OF FOOT; NECK HURTS/COULD NOT MOVE NECK; HEAD SWELLING AND TENDER; SLEEPY; HEADACHE; CHILLS; HEART ACHE; This spontaneous report received from a patient concerned a 64 year old African American, not Hispanic or Latino male. The patient's height, and weight were not reported. The patient's concurrent conditions included blood pressure. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1805020, expiry: unknown) dose was not reported, 1 total administered on 08-APR-2021 between 09.30 and 09.40 to left arm for prophylactic vaccination. Concomitant medications included acetylsalicylic acid (Aspirin) for blood pressure. On 08-APR-2021, 20 minutes after vaccination, the patient started having symptoms. The patient's heart started aching and that lasted for 15-20 minutes and then went away. On 09-APR-2021, the patient had chills that had lasted for four hours. On 10-APR-2021, the patient could not move his neck left or right and back of his head felt like it was swelling and tender; he also had a headache, and he was extremely sleepy. The patient's neck and head tenderness lasted three to four days. On 11-APR-2021, the patient eyes had blood shot and were red and reported that he might had a stroke or blood clot. On 17-APR-2021, he had a knot came up in the center of right arch on foot. On 19-APR-2021, at the time of this report, the patient's eyes were still red and had a slight headache; the patient's neck still hurts, he was sleepy, and the knot was still there on his right arch of his foot. The patient took acetylsalicylic acid (Aspirin) but he was already taking that for his blood pressure. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from heart ache on 08-APR-2021, head swelling and tender on 14-APR-2021, and chills on 09-APR-2021, and had not recovered from neck hurts/could not move neck, bloodshot in eye/eyes were red, headache, sleepy, and knot in center of right arch of foot. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: This 64-year-old African American (non-Hispanic/Latino) hypertensive male patient reported "heart aching" 20 minutes after receiving COVID-19 VACCINE AD26.COV2.S for the prevention of symptomatic SARS-</p>

CoV-2 virus infection. The event lasted for 15-20 minutes. Other associated symptoms developed in the succeeding 3 days: chills that lasted for hours, could not move his neck and felt it was swelling and tender, headache, sleepiness, blood shot eyes. Nine days after vaccination, the patient reported he had a knot in the center of arch right foot. The patient took Aspirin. No other details was reported. The event is confounded by the underlying hypertension. The information available precludes a complete and meaningful assessment. However, considering the temporal relationship and recently evolving theories in the literature about COVID infections and vaccinations, potential vaccine contribution cannot be excluded. Additional information was requested.

1269942	4/29/2021	MN	44	M	4/1/2021		<p>CHEST PAIN (WHOLE CHEST HAD LOT OF PAIN)/THOUGHT THAT HE HAD HEART ATTACK; SHORTNESS OF BREATH/COULD NOT BREATHE; SEVERE CRAMPING IN LEFT SHOULDER AND UPPER BODY; DIFFICULTY IN STANDING; SINUS; THOUGHT THAT HE WAS ABOUT TO PASS OUT; BUNCH OF CLOTS IN THE BOTTOM SIDES OF BOTH LUNGS AND ON THE TOP OF ONE OF THE SIDES; BEGINNING STAGES OF PNEUMONIA ON BOTH LOBES OF THE LUNGS (COLLAPSED); CRAMPING IN CHEST; This spontaneous report received from a patient concerned a 44 year old male. The patient's weight, height, and medical history were not reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: Unknown) frequency 1 total, dose was not reported, administered to left arm on 06-APR-2021 at 12 noon for prophylactic vaccination. The batch number was not reported and has been requested. No concomitant medications were reported. On 6-APR-2021 at 12 noon, patient got vaccinated and was fine that day . Next morning on 07-APR-2021, patient woke up with sever cramping in same shoulder which he got the shot in, most pain was in the upper left quarter of his torso to down half way to chest up to the shoulder till the neck . By the end of the day it spread to his whole chest and upper body. Also he had shortness of breath ,could not breath .The cramping and shortness of breath came at same time. He took Advil and went along with his day . He took 3 tablet of Advil 200mg every 4-5 hours all day ( total of 3 dose that day) . By night time the case was progressively worse as the whole chest had a lot of pain . He thought that he had heart attack . He thought that he was about to pass out . He could not stand on his own . So his wife took him to emergency room at mid night at 12:30 am on 08-APR-2021. He stayed there for 5 hours and they did bunch of tests , EKG which rolled out the heart attack .They did Chest X-ray which found things then did D-dimer which its level was very high . They found bunch of clots in the bottom sides of both lungs and on the top of one of the sides. They did ultra sound on the legs which had no evidence of blood clots . They discharged him from the emergency room as they felt that he was ok to be out . After couple of hours after discharge , patient's health care professional wrote for</p>

him Eliquis, antibiotic and pain reliver. He was given antibiotic because he had beginning stages of pneumonia on both lobes of the lungs (collapsed) . It was found air sacs in lung with signs of pneumonia in both lobes . He came home and started to monitor his blood oxygen . He stayed in the same position till recovery . He was better each day since last week but still had sinus and cramping in the chest ( very minor but was still there). The lung capacity was very limited to take some steps. Patient stated that he needed a specialist to understand his condition. He had no medical history before that incidence . He was wondering regarding which type of blood thinner was good for this type of blood clots because he read that the regular blood thinners are not good for that type of blood clot which his HCP gave (regular blood thinner). Laboratory data included: Total lung capacity decreased (NR: not provided) lung capacity is very limited. On 08-APR-2021, Laboratory data included: Chest X-ray (NR: not provided) found things, EKG (NR: not provided) rolled out heart attack, Fibrin D dimer (NR: not provided) level was very high, and Ultrasound scan (NR: not provided) no evidence of blood clots. Treatment medications (dates unspecified) included: apixaban, and ibuprofen. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of the severe cramping in left shoulder and upper body, chest pain (whole chest had lot of pain)/thought that he had heart attack, shortness of breath/could not breath, thought that he was about to pass out, difficulty in standing, bunch of clots in the bottom sides of both lungs and on the top of one of the sides, beginning stages of pneumonia on both lobes of the lungs (collapsed), cramping in chest and sinus was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: This 44-year-old male patient reported blood clots of both lungs 2 days after receiving COVID-19 VACCINE AD26.COV2.S for the prevention of symptomatic SARS-CoV-2 virus infection. The patient denies any medical history/condition prior to vaccination. The symptoms reported were severe cramping of arm that spread to his whole chest and upper body and shortness of breath; the patient thought he had a heart attack, about to pass out and could not stand because of the progression of pain. EKG done at the emergency room ruled out heat attack,

1269952	4/29/2021	FL	50	M	4/23/2021		<p>BLOOD CLOT IN LEG; SHORTNESS OF BREATH; HEART RATE INCREASED; GANGRENE IN TOE; RIGHT LEG SWOLLEN; RIGHT FOOT SWOLLEN; CHILLS; RUNNY NOSE; FEELING HOT; This spontaneous report received from a patient concerned a 50 year old male. The patient's height and weight were not reported. The patient's concurrent conditions included high blood pressure and diabetes. The patient received COVID-19 vaccine Ad26.CoV2.S (suspension for injection, route of administration not reported, batch number 1802070, expiry date unknown), dose not reported, 1 total administered on 19-APR-2021 for prophylactic vaccination on left arm. Concomitant medications included amlodipine besilate for drug used for unknown indication, empagliflozin for drug used for unknown indication, fenofibrate for drug used for unknown indication, insulin aspart for drug used for unknown indication, insulin glargine for drug used for unknown indication, losartan for drug used for unknown indication, and pioglitazone hydrochloride for drug used for unknown indication. On an unspecified date (reported as 22-MAR-2021; 28 days prior to vaccination), the patient experienced shortness of breath, heart rate increased, runny nose, chills and was hospitalized (date unspecified). He reported that on this past Saturday, 17-APR-2021 (2 days prior to vaccination), he went to the emergency room. He reported that his toenails were coming off, the skin on his toes was coming off, and he had swelling in his right foot and up his leg. He says there was no circulation going to his toe and he was diagnosed with having a blood clot in his right leg. He says he had surgery to open up the arteries in his leg, and also reported gangrene in his toe. The subject was discharged on 21-APR-2021. On 23-APR-2021, the patient experienced feeling hot. He also reported that he may need to have his right pinky (fifth) toe amputated because it has gangrene. He reported that he is going to go back to the hospital, to which he would seek medical attention if he was having issues. Treatment medications (dates unspecified) included paracetamol. When called back due to his vaccination dates being after event start dates, the patient said that his memory is not too good, so he 'had to take his time to remember the correct dates'. The action taken with COVID-19 vaccine Ad26.CoV2.S was not applicable. The patient was</p>

----------	-------	-------	---------	-----	----------	------------	--------------

recovering from blood clot in leg, and had not recovered from runny nose, shortness of breath, heart rate increased, chills, feeling hot, gangrene in toe, right leg swollen, and right foot swollen. This report was serious (caused hospitalization).; Sender's Comments: V0: This 50-year-old hypertensive and diabetic male patient reported that he was feeling hot and may need to have his fifth toe amputated because it has gangrene 4 days after receiving COVID-19 VACCINE AD26.COV2.S for the prevention of symptomatic SARS-CoV-2 virus infection and 2 days after discharge from the hospital. The patient was hospitalized for shortness of breath, heart rate increased, runny nose, and chills 28 days prior to vaccination. The patient went to the emergency room 2 days prior to vaccination because his toenails/skin on his toes were coming off, swelling in his right foot and up his leg, gangrene in his toe; he reported that there was no circulation going to his toe and was diagnosed with having a blood clot in his right leg; the patient reported he had surgery to "open up" the arteries in his leg. Four days after vaccination, the patient felt hot and reported reported that he may need to have his right pinky (fifth) toe amputated because it has gangrene. The patient is taking paracetamol as treatment. No other details was reported. Based on the lack of temporal association, the causality is considered not related for the events blood clot in leg, shortness of breath, heart rate increased, right leg swelling, right foot swelling, chills, and runny nose. The information available regarding event gangrene of fifth toe and feeling hot precludes a complete and meaningful assessment. However, considering the temporal relationship and recently evolving theories in the literature about COVID infections and vaccinations, potential vaccine contribution cannot be excluded. Additional information was requested.

The patient's height, and weight were not reported. The patient's past medical history included DVT (deep vein thrombosis) of lower extremity and was not on anticoagulation since and was treated with warfarin times 3 months only. The concurrent conditions included type 2 diabetes, chronic hypoxemic respiratory failure, chronic kidney disease, anemia, and hypertension. The patient was previously treated with warfarin. The patient received COVID-19 vaccine ad26.cov2.s (suspension for injection, intramuscular, batch number: 1802070, and batch number: 1802070 expiry: 25-MAY-2021) dose was not reported, administered in left deltoid on 09-MAR-2021 for prophylactic vaccination. No concomitant medications were reported. On 14-APR-2021, the patient developed a left upper extremity DVT involving the subclavian and axillary vein, left upper arm swelling and had left upper arm pain. On 19-APR-2021, the patient called and notified the office that the left arm was sore and swollen times 4-5 days. A registered nurse did a home visit on 20-APR-2021 and recommended an ultrasound to be done. On 26-APR-2021, the ultrasound confirmed a left upper extremity DVT involving predominantly the subclavian and axillary vein. On 26-APR-2021, Laboratory data included: CT Angiogram (to rule out pulmonary embolism) pending, COVID-19 virus test (NR: not provided) pending, Computerized tomogram thorax (NR: not provided) pending, Creatinine (NR: not provided) 1.59, ECG (Electrocardiogram) results not provided, Fibrin D dimer (NR: not provided) 3.95, Glomerular filtration rate (NR: not provided) 52, Hematocrit (NR: not provided) 33.2 %, Hemoglobin (NR: not provided) 10.4, International normalised ratio (NR: not provided) 2.8, NT-proBNP (NR: not provided) normal, Platelet count (NR: not provided) 309, and Prothrombin time (NR: not provided) 28.4. The patient was treated with rivaroxaban, 15 mg, oral, twice a day. The patient was currently in the emergency room with testing pending. The patient did not have other symptoms to report or note. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient had not recovered from left upper arm</p>

----------	-------	-------	---------	-----	----------	------------	--------------

swelling, left upper arm pain, and a left upper extremity dvt involving the subclavian and axillary vein. This report was serious (Life Threatening).; Sender's Comments: V0: This 74-year-old male patient was found to have left upper extremity deep vein thrombosis (DVT) confirmed by ultrasound 17 days after receiving COVID-19 VACCINE AD26.COV2.S for the prevention of symptomatic SARS-CoV-2 virus infection. The patient has underlying type 2 diabetes, chronic hypoxemic respiratory failure, chronic kidney disease, anemia, and hypertension; the patient had prior history of DVT of lower extremity of unspecified date and was treated with warfarin for 3 months. No concomitant medications were reported. The symptom reported left upper arm pain and swelling 5 days after vaccination; persistence prompted consult with a registered nurse the recommended ultrasound; which revealed left upper extremity DVT involving predominantly the subclavian and axillary vein. Platelet count 309, Prothrombin time 28.4, INR 2.8, NT-proBNP normal, Fibrin D-dimer 3.95, GFR 52; awaiting result of CT and CT angiogram, COVID test, and ECG. The patient was treated with rivaroxaban. No other details reported. Based on the information that is available, the event is assessed as plausible with the causal association to immunization, per causality classification of adverse events following immunization based on a lack of a definitive plausible biological mechanism. However, considering the temporal relationship and recently evolving theories in the literature about COVID infections and vaccinations, potential vaccine contribution cannot be excluded. Additional information was requested.

1270180	4/29/2021	FL	26	F	4/7/2021	4/14/2021	Exactly one week after my shot (4/14) I felt a headache in the evening. It felt like it was sinus related so I figured it was allergies. However it continued the next day so I tried Advil. It kept going. It has now been 2 weeks and a day since the headaches started and I still have them. They go away late at night and return shortly after I wake up. They feel like tension headaches in the back of my head and also sinus headaches. I was concerned about clots so I went to the dr on 4/19. She did not think it was clots because the headaches were not severe and I had no other symptoms. She had me do different tests and concluded I had no neurological issues. She gave me a prescription for butalb-apap-caf50. This did not help. She also told me not to drink alcohol so I didn't. I started feeling better on 4/24. I had a little to drink and my head hurt really bad. My headache was practically nonexistent 4/25 so I had one glass of wine. Not even half way through that glass, the head feeling from last night came back. The next day my headaches were back and have now continued since. I stopped drinking and have not felt that bad feeling in my head at night since. The headaches aren't severe but they really suck. They make it hard to do things and all I want to do is lie down even though that doesn't help. Exercise and walks sometimes help. No medication has made any noticeable difference.

1270282	4/29/2021	PA	54	F	4/7/2021	4/8/2021	She got the vaccine, when they put the needle in she said it was far in. The pain was bad, but she could deal with it. Then 5 days later something hit her and hit her bad. She went to the ER and they gave her Bentyl, diarrhea medicine as she was vomiting, not eating anything, and they gave her some anti-vomiting medicine. They sent her home and said she would feel better. The diarrhea and vomiting stopped but she then started with a rash. it's all over her hands, arms, back, itching, and taking Claritin for it. it won't go away. Her symptoms continued to worsen, and woke up one morning and had so much pain that she could not move or breath and her husband called an ambulance and they took her hospital and diagnosed with a blood clot. She was in the hospital for 3 days and now discharged on Eliquis. She has bruises all over her coming out and very upset that she is still feeling bad and doesn't know how the rash is going to go away. She was also prescribed Oxycodone for pain and also Tessalon Perls to take for coughing.
1270320	4/29/2021	NY	57	M	3/25/2021	4/15/2021	On April 15, exactly 3 weeks after vaccination, patient developed abdominal pain, eventually prompting an ER admission 4/20 and was subsequently found to have a portal and superior mesenteric vein thrombosis prompting admission and initiation of anticoagulation. He tolerated the anticoagulation well and was discharged on 4/23.
1270463	4/29/2021	NJ	54	F	2/23/2021	3/9/2021	Hospitalized on April 27, 2021 with blood clots in my lungs.

1269509	4/29/2021	FL	75	F	1/13/2021	4/7/2021	<p>clot on the left pulmonary vein; This is a spontaneous report from a contactable nurse (patient) from a Pfizer-sponsored program COVAX US Support. A 75-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), dose 2 via an unspecified route of administration, administered in left arm on 13Jan2021 09:30 (lot number: FL3022; expiration date: May2021) at the age of 75 years old, as single dose for COVID-19 immunisation. Medical history included high blood pressure (taking losartan), anxiety with COVID; both from an unknown date and unknown if ongoing. Concomitant medications included losartan taken for high blood pressure from Jun2020 to an unspecified stop date; escitalopram oxalate (LEXAPRO) taken for anxiety with COVID from Jun2020 to an unspecified stop date. The patient previously received first dose of bnt162b2 on 23Dec2020 at the age of 75 years old for COVID-19 immunisation (lot number: ELD140; Pfizer product; expiry date: unknown). It was the first time they found a clot on the left pulmonary vein of the patient on 17Apr2021. The patient stated that she felt this was medically significant and that she had no symptoms. She stated that her inner voice said it was related to the vaccine. She started apixaban (ELIQUIS) 5mg twice a day on 09Apr2021 for the clot. She had nothing medical and she was in denial and shock as she had never had an issue until now and she never took pills. She is waiting to get a heart monitor and after that to have a TEE as they want to be sure the clot doesn't go to her heart. She was in complete denial, that she has no symptoms and she is feeling fine. She was told no exertion for 2 weeks, that she can go for walks, she thought it may be until the apixaban kicks in. The patient underwent lab tests and procedures which included chest scan: everything came back normal on unspecified date (6 months ago she had another chest scan), chest scan: unknown result on 07Apr2021. The patient has not recovered from the event.; Sender's Comments: Based on the current available information, the event Pulmonary venous thrombosis is most likely related to an intercurrent or underlying condition which is not related to the suspected drug (weak temporal association). The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as</p>

part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Committees and Investigators, as appropriate.

Large DVT in leg femoral popliteal; This is a spontaneous report from a contactable consumer, the patient. A 74-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: UNKNOWN) via an unspecified route of administration on an unspecified date (at the age of 74-years-old) as a single dose for COVID-19 immunisation. The patient medical history was none. Prior to vaccination, the patient was not diagnosed with COVID-19. There were no concomitant medications. The patient previously received the first dose of BNT162b2 on 18Jan2021 at 12:00 (Lot Number: Unknown) for COVID-19 immunisation. The patient had not received any other vaccines within 4 weeks prior to the COVID-19 vaccine. The patient experienced large DVT in leg femoral popliteal without other cause on 24Mar2021, diagnosed 3-4 weeks after the 2nd vaccine. The patient underwent lab tests and procedures which included PCR COVID test on 24Mar2021 (post vaccination), which was negative. Therapeutic measures included rivaroxaban (XARELTO) as a result of large DVT in leg femoral popliteal (deep vein thrombosis). The patient was recovering from the event, large DVT in leg femoral popliteal. No follow up attempts are possible; Information about Lot and batch number could not be obtained.

1269525	4/29/2021	MO	68	M	3/23/2021	4/6/2021	atrial fibrillation; atrial fibrillation; splenic infarction; extreme left upper abdominal pain; large portion of his spleen unusable; blood clots causing that portion of his spleen to die; blood clots causing that portion of his spleen to die; This is a spontaneous report from a contactable consumer (patient). A 68-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot: EN6206), via an unspecified route of administration in right arm on 23Mar2021 09:00 (at the age of 68-years-old) as single dose for covid-19 immunisation. The vaccination facility type was a health department. Medical history included atrial fibrillation (under control with medicine). The patient's concomitant medications were not reported. The patient previously took ciprofloxacin hydrochloride (CIPRO) and experienced allergies: Cipro. The patient had no COVID prior vaccination and was not COVID tested post vaccination. No other vaccine in four weeks. It was reported that within 13 days of the injunction (on 06Apr2021 at 04:00), the patient had three atrial fibrillation events on three separate days between 01:00 and 03:00 while sleeping and on day 13 was admitted to the hospital with extreme left upper abdominal pain they diagnosed with splenic infarction and rendering a large portion of his spleen unusable from blood clots causing that portion of his spleen to die. Now the patient have to take blood thinners the rest of his life. The events resulted in emergency room/department or urgent care, hospitalization for 1 day, disability or permanent damage. The events treatment included several pain shots administered then given enoxaparin sodium (LOVENOX). The outcome of the events was recovered with sequel.

1269527	4/29/2021	NC	60	F	4/7/2021	4/7/2021	multiple pulmonary embolisms/Pulmonary embolism and subsegmental pulmonary embolus; felt sluggish directly; feeling discomfort in my lungs; pain in my lung/chest area; pain in my lung/chest area/right-sided chest pain under the rib; difficult and extremely painful to breathe/significant shortness of breath/shortness of breath due to extreme pain; blood clots; This is a spontaneous report from a contactable consumer (patient) and physician. A 60-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EP7534 and expiration date not provided), via an unspecified route of administration, administered in Arm Left second dose on 07Apr2021 17:00 at single dose for covid-19 immunisation. The patient medical history was not reported. The patient was not pregnant at time of vaccination. The patient's concomitant medications included cetirizine, diphenhydramine, and phenylephrine. The patient historical vaccine includes bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EN6203), right arm first dose on 10Mar2021 for COVID-19 Immunization. On 07Apr2021 21:30, the patient felt sluggish directly after receiving the second dose. The patient began feeling discomfort in my lungs about 5 hours after the dose. The pain in my lung/chest area grew worse throughout the night to the point where it was difficult and extremely painful to breathe. The patient went to urgent care in the morning, and they ran an EKG, urine analysis, and chest X-ray: all with unknown results. They were concerned it could be something worse along with potential pneumonia, so they sent me to the emergency room. In the emergency room, I received a CT scan where they found multiple pulmonary embolisms (1 large one in my right and multiple in my left lung). The patient stated that she had just had my yearly physical the previous week (Apr2021), with no signs of any health issues. With that, the doctors believed my condition to be related to my 2nd dose, so I was admitted to the hospital. I had to stayed for 2 nights. I am now on blood thinners, other meds (pain medications), and require oxygen during sleep (O2 levels drop too low). I have been referred to lung and hematology specialists. Also, reported that patient experiencing significant shortness of breath and right-sided chest pain under the rib. This persisted for some time until she presented to the

1269617	4/29/2021	AZ	81	M	2/23/2021	3/1/2021	<p>Got worse and the leg swelled and was also having foot swelling because blood flow wasn't there; sore arm; blood clot; pain behind left knee; This is a spontaneous report from a contactable consumer (patient's wife). An 81-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), via an unspecified route of administration, administered in right shoulder on 23Feb2021 (Batch/Lot Number: EN6202) (at the age of 81-years-old) as single dose for covid-19 immunisation. Medical history included diabetes mellitus, stage 3 renal failure (was not bad, was in stage 5 couple of years ago, was a month or so away from full failure, was in the hospital and had dialysis, was able to get reversed with medication and diet), high blood pressure, and blood cholesterol increased/high cholesterol. The reporter stated that with regards to patient's height, he shrunk a little. Patient had no prior vaccinations within 4 weeks, didn't get flu shots. Concomitant medications include about 12 other unspecified drugs, takes statins, has high blood pressure and high cholesterol. Patient started experiencing pain behind his left knee about 6 or 7 days later in Mar2021 (also reported as 04 or 05Apr2021, pending clarification). By that Sunday, it had gotten worse. The leg swelled and was also having foot swelling because blood flow wasn't there. There was no TIA's no stroke, no heart racing, no sweating, was all pain. Got leg up and kept elevated until they could get to the doctor and get imaging. Patient went Monday 08Mar2021 to see the doctor. Patient was brought to the doctor and was then sent to the imaging place. Radiology read the imaging around 5:15pm on the Monday, 08Mar2021. The radiologist said there was 2.5" blood clot behind the left knee. He had never had a blood clot before. Patient was then sent to the Emergency Room at (Name) Hospital, in (Name) where they live. Was kept there several hours. Did a lot more blood tests. He was immediately put on 10mg ELIQUIS 10mg, once in the morning, and once at night. He is now taking 5mg Eliquis in the morning, and 5mg at night. He has not had any of these problems before the Pfizer shot. The reporter knew that not a lot had been reported. It seemed it should be safe. The correlation and timing having the shot on 23Feb2021 and all of a sudden a week and a half later this happened. It was 10 days later. There was nothing they can do about</p>

1269723	4/29/2021	CT	58	M	3/10/2021	3/15/2021	DVT in right leg; Swelling in right leg; Discomfort in right leg while walking; This is a spontaneous report from a contactable consumer (patient). A 58-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), first dose via an unspecified route of administration, administered in the left arm on 10Mar2021 at 16:30 (batch/lot number: EN6208) as a single dose for COVID-19 immunisation (wanted the protection). Medical history included deep vein thrombosis (DVT) from Jul2018 and ongoing. No family medical history relevant to the adverse events. Concomitant medication included warfarin taken for maintenance level for history of DVT from Aug2020 and ongoing. The patient experienced DVT in right leg on 02Apr2021, swelling in right leg on 15Mar2021 and discomfort in right leg while walking on 15Mar2021. The patient reported that he had a reaction to the COVID-19 vaccine and he believes that it was directly related to the COVID-19 vaccine. He reported that he has a history of blood clots in his right leg going back to 2018. He reported that his most recent DVT was in Aug2020 and he was cleared in Nov2020. He reported that he received the COVID-19 vaccine on 10Mar2021. He reported that on 15Mar2021, he started to notice his right leg swelling. He reported that he called his physician on 29Mar2021 and that his physician ordered an ultrasound. He reported that he had the ultrasound on 02Apr2021 and a deep vein thrombosis was found again. Swelling in right leg: he reported that the swelling has gone down. He reported that the reason that he mentioned that he has a history of blood clots was because of his warfarin dosage. He reported that he was first diagnosed with a deep vein thrombosis in Jul2018. He reported that he went through that cycle and that his maintenance level of warfarin was maybe 10 or 12 mg of warfarin per day. He reported that he had another deep vein thrombosis in Aug2020, and since Aug2020 he has been on 17 mg of warfarin daily. He reported that the blood level on warfarin maintenance was supposed to be between 2 and 2.5. He reported that now because of the deep vein thrombosis he experienced in Aug2020, his doctor wanted his level to be at 2.5 to 3.5. He stated that he doesn't think that at that blood level for his warfarin that he should have gotten a blood clot. He reported that something compromised or interfered with the warfarin,

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

resulting in a deep vein thrombosis. Discomfort when walking; he reported that it feels like his leg was compressing. He reported that the discomfort seems to have gotten better. He was queried for details of warfarin prescription. He reported that the 10 or 12 mg warfarin tablets that he had been taking when the blood clot was diagnosed in Aug2020 have been consumed and he no longer has the bottle. He reported that he did not have the bottle with him for his current warfarin prescription. He reported that the warfarin was not auto-refilled by the pharmacy. He reported that the warfarin was only prescribed a week or two at a time. Investigations: he reported that since Aug2020 when the deep vein thrombosis returned, he started doing self INR tests at home. He reported that he constantly self-monitors his INR at home and his levels were consistently at 3.0 to 3.1. He reported that he monitors his INR at least once a week, sometimes twice a week depending on how he feels. He reported that sometimes his INR goes over 4 and he can feel it. He reported that his system was a little off when it feels too high so he knows how to adjust. He reported that he last checked his INR today, 15Apr2021, and that it was 4.0. He reported that he typically checks his INR on Wednesday. He reported that he keeps a log of his INR levels. He reported that he did not see his physician on 29Mar2021, but that he called his physician and his physician wrote a prescription for the caller to get an ultrasound. Vaccination facility type was pharmacy. Vaccine was not administered at military facility. The adverse events did not require a visit to the emergency room and physician office. No prior vaccinations (within 4 weeks). He reported that he doesn't usually get vaccines. BNT162B2 second dose (lot number: ER5729) was administered on an unspecified date; anatomical location: left arm. The outcome of the events was recovering.

1269733	4/29/2021	PA	52	F	4/1/2021	4/1/2021	<p>blood clot; swelling and pain in right leg; swelling and pain in right leg; right arm hurting tremendously; This is a spontaneous report from a contactable Nurse. A 52-years-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in Arm Right on 01Apr2021 13:45; at the age of 52-years-old, (Batch/Lot Number: ER8734) as SINGLE DOSE for covid-19 immunisation. Medical history included ongoing hypertension, ongoing memory impairment (She states that she was diagnosed either last year or the year before that she can't remember. She states that it is ongoing, but it is well controlled). Historical vaccine included vaccine to tetanus (About 3 or 4 years ago). There were no concomitant medications. The patient experienced blood clot (thrombosis) (disability) on 13Apr2021 with outcome of not recovered, swelling and pain in right leg (disability, medically significant) on 09Apr2021 with outcome of not recovered, right arm hurting tremendously (disability) on 01Apr2021 with outcome of recovered on 04Apr2021. The patient underwent lab tests and procedures which included ultrasound scan: positive on 13Apr2021 had a blood clot. Therapeutic measures were taken as a result of blood clot (thrombosis) included Xarelto and due to pain in extremity the patient received ibuprofen (7 ibuprofen every day); Sender's Comments: Based on the information available and a close temporal association, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported events of Thrombosis. The case will be reassessed once new information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified.</p>

1269746	4/29/2021	AZ	46	M	3/12/2021	3/12/2021	Regular pain feeling; Headache; Muscle pain; Calf feels tight, stiff, it feels like dead weight; Calf feels tight, stiff, it feels like dead weight; Pain running up the right arm up to the shoulder/Calf pain; He asked if someone can tell him if it is a blood clot in the back of his calf; This is a spontaneous report from a contactable consumer (patient). A 46-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in left arm (shoulder) on 12Mar2021 10:07 (Lot Number: EN6202) as single dose for covid-19 immunization. There were no medical history and concomitant medications. The patient has no prior vaccinations within 4 weeks. The patient was not sick at time of vaccination. The patient reported that on 12Mar2021, he has been feeling the regular pain feeling, a headache, muscle pain before, it comes and goes. However, he said that the last few days (2021), there had been, by his calf muscle in the back there, they've been tightening, like stiffening up on him when he's sleeping. His calf feels tight, stiff, it feels like dead weight. It wakes him up at times. He also reported pain running up the right arm up to the shoulder on unknown date in 2021. He was just curious in terms of what that might be. He asked if someone can tell him if it is a blood clot in the back of his calf. The headache went away after 2-3 days. He also reported that his eyes also hurt a little bit and was the same time frame as the headache (onset date reported as 12Apr2021: after the second dose, pending clarification). He stated that those things were just mild, nothing major. He did not take anything for these. He confirmed he no longer had muscle pain. He just has pain behind the calf and right arm up to his shoulder. His calf pain, started to feel tight, started within the last 2- 3 weeks (2021). The arm pain in right arm up to shoulder started maybe within 2 days. The patient received the second dose on 02Apr2021. Outcome of the events muscle pain and headache was recovered in Mar2021, events pain running up the right arm up to the shoulder/Calf pain was not recovered, and outcome of other events was unknown.

1269535	4/29/2021	CO	59	F	4/5/2021	4/5/2021	<p>blood clot under her eye; bright red bruise in the corner of the eye to the middle of the eye underneath; feeling crummy; she was down; headaches; couldn't move; arm hurt all the way below her arm pit into her breast; arm hurt all the way below her arm pit into her breast; arm hurt all the way below her arm pit into her breast; got very sick; This is a spontaneous report from a contactable consumer (patient). A 59-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot Number: ER8737), dose 1 via an unspecified route of administration, administered in Arm Left on 05Apr2021 08:30 (at the age of 59years) as single dose for Covid-19 immunization. Medical history included ongoing rheumatoid arthritis and osteoarthritis (not bad enough that she takes treatment, but she is diagnosed; she was diagnosed way back in 2006). Concomitant products: patient stated she takes some medications (not further specified). The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient reported that she had her first dose of the Pfizer Covid-19 vaccine on 05Apr2021 and got very sick. She was down for two days and after day 10 (as reported) she has a blood clot under her eye. She would like to know what would happen if does not get a second dose. She consulted if there is any talk on whether or not people should receive an additional dose of the Pfizer Covid-19 vaccine next year. The patient further reported that on 06Apr2021 she woke up feeling crummy right away and a couple of hours into that day she couldn't lift her arm, literally couldn't lift arm for 6 inches and stated it went on for 2 days. She further stated that her arm hurt all the way below her arm pit into her breast. She stated that it all ended on 08Apr2021 and she went back to work on 08Apr2021. The patient added that she was down for two days, had headaches, and stated she never knew what people meant when they said they got hit by train. She doesn't believe she had a fever and couldn't move. The patient further stated that she got pretty darn sick and this morning 14Apr2021, she woke up with a blood clot under her eye. She is an esthetician and is pretty good with skin. She stated that she doesn't know how she could get this overnight unless she injured herself in her sleep, but she is a light sleeper. She does not know if it is a clot. She also stated that she called a medical esthetician who told her to take a baby</p>

							aspirin and cold compress. The patient clarified that she didn't feel so good and today she feels better. She doesn't know that it is a blood clot, it is not raised and not hard, it looks like she has a bright red bruise in the corner of the eye to the middle of the eye underneath, not in the eye. She wants to make it clear she doesn't know if it is a blood clot. She feels like if she hurt herself, that would be the reason, but it would be painful, and it is not. She added that the bruise is about the same. Therapeutic measures were taken as a result of the events (except for feeling down and couldn't move). The outcome of events thrombosis and contusion was not recovered; the outcome of other events was recovered on 08Apr2021.

1272137	4/29/2021	MA	66	M	4/1/2021	4/5/2021	Patient received the second dose of Moderna vaccine on 4/1/21. Approximately 5 days afterwards he began to have a headache. This lingered and progressed to the point that presented to the emergency room. A CT head revealed cerebral venous sinus thrombosis. No evidence of thrombocytopenia but notably, the patient's platelets clump.
1272068	4/29/2021	OR	42	F	4/19/2021	4/26/2021	Pulmonary embolism. Catheterization to break the clot. Now on blood thinners.
1271962	4/29/2021	MT	22	F	2/20/2021	4/5/2021	On April 5th, 2021 I went to the E.D. , for shortness of breath and severe right shoulder pain. While there they got a chest x-ray, ran labs, and did a chest CT. The CT revealed that I had one blood clot in my left lung and two blood clots in my right lung, as well as slight pleural effusion in the right lower lobe. They put me on Xarelto for the next 3-6 months and monthly follow up visits with my primary care provider. I was also given Hydrocodone as need. I experienced extreme pain with breathing and sort of movement for a week and half but currently only have occasional shoulder and back pain usually at the end of the day.
1271930	4/29/2021	MA	50	M	4/1/2021	4/22/2021	starting have shortness of breath/difficulty breathing and back and chest pain. light headed, pain unbearable. Saturday April 23rd Went to er was treated for kidney stones but they could only find one small one, Was sent home with pain medication. Shortness of breath persisted as did bloody cough and pain in chest and all over. Went back to the er on 4/28 as pain was unbearable (chest pain) once given a cat scan and diagnosed with blood clots in my lungs and then an ultra sound and found a blood clot in my leg (just above knee). It is thought that I was mis-diagnosed on the original trip to the er with kidney stones. I have been put on blood thinners and pain medication and will be following up with my doctor.
1271920	4/29/2021	MI	63	M	3/16/2021	4/8/2021	3 weeks after Patient got this shot he got blood clots in his leg and amputated next week .The problem is he has ITP platelets were 12,000 He can't make blood clots!!!

1272491	4/29/2021	CA	40	F	4/11/2021	4/11/2021	<p>Patient is a 40 y.o. female who presents for evaluation of adverse reaction to Johnson and Johnson COVID vaccine (received on 4/11/21). She received the vaccine on April 11th, around 2:30 p.m. at 8:00 p.m. that night she developed fever with temp 100.4°, chills, headache, nausea and body aches. At 10:00 p.m. that night she developed palpitations, heart racing, shortness of breath, tightness in her throat and chest. She was unable to sleep that night. The next day on April 12th, she continued to have low-grade fever with temp 99°, shortness of breath, chest tightness. She reports taking a pregnancy test at home which revealed a faint positive pink line. That night she took Tylenol which helped relieve some of her symptoms. On April 13th, she continued to have shortness of breath and chest tightness, her heart palpitations improved slightly. She reports retaking the home pregnancy test and this time it was negative. On April 14th, she had a same-day clinic visit, labs that day revealed slightly elevated D-dimer and normal chest x-ray. She continued to have shortness of breath and on April 16th, she presented to the ER due to sudden onset of bad headache, nausea, diarrhea and heart palpitations. She was discharged from the ER with close follow-up with her primary care doctor. Her symptoms did not improve and subsequently on April 20th, she began to have left-sided facial numbness. On April 21st, she went to the ER and was found to have left-sided facial weakness and suspected Bell's palsy. She was admitted for further diagnostic workup (CT Brain normal, MRI Brain normal, and MRV Brain with no evidence of venous sinus thrombosis, carotid doppler normal, MRA Brain normal, MRI sella (pituitary) normal), and treatment was initiated with prednisone and antiviral medications. On April 23rd she developed left arm weakness as well. She was discharged with closed follow up with her PMD and specialists. She recently was seen by pulm Dr and scheduled for PFTs. She is nearly completed with course of prednisone and valacyclovir, left facial weakness slightly improved but not resolved, has follow up with neuro this week.</p>

Pulmonary embolism without acute cor pulmonale, unspecified chronicity, unspecified pulmonary embolism type (HCC) 04/26/2021 Resolved Hospital Problems No resolved problems to display. CONSULTS: None INPATIENT PROCEDURES: None DETAILS OF HOSPITAL STAY: Patient is a 51 y.o. male with a past medical history of psoriasis, environmental allergies who presents today with sudden shortness of breath, left side pleuritic chest pain 7/10, worsened with deep inspiration. No recent travel, no family history, no history of malignancies, no immobilization or surgeries. He had his 2nd dose of Pfizer COVID vaccine on April 1. He does not have a history of COVID-19 infection, and COVID-19 PCR test was negative in ER. His blood pressure is a little high at 170 6/83 mm, pulse 76 per minute saturating 96% on room air, troponin less than 6, BNP 16, WBC 12.3,, EKG without any significant ST T-wave changes. CT angiogram of the chest shows nonocclusive thrombi in almost all the lobes, there is no saddle embolus noted. There is no evidence of right heart strain. Echo: The technical quality of the exam was limited due to suboptimal acoustic windows. The left ventricle is normal in size. There is normal left ventricular wall thickness. The left ventricular ejection fraction is 60%. Regional wall motion abnormalities cannot be excluded due to limited visualization. The right ventricular size, thickness, and function are normal. No significant valvular pathology identified with Doppler examination. There was insufficient tricuspid regurgitation envelope detected to calculate right ventricular systolic pressure. Injection of contrast documented no interatrial shunt. There is no comparison study available. He was started on Heparin gtt. And admitted for observation. He required no supplemental oxygen. He was discharged later pm on Eliquis 10 mg bid for 7 days, than 5 mg bid for 3 months. I am questioning did he had COVID-19 vaccine related bilateral PE. His hypercoagulable profile is pending. He has no sign of malignancy, no new symptoms, no weight loss. He had normal colonoscopy 2 yrs ago. He should follow up with his PCP. He was given work excuse from 4/26-5/3/21. She shouldn't take non steroidal anti-</p>

							inflammatory (Ibuprofen (Motrin), Naproxen, Naprosyn, Voltaren, Relafen ... meds because of blood thinner Eliquis. He can take Tylenol 500 mg 1-2 tabs 3-4x a day as needed. He was also prescribed Lidoderm patch. For HTN he was started on DASH diet and Norvasc 5 mg daily. He should follow up with PCP next week. Also he was instructed to quit smoking.
1271834	4/29/2021	CA	49	F	3/22/2021	4/5/2021	Blood Clot and pulmonary embolism from first shot.
1270988	4/29/2021	MA	81	F	3/6/2021	3/8/2021	After 2nd Vaccine on 3/6/21, she became ill on 3/8/21, fever and chills was in bed all day on 3/9/21 with the same symptoms. Woke up on 3/9/21 with shingles, Her PCP was treating her with Famciclovir and Gabapentin for pain. She no longer had the fever or chills but still didn't feel well. On 3/17/21 she was admitted at Medical Center which she was treated for a blood clot in her lung and for pericardial effusion. She was put on blood thinners which then caused a bleed in her hip bone. She had a surgery to put a filter in to stop more blood clots and to drain the fluid from her heart. She died on 3/27/21 around 3:30pm.
1266576	4/28/2021	NY	41	F	4/1/2021	4/1/2021	Within 4 hours had nausea, headache. Lasted for about a day. 12 days later vertigo, nausea, headache resumed. Went to primary who detected a drop in oxygen levels, was then sent to ER where many tests were done. Included chest scan, to look for clots. None were found. Took dramamin for vertigo which helped. Symptoms of nausea, headache, vertigo continue to persist off and on. On Friday 4/23 I died my hair. Within 2 minutes an allergic reaction too place: sudden nausea, some shaking, headache. Took benedryl which help. At this point, I have continued bouts of nausea and no appetite. Its been close to a month and I'm really scared for my health. I was completely healthy before.
1266422	4/28/2021	FL	79	F	4/5/2021	4/22/2021	Patient stated that her doctor says she has blood clots and believe it could be due to the vaccine.

1266417	4/28/2021	NY	54	M	3/20/2021	3/30/2021	<p>Patient is a lovely 54 year old- year old male initially seen 4/5/2021, kindly referred by Dr. History of COVID pneumonia in 4/2020 which was complicated by ARF and shingles, Ramsay Hunt Syndrome, with subsequent post-herpetic pain on right side of scalp.He recently received his COVID-19 Pfizer vaccine 3/20/2021 11 days prior to presentation to the hospital with shortness of breath, worsening dypnea on exertion which started 2 days after vaccine. Before this he was biking twice a week, and swimming nearly daily. He did report any medical problems before COVID, was on no meds. 3/31/2021- CT PE protocol showed multiple bilateral PEs without right heart strain. Pulmonary Vasculature: Bilateral filling defects consistent with pulmonary emboli are visualized involving the following: Distal right main pulmonary artery extending to the right lower lobar, segmental, and subsegmental branches, right middle lobar, segmental, and subsegmental branches and proximal right upper lobe artery. Left lower lobar, segmental, and subsegmental arteries. The right heart is not dilated.COVID/flu swab neg, trop x2 neg, BNP wnl. - Started on therapeutic lovenox then plan to transition on discharge to PO xarelto 15 mg bid x21 days then continue with xarelto 20 mg daily. He was seen by Dr. and referred to me for follow up. He had US 4/5/2021- which showed Right Lower Extremity: There is acute thrombus of the femoral proximal vein.Right Lower Extremity: There is no evidence of deep or superficial venous thrombosis in the common femoral, popliteal, posterior tibial, peroneal, GSV and SSV veins. Left Lower Extremity: There is no evidence of deep or superficial venous thrombosis.' 4/5/2021: Initial hematology visit Currently does not have any pain in legs, swelling. Reports that he still is not back to 100%, he got on peloton yesterday and was only able to go 5-6 miles at a slower pace. Denies fevers, chills, sweats. He has some intermittent pain where his previous zoster scalp lesions were. He has been undergoing facial PT. Thrombophilia workup sent which was grossly negative.</p>

1266384	4/28/2021	WA	65	F	3/30/2021	4/26/2021	Patient with dementia NOS received COVID-19 vaccination first dose (as reported) on 3/30/2021. Family reported she was feeling unwell with vague complaints thereafter. Found dead on 4/27/2021. Autopsy performed on 4/28/2021 revealed ischemic bowel with an acute superior mesenteric artery thrombosis. She had little other cardiovascular disease to account for the thrombosis.
1266361	4/28/2021	KS	65	F	4/22/2021	4/23/2021	April 22, 2021 morning my auntie got her first dose of Pfizer vaccine. She happily shared here vaccine experience with family member and relative. April 23 morning, she told us she has severe abdominal pain, has the need to have a bowel movement, but she was defecated. She also told us that she vomit couple times already, then she has no more energy to talk. She got into the hospital and she was announced death right after midnight at 12:04 April 25th. Reason of death given is "septic shock secondary to ischemic bowel & intra-abdominal sepsis". But it is the blood clots issue that is causing it. I was told that after my auntie got into hospital the very next day after Pfizer vaccine, hospital later found out that my auntie has blood blockage issue that is causing blood couldn't flow to her intestines. The acid in her blood was very high, 6+. After more than 6 hours without blood to her intestines, her intestines tissues start dying and turned black color. Doctor found out about this at the night of April 23, 2021 nighttime. April 22, 2021 morning is the day my auntie got her Pfizer covid vaccine. There is a very high chances of the Pfizer vaccine is causing the blood clots that lead to blood blockages.
1266356	4/28/2021	CO	61	F	3/7/2021	4/2/2021	For the past 2 1/2 - 3 weeks I have had a pain in my left leg. Today it was extremely painful so I went into the dr. office and after an examination and ultra sound it was determined that I have a blood clot.

1266733	4/28/2021	CT	57	F	3/11/2021	4/6/2021	Patient reported left calf pain on 4/6/2021. She underwent lower extremity duplex which was positive for left deep vein thrombosis.
1266769	4/28/2021	MA	53	F	2/24/2021	3/13/2021	On the morning of Saturday, March 13th my mother had a CARDIAC ARREST, luckily i was with her when this happened and called 911 immediately and followed an emergency/cpr protocol. She had no pulse when the emergency team arrived and they used the defibrillator on her three times in our house before they took her in the ambulance where they used the defibrillator another time. She was rushed to the Hospital where she was sedated and put on a breathing machine. It did not seem as if she would survive, the entire morning was a whirlwind and traumatizing. In the afternoon they transferred her to the ICU unit. Luckily after 24 hours they lowered sedation and she had no brain injury etc., we were all amazed she was alive. The doctors ran tests etc. to find out what caused this cardiac arrest event, they found NOTHING - no blood clot, no clogged arteries, nothing that could have caused this. My mother also has had not health conditions before this that would have caused this. She now has a defibrillator implanted and her life will never be the same, her families either, we will constantly worry. I have post traumatic stress from witnessing my mother turn purple and lifeless right in front of my eyes and the emergency team working on her all morning and in the ER. Thank gosh i was with her that morning and that the emergency team arrived within a few minutes or else my mother would not be here today. The only thing that changed leading up to her Cardiac Arrest was that she got the Pfizer Covid-19 vaccine on February 24th - we need answers, did the vaccine have anything to do with this?

1266095	4/28/2021	FL	41	F	4/10/2021	4/10/2021	As soon as I took the vaccine shot I had an immediate headache, after taking the vaccine I took Tylenol and slept in the rest of the day. The next day I woke up and my arm was red and swollen. I was running fever, still had the headache and now blurry vision. My entire body was hurting. My left side of my body felt numb and tingling. The next two days the pain became worse. I did not really have an appetite. When I did eat I could barely hold my food down. On Wednesday morning I could barely get out of bed, I also felt extreme pain in my lower legs, stabbing pain in stomach and right lower side. I also had ringing in my ears, more in the right ear. I then notice a bruise on my left leg, that it was not originally there, and was also tender to touch. I went to the emergency room on the same day and I was admitted. I was in there for 4 days, they tested my leg and stated it was not a blood clot, although it look and felt like one. They discharge me and advise me that it was a migraine that was causing all my pain. This was on Sunday, I had a follow up with my PCP on the Friday, however to being in so much pain and shortness of breath, and arm pain I was advise to go to the ER on the Thursday and was admitted again. I was told in the ER I had a blood clot in my right arm and it was most likely from the IV from the previous visit. My blood pressure and heart rate was so high that they put me on medication. No matter the pain medication they gave me, it would not completely take the pain away. They discharge me again on Monday and after me begging them to get run any and all test, they said they found nothing. I'm still in the same amount of pain and same symptoms, still having trouble keeping my food down. The only thing that changed is my left arm is not as sore, however I still have a huge knot and its still warm to touch. I don't know what else to do that is why im contacting the CDC for help. I'm in a extreme amount of pain and pounding headaches. Please help

1265991	4/28/2021	PA	79	F	2/23/2021	2/24/2021	Blood clot in lung; Shortness of breath; Felt tired; Slight headache; This is a spontaneous report from a contactable consumer (patient). A 79-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot Number: EN6201), dose 2 intramuscular, administered in Arm Right (also reported as "injected intramuscularly in right arm") on 23Feb2021 13:00 (at the age of 79years) as single dose for Covid-19 immunization. The patient received the first dose of BNT162B2 (lot number: EL8982) on 02Feb2021 (at the age of 79years) for Covid-19 immunization. Medical history included high blood pressure (diagnosed prior to 10 years ago), respiratory illness, genetic/chromosomal abnormalities, endocrine abnormalities including diabetes, diagnosed allergies, compromised immune status, and obesity (Little on the heavy side but she does not think she is obese); all from an unknown date and unknown if ongoing. Concomitant medication included lisinopril taken for high blood pressure at 20 mg once daily, started at least 10 years ago. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. It was reported that the patient had received the two doses, she had shortness of breath in the morning around 08:30 on 08Mar2021 and went to her doctor. They did blood work and she was put in the hospital because the doctor found out she had blood clots in her lungs (11Mar2021, 13:00). The patient was hospitalized for blood clot in lung from 11Mar2021 to 13Mar2021. She doesn't know if it came from the vaccine or not. She was sent home on Eliquis for 6 months to get blood clots from her lungs. She also has oxygen for when she needs it and mostly for when she is ambulatory. It was further clarified that when she went to her doctor's office, they did blood work. When they got results, they called her at home and told her that she had to call the ambulance and go the hospital in the ambulance, so she did; Ambulance to ER (hospital) on 11Mar2021. There was also a problem with the left ventricle of her heart (12 Mar2021 12:30). She stated whichever part pumps blood into the pulmonary vein, something is wrong there. She was going to have an echocardiogram to check that out again on 29Apr2021. She does not know the outcome of that yet until she gets that done. They gave her Eliquis as a blood thinner and oxygen. She has not really needed the oxygen around the house. But if she goes outside,

1269327	4/28/2021	CA		F	2/10/2021		<p>little pain in the arm; very tired and falling in and out of sleep; very tired and falling in and out of sleep; lymph nodes near the tonsils on her left side were protruding out; she gets sore throats a lot; This is a spontaneous report from a contactable consumer (patient). A female patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), dose 2 via an unspecified route of administration, administered in Arm Left on 10Feb2021 10:40 (Batch/Lot number was not reported) as SINGLE DOSE for covid-19 immunisation. Medical history included heart attack, two blood clots and anxiety. Concomitant medication was not reported. Patient previously took first dose of BNT162B2 for covid-19 immunization. On an unspecified date in 2021, the patient experienced little pain in the arm, very tired, falling in and out of sleep and lymph nodes near the tonsils on her left side were protruding out. Patient got 2nd Pfizer covid vaccine 10Feb2021, yesterday, tired, falling in and out of sleep, she read paper and knows tiredness is a reaction, she put her hand on her left side of neck which is also the injection side, Patient was notorious for sore throats, but, she had no sore throat. her lymph node felt like it was protruding out on unspecified date in 2021. She had some hot soup and it went away. She woke up this morning and it was there again. She had a couple of cups of hot tea, it was gone down. No pain to touch, it was really protruding, a good size. When I have hot stuff, it kind of shrunk it. I saw my health care provider on 11Feb2021, the day after her shot, she did lab work, but she didn't this when she saw her. She got this on Valentines Day. She took Coumadin and there are vegetables she cannot have, she like to had vegetable soup for the warmth. Once she had that the lump goes away. If she tells me to go to the hospital, she was going to go over the bridge. Caller was asked what she meant by that statement, Caller states, That was a figure of speech. She was too afraid to do that. Her throat was not red, she had looked. she had read the documentation, front and back, she was a worrier, since 27 years old, she can turn something into nothing. That was how her anxiety gets. She had a heart attack at age 49, and two blood clots years after. She hasn't been anywhere in over two years. She has done everything. She hasn't seen her family and grandkids. She goes to</p>

the market gloved up and masked up. No one has been in her house. She has been tested for COVID because she gets sore throats a lot. The COVID test have been negative. Nothing has ever shown. Caller states she is not going to the hospital. She has a new doctor. She doesn't know what to do. She wants to know if that is a side effect. The patient underwent lab tests and procedures which included sars-cov-2 test: negative. Outcome of the event lymph nodes near the tonsils on her left side were protruding out was recovered on unspecified date in 2021. Outcome of the other events was unknown. Information about lot/batch number has been requested.

Subsequently - a doctor discovered numerous blood clots in that leg; then a blood clot in one of her lungs; her left leg (she was inoculated on the left side) swelled up; it was painful; She is being treated but the lymphadenopathy has not subsided in her leg; she is now unable to walk without a cane; This is a spontaneous report from a contactable consumer. A 69-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot number not reported) on an unspecified date in 2021 at single dose (inoculated on the left side) for covid-19 immunisation. The patient medical history and concomitant medications were not reported. The patient received the vaccine few weeks ago, in 2021, and within 3 hours, she recounted her left leg (she was inoculated on the left side) swelled up dramatically it was painful. Subsequently a doctor discovered numerous blood clots in that leg, then a blood clot in one of her lungs. She is being treated but the lymphadenopathy has not subsided in her leg and she was now unable to walk without a cane. The outcome of lymphadenopathy and unable to walk without a cane events was not recovered; outcome of the other events was unknown. Reporter asked if there were reports of blood clots that have been validated as a result of the Pfizer shot. Information on the lot/batch number has been requested.

1267477	4/28/2021	NC	57	M	3/25/2021	4/8/2021	Left leg pain and swelling a couple weeks after shot one of Pfizer vaccine. After a few more days of leg not getting any better, saw Doctor who ordered Ultra sound of left leg and CT scan of lungs. Extensive DVT clot found in left leg, low density bi lateral pulmonary embolism in both lower lobes of lungs found from CT scan. Hospital stay for 2 days, Heparin given in hospital and now I'm on eliquis blood thinner. Had gotten my second Pfizer shot 3 days before admittance to hospital.
1266035	4/28/2021	NJ		U	2/1/2021		have developed 2 massive blood clots; This is a spontaneous report from a contactable consumer (patient). A patient of unknown gender and age received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) in Feb2021 at single dose for COVID-19 immunisation. Medical history and concomitant medications were unknown. Historical vaccine included first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) in Jan2021 for COVID-19 immunisation. Since then, the patient had developed 2 massive blood clots. The patient did not have a history of blood clots. The outcome of the event was unknown. There was no doubt this was related. No follow-up attempts are needed; information about lot/batch number cannot be obtained.
1266028	4/28/2021			F	3/9/2021		portal vein thrombosis; thrombocytopenia; This is a spontaneous report from a contactable consumer (former colleague). A 6-decade-old (in her 50s) female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot and expiry were not reported), via an unspecified route of administration on 09Mar2021 as single dose for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient received the first dose of bnt162b2 around 09Mar2021 and was hospitalized 2 weeks later. It was reported that the patient experienced portal vein thrombosis and thrombocytopenia in 2021. The patient died in 2021 due to portal vein thrombosis and thrombocytopenia at a State hospital. No autopsy was performed. Information on the lot/batch number has been requested.; Reported Cause(s) of Death: Thrombocytopenia; portal vein thrombosis

1265973	4/28/2021	CA	72	M	2/3/2021	2/1/2021	Blood clot in right lung; Sore left arm at injection site; Shortness of breath; This is a spontaneous report from a contactable consumer (patient). A 72-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), first dose intramuscular, administered in the left upper arm on 03Feb2021 at 09:00 (batch/lot number: EL3248) as a single dose for COVID-19 immunisation (prevention). Medical history included rheumatoid arthritis from Dec2009 to an unknown date (takes daily pills for rheumatoid arthritis), squamous cell lung cancer early stage from Aug2018 to an unknown date, lung surgery to remove small portion of that and went on chemo in Aug2018, skin cancers prior to getting the vaccine, reading glasses (he needed prior to getting vaccine), blood pressure (abnormal) (takes blood pressure medication; takes daily pills). Family medical history was reported as none. Concomitant medications included nivolumab (OPDIVO) taken for squamous cell lung cancer early stage from 17Jan2019 to an unspecified stop date (getting it every 4 weeks for 2 years and 3 months; the bag was 480 ml); and unspecified blood pressure medication and rheumatoid arthritis medication. The patient experienced blood clot in right lung on 25Feb2021, sore left arm at injection site on 03Feb2021 and shortness of breath on Feb2021. The patient had the first Pfizer COVID vaccine on 03Feb2021 and second one on 01Mar2021. He did not really have any special events but then he had a CT scan on 23Feb2021, which was about 20 days after first shot. When he went in for doctor's meeting a couple of days later, they said he had a blood clot in right lung. He later stated he was not positive it was in the right lung. He told his doctor that he just got the shot, but they said they had not heard of any reports from Pfizer of people getting blood clots in their lungs after getting it. He thought about reporting then, but did not. He has no evidence that the blood clot in his lung was related to the vaccine. He was also a lung cancer patient and was on an immune therapy drug nivolumab from (name). He has been on it for over 2 years and started Jan2019. He was diagnosed with cancer back in Aug2018. It was squamous cell lung cancer early stage. He had lung surgery to remove small portion of that in Aug2018 and went on chemo. On 17Jan2019, he started on nivolumab immune therapy drug. Fortunately, it worked extremely well. He

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

immediately started recovering and was feeling better. The last few CT scans indicated he had no sign of disease. It does not mean he was cured, but was healthy otherwise. The nivolumab spurred his immune system to eat the cancer cells. It stimulates your immune system. It has been a pretty successful drug and has been on the market for about 5-6 years. He and his wife both got shot on same date. The word on the street was that you should ask for Pfizer because it seems to have less side effects that people can get for vaccines. Pfizer's reputation has been known for having less common serious side effects. He had a sore arm and it went away about a day later. They prescribed rivaroxaban (XARELTO), a blood thinner, for his blood clot which he went on and got on a day or two later. He was hoping it was gone. He feels better. At the time, he did not know he had the blood clot. He visits his doctor for treatment for nivolumab every 4 weeks and every 4 months, they do a CT scan. At his last visit, he reported that he was still fine but lately experienced some shortness of breath. It was occasional and it comes and goes and was not all the time. He plays golf and noticed the shortness of breath during his game. He quit a couple of holes early and did not want to take any chances. The doctor later told him that a blood clot in your lung can contribute to shortness of breath. When he started rivaroxaban it was 2 pills a day for about 2-3 weeks and it was a starter dose. It was a little more in the beginning. He thinks it was 10 mg twice daily and then it went to 1 tablet a day for the last week at dinner and now it was 15 mg once daily. The two combined were greater to jump start you. It was not a special dose. He then corrected dose to 15 mg rivaroxaban twice daily for the starter dose for 2-3 weeks and one tablet daily for the last week of the starter. Then he switched to maintenance dose of 20 mg daily. He did not have a lot or expiration for the previous dose of 15 mg. The lot and expiration for the 20 mg was unknown because he believes the label was covering it. He stated he needed to get his glasses to read bottle. They were reading glasses and he needed prior to getting vaccine. Nothing has changed with his vision. He was hoping to get off of them and has never been on them. He hopes it was not a long term thing. Second dose was given 01Mar2021, Pfizer COVID vaccine, BNT162B2, expiration was unknown. Injected in left upper arm in the

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

muscle (intramuscularly). Second dose administered at 09:20-09:30. He takes blood pressure medication and did not see it was relevant. Takes daily pills for that and rheumatoid arthritis. In the past, he had a few skin cancers. All were prior to getting the vaccine. They were some squamous and basal cell. He has had nothing in quite a while. Nivolumab was helping skin issues. Squamous cell skin cancer was the same family as lung cancer. He did not have a lot of expiration for the nivolumab. He received it by IV infusion. Shortness of breath was mid Feb2021, on and off for a couple of weeks prior to doctor visit on 25Feb2021. He usually does not have much to report and mentioned it. It did not prevent him from doing anything and was not debilitating. One of his fellow golfers said he was huffing and puffing and he just poo poed it away. He had a flu vaccine in Oct2021 (as reported). No further details provided. Blood clots in right lung morning time, unknown time. Sore left arm at injection site noon - to late in the day of the shot. Shortness of breath - sometimes he feels it in the morning or midday if active. He cannot say a straight time. No emergency room (ER) or physician's office visit required. Vaccination facility type was clinic. Not a military facility. On 25Feb2021, normally scheduled office visit and did the CT scan on 23Feb2021. He went in separate for that. He had the treatment on Thursday. He has another CT scan scheduled in third week of May2021. They were doing it early because of the blood clot. Hopefully, it was gone by then. Prior vaccinations (within 4 weeks): 1st and 2nd Pfizer COVID vaccine as mentioned above. CT scan on 23Feb2021, positive for small blood clot in single vessel in what he thinks was his right lung. All of his previous trouble with the lung cancer was in his right lung. He has never heard of anyone else having blood clots related to the Pfizer COVID vaccine. He does not think he has heard of any and wanted to know if there were any. He knows there was something in the press about the (name) vaccine with blood clots. When you do 120 million and have a handful of people, you may have a few things. He did not have any information on the people for (name) to report on. He knows of others who have had the vaccine and no one had any symptoms. No further details provided. The outcome was recovered on 04Feb2021 for the event "sore left arm at injection site"; recovering for the event

1265948	4/28/2021	TX	52	F	3/20/2021	4/9/2021	<p>Pulmonary embolism; Shortness of breath; she tested positive for Covid; she tested positive for Covid; This is a spontaneous report from a contactable consumer (patient) via Pfizer sponsored program. A 52-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection) (at 52 years of age), dose 1 via an unspecified route of administration on 20Mar2021 12:00 (Batch/Lot Number: ER8727; Expiration Date: 31Jul2021) as a single dose for COVID-19 immunisation. Medical history included allergies wherein she mentioned that her allergies were acting up so she took Tylenol 500mg, 1 pill; and insomnia. Concomitant medications included paracetamol (TYLENOL) taken for hypersensitivity; cetirizine hydrochloride, pseudoephedrine hydrochloride (ZYRTEC DUO) taken for hypersensitivity, start and stop date were not reported; and dextromethorphan hydrobromide, doxylamine succinate, ephedrine sulfate, ethanol, paracetamol (NYQUIL) taken for insomnia (it helps her sleep at night), start and stop date were not reported. It was reported that the patient already received 1st dose of the Pfizer-BioNTech Covid-19 Vaccine and was scheduled to receive the 2nd dose on 17Apr2021. Yesterday, she tested positive for Covid and got hospitalized. She said she got discharged today and is now on medication which includes a blood thinner. She wanted to know if she needed to reschedule her 2nd dose, and how. It was clarified that the patient had Covid test on 12Apr2021 with Positive result. She mentioned that she was reading paperwork and it said something about to let her vaccination provider know about medical conditions, allergies, bleeding or if she take blood thinners. She stated that she was prescribed blood thinners yesterday evening and she was going to be taking them for 3-6 months. She questioned if it was going to affect if she takes the shot on Saturday. She added that she will be on the blood thinner 5-6 days by then. She stated that she was tested for Covid in the hospital that she went in with shortness of breath and they did the test yesterday. She had shortness of breath Saturday (09Apr2021) and she went to the ER on 12Apr2021 and was admitted and was released 13Apr2021. She stated that she was diagnosed from being discharged with blood clots and she is now on a blood thinner and a steroid pill for inflammation. She</p>

1265944	4/28/2021	CA	42	F	1/28/2021	1/29/2021	DVT; PE; This is a spontaneous report from a contactable physician. A 42-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), intramuscularly in the left arm, on 28Jan2021 (at the age of 42-years-old) as a single dose for COVID-19 immunisation. Medical history included hypertension (HTN) and fibroids. The patient was not pregnant at the time of vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient had no known allergies. Concomitant medication included amlodipine besilate (MANUFACTURER UNKNOWN). The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), intramuscularly in the right arm, on 07Jan2021 (at the age of 42-years-old) for COVID-19 immunisation. The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient experienced deep vein thrombosis (DVT) and pulmonary embolism (PE) on 29Jan2021, which caused hospitalization for 5 days from an unspecified date to an unspecified date. Therapeutic measures were taken as a result of the events, which included direct oral anticoagulants (DOAC). The clinical outcome of DVT and PE was recovering. It was also reported that since the vaccination, the patient had not been tested for COVID-19. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up.; Sender's Comments: Based on the information currently available, a possible contributory role of the suspect vaccine BNT162B2 or comirnarty in triggering the onset of Deepvein thrombosis,pulmonary embolism cannot be excluded.But also consider relevant medical history of hypertension and fibroids tendency to form blood clots and concomitant medications also have possible contributory role. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1265873	4/28/2021	PA		M			<p>STROKE; BLOOD CLOT IN LEG; This spontaneous report received from a consumer concerned a 51 year old male. The patient's height, and weight were not reported. The patient's pre-existing medical conditions included the patient was healthy with no health issues. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin, and batch number were not reported) dose, start therapy date were not reported, 1 total administered for prophylactic vaccination. The batch number was not reported and has been requested. No concomitant medications were reported. It was reported that on an unspecified date in 2021, the patient started with symptoms after 13 days of vaccination. The patient woke with leg pain That morning, he got in the vehicle to go to work and pulled over due to heaviness in his left arm and slurred speech. An ambulance was called and they took him to the emergency room. From there he was life flighted to another hospital and was continued with laboratory tests. Laboratory data included: doppler ultrasound (NR: not provided) not reported, MRI (magnetic resonance imaging) (NR: not provided) not reported, scan (NR: not provided) not reported and other tests. It was due to the blood clot in his leg that caused him to suffer a stroke. He spent days in the hospital and had to wear a heart monitor for two weeks. He was on blood thinners until further notice to prevent this from happening again. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of the blood clot in leg and stroke was not reported. This report was serious (Hospitalization Caused / Prolonged).;</p> <p>Sender's Comments: V0: This case concerns a 51 year-old male with no prior medical issues who was hospitalized for a stroke and blood clot in his leg 13 days after receiving the Janssen Covid-19 vaccine. Concomitant medications, family history, and social history were not reported. Thirteen days post-vaccination, the patient awoke with leg pain. While driving to work, he experienced heaviness in his left arm and slurred speech and pulled his car over. An ambulance took him to a local hospital and from there, he was air-lifted to another hospital where doppler ultrasound, MRI, and other unspecified tests were performed. He spent an unspecified number of days in the hospital and wore a heart monitor for 2 weeks. He was treated with blood thinners. Per the reporter (patient's daughter), the blood</p>

A 61-year-old male patient received bnt162b2 (BNT162B2), via an unspecified route of administration on 21Mar2021 09:00 (Batch/Lot number was not reported) as single dose f(at the age of 61-year-old) or COVID-19 immunisation. Medical history included dialysis, diabetes mellitus, known allergies: A7, Penicillin, Aspirin, Iodine, Povidone, Pepcid, dyes, Iodine allergy. The patient's concomitant medications were not reported. The patient previously took Aspirin, povidone and pepcid ac and experienced drug hypersensitivity with all. Prior to vaccination, the patient was not diagnosed with COVID-19. The patient experienced death cause: medication on 18Apr2021, he was told by the professional health care that he had small clots in his blood in Mar2021, felt cold/intense cold even in his bones on 21Mar2021, sweating on 26Mar2021, her husband during that night was not able to sleep on 21Mar2021, he started having fever on 21Mar2021, arm started to sore and DVT on 29Mar2021. The patient was hospitalized for he had small clots in his blood, felt cold/intense cold even in his bones, sweating for 27 days. The event DVT was medically significant. The course of events was as follows: After getting the vaccine in 21Mar2021 her husband during that night was not able to sleep. He started having fever and felt cold. Days later he continued with the symptoms. On 26Mar2021 after vaccination he had dialysis same day in the afternoon. When arriving home the person notifies symptoms of intense cold even in his bones and then he started to sweat excessively on 26Mar2021 (Friday). The reporter decided to take her husband to the emergency room on 28Mar2021 (Sunday) where he had a general checkup. He was told by the professional health care that he had small clots in his blood. After some time he had health complications where they had suggested to amputate some of the limbs because of this, the reporter alleges those complications were due to the vaccine. On Monday 29Mar2021 same symptoms reappeared and he was admitted to Hospital. Had a blood test and notified to

1265982	4/28/2021	MO	76	F	3/17/2021	3/29/2021	Blood clot in her lower abdominal area; had the worst pain through her side that ran down her left leg and to her ankle; had the worst pain through her side that ran down her left leg and to her ankle; nerves are all tangled up; This is a spontaneous report from a contactable consumer (patient). A 76-year-old female patient received the second dose of bnt162b2 (BNT162B2, Solution for injection, Lot Number: EN6207), via an unspecified route of administration, administered in Arm Right on 17Mar2021 13:50 (at 76-years-old) as single dose for COVID-19 immunisation. The vaccine was administered at a hospital. It was not administered at a military facility. Medical history included hip replacement four years ago in 2017 (First right then 2 months later left) and knee replacement six years ago in 2015 (both 2 months apart). There were no concomitant medications. The patient previously received the first dose of bnt162b2 (BNT162B2, Solution for injection, Lot Number: EN6203), administered in Left Arm on 25Feb2021 (at 76-years-old) for COVID-19 immunisation and experienced bad headaches. The patient received the second dose of vaccine on 17Mar2021. On 29Mar2021, she was not hurting and went to brunch with friends. Afterwards (on the same date, 29Mar2021), she was sitting and got the worst pain through her side that ran down her left leg and to her ankle. She drove herself home but was in such misery. She went to the emergency room the next day, on 30Mar2021, wherein she had a CT (computerized tomography) scan that showed a blood clot in her lower abdominal area. She was taking pain medication every 6 hours, or she could hardly stand it. On 08Apr2021, she went back to the emergency room because she could hardly stand it. She was kept in observation status but was not admitted. She was scheduled to have another CT scan on 06May2021. She is not sure what they will do because the nerves are wrapped around it. She also mentioned that her doctor wants to do a biopsy. The pain was also running down to her ankle. She stated that she has had both of her hips replaced in the past. She added that her doctor will do an MRI (magnetic resonance imaging). He will put in a drain if it has not shrunk. The doctor can't do anything because the nerves are all tangled up (2021). As corrective treatment, the patient was taking pain medication for the blood clot and pain through her side that ran down her left leg and to her

1269415	4/28/2021	GA	64	F	4/6/2021	4/8/2021	? Tuesday, April 6th ? Patient receives the 2nd Pfizer vaccine shot ? Thursday, April 8th ? Patient is sick with vomiting and diarrhea ? Friday, April 9th ? Patient is delirious and still sick with vomiting and diarrhea. She is also has pain in her stomach. An ambulance is called to take her to the hospital. The hospital determines her white blood count is elevated, indicating an infection. Blood sugar is very high ? approximately 400. Covid test is negative. She is restless upon arrival. She tries to climb out of bed continuously. She is restrained. o Saturday, April 10th ? Patient is running a fever and is in pain. She is also confused and doesn?t recognize her oldest sister. Meds are administered to handle both items. (Toradol?). Blood sugar around 200. She continuously counts and calls for Mother and Father. Patient continues to be restless o Sunday, April 11th - at request of family, a CT scan is done of her stomach and abdomen. Nothing is found. Potassium was at 3.2 (normal is 3.5) so she received an IV drip to help with potassium levels. Sugar ? 206. Later drops to 176. Patient calms down some. She is still confused and doesn?t recognize her oldest sister. ? Monday April 12th ? the hospital attempts to do an MRI, but patient panics. This is a closed MRI and her 1st husband died in one. The MRI isn?t done. ? Tuesday, April 13th ? she is asked by the doctor to state her name and wiggle her toes. She complies. Doctor orders speech therapy. She is sedated for an MRI and a CT scan. Both are successfully completed. She sleeps for the rest of the day. Blood sugar ? 274 @ 5:09pm. ? Wednesday, April 14th ? Patient was asleep all day. Most of the day she isn?t responsive when nurses come in and do things like take blood. She normally responds even if she is asleep. Around 5pm she starts to respond and make noises; she briefly opens her eyes then falls asleep. She continues to run a temperature. ? Thursday, April 15th ? Patient is asleep most of the day. She is responsive when nurses do things like take blood. A spinal tap is performed. There was mention of dementia. Hospital is sharing little information, varying from she is retreating into herself vs. something worth isolating is going on. Temp was 102.3 at 7:37, but later dropped to 99.3 without meds. Dr. (neurologist) provides an update to the family. Tests so far are negative. EEG showed sleeping brain (she was asleep during test). MRI showed

1269156	4/28/2021	CA	74	F	3/9/2021		NOSE BLEED; BODY ACHES; HEADACHE; FATIGUE; NAUSEA; DIZZINESS; WARM FEELING IN THE VEINS OF THE PALMS AND FEET; SEVERE CHILLS; This spontaneous report received from the patient concerned a 74 year old mixed race female. The patient's height and weight were not reported. The patient's concurrent conditions included penicillin allergy. The patient took no concomitant medications. The patient received COVID-19 vaccine Ad26.CoV2.S (suspension for injection, route of admin not reported, batch number: 1805020 expiry: 25-MAY-2021) dose was not reported, 1 total, administered on 09-MAR-2021 to left arm for prophylactic vaccination. On 09-MAR-2021, the patient experienced severe chills at around 21:00, 5 hours post vaccination. On 10-MAR-2021 around 04:30, the patient woke up with a pounding headache, chills, body aches. During day the patient also felt fatigue, nausea, dizziness and a feeling of warmth in the veins of her palms and feet. It was reported that the symptoms disappeared on the morning of 11-MAR-2021, which was 2 days post vaccination. It was reported that about 30 minutes prior to call on reporting day of 25-APR-2021, the patient blew her nose and she said a little bloody clot came out, followed by a nose bleed lasting about 30 minutes. The patient reported that she never got nose bleeds and she had no fever, shortness of breath or chest pain. The action taken with COVID-19 vaccine Ad26.CoV2.S was not applicable. The patient recovered from dizziness, warm feeling in the veins of the palms and feet, body aches, severe chills, fatigue, nausea, and headache on 11-MAR-2021, and nose bleed on 25-APR-2021. This report was non-serious.

1269148	4/28/2021	NM		F	4/8/2021		<p>ELEVATED D-DIMER; SHORTNESS OF BREATH; HEADACHE; CHEST PAINS; DECREASED APPETITE; FEVER; This spontaneous report received from a physician concerned a 25 year old female. The patient's height, weight and medical history were not reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of administration, dose and batch number were not reported) administered on 07-APR-2021 for prophylactic vaccination. Batch number will be requested via follow up. Concomitant medications included unspecified oral contraceptives. On 08-APR-2021, the subject experienced shortness of breath, headache, chest pains, fever, and decreased appetite. Physician saw the patient on 14-APR-2021 and ordered D-dimer which came back at "0.80" and again on 20-APR-2021 which came back "0.82" (units and normal range unspecified). Physician reported that the patient's platelet count had not been done yet, but the d-dimer was a little elevated and given her chest pains, he wanted to evaluate for a blood clot and possibly order CT (computed tomography) scan of her chest. The physician did mention VAERS report filed case # 446427. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient had not recovered from headache, shortness of breath, and chest pains, and the outcome of decreased appetite, fever, and elevated d-dimer was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: This case concerns a 25-year-old female who had elevated d-dimer test results 7 days after receiving the Janssen Covid-19 vaccine. Full medical history was not provided. Concomitant medications included unspecified oral contraceptives. The day after vaccination, the patient experienced shortness of breath, headache, chest pains, fever and decreased appetite. Seven days post-vaccination, she went to see her physician who ordered a d-dimer test which came back elevated at 0.80 (normal range not reported). Repeat d-dimer test 6 days later came back at 0.82. A platelet level had not been checked, nor other diagnostic tests to evaluate for possible thrombosis. As of the the time of this report, the outcome was unknown. Based on the available information, the relationship with Janssen Covid-19 vaccine is considered unclassifiable. Further information (e.g. full medical history, social history, family</p>

1269146	4/28/2021		52	M	4/1/2021		<p>history, CBC, doppler ultrasound, anti-platelet factor 4 antibodies, fibrinogen) will be requested.</p> <p>DVT POST COVID INJECTION; This spontaneous report received from a patient concerned a 52 year (also reported as 53 year) old male. The patient's height, and weight were not reported. The patient's past medical history included provoked DVT (deep vein thrombosis) 10 years ago, and concurrent conditions included hypertension. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, intramuscular, batch number: Unknown) dose was not reported, administered on 12-APR-2021 into left deltoid for prophylactic vaccination. The product was properly stored from receipt to administration. The batch number was not reported. The Company is unable to perform follow-up to request batch/lot numbers. No concomitant medications were reported. Patient received J&amp;J vaccine at place of employment. After 24 hours on an unspecified date in APR-2021, the patient developed lower leg DVT (deep vein thrombosis) post COVID injection. It was confirmed by positive d-dimer (coded as Fibrin D dimer) and US (ultrasound scan). Exact results and date of the tests were not provided. The patient was started on rivaroxaban. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of DVT post COVID injection was not reported (captured as unknown). This report was serious (Other Medically Important Condition).; Sender's Comments: This 52/53-year-old hypertensive male patient of unspecified ethnicity developed lower leg deep vein thrombosis (DVT) after 24 hours of receiving COVID-19 VACCINE AD26.COVS for the prevention of symptomatic SARS-CoV-2 virus infection. The was prior history of "provoked" DVT 10 years ago. No concomitant medications reported. The patient reported that D-Dimer was positive and ultrasound showed DVT. The patient was started on rivaroxaban. No other details reported. The information available precludes a complete and meaningful assessment. However, considering the temporal relationship and recently evolving theories in the literature about COVID infections and vaccinations, potential vaccine contribution cannot be excluded. Additional information was requested.</p>

1267830	4/28/2021	NM	43	F	4/7/2021	4/7/2021	4/7/21 around 630pm began to feel ill and had sore arm. By about 1030pm, had significant body aches, headache, clammy skin, vomiting, diarrhea, near passing out, fast heart beat, with fever. These symptoms lasted about 48 hours. The next 48 hours just had ill feeling with extreme fatigue. Come 4/12/21, I had nausea, headache, fever of about 100.4 and body aches. By 4/14/21, I ended up going to the ER for shortness of breath, chest tightness, extreme fatigue and voice hoarseness. Those doctors performed several labs to include Chest CT which showed elevated D-Dimer levels. An EKG was performed which was baseline. Ultrasound of my veins was performed. They also did a COVID test which was negative. They sent me home and told me to rest and drink lots of fluid. On 4/16/21, I had a video call with my doctor who didn't like the sound of my voice and straining to catch my breath and I was sent to urgent care/ER. They admitted me as an ER visit due to my continued shortness of breath, cough, sore throat, night sweats, dizziness, chest tightness along with my voice being hoarse. Another COVID test was performed and was negative. During their exam, my oxygen levels were dropping into the low 80s and my heart rate was in the 120s and 130s. Their CT scan was down so they sent me to another ER where another CT scan was performed. Another COVID test was performed and was negative. My D-Dimer was elevated, liver enzymes was slightly elevated and again my oxygen levels were lower than would like to see and elevated heart rate. I ended up being admitted into the hospital for an overnight stay to monitor my symptoms. They treated me for suspected blood clot, shortness of breath, chest tightness. I was given 2 shots of heparin in the stomach, IV fluids, multiple vitamins in attempt to boost my immune system, along with ADVAIR and Albuteral. My discharge diagnose from the hospital was Acute Bronchitis, Anxiety disorder, Recent Moderna 2nd dose COVID vaccine with significant side effects in the form of fever, generalized weakness and dizziness.

---

this in his family or himself. He said the condition's medical term was pulmonary embolism but he just said blood clots in the lungs because he thought he would make it easier to explain. Both doctors that saw him felt it was brought on the by the vaccine. He was not looking to sue or anything, he didn't want to be taking a blood thinner for the rest of life. He was not doing this for any reason other than to get well. He realized this situation was very rare with Pfizer, it was like 4 in 1 million with Pfizer according to his physicians. Covid tested post vaccination: Nasal Swab on 17Apr2021 with negative result. Therapeutic measures were taken as a result of had pulmonary embolism in both lungs, blood clots/blood clots in the lungs. The outcome of events was recovered with sequelae.

1261794	4/27/2021	PA	62	F	4/1/2021	4/1/2021	<p>had a stroke after getting the Pfizer vaccine; weakness left arm and left leg; Headache; Dural venous sinus thrombosis; This is a spontaneous report from a contactable consumer (patient). A 62-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection) (at 62-years of age) dose 2 via an unspecified route of administration, administered in arm right on 01Apr2021 10:20 (Batch/Lot number was not reported) as a single dose for covid-19 immunisation (to not get Covid). Medical history included ongoing multiple sclerosis which was diagnosed back in the early 90's and the doctors saw no new reasons on any part of the MRI of the brain, neck, and spine, there were no new lesion and she has had no problems for 30 years; and she had sinus pressure. There were no concomitant medications. Historical vaccine included BNT162B2 (Batch/lot number: EN6208) dose 1 in her left arm on 11Mar2021 (at 61 years of age) for COVID-19 immunisation. It was reported that the patient had a stroke after getting the Pfizer vaccine. She stated that she was in the ICU for 3 days. They tested every part of her body and couldn't find a reason. She added that she had a clot in her brain with a small bleed and they told her it was highly unusual to happen in that part of the brain. It was stated that it was where the blood goes from the brain to the heart. She mentioned that it was a dural venous sinus thrombosis. She was in the neuroscience ICU for 3 days and her left leg and left arm are still weak and she will start PT. She wanted to talk about reporting and let us know this was happening and that the neuroscience team reported it to the CDC online while she was in the hospital. She wanted to talk about her concerns and see if we are seeing this with other people. She added that she was tested, and they found nothing. She mentioned that she got the vaccine in a Thursday morning and by Friday she had weakness in her left arm and left leg and a headache. She added that there was a high probability that it was related, that it was a new vaccine and it was hard to say it definitely happened from that but it was a high probability. She had other questions, she has heard from other people with other vaccines and people with Covid experience blood clots. She stated that she was wondering what if it was with the vaccine that is reacting to what it thinks is Covid, or is it the body's response. She was wondering if Pfizer comes</p>

1261278	4/27/2021			U		3/28/2021	PASSED OUT; BOTH ARMS WENT COMPLETELY NUMB; LEGS CRUMBLLED/COULDN'T STAND UP; VOMITED; THE DAY GOT THE VACCINE IT BLED AND A BLOOD CLOT CAME ON MY ARM; This spontaneous self-report concerned a patient of unspecified age and sex. The patient's weight, height, and medical history were not reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin, and batch number were not reported) dose was not reported, administered on 28-MAR-2021 for prophylactic vaccination. The batch number was not reported and has been requested. No concomitant medications were reported. On 28-MAR-2021, the day the patient got the vaccine it bled and a 'blood clot' came on my arm (coded to injection site bleeding). On 01-APR-2021, the patient passed out in a store, both arms went completely numb, legs crumbled/couldn't stand up, and vomited. The patient believed this was a side effect of the vaccine. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of events (passed out, both arms went completely numb, legs crumbled/couldn't stand up, vomited, and the day got the vaccine it bled/blood clot came on my arm) was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: This patient of unknown age and gender passed out 3 days after receiving the Janssen Covid-19 vaccine. The patient was in a store when when both arms became numb, legs "crumbled" and could not stand; the patient also vomited. No other information regarding the serious loss of consciousness was provided. Additionally, on the day of vaccination, the patient experienced bleeding at the injection site and a clot formed. Considering the missing information (e.g., age, sex, medical history, concomitant medications, clinical details leading up the event, corrective treatment, event outcome), the serious loss of consciousness is considered unclassifiable. The nonserious injection site reaction is consistent with a causal association with vaccination.

1261282	4/27/2021			F			LARGE BLOOD CLOT; SWOLLEN BALL ON SIDE OF KNEE; This spontaneous report received from a female patient of unspecified age reporting on self. The patient's weight, height, and medical history were not reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: Unknown, Expiry: Unknown) dose was not reported, 1 total administered on 05-APR-2021 for prophylactic vaccination. The batch number was not reported and has been requested. No concomitant medications were reported. On an unspecified date, the patient experienced large blood clot and swollen ball on side of knee. The swollen ball on side of knee was going on for a couple days now. The action taken with covid-19 vaccine ad26.cov2.s was not reported. The patient had not recovered from large blood clot, and swollen ball on side of knee. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: This is a report of a female patient, unspecified age, unknown ethnicity, who experienced a large blood clot and swelling on the side of the knee (laterality not reported) on an unspecified number of days after receiving the covid-19 vaccine ad26.cov.2. The information provided precludes a meaningful medical assessment. Additional information requested.
1260997	4/27/2021	CA	54	F	4/5/2021	4/21/2021	Presented to the ED on 4/25 with severe R calf swelling and pain x4-5 days. Found to have ACUTE THROMBOSIS IN THE DEEP VEINS OF THE RIGHT FEMORAL, POPLITEAL, POSTERIOR TIBIAL, PERONEAL VEINS and ACUTE THROMBOSIS IN THE DEEP VEINS OF THE RIGHT CALF. Admitted for systemic anticoagulation and possible catheter-directed thrombolysis given extent of clot burden and symptoms.

1261010	4/27/2021	OH	75	M	3/4/2021	3/9/2021	Deep Vein Thrombosis right leg. Five days after being vaccinated I began to notice swelling in my right leg from my knee through my ankle-foot area. There was an associated increase in pain in the knee. I tried to shake it off hoping that the swelling and pain would go away, but I finally relented to the concerns of my family and sought care on the 6th of April at the emergency room because my doctor refused an in-person appointment. The emergency room physician prescribed Eliquis which I have been taking. The swelling seems to have leveled off, but my right leg still appears to be twice the size of my left leg

1261166	4/27/2021	MN	90	F	3/1/2021		LOW GRADE BLADDER INFECTION; EXTREMELY WARM SENSATION IN CHEST AND BACK; COUGH; SHORT TERM MEMORY LOSS; COULD NOT REMEMBER; NOT WELL; HALLUCINATIONS; COULD NOT WALK; COULD NOT FEED HERSELF; CONFUSION; PLATELET COUNT DECREASED; UNABLE TO STAND; FALL; DIZZY; FELT TIRED; WEAKNESS; EYES LOOKED PUFFY; ABDOMEN WAS LARGER; BIBASILAR ATELECTASIS; CARDIOMEGALY; SWELLING IN BOTH LEGS INCLUDING ANKLE AND TOES; LEVEL 4 PITTED EDEMA; This spontaneous report received from a consumer concerned a 90 year old female. The patient's weight and height was not reported. The patient's past medical history included Alzheimer's, and dementia. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported) dose was not reported, 1 total, administered on 08-MAR-2021 for prophylactic vaccination. The batch number was not reported and has been requested. No concomitant medications were reported. On 11-MAR-2021, the patient felt tired. On 12-MAR-2021, the patient had a fall, was dizzy and unable to stand. On 13-MAR-2021, the patient was taken to the emergency room and had a low grade bladder infection and was treated with intravenous (IV) antibiotic (unspecified) from 13-MAR-2021 to 15-MAR-2021 and from 15-MAR-2021 she was switched to oral antibiotic (unspecified) until 23-MAR-2021. The patient was confused and could not walk. It was reported that, the patient was unable to feed herself. On 13-MAR-2021, the patient experienced platelet count decreased. On 13-MAR-2021, the patient's laboratory data included: electrocardiogram (ECG) which could not rule out anterior infarct age undetermined and her platelet count was 136 (unit non specified). On 14-MAR-2021, the patient had hallucinations and her platelet count was 130 (unit non specified). On 15-MAR-2021, her laboratory data included: abdomen computerized tomography (CT) scan which showed bibasilar atelectasis and cardiomegaly, likely cyst vs hemangioma. Unchanged incompletely characterized exophytic lesion in the left kidney significant and possibly represented a hemorrhagic cyst, further evaluation with magnetic resonance imaging (MRI) would need to be performed for definitive characterization. On 17-MAR-2021, the

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

patient's cognition seemed well. On 19-MAR-2021, the patient started showing symptoms of blood clot. On 19-MAR-2021 to 22-MAR-2021, the patient was not well. The patient was wearing slippers because she had level 4 pitted edema and was swollen from her knees down including ankle and toes. It was reported that, her swelling was greater on the left side than the right side and she had this swelling on 23-MAR-2021. Also, the patient's confusion returned. On 29-MAR-2021, the patient had confusion and her ultra sound of left leg was normal. On 01-APR-2021, the patient's laboratory data included: diagnostic ultrasound revealing contralateral femoral vein was widely patent. On 03-APR-2021 and 09-APR-2021, the patient was confused and did not know where she was. On 07-APR-2021, her electrocardiogram did not mention anterior infarct and it was abnormal ECG no significant change found. On 10-APR-2021, the patient could not remember where she was. On an unspecified date, the patient had cough and extremely warm sensation in chest and back. The patient was in rehabilitation center and was set to be discharged 16-APR-2021. On 13-APR-2021, the patient's platelet count was 171 (unit not specified). On 17-MAR-2021, In rehabilitation center the patient was no longer wearing shoes due to swelling of ankle, legs toes and feet. The patient's eyes looked puffy and her abdomen was larger. The patient was treated with Lasix (furosemide) in the rehabilitation center. According to the patient's physician, the patient had no sign of stroke. The patient was propped up on right side while at rehabilitation center so according to her daughter the patient was experiencing weakness. At rehabilitation center an ultrasound was ordered for left leg. The patient's both legs were swollen and one was more swollen than the other. The patient was having an issue with memory and confusion which was unusual as the patient had previously been treated neurologist for Alzheimer's disease and dementia and was highly intelligent. At the time of this report, the patient was being treated for low grade bladder infection. The patient's primary care physician reports that she had no concerns about the vaccine being linked to the patient's fall and hospitalization and reported that there were no blood clots, no stroke, no deep vein thrombosis, and no coagulation abnormalities. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The

patient recovered from not well on 22-MAR-2021, was recovering from platelet count decreased, and the outcome of cough, swelling in both legs including ankle and toes, extremely warm sensation in chest and back, confusion, fall, hallucinations, low grade bladder infection, could not feed herself, could not walk, felt tired, dizzy, unable to stand, level 4 pitted edema, could not remember, eyes looked puffy, abdomen was larger, weakness, short term memory loss, bibasilar atelectasis and cardiomegaly was not reported. This report was serious (Hospitalization Caused / Prolonged, and Other Medically Important Condition).; Sender's Comments: v0 This spontaneous report involves a 90-year-old white female patient with the past medical history remarkable for Alzheimer's and dementia who felt tired 3 days after the Janssen COVID-19 Vaccine Ad26.COV2 had administered. The next day the patient had fell, was dizzy and unable to stand. The next, the patient was taken to the emergency room and was diagnosed with a low grade bladder infection. The patient was confused and could not walk and was unable to feed herself. The next day, the patient had hallucinations and her platelet count was 130 (unit non specified), normal range 179-450. While hospitalized, the patient started showing symptoms of blood clot, had pitted edema, could not remember where she was. On an unspecified date, the patient had cough and extremely warm sensation in chest and back. The patient's eyes looked puffy and her abdomen was larger. The patient's primary care physician reports that she had no concerns about the vaccine being linked to the patient's fall and hospitalization and reported that there were no blood clots, no stroke, no deep vein thrombosis, and no coagulation abnormalities. Considering the patient's age, gender – predisposes to urinary tract infections, as well as the underlying Alzheimer's and dementia the causality for the events assessed not related to the vaccine.

The patient's height, and weight were not reported. The patient's concurrent conditions included overweight, high blood pressure, and high cholesterol. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 207A21A expiry: unknown) dose was not reported, 1 total administered on 06-APR-2021 to left arm for prophylactic vaccination. No concomitant medications were reported. On 07-APR-2021, the patient experienced a mild fever. On 08-APR-2021, the patient was achy and had a mild headache. The headache continued for several day and became pretty bad for about two days. On an unspecified date in Apr-2021 the patient was treated with Tylenol for headache. On 12-APR-2021, the patient experienced leg cramps in her right leg. On 15-APR-2021, the patient had an ultrasound and a blood clot was found in her right leg. The patient started on Apixaban (Eliquis). The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from headache on an unknown date in APR-2021, and the outcome of blood clot, ache, leg cramps and fever was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: This 50-year-old female was found to have blood clot in her right leg 9 days after receiving Janssen COVID-19 vaccine for the prevention of symptomatic SARS-CoV-2 virus infection. There was reported mild fever, headache, and "aches" 1 to 2 days after vaccination that was treated with Tylenol. The symptom reported was leg cramps on right leg 5 days after vaccination, and ultrasound showed blood clot in her right leg 3 days after the symptom of cramps was noted. No other laboratory/diagnostic test reported. The patient was treated with apixaban. The outcome of blood clot in leg was not reported. Based on the information that is available, the event is assessed as plausible with the causal association to immunization, per causality classification of adverse events following immunization based on a lack of a definitive plausible biological mechanism. However, considering the temporal relationship and recently evolving theories in the literature about COVID infections and vaccinations, potential vaccine contribution cannot be excluded.</p>

1261717	4/27/2021	NC	51	F	4/7/2021	4/7/2021	portal vein thrombosis; ischemic colitis; This is a spontaneous report from a contactable consumer (patient). A 51-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection; Batch/Lot number was not reported), via an unspecified route of administration, administered in the left arm, on 07Apr2021 at 09:30 AM at the age of 51-years-old as single dose for COVID-19 immunization. The vaccination facility type was pharmacy or drug store. The patient was not pregnant. The patient had no other vaccine in four weeks. The patient had no medical history and had no known allergies. Concomitant medications included estradiol patch and cyanocobalamin (VIT B12); both taken for unspecified indications, start and stop dates were not reported (reported as other medications in two weeks). The patient previously received the first dose of BNT162B2, administered in the left arm on 10Mar2021 at 08:45 AM at the age of 51-years-old for COVID-19 immunization. The patient reported that at 11:30 pm on 07Apr2021, she had extreme, spontaneous, stomach cramps that was so bad she thought she was going to pass out. That lasted for one hour, then diarrhea. A few hours later, she started blood red rectal bleeding. At the hospital (on Apr2021), she was diagnosed with Ischemic colitis (from colonoscopy) and a blood clot was also found, portal vein thrombosis. She was 100% certain the extreme stomach cramps were brought on by the vaccine and that in turn caused the ischemic colitis; the blood clot may or may not have already been there. The patient reported that the doctors at the hospital were quite put off to try to tie any relation to this episode with the vaccine which was quite frustrating to the patient as it was quite obvious (as reported). The events resulted in doctor or other healthcare professional office/clinic visit, emergency room/department or urgent care, and hospitalization. The patient was hospitalized for 2 days in Apr2021. On treatment for the events, the patient reported that the colitis healed on its own, and she was on blood thinners. The patient had no COVID prior the vaccination. The patient was test for COVID post vaccination which was a nasal swab with a negative result on 08Apr2021. The outcome of the events was recovering. Information on the lot/batch number has been requested.

1261383	4/27/2021	IL		M		4/18/2021	<p>BLOOD CLOTS IN THE LEG; BLOOD CLOT IN THE CHEST; This spontaneous report received from a consumer (calling on behalf of her husband) concerned a 60 year old male. The patient's height, and weight were not reported. The patient's concurrent conditions included diabetes mellitus, asthma, high blood pressure, and penicillin allergy. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin: unknown, batch number: Unknown) on 12-APR-2021, into right arm, for prophylactic vaccination. The batch number was not reported and has been requested. No concomitant medications were reported. On 18-APR-2021, the patient began experiencing pain and swelling in the left leg. His leg was very hot and red "like a fever" and the pain was radiating up to the chest and heart and also spread to the right side of the chest. The patient was experiencing a lot of pain and couldn't breath. On 19-APR-2021 the patient's wife called the doctor and he was admitted to hospital. An ultrasound was performed which confirmed blood clots in the leg and chest. At the time of this report patient was still in the hospital. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient had not recovered from blood clots in the leg, and blood clot in the chest. This report was serious (Hospitalization Caused / Prolonged).; Sender's Comments: V0: This 60 year-old male with medical history significant for diabetes, high blood pressure, and asthma was hospitalized for blood clots in the leg and chest 7 days after receiving the Janssen Covid-19 vaccine. Concomitant medications were not reported. Six days post-vaccination, the patient began experiencing left leg pain and swelling. His leg was red and hot and the pain would radiate from his leg to his chest. He was also experiencing difficulty breathing. The following day (7 days post-vaccination), he was admitted to the hospital. An ultrasound confirmed blood clots in the leg and chest. Other diagnostic test results and corrective treatment were not reported. As of the time of this report, the patient was still in the hospital. Based on the limited information, the relationship with Janssen Covid-19 vaccine is considered indeterminant. More information (e.g. platelet count, D-dimer, fibrinogen, anti-platelet factor 4 antibodies, medical records) is being sought.</p>

1261611	4/27/2021	VA	85	F	1/22/2021	1/23/2021	was achy with the first dose; sore arm with first dose; This is a spontaneous report from a contactable consumer (patient). A 85-years-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Lot Number: EK4176), via an unspecified route of administration on 22Jan2021 as single dose (at the age of 85-years) in Arm Left for covid-19 immunization. Medical history included: knee arthroplasty from Apr2018 to an unknown date (knee cap was not replaced) and breast cancer from Aug2013 to an unknown date. The patient did not receive any other vaccination within 4 weeks. Concomitant medications included: levothyroxine sodium (SYNTHROID) 200mcg daily taken for hypothyroidism (since 35 years); omeprazole 20 mg daily taken for gastroesophageal reflux disease; furosemide 40mg daily taken for left ventricular failure from 2017 to an unspecified stop date; spironolactone 25mg, takes half tab daily, taken for left ventricular failure from 2017 to an unspecified stop date; ascorbic acid, betacarotene, cupric oxide, tocopheryl acetate, zinc oxide (PRESERVISION), 1 daily taken for macular degeneration from 2011 to an unspecified stop date; colecalciferol (VITAMIN D) 5,000 units daily taken for vitamin d deficiency (since 6-7 years) (all are ongoing). On 23Jan2021, the patient experienced achy and sore arm with first dose. She is always achy. The degree of the achiness went away. On an unspecified date, the patient had ultrasound to check for deep vein thrombosis and results were unknown. The outcome of pain in extremity was recovered on 25Jan2021 and for another event it was unknown.

1264426	4/27/2021	AZ	78	F	4/1/2021		BAD CHEST PAINS, PAIN IN CENTER OF CHEST; FEELING OF HEART NOT BEATING RIGHT; BLOOD PRESSURE OF 212; CELLULITIS IN HER WRIST; This spontaneous report received from a patient concerned a 78 year old female patient. The patient's height was 166 inches and weight was 138 pounds. The patient's concurrent conditions included white coat hypertension, asthma, severe allergy to codeine, abstain from alcohol, and non-smoker. The patient was not pregnant. The patient received vaccination with covid-19 vaccine ad26.cov2. s (suspension for injection, intramuscular, batch number: 1805020, and expiry: UNKNOWN) dose was not reported, administered on 02-APR-2021 09:00 in left arm as prophylactic vaccination. Concomitant medications included estradiol. The patient reported that about 15-20 minutes post-vaccination on 02-APR-2021 as she was waiting in waiting area of vaccination clinic, she started to get bad chest pain which was in the center of her chest. She experienced heavy pressure in her chest. No arm pain or sensation was reported other than her chest. The patient further explained that she could feel that her heart 'wasn't beating right' and reported as 'heart feeling wonky'. The patient felt the top of her heart beating faster than the bottom. The vaccination paramedic took her blood pressure which was 212 (patient did not have any other information on her blood pressure). The paramedics called ambulance and after a 15 minute drive patient arrived at emergency room at 9.30. The patient had an echocardiogram or 'an ultrasound' of her heart and was told that it was not functioning properly that her ventricle was functioning at 40% of normal. The patient was put on nitroglycerin and heparin drip. Blood test was also done which showed troponin levels at 113 or 116, 'somewhere in there'. The patient was told that 'some type of cardiac event had occurred'. The patient's tests were reviewed same night and patient spent the night in emergency room because there were no beds. On 03-APR-2021, the patient was transferred to a hospital where she was put on nitroglycerin and heparin drip. The patient was moved again to another hospital on night of 04-APR-2021. The patient had angiogram and CT of vein and arteries. No clot was found by that time. The patient was discharged on 06-APR-2021. The patient saw a cardiologist on 15-APR-2021 who told patient that 'he thought she had

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

some kind of clot that dissolved in the hospital'. Since patient has been home, she experienced pain and discomfort in arm and wrist with cellulitis in her wrist. The patient was taking cephalexin 500 mg three times a day for 10 days. The patient said it was due to angiogram she had because the angiogram team had hard time with her angiogram and had to go in twice. The patient had been taking percocet 5 mg tablet as needed for pain. The patient attempted to report these events online and left a message for someone to call her back but email did not work as she was unable to send. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of bad chest pains, pain in center of chest, feeling of heart not beating right and blood pressure of 212, and cellulitis in her wrist was not reported. This report was serious (Hospitalization Caused / Prolonged, and Other Medically Important Condition).; Sender's Comments: V0: This 78-year-old white (non-Hispanic/Latino) female patient was hospitalized for chest pain, palpitations, and blood pressure of 212 within the hour of receiving COVID-19 VACCINE AD26.COV2.S for the prevention of symptomatic SARS-CoV-2 virus infection. Concurrent illness included white coat hypertension, asthma, severe allergy to codeine; denies smoking and have abstained from alcohol. The patient complained of "bad chest pain" described as heavy pressure on the chest and that she could feel her "heart was not beating right/heart feeling wonky/top of her heart beating faster than the bottom". Blood pressure was 212 when it was checked, the patient was transported to the emergency room where echocardiogram showed that her ventricle was functioning at 40% of normal; Troponin was 113 (or 116). The patient was started on nitroglycerin and heparin drip. CT Angiogram of veins and arteries done 2 days after the vaccination showed no clot; by the attending cardiologist thought that some kind of clot might have been dissolved. Due to difficulty of doing the angiogram, the patient had cellulitis in her wrist with pain and discomfort in arm and wrist; the patient was taking cephalexin and percocet for the cellulitis and pain. No other details reported. The short latency and the advanced age confounded the event. The information available precludes a complete and meaningful assessment. However, considering the temporal relationship and recently evolving theories in the

1264907	4/27/2021	IL	53	F	1/27/2021	2/3/2021	On 02/03/2021 @ 1 am (approx. 1 wk. after 1st vaccine shot), started having pains under ribcage. Pains off and on until on 02/09/2021 about 3 am when the pain got so bad I went to the emergency room. Diagnosed with pulmonary embolism. Never had a blood clot or DVT before. Blood test found I had Factor V. Had pain again under ribcage one week after second vaccine, but blood thinners appears to have dissolved if it was a clot. My father then tested and found positive for Factor V after my diagnosis. He then had a blood clot in leg approx 3 weeks after his second Pfizer vaccine, and had never had a blood clot like that before. Appears to be a connection between Factor V and blood clots after Covid vaccines.

1262665	4/27/2021	WI	43	F	4/5/2021	4/12/2021	leg. Patient had blood tests done as well as CT Scan, carotid artery ultrasound, electrocardiogram and MRI but the results were not reported. The information provided precludes a meaningful medical assessment. Additional information requested.  Mon 4/12/21 - Headaches started and have continued daily. Tue 4/13/21 - Soreness in right calf muscle, continued for 4 days. Headache continued. Wed 4/14/21 - Sharp pain in pelvis (right and left side) same location I experienced pain the day of receiving vaccine. Occasionally felt this pain 2 or 3 times / day for 2 days. Sought medical attention at ED on the advice of our Nurse Call Center. Was evaluated for blood clots, none found on this day. CT scan, ultrasound of both legs, blood tests. Returned home with directions to take Extra Strength Tylenol for headache. Thu 4/15/21 - Shooting pain in random parts of my body, mostly legs and arms. Experienced throughout this day only. As of 4/27/21, 22 days after being vaccinated, I am still experiencing headaches. More noticeable when I am exerting myself - walking outside for 1-2 minutes triggers the headache. Headaches are usually located in the lower back of my head. Before being vaccinated, I would experience less than 1 headache per month, and they go away within the day.
1262854	4/27/2021	KY	59	F	3/5/2021	4/17/2021	had to jansen & jansen vaccine on March 5, 2021 at pharmacy & on march 16 dianosed with covid. April 17 leg started feeling funny & went to ER on the 18th was dianosed with surface clots.

1264437	4/27/2021	CO	40	F	4/1/2021		<p>STOMACH FLU; CHEST PAIN UNSPECIFIED; SHORTNESS OF BREATH; EKG SINUS TACHYCARDIA, LOW VOLTAGE PERIODICAL, UNCONFIRMED DIAGNOSIS; DIZZINESS; SLEEPING 14 HOURS; LARGE NODULE AT INJECTION SITE; SWELLING AT INJECTION SITE; REDNESS AT INJECTION SITE; SORENESS/PAIN AT INJECTION SITE; HIGH BLOOD PRESSURE; This spontaneous report received from a patient concerned a 40 year old female. The patient's height, and weight were not reported. The patient's pre-existing medical conditions included the patient had no known allergies. The patient was not pregnant at the time of report. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 202A21A, expiry: 23-JUN-2021) dose was not reported, administered on 09-APR-2021 in left arm for prophylactic vaccination. No concomitant medications were reported. On 09-APR-2021 (following vaccination), the patient's area around the injection site was swollen, a large nodule formed, it was red, sore and painful. These local symptoms lasted for a week then disappeared. The patient felt very fatigued, and reports sleeping 14 hours that night. On 10-APR-2021 the patient experienced headache and felt like his head was in a vise around each cheekbone. The fatigue and headache was gone on 11-APR-2021. On 19-APR-2021 the patient had vomiting and diarrhea for about 16 hours. The local symptoms swelling, redness, pain at injection site reappeared. On 19-APR-2021 the patient was very fatigued and took Pedialyte (calcium chloride/glucose/magnesium chloride/potassium chloride/sodium chloride/sodium lactate) to get rehydrated. On 21-APR-2021, the patient visited the emergency room as new symptoms appeared stomach pain, chest pain, shortness of breath and dizziness and her blood work and electrocardiogram(EKG) was done. The health care professional(HCPs) ruled out heart attack and told patient nothing in the symptoms or blood work warranted a scan for blood clots. The patient received anti-nausea intravenous (IV) medication, diagnosis of stomach flu and was sent home. The patient reports that her blood pressure readings were 144/104 and a pulse was 119. The emergency room health care professional instructed the patient to follow up with doctor</p>

1263940	4/27/2021	CO	46	M	4/8/2021	4/22/2021	Janssen COVID-19 Vaccine EUA: two weeks after vaccination patient reported to an urgent care with right leg swelling and headache. Two days later patient presented an emergency department, diagnosed with left lower extremity deep vein thrombosis (DVT) and bilateral pulmonary emboli (PE). Transferred to current hospital for management including anticoagulation with a direct thrombin inhibitor, intravenous immune globulin (IVIG), and additional laboratory testing.
1263100	4/27/2021	FL	42	F	4/13/2021	4/14/2021	42-year-old female with previous history of chronic/refractory immune thrombocytopenic purpura (ITP). She received the Moderna COVID-19 vaccination on 4/13/2021 and subsequently developed headache, photophobia, diplopia and blurry vision. She had outpatient labs 4/14/2021 with a platelet count of 8000 and presented to the emergency room. She was seen by hematology/oncology and was started on high-dose dexamethasone for 4 days, IVIG x2 doses with an excellent response. Platelet count on discharge was above 200,000. Due to the headache and visual disturbance MRI and MRV was obtained which showed no evidence of cavernous sinus thrombosis however there was a question of idiopathic intracranial hypertension and ophthalmology and neurology was consulted. She had a fundoscopic exam with no evidence of papilledema. Her headache slightly improved with acetaminophen and hydrocodone. The patient was cleared for discharge home by hematology/oncology and will follow up with them in 1 week.

Sharp - left mid back , left low back, left hip and left thigh. Does not radiate to foot. Does not cause paraesthesias, numbness, weakness or tingling. No problems urinating, dysuria. The pain started after janssen vaccine along with low grade fever; lasted for 2 days then went away for over 1 week. In fact he drove and hiked 10 miles as well w/o any recurrence of pain. He notes pain restarted 2 days ago. Massage and heat help. Exercising does not worsen. Pain for past 2 days is at a 2 level. No hx of back pain or arthritis. He does have hx of renal stones and cystitis but was cleared last year by his urologist. He has not drunk enough water today and would like to do his cbc on 4/22. He denies any heaches, vision changes, abd pain or leg pain. Most of the time his pain is low back area. It was more intense in the 2 days after vaccine. No hx of blood clots. No chest pain or SOB. No injuries to back. Pain is the same as post vaccine though milder. He denies straining his muscle. No easy bruising or bleeding. kidney stones feel much differently.

1260342	4/26/2021	TX	48	F	4/10/2021	4/13/2021	Patient came in this evening 4/26 after emergency room visit for blood clot in leg/shin. She received Janssen IMZ 4/10. Her symptoms of painful leg began several days after her IMZ and continued to worsen with her leg shin swollen, painful, bruised with a knot until she sought medical help in the ER. Ultrasound was done and ruled out deep vein thrombosis, determined to be peripheral blood clot. She was sent home on meloxicam for pain and inflammation.
1260292	4/26/2021		50	F	3/23/2021	4/2/2021	on April 2 nd i had to go to family walk in clinic over chest pains and contractions. The clinic ran vitals with EKG letting me know a ambulance had to be called cause i was having a heart attack. I was not aloud to leave . In the ambulance i was giving Asprin ,Nitros and a blood clot remover with high blood pressure meds. Takin to hospital.

1259807	4/26/2021	NJ	60	F	4/3/2021	4/4/2021	I woke up from almost like a pop in my brain and fluid started pouring down my throat and I started choking. I woke up and was able to spit some of it out. It was clear and also tinged with blood. It stopped once I stood up. I immediately thought my brain was leaking. I told my daughter about this the next day. My balance was off and I had a weird flapping in my head for the next few days. As well as a headache. A few days after I heard about the blood clots. I am not 100% sure if it was from the shot but it was literally hours from when I received it. It was very scary.
1259776	4/26/2021	AZ	53	M	4/4/2021	4/8/2021	Received the vaccine on 4/4/2021. On 4/8/2021 started having pain in lower left leg. Pain off and on for two weeks. Pain intensified on 4/23/2021. I went to the emergency room where they performed on ultra sound examination of my left leg. Confirmed that I have a deep vein thrombosis (DVT) behind my left knee. Prescribed Eliquis. Saw Dr. today. He could not confirm that DVT was caused by vaccine, but I thought I should report it. I am to stay on Eliquis for six months at which time I will be evaluated for a blood clot disorder.

1255713	4/25/2021	VA	41	F	1/19/2021	1/1/2021	DVT; multiple bilateral pulmonary embolisms; rash; hives on my lower abdomen; calf injury due to extreme pain that felt like a constant cramp; This is a spontaneous report from a contactable Other HCP (patient) . A 41-years-old no pregnant female patient received bnt162b2 (BNT162B2), dose 1 via an unspecified route of administration, administered in Arm Left on 19Jan2021 16:30 (Batch/Lot Number: EL1283) as SINGLE DOSE for covid-19 immunisation.Age at vacciantion:41 years. No other vaccine in four weeks. No COVID prior vaccination Medical history included type 1 diabetes mellitus from an unknown date and unknown if ongoing , Hashimoto's Disease from an unknown date and unknown if ongoing. Concomitant medication(s) included metformin (METFORMIN) and levothyroxine (LEVOTHYROXINE) . The patient experienced DVT followed by multiple bilateral pulmonary . The clinical course was reported as follows:"Within 5 hours of the first dose I got a 3" in diameter rash and hives on my lower abdomen, which I reported when receiving my second dose. About a week before the second dose, I self-diagnosed myself with a calf injury due to extreme pain that felt like a constant cramp that lasted until my second dose. After the second dose, I was hospitalized 5 days (16Feb2021-20Feb2021) with multiple bilateral pulmonary embolisms/blood clots in both lungs after being sent to the ER by a nurse practitioner, and told that my previously self diagnosed leg injury was really DVT - I actually left the hospital with one blood clot still in my leg.Hospital's Cardiac ICU by physician's transport because my case was too to be treated at (Withheld). I am lucky to have survived this-please warn people of the symptoms" The patient underwent lab tests and procedures which included antiphospholipid antibodies (unknown date): unknown results (won't be in until mid-Jun because it requires testing 12 weeks apart)-tested negative for genetic conditions that could have caused the clots , sars-cov-2 test: negative on 16Feb2021.The events DVT and pulmonary embolism resulted in Emergency Room vists /Physician office visit .The event "DVT" was treated with Heparin, still on blood thinner. The patient received the second dose on 08Feb2021 left arm (Lot#BL9269).The outcome of the event DVT was recovering.The outcome of the other events was unkonwn; Sender's Comments: Based on vaccine-event chronological association a

sleepy throughout the day 09Apr2021 - Almost fell to floor from sitting position. Patient's daughter lowered patient gently to the floor. Revived shortly 13Apr2021 Saw primary doctor Dr (name withheld). Shared her debilitating symptoms bedridden since Covid-19 vaccine on 26Mar. BP taken from lying down, sitting and standing was markedly different and explained caused passing out and lightheaded. No longer able to do activities of daily living 14Apr2021 - Exhaustion and fatigue, her daughter to her back to the hospital 14Apr2021 - Passed out in Emergency Room @ (hospital name withheld). Admitted. Blood clots in LUNGS. The events resulted in: Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care, Hospitalization, Life threatening illness (immediate risk of death from the event), Disability or permanent damage. The patient was hospitalized for unable to complete daily 1 mile walk at park/unable to take stairs, lightheaded/dizzy, passed out completely while sitting, all from 28Mar2021 to 30Mar2021. The patient underwent lab tests which included blood pressure measurement: markedly different on unknown date. Patient was not pregnant. No other vaccine in four weeks. Patient had covid prior vaccination. No covid tested post vaccination. The treatment received for events included Heparin administered, still hospitalized as of now. Information about Lot/ Batch number has been requested.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1255643	4/25/2021	OH	36	M	4/6/2021	4/8/2021	<p>Looked like he was in sepsis; thrombus occluding his IMV protruding into part of the SMV; Thrombocytopenia; Bacteremia with E. Coli; Unable to tolerate diet; Abdominal pain; Nausea; Vomiting; Muscle aches; Chills; Fever; This is a spontaneous report from a contactable physician. A 36-year-old male patient received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration, on 06Apr2021 at 10:00, at the age of 36 years old, for COVID-19 immunization. The patient's medical history included diverticulitis ongoing since 05Nov2018. Concomitant drugs included escitalopram oxalate (LEXAPRO) ongoing since an unspecified date. There were no other vaccinations 4 weeks prior to receiving BNT162b2. Two days after vaccination, on 08Apr2021, the patient developed nausea, vomiting, muscle aches, chills, and fever. The patient continued to have these symptoms and then developed abdominal pain on 11Apr2021, so the patient went to ER. Nausea, vomiting, muscle aches, chills, fever, and abdominal pain were reported as medically significant events. A CT of the abdomen and pelvis was performed on 11Apr2021, which seemed at that time to reveal only uncomplicated diverticulitis. Therefore, the patient was sent home with oral antibiotics. Then, the patient presented back to ER on 14Apr2021: the patient couldn't tolerate his diet and was experiencing worsening of abdominal pain. Another CT of abdomen and pelvis was therefore done on 14Apr2021, which this time revealed a thrombus occluding his IMV protruding into part of the SMV and the portal vein. In light of this finding, on 14Apr2021 the medical staff retroactively looked at the patient's CT scan from 11Apr2021 and they found that the thrombus was already present but less evident than on 14Apr2021. The patient also looked like he was in sepsis, so the medical team was performing a full septic work-up and the patient was hospitalized on 14Apr2021. The patient was terrified, and the medical staff were ruling out acute mesenteric ischemia. On 14Apr2021, blood work showed thrombocytopenia, and a bacteria blood test showed bacteremia with E. Coli. The event thrombus was reported as serious since medically significant, life threatening, and requiring hospitalization. No information regarding seriousness was provided for thrombocytopenia and bacteremia. Treatment with</p>

heparin drip was started (ongoing at the time of the reporting) and the patient improved. However, the reporter stated that at the time of the last reporting, all of the patient's symptoms were ongoing, that all of the patient's symptoms had worsened. At the time of the last reporting the patient was in the ICU. The patient had not recovered from the all reported events. The reporter did not know if the reported events were related to BNT162b2, however she added that diverticulitis could also cause all the patient's side effects. Information on the lot/ batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the thrombosis, sepsis and other reported events due to temporal relationship. However, the reported events may possibly represent intercurrent medical conditions in this patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including MRI of abdomen and vascular angiogram, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1255577	4/25/2021	IN	22	M	4/8/2021	4/1/2021	<p>Passed out; pounding headache/headache symptoms are getting worst; body ache; tiredness; This is a spontaneous report from a contactable consumer. A 22-years-old male patient (Son) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), dose 1 via an unspecified route of administration on 08Apr2021 (Batch/Lot number UNKNOWN) as single dose for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. My son is having a tough time with the vaccine. Everyday he has a couple of side effects. He started with body ache and tiredness on unspecified date Apr2021. He had a pounding headache. His headache was moderate today. However, the headache symptoms are getting worst. Generally, the symptoms last a day his have been getting worst for 7 days. He has been taking Tylenol and Advil. But the Advil doesn't even seem to hep anymore." headache is a common side effect reported with the vaccine. If the symptoms persists or get worst please consult your HCP. Please note blood clot has not been associated with the vaccine. Patient is been experiencing what I considered to be pretty severe, I guess reaction in term of aches and headache. This morning he woke up with the pounding headache, he kid described it as pounding and I just I guess I want to ask because everywhere I read, it says mild headaches are common and aches and I understand that but I guess understanding why this, this is considered somewhat as severe reaction or is there anything he can do to alleviate the symptom and should he, I guess my question is actually I guess my question also is should he not possibly get the second dose if he is experiencing such bad headaches with the first dose. When paraphrased the concern, reporter stated, Yes, basically we are thinking if can do to alleviate it and then he could not get the second dose, if you have any advice, I guess and just let you know he went to his health center in the college he went to get a COVID test and a flu test just to make sure he doesn't have actual Covid or flu and those report I got yesterday and so they told him that it's most likely still vaccine reaction. When probed for event start date, reporter stated, I would say a day after, I would say 09Apr2021, I guess it's phantom (not clarified) with symptom, the first day he was just tired, as far as the headache that started on the 09Apr2021. He (son) also</p>

passed out after the vaccine, which I also did that I didn't have Pfizer I (reporter) had Moderna and I had that same reaction, so I think that sometimes happens to some people but that's it happens also. When probed for vaccination anatomical site, reporter stated, Outside of the body I guess, I don't know that for sure. Patient still having the problem (event), and out event outcome, reporter stated, Yes, I think persisting, I think it varies. Patient has been taking Advil (Ibuprofen) and Tylenol (treatment). The patient underwent lab tests and procedures which included influenza virus test: negative on 12Apr2021, sars-cov-2 test: negative on 12Apr2021. They told him that it's most likely still vaccine reaction. Therapeutic measures were taken as a result of body ache (pain), tiredness (fatigue), pounding headache/headache symptoms are getting worst (headache). The outcome of the events was reported as unknown. QR Comment: Call handler not filed split case. Might have been split case. Information about the lot/batch number has been requested.

1255710	4/25/2021	VA		F	2/8/2021		<p>DVT; multiple bilateral pulmonary embolisms/blood clots in both lungs after being sent to the ER; one blood clot still in my leg/ blood clots in both lungs; This is a spontaneous report from a contactable Other HCP. A 41-year-old female reported that she received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot number BL9269), intramuscular into the left arm on 08Feb2021 at single dose for COVID-19 immunization. No COVID prior vaccination. Medical history included type 1 diabetes mellitus, Hashimoto's Disease. Concomitant medication(s) included metformin (METFORMIN) and levothyroxine (LEVOTHYROXINE) . The patient had received the first dose of BNT162B2 on 19Jan2021. About a week before the second dose, she self-diagnosed with a calf injury due to extreme pain that felt like a constant cramp that lasted until her second dose. After the second dose, she was hospitalized 5 days (16Feb2021-20Feb2021) with multiple bilateral pulmonary embolisms/blood clots in both lungs after being sent to the ER by a nurse practitioner, and told that her previously self diagnosed leg injury was really DVT. She actually left the hospital with one blood clot still in her leg.Hospital's Cardiac ICU by physician's transport because her case was too to be treated at (Withheld). The patient underwent lab tests and procedures which included antiphospholipid antibodies (unknown date): unknown results (won't be in until mid-Jun because it requires testing 12 weeks apart)-tested negative for genetic conditions that could have caused the clots , had a negative COVID nasal swab test on 16Feb2021.The events DVT and pulmonary embolism resulted in Emergency Room visti /Phisician office visit .The event "DVT" was treated with Heparin, still on blood thinner. The outcome of the event DVT was recovering.; Sender's Comments: Based on vaccine-event chronological association causality between reported events and BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) cannot be excluded. . The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.,Linked</p>

1255342	4/25/2021	OH	67	F	3/16/2021	3/1/2021	<p>blood clot; Right leg swelled and achy; Right leg swelled and achy; This is a spontaneous report from a contactable nurse (patient). A 67-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot Number: EP7534),dose 1 via an unspecified route of administration, administered in Arm Left on 16Mar2021 (at the age of 67years) as single dose for Covid-19 immunization. Medical history included ongoing Beta thalassemias. The patient's concomitant medications were not reported. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient stated she has never had a problem with vaccinations, and she gets the flu vaccine every year. The patient reported that after the first injection coincidentally she did develop a blood clot in her lower leg. She thinks that it was due to a plane ride, but she has never had a blood clot before the injection. She added that she had the first dose on 16Mar2021 and developed a clot in a week. She further clarified that she got her first injection on 16Mar2021 and realized when she went on a flight, which is not that far she developed that clot and was having problems shortly after flight home on 24Mar2021 where her leg swelled up and she is on blood thinners since she went to the emergency room. She added that she developed the clot sometime between that flight and 02Apr2021. She had a doppler study on an unspecified date and it showed a blood clot. She stated that the outcome was she does not have the blood clot (as reported) but she will be on blood thinners and she needs to follow up on her scan to see if the clot issue is resolved but she will not have a doppler scan for another month or two and the blood thinner she is taking is Xarelto. She also stated that her right leg swelled up and it felt like a log. She reported it felt achy and swollen quite a bit from knee down and her leg was achy. It started between 24Mar2021 and by time she went to the emergency room she was not getting better. She had her symptoms for a week and toward the end of the week she thought she had a blood clot since it was not getting better it just got worse. She added that right now it is not swollen but she has been supine, and she does believe that it is better. The outcome of events was recovering. (As reported "outcome is unknown but pretty sure it has improved because of the blood thinners"./She stated she does not think it has resolved because it takes time for</p>

---

clots to resolve./She added that right now it is not swollen but she has been supine, and she does believe that it is better.) The reporter stated for the seriousness criteria for event blood clot: she believes as a nurse that any blood clot is extremely dangerous, and she was not hospitalized but obviously a blood clot is serious, and she could have ended up with pulmonary embolism. The seriousness for events right leg swelled and achy was reported as medically disabling. Causality assessment: Patient stated for the blood clot she has doubts if it was related to the vaccine but is it something that should be known about; for the leg swelling and achy she has doubts but it could have been the plane ride.; Sender's Comments: Based on the current available information, the reported events are most likely related to an intercurrent or underlying condition which is unlikely related to the suspected drug. The plane ride may provide an explanation for the events. The case will be reassessed if additional information becomes available.

1255715	4/25/2021	MI	81	F	1/13/2021	1/30/2021	This is a spontaneous report from a contactable consumer. This 81-year-old female consumer (patient) reported that she received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number unknown) at single dose for COVID-19 immunisation on 13Jan2021. Relevant history included mild dementia, high cholesterol. Relevant concomitant drugs included memantine 10MG,donepezil 5MG,atorvastatin, cetirizine hydrochloride (ZYRTEC). The patient was not pregnant. No known allergies. On 30Jan2021, the patient fell and became unconscious after getting up from bed to use bathroom, was able to get up and go back to bed. Next day, 31Jan2021, she told her daughter at 2pm what had happened and daughter took her to urgent care. Urgent care was performed EKG and called ambulance as EKG suggested suspicious activity. She was coughing with blood. Cat scan of the lung revealed acute saddle pulmonary embolism with acute cor pulmonale and a large blood clot in the calf. On 02Feb2021 then placed her on blood thinner and discharged her. As soon as arrived home, she began to suffer a massive gastro intestinal bleed and was rushed back to the hospital. On 04Feb2021, she began to have heart issues and suffered a mild heart attack and underwent a procedure to have a stent inserted. She developed the shingles the next day (05Feb2021). The events assessed as serious due to Hospitalization, Life threatening illness (immediate risk of death from the event), Disability or permanent damage. The patient visited Emergency room/department or urgent care. The outcome of events was resolved with sequel. Treatment therapy involved. The patient was not diagnosed with COVID prior vaccination. The patient had Nasal Swab/Fast Test/PCR (for COVID) in Apr2021 with negative result. Information on the lot/batch number has been requested.

1254752	4/25/2021	IN	61	F	3/19/2021	3/19/2021	<p>Her platelets are 200, which is very low; Bell's palsy; Shot on the top of my shoulder; excruciating pain/shoulder pain/given high on the top of her shoulder. It hurt; sore arm; This is a spontaneous report from a contactable consumer (patient). A 61-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), first dose at the age of 61-years old via an unspecified route of administration on 19Mar2021 10:10 (Batch/Lot number was not reported) as single dose for covid-19 immunisation. Medical history included systemic lupus erythematosus from 1985 and ongoing, arthritis and osteoarthritis from an unknown date and unknown if ongoing (She has osteoarthritis throughout her body and her feet). Family history included stroke (husband died at the age of 59, he was having stroke upon stroke). The patient's concomitant medications were not reported. It was reported that when she received the shot, it was given high on the top of her shoulder and it hurt. She could not move her arm for 3 days. The pain was excruciating. On the 4th day, her arm was sore, but she could move it. She had no fevers, she didn't get sick, but she just couldn't move her arm. The shot was given at at 10:10 am, and by noon she could barely move her arm. Her left side of the mouth doesn't want to work properly. Her Bells Palsy started on 05Apr2021. She was in her car and driving to the store, when all of a sudden her left eye was watering. She got home and she didn't see anything wrong with her eye, except it was watering. She could tell a difference between the left and right side of face when she touched it. Something was wrong with her right side. Her eye was not opening all the way, it's been dropping, and her lip was down. She can't smile, and when she drinks water it's comes out. The patient clarified that it was her left side that is drooping. She went to the emergency room due to Bell's palsy. She could not move her arm within 2 hours of getting the shot. The patient mentioned her whole body aches from the Lupus and arthritis, but the shoulder pain was different after the vaccine. The shot itself hurt, and she thinks the one who administered the vaccine might have hit something. There's not a day that doesn't go by that she is not in pain. Her platelets are 200, which is very low. The patient underwent lab tests and procedures which included activated partial thromboplastin time: unknown result, blood glucose: unknown result, computerised</p>

1254765	4/25/2021	NJ	66	F	2/26/2021		<p>blood clot in her right ankle; varicose vein in her right ankle and it started to hurt; varicose vein in her right ankle and it started to hurt; ankle on her right side started swelling; This is a spontaneous report from a contactable consumer (patient). A 66-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration on arm left on 26Feb2021 14:00 (Batch/Lot Number: EN6198) as SINGLE DOSE for covid-19 immunisation. The patient medical history was not reported. The patient's concomitant medications were not reported. The patient previously took the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EM9809 and expiry date: 30Jun2021) on left arm on 05Feb2021 for covid-19 immunisation. The patient experienced blood clot in her right ankle, varicose vein in her right ankle and it started to hurt, ankle on her right side started swelling, all on an unknown date. All events caused patient physician office visit. Treatment received for all events. It is reported that she is calling about the Covid 19 vaccine. She wanted to report that she developed a blood clot in her right ankle. She went to the doctor yesterday on 06Apr2021. She would like to add she has no prior history of any type of blood issues. The doctor she saw thought that the blood clot and the Covid 19 vaccine could be related but would not commit to saying so directly. She started having issues about 6 days after the second Covid 19 vaccine. She doesn't exactly remember when, maybe the 04Mar2021 or 05Mar2021. She ignored the issues attributing them to over exercising. She reached a point where she couldn't ignore the issues anymore and went to the doctor. Caller clarifies she has a varicose vein in her right ankle and it started to hurt then her ankle on her right side started swelling. She only payed attention to her ankle when it got worse. The last 3 weeks have been awful. She would like it known that she does not lead a sedimentary lifestyle. She rides her bike 60 miles a week and walks 10 miles a week. She's always moving. This is unusual for her. The doctor she saw diagnosed her with a blood clot and he did a sonogram in his office. She has been prescribed Xarelto 15mg tablets. Take 2 tablets twice daily for the first 21 days then on the 22nd day start taking one 20mg tablet once daily. The patient underwent lab tests and procedures which included sonogram:</p>

1254796	4/25/2021	CT	53	M	3/21/2021	3/22/2021	Blood clots in right leg below knee; he passed out from pain; pain in his right knee; he couldn't bend his knee at all; knee was swollen; couldn't walk/limping around; his knee more stiff; This is a spontaneous report from a contactable consumer (patient). A 53-year-old male patient received the first dose of BNT162B2 (Pfizer-BioNTech COVID-19 vaccine, lot number: EN6206), via an unspecified route of administration, administered in the right arm on 21Mar2021 at 10:00 as a single dose for COVID-19 immunization. Medical history included ongoing Factor V Leiden heterozygous, allergies to mushrooms from an unknown date and unknown if ongoing and a torn meniscus in his right knee and he had surgery 3 to 4 years ago. The patient's concomitant medications were not reported. The patient previously took Cephalexin and Percocet and experienced allergies. The patient did not have COVID prior to vaccination and has not been tested post vaccination. On 22Mar2021 at night around 2:30AM, the patient woke up and started walking to the bathroom and he passed out from pain. He had pain in his right knee. He thought he had torn his knee again. He had surgery 3 or 4 years ago for a torn meniscus in his right knee and he thought he had torn his meniscus again. He passed out, his wife found him and he went back to bed. In the morning, his knee was still very very sore, he couldn't bend his knee at all. He took an Advil between 6:30AM and 8:00AM. He hadn't taken any medications prior to the COVID-19 vaccine. His knee was swollen but the pain was manageable. He couldn't walk, he was on crutches for about 24 hours then the swelling started coming down and he put a brace on his knee. He could then walk without the crutches but it was still painful. The next day he had pain in the back of his knee. He thought the pain was caused because he had put the brace on and had been using the crutches. Like he had made his knee more stiff from not using it. He was limping around and the pain was bearable. At that point, the pain was maybe a 4 on a scale of 1-10 where his pain had been a 9 on a scale of 1-10. He took another Advil and he realized the pain in the back of his knee wasn't going away. He went to see his family doctor and his doctor was able to get him in that same day for an ultrasound. The ultrasound showed 2 blood clots behind his right knee. The patient had blood clots in right leg below knee. The week of the report, he got an

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
-----------------	--------------	--------------	----------------	------------	-----------------	-------------------	---------------------

appointment with a hematologist. The hematologist reviewed his case and the doctor isn't 100% sure the blood clots were from the Pfizer COVID-19 vaccine but the doctor isn't ruling it out either because it happened within 24 hours of receiving his first COVID-19 dose. He hadn't done anything strenuous before getting the COVID-19 vaccine, nothing that he thinks would have caused the blood clots. He would like to add, what he thinks is relevant, is that he is positive for Factor V. He reports he has one copy and Factor V only impacts about 3% of the population. The hematologist thought that he might be prone to developing blood clots. The hematologist reports that he has had patients who have had the COVID-19 virus who have developed blood clots. Maybe it's possible that the COVID-19 antibodies were trying to build up his immune system to COVID-19 and it created something similar to having the COVID-19 virus. If he is predisposed to blood clots then the COVID-19 vaccine may have precipitated the blood clots. His second COVID-19 vaccine is scheduled for Sunday, 11Apr2021. He had talked to both his family doctor and his hematologist and they both thought he should be ok in getting the second COVID-19 vaccine. He was prescribed blood thinners. If the second COVID-19 vaccine caused more blood clots the blood thinners would help him. He was asking if there is any additional information or guidance on receiving the second COVID-19 vaccine after his reaction. The pharmacist told him that the COVID-19 vaccine trials were all done in the left arm. He received his vaccine in his right arm and his right knee was affected. If he gets the second COVID-19 vaccine he's getting it in his left arm. He was prescribed Eliquis 5mg take one tablet twice daily. The outcome of the event blood clots in right leg below knee was recovering while the outcome of the other events was unknown.

1255567	4/25/2021	DC	70	M	3/12/2021	4/1/2021	COVID-19 test was positive; COVID pneumonia, COVID-19 test was positive; slight delirium; Arrhythmia; Abdominal pain; hypoxic; achy; myalgia; This is a spontaneous report from a contactable Physician reported in response to HCP letter sent via telephonic follow-up activity. A 70-year-old male patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot number and expiry date were not reported) via unspecified route of administration on 12Mar2021 (age at vaccination 70-year-old) for COVID-19 immunization. Medical history included hodgkin's disease (HD) for 7 years, diabetes for 40 years/controlled, chronic obstructive pulmonary disease (COPD), congestive heart failure (CHF), non-responder to hepatitis B vaccine, dialysis on 05Apr2021 from 6 years, asthma in youth, arthritis, right hip replacement 1 month ago on 20Feb2021 and developed deep vein thrombosis (DVT) and cerebrovascular accident (CVA), atrial fibrillation (Afib) also started at that time in Feb2021. Concomitant medication included carvedilol (COREG) 6.25, furosemide sodium (LASIX) 40, APIXABAN (ELIQUIS) 5mg twice daily, multivitamin, iron twice a day, atorvastatin calcium (LIPITOR) 80 mg, insulin 18 u at night, calcium acetate 667 mg 2 tablets 3 times a day w/meal, famotidine 20mg daily, calcitriol (CALCITROL) took 3 times a week (was on dosing algorithm depending on phosphorous and vit D levels). Past drug history included amlodipine, ibuprofen, lisinopril with reaction allergies, metformin with contraindication to patient on dialysis, not a true allergy and patient previously took first dose of BNT162B2 on 17Feb2021 for COVID-19 immunisation. No prior vaccinations within 4 weeks. The patient experienced COVID-19 test was positive, COVID pneumonia, slight delirium, arrhythmia, shortness of breath, tachypnea, abdominal pain on an unknown date, hypoxic on 14Apr2021, myalgia and achy in Apr2021. It was reported that patient in her hemodialysis unit who were vaccinated with BNT162b2 but were recently diagnosed with COVID-19. Patient COVID results were sent to the local health department for genetic sequencing (pending) and SARS titers were drawn (pending). He presented to HD unit with SOB on 05Apr2021 and routine COVID-19 test was positive. He was hospitalized for COVID pneumonia and put on high flow oxygen, he was still in

----------	-------	-------	---------	-----	----------	------------	--------------

hospital. He came in for dialysis on 05Apr2021 and was very short of breath. Patient reported that the night before they felt myalgia and achy. No fever. Sent straight to the ER from the dialysis unit to check fluid levels and was admitted. He was tested for Covid and was found positive. His oxygen saturation was at 90. Required 2-3 liters of oxygen and next day on 06Apr2021 graduated to high flow oxygen for several days. on 14Apr2021, the patient became more hypoxic and was transferred to ICU. Patient had slight delirium and was not acting like himself. He underwent lab test included respiratory rate (RR) greater than or equal to 30 breaths per minute, heart rate (HR) greater than or equal 125 beats per minute, use of vasopressors to maintain BP, SpO2 less than or equal 93% on room air, PaO2/FiO2 less than 300 mm Hg on an unknown date, dialysis, chest X-ray showed bilateral fluffy infiltrates, covid test positive, CT scan had classic ground glass look for covid, CT of chest w/ contrast and no embolism, white cell count 6.2, hemoglobin 11.2, hemocrit 34.6%, platelet 110, sodium133, blood urea (BUN) 38, creatinine 3.7, brain natriuretic peptide (BNP) 1962, troponin 0.125, albumin 2.9, aspartate aminotransferase (AST) 49, alanine aminotransferase (ALT) 27, Pulse O2 low at 90 on 05Apr2021 and blood immunoglobulin G, blood immunoglobulin M (IgM /IgG) had unofficial result as a titer of 1 on 06Apr2021. He displays clinical signs at rest indicative of severe systemic illness. He came in slightly tachycardic about 120 bpm. Hypotension caused by hospital pulling too much fluid not by disease. No mechanical ventilation needed. Patient required oxygen because O2 saturation was at 90. Required 2-3 liters of oxygen initially and next day graduated to high flow. He was complaining of severe GI distress. Sonogram was negative. CT scan scheduled for tonight. He was on anticoagulation from prior DVT. Patient received treatment with remdesivir for COVID-19 and hydroxychloroquine/chloroquine, azithromycin, corticosteroids, decadron steroid for other events. No immunomodulating or immunosuppressing medications or received any other vaccines around the time of COVID-19 vaccination. Adverse events were resulted in emergency room, hospitalization and admitted to an Intensive Care Unit. The outcome of event COVID pneumonia was not recovered, whereas unknown for all

1255308	4/25/2021	OH	49	F	3/25/2021	3/25/2021	she thought she had a blood clot; maybe it is MS (multiple sclerosis); possible septal infarct; weakness in her left arm; losing her balance; vaccine was given up high on her arm, not 2 fingers down. She thought they had hit bone; less range of movement in her left foot; trouble walking; like someone who had a stroke; numbness; legs felt heavy climbing stairs; immediate pain when needle went all the way in and worse when vaccine went in; pain in shoulder joint; This is a spontaneous report from a contactable consumer (patient). A 49-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot Number: Ep6955), dose 1 via an unspecified route of administration, administered in Arm Left on 25Mar2021 18:00 (at the age of 49years) as single dose for Covid-19 immunization. The patient is not pregnant at the time of vaccination. Medical history included anemia that is treated, living kidney donor, gastric bypass in 1999, gallbladder removal, hysterectomy, intussusception x2, migraines, high heart rate, and smoking. Concomitant medications included omeprazole (OMEPRAZOLE), amfetamine aspartate, amfetamine sulfate, dexamfetamine saccharate, dexamfetamine sulfate (ADDERALL), and albuterol [salbutamol] (ALBUTEROL [SALBUTAMOL]); all taken for an unspecified indication, start and stop date were not reported. The patient previously received Flu vaccine and Tetanus vaccine. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient has not been tested for COVID-19 since the vaccination. She got the shot on 25Mar2021 on Thursday evening at 1800. She is 49 years old and has had all the flu shots and tetanus shots. She has never had one hurt so bad. She stated that the vaccine was given up high on her arm, not 2 fingers down. She thought they had hit bone. It was reported that the patient experienced immediate pain when needle went all the way in and worse when vaccine went in. The whole time it hurt really bad and her arm hurt severely for 2 days from 25Mar2021. She still has pain in shoulder joint. That aside wasn't a big deal, it went away even though the joint is sore. The following Monday 29Mar2021 in the evening, her legs felt heavy and she had trouble going up the stairs. Then she had complete numbness of her left leg, from her hip or butt crack to the tip of her toes. It was

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

on the same side she had the shot. It was further reported that the patient's legs felt heavy climbing stairs then she woke Thursday morning with her left leg numb. She couldn't feel herself starting to have a bowel movement because the numbness went all the way up to that area. She went to the ER (emergency room) on Saturday night (03Apr2021) because she was afraid of a blood clot. An ultrasound was done on her left leg, CT of head and neck, and blood work with nothing found. She has numbness and less range of movement in her left foot with trouble walking and have had no improvement with calf being numb. It was further clarified that when she was Easter shopping, there was numbness in her foot was causing her to drag her foot around the store. It was like someone who had a stroke, with slight impairment on one side. Her foot slaps the floor. She doesn't have control of it, she can't flex her foot up and down at all and she has little movement in her toes, even now. When she went to the emergency room, she thought she had a blood clot. She is a kidney donor and is healthy over all except for anemia that gives her tingly toes since she was 30, off and on. She never had a body part felt so numb, other than when she sits on her leg wrong. They did a bunch of tests there. They did a doppler, CT scan, and an EKG (unspecified date) which was abnormal. Her EKG has never been abnormal before. It said possible septal infarct undetermined time. The doppler showed no deep or superficial blockages noted from her groin down to her toes/ankle. The doppler was to check for blood clots. They referred her to her primary care provider who said that she will do a neurological exam. She has weakness in her left arm as well. The weakness in her left arm was only told by the neuro touch test. The patient further clarified that she doesn't have less range of motion, it is really just pain (arm). She can still move her arm all the way. Her left side is weaker or less sensitive as far as the neuro test. She wasn't aware she had less feeling on her arm until the nurse said she did. Her arm pain is nothing significant, it can hurt when moving her arm. She had no leg pain or anything like that until later in the week. She still had symptoms of losing her balance. Getting in and out of the chair she almost fell down. She didn't realize the numbness. Monday, she felt heaviness going up the stairs. For 2 days she had the worst pain ever in her arm.

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

She had the tetanus shot and didn't have anything like that. It went away, when she raises her arm off from the side, she still has pain in the joint. She has migraines, it is nothing that is causing difficulty. She is more concerned something else happened. Patient thought maybe it is MS (multiple sclerosis) and asked if it is peripheral artery disease. She did smoke half a pack every other day. She is 49 but didn't start smoking till she was 36. It is a terrible habit and her doctor is aware. She also had her good and bad cholesterol which was just over 100. She is just reporting it because it happened on only the left side and she is a healthy person. She never had high blood pressure and never been treated for it, but she has had high heart rate before. It is not something that has ever caused any issue. She doesn't have something like peripheral artery disease, when she (software company name withheld) that is said plaque in the arteries. The doppler showed no signs of blockage superficial or deep on that side. She doesn't have an appointment until 29Apr2021. She doesn't know what to do to get more urgent care. The pain in her arm was better after the first 2 days. It is like a tooth ache, a dull ache. It is not all the time, just when moving her arm. Her legs were worse to where Thursday, she woke, and she was numb from the top of her leg to the tip of her toe. She can still lift her leg, but when she walks the tip of her second toe which is longer will drag on the ground. When she walks it is hard to hold her shoe on the left foot or put her shoe on. She can't maneuver her foot. When her foot hits the ground, the ball area of her foot smacks the floor because she doesn't have control over it. It is laboring to walk and is hard. She was kind of limping and pulling that leg on the left side. Her laboratory tests were BMP, CBC auto diff, CBC with diff, CT, angiogram of the head and neck, EKG 12 lead, and they did a venous doppler of the left lower extremity. It all came back good except the EKG which says septal infarct undetermined date, which has never come up on any tests before. The events resulted in Emergency room/department or urgent care, Disability or permanent damage. There was no treatment received for the adverse event. The patient has not been tested for COVID-19 since the vaccination. The outcome of events was not recovered.

A patient of unspecified age and gender received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot Number and Expiration Date were not reported), via an unspecified route of administration, on an unspecified date, at a single dose, for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient previously took the first dose of BNT162B2 for COVID-19 immunization. The patient was calling about the side effects of Pfizer COVID-19 vaccine and was wondering. The patient got the first and second vaccine of Pfizer for COVID-19. After the second dose of vaccine on an unspecified date, the patient developed like a blood clot, black and blue in the arm. The patient wanted to ask if this is a rare side effects or common. The outcome of the events was unknown. No follow-up attempts are possible; information about batch number cannot be obtained. No further information is expected.</p>

1257204	4/25/2021	MO	39	F	3/3/2021	3/23/2021	Patient began experiencing pain and difficulty walking on Tuesday, March 23. Later that afternoon she was taken to an Urgent care, who sent her to the ER for evaluation. She was diagnosed with a very large blood clot in her leg, spanning from just above the knee to her groin area. They admitted her and began treating her with blood thinners. While undergoing that treatment, her heart stopped 3 times and she had to be resuscitated. They discovered a pulmonary embolism. While removing a large clot from her lungs, the doctor found that her lungs were riddled with hundreds of tiny blood clots. They also said that she was bleeding internally, very heavily, from an unknown location. In all, they gave her 20 units of blood, and none of it stayed in her veins. The doctor said it seemed to just disintegrate. At that point, her brain and organs had begun shutting down and family made the decision to remove her from life support. She passed away Thursday evening, March 25, 2021.

1256715	4/25/2021	NY	34	F	3/20/2021	4/2/2021	During my menstrual cycle I usually have no symptoms other than tender breasts. So these symptoms were very unusual. Leg pains, pain and pressure in pelvis, clitoral pain, pain around vaginal opening, stinging like acid during urination that sent a shock through my entire body, uncontrollable bladder, nausea, large blood clots, lower stomach pain, flank pain, hot/cold chills, if I touch my belly button the pain radiated to my vagina, ovaries hurt, cervix pain, dryness, unable to get comfortable, crawling out of my skin, and constant urge to urinate, depression. I landed myself in the ER where they told me to take Tylenol and Motrin and sent me on my way. These medications were not able to control the amount of pain I was in. I have now reached out to a couple specialists.

1256683	4/25/2021	NY	81	M	4/1/2021	4/14/2021	4/14/2021 Two weeks after the 2nd Covid-19 vaccine, about 11 PM. patient, developed a sudden numbness in his right are, hand & right side of the face. He had no sensation and could not feel anything. He immediately was taken to the emergency room at Hospital. They began testing and suspected a blood clot. They administered blood thinners, TPA by injection into the port, performed many tests including Ct scan, chest Xray, blood tests, EKG etc. He was being monitored & hooked up to various scanners. They decided to move him by Ambulance to the ICU Unit at Medical Center . He was in the neurology emergency room there for several hours & then moved the Neurology ICU. They kept him there, doing various testing, until Friday 4/16/2021 When they moved him to a regular Neurology floor. Staff neurologists continued to monitor his condition. On Saturday, 4/6/2021, an MRI showed a small blood clot in the Thalamus of the brain, which they believe caused the lack of sensation on the right arm, hand & face. He was discharged & went home on Monday 4/18/2021. New medication was prescribed, Physical therapy and was told to make an appointment with a Neurologist. On Thursday, 4/22/2021 patient had an appointment with his Cardiologist, Dr. the Dr gave him an examination & told him to proceed with the neurologist, etc. Patient has an appointment at PT in on Wed. April 28, 2021. He is waiting for an appointment with Dr. Neurologist at Neurology Group
1256680	4/25/2021	MN	50	F	4/10/2021	4/16/2021	Patient presented post-seizure. Reported 1 week of headache prior to presentation. Found to have cerebral venous sinus thrombosis, small areas of hemorrhage in the right frontal lobe, and bilateral pulmonary emboli, as well as thrombocytopenia (previously had normal platelet count). Per MD "Clinical picture is entirely consistent with VITT. See no other obvious explanation for this constellation of clinical findings. ~~

1256512	4/25/2021	NH	60	F	4/7/2021	4/8/2021	Day one post vaccination - dull headache, leg pain, abdominal pain, back pain - these symptoms continued for a few days, I started to feel a bit better, did not take any pain reliever medications because I didn't want to mask symptoms. On 4/14/21, 7 days post vaccination, my leg pain in both legs worsened including numbness and a burning sensation in both feet. Back pain continued, arm pain started in both arms with numbness in both hands however the pain on my left side with legs and arms is worse. I've had intermittent shooting pains in my left ear, left jaw, left temple and across the left side of my face. I've also experienced shoulder and neck pain. The abdominal pain is intermittent and mild. On 4/15 - 4/18 the pain in my legs was so bad that it was waking me up at night and my arm pain was occurring more frequently. I decided to go to the ER on 4/18, day 11 post vaccination, due to my concern of a possible DVT or other type of blood clot. The ER physician's assistant did not look at my legs but did several blood tests and other tests.
1256268	4/25/2021		46	M	4/6/2021	4/12/2021	Iliac vein thrombosis pt started with right lower quadrant abdominal pain six days after vaccine. Persistent pain since then leading to hospital stay and diagnosis on imaging of right iliac vein thrombosis. no prior history of DVT, no family history of DVT, no inciting event/travel/change in activity level/surgery/illness
1256081	4/25/2021	NJ	58	F	4/8/2021	4/14/2021	April 14, my sister was transported to hospital feeling faint and numbness in her left leg. As a result, she was admitted and treated for: ? blood pressure readings as low as 82/43, 76/50 while standing ? blood clots on her heart that traveled to her brain that were causing multiple mini strokes ? 95% blockage in her right heart vessel which required a stent ? 50% and 60% blockage in other chambers that will require attention She was given heparin and then switched to a different blood thinner to dissolve the clots. she was discharged on April 23rd with instructions to followup with her cardiologist and neurologist.

1256761	4/25/2021	NC	43	F	4/7/2021	4/25/2021	Janssen COVID-19 vaccine EUA Patient presented to hospital after crushing chest pain and syncopal event. Found to be hypotensive and hypoxic and echocardiogram revealed RV dilation and dysfunction with clot visualized in R atrium of heart. Patient received IV alteplase followed by start of IV heparin infusion. Currently intubated in ICU, on 3 vasopressors for shock.
1251620	4/24/2021	IL	73	F	4/5/2021	4/8/2021	Severe pain in left thigh groin & knee area. Went to ER, confirmed blood clot. Sent home w/blood thinners - Xarelto
1251583	4/24/2021	MD	33	M	3/31/2021	4/15/2021	4/15/21 woke up with severe pain in left upper thigh. Fatigue and headache began a few hours later. Needed to leave work. Early evening a rash developed in the left thigh and left foot swollen size of balloon and bright red. Went to the ER 10:30PM, admitted from ER on 4/16/21 for possible deep vein thrombosis and cellulitis of left leg. Shortly after admission, unable to obtain venous access, central line inserted for IV fluids and IV vancomycin and Zosyn. Foot swelling increased up to below knee with bright red skin color. No open wound noted on extremity. Ultrasound did not find a thrombosis but enlarged lymph nodes. 6 days later leg still swollen and red, repeat doppler ultrasound negative, but report stated could not compress to complete test due to severe swelling. He was also tachycardic and hypertensive during admission. Infectious disease doctor consulted and confirmed severe cellulitis but it was written in discharge summary the covid vaccine can not be ruled out as a cause of the infection and admission. Lasix was initiated to decrease swelling in lower extremity. He was on SQ heparin 3 times a day during the admission. He was discharged on Doxycycline and Augmentin. After discharge saw primary care physician who palpated large lymph nodes in neck. Mild headache persists. Ultrasound of neck to be completed on 4/27/21. Started on Tizanidine for pain.
1251532	4/24/2021	CT	19	F	4/10/2021	4/11/2021	Patient stated she needed to go to hospital for adverse reaction of pain in leg. After asking MD to check her leg, they discovered a blood clot per patient. She is now doing well per her.

1251720	4/24/2021	NY	52	F	4/4/2021	4/5/2021	The day after I received the vaccin I experienced an extreme tension in my two eyes that I still have now but not as intense. My left eye is the most affected - The blood flows really fast in the eye and it is pulsing. I don't have the sensation every day now but still on and off. Both of my eyes feel tension not as much as it was at the beginning but still experiencing symptoms of pressure and pulsions. It feels like I am going to have an ophthalmic migraine. My eyes doesn't feel right either. Overall, I felt weak, highlighted and it felt like if I was experiencing feeling of "dissociation" - caused I think by my sight being affected. I couldn't do a lot as my energy was very low and it felt that my oxygen wasn't at its maximum. Every small activity required a lot of energy and I could barely walk around my block. It affected my work and I couldn't teach at the end of that first week. I wasn't feeling good. I went to my doctor on Monday, April 12th as I was concerned about blood clot or other neurological and pulmonary issues. My Doctor examined me and listened to me and concluded that the sides effects were taking longer than the average to go away. The following day I woke up reading about the blood clots due to J&J vaccin. I called back my doctor and we did a blood test. It came back negative and I got my eyes checked by my ophthalmologist too, and he didn't see anything.

1251238	4/24/2021	OH	47	F	4/8/2021	4/16/2021	tia in right eye, on Friday morning on 4/16/ 21, between the hours of 8 am and 9:30 am, I went from feeling fine and sleeping to waking up not being able to hear in both ears, not being able to see anything out of my right eye, my left arm was completely numb all the way up to my shoulder and neck, the right side of my tongue was numb and my blood sugar was over 611. Initially they thought it was just a reaction to my high sugar levels, since the mri's showed I did not have evidence of a stroke. It wasn't until I saw a retina specialist the following Tuesday that she confirmed that yes I did have a stroke in my eye. I have not recovered my vision fully in my eye or the sensation in my tongue. I didn't connect it to the vaccination until I spoke with a friend whose sister also got pfizer 5 days before me and suffered a stroke 3 days before me, and two days after we spoke they announced Johnson& Johnson pause due to clots in women. The retina specialist says we will have to wait and see if the damage heals on it's own in the meantime I need to see her on a monthly basis.
1251780	4/24/2021	CA	50	F	4/16/2021	4/17/2021	4/16/21 Second Dose received. 4/17 and 4/18 noticed light swelling in ankles. No other effects. 4/19 - Emailed my Cardiologist about swollen ankles. Didn't think about the vaccine as a potential cause. He scheduled an Echocardiogram for May. 4/20 to 4/22 - Edema in ankles and lower legs with pain on bottom left. Tried heat and elevation with no relief. 4/23 - Called Advice Nurse with recommendation to go to ER. ER determined a blood clot in left leg at the left posterior tibial vein measured at 6.3cm.

1251240	4/24/2021	CO	74	M	3/31/2021	4/13/2021	13th of April. I had a blood clot in my hand. My index finger on my left hand was numb and black and blue all around the knuckle area and into my hand area. I went to my primary care - I went to the acute center there. She said the hand was cold and could see the black and blue. They put me on Plavix for 30 days and I haven't had any reoccurrence of that. I think it was the 21st, I couldn't sleep all night, I had a kidney stone - the pain was so bad I got nauseous - around my back and side and in my front. I didn't have a fever. I went to the doctor office and they checked urine - and said there was blood in the urine. I was prescribed - Tamsulosin HCL. They thought I had passed most of it by the time I got there.
1252112	4/24/2021	TX	52	F	3/21/2021	3/21/2021	Transverse sinus thrombosis in the brain with severe headaches, nausea, dizziness, and blurred vision. 1247493	4/23/2021	CA	32	M	4/8/2021	4/16/2021	<p>Covid-19 vaccine JJ: 32 y.o. male w/ no PMH presenting 2 weeks after receiving his Johnson &amp; Johnson COVID vaccine after having severe L calf pain found to have thrombocytopenia. From H&amp;P on 4/21, Patient reports that he had both fevers and aches after his vaccine (4/8/2021). Several days later developed low back pain radiating into his left leg which he initially attributed to sciatica. However, several days later, he went for a 6 mile hike, and felt that his left leg was hurting more. He went to PCP, where he received a blood test and was found to have a platelet count in the low 60s. This was initially thought to be a lab error, but he noticed that his left leg was swollen, somewhat red, and appeared that his blood vessels were swollen. This swelling resolves when he is lying down, and is worsened when he is standing. He received an US to r/o DVT, which was negative. However, after his repeat platelet count demonstrated thrombocytopenia, he was sent to the ED. He denies any recent leg trauma, though he has broken his leg before nearly 15 years ago. He denies weakness or issues going to the bathroom. Denies chest pain or shortness of breath. Denies chills, fevers, but did wake up last 2 nights drenched in sweat. He also reports a petechial rash on his legs. As of 4/22, medical team suspects Vaccine-induced thrombocytopenic purpura (VITT). VITT requires 1) thrombocytopenia, 2) documented clot, 3) positive PF4 Ab, and 4) recent AstraZeneca or J&amp;J vaccine. He meets criteria 1, 3, and 4. He has clinical signs of DVT but does not have a documented clot. Patient has L calf tenderness and prominent pooling of blood and vein engorgement of the L leg when he stands up. Possible that he had a DVT or multiple that cleared and now he has post-thrombotic syndrome. This is consistent with the pooling of blood with gravity and relief of symptoms with elevation. As he has had 2 negative US for DVT, unlikely that he has an unresolved DVT. abdominal and head CT are neg for thrombosis.</p>

1247470	4/23/2021	AZ	55	F	4/5/2021	4/6/2021	4/5/2021--Received Janssen vaccine. Felt very hot during the day. 4/6/2021--Woke up with very bad headache and rash on the injected arm plus on my stomach. Went for a walk and felt pain in my left calf and achilles tendon. Went to work. 4/7/2021--Started my work day as a Personal Trainer/Fitness Instructor at 6am as usual. Taught cycling classes and trained a few clients. Went for walk. Still had a headache. When I got in my car to head home, my vision was super blurry and I felt very dizzy. I ate an orange and peanuts and hydrated more. I was not even sure I could drive home. I got home told my family how I was feeling. My husband noticed my eyes were very red and swollen. I took a shower, drank a smoothie and ate a salad. Used my aunt's BP cuff to check my BP and it was 148/99. I have NEVER had HBP. 4/8/21--Woke up feeling disoriented as if the left side of my face, body were off--neurological stuff. I went to reach for grapes in the refrigerator and could not grab them. I felt like I have never felt before and ask my husband to drive me to the ER. While at the waiting room at the ER, I felt chest tightness and pain and nauseous. My BP was 153/111. Again, I have never been diagnosed or been treated for hypertension. They did EKG, lab tests, chest X-ray. Once my BP came down, they sent me home. This is before all the JJ Janssen vaccine "news" came out and the reasons it was paused. I developed a very bad cough about two hours after I got home from the ER. 4/9/11--Made appointment with a brand new primary care doctor. Saw her on Monday 4/12/2021 as recommended by ER. I had never met her before. She prescribed a very low dose of BP medication, which I did not take because the number one side-effect is dry-cough. I was already coughing a lot, later on with blood. 4/11/2021--Still feeling pretty bad, I woke up to the news of the Janssen vaccine being paused. Frankly, I felt relieved that I was not going crazy. This truly has been one of the hardest things I have ever gone (and still am) going through. I became concerned about the pain in the left calf and heel could be a clot. Called primary care doctor. Had ultrasound of legs and chest x-ray the following day 4/12/2021--Had persistent cough with blood. Went to ER at 9pm. Had EKG, blood work, CT without contrast of chest, covid test--negative. Got home around 2am. 4/19/21--Followed up with primary care doctor who after

1247460	4/23/2021	CA	41	F	4/3/2021	4/9/2021	<p>explaining to her I am extremely fatigued, still blurry vision, dizzy, cough better but not gone, chest discomfort on the left side, she referred me to an optamologist and cardiologist. My insurance and this poorly established referral system is very difficult to navigate. Up to now I am still waiting for the referral and pre-aurhtorization to the opthtamologist. (4/23/2021). I want to say, I am pretty healthy. I have worked in fitness and wellness for over 30 years. I have never drank alcohol, smoked or done any drugs. Prior to this no physician has told me I have HBP or any issues for which I have to be medicated. I take zero medications. Even when I had the bad headache from the vaccine I took nothing. I have not worked in two weeks and had not driven until last saturday. If I don't work, I don't get paid. I pay for almost \$600/month for my insurance in the marketplace. This has been another stressor of this storm. Getting providers to really listen and insurance companies to take situations like this seriously. I could not drive at night. This has been rough and I look forward to being myself soon. This reaction felt like a heart attack/stroke with extreme fatigue, acid reflux, cough with some blood, muscular pain. The rash and headaches were the least of my concerns. I am not yet recovered from all of this. I sure hope there is no permanent damage and that this too shall pass. It is important to note that I have tried reporting this event several times to the VAERS website online. I completed the 4-5 pages multiple times and it would not let me submit. I also called the VAERS 1-800 number to report and they told me to go back to the online form. I left several messages when I could not get it done online and to this date no one has called me back. I called to report my adverse reaction and they told me they do not take that info. I also called the health dept. After several phone calls to them a nurse called me back but did not take a formal report. When someone is feeling pretty sick, this is a lot to ask of. I persisted because I feel this is important to be reported.</p> <p>Left calf and thigh pain and swelling on the 6th day following vaccine which continued intermittently for a total of 12 days. I was seen at an urgent care, a left leg ultrasound was completed and I was diagnosed with deep venous thrombosis. I was prescribed Xarelto.</p>

1246983	4/23/2021	FL	58	F	4/5/2021	4/5/2021	<p>from Urgent care with following diagnosis: Acute cystitis without hematuria, abnormal urinalysis adverse effect of vaccine, initial encounter cyanosis of skin, shortness of breath and protein found in urinalysis. Instructed to immediately get CT angiogram to rule out blood clot. 12: pm Admitted to Mount Sinai Emergency Room-blood work, XRay and IV given. details below Discharged with the following diagnosis: Foot cramps - Primary Local reaction to COVID-19 vaccine Friday 4/16 Subtle and lingering muscle spasm on left foot. Experienced chills and consistent headache throughout the day Saturday 4/17 10 pm: Began to run a fever however did not check the temperature. Radiated heat and friend took care of me throughout the night as I sweated with confusion Sunday 4/19 Complete fatigue and tiredness, cramping in the foot seemed to have subsided. Still was running hot throughout the day. Monday 4/20 Took off work due to exhaustion and muscle ache and what seemed to be a fever Thursday 4/23 Followed up with General Practitioner Dr. Franco and was advised to report my experience with the Johnson and Johnson vaccine. Feeling better as of Friday 4/24 with slight fatigue but body temperature seems to be ok. No signs of the lingering cramping in the left foot but still slightly achy all over the body.</p> <p>After vaccination, at 10pm I started feeling flu like symptoms, fever chills shakes feeling miserable and this lasted 3 days straight, I also had diarrhea, nausea and vomiting. I woke up with a swollen jugular vein that ended up being a blood clot, 10 days later my arm was swollen up twice the size of my leg, the jugular was still swollen. I call the urgent care nurse they said to go to ER. I went to hospital got a CAT scan and ultrasound, I was given a shot of warfarin that was supposed to last for 12 hours. I went home and the next morning instead of going to the hospital, I went to hospital and they found 2 blood clots in brain, arm and leg and neck. I have had no history of blood clots and this all happened after the J&amp;J vaccine. They did a procedure where they tried to put a balloon to relieve the pressure. The blood clots in the brain cannot be removed because of their location and it would be dangerous to remove and I am on blood thinners for the rest of my life. Multiple blood clots in body brain, arm and shoulder.</p>

1246956	4/23/2021	TX	73	F	4/9/2021	4/10/2021	Stroke and blood clot in right leg.
1247196	4/23/2021	FL	38	M	3/31/2021	3/31/2021	Patient states shortly after he received the vaccine, he developed intermittent bilateral upper and extremity numbness/tingling x 2 weeks. CTA/CTV head ruled out cerebral venous sinus thrombosis. MRI cervical, thoracic, and lumbar spines showed degenerative disk disease.
1247645	4/23/2021	WA	48	F	4/8/2021	4/8/2021	On the night of my J&J my vaccine , I felt very tired and sleepy but I could not sleep. The next morning I felt a burning sensation to my eyes as well to my right ear and that went away. I went to see my PCP that day as well because I was having a pressure sensation down my right calf and leg. On Wednesday I felt numbness sensation down my right arm and the right side of my body was weak. On Thursday, I called my PCP who advised me to go to the ER and to get monitored for thrombosis. I also began to have headaches and blurry vision. At the ER they performed an ultrasound and did lab work. The ultrasound exam did not show evidence of thrombosis or blood clots. The ER physicians told me to rest and elevate my legs. I also noticed that my BP was 130/90 which I never had before. To this day I still have throbbing sensation to my right calf and leg. I again went to the ER and they monitored me. They told me to take Ibuprofen for pain and again did an ultrasound which did not show any blood clots. I then started to have a burning sensation to my skull and scalp and also my left arm. I have not fully recovered from my symptoms.
1247700	4/23/2021	CO	45	F	4/7/2021	4/17/2021	Shortness of breath for several days, feeling fatigue and week, pain in right elbow Diagnosed Apr. 17 in ER setting: acute segmental and subsegmental pulmonary embolism without acute cor pulmonale Acute thrombosis of superficial vena basilica right arm
1247803	4/23/2021	OH	66	F	3/15/2021	4/19/2021	Patient received Moderna vaccine and was in her usual state of health. Developed shortness of breath and dyspnea of exertion for 2 weeks. Presented to her Physician's office who ordered a CT Angio which revealed multiple acute pulmonary emboli throughout both left and right main pulmonary arteries and lobar branches with ventricular strain. Patient underwent EKOS procedure to remove clot burden and was initiated on Xarelto. Patient is requiring 4L of oxygen at this time.

This vaccination was given on 04/10/2021. Patient is 39-year-old female with a past medical history significant for ulcerative colitis that has been in remission since the patient was 21 years of age, epileptic seizures on Vimpat and clonazepam. Patient comes in as a transfer with a chief complaint of possible reaction to Johnson and Johnson COVID-19 vaccine. Patient presents with multiple complaints. The patient states that upon receiving the vaccine on 04/10/2021 she suddenly developed presyncopal episodes where she felt like she was about to pass out but that subsided later on. 12 hours following the shot she had intense headache which was frontal and then later on travel to the back of her head and traveled down her spine. Patient described the headache to be the worse headache of her life, stated that it was worse than going through labor. Patient stated that she received morphine which helped her with the headache. Patient also complained of chest pain which was left-sided with no radiation, constant. No history of previous myocardial infarctions. Her troponins that were conducted were negative. Patient also complained of experiencing blood in her stool. She stated that when she wiped herself on the morning of 04/13/2021 she experience blood on the toilet paper and blood in the bowel. However, her stool occult blood that was conducted was negative. Patient is being followed by Neurology, she contacted her neurologist and they recommended to come to the ED with concerns of thromboembolism. Patient's D-dimer was negative. Patient denied any recent travel anywhere or coming into contact with anyone sick. She denied developing any fevers cough shortness of breath abdominal pain nausea vomiting or any urinary concerns. 4/15/21: Patient is a 39-year-old female with a past medical history significant for ulcerative colitis that has been in remission since the patient was 21 years of age, epileptic seizures on Vimpat and clonazepam. Patient comes in as a transfer with a chief complaint of possible reaction to Johnson and Johnson COVID-19 vaccine. Headache: MRI brain and MRI venogram was ordered. MRI brain did show concerning signed for idiopathic intracranial hypertension. Neurology was consulted. Patient had high volume LP. Patient</p>

responded well post LP. Patient will be discharged on topiramate with a taper instructions per neurology. Patient will make appointment with Ophthalmology. Patient will follow up with Neurology as well. Chest pain concerning for ACS: Negative troponin. EKG normal sinus rhythm. Concern for vaccine reaction: Patient has J&J vaccine. No clots were noted. Patient's symptoms are most likely are secondary to idiopathic intracranial hypertension and history of migraines. 4/16/2021: 39-year-old female presents emergency room with chief complaint of headache. Onset this morning. Headache is generalized. Headache is constant. Headache is worth with position change. Such as moving head side to side or with changing from lying to sitting and sitting to standing. Headache improves with lying supine. To has tried pushing fluids, taking over-the-counter medication, and also increasing her caffeine intake to offset the headache. She denies any of these helping with her symptoms. Patient's pain is right an 8 out of 10. The patient denies anything additional alleviating and or aggravating factors to chief complaint. Today when the patient's headache started. She contacted her neurologist. She was told to come to the emergency department for a blood patch. The patient added that her neurologist felt that she needs a blood patch not only because of the recent lumbar puncture but because there was at minimum 25 mL of spinal fluid removed at the time of her lumbar puncture. This lumbar puncture occurred under fluoroscopy. However, they had difficulty getting the pressure gauge on thus, more than 25 mL was removed.. Pain Pain Scale: 8 /10. Timing: constant. gradual. Character: mild. 4/19/21: patient reports intense headaches she attributes to the spinal tap. Ketorolac, DHE, ondansetron given.

1247811	4/23/2021	NY	33	M	4/8/2021	4/16/2021	Severe thrombocytopenia (Platlet Count of 18) HPI: 33 y.o. male with no PMH coming in now w/ progressive thrombocytopenia to 18. He received the J&J covid vaccine on 4/8 and felt well afterwards. Last Friday (4/16) he began to experience constitutional symptoms (fever to 100.4, chills, night sweats feeling drenched, decreased appetite) so decided to get his labs drawn as an outpatient for further evaluation. Symptoms progressed until Tuesday, when they began to subside slightly. At that point, his labs resulted and were notable for thrombocytopenia. He got his labs redrawn the day before admission and it was noted that his thrombocytopenia was worsening, so he was directed to the ED for further evaluation. Patient seen by hematology, started on dexamethasone 40 mg PO daily as well as IVIG treatment x2. MRV of brain without evidence of dural venous sinus thrombosis ***PATIENT CURRENTLY HOSPITALIZED***

1245460	4/23/2021	FL	73	F	2/10/2021	2/13/2021	I had a stroke; Blood clot; Speak was bad, couldn't form words, speak was impaired; Missed her dose due to the decision not to get it; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of CEREBROVASCULAR ACCIDENT (I had a stroke) and THROMBOSIS (Blood clot) in a 73-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 010M20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included No adverse event (No medical history was reported.). On 10-Feb-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 13-Feb-2021, the patient experienced CEREBROVASCULAR ACCIDENT (I had a stroke) (seriousness criterion hospitalization). On an unknown date, the patient experienced THROMBOSIS (Blood clot) (seriousness criterion medically significant), SPEECH DISORDER (Speak was bad, couldn't form words, speak was impaired) and INTENTIONAL DOSE OMISSION (Missed her dose due to the decision not to get it). On 16-Feb-2021, CEREBROVASCULAR ACCIDENT (I had a stroke) had resolved. At the time of the report, THROMBOSIS (Blood clot) and SPEECH DISORDER (Speak was bad, couldn't form words, speak was impaired) outcome was unknown and INTENTIONAL DOSE OMISSION (Missed her dose due to the decision not to get it) had resolved. Not Provided The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Concomitant product use was not provided. The patient was receiving treatment with clopidogrel (Plavix) 75mg since the stroke (which is a stronger blood thinner TPA drug that resolve the blood clot). Reportedly, the patient was hospitalized for 3 days. Patient also stated that she was nervous about getting her 2nd dose so she missed her dose due to the decision not to get it with regards to the fear of having another stroke. Company comment Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. This case was linked; Sender's Comments:

1245238	4/23/2021	TX	52	F	4/8/2021	4/15/2021	The back of my left leg hurting all of a sudden on 04/15/2021. The pain on the leg is getting worse each day. Went to the ER on 04/20/2021. Per the doctor no swelling and no redness. I said something is really wrong please check. They did blood work and everything came back good. They did a sonogram and that's where they saw a Blood Clot. Was given Eliquis.
1245284	4/23/2021	MO	24	F	4/7/2021	4/7/2021	In addition to the five main side effects (fever, chills, headache, nausea, and muscle pain), I also had severe lower body pain in my legs. I couldn't walk. It felt like my limbs were cut off from the rest of my body. I had an intense sensation of knives stabbing me in different places all over my body. I couldn't sleep the night of the shot due to the pain. Today marks 15 days since getting it, and I still have fatigue, radiating pain down my left arm and leg, and brain fog. I had a pretty bad migraine the other night. I have not received any treatment. I called my doctor who told me to go to the ER to get checked for a blood clot using a Doppler. I haven't gone yet because it's expensive and I'm still functioning. I'm considering going if I don't get better.
1245306	4/23/2021	NY	68	M	2/13/2021	3/10/2021	I got a blood clot, venous, in my upper right leg. Started on or about March 3rd, 2021

1245459	4/23/2021			M			Ischaemic stroke; This spontaneous case was reported by a consumer and describes the occurrence of ISCHAEMIC STROKE (Ischaemic stroke) in a male patient of an unknown age who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. The patient's past medical history included No adverse event (No medical history was provided.). On an unknown date, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On an unknown date, after starting mRNA-1273 (Moderna COVID-19 Vaccine), the patient experienced ISCHAEMIC STROKE (Ischaemic stroke) (seriousness criterion medically significant). At the time of the report, ISCHAEMIC STROKE (Ischaemic stroke) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. No concomitant medications were reported. Reporter mentioned that diagnosis from hospital which included magnetic resonance imaging (MRI), computed tomography (CT scans), and echocardiogram (EKG) did not reveal any signs from where the blood clots were originated. No treatment information was provided by the reporter. Very limited information regarding this event/s has been provided at this time. Further information has been requested
1246817	4/23/2021	IL	53	M	3/26/2021	4/16/2021	Blood clot in each lung. Started in legs, spread through heart and settled in lungs. This occurred about 3 weeks AFTER J&J/Jansen vaccine. Immediate symptoms were painful leg cramps on both sides back pain, fever sweating, nausea, clammy skin, headache, neck pain.

1245476	4/23/2021	IL	82	M	2/3/2021	3/1/2021	Blood clots; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of THROMBOSIS (Blood clots) in an 82-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 013A21A and 031L209) for COVID-19 vaccination. Concurrent medical conditions included Cancer (The patient was in recovery from cancer). On 03-Feb-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 05-Mar-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. In March 2021, the patient experienced THROMBOSIS (Blood clots) (seriousness criterion medically significant). At the time of the report, THROMBOSIS (Blood clots) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): In March 2021, Computerised tomogram: blood clots (abnormal) Blood clots. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Concomitant medications were not provided. Description: The patient developed blood clots (medically significant) two weeks after receiving his second dose of the vaccine . The patient was in recovery from cancer and was required to have computerized tomography (CT) scans. He had a computerized tomography (CT) scan within two weeks of taking his second dose and the blood clots were discovered. The patient had never had blood clots before. The patient had already been in contact with his oncologist and was prescribed apixaban. The patient received both scheduled doses of mRNA-1273 prior to the event, therefore action taken with the drug in response to the event is not applicable.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.
1245770	4/23/2021	NH	45	F	4/18/2021	4/22/2021	Blood clot in right arm

1245965	4/23/2021	MD	29	F	3/25/2021	4/21/2021	My menstrual cycle came a lot heavier than it has ever been, including large blood clots. Additionally, my premenstrual symptoms were much more painful and intense
1246172	4/23/2021	VA	78	M	3/8/2021	4/1/2021	PATIENT EXPERIENCE A BLOOD CLOT IN LEG AND HAD TO BE HOSPITALIZED
1246262	4/23/2021	MI	49	M	1/9/2021	1/26/2021	I had a massive stroke at work a few weeks after the 1st vaccine shot. Rushed to hospital for emergency surgery to remove blood clot in right side of brain. My paralysis was reversed after surgery but lingering headaches exist.
1246442	4/23/2021	NY	53	F	3/26/2021	4/14/2021	Muscle aches started about 12 hours after the injection. First my legs and back but after another 12 hours it was mostly my legs. Legs felt like the muscles were being pulled. (It felt like the beginnings of the extreme reaction I had to ampicillin 2 decades earlier, though not nearly as severe.) My arm swelled slightly, was warm at the injection site and ached about 12 hrs after the injection. The leg aches lasted about 2 days, the arm ache lasted about 1 day and the slight arm swelling lasted about 6 days... Reason for my reporting: I had an annual eye exam 4/14/21 where a retinal scan was done. The optometrist saw some blood spots in my left eye and referred me to an ophthalmologist. Ophthalmologist performed additional scans and tests including a Fluorescein angiography and determined I have BRVO (Branch Retinal Vein Occlusion) which is a series of blot clots in small vessels of the eye's main vein. He did not say it could be a result of the vaccine but I have no risk factors associated with getting BRVO. Since it is not affecting my vision yet, the doctor wants to monitor it in 3 months to make sure it has not worsened. Since the Janssen vaccine was put on hold for causing other types of blot clots in women in my age group, I am wondering if the vaccine caused the blood clots in my eye.
1246568	4/23/2021	UT	51	M	2/1/2021	3/16/2021	I had a pulmonary embolism on 3/17/2021. Prior to that a blood clot in my left calf.

3/29/2021

4/12/2021 My first period after the vaccine arrived 6 days early, which is quite abnormal for me. The day before I couldn't work at my desk due to pain in my low back and hip flexors, which is also abnormal. Then the period was heavier than normal lasted 3 days longer than normal. It looked like there were clots in the blood. I mentioned this experience to a friend, who said several of his female friends also experienced bizarre periods after receiving the JJ vaccine. Was this drug tested on women of reproductive age before being released?

BLOOD CLOT; This spontaneous report was received from a female patient of an unspecified age. The patient's weight, height, and medical history were not reported. The patient received Covid-19 vaccine Ad26.COV2.S (suspension for injection, route of administration, and batch number were not reported) dose, vaccination site, and start therapy date were not provided, for prophylactic vaccination; and was treated with XARELTO (rivaroxaban; film-coated tablet, oral, batch number was not reported) dose, frequency, and therapy dates were not provided, for an unknown indication. The Company is unable to perform follow-up to request batch/lot numbers. No concomitant medications were reported. On an unspecified date, the patient experienced a blood clot. The patient reported she got a blood clot after receiving her vaccine, and that she had just started taking rivaroxaban. Action taken with Covid-19 vaccine Ad26.COV2.S was not applicable, and action taken with rivaroxaban was not reported. The patient outcome for the event of blood clot was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: v0 This report involves a female patient of unspecified age who experienced a blood clot on an unspecified date after receiving the Janssen COVID-19 Vaccine Ad26.COV2. Concomitant medications included rivaroxaban (recently started). The patient's past medical history and details of the event were not reported. The recent starting of rivaroxaban infers a recent clot or a condition that would predispose the patient to develop a clot, however this case has insufficient information to make a meaningful medical assessment.

1249343	4/23/2021			M			<p>CLOT OF ABOUT 3-4 INCHES; LOWER LEG PAIN; This spontaneous report received from a patient via a company representative concerned a 35 year old male. The patient's weight, height, and medical history were not reported. The patient had no history of blood clots and is active. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: unknown, expiry: unknown) dose was not reported, 1 total administered on 23-MAR-2021 for prophylactic vaccination. The batch number was not reported. Per procedure, no follow-up will be requested for this case. No concomitant medications were reported. On an unspecified date in 2021, the patient experienced lower leg pain. About a week after that, on an unspecified date in 2021, the patient experienced clot of about 3-4 inches confirmed by ultrasound. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of the lower leg pain and clot of about 3-4 inches was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: This 35-year-old male patient of unknown ethnicity was reported in social media to have "clot of about 3-4 inches confirmed by ultrasound" after an unspecified duration from receiving Janssen COVID-19 vaccine for the prevention of symptomatic SARS-CoV-2 virus infection. This was preceded by symptom of lower leg pain 1 week prior. No other details was reported. The information available precludes a complete and meaningful assessment. The case will be re-assessed once additional information is received.</p>

1249274	4/23/2021	TX		F	4/8/2021		<p>BLOOD CLOT IN LEFT LUNG; SHORTNESS OF BREATH; DIARRHEA; LEG PAIN; INJECTION SITE PAIN; HEADACHE; SWEATING; DIZZINESS/FEELING FAINT; This spontaneous self-report was received from a patient and concerned a 29 year Black Mexican, White (Hispanic or Latino) old female. The patient's height and weight were not reported. The patient's concurrent conditions included hypertension, latex allergy, allergic to banana, and non smoker. The patient received Covid-19 vaccine ad26.cov2.s (suspension for injection, route of administration not reported, batch number: 205A21A expiry: UNKNOWN) dose was not reported, 1 total dose on left arm administered on 08-APR-2021 (Thursday) for prophylactic vaccination. Concomitant medications included labetalol and nifedipine for hypertension. On 08-APR-2021, when patient received a vaccination it hurt at the time of injection. Later, she developed a headache. At night, she woke up with sweating. She went down to the kitchen and felt shortness of breath and felt faint. On 09-Apr-2021 (Friday), after she woke up, she developed diarrhea all day. On 10-APR-2021 (Saturday), her symptoms were continuing included diarrhea, sweating, dizziness, legs hurting, headache, and feeling shortness of breath. On 11-APR-2021 (Sunday), she felt better, however headache was ongoing. At night, she started feeling bad again. On 12-APR-2021, she woke up with diarrhea and sweating, no symptoms have resolved. On 13-APR-2021, her legs continued to be in pain. At night, she went to emergency room (ER) and have blood work done, showing it was positive for a blood clot. Her computerized axial tomography (CAT) was performed and blood clot in left lung was found. Her doctor said that all other blood work came back normal, and he did not see anything else wrong with her, and that the blood clot was related to the vaccine. He wanted to put her on a blood thinner and prescribed Eliquis (apixaban). Doctor mentioned that if she felt shortness of breath or started feeling dizzy, she must go to the hospital. It was reported that she was hospitalized for 1 day, and both admission and discharge dates were reported 13-APR-2021. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient was recovering from blood clot in left lung, injection site pain, headache, sweating, shortness of breath, dizziness/feeling faint, leg pain, and diarrhea. This report was serious (Hospitalization Caused</p>

The batch number was not reported and has been requested. No concomitant medications were reported. On an unspecified date, the patient experienced venous clot and thrombosis, and was hospitalized (date unspecified). It was reported that the patient was currently hospitalized and the physician was asking for information in regards to anticoagulation therapy. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of venous clot and thrombosis was not reported. This report was serious (Hospitalization Caused / Prolonged, and Other Medically Important Condition).; Sender's Comments: V0: A patient of unspecified age, ethnicity, and sex experienced venous clot and thrombosis an unknown time after vaccine. This was reported by a physician to a company representative. No laboratory values are reported. No clinical history, medical history, medications, or details are reported. There is insufficient information to make a meaningful medical assessment. Additional information has been requested including attempted contact with the treating physician.

1249414	4/23/2021	FL	64	F	3/17/2021		<p>CLOTS ON RIGHT LEG; HEADACHE; PRESSURE ON BOTH LEGS; PRESSURE ON HANDS; This spontaneous report received from a patient via a company representative concerned a 64 year old Hispanic or Latino female. The patient's height, and weight were not reported. The patient's concurrent conditions included high blood pressure and diabetes. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1805029 expiry: UNKNOWN) dose was not reported, 1 total administered on 17-MAR-2021 at left arm for prophylactic vaccination. No concomitant medications were reported. On 17-MAR-2021, the patient had experienced headache after vaccination. On 27-MAR-2021, the patient began to experience intermittent pain on right leg. On 30-MAR-2021, she experienced headache again and was still having leg pain; she visited the Emergency Room (ER) and was admitted on 30-MAR-2021. On 02-APR-2021, the patient experienced clots on right leg. On APR-2021, a catheter was placed in catheterization procedure and her right leg vein was unclogged of a clot. A second clot did not require removal because the vein had already unclogged itself after medication. The patient was administered unspecified anticoagulants. She was discharged on 5-APR-2021 and was prescribed ticagrelor which was then changed to clopidogrel. On 18-APR-2021, the patient experienced a headache again and feeling of pressure on legs and hands. Patient was advised to visit ER. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from clots on right leg and intermittent pain on right leg on 02-APR-2021, recovered with sequelae from headache on 19-MAR-2021, and had not recovered from pressure on both legs and pressure on hands. This report was serious (Hospitalization Caused / Prolonged, and Other Medically Important Condition).; Sender's Comments: V0: This 64 year-old Hispanic or Latino female with history of high blood pressure and diabetes was hospitalized for clots in her right leg 13 days after receiving the Janssen Covid-19 vaccine. Concomitant medications were not reported. On the day of her vaccination, she experienced a headache. Ten days later, she began to experience intermittent leg pain. Three days later (ie, 13 days post vaccination), she went to the emergency room (ER) and</p>

was admitted to the hospital. During the hospitalization, a clot was removed via catheterization and she was administered unspecified anticoagulants. A second clot resolved on its own without surgical intervention. After 6 days in the hospital, she was discharged with ticagrelor which was later changed to clopidogrel. She recovered from the clots. Thirteen days after discharge, she began to experience headache and "pressure" in both legs and hands. She was advised to go to the ER; no further information was provided. Based on the limited information, the relationship of the serious events with Janssen Covid-19 vaccine is considered indeterminant. Additional information is being sought.

1249273	4/23/2021			M		4/8/2021	<p>BILATERAL BLOOD CLOTS IN LEFT AND RIGHT LOWER LUNGS; This spontaneous report received from a patient via a company representative concerned a 46 year old male. The patient's weight, height, and medical history were not reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: unknown, expiry: unknown) dose was not reported, 1 total administered on 05-APR-2021 for prophylactic vaccination. The batch number was not reported. The Company is unable to perform follow-up to request batch/lot numbers. No concomitant medications were reported. On 08-APR-2021, the patient experienced mild chest pain and dyspnea. On 14-APR-2021, the patient visited to emergency room and diagnosed with bilateral blood clots in left and right lower lungs. The patient had no prior medical history of blood clot and pulmonary issues. On 14-MAR-2021, treatment medications included: rivaroxaban. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of bilateral blood clots in left and right lower lungs was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: This is a 46 male patient, unspecified ethnicity who was noted, at the emergency room (ER), to have bilateral blood clots in left and right lower lungs 9 days after receiving the covid-19 vaccine ad26.cov2.s. Weight and height were not reported. Medical history, smoking history and concomitant medications were not reported. Six (6) days prior to the visit to the emergency room, the patient experienced mild chest pains and dyspnea. Patient was sent home from the ER with Rivaroxaban. Based on the available information and considering the temporal causality, this is assessed as indeterminate per WHO causality classification of adverse reaction following immunization.</p>

1248394	4/23/2021	WA	61	F	4/6/2021	4/9/2021	received the vac on 4/6, starting aprox 8th -9th I start to not feel good... just thought is was a mild reaction to the shot... by the 12th I felt terrible, very short of breath and unable to walk with out thinking I was going to die..... waiting as long as I could then I went to urgent care on the 14th and was told I probably have asthma and was given a few medications... on the 18th things were not any better and I no longer could take the pain and not being able to breathe... so I went to the hospital and was admitted to the PPC floor of the hospital after being in the ER. the next morning I had to have a procedure to break up BLOOD CLOTS in my lungs... I spent 4 days in the PPC ward and now home trying to recover from this... I was told my condition was very serious and was lucky I came in... Of course the doctors will not say this was a direct link to the shot ... i never had any problems before and never any blood clots. The doctor who did the procedure told me to make sure I REPORTED IT.... I was released from the hospital on the afternoon of the 21st.. 4 days!
1248534	4/23/2021	PA	64	F	4/5/2021	4/8/2021	I became confused and unsteady. I then fell. My husband helped me up but he knew something was wrong. He called 911 an ambulance took me to the hospital but I was transferred to another hospital. In case I needed surgery. It was touch and go. I was suffering a stroke. A blood clot was also found. I was in the hospital ICU for 3 days then transferred to another room. For another day.
1248592	4/23/2021	WA	70	M	3/13/2021	4/7/2021	I experienced a mini-stroke (TIA) in which my speech was affected and which resulted in me being hospitalized. For about 5 minutes, I was unable to find words and properly communicate. I went to the ER and was admitted and had a battery of tests, kept overnight, and discharged the following day. My statin dose was increased, and I was put on a baby aspirin, in addition to Pradaxa blood thinner. i believe that I may have had a vascular thrombi related to the effect of the medicine/spike protein.
1248330	4/23/2021	LA	65	F	3/9/2021	4/19/2021	Patient has leg cramps starting on Monday, April 19th. She went to the hospital at later date. Doctor diagnosed her with leg clot.

1248713	4/23/2021	NY	47	M	4/6/2021	4/12/2021	patient presented to emergency room with severe headache and blurry vision. diagnosed with cavernous sinus thrombosis
1248862	4/23/2021	NC	58	M	3/15/2021	3/16/2021	Patient flew from city to city through another city on Tuesday 3/16/21. He had a reaction on the flight where he coughed for 1.5 hrs and was hot in the airplane. He could not go to work and was required to get Covid tested on 3/18. Still coughing and having trouble sleeping (laying down). Rapid Covid test negative on 3/18. PCR test results negative on 3/21 from hospital. He continued to grow weak and cough from 3/16-3/21. At 3am on 3/22 he called and said that his feet were 2X their size and having difficulty breathing. Taken to hospital via ambulance. When transferred to ER bed, Dr said that he lost pulse. They intubated and got his pulse back. Died at 5:15am. Autopsy said cardiac arrest. Dr said that they could not maintain a heart beat. He asked me if the patient had a history of blood clots? No he did not ever have a blood clot that I know of. He had a chest xray post mortem showing fluid in his lungs from low circulation of blood.

1249245	4/23/2021			M	3/26/2021		<p>PASSED OUT; COULD HARDLY GET UP; TROUBLE WITH LEFT HIP OR KNEE; LIGHT HEADED; NOT FEELING UP TO PAR; This spontaneous report received from a patient concerned an 85 year old male. The patient's weight, height, and medical history were not reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: unknown, expiry: unknown) dose was not reported, 1 total administered on 26-MAR-2021 for prophylactic vaccination. The batch number was not reported and has been requested. No concomitant medications were reported. On 26-MAR-2021,(on the night of vaccination) patient could hardly get up while he was putting some beer in refrigerator. Since then patient had trouble with his left hip or knee. Few days before 10-APR-2021, patient was light headed and not felt up to par. On 10-APR-2021, the patient was passed out which he never experienced before. On the same day, the patient was hospitalized and checked everything including blood clots in his leg. They did not found anything that could be causing problem. The patient was admitted to the hospital for 3 days. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of the could hardly get up, trouble with left hip or knee, not feeling up to par, light headed, passed out was not reported. This report was serious (Hospitalization Caused / Prolonged).; Sender's Comments: V0: This 85-year-old male patient of unknown ethnicity was admitted in a hospital after "passing out" 15 days after receiving Janssen COVID-19 vaccine for the prevention of symptomatic SARS-CoV-2 virus infection. The patient noted difficulty standing up on h the day of vaccination but attributed it to his hip or knee "trouble". On the day of hospitalization, the patient complained of light headedness and was rushed to the hospital when he was found passed out. The patient reported that the hospital checked everything including clots in his leg but did not found anything that could cause the problem. No laboratory/diagnostic test results were reported; the treatment and outcome was not reported. Based on the information that is available, the event is assessed as indeterminate with the causal association to immunization, per WHO causality classification of adverse events following immunization based on a lack of a definitive plausible biological mechanism. However,</p>

1249271	4/23/2021	VA	72	F	3/14/2021		FAST HEART RATE; BLOOD CLOT IN BOTH LUNGS; ACHY; LOW ENERGY; VERY WEAK; HEADACHE; FEVER; This spontaneous report received from a patient concerned a 72 year old female. The patient's height, and weight were not reported. The patient's concurrent conditions included fibromyalgia. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1805022, and expiry: UNKNOWN) dose was not reported, administered on left arm on 13-MAR-2021 for prophylactic vaccination. Concomitant medications included pregabalin(Lyrica) for fibromyalgia and bad back. The patient reported pregabalin makes her gait off. On 13-MAR-2021, the patient felt okay. On 14-MAR-2021, the patient experienced achy, low energy, very weak, headache, fever of 100 degrees fahrenheit. Laboratory data included: Body temperature (NR: not provided) 100 F. On 13-APR-2021, she had wellness visit. The patient had a fast heart rate. Laboratory data included: Heart rate (NR: not provided) 144 (units unspecified). So immediately her electrocardiogram was taken and she was hospitalized for 2 days in emergency room by ambulance and started running tests. The patient had a computer tomography with dye contrast and it showed blood clots in both lungs. She had many tests, echocardiogram and X-rays. Treatment medications (dates unspecified) included: continuous oxygen via nasal prong (3.2 litre down to 2 litre), warfarin sodium(Coumadin), blood, whole, and rivaroxaban(Xarelto). The patient stated once she had rivaroxaban she felt "free". Currently also had 2 intravenous and taking blood regular. She was also on physical therapy. The therapist came in and made her walk across her room twice according to therapist she did not need oxygen. The patient currently had 2 IV's and taking blood regular. The patient will be discharged with or without the oxygen. The patient has machine on her chest with all kinds of wires. She don't know about her oxygen saturation. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from achy, low energy, very weak, headache, and fever on 15-MAR-2021, had not recovered from fast heart rate, and the outcome of blood clot in both lungs was not reported. This report was serious (Hospitalization Caused / Prolonged and Life Threatening).; Sender's Comments: V0: This is a 72 year old female, unspecified

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							ethnicity, who experienced tachycardia and was noted to have blood clots in both lungs 32 days (around 1 month) after receiving the COVID-19 vaccine ad26.cov2.s on the left arm. Patient had Fibromyalgia and is maintained on Pregabalin (Lyrica). Patient's height and weight were not reported as well as history of smoking, allergies or drug abuse. One day after receiving the vaccine, the patient experienced fever, headache, weakness and pain, which resolved. During a wellness visit after a month from the vaccine, tachycardia was noted and an EKG was done. Patient was immediately brought to the ER, where the CT Scan (with contrast) showed blood clots in both lungs (detailed result not reported). Other tests done were also not reported. Patient was subsequently admitted in the hospital and was discharged after 2 days. The information provided is insufficient to show that the vaccine is causing the event; hence, this is assessed as indeterminate per WHO causality classification of adverse event following immunization. Additional information requested.
1248552	4/23/2021	MA	95	F	4/12/2021	4/23/2021	Developed severe right leg pain within two days after the vaccine. She had confirmed deep venous thrombosis on ultrasound confirmed on 4/23/21 without other known provocation.

1241986	4/22/2021	CA	50	F	3/15/2021	3/15/2021	I had 2 adverse reactions to the Janssen Covid-19 Vaccine EUA: AE #1) Roughly 15 minutes after receiving the vaccination, the lower half of my face went numb for approximately 3 hours. The people who administered the vaccine made me stay at the site for about an hour and a half to make sure that the reaction did not get worse. AE #2) 10 days after receiving the vaccination, the lower part of my left leg began to swell significantly. I went to the emergency room on 4/13/2021. When I was there, they did tests and confirmed that I have a blood clot behind my knee. To treat the blood clot, the emergency room doctor gave me lovenox 110mg and warfarin 5mg. Since then, I have followed up with my primary doctor who has me taking warfarin 10mg ( 1x daily) and lovenox (as needed).
1242013	4/22/2021	NY	73	M	2/20/2021	3/7/2021	8 Days after my 2nd Moderna Shot, Fatty Blood Clots started pouring out of my mouth(about 50 over a 24 hour period) . There was No cause or affect to it- meaning No cough or Nose Bleeding,etc. I went to emerency room on 03/09/2021 and was admitted for testing. While there they ALSO noticed my heart was Pausing. A 3 day ZIO Test was done. It came back extreme with 39 Pauses and a pulse as low as 35 BPM. A Heart Pace Maker had to be placed in me at Medical CTR on 04/20/2021.
1242195	4/22/2021	SC	63	M	4/10/2021	4/12/2021	Took my last shot of Pfizer on 4/10/2021 at 10:00 AM and on4/12/2021 started having shortness of breath,tiredness, and chest pains this continue on until 4/15/2021 while I was at work at 6:15 PM my wife had to be called to come pick me and take me to the hospital where they did a Cat scan and discovered that I had Blood Clots In both Lungs and had to remove them at that time in order to save my life
1241772	4/22/2021	NC	60	M	3/26/2021	3/31/2021	I have severe swelling in both legs from knee to my feet, severe itching and hives, legs have blistered and burst open. I also have a Blood clot in my lower left leg. Have tried 2 kinds of antibiotics, I am on Xarelto 10 mg tab for the blood clot

1242493	4/22/2021	IA	45	M	3/13/2021	3/16/2021	On March 13, I received the Johnson & Johnson vaccine at the clinic. The pharmacist monitored me for symptoms but there were none right away. I did have a fever and some body aches in the two or three days that followed but those were short-lived. While driving on March 16, I started experiencing some irregular breathing and periods of shortness of breath about three hours after leaving home. I stopped at the emergency room at the Health Center where Dr diagnosed me with an acute pulmonary embolism after discovering a small blood clot in one of my lungs. He prescribed me with Eliquis, which I am still taking today. Their phone number is provided if you have questions. I haven't had too many shortness of breath episodes lately but do not know if the blood clot is still there. I am scheduled to see my hematologist on April 27 to get further updates on this. My hematologist Dr is located in clinic number provided While it has not yet been proven that the vaccine caused the blood clot in my lung, I feel the need to report this in the wake of recent news about the Johnson & Johnson vaccine. My hematologist and primary care physician are both aware that I have received the vaccine but I have not received any further communication from them.
1242553	4/22/2021	OH	71	F	3/9/2021	3/30/2021	~~I received the Johnson and Johnson Covid vaccine on March 9th. On March 30 I was admitted to the hospital with excessive blood clots in my right leg and right lung. My Pulmonary Dr felt I should report this to you. I did have blood clots last year and recently ( February 8th) had back surgery both circumstances could of contributed to the issue. If you need any further information or have questions please do not hesitate to contact me.
1242561	4/22/2021	OH	69	F	3/30/2021	4/19/2021	Patient presented for the outpatient procedure of a cataract extraction. Found to be hypertensive and very short of breath. Sent to primary care physicians office who in turn ordered a CT scan. Found to have Pulmonary Embolism and Deep Vein Thrombosis

1240530	4/22/2021	CA	53	F	4/9/2021		<p>SHORTNESS OF BREATH; OUT OF BODY FEELING; EPIGASTRIC PAIN; POSSIBLE RHEUMATOID ARTHRITIS FLARE; STINGING IN THE RIGHT ARM; This spontaneous report received from a patient concerned a 53-year-old not Hispanic or Latino white female. The patient's height, and weight were not reported. The patient's concurrent conditions included rheumatoid arthritis, gastroesophageal reflux disease (GERD), hashimoto's thyroiditis, possible sjogren's, penicillin allergy and sulfa drugs (sulfonamide) allergy, and other pre-existing medical conditions included opiates allergy causing rash. The patient experienced drug allergy when treated with Azithromycin, Ciprofloxacin and Levofloxacin for an unknown indication. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 043A21A, expiry: UNKNOWN) dose was not reported, administered on 09-APR-2021 in right deltoid for prophylactic vaccination. Concomitant medications included Acetylsalicylic acid (Aspirin) to prevent blood clot, and Prednisone for an unknown indication. On 09-APR-2021, the patient experienced stinging in the right arm for a few seconds while getting the vaccine shot, then pain in left arm, stomachache in the night, profound weakness in the legs, heaviness in both legs and both arms, shortness of breath, out of body feeling, severe pain in the epigastric area. It was reported that vaccine could have triggered a rheumatoid arthritis reaction in legs hands, feet and arms. The feeling of weakness and heaviness in the arms and legs were still on going, and the reaction with Aspirin occurred about 30 minutes ago but became better once she took a liquid antacid. The patient took the Aspirin to prevent clots because she was on prednisone, which was read on the news that blood clots may form after getting the vaccine. She attributed the heaviness of the arms and legs as a possible rheumatoid arthritis flare. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from stinging in the right arm, and epigastric pain on an unspecified date in APR-2021, was recovering from out of body feeling, and had not recovered from shortness of breath, and possible rheumatoid arthritis flare. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: 20210421350-covid-19 vaccine ad26.cov2.s-possible</p>

1242735	4/22/2021	NE	28	M	4/10/2021	4/20/2021	ED NOTE is as follows...from 4/21/21 @ 21:47 a 28 y.o. male who to the emergency room with reports of a headache for the last 48 hours. He reports this as being one of the worst headaches he has ever had. He was seen at urgent care and given Toradol, Zofran and Benadryl and still rates his pain an 8 out of 10. He does feel pressure behind his eyes. And reports vomiting in the parking lot at urgent care. He denies abdominal pain back pain, neck pain, shortness of breath, chest pain, numbness or tingling or any other worsening concerns. Reports that he did receive a recent Johnson & Johnson vaccination. Patient states he does vape. He occasionally drinks alcohol he denies any illicit drugs. Patient denies any head trauma. Diagnosis management comments: This is a 28-year-old male arrives to the emergency room with reported migraine headache for the last 48 hours. He did report that he was go to urgent care in which he received a migraine cocktail of Zofran, Benadryl and Toradol. Patient reported that his headache was not resolved so urgent care sent him on for further evaluation. Patient upon arrival had a negative neurological exam however he did report that he had pressure behind his eyes. Was unable to see any papilledema on fundoscopic exam. Check patient's pressures bilaterally and they were 21 and 18. Patient did report to me that this was the worst headache of his life. I did administer IV fluids here as well as Tylenol and morphine. Patient did report some improvement. Patient did report in his past medical history had a recent Johnson & Johnson vaccination. A CBC and CMP was obtained. Did have thrombocytopenia with a count of 66. Since my exam was PERRL with normal extraocular movements. He had no eye redness or eye pain. Of low concerns for any iritis or uveitis. Patient's patient CT of his head did show a abnormal CT that had a dense appearing superior sagittal sinus that was representing a venous thrombosis. Radiologist did recommend a MRI MRV. An MRI and MRV was ordered. Patient MRI MRv did show findings are consistent with a venous thrombosis involving the right jugular right transverse sinus and superior sagittal sinus there is also a patchy edematous change within the subcortical white matter areas bilaterally and symmetrically. There was no CVA. With patient's reported migraine headache. Reported blurred

1241572	4/22/2021	NY	41	F	4/9/2021	4/13/2021	My period was supposed to start on 04/09 the day I got the vaccine. It was delayed until 04/13 when it began to bleed BLACK clotty sticky sludge. It had the appearance and consistency of vegemite or molasses. Black sludge. At first it was extremely heavy with very large black clots. Then it became tiny little black clots suspended in a brown sludge. This continued for 6 days until 04/18. Then on 04/19 my menstruation turned bright red with no clots, but has not abated at all for another 4 days. I am currently today on Thursday 04/22 still bleeding almost 2 weeks after taking the J&J shot. I cannot believe I am still bleeding after 10 full days!!! Never in 30 years of menstruating have I had a 10 day period. I am very scared and upset.

1241054	4/22/2021	PA		F		4/14/2021	<p>BLOOD CLOT IN LEFT CALF; This spontaneous report received from a patient and concerned a female of unspecified age. The patient was called to obtain additional information on 21-APR-2021 and message was left on a voicemail. The patient's height, and weight were not reported. The patient has no family history of thrombosis. The patient does not have any underlying conditions. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: unknown) dose was not reported, administered on 13-MAR-2021 for prophylactic vaccination. The batch number was not reported and has been requested. No concomitant medications were reported. On 14-APR-2021, the subject experienced blood clot in left calf. The patient noted that she did not have any underlying conditions or family history that may have made her more predisposed to this diagnosis. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient had not recovered from blood clot in left calf. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: This spontaneous report concerns a female patient of unspecified age who experienced a blood clot one day after Janssen COVID-19 vaccine was administered for prevention of symptomatic SARS-CoV-2 virus infection. The patient's height, and weight were not reported. The patient has no family history of thrombosis and has not reported any underlying conditions. No concomitant medications were reported. The patient did not provide details related to the blood clot, except it was not resolved at the time of the report. Given lack of alternative explanation and temporal plausibility the event is considered possibly related to Janssen COVID-19 vaccine.</p>

1241062	4/22/2021	NY	43	F		4/1/2021	EXHAUSTION; PAIN IN ARM; SCABBY RASH/RASH ON BACK/UPPER AND LOWER ARM/LEG; ITCHY RED RASH ON BACK/UPPER AND LOWER ARM/LEG; This spontaneous report received from a consumer concerned a 43 year old female. The patient's height, and weight were not reported. The patient's concurrent conditions included asthma, and tiny clot in lung. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, and batch number: 042A21A expiry: UNKNOWN) dose was not reported, administered on 09-APR-2021 for prophylactic vaccination. No concomitant medications were reported. On APR-2021, the subject experienced itchy red rash on back/upper and lower arm/leg. On APR-2021, the subject experienced scabby rash/rash on back/upper and lower arm/leg. On 09-APR-2021, the subject experienced pain in arm. On 10-APR-2021, the subject experienced exhaustion. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from exhaustion on APR-2021, was recovering from scabby rash/rash on back/upper and lower arm/leg, and the outcome of pain in arm and itchy red rash on back/upper and lower arm/leg was not reported. This report was non-serious.
1241112	4/22/2021	CA	51	M	4/1/2021	4/9/2021	I experienced "Moderna Arm" on the day following the injection, but it subsided after a couple of days. Eight days later, though, it returned (swelling/redness/milder pain) -- accompanied by swelling in my right ankle and tightness/some tingling/mild pain in my right ankle/upper calf. I suffered a blood clot for the first time in each leg in early November; the more serious of the two was in the vicinity of my upper calf in my right leg. In December, I began to experience sensations in my right ankle that were similar (albeit more intense) to what I later experienced after my vaccine; the post-vaccination symptom in my right calf was also similar (but milder) to what I had experienced from the DVT.

-----------------	--------------	--------------	----------------	------------	-----------------	-------------------	---------------------

Patient was on Clopidogrel bisulfate but was asked to stop on the day he was diagnosed with the blood clot. Other concomitant medications include: amlodipine, metformin, and vitamin B complex,. Indication for all medications being taken is unknown. Age and obesity (BMI = 34.5 per weight and height provided) are known risk factors for developing blood clot in the lower leg. Having a stent and concomitant medication suggest a cardiac problem. Based on the available information and considering the temporal relationship, the events of left leg calf pain and blood clot are assessed as indeterminate per WHO causality classification of adverse events following immunization.

1241226	4/22/2021	MI	52	F			<p>CEREBRAL INTRACRANIAL HYPERTENSION WITH FREE FLUID IN BRAIN BEHIND EYE; FLARED UP ARTHIRITIS; This spontaneous report received from a patient and concerned a 52 year old, White, not Hispanic or Latino, female. Initial information was received on 16-APR-2021 from the patient, with additional information received on 20-APR-2021 from the patient. The patient's weight was 170 pounds, and height was 65.5 inches. The most recent body mass index was 27.9. The patient's family history included rheumatoid arthritis in father, and concurrent conditions included arthritis (possibly rheumatoid arthritis), chronic back pain, and hip pain. The patient was due for a surgery, but it was cancelled due to pandemic. She had no history of headaches or migraines. Patient received several unspecified vaccines (had several vaccines 3 years ago before trip ) with no problems. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1805020 expiry: UNKNOWN) dose was not reported, administered on 15-MAR-2021 on right arm for prophylactic vaccination. Concomitant medications included acetylsalicylic acid 81 mg, daily, ascorbic acid, ergocalciferol, metaxalone, oxycodone, and zinc. The patient concurrently receives spinal/epidural pain injections every two to three months. Approximately 16-30 hours after the vaccination, she had a flare up of her arthritis (left hip, L3, L4, L5, sciatic pain on the left side going all the way down to her knee, ankle, and foot, where her normal arthritis hurts daily). Pain medication did not help. She also developed migraines which caused pain behind the left eye similar to severe sinus infection, light sensitivity, her face felt tingly and numb in her temples and cheeks (left side). She was concerned about a stroke, but did not have droopiness and could smile on both sides. On 29-MAR-2021 (day 14 post vaccination), the patient went to her pain specialist to receive her spinal/epidural pain injection because she was in a lot of pain and she was "overdue". In retrospect, the patient wondered if she should have waited longer after having received the vaccine before doing so. On 30-MAR-2021 (day 15 post vaccination), she awoke and was blind for several (12 - 14) hours. She thought she had a stroke and took 4 baby aspirins. She was rushed to the hospital and was hospitalized on 30-MAR-2021. After the initial 2-3 hours that she was completely blind, it</p>

----------	-------	-------	---------	-----	----------	------------	--------------

would come back within minutes. The vision came back in halos. It was blurry but if she moved or bent down, it would go again and then it would come back very quickly. Several tests were performed. The MRI (Magnetic resonance imaging) did not show clots, stroke, or tumors, but showed intracranial hypertension. After the CT and MRI, a lumbar puncture was performed (results not provided). The patient said that the hospital noted cerebral intracranial hypertension with free fluid in her brain behind her eye. In the hospital, bloodwork was normal except for her triglycerides which were high. Patient reported that her platelet levels which were "perfect" and provided "318" as a specific example. She was discharged on 01-APR-2021. Corrective treatments included: steroids in the hospital for the intracranial hypertension and prescription strength aspirin 325 mg. The patient was not certain if injectable blood thinners were given to her in the hospital. She was discharged with methylprednisolone, alprazolam, twice a day prn to treat her headaches, aspirin 325 mg daily, and rosuvastatin 5 mg, daily, for high triglycerides. After patient was discharged, she had 2 episodes of lightheadedness with the blindness. The first one lasted about 5 minutes maximum and the second one on 12-APR-2021 lasted approximately 30-40 minutes. She had to be sitting down and her vision returned in halos with a lot of fireworks like bright stars. The patient had ringing in the ears, especially the left ear and when she had these episodes. On 14-APR-2021, the patient patient went to PCP (primary care provider). She stated that alprazolam helps her headaches. On 20-APR-2021, she had a "good day", did not experience headaches, and did not take alprazolam. She will follow up with a neurologist and an ophthalmologist. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of the cerebral intracranial hypertension with free fluid in brain behind eye and flared up arthritis were not reported. This report was serious (Hospitalization Caused / Prolonged, and Other Medically Important Condition).; Sender's Comments: V0: This 52 year-old White female was hospitalized for intracranial hypertension 15 days after receiving the Janssen Covid-19 vaccine. Medical history includes an unspecified arthritis with chronic left hip and back pain for which she receives epidural injections every 2-3 months, and a body mass index of 27.9. She

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

has no history of migraines or other headaches and has tolerated multiple vaccinations previously. Concomitant medications include acetylsalicylic acid 81 mg daily, metaxalone, and oxycodone. Approximately 16 hours after vaccination, she experienced a flare of her arthritis which her pain medications did not relieve. The next day, she began to experience migraine headaches which were associated with pain behind her left eye and sinuses, left-sided facial tingling and numbness without weakness, and light sensitivity. Fourteen days post-vaccination, she received an epidural injection because she was in a lot of pain. The following morning, she awoke and experienced visual disturbance, described as "complete" blindness. then return of vision with halos and blurriness, and intermittent loss and return of vision depending on her body position. She took 4 baby aspirins, went to the hospital, and was admitted. MRI showed intracranial hypertension but no clots, stroke, or tumors. A lumbar puncture and CT scan were also performed. Blood tests, including platelet counts (e.g. 318), were normal except for high triglycerides. She was treated with steroids and aspirin 325 mg and was discharged 2 days later. She was given methylprednisolone, oxycodone-acetaminophen and alprazolam prn for headaches, aspirin 325 mg, and rosuvastatin for high triglycerides to continue at home and will follow up with a neurologist, ophthalmologist and her primary physician. Based on the available information, the relationship of intracranial hypertension with Janssen Covid-19 vaccine is considered inconsistent.

1241351	4/22/2021	NJ	60	M	4/1/2021	4/11/2021	10 days after the shot, my blood pressure rose to 198/112 and my pulse went to 161. and i called 911 and went to hospital. i had a severe headache for 3 days leading up to calling 911. finally on the April 1st, i went to hospital. i had a lump on my right shoulder never there before and i felt like the lump was causing my right side of my face to be numb. The hospital refused to believe me that i had some blood clot, they downplay the incident and instead gave me a brain CT SACN and brain MRA which was negative, they kept me for observation overnight and let me go noon the next day. since i have had follow ups with my regular doctor, a cardiologist and my nephrologist. I know that reaction was due to medication, either way glad i got the shot. BUT Since this time, I am retaining water, i know this because my rings do not fit anymore, rings i had for 20 years, never ever once had a hard time to put on or remove. I know my body, thats not the worse of it. i test my blood pressure every day at requesting of my kidney doctor, since the incudent of my pressure 198/112 my diastolic on average is raised 20 points. I log this daily. here are some examples from before the medication 111/67 , 109/63 , 129/64 , 105/62 120/81. now my pressure is totally different for example, 155/88 150/91 157/90 , 134/88. nothing else changed in my life, I am exactly the same as before only now i have covid shot.. yesterday i saw the 4th doctor since i am shot up and she gave me a new pill olmesartan medoxomil, only on it one day but my diastolic pressure is still much higher than before. i dont want to die, i dont want a stroke, or a heart attach, i have a lot to live for still. nobody is helping me, doctors are just throwing pills at me and not treating root cause which i feel strongly to beleive it is from covid shot.

The patient's height, and weight were not reported. The patient's concurrent conditions included dairy allergy, wheat allergy, and gluten allergy, and other pre-existing medical conditions included the patient had give birth 4 times with healthy delivery. The patient never got a clot before, not overweight. The patient was not pregnant at the time of report. The patient was non-smoker and alcohol user. The patient did not have any drug abuse/illicit drug use. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, and batch number: 1802072 expiry: UNKNOWN) dose was not reported, administered on 11-MAR-2021 on left arm for prophylactic vaccination. No concomitant medications were reported. On 17-MAR-2021, the patient experienced consistent pain (pain to touch ) while waking and resting in right calf muscle. She did not take anything for that pain. The patient had no swelling. She had normal temperature. On 13-APR-2021, the patient went to MD for D-dimer to be measured because her physician recommended to do so since she was going to have a long flight on 14-APR-2021. The physician had a concern for having a blood clot. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from consistent pain while waking resting in right calf muscle on 23-MAR-2021. This report was non serious..
1242711	4/22/2021	UT	57	F	4/8/2021	4/12/2021	Soreness in my legs - I have blood clot history in my family and was worried. I went to see my doctor. - 14th. He did a visual exam. He said I was developing immunity because the vaccine was working. On the 19th, in the middle of the night, I had diarrhea and wasn't feeling well at all. I had diarrhea for 18 hours - and I was sleeping and running a fever but it didn't go over 101: It was at 99 - 100.5. Diarrhea stopped yesterday -I was eating BRAT (bananas, rice, applesauce, toast) - no caffeine - diet. But this morning, I work up with diarrhea again and I have had diarrhea three times already today. I've had a ringing in my ears that started two days ago and it's still there.

1244754	4/22/2021	LA	49	F	4/1/2021	4/4/2021	On the 4th day following the vaccine I woke up with swelling in my left armpit about the size of a golf ball. Achiness on the left side of my face, neck and shoulders that lasted till the 8th day. By the 14th day, the swelling in my left armpit had shrunk to the size of a large acorn with an enlarged vein like tissue protruding down my inner armpit. This area was still sore. On Day 21st I saw a doctor who suspected a blood clot and ordered an ultrasound at the hospital and blood work. After an ultrasound for approximately an hour the technical did not detect a blood clot and sent me home. The doctor phoned me to tell me they did not find anything and that if the pain and swelling continues I could see a surgeon to have the enlarged area surgically removed.
1244714	4/22/2021	OH	33	F	4/10/2021	4/10/2021	by 4:45 pm I felt off. By 6:30 pm I felt like I couldn't move very well. It affected all the bones I have ever broken or sprained before. Had cold chills, my temperature was 95.1. I felt like my blood pressure was high. I had a bad headache and took advil. April 11th I still felt off and had a headache. Around 4:30 pm I had rectal bleeding. Wednesday April 14th I had very bad leg pain in my right leg. Friday April 16th I went to urgent care for Leg pain and slight chest pain. They sent me to the ER. I had a chest Xray and ekg done and both came back normal. I was able to have a vascular ultrasound Monday April 19th in right leg and it showed no blood clots. I still have leg pain April 22nd.

1236887	4/21/2021	TX	82	M	4/8/2021	4/10/2021	Extreme lower extremity swelling and pain. Evaluated in PCP office on 04/22/21, ultrasound of right LE was negative for blood clot. Patient's symptoms worsened and PCP referred patient to ER on 04/16/21 and CT of chest revealed 3 clots in the lungs. Patient was admitted to hospital and stated on heprin therapy. Still currently inpatient awaiting approval to transfer for inpatient rehab due to decreased endurance and bilateral lower extremity pain which is affecting ability to ambulated without assistance.
1236952	4/21/2021	AZ	62	F	4/14/2021	4/15/2021	18 hours after my 2nd moderna vaccine, I experienced slurred speech. When I arrived by car at my destination, I checked into a motel, looked into the mirror and noticed my left side of my face was drooping. I knew this was sign of stroke. I called 911 right away. I was taken to hospital. They did a CBC the night I arrived and the next day as well. They did 2 cat scans with and without contrast. Dr. in the ER determined that I had suffered a Transient Ischemic Attack which was brought on in less than 24hours of the 2nd Modern vaccine shot, and that the TIA was from the vaccine. The cat scans did not reveal any blood clots at the time of the scans. Dr. concluded that they had broken up quickly and that was why he diagnosed me with TIA.

1235767	4/21/2021	MD	20	F	3/20/2021	3/20/2021	small clot behind my left knee; left foot had swollen; This is a spontaneous report from a contactable consumer (patient). A 20-year-old female patient received BNT162B2 (lot number: ER2613) first dose on 20Mar2021 10:15 on left arm at single dose for COVID-19 immunisation. Medical history and concomitant medications were none. Patient is not pregnant. No other vaccine in four weeks. No Covid prior vaccination, No known allergies. She took the vaccine around 10:00am and around 6:00pm (also reported as 06:30 PM) she noticed that her left foot had swollen. She consulted with her general physician and he requested that patient did an Ultra Sound exam of her left leg. The result of the exam reported a small clot behind her left knee. Therefore, doctor suggested that she reported these events to Pfizer so an evaluation is made to identify if similar events have occurred with other patients. She was concerned if she should take the second shot on 17Apr2021. AE resulted in Doctor or other healthcare professional office/clinic visit. Patient received Eliquis 5mg (two times daily) as treatment. Patient had Nasal Swab on 01Apr2021 and tested negative. The outcome of the events was not recovered.
1235740	4/21/2021	CA	60	F	3/4/2021	3/4/2021	I fainted; blood clots; light headed; I lost all color and my skin was wet and clammy; I lost all color and my skin was wet and clammy; This is a spontaneous report from a contactable consumer. A 60-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) lot number: EN6199, via an unspecified route of administration, administered in right arm on 04Mar2021 15:00 as single dose for Covid-19 immunisation. Medical history included known allergies to Atovaquone/proguanil. Concomitant medications were not reported. On 04Mar2021, approximately 10 minutes post vaccine, the patient fainted in the waiting area. She was told by a witness that she fainted two times. EMTs administered an IV and did a simple EKG. The patient lost all color and her skin was wet and clammy. EMTs were concerned about her heart and transported her to the ER where she had a full EKG and lab work for D-Dimer to consider blood clots. The patient has remained lightheaded for weeks after the vaccine. The outcome of the events was recovered with sequelae.

(abnormal) revealed blood clots. On 15-Apr-2021, International normalised ratio: low (Low) Low. It was reported that the patient still has difficulty with memory recall, brain fog, headache, and still having trouble with low INR. The patient did not have any side effects after the first dose. Treatment for the events included Levonox injections and Coumadin (increased dose). Based on the information provided which includes a strong temporal association between the use of mRNA-1273 vaccine and onset of the reported events, excluding other etiologies causal relationship cannot be excluded. Headache is consistent with the product known safety profile.;

Sender's Comments: Based on the information provided which includes a strong temporal association between the use of mRNA-1273 vaccine and onset of the reported events, excluding other etiologies causal relationship cannot be excluded. Headache is consistent with the product known safety profile.

1235625	4/21/2021	IN	22	F	4/16/2021	4/16/2021	Consistent headache - Tylenol or Excedrine relieved Heavy period - began 4 days early. Excessive blood clots and amount of blood. Left arm pain- unable to move arm without pain x 3 days. Tylenol relieved Fever- began 2 days after. Tylenol reduces fever.
1235593	4/21/2021	IA	46	F	3/5/2021	3/21/2021	I received the Janssen vaccine on 3/5/2021. My first menstrual cycle after the vaccine, which started on 3/21/21, was significantly different than any other period. I woke in the middle of the night to extreme pain in my abdomen and bled along the floor as I walked to the bathroom. There were clots in the blood in addition to extraordinarily heavy blood flow. The period was so significantly different from any other that I scheduled an appointment with a nurse practitioner that works with my primary care doctor. I asked her to "run" all tests that were available and approved by insurance, which she did. All came back normal. Due to the significant difference in my period this month, the ARNP requested an inner-uterine ultrasound which found the below:

1235798	4/21/2021			F			Blood clots in legs where old injury was; This is a spontaneous report from a contactable consumer (patient). A 83-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), first dose via an unspecified route of administration on an unspecified date (Batch/Lot number was not reported) as SINGLE DOSE for covid-19 immunisation. Medical history included patient had an old leg injury several times in the past, which was fine. The patient's concomitant medications were not reported. The patient experienced blood clots in legs where old injury was on an unspecified date with outcome of unknown. Received call from consumer who stated she had a speech impediment. She was calling about the Pfizer COVID vaccine. She had the 1st shot. She had an old leg injury several times in the past, which was fine. This time it had big blood clots that appeared since the vaccine. She was afraid to go for second shot. She would like some guidance about getting second shot because she was afraid to go get it. Unable to confirm if speech impediment was prior to receiving vaccine or after. No further details provided. Information on the lot/batch number has been requested.

1238918	4/21/2021	VA	33	F	4/10/2021	4/18/2021	Patient developed unexplained bilateral bruising behind both knees eight days following vaccination. Does not have a history of bruising so visibly nor a history of blood clots. Bruises started off very red, slightly itchy and scattered. Over the next few days, the bruises darkened purple and merged closer together. Bruising was much more severe on the left leg than the right. Bruising has become less apparent over time.
1238925	4/21/2021	NC	47	M	3/16/2021	4/15/2021	Pt experienced pain/cramping in his right leg on or about 4-15-21. Thought this was due to new work shoes. Pain continued through the weekend and on Monday 19th visited his PCP where a scan was preformed confirming a clot in his right leg between his thigh and ankle. Pt started on therapy and has a follow up with his physician on Friday 23rd. Pt doing well and in good spirits.
1238583	4/21/2021	MS	70	F	3/31/2021	4/6/2021	States she developed leg pain 6 days after shot and didn't think it was anything to worry about until she saw the J&J blood clot news and decided to get checked. Had appt and ultrasound on 4/19/2021 with NP. Found to have two non-occlusive, small blood clots in the right leg.
1239001	4/21/2021	CO	57	M	3/22/2021	4/21/2021	Day following shot it felt flu like, days following shortness of breath, stopped to rest and catch breath. 04/04/21 after getting coffee in hotel I could not regain my breath, became pale, sweaty and chilled. Was taken to emergency room, given oxygen and CT was taken of lungs, CT showed numerous blood clots throughout lungs with two larger at the bridge between, one on either side. Was give oxygen to help breathing, given Heparin to stop clot growth and T___ (something) to dissolve clots. Morning 04/05 was taken off oxygen and that evening clot medication was removed. Discharged morning 04/06 and put on Eliquis and to be reevaluated in three months by PCP. Sometime in the spring of 2020 I was asymptomatic for COVID, it was not until June last year until I knew after donating blood and it was test for COVID antibodies and I was positive.

1239026	4/21/2021	CA	51	F	4/9/2021	4/9/2021	Felt slightly dizzy or "woozy." It came and went for about 45 minutes as I sat in my car in the parking lot after vaccination. After about an hour, it completely subsided and I didn't feel dizziness anymore. I did not receive any treatment for this. Also, on the fourth day after vaccination (April 13), I felt pressure/tightness in my chest. Because the blood clot cases had been publicized, I called my doctor, who advised me to go to the emergency room of our local hospital. They gave me an EKG, which looked fine, and said they thought the tightness might be related to my asthma (although that is not a symptom I have ever felt with my asthma before, which usually manifests as slight wheezing). The chest tightness lasted about two days and then went away completely without treatment.
1239051	4/21/2021	NM	63	F	3/1/2021	4/1/2021	2 weeks and 2 days after receiving the vaccination I had a blood clot blown from my nose no before issues with a bloody nose and not after it was a large blood clot there was not any continued bleeding before or after. Also where the shot was given is still sore in that area and does not seem to get better this is my right arm I am exercising and not any improvement.
1237543	4/21/2021	OR	37	F	4/7/2021	4/7/2021	Patient developed palmar digital vein thrombosis in 4th digit of left hand
1239125	4/21/2021	NE	67	M	4/12/2021	4/21/2021	Patient admitted with DVT, acute occlusive venous thrombosis in the left posterior tibial and peroneal veins.
1239231	4/21/2021	FL	54	M	4/7/2021	4/17/2021	I went to the ER on 4/17/21. Had Pulmonary Embolism in both lungs. I was in the hospital 3 days. I have no personal history of blood clots and no family history of blood clots. Now I must be on blood thinners the rest of my life, because the science does not know? I understand from the doctors that 4 out of 1,000,000 cases are happening with the Pfizer vaccine. Why is this information not being released to the public? I almost died from the Pfizer vaccine and am not permanently disabled by it.
1239772	4/21/2021	WA	67	F	1/30/2021	4/9/2021	After an arterial catheterization, a blood clot developed in my forearm, about an hour later.

1237959	4/21/2021	ID	62	M	3/12/2021	3/19/2021	Superficial vein thrombosis in left thigh that was reported to a primary care provider on 3/19, 6 days after the vaccine was given.
1238060	4/21/2021	NV	62	F	4/9/2021	4/9/2021	4-9-21 vaccination Later that evening, I basically feeling 'outside of myself' like my 'spirit left my body'. Took me a week to feel like myself. I had the headaches, felt sluggish, lethargic for a week. I was unable to do normal daily activities. I went to see my PCM on 4-12-21. He did some medical tests / labs. Results were negative for clots. They said I have a cyst on the back of my leg. Waiting on results of my MRI. *HA are ongoing.
1238450	4/21/2021	MN	37	F	4/9/2021	4/12/2021	Thrombosed Hemorrhoids. Extreme pain, bleeding. Went in to urgent care after 3 days and they cut them open to remove blood clots. There was no clear event that triggered these to appear.
1238510	4/21/2021	WI	26	F	4/9/2021	4/11/2021	On Sunday morning i woke up to my left arm being swollen, red, hot to the touch. Over the course of the next few days the swollen part got bigger to the size of a baseball Tuesday I called my doctor and they wanted me to get seen right away at the ER. They did an ultrasound right away and they ruled out a blood clot and an abscess. They figured it would just be an infection. They put me on an antibiotic for 7 days up to 4x a day. Today 4/21 I took my last dose of the 7 days. Called my doctor and they are starting me on another 5 days of antibiotic to get rid of this infection in my arm. It is now down to a quarter size or a little bigger. Hoping that in the next 5 days it will be completely gone. I don't have the redness and heat anymore just a smallish lump.

1238341	4/21/2021	FL	64	F	4/7/2021	4/17/2021	<p>Patient claims "3 days" after vaccination she developed headache that worsened over the next two days to include dizziness, photophobia, scotomata. However, the state tracking system lists her date of vaccination 10 days prior to the symptom onset. Below is a more detailed description: This is a 64-year-old female nurse practitioner with coronary artery disease, uncontrolled (untreated) type 2 diabetes, obesity, and remote history of kidney donation who presented yesterday with a 5-day history of nausea and frontal headache with new recent dizziness /lightheadedness when standing. She describes her headache as starting out as temporal and periorbital and then persisting as a frontal discomfort radiating to the back and down the neck. Associated with this were complaints of blurry vision, photophobia and scotomata. She denies any focal weakness or numbness/tingling. There was no vomiting or reports of seizures. She denies no recent problems finding words or bouts of confusion. She denies a history of arrhythmia or palpitations. Patient received the first dose of the Moderna COVID-19 vaccination on 4/14/2021 into her right arm, 5 days prior to admission (But state records list 4/7/2021 as the date). She did not take any medication to pre-empt side effects such as NSAID, aspirin, H2 blocker, or Tylenol. Initially she developed a sore arm the night of the vaccination. Three days later the headache developed that did not respond to Tylenol PM although it helped her sleep. She noted taking more than the recommended dose and had mouth dryness. Patient denies any past history of COVID exposure and any illness c/w COVID where she was not tested. She has never had her antibody titer checked. She recently had a dental procedure for an exposed nerve and had a temporary filling placed. No antibiotics were given and denies having a dental abscess. She described that one of her sisters developed "blood clots from her heart due to atrial fib" after her Pfizer vaccination. She denies rashes or stigmata of endocarditis, no fevers, chills, or night sweats. She describes vaginal itching a few days ago and self treated with an anti-yeast cream (Monistat) that relieved symptoms and does not currently have dysuria, frequency or urgency. On admission, her UA was abnormal and culture is pending but she received one dose of Rocephin and is still without urinary symptoms. After admission CT scan and MRI of the</p>

1238201	4/21/2021	TX	42	F	2/4/2021	4/7/2021	On 4/7/21 patient was unable to go to work due to fatigue. She was sent home from a free-standing ER who reported she most likely had a viral illness. She passed out getting into the bathtub and presented to Hospital. At this hospital her chief complaints were excessive fatigue, myalgia, fever, chills. She was diagnosed with TTP with portal venous thrombosis. She was refractory to high dose steroids, plasmapheresis, and rituximab x2. She is now set to begin treatment with caplacizumab and is currently on day 12 of hospitalization.
1233380	4/20/2021	MN	61	M	3/4/2021	3/9/2021	Client's wife called and reported that client had a heart attack 5 days after receiving the vaccine. He also had blood clots.
1233671	4/20/2021	FL	75	F	2/1/2021	3/1/2021	Developed increased weakness and was admitted to Hospital. Was treated with plasmapheresis and during treatment developed acute psychosis and paranoid delusions. Was transferred to the Geriatric Psychiatry Unit at Hospital in for further treatment. Around a week into that admission, she had a dramatic neurologic change and was found to have extensive dural vein thrombosis with ischemic and hemorrhagic events. She was started on heparin drip and sent to Unit for thrombectomy that was unsuccessful. She is currently intubated and comatose with plans for compassionate withdrawal of care soon. Family wanted this sequence of events to be related to the appropriate authorities to investigate if there is any link to the initial vaccination.

1233094	4/20/2021	FL	75	M	4/8/2021	4/8/2021	It started with a familiar reaction and that was I had tingling and pain in my feet it started with both feet and it was significant, like when the feet goes to sleep and it is coming back and you feel the pins and needles feeling, and it was exactly what I get with CIDP. It moved from both feet up to both hands and I was not really afraid because that is what happens with CIDP when your auto immune system is stimulated. I get numbness on my feet and in my hands. I thought that the vaccine stimulated my immune system. The CIDP has been in remission and maybe the shot has stimulated my nervous system. The other day I noticed that when taking the hot plate from the microwave it was hot but I did not feel it at all. I thought the food has not heated up, when my wife touched the plate she said it was very hot and I did not feel the plate hot at all. I also felt pain in my left foot to a point that I am not ambulatory. The pain is so extreme in my left foot if I try to stand up. I have been in my bed for the last 2 days. I am not sure if it is the CIDP or GOUT that is attacking my foot but it has been triggered by the vaccine. I also have severe pain in my left leg. I called my cardiologist and I have a phone consultation with him today to check for clot formation. The pain has subsided a bit today, but yesterday the pain in my leg was very intense. I also had pain at the injection site and felt a little feverish since yesterday around 3PM and it went to 101F and this morning I am fine again. I did not take anything for it and this morning I woke up and I felt well (in regards to the fever). I did not have fever before then.
1233017	4/20/2021	NC	29	F	3/8/2021	3/27/2021	Patient developed a cerebral venous sinus thrombosis diagnosed on 3/27/21 after receiving the moderna covid vaccine on 3/8/21
1233121	4/20/2021	MN	58	M	3/12/2021	3/22/2021	Received shot on 3/12. Starting having pain in chest on 3/22. Was diagnosed with blood clots in the lungs on 3/26 via blood test and CT scan.
1233144	4/20/2021	NH	48	F	3/28/2021	4/1/2021	Blood clot in the Right arm, s/s started 48 hours after first shot in the series.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1233196	4/20/2021	MA	20	M	3/12/2021	3/20/2021	Admission HPI: Right-sided chest pain began 2 days prior to admission (3/19) after getting out of car, without identifiable trigger. Pain was sharp, pleuritic, and worst with movement; didn't feel it when still. Pain not responsive to ibuprofen or heating packs. Reported 30-60 seconds of self-resolving heart racing during ocular migraine which has been his baseline for years. Not associated with SOB (at rest or with exercise), palpitations, presyncope, or syncope. No viral URI symptoms, N/V, or rash. He did receive his 2nd Moderna COVID vaccine about 1 week PTA, followed by 36hrs of fevers, chills, and body aches. Given persistence of pain, Patient asked his parents to present to urgent care. In UC, he was noted to tachycardic with CXR with bibasilar atelectasis and b/l effusions, per report. Given continued tachycardia, decision was made to transfer to ED to r/o PE. In ED, tachycardic to 104-116 and tachypneic 22-26. Had one episode of tachycardia to 182 iso ocular migraine. Endorsed chest pain but points to R middle abdomen when asked where worst. Exam was unremarkable. He received 1 dose of morphine which reduced pain from 10/10 to 0/10. Labs notable for leukocytosis (14.61), thrombocytopenia (422), elevated d-dimer (1.56), and elevated CRP (5.6). Otherwise normal chem and coags. COVID/RVP negative. CXR unremarkable. CTPA showed scattered PEs in b/l lower lobes with small pulmonary infarct in RML. No evidence of right heart strain. Heme was consulted who recommended starting him on lovenox and sending lupus anti-coagulant. Cardiology was consulted who recommended EKG, BNP, and troponin, all of which were normal and reassuring against right heart strain. ECHO was therefore deferred to the AM. The decision was made to admit. Upon arrival to the floor, Patient was tachycardic 114 and tachypneic to 22, otherwise stable vitals. He denied any pain since morphine. Denied any unexpected weight loss; reports that car ride was short. Mom reports that Patient has been less active d/t cold weather and baseball being on hold. Denies family or personal history of clots. Last seizure ~13 years ago. Hospital Course: (3/21 - 3/22) Patient was admitted to the hematology service. He was therapeutically anticoagulated with LMWH injections and his anti-Xa level prior to discharge was 0.92. (goal 0.5-1.0) Lower extremity ultrasound with Doppler showed patent veins

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							and no evidence of DVT and upper extremity ultrasound showed no evidence of DVT, though there was potential evidence of collateralization seen in mid and distal third of right subclavian vein and left internal jugular vein. Since this was an unprovoked PE, a full thrombophilia workup was sent and will be followed up by the outpatient hematology clinic. Cardiology consulted regarding possibility of right heart strain and the tachycardia during migraine episodes. Echocardiogram performed on 3/22 was technically limited but showed no gross abnormalities. The cardiology team requested a repeat echo scheduled outpatient for 1-2 months after discharge.
1233202	4/20/2021	KY	54	F	3/10/2021	4/1/2021	Patient states that while vacationing, 3 weeks and 1 day after receiving her Janssen vaccine, she woke up at 8:30am with numbness in her left foot. When attempting to stand she fell to floor. After checking her blood pressure and blood sugar she took 2 tylenol and sat down to rest. Around 10:30am she began to have numbness in her left hand and on the left side of her face. She was taken by ambulance at that time to Hospital. While there they ran a number of tests and scans diagnosing her with have a stroke caused by a small blood clot in right side of her brain. She was admitted to the hospital and was not discharged until 4/3/2021. Upon returning home, she has been seeing her PCP, APRN and a neurologist. She has since been released on 4/19/2021 to go back to work and has no residual side effects from stroke. She states she is now on blood pressure and cholesterol medication and is taking a daily baby Aspirin.

1233510	4/20/2021	MN	46	F	4/8/2021	4/19/2021	Death. Multiple pulmonary thrombi.
1233528	4/20/2021	NJ	45	F	4/9/2021	4/13/2021	I had a deep purple bruise the size of a quarter on my right arm a few days after taking the Janssen vaccine. I did not injure myself or bump into my right arm so I was baffled about how I got the bruise. I also experienced weird sensations in the muscle of my left calf on two occasions a few days within my vaccine. They felt like muscle contractions and the muscles quivered and I thought I was getting a charlie horse, but they were not painful or unbearable. The quivering lasted about 10-30 seconds. I've never had any sensation like this in my calf before. All of this coincided with me hearing news about the blood clots and deaths associated with the J&J vaccine shortly after I took the jab. Initially, I brushed it off and talked myself out of any connection between the vaccine and my symptoms. I was talking with family & friends recently and they suggested I report my symptoms so that's I why I'm reporting now 11 days after my vaccine.
1233567	4/20/2021	CA	70	F	2/11/2021	2/19/2021	I was diagnosed with Covid-19 on 12/02/2020 which was six weeks before my first dose of the vaccine on 01/21/2021. I also tested positive on 12/16/2020. I started to have a lot of problems with my legs. I had a lot of pain in my right leg. I was also very short of breath. It was excruciating pain at the top of my right thigh. I have been a runner in the past so this is unusual for me. I have a blood clot that was found on a scan with contrast. I have seen an ENT, Neurologist, Cardiologist, Orthopedist and Hematologist. I am also a cancer survivor of Non-Hodgkin's Lymphoma. I have been prescribed Eliquis and taking it for one week and the pain has improved.
1233582	4/20/2021	WA	43	M	2/16/2021	2/18/2021	The same day, I was exhausted. It lasted 2 days. After that, on the 2nd or 3rd day after my shot, my right calf began to hurt. I knew it was connected to the vaccine, but I figured it would go away. Once the information came out about blood clots and my calf still hurt and didn't get better, I decided to go and get it checked out.

1232423	4/20/2021	MA	33	M	3/28/2021	3/28/2021	03/28: At 9 PM (9 hours after shot), I rapidly experienced fatigue, fever (101 degrees), chills, aches, and slight nausea. I took my vitals during this time: SPO2 of 98-99%, BP was 123/80, and heart rate was in the mid-to-high 80s. By midnight, I felt much better and assumed everything was over. 03/29: Woke up feeling fairly tired. As I was trying to do my normal morning routine of cleaning up, taking out trash, etc. I noticed a shortness of breath. No fever or other symptoms from the night before. I checked my SPO2 levels with 3 different oximeters, and all gave readings in the 93%-94% range. My heart rate, which is usually in the 80s and 90s when moving about, was in the low 70s, bottoming at 72. This was nerve racking. This along with intermittent dizziness persisted for 24 hours. I got COVID tested and it came back negative. Flu came back negative, too. A consult with a doctor inferred that "everyone has different vaccine side effects." Not helpful. This shortness of breath/fatigue/low blood oxygen saturation continued persistently for the next 48 hours. I was essentially advised to stay home and rest. I noticed some lymph node swelling, too. By day 4, I was feeling much better. My heart rate had gone back up into the 80s, and my blood oxygen sat. had increased to 96-97%. I was still somewhat tired and got winded very, very easily. It's been over two weeks since my second shot upon writing this. I didn't want to report, but I can't make heads or tails as to why this happened. The only change in my health was taking the vaccine. I don't have any blood clots, asthma, or underlying issues. However, these side effects, if they are as such, need to be discussed. I know others who got the Moderna vaccine with similar anecdotes. The difference is, living with a clinician, I monitor my vitals all the time and knew enough to take measurements.

1231406	4/20/2021	CA	50	M	3/19/2021	4/12/2021	About 3 weeks after the vaccine I started having severe chest and belly aches on the right side. CT scan showed a blood clot on my lungs and pneumonia
1233670	4/20/2021	UT	81	F	3/16/2021	3/22/2021	Patient is a 81-year-old woman who last Tuesday received her second vaccination shot in her left arm. Several hours after the procedure she developed pain and discomfort in her left arm. The left arm discomfort gradually increased over the past 3 to 4 days and she began to experience symptoms of claudication in her left forearm and hand. She had a difficult time performing her daily tasks. The pain significantly worsened today to the point that she had constant pain in her hand and developed numbness in her fingers. She presented to the urgent care clinic and was subsequently transferred to the emergency room where CT angiogram demonstrates thrombus in her left brachial artery. She denies a history of heart palpitations. She has no history of hypercoagulable state. She has no history of blood clots or easy bleeding. She has no history of infection and denies fevers chills or night sweats. She has no significant history of peripheral vascular disease and can walk over a mile without difficulty. She denies symptoms of transient ischemic attacks. Left brachial ulnar and radial artery thrombectomy due to inflammation of the brachial artery and thrombus in the brachial artery extending into the origin of the radial and ulnar arteries done on 3/22/2021. Discharged on aspirin 81 mg daily and Lovenox. Has transitioned to Eliquis now. Complication of left arm wound dehiscence. Debrided by wound clinic on 4/9/2021. Taken for washout/wound closure on 4/13/2021. Continues to f/u in our clinic.

1231727	4/20/2021	NC	58	F	4/9/2021		BIG KNOT LIKE BUG BITE OR A BEE STING ON ARM AROUND THE INJECTION SITE; HOT SKIN AROUND THE INJECTION SITE; SLIGHTLY ITCHY AROUND THE INJECTION SITE; HARD SKIN ON ARM/TOUGH SKIN ON ARM; SORE ARM AROUND THE INJECTION SITE; SWELLING AROUND THE INJECTION SITE; This spontaneous report received from a patient concerned a 58 year old female. The patient's height, and weight were not reported. The patient's past medical history included blood clots. The patient was previously treated with warfarin for blood clots. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 043A21A, and expiry: UNKNOWN) dose was not reported, administered on 09-APR-2021 for prophylactic vaccination. No concomitant medications were reported. On 09-APR-2021, the subject experienced big knot like bug bite or a bee sting on arm around the injection site. On 09-APR-2021, the subject experienced hot skin around the injection site. On 09-APR-2021, the subject experienced slightly itchy around the injection site. On 09-APR-2021, the subject experienced hard skin on arm/tough skin on arm. On 09-APR-2021, the subject experienced sore arm around the injection site. On 09-APR-2021, the subject experienced swelling around the injection site. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from sore arm around the injection site on APR-2021, was recovering from big knot like bug bite or a bee sting on arm around the injection site, swelling around the injection site, hot skin around the injection site, and slightly itchy around the injection site, and the outcome of hard skin on arm/tough skin on arm was not reported. This report was non-serious.

1232271	4/20/2021	CT	65	F	4/14/2021	4/14/2021	I had no symptoms except a very sore arm the first shot . After 2nd shot I had Unexplained severe pain in my foot for hours and then it went away the next day. I could not walk as I could not bear any weight on it. Also with the 2nd shot I had fever, chills, sweats, head ache, body aches, exhaustion and nauseous for a good 36 hours. My husband was afraid the pain in the foot was a blood clot and wanted me to go to the hospital but I was honestly just to sick to go to the hospital. I was too sick to move. After 36 hours most symptoms disappeared leaving just fatigue for the next 24 hours.
1232919	4/20/2021	ND	56	M	4/14/2021	4/18/2021	Blood clot in lower leg. After ultrasound, Doctor gave treatment protocol. Still undergoing treatment course.
1232427	4/20/2021	FL	34	F	4/14/2021	4/14/2021	She got her vaccine, initially she had bruising on her forearm that was blue/yellow with a swollen vein connected running down to her hand. She had tingling and numbness in her fingers in a select few on the left hand. She also had drooping of her left eye for a short period and a sensation on her left leg, swelling and pain. She went to the urgent care on 4/15/21, they told her to go home and monitor it. She knew that somewhat was not right and called a nurse at Hospital and went to the ER shortly thereafter and confirmed that she had a blood clot in her jugular vein IJ-DVT. In the ER they gave her a shot of Lovenox in the ER into her stomach and run several tests. They also gave her an anti-inflammatory in her right arm. She was sent home with Eliquis for the next 3 months. She has extreme exhaustion, and in addition to that she has had a lot of swelling on the left side of her leg, and visited the ER again on 4/17/21. Her left foot became blue, very swollen, so they ran a number of tests which all came back negative. She thinks these are side effects in relation to the previous. She is still continuing with stiffness in her neck as well. She also has a severe headache, fever of about 100, and severe achiness. She has not been able to work due to these symptoms since 4/15/21. The ER told her to have a lot of rest, no heavy listing/straining due to the clot.

1232464	4/20/2021	FL	65	F	3/11/2021	3/11/2021	pt says one of her toes on her left foot went completely numb. Within a couple of days she started swelling between her left big toe and the toe next to it. Her entire left foot started swelling and then her leg started swelling. She went via ambulance to ER. They did an US of her leg and found 2 blood clots in the back of calves. She was given a RX for blood thinner. She went to 3 pharmacies and could not find it so she went home. She went home and then her right foot swelling as well. She went back via ambulance to ER. She was given blood thinner injection, and IV and took blood work. Pt was admitted where she stayed for 5 days. She was released and prescribed Eliquis. She has to take 20 mg a day for first week and then 10mg a day the following week for 3 months. She still has constant pain and her left foot continues to swell. Pt will have to have another US in 3 months.
1232476	4/20/2021	FL	53	F	3/25/2021	4/12/2021	Patient presented to Emergency Department on 4/17/21 with a severe headache that started 5-7 days prior. CBC and Chem-8 were normal with platelets of 314. Findings from CT head venogram showed irregularities of the left transverse sinus with possible sinus thrombosis. Patient was admitted for further work-up and treatment. Patient was followed by Neurology. On 4/18 MRI revealed no cavernoma seen and no stroke or hemorrhage. Per Neurology, the areas of filling defects seen on CTV are still present which could be nonocclusive thrombus vs stenosis with prominent arachnoid granulations, but given history and risk factors, would treat as cerebral sinus venous thrombosis. Patient was treated with heparin then transitioned to apixaban, which she was discharged on. Patient was instructed to follow up with neurology in 3 months for a repeat CTV. Patient was discharged 4/19/21.
1232500	4/20/2021	MA	75	F	4/7/2021	4/10/2021	Blood clot causing swelling, pain, redness in left leg from groin to ankle--sent for ultrasound from Vascular surgeon's office at.

1234262	4/20/2021	OH	71	F	3/13/2021	3/16/2021	<p>Patient with questions /concerns-said she had to get vaccine because of recent dx/tx for breast cancer. She said received vaccine on 3/13- then on 3/16 she was seen for one of her breast cancer therapy sessions- they have been treating her for lymphedema - she said she has been going for breast cancer in July- no chemo just radiation- surgery of breast with removal of seven surrounding lymph nodes. She was advised to wear a compression bra- on 3/16 and ever since then her left side of neck has been sore- thought it was likely related to compression bra not fitting correctly b/c too tight &amp; was professionally fitted on her- the straps seem very tight over the collar bone area that was damaged/irritated by the radiation she received on that side up through Oct 2020 for cancer. Now when she saw story today in news she got concerned could the neck soreness really be from a blood clot? She as been going the week for tightness in neck to physical therapy which started yesterday for lymphedema. Again her radiation ended Oct 2020 but she has had persistent swelling in breast &amp; fluid in lymph nodes on the left side. She still has pain in on collar bone- on same side of radiation- blisters, sore, red. As well as this new compression bra having two tight straps on each side. Her COVID vaccine shot in right arm but left side where breast surgery was She went on 3/16 for consultation on breast lymphadema - that was when told her to wear tighter bra for compression on 3/16. She is going today to be fitted for new one that is not so tight. She is approx. 4 weeks post vaccination &amp; post when started wearing that tighter bone- maybe three inches from where had radiation injury is located.</p>
1234286	4/20/2021	KS	44	F	3/20/2021	4/13/2021	<p>pt said she had isolated pain above her left elbow around 4/13/2021. the pain is now from her elbow to mid bicep. (she had given blood on 3/4/2021) pt saw a provider on 4/19/2021 regarding her symptoms. She was referred for a US. Results were superficial thrombosis left cephalic vein at the level of the mid upper arm extending into the forearm. She had blood work and was told to take Ibuprofen for pain and to stop taking her birth control. Pt will have a FU appt to discuss blood work results.</p>

1234420	4/20/2021	WV	56	M	3/17/2021	3/19/2021	I began to feel numb around my mouth and nose. It spread to most of my face, then chest, then arms, mainly left arm and leg, then to both legs. General weird feeling / numbness, no pain. I had trouble with limb control, not bad, but enough to notice. Mainly left side, but noticeable on both sides. From the onset on face numbness to the chest leg spread was just a matter of a few, maybe 5 minutes. I looked at my face in the car mirror, and appeared to have facial control. I was driving to a relatives house, and it worried me. On the way, I also noticed a lump in my right neck, about the size of a pea. When I got to my relatives house I told them I thought I had a small stroke, but wasn't sure. The numbness lasted until the next day, then slowly went away. It took about 2 days before the numb twitchy feeling went away from my left eye/upper cheek area. The lump in my neck also went away. rubbing on it actually made the numbness slightly go away. I did not go to a hospital, or seek any treatment. I think I should have. I do believe that I had a small stroke / blood clot, and that it should be reported. I think I am OK now,
1234466	4/20/2021	SD	63	M	4/9/2021	4/10/2021	Patient came to pharmacy today w/ his wife to pick up Rx for XARELTO. He has developed multiple DVT's in his leg. He reported symptoms started the day after (Saturday) his second dose of Moderna COVID 19 vaccine on Friday 4.9.21. His leg was swollen by Sunday 4.11.21. Symptoms would get worse and then get better. He finally went to see Dr. today 04.20.21. They found several blood clots in the leg via doppler. Patient was therefore prescribed Xarelto. Pt wife advised that Dr said clots were due to Moderna vaccine and they should let pharmacy know also. Their next appointment will be in 2 weeks.

1234475	4/20/2021	VA	48	F	4/12/2021	4/13/2021	<p>On Monday, 4/12/21, I was given the 2nd dose of the vaccine. There were no immediate symptoms other than a sore arm (from injection site) later that day. Tuesday morning, my left arm was swollen and I experience joint pain in my fingers and wrist. The following afternoon, I began to feel extremely tired and had vertigo. I laid down and slept the entire evening; still feeling the joint pain. The following Wednesday morning, I woke up to a swollen arm with a knot at the injection site, blisters, body rashes, and wheals under my breast and wheals on my shoulder, legs, and feet. I was even more exhausted. I took Benadryl for the rash and Advil for the pain. Thursday, I continued to develop rashes that would come and go on the left side of my body and upper chest. Friday, still experiencing the inflammation and pain, I visited my doctor who told me to continue taking the Benadryl and OTC pain meds. For good measure, we ordered a d-dimer test. Over the weekend, in addition to the other symptoms, I began to have a lot of ringing in my ears, a backache (throbbing sensation), and my hands began to painfully swell with blisters. I could only taste the salt or sugar in foods and was extremely tired. Monday morning, I received a call from my doctor advising me that the d-dimer test came back extremely high (1.23) and needed to have a vascular ultrasound to check for blood clots. I visited an ER and had the test done. No clots were found but I continue to experience ringing in my ears, severe pain in my back that limits my ability to walk and breathe, swelling of various extremities, a rash (and itching), and overall inflammation. The Benadryl isn't working nor is the OTC pain medication. My doctor has prescribed Prednisone.</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1234257	4/20/2021	CA	27	F	4/5/2021	4/16/2021	a 27 y.o. female with a history of Covid infection December 26, 2020, positive covid test December 29, 2020. She had approximately 2 weeks of symptoms including generalized body ache and generalized weakness. Fatigue and some headache. Had some persistence of symptoms after that time. Had some benefit from ibuprofen. Was seen at emergency room on January 27, 2021 stating that she felt that all her symptoms of Covid had resolved except for some chest pain which awoke her on January 27. She presented to the emergency room. Had sinus tachycardia at 113 but otherwise unremarkable physical exam, laboratory studies with white blood count elevated 16,004-20, hemoglobin 13.7 g hematocrit 41.8%, MCV 87.1, RDW 12.7%, platelet count 329,000, segs 72.8%, lymphs 20.6%, monocytes 4%, eosinophils 1%, basophil 0.6%. BUN 10.1, creatinine 0.8, AST 24, ALT elevated 56, alkaline phosphatase 68, total protein 7.6, total bilirubin 0.3, albumin 3.6, globulin by subtraction 4.0, troponin less than 0.02, D-dimer quantitative 0.22, urine pregnancy test normal. Chest x-ray normal. Chest pain appears to be musculoskeletal and was reproduced by palpation of her chest wall. No evidence of deep venous thrombosis or pulmonary embolism. D-dimer was normal. Heart rate returned to normal after some intravenous fluids. Patient discharged on Zithromax 500 mg day 1 and then to 50 mg days 2 through 5. Also continued on ibuprofen. Received Johnson and Johnson vaccine April 5, 2021. Over the next week patient started having increasing soreness. Her joints hurt more than usual and her headache was worse. She had a sensation that her legs were "numb and tingly" starting at her buttocks and extending down her leg. Because of reported incidence of cerebral sinus thrombosis or cerebral vein thrombosis patient appropriately presented for screening in the emergency room and was sent for appropriate imaging. April 16, 2021 CT scan of head with and without contrast no acute intracranial hemorrhage, no mass-effect or midline shift. On contrast-enhanced images there appears to be a lobular nonocclusive filling defect in the far lateral right transverse sinus. Lobular occlusive filling defect is also likely present in the mid to central right transverse sinus. Short segment filling defect in the medial left transverse sinus. Remainder of sinuses and internal cerebral veins

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

are patent. Focal lobular filling defect within the confluence of the right and transverse sinus most likely related to arachnoid granulation. No edema hemorrhage of the cerebellum or cerebrum. No other significant findings. April 16, 2021 confirmatory MRI angiogram of head without contrast with no restricted diffusion to suggest acute or subacute infarct. Contrast void in the middle to central right transverse sinus consistent with occlusive thrombus. Nonocclusive thrombus in the far lateral right transverse thrombus. Narrowing of the medial left transverse sinus without complete occlusion. April 16, 2021 2345 hrs. initial hematology consultation. D-dimer and fibrinogen levels have been requested stat and are still pending. If fibrinogen level is low will replace with cryoprecipitate. If D-dimer is elevated barely confirms diagnosis of possible vaccine related thrombosis. The fact the patient is not thrombocytopenic at this time is encouraging, however despite the lack of thrombocytopenia she still has clearly documented symptomatic nonocclusive and occlusive thrombus in her cerebral sinus. From UPToDate.com Ad26.COV2.S (Janssen COVID-19 vaccine, also referred to as the Johnson & Johnson vaccine) ? On April 13, 2021, the US Food and Drug Administration (FDA) and Centers for Disease Control and Prevention (CDC) recommended pausing administration of AD26.COV2.S to further investigate rare cases of cerebral venous sinus thrombosis and thrombocytopenia [33]. As of that date, six cases had been reported, all in females aged 18 to 48 years with onset 6 to 13 days after vaccination; during this period, 6.8 million doses were administered (with 1.5 million doses in females of that age range) [121-123]. Since some vaccine recipients have not been followed for longer than the time frame over which these symptoms develop, the incidence may change with additional follow-up. Initial symptoms included headache, backache, chills, and fatigue, and progressed to focal neurologic deficits. Intracerebral hemorrhage and thromboses at other sites were also seen in some patients. All of the five patients who were tested for the anti-PF4 HIT antibody tested positive. Another case, in a young male who was a vaccine recipient in one of the pre-emergency use authorization efficacy trials, had been previously reported. These cases appear similar to those reported following ChAdOx1 nCoV-19/AZD1222, another

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

adenovirus-vector vaccine. Although rare, the observed number of events exceeded the expected rate among females <50 years old. Given the extreme rarity of these events, the FDA and CDC acknowledge that they recommended the pause out of an abundance of caution and to ensure awareness of these rare events.

?Evaluation and management of possible thrombotic complications ? Recipients should be aware of the possible association and seek immediate care for signs and symptoms suggestive of thrombocytopenia (eg, new petechiae or bruising) or thrombotic complications (including shortness of breath, chest pain, lower extremity edema, persistent severe abdominal pain, unabating severe headache, severe backache, new focal neurologic symptoms, and seizures) [117]. In such cases, some experts suggest evaluation with complete blood count and differential (including the platelet count), quantitative D-dimer, HIT testing, and imaging of any suspected site of thrombosis [113,114,125]. Onset 4 to 20 days after vaccination, platelet count <150,000/microL, elevated D-dimer, and a positive anti-PF4 antibody (HIT antibody) suggest the diagnosis. Treatment with a non-heparin/non-warfarin anticoagulant (eg, argatroban or direct oral anticoagulant) and intravenous immune globulin has been suggested. The CDC recommends not using heparin in individuals with thromboses following receipt of Ad26.COV2.S unless HIT testing is negative [126]. (See "Cerebral venous thrombosis: Etiology, clinical features, and diagnosis" and "Clinical presentation and diagnosis of heparin-induced thrombocytopenia", section on 'Terminology and HIT variants' and "Management of heparin-induced thrombocytopenia", section on 'Role of IVIG'.) As stated above all the 6 cases were "all in females aged 18 to 48 years with onset 6 to 13 days after vaccination" this would certainly fit the timeframe that we are seeing in this case. Recommendations from national guidelines would be to start treatment with dexamethasone immediately while awaiting intravenous gammaglobulin. To pursue intravenous gammaglobulin treatment at 1 g/kg over 1 to 2 days. It is recommended to avoid heparin and instead use direct factor X inhibitor such as Eliquis, which this patient is already been started on. There is unfortunately considerable risk that even though patient's symptoms appear mild at this time, that she may

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

deteriorate in the very near future and I would recommend treating her aggressively at this time with dexamethasone and intravenous gammaglobulin while we are awaiting further testing. Patient clearly has had unusual thrombosis, especially in a 27-year-old. With the fact that she had headache dating back to January, it is impossible to determine the acute versus chronic nature of her venous sinus thrombosis. Covid infection does cause increase in coagulation as well. However, given the small risk of tragic outcome with cerebral vein and sinus thrombosis in the setting of Covid vaccinations, we will proceed aggressively with treatment starting tonight with intravenous gammaglobulin and intravenous dexamethasone. Will require rapid fasting glucoses to evaluate possible hyperglycemia from high-dose dexamethasone. Will consider stopping dexamethasone at 48 hours. Current recommendation for gammaglobulin would be single 1 g/kg or 500 mg/kg over 2 days. No recommendations for treatment beyond this point. Current recommendations for gammaglobulin dosing would recommend using an adjusted dose for patients with greater than 125% of their ideal body weight. This patient at 122 kg on a 5 foot 2 inch frame does qualify for adjusted dose and her orders reflect that. I appreciate the opportunity see this patient this evening and consultation requested by Dr. We will follow patient in hospital. Hopefully she will have gradual improvement and avoid any serious or tragic complications of her cerebral sinus thrombosis. We will have pharmacy report possible adverse reaction to Johnson & Johnson vaccine to the FDA as required by law. April 17, 2021 follow up. No new events. Laboratory studies remained excellent. White blood count is further elevated, however, this may be secondary to high-dose dexamethasone with a white blood count of 16,060. Hemoglobin 14.0 g hematocrit 42.8%, MCV 86.8, RDW 12.9%. Platelet count is actually increased slightly at 374 as of 9:10 AM this morning. Differential shows left shift as expected with dexamethasone. Results from yesterday showed fibrinogen normal at 369 (180?415) pro time normal at 10.4 seconds with INR of 0.97, PTT 26.7. D-dimer 0.23 (0.19?0.50). With platelet count, fibrinogen and D-dimer normal I am inclined to believe that this is not an acute post vaccination HIT-like phenomena. If it were I would still expect to see some

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

degree of thrombocytopenia elevated D-dimer and perhaps low fibrinogen. The other explanations for her cerebral venous sinus thrombosis are either idiopathic spontaneous and merely coincidentally associated at the exact same time as her Covid infection or more likely, cerebral venous sinus thrombosis secondary to hypercoagulable state secondary to her Covid infection from December 2020. Unfortunately there is no way to accurately date the acuity of the venous thrombosis in her cerebral sinus. HIT Testing is still pending and most likely will not be available for 3-4 more days despite being ordered stat. Have called the laboratory and asked them to check with our outside reference lab what the expected return time is on this test. (LabCorp says "Tuesday April 20, 2021). Patient refused intravenous gammaglobulin infusion which has been ordered last night. Patient has been receiving dexamethasone which was a bridge until intravenous gammaglobulin could be administered. Current guidance from the expert hematology panel (EHP) on Covid vaccine induced thrombosis dated April 7, 2021 from the public health would state that a patient who has a reduced platelet count without thrombosis with a D-dimer normal and normal fibrinogen or thrombosis with a normal platelet count and D-dimer normal and normal fibrinogen are "unlikely cases". They recommend for probable cases who have D-dimers that are elevated to send HIT assay and then give immediate intravenous gammaglobulin while awaiting results. They recommend fibrinogen supplementation, if needed. They recommend a direct acting antithrombin agents such as the Eliquis this patient is receiving. They recommend steroids particularly if there is a delay in getting intravenous gammaglobulin delivered. With the fact that we now have 24 hours in the hospital with no evidence of thrombocytopenia, no evidence of increased fibrinolytic activity or active thrombosis, and no evidence of hypofibrinogenemia, I would argue that her presentation is subacute. In this setting, I do not feel intravenous gammaglobulin would be necessary and does involve a small risk as well as considerable cost. Dexamethasone also involves small risk and negligible cost. I have discontinued both of these medications. My overall impression would be that this was not related to her Johnson & Johnson vaccination which was recent, but

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

rather her more distant Covid infection. It is impossible to definitively answer the question however. The next question is duration of anticoagulation. Risk of recurrent cerebral sinus venous thrombosis is relatively small but the morbidity can be high. Studies have been performed showing medications in the same class as Eliquis have been associated with a decrease in incidence of the recurrence. Most hematologist recommend 3 months of anticoagulation for provoked venous thrombosis including cerebral sinus venous thrombosis. I feel this patient's thrombosis is "provoked", with her association at the same time of her Covid infection (and possibly vaccination). I would recommend Eliquis (apixaban) 5 mg twice daily or Xarelto (rivaroxaban) 20 mg daily with food. I would feel comfortable in discharging patient for outpatient follow up IF Dr and other speciality services agree. Plan 3 months of full dose anticoagulation with direct factor X inhibitor. Circulation 2010 Jun 29;121(25):2740-6 "Long-term evaluation of the risk of recurrence after cerebral sinus-venous thrombosis", Background: The clinical course of cerebral sinus-venous thrombosis (CSV) is largely unknown because prospective studies with a long follow-up and with the goal to assess thrombosis recurrence rate and predisposing factors for recurrence are lacking. Methods and results: One hundred forty-five patients with a first CSV were followed up for a median of 6 years after discontinuation of anticoagulant treatment. End points were recurrent CSV or other clinical manifestations of venous thromboembolism. CSV recurred in 5 patients (3%) and other manifestations of venous thromboembolism (deep vein thrombosis of the lower limbs or pulmonary embolism) were seen in 10 additional patients (7%), for a recurrence rate of 2.03 per 100 person-years (95% confidence interval, 1.16 to 3.14) for all manifestations of venous thromboembolism and 0.53 per 100 person-years (95% confidence interval, 0.16 to 1.10) for CSV. Nearly half of the recurrences occurred within the first year after discontinuation of anticoagulant therapy. Risk factors for recurrent venous thrombosis were male sex (adjusted hazard ratio, 9.66; 95% confidence interval, 2.86 to 32.7) and, for thromboses other than CSV, severe thrombophilia resulting from antithrombin, protein C, protein S deficiency, antiphospholipid antibodies, or combined abnormalities

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							(adjusted hazard ratio, 4.71; 95% confidence interval, 1.34 to 16.5). Conclusions: The risk of recurrent CSVT is low and is higher in the first year after discontinuation of anticoagulant treatment and among men. Mild thrombophilia abnormalities are not associated with recurrent CSVT, but severe thrombophilia entails an increased risk of deep vein thrombosis of the lower limbs or pulmonary embolism. April 19, 2021 Follow up, no change in condition. Discussed case with Dr. will order Factor V Leiden, prothrombin gene mutation, anti phospholipid and anti cardiolipin antibodies, if she will allow draw. Expect Heparin Induced Thrombosis testing result tomorrow, but with no thrombocytopenia after given heparin, expect will be normal. Will await result. If discharged, would recommend 3 months direct thrombin inhibitor (Eliquis/Xarelto/Pradaxa) at full anticoagulation dose. Then stop, no taper. Overall still feel "provoked" thrombosis due to December Covid, unrelated to J&J Covid vaccine, but can not definitively prove that..
1234495	4/20/2021	AR	18	F	4/8/2021	4/20/2021	I had other symptoms earlier on that I reported using v safe but today I started my period (while on birth control) two weeks and one day early. I normally have a very light bleed in day one and it is very heavy and has lots of clots. My first spot of blood appeared around 3 pm and I have bled about 15 ml since then. I know the volume as I use a menstrual cup. My first bleed day I normally don't bleed but one small clot ~2 ml in volume.
1235108	4/20/2021	NM	83	F	3/3/2021	3/7/2021	Patient developed pain in her left calf 4 days after the 1st Pfizer COVID-19 vaccine. She was sent for venous doppler and found with an extensive superficial venous thrombosis in the left great saphenous vein that was only cm from the deep system. The clot extended from the upper calf to the thigh. She was and is being treated for DVT as the clot was so extensive. She has no history of clots. She does have varicose veins and has not been as active as usual. She is currently still in treatment .

1234509	4/20/2021	AL	62	M	2/22/2021	3/4/2021	On 3/4/21 noticed my left calf was swollen. I did not think much of it at first. A week later the swelling had progressed to include my ankle. Saw Dr. and ordered an ultrasound on both of my legs. Right leg was normal & left lower leg had a clot(s) in it. Dr. ran blood work then prescribed Eliquis. Saw him in follow-up on April 14. Swelling down but not gone. Renewed the prescription for Eliquis and set a followup visit for Friday June 18. He ordered additional blood work to be drawn on Wednesday June 16 to have results at the next visit.
1234526	4/20/2021	CA	60	M	3/13/2021	3/29/2021	Blood clot in left leg on 3/22/2021 and 3/29/2021
1234907	4/20/2021	FL	65	M	4/12/2021	4/15/2021	On April 16 patient came home fatigue, pale and legs hurting. The next day complained of right knee pain, Fatigue and looked pale. He woke up in the middle of the night complaining of right calf tightness and pain. On Sunday 18th he started to limp and when we looked at his calf it was double in size, warm to touch, and redness. We then went to the ER and had an ultrasound and CT scan . We were told he has multiple blood clots in the right leg and clots in both lungs. He was then transported to a hospital and given blood thinner shots in stomach. He was released from the hospital 4/20 and given blood thinners and assigned a hematologist. He'll be on blood thinners 6-12 months, out of work a month and tested regularly to check platelets.

1235447	4/20/2021	MN	33	F	3/22/2021	4/17/2021	Patient presented to the ER on 4/20/21 with headache. On Saturday (4/17/2021), the patient had "the worst headache I have ever had" along with severe inner left ear pain. Patient took an ibuprofen which helped with the pain for about an hour then the pain came back. Pain got worse 2 hours later when she drove home from work. She called the RN line and was told to take ibuprofen and follow up in the AM. The next day 4/18/2021, patient went to urgent care and received Toradol and was told it was a migraine. Today 4/20/21, patient still had pain and noted feeling left sided facial numbness and blurry vision that correlated with when she got the headache. Patient went to an urgent care today and CT scan revealed a blood clot. She was then sent to the ED for evaluation. In the ED, she has no headache and facial numbness and has minimal left ear pain. Her headache is localized to the left side of her head. Patient denies fever, chills, and COVID symptoms. Patient was started on argatroban drip per hematology recommendation.
1233706	4/20/2021	GA	45	M	3/17/2021	4/3/2021	DVT - Left leg. Three separate clots in three different veins. Placed on Eliquis for 3-6 months.
1233645	4/20/2021	PA	33	F	3/19/2021	3/20/2021	The day after my first vaccine dose (3/20/2021), my menstrual cycle started and I had large globs. Some looked like large blood clots, while others looks like they might contain tissue almost like what you would expect in the event of a miscarriage. I know for certain I was not having a miscarriage. No treatment. Symptoms subsided until next menstrual cycle on (3/17/2021), when I again experienced the same symptoms. Symptoms the second time were not as prevalent as the first time but still noticeable.
1234477	4/20/2021	CA	29	F	4/11/2021	4/12/2021	Experienced these symptoms within 12-24 hours: Chills, fever, headache, body ache, nausea, vomiting, confusion, memory loss. Went to hospital 22 hours after receiving shot. Blacked out for 7 hours that day at the hospital. Was tested for meningitis and did MRV scan for brain clots but all came back clear / negative. Likely experienced dehydration and drop in sodium levels. Was hospitalized from 4/12-4/16.

1234044	4/20/2021	OH	72	F	3/4/2021	3/24/2021	<p>Patient called c/o shortness of breath on exertion, slight cough, runny nose, weakness and fatigue. States O2 sitting 97 and P 79-80 and O2 walking &lt;88 and P 100's. States had covid vaccine # 1 on 3/4/2021. Completed viral/travel screen which was negative. Patient is a 72 y.o. female with chronic diastolic heart failure, hypertension, hyperlipidemia, hypothyroidism, vitamin D deficiency, depression with anxiety, who presented with shortness of breath on exertion. CTA chest was performed, showing filling defects in secondary and tertiary pulmonary arterial branches in bilateral lower lobes as well as right upper lobe. Patient was admitted for management of acute bilateral pulmonary emboli. Patient was started on Lovenox 1 mg/kg twice daily; transitioned over to oral apixaban for discharge. TTE obtained, without evidence of right heart strain. Patient is a 72 y.o. female who presents to the office today stating "I do not feel so good". She mentions noting blurry vision over the past 1 week right eye only with decreased vision. Denies any eye pain. Thinks her vision is worse outside in the sun. In addition, today she states she was up moving around getting ready for today's appointment when all of a sudden she felt a brief slight low light shock pointing to left anterior chest wall. Denies any chest pain or pressure but reports noting her heart rate was elevated up to 150. She states her O2 sat at home was 97% on room air. She checked her blood pressure which was not abnormal but cannot recall the number. She was recently diagnosed with a PE for which she was hospitalized, see previous note. She is concerned as she feels perhaps her Covid vaccine initially received on 3/4/2021 could have caused her blood clot. Her second dose was received on 3/31/2021 and has since not been feeling well EKG in the office with new onset A. fib relation noted, rapid ventricular rate with a pulse of 152 bpm. 911 was called and patient transferred to the ER for further evaluation and recommendations. Patient currently on Eliquis for PE. Patient, with a past medical history of essential hypertension, mixed hyperlipidemia and grade 1 diastolic dysfunction, as well as acute bilateral pulmonary emboli 3/2021 diagnosed a few days after her first dose of the Pfizer Covid vaccination, now anticoagulated on Eliquis who presented to KMC emergency room on 4/14/2021 from her primary care provider's office after being found in newly diagnosed</p>

atrial fibrillation with RVR, rate in the 150s. Of note, patient had received her second dose of the Pfizer Covid vaccine on 4/10/2021. She had scheduled this primary care provider appointment due to waxing and waning blurred vision of her right eye, with associated right-sided headache that had been ongoing over the last week. Patient reports that on the day of arrival she had not felt well, felt slightly weak and fatigued, but denied shortness of breath, chest pain or heart palpitations. Per ER notes, patient was instructed on vagal maneuvers while she was in the ambulance, and had converted to sinus rhythm by the time of her arrival to the emergency room. Per review of her telemetry on the day of discharge, patient did have one short episode of PAF on 4/15/2021, spontaneously converting to sinus rhythm, as well as intermittent PACs. Her home lisinopril was changed to Coreg, without further episodes of RVR and with good blood pressure control. In regards to her headache, patient underwent an MRI of the brain, which was negative for acute findings; she had no temporal tenderness, and ESR was within normal limits. She did improve symptomatically with administration of Tylenol and Zofran for her corresponding nausea/vomiting. On the day of discharge, patient was feeling much better, and stable for discharge. An appointment with doctor of ophthalmology was offered to patient for 4/16/2021, however due to transportation issues, this was rescheduled for 4/20/2021. She was instructed on changes in her medication, as well as encouraged to schedule an appointment with her established cardiologist. All questions and concerns were addressed.

1234046	4/20/2021	MI	103	F	4/7/2021	4/13/2021	Received a Janssen vaccination on 4/7/21 from a home visiting nurse from the County Health Department. On approximately 4/13/21, the family noticed slight signs of an issue, with patient slumping towards the right, and showing some signs of weakness on right side of body. Family contacted the PCP, who advised to take her to the ED. Family was hesitant to do that because patient had been bedridden for past few years. She seemed to improve somewhat on 4/15/21. Then the morning of 4/16/21, the family found her on the floor of her bedroom. She appeared to have had a moderate to severe stroke. Right side of body paralyzed, cannot speak. Uncertain whether mental faculties further deteriorated. PCP ordered a hospice facility for care. Stroke likely caused by blood clot but unsure if related to JJ vaccine. She has not been evaluated in person by her health care providers.
1234034	4/20/2021	KY	53	F	2/12/2021	3/24/2021	Stroke from a blood clot that went to the left side of my brain causing the right side of my body to be numb , weak and to lose a range of motion. Event date: 3/24/2021; hospitalized 3/24/21, 3/25/21, and 3/26/21.

1234070	4/20/2021	MI	34	F	4/8/2021	4/10/2021	4/10/21 Patient presented to Urgent Care with Arm Pain (left arm painful and tingly since COVID shot 4/8; now pain is different and there is a lump on her forearm she can feel). 4/13/21 Contacted the office to schedule an appointment regarding worsening symptoms. Scheduled appointment. 4/14/21 cont. Seen in office by PA for: 1. Left arm pain - tender nodule L forearm, will get US due to recent birth, Johnson and Johnson vaccine, FH of DVT, to r/o DVT causing the lump, await results. Symptomatic care in the interim, may use warm compresses. - USV VENOUS UPPER EXTREMITY DUPLEX LEFT; Future 2. Paresthesia of left arm - site of reported injection and superficial induration 1.5cm from acromion process, suspect SIRVA due to sit of administration of vaccine, recommend symptomatic care with warm compresses, gentle massage if benefit noted, pt is breastfeeding so recommend local care at this time, consider PT, pt declines at this time as she will be on vacation next week. Discussed possible cortisone injection but deferred due to recent COVID vaccine 6 days ago, pt agrees as there is some recommendation to avoid steroids in close proximity to vaccinations to avoid blunting the immune response 3. Family history of DVT - see #1 4/15/21 After speaking with the DVT clinic Dr contacted the patient and recommended she take an 81mg low dose daily aspirin, until symptoms resolve, around one month. And repeating venus duplex in 7-10 days. Determined she would go prior to her leaving for her trip as she planned to be out-of-town during that time frame. (Per provider result notes.) 4/16/21 Patient was seen in emergency department for: Patient presents for evaluation of multiple concerns. Following the Johnson & Johnson COVID-19 vaccine she was recently diagnosed with superficial thrombophlebitis in the left forearm by ultrasound, has been taking aspirin and symptoms have not worsened. Left upper extremity exam is quite reassuring today, I see no clinical evidence for DVT and she is neurovascular intact. I did not feel that repeat ultrasound was necessary at this time, but she does have this scheduled next week so I advised her to keep that appointment. She has a very slight headache which has been present since the day she received the vaccine, currently 2/10 without vision or other neurologic concerns. No abdominal pain. I have low clinical suspicion for CVST or PVT at this time.

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

Advised return if she develops worsening headache or new neurologic symptoms. Patient complained of new onset left lower lateral breast pain and lump starting today. She is currently breastfeeding and notes decreased milk production today. She does have a tender fullness on exam but no redness or visible swelling, she is nontoxic and well-appearing without fever. She has history of mastitis in the past, but she states her PCP recommended she be evaluated for possible blood clot in the breast. Advised the patient that I have very little concern for that at this time, if anything it would be superficial and not amenable to anticoagulation but I did not feel that imaging was necessary at this time. I will cover her with antibiotics for lactational mastitis, she has cephalosporin allergy but states she had formal testing for penicillin allergy and tolerated this well so I prescribed Augmentin. She will use a warm compress and continue nursing, I did recommend she start on the right side to initiate let down on the left. 4/20/21 patient was seen in the office for: Patient presents for follow up of recent ED visit. She was seen here last week for left arm pain/nodule/paresthesia following her Johnson & Johnson vaccine. She also reported a slight headache that was present since day of vaccine. An US was performed and showed a left cephalic vein thrombus of LUE. She was advised to start ASA 81mg daily for the next month and get repeat US in 7-10 days. She then called in with left breast pain/swelling and was directed to the ED for evaluation of possible blood clot. She does have hx of mastitis several weeks ago. The ED did not pursue additional imaging of breast, they told her it was likely lactational mastitis and they did prescribe augmentin and warm compresses for this. Today, patient presents states he feels "a lot better". Regarding the left breast lump, redness, swelling she states this has completely resolved. She did not start the augmentin as she was worried about this potentially causing thrush for her daughter; she explains she had mastitis 7-8 weeks ago and was on antibiotics and then her and her daughter continually passed thrush back/forth to each other 3x so she was hoping to avoid this. She did treat with frequent feeding/pumping, and warm compresses and symptoms resolved. She was told to see us for elevated blood pressure in the ER, per review of EMR and her DC papers, her blood pressure in the ED

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
-----------------	--------------	--------------	----------------	------------	-----------------	-------------------	---------------------

was 130/75. Today her blood pressure is 122/78. Regarding her left arm symptoms, she states the numbness/tingling has nearly resolved; she will occasionally get a very mild tingling in her 4th/5th fingers that resolves after a few seconds. She denies pain or swelling of the arm. She no longer can palpate the clot and thinks that it is gone. She no longer feels swelling or tenderness in her left axilla. She stopped the ASA and started motrin/warm compresses as was advised by the ED. Her mild headache continues since the vaccine but is somewhat improved. She denies worsening or severe headache; denies vision changes, dizziness, lightheadedness, speech difficulty, etc. Phone encounter also from 4/20/21: Phone call placed to DVT clinic to get their guidance as Dr had talked with them last week. Reached RN, who reviewed with Dr. After review of patient's history/chart/growth of superficial clot, Dr recommended that patient not travel as planned and continue on 81mg ASA daily. They would like us to place a referral so they can see her later this week or early next week. They also want us to place order for repeat US either this coming Friday or Monday and they will coordinate to get this done at their office/same time as appointment. I did place phone call to patient to discuss and give their advice. They had just left this morning by car. I reviewed Dr advice to not travel and she will discuss with her husband if they are going to run around or not. She was agreeable to continuing on the 81mg ASA Daily and repeat US/visit with DVT clinic in 5-7 days as recommended.

An US was performed and showed a left cephalic vein thrombus of LUE. She was advised to start ASA 81mg daily for the next month and get repeat US in 7-10 days. She then called in with left breast pain/swelling and was directed to the ED for evaluation of possible blood clot. She does have hx of mastitis several weeks ago. The ED did not pursue additional imaging of breast, they told her it was likely lactational mastitis and they did prescribe augmentin and warm compresses for this. Today, patient presents states he feels "a lot better". Regarding the left breast lump, redness, swelling she states this has completely resolved. She did not start the augmentin as she was worried about this potentially causing thrush for her daughter; she explains she had mastitis 7-8 weeks ago and was on antibiotics and then her and her daughter continually passed thrush back/forth to each other 3x so she was hoping to avoid this. She did treat with frequent feeding/pumping, and warm compresses and symptoms resolved. She was told to see us for elevated blood pressure in the ER, per review of EMR and her DC papers, her blood pressure in the ED

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							was 130/75. Today her blood pressure is 122/78. Regarding her left arm symptoms, she states the numbness/tingling has nearly resolved; she will occasionally get a very mild tingling in her 4th/5th fingers that resolves after a few seconds. She denies pain or swelling of the arm. She no longer can palpate the clot and thinks that it is gone. She no longer feels swelling or tenderness in her left axilla. She stopped the ASA and started motrin/warm compresses as was advised by the ED. Her mild headache continues since the vaccine but is somewhat improved. She denies worsening or severe headache; denies vision changes, dizziness, lightheadedness, speech difficulty, etc. Phone encounter also from 4/20/21: Phone call placed to DVT clinic to get their guidance as Dr had talked with them last week. Reached RN, who reviewed with Dr. After review of patient's history/chart/growth of superficial clot, Dr recommended that patient not travel as planned and continue on 81mg ASA daily. They would like us to place a referral so they can see her later this week or early next week. They also want us to place order for repeat US either this coming Friday or Monday and they will coordinate to get this done at their office/same time as appointment. I did place phone call to patient to discuss and give their advice. They had just left this morning for another state by car. I reviewed Dr advice to not travel and she will discuss with her husband if they are going to run around or not. She was agreeable to continuing on the 81mg ASA Daily and repeat US/visit with DVT clinic in 5-7 days as recommended.

1234152	4/20/2021	MA	47	M	3/12/2021	3/18/2021	<p>Pt. had (what we think) a small seizure on Thursday, March 18th and then again on Saturday, March 20th. On Sunday, March 21st, 911 had to be called as his seizure did not end. He had a grand male. He was seizing for several hours. At the time this was all occurring he has been on anti seizure meds for a few years Divalproex 1000 mg am and 1000 mgs pm daily). He passed 1 week later, March 28 at approx 6:45pm at the Clinic. I am unable to get any information on his medical report for that week. Statement from his Nurologists is on second page. Additional information for Item 18: Statement: 47 year old gentleman who passed away on March 28 from aspiration pneumonia secondary to status epilepticus and on a history of multiple sclerosis / additional leukoencephalopathy of unknown etiology (both treated with rituximab), prior seizures (on valproic acid) and pulmonary embolism (on apixaban). The key reason for reaching out is in light of the announcement about the side effects of the Johnson &amp; Johnson vaccine specifically cerebral venous sinus thrombosis. While he had a known history of seizures, he had no clear trigger for these seizures; including that his valproic acid level was therapeutic (83.0 mcg/mL) at time of presentation. He had, however, received the Johnson &amp; Johnson vaccine on March 12 before having what in hindsight appeared to be repeated seizures between March 18-21; he had a more significant one on March 21 that hospitalized him. This time frame appears consistent with the reported cases of central venous sinus thrombosis associated with the Johnson &amp; Johnson vaccine. Equally, he was taking apixaban at that point in time and his PLT (173) / INR (1.1) / PTT (36.6) at time of presentation were all normal and stable. He did have an elevated ProBNP (552.0) at presentation; nasopharyngeal swab was negative for COVID / Influenza A/B / RSV and non-contrast head CT did not show any clear new abnormalities. His only D-dimer was obtained on March 23 and was 226. He did not have a CT angiogram or venogram. Overall the link between the vaccine and pt. seizures is not definite. At the same time, the similarity with the reported cases has led to me wanting to report it in case of the possible link. If you require further information then please don't hesitate to email me Pt. med list at the time of this incident Modifinil - 100 mg/1per day/AM Sertraline - 100 mg/1per day/AM</p>

1234170	4/20/2021	CA	46	F	4/9/2021	4/20/2021	We got a call from Doctor from ER to inform us that this patient came to the ER today & got swollen arm @ the injection site (left arm). They did the ultra sound & found there's a clot in brachial vein on the opposite arm (right arm). Doctor said they'll give pt Eliquis today.
1234219	4/20/2021	NC	52	F	4/14/2021	4/16/2021	On Friday 4/16/21 evening, I had my left tonsil spontaneously rupture without any provocation. I was not eating or drinking but felt like I had something in my throat. I coughed it into a tissue, and it was a blood clot the size of a nickel. My tonsil had 2 places that it was oozing blood and continued to bleed for about 1.5 hours. It eventually tapered off and the redness/bruising disappeared over the next 48 hours. There was no pain, no warning - just a mouth full of blood. The tonsil that ruptured was on the same side as where I received the injection and I had swollen lymph nodes under my arm on that same side until Sunday 4/18. I can't help but think it was related to the vaccine as I had no other cold/hay fever/allergy symptoms of any kind to explain a bleeding tonsil.

1229047	4/19/2021	IA	43	F	1/7/2021	1/18/2021	Hospitalized with cerebral venous sinus thrombosis from 1/26/2021-1/29/2021. Presented with severe headache. Treatment included anticoagulation initially with heparin infusion, followed by oral anticoagulation with Eliquis. She required prescription medications for management of headache. Discharged home with ongoing headache.
1228783	4/19/2021	TN	50	F	2/26/2021	3/1/2021	Patient received her 1st dose of Pfizer COVID vaccine on 02/26/2021. She noted some wheezing and slight shortness of breath and shared this information with her PCP at her regularly scheduled visit on 03/01/2021. PCP refilled inhaler at that time. Her shortness of breath progressively worsened, and she was seen by another provider as a walk-in at the office of her PCP on 03/13/2021. At that time, she was prescribed prednisone for 5 days, noting some improvement after a few days. She received her 2nd Pfizer COVID vaccine on 03/19/2021. The patient woke up on the morning of 03/20/21 with a swollen and painful leg and by 03/22/21 called PCP and was seen in the office. PCP ordered D-Dimer and LE ultrasound. Per the patient, the D-dimer was abnormal and the LE U/S showed a blood clot. PCP sent the patient to the ER, where a chest CT was ordered and showed a pulmonary embolus. She was admitted overnight and started on Eliquis, and discharged the next day after seeing a hematologist.
1228716	4/19/2021	TX	48	F	4/9/2021	4/10/2021	THE DAY AFTER VACCINATION, PATIENT HAD BURING SENSATION AND PAIN IN BILATERAL LOWER EXTREMITIES. REFERRED TO ER. ULTRASOUND SHOWED NO EVIDENCE OF CLOTS
1228712	4/19/2021	AR	70	M	2/10/2021	3/24/2021	Patient had blood clots in right leg and in each lung.

1227915	4/19/2021	MN	58	F		3/30/2021	<p>PULMONARY EMBOLISM; FEVER; SLIGHT COUGH; FEELING ACHY; CHILLS; This spontaneous report received from a patient concerned a 57 year old female. The patient's height, and weight were not reported. The patient's past medical history included right leg deep vein thrombosis (2011), arthroscopic meniscus surgery (2011), and superficial thrombophlebitis on left leg from mid-calf up to mid-thigh (AUG-2020), and concurrent conditions included factor V Leiden mutation. (2011). The patient was not on oral contraceptive pills. No immediate family had history of clots. A family member on mom's side has had clots. She had right leg deep vein thrombosis in 2011 after arthroscopic meniscus surgery on right knee, followed by long car ride. She was diagnosed with Factor V Leiden mutation in 2011 at the time of that clot. She was on warfarin for about 4 months then taken off. She did well for almost a decade. In last AUG-2020 had a superficial thrombophlebitis in left leg from mid-calf up to mid-thigh. She was Xarelto (rivaroxaban), monitored with ultrasound, taken off on 15/17-JAN-2021. The patient was previously treated with warfarin for right leg deep vein thrombosis, and rivaroxaban for superficial thrombophlebitis on left leg from mid-calf up to mid-thigh. The patient received COVID-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1808980), administered on 30-MAR-2021 for prophylactic vaccination. No concomitant medications were reported. On 30-MAR-2021, the patient felt good with slight cough on the day. She experienced achy by 7 PM, went to bed, then started getting the chills. At 2 AM on 31-MAR-2021 she had fever of 102 F. The laboratory appointment on Thursday, 01-APR-2021 unrelated laboratory was ordered. On 01-APR-2021, she was walking from parking lot to a building and was very short of breath. On 03-APR-2021, she was going up one flight of stairs, and felt severely short of breath and had dry cough. On 4-APR-2021, she experienced pain between shoulder blades in back. Oxygen saturation at home was 93-94% on RA while resting. On 4-APR-2021, she went to emergency room at a computerized tomogram (CT) of chest with contrast around at 6:30 PM showed massive pulmonary embolism. The right chamber the heart was enlarged due to the blockage from the embolism. Blood levels for "stress on heart" came back high. The patient</p>

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

went to cath lab for pulmonary angiogram on 4-APR-2021 and had EKOS catheter direct thrombolysis. She was started on heparin and transitioned to Xarelto (rivaroxaban) on 5-APR-2021. She was on blood thinners and the left lung was cleaned up and removed. The clot was still on the right lung, unable may or may not be cleared. The patient was discharged on 06-APR-2021. The patient was hospitalized for 2 days. On 04-APR-2021, Platelet count was 181 (normal range 140-440), on 5-APR-2021, Platelet count was 160 (normal range 140-440), on 6-APR-2021 Platelet count was 154 (normal range 140-440). At the time of this massive PE event, the patient was not on any anticoagulation and since the event, had been restarted on Xarelto, and she was told she needs to continue for life. The action taken with COVID-19 vaccine ad26.cov2.s was not applicable. The patient had not recovered from pulmonary embolism, and the outcome of feeling achy, chills, fever and slight cough was not reported. This report was serious (Hospitalization Caused / Prolonged, and Life Threatening).; Sender's Comments: V0: A 57-year-old woman with a history of Factor V Leiden deficiency (off anticoagulation for several months) and previous DVT 10 years ago was hospitalized for pulmonary embolism four days after vaccine. The same day after vaccine, the patient reported chills and a 102 F fever. Two days after vaccine she experienced shortness of the breath and four days after vaccine, the shortness of breath became worsened with pain in the back between the shoulder blades. The patient went to the hospital and was diagnosed with massive pulmonary embolism with enlargement of the right side of the heart. She underwent direct catheter thrombolysis in the cath lab and was started on Xarelto. The patient was hospitalized for 2 days and is doing well. Although there is a close temporal relationship, the history of Factor V Leiden with previous DVT provides plausible alternate explanation for the event.

1229461	4/19/2021	MO	30	F	4/5/2021	4/7/2021	I had my first dose of Covid 19 Pfizer vaccine on the 5th of April, 2021 at 1pm. I had sore arm and was fatigued which was expected. However, the day I had my vaccine was also the day my menstrual cycle started and just to assure myself I informed the pharmacist and asked if that was okay and they said it shouldn't be a concern. I was doing fine until toward the end of day 3. I was expecting my period to stop as it always does on 3rd day but I started bleeding heavier that day there after. It didn't worry me much until I started discharging huge blood clots as big as an apple 2 times every after 30 mins from that moment. I rushed to the ER later that night(still bleeding heavily with blood clots every now and then) but I was not admitted since my vitals and the blood counts were normal at that moment. I went back home and hoped the bleeding would stop but again with on pain or fever what so ever I kept bleeding all day. This is my 5th day of bleeding. Then on Sunday morning, I still kept bleeding heavy and I was too weak that I went back to the ER again. This time , (day 6) I got admitted because I have had lost a lot of blood and I needed blood transfusion. My HB dropped from 11.3 to 6.7 and it went further down to 5 something. I got 3 units of blood transfusion in the ER. They did ultrasound, CT scans(with and without contrast) and still couldn't figure out the cause of the bleeding. My uterus showed no problems but my body was not even responding to Tranexamic acid to stop the bleeding. So the doctor proceeded with an angiogram and did an emergency uterine artery Embolization to stop the blood supply to the uterus. The bleeding stopped there after and I started regaining my vitals. However, the cause of the bleeding still remains unknown.
1229416	4/19/2021	CA	53	F	3/17/2021	4/5/2021	Patient diagnosed with a left arm deep vein thrombosis that extends from the forearm to the lateral part of the subclavian vein- nonocclusive in some areas.

1229175	4/19/2021		61	M	4/1/2021	4/15/2021	Starting about 2 weeks after vaccine administration in left deltoid, patient started having a blotchy rash on left inner forearm. It looks like a giant bruise or almost like bleeding under the skin. Dark round circles. No pain, swelling, itchiness, or fluid. No pain on applying pressure to it. Was worried it was a blood clot but we think it is associated with receiving the vaccine as it is only in the left forearm. Patient states that it is "clearing up".
1229402	4/19/2021	SC	85	F	3/31/2021	4/10/2021	Patient was hospitalized due to multiple blood clots, including jugular, brachial, and others. Patient was hospitalized for treatment on 4/10/21 and is still there.
1229055	4/19/2021	TX	33	F	3/10/2021	3/29/2021	I found out about my pregnancy the day I got the vaccine (which was after I got the vaccine). After that I proceeded to get a pregnancy test confirmation (march 26) and it came back positive from the doctors office. On March 28 I began to have bleeding and I passed a blood clot the size of a baseball. I called the nurse line that next day and they told me they could not give me any medical advice because I had not been seen by a doctor for this pregnancy. During that week I began to experience a rash that began in the middle of my chest and proceeded to spread All over my stomach and back. It is now April 19 in the rash has continue to spread all over my limbs. On April 5 I went to the pregnancy clinic and was also getting a ultrasound and they were unable to locate the embryo in the uterus. On April 15 I got an ultrasound transvaginal and they were unable to locate an embryo or in a heartbeat. I then went to the hospital the next day on April 16 the hospital that I received my vaccine at and they did not give me any care and told me that my rash was a possible contact to something I may have come in contact recently. I try to express to the doctor that I've been experiencing issues since I received the vaccine and he did not connect any of the dots to my experiences. As of today April 19 I have come across several Different websites that state that red spot is a part of the symptoms an adverse reaction to the vaccine or should be of concern.
1229208	4/19/2021	CO	76	M	3/11/2021	3/21/2021	Patient urinated and passed a small blood clot. Happened once ten days after vaccination and then resolved. Patient had another episode 4/9/2021, passed small blood clot with urination, and again, resolved

1229080	4/19/2021	CO	41	F	3/8/2021	3/19/2021	<p>Patient is a 41 yo woman with no PMH who presented to an outside urgent care with left flank pain found to have a wedge-like defect in the posterior left lower renal pole suggestive of a renal infarct. She underwent CTA which did not show any embolism, thrombus, dissection. The radiologist did note mild beading of the bilateral renal arteries, however the radiologist at Valley View reviewed the images as well and was not as convinced. Left renal infarct: Given suggestion of mild feeding of the bilateral renal arteries, patient underwent CTA of the chest, head and neck which did not show any other signs of fibromuscular dysplasia. Echocardiogram did not have any thrombus or decrease in function. Patient did not have any arrhythmias on telemetry. Blood cultures were ordered and pending on discharge, but patient did not have any of endocarditis. A hypercoagulable work-up including factor V Leiden, protein C, protein S, Antithrombin, lupus anticoagulant, beta-2 microglobulin, anticardiolipin antibodies were all sent and are pending at the time of discharge. Discussed the case with hematology at hospital: Most experts treat with 3 months of anticoagulation other evidence is not entirely clear and aspirin 81 mg may be a reasonable choice. In light of the patient's lack of insurance, decision was made to treat with 1 month of apixaban followed by 81 mg of aspirin daily indefinitely. Discharged with a short course of oxycodone 5 mg #15.</p>

1227921	4/19/2021	TN		F	3/1/2021		DVT; HEADACHE; UNCONTROLLED SHAKING; TROUBLE BREATHING; FEVER; This spontaneous report received from a company representative concerned a 29-year-old female. The company representative heard the information on the local news. The patient's height, and weight were not reported. The patient was taking estrogen-based birth control pills. The patient received COVID-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: Unknown) dose was not reported, administered on 19-MAR-2021 for prophylactic vaccination. Concomitant medications included estradiol for birth control. On an unspecified date in MAR-2021, one-week post-vaccination, patient developed uncontrolled shaking, had trouble breathing and fever. She went to the emergency room for her symptoms and was sent home (no time frame was reported). One week later, she developed swollen legs and couldn't walk, and she was diagnosed with a deep vein thrombosis (DVT). On an unspecified date she was hospitalized and admitted in the intensive care unit (ICU). Patient was out of the ICU on 11-APR-2021 (Sunday). Patient was still under treatment. It was also reported that patient had headache that persisted for 2 weeks. The report was from the local news and follow-up was not possible. The action taken with COVID-19 vaccine ad26.cov2.s was not applicable. The outcome of the uncontrolled shaking, trouble breathing, fever, headache and DVT was not reported. This report was serious (Hospitalization Caused / Prolonged, and Other Medically Important Condition).; Sender's Comments: V0: This is a spontaneous report of a 29-year-old female who developed a deep vein thrombosis two weeks after receipt of the Janssen COVID-19 vaccine. She also reported uncontrolled shaking, trouble breathing, and fever one week after vaccine administration, and a headache which had persisted for two weeks. No medical history was reported; she was taking estrogen-based birth control pills. Estrogen-based birth control pills place the patient at risk for thrombosis, but there are insufficient other details to make a meaningful medical assessment regarding the events in the case.

The patient received COVID-19 vaccine ad26.cov2.s (suspension for injection, intramuscular (right deltoid), batch number: 043A21A) dose was not reported, administered on 05-APR-2021 for prevention of covid-19 disease. No concomitant medications were reported. On 05-APR-2021, an unspecified amount of time after vaccination, the patient experienced arm soreness and tiredness that resolved within 3 days. On 15-APR-2021, 10 days after vaccination, the patient experienced calf pain and blood clot. It was reported the patient felt a very sharp pain on her right calf while walking, pain scale was 8/10, and it was so painful that she could not put pressure on it. Therefore, she decided to go to the hospital to have it checked. Her attending physician confirmed based on ultrasound that she has a blood clot on her right leg. She was prescribed blood thinner Eliquis (apixaban) however she was still undecided because her insurance denied to cover it and it was out of pocket. Once she returned home, she stated that the sharp pain was gone and it was just achy. After conversation with her physician, her physician postponed the medication for now because he wanted to make sure that her blood was not already thin before prescribing a blood thinner. She will go to the hospital again on 16-APR-2021 to see a hematologist for blood works and her physician advised her not to work until 20-APR-2021 as a preventive measure. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from arm soreness, and tiredness on 08-APR-2021 and had not recovered from blood clot. This report was serious (Other Medically Important Condition, and Life Threatening).; Sender's Comments: V0: a 36-year-old female experienced a blood clot in her right leg, 10 days after receiving the Janssen COVID-19 vaccine for prevention of COVID-19 infection. The patient is a non-smoker, her BMI is 34.5; she has no other relevant medical history and reported</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							no concomitant medications. Ten days after receiving the vaccine, she felt a sharp pain, graded 8/10, in her right calf while walking. Ultrasound showed a blood clot on her right leg. She was prescribed Eliquis but did not fill the prescription and the pain subsided; she was to have further blood tests and see a physician the following day. Additional information is being sought.
1228271	4/19/2021	IL	30	F	3/20/2021	4/16/2021	Patient has been having left arm pain. Developed acute, partially occlusive left subclavian deep vein thrombosis found on duplex on 4/16/21. She was started on lovenox and will have further work-up.
1228553	4/19/2021	KY	65	F	4/5/2021	4/18/2021	The patient presented to the emergency department with altered mental status, dry heaving, and body aches. She was found to have a partially occluding thrombus of the right cephalic vein consistent with venous thrombosis, as well as findings of thrombosis in the anterior segment branch of the right portal vein. She had a d-dimer of 25.77 increased to 35.2, and was thrombocytopenic with a platelet count of 92, which dropped to 36 the following morning. Platelets to present were: 92-36-32-23-19-28. The patient received the Johnson & Johnson COVID-19 vaccination two weeks prior to presentation.
1228515	4/19/2021	VA	68	M	3/19/2021	3/20/2021	I had a blood clot on right side of brain resulting in stroke and not being able to use left side of body.

1228508	4/19/2021	TX	42	M	3/10/2021	3/31/2021	Pt was found in severe distress in the bathroom by his wife. He couldn't walk or stand, complained of being dizzy with slurred speech and was throwing up a lot. 911 was immediately called. The EMTs during their assessment said his BP was normal but when he was asked his name, he started saying the alphabet"ABC... XYZ". He was transported by ambulance to ER. Cat scan showed he had a bleed on the brain. The doctors told us it was because he had very high blood pressure, however where the bleed was, they said he wouldn't need surgery and that the body would reabsorb it over time. He was admitted to the ICU and has been there ever since. Several days later, he started having difficulty breathing and they discovered several blood clots in his right leg that had broken off into his heart and lungs. He had emergency surgery to remove the clots in his heart (approximately 10) and was given heparin in small doses over an 8 hour period so that it wouldn't cause the bleed in his brain to increase. The doctor should fill in the rest.

1228483	4/19/2021	PA	58	M	3/31/2021	4/4/2021	He got his vaccine, and on Sunday he thought that he had a cramp in his leg, and asked his wife and told her that he had this. By that afternoon he still had the cramping feeling, and started drinking water as his wife is a nurse and felt that he may be dehydrated. Throughout the week he had a Charlie Horse pain in his left calf, and felt that it was getting worse and not going away. The whole week he went to work and on the 7th day it started swelling and went to Hospital after he got off of work, and he saw a resident Dr. who said that his leg was swollen and told him that she was going to schedule an ultrasound. He had that on Friday on 4/16/21, and was scheduled for 4:00 but due to the pain went to the ER and gave him IV and checked his blood work. The ultrasound showed that he did have a blood clot and prescribed Eliquis and gave him a dose while in the ER. He told him that he would be on that for a while. He is supposed to see the resident this afternoon for recheck. He is still having pain and wanting to know where he is going to do from this point. He does work out every day at his home gym and has not smoked, and now wanting to know how this is going to affect his life from this point into the future. He also jumps rope 3 times a day and now not able to do this.

1227917	4/19/2021	NJ		M		4/4/2021	<p>BLOOD CLOT IN LEG; This spontaneous report received from a patient concerned a 72 year old male. The patient's height, and weight were not reported. The patient was reported to be over 6 feet tall and not overweight. The patient's past medical history included cataract surgery (in his 60s); and concurrent conditions included former smoker (ex-smoker who quit 1 year ago). The patient had no chronic medical conditions and had no history of recent travel or trauma. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: Unk) dose was not reported, administered on 01-APR-2021 for prophylactic vaccination. The batch number was not reported and has been requested. The patient was not taking any concomitant medications. On 04-APR-2021, the patient's leg felt abnormal and on 05-APR-2021, the patient went to urgent care center, where an ultrasound found a blood clot. The patient was prescribed Eliquis (apixaban) and was since feeling better, however, still had leg discomfort. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient was recovering from blood clot in leg. This report was serious (Other Medically Important Condition). Additional information was received from consumer (daughter of patient) via telephone follow up on 16-APR-2021. The following information was updated and incorporated into the case narrative: patient details, medical history, concurrent conditions, medical story including treatment, and event details.; Sender's Comments: V1: Follow up from the patient's daughter provided additional clinical details. This case concerns a 72 year-old male without significant medical history who was diagnosed with a blood clot in his leg 4 days after receiving the Janssen Covid-19 vaccine. He is not overweight, is not taking chronic medication, and had no recent trauma or travel. He quit smoking one year ago. Three days after vaccination, his leg felt abnormal. The following day, he went to an urgent care center where an ultrasound revealed a lower extremity blood clot. He was sent home with apixaban. No information regarding blood testing was provided. As of the time of the report (i.e. 11 days after his diagnosis), he is feeling better but still has leg discomfort. Based on the limited information, the relationship with Janssen Covid-19 vaccine is considered inconsistent. Additional information is being sought.</p>

1227977	4/19/2021	IN		M	3/24/2021	3/26/2021	<p>Pulmonary embolism/ blood clot/ passed out; This is a spontaneous report from a contactable consumer (patient's daughter). A male patient of an unspecified age received BNT162B2 (Pfizer COVID-19 vaccine), dose 1 via an unspecified route of administration, administered in arm, side unknown, on 24Mar2021 14:30 (Lot Number: EN6208) as single dose for COVID-19 immunisation. Vaccination facility type was clinic. Medical history included colon cancer in 2011. He had cancer in 2011 but resolved that year without chemotherapy or radiation. His lab work was good. There were no concomitant medications. No prior vaccinations (within 4 weeks). No family medical history relevant to AE. The patient experienced pulmonary embolism on 26Mar2021 with fatal outcome. The reporter was reporting on the Pfizer COVID vaccine that her father received. She stated he died from a blood clot after receiving the first dose. Stated she needs help because he had no health issues and he died. She just wanted this information to be out there and for people to be aware. This morning they had been reading on the news that the Johnson and Johnson vaccine is on hold. It seems to be put on the market without research. She felt like her father was a guinea pig. Her mother didn't want to get her second dose. Stated there seems to be an issue with Pfizer too. Her father had no issues whatsoever. His death certificate stated the cause of death was a pulmonary embolism, but he had no history of blood clots. Passed away Friday 26Mar2021 at 11:33 am. The reporter stated when he went to Emergency Room they thought he was having a heart attack. All physicians were wondering what happened because he had no health issues. The event required a visit to the emergency room that day because he passed out at his job. The patient underwent lab tests and procedures which included lab work: good in 2011. The patient died on 26Mar2021. An autopsy was performed that revealed pulmonary embolism.; Reported Cause(s) of Death: Pulmonary embolism; Autopsy-determined Cause(s) of Death: Pulmonary embolism</p>

1228608	4/19/2021	CA	59	F	3/13/2021	3/13/2021	She got the vaccine and immediately she got the headache, loss of appetite, dizziness. The next day she had the aches and pains, nausea, loss of appetite, vomiting and she is still going through it on 4/19/21 and this is her first day back to work. She did have brain fog, nose was bleeding everyday and was put on antibiotics as her arm swelled up. Her arm swelled up, and went to the ER who said that she had an infection in it, and gave her antibiotics and anti-inflammatories. The infection did go away but the inflammation and swelling are still present. She started getting numbness in her arms and legs, and had a CT scan which did not show any blood clots. She is waiting on a referral to a neurologist to see what is going on with that. She also has been having problems with her lungs, asthma has been acting up and gave her a shot to open her throat as it was slowing closing and gave her a steroid shot to stop the swelling as she was having difficulty speaking. If she talks too much her throat gets irritated and starts to lose her voice. She has been in and out of the ER and UC due to this. She never had a fever, rash, or anything else. She does still have a lot of weakness.
1228364	4/19/2021	PR	68	F	4/9/2021	4/16/2021	On Monday April 12, my mother reported leg pain which she thought was related to a flare up of her knee (surgery 4 years ago). She described her pain as a strong sharp pain, that spread throughout her calf area. She reported it as increasing in pain and worsening daily. By Friday April 16th I asked her to report to Emergency Department. At which time she was told she had a blood clot in her right leg.

1230848	4/19/2021	AZ	64	F	4/5/2021	4/12/2021	Exactly a week after receiving the J&J vaccine, I was out on my morning walk when my head became very fuzzy and my vision was altered (seeing jagged zigzags-fuzzy ones with my left eye). The vision issue persisted when I closed my eyes. The fuzzy head issue continued during a very difficult walk home and when I arrived and things didn't clear, my husband ended up taking me to the emergency room. I got in quickly because the symptoms I described sounded to them like a stroke. But, I didn't have a stroke. They did a CT scan. It was fine. The vision thing they thought sounded like the effect of a migraine. But, I've never experienced migraines. (Note: this incident occurred the day before the news of the J&J blood clots became public). Anyway, after a couple of hours in the emergency room, I was fine and went home. So, I don't know what happened and it probably didn't have anything to do with the vaccine. I'm not prone to being alarmist and I would only consent to go to the emergency room if I thought I were in a serious situation. The blood work indicated my platelets were in the normal range. And, I'm too old to be in the category of the six women who experienced blood clots. However, I just thought I should report this in case anyone else experiences something similar.

1230972	4/19/2021	FL	74	F	2/27/2021	4/13/2021	<p>Blood Clot in the Left leg; Pain in the Left Leg; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of THROMBOSIS (Blood Clot in the Left leg) in a 74-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 007B21A and 007B21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Blood pressure high. Concomitant products included LISINOPRIL and HCTZ for Blood pressure high. On 27-Feb-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 27-Mar-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 2 dosage form. On 13-Apr-2021, after starting mRNA-1273 (Moderna COVID-19 Vaccine), the patient experienced PAIN IN EXTREMITY (Pain in the Left Leg). On 14-Apr-2021, the patient experienced THROMBOSIS (Blood Clot in the Left leg) (seriousness criterion medically significant). At the time of the report, THROMBOSIS (Blood Clot in the Left leg) and PAIN IN EXTREMITY (Pain in the Left Leg) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 14-Apr-2021, Ultrasound joint: ultrasound (abnormal) Blood Clot in the Left leg. Patient did not have a history of Blood Clots. She was Not taking any hormones (Estrogen, Progesterone) Treatment for event included Eliquis for blood clot. The patient received both scheduled doses of mRNA-1273 prior to the events; therefore, action taken with the drug in response to the events is not applicable. Based on the current available information and temporal association between the use of the product and the onset date of the reported event a causal relationship cannot be excluded.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the onset date of the reported event a causal relationship cannot be excluded.</p>

1231007	4/19/2021	NY	70	F	2/21/2021	2/22/2021	The day after I received the vaccine I felt pain in my right leg. I went to a pain mangagement doctor and he ordered an ultrasound. It revealed that it was negative for a blood clot but it was an psuedo aneurism. I then had a CTA scan that revealed that it was a Popiteal aneruism. The doctor does not know the cause of this but said that it could be a reaction from the vaccine.
1231017	4/19/2021	NV	63	M	3/11/2021	3/18/2021	ultrasound found first blood clot behind left knee on 3/18/21....Another clot on left ankle on 4/08/21.... Another clot on left shin on 4/16/21.... Doctor prescribed Xarelto on 3/18/21... Since that date the 2 later blood clots have formed... I have NEVER had a blood clot before receiving Jansen vaccine at a community church on 3/11/21
1231037	4/19/2021	NM	61	U	4/15/2021	4/15/2021	Patient experienced leg pain with first vaccine that continued and only worsened with second shot. He also had 4-5 episodes of headaches that went away and SOB episodes when talking. Cramps in left leg: He went to the hospital. The ultra sound lady said she saw a small clot. The PA he saw reported the radiologist did not diagnose a clot. The PA cautioned from prescribing any blood thinners for fear of interacting with DM medications (metformin and lisinopril). The PA gave the green-light for the second shot. Symptoms worsened after booster.
1231133	4/19/2021	MT	76	M	2/18/2021	3/10/2021	Severe blood clots on both lungs
1231186	4/19/2021	TN	18	M	4/5/2021	4/16/2021	Approximately 11 days after receiving my first dose, I began feeling dull pain in my left calf. By Saturday, 4/17, the pain was severe enough to warrant a trip to the emergency room. After receiving an ultrasound of my leg, two blood clots were found in my left calf. One fully occluded a vein and another partially occluded a different vein.

1231210	4/19/2021	IN	57	M	3/12/2021	3/15/2021	I received the vaccine on 3-12-21 and woke up 3-15-21 with pain in the bottom of my left foot. I scheduled an apt with my PCP on 3-16-21. My PCP scheduled an ultrasound on 3-24-21 where the nurse discovered blood clots in my lower left leg. I started taking Eloquis later that afternoon. I then had an apt with a blood dr. on 4-9-21 where she drew blood for tests. I was experiencing my heart racing and she scheduled me an apt with a cardiologist on 4-13-21 where the cardiologist suspected that the clots had moved into my lungs. The cardiologist did an EKG on the same day. I have a heart echo scheduled for 5-7-21. I am experiencing side effects from Eloquis so 4-19-21 I switched to Xeralto.
1231267	4/19/2021	MA	21	F	4/16/2021	4/17/2021	The day following the injection, I had vaginal spotting that was bright red, not clots, and severe cramping. Note that this was not during the menstruation portion of my cycle. It lasted for about 2 hours.
1229630	4/19/2021	WA	64	M	3/28/2021	4/7/2021	Pain in lower left bicep in first week, experiencing fatigue/tiredness. After 10 days I experienced severe pain at the site of injection, very small red spot appeared around injection site. Pain was so severe, I took one capsule hydrocodone 5-325 TB at 2 AM. The medication did not cure the pain, and I slept less than two hours. I called my nurse practitioner's office, and they offered an appoint late in the morning. And I couldn't wait that long so I drove to urgent care. Prompt care examined and saw no swelling, ruling out possible blood clot. Prompt care did not have ultra sound. They told me to use ice, heat, and pain medication. Extreme pain continued for about three more days, pain medication did very little to help. Unable to speak directly to the Nurse Practitioner on the phone, due to my disability and alexia, communicating online is very difficult without an assistant present. The pain slowly subsided over the next week.

1231266	4/19/2021	NV	30	F	4/6/2021	4/6/2021	Around 5:30 pm in the evening following my vaccine I started having chills, headache, nausea, and fever of 101. Chills got worse, whole body was shaking and shivering. Nausea progressed into constant dry heaving. Head was pounding with the worst pain I have ever felt in my life, worse than natural child birth and worse than running marathons. The nausea was so bad and I could feel my fever burning and getting worse. I was about to vomit so got out of bed to go to the toilet to vomit and the whole room started spinning completely out of control. My heart was racing and I could hear it and feel it pounding rapidly through my ears. I couldn't walk and was so disoriented I crawled to the bathroom to throw up in the toilet. My husband heard me and came and picked me up off the bathroom floor and carried me to our bed. As the night progressed fever got worse, head was in almost unbearable pain, severe body aches over my whole body, heart racing and horrible nausea and dry heaving. I made it through the night. For two days after I had a headache and fever and nausea and body aches and couldn't get out of bed to care for my children. By the third and fourth day I was able to get out of bed at times and still felt fatigue, nausea, headache and body aches. Anytime I would stand up for 10 days after the vaccine it felt like I was rocking on a boat. I am almost at 2 weeks and still feel fatigue and dizziness at times. On April 15th, 9 days after my vaccination I had symptoms of a blood clot in my leg. I went to the Emergency Room and was diagnosed with a superficial blood clot of the leg as well as swelling in the vein. I am thankful to be alive!
1230927	4/19/2021	VA	37	F	2/15/2021	2/20/2021	Extremely heavy period bleeding started on February 20th out of no where. Bleeding contained big clots and was very heavy. Went to my GYN on March 15th who prescribed a five day supply of Tranexamic acid. On March 20th, my bleeding finally stopped.

1229975	4/19/2021	TX	70	M	2/24/2021	2/28/2021	Reported by patients wife. She Reports blood clot in left leg "from thigh to calf". Treated with blood thinners since beginning of March 2021. Has taken Enoxaparin Sodium 100mg bid since onset and recently started on Xarelto by hematologist 04/16/2021.
1230337	4/19/2021	FL	41	F	2/9/2021	4/19/2021	I developed a rash 3 weeks after my second shot on my legs arms stomach and back. Not going away does not itch red spots doctor treated with ABx didnt help gave me prednisone no help. Today noted blood when I wiped saw blood and clots in toilet my period just went off last week now I'm bleeding again this has never happened before. I am very concerned please contact me asap
1230389	4/19/2021	VA	65	F	3/8/2021	3/15/2021	High fever, severe night sweats, blood clots in lungs
1229680	4/19/2021	MO	46	F	4/6/2021	4/7/2021	Received Janssen vaccine 4/6. Started menstrual cycle 12 hours after vaccine even though had just completed last cycle 1 week prior. Normally cycles are 28-30 days apart. They have not been quite as regular since Covid and has had some shorter periods between normal cycles. After the vaccine bleeding was heavier than normal with large clots but by end of last week had changed color and looked like it was ending. Today had no discharge upon awakening but again has a small amount of bright blood. Of course, there is concern for coagulopathy related to the vaccination. No leg pain, no shortness of breath. Has had HA off and on since had Covid but no worse now than in previous weeks. Left ear pain has been painful since Covid but now has pain in both ears when that occurs. Quit taking ibuprofen last week for discomfort and switched to Tylenol.
1230006	4/19/2021	AZ	44	F	4/12/2021	4/12/2021	Patient's husband reported that patient has been feeling nauseated since she received the vaccine and that she has started having stomach cramps. He reported that they are concerned about her having blood clots and he was informed to take her to the her primary care if that is a concern. He bought OTC aspirin and reported that he will have patient take it for the new two weeks. He was advised to take patient to the doctor is nausea and cramping persist.

1230189	4/19/2021	LA	35	F	4/10/2021	4/12/2021	I received the vaccine on day 5 of my period. I take no hormones of any kind and my periods are regularly 5-7 days in length. My period began on 4/6. Instead of beginning to wane, my period started to get extremely heavy and I started passing clots again about 24hr after the injection. On the night of 4/12 I passed an unusually large clot, roughly the size of a hockey puck and felt very faint and weak. I continued to bleed quite heavily until this morning (4/19), for a total of 14 days. I called my obgyn on Tuesday of last week to report the excessive bleeding and that my cervical lymph nodes had become so swollen that it was bothersome to swallow. My Dr said to go to ER if I experienced typical blood clot/PE symptoms and had received no guidance about the effects of this vaccine on menstruation. I have had mild headaches, sore throat, mild fevers and fatigue as well since the injection
1230142	4/19/2021	CA	57	F	4/11/2021	4/11/2021	5 minutes after injection my forearm and hand began to tingle and have pressure, nerve type pain. No breathing issues so was sent home. Reported the continued arm pain the next day to the doctor and she ordered an ultrasound. Report negative on blood arm clot. Got a fever, body aches, headache, tired, triggered a migraine per doctor, localized reaction of 2 3/4" at injection site with redness, swelling, pain. Almost passed out at a store - Became dizzy, tingling hands and sweating and taken to ER by ambulance. ER ruled out blood clot but found I had a UTI without any symptoms-prescribed an antibiotic. Continue to have minor headache and minor discomfort at injection site. Awful experience and adverse reactions!
1230134	4/19/2021	DC	44	F	3/28/2021	3/31/2021	Started to feel chest pain and shortness of breath 3 days after the vaccine. Ended up in the hospital 5 days after the vaccine and diagnosed with blood clots in the lungs.

1230114	4/19/2021	WA	29	F	4/6/2021	4/6/2021	Headache that night of the shot (within an hour or two of the shot). That lasted until Thursday evening and going into Friday. I didn't wake up with it. I took 600 mg of Ibuprofen at bedtime on Wednesday. Didn't wake up with the headache Thursday. I started getting body aches all over my body on Wednesday and they got worse until about 2:30 and I took a 15 min nap and woke up and felt a little better but I had them all the way to bedtime. And I was cold. That was until 1:00 PM on Wednesday. Wednesday night at 06:00 pm, on my left foot from arch to my toes I had a hot sensation. I thought one of my pets had pidd on my foot - hot and wet feeling. But they didn't. That has been happening frequently and intermittently and I am still experiencing them. The level of heat has decreased - it is warm and wet instead of hot and wet feeling. Happens frequently throughout the day. On Friday, I noticed, I had a rash on my left forearm. I noticed it on Friday evening and that went away on Thursday of last week after I was able to be hydrocortisone ointment on it for a few days. The rash was really itchy. Patient portal - messages to doctor: She ruled out deep vein thrombosis - Naturopathic Oncology .
1225680	4/18/2021	MO	43	F	4/6/2021	4/6/2021	Approximately 6-8 hours after the vaccine experienced chills, body aches and developed 100.3 fever. The night was miserable with fever, chills and dizziness when walking to the bathroom. The next day low grade fever and chills that began to subside around 24 hours post vaccination. For the next 48 hours had residual aches and fatigue. Began feeling significantly better after the 72 hour mark. However, after learning about blood clot issue has been having anxiety and some left sided pain that I'm not sure if it's anxiety or migraine related or possibly something worse.
1225652	4/18/2021	CO	40	F	4/2/2021	4/13/2021	Approximately 11 days s/p 2nd vaccination, patient developed calf pain. After the pain persisted for two days she went to the local emergency room and was diagnosed with a DVT. No personal or family history of blood clots. No precipitating life events. No culprit medications. Age appropriate cancer screening up to date.

1225290	4/18/2021	NY	66	F	3/30/2021	3/30/2021	Immediately upon receiving the shot I had a severe headache in the back of my head and in my upper back. It reminded me of the pain I had with the TIA several years ago. I told the pharmacist that gave me the shot and she said that it was something she had not seen before so quickly sat there for 30 minutes. The pain continued but was not quite as severe. I left with my son and almost when to the hospital but decided to come home and monitor. It lasted three days and I still get random pains there in the back of my head. I suffer from anxiety so I had thought at the time that it possibly could have been nerves. But now in light of the reported cases of blood clots and the fact that I have had at least one TIA...maybe two, I thought that I should report this incident. It was an immediate severe pain!!
1225926	4/18/2021	MI	35	F	4/8/2021	4/17/2021	Dural venous sinus thrombosis.
1225184	4/18/2021	AR	56	F	4/7/2021	4/13/2021	On April 7th received Janssen COVID vaccine at pharmacy. On April 13 started developing shortness of breath and dizziness/light headed. Had knee surgery at hospital the 14th on right knee to remove cyst (scheduled surgery). On 15th still short of breath and felt like had cold. Worsening SOB on 16th. On 17 was SOB walking from bathroom. Talked to daughter on phone and she said to go to ER. Went to ER about 8pm and Was diagnosed with bilateral blood clots in lungs and admitted to step down on heparin drip. Getting Echo TEE on Monday 19th and bilateral leg ultrasounds today on 18th

1224928	4/18/2021	MA	48	F	4/1/2021	4/2/2021	Blood clot DVT in left leg.; Blood clot DVT in left leg.; This is a spontaneous report from a contactable consumer. A 48-year-old non -pregnant female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), at the age of 48 years, via an unspecified route of administration, administered in the left arm on 01Apr2021 10:45 (Batch/Lot number was not reported) as a single dose for covid-19 immunization. The patient has no medical history. Patient has not had Covid prior to vaccination. The patient has no known allergies. The patient's concomitant medications were not reported. The patient experienced blood clot DVT in left leg on 02Apr2021 at 09:00. Treatment for the event includes blood thinners. It was reported that the AE resulted in: Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care, Life threatening illness (immediate risk of death from the event). The patient underwent lab tests and procedures which included nasal swab for covid test on 02Apr2021 which had a negative result. The outcome of the event was not recovered. Information about Lot/batch number is requested.
1225320	4/18/2021	IN	56	F	4/1/2021	4/16/2021	Hives over most of body. Extremely itchy. Started on day 15 after vaccine. Went to urgent care on day 16. Put on Hydroxyzine, famotidine, clotrimazole/betamethasone topical ointment. Day 17 woke up and am 75% better on itchiness. Welts are still there but puffiness is mostly gone.
1225703	4/18/2021	NC	68	M	2/13/2021	3/18/2021	ON 3/18/2021 I had a massive stroke due to several blood clots in the caratid artery and in the brain. I survived and am now in the process of rehab to regain full mobility.

1225799	4/18/2021	FL	53	F	4/3/2021	4/11/2021	4/11/2021 830PM I NOTICED MOISTURE IN MY UNDERWEAR. WENT INTO BATHROOM , PANTIES BLOODIED, BRIGHT RED AND A QUARTER SIZED CLOT WAS IN THE TOILET. I SUFFERED NO PAIN. HOWEVER I HAD A TOTAL HYSTERECTOMY IN 1997, AND SHOULD NOT HAVE ANY BLEEDING WHATSOEVER. TOOK A SHOWER, ADVISED MY HUSBAND OF THE INCIDENT. WENT TO BED , 230AM 4/12/2021 SAME THING HAPPENS, ONLY NOW I AM WIPING BRIGHT RED BLOOD AND I FELT A LARGER SIZED CLOT LEAVE MY BODY. I WENT TO THE ER IMMEDIATELY.
1225816	4/18/2021	MS	75	M	4/5/2021	4/12/2021	Almost exactly seven days after my second Moderna shot, I had a urination which was dark blood red. It included a small blood clot, which by my estimate was at most 1/2" long by 1/8" in diameter. There was no pain or burning on discharge, either with that urination, or before, or after. My next urination after that had a very small amount of dark red discoloration; and there has been no dark red in my urine after that [now six days]. Following that bloody urination, I did have a slight discomfort in the area below my belly button for several hours, but then it stopped. Since that incident, I have increased my intake of water and decreased my intake of acidic and carbonated drinks. I have not smoked in more than 45 years; and the occasional urinary dribbling I had experienced for some years before that incident has decreased noticeably. All else is OK. As a non-healthcare professional, I concluded the outcome to date is good. I have an appointment to see my doctor, on April 22.
1225906	4/18/2021	PA	45	M	4/9/2021	4/10/2021	Patient received his second Pfizer vaccine on Friday. Saturday he came down with symptoms that we considered were like the stereotypical second dose. Fever, cough, shortness of breath, coming and going. It lingered until Tuesday, at which time he got a Covid test-negative. Went to dr, and he said there was a possibility of blood clots. Tests showed that he had severe pulmonary embolisms in both lungs- the main and 3 secondary arteries.

1225942	4/18/2021	WI	16	F	3/19/2021	3/28/2021	Patient was a 16yr female who received Pfizer vaccine 3/19/21 at vaccine clinic and presented with ongoing CPR to the ED 3/28/21 after cardiac arrest at home. Patient placed on ECMO and imaging revealed bilateral large pulmonary embolism as likely etiology of arrest. Risk factors included oral contraceptive use. Labs have since confirmed absence of Factor V leiden or prothrombin gene mutation. Patient declared dead by neurologic criteria 3/30/21.
1225955	4/18/2021	OH	70	F	4/5/2021	4/13/2021	Mother in hospital with blood clots in both lungs on a ventilator. She has been hospitalized since 4/16/21
1225999	4/18/2021	IL	40	F	4/2/2021	4/14/2021	Repeated, extreme nosebleed with large clots. I was unable to stop it and had to go to the ER on 4/16. They had to cauterize the site of the bleed. I do have a history of mild nosebleeds but this was unusual. I do not take any blood thinning medications. The silver nitrate did stop the bleeding. The ER ductus was not concerned that this was vaccine related but I thought it was unusual enough to report.

1224924	4/18/2021	NY	67	F	3/17/2021	4/3/2021	I had emergency surgery to remove a femoral blood clot from my groin to the bottom of my left leg; This is a spontaneous report from a contactable consumer (patient). A 67-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in left arm on 17Mar2021 12:00 (Batch/Lot Number: EP6955) as single dose for covid-19 immunisation at a Pharmacy or Drug Store. Medical history included known allergies to sulfa drugs, latex, animal dander, dairy, wheat, mold, mildew, ragweed and other wildflowers; and clot once before in the same leg-left inner thigh in 1974. Concomitant medications included thyroid (ARMOUR THYROID) and apixaban (ELIQUIS). The patient previously had a pneumonia vaccine on 24Feb2021 in the left arm. The patient does not know if her first dose of Pfizer vaccine caused this, but on "04Mar2010" (as reported) she had an emergency surgery to remove a femoral blood clot from her groin to the bottom of her left leg which started on 03Apr2021 at 12 AM (as reported). The event resulted in emergency room/department or urgent care visit, hospitalization for 2 days and was considered life threatening illness (immediate risk of death from the event). She had a clot once before in the same leg-left inner thigh in 1974. The patient was on Eliquis 5 mg 2 pills 2 X day for two more days, then 1 pill in am and 1 pill in evening for rest of her life. The patient had the second dose of BNT162B2 (lot: ER8732) on 07Apr2021 in the left arm. The patient has no covid prior vaccination and was not tested for covid post vaccination. The event recovered with lasting effects.

1224406	4/18/2021	NC	35	F	3/26/2021	3/29/2021	Abnormal bleeding / Menstrual cycle began 4 days early; heavy blood clots / Menstrual cycle began 4 days early; This is a spontaneous report received from a contactable consumer. A 35-year-old female consumer (patient) reported for herself that she received the second dose of BNT162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot #ER8730) via an unspecified route of administration in arm left on 26Mar2021 05:00 PM at single dose for COVID-19 immunisation. Relevant medical history was not reported. Concomitant medications included levothyroxine sodium (SYNTHROID). The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, was the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. On 29Mar2021 the patient experienced abnormal bleeding with heavy blood clots and menstrual cycle began 4 days earlier (less than 72hours after second vaccine). Adverse event start time was 10:00 AM. The events were resolving at the time of report. No treatment was received.
1226060	4/18/2021	OH	50	F	3/21/2021	4/6/2021	About a week and a half after 1st vaccine pt had a pain in her knee that eventually spread up and down to ankle and thigh area. On 3/21 she went to urgent care and was referred to the emergency room because she was also having a pain in her chest. She had a stress test, EKG, chest xray, and Doppler and was diagnosed with a large DVT in the thigh and a small clot near the ankle. She was given Lovenox injections inpatient for 3 days and sent home on Xarelto 15/20mg starter pack and Aspirin 81mg. She was also started on metoprolol tartrate 25mg and atorvastatin 40mg. She saw her PCP 4/6 and sees a cardiologist and hematologist within the next couple of weeks for follow-up.

1224396	4/18/2021	NY	72	F	3/29/2021	3/1/2021	<p>hoped she wasn't having a heart attack; Elevated Pulse/high pulse/pulse was 165 beats per minute/climbed up to 195; Drenched in sweat/sweating/sweating like a dog in the middle of the night; Wasn't feeling well; Tightness in chest; Cough; Sinuses congested; Sore; Puffy, bubbled up arms, inflamed; Puffy, bubbled up arms, inflamed; Feverish/felt hotter than usual; Really, really tired/wiped out tired; so sleepy; Sore Arm/her arm started to hurt; Nauseous; Sore Throat/throat hurts; eyes half closed/eyes closing; Puffy Face; blood clot; This is a spontaneous report from a contactable consumer (patient). A 72-year-old female patient received the first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number ER8733, expiry date: unknown), via an unspecified route of administration, on 29Mar2021 11:45, as single dose, for COVID-19 immunisation. Medical history included ongoing latex allergy (developed welts where the straps met the skin) diagnosed 20-30 years ago; ongoing dye allergy (developed warm soreness to leg, tightness in the chest, could not breathe) diagnosed many years ago; sulphite allergy (diagnosed about 1975-1980; cannot eat processed foods, bleached foods, frozen pre-made foods; tries to eat only single item foods; last anaphylactic reaction after eating olive oil at a restaurant because it had sulphites in it; Mother was possibly allergic to sulphites; Son also allergic to sulphites); and blood pressure that runs low. The patient previously took epinephrine and experienced epinephrine allergy; ciprofloxacin (CIPRO) and experienced Cipro Allergy (eyes closed, got puffy, couldn't breathe); amoxicillin for abscessed tooth and had a reaction because of the sulphites in it; epinephrine (EPIPEN) and experienced epinephrine allergy (does not use it anymore); plantago ovata (METAMUCIL) which she then found out the orange one had sulphites. Historical vaccine included flu shot for immunization and she experienced 104-degree temperature and was sick as a dog and she went to the emergency room (she had flu shot maybe 3 times). Ongoing concomitant medication included multivitamins. The patient got her first dose of BNT162B2 on 29Mar2021 at 11:45. On the same day, once she got home, she became really, really tired/wiped out tired; was so sleepy; experienced sore arm/her arm started to hurt; was nauseous; had sore throat/throat hurt; eyes half</p>

closed/eyes closing and puffy face. On 30Mar2021, the patient experienced elevated pulse/her pulse got too high/pulse was 165 beats per minute/climbed up to 195. Her heart rate was 194 at some point for a couple of minutes then stayed at 165 for a long time. She hoped she wasn't having a heart attack. She had tightness in her chest, wasn't feeling good and was coughing. She stayed in her bed to wait out her symptoms. These lasted for 10 minutes (as reported). She started meditating hoping her heart rate would decrease and it did after about 15-20 minutes. The patient also felt feverish/felt hotter than usual. Before she took the vaccine on 29Mar2021, her temperature was at 96. She stated that her temperature usually runs low as 95-06 degrees. She also felt like her sinuses were congested; was sore; had puffy, bubbled up arms, inflamed. The patient hoped it was not a blood clot she developed. At the time of the report, the patient stated that her heart rate was 61 beats per minute, earlier it was in the 70s; and her temperature was at 96.3. Her second dose is scheduled on 19Apr2021 and mentioned that if these were her reactions with the first dose, she is questioning getting the second dose. The outcome of "blood clot", "hoped she wasn't having a heart attack", "Wasn't feeling well", "Tightness in chest", cough, and sinuses congested was unknown. The patient recovered from "Drenched in sweat/sweating/sweating like a dog in the middle of the night", and "Elevated Pulse/high pulse/pulse was 165 beats per minute/climbed up to 195" on 30Mar2021; and was recovering from "Sore Arm/her arm started to hurt", and "eyes half closed/eyes closing". The outcome of the remaining events was not recovered. Information on the lot/batch number has been obtained. Additional information is expected.

1224644	4/18/2021	FL	77	F	3/28/2021	3/29/2021	back to having blood in her stools/ still bleeding/ numerous large volume stools; she did not have blood on the toilet paper, any rectal bleeding/ had no bleeding or anything for the rest on the day on 29Mar2021; This is spontaneous report from a contactable consumer (patient). A 77-year-old female patient received bnt162b2 (BNT162B2), dose 2 via an unspecified route of administration at the age of 77-years-old, administered in Arm Left on 28Mar2021 (Lot Number: ER2613) as single dose for COVID-19 immunization. Medical history included ongoing irritable bowel syndrome for a good part of her life, over 50 years, High level of hormones, Testosterone (Problems for the last couple of years, 2-3 years), Losing hair, Rectal bleeding from Jan2021 to an unknown date (Rectal bleeding, noticed blood on toilet paper, and rectal bleeding, in the beginning of Jan2021), that her stools were thin and maroon color/that her stools had specks in them, clots, that looked like blood. She started complaining about this. Concomitant medication included spironolactone taken as Diuretic or for Hormones from Jan2021 and ongoing. The patient previously received bnt162b2 (BNT162B2), dose 1 via an unspecified route of administration at the age of 77-years-old, administered in Arm Left on 28Feb2021 (Lot Number: EL9267) as single dose for COVID-19 immunization and experienced bleeding, blood in her stools, she did not have blood on the toilet paper, any rectal bleeding and she had volumes of regular stool like normal people stool. She stated she had no bleeding or anything for the rest on the day, aching arm, and Volumes of regular stool/ went to the bathroom 20 times. The patient has had Irritable Bowel Syndrome for a good part of her life, over 50 years, and since the pandemic and being house bound the Irritable Bowel Syndrome was worse. She wanted to get the vaccines but wanted to address the bleeding first that started in Jan2021 the day she started her spironolactone medication. She stated her and her husband wanted to get the vaccines but it was so hard to get in. Her doctor suspects Hemorrhoids. She believed it is not Hemorrhoids because she doesn't hurt or itch. She believes she has blockages in her bowels. That her stools were thin and maroon color. That her stools had specks in them, clots, that looked like blood. She started complaining about this, and noticed blood on toilet paper, and rectal bleeding, in the

---

beginning of Jan2021. Then they were finally able to get their vaccines. The day after receiving the vaccine, 29Mar2021, she did not have blood on the toilet paper, any rectal bleeding, and she had volumes of regular stool, like normal people stool. She had numerous large volume stools on 30Mar2021. She stated she had no bleeding or anything for the rest on the day on 29Mar2021. She told her husband and sister. She thinks there may be something in the vaccine that could help her Irritable Bowel Syndrome. She wanted to report her experience in case it could help someone and help down the road for Irritable Bowel Syndrome patients. On 30Mar2021 she was back to having blood in her stools. She stated she is still bleeding in Mar2021. The side effects said some may have diarrhea but not her. She was scheduled to have a blood test in the next 2 weeks to check her hormone levels and see if the medication was helping her. The patient underwent lab tests and procedures which included colonoscopy: results not reported on 27Apr2020, computerised tomogram: results not reported on 27Apr2020. Numerous large volume stools resolved on 30Mar2021. Outcome of the rest of the events was unknown.

1224636	4/18/2021	NY	73	M	2/14/2021	2/1/2021	Blood clots after the 2nd dose; Blood clot split and some went into side of lung; This is a spontaneous report from a contactable consumer (patient). A 73-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration in the right arm, on 14Feb2021 at 15:45 (Lot Number: EL3247) (at the age of 73-years-old) as a single dose for COVID-19 immunisation. The patient had no medical history, family history, or concomitant medications. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot number: E10142 (as reported)), in the right arm, on 24Jan2021 at 15:45 (at the age of 73-years-old) for COVID-19 immunisation. The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient experienced blood clots after the 2nd dose and blood clot split and some went into side of lung in Feb2021, which required hospitalization from 27Feb2021 to 28Feb2021. The clinical course was reported as follows: The patient stated he did not know what date the blood clots occurred and can't tell when that happened, but it was maybe a few weeks after the second dose of the vaccine. He stated that one blood clot is in the right leg near the calves and the blood clot broke and split some and went up into the side of his lung as it was detected in a doppler on 27Feb2021. The patient was hospitalized from 27Feb2021 to 28Feb2021. The doppler was performed as soon as he went into the emergency room and they went through a series of tests with unknown results on 27Feb2021 and 28Feb2021. The patient stated that the right leg is bigger than the other leg and they told him it might stay that size and may not go down. The patient is now on apixaban (ELIQUIS) 5 mg for the rest of his life. In the beginning, they gave him an unspecified shot in his stomach, then after that he began taking apixaban at two pills in the morning and two pills at night, then they cut him down to 1 pill in the morning and 1 pill in the evening, and he started it right when he went into the hospital immediately. Therapeutic measures were taken as a result of the event as aforementioned. The clinical outcome of blood clots after the 2nd dose and blood clot split and some went into side of lung was unknown.

1224608	4/18/2021	ME	57	F	3/31/2021	4/1/2021	tip of left ring finger turned white and numb/finger was completely white and the rest of her hands were blue and red and white and yellow; tip of left ring finger turned white and numb; her finger felt funny; Reynauds phenomenon; sore arm; fever; chills; headache; swollen lymph node in the armpit of the arm she got her Covid 19 vaccine in; swollen lymph node started with a sharp pain and it's very sore; left foot, it was pulsing and throbbing all night; feet were modeled red, blue; feet were modeled red, blue; very sick; needed her glasses trying to give her primary care doctor's phone number; has something like gout in her foot; The swollen lymph node started with a sharp pain and could be a blood clot as far as she knows; This is a spontaneous report from a contactable consumer (patient) via the medical information team. A 57-year-old female patient received first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot: EW0150; expiry: 31Jul2021), via an unspecified route of administration in left arm on 31Mar2021 01:30 as single dose for covid-19 immunisation. The vaccination facility type was a warehouse. The vaccine was not administered at a military facility. No previous immunization with the Pfizer vaccine considered as suspect. No vaccines administered on same date with the Pfizer vaccine considered as suspect. No prior vaccinations (within 4 weeks) and no following prior vaccinations. Medical history included covid-19 in Nov2020. The patient had no concomitant medications. The patient had the first dose of bnt162b2 on 31Mar2021 and 12 hours later (on 01Apr2021), sore arm, fever, chills and headache. Got a swollen lymph node in armpit, same arm as injection left side, today tip of left ring finger turned white and numb. She thinks it was Reynauds phenomenon. The patient called and told nurse in her doctor's office and they said if it was painful, it could be a pain clot. It was painful at first, that lymph node started 24 hours later with a sharp pain, and then she just assumed it could be a lymph node. Swollen lymph node started with a sharp pain and it was very sore. The nurse told the patient to call Pfizer. The patient was fine until the tip of her finger happened. The patient said If it was painful it could be a blood clot, would need an x ray and asked if did the shot cause this. The complete ring finger left hand, the patient looked it up and it said it could happen to her feet and she looked,

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

and her feet were modeled red, blue it was bizarre. Never happened before. The patient was not happy about getting the vaccine, she already had covid in November of last year (2020). The patient wouldn't have called if it wasn't for her finger. Not just her feet, her hands got like this too. The patient didn't want to get the second shot. The patient asked if there was any information or mandate on timing information for the second dose, should she needed to postpone it. The patient asked if what was the efficacy after first dose as she felt like she was immune because she had the virus and now the vaccine. She was very hesitant to get the Covid 19 vaccine. She thinks her body created Covid 19 antibodies. A couple days ago she was very sick. The swollen lymph node started with a sharp pain and could be a blood clot as far as she knows (in 2021). Even putting on deodorant she can tell it's there, it was very sore and there's a lump. Today (on 01Apr2021), she noticed the tip of her finger got white it was numb. She looked it up online and she thinks it was Reynaud's phenomenon. She has a picture if Pfizer needed it. The finger was on the same arm that she received her vaccine in. It was the ring finger on left hand. Once it started happening her finger felt funny and felt numb. She put her finger under warm water. She reported that the white color was maybe a third of the way down towards her knuckle. She was asking if this was normal or has this been reported. She had called her doctor today and spoke with the nurse who told her to call the CDC and report her symptoms. She needed her glasses trying to give her primary care doctor's phone number. The patient wanted to add that she has something like gout in her foot and on that side too, the left foot, it was pulsing and throbbing all night. She's had this pain in her left foot, she thinks its gout because it was all the symptoms of gout and she had it for a while, it hurts off and on but that night it was hurting and throbbing. She has not been diagnosed with gout in that left foot. She still has a headache but today she felt good except for her finger turning white and going numb. The lymph node in her armpit hurts. Her doctor's nurse told her if its painful to the touch it could be a blood clot so she was nervous about that. The tip of her finger was completely white and the rest of her hands were blue and red and white and yellow. She reported that her finger was back

to normal now. She didn't want to get too inoculated since she also had the Covid 19 virus. The events did not require visit to emergency room nor physician office. The outcome of the events was unknown for thrombosis, Raynaud's phenomenon, erythema, cyanosis, illness, visual impairment, and gout while for the remaining events was recovering.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1224548	4/18/2021	MA	67	M	2/25/2021	3/15/2021	found down unconscious; unwitnessed fall; oxygen was in the 60s; submassive bilateral pulmonary emboli; right femoral vein emboli/ occlusive thrombus visualized in the right proximal femoral vein; some degree of right heart dysfunction; blood sugar very high; A1C elevated; Haptoglobin elevated; elevated troponin; This is a spontaneous report from a contactable nurse. A 67-year-old male patient received second dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; Lot number was not reported) via an unspecified route of administration, at the age of 67-year-old, on 25Feb2021, as SINGLE DOSE for covid-19 immunisation. Medical history included Traumatic brain injury at the age of 29 which resulted in a CVA (right sided stroke)because the hospital did not know how to give Mannitol, behavioral problems in 2008, run over by a train in 2008, wears two AFOs (one on the left leg from having a right sided stroke, he also wears one on his left leg from having a stroke with right sided weakness, the right AFO was worn since he was 29, and then the other one he started wearing in 2008 when he was run over by a train and almost had his leg severed and he wears a left AFO), dementia diagnosed 4-5 years ago, head surgeries, depression, affective disorder, anxiety. The patient had multiple hospitalizations, and he has hyper reflexivity like all brain patients have. The patient has no history of blood clots or emboli. Concomitant medications included olanzapine (ZYPREXA) taken for depression and oxcarbazepine (TRILEPTAL) taken for affective disorder and anxiety. The patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; lot number not reported) single dose for covid-19 immunisation, pneumonia and flu vaccine in 2008 for immunization and has no reaction. The patient received his second dose of the vaccine on 25Feb2021 and two weeks later he was found down/ was found down unconscious at the nursing home and his oxygen was in the 60's on 15Mar2021. The nursing home did not know if her brother hit his head because it was unwitnessed. The patient was found down, not responsive, and it was an unwitnessed fall. The patient was treated as a trauma patient and that this occurred around 10 oclock on 15Mar2021. At that time, he was transferred to a local hospital to the emergency room and put on oxygen. They transferred him within 4 hours

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

because they did not know what to do. Caller adds that the hospital thought that he had a subdural hematoma but the hospital does not have a neuro radiologist, so the hospital transferred to the other hospital that somebody with head knowledge can look at his CAT scan. The patient was misdiagnosed with a subdural hematoma because there were changes in his CT scan from his 3 previous brain surgeries. The patient had a traumatic brain injury when he was 29, and experienced changes. The patient was found to have submassive bilateral pulmonary emboli on 15Mar2021 described as central lobar sub segmental PEs in both lungs, PE was within the distal right main artery, pulmonary artery distal left main, left middle lobe, middle right lobe / upper right lower lobe and middle lobar, segmental and sub segmental pulmonary arteries. The patient also had pulmonary emboli in the distal left main pulmonary artery of left middle lobe and left lower lobe, pulmonary arteries. There was also some degree of right heart dysfunction which was diagnosed by contrast. On 15Mar2021, the patient also had right femoral vein emboli/ occlusive thrombus visualized in the right proximal femoral vein. The patient is in a nursing home, the doctor did not want to listen to the reporter because her brother is a nursing home patient and they just assume he is immobile but he is not. The patient underwent lab test and procedures which included Blood sugar very high (they think it was because of heart strain and acute injury because then it came down down down), A1C elevated, Haptoglobin elevated, elevated troponin. These results were all elevated and from acute injury. At the time of the report, the patient is feeling better and needs less oxygen. The events found down unconscious, unwitnessed fall and oxygen saturation low, pulmonary embolism, right femoral vein emboli/ occlusive thrombus visualized in the right proximal femoral vein, and some degree of right heart dysfunction caused hospitalization from 15Mar2021 to 18Mar2021. The reporter absolutely does believe the events and the suspect drug are correlated. Outcome of found down unconscious, unwitnessed fall and oxygen saturation low, pulmonary embolism was recovered on 18Mar2021 while it was unknown for the other events.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1224538	4/18/2021	WY	59	M	3/11/2021	3/18/2021	<p>Bell's palsy; eye sight in that eye is getting worse every day; right eyelid was sticking on his eye and wouldn't shut; he couldn't move his face on the left side and he can't control it at all; blood got really thin and wouldn't clot; left hand got really swollen; entire arm bruised; edema in his hand; edema in his hand got to the point where his skin was cracking; blood got really thin and wouldn't clot; face went numb; This is a spontaneous report from a contactable consumer (patient). A 59-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; lot number: EN6207, Expiration Date: Jul2021), via an unspecified route of administration, administered in Arm Right on 11Mar2021 (at the age of 59 years old) as single dose for covid-19 immunisation. Medical history included lupus from 2020 and ongoing, ongoing High Blood Pressure, Spinal Surgeries from 1999, Chronic Pain, Retention water, blood clot issue. The patient previously had tetanus shot. Concomitant medications included losartan potassium; allopurinol; hydroxychloroquine; methocarbamol; morphine sulfate (MS CONTIN); oxycodone; furosemide. Caller states he is calling about the Pfizer Covid 19 Vaccine. Seven days later the dose of vaccine (18Mar2021), patient developed Bell's Palsy which he has never had before and has never had any other problem with. He has seen an ENT, his pain doctor, and his medical doctor and they all say the Covid vaccine has caused the problem he is having. He was told by his ENT this is very possibly permanent. Emergency Doctors are who he went to because he thought he was having a stroke, because half of his face went numb. He has been to the doctor 10 times in the last 7 days, it has not been fun at all. He didn't put it together until he saw the ENT, who said Bell's Palsy is caused from a virus. States he had no idea until he said that, that it could possibly be from the injection. States he has never had Bells Palsy before and it started 8 days after the initial shot. His right eyelid was sticking on his eye and wouldn't shut and he couldn't move his face on the left side and he can't control it at all. Clarifies he couldn't shut his right eye all of the way. Since then they have told him he needs to tape his eye shut for 12 hours a day to keep from going blind. The thing that bothers him is his eye sight in that eye is getting worse every day even though he uses the cream and tapes it shut. His wife told him even with both</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

eyes shut, it will not completely shut because his lower eyelid is hanging down too far. The ENT told him he needs a hearing test today at 2:00p.m. to see if this is going to be a permanent problem. He is getting ready to go to the ear doctor to find out more. At the same time he developed the Bells Palsy, his blood got really thin and wouldn't clot which seems really weird. Also on 18MAR2021, his left hand got really swollen and the entire arm bruised and they said the edema in his hand got to the point where his skin was cracking because his blood got so thin that it couldn't clot at all. He had a blood clot issue in the past. States his arm and hand have improved, he can move his hand again finally. The ENT said that since he has been on Prednisone, for recovery for Bells Palsy, for over a week and gotten worse instead of better, it may be permanent. Prednisone is not working, it has actually gotten worse. Prednisone 10mg for 7 days and to decrease by one tablet every day until gone but states he has gotten worse. Treatments (assessed as for all events): Prednisone. States that it has been two weeks since this happened and the doctor told him the only other option is skull surgery. The bones in his head would be drilled out to make room for the nerves in hopes he would be able to work his mouth again, so not a good thing. Eye cream. He is on disability and his house payment is 3/4 of what he makes, so he can't take care of the medical bills himself otherwise he wouldn't worry about it. It is very depressing. His medical doctor said he hadn't seen any cases of Bell's Palsy for 2 years, and he has seen 4 in the last week so that doesn't give him a lot of confidence even though he is still encouraging people to get the vaccine because it is safer than not. He has multiple visits to the ER 3 times between 18MAR2021 and 19MAR2021 within 24 hours; states he was in the ER for hours and hours but no admission. States they did a CT Scan, MRI, CT with contrast and then after that ended up 22 saw ENT who confirmed the fact that Covid Vaccine that gave Bells Palsy and on 22-23 saw his GM again. Prior Vaccinations (within 4 weeks): None within 4 weeks; states 9 months ago he had a Tetanus Shot. No AE(s) following prior vaccinations. The outcome of the event Bell's palsy, Visual acuity decreased, Eyelid disorder, Orofacial dyskinesia, numbness in face was not recovered; other events was recovering. All events happened on

---

pacemaker was going all over her chest, the doctor did not believe her and it landed under her armpit, it was the size of an orange, the doctor thought it was a lump, she went to the hospital, her pacemaker started falling apart, they took it out and put a new one in, it was about 4 years ago; a lump in her breast, she has been put under 30 times, they were all necessary, nothing for glamorizing; had surgeries in her left arm and some fingers than were numb. There was no prior vaccinations within 4 weeks, no events prior vaccinations and no family history. Ongoing concomitant medication included baclofen taken for muscle spasms for about 2 years, calcium for arthritis and her bones degenerate for 30 years, ergocalciferol (CALCIFEROL VIT D) taken for gets anemic real easy for 20 years, duloxetine taken for anxiety, taking this about 3 years ago; ferrous sulfate taken for anemic real easy for about 20 years; folic acid taken to rebuild cells taking this she thinks in 2015, furosemide taken for a diuretic to get rid of fluid for 2 years, metoprolol tartrate taken for atrial fibrillation, and blood pressure, taking this since she had her pacemaker put in; montelukast for asthma for 20 years; hydrocodone bitartrate, paracetamol (NORCO) taken for arthritis for 20 years, and warfarin taken for blood thinner/thin the blood out so she doesn't get blood clots; and adults vitamins for bone supplement and metabolism for 20 years as her body doesn't absorb what she eats. She says she takes a lot of medications and when she does blood bloodwork she was low so they make her take them. The patient previously took rivaroxaban (XARELTO). On 06Feb2021, the patient experienced she thought she was having a heart attack. The patient reported that she had to call an ambulance at 11:30 at night, she thought she had a massive heart attack. She had chest pain, nausea, it was hard to breath, she got a sharp pain underneath her left rib cage. She stated that when the ambulance got here they thought she was having a heart attack, they did nitroglycerin, when they got to the house, when in the ambulance on the way to the hospital they did another pill of nitroglycerin when they got to the hospital. The pain was a number 10. She stated she broke out in sweat, once they got her all hooked up they got to the hospital 6 miles away to the hospital. She was there for 2 full days, they did Xrays, dye in her, checked her hears, and did bloodwork. When she had chest pain, she reported they

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
-----------------	--------------	--------------	----------------	------------	-----------------	-------------------	---------------------

gave the morphine, it lasted about 6 hours; she still had problems breathing, they took her, she must have passed out because she didn't remember all the tests, she was in and out of it, the severe pain stopped after 6 hours, still had pain off and on, periodically. When she got pain in the ambulance then the nausea went away. After the hospital nitro and another shot for the pain, the nausea stopped. After the hospital after this they gave morphine and the pain subsided a little but didn't totally go away until 6 o'clock in the evening, she still had problems breathing because every time she breathed she got pain under her left rib cage. She says the sweat was at home, real bad, number 10, she broke out in a clammy sweat, on the 6th when she was having pain. She says that after the hospital, a couple days after that, she saw her cardiologists, he told her what happened, it was related to vaccine, it was the muscle that goes around her heart, it was having like a charley horse, he says it felt like you're having a heart attack, her tests said her heart was good. She talks about her blood pressure and heart rate, and says 102, 103, it went up to 200 in the ambulance. She says they thought it was a heart attack, her blood pressure was usually low blood pressure and all the symptoms she was having was because of her muscle having a charley horse that felt like it was coming from the heart, if they had contacted him, he said she would have just needed a massive amount of anti-inflammatory and it would have stopped the pain. The events required an emergency room visit. She wanted to know if anybody else has been hospitalized for massive heart attacks and says that's what she was having. The patient had her second shot on 22Feb2021. Outcome of event nausea was recovered on an unspecified date; and outcome of the rest of events was unknown.

1224468	4/18/2021	TN	63	M	3/15/2021	3/15/2021	multi focal pneumonia; atrial fibrillation/the second worst feeling he has ever had since he had his first heart surgery; arm started hurting real bad/a severe pain that radiated down to elbow, arm, chest; This is a spontaneous report from a contactable consumer (patient). A 63-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in Arm Left on 15Mar2021(Lot Number: EN6204; Expiration Date: 30Jun2021) as single dose for covid-19 immunisation. Medical history included acute diabetes, acute thyroid disease, covid like in 2021 (10 weeks before), 3 heart surgeries with 12 stents, ongoing chronic obstructive pulmonary disease (COPD)slight case diagnosed in 2016-2017, bad thyroid from 2006 and ongoing and told he had full blown Hashimotos in 2017, bad diabetic from 2015 and ongoing and went into diabetic type coma on 18Dec2015 (sugar when got him out of the parking lot cause he had to drive there was 738 or 768 put him in ICU from 18Dec2015-25Dec2015. Had to give him shots like every 2 hours. Started giving him insulin there but insurance wouldn't approve it so kept him on Metformin. Like 5th or 6th day got it under control), bad heart from 2007 and ongoing (In 2017 he had a heart attack they call 'widowmaker', he was told he hemochromatosis like his brother and sister. Caller stated they got it from his parents, but the doctors can't find it now. He had 3 different heart surgeries and has 12 stents in him. 9 weeks before (2021), he went to the hospital because of his heart, got a real bad heart, been put on a heart transplant list, they told him his blood tries to flow backwards and all of it's going over to the right chamber; after 2 hours after he had been admitted to the hospital they told him he had had a heart attack, level 3- they knew from blood tests they'd done. About 1 hour later said test was positive for COVID. He had no symptoms. While in hospital they gave him Zinc, Vitamin D3, Vitamin B1 and that was it. They kept him 5 days at the hospital. Also reported that went to the hospital for triple bypass heart surgery when he got in said somethings wrong, watch everything on the monitors wouldn't tell him nothing; said your widow maker is completely blocked up 99% had to go in and unblock that up so they can't do any kind of bypass on him again. The only thing they can do was heart transplant or heart graft

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

where they take part of the left chamber and he didn't have but like 18% of that left, take it come over whatever they're talking about, he doesn't know it's a heart graft whatever they're talking about there), 2 hernia operations, hemochromatosis (little sister and older brother has hemochromatosis-patient got hemochromatosis (too much iron in the blood) from 1 gene from his mother and 1 gene from his father. Brother doesn't have it anymore; but patient's and his sisters mutated); ongoing blood pressure abnormal; anxiety; ongoing wheezing; ongoing chronic Atrial fibrillation. Concomitant medications included aspirin (ASPIRIN [ACETYLSALICYLIC ACID]) taken to help blood to be thin from 2007 and ongoing; levothyroxine taken for Bad thyroid from 2006 and ongoing; metoprolol succinate taken for blood pressure from 2015 and ongoing; clonazepam taken for anxiety from 2012 to an unspecified stop date; fluticasone propionate taken for sinuses from 2015 and ongoing; insulin glargine (LANTUS) taken for diabetes from 2019 and ongoing; insulin aspart (NOVOLOG) taken for diabetes from 2019 and ongoing; salbutamol (ALBUTEROL HFA) taken for wheezing from 2018 and ongoing; budesonide, formoterol fumarate (SYMBICORT) taken for COPD from 2018 and ongoing; amiodarone (AMIODARONE) taken for atrial fibrillation from 22Mar2021 and ongoing; amoxicillin, clavulanate potassium (AUGMENTIN) taken for an unspecified indication from 22Mar2021 to 29Mar2021; apixaban taken for prevent blood clots and chronic Atrial fibrillation from 22Mar2021 and ongoing. The patient had pneumonia shot and flu shot took that in Sep2020. The was no vaccinations within 4 weeks prior to the BNT162B2. The patient previously received Xanax for anxiety from unknown date to 2012; received Humalog , Glipizide and Metformin for Diabetes. The patient got his first Pfizer COVID-19 Vaccine shot on Monday 15Mar2021 at sometime between 15:30-16:00. Not even an hour after he got the Pfizer COVID-19 Vaccine shot his arm started hurting real bad, felt like a hot ice pick was in his arm-described as it started locally just in one spot, then started getting worse going down to his elbow. About 30-45 minutes after got out of there, he was sick, didn't know what was wrong with him. Also reported as by 16:30 he felt bad and pulled up to a friends house. He would say it was an allergic reaction;

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

starting in his arm, a severe pain that radiated down to elbow, arm, chest, it was hard to breathe since 18Mar2021. He went to a friends house after getting the shot, and by the time he got to the friend's house, he felt sick and laid down for about two hours and just kept feeling worse and worse. After that he went home and went to bed. He stayed in bed Tuesday, 16Mar2021, Wednesday, 17Mar2021 and was able to drag himself out of bed to at least go to the bathroom on Thursday morning, 18Mar2021. When he got out of bed, he couldn't breathe. When he got up Thursday morning he couldn't even move his whole left side, had to grab nightstand and pull himself up to stand up out of the bed; stumbled to the bathroom about 3 feet away. He made his way to the phone and called his sister to tell her to call an ambulance because he couldn't breathe. When he got to the emergency room he was told he was in atrial fibrillation. He stayed in the hospital with primary diagnosis as multifocal pneumonia with atrial fibrillation. Feeling like heart beating out of his chest, machine going off every 2-3 minutes. It took about 9-10 hours to get the atrial fibrillation under control. He stayed in Hospital for 4 days-admitted 18Mar2021-discharged 22Mar2021. He spoke to his heart doctor who said it was hard to breathe due to the Atrial fibrillation and all his doctors say they did not know whether it was a reaction to the covid vaccine. He heard the doctors talking and they were saying they didn't think he was going to make it. His heart rate was going between 80 and 200. He had 3 different IV's going in each arm shooting different heart medications in him and the doctor explained that the medications didn't mix well, could not go in the same IV at the same time. The patient shared that this was the second worst feeling he has ever had since he had his first heart surgery. He meant they thought he was dead or dying he lost feeling of everything. His arm felt better, but every now and again felt like a little knot or something was in there. He was breathing better, they gave him inhalers, albuterol. He thought that his heart doctor was going to start him on oxygen. He went to his Cardiologist on 01Mar2021 on Monday, 2 weeks before getting his first Pfizer COVID-19 Vaccine: cardiologist told him his triglycerides raised up about 15 was about 268. All his Cardiologist did was change his blood pressure medicine. Went to his Endocrinologist on 08Mar2021

1224436	4/18/2021	NE	72	M	3/17/2021	3/19/2021	deep vein thrombosis on Sunday; Extreme fatigue on Friday; This is a spontaneous report received from a contactable consumer. A 72-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN6208) via unspecified route on left arm single dose for COVID-19 immunization on 17Mar2021, 10:45 AM, at 72-year-old. Medical history was not reported. The patient had not had COVID prior vaccination. Concomitant medications in two weeks included: fluoxetine 20 mg; atorvastatin 10 mg. The patient had not had other vaccine in four weeks. The patient previously took morniflumate (FLOMAX) and had allergy to it. The patient was extreme fatigue on Friday 19Mar2021 and deep vein thrombosis on Sunday 21Mar2021 06:00 PM. I was hospitalized for two days including a veinogram to remove the blood clots from my left leg. I'm now taking rivaroxaban (XARELTO) 15 mg twice a day and were wearing a compression sock for my left leg. Treatment also received as IV heparin. Emergency room/department or urgent care involved and reported as serious due to hospitalization for 2 days. The patient had not had COVID tested post vaccination. Outcome of the events was resolving.
1224902	4/18/2021	TX	63	F	3/17/2021	3/27/2021	developed blood clots in lungs; This is a spontaneous report from a contactable consumer (patient). A 63-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot Number: CP6955), via an unspecified route of administration into the left arm on 17Mar2021 as a single dose for COVID-19 immunisation. Medical history included allergies to sulfa. Patient was not pregnant. There were no concomitant medications. The patient previously took amoxicillin and experienced drug allergy. The patient developed blood clots in lungs on 27Mar2021 09:45. The patient was brought to the emergency room and was hospitalized for 3 days. The event was reported as life threatening. It was also reported that the patient was given treatment (unspecified). The patient underwent lab tests and procedures which included SARS-CoV-2 test: negative on 27Mar2021. Outcome of event was recovering.

1224670	4/18/2021	IN	54	M	3/18/2021	3/1/2021	<p>This is a spontaneous report received from a contactable consumer (patient). A 54-year-old male patient (height: 193cm, weight: 99.79kg) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, batch/lot number: EN6207) via an unspecified route of administration at right upper arm on 18Mar2021 18:00 (54-year-old at time of vaccination), at single dose, for COVID-19 immunization. The patient's medical history included blood pressure, teeth cleaned (Shortly before the shot, went to the dentist to have teeth cleaned. Directly from Dentist went to pharmacy. Went to pharmacy's Drive Thru to pick up a little antibiotic from the dentist. It was 4 capsules of Amoxicillin. He was supposed to take the Amoxicillin before the dentist office visit, but he forgot to do that. Therefore, soon as he left the dentist office he went to pharmacy to pick it up so he could take it. While he was there, was offered the COVID 19 vaccine and that it was the last shot). Concomitant medications included atenolol tablet from 2016 (been taking for 5 years) and ongoing for blood pressure, and ascorbic acid/ cyanocobalamin/ ergocalciferol/ nicotinamide/ pyridoxine hydrochloride/ retinol/ riboflavin/ thiamine mononitrate (ONE-A-DAY). No additional vaccines administered on same date. No history of all previously immunizations. No prior vaccinations within 4 weeks. He got the shot Thursday and by Sunday, many different side effects were coming in. He has had side effects from the COVID VACCINE, but initially he does not want to file report, just thinks that everyone needs to get the shot. He does not have complaints. He is wondering how long the side effects will last, and when they go away. States that he is being treated as he has gone to the doctor's. Also states that he made an appointment with the doctor and almost went to the emergency room a couple of times. Right after the shot, he was getting in the car and his right leg started hurting (on 18Mar2021). It didn't go away for a couple of days. It went away but then noticed his shoes started feeling funny. He wasn't looking at his feet, put his shoes on they felt tight. Then he started to look at feet more. Below his knees, his legs are swollen. Swelling started within 2 to 3 days after the vaccine. The swelling is really severe when standing. Everybody at work has seen how sick he is and his legs. Swelling in the legs has him concerned, thinking maybe it's a blood clot. He was given medicine and</p>

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

would like to see it go away. He keeps his legs up. He has other side effects (all in Mar2021) and is having flu like symptoms. He basically has the flu. He has never had the flu shot. This is the first flu shot (He referred to the COVID vaccine as the flu shot as documented. However, confirmed suspect product as Pfizer covid vaccine) he has had that he knows of. He is questioning if he should get the second shot. He feels a little dizzy. Quick questions get him confused and that it comes and goes. Lungs felt full, gasping for air: not now but, since the doctor gave him antibiotics (unspecified injections, he was given 2 shots at the doctor's office, one in each arm), his lungs felt full. At times he was gasping for air. It went away but thought he was going to die. Now when he gets winded, it feels like he has a dry cough. Gets winded easily. The doctor ordered him an inhaler, Symbicort, but it was very expensive, so he did not get it at that time. He never picked it up because it was too much money. The fluid is not there anymore and he does not feel like he needs this as does not feel like it needs to be cleared. He is having wheezing. He can now take deeper breaths. Fatigue: initially, that he was feeling tired within 1 or 2 days, but he did not recall the next day feeling that way (later stated it was within 2-3 days he started to feel tired). He is still tired. Unable to clarify time frame of fatigue further. He feels bloated and full. Hasn't really eaten but feels real full and bloated. Hot and cold flashes started occurring about the same time as the other symptoms. He had these last evening. He does not get the flu very often and doesn't take the Flu shot. This is the closest thing he can remember having a pretty good episode with the flu. He was also given prescriptions for 2 new medications: Triamterene 37.5mg daily, for leg swelling; Clindamycin, 300mg, twice a day, an antibiotic. The odd thing is that it seems like his eyes are big, like really, really big, like they are really open. It is like big eye balls. States that he is just sick and his body is reacting to getting better. He has not been to work in the last 3 days. States that he is fine, just worried about work. Patient asked for personal advice about going back to work. The outcome of "his right leg started hurting" was recovered; outcome of "below his knees, his legs are swollen/ swelling in the legs/ put his shoes on they felt tight" and Fatigue/feeling tired was not recovered; outcome of other events was unknown.

1224262	4/18/2021	CA	19	F	3/28/2021	3/30/2021	strange pain on her left collar bone; going to see someone just in case it's a blood clot; lump on her collar bone, left collar bone; does hurt a little bit; This is a spontaneous report from a contactable consumer or other non hcp (patient herself). A 19-years-old female patient received bnt162b2 (BNT162B2, Formulation: Solution for injection), dose 1 intramuscularly administered in Arm Left (like the shoulder area) on 28Mar2021 09:00 (Lot Number: ER8734 and Expiry date: unknown) as single dose for covid-19 immunisation. The patient medical history was not reported. There were no concomitant medications. No additional Vaccines administered on same date of the Pfizer suspect. On 30Mar2021, the patient experienced going to see someone just in case it's a blood clot, lump on her collar bone, left collar bone, does hurt a little bit and on unspecified date strange pain on her left collar bone. 19-year-old female got the first Pfizer Covid vaccine at 9 am on Sunday, March 28 and this morning, she woke up with a strange pain on her left collar bone and there was a lump there, states when she woke up, she noticed a pain, checked in the mirror, she saw on the left side she saw a bump and checked on the right side and didn't see anything and that's when she got worried. Caller states she was just calling to report it, she's worried that it's a blood clot or something else. Why was the patient taking Pfizer BioNTech COVID Vaccine (Verbatim): she wanted to be vaccinated to protect herself and her community. Caller states she would not like to provide her last name at this time. However, provided her last name initial. She also reports she would not like to provide her address, height, or weight right now. She states she used to volunteer at a hospital. She does not see expiration or NDC number on card she received when she got her vaccine. Caller states she does know that one of her family members has the Factor 5. She is not sure if she has it but would like to be tested for it. The outcome of the event going to see someone just in case it's a blood clot was recovered, lump on her collar bone, left collar bone and does hurt a little bit was not recovered and strange pain on her left collar bone was unknown. Information on batch/Lot number has been requested.

----------	-------	-------	---------	-----	----------	------------	--------------

Mainly Prednisone, CellCept and Tacrolimus. Historical vaccine included BNT162B2, Lot: EK4176, on 13Jan2021 for COVID-19 immunization. Concomitant medication(s) included prednisone taken for transplant suppression and sjogren's from 1998 and ongoing; allopurinol taken for gout and ongoing; amlodipine taken for raynaud's phenomenon; bisacodyl (DULCOLAX [BISACODYL]) taken for an unspecified indication and ongoing; hydrofluoric acid (HYDROFLUORIC ACID) taken for moisturizing legs for skin and ongoing; losartan taken for hypertension and ongoing; magnesium oxide taken for supplement magnesium levels are low and ongoing; mycophenolate mofetil (CELLCEPT [MYCOPHENOLATE MOFETIL]) taken for Kidney Transplant Suppression and Sjogren's for 18-20 years and ongoing; rosuvastatin taken for blood cholesterol abnormal and ongoing; tacrolimus taken for kidney suppression anti rejection and ongoing; tiotropium bromide (SPIRIVA) taken for lung problems copd; states he has had 8 pneumonias and bronchitis and ongoing; valaciclovir (VALACICLOVIR) taken for outbreaks of shingles in mouth herpes simplex and ongoing; vitamin d ongoing; vitamin b12 taken for supplementation, ongoing. The patient experienced positive covid test on 27Mar2021 11:00 with outcome of recovering, not sleeping on that shoulder on an unspecified date with outcome of unknown , head congestion on an unspecified date with outcome of unknown, sinus infection on an unspecified date with outcome of recovered, bronchitis on an unspecified date with outcome of unknown. Stated he had his second shot on 3Feb2021 and on 27Mar2021, he was diagnosed with Covid. Caller stated on Saturday 27Mar2021, when they found out, the emergency room was really startled [that he tested positive for Covid after being fully vaccinated] and the hospital is a good size. Stated he was the first person that has been fully vaccinated that has caught Covid at the hospital. States he may have caught the virus earlier. States it started with head congestion that lead to a sinus infection and he was put on a Z-pack. States the sinus infection went away but he started having lung trouble so he went back and they said he had bronchitis, his lungs looked fine, and they put him on a different antibiotic. States they said lets do a Covid swab to make sure but they really doubt he would have it

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

and the Covid test came back positive and boy were they surprised. Clarifies the antibiotic didn't work on the Covid. States it was Levofloxacin, dosage unknown. States the Hospital is normally good about putting the dose on there but they didn't put the dosage and they kept the bottle at the emergency room on Saturday. Caller states that he is also on these other medications; however he doesn't think they were taken within the 2 weeks before the vaccines. Acetaminophen as needed, albuterol as needed, Refresh Eye Drops as needed, Guaifenesin as needed uses when he gets a chest cold and gets them fairly often, and Sudafed as needed. States a surgeon once told him he had the worst bronchitis that he has seen in his career. States he has had a collapsed lung. States during therapy they were putting in a subclavian line and nicked his lung. States boy does that hurt getting a line put in. Caller states he had a kidney transplant in 2014 and he has been on immunosuppressant drugs for 18 years. Mainly Prednisone, CellCept and Tacrolimus. Treatment was giving him a boost of dexamethasone, simply relying on the vaccine to help him get better. States he had no adverse reactions, other than not sleeping on that shoulder, that is all he had. Emergency Room visited on Saturday 27Mar2021 and 23Mar2021. States they did X-rays and blood tests and that is when they told him on 23MAR2021 that he had Bronchitis and sent him home on the antibiotic. The patient underwent lab tests and procedures which included blood test: unknown result on 23Mar2021, sars-cov-2 test: positive, x-ray: unknown result on 23Mar2021. Therapeutic measures were taken as a result of positive covid test, sinus infection, bronchitis.

1224724	4/18/2021	OH	29	F	1/22/2021	3/1/2021	pre-eclampsia; blood pressure remains somewhat elevated; heart rate is severe, intermittently/heart rate remained very elevated; the end of January for the first shot and three weeks later for second shot and at the time, she was pregnant; protein in the urine; weighed a little more; This is a spontaneous report received from a contactable healthcare professional (HCP) (patient) via the medical information team. This healthcare professional reported information for both mother and fetus/baby. This is a mother (patient) report. A 29-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), first dose (batch: EL9262) on 22Jan2021 (at the age of 29-years-old) then second dose (lot: EN6201) on 18Feb2021 (at the age of 29-years-old); both via an unspecified route of administration as single dose for covid-19 immunisation. The patient was pregnant at the time of vaccination. Medical history included blood clot (during her previous pregnancy); pulmonary embolism (during her previous pregnancy) and pregnancies (previous pregnancies were kind of close together). Concomitant medication included enoxaparin sodium (LOVENOX) for blood clot prophylaxis/pulmonary embolism prophylaxis (patient had a blood clot, a pulmonary embolism, during her previous pregnancy and so they make her prophylactically take it, always has been on it. The patient had a blood clot and was breastfeeding so she did enoxaparin sodium and she got pregnant again and was still on enoxaparin sodium). The patient received first dose of bnt162b2 on 22Jan2021, and the second dose on 18Feb2021. She was pregnant at the time, subsequently developed pre-eclampsia on 22Mar2021, and delivered on 25Mar2021, 7 weeks before her due date. The patient's seriousness for preeclampsia was hospitalization from 22Mar2021 to 28Mar2021 and life threatening. The patient stated that they delivered the baby and the overall preeclampsia has resolved. The patient's blood pressure remains somewhat elevated and heart rate was severe, intermittently in Mar2021 with seriousness of medically significant and hospitalization from 22Mar2021 to 28Mar2021. The patient had a doctor appointment at a maternal fetal medicine on 22Mar2021 then from there she was delivered because her blood pressure and heart rates continued to worsen. The patient still has increased

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

blood pressure, but she never had any blood pressure issues, just mild. The patient's blood pressure remained somewhat elevated and heart rate remained very elevated, but she couldn't say there was still protein in the urine (in 2021). The patient stated that her heart rate and blood pressure improved, and were medically significant. The patient remained on the dose and then her heart rate went up, not her blood pressure, just her heart rate went up really high starting in February, beginning of March and they increased her dose to, maybe in March, beginning of March, her heart rate went up, had her on enoxaparin sodium at 100mg once daily as her prophylactic dose and changed and went up from that to 100mg twice daily by injection. The patient stated that she may have weighed a little more (in 2021). The last weight was with pregnancy and pre-eclampsia. The patient weighed 205 (unspecified date). The patient was pregnant so she was seeing more of her maternal/fetal medicine and OB, but had seen her primary care throughout, maybe once. The patient stated that they didn't have enough data on pregnancy and neonatal and she wanted to contribute and advance knowledge in her area by providing information. The patient got the vaccination just on her own, just wanted to protect herself and her baby, the benefits outweighed the risks so she proceeded to get the vaccine. The outcome of the events blood pressure increased and heart rate abnormal was recovered in 2021; for pre-eclampsia was recovered with sequel on 25Mar2021 while for the remaining events was unknown. The patient did not believe the pre eclampsia had anything to do with the vaccine. The patient was not indicating that the vaccination led to the pre-eclampsia, that's for Pfizer to determine. No follow-up attempts are needed. No further information is expected.; Sender's Comments: Based on the current available information, the events Pre-eclampsia, Blood pressure increased, and Heart rate increased are most likely related to an intercurrent or underlying condition which is not related to the suspected drug. The patient was pregnant at the time of vaccination may provide a plausible explanation for the events. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of

1224818	4/18/2021	NJ	48	M	1/27/2021	1/28/2021	Heart stopped 6 times; unresponsive; soreness; felt like unwell; vomiting; Body aches; achiness; passed out 7 times; fever; chills; Left arm soreness at injection site and up back of shoulders; Left arm soreness at injection site and up back of shoulders; This is a spontaneous report from a contactable consumer.A 48-years-old male patient received second dose of bnt162b2 (Pfizer-Biontech Covid-19 Vaccine, Formulation: Solution for injection, Lot Number: EN5318), intramuscular, administered in left arm on 27Jan2021 11:00 at single dose for covid-19 immunisation. Medical history included asthma, myocarditis and allergies to Fruit or nut that grows on trees. Concomitant medication included esomeprazole magnesium (NEXIUM). The patient's heart stopped 6 times on 29Jan2021, he had a low grade fever, achiness and chills at 01:30, but they were gone the next day. Basically, at first, he took the shot and got the reactions that everyone else does, right arm soreness 01:30. On 07Jan2021 17:00, patient took the first dose of bnt162b2 (Pfizer-Biontech Covid-19 Vaccine, Formulation: Solution for injection, Lot Number: EL1042), intramuscular, administered in left arm. No prior vaccination was given within 4 weeks. He fell in the shower and passed out and hit his head at 18:00. He was not hooked up to a machine. About 18:30, his wife got him to the couch. He drank carrot juice and ate a granola bar. At 18:30 his eyes were wide open, but he was unresponsive. About every 30 minutes, he was going down. The third one came about 18:45-19:00. The pass outs lasted 15-20 seconds. and all he remembers was waking up to her screaming at him. The next one came at 19:15 and was in the ambulance on the way to the hospital and that is when he vomited in the ambulance and on the couch. Pass out number 3 was at home and 4 was in the ambulance. There was vomiting with both of them. Pass out number 5 was in the hospital when she was getting in the bed and was not hooked up in the room yet. Finally, they got him hooked up to a machine at 20:30 and into a room. They said if you feel dizzy, press the button. He found out his heart rate went from 80's down to 30's. That was the 6th pass out. This was the first time he was on a machine. His heart did not actually stop, it just went down to 30's and would come back. Then, it happened one more time on the machine and at that point, they were hooking him up to an IV and giving him medication to

1224898	4/18/2021	IL	67	F	3/17/2021	3/25/2021	Stroke due to a large blood clot to the brain; Stroke due to a large blood clot to the brain; Widespread blood clots in both of her arms; This is a spontaneous report from a contactable consumer (daughter). A 67-year-old female patient received the 2nd single dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration, in the left arm, on 17Mar2021 (at the age of 67 years old, not pregnant at time of vaccination) (Lot number was unavailable since unable to locate or read the details), for COVID-19 immunisation. The patient's medical history included ongoing atrial fibrillation, high blood pressure, and scoliosis. Concomitant medications included ongoing acetylsalicylic acid (ASPIRIN) for atrial fibrillation, naproxen, pregabalin, tramadol, and metoprolol. The patient never had a history of blood clots. There were no allergies to report. The patient had not received any other vaccines in the four weeks prior to receiving BNT162b2. The patient had received the first single dose of BNT162b2 on an unspecified date, in the left arm. The patient's daughter stated that her mother suffered a stroke due to a large blood clot to the brain on 25Mar2021 at 12:30 am, requiring hospitalization. During hospitalization, a surgery to remove blood clot from the brain was needed. Hospitalization lasted 12 days. The reporter added that in the week prior to the reporting, the mother 'passed' (as reported) but had widespread blood clots in both of her arms. The patient required unspecified treatment due to the events and had not recovered at the time of the reporting. The events were considered also serious since life threatening and due to disability. The patient did not have COVID-19 prior to the vaccination and had not tested positive post vaccination. Information on lot/batch number has been requested.

1224438	4/18/2021	DE	57	F	2/16/2021	2/18/2021	Post menopausal bleeding; vaginal bleeding; This is a spontaneous report from a contactable physician (patient) reported for herself. A 57-year-old female patient received 2nd dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, LOT number: EL9266, expiration date unknown) via unspecified route of administration at arm right on 16Feb2021 16:15 at age of 57-year-old at single dose for COVID-19 immunisation. Patient was not pregnant at time of vaccination. Medical history included hypertension, allergic to Cipro. Patient previously received 1st dose of BNT162B2 on 21Jan2021 at 02:00 PM (Lot number: EL3246) at single dose for COVID-19 immunisation. Concomitant medications included lisinopril, biotin/ cyanocobalamin/ folic acid (MVI 3), vitamin D3. Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. LMP 7/2018 No significant gynecological history other than pregnancies/childbirth. No prior abnormal vaginal/uterine bleeding. No known history of uterine fibroids. No h/o bleeding/coagulation disorder. On 18Feb2021, patient experienced vaginal bleeding began with light flow and gradually increased with use of pads and tampons. There was no clots. Menstrual period lasted until 23Feb2021. (This appeared to be similar to menstrual periods in the past except there was no cramping on the first day and in the past would have expected to end on 22Feb2021. No further vaginal/uterine bleed or spotting since 23Feb2021. On 19Feb2021, platelet was 349 (normal range: 150-450). On 16Mar2021, endometrial biopsy was negative. On 16Mar2021, Pap (Smear cervix) was negative. On 16Mar2021, ultrasound showed endometrial thickness within normal range 4 mm, 2 small fibroids 1 cm, 2 cm, normal ovary sizes, small L ovarian cyst. Prior to vaccination, the patient wasn't diagnosed with COVID-19. Since the vaccination, the patient been tested for COVID-19 by COVID-19 PCR (SARS-CoV-2) saliva with unknown results. It was reported that patient experienced Post menopausal bleeding on 18Feb2021 at 12:30 and vaginal bleeding on 18Feb2021 at 12:30. Outcome of events was recovered on 23Feb2021. Events resulted in doctor or other healthcare professional office/clinic visit. There was no treatment for the events.; Sender's Comments: Based on the information provided, reported events are not related to suspect product. Case

1227272	4/18/2021	MD	83	F	3/8/2021	3/9/2021	<p>massive stroke; massive blood clot in brain next day; This is a spontaneous report from a contactable healthcare professional. An 83-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 08Mar2021 10:00 (Batch/Lot number was not reported) as a single dose for COVID-19 immunization. There were no medical history and concomitant medications. Patient is not pregnant at the time of vaccination. Patient did not receive any other vaccines within 4 weeks and no other medications within two weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination. Patient has not been tested for COVID-19 since the vaccination. Patient has no known allergies. On 09Mar2021 19:00, patient had massive blood clot in brain and stroke. AE resulted in: emergency room/department or urgent care, hospitalization, life threatening illness (immediate risk of death from the event). Patient died on 13Mar2021 with cause of death: massive stroke. Outcome of the event "massive blood clot in brain next day" was unknown. Autopsy was not performed. Treatment received for AEs include anticoagulant. Information on the lot/batch number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Stroke and Thrombosis cerebral cannot be totally excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: massive stroke</p>

1227130	4/18/2021	OH		M	3/12/2021		<p>PNEUMONIA; BLOOD CLOTS; This spontaneous report received from a consumer concerned an 89 year old male. Initial information was received on 13-APR-2021 and processed with additional information received on 15-APR-2021. The patient's height, and weight were not reported. The patient's past medical history included congestive heart failure (ejection fraction 20%), large lower left groin hernia, atrial fibrillation, and dementia. No known drug allergies was reported. There was no history of blood clots. The patient received vaccination with covid-19 vaccine ad26.cov2.s (suspension for injection, intramuscular, batch number: Unknown) dose was not reported, administered on 04-MAR-2021 for prophylactic vaccination. Vaccination site was not reported. Batch number was not reported, will be requested. Concomitant medications included apixaban twice a day for atrial fibrillation. On 11-MAR-2021, the patient was taken to Emergency Room (ER) and diagnosed with pneumonia. Patient was awake over 48 hours 'felt due to dementia and illness'. On 14-MAR-2021, the patient was taken back to hospital and X-ray and CAT scan showed saddle pulmonary embolism. On 15-MAR-2021, the patient was discharged to a home with hospice. On 23-MAR-2021, the patient deceased. It was unknown if autopsy was performed. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. This report was serious (Death, Hospitalization Caused / Prolonged).; Sender's Comments: V0: An 89-year old man experienced fatal saddle pulmonary embolism 10 days after vaccine. Relevant medical history included congestive heart failure with ejection fraction 20%, atrial fibrillation (A Fib), and dementia. Relevant concomitant medication (others not reported) included Eliquis for A fib. The patient was diagnosed with pneumonia in the Emergency Department 7 days after vaccine, and 3 days later was brought back to the hospital and diagnosed with saddle pulmonary embolus. He was discharged home on hospice the next day and died 19 days after vaccine. There was no reported thrombocytopenia. The patient's age, concurrent pneumonia, and complicated past medical history are confounders. There is insufficient information to make a meaningful medical assessment. Additional information has been requested, including attempts to contact the patient's treating physicians.; Reported Cause(s) of Death: PNEUMONIA; BLOOD</p>

1227131	4/18/2021			F		4/14/2021	<p>ARACHNOID GRANULATION; This spontaneous report was originally received from the patient's husband and concerned a 45-year-old female patient. Initial information was received and processed with additional information received in discussion with treating physician on 15-APR-2021. The patient's weight 69 kg and height 178 cm. Patient's medical history included smoking for 10 years and quit 10 years ago. Subject's concurrent conditions included insomnia. The patient was reported to be in good health, Body Mass Index (BMI) reported as 21.7. The patient had no family history of blood clots. On 08-APR-2021, the patient received vaccination with Janssen COVID-19 vaccine Ad26.CoV2.S (suspension for injection, route of administration not reported; batch number not reported and requested), dose unspecified, for COVID-19 vaccination. Batch number was not reported, will be requested. Non-company suspect drug included unspecified contraceptive pill (unknown, oral) for unspecified indication. Concomitant medications included cannabis sativa for insomnia. On an unspecified date 'just following' vaccination, the patient had influenza-like symptoms. On 10-APR-2021, patient started experiencing headaches. On 14-APR-2021 (6th day post-vaccination), the patient presented to Emergency Room (ER) with four days of worsening headache and diagnosed with suspected right transverse sinus thrombosis (later ruled out.) The patient was transferred to a second hospital's intensive care unit (ICU) on an unspecified date. On 15-APR-2021 (7th day post-vaccination), a magnetic resonance imaging (MRI) scan of the brain showed suspected cerebral venous sinus thrombosis (CVST). No other symptoms or neurologic deficits reported, and her platelet count was reported as normal at 268,000 on admission (units and normal range not reported). The admitting physician initiated argatroban whilst closely following the patient's platelet count. Testing for a panel for heparin-induced thrombocytopenia including anti-platelet factor 4 (anti-PF4) antibodies and other unspecified workup were also planned. On an unspecified date, MRV of brain showed an absence of flow in right transverse sinus highly suggestive of thrombosis, sluggish flow in sigmoid sinus and superior IJ. MRA showed non-visualized of A1 segment of right ACA, more distal segment supplied by Left ACA, this is a normal anatomic variant. Also non</p>

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

visualization of R vertebral artery which is felt to be a normal anatomic variant as well. This read was reviewed on 15-APR with neuro-interventionalist physician and 3 radiologist who were all in agreement that this was instead a normal variant (arachnoid granulation.) Report was addended to clarify that there was never any thrombosis. Patient's blood pressure was 120/86 and heart rate 88. Patient was fully anticoagulated with argatroban. No heparin was received. Heparin induced thrombocytopenia (HIT) panel was sent and lab was requested to urgently process. Platelet count remained normal from 268 to 227 on 15-APR-2021. On 15-APR-2021, a CT venogram was performed which again confirmed no thrombosis; rather there was arachnoid granulation (normal variant). All imaging was confirmed with neuro-interventionalist physician and 3 radiologist who were all in agreement. Treatment with agratroban was discontinued on 15-APR-2021. As of 15-APR-2021, patient was clinically improving. Headache was resolved and neurologically intact. Patient was eating and was planned to discharge home later in the day. The action taken with COVID-19 vaccine Ad26.CoV2.S was not applicable. Action taken with contraceptive pill was unknown. The event arachnoid granulation was recovering This report was serious (hospitalization/prolonged hospitalization).; Sender's Comments: V0: A 45-year-old female experienced headache 2 days after vaccine and was hospitalized for suspected transverse venous sinus thrombosis (which was ruled out) 6 days after vaccine. There was no secondary hemorrhage, and after the imaging was reviewed with a neuroradiologist, it was determined that there was no thrombosis at all, but rather an arachnoid granulation (normal anatomic variant.) This was confirmed on follow up CT venogram the following day. Relevant concomitant medications included oral contraceptives. Platelet count was normal (268,000) on admission. No heparin was received, but a panel for heparin-induced thrombocytopenia, including ELISA for anti-PF4 antibodies is pending. The patient was initially anticoagulated on argatroban and symptoms improved one day after admission; the headache is resolved, she is neurologically in tact, and discharge is planned to home. Although the use of oral contraceptives is a risk factor for thrombosis, there was no thrombosis in this

1227158	4/18/2021	CO	61	M	3/17/2021	3/17/2021	<p>case.</p> <p>found a deep blood clot.; my calf, foot, and knee swelled up by evening./It stayed swollen for a week; my calf, foot, and knee swelled up by evening./It stayed swollen for a week; This is a spontaneous report from a contactable consumer (patient). A 61-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection) (at 61-years of age), dose 1 via an unspecified route of administration, administered in arm right on 17Mar2021 12:00 (Batch/Lot number was not reported) as a single dose for COVID-19 immunisation. Medical history included blood clot after a back fusion about 16 years ago (2005), and had a knee replacement 3 months before the vaccine (Dec2020). The patient's concomitant medications were not reported. The patient previously took ANCEF [cefazolin sodium] and had allergies; and oxacillin which the patient had allergies and hepatitis. The patient was not diagnosed with Covid prior to vaccination nor was he tested for covid since vaccination. The patient did not receive any other vaccine within 4 weeks prior to Covid vaccine. It was reported that the day the patient received the first vaccine his calf, foot, and knee swelled up by evening. It stayed swollen for a week and he went to see his doctor. He did an ultrasound on his calf and found a deep blood clot. He was now on blood thinners. He mentioned that he had a knee replacement 3 months before the vaccine but it was progressing fine. Usually blood clots occur after surgery within a 2 week period. He had a blood clot after a back fusion about 16 years ago. He was reporting this because his doctor was not sure why he got the blood clot and it coincided with the vaccine. The patient underwent lab tests and procedures which included ultrasound scan: found a deep blood clot in Mar2021. The events started on 17Mar2021 18:30 with outcome of recovering. The events resulted to doctor or other healthcare professional office/clinic visit. Therapeutic measures were taken as a result the events with LOVANOX and PRADAXA. Follow-up attempts are completed. No further information is expected.</p>

1227231	4/18/2021	PA	29	F	3/25/2021	3/28/2021	cerebral venous sinus thrombosis; CT scan that revealed the clot; horrible headache after intercourse; vomiting; This is a spontaneous report from a contactable consumer (patient). A 29-years-old non-pregnant female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Batch/Lot Number: EP7534), second dose via an unspecified route of administration, administered in left arm on 25Mar2021 09:45 as single dose for COVID-19 immunisation. Patient was 29 year old at the time of vaccination. Medical history included asthma, gastrooesophageal reflux disease, peanut and treenut allergy, all from an unknown date. Patient had estrogen allergy. Patient was not diagnosed with COVID-19 Prior to or after the vaccination. Concomitant medications included cetirizine hydrochloride (ZYRTEC ALLERGY), medroxyprogesterone acetate (DEPO PROGESTIN), beclometasone dipropionate (QVAR), OMEPRAZOLE, SERTRALINE HYDROCHLORIDE, all taken on an unspecified date and for unknown indication. Patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Patient had her first dose of bnt162b2 on 04Mar2021 at 9:45 am in left arm for COVID-19 immunisation. On 28Mar2021 at 09:45 the patient was diagnosed with cerebral venous sinus thrombosis a few days after receiving the second dose of the vaccine. She had a horrible headache after intercourse, went to the ER after vomiting, and had a CT scan that revealed the clot. The patient was hospitalized for cerebral venous sinus thrombosis. The patient underwent lab tests and procedures which included computerised tomogram: revealed the clot. Patient received Heparin and Eliquis as treatment for the events. Outcome of the events was recovering. No follow-up attempts needed. No further information expected.
1226093	4/18/2021	NH	72	M	3/27/2021	4/5/2021	DVT blood clot in left leg

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1227129	4/18/2021			U			<p>BLOOD CLOT; RIGHT LEG PAIN; HEADACHE; This spontaneous report received from a patient concerned a patient of unspecified age and sex. The patient's height, and weight were not reported. The patient's concurrent conditions included COVID-19. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1805022, and expiry: UNKNOWN) dose was not reported, administered on 06-MAR-2021 at 02:19 for prophylactic vaccination. No concomitant medications were reported. The patient reported that she had a blood clot/pain in right leg 2-3 days after she received the vaccine. She reported that she used compression socks for a week. The patient also reported that she experienced headaches (date unspecified), which still come and go every other day. The patient stated that she had the same blood clot pain in the same leg as when she had COVID-19 infection in MAR-2020. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient had not recovered from headache, and the outcome of blood clot and right leg pain was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: A patient of unspecified age and sex reported a "blood clot/pain" in right leg 2-3 days after vaccine. The patient had a history of "blood clot pain" in the same leg when she had COVID infection one year ago. History of thrombosis would provide a plausible alternative explanation for the event, although there are insufficient details to make a meaningful medical assessment. The patient was contacted and could not be immediately reached. Additional information has been requested for further assessment.</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1227269	4/18/2021	MI	64	F	3/19/2021	3/1/2021	possible pinched nerve; TIA; heart rate is low anyways from the medications but it dropped to 35 when she was in the hospital/heart rate dropped; her right arm, the right side of her face, and her right knee were numb/ she has numbness in her right finger and right thumb; face feels like its burning; her vision was kind of blurry; sensational loss in her right hand; caller's sclera looked like her eye was bleeding and her pupil started turning a different color.; caller's sclera looked like her eye was bleeding and her pupil started turning a different color.; eye was super red; rupture of a blood vessel in her eye; blood clot in eye; This is a spontaneous report from a contactable nurse (reported for herself). A 64-years-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Solution for injection, Lot Number: ER2613, expiry date not reported), via an unspecified route of administration, administered in left arm on 19Mar2021 09:00 at a single dose for covid-19 immunisation. Medical history included ongoing hypertension from 1900 wherein blood pressure was high prior to her atrial fibrillation medications; A fib (atrial fibrillation) from 2016 and ongoing; and ongoing heartrate low. As a child the caller had the vaccine in the sugar cube (unspecified) and her mouth was swelling from it; and stated that patient's sister was hospitalized after receiving the same vaccine. Family medical history included mom has hypertension. Concomitant medications included apixaban (ELIQUIS) taken for A fib (atrial fibrillation) from an unspecified start date and ongoing at 5 mg twice a day; sotalol taken for A fib (atrial fibrillation) from an unspecified start date and ongoing at 80 mg, twice a day; and diltiazem taken for A fib (atrial fibrillation) from an unspecified start date and ongoing at 180 mg, once a day. The patient was a healthcare worker and she has had friends who have died from covid. The patient had no previous immunization with the Pfizer vaccine considered as suspect and no additional vaccines administered on same date of the Pfizer suspect. Patient had no prior vaccinations (within 4 weeks). The patient stated she had the first dose of the vaccine and had a TIA (Apr2021) and rupture of a blood vessel in her eye 20Mar2021. The TIA was on Monday (Apr2021) and she was supposed to have her second dose tomorrow (09Apr2021). She stated she may get it but she is not taking it tomorrow because she is still

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

having residual symptoms. She asked what the length of time she can wait to get it before she has to restart. Patient reported that after she got her first vaccine she had a ruptured blood vessel in her eye the next day (20Mar2021). She put warm and cool compresses on her eye then the ruptured blood vessel subsided. The ruptured blood vessel came back again a few days later and this time it was the entire sclera. She developed blood clots in her eye and the doctor said it probably wasn't from the vaccine (Mar2021). She was supposed to get her second dose of the vaccine tomorrow 09Apr2021 but she was going to hold off for now. She then had a TIA (Mar2021) and became hospitalized because of it from 06Apr2021 to 07Apr2021. The patient has ongoing atrial fibrillation but has been taking her medication religiously. She believed that the TIA was from the vaccine as there was no explanation as to why it happened. Her heart rate was low anyways from the medications (dates unspecified) but it dropped to 35 when she was in the hospital (Apr2021). The patient's primary care provide was not the attending in the hospital when the caller was hospitalized. Furthermore, it was reported that on 21Mar2021, patient's eye was super red but only on one side of her left eye. On Tuesday, 22Mar2021, caller went to see her primary care provider and they told the patient to put a warm compress and no eye drops in her eye, that helped. Then that Friday, 25Mar2021, the patient's sclera looked like her eye was bleeding and her pupil started turning a different color. Then last Monday (Apr2021), the patient woke up and her right arm, the right side of her face, and her right knee were numb she got up and went to see if she had a facial droop and did not. The patient thought it was from her sleeping wrong, but these symptoms did not go away. The patient went to the Emergency Room where they did a CT of her head and neck, with and without contrast which was negative. The patient was admitted on 06Apr2021 to the observation unit where they did an MRI and ECHO, which were both negative and she was diagnosed with a TIA and possible pinched nerve (Apr2021). The patient denied any heavy lifting prior to this event other than normal day to day things. The patient was discharged on Wednesday 07Apr2021. The patient's face felt like its burning, she has numbness in her right finger and right thumb. Physical therapy and occupational therapy said

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

the patient should be okay but to be careful with things that were hot because she was at risk of burning herself. The second time the patient's eye became red, her vision was kind of blurry (Apr2021) and she didn't know if the blood was in her pupil. The only deficit that the patient has now is sensational loss in her right hand (Apr2021) and that should improve per the occupational therapist at the hospital. The caller was supposed to get the second dose of the vaccine on 09Apr2021 but she doesn't want to take it while she is having these symptoms. Results of tests and procedures for investigation of the patient included: head ct with and without contrast: negative on 06Apr2021; MRI brain: negative on 06Apr2021; Echocardiogram: negative on 07Apr2021; speech evaluation: passed on 07Apr2021. The patient asked what the efficacy is after one dose and if a booster will be needed since she is only protected for 6 months. Patient asked if she needed to restart the series of vaccinations if she doesn't get the second vaccine tomorrow 09Apr2021. The events ruptured blood vessel in eye, blood clot in eye, sclera looked like her eye was bleeding, eye was super red were reported as serious medically significant, and heart rate dropped as life-threatening. As reported, the events required emergency room and physician's office visit. Therapeutic measures were taken as a result of the events rupture of a blood vessel in her eye, and eye was super red. The outcome of the events reported was unknown. As per reporter, the events ruptured blood vessel in eye, blood clot in eye, and heart rate dropped were related to the covid BioNTech vaccine.; Sender's Comments: Based on the temporal relationship, the association between the reported events with BNT162b2 use can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

1227284	4/18/2021	WA	74	F	3/30/2021	4/6/2021	She almost died from pulmonary edema; Lungs have blood clots in them; This is a spontaneous report from a contactable consumer (patient's husband). 74-year-old female patient received BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine), dose 2 intramuscular, administered in left upper arm muscle at age 74 years on 30Mar2021 (Batch/Lot Number: EP6955) as single dose, for COVID-19 immunisation. The patient medical history was reported as no. There were no concomitant medications. The patient historically took the first shot of BNT162B2 on an unspecified date for COVID-19 immunisation. It was reported that the patient took the shot of second dose of Pfizer BioNTech COVID Vaccine (Lot number: EP6955) shot on 30Mar2021 in her left upper arm muscle. Patient was in the hospital at the time of reporting hanging on to life. Patient got pulmonary edema and she almost died, her lungs are, have blood clots in them from 06Apr2021 then she went to the hospital on 07Apr2021, has to stay in the hospital for 4 days. Patient was not experiencing symptoms anymore, she has had blood thinners they administered blood thinners (treatment), she was improving. She has to stay 2 more days in the hospital taking the blood thinners. Laboratory test was done on 08Apr2021 which is in the hospital where she almost died. Vaccine was administered at a hospital. Patient was recovering at the time of report.
1227295	4/18/2021	NY	30	F	4/3/2021	4/13/2021	On April 16, 2021 (Day 13 after Vaccine) I was diagnosed with acute deep vein thrombosis (DVT) of my femoral vein in my left leg by Hospital. In other words, I was diagnosed with a blood clot in my upper left leg. Pain in both my legs had started on April 13, 2021 (Day 10 after Vaccine). On April 16, I had a virtual appointment with my doctor, Dr. , who prescribed an ultrasound to rule out DVT. I went to an ultrasound appointment at Radiology at 3:30pm where a blood clot was found in my left leg. I was admitted into the emergency room at Hospital and prescribed medication and follow ups from there. These adverse symptoms developed after I submitted other adverse symptoms to VAERS on April 13, 2021 (Temporary VAERS E-Report Number: 435841).
1227316	4/18/2021	PA	44	F	4/14/2021	4/18/2021	Spotting between periods in the form of clots. Day 16 of cycle. Cramps.

1227320	4/18/2021	CA	71	M	1/16/2021	1/18/2021	about 2 days after the 1st dose of the moderna vaccine, felt very tired and unwell for several days. He felt okay for about 2 weeks then on January 29, 2021 he felt intense chest pain. Concerned it was a heart attack, he was brought to the hospital. He stayed one night and the hospital ran several tests like EKG, stress test and others. Found his results to be normal and was released on January 20, 2021. Even the moment he was released, he felt very dizzy but hospital was not concerned and thought maybe side effect of medication. He continued to feel dizzy, fuzzy brain and hard time staying awake during the day and sleeping through the night for the rest of the week. He passed sometime in the early hours of February 6, 2021. Doctor's suspicion is a blood clot. He has no history of blood clots, heart problems or any health issues.
1227376	4/18/2021	TN	46	F	3/15/2021	3/25/2021	Shortness of breath, nausea, headache, incident of blurred vision in one eye. Had visit with PCP on March 26th with follow-up testing on March 30th and 31st. Condition worsened and went to emergency room on April 4th and was admitted to ICU. EKOS procedure performed on April 5th. Discharge diagnosis on April 7th: 1) Acute bilateral PE (Pulmonary Embolisms/Blood Clots) with significant right heart strain status EKOS cath directed thrombolytics on April 5th. 2) Extensive bilateral deep vein thrombosis. 3) Significant right heart strain confirmed on the echo 4) Mild anemia 5) Metabolic acidosis with mild hyponatremia 6) Hypercoagulable workup, most results pending at discharge 7) Acute hypoxic respiratory failure
1227242	4/18/2021	CA	31	M	4/18/2021	4/18/2021	I felt numbness in my right leg, the numbness went up to my right arm and then I started slurring. This happened within a few minutes. I laid down and called a nurse adviser. I was recommended to go to ER, so my wife took me to ER. They did CT scan of my head, then CT scan of my head and neck with contrast, then MRI of my head, then MRI of my head and neck with contrast. It was confirmed that I had an ACUTE ISCHEMIC STROKE. It was decided to perform carotid endarterectomy surgery to remove a clot in the neck carotid artery. The clot was removed.

1226242	4/18/2021	NC	59	F	4/2/2021	4/10/2021	Eight days after receiving the vaccine, my wife developed shortness of breath, headache, fatigue, and unusual vision problems. She was taken to the emergency room on 4/15 where she underwent a battery of tests (see details below). She was admitted to the hospital (where she currently is) and was diagnosed with blood clots in the lungs and two strokes in the area of the brain that affects vision. She then underwent ultrasound tests of her legs and carotid artery, which were negative for signs of blood clots. Although my wife's symptoms are different than the symptoms of others that led to the vaccine pause, her doctors strongly encouraged us to report it to the VAERS. My wife had no underlying or pre existing conditions that would lead to blood clots in her lungs, and stroke. After extensive testing there is no evidence that the blood clots in her lungs as well as the clot/clots that went to her brain initiated in her legs. They believe that some sort of "event" would have had to happen to cause these blood clots, and the only unusual thing in the time frame of this condition is the vaccine. As I mentioned earlier, my wife is still hospitalized.
1226112	4/18/2021	TX	36	F	3/6/2021	4/13/2021	Pt presents to the ED with c/o right leg/calf pain and swelling. She also had a headache last week. She is concerned she may have a blood clot related to the Johnson & Johnson COVID vaccine, as the vaccine is currently on hold.

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1227128	4/18/2021	TX		F		4/11/2021	THREE BLOOD CLOTS IN THE LUNG; TWO BLOOD CLOTS IN THE LEG; HEART ENLARGEMENT OF LOWER CHAMBERS; This spontaneous report received from a consumer concerned an 86 year old female patient. Initial information received on 13-APR-2021 and processed with additional information received on 15-APR-2021. The patient's weight was 161 pounds, and height was 67 inches. The patient's past medical history included hip fracture in 2015, and uncomplicated hip replacement surgery in 2015. Patient's concurrent conditions included non-smoker and no alcohol use. No recent travel or trauma was reported. No varicose veins or known cancer was reported. Patient saw her doctor for annual checkups and cancer screening. She is an active person who lives alone, still drives, and performs activities of daily living independently. The patient received vaccination with covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1805029) dose was not reported, administered on 08-MAR-2021 for prophylactic vaccination. Vaccination site was not reported. No concomitant medications were reported as it was reported that the patient denied HRT and chronic medications. Approximately 1 week later, on or about 15-MAR-2021, she began to feel fatigue, tiredness, and shortness of breath which she thought might be due to the start of a heavy pollen season. On 11-APR-2021, the patient's fatigue, shortness of breath, and tiredness did not improve, so her son took her to the Emergency Room (ER), where CT scan found 3 clots in her lungs and duplex scan found 2 clots in her legs (patient's son was not certain if bilateral or unilateral). Patient's oxygen saturation was in 80s. On 11-APR-2021, a test also revealed that the lower chambers of her heart were enlarged. On 12-APR-2021, patient underwent EKOS procedure to treat lung clots. Tissue Plasminogen Activator (TPA) had been put into the lungs via EKOS procedure 'with ultrasound inserted into blood clot in the lung'. Patient initially was treated with heparin but was stopped. Patient was treated with unspecified anticoagulant as patient's son did not know. Pulse rate was 139. On 12-APR-2021, patient was admitted to Intensive Care Unit (ICU) (no beds were available on 11-APR-2021). He had no information regarding lab results. On 15-APR-2021, patient was transferred out of ICU to a

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

room on regular floor. Patient was still very tired. Oxygen saturation was in 90s. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient had not recovered from three blood clots in the lung, two blood clots in the leg, and heart enlargement of lower chambers. This report was serious (Hospitalization Caused / Prolonged, and Life Threatening).; Sender's Comments: V0: This 86 year-old active, independent female was hospitalized for 3 blood clots in her lungs and 2 blood clots in her legs 5 weeks after receiving Janssen Covid-19 vaccination. Medical history includes hip surgery after a hip fracture with uncomplicated course 6 years prior; she is a nonsmoker, does not have varicose veins, no known cancer, no history of recent trauma or travel and takes no chronic medications. Approximately 1 week after vaccination, the patient began to feel fatigue and shortness of breath. She initially thought her symptoms were due to the start of heavy pollen season. When symptoms did not improve 4 weeks later, she went to the emergency room where CT scan found 3 clots in her lungs and duplex scan found 2 clots in her legs. Oxygen saturation was in the 80s at that time. The following day she underwent EKOS procedure to treat the lung clots and was initially treated with heparin. The anticoagulant was subsequently changed after a public health announcement. She was admitted to the ICU and transferred to a regular room 3 days later. She was told the lower chambers of her heart were enlarged. She still feels very tired but her O2 saturation has improved to the 90's. No laboratory results were available to the reporter. Based on the limited information, the event is inconsistent with the causal association to immunization, per the WHO causality classification for adverse events following immunization.

1226730	4/18/2021	UT	65	M	3/5/2021	3/8/2021	Big blood clots following Prostate Surgery 3 days after Vaccine applied Please see attached explanation and pictures
1226935	4/18/2021	VA	56	F	1/1/2021	1/21/2021	I am post menopause. I began menstrual cramps on the 1/20/2021. My period started a day later. The flue was heavy and with clots. My hot flashes stopped for 2 months. My hot flashes resumed at the end of March 2021.
1226954	4/18/2021	CA	82	F	2/14/2021	2/28/2021	Blood clot in left arm on 2/28/2021 (2 weeks after 2nd dose of Moderna). Diagnosed at Emergency Room.
1226955	4/18/2021		62	M	3/24/2021	3/29/2021	Extensive DVT requiring surgery. Received second Moderna vaccine approximately one week prior to admission, presented with acute onset of left leg swelling and pain. Left lower extremity ultrasound demonstrated an extensive deep venous thrombosis extending from the common femoral vein into the peritoneal and posterior tibial vein with a patent IVC. He was given a treatment dose of enoxaparin and admitted to the hospitalist service. Overnight he developed diminished sensation in his toes and vascular surgery was consulted. On 3/31/2021 he underwent mechanical thrombectomy of the left superficial femoral and common femoral veins as well as stenting of the left common iliac vein stent. Of note he was noted to have May Thurner physiology with compression of the left common iliac vein by the external iliac artery on the right. Post procedurally the patient's swelling and edema was significantly improved. He did not have any significant pain or difficulty ambulating. On postoperative day #1 he was evaluated and found to be hemodynamically stable with improvement of his symptoms and stable for discharge home. Prior to discharge it was discussed with the patient that he will need to be on a loading dose of Eliquis for 7 days, followed by a maintenance dose of 5 mg twice daily. No h/o COVID.

1226125	4/18/2021	TX	44	F	4/12/2021	4/13/2021	4/13/2021 1am shortness of breath, chest tightness, 10:30 am Dr Visit (X-ray, EKG, Blood clots lab done) 12:00pm Sent to Hospital, Again everything done(X-Ray,EKG,Blood work, CT scan) They gave me an albuterol treatment which alleviated some chest tightness. I was released around 4pm from hospital. Once home I took some Benadryl 25mg
1222394	4/17/2021	SC	68	M	4/3/2021	4/12/2021	Bilateral pulmonary embolism, clot in leg, pneumonia developed after the vaccine. Patient was hospitalized for 3 nights.
1222465	4/17/2021	PA	41	F	3/20/2021	3/22/2021	The first two days I had a normal reaction with fatigue and soreness. On the second night I developed a severe sinus issue that caused my tongue to turn white/gray and be dry and sore. Frequent diarrhea, headache, sore throat, soreness, low grade fever for half a day and a resulting acid reflux condition. (I have never had acid reflux before) I was tested for Covid and Strep, both negative. Continued lymph node sensitivity for two weeks. 3.5 weeks in, I developed muscle tension, unrelenting, from the back of my head all the way down my spine. I had continued chest pressure and some numbness on my left side in my arm, leg and later my face. No home remedies worked and rarely do I get back/neck/shoulder pain. I was not doing anything strenuous. I went to the ER where they tested me for blood clots (J&J news had just come out and I have a family history) and prescribed valium for the muscle tension which has somewhat helped. I fully recognize that this might be bad luck, a series of unfortunate events after I received my shot. However, I have not been sick all year, I have never had acid reflux issues or pain like this in my neck/back/shoulders previously. The fact that in the 4 weeks after the shot I have not had a single day where I felt normal is a red flag to me. I feel like it is worth reporting in case anyone else has had a similar experience.
1222480	4/17/2021	TX	35	F	4/14/2021	4/15/2021	DVT (blood clot) in right leg below knee; leg cramps with sharp pain in calf with pressure, dull pain throughout leg and up to arm and shoulder when seated or laying down; prescribed blood thinners and scheduled follow up with primary care on Monday.

1223301	4/17/2021	TX	53	F	3/16/2021	3/24/2021	Patient reports tear in esophagus on 3/24/21 in the evening whenever she felt sick to her stomach. She did not feel well, drank one beer, and ate a packet of tuna. She continued to not feel well and felt the food did not go down correctly, so she reached into her throat and noticed blood. She called her doctor and the doctor recommended monitoring for increased bleeding. Later that night, she reports not feeling well again, made herself throw up, and noticed the vomit was all blood. The patient then called 9-1-1, and presents to the hospital. During the hospital visit she noticed that she saw 'blood clots about the size of a quarter' when she went to the bathroom. Patient reports the hospital gave her 4 pints of blood, 4 bags of 'yellow stuff' (patient assumes its plasma), protonix, antibiotics, and NS. Patient was in the ICU and reports being in the hospital for about 5 days total, whenever the doctor recommended being put on hospice. The patient did want to be put on hospice and wants to be treated, so she contacted her heart doctor and is waiting on an appointment with him on the 28th of April. Patient reports that doctor told her that she 'needs a new heart', but that she is not a good candidate, and that the Dr. told her this just a day or two ago. Patient reports that she did not know it was a tear in her throat (esophagus) until they "stuck a scope down there".

1223364	4/17/2021	IL	50	F	2/16/2021	3/8/2021	I received vaccine doses on 2/16/21 and second on 3/16/21. Trying to complete good deeds for Lent, I donated Plasma for the first and only time on 3/7/21. On 3/8/21 my right calf starting seizing up and I was experiencing calf pain. I was advised to do stretches and use a heating pad. It persisted for over a week and I went for a Doppler ultrasound scan on 3/17/21. Blood clots were found. The Plasma donation center screening led me to believe that they were concerned with other vaccines but not the Covid19 vaccine. Writing report because I think there is a possible connection to the blood clots, vaccine and plasma donation. I had to "do nothing" for three weeks and have been placed on Eliquis, a blood thinner for four months. Follow-up with Dr. for blood work and Doppler in July.
1221993	4/17/2021	IL	82	F	4/8/2021	4/9/2021	4/9/21 before 8am - coughed up large amounts of blood, went to ER at hospital several hours later. Admitted to the hospital for 4 days after finding blood clots in the lungs.
1223282	4/17/2021	WA	72	F	3/6/2021	3/9/2021	Noticed painful right calf 3/09/2021. Went to urgent care at hospital on 3/10/2021. Was given an ultrasound and it was determined that I had a blood clot in my calf vein. Was given heparin treatment for seven days followed by xarelto. I have had 2 dvts in the past associated with surgery. This dvt was listed as unprovoked, however I believe it was caused by the second shot of modern. Was told by doctors to report this to veers.

1222355	4/17/2021	PA	64	F	4/12/2021	4/12/2021	The patient received vaccine at the pharmacy and stayed for an observational period of 15 minutes. The patient left the pharmacy seeming fine but then reported on 4/17 that she had fainted at her residence and she was taken in an ambulance to a hospital. Patient said that the hospital ruled out a blood clot.
1221552	4/17/2021	WA	45	M	4/15/2021	4/16/2021	Noticed a feeling of pressure around bend in arm the day after vaccine. Took off sweatshirt to find a cause unknown but noticeable spot that was not previously there. It looks like a small blood clot. We can provide pictures. The pain subsided, no tingling or numbness by end of day. Concern is mostly whether pt should take a second dose with this reaction. Pt has severe varicose veins in his legs, not sure if its related.
1222039	4/17/2021	VA	41	F	1/19/2021	1/1/2021	Short Summary: DVT followed by Multiple Bilateral Pulmonary Embolisms (significant blood clots in both lungs). Context: After the first vaccine (about a week before my second vaccine), I self diagnosed myself with a calf injury due to extreme pain in my calf that felt like a continuous cramp. The extreme pain lasted until my second shot (about a week). When going for my second shot, I reported a rash with hives on my lower abdomen that had appeared within five hours of my first shot, so they requested I stay a little longer for observation. That night I began having some breathing difficulties, but assumed they were to be expected. The breathing difficulties continued to get worse until my nurse practitioner told me to go directly to the nearest ER (2/16/21), where I was officially diagnosed with multiple bilateral pulmonary embolisms. I was admitted to healthcare facility for 24-48 hours, until an EKG revealed heart abnormalities that caused them to use a physician's transport to move me to another unit. I was discharged from the hospital on 2/2/21 after I stabilized from heparin shots, avoiding more invasive procedures. I have been in ongoing recovery since then, receiving ongoing care from a hematologist and pulmonologist. A little extra context for you - I arrived to the hospital with diabetic ketoacidosis and have an endocrinologist since hospitalization that has diagnosed me with Type 1 Diabetes (previously misdiagnosed as type 2 - I'm now on insulin which is controlling my blood glucose well).

1223789	4/17/2021	MA	61	F	3/5/2021	3/6/2021	My sister, received the J & J vaccine on March 5th. I now know that she was not feeling well for a few days afterwards. She then felt better until day nine after the vaccine. On the evening of the ninth day, she began having abdominal pain, vomiting & diarrhea, headache. This was Sunday evening. Unfortunately I wasn't aware of how she was feeling and she didn't go to the emergency rm. until Tuesday morning. Tests determined her platelet level was low and abdominal CT showed bleeding from her adrenal glands. She was given platelets, pain meds and admitted into the hospital. Later that night staff felt she wasn't responsive and a head CT was performed. It was determined she had a brain hemorrhage and emergency surgery was performed. It is my understanding that there was brain damage at that point. During the early morning hours of the 10th day, post surgery, a repeat CT scan was done showing more hemorrhaging and blood clots. She also developed a DVT and PE and was kept on a respirator until the 13th day post vaccine to allow family to say their goodbyes. On the morning of the 13th day patient was removed from life support and she passed.
1223595	4/17/2021		43	F	3/20/2021	3/21/2021	The day after patient received vaccination, she experienced severe and unusual vaginal bleeding that lasted one month. Bleeding contained clots, which is not typical of her menstrual cycle.
1223729	4/17/2021	CA	60	M	4/12/2021	4/15/2021	On Thursday around noon, pt. had a headache, chest pains, numbness in left arm, the ER checked his heart rate and it was 215, they did blood work which came back normal & took more blood 4 hours later to check for heart damage, They admitted him to the hospital and did an EKG the next day that did not show any negative results (you'd have to get that from the hospital) They completed an Angiogram and found no blockage. Today, April 17th, I believe they did a cat scan of his lungs to check for blood clots and I am not sure of the results.

1219057	4/16/2021	OH	22	M	2/26/2021	2/26/2021	My son Fell out at work after shot was given. He had a seizure, he lay unresponse on floor until medics were called. He noe has a blood clot in brain & has had 3 more seizures.Patient drives a fork lift & drives a truck he is nolonger able to do either.
1219055	4/16/2021	WV	72	F	4/3/2021	4/3/2021	On April 3, 2021 the patient received the first dose of the Moderna COVID vaccine. The patient's husband states that "crashed an hour and a half after she got the shot." He defines this "crash" as decreased blood sugar, decreased responsiveness, and the seizures. She presented to the Hospital for evaluation and was subsequently transferred to the Medical Center on April 4th for further workup. She was intubated on April 4th and subsequently self-extubated on April 8th. Nursing staff and documentation indicate that the patient has had no further seizures since her presentation to the medical center. On April 14th she was found to have an acute lower extremity DVT. She was placed on a heparin drip and her platelet's dropped to 35. The heparin drip was discontinued, a HIT panel was ordered, and argatroban was started. Heamtology was consulted and the patient was found to have thrombotic thrombocytopenia. An MRI of the brain was ordered to rule out CNS thrombosis given recent seizures. The MRI has not been performed yet and the patient is still hospitalized.

1218973	4/16/2021	MD	37	F	3/23/2021	4/2/2021	Per hospital chart notes, known timeline of events is pieced together as follows: 2021-03-23 - patient received J&J COVID-19 vaccine at Drug Store 2021-03-24 - patient developed myalgias, headache, shortness of breath, and chills - resolved within 24 hours 2021-04-02 - patient developed headache intermittent from right to left side of head for which patient was seen at an urgent care. Patient was prescribed Fioricet (butalbital/acetaminophen/caffeine). 2021-04-05 - patient developed right-sided neck pain 2021-04-06 - patient got tested for COVID-19, resulted negative on 2021-04-07 2021-04-08 - patient seen at Medical Center emergency department for headache and right-sided neck pain that shoots to (2021-04-08 cont.) the head and shoulder, for which patient self-medicated with ibuprofen. Patient reported to ED provider that using ibuprofen nearly relieves headache and makes her functional and had the most improvement the day she visited the ED prior to her visit. Patient received a CT scan of the head without contrast that was unremarkable. Patient was diagnosed with headache and neck sprain and was prescribed ibuprofen 600 mg, take 1 tablet by mouth every 8 hours, and diazepam 5 mg, take 1 tablet by mouth 3 times a day as needed for muscle spasm. 2021-04-12 - patient developed left lower extremity pain 2021-04-14 - patient followed up with Neurologist outpatient as directed by ED provider and was advised to get an MRV and left lower extremity doppler. Patient was prescribed tramadol 50 mg and butalbital/acetaminophen/caffeine (Fioricet) by the Neurologist. 2021-04-15 - patient presented to Medical Center ED before outpatient MRV and LLE doppler could be done due to worsening right-sided neck pain and inability to ambulate comfortably due to lower extremity pain that had been worsening over several days. Upon examination, there is subtle swelling to left lower extremity and doppler revealed multiple DVTs in left lower extremity. CT head without contrast was unremarkable, however, CT venogram of the brain reveals thrombi of the right transverse sinus and sigmoid sinuses, as well as IJ. Patient was initiated on argatroban and admitted to inpatient at the time of this report. "Heparin induced platelet antibody" and "lupus anticoagulant evaluation" tests are ordered and pending.

1218939	4/16/2021	CA	68	F	2/10/2021	2/16/2021	I am on Warfarin daily and prior to my first Moderna vaccine, my INR was 2.2. It jumped to 3.4, 3.8, then 3.9 and I have not changed anything in my diet, nor have I changed any medication routine. I have heard about blood clots, but was wondering if there is an interaction with warfarin or similar meds. I have no symptoms other than bruising more easily.
1218850	4/16/2021	NH	43	F	4/11/2021	4/12/2021	Received the J&J Covid Vaccine shoot on Sunday, April 11th at the Clinic. The night of receiving my shot, I had a migraine and neck pain which resulted in trouble sleeping. When I got up in the morning, I started having severe muscle pain in my thighs and in my calf, mild cramps in the abdomen. The leg pain lasted the entire day with exhaustion, which interfered with my ability to work a full day. When I went to bed later that night, I still had pain behind my left knee and I was worried about if there was a blood clot. I got up the next morning and my legs were still cramping but improved from the prior day. When I saw the news discussing the blood clot issue associated with the J&J vaccine, I felt it was important to contact my Dr. to discuss the leg pain. They did an ultrasound (vascular scan) on my left leg and follow up with my doctor's office walk-in clinic after the scan. My legs were examined and no clots were identified. We discussed things to watch for.

1218790	4/16/2021	MO	49	M	4/5/2021	4/7/2021	Swollen lymph nodes and abdominal pain from right hip bone down to scrotum. Pain on 4/7 was such that i though i was suffering a hernia. Couldn't get out of car or move my right leg across my body. Could put right leg into pants leg. Hurt to bend over and do much of anything on 4/7. Initially thought pain was in testicle but doesn't hurt at all to the touch. Realized it more a swollen area in the groin between hip bone and scrotum. Nothing hurts to the touch at all in that area either which lead my to believe it was swollen lymph nodes. The Feeling is as if i got hit in the right groin and my testicle has been hit and discomfort is 8 inches above right testicle in my groin area. It has been improving every day since then, the more i walk the better it is. It only hurts when i sit now and it seems to aggravate it pretty well but once i start moving the pain goes away. It has been 9 days now and the i don't notice it all day until i come back to the office and sit at my desk and again it gets aggravated and the discomfort feels like my right testicle is near my appendix Since this all started my legs feel heavier in the calf and have little nerve sensations when i sit too, which concerns me about the blood clot possibility and so i have been emailing with my doctor. I am going to make appt for Monday 4/19
1219249	4/16/2021	NY	47	M	4/5/2021	4/7/2021	2 days after receiving the vaccine I have been diagnosed with Deep vein thrombosis and pulmonary embolisms.
1218587	4/16/2021	ND	55	M	3/31/2021	4/3/2021	Patient received Johnson & Johnson (J&J) Janssen COVID 19 vaccination on 3/31/21. Follow up telephone call was done to patient to assess for warning signs of blood clots. Patient reports new onset of shortness of breath 3 days after receiving the J&J COVID 19 vaccination and severe headaches. Patient denies any other symptoms of abdominal pain, leg pain or swelling, backache, petechiae, or new or easy bruising. Patient was given the following recommendations to seek medical care at the nearest emergency department. Patient states he is going to make a medical appointment with his primary care doctor at a local clinic in the town he lives in. Patient was advised due to the symptoms he is experiencing that he should seek medical attention for the symptoms he is having due to the warning signs of a type of blood clot that is occurring in the J&J COVID 19 vaccination.

1216640	4/16/2021	MI	73	M	2/21/2021	3/19/2021	My father received the first dose of the moderna vaccine on February 21, 2021. On March 19, 2021 my father exhibited stroke-like symptoms and was admitted into the hospital for a medical emergency. The doctors ran multiple tests and determined that he suffered a transient ischemic attack (TIA). His symptoms subsided and he was discharged on March 20, 2021. He received his second dose of the moderna vaccine on March 21, 2021 and, on the same day, suffered the same stroke-like symptoms which the doctors determined was another TIA. My father had no previous history of strokes, seizures or stroke-like symptoms prior to receiving the moderna vaccine. My father was re-admitted into the hospital on March 21, 2021 and over the course of two weeks was subject to a number of tests which revealed that his platelet count had significantly decreased to the point where his blood began to clot. They diagnosed him with a sudden onset of thrombotic thrombocytopenic purpura (TTP). The doctors explained that TTP was very serious and life-threatening disease if left untreated. Since this discovery, my father has needed to receive multiple plasma exchanges and rituximab treatments. I have written records asking the doctors about the link between the moderna vaccine and his TTP. The doctors recommended that I report this information. I believe it's critical for others to be made aware about the serious side effects of the moderna vaccine. I am willing to share my father's medical records which proves the drastic decrease in his platelet count following his receiving the moderna vaccine.

1218531	4/16/2021	FL		M		4/5/2021	DEEP VEIN THROMBOSIS; This spontaneous report received from a patient concerned a 46 year old male. Initial information was received and processed with additional information received on 15-APR-2021. The patient's weight and height were not reported. Patient's medical history included insomnia for which he took klonopin occasionally. Patient was non-smoker. Patient's body fat was reported as 6% The patient received vaccination with Janssen COVID-19 VACCINE (covid-19 vaccine ad26.cov2.s) (suspension for injection, route of admin intramuscular, batch number: Unknown) dose was not reported, administered on 14-MAR-2021 13:00 in left arm for prophylactic vaccination. Batch number was not reported, will be requested. No concomitant medication was reported as patient reported not taking any medication at the time of the event. Patient' did not have any blood work done since taking the vaccine. On 23-FEB-2021, platelet count was 206. On 05-APR-2021, the patient was diagnosed with deep vein thrombosis. Patient reported that after 2 weeks of vaccination, he experienced pain in left calf muscle for 2-3 days. Physician sent the patient for doppler scan for his leg. Patient was diagnosed with deep vein thrombosis. Treatment medications included: Eliquis (apixaban). Patient was prescribed apixaban 20 mg a day for a week and continue with it 10 mg a day for 2.5 months. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of deep vein thrombosis was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: A 46-year-old man was diagnosed with deep venous thrombosis (DVT) in his left leg 21 days after vaccine. There was no relevant medical history or concomitant medications, he is a nonsmoker, and there is no family history of thrombosis. Nineteen days before vaccine his platelet count was normal at 206,000 and no laboratory work has been performed since then. The patient was treated with Eliquis. Idiopathic DVTs often are followed by an extensive workup to identify the cause, and the patient is reaching out to his physician to discuss further. Based on information currently available, company causality is considered possibly related.

1216619	4/16/2021	NV	27	F	3/17/2021	3/18/2021	On 03/18/2021 at 03:30AM I had a lot of arm pain from my shoulder to my elbow in my left arm. This lasted until 03/31/2021. On 03/18/2021 I woke up with a headache that would not go away. Next, at about 03:15PM I was not able to walk for about 10 minutes. Then, at about 05:00PM I started menstruating. At 07:00PM I had severe pain in my pelvic area for an hour and a half. At approximately 08:30PM I passed a softball sized blood clot vaginally. I bled heavily through the night. On 03/19/2021 I still had a headache and no energy at all. I continued to bleed heavily all day as well. 03/20/2021 was the exact same as the days prior. 03/21/2021 I was still bleeding heavily throughout the day with no energy. I still had the headache as well. I started feeling dizzy while walking on this day. 03/22/2021 I went to work like normal. I was cold all day. I was still bleeding, headache and dizziness. It was hard to stand for 30 minutes. While climbing the stairs I got very light headed and dizzy. I could not go up the stairs at a normal pace. 03/23/2021 I had the same symptoms all day but I was getting short of breath walking short distances. I still had very little energy and a headache. I also lost all color in my face and hands. I was still cold all day. I noticed some slight swelling in my ankles. 03/24/2021 The symptoms were getting more intense. I was still cold. I finally took some aspirin for the headache because it was very severe. The medication didn't help with it. This routine went on for the next week and the symptoms intensified with each day. Throughout this time I was still passing clots that ranged in size from golf/ping pong ball to baseballs. They were very painful when they passed. The days from 03/25/2021 to 04/01/2021 were all the same as far as how I felt. On 04/02/2021 I woke up with the same symptoms but now I could not stay awake for anything. I slept on and off all day. I only ate one meal a day because I was so tired and I had no appetite. The headache was getting worse as the days went on. The bleeding was still happening. It was not as heavy as the weeks before, but enough to be painful still. I also started having abdominal pain. On 04/03/2021 I was seeing stars when I moved too quickly. My heart rate was elevated with shortness of breath along with the rest of the previous symptoms. My headache however was very intense. 04/04/2021 I still couldn't stay awake on top of all the other symptoms. The dizziness and stars were

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							more frequent. I couldn't move my head without seeing stars. 04/05/2021 I couldn't get warm and I still felt the same way. I called and made a doctor's appointment for Wednesday the 7th. I had all the same symptoms still and they were getting worse. I had to move in slow motion so I could try to function. 04/06/2021 I woke up drained of all my energy and color. I couldn't shower because of the pain in my body. I couldn't stand because I felt like I was going to fall down. I could barely stand up straight let alone walk very far. I was shaking from being so cold. I had all the same symptoms from the days prior. I was in severe pain. I couldn't sit because of the pain in my abdomen I couldn't stand because of the weakness in my legs. I could barely see anything because of the stars I was seeing. At this point I had no color and I was barely conscious. That is when my family took me to the emergency room.
1219326	4/16/2021	AZ	77	F	4/12/2021	4/15/2021	Body aches night of injection. Extreme bloody nose with clots on 3rd day after injection. Swollen and very itchy right wrist 3rd day after injection. Was able to stop bloody nose after 1 hour, did not need medical help. Have not experienced a bloody nose in over 50 years so this was quite unusual.
1219778	4/16/2021	TX	60	F	4/1/2021	4/3/2021	38 hours after injection the patient experienced severe dizziness, vomiting. Couldn't walk. Moving slowly. Went to ER on Monday, and was diagnosed with Left Subclavian Thrombosis causing cerebellar infarction and requiring a subclavian thrombectomy.

1217229	4/16/2021	NC	50	F	4/8/2021	4/8/2021	After I drove up and got my shot, the people had me drive to the next parking lot and park. We had to park every other space. By the time I got parked, I started to feel dizzy. I was afraid to tell anyone because I didn't want to go to the hospital. At first, I felt extremely dizzy so that I would not have driven if I had been allowed. Then, My heart then started to race for about 5 minutes before it started to calm down. The person who gave me my shot wrote on my paper on my dashboard that I had to sit for 20 minutes after my shot. I sat there for the whole 20 minutes and by the time I left, I felt much better, but it scared me it a bit. I was told to beep my horn if I had a reaction, but I was afraid too. I sat in my truck and waited to see if it got better or worse. It did get better. I was told by friends that I should report it so I am. I have been fine this week since that happened after the vaccination, without any dizziness or heart racing. But, I am having pain in my left leg and I'm a little worried about that because people are reporting blood clots. I think I have a vein that is bad in that leg, although I have never been diagnosed with it. That area has caused me pain in the past but I am so used to it that I normally just ignore it. There's just a spot on my left thigh that hurts where I think the veins are bad. Since the vaccination, I have had more pain in that area. I don't know if I need to be concerned with that. I have been trying to wait that out too.

4/9/2021

Later that day I started getting pain in the hip/groin area of my left leg preventing me from putting pressure on it or walking. The acute pain diminished after about 3 hr and I could walk again but the hip flexor area remained tender and felt like a sore muscle had been pulled for about 3 days. About 5pm I developed really bad chills which lasted about 24 hrs and was really intense about the first 6hr. About 11pm I developed a severe headache preventing me from sleeping which lasted about 9hrs. 4/10 I had occasional chills, the headache had subsided a little but had a nagging tension feeling and I was really fatigued and really wiped out the remainder of that day. My Gynecologist advised I stopped taking my Birth Control for the next month to lower my risk of blood clots.

1217463	4/16/2021	CA	86	F		3/12/2021	BODY PAIN ESPECIALLY BACK PAIN, NECK PAIN AND JOINT PAIN; This spontaneous report received from a patient concerned an 86 year old female. The patient's weight was 180 pounds, and height was 153.67 centimeters. The patient's past medical history included history of arthritis, heart attack, double hernia surgery, left knee fracture, right leg artery clot, and right toe gangrene, and concurrent conditions included shortness of breath, blood pressure, non alcohol user, non smoker, hay fever allergy, and sticky tape allergy, and other pre-existing medical conditions included no history of drug abuse. the patient had no history of vaccine allergy and no pre-existing acute illness 30 days prior to vaccination. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1805029 expiry: UNKNOWN) dose was not reported, administered on 11-MAR-2021 17:30 for prophylactic vaccination. Concomitant medications included metoprolol tartrate for blood pressure, venlafaxine hydrochloride for blood thinner, calcium for drug used for unknown indication, clopidogrel bisulfate for drug used for unknown indication, losartan potassium for drug used for unknown indication, and oxybutynin hydrochloride for drug used for unknown indication. On 12-MAR-2021, treatment medications included: acetylsalicylic acid. On 12-MAR-2021 00:30, the subject experienced body pain especially back pain, neck pain and joint pain. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient was recovering from body pain especially back pain, neck pain and joint pain. This report was non-serious.

1218520	4/16/2021	TX		F	3/31/2021		<p>LOW VITAMIN D LEVEL; FELT VERY SHORT OF BREATH, THINKS IT MAY BE DUE TO BLOOD CLOT; This spontaneous self-report was received from a patient and concerned a 32 year old female. Initial information received on 11-APR-2021 was processed with additional information obtained from telephone follow up with the patient on 15-APR-2021. The patient's weight was 200 pounds and height was 65 inches. The patient's past medical history included COVID-19 infection last year with minimal symptoms and not hospitalized, and concurrent conditions included protein C and protein S deficiencies with "many previous clots" with most recent in 2019, alpha 1 antitrypsin deficiency, low iron, low ferritin, low vitamin D, and contrast dye allergy. The patient was previously treated with warfarin for anticoagulation for 13 years, and 8 months ago was switched to XARELTO. The patient received COVID-19 VACCINE AD26.COV2.S (suspension for injection, route of administration, dose, vaccination site, and batch number were not reported) administered on 31-MAR-2021 at 10:30 for prophylactic vaccination. The batch number would be requested in follow up. Concomitant medications included rivaroxaban for anticoagulation. On 31-MAR-2021 around 19:30, the patient felt very short of breath, had a hard time breathing and "thought it may be due to a blood clot" and felt "like it maybe getting worse". She saw hematologist on 14-APR-2021, who, at her request, stopped XARELTO effective 15-APR-2021, and started a 2 week course of Lovenox, with plan to start warfarin after that. This was not medically indicated, but requested by patient, and physician agreed. Her oxygen saturation at that visit was normal. On 14-APR-2021, laboratory data included: platelet count (NR: not provided) 470 (units unspecified), and vitamin D (NR: not provided) low at 19 (units unspecified); as treatment "mega dose" was ordered to her pharmacy. Her hematologist scheduled a VQ scan for 19-APR-2021 to evaluate for pulmonary embolism. The patient reported the event felt very short of breath, thinks it may be due to blood clot related to COVID-19 VACCINE AD26.COV2.S. The action taken with COVID-19 VACCINE AD26.COV2.S was not applicable. The patient had not recovered from the events. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: This 32 year-old female with medical</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							<p>history significant for obesity (BMI 33), Protein C &amp; S deficiencies with "many previous clots" (most recent in 2019) began to feel very short of breath approximately 9 hours after receiving Janssen Covid-19 vaccination. Other medical history included alpha 1 anti-trypsin deficiency, low ferritin, low vitamin D, allergy to contrast dye, and mild Covid-19 infection last year which did not require hospitalization. Concomitant medications included rivaroxaban which was started 8 months ago; warfarin had been used for 13 years prior to rivaroxaban. She felt her difficulty breathing could be a blood clot and went to see her hematologist 2 weeks after vaccination. Rivaroxaban was stopped at her request, not because it was medically indicated, and enoxaparin was started with a plan to start warfarin 2 weeks later. Platelet count was 470, vitamin D level was low, and oxygen saturation was normal at that time. A VQ scan is scheduled 5 days later since she is allergic to dye. While the cause of the dyspnea has not yet been determined, a new blood clot would most likely be related to the patient's underlying hypercoagulable state and not the vaccine. Based on insufficient information, the causal association of serious shortness of breath to immunization is assessed to be indeterminate per the WHO causality classification for adverse events following immunization.</p>
1217054	4/16/2021	CA	21	F	4/13/2021	4/15/2021	Painful cramps, heavier period on first day with clots. Not my usual period, heavier.

1217053	4/16/2021	CA	30	M	4/15/2021	4/15/2021	<p>Client was vaccinated with the Pfizer Covid vaccine with lot #EW0162 at 11:59am on 04/15/2021. EMT observed client standing at the facility exit speaking to the interpreter. EMT noted upon approach client appeared alert, tracking with his eyes, in no apparent distress. Client had a chief complaint of numbness at his injection site. Client stated that he had completed his 15 minutes and had exited the site but began to experience numbness at his injection site while exiting. This was the client's first dose of the Pfizer vaccine. Client states he has a history of a deep vein thrombosis and hypertension. Client is not on any medications and denies any known allergies. Assessment revealed that client's left arm/injection site was clean, dry and bandage remained intact. Client was negative for hives, swelling, severe sweating, shortness of breath or other signs of anaphylaxis. Client was alert and oriented to person, place, date, and event; and airway, breathing and circulation were intact. Client had full range of motion of his arm and denied any tingling. Client denied any pain upon palpation of the injection site and stated that his numbness was strictly localized to injection site and did not spread to rest of arm. Client's vital signs upon entering EMT station for further evaluation revealed: blood pressure 180/140, respirations 18, pulse 68, 98% on room air; lung sounds clear bilaterally, temp 98 degrees F, eyes remained equal, round, and reactive to light at 5 mm. Client stated that he had his blood pressure taken last week and that his systolic was approximately 160. Client agreed to remain for an additional 30 minutes of monitoring per site lead nurse and was stable throughout observation. Vital signs at 1220: blood pressure of 180/140, respiratory rate of 18, heart rate of 68, and oxygen saturation of 98% on room air. Vital signs at 1235: blood pressure of 160/124, respiratory rate of 18, heart rate of 76, and oxygen saturation of 99% on room air. Vital signs at 1250: blood pressure of 158/118, respiratory rate of 18, heart rate of 76, and oxygen saturation of 99% on room air. At the completion of the client's observation, client stated that numbness was "better" and stated that it was "almost gone." Client's blood pressure improved upon reassessments, and all other vitals were remained within normal limits. Client was provided with vaccine information packets and encouraged to seek follow-up</p>

							care or emergency care if symptoms become more severe later in the evening. EMS was denied by client, no medication or other interventions were indicated or administered. Client departed facility by ambulation to private care at 1253 in positive disposition. EMT reported to lead nurse about client's status after client left facility already. Lead nurse educated EMT regarding high blood pressure referral to EMS. But EMT stated client denied EMS.
1216642	4/16/2021	IL	35	M	12/31/2020	2/17/2021	In the 3 weeks leading up to February 10th, I became progressively more bloated with fluid in my stomach area, with an increasing feeling of fullness. By the 10th, I felt so full that I had only eaten one meal in two days. I had also been sleeping upright for days to attempt to clear what I perceived to be a stomach blockage and therefore was quite tired. I walked in to the ER and the x-ray revealed the blood clot in my portal vein. The physician immediately had enoxaparin administered to me and I was admitted. I received another enoxaparin dose the next morning. I was discharged on Xarelto 15mg twice a day in the afternoon of Feb 11th. I am continuing on Xarelto as my hematologist runs various tests and I have an EGD on 4/16 due to a possible stomach ulcer. I was diagnosed with: Mesenteric venous thrombosis Elevated transaminase measurement Fatty liver
1218182	4/16/2021	DC	31	F			Asthma flair up, abdominal pain, blood clot, headache, and lack of sleep.
1218187	4/16/2021	WA	41	F	4/9/2021	4/13/2021	Six days after my second shot of Pfizer I got a DVT Clot in my left leg behind the knee. Started with Severe pain felt like a charlie horse in my left calf and foot that would not go away for more than 24 hours. My Blood pressure spiked and i got a migraine from the pain , My left leg and food felt like stone.. The next day I called the nurse from my insurance company and she advised I go in to the hospital. Went to ER got a Ultrasound, blood tests and the ultrasound came back positive for a DVT clot. Treatment is Xarelto and follow up with my primary. Lab Results came back normal.

1218197	4/16/2021	ND	44	F	3/31/2021	4/6/2021	Follow up telephone call to patient after receiving the Johnson & Johnson (J&J) Janssen vaccination on 3/31/21 was made 4/15/21. Patient was screened for warning signs of blood clots and patient answers yes to having severe headache and shortness of breath. Denies any abdominal pain and leg pain. Patient states symptoms began 4/6/21 at around 6pm in the evening and continue to the day of telephone call. Transportation arrangement was made for patient due to lack of transportation to go seek medical attention in ER. Patient was transported to ER for medical evaluation. Upon review of patients chart, patient was seen 4/15/21 in ER. Patient did not report any symptoms of severe headache and shortness of breath. Patient complains of having common cold in ER.
1218240	4/16/2021	NC	78	F	2/4/2021	3/4/2021	Extensive DVT(blood clots) involving both legs-- initially with tachycardia dyspnea. Now on 10a meds. Likely to have disability or permanent damage. History of post-op DVT with PEs following shoulder surgery, subsequent placement of IVC filter.
1218318	4/16/2021	NC	34	F	4/1/2021	4/15/2021	I have a history of heavy periods which resulted in the need for an ablation in October 2018. Since the ablation my periods have been much more manageable. I got my period 13 days after receiving the shot and it started out much heavier than normal, by the second day I was bleeding extremely heavily, soaking an overnight pad in less than 2 hours with bright red blood and passing clots the size of dimes and pennies. Day 3 has started out the same as day 2. Prior to my period starting my back hurt and I had much worse than normal abdominal cramps. Nothing in my life has changed besides the vaccine, I am certain there is a connection between the two. I am not sure how long this will last, I was instructed to go ahead and report the adverse event.
1218327	4/16/2021	MI	56	F	3/27/2021	3/27/2021	Cerebral venous sinus thrombosis with venous infarct. Was also found to have antithrombin III deficiency and elevated factor 8. She had uncontrolled HTN and DM at the time and untreated OSA.

1218378	4/16/2021	TX	55	F	3/31/2021	4/2/2021	I would like to amend my first report to add that 2 days after I received the vaccine I noticed bruises in my hands and one in my leg. 2 bruises on my knuckles and also 2 on the side of my hands. They are symmetric, I did not hit my hands anywhere. My husband also noticed a small bruise on my right leg. They were very prevalent the first week I received the vaccine and they are slowly fading away. The ones in my hands are almost gone, the one in my leg is very small now. You can still see it though. After seeing about the Janssen vaccine being associated with blood clots I had a virtual visit with my doctor, and he does not seem very concerned about blood clots but asked me to come in for some blood work. I did not go yet because I would like to wait for at least 28 days after the vaccine to go in and have the blood work done. I also remember I had a very bad headache one day soon after I got the vaccine but I was battling some sinus issues before the vaccine, so I am not sure if that was related to sinuses or not. I took an Advil and it went away. And my arm still hurts a little, not as often as before. The pain comes and goes. Before it would happen several times during the day now it is more like once a day and once it goes away it just comes back the next day.
1218422	4/16/2021	WY	67	M	4/5/2021	4/6/2021	DEATH! About 24 hours after getting his 2nd Moderna Covid-19 shot, patient got deathly ill with explosive vomiting and diarrhea. Not long later he was passing out. Paramedics were called, and he was taken to the hospital where he passed away from a massive heart attack. The doctors gave him clot-busting drugs in an attempt to save him. He has never had problems with blood clots in his life. He was the healthiest one of us all, and was almost never sick. The doctor said that it was probably no coincidence that he died so soon after receiving his Covid shot. I am convinced that they are connected. A healthy man suddenly gets blood clots in his heart 24 hours after getting his shot? Not a coincidence!!!!!!!!!!!!!!1

1218425	4/16/2021	OH	53	F	3/18/2021	4/5/2021	Patient received the COVID 19 vaccine on March 18, 2021 @6:00pm. On April 5, 2021 @8:00am the patient began to feel pain in L leg which progressed to area red and tender to touch and increased in pain with each day. Patient went to the ER on April 9, 2021 and an ultrasound revealed a 10 cm blood clot in left leg. Patient was not admitted but sent home on Zarelto 15 mg 2x daily. Patient did see physician as a follow up.
1217613	4/16/2021	CA	35	F	3/9/2021	3/19/2021	Site: Pain at Injection Site-Mild, Systemic: see below - Medium, Additional Details: Patient states that 10 days after vaccination, started to get swollen legs and pain which went away a week later. She was concerned due to blood clot warning and I advised her to seek additional medical assistance which she said she would seek. She did state in addition, she experienced swollen lymph nodes and breast tenderness which occurred right after vaccination and lasted 2 weeks.
1221210	4/16/2021	CA	39	F	4/2/1981	4/3/2021	On the day after vaccination I had extreme dizziness and faintheadedness, and heavy brain fog. I could not drive or stand up for long periods of time. I was having issues expressing thoughts and having my normal conversations. This was accompanied by strong headache on right side of my head and slightly stuffed sinuses. The day afterwards all symptoms disappeared. However, they reappeared at milder levels intermittently through the next several days. I am now at day 14 with the dizziness and brain fog still occurring intermittently and last night had short episode of abdominal pain. I decided to call the doctor's office this morning when the dizziness started again, for advice and to schedule a brief exam. They told me to go straight to the ER instead, so I went and had blood drawn. Blood came back normal and likelihood of clot very low, so was released but referred to my primary doctor and a neurologist for follow up over the next week. The intermittent dizziness and brain fog persist ever since my shot 2 weeks ago. Additional symptoms that I believe to be normal are dull leg pain behind the knees, slight tightness in chest sometimes, and recurring mild headache.

1221044	4/16/2021	TX		M	1/6/2021	2/1/2021	<p>Blood clot in the right leg; Blood clot in the lungs; Blood clot in the hip; This spontaneous case was reported by a consumer and describes the occurrence of THROMBOSIS (Blood clot in the hip), THROMBOSIS (Blood clot in the right leg) and PULMONARY EMBOLISM (Blood clot in the lungs) in a male patient of an unknown age who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. Unknown and 015L20A) for COVID-19 vaccination. The patient's past medical history included No adverse event (No reported medical history). On 06-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 06-Feb-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. In February 2021, the patient experienced THROMBOSIS (Blood clot in the hip) (seriousness criteria hospitalization and medically significant). In March 2021, the patient experienced THROMBOSIS (Blood clot in the right leg) (seriousness criteria hospitalization and medically significant) and PULMONARY EMBOLISM (Blood clot in the lungs) (seriousness criteria hospitalization and medically significant). The patient was hospitalized on 16-Mar-2021 due to PULMONARY EMBOLISM, THROMBOSIS, THROMBOSIS At the time of the report, THROMBOSIS (Blood clot in the hip), THROMBOSIS (Blood clot in the right leg) and PULMONARY EMBOLISM (Blood clot in the lungs) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Patient states that 2-3 weeks after receiving the second shot they had a blood clot in the hip and a week later they had a blood clot in the right leg and in the lungs. Patient reports they had to be hospitalized for two nights, in the Medical City Fort Worth Hospital. Patient states they do not have any history of blood clots. Patient mentioned reading online, in forums, that people had taken Pfizer and Moderna vaccines and two weeks after had blood clots and ended in the hospital. 1221137	4/16/2021	FL	93	F	1/22/2021	1/22/2021	My my grandma got them a derma vaccine on January 22 she died on February 11 she was admitted to the hospital with a blood clot in her leg they tried to do surgery but when they put her under the anesthesia she never woke back up. She was 93 years old and had many other health conditions but when I called the doctors office to ask them if they reported my grandma they just kept giving me the runaround I tried to call hospital as well and I got the same thing they told me to go back to the doctor. I think someone should know and I think it?s way too difficult for family members to try to report adverse side effects it took me all day to find someone that could help me get to this website. I think there may be a lot more adverse side effects but people don?t know how to report them.
1221028	4/16/2021	RI	22	F	4/7/2021	4/15/2021	Started about 11:30am on April 16th, shortness of breath, heart rate in the 120s, chest pain, and headache I called my campus health services and they instructed me to go to the ER. I had a positive d dimer and was given a contrast CT scan which turned out negative for blood clots. Still experiencing the same symptoms as of 8:30pm April 17th.

1221191	4/16/2021	UT		M	2/6/2021		<p>pulmonary fibrosis; heart hurt; hearing and eyes are no good and he is old; COPD; hearing and eyes are no good and he is old; arm sore; lungs felt funny and airy but could breathe real good; real bad frontal headache and the top of the head that were two real strong headaches that lasted quite a while; change in smell for several days; he is in terrible pain lying in the bed due to dirty things wrong with him; terminally ill; neck pain; This is a spontaneous report from a contactable consumer or other non-health care professional via PPDI. An 80-years-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Formulation: Solution for injection, Lot number: en5318) via unspecified route of administration on 06Feb2021 as single dose for COVID-19 immunization. Medical history included twelve chronic conditions that he has been treated for, for years. Patient mentioned on an unspecified date, he already died once, clarified, it was very sudden and he had a heart attack in his sleep. He had central sleep apnea and he stopped breathing. He has atherosclerosis, his arteries are clogged and he has chronic inflammation, stated it is a can of worms. He has polycystic kidney disease, stated his kidneys are headed that way. He has chronic insomnia, Cerebrovascular accident from 2008, had mini strokes and had heart surgery for blood clots to his brain in 2008. The patient concomitant medications were not reported. On an unspecified date, the patient experienced pulmonary fibrosis, heart hurt, arm sore, lungs felt funny and airy but could breathe real good, real bad frontal headache and the top of the head that were two real strong headaches that lasted quite a while, change in smell for several days, he is in terrible pain lying in the bed due to dirty things wrong with him, terminally ill, hearing and eyes are no good and he is old, copd, hearing and eyes are no good and he is old and neck pain. AE for second dose transmitted. Patient also stated that after the second shot, his arm was sore at the site, swelling and pain more profound and sooner, knot in the arm, arthritic knees and joints became more painful, illusion of a spider walking on the wall, pain in the left arm bicep, lower left back got painful and went down in to the hip and left thigh muscles and had headaches. Patient mentioned his heart and lungs heart a few days after the second shot and had a strange feeling in his lungs. Patient stated he had night</p>

							sweats and got drenched but this is a symptom of a heart problem which he has. Patient stated his heart beat was skipping around 68-78 and his oxygen was skipping around. Patient stated that he has PVC. Patient stated he had a headache on the top of his head. Outcome of the events was unknown.
1221434	4/16/2021	PA	49	F	3/20/2021	3/21/2021	On March 21, 2021 at around 5:30 I had fever, headache, nausea, fatigue, dizziness. The next day, March 22, I had heart palpitations, dizziness and still fever. On March 24, 2021 at approximately 8:00 pm, my right leg became heavy and felt numb. On March 25 I woke up to my mouth locked with Bell's Palsy like drooping on the right side of my face. My mouth remained unable to open fully for the next day and the numbness and pain in my leg increased. On March 26 I went to the ER because I was afraid I was having a stroke. They gave me tests and said I did not have a stroke. They gave me steroids and they helped with my jaw but the pain in my leg increased. The pain in leg continued with more pain in my knee. I followed up with my family doctor and they sent me to have an ultrasound of my leg to check for a blood clot on April 9th No blood clot was found. Pain continued and increased so the doctor sent me for an MRI on April 14. MRI showed moderate effusions to the knee joint and I have an appointment with a orthopedic doctor on Tuesday April 20th. I continue to have stabbing pain in my knee and swelling and discomfort.
1221214	4/16/2021	PA	42	F	2/22/2021	3/9/2021	I woke up in the middle of night with chest pain and trouble breathing. I had a pulmonary embolism. The pain and difficulty breathing lasted several days. Since then, I have experience a flare of the antiphospholipid syndrome - low platelets (blood work), splinter hemorrhages, clots, and the like. Whether from the embolism or other, the pulmonary hypertension has gotten drastically worse - with increased shortness of breath, irregular heart beats, dropping pulse ox.

1221237	4/16/2021	NJ	34	F	4/10/2021	4/10/2021	Fever (102), body chills, body aches, headache, abdominal pain, water retention, nausea, insomnia. Most of the symptoms occurred on the first night. Nausea took 4 days to subside. I'm on day 6 and I had an ultrasound done to my leg as my left leg has started to hurt. Ultrasound showed no blood clots. Pending blood work results. Water retention is still present however it does seem to be subsiding today, day 6.
1221315	4/16/2021	LA	55	F	4/7/2021	4/14/2021	Patient started noticing left arm swelling and pain about 2-3 weeks after the vaccine. She then presented to the hospital 4/16/21 and was found to have a deep vein thrombosis in her left brachial vein as well as a thrombosis in her right internal jugular vein. She is currently being further worked up and will be admitted to the hospital for anticoagulation.
1221387	4/16/2021	CT	67	F	2/20/2021	3/14/2021	Approximately 3 weeks after 1st vaccine, on March 14, 2021, I developed a film over my right eye and experienced jagged multi colored lines. Experienced this every few days for anywhere from 15 minutes to 1 hour in length. Again 3 weeks after my second vaccine, I woke up with the same eye problem which has been constant now for 1 week. I am unable to see clearly out of my right eye. This is still ongoing and my retinal specialist believes a blood clot may have traveled to my eye and burst causing this problem.

							13Feb2021 in left arm at 10.30 am and his 2nd dose of Moderna vaccine was scheduled on 13Mar2021. On 13Mar2021he went to Emergency Room (ER) and he had major surgery on small intestine, patient mentioned that his small intestine got blocked and due to blockage the blood supply was stopped and the intestine started to die. On that day, the patient underwent a surgical procedure which the doctor had to take out 12 inches of small intestine and stapled back. He was hospitalized for five days. Five to seven days after his surgery, he developed blood clot thrombosis in his right and left legs. Treatment for the event included blood thinner, which he has been on for 45 days. It was reported that the second dose of Moderna vaccine was missed due to hospitalization for the events and the blood thinner that he was on. Most recent FOLLOW-UP information incorporated above includes: On 13-Apr-2021: reporter added, product indication added, event added(missed dose), event assessment done, additional info added( Source Document and mail document added); Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.

1213036	4/15/2021	MI	42	M	3/24/2021	4/10/2021	Received vaccine 3.24.21. Had been incarcerated / in prison system until 4.7.21. Complex past medical history. 4.10.21: Went to ED on 4.10.21 - for hematuria. CHIEF COMPLAINT: BLOOD IN URINE (patient reports hematuria an hour prior to arrival along with spitting up a large clot (hemoptysis). denies rectal bleeding at this time. denies being on a blood thinner. c/o back pain starting a few hours ago. HX aortic aneurysm and scheduled to get surgery in a few weeks. )Urinalysis returned showing moderate amount of blood was 73 RBCs. Patient did not have frank hematuria on specimen. Patient's laboratory work otherwise remains unremarkable. Electrolytes within normal limits. Patient has a stable hemoglobin of 13.8. CT scan showed evidence of acute aortic dissection. There were scattered faint ground-glass opacities along the right upper lobe as well as left upper lobe. COVID-19 testing was added on after results. At this time I do not have a great explanation for the patient's hematuria. I did instructed to follow up with Urology for further evaluation of this. He is hemodynamically stable I do not believe further testing is warranted at this time. Return precautions were discussed including urinary retention, large volume bleeding or any other concerning symptoms. He voiced understanding of this and was discharged stable condition. He was provided a work note as he is on probation and it is for her of his hospitalization at this time. 4.13.21: Went to ED on 4.13.21: CHIEF COMPLAINT: LEG PAIN (pt c.o. right leg swelling/pain that started 3 days ago; had johnson&johnson vaccine on 3/24 and is concerned for blood clots; supposed to have surgery at the end of the month; recently seen for blood in urine; c.o. generalized body aches)42-year-old male presents with right calf pain and reported swelling. On presentation patient is well-appearing and nontoxic, afebrile, hypertensive 134/113 with otherwise normal vital signs. On exam, the patient has no swelling in the bilateral lower extremities, he does have very mild tenderness to palpation in the right posterior proximal calf just below the knee. Remainder of physical examination is otherwise unremarkable. Given history of blood clot and reported right calf pain, right lower extremity duplex venous ultrasound ordered to evaluate for DVT. EKG was obtained on arrival, and showed normal sinus rhythm with no evidence of ST

1212971	4/15/2021	AZ	46	F	4/3/2021	4/15/2021	I had bloodwork showing increased D-Dimier and that I may have a blood clot.
1213979	4/15/2021	TX	48	F	3/15/2021	4/12/2021	HOSPITALIZED FOR BLOOD CLOTS, UNRESPONSIVE AND TAKEN TO HOSPITAL
1212939	4/15/2021	NY	48	F	2/16/2021	3/21/2021	3-4 weeks after the vaccination I developed a ovarian vein thrombosis and was hospitalized on 3/15/21 . I am concerned based on new reports of blood clots in women with the Johnson & Johnson vaccination that this is related to my first injection. I was a healthy individual prior to this with no history of blood clots.
1212978	4/15/2021	TX	38	F	4/6/2021	4/12/2021	Pt states that on Monday she noticed that she couldn't put pressure on her leg to walk. (04-12-21) Pt called and made an appointment on 04-13-21 and saw her PCP. Ultrasound was ordered and was dx with near occlusive vein thrombosis in the distal right femoral vein. Pt was prescribed Lovenox 100mg to take now and was also prescribed eliquis 5 mg twice daily, and acetaminophen-codeine to help with the pain.
1214025	4/15/2021	CT	53	M	3/21/2021	3/22/2021	Received the first shot of Pfizer Covid Vaccine at 10:00 AM on 3/21/21. Aside from some drowsiness I felt fine the entire day. Then that night I woke up at 2:30 AM with severe pain in my right knee. I was unable to bend the knee or walk for the next 36 hours. After that the pain transitioned to the back of my calf muscle for the next few days. The pain then went back to my knee for a day and then returned to the back of my calf muscle. On 3/30/21 I saw my primary care physician who then sent me to get an ultrasound which determined that the pain in my knee and calf were caused by blood clots (DVT). I was then prescribed Eliquis 5 mg blood thinners.

1212435	4/15/2021	OH	78	M	3/17/2021	4/1/2021	He got the vaccine, was not able to breath real good and didn't think about it. It got to the point within 2 weeks that he was not able to get up from the chair due to the shortness of breath. By 4/1/21 he was not able to breath very well, but continued to stay home. Then by 4/12/21 he was not able to breath well at all and his wife took him to the ER. In the hospital they did x-rays and found out that his lungs are full of blood clots and both legs have blood clots in them. He was admitted and gave him Heparin drip for the 2 days to get the blood clots dissolved and was also on oxygen for 2 days. He was discharged home yesterday with Xarelto, and was told that he would be on that for the rest of his life, and is on oxygen for sleep and when he's up and around, but if he's resting and feels he's breathing okay he can remove it. They informed him that it would take approximately 2 months for all the blood clots to dissipate, and that he was full of blood clots, and had both legs and both lungs which are quite full.
1212931	4/15/2021	GA	78	M	4/6/2021	4/7/2021	Stroke caused by blood clot - Vision Impairment and memory impairment

1214246	4/15/2021	MO	43	F	4/6/2021	4/7/2021	Pt called LPHA to report she was seen in the ER on 4/8/21 for a potential blood clot in her left leg. Pt reported she awoke from sleep late 4/7/21 early 4/8/21 with severe pain in her left leg. She reported it hurt so bad she was "screaming". She stated it felt like a "charley horse" and her husband noted a knot in her leg. She went to the ER on 4/8/21 due to the inability to put pressure on her leg and/or walk on her leg. She reports having a CT scan of her chest at the ER and no clots were noted. She stated they did not image her leg at that time and scheduled an ultrasound/doppler for around 4/27. She was prescribed some oral blood thinner, but could not recall the name. She stated she stopped the blood thinner on 4/12/21 after the new reports regarding the J & J vaccine and not using blood thinners to treat. Today she states her leg is purple, black and blue and is swelling more when she is up on it at work. RN instructed pt to call her primary provider regarding stopping the blood thinner and to see if re-evaluation of her leg is needed. Pt also instructed to seek emergency treatment for increased swelling or pain to her leg, headache, abdominal pain, shortness of breath or any other concerns. Pt plans to speak with or see her primary provider today.

1213429	4/15/2021	UT	54	M	3/8/2021	3/22/2021	DIAGNOSIS: 1. Superficial thrombophlebitis MEDICAL DECISION MAKING/DIFFERENTIAL DX: Differential diagnosis includes DVT, superficial thrombophlebitis, muscle strain, tendinitis. The patient presented to the emergency department with atraumatic left leg pain. An ultrasound reveals a fairly large blood clot in the greater saphenous vein. Although this is a superficial clot, given its extent, I think it warrants anticoagulation. Per the trial, the patient would benefit from 45 days of 10 mg Xarelto treatment. The patient was given good precautions regarding bleeding risk while on a blood thinner. He will schedule follow-up appoint with his primary care doctor. He will also use Tylenol and warm packs to help with the discomfort from the superficial thrombophlebitis. He was discharged in satisfactory condition.
1213504	4/15/2021	OH	70	F	3/24/2021	3/27/2021	Deep Vein Blood Clot
1213492	4/15/2021	LA	61	F	3/18/2021	3/27/2021	on Saturday, March 27th, patient noticed swelling in left lower leg with Shortness of breath, and heart racing. on 3/39, the patient presented to the ED and was admitted and diagnosed with a blood clot from left groin to left ankle, with "clot in heart and lungs". heparinized and discharged home on Coumadin currently taking 5 mg on Sunday, Monday, Wednesday, and Saturday and 2.5 mg on Tuesday and Friday each week.
1213487	4/15/2021	SC	53	F	4/12/2021	4/13/2021	Patient reports they injected Humira on Sunday 4/11, then they got their J&J COVID vaccine on Monday 4/12. Patient reports they developed a fever of 103°F for 2 days and could not get out of bed the first day. Patient has also had a migraine for 3 days that is improving, and today it comes-and-goes. Patient also takes estrogen, so they are concerned for thrombosis risk. Patient denies blurred vision, fainting or loss of consciousness, or other changes in mental status. Patient also denies swollen or redness in their calves and ankles.

1213440	4/15/2021	OH	27	F	4/9/2021	4/11/2021	Friday evening I had what I thought was normal reaction: chills, aches, headache, nausea. Saturday it was mostly aches. Sunday was dizziness, aches, nausea and cramping in left leg. Monday was nausea, aches, tingling in hands and feet, headache, brain fog. Tuesday I woke up with major imbalance and needed to use walls to walk without falling over. Dizziness subsided after some time to only rapid movements. I had a warm burning sensation in left leg with tingling hands and feet. Moderate headache. Reports came out of stopping the Janssen vaccine so I contacted my doctor with my symptoms and they ordered blood tests for clots.
1213431	4/15/2021	NY	47	F	3/1/2021	3/16/2021	Patient admitted with massive portal vein thrombosis and low plt in setting of infection. Symptoms started one week prior
1213430	4/15/2021	OH	58	F	3/19/2021	4/5/2021	Patient reports being hospitalized April 8-10 with blood clots in her legs and lungs
1214146	4/15/2021		44	M	3/12/2021	3/14/2021	March 14 2021 - 2 days after first vaccine shot, leg pain, 1-3 days later diagnosed with superficial blood clot in left leg via ultrasound, treated with baby aspirin for 3 days and heat pad, symptoms slowly lessened till 2nd dose of vaccine on April 2nd, after second dose symptoms worsened again, both legs still fatigue very quickly to this day (April 15 2021) when I'm sitting down on chairs, seats etc. April 8 2021, 12:30pm - heart pain for 30 minutes, felt very weak, similar to light heart attack, ER visit later that day couldn't find any explanation
1211576	4/15/2021	NY	56	M	3/16/2021	3/29/2021	Swelling in left leg around calf and ankle. After a blood test and sonogram a Deep Vein Thrombosis was found in my left leg. Determined "unprovoked" by Dr. after subsequent blood test results came back negative.
1215421	4/15/2021		33	F	4/1/2021	4/2/2021	abdominal pain since vaccine, found to be pregnant. headache 1 week after vaccine. normal exam. no change in vision. no personal or family history of clots. better with reglan

1212681	4/15/2021	NY	82	F	3/17/2021	3/21/2021	In the middle of the night, I AWAKENED to the MOST SEVERE PAIN in my left arm. Thought perhaps a clot or a heart attack. ALTHO IVE NEVER HAD EITHER SO I DIDNT KNOW WHAT WHAT HAPPENING. I just lay there in place. I was awake and alert so I figured neither of the above. However, when I tried to use my arm, in a number of directions, It was extremely painful. I could not put this arm behind my back as tho to scratch my back. I am not sure if it was an attack on a MUSCLE or TENDON. I do know that in December 2019 I was given a 3-day dose of CIPRO anti-Biotics WHEN in the middle of the THIRD night I awakened with exactly the same reaction to the COvid vaccine BUT IN MY RIGHT LEG. In both instances it has taken me months to heal. I did go for therapy for my right leg event. Not for the left arm. I can only conclude that there is a connection between the medications.
1212437	4/15/2021	TX	76	F	3/7/2021	3/22/2021	Right leg swelling below knee , feels like needles around right ankle, call heart doctor had a scan of both legs found no blood clots have tried using a extra water pill to bring down swelling but it comes back the next day.
1212661	4/15/2021	OH	45	M	3/29/2021	4/7/2021	DVT in calf that turned in to substantial pulmonary embolisms in both lungs with no prior blood clot history. Treatment included a TPA to dissolve clots as well as vascular surgery to remove clots not dissolved in the left lung.
1212913	4/15/2021	AZ	36	F	3/1/2021	4/7/2021	Menstruation: I received my vaccine late night March 30 and was fatigued and slept most of the next afternoon and through the night. I began my period on April 1, which is around the usual time. Everything seemed fine for that first week (flow, discomfort levels, mood, etc.). but I still haven't stopped bleeding (as of April 15), which is completely abnormal; today marks two straight weeks of menstruating. Within this second week, there is significantly more cramping and back pain than usual, and my flow is very heavy with frequent large, thick clots passing in the blood, some globules the size of quarters or even half-dollars (though amorphously shaped). I go back for my second dose on April 22, and have a scheduled doctor's appointment on April 28.
1212599	4/15/2021	OH	65	M	2/15/2021	4/5/2021	Blood clot resulting in stroke in left brain

1215435	4/15/2021	DE	60	M	3/7/2021	3/18/2021	Patient began experiencing back pain on March 14 and on or around March 18 he started coughing up blood clots according to a coworker. Patient lived alone and was unable to be reached on Sunday March 21. I went over to his house and found him deceased in his bed. Patient had a trashcan beside his bed and it appeared to have some blood in it. Patient had thick mucus coming out of his mouth and blood coming out of his nose. According to paramedics he had passed a few hours before finding him. Unfortunately Patient has been cremated so there is no way to say that this was related to the Covid 19 shot from Johnson and Johnson, however there are new reports that blood clots have been a side effect. I would like to speak with someone from the Department of Health to discuss this further. I feel this could be related to the vaccination and I would to know how long the Health Department knew about this possible side effect. If patient would have known sooner that the blood clots were a side effect I feel he would have gone to the Emergency Room. Patient had no health insurance and he was trying to prevent getting Covid. This has caused our family so much heartache and we are all very apprehensive about getting the Covid Vaccine ourselves. Please contact me as soon as possible, I am also patient's executor so I am able to speak to you on behalf of patient and our family. Thank you.
1215502	4/15/2021	MO	53	F	3/26/2021	4/2/2021	7 DAYS AFTER VACCINATION PATIENT FELT NUMBNESS AND LOSS OF TASTE IN HER TONGUE. THE FOLLOWING MORNING SHE WOKE AND ONE SIDE OF THE FACE WAS DROOPING. 1215648	4/15/2021	CA		M	2/1/2021	3/27/2021	bruises are darker than normal since he has started Eliquis; Constipation; swollen index finger and swollen toe/determined to be gout; felt lousy; This is a spontaneous report from a contactable consumer, based on information received by Pfizer. This spontaneous case was reported by a physician and describes the occurrence of GOUT (swollen index finger and swollen toe/determined to be gout), FATIGUE (felt lousy), CONTUSION (bruises are darker than normal since he has started Eliquis) and CONSTIPATION in 92-year-old male patient who received apixaban (Eliquis) tablet (batch no. 1790398) for Venous thromboembolism. CO-SUSPECT PRODUCTS included Covid-19 Vaccine for an unknown indication. The patient's past medical history included Large intestine infection, Hypercoagulability and Constipation. Concurrent medical conditions included Gout. In February 2021, the patient started Eliquis (batch no. 1790398) (Oral) at an unspecified dose twice a day. On an unknown date, the patient started Covid-19 Vaccine (unknown route). On 27-Mar-2021, the patient experienced FATIGUE (felt lousy). On 29-Mar-2021, the patient experienced GOUT (swollen index finger and swollen toe/determined to be gout). On an unknown date, the patient experienced CONTUSION (bruises are darker than normal since he has started Eliquis) and CONSTIPATION. The action taken with Eliquis(Oral) was unknown. At the time of the report, GOUT, CONTUSION and CONSTIPATION outcome was unknown and FATIGUE resolved. For Eliquis(Oral), the reporter did not provide any causality assessments. The reporter stated that he was put on Eliquis for ninety days and has used it for thirty days so far. He has had some issues that require an enema. Concomitant medications included: dark Cherry Extract - started on or after 29-Mar-2021. The reporter stated that he had been taking Eliquis for 45 days for blood clots that stemmed from a colon infection with secondary hypercoagulability. On Saturday 27-Mar-2021, the patient had his second injection of the Pfizer Covid vaccine. After receiving the vaccine, he said he felt lousy and had common side effects for a vaccine that lasted for about 2 days. On 29-Mar-2021 he woke up with a swollen index finger and swollen toe and this was determined to be gout. The gout in his index finger he had before. The patient stated that whenever he got bruises he had noticed that the bruises were darker than

1215649	4/15/2021			F			<p>Patient advised she took COVID-19 Vaccine and formed blood clots in leg; This is a solicited report from a non-Pfizer sponsored program: -CW2891702, received from a contactable consumer, based on information received by Pfizer from manufacturer (manufacturer control number: BMS-2021-032881), license party for apixaban. This 86-year-old female patient was involved in a patient support program. The patient (patient ID: (ID)) received APIXABAN. The report describes a case of THROMBOSIS (Patient advised she took COVID-19 Vaccine and formed blood clots in leg). Co-suspect products included Covid-19 Vaccine for an unknown indication. On an unknown date, the patient started APIXABAN (unknown route), (unspecified dose and frequency). On an unknown date, the patient experienced THROMBOSIS (seriousness criterion medically significant). The action taken with APIXABAN (Unknown) was unknown. At the time of the report, THROMBOSIS outcome was unknown. For APIXABAN (Unknown), the reporter did not provide any causality assessments. This report was received from consumer. The patient received therapy with apixaban and COVID-19 Vaccine for unknown indication. Follow-up is unable to be performed. Medical evaluation comment: This patient had blood clots in the leg after apixaban therapy. Based on the limited information regarding medical history, event details, treatment details, it cannot be ascertained that the suspect drug contributed to the reported event. The reporter's assessment of the causal relationship of the event Thrombosis leg with the suspect products was not provided at the time of this report. Since no determination has been received, the case is managed based on the company causality assessment. Amgen's assessment: the event, Thrombosis leg, was assessed as unrelated to apixaban. No follow-up attempts are possible; information about batch number cannot be obtained.; Sender's Comments: As there is limited information in the case provided, the causal association between the event of thrombosis and the suspect vaccine BNT162B2 cannot be excluded. Based on known mechanism of action of the drug, the event of thrombosis is assessed as not related to Apixaban. The case will be reassessed once new information is available. The impact of this report on the benefit/risk profile of the Pfizer drug is evaluated as part of Pfizer procedures for safety</p>

1215952	4/15/2021	LA	72	F	2/24/2021	2/26/2021	Began with a severe cough 02/27/21 lasting for days.....possibly causing blood clots in the lungs.
1216371	4/15/2021	GA	38	F	4/13/2021	4/15/2021	I have very regular and reliable menstruation patterns and had finished my menstruation bleeding 8 days before this injection and was beginning to shed the mucous lining that traditionally follows all blood products. Today, April 15, I have begun spotting again and passing small clots. I feel fine otherwise with the exception of standard injection site discomfort.
1216052	4/15/2021	NY	34	F	3/31/2021	3/31/2021	Approximately 5 hours after the vaccine I developed a very bad headache followed by chills, sweats, congestion, chest pain, body pain, muscle pain, fatigue and fever. The muscle pain and weakness was so bad I would loose balance when walking. I then started to menstruate clots, not my normal cycle timing, which lasted about 2 days. The clots subsided but I am still bleeding today. I was in bed for 4 days with severe immune response symptoms. After those symptoms subsided the fatigue was so extreme it was hard to function.
1216090	4/15/2021	NY	78	F	4/2/2021	4/4/2021	The patient received her Moderna Covid vaccine and a couple of days later she had shortness of breath and was brought to the hospital a couple of days later. They found multiple blood clots in her lungs. The hospital discharged her too early and she had to go back, They told her to get her second dose on her regular scheduled date.

1216137	4/15/2021	SC	67	M	3/28/2021	4/10/2021	The patient called to make us aware that he was diagnosed with a blood clot on Saturday and he wasn't sure if there was a connection or not but wanted us to report it.
1216189	4/15/2021	CA	78	F	4/1/2021	4/2/2021	78 year old woman admitted with severe back pain, inability to ambulate and leukocytosis on 3/31/21. History of hypertension, CHF, obesity, chronic kidney disease, and back pain. Work up included multiple consults. The patient was placed on SQ heparin for VTE prophylaxis. Acute L5 fracture was found along with emphysematous changes. Neurosurgical evaluation- no surgery was necessary. During the first 24 hours (before receiving the vaccine), the patient's Hg dropped 9.3 to 6.8 and platelets dropped 130K to 61 K with no apparent bleeding source. PRBC transfusion was given. GI consult was obtained the patient was scheduled to have EGD the following morning (day 3). Cardiology was obtained for elevated troponin and hypoxia. An echo obtained on day 2 showed moderate elevated pulmonary artery pressure, mild to moderate tricuspid regurgitation, and normal sized right atrium and ventricle. The patient received the Janssen vaccine upon request the morning of hospital day 2 (4.1.21 at 11:02). At 11:37PM on 4/1/21 the patient received 5mg IV metoprolol for elevated HR of 132 (BP 129/67). At 0128 on 4/2/21 the patient's heart rate dropped into the 60's and then declined further requiring cardiac resuscitation. The attempt was unsuccessful and the patient expired at 01:43 on 4/2/21. An autopsy was conducted (results available on 4/13/21) showed a 4 cm clot in the patient's right atrium and a mural thrombus in her femoral artery.
1216288	4/15/2021	CO	65	M	3/20/2021	3/23/2021	Patient received first Moderna mRNA vaccine 2/20/2021, second Moderna vaccine 3/20/21. 1215648	4/15/2021	CA		M	2/1/2021	3/27/2021	bruises are darker than normal since he has started Eliquis; Constipation; swollen index finger and swollen toe/determined to be gout; felt lousy; This is a spontaneous report from a contactable consumer, based on information received by Pfizer. This spontaneous case was reported by a physician and describes the occurrence of GOUT (swollen index finger and swollen toe/determined to be gout), FATIGUE (felt lousy), CONTUSION (bruises are darker than normal since he has started Eliquis) and CONSTIPATION in 92-year-old male patient who received apixaban (Eliquis) tablet (batch no. 1790398) for Venous thromboembolism. CO-SUSPECT PRODUCTS included Covid-19 Vaccine for an unknown indication. The patient's past medical history included Large intestine infection, Hypercoagulability and Constipation. Concurrent medical conditions included Gout. In February 2021, the patient started Eliquis (batch no. 1790398) (Oral) at an unspecified dose twice a day. On an unknown date, the patient started Covid-19 Vaccine (unknown route). On 27-Mar-2021, the patient experienced FATIGUE (felt lousy). On 29-Mar-2021, the patient experienced GOUT (swollen index finger and swollen toe/determined to be gout). On an unknown date, the patient experienced CONTUSION (bruises are darker than normal since he has started Eliquis) and CONSTIPATION. The action taken with Eliquis(Oral) was unknown. At the time of the report, GOUT, CONTUSION and CONSTIPATION outcome was unknown and FATIGUE resolved. For Eliquis(Oral), the reporter did not provide any causality assessments. The reporter stated that he was put on Eliquis for ninety days and has used it for thirty days so far. He has had some issues that require an enema. Concomitant medications included: dark Cherry Extract - started on or after 29-Mar-2021. The reporter stated that he had been taking Eliquis for 45 days for blood clots that stemmed from a colon infection with secondary hypercoagulability. On Saturday 27-Mar-2021, the patient had his second injection of the Pfizer Covid vaccine. After receiving the vaccine, he said he felt lousy and had common side effects for a vaccine that lasted for about 2 days. On 29-Mar-2021 he woke up with a swollen index finger and swollen toe and this was determined to be gout. The gout in his index finger he had before. The patient stated that whenever he got bruises he had noticed that the bruises were darker than

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							normal since he had started Eliquis. The patient also stated that he has had considerable constipation that started before Eliquis, but still persisted at times and he had treated with enemas. Patient was a retired physician. Follow-up (30Mar2021): This is a follow-up spontaneous report from a contactable physician, based on information received by Pfizer. Most recent follow-up information was received from a physician on 30-Mar-2021 included the following: the event adverse event nos was amended as information on adverse events were received, new events and suspect product added, patient attributes, medical history, product attributes and narrative updated.
1213360	4/15/2021	UT	71	F	3/1/2021	3/16/2021	First Pfizer vaccine on 02/04/2021, Second Pfizer on 03/01/2021. No reaction until 1:00 on Mar 16, 2021, while drinking a smoothie I experienced a severe (level 8-9) pain in my right lower quadrant of my stomach. The pain never let up, thinking it was the Greek Yogurt not agreeing with me, I took 2 Tums followed by Daily Ease and laying down with a heating pad. After 6 hours of the pain we went to the ER. Given Dilaudid through I.V., took pain away. Had CT scan which showed a grapefruit mass in the Cecum area, an ultrasound confirmed this. Mar 17, 2021 had a colonoscopy and was told by the G.I. doctor it was a cancerous tumor and would need surgery the following week. The surgeon later suggested it could be a lymphoma in the colon, still requiring surgery. A CT scan on 03/18/2021 of my lungs showed all clear. I was discharged on 03/18/2021. The pathology report showed only dead tissue and would require another colonoscopy, done on 03/26/2021. The conclusion was a BLOOD CLOT.

1215014	4/15/2021	MI	50	F	4/9/2021	4/12/2021	Monday started having swelling behind my neck between my two shoulders and then a headache began. Went to Healthcare expressed by the doctor did not think it was blood clot, but probably related to the vaccine. Gave me a steroid and muscle relaxer sent me home to call provider next day. Had Televisit with primary?s Wednesday April 14, 2021, by then news had broke about the new type of blood clot CVST and the low platelet count, I explained still had headache and swelling, sour stomach over night(have had this before) and felt weak for a brief few minutes on right side but quickly went away, also was walking for a brief few minutes like I was drunk, again went away after a few minutes. Discussed with primary my anxiety could be contributing to some of the extra feelings I was having, agreed to do bloodwork to check platelet levels. She did not think it was blood clots discussed with me about what I needed to look for and to go to ER immediately if I experienced any of them. Blood work did today, Thursday April 15, 2021. still headache and some swelling in back of neck between shoulders, dizzy off and on. All pain moderate to mild. Awaiting blood work for next step.

1214990	4/15/2021	RI	74	F	4/6/2021	4/11/2021	5 pm on Sunday, I started getting pains on my lower leg. Not like an ache. All up and down the inside of the leg (the pain was). There was a pressure point where I found a point where if I pressed it, it was really painful. My skin - the inner leg towards the back - it was really really sensitive. If you touched it lightly it felt painful - not a searing pain. If I massaged it, it would go away but in a few minutes it would come back. I took an aspirin in case of a clot. At this time, I was thinking of deep vein thrombosis. Gradually, it went away. It lasted quite awhile - it lasted between 2 or three hours like this. Even now, the skin isn't sensitive, but I can still press that one point and it hurts. (That pressure point.) I went to the Doctor on the 13th, he sent me to an Ultrasound there wasn't a clot in the leg. That came out fine. When I had the IBS for four months (with a lot of diarrhea). I just found out yesterday that my magnesium was low and they gave me a drip for that. My potassium was a little low also. I had the magnesium drip last night - it was an Hospital ER visit - but it was for bloodwork that had been done yesterday to check me after IBS symptoms.
1214815	4/15/2021	OH	44	F	3/11/2021	3/24/2021	Patient started not feeling well on 3/24. She was experiencing dizziness, headache, chills and fever. She contacted her doctor on 3/25 and he thought maybe she had an inner ear infection. Symptoms continued to worsen and eventually an ambulance was called on 3/27 because patient stated she was having severe SOB and headache along with dizziness and fever. Patient was transported to Hospital where they tested her for covid and pneumonia. Both came back negative. After several tests it was confirmed she had a blood clot in her lung and was also told she had clots in her leg and heart as well. She was in the hospital for 3 days where she was given heparin and several medications for the headache. Patient was discharged on lovenox and coumadin and eventually switched to xarelto by pcp who is managing her anticoagulation. She still has follow up appointments with a cardiologist and neurologist. She said she is still experiencing some dizziness and SOB but overall doing better

1207891	4/14/2021	MS	60	F	2/1/2021	2/1/2021	Took the moderna 1st test and within two hours of the vaccine, between the forefinger of my left hand and the thumb began to swell, tighten. I observed it, it appeared to be a large clot, it stiffened almost paralyzing the area between these two fingers, it hurt, and then as suddenly as it came it left. No further on the first vaccine. On the second vaccine in the same hand, a day after the shot, my left hand swelled from the wrist to the fingers but especially in the area of the back of the hand. it nearly paralyzed moment in the hand, for at least two days. it hurt extremely when I would attempt to move the hand back at the wrist, to move the hand in any way. I took two motrins on the second day and it went away as suddenly as it began. I have not had any other problem to date
1207773	4/14/2021	IN	71	M	2/26/2021	3/15/2021	2nd moderna vaccine was given to my dad on 02/26/2021 and on 03/15/2021 my dad was visiting me all day and he acted fine and normal. At the end of our visit between 8 & 9 pm we went to the store where he started to gasp for breath. He had to keep stopping and said he couldn't breath. I had him sit several times because I didn't know how bad it was. By the time we reached the doors to leave after a short trip he almost fell over and he became confused and said he couldn't breath. I had another customer get my dad a wheel chair close by while I called 911. The ambulance came quickly but at the hospital my dad went into cardiac arrest and his heart stopped 2 or 3 times and it had to be restarted. When I was able to get to the hospital my dad was on a ventilator and sedated. They had put him on medicine to blast the blood clots they had found. They said he had 2 very large blood clots with one on each lung. Later his kidneys started failing him and they said he would need to go on dialysis as soon as the next day. Later that night they told me my dads heart was shutting down and he had developed pneumonia. My dad died that night and I had to watch him take his last breath. If you want further information please contact Medical center would be the ones to contact for all information and my dad was in the critical care unit.

1207844	4/14/2021	NY	77	M	2/26/2021	2/28/2021	He got the vaccine, and didn't have any real reaction, anything unpleasant, he had a numb lip and 2 fingers were numb. He called his doctor and she told him to go to the ER, which he did at Hospital. They did a CAT scan of his brain. They tried to do an MRI and they pushed his head against the machine as his back is curved and he stopped breathing. They had given him 2 narcotics for anxiety before the scan. He was then transferred to Hospital in . He saw Cardiophysilogist/IM and he found that he had a blood clot (? where), and they inserted a pacemaker through his groin as his pulse dropped to 40 BPM. He was hospitalized for 7 days, and discharged him with instructions on what he is able to do. They started him on new blood pressure medicines for his kidney's. On 3/26/21, lot# 028A21A. He subsequently had the 2nd vaccine, and all liquids emptied from his body (vomiting and diarrhea), at the same time, and then he was fine once everything settled down which lasted for about 3-4 minutes and then he was fine.
1207793	4/14/2021	TN	49	F	3/16/2021	3/21/2021	About a month after the shot, I developed a blood clot in my lung. The clot was found by a CT scan. I am currently taking Eloquis to hopefully dissolve the clot. I have been overly tired with little energy and some muscle/body aches.

1207850	4/14/2021	CA	29	F	3/18/2021	3/19/2021	Severe menstrual pain although I was not actively on my menstrual cycle. Ended period on 03/11/2021 and started heavy brown clot like bleeding one day after second dose on 03/19/2021. After second cycle one month later in April, have severe severe cramping and menstrual pain.
1208468	4/14/2021	NY	45	F	4/9/2021	4/9/2021	DAY 1- two hours after vaccine my right arm and right leg felt restricted, numb and had some tingling in my hand, dull headache, muscle pain and dizziness. Day 2- mild pain at injection sight, muscle pain and general tirednes, dull headache,dizzy, right arm& left arm felt restricted and numbness in right pointer finger. Right leg felt restricted and pain behind the knee. Day 3- dizzy, dull headache, faint, high blood pressure, right arm & leg and left arm felt restricted and numbness/tingling in right hand. Pain behind right knee persisted. Went to ER Sunday early afternoon. Diagnosis is a cerebral venous thrombosis in sinus cavity. Still experiencing general weakness/tired, dizzy/unbalanced.
1207088	4/14/2021	FL	54	F	3/22/2021	4/5/2021	The week of April 5, I believe it was April 5 & 6, I thought that I was coming down with a sinus infection. I was having some blood when blowing my nose and remember seeing some small, hard balls which I now realize were clots. I did not go to the doctor because my back was very bad and I was in a lot of pain and I had an upcoming appointment with my doctor. I believe that the symptoms resolved after 2 or 3 days and I did not even mention it to my doctor when I saw him. I felt a lot of pain in my leg, but this is probably due to my ongoing sciatica/radiculopathy /bursitis problems that I experience.

1207707	4/14/2021	OH	46	F	3/25/2021	3/31/2021	I was sick the day after both vaccination, just flu like symptoms the following day. Approx 5 days later I woke up and my right leg was sore, all the way down my inside vein. I had varicose veins in this leg for years, but this was different. It was painful, swollen, red, warm and the vein is hard. I was scared a DVT may be developing and went to the ER. An ultrasound showed there was no DVT and was told to take ibuprofen for the pain and heat to the leg and a diagnosis of Thrombophlebitis. I followed up with a vein doctor. He performed an extensive ultrasound, showing a watch spot for a possible clot turning into a DVT and placed me on blood thinners for 6 weeks, and to wear compression hose. I know I had previous varicose vein problem in this leg and the vaccination did not cause this, but I do think it caused the Thrombophlebitis. I am reporting this because this should be looked into, there are others with vein issues that maybe should be aware of this possible side effect.,
1208759	4/14/2021	LA	56	F	2/22/2021	2/27/2021	Blood Clots in both little toes. Eliquis 5 mg, Gabapentin 300 mg, Tramadol 50 mg.
1208750	4/14/2021	OR	77	F	3/10/2021	3/24/2021	Fell two weeks after immunization. Developed blood clot after procedure. Husband concerned immunization is cause of clot and not the surgery or down-time after the procedure. Transferred to new hospital from previous hospital and had significant stroke due to clot
1208715	4/14/2021	TN	68	M	1/20/2021	1/24/2021	Swollen right leg in AM four days after vaccine. Diagnosis of DVT next day, five days after vaccine. Have been on eliquis for about 4 months. Leg is still swollen. Not surprising since the covid spike protein causes blood clots.

1208676	4/14/2021	TX	55	M	4/3/2021	4/3/2021	Approximately eight hours after receiving the shot, I started getting a headache, body aches, and chills (April 3rd, 8 p.m.). I went to bed and had severe chills and body sweats for the entire night. The primary symptom to report is that my heart raced all night. It felt like it was beating at about 140 to 150 Hz or higher. When I woke up in the morning, it felt like my chest had been pounded on all night. The pain was in my sternum area. The headache and body aches took a little over a day to go away. The chest pain took a couple of days to die down. On April 12th, I walked my dogs in the morning and felt out of breath, which isn't normal for me. In the afternoon, while working at my desk at home, I started getting more and more severe chest pain and then started getting dizzy and felt weak. I drove myself to the local ER and they tested me for a heart attack. All tests came back negative. They suggested going to another facility to get checked for clots or to make an appointment with a cardiologist. The next day, after talking to a doctor friend, he suggested going to the ER facility to get imaged for clots and to get fully checked out. No cardiologist appointments were available till the next week. I went to the ER facility and was there for seven hours getting tested. They came back and said all test results were negative and that my heart looked fine. They did not have any suggestions for what might be causing the pain in my chest.
1208654	4/14/2021	WI	87	F	3/12/2021	3/15/2021	Patient presented 3 days after her second DuoNeb vaccine with weakness dizziness chest pain or shortness of breath and was initially diagnosed with a pneumonia by chest x-ray obtained with antibiotics without improvement. Subsequently she was hospitalized and CT of the chest showed left lower lobe segmental pulmonary embolism. The patient never had history of venous thromboembolism in the past. She had weakly positive anticardiolipin antibody of IgG type of unknown significance. She was treated initially with antibiotics but after diagnosis of the blood clot she was started on anticoagulation with apixaban with improvement

1208579	4/14/2021	NY	79	F	1/31/2021	2/3/2021	Developed blood clot in heart -- > went into Atrial Fibrillation with no prior history of A Fib -- > Large clot was thrown from the heart into the brain splitting into two clots, one blocking brain stem and one blocking right hemisphere -- > Death on 2/10/21
1208490	4/14/2021	AZ	28	F	4/5/2021	4/9/2021	The day I received the shot, I started to feel severe fatigue, headache, light-headed, and started running a fever about 6 hours after the shot was administered. The next day (4/6) was worse. Severe fatigue, muscle aches, headache, loss of appetite, fever (101.5 was the highest I notice but seemed to be around 101.1-101.3 all day), and general flu like symptoms. However, I also started experiencing abnormal menstrual bleeding. I am on the Depo shot and have been for some time. Due to this, I do not usually experience any menstrual bleeding so I found this to be a little odd. It was not heavy but it was noticeable and contained quite a few clots. Day 3 (4/7) was about the same except my fever came down and ranged from 99.8-101.1. Abnormal menstrual bleeding continued. New side effect this day included diarrhea. Day 4 (4/8) I started to see improvement. No fever (that I could tell). Remaining side effects included mild headache, fatigue, diarrhea, and abnormal menstrual bleeding. Day 5 (4/9), I had one of the worst nose bleeds I've ever had in my life. I apologize for the graphic description but it lasted about 20 minutes and my bathroom looked like a crime scene after. Blood was pouring out of my left nostril and I threw two large clots that were about the size of slug (or slightly larger than a fun size snickers... I wish I had a better way to describe it). I've had some bad nose bleeds, particularly when I was on Accutane, and this was worse! The rest of the day I felt like I was improving. Energy levels were better. No fever. Menstrual bleeding stopped. Only lingering side effect was mild headache and mild diarrhea. Since then I've continued to feel better and the diarrhea seems like it's improving. Mild headache persists. Only new item is an annoying twitch in my left eye that started on Monday (4/12).

1208296	4/14/2021	IN	78	M	4/9/2021	4/13/2021	<p>Patient states on Friday, 4/9, he went to the pharmacy to receive his J&amp;J Covid-19 vaccine. He states on Saturday morning, his R nostril began to bleed, and continued to bleed until Monday. He states on Wednesday, 4/7, he noticed oral sores that at first were not painful, but large. He was worried about it interfering with his shot, but because he had waited so long to get it, he decided to proceed anyway. He denies any fever or chills, no frank diarrhea, but occasional loose stools, without blood seen. He denies HA, vision changes, or focal neuro deficits. On Sunday, 4/11, the patient ended up going to ED to evaluate his epistaxis, the MD attributed it to his elevated BP, the patient reports it being 160s/90s. They gave him new BP medications, which he took, but when he saw the Dr., he instructed the patient not to keep taking his BP meds. When asking the patient if anything correlates with foods he eats, the only thing he can pinpoint it to, would be pico de gallo. He states it has irritated his mouth before. He also reports recently taking his wife's supplement (unknown name) but thinks it is for cholesterol. He took that approximately 1 week ago. No new changes in food habits, mouthwash, or toothpaste. He states once his sores began to get a little painful, he went to buy a special mouthwash for oral sores (unsure name). His only reported allergy is to Lisinopril, which his reaction was a whole body rash. He states they did not pack his nose or do anything for his epistaxis at the ER, but eventually he let the nostril clot with blood. Now he feels fullness in the nare, but does not want to disturb the clot in fear that it will re-bleed. His wife also noticed a petechial rash that began on his BLE, he is unsure when that started. He presented to ED on 4/13, due to his PCP instructing him to be evaluated when he had outpatient labs done and revealed a PLT count of 4,000. In the ED, the patient had normal vital signs. He was transfused one unit of PLTs. He also had a negative head CT. He was also started on decadron 40mg PO daily by heme/onc. Patient tells me today his sores are less painful and feel smaller than usual. Heme/onc also ordered 2 IVIG 1,000 mg/kg/day x2 doses.</p>

1208528	4/14/2021	TX	33	F	3/18/2021	3/20/2021	3/18?got shot I was terribly sick for 24 hours?throwing up, body aches, hot flashes. I was in bed. 3/20?got period 3/21?I was gushing blood like never before in my entire life. I went through a menstrual cup in 1.5 hours. This excessive cycle lasted for days. My period is normally 3/4 days and this one was 6/7 days. I also passed 3 golf ball sized blood clots. I have never in my life passed a clot, let alone three that size. The next cycle I had a tiny bit of break through bleeding the day I ovulated?that never happens. Then this cycled I have felt crampy and bloated. Like I am going to start my period at any minute but do not. I am expecting my next period in less than a week. But this cycle has been completely abnormal and nothing changed but getting the shot two days prior to it starting.
1206421	4/14/2021	CA	17	M	3/11/2021	3/14/2021	Blood clot in right calf. Noticed pain and knot in calf on Sunday 3/14/2021. It worsened over the next few days. Went to Urgent care on 3/18 and they sent us straight to ER for Ultrasound. In hospital they found it was a clot identified as deep vein thrombosis, and started a treatment of blood thinner and pain medication.
1207166	4/14/2021	MD	42	F	3/29/2021	4/2/2021	I had a sudden, large, spontaneous bruise on the index finger of my left hand with no precipitating incident or injury. It filled the space between my first and second knuckle completely and extended into the finger tip and below the second knuckle. It is only in hindsight that I thought it could be a blood clot, although I am not sure. It resolved on its own with a few days, although I unfortunately don't know exactly when.

1206989	4/14/2021	OH	56	F	3/31/2021	4/3/2021	I HAD THE PFIZER VACCINE ADMINITERED AT FACILITY ON 3/31/21. THIS WAS THE FIRST DOSAGE. ON DAY 5 I HAD PAIN IN MY LEFT LEG FROM GROIN TO CALF. BY DAY 5, I BEGIN TO LIMP, MY LEG WAS BURNING, INCREASED PAIN AND I COULD FEEL WHAT I BELIEVE TO BE BLOOD CLOTS AND MY LYMP NODE IN MY LEFT GROIN FELT SWOLLEN. OVER THE COURSE OF 2 DAYS, THE PAIN BECAME WORSE. I CONTACTED MY DOCTOR AT FACILITY FOR A TELEPHONE INTERVIEW IN REGARDS TO WHAT I STATED ABOUT THE PAIN. CLOTS, SWOLLEN LYMP NODES ETC.. AND EXPLAINED THAT THIS OCCURED AFTER OBTAINING THE COVID-19 VACCINE. I WAS ADVISED TO HAVE A DOPPLER PERFORMED AT THE ER. I WENT TO THE ER LATER THAT EVENING AND WAS TOLD THAT DOPPLERS WERE NOT COMPLETED AFTER 4 P.M. BLOOD WORK WAS PERFORMED BY HOSPITAL. MY LAB WORK WAS NORMAL AND I WAS ADVISED THAT I WOULD BE CONTACTED THE NEXT MORNING FOR AN APPOINTMENT FOR THE DOPPLER. ON 4/8@1:00 PM, I HAD THE DOPPLER PERFORMED AT HOSPITAL. I WAS TAKEN BACK TO THE ER AND WAS INFORMED THAT I HAVE DVT AND THIS WAS POSSIBLY LIFE THREATING. I HAD NO PRIOR HISTORY OF CLOTS. I'M CURRENTLY TAKING ELIQUIS FOR THE BLOOD CLOTS, WEARING A COMPRESSION GARMENT AND TYLENOL FOR PAIN. I WAS ADVISED TO HAVE ANOTHER DOPPLER COMPLETED IN 6 MONTHS

The occurrence of additional non-serious events is detailed below. Family history included Clot blood (Family history of clots; her father and his sister had clots after surgery). Concurrent medical conditions included Burning sensation. On 12-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 04-Apr-2021, the patient experienced PULMONARY EMBOLISM (had labored breathing,they found several clots in right leg and lungs) (seriousness criterion medically significant) and THROMBOSIS (It was shiny and hard and calf blewup twice the size,they found several clots in right leg) (seriousness criterion medically significant). On an unknown date, the patient experienced BURNING SENSATION (burning sensation in the lung). At the time of the report, PULMONARY EMBOLISM (had labored breathing,they found several clots in right leg and lungs), THROMBOSIS (It was shiny and hard and calf blewup twice the size,they found several clots in right leg) and BURNING SENSATION (burning sensation in the lung) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On an unknown date, Ultrasound Doppler: several clots in right leg and lungs (abnormal) several clots in right leg and lungs. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. No concomitant products were reported. Patient was taken to the ER (emergency room). The physician suspected blood clots and treatment included was blood thinner. Patient reported that "patient got ultrasound done on Monday, and they found several clots in right leg and lungs".; Sender's Comments: Based on the current available

1206416	4/14/2021	CA	67	M	2/27/2021	3/20/2021	24 hours after 2nd vaccine, usual injection discomfort, low back ache, felt not well, minor, resolved quickly. 3 weeks after 2nd vaccine, onset of new bilateral lower extremity 3+ pitting edema. No previous episodes. Very active, healthy exercising/running life style. some relief with self administered HCTZ and leg elevation. Very unusual, not expected, no obvious explanation. Waxed and waned. No fever, SOB. No risk factors for DVT. Painful due to new acute stretching of skin around ankle up to mid calf. consulted ab PMD 4/11/21, suspecting side effect of amlodipine or lisinopril, however, I've taking these meds for years. This is very unusual. Lab. tests are ordered. My concern is clot.
1206389	4/14/2021	VA	44	F	3/24/2021	3/26/2021	Within 48 hours after I received my vaccination, I started to experience severe back pain. I then noticed that I had two bruises on my back. I put a ThermaCare patch on each of the bruises to help with the pain. Within two days, the pain started to go away and the bruises started to fade. The next day, I started to experience severe back pain again and I noticed that I now had three different bruises on my back. I put a ThermaCare patch on each of the bruises and started to take some Tylenol for the pain. I also called my Primary Care Physician. I went in to see PCP on April 1, 2021. During this visit, doctor indicated that I seemed to have burst blood clots in my back. I currently have a little back pain but, I still have the three bruises. They are starting to fade but, they are still very noticeable.

1206380	4/14/2021	TX	19	F	4/8/2021	4/10/2021	On 4/8/2021 I developed a headache after receiving the Johnson and Johnson vaccine. I took the next few days easy, and laid in bed for the majority of the weekend. On 4/10/2021 I left my residence to get dinner and noticed I was short of breath just walking from the building to my car. The shortness of breath worsened over the next few days. On 4/13/2021 I called a clinic and told them I had been short of breath and they directed me to the ER. I arrived to the ER around 2:30 in the afternoon. They ordered a chest x-ray and ran a test to determine if I could have a blood clot. The test came back with results indicating I could have a blood clot, so they did a chest CT and an MRI. The chest CT showed a blood clot in my left pulmonary artery. They prescribed a blood thinner, told me to stop taking oral birth control, and discharged me.

1207683	4/14/2021	WA	60	M	3/8/2021	3/17/2021	Blood clot in left leg; first noticed on March 17; swelling and pain bad by March 19, called advice nurse who told me it sounded like a blood clot and told me to go to emergency room.
1207681	4/14/2021	CA	40	F	3/22/2021	4/9/2021	3/22/21- Raging headache, extreme chills. 4/9/21- Left foot swelled up like a grapefruit, was worried about blood clot when I saw them on 4/10/21.
1207638	4/14/2021	NV	50	F	3/24/2021	3/25/2021	Pulmonary Embolism (blood clot)
1207618	4/14/2021	MI	50	F	12/23/2020	3/8/2021	Blood clot left calf
1207615	4/14/2021	OH	51	F	3/3/2021	3/7/2021	Presented to UCC on 3/7/2021 with complaints of left leg pain/swelling, had cervical block 03/02. when she got home she noted some groin pain,. and this morning left leg was so swollen. she is also complaining of mild shortness of breath. denies chest pains, was tachy at triage. She was then transferred to Emergency Department. Per their report: The patient presents with a swollen discolored left lower leg. She does have discoloration and I am concerned for massive DVT and cerulea dolens. She does have really minimal pain to the leg except to the groin, she has intact pulses, I have low suspicion for acute ischemia/arterial clot. She does complain of some mild dyspnea with exertion above baseline so I do have concerns for possible PE. She is hemodynamically stable, appears in no distress. She is on oral contraceptives, mild obesity, no other significant VTE risk factors. I am going to empirically start her on heparin, I have also ordered a CT PE and a CT abdomen pelvis to check for proximal propagation of the DVT along with a left lower extremity duplex Doppler ultrasound. Duplex ultrasound also showed extensive left lower extremity DVT up to the common femoral, she does have bilateral PEs without evidence of significant clot burden or heart strain, she is hemodynamically stable with normal pulse oximetry. The patient also has clots proximal up to her IVC. I discussed this with Dr. of vascular surgery for possible thrombolysis therapy of the left lower extremity. She was discussed with SOUND for admission.

1207693	4/14/2021	CA	55	F	4/2/2021	4/3/2021	The day after my vaccination, my lymphdema was acute. I have had lymphedema since 2018 when I had a lymph node removed due to melanoma. Ever since my right leg and foot often swell up by the end of the day. Following the shot, the next day my leg and foot were swollen at the beginning of the day and all day and much more painful than usual. I did some exercises to relieve the pain and by Sunday felt better. I didn't think much of this but in light of the blood clot side effect that some have experienced I thought it might be helpful to mention this side effect I experienced.
1207527	4/14/2021	MD	27	F	4/8/2021	4/13/2021	I had a fever of 103.8 8-12 hours after the vaccine. After the first 24 hours all normal side effects went away. Yesterday (day 5), I started having leg discomfort and it continues today. Could easily be a pulled muscle but I'm also concerned about blood clots so I'm watching my symptoms and if anything worsens, I will get seen by patient first.
1210395	4/14/2021	NJ	48	M	2/17/2021	3/5/2021	I got my second Pfizer covid shot on 2/17/21. Since then I have ahad 2 large blood clots form in my lower right leg. I had one in the same place 24 years ago.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1210605	4/14/2021	UT	36	M	3/10/2021	3/13/2021	I had the 1st shot on Wednesday March 10th. On Sunday the 14th, just before going to bed at about 11pm, I went to pee. The urine was very dark brown. Didn't appear to have any red for blood. The next day I felt like water was being retained and it felt that I couldn't empty the bladder and pee was coming out slower than usual. Late Monday the 15th before bed I peed another dark brown urine and a red blood clot came out. At that point I became very concerned and sent to see the doctor on the 16th. Referred to a kidney specialist for March 31st. Between March 14th to March 29th , somedays I felt like I was retaining water, most days felt like I couldn't empty my bladder with slow flow. With the recent news of the concerns of blood clots with vaccines, I felt that I should report this.
1210554	4/14/2021	IL	65	F	3/16/2021	4/13/2021	Bilateral pulmonary embolisms requiring ICU admission. Patient presented to Emergency Room on 4/13/21 with presented to the ED with shortness of breath and chest pain. The patient notes that she developed shortness of breath, particularly with exertion, about 1 week prior to presentation. 2-3 days prior to presentation, she developed pleuritic chest pain on the right anterior chest. She denies any recent fevers, chills, weight changes, palpitations, cough, sputum production, abdominal pain, nausea, vomiting, diarrhea, constipation, lower extremity edema. She does note that she received her first dose of the COVID-19 vaccine on 3/16/2021 and was due for dose#2 on the day of admission. She denies a personal history of blood clots and denies current smoking, estrogen use, or recent surgery. She does note a history of blood clots in her sister, but she is unsure whether they were provoked or unprovoked. Patient required BiPAP on admission and was initiated on a heparin drip. Initial CT w/ some concern for R heart strain, however, echocardiogram showed no signs of R heart strain and she was hemodynamically stable. She was weaned from the BiPAP to Non-rebreather, and eventually nasal cannula. The heparin drip was transitioned to lovenox with plans to go home on a DOAC. Still hospitalized at time of event report.

1210553	4/14/2021	CO	54	M	3/25/2021	4/6/2021	4/6/21 - got bloody nose at 10:00 A.M, which would not stop. Nose still bleeding 2 hours later, got dizzy, so lied down. Vomited blood and could not stop the bleeding. Went to the ER at 2:00 PM, to have them stop the bleeding 4/6/21- E.R. - Fainted n the lobby while waiting. Taken back to room and given IV and gave multiple tests. E.R. doctor put packing in nose to slow bleeding. Still The Diagnosis was Epistaxis and Vasovagal syncope, and advised to follow up with my doctor and otalaryngologist. 4/8/21- Nose bleeding finally cam to stop in the evening, but had fatigue, weakness, irregular heartbeat, and shortness of breath 4/9/21- ENT and Allergy removed packing, completed nasal scope. Nose still felt like it was stuffed with blood clots until 4/13/21
1210548	4/14/2021	VA	23	M	4/8/2021	4/10/2021	Swollen leg possible blood clot, couldn't walk for days. got antibiotics and its coming along still swollen but able to walk again somehow
1210545	4/14/2021	CA	56	F	4/10/2021	4/10/2021	First night:excruciating headaches,pain in the neck,eyes hurt,stomach pain slight fever and chill so i took ibuprofen and that helped headaches and early sunday morning took aspirin also helped Second day: all day muscle aches over body and very tired. Third day : my left arm that had vaccine hand and arm went numb for half hour an went away. Forth day:more than half day my vaccine arm and hand numb and try to shook it up but no luck and heard bad news about Janssen. I am very scared and worry about this vaccine about blood clot. they said it happened 6-13 days after vaccine shot. it's been only 5 days for me and i am very scared.
1210530	4/14/2021	NE	64	F	4/9/2021	4/9/2021	Blew my nose on 4/14/21 at 7:30 p.m. only to have my left nostril start bleeding like a faucet. It continued for approximately 10 minutes until I hacked out what looked like a clot from my throat about the size of a 50 cent piece. My nose then stopped bleeding and after clearing my throat several times for about 20 minutes, everything is clear. I placed a cold pack on my face for about 20 minutes. This is definitely an odd thing for me. I do not smoke and never have. I felt fine before the nosebleed and feel absolutely fine now, an hour after the event started. I didn't feel bad during the nosebleed, only scared.

1210520	4/14/2021	FL	64	F	3/16/2021	3/25/2021	Cranial and spinal SAH hematoma at roughly same time as heart attack. Cause of hematoma was unknown. Potentially a side effect of elliquis; but her cardiologist does not believe ellipsis was the cause. Heart attack at similar time due to blood clot and blocked artery and possibly reaction of body to hematoma. We do not have any hard data that either are related to the vaccine; but are reporting them under the advice of a doctor to give information for science.
1210103	4/14/2021	UT	45	M	4/7/2021	4/14/2021	nausea, vomiting, diaphoresis, dizziness, headaches, bilateral transverse sinus thrombosis
1210412	4/14/2021	NY	49	F	3/3/2021	3/3/2021	I had my second shot and the same night developed a clot in my arm. I had blood coagulation labs drawn and my C protein and cardiolipin have altered and show I may get clots now. I had labs previous to this because of my gallbladder surgery and all my blood was normal.
1210718	4/14/2021	MO	39	F	3/14/2021	3/14/2021	After receiving my vaccine on March 14th, I started experiencing pressure in the left side of my head and severe headache. As the days progressed, I was continuing to have severe headaches for the next couple of weeks. I was taking exedrin Migrane medicine to try and calm it down. When I would try an work out it was worse, it was like the pressure on the left side of my brain was expanding and it would be worse. My legs and body did feel weak. It has slowly gone down with less and less of these headaches over the last couple of weeks. They were definitely different than what a normal migraine feels like and very specific type of feeling. I don't know if I have had any clots or not, but I am currently trying to get into a neurologist to get looked at to make sure there is not something else going on. I am going to try and contact Johnson and Johnson to see if they can help refer to a neurologist because I currently do not have health insurance.
1210365	4/14/2021	MD	65	F	3/8/2021	3/11/2021	left knee swollen: x-ray done on 3/15/21, showing nothing wrong, doppler test done on 3/19/21- no blood clots, MRI done on 4/14/21, waiting on results: shortness of breath started on 3/12/21 and lasted about 3 weeks.

1208162	4/14/2021	IL	55	F	3/11/2021	3/25/2021	Blood Clot in right calf. deep arterial thrombosis
1208872	4/14/2021	PA	41	M	3/20/2021	3/21/2021	On March 20th I received the J&J covid-19 vaccine shot. Starting on March 21st I begin to experience symptom such as fever, chills and body aches. That lasted for about 2 weeks. The week of April 5th- I been to experience struggling the ability to breathe. I was having serious pain in my left side of my chest and in the lower left side in my back. It was so severe, I went to the hospital on April 8th and at the hospital the Doctors discovered I had blood clots in my lung. I was in the hospital for 2 days. Iam currently on blood thinners inhaler and and oxygen.
1211350	4/14/2021	NC	87	F	4/1/2021	4/4/2021	Early on Sunday morning, April 4th, patient woke up with swollen right hand with immense pain. On Monday, April 5th an ultrasound confirmed a blood clot in her right forearm.
1211308	4/14/2021	FL	61	M	4/9/2021	4/10/2021	Passed 2 blood clots via urine. No pain and none since.
1211304	4/14/2021	ME	36	M	4/8/2021	4/8/2021	On the evening of 4/8/2021 at around 8 pm I began experiencing an upset stomach (felt like I might throw up) and then shaking in my stomach started and I got a lot of chills and a headache. Then I spiked a very high fever and sweat like crazy. I was shaking like crazy and had to call a doctor on call twice. I had full body pain and was very sleepy. The fever and chills lasted a bit over 2 days but unfortunately the pain in my body had not gone away. Currently (4/14/2021) I have pain in all my joints and my neck and back and I noticed a rash around my right knee. I have felt very tired. I have felt some mild shortness of breath, which may be seasonal allergies (discussed with a nurse earlier, my oxygen levels are 98 percent today, so I am breathing fine, but there is a sensation of shortness of breath) . I have consulted my primary care office about the above and they are speaking to the doctor. I am trying to limit my exposure to any hospital setting until the 14 days (2 weeks) is up from the vaccine. Hopefully these symptoms will go away soon and hopefully none are related to a blood clot issue. We'll see if my doctor or you guys may recommend a future platelet test?

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1211294	4/14/2021	FL	41	M	1/27/2021	3/16/2021	I suffered a stroke on March 19, 2021 that effected my Occipital and Temporal Lobes on the right side of my brain. The primary symptom was almost total and complete blindness. Taken to emergency room, made a stroke alert, tPA cleared clot, spent 5 days at the hospital.
1211121	4/14/2021	MN	61	F	3/7/2021	3/8/2021	Whether the adverse events were caused by the vaccine is to be determined. We are available to discuss more details if this information can be used to help others from experiencing these reactions. The morning after getting the vaccine, patient discovered that she could not swallow. As her condition worsened, she was taken to the emergency room. Over the past month, patient went to the emergency room 4 times. The last time resulted in extended hospitalization that continues to this day. In addition to the swallowing problem, two other major adverse events need to highlighted. First, on 27 March, while in the hospital, vaginal bleeding started. On 29 March, her doctor, performed a hysteroscopy/DNC finding "an unexplained blood clot (hematoma)." The second major event was when patient demonstrated significant confusion and lack of memory. On 7 April, she was diagnosed with Metabolic Encephalopathy. Neurologists at the hospital suspected that her MS was reacting to her UTI and once the infection is eliminated her memory should come back. But as of 10 April, she was still having issues including hallucinations. Although she is eating some as of 13 April, she is still very weak and will likely be moved from the Hospital to a rehab facility. She still does not remember much of the last 37 days.
1210615	4/14/2021	NJ	63	F	3/8/2021	3/9/2021	On March 8th received the J&J shots, March 9, 10th & 11th was extremely nauseous in the morning. On the 12th had severe chest pains which I chalked up to a very bad case of heart burn. On March 24th, while driving I had two major (what I thought at the time) was panic attacks...body started shaking, heart was beating like crazy, couldn't catch my breath, felt like I was going to pass out or die. Had to pull over twice to calm myself down. (From what I read this could be a sign of a blood clot but I am not a doctor.) Had minor heart burn until April 5th....which ironically was the end of my 28 days until the vaccine fully kicked in. Just reporting what happen. I feel fine now.

1210787	4/14/2021	MD	57	M	3/27/2021	3/29/2021	Pt developed abdominal pain and anorexia beginning two days after receiving vaccine dose. Presented to ED and found to have portal vein, SMV and splenic vein thrombosis. Underwent TIPS c/b recurrent thrombosis x 2 and cecal pneumatosis s/p exploratory laparotomy, open abdomen, delayed closure. He was mechanically ventilated and briefly requiring vasopressor support, now extubated and off pressors. Remains inpatient on anticoagulation and TPN. Hematology work-up while inpatient was negative.
1210766	4/14/2021	FL	61	F	3/19/2021	3/29/2021	3/29/21 6 pm - Severe pain lower right leg, ankle, and foot, unable to weight bear on right leg About an hour later I was able to walk a little. Stayed off my feet. Right foot became very cold. 3/30/21 Saw my primary care physician at med center. She sent me for an ultrasound at medical arts. From there I was sent to the emergency room at hospital. I asked the attending physician assistant about a correlation between the blood clot and the Covid vaccine because I had read about it being a concern in other countries. He stated that was a bunch of baloney. Was told to have a repeat ultrasound in a few days and was prescribed a 30 day starter pack of Xarelto and released. 3/30 repeat penis ultrasound of right leg showed the same results. 4/1 appointment with hematologist. Prescribe Xarelto for three months and ordered a repeat ultrasound in three months and bloodwork at that time.
1210737	4/14/2021	MA	33	F	3/7/2021	3/8/2021	Approximately five hours after receiving the shot, I developed a headache. Within 12 hours, I had chills, sweats, and fever for approximately 12 hours. The morning after receiving the shot, I developed neck and shoulder pain which became more sever on the next 2-3 days. The neck and shoulder pain has been ongoing for 5 weeks since receiving the shot on the injection side. I have seen my primary care physician twice, most recently to rule out a blood clot (yesterday 4/13). I have also received physical therapy. There was no neck injury or pain prior to the vaccine.

1209308	4/14/2021	SD	54	M	1/6/2021	1/7/2021	Muscle tightness - soreness - at the arm with the injection and it was for about three and five days. Maybe about 2 weeks from vaccine - I had some congestion (nasal congestion and sneezing) - it was odd (not allergies) and it lasted a solid with heavy heavy drainage and that lasted about two days. I had to use the Mucinex D for it. Then I had the nose bleed - it wouldn't stop bleeding in right nostril. I went to ER - Sunday, the 28th - started at 10:30 pm and after midnight on the 29th it was after 4 hours of bleeding when I went to ED in town. The doctor said my nasal passages were really dry because of the weather. I was using a travel CPAP that doesn't have a humidifier. They cleared a giant clot in the back of my throat - it was the size of a hamburger - it was huge. They used a nasal vasodilator - it looked like nasal spray and they did it and stopped. Vitals were stable and they sent me home. I might have one bloody nose after - a week after and they had given me the nasal vasodilator and that stopped it. They also prescribed a nasal saline spray and I only use the CPAP with the humidifier now.
1209104	4/14/2021	MI	73	F	3/8/2021	4/5/2021	3 weeks post vaccination patient developed chest pain and shortness of breath. Was able to tolerate symptoms, then had radiation treatment and developed more shortness of breath. Was transported via EMS to hospital where an xray and MRI were completed and showed multiple blood clots in her lungs. Venous Doppler was also completed and blood clots were found in her legs. She was subsequently admitted to hospital.
1209054	4/14/2021	TN	59	F	2/11/2021	2/15/2021	received 2nd dose on 2/11/2021. Woke around 4AM on 2/15/2021. Noted blurry vision in left eye. By 8am had progressed to blackness starting at inner visual field and spread to total blindness by 9:30am. Went to urgent visit with optometrist. Appt was made for urgent work in with a Retinal Specialists on 4/16/2021. Diagnosed with left retinal vein thrombosis. Ordered further testing. MRI of brain and orbits, TEE, carotid ultrasound and sent to hematology/oncology for evaluation. Only finding on bloodwork was elevated homocysteine. Being treated for HTN now with Metoprolol, Amlodipine, Losarten/HCTZ, Crestor and BASA, MVI. Vision is unchanged. Blindness remains in left eye. Right eye at this point is unaffected.

1209997	4/14/2021	IN	51	F	3/27/2021	3/27/2021	I submitted a report after my first dose of the vaccine , and now this is the report after my 2nd dose of the Pfizer vaccine: I got the 2nd dose at 4:10pm. I did not feel the shot at all this time, but my arm was a bit achy soon after. One hour after the shot my leg muscles hurt and I felt fatigued. Two hours after the shot I felt really tired and really silly, kind of loopy. Three hours after the shot my L arm was hurting more and it hurt to take the band aid off. Then my stomach started feeling upset. I went to bed at 10:30pm and had a very rough sick night. I was awake most of the night, only dozing a few times. I had a fever (101) and chills; nausea and belching; dry mouth; aching and strange pains coming and going; a slight headache; and my L arm was hurting. By 7am I started crying, and I had more physical pain. I got up at 8am feeling so sick with extreme fatigue, headache, and in a lot of pain in body. My Mom had to make my breakfast for me and I took small bites of that oatmeal throughout the day. I couldn't eat very much because my stomach was so upset. I felt hot and cold and got chills often during the day. By 6:45pm the fever returned (100.3) and I felt sicker again with head and tummy hurting; body aching; and nausea. Finally at 8pm I took 2 Tylenol which helped a lot, but then I worried what if that reduced the effectiveness of the vaccine. I went to bed at 9:15pm and fell asleep right away, but woke up many times soaking wet with sweat. The next day I still had trouble with temperature regulation and I felt very tired and headachy and my L arm still hurt. A few days later I got my menstrual cycle about one week early, and it was the strangest period I've ever had. It was a very light flow, I had lots of clots, and along with the small amount of blood, there was lots of clear stretchy mucous like I get at ovulation. After my first vaccine dose I got my period a few days later also, but that time I only had brown spotting for 4 days and no regular blood flow at all, so this time it was slightly more of a period, but it was really not my usual kind of period. Overall, I felt completely whacked and wrecked by the 2nd dose. It was a terrible experience.
1210908	4/14/2021	FL	59	M	3/17/2021	3/27/2021	blood clot

1209395	4/14/2021	MD	68	M	4/6/2021	4/13/2021	Developed chest pains, Rehabilitation Center moved to hospital on 4/13/2021. Took a turn for the worse in the evening of 4/13/2021. Hospital found fluid on lung x ray. He was placed on ventilator overnight preformed CT Scan the afternoon of 4/14 and discovered several bloods clots In right lung. Patient still in hospital under sedation and on ventilator. Hospital has started him on Heparin.
1209889	4/14/2021	FL	20	F	3/23/2021	3/24/2021	About 10 hours after receiving my vaccine- I became extremely ill. I had migraines, fever of 101, chills, nausea, tightness of chest, abdominal pain, difficulty with my stool / bowl movements, and body aches. I could not move, and most effects subsided after laying in bed for two/three days straight. However, continuing up to today (three weeks later) I have still had tightness of chest/throat, bowl difficulties, and abdominal pain. I also noticed that for the past 2/3 weeks I have also had blood spotting with clots alongside my abdominal pain. It has not yet subsided.
1209826	4/14/2021	MN	42	M	3/9/2021	3/31/2021	He developed Superficial Phlebitis in the left lower leg on 3/31/21, and was seen in the ER. He reports concern to me on 4/14/21 that due to reports of blood clots with the Janssen vaccine, that he is concerned that his vaccine on 3/9/21 may have provoked the blood clot. He still has some phlebitis in the lower left calf. Note, he is on self given testosterone, which may also contribute.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1209886	4/14/2021	TX	35	F	3/31/2021	4/4/2021	Initially pain all over and muscle and joint pain that started passing over first 3 days, on 4th day symptoms subsided but noticed charley horse in right leg, persisted for 4 days and started treating as if blood clot by drinking water, raising leg, taking Aleve, and hot pad so symptoms subsided. Began having difficulty breathing even though symptoms passing so still concerned by the 10th day sought medical treatment and testing for clot. Diagnosis was dehydration likely caused by menstruating at same time as vaccination. Prescribed nsaid and muscle relaxer to reduce symptoms and action plan for increasing water and natural iron intake prior to next dose to prevent more dangerous complications. Had hospitalization for SARS in 2009 and also treated for dehydration, did not consider the vaccine might have a similar effect to the prior infection since I was coughing so hard I was vomiting up all water for 3 days, but my vaccine symptoms were VERY similar to the 2009 illness in slow mo without the coughing including the pain and nausea (hospital could only confirm it was an unknown coronavirus at the time my roommate brought from another county, he was a another race native and very ill but was not hospitalized and didn't disclose he was sick so he wouldn't miss the start of the semester in quarantine, flew anyway and didn't tell us until I was hospitalized). Still dehydrated at 2 weeks after vaccine (today) but functionally symptom free at this time. Menstruation was normal, lighter flow than usual, and lasted 7 days which is normal for me post-IUD. Symptoms persisted after period stopped but progressively improved thereafter, unclear if because of home care for potential clot or because no longer menstruating so better able to retain water.
1209797	4/14/2021	CA	86	F	3/18/2021	3/27/2021	vomiting, shortness of breath, hospitalized, chart shows she suffered from blood clot, hospital has extensive records from tests

1209796	4/14/2021	AK	45	F	3/17/2021	3/20/2021	<p>I received the vaccine at approx 930 am, Wed, March 17 (Johnson and Johnson Lot 1805020) at the Facility by Fireman(Emergency Responders). Vaccine was from Health Care. At first, after about 15 minutes I was feeling a little flush, there were light red splotches on my skin (only a couple, very light red - like when i get really nervous and get red splotches on my neck.) I felt a little nauseous and dizzy off an on for about an hour (but i had not had anything to eat or drink yet that day either). The site of the shot was a little sore and warm about an inch or two away from the needle injection site, but not a big deal. That night my right arm (which is where i received the shot) ached terribly, all the way from my shoulder to my fingers. The next day (Thursday, March 18) was the same. Sometimes my left arm tingled like it was starting to fall asleep. This went on the whole next day. Injection site still sore too, and warm. The day after that (Friday, March 19) the injection site was sore (like a sore muscle) and that was it. Saturday, March 20, the same until about midnight. Around midnight my son, and I came upstairs from watching tv and my arm (at my wrist) was aching intensely! I looked down and there was a small lump where one if the veins are. I can see my veins easily here and I am very light-skinned. Son could also see the lump. My arm kept aching so badly! I was messaging the lump over and over. After about 5-10 minutes it went down a little bit, ached a little less, and i left it alone. The next day it looked like i had a bruise on my wrist and hand (where the meaty part of your hand is going to the thumb. The next day, Sunday, March 20th, a neighbor said it could be a blood clot and i took an aspirin. Today, Wednesday, April 14, 2021. Approx 1130am, after getting out of bed, getting some coffee. I was sitting at my desk in my home office, took my medication and took my first sip of coffee. All of a sudden, my chest starting hurting. I cant say where the pain originated, it was in the chest/upper stomach area. It ached a lot, I felt very flush, I honestly cant remember if it were hard to breath, all i could think is "what is this?". I didn't know if i would throw up, burp, pass out. the aches starting migrating, still saying in the chest, but expanding to my lower back. I got out of my chair and tried to move around...it took a good 3-5 minutes before it started to dissipate and I took another aspirin.</p>

1209534	4/14/2021	TX	70	F	3/15/2021	4/2/2021	J&J vaccine 3/15 and on 4/2/2021 I thought I pulled a muscle and my leg started swelling, but my right leg only. I thought it would go down and my leg and foot started swelling up and my foot got really cold. I went to the hospital on 4/11 and they said it was a DVT and they checked my lungs and said I had small blood clots in my lungs as well. They put me on Eliquis to keep my blood thinned out.
1209444	4/14/2021	CO	44	M	3/10/2021	3/13/2021	Blood clots in my lungs
1209473	4/14/2021	AZ	50	F	1/29/2021	2/17/2021	I did not know this could possibly be a side effect of the vaccine until my school nurse alerted me to the possibility and advised me to report my reaction. I developed sinus congestion that I did not think was serious in the weeks after the vaccine. I had headaches and nasal congestion. many weeks after the vaccine, I sniffled and a large mass went down my throat, again I thought nothing of it. Last weekend, I got a very painful headache behind my other eye. I massaged my brown-bone and a large walnut sized and shaped mass, brown and red in color, shaped exactly like a shelled walnut with lobes came out of my nose. My school nurse told me this sounds like it was a sinus blood clot and to alert the clinic. The clinic in town where I got my vaccine said because I am not ethnicity, I had to report it myself on VAERS.
1209811	4/14/2021	MI	62	F	3/31/2021	4/4/2021	received Jansen vaccine on 3/31/21 and the following day I had a headache,, achy and tired. I expected this, but a few days later I was still having what I describe as migraine type headaches and at one point I was sweating profusely, dizzy massive headache with not only nausea, but dry heaving so bad I could barely get to my medication and seriously thought it would never subside. I continued with headaches up until today April 14. This is the first day I have not had a headache. I contacted my vascular doctor as I had a blood clot several years ago and he has prescribed Eliquis twice a day for the next 2 weeks. Today marks 2 weeks and like I said, it's the first day I have not had a headache

1203128	4/13/2021	FL		M			<p>DVT; PULMONARY EMBOLISM; KIDNEY BLEEDING; This spontaneous report was received from a physician, and concerned an adult male patient (greater than 50 years old). Initial report was processed along with additional information received on 12-APR-2021. The patient's weight, height, and medical history were not reported. The patient received Covid-19 vaccine AD26.Cov2.S (suspension for injection, intramuscular, batch number was not reported) dose and site of vaccination were not reported, administered on 20-MAR-2021 for prophylactic vaccination. No concomitant medications were reported. On an unspecified date in 2021, the patient experienced deep vein thrombosis (DVT), pulmonary embolism (PE), and kidney bleeding. The patient was admitted to the hospital and was treated with heparin as well as an inferior vena cava (IVC) filter (put in after he experienced bleeding from his kidney). Laboratory data included: a negative COVID-19 virus test, and throughout hospitalization his platelet count (NR: not provided) was normal: 191,000 and 264,000 (units not provided). The patient's test came back positive for one copy of the Factor V Leiden mutation which predisposed him to blood clots. On 12-APR-2021, the patient was to start a trial to Lovenox (enoxaparin sodium); they will assure there is no bleeding, prior to discharge. At the time of this report, the patient was still hospitalized but doing well. Action taken with Covid-19 vaccine AD26.Cov2.S was not applicable. The patient was recovering from DVT, pulmonary embolism, and kidney bleeding. This report was serious (Hospitalization Caused / Prolonged, and Other Medically Important Condition).; Sender's Comments: v0 An adult (greater than 50 years old) male patient with a past medical history remarkable for the Factor V Leiden mutation experienced deep vein thrombosis, pulmonary embolism, and kidney bleeding on an unspecified date after receiving Janssen COVID-19 Vaccine Ad26.COV2.S. The patient was admitted to the hospital and was treated with heparin as well as an inferior vena cava (IVC) filter (put in after he experienced bleeding from his kidney). The patient had a negative COVID-19 virus test, and throughout hospitalization his platelet count was normal: 191,000 and 264,000 (units not provided). The Factor V Leiden mutation is known to predispose patients to venous thrombosis, therefore the causality for deep vein</p>

1201967	4/13/2021	TX	36	F	3/25/2021	4/9/2021	36 y.o. female referred for the above chief complaint. She has no significant medical history and presented with a headache that became severe 3 days ago. She received the Johnson and Johnson COVID vaccine on March 25th and had a mild headache following that which she attributed to the vaccine. 3 days ago the pain became excruciating and was associated with vomiting. This prompted presentation to the ED where she was treated with Dilaudid. She was discharged home and has been using her mom's headache cocktail with some transient relief. She presented back to the ED today with continued symptoms. MRV revealed a venous sinus thrombosis and neurology was therefore consulted. She has no history of clots personally or in the family. Her dad did have a stroke in his 50s. Patient otherwise denies any other associated speech change, vision change, extremity numbness, extremity weakness, coordination difficulty, or dizziness. Patient admitted to the neurology ICU and started on anticoagulation.

1202072	4/13/2021	CA	86	F	4/9/2021	4/11/2021	PATIENT WOKE UP AT 12 AM THROWING UP BLOOD AND FEELINGS OF PASSING OUT, 911 WAS CALLED AND AMBULANCE TOOK HER TO HOSPITAL, WHERE THEY DETERMINED IT WAS A STROKE AND MOVED HER TO ANOTHER HOSPITAL, WHERE CURRENTLY BEING TREATED DETERMINED BLOOD CLOT IN BRAIN. MOST LIKELEY DUE TO VACCINE SHOT.
1202133	4/13/2021	NJ	61	F	4/5/2021	4/10/2021	Around noon on 4/10, 5 days after shot, I started feeling a buzzing sensation in my right arm, as if my cell phone was vibrating. This persisted around 48 hours, stopping sometime around noon 4/12. A web search led me to issues with nerve damage and the further down the rabbit hole I went, possibly Parkinson's disease. This is a degenerative brain disorder. I scheduled appointment with my internist ASAP for May, the soonest I could get in. I also cold called a Neurologist office and they advised me to first see the internist. When I got up today and saw the issues with the J and J vax, and the rare instance blood clots in the brain, I thought my experience of 48 hours of some kind of nerve damage(?) or stimulation could be relevant or at least reported to someone.
1201948	4/13/2021	LA	43	F	2/25/2021	3/6/2021	X4 BLOOD CLOTS WITH 1 MONTH
1202715	4/13/2021	WI	41	F	2/4/2021	4/13/2021	I developed a sudden, sharp stabbing pain in the left side of my head while at work. I had not fallen nor had any injuries/illness. I went to ER; CT scan was concerning for clot in sinus so I was sent via ambulance to inpatient neurology where further MRI/MRV scans determined it was not in fact a clot, but a small bleed of unknown origin. Again, I had no injuries. I was hospitalized while multiple scans were completed along with lab work. Home now following up with neurology, still have head pain, unable to fully work, etc. Hematoma is still there but not growing.

1203266	4/13/2021	MA	31	F	4/3/2021	4/4/2021	All regular side effects on day 1 + day 2. (Fever, chills, bone and muscle aches, headache). Shortness of breath started the next day on Sunday , extreme, far beyond normal asthma or any asthma attack. Went to urgent care on Tuesday- they said it was likely a side effect of j & J and tested me for COVID, kidney disease other things, all came back negtative. Apparently I wasn?t the first person they had seen with shortness of breath. Blood in cough and spit on Wednesday after 2.5 days of shortness of breath. Dizziness (extreme) throughout and chest pain, sternum hurt, chest tightness. Went to Er. They ran a lot of tests and they too said they had seen others with shortness of breath from j and j. They ruled out many things like pneumonia, a birth control blood clot, any lung diseases with X-rays and blood tests. I was given torkeril to ease the chest pain and tightness which it did. Blood stopped coming up in tissues. Doctor said likely inflammatory reaction to the vaccine in lungs, (I have a piece of paper proving that) and cartilage and sternum., which hurt extremely when he touched it. Blood was likely from burst capillaries from overcompensation from trying to breathe. Recommended I return if more blood came up, which it hasn?t. Shortness of breath has not subsided. I can?t even hold a phone app without being winded. So email back, don?t call.

1203182	4/13/2021	WA	80	F	3/10/2021	3/11/2021	Morning on 3/11 awoke with fever and body aches, breathing became difficult over the next several days, along with light headedness. ED visit on 3/14 diagnosed with COPD flare advised to follow up with PCP. 3/22 follow up with PCP, discovered blood in stool sent to ED. Admitted on 3/22 with low hemoglobin and blood in stool. Endoscopy on 3/23 and coloscopy on 3/24. Source of bleed undetermined. Released on 3/23. 4/1 returned to ED as symptoms continued. D-dime blood test and CAT found blood clots in lower right lung. Prescribed Eloquis and released. Returned to ED on 4/5 admitted with low hemoglobin (7.1) bleeding, breathing difficulty. Endoscopy repeated on 4/6 not bleeding found. Released on 4/9.
1202729	4/13/2021	CA	88	M	2/14/2021	2/16/2021	On Sunday afternoon, March 14, I received the first dose of the Pfizer vaccination. On the morning of March 16 I had a sudden hit of fatigued and my left leg started going numb while doing some menial work in the yard, The numbness cleared when I went inside and laid down but some form of the fatigue persisted for several days. Then, on March 28, two weeks after the vaccine, I woke up to a leg severely swollen from toe to hip. I waited two days to see if it went down but it only got worse, swelling to double the size by volume. I went to the doctor and they sent me to the hospital for ultrasound, suspecting a blood clot. No blood clot was evident but there were multi swollen limp nodes in the upper leg area. The problem worsened and two days later I was sent in for a CTscan which now showed multi blood clots near the swollen limp nodes. I was barely able to walk as major pain persisted with no signs of decline. I am now on blood thinner. It has been 2 months since the vacination and my leg is still swollen the same amount (2X by volume).
1202613	4/13/2021	MI	71	F	3/24/2021	3/31/2021	Seven days after Moderna vaccine I got up and started feeling a warmth in my leg that started in foot and went up and it started hurting really bad, called an ambulance and went to hospital and because of blood clots, I had to have emergency surgery, it was very huge arterial clot, and developed shingles as well.

1200326	4/13/2021	SC	45	F	2/4/2021	2/7/2021	A couple of days after the receiving the vaccine I started having severe heart palpitations. I noticed that a hemangioma on my lip was extremely swollen and black and blue looking while experiencing the palpitations. I was also dizzy. I sent pictures of mu lip to my doctor at college and he encouraged me to see my primary care doctor. Both doctors agree that they suspect I had a blood clot. I also haven't had a regular period since the vaccine. I had one brief period shortly after the vaccine, and it was unlike my periods before the vaccine. I haven't had a period in two months and I don't believe that is coincidental as I was 28 days regular before the vaccine.

1201033	4/13/2021	NC	51	F	4/7/2021	4/7/2021	at 11:30 pm on 4/7/21 I had extreme, spontaneous, stomach cramps so bad I thought I was going to pass out, that lasted for one hour, then diarrhea. A few hours later I started blood red rectal bleeding. At the hospital I was diagnosed with Ischemic colitis (from colonoscopy) and a blood clot was also found, portal vein thrombosis. I am 100% certain the extreme stomach cramps were brought on by the vaccine and that in turn caused the ischemic colitis, the blood clot may or may not have already been there. Note: The Dr.'s were not interested to tie any relation to this episode with the vaccine which was quite frustrating as it was quite obvious
1201016	4/13/2021		32	F	3/23/2021	3/23/2021	Around 6 hours after the shot, patient started feeling headaches. Later that evening came muscle pain, chills, high fever, nausea, vomiting, and migraines. The next day, most side effects went away except for the looming headache. Since the vaccine, patient has been experiencing episodes of dizziness and lightheadedness. There was an article that came out today as it relates to blood clots being a possible side effect of the vaccine and to report any feeling of headaches or possible symptoms that may be related to that.

1199637	4/13/2021	VA	36	F	4/7/2021	4/9/2021	Extended menstrual bleeding and spotting after receiving COVID vaccine. Received second Pfizer vaccine on day three of monthly period and heaviest day had passed. Typically have heavy bleeding/cramps on day #2 ONLY. After receiving vaccine, menstrual bleeding continued for longer/heavier than occurred during Pfizer vaccine #1. Seeing spots of bleeding and clots on day 8 which has never occurred during my cycles, even during periods of extreme stress. Menstrual bleeding is typically noticeable for me for 5-6 days and have never seen clots this far into my cycle. Only other physical side effects were feel of malaise day after receiving injection + headache + soreness in left arm injection site + pain on outside of left breast under arm and next to rib cage (no extreme tenderness to right breast).
1200987	4/13/2021	IL	48	M	4/12/2021	4/12/2021	The fire department came to his house as he is a paraplegic to give him the vaccine, and he can't move, is fatigued, has tightness in his joints, and has stomach issues, and takes Oxybutynin to control his urine and doesn't know what he's supposed to do. Off and on he has had a headache. Doesn't understand why they would give him a shot if it gives people a blood clot and he's a paraplegic. He already has an IVC filter in his veins to prevent him from getting blood clots.
1200861	4/13/2021	NV	63	M	3/11/2021	3/23/2021	He had his vaccine in different state while visiting his daughter. Returned home and was found to have a blood clot behind his left knee. Also, he called the doctor last week and told him that he believes he has another one above the left ankle. He has an appointment on Thursday to see him again. He had two venous ablation procedure in both legs in late November/December of 2020. He was taken off of the baby aspirin and then put on Xarelto. The 2nd possible blood clot appeared about 10 days ago above the left ankle.

1201764	4/13/2021	HI	69	M	4/10/2021	4/10/2021	- The following message was transmitted to my PCP on Sunday, 04/11/2021, about 11 PM. - Hello, yesterday, Saturday, April 10th, 2021, I received the Janssen (O42A21A) single-dose vaccine around 10 AM. About an hour after arriving home, i started having some of the most common symptoms reported, as in the following: Low-grade fever 99.3', Marked fatigue, mild muscle aches, some dizziness and generalized weakness. Took one 800mg Ibuprofen and rested. Last night, at around 10 PM, I had one episode of hematuria with some visible small-to-medium sized red clots, with no pain or discomfort on urination. Today, in the AM, I took another 800m Additional information for Item 18: 800mg Ibuprofen tablet, and by 12 noon, there was less fatigue and weakness, as I moved on in the day, the other symptoms improved or sub-sided, Except, for some, small clots, in a otherwise normal-appearing colored urine, around 1 PM. My B/P was 148/78, pulse 70, which is normal range for me. Additional information for Item 18: On Monday, 04/12/2021, during the day-time, I again experienced severe-to-moderate fatigue, and some dizziness, and then, last night, at around 7 PM, and 10 PM, I had two separate episode's of hematuria with some visible small-to-medium sized, Dark red clots this time, with no pain or discomfort on urination.
1201747	4/13/2021	AZ	92	M	1/15/2021	2/23/2021	Father started complaining about his right leg after first dose of Vaccine. After second dose on Feb 12, 2021, Father started complaining much more about his leg. On Feb 23, 2021 it was diagnosed Father had a Blood Clot in his leg.
1201742	4/13/2021	TX	76	M	4/8/2021	4/8/2021	Patient reported thinking he had a blood clot in both legs. Patient stated Saturday night he experienced severe leg pain in both of his legs lasting 30 minutes later. Patient stated that he felt as if he had pain in every muscle in both of his legs; patient stated that he could not stand for quite some time once pain began. Patient stated that pain caused him to wake up. Patient stated that he did not have any other problems afterwards.

1201729	4/13/2021	IL	60	F	3/25/2021	4/11/2021	Called 911, hospital dianosed with Vertigo. woke up in bed during night turned to right side and got dissy and nausus, happened twice called 911, hispital dianosed with vertigo , ct scan showed no clots in neck or brain, said could be iner ear, follow up with family doctor. was givenMeclizine 25 mg tablets, Ondansetron ODT 4mg tablets
1201709	4/13/2021	IL	47	F	3/17/2021	4/2/2021	I started having left abdominal pain under my ribs (spleen and liver) on the afternoon of Friday, April 2 that lasted though Sunday, April 11. I went to the ER at 1am on Sunday, April 4 because the pain would not improve and kept me awake. I was admitted to the hospital for two days with a host of CT scans, blood work, Xray and ultrasounds for a diagnosis of splenic infarction and inflammation of the liver which I have never had before. No other clots were found, just evidence of spleenic infarction and inflammation of the spleen. Labor shows evidence of the diagnosis and I have now been put on low dose aspirin 81 for blood clot concerns and preventative by the advise of Hemotologist.
1201649	4/13/2021	FL	61	F	4/6/2021	4/7/2021	Beginning approximately 10 PM (about 8 hours post-injection), I started to have chills (feet were freezing) and was exhausted. Went to bed, and slept most of the night, only waking once to urinate and to drink a small amount (approx 2 oz) of Coca Cola -- I was very nauseous and thought it would help settle my stomach. During the night I sweated profusely. At 8 AM, I woke again and went to urinate. At that time I felt very nauseous, dizzy, and light headed. When I walked about 2 -3 feet to my bedroom, I collapsed on the floor - unconscious. My partner called EMS, they arrived minutes later. By then I was conscious. They transported me to Medical Center Emergency Room, where I remained for several hours. They indicated that my SYNCOPE was a result of dehydration. TODAY, 4/13, news of BLOOD CLOTS has compelled me to report my adverse reaction.

1201641	4/13/2021	GA	60	F	3/9/2021	3/16/2021	Within 7 days of vaccine, I began experiencing aching of right posterior leg just below knee. Applied heat, elevated and just continued to ache intermittently, daily. Waited and disregarded as anything to worry about. After 2 wks of continued symptoms despite no redness, swelling or positive homans sign, being a health care professional (RN), I decided to seek evaluation at local ER to rule out DVT. On April 1st, I presented to ER, Address and number provided.completed and diagnosed with posterior tibial venous thrombosis on
1201612	4/13/2021	NV	58	F	3/23/2021	3/23/2021	On 23 March 2021 I received the Janssen Covid-19 Vaccine LOT #1805025. I contacted Johnson & Johnson via phone to report that I was experiencing an intense, deep pain in my upper left thigh and a headache about two hours after receiving the Janssen vaccine. Case #ICSR Information : 20210346108 JANSSEN COVID-19 VACCINE SECURE! The pain in my thigh worsened whenever I stood or sat still. I inquired if thrombosis is a side effect or something that I need to be concerned about. The woman on the phone said she looked up thrombosis, but did not see it listed. I asked if I should start taking aspirin. The woman on the phone said that she could not give me medical advice. I was so concerned that I took a full aspirin about every four hours for twelve hours on that day and a full aspirin for about three days thereafter and two baby aspirin ever since. The pain in my thigh diminished by 26 March 2021, but ended a few days later. The headache occurred intermittently. I have had some chest discomfort since then, but it hasn't risen to the level of angina. I am still concerned about thrombosis because of the intensity of the pain.

1201593	4/13/2021	CA	46	F	4/1/2021	4/12/2021	I had the J&J vaccine on 4/1/21. I have a history of blood clots. I have tested positive twice. Once back in 2001 when I was pregnant and later on around 2008. I have had these symptoms before, but since I have a rare bone disease and have medical issues I really don't like to complain and just deal with this stuff with the pain pills I have a prescription for. Anyway, yesterday I was feeling a little off. My hands, feet and limbs in general tingling. I had a headache which is rare for me and tried to drink extra water, but by 5pmish came I took a handful of tylenol since I had an after work walk to go on with a girlfriend. After the walk I came home and had a desire to lay down and go to sleep. my leg was starting to go from tingle to burn. i decided that i needed to eat some dinner. after dinner i was struggling with breathing while sitting in the recliner chair watching TV, so I told my other half I needed to lay down, this was around 7pm. Then it was just a crazy leg burn from the back of my knee into my foot. I was describing it as if I someone pour gasoline on me and lite the match and I was burning alive. I took a muscle relaxer and forced myself to sleep. The day after the J&J shot. i had chills and was so cold that mid day when I had breaks during my work from home, i climbed in bed with a heating pad to warm up. the shot also left a scare on my arm, which i found odd since i give myself six injections a week for my bone disease. I tested positive with Covid December 20th, 2020 and it was a rough first week, but after about 10 days I was pretty much back to walking around and feeling better. You're more than welcome to have all of my medical record information, just let me know what you need. My doctor switched over to a different portal that I don't have access to and I haven't talked to her or her office since I had covid back in December and it's still a few hours before her office opens to report this, but I saw this on the news. My leg is still tingling and stiff. Again this is not my first time going through this, so I usually just push through it, but since I saw the news I am reporting it.

1201310	4/13/2021	IL	49	F	3/20/2021	3/26/2021	I have a history of untreated fibroids that were diagnosed in December 2019. Because the coronavirus pandemic began in February 2020, elective surgeries were not allowed in my state. My bleeding and blood clots were caused by the fibroids during menstruation. On March 20, 2021, I received the Johnson & Johnson 1-shot COVID vaccine. By March 26th, the blood clots that were coming out of my body were enormous. They had NEVER been that large. Being concerned, I immediately saw my doctor as soon as my period ended. Today, I learned the J&J vaccine has been paused due to blood clots. I believe that my blood clots became so large because I was given this particular vaccine. WOMEN SHOULD BE ADVISED THAT IF THEY HAVE BLOOD CLOT CAUSING FIBROIDS, DO NOT TAKE THE JOHNSON & JOHNSON COVID-19 VACCINE.

1201333	4/13/2021	MT	29	F	4/8/2021	4/9/2021	Headache (turned into a migraine), extremely drained of energy, lack of appetite, and felt off all day (4/9/21). The next morning (4/10/21) felt the same as the day before, however, had several episodes where I would get really light headed, dizzy, and nauseous. Went to Home Depot at 2:15pm (4/10) and while there my vision blurred and started to fade, I had ringing in my ears and couldn't hear out of the right and barely was able to hear out of the left. I got very nauseous and I couldn't breathe. I managed to sit on something and put my head between my legs that helped. Fortunately my step- dad was with me and helped me outside while I could barely see and hear and he stated I was very pale. I was having a hard time talking or being coherent. Once outside the symptoms slowly cleared over about the next 6-7 hours. At 4:45pm my mom decided to take me to the doctor but the walk in had just closed and I went to the ER. They stated I had elevated d-dimer and did a chest CT scan to check for blood clots around 7:30pm (I believe not sure exact time) doctor stated they came back clear but when asked if he suspected that the episode and symptoms were due to a dissipated blood clot he would not directly answer it. I overheard him dictating his notes and he stated he believed as such. I have never experienced anything like this before. I still felt drained, headache (migraine), occasionally dizzy, and lack of appetite (4/11/21, 4/12/21) and still currently feel the same drained, migraine, lack of appetite, and occasionally dizzy.

1205445	4/13/2021	MN	33	F	4/9/2021	4/9/2021	Tachycardia. I had the expected side effects of headache, chills, body aches, fatigue and fever (102.6 F) but began to experience symptoms of pounding/racing heart that worsened through the evening. By 10:00 pm my heart rate was bouncing around between 130 bpm and 155 bpm, and I was beginning to have pain in my lower legs/ankles. Was told by a on call nurse for my clinic to go to the ER. I was in the ER for about 5 hours, roomed the whole time as they worked to get my heart rate down and checked to make sure I didn't have a blood clot. They performed an EKG and CT Scan of my chest, both were fine. I was eventually allowed to leave after 4 am on 4/10/21 after my heart rate got into the high 90's with only small spikes into the 110's with slight movement and once my fever had broken.
1205440	4/13/2021	IL	35	F	4/1/2021	4/2/2021	Prior to vaccination bowel movements were every 2 or 3 days with mild constipation. Mild diarrhea like symptoms began the morning after the vaccination. Bowel movements were at least 4 to 5 times a day for the first 3 or 4 days and then to 3 to 4 times a day. Bowel movements included sticky/slime looking substance what may have looked like blood clots. Symptoms lasted from 4/2/2021 to approximately 4/11/2021. Bowel movements are now 2 to 3 times a day but normal, with no other substance.

1205190	4/13/2021			U	3/9/2021		<p>her veins were swollen and she had blood clot.; her veins were swollen and she had blood clot.; severe earache; severe headache; her mouth and throat were on fire.; her mouth and throat were on fire.; This is a spontaneous report from a non-contactable consumer (other HCP) via medical information team. A patient of unknown age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, lot number and expiration date were not reported) via unknown route of administration on 09Mar2021 as single dose for covid-19 immunisation. Reportedly, patient got the first dose of the Pfizer COVID-19 vaccine on 09Mar2021. After that, she had developed severe earache, severe headache, her mouth and throat were on fire. Few days later, her veins were swollen and she had blood clot. She was also afraid to take her medication, Eliquis, since there may be more adverse events from that medication. Patient was scheduled for her second shot of the Pfizer COVID-19 vaccine today, 20Mar2021. She was told that the adverse events after the second dose of the vaccine are worse than the first dose. She has also read that people die from the vaccine. She wants to cancel her appointment today. She wanted to know if the vaccine would be 80-85% effective after a single dose. She wanted to know if she would be ok with just one dose of the vaccine. No PQC was present. The outcome for the events was unknown. No follow-up attempts are possible. No further information is expected.; Sender's Comments: Based on the information currently available, a possible contributory role of the suspect vaccine BNT162B2 in triggering the onset of thrombosis and other events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p>

1205072	4/13/2021	MA	60	F	3/4/2021	3/17/2021	Two weeks after 1st Pfizer shot I began to have very heavy breathing while on a daily walk that continued with any exertion. It continued for several days. I called PCP and was seen. Chest Xray & bloodwork was done. Was called to go to E.R. for CT scan of lungs. Pulmonary Embolisms were seen and a blood thinner was given. Heart monitored for previous Afib (ablation performed 5 yrs ago). CT scan w/dye was done of abdomen, Right leg ultrasound with compare L, MRI w/contrast done of abdomen/pelvis. No reason has been found for cause of several blood clots in both lungs - sub arteries. Am being followed up by Vascular Doctors in 2 weeks.
1205071	4/13/2021	OH	85	U	2/11/2021	2/18/2021	On February 18, 2021 between hours 18:20-18:40 and a week after taking the second shot, patient lost balance (fainting) at home, fell, bruised a rib and fractured skull, causing subdural hematoma (bleeding outside of the brain). Bleeding stopped and several CT scans were performed. Under medical supervision, an anticoagulant medication was stopped to allow for healing. On February 20, 2021, moved from ICU to regular hospital room and on February 23 moved to another hospital for intense rehabilitation. Within days a thrombus developed causing a minor Cerebrovascular Accident, which was immediately identified by a medical doctor and nursing staff. On March 2, 2021 at 10:30 am moved to a Medical Center for further treatment. An endovascular thrombectomy for the removal of a thrombus was performed by a doctor. After recovery in the Neurosciences Critical Care ICU, under amazing care by the doctors, further thrombi developed on patient's lungs and around the bowel. Patient expired at 8:01 on March 4, 2021 due to Ischemic Complications of Thrombi/Thromboemboli.
1205067	4/13/2021	LA	18	F	4/6/2021	4/6/2021	Evening after shot had fever of 102.3, chills, body aches bad enough to make it hard to walk. Those ended by next day. Developed very sore left hip/buttocks. Pain up to level 8. Now about 3-4. Saw pediatrician today to see if there was concern for blood clot. Was told to watch for sudden changes and sharp pain.

1205263	4/13/2021	MN	56	F	3/24/2021	3/1/2021	allergic reaction/Allergic anaphylactic reaction; lungs were filling up with fluid; throat was closing; Main trouble is breathing and is out of breath; legs sore; Throat sore; Cough; hard for her to walk; tired; trying to swallow a tablet and digest it and it gets stuck; trying to swallow a tablet and digest it and it gets stuck; breathing was heavy; choking; trying to swallow a tablet and digest it and it gets stuck; This is a spontaneous report from a contactable consumer. A 56-year-old female patient received bnt162b2 (BNT162B2 reported as PFIZER COVID 19 VACCINE), dose 1 via an unspecified route of administration in the right arm on 24Mar2021 (Lot Number: ER2613) as a single dose for to prevent COVID (covid-19 immunisation). Medical history included having blood clot from 2019 to Mar2021 which the patient stated a couple of weeks ago (Mar2021), she had an ultrascan in her leg and the blood clot was not there, but she is on medication. The patient has recovered completely from blood clot (not ongoing). Concomitant medication included warfarin (WARFARIN) to prevent from having blood clot ongoing since Jun2019. The patient previously took gabapentin for pain but had throat started closing, allergic reaction, coughing and was intubated until she was released from hospital; and albuterol [salbutamol] for dyspnoea but had nebulizer to open up her airways and prevent closing and did not work (drug ineffective). The reporter mentioned that the patient ended up in the ICU because of the COVID vaccine. As soon as the vaccine was administered within seconds, the patient experienced a reaction and was given an epi pen, another epi pen even an epinephrine drip and was sedated and intubated. The reporter mentioned that they gave the patient the first shot of epi pen and it did not work, and she was given a second one and a third one plus steroids. By the time the ambulance people arrived, they hooked the patient up to an IV and gave her additional epinephrine and administered another epinephrine. The ambulance guy told her; she does not need to keep up with them because they needed to go to the hospital ASAP because the patient is not getting better but getting worse. Once the patient got to hospital, she was intubated because her throat was closing. The reporter stated that the patient has allergies to begin with and this was worse than the first time she had to be intubated. The epi pens did not work, the patient was

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

intubated and then had to be sedated. The patient was on Propofol in order to sedate her and later on in the evening was given Fentanyl to relax her then the epinephrine drip was removed at 6 pm on 24Mar2021. The epinephrine drip was started in the emergency room and the patient could not be moved to the intensive care unit until she was somewhat stable. The patient was moved to the intensive care unit and was there overnight and by the time next morning she was able to be extubated where they removed the tube from her around 9:30 to 10:00 25Mar2021. Of course, the patient was taken off Propofol, but she went through a lot and her legs are sore, throat is sore, and is coughing on 25Mar2021 because of the side effects from being intubated and that she went through a lot. The intensive care unit doctor said that the patient can no longer have the vaccine and she would only be 70% protected till whenever they are not sure how long the vaccine will last. The adverse events almost took the patient's life which made the reporter angry at that. The reporter is not sure what the contents in the vaccine that it in the other drugs and vaccines since there is something that is contained in all of them and the patient was not allowed to have any whether it is the Pfizer or Moderna and it is even up for discussion for even the flu shot because of the reaction and there does not want to be any chances and that everything should be proceeded with caution. The reporter wanted to know what is in the COVID 19 vaccine to see about what could have caused the allergic anaphylactic reaction. The reporter stated and the fact that the epi pen did not work, she was taken aback. The reporter added that the doctor had a hard time intubating because of her throat but they were able to intubate from the second time. The reporter stated that it is taking a while but her wife is recovering and feeling it is taking a while taking a little bit longer. The reporter also stated that they kept the patient in the intensive care unit overnight and after the tube was removed in the morning, by the late afternoon she was moved to a different floor to continue to be observed and the intensive care doctor said 2 days out her wife would be safe to go. The patient stood up but it was hard for her to walk on 25Mar2021 because it could have been from the epi pen, but she is not sure. The patient stated the side effect came out of the allergic reaction and it was on Thursday 25Mar2021.

---

Patient stated the main trouble is her breathing, she is out of breath still and really sore throat on 25Mar2021. The patient stated that the leg sore is still ongoing and is about the same. It was mentioned that the throat sore was still ongoing but some days are worse and some days are better. The patient stated that when she has a problem trying to swallow a tablet and digest it and it gets stuck on Mar2021. It was stated that the cough was not going away. The cough comes and goes away. She will cough for five minutes constantly and then it disappears then she will fall asleep and wake up coughing. It's as if she is choking (Mar2021). When she is talking, she coughs more. With regards to the allergic anaphylactic reaction, the patient stated she is experiencing the aftereffects of the allergic reaction and being intubated like being out of breath. The patient stated that will come in time and that's what happens when she gets intubated. Her breathing was heavy and comes back fully with rest on Mar2021. This has taken a lot out of her. She was feeling tired which was still ongoing it is about the same but comes and goes on 25Mar2021. The patient is experiencing lingering side effects and the patient does not feel as if she has recovered completely. It was also mentioned that the patient was intubated on 24Mar2021 to 25Mar2021. It was reported that treatment of the patient included Epi Pen, Epinephrine Autoinjector USP 0.3 mg (Epinephrine injection manufacturer was Mylan) which the patient was given at least three injections (two in the right leg and 1 on the left) then received another in the ambulance (unknown site). Patient received an Epinephrine drip and it was like 0.1 mg all the way up until 6 pm (only on 24Mar2021). The epinephrine drip was started when patient was intubated at the hospital. It was given for patient's allergic reaction through IV. The patient's lungs were filling up with fluid so her airway was restricting her from breathing and to prevent damage of the lungs that is when the intubation came in. The patient also received Prednisone which the reporter does not recall when this medication was started it may have been after the epinephrine drip was removed but she is not sure if they started the prednisone after or if it was the same evening which the reporter kind of thinks it was. The reporter stated that the patient took Propofol 24Mar2021 to 25Mar2021 which was given through the patient's IV and was given to help her airways being

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							intubated, they sedate their patients. The patient also received fentanyl which must have been added either right before Epinephrine drip was removed or after but reporter does not recall. Patient was given Fentanyl 24Mar2021 to 25Mar2021 through her IV. Patient received this medication to relax because sometimes it is like some patients tend to want to sit up and kind of hear you, hear what people are saying and to relax patient sometimes because they can get scared and not exactly sure what is going on. The events anaphylactic reaction, pulmonary oedema, throat constriction and breathing difficult. The patient underwent lab tests and procedures which included lung was checked from a CT scan was unknown results on 12Jun2019, D dimer test was elevated on an unspecified date, ultrascan in her leg (ultrasound scan) blood clot was not there on Mar2021 and weight was probably weighs 180 or her weight may be a little less like 175 on an unspecified date. The outcome of the events anaphylactic reaction and throat constriction were recovering, as for the events leg pain, throat sore, cough and tiredness were not recovered while the outcome of the other events was unknown.

1205919	4/13/2021		23	M	1/4/2021	1/12/2021	Approximately 7-10 days or so after receiving the first dose of the pfizer Covid vaccine I started to develop this red, nodule-like, painful "rash" on both of my forearms. Not only the left arm where the vaccine was administered. This did not go away after a couple of days, and I was instructed by a physician to being taking Benadryl. This appeared to alleviate the symptoms (no visible red nodules anymore) 4-5 days prior to my second dose, so I stopped the medication and presumed it was done. Then, within 4-5 hours of receiving my second Pfizer covid vaccine, I broke out into the same red, painful, nodule-like "rash" along both of my forearms. This time was worse than the previous reaction. I was instructed to take Allegra at the time by a physician, which I did for approximately 4 weeks. This seemed to get rid of the symptoms I was experiencing, and I could not visualize the nodules on my forearms anymore. However, after approximately 2 weeks, I noticed a painful and swollen vein in my right forearm, opposite arm to the one I received the vaccine in. I did not think much of it at the time, since I had no other associated symptoms. Then, over the next couple of weeks, it appeared to become more swollen and painful. Also, I saw another swollen vein near my knee. On April 6, I had labs drawn and CBC, CMP, TSH, and ESR came back normal, but the CRP was elevated. Thus, I was instructed to begin aspirin 325mg, which I took for 4 days beginning April 8th and ending April 12th. On April 13th, an official ultrasound confirmed a DVT in my right popliteal vein, a superficial thrombus in my proximal great saphenous vein, and a superficial thrombus in my right forearm where the pain originated from weeks prior. The initial presumption at this time is that the clots are vaccine-related, but could be linked to an underlying blood disorder that was triggered by the vaccine. Blood hyper coagulation labs have not yet come back. I was initiated on Eliquis starting April 12th for the DVT.
1205904	4/13/2021	MD	27	F	4/5/2021	4/7/2021	Two days after vaccine - severe bloody nose. Clots of blood came out.
1205903	4/13/2021	CA	70	F	3/12/2021	3/14/2021	What appeared to be blood clots on both forearms.

1204138	4/13/2021	RI	59	F	4/10/2021	4/11/2021	As described above, about 13 hours after the vaccine I woke up at 3 am with a severe pounding and constant headache. I was also extremely fatigued so much so that I did not get out of bed or do anything all day 4/11 and didn't start feeling better until the following Monday. Then I hear in the news about the 6 adverse reactions and the J&J vaccine shutdown, possibility for blood clots etc. and to keep an eye out for various symptoms over next 2-3 weeks! It was stressful enough registering and not being able to secure the Moderna or Pfizer so I just said ok and got the J&J. Now I have something else to worry about. Heart and blood clot issues are in my family. I do not take any blood thinners and don't plan to. But now am questioning whether I should have gotten the vaccine at all. I have had enough chronic illness in my life. In fact, December 2019 I was in another town taking care of my mother and her subsequent death when I caught someone's cough. Urgent care diagnosed me with pneumonia, fluid in the lungs, put me on course of antibiotics. I couldn't breathe, needed a nebulizer etc. They called me and said it was not pneumonia or flu a or b (I get the shot every year) and to go to the ER if it got worse. I couldn't eat or move much for three weeks and breathing was extremely difficult. I had to get a nebulizer. Eventually went away. Then in March Covid 19 became official. When I tested for Covid 19 here at a state site in 2021, I tested negative.

1204092	4/13/2021	TX	26	M	3/12/2021	4/5/2021	Pfizer COVID-19 Vaccine EUA Patient received Pfizer COVID vaccine on 3/12/2021. Patient presented to outpatient clinic on 4/8/2021 for complaints of leg pain since Monday 4/5/2021. Patient states that Monday he woke up with point tenderness in his left calf which went away after about 2 hours. Tuesday, he woke up the same pain, which is persistent to this point. Patient denies exacerbating or relieving features. Patient denies trauma, no precipitating event and denies history of similar symptoms. Patient has not presented for medical attention for this prior today. Patient had a venous doppler ultrasound which showed a clot in the posterior tibial vein. Patient started on apixaban
1204058	4/13/2021	VA	84	M	3/12/2021	3/26/2021	Patient started having abdominal pain on March 26, 14 days after vaccination. Went to ER on March 29 and was admitted. Diagnosed with blood clot in spleen. Discharged from hospital on March 31.
1204047	4/13/2021	IL	38	F	3/21/2021	4/13/2021	Same day:Tingly arm. Metal taste in mouth. That night: very sore arm. Nausea started and dizzy spell at night. Nausea lasted 2 days 3 weeks after shot: spotting about 6 days before period. Heavy period with clots that came a few days early.
1205012	4/13/2021	IL	35	M	3/23/2021	3/29/2021	Lower leg pain, confirmed clot about 4 inches long via an ultrasound on 4/9
1204222	4/13/2021		24	F	3/31/2021	4/4/2021	THREE DAYS AFTER VACCINATION, MY DAUGHTER STARTED BLEEDING INTENSIVELY THRU HER NOSE. PRESSURE WAS APPLIED BUT HEMORRAGE LASTED FOR 15 MINUTES. AT THE END, A BLOOD CLOT WAS EXPELLED NASALLY.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1205261	4/13/2021	MN	86	F	3/24/2021	3/1/2021	Diarrhea; Vomiting; Weak; Found Slumped Against the Wall; Low Potassium; MRI Found Multiple Small Emboli in Brain; thrown more clots; Aphasia; Difficulty Walking; potassium dropped and she went into A-Fib and threw clots; potassium dropped and she went into A-Fib and threw clots; has problems with recent memories; confusion; food sensitivities; This is a spontaneous report from a contactable physician (patient's daughter). An 86-year-old female patient received her second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date were not provided) at the age of 86-years-old, via an unspecified route of administration on 24Mar2021 at 14:00 at single dose for COVID-19 immunization. Medical history included high blood pressure diagnosed in 1971 (reported as 50 years ago) and ongoing; type 2 diabetes in 2011 (reported as 10 years ago) which resolved in 2019 (about 2 years ago) after the patient lost some weight; she had an episode of A-Fib in 2019 when her potassium was low (lower than the current hospitalization), once the potassium was corrected, her A-Fib resolved. The physician stated that patient has shrunk and was now about 5 foot 2 inches. Clarified that this has not recently occurred since the vaccine; stated it was happening just with age. The patient received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date were not provided), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's concomitant medications were not reported. The patient did not have any issues with the first dose of the vaccine. She received her second vaccine dose on 24Mar2021. The physician spoke with the patient on Friday, 26Mar2021, and the patient was fine. On Saturday, 27Mar2021, the patient had an episode of diarrhea, vomiting and was weak. The lady cleaning the patient's house found her slumped against the wall. The physician met them at the hospital and said the patient seemed okay. They thought it was just an issue from her potassium being low on Mar2021, so they gave her that. The hospital did a CT scan that showed nothing on Mar2021. The hospital did an MRI of the head that showed multiple small emboli in the brain on Mar2021. The physician believed that the patient must have thrown more clots because she became aphasic on Mar2021

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

and could not name things. The patient also had difficulty walking on Mar2021. The physician felt it was important to call and report this since she has heard of people throwing clots with vaccines. The physician did not know if the events were related to the vaccine. The patient was in the hospital for 7 days (as reported). She was now able to walk with some assistance. The patient's son thought that the patient was okay when he went to see her. Since the reporter was a physician, she knew which questions to ask the patient and saw that she still had some problems. The patient could remember some things but has problems with recent memories on an unspecified date in 2021. She also has some confusion on an unspecified date in 2021, such as she thought she was in a boat hospital. The physician was uncertain if the vomiting and diarrhea was somewhat better. They were wondering if the patient has some food sensitivities (2021). The patient also had carotid studies done in the hospital on Mar2021 and they were fine. They believed that patient's potassium dropped, and she went into A-Fib and threw clots on Mar2021. The clots must have come from the heart valves since the carotid studies were fine and if the clots had been in her legs, they would've gone to her lungs not to her brain. The patient underwent lab tests and procedures which included CT scan: negative, potassium: low, carotid studies: fine, MRI of the head: multiple small emboli in brain, all on Mar2021; and potassium: low, height: 5 foot 2 inches (shrunk), and weight: lost, all on an unspecified date. The events diarrhea, vomiting, weakness and fall required emergency room visit. The outcome of the event difficult walking was recovering and unknown for all other events. The events diarrhea, vomiting, weakness, fall, potassium low, cerebral embolism, thrombosis, and "potassium dropped and she went into A-Fib and threw clots" were assessed as serious due to hospitalization and being life threatening; and the events aphasia and gait disturbance were assessed as serious due to hospitalization. All other events were non-serious. The patient was hospitalized from 27Mar2021 until 02Apr2021. Information about the lot/batch number has been requested.

1203969	4/13/2021	NC	22	F	4/8/2021	4/8/2021	- 22 year-old female - Tested positive for COVID-19 on January 31, 2021. My symptoms lasted 21 days and started with major gastrointestinal issues, headache, and cough. - Had a negative COVID-19 PCR test on February 25, 2021 - this negative PCR was needed to travel back. - Landed on February 28, 2021 and completed my quarantine at my parents house. - I returned to work on the 15th of March, 2021. - Over the weekend I traveled and flew back on April 5, 2021. Because I had flown, I was doing a courtesy and went to the local store to get a rapid antigen test. APRIL 8, 2021 - left work at 12:30 and went to the store to get the rapid antigen test which came back positive. I was told by the nurses that it only came back positive because it has been less than 90 days since I initially tested positive. I was told I did not need to self-isolate and could go about as normal. I had my second dose of the Moderna vaccine on this day at 2:00 p.m. I went to get my second jab. Just to be safe, after my jab I went to the local urgent care where they took a nasal swab for a PCR test. The results of the PCR test came back Saturday, April 10 about 7:30 that evening and the result was "NOT DETECTED". SYMPTOMS: Thursday, April 8th about 8:00 pm I started to have difficulty breathing and taking a deep breath was difficult. I put it down to anxiety about the initial positive test. Saturday, the difficulty breathing continued, along with new pressure in my chest. I was unable to sleep Saturday night - as soon as I was nearly sleep, I would wake up gasping for a breath. Sunday, the pressure in my chest continued and so did the difficulty breathing. I went to the Emergency Room on Sunday, April 11 about 4:15 pm - they took a chest x-ray, ran blood tests, and did an EKG which all came back completely normal - no pneumonia, heart attack, or blood clots. The doctor gave me a 1 mg dose of an anti-anxiety medicine because he could tell I was very stressed. He later prescribed me Prednisone (3 tablets a day for 4 days). As of today, I am still having a very hard time taking a full, deep breath and continue to have pressure in my chest.

1203725	4/13/2021	IN		U			10 days after receiving my first Pfizer shot I suffered a stroke that was caused by a blood clot. I was unable to speak for a short time the morning of 4/1/2021 and went to emergency room at. My speech had already returned and I was no longer having symptoms. There were numbers tests and scans run and it was confirmed that I had a stroke that was caused by a blood clot. There were no obvious issue present to why I would have had this happen.
1203666	4/13/2021	CO	52	F	4/4/2021	4/5/2021	Patient developed a severe headache, nausea, and vomiting on 4/5 PM. She continued to have severe headache, improving to a 5 and then worsening to a 10 for several days. She had some chills develop the AM of 4/6, but no fevers, myalgias, rash, or other side effects. She went to ED on 4/9 and was transferred to our facility. Found to have subarachnoid hemorrhage. CT angio without evidence of clot. No clear etiology for bleed per neurosurgery
1203538	4/13/2021	TX	63	F	3/9/2021	3/17/2021	I had a discoloration on my left breast and slight pain underneath my left arm. I had NO redness, NO swelling and NO heat underneath my arm. I had a mammogram and the radiologist asked for an ultrasound. The ultrasound revealed a deep vein thrombosis underneath my left arm.
1203501	4/13/2021	OK	54	M	3/12/2021	4/11/2021	Blood clots in kidney. Currently hospitalized.
1203471	4/13/2021	MA	47	F	2/11/2021	3/20/2021	I had a blood clot in my right leg . It started to bother me on 3/19/21. I called my doctor on 3/22/21 and she advised that I be seen in the ER. The ER doctor confirmed that I had a blood clot in my leg and I was treated with Lovenex. In addition to the clot in my leg, I have multiple bruises on my arms and legs where blood vessels broke in the couple days before and after the ER visit. I also felt very out of shape, with trouble getting enough breath. Within 2 days of getting the Lovenex, I felt like I could breath normally and my symptoms improved. Not sure if it is connected to the vaccine but thought it was important to report. I am an active, otherwise healthy person who walk at least 5 miles daily. The blood clot was very unexpected.

1203462	4/13/2021	CO	66	F	3/21/2021	3/24/2021	On 3/24/21, just three days after receiving my second Pfizer vaccine, I started noticing excruciating pain in my left calf. I managed the pain with Tylenol, but as it continued to get worse and debilitating, I saw my doctor on 3/30/21 who immediately scheduled an ultra sound. On 3/31/21 at 9:00 am, I had the ultra sound and the results were DVT (BLOOD CLOT). SEE DETAILED RESULTS IN ITEM 19.
1203460	4/13/2021	OH	40	M	3/10/2021	3/15/2021	Pt had Covid in November 2020. He was in the hospital and had blood clots in the left leg.
1203447	4/13/2021	OH	23	F	4/8/2021	4/9/2021	Around 2:30pm on 4/9/21 (one day after vaccination) I got a Charlie horse in my right calf. I didn't think much of it. About 20 minutes later when trying to get out of bed I got another Charlie horse in my left calf this time. This one was much more painful and intense. After it let up I laid there for a little longer and tried to get up when my leg calf, again, got another Charlie horse in the same place. This happened a total of 4 times, back to back to back to back. Each Charlie horse I had in my left calf was especially intense and painful, worse than any Charlie horse I'd ever had before. I don't get Charlie horses often, but I have been a lifetime athlete so I'm familiar with the feeling. I had not previously worked out in the days leading up to my vaccine. I'm not even sure this is an adverse effect of the vaccine, I just didn't know if anyone had had a similar reaction and have been made aware that blood clots have also been a concern with the J&J vaccine. I'm also unsure if my Zolof, which has a warning that it may cause dizziness, may have reacted with the vaccine to make me incredibly dizzy. But around 04:00am on 4/9/21 (I work night shift) I became increasingly dizzy making it difficult to perform the tasks at hand. Enough so that I had to sit down and even reading words off a computer screen made me dizzy. I couldn't drive home from work at 07:30am that morning because I was concerned with my dizziness. It had subsided by the time I woke up at 02:00pm later that day.

1203443	4/13/2021	NY	30	F	4/3/2021	4/4/2021	The adverse symptoms I experienced were abnormally severe/heavy menstrual bleeding and abdominal pain. I was on Day 4 of my menstrual cycle on the day of my injection (April 3, 2021). My menstrual cycle usually starts to go away on Day 4 and concludes by Day 7. But the day after my injection, in addition to experiencing the common side effects of fever, chills, aches, and headaches, I also experienced an uptick in bleeding, which included severe/heavy menstrual bleeding with very frequent and large blood clots. That same day (April 4), I started my new birth control cycle as prescribed. By Day 8 (April 7, 2021), my menstrual bleeding continued to be so severe/heavy that I went to my OB-GYN for testing. The OB-GYN ruled out everything but the vaccine as an environmental factor. It was suggested that I take 600mg of Motrin every 6-hours for 48 hours. My menstrual bleeding continued for several more days until concluding on Day 12 (April 11, 2021) but I am still experiencing abdominal pain.
1203430	4/13/2021	CA	52	F	4/2/2021	4/3/2021	Almost immediately (remember noticing the next day after my vaccine shot), a very hard big lump started forming about an inch lower than where the injection needle went in (it was definitely about an inch down from where my band-aid was). The lump got bigger and harder over the last week and seemed to spread out into like a sideways egg shape. My skin there almost looked like a light purple bruise in the shape of a sideways egg. It has gone down now in the last couple of days, but there is still a hard nugget of lump there. It has me concerned like it could be a blood clot or something.
1203392	4/13/2021	ID	48	M	4/6/2021	4/11/2021	Sunday morning, 4/11/21, had severe itching in hands/feet that was improved by deep massage and hot water. Also had hives on flanks that moved up sides. Initially took Benadryl 1 tab twice and then in evening took 2 tabs d/t worsening symptoms. Next day had similar symptoms but hives also on trunk that traveled up to neck and jawline. Denies airway involvement or s/sx of blood clots.

attenuation pericardial effusion is present which is new relative to the comparison examination. Pericardial fluid measures up to 1.7 cm in thickness. No thoracic aortic aneurysm or dissection. No mediastinal mass or lymphadenopathy. Two small enhancing foci are present in the liver, larger 1.8 in length which are similar to the comparison examination. Interval cholecystectomy. Visualized upper abdominal contents are otherwise without significant abnormality. There has been partial resection of the left 5th rib. Osseous structures are otherwise intact. IMPRESSION: 1. No evidence of pulmonary embolism. 2. Pericardial effusion and small bilateral pleural effusions which are new relative to comparison examination. 3. Two small enhancing liver lesions which are not further characterized by this examination but are similar to comparison examination. These could potentially represent hemangiomas. Assessment / Plan a 49 y.o. female with history of hypertension, developmental delay, DVT x1 not currently on anticoagulation, GERD, and anxiety who is being admitted for acute hypoxic respiratory failure, felt likely secondary to fluid overload from cardiomyopathy from pericarditis with associated pericardial effusion. #Acute hypoxic respiratory failure #Elevated Pro BNP #Cardiomegaly #Dyspnea on exertion #Pleuritic chest pain #Elevated D-Dimer Acute. Hemodynamically stable. On room air at home, and requiring 3 L via NC here. Considerations include new onset CHF, PE, PNA, PTX, pericarditis, pericardial effusion. Presentation most concerning for new onset CHF/cardiomyopathy from pericarditis with associated pericardial effusion, as demonstrated on CT angiogram. She has significantly elevated CRP which further supports pericarditis, and onset of symptoms approximately 7 to 10 days after receiving her first COVID-19 vaccine dose 4 weeks ago, which may be associated. Also possible viral or idiopathic. Mildly elevated BNP and pleural effusions suggesting cardiomyopathy. Patient had a fever to 101.4 °F earlier today, per caregiver at bedside, and has had shortness of breath and cough, and thus pulmonary infectious process strongly considered, though clinically I feel infection less likely. She has a chronic leukocytosis and WBC is 21 today. She received ceftriaxone and doxycycline for pneumonia today in the ED, and may

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
							consider continuing these tomorrow. No evidence to suggest tamponade on bedside POCUS. - Admit to PCU with tele - Echo in AM - Ibuprofen 800 mg 3 times daily and colchicine 0.6 mg daily for treatment of pericarditis - Diuresis: 40 mg IV Lasix given at 0037 - Respiratory support as needed, wean as tolerated - RTDP - Incentive spirometry - Consider continuing antibiotics pending clinical status in AM #Leukocytosis Acute. WBC 21.5 on admit, increased from 15.1 two and a half months ago, but that was at end of admission for cholecystitis. Potentially due to inflammation, possibly infectious process. See discussion above. - Trend with CBC #Hypertension Chronic, presumed well controlled. - Continue home hydrochlorothiazide and losartan #Thrombocytosis Acute. Suspect reactive thrombocytosis due to inflammation from pericarditis. - Daily CBC while inpatient #Elevated AST and ALT Acute, mild. Most likely secondary to congestive hepatopathy. Will trend. - AM CMP #Hypoosmolar hyponatremia Acute, mild. Considerations include beer potomania, hypothyroidism, SIADH, low solute diet ("tea and toast"), increased free water intake, medication induced (SSRIs, thiazides). Suspect low solute diet. SIADH from pulmonary pathology is also possible. - Repeat BMP #Anxiety Chronic, presumed stable. - Continue home sertraline Ppx: Lovenox Central Lines/IVs/Tubes/Drains: PIV CODE: Full Dispo: PCU with tele Active Hospital Problems Diagnosis SNOMED CT(R) Date Noted ? <i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1204289	4/13/2021	IN	40	F	3/23/2021	4/5/2021	Woke with nausea, vomiting, climbing fever upto 103, body aches, chills on 4/5/21. Symptoms resolved but felt tired on 4/6/21. Morning of 4/7/21, woke with shortness of breath and chest pain. Negative COVID-19 test. Went to hospital and did a cardiac workup and blood work, CT scan followed that showed several blood clots in lungs. Was given heparin bolus, and continued for an additional day, then switched to Eliquis. Hospitalization duration was 2.5 days.
1204331	4/13/2021	CA	20	M	4/12/2021	4/12/2021	It is now the next day, and I feel significantly better. I have pain at the injection site, some muscle fatigue, a little bit of a depleted appetite, tiredness in my eyes and head (likely due to lack of quality sleep), and a bit of sweating, but my pain has reduced to maybe a 2/10 or 1/10 (i.e., not even uncomfortable). I did end up getting decent sleep between 2 AM and 12 PM with only a few interruptions of family members checking on me. The only notable pain that is worrying me is abnormal soreness in my right wrist that is not the result of overuse, overextension, etc., although I was able to take care of that pain with another 3 Advil pills. I am considering scheduling a doctor's appointment, as I know the J&J vaccine got recalled today for blood clots. My assumption is that because I am a healthy 20-year-old, my immune system overreacted to the vaccine, but I want to check to make sure that it doesn't cause any additional health problems.
1204386	4/13/2021	CO	63	F	3/29/2021	4/4/2021	4/4/21 Swelling below waist, including buttocks, hips, thighs, and knees. Severe itching and pain. 4/7/21 Swelling spread to calves and ankles. Severe pain and itching. PCP prescribed 50 mg Benadryl every 6 hours and was told to go to Urgent Care if symptoms persist. 4/9/21 Went to Urgent Care Clinic due to excruciating pain in legs. Admitted to accompanying ER. Received IV and had blood drawn, showing extremely low platelet levels (37k). Discharged with prescription for antihistamine, steroid, and hydroxyzine HCL. Ultrasound taken but did not show blood clots. 4/11/21 Pain and itching spread to both arms. Extreme pain when standing and walking. 4/13/21 Went to ER. Ultrasound confirmed multiple blood clots. Discharged with prescription for Xarelto.

1204408	4/13/2021	MN	49	F	3/30/2021	4/2/2021	I peed some blood clots for 2 days, it was sporadic, not every time I went to the restroom. My urine turned orange.
1204630	4/13/2021	MN	67	M	3/17/2021	4/5/2021	rt superficial lower extremity thrombosis- redness, tenderness, swelling rt lower extremity.
1204448	4/13/2021	TX	59	F	3/5/2021	3/7/2021	To summarize our conversation, you stated that you received the second Pfizer vaccine on 3/4/21. Three days later, on 3/7/21, you began to have fatigue, shortness of breath, dizziness and chest pressure. Because all symptoms continued for 24 hours, on the evening of 3/8/21, you took yourself to the Emergency Department. Your ER work-up included a CXR (negative), an EKG (showing a left bundle branch block), serum bloodwork (negative for MI), however, the D-dimer and spiral CT were both positive for a pulmonary emboli (i.e. a blood clot in your lungs). You were admitted to the hospital and started on the blood thinner, Eliquis. During your 3-day hospital stay, your work-up also included a bilateral lower extremity Doppler study (negative) and an echocardiogram (showing left ventricular hypertrophy). You were discharged on all of your previously prescribed medications (see list below), except for the fish oil. You were also started on Eliquis. Since discharge, you have followed up with your PCP and have been referred to a cardiologist and pulmonologist. To date, you have had no further symptoms. PAST MEDICAL HISTORY: hypertension, hypercholesterolemia, pre-diabetes. PRE-VACCINE MEDICATIONS: losartan, HCTZ, amlodipine, Welchol, fenofibrate, fish oil. POST-ER VISIT MEDICATIONS: losartan, HCTZ, amlodipine, Welchol, fenofibrate, Eliquis.

1197881	4/12/2021	FL	67	F	3/29/2021	4/1/2021	During the middle of the night on Thursday April 1, 2021 when I was sleeping I woke up with terrible cramping in both calves of my legs and in left foot after receiving my first dose of Pfizer Covid-19 vaccine on Mar. 29 at a pharmacy at 1:53 P.M. I have had cramping in my legs/feet/toes before so this could be totally unrelated. I have Theraworx in my nightstand and put some of it on which helped and they went away. I heard about blood clots possibly associated with other Covid-19 vaccine from another mfg. so just wanted to report this and make sure it is safe for me to get my 2nd dose of Pfizer vaccine on April 19th.
1197898	4/12/2021	OH	45	F	4/8/2021	4/9/2021	Chest heaviness/pain accompanied by fatigue, dizziness, shortness of breath, and nausea. Given the combination of symptoms, I presented to a local emergency room to be evaluated for a heart condition. ER doctor evaluated to rule out heart attack, stroke, and/or blot clot. All tests appeared normal. Symptoms attributed to side effects from vaccination.
1198435	4/12/2021	MI	63	F	4/5/2021	4/6/2021	12 hours after receiving 2nd vaccine (4-5-21) I started throwing up through Tuesday 4-6-21. Then on 4-7-21, my left leg calf was very sore and hard for me to walk, Got worse, so on 4-9-21 went into Urgent care and through a vascular ultra sound determined I had a very Large blood clot in my calf. (ACUTE THROMBOSIS OF THE LEFT PROXIMAL PERONEAL VEIN)
1198041	4/12/2021	PA	50	F	3/25/2021	4/1/2021	Menstrual period began two days after 1st Moderna vaccine with spotting on 3/27/21. One week after vaccine, heavy period began with several fist-size clots the evening of 4/1/21. Today is 4/12/21 and I am still having my period. It has lightened up but not stopped after more than two weeks. My age is 50 and I am in peri-menopause.
1195691	4/12/2021	FL	28	F	2/17/2021	3/1/2021	One month after having my second covid vaccine, I had the worse menstrual cycle of my life. I had heavy bleeding for 4 days and horrible menstrual cramps. So bad that motrin/tylenol did not take away the pain. Also passed a lot of clots. Also after my period, I've had continual bleeding/spotting. I've even gone to the OBGYN to get checked. I'm still bleeding...

1196323	4/12/2021	CO	32	M	3/22/2021	3/28/2021	Patient symptoms of chills, headache, and body aches began on Sunday 3/28, 6 days after vaccination. One day later, on 3/29, patient started experiencing pain in the right armpit, the same shoulder where the vaccine was received. That pain built up until Wednesday 3/31, when the arm was very swollen, purple, and rapidly losing sensation. The patient went to the ER. In the ER, via ultrasound, the patient was diagnosed with deep vein thrombosis of the right subclavian and axillary veins. From 4/1 to 4/2 the patient underwent an interventional radiology procedure, thrombolysis, using tPA directed by catheter to the site of the 12 cm long clot. On 4/2, it was determined that the flow was not restored to the vein, and the radiologist informed the patient that right first rib removal would be necessary. On 4/9, right first rib resection surgery was performed to alleviate pressure on the subclavian vein. Patient is currently recovering on the blood thinner Eliquis. Additional procedures for thromboectomy and angioplasty will follow in approximately two weeks to clear the subclavian and axillary veins.
1196269	4/12/2021	IL	65	M	2/16/2021	3/2/2021	Patient received Pfizer COVID vaccines 1/26/21 and 2/16/21. Developed dyspnea and fatigue 2/2021. Admitted to hospital on 3/2/21 with extensive bilateral acute PE (5 lobes). Right acute occlusive DVT in femoral/popliteal veins and partial thrombosis in the left (age indeterminate) of the femoral and popliteal veins. TTE ok. Started on heparin and transitioned to Eliquis (10 BID x7 days then 5 BID). Normal PSA (0.34)
1196263	4/12/2021	MD	69	M	4/9/2021	4/10/2021	passed blood clot in urine
1196171	4/12/2021	WI	34	M	3/31/2021	4/5/2021	Blood clots (DVT in right leg and three pulmonary embolisms in right lung), symptoms appeared around 4/5/2021 and diagnosed on 4/9 and 4/10. Also started experiencing diarrhea during the same time period. Being treated with Xarelto and Azithromycin.

1196101	4/12/2021	FL	57	M	3/23/2021	4/9/2021	Blood Clot On Friday, April 9th I started with a pain in my ankle around 4PM. It was getting worst and worst. It got red, swollen and I was unable to walk normal, I started limping. Around 2PM on Saturday, April 10th, I went to the ER and I had my ultrasound done. I have a blood clot. They prescribe me Eliquis; 10 mg twice a day for one week and 5 mg twice a day for two to six months...

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1196521	4/12/2021	NY	47	F	4/5/2021	4/5/2021	<p>5 April 2021, at 14:15: Approximately 45 minutes after my initial Moderna vaccine the left side of my face became freezing cold and numb. The progression was instantaneous yet started deep in my inner left ear and around the outside corner of my left eye and instantly moved up to my forehead (crossing the midline), then down the midline of my face encompassing my left eye, the left side of my nose, lips, roof of my mouth, gums, tongue, back over to my left cheek area all the way to my left ear. Simultaneously, I had a surge of metallic-tasting saliva, and I had a tingling vibration (tingling without the pins-and-needles) in both of my hands and on my left shin, just above my ankle to just below my knee. It all happened so fast that I could not talk and verbalize what was happening, I could only hold up my hand in a STOP position. My airway was open and I did not have any respiratory issues. The numbness in my face was about a 9 out of 10. Very numb, very frozen. We went back to the vaccination site and I was put under observation for an additional 15-20 minutes. The observation was 100% hands-off?no BP, no pulse ox, no temperature. I was released with the advice that if I developed any breathing difficulties that I was ?to go to the local emergency room.? 5 April 2021, at 19:00. The numbness receded to about a 5 out of 10. I did not have any respiratory issues, but was able to start noticing other parts of my body that were numb: the entire roof of my mouth; my teeth/gums from the midline-left; when I swallowed I noticed that my throat had no sensation on the left side and felt ?smooth?; both deep, inner ears ached without the any sharp pain. I had a massive headache and took 400mg of ibuprofen and went to bed. 6 April 2021, 09:00. After waking I got out of bed and noticed that my left leg was weak. I thought it was the position that I had been sleeping in, yet it did not?and still has not?gone away. The numbness in my face was still present and that it had extended down onto my lower lips and chin. Most of the left side of my face felt like heavy Silly Puddy, it felt swollen and stiff. The outside corner of my left eye, the left side of my nose, forehead creases and ear were stationary and not moving. My blinking felt off, but didn?t look off. I could now tell that the entire left side of my body was markedly weaker than my right side, my balance was off. I could not feel sensation in my chest/lung cavity as I inhaled and exhaled like I could on</p>

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							<p>my right side. I did not have any airway or breathing difficulties. I rested and hydrated. 6 April 2021, 20:00. A rash of itching, burning hives erupted onto my lower left jaw from just outside my lip line and spread along the curve of my lower jaw bone to my hairline. By 22:00 the itch and burning had subsided, but I could feel that it was still there. 7 April 2021, 02:30. I woke up with excruciating, stabbing ear pain in my right inner ear. I took ibuprofen and tried to fall back to sleep. 7 April 2021, 09:00. My face felt increasingly swollen and stiff and the numb/tingling/vibration sensation in my lower left leg began to spread to my inner leg, around to my calf, up and over my knee to my upper thigh; my leg became so weak that it buckled. We spoke to a nurse advice line and she recommended going to the emergency room. 7 April 2021, 15:00. Dr. saw me. I was given to CT Scan to rule out stroke and an ultrasound to rule out blood clot. I was given the diagnosis of Bell's Palsy and was put on antiviral medication; I declined the steroids because they increase my allergic response reactions. 11 April 2021, 18:00. My face started to swell up over my left eye, left cheek, left ear and over to my right cheek. It did not restrict my airway. I went to bed. 12 April 2021, 17:30. My face?midline to left?is still numb; the left side of my body?especially my left leg?is still markedly weaker than my right; I get winded easily; I tire easily; my mouth still tastes metallic; I still have inner earaches on both sides; my eyes are extremely dry. I am also a yoga instructor. I know my body. I was perfectly able-bodied and healthy at 13:20 on 5 April 2021, 45 minutes later my world unraveled and no one knows how long it will last.</p>

1199475	4/12/2021	WA	33	F	4/2/2021	4/6/2021	I'm not a medical professional, I'm reporting this due to the proximity in which the events occurred. I am a 33 year female with no history or family history of blood clots. I received the 2nd dose of my Pfizer vaccine on Apr 2 and on Apr 5 I began experiencing pain in my right leg. I had not injured it, and by Apr 14 I felt compelled due to the increased pain to contact a medical professional. They ran a d-dimer and mine came back high at 0.89. I was instructed by my PAC to go to the ER and tell them about the elevated d-dimer results. At the ER they performed an ultrasound and confirmed "Acute occlusive deep venous thrombosis in the right calf involving the entire length of 1 peroneal vein.". They also performed a CT scan on my chest and discovered "Right lower lobe distal segmental and subsegmental pulmonary artery emboli". They also performed a series of blood tests, all of those came back fine. I am being treated with 15mg of rivaroxaban (Xeralto).
1198615	4/12/2021	WI	28	F	3/26/2021	4/1/2021	Received Moderna COVID vaccine on 2/26/2021 and 3/26/2021. After initial dose she was fatigued. had also taken Plan B 3/1/2021. Fatigue lasted 1 month. 5-6 days after second dose she developed shortness of breath and chest pain. and 9-10 days later noticed a prominent vein in the leg. Called physician office 4/8/2021 and sent to urgent care then ER, found to have superficial thrombosis in leg and multiple bilateral segmental and subsegmental pulmonary emboli.

1199238	4/12/2021	NC	52	M	3/5/2021	3/29/2021	Approximately three weeks after receiving Johnson & Johnson vaccine, I began to get pains in legs. Calves were aching and throbbing. Didn't think anything of it at first....just thought achy muscles and such. The day before Easter (April 3rd 2021) decided since the pain was continuing and the internet will scare you to death - I went to a local Emergency Room in advance, I had an ultrasound on my left leg and it was noted I had DVT. (blood clot in left calf) To briefly explain: I had an achilles issue back in Nov. 2020 (slight micro tear - achilles tendonitis) I thought maybe this was related to that, as I had not been to the doctor to get it checked until early March 2021. and it bothered me off and on for a few months. I thought the calf pain may have been related to that? I explained to the emergency room doctor about my achilles and thought it was an issue related to that. They decided to perform an ultrasound on my left leg. Which noted the DVT/Blood Clot. They put me on a starter pack of Xarelto and I am to follow up with my normal doctor on April 22, 2021.
1199137	4/12/2021	WI	41	F	4/8/2021	4/9/2021	At the time of the shot I felt the stuff going into my system and all the way down my whole right side all the way down to my right leg. It wasn't painful or anything I was just aware that something was just injected into my body. About an hour after my injection I had a pain go into my hand a few times and I had to keep moving it around to make it go away which it did. That night had neck pain. That night I woke up to a pain in my right calf muscle and I thought I was going to get a Charlie horse so I got up and walked it off. It never got as bad as a Charlie horse. So I went to sleep and not much longer I woke up to the same thing in my left calf muscle. So I got up and walked around. Next morning Same thing happened. So I called the place I got the shot and they suggested taking magnesium pills and electrolytes as well as did my Dr Office. So I did that. Two days later I was feeling a pain in my left back shoulder blade. It eventually went away. I was worried about blood clots, but idk what caused this? Had diarrhea for a few days. And sweats the next morning. I?m day 5 into the first shot of Pfizer right now. I?m worried if I should get the second shot because of the leg cramping.

1199088	4/12/2021	IN	45	F	2/13/2021	2/18/2021	My last period prior to my first vaccine shot had been in June 2020. All signs, including blood work, pointed to me having entered menopause. My mom also went through menopause at age 45 when her periods suddenly stopped, so I figured I was following in her footsteps. On Saturday, February 13, 2021, I received my first dose of the Moderna vaccine, and by Thursday morning, I was spotting. This was very surprising since I had not had a period in several months. Over the course of a couple of days, it turned into a full-blown period with the most severe cramping I've ever had in my life. By Saturday, they felt like labor contractions, and I was releasing sizable blood clots. I made an appointment at our health clinic, and all bloodwork again pointed to menopause. After my 2nd Moderna vaccine, I again experienced just a tiny bit of brown spotting a few days after the vaccine. However, it did not progress into a full-blown period that time.
1198895	4/12/2021	CO	58	F	3/6/2021	3/18/2021	I was given my first Covid vaccine on 3/6/21. About 12 days later I started having some difficulty breathing, pounding heart and some dizziness. My symptoms got worse one the next week and a half. I went to an emergency room on 3/28/21 and was admitted to an ICU with a Saddle Embolus of Pulmonary Artery with Acute Cor Pulmonale. Many blood clots in my lungs and one very large one in the artery between my heart and lungs. I am now on Blood Thinners.
1198759	4/12/2021	CA	38	F	3/26/2021	3/31/2021	Sever headache and nausea 24 hours after shot. Then 5 days after shot sever abdominal pains on the right side. Was hospitalized and they found a blood clot in a vein leading from my ovary on the ride side. Treatment was Eliquis and further testing.
1198698	4/12/2021	IA	66	M	3/20/2021	3/28/2021	Patient received his first Pfizer shot on March 20th. He began to have pain in the back of his right knee which sent him to the ED. Upon further investigation, he was found to have a blood clot and was given Eliquis as a blood thinner. His physician requested that he make a report as he received his first COVID shot 8 days prior to the blood clot. He denies any diabetes, chemotherapy that may have irritated his vessels. Gabapentin,

1194958	4/11/2021	CA	62	F	1/27/2021	1/29/2021	2 days after i received the vaccine had difficulty breathing shortness of breath and on 5 and 6 days also then had chills hand tremors loss of appetite nausea this continued for 2 more months. I went to Urgent care and on March 26 then found a clot in my right lung. I am on warfin now and none of these symptoms did I have prior to the vaccine. I had 5 covid tests to see if I had COVID but all the tests were negative.
1194716	4/11/2021	NM	47	F	3/25/2021	4/9/2021	Abnormal menses. Huge clots. Velocity and volume of blood extreme. (Different from previous experiences of menorrhagia). The only other time I experienced this type of dramatic and concerning bleeding was after I took the Hepatitis vaccine (first shot) about 2 years ago. I think that's the only other vaccine I've had as an adult. There is mention of heavy bleeding as a rare side effect for Hepatitis vaccine, and I surely hope you will study this effect from Covid vaccine as it took nearly a year to regulate my cycle after the Hepatitis vaccine reaction. I've seen some reports suggesting that the excessive bleeding that women are experiencing after the Covid vaccine is due to stress and that is just plain insulting. Stress does affect the menstrual cycle; that is well-known, but this is something entirely different. I have also had small clots in the nose during the past several days, which again, is highly abnormal for me. Thank you for looking into the bleeding side effects that hundreds (if not more) women are struggling with at this time.
1194661	4/11/2021	WA	27	F	3/21/2021	3/21/2021	had headache rest of the day, mild and tolerable, most of thursday had headache and body aches was able to work. Friday I felt better friday night I started to get a headache again this time only on my right side, with lots of pressure. Saturday I had pressure and dull headache all day, I took Tylenol and Ibuprofen with no relief. Sunday I went to urgent care the headache was much worse now on the left side of my head, urgent care misdiagnosed me as having a sinus infection. Early monday morning I work up to a hard pulsing pain in my head, went to the ER where they found I had two blood clots in my brain (acute cerebral sinus thrombosis), one significant one obstructing blood flow and one much smaller one.

1192803	4/11/2021	IL	61	F	3/24/2021	3/29/2021	I experienced a slight headache sore arm and elevated blood pressure after the shot. My blood pressure is usually very well controlled. On Monday the 29th, at about 3:30 pm, I started to slur my words. At first we blamed it on the Novocaine earlier in the day, but I had been talking fine after it and had had it many, many times before and it was worn off. We called my doctor's office after my right arm and leg became very heavy and awkward. They told me to go to the nearest hospital. When I got there, I presented as a full stroke. I was very hard to understand and my mouth drooped and I had very little use of my right arm and leg. They ran tests, but could not give me the medication because I was already on Eliquis. They thought they saw a small clot very high up. I was hospitalized over the next four days and improved my speech dramatically after a bad headache on March 30. The doctors go back and forth to whether it was a Acute Ischemic Stroke, which is what my paperwork says and a complex migraine. I do not experience migraines or anything like this ever before. I did not have a real headache on the 29th. Since my symptoms, right arm and leg difficulties are still here, my Doctor believes it was a stroke. I have an appointment with a Neurologist and I have to have another MRI. I am going to Physical Therapy. My Doctor told me to fill this out, she thinks it may be from the vaccine.

1193466	4/11/2021	SC	32	F	4/7/2021	4/8/2021	On 4/8 the expected flu like symptoms began. On 4/9 around 10am my back and chest hurt. Around 12pm on 4/8 I had severe nerve like pain in my neck, back, chest that was radiating throughout my arms and body. I went to the ER they did an EKG, X-ray, blood test, contrasted CT scan to rule out blood clots. My blood pressure and pulse and respiratory were all high. I was given morphine, toradol and a steroid through IV to control the pain. The pain caused me to feel immobile due to the more I moved the more it hurt. I was discharged after no life threatening issues were found even still with an elevated bp and pulse. The doctor did say he was concerned of the pain radiating but was unable to state from what. I was sent home with morphine pills (which I have no taken any as we are in a large opioid pandemic as well and I am a clinical therapist). I could not sleep when I returned home. I had to sit straight up. I took Tylenol and it relieved the pain slightly. On 4/10 I attempted a car ride to get out of the house. Shortly after leaving my house my face became bright red, I couldn't breathe well, I felt extremely hot and the pain was no radiating down my legs. I went to the pharmacy that gave me the shot as they have a clinic. My bp was 147/97 with a pulse of 116 and a fever now of 101.4 ( I havent had the fever until this point). They advised me to go back to the ER. Upon arriving to the ER for the second time in two days. Same test were given besides the CT. I was given toradol by IV and saline again. The pain continues to radiate though my body. I can barely move. Again it is not muscle pain but nerve pain! I can barely move my neck or legs. The hospital discharged me again as administer a Covid test. The rapid was negative. These are symptoms from the shot there is no coincidence. My wbc was 7.2 on 4/9 but 17.1 on 4/10
1195472	4/11/2021	TN	67	F	3/4/2021	4/6/2021	Rectal bleeding 2 days after receiving 2nd shot in arm on 1 April 2021. . Rectal bleeding only occurred after bowel movements that were loose. Experienced some diarrhea 2-3 days and rectal bleeding continued until 9 April before slacking up. Blood in stools, watery and dark red. Upon tissue wiping, observed stringy, dark red blood, clot like discharge. Some stomach cramping 2-3 days after 1 April. Felt some slight fatigue and sleepy.

1191824	4/10/2021	MI	78	F	3/11/2021	3/12/2021	<p>it began working up her arm with arm pain and chest pain which persisted and she went to the hospital and was admitted for 23 hours; it began working up her arm with arm pain and chest pain which persisted and she went to the hospital and was admitted for 23 hours; blood pressure went up to 198/203; still has tiredness; difficulty swallowing like her throat is still tight; difficulty swallowing like her throat is still tight; short of breath; This is a spontaneous report received from a contactable consumer (patient). A 78-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Lot Number: EN6205), first dose via an unspecified route of administration, administered in Arm Right on 11Mar2021 11:00, single dose for covid-19 immunisation. Medical history included silent heart attack, ongoing Barrett's oesophagus from 2008, fall she had over two months (2021), eye surgery on an unknown date. She does not get any shots and can't have shots even for the flu shot because she had problems with two flu shots she had; states she had a problem with each one of the flu shots and does not know the names of the flu shots and has no lot numbers to provide for them; states she had the flu shots in the early 1990's and worked in healthcare and had to have them and they told her back then if she wanted to work she had to have the flu shots and then she got sick with both of the flu shots and they said they guessed they would not force her to have the flu shots. The patient's concomitant medications were not reported. Patient had the first dose administered and then about 14 hours after (12Mar2021) that she had no problems until it began working up her arm with arm pain and chest pain which persisted and she went to the hospital and was admitted for 23 hours. She does not know what to do about getting the 2nd dose of the vaccine and was at her cardiologist's this week and he said he is not familiar with the Pfizer vaccine causing chest pain; caller states she has a history of silent heart attacks. She still has tiredness and difficulty swallowing like her throat is still tight and they told her to mention if she does go for the second dose of the vaccine to mention that she had this situation. The chest pain and arm pain began 12Mar2021 and the arm pain is in her right arm where the vaccine was administered and the arm pain and chest pain have resolved; states the arm pain and chest pain stopped and she thinks that lasted</p>

---

about an hour and a half and she called a family member to take her to the hospital; states about 2:30am that same day she was admitted the morning of 12Mar2021 and was discharged on 13Mar2021. They ran every test known to the patient and for a while her blood pressure went up to 198/203 in the emergency room (12Mar2021) and she is not on any medication; caller states she does have Crestor but has not started on it and has not taken it yet. The tiredness and difficulty swallowing like her throat is still tight began the same time she was having the chest pain and she is not having any chest pain or anything like that right now but the tiredness and difficulty swallowing like her throat is still tight is still ongoing; states she did go get cardiac clearance to make sure which was this past week and she does not feel well and like for her the tiredness is bugging her. The tiredness and difficulty swallowing are better but she knows they are there and she tries to swallow something and is like boy her throat is still tight. They did an ultrasound in her left leg because she was limping from a fall she had over two months ago but still has a sore ankle from that and they sent her down for the ultrasound and a CT looking for blood clots in her lungs because she was short of breath (12Mar2021); caller states she thinks they were running everything they could to rule out things; states everything was negative for the CT and ultrasound and she believes the CT and ultrasound were done on 12Mar2021. She has no idea when she was diagnosed with silent heart attacks but they kept asking her about this when she went in for eye surgery and asked her when she had a heart attack and she said she had never had one and they said yes she had and she never knew. She just set up a HCP appointment after the reported events with a gastroenterologist because she has Barrett's and because of the esophagus she did not know if it flared up by the Pfizer vaccine and that caused the pain because the two pains of the heart and esophagus mimic each other with pain going up into the jaw so they were ruling out which one it was; states she went out as an atypical chest pain and called the cardiologist and went in and went over her records from the hospital with the cardiologist. She does not know what caused what in terms of the pain. The outcome of the event blood pressure increased was unknown, chest pain and pain in arm was recovered, other events was recovering.

1191776	4/10/2021	FL	84	F	2/19/2021	2/19/2021	ringing in her ears; Blood pressure went up; This is a spontaneous report from a contactable consumer (patient). An 84-year-old female patient received her second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date were unknown) at the age of 84-years-old, via an unspecified route of administration on 19Feb2021 at 11:30 at single dose for COVID-19 immunization. Medical history included high blood pressure diagnosed 3-5 years ago and ongoing and blood clots (reported as blood thinner) from an unspecified date and ongoing. Concomitant medications included rivaroxaban (XARELTO) from 2020 and ongoing as blood thinner, metoprolol from 2018 and ongoing for high blood pressure, amiodarone from 2020 and ongoing for high blood pressure, and ongoing normal supplement. The patient received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL9263) at the age of 84-years-old, via an unspecified route of administration in left arm on 22Jan2021 at single dose for COVID-19 immunization. On 19Feb2021 at 15:30, four hours after the second dose of the COVID vaccine, the patient started having ringing in her ears and it has not gone away. It was like a truck in her head, she felt like she was losing her mind, it was driving her insane. She could not live like this; it was the worst thing in the world. Her blood pressure went up. She went to the ER for the ringing in ears and had to stay for 2 days at the hospital because they saw a blip on her EKG and it turned out to be nothing. She was hospitalized from 19Feb2021 to 21Feb2021. She has seen 3 doctors. One of them recommend a stress test which was done on 2021 and it was ok. She went to the doctor's office and they thought she had fluid, but it was not there; the neurologist said there was nothing they could do. With regards to treatment for ringing in hears, first, she stated nothing, she did not know what to do. She has gone to 3 doctors and one of them prescribed prednisone but that did not help. She had to take an MRI yesterday (25Mar2021) because they wanted to make sure her brain was okay, and it was all normal. The outcome of the event ear ringing was not recovered and unknown for all other events. Information on the lot/batch number has been requested.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1191609	4/10/2021	OH	42	M	2/6/2021	3/7/2021	Approximately one week after my second dose my right leg began swelling. For three weeks after the swelling began it would get better than get worse. On Tuesday, March 30, 2021 my entire leg swelled to twice its normal size at which time I went to the emergency room and a blood clot was diagnosed in my right leg. I completed a multitude of tests and bloodwork with a hematologist and there are no factors or reasons they can identify as to why I developed a blood clot.
1191351	4/10/2021	IN	45	F	4/5/2021	4/9/2021	I reported previously that the day of the shot (that evening at close to midnight) I fainted. I woke up on my bathroom floor. I walked down my hall and saw black dots and felt dizzy with nausea. The next thing I knew I was on the bathroom floor and didn't remember how I had gotten there. It is Friday and I now am experiencing shooting pains in the side of my head. I also have been experiencing pains in my calf muscles and some chest pains. I am still extremely tired and having abdominal pain. I have contacted my doctor's office about the fainting but I am going to call Monday to get an appointment to get checked out. I am concerned about possible blood clots.
1191213	4/10/2021	PA	49	M	4/8/2021	4/8/2021	systemic reaction followed by deep vein thrombosis
1191129	4/10/2021	TN	60	M	3/18/2021	3/30/2021	The night after my first vaccine, I awoke at about 3:45AM with extreme aches and pains all over my body for about 4 hours, then I was okay. Twelve days later, I tried to go for a short walk with my wife and the pain in my left leg was horrible at times. The calf muscle was swollen and pink and very warm to the touch. Also my toes were kind of purple and my ankles were badly swollen. I thought the toes and ankles might be related to my Bradycardia, but the calf muscle sent us to the ER to be checked for a blood clot. They did check the major arteries, as those are the dangerous ones, but did not check the calf as they said if one was there it wouldn't throw to the lungs or heart. I was discharged. The swelling went down in the calf. Still some aches in the back of both legs now when I walk very far - but really not bad. Having the purple toes and a possible blood clot... my daughter who is a nurse encouraged me to submit this information. Thank you.

1190993	4/10/2021	AL		M	2/6/2021	2/1/2021	blood clots in his lungs; Lot of pain in his left side; This is a spontaneous report from a contactable consumer. A male patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), dose 2 via an unspecified route of administration on 06Feb2021 as single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient previously took bnt162b2 for COVID-19 immunisation and had lot of pain in his left side (1 st dose-During period (first part of Jan and part of Feb) he was bedridden). It was reported that caller received the first dose of the Pfizer-BioNtech Covid-19 vaccine on 16Jan2021, in the hospital. On 06Feb2021 he received the second dose of the vaccine. Twelve days later he was diagnosed with multiple blood clots in his lungs, from Feb2021 he was hospitalized, he was prescribed to take Eliquis (Apixaban; blood thinner) 5mg tablets for 6 months. During that period (first part of Jan and part of Feb) he was bedridden because he had a lot of pain in his left side and it would not let him get out of bed, so he was on bed for a while. His primary care doctor told him that the clots might have appeared in his leg and went to his lung. Caller would like to know if any participant developed blood clots during the clinical trials of the vaccine. Therapeutic measures were taken as a result of blood clots in his lungs. The outcome of events was unknown. Information on the lot/batch number has been requested.

1190964	4/10/2021	TX	72	F	3/9/2021	3/13/2021	the problem was a bloodclot; slight swelling of right foot; This is a spontaneous report from a contactable consumer, the patient. A 72-years-old non-pregnant female patient received the first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration in the left arm on 09Mar2021 13:30 (Batch/Lot number was not reported) as single dose for COVID-19 immunisation. Medical history included diabetes, high blood pressure and allergy to tape. Concomitant medications included levothyroxine; olmesartan; metformin; all were taken for an unspecified indication, start and stop date were not reported. The patient did not receive any other vaccine within four weeks prior to BNT162b2. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. On 13Mar2021 15:00, the patient noticed slight swelling of right foot and on 14Mar2021, the swelling increased so the patient texted the nurse who arranged appointment. The nurse said to contact the doctor and the patient spoke with registered nurse (RN) on duty who told the patient to go to the emergency room (ER) because the symptoms indicated the problem was a blood clot. The ER doctor examined and ordered an ultrasound and the results confirmed blood clot. The patient was given a prescription for blood thinner to take for 21 days (times/day, 15mg) and was told to make an appointment with the primary doctor. The patient's doctor was on spring break and she was walked in to see another doctor who said swelling looked improved and showed her where the clots were located. The patient saw her primary doctor today and she ordered a visit with a hematologist as soon as possible (ASAP) because of concerns about possible underlying issues. The outcome of events, slight swelling of right foot and the problem was a blood clot was recovering. The lot number for the vaccine, BNT162b2, was not provided and will be requested during follow up.

A 69-year-old female patient (patient was not pregnant at the time of vaccination) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot number: EN3248, Expiry date: unknown) via an unspecified route of administration, administered in left arm on 16Feb2021, 15:30 PM at a single dose for covid-19 immunisation (age at vaccination was 69 years). Medical history included blood pressure and thyroid. Concomitant medication patient received within 2 weeks of vaccination included levothyroxine, valsartan, furosemide, acetaminophen. No other vaccine was received within 4 weeks prior to the COVID vaccine. On 16Feb2021, 3 hours after the patient received the vaccination at 18:30 the patient's left leg from the knee down started to swell, got really hard and became very painful. She could hardly walk and afterwards the pain was so intense that she went to the doctor. Doctor took X-rays of her left leg on 16Feb2021, then he diagnosed her with blood clots. He gave the patient 2 heparin shots and immediately sent her to the hospital for a deep vein ultrasound on 16Feb2021. The results showed blood clot in the leg. The patient was prescribed medication and sent home. Her leg continued to be rock hard and painful. On 02Mar2021, the patient was sent for a blood panel work up. There was no improvement. On 08Mar2021, the doctor sent her for a lung CT scan. On the same evening, the patient was called to the doctor's office and was sent to ER immediately as the results showed blood clot in the lung. The patient's dose of Eliquis was doubled. This has now been going for 5 weeks, the patient had not been without pain during this time. Her left leg hardness had gone down a little but was still twice the size of her right leg, knee was huge. The swelling never goes down, not even at night. No covid prior vaccination and no covid tested post vaccination was reported. This case was reported as serious. The outcome of all the events was not recovered. No follow-</p>

1189595	4/10/2021	FL	42	F	3/27/2021	3/27/2021	Vaginal bleeding and cramping similar to menstruation the same night as second dose was administered. Last menstrual cycle was on 11/06/2020. No period since then (due to birth control). On 03/27/2021 I started bleeding and thought how weird after all this time of not having it. The flow is light throughout the day but when go urinate there are little blood clots almost every time. The cramps are sporadic and the bleeding is going on 2nd full week without no break in between as of this date.

1189625	4/10/2021		73	M	2/1/2020	1/1/2021	<p>Deep vein thrombosis; This spontaneous case was reported by an other health care professional (subsequently medically confirmed) and describes the occurrence of DEEP VEIN THROMBOSIS (Deep vein thrombosis) in a 73-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. Co-suspect product included non-company product IBRUTINIB (IMBRUVICA) tablet for CLL. The patient's past medical history included Blood immunoglobulin G (low levels from past 20 years). Concurrent medical conditions included Chronic lymphocytic leukemia, Depression, Drug allergy (allergic reaction to Rituxan.) and Glaucoma. Concomitant products included FLUOXETINE HYDROCHLORIDE (PROZAC) for an unknown indication. In February 2020, the patient started IBRUTINIB (IMBRUVICA) (unknown route) 420 milligram once a day. On 20-Dec-2020, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 08-Jan-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. In January 2021, the patient experienced DEEP VEIN THROMBOSIS (Deep vein thrombosis) (seriousness criterion medically significant). At the time of the report, DEEP VEIN THROMBOSIS (Deep vein thrombosis) had not resolved. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): In January 2021, SARS-CoV-2 antibody test (610-1600): 347 (Negative) 347. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Other history included: no alcohol use, no drug abuse, non smoker Treatment information were not provided. Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. However, the patient's past medical history of CLL and drug IBRUTINIB can contribute to this event. further information has been requested Reporter did not allow further contact; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. However, the patient's past medical history of CLL and drug IBRUTINIB can contribute to this event. further</p>

1192114	4/10/2021	IA	52	F	3/31/2021	3/31/2021	got extremely weak, very weak in the shower and didn't know if she will be able to keep standing up; chest pain in my right side; my left leg started aching; my toes tingle like they have fallen asleep on that left side; heart was beating faster than what it should have been, they said she was tachycardic and her heart was racing; heart was beating faster than what it should have been, they said she was tachycardic and her heart was racing; Redness; back was all red, really red; The initial case was missing the following minimum criteria: unspecified product. Upon receipt of follow-up information on 01Apr2021, this case now contains all required information to be considered valid. This is a spontaneous report from a contactable consumer reporting for herself. This 52 years old female patient received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot EP7533) on 31Mar2021 at 09:30, for COVID-19 immunisation. Medical history and concomitant medications were not reported. The patient received the vaccine on 31Mar2021 at 9:30 and was fine all day until 7 o'clock at night. She went to take her shower and got extremely weak, very weak in the shower and didn't know if she will be able to keep standing up, so she got out of the shower, went upstairs; the weakness persisted and then she started feeling chest pain in her right side, her left leg started aching and her toes tingled like they had fallen asleep on that left side so she got scared and went to the emergency room where they kept her overnight. Her heart was beating faster than what it should have been, they said she was tachycardic and her heart was racing and that was why they kept her at the hospital. She also had redness, her back was all red, really red. They did lots of lab work and blood work, a stress test, an ultrasound on her left leg for blood clot and a CAT scan on her heart, all with unknown results. When probed about hospitalization, she stated to stay overnight. She was hospitalized on 31May2021 at about 19:30 and did not get out until 13:30 on 01Apr2021. Events outcome was unknown.

1191916	4/10/2021			F			<p>she had developed what she believes is a blood clot in her leg; This is a spontaneous report from a contactable other healthcare professional (nurse) via medical information team. The contactable consumer reported for her mother that a 77-year-old female patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, formulation: solution for injection) intramuscularly on an unspecified date as single dose for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient previously took her first dose of bnt162b2, on an unspecified date for covid-19 immunisation. The patient's mother received the second dose of the covid vaccine yesterday morning. When the caller saw her mother last night, she had developed what she believes is a blood clot in her leg on an unknown date. The reporter would like to know whether a blood clot is a possible side effect from the covid vaccine. The patient did not receive any type of treatment for the adverse event. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported event of Thrombosis leg due to temporal relationship. However, the reported event may possibly represent intercurrent medical condition in this elderly patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including venous doppler of lower extremities and coagulation panel, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p>

1191906	4/10/2021			U	2/3/2021		<p>after the 2nd shot, my platelets were lower to 369 which was normal for me; This is a spontaneous report received from a contactable (reporting for self). A patient of unspecified age and gender received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VAC-CINE, Formulation: Solution for injection, lot number and Expiration date was not reported) via an unspecified route of administration on 03Feb2021 as single dose for COVID-19 immunization. Medical history included polycythaemia vera, essential thrombocythaemia. The historical vaccine included first dose of BNT162B2 received on Jan2021 for COVID-19 immunization. The patient's concomitant medications were not reported. The patient previously took jakafi for polycythaemia vera and experienced skin lesion. It was reported that patient received her/his two BNT162B2 Covid 19 vaccine back in Jan2021 and 03Feb2021. After her/his 2nd shot of BNT162B2, her/his platelet dropped down around 400. Patient was using medication Jakafi up until Dec2020. But patient had skin lesions and he/she dropped it. So, at the time patient received the vaccines, he/she was not on any medication. Patient was asking that can you look into if BNT162B2 or similar medication can possibly be produced to drop down the platelet level and hemoglobin for the patients who have Polycythemia Vera and Essential Thrombocythemia. Patient wrote to Pfizer because the BNT162B2 could be a way to find a medication for Polycythemia Vera and Essential Thrombosis. Because right after the 2nd shot, "my platelets were lower to 369 which was normal for me". Patients platelets were over 1000 when he/she started the Jakafi medication. It did drop to 500-600 but not lower than that. Patient not sure if it was the vaccine that helped to lower platelet but, patient was trying to see if it can be studied to find a medication for the referenced diseases. The outcome of the event was unknown. No follow-up attempts are needed. No further information is expected.</p>

1191777	4/10/2021	NY	69	F	3/26/2021	3/26/2021	Weight: Gained 25lbs; Arm is slightly tender; arm might get a little stiff; excruciating leg cramping going from her buttock down behind her knee and rolling to the inside of her thigh/the same pain occurred on the opposite leg around noon and lasted for 15 minutes; excruciating leg cramping going from her buttock down behind her knee and rolling to the inside of her thigh/the same pain occurred on the opposite leg around noon and lasted for 15 minutes; the inside of her thighs were a little red on the side, both legs from her thighs to her knees; the shot is already fogging her mind; This is a spontaneous report from a contactable consumer (patient). A 69-year-old female patient received the first dose of NT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), via an unspecified route of administration, administered in left arm on 26Mar2021 08:30 (Lot Number: ER8727; Expiration Date: 31Jul2021, at age of 69 years old) at a single dose for covid-19 immunization. Medical history included allergies: Penicillin, Ampicillin, hair color product. The patient's concomitant medications were not reported. She was allergic to Penicillin, and Ampicillin. As a child, always reacted strongly to any vaccination she was given with a fever and flu like symptoms for a couple of days. With Ampicillin, she thought she was having a heart attack. Was told to stop Ampicillin immediately because she could get a heart attack. This was when she was 25 years old and she never went to the ER. She was allergic to a hair color product in the 1990s and it made her scalp itch really badly. Was given a cortisone shot, which she reacted immediately breaking out head to toe in hives. Has no NDC/LOT/EXP for the vaccinations she reacted strongly to as a child. Stated this was in the 1950s or early 1960s. Clarified she did not have a heart attack with Ampicillin, but it felt like she was having one. Has had cardiograms per her request and her heart and heart walls are perfect. The patient received the first dose of the Covid vaccine at 8:30 a.m. this morning on 26Mar2021. Caller reports around 11 a.m., she experienced excruciating leg cramping going from her buttock down behind her knee and rolling to the inside of her thigh, states that the pain lasted 15 minutes. The patient reports the same pain occurred on the opposite leg around noon and lasted for 15 minutes, states that "the pain was so excruciating that she could barely stand up and it was so agonizing it was

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

unbelievable." The patient noticed that the inside of her thighs were a little red on the side, both legs from her thighs to her knees. The patient states that she has not been in the sun, and didn't think it was anything alarming, but this is abnormal for her, states that she received the vaccine in the right arm and her upper torso is fine and her head is clear, asked if anyone else had reported this reaction. She was planned to received the second dose on 16thApr in the early afternoon. The patient stated the COVID shot was already fogging her mind. The patient felt pretty good after first shot. Felt nothing. Fifteen minutes before leaving the diner she got a leg cramp. Was sitting in a booth and didn't think much of it. Attributed it to the way she was sitting. Around 11AM when she got back to her garage, she was in agony. It hurt from the top of her rear all the way down the side to the back of her knee and rolled to the inside of her thigh. She was in such agony and didn't know if she could get out of her chair and walk. By the time she reached her apartment it has subsided. An hour later, same thing happened in the left leg. She was laying in bed and texting because she didn't know if she would get any other reaction. This leg cramp was even worse. She was in tears. Got off bed to try and walk it off. Initial leg cramp happened in right leg. Was excruciating. Both times it lasted for 15 minutes. Both cramps were from her buttocks, all down to her knees, and rolled over into her thigh. Didn't know if that was a reaction. It is not typical of anything written on Pfizer's information or that she had heard. She was concerned. Heard about blood clots, but not with this particular product. Stated second leg cramp subsided. If it hadn't, she wouldn't have gone to the ER. Leg cramps was so excruciating. Originally thought it was coincidental and stated she will be 70 on (Date withheld). To say she has never had leg cramps before would be a lie. The way the leg cramps were timed was kind of weird. It was absolutely the same kind of cramp and location just on the a different leg. Weight: Gained 25lbs. Doesn't have COVID or any symptoms. Tested three to four months ago and was negative. Received first dose COVID-19 Vaccine today, 26Mar2021, at 08:30AM. First leg cramp began 11:00AM in right leg. Second leg cramp began Noon in left leg. Each time lasted 15 minutes. Not having leg cramps right now. Could barely talk when having leg cramps. Was worried about getting clots in

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1191897	4/10/2021	PA		F			<p>legs. Otherwise she would think it was because she was getting older. She doesn't get leg cramps very often. Doesn't know when the last time she had leg cramps prior to today. Nurse technician at vaccine faculty stated caller's allergy history wouldn't be a problem and she only had to sit for 15 minutes. Received the COVID-19 Vaccine and hardly felt it. Waited for 15 minutes. She was fine until 11AM. She was fine now, but her arm might get a little stiff tomorrow. Arm was slightly tender. Surprised she felt something in her legs. Doesn't know whether to associate it with COVID-19 Vaccine or not. Has nothing to complain about in the upper torso or from the waist up. Wants to know if this is a reaction or coincidence. Stated she expected to have a stiff arm. The outcome of the event "Cramps in legs" and "pain" was recovered on 26Mar2021. The outcome of other events was unknown.</p> <p>blood clot on the lungs; This is a spontaneous report from a Pfizer sponsored program. Received from a contactable consumer. A female patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that the patient already got the 1st dose of the vaccine and have a 2nd dose schedule tomorrow. They wanted to reschedule the 2nd dose because the patient was in the hospital and might have a blood clot on the lungs. Treatment was received. The outcome of the event was unknown. Information on the batch/lot number has been requested.</p>

1185007	4/9/2021	NY	56	F	4/8/2021	4/8/2021	At the evening first veins started to bulge ( on the left arm), than they moved to the Lt neck, Lt and Rt breast and by the morning i had it on Bilateral popliteal fossas ( behind both knees). I called to Moderna and they said they do not know what to do with it. It looks like vein blockage and thrombosis
1184977	4/9/2021	WI	68	M	3/8/2021	3/14/2021	3/14/2021 Tightness in chest, attributed to physical work outside, 3/15 still felt tightness, 3/16 getting winded and went to the ER around 5:30pm, they took blood and ran test EKG, X-ray and ECHO complete with TTCV, ultrasound of chest, and test showed multiple blood clots in both lungs; by this time he was having trouble breathing and was admitted because of the blood clots. He was given Heparin and Vicodin through IV, on 3/17 they ran more test to see where blood clots came from and where they came from but nothing was found in legs. he was in a lot of pain Wednesday and he was sent home on 3/19.
1184709	4/9/2021	NY	43	F	3/12/2021	4/6/2021	Blood clot greater saphenous vein. Diagnosed 4/6/21
1187427	4/9/2021	GA	51	F	3/11/2021	3/15/2021	Chest heaviness and Extremely bad leg pain; lower leg (calves) hurt the worse. I have been feeling the pain since Monday, March 15. I went to the Urgent Care on March 16; I was sent to the ER where I stayed overnight. They ruled out heart related issues and blood clots. I had a follow up appointment on March 26; he said that he had seen patients who experienced the same, and it was due to the vaccine. Unlike them, my pain remained. He thinks that the vaccine triggered something else in me. After his appointment, I saw my orthopedist who prescribed meds to help with leg pain. If pain is not better in a month, then he will order a MRI. I saw my rheumatologist Monday, April 5. She is going to work with my orthopedists to treat me. Currently, I am doing the exercises that were prescribed for me to do at home, and I am on pain meds.

----------	-------	-------	---------	-----	----------	------------	--------------

unspecified date with outcome of unknown, 10 mg 3 times a day wasn't enough (therapeutic product effect incomplete), on an unspecified date with outcome of unknown, he'd switch and do a couple doses of 15 mg and it was better but not enough (intentional product use issue) on an unspecified date with outcome of unknown, after he received the COVID vaccine, he experienced a bad reaction (unspecified) on an unspecified date with outcome of unknown. The events were reported as serious as involved hospitalization. The patient passed away on an unspecified date in Feb2021. It was not reported if an autopsy was performed. The clinical course of the events included the following information. On 21Sep2020, a spontaneous report was received from a consumer, via a company representative, regarding a 74-year-old male who was being treated with FIRDAPSE 10 MG (amifampridine). On 22Sep2020, additional information was received from a consumer. On 02Oct2020, additional information was received from a consumer and chemotherapy was added as a co-suspect. On 01Feb2021, additional information was received from a consumer via a company representative. On 09Feb2021, additional information was received from a consumer, and this case was determined to be the master case for cases 2021CAT00039 and 2021CAT00052 (both invalid, duplicate cases) and the information was merged into this case (2020CAT00505). This case was re-assessed as serious/unexpected, and COVID vaccine was added as co-suspect. On 18Feb2021, additional information was received from a consumer via a company representative. On 19Feb2021, additional information was received from a patient ambassador via a company representative. Medical history included LEMS (Lambert-Eaton myasthenic syndrome) and migraines. Concomitant products included: an unknown statin, pantoprazole, and acetylsalicylic acid (ASPIRIN) 81 mg. On 18Sep2020, the patient started treatment with FIRDAPSE 10 mg at 10 mg, 3x/day orally for LEMS. On 19Sep2020 and 20Sep2020, after starting the product, the patient experienced moderate headaches. On 21Sep2020, the patient did not experience a headache. On 22Sep2020, the patient experienced a headache that was "4/10." He had taken acetaminophen; aspirin; caffeine (EXCEDRIN) and ibuprofen as treatment and it "helped." The patient

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

had not spoken to his HCP (health care provider) about the event but was going to call his HCP and ask to increase his dose of FIRDAPSE. The product was working and he was walking better, but he had heard people taking up to 80 mg a day. As of 22Sep2020, product use was ongoing and headaches were improved. On 02Oct2020, it was learned that his medical history included being prone to headaches (also reported as migraines ever since he was a kid) and "chemo" for small cell lung cancer stage 4 which was in his liver and lymph nodes. Concomitant products included furosemide. It was noted that the patient had been on the product for 4 to 5 days when he experienced his moderate headaches. He had the headaches for just a couple days, but he wasn't sure if it was due to the FIRDAPSE or it was the chemo. He took "a couple" of ibuprofen and he was "alright." On an unspecified date, the patient was in contact with his HCP and he was told to "keep an eye on it" (presumed headaches) and see if it got worse. They agreed that it could have been the chemo or a "fluke" thing. He also spoke to his HCP about his FIRDAPSE dose of 10 mg, 3x/day not being enough. He would switch and do a couple doses of 15 mg and it was better, but not enough. His HCP thought he should be taking 20 mg 3x/day, so he was working with the patient's insurance and pharmacy to get it changed. As of 02Oct2020, FIRDAPSE and chemo treatment were ongoing and moderate headaches were resolved (reported as he'd been good for a few days). On 01Feb2021 and 09Feb2021, it was learned that on 02Oct2020, the patient's FIRDAPSE dose increased to 20 mg, 3x/day. On an unspecified date, the patient received the COVID vaccine at an unreported dose, route, and frequency of administration for an unreported indication. After the patient received the COVID vaccine, he experienced a bad reaction (unspecified). Since 27Jan2021 (reported as since Wednesday, relative to 01Feb2021), the patient had been sick. On 31Jan2021, the patient went to the emergency room, and they thought he had a blood clot on his lung. Subsequently, he was admitted to the hospital. Initially, when the patient was in the hospital, they took all his medications away, including his FIRDAPSE, as the pharmacy was managing his medication. The patient wife was able to get the doctors to let the patient keep his FIRDAPSE in his room with

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

him before he missed any doses because he could not walk without his FIRDAPSE. On an unspecified date in 2021, the patient had radiation of his head and lung for his cancer (previously reported medical history), and "they" (presumed his medical provider) said he could have a raspy voice and headache, which he did experience but then resolved. While in the hospital, the patient's blood pressure was not stable. It went "up and down, up and down." He had fluid in the bottom right lobe of his lung, where the cancer was, and they could not "tap it" due to the blood pressure issues. They were trying to get the fluid out every other way they could. The doctors said he had inflammation in the bottom of his lung. He was given a "good dose" of prednisone, but he was just exhausted. They were trying to control his blood pressure and his pulse. When they got one of them "up," the other went "down." The doctors said that the patient's LEMS had nothing to do with why he was in the hospital. His wife expressed her gratitude for the FIRDAPSE and how it had helped him. As of 09Feb2021, treatment with FIRDAPSE was ongoing. The patient was still in the hospital and not doing well, also reported that he was still the same, he had not improved but he had not worsened. The blood clot on his lung, blood pressure fluctuation and pulse issues, fluid in the bottom right lobe of his lung, inflammation in the bottom of his lung, and exhaustion were not resolved. The status of the bad reaction to the COVID vaccine was not reported. No additional information was provided. On 18Feb2021 and 19Feb2021, it was learned that the patient's medical history included: muscle weakness and lung cancer with brain metastases. On unspecified dates, after starting FIRDAPSE, the patient's muscle weakness began severely progressing, and he experienced fatigue. The weakness was worsening significantly, even after being on the medication (presumed FIRDAPSE). On 14Feb2021 or 15Feb2021, the patient was discharged from the hospital. On 18Feb2021, the patient took his last dose of FIRDAPSE. On 18Feb2021 or 19Feb2021 (reported as last night, relative to 19Feb2021; yet also reported as either 18Feb2021 or 19Feb2021), the patient passed away. The cause of death was unknown. A 74-year-old male, with a history of migraines and chemotherapy for metastatic small cell lung cancer, was taking an unknown statin, furosemide, pantoprazole, and

Aspirin. He added FIRDAPSE for LEMS on 18Sep2020 and experienced headaches for a couple days, but he wasn't sure if it was due to the FIRDAPSE or chemo. After COVID vaccine, he experienced a bad reaction (unspecified). Since 27Jan2021, he was hospitalized with a blood clot on his lung. He had brain and lung radiation for cancer. While in the hospital, he had fluid and inflammation in the bottom right lobe of his lung, where the cancer was, which could not be drained due to labile blood pressure. His muscle weakness began progressing and he experienced fatigue. In Feb2021, he was discharged on FIRDAPSE. A few days post-discharge, he died. Based on the information provided, the events were assessed as unrelated. Information on the batch/lot number has been requested.; Reported Cause(s) of Death: Passed away

1187893	4/9/2021	GA	49	F	3/31/2021	3/31/2021	0213A21A -(The lot number is hard to read and it could be this number or the one above.) Wednesday, Thursday and Friday - I had headaches and I had extra fatigue (I already do have fatigue because I have insomnia). My arm soreness was on the other arm not on the one that I had an injection. Friday and up until yesterday, I had nausea. Saturday, I had headache and being tired. Sunday, I had chest pain (woke up with it) like a burning in my chest. My left arm, I felt a tingling down my arm to my legs - it almost felt like a blood clot was there in my arm. I had to put heat on and then ice. I couldn't extend arm because it hurt. Midnight on Monday, the burning and the chest pain was too much and I was getting worried. The only thing I have is asthma, otherwise I'm healthy. I went to ER - they gave a Cocktail of Lidocaine; Malex and something else to see if it would help with the burning in my chest. Monday, I took Tylenol. Tuesday, the chest pains were more intense. 03:00 on Wednesday am - I went back to ER. They brought me to a full chest x-ray - front, side and back and a CAT SCAN and gave me another Cocktail and also put something in my IV. This time, they sent me home with four different medicines. The meds are: Generic of Nexium; Aspirin low dose of 81 mg - bayers children - one a day; Generic version of Bentil Triacetin - I take this when I want to be still; Generic version of Valium - they gave me four of these - and I have one left that I will take tonight so I can sleep. I am taking Vit D. I haven't taken Tylenol since getting on these. I try to stay hydrated. I still have a really really funny feeling inside me. Last night, I was very restless and couldn't sleep. It makes me on borderline and dizzy and my heart starts palpitating. It's a scary feeling in my chest.
1188195	4/9/2021	MI	58	F	3/12/2021	3/12/2021	I had a number of side effects the same day...nausea, restlessness, migraine. Then the headaches & migraines continued. Previously I hadn't had a significant migraine for over a year. So far I've had 3 that required medication, & several lesser headaches. Tjis is what is unusual, & due to recent reporting regarding possible,link to brain blood clots, I'm worried.

1181814	4/8/2021	GA	31	F	3/26/2021	3/27/2021	I had just had my period on 02/22/21 (first day of the cycle) and then received the first dose of the vaccine the following week (on 03/04/21). I had a slight period the day after (03/05/21) which lasted about 3 days. I thought it was just a coincidence and didn't think much of it. The same issue happened after I got the second dose on 03/26/21; I got my period again. My period is usually normal (every 27-31 days), so it was definitely strange to me that my period came so soon and both times were immediately the day after the shot. It was just a normal period with no blood clots or anything abnormal, but I do feel like it's an adverse reaction of my body to the vaccine.
1181756	4/8/2021	CA	72	F	3/10/2021	3/11/2021	blood clot in left arm causing enormous swelling
1182094	4/8/2021	CA	71	F	3/26/2021	4/2/2021	After COVID Vaccine #2, I had major brain fog, fatigue and almost constant nausea for two days. It stopped for a day, then continued from Monday afternoon and I think still continues today, April 8. However, a week later on Friday April 2, I had an extremely painful abdominal flareup with diarrhea, then blood clots throughout the night which turned out to be ischemic colitis. Hospitalized for three days, had CT scan and then a colonoscopy.
1180842	4/8/2021	OH	54	M	3/29/2021	3/31/2021	Received 2nd Moderna Covid shot on 03/29/2021 and on 03/31/2021, felt what I thought was a muscle cramp that never went away. Went to urgent care where the shot was given on unspecified date and they diagnosed what I thought was a muscle cramp area, as a blood clot.

1182480	4/8/2021	NJ	72	F	2/23/2021	3/5/2021	positive COVID-19 test with symptoms; This is a spontaneous report from a contactable consumer (patient herself). This consumer reported similar events for 2 patients (for herself and for her husband). This is the first of two reports. A 72-year-old female patient received BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine), dose 1 via an unspecified route of administration, administered in top of left arm on 23Feb2021 16:10 (Batch/Lot Number: EN6200) as single dose for COVID-19 immunization (protection; felt it would help). Medical history included thinking she thinks she got COVID from her husband, ongoing headache prior to receiving the vaccine. Concomitant medication includes taking unspecified blood pressure medication and thyroid medication. Patient stated that she and her husband got the first dose of Pfizer COVID-19 vaccine and got COVID within a few days of getting the immunization. She believed they got it from the clinic. Patient stated she got COVID Vaccine 23Feb2021 at 4:10pm and she tested positive for COVID on 05Mar2021 and on that same day states she was treated with COVID antibodies/monoclonal antibodies. She thinks she got COVID from her husband. Symptoms started on 01Mar2021 with a cough, which started getting worse. Then, headache started and she felt 'all together down'. She stated that symptoms almost felt like a sinus infection. Patient stated that her doctor said that her lungs were affected. Patient stated that overall symptoms have improved, but she still experiences lack of energy and a little shortness of breath which she thought was due to the lack of energy. Patient stated that she has to sit down more due to the weakness, stating she can only walk around in her garden once before she has to sit down and take a break, which is more often than before. She stated that she did get headaches prior to receiving the vaccine, but they are normally in the back of her neck area and now they are higher in the head. Patient stated she still gets intermittent headaches, and she is not sure if they are from COVID or not. Weakness and shortness of breath started a few days later after the cough. Clarified as Wednesday, 03Mar2021 or Thursday, 04Mar2021 when these started. By the time her husband tested positive, she immediately was tested for Rapid COVID test on 05Mar2021 and they went in for antibodies. She knows that her husband had it worse, as

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							they caught hers quicker. Patient added that she always felt like she had a fever; felt flush; skin felt warm but had no fever, her highest temperature was 99.5. Patient also stated that pretty early on, her legs felt like they weighed 100 pounds, from her knee to ankle felt like they had a band around them, by the end of the week it was at it's worst. It still hurts some now, but she can get around more. Patient stated her doctor sent her to get a doppler study to make sure she didn't have any blood clots, the results were negative on Mar2021. Patient stated that her doctor told her that this could happen to people with neuropathy, which could be common for her age. Patient took a second PCR COVID test on 17Mar2021 and it was still positive. Vaccination Facility Type was urgent care not facility. The AE required a visit to Emergency Room (treated with antibodies and sent home) and Physician Office. The doctors have advised them to take the second dose three months later. Patient wanted to know if she get the second dose 3 month later and would she have to restart the series of the vaccine all over again. The outcome of the event was recovering.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021315088 same drug, similar events, different patient

An 81-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration in right arm on 09Mar2021 (Lot Number: EL9266) at single dose for covid-19 immunization. Medical history included arthritis, respiratory issues, allergies, Eczema of the nipples and breast, arthroscopic surgeries, she lost her voice. Caller stated she exercised everyday, she did yoga. Caller reported the last 2 years she hadn't been able to climb the mountain on the stairs. Caller states she didn't catch a cold, she was fine, she was very active. She was good except arthritic conditions, she has had arthroscopic surgeries, that was a side effect of that. Caller reporting she was a first responder and had some respiratory issues. Caller stated she had some allergies, if with dust or smoke, her throat constricts, it was just small, like her throat. She cannot be around that. She got once in a while, when she got in a rush. Caller stated before the vaccine, she had eczema in her nipples, on her breast. Caller stated she never got sick, besides the rash she got once in a while. Caller states but she was very healthy otherwise, no medication, no smoking, no drinking. Caller stated she was from 9/11, this was what happened with her voice once in a while, she lost her voice. Caller stated she had had some respiratory issues and allergies and so on. Caller stated she was here for 56 years and her mother died of old age so she was not sure. There were no concomitant medications. The patient previously took advil. Caller stated she used to take Advil when she went to the gym and had problems but she hasn't taken Advil for a while. She didn't take meds. Caller stated she didn't drink or smoke because what it did was it gave you a release. Caller stated she was not taking none, she was pushing through and hoping it will heal itself. The patient experienced blood clot in right leg on 26Mar2021, break in rash on an unspecified date, headache on 09Mar2021, slight fever on 09Mar2021, veins are swollen on 12Mar2021, right

knee got swollen on 12Mar2021, sore throat on an unspecified date, ear ache on 10Mar2021, nausea on 09Mar2021, rash in mouth and throat on an unspecified date, felt like burning/ sore in her mouth like she was burned on 10Mar2021, sore in her mouth like she was burned on 10Mar2021, dizzy on an unspecified date, weak on an unspecified date, felt like sleeping all the time on an unspecified date, couldn't walk on 12Mar2021, pain in her arm on an unspecified date. Was a first responder, sometimes break in rash once in a while. Got Pfizer 1st vaccine 09Mar, was scared to have difficulty breathing however had headache, slight fever, right knee and veins were swollen, sore throat, ear ache, nausea, rash in mouth and throat also felt like burning also was dizzy and weak and felt like sleeping all the time. Caller stated she was told by her doctor to take the shot on 09Mar2021. Caller stated she had headache, slight fever, then her head was ok the fever was gone but the headache persisted as of today. Caller stated she still had headache and ear ache and her knee got swollen, her right knee. Caller stated for a few days she couldn't walk. Caller reported she has arthritic conditions in knees, she exercises everyday and no problem, but she couldn't walk for a few days. Caller states now she is able to walk on something, but the veins in the knee were still there and she didn't know. Caller stated she was due for second next on Tuesday and she was wondering what to do. Caller stated she was honestly worried about this reaction after the first shot. Caller stated she was told the 2nd had a worse reaction, so she was really weary and worried. Caller stated she only slept 5 hours at night, but now she wanted to sleep all the time. Caller stated she had such a headache and earache. Caller stated it made her nauseous, like in a sea or something. She stated she didn't know how to explain. She didn't vomit like when you were nauseous, it wasn't that feeling. Caller stated it was just lingering like when you were in the ocean. Caller reported headache has gotten better. It has gotten worse and then gotten better. Caller stated the earache was so painful and was still there. Caller reported she got it during the day and when she lied down, but the severity had subsided. Caller stated she didn't measure fever. She wanted to say after that, her mouth was sore after fever from the heat or from the vaccination. Caller stated her mouth was still today, still sensitive. Caller reported it

was like her throat and her mouth was so sore like a burn. Caller reported her headache was mostly on the left side, but went to the right side too. Caller reported she could feel it in her eye, it hurt and her ear hurt. Caller reported her sore throat, the upper part, was still sensitive. Caller stated she couldn't swallow, but it was clear, her mouth was clear, only the upper top she would say. Caller stated it's 99% gone, its healing. Nauseous, like in a sea, its not like she has it all day long- nauseous- maybe once a day, nothing severely like what she had for a few things. The patient had a pain in her arm and she had that symptom one night and the following day she had nothing. Her arm was cooperative. Since she had been diagnosed with a blood clot. She saw her doctor on Friday and was recommended that she took some medications. She continued to have headache which she reported, though not as bad. She also reported that she had a sore mouth and earache. She was still fighting symptoms and didn't know what to do with the blood clot. She was scared to take the blood thinner Eliquis and that she will have side effects that it will do her harm she felt Eliquis will do her harm if she received the second dose of the vaccine or takes Eliquis. She was supposed to 20mg daily which she felt will kill her given her body was not healed from receiving the first dose of the Covid-19 vaccine. There was no prior vaccinations within 4 weeks. She was prescribed Eliquis Film-coated tablet (Lot Number: ABN4449S, Expiry date: Feb2023) 20mg daily for blood clot but had not started because she felt it will kill her was scared to take the second dose of the vaccine. The patient underwent lab tests and procedures which included Sonogram: blood clot in right on 26Mar2021. Therapeutic measures were taken as a result of blood clot in right leg. There was Physician Office Visit for all events. The outcome of the event blood clot in right leg, veins are swollen, right knee got swollen, couldn't walk was not recovered, of event slight fever was recovered on 10Mar2021, pain in her arm was recovered, of event ear ache, nausea, felt like burning/ sore in her mouth like she was burned, sore in her mouth like she was burned was recovering, of other events was unknown.

1182760	4/8/2021			M	3/10/2021	3/1/2021	they did a culture and do not know if he has a kidney infection or urinary infection.; they did a culture and do not know if he has a kidney infection or urinary infection.; He stated running a fever yesterday (100.3 degrees last night); he has a lot of blood in his urine; he had a sore arm for a couple of hours; This is a spontaneous report from a contactable consumer non health care professional via Medical Information team. A patient of 63-year male received of (BNT162B2) (solution for injection/Lot/Batch number not provided, via unspecified route of administration on 10Mar2021 at a single dose of COVID-19 immunization. The patient's relevant medical history included kidney stones, he is on blood thinners because in 2019 he had blood clots in his lungs and was diagnosed with a pulmonary embolism and thrombosis. Laboratory data included body temperature( fever) 100 degrees centigrade, Concomitant medications were not provided. It was reported that the patient had taken covid vaccine, for first shot the patient had experienced a sore arm for a couple of hours that night but no other issues. He took Tylenol after the shot that day and evening, running a fever yesterday (100.3 degrees last night), lot of blood in his urine, He started antibiotics, Macrobid. He is having some difficulty taking it so they gave another prescription, Augmentin, and he is going to call today to see if he should start taking this and stop taking the Macrobid. He is scheduled for his second dose tomorrow on 31Mar2021. He has a history of kidney stones and is not sure if that is what this is because he has a lot of blood in his urine. The only day he knows they give the vaccines is on Wednesday so if he waits he may have to wait a week. He stated he feels a little better at this moment since he has been awake since 7:00 this morning. He asked if he is still able to get his second dose tomorrow while he has a fever and patient stated some people say they have a rough time on the second shot and these are relatively young, healthy people, they did a culture and do not know if he has a kidney infection or urinary infection. For the kidney infection event was medically significant, Outcome of the events was unknown and He stated running a fever yesterday (100.3 degrees last night) was not recovered. Lot/Batch number has been requested. No further information was reported.

1175158	4/7/2021	TX	68	M	3/16/2021	3/1/2021	Shortness of breath; headache; Felt like at least 100 degree temp/slight fever; lack of appetite/completely lost appetite/No appetite; Body aches; Joint aches; Tiredness; Delirious; Chills; cold sweats; felt weak; flu-like symptoms; feel almost as miserable; can't taste food as well/lack of taste; diarrhea; This is a spontaneous report from a contactable consumer. A 68-year-old male patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, batch/lot and expiration date unknown), via an unspecified route of administration, administered in the right arm on 16Mar2021 at 10:20 as a single dose for covid-19 immunization. The patient's medical history included deep vein thrombosis (DVT) in from 2017 to 2017. Patient always had swelling on the leg where he got the blood clot. The patient's veins in his leg were damaged and the doctor takes care of his legs. He has very poor blood flow in the affected leg, that all the fluids and waters, the heart was having a hard time pumping it back up. He uses compression stockings, physical therapy, and that he raises his legs in the evening. The caller mentioned that vessels in his affected leg are damaged for good. Patient was in a treatment facility for alcoholism. Patient reported that he hasn't had a drink in 2-3 years but still has to go to treatment, caller was released from the treatment facility because he got sick with COVID. Patient had Covid-19 on 15Dec2020 to 08Jan2021 (the side effects experienced after the first dose of the Covid-19 vaccine weren't as severe, that the real virus is pretty bad). Concomitant medications included blood thinners (unspecified) and a couple of other medications. Patient reported that he skipped some doses of his regular medications while he was feeling poorly. On 16Mar2021, the patient experienced delirious, chills, tiredness, body aches, joint aches, cold sweats, felt weak and flu-like symptoms. On 17Mar2021 patient had headache, felt like at least 100 degree temp/slight fever, lack of appetite/completely lost appetite/no appetite; can't taste food as well/lack of taste and diarrhea in Mar2021; and shortness of breath on an unspecified date. It was further reported that the adverse events that he was experiencing were as bad as his experience with COVID-19 except he could breathe. Gradually over the next 24 hours and the night of 16Mar2021, he started getting chills and fevers, getting

very tired, and experiencing flu-like symptoms. He had fatigue, cold sweats, slight fever, headache, diarrhea, and the lack of taste or appetite. He said that his adverse events started 10 hours after getting vaccinated. For the next few days, he felt weak and had to exert a big effort to get out of bed. On the second day of vaccination, he developed diarrhea and completely lost appetite. Patient also reported that he experienced body aches. He experienced body aches and joint aches. Patient had no appetite, that he still hasn't eaten much the last few days but that he has started eating today. He described his experience to be severe but not severe enough for him to be hospitalized. He said that he missed 3 days of work because of his symptoms. It was on the 6th day since he got vaccinated and everything has subsided and he was getting his energy back but he is still recovering. Patient called his physician and the nurse he spoke with stated that the first 3 days following the Covid-19 vaccine the side effects could be very severe and that the side effects could continue over next 3 days. Caller reported that he is on the 6th day now since he got vaccinated and everything has subsided as he was starting to feel better, he was coming around, but it was not 100 percent. So patient was inquiring about the second dose of the product. The patient further mentioned that the side effects following the first dose of the Covid-19 vaccine caused him to feel almost as miserable as he did when he actually had Covid. Patient also stated that he was close to calling ambulance the night of 16Mar2021 when he began experiencing AEs. The patient was delirious, he wasn't sure what was going on, that he was trying to grab his phone and text but couldn't use his phone. Patient was wandering around his room. Patient would get cold sweats at night. Caller reported on the morning of 17Mar2021, he woke up soaked in sweat. Patient called his doctor's office that he just needs guidance on whether or not to get the second dose. The headache went away gradually and was gone probably late Saturday, 20Mar2021 or Sunday, 21Mar2021. for the event tiredness, patient stated that he's still trying to regain his full strength but, 22Mar2021 was the first day that he has been able to sit up and do things and that he hasn't had to lay down all day long. Felt like at least 100 temp, patient reported that he doesn't have a thermostat. He reported that he felt feverish at least the first 3 days

following the first dose of the Covid-19 vaccine on 16Mar2021. Body aches/joint aches, reported that the body aches and joint aches have almost completely subsided. Patient stated that he doesn't really feel them, that he is 68 and at that age you're going to feel some aches regardless if you're sick or not. Caller reported that he can barely talk, that he still doesn't feel completely right. No appetite: caller reported that when his symptoms were severe that he did not want to eat. Caller reported that he did hydrate. The decreased appetite has improved but that's still not quite what it was. Caller reported that he was trying to eat to improve his energy level. Can't taste food as well, mentioned as that everything tastes the same, whether he eats a grape or a banana. Caller reported that he noticed that he wasn't able to taste food as well the third day after his symptoms began, but states it was improving. Patient reported that the diarrhea began on 18Mar2021 or 19Mar2021 and that he can't hold it too long. He ate cereal in the morning and immediately had to use the bathroom and it's getting a little better. Patient reported that he took 1000 mg of Tylenol for 2 to 3 days in a row. He took two 500 mg tablets three times because of headache and chills. Patient stated that the only difference between the side effects he experienced following his first dose of the Covid-19 vaccine and having the Covid-19 virus was that he doesn't have any problems struggling to catch his breath. The patient recovered from the events chills on 20Mar2021, headache and felt like at least 100 degree temp/slight fever in Mar2021; recovering from tiredness, body aches, joint aches, can't taste food as well/lack of taste, lack of appetite/completely lost appetite/No appetite and diarrhea; not recovered from shortness of breath; and unknown outcome for all the other events.

1177443	4/7/2021	OH	51	M	4/2/2021	4/6/2021	Currently, developed 3 blood clots in right arm 4 days after receiving the vaccination. First was noticed on the morning of April 6, the second in the evening of April 6, and the third was noticed on the morning of April 7. First one has appearance of cellulitis located on the forearm. Doctor issued treatment for cellulitis on April 6. Reddish/purple skin colored with grey edges in a circle. Second clot is below the skin with slight bulge closer to the elbow than the first. The third indication is in the upper arm above the elbow on inside of arm. Appearance marked by 2 curved lines similar to varicose veins just below where the clot is bulging the skin. No discoloration of the 2nd and 3rd indications of clot.
1177143	4/7/2021	RI	68	M	2/19/2021	3/31/2021	About a month after my second Pfizer inoculation I awoke one morning with almost no vision in my right eye. I was diagnosed April 1 with a blood clot in my retina that has changed my vision from 20/30 in that eye to 20/125. My left eye remains 20/20. I'm in excellent health and never had any kind of clot or eye issue. The traditional causes of Retinal Vein Occlusion don't pertain to me - no heart trouble, high blood pressure or diabetes. I'm thin and physically active, never smoked, drank or used drugs.
1175795	4/7/2021	WI	55	M	3/13/2021	3/28/2021	Patient called 4/7 to advise us of an outpatient treatment for a blood clot on 4/4/21. In hindsight, he is questioning whether there is an association between his COVID vaccine series and the clot. He received his 1st dose (reported above) on 3/13/21. Symptoms (gradually progressive redness, irritation, swelling) began approximately 3/28/21, but were not recognized as a blood clot at the time. He received his second dose on 4/3/21 (Lot EW0150) in the right deltoid muscle. He reported to the ED for treatment on 4/4/21 with continued worsening of symptoms. So far, his treatment is going well with no lasting deficits and continuing followup treatment.

A 39-years-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; lot number: ER8730; Expiration date was not reported), via an unspecified route of administration, administered in Arm Left on 24Mar2021 17:00 as SINGLE DOSE for COVID-19 immunization. Medical history included DVT (deep venous thrombosis) 3 years ago in his right calf/DVT of calf from 2019 to an unknown date (Right Calf; DVTs in his calf and had treatment with Eliquis and got off of that, had an ultrasound to check that it was gone); broke his ankle on an unspecified date in 2019; being in a tourniquet too long (DVT (deep venous thrombosis) 3 years ago in his right calf, from being in a tourniquet too long, was in an operation, was treated with ultrasound); normally when something hurts that bad, he has a softball size bruise on his arm, he has lived and had bruises like that before; Operation (DVT (deep venous thrombosis) 3 years ago in his right calf, from being in a tourniquet too long, was in an operation, was treated with ultrasound/rebreak his ankle and put rods and screws in). The patient's concomitant medications were not reported. It was reported that feeling pain in arm on 24Mar2021, fatigue on 25Mar2021, fever on an unknown date in Mar2021, silver dollar rash at the injection site on 25Mar2021. He reported that he had DVT (deep venous thrombosis) 3 years ago in his right calf, from being in a tourniquet too long, was in an operation, was treated with ultrasound. This morning (25Mar2021), his whole calf was constricted, felt like the muscle was separating inside, compared it to the same feeling of DVT that he had those years back. Patient reported that he thought he might be having allergic reaction. He was so tired, he can barely can move, he had a silver dollar size rash on his arm and his arm hurts so bad that he can hardly move it. He stated that this was weird and he has it every now and then, but it is really bad today. He states that 3 years ago he had DVTs in his

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

calf and had treatment with Eliquis and got off of that, had an ultrasound to check that it was gone. He stated that his leg and it hurts so bad. It felt like has phantom clots in the same the muscles are separating again, like the muscle is trying to tear itself in half. Caller asks, the vaccine won't cause blood clots, will it?. Described about Tired, he couldn't get out of bed and he had been laying there for 3 hours this morning. Stated he ate dinner and went to bed. Stated that he works a full time job doing HVAC and goes to school full time so he could've been tired last night and not noticed it, because he is always tired, but today was different. Described about Left Arm Hurts, that it felt like when you play dead arm, that is when a person socks another kid in a certain spot, felt like he was hit with a bat in that spot. Hurt bad and he was surprised how bad it hurt. When he got the injection, he felt nothing. Now he feels like he fell down on his arm. Within a few hours he noticed it and thought it would probably go away. States that he was checking to see if he had a big ole bruise, and that when he noticed the rash. He stated that normally when something hurts that bad, he has a softball size bruise on his arm. States that he has lived an had bruises like that before. Described about Phantom DVT Pain: He stated that his leg started twitching and woke him up. he called it phan-tom DVT, it felt like DVT, like the muscles have memory and start contracting and get so tight like they are tearing each other apart again. Stated that he is limping today (25Mar2021). He stated that it was contracted for 10 minutes and his whole calf was tight. It was his right leg, the same leg as he had 3 blood clots in. He stated that he broke his ankle in 2019 and they left the tourniquet on too long and they had to rebreak his ankle and put rods and screws in and he developed DVTs in his right calf. Stated that it was treated and he had ultrasounds at 3 months, 6 months, and a year and it is all gone and he has had no symptoms since. He stated that it felt like he has 3 blood clots back hardcore with a vengeance. Stated that he had no edema in his foot, it is not full or swelling or trust him he would be running, well not running, but he would be going to the hospital. Patient was not received treatment for the events. Seriousness of the events was reported as Non-serious. Outcome of the events Fever and limping was reported as unknown and outcome of all other events was not recovered.

<i>VAERS_ID</i>	<i>RECVDATE</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1174174	4/7/2021			U	3/6/2021		<p>I broke a pimple and came liquid after taking the pimple out, it came a little thing like clear and then it came like blood; it was like a clot; broke a pimple; This is a spontaneous report from a contactable consumer. A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), dose 1 via an unspecified route of administration on 06Mar2021 (Batch/Lot number was not reported) as SINGLE DOSE for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. Consumer stated, "I am kind of concerned because I was showering myself like 30 minutes ago, well I was cleaning my face and well you like night routine and I broke a pimple that I didn't have and came liquid after taking the pimple out, it came a little thing like clear and then it came like blood not too much for sure, then I realized that the blood that came out wasn't liquid, it was like a clot. I cleaned it with a t-shirt and I was able like to move it. So I am kind of concerned because I got my first dosage of the Pfizer vaccine on March the 6th, I am about to get my second dosage this Saturday and as you know and everyone should know right now what's going on with this (name) and (name) vaccine and then what everyone is talking about, it's impossible to not be concerned about the side effects." The event clot blood was assessed as serious (medically significant). The outcome of the events was unknown. Information on lot/batch number has been requested.</p>

1174114	4/7/2021			F			<p>blood clot; This is a spontaneous report from a contactable consumer(patient). A female patient of an unspecified age received BNT162B,(PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date (Batch/Lot number was not reported) as SINGLE DOSE for covid-19 immunisation. prednisone (PREDNISONE), route of administration, start and stop date, batch/lot number and dose were not reported for allergies Medical history included weakened immune systems and ongoing allergies. It was reported that patient wants to know if there is any reported interactions between the use of prednisone and receiving the COVID-19 vaccine manufactured by Pfizer. She was informed that the vaccine might not work as well for patients taking prednisone. The patient has been on Prednisone for 10 years, caller heard that when the patient has been on Prednisone for that long the vaccine does not work. The patient is taking Prednisone to treat some allergies. Patient also has blood clots and wants to know if patients with a history of allergies should take the COVID-19 vaccine manufactured by Pfizer, and how could she know if she would have an allergic reaction towards the vaccine. The action taken in response to the event for Prednisone was unknown. The outcome of the event was unknown. Information on the batch/lot number has been requested.</p>

1173987	4/7/2021	OH	69	F	3/18/2021	3/19/2021	<p>If she laid her arm on it, it was painful on the left side where she got the injection between her left breast and axilla; couldn't go back to sleep; very tired; weak; She had the lump and that was in the lymph node; painful if she put her arm down/painful on the left side/extended underneath the axilla/looked like it was connected to the breast; irregular heart beats; painful if she put her arm down/painful on the left side/extended underneath the axilla/looked like it was connected to the breast; painful if she put her arm down/painful on the left side/extended underneath the axilla/looked like it was connected to the breast; baseball sized lump. It was hard/where she got the injection; It looked like it was connected to the breast because it was so huge.; Fever blister; heart beating so out of rhythm; This is a spontaneous report from a contactable nurse (patient). A 69-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot Number: EN6207), via an unspecified route of administration, administered in arm left on 18Mar2021 at 12:20 (at the age of 69-years-old) as a single dose for COVID-19 immunisation. Medical history included ongoing coeliac disease; hypothyroidism, is diabetic and has irregular heartbeat from an unknown date and unknown if ongoing. Concomitant medications included levothyroxine taken for hypothyroidism; hydrochlorothiazide, olmesartan medoxomil (OLMESARTAN/HCTZ MYLAN) taken for blood pressure measurement; metformin, glipizide and pioglitazone hcl taken for diabetes mellitus; acetylsalicylic acid (ASPIRIN 81) taken for thrombosis; metoprolol taken for heart rate irregular, cyanocobalamin (VIT B12) taken for an unspecified indication, all from an unspecified start date and ongoing; famotidine, rosuvastatin, vitamin d2, vitamin d3 and potassium, all taken for an unspecified indication, start and stop date were not reported. The patient previously received the first dose of BNT162B2 (lot number: EN6198, NDC: 59267-1000-1, expiry: unknown) on 27Feb2021 at 1:40PM for COVID-19 immunisation. The patient got her last shot on 18Mar2021. The first day was fine. She woke up the next morning at three or four with her heart beating so out of rhythm it was crazy. It took almost the whole day. She called her cardiologist and couldn't get into them and she didn't want to go to the ER. She didn't have a way to</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

prove any of that. She also got a baseball sized lump. It was hard. If she laid her arm on it, it was painful on the left side where she got the injection between her left breast and axilla. It extended underneath the axilla. She wasn't able to get in with the cardiologist because she waited to late in the day. She couldn't get off the couch that day because her heart was so out of rhythm. She was very tired and wanted to just lay down. She hates going to the hospital. She doesn't want to go to the hospital. She has a history of irregular heartbeats. She should have gone in and had an EKG. She has pictures of the lump if those are needed. HCP information: Her doctor had said if she had anything like any abnormal heart beats to come in and get an EKG. She also had a fever blister on 22Mar2021 that she hasn't had in years and was asking if this influences her immune system. She had the lump and that was in the lymph node and now a fever blister on the top lip. Heart beating so out of rhythm: it lasted all that day. She took a nap after she talked to the doctor's office and slept for several hours. When she woke up it was kind of back in rhythm, but it was going in and out. It wasn't as frequent as it was prior to nap. Prior to the nap it was almost continuous. It slowed down a lot on the 19Mar2021 and was gone by 20Mar2021. Outcome of event: She has PAC's and PVC's anyway. That is why she follows up with the cardiologist. They haven't been so out of rhythm as they were after the vaccine. She couldn't go back to sleep. She still has them occasionally and that is kind of normal for her. She was weak and tired. Baseball sized lump: it has gone down. She took pictures to show her friends who were all getting the shots. It is gone now. It might have started on 20Mar2021. She woke up with the lump on Saturday. She has recovered completely. Her daughter said she needed to get it checked out. Reporter had heard of a lump on the breast was a side effect. It looked like it was connected to the breast because it was so huge. Seriousness criteria: It was irritating because it was so big. It was painful if she put her arm down. It was like her breast were engorged. Causality: Heart beating so out of rhythm: she hasn't had it that bad, so she thinks it was. She had it a long time ago, maybe once before, but it never lasted that long or took her down like that. She is not the only one that has had the complaint of irregular heartbeats. She put on social media what she

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

experienced and how weak she got. Several friends said that happened to them as well. She doesn't know their history. Reporter declined to do a report on her friends. That was another reason she didn't go to the hospital. She thought it was a normal side effect. She thinks she found on her paperwork about the lump in the lymph nodes. The patient underwent lab tests and procedures which included electrocardiogram: unknown results and heart rate: irregular on an unspecified date. The outcome of the event fever blister was not recovered, while of the rest was unknown. Reporter seriousness for heart beating so out of rhythm was reported as disabling.;

Sender's Comments: Based on the information currently available and the plausible temporal relationship, a possible contributory role of suspect product BNT162B2 to the reported events 'heart beating so out of rhythm ', 'baseball sized lump (where she got the injection/It looked like it was connected to the breast because it was so huge)' cannot be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

1178464	4/7/2021	PA	40	F	1/25/2021	1/29/2021	I have always had relatively heavy periods due to my diagnosis of VonWillebrand's disease. Four days after receiving the vaccine, my cycle came on early and I had heavier bleeding than I have ever experienced with large clots. The bleeding slowed down, but lasted for an entire month. My cycle then returned to normal. It seemed very coincidental that this happened immediately following the vaccine, and was not normal for me at all. I recently read similar stories of other women reporting this, so while at the time it was concerning, I did not report it. I am a firm believer in science and thought this was possibly just a fluke, but felt that after reading many stories of women having a similar experience, that the responsible action is to report this, to ensure that all of the data is being studied, since the vaccine is so new. That being said, I only had mild side effects from the vaccine, and I am very grateful that I was able to receive the vaccine, as I have known quite a few people that have died from COVID. This bleeding for me was not dangerous at any time, and while I was a bit faint, the bleeding during the course of the month did slow down and this all resolved. Therefore, I would still get the vaccine again. I should note that after my second vaccine, I had a few days of spotting outside of my cycle, which resolved as well. I have had no issues since.

1177623	4/7/2021	WA	48	F	3/26/2021	4/4/2021	Woke up on 4/4 with a golf ball sized, raised welt at the injection site. It was hot and very red. The next day, it was even larger, by 4/7, it had completely gone away. Everyone thinks I should also mention that I was admitted to the hospital with chest pain, high BP/Pulse on 3/31, they did a D-Dimer on me and it was elevated, suggesting a clot has formed and is in the process of breaking down. I had a CT of my chest and no PE was found, but I had thickening of my left lobar pulmonary artery wall, further supporting the suggestion of a possible blood clot. After an echo stress test, I was discharged the next day on HTN meds. I was experiencing chest discomfort prior to my vaccine, but again, EVERYONE is telling me I need to report this, so I am. :)
1178463	4/7/2021	VT	38	F	4/6/2021	4/6/2021	Had a sudden bleeding from left nostril that took 30 minutes to to stop at 3:30 pm on 4/6/2021. On 4/7/2021 at 1:05 pm sudden bleeding from left nostril again took about 25 minutes to stop bleeding had a quarter sized blood clot come out of my mouth towards end of nose bleed. Do not typically get nose bleeds. Called dr told to report incidents and to report to Ed if gets worse or happens again.

1173004	4/6/2021	ND	72	F	3/12/2021	3/14/2021	Client reported today, 4/6/21, the day after her first COVID-19 Pfizer vaccine, she was very tired and had some achiness. 2 days post vaccination, she reported some pain in her thigh, pain went from thigh to her knee, to her thigh over the next couple days, then after about 4 days she noticed a bruise on the inside of the right knee without any known trauma. Client reports she continues to have tenderness to touch on thigh and leg. Client denied any swelling. Client has had hx of blood clots in her knees when she was in her 20's.
1172452	4/6/2021	NY	49	M	3/31/2021	4/1/2021	Patient received Johnson&Johnson COVID vaccine in the afternoon on 3/31/21. Patient reported having right arm pain, diaphoresis, chills, nausea, and muscle aches/pain in upper leg/lower back at 5:30am the following morning. Patient took 2 tablets of 500mg naproxen in the morning and in the afternoon. Symptoms did not resolve and patient had to leave work early. Upon getting home patient took 2 tablets of 650mg tylenol and symptoms resolved within 48 hours. On 4/3/21 patient reported mild to severe pain in heel of left foot. The following day the patient went to WellNow urgent care to get his heel examined. During examination provider noticed patient's lesions and patient stated more lesions have appeared since getting the vaccine. 1 on his stomach, 1 on the dorsum of his left foot, 1 on his back, 1 on his left elbow, in between his toes of his left foot, and in between the fingers of his right hand. Patient stated that these lesions cause a burning sensation and can become itchy. Patient was sent to Hopsital ED as provider at urgent care was concerned patient may have purpura. Patient was seen and discharged on 4/4/21 from the ED. The heel pain was determined to be plantar fascitis which was treated with at home exercises with a heel cup. The patient was given clotrimazole for his lesions. The patient had a follow-up visit with his primary care provider at hospital on 4/6/21 in which he explained the clotrimazole only made his lesions worse. Patient was referred to follow up with dermatology on 4/8/21. Primary care provider believes progression of the lesions since getting the vaccine leads to concern of an underlying autoimmune exacerbated by vaccine.

							Janssen COVID-19 Vaccine.; Reported Cause(s) of Death: DEATH 4 DAYS AFTER RECEIVING VACCINE
1170312	4/5/2021	FL	55	M	4/1/2021	4/3/2021	I had a sharp pain in my chest and told my wife something was wrong.. I sat down and started sweating, after that my wife said she was asking me if I was ok and she said I was staring straight ahead and moaning then my eyes rolled back in my head and I was unconscious. My wife called 911 and was trying to get me to respond but no response. While she was yelling get an ambulance I came to and I asked my wife who are you calling. She told me I was unconscious for several minutes. I went to the ER via ambulance due to the symptoms. The paramedics thought I had a blood clot or heart attack.
1170033	4/5/2021	CA	86	M	3/5/2021	3/9/2021	The first doze made him tired and got back pain. Went to his Primary Doctor to see if it is okay to get the second dose. He got his blood work done, echo Cardiogram and all the necessary test have been done and he is okay to proceed by his Doctor. On the fourth day after he get the second dose of Pfizer-BioNTech, in the afternoon, he couldn't get up from his bed that he had lay down. He experienced slur, facial droop and left side hand weekness. We called the paramedics right away and they checked him and took him to the nearest Emergency Hospital. They ran tests, did CT scan and diagnosed him with Ischemic Stroke on his right side which has effect on the left side of his body for facial droop and weekness and not being able to get up. He was threatred with Mechanical Thromboctomy to remove the blood clot. He stayed in the hospital for 8 days and is bed bound up until now and is transferred to a re-hab. He still can't stand. Today is the 27th day since the adverse reaction started. His left hand has improved a little bit.

1169237	4/5/2021	CA	88	F	2/26/2021	2/28/2021	Blood Clot, lower leg (left calf muscle). MD. recommed Xeralto 20mg
1170456	4/5/2021	MI	56	F	4/1/2021	4/2/2021	Symptoms began about 5 hours after the application of the vaccine and consisted on: fatigue, headaches and high resting hearth palpitations. During the night and the day after (Friday 04/02) symptoms worsened especially heart palpitations being all day above 120 up to 135 per minute. At moments it was difficult to breath and talk. By the end of the day I also experienced chest pain and signs of low oxygen (blue lips and pale colors) as well as mild fever. After calling paramedics, I was transported to the ER where blood, urine and Covid test were performed. I was told that some values of the blood test could suggest a blood clot so a CTscan was also performed with negative results. After a few hours in observation with infusion of fluids, potassium and magnesium I was sent home. Saturday and Sunday (days 3 and 4 after the vaccine) symptoms improved however heart palpitations were higher than normal and I still experience mild fever (98-99F). Insomnia and fatigue persisted for two more nights. Finally today Monday April 5, I could say that I feel back to normal.

1168887	4/5/2021	MO	71	M	3/10/2021		<p>UNABLE TO URINATE AT ALL; BLOOD CLOTS THAT WERE BLOCKING CATHETER; PROSTATE INFLAMMATION/ ENLARGED PROSTATE; This spontaneous report received from a consumer concerned a 71 year old male. The patient's weight was 212 pounds, and height was 182 centimeters. The patient's past medical history included urinary tract infection (UTI), enlarged prostate,. The patient's past medication included shingles vaccine for alpha gal syndrome. Concurrent conditions included kidney stones, alcohol user, non smoker, polyethylene glycol allergy, sulfa allergy, alpha gal syndrome and high uric acid. The patient previously experienced drug allergy when treated with polyethylene glycol for unspecified indication. The patient had no illness at the time of vaccination, no history of drug abuse. Because of the inflammation the stones caused when in the process of being passed, the patient also had occasional issues with an enlarged prostate as well as UTIs as a result of the stones. However, the patient never had his prostate enlarged to the point where he could not urinate as a result of passing stone. The patient has passed a small stone unannounced without symptoms approximately 10 days prior to receiving the COVID vaccine. The patient had no side effects after passing the stone, there was no pain, no dis colouration and no trouble urinating. The patient felt 100% with no after effects that would be attributed to passing the small stone. The patient received COVID-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1805029, and 1805029 expiry: not reported) dose was not reported, administered on 09-MAR-2021 09:30 in left deltoid for prophylactic vaccination. Expiry date was not reported and has been requested. Concomitant medications included allopurinol for high uric acid, and prevention of stones On 10-MAR-2021, 1:00 AM, approximately 15 hours post vaccination the patient experienced pain and trouble urinating. Subsequently, the patient went to urgent care where he was diagnosed with enlarged prostate and sent home. By mid morning, he was unable to urinate at all and went to see the physician. Patient has undergone a bladder scan and catheter was placed. On 10-MAR-2021 01:00, the patient also experienced prostate inflammation/ enlarged prostate On 13-Mar-2021, the patient returned to the emergency room twice</p>

----------	-------	-------	---------	-----	----------	------------	--------------

for blood clots that were blocking the catheter due to overextension of the bladder. On 18-Mar-2021, the patient returned to the physician, got the catheter removed and scope was performed. The patient was noted to have greatly enlarged prostate gland and the physician allowed him to leave the office without catheter. Several hours later, the patient was unable to urinate once again and went to physician's office and the catheter was put back in for additional two weeks, at the end of that time the patient will be reassessed. Laboratory data included: Prostate examination (NR: not provided) Enlarged prostate. On 18-MAR-2021, Laboratory data included: Ureteroscopy (NR: not provided) prostate greatly enlarged. Treatment medications (dates unspecified) included: finasteride to help with urine flow. The action taken with COVID-19 vaccine ad26.cov2.s was not applicable. The patient was recovering from prostate inflammation/ enlarged prostate, had not recovered from unable to urinate at all, and the outcome of blood clots that were blocking catheter was not reported. This report was serious (Other Medically Important Condition) Additional information was received from consumer on 31-MAR-2021 following information was updated and incorporated into case narrative: Patient demographic details (height, weight, date of birth), patient's past medical history ( urinary tract infection (UTI), enlarged prostate), past medication (shingles vaccine for alpha gal syndrome), concurrent conditions (kidney stones, alcohol user, non smoker, polyethylene glycol allergy, sulfa allergy, alpha gal syndrome and high uric acid), COVID-19 vaccine therapy details (vaccination time), additional event of enlarged prostate, reporter details, lab details were added.; Sender's Comments: V2. Follow up information received regarding Patient demographic details, past medical history, past medication, concurrent conditions, vaccine therapy details, additional events , reporter details, lab details were added . 20210323574-COVID-19 VACCINE AD26.COV2.S- Unable to urinate at all, Prostate inflammation. Follow-up received regarding Clinical Details. This event(s) is considered not related. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There are other factors more likely to be associated with the event(s) than the drug. Specifically:

A 78-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot Number: EN5318), dose 2 intramuscular route of administration, administered in Arm Right on 02Feb2021 17:00 as SINGLE DOSE for covid-19 immunization. Medical history included breast cancer (additional Information for Other Conditions: 19 radiations and they took out three lymph nodes on the left, she was diagnosed 3 years ago), blood pressure, 19 radiations, shingles shot. Reports she had the shingles shot a few months ago, vein disorder from Sep2020 to an unknown date. Patient was not sure if vein injections might be indicative of something and clarifies that she had vein issues in her legs had vein injections to dispose of the larger veins. She has had the vein injection a number of times throughout the years. The last time she had it done again was in Sep2020. Concomitant medications included losartan; taken for blood pressure abnormal; amlodipine besilate taken for blood pressure abnormal; tamoxifen taken for breast cancer. It was reported that, she has been taking losartan for years for blood pressure and amlodipine besylate about a year ago. The patient previously administered first dose BNT162B2 on 12Jan2021 11:30 (Lot number:EL3246), intramuscular injection in right arm for covid-19 immunization On 03Feb2021, patient experienced charley horse, gained weight since covid, she was 136 pounds and she just weighed herself and weighs 142 pounds, she could not step down on her left leg. Clinical course of events includes, patient was curious, she had her second shot at 5pm on Tuesday. Yesterday morning when she woke up at 6:30 or 7 in the morning, she could not step down on her left leg. For the last day and a half, she has had what had a bad charley horse behind her knee on the upper part of the calf. She was asking if the vaccine has any indications of a blood clot. Reports she was sitting in a car for 5 hours waiting to get the vaccine. She plays golf, stays busy, she does a lot, she was not someone that is very stagnant normally. When she went to get out of bed, she could not put her foot down, she was limping. She cannot step down without being in pain.

1164900	4/3/2021	CA	73	M	2/9/2021	2/23/2021	Patient started feeling woozy, dizzy, slurring words and fatigued around 11:30am. By the afternoon he was extremely fatigued and barely ate lunch or dinner. He went to bed at 9:30pm. By 1:30am, he woke up and urinated the bed because he couldn't get his urinal in place. He was extremely weak and shaking, and could barely hold his body upright when I used the lift to get him out of bed. He was not making coherent sense when he spoke, though his words and sentences were sensical, it made no sense in context. We sent him to the ER on recommendation of the advice nurse and 4:30am. He was checked in and showed low levels of sodium and potassium. They gave him an IV and he began to feel better very soon, though he remained weak and woozy and nauseous. He returned home in early afternoon, but remained weak for over 2 weeks afterward, slurring words and having trouble lifting his arms, though mental function returned by that same day. The doctors believe that he had a TIA, though no evidence of a clot showed up. They did discover that he has atrial fibrillation, though they had never detected that before on the heart exams following his heart attack.

1163369	4/3/2021		84	M	2/12/2021	2/22/2021	Blood clots
1163438	4/3/2021	OH	54	F	2/27/2021	3/1/2021	After the first vaccine on 2/6/2021, I did not have any reaction except a sore arm until 2/10/2021 when developed a bad headache causing me to leave work. When I awoke on 2/11/21 I felt worse as the day went on until I had complete flu like symptoms. On Friday, 2/12, I went to my primary care doctor and they did a COVID-19 test which was negative. Hence, I just waited for the reaction to go away, I was not better and able to resume normal activity until 2/15/21. I did decide to get the second shot as I was not entirely sure it was a result of the vaccine. On 2/27/2021, I received the second vaccination. Again, the immediate side effect was only a sore arm. On the following Monday (3/1/2021) see cont.I began to have what I thought was muscle aches and pains around the mid section on my body but they were manageable. On Tuesday and Wednesday (3/3/2021) the pain and area of the pain spread and intensified. I was unable to sleep or find a comfortable position and was losing strength and knew I needed medical attention as I was afraid it was a heart issue. My husband took me to the ER (3/4/2021). The ER doctor ran a CT scan with contrast and the result was a blood clot in my right lung and pneumonia in my left lung along with pleurisy. I was then admitted to Clinic on 3/4/2021. I remained in the hospital until 3/7/2021. There I was treated with IV antibiotics, warfarin, Lovenox (80mg), and pain medication for the pleurisy. I was also on a full time heart monitor and my heart was checked several times. Since returning home, I finished a dose of two antibiotics and am using an inhaler to help with breathing. I have also just finished a long dose of steroids. My INR is still not regulated to the therapeutic level. Prior to this reaction, I was in the therapeutic range and had been checked. As of 4/3/2021 I am at 1.8 not in the 2-3 range and have increased my dose from before the reaction at 7.5 mg to 9.0 mg daily.

1160713	4/2/2021	MI	74	F	3/7/2021	3/16/2021	<p>DETAILS OF HOSPITAL STAY: PRESENTING PROBLEM: Cardiac arrest (HCC) [I46.9] HOSPITAL COURSE: Patient is a 74 year old female who receives care through healthcare clinic and second healthcare clinic with past medical history of HTN, CKD, cardiomyopathy/congestive heart failure, atrial fibrillation on Pradaxa who presented to the ED 3/16 after suffering an out of hospital cardiac arrest at her dentist's office. Per report, patient had SBP in the 80s on arrival but was asymptomatic. Prior to start of any procedure (no reports of being given sedative medications), she became unresponsive. CPR was initiated and was found to be in asystole. She received 3 rounds of CPR with ROSC. CT head without acute abnormality. Chest XR showing mild vascular congestion and interstitial edema. Initial labs showing AKI, elevated liver enzymes, BNP &gt;29,000, troponin 39, lactic acid of 11, INR of 6.6, PTT 62, APTT 87. UA with protein, nitrite, moderate blood. Urine culture ordered. Blood cultures ordered. In ED, patient was hypotensive requiring addition of vasopressors. Targeted temperature management was started. Ceftriaxone and flagyl started for possible urinary tract infection and aspiration. Patient with profound coagulopathy, INR increasing to 12.0 on arrival to the ICU. Two units FFP and vitamin K were given. Patient with escalating pressor requirements at this time so CT t/a/p was ordered showing multiple bilateral rib fractures, nondisplaced sternal fracture with small anterior mediastinal retrosternal hematoma, small right sided hemothorax, right chest wall hematoma, patchy bilateral airspace disease consistent with atelectasis/infiltrate/aspiration, diffuse GGO consistent with interstitial edema, enlarged pulmonary arteries consistent with pulmonary hypertension, cholelithiasis. FDP elevated and 2 units of cryoprecipitate given 3/16. Hemoglobin decreased to 5.9 3/17 with INR of 5.4. Two additional units of FFP and additional dose of vitamin K ordered. Two units RBCs ordered. CTA thorax and abdomen 3/17 re-confirmed hemothorax and chest wall hematoma but no active bleeding noted. CT bilateral LE showed no evidence of hematoma. Trauma consulted who recommended chest tube placement. Overnight 3/16-3/17, patient also noted to have seizure activity on EEG and patient loaded with Keppra. Head CT 3/17 negative for hemorrhage or other acute processes. Patient remained in status epilepticus</p>

3/17am and additional Keppra load was given and neurology consulted. Received Praxbind for continued bleeding/coagulopathy. 3/17pm went into PEA arrest with 10 minutes of CPR with ROSC. Bronchoscopy following ROSC noted evidence of bleeding from multiple areas, clots removed. MRI brain showing diffuse anoxic brain injury. Propofol stopped 3/19am. After goals of care discussion this morning, all first degree relatives (daughter and son) all in agreement to transition to comfort care measures. I received call from bedside RN that patient had passed away. On exam, no heart or breath sounds appreciated upon auscultation for 2 minutes. No spontaneous movement or chest rise noted. No pulse palpated for two minutes. Pupils fixed and dilated. No response to noxious stimuli. Time of death 1400 3/20/2021.

<i>VAERS_ID</i>	<i>RECVDATE</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1162086	4/2/2021	VA	34	F			<p>Her heart rate in the vaccinated arm had a mark for arrhythmia; inflammation in the vaccinated arm; some aching in the arm but I thought perhaps the stiffness is going to be, the onset of stiffness; If I put my arm bended towards my chest that's when I would feel sort of a pop or some type of spasm and I drop my arm just like shake it off that would stop the static; Some aching in the arm; She thought she felt muscle spasms in the vaccinated arm; This is a spontaneous report from a contactable consumer (patient). A 34-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot Number: EN6208), via an unspecified route of administration on an unspecified date (at the age of 34-years-old) as a single dose for COVID-19 immunisation. Medical history included endometriosis from an unknown date and unknown if ongoing. The patient's concomitant medications were not reported. The patient received the 1st dose of the Pfizer COVID vaccine on Tuesday (unspecified date). She thought she felt muscle spasms in the vaccinated arm, it felt like it was matching her heart rate. Her heart rate in the vaccinated arm had a mark for arrhythmia. She spoke to a family member who is a medical student, he thought it was caused by pressure on the vessel or pressure on the area. She reported having a rare form of microscopic endometriosis. She also read in a magazine that there were 36 cases of severe reactions after receiving the COVID vaccine. Not sure if it was the Pfizer COVID vaccine, but in one case, a female had heavy vaginal bleeding and her obstetrician found that she had 0 platelets although the week before her platelet count was normal. On 19Mar2021, when probed for the side effects experienced, consumer stated, "Yesterday there was some aching in the arm but I thought perhaps the stiffness is going to be, the onset of stiffness is going to start but it didn't start as stiffness it just started progression to muscle out what I thought, muscle spasm. If I put my arm bended towards my chest that's when I would feel sort of a pop or some type of spasm and I drop my arm just like shake it off that would stop the static. When I work at my desk I keep my arm folded and today this morning is when I started to feel that the spasm in my fore arm sort of matched my heart rate a little bit and I thought do I feel my heart rate in my arm I thought that was impossible but apparently you</p>

----------	-------	-------	---------	-----	----------	------------	--------------

can. I have a blood pressure check machine just to make sure I don't have high blood pressure which I have never had but I just in case you just want to check your 'vital signs'. I put that on, it also checks 'report' and your heart rate. I put it on my right arm which was the non-vaccinated arm because I didn't want to irritate inflammation in the vaccinated arm. When I put it my right arm my 'signs' they were perfectly fine and it was 118 over 66 and pulse rate 85 but I thought, you know I really need to check the arm that I felt the, that was vaccinated but I actually felt the heart beating through the arm 'is due to' muscle spasm so I put the device on that arm that was vaccinated, my left arm and when the results stopped it was completed, it was 107 over 68, 81 Pulse but then it had the notation that I had arrhythmia, I thought that here must be the heart, I don't know if it was skipping and so I thought it is a perhaps a blood clot matter but I keeping think what Pfizer had blood clot side effects so that's where I started to check and when I started to check on maybe compression or maybe inflammation I didn't want to assume blood clot so I checked for inflammation and compression. My sister's husband is a doctor, he said it sounds like Thoracic outlet syndrome and that compression but then there is like the 'veins' one which is the blood clot, then I thought man that does sound like what I have but the fact that it was involved with blood clot but let me check to see if Pfizer did have a blood issue or a blood clot matter, that's when I thought those rare side effects. I have Endometriosis (History) but I have rare type of Endometriosis that's called microscopic (not spelled) and so it travels throughout head to toe of my body and always triggers some sort of inflammatory problem that mimic other type of condition, either trigger finger arthritis and then I don't get also sensation and then it's ruled out and then I don't have it back but it mimics something that's different and that's what I am little concerned because if the vaccine attacks right there." For treatment, consumer stated, "I did immediately because I have heavy blood flow with Endometriosis, it's little bit frightening that the vaccine could be taking out my platelets and if I start bleeding I may just end up hemorrhaging and I went to online because the fastest thing to do on weekend, it's doing online when I did quick diagnostic to do the complete blood count to check my platelet numbers are okay so I

1161921	4/2/2021	TN		F		3/1/2018	<p>her heart went back into afib one; feeling tired; numbness in her hands and fingers; tingling in her hands and fingers; lower back pain on the right side/lower back starts to hurt sometimes; weakness in legs/legs are weak; shortness of breath; feeling off; black eye; This is an initial solicited report from a non-Pfizer sponsored program, from a contactable consumer, based on information received by Pfizer. This 79-year-old female patient was involved in a patient support program. The patient received apixaban. The report describes a case of fatigue (feeling tired), hypoaesthesia (numbness in her hands and fingers), paraesthesia (tingling in her hands and fingers), back pain (lower back pain on the right side/lower back starts to hurt sometimes) and muscular weakness (weakness in legs/legs are weak). The occurrence of additional non-serious events is detailed below. The patient's past medical history included High frequency ablation and Hospitalisation. In March 2018, the patient started apixaban (Oral), (unspecified dose, twice a day). On an unknown date, the patient experienced fatigue (feeling tired), hypoaesthesia (numbness in her hands and fingers), paraesthesia (tingling in her hands and fingers), back pain (lower back pain on the right side/lower back starts to hurt sometimes), muscular weakness (weakness in legs/legs are weak), dyspnoea (shortness of breath) and feeling abnormal (feeling off). The action taken with apixaban (Oral) was unknown. At the time of the report, fatigue, hypoaesthesia, paraesthesia, back pain, muscular weakness, dyspnoea and feeling abnormal outcome was unknown. For apixaban (Oral), the reporter did not provide any causality assessments. Patient received apixaban for the indication of Atrial fibrillation. The consumer reported that in Mar-2018 during a trip with her daughter, she began feeling tired and her legs hurt. When she returned home, she was hospitalized and diagnosed with Atrial Fibrillation. Follow-up (18Mar2021): This is a follow-up solicited report from a non-Pfizer sponsored program, from a contactable consumer, based on information received by Pfizer license party for apixaban. This 79-year-old female patient was involved in a patient support program. The patient received APIXABAN. The report describes a case of ATRIAL FIBRILLATION (her heart went back into afib one). The occurrence of additional non-serious events is</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

detailed below Co-suspect products included Covid-19 Vaccine. The patient's past medical history included High frequency ablation and Hospitalization. Concurrent medical conditions included AFib. In March 2018, the patient started APIXABAN (Oral), (unspecified dose, twice a day). On an unknown date, the patient experienced ATRIAL FIBRILLATION (seriousness criterion medically significant), FATIGUE (feeling tired), HYPOAESTHESIA (numbness in her hands and fingers), PARAESTHESIA (tingling in her hands and fingers), BACK PAIN (lower back pain on the right side/lower back starts to hurt sometimes), MUSCULAR WEAKNESS (weakness in legs/legs are weak), DYSPNOEA (shortness of breath), FEELING ABNORMAL (feeling off) and EYE CONTUSION (black eye). The patient was treated with Surgery (heart monitor) for Atrial fibrillation. The action taken with APIXABAN(Oral) was unknown. At the time of the report, ATRIAL FIBRILLATION, FATIGUE, HYPOAESTHESIA, PARAESTHESIA, BACK PAIN, MUSCULAR WEAKNESS, DYSPNOEA, FEELING ABNORMAL and EYE CONTUSION outcome was unknown. The patient stated that she had the coronavirus Pfizer vaccine and a few days later she had a black eye. The patient was concerned about this because she takes Eliquis so she asked a healthcare professional for advice they then informed her that the vaccine had caused her black eye. She was told that she cannot miss her second vaccine and that she might have to stop Eliquis. Patient was concerned about having to stop and had some questions. The patient reported that, she had been on Eliquis for a while and she had been doing just fine. She recently took the Pfizer Covid vaccine and a week or two later she developed a "black eye". She described the color around her eye as eggplant purple. She remembered her mother would have blood vessels burst around her eye, so at first, she thought nothing of it. She said the day before yesterday she went with her daughter while she got the Moderna Covid vaccine. She asked the nurse administering her daughters Moderna Covid vaccine if the Pfizer vaccine could cause black eyes. The patient said the nurse did some research and told her the the Pfizer vaccine was known to cause hemorrhaging, and that the vaccine caused the black eye. The nurse told the patient she should go to her HCP as soon as possible and get blood work done. The patient did not

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

say anything else was abnormal about her blood work. She told the HCP what happened to her eye after she was given the Pfizer Covid vaccine. The HCP told her that no matter what the patient should get the second Pfizer vaccine, even if she had to stop the Eliquis for a few days. The patient said she did not want to stop the Eliquis because she has been doing wonderful on the medication and did not think the Eliquis was the cause of the black eye. She said she will have a talk with her normal primary care doctor as well as her cardiologist. The patient said she rather not get the second covid then stop the Eliquis. The patient started Eliquis two years ago after her heart went into "full afib" she had an ablation procedure and they shocked her heart three times to get it back into rhythm. Since starting the Eliquis the patient said her heart went back into afib one time. She wore a heart monitor and her heart went back into sinus rhythm on its own. She also mentioned that her HCP prescribed her a diuretic but she said she has a terrible reaction to it. She was prescribed the diuretic to help with the swelling around her ankles. She said the diuretic was also to help "keep congestion from her heart". The diuretic makes her feel "terrible" so her HCP allows her to cut the pill in half or quarters and take as needed to keep swelling down. She said the diuretic makes her feel faint and she even passed out one time while walking in the mall. She said she has not taken it in a while. The patient said she had a lot of allergies to medications, to many to list.

DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 17-Mar-2021, Prothrombin time: 16.2 seconds. For APIXABAN(Oral), the reporter did not provide any causality assessments. Patient received apixaban for the indication of Atrial fibrillation. The consumer reported that in Mar-2018 during a trip with her daughter, she began feeling tired and her legs hurt. When she returned home, she was hospitalized and diagnosed with Atrial Fibrillation. The strength of Eliquis was 5 mg. Most recent follow up information received on 18-Mar-2021 from Non-Health Professional incorporated above includes : New events added, lad data, concomitant drugs and narrative updated.; Sender's Comments: BMS Medical Evaluation Comment: This 79-year-old patient had atrial fibrillation after therapy with apixaban. Elderly age and underlying atrial fibrillation can be associated with increased risk of arrhythmias and

based on the absence of etiological plausibility; the  
reported event is considered not related to apixaban.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1162036	4/2/2021	AL	73	M	1/21/2021	2/13/2021	Fluid overload; shortness of breath; Graft clotted off; This is a spontaneous report from the Pfizer sponsored program. A contactable Nurse reported that a 73-year-old male patient (husband) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot Number: EK4176), via an unspecified route of administration, on Right Arm on 21Jan2021 at single dose for COVID-19 vaccination. Medical history included ongoing Diabetes, ongoing Vascular problems, ongoing Congestive heart failure; all (At least 15 years ago), blood thinners, dialysis from Sep2020 (husband has been on Dialysis since Sep2020. last time he was dialyzed was 11Feb2021) and Allergic to seafood and nuts. Concomitant medication(s) included clopidogrel bisulfate (PLAVIX) for blood thinner and acetylsalicylic acid (ASPIRIN) for blood thinner. The patient experienced fluid overload and shortness of breath on an unspecified date, graft clotted off on 13Feb2021. The patient was hospitalized for fluid overload from 16Feb2021 to an unknown date. She stated that her husband is on dialysis in the hospital and is going to miss the second dose appointment for the Pfizer covid 19 vaccine. She wanted to know what to do about the second dose. She wanted to know how long a person has to be off steroids before getting the vaccine and if she can reschedule the second dose appointment as he was hospitalized. Her husband is allergic to seafood and nuts. His appointment is at 10:30 (On 17Feb2021). She reported that he is on dialysis and his graft clotted and he has not had any dialysis in about a week. Her husband had fluid overload and shortness of breath. She said that he had to have an emergency port put in and they dialyzed him in the ER. He typically goes Tuesday or Thursday or Saturday. She said that he had not been dialyzed in over a week and he was getting fluid overload. She said that the last time he was dialyzed was 11Feb2021. She clarified that her husband has been on Dialysis since Sep2020. She said that when he got his Covid vaccine they checked that he was on Plavix and Aspirin. She said that they are supposed to hold the site because he has the tendency to bleed more while on blood thinners, but she does not know if that was the reason. She said that she knows what it was and he had to be dialyzed because of the fluid, but she was not told that her husband had fluid overload by the physician.

---

She said that her husband has congestive heart failure as well. The patient was hospitalized due to Fluid overload from 16Feb2021 to ongoing. Outcome of all events was unknown and for remaining event Graft clotted off was not recovered. ; Sender's Comments: The causal association between the suspect, BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) and the events, fluid overload, graft clotted, shortness of breath is unrelated. The impact of this report on benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events.

A 69-year-old female patient received first dose of bnt162b2 (BNT162B2), intramuscular in Jan2021 (Batch/Lot number was not reported) as single dose, second dose intramuscular on 15Feb2021 (Batch/Lot number was not reported) as single dose for covid-19 immunisation; methotrexate sodium (METHOTREXATE SODIUM), route of administration, start and stop date, batch/lot number and dose were not reported for an unspecified indication; adalimumab (HUMIRA, Solution for injection in pre-filled syringe), subcutaneous from 2015 (Batch/Lot number was not reported) to 2020, at 40 mg (40 mg, 1 IN 2- 2), subcutaneous from 2020 (Batch/Lot number was not reported) and ongoing, at 40 mg (40 mg, 1 IN 2- 2) for Moderate To Severe Rheumatoid Arthritis and lupus. Medical history included hatal hernia, blood clots on legs were not worsened with Humira, non smoker, abstains from alcohol, allergy to latex manifested by rash, allergy to Sulfa drugs manifested by upset stomach. Concomitant medications included lisinopril (LISINOPRIL) taken for blood pressure, start and stop date were not reported; ezetimibe (ZETIA) taken for blood cholesterol, start and stop date were not reported; folic acid (FOLIC ACID) taken for rheumatoid arthritis, start and stop date were not reported; esomeprazole magnesium (NEXIUM) taken for hiatal hernia, start and stop date were not reported; apixaban (ELIQUIS) taken for blood clots on legs, start and stop date were not reported; prednisone (PREDNISONE) taken for an unspecified indication, start and stop date were not reported; colecalciferol (VITAMIN D) taken for an unspecified indication, start and stop date were not reported; proline (PROLIN) taken for an unspecified indication, start and stop date were not reported; tramadol (TRAMADOL) taken for pain, start and stop date were not reported. The patient experienced lung disorder on an unspecified date with outcome of not recovered, post procedural complication on an unspecified date with outcome of unknown, shaking on an unspecified date with outcome of not recovered, tiredness in Jan2021 with outcome of recovered in Jan2021, feeling down on an unspecified date with

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

outcome of unknown. Clinical course: Solicited report by a consumer of a 69 year old female with events of small tumor on thyroid, blood clot on both legs, coughing and shortness of breath and non-serious lungs issue caused by methotrexate, after surgery shaking a bit, tired and cloudy weather caused to feel down a bit with HUMIRA 40MG/0.4ML (ADALIMUMAB). The patient had a relevant medical history of hiatal hernia and blood clots on both legs. On unknown dates, the patient experienced lungs issue caused by methotrexate, after surgery shaking a bit and cloudy weather caused to feel down a bit. In 2016, the patient experienced blood clot on both legs. In Sep2020, the patient experienced small tumor on thyroid. On 01Sep2020, the patient experienced coughing and shortness of breath. In Jan2021, the patient experienced tired. In Jan2021, the tired resolved. Methotrexate and covid-19 vaccine were also considered suspect. In Sep2020, the patient was admitted in hospital for cough, shortness of breath and was treated with unknown oral and intravenous antibiotics. While she was in the hospital, it was discovered that she had a tumor on her thyroid. She had stayed a week in hospital. She also had a lung issue. It was discovered lots of scar tissue on lungs and according to the physician it might be from patient's lupus, rheumatoid arthritis or methotrexate. The physician said that it was caused by the methotrexate not the Humira. Methotrexate was stopped for her. Patient denied to have pulmonary fibrosis and said that according to her doctor she did not have it and she did not know her diagnosis as it was not discussed with her doctors. For problems in lungs, patient was on oxygen. Patient was off of Humira for three weeks. She had surgery on thyroid biopsy. After the surgery she was shaking a bit. She thought it was because of the anesthesia but she was fine shortly after. The biopsy results were inconclusive which looked like it was not cancerous but physician could not really tell patient if it was or it was not. On unknown date in 2020, patient had restarted Humira again. On 04Dec2020, patient had thyroid tumor removed and was on oxygen until 11Jan2021. Sometimes the cloudy weather caused patient to feel down a bit. She did not have any paper work for the blood test. It was unknown if patient was enrolled in a covid-19 vaccine trial. In Jan2021, patient received 1st dose covid-19 vaccine manufactured by

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

Pfizer. On 15Feb2021, patient received 2nd dose covid-19 vaccine manufactured by Pfizer. The reported events except for coughing were serious as medically significant. The patient underwent lab tests and procedures which included biopsy: inconclusive in Oct2020 and in Dec2020, biopsy of tumor: inconclusive in Sep2020, blood test: unknown results in 2020, computerised tomogram of chest: unknown results in Oct2020, COVID-19 TEST: negative in 2020 and in 2020. The action taken in response to the events for bnt162b2 was not applicable, for methotrexate sodium was permanently withdrawn on an unspecified date, for adalimumab was dose not changed. The reporter's assessment of the causal relationship of the events with the suspect products bnt162b2 and methotrexate sodium was not provided at the time of this report. Since no determination has been received, the case is managed based on the company causality assessment. Pfizer is a marketing authorization holder of methotrexate sodium in the country of incidence or the country where the product was purchased (if different). This may be a duplicate report if another marketing authorization holder of methotrexate sodium has submitted the same report to the regulatory authorities. Information on Lot/Batch number has been requested.; Sender's Comments: Considering temporal relationship, a possible contribution role of vaccination with BNT162B2 to the onset of events, cannot be completely excluded. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1162121	4/2/2021	FL	69	M	3/12/2021	3/13/2021	<p>Left leg basically numb and rubbery/ leg had just gone to sleep; Tried to stand up and fell; Urinating almost non-stop; going about every 2 hours and going a lot; he had no strength except a smidgen of strength in the right leg; trying to learn how to walk/ He can't walk to the commode very well; Weight: States 201; then mentions that during the night he thought about how much he was urinating and got on the scale out of curiosity and it said he weighs 191; Afraid he was having a stroke; he had trouble holding his fork/Like a cramp in hand; Sore Arm; This is a spontaneous report from contactable consumer (patient). A 69-year-old male patient received his second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN6199) at the age of 69-years-old, via an unspecified route of administration in right arm on 12Mar2021 at single dose for COVID-19 immunization. Medical history included blood clots (reported as blood thinner). Concomitant medication included apixaban (ELIQUIS) from 2019 and ongoing as blood thinner. The patient received his first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN6199) at the age of 69-years-old, via an unspecified route of administration in right arm on 16Feb2021 at 14:00 at single dose for COVID-19 immunization which gave him severe diarrhea, nausea, gastrointestinal distress, a sore arm and it wore him out. After the second dose of the vaccine on 13Mar2021 which was administered in a public health department, the patient experienced sore arm. He was concerned because around 02:00 on 19Mar2021, he got up to go to the bathroom and noticed his left leg was basically numb and rubbery. As soon as he tried to stand up, he fell. He thought the second vaccine was the one everyone says will be harder than the first. They even gave him a sheet of paper that scared the hell out of him. Thought he was okay after the second vaccine until around 02:00. At first, he thought his leg had just gone to sleep. It was like having noodles for legs. The patient has been urinating almost non-stop which also started around 02:00, this was what woke him up. He had to crawl on hands and knees after falling to get into the bathroom, he had no strength except a smidgen of strength in the right leg. On 18Mar2021, while eating dinner, he had trouble holding his fork and did not think much about it. He had a cramp feeling in right hand. Today, while eating lunch with a fork, he also had a</p>

1161020	4/2/2021	TX	69	M	2/27/2021	2/28/2021	<p>difficulty. The patient eats with his right hand. The patient has been trying to learn how to walk since early this morning. He has worn out his wife since she was cleaning up after him in the bathroom and helping him walk. He couldn't walk to the commode very well, couldn't hold his water, and has been making a mess all day. He was at first afraid he was having a stroke but had no stroke symptoms. The patient reported that his weight was 201, then mentioned that during the night he thought about how much he was urinating and got on the scale out of curiosity and it said he weighs 191. At this time, his leg weakness persists but he was able to stand and hold his own body weight. Issue with holding fork and cramp feeling in right hand was persisting. Urinating was persisting and stated he was going about every 2 hours and goes a lot. The outcome of the event pain in arm was recovered on 17Mar2021; unknown for stroke, fall, and weight loss; and not recovered for all other events.</p> <p>I seem to have thrown a clot that blocked Right Optic Nerve Artery. Immediate blindness in Right Eye.</p>

1160456	4/2/2021	MI	71	F	3/24/2021	3/28/2021	Went to bed on fourth night after shot with symptoms from shot seemingly resolved. Woke up the fifth day and got out of bed to discover intense pain in right leg. Nothing like a charley horse cramp. Small nodule about the size of a pea, located 6 inches up from outside ankle bone. ¼ inch beneath skin. Great difficulty putting weight on right leg, created acute feeling of pinching or twisting pain. Level of pain (1-10) was an eight [note: my definition of the "worst pain imaginable" has been altered after being stung by a tarantula hawk wasp]. I hobbled to the bathroom and took two aspirin. Hobbled around on flat surfaces gradually reduced pain to a level 3-4, though I had trouble walking up and down steps for the remainder of the day (level 5-6). Fifth day, the pain level on flat surfaces was down to 1-2, on stairs, 2-3. at end of sixth day, no pain on flat surfaces, 1-2 on stairs. No pain by evening. I took two aspirin in morning and two in afternoon during this period. Seventh day, I woke up to find pain returned as I got out of bed (level 4) but was walked out within in three to four hours. I had talked with my sister (an extreme case of Factor five leiden, which I do not have) and felt this was not a blood clot, but went in to the doctor's because my husband and I were about to leave on vacation. She ordered a Doppler and ultrasound (which showed no blood clot) after telling me this type of muscle/nerve pain was just starting to be reported in patients after the vaccine. She had seen an earlier patient who had swelling and inflammation, which showed no other explanation after testing than post-vaccination reaction. I felt no lump, heat, or tenderness pushing on the skin. Doctor requested I report it on-line.
1160323	4/2/2021	AZ	66	M	3/4/2021	3/6/2021	My Ooxgyen was dipping into high 70s to low 80s with oxygen @4 lpm, Also very dehydrated and went to hospital due to feet and ankles swelling up alot.. In the hospital for 9 days to lower clots from legs and constant high oxygen therapy also hemoglobin and hematocrit went upper range. Im home now doing better, but I dont think I should take the 2nd dose.

1161172	4/2/2021	CO	54	F	3/24/2021	3/26/2021	I was vaccinated last Wednesday, March 24, at 8 pm with the Janssen vaccine. As soon as I was vaccinated (on my left arm), I put on my coat and I felt a brief and sharp pain in my left arm. And nothing else. On Friday night, I felt a very slight tingling in my left hand. And pain in the upper arm, in the region between the place where the vaccine was applied and my elbow. This pain seemed to spread to the forearm. Since then, I have tingling / numbness in my left hand and forearm and pain throughout my left arm, left shoulder, upper left center of the back and neck. And these pains and numbness have been increasing every day. Ten days have passed since the vaccine was applied and the condition only worsens. I took Voltaren in the last 3 days and the pain has not subsided. I am worried and scared. Was it a case of thrombosis or pulmonary embolism? In addition, I saw in the CDC information that, during the JNJ vaccine tests, there was a case of a severe reaction called brachial neuritis; as I didn't know what it was, I did a Google search and, apparently, the symptoms I have coincide with those of this disease. Anyway, what do you advise me to do? I have waited until now imagining that the pain and numbness would lessen. But the opposite happened and everything just makes it worse. I look forward to feedback and guidance. I haven't been to a doctor yet, but it looks like it will be necessary. Thanks.

1159908	4/2/2021	AZ	60	F	3/6/2021	3/12/2021	She got her vaccine and had no reactions at all. On 3/12/21 she was in her car and started having stabbing pain in the left side of her chest under the rib. She thought it was gas pains and dismissed it, and then it started radiating towards the front and the stomach. On 3/16/21 she went to the ER and they did a CT scan that showed that she had a blood clot on her spleen. With that they gave her the diagnosis of idiopathic splenic infarction. She was then sent by ambulance to another hospital to be admitted in case she was needing surgery. She was given heparin and on that for 2 1/2 days. They determined that 60% of her spleen is dead, blood supply cut off to it, and the other 40% is nonfunctional. On 3/19/21 they gave her vaccines of Prevnar 13, HIB, meningococcal, meningococcal B, and a flu vaccine. She was discharged on the 3/20/21 with Plavix. She saw her regular doctor yesterday and he diagnosed her with functional asplenia and to continue the Plavix. She is no longer having any symptoms after dissolving the blood clot.
1162619	4/2/2021	NV	18	F	3/16/2021	4/1/2021	Superior sagittal sinus thrombosis diagnosed on 4/1/2021. Symptoms started early on April 1, 2021
1162715	4/2/2021	AZ	67	F	3/9/2021	3/9/2021	I was 2 weeks post prolapse surgery and healing quite well. I thought that would be enough time to wait to heal and get my vaccine. I got the vaccine in the afternoon and that night at about 10 pm I started bleeding profusely with blood clots coming out of my vagina. Before this I had no bleeding post surgery or any complications. This lasted all night. I went to the surgeon next day and the bleeding and blood clots had stopped. 2 days later it started again all night long. I refrained, stupidly, to not go to ER because of the virus. It stopped next day and then 2 days later I woke up in blood and clots and it would not stop. I had to go to the ER my surgeon said to stop it. He added more stitches to my previous surgery.

1159748	4/2/2021	WV	45	F	3/20/2021	3/21/2021	The evening (3/20/21)I received the vaccine I noticed fatigue, headache and chills. The next morning I developed shortness of breath. The day after that my left left began swelling for no reason, was slightly discolored and warm to the touch. As the week went on my shortness of breath became greater and my leg more swollen. On (3/26/21) I sent to the ER by my doctor. Had a ultra sound and discovered an extensive DVT in my left groin down to behind left knee. Had a CT and discovered blood clots in my lungs. I had never had any underlying health conditions or been on medications, don't smoke, no complaints prior. Was transported to hospital spent 2.5 days in ICU before being moved to a regular bed for a total of (4) days hospitalized. The doctor installed two sheaths on each side of groin, injected my lungs with medication to blast/dissolve the clots and installed a filter in the main artery to catch any clots that may break away from leg. I was also put on a Heparin drip while in ICU. The next day the doctor went and the procedure was a success dissolving the clots. He removed the sheaths. I went back to ICU. The next day (3/28/21) a second ultra sound was done to left leg and DVT is still in left leg. Have been described Eliquis blood thinner.

1162139	4/2/2021	AL		M	2/6/2021		<p>He was diagnosed with multiple blood clots in his lungs/ clots may have appeared in his leg and went to his lung; bed ridden; pain in left side; This is a spontaneous report from a contactable consumer (the patient). A 70 year old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH, COVID-19 MRNA VACCINE)), via an unspecified route of administration on 06Feb2021 (Lot number: UNKNOWN) as a single dose for COVID-19 vaccination. The patient medical history and concomitant medications were not reported. Historical vaccination included BNT162B2 (PFIZER-BIONTECH, COVID-19 MRNA VACCINE), dose 1 via an unspecified route of administration on 16Jan2021 (Lot number: UNKNOWN) as a single dose for COVID-19 vaccination. The patient reported that he received the first dose of the Pfizer-BioNtech Covid-19 vaccine on 16Jan2021. On 06Feb2021 he received the second dose of the vaccine. Twelve days later he was diagnosed with multiple blood clots in his lungs, and from "15Feb2021 to 16Feb2021" he was hospitalized. He was prescribed to take Eliquis (Apixaban) a blood thinner, at 5 mg tablets for 6 months. He also reported that during that period (first part of Jan and part of Feb) he was bedridden because he had a lot of pain in his left side and it would not let him get out of bed, so he was on bed for a while. His primary care doctor told him that the clots may have appeared in his leg and went to his lung. The patient would like to know if any participant developed blood clots during the clinical trials of the vaccine. The clinical outcome of the events was unknown. Information on the lot number has been requested.</p>

1154074	4/1/2021		57	M	2/25/2021		<p>Blood clot/very large blood clot from his thigh to his calf; Joint pain; chills; he can't even walk now; leg pain; This is a spontaneous report received from a contactable consumer (patient's wife). A 57-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, lot number: EN6202), via an unspecified route of administration, on 25Feb2021 (at the age of 57-years-old), at a single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. The consumer stated she's asking on behalf of her husband. He received his first dose of Pfizer-BioNTech COVID-19 Vaccine on 25Feb2021 and had Joint pain and chills after that (on unspecified date in 2021) he was diagnosed with Blood clot (unspecified date in 2021); she stated he had no history of similar health issues and wanted to know if it could be directly linked to this vaccine. The wife further reported that it's dramatically changing his life, he can't even walk now. He had the Covid vaccine on 25Feb2021 and he has no history of blood clots. He developed a leg pain (on unspecified date in 2021) which was odd and they thought that maybe it was some arthritis or something like that. They went to the orthopedist and he was being treated for what the orthopedist thought was a bakers cyst. But then they discovered it was a very large blood clot from his thigh to his calf. They would like to know about this. They have been looking into what he had experienced, and it seems very unusual. It just seems too coincidental that this happened after the Covid vaccine. The emergency room doctor of course shut them down immediately and said that the Covid vaccine never would have done this. But the patient's doctor yesterday said that there are too many unknowns to say for sure that the Covid vaccine didn't cause this. She is not saying that they are against the Covid vaccine, but they are concerned. The patient is on blood thinners now and they just need to know if there is a possible correlation. She had heard on the world news that there is a connection after receiving the (company name) Covid vaccine and now they are shutting this vaccine down in (region name). She saw on the news last night they were asking if there is a correlation with the Pfizer and (company name) Covid vaccines and this. It is very concerning. They have been trying to do research and there is</p>

1156253	4/1/2021	AZ	68	M	3/12/2021	3/12/2021	I didn't have pain in the arm, after an hour I had a slight headache. The headache lasted about a day. After the 3-4 day I had severe diarrhea and stopped taking my supplements. It stopped for a couple days then came back for a day. I had no headache or pain, just 3 bad episodes of diarrhea. On March 24th I went into the Hospital with severe pain in my lower left back side. I thought I was passing a kidney stone, with the pain I was having. When I got there they did a CT scan and blood work and it wasn't kidney stone but I had a blood clot on the lower left side of lung and the right side as well. They immediately put me on blood thinners. I was there for a day and a night. They released and put me on medication. I've had minor pain but nothing like the pain I had before. I have since followed up with a Pulmonologist and PCP. Pulmonologist said I had blood clots but couldn't give me a cause. My PCP said she thought I had or have Covid. I asked to have my blood drawn and she said it was too late for that because I had taken the vaccine already.
1155524	4/1/2021	CA	70	F	3/25/2021	3/26/2021	Pt. states she started to spit blood approximately 12 hours after Covid 19 vaccines. It happened both times. 1st dose given on 2/25/21, reporting second dose from 3/25/21 because pt. sought ER care at . She states the blood was coming from throat area, not vomiting. She just spit out blood and blood clots. Dr. will send her to ENT to rule out lesion.
1155444	4/1/2021	NE	53	F	3/25/2021	3/26/2021	Minor change - cotton mouth at some point in every day since starting 1 hour after vaccination, including slight difference of tongue feeling thicker as in slightly thirsty and dry. MAJOR CHANGE - 12 hours after vaccination, like a faucet turning on menstrual cycle break-through heavier somewhat clotted bleeding starting 4 days early which NEVER happens - convinced is due to the vaccine. Flow for 12 hours then stopped for 12 hours, going on since but now into the regular week. Want to know why. VERY CONCERNED about girls such as 13-year olds and what the vaccine might do to their female bodies and ability to have children and to have normal cycles.

A 74-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EN6205), via an unspecified route of administration, administered in the left arm on 03Mar2021 (at the age of 74 years old) at a single dose for COVID-19 immunization. Medical history included lumbar spine infusion (operations on spinal cord) from an unknown date and unknown if ongoing. There were no concomitant medications. It was reported that the patient needed the call handler to speak slowly, she doesn't feel that well. She had the first dose of BNT162B2 last 03Mar2021 and the second dose will be on 23Mar2021. She said something was happening to her arm but it was not where the needle went in, that is not where it is. It hurt there at where the needle went in, in the beginning but now it hurts down toward the elbow and it penetrates through the epidermis, endodermis and the muscle and feels like it's at the bone. She hopes it was not a blood clot. She has been looking at the website and they say people could have blood clots and she does not know if this was a blood clot, she can't hardly lift her arm, it was the left side that the shot was in because her right side is partially paralyzed due to effect of lumbar spine infusion and so when she tried to get up sometimes she can hardly lift that arm and so she didn't know what to do if she should call the primary care doctor to see if she has a clot but she read it and it says to call this number if you</p>

-----------------	--------------	--------------	----------------	------------	-----------------	-------------------	---------------------

are having compactions and she been on hold over and hour and a half. It was hurting and the feeling like she couldn't hardly raise the arm or get any kind of strength in it. She knew in Europe they have had few people who have had blood clots, and she thought could that be a sign of a blood, like blood not moving through her veins like it is supposed to. It is not moving it has not made it to her heart yet. She says it is associated with the product, this is the only thing she has had in her arm she knows it is the product. She said her birthday just passed. She turned 75 years old but when the issue started in her arm she was 74 years old. It did not start the first week, the first week it was just sore around where the shot went in but then last week it started happening where it was hurting down her arm and she was getting close to the second shot which she doubts she will have but it is the 23rd which is next week. She used to be 5'2" but the operations on her spinal cord, she guesses she might be 4'10 now. She does not know because she can't hold her head up straight because the doctor that fused it, she indented it instead of it being more out and because of that her head is forward and down. It was also reported that she hasn't been to the doctor she only goes to pain management for him to check out her body and everything and renew prescriptions. The outcome of the events was unknown.

1153985	4/1/2021	KS	70	F	3/10/2021	3/15/2021	Blood clot in the lung; A spontaneous report was received from a consumer concerning a 70-years-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced blood clot in the lung/ Pulmonary thrombosis. The patient's medical history included hyperthyroidism. Products known to have been used by the patient, within two weeks prior to the event, included levothyroxine for hyperthyroidism. On 10 Mar 2021, approximately five days prior to the onset of the events, the patient received the first of two planned doses of mRNA-1273 (Batch number not provided) via unknown route for prophylaxis of COVID-19 infection. On 15 Mar 2021, the patient developed a medically significant event of blood clot in her lung and was hospitalized for 2 days followed by short of breath and cannot walk very far. Treatment for the event included blood thinner. Action taken with mRNA-1273 in response to the events was not provided. The outcome of the event, blood clot in the lung/t Pulmonary thrombosis was not provided.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.

1154148	4/1/2021	CO	51	F	3/1/2021	3/17/2021	DVT (deep vein thrombosis) in right medial subclavian; superficial thrombosis in right proximal basilic vein; right arm swelling in the setting of receiving her Pfizer covid vaccine in the right arm 1 week prior; This is a spontaneous report received from a contactable healthcare professional. A 51-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 intramuscular, administered in arm right in Mar2021 (Batch/Lot number was not reported) as a single dose for COVID-19 immunization. Medical history included hyperlipidemia, acute pancreatitis, May-Thurner syndrome, and allergies: penicillin, IV contrast. Concomitant medications included drospirenone, ethinylestradiol betadex clathrate (YAZ), fenofibrate, and levothyroxine. Patient is not pregnant at the time of vaccination. Patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination. Patient has not been tested for COVID-19 since the vaccination. Patient was seen at the ED for right arm swelling in the setting of receiving her Pfizer COVID vaccine in the right arm 1 week prior. She was found to have a DVT (deep vein thrombosis) in right medial subclavian and superficial thrombosis in right proximal basilic vein. The events started on 17Mar2021 09:00. AE resulted in emergency room/department or urgent care. Patient was recovering from the events. Treatment for AEs include anticoagulation. Information about lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of subject vaccine cannot be excluded for the DVT and other reported events, based on temporal relationship. However the reported events may likely represent intercurrent medical conditions in this patient. There is very limited information provided in this report. This case will be reassessed upon receipt of follow-up information. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1157535	4/1/2021	CO	50	F	1/6/2021	1/7/2021	Cellulitis; Clammy skin and hands; Nauseous; Fatigue; fever; chills/teeth chattering; red rash; red mark on their right arm; hot to the touch; tender; Arm swollen and sore; A spontaneous report was received from consumer, concerning a 50-years-old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced cellulitis, chills, fatigue, nausea, fever/pyrexia, red mark on their right arm/ vaccination site erythema clammy skin and hands/cold sweat, red rash/ rash erythematous ,arm swollen and sore/pain in extremity, red rash, hot to touch/ feeling hot and tenderness. The patient's medical history was not reported. Concomitant medications included bomocriptine, doxycycline, cetirizine hydrochloride, ibuprofen. On 06-JAN-2021, prior to the onset of the events, the patient received mRNA-1273 intramuscularly in Right arm for prophylaxis of COVID-19 infection. On 07-JAN-2021, after receiving mRNA-1273, the patient's arm was swollen tender, and sore. The patient reported that the arm felt better the next day, after sleeping and taking it easy. The patient stated that on 08-JAN-2021, she woke up with more energy after sleeping and taking it easy. The injection site was not treated directly, but she may have taken some Advil for symptom relief. On 19-JAN-2021, the patient started not feeling well. On 20-JAN-2021, the patient noticed a red mark on their right arm where they had received the injection. The patient reported that she had a red rash on the right arm, below the injection site, that was hot to the touch. On 21-JAN-2021, she reported seeing a physician. The physician ordered an ultrasound to rule out a blood clot in the patient's arm. The doctor diagnosed the patient with cellulitis and prescribed an antibiotic (Doxycycline) and cetirizine hydrochloride. The event cellulitis was assessed as medically significant as per IME list. The patient reported feeling very nauseous and fatigued. The patient also reported chills and fever, chattering teeth, clammy hands and feet. The patient is still fatigued and nauseous but is starting to feel better today 28-JAN-2021. The treatment included an antibiotic (Doxycycline) and cetirizine hydrochloride. Action taken with mRNA-1273 in response to the events was not reported. At the time of this report, the outcome of the events cellulitis, chills, fatigue, nausea, fever, red mark on their right arm, clammy skin and hands, red rash, arm swollen and sore,

1157825	4/1/2021	MD	42	F	1/15/2021	1/21/2021	I took Tylenol prior to vaccination. About 5 or 6 hrs later, I had heaviness in my arm and mild headache. I took Tylenol again and I was fine. I started having headaches, so I checked my BP. It started spiking to like 168/100 and 180/110. I went to cardiologist and he did an ECHO, checked the carotid in my neck and a doppler to check for blood clots. Everything was normal. He prescribed a new BP med (Losartan - 50mg once a day) and diuretics (HCTV - 12.5 mg once a day in the morning). My BP was stabilized, but then it started to increased again, so he increased my Losartan to twice a day. Now it's stabilized.
1158135	4/1/2021	TX	39	M	3/17/2021	3/20/2021	Got a sudden heart attack after developing chest pain/discomfort while walking outside on 3/20 afternoon time. Went to ER and shifted to hospital. Treated with 2 stents in heart. Arteries were found blocked and blood clot was removed.
1155485	4/1/2021	OK	65	F	1/14/2021	1/17/2021	About 3 days after the vaccine my daughter mentioned to me that I was not breathing right. It was harder to breathe and I could not even take a shower that I would be out of breath. My daughter checked my pulsox and it was 85. I couldn't really walk or do anything so my daughter transported me to ER and lots of labs were done so since my D Dimer was too high they did a CT scan and it showed some blood clots in my lungs. They admitted me because they were concerned with the location of one of them. They did some heart tests too and put me on Eloquis and then sent me home. I stayed for 2 days. Then they scheduled me FUs with a heart doctor and a pulmonologist.

1150488	3/31/2021	FL	80	F	2/26/2021	3/15/2021	mini stroke; still weak; A spontaneous report (United States) was received from a consumer concerning an 80 years old, female patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced event mini stroke/transient ischaemic attack and still weak/asthenia. The patient's medical history was not provided. The concomitant medications on use were also not provided. On 26 Feb 2021, approximately 17 days prior to the onset of the events, the patient received their first of two planned doses of mRNA (Batch number: 011A21A) through unknown route of administration for prophylaxis of COVID-19 infection. On 15 Mar 2021, patient experienced mini stroke. The patient was hospitalized on the same day till 17 Mar 2021. It was serious event which required hospitalization. Laboratory tests performed included ultrasounds, cat scan of the brain, MRI of brain, ultrasound of arteries, and chest x-ray. The findings of lab tests were not provided. The patient was given acetylsalicylic acid and an injection in the belly to prevent blood clots. Action taken with mRNA-1273 in response to the events was not reported. The outcome of the events was unknown; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of these events, a causal relationship cannot be excluded

1151065	3/31/2021	TX	69	M	1/5/2021	2/5/2021	Stroke; Blood clot on the brain; I Just sort of zoned out on them; Arm soreness; I Just kept getting tireder; A spontaneous report was received from a consumer, concerning a 69-years old male patient, who received Moderna's COVID-19 vaccine and experienced stroke, blood clot on brain, arm soreness without redness and swelling, he just kept getting tireder, he just sort of zoned out on them. The patient's medical history was not provided. Concomitant product use was not provided by the reporter. On 05 Jan 2021, prior to the onset of events, the patient received the first of two planned doses of mRNA-1273 (lot number 037K20A) via unknown route for COVID-19 infection prophylaxis. On 05-FEB-2021, prior to the onset of events, the patient received the second of two planned doses of mRNA-1273 (lot number 032L20A) via unknown route for COVID-19 infection prophylaxis. On 05 Feb 2021, after the second dose of vaccine, the patient experienced arm soreness and fatigue, He did not get any medication or treatments for his arm soreness without redness and swelling and and just kept getting tireder events. On10-MAR-2021 patient experienced just sort of zoned out of them, stroke, blood clot on brain. An ambulance was called for him and he was taken to the hospital where he received MRIs, and CT scans. He states they think it was a stroke. No treatment medication was reported. Action taken with mRNA-1273 in response to the event was not applicable. The outcome of the events (arm soreness without redness and swelling and he was just kept getting tireder) was recovered but the events (stroke, blood clot on brain, he just sort of zoned out on them) not resolved at the time of this report.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.
1151097	3/31/2021	NY	56	M	3/14/2021	3/16/2021	Reports that 2 days after vaccine, patient noticed L neck pain and warmth with possible rash. Says that while the rash/warmth improved, he noted that a vein was very prominent on that side and he came to my office (I'm his PC doctor) to show me it. I felt a cord, and suspected a superficial neck vein thrombosis L side, which was confirmed on US.

This 67-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL9266) on 12Feb2021 02:15 PM in left arm at single dose for COVID-19 immunisation. Medical history included slight asthma, known allergies: sulfa, penicillin. No COVID prior vaccination. Concomitant medications included Vitamins (over-the-counter, other medications in two weeks). No other vaccine in four weeks. The patient previously received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL9262) on 22Jan2021 03:30 PM in left arm at single dose for COVID-19 immunisation at the age of 67-year-old. The patient was not pregnant, was not pregnant at time of vaccination. No COVID tested post vaccination. On 15Feb2021, within a few days of receiving second dose of vaccine, the patient developed blurry vision of right eye. After seeing a retina specialist, patient was diagnosed with BRVO (retinal vein branch occlusion). The cause of BRVO is a localized clot (thrombus) development in a branch retinal vein. The events resulted in disability or permanent damage. The patient received treatment as anti-VEGF drug - Avastin for the events. Outcome of the events was not recovered.

A 30-year-old non-pregnant female patient received the second dose of bnt162b2 (BNT162B2 reported as PFIZER COVID 19 VACCINE; lot number: EN/ EW 6198; expiration date: unknown), at vaccination age of 30-year-old via an unspecified route of administration in the left arm on 02Mar2021 as a single dose for covid-19 immunisation. The patient medical history was not reported. The patient was not diagnosed with covid prior to vaccination. The patient received the first dose of bnt162b2 (BNT162B2 reported as PFIZER COVID 19 VACCINE; lot number: EN6198), at vaccination age of 30-year-old via an unspecified route of administration in the left arm on 09Feb2021 as a single dose for covid-19 immunisation but had weakness, fainted, lost consciousness and concussion. There were no concomitant medications. The patient did not receive other vaccine in four weeks. The reporter mentioned that on the next day after vaccination (03Mar2021), the patient's one foot and leg became very cold and turned blue other foot warm and hot started cardiac arrhythmia, dizziness, lightheadedness, nausea, muscle weakness, extreme fatigue, extremely low blood pressure and tachycardia when resting. The reporter stated that since 02Mar2021, she hasn't been able to get out of bed due to extreme weakness. The reporter also mentioned that her heart rate (HR) gets up to 135 [unit unspecified]. The reporter also stated that the patient was wearing a heart monitor and was waiting for data. They went to the emergency room (ER) on 12Mar2021 due to concerns of blood clot, ruled out blood clot. The doctors can't explain what is happening to her. She was extremely healthy and fit, no previous cardiac or energy issues. No blood pressure issues or family HX. She says she "feels like she's dying". The adverse events resulted in doctor or other healthcare professional office/clinic visit, emergency room/department or urgent care,

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							hospitalization, and life-threatening illness (immediate risk of death from the event). The hospitalization was reported as 1 day. It was unknown if the events received treatment. The patient was not tested post vaccination. It was further reported that her sister had the second Covid shot 02Mar2021 and a few hours later she lost consciousness. She has been in the hospital ever since. She was in and out of consciousness, her blood pressure is low, and her heart rate is high. One of her legs is blue and cold, the other is hot. She cannot get out of the bed. The doctors don't know what is wrong. It was mentioned that the patient was healthy and not taking any medication. The outcome of the events was not recovered.
1148732	3/31/2021	FL	83	M		3/18/2021	Blood clots in urine; Chills; A spontaneous report was received from a consumer concerning an 83-years-old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced blood clots in urine/haemorrhage urinary tract and chills. The patient's medical history was not provided. Concomitant product use provided by reporter included baby aspirin. On 18 Mar 2021, prior to the onset of the events, the patient received first of two planned doses of mRNA-1273 (lot/batch number: 030A210) intramuscularly for prophylaxis of COVID-19 infection. On an unknown date, the patient experienced blood clots in urine and chills. The event blood clots in urine was medically significant. Treatment information was not provided. Action taken with mRNA-1273 in response to the events was not provided. The outcome of the events blood clots in urine and chills was resolved on an unspecified date.; Reporter's Comments: Although a temporal association exist, there is not enough information to assess the events of blood clots in urine as the patient's medical history is lacking. However, chills is consistent with the known safety profile of the vaccine. Further information has been requested.

blood clots on Mar2021 with outcome of unknown, whether the injection was done in the wrong location on Mar2021 with outcome of unknown, her arm was very itchy and a red papule-like round rash developed, it was pigmented on Mar2021 with outcome of unknown, her arm was very itchy and a red papule-like round rash developed, it was pigmented on Mar2021 with outcome of unknown, her arm was very itchy and a red papule-like round rash developed, it was pigmented on Mar2021 with outcome of unknown, it was "highlighted" and "dot-like" on Mar2021 with outcome of unknown, had a sharp pain, and tingling or pain-like sensation at the fingertips/she was going "through a world of pain", and from the arm down to the side of body on Mar2021 with outcome of unknown, had a sharp pain, and tingling or pain-like sensation at the fingertips on Mar2021 with outcome of unknown. The patient underwent lab tests and procedures which included body temperature: 99.4 fahrenheit on Mar2021, body temperature: 100 fahrenheit on Mar2021. The consumer reported that "Who makes the vial label? What syringe did they use to give her the vaccine? How big was it? Where is the vaccine administered? Did we make a second batch with "much less" side effects? She thought there was an earlier version which should have more side effects. Did she have to share a vial with other people? Is it multiple doses? How much is the dose of a vaccine?" Consumer stated the lot number was a "so vague looking thing" to come with the Pfizer vial. Upon clarification, said she did not see the lot number on the vial, but on the vaccination card, where the lot number was very small. She would include 5 labels with lot numbers to split to each person who gets the dose from the same vial. The clinical course was reported as follows: She got the second dose of Pfizer's COVID-19 vaccine on 05Mar2021 and has developed side effects. Her nervous system was affected, she has weakness on her leg, had very tight calf muscles, eye pain. When she was working, she started to have difficulty breathing, she was dragging her feet, could not take the next step. This was 2 weeks ago and went away for a while. Today she had "such a tight feeling" of the calf, and a little bit of pain to it, she was nauseous. She was wondering if it was a lung issue or blood issue, such as blood clots. She had a fever too, 99.4°F at one time and over 100°F for a day or so. The

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1151601	3/31/2021	PA	78	M	3/11/2021	3/28/2021	<p>first dose didn't give her any side effects. She was also concerned about whether the injection was done in the wrong location, she thought it was in the deltoid, but 10 days later her arm was very itchy and a red papule-like round rash developed, it was pigmented, she wondered if it was a hair, it was "highlighted" and "dot-like". It was located in the 2/3 lower to the elbow from the shoulder, she thought it was "really low" and they missed the deltoid muscle, she had no idea if the nurse didn't know the exact location and putting it "in the skin" was the cause of her symptoms. Stated they put a bandage in the wrong location, there was nothing there. She additionally had a sharp pain, and tingling or pain-like sensation at the fingertips, yesterday she was going "through a world of pain", and from the arm down to the side of body. With the first dose she didn't have any pain, but it was "very weird", afterwards she had some "sharp pain" under the scapula and didn't know why. She thought it was "echo" through the nervous system. Stated when she got the vaccine, she saw 3 dark marks on the syringe and two thirds were filled with the liquid. She wanted to know if this dosage was correct. Mentioned a lot of people had side effects, a lot of times they are given in the wrong location, in an entirely different place. She thought there was an earlier version of the vaccine which should have more side effects. She had a "very bad bad" experience 4 years ago when she got a rabies vaccine, it was given at 45°, the nurse gave the injection "cutaneously", after 5 min she was "so in pain".</p> <p>Copious bleeding from left nostril, running down throat to the point patient was choking on it. Clott-like material in the sputum. Copious bleeding lasted for fat least 1.5 to 2 hours, slowed down only when treated an packed in the hospital ED. Chemical cauterization with Silver Nitrate at approximately 10:30 PM. ENT follow up scheduled for April 1.</p>

1151636	3/31/2021	PA	85	M	2/3/2021	2/12/2021	<p>My father received his first Pfizer vaccine on 02/03/21. On 2/12/21 I rushed him to the ER. He was vomiting uncontrollably and had shortness of breath. Once arrived at ER, they immediately put him on oxygen. Vomiting lasted several hours. They tested him for Covid and did a chest x-ray. Tested positive for Covid. Chest x-ray showed Covid pneumonia. Was admitted. Stayed in hospital for 5 days and was then released to nursing home for physical and occupational therapy. He was very weak and on days experienced what they called Covid fog. After 2 weeks of therapy, he was released on 03/06/21 to go back home to his apartment, with extended visiting nurse therapy. On 3/10/21, was the first visiting nurse appointment. At 12:00 an RN came to his apartment from Home Health Care. She checked his vitals. She said his blood pressure was good, lungs sounded good and oxygen level was 98. She said he was doing good and that she would not need to continue to come out and check on him weekly. She left. At 2:30 the same day, a Physical Therapist from Home Health Care came. She asked him lots of questions and adjusted my fathers' walker for him. He showed her how he was doing using the walker. Walked approximately 15-20 feet in his apartment. She checked his vitals before she left. His oxygen level was now at 91. She had him take a few deep breathes until his oxygen level was up to 93. She left and said she would be back on Friday the 12th to begin the actual physical therapy then. Within 10 minutes after she left my father started shaking uncontrollably and was having difficulties breathing. I called 911. Paramedics arrived. My fathers' oxygen level was all the way down to 74. They took him to the ER. When getting him out of ambulance he began vomiting. Vomiting lasted for hours just like when he went to the hospital back in February. They tried 3 different drugs to control the nausea. They did EKG, chest and abdomen scans. Was found that he had multiple blood clots and inflammation in his lungs and a bacterial infection in his blood. After testing, bacteria was found to be E Coli. Treated him with heparin for clots and antibiotics for infection and had him on oxygen in nose. Every day thereafter, he felt worse. They switched him to a high flow oxygen mask to keep his oxygen levels up. By Saturday night (early morning Sunday) on 03/14, they had taken the high flow oxygen mask off and hooked him up to a BiPap oxygen machine</p>

because his oxygen levels were dropping too low. We were then told by the lung doctor, that the damage to his lungs was extreme and that the next step would be to put him on a ventilator and feeding tube. My father did not want this per his will and his discussion with Dr earlier in the week. Dr indicated that he would not get better just being on the BiPap machine and we then chose to have them take him off of the machine because he did not want to go on life support. My father passed away on Sunday, March 14th around 6:30pm.

The patient experienced arm swelling /left arm swelling (hospitalization) on 09Mar2021 with outcome of recovering , blood clots in arm/blood clots in left arm (hospitalization) on 11Mar2021 with outcome of not recovered , swollen lymph nodes /swollen lymph nodes in left arm (hospitalization) on 11Mar2021 with outcome of not recovered , nodules were found on her lungs/nodules in lungs (hospitalization) on 11Mar2021 with outcome of unknown , soreness at the injection site on 05Mar2021 with outcome of not recovered , left arm discomfort on 08Mar2021 with outcome of not recovered , left arm redness on 09Mar2021 with outcome of not recovered. The patient was hospitalized from 11Mar2021 to 12Mar2021. On 05Mar2021 she began to have arm pain. 48 hours later, patient's arm started really hurting her, something about her arm being sore on the day of injection and reporter said she was going to be sore and when she got back from going away for the weekend, she thought uh oh, there was a problem here, this was not normal, not right. On 10Mar2021, she experienced swells arm swelling and went to urgent care which was diagnosed with swollen lymph nodes and given Cheplex prescription at urgent care. 11Mar2021, daughter was admitted to hospital by her provider. Daughter was found to have blood clots in arm and continued swollen lymph nodes. Daughter was given IV cheplex and Eliquis while in hospital. Daughter will have

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

to be on Eliquis for next 3 months per reporter. The patient had her first vaccine, Pfizer, and became ill with blood clots, swollen lymph nodes, and wound up in the hospital. Reporter stated that she and the patient were worried about her getting the second shot. The patient was on blood thinners and was seeing a pulmonary doctor and hematologist. She didn't know about her getting the second shot and thought this should be reported. The patient was due for the second vaccine next week on 26Mar2021 and she was still sick, should it be postponed or what? The patient went the night before the hospitalization to the Urgent Care and the doctor prescribed Keflex, an antibiotic and saw her primary care doctor the next morning and she put her in the hospital. Reporter stated they were getting nervous and wanted to report for side effects. She stated the patient was home from the hospital but still sick really bad. The patient went to Urgent Care 10Mar2021, saw her primary care 11Mar2021 and was sent to the hospital 11Mar2021. Reporter later clarified that the patient was sent to the Emergency Room and after a few hours, she was sent upstairs to be admitted for a 24 hour hospital stay. The patient received Eliquis; Keflex as treatment. Fluids at the hospital, unknown type. Reporter stated they decided the patient wasn't doing really well and went to the Urgent Care that night and were given Keflex because they felt there was an infection. When they discovered it further that there were blood clots, the patient was told to stay on the antibiotic and given fluids and put on blood thinner, Eliquis, states patient had never been on a blood thinner before. Patient was admitted on 11Mar2021 for 24 hours. Reporter stated that they kept the medicine going and then felt she was stable enough to be discharged the next night at around 18:00 to continue with Keflex antibiotic and Eliquis for 3 months. Reporter stated they were told to contact a hematologist and pulmonary doctor for the nodules in her lungs and to contact her primary doctor if not doing better in one week, but they will probably contact her tomorrow. Reporter clarified that the patient had a chest x-ray a couple of months ago and everything appeared fine, so she thinks that the nodules developed after the vaccine. The patient had a chest x-ray on 11Mar2021 and nodules were found on her lungs, scheduled to follow up with lung doctor. Reporter stated whether they were there before

or not was unknown. No follow up X ray yet. Reporter would like to know if daughter should get second dose? Second dose was scheduled 26Mar2021. Adverse events required visit to emergency room: Urgent Care the night before, follow up the next morning with primary doctor, the doctor got her in right away and said she needs to go to the hospital. Yes, patient went through the ER, doctor said that she would be coming and then after there a while, she was admitted to the hospital. Adverse events required visit to physician office. Patient saw the doctor on 11Mar2021 and was sent to the hospital. Information about lot/batch has been requested.

1148710	3/31/2021	KS	57	M	2/3/2021	2/3/2021	<p>blood clot in lower leg; achy; Pain in the back of leg that would not go away; body ache/ache; headache; A spontaneous report was received from a consumer concerning a patient age ,57 years old male patient who developed Blood clot in lower leg/Thrombosis, Body ache/Myalgia, Headache/Headache and pain in the back of the leg that would not go away/pain in extremity. The patient's medical history included Central Retinal vein occlusion (CRVO). Concomitant product use was not provided/unknown by the reporter. The patient received their first of two planned doses of mRNA-1273 (Batch number not provided) on unknown date. The patient received their second of two planned doses of mRNA-1273 (Batch number not provided) on 03 Feb 2021, intramuscularly in the (unknown injection site) for prophylaxis of COVID-19 infection. On the same day as receiving the vaccine 03 Feb 2021 patient reported as having pain in back of the leg that would not go away. Patient also had body aches, felt achy and had headache. Patient went to Emergency room on 03 Feb 2021 and was diagnosed a blood clot in lower leg. The event blood clot in lower leg was assessed as medically significant based on IME list. Treatment information was not provided/unknown. Patient is following up with a hematologist. The patient received both scheduled doses of mRNA-1273 prior to the event(s); therefore, action taken with the drug in response to the event(s) is not applicable. The outcome of the event(s), Blood clot in lower leg/Thrombosis, Body ache/Myalgia, Headache/Headache and pain the was unknown.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events (pain, myalgia, and headache) a causal relationship cannot be excluded. A very limited information regarding these event (Thrombosis) has been provided at this time. Noting the history of central retinal vein occlusion may remain as a risk factor for thrombosis. Further information has been requested.</p>

1148725	3/31/2021	PA		F	2/4/2021		<p>blood clot in her leg/clots in upper thigh on inside of thigh which were very sore; more lumps in crease of leg/knee/lump red and raised/ones behind the knee in the crease are still there and hard as a rock; lump was red and raised; Patient reports it was really sore up toward groin; A spontaneous report was received from a consumer concerning herself, who is 68-years old female patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced thrombosis, mass excision, groin pain, skin swelling, developed more clots in upper thigh on inside of thigh which were very sore. No medical history was reported. No concomitant medications were reported. On 04-Feb-2021, the patient received their first of first planned doses of mRNA-1273 (Lot number: 031120A) was administered intramuscularly with unknown site for prophylaxis of COVID-19 infection. On an unknown date, an unspecified amount of time, the patient developed a blood clot in her leg, her lump was red and raised. She went to the doctor and they told her to put a warm compress and keep her leg up. The lumps did not start to go down. She started to develop more lumps in crease of leg/knee. Patient went to vascular doctor who did an ultrasound and diagnosed superficial thrombophlebitis. Patient then went to get second Moderna vaccine on 10MAR2021(lot#036021A). She developed more clots in upper thigh on inside of thigh which were very sore. Patient reports it was really sore up toward groin. She went to doctor again and they put her on Xarelto, and Aleve as directed on box. Symptoms are ongoing. Original lumps were no longer sore to the touch, ones behind the knee in the crease are still hard as a rock. New lumps after second dose are tender. Action taken with mRNA-1273 in response to the events was not applicable. The outcome of the events were not recovered. The reporter did not provide an assessment for the events; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.</p>

1148785	3/31/2021	CA	68	M	3/3/2021	3/15/2021	Chills; seems to have some kind of hypothermia/kept reading 94.7; hemorrhoids; pulmonary embolism in his right lower lobe; This is a spontaneous report from a contactable pharmacist (patient). A 68-year-old male patient received bnt162b2 (BNT162B2), dose 2 via an unspecified route of administration on 03Mar2021 (Batch/Lot Number: EN6198; Expiration Date: 30Jun2021), at the age of 68-years at vaccination, as SINGLE DOSE for COVID-19 immunisation. Medical history included paraplegic, he has been paralyzed for 45 years. The patient received first dose of the vaccine on 10Feb2021 with lot number: EN5318, expiration 31May2021. There were no concomitant medications. The patient went on Monday to the ER for an unrelated condition and they did a CT scan and found a blood clot, a pulmonary embolism in his right lower lobe. He confirms the pulmonary embolism was diagnosed on Monday, 15Mar2021. He got home that night and read the headline in the (Withheld) times that said several European countries are pulling the Astra Zeneca vaccine over concerns about blood clots even though there has not been any causal relationship found. He thought that with the drug companies, they should be able to have data regarding potential adverse effects for Pfizer so he was calling report that. He discusses it with the ER doctor and he couldn't really figure out why he had a blood clot, it was incidental to what he was being scanned for, it surprised him. They put him on Eliquis so he is on an anticoagulant, which will cost him a fortune. Today will be the third day he has been on the Eliquis. He is at home and he would say his only concern is that he does have hemorrhoids so when he has bowel movement tomorrow, because he doesn't go every day, but when he goes he is concerned if he starts to bleed that the anti-coagulant might cause the bleeding to be more significant than it usually is. No further information provided. His only other concern is he seems to have some kind of hypothermia, he is not entirely sure because of his thermometer is not very good. That is the reason he went into the Emergency Department because it kept reading 94.7 and he googled it and it said if it is below 95 it is a medical emergency and go to the ER so he got to the Emergency Department and it was 97.6 and now he checked his temperature again with the thermometer and it was 96.8 so either he has a faulty thermometer or something but

1149915	3/31/2021	WI	86	M	2/3/2021	2/3/2021	<p>her husband's pain is more in his right elbow and right shoulder/pain is more like a joint pain; right arm pain started with the COVID-19 Vaccine injection site/pain is in his right (dominant) arm; husband is experiencing a sore arm, husband's arm has been sore as worsened; This is a spontaneous report from a contactable nurse. A 86-year-old male patient received first dose of BNT162B2, (PFIZER-BIONTECH COVID-19 VACCINE, Formulation: Solution for injection, Batch/Lot Number: EL9269), via intramuscular route of administration, administered in Arm Left on 03Feb2021 14:15 as single dose for covid-19 immunization. Medical history included was none. Concomitant medication was not reported. Upon follow-up (16Mar2021): it was reported that, first dose of Pfizer covid-19 was shot on an unspecified date at 14:15 PM via intramuscular route of administration in right arm of Batch/Lot number: EL9269. She said her husband's arm has been sore for 8 days. Her husband's arm has been sore for 8 days was reported as worsened. She said her husband tried Advil, Tylenol, hot packs, cold packs, and nothing seems to help his sore arm, and pain was in his right (dominant) arm, the pain was more in his right elbow and right shoulder, and her husband's pain is more like a joint pain. She said her husband has a high tolerance for pain, and normally doesn't take anything for pain. She said her husband can't put his jacket on because he is unable to lift his arm due to the pain in his right elbow and right shoulder. She said her husband has been trying everything, and nothing seems to help his right elbow and right shoulder pain much. Clarified her husband's right arm pain started with the COVID-19 Vaccine injection site and then the pain moved into his right shoulder and then into his right elbow. Reported her husband had a CAT scan of his head and neck on 01Feb2021 checking for blood clots. She said the results of the Head and Neck CAT (Computerised tomogram) Scan were normal. Reported her husband's second COVID-19 Vaccine dose is scheduled for 24Feb2021. The reporter classified the event husband is experiencing a sore arm and husband's arm has been sore as worsened as disability and other events was not reported and assessed the causality between the event husband is experiencing a sore arm and husband's arm has been sore as worsened the vaccines as Related. Upon follow-up, it was reported that, the patient has a very sore arm</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							for about 8 days but then it resolved and no trouble since then. His second shot did not have much of a reaction and both are fine now. Therapeutic measures were taken as a result of husband is experiencing a sore arm and husband's arm has been sore as worsened and included treatment with ADVIL at a dose of 200 mg (Lot Number: W36210, Expiration Date: Nov2019), TYLENOL, at a dose of 500mg, hot packs and old packs. Upon follow-up (16Mar2021), the outcome for the events were recovered on 11Feb2021. Follow up (16Mar2021): This is a follow-up spontaneous report received from a contactable nurse includes, updated information about the first dose of Pfizer vaccine, route of administration for the second vaccine and the outcome for the events. Follow-up attempts are completed. No further information is expected.; Sender's Comments: Considering temporal relationship and known safety profile, the reported pain in arm was likely causally related to the vaccination with BNT162B2. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1150377	3/31/2021	MI	62	M	3/10/2021	3/12/2021	Superficial blood clot on left calf at the lower end of some varicose veins two days after injection; Superficial blood clot on left calf at the lower end of some varicose veins two days after injection; This is a spontaneous report from a contactable consumer (patient). A 62-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot: EN6207), via an unspecified route of administration in right arm on 10Mar2021 14:30 (at the age of 62-years-old) as single dose for covid-19 immunisation. The vaccine facility type was a pharmacy or drug store. The patient had no other vaccine in four weeks. The patient did not have Covid prior vaccination and was not Covid tested post vaccination. Medical history included macular. Concomitant medication included amitriptyline. The patient previously took erythromycin and statins and experienced drug allergies from these. The reported adverse events were superficial blood clot on left calf at the lower end of some varicose veins two days after injection (on 12Mar2021 at 10:00). It may be unrelated, but the patient wanted to let know. The events resulted in emergency room/department or urgent care. AE treatment included hot compress, support stockings and ibuprofen (MOTRIN). The outcome of the events was recovering.; Sender's Comments: Varicose veins most probably was a preexisting condition, unrelated to BNT162B2 vaccine. The reported superficial blood clots are considered a complication of varicose vein and unlikely related to BNT162B2.

1150382	3/31/2021	OH	82	F	1/23/2021	1/24/2021	<p>After her 1st dose, she had an allergy so bad; Swelling and hives all over body; Swelling and hives all over body; This is a spontaneous report from a contactable nurse, the patient. An 82-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration in the arm on 23Jan2021 (at the age of 82-years-old) as a single dose for COVID-19 immunization. Medical history included the patient was on blood thinner therapy; allergy to a lot of medications, mold and cut grass; operation to remove clots in Nov2020 (two months prior to vaccination); thyroid disorder. Concomitant medications included unspecified thyroid pills and apixaban (ELIQUIS) as a blood thinner. The patient previously took moxifloxacin (AVELOX) and experienced allergy and rash and was in the hospital. On 24Jan2021 (the next day after vaccination), the patient experienced an "allergy so bad", swelling and hives all over her body. The patient went to the emergency room due to the events and was "hooked up" with intravenous (IV)s for an hour before she could go home. The reactions were assessed as related to the vaccination by the patient. The patient was scheduled for her second dose on 23Mar2021. She was not given the Pfizer-BioNTech COVID-19 Vaccine fact sheet for recipients and caregivers until after being administered the first dose of the vaccine. If she had been given the fact sheet for recipients and caregivers before being administered the first dose, she would not have gotten the vaccine because the sheet says not to get the shot if you are allergic to other medications or other reasons for allergies or on blood thinners. The patient questioned whether she should get the second dose as her physician said she should not get the second dose while on apixaban. The clinical outcome of "after her 1st dose, she had an allergy so bad" and "swelling and hives all over body" was unknown. Information on lot number/batch number has been requested.; Sender's Comments: Based on temporal relation and known safety profile of the vaccine, a causal relation between events allergy to vaccine, swelling, hives and BNT162B2 cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. 1148712	3/31/2021	GA	64	F	2/14/2021		<p>bleed heavily again; a feeling of pins and needles in their face/tingling sensation in face; A spontaneous report was received from a consumer who was also a 64-year old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced heavy bleeding/ postmenopausal bleeding, a feeling of pins and needles that began on the left side of the face and radiated down to the bottom of the chin with sensitivity on the nose and lips/ paraesthesia oral. The patient's medical history was not reported by the reporter. Concomitant medications taken by the patient were not provided. The patient received the first of two planned doses of mRNA-1273 (Lot number: 031M20A) intramuscularly in the left arm on 14 Feb 2021. On 13 Mar 2021, prior to the onset of the event, the patient received their second of two planned doses of mRNA-1273 (Lot number: 026A21A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 18 Feb 2021 four days after the first dose of vaccination, patient began to bleed as if their menstrual cycle began. Patient reported that she was at a menopausal phase in life to typically do not bleed not or if they do there was a light pink blood excreted, the last time this had occurred was in November. Patient had a bleeding that was very heavy and contained large blood clots. The event heavy bleeding/ post menopausal bleeding was a medically significant event. Patient stated that this bleeding lasted 7 consecutive days until 25 Feb 2021. The bleeding then stopped 26 Feb 2021 for 2 days, and then heavy bleeding episode came back again on 28 Feb 2021 for 2 days lasting until 02 March 2021. On 03 March 2021, patient reported that she had a fever of 102F which lasted for 24 hours. Patient also reported that she had very sore gums and swelling inside of mouth. Patient reported that she was not sure if these events were due to the vaccination. On 13 Mar 2021, after the 2nd dose patient had begun to bleed heavily again. Patient also reported that after the first and second dose immediately afterwards there was a feeling of pins and needles in their face. This tingling sensation began on the left side of face down to the bottom of the chin with the most sensitivity on the nose and lips. This tingling sensation was far more pronounced after the second dose than the feeling of the first dose. Patient reported that the heavy bleeding and feeling pins and needles in face were present on 15 March 2021. Treatment</p>

1153487	3/31/2021	WV	65	F	3/3/2021	3/12/2021	Blood clots; This is a spontaneous report from a contactable consumer (reported for herself). A 65-years-old (non-pregnant) female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Solution for injection, Lot Number: EN6199, expiry date not reported), via an unspecified route of administration, administered in left arm on 03Mar2021 10:45 at a single dose for covid-19 immunisation. Medical history included known allergies to sulpha. The patient had no Covid prior vaccination. Concomitant medications included atorvastatin (LIPITOR) and lisinopril, both taken for an unspecified indication, start and stop date were not reported. The patient had no other vaccine in four weeks. The patient had the vaccination on a public health clinic/veterans administration facility. On 12Mar2021, patient experienced blood clots that resulted in doctor other healthcare professional office/clinic visit, and emergency room/department or urgent care. The patient was not tested for Covid post vaccination. Therapeutic measures were taken as result of the event which included that the patient was put on blood thinners. The event blood clots recovered with lasting effects.

A 45-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration, administered in the left arm on 15Jan2021 (Batch/Lot number was not reported) at a single dose for covid-19 immunisation. The patient received the first dose on 29Dec2020 in the left arm for covid-19 immunisation. The patient did not receive any other vaccines in four weeks. Medical history included allergies: Sulfa. Patient was not pregnant at the time of report. The patient has not had COVID prior vaccination and was not tested post vaccination. Concomitant medication included ethinylestradiol, levonorgestrel (SEASONIQUE) taken for birth control. The patient experienced deep vein thrombosis in right calf on 13Feb2021 with outcome of recovering. The event deep vein thrombosis in right calf resulted in doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care. The patient received aspirin regimen as treatment for the event deep vein thrombosis in right calf.; Sender's Comments: Based on the information currently available, the event deep vein thrombosis most likely represents an intercurrent medical condition and was unrelated to Bnt162b2 vaccine. A possible contributory role of concomitant drug ethinylestradiol, levonorgestrel to the event can not be totally excluded. Case will be re-assessed upon the additional information provided. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.</p>

1153319	3/31/2021	CA	70	M	3/11/2021	3/1/2021	blood clot formation that went to my brain; stroke; numbness; paralyzed; vision is messed up; trouble concentrating; This is a spontaneous report from a contactable consumer (patient) . This 70-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Lot number: unknown, may be EN8199 or EN6199), via an unspecified route of administration on 11Mar2021 at single dose in right arm about 16:00 for COVID-19 immunisation. Medical history included ongoing probably overweight and blood clot about 20 years ago. The patient's concomitant medications were not reported. It was reported that, the patient who was administered the first dose of Pfizer-BioNTech COVID-19 Vaccine on 11Mar2021. He reported on 14Mar2021 he got a blood clot and had a stroke. He asked if he should or should not still get the second dose of the Pfizer-BioNTech COVID-19 Vaccine related to these events. He had in the hospital from 14Mar2021 to 15Mar2021. He was supposed to have an appointment with his Family Care Physician, Doctor next Monday or Tuesday. He had to go to the emergency room because of these events where he was admitted to the hospital from 14Mar2021-15Mar2021 when he was discharged home under family care. They let him go so soon on 15Mar2021 because he insisted on it, if he was just going to be laying in the hospital he could be laying at home. There was not much they could do in the hospital except observe him, monitoring symptoms of when his numbness and the being paralyzed like in the face for improvement, then they figured the clots were clearing up. They put him on an Aspirin and other unknown things to keep events from reoccurring soon after these events. He was still does not feel 100%, his vision was messed up, he has trouble concentrating, vision was blurred sometimes; that was what happened, he knew he had a stroke when his vision went south on him on 14Mar2021. While in the hospital they did everything except no x-rays; he had CT scan, lots of bloodwork and stuff like that. He does not have further information on those tests or results. The seriousness of the events blood clot formation that went to my brain, stroke, numbness and paralysed was reported as serious (hospitalized). The outcome of events was reported as unknown. Information about lot/batch number has been

1147839	3/30/2021	IN		F	3/10/2021	3/10/2021	Per clinical pharmacist internal report: Adverse Drug Reaction Vaccine: COVID vaccine (unclear if 1st or 2nd and which manufacturer) Reaction: Unclear if associated with vaccine but wanted to report in case it is Patient presented to hospital via EMS with a CC of dizziness and nausea. She was found to have increase O2 demands (4L O2, 3L O2 at home) but was ready for discharge when she developed aphasia, bilateral grip weakness, and staring into space. Oxygen was increased to 10L and a Code Stroke was called. Subsequent workup was negative for a stroke (MRI, CT). The following day, another episode occurred and MRI did show an acute left frontal stroke determined to be embolic in nature per neurology in a patient with a below goal INR and atrial fibrillation. The patient has a past medical history of atrial fibrillation (CHADS VASC 5 prior to CVA this admission) and is on warfarin at home. INR at admission was 1.79 (previously stable with home regimen per hospital ACC notes, no missed doses were noted PTA). Due to NPO status, the patient was soon placed on full-dose enoxaparin at 0346 on 3/11 when admitted. This was continued and no doses were missed prior to CVA being diagnosed. The patient's husband states that she was in normal health until her COVID vaccine the morning of admission. Unclear if COVID vaccine could have decreased INR or put patient at a higher clot risk. Of note she was found to have Ulceration and infection of left 2nd toe however systemically she was not exhibiting signs of infection. Pfizer COVID-19 Vaccine - lot number: EN6199 Given at hospital on 03/10/2021

1147755	3/30/2021	CT	64	F	3/27/2021	3/29/2021	I have tinnitus...so loud I can not get away from it. I noticed it when I went to sleep last night. I had the shot at 3Pm Saturday. I woke up at 3:47 and started to feel terrible. Chills, severe congestion, head hurt so bad, nauseous, ached all over. I have never felt so badly EVER. at 3pm Sunday I took two tylenol and everything got better. I was fatigued but functioning. I still had a slight headache but was able to eat a light dinner. Monday I was so fatigued I could not drive or go to work. I had severe brain fog. Monday night I noticed how loud my ears were when I went to bed. I could not get away from the noise. today the brain fog seems to be lifting but I am still drained and not feeling great. no energy. I have heart palpitations and shortness of breath. At one point I had a pain in my chest and was concerned about a blood clot. That seems to have passed the palpitations remain.
1147735	3/30/2021	CA	21	F	3/27/2021	3/27/2021	Few hours after I got the vaccine I experienced sinus pressure in my left nostril. I went to blow my nose and a blood clot came out. I tried to blow my nose again but nothing came out. I went to sleep and the next day (the day after I got the vaccine) I still felt the same sinus pressure. I showered about mid-afternoon that day and after I got out of the shower my nose was bleeding, but it was a mild nose bleed. The rest of the day, I experienced a headache that felt like it was coming from the place I experienced the sinus pressure. The head got progressively worse as the day went on, I took Advil to get rid of the pain and went to sleep early. The next few days I experienced a headache that would be mild when I woke up in the morning, then got progressively worse as the day went on. Right now (4 days after the vaccine as I'm submitting this report) the pain of the headache has somewhat subsided, but the pain is still present.

1147110	3/30/2021	OH	66	M	2/17/2021	2/18/2021	Arm hurting at the injection site; Slight headache; This is a spontaneous report from a contactable consumer (patient). This 66-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; lot number EL9266) via an unspecified route of administration in the left arm on 17Feb2021 at 11:00 (at the age of 66-years-old) as a single dose for COVID-19 immunisation. Medical history included deep vein thrombosis (DVT), gout, high blood pressure (HBP), high cholesterol, focal segmental glomerulosclerosis (FSGS), rheumatoid arthritis, and penicillin allergy, all from unknown dates and unknown if ongoing. Prior to vaccination the patient had not been diagnosed with COVID-19. The patient reporting taking concomitant medications. The patient previously received moxifloxacin hydrochloride (AVALOX) from an unknown date for an unknown indication and experienced drug allergy. The patient had not received any other vaccines in the 4 weeks prior to the COVID vaccine. The patient experienced arm hurting at the injection site and a slight headache for a couple days on 18Feb2021 at 06:00. The events were reported as non-serious and did not require hospitalization. No treatment was received for the events. The clinical outcomes of arm hurting at the injection site and slight headache were recovered in Feb2021. It was also reported that since vaccination the patient had not been tested for COVID-19.
1146214	3/30/2021	WA	28	F	3/17/2021	3/28/2021	Was 5 weeks pregnant at time of vaccine with strong HCG levels, approximately 2 weeks after vaccination patient suffered a miscarriage. Vaginal bleeding, cramping and passed large clots including a sac like tissue.
1147267	3/30/2021	CO	74	M	3/20/2021	3/21/2021	Had vaccine about 9:35 am on 3/20/21. In the middle of the night about 2:30 am 3/21/21 He should signs of paralysis on right side of his body and was not able to walk. Went to the emergency room on 3/21/21. Admitted to the hospital. MRI was done about 8:00 pm on 3/21/21 and results were blood clot on left side of the brain caused a stroke. Paralysis of right side of his body and changes in speech. Transferred Rehabilitation Hospital 3/24/21. Possibility of second stroke, and another scan done 3/29/21. Waiting for results

1147964	3/30/2021	ID	46	M	3/18/2021	3/18/2021	Within an hour of receiving the vaccine I felt a sharp pain shoot down the back of my knee to my heel. I continued to work with the pain. The next day my knee and calf was sizeably larger. I went to the urgent care on March 19, 2021. Then to the Emergency room on March 20, 2021. They performed an ultrasound of my leg and found a blood clot. It is in a superficial vein. Followed up with a vein doctor and will go again in three months for another follow up.
1143483	3/29/2021	WA	49	M	3/9/2021	3/1/2021	Blood clot; Unable to use arm at all; This is a spontaneous report from a contactable consumer (patient, self-reported). A 49-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, lot number and expiry dates were not provided), via an unspecified route of administration, in arm left, on 09Mar2021 02:15 AM, as single dose for COVID-19 immunization. Patient's medical history included Fibromyalgia. Concomitant medications were not reported. Patient was not diagnosed with COVID, prior vaccination. Patient has not been tested for COVID, post vaccination. Patient did not receive other vaccine in four weeks of vaccination. On an unknown date in Mar2021, patient had Blood clot and patient was unable to use arm at all. Patient resulted in Emergency room/department or urgent care, Disability or permanent damage in Mar2021. Patient did not receive treatment for adverse events. Seriousness of the events reported as hospitalization and disability. Outcome of the events was not recovered. Information about lot/batch number has been requested.
1144314	3/29/2021	CA	81	M	3/14/2021	3/26/2021	patient complained of shortness of breath of 3/22/2021 to primary care physician approximately 1 week post covid vaccine. CT Scan was ordered. Confirmed on 3/26/2021 as Left Lower lobe occlusion and diagnosed with Pulmonary embolism. On 3/26/2021 at Emergency department, he also showed bilateral PE with large clot burden. Patient is hospitalized a this point since 3/26/2021 and has been treated for PE since. He was discharged on 3/28/2021 and continue treatment as appropriate with Rivaroxaban.

No medical history was reported. No concomitant medications were reported. On 19 Jan 2021, the patient received the first of two planned doses of mRNA-1273 (Lot number: not provided), on 15 Feb 2021, the patient received the second of two planned doses of mRNA-1273 (Lot number: 027L20A) intramuscularly for prophylaxis of COVID-19 infection. On an unknown date, the patient experienced a superficial blood clot in her leg (medically significant). She also reported that the area was sore to touch. The doctor prescribed medication to treat her problem, but they said to wait a week to see if it solved on its own before taking it. She was also applying ice pack on the affected area. No further information as reported. The patient received both scheduled doses of mRNA-1273 prior to the event, therefore action taken with the drug in response to the event is not applicable. The event of superficial blood clot in the leg/area is sore to touch (thrombosis) was unresolved. The reporter did not provide assessment for the event of superficial blood clot in the leg/area is sore to touch (thrombosis).; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.</p>

1142665	3/29/2021	TN	36	F	2/12/2021	2/14/2021	Working full time during this post injecting time but 2days later sarterd with nausea and vomiting and then itching and then next day asthma started to flare up and by the next day it developed into full blown exacerbation. As everything worsened and couldn't control anymore with inhaler and even tried nebulizer, I went to hospital. I went to ER that day on 2/17. They did breathing treatments, several Blood tests, chest xrays, Epi injection, IV steroids and several other meds, oxygen, and was admitted. As it worsened I had to be intubated 3 different times, where I would get to point they thought could be weaned off and for a day or two and would be a little better and then would worsen again requiring me to be reintubated for a total of about 10 days on the ventilator. During this time on vent second time I developed pneumonia, staph/MRSA, UTI. After being put on vent 3rd time I had to be life flighted to bigger hospital ICU. Then after a few days they were able to wean of ventilator but during which time I developed laryngospasms. I continued to improve with breathing but mentioned I had leg pain and the said probably due to low sodium and lack of mobility. I was finally released on 3/5 and discharged home with home health but sent home in supplemental oxygen due to says dropping and poore tolerance without sitting O2 stay at hospital prior to DC home. After getting home the next day or two right leg pain worsened along with breathing worsenining and HH sent me to PCP who discovered blood clots and sent me to local er, that day which was 3/8. That hospital evaluated breathing issues and took blood work and chest xrays, started me on heparin drip and sepsis protocol and then called in life flight to send me to bigger ICU hospital within a few hours after arrival which they debated on ventilator or bipap but ended up on bipap and flown to hospital. There I was treated for breathing issues, infection, clot, vocal cord dysfunction from the multiple intubations then sent home when stable again with home health RN, PT, PT and ST. Also during all this hospital stay I was treated 4x for covid and all negative. Then after coming home this last time on 3/13 i had 15-20lb with gain in a little over a week and in 3 of those last days almost 9lbs with abdominal distension and chest pain/ nausea/ dizziness/low BP but fluctuating high at times / high Hr, so referred back to PCP 3/23 who sent me to ER that day concerned of abd blessed, kidney and

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

or liver issues/sepsis/etc. PCP sent to ER. They did blood work and Abd CT and xray not showing anything and blood levels of liver slightly elevated, with blood in urine and so they said nothing of concern even though I went from looking normal to 6/7 months pregnant in less than a week. Followed up with pulmonologist who said bases of lungs hypoventilated, PFT very poor, wheezing and tight and WBC still up and gave me more steroids and asthma meds. Went to urologist due to blood in urine and also having urinary retention. They advised me to self cath and I will follow up in 1 month to determine if they need to do more tests to look into it more. PCP still concerned about these new abd. And other symptoms, and referring to specialists (cardiologist, Gastroenterologist, and Nephrologist) along with others already seeing too find the root of what are causing these new problems and if other organs are being affected with this whole immune response. I work full time, had 3 kids and works out with no limitations in my daily activities or ability to function, however since all this and being the hospital for pretty much most of laar month, the ongoing breathing issues (which I'm still requiring O2 at home) and all the other medical issues and the physical weakness/ lack of cardiopulmonary endurance I am unable to work (on short term disability/FMLA) and limited to home with ability to do much at all. Now I'm left with decreased income and tons of medical bills to come which is very concerning in itself how I will even pay since i can't work right now, but the most concerning is I'm still in this waiting game to figure out why things are not improving that much and why these other symptoms are arising. I have worked my whole life and love my work and my life and was trying to protect from this horrible virus by doing my part and getting vaccinated. But it seems that my life went from nothing wrong to one crazy medical reaction to another after this 2nd covid-19 moderna injection.

1141723	3/28/2021	NY	67	M	2/1/2021	3/18/2021	My leg and foot swelled on Thursday. We elevated and treated with heating pad & Advil. The swelling went down, so we started for home, drove 4hrs. My leg & foot swelled back up. We went to the ER they gave me an ultrasound, and said I had 2 blood clots in my leg. They prescribed, Eliquis.
1142097	3/28/2021	PA	50	M	3/13/2021	3/20/2021	1. Around March 20th, 7 days after the vaccination, felt mild pain between left ear and temple. Pain was more if the head is shaken or if I jump. This pain disappeared on 27th March. 2. On March 26th both the feet are swollen , left foot more than the right. I still feel slight numbness in the feet today on March 28th. 3. On March 27th , around noon, a blood clott showed up on my left palm , it caused intense pain in the arm for 10 minutes before starting to subside itself. I felt a lump in my palm , it was visible in dark color ,about 1 cm in size. I still feel it in my palm today on 28th March.
1142211	3/28/2021	CA	19	M	3/26/2021	3/26/2021	Unknown relation to vaccine but since I was vaccinated, I have had about three nosebleeds per day with unusually heavy bleeding (lasting more than 20 minutes). They seem to be random with no obvious cause. Treatment was per the usual, folded tissue paper in nose and tilt head forward to allow the blood to clot.

1140686	3/28/2021	OH		M			throwing blood clots within a few weeks of final vaccine.; This is a spontaneous report from a contactable consumer (patient's daughter) via a Pfizer-sales representative. A male patient of an unspecified age received the second dose (reported as final dose - pending clarification) of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number and expiration date were not reported), via an unspecified route of administration on an unspecified date as SINGLE DOSE for COVID-19 immunisation. Medical history included history of blood clots and transient ischemic attacks (TIAs). The patient's concomitant medications were not reported. Historical vaccine includes first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) on an unspecified date for COVID-19 immunisation. On an unspecified date, the patient experienced throwing blood clots within a few weeks of final vaccine. The patient and the daughter are concerned about the vaccine having this effect. The outcome of the event was unknown. Information about the batch/lot number has been requested.
1139202	3/27/2021	TX	76	F	1/16/2021	2/20/2021	02/20/2021Shortness of breath on climbing 15-20 stairs, 02/24/2021/D-dimer test very high, 02/24/2021Admitted to hospital. CT Angiogram showed blood clots in lungs. Administered IV Hyperin. scans of legs-no blood clots, Scan of heart and arteries. 02/26/2021Released with perscription of Eliquis. 03/04/21 Blood test by Hematologist Normal; 03/08/21 CT Scan of body-Normal-no tumors/cancer detected
1139635	3/27/2021	KY		U			I have had a heavy period every other week with large quantities of clots and pain. Periods also last much longer. Currently on period, 7th day, and still no sign of stopping.

1140235	3/27/2021	FL	69	F	2/20/2021	3/14/2021	Couple of days after first Vaccine my left leg just above my ankle on underneath the skin it felt like the blood getting very hot and feverish for a few minutes then go away for awhile then do it again and happening constantly. Then in my 3rd week it jumped to middle of leg and then up to lower knee (all left leg), then go back down to ankle. It just feels like hot blood under the skin. I then called my primary doctor and they had me do in as I was concerned it could be a blood clot, but he checked and assured me it wasn't. Dr. said they have been seeing patients with same issue I am having, having the Pfizer shots but those people have in both legs or both arms and he really couldn't give me a answer but to report to CDC. He said to proceed with second shot which I did and still having same issue. I called my primary doctor back again this week as this continues with "Hot Spots" and I was experiencing numbness in two small toes on left leg and next 2 toes tingling and concerned for these "Hot Spots" (no rashes). He is now setting me up for a sonogram to reassure me it isn't a blood clot. I was never sick with the shot, just minor soreness in arm for following day and tired on first round. Called me a prescription in for Gabapentin 300mg.
1139939	3/27/2021	IL	63	F	3/13/2021	3/14/2021	PT CALLED ON 3-27 TO REPORT A BLOOD CLOT IN HER EYE AFTER RECEIVING THE VACCINE ON 3-13, STILL PRESENT
1139882	3/27/2021	GA	40	F	3/22/2021	3/24/2021	I started my period two days after receiving the shot, which was two weeks earlier than expected. Flow was unusually heavy and very clotted - all abnormal for me. While I may have felt some fatigue from the shot, I never felt ill in any way. I also never felt any of the points of pain I might feel with my normal period, such as sore breasts prior to my period and cramps in my upper legs when it arrived. I only had a sore arm for a day where I received the shot.
1139742	3/27/2021	GA	59	F	3/16/2021	3/22/2021	Extensive dural venous sinus thrombosis, SAH, acute ischemic thalamic infarct. Headache, lethargy, diplopia, right arm weakness

1139599	3/27/2021	FL	72	M	3/10/2021	3/14/2021	<p>Patient was found deceased in his own home on Monday, March 15, 2021. He was found on the floor in a sitting position with three fingers of his right hand on his right carotid. It appeared that he was getting ready for church, which was a routine event. Although patient was a diabetic, he never had episodes that were life threatening, and was always able to manage to remediate with insulin or food. Patient last spoke to a neighbor at 2:30 a.m. on Sunday, March 14th, who said he appeared to be just fine and they scheduled a date with their dogs on Sunday afternoon. A sheet of instructions found on the kitchen counter at the home informed us that he had a COVID vaccine at the VA Hospital on Wednesday, March 10th. He was documenting side-effects of very sore right arm and low blood sugars. that was unusual because if he was able to manage he wouldn't have noted it. It was apparent that something sudden happened such that he was unable to get to help and his heart rate must have been of concern. We believe that patient suffered onset of some sort of cardiac event, blood clot, high heart rate, or heart attack, that was associated with the vaccine on Wednesday and 4 days later he was suddenly gone, unable to call for help (he has family close by in this community). We want healthcare providers and individuals to be able to make informed decisions about giving/taking the vaccine when there is another health issue such as diabetes to consider. We lost a brother, a father, a friend and a dedicated veteran unnecessarily.</p>
1139491	3/27/2021	NY	45	F	3/22/2021	3/25/2021	<p>I had my second vaccine on Monday, 3/22, and woke up at 1am on Thursday 3/25 with extreme chest pain, shortness of breath, sweating and chills. I went to the ER, and they discovered two blood clots in my lungs. I've never had pulmonary embolisms before, so this is a very strange coincidence. I am in cancer treatment, so my risk of PEs is higher, but the timing is too close for me not to think that the second vaccine traumatized my immune system, causing the PEs.</p>

1137221	3/26/2021	CO	79	F	1/30/2021	2/27/2021	<p>Blood clots in both legs; Cramps and spasms on her right and left legs; Painful nodules under both arms and shoulders; Itching down to her toes and left side of the body; Injection site itching; A spontaneous report was received from a consumer concerning a 79-year-old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced Cramps and spasms on her right and left legs, injection site itching, itching down to her toes and left side of the body/pruritus, painful nodules under both arms and shoulders/nodules and blood clot in both legs/Thrombosis. Medical history was not reported. Concomitant medications included losartan, cetirizine hydrochloride and pantoprazole. On 30 Jan 2021, the patient received her first planned dose of mRNA-1273 (batch number: 007M20A) intramuscularly for prophylaxis of COVID-19 infection. On 27 Feb 2021, she had her second planned dose of mRNA-1273 (batch number: 01021A) intramuscularly on left arm. Soon, she developed itching at injection site down to her toes and left side of the body. She developed painful nodules on shoulders as well as both under arms and it was mentioned that the one on left side was severe. On 09 Mar 2021, she began experiencing cramps and spasms on her right and left legs. She was diagnosed with blood clots in both legs while in the emergency room (ER). She was treated with hydroxyzine and apixaban. The event blood clot in both legs was considered to be medically significant. The action taken with mRNA-1273 in response to the events injection site itching, itching down to her toes and left side of the body, painful nodules under both arms and shoulders and blood clot in both legs was unknown. The outcome of the events Cramps and spasms on her right and left legs, injection site itching, itching down to her toes and left side of the body and blood clot in both legs was unknown whereas painful nodules under both arms were still sore but better.. The reporter did not provide any causal relationship between mRNA-1273 and the events injection site itching, itching down to her toes and left side of the body, painful nodules under both arms and shoulders and blood clot in both legs.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.</p>

1138552	3/26/2021	WI		M			<p>vaccine may be linked to the patient's ITP/the ITP became clinically apparent following the vaccine; A 22-year-old healthy male with no medication use received the Pfizer-BioNTech BNT16B2b2 mRNA vaccine through his work as an emergency department employee. On day three, post-vaccination, he experienced widespread petechiae and gum bleeding, which prompted his presentation. He was current on his vaccines, including yearly influenza, with no history of adverse reactions. He denied respiratory and gastrointestinal complaints or a history of infection. He had no personal or family history of bleeding or autoimmune disease. Vital signs and the remainder of his exam were normal. Laboratory tests revealed normal white-cell count, hemoglobin, and severe thrombocytopenia with a platelet count of <math>2 \times 10^9/L</math>. Two months prior to receiving the vaccine, the patient was evaluated at an outpatient clinic for upper respiratory symptoms. His PCR assay returned negative for SARS-CoV-2, and complete blood count was unremarkable with a normal platelet count of <math>145 \times 10^9/L</math> (reference range, <math>140-400 \times 10^9/L</math>). The upper respiratory symptoms resolved within a few days, and the patient had no further complaints. However, as a precautionary measure, one-week post outpatient evaluation, he was again tested for SARS-CoV-2, which returned negative. At the emergency department on day 3, post-vaccination, the following labs were normal or negative: prothrombin time, partial thromboplastin time, fibrinogen, BUN, creatine, electrolytes, bilirubin, LDH, alkaline phosphatase, albumin, globulin, total protein, and haptoglobin. The aspartate aminotransferase and alanine aminotransferase were mildly elevated; however, they normalized the next day. Additionally, he tested negative for HIV, Hepatitis B, Hepatitis C antibody, and Epstein Barr Virus serology. A nasopharyngeal swab also returned negative for SARS-CoV-2 antigen. The patient was then admitted and given dexamethasone 40 mg daily for 4 days, a platelet transfusion, and intravenous immunoglobulin at 1 g/kg for 2 days. Immunologic studies performed on day 6 for Rheumatoid factor, antibodies for Cyclic Citrullinated Peptide, Anti Centromere, Chromatin IgG, dsDNA, Jo1, Ribosomal P Protein, Ribonucleoprotein, Scleroderma, Smith, Sjogren's Syndrome B, Sm/Rnp IgG, Antinuclear Antibody (<math>&lt;1:80</math>, normal <math>&lt;1:80</math>) were normal. However,</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

Sjogren's Syndrome A antibody (2.8) was elevated (normal <1 AI). On day six, post-vaccination, petechiae and oral bleeding decreased, and the patient was discharged with a platelet count of 28 x 10<sup>9</sup>/L. Based on the presentation, a platelet count <100 x 10<sup>9</sup>/L, and the exclusion of alternative causes, a diagnosis of ITP was made. At follow up, on day 11, the patient's platelet count normalized to 173 x 10<sup>9</sup>/L, and the patient tested positive for plasma IIb/IIIa and Ia/IIa platelet autoantibodies. Sjogren's Syndrome A antibody decreased from 2.8 on day 6 to 1.5 (normal <1 AI). Moreover, complement C3 (94) was normal (reference range, 79-152 mg/dL), while complement C4 (10.9 mg/dL) was low (reference range, 16-38 mg/dL). On day 34 a repeat of the patient's abnormal immunologic studies showed a normal value of both Sjogren's syndrome A antibody (SSA AB: <0.2) and Complement C4 (27.6 mg/dL). Additionally, SARS-CoV-2 IgG antibody testing was performed to rule out that a previous COVID-19 infection elicited the ITP experienced on day 3. However, SARS-CoV-2 IgG was negative. As of 16Feb2021, and since the patient's discharge on day 6, he remains healthy without any evidence or symptoms of autoimmune disease. [Correction added on 22Feb2021, after first online publication: 11Feb2021]. Previous studies reported only mild or moderate adverse events following the Covid-19 vaccine. To the author's knowledge, outside of a report in the press, this is the first case published in the medical literature of an individual, with no other cause identified and no associated illness, experiencing ITP after receiving the Pfizer-BioNTech vaccine. The temporal relationship of the patient's presentation 3 days post-vaccine administration suggests, but does not prove, the vaccine may be linked to the patient's ITP. Additionally, the rapid and severe drop in platelet count to 2 x 10<sup>9</sup>/L is reminiscent of the abrupt onset observed in drug-induced thrombocytopenia, which further suggests a recent etiology. However, it must be noted that the incidence of ITP is about 3.3 per 100 000 adults/year.<sup>8</sup> Therefore, it is also plausible that this patient's diagnosis was purely coincidental, given that over 12 million vaccines administered to date. Additionally, 43 448 participants were included in the Pfizer-BioNTech trial, and no ITP was reported. Moreover, considering the low complement C4 (10.9 mg/dL), mildly elevated SSA Ab (1.5), and 2

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

months prior, the platelet count (145 x 109/L) was near the lower limit, it is difficult to exclude alternative causes, such as an underlying autoimmune condition with pre-existing ITP. In this scenario, the ITP became clinically apparent following the vaccine, though this patient never manifested symptoms suggestive of autoimmune disease. This case was reported to the FDA's Vaccine Adverse Events Reporting System (VAERS) and is valuable both for post-approval pharmacovigilance and as a foundation for clinicians to evaluate future patients with suspected ITP. Rare vaccination events are important, but do not diminish the enormous utility of vaccination and the well-documented safety profile of the Pfizer-BioNTech BNT16B2b2mRNA vaccine. No follow-up attempts are needed; information about batch/ lot number cannot be obtained.; Sender's Comments: The causal relationship between the reported event immune thrombocytopenia and BNT16B2b2 vaccine cannot be excluded based on a plausible temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

1137940	3/26/2021	FL	84	M	3/12/2021	3/15/2021	About 11:30 PM on 03/15/2021, started gasping for breath when laying down, sat up in lazy boy for a hour and half, beathing returned to normal. About 3:30 PM on 3/16/2021, started gasping for breath again. Called my daughter and she transported me to Hospital. They tested for covid - results negative. They did a C-Scan of my chest and saw a blood clot in each lung. While hooked to the monitors, they found I had Afib. They also did an ultra-sound of my legs and found a small clot in each leg below the knees in a small vein. I have never had any record of clots or Afib. They transferred me to Medical Center early on 3/17/2021. They started a heparin drip to soften the clots. In the afternoon of 3/17/2021, they performed a Suction Thrombectomy to remove the clots from my lungs. On 3/19/2021, they put me on Eliquis Tab. I was released from the hospital in the evening of 3/20/2021.

1135692	3/26/2021	VA		M	1/28/2021	1/28/2021	Pneumonia; Thrombus; Incoherent; dehydrated; threw up; Fever; A Spontaneous report was received from Consumer concerning 73-year-old of male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and fever, incoherent, threw up, dehydrated, blood clot and he was diagnosed with Pneumonia. The patients relevant medical history included. The concomitant medication was not reported. On 28 Jan 2021, prior to the onset of the event, the patient received their first dose mRNA-1273 (Lot number: 012M20A, Expiration date: not provided) via unknown route in the left arm for prophylaxis of COVID-19 infection. On same day, after vaccination patient experienced fever, incoherent, threw up, dehydrated. Few days later he went to the hospital because of shortness of breath, the hospital diagnosed him with a blood clot (on 31 Jan 2021), Then on 09 Feb 2021, he went to see his family doctor because he still did not feel well and he was diagnosed with Pneumonia. Treatment was included as Eliquis and Antibiotic. Action taken with the mRNA-1273 in response to the events was not provided. On 29 Jan 2021 the outcome were recovered for fever, incoherent, threw up, dehydrated. The outcome were unknown for pneumonia and shortness of breath. On 01 Feb 2021 the outcome blood clot was recovered.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events of pyrexia, vomiting, dehydration , incoherent and thrombosis, a causal relationship cannot be excluded. Based on the current available information and the mechanism of action of mRNA-1237 vaccine, the event of pneumonia is assessed as unlikely related. Further information has been requested.
1137624	3/26/2021	FL	56	F	1/11/2021	1/24/2021	I noticed increasing episodes of SOB, dizziness, and PVCs. My blood pressure continued to increase. After 4 weeks of increasing symptoms I reported to the ED. I was admitted for Right Lower Lobe blood clot, hypertension, and PVCs.

1139147	3/26/2021	WA	68	F	2/27/2021	3/1/2021	I went into DKA, my left eye bled, my left arm has a blood clot I was in hospital 9 days and a rehabilitation place for 11 days.
1138686	3/26/2021	CA	62	M	2/23/2021	3/1/2021	Pt developed a RT Leg DVT Deep Vein Thrombosis and Pulmonary embolus. Started having symptoms of dyspnea. , low oxygen saturations in the 80s and RT pleuritic chest pains one week after getting the shot. He had never had a DVT or PE before. Was seen in Emergency on 03-23-2021 . He was admitted on 02-23-2021. Started on anticoagulation and went to the cath lab to have intraarterial administration of TPA in pulmonary arteries.
1135707	3/26/2021	UT		F		3/11/2021	Blacked out; Multiple blood clots; inflammation in spine; A spontaneous report was received from a consumer, concerning a female patient of unspecified age, who received Moderna's COVID-19 vaccine and experienced multiple blood clots/ thrombosis, inflammation in spine/inflammation, blacked out/loss of consciousness. The patient's medical history included blood clots. Concomitant product use was not provided by the reporter. On an unspecified date, prior to the onset of events, the patient received their first of two planned doses of mRNA-1273 via unknown route for COVID-19 infection prophylaxis. On 11 Mar 2021, the reporter stated that her sister received the Moderna vaccine and she had multiple blood clots, inflammation in spine and blacked out. The events multiple blood clots and blacked out were assessed as serious based on IME list. Treatment information was not reported. Action taken with mRNA-1273 in response to the events was not reported. The outcome of the events multiple blood clots, inflammation in spine and blacked out was reported to be unknown at the time of this report.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

1133011	3/25/2021	WA	57	M	1/12/2021	1/1/2021	<p>Diagnosed with DVT; Leg got really swollen/swelling of the lower calf area; Sore arm; Sore arm; Pulled a muscle; A spontaneous report was received from a consumer concerning a 57-years-old male patient, who received Moderna's COVID-19 vaccine (mRNA -1273) and experienced events, DVT/ deep vein thrombosis, pulled a muscle/myalgia, swelling of the lower calf area(leg got really swollen)/peripheral swelling and calf pain(sore arm)/pain in extremity. The patient's medical history was not provided. No relevant concomitant medications were reported. On 12 Jan 2021, prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 (Batch number: unknown) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 09 FEB 2021, prior to the onset of the symptoms, the patient received their second of two planned doses of mRNA-1273 (Batch number: 013M20A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. On 12 Jan 2021, after receiving the vaccine the patient had sore arm. On an unspecified date in Jan 2021, the patient had experienced a pull in his muscle in his calf and lower calf area got swollen. On 09 Feb 2021, after receiving the second dose of vaccine he had experienced a sore arm. On 11 Mar 2021, his leg got really swollen and on 12 Mar 2021, he visited hospital where it got diagnosed as DVT in his right lower calf. Treatment for the events included blood thinner Apixaban. Patient is concerned about possibility of indirect relation of events to the vaccine. The patient received both scheduled doses of mRNA-1273 prior to the events, therefore action taken with the drug in response to the events is not applicable. The outcome of the event DVT, leg got really swollen, swelling of the lower calf area and calf pain were unknown at the time of this report. The event pulled a muscle is not resolved. The event sore arm which the patient experienced for both the doses got resolved on 13 Jan and 14 Jan 2021, respectively.; Reporter's Comments: Based on the information provided which includes a strong temporal association a causal association between the event of sore arm and the administration of mRNA-1273 cannot be excluded. The evens of DVT , pulled muscle and swelling of lower calf is assessed as unlikely related to mRNA-1273. Events were all attributed to muscle strain.</p>

1135306	3/25/2021	PA	71	F	2/5/2021		<p>Clot on the lower left leg; foot and ankle swollen; A spontaneous report was received from a physician concerning a 72-year-old, female patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced foot and ankle swelling (joint swelling) and clot on the lower left leg (deep vein thrombosis). The patient's medical history was not provided. No relevant concomitant medications were reported. No information on allergies were provided. The reported stated that the patient was physically and mentally healthy before vaccination. On 5 Feb 2021 , prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: 012M20A) via intramuscular route on left side for prophylaxis of COVID-19 infection. On 5 Mar 2021 prior to the onset of the events, the patient received their second planned dose of mRNA-1273 (Lot number: 036A21A ) via intramuscular route on left side for prophylaxis of COVID-19 infection. Doctor found a clot in her lower left leg. Patient said that on Feb 2 before receiving the first dose on Feb 5 needed to have an x ray and blood work due to foot and ankle got swollen. Patient said they checked it for different things and that the doctor thought It would be a pseudo gout. As the ankle was still swollen patient went to her family doctor and doctor insisted to have a test for deep vein thrombosis. They have found a clot on the lower left leg. The patient had stated she have not a had a surgery or an injury and that it happened between doses. Treatment drug used for the event included was apixaban. Action taken with mRNA-1273 in response to the events was not applicable. The outcome for the events, foot and ankle swelling and clot on the lower left leg, was considered unknown.; Reporter's Comments: Very limited information regarding this event has been provided at this time. Further information has been requested. It was reported that the patient had an x ray and blood work due to foot and ankle swelling before receiving the first dose of vaccine and that the doctor thought it to be a pseudo gout.</p>

---

went to sleep, he noticed the soreness was in right arm, so he didn't lay on that side. He noticed it enough to sleep on the other side. On 07Mar2021, the patient had bloody stools, which were a rare occasion in the past. The patient stated the blood was significant enough to draw his attention, almost felt like a blockage in the system. The patient "sat on the pot" for 15-20 minutes and broke into a sweat (07Mar2021). The patient did not know if he had bloody stool then, because he didn't turn on the light, but ever since then, it has been bloody. No BM's (bowel movement) since yesterday (09Mar2021). The patient was tired yesterday (09Mar2021). He just laid around all day on a heating pad. He had a dull ache in stomach since it started (07Mar2021). Still there today, but not that bad. The patient stated he had radiation treatment for early stage prostate cancer, they tried to prevent burning or damaging the rectum, but this could be related to that. On Sunday night (07Mar2021), about midnight, he got an awful, awful stomach pain that woke him up about midnight. He tried to move his bowels 2-3 times Sunday night (07Mar2021) and on Monday morning (08Mar2021) he was able to move them a little bit. His underwear he had from Sunday night had lots of red stains in them, and all day Monday (08Mar2021) he was having a bellyache. Every time he managed to move his bowels and it was bloody and seemed to get bloodier pretty much all day. Yesterday (09Mar2021), he laid on a heating pad and went to bed early about 20:30, he usually goes about 22:00. He managed to stay in bed for about 9 hours, and he usually can't sleep that long. He slept on his side. He started having dark thoughts (unspecified date Mar2021), stating that last Spring and early Summer he went through treatment for 45 days with external beam radiation therapy (EBRT). On Monday night (08Mar2021), the patient had terrible cramps about midnight, with very cold sweat and diarrhea. The next morning (09Mar2021), every bowel movement was very bloody. Then all day Tuesday (09Mar2021) very lethargic. No more bowel movements until the following Friday. The patient stated he felt like I was trying to pass a blood clot. The patient stated he seemed to have problems with bowels all day yesterday (09Mar2021) and was not much better; he had really low energy (09Mar2021). Today (10Mar2021), he seemed to feel better, but not much. He had not eaten much (Mar2021)

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							and was hesitant to put food in his system, since his system was not functioning very well. The patient had not been seen by doctor or in an emergency room. His wife was a retired nurse, and they have discussed if he was not better, they were going to call his primary care provider and urologist. The patient had coffee this morning (10Mar2021), and he barely touched it yesterday morning. So far, no bloody discharge, no discharge or bowel movements today. Three to four times in the night he did pass gas (Mar2021), and that was all that happened. The patient knew side effects were rare with this (vaccine) and unsure if these side effects were something reported; this was certainly unusual for him. The clinical outcome of bloody stools, dull ache in stomach, had really low energy, terrible cramps, very cold sweat, diarrhea, tired, and lethargic was recovering. The outcome of belly ache, decreased appetite, and gas, was not recovered. The outcome of other events was unknown. It was also reported that since the vaccination, the patient had not been tested for COVID-19.
1133212	3/25/2021	MO	38	F	3/8/2021	3/17/2021	The patient was experiencing headaches 1 week ago. She also had aphasia later in the week. She went to an outside hospital on 3/24/2021 and was found to have intraparenchymal hemorrhage in addition to venous sinus thrombosis. She is being treated for the venous sinus thrombosis with heparin.
1135458	3/25/2021	NM	70	M	2/12/2021		Severe pancreatitis with no specific cause identified followed by complications of peritonitis, fluid in lungs of 80%, deep leg vein thrombosis, and multiple episodes of coronary arrest and systemic inflammation.
1132787	3/25/2021	MO	32	M	3/6/2021	3/10/2021	Within a week of getting the vaccine I developed a blood clot in the lining of my stomach
1132430	3/25/2021	PR	86	F	2/24/2021	2/25/2021	The daughter of the patient stated that her mother is a cardiac patient and has a stent. The patient always has edemas on her legs but the day after the vaccination she observed edema and report pain on the left thigh. The following Monday she visited the MD and he order a venous Doppler. The result was a thrombosis on the right leg . The patient was put on medication (Xarelto)

1132399	3/25/2021	FL	69	M	3/22/2021	3/22/2021	He received his vaccine, had a sore arm and that evening around 7 hours later it was as if a switch flipped he was not able to breath, and his wife noticed on his body she could see all his veins like a track on his trunk and everywhere. He could not talk. He said that he was burning up, was hot and clammy. He got in the shower to cool himself down, and was told that the oxygen was not getting to where it was supposed to go. His wife called 9-1-1 and the EMT's said that his oxygen had dropped down into the 60's. He went to the hospital and they said he had pulmonary edema that filled his lungs that quickly. He was not intubated, and is on a BiPAP. He was given Lasix, steroids, antibiotics trying to pull the fluid off of his lungs. He has had so many different scenarios from people at the hospital right now and at one time one of his nurses said that his blood work showed a possible blood clot. They looked at his lungs and they said that they did not see it in his lungs. Then they said that he had a heart attack and that he needed a valve replacement. Today, 3/25/21 they told him that he did not have a heart attack, did not need a valve replacement. Last night they said that his BP was dangerously high and today, his BP is fine. He also had an adverse reaction to the steroids and had a ROID rage from that as well giving the nurses and his wife a hard time, hanging up the phone on her, and said that he was leaving the hospital. He was fine prior to the vaccine, and does not have any other issues for him to have this reaction. He is in ICU and they keep saying that they are going to put him in a cardiac care unit. He has a lot of IV lines and his 2nd COVID test came back negative. He feels like they are just running test to get money out of him. They said that he may be able to go home tomorrow.

blood clots that had apparently broken up and gotten stuck in my lungs; A spontaneous report was received from a consumer who is a male patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced blood clots that had apparently broken up and gotten stuck in lungs/thrombosis/pulmonary embolism. The patient's medical history was not provided. No relevant concomitant medications were reported. On 04 Mar 2021, prior to the onset of the events, the patient received the first of two planned doses of mRNA-1273 (Lot number: not provided) intramuscularly for prophylaxis of COVID-19 infection. On 09 Mar 2021, five days post-vaccination, the patient reported he had a significant event in which his wife had to call an ambulance and rush him to the hospital. It was discovered that he had blood clots that had broken up and got stuck in his lungs. The patient reported he was put on heparin and apixaban blood thinners. The patient stated he is scheduled for further testing. Treatment included, heparin and apixaban. Action taken with mRNA-1273 in response to the events was not reported. The outcome of the events, blood clots that had apparently broken up and gotten stuck in my lungs/thrombosis/pulmonary embolism, were considered unknown.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.

1131196	3/25/2021	PA		F	2/5/2021	2/17/2021	<p>blood clot; Vertigo; Nausea; Vomiting; A spontaneous report, was received from a consumer concerning a 53 year old female patient who received Moderna's COVID-19 Vaccine (mRNA-1273), and experienced vertigo , nausea, vomiting and also developed a blood clot (thrombosis) during hospitalization. Patient had no medical history. The concomitant medication included were zolpidem tartrate 10mg nightly, allopurinol 100mg daily, duloxetine 50mg daily, multivitamin, vitamin d and acetylsalicylic acid 81mg. On 05 Feb 2021, prior to the onset of events, the patient received the first of two planned doses of mRNA-1273 (Batch no- 010MZ0A), intramuscularly in the left upper arm for prophylaxis of COVID-19 infection. On 17 Feb 2021, few days after administering the vaccine, the consumer experienced vertigo related nausea and vomiting. The patient was hospitalized for two days and experienced a blood clot during hospitalization. Patient was treated with only diazepam on first two days of treatment. In hospital, patient was given meclizine, diazepam and other anti-nausea medication whereas at home, patient was treated with ondansetron 8 mg, meclizine and diazepam. On 05 Mar 2021, the patient received the second of two planned doses of mRNA-1273 (Batch no- 036A21A), intramuscularly in the left upper arm for prophylaxis of COVID-19 infection. The action taken with the second dose of mRNA-1273 in response to the event was not applicable. The outcome of the events, vertigo, nausea, vomiting was not recovered whereas the outcome of blood clot was unknown at the time of the report.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.</p>

1135376	3/25/2021	CA	73	M	1/31/2021	2/15/2021	I am writing this to let you know that two weeks after receiving my first COVID 19 vaccination I developed a severe blood clot from my right ankle to my right groin. I am Factor 5 deficient, and believe that the vaccine caused the clot. I had no symptoms at all until I noticed my right calf was swollen (no pain). My wife insisted I go to emergency because I am Factor 5 deficient and inclined to thickening of the blood. I have not been on a plane or taken a long trip by car. I walk 3 miles a day, play golf and am very active. I strongly believe the vaccine caused the clot. I will be on blood thinners the rest of my life..
1135371	3/25/2021	MA	37	M	3/20/2021	3/23/2021	Patient developed myalgias and chills the day after vaccination. Three days after vaccination, awoke from sleep with burning upper chest and neck pain lasting several hours. Came to the ED. ECG notable for lateral ST elevation. Troponin I elevated. CRP elevated. COVID PCR negative x2. Treated with aspirin and intravenous heparin infusion. Echocardiogram revealed left ventricular systolic dysfunction (EF 48%). Cardiac catheterization revealed no coronary obstruction or thrombosis. Cardiac MRI revealed late gadolinium enhancement and myocardial edema consistent with acute myocarditis. Max temperature during hospitalization 37.4C.
1128546	3/24/2021	CT	69	M	2/8/2021	2/9/2021	Patient was admitted to the ED with left deep peroneal vein thrombosis on Feb. 9 2021 after patient noticed prolonged edema in both ankles. Patient started taking 10 mg of Eliquis twice a day on Feb. 11, 2021. And on Feb. 17 2021, 2 more blood clots were found in the patient's peripheral veins within the limbs. Patient decreased dose of Eliquis to 5mg twice a day on Feb. 18 2021. Patient continues to take 5mg of Eliquis twice a day.

1131365	3/24/2021	CO	71	F	2/25/2021	3/6/2021	On March 6, I woke up feeling like I had a Charlie horse in my left calf. I tried to walk and it was sore but I felt it would go away in a day or two. By Wednesday, March 10, I called my doctor and after telling them my left calf hurt , they had me come right in. After seeing dr I was sent to get a sonogram immediately and was told I had a blood clot inside my left knee. I was sent back to Dr and was given Xerelto 15 mg twice a day for 21 days and the 20 mg once a day until gone. Today,, it is still sore. I am asking if I should take my second shot on March 29 or not.
1131317	3/24/2021	WI	69	M			I was breaking down existing blood clot in my right leg when after getting the 1st shot got a red rash & my right leg swelled up producing a blood clot in my right leg .
1130597	3/24/2021	VA	37	F	3/18/2021	3/23/2021	A medical provider and myself already reported an allergic reaction that started about 24-30 hours post vaccination (rash on chest, high blood pressure, feeling unwell, chest tightness). On 3/23 in the afternoon, my right knee started suddenly swelling and became painful. I went to the ER to rule out a blood clot- which was not indicated. It was determined the lymph node in the back of my knee (same side as my shot arm) was swelling due to moderna. I was given naproxen to treat it for one week.
1130573	3/24/2021	AZ	67	F	3/9/2021	3/14/2021	I woke up at 1 am and needed to urinate. I did but then immediately felt the urge to go again but I could only go a small amount. This continued on for every 5 to 10 minute until 2am. My urine was tinged pink and then continued to get worse. By 2am, it was the color of tomato juice with several clots. I went the the emergency room and was given 1 liter of IV solution and an IV antibiotic. I was released around 4am and returned home. I was prescribed a 7 day regimen of oral antibiotics. I did not feel any pain, only the discomfort from the urge to urinate which lasted about 18 hours. By 9am, my urine was clear and in normal amounts. I have never had a UTI in my life which is why I am reporting this.

1129669	3/24/2021	NY	71	M	2/14/2021	2/15/2021	Blood clot in my left leg; A spontaneous report was received from a consumer concerning a 71-year-old, male patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced deep vein thrombosis. The patient's medical history was not provided. Concomitant medications was not reported. On 14-FEB-2021 prior to the onset of the events, the patient received the first of two planned doses of mRNA-1273 (Lot number: 030M20A) in the left arm for prophylaxis of COVID-19 infection. The next day after receiving mRNA-1273, the patient developed a blood clot in left leg and extended from upper left leg down into his lower leg. He went to the emergency room and was treated for the event with Xarelto. Action taken with mRNA-1273 in response to the events was not reported. The outcome of the event deep vein thrombosis was not reported.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.
1131580	3/24/2021	ND	70	M	3/12/2021	3/20/2021	After second Moderna covid vaccine , 1 1/2 weeks after second vaccine I ended up with blood clots in right leg and right lung - hospital overnight stay. Outcome is not good thanks to the covid vaccine
1131644	3/24/2021	NE	82	F	1/26/2021	2/17/2021	2 large Blood Clots in the lungs
1131671	3/24/2021	LA	51	F	3/13/2021	3/15/2021	Following the vaccine injection which was provided by the personnel, I have developed minor fainting spells and angina for the past 10 plus days. A large dried blood clot was noted on the first day of my period which occurred on March 16th. I continue to pass large blood clots while I was having my period. I also want to point out that a personnel who gave me an injection was incorrectly injected the vaccine outside of the area of the preferred injection zone. I have reported this event to the supervisor who was on site. I have not yet contacted my health care provider at this time but plan to contact her tomorrow as these symptoms have been persisting.
1129475	3/24/2021	VA	39	F	3/9/2021	3/10/2021	Early onset of menstrual period-14 days early-lastest 11 days versus normal 5 and heavy bleeding including large clots for 10 days.

1131574	3/24/2021	NC	42	F	3/19/2021	3/19/2021	Weird headache at top of head which would come on quickly for a minute or two then vanish and repeat every 10-15 minutes or so. Very tired. Had started menstrual cycle on March 17, but post vaccine it was lighter than normal and then on the 22nd it became very heavy and there were lots of large blood clots. This has lasted an additional three days. My cycle usually lasts 5-7 days but day 2/3 are the heaviest and it's usually very light by day 6/7. I have not had blood clots in several years. These are very large.
1126059	3/23/2021	PA	80	F	2/5/2021	3/9/2021	Bilateral pulmonary emboli; A spontaneous report was received from a physician concerning an 80-year-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) experienced shortness of breath and oxygen level low. The patient's medical history was not provided. Concomitant product use was not provided by the reporter. The patient received her first of two planned doses of mRNA-1273 (LOT: unknown) on 05-Feb-2021. On 05-Mar-2021, approximately 1 day prior to the onset of the symptoms, the patient received their second of two planned doses of mRNA-1273 (Batch number: 048A21A) intramuscularly for prophylaxis of COVID-19 infection. On 06-Mar-2021, the patient developed shortness of breath and her oxygen level was low. On 09-Mar-2021, she was diagnosed with bilateral pulmonary embolisms. No hospitalization was required. The reporter stated that the patient had no history of blood clots. Treatment for the event included apixaban. The patient received both scheduled doses of mRNA-1273 prior to the events; therefore, action taken with the drug in response to the events is not applicable. The outcome of the events was considered unknown.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded

1127071	3/23/2021	CA	71	M	2/13/2021	2/25/2021	Feb 25th afternoon I started feeling pretty yucky. As the evening progressed I had chills, body aches, and fever. I thought I had covid. On the 26th I was worse. on the 27th I went to the ER, and the diagnosis was "unknown virus" I continued to get worse. On March 3rd I called the nurse and she said "I need to go to the ER, don't go to the ER, go to the closest ER to you". I received the same diagnosis. I thought maybe my CPAP machine had bacteria and they tested for bacteria and it was negative. I went home. On march 8th I was really bad off, I had 103.7 fever still and O2 was 70-80. I was admitted to the hospital. they tested me again and I had bacterial pneumonia. 3 days later they were going to send me home but when I woke up that morning I felt like I had been kicked in the ribs on my right side. I sat in a chair and if I coughed, hiccuped or anything It felt like a knife through my chest. a CT scan showed a massive blood clot in my lung. I was put on medications and I was discharged on March 17th. My left lung had 100% pneumonia and the blood clot was in the right lung and my lungs were unable to help each other. With any exertion, my heart rate jumps and my O2 drops. I can only sit. The theory they had at the hospital is that the Moderna vaccine had the full attention of my immune system which allowed other infections to come into my body unchecked. Since the pandemic started I have left my house on my bicycle to the store and that is it. I have had almost no exposure.
1126935	3/23/2021	FL	50	F	3/9/2021	3/19/2021	Patient came to emergency room complaining of pain, intense, severe locating in epigastric area and diffuse all over the abdomen associated with nausea and vomiting. While admitted it was identified that Pt had Subacute thrombosis of the main trunk of the superior mesenteric artery with no flow distal, 3 cm from the ostium with no flow identified in the right-sided branches or jejunal branches. MD thinks is due to Moderna Vaccine as Pt has no history or clots.

1125249	3/23/2021			F	2/9/2021	2/12/2021	Two blood clots in the posterior lobes of her lung; heart rate was really fast; A spontaneous report was received from a 69 year-old female consumer who received Moderna's COVID-19 Vaccine (mRNA-1273) and experienced two blood clots in the posterior lobes of her lung and heart rate was really fast. The patient's medical history included diverticulitis. Consumer mentioned that she was recovering from diverticulitis when she received the first Moderna vaccine. Products known to have been used by the patient, within two weeks prior to the event, included flagyl, bactrim, clindamycin (for a dental procedure one day after her vaccine), famotidine, lorazepam and elavil. On 09 Feb 2021, four days prior to the onset of the events, the consumer received their first of two planned doses of mRNA-1273 (lot/batch: 030M20A) intramuscularly in left arm for prophylaxis of COVID-19 infection. On 12 Feb 2021, the consumer experienced really fast heart rate and went to urgent care. The patient was referred to the hospital where it was found that the patient had two blood clots in the posterior lobes of her lung and she was hospitalized. Treatment for the event included heparin bolus (dose and duration) not specified. The patient was discharged on 13 Feb 2021 and started on Eliquis 5 mg twice a day. Action taken with mRNA-1273 in response to the events was unknown. The outcome of the events was resolved. The assessment for the events was not provided.; Reporter's Comments: Very limited information regarding the events has been provided at this time. Further information has been requested.

1123131	3/22/2021	NC	85	F	2/25/2021	2/26/2021	hard of hearing; Headache and then I had muscle aches/Achy and headachy; Headache and then I had muscle aches/Achy and headachy; Little bit of discomfort; Kind of stiff; Trouble in seeing; Used to be 5'7" but now I am 5'4"; she noticed bright red bleeding in her urine when she emptied her bladder; I just had a taint little bit till the day when I got it and then the next day I went to the bathroom to empty my bladder again and I had bright red bleeding again with some blood clots in it; Skin dry; slept a lot; she felt tired and so rotten; mild low-grade fever; body aches and pains; This is a spontaneous report from a contactable consumer (patient herself). An 85-year-old female patient received her second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EM9810) via an unspecified route of administration on 25Feb2021, 11:00 am as a single dose for COVID-19 immunisation. Medical history included hypertension, stroke, heart attack, COVID-19 in Aug2020 (actually had COVID this summer in August, had the mild case), and emergency surgery in Aug2020. Concomitant medications included ajmaline (CARDIA), isosorbide, and levothyroxine sodium (SYNTHROID) taken for cardiac disorder; and losartan. The patient her first dose on 04Feb2021 and experienced headaches, muscle aches and pains, chills, other flu-like symptoms, heart conditions, and sensitivity to eggs. She mentioned that this was normal and nothing unusual. She received her second dose on 25Feb2021 at 11:00 am. She was still kind of stiff but was okay. The next day on 26Feb2021 at 11:00 am, she noticed bright red bleeding in her urine when she emptied her bladder. After a few hours it faded. On the next day on 27Feb2021, she experienced the bright red bleeding in the urine again. The red blood did not hurt and patient was achy and headachy, "you know muscles." So, that kind of happened and it just kind of eased off. She slept a lot because she felt tired and so rotten from Friday, Saturday, Sunday after getting the shot. She also had a mild low-grade fever, headaches, and body aches and pains which she considered normal. Patient was hard of hearing and did not have a bright red bleeding, just had a taint little bit till the day when she got it and then the next day, she went to the bathroom to empty her bladder again and had bright red bleeding again with some blood clots in it. Then she did not really have that much the rest of the day and since then it

							seems to be clear. She did have a little bit of discomfort and her skin was dry. She have never had that experience before so she was just not sure was that connected with that shot? She wanted to know if there were any other patients that have had that. Patient also stated, "I have a bit trouble in seeing. So, I am going to have my magnifying glass" when asked about the product details. She will be getting her annual check up on 24Mar2021 so she will also check with her doctor. She mentions that she doesn't take that much flu-shots because she is sensitive to eggs. Her urine seems to be clear as of the time of report. She wants to know if the bright red bleeding in the urine has been reported. Patient stated, "I used to be 5'7" but now I am 5'4". I think I am weighing about 158 now. I am sorry like I said because of my hearing and with a language difference a little bit. I was having a trouble hearing you." The patient did not have treatment for the events. Outcome of the events was unknown.
1122738	3/22/2021	WV	62	F	2/27/2021	3/5/2021	blood clot formed in left arm; This is a spontaneous report from a contactable consumer (patient). A 62-year-old female patient, not pregnant at time of vaccination, received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Lot Number: EN6198), via an unspecified route of administration, on right Arm on 27Feb2021 0100, SINGLE DOSE for covid-19 immunisation. Medical history included Diabetic, High blood pressure, both from an unknown date. Concomitant medications included glipizide, metformin, fenofibrate. The patient previously took sumatriptan succinate (IMITREX) and experienced drug allergy. After vaccination 6 days later (05Mar2021) a blood clot formed in left arm. Shot was given in right arm. Hospitalization followed and now on blood thinners. AE resulted in: Emergency room/department or urgent care, Hospitalization, Life threatening illness (immediate risk of death from the event). The patient was hospitalized for 2 days. The outcome of the event was not recovered. Eliquis was given as treatment for the event. No covid prior vaccination. Not covid tested post vaccination.

1122080	3/22/2021	PA	46	F	3/12/2021	3/19/2021	<p>Patient's received 2nd dose of Moderna vaccine Friday 3/12. Her husband reported she had not unexpected fatigue, malaise, and fever for 1 day but better after that. On Monday she began complaining of shortness of breath. This progressively worsened and she started having presyncopal episodes. On Saturday she was unable to come down the stairs in the house so husband planned to take her to the hospital but she stood up and passed out and woke up quickly. He decided to call EMS. By the time she presented to our hospital she was cyanotic and agonal breathing. On moving her from EMS stretcher to ED bed she had PEA cardiac arrest. She underwent mechanical device CPR with only brief (&lt;1 min) ROSC x1. She at some point did have a shockable rhythm. Cath lab was notified and she was taken emergently to the cath lab with ongoing mechanical device CPR. Peripheral VA ECMO was placed after about 1.5 hours. Pulmonary angiogram was done which showed massive saddle PE with near complete obliteration of the right pulmonary tree and some filling defects in the left tree as well. At that time she had severe mixed respiratory and metabolic acidosis with a lactate of 24. She also had no gag or corneal reflex, minimally responsive pupils, and no response to noxious stimuli. Mechanical thrombectomy was attempted with some result. She was transferred to the SICU with increasing pressor requirement, and DIC. Ultimately, the venous catheter of the ECMO circuit malfunctioned thought to be secondary propagating IVC thrombosis. Family decided to withdraw care and she passed away.</p>

1122195	3/22/2021	PA	65	M	2/21/2021	3/1/2021	My husband had a stroke one week after his 2nd dose. The blood clot affected his occipital lobe. Ten years ago he had a stroke in the same area below this area. On that Monday around 7 PM, he took our refuse out to the curb in front of our home. When he came in he did not recognize me or his surroundings. I took him to the hospital by car as I was not sure what happened to him. After testing the doctors said he had a minor infarct. The stroke affected his memory. He was very confused and did not remember anything from the moment of the incident until moments before exiting the MRI machine, approximately 2 hours later. He still cannot recall anything surrounding the incident. We questioned if this was related to his recent vaccination and the doctors stated no, however, we believe it is something that should be reported since it occurred a week after the vaccination.
1122238	3/22/2021	IN	53	F	1/9/2021	1/9/2021	1/9 vaccination 2.5 hours later, my arm was swollen, itchy, raised, heated, increased HR, chills, weakness. Symptoms lasted for 2 days. Fatigue lasted for 4-5 weeks after; 'washed out' 1/13 days later, I could barely walk due to the swelling. I thought my foot was going to collapse due to the crackling sound. Sent to urgent care for xray, swelling and inflation, no breaks. 1/21 I had to go to a foot and ankle specialist 1/25 I was referred to have a doplar to make sure I didn't have a clot. I had to get fitted for a special foot brace, had to get a second one. My retina, on my L side, started to see flashes of light. Dr. stated it was prob going to tear. The specialist said could be a autoimmune; fighting off the vaccine. 1/28 urgent care. Foot was infected. Prescribed 500 mg x3 Cyclo x 7 day; probiotic, as well. I removed my name for 2nd vaccine. Swelling lasted till March 13. Told body was fighting off vaccine.

1123595	3/22/2021	WA	57	F	3/19/2021	3/20/2021	I began to have several very severe nose bleeds starting Saturday and into Sunday night. It was nothing I had ever experienced. It took 30 minutes to an hour to get them to stop. Then it would randomly start again. Just sitting quietly and it would start again. I am hoping they do not continue into today. I have had one real nose bleed in my life and it was a broken nose. These were as bad if not worse than the broken nose. During the time when I was trying to stop them, huge clots would form but they would just fill the gap and the blood would drain out the other side or down my throat and into my mouth. Soon the clots would get a little smaller and finally After getting the clots all out it would finally subside.

1124590	3/22/2021	IN	65	M	2/7/2021	2/20/2021	Swollen right lower leg. Doppler study revealed multiple blood clots. Stared on Eliquis. Continues on Eliquis at this time and leg still swollen
1124682	3/22/2021	NY	34	F	3/17/2021	3/17/2021	No pain or adverse event for the first 4 hours after vaccination. Starting at 2pm, which was 4 hours after my vaccine, , my chest began to tighten. It was not severe; I took a normal walk and was just mildly uncomfortable. It escalated hourly for about 10- 12 hours. At 8pm, the pain, pressure, and tightness around the chest went from mild to moderate, from a pain level of 2 to about 3 or 4. The sensation was one of a stack of books on my chest. There was pressure and mild pain (again, not severe), about 8-10 inches horizontally across my chest, from about the bottom of my sternum to the collarbone. I also felt some pressure in my lower throat, perhaps the bottom third of my neck. I did not have any shortness or breath, swelling, or difficulty swallowing. At about 9 pm, I became itchy on my neck, ankles, and flank. I developed some red spots, which were not large enough to be hives, They mostly became red from my itching, though they were more moderately itchy than seriously itchy. I have had hives before, and they did not appear to be hives, more just isolated red spots. Once I became itchy, I went to the ER. They worked me up for cardiac issues and a blot clot, but all tests were negative. I did not take any medication other than my standard Oxcarbazepine 8pm dose of 300 mg. The itchiness went away at about 11pm (two hours after onset), and the chest pain did not worsen. The following morning, it was significantly better, and about 36 hours after I first received the vaccine, it was gone entirely.

1124798	3/22/2021	AZ	87	M	2/13/2021	3/4/2021	Blood Clot in the lower right
1124134	3/22/2021	MI	73	F	3/13/2021	3/15/2021	On Sunday 2/14, pt notes that she experienced chills and "just felt out of sorts." On 3/15 at 1:30pm, she was scheduled for a wellness exam with her primary care provider. She notes that when staff took her vital, they were concerned because she seemed short of breath. Pt notes that she is overweight and does have dyspnea on exertion at times, but staff were concerned because she had been at rest for some time and they considered the shortness of breath unusual. Pt reports that her blood pressure was normal and her O2 sats were running 97-98% on room air. However, her pulse was 150. An EKG was done and the physician voiced concern over how long her pulse had been elevated. She was transferred to the ED, where per her report another EKG showed that she was in atrial flutter. Pt reports that she was treated with IV Cardizem and given and IV bolus of magnesium. At approximately 4:30pm, a CT with contrast was completed to rule out blood clot or PE. A third EKG done in the ED revealed that she had returned to normal sinus rhythm. She was discharged home at 6:30pm. Pt reports that she was seen for follow up on 3/20. At that time, her physician ordered repeat labs - CMP, potassium, magnesium, and thyroid - all of which were normal per her report. He changed her medication from baby aspirin 81 mg to Zarelto 20 mg, noting that she is at high risk for stroke. Cardiology has been alerted and she has an ECHO scheduled. Since her discharge from the ED, pt has been monitoring her pulse daily and it have ranged from 66-72 bpm/

1121114	3/21/2021	PA	48	F	3/11/2021	3/13/2021	The next day after the shot, I had a small rash on my wrist. It disappeared during the day. Saturday evening, my right thigh felt like it received a trauma like a hit, but I did not have an injury. An area the size of my hand is slightly pink on the thigh. On Tuesday, I tried starting ibuprofen, but it did not really remedy the pain. I went to urgent care Wed. evening. They sent me for an ultrasound to rule out blood clots. No blood clots, but lymph nodes were visible in ultrasound. They suggested I follow-up with PCP. On Thursday and Friday, the leg felt crampy but less painful. Friday night the pain traveled down my right leg to ankle as well as right lower lung had dull ache. Returned to urgent care. They are treating the leg for cellulitis (1000mg daily of generic Keflex.) They said if the leg felt better in 24 hrs, probably cellulitis, but if not, it might be a response to vaccine. There is no relief after 3 doses and 24 hr + later.
1120882	3/21/2021	MI	54	F	3/13/2021	3/21/2021	This morning, a week after my shot, my arm started itching incessantly. The area has become red, hot, itchy, and now my whole shoulder hurts. I'm currently trying to get an online appt. to see if I should go to the hospital as I have a history of blood clots.
1120842	3/21/2021	AL	72	M	2/1/2021	2/1/2021	this is all per family, 4 to 5 days after 2nd COVID vaccine he was acting unusual and was taken to the hospital. He had a clot in his brain and underwent brain surgery. He experienced seizures after the surgery, but it was ultimately reported the surgery went well. He remained intubated and on a ventilator after surgery. He developed complications of his lungs and kidneys while on the ventilator. Ventilator was removed 3/16/2021 and he passed away that day. The hospital providers thought the clot in the brain may have been from hitting his head over a month ago. From my understanding he was A&O, independent with ADLs, and lived in his private residence prior to these complications.

1115248	3/19/2021	OH	65	F	1/5/2021	1/1/2021	Localized discomfort where they gave her injection of first dose; both of her feet were only slightly swollen; This is a spontaneous report from a contactable consumer (patient). A 65-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration in the upper left arm on 05Jan2021 around 11:00-11:30 at SINGLE DOSE for COVID-19 immunisation. The patient had no prior vaccinations within 4 weeks prior to the first administration of the vaccine. Medical history included ongoing thyroid condition (Over 25-30 years ago. Ongoing controlled with Synthroid), breast cancer (2019 treatment and surgery. Presumed resolved with radiation treatment, but no treatment within a year prior to getting Pfizer COVID-19 Vaccine. Has no history of blood clots. She had full genetic testing for breast cancer and the results came back unremarkable for everything; every gene they could test they tested and they had nothing come back), lyme disease from 2002 (20 years ago; Has some suppressed immunity from Lyme Disease). The patient had no family medical history. Concomitant medication included ongoing levothyroxine sodium (SYNTHROID) taken for thyroid condition. In the evening on 05Jan2021, the patient experienced localized discomfort where they gave her injection of first dose. The event lasted maybe a day. It was also reported that about 3 or 4 days (Jan2021) after she was administered her first dose of Pfizer COVID-19 Vaccine both of her feet were only slightly swollen. She considered this event insignificant at the time. She drank water and this event went away after about 2 days. Event was not uncomfortable. Recovered completely to her awareness at that time. On 06Jan2021, the patient recovered from localized discomfort where they gave her injection of first dose and recovered on an unspecified date from the event both of her feet were only slightly swollen. Information on the lot/batch number has been requested.

1115043	3/19/2021	PA	68	M	2/13/2021		<p>Blood Clot in Leg; Tenderness; A spontaneous report was received from a consumer concerning a 68-year-old, male patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced blood clot in leg and tenderness. The patient's medical history was not provided by the reporter. Concomitant medications reported included diltiazem hydrochloride, atorvastatin calcium and acetyl salicylic acid. On 13-Feb-2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number:031M2QA) through intramuscularly in the right arm for prophylaxis of COVID-19 infection. On 13-Feb-2021, following administration of the vaccine, the patient had tenderness in his leg that continued until he sought out medical treatment. After medical treatment is was concluded that the patient has a blood clot in his leg and has to receive medical treatment to resolve that condition. The treatment information included rivaroxaban. Action taken with mRNA-1273 in response to the events was not applicable. The events, blood clot in leg and tenderness were considered recovered.; Reporter's Comments: There is not enough information to assess the causa association between the reported event of blood clot in leg and the administration if the mRNA-1273 vaccine. Critical details such as the patient's medical history is lacking. Additional information has been requested. Howe ever, based on temporal association between product administration and the event of tenderness, a causal relationship cannot be excluded.</p>

1114705	3/19/2021	OH	86	F	2/16/2021	2/17/2021	In the afternoon after getting the vaccine she was eating an ice cream bar and had a time trying to eat it, it did not go down and it did not go down. She ate dinner and at 10:30 she had terrible burning that went through to her back, had shortness of breath like she could not catch her breath. Her daughter took her to the ER as the pain was so severe she thought she was having a heart attack. In the ER they ran a bunch of tests, did an EKG and took blood, she did not have a heart attack. She was admitted and monitored her. She did have a chest x-ray in the ER as well. Nothing showed blood clots in her lungs, nothing in her lungs, but she still had the SOB and the pain went away. She thinks they may have given her some medicine and the pain was gone, but she still was shortness and still is today 3/19/21. She has an appointment next week to have an echocardiogram. She has had check ups with the cardiologist and her PCP since coming home from the hospital. Her PCP gave her an inhaler to use but she has not used it. She did not have any reaction to the injection site itself. Ever since this has happened has had no appetite, brain fog, shortness of breath, fatigue and nothing sounds good to eat. She can taste okay, but nothing tastes good to her. She said she doesn't think she can handle this much longer, it's been over a month.
1113954	3/19/2021	IL		F			tends to have blood clots; This is a spontaneous report from a Pfizer-sponsored program, patient. A female patient of an unspecified age received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at a single dose for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. It was reported that the patient was scheduled to get the second shot this afternoon (02Mar2021), on a blood thinner and tends to have blood clots. Outcome of the event was unknown. Information on Lot/Batch number has been requested.

1114378	3/19/2021	TX	68	F	2/6/2021	2/10/2021	multiple blood clots in lungs; multiple blood clots in legs; feeling chest pain; short of breath; This is a spontaneous report from a contactable consumer (patient). A 68-year-old female patient (pregnant: No) received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL9269), via an unspecified route of administration in left arm on 06Feb2021 at 18:00 at single dose for covid-19 immunisation. The relevant medical history included DCIS Breast cancer from 2016, Known allergies: penicillin from an unspecified date. Concomitant medications included levothyroxine sodium (SYNTHROID). The patient previously received first dose of BNT162B2 on 16Jan2021 at the age of 68 years old (lot number: EL3249, at 06:15 PM, in Left arm) for covid-19 immunisation. The patient received 2nd Pfizer vaccine dose on Sat, 06Feb2021. On Wednesday 10Feb2021 she became short of breath. On 11Feb2021, she began feeling chest pain. On 12Feb2021, she was advised by primary care Dr to go to the emergency room. She was admitted on 12Feb2021 to ICU with multiple blood clots in her lungs and legs. She was told by the emergency Dr this was a sign of Covid, they did a Covid test, came back negative. She remained in the hospital till 18Feb2021. She was at the time of the report on Eliquis (10 mg/d). A hereditary blood clot test was done that came back negative. She had never had an issue before the vaccination with blood clots nor anyone in her family and she was in good health before the vaccination. Dr didn't think the vaccine caused the blood clots but her primary care Dr thought it did-which was why she was reporting it. The patient also stated that event multiple blood clots in her lungs and legs resulted in Emergency room/department or urgent care, Hospitalization and Life threatening illness. The patient had hospitalization for 7 days. Treatment Heparin 25,000unit in .45% NaCl Premix, Narcan received. No covid prior vaccination. The patient underwent lab test included Nasal Swab which showed negative on 12Feb2021; Hereditary blood clot test which showed negative on an unspecified date in 2021. Therapeutic measures were taken as a result of all the events. The outcome of the events was recovered with sequel.

1115425	3/19/2021	KY	28	F	1/13/2021	1/14/2021	the day after the vaccine around midday I started feeling aches tired chills, persisted through that Saturday, all symptoms resolved the 16th. That weekend I had heart palpitations, the Monday after my standing heart rate chest xray, ddimer - possible lung collapse, any exertion my heart rate would elevate, they performed an MRI with contrast, there could be a blood clot in the lung so I went to see a cardiologist, They put me on epinolol and did an echocardiogram, everything else checked out in my tests. I have not recovered my breathing still bothers me and my heart rate still elevates with exertion.

1115977	3/19/2021	MD	62	F	1/30/2021	1/30/2021	I had arm pain, aches, tired and vomited a few time. I felt weird all over. I had pain in my upper abdomen, legs and lower back. Chills and anxiety. On 2/8, I had a tele visit with my doctor. I took Tylenol as instructed to make sure that I didn't develop a fever. My doctor said that it could be from the vaccine. My left leg and foot were swollen on 2/13, so I called my doctor again and he sent me for a Doppler to check for a blood clot. I saw him on 2/15 in person. I have lower back pain and weakness in my legs at times, but it doesn't prevent me from doing anything. They feel heavy, especially if I walk for an extended period of time.
1114806	3/19/2021	VA	45	F	3/6/2021	3/12/2021	Diagnosis: Cortical vein thrombosis, massive intracerebral hemorrhage with tentorial herniation, thrombocytopenia. Clinical Presentation and Course: 1 week after receiving Janssen COVID19 vaccination, patient developed gradually worsening headache. On March 17th, patient presented to Hospital with dry heaving, sudden worsening of headache and L sided weakness. Evaluation with head CT revealed a large R temporoparietal intraparenchymal hemorrhage with 1.3cm midline shift. She ended up getting intubated for worsening mental status. On evaluation at arrival in Medical Center, she was noted to have extensor posturing. Repeat imaging revealed worsening midline shift to 1.6cm. CTA showed cortical vein thrombosis involving the right transverse and sigmoid sinus with tentorial herniation. Patient developed brain herniation and brain death was pronounced on March 18th, 2021.

1114709	3/19/2021	GA	30	F	2/12/2021	2/13/2021	I was 30 + 2 weeks at the time of my second Moderna vaccine. My due date is 4/22/2021. Pregnancy has been uneventful until the second Moderna vaccine. At 3:00 am (14 hours post vaccine), I woke up with the urge to go to the bathroom. I went, urinated, and had a small amount of diarrhea. I laid back down and within 30 second had urge to go again. I repeated this six times back to back. I began to have severe lower abdominal cramping and could not sleep again. I didn't know if I had to urinate or defecate but the urge was extremely severe and constant. My temperature began to rise, and I was shaking/aching severely. I took 500 mg tylenol at 5:45 am and that kept my temperature around 99.5 (normal 97.5). Around 7:30 am I called my OB and they told me to go to emergency/labor and delivery ward of the hospital. At this time, my diarrhea and urge to defecate to stop and it turned to a constant urge to urinate with near constant, severe, lower abdominal cramping. At the labor and delivery ward, they monitored the baby (stable and moving the whole time), did a fetal fibronectin (normal), did a CBC (normal except preexisting mild anemia), and a urinalysis (normal). Hospital determined I was not in labor and did not have UTI so they sent me home. I continued to have temperature raises (up to 100.4 but always took tylenol at this point), severe lethargy, no appetite, severe abdominal cramping, constant urge to urinate, severe shaking, etc. until approximately 8 or 9 pm that evening (32 hours post vaccine). Everything except the constant urge to urinate resolved. Three days post vaccine (evening of 2/15/2021), I began to urinate large blood clots. I scheduled an appointment with my OB for a repeat urinalysis and urine culture. I had the appointment on 2/16/2021 and the only abnormality was hematuria. Urine culture was negative. Doctor prescribed 7 days of antibiotics just in case (while waiting for urine culture). My symptoms finally resolved on 2/19/2021 (7 days after vaccination), with slow improvement after urinating the large blood clots. I have not had any symptoms since then and my baby appears healthy still in utero. I have no history of UTIs.

1116991	3/19/2021	MN	85	M	3/2/2021	3/4/2021	<p>Patient is a very pleasant 85-year-old male who presented to the emergency department first on 3/8/2021 via private vehicle accompanied by his spouse in no acute distress with complaints of left arm pain and swelling after receiving his Pfizer COVID vaccination on 3/2/2021. Medical history includes hypertension, heart failure, CAD, GERD, diaphragmatic hernia, chronic left shoulder pain, among others. Patient states he received his vaccine on Tuesday and began to develop pain, swelling, and bruising at the injection site on Thursday. Since that time all of his symptoms have worsened. 9/10 pain this morning has lowered to a 4/10 after 2 tylenol, which he took approximately one hour prior to arrival. Is not anticoagulated but takes baby aspirin daily. He did stop this when he first noticed the bruising. Denies recent trauma, including falls. His chronic left shoulder pain is unchanged from baseline; the pain he presents to the ED for is located lower at the injection site. Further notes pain patches helpful with his pain. Seen again on 3/15/2021 for persistence and involvement of his forearm with the bruising and pain. Over the last week the purple discoloration has migrated down his arm towards his hand. He denies any new numbness or weakness in the arm. Exam reveals impressive and extensive ecchymosis that involves both his upper and lower arm and is circumferential in nature. There is no area of discrete swelling or tenderness. Good peripheral pulses and capillary refill. Normal strength of hand. An ultrasound done showed no clot.</p>

1115064	3/19/2021	VA	46	F	3/5/2021	3/12/2021	<p>On March 5, I received my first dose of the Covid shot. Later that day, I was fatigued. Six days later, however, sometime early morning on March 12, (I was in and out of sleep because of it), I had pain swallowing my saliva on my left side (also the side of my vaccine in my arm). It was hard to pinpoint but the pain came from somewhere at the back of my throat and my ear. If I had to guess what time it was, it probably was around 1-2am that the pain began. March 12, I went to see my primary care doctor. He checked my ears &amp; didn't see any concern. He saw a little redness at the back of my throat but couldn't definitively say what I had. He thought it was a virus but didn't discount a reaction to the vaccine (although he said it was unlikely since reactions usually happen within 3 days). He ran no tests and didn't prescribe anything. March 13, I was feeling worse. I suddenly had a fever (101 was the highest it ever got), swollen lymph nodes, a white tongue. I went to the local ER at 9am who said I might have oral thrush but he didn't sound convinced because my tongue wasn't as white or thick as thrush would present (he said for example that typically when you have thrush, you could scrap it off and it would bleed). He diagnosed me with Thrush and Lymphadenopathy. He prescribed anti-fungus medication Clotrimazole 10 mg Troche, five times a day. On Sunday, March 14, my throat pain got worse (it was constant pain v.s. pain only swallowing) so I called the on-call doc who told me to get tested for Strep. The next day, on March 15, I could swallow easier so my doctor didn't think it was necessary. My lymph nodes were still swollen, I had a bit of a fever, and it was still a bit hard to swallow but I was recovering. I had some lingering ear pain. By March 15 I was much better. Today, March 19, I still have a sensation on my left ear/throat area after swallowing but I am much better. Please note that while the ER doctor thought it was fungal and my primary care doctor thought it was viral, neither were sure/thought it was the vaccine. ** Also please note, this is the second time I am completing this because the system booted me off after 20 min the first time and it was erased. It takes times to complete. Just a thought for future reference, it might be helpful to allow for more time.**</p>

1111371	3/18/2021	CO	65	F	2/15/2021	2/16/2021	Alt is at 148; my INR level went from 2.9 to 4.3; This is a spontaneous report from a contactable consumer, the patient. This 65-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number: unknown), dose 1, single dose via an unspecified route of administration in the left arm on 15Feb2021 at 12:00 PM (at the age of 65-years-old ) for COVID-19 vaccination. Relevant medical history included asthma and chronic blood clot in heart. The patient was not pregnant. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. The patient had no allergies to medications, food, or other products. Concomitant medications included amiodarone and warfarin. On 16Feb2021 at 15:00 the patient experienced alanine aminotransferase (ALT) at 148 and international normalized ratio (INR) went from 2.9 to 4.3. The events were reported as non-serious and required a doctor or other healthcare professional office/clinic visit. Treatment received for events alanine aminotransferase (ALT) at 148 and international normalized ratio (INR) went from 2.9 to 4.3 included reducing dosage of warfarin still working on the liver. The clinical outcome of alanine aminotransferase (ALT) at 148 and international normalized ratio (INR) went from 2.9 to 4.3 was unknown. Since the vaccination, the patient has not been tested for COVID-19. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.
1111026	3/18/2021	CO	60	F	3/16/2021	3/18/2021	Presents with chief complaint of left chest wall swelling. The patient states that she has a history of Covid prior and received a Madera vaccine 2 days ago. This was the first vaccine. She states that she had a significant amount of redness and swelling at the vaccine site on her left arm initially. Yesterday she started noticing some swelling above the clavicle on the left-hand side and was concerned that this could be a blood clot given her history of Covid. She states it is tender to the touch. She has not had a fever and denies any redness. No history of similar in the past and no prior venous thromboembolism.

1111014	3/18/2021	NJ	44	F	2/7/2021	2/7/2021	Felt heat up my chest immediatley-then it subsided . I sat for 30 minutes. I went home and had severe pain in stomach, nausea, fevers etc. I felt chest pressure had fevers and diarrhea for two weeks. I was admitted to the hospital for the chest pressure and high heart rate and possible dehydration. My D-dimer elevated however, no clot was fount on Cat Scan of chest.
1112605	3/18/2021	PA	78	M	3/14/2021	3/14/2021	Received the Vaccine Shot, waited 15 minutes with no issues. Went home, in about 15 minutes had extreme chest pain. Quickly moved to emergency room. Was given nitroglycerin paste on chest, Asprin to chew, Heprin and cardiac cautherization. Cautherization showing no real issues. Eventually the pain was gone. Cardiac doctor mentioned heart possibly being highly stressed earlier. I have some thoughts that it may have been a temporary blood clot, but not proven. Chest pain was very bad until emergency room starting getting it under control. never had that much pain before with previous heart attacks in 2004-05
1110877	3/18/2021	PA	61	M	1/14/2021	3/18/2021	EE admitted to hospital 3/18/2021 with "blood clots~~
1111566	3/18/2021	TN	63	F	2/24/2021	2/28/2021	Developed extensive DVT with pulmonary emboli 4 days after receiving Covid vaccine. Clot was evacuated with thrombectomy but reaccumulated 1 day later, despite being treated with Eliquis.
1110612	3/18/2021	NC	42	F	1/4/2021	2/9/2021	EDC: 25 APR 2021 AE1: Superficial Venous Thrombosis: On 10 Feb 2021, patient presents with RLL pain and swelling. Dopplers with non-occlusive Superficial Venous Thrombosis. Started on 40 Lovenox qd. On 23 Feb, had worsening pain and repeat doppler showed occlusive SVT. Her Lovenox was increased to 40 mg BID and referred to Hematology. Her hematologist increased her lovenox to 80 mg bid. SAE: Pulmonary Embolism: On 3/9 patient developed Shortness of breath and chest pain and went to ED where she was diagnosed with Bilateral pulmonary emboli. She was admitted to the hospital and started on an heparin drip. AE2: SVT: Patient developed a second SVT after discharge from hospital on 17 Mar 2021 that is located away from original SVT site.

1112779	3/18/2021	CA	65	F	2/26/2021	2/28/2021	Just 38.5 hours after receiving my 2nd dose of the Pfizer Covid-19 Vaccine I suffered a Cerebral Vascular Accident, a CVA, a Stroke @ 5:05a.m. in our home. My entire right side was paralyzed & unable to speak. My husband alerted #911 & fortunately @ the hosp. I received immediate life saving care. I had a C.T. Scan which revealed #2 blood clots in the left side of my brain. Intravenous T.P.A. was administered & then a thrombectomy was performed. Hospitalized approx. 5:45a.m on Sun., Feb. 28th, 2021 till my discharge on Wed., March 3rd, 2021@ 5:30pm.
1111548	3/18/2021	NY	59	M	2/20/2021	3/12/2021	Pfizer-BioNTech COVID-19 Vaccine EUA Approximately three weeks after this injection, I began to feel a pain in my left leg. I assumed it was a cramp. I then received a second dose (Lot # EN6206) on 3/13/21. Over that weekend the pain in my leg grew worse and the leg began to swell. on 3/15, I went to my primary care physician who said it looked like a blood clot. He sent me to a radiologist for an ultrasound (?) of the leg. After confirming the clot, I went to a local ER. They started me on Eliquis to treat the clot
1112614	3/18/2021	RI	78	M	3/13/2021	3/15/2021	Blood clot in urinary track
1107421	3/17/2021	VA	75	M	12/30/2020	1/6/2021	I had sudden malaise, lost consciousness and my wife says was not breathing briefly. I revived and was taken to the hospital, and treated for 2 1/2 days with heart catheterization and TPA injected into my clot in the pulmonary arteries with good resolution. I did have cor pulmonale with acute severe right heart failure as part of that. Dr. thought the clot came from my right calf by his examination. Diagnosis was confirmed by CAT scan cardiac Echo and right heart catheterization.
1109422	3/17/2021	CO	71	M	1/29/2021	3/7/2021	Client received first dose of Moderna vaccine on 1/29/21. Client presented for a second dose on 3/12/21 and reported that he had 'blood clots in the lungs' on 3/7/21 and was hospitalized. The cause of the blood clots is unknown. Client has since recovered and spoke to his doctors and they advised that he receive the second dose of Moderna as scheduled on 3/12/21.

1104554	3/16/2021	PA	77	F	2/1/2021	2/14/2021	I had quite an adverse reaction to the second MODERNA vaccine. That afternoon and evening I developed symptoms. I was experiencing chills, fever, body aches, headache, sore throat, shaking and nausea. As the week went on, my reaction became worse. I was sweating profusely and had shortness of breath accompanied with burning pain on the top of my hands and feet and a rash. On Friday morning, 5 days after the vaccine, I collapsed and had a stroke. I was rushed to hospital and was admitted. It was confirmed that I had a stroke. through a Cat Scan and MRI. On Saturday, I had another stroke. This time I was transferred to hospital. I had a huge blood clot on the left side of my brain which has effected my speech and walking. My entire life has been effected and changed. I had a plethora of tests done, MRI, CAT SCAN, EKG, BLOOD WORK etc. I also have to have speech therapy, physical therapy and occupation therapy. I spent about weeks in the hospital. The doctors think it is a possibility that the 2 Moderna vaccine caused my two strokes. What can be done about this? I will have problems for the rest of my life.
1104499	3/16/2021	VA	54	F	2/2/2021	2/4/2021	Developed numerous blood clots in left saphenous vein and likely pulomary embolism (did not do test for embolism b/c I am allergic to the contrast but I was very short of breath for several weeks). Not sure if this is related to the vaccine since I was post bone surgery and also on estrogen therapy (ovaries removed 5 years ago) but I have not ever developed a problem before after surgery and while on estrogen.

1104327	3/16/2021	FL	68	F	2/10/2021	2/12/2021	68 yo WF in excellent health with prior history of intermittent benign positional vertigo for seven years and a cerebral concussion two years ago from which she recovered uneventfully in 6 weeks with no residual neurologic or physical issues. Patient received first dose 1/19/2021 with only mild fatigue and arm soreness at injection site. 16 hours after the second dose, Patient developed a dull total cranial headache and fatigue , retiring to bed , taking no medicines. She had taken only her premarin 0.625 mg for the last week. Patient awoke at 4:30 am with severe headache, nausea and vertigo, being unable to stand without assistance. urinary incontinence also occurred, but most likely occurred as she was unable to to get to the bathroom due to vertigo and pronounced vomiting of clear yellow fluid. incontinence never occurred again throughout the illness. examination at this time showed nystagmus on bilateral lateral gaze and vertical nystagmus. no other neurological signs or symptoms were present. On return to bed, Patient continued to have vertigo headache and nausea even supine with eyes closed. Vetigo and standing instability did not respond to epley manuevers. Headache remained mild to moderate, along with persistent vertigo and nystagmus for 4 days, becoming slightly less each day. On the fifth day, Patient was able to ambulate unaided by holding onto walls furniture etc. vomiting did not reoccur after her initial bout. Headache abated on the fifth day. Patient remained "fuzzy" and imbalanced for the next 14 days with occasional mild posterior cranial headache. Rotary nystagmus abated on the 7th day. Note is made that no abnormalities of the tympanic membranes were noted. no cardiac symptoms or irregularities were noted HR 60 BP 110/70 several attempts at epley manuevers only resulted in symptom worsening. Patient felt well enough to traveled by airplane day 8 post dose, having still some "fuzziness 'and slight imbalance, being unable to walk briskly due to gait instability..symptoms worsened slightly after air flight, and on return to home, slight barotraumatic changes were noted in the tympanic membranes, slight fluid levels and some small streaky membrane hemorrhages noted. her gait became slightly more unstable, but she was able to walk unaided. symptoms improved daily and by day 14 symptoms seemed to be much lessened, no nystagmus being noted. vertigo was present only on

							<p>rapidly standing , position change and vertical looking up., vertigo abating quickly after each motion at rest. Patient traveled by plane on 3/4/21-3/8/21, vertigo escalated to mild to moderate..no response to epley maneuvers. Vertigo worsened daily and Patient again developed mild gait instability and nystagmus bilaterally and vertically. Ear exam was unchanged. no headache was present during this time. Patient was taken for balance training to a specially trained Physical therapist on 3/10/21 for evaluation , Patient being markedly symptomatic, examination showing both right and left ear abnormalities as well as vertical nystagmus. driving was prohibited. The constellation of symptoms for the even are most consistent with acute vestibular neuronitis or central vertigo.. Neuologic localizing signs suggestive of cerebral thrombosis, etc were not present , so MRI was not performed. Patient had Had a Notmal CT scan with here cerebral concussion two years prior. As the symptoms weer worsening and the result of the balance training session on 3/10/21 resulted on significant worsening on awakening on 3/11/21 with moderate gait instability, bilateral horizontal and vertical nystagmus, Prednisone 40MG po was administered. Approximately 8 hours after the prednisone dose, Patient was able to stand unaided, and vertigo was almost totally cleared. 30mg prdnisone was administered on 3/12/21 with Patient being totally asymptomatic. No nystagmus could be detected and epley maneuvers done by the physical therapist resulted in no symptions or evoked nystagmus. Predinsone dose was deescalated by 10 mg daily, Patient remaining totally asymptomatic. today 3/16/21 Patient will take 5mg of prednisone, still assymptomatic, prednisone to be discontinued tomorrow.</p>
1104152	3/16/2021	KS	61	M	3/10/2021	3/13/2021	Developed 3 small blood clots in his left lower leg on Saturday, 3/10/2021 - swelling and slight redness along with pain

1103636	3/16/2021		78	M	2/24/2021	2/24/2021	He has had a friable capillaries, so sometimes when he urinate, he urinate blood or little blood clots; This is a spontaneous report from a contactable consumer. A 78-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EN6198), via an unspecified route of administration on 24Feb2021 at a single dose for COVID-19 immunization and apixaban (ELIQUIS), via an unspecified route of administration from an unspecified date to an unspecified date at unknown dose for Atrial Fib (atrial fibrillation). Medical history included prostate cancer from about 10 years ago and was treated by radiation, the radiation has caused capillaries in the penis to be fragile (friable capillaries) and there were times when he bleeds and has some clots and it usually resolves itself; and bloody urine in the past. The patient's concomitant medications were not reported.. Radiation has caused capillaries in the penis to be fragile and there are times when he bleeds and has some clots. The patient has had a friable capillaries, so sometimes when he urinates, he urinate blood or little blood clots. The patient was on Eliquis, so yesterday when they came home after he got the vaccine, he was bleeding with the clots which he has done in the past. The reporter asked if it is possible that the vaccine can precipitate a bleeding episode in someone that is on Eliquis and had on and off had bloody urine in the past. After the shot, he was bleeding with the clots and with the bloody urine. The patient got the first dose of the Pfizer COVID-19 vaccine on Wednesday. He had radiation for prostate cancer 10 years ago. He had a bloody urine periodically and the doctors were aware. He had a blood urine one hour post vaccination in 24Feb2021. It would take at least a few hours for the medication to get in the system before having any kind of reaction. It resolved on its own he doesn't have a blood urine anymore. The second dose of the vaccine is due on 16Mar2021. The action taken in response to the events for apixaban was unknown. The outcome of the events was recovered on unspecified date in Feb2021.

1103625	3/16/2021	MI	75	M	2/3/2021	2/3/2021	dizzy; BP dropped to 117/79.; This is a spontaneous report from a consumer. A 75-years-old male patient started to receive bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) lot number: EL9265, via an unspecified route of administration in left arm,from 03Feb2021 as a single doseE for COVID-19 immunization . Medical history included a stroke and high blood pressure . Concomitant medication included oral clopidogrel (CLOPIDOGREL), 75 mg once a day for a storkeand apixaban (ELIQUIS) 5 mg 2x/day oral for blood clots. On 03Feb2021Patient had a reaction with the first dose of the Pfizer vaccine. He got a little dizzy and his BP dropped to 117/79. He wants to know if it is safe to take the second dose.. Patient states that he had a mild reaction to the COVID shot on 03Feb2021. Patient states that he got kind of dizzy, and his blood pressure dropped to 117. Patient states that his reaction lasted about an hour, and he had no other problems. Patient is wondering if he should get the second dose, or if he should not take some of his blood thinning medications on the same day as his second dose. Patient got his first dose of the product on 03Feb2021, and the side effects occurred that same day, just after the patient left the clinic, about 15 minutes later. Patient reports that he got kind of dizzy and he checked his blood pressure which was 117/79. Patient states that the dizziness lasted about an hour, and he did not check his blood pressure again after that. The outcome of the events was not reported.

1104841	3/16/2021	AZ	76	M	2/3/2021	2/10/2021	My husband received the first injection on Feb 3, 2021 he developed a cough afterwards, cough would come and go. He was scheduled to receive 2nd dose on March 11 and I was concerned about having a cough at the time of 2nd vaccine. He went to walk-in clinic and got a covid test was negative, he said his exam was normal, they gave him prescription of Benzonatate 100mg he took one and it did not help so he never took any more. On March 5 while working in the yard he collapsed, paramedics arrived and he was in cardiac arrest, they started CPR, they used AED was in vfib, he was taken to Hospital then transferred to second hospital. I was told he had blood clots in both lungs, one in his leg, and possible clots in the mesenteric area of abdomen. His heart stopped due to the blood clots in his lungs. He remains in the hospital in the Intermediate Coronary Care Unit. He has not yet gained full consciousness.
1106925	3/16/2021	MI	53	F	2/1/2021	2/17/2021	I received my first vaccination on February 11, 2021. On February 17th I was rushed to my local ER with a massive heart attack. I was rushed by helicopter to second hospital where I underwent an emergency Heart Catherization. It was discovered that I will need a triple bypass surgery. However, there is a HUGE blood clot that formed in my heart, and further treatment is on hold for now, until the massive clot has safely dissolved.

1106326	3/16/2021			M			<p>acute severe ITP; The initial case was missing the following minimum criteria: literature report without causality. Upon receipt of follow-up information on 01Mar2021, this case now contains all required information to be considered valid. This is a literature report. A 22-year-old healthy male with no medication use received the Pfizer-BioNTech BNT16B2b2 mRNA vaccine through his work as an emergency department employee. On day three, post-vaccination, he experienced widespread petechiae and gum bleeding, which prompted his presentation. He was current on his vaccines, including yearly influenza, with no history of adverse reactions. He denied respiratory and gastrointestinal complaints or a history of infection. He had no personal or family history of bleeding or autoimmune disease. Vital signs and the remainder of his exam were normal. Laboratory tests revealed normal white-cell count, hemoglobin, and severe thrombocytopenia with a platelet count of <math>2 \times 10^9/L</math>. Two months prior to receiving the vaccine, the patient was evaluated at an outpatient clinic for upper respiratory symptoms. His PCR assay returned negative for SARS-CoV-2, and complete blood count was unremarkable with a normal platelet count of <math>145 \times 10^9/L</math> (reference range, <math>140-400 \times 10^9/L</math>). The upper respiratory symptoms resolved within a few days, and the patient had no further complaints. However, as a precautionary measure, one-week post outpatient evaluation, he was again tested for SARS-CoV-2, which returned negative. At the emergency department on day 3, post-vaccination, the following labs were normal or negative: prothrombin time, partial thromboplastin time, fibrinogen, blood urea nitrogen, creatine, electrolytes, bilirubin, Lactate dehydrogenase, alkaline phosphatase, albumin, globulin, total protein, and haptoglobin. The aspartate aminotransferase (42) and alanine aminotransferase (90) were mildly elevated; however, they normalized the next day. Additionally, he tested negative for HIV, Hepatitis B, Hepatitis C antibody, and Epstein-Barr Virus serology. A nasopharyngeal swab also returned negative for SARS-CoV-2 antigen. The patient was then admitted and given dexamethasone 40 mg daily for 4 days, a platelet transfusion, and intravenous immunoglobulin at 1 g/kg for 2 days. Immunologic studies performed on day 6 for Rheumatoid factor, antibodies for Cyclic Citrullinated Peptide, Anti</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

Centromere, Chroma-tin IgG, dsDNA, Jo1, Ribosomal P Protein, Ribonucleoprotein, Scleroderma, Smith, Sjogren's Syndrome B, Sm/Rnp IgG, AntinuclearAntibody (<1:80, normal <1:80) were normal. However, Sjogren's Syndrome A antibody (2.8) was elevated (normal <1 AI). On day six, post-vaccination, petechiae and oral bleeding decreased, and the patient was discharged with a platelet count of 28 x 109/L. Based on the presentation, a platelet count <100 x 109/L, and the exclusion of alternative causes, a diagnosis of ITP was made. At follow up, on day 11, the patient's platelet count normalized to 173 x 109/L, and the patient tested positive for plasma IIb/IIIa and Ia/IIa platelet autoantibodies. Sjogren's Syndrome A antibody decreased from 2.8 on day 6 to 1.5 (normal <1 AI). Moreover, complement C3 (94) was normal (reference range, 79-152 mg/dL), while complement C4 (10.9 mg/dL) was low (reference range, 16-38 mg/dL). On day 34 a repeat of the patient's abnormal immunologic studies showed a normal value of both Sjogren's syndrome A antibody (SSAAB: <0.2) and Complement C4 (27.6 mg/dL). Additionally, SARS-CoV-2 IgG antibody testing was performed to rule out that a previous COVID-19 infection elicited the ITP experienced on day 3. However, SARS- CoV-2 IgG was negative. As of 16Feb2021, and since the patient's discharge on day6, he remains healthy without any evidence or symptoms of autoimmune disease. This is the first case published in the medical literature of an individual, with no other cause identified and no associated illness, experiencing ITP after receiving the Pfizer-BioNTech vaccine. The temporal relationship of the patient's presentation 3 days post-vaccine administration suggests, but does not prove, the vaccine may be linked to the patient's ITP. Additionally, the rapid and severe drop in platelet count to 2 x 109/L is reminiscent of the abrupt onset observed in drug-induced thrombocytopenia, which further suggests a recent etiology. However, it must be noted that the incidence of ITP is about 3.3 per 100 000 adults/year. Therefore, it is also plausible that this patient's diagnosis was purely coincidental, given that the country has administered over 12 million vaccines to date. Additionally, 43 448 participants were included in the Pfizer-BioNTech trial, and no ITP was reported. Moreover, considering the low complement C4 (10.9 mg/dL), mildly elevated SSA Ab (1.5), and 2 months

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

prior, the platelet count (145 x 109/L) was near the lower limit, it is difficult to exclude alternative causes, such as an underlying autoimmune condition with pre-existing ITP. In this scenario, the ITP became clinically apparent following the vaccine, though this patient never manifested symptoms suggestive of autoimmune disease. This case was reported to the FDA's Vaccine Adverse Events Reporting System (VAERS) and is valuable both for post-approval pharmacovigilance and as a foundation for clinicians to evaluate future patients with suspected ITP. Rare vaccination events are important, but do not diminish the enormous utility of vaccination and the well-documented safety profile of the Pfizer-BioNTech BNT16B2b2 mRNA vaccine. No follow-up attempts possible. No further information expected.; Sender's Comments: The young adult having extremely low platelet 3 days presented with skin/subcutaneous bleeding following vaccination, a contributory role of the vaccine use therefore cannot be fully excluded in triggering the event onset. Meanwhile, the adult experienced upper respiratory symptoms prior to the vaccination having positive autoimmunological biomarkers positive including Sjogren's Syndrome A antibody elevated, tested positive for plasma IIb/IIIa and Ia/IIa platelet autoantibodies, complement C4 low, a underlying autoimmune condition with pre-existing ITP might not be completely ruled out. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1106640	3/16/2021	WA	78	M	3/3/2021	3/8/2021	During my earlier years working in an industrial area I had inhaled asbestos which caused me to have plural thickening in my lungs. Every year since that diagnosis I have been required to annual Pulmonary (lung and heart) testing. On February 11th I had my 30th annual Pulmonary exam consisting of EKG, Stress Test, and Chest X-ray. As in the past, results were all good. On March 3rd I had my 1st Pfizer vaccination. Five days later on March 8th I collapsed, was taken to the hospital by ambulance having suffered a massive Pulmonary Embolism affecting my heart and right lung. During my 2 hour operation, Surgeons used a flexible suction tube inserted thru my groin to remove a large blood clot (embolectomy). Pieces totaling about 14cm long, 2cm wide and 1/2 cm thick. I was discharged 3 days later and instructed to take blood thinning medication probably for the rest of my life. I am now 78 years old.
1106515	3/16/2021	UT	39	M	2/2/2021	2/21/2021	Severe middle back pain beginning February 21. Initially thought it was a kidney stone, but a visit to a urologist on February 25, determined it wasn't a kidney stone. The urologist ordered some blood work and that indicated that I most likely had blood clots. Went to the ER on the 25th and had further tests that determined that I indeed did have blood clots in my lungs.
1106505	3/16/2021	MI	74	F	2/25/2021	2/27/2021	Ocular stroke. A black curtain dropped down over right eye. Went to ER on the 28th, and was admitted. Had a blood clot in the right eye. Carotid artery right side did not have stenosis, they do not know why she had a stroke. Doctor can't say that it was caused by the vaccine. She now has a permanent blind spot in right eye.
1106428	3/16/2021	FL	68	M	2/18/2021	3/10/2021	Sub-Clavian Vein Blood Clot
1106403	3/16/2021	NV	50	F	2/9/2021	2/11/2021	Blood clots in the left leg, same side as the vaccine was given. Woke up approximately two days afterward (2/11/21) with muscle pain in the left thigh. The pain did not lessen over the week, assumed it was just muscle. The pain migrated down to my calf and then was too painful to stand on or walk on 2/18/21.

1101152	3/15/2021	TN	72	F	2/2/2021	2/17/2021	<p>Blood clot on right lung; soreness in arm; A spontaneous report was received from a 72 year old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and who experienced blood clot on right lung (pulmonary embolism) and myalgia. The patient's medical history was not provided. The patient had family history of blood clot (mother and brother). No concomitant product use was reported. On 02-Feb-2021, the patient received her first of two planned doses of mRNA-1273 (Lot number: 011M20A) intramuscularly for prophylaxis of COVID-19 infection. The patient had soreness in the right arm which subsided couple of days later. The patient also experienced shortness of breath for a week after vaccine administration. On 17-Feb-2021, the patient went to the hospital and underwent COVID-19 virus test, the results of which were negative. On 17-Feb-2021, the computerized tomography scan on chest showed moderate size blood clot on right lung. On 18-Feb-2021, the patient was discharged from the hospital on recommendation to initiate and continue lifetime treatment with Eliquis (apixaban, 5mg every 12 hours). According to the physician, moderate size blood clot on right lung of the patient could be attributed to the genetic history (patient's mother and brother also had blood clot). The patient also followed up with primary care physician, who informed that it was genetic and not related to vaccine. Action taken with mRNA-1273 was not reported. The outcome of the events, pulmonary embolism was unknown. The outcome of the event, myalgia was considered as recovered/resolved.;</p> <p>Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.</p>

1102512	3/15/2021	TX	34	F	3/9/2021	3/9/2021	I received my first dose Pfizer vaccine on 03-09-2021. I have a history of blood clot, 10 years ago. I am currently 9 weeks pregnant. I called my doctor's office who encouraged me o go to the ER since I was having symptoms of a blood clot. I went to the emergency room at Hospital where they did some blood testing. I then went to Hospital where they did more lab work and blood testing, they did an D-dimer test ad my level was at 3.23 and explained to me it could be due to my pregnancy. They ran some more tests showing I have a clot in the superficial femoral/ popliteal vein. They placed me on Lovanox medication for two days. I will be seeing a maternal fetal doctor tomorrow for further evaluation. They also monitored my baby and baby is doing fine.
1102925	3/15/2021	CA	70	F	1/14/2021	2/25/2021	I started to have tingling sensation to my left leg. I have history of DVT, hemochromatosis, hyperthyroidism but is all managed. The issue is that the tingling sensation I was experiencing was moving in my left leg, was painful but then it went away. I went to the emergency room 02-25-2021 that started with a blood clot and they placed me on Xarelto medication. My PCP encouraged me to go to the ER. they did an U/S of my left lower extremity which showed blood clot. I am already on blood thinner medication and no one can explain or give me an answer as to why I have a blood clot after my vaccine when i am on blood thinner medication.
1102909	3/15/2021	AZ	43	F	2/5/2021	2/24/2021	Starting on February 24, 2021, I started to have shortness of breath. This slowly got worse until on March 2, 2021 I was unable to breathe in all the way and was getting a sharp pain in my side/back when I tried to breathe in more than half way. I then went to the emergency room recognizing the symptom as likely being a pulmonary embolism, as I had experienced one four years earlier. It was, in fact, a PE. I was in the hospital for five days as they treated the clots with blood thinners. I slowly got my breathing more back to normal and was discharged. They are still runnyng myriad tests to try to determine the cause or causes, but I thought it wise to report here in case the vaccine is a factor. I received my second dose on 2/26/21, a few days before I went to the hospital but my symptoms started a few days before that.

1102813	3/15/2021	MI	79	F	2/11/2021	2/14/2021	Developed an Acute nonocclusive DVT in left leg 10 days after my first vaccine. Decided to decline my second vaccine. I do have a history of having blood clots, but last one was 32 years ago.
1102699	3/15/2021	LA	44	F	1/16/2021	1/19/2021	First Vaccine Dose on 12/26/2020 felt extremely fatigued. After 2nd vaccine dose on 01/16/2021 developed fever, chills, weakness, fatigue, body aches approximately 10 hours after received the 2nd dose. This all lasted about 24 hours. Then on 01/19/2021 which was the 2nd day of mine menstrual cycle, I had a very abnormal menstruation. I was passing "fist" size blood clots which made me very weak. this lasted again about 24 hours then it stopped. I had some labs drawn on 02/27/2021 which came back with very low Iron, Hematocrit and Hemoglobin levels. I usually do show signs of anemia in previous blood work but this time the levels dropped lower so i was referred to see a Hematologist.
1103001	3/15/2021	UT	59	M	2/22/2021	3/9/2021	Development of blood clots in lower right leg causing swelling and pain. Pt. visited doctor who prescribed an ultrasound which revealed the clots. Doctor has now put pt. on blood thinners indefinitely.

1102279	3/15/2021	MD	71	M	3/3/2021	3/6/2021	Diagnosis of a deep vein thrombosis in the left leg.
1102241	3/15/2021	FL	78	F	1/12/2021	2/7/2021	First dose was on 01/12/2021 at 9:30 am. No reaction until Feb.7. 2021, when left leg began to swell, but not seriously. Feb.8, 2021 leg was continuing to swell. went to doctor's office where he prescribed an ultrasound. Was told there was a clot behind my left knee and in some of the smaller veins. I had the chills, joint pains all over, which lasted about the three weeks, but was slightly different every day. When I began the 20 mg dose of Xarelto, every symptom cleared up and I felt great. I am continuing on the 20 mg Xarelto.

1101157	3/15/2021	OH	78	F	2/10/2021	2/10/2021	<p>blood clot in left forearm; Sore arm; A spontaneous report was received from a consumer concerning a 78, year, old, female patient who developed a blood clot in the left forearm. The patient's medical history included hypertension, high cholesterol and hypothyroidism. On 19-JAN-2021 the patient had two stents placed in her heart. Products known to have been used by the patient, within two weeks prior to the event, included clopidogrel bisulfate (One 5 milligram AM and PM) and apixaban (One 5 milligram AM and PM) and Aspirin. On 10-FEB-2021, approximately six days prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 (Batch number not provided) intramuscularly in the left arm for prophylaxis of COVID-19 infection. The patient had a sore arm for about a day after the vaccination. Six days later the left arm was red and swollen, inside forearm four inches down below the elbow it was stinging, slightly swollen, just to a soft touch she felt lumps of swelling. The patient went to the emergency room and had blood work and an ultrasound. The emergency room doctor told her that she had a blood clot in the left forearm four inches down below the elbow. The lab test done at the emergency were blood work and ultrasound. Treatment for the event included changing her current medication to one clopidogrel bisulfate 5 milligrams AM and PM and apixaban two tablets of 5 milligrams AM and PM and to discontinue the Aspirin for one week. There was no change planned to the dosing schedule of mRNA-1273 in response to the event(s) and is scheduled to get her second vaccination 10-MAR-2021. The outcome of the events were considered as unknown. Follow up: No follow up information received.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.</p>

1103401	3/15/2021	PA	33	F	3/8/2021	3/10/2021	I received my second Moderna vaccine on 3/8/21. On 3/10/21 I started spotting (bleeding: a menstrual period). This was 12 days ahead of my normal cycle. Today, 3/15/21 I am still experiencing mensuration bleeding. The blood is mostly brown, but also red, and has small clots. It comes and goes throughout the day unlike my normal period.
1100924	3/15/2021	NC	63	F	1/22/2021	2/8/2021	DVT blood clot in left calf verified via ultrasound on 2/17/2021. Symptoms: pain in left calf and foot proceeded by chills/fever and right fingers/hand inflammation. Symptoms began 2/08/2021.
1100271	3/15/2021	WI	82	F	2/8/2021	2/10/2021	Lost control of muscles; ended up blacking out; could not move; could not talk; A spontaneous report was received from a Consumer concerning about a 82 years old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced Paralysis, Syncope, Mobility decreased and Aphasia. The patient's medical history was provided as diabetes, dementia as current illness. Relevant concomitant medication was reported as blood thinner for blood clots. On 08 FEB 2021, prior to the onset of event, the patient received their first dose of two planned doses of mRNA-1273 (lot/batch: unknown) for prophylaxis of COVID-19 infection. On 10 FEB 2021, the patient experienced Paralysis, Syncope, Mobility decreased and Aphasia. Due to these events patient's required hospitalization and on oxygen. Laboratory details was not provided. Treatment information was not provided. Action taken with mRNA-1273 in response to the events was unknown. The outcome of the event's Paralysis, Syncope, Mobility decreased, and Aphasia was as unknown.; Reporter's Comments: The events were consistent with increased risk of cerebrovascular complications associated with elderly age of patient. Company assessed the events to be unlikely related to company product.

1100197	3/15/2021		78	M	2/24/2021		<p>On Eliquis and on and off had bloody urine; This is a spontaneous report from a contactable consumer, based on information received by Pfizer from Bristol-Myers Squibb (manufacturer control number US-BRISTOL-MYERS SQUIBB COMPANY-BMS-2021-020443), license party for apixaban (ELIQUIS). This spontaneous case was reported by a patient family member or friend and describes the occurrence of haematuria (On Eliquis and on and off had bloody urine) in 78-year-old male patient who received apixaban (Eliquis) for Cerebrovascular accident prophylaxis. Co-Suspect Products included Covid-19 Vaccine for COVID-19 immunization. The patient's past medical history included Prostate cancer (about 10 years ago), Radiation therapy and Capillary fragility. On an unknown date, the patient started Eliquis (unknown route). On 24-Feb-2021, the patient started Covid-19 Vaccine (unknown route). On an unknown date, the patient experienced haematuria (On Eliquis and on and off had bloody urine). The action taken with Eliquis (Unknown) was unknown. At the time of the report, haematuria resolved. Event reoccurred on 24-Feb-2021 For Eliquis (Unknown), the reporter did not provide any causality assessments. The reporter stated that the patient got the Covid vaccine the previous day, he had a history of prostate cancer from about 10 years ago and was treated by radiation, the radiation had caused capillaries in the penis to be fragile and so sometimes when he urinate, he urinate blood or little blood clots, neurologist was aware of it, cardiologist was aware of it but they did not treat it, they just waited for it to resolve itself. He was also on Eliquis for a Atrial fib so the previous day when we came home after he got the vaccine, he was bleeding with the clots and with the bloody urine which he had done in the past. He had a blood urine one hour post vaccination. She was shocked. It would take at least a few hours for the medication to get in the system before having any kind of reaction. It resolved on it's own he did not have a blood urine anymore. The second dose of the vaccine was due on 16-Mar-2021.</p>

1103049	3/15/2021	NV	79	F	2/18/2021	2/18/2021	On my right leg down close to the ankle I have a swelling that is showing bruising and a lump that is painful. I am not sure if it is a clot or not. I have not been to Urgent care . I informed people giving me vaccine I was on blood thinners. Nobody seem to show concern about that. I have already received 2nd shot, which I got very sick after, but symptoms seem to happen to others. My concern is the lump on my leg if it is a clot and concern if I will get more now that I took the 2nd vaccine.
1098030	3/14/2021	VA	44	F	2/27/2021	3/9/2021	Woke up with sore upper right thigh Tuesday March 9. Very tender to the touch. Visited Dr. Wednesday March 10, ordered ultrasound which was completed on Thursday March 11 and diagnosed a superficial blood clot. Prescribed Xarelto 10mg.
1098455	3/14/2021	FL	28	F	3/11/2021	3/13/2021	vein thrombosis
1098715	3/14/2021	NY	66	M	2/13/2021	2/26/2021	My 1st Covid-19 vax was on Saturday 02/13/2021. On Friday 02/26/2021 I had pain in my right ankle and foot and thought it was possibly just another bruise. Saturday evening 02/26/2021 I realised it was a blood vessel popping out. On Tuesday 03/02/2021 I had an ultrasound and it was diagnosed as a "superficial thrombosis". It goes from the inside of my right foot to the top of the foot. Then it can be seen on the inside of my ankle, skip a spot, and is again visible on the inside of my calf. It ends mid-calf on my right leg.

1099190	3/14/2021	OR	44	F	3/9/2021	3/9/2021	<p>feverish, easy fatigue, bilateral stiffening of the calves, some edema. Diagnosis, DVT of popliteal vein and pneumonia. Given an iv bolus of a broad spectrum antibiotic. Started on Eliquis two 5mg pills twice a day for one week and the one tablet am and one pm. Given Lasix bolus and then started on 5 mg Lasix/day. Swallowing tests more or less OK WEDNESDAY FEB. 4. Discharged. MONDAY, MARCH 8, Check up with GP, Blood pressure 127/76. Lasix discontinued. THURSDAY, MARCH 11, Check up with GI doctor, Blood pressure consistently 150/90. Sent to adjacent cardiologist's office (next door). High BP reading confirmed and reconfirmed the next day. Dose of Metoprolol succinate increased to 5 mg 2xday. Note 1: Still have the DVT. Note 2: Received 2nd dose of Moderna vaccine on Feb 11. Note 3. All medical records available either through hospital, GP or by contacting me. Note 4: This is not a crank report. I have had 50 years teaching and doing funded research in 3 medical schools rising to the rank of full Professor in each.</p> <p>After waiting my 15 min, and left the facility about 10 min later my left side of face tingled. Then about 1 hour after getting the shot I had a horrible leg crap in left leg to the point it was hard to walk. Went to ER and ruled out blood clot and I also developed sores in my mouth. That night I started feeling warm sensation down both arms and tingling in both hands and this had been going on each day throughout the day where I have a warm sensation down my arms and through my upper chest and is not going away, today 3/14/21 I went to urgent care again as now left side has swelling in my lymph nodes in my chest and I still have the tingling in my face and my head does not feel right. Urgent care did a neurological base test and I seem fine in that department but told me to report the warming sensation as it's not my skin but I feel it inside.</p>

1096852	3/13/2021	TN	72	M	3/3/2021	3/4/2021	About 27-28 hours after injection felt strong pain in left lung area. Got progressively worse, especially at night when lying in horizontal position. The pain became extreme, could hardly breathe (inhalation causing extreme pain) and couldn't really walk on morning of March 6 (about 66 hours after vaccination. Called General Practitioner and he said to go to Emergency Rm. A catscan showed a small blood clot in each lung. Given blood thinner injection. Subsequent Ultrasound of legs showed no clots there. Released 48 hours later, put on Eliquis -- 5mg -- two each time, twice a day for 6 days, then one each time twice a day. for 3 months.
1097794	3/13/2021	FL	52	F	3/7/2021	3/7/2021	15 min. after shot, my neck became warm and flushed, slightly red. By 30-40 minutes after shot, my face was also flushed and the inside of my mouth (mostly roof of my mouth) and lips were itchy/tingly. Then, I took 2 Zyrtec 10 mg. as instructed by my allergist if I had a reaction. Within an hour, the flushing and itchiness were gone. 2 days later - had strange pain, swelling, and warmth in upper left shin below knee. Worried about possible blood clot, I took 2 baby aspirin. Pain and swelling went away. Not sure if related to vaccine but unaware of anything else that could have been different.

She states that her symptoms started on Sunday. She has pain with a deep breath and also with exhaling. She reports it is a sharp pain. She states that she has had no lower extremity edema or calf pain, however, she did have a shooting pain down her right leg recently. She denies any history of personal or family history of deep venous thrombosis or pulmonary embolus. She reports that she has not had any hemoptysis. She denies feeling short of breath. She denies abdominal pain, nausea, vomiting, or diarrhea. She states that she has not had any COVID exposures or known symptoms. She has received two COVID vaccine doses. She reports that she has not been sick and denies fever, chills, or cough. In the emergency department she was diagnosed with an acute pulmonary emboli in the right main pulmonary artery with extension into the segmental pulmonary arteries. There is concern for early pulmonary infarct. This has prompted admission to the hospital.

1091908	3/11/2021	IL	83	M	1/27/2021	2/12/2021	DVT blood clot in the right foot, then spread to lower leg and knee and thigh, groin
1091986	3/11/2021	NV	29	F	1/9/2021	1/11/2021	I had just finished my cycle the day before. I woke up Mon morning to thick, clotted blood. I contacted my provider and I was instructed to take a pregnancy test, which was positive. I went in for an exam on the 12th and they confirmed that I was indeed pregnant. They tested my Beta Hcg twice. I didn't get my results immediately due to one site being closed due to COVID. I could've gone to the hospital and received the results immediately, but my doctor didn't want to take the chance due to the hospital having a lot of COVID. They confirmed that I was pregnant on the 19th or 20th. I bled for a few days after that. The final Beta Hcg was done and my level was 0.

1092316	3/11/2021	VA	66	F	2/26/2021	2/27/2021	Received report that client was admitted to the hospital on Feb 27th with persistent tachycardia. Called client on March 11 to inquire. Client shared that she has felt weak since having COVID-19 in September 2020 and was hospitalized for 3 months. She shared she has felt weak since having COVID-19. She shared that on the morning after receiving the vaccine she was getting out of her bed, which is on the floor, and she hit her head. She shared that her daughter was concerned and took her to the emergency department (ED). While there in the ED her blood work ?wasn?t right? and they thought she might have a small blood clot in her lung and she was admitted. While in the hospital she received eliquis which she had a reaction to. She shared she was in the hospital for 1 day. Recommended she see her PCP for these health concerns as well as before receiving the 2nd dose of a COVID-19/Moderna vaccine.
1092438	3/11/2021	PA	45	M	3/1/2021	3/10/2021	Spontaneous Pain in inside left foot just above heel, pain radiates all over back of foot when standing or walking. Feels like blood clot / ruptured blood vessel. Not sure if this is attributable to vaccine
1092477	3/11/2021	FL	83	F	2/17/2021	3/7/2021	Pericardial effusion; multiple blood clots in portal vein.
1092490	3/11/2021	MO	99	F	2/9/2021	2/10/2021	Patient became lethargic, extremely tired, unable to care well for self. Patient had no appetite, refused most food and spent many hours simply sitting in her chair. She felt that she was having a heart attack and called 911 using her emergency response button on 2/21/2021. Doctors indicated that the patient's life was in serious danger, but because of age they were hesitant to try to remove the clot pressing on her heart. She was only allowed to go back home because we utilized Hospice. When asked about her life expectancy, we were told she could die any minute or might live a few more months, but that she was not expected to live much longer. SHE WAS IN GOOD HEALTH PRIOR TO THE IMMUNIZATION!

was called. No stridors. No wheezing. Reports continued tingling and the numbness in her mouth but no lip swelling or tongue swelling. Denies any difficulty swallowing at this time. No wheezing. No abdominal pain or nausea. No rash at this time. Of note, patient also notes left-sided facial, arm, and leg numbness starting about 10 minutes prior to arrival to the emergency department. She reports that she has had recurrent numbness on the left side in the past, which was thought to be due to migraine versus TIA. She has had extensive work-up and multiple hospitalization for this symptom. She reports that she is allergic to iodine and gadolinium containing contrast. Denies any headache at this time though she had a mild headache after receiving the vaccine. Denies any blurry vision. Denies any weakness in her bilateral upper and lower extremities. Assessment and Plan: Vital signs notable for O2 sat of 96 to 98% on room air without tachypnea. Patient is mildly hypertensive. Patient is well-appearing speaking full sentences without any dysarthria. Pupils are equal and reactive to light. Extraocular movement intact. She notes diminished sensation to her left face, left upper extremity, and left lower extremity. Tongue is midline. Hearing is intact bilaterally. No facial droop. She has 5 out of 5 strength in bilateral upper and lower extremities. No pronator drift. Normal gait. No tongue swelling or lip swelling. No stridors. No uvula swelling. No pharyngeal or erythema. Lungs are clear to auscultation bilaterally without wheezing or rhonchi. Cardiac exam without murmurs rubs or gallops. Regular rhythm. No abdominal distention or tenderness on palpation. No CVA tenderness. 51-year-old female who is presenting to the emergency department with improving lip swelling and numbness in her mouth, raising a concern for anaphylaxis related to her Covid vaccine. Reassuringly, status post EpiPen, her symptoms are improving. However, she has new onset left-sided numbness, with without any headache. She reports that she has had this numbness in the past the last time she had the numbness on the left side was approximately 10 years ago. Her neurologic exam is only notable for diffuse numbness on her left side including her face. Differential diagnosis include migraine headache and TIA. Stroke is possible though less likely given the patient has had the same symptoms in the past

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1092549	3/11/2021	CA	72	F	2/17/2021	2/19/2021	with negative work-up. Will defer code stroke at this time but will emergently consult neurology. Will get labs including BMP and CBC. We will continue to monitor her from the anaphylaxis perspective. We will also give her a dose of steroid. Prednisone 60 mg by mouth given 12:29 PM NEUROLOGY CONSULT NOTE Assessment: Formulation- Diagnosis is guarded. Localization structurally would suggest subcortical (thalamic) or small brain-stem in a sensory territory on the right. Etiologies could be stroke given her vascular risk factors but seems unlikely given there is stereotypy of earlier symptomatology. Demyelinating would be another possibility as well, but again, the stereotype. Seizure unlikely because of the timing of rush from toes to body was minutes and duration of some occasions being days. Complicated migraine possible, has some risk factors, but should be treated as dx of exclusion. She does make complaint of headache, which could support. Some FND elaboration on her anxiety-ridden allergic reaction is also possible, but no objective non-structural signs to support.
							blood clots dx'd via ultrasound on 2-20-21

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1090240	3/11/2021	NY	71	M	2/10/2021	2/1/2021	Cardiac arrest; Pulmonary embolus; Renal failure; Fever; Dehydration; Not eating or drinking; COVID-19 confirmed by positive COVID-19 test / COVID pneumonia; blood clot; blood pressure was low; Respiratory arrest; Respiratory failure; Hypoxemia; ventricular tachycardia; This is a spontaneous report from a contactable nurse reporting on behalf of the husband. A 71-year-old male patient received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot EL9264) on 10Feb2021 at about 19:00 (at the age of 71 years), in left deltoid, for COVID-19 immunisation. No other vaccines were given on the same day or within 4 weeks. The patient declined flu vaccine and pneumococcal vaccine (PNEUMOVAX), he had never had another vaccine except maybe his childhood vaccines. Medical history included rotator cuff surgery and cataract removed in 2020. The patient exercised regularly, he was healthy, he walked for miles and didn't eat any non-sense, he did not eat out, he did not smoke. The patient's mother was 100 years old and fully competent. The patient had two sisters older than him, the oldest one had hypertension the second sister did not have anything that they were aware of. The patient's father lived until he was 98 years old. The patient concomitant medications were none. The patient was told to take vitamin D 50,000 units but didn't even take them (he still had 9 of them in the bottle and they gave him 13). The patient experienced fever on 11Feb2021, renal failure on 14Feb2021, pulmonary embolus on 28Feb2021, cardiac arrest on 04Mar2021, dehydration and not eating or drinking on an unspecified date in Feb2021. These events required ER visit and were reported as serious as involved hospitalization from 14Feb2021 to 04Mar2021 and as fatal events. The patient died on 04Mar2021. Clinical course of the events included the following information. The patient received the first vaccine on 10Feb2021, the next day he developed a fever. The reporter spoke with the patient's doctor who told to give the patient paracetamol (TYLENOL) thinking the fever was from the vaccine. On 12Feb2021 and 13Feb2021, the patient's temperature was 102. Then the doctor advised to take the patient to the hospital. The patient's temperature was still 102, he was in renal failure, and they had to dialyze him. The patient was otherwise healthy, the patient's last physical was in Dec2020 and the only thing it showed

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

was that his A1C was 5.7. The patient had no cholesterol or hypertension. The doctor advised the patient to decrease sugar and carbs because the holidays were coming up. The patient's follow up was scheduled on Mar2021. The reporter felt that the vaccine has something to do with the patient renal failure. The reporter spoke with the doctors at the hospital who didn't want to commit to anything. The reporter believed this was an adverse event. The caller mentioned that she had her vaccine before and she was fine. The patient was admitted on 14Feb2021 and by Wednesday he was not eating or drinking, he was dehydrated. The patient's admitting diagnoses was elevated temperature and ruling out COVID. The patient tested positive for Covid on 14Feb2021 (COVID-19 PCR test). The patient's temperature was 99.8 and then kept creeping up, on Saturday it was 102. The caller gave the patient Tylenol cold and flu (lot T0CL001021, expiry date Oct2021) took the edge off but in three hours the temperature was back up again. The patient never complained of pain and didn't want to take Tylenol. On 15Feb2021 the patient's numbers were getting better after the fluid challenge and then his numbers kept creeping up after that. The patient had the fever a week until they had it under control. The fever went away, it was gone for like 5 days, then it spiked again. The patient was started on piperacillin/tazobactam (ZOSYN) for like 3 or 5 days and the fever went away but then it kept getting worse. On 28Feb2021, the medical personnel thought the patient had a pulmonary emboli but because of the renal failure, they couldn't do a computerized tomography on the patient. The doctors mentioned that the patient was in renal failure and they thought they heparinized the patient and he had a blood clot who led to pulmonary embolus, cardiac arrest, and death. The patient was diagnosed with a pulmonary emboli on 28Feb2021. The patient started de-saturating and the doctors intubated and sedated him that whole time until this. Dialysis was started on 01Mar2021 and the patient received it every day except 04Mar2021. The patient's blood pressure was normal, it hardly ever went above 120. The patient was on the medical floor from 22Feb2021 to 04Mar2021. When the patient was on the medical surgical floor, he was on high flow 5 liters. After the patient started desaturating, he went to the intensive care unit and was

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

put on a non-rebreather on 45%. The patient's highest heart rate was after intubation was 135, but the patient's blood pressure was low so they started him on some vasopressors. They did the fluid challenge on the patient and his labs were a little better than the labs kept creeping up until the doctor inserted a shiley catheter for dialysis. Respiratory: Respiratory arrest and then cardiac arrest. Respiratory failure, they intubated the patient. The reporter assumed dyspnea because the patient was intubated. Tachypnea was when the patient was in the intensive care unit already intubated. Hypoxemia, they intubated the patient so the caller guessed it was for the oxygen saturation drop. Covid pneumonia: yes. Chest x-ray showed mild pneumonia. The caller requested a follow up x-ray and the doctors said they were going to do another one but the caller is unsure if they did or when. The patient received additional therapies for COVID-19: remdesivir. Other radiological investigations: unable because of the patient's kidney function. They were looking at the D dimer and BMP to come up with the embolus since the patient couldn't have the scan. ARDS: no. Cardiovascular: The patient had a heart attack on 04Mar2021. The reporter thought it was from the pulmonary embolus which led to cardiac arrest. Arrhythmia: the caller guessed so, the patient was being worked on for 10 minutes before the caller got there. The caller saw a rhythm strip which showed a flat line and then she noticed ventricular tachycardia, then a flat line. The patient did not have SARS-CoV2 antibodies at diagnosis. Gastrointestinal/Hepatic, neurological, hematological, dermatological: none. Vascular: pulmonary embolus: yes, deep vein thrombosis, limb ischemia, vasculitis: no. Renal: renal failure: yes, acute kidney injury: no. The patient was scheduled for his second vaccine dose on 03Mar2021 at 04:15 but did not receive it. Time of death was 4:15 in the afternoon on 04Mar2021. The reporter considered renal failure, fever, dehydration, not eating or drinking, cardiac arrest and pulmonary embolus as fatal and related to the suspect vaccine. The outcome of the other events was unknown. Cause of death was unknown. No autopsy was performed.; Sender's Comments: Based on current information available, the company considered there is a possibility that all reported events are consequence of COVID-19 pneumonia on the basis of advanced age.

1090229	3/11/2021	MI	63	F	2/1/2021	2/1/2021	pulmonary embolism/Blood clots in the lung; heart attack; Shortness of breath; headache; jaw hurt; Shin hurt; heart burn; This is a spontaneous report from a contactable consumer (patient's son). A 63-year-old female patient (mom) received the second dose of BNT162B2 (Pfizer-Biontech Covid-19 Vaccine), via an unspecified route of administration in arm in Feb2021 (reported as in the first week of Feb2021) at single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. Patient previously received the first dose of BNT162B2 in Jan2021 for COVID-19 immunization. Reporter (patient's son) received his first dose of Pfizer COVID vaccine on Wednesday and wanted to know if this vaccine could cause blood clot. He stated his mom (patient) in the hospital due to pulmonary embolism from 24Feb2021, 2.5 weeks after her second shot. He stated his anxiety levels were higher than normal. He had strong response to flu vaccine this year and experienced chill, shakes, fever, received antibiotic, and loss sense of taste from the flu vaccine. Reporter read online that some people commented that they have DVTs (deep vein thrombosis) and blood clots from the Pfizer COVID vaccine. Patient experienced blood clots in the lung in Feb2021 and hospitalized on 24Feb2021. Patient got her second shot about 2 weeks before and she ended up in the hospital with pulmonary embolism. They looked at her lungs and found all the blood clots. Patient had really bad shortness of breath, headache, her jaw hurt, and her shin hurt. She was helping out at vaccine clinic and she was out of breath, she said the old people in strollers were passing her. Patient began to make complaints about how she was feeling in mid of Feb2021. Patient said in rare cases 2 weeks after the second dose reactions could happen. Patient got done working in ICU, and helped with PPE, then at 11 she left work at the hospital, she was experiencing heart burn for 3 days and so she thought had a heart attack drove to an ER (emergency room) on the way home, and then was admitted to the hospital on that same day 24Feb2021, she was supposed to be discharged today (26Feb2021). Patient had been feeling out of breath for past 2 month, it was possible it might seem like it was related to the vaccine but it could also not be related. Reporter stated that on the internet he saw how a 1000 deaths happened after the vaccine, it

was all old people, but in the autopsies there was no link to the vaccine, they were going to die regardless. Lab data included: She did get a test before for Factor 5 Leiden but it was negative. They did test for COVID, it was negative, while in the hospital. In the hospital they were also testing her again for the Factor 5 Leiden, the results hadn't come back yet. They did test for blood clots, they did an MRI (magnetic resonance imaging) in Feb2021, it was positive for blood clots (blood clots in the lungs). When she was admitted her oxygen was 85%. Outcome of the events was unknown. Information on lot and batch number has been requested.

<i>VAERS_ID</i>	<i>RECVDATE</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1090223	3/11/2021		70	F			<p>SV for unstable angina; CAD; Tachycardia; Nausea; Belching; SOB; Chest heaviness, chest pressure, chest tightness; Pain; This is a spontaneous report from a non-contactable other HCP. A 70-year-old female patient received the first dose of bnt162b2 (lot number EN6205) via unspecified route of administration on unspecified date at single dose for COVID-19 immunisation. The patient's medical history and concomitant medications was not provided. Upon 15 minutes after injection, she noted nausea with belching and had some SOB. Symptoms worsened as she ambulated over to the medical bay along with her chest pressure. She denied rash, hives, welts, hoarseness, stridor, itching, lightheadedness, dizziness, facial swelling, lip swelling and tongue swelling. Patient reported recently admitted for unstable angina and CAD with tachycardia. Patient had elevated d-dimer and blood clot was ruled out. Patient discontinued on new medication, beta blocker. Since discharge this Sunday 21Feb2021, she reported chest heaviness as if she has "cardboard on chest." Can slightly increase with going up and down stairs or increased activity. She states she had reached out to her cardiologist via an online site but has not heard back. Patient stated her pain is about the same today. Patient complains of chest tightness and shortness of breath. The outcome of events was unknown. No Follow-up attempts are possible. No further information is expected.; Sender's Comments: Based on temporal association, the contribution of the suspect drug to the onset of events unstable angina and tachycardia cannot be excluded. The patient's age and suspected cardiac condition are risk factors. The event CAD, given its progressive nature, is most likely an underlying condition, thus unrelated to the suspect drug. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.</p>

1087308	3/10/2021	PA	92	F	2/15/2021	2/18/2021	her mother didn't want anything to eat; her mother wasn't making any sense when she talked; Dizzy; Weakness; shaky; stomach became upset; her mother had a pretty severe headache come on; Nose bleeds; Blood pressure increased; her mother's comprehension is not at the same level as prior to being hospitalized; This is a spontaneous report from a contactable consumer. A 92-years-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on left arm on 15Feb2021 12:30 at SINGLE DOSE for covid-19 immunisation. Medical history included blood pressure high, high cholesterol. Caller stated her mother has had high blood pressure for around 15 years. She said her mother's blood pressure medicine has changed over the years, providing her current blood pressure medication as: Ramipril 2.5mg capsule, once a day, Bisoprolol 5mg tablet, once a day. Reported her mother has had high cholesterol for at least 30 years. She said her mother's cholesterol is controlled with Simvastatin 40 mg, once a day. She said her mother has been on Simvastatin for at least 10 years and her mother's Simvastatin dose has been bumped up gradually over that time. She said the Simvastatin 40mg is dispensed in a pharmacy bottle with no NDC, Lot, and expiration date. Concomitant medication included omeprazole (OMEPRAZOLE), simvastatin (SIMVASTATIN) for high cholesterol, ramipril (RAMIPRIL) for blood pressure high, bisoprolol (BISOPROLOL) for blood pressure high. The patient experienced nose bleeds on 18Feb2021 with outcome of recovered on 22Feb2021, her mother had a pretty severe headache come on on 18Feb2021 with outcome of not recovered, blood pressure increased on 18Feb2021 with outcome of recovering, dizzy on 20Feb2021 with outcome of unknown, weakness on 20Feb2021 with outcome of not recovered, shaky on 20Feb2021 with outcome of unknown, stomach became upset on 20Feb2020 with outcome unknown, her mother didn't want anything to eat on 21Feb2021 with outcome of unknown, her mother wasn't making any sense when she talked on 21Feb2021 with outcome of not recovered, her mother's comprehension is not at the same level as prior to being hospitalized on an unknown date with outcome unknown. The patient was hospitalized from 21Feb2021 to an unknown date. Reporting on her 92 years old

mother who received her first Pfizer COVID-19 Vaccine dose last Monday, 15Feb2021. She said the first couple days her mother was fine after receiving the COVID-19 Vaccine. She said on Thursday, 18Feb2021, her mother had a pretty severe headache come on. She said her mother normally doesn't have headaches. She said her mother began having nose bleeds that started on Thursday (18Feb2021), and continued on Friday (19Feb2021), and Saturday (20Feb2021). She said her mother's blood pressure was up during that time, as well. She said on Saturday night (20Feb2021) at 9:00 PM she took her mother to the Emergency Room because her mother's blood pressure was very high. She said a CT scan of her mother's head was done and was negative for a stroke. She said her mother was kept in the Emergency Room and monitored. She said her mother's blood pressure was gotten under control with given blood pressure lowering medication in the Emergency Room and her mother was discharged home at around midnight. She said she does not know the name, dose, NDC, Lot, and Expiration Date for the blood pressure medication. Reported her mother takes Warfarin for blood clots. She clarified her mother is monitored monthly and her mother's Warfarin is adjusted accordingly. She said her mother takes a Warfarin 1mg tablet daily on Monday through Friday, and a 1/2 Warfarin 1mg tablet (0.5mg) on Saturday and Sunday. She said the Warfarin is dispensed in a pharmacy bottle with no NDC, Lot, and Expiration Date. She said her mother has been on Warfarin for around 20 years, since her mother had a blood clot. Reported her mother takes a stomach medication, clarified as Omeprazole 20mg capsule once a day. She said her mother has been on Omeprazole for years. She said the Omeprazole 20mg capsule was dispensed in a pharmacy bottle with no NDC, Lot and Expiration Date. She said her mother's stomach had been fine. She said her mother didn't get sick to her stomach, until the night she was released from the Emergency Room (20Feb2021). She said when her mother sat up and tried to stand while she was in the Emergency Room on Saturday night (20Feb2021), her mother was dizzy, and felt weak and shaky. She said her mother was given some orange juice and peanut butter crackers at the time. She said her mother's stomach became upset then. She said she thinks her mother's

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

stomach upset had more to do with having the orange juice and peanut butter crackers than anything else. She said her mother has never had nose bleeds or headaches before. She said her mother has blood pressure issues that she takes blood pressure medicine for. She said she thinks the COVID-19 Vaccine may have exasperated her mother's issues. Reported on Sunday (21Feb2021), her mother didn't seem much better to her. She said her mother's blood pressure was up, her mother was dizzy, weak and had a bad headache. She said her mother has a healthy appetite for 92 years old and her mother didn't want anything to eat. She said she ended up calling 911 because her mother wasn't making any sense when she talked. She clarified her mother was picked up by the ambulance at 9:00PM on Sunday (21Feb2021); and admitted to the hospital. She said her mother is still in the hospital as of today, Tuesday, 23Feb2021. She said her mother had a CT scan, a MRI, and an EEG. She said the CT scan, and MRI were negative, and the EEG results were not back yet. She said her mother may be released home today, 23Feb2021, depending on the EEG results. Reported her mother has never had nose bleeds or headaches before. Reported on Sunday, 21Feb2021, she took her mother's blood pressure. She said her mother was very weak and incoherent. She said her mother was unable to comprehend the way she usually does. Reported her mother has had no more nose bleeds since yesterday 22Feb2021. She said her mother is still quite weak, but her blood pressure is now under control. She said her mother has been on a stroke watch while at the hospital, and her mother has not been allowed to get up out of bed as of last night (21Feb2021). She said the hospital staff are supposed to let her mother walk today (23Feb2021) to see if her mother's blood pressure stays stabilized. She said her mother's comprehension is not at the same level as prior to being hospitalized. She clarified her mother still drives a car at 92 years old and takes care of her own check book. She said she doesn't know if her mother will still be able to do that at this time. Reported her mother was checked for a UTI while at the hospital. She said the hospital went ahead and treated her mother for a UTI without knowing if her mother had a UTI. She said because her mother is elderly, a lot of times the elderly have UTIs. She said the hospital didn't want to

---

waste time and went ahead and treated her mother for a UTI because her mother hadn't been on antibiotics recently. The caller stated she did not have any information on the medications her mother has been given while at the hospital. Reported at first she did not think her mother's symptoms had to do with her mother's first COVID-19 Vaccine dose, but then there was a new part to her mother's story that made her think her mother's symptoms had to do with the COVID-19 Vaccine. Caller stated she is apprehensive for her mother to go get her second COVID-19 Vaccine shot. The patient underwent lab tests and procedures which included blood pressure abnormal: up on 18Feb2021, Head CT: negative on Feb2021, Head CT: negative for stroke on 20Feb2021, EEG: unknown results on Feb2021, MRI brain: negative on Feb2021. Therapeutic measures were taken as a result of nose bleeds, blood pressure increased, dizzy, weakness, shaky.

1086928	3/10/2021	CA	50	F	1/16/2021	2/1/2021	<p>showed no acute intracranial process Identified. No evidence of enhancing lesion. Patient had not completed laboratory at this time. It was unknown if the patient had doctor or other healthcare professional office/clinic visit. The outcome of the event was not recovered. No follow-up attempts are possible. No further information is expected.</p> <p>Chose not to get second shot; Deep Vein Thrombosis; A spontaneous report was received from a consumer, concerning a 50 year-old, female who received Moderna (mRNA-1273) and developed deep vein thrombosis, and chose not to get second shot. The patient's medical history was not provided. Concomitant product was not provided. On 07Jan2021 (previously reported as 16Jan2021), approximately one week prior to the onset of symptoms, the patient received their first of two planned doses of mRNA-1273 (batch number: 025L20A) intramuscularly for prophylaxis of COVID-19 infection. A week post vaccination, she had a thick painful cord down injection arm and was misdiagnosed with tendonitis. After a second opinion, she was diagnosed with deep vein thrombosis. On 01FEB2021, an ultrasound confirmed a blood clot and subsequently, she went to the ER. A computerized tomography (CT) of the lungs ruled out pulmonary embolism. Based on these events, the patient chose not to get the second shot. Treatment included rivaroxaban and follow-up with hematologist. The second dose of mRNA-1273 was discontinued in response to the event. The outcome of the events deep vein thrombosis and chose not to get second shot were unknown. Follow-up information received 08Feb2021 included additional event, date of first dose was updated from 16Jan2021 to 07Jan2021, diagnostic test and treatment.; Reporter's Comments: This case concerns a 50 year-old, female who experienced deep vein thrombosis. Treatment included rivaroxaban and follow-up with hematologist. Very limited information regarding this event has been provided at this time. Further information has been requested. The causality for the event of intentional dose omission is assessed to be not applicable.</p>

1084516	3/9/2021	VA	81	M	2/27/2021	3/4/2021	4 days after second short arm of shot ballooned such that no features can be distinguished. Visited Doctor twice but they had not seen anything like this. They ordered scan on left arm for possible blood clots; negative. Prescribed Benadryl every 8 hours, taken for three days but no relief from sever swelling. It is now 7 days since the arm first swelled up.
1085254	3/9/2021	NJ	90	M	3/1/2021	3/1/2021	Severe abdominal pain unable to eat or sleep for 36 hours. He went by ambulance to the Hospital emergency room. They tried to pump his stomach but he aspirated and went into cardiac arrest. He was revived but never regained consciousness. (The ICU Dr said that he had blood clots in his abdomen from a recent stroke. We were unaware of him having a stroke other than in 2026. The same Dr. said that he had necrosis in his lungs from aspirating. The necrosis was from his bowel dying) He was put on a ventilator and given drugs to increase his heart rate. On 3-5-21 the heart drugs were reduced and he died. I was with him when he recieved the vaccination and he was healthy, just old. I think that the shot killed him.
1085298	3/9/2021	PA	59	F	2/27/2021	3/3/2021	She got the vaccine, started feeling like she thought was muscle pain and now that she thinks about it was menstrual cramps. Then some dark menstrual discharge. She thought it had stopped, but this afternoon had dark bloody clots/discharge when wiping. She is not having as bad of cramps. Sunday and morning were definitely worse days than today. She has not had a menstrual cycle in over 15 years, she is 60. She did not take anything for the pain. She is still having the symptoms, and actually worse than it was earlier.

1085423	3/9/2021	NY	37	M	3/2/2021	3/4/2021	2 days after my 1st vaccine (Thursday, 3/4), I started to feel a slight shortness of breath...it was not severe but felt pretty constant regardless if I was still or moving...not a full catching of breath but the sensation was there I went to Urgent Care on Friday 3/5 to get tested for COVID, and that came back negative on Rapid (3/5) and PCR (3/7) The symptom continued into Monday 3/8, and I went back to Urgent Care to get a Chest X-Ray and Blood work. The Chest X Ray came back normal, but the D Dimer showed an elevated level and they recommended I go get a CT Scan to check for Blood Clots I went to NY Presbyterian ER to get a CT Scan with Contrast, which came back clean. They also did a ECG 12 Lead and Troponin I Test, all came back clean I was discharged on 3/8, with Hospital potentially diagnosing the issue as Pueris. This could be from a common cold, but also concerned that the vax caused some internal inflammation Still feeling the sensation on 3/9, have a follow up appointment with GP on Friday 3/12 to go over all tests
1085435	3/9/2021	TX	67	M	2/27/2021	3/3/2021	Onset of leg pain began four days after vaccination (vaccination on 2/27 onset of leg pain 3/3). DVT behind left knee confirmed with ultrasound on 3/8 and started on apixiban 3/9. No history of clots and no activities that would contribute to an elevated risk: no family history, no recent injuries or surgeries, not sedentary, nonsmoker, and drink only in moderation.
1086059	3/9/2021	CO	92	F	2/21/2021	2/25/2021	DVT in right leg discovered after swollen foot on 2/25/2021 via ultrasound. Clot extends from mid thigh to mid calf. Placed on Xarelto 15 mg 2x/day until next imaging appointment on March 30, 2021. First incident of blood clot for mother.

1086384	3/9/2021	TX	36	F	1/5/2021	1/5/2021	On the following day after receiving my first dose of the vaccination, my arm was throbbing, completely swollen, decreased ROM and skin was RED and severely tender to the touch. Took OTC Tylenol (2) po and had no signs of relief. Pain , swelling, and skin redness lasted for 3 days. On February 10th, 2021 I had a positive pregnancy test (confirmed by bloodwork and urine) which indicated I was 6-7 weeks pregnant and had a miscarriage on March 2021, after giving live births 3 prior times. The cause of the miscarriage is unknown. I also developed a blood clot on the arm that was inserted for an IV. I have no family history or personal history of needing blood thinners.
1086484	3/9/2021	CO	27	F	2/13/2021	2/18/2021	I got the Covid vaccine on 2/13/21, I lost a small clot and started to bleed on 2/19/21. I was due around Oct 4th, at the time of the vaccine I was 6 weeks pregnant. I miscarried at home on 2/25/21- I lost a very large clot and was bleeding heavily for a week. Doctor confirmed with HCG test that I miscarried. This was my second pregnancy, I had my first child 1/10/20.
1086527	3/9/2021	NY	74	F	2/13/2021	2/22/2021	The night of my 1st COVID Vaccine, I developed fever that lasted 2 days. Next day had chills, and sweats, and nausea, Next day fever 102, headache, chills. Next day Tuesday, 2/16, fever 100, started to feel less achy. Then felt better on the 17 of February. The rash, pain and swelling began on the 22 of February. Red rash, swelling, upper thigh, both legs radiating down to ankles. As days went on the swelling increased , along with pain, and redness.Difficulty walking . Ankles swollen, skin shiny, very painful. Called Dr. he advised give it a few more days, not knowing why this was happening. My Rheumatologist suggested it was an allergic reaction of some kind. She discontinued my Lamisil and Fosomax. Redness continued along with swelling , and pain . On March 9, went to my physician. Saw the PA, she said she would speak to Dr. He wanted to make sure I didn't have DVTs. He wanted me to get a Doppler for clots. I went to Hospital and had Doppler and it was Negative for deep vein thrombosis.

1086033	3/9/2021	OH	67	F	2/15/2021	2/15/2021	Blood clots in arm; Arm was sore; A spontaneous report was received from a healthcare professional concerning a 67-year-old, female patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced sore arm/pain in arm and blood clot in her arm/thrombosis. The patient's medical history, as provided by the reporter included diabetes. Concomitant medications were not included. On 15 Feb 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: 031M20A) in the left arm for prophylaxis of COVID-19 infection. On 15 Feb 2021, post vaccination the patient experienced sore arm and her condition got worse. She was then taken to emergency room with blood clots in her arm. Action taken with mRNA-1273 in response to the events were not reported. The outcome of the events, sore arm and blood clot in her arm, were not known.; Reporter's Comments: This case concerns a 67-year-old, female patient, who experienced thrombosis and pain in arm. Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. The patient's medical history of diabetes is a risk factor. Further information has been requested.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1081108	3/8/2021	CA	72	F	2/1/2021	2/1/2021	Cellulitis in left leg may be acting up/Might have an infection in area of cellulitis in left leg; Cellulitis in left leg may be acting up/Might have an infection in area of cellulitis in left leg; Questioned if she might have a blood clot in left leg; Might have an infection in area of cellulitis in left leg; pain in the left leg; This is a spontaneous report from a contactable consumer. A 72-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL9262, expiration date 31May2021), via an unspecified route of administration on 01Feb2021 at left upper arm around 19:00 or a little later at single dose (at the age of 72-years-old) for covid-19 immunization. Medical history included bad knees and got injections for this and recurrent cellulitis of legs (cellulitis was not active at time of vaccine; but anytime her leg swells with bad knees she had a little episode with the cellulitis down around her ankles on both legs but left leg was more predominant. She had been keeping it at bay), mineral supplementation, bad knee pain, blood pressure medication (abnormal), urine output control (abnormal), dehydrated and dizzy. Concomitant medication included lisinopril as blood pressure medication, potassium for Mineral supplement, solifenacin succinate for urine output control, paracetamol (TYLENOL 4) for bad knee pain. She had taken potassium before and it calmed it down: she was little dehydrated, little dizzy, so was drinking some Pedialyte, water, and taking potassium. The patient had it once before but it kind of snuck up on her again. The patient called to ask if anyone had reported any type of blood clot on the same side of the body that the Pfizer COVID-19 Vaccine was administered. She questioned if she might have a blood clot in her left leg after having been administered the Pfizer COVID-19 Vaccine. She had recurrent cellulitis in both legs prior to Pfizer COVID-19 Vaccine. The doctor thought the cellulitis in left leg may be acting up and that she might have an infection in that area of cellulitis. She reported pain in the left leg when she rested her leg on a pillow; but did not feel any pain when she was standing and walking. The pain became a little too hard for her to bear so the doctor prescribed her Cephalexin 500m capsule every 12 hours-she was on the 3rd capsule now. Onset date for the events was approximately 03Feb2021 or 04Feb2021. The events were better since started

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							Cephalexin. Second dose date scheduled for 22Feb2021 but did not give her time. The outcome of the events was recovering. Follow-up (23Feb2021): New information received from the product quality complaint group includes confirmation of lot number (EL9262) and new expiry date.
1081226	3/8/2021	IN	75	M	2/25/2021	2/26/2021	Left leg-knee started swelling, knee was sore, fluid around knee appeared, unable to lift leg, and large contusion appeared on back of thigh. 1080222	3/8/2021	NM	72	M	2/10/2021	2/18/2021	Pulmonary embolism; Multiple clots in his lungs; Shortness of breath; This is a spontaneous report from a contactable consumer (patient wife). A 72-years-old male patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number unknown and expiration date not reported), via an unspecified route of administration on 10Feb2021 at a single dose for Covid-19 immunization. The patient medical history was not reported. Concomitant medication included levothyroxine. The patient previously took first dose of bnt162b2 (EL8982) on 19Jan2021. The reporter (wife) stated that she and her husband both took the Covid vaccine. The patient (husband) is the one who have the adverse reactions. On 19Jan2021, she and her husband had the first shot, the Pfizer Covid shot. On 10Feb2021, they had the second shot. Just today she picked her husband from the hospital, they dismissed him for today because on 18Feb2021, she had to take him to emergency room because he had pulmonary embolism. He has multiple clots in his lungs. This is nothing that they dealt before with him. The reporter is afraid that it might be related to have taken the vaccine. Reporter stated that when she took him to the emergency room, it was 18Feb2021. Now he had a little shortness of breath for few days before the 18th but they didn't realize that he was having a big problem. He fully developed this on 18Feb2021. The reason for hospitalization was pulmonary embolism and blood clots in his lungs. He is little bit slow like the reporter said she got him to the hospital where he stayed 3 days she guess with pulmonary embolism, from 18Feb2021 to 21Feb2021. He had lot a of lab work while he was in hospital on these days the wife described. He had blood work, Echocardiogram, CAT scan, Ultrasounds, Chest X-ray, Covid rapid test, they haven't got back the result yet. Outcome of the events was unknown.
1079045	3/7/2021	MA	83	F	2/12/2021	2/15/2021	Initially, a UTI developed. As the UTI resolved, double pneumonia took hold. At the hospital they then discovered multiple clots in the legs.

1076717	3/5/2021			F			<p>Thrombocytopenia (diffuse petechiae, easy bruising, bleeding gums); Polychromasia; Petechiae; Easy bruising; Mild headache; Anisocytosis; A spontaneous report was received from a literature article concerning a 36, year old, female patient who experienced thrombocytopenia, headache, polychromasia, anisocytosis, petechiae and easy bruising. The patient's medical history included thrombocytopenia and allergy to acetaminophen. Products known to have been used by the patient, within one week prior to the event, included ibuprofen and sumatriptan. A vaginal ring containing etonogestrel-ethinyl estradiol, was place one week prior to hospitalization. Approximately one week prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 (Batch number not provided) on unknown date, intramuscularly in the for prophylaxis of COVID-19 infection. The patient presented to the hospital on unknown date with diffuse petechiae, easy bruising, bleeding gums and mild headache. Vital signs were within normal limits upon arrival at hospital. Physical exam was notable for diffuse petechiae of the extremities and trunk along with oral ecchymosis of 1-2 cm; no focal neurological deficits were observed, and no hepatic or splenic enlargement was noted. Blood work was significant for white blood count of 13.1 L/uL, hemoglobin 13.6 g/dL, heamatocrit of 42.1%, and platelet count of 3000/uL. Prothrombin time and activated partial thromboplastin time were within normal limits. SARS-CoV2 swab was negative but the SARS-CoV2 IgG antibodies were reactive. Peripheral smear showed thrombocytopenia without clumping along with polychromasia and anisocytosis appreciated with some mature neutrophils. A CT scan of the head did not show acute infarction or hemorrhage. Treatment for the event included, dexamethasone 40 mg intravenously daily for four days, intravenous immunoglobulin (IVIg) 1 mg/Kg for three days and was place on the Health Stroke Scale monitoring. Platelet count improved to 28000/uL within 3 days and oral lesions disappeared through some petechiae remained. The patient's contraception ring was not removed. The patient was discharged with outpatient hematology follow up. Action taken with mRNA-1273 in response to the event(s) was not provided. The outcome of the event(s) was not reported. According to the abstract, the temporal sequence of the events suggests</p>

1075247	3/5/2021	WI	54	M	2/12/2021	2/12/2021	Deep vein thrombosis left calf; Difficulty breathing; Pulmonary Embolism; Felt doggy, sluggish, punky; Arm hurt; A spontaneous report was received from a nurse concerning a 54-year-old, male patient who experienced pulmonary embolism, deep vein thrombosis, vaccination site pain, sluggishness and dyspnoea. The patient's medical history was not provided. Concomitant product use was not provided by the reporter. On 12-Feb-2021, approximately 2 days prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 (Batch number: unknown) intramuscularly in the left arm for prophylaxis of COVID-19 infection. The patient received his vaccine on 12-Feb-2021 and reported that his arm hurt a little for a few days. On 14-Feb-2021, he reported that he started feeling sluggish and on 20-Feb-2021 he began to have difficulty breathing and pain in the right lower base of rib cage. He went to urgent care where he was diagnosed with a pulmonary embolism for which he received treatment. On the evening of the same day, he again started having difficulty breathing with pain upon inhalation. He returned to urgent care and was subsequently admitted at 12:30 AM on 21-Feb-2021. That Monday, 22-Feb-2021, a doppler ultrasound revealed a deep vein thrombosis in the left calf. Patient was treated with heparin intravenously (IV). He was discharged 22-Feb-2021. Treatment for the event included Xarelto 20mg twice per day for two weeks and Heparin IV. Action taken with mRNA-1273 in response to the events was not provided/unknown. The outcome of the events, pulmonary embolism, deep vein thrombosis and dyspnea, was considered recovering/resolving as of discharge on 22-Feb-2021. The outcome of the events, vaccination site pain and sluggishness, were considered recovered/resolved.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

1075308	3/5/2021	CA	61	F	1/20/2021	1/21/2021	<p>still have sore muscles in my shoulders; still feeling bad with all the above symptoms; 23Jan2021 went to get covid test but due to blood in my nose received antibody test which was neg; bad headache; winded; vomited; diaherria; coughing/cough; large clots gushed from my rt nostril went to er stopped bleeding after 2 hrs; large clots gushed from my rt nostril went to er stopped bleeding after 2 hrs; This is a spontaneous report from a contactable other hcp (patient). A 61-year-old female patient received their first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EL1283, expiry date not reported), via an unspecified route of administration on the left arm on 20Jan2021 18:45 at single dose for COVID-19 immunization. Medical history included diabetes mellitus and high BP from an unknown date and unknown if ongoing. Concomitant medications included levothyroxine, losartan potassium and sodium fluoride (CREST CAVITY PROTECTION). The patient previously took septria and experienced allergies. The patient reported that on 21Jan2021, they woke up and brushed their teeth then at 6:40am blood with large clots gushed from their right (rt) nostril. The patient went to ER and stopped bleeding after 2 hrs. On 22Jan2021, the patient woke up with bad headache, winded, vomited, diaherria (as reported), coughing. On 23Jan2021, they went to get covid test but due to blood in their nose, they received antibody test which was negative. On 24Jan2021, the patient was still feeling bad with all the above symptoms. Then on 25Jan2021, they went to ENT doctor who cauterized their nose and stated that since antibody was negative to take the moderna vaccine since they have no antibody in their system, the Pfizer vaccine did not work. From 26Jan2021 to 13Feb2021, the patient felt same started feeling better 14Feb2021 but still have sore muscles in their shoulders and cough. The patient underwent lab tests and procedures which included sars-cov-2 antibody test: negative on 23Jan2021. The action taken in response to the event(s) for bnt162b2 was not applicable. Therapeutic measures were taken as a result of epistaxis and clot blood which include the doctor cauterized their nose. The patient recovered with sequel from the events.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the epistaxis and other reported events due to</p>

1071927	3/4/2021	TX	74	F	12/28/2020	1/11/2021	It started out with just stiffness in my legs and back. Then at night I couldn't put my legs down they hurt and my shins felt like I had shin splines. This lasted about a week or more. I went to a Dr. because my left knee and shin were hurting so bad. The Dr. was not sure and did a Doppler to see if I had a Blood clot in my left knee but I didn't. She put me on an antibiotic, that I really didn't need I don't think. I took that for a few days and stopped because it wasn't helping any. On the 14th I went to see another Dr. and he put me on Prednisone, at this time I could barely walk my right hip was hurting so much. I was taking little bitty steps. The prednisone has been helping, it's allowed me to walk and to function. I was to the point it was getting so bad. I'm still having some stiffness, my left elbow gets inflamed at times, my left hand and knuckle swell and get stiff at times too. It seems to move around at effect different places. The medication helps me move better, I have been off work for 7 weeks, I plan to go back and try half days.

This Nurse (patient) reported for self that the 83-year-old female patient received first dose of bnt162b2 (BNT162B2, PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN6200), via an unspecified route of administration on 17Feb2021 09:30AM on right arm at single dose for covid-19 immunization. Medical history included rheumatoid arthritis from an unknown date and unknown if ongoing Reported she was diagnosed with Rheumatoid Arthritis about 10 years ago, fibromyalgia from an unknown date and unknown if ongoing and stated when the doctor couldn't figure out what was causing her pain, the doctor said she had Fibromyalgia, carotid endarterectomy from 2014, pain in extremity from an unknown date and unknown if ongoing She said she has rheumatoid arthritis, and has had terrible leg pain for a long time. Family Medical History Relevant to AE(s) was not provided. Concomitant medication included cortisone (CORTISONE) for Pain in leg from 10Feb2021 and stated her doctor gave her a Cortisone shot in her right knee to help with her right leg pain. Reported she received a Cortisone shot in her right knee on Wednesday, 10Feb2021. She said the doctor gave her the Cortisone shot in her right knee to see if it would help her right leg pain. She said she has a problem with Cortisone, clarifying the Cortisone keeps her awake. She said the doctor wanted her to have another Cortisone shot in 3 months, and she is not going to take the Cortisone shot because she doesn't like how the Cortisone makes her feel. The patient experienced pounding in head (hospitalization, medically significant), heart pounding (hospitalization, medically significant), elevated bp (hospitalization, medically significant), bouncing off the walls, and going from side-to-side when she tried to walk (hospitalization, medically significant), dry mouth (medically significant) all on 17Feb2021 with outcome of recovering, throat tightness (medically significant) on 18Feb2021 with outcome of recovering, weakness (medically significant) on 19Feb2021 with outcome of not recovered, tiredness (medically significant) on 19Feb2021 with outcome of not recovered.</p>

significant) on 19Feb2021 with outcome of not recovered, oxygen saturation level kept dropping on an unspecified date with outcome of unknown, shaking on an unspecified date with outcome of unknown, cold on an unspecified date with outcome of unknown. He experienced terrible pain in the leg after the 1st dose and took a marijuana cookie and she was rushed to the ER because she was shaking and cold. The patient was hospitalized for events pounding in head, heart pounding, elevated bp and bouncing off the walls, and going from side-to-side when she tried to walk from 17Feb2021 to 18Feb2021. The nurse states that "I told her up until a Month ago, she was taking care of a huge house and husband that is blind. I've been having the pain in my legs for over a month, doppler was done, and I had an injection in my knee with cortisone, I won't do that again, it keeps me awake at night. There is no diagnosis yet on the pain, have an orthopedic appointment coming up. Caller states, I got the first Pfizer vaccine shot on Wednesday at 9:30 am in right arm. Never so much have felt it. or have not felt anything else since. My friend talked me into eating a marijuana cookie about 5pm that day, and at 6 or 6:30pm, I started feeling terrible, my head was feeling terrible, my heart was pounding, I could hardly walk, my mouth was dry as a bone. we called paramedics, we found out on Friday before the shot that I have a right bundle block. Woke up 4:30 in the morning the Friday before with chest pain. EKG found right bundle block, my blood pressure was 245/105, that night in the ER, they got my blood pressure down and sent me home. Wednesday, I had the covid shot in right arm, at 9:30am, that day about 4:30 - 5:00 had the cookie thing, about 6pm, had to call the paramedics, they kept me in the hospital overnight. because my oxygen saturation kept dropping, down in the 86% or 89%, I don't know. Gave me breathing treatments, CT scan for blood clots in lungs was done, Doppler for blood clots in legs, and a HgbA1C. They did an echo of my chest. I don't know all of the results yet. Even yesterday, in the hospital I felt better, but feel week and tired, while walking the hall in the hospital my Blood pressure went up a little bit. I told the nurse, my head feels like this when my blood pressure is up. They sent me home last night. Today, I am feeling okay. My mouth is still a little dry, got a little better yesterday. My legs are still killing me, I have an

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

appointment with my Cardiologist and Rheumatologist, I have Rheumatoid Arthritis. My question is , the doctor didn't know if it was from the cookie or from the vaccine. I am wondering if I should get the second vaccine." She stated she never had a sore arm after getting the COVID-19 Vaccine. She said she did something stupid after she received the COVID-19 Vaccine. She said she has rheumatoid arthritis, and has had terrible leg pain for a long time. She said her friend talked her into having a cookie that had marijuana in it. She said her leg pain was so severe at the time, she took the cookie with marijuana in it around 4:30PM-5:30PM on 17Feb2021. She said at 7:00PM she was bouncing off the wall (clarified as unsteady, and going from side-to-side when she tried to walk), her head was pounding, her heart was pounding, she was dizzy and shaky. She said she went to the hospital emergency room. She said the hospital kept her overnight because her oxygen saturation level kept dropping. She said she got home from the hospital last night (18Feb2021), clarifying she was discharged from the hospital at 6:00PM. She said she noticed her mouth was very dry when she went to the hospital on 17Feb2021, and her mouth continued to stay very dry all night. Caller asked if she should get the second COVID-19 Vaccine shot after experiencing what she did after receiving the first COVID-19 Vaccine. Reported her leg pain became severe about a month ago, clarifying she has had leg pain for a long time. Reported her blood pressure was up while she was at the hospital, clarifying she had one blood pressure reading of 145/82 that she recalls. She said her blood pressure is pretty normal, and she takes blood pressure medications. She said she believes her heart rate was up too, but was unsure what her heart rate was. Reported a couple days before receiving her first Pfizer COVID-19 Vaccine, she went to her doctor on 12Feb2021 because she was having severe chest pain. She said her doctor did an EKG and told her she had a right bundle branch block. She said her doctor sent her to the hospital Emergency Room. She said while she was in the Emergency Room she had an extremely high blood pressure of 245/105. She said she came home from the Emergency Room on 12Feb2021, and had a couple spells, but was OK. She said she was OK when she went to get her first COVID-19 Vaccine shot on Wednesday, 17Feb2021. Reported

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

she had difficulty reading her COVID-19 Vaccine Immunization Card. She said the Pfizer COVID-19 Vaccine Lot Number looked like EN6200, and there was no NDC Number, or Expiration Date listed on the card. Reported she had blood work done at the hospital. No further details provided. Treatment included she was given Albuterol breathing treatments while in the hospital, along with some other things that she can't remember. Reported she believes her symptoms were medically significant because she was nervous from recently being to the Emergency Room for her severe chest pain a few days before. Reported she did not think her symptoms were from the COVID-19 Vaccine. She said she thought the cookie with marijuana in it caused her symptoms because the symptoms happened about 1-1/2 to 2 hours after she had the cookie with marijuana in it. Reported she feels very weak and tired. Reported yesterday (18Feb2021) while she was in the hospital, her head felt like it was going to explode when the hospital staff tried walking her around. She said she asked the hospital staff to check her blood pressure because her head will feel like that when her blood pressure is up. She said when the hospital staff checked her blood pressure, her blood pressure was elevated. Reported the pain in her legs is driving her crazy, so she called for an appointment with an orthopedist today. Reported she is feeling better, but is still experiencing a tightness in her throat. She clarified she felt the throat tightness on Wednesday, 17Feb2021. She said she has no problem swallowing or eating, but her throat feels tight. Vaccination Facility Type was Hospital. History of all previous immunization with the Pfizer vaccine considered as suspect (or patient age at first and subsequent immunizations if dates of birth or immunizations are not available) was none. Additional Vaccines Administered on Same Date of the Pfizer Suspect was None. AE(s) required a visit to: Emergency Room (admitted to hospital), no Physician Office. Prior Vaccinations (within 4 weeks) was none.; Sender's Comments: The 83-year-old female patient had medical history included rheumatoid arthritis, fibromyalgia and carotid endarterectomy, and was on multiple concomitant drugs. Considering temporal relationship, a possible contribution role of vaccination with BNT162B2 to the onset of the reported events, cannot be completely excluded. The impact of this report on the benefit/risk

1068151	3/3/2021	NC	73	F	1/22/2021	1/23/2021	When I cough it was blood in that cough couple of times; Left leg swell up from my feet to all the way up; When I woke up, I didn't know what time, what date, nothing; I was all confused; Feeling achy/ body ache; This is a spontaneous report from a contactable consumer (patient). A 73-year-old female patient received first dose of BNT162B2 (Pfizer COVID vaccine), lot no. EL347, via an unspecified route of administration on 22Jan2021 at a single dose for COVID-19 immunization at a health department because she was at high risk and she was 73. Medical history was not reported. Concomitant medications included unspecified medications. The patient had an injection done 2 weeks, not this last Friday, the Friday before that. They had to make her wait for half an hour before she left and she was okay. Then Saturday (23Jan2021), she started feeling achy but to she was okay. Then Sunday (24Jan2021), she had a very bad experience, she went and start watching TV and she fell asleep. When she woke up, she didn't know what time, what date, nothing. And she looked at the time on her TV and it said 6:45, she didn't know if it was am or pm. And it was dark outside and she didn't know if it was Monday or Sunday. She was all confused, she called someone to make sure what day and time and all and still she was still confused. And then she had to call her aunt and then she told her no it's Sunday and it's night time and so on. Then she got better. Then during the week she didn't have that much body ache, she expected that because that was in that papers. Then today is Sunday, Friday morning (29Jan2021) she got up and she coughed, when she coughed it was blood in that cough couple of times. Then her daughter came over and took her to the hospital (hospitalization details were not clarified). She had lab work the day they took her in the emergency room. At the hospital, they did all kind of tests, on top of that her leg, her left leg swelled up from her feet to all the way up, all the way up. They thought that it could have been some blood clot. And they took test and all and nothing, everything was okay. They couldn't find out why her whole leg was swollen. On top of that, they did chest x-ray and they did something else she can't remember, another test. And they took all kind of blood work and all. And they did to see if she had the virus, the COVID. And yesterday they called her from the hospital and they said that she didn't have the virus. And

she asked them about the blood work and they told her if there was anything more than they would call her. So, she thinks all this came from that injection. She called because this was not guaranteed if this was from injection. When confirmed that COVID test was negative and blood work report was not out, she stated they haven't called her that meant her blood work was okay. The swollen leg has been gone down and blood once in a while she sees a little bit. They gave her 2 prescriptions, one was antibiotic and one is steroid. Due date for the next shot is 12Feb2021. The outcome of the events was recovering.

1068231	3/3/2021	PA	70	F	1/3/2021	1/1/2021	wrist pain; wrist pain and it locked up.; little bumps on the back of her hand; Headache; This is a spontaneous report from a contactable consumer (patient). A 70-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE;lot EJ1686) on 03Jan2021 in the morning before 12:00 pm (at 70 years) at single dose in right arm for COVID-19 immunization.Medical history included hypertension from 2002. Concomitant medication included enalapril for hypertension from 2002 (she tried several things-unspecified-before enalapril, took a number of months before she found something to tolerate). The patient on 24Aug2015 (at 65 years) took varicella zoster vaccine live (oka/merck) (ZOSTAVAX) for immunization and experienced shingles (it started a couple months after the shot, she had skin discoloration, black spots over the skin, caused by her bathing suit and the pool water, and it stayed for about 1.5 years, she was using a cream. It was maybe 2 years before it disappeared). Patient received first dose of the vaccine on 03Jan2021, after in Jan2021, she had a headache, a week and half later pain in wrist and wrists locked up, pain floated up to the back of her hand, continued since, locking of wrist stopped, pain continued, little bumps came on the back of hand.Patient added she may have had headache the second day (as reported), it came and went, she didn't pay attention, she had a headache morning and it gone as of 15Feb2021, but still came and went. Wrists locking up recovered before 24Jan2021. Bumps on back of hand started the same time, it came and went, stayed most of last week, still had it this week, about the same.No blood tests done since this happened.Final outcome of headache was unknown. Wrists locking up recovered in Jan2021. Bumps on back not recovered. wrist pain was recovering.Patient took the second dose of the vaccine (lot EN5318) on 24Jan2021 in the afternoon (maybe 2 or 3:00PM) at single dose in left arm for COVID-19 immunization. On 12Feb2021 patient lost part of mobility in the small finger of the right hand, can't lift it all the way above. Patient was scheduled to go to the doctor on 15Feb2021 in the afternoon. Patient saw joint pain listed on contraindications, would like to know the nature of the joint pain described from side effects of the covid vaccine. She was concerned of a blood clot, unsure what happened or what can cause it, was unsure if it was

1068079	3/3/2021	NY	66	F	1/30/2021	1/30/2021	migraine with flashes of light in left eye; migraine with flashes of light in left eye; gets IBS stuff; has had diarrhea; diarrhea, had a mild version of the diarrhea that seemed to get worse after the vaccine and still ongoing; vessels in hands really dilated and dark blue; This is a spontaneous report from a contactable consumer (patient). A 66-year-old female patient received the first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot number EL9264), via an unspecified route of administration (arm left) on 30Jan2021 14:00 at SINGLE DOSE for to have some protection against COVID, at 66 years old. Medical history included connective tissue disorder and anti-cardiac lipid antibody problem; she is prone to blood clots from 2001. At that time, she was sent to the hospital and no one could figure out what it was. She was seeing the Rheumatologist and another person, and they knew something was going on and was given Prednisone (from 2001) because her tissues in the joints were swelling and she had trouble with speech. Patient also reported this as some weird connective tissue disorders already and some anti-cardiac lipid antibody problem. It was really weird and had not changed a bit since so she was kind of checking to see if anyone has reported anything like this. She reported that with this weird antibody problem, she is more prone to blood clots and has to be careful with medications with her blood she knows that some breast cancer medicines can do that. She stated this immune thing was never diagnosed. She also had migraine with globes of flashes of light, left eye (does not typically get migraines and has only had 1 in her life and she saw globes of lights in both eyes and had to go to the emergency room and was told it was an ocular migraine and this was also only in the left eye. This was long ago) from an unspecified date. Concomitant medication included low dose steroid (unspecified). The patient previously received flu vaccine on Sep2020 (AE none). No other vaccines were administered on the same day. On 30Jan2021, the patient experienced vessels in hands were really dilated and dark blue 5 hours after vaccination. On 30Jan2021, the patient also experienced IBS stuff and has had diarrhea the last couple of days after getting the COVID vaccine. She took Pepto Bismol to help and had a mild version of the diarrhea that seemed to get worse after the vaccine and still ongoing.

-----------------	--------------	--------------	----------------	------------	-----------------	-------------------	---------------------

On 01Feb2021, the patient experienced migraine with flashes of light in left eye. It was further described as having a weird migraine with flashes of light in the left eye and she got the shot in her left arm and not sure if that makes any difference. She does not typically get migraines and has only had 1 in her life. The migraines started in the morning and lasted about an hour (as reported) and now they are gone and hopes they stay gone (reported as recovering). She wanted to know if she can take TYLENOL or ibuprofen for vaccine. She heard about people getting symptoms after the second dose not the first dose. Events did not require visits to the emergency room or physician office, but stated that if her vision become worse, she would go to the eye infirmary close by. The outcome of the events diarrhea and vessels in hands really dilated and dark blue, gets IBS stuff was not recovered. Outcome of the events migraine with flashes of light in left eye was reported as recovering.

1069009	3/3/2021	PR	94	M	1/21/2021	1/30/2021	Several days after vaccination his left arm turned red. He was taken to the hospital where he was evaluated and admitted with a diagnosis of left axillary vein thrombosis. A chest X-ray was taken and he presented bibasilar atelectasis and pneumonia with pleural effusions.
1069054	3/3/2021	NY	66	F	1/14/2021	1/16/2021	Anxious; Tired; Blood clots in left leg, right leg and brain; A spontaneous report was received from a consumer who was also a 66-year-old female patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and developed blood clots in the left leg, right leg, and brain, anxious and tired. The patient's medical history was not provided. Concomitant medications reported included vitamin D, magnesium, lisinopril, and vitamin B12. On 14 Jan 2021, approximately 3 days prior to the onset of symptoms, the patient received their first of two planned doses of mRNA-1273 (Batch number not provided) intramuscularly in the left deltoid for prophylaxis of COVID-19 infection. On 16 Jan 2021, the patient experienced immense pain in the middle of the night, and subsequently saw her primary physician. An ultrasound revealed blood clots in her left leg, right leg and brain. A hematologist and vascular surgeon were consulted. Patient was treated with apixaban while they are doing blood work. The patient also became tired and anxious. She noted that she never had comorbidities before and was upset that her life has completely changed. A repeat ultrasound was scheduled for 19 Feb 2021. The mRNA-1273 dose was discontinued in response to the event of blood clots in the left leg, right leg, and brain, anxious and tired. The outcome of events, blood clots in the left leg, right leg, and brain was considered unknown at the time of this report. The outcome of the events, tired and anxious were considered not resolved at the time of this report.; Reporter's Comments: Very limited information regarding the events has been provided at this time. Further information has been requested.

1070714	3/3/2021	CA	77	F	2/1/2021	2/1/2021	she was hospitalized 2.5 days after having symptoms of a "massive heart attack" 2 days after the vaccine; blood clot; pain on the left side/pain so bad/ pain was so severe couldn't bent over and couldn't get up; pain was in the heart and underneath the rib; pain was in the heart and underneath the rib; had a little trouble breathing; broke out in a sweat; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect from a contactable consumer (patient). A 77-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number/expiration date unknown), via an unspecified route of administration on an unspecified date in Feb2021 at a single dose for COVID-19 immunization. Medical history included asthmatic, had double pneumonia years ago, has ongoing atrial fibrillation and a pacemaker to control it as the only problem she has in her heart. The patient's concomitant medications were not reported. On an unspecified date in Feb2021, the patient was hospitalized for 2.5 days after having symptoms of a massive heart attack two days after the vaccine. It was reported that two days post vaccination, the patient was rushed to the hospital by ambulance as they thought she was having a massive heart attack. She added her symptoms lasted for hours, she had pain so bad that she was bent over and had a little trouble breathing. She said the pain was in the heart and underneath the rib, on the left side. She later mentioned she did not feel like it was AFib. She said they did every test possible and listed the following ones: ultrasound, stress test, x-ray (unknown results), and blood work in Feb2021. She specified that her blood work indicated a blood clot. She mentioned she was told by her personal friend, who was a doctor, that by having the shot sometimes it indicated you have blood clots when you really don't. The patient also specified that she broke out in a sweat, the pain was so severe that she could not bend over and could not get up; therefore, they treated her as if she was having a massive heart attack for 12 hours at the hospital. It was reported that they kept giving her stuff to stop the effect with her heart. She mentioned her second dose was scheduled on 25Feb2021. She asked if her experience was reported as a side effect to the vaccine and should she get the second dose of the vaccine. She explained the doctors did not know what

1070763	3/3/2021	CA	66	F	2/18/2021	2/18/2021	<p>large knot right above the injection site/size of a half dollar/size of a silver dollar and where the needle went in was right at the base of that knot/like egg under the skin or clot; felt like she got a flu shot and could tell her arm was very sore; swelling started almost immediately after the shot/swelling was exactly underneath the injection site, just in the pronounced area/about 4 inches wide and about 2 inches high; thought maybe someone has hit a vein because it did bleed and ran down her arm; This is a spontaneous report from a contactable consumer. A 66-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection, lot number: EN6201, unknown expiration), via an unspecified route of administration on 18Feb2021 at 04:30 at a single dose for COVID-19 immunization. Medical history reported as none. Concomitant medications included tolterodine and adalimumab (HUMIRA). The patient reported that she received the COVID vaccine on 18Feb2021 at around 4:30. Firstly it was fine, she felt like she got a flu shot and could tell her arm was very sore. What concerned her was the swelling started almost immediately after the shot on 18Feb2021. She knew that was one of the symptoms. This morning and yesterday though (18Feb2021), she noticed some of the symptoms. She got a large knot that was right above the injection site. Yesterday, it was about the size of a half dollar, today it is about the size of a silver dollar and where the needle went in was right at the base of that knot. It feels like an egg under the skin or a clot. Like a knot (a hard spot underneath the skin). The patient was wondering if it was something she should be concerned about because the swelling was exactly underneath the injection site, just in the pronounced area. It was a rectangle and is about 4 inches wide and about 2 inches high and then right above that was where the needle went in. The large circle or knot was right above that and she was thinking possibly when she was given the injection she has never really bleed before. So, she thought maybe someone has hit a vein because it did bleed and ran down her arm. She got no problem. That happens at times, but she started thinking if this was a clot or it was something that is right above there because it is so pronounced, and it really hurts. The patient stated that she took some Aspirin last night and is going to take an ibuprofen in a little while. She mentioned that she</p>

1064684	3/2/2021	OR	88	F	2/11/2021	2/19/2021	Deep vein thrombosis (DVT) of left lower extremity She reported swelling of her left leg and was seen at Family Medicine Urgent Care on 2/19/2021 and was diagnosed with a thrombosis of the left popliteal vein. She was treated with Xarelto for anticoagulation and compression stockings. Her treatment course was uncomplicated when I saw the patient at follow up and was made aware of her condition at her appointment with me on 3/1/2021.
1065160	3/2/2021	TN		F	2/10/2021	2/13/2021	Stroke; This is a spontaneous report from a contactable consumer reporting on behalf of the mother. An approximately 81-year-old female patient received the second single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot EL9264) on 10Feb2021, for COVID-19 immunisation. The patient received the first dose of BNT162B2 vaccine on 23Jan2021 (Batch/lot number: EL3302). Medical history was not reported. Concomitant medications included two unspecified prescriptions. On 13Feb2021 the patient experienced stroke which required hospitalization on the same day. The reporter was not sure of the name but they did a 'CAT' where they went up and pull the clot out of the brain. Event outcome was unknown. The patient was still in the hospital at the time of report. No investigation was performed before the event.

1067083	3/2/2021	MA	49	M	2/23/2021	2/24/2021	Early Wednesday morning (2/24) around 5:00AM, I woke up to extreme pain in my left arm, primarily along the upper forearm, inside of my elbow, and lower bicep. There was no trauma or unusual behavior prior to onset of pain. It came on suddenly and worsened with extension of the arm. Symptoms worsened over the next few days, with pain intensifying and extending down into my hand and up into my armpit and shoulder. I tried ice, Ibuprofen, Acetaminophen, and Vicodin for pain relief, but nothing really helped other than the ice. On Saturday morning (2/27), I visited Urgent Care and was diagnosed as brachial plexis neuritis, aka Parsonage-Turner Syndrome by Dr and prescribed Prednisone and rest. On Sunday evening (2/28), I went to the ER seeking pain relief and second opinion. On Monday (3/1) morning, I was seen by ED doctors, and then three different neurologists. After doing an ultrasound which ruled out vein/artery thrombosis, the neuro team diagnosed Parsonage-Turner Syndrome. They've prescribed Gabapentin, Acetaminophen, and Ibuprofen for pain relief, a follow-up neuro consult, an MRI for next Friday, and an EMG in a few weeks. Last night while sitting and reading, the same pain began in my right arm, similarly to how it presented in my left arm last week. The right arm pain is less than the left arm pain, but at this point seven days later, I am experiencing neuropathic pain in both arms.
1068762	3/2/2021		76	M	1/11/2021	3/2/2021	DEATH Narrative: patient's wife reported he had gone in an outside hospital, had held his brilinta as advised anticipating shoulder surgery "and he threw a big clot and died.~~

1067148	3/2/2021	IL	61	F	1/8/2021	1/9/2021	The next day, when I woke up I was unable to stand on my left leg. Pain in the posterior knee. Felt like I was walking through mud. Joints were all loose. Just a really bad left knee pain. They a lower extremity doppler to that leg - to look for blood clot and that was negative. Physical therapy - taped my knee; pain was so bad I had to stay home a couple of times. My hands (both) were so painful. Like I had frostbite. Occupational therapy did hand massage and paraffin for the pain. And isotoner glove at night and that helps with the buzzing. I am 2 months out today from the vaccine and I'm starting to feel like normal. Took two months to fade away. It may have been because I was still having COVID antibodies. COVID antibodies on August started at 6.95. I'm not totally recovered right now but I'm close to normal. Doctor visit - January 29, 2021 and February 5, 2021, and February 19th. They put me on high dose of Steroids - 20 mgs Prednisone daily and another round of blood thinner -ELIQUIS mg which helped me with pain and joints.
1065118	3/2/2021	WA	58	F	1/23/2021	1/30/2021	Blood clot in lower left leg; This is a spontaneous report from a contactable consumer (patient herself). A 58-year-old female patient received BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine), via an unspecified route of administration on the left arm, at age 58 years, first dose on 23Jan2021 14:00 at single dose for COVID-19 vaccination. Medical history was reported as none. Patient had no known allergies. The patient is not pregnant. There were no concomitant medications. There were no other vaccines administered in four weeks and no other medications taken in two weeks. On 30Jan2021, patient experienced blood clot in lower left leg. ER doc indicated that patient had no reason to have formed a clot given the medical history, health, weight, age, diet, no surgeries, no prior injury, etc. Facility type vaccine was administered at a Public Health Clinic/Veterans Administration facility. Event resulted in emergency room/department or urgent care. Therapeutic measures were taken as a result of the event includes rivaroxaban (XARELTO) as blood thinner. The outcome of the event was not recovered. Information about lot/batch number has been requested.

1062122	3/1/2021	NC	81	F	1/26/2021	1/26/2021	itching at her head, face and shoulders and the back; This is a spontaneous report from a contactable consumer (patient). An 81-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE lot#: EL9261), via an unspecified route of administration on the right arm on 26Jan2021 10:30 at SINGLE DOSE as COVID-19 immunization at the hospital. Medical history heart attack, ongoing bone disorder (reported as bone), ongoing blood pressure abnormal (reported as blood pressure), ongoing pain in leg, ongoing blood cholesterol abnormal (reported as cholesterol), ongoing allergy, and ongoing blood clots in leg. The patient was also allergic to sulfa. Ongoing concomitant medications included hydrochlorothiazide, triamterene (MAXZIDE) since 2011 (taking for 10 years) and for blood pressure, cetirizine hydrochloride (Zyrtec) from unknown date (taking for long time) for allergy, losartan (LOSARTAN) since 2016 (taking for 5 years) for cholesterol, potassium (POTASSIUM) from unknown date (taking for long time) for pain in leg, metoprolol tartrate (LOPRESSOR) since 2011 (taking for 3 years) for blood pressure, omeprazole (PROTONIX) since 2011 (taking for 3 years) for blood clots in leg, fish oil (FISH OIL) from unknown date and indication, acetylsalicylic acid (ASPIRIN) since 2001 (taking for 20 years) for heart attack, colecalciferol (D3) since 2016 (taking for 5 year) for calcium supplementation reported as (calcium and body build up), and calcium (CALCIUM) from unknown date for bones. The patient first dose of the Pfizer COVID 19 vaccine on 26Jan2021 at 10:30AM in the right arm. She noticed about 9PM last night, she started itching at her head, face, shoulders and back. The itching only lasted for a little over an hour (26Jan2021 10:00 PM). She took some diphenhydramine (BENADRYL) and it helped, gave her some relief. She was fully recovered today 27Jan2021. She was scheduled for the next dose 16Feb2021.

<i>VAERS_ID</i>	<i>RECVDATE</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1062457	3/1/2021	WI	81	M	2/2/2021	2/9/2021	<p>Patient admitted for fatigue, dry throat, generalized weakness, dyspnea on exertion. During hospitalization was identified to have an acute ischemic CVA -- unclear time of symptom onset, possibly evening of 2/9 or morning of 2/10. Time course suspicious for possible COVID vaccine adverse event. He received his first Moderna COVID vaccine on 2/2/21 per WIR. Per PCP note on 2/9/21: Patient is here today accompanied by his wife with concerns for fatigue, headaches, head pressure and tremors. Received vaccine last Tuesday. Around 10 PM that evening he developed pressured in the head. On Wednesday morning, he states he got out of bed and was in a cold sweat - he states he pajamas were soaked in sweat and he felt chilled. He experienced brief numbness of the left arm down to his fingers. On Thursday, he felt fine - he went out to snow blow. Friday he developed headaches and head pressure. At night, he felt his breathing was labored as he was "gasping for air." On Saturday and Sunday, he sat and laid around all day. On Monday, he wakes up at 125 AM and his blood pressure was 165/104 and it remained elevated for 3 separate readings. Patient was then admitted on 2/10/21 with weakness and confusion, then on 2/11 MD noted ?word finding difficulty, slurred speech, possible subtle right upper lip droop, and possibly some mild right hemineglect? with MRI showing likely embolic source of infarcts and cerebral MRA with possible acute thrombus. His symptoms the day after the vaccine seem a bit suspicious for TIA. Per Drug Policy Manager call to Moderna, no current reports of TIA/stroke secondary to COVID vaccine, so time course may be incidental. Patient had echocardiogram without right to left shunt or clot identified, no known history of atrial fibrillation. Was monitored on telemetry for the duration of his hospitalization without any noted arrhythmias, discharged on e patch for 14-day outpatient monitoring.</p>

1059874	2/27/2021	MO	27	F	1/21/2021	2/2/2021	My last period started Tuesday Feb 2nd and did not stop until 14 days later, more than double my usual menstrual cycle. It seemed pretty normal and painless, but then on 8th day I was surprised to find myself still bleeding . It was a darker color around then, but then became brighter and I noticed myself passing clots when I went to the restroom that were loose, but about the size of a quarter or half dollar. I did not bleed through any menstrual pads, but the return of bright red after it being a darker red that im used to at the end of a period had me concerned. I was in slight discomfort around my uterus/bowels and I couldn't tell if it's my body recovering from the vaccine, or something else. I received my second dose of the COVID-19 vaccine 2/11/21 (Pfizer) and stayed home from work as I had a fever/headache/chills (this was not unexpected to me, my coworkers had the same symptoms). Family medical history: grandmother (dad's mom) in remission from stage 4 uterine cancer about 5 years ago. Mom had endometriosis at 45 and had a hysterectomy.

1059465	2/27/2021	CO	77	M	2/25/2021	2/26/2021	Dramatic drop in %SpO2: from a range of 94 - 97, to 88 - 89, with occasional drops to 87. I checked it because I found, even on waking, that I needed to make an effort to breathe more deeply - which did make enough of a difference. In a setting where it would have been available, I am sure I would have received O2. I also had a fever of up to 101.3, and felt "rotten", but not dire. In 2017, I had some sort of incident - I was traveling at the time, and it was never "determined" - that may have been a "scatter" pulmonary embolism - where the clot breaks apart before distributing into the lung. Initially, I did have quite low %SpO2 readings, but over the years that has improved. But these readings were even lower than I had ever seen. I have two oximeters, to, um, verify each other, so I am reasonably confident of their readings. I have a background in physics so I have some experience with instrumentation. This situation continued for perhaps 6 hours, then the fever slowly went down and the %SpO2 increased to 90 ? 91, which was ?manageable?, then slowly higher. It is still lower than it had been, but feels normal enough. Since this dramatic drop in %SpO2 seemed a part of COVID-19 symptoms, I thought this might be significant, and that is why I am reporting it.
1057786	2/26/2021	TN	53	F	1/26/2021	1/27/2021	Within 12 hours of receiving my second vaccine, My left leg felt like it internally rotated and started to hurt and feel like lead. On January 28, 2021, I went to the ER and an extensive blood clot (DVT) was found.
1056011	2/26/2021	TX	75	M	2/7/2021	2/10/2021	My grandpa had a stroke on the 15th of February. He claimed he had been feeling "off" for a few days, but didn't say anything. A blood clot had formed in his brain. He was doing better and about to go to rehab to strength his right side of his body. On the 22nd he took a turn for the worst. He was having trouble breathing and they sedated and partially paralyzed him to put a tube in his mouth. I believe another blood clot had formed and oxygen wasn't properly going through his body. They could not stabilize him, and he passed away the same day.

1056626	2/26/2021	NC	94	F	1/23/2021	1/23/2021	Vertigo last week that stayed for five days; pain at the injection site; 2 stroke like symptoms/ like she was having a TIA (Reporter confirmed TIA as Transient ischemic attack); Blood Pressure 170/130; Fatigue; Joint ache; Nausea; Vomiting; Fever 100.1; Stress; 2 stroke like symptoms/numbness in her lip; Pervasive aching; Momentary confusion; , like she was having a TIA; Not able to answer questions; she still has not recovered her strength; This is a spontaneous report from a contactable consumer (patient's daughter). A 94-year-old female patient (mother) received 1st dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) (Lot# EL1283), via an unspecified route of administration on 23Jan2021 13:00 at a single dose for COVID-19 immunisation. The patient's medical history included ischaemic stroke, haemorrhagic stroke in Aug2019, pulmonary embolism, deep vein thrombosis (DVT), cholesterol, myalgia condition, blood pressure, thyroid, sleep and vertigo. The patient concomitant medications included amlodipine for blood pressure, calcium carbonate/colecalciferol (CALCIUM + VITAMIN D), rosuvastatin calcium (CRESTOR) for cholesterol, levothyroxine for thyroid, eszopiclone (LUNESTA) for sleep medication, ascorbic acid, cupric oxide, dl-alpha tocopheryl acetate, xantofyl, zeaxanthin, zinc oxide (PRESERVISION AREDS 2), prednisone for myalgia condition, and escitalopram. The patient experienced fatigue, joint ache, nausea, vomiting, blood pressure 170/130, fever 100.1, stress, stroke like symptoms, numbness in her lip, momentary confusion; like she was having a TIA; not able to answer questions, tired, pervasive aching, all on 23Jan2021 19:00. Events reported as follow: patient had the Pfizer vaccine on Saturday around 1 pm and Saturday (Clarified 23Jan2021) night she had severe side effects for about 4 hours. When probed for side effects, the reporter stated it increased gradually over time. So, first patient had joint achiness and then she experienced nausea and vomiting. The reporter took her blood pressure. It was 170/130 and so reporter called EMS and they came up and her blood pressure had gone back down to normal and they recorded she had a fever of 100.1. EMS believed that the combination of the 'violence' of the onset and the fever caused her blood pressure to spike but she had a history of ischemic and hemorrhagic stroke. So, the reporter was concerned that the stress

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

and whatever that was going on the reaction, the reporter was concerned that it was going to cause her a stroke. Patient had 2 stroke like symptoms, one was that she had numbness in her lip and the second was that she had momentary confusion, like she was having a TIA (reporter confirmed TIA as Transient ischemic attack). The only symptom of that was when the reporter asked her the name of her children she gave the names of her grandchildren but that confusion cleared up quickly and she was fine for a while but not able to answer questions, sharply. By the time that EMS got there patient was sharp again, no problem. For treatment, the reporter gave patient aspirin. The reporter put some Salonpas patches on her joints. It was like the analgesic patch. It was an external patch that patient put on. Patient usually does not need them that was why she was taking the prednisone to treat that kind of pervasive aching. The reporter also gave her the fluids, Gatorade kind of stuff to replace her fluids from throwing up and that kind of stuff. One more thing, it all started with an extreme fatigue but that seem normal but it seemed to lead into the other symptoms. Like it was a big day to go out and get the vaccine. So, she was a little bit tired. This was a very deep fatigue that was part of it too. Reporter stated only 81 aspirin (later clarified as treatment) as she could not go back on blood thinners because she had the hemorrhagic stroke. As of 11Feb2021, it was reported that patient still has not recovered her strength since 23Jan2021 19:00 and was reported as ongoing but improved. On 03Feb2021, the patient had vertigo that stayed for five days and was now improved. The patient was scheduled for the second dose on 13Feb2021. The immediate effects her mother had after the first dose of the vaccine were pain at the injection site; fatigue; fever; nausea. Mentions she also had some confusion and they were worried that the patient might be having another stroke. But all of this cleared up; all of this in a violent episode that lasted about four hours. Today she wants to report that her it took her a week for her mother to recover. Adds her mother could walk for half an hour before the vaccine but since the vaccine she still has not recovered her strength. Adds her mother has only been able to walk about 15 minutes with a walker and resting a lot, for a couple time in three weeks and this was their main way of maintaining her health. Adds her mother

A 71-years-old male patient received the first dose of bnt162b2 (BNT162B2; Lot # EL 1284) vaccine , intramuscular in the left deltoid on 22Jan2021 17:00 at single dose for Covid-19 immunisation . The patient medical history was not reported. Concomitant medication included apixaban (APIXABAN), acetylsalicylic acid (ASPIRIN) atorvastatin (ATORVASTATIN), cyanocobalamin (CYANOCOBALAMIN), metoprolol tartrate (METOPROLOL TARTRATE) , pantoprazole (PANTOPRAZOLE), sumatriptan (IMITREX [SUMATRIPTAN]), triazolam (TRIAZOLAM). The patient experienced DVT (deep vein thrombosis) on 26Jan2021 with outcome of not recovered , left parietal occlusion (ischaemic stroke) on 26Jan2021 05:30 with outcome of unknown , right paralysis on an unspecified date with outcome of unknown. The patient was hospitalized for DVT (deep vein thrombosis) and stroke from 26Jan2021 to 30Jan2021. The patient underwent lab tests and procedures including blood pressure diastolic: 84 mmhg on 30Jan2021 , blood pressure systolic: 141 mmhg on 30Jan2021 , body mass index: 26.4684 kg/m2 on 26Jan2021 , body temperature: 98.2 °F on 30Jan2021, heart rate: 55 bpm on 30Jan2021 , magnetic resonance imaging: acute left parietal lacunar infarct, Lower extremity ultrasound: left popliteal vein DVT, oxygen saturation: 95 % on 30Jan2021 , respiratory rate: 18 br/min on 30Jan2021. The reporter considered the reported events to be possibly related to BNT162B2 vaccine. Follow up information has been requested.;</p> <p>Sender's Comments: Based on the limited information currently available, a possible contributory role of the suspect drug in the reported events cannot be completely excluded given the known suspect drug profile and/or implied temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p>

1056972	2/26/2021	ME	77	F	1/29/2021	2/4/2021	5-6 days after receiving first Moderna covid vaccine pt. began not feeling well. On 02/10/2021 she saw a provider in an office for eval of abdominal pain and diarrhea and sent home. On 02/15/2021 she presented to a local ED with continuing symptoms, transferred to Medical Center, She is currently an inpatient there with a diagnosis of multiple blood clots in abdomen and brain and antiphospholipid syndrome.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1058169	2/26/2021	OH	65	F	1/23/2021	1/23/2021	Diagnosed with May-thurner syndrome; Deep vein thrombosis; Both of her feet were only slightly swollen; Dull minor headache; Off-label use; Inappropriate schedule of vaccine administered; Localized discomfort where injection of second dose of Pfizer COVID-19 Vaccine was given; This is a spontaneous report from a contactable consumer (patient). A 65-year-old female patient (weight: 77.56 kg, height: 157 cm) received the second dose of BNT162B2 (Pfizer-Biontech Covid-19 Vaccine) at single dose, in the upper left arm, on 23Jan2021, for COVID-19 immunisation. Relevant medical history included thyroid condition from an unspecified date (over 25-30 years before this report) and ongoing, controlled with levothyroxine sodium (SYNTHROID); and breast cancer from an unspecified date, in 2019 (treatment and surgery on an unspecified date, in 2019. Presumed resolved with radiation treatment, but no treatment within a year prior to getting Pfizer COVID-19 vaccine). The patient previously, on 05Jan2021 (18 days before the second dose), received the first dose of BNT162B2 (Pfizer-Biontech Covid-19 Vaccine) for COVID-19 immunisation. After the first dose, the patient experienced localized discomfort at the injection site and swelling of feet. Concomitant medication included levothyroxine sodium (SYNTHROID) from an unspecified date and ongoing, 0.88 mg, daily, for thyroid condition. On 23Jan2021, the patient experienced injection site discomfort described as "localized discomfort where injection of second dose of Pfizer COVID-19 Vaccine was given". On 24Jan2021, she had dull minor headache. On an unspecified date, the patient was hospitalized after the second dose and was diagnosed with May-thurner syndrome. She clarified that May-Thurner syndrome was where the iliac artery collapses and crushed the iliac vein in the upper abdomen; from that point down it started creating a blood clot. She developed a deep vein thrombosis (DVT) from her left ankle up to her right rib cage area; it was a monster. On 10Feb2021, the patient experienced deep vein thrombosis and thrombectomy was performed on the same day (outpatient thrombectomy surgery, performed 10Feb2021. It was a great surgery, very corrective. She never did have any pain or discomfort which confused everyone. She felt fine this whole time, no issues). On an unspecified date, both of her feet were

-----------------	--------------	--------------	----------------	------------	-----------------	-------------------	---------------------

only slightly swollen. Relevant laboratory test, performed on an unspecified date, in 2021, included computerised tomogram (CT scan with contrast of her abdomen and chest) that showed deep vein thrombosis: left ankle-right ribcage area. The adverse events May-Thurner syndrome and deep vein thrombosis were assessed as serious, hospitalization required from 02Feb2021 to 10Feb2021. The patient recovered from deep vein thrombosis on 10Feb2021, recovered from headache on 26Jan2021, recovered from swelling of feet and vaccination site discomfort on an unspecified date, while clinical outcome of the other events was unknown. Her vascular surgeon said he did not believe these events were vaccine related but cannot rule it out; her Primary Care Physician absolutely believed the events were vaccine related. The information on the lot number has been requested.

1058182	2/26/2021	FL	69	F	2/5/2021	2/8/2021	3 days after vaccine started coughing up blood clots. Started off as a couple small clots then within a half hour later I coughed up the size of a quarter Went to ER and then was admitted.; This is a spontaneous report from a contactable consumer (patient). A 69-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, lot number: EL9269), intramuscular at the right arm on 05Feb2021 13:30 at single dose for COVID-19 immunization. The patient's medical history included rheumatoid arthritis (RA), transient ischaemic attack (TIA), atrial fibrillation (AFib), thyroid nodules, and back surgery. The patient's concomitant medications included methotrexate, atorvastatin, rivaroxaban (XARELTO), ergocalciferol (VIT D), and zinc. The patient was not pregnant at the time of vaccination. The patient previously took sulfur and acetylsalicylic acid;oxycodone hydrochloride (PERCODAN). The patient previously received the first dose of BNT162B2 (lot number: EL8982) on 15Jan2021, 01:30 PM at left arm for COVID-19 immunization. On 08Feb2021 23:45, 3 days after vaccine started, patient experienced coughing up blood clots. It started off as a couple small clots then within a half hour later, she coughed up the size of a quarter. She went to the emergency room (ER) and then was admitted for 3 days. The patient underwent lab tests and procedures which included nasal swab: negative on 09Feb2021. The patient had Cat Scans and broncoscopy as treatment for the event. Facility were the most recent COVID-19 vaccine was administered was reported as other. The outcome of the event was recovered on Feb2021.

---

intestinal symptoms. The patient received her first dose of the Pfizer COVID vaccine on 08Jan2021 and felt a metallic taste in her mouth (said that the metallic taste lasted about three hours; ate to get rid of the metallic taste). On 29Jan2021, the patient received her second dose; after 10 minutes her face went numb; her nose, forehead, and under her eyes all the way up felt numb. Also, the patient's systolic blood pressure was at 150. The patient reported that she also tasted rubber band taste in her mouth. The patient's neighbor that was there with her getting the vaccine told the nurse and they called the paramedics. The paramedics stated that they thought she had a stroke. She said that her blood pressure was 150 systolic (usually 107-110/79). The patient had diastolic heart failure which was diagnosed about 5 years prior. The numbness stayed with her until about 22:00 on 29Jan2021. The patient had a history of "migraines and gets abdominal pains, numbness in her nose, foot", and she experienced "nausea and vomiting and stuff with her migraines." The patient thought the vaccine just gave her a big migraine. The patient took sumatriptan succinate (IMITREX) and it did nothing. The patient said that on 31Jan2021 her eye felt weird. The patient blew a blood vessel under her eye lid. The patient's eye looked like a blood clot in the corner of her eye then it dispersed throughout the eye and then now it was just below the pupil of her eye. The patient called the doctor on 01Feb2021, but they were out because of the snow. On 02Feb2021, the patient received a call from the doctor's office saying that the physician assistant would call her back, but the patient had not heard anything yet. The blood circulated around her eye and now it was just only under her pupil. The patient said that her daughter sent her something that said that some people have gotten Bell's palsy after getting the vaccine. The patient said that she was concerned about this with the facial numbness. The patient said that every once in a while, her face felt weird; her cheeks feel weird and her nose. The patient said that it comes and goes. The day after she got the second shot, she felt like she got run over by a truck and like someone beat her up. The patient's migraines were under control with magnesium. The migraine came on so quick it was like a boom. The patient said that was why she was concerned. The patient said that she declined going to the hospital; and

1055819	2/25/2021	AZ	83	F	1/26/2021	1/27/2021	there was no trip to the emergency room or physician office. The patient underwent lab tests and procedures which included blood pressure: 150 systolic on 29Jan2021 (usually 107-110/79). Therapeutic measures were taken as a result of stroke.  On January 1, 2021, patient was admitted to Medical Center with COVID. Tested positive on January 2, 2021. Spent 10 days in hospital. Once recovered from pneumonia and fever gone, on January 10, 2021, she was transferred to Rehabilitation Center for continued treatment. She spent 16 days there. She developed UTI and CDIF infections and was on/off oxygen. She started physical therapy. She was scheduled to be released to go home on January 27, 2021. On January 26, 2021, the day before going home, Rehabilitation Center gave her the Moderna vaccine. On January 27, the day she went home, she started feeling very weak and couldn't walk. My dad tried lifting her and they both fell to the ground. My dad called 911 and she was taken to Medical Center, with high fever and possible stroke symptoms (which later was negative). Two days later, she had difficulty breathing and was put on a ventilator. She was on a ventilator for about three days. They took it off and she slowly started recovering. The doctors did all kinds of tests (blood clot in lung, heart, etc.) and all was negative. The only thing they could trace it to was an adverse reaction to the vaccine. After spending 11 days at hospital and treating her for various infections, her heart stopped and she passed away suddenly.
1053724	2/25/2021	OR	73	M	2/8/2021	2/1/2021	Within a few days after receiving the vaccination I noticed a significant blurring of vision in my left eye. Consulted my ophthalmologist, who diagnosed a central retinal vein occlusion, confirmed with an OCT., and referred me to a retina specialist. Primary care physician started me on Xarelto and referred me to a hematologist. I do not have any history of blood clots.

1053897	2/25/2021	IA	43	F	1/15/2021	1/15/2021	Pfizer COVID-19 Vaccine EUA Pt received 2nd dose of COVID vaccine 1/15/21. A few hours after receiving vaccine, pt developed shoulder and neck pain. She felt feverish, chills that night but did not check temperature. Over next few days, she developed increasing generalized body aches, joint aches, headaches, weakness, fatigue. On 1/21/21 pt noted SOB and chest tightness, so she reported to ED. She checked her pulse ox and was 99%, was tachycardic to 140-150. She takes propranolol for essential tremor, so she took propranolol 40 mg PO x 1 and presented to ED on 1/21/21. In ED, pt was no longer tachycardic. Pt also states her concern for blood clot (mother had DVT in her 30s). She presented with moderate chest pain and tightness, as well as headache, weakness, SOB. Pt given APAP 1000 mg PO x 1, ibuprofen 800 mg PO x 1, orphenadrine 100 mg PO x 1. Nitroglycerin 0.4 mg SL x 1 ordered, but not given on MD's orders. Pt discharged home. 1/22/21: Pt f/u with hospital. DO says her elevated WBX and Cr were likely d/t vaccine and dehydration. DO offered to schedule f/u BMP and CBC on Monday 1/25. Pt also scheduled for outpt fluids at infusion center on Monday 1/25 in case BMP and CBC still indicate dehydration.
1054106	2/25/2021	CA	69	F	2/16/2021	2/16/2021	2 hours after injection left leg from the knee down started to swell and the muscle turned rock hard Severe pain made it impossible to walk The swelling is not going down and is causing great discomfort went to the doctor yesterday and it was determined there is a blot clot
1054390	2/25/2021	MN	36	F	1/13/2021	1/20/2021	After the first dose I had muscle soreness and a headache the first day, and then it resolved, but, one week later I developed a rash about 4 inches below the injection site that was red, hot to the touch, hard, and painful. It was about 1inch by 4inches. I called my doctor thinking it may have been a blood clot, but she said it will likely go away in a couple days. It did, but, wanted to report it. After the second dose I had the same red rash, but it showed up within the first 12 hours of the vaccine. I was rotating ibuprofen and and Tylenol every 3 hours, so I didn't have a fever, but, I had muscle pain and night sweats for about 5-7 days, with the second night being the worst.

1048211	2/23/2021	NY	64	M	1/16/2021	1/24/2021	<p>a genitourinary infection (UTI)/diagnosed with a gram negative urinary tract infection; iron level was low at 21. He said a normal iron level for a male is 35; couldn't walk afterwards; Tiredness; another soft tissue injury; Headache; left eye was totally blurry/ one eye blurriness; has severe eye dryness; Injection site pain; Injection site redness; injection site puffiness; stated he noticed at around 2:30PM-3:00PM he had a rash on his hip and back; shingles/ shingles pain; a fever of 100.4 Degree F/Fever; This is a spontaneous report from a contactable pharmacist (patient) reported similar events for two patients. This is the first of two reports. A 64-year-old male patient receive first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL3246), at same age intramuscular in arm left on 16Jan2021 11:00 at single dose for COVID-19 immunization. Medical history included fallen at work and landed on his left side, hitting his head and left knee, a knot on the left side of his head, bleeding from above his left eyebrow, had a left black eye, all on Nov2020, subarachnoid hemorrhage, cataract surgery, using crutches when he walks, in the hospital from Nov2020 to 17Nov2020, pacemaker implanted while he was in the hospital on Nov2020, he couldn't walk on 19Nov2020, 6 stents, 3 cardiac stents on Oct2020, and chicken pox as a young adult. Concomitant medication included aspirin [acetylsalicylic acid], clopidogrel bisulfate (PLAVIX) from unspecified date to 27Jan2021 for 6 stents, paracetamol (TYLENOL, 500 mg, caplets, NDC Number: 5058044936, Lot Number: SJA066 and Expiration Date: Jul2024). The patient said he received his first COVID-19 Vaccine dose on 16Jan2021. He said at the time he pre-medicated with 2 paracetamol. He said he had read afterwards that it is not recommended to pre-medicate with Tylenol before receiving the COVID-19 Vaccine. On 24Jan2021 he developed a fever of 100.4 Degree F (body temperature). He stated his fever was 8 days after receiving his first COVID-19 Vaccine dose. On 27Jan2021, he was urinating blood/blood clots and was admitted to the hospital and treated for a UTI. He was diagnosed with a genitourinary infection (UTI). He clarified on the morning of 27Jan2021 his urine looked darker than normal. He said he went to physical therapy (PT) on 27Jan2021. He said when he came back from PT, and went to the bathroom, there was blood and blood clots in his urine.</p>

---

He said he called his urologist, and his urologist saw him on 27Jan2021. He said his urologist took a urine sample, and his urine sample was clear and negative for nitrites. He clarified his urologist did a digital prostate exam, and his prostate was fine. He said his urologist wanted him to make an appointment for a cystoscopy, and a CAT scan of his abdomen and pelvis. He said after he got home from the urologist, he went to the bathroom, and again had blood and blood clots in his urine. He went to emergency room. While he was in the Emergency Room, he was set-up on CBI (Continuous Bladder Irrigation). He said the urologist did not seem concerned about the amount of blood in his urine. He clarified he was admitted to the hospital, and had in place for approximately 16 hours. Next day (28Jan2021) he was diagnosed with a gram negative urinary tract infection. He said he was given a daily dose of IV Ceftriaxone 1gram on 29Jan2021 and 30Jan2021. He said he was also given a daily dose on 29Jan2021 and 30Jan2021 of IV Ferlecit 125mg because his iron level was low at 21. He said a normal iron level for a male is 35. On 31Jan2021 he had injection site pain in his left arm, he said the COVID-19 Vaccine injection site was red and puffy. He said the COVID-19 Vaccine injection site pain, redness, and puffiness resolved on the same day, 31Jan2021. He said his second COVID-19 Vaccine dose was given in the same arm (left) on 06 Feb2021. He stated he asked that the second COVID-19 Vaccine dose be given in the same arm (left) because his left arm is his non-dominant arm. He was discharged from the hospital on 30Jan2021, and was given a prescription to take 1 Levaquin 250mg orally for 3 days starting on 31Jan2021. He said the Levaquin 250mg was dispensed in a pharmacy bottle, and did not have the NDC, Lot, and Expiration Date. He said he was also prescribed oral Feosol 325mg, twice a day, starting on 31Jan2021. He provided the Feosol 325mg, NDC Number: 12451-10-17 (unsure if he provided the correct NDC), Lot Number: 201167, and Expiration Date: Jul2022. At around 2:30-3:00PM on 31Jan2021, he developed a rash on his hip and back, saying the hip and back rash were along the same pathway. He said he spoke to a PA (physician assistant) about his rash. He said on 31Jan2021 he had taken 1 oral dose of the Levaquin 250mg. He said the PA discontinued the oral Levaquin 250mg, and changed his

----------	-------	-------	---------	-----	----------	------------	--------------

prescription to Macrobid 100mg, twice a day, for 5 days. He said he started the Macrobid 100mg, twice a day, on Monday, 01Feb2021. He said he completed the Macrobid 100mg prescription on Sunday, 07Feb2021, and did not have the Macrobid 100mg NDC, Lot and Expiration Date. He clarified his rash was raised, oozy, and looked weird, like a pimple that came to head. He said he spoke to his dermatologist on a video call Sunday, 31Jan2021. He said his dermatologist told him he had shingles and prescribed Valtrex 1gram, three times a day, for 7-10 days. He stated the Valtrex 1gram was dispensed in a pharmacy bottle. He said he took his first Valtrex 1gram dose on Sunday evening, 31Jan2021, and was still taking the Valtrex 1gram as of today (08Feb2021). He had an appointment to see his dermatologist in person on Wednesday, 03Feb2021, but woke up with a wicked headache that morning, so he took paracetamol and went back to sleep. He said when he woke, he still had headache, and his left eye was totally blurry. He said back in Nov2020 he had fallen at work and landed on his left side, hitting his head and left knee. He said his fall left him with a knot on the left side of his head, and he had bleeding from above his left eyebrow, and had a left black eye. He said he also had a subarachnoid hemorrhage. He said he had a CT scan of his head that showed the subarachnoid hemorrhage was contained, so the doctors wanted to just monitor him. He said he was on Effient at the time and the doctors changed him to Plavix. He said he also was taking Aspirin 81mg. He said he was taken off of Plavix on 27Jan2021 when he was admitted to the hospital for having blood and blood clots in his urine. He said he continues to take the Aspirin 81mg daily. He clarified he has been on compensation since his fall in Nov2020. He said he also had cataract surgery 2 years ago. He said he immediately called his eye doctor, and then went to the hospital Emergency Room because he thought he had a stroke. He said the Emergency room did a CAT scan and CTA of his head, which were both normal. He said a neurologist saw him in the Emergency Room, and said since it was a headache with one eye blurriness, he should see his eye doctor. He said the neurologist told him if he had a headache and both eyes were blurry, it would more likely have been a stroke. He stated when he was discharged from the Emergency Room on

03Feb2020, he went directly to his eye doctor. He said his eye doctor did several tests: field of vision, a sonogram, pictures of his left eye, and a dilation of his eyes. He said he had an eye test where he looked at a half circle and clicked a counter when he saw dots, and another eye test where he stared at something that looked like a hot air balloon, while the eye doctor took measurements. He said the eye doctor also measured his eye pressure, which was normal. He said he was at his eye doctor's office for a good couple of hours. He said his eye doctor told him that he has little white dots on the background area of his eyes that indicates he has severe eye dryness. He said his left eye is much worse than right eye. He said his eye doctor asked him if he took Crack, or Cocaine, or any kind of opioids in the last few weeks. He said he told his doctor he took 1 dose of an opioid on 31Jan2021 because of the shingles pain. He clarified he had a Percocet prescription leftover from his hospitalization in Nov2020. He said he took another dose of the Percocet the week before 31Jan2021 for pain in his knee from the fall he had in Nov2020. He said his eye doctor told him his dry eyes could be caused by the Percocet. He said his eye doctor prescribed lubricating eye drops (Refresh Optive Mega 3, UPC Number: 0023577330, Lot Number: T095, and Expiration Date: Aug2022), that he is to use in both eyes every hour, and an eye ointment in his left eye only at bedtime. He had been using crutches when he walks because of the problem with his right knee since he fell in Nov2020. He said on 06Feb2021, he took a shower, and when he went to get out of the shower, his right leg gave out. He said he didn't fall, but he couldn't walk afterwards. He said he went to the Emergency Room on 06Feb2021, and an x-ray and sonogram were done of his right knee. He said he was told he had another soft tissue injury like he had when he fell back in Nov2020. He said he was given a leg immobilizer to use. He said when he first fell in Nov2020, he originally fell on his left knee. He said he has had PT since being discharged from the hospital on 17Nov2020. He said he also had a pacemaker implanted while he was in the hospital in Nov2020. He said after his discharge from the hospital on 17Nov2020, he went to take shower at home on 18Nov2020 and his left knee gave out. He said he was able to lower himself to the floor in the shower stall, but he couldn't get out of the

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

shower stall. He said he was left sitting on his left leg and he couldn't use his right leg. He said he finally got himself to bed, and iced his right knee because he sat on it for over an hour. He said the next day (19Nov2020), he couldn't walk and had to have an ambulance take him to Emergency Room. He said he hasn't had PT since 27Jan2021, and needs clearance from his doctor before he can restart PT. He said he has been without PT for 2 weeks now. He said on 06Feb2021 he was unable to get a MRI on his knee because he had too much swelling that would have made the MRI imaging cloudy. On 06Feb2021 he was due for his second COVID-19 Vaccine, so before he was discharged from the Emergency Room he was given his second COVID-19 Vaccine dose. He was using the Refresh Optive Mega 3 eye drops constantly now. He said he had no fever, but is more tired than in the past. He said the last couple of days he can sleep for hours, and wake up and feel like he can go right back to sleep. He said he and his cardiologist are concerned because since 27Jan2021, he has only been on Aspirin 81mg. He said he has 3 cardiac stents since Oct2020, and should be on dual therapy. He said he had a CT of his abdomen and pelvis while he was in the hospital. He said he has been off of Plavix since 27Jan2021, and can restart the Plavix until he has a cystoscopy. He wants to know if UTIs in men are common after getting the COVID-19 Vaccine, so he can decide if he should cancel the cystoscopy and restart his Plavix. The second COVID-19 Vaccine Lot number as EL9261 or EI9261. He stated the vaccine lot number was handwritten on his COVID-19 Vaccine immunization card and was difficult to read the handwritten vaccine lot number. The patient underwent lab tests and procedures which included bacterial sepsis: gram negative urinary tract infection on 28Jan2021. Clarified he had no pain, burning, or urgency with the UTI. He said he was told by the hospital he had gram negative rods in his urine, when he was started on the IV Ceftriaxone on 29Jan2021. He stated he has never had a UTI before. Clarified his body temperature is rarely 98.6 degrees, and is normally 98.2 degrees and he had never had shingles before. He said he had chicken pox as a young adult, and he only had 1 spot of chicken pox. He had never had dry eyes before. Reporter seriousness for fever, UTI, injection site pain, injection site redness, injection site puffiness, rash,

Feb 9, patient was light-headed, as if he was going to faint. He did not have appetite. Evening of Feb 9, started vomiting large amounts of blood. Ambulance took him to hospital. CT scans showed abnormally enlarged pancreas. Patient aspirated blood and was put on a ventilator for 48 hrs. Endoscopic ultrasound showed ulcers in stomach that appear to have been bleeding, which were clipped and shot with epinephrine. After being treated for ulcers, patient developed blood clots in leg and lungs. It is almost two weeks since initial emergency, and patient is still showing sings of internal bleeding (low blood pressure, low hemoglobin, blood in stool). Still no firm explanation for continued bleeding. Before adverse event on Feb 9, patient did not report other symptoms from shot, however, he did show unusual signs of large bruising on his arm. Patient is currently at Hospital. Blood thinners are being discontinued, but patient still has blood clots.

1047631	2/22/2021	NE	42	F	1/11/2021	1/13/2021	Two days after the 2nd injection I started to have chest pain and not feel right. I went to the Station where I volunteer. I did and EKG which showed Anterior Infarct. I went to the ER. They gave me 4 baby aspirin to take and some blood work. I was told the blood work showed elevated levels consistent with a blood clot as well. I had a CT scan to rule out a clot in my heart or lungs. Which it was negative. I was released and told to see a cardiologist in the next few days. I saw the cardiologist two days later who said I ended up with Pericarditis and that it should resolve on its own. I was feeling better until two days ago when I developed chest pain again. I again went to my fire station I volunteer for and did an EKG which showed Anterior Infarct. I am currently waiting for treatment from my cardiologist.

1044020	2/21/2021	IN	70	F	2/11/2021	2/11/2021	Flu like symptoms about 4 hrs after vaccine(Thurs)...left arm, muscles, joints hurt, chills, tired, not feeling well. most symptoms disappeared after 24 hr however right ankle and leg continue to hurt (FRI and SAT) and by Sun. calf on right leg hot red and swollen. Mon called my physician and went to hospital for sonogram on right leg. Results were a blood clot on the back of my leg from ankle to knee. Xarelto was prescribed as blood thinner and taken. Tuesday appt. with Doctor for consultation and blood work was prescribed with follow up appointment March 2 . My concern is taking second dose of Pfizer vaccine on Mar 4. My doctor and I will discuss. On internet others have reported this same side affect of blood clots from 2 days to 2 wks after. This needs to be addressed.
1044071	2/21/2021	NE	38	F	12/16/2020	12/25/2020	I had a major stroke on 12/25/2020, 9 days after receiving the vaccine. I had a clot in my MCA. My left arm was completely flaccid, with left facial droop and garbled speech. Thankfully I was able to receive TPA that day, which resolved all of my symotoms.
1044102	2/21/2021	OH	77	M	2/9/2021	2/15/2021	Shortness of Breath causes by multiple large blood clots, put on blood thinners, seems to be fine, but has follow up appointment in March
1044799	2/21/2021	CA	73	F	2/8/2021	2/8/2021	Blood clots in left leg diagnosed in Hospital, , emergency room 02/08/2021, about 5 hours after first vaccine. Treated with eliquis. History of prior embolus and blood clots. Referred to primary physician who referred me to a vascular surgeon and a hematologist. For about 3 days extremely tired and slept quite a bit. I already have rotator cuff injury of arm where I got shot so pain was not able to be separated from rotator cuff pain. No temperature, rash, redness or swelling of injection site.
1040874	2/19/2021	MN	65	M	1/30/2021	2/6/2021	Within one week of receiving vaccine, experienced shortness of breath and chest tightness on exertion, lightheadedness, tachycardia. Became increasing worse over next 5 days. Visit to ER on 1/18/21. Diagnosed with many bilateral pulmonary emboli with clots in both pulmonary arteries. Admitted to hospital and started on Eliquis. Had doppler on legs which showed DVT.

1040920	2/19/2021	FL		F	1/8/2021	2/5/2021	Do not feel that the medication was delivered into arm; Heard a click as withdrew the needle, fluid squirted; Do not feel that the medication was delivered into arm; A spontaneous report was received from a consumer concerning a 73-year-old female patient who experienced heard a click as withdrew the needle, fluid squirted and do not feel that the medication was delivered into arm. The patient's medical history included cancer. Products known to have been used by the patient, within two weeks prior to the event, included blood pressure medication, rapid heartbeat medication, medication for a blood clot in their lung, vitamins and minerals The patient received their first of two planned doses of mRNA-1273 on 08 Jan 2021. On 05 Feb 2021 the patient received their second of two planned doses of mRNA-1273 (LOT #031L20A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. Patient had their first dose of the Moderna vaccine on 08Jan2021 in their left arm, and their second dose on Friday 05Feb2021 in their right arm, both at the Health Department. During the administration of the second dose, the patient heard a click noise, and as the syringe was pulled out they noticed some fluid came out. Patient wants to know if they got the full dose, or not, and what to do regarding this. Patient provides consent for Safety to follow up Lot# for the second dose is 031L20A. Treatment information was not provided/unknown. Action taken with mRNA-1273 in response to the event(s) was unknown. The outcome of heard a click as withdrew the needle, fluid squirted and do not feel that the medication was delivered into arm was considered as resolved on 05 Feb 2021.; Reporter's Comments: This report refers to a case of Vaccine underdose and Wrong technique of vaccine administration for mRNA-1273, lot number 031L20A, with no associated AEs.

1041402	2/19/2021		21	F	1/26/2021	1/26/2021	Pt reports receiving dose #1 of the COVID-19 vaccine (Moderna) on 1/26/21. She reports feeling intense abdominal cramping that evening into the next morning, and she reports starting her menstrual period that morning. The pt continued to have 2-3 days of heavy menstrual bleeding then 2-3 weeks of intermittent passage of menstrual blood and clots with continued cramping. The pt has been receiving depo provera injections on time for approximately two years, and she reports that she has not had her period during this time. After receiving the COVID-19 vaccine was when she resumed her menstrual period after a long time. She reports to her primary care clinic today to receive her depo injection on time, and she reports having some menstrual bleeding today. This RN consulted with a provider on site who encouraged use of tylenol for abdominal cramping, maintaining hydration and rest. This RN asked pt to call back next week after her 2nd dose of the COVID-19 vaccine to report status of menstruation and any side effects from depo injection or covid vaccine. It is also important to note that the pt has a hx of dysmenorrhea, but the two years of depo injections have suppressed her regular menstrual cycle.

1037837	2/18/2021	CA		F	1/20/2021	1/25/2021	ultrasound revealed blood clots at right leg; Swollen ankle and foot after 5-6 days of first dose; Swollen ankle and foot after 5-6 days of first dose; This is a spontaneous report from a contactable consumer reported for herself. A 73-year-old female patient received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration in left arm on 20Jan2021 11:00 at single dose for COVID-19 immunisation. The patient was vaccinated in nursing home/senior living facility. Medical history included high blood pressure, monitored for lymph node growth. The patient had no known allergies. Prior to vaccination, the patient was not diagnosed with COVID-19. Concomitant medication included high blood pressure medication and clonazepam. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced swollen ankle and foot on 25Jan2021 12:00 AM after 5-6 days of first dose, ultrasound revealed blood clots at right leg. Doctor ordered to take apixaban (ELIQUIS) immediately during second week. The events resulted in Doctor or other healthcare professional office/clinic visit. Since the vaccination, the patient had not been tested for COVID-19. The outcome of events was not recovered. Information on the lot/batch number has been requested.

1038250	2/18/2021	NY	73	F	12/24/2020	12/25/2020	<p>Saddle embolism in lungs; DVT in left leg; Slight fever; Extreme fatigue; Shortness of breath, struggling for every breath; Low o2 sat; A spontaneous report was received from a health care professional, who was a 73-year-old, female patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and experienced shortness of breath, slight fever, extreme fatigue, left leg deep vein thrombosis (DVT), and saddle pulmonary embolism (PE). The patients' medical history was not provided. No concomitant medications list was provided. On 24 Dec 2020, prior to the onset of symptoms, patient received the first of two planned doses of mRNA-1273 (Batch number 011J20A) for the prophylaxis of COVID -19 infection. On 25 Dec 2020, patient experienced shortness of breath with low oxygen saturation levels. On 26 Dec 2020, the patient's oxygen saturation levels were down to 89% with slight fever and extreme fatigue. On 27 Dec 2020, patient's energy was back to normal. On 28 Dec 2020, the patient woke up in the morning with symptoms of almost could not breathe, could not walk across the room. The patient's vital signs included oxygen saturation 83%. The patient was struggling for every breath. The patient tested negative for COVID-19. On 30 Dec 2020, another COVID-19 test was negative. On 31 Dec 2020, patient's vital signs included oxygen saturation closer to 90%, and she reported getting better. Symptoms remained the same for about a week. On 08 Jan 2021, the patient experienced left ankle and foot swollen. The patient was seen by physician and then sent to emergency room where it was determined that the patient had DVT in the left leg. A computerized tomogram (CT) scan found clots in the left lung, or saddle PE. On 09 Jan 2021, the patient was discharged from the hospital. Treatment for the events experienced included intravenous heparin and blood thinners. Action taken with planned second dose of mRNA-1273 in response to the events was not provided. The event, extreme fatigue, was considered resolved on 27 Dec 2020. The outcome of the events, shortness of breath, slight fever, DVT and saddle PE were not provided. Follow-up received on 19 Jan 2021 included updated events (DVT and saddle PE), updated event details, treatment, and hospitalization details.; Reporter's Comments: This spontaneous report refers to a case of 73- year-old female patient who experienced serious</p>

event of pulmonary embolism and deep vein thrombosis and non-serious events of shortness of breath, oxygen saturation levels were down to 89% with slight fever and extreme fatigue the next day after administration of the first dose of mRNA-1273, lot # 011J20A, expiration date-unknown. Based on temporal information provided and the known safety profile of the vaccine and the absence of any other etiology factors, a causal association between the vents of shortness of breath, oxygen saturation levels were down to 89% with slight fever and extreme fatigue and the administration of mRNA-1273 vaccine cannot be excluded. Fever and fatigue are consistent with the known safety profile of mRNA-1273 vaccine. There is no enough information t clinically assess the causal association between the events of pulmonary embolism and deep vein thrombosis as the patient's medical history and list of concomitant medications were lacking. Main field defaults to 'possibly related'

1038305	2/18/2021	TX	50	M	1/6/2021	1/21/2021	<p>On January 21, 2021 I started feeling pains in my right shoulder (1st shot was left shoulder) and the following day it had spread across my body, shoulders, chest, arms, legs and calves. I also had a severe headache along with the muscle pains and woke up each day since in a pool of sweat with the sheet soaked to this day. Due to the severe muscle pains, I started taking Tylenol and all the symptoms pointed to the virus itself. I was tested for the virus on Monday, January 25th with negative results on the morning of the 26th. I continued to self-medicate with Advil every four hours to remove the severe muscle pains noted above. To back track slightly, I had a colonoscopy on January 19, 2021 and one large polyp was removed without issue. Due to the full body muscles pains and taking the Advil, it likely caused bleeding from the polyp site of the colonoscopy and went to the ER and they transferred me back the hospital on January 28, 2021, the location of the colonoscopy, and hospital found nothing wrong with the colonoscopy during my 2.5 day stay there. The did an x-ray of my chest to test for the flu and related items and found everything to be clear. They also a CT of my abdomen to look for any abnormalities and found none. Through all this the muscle pains continued when I would move, the muscles would fire up and intense pain persisted until I could calm them down after about 30 mins of intense pain. Hospital also tested me twice for the COVID virus and each turned out negative. Overall, I've been tested for the virus nearly 12 times and all were negative. From the visit to Hospital, with the colonoscopy and no additional bleeding occurring, Hospital gave me a steroid called Prednisone to mask the pain on Saturday, January 30, 2021 at about 1pm and by 4pm they fully released me with no idea what was causing the severe muscle pain across my body when I moved. I literally just walked out of the hospital since the steroid masked the muscle pain issue. The steroids worked but I was still walking up in a pool of sweat and very clammy and wet each morning from 1am until I woke up. On February 2, 2021 I had 3 bowel movements that were all dark purple and full of blood clots which led me back to Hospital and the ER could not get in touch with the Hospital Doctors for transfer so they admitted me to the Hospital, thank God. On February 4, 2021 Methodist performed an emergency colonoscopy to</p>

---

clamp the polyp site, took two additional polyps out and did an endoscopy to ensure my upper and lower GI track were clear, and it was and the two additional polyps were benign. Through all this the serve muscle pains persisted and Hospital moved me to a patient room and out of the ER. Over the next several days, February 4 thru the 11th Hospital cleared me of everything they could test for, over 85 different tests were ran based on MyChart. All my blood counts were all over the place, WBC were 19,000, Platelets were nearly 700, my sedimentation rate reached 64+ and the server muscle pains persisted and I was basically incapacitated during my entire stay at Hospital. Hospital had several specialists seem me from Internal Medicine, Infectious Disease, Neurology to Rheumatoid ologist and none of them found anything wrong with me other than my COVID anti-bodies were enormously high with not signs of slowing down. The conclusion by each of the specialist is that my symptoms all point to an Adverse Level 3 Inflammatory Reaction to the first COVID Vaccine shot. The Infectious Disease specialists emphasized that I DO NOT get the second vaccine shot since it would like have killed me. (We had cancelled my 2nd shot, scheduled for February 3, 2021 via Cancer Center the week of January 30, 2021.) Hospital concluded that they could not do anything further for me since all their extensive testing all came up negative other then the COVID antibody levels and started me on the same steroid via IV on February 10, 2021 and on February 11, 2021 I was released from Hospital with a 28-day gradual reduction of the steroid over that timeframe to see if the COVID antibody production would simply stop. They had no other recourse or follow up with for any of the specialists. I?m on my own at this point and scared. To help with the inflammation the only thing my wife and I saw we could do is see a health and well Doctor to try and purge myself of the inflammation and assist my bowel and liver health with trying to rid me of the vaccine and hopefully the antibody production. I?m on a strict diet and taking supplements to assists in the reduction of inflammation and cleaning my system out. Starting today, February 18, 2021 I start stepping back on the steroids prescribed by Hospital and praying that the symptoms and pain simply go away but I?m still having night sweats, weak and shaky.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1040119	2/18/2021	ND	43	F	1/26/2021	2/4/2021	I didn't notice any symptoms right away. When they started, I didn't think it was abnormal at first. I am female and still have my menstrual cycle. This time it appeared to be heavier than usual and had some blood clots. However, before I was on birth control it was always that way. Sometimes it is a little heavier when I have more stress or the weather is not ideal. My cycle started around 2/4/21. On 2/8/21, I combed my one cat. She scratched and bit me and has done so in the past. She and I both are vaccinated and I've never developed any infections because of it in the past. On 2/10/21, I noticed a cluster of red pinpoint dots underneath my skin on my arms and chest. They weren't bumpy, warm to the touch, itchy or anything. It just looked odd and I didn't know how it happened. I work with a Nurse Practitioner and she suggested I go into to a clinic as those usually indicate an infection is developing. I went to the Urgent Care and was treated. He did blood work on me and informed me that my glucose was a little low. It was supertime so that didn't surprise me. He told me there was no signs of infection in my blood work but was prescribing two antibiotics in case one developed. When I was getting my meds at the pharmacy, a call was coming through that I didn't recognize so do to phone scams, I didn't answer it. I started the antibiotics. Then over the course of 2/13/21 and 2/14/21 weekend days, I felt more fatigued than usual, nauseated, had a decreased appetite and still had my menstrual cycle. I still didn't think much about it as a side effect of the antibiotics was nausea and decreased appetite and the fatigue could be related to it being so cold and winter usually affects my depression symptoms. Then on 2/14/21 I noticed my lower abdomen was covered in those red, pinpoint blood dot clusters and there were unexplained bruises on my body. I took a shower and when I went to wash my legs, my pelvic area was completely bloody and a blood clot dropped into the bathtub. Never has that occurred when I have my period. It looked like I had just given birth it was so much blood. I became nauseated and dry heaved several times. On 2/15/21, I sent a message to Dr asking what was happening to me. He called me and informed me that he had tried to call me the night he saw me because he saw my platelet count was only 11,000 and should be a minimum of 140,000. Dr asked that I return to Urgent

1035850	2/17/2021	NC	67	M	2/4/2021	2/6/2021	<p>Care as soon as possible. I arrived there around 12:30 pm that day. He had bloodwork done again on me. My platelets went down to 9,000. I explained that my menstrual cycle would not stop and it should've but I just keep bleeding. Dr contacted a Hematologist that informed him that recently the blood disorder Immune Thrombocytopenia (ITP) has been linked with the COVID19 vaccination in rare cases. I was scheduled to be seen by a Hematologist and put on the medication prednisone to build up my platelet count. I returned to Urgent Care for blood work again on 2/16/21. My platelets went up to 30,000. I met with Hematology on 2/17/21 and had blood work again, platelets 28,000. All providers looked over my medical record and noted that since my gastric bypass surgery in 2015, my health has been good, my blood work has been normal and I live a clean lifestyle. Again, the only issue showing up in my bloodwork was that my platelets were extremely low. Now I have weekly blood draws, take 80 mg of prednisone and have a Hematologist when just a few weeks ago my health was good.</p> <p>Patient woke up on the morning of 2/6 with symptoms of a stroke. Rushed to hospital where clot found in brain. Recovered from initial stroke but then had another major stroke on 2/8 and never recovered.</p>

1033682	2/16/2021	WI	95	M	2/4/2021	2/5/2021	L hand edema, hematoma which burst and caused bleeding sending pt to the ER for pressure dressing and 2 stitches. L hand and arm progressively got more edematous and bruised looking (severely black/blue/purple) and the hand continued to bleed and swell on 2/6/21. Severe arterial and venous issues and apparent blood clots. On 2/7/21 there were also lumps noted on left inner thigh. Pt. stopped eating or drinking on 2/8/21 and expired on 2/12/21.
1032868	2/16/2021	NC	35	F	2/9/2021	2/12/2021	Developed nose bleed around 8am, took 18 minutes to completely stop (held pressure x8 min, then clot dislodged, held pressure again x10 min). Got lightheaded, heart rate increased to 120 bpm, felt palpitations, got I-watch and took EKG. Then felt stronger palpitations, had to sit down, 2nd EKG read 172bpm. 911 called, felt very dizzy, laid down in floor with legs up, pursed lip breathing. Ambulance arrived and had SBP of 100. HR in ambulance on way to hospital was around 120.
1033516	2/16/2021	MN	32	F	1/29/2021	2/15/2021	At the time of administration of the first dose of Moderna vaccine, I was 6 weeks pregnant. I had confirmed pregnancy with home positive test and missed period. I had an estimated due date of 9/24/2021. This was my 4th pregnancy. I have had two uncomplicated pregnancies to term. In September 2020 experienced a chemical pregnancy with early pregnancy loss at 5 weeks. The first 24 hours after 1st dose of vaccine I experienced extreme arm soreness in the arm that was vaccinated, causing headache and unable to sleep. After 24 hours I felt "normal". 2 weeks and 3 days following the first dose of Moderna, I had a miscarriage. On the night of 2/15/21 I lost the pregnancy with vaginal bleeding, bright red blood, passing tissue, clots/ sac. I had an uneventful pregnancy up to that point, feeling well as I had with prior pregnancies.

1032596	2/16/2021			M			On Saturday little blood clot, no liquid blood, and this morning this same; a little blood in the urine; This is a spontaneous report from a contactable consumer (the patient). A male patient (Age: 77, Unit: Unknown) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number not provided), via an unspecified route of administration on an unspecified date (age at vaccination unknown) as a single dose for COVID-19 immunization. The patient's medical history included little blood clot, no liquid blood, 7 years ago (unspecified date in 2014). The patient's concomitant medications included fish oil and acetylsalicylic acid (ASPIRIN). The patient stated he received the first dose of the COVID shot on Thursday (unspecified date). The next morning, there was a little blood in the urine. On Saturday, little blood clot, no liquid blood, and this morning the same. The patient had this before 7 years ago. The patient asked if anyone else reported this and for information. The clinical outcome of little blood clot and a little blood in urine was unknown. Information on Lot/Batch number has been requested.
1032994	2/16/2021	AZ	74	M	2/10/2021	2/10/2021	Received 1st. Pfizer vaccine shot at 10:00 am Thursday 2/10/2021 At approximately 6:00 pm same day I started to have severe pain in my side shortness of breath and could not lie down to go to sleep. Had to go to bed sitting up with three pillows on my back. The next morning went to doctor who ordered blood test and chest X-Ray. Chest X-Ray indicated Pulmonary Embolism. Doctor started me on Eliquis blood thinner to hopefully dissolve the blood clot on my lung. Doctor suggested I report Pulmonary Embolism occurring same day as my first vaccine shot. Do not know if shot caused Pulmonary Embolism or just a coincidence. In addition doctor found blood in my urine and a CT of Bladder has been ordered

1034428	2/16/2021	CO	46	F	2/4/2021	2/13/2021	I have an extremely big hive on my right arm, same area I got the shot. I was very worried about having an infection or developing blood clot. I saw my family doctor this morning, she hasn't seen such a reaction in any other patient. She prescribed Benadryl and hydrocortisone cream. and a follow-up on Friday. If there is no change she said she might have to prescribe antibiotics. She told me to contact her if any changes develop, and yes it has I will be contacting her in the morning because the hive is getting much bigger. I am very worried any my health right now since the hive is spreading and its itching, burns and looks very inflamed. I hope to hear from someone very very soon. Thank you.

1030030	2/15/2021	CA	61	M	12/18/2020	12/1/2020	the swelling and extreme tenderness of the site of injection; the swelling and extreme tenderness of the site of injection; headache; I couldn't sleep last night because I have headache, throbbing headache and back pain; Nausea; I had like metallic taste; Dizziness; The initial case was missing the following minimum criteria: suspect drug. Upon receipt of follow-up information on 27Jan2021, this case now contains all required information to be considered valid. This is a spontaneous report from a contactable physician. A 61-year-old male patient received his first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EJ1685, expiration date Mar2021) on his left arm, intramuscular on 18Dec2020 at 0.3 mL, single for COVID-19 immunization. Medical history included hypertensive, 2 stents in heart in 2016, Hyperlipidemia, hypothyroidism, coronary artery disease in 2016 and Allergic (Allergic rhinitis + Chronic sinusitis). Concomitant medication included acetylsalicylic acid (ASPIRIN), clopidogrel bisulfate (PLAVIX). It was reported that the patient had swelling and severe tenderness left his arm. He couldn't sleep last night because he had throbbing headache and back pain on 18Dec2020. Initially, he had nausea. Patient stated further stated that Headache and swelling and extreme tenderness of the site of injection, that is the swelling, no redness but the swelling and tender and painful. Initially, he had till now the mild back pain. He patient said she took Tylenol. She also mentioned that initially she had like metallic taste and then disappear. The patient also had dizziness a little bit. The outcome of the event vaccination site swelling, dysgeusia and tenderness was recovered on unspecified dates, headache and back pain was not recovered, recovering for nausea while unknown for the remaining events.

1026850	2/12/2021	MA	76	M	2/5/2021	2/6/2021	On Saturday 2/6/21 in the morning on the left side under armpit felt like he had a pulled muscle or something. It eventually radiated over up into the left quadrant of his chest where he could not push down on it. It was extremely painful by Monday. He has a history of esophageal spasms and exacerbated them to where he thought he was having a heart attack. He called his Cardiologist and told him to go to the ER. He went to the hospital Monday evening, he had two EKG's, had blood drawn 3 times, did sonograms looking for blood clots. He did inform them that he had the vaccine on Friday and they told him it was due to that. He went to nuclear medicine to get his lung checked for blood clots as well. All tests were negative. He saw his PCP today who told him that the lymph nodes were affected due to the vaccine. He has improved greatly, still has some slight discomfort which his PCP said would go away in time.

1026016	2/12/2021	KY	45	F	1/6/2021	1/6/2021	possible case of cellulitis; arm feeling heavy; hot to touch; swelling; rash developed that was 3-4 inches diagonal that appear to spread to upper arm in couple of days; redness; shower with itchiness at the site of injection that was round in shape; thrust from antibiotics bactrim and Amox/Clav; on and off adverse event with feeling left ear on fire; A spontaneous report was received from a healthcare facility staff member concerning a 45-years-old, female patient who experienced possible case of cellulitis, on and off adverse event with feeling left ear on fire, hot to touch, redness, swelling, arm feeling heavy, thrust from antibiotics, rash developed that was 3-4 inches diagonal that appear to spread to upper arm in couple of days and shower with itchiness at the site of injection that was round in shape. The patient's medical history was not provided. Concomitant product use was not provided by the reporter. On 06-Jan-2021, prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 [Lot number 012L20A] intramuscularly in the right upper arm for prophylaxis of COVID-19 infection. On 06 Jan 2021, the patient started experiencing on and off adverse event with "feeling left ear on fire". Eight days later the patient noticed itchiness at the site of the injection that was round in shape. Rash developed that was 3-4 inches diagonal that appeared to spread to upper arm. The injection site was hot to touch, redness, swelling and arm feeling heavy. On 13 Jan 2021 or 14 Jan 2021, the patient was recommended Bactrim (sulfamethoxazole, trimethoprim), amox/Clav (amoxicillin, clavulanic acid) and clotrimazole lozenges because the primary care physician (PCP) was believing she possible has a case of cellulitis. The patient went to the emergency room (ER) on 17 Jan 2021, in which an ultrasound was performed and did not suspect any blood clot or cellulitis. Upon discharge, the patient experienced thrust from antibiotics. Treatment for the event included Bactrim (sulfamethoxazole, trimethoprim), amox/clav (amoxicillin, clavulanic acid), clotrimazole lozenges and Benadryl (diphenhydramine hydrochloride). Patient informed that the symptoms are on-going where the swelling and redness comes and goes. Action taken with mRNA-1273 in response to the events was not provided. The outcome of the events possible case of cellulitis, on and

							off adverse event with feeling left ear on fire, hot to touch, arm feeling heavy, thrust from antibiotics, rash developed that was 3-4 inches diagonal that appear to spread to upper arm in couple of days and shower with itchiness at the site of injection that was round in shape was considered as not recovered and for redness and swelling outcome is considered as unknown.; Reporter's Comments: This case concerns a 45 year old female subject with a serious unexpected cellulitis, with NS unexpected burning sensation, feeling hot, limb discomfort, thrush, and NS expected Vaccination site events of erythema, swelling, pruritus, and rash. Event onset same day as first dose mRNA-1273. US without blood clot or cellulitis. Based on the current available information and temporal association between the use of mRNA-1273 and the start date of the events, a causal relationship cannot be excluded.
1025635	2/12/2021	SC	71	F	1/28/2021	1/30/2021	I presented at ER with burning, throbbing right leg pains at upper calf and upper thigh area. The ER doctor said it was not a blood clot, but was the beginning of Shingles on the back of my right thigh, buttock and downward just below the back of my knee. I was prescribed Acyclovir, Hydrocode with Tylenol and suggested topical creams. I was unable to find the Zostrix suggested so began with Caladryl and Terrasil cream as well as baking soda/water soaks a couple times a day. As of today, February 12, I still have leg pain, markings from the lesions and am unable to sleep more than a couple of hours a night without throbbing, burning pain especially at 2 lesion sites. Now taking Tylenol alternating with Tramadol for the pain.

1025460	2/12/2021	CA	72	M	1/19/2021	2/3/2021	Patient went to bed totally fine and woke up saying he could not see in one eye. I rushed him to the emergency hospital they ran cat scans, MRI, heart tests etc. He stayed overnight while they checked. The next day we went to eye doctor who told him he had a eye stroke. He would regain some of his site not all of it. Something to do with blood clot or loss of blood to the eye. I was not satisfied with that so made another drs appointment for the next day with a different eye doctor. The first eye doctor gave us some blood test to do so we did it then. Later that evening we got an emergency call form the first eye doctor to get back to the hospital right away he could lose sight in the other eye.. They found some high c-reactive protein. Normal is 8 his was over 40. They put him on heavy steroids and did biopsy on both temples of his eyes. This started last Wednesday morning. He was released from the hospital Monday Morning to see his regular doctor that afternoon. Test results for the eye would be Tuesday and all other vital tests came back fine thank goodness. On Tuesday the biopsy tests also came back negative so they are stopping steroids. I think they were looking for auto immune issues. Today we are going to Rheumatologist

1023403	2/11/2021	SC	48	M	1/6/2021	1/8/2021	bakers cyst behind my right Knee; pain and swelling in my right knee/ calf and ankle/in the right leg/in left hand; pain and swelling in my right knee/ calf and ankle/in the right leg/in left hand; pain and swelling in my right knee/ calf and ankle/in the right leg/in left hand; pain and swelling in my right knee/ calf and ankle/in the right leg/in left hand; This is a spontaneous report from a contactable consumer (patient). A 48-years-old male patient received the first dose of BNT162B2 Pfizer-BioNTech COVID-19 Vaccine, lot number EH9899, via an unspecified route of administration in left arm on 06Jan2021 at 09:00 at single dose for COVID-19 immunization. The patient received vaccination in Doctor's office/urgent care. Medical history included bladder cancer from an unknown date, cancer treatment with tumor vaccine therapy BCG (Bacillus Calmette Guerin) on 23Dec2020, bone spur in right thumb from an unknown date, COVID-19 from an unknown date and drug allergy to amoxicillin/clavulanate potassium (AUGMENTIN). The patient has not been tested for COVID-19 since the vaccination. Concomitant medication included doxycycline. On 08Jan2021 (also reported 3 days after the vaccine) at 05:45 the patient experienced pain and swelling in his right knee/calf and ankle. Pain and swelling in the right knee, calf and ankle continued until 14Jan2021 when the patient went to the urgent care. He was sent to the emergency room with a suspected blood clot and ultrasound proved no clot was in the leg. On 15Jan2021 the patient went to a hematologist and had an additional ultrasound which found a bakers cyst behind his right knee. He continued to have pain and swelling in the right leg and left hand which had already arthritis and he suspected it was an immune response to the vaccine. Rest, ice, compression and elevation were suggested as therapeutic measures to treat the events. The reported events had not resolved yet at the time of the report.

1019015	2/10/2021	FL	86	M	1/11/2021	1/18/2021	eye lid infection; This is a spontaneous report from a contactable consumer reported for her husband. An 86-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Pfizer product; Batch/lot number: EL3246) via an unspecified route of administration on 11Jan2021 at a single dose for COVID-19 immunization. Medical history included pulmonary embolism (PE) diagnosed 3 years ago, treated at (university name) hospital for about 3 weeks and the clot was gone and he went back to his normal routine. Other products were reported as no. Caller stated she and her husband got the first dose of the Covid vaccine 2 weeks ago today, 11Jan2021, stated they were scheduled to get 2nd dose next week 01Feb2021. Caller stated her husband had developed, unrelated to vaccine, an eye lid infection on 18Jan2021 with outcome of not resolved, stated he went to doctor had been treating it with topical antibiotics and anti-inflammatory eye drops, infection was improving but persistent, doctor wanted to put him on an oral antibiotic, they were very reluctant to do so, stated that they considered doxycycline but they read not to be taken with vaccines, stated he would not take that one, caller wanted to know did he need to ride the infection out and possibly end up with an incision and drainage or if he can take an antibiotic. Stated the main concern was that could an antibiotic possibly diminish the efficacy of either the first or second doses of the Covid vaccine and wanted to know if this was possible. Stated her husband was a retired orthopedic surgeon.; Sender's Comments: Eyelid infection is considered unrelated to the vaccine use representing a coincidental skin/ subcutaneous infectious condition.

1019152	2/10/2021	CA	71	F	1/21/2021		<p>had like sort of a hard time breathing; got really weird smell; lips and her tongue were all this kind of swelled and then like it was steamed; lips and her tongue were all this kind of swelled and then like it was steamed; her arm, both of her arms went numb; could not go to sleep; This is a spontaneous report from a contactable consume r(patient). This 71-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 21Jan2021 at single dose (Lot # EL8982) for covid-19 immunisation. Medical history included stated, the only thing was got the susceptible to blood clots, had that gene so that is one of the reasons took the vaccine other than that did not take any meds. The patient didn't even take any blood thinners because did not need them." (not clarified further). No concomitant therapy included. The patient did not know if it is the vaccine but she got really weird smell and then her lips and her tongue were all this kind of swelled and then like it was steamed. The patient stated, "In the tongue and my lips, it was like when you get chilli on them and a distinct type of smell. " And then her arm, both of her arms went numb and she had like sort of a hard time breathing. Now, that it went away but she just waited and waited and it lasted almost in the most of the night and then she could not go to sleep but it was something she had never had before and it was very strange. She did not know if you have that kind of reaction from people or you know if it has come up but she thought she better report it because she had not had my second dose yet. She had to get the second dose on 09Feb. No treatments were received. Outcome of the events was recovering.</p>

1019946	2/10/2021	FL	81	M	2/1/2021	2/1/2021	Wife calling, sitting with her husband an 81 yo m currently in the Neuro ICU. He went Pharmacy Monday morning 11:30 AM for a covid shot. No immediate issues, no symptoms that day. 8 PM that night she noted facial asymmetry and slurred speech, called 911. He's still in hospital, improving mentation today, more aware to person than before. Had surgery to remove the clot. She doesn't currently have all the information on her person (ex, unsure exact meds, CDC card at home. She isn't certain it's related but wants to report this, just in case. Reviewed with Dr., no reports of this type of ADR, most likely issues unrelated, but Relayed to patient also that it's great that she had the presence of mind to report this, because this is how we can best assess vaccine safety. PCC will Check back in a week for patient status, missing report information. Slurred speech, facial asymmetry/other neuro, confusion, blood clot, - still ongoing but improving
1019741	2/10/2021	CT	50	F	1/26/2021	1/28/2021	I developed a itchy oval raised rash that started on my lower abdomen and has spread to most of my body. My physician is treating as it Pityriasis Rosea and prescribed Clotrimazole-Betamethasone cream to help with the severe itching.
1019785	2/10/2021	TX	49	F	1/5/2021	1/11/2021	1 week after the first dose patient started to have her period. The period consisted of heavy clots and would go through 6-8 pads /day. Period lasted 3 weeks and went to see GYN and they prescribed Provera, which helped stop the bleeding.
1020333	2/10/2021	CA	91	F	1/22/2021	1/31/2021	Had swelling in leg for a couple of days prior to the early morning of 1/31 where the knee and entire lower leg was swollen and painful and made it very painful to walk. After sending photo to primary care physician had mom evaluated for a blood clot. It was determined based on blood test, vascular ultrasound that right non occlusive (mid) Femoral vein DVT.

1020860	2/10/2021	TX	69	M	2/4/2021	2/7/2021	I went to my doctor yesterday because my left calf muscle had acute pain. He did an ultrasound to verify that it was not the result of a blood clot which was negative; so he gave me pain pills and instructions to use hot/cold compresses. After getting out of a tub of warm water I noticed blotches of redness (rash) above my right knee which had already begun to swell. I also noticed that my right calf muscled is beginning to be sore and a rash was developing on my arm below my elbow.

1018790	2/10/2021	NY	88	F	1/19/2021	1/1/2021	high blood pressure/blood pressure was sky high; she didn't feel well/not being well; dizzy; nausea; sharp pain in stomach; This is a spontaneous report from a contactable consumer (patient's daughter). An 88-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL3247), via an unspecified route of administration on 19Jan2021 at 14:00 into left arm at single dose so she wouldn't die from COVID-19, she is 88. Medical history included cancer survivor, patient had one kidney, that kidney was stage 4 kidney disease and was not on dialysis, the one kidney was kidney cancer in 2010; high blood pressure; had blood clots from 2017; heart disorder; iron was low; having problems with memory. Concomitant medications included amlodipine started taking it years ago and hydralazine both for high blood pressure, bupropion, iron started a year and a half before (in 2019) for iron was low, all ongoing; donepezil started taking it in 2011 or 2012 as memory medication, apixaban (ELIQUIS) started taking two years before (in 2019) for blood clots, isosorbide started it so many years for heart, quetiapine from 2011 for having problems with memory. The patient previously took another medicine for blood clots. The patient went to hospital for the following side effects: dizzy and nausea on 23Jan2021, sharp pain in stomach in Jan2021, high blood pressure on 24Jan2021. Reporter would like to know if this side effects were reported or what should she do for her mom. Patient had just not being well in Jan2021 after received bnt162b2. Reporter had to take her mother to the ER 24Jan2021, and right now patient was dizzy, had nausea, and reporter took her to the ER yesterday and they couldn't find anything, and reporter was trying to find: was this due to the vaccine. Patient said she didn't feel well, since Saturday (23Jan2021). Patient now had a lot of stomach pain, so reporter took patient to the ER on 24Jan2021, and did a lot of tests, and her blood pressure was sky high, reporter wondering did the vaccine affect blood pressure. Patient was just not herself, and reporter knew the patient, patient had been doing pretty good, but was not herself. Reporter stated they let patient came home from the hospital on 24Jan2021, clarified she was in the ER on 24Jan2021, was not admitted to hospital. The outcome of event nausea was not recovered, outcome of the other events was unknown.

1017602	2/9/2021	MD	54	F	1/4/2021	1/5/2021	On Tuesday went to work and at around 1:30 she told her boss that she was not feeling good. Felt achy in her body, her arm was hurting and was not feeling like herself. She went home, sat on the sofa and drank something and went to sleep and felt drained, and slept for 4 hours. She then woke up with runny nose, low grade temp, and felt really weak. The next day, 1/6/21 her body ached bad. She slept a lot that day and drank a lot of water, didn't eat and just felt really sick. Then on Saturday evening, she looked at her leg and felt cold chills and her leg was hot. She looked at her leg and had an area that was like a red dot, and she then realized that her leg was about to be inflamed. She went to bed, woke up and her entire leg was blotchy red, swollen and hot. She then called her family and around 12:00 on Monday 1/11/21. She went to the hospital, and they treated her like she had COVID, isolated her and was negative. Sent her to vascular and did not have a blood clot in her leg, and told her she had an cellulitis flair, and she started being treated with IV antibiotics. Was in the hospital for 5 days. She was discharged and went home after infectious disease team told her to go home with a nurse on IV antibiotics. She came home on 1/15/21, and was off the IV antibiotics on 1/22/21. She has been home and unable to work. She is going to therapy for her legs. They changed her hypertension medications, and put back on her antibiotics last week as they told her that the swelling was not going down. Her kidney function is low and told today, 2/9/21 that she is concerned about her kidney function. She is to have more labs drawn on Monday, 2/15/21.

1016218	2/9/2021	TX	41	F	1/27/2021	2/3/2021	Vaccine was on 1/27 and although I experienced local reaction ok arm, it eventually began to fade. One week after injection I began feeling my arm burn and itch, and on Thursday 2/4 it started getting red again as if I were just injected. It has spread each day and the rash is over a large part of arm. I went to urgent care on 2/6 and they checked CBC and D Dimer to ensure there was no infection or blood clot. I was advised to return if it did not go away in 2 days, apply ice packs, and to keep an eye on how it was spreading. If it continued to go around the arm vs upwards, it was simply a reaction to vaccine. (As opposed to infection) I also emailed my PCP w pictures of progression and was advised to wait it out. It is almost a week later and it continues to grow slowly. Extremely hot to touch, painful, constant burning itch. Some days it is hard around injection site like at beginning. The redness seems to calm down at times throughout the day,, but come back. The redder it is, the hotter the skin is. Believe it may simply be a sign my body is working, but even doctor was surprised it went away and came back worse. Realize this isn't life threatening,, but VSafe stopped texting me on 2/3 so I have not been able to submit this reaction to them. Feel it is important this side effect is recorded.

1017716	2/9/2021	IL	62	F	1/6/2021	1/8/2021	On 1/8/2021 2 days after I received the Covid vaccine I started to have SOB and coughing. I started to used my inhalers and it would give some relief but I was using it more than normal. I had not had asthma attack for more than a year. My asthma is very controlled that I don't use any inhalers whether daily or as needed. I went to work as usual since at that time my symptoms weren't getting worse but also not getting better. On 1/19/21, I was feeling more out of breath and having more dry hacking cough that when I called EH I was told to do the Covid testing. That same day I called my Asthma doctor and did a video call and was prescribed Breo inhaler, spiriva inhaler, xopenex nebulizer treatment and xopenex rescue inhaler. I couldn't go to work because of my shortness of breath and coughing. The treatment didn't work. On Tuesday 1/26/21, I called my asthma doctor again and another video call was made. She changed my inhaler to symbicort, still continue spiriva inhaler and nebulizer treatment. I also contacted my primary doctor who asked that I schedule an appointment with him so he can see me. On 1/28/21, I saw my primary doctor who did blood works to see if I have any blood clot and to see how my heart was doing. I was given phenergan with codeine to help with my coughing and it did help me to go to sleep. My blood works came out negative and he ordered CAT scan of my chest since I can't get rid of my SOB and coughing. I had the CAT scan on 2/3/21. He called me the next day and I was told that I had mucous plugging. He told me to go home and he prescribed Duoneb nebulizer treatment 4x a day and spiriva inhalers 2x a day. I started to get rid of the mucous that I had and started to breath better. It took 4 days of 4x a day nebulizer treatment and inhalers before I started to feel

1009473	2/7/2021	VA	38	F	1/28/2021	1/28/2021	<p>Moderna shot #2: About 6-8 hours in, I got the expected serious joint aches, chills, headache, and fever (101F). This lasted for about 2 days, managed well by alternating Motrin and Tylenol. A mild rash occurred a few days after shot #2. Thought I was done since most of my colleagues bounced back after 2-3 days. Then 48 hours in, I developed a racing heart (HR in the 110-120s), sweating palms/soles, tingling/numbness in the feet/arms, warm flushes over my chest, nausea, and a few loose stools. No position or relaxation method would resolve these symptoms. All I could do was lie down perfectly still with an ice pack on my forehead and hope this was short-lived and would pass. I could not sleep. I had no appetite. Over the 8 days this has been occurring, I lost 3 pounds. I could not find any literature of anyone else having any cardiac/dysautonomia symptoms. It scared me. I have no prior cardiac history and no history of anxiety. I went to the ER. Labwork showed an elevated D-dimer (luckily the CT scan showed NO blood clots), elevated WBC/neutrophils, and low potassium. Thyroid labs (which I had tested a few days later) were normal. The ER assumed the abnormal labs were due to the immune response to the vaccine and referred me to a cardiologist. I did a virtual visit with the cardiologist the next day. He suggested a heart monitor and scheduling an echo. The heart monitor was mailed to me. I started wearing it on 2/4/21 (3 days ago). I am supposed to wear it for 7 days and then mail it back. My echo is scheduled for 3/4/21. Again, I have had no previous cardiac history. I am an active, healthy 38 y/o F. These symptoms (racing heart (HR in the 110-120s), sweating palms/soles, tingling/numbness in the feet/arms, warm flushes over my chest, nausea, and a few loose stools) have continued to last for another 8 days and are debilitating. I have not been able to work. On day 7 of these symptoms, I called my PCP's emergency line. They suggested calling the cardiologist to see if they would consider prescribing a beta blocker for symptomatic relief. I called the cardiologist last night. They prescribed Metoprolol. I haven't taken it yet. It's officially day 8. I thought I was in the clear and had not had symptoms since last night, but then just now another episode of these cardiac/dysautonomia symptoms have occurred but less intense than previously. At this point, I have had had 10 days of symptoms post Moderna</p>

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							vaccine #2 but 8 of those days are specifically the cardiac/dysautonomia symptoms. Although a little better, these symptoms have NOT resolved and continue. I realize I am probably an outlier in terms of how I have reacted to this vaccine. I would love a call back to know if other people have had a similar experience, so I can understand if this is ?normal.? I understand 7% of patients in the Moderna vaccine trial had ?symptoms? lasting longer than 7 days. Were they symptoms similar to mine? Will this go away completely? Any help is appreciated. Of note, I did develop a nice rash below my injection site on Moderna shot #1. Does that mean I?m more ?reactogenic? and would potentially have a harder time with shot #2? Does size matter in how you will react? Moderna is 100 mcg (instead of Pfizer?s 30 mcg) I am petite (5?2? and am now 106 lbs since I?ve lost weight).
1016143	2/6/2021		23	F			23 y.o. female presents with shortness of breath x 1.5 weeks. States in the last 4 days she had increased shortness of breath and feeling like she cant get a deep breath. States it does hurt when she breaths as well and radiates to her back. States she also feels like her heart is racing and intermittent palpitations. Denies calf or leg pain. No recent travel. She does take OCP. Denies other medical problems. Denies drug use. Only occasional etoh use. No headache, nausea, vomiting, cough, fever. No history of CA, blood clots. She works at dermatology office and got the COVID vaccine 3 weeks ago.
1004777	2/5/2021	TN	53	M	1/18/2021	1/19/2021	Headache the next morning after receiving vaccine that hasn?t gone away, fluid in left lung, blood clots in right lung and leg.
1004784	2/5/2021	KY	76	F	1/14/2021	1/21/2021	About a week after receiving the vaccine soreness in my arm which lasted for about 3 days. About 5 days after the soreness went away I developed a rash on my arm. My arm was hot and swollen. I went to an urgent care the same day I noticed the rash, they put me on steroid and antibiotic Cephalexin. They also sent me to the ER for an ultrasound to make sure I didn?t have a blood clot. It is normal now. Besides the rash I felt fine otherwise.

1006210	2/5/2021	TX	27	F	1/8/2021	1/15/2021	<p>The Moderna vaccine administration was painful at the time the shot was received. I experienced symptoms of fatigue and body aches for 24 hours after receiving the vaccine. My left arm was extremely sore and knotted for over a week after administration. The vaccine site was red and splotchy for the first 7 days after getting the shot. By the early morning of the 8th day (01/16/21), the splotches had joined together to make a large red area surrounding the vaccine site, that was raised and hot to the touch. During that entire day, pain was shooting down my left arm to my fingers (particularly the left middle finger) in a manner that felt like how severe arthritis pain is described. The pain became worse as the day went on. I texted a picture of my arm to my boss, who is a physician, to see what he thought I should do. He stated that from the photo, it looked like Cellulitis, and offered to send in an antibiotic to my pharmacy. Soon after, the pain was so intense (especially with movement of the arm) that I had someone drive me to ER &amp; Urgent Care around 8:30pm. The physician there marked my arm and prescribed 2 antibiotics to begin taking immediately (Bactrim &amp; Amoxicillin) with the instructions to come back in 48 hours. By the next day, the redness was spreading by the hour, which was marked &amp; tracked via photos that documented the progression. By Monday morning, the redness had continued to spread &amp; take up most of my left upper arm. The skin was hot to the touch and swollen. I had my boss look at my arm in the morning and mark the redness, then I had another physician at my office look at it in the afternoon and do the same. Their analysis was that the antibiotics were not working, and I went back to ER after I got off work at 5pm, which was around the 48-hour mark when I was supposed to return. ER gave me several IV antibiotics and ordered an Ultrasound of the left arm to make sure there was no blood clot hidden beneath the swelling. They also took several different lab and blood culture samples. I ended up having a reaction to one of the IV antibiotics (Vancomycin), where they had to counteract the reaction with IV steroids &amp; antihistamines, and decided to hold off on giving me the third IV antibiotic that was initially planned. I was sent home with Clindamycin 900mg, a Medrol dosepack, and told to discontinue the Bactrim, but continue the Amoxicillin. I continued to check back over the following days, and ended up receiving another</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							IV antibiotic (Clindamycin) and more lab tests. The provider that saw me on Monday said that she was close to admitting me to the hospital, and if I did not improve by the following day, she would proceed with sending me. By the 5th/6th day, the redness seemed to be improving and becoming smaller.

1007360	2/5/2021	AZ	35	M	2/1/2021	2/1/2021	I had the normal symptoms of pain at injection site, headache, fatigue, chills, muscle aches. I did get a fever for a short duration. The main thing I wanted to report is that I feel my heart and blood flow had been compromised from the vaccine. The reason I say this is that I have been getting pains in my chest and the blood flow in my body just feels not right. Lastly, I do feel it affected my cognition but I hope this will resolve soon as the fatigue dissipates. I also easily get skin reactions (skin reactivity increased such as redness and I got one red bump that looks like a hive but went away the next day). Not sure, but I feel this vaccine may be a cause for a potential blood clot. I do wonder if it has any effect on the characteristics of the blood. This is so far my experience and I hope as time goes on things become better.
1000489	2/4/2021			M	1/20/2021		I may have a blood clot in my leg.; This is a spontaneous report from a contactable consumer (patient). A male patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not provided), via an unspecified route of administration on 20Jan2021 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient got the first dose of the vaccine on 20Jan2021 and is going to visit his doctor because they think that he may have a blood clot on his leg on an unspecified date. He wanted to know if it was okay if they give him a shot of something like contrast to see the ultrasound. The outcome of the event was unknown. Information about lot/batch number has been requested.

993749	2/2/2021	WV	42	M	1/13/2021	1/1/2021	Cholesterol little elevated; Vitamin D two points low; just about face planted; dizziness worsened; This is a spontaneous report from a Pfizer sponsored program from a contactable consumer (patient). A 42-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot number: EL8982 or E68982), intramuscular on 13Jan2021 16:00 at single dose in left deltoid for COVID-19 immunisation. Patient age at time of vaccination was 42 years. Medical history included retinal blood clot in his retina which was why he was tested for rheumatoid arthritis (RA), and Meniere's disease for which he was asked to try meclizine which was for inner ear but he did not start taking meclizine, and six years ago, they did blood work and he was told he may have RA or he may have markers for RA but he has had no further issues and does not take any medication for this. The patient's concomitant medications were not reported. Historical vaccine included influenza immunisation (flu shot) in Sep2020 and first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EK9231) administered on 22Dec2020 around 15:15 at single dose intramuscular injection in left deltoid, and on 06Jan2021 he started to experience dizziness/feeling dizzy and going to throw up on 11Jan2021. He received the second dose of the Pfizer's COVID-19 vaccine on 13Jan2021 and for the last days it seems that the dizziness is being incrementing, reported as worsened. His physician recommended him to perform laboratory tests and the results came back without abnormal findings except for cholesterol and vitamin D. He was told his cholesterol was a little elevated and his vitamin D was two points low, regarding his lab work. He got a vitamin D supplement which he started to take. He will start on his cholesterol medication today that was prescribed. Reportedly he has a Roomba and when he went to go press the button for it, he just about face planted. He looked online and could not find anything about the dizziness aside from dizziness could be a sign of a severe allergic reaction. He does not have hypotension or anything like that. Dizziness was not resolved, while outcome of other events was unknown. It was stated dizziness is not reported as a side effect of the vaccine.

995232	2/2/2021	FL	70	F	1/12/2021	1/13/2021	arm soreness/Arm hurt; headache; swollen glands; head "felt stuffy"; very weak muscles (had to be helped to the bathroom); very weak; not feeling well; very sick; This is a spontaneous report from a contactable consumer (patient). This 70-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on 12Jan2021 at single dose for COVID-19 immunisation. Age at vaccination was 70-year-old. Medical history included Sars-Cov-2 infection (Mar2020), sick for 5 or 6 days, who knowingly has antibodies, and has donated plasma on multiple occasions, asthma but does not report respiratory symptoms, mild hypertension, migraines, vascular problems, and chronic portal vein thrombosis (PVT). Concomitant medications included linacotide (LINZESS), hydrochlorothiazide, rosuvastatin, montelukast, levothyroxine, clopidogrel. On 13Jan2021 at night, she reports arm soreness/arm hurt, and that when she woke up the next day she 'felt like she had Covid all over again' with: headache, swollen glands, head 'felt stuffy', very weak muscles (had to be helped to the bathroom), no fever but caller did state that she took a Tylenol. From Wednesday to Saturday she didn't feeling well, but every day she felt a little better. She has asthma - drug out my peak flow meter (as reported). No asthma sx during this whole thing. She reported adverse events and thinks some might have been stunted by the Tylenol she took after the first dose. She reported she was very sick, she still had like waves of not feeling well. She had most of the symptoms that she had was when she had Covid. She was sick, she was in bed and could not move. The most severe symptoms were on 13th and slowly each day felt better and it was until Saturday was when she really started to feel a 100 percent herself. Events were reported as non-serious. She had recently lab test within the last month or so. She had two or one and blood and everything was negative, everything was normal. Outcome of very sick and not feeling well is not recovered, while the outcome of the other events is recovering. She should receive the second dose on 02Feb2021. Information about lot/batch number has been requested.

992155	2/1/2021	NY	55	F	1/13/2021	1/14/2021	The day after the vaccination I had redness around my whole shoulder and arm. On the third day I developed swelling of my shoulder and neck with horrible pain when I breathe. I went to urgent care and had an x-ray which was clear and they were treating me for myalgia with Motrin. I refused any narcotic pain medication or a Toradol shot. The pain never stopped on the 19th I went to Work Force Safety and reported it and I was examined by the nurse practitioner who saw all the swelling and the pain that I was in. That nurse practitioner told me if it wasn't better in a few days to go to the emergency room to be examined. On January 23 , I developed swelling and pain went underneath my armpit it's a burning pain that's constant since the third day after my injection. My blood pressure was 153/104 and I was having nausea and not feeling well at all. On January 25 the pain and swelling were still there I went to work for a few hours and I went to the emergency room. They gave me lidocaine patch and Zofran for the nausea my blood pressure was 159/103 and I had an ultrasound to rule out a blood clot there was no blood clot but there was lymphadenopathy under my arm hurt and swelling and inflammation around the shoulder. The chest x-ray showed left pleural effusion / Pneumonia. My oxygen saturation was 93 and they wanted to admit me but I am a single mom with a new diabetic 14-year-old at home so they let me go home with a pulse oximeter and a prescription for doxycycline For 10 days. They called me the next day from the emergency room to follow up with a pulmonologist and cardiologist. On January 28 I saw the pulmonologist who did an ultrasound in his office and saw the fluid on my left lung. He said that most likely because the technique of the injection was so high in my shoulder that they probably had a nerve and I did have the swelling in the lymphadenopathy and all the pain and it hurt when I breathe so I wasn't breathing correctly and I was splitting my arm against me and that's how I probably developed plural effusion and pneumonia. I am following up with him on February 4. I still have shortness of breath and my oxygen saturation is 93. I am also on two inhalers that the pulmonologist ordered.

992245	2/1/2021	AZ	59	M	1/11/2021	1/19/2021	Superficial and deep vein thrombosis was diagnosed on 27th of January. Symptoms had been going on for around 2 weeks.
992810	2/1/2021	FL	68	F	1/19/2021	1/22/2021	Concern comes from a pulmonary Embolism and DVT diagnosed within a week of the first shot. Realize this could be a coincidence, I have no history of clots.
992022	2/1/2021	MN	64	F	1/19/2021	1/27/2021	Superficial blood clot in right medial knee area. Aspirin, elevate right leg, compression and heat.
991754	2/1/2021	MO	32	F	1/27/2021	1/28/2021	Started with fever, chills, lethargy, headache and nausea around 0900 on 1/28/21. By 1500 I had severe nausea which resulted in vomiting (water and dry heaving) with a small amount of blood (small clots) with first time vomiting. Then at 1700 I could barely move with severe body aches and headache. Attempted to drink some water and eat soup, but intestines burned too much. Slept from 0800 on 1/28/21 through till 0830 on 1/29/21 with very minimal waking. Only left my bed to throw up one time and use the restroom one time. Took Tylenol around the clock. Upon waking on 1/29/21 noticed a petechiae type rash on both sides of my face, sore throat and mild headache (took tylenol). 1/30/21 no symptoms and facial rash slowly disappearing.

990624	2/1/2021	GA	60	F	1/14/2021	1/15/2021	nose bleed/kind of "blew like a quarter size of blood clot"; congestion in her throat; headache; tired, very tired and just wanted to sleep; nausea, some nausea; feeling unwell; This is a spontaneous report from a contactable consumer (patient). A 60-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number EL0140 and expiry date unknown) via unspecified route of administration on 14Jan2021 at single dose for Covid-19 immunization on her job (nursing home). Medical history included blood pressure high. Concomitant medications vitamins. The patient took that COVID-19 vaccine shot yesterday (later clarified the date as 14Jan2021) on her job. The patient informed that she was okay the first day, but yesterday (15Jan2021) last night she had some new problems and she wanted to talk about and see it's a clinical sign. The patient informed that it was headache, tired, very tired and just wanted to sleep. The patient had no swelling/no swelling in arm, nausea, some nausea and even she has been just feeling unwell. The patient informed that today (16Jan2021) this morning, she was having nosebleed until the last time she felt like congestion in her throat and she kind of "blew like a quarter size of blood clot". The patient blew her nose and it bled a while, but then a quarter size blood clot come out and since then it wasn't bleeding, her nose was not bleeding. The patient did not receive treatment due to the events. The patient underwent lab tests and procedures which included COVID testing; swab the nose: negative on 13th or maybe 14th (Jan2021). The outcome of the events headache, tired, very tired and just wanted to sleep, nausea, some nausea, feeling unwell, nose bleed/kind of "blew like a quarter size of blood clot", congestion in her throat was unknown.

990361	2/1/2021	IN		F	1/14/2021	1/14/2021	<p>blindness in left eye; stroke in back of the eye; blood clot; A spontaneous report was received from a consumer concerning an 83-year-old, female patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and experienced blindness in left eye, blood clot, and stroke in back of the eye. The patient's medical history was not provided. Concomitant medications reported included comerdol, losartan, hydrocortisone, meloxicam, and unspecified stomach pills. On 14 Jan 2021 at 10:15 am, approximately 3 hours and 45 minutes prior to the onset of the events, the patient received a dose of mRNA-1273 (Lot number: 013L20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 14 Jan 2021 around 2:00 pm, the patient lost sight in her left eye as a result of a blood clot and stroke in the back of her eye. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not reported. The outcome of the events, blindness in left eye, blood clot, and stroke in back of eye, was unknown.; Reporter's Comments: This case concerns an 83-years-old female patient, who experienced a serious unexpected event of blindness unilateral, retinal artery occlusion, and thrombosis. The event of blindness unilateral and retinal artery occlusion occurred 3 hrs. after first dose of mRNA-1273, lot # 013L20A. The event of thrombosis occurred on an unspecified date after first dose of mRNA-1273, lot # 013L20A. Treatment included details were not provided. Concomitant medications included Comerdol, Losartan for blood pressure, Hydrocortisone, Meloxicam and stomach pills. Very limited information regarding this event has been provided at this time. Based on the current available information and temporal association between the use of the product and onset of the event a causal relationship cannot be excluded.</p>

990355	2/1/2021	NY	60	M	1/7/2021	1/11/2021	DVT blood clot; A spontaneous report was received from a 60-year-old male consumer who received Moderna's COVID-19 vaccine (mRNA-1273) and developed deep vein thrombosis (DVT) blood clot. The patient's medical history, as provided by the reporter, included factor V Leiden, enlarged prostate, DVT, pulmonary embolism and hypertension. Concomitant medications reported included valsartan, alfuzosin, and acetylsalicylic acid. On 07 Jan 2021, approximately four days prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: 011J20A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. On 11 Jan 2021, the patient developed DVT blood clot and experienced leg pain so intense that he could not walk. A doppler exam showed the DVT was from the top of the calf to mid-thigh. Treatment for the event included a rivaroxaban starter pack with dose tapering. Action taken with mRNA-1273 in response to the event deep vein thrombosis (DVT) blood clot was not reported. The outcome of the event, DVT blood clot, was unknown.; Reporter's Comments: This case concerns a 60-year-old male patient with a relevant medical history of factor V Leiden, DVT, pulmonary embolism and hypertension who received their first of two planned doses of mRNA-1273 (Lot number: 011J20A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. Patient experienced the medically significant unlisted event of Deep vein thrombosis approximately four days after administration of vaccine. Treatment for the event included rivaroxaban. Based on the temporal association between the use of the product and the event occurring after receiving the vaccine, a causal relationship cannot be excluded and the event of Deep vein thrombosis is possibly related to the product. Of note, the patient's underlying Factor V Leiden which predispose to developing abnormal blood clots, and prior medical history of DVT with pulmonary embolism are considered risk factors to the occurrence of the event.

988076	1/30/2021	NY	59	M	1/13/2021	1/16/2021	<p>On day 04 After receiving the 2nd Covid 19 Pfizer vaccine, I experienced a deep pain in my upper inner right thigh around 0600 am of the 16th of January. At the same time my calf muscle of that same right leg was in pain. I thought it to be muscular pain as I was told by the reading material regarding symptoms of the covid 19 vaccine there could be aches an pains attributed to the 2nd shot. I used a deep heating rub on both areas of my right leg and put heat on them to treat the soreness. This occurred over the next few days feeling this pain in my right leg and treated the same way applying heat. Within about 24 hours of the pain in my legs I started experiencing a shortness of breath while walking up and down st. On day 04 After receiving the 2nd Covid 19 Pfizer vaccine, I experienced a deep pain in my upper inner right thigh around 0600 am of the 16th of January. At the same time my calf muscle of that same right leg was in pain. I thought it to be muscular pain as I was told by the reading material regarding symptoms of the covid 19 vaccine there could be aches an pains attributed to the 2nd shot. I used a deep heating rub on both areas of my right leg and put heat on them to treat the soreness. This occurred over the next few days feeling this pain in my right leg and treated the same way applying heat. Within about 24 hours of the pain in my legs I started experiencing a shortness of breath while walking up and down stairs as part of my daily activities. The symptoms of shortness of breath only seemed to appear when I was on any form of extended walking activity or physical movements or exercise this would of have been starting around the 17th of January. The right leg pain was masked by the heating rub while the shortness of breath continued for the next few days. On the 19th of January, I went to an Urgent Care Facility at 0800 am to see a Medical professional to discuss my symptoms I was previously experiencing and to figure out why I was having a shortness of breath and the pain in my right leg. The on staff Physician's Assistant had a Nurse conduct a Covid 19 Rapids test (negative) and a second swab was administered and sent to the Lab. Which produced a (negative for Covid 19) on the 20th of January. An Xray was not taken to determine my shortness of breath. The Dr listened to my lungs and heart, though I did let the PA know I had received both Pfizer shots and when they were administered. I was carrying My Shot record for the</p>

vaccine with the dates and lot number. He didnt appear to be interested in further diagnosis and made sure I had the paperwork to track the results of my Covid swab sent to the lab. The visit was completed and I was released to go back to work/home. I carried on the symptoms of the shortness of breath from the 19th of January to the 22nd of January monitoring my O2 (oxygen levels) with a pulse oximeter. They ranged from 90-93. On the evening of the 22nd of January I was becoming very uncomfortable with my breathing climbing the stairs in my home and monitored my O2 readings with the oximeter on my finger when walking upstairs and they dropped down to 60-65. My wife drove me to the emergency room at Hospital. I walked into the ER and checked myself in for shortness of breath and leg pain in my right leg. I was admitted into the emergency room and put on 15 litres of oxygen. The emergency room Dr ordered a chest Xray, Cat Scan of my chest and heart and a sonogram of my right leg. The testing results came back with a noted large pulmonary emboli on my lungs/heart area and blood clots throughout my right leg (right lower extremity DVT). Surgery was performed to remove the pulmonary emboli and I was put on a Heparin Drip to thin out my blood for the remaining clots in my chest and my right leg. The attending physician ordered a T.E.E. (transesophageal Echocardiogram) to observe my heart functions. I was told the TEE did not demonstrate any further recommend surgeries. I was administered a test for my cardio and heart functions prior to my discharge on 27 January 2021. I was prescribed Eloquis for maintenance medication to be monitored by followup visits to my cardiologist and Hemotologist within the next few weeks. I have not family or personal history of Blood Clots. I do perform administrative duties as part of my job, which requires sitting and working on a computer. Note however I move around very often during a work day and operate a farm tractor and have an active life style. I have not recently had any extended trips more than 2 hours nor have I flown within the past year or so.

984641	1/29/2021	IN	35	F	1/16/2021	1/16/2021	Nausea; Slight temperature 99.7; Fatigue; General feeling of aches and pains; Sore throat; Throat seemed red; Sick; Feeling heavy with her chest. She went to the ER; This is a spontaneous report from a contactable nurse. This nurse reported for a 35-year-old female patient (Daughter) received 2nd dose of BNT162B2 (COVID-19 Vaccine lot number: EK9231, Expiry date: Apr2021) on 16Jan2021 at single dose for covid-19 immunization. Medical history reported was She was positive, our whole family had COVID and we all came down which was about the same time which was 29Dec. Concomitant drug were not reported. Retired Nurse stated, "I am calling for my daughter. She received her 2nd vaccination yesterday morning and she had some side effects. Like about 6 o'clock this morning she came in, she came in 6:35, she came and woke me up and said that she felt some of the reaction she is having. She has nausea, she has slight temperature 99.7, fatigue. Just a general feeling of aches and pains. It does not seem like it's an emergency. She was treated in the ER with steroids and since that point we have all recovered until she went for the 2nd. She works in a hospital, she got her 2nd dose of vaccine like I said yesterday morning. "Retired Nurse stated, "I am not sure causality. I mean it is not an emergency. She was feeling fine yesterday. We all are feeling better now. She had the vaccine and last night she said she had a sore throat when I looked at her throat. Her throat seemed red but there was no angioedema or anything like that, she went to sleep and she came in 'feeling really' (voice distortion) sick. So, I do not know. Did they have relapses from the COVID? I do not know." Treatment was "Tylenol." Like I had said that she was feeling heavy with her chest. She went to the ER. She was at her work. She went to the ER." "Probably close to 10 days ago, they did lab work I think they might have been looking for a clot. They did do some lab work at the hospital with unknown results." Outcome of the event was unknown. No follow-up attempts possible. No further information expected.

985625	1/29/2021	CA	59	F	12/23/2020	12/23/2020	<p>Blg black thing; Big scar; Felt like chemical burn; Peeling; Cellulitis; Extravasation in tissues; Bruising from upper arm down to elbow; Arm was hot and tender; Swelling from upper arm down to elbow; Arm hot and tender; Bump/clot at injection site; Unsure if it was given intramuscularly; A spontaneous report was received from a physician who was also a 59-year-old female patient, who received Moderna's COVID-19 Vaccine (mRNA-1273) and experienced a bump/clot at the injection site, swelling, bruising from upper arm to elbow, feeling hot, tenderness, extravasation in tissues, vaccination site cellulitis, a big blackened area, scar, chemical burn, unsure whether it was intramuscular and peeling. The patient's medical history was not provided. Concomitant medication use was not provided by the reporter. On 23 Dec 2020, immediately prior to the onset of symptoms, the patient received the first of two planned doses of mRNA-1273 (Lot number unknown) intramuscularly in the left arm for prophylaxis of COVID-19 infection. The physician reported that she was injected with the vaccine abruptly and roughly. She noticed a bump at the injection site right away. The nurse applied a cold compress. Later that day, she realized it was a clot. On 24 Dec 2020, she had swelling, bruising from her upper arm to her elbow, and the area was hot and tender. On 30 Dec 2020, she went to the emergency room where an ultrasound showed extravasation in the tissues. She was treated with cephalexin for cellulitis. On 01 Jan 2021, the bump began to subside; however, there was a large black area that started to peel. The reporter stated it looked like a chemical burn. On an undisclosed date, there was a large scar in its place. Treatment for the events included a cold compress and cephalexin. The reporter stated she is unsure whether it was intramuscular. Action taken with mRNA-1273 in response to the events was not provided. The event, scar, was not resolved. The outcome of the events, bump/clot at the injection site, swelling, bruising from upper arm to elbow, feeling hot, tenderness, extravasation in tissues, vaccination site cellulitis, a big blackened area, chemical burn, and peeling, were considered resolving. The event, unsure whether it was intramuscular, was resolved.; Reporter's Comments: This report refers to a case of incorrect route of administration for mRNA-1273 and concerns a 59 year-old, female</p>

patient, who experienced the events of bump/clot at the injection site, swelling, bruising from upper arm to elbow, feeling hot, tenderness, extravasation in tissues, vaccination site cellulitis, a big blackened area, scar, chemical burn and peeling. The event of bump/clot at the injection site occurred the same day after the first and only dose of mRNA-1273 vaccine administration. The events of swelling, bruising from upper arm to elbow, feeling hot, tenderness occurred the next day after the vaccine administration. The events of extravasation in tissues, vaccination site cellulitis occurred 7 days after the vaccine administration. The events of a big blackened area, scar, chemical burn and peeling occurred 9 days after the vaccine administration. Based on the current available information and temporal association between the use of the product and the start of the events, a causal relationship cannot be excluded and the events are assessed as possibly related.

986092	1/29/2021	NM	39	F	1/12/2021	1/12/2021	the right side swelling, swelling underneath armpit, swelling of collarbone and neck; This is a spontaneous report from a contactable Nurse reporting for herself. A 39-years-old female patient received the second dose of bnt162b2 (BNT162B2; Lot # EL0142) vaccine, intramuscular on 12Jan2021 15:30 at single dose for Covid-19 immunisation. Medical history included deep vein thrombosis, provoked DVT, and moderate asthma . There were no concomitant medications. The patient received the first dose of BNT162B2 vaccine on 23Dec2020. The patient experienced right side swelling on 12Jan2021 some hours after injection. On 13Jan2021 swelling underneath armpit was significant, swelling of collarbone and neck was also present. The reported event was considered Important Medical event. The outcome of the event was recovering. The event was treated with Round the clock Ice pack. Antihistamine and NSAIDs. Followup information has been requested. Lot number already provided.; Sender's Comments: Based on the compatible temporal association, a contributory role of suspect vaccine BNT162B2 in the development of "the right side swelling, swelling underneath armpit, swelling of collarbone and neck" cannot be excluded. The impacts of this report on the benefit/risk profile of the product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

The droopiness is not excessive, but it is odd.; Right eyelid puffiness/ on the right side of patient's face, the eyelid was puffy; Right eye full of fluid/Under that eyelid is full of fluid; Can't hardly see out of right eye due to swelling; This is a spontaneous report from a contactable consumer. A 71-year-old male patient (reporter's husband) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL3299) via an unspecified route of administration on the left arm on 13Jan2021 14:00 at a single dose for COVID-19 immunization at a clinic/ used empty offices. Medical history included being diabetic, had heart attacks and blood clots on unspecified dates. It was confirmed that all of this occurred years ago prior to COVID-19 vaccination. The patient had no relevant family medical history and no relevant tests. The patient takes a number of medications (unspecified). The patient previously received Flu shot at least six weeks ago in Nov2020 and had no adverse events. The patient had no additional vaccines administered on the same date as BNT162B2. The reporter and her husband (patient) got their shots on Wednesday afternoon. That morning, on 15Jan2021 at 08:00, on the right side of patient's face, the eyelid was puffy/ right eyelid puffiness. He can hardly see out of it. He can see. Under that eyelid was full of fluid/ right eye full of fluid. The right side of his mouth was droopy. The droopiness was not excessive, but it was odd. The reporter also stated that the "patient had a raspy voice in the morning anyways." The outcome of the events was unknown.

A 57-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 17Dec2020 at single dose (lot number: EJ1685) on Deltoid Left for covid-19 immunisation. Medical history included Paroxysmal supraventricular tachycardia. The patient's concomitant medications were not reported. The patient experienced a warm feeling in her chest like tingling; kind of short of breath, it went away like she said it was just breath it was like for couple of minutes and then it went away and then she was just fine till it's been long here honestly about 3 or 4 days later; got shot in her right arm but left hand start swelling up first a little bit and then her left arm start swelling up and it's just and then that's the base and then her right hand start very, very mild swelling in her right hand. The hospital think there as some clot or something weird but she did not and then that started going down after that it just started going down and went away and never had swelling since then but this was going to long but this was something weird happened to her. She got chills, She got fatigue. She had increased heart rate after that it started getting worse. She had Paroxysmal supraventricular tachycardia, she had that always but it's been control. She walked 5 miles daily a day, she was in shape, she had lot since then, so it's been under control, she never had problem with it until after she got the shot, her heart rate was she had to add medication, she never have to add. She took metoprolol (Treatment) so she added that and she added more and that's thing get it under control and then she take herself back off because she felt like it was under control but she had GI problems since, now she was getting better now, still have some issue, did not feel good, off and on. The patient underwent lab tests and procedures which included blood test: good on 04Jan2021 (blood work to see if something was going on

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT

980727	1/28/2021			F			Tiredness; Headache; Nausea; Swelling; Feeling unwell; Nose bleed; Coughed up a blood clot; Congestion; This is a spontaneous report from a contactable consumer (patient). A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration on an unspecified date as single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced tiredness, headache, nausea, swelling, feeling unwell, nose bleed, coughed up a blood clot and congestion on an unspecified date. The patient underwent lab tests and procedures which included sars-cov-2 test: unknown results on COVID test close to that time too where they swabbed my nose. Details were as follows: patient got the vaccine on 19th (month and year unspecified), and the COVID test with unknown results close to that time, where they swabbed her nose. She has had had tiredness, headache, nausea, swelling, feeling unwell, and the last night she had a nose bleed and coughed up a blood clot out of her throat. She also had a lot of congestion since taking the injection, and did not know if it was from the injection or the COVID Test. The outcome of tiredness, headache, nausea, swelling, feeling unwell, nose bleed, coughed up a blood clot and congestion was unknown. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up.
982241	1/28/2021	IN	89	M	1/13/2021	1/14/2021	After I received the vaccination that evening I went to bed and woke up about midnight felt water in the bed and it was coming out of my arm, I dried it off went back to sleep. The next morning my arm was swelling, and it?s gotten worse and worse, the top of my had is so swollen I cannot make a fist. My doctor sent me to the hospital and blood work was alright the echocardiogram showed heart is alright no blood clot and there?s no other reason. My doctor thinks it?s because of the vaccination.
983350	1/28/2021	ND	57	F	1/7/2021	1/11/2021	Patient experienced a blood clot on January 11th. She is unsure if it is related to the vaccine or not.

983906	1/28/2021	FL	85	M	1/19/2021	1/20/2021	<p>Patient received Pfizer-BioNTech Covid-19 vaccine, first injection, in the afternoon of Tuesday, 1/19/2021 - administered by pharmacy staff. All residents and staff of the facility were vaccinated (except one resident). Wednesday afternoon (1/20/2021), patient was noted to have a open area on his 3rd left toe with digital edema and blackening of toe, 2nd toe had a fluid filled blister as did area superior to left medial knee. There was also an open area inferior to left medial knee. Bruising or blackened areas to 3rd left toe and bottom of left foot (pad below toes 1-3). Patient was placed on Keflex 500 mg BID for 10 days, Clotrimazole 1% topical cream for ring worm middle of left foot, and ammonium lactate 12% lotion for dry skin. By Saturday, 1/23/2021, multiple blisters had erupted on patient's left medial knee area and 4th left toe. Some of the prior blisters were now gone, but new blisters were larger. On Thursday, 1/28/2021, patient now has blisters and open areas on bilateral feet, legs, and hands. He has a red rash on his right lower leg just superior to the medial ankle. Patient was placed on a 10 mg Medrol Dose Pak. There have been no changes to the patient's diet or medications. Patient is confined to the facility due to dementia. He goes from his bedroom to a sitting area, right outside of his bedroom door. He ambulates with assistance using a cane, only to the bathroom in his room. He has a private room.</p>

983883	1/28/2021	AZ	50	F	1/20/2021	1/28/2021	Got booster shot on Wednesday the 20th, came home and was fatigued. Thursday had horrible headache that would not be relieved with tylenol. I took a plane and arrived at 1130 pm. I went to bed shortly after arriving at my daughters house. Friday morning, I was unable to be woken up and my daughter called 911. I was in a coma. I suffered cardiac arrest during a CT to check for clots. I was resuscitated and put on life support. CT scan for clots, strokes, heart attacks were all clear. I was admitted to the C-ICU and on life support, on the ventilator, and was on 3 different medications at max dosage to keep my blood pressure barely surviving. The doctors told my daughter not to expect me to survive because they had no idea why I was suddenly so ill. A doctor then told my daughter that my kidneys were failing, and my liver was damaged. I also developed a high fever and had a high white blood cell count. They gave me Vancomycin and another antibiotic, and then the next the day a kidney doctor gave me lasix to flush out all of the excess fluid. I woke up on Saturday not knowing what had happened and was completely terrified and confused. My daughter was allowed into the ICU to see me and keep me calm, thankfully. She explained to me what happened. I am still in the hospital, as they are keeping me for observation and trying to determine if my kidneys will start working properly again. Prior to this, I have only ever had a kidney infection, and I thought before I might have had the start of a UTI. I do have chronic high blood pressure as well, a long term side effect from open heart surgery 10 years prior for an aneurysm, but aside from that I am relatively healthy 50 year old.

976797	1/27/2021	MI	43	F	1/12/2021	1/12/2021	hot sensation/weird very hot rush down her right arm that was vaccinated and went up the back of her neck only on the right side; dizzy; Heart racing; Her arm was very sore- it was difficult to lift it; Her arm was very sore- it was difficult to lift it; She did feel a little out of it, as it produced a little bit of anxiety; A mild allergic reaction; This is a spontaneous report from a contactable Other Health Professional (patient). A 43 years old female patient received 1st dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot: EL3248, Expiration Date: Apr2021), via an unspecified route of administration on 12Jan2021 at 13:22 at single dose on right arm for covid-19 immunisation. Medical history included vasovagal (she did have a history of vasovagal. She talked to her doctor about this prior to the vaccine. At first when she had it her previous doctor felt a little confused. She was unsure if it was vasovagal or a blood clot in her lungs. She did get it checked out with a cat scan and there was no clot. They had to have tested her for anaphylaxis at that time. It was not a clear diagnose. Then she saw a cardiologist. She was diagnosed with vasovagal at that time. It lasted only a few months and she was fully recovered). Concomitant medications included ongoing ergocalciferol (VIT D) and ongoing vitamins NOS (MULTIVITAMIN). Patient received the vaccine on Tuesday, 12Jan2021. Her appointment was at 12:54, but she got the vaccine at 13:22. She was looking at her phone to re-schedule her second dose. She felt totally fine. At 13:27 she had this weird very hot rush down her right arm that was vaccinated and went up the back of her neck only on the right side. She looked up from her phone and was very dizzy. She stood up and as she did her heart started to race. It was a really weird feeling that she has never felt. She was a little out of it. She had no trouble breathing. Within 30 seconds she was completely fine. She did feel a little out of it, as it produced a little bit of anxiety. She had no other symptoms. She stayed at the facility for 30 minutes. As she was leaving one person asked how she felt and she was told to let the EMTs know. She let them know what happened. One woman working there said it could have been an anxiety attack. She did not have a lot of anxiety but she did have some. It did not feel like that. She had never had the warm sensations or heart racing. She was totally fine when talking to the EMTs. They did not seem concerned and

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

they let her schedule her second shot. She read on Pfizer about allergic reactions. She was assuming this was what happened. A mild allergic reaction. She had no breathing issues or hives. Her arm was very sore- it was difficult to lift it. She had also never had this type of soreness with vaccines. Dizziness: She has had the dizziness a couple of times. Twice now. One when she had gotten home. It was very mild and nothing compared to what she had when she got the vaccine. Then another last night at bedtime. It was a woosh of dizziness. Arm soreness: very improved now. felt like she would normally have after getting a vaccine. The first day was intense but after a few hours was less. The next day she woke up and it was pretty much gone. She still had a little but it has mostly improved. Caller stated she would still like to get the second dose but she was a little nervous. She had it maybe once or twice since then and it has been mild with no extreme pressure drops. They thought maybe it was a virus that affected her. Her reaction to the vaccine was different. The difference was pretty significant. Vasovagal felt like her heart will stop and she will pass out. After the vaccine she felt dizzy but didn't feel faint, and had a racing heart. Nobody seemed concerned about her reaction and getting the second dose. But she read that Pfizer does not recommend getting the second dose even if you had a mild reaction. She was wondering what she should do. Her second dose is scheduled for 02Feb2021. Outcome of hot sensation/weird very hot rush down her right arm that was vaccinated and went up the back of her neck only on the right side and heart racing was resolved on 12Jan2021, dizzy was resolved on 13Jan2021, outcome of anxiety was unknown, outcome of her arm was very sore- it was difficult to lift it and a mild allergic reaction was resolving.

975020	1/26/2021	NY	73	F	12/24/2020	12/28/2020	Had normal side effects the day after, 12/25/20 slight fever, lethargy, not even sore arm. on the 27th, felt fine. On 12/28/20, woke up not able to breath, oxygen saturation 83%, could not walk across the room without gasping for air, which lasted for about 2 days. Could not reach her PCP due to holidays, was convinced she had COVID. Went to drive-thru facility and got the COVID test on 12/28/20, negative on 12/29/20. Then made another APT, went back on 12/30/20 had negative test again. On 12/30/20 started feeling better, was not great but her O2 SAT's were about 90. Stayed that way until 1/8/21, had FU from lumpectomy with surgeon, when she got up her left ankle/foot were very swollen and red looking. Saw that Dr., and discussed the postop business and showed her the foot/leg told her to have it looked at. Her PCP was closed, she went to radiology Dept in Hospital and found DVT in her left leg. She was then told to go to the ER and ordered a CT scan, which showed pulmonary emboli in both lungs. Put on heparin IV right away, later transferred to another hospital where CV surgeon on staff. By that evening they decided that she was walking , talking and checking blood levels, kept her overnight and sent her home the next day. Needed to be on blood thinners, and saw pulmonologist. Has APT with hematologist this week. Pulm told her to call and report adverse reaction. Today, 1/26/21 her O2 SAT's are in the 99%, leg is still swollen, and is able to breath better. On Eliquis which will prevent new clots, but the others should be absorbed. Got 2nd dose on 1/21/21 and had only the classic side-effects for about 30 hours but was then fine. Had fever, chills, nausea, sore arm, cough, but then was fine. Same lot # as dose 2.
975052	1/26/2021	MI	33	F	1/19/2021	1/24/2021	Blood clot, DVT of a ill art vein acute left
972101	1/25/2021	CO	64	F	1/12/2021	1/19/2021	On Jan. 19th, 2021, right arm suddenly became sore again at injection site. This was 1 week after vaccine injection. Next day, upper right arm was red, rashy, tender to touch and hot to touch. Red area on arm spread during the day. No fever. Called my Doctor and went in for check. Suspected blood clot, but ultrasound was negative. Suspected Cellulitis. RX given for Keflex 5 day regimen. Symptoms ceased on Jan. 23rd, 2021.

970593	1/25/2021	TN	75	M	1/22/2021	1/25/2021	This morning at about 745am we were about to begin our dialysis treatment and my husband had to blow his nose and when he did there was blood in the tissue, so I got him more tissue and there was more blood in the tissue. I then got a cold compress and had him lay back with feet up and put cold compress on his nose and a small ice bag on his forehead and for a little bit when I took the tissue from left nostril that is where the blood was coming from and i saw that there was clotted blood. After changing the cold compress on his head the nosebleed began to subside and he continue to sit with his head back but when he sat up after about a half hour it started to bleed again out of the left nostril and that is what he has began experiencing. whenever he sits up it begins again it begins but no clotted blood.

971534	1/25/2021	CA	60	F	1/11/2021	1/1/2021	<p>Temperature 101.7; Back pain/pain in her back; Right upper jaw pain that felt like sinus; Heart rate 130's; Oxygen Saturation dropping; Headache/head felt like it would explode; Ringing in the ears; Thighs are burning; calf pain/Calves were sore in back; Calves were sore in back and felt like DVT; Chest pressure; she sound like a hypochondriac; flu like symptoms; can barely walk; Nausea; Shivering; weak; felt miserable; dry hives; This is a spontaneous report from a contactable Nurse reporting for herself. A 60-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) Batch/lot number: EL1283, Expiry Date: 30Nov2021, intramuscularly into right deltoid on 11Jan2021 07:15 at single dose at the hospital for Precaution as frontline healthcare worker. Medical history included Wolff-Parkinson-White (WPW) syndrome from 2000, heart surgery in the past on unknown date, had surgery that was in 2000. Years of chest pain and PVC after that; allergic to Sulfa with hives: One time she mixed it up with a medication of her sons and took it by mistake and did not realize it and she did not have any reaction, she has not had in years. It was an injection and she doesn't have the name, lot or expiration. Family medical history included Mother was diabetic and sister was prediabetic and was 61. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (Lot E49899) on 18Dec2020 at 10:30 am injected in Right Deltoid for COVID-19 immunisation and experienced shivering; same body aches, she took TYLENOL; had major headache all night long, all over her head; It was a pressure headache; Someone gave her MOTRIN and within 3 hours she was totally fine. The patient stated she received the Pfizer COVID vaccine second dose on 11Jan2021 and has had problems since then. She has been miserable, took paracetamol (TYLENOL), headache, have ringing the ears, head was exploding, back aches, calf pain, temperature at 8 am 101.7 and 101.7 at 10:40 on 12Jan2021, feeling very weak, nausea, dry hives, Right upper jaw pain that felt like sinus, all in Jan2021. Her heart rate was in the 130's at 3:30-4:00 on 12Jan2021 and now down to 115-108. Her Oxygen saturation has been 91-95 %. She just had a miserable night (Jan2021). She had this pressure in her chest. Her heart rate was 130 and O2 was 93%. Her O2 saturation</p>

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

last night (on 11Jan2021) was 91-94%, mostly about 93%. Chest Pressure began around 3am on 12Jan2021. She called healthcare provider and was waiting to get advice from them if she needs an EKG. She was still having a little bit of mild pressure. She noticed that her oxygenation was 93% when this was happening. It went up to 95% for a second last night. Her heart rate was now between 112-115. When she walked, it went to 125-130. It started around 3:30-4:00 this morning (on 12Jan2021) and was mildly improved. she was feeling the chest pressure back pain had less, but had pain in the upper jaw, flu like symptoms on 12Jan2021. she said she could not get out of the bed right. She did have a heart surgery in the past, her legs were burring, and week. she said after the first dose she did had a reaction but took MOTRIN and went to work the next day. The patient wanted to know about the heart rate being high and ringing in the ears. She wanted to know if it was supposed to drop your saturation and increase your heart rate. Is she just behaving like the norm or should her O2 be much higher. Her first shot was not as bad as this reaction. There was no prescriber. The temperature just began now as she just took it. Oxygen Saturation dropping began when she woke up in middle of night around 3:30- 4:00. She used her pulse oximeter and noticed it then. It was associated with her ears ringing and her head felt like it would explode at 3:30 on 12Jan2021. She felt better with headache but still had it. She was so weak on 12Jan2021, she did not want to go anywhere. Her oxygenation had worsened to 93% on average. She had a headache last time but did not have ringing in her ears. She woke up about 3:30 with it. The headache now was all over head from front to back and comes and goes. Last time she went to work after receiving the first one and today (on 12Jan2021), there was no way she could go to work. She took TYLENOL when she got home because she was shivering and took more at 3:30 because she felt miserable because of her chest. She took 1 gram. Her headache did not go away. She got to sleep after she took the TYLENOL. Her back and jaw was bothering her. It felt like the flu. She had upper jaw pain and pain in her back. She didn't have a good back and just aches. After the first one, it took 10 hours for the shivering to start. This time it was very similar. The shivering started about 10 hours later, at

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT

9pm on 11Jan2021. Back pain starting at 05:00 on 12Jan2021 was stated as being sharp on right side scapula and feel like the flu. It is to the right of spinal vertebrae. She thought she would go to bed and lie down. She has had back pain before. The jaw pain started around 05:00 on 12Jan2021. She felt it in her cheek. It was a little bit better. Nausea started at 11:00 pm on 11Jan2021 and got worse at 03:30 when she got up to go to the bathroom around midnight. She felt like she could vomit and felt better, but she couldn't. Her thighs were burning at 03:30 on 12Jan2020. It was persistent weak and burning. She can barely walk. The areas that have hurt like when you get the flu, she was having now in the same places, so she thought it was from the shot. Calves were sore in back and felt like a DVT (Deep vein thrombosis), started at 03:30 of 12Jan2021 and was still sore. She said she sound like a hypochondriac. It was in back of calf towards knee. She did not think it was a blood clot. It was feeling better. It was still sore but nothing like it was at 03:30. It is just an odd pain. She did not want to leave the house and surprised that her oxygen saturation was low. She just wanted to go back to sleep for a bit. Oxygen Saturation dropping was reported as worsened. The outcome of events Chest pressure, Heart rate 130's, Headache/head felt like it would explode, Right upper jaw pain that felt like sinus, calf pain/Calves were sore in back and Calves were sore in back and felt like DVT was recovering. The outcome of events Oxygen Saturation dropping, Ringing in the ears, Shivering, Back pain/pain in her back, Nausea, and Thighs are burning was not recovered. The outcome of events Temperature 101.7, she sound like a hypochondriac, dry hives, flu like symptoms, weak, felt miserable and can barely walk was unknown. The reporter considered events Heart rate 130's, Temperature 101.7, Oxygen Saturation dropping, Right upper jaw pain that felt like sinus and Thighs are burning were related to BNT162B2. The reporter considered events Chest pressure, Heart rate 130's, Temperature 101.7, Oxygen Saturation dropping, Headache, Ringing in ears, Shivering, Back pain, Nausea, Thighs are burning, Right upper jaw pain that felt like sinus and Calves were sore in back and felt like DVT as serious due to Medically significant.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on

971549	1/25/2021	NY	52	F	12/23/2020	12/1/2020	<p>Pneumonia; Left Arm Swelling / her arm and shoulder became swollen; Left Arm Swelling / her arm and shoulder became swollen; she also has something else going on in her shoulder; achy all over in her neck, arm, and shoulder; achy all over in her neck, arm, and shoulder; Felt sick to her stomach; her arm was sore that evening; This is a spontaneous report from a Pfizer Sponsored Program made from a contactable consumer (patient). This 52-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot#: EK5730) at single dose on left arm on 23-Dec-2020 for COVID-19 immunization. Medical history included sleep apnea; high blood pressure; COPD (chronic obstructive pulmonary disease). Concomitant Medication was nothing new, her normal medication, she took vitamins, and high blood pressure medication. She had had no positive test for Covid prior to the vaccine, she had had no antibody test, she had had no issues with vaccine in the past. The patient experienced left arm swelling in Jan2021 and pneumonia on 08Jan2021. The patient worked in a hospital and received her first dose on 23Dec2020 and she was supposed to get the second dose today but she was not at work today. She was wanting to know if she should go ahead and take the second dose because her arm was still swollen. The product was the Covid vaccine. She stated that her arm was still swollen, when she got shot she was fine, her arm was sore that evening (Dec2020) and then nothing, then a weekend after new years her arm and shoulder became swollen (Jan2021) and she had been to the ER and the doctor thought the swelling was because of the shot, but she also had something else going on in her shoulder (Jan2021). So in the meantime she went to the ER and they took X rays, and they told her that she was starting to develop pneumonia. She was going back to work tomorrow, being that she was on the antibiotics now, still had swelling in the arm, and had pneumonia, should she still get the 2nd shot. She noticed the swelling Saturday after New Years. She was also achy all over in her neck, arm, and shoulder (Jan2021). She felt sick to her stomach, this was all the first Week of Jan2021. She went to the ER, she was not admitted and came home the same day. She went to the ER on 08Jan2021. 08Jan2021 was also when the pneumonia was diagnosed. The name of antibiotic she</p>

----------	-------	-------	---------	-----	----------	------------	--------------

was prescribed was doxycycline. She started it on Saturday 09Jan2021, she was prescribed 100 mg 2 pills a day for 10 days. When they did the X ray, they said that the pneumonia had showed up, or she was just starting to get pneumonia. Patient stated that she didn't believe because they made a comment about the way she was laying however she had been taking the medication and feeling better. She was schedule for the second dose today. She did reschedule for Friday, and wanted to know if she should still get it. In the ER, they said it could have been a blood clot and so they did a scan to find blood clots but it was negative. The outcome of event pneumonia was resolving; events left arm swelling and shoulder became swollen was not resolved. The outcome of rest evens was unknown..

968400	1/23/2021	LA	43	F	1/6/2021	1/11/2021	Injection site soreness for about 2 days. Day 5 developed bilateral calf pain. Not unbearable, it just felt like I had worked out my calf muscles at the gym the day before or something & I hadnt done any exercise at all that week and not at the gym in years. It seemed worst when I first started moving snd seemed to get better as I warmed up and moved around. Lasted about three days. I do vascular ultrasound and so checked myself for blood clots and I was negative. The last symptom that I dont think Ive had before is this weird pulsing or rapid twitching sensation on the back/left side of my head. Like a nerve firing maybe? I dont know. Felt like one small focal area, like fluttering.. It was very fast. It would last for like a minute or two and then stop . That happened about 3-4 times. On different days, not sure what day. It was so short lived I didnt pay much attention to it. It happened sometime between 1/18/21 & 1/22/21. It only happened one time a day.

967025	1/22/2021	MO	78	F	1/21/2021	1/22/2021	When I awoke this morning and was getting dressed, I noticed a soreness in the back of my left leg (on the right side of the left leg). I felt a lump, It was about 2-3 inches above the knee. It was what I would describe as a medium-sized lump. I called my doctor to leave a message about my symptoms. My doctor called a few minutes after 11 am and asked me to immediately come in so he could see the lump. He thought I might have a blood clot. This lump was not present late last night because when I put lotion on my legs after my shower, I felt no lump or soreness. I worked out this morning and by 11:00, it seemed to me the lump was not as big as it was when I was getting dressed earlier this morning.
967200	1/22/2021	IA	37	M	12/31/2020	1/5/2021	Spontaneous bleeding from the mucosa of the underside of superior left eyelid at approximately 130 am. I awoke from sleep at that time with mattering in my left eye making it difficult to open. Upon examination in the mirror it was obvious the mattering was due to blood. The blood was obviously coming from my left eye. There was no bleeding from my nose. I had apparently been bleeding for sometime as pooled and clotted blood was also present on my face, arm, pillow, and sheets. Uncertain exactly how much blood total but I would estimate 20 ml of blood. The bleeding stopped spontaneously a few minutes after I awoke. There as an additional scant bleeding the following morning. I was later evaluated by an ophthalmologist who did identify a small punctuate superficial capillary on the mucosal side of my left eyelid which was thought to be the source of bleeding. I have not had further events since.
966606	1/22/2021		27	F	1/18/2021	1/18/2021	Heart rate elevated to 150 and above, shortness of breath. Went to emergency room. Admitted with blood clot in lung. Previously had COVID in 2020, and we are unsure if this is related to previous illness.

961879	1/21/2021	TX	81	M	1/13/2021	1/13/2021	My 81-year-old father, and my brother received the first dose of the Pfizer covid vaccine at the Hospital on Wednesday January 13, 2021. Within a couple of minutes of them returning home, my father collapsed. As it turns out, he'd had a silent heart attack. He is still in the medical center area Hospital this morning. A cardiologist who was filling in for my father's primary cardiologist thought maybe my father had a blockage and might have needed a stent. But when Dr. performed a cardiac catheterization, he only found a little plaque. Medical personnel are not too sure what caused the heart attack. My was very dehydrated when he was admitted, and he has underlying health conditions including diabetes, high blood pressure, dementia and a history of blood clots. Those are just a few of his health issues. His primary cardiologist, Dr is back in town. He plans to see if my father has AFib before they release him. I believe Dr. an internist at Hospital, said my father's INR on admitting was 1.2. My father's hematologist, Dr., had told us to let the person administering the vaccine know that my father is on blood thinners. I was not present when my father and brother received the vaccine, but I assume my brother passed that information on to them.
959549	1/20/2021	MO	58	F	1/2/2021	1/13/2021	1/4/21- Patient stated she had tenderness on the back of her left lower leg with redness then 1/8/21 started to have shortness of breath and made a doctor's appointment for 1/13/21. Seen by provider on 1/13/21 and was sent to ED and admitted to the hospital [ICU] with NSTEMI, acute deep, occlusive venous thrombosis left femoral vein and saddle embolus of pulmonary artery. Transferred to another acute care hospital for removal of thrombosis. Patient started on Eliquis and no intervention for removal of the thrombosis.

957555	1/20/2021	NY	38	M	10/2/1982	1/1/2021	I am a registered nurse at hospital. On 12/25, seven days after receiving the shot I started to get right lower leg pain and I kept complaining about it till New Years Day. I had no symptoms of a DVT. I triaged on 1/1/21 and the doctors ordered labs/imaging and the results were as followed: D-Dimer biomarker (+) , Ultrasound of the Rt lower leg ( - ) , CTA showed a PE (segmental right upper lobe pulmonary artery consistent with pulmonary embolus). I was discharged on Xarelto and advised to follow up with a hematologist. On 1/5/2021, I went to hematology and they did a whole bunch of labs. I was sent to get a ultrasound of the leg because the pain persist and they found a clot hidden by my soleus. The plan is to continue on the Xarelto for 6 months. Come back in 3 weeks to scan my leg again and get my lab results. On 1/12/2021, I received the 2nd shot of the Pfizer vaccination.
957860	1/20/2021		49	F	1/13/2021	1/14/2021	~~I received the Pfizer Covid vaccine Wed afternoon around 4pm. Thursday morning around 9:30 I started with severe pain in my left leg. The pain worsened through the day and my leg began swelling. No other symptoms at all. This morning my leg was twice the size of my right leg so I went to the ER. I live in so I'm at ED. I have a massive blood clot running the the length of my leg - from my thigh to my ankle. I'm very lucky I got here so fast! I?m a very healthy 49 year old with no history of DVT or blood clots so they dug further to find out why. A cat scan showed I have a congenital condition called May Thurner Syndrome. I?m so relieved to have an answer and it?s fixable! The vascular doctors are not 100% convinced that?s not all that was going on as I was born with the syndrome and I?ve gone this long without a clot. So they are doing lots of labs to see if anything else shows up. This is where we are at. I?m being admitted to take care of the clot.~~

958057	1/20/2021	PR	40	F	12/30/2020	1/4/2021	On January 4 at 2:00 pm I suddenly started to bleed from the nose from the left nostril and then from both. The event lasted more than 35 minutes so I had to go to the ER. The diagnosis was Epistaxis. I was discharged because at the time of the medical evaluation I removed a large clot from my mouth and the bleeding stopped. Appointment with primary physician for diagnosis and appointment with ENT was ordered. On January 5 at 4:15 am I had another episode of nasal bleeding lasting 25 min. After removing a clot through the mouth, the bleeding stopped. At 4:00 pm I presented Epistaxis again so I had to return to the Emergency Room. I was reevaluated and the instruction was to visit the ENT and Afrin prescription for three days and Claritin D q 12 hrs PRN. From January 6 to 9, I began to eliminate a serous-bloody vaginal discharge. That began with the elimination of a clot and progressively diminished day by day. January 11, 2021, the ENT evaluated me and indicated that it did not observe polyps or anatomical problems. I had not previously prolonged nosebleeds. Previously two minor episodes happened to me, a year ago that resolved in less than 7 minutes. I didn't have a cold or any other symptoms. I want to raise the flag because it was a strange event that occurred after the vaccination and that I had not experienced before in that way. My next dose is January 29, 2021. I am awaiting clot test results
958945	1/20/2021	WA	50	F	1/4/2021	1/5/2021	tried to use a cream Dr prescribed for hemrrhoids, had to have them surgically cut, drained of blood clotts, sent home. went back to urgent care 4 day later still in a lot of pain, was given a surgical consult, waiting for a appointment. Rash Dr prescribed prednisone and topical cream 2x daily on rash, still having rash issues spreading.

959270	1/20/2021	NJ	57	F	1/13/2021	1/14/2021	Painful joints started at 430PM 1/14/21 started in hands and progressed to entire body. By 630 PM I was in bed with muscle aches, chills, headache, nausea, extreme fatigue, slept 12 hours. Got up 1/15/21 in AM still no relief felt heart palpitations and some dyspnea on exertion with noted drops in pulse ox levels. SpO2 fluctuated from high 90s, then hovered in low 90s and had intermittent irregular drops to as low as 84%. Went to Urgent care at Primary's recommendation, O2 91%, CXR negative, Covid PCR done. SpO2 increased to 96% on ambulation, sent home. Symptoms resolved 1/16 except for O2 drops. Covid negative report 1/17/21. SpO2 still fluctuating, Primary called 1/18/21 referred me to ER r/o PE. DDimer drawn, slightly elevated, CTA done negative for clot, discharged home.
959645	1/20/2021	MN	25	F	1/7/2021	1/15/2021	I started having cramps Friday night and Saturday morning I started bleeding, by Saturday evening I was passing clots and tissue. ER doctor and nurses did tests and found I was having a miscarriage.
959492	1/20/2021	IA	31	F	1/12/2021	1/15/2021	Employee received her 2nd Pfizer vaccine on 1/12/2021. Twelve hours after her vaccine she developed a fever with a T-max of 102 degrees. The fever lasted 18 hours. She also complained of severe malaise and fatigue lasting 36 hours. On day 3 (Friday, January 15, 2021) she developed left lower extremity pain that persisted over the weekend. She was seen in Urgent Care today where she was diagnosed with a deep vein thrombosis of the proximal vein. She also came to the ETC and was ruled out for a PE. The employee does have a family history of antiphospholipid in her mother. She has a follow up with her PCP and will also receive a work up in hematology as she had never been tested for any genetic coagulation conditions after her mom's diagnosis.

954804	1/19/2021	MA	48	F	1/8/2021	1/10/2021	Started with severe chills, body aches and feverish. The. Slight leg pain which worsened with time , swelling on the right leg calf, warm to touch and difficulty breathing. Got hospitalized on 1/16 21 with multiple clots in my right leg and clot in the lung. Still in the hospital now.
955565	1/19/2021	OH	19	F	1/7/2021	1/14/2021	One week after the shot (1-14-2021) Patient (19 y.o.)reported side pain and appeared constipated, Laxatives given along with Tylenol, on further assessment Patient was noted to have left leg redness and abdominal fullness. Dr. was updated and we had orders for close monitoring, the next day when she got up, her leg appeared better, and she had passed a small BM, but by lunch she had developed significant pain and edema in her left leg, and the color of her leg was reddened again. She was sent to the emergency room with her symptoms. She was admitted back to our facility yesterday, her diagnoses included Acute provoked left external iliac, femoral, popliteal, and peroneal DVT. Elevated Factor II levels, Elevated APC resistant, May-Thurner Syndrome, history of developmental disabilities, fecal impaction and urinary retention - suspected related to her fecal impaction. Vascular surgery was consulted, and pt. was started on a heparin drip, and mechanical thrombectomy was needed for both legs due to multiple clots. She was started on Eliquis and Plavix, and thigh high compression stockings were ordered, ace wraps being used until these are supplied. Her Fecal impaction was addressed also and the urinary retention resolved.

934912	1/11/2021	FL	28	F	12/24/2020	1/4/2021	DVT; have pain in same site where DVT is; This is a spontaneous report from a contactable consumer. A 28-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EK9291), via an unspecified route of administration in left deltoid on 24Dec2020 10:00 at first single dose for COVID-19 immunization. Medical history was none. There were no concomitant medications. Caller was calling to report a possible adverse reaction to the Pfizer Covid-19 vaccine. The patient was currently at hospital, she was admitted for deep vein thrombosis (DVT) of left iliac vein, the patient had no past history as to why this would happen, that she is only 28 years old. Received the vaccine on 24Dec2020, the following day she did have pain in same site where DVT was. Took ibuprofen for the pain. The patient was admitted yesterday 04Jan2020 for the DVT, they were currently treating her with Lovenox injections and prescribing dose for discharge is Eliquis. CT scans and three shots of Lovenox for it, doing a doppler of bilateral legs and echocardiogram (echo) of her heart to make sure there is nothing else. The AEs require a visit to emergency room. The patient was asking if she can still get the 2nd dose based off the adverse event she experienced. Outcome of DVT was not recovered, of pain was unknown.
935738	1/11/2021	CA	56	F	12/18/2020	12/18/2020	After 7hrs of the vaccine I was feeling very tired I had muscle ache almost a week later I went to the ER because I had a lot of pain on my legs mainly on my right one I thought I had a blood clot but in the ER they told me it was just a reaction the the vaccine.
936435	1/11/2021	TX	33	M	12/19/2020	12/28/2020	Had a blood draw in left arm 12/24/2020. Eventually led to superficial venous thrombosis of left basilic vein confirmed by duplex us and ct angiogram w/ contrast. Indentured vein led to seek diagnosis and treatment

932091	1/10/2021	FL	50	M	12/16/2020	1/5/2021	Started severe belly pain and went to Emergency room and diagnosed with mesenteric vein thrombosis after the CT scan of the abdomen, treated with heparin drip, antibiotic and discharged with anticoagulant pills(Eliquis). I am not sure that it is because of the vaccine my doctors are also not sure about it, but I am sure that I am a healthy person without any health issues . I am working as registered nurse, our unit is for covid-19 patient's since march 2020 and I had covid -19 on August month and recovered after 3 weeks.
927684	1/8/2021	IN	47	F	12/23/2020	12/25/2020	excessive sleeping; Extreme fatigue; temp 100; sore throat; loss of balance; Muscle weakness; This is a spontaneous report from a contactable nurse (patient). A 47-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EL1284), via an unspecified route of administration in the left arm on 23Dec2020 12:00 at a single dose for COVID-19 immunization. The patient's medical history included COVID-diagnosis from Mar2020 that resulted in blood clots and pneumonia both on 2020, and allergies to shellfish, eggs, peanuts. The patient was not pregnant. Concomitant medications included acyclovir [aciclovir], levothyroxine sodium (SYNTHROID), apixaban (ELIQUIS), escitalopram oxalate (LEXAPRO), and bupropion hydrochloride (WELLBUTRIN). The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 25Dec2020 06:00, the patient experienced extreme fatigue, temperature of 100, sore throat, loss of balance, muscle weakness, and excessive sleeping. The events resulted in doctor or other healthcare professional office/clinic visit. The patient underwent other lab tests and procedures which included COVID test nasal swab was negative on 28Dec2020. Outcome of the events was not recovered. The events were considered non-serious by the reporter.

930155	1/8/2021	UT	39	F	1/4/2021	1/4/2021	Employee reports 1/4 he had a sore arm, later that night HA, fever, chills. 1/5 1600 headaches progressed to migraine with extreme fatigue. 1/6 evening he went to ED due to symptoms and history of blood clots in the brain. CT was done in the ED. It showed signs of COVID in the CT chest. COVID test negative. 1/7 AM SOB and cough started. HA continues but manageable, dizziness and a crawling feeling under skin. 1/8 AM tightness in chest, crawling under skin increased, HA, dizziness and slight bodyaches.
930753	1/8/2021	MA	60	M	1/6/2021	1/7/2021	I woke up at approximately 4:00 am with an extremely dry mouth. I went into the bathroom and took a drink of water. I returned to bed. I noticed that my breathing was becoming more rapid. I had trouble catching my breath. I sat up on the side of the bed. My heart was pounding and quick. My breathing was difficult. I woke up my wife. After about 5 minutes my symptoms improved. She took my pulse which was now at 62ppm. I laid back down in a reclined position. My symptoms of difficulty breathing and elevated heart rate quickly returned. My pulse was now up to 98 ppm. I sat up again. My symptoms gradually improved. Being unsure of what was going on my wife called 911. The ambulance arrived in about 8 minutes. I was about 60% better. Vitals were improving other than my blood pressure which was 180/100 Being unsure of what was happening, I was transported to Hospital. I had a chest x-ray, a chest CT scan with contrast to rule out a blood clot, blood work including tests to rule out MI x2. All test were negative. By about 6:30 am I was feeling at least 80% better. My breathing I felt had returned to normal. My pulse was down into the 50"s which is my normal range.

925634	1/7/2021			U			<p>DVT; This is a spontaneous report from a contactable nurse. A patient of unspecified age and gender received BNT162B2, via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The nurse asked if there is any DVT cases reported following the administration of Pfizer-BioNTech COVID-19 Vaccine. E-transmitting duplicate AE caller already reported a DVT case post vaccination. Caller also asked "Why is there's a statement indicating that individuals with a history of bleeding disorder or taking anti-coagulant should contact their vaccination provider? How did they prove 95 % efficacy? Why aren't antibodies produced after the 1st dose of Covid-19 vaccine?" The outcome of the event DVT was unknown. Information on Lot/batch number has been requested.; Sender's Comments: Very limited information was provided for this individual patient, such as pre-existing medical history, suspect administration details, clinical course and relevant supportive lab data for the reported Deep vein thrombosis (DVT). Pending further details, the Company would handle this reported DVT related to the administration of BNT162B2, COVID-19 immunization, for reporting purpose. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.</p>

<i>VAERS_ID</i>	<i>RECVDATE</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
925644	1/7/2021	NY	85	F	12/23/2020	12/26/2020	Confirmed DVT in the left leg; COVID test (PCR swab): positive on 26Dec2020; COVID test (PCR swab): positive on 26Dec2020; This is a spontaneous report from a contactable other healthcare professional. An 85-year-old female patient received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# ELO140, expiration date: Mar2021), via an unspecified route of administration in arm (deltoid; unknown side) on 23Dec2020 at single dose for Covid-19 immunisation. Medical history included type 2 diabetes mellitus from 2017 and ongoing, high blood pressure from 2017 and ongoing, atrial fibrillation (A-Fib) from 2019 and ongoing. The patient's concomitant medications were not reported. The patient was administered first dose of the COVID vaccine on 23Dec2020 and then was swabbed for COVID on 26Dec2020, and then on 28Dec2020 her PCR swab was positive for COVID. She was asymptomatic until she started complaining of leg pain. She ordered an ultrasound for the patient on 30Dec2020, and it confirmed a deep vein thrombosis (DVT) in left leg. The patient was being treated with anticoagulant apixaban (ELIQUIS) currently. Caller stated that this could be that it (DVT) is from COVID, but her real question was, could it be from the vaccine? In Pfizer's information packet for patients, there is section on what to tell your provider prior to getting vaccinated. One of the things on there is if you have a bleeding disorder or are on an anticoagulant. There is no explanation as to why it was in the packet of information. Caller has looked everywhere and can not figure out why that is on the FAQ/packet information. The patient was due for the second dose on 13Jan2020, but she was worried and hesitant to approve it. The patient underwent lab tests and procedures which included COVID test (PCR swab): positive on 26Dec2020, ultrasound of the left leg: confirmed DVT on 30Dec2020. The outcome of events was not recovered.; Sender's Comments: There is not a reasonable possibility that event "COVID test (PCR swab): positive" is related to BNT162B2 vaccine. The event occurred 3 days after vaccination, when vaccine was not expected to achieve the effect. The event DVT of legs is not considered related to BNT162B2 vaccine. The patient had underlying diabetes and cardiovascular disorders, which are considered as risk factors for DVT. The impact of this report on the benefit/risk profile of the Pfizer product is

924184	1/6/2021	NE	35	F	12/28/2020	12/28/2020	DESCRIPTION THAT FOLLOWS IS FROM PATIENT: Monday 12-28 evening I begun to get chills and body aches, the next morning when waking up I felt like a truck hit me. Starting Tuesday morning, for three days, I got calf/feet cramps that were non-stop. I did call my doctor and got lab work done on 12-31. This lab work showed some kidney values that were off. Starting Sunday my legs and feet swelled up. I had a routine MS appointment on Monday and they stated since there is no data for folks with MS and the vaccine that they cannot rule out the vaccine is playing a role in some of this along with the IVIG. I did follow up with my primary care doctor on Tuesday and they re did lab work as well as did a ultrasound to rule out blood clots. She did state she felt like it was the perfect storm between the COVID vaccine and then the Immunoglobins that I am on. She suggested I download the app for CDC and report those items as well. The doctors are still suggesting I get the 2nd shot just have to do some things prior to the second shot.
922331	1/6/2021	RI	44	F	12/28/2020	12/28/2020	Initial swelling and soreness right after injection. Swelling and pain continued for the next few days, Motrin 800mg and Benadryl 25mg at bedtime were taken. Swelling and pain persisted. Area became hard, red, itchy and raised over the holiday. Swelling, redness and itchiness became worse over the weeknd into Monday. I was unable to lift my arm, bring it behind my back or reach. It was very painful and hot. I then contacted employee health. They did not feel it was infected but was the delayed reaction to the moderna vaccine. I did not feel comfortable with this and I then contacted my physician who looked at it and felt it was in fact cellulitis, I was sent for a ultrasound to rule out a blood clot and labs and an IV infusion of Rocephin as well as oral antibiotics. I received my first infusion yesterday. The swelling has improved greatly, however the redness has spread beyond the marked area on my arm and I will be receiving another dose of IV Rocephin today. My labs showed my CRP was elevated and my ALT/AST were elevated as well.
923031	1/6/2021	LA	31	F	12/30/2020	12/31/2020	Worsening arm pain after injection that eventually resulted in my being diagnosed with a blood clot in the arm that I received the injection on

924035	1/6/2021	TX	28	F	12/28/2020	12/30/2020	So I got the vaccine Monday night after work. Tuesday and Wednesday I ran a super high fever, body aches, lymphnode swelling on that side. No big deal . Well Thursday morning I woke up with a rash on both of my legs and my legs swollen like tree trunks. It?s a petechial rash. I called the pharmacist told to take Benadryl and Zyrtec since Friday. So I went to the doctors last night since I still have this rash and it hasn?t gotten any better with Benadryl and Zyrtec. I got blood work done today. And I have to get an arterial and venous Doppler done on Wednesday next week. They are concerned I may have blood clots since my legs are so swollen with a petechial rash. They are also giving me steroid taper.
924162	1/6/2021	NE	35	F	12/28/2020	12/28/2020	AS REPORTED BY PATIENT: Monday 12-28 evening I begun to get chills and body aches, the next morning when waking up I felt like a truck hit me. 921228	1/5/2021	VA	77	M	12/24/2020	12/24/2020	vomited; nausea/ felt sick to his stomach; felt woozy; didn't feel well; right deltoid soreness; This is a spontaneous report from a contactable physician (patient). A 77-years-old male patient received the first dose of BNT162B2 (Lot: EH9899), via an unspecified route of administration in deltoid right, on 24Dec2020 11:30 at single dose for COVID -19 immunization. Medical history included pulmonary embolism half a dozen years ago. He has had no problems with Deep Vein Thrombosis or pulmonary emboli since then, since half a dozen years. He has had a battery of lab tests 2 months ago, his blood glucose was high, it was 106 mg. The potassium was ok. He has had no issues with vaccines in the past. He had an antibody test last Jul2020 because he had bacterial lower urinary tract prostate infection. Concomitant medication included rivaroxaban (XARELTO) at 10 mg a day and cefalexin sodium (CEPHALEXIN) at 500 mg three times a day, well approximately 3, sometimes he forget a dose. The physician reported possible side effects of Covid vaccine. The physician received the vaccine on 24Dec2020 at 11:30 in the late morning and felt fine. He woke up on 25Dec2020 and at 2:30AM he was sick to his stomach and vomited and didn't feel well the rest of the day. Since then he had been okay, he had occasional nausea and vomiting. He clarified that on 24Dec2020, in the late evening, his appetite which was usual, was robust. Then on 25Dec2020 at 2:30 in the morning he vomited, and had no trouble since then. From what he read, nausea and vomiting are observed following the injection. On 24Dec2020 just before bed, he had a light supper, his appetite was robust, then unexpectedly he woke up sick to his stomach and went back to bed on 25Dec2020. He clarified that he had not vomited since the one episode on 25Dec2020. He also added that he has not been nauseous since then. Caller also added that he felt a little woozy on Holiday 25Dec2020, it only lasted up until the evening of 25Dec2020. He had the 1 episode vomiting on 25Dec2020 and felt woozy until late evening of 25Dec2020. His right deltoid where he received the vaccine was a little bit sore on 24Dec2020, and he was still having a little bit of soreness, it is slight, not very tender, he is unable to do usual morning exercises with out noticing the discomfort, the exercise he is doing is chin ups, the soreness is not intense and it never was.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							The lab test in 2020 included Height: under 5 feet 5 inches. Weight: about 165lbs or 167lbs. He had no positive test for COVID prior to the vaccine. All the tests were negative. The 1st one was nasopharyngeal, and all the next ones after were nasal swabs. He thought they are all reverse transcriptase tests. The last time he had a COVID test they did a nasal swab, it was this morning, and before that was last Monday or Tuesday, but he thought more so Monday. He had one PCR test. The outcome of the events vomited, nausea and felt woozy was recovered on 25Dec2020. The outcome of the event right deltoid soreness was recovering. The outcome of the other event was unknown. The 2nd dose for Covid vaccine was schedule for 14Jan2021.
920728	1/5/2021	NE	37	M	1/4/2021	1/4/2021	DEVELOPED CONTINUOUS CHEST PAIN WHEN BREATHING IN. WAS SENT TO THE EMERGENCY ROOM. WAS SEEN IN ER AND DISCHARGED AFTER OBSERVATION PERIOD. ER PROGRESS NOTE: Patient is a 37 y.o. male who arrived by Home presented to the emergency department for Chest pain. Patient states that approximately 15 this morning he received a Covid vaccine and approximately 1 hour later he started to have chest pain. Patient describing chest pain as sharp, left-sided, nonradiating, nonexertional, only occurring with taking a big deep breath, has never had similar symptoms before, not improving with home baclofen, currently a 3-4 out of 10, not occurring at rest only with deep breath. Patient states that he became concerned that it was a side effect of the vaccine and came to ED for further evaluation. Patient just denies any associated shortness of breath, nausea or vomiting. Patient states he has history of bipolar, takes no mental and has been taking as prescribed. Patient states he is otherwise healthy. Patient works at a healthcare facility, has a weekly Covid antibody test which is was been negative, denies any other associated symptoms today. Patient is a daily smoker, no history of blood clots, no recent travel or surgeries. Patient denies any headache, change in vision, nausea, vomiting, neck pain, back pain, fever, chills, shortness of breath, abdominal pain, flank pain, change in urination, diarrhea, constipation, rashes, lightheadedness, dizziness, or any other associated symptoms.

918807	1/4/2021	AK	49	M	12/31/2020	1/2/2021	Patient got his Covid vaccine this past Thursday, 2 days ago. He experienced typical side effects of a sore left shoulder and some fatigue but was feeling well until this afternoon around 1:55 PM when he noticed throbbing of his left hand. He looked down and noticed that there was a purple discoloration to his middle finger and distal palmar aspect of his hand. He felt like there was maybe some swelling as well and that he might have been having an allergic reaction so called the emergency department for further advice and came in for evaluation. By the time I arrived to the emergency department the patient's left hand was no longer swollen and there was only a small purple discoloration to the palmar proximal middle finger. I was concerned that the patient developed a small blood clot that was resolved upon evaluation.
919376	1/4/2021	MT	19	F	12/30/2020	1/2/2021	Patient received Moderna vaccine, Wednesday 12/30. On Saturday 1/3/2021 patient felt pressure/tightness in lower extremity. When patient touched area, a noticeable ball was felt under the skin, tender to the touch and warm. Patient went into urgent care on Monday 1/4/2021 with a confirmed dx of a superficial blood clot. Unknown etiology of whether this is from current birth control or the COVID19 Moderna vaccine.
919000	1/4/2021	OH	49	F	12/23/2020	12/23/2020	I had itching and redness and knots that formed in my left leg. The knots were at the site of a varicose vein. I sought tx at an ER on 12/26 to ensure it was not a blood clot. I followed up with my family dr on 1/4/2021 (When her office reopened) and was diagnosed with Superficial Thrombophlebitis. The knots remain in my leg. The redness has mostly gone away. My PCP felt as I recently had covid, the vaccine likely flared up the inflammation in my body and caused this condition.

912225	12/29/2020	NC	42	F	12/19/2020	12/1/2020	BNT162B2 was given to the patient subcutaneously instead of intramuscular; upset; crying; This is a spontaneous report from a contactable nurse via medical information team. A 42-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via subcutaneous on 19Dec2020 at single dose for COVID-19 immunization. Medical history included deep vein thrombosis (DVT) from 3 years ago and unknown if ongoing. Concomitant medication included acetylsalicylic acid (ASPIRIN (E.C.) for DVT and multivitamins. The patient stated "BNT162B2 was given to me subcutaneously instead of intramuscular (IM)." She stated she works at (Name withheld) and it was administered by an employee and her hospital employee health will not talk to her and she was being brushed off. The patient asked what's needed to do moving forward. She stated she does not know the efficacy for subcutaneous administration. After providing information in attached document the patient asked what should her next steps be since the hospital will not answer do anything about this incorrect administration. BNT162B2 was administered her incorrectly. The patient was little upset and was crying about it in Dec2020. The outcome of the events was unknown. Information on the lot number/batch number has been requested.

912165	12/29/2020	CA	36	F	12/28/2020	12/28/2020	<p>She arrive at 3:43 and she was nervous before the vaccination for COVID19 ( Morena) because has had anaphylactic reactions to Flonase. She was feeling well up to 15 min post vaccination when she felt she is going to pass out w/o loosing consciousness. She felt weak and feeling fainted when we transferred her to the stretcher. Her BP was 163/106 P=112, Pulse Ox 100% at 16:09. She was resting, received O2 lit per min, she was feeling chest tightness when she used her inhaler Albuterol 2 puffs X2 within 5 min. She was feeling weak and stating "I am going to pass out." Her repeat BP=152/110, P=94 with pulse Ox 100% at 16:12 repeat at 16:30 BP=139/100, P=99 pulse OX 100% She then C/O chills later. Paramedics were called and transferred in to ED. She takes AMLODIPINE 5 MG DAILY FOR HTN. She has family HX of HTN. Negative for headache, + palpitations, + presyncope, + shortness of breath, slight difficulty brathing. She did not experience any loss of consciousness. Never had any chest pain, angioedema, rash, pruritus, throat swelling, hoarse voice. The patient has had no recent illnesses, fevers, chills, nausea, vomiting, diarrhea, or flu-like illnesses. She has had no cough, rhinorrhea, or congestion. She denies any recent vaginal bleeding, or abdominal pain. Denies any history of cardiac disease, or history of arrhythmias. Denies any history of prolonged immobility, recent travels, or history of clots. In ED: 36 year old female presents with dizziness and presyncopal like symptoms approximately 15 minutes after receiving the Medina vaccine at this hospital the patient who is mildly tachycardic mildly hypertensive but otherwise normal and stable vital signs and is overall nontoxic appearing. Of note the patient's oxygen saturation was 97% while I was in the room and not the 2% that is documented here. EKG notable for a rate of 87 normal axis normal sinus rhythm T-wave inversion in V1 otherwise no evidence of Brugada interval abnormality or evidence of electrolyte abnormality that would require further workup at this time. Patient counseled to follow up with her primary care. Patient given EpiPen given her EpiPen has expired. Patient requested to go back to work I feel this is fair given patient will be on campus and can return to the emergency department should she develop any further symptoms. Patient states her symptoms have completely resolved and she has normal vital signs</p>

910641	12/28/2020	MD	54	F	12/18/2020	12/18/2020	Weakness and tingling down left arm; Weakness and tingling down left arm; Lightheaded; PVC's every 3 beats; emotional too and just very tired; Can not read the vaccination card as she does not have her glasses; Palpitations; Fatigue; Slept a lot; Thready pulse and vertigo; Thready pulse and vertigo; Soreness in left arm at the injection site and down the left arm; Soreness in left arm at the injection site and down the left arm; This is a spontaneous report from a contactable nurse (patient). A 54-year-old female patient received first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, reason for no lot number of COVID Vaccine: Can not read the vaccination card as she does not have her glasses, Expiry Date unknown), via an unspecified route of administration in the left arm on 18Dec2020 at single dose for 'Work with COVID patients'. Medical history included none. There were no concomitant medications. The patient experienced weakness and tingling down left arm (hospitalization) on 22Dec2020, lightheaded (hospitalization) on 22Dec2020, PVC's every 3 beats (hospitalization) on 22Dec2020, soreness in left arm at the injection site and down the left arm on 18Dec2020, thready pulse and vertigo on 19Dec2020, fatigue on 20Dec2020, slept a lot on 19Dec2020, palpitations on 21Dec2020. Details as follows: Caller says she received the vaccine, she is a nurse. She got the vaccine on Friday, 18Dec2020. She had soreness in her arm and at the injection site on Friday but that was it. On Saturday (19Dec2020) she noticed a thready pulse, but went on with her day with only a little arm pain. Sunday (20Dec2020) she was fatigued and the thready pulse continued. She slept a lot on Saturday (19Dec2020) and Sunday (20Dec2020). Yesterday (21Dec2020) she felt a little better, but had palpitations here and there. This morning (22Dec2020) she went into work, was very lightheaded, had tingling down her left arm, and had palpitations. So she hooked herself up to a monitor. Her pulse ox was between 97-99%. Her heart rate would be in the 90s and then drop to 48, so she went down to the ED. She has had a CT, and she is throwing PVC's every 3 beats. She has not been admitted as they are still waiting for results. She is still in the ED. They did a CT to see if there was a possible clot. On 18Dec2020 she received the vaccine around 2 PM. She had soreness at the injections site and down the left arm, which went

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

away by Sunday (20Dec2020). She now (22Dec2020) has weakness and tingling down the left arm. It was never red or anything at the injection site. Saturday, 19Dec2020, she had thready pulse and Vertigo which lasted until Sunday 20Dec2020. She would be laying in bed and try to flip to the other side and having vertigo. When the fatigue started on Sunday (20Dec2020) she did not feel like herself. She was very emotional too and just very tired. Since she went to the ED she has had a CT scan, one with contrast and one without. She had a chest X-ray, and she is on a cardiac monitor. Results are pending. She has Trigeminy PVCs. She says she never goes to the hospital. But she is not admitted yet (pending clarification). Can not read the vaccination card as she does not have her glasses. Unable to read off the NDC, lot, and expiration date. History: Has been on the same vitamins for two years with nothing new. Blood pressure: Normal base line is 130s/80s maybe lower. Heart rate: Currently within her normal limits of 80s-90s. Depending on what happens, it was asked if she should get the second dose. The patient underwent other lab tests and procedures which included blood pressure measurement: 163/76 on 22Dec2020, chest x-ray: unknown result on 22Dec2020 (Result: Pending), computerised tomogram (CT scan): unknown result on 22Dec2020 (Result: Pending), heart rate: 80s-90s on 22Dec2020, Pulse oximetry: 97-99 % on 22Dec2020, cardiac monitor: results are pending on 22Dec2020. The outcome of events weakness and tingling down left arm, pvc's every 3 beats, lightheaded, palpitations and fatigue was not recovered. The outcome of the event soreness in left arm at the injection site and down the left arm was recovered on 20Dec2020. The outcome of the events thready pulse and vertigo was recovered on 20Dec2020. The outcome of the event slept a lot was recovered on 20Dec2020. The outcome of other events was unknown. Information on the lot/Batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject vaccine cannot be excluded for the reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once

908959	12/24/2020	CA	42	F	12/23/2020	12/23/2020	Observed for 15 minutes after vaccine. About 30 minutes later in my car, felt sharp shooting pains in left neck. About 8 hours after receiving first dose, started coughing up blood, bright red, with streaks and clots. No cough, fever. Seen in ER with chest xray and ct scan with contrast. No resolve. On second day after receiving vaccine? Continue to experience bright red sputum. No resolve.
908846	12/24/2020	MO	49	F	12/24/2020	12/24/2020	Very mild, but unexpected nose bloody nose from left nostril. Only noted when blowing nose. With 1 clot.
905649	12/21/2020	NH	37	F	12/16/2020	12/16/2020	The evening of 12/16 my headache begin at the next day fever of 103 stayed for 7 hrs took administered Tylenol exp chills, body aches, and rash on face around the eye spread to right side of nose, side went to hand area lasted from 12/17 to 12/21.The headache started effecting my neck contacted my PCP on 12/19. I went to ER on 12/19 ran tests CT scan check for clots negative, lumbar puncture and chest X-ray was fine and dint exp respiratory problems. I missed 3 days of from work 12/9 to 12/21.
904983	12/21/2020	LA	58	F	12/18/2020	12/18/2020	Friday night same night of vaccine. Arm started aching and hurting. After my shower, my whole arm was in pain. Pain then moved all the way to my back. I took two tylenol, and it calmed it down. At 3 am, it started hurting really bad, I had to take a lortab - a stronger pain med at 5am that morning. Around 10am, my whole back started hurting, and that evening, it still was hurting. I ended up taking 3 lortab that day. The pain went to my neck. On Sunday, I ended up taking two lortab . All together, I took 5 lortab to ease pain from this vaccine. I was scared that I was getting another blood clot from the feeling of the pain. I am still just sore. NOTE: I am on blood thinner
