1135999	3/25/2021		74	M	3/23/2021	3/23/2021	vaccine side effect. Patient reports slurred speech, difficulty forming sentences, SOB, R arm tingling x 3 hours. Patient reports symptoms have improved but not resolved. J&J vaccine today at 1045. Denies chest pain, N/V/D, HA, vision changes. Patient is a 74 year old male who presents to ED following a 10 second episode of right arm tingling followed by a 90 minute episode of difficulty finding words. This happened tonight at 8:30pm after dinner when he was with his wife. His symptoms resolved upon arrival at the ED at 10pm. He denies any weakness, no syncope, no chest pain or shortness of breath, no new visual symptoms. He does have a history of CHF, MI in 2013 s/p stent placement, he takes Plavix. He takes a beta blocker for PVC's. He reports he had a J&J COVID shot this morning at 11am and is wondering if his symptoms are a reaction to the vaccine. He is followed closely at Ajou hospital for all his medical care.
1136155	3/25/2021	NY	63	M	3/15/2021	3/24/2021	Pt received 1st moderna vaccine on 3/15/2021 and was admitted with sudden hypoxia , sob , low grade fever and pleuritic chest pain 10 days later. Pt is lifelong non smoker. no recent travel or recent illness. no new medications.

1136074	3/25/2021	CA	37	F	3/22/2021	3/22/2021	Minutes after receiving the shot on Monday, 3/22/2021 at approximately 11:15am, I (F/37yo) felt a very small, but acute tightness/pressure in my upper right chest area. I didn't initially report it as it was not one of the listed reactions I had read about in the information given to me -- I assumed I was very anxious, maybe breathing nervously, and that it would go away. The next day I felt very fatigued, light-headed, had extreme muscle and joint pain throughout my body, slight nausea, and the injection site (my left arm) was very sore. I took Tylenol and slept. I felt weak and "off" the whole day. The acute chest pain I felt after the shot had now become less "acute" and turned into a wider and duller general pressure. The next day, Tuesday, I also began feeling intermittent flashes of hot or cold-like patches in my head, which I also consider a part of a general inflammation my body might be having. It is now Thursday, 3/25/2021 and the chest pressure has increased even more, having now spread from the upper right side to include the center of my chest. My headache is still lingering, I still don't feel like my normal self and feel "off" somehow, and the chest pressure is worrying me because I don't know what's going on internally. I reported the chest pain to my doctor and was told that my exact reactions don't make any sense in relation to the known adverse reactions to the Moderna COVID vaccine. I was advised to report this here and to also go to an urgent care clinic or emergency room if my symptoms worsen.
1136104	3/25/2021	CA	34	F	3/25/2021	3/25/2021	15 minutes following vaccine, patient experienced chest tightness, sensation of throat closing, and shortness of breath. No chest pain, dizziness, vomiting, chills, fever, cough, congestion. Patient brought immediately to on-site Urgent Care clinic. EKG revealed sinus tachycardia. Patient given 50mg Benadryl IM and 0.3mg epinephrine IM. Patient initially improved but then began to report chest tightness and more shortness of breath. Paramedics called and patient transported via ambulance to hospital for further treatment.

1136112	3/25/2021	MA	41	F	3/25/2021	3/25/2021	Within 15 minutes: Dizziness, light headed, seeing stars, blurred vision, racing heart rate. I thought at the time I was having a panic attack. I tried to slow my breathing and relax. It did not help any. I monitored my Heart rate on my watch. My EKG said my heart rate was high and marked 138 at one point while at rest when my average resting rate is 52. By the time I walked to my car I felt chest pain and pain in my neck. It was a tightening and burning. In my car, at 1:25 I took antihistamine in a 24 hr dose of Claritin and an inhalation of OTC Flonase. I felt my body calming slightly, but not 100% returning to normal. I alerted my Dr. and she agreed I should not have the second dose without first taking an otc antihistamine and also having an epi pen on hand. I stayed with a friend so I was not alone, and continued to rest. At 6:12 i tried to move around and my hear rate shot back up to 132. I sat back down. At 9:30 I still have pain like I?ve been punched really hard in the chest.
1134291	3/25/2021	LA	49	F	3/16/2021	3/17/2021	Developed pain/numbness to injection arm, headache, fever, chills. Then developed chest pains/tightness and shortness of breath. Admitted to hospital on 3/17/2021 in MICU for observation due to tachycardia and SOB.
1136164	3/25/2021	SD	21	F	3/24/2021	3/24/2021	Immediately after injection: dizziness, nausea, light headedness, temporary loss of hearing, blurred vision, abdominal cramps, fever. 1+ Hour after injection: severe abdominal cramps, nausea, severe headache (severe pain behind eyes specially when eyes were open), chest pains, upper back pain, pain in all joints (primarily hips), muscle aches over whole body, fatigue, chills, fever, trouble breathing, light headedness Morning After Injection: full body ache, severe fatigue, trouble sleeping, fever, chills, body sweats, slight chest pains, even more severe headache. 24 -36 hours after Injection: reduced muscled aches, fatigue, headache, pain at the sight of injection.

1134496	3/25/2021	UT	26	F	3/24/2021	3/24/2021	Stayed 30 minutes after vaccine at vaccination clinic to be safe in case of a reaction. About 5 minutes after leaving 11:30 I could taste the vaccine in my mouth. I immediately felt intense sharp tingling in my lower lip, it felt hot and swollen (upper lip never had a reaction). I instantly felt a lump in my throat and had a hard time swallowing. I started with chest pain that resolved itself in a minute or two. A few minutes later a family member noticed my face was red and flushed and said I looked like I had a sun burn. Swelling in throat resolved within an hour. Lip never visually looked swollen but I could feel the tightness, burning and tingling that resolved within the hour. Redness on face resolved within a couple hours. Had tiny blisters about 3 show up above upper lip I still have them the next day with a couple more but they aren't causing problems. My airway was never blocked I never had a hard time breathing. I did have a sore throat this morning March 25 day after vaccine. All other symptoms seem normal.
1134515	3/25/2021	PA	35	F	3/18/2021	3/23/2021	3/23: hands & feet felt puffy and swollen, but not actually puffy. 1135542	3/25/2021	CO	34	F	1/26/2021	1/29/2021	hurting from her hand to her chest; stress; nausea and threw up that night; nausea and threw up that night; Bell's palsy; arm on the side she got her shot was hurting; This is a spontaneous report from a contactable consumer (patient). A 34-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection) (at 34 years of age), dose 2 via an unspecified route of administration, administered in Arm Left on 26Jan2021 (Batch/Lot number was not reported) as a single dose for COVID-19 immunisation. Medical history included asthma wherein she doesn't take medication, it was usually when she was cold; she had this diagnosis since her childhood. She was diabetic and was diagnosed when she was 16 years old (2002). Concomitant medication included insulin human injection, isophane (HUMULIN N) and insulin human (HUMULIN R), both for diabetes mellitus. Historical vaccine include PFIZER BIONTECH COVID 19 VACCINE first dose on 06Jan2021 for COVID-19 immunisation. She got the second dose and her arm on the side she got her shot was hurting from her hand to her chest for about 10 days. Then she got diagnosed with Bell's Palsy. The left side of her face has been twitching and droopy and not right. She got the second dose on 26Jan2021. Three days later was when she started experiencing the pain on left arm (29Jan2021). The shot was given in the left arm. It took 10 days to heal. Then after that was when she started to feel her face. She tried to call the doctor and they couldn't see her until 08Mar2021 to get diagnosed. She had been on medication for two days. She started one medication on Monday. There had been no improvement yet. One of the medication was Acyclovir 800mg tablet. She was taking it five times per day. She started it on 09Mar2021. The other medication she takes three at the time for the first six days. Then two at a time. It was a steroid. She started it on the 08Mar2021. She added that she was a diabetic and being on the steroid had her blood sugars high now. They said it was stress and not eating right. Investigations included blood work and checked her thyroid, both with unknown result. Then when she got in to the doctor she was diagnosed because it had been going on for five weeks. The arm pain started a couple of days after the vaccination (29Jan2021). It was after 10 days when she developed Bell's Palsy (Feb2021). The day that she got it she had

1134553	3/25/2021	WI	43	F	3/25/2021	3/25/2021	<p>nausea and threw up that night (Feb2021). She had gone to the emergency room for the arm pain as she was in bad pain and didn't go to work for 2 days. The ER told her it could take 10 days. She doesn't remember the exact date. It was sometime the first week of Feb2021. The outcome of vaccination site pain was recovered on 08Feb2021, chest pain was recovered on an unknown date; while unknown for other events. Therapeutic measures were taken as a result of Bell's palsy and vaccination site pain. Information on the lot/ batch number has been requested.</p> <p>Patient called clinic with complaints of possible reactions to the second dose of the vaccine today. States that after she was observed for 15 minutes following the second dose of the Pfizer vaccine, she went home and noticed some slight tongue tingling that lasted for a few minutes then went away. She had her second dose today at 0945. Denies any reactions after her first dose. States now she has bumps on her skin similar to a skin rash with some pruritus. Denies wheezing, dyspnea, SOB, lip/tongue swelling, throat tightness, dysphagia, chest pain, nausea, vomiting. States she did take Zyrtec 10 mg this morning which is normal for her as she has allergies. She was currently at work when calling. Advised Pt of the following for treatment: 1. Topical hydrocortisone 1% cream to affected areas for the itch. Cool compresses for swelling and the itch. 2. OTC Zyrtec-- advised her to take a second dose of 10 mg tonight when going to bed. Also advised her to take Benadryl 25 - 50 mg every 4-8 hours as needed, max 300mg daily. Can be sedating, do not take with driving or operating machinery. Decided it would probably be best for her to leave work and go home in case she gets sleepy. She denied needing a work note at this time. 3. Advised to call 911 if signs and symptoms worsen at any time. Advised Pt not to follow up at center if having any red flag symptoms but rather go to the ED immediately. Red flag symptoms: SOB, wheezing, lip/tongue swelling, throat tightness, chest pain. Discussed reaction with collaborating physician who was also the clinical observer for the vaccines today. Also made clinic manager aware</p>

The patient's medical history was not provided as exposed to COVID-19. Concomitant medications were not reported. On 04 MAR 2021, approximately one day prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: 011A21A) via unknown route in an unknown location for prophylaxis of COVID-19 infection. After receiving vaccine, patient felt like she had COVID -19 and she was going to die. On 05 Mar 2021 the events started with neck and arm tightening, swollen glands and headache. The patient had full blown chills, nausea to 100 degree, fever, body ache, hallucinations. She reported that she felt pain everywhere, heartracing 120bpm, chest pain, dizziness. She fell down while loading dishes and also she reported vertigo. The event hallucination was considered as medically significant. The treatment taken for the events was reported as Tylenol once in every six hours. Action taken with mRNA-1273 in response to the events was unknown. All the events except headache, vertigo and nausea was considered resolved on an unknown date.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.

1129923	3/24/2021	MA	55	M	3/24/2021	3/24/2021	<p>Patient received first dose of Pfizer vaccine 3/24/21. Patient became unsteady and was directed to stretcher. Patient has a hx of HTN and reports not taking his BP medication for "a while." Patient was unsure what BP medication he was on. Reports potentially taking Lasix and Vit K. Patient reports not eating or drinking prior to receiving the vaccination. Alert and oriented. Denies SOB/chest pain. Vitals taken at 10:45AM: BP 197/11 HR 75 SPO2 98% RA ED rapid response called. Pt unable to stand up from stretcher. Patient was taken to ED and neurology was consulted. Neurology noted: 55-year-old man past medical history of hypertension coming with uncontrolled hypertension systolic over 220. Concern for gait instability, no evidence of strength weakness on any extremity with confrontational testing. No evidence of change in altered mental status, no evidence of cranial nerve palsy, and no evidence of sensory loss. No evidence of coordination problems with finger-to-nose testing and heel-to-shin testing bilaterally. He exhibits 5 out of 5 confrontational testing to all extremities muscles as above albeit with giveaway weakness. NIHSS 0. Although patient presents within TPA window he has had no disabling symptoms and therefore is not a candidate for TPA. Although the patient presents with a mechanical thrombectomy window he has no disabling symptoms and no evidence of LVO either on exam or my preliminary read of his CTA head and neck. As such he is not a candidate for mechanical thrombectomy. Symptoms do not localize well although patient presents with clear hypertensive urgency versus hypertensive emergency. Would recommend full medical work-up for this condition as we rule out signs of acute ischemic stroke. Patient passes dysphagia screen in the ED. Recommendation: 1. Admit to Observation. 2. MRI brain without contrast 3. Obtain stroke labs A1c, TSH, lipid profile 4. PT OT consult evaluation and treat 5. Social worker and case management consult for stroke work-up</p>

1128851	3/24/2021	CO	30	M	3/4/2021	3/7/2021	substernal chest pain; shortness of breath; Troponin peaked at 9.100; This is a spontaneous report from contactable physician. A 30-year-old male patient received his second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date were unknown), intramuscular in left arm on 04Mar2021 at 15:45 at single dose for COVID-19 immunization. Medical history and concomitant medication were reported as none. The patient has no known allergies and has other medications in two weeks. It was unknown if the patient has other vaccine in four weeks. He has no COVID prior to vaccination. The patient received his first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date were not provided), via an unspecified route of administration on 10Feb2021 at single dose for COVID-19 immunization. The facility the vaccine was administered was reported to be other. On 07Mar2021, the patient who has no prior medical history was admitted for substernal chest pain and shortness of breath; troponin peaked at 9.100 with no EKG changes. Heart catheterization was normal. The patient was not tested for COVID post vaccination. The events resulted in emergency room/department or urgent care and required hospitalization for one day. The outcome of the events was recovering. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a possible contributory role of the suspect drug in the reported events cannot be completely ruled out given the known suspect drug profile and/or implied temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1130405	3/24/2021	CA	39	F	3/17/2021	3/18/2021	I have a history of anaphylaxis, and disclosed that to the medics so they watched me more carefully, which was good, as while I did not experience anything that severe, I did immediately get itchy, turn red and feel quite nauseated. However, after they monitored me awhile, I told them I felt okay to go home. The next day I had the expected mild flu-like symptoms, which I anticipated. However, what's been atypical is they returned tenfold three days later. This time with a much higher fever (103), severe chills, fatigue, a seemingly never-ending headache, muscle spasms, chest palpitations and suddenly I am experiencing asthma (which is typically seasonal) and am coughing, too. I'm now a week past when I was vaccinated and each day was feel worse, not better. I have had to cancel my clients and hire a sitter to care for my kids as I am too weak and ill to do it. I looked up common reactions and nothing states chest pain and/or asthma, nor that it should last this long. That said, as I am high-risk, I work from home and homeschool both of my young kids. Thus, I have been nowhere aside from the vaccine site. Moreover, my partner, our kids and sitter get routinely tested for me, and everyone is negative. Thus, it appears I am having prolonged, heightened side-effects much more intense than the 'mild' flu-like symptoms otherwise reported, which is concerning. I took no medication prior to receiving the vaccine, either.

1128543	3/24/2021	PA	41	M	2/17/2021	3/18/2021	41yo male with history of HLD, LBP, and tobacco use who presented to care initially at the with chest pain. He received the second dose of the Moderna vaccine on 18MAR21 at clinic and within 14 hours developed chills and myalgias. He denies any immediate onset of symptoms after receiving the vaccine. The following day he reports experiencing chest pain 24 hours after the vaccine was administered that progressively worsened over the subsequent 36 hours that finally prompted him to seek care. He describes the pain as a central non-radiating squeezing pain that worsened with movement and breathing. He waited to seek care because he reports several of the soldiers in his unit have experienced similar chest pain that eventually resolved. He reports being at his baseline health prior to receiving the vaccine and denies any fever, cough, rhinorrhea, congestion, malaise, vomiting, diarrhea, or rash. Upon initial presentation to care at clinic he was noted to have a Troponin I of 0.9, WBC of 14, elevated CRP (7.3), and temp to 101.4. Patient was given ASA, Plavix, Lovenox, Tylenol, and Ceftriaxone. Since arriving to clinic and EKG was obtained showing ST elevation in lead 1 and avF concerning for ischemia and underwent a left heart catheterization which was clear of obstruction. Serial high sensitivity Troponin levels have been trended to peak of 465. Respiratory viral panel to include SARS COV-2 was negative. Cardiac MRI was consistent with myopericarditis, and show mildly reduced EF for 46%. Blood cultures have not grown any organism. His chest pain has resolved since starting Aspirin and Colchicine.

1131656	3/24/2021	AR	55	F	1/19/2021	2/10/2021	Day of shot developed pain in entire right side(chest area), also acid reflux and nausea. That went away about 12 hours after the vaccine. Ten days after I developed a slight pain in right lateral side that progresses to constant pain in 2 places on right side including under right clavicle. I had pain upon taking in a deep breath. Saw MD after 4 days of these SXS. Performed labs, Chest x-ray and EKG. All were essentially normal except elevated WBC count. Have 2 COVID test which were both normal. Md said possibly some sort of inflammation and suggested taking anti-inflammatories which did not help much at all with SXS. After a few more days the SXS changed to constant chest pain(pressure), SOB upon exertion and pain behind knee. F/U with MD again and it was decided to wait a few more days. Upon suggestion from friend asked MD to perform D-Dimer lab test. The result was 4,400. My normal value should have been 550. Sent to ER. CT of chest, EKG and more labs performed. CT revealed large bilateral pulmonary embolisms in pulmonary arteries. Started on blood thinners. Ultrasound of left leg revealed large DVT. Sent home after 2 days on blood thinners. SXS stopped after a few days.
1131551	3/24/2021	TX	34	F	2/12/2021	2/21/2021	Debilitating heart palpitations/chest pain. Dizziness/ fainted momentarily. Sought emergency care- no physical cause found- not associated with any health issues. fever newly present at discharge from emergency room.
1131536	3/24/2021	MN	29	M	3/19/2021	3/21/2021	Have had some chest pain for a few days and different breathing. Doesn't feel like my normal breathing just feels more restrictive than normal.

1131528	3/24/2021	TX	60	F	3/16/2021	3/16/2021	Felt abnormal and went to bed. Woke up at 9:35am with 101.7 temperature and called into work to advise I will not be coming in. I went back to bed no food no medicine, Most information I read and was aware is that it would be better with sleep. Only to wake up at 8:30pm with a 102.7 had 500 mg acetaminophen went back to bed. Woke up Thursday morning at 9:45am fever free. Friday afternoon I noticed swelling on my left neck area. Just inside my left clavicle. I made a Dr appointment for Monday and Dr. found several Lymph nodes swollen as well as under my left arm pit area. Due to some chest pain she sent me for a chest x-ray.
1131420	3/24/2021	SC	62	F	3/16/2021	3/20/2021	4 days after vaccine, had fluttering in chest while sitting watching tv. 5 days after vaccine had fluttering in chest while on treadmill. 7 days after vaccine had fluttering in chest while dressing. Lasted few minutes. No SOB or chest pain.
1131329	3/24/2021	AZ	32	F	3/24/2021	3/24/2021	Lip swelling/ numbness, face numbness/ redness/ itchiness, trouble breathing, chest pain/ tightness, drop in blood pressure
1131048	3/24/2021	WV	51	F	3/24/2021	3/24/2021	Approximately 10 mins after vaccine, patient reported tongue numbness and dry mouth. Felt as if tongue was swelling. No dyspnea or chest pain. Mild anxiety. Vitals checked and BP was elevated, SaO2 stable as was pulse. Given 25 mg Benadryl and improved significantly. Monitored for additional 20 mins and released to go home.
1131029	3/24/2021	TX	83	F	3/11/2021	3/12/2021	Patient complains of nausea. This is nausea, without vomiting. This has been present for the past 2 weeks. The frequency of episodes is several times daily. Associated symptoms include lightheadedness and weakness. Pt received her first Moderna COVID-19 vaccine on 3/11/21, she has been experiencing these symptoms since that date. ROS: CONSTITUTIONAL: Negative for chills, fatigue, fever, and weight change. CARDIOVASCULAR: Positive for tachycardia. RESPIRATORY: Positive for dyspnea and unusual chest pain. GASTROINTESTINAL: Positive for heartburn. MUSCULOSKELETAL: Positive for bilat leg pain. NEUROLOGICAL: Positive for weakness. PSYCHIATRIC: Positive for frustrated.

1130394	3/24/2021	WI	71	F	2/28/2021	3/3/2021	The patient initially presented (3/3/21) with headache, fevers, nausea, vomiting, diarrhea, myalgias, malaise. Patient related she was in her normal state of health and only started to feel poorly after she received her second COVID-19 vaccination three days earlier. She interestingly related that after her first Pfizer COVID-19 vaccination she had significant burning in her stomach that she noted but no other major symptoms and notably did not experience this severe burning in her stomach after the second dose. She denied any chest pain, current dyspnea, productive cough, sore throat, urinary symptoms, sick contacts. She has no history of C. difficile, no recent antibiotics, no recent spoiled foods, no recent travel, no history of radiation. She does have a history of GERD and has had gastritis with mild gastrointestinal bleeding in the past and undergone EGD negative for H. pylori infection. She also has undergone colonoscopies with polyps that have been removed and reported as tubular adenomas. As her hospitalization progressed, she was diagnosed with Severe Sepsis due to E. Coli bacteremia in setting of liver abscess, Cholelithiasis without acute cholecystitis, Atrial Fibrillation with rapid ventricular response, Transaminitis (which resolved). Patient was appropriately treated for these conditions. Also, her known uncontrolled diabetes was treated. Per an Infection Disease note on 3/9/21: The patient has had hx of biliary colic (self diagnosis) now with discovery of non-obstructive cholelithiasis on RUQ US it is plausible that the abscess originated from self limiting cholecystitis/choolangitis which would be consistent with recent abdominal pain exacerbated with oral intake. Difficult to state definitively any relation to COVID-19 vaccination, though may have resulted from associated dehydration. Additional COVID vaccine info (both Pfizer): first dose: 2/7/21 lot# EN 5318 second dose: 2/28/21 lot# EN6202

1130142	3/24/2021	IN	65	F	2/9/2021	2/12/2021	Flue like symptoms; Little off balance; Severe mid chest pain; Fatigue; Arrhythmia a couple of times; Tremors a couple of times; Itching all over the body; A spontaneous report was received from a consumer concerning a 65-year-old, female patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced itching all over the body/pruritus, fatigue, flue like symptoms/influenza like illness, little off balance/balance disorder, tremors and arrhythmia(intervention/medically important) a couple of times and severe mid chest pain/ chest pain. The patient's medical history as provided by the reporter included cochlear implant. Concomitant medications reported included domperidone. On 09 Feb 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: 013M20A) intramuscularly in the left deltoid for prophylaxis of COVID-19 infection. On 12 Feb 2021, the patient experienced itching all over the body. On an unspecified date, the patient experienced fatigue, flue like symptoms, little off balance, tremors and arrhythmia a couple of times and severe mid chest pain. Lab details were not provided by the reporter. Treatment for the events included ibuprofen. Action taken with mRNA-1273 in response to the events were not reported. The outcome of the events, itching all over the body, fatigue, flue like symptoms, little off balance, tremors and arrhythmia a couple of times and severe mid chest pain were unknown.; Reporter's Comments: events of unexpected influenza-like illness, chest pain, tremor, balance disorder, pruritus, and expected fatigue. Event onset occurred Day 4 after the first dose of mRNA-1273. Treatment with ibuprofen. Event outcomes unknown. Based on current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.

1130555	3/24/2021	IL	62	F	2/25/2021	3/3/2021	HPI: 62 yo with a "bad gallbladder attack" 20 years ago. She was sick for 2 weeks but had no insurance and was treated conservatively. Her pain was principally in the R post. Flank. Since then she's has occasional mild attacks associated with the same flank pain and nausea. Two weeks ago last Friday while working at the post office, she became acutely ill with the same flank pain but this time also with epigastric and chest pain with nausea. She saw Dr. 4 days later and still felt lousey and then followed up on March 13. At that time the patient related the history as "The pain is described as aching, colicky, cramping and pressure-like, and is 5/10 in intensity. Pain is located in the RUQ, epigastric with radiation to right back. Onset was 4 days ago. Symptoms have been gradually worsening since. Aggravating factors: activity and eating. Alleviating factors: none. Associated symptoms: anorexia, belching, flatus and nausea. The patient denies fever, hematochezia, hematuria and melena." Subsequent blood work was normal including CBC, LFTs and lipase. US: A 1.9 cm shadowing gallstone is visualized. It is mobile. There is no gallbladder wall thickening or pericholecystic fluid. Patient reports right upper quadrant pain during the scanning. The common bile duct is normal in caliber measuring 2 mm. She remains fearful of eating. No CBD sx/signs. She's had one of two Covid vaccinations
1130571	3/24/2021	AL	18	F	1/16/2021	1/16/2021	I started having the symptoms in the afternoon. I was really fatigued and throwing up multiple times (nothing left in my stomach); had chest pain. My boyfriend rushed me to the hospital. While I was at the hospital (about 3:00 am) I threw up again at the hospital. They monitored me and put an IV on me. When I was able to hold down water and stop throwing up they let me go home - which was about 7. Prescribed Zofran and Pepsin. And they put me on a clear liquid diet for a day. They told me to Zofran, Pepsin and Benadryl before the second dose and told me to eat a meal before getting the second dose and I had no symptoms at all with second dose.

1125384	3/23/2021	IL	89	M	2/26/2021	3/11/2021	3/11/21 orthostatic hypotension, Fall and N-Stemi dx at a hospital -3/12 transferred to another hospital - 3/16 discharged to Swing bed at another hospital HPI: History of Present Illness: Patient is an 89-year-old Caucasian male with a medical history significant for atrial fibrillation on anticoagulation due to prior GI bleed, HTN, HLD, T2 dm, BPH who initially presented to outside facility following a fall. Fall was mechanical in nature and occurred whenever he slipped on water while walking with his cane out the front door. Primary point of impact was on his left leg in hip as well as possible head trauma. Preceding this event, patient denies any presyncope, syncope, chest pain, shortness of air, palpitations. An extensive workup was performed outside facility including CT scan of the left hip without contrast, CT scan of the head without contrast, lumbar x-ray, CT scan of the left knee without contrast all of which showed no acute fracture or abnormality. EKG showed normal sinus rhythm heart rate of 75 with incomplete RBBB. Labs are included below. Vital signs normal. Patient was getting ready to be discharged from facility and whenever they sat him up, he had an episode where he stared ahead and got diaphoretic as well as dizzy. Patient has recollection of this incident. Outside ER decided to get troponin at that time and came back elevated at 0.163. Patient continues to deny any chest pain. Denies other associated symptoms including fever, fatigue, chills, shortness of air, palpitations, abdominal pain, nausea, vomiting, diarrhea. CBC: WBC 9.2, HGB 13.4, HCT 39.3, PLT 223 BMP: Na 141, K 3.7, Cl 104, HC03 31, BUN 22, CRT 0.94, GLU 124. PT 10.5, PTT 24.7, PLT 1.07. Due to lack of Cardiology coverage at outside facility, patient transfer was requested for further troponin trending and possible cardiology evaluation should be deemed warranted. hpi 3/16 The patient is a 89 y.o. male with a past medical history notable for atrial fibrillation, CAD, diabetes, BPH, hyperlipidemia. The patient presents for evaluation of worsening issues of weakness status post recent hospitalization were patient was fainted and was found to have orthostasis. Patient had a cardiac workup which was negative for any significant cardiac disease. Patient's plan is to hopefully get stronger return home to more independent living. Patient was seen today in his room. Patient notes that he has done very well with therapy after his fall. Patient is

1126549	3/23/2021	CT	67	F	3/9/2021	3/9/2021	Under eyes feels like hives; No appetite; Left arm is stiff; Knees, legs and back all hurt; Having some chest pain; Left arm is swollen; Cheeks are puffy; Chills; Head hurts so bad can barley lift it off the pillow; Fainted after vaccine; High blood pressure; A spontaneous report was received from a consumer concerning a 67-year old female patient, who experienced fainting after vaccine (syncope), high blood pressure, head hurts so bad and can barley lift it off the pillow (headache), left arm is swollen (peripheral swelling), cheeks are puffy (swelling face), under eyes feel like hives (urticaria), left arm is stiff (limb discomfort), knees, legs and back hurt (pain), chills, no appetite(decreased appetite), and having some chest pain (chest pain). The patient's medical history included breast cancer, seasonal allergies, and asthma. Products known to have been used by the patient, within two weeks prior to the events, included chemotherapy unspecified (chemo pills for breast cancer). On 09 Mar 2021, prior to the onset of the events, the patient received the first of the two of their planned doses of mRNA-1273 (Lot number: 027A21A) for prophylaxis of COVID-19 infection. On 09 Mar 2021, the patient passed out at the facility right after her shot. The patient also reported that her blood pressure was very high, and she was rushed to the hospital for a few hours where vitals got down to stable, and she was sent home. On 10 Mar 2021, the patient reported that her head hurt so bad and she could barely lift her head off the pillow, her left arm is very swollen, her cheeks are puffy, under her eyes feels like hives, left arm is stiff, knees, legs and back all hurt. The patient also stated having chills, some chest pain, and no appetite. Treatment information for the events was unknown. Action taken with mRNA-1273 in response to the events was not provided. The events, fainting after vaccine (syncope) and high blood pressure were considered as recovered on 09 Mar 2021. The outcomes for the events of head hurts so bad and can barley lift it off the pillow (headache), left arm is swollen (peripheral swelling), cheeks are puffy (swelling face), under eyes feel like hives (urticaria), left arm is stiff (limb discomfort), knees, legs and back hurt (pain), chills, no appetite (decreased appetite), and having some chest pain (chest pain) were considered as not recovered.; Reporter's Comments: Based on the current available information and temporal association between the use of

This 76-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in arm left on 23Feb2021 15:15 (batch/lot number: EN6198) as a single dose for COVID-19 immunization. Medical history included heart attack approximately 20 years ago). Family history included heart problems. Patient received unspecified concomitant medications. No additional vaccines administered on the same date of the Pfizer suspect. Patient experienced some side effects after receiving the first dose of the Pfizer-BioNtech Covid-19 vaccine. About 3-4 hour after she received the vaccine, on 03Feb2021 19:00, she had heart pain for around 5 hours, she also experienced shoulder and neck ache. These symptoms have resolved. She would like to know if she should receive the second dose of the vaccine, if these symptoms would be worse. Treatment for side effects: she put Spikenard, an oil, on the chest for the heart. At 15:10, she was fine, went home, had dinner, and then she first got shoulder pain/shoulder blade pain and then a stiff neck. Then she thought, she will go to bed and then had severe chest pain most of the night. Patient has never had flu or any vaccines. AEs did not require a visit to emergency room/physician office. Patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Outcome of the event shoulder pain was recovering, of the event neck pain was recovered in 2021, and of the events heart pain, stiff neck, and chest pain was recovered on 23Feb2021.

1125075	3/23/2021	TX	72	F	1/25/2021	1/26/2021	Heart attack; Fatigue; Chest Pain; Cough; Fever; Muscle pain in chest area; Chills; A spontaneous report was received from a 72 year-old female patient who was administered Moderna's COVID-19 vaccine (mRNA-1273) and developed heart attack (myocardial infarction), fever (pyrexia), cough, fatigue, muscle pain in chest area (myalgia), chills, and chest pain. The patient's medical history and concomitant medications were not reported. On 25-JAN-2021, 26 hours prior to the onset of events, the patient received her second of two planned doses of mRNA-1273 (lot#: unknown) intramuscularly for the prophylaxis of COVID-19 infection. On 26-JAN-2021, the patient reported they have developed chills, fever, and muscle pain in the chest area. The reporter specified that it wasn't chest pain. The patient took acetaminophen for the pain. On 27-JAN-2021, the patient reported her fever subsided but she was still having a little cough and chest pain. On 28-JAN-2021, the patient had chest pain again during a nap and decided to call 911 because she was about to pass out. The patient was taken to the ER (emergency room) where an EKG (electrocardiogram) was performed. A few moments after the EKG, the patient had a heart attack. The cardiologist suspected the patient may have had a heart attack two days earlier because her cardiac enzymes were too high to be a result of a recent heart attack. The patient was admitted to the hospital from 28-JAN-2021 until 01-FEB-2021. Catheterization and stent placement were performed. Treatment medications included acetaminophen, clopidogrel, metoprolol, low-dose aspirin, and atorvastatin. At the time of this report, the patient was still feeling fatigued but other than that, she was feeling better. Action taken with mRNA-1273 in response to the events was not applicable. The outcomes of the events, heart attack, cough, muscle pain in chest area, fever, chills, and chest pain, were resolved. The outcome of the event, fatigue, was not resolved.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

1126560	3/23/2021	NH		M			<p>passed away; chest pain; trouble breathing; This is a spontaneous report from a contactable physician and from three non-contactable consumers from a Pfizer-sponsored program. A 66-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; lot number and expiry date not reported), via an unspecified route of administration, on an unspecified date, as SINGLE DOSE for covid-19 immunisation. The patient had just taken the COVID-19 vaccine and he was hospitalized due to the effects. The patient was rushed to hospital with chest pains and was experiencing trouble breathing. The patient was in the ICU fighting the effects of the vaccine. The patient passed away four hours late on an unspecified date. The outcome of chest pains and trouble breathing was unknown. Cause of death was unknown. It was unknown if an autopsy was performed. Information on the lot/Batch number has been requested.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events death, chest pain and dyspnea cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.; Reported Cause(s) of Death: passed away</p>

1127240	3/23/2021	TN	72	F	3/19/2021	3/19/2021	Patient received her first Pfizer dose with no problems. She came back at her scheduled appointment for the second dose of Pfizer. She initially did well, but after 30-40 minutes the patient came back to the pharmacy complaining of chest pain and felt her throat was tightening up. She felt it was from the vaccine and not from any other reason. I asked her if I could call a paramedic and she declined. I asked about calling a family member/ friend and she also declined. I gave her 5ml of liquid Benadryl and asked her to continue sitting in the pharmacy. After apx. 10-15 minutes she stated she was starting to feel better. I checked on her every few minutes and kept her in my view the entire time. After apx. 30 more minutes she stated feeling a lot better and wanted to go home. I again offered to call someone or call paramedics and she adamantly refused. I gave her some additional Bendadryl to take home with instructions to take 5 ml every 4 hours for the rest of the day. She left the store. After a apx. 5 minutes a technician went out to see if she had left. She spoke to the patient in her car and patient stated she was fine and heading home. She stated she could drive b/c she only lives a couple minutes from the store. I called the patient at home later that night to check on her and she stated feeling fine, and thanked me for checking on her.

1126941	3/23/2021	MI	61	F	3/15/2021	3/19/2021	<p>Patient with 2 Emergency Department visits after vaccination. (3.19.21 & 3.22.21) 3.19.21: Symptoms: Patient had the J&J vaccine on Tuesday, and felt fatigued on Wednesday. Today she is more short of breath than normal and states she has chest pain. Daughter has suggested an ambulance, but patient, who is A&O X 3, declines. Daughter will bring to ED for evaluation. 61-year-old female with history of asthma, sleep apnea, environmental allergies, and hypertension presents emergency department complaining of shortness of breath and cough that started this morning and midsternal chest tightness rating at a 7/10. Sent home with prescriptions to manage cough, inhaler and steroid burst. 3.20.21 Office Visit: Patient states Wednesday 03/17/21 morning cough and mild fatigue started. Thursday 03/18/21 patient had shortness of breath with exertion x2 days. Yesterday 03/19/21 patient went down the stairs and was having severe shortness of breath. Patient felt like she couldn't get enough air in. Patient was seen in ED 03/19/21 and prescribed cough medicine. Patient states cough is constant with intermittent coughing fits. Patient was tested for COVID-19 while in ED and results were negative Shortness of breath is still present, but is better after ED visit. Patient states she feels 50% better today 03/20/21. Patient has been using inhaler and prednisone. Patient is needing to move slower to compensate for shortness of breath. Cough is present still. Cough is deep and dry. Yesterday 03/19/21 cough was productive. Today 03/20/21 patient is getting a small amount of phlegm out and it is white in color. Denies fever. No known exposure to COVID-19. History of asthma, not much relief currently with inhaler. When shortness of breath is present, it takes patient about 20-30 minutes to recover. Intermittent wheezing with mild wheezing present currently. Tightness in chest is present and coughing makes it worse. Patient had COVID-19 in April of 2020. Any treatment So Far: ED visit, Inhaler, prednisone, and prescribed cough medicines 3.22.21: Mon Mar 22, 2021 1722 This is a 60 year female presents for evaluation of shortness of breath. Some been going on for about a week now. She was just seen in the emergency department 3 days ago for same complaints. At that time she had a cardiac workup that was unremarkable. On initial evaluation here today she appears in no acute</p>

1126834	3/23/2021		78	F	1/13/2021	1/16/2021	vaccinated 1/13. presented for COVID screening on 1/14 due to a + exposure. Test was +. Patient came to ED on 1/16 with weakness, congestion, poor appetite, coughing. Previous headache and sweating had resolved by the time she presented. Discharged with isolation instructions. Returned to ED late on 1/22 with "right-sided chest pain described as sharp constant 6/10 nonradiating pain localized to the right side of upper chest, shortness of breath with exertion since this afternoon. She does endorse subjective fevers, with associated increased coughing which is productive in nature, shortness of breath." Admitted to ICU early 1/23, transferred to Medical Center on 2/4/21.
1122931	3/22/2021	MT	49	F	2/12/2021	2/12/2021	1st dose 1/19/21 resulted in 72 hours with fever 102, body aches, chills, headache, coughing, shortness of breath, extreme fatigue. Symptoms resolved pretty abruptly at 72 hours. 2nd dose 2/12/21. Again symptoms within 12 hours. fever up to 103, chills, headache, extreme fatigue, body aches, coughing, increased oxygen demand. Initial symptoms lingered over 14 days. On 2/25 was prescribed 20mg prednisone for 5 days which resulted in slight improvement. Then continued to slowly decline again with increased fatigue, chest pain, more shortness of breath. Saw pulmonologist on 3/10. Referred to cardiologist and echo on 3/11 with concern for heart failure. Echo on 3/11 showed acute right sided heart failure, new diagnosis. Cardiologist and pulmonologist both state that I reacted with severe symptoms to first dose of vaccine but recovered. 2nd dose I just could not recover from and with my compromised lungs from post-acute covid syndrome, wound up with heart failure.

1122976	3/22/2021	CA	57	F	3/19/2021	3/19/2021	57y/o female presents with mild throat tightness ~15min after receiving Pfizer vaccine into the left arm. She states that it feels as though something small got stuck in her throat and is causing mild discomfort. She reports associated injection site pain, body cramps, and headache. She denies itching, difficulty breathing, shortness of breath, chest pain, palpitations, blurry vision, presyncope, difficulty swallowing water, or lip/tongue swelling. She reports no change in symptoms after 40min. post-injection. Physical Exam: Heart Rate 66bpm, Blood Pressure 115/74, Repeat Blood Pressure at 40min post-injection 120/80 Cardiac: regular rate and rhythm Lungs: unlabored breathing, clear to auscultation bilaterally Skin: no injection site erythema or swelling. No rash. No lip/tongue swelling or narrowing of oropharynx. Plan: Patient reports that her symptoms have improved at 1hr post-injection and would like to leave. I advised her that she should wait until all of her symptoms have resolved as throat tightness is a concerning adverse reaction. I provided her with options including contacting EMS right now to take her for observation at the hospital, however, the patient declined and said she would not go in the ambulance. She insisted that she wanted to go home and that her husband was driving and would take her to the emergency room if her symptoms worsen. Patient was well-appearing when she left the vaccination site.

1123124	3/22/2021	CA	60	F	2/17/2021	2/17/2021	<p>Due to 4 days progressive worsen skin lesion. Lesion as erythema multiform, generalized on hand, forearm, body and lower leg; Oral ulcer; Chill; Body ache; Joint pain; Joints swelling; Diarrhea; This is a spontaneous report from a contactable other healthcare professional (HCP). A 60-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EN6201), via unspecified route of administration in the left arm on 17Feb2021 as single dose for COVID-19 immunization. Medical history included hyperlipidemia. The patient had no known allergies. The patient is not pregnant. There were no vaccine in four weeks. Other medications in two weeks included cholesterol med. The previously received the first dose of BNT162B2 on 26Jan2021 12:00 intramuscular at left arm (lot number: EL9262) for COVID-19 immunization. The patient was seen at urgent care on 04Mar2021 due to 4 days progressive worsened skin lesion. Lesion as erythema multiform, generalized on hand, forearm, body and lower leg from 28Feb2021 (12:00 AM). Patient presented with chill, body ache, joint pain, joints swelling and diarrhea since second dose of vaccine on 17Feb2021. She also has oral ulcer at the same time when rash started on 28Feb2021. Vital sign was stable, no shortness of breath (SOB) and no chest pain. Events resulted in Doctor or other HCP office/clinic visit. The treatment for the events included Hydroxyzine 25 mg prn. It was unknown if patient had COVID prior vaccination or if COVID tested post vaccination. The outcome of the events was not recovered.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of event Erythema multiforme cannot be excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p>

Nurse Practitioner Cosigned by: MD at 3/19/2021 9:22 AM Expand AllCollapse All 3/18/2021 Subjective female who was seen at Clinic today for her first dose of the COVID 19 vaccination. She was given the Pfizer vaccination in the left deltoid muscle. During her 15 minute waiting period after the injection, the patient began to experience lightheadedness and dizziness. She denied rash, hives, welts, difficulty breathing, difficulty swallowing, wheezing, throat tightness, hoarseness, stridor, itching, facial swelling, lip swelling and tongue swelling. This provider was notified of patient reaction and she was then assessed in the emergency bay area. Monitored patient for severe reaction symptoms, including but not limited to abdominal pain, blood pressure abnormality , chest pain, collapse, drooling, hypotension, increased swelling, rapid progression of symptoms, respiratory distress, skin changes, tongue swelling and vomiting. Pt became hot and light headed after receiving her shot. She was brought by WC to the bay. She was given water and an ice pack was laid on the back of her neck. ALLERGY REVIEW OF SYSTEMS: Patient complains of dizziness Hot and sweaty: CONT negative HENT negative Eyes negative Respiratory negative Skin negative GI negative Musculo negative Previous Reactions: None Objective Vitals Vitals: 03/18/21 1535 03/18/21 1550 BP: 131/67 130/75 Pulse: 84 65 SpO2: 100% 100% Physical Exam Vitals and nursing note reviewed. 1124606	3/22/2021	CA	65	M	1/21/2021	1/22/2021	65 Y male who is referred for c/f dyspnea and chest pain. Per clinic notes: "Brief summary covid vaccine 1/21 with side effect within 12 hr lasting 3 d By around 1/26-1/29 had cp w/ exertion and SOB TST 2/2 w/ Minor ekg changes and min workload per pt (mod workload per note) nuc study pending. Cough and SOB worse over the last 5 d or so, sleeping in recliner, and having trouble sleeping. Though no desat on march test, he has freq intermittent coughing and he was tachycardic to 110 on exam this am." Pt states symptoms worsening over past week. No symptoms at rest. With exertion has anterior chest tightness and dyspnea. No radiation of pain or migration. He can walk usual distances but much slower. Improved at rest. Cannot lay flat at night. Cannot sleep much at night. Dry cough. No wt changes or LE pain/swelling. No f/c. No ill contacts. No chest pain currently. Pt underwent exercise treadmill stress test on 2/2/21 that showed borderline ischemic changes (so a myocardial perfusion study was planned) but patient's dyspnea on exertion worsened so he was seen in clinic on 2/10/21 where he was noted to have elevated BNP and D-dimer, was sent to the emergency department where CT angiography was negative for pulmonary embolism but it revealed pulmonary edema with bilateral pleural effusions. Patient was admitted, noted to have elevated troponin, anterolateral ST depressions on EKG, noted to have rapid atrial fibrillation, had NSTEMI so he underwent cardiac cath on 2/10/21 that revealed multivessel coronary artery disease, was hypotensive so IABP was placed, percutaneous coronary intervention of left main, LAD and RCA were done and admitted to the ICU. TTE on 2/11/21 showed LVEF 45% with moderate posteriorly directed MR, was diuresed, started IV amiodarone for SVT and atrial fibrillation, IABP was removed on 2/12/21, dopamine IV drip was weaned and patient was transferred to telemetry on 2/13/21 for further care. Heparin was transitioned to Pradaxa on 2/14/21 and dopamine drip was weaned off on 2/16/21. Patient then had an episode of epistaxis on 2/18/21 (resolved with pressure and Afrin spray), had cough on 2/18/21 and chest x-ray showed mild worsening bilateral central patchy parenchymal opacification so IV Zosyn was started (2/18-2/21/21) then changed to Augmentin (with plans to complete course on 2/24/21), Lasix give for diuresis, CT chest and abdomen was done on 2/20/21 for

							anemia that showed no obvious hematoma or soft tissue collections. Patient continued diuresis and cardiac medications adjusted. Coronary artery disease, paroxysmal atrial fibrillation, NSTEMI status post percutaneous coronary intervention, cardiogenic shock, systolic dysfunction congestive heart failure, moderate MR: Patient was continued on current cardiac medications including aspirin (for 1 month post cath until 3/10/21), clopidogrel, atorvastatin, Pradaxa, losartan, spironolactone. Continued lasix 80mg PO daily as maintenance diuretic regimen per cardiology recommendations. Patient's current weight is 178 lbs (admission weight was around 189 lbs). Patient was not started on beta blockers given recent cardiogenic shock. Acute kidney injury: Seems to have resolved with current creatinine of 1.2. Leukocytosis: Resolved. Will complete about 7 day course of antibiotics with Augmentin until last dose on 2/23/2021. Tobacco smoker: Patient was counseled on smoking. Patient was advised to quit. Discussed smoking cessation classes. Continued nicotine patch. Anemia: No evidence of active bleeding. Will repeat CBC on 2/26/21 as patient is on dual antiplatelet therapy as well as anticoagulation. Patient was also placed on pantoprazole for GI ulcer prophylaxis. Patient got 2nd COVID19 Moderna vaccine as outpatient on 2/27/21.

1121951	3/22/2021	KY	78	F	3/20/2021	3/21/2021	Patient is a 78 yr/o female who IBS, HDL, GERD, gastroparesis, anxiety, depression presents to the Emergency Department complaining of fever and generalized body ache onset 3 AM this morning. She attributes it to the second Covid shot that she received yesterday. She progressively started experiencing abdominal discomfort which she attributes to gastroparesis. Reports she took Tylenol at 1 PM for body ache with no relief. She also took Zofran for nausea. She had associated diarrhea without any hemochezia. Denies chest pain but has shortness of breath. She did not check her temperature at home. States she had a fever upon arrival to the emergency department. She denies dysuria, hematuria, flank pain. Patient has a history of COVID-19 infection in April 2020.
1124730	3/22/2021	CA	28	F	3/22/2001	3/22/2012	At 4:15 pm, While under observation for 30 minutes, pt c/o heaviness in the eyes., and slight chest pain. pt. also c/o nausea and vomiting symptoms. pt. c/o numbness in the left arm. Pt. was encouraged to take deep breaths. Pt. was helped to the ground in a supine position. BP=140/90, HR=88, RR=18 . Pt was alert and oriented X4. 2 minutes after deep breaths, patient reported that all symptoms had subsided except numbness in the left arm.
1125110	3/22/2021	FL	62	M	3/19/2021	3/19/2021	Chest pain (middle of chest); wheezing; back pain; disorientation; light headed
1124710	3/22/2021	MI	56	M	3/20/2021	3/20/2021	Apprx. 6 hrs after the shots (both my girlfriend and I experience almost identical symptoms) Severe chills, Fever, severe headache, severe muscle pain throughout the body, chest pains, diarrhea, nausea, vertigo, increase heart rate! Two days later and I am still experiencing vertigo, diarrhea, nausea!
1124708	3/22/2021	CA	56	F	3/19/2021	3/19/2021	Severe burning in chest immediately after injection, sudden severe weakness, severe headache onset within 5 minutes, with some queasiness, subsequent chest congestion, cough, pain in chest area, sore throat.

1124644	3/22/2021	WA	73	F	3/2/2021	3/11/2021	History of present illness: patient is a 73 y.o. year old female with a history of hypothyroidism, hypertension, history of breast cancer status post bilateral mastectomies who presented with complaints of bruising, petechial rash and gum bleeds. She noticed that when she was brushing her teeth this morning, her gums were bleeding and found a pea size hematoma in the bottom of her lip. Denies recent injury or trauma. Denies fevers chills nausea vomiting chest pain shortness of breath cough weakness dizziness lightheadedness. Denies hematuria or blood in stools or dark stools. Patient reports she received her first dose of Covid vaccine on March 2. She noticed a large bruise in her injection site this morning. Denies pain. She reports that her lower extremity started itching last week and she began scratching and knows it is small red dots diffusely distributed in her bilateral lower extremities. Denies starting any new medications. Denies history of HIV or hep C. She reports starting a new topical medication given to her by a dermatologist for dry skin but does not know the name. Denies history of blood disorders. 3/18: Patient diagnosed with idiopathic thrombocytopenia and admitted to medical floor. History of present illness as above. Plt <2; WBC 9.2; Hgb/Hct 13.2/38 3/19: Oncology provider consulted and recommended oral prednisone 100 mg daily, transfusing for any evidence of significant bleeding and considering IVIG if no improvement in platelets after 2 days. After further discussion plan was changed to dexamethasone 40 mg dailys x 4 days and rechecking CBC, transfusing platelets if <2 with a goal of >10. Labs showed plt <2, transfused 1 units, plt increased to 9, transfused additional unit. Plt <2, <2, transfused 1 unit plt, increased to 9, transfused additional unit of plt. WBC 94.6, 10.1, 13.4 (no s/s infection, monitored); Hgb/Hct 13.1/38, 12.8/37, 11.7/33 (decreased throughout day). 3/20: Provider consulted hematology who recommended rechecking platelets in 24 hours and considering IVIG on 3/21. Continued dexamethasone. Platelets increased to 11 after additional plt transfusion on 3/19. WBC 15 (no s/s infection, monitored); Hgb/Hct 11.3/32. 3/21: Platelets found to be <2 with morning labs. Transfused 1 unit of platelets, IVIG ordered by hematologist, and dexamethasone was continued. Plt <2, transfused 1 unit plt, plt increased to 21. WBC 14.2, 17.5 (no s/s infection,

ITP refractory to treatment with prenisone, high-dose dexamethasone and is status post 1 dose of IVIG. Patient to receive her last dose of dexamethasone today and reassess tomorrow. Additional dose of IVIG planned for 3/22. Plt 2 in the am, increased to 43 in the afternoon. WBC 11.5, 13.7 (no s/s infection, monitored); Hgb/Hct 11.2/33, 12.8/37 Patient is still currently admitted.
1124577	3/22/2021	MI	70	M	3/2/2021	3/3/2021	Immediately after standing up experienced ringing in the ears and faintness. Was helped back to nurse who laid me for 15 minutes for observation. When I laid down I became very flush and sweaty. Then at 12am experienced fever of 101, body aches, and sharp stabbing chest pain which has lasted 18 hours so far.
							My father received the first Covid shot 3/2; he woke up 3/3 with severe body aches and weakness, which we thought nothing of. However, every day, he got weaker and weaker. He has been treated for Liver cancer, he received his first infusion of Opdivo almost 4 weeks before the vaccination. About 7 days after the shot, he was having trouble swallowing so he went to the ER to get a CT scan. He was found to have greatly elevated troponins, the DR was baffled he wasn't having any chest pain; they were apparently not trending either., he has never had a heart attack or any other heart problems, takes Nadolol for high blood pressure. The CT scan showed significant growth of his tumors which had been stable for a year and the last CT scan was the end of January; liver enzymes were also significantly elevated whereas they were stable before. My father deteriorated rapidly, and died on 3/18/21. The day he got the shot just prior, he was hauling wood, shoveling snow and living a normal life feeling good. The day after the shot he could barely get out of bed he was so weak, until he finally died 16 days later.

1123658	3/22/2021	VA	62	M	1/6/2021	1/7/2021	Second COVID vaccine received 01/06/21. Within 24 hours developed fever, chills, malaise, myalgia, nausea, vomiting, diarrhea. Duration 8 hours, clinical dehydration, missed one night ED shift(HCP). 5 days post vaccine, 01/11/21 developed neck and chest pain, progressed requiring ED visit 01/12/21. Cardiology consult, negative cardiac evaluation. Persistent intermittent chest pains, usually exertional and post-exertional. 02/05/21 developed atrial fibrillation with rapid ventricular response with unsuccessful cardioversions, small pericardial effusion by echo. 03/11/21 readmission for enlarged pericardial effusion and pericardiocentesis. Continue high dose aspirin, colchicine, metoprolol, flecanide. Have not returned to work.
1124682	3/22/2021	NY	34	F	3/17/2021	3/17/2021	No pain or adverse event for the first 4 hours after vaccination. Starting at 2pm, which was 4 hours after my vaccine, my chest began to tighten. It was not severe; I took a normal walk and was just mildly uncomfortable. It escalated hourly for about 10- 12 hours. At 8pm, the pain, pressure, and tightness around the chest went from mild to moderate, from a pain level of 2 to about 3 or 4. The sensation was one of a stack of books on my chest. There was pressure and mild pain (again, not severe), about 8-10 inches horizontally across my chest, from about the bottom of my sternum to the collarbone. I also felt some pressure in my lower throat, perhaps the bottom third of my neck. I did not have any shortness or breath, swelling, or difficulty swallowing. At about 9 pm, I became itchy on my neck, ankles, and flank. I developed some red spots, which were not large enough to be hives, They mostly became red from my itching, though they were more moderately itchy than seriously itchy. I have had hives before, and they did not appear to be hives, more just isolated red spots. Once I became itchy, I went to the ER. They worked me up for cardiac issues and a blot clot, but all tests were negative. I did not take any medication other than my standard Oxcarbazepine 8pm dose of 300 mg. The itchiness went away at about 11pm (two hours after onset), and the chest pain did not worsen. The following morning, it was significantly better, and about 36 hours after I first received the vaccine, it was gone entirely.

RN Leader notified and at bedside. 11:50: MD at bedside for evaluation. Pt states symptoms are not worsening. Pt offered PO Benadryl, but declined due to potential for sedative effects and not having a ride home at this time. MD in agreement to hold off on Benadryl - per his instruction, will continue to monitor pt for additional 30 min (1 hr total), and take Benadryl once she arrives home. 12:31 - VSS, BP 116/82 (95), O2 99%, P 75, RR 18, T 97.6. Pt is A&Ox4, speaking in full sentences. Reviewed MD instructions and ER precautions with pt, including to call 911 in case of chest pain, SOB, or throat swelling. Pt verbalizes understanding. Pt is able to ambulate independently to exit of facility.

1123786	3/22/2021	KS	47	M	3/18/2021	3/18/2021	Notes: APRN (Nurse Practitioner), Cosigned by: MD at 3/19/2021 9:22 AM, COVID VACCINE CLINIC 3/18/2021 Patient/Date: 3/18/2021 Subjective: a 47 y.o. male who was seen at SVH COVID Vaccine Clinic today for his first dose of the COVID Pt is a 47 y.o. male who was seen at COVID Vaccine Clinic for his first does of COVID 19 vaccination. He was given the Pfizer vaccination in the left deltoid muscle. During his 15 minute waiting period after the injection, the patient began to experience lightheadedness and dizziness. He denied rash, hives, welts, difficulty breathing, difficulty swallowing, wheezing, throat tightness, hoarseness, stridor, itching, lightheadedness, dizziness, facial swelling, lip swelling and tongue swelling. This provider was notified of patient reaction and he was then assessed in the emergency bay area. Monitored patient for severe reaction symptoms, including but not limited to abdominal pain, blood pressure abnormality , chest pain, collapse, drooling, hypotension, increased swelling, rapid progression of symptoms, respiratory distress, skin changes, tongue swelling and vomiting. Pt received shot and complained of being hot and sweaty. He was laid on the floor in injection room 5, with his feet elevated, some water was given and once pt was feeling better he was transferred to the ER bay for observation. He refused a wheelchair and walked to the bay with help. After sitting for awhile we cooled down and he was allowed to leave. ALLERGY REVIEW OF SYSTEMS: Patient complains of dizziness, and hot and sweaty: CONT negative, HENT negative, Eyes negative, Respiratory negative, Skin negative, GI negative, Musculo negative, Previous Reactions: None, Objective: Vitals - There were no vitals filed for this visit. Physical Exam - Constitutional: Appearance - He is well-developed. HENT: Head - Normocephalic and atraumatic. Right Ear- External ear normal. Left Ear: External ear normal. Nose - Nose normal. Eyes - Conjunctiva/sclera: Conjunctivae normal. Pupils - Pupils are equal, round, and reactive to light. Cardiovascular: Rate and Rhythm - Normal rate and regular rhythm. Heart sounds: Normal heart sounds. Pulmonary: Effort - Pulmonary effort is normal. Breath sounds: Normal breath sounds. Musculoskeletal: General -Normal range of motion. Cervical backN - normal range of motion and neck supple. Skin: Coloration: Skin is pale. Neurological: Mental Status - He

1119811	3/21/2021	WV	55	F	12/29/2020	2/1/2021	chest pain; signs of super ventricular tachycardia; swelling on the right side of my face; Frequent palpitations; From the knees down, both legs felt numb into her feet; Could not stand; shortness of breath; Premature ventricular contractions; A spontaneous report was received from a consumer concerning a 55-years-old female patient , who received Moderna's COVID-19 vaccine(mRNA-1273) and experienced the following: chest pain, could not stand (dysstasia), shortness of breath (dyspnea), signs of supraventricular tachycardia (supraventricular tachycardia), swelling on the right side of face (swelling face), from the knees down, both legs felt numb into the feet (hypoesthesia) , frequent palpitations (palpitations), premature ventricular contractions, a lot of them (ventricular extrasystole). The patient's medical history was not provided. Relevant concomitant medications as reported included metoprolol . On 29 Jan 2021, prior to the onset of events, the patient received their second of two planned doses of mRNA-1273(Lot/batch:013L20A) intramuscularly in the left deltoid for prophylaxis of COVID-19 infection. On an unspecified date the patient experienced events swelling on the right side of face , signs of supraventricular tachycardia , frequent palpitations . On 01 Feb 2021, the patient experienced shortness of breath and a lot of premature ventricular contractions (this was confirmed by patient's doctor on an EKG). On 05 Feb 2021, the patient reported they were starting to get in trouble. They woke up on 06 Feb 2021 with chest pain and very short of breath. From the knees down, both legs felt numb into the feet. By the end of the day, the patient could not stand. The patient's cardiologist prescribed metoprolol which was helping some. On an unknown date, the patient ended up in the emergency room (ER) with chest pain. An echocardiogram didn't show much. The last week of February 2021 (dates unspecified) the patient reported they went to the ER again for chest pain. At that time, the numbness and tingling had gone away. The patient was admitted for two nights to the local hospital and while there had a poor exercise test and signs of superventricular tachycardia. Treatment included an increase in metoprolol, but the patient still had frequent palpitations. Metoprolol was again increased to control and monitor the heart. The patient is wearing a heart monitor. The patient received both scheduled doses of

1120608	3/21/2021	TX	25	F	3/18/2021	3/21/2021	<p>mRNA-1273 prior to the event(s); therefore, action taken with the drug in response to the event(s) is not applicable. At the time of the report, the outcome of the events ,swelling on the right side of face,signs of supraventricular tachycardia , frequent palpitations, shortness of breath, premature ventricular contractions, chest pain, and could not stand, was unknown . At the time of the report, the outcome of the event from the knees down both legs felt numb into the feet, was considered resolved .; Reporter's Comments: The events were consistent with increased risk of cardiovascular complications associated with age of patient. Company assessed the events to be unlikely related to company product.</p> <p>Patient had vaccine on 3/18/21 at 1600. She presented to the ED on 3/21/21 @ 2202 for chest pain that started at ~1600. She states the chest pain is in the center of her chest, feels like pressure, non-radiating, with occasional shortness of breath. It felt similar to when she had COVID in January. She denies other symptoms including fever, URI symptoms, palpitations, pain with deep inspiration, leg swelling, recent travel, nausea/vomiting, diarrhea, dizziness, feeling like she was going to pass out, rash or other symptoms. It is not exertional and was better with walking. Denies heavy lifting or injury. She was hypertensive in the ED BP 151/99 but all other vitals within normal limits. EKG shows NSR without evidence of arrhythmia or ischemic changes. She did have U waves seen so labs were drawn including CBC, CMP, cardiac enzymes. Chest x-ray showed no acute cardiopulmonary process. She received 30 mg Toradol IV for pain. Labs were all within normal limits except mild hypokalemia. She felt better on reassessment and BP was still elevated but improved 137/90. She was discharged and instructed to take OTC Tylenol as on the bottle as needed for pain and given return precautions and follow up with PCP on return to stateside.</p>

1117672	3/20/2021	CA	45	F	3/16/2021	3/16/2021	chest pain, fatigue, headaches, chills, arms soreness, insomnia
1118839	3/20/2021	AL	40	F	3/19/2021	3/19/2021	Received vaccine around 11:40am. Around 7pm same night on 3/19/21 noticed rash to tops of both feet, with mild swelling and itching to feet and lower legs. Took 2 benadryl and went to sleep. Woke up this morning with facial swelling, eyes swollen shut. Took Claritin and states improved greatly. Reports itchiness in throat but denies difficulty breathing, throat swelling, chest pain or shortness of breath. Rash on feet/legs was gone when she woke up, still has itchy sensation to body but no rash. Patient reports improving symptoms at time of evaluation in Urgent Care, but would like to report side effect/reaction.

1118340	3/20/2021		78	M	2/5/2021	3/20/2021	<p>Patient is a 78-year-old male with history of COPD, paroxysmal atrial fibrillation, ischemic cardiomyopathy, type 2 diabetes mellitus, status post mitral valve replacement with metallic valve on Coumadin, stage II: CAD status post LAR. Presented to Hospital campus on account of severe shortness of breath in a patient with significant weakness. Patient has had significant shortness of breath progressively worsening. Patient was just discharged from this facility on 03/17/2021. The patient was admitted on 03/05/201 on account of shortness of breath. During the admission, patient had a multiloculated right-sided pleural effusion requiring video-assisted thoracoscopy and evacuation of hemothorax. Associated with chest wall mass. Subsequent biopsy revealed evidence of small cell carcinoma. The patient was seen by oncology during that admission with a Mediport put in place. With plans to follow-up with oncology outpatient for continued management and to hopefully initiate chemotherapy. There was also concern for acute congestive heart failure and required diuresis. Echocardiogram was showing EF of 40% at the time. Now, patient is presented to the emergency room on account of significant weakness in the patient well developed worsening shortness of breath over the last couple of days. Patient was still short of breath and weak he could not even get up the toilet seat. When EMS saw the patient he was satting 80% on room air and required 6 L via nasal cannula. Did not complain of any chest pain or cough with this finding. Neither did he complain of any fever. In the emergency room, patient was tachypneic and slightly tachycardic. Lab work shows lactic acid of 2.3 glucose of 302 and creatinine of 1.90. The patient's BNP was 1170 with GFR of 34. Patient INR was 4.5. Chest x-ray shows Trace right pleural effusion. No pneumothorax. With concern for pneumonia patient was given azithromycin and Unasyn. Also with concern for possible CHF patient was given Bumex.</p>

1115812	3/19/2021	IL	47	F	3/16/2021	3/16/2021	Immediately broke out in a sweat and was very hot. Didn't think much about it. The staff noticed I was in some distress and kept asking if I was okay to which I replied I thought I'd be fine once I got some fresh air. Left the facility to drive home and didn't feel right, Within 30 minutes, developed chest pains, rash and labored breathing. I recognize the symptoms as the same symptoms I get when I've had morphine, which I now must list as an allergy. This lasted 4 hours, then got better. The next day around 1:00, I became ill again with flu-like symptoms and had to leave work. Headache and body aches mostly. I was ill with these symptoms for a 24 hour period. Hopefully all symptoms have passed, except my arm which is red, swollen, itchy and feverish.
1115156	3/19/2021	PA	65	F	3/19/2021	3/19/2021	Pt. states that she received the 1st pfizer covid vaccine to left arm at 0930 on 3/19/21. Pt. states that she started to have heart palpitations around 15 minutes after receiving the covid vaccine. Patient noticed arm redness to bilateral arms. Pt. states that heart palpitations have resolved. Pt. denies shortness of breath, denies chest pain, denies difficulty breathing.
1115904	3/19/2021	MI	63	F	3/18/2021	3/18/2021	Patient presented to clinic for Covid-19 vaccine. Patient started complaining of chest pain 5 minutes after vaccination. Patient denied shortness of breath, but states the pain worsened with deep breathing. Patient denies other complaints or symptoms. Vital signs stable and work of breathing normal. RN auscultated lung sounds, upper lobes clear bilaterally. Blood sugar 227. Patient states she has diabetes and hypertension. Patient kept closing her eyes, RN encouraged patient to keep her eyes open, but patient kept stating, "I'm tired." RN notified provider, provider in to assess patient. Per provider, patient to go to ED via EMS. Patient's husband notified and arrived to clinic to be with patient. RN contacted EMS and report given.
1117071	3/19/2021	TX	27	M	3/1/2021	3/12/2021	Patient developed chest pain, shortness of breath, and fatigue approximately 10 days after receiving 2nd dose of Moderna vaccine. Patient describes symptom onset as acute, and came to hospital 2 days after chest pain developed, as it became more unbearable. Described chest pain as worse with leaning forward.

1115944	3/19/2021	NC	55	M	3/18/2021	3/18/2021	1-2 hours after receiving Moderna vaccination patient began complaining of chest pain to family members but refused to seek medical attention. He was found deceased this morning (03/19/21) by his family. Medical Examiner determined time of death was around 8:40pm on 03/18/21.
1115987	3/19/2021	NJ	61	F	3/18/2021	3/18/2021	At about exactly 12 hours after receiving the vaccine. I was sitting in my living room watching TV and a sudden severe pain shot through my chest and followed by tightness and difficulty breathing. It was immediately accompanied by a pain between the shoulder blades, cold sweat, nausea, then neck pain and faintness along with the uncontrollable need to move my bowels which was in diarrhea form and continued 3 times within 20 minutes with the other symptoms. After about 5 minutes of receiving the onset of the initial shocking pain, the intensity of the chest pain left but the tightness remained and faded but would return and then subside again every 10 minutes. I went to the emergency room at 11:20pm discharged at 2:50am on 3/19/21.
1115816	3/19/2021	TX	66	F	3/11/2021	3/11/2021	Symptoms began little after ten hours of receiving vaccine. Symptoms included flu like symptoms of aches, joint pain and fatigue with fever up to 101 lasting 3 1/2 days. Fever broke Sunday night 14th, approx 9:00pm. Awoke Monday the 15th light headed and fatigued but aches and fever gone. Then approximately 5 pm on Monday the 15th started having chest pain, upper right side. By midnight I was being transferred to ER for the chest pains. Released Monday morning the 16th from ER. Dx. Possible chest wall inflammation; Followed up with primary care office (not my regular Dr. but with Dr. Have been experiencing internal jittering; agitated cough, upper respiratory issues (but lungs are clear.) ever since I originally had Covid.

1114505	3/19/2021	AL	37	M	3/16/2021	3/16/2021	Well I?m alive. It started about 45 minutes after taking the vaccine. It began as heavy salivating and turned into a numb tongue. I have never had an allergic reaction, so didn?t pay much attention to it. After returning home I became severely lightheaded and almost passed out. I immediately took a Benadryl and Motrin. Then my heart rate shot up to 160BPM according to my smart watch and maintained that for around 5 minutes. The home medicine helped it to subside, but the same feelings would return in moderate waves. By 2pm, I decided I should seek professional help and was taken to the ER by a family member. By this time I had moderate chest and jaw was very tight. At the ER I was monitored for 1 hour and then given an IV injection of Benadryl, Pepcid, and Decadron(steroid). I immediately get relived and well. I was released from the ER around an hour later and sent home with a prescription of Benadryl, Pepcid, and Prednisone Oral Steroid. I have since had a few different side effects like chest pain, extremely flushed face, and low grade fevers. The medicine taken at home immediately stopped the face flushing.

1114378	3/19/2021	TX	68	F	2/6/2021	2/10/2021	multiple blood clots in lungs; multiple blood clots in legs; feeling chest pain; short of breath; This is a spontaneous report from a contactable consumer (patient). A 68-year-old female patient (pregnant: No) received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL9269), via an unspecified route of administration in left arm on 06Feb2021 at 18:00 at single dose for covid-19 immunisation. The relevant medical history included DCIS Breast cancer from 2016, Known allergies: pencillin from an unspecified date. Concomitant medications included levothyroxine sodium (SYNTHROID). The patient previously received first dose of BNT162B2 on 16Jan2021 at the age of 68 years old (lot number: EL3249, at 06:15 PM, in Left arm) for covid-19 immunisation. The patient received 2nd Pfizer vaccine dose on Sat, 06Feb2021. On Wednesday 10Feb2021 she became short of breath. On 11Feb2021, she began feeling chest pain. On 12Feb2021, she was advised by primary care Dr to go to the emergency room. She was admitted on 12Feb2021 to ICU with multiple blood clots in her lungs and legs. She was told by the emergency Dr this was a sign of Covid, they did a Covid test, came back negative. She remained in the hospital till 18Feb2021. She was at the time of the report on Eliquis (10 mg/d). A hereditary blood clot test was done that came back negative. She had never had an issue before the vaccination with blood clots nor anyone in her family and she was in good health before the vaccination. Dr didn't think the vaccine caused the blood clots but her primary care Dr thought it did-which was why she was reporting it. The patient also stated that event multiple blood clots in her lungs and legs resulted in Emergency room/department or urgent care, Hospitalization and Life threatening illness. The patient had hospitalization for 7 days. Treatment Heparin 25,000unit in .45% NaCl Premix, Narcan received. No covid prior vaccination. The patient underwent lab test included Nasal Swab which showed negative on 12Feb2021; Hereditary blood clot test which showed negative on an unspecified date in 2021. Therapeutic measures were taken as a result of all the events. The outcome of the events was recovered with sequel.

1114368	3/19/2021	OH	83	M	2/27/2021	2/27/2021	<p>Didn't realize what was going on; Whole body felt like itching, whole body was just feeling funny; Feet are numb and cold; Feet are numb and cold; Ended up in the emergency room because I was having some problems with chest pain; heart problems; Sick all day Saturday, all day Sunday, and most of Monday; This is a spontaneous report from a contactable consumer (patient). An 83-year-old male (also age at vaccination) patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), second dose via an unspecified route of administration, administered in Arm Right (reported as Right upper arm) on 27Feb2021 (Batch/Lot Number: EN6205) as SINGLE DOSE for covid-19 immunization. Medical history reported that "I have had one stent and one angioplasty done. Stent was done last year in 2020 and angioplasty was done in '1990' (not confirmed)." The patient also added "I gained a bunch of weight when I had my thyroid removed." The patient previously took the first dose of bnt162b2 on unspecified date for Covid-19 immunization. For the concomitant medication the patient stated, "Yes, I am taking medications." (specified medications not reported/ provided). It was reported by the patient that, "I got this, my second COVID-19 Vaccine shot Saturday morning. All day Saturday (27Feb2021), all day Sunday and most of Monday, I was so sick, I didn't realize what was going on. Yesterday (02Mar2021), I ended up in the emergency room because I was having some problems with chest pain. So, I presume this is all connected to the second shot I got." It was added by the patient, "I am asking question. About an hour or less than an hour ago I woke up, and my whole body felt like it was itching. I mean my whole body was just feeling funny. I was itching all over, that went away, I took a pill a while ago for that. 'Lorazepam' (not confirmed over the call), it's a nerve, anxiety pill and it kind of helped. But right now, my feet are numb and cold." For the laboratory test the patient stated that, "Yes they did a lab test on me yesterday (02Mar2021) as I went to the emergency room with some heart problems. They did blood work, that's all they did." The patient reported for the results, "They said everything was fine." The outcome of the events was unknown. The patient explained that "No, I didn't take any medication for that." However treatment was received for Whole body felt like itching, whole body was just feeling funny.</p>

1114319	3/19/2021	MA	73	M	2/19/2021	2/19/2021	<p>RA; Substernal CP; mild SOB; CP / pressure 5/10 radiating to neck; This is a spontaneous report from a contactable Nurse. A 73-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscularly in Right Arm on 19Feb2021 14:15 (Lot Number: EL9262) as single dose for covid-19 immunisation. Medical history included enlarged prostate and asthma. Concomitant medications in two weeks included salbutamol (ALBUTEROL); fluticasone furoate, umeclidinium bromide, vilanterol trifenate (TRELEGY, reported as triogy); morniflumate (FLOMAX, reported as flowmax). If other vaccine in four weeks: No. If covid prior vaccination: No. If covid tested post vaccination: No. Known allergies: No. Facility type vaccine Other (as reported). The patient experienced RA (rheumatoid arthritis), substernal cp (chest pain), mild SOB (Shortness of breath), CP/pressure 5/10 radiating to neck, all on 19Feb2021 14:15 with outcome of unknown. The patient underwent lab tests and procedures which included chest pressure: 5/10 on 19Feb2021, oxygen saturation: 97% on 19Feb2021. Clinical course: Substernal CP (Chest pain) approx 10 min post vaccine with mild SOB. Patient denied scratchy throat or throat swelling no swelling noted patient speaking in full sentences O2 sats 97 %, RA, no hives noted, no rash, no difficulty swallowing. Patient reported CP / pressure 5/10 radiating to neck. No pain on palpation lungs clr bi laterally EMS called patient care transfered to paramedics. The events resulted in Emergency room or department or urgent care. No treatment received for the events.; Sender's Comments: The reported RA (rheumatoid arthritis) was more likely an intercurrent disease, and less likely causally related to the use of first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE). This case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p>

A 23-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot number EN5318), via an unspecified route of administration in the left arm on 15Feb2021 at 08:15 (at the age of 23-years-old) as a single dose for COVID-19 vaccination. The patient had no relevant medical history reported. The patient did not have any known allergies. The patient's concomitant medications were not reported. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot number EN5318), via an unspecified route of administration in the left arm on 25Jan2021 at 08:15 (at the age of 23-years-old) for COVID-19 vaccination. The patient did not receive any other vaccine within 4 weeks prior to the vaccine or any other medications within two weeks of vaccine. The patient did not have COVID-19 prior to the vaccination. The patient was tested for COVID-19 on 11Feb2021 with nasal swab and the result was negative. On 15Feb2021 at 20:30 the patient experienced chills, migraine, cold sweat, chest pain, light headedness, and dehydration. The patient did not receive any treatment for the chills, migraine, cold sweat, chest pain, light headedness, and dehydration. The clinical outcome of the chills, migraine, cold sweat, chest pain, light headedness, and dehydration was not recovered.

1114275	3/19/2021		75	F	2/3/2021	3/8/2021	Difficulty breathing; Chest pains; Blood clots in both of her lungs; Blood clots in both legs; Tired/ wiped out; A spontaneous report was received from a consumer (patient's daughter), concerning a 75-years-old female patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced difficulty breathing (dyspnoea), chest pains, blood clots in both of her lungs (pulmonary embolism), blood clots in both legs (deep vein thrombosis), tired/ wiped out (fatigue). No medical history was reported. No concomitant medications were reported. On 03 Feb 2021, the patient received their first of two planned doses of mRNA-1273 (Lot number: not provided). On 03 Mar 2021, the patient received their second of two planned doses of mRNA-1273 (Lot number: not provided) intramuscularly for prophylaxis of COVID-19 infection. On an unknown date, the patient was completely wiped out for a couple of days following the vaccine. She was very tired and out of it. On an unknown date, over the weekend, the patient had difficulty breathing. On 08 Mar 2021, in the morning, the patient was hospitalized for chest pains and difficulty breathing. On the same day lab data revealed that she had blood clots in both of her lungs. On an unknown date, the patient had clots in both legs as well. She was hospitalized for a week and was in rehabilitation being monitored. The reporter also informed that the patient will be hospitalized until 18 Mar 2021 for the clots in both legs. The patient received both scheduled doses of mRNA-1273 prior to the event, therefore action taken with the drug in response to the event is not applicable. The outcome of the events of difficulty breathing (dyspnoea), chest pains, blood clots in both of her lungs (pulmonary embolism), blood clots in both legs (deep vein thrombosis), tired/ wiped out (fatigue) was unknown. The reporter did not provide assessment for the events of difficulty breathing (dyspnoea), chest pains, blood clots in both of her lungs (pulmonary embolism), blood clots in both legs (deep vein thrombosis), tired/ wiped out (fatigue). Follow-up received on 16 Mar 2021 included hospitalization end date, date of first dose of vaccine.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.

1113931	3/19/2021	OH	23	F	3/2/2021	3/2/2021	Seizure; Headache; Couldn't feel lower legs; Extreme chest pains and chills; Extreme chest pains and chills; Arm swelling; Pain; Itching; This is a spontaneous report from a contactable healthcare professional (patient). A 23-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiration date unspecified), via an unspecified route of administration (left arm) on 02Mar2021, 16:15, as single dose for COVID-19 immunisation. Medical history included ongoing epilepsy, covid back in Dec2020, known allergies to flu vaccine and TB test and seizure (have history). Concomitant medications included levetiracetam (KEPPRA), lamotrigine (LAMICTAL), cenobamate (XCOPRI) and magnesium. The patient had no other vaccine in 4 weeks. On 02Mar2021 16:15, the patient experienced arm swelling, pain, itching, couldn't feel lower legs, extreme chest pains and chills. On 02Mar2021, at 17:15, the patient experienced headache an hour later. On 03Mar2021 01:00, the patient experienced seizure at the middle of the night around 01:00. The events resulted in emergency room/department or urgent care. The patient had Covid prior vaccination; and was not Covid tested post vaccination. Outcome of event seizure was not recovered; outcome of the rest of events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The patient had underlying epilepsy. However, based on the close temporal association, a possible contributory role of bnt162b2 to the development of seizure cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1117137	3/19/2021	CA	25	F	3/4/2021	3/4/2021	Pt had the pfizer Covid shot. she was sick from the first shot on Feb 4 2021. Fever , headache and chills. She decided to get the second pfizer on March 4. Immediate chest pains then 15 min later, syncope , followed by myoclonic or seizure type activity of both the RT upper and lower extremities. This was seen by me in the emergency room. She was given ativan and the seizure type movement stoped. I called her today on 03-19-2021, She told me she was sick for five days following the second pfizer, Had headaches. body aches and fevers. but today was doing well.
1116933	3/19/2021	SC	49	F	3/17/2021	3/17/2021	About 10 minutes after receiving vaccine, I experienced a gurgling sensation on the left side of the chest while breathing. That lasted for about 5 minutes and then dissipated. Throughout the day, I had intermittent chest pain. Upon going to bed that night I found I could not sleep on my right side because it hurt to breathe (primarily to exhale). On my back, I was okay. I had minor chest pain, all on the left side, the next day (3/18) in the morning. By lunchtime it was gone. The evening of 3/18 (roughly 5:15-7:00), I experienced extreme chills. Finally put on my winter coat over my sweatshirt to get warm.

1116088	3/19/2021	CA	50	F	3/19/2021	3/19/2021	<p>Patient is a 50 year old woman who presents 10 minutes post-vaccination of her first Moderna vaccine in the left deltoid. She describes that 5 minutes following vaccination that she started to experience pain in the left arm, which was then followed by a burning sensation in her left upper back and mid sternum. She denies a history of similar episodes. She denies a history of reactions to vaccines received in the past. She does describe sensitivities to the top 8 allergen foods, relating that she experiences abdominal bloating. She also describes a sensitivity to codeine, specifically Tylenol #4, relating that she experiences itching of the skin. She denies chest pain, headache, lightheadedness, dizziness, cramping abdominal pain, nausea, vomiting, diarrhea, urticaria, pruritus, swelling of the lips, mouth, and tongue. Past medical history of obesity. During medical observation, while waiting for EMS to arrive onsite, the patient began to describe the feeling of something "being stuck in her throat," relating that it "felt odd to swallow" and that she was experiencing a metallic taste in her mouth. Upon examination, no signs of swelling of the throat, lips, and tongue. Neck was supple and without signs of edema. Bilateral lungs were clear to auscultation in all fields. No audible wheezing or stridor. No visible use of accessory muscles.</p>

1116589	3/19/2021	KY	41	F	3/11/2021	3/23/2021	Started on day 5. Began day feeling extreme fatigue, dizziness, chest pain. Went to emergency room for chest pain. No indication of heart attack per ER. Extreme fatigue lasted for 3 days.
1116633	3/19/2021	WV	34	F	3/18/2021	3/19/2021	Sweating, chills, body aches, headache, muscle soreness of the right arm and my entire body, swollen neck, fatigue, chest pain due to very painful indigestion(was not moving around much after eating peanut butter) pain so severe it followed with vomiting. Unkown if related. It?s very rare for me to vomit. Unable to get around well. Right knee pain which caused limping and not being about to walk at times. (Previous history of knee pain, but not for years). As of now I still have these symptoms besides chest pain and vomiting.
1116636	3/19/2021	OR	67	F	3/14/2021	3/14/2021	Pt developed facial flushing, throat itchiness and "chest tightness" post-vaccination. Pt with reported history of anaphylaxis. No shortness of breath or chest pain. - Pt given 25mg diphenhydramine - Sxs gradually resolved without further intervention
1116658	3/19/2021	CA	30	F	3/17/2021	3/18/2021	Shortness of breath, fever, chest pain. She was readmitted after emergency department visit.
1116318	3/19/2021	PA	30	F	3/19/2021	3/19/2021	At 13:55 on 3/19/21 patient received 1st Pfizer vaccine to left arm. At 14:05 on 3/19/21 patient developed itching to bilateral lower and upper arms. Denies shortness of breath, denies trouble breathing, denies chest pain, denies hives.
1110686	3/18/2021	WI	62	F	1/11/2021	1/13/2021	I had chest pressure and chest pain. 160/100 - blood pressure when I checked it. I just didn't feel good. I went to my doctor - they increased my blood pressure med dosage. Next day, I saw a cardiologist (16th) and he had another medication: Hydrochlorothyzide - HCTZ - 12.5 mg daily. Eventually they had to increase the HCTZ about two weeks ago and now my blood pressure is normal.

1111412	3/18/2021	FL	68	F	3/7/2021	3/11/2021	Second vaccine shot given March 7th. 25 hours later I experienced headache, tiredness, fever, aches and chills. March 10th was a normal day. No symptoms; felt great, normal routine for the day. That night at 12:30 am I woke up with chest pain and shortness of breath. I was in extreme pain and felt like I couldn't breathe. My husband took me to the Emergency Room. Nitro and morphine administered. No relief. EKG, Chest X Ray, CT Scan with contrast, cardiac catheterization, Echo, and lots of bloodwork. I was in pain until 5:15 pm on the 11th. My primary doctor came and hospital switched morphine to toradol which provided some relief. I stayed overnight in hospital and was discharged at 6 pm on the 12th.
1111480	3/18/2021	NC	44	F	3/13/2021	3/15/2021	Around 7 pm on 3/13, I developed brain fog, trouble walking, and then fever, severe muscle pain worse in legs, and chills. Most of these symptoms seemed to improve on 3/14, but then on 3/15, I developed new onset of shortness of breath and chest discomfort. On 3/16 around 1 pm the shortness of breath worsened and I went to the emergency room. I felt that I couldn't take a deep breath in and I had chest discomfort on the left side of my chest worse when taking a deep breath. My legs were hurting as well, especially my left leg. I had sinus tachycardia (heart rate 106-120) and increased respiratory rate (rate of 20) with O2 sats 100% on room air. My breathing and heart rate improved somewhat with 1 liter oxygen therapy, 1 liter of IV fluids, albuterol inhaler, and decadron 6 mg orally. It was thought that I had a delayed asthmatic/allergic reaction to the vaccine. I do not have a history of asthma. I was prescribed a Medrol dose pack and albuterol inhaler. My hands and feet are very cold and tingling on 3/18. Shortness of breath and chest pain seems to have improved but not completely gone as of the time of this submission on 3/18.

1110290	3/18/2021	IL	63	M	3/12/2021	3/17/2021	3/17/21 63 y.o. male who presents with sudden onset of chest pain and palpitations, which occurred while patient was exerting himself. Pain is substernal, radiated to the left arm, associated with lightheadedness. Denies diaphoresis or nausea. Per EMS there were short runs of nonsustained ventricular tachycardia 3/18: - remains inpatient admission as of 3/18/21 @ 0900 63 y.o. male with a past medical history of nonsustained ventricular tachycardia. He states he was lifting a couch yesterday and his heart started beating fast. He did not really have any chest pain, but felt a little bit lightheaded. He called an ambulance and they brought into the ER. In the emergency room his EKG did show some frequent PVCs. However, he did not really require any intervention. He was given 3 nitro, but it really did not make any difference in the way he was feeling. The patient denies multiple times that he actually had chest pain. He states he just felt like his heart was beating funny. The patient's most recent stress test was a nuclear stress test in May of 2019. Overnight, the patient has felt very well. He denies any significant chest pain. He denies any further heart palpitations. On the monitor he would occasionally going to bigeminy, which is not abnormal for him. EKG this morning was unremarkable. After speaking with the patient's wife, she told me that he has had a several month history of very limited exertion. She states every time he exerts he becomes extremely dyspneic and has heart palpitations and sometimes almost passes out. She states last night he was extremely diaphoretic and very nearly passed out.
1111822	3/18/2021	OH	52	F	1/27/2021	1/27/2021	I received the second dose of the Moderna COVID-19 vaccine on 1/27/21 at 07:30 a.m.. Around 11:30 p.m. I developed a throbbing headache, chills, and severe muscle and joint pain. Throughout the night I developed dizziness, crushing chest pain and my left ear felt plugged. In the morning, I was up walking and started to not feel right due to the dizziness and fainted. After 6 days of feeling this way, I contacted my PCP and had a virtual visit. I was given a step down dose of Prednisone and a medication for the dizziness. My PCP advised me that I needed to report my reaction to this vaccine to the CDC. I contacted my Manager and also had to contact the nurse here.

1110662	3/18/2021	FL	74	F	3/15/2021	3/16/2021	caller states that his mother has become increasingly more tired, has a fever of 102, c/o chills, feeling dehydrated. Tingling in legs and feeling unsteady on feet. Was working in garage earlier today however had to lay down due to fatigue. Caller gave his mom 2 tylenol approx 20 min prior to calling, reports that he feels that is helping. Reports that she is A/Ox3 just "tired". Advised to increase fluids and monitor fever and effectiveness of tylenol. If she doesn't improve in the next hour, or if she begins to experience any chest pain, SOB or neuro changes, caller needs to take her to contact her PCP and/or ER. Spoke with son, his mom is doing much better, no fever and symptoms have resolved.
1110327	3/18/2021	NH	40	F	3/12/2021	3/14/2021	After first shot I got intermittent deep tissue numbing (not tingling) over the span of 5 days beginning about 12 hours after the injection on left side of body (injection on left arm. After the second shot (in right arm) I got tingling in right side of face about 30 min after injection. Effects weren't bad until Sunday night when I began feeling ?odd?, deep tissue numbing in left arm, could feel my heart but didn't feel like it was racing or pounding TOO hard, chest pains, loose stools, and when I took my BP it was high and rose to 188/???. It is usually 111/55ish. We called EMS and they gave aspirin, ekg showed PVCs (which is normal for me) and still high BP. At hospital still high. It seemed to have set off my orthostatic which usually drops but this time it was up and down. On Monday it was high 130s/80s to low 101/50s. And on Tuesday my HR kept dropping into 40s even when walking around. Wednesday I felt okay but started getting numbing late at night and just not feeling right. It is Thursday morning and I still don't feel right.

1110159	3/18/2021	IL	48	F	12/28/2020	12/28/2020	sx started 5-10 min later-shoulder pain started in L shoulder, vaccine location, went across to other shoulder. next day, walking to garage-could not breathe, chest pain, heartrate elevated, 104 fever. ED-chest xray, EKG, blood work. 3-4 hrs. waiting for heart rate to go down. sent her home 103 fever. felt bad for 4 days after that-heart rate, fever. no Rx. otc Tylenol for fever. Doctor told her she should not have had vaccine since she recently had Covid.
1112605	3/18/2021	PA	78	M	3/14/2021	3/14/2021	Received the Vaccine Shot, waited 15 minutes with no issues. Went home, in about 15 minutes had extreme chest pain. Quickly moved to emergency room. Was given nitroglycerin paste on chest, Aspirin to chew, Heparin and cardiac cautherization. Cauterization showing no real issues. Eventually the pain was gone. Cardiac doctor mentioned heart possibly being highly stressed earlier. I have some thoughts that it may have been a temporary blood clot, but not proven. Chest pain was very bad until emergency room starting getting it under control. never had that much pain before with previous heart attacks in 2004-05

1112648	3/18/2021	VI	52	F	1/11/2021	1/12/2021	After 24 hours of my vaccine at about 4pm the following day at my work, I started to feel like I was getting a cold, my face was hot. I went to the station to take my temperature, it was 98.4F and then I did a re-check 15 minutes later it was 97.2F. I was still feeling under the weather and left work a little before 5pm. I started to drive to the pharmacy when I got there I felt dizzy, I still went in and bought Tylenol cold and flu PM. When I got home, I still was feeling bad, I had severe headaches, migraines and also pain to base of my neck and my chest felt very heavy, like someone was sitting on top of me. I then went to bed early, was lying flat on my bed when I started to feel my heart, shaking my whole body. I felt really scared, these were strong palpitations. I then woke up around 3am, still having persistent headaches 10/10 pain level. I woke up because I could not sleep and went to my living room, still having chest pain and pain in my neck with headaches that did not go away. My BP in the morning was high for me was 132/96, then 133/98 and at 730am it was 137/100 with a pulse of 80. I went to the emergency room where I received IV medication, blood tests, triponents and EKG were performed which came back negative. After an hour of my iv medication, I still continued with headaches, neck pain and my blood pressure was still high. My doctor said that i had a severe reaction to the vaccine. I was discharged to go home after a few hours and I rested then I slowly started to fee better.
1112757	3/18/2021	CA	62	F	3/16/2021	3/16/2021	Light headedness and chest pain shortly after 2nd dose of Moderna vaccine
1112831	3/18/2021	WA	40	M	3/18/2021	3/18/2021	1 hour after shot, felt: Chest tightness Increased heart beat Felt warm in face Difficulty breathing Loss of taste Lasted about 1 hour. Chest tightness and difficulty breathing were mild and intermittent. Occasional chest pain. Nothing severe just felt uncomfortable. After symptoms subsided, contacted doctor who recommended I go to urgent care to be checked out.

1111830	3/18/2021	WI	38	M	3/16/2021	3/16/2021	38-year-old male with past medical history of anxiety, sleep apnea presents to the emergency department with throat tightness. Patient received his first dose of vaccine at 130 on 3/16/21. He waited for approximately 20 minute without any symptoms. On the way to his car approximately 30 minutes after the vaccine he started having his throat tightness. When he got home he drank some water to see if it was a sore throat however he had no pain anywhere. He feels like he was having difficulty swallowing his saliva however he was able to do it. He also was able to drink fluids. He called the nursing hotline who told him to take Benadryl (50mg) and come into the emergency department. His symptoms are still present but have improved. He denies any headache, vision changes, neck stiffness or difficulty moving his neck, chest pain, shortness of breath, difficulty breathing, nausea, vomiting, diarrhea, abdominal pain, rash. Physical exam significant for mildly edematous uvula. He was given 10 mg of dexamethasone in the ED Patient was monitored in the ED for 5 hours after exposure. Symptoms resolving after Benadryl and dexamethasone. Mildly edematous uvula without other signs of edema or allergic reaction on reassessment. Patient without stridor or respiratory distress. He no longer has throat closing sensation. He was discharged with an EpiPen, prescription for 3 days of cetirizine, instructions to follow-up with his primary care provider for further workup and for discussing options for receiving his second COVID vaccine dose, and given ED return precautions

1108042	3/17/2021	OH	59	F	3/16/2021	3/16/2021	Patient received Janssen COVID19 vaccine (LOT#1802068) at approximately 12:00 pm on 3/16/21. During the 15 minute observation period, she expressed "I don't feel good" and endorsed nausea. Shortly thereafter at approximately 12:10 pm, she started to slouch and nearly fainted while sitting in a chair. She did not fall or hit any part of her body. She was easily aroused with a touch on her arm and responded to verbal questions within seconds (less than a minute). She denied trouble breathing or chest pain. She then reported nausea again and was offered a receptacle to vomit in if needed; however, she did not vomit. Patient was encouraged and instructed to sit on the floor to prevent injury in case of fall but she refused stating that she didn't think she would be able to get back up given her preexisting knee problems. Pharmacy staff offered her water, a fan, and opened windows. Her jacket was removed in order to monitor blood pressure/ pulse, which was not abnormal. Patient did not have any trouble breathing, rash, swelling, abdominal cramps, or mental status changes. She was contacted via phone a few hours later for follow up on the incident, at which time she denied any issues and reported feeling well.
1108060	3/17/2021	MD	69	M	2/25/2021	3/16/2021	03/16/2021: Presented to the emergency department with chest pain and palpitations. The patient was admitted for chest pain observation and inpatient dialysis. The patient was discharged the next day with plans for an outpatient stress test.
1108117	3/17/2021	ME	60	M	3/6/2021	3/7/2021	Felt poorly with myalgia, weakness and chills on first day after vaccine that did not resolve. Developed severe shortness of breath and chest pain on day 9 after vaccine and found to be in atrial flutter with rate of 160 on day 10 after vaccine. Has long ho diabetes, but no cardiac history.

1108227	3/17/2021	IA	56	F	2/12/2021	2/12/2021	Body chills, did not take temperature but could tell I had low grade fever, it was about the same symptoms as first dose but not as severe. Felt like recovered faster than 1st dose. Felt like my coughs were more productive than 1st dose though. More phlegm. Lasted about 3 days. I also felt like had tachycardia, like my heart beat was off, I felt it around the 3 day and it is still ongoing. I did have a heart work up after my covid and it came back normal. I also came back that I had a very small episode of tachycardia when I wore the halter monitor. Also had chest pains and decided to go to the hospital on 03/07 to get checked. The lab work they did included a D Dimer that was very high. Higher than when I had COVID. They did a CT with and w/o dye and they also did an Xray (chest and lungs) and it showed that I had a lesser lung expansion. I did not have that with the last CT done in end of January or 1st week of February. I also still have to this day period chills (like I need to add a heating pad on my feet, on my legs or my arms to feel comfortable). I also have periodic headaches that come very rapidly and very severely and sometimes it can just last a little while or it can last some hours. I also have dizziness with the headache episodes. This has been going on for the last 2-3 weeks along with terrible joint pain.
1108165	3/17/2021	CA	41	M	3/10/2021	3/16/2021	Significant chest pain in heart area 6 days after first shot, especially if I took a deep breath. I don't think it was even that bad when I suspect I first got Covid 1 year ago. Got mostly better by the next day.
1107878	3/17/2021	MD	84	M	1/28/2021	3/16/2021	03/16/2021: Presented to the emergency department with substernal chest pain/pressure. Patient was admitted for non-ST elevation MI, and currently awaiting cardiac catheterization.
1107350	3/17/2021	OR	35	M	3/12/2021	3/12/2021	High fever for 2 days -topped out at 104, muscle aches and pain, Chest pain and mild breathing issues, and extremely tired

1109686	3/17/2021	AZ	26	M	3/4/2021	3/8/2021	c/o sob, stomach upset, lightheadedness, diarrhea and fatigue, onset 3/8/21. dose 1 Pfizer Covid vaccine given at a medical center 3/4/21, denies any anaphylactic type reactions immediately post vaccination. Reports the fatigue was so severe that he almost fell asleep while driving and "almost had an accident". He had a negative covid-19 test at the medical center on 3/10/21, however his sx persisted especially the feeling of sob and lightheadedness so he presented to ED for eval on 3/15/21 where he had another negative covid test. He received fluids and a CXray was done and negative. His home O2 sat has been 94% and HR 75. Hedneis any ahx of asthma or lung disease. The fatigue has subsided today but can be intermittent and random, yesterday he had 3 episodes of sob intermittently w/o wheezing or chest pain. he denies loss of taste or smell, the lightheadedness has subsided today.
1109606	3/17/2021	OR	65	M	3/7/2021	3/7/2021	Called over to patient's car after vaccination where patient reported feeling nauseated and unwell. Reports sudden onset of nausea and dizziness. Denied chest pain/pressure, palpitations, SOB, HA, abdominal pain, or any other complaints. Reports feeling well prior to vaccination. HR initially low 40s regular with thready radial pulse. Quite diaphoretic. Patient reclined in driver's seat as far as possible. EMS on site notified and responded. PMH significant for HTN and HLD. No DM, neurologic, or cardiac history. Medications Losartan and Lovastatin NKDA Initial HR 42, sinus on monitor without ectopy. BP 92/56 RR 16 SpO2 97% RA Alert and oriented, Pale cool diaphoretic Regular bradycardia with normal S1 and S2 Lungs CTAB Abdomen soft, NT/ND Likely vasovagal, with increasing HR and BP after 15 minutes, however patient still reports feeling dizzy and nauseated with borderline hypotension. Strongly recommended transport to the Emergency Department for further evaluation and monitoring. Briefly discussed that as patient was alone in the care, I felt extremely uncomfortable allowing the patient to drive. Transported in care of EMT. Returned within 2 hours and picked up his car.

1109336	3/17/2021	MD	48	F	1/29/2021	1/29/2021	Within the first few minutes experienced palpitations, increased heart rate, and dizziness. Palpations were frequent. This continued for several days. I have a history of SVT's - but after vaccine the palpations felt with SVT's increased in frequency and lengthy. Heart rate was in the 90's- 110's at rest most of the time. Had chest discomfort by day 3 post vaccine. On Feb 8th- late night began to have left chest pain, left arm/jam tingeling, and shortness of breath. In addition to this had weakness, fatigue, muscle aches, pain at injection site, headache- started on January 30th 2021 and worsened over the next several days. ** Immediate syptoms not reported at the vaccine site as I thought they would go away on own.

1109331	3/17/2021	PA	47	F	1/6/2021	1/17/2021	<p>This is a follow up report starting from day after that first report was made -Report # 244159 - Starting with the 17th of January - I was still having facial numbness/tingling/pressure in my head/feeling like head was going to swell; arms were so heavy - couldn't lift my arms - like a heavy pressure on my chest; breathing was a problem; Swelling in my head caused eye issues.</p> <p>18th - tingling started on back of neck; affecting my hearing and eyes (swelling in head); a lot of cognitive challenges. 1-20-2021 - heart racing; itchy all over; blood pressure spikes. Heart can feel like it's too fast and then going too slow. 1-21-2021 - legs burning from waist to hip; chest pain; heart racing; struggling to breath. 1/22 - chest pain and discomfort - pain shooting through arms; didn't sleep well. Arms wanted to pull into my chest. Stomach cramping on 1/23 - stabbing pain in wrists and hands; left side on heart pain. Pain was like having a beating. Left knee pain - January 24 - up all night with shooting pain in arm; fine motor pain skills shot - can't do what I need to do. January 25 - Elevated heart rate; elevated blood pressure. 1/26 - vision challenges; fuzzy. Heart racing; feet swollen; face feels puffy doesn't look puffy - pressure/tingly feeling in left cheek. Ongoing and Changing symptoms every day/week - with no let up.</p> <p>3/11/ - buckling of legs started. Big thing now is my legs are buckling (happening from the hips) - when I try to get up or walk. I haven't fallen yet but I know it's coming.</p> <p>3/12/2021 - heavy weight back in the arms. I still don't have the fine motor skills. I still can't drive and don't have control over my body and reflexes enough. Still having Pressure in chest and the face and head swelling - is unbearable and affecting my vision. I will see a neurologist next month. Dr is not sure what to do. Jan 12 - first ER visit. I have specific notes/log on all of my symptoms each day. If anyone wants to call - please call on Mondays or Wednesdays only(or Saturday or Sunday.) Also, Menstrual cycle is wonky. I had a normal period before the vaccine - 12/28-12/31/2020 - but didn't have one in January and I had one in February 10th - but just one day; 3/11/2021 - I had my next one and it was four days long and fourth day was very heavy then all the rest of the days.</p>

1108512	3/17/2021	NM	70	F	2/22/2021	3/3/2021	<p>She is very active in her daily life as she continues to train race horses. She reports she had been feeling well. She received her 2nd COVID vaccine on 2/22/2021. On 3/3/2021 she began feeling achy, foods no longer tasted good to her, over the next day or so she developed nausea with dry heaves, diarrhea, and burning with urination. She then stopped eating. She has a dry non-productive cough. She denies any melena, hematochezia, hematemesis, chest pain, fevers, chills, shortness of breath. She is now complaining of generalized weakness. She denies any abdominal pain, but admits to some tenderness in the right side of her back. She denies any known ill contacts. She and her Husband mostly stay at home since COVID began. She reports they have not even traveled with the horses since COVID started. 3/15/21 In the ED she was found to have a right pyelonephritis, acute kidney injury, elevated LFT's, leukocytosis. She had an abdominal CT that showed concern for dilated CBD. She went later for a gallbladder US. This showed no dilations of CBD. 3/16/2021: Today there was a significant improvement in leukocytes. Her blood pressure has dropped and is low to low normal. She continues to feel generalized weakness. She is eating ice chips and tried a jello this morning that she has kept down. She denies any further diarrhea or active vomiting overnight. She denies any abdominal pain, but does have tenderness to the epigastric area with palpation. Creatinine is unchanged this morning. I gave an IV fluid bolus this morning to support BP. She does continue to have the dry cough. She reports she had a rash to her right arm around the COVID injection site that was itchy for a couple of days. It has resolved. She denies any other rashes, joint inflammation or redness. She denies any shortness of breath. Eosinophilia, with 1600 AEC. Concerning for possible delayed hypersensitivity to COVID vaccine. Will continue to trend. Cough non-productive. Continue to monitor respiratory status/sx. CRP, LDH, ESR, and CRP added on to labs. Will draw D-dimer tomorrow morning as well.</p>

1109222	3/17/2021	TX	67	M	3/10/2021	3/11/2021	I suffered a heart attack on March 11, 2021, at approx 145pm, while sitting at my desk - WFH. My symptoms were sweats, nausea, followed by chest pains beginning on the left side of my chest; sweats and nausea subsided for approx 1 hr, returning again, followed by chest pains radiating the across the full chest approx. I left my desk at the onset to wash my face, returning to my desk to talk a scheduled phone call at 2pm, lasting until 3pm. I left desk to walk outside to take in some fresh air, my wife ask me if I was ok, I said no. She ask if I was having a heart attack, to which I replied, I don't know. shortly there after we left for the ER at arriving approx 4pm. At that point ER staff did a quick assessment, taking my to an ER patient room where i was advised by the attending Dr that they thought I was having a heart attack. Shortly thereafter I was taking to the Cath lab where a stent was insert and then taken to ICU. Where I remained until I was released on 3/12/2021 at 3pm. There was no detectable heart damage and I was placed a regime of blood thinner, a beta blocker and cholesterol med. I do not have high blood pressure, high cholesterol or history of heart problems. My last physical was Feb 2021.

1104591	3/16/2021	ME	60	F	3/9/2021	3/9/2021	<p>This patient was vaccinated approximately 1 hour prior to presentation here with her first dose of the Pfizer COVID-19 vaccine. She felt fine right after her vaccination but as she drove to her destination where she was going to take a walk, she started to develop left-sided facial burning and swelling. That prompted her to call her PCP in that office recommended she come back to the vaccination clinic to be evaluated. I evaluated her at approximately 2 PM.. She was feeling well for the most part with the exception of left-sided facial burning and swelling and a little bit of redness over her left cheek. She denied fevers, chills, itching, other areas of rash, difficulty speaking, difficulty swallowing, tongue swelling, lip swelling, wheezing, chest pain, or difficulty breathing. She recalls a penicillin allergy at age 5 or 6 but cannot remember the reaction. She has never reacted to a vaccine before. Initial vital signs included a blood pressure of 134/73, a pulse that was 70 and regular, and an oxygen saturation of 100% on room air. She had normal mental status and her lungs were clear. The left side of her face was slightly swollen over her left cheek as compared to the right with some slight increased flushing on the left side. There was no stridor, she was speaking comfortably, and her lungs were clear with good airflow. Her heart demonstrated S1 and S2 with regular rate and rhythm. I administered 2 doses of Benadryl, 25 mg with each dose about 15 minutes apart with her last dose at approximately 2:25 PM. I rechecked her vital signs at 2:50 PM and her blood pressure was 138/79 with a pulse of 70 and regular and an oxygen saturation of 99% on room air. Her lungs were clear and she was moving good air. I did take a relook at her face which was improved with decreased swelling. At 3 PM, because she was doing much better, I discharged her to home with instructions to use Benadryl 50 mg when she got home and then 25 to 50 mg every 4 hours today. If she develops any respiratory symptoms such as difficulty swallowing, cough, breathing difficulty, swollen tongue or swollen lips, as well as increased facial swelling, she will call 911 to be evaluated. She should not get the second Pfizer COVID-19 vaccine.</p>

1105044	3/16/2021	CA	39	M	3/16/2021	3/16/2021	39y/o male presents with syncope, head injury and body shaking within 5min of receiving Pfizer vaccine in left arm on 3/16/21. Patient lost consciousness, fell from a seated position and hit the left side of scalp on the floor. Patient then experienced uncontrolled body shaking for <5sec. He had drool from his mouth during episode. Patient regained consciousness after cessation of shaking. He reports associated sweating and head pain. He denies throat enclosing, difficulty speaking, lip/tongue swelling or itching, injection site pain or itching, blurring of vision, light headedness, chest pain, palpitations, or shortness of breath. He reports history of syncope when getting his blood drawn and at site of blood. He denies allergies to medication or vaccinations. He denies any current medical conditions or h/o seizures. On physical exam: Vitals: Heart rate 88, blood pressure 150/100 Skin: his skin is diaphoretic and ~4x2cm skin abrasion to his left scalp is noted. Cardiovascular: Radial Pulse 2+ . Heart regular rate and rhythm. Lungs: clear to auscultation bilaterally Patient was examined by EMS and informed that he could be transported to hospital via ambulance for immediate consultation with provider or can decline services and seek care at a later time. Patient opted to drive on his own to seek care at a later time. He was advised to contact his primary care provider regarding his adverse reaction, seizure and head injury. Note: MA called for PA on site when patient fell and hit head. PA told site manager to call 911 while attending to patient. When PA arrived to patient's side, he had regained consciousness and PA proceeded to provide care and investigate incident.

1104020	3/16/2021	NC	54	M	3/15/2021	3/15/2021	after about 30 minutes, I started having a metallic taste in my mouth. I was also experiencing soreness in left arm area. After about an hour, the pain in my arm started to feel as though it was spreading to my left chest cavity area. I then started to get chest pains in the left breast area to the armpit area, but not severe, just concerning. After probably 70-80 minutes, I started feeling drowsy. I continued to feel drowsy all evening and did not sleep well. I woke up and could not return to sleep at 4:45am. My normal waking time is 6:00am. I had/have quite a bit of soreness in my arm, but nothing unbearable. No signs of rash or inflammation around injection sight. I am taking a sick day from work to relax and recover from loss of sleep. The metallic taste persist, but only an annoyance and taste seems to be normal when eating or drinking. A slight achiness in joints, but a cold front was also moving in, which can cause me to have the same effect.
1103881	3/16/2021	UT	72	M	2/11/2021	2/11/2021	Immediate soreness in left arm. That evening, I felt flue like symptoms of severe ache of upper shoulders and back. Of more concern, when I lay down for bed, I felt a heavy weight in my upper chest, making breathing painful. Use of my CPAP machine allowed me to get some sleep. these symptoms continues for 4 days, after which they subsided.
1103826	3/16/2021		87	M	1/25/2021	3/6/2021	chest pain, acute heart failue death
1103814	3/16/2021	CT	26	F	3/13/2021	3/13/2021	Fever Couldn't talk Sharp join & chest pains Painful to move eyes Fatigue Bedridden- couldn't move on my own Shortness of breath Lasted 7 hours; took 3 Tylenol @ 500mg each; lots of fluids

1103813	3/16/2021	NY	67	F	2/28/2021	3/2/2021	Pt was vaccinated on 2/28 and on 3/2 began to experience worsened SOB from baseline, development of sternal chest pain, abdominal bloating, nausea and fatigue. She presented to the hospital on 3/9 c/o intractable pain and nausea/vomiting that was worsening. Imaging revealed no change in her cancer from same imaging in Jan 2021. PE ruled out. No sepsis. She had acute kidney injury/dehydration. started on ivf. renal imaging normal. echo normal. ekg normal. she rapidly progressed to anuric renal failure and died 3/13/2021. oncology ruled out tumor lysis. she was not felt to be a candidate for dialysis.
1103717	3/16/2021	CA	34	F	3/3/2021	3/4/2021	I was asleep on Thursday night and my heart started to race. I had fast heart palpitations that it woke me up, when I woke up I had difficulty breathing and felt severe chest pain. I felt pressure and started coughing a lot. My husband helped me with some breathing exercises and helped me call online 24 hour Kaiser nurse. My chest hurt a lot and they recommended I went to emergency. I did and they said x-ray and cardiogram was ok. They injected a pain killer and left me there until morning. Then I was released. Pain killer helped. On Friday evening I had no more chest pain, but I felt nauseous, had chills, body aches, headache and no appetite. These symptoms lasted until Monday. I started to eat again bread and butter by Tuesday, I felt better on Tuesday, I was still very fatigued, low energy and sensitive stomach, mild nausea. Nausea stopped Wednesday, stomach was still mild sensitive still.
1103680	3/16/2021		51	F	3/15/2021	3/15/2021	Anaphylaxis; Severe Angioedema of lips, tongue, eyelids. Hypoxemic Respiratory Distress, O2 88-89% on presentation. Chest pain/tightness. Epi pen, IM, minimally responsive. Epi gtt, IV steroid, dual histamine block. IVF bolus x2L. HF O2 support, via non RB. Pt with slow response to above intervention, but remained hemodynamically stable and with improvement to respiration/oxygenation and angioedema over about 1 hour. while patient prepared for transfer to higher level of care.

1105352	3/16/2021	NY	52	F	3/11/2021	3/14/2021	Patient woke with severe chest pain and difficult to take deep breaths. Chest pain extended over her shoulder and around her neck. Pain worsened during the day, went to ER, found to have positive troponins and subsequent ecg were abnormal. Echo was negative and angiogram showed no blocked arteries. Cardiologist diagnosed her with pericarditis
1103715	3/16/2021	SC	59	F	2/18/2021	3/16/2021	02/19/2021 I had fever 101-104 for 2 days, vomiting, horrible headache, unbelievable joint muscle pain, vomiting, weakness and dizziness, diarrhea, chills and sweating, chest pain, trouble breathing
1106582	3/16/2021	OR	34	F	1/29/2021	1/29/2021	Left side chest pain on the same side as the injection. The pain started after the first vaccine and has not gone away since. Treatment was sought at a local emergency room but there were no findings of any irregularities.
1105283	3/16/2021	CO	58	M	3/10/2021	3/15/2021	Ablation procedure for pericarditis occurred on 3/5/21. Received 1st dose of Moderna on 3/10. That night experienced fevers (101.7F) and fever like symptoms (sweats, chills, body aches). Continued to "not feel well". 3/15/21, presented to ED with chest pains and dx with pericarditis again. Treated with IV Vanco x1 and IV Zosyn x2 until blood work came back and cultures were negative. Due to no infection and negative for an MI, Dr. determined pericarditis was a rxn to the vaccine. Other tests results include: Elevated BNP, BUN, and CRP. CT of chest, abdomen, and pelvis is clear. 5 covid tests since admission, all negative. IgG antibodies for COVID negative. PT currently is stable and bloodwork somewhat improved. On O2, fluids and Morphine for chest pain. An acute Hepatitis panel is currently pending.
1105349	3/16/2021	IN	91	M	2/18/2021	2/19/2021	Facility transfer resident to ER due to respiratory failure. Symptoms included decrease oxygen stats, difficulty breathing and chest pains. ER transferred to Hospital with diagnosis of myocardial infraction. Admitted to ICU on telemetry. Placed on 50% Bipap for Hypoxia. Placed on IV Amiodarone and Ceftriaxone. Resident was stabilized and discharged back to facility on 2/24/2021.

1106702	3/16/2021	AR	71	F	3/3/2021	3/15/2021	<p>HOSPITALIST HISTORY AND PHYSICAL DATE OF ADMISSION: 3/15/2021 DATE OF H&P: 3/16/2021 PATIENT DEMOGRAPHIC: 71 year-old female MODE OF ARRIVAL: EMS.</p> <hr/> <p>CHIEF COMPLAINT: Dyspnea and mild cough. HISTORY OF PRESENT ILLNESS: 71 year-old T2 diabetic female who presented to the ED late yesterday for evaluation of increasing shortness of breath. Also, reports she's had a nonproductive cough for several days. Yesterday, her breathing just sufficiently severe that she could not walk through the house without stopping to catch her breath. No chest pain. She ultimately decided to summon EMS. They reported that her initial SaO2 values to be in the low to mid 80% range. She was placed on 2 L/min of supplemental oxygen and given a SABA updraft in route. When she arrived at the ED, her SaO2 registered 92%. She denies any prior history of asthma or COPD. No ischemic or valvular heart disease. No history of CHF. No orthopnea. No pedal edema. No high fever. Of note, she completed her second COVID19 vaccination approximately 10 days prior to onset of her chief symptoms as described. In the ED, her chest x-ray was felt to show no evidence of acute cardiopulmonary disease. Her d-dimer was normal. However, a CTA of the chest revealed extensive centrilobular ground-glass nodularity throughout the lungs. No pulmonary embolus or signs of right heart strain. Patient admitted with atypical pneumonia/pneumonitis and associated dyspnea, cough and hypoxemia. ASSESSMENT: 71-year-old T2 diabetic with hypertension presents with increasing shortness of breath and nonproductive cough, onset approximately 10 days post second COVID-19 vaccination. CTA of chest reveals an atypical pattern of extensive centrilobular ground glass nodularity. Clinically she has associated mild bronchospasm and hypoxemia.</p>

1105807	3/16/2021	MO	21	F	3/10/2021	3/11/2021	<p>Patient received first dose of Moderna COVID-19 vaccine on 2/10/21 and had a large, red, inflamed area on her arm at the injection site for a few days, but otherwise tolerated vaccine well. She received the second dose of the Moderna COVID-19 vaccine on 3/10/21 and the next day (3/11/21) developed fatigue and lightheadedness while exercising, which continued for the next few days. She developed acute onset, sharp chest pain on 3/13/21 AM which did not resolve so she presented to an ED. Vitals were normal but labs notable for troponin I which peaked at 4.36, CK 758, d-dimer 640. CBC/CMP and EKG were unremarkable and initial TTE with EF ~45%. Repeat TTE obtained a few days later with normal LV and RV size/function without any wall motion abnormalities. Cardiac MRI obtained with normal LV function (EF 64%) but late gadolinium enhancement in a subepicardial distribution within the inferolateral wall of the left ventricle at the base most compatible with myocarditis. ESR and CRP were normal. Further workup to determine etiology of myocarditis was negative (ANA, ANCA, RF, hepatitis panel, HIV, full respiratory viral panel, COVID-19 PCR). She was placed on metoprolol succinate 12.5mg XL daily and will follow up with a cardiologist as an outpatient. Family concerned that COVID-19 vaccine was the trigger/underlying etiology of her myocarditis.</p>

1105850	3/16/2021	IL	83	F	3/9/2021	3/13/2021	3/13/21 ER HPI: 83 y.o. female who presents to the Hospital Emergency Department by private auto with her daughter. The patient comes in because her blood pressure at home has been very high. It is actually not reading on her cuff. She has a very dull headache on the left side of her head, but states it is very mild. No chest pain. She might be a little bit short of breath, but not much more than normal. She denies any current neck pain. She states a few hours ago she had a little bit of pain in the left side of her neck that was just brief and then way. On my initial evaluation her systolic blood pressure was around 240. The patient does have a history of anxiety. She states she has had typical anxiety, but nothing new. 3/15 office followup note: Subjective: Patient is 83 y.o. year old female that is here for ER follow up. 2 ER visits over the weekend. BP was elevated into the systolic 200s. Has ringing in ears when BP was elevated. On Saturday: Left side of throat dry Left side of face "doesn't feel right", hard for patient to describe When she woke up on Saturday, couldn't see out of left eye, this has improved Says her voice doesn't sound the same, "gravely" She did not tell the ER doctor on Saturday about the neurologic symptoms. In her 1st ER visit she had a chest x-ray which showed no acute disease. Cardiac enzymes were negative. ER doctor increased her losartan dose and gave her p.r.n. clonidine. In the early morning hours on Sunday, she returned to the ER. Blood pressure was elevated again at 208/85. Patient was given sublingual nitro and a Norvasc 5 mg tablet. After the sublingual nitro, blood pressure was 144/84. ER doctor discharge patient with follow-up today.

1106212	3/16/2021	FL	68	F	1/22/2021		Light-headed; Pressure in my chest; Pressure on my jaw and shoulder, my left shoulder; pressure on my jaw that go up to my head; Pressure on my jaw and shoulder, my left shoulder; pressure on my jaw that go up to my head; Pressure on my jaw and shoulder, my left shoulder; pressure on my jaw that go up to my head; Arm was sore; Had light headache; This is a spontaneous report from a Pfizer sponsored program. A contactable consumer (patient) reported that a 58-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot Number: EL8982) via an unspecified route of administration on 22Jan2021 as single dose for covid-19 immunisation. The patient medical history was not reported. Concomitant medication included aspirin (ASPIRIN [ACETYLSALICYLIC ACID]) taken daily. The patient experienced light headedness and pressure in her chest that went to her left shoulder and jaw. Patient had light headache, pain in chest, and pain in jaw. She woke up this morning feeling better but still had slight pain in jaw. Wondering if side effects are from vaccine and will she be ok. Patient stated, "I have the first dose of the vaccine on 22Jan2021, I didn't have any side effect, my arm was sore but nothing big. But yesterday I feel light headed, like pressure in my chest, kind of pressure on my jaw and shoulder, my left shoulder, and my vitals were okay like my blood pressure, my heart rate and everything was normal. Further she explained this morning I felt better I didn't have pressure on my chest or anything but the pressure on my jaw that go up to my head. Is that related to the vaccine or is something that I have to worry about?" Consumer stated, "The second one is going to be on 12Feb2021, this Friday." Patient stated, "No, I was calling because today I feel better, I don't have the pressure on my chest. But I still have the pressure on my jaw and on my kind of my head. But no I have not called anybody. It's not like an emergency, I am calling because I was not sure about this is related to the vaccine." For treatment consumer stated, "No, today I took some Tylenol, that's all." No investigation assessment. The outcome of the event 'Light-headed' was recovering, the patient recovered from the event 'Pressure in my chest' on an unspecified date, was not recovered form Pressure on my jaw and shoulder, my left shoulder; pressure on my jaw that go up to my head and

1106258	3/16/2021	GA	61	F	2/2/2021	2/1/2021	nausea; chills; diarrhea; bad chest pain could barely breathe; bad chest pain could barely breathe; left arm where the injection was given was very painful from the injection site to her wrist and; left arm where the injection was given was very painful from the injection site to her wrist and; can barely lift her arm over her head; increase in her blood sugar; arm pain; This is a spontaneous report from a contactable consumer (patient herself). A 61-year-old female patient, not pregnant, received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EL9265), via an unspecified route of administration in the left arm, on 02Feb2021 14:30, at a single dose, for covid-19 immunization. Medical history included diabetes, high blood pressure, and sciatica. Concomitant medications included insulin glargine (LANTUS); metformin; hydrochlorothiazide; candesartan; glipizide (GLIPIZIDE XL) and; colecalciferol (VITAMIN D [COLECALCIFEROL]) - all taken for unspecified indications with start and stop dates not reported. The patient previously received sitagliptin (JANUVIA) and experienced allergies. The patient did not receive any other vaccines within 4 weeks prior to the Covid vaccine. The patient did not have Covid prior vaccination. The patient received the vaccine in a public health clinic/veterans administration facility. The patient received the Pfizer vaccine dose 1 on 02Feb2021. The patient experienced nausea, chills, diarrhea and bad chest pain could barely breathe - these have passed. Her left arm where the injection was given was very painful from the injection site to her wrist and she has been alternating ice pack/heat pad and taking Tylenol 650 mg for the pain. She can barely lift her arm over her head. She also noticed an increase in her blood sugar and her blood was really dark - she stated this was unusual. She asked if there was anything she can do or take that might decrease her arm pain. All the adverse events happened on Feb2021 and resulted in doctor or other healthcare professional office/clinic visit. It was reported that the patient had not recovered from all the adverse events at the time of the report. No treatment was received for all the adverse events, except for "left arm where the injection was given was very painful from the injection site to her wrist" (alternating ice pack/heat pad and taking Tylenol 650 mg for the pain). The patient has not been Covid-tested post vaccination.

1102415	3/15/2021	MO	21	M	2/25/2021	2/25/2021	~~Moderna" Adverse vaccine reaction possible as began 12 hours post second COVID vaccine dose on Friday. A ER note was generated in a T-Con on a patient who got their 2nd Covid Vaccine and began experiencing chest pain approx. 12 hours post vaccine. Patient did not report to the ER until 28Feb21. It was discussed that he has myocarditis v pericarditis, elevated D-Dimer of 770, swollen lymph nodes, and elevated Troponin. Patient was transferred to Research Medical Center due to no available beds. Patient was referred to a Case Manager and Cardiology. The patient completed a follow up appointment with 509 MDG on 9Mar21 and reported Dull pain that has been affecting sleep. Cardiology reports shows Troponin was elevated to 9.1 decreased to 4.2 and back up again to 13.4. Cardiac revealed late gadolinium enhancement, possibly representing myocarditis and then at discharge possibly myocarditis.
1101713	3/15/2021		58	M	3/15/2021	3/15/2021	He received the vaccine at 1055. At 1108 am the patient became light headed, dizzy, and diaphoretic. The patient experienced LOC for a few seconds. He did not fall during the episode. After a few minutes he was able to stand and walk to the observation area with assistance. Vitals were taken at 1110 BP was 104/57, HR 53, sat 97%. The patient's hands were clammy and he was pale at the time. He denied SOB, chest pain, or difficulty breathing. At 1122 am vitals were 134/73, HR 59, and sat 97%. He reported he felt better at that time. He called his wife to take him home so he would not have to drive. His wife arrived at 1210. The patient left in a stable condition, vitals normal, and walking without assistance.
1101725	3/15/2021	CA	62	F	1/26/2021	1/28/2021	A couple of days after at 10:30 PM I had a fever of 101.5 with a headache in the front on top of my forehead. I stayed home from work the next day and my fever was 100.0. Tylenol helped. I felt tired but better. It became difficult to breath. It felt like I had chest pains especially on exertion. It improved if I sat down. It lasted aa week. My doctor sent me for a chest x-ray and blood tests. I had contracted Covid-19 on the third week after my first dose of the vaccine. Positive test results on 01/11/2021.

1102433	3/15/2021	NJ	64	F	2/10/2021	2/10/2021	2/10 1015 AM 10PM I was extremely fatigued. Slight HA. Dizziness/light vertigo. Sore shoulder on left. Symptoms with stomach cramping lasted into 2/11, all day. By 9PM, I had a severe HA, chills, spent most day in bed. My heart was pounding. Couldn't lay down, HA was throbbing. Temp was 101.5. I contacted my PCM. Advised to rotate between Tylenol and Motrin. The fever did break overnight. 2/12 I was still feeling fatigue, HA. No fever, no chills. Still having vertigo with chest tightness. That had set in on the 2/11. Started my albuterol on 2/11 and lasted till 2/16 with a slight cough. 2/16 Dr was able to see me. She could feel the inflammation in my chest. *Exacerbated the problem because on 2/13 I felt chest tightness and thought it was the asthma, exercises made my symptoms worsen. The acid reflux gave me the sense I was having tight chestness due to the asthma but it was actually due to me exercising on 2/13 which worsened by the 2/15-2/16. I had still had the chest pain, HA Prescribed Advil.
1102410	3/15/2021	WV	50	F	3/13/2021	3/14/2021	Extreme headache Extreme neck ache Chills-uncontrollable shakes Fever Muscle spasms Joint pain Ear pain Extreme fatigue Chest pain Skin tenderness all over Injection site pain Symptoms Started 13 hrs after vaccination. I was a long hauler from Covid that started on July 24, 2020 and it took 4 months to begin to recover. I was hospitalized for 5 days. I received Covid plasma in the hospital.
1101697	3/15/2021	IL	70	M	3/15/2021	3/15/2021	20 minutes after receiving moderna vaccine, pt developed generalized shaking, felt "cold". Reported no shortness of breath, chest pain, fever. b/p 156/93. HR 118

<u>VAERS_ID</u>	<u>RECVDATE</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1102478	3/15/2021	IL	75	F	2/24/2021	2/25/2021	Received the second dose of COVID 19 on Feb. 24, 2021, at 2:20 pm. After the injection, I sat for 15 minutes, felt fine, then left, went home. The next morning at 5 am, woke with right arm throbbing and a huge swelling where the vaccine was injected. I got up, felt dizzy, and went to the bathroom, took my temperature, which was 101 F, then got the chills and had chest pains across my entire chest. Tried to go back to bed but the symptoms got worse. Called my neighbor and asked him to take me to the ER. He took me to the ER and I was checked for fever, had a chest x-ray, urine test, blood pressure checked and at 5 PM was admitted.
1102364	3/15/2021	MI	64	F	3/6/2021	3/15/2021	Patient initially had bruising and arm pain due to administration of the vaccination in her left deltoid on 03/06/2021 as she reports the pharmacist said he "hit a vein" during administration. She states that after 1 day her arm pain resolved but she still had the bruising. On 3/15/2021 patient woke up with swelling, warmth, and erythema distal to her original vaccination site. She denies any injury to this area. The erythematous patchy area distal to her bruising is nonpruritic and nontender to palpation. Patient denies other vaccine reaction symptoms such as headache, dizziness, runny nose, sore throat, cough, chest pain, shortness of breath, diarrhea, constipation. I recommended that patient use heat 10min three times daily for reduction in swelling and continue to monitor this site for any changes. If any changes occur patient needs to call the office; patient confirmed understanding. Also advised patient to call office if any new symptoms occur of vaccination reaction; she confirmed understanding.
1101353	3/15/2021	IN	35	F	2/15/2021	2/16/2021	Abdominal and back rash - have tried creams to resolve itching and appearance. Still some on my back. Abdomen rash has cleared. Chest pain, right sided. Pain through jaw and shoulder. Felt as if I pulled a muscle. Slept a few hours and it was gone; had it not been gone when I woke up, I would've went to the ER.

1101343	3/15/2021	IN	67	F	3/1/2021	3/12/2021	Approximately 24 hours after vaccine, had symptoms very similar to when I had Covid in January - tired, queasy stomach, headache, no appetite. Thought I was doing better after 48 hours but had a relapse last night with fever and chest pains. When I take a deep breath, feel pain in my chest.
1101270	3/15/2021	FL	45	F	3/11/2021	3/11/2021	muscle aches, palpitations, "feels like heart is accelerating and decelerating", chest pain, nausea, vomiting, has hx of GI upset Referred to see primary physician STAT.
1101228	3/15/2021	PA	25	F	3/14/2021	3/14/2021	By the one hour mark, I had chest pain, difficulty breathing, and rapid heart rate. It felt like my heart is overworking itself even though I am just sitting still on the computer. Other side effects were headache, nausea, and chills. Noticed my heart rate was fast during the 15 minute observatory period at the facility but assumed it was from the adrenaline + fear of needles. By the twelve hour mark, heart + chest no longer hurt and most side effects were gone.
1100985	3/15/2021	IN	53	M	3/13/2021	3/14/2021	Fever, severe aches and pains still continued into the second day now. Chest pain along with major joint pain
1100839	3/15/2021	PA	73	F	3/12/2021	3/12/2021	The patient had her second vaccination for Coronavirus this afternoon. She was asymptomatic for 15 minutes afterwards, but while driving home she developed tingling of her lips and the feeling of heat in her throat. She went back to the outpatient center where she had the vaccination, where they assessed her. She was not hypoxemic, tachypneic, or hypotensive. There was no visible angioedema. She had no rash or shortness of breath. The vaccinations center administered Claritin and Pepcid and referred the patient here to the emergency department for evaluation. The vaccination occurred 1 hour ago now. The patient says that she feels better, but continues to have the sensation of "heat" in her throat. She has no history of prior allergic reactions. She has no chest pain, difficulty breathing, nausea, vomiting, rash, or itching.
1100709	3/15/2021		31	F	3/12/2021	3/13/2021	Bodyache and headache since she got J&J shot yesterday . Had 100.5°F temp 20mins PTA. Denies URI symptoms, chest pain or difficult breathing.

1100565	3/15/2021	AZ	29	F	1/8/2021	1/8/2021	some kind of back pain, behind her heart; heart pain; pretty strong chest pain; fatigue caused by the vaccine was so profound; This is a spontaneous report received from a contactable consumer(reporting for her daughter) A 29-year-old female patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EL0142 expiry date 31Mar2021 via an unspecified route of administration on 08Jan2021 (at the age of 29-year-old) at single dose for COVID-19 immunisation. The first dose of bnt162b2 was taken on 17Dec2020. The patient's medical history included bipolar disorder. Concomitant medications included quetiapine (QUETIAPINE). The patient experienced some kind of back pain, behind her heart, heart pain and pretty strong chest pain on 08Jan2021 with outcome of recovered. In addition experienced "fatigue caused by the vaccine was so profound that was advised to not take her bipolar medication, quetiapine" on an unspecified date with outcome of recovered. It was reported that "It took 36 hours for the extreme fatigue to stop. This was very frightening because being without the medication could cause auditory hallucinations to return after 36 hours. There should be a warning for people who must take sedative medication regularly so that they can make an informed decision about whether or not to receive the vaccine".

1100483	3/15/2021		73	F			<p>L arm/hand numbness; blood pressure abnormality; chest pain; respiratory distress; This is a spontaneous report from a non-contactable other-HCP. This other HCP reported for a 73-Years-Old (same age at vaccination) female patient that she received the first dose of bnt162b2 (BNT162B2, Lot number EN6205), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient medical history and concomitant medication was none. She had not been back to her pcp for "several years". No known history of HTN. She did have a blood pressure cuff at home. During her 15-minute waiting period after the injection on an unspecified date, the patient began to experience L arm/hand numbness. Monitored patient for severe reaction symptoms, including but not limited to blood pressure abnormality, chest pain, rapid progression of symptoms and respiratory distress. Treatment included: no therapy. Follow up response was excellent. Patient discharge: stable to go home and follow up with PCP. Outcome of events was unknown. No follow-up attempts are possible. No further information expected.; Sender's Comments: Based on the information provided, and on a close drug-event temporal association, the Company assessed there was a reasonable possibility that the reported serious events were related to the suspect vaccine BNT162B2. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p>

1100242	3/15/2021	FL		M	1/11/2021	2/1/2021	Pericarditis; Atrium flutter; Extremely anemic; Night sweats; A spontaneous report was received from a consumer concerning a male patient who experienced pericarditis, atrium flutter/atrial flutter, became extremely anemic/anaemia, and developed night sweats. The patient's medical history was not provided. Products known to have been used by the patient, within two weeks prior to the event, included sucralfate, mesalazine, metoprolol, escitalopram oxalate, colesevelam hydrochloride, multivitamin, vitamin D3, vitamin B 12 and fluciconide. On 11 Jan 2021, the patient received their first of two planned doses of mRNA-1273 (Batch# 029K20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 8 Feb 2021, the same day as the onset of the symptoms, the patient received their second of two planned doses of mRNA-1273 (Batch# 026L20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 08 Feb 2021, the patient presented to the emergency room with severe chest pain across his entire chest and entire jaw that was exacerbated when he took a breath. A pulmonary function test and electrocardiogram were performed (results not provided). The patient was admitted to the hospital with pericarditis and discharged 3 days later. Treatment included colchicine. In Feb 2021 (date not specified), the patient experienced night sweats and had a blood test (result not provided) that showed extreme anemia. The patient also developed atrial flutter. Treatment for atrial flutter included cardiac ablation and apixaban. The patient received both scheduled doses of mRNA-1273 prior to the events; therefore, action taken with the drug in response to the event(s) is not applicable. The outcome of the events, pericarditis and atrium flutter, was considered not recovered. The outcome of the events, anemia and night sweats was not provided.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. The patient's medical history of taking colchicine can be contributory to the Anemia.

Hives/rash developed within 15 minutes, was injected with 25mg of Benadryl. Another 15 minutes or so later it had become hard to swallow, I was given another 25mg dose of Benadryl. After the second dose it became hard to breathe, started coughing and chest started to hurt. I didn't realize but had broke out in sweat. Nurse checked my eyes. Called paramedics and had epi pen ready. I thought a third dose of Benadryl had been administered but that I am not certain of. Blood pressure was higher than my usual but still considered normal (113/82 I think?) pulse was 120 something, at rest I am usually at 70. I became lightheaded. Paramedics did an ekg, it was normal. They monitored me while I stabilized. Was released when pulse was in the 80?s range. Residual chest pain after. 8 days after vaccination I broke out in sweat and became nauseous. Vomited. I then noticed below the vaccination injection (still bruised) and around where last dose of Benadryl was injected there was a large red welp, hot to the touch. The heat eventually went away but the welp remained a few days. 11 days after vaccination is when the cluster headache appeared. Shortness of breath was noticeable on day 12. Day 14 fever and nasal congestion with slight irritation in throat, occasional cough. Day 15 sore throat, coughing progressed (non productive) in to fits that led to vomiting. It is day 18 and shortness of breath is present at rest, chest pain, rash near injection site and bruise is still present. Temp has been low grade fever, hadn?t gone above 100. Normal is 96.9/97.1 for me. Oddly day 13 (the day before fever became present) my temp was lower than usual 95.6/95.7 yet I wasn?t cold.

1103194	3/15/2021	CO	66	M	3/8/2021	3/10/2021	Moderna COVID-19 Vaccine EUA. At approximately 4:30 p.m. while at home, I felt pressure in my chest, shortness of breath. After the symptoms became worse, I was driven to the Emergency Department for treatment. My initial blood pressure was 247/114. I was administered aspirin iohexol (OMNIPAQUE) and nitroglycerin (NITROSTAT). I was given oxygen. Blood was drawn, an EKG standard was taken, a CTA Chest scan was done and a XR Chest 2 View PA and Lateral were taken. I was released from the hospital at approximately 11:30 p.m. My blood pressure at the time was 187/107. My breathing was easier and my chest pain was low.

1102493	3/15/2021	FL	77	M	2/8/2021	2/8/2021	He had the injection, had the sore arm and approximately 3 hours after the vaccination he began to experience severe chest pain across his entire chest and into his jaw, which was exacerbated upon taking a deep breath. He called his cardiologist who advised him to go to the ER. He was worked up, subsequently admitted from 2/8/21 to 2/11/21, a lot was ruled out but no specific diagnosis made at that time. They did note some pleural effusion and pericardial effusion at that time. Upon discharge on 2/11/21, starting Thursday evening he continued to have pain in the chest, but not as severe as when he entered into the hospital. Every evening including last night has began with severe night sweats, low grade fever and the chest pains have continued. Went to see his PCP, Cardiologist and his Electrophysiologist several days later the following after discharge, he does have a pacemaker, and was told by all three of them that he has pericarditis and that the reaction could have been related to the vaccination. It seemed more than coincidental that the symptoms did not appear until 3 hours after the vaccine. Was put on Colchicine to treat the pericarditis and then received a 2nd opinion and has reinstated the colchicine. His low grade fever has finally dissipated. During the day he feels okay, but still continues with the chest pains and the night sweats. His hemoglobin dropped in the hospital possibly related to the heparin and then put on Eliquis postop, and now discontinued, and received an iron infusion to boost his hemoglobin. He is scheduled for another iron infusion this Wednesday. He went to see GI physician and feels that he may have a bleed due to the infusion. He has had an anastomosis due to Crohn's disease and feels that's where the bleed may have been coming from as he did have an ulceration at last colonoscopy. He did have atrial flutter due this and was advised to have an ablation, and trying to reduce the pericarditis and FU later with other heart related problems.
1103370	3/15/2021	FL	83	F	3/12/2021	3/13/2021	Chills, temperature 103.6, nausea, chest pain, vomiting progressively (temperature went below normal after vomiting) for 15 hours total. Left arm still red, swollen and hot.

1103034	3/15/2021	MA	49	F	12/29/2020	1/6/2021	Soreness in the arm and redness gone by 01/05/2021. It became red and swollen with numbness and tingling. There was a rash and coldness in the arm. Sharp chest pain onset with coldness feeling. On 1/09/2021 one onset of chest pain and coldness in the arm all the way down the arm and into the fingers. Observed in the ER with EKG. Followed up with care clinic. Stress test scheduled but cancelled, rescheduled on Mar 29th.
1103070	3/15/2021		81	F	3/11/2021	3/12/2021	Bradycardia; Chest pain; Shortness of breath; Sinus bradycardia; Symptomatic sinus bradycardia
1103088	3/15/2021	TN	58	F	3/10/2021	3/11/2021	Patient awoke in the night with severe shaking, chills. Reports back and chest pain-began vomiting, then fainted and hit her head on toilet. Did not seek medical attention. Refuses second vaccine.
1102901	3/15/2021	FL	37	F	3/3/2021	3/3/2021	Tongue, lips, face went numb at around the 5 min mark. Then hands and arms. I was dizzy and weak, had a hard time walking. I noticed my vision was blurred. I couldn't see freckles on my arms that I usually can see. After 40 mins the numbness improved. On the drive home I was swept with head-to-toe numbness for about a min with the feeling like I was going to throw up and chest pain. The chest pain continued to come and go a few times for the next 10-12 hours. I was very dizzy and very weak. My vision went back to normal about 5 hours later. But I remained dizzy and weak for about a week. I still have dizziness on and off throughout the day that I never had before though. All those symptoms I feel like are outside of what was expected and concern me but other than that I had symptoms that I expected as well like my arms was sore for maybe 3 hours total the day after, I was tired, and had an elevated temp around 100 degrees.

Pt received her first dose of Moderna vaccine at approximately 0900. Pt moved to the monitoring area where she was instructed to wait for 30 minutes due to her medical Hx and previous allergic reactions, Pt alerted a clinician stating she felt a tingling sensation around her mouth and minor swelling of her lips. Responded as well as fire department. Pt was given at 2 doses of EPI 1:1000 for a total of 1.0mg (0.5mg/dose) and 50mg of Benadryl. All medicine administered IM. Pt experienced relief post med administration. Pt denied any shortness of breath or chest pain. No headache/blurred vision or tinnitus. Pt denied any nausea or vomiting. Pt had equal grips and pushes. Skinsigns were warm and dry. No hives, redness or itching. Pt was transported to Hospital by fire department. Vital signs: BP 142/82, HR 78, RR 18 Hx: HTN, Thyroid issues, CA, Allergic reactions ALLERGIES: Sulfa, Seafood MEDS: UKN Conclusion Pt was identified as a "30 min monitoring" upon check-in. Pt was instructed to wait in the designated area. Upon feeling a reaction to the vaccine, pt promptly notified staff. Immediate response to the incident resulted in a successful pt outcome. System put in place worked as intended. Identified a pt with potential vaccine reaction prior to the administration of medicine. Staff instructed pt to wait in the appropriate area. A timely response, including rapid administration of appropriate medication prevented further swelling and potential airway involvement.

1097250	3/13/2021	IN	55	M	3/11/2021	3/12/2021	On Friday morning I started having chest pains. The pains were sharp and would go away quickly. (Almost immediately) They were from the center of my chest to the right of my chest at about the same level as my heart, I could tell that the pains were NOT coming from my heart, or at least, that is how it seemed. I also felt some pains to the left of the center of my chest, but the pains from the left were fewer and not as pronounced. These pains resulted in my leaving work early (I was on the way to work when they started) and I stayed home from work today. The pains did not continue for more than 4 hours or so, and seemed to dissipate later that day. I did feel some discomfort in my chest this morning. This discomfort was extremely mild and did not last much more than an hour and a half. I feel fine this afternoon, as I am writing this note. I have been eating, urinating and have had normal bowel movements today, so I think I am okay. You might be mindful of these chest pains the Moderna vaccine is causing. The pains were sharp and noticeable. I did not call my Doctor because it did not seem necessary. Thank you.

1094315	3/12/2021	CA	33	F	1/15/2021	1/15/2021	Within 5 minutes, I felt burning sensation in my chest; in 10 minutes - I started getting chills and within 15 minutes chills were a lot worse. They placed me on a gurney, and the chills started getting so bad I was shaking and out of control and I was really cold. After about 25-30 minutes after I felt like my blood pressure dropped and I actually passed out and once I passed out I don't know how long I was out for. Maybe less than a minute, I couldn't breathe and I was hyperventilating and they put a oxygen mask on me. They took me to ER (Hospital) and I recognized I was in there when I "woke up" - they were trying to get an IV in me but I was shaking so much it took several attempts. They gave me several medications because I was nauseated as I wanted to vomit and they gave me anaphylactic medications. I was having chest pains. I fell asleep. They were going to admit me but I kind of refused to be admitted and they let me go with Zofran, prednisone and one other medication. One of coworker took me home. I slept the rest of the day and night. The next day, Really fatigued and chest pain was semi getting better. Breathing - was pretty okay after that. By day 3, I was fine.
1094363	3/12/2021	MD	75	F	3/4/2021	3/9/2021	Patient presented to the ED on 3/9/2021 with chest pain, headache, and brief blurred vision. There was no signs of stroke or MI event. Reason for admission: chest pain.
1094199	3/12/2021	CA	26	F	3/11/2021	3/11/2021	Pt received Moderna Vaccine at 04:56pm, was placed on observation for 30 mins due to hx of allergies. Upon observation of patient, patient stated she was experiencing possible allergic reaction tingling sensation to lips and irritation to throat. No angioedema, no wheezing, no hives, generalized rash or respiratory distress, O2 sats were noted to be 100% on RA. Pt stated she felt as her throat was closing up, pt was noted to be anxious due to symptoms, and continued to state her throat was closing up. Epi pen 0.3mg IM administered at (05:09) was administered, pt was also medicated with benadryl 50mg IM (05:10) and solumedrol 125mg IM (05:16pm). Pt was alert, oriented, no angioedema noted, no wheezing, no respiratory distress, no ALOC, no hives, no chest pain. Overall, pt stated she felt better and symptoms had resolved after administration of medication. Pt was transported to hospital for further evaluation.

1094457	3/12/2021	PA	79	F	2/24/2021	2/25/2021	Was napping the day after receiving the vaccine and woke up about 3:00 pm to severe chest pain on the right side radiating deep into the shoulder blade. It would last about 5 - 10 min., stop for the same amount of time, then start up again.... on & off until close to 11:00 pm. Since someone else I know had the same thing happen the day after her shot, I assumed I had the same symptom, tho' it was very frightening. A week later after going to bed on Friday night, I woke at 2:00 a.m. to the same pain only this time on my left side. Thinking I could be having a heart attack, I went to the hospital where I was admitted after having a series of tests. I was there for 2 days during which time I also began to have un-controllable diarrhea. Altho' they could find nothing wrong with my heart, after scans, x-rays, a stress test, numerous blood tests etc., they cannot say positively whether or not it was from the Covid vaccine. I tho't it best to report this in case others have similar events. I had the MODERNA vaccine
1094479	3/12/2021	MA	69	M	3/12/2021	3/12/2021	Called to patient's side after receiving COVID vaccine, he became diaphoretic and dizzy. He states he was feeling dizzy prior to receiving the vaccine, but felt much worse immediately after. He denies n/v/chest pain/SOB. He denies any palpitations. On intial exam HR 120, patient diaphoretic, appeared weak, fatigued. He was placed in wheelchair, declined stretcher, and brought to recovery area. He had not eaten or had anything to drink. He tolerated juice without difficulty. He reports feeling really nervous. On exam he was found to be diaphoretic. Heart was found to have irregular rhythm with pauses on auscultation. Lungs mild wheezing throughout. He is alert in oriented, but seems somewhat slow to respond. He is answering questions appropriately overall. He denies fever, chills, cough. EMS activated. Transferred to EMS stretcher upon EMS arrival with plan to go to
1094506	3/12/2021	GA	81	F	3/8/2021	3/10/2021	Patient is a 81 y.o. female who received the Moderna vaccine on Monday. On Tuesday she developed oral purpura and began spitting up blood. She developed some large hematomas. She was seen in clinic today and had a platelet count of 5k previously normal. Labs are still pending right now. No head ache or neuro changes. No obvious GI bleeding. No chest pain or shortness of breath.

1094194	3/12/2021	MD	42	F	3/7/2021	3/8/2021	Immediately after receiving the vaccine, I felt pretty good. Just some soreness in arm and a minor headache an hour later. I took Tylenol and symptoms were bearable the rest of the day. By around 6 or 7p that night, I experienced full body pain and chills, similar to the flu. I also had some chest pain and tightness but attributed that to the overall body pain. I was also very winded and short of breath. I called my Primary Care Doctor to report this, and she said this was a normal reaction and it meant my immune system was working. It continued into the next day, and I took my temperature and had a 102 fever. I slept most of the day and was unable to work. I also had a severe headache. The next day, on Day 3, my flu symptoms were getting better; however, I felt dizzy and short of breath. I also fainted . This is the first time this has ever happened to me. I have never fainted in my life. My symptoms seemed to resolve after eating and drinking, so I figured it may have been dehydration. On Day 4, I was concerned because I was having shortness of breath and chest pain, along with dizziness. I could not take a deep breath without having pain. I called my Primary Care Doctor, and she told me she was concerned I might have covid and to go to the ER. I do not believe I have covid. No one in my household has these symptoms except for me. I believe it is from this vaccine. My chest pain/shortness of breath seemed to go away. for a bit so I did not go to ER. I'm on Day 5 now, and the chest pain/shortness of breath has come back, so I decided to report this because I do not listed on the list of common side effects for the Johnson and Johnson vaccine. I joined a J&J social media group where others are also reporting these symptoms, so I decided to report to Vaers. I also have had night sweats every day since taking the vaccine and my blood pressure is lower since taking the vaccine.
1094655	3/12/2021	MA	60	M	2/27/2021	2/27/2021	After first dose of vaccine, developed 5/10 persistent chest pain accompanied by diaphoresis. Known history of CAD. EMS was called for transport to hospital for urgent medical evaluation. Per family, the patient was taken to local ED on 2/27/21. Had EKG, blood enzymes x 2 and "everything checked out" and he was discharged home. Family notes that PCP follow up arranged and patient reported anxiety.

1093460	3/12/2021	CA	22	M	3/11/2021	3/12/2021	<p>On Thursday, March 11th, 2021 approximately 3:10 pm, Patient received his first dose of Moderna Vaccine (Lot number: 003A21A) in his left deltoid. Patient received the Moderna Vaccine. After which he sat in the designated medical observation area for 15 minutes. Approximately five minutes later around 3:15 pm, Patient experienced syncope, fell out of his chair, hit the left side of his forehead on the ground. Due to the fall, he experienced a mild abrasion on the left side of his forehead, which led to bleeding. The Physician's Assistant rushed to aid Patient who was lying on the ground in a supine position. Emergency Medical Services (EMS) - Fire Department and ambulance were called immediately and approximately five minutes later EMS arrived. During the time frame prior to EMS arrival, the Physician's Assistant asked numerous questions to Patient to assess his condition. She asked Patient if he could breathe and he responded "yes". She asked Patient if he was short of breath and he responded "no". She asked Patient if he felt like his throat was closing and he responded "no". At this point, an Epinephrine pen was not used. Patient was alert and the Orient x 4 questions were asked [(1) Who are you? (2) Where are you? (3) What is the date and time? (4) What just happened to you?]. Patient also denied head pain, neck pain, nausea or chest pain. Staff performed a limited neuro-exam and was deemed within normal limits. Patient's Glasgow Coma Scale score was 15. Patient mentioned that he has a phobia of needles and something like this has happened before when he was "young". Patient initially did not want an ambulance to be called. It was explained to him that it might be in his best interest to call EMS due to syncope and abrasion on his forehead due to the fall. Patient also mentioned that he only consumed two cookies and coffee for that day. When the EMS arrived (about 5 firefighters), they interviewed him and performed a blood pressure test. His sitting blood pressure was 130/82. One of the firefighters assessed his spine and Patient denied cervical, thoracic, and lumbar tenderness or pain. The firefighter assessed Patient's glucose level, which was a bit difficult to obtain in the first initial efforts, with the glucometer reading "error". The firefighters eventually were able to obtain a reading on Patient's glucose and it read 86. Patient was able to stand on his own, and a second blood pressure test was performed;</p>

This morning was lying down because of the body aches and she started with sharp chest pain and can not get a full breath in it is still there if she tries to take a deep breath no fever no chills she did have body aches after the vaccine no NVD she has a migraine headache that started last night with a regular headache last night this morning with migraine~~
1093411	3/12/2021	IN	65	F	3/5/2021	3/5/2021	About 10 minutes after the shot I felt a warm sensation inside my arm running all the way down to my arm and my hand went numb . I waited a few more minutes then I was released. Then 1/2 hour later my eyes were very sensitive to light I wore sunglasses. Then five hours after the shot I had chest discomfort on left side of my chest which felt like I was having a heart attack pain subsided then every 2 hours it came and went until the middle of the night. Then next day still having same chest pain. Then I had difficulty swallowing was choking so I called my doctor. I also had trouble breathing. Dr. Advised to go to ER if I needed to. I rested and rested and monitored myself. Blood pressure fluctuated somewhat. Still had chest pain and discomfort 24 hours after the vaccine. I had never had chest pain or discomfort before. It was quite alarming. Not being able to swallow was alarming also. Several years ago I had an allergic reaction to a cleaning problem some of the same symptoms it was very scary no heart or chest pain with that allergic reaction to a cleaning product that had bleach in the product.

1095588	3/12/2021	IA	69	F	2/26/2021	2/27/2021	<p>Pfizer COVID-19 Vaccine EUA 3/2: Pt received Pfizer vaccine 2/26/2021 and started feeling progressively worse - endorsed fever, diarrhea, body aches, trouble breathing, lack of appetite. On 3/2/2021 pt and husband presented to ED. Pt's husband stated that pt had become more and more confused since she received the vaccine and that on 3/2 she could not complete her sentences. Temp 101.6 on arrival, tachycardic in 130s, tachypneic in 120s, but not hypoxic. Patient was given acetaminophen on arrival. IV was inserted and patient was given 1 L intravenous fluid replacement as well as 2 g ceftriaxone for broad-spectrum coverage within 3 hours of arrival. Blood work was drawn that shows no leukocytosis but lactic acidosis to 3.3. There are multiple electrolyte abnormalities, hyponatremia 127, hypokalemia 2.8, creatinine 1.01, ALT 59 AST 53, ALP 136, total bili 1.3, lactic acidosis 3.3, troponin 0.02. Patient was given 40 mEq of oral potassium. Additional L of normal saline was given for total of 2 L normal saline bolus. Chest x-ray shows right basilar pneumonia. Also shows pulmonary nodule of which husband was made aware. LFTs are noted be elevated, so biliary ultrasound was obtained that was negative with limit to body habitus. Husband was updated. Azithromycin was added on. Rapid COVID antigen was negative. 3/3/21: Febrile, SOB overnight. Pt more lethargic, trailing off in the middle of sentences and having difficulties following conversation. Continue sepsis protocol, add vancomycin IV to ceftriaxone and azithromycin. Frequent neuro checks. MRCP. Chest pain-free, serial cardiac enzymes from yesterday to demonstrate nonischemic pattern likely type 2 NSTEMI. 2/2 blood cultures from 3/2 positive for Streptococcus pyogenes (Group A). Vancomycin and azithromycin dc'd. 3/11: Discharged from hospital. Patient admitted for acute hypoxic respiratory failure secondary to right basilar community-acquired pneumonia. Blood culture grew Streptococcus pyogenes, patient was initially treated with ceftriaxone and switched to Ancef . repeat blood culture on 03/04/2021 showed no growth. Patient will complete a total 14 day course of antibiotics with amoxicillin from culture negative date. Patient had right-sided pleural effusion, pulmonary consulted and she underwent thoracentesis x2 culture showed no growth, considered parapneumonic effusion. Patient required 2 L continuous oxygen and deemed stable for discharge.</p>

1095776	3/12/2021	OK	40	M	3/10/2021	3/10/2021	Patient felt to be in distress at the close of his observation time. He was complaining of trouble with focusing his eyes, left sided chest pain, and was diaphoretic. Pt appeared to be in moderate distress and very anxious. I examined the pt through the car window and listened to his heart and lungs. Pt was not in respiratory distress and heart rate and rhythm were regular. Reassurance was provided to the pt, but he was also told that to be safe I recommended that he be evaluated in the emergency department and that he be transported via ambulance. Pt expressed understanding and agreed to going to the ED but was refusing transport via EMS. Pt was the passenger in the vehicle and he said that the driver could just take him. I expressed that transport via EMS would be the safest but we could not make him go via EMS and that if they wanted to leave via private vehicle then they could but i still recommended that he be evaluated in the ED. He expressed understanding and that he would go directly to the ED via personal car.
1095867	3/12/2021	CA	81	F	2/23/2021	2/23/2021	She had no issues with the 1st dose in the series. She did not have any symptoms but acknowledged feeling anxious about the side effects prior to arrival for vaccine. After the 2nd dose, she experienced chest pain, jaw pain, body numbness and tingling, and nausea. She did not have vomiting, shortness of breath, syncope, or headache. She was hypertensive on the cardiac monitor and EKG with T wave inversion in lead III, otherwise unremarkable. Heart rate stable, alert and oriented, cardiopulmonary exam benign. She was sent to the ER for further workup, but did not seem to have any allergic reaction to the vaccine. It is unknown what occurred at ER, as she either went to a separate health system or did not go at all.

1095180	3/12/2021	TX	31	F	3/1/2021	3/8/2021	I started having chest pains and rib soreness. I woke up feeling like I got hit by a truck. I started taking ibuprophen thinking I may have pulled something but the soreness never subsided. It hurts to move, when I cough, sneeze, etc. I went to the Urgent Care/ ER last night because I wanted to see if something major was wrong, They did blood work and ran a couple of tests but everything came back fine. I didn't mention to them that I received the first dose of vaccine because I didn't think I could get a side effect a week later until I looked on the website today. I'm still in pain and I have no idea what could have caused this other then the vaccine.

1090200	3/11/2021	TN	76	M	1/22/2021	1/22/2021	Exacerbation of previously controlled hypertension with blood pressure spiking to 200/100; Had skeletal chest pain; doing well until Covid vaccine; This is a spontaneous report from contactable physicians (one of which was the patient). A 76-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EL1283), via an unspecified route of administration at the right arm on 22Jan2021 08:30 at single dose for COVID-19 immunization. Vaccination was done in a TN. Medical history included CABG Post op RT CABG (coronary artery bypass; doing well until Covid vaccine) from 11May2020 and hypertension. Concomitant medication included metoprolol succinate (TOPROL), ubidecarenone (COQ10), losartan and Hybrid. There was no other vaccine receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient previously took atorvastatin (LIPITOR) and experienced allergies: Lipitor. The patient experienced exacerbation of previously controlled hypertension with blood pressure spiking to 200/100 on 26Jan2021, went to local ER, BP 180/100 there on 26Jan2021. He had skeletal chest pain which began 25Jan2021 22:00. He stated post op right cabg from 11may2020, doing well until covid vaccine on 22Jan2021. Treatment IV Hydralazine received. The events were considered non-serious by the reporter. On 26Feb2021, it was reported that the patient provided information to another physician regarding the reported adverse events with the use of BNT162B2. The physician did not consider the Pfizer product had a causal effect to the adverse events. Lab data also included Covid test (rapid nasal swab) on 26Jan2021 was negative. The outcome of the events was not recovered. Follow-up (26Feb2021): New information received from a contactable physician in response to HCP letter sent includes: reporter details (added a physician as a reporter), causality assessment and clinical course details. Follow-up attempts are completed. No further information is expected.; Sender's Comments: Based on the compatible time association, the possible contribution of suspect vaccine BNT62B2 to the events hypertension aggravated, skeletal pain and unwell cannot be excluded. The fluctuation of underlying hypertension may be major cofounder. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer

1087769	3/10/2021	NJ	37	F	2/16/2021	2/17/2021	<p>Here is my story. Part 1: I had my second Moderna vaccine on 2/16. 36 hours later I was laying In bed when I all of a sudden felt very strange- sort of faint - like I was going to pass out. Then I started feeling like my Body was going numb. We called 911. I was taken to the ER. What followed was about 15-20 ?neurological? episodes (every ten minutes or so) where my entire body from head to toe became paralyzed- I couldn?t move any of my limbs. I also had no sight. I was not blacked out Bc I could hear everything that was happening. It was also accompanied by extreme chest pain, numbness, contracting of muscles in chest cavity that felt almost like a heart attack. Each individual episode lasted about 3-5 minutes and then slowly the paralysis would undo and I?d regain feeling. And then the full episodes would start over a few minutes later. This went on for a few hours repeatedly while in the ER. I was admitted for testing and monitoring for two days (EEG, EKG, MRI, Catscan) all clear. Once discharged I had lingering neurological symptoms but not the full paralysis episodes. Lingering symptoms included severe chest pain, numbness/weaknesses predominant on the left side as well as other random areas. I was very weak and tired. I started to improve very slowly - by day 10 post hospitalization I was starting to feel like things were turning the corner and maybe I was on my way to recovery. Part 2: I started to finally feel more improved from the lingering neurological issues and then all of a sudden around 5:30PM I was in the kitchen making dinner for my kids on 3/2 and the episodes started again. Called 911. Again, every ten minutes or so they came on (maybe 15-18 episodes) of complete paralysis- this time accompanied by seizure like rapid eye movement from side to side and fluttering of the eyes. I was readmitted to the hospital where the episodes repeated to happen again, maybe 15-20 times. I was admitted. They did a 24 hour video EEG which ?caught? the episodes on video and sound but did not appear negatively on the EEG in terms of abnormal brain activity. I?ve been released as they say there is nothing to do. I have lingering muscle weakness in my eyes- I can?t focus my eyeballs or ?track? on an eye exam and continued muscular chest pain. I also have a lot of PTSD from the trauma of the events.</p>

1087143	3/10/2021	ID	39	M	2/2/2021	2/2/2021	myocarditis; severe chest pain; developed severe flu symptoms; This is a spontaneous report from a contactable healthcare professional (patient). A 39-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, batch/lot number and expiration date were unknown), via an unspecified route of administration in the left arm on 02Feb2021 at 08:30 AM (at the age of 39 years old) at a single dose for COVID-19 immunization. The vaccine was administered to the patient at a hospital. The patient had no medical history and had no known allergies. The patient had no COVID prior to vaccination. Concomitant medication included testosterone. The patient had no other vaccine in four weeks. The patient previously received the first dose of BNT162B2 on 12Jan2021 at 12:30 AM (at the age of 39 years old) in the left arm for COVID-19 immunization. The patient developed severe flu symptoms on 02Feb2021 at 20:30. The patient experienced chest pain and myocarditis on 12Feb2021 at 03:00 AM. It was reported that after 12 hours, the patient developed severe flu symptoms for the following 48 hours. Then she developed severe chest pain and was hospitalized for myocarditis. The patient was hospitalized in Feb2021 for 5 days. The patient received treatment for the events which included heart medications and heart angiogram. The patient was tested for COVID post vaccination which included blood test and nasal swab, both with negative results on 12Feb2021. The outcome of the event was recovering. Information on the batch/lot number has been requested.; Sender's Comments: The event myocarditis was most likely due to influenza, which was an intercurrent infection, and unrelated to suspect vaccine BNT162B2. There is no plausible mechanism implicating BNT162B2 to the reported event based on the drug known safety profile. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1088668	3/10/2021	MA	74	F	3/10/2021	3/10/2021	Approximately 10 minutes after vaccination patient complained of substernal chest pain. No associated symptoms. No anaphylactic symptoms. Usually takes sublingual nitro but did not bring to vaccination site.
1088280	3/10/2021	NJ	36	F	2/26/2021	2/26/2021	10 days and I still feel like shit after this vaccine... last night was scary. Back left under ribs back pain...then chest pain left / same spot on the front left... felt like a cardiac event. Then I saw the large inflamed rash on my left arm and I collapsed in the shower. I took my medicine and went to sleep and felt ok for a little this morning and now the pain is back - this time with heartburn. I've been sick to my stomach on and off since the vaccine, weird taste and feeling in the back of my throat, place where they gave me the shot swelled up half the size of a baseball within an hour of the vax - it's still a bit bigger than my other side. Could it be allergic reaction to this?

1088751	3/10/2021	CA	85	M	2/10/2021	2/22/2021	85 year old male who presents with 2 episodes loose black stools, weakness, decreased appetite, increased lethargy and subjective fever today, 02/22. Again admitted and had further rheumatological and infectious work up with negative results. He was initially admitted to Hospital on 02/12 with fatigue, atypical chest pain, melena. He had received 2nd dose of Pfizer vaccine on 02/10. He was hospitalized from 02/12-02/15 and thought to have viral pericarditis. Diagnosis at discharge: SIRS DUE TO NONINFECTIOUS PROCESS W ACUTE ORGAN DYSFUNCTION. He was started on celebrex in addition to the the colchicine as an anti-inflammatory. After initiation of the anti inflammatory medications, patient's fever resolved, he started feeling better and his inflammatory markers decreased. He was monitored for another days and was feeling better. He is therefore being discharged home. In view of the negative work up, there is suspicion that these may be a hyper inflammatory response to the COVID vaccine since his symptoms were temporally related.

1085090	3/9/2021	OR	55	F	1/20/2021	1/21/2021	<p>Thirty hours in, I had joint aches in my spine (mainly neck and low back); low grade fever; nauseated; headache. I felt like everything was it was swollen and tight - I couldn't wear my watch on my wrist. Almost like lymph system - nothing tight in my arm pits; felt like my pants were too tight in my groin - my body was swollen by my lymph nodes. Developed all kinds of gas in my stomach. I was having chest pains - 3 or 4 times a month before the vaccine - after the vaccine - I'm having the chest pains daily. That lasted for about 12 hours. Next day, 22nd, I developed diarrhea for 24 hours. 9 days later - I got numbness and tingling started radiating down my wrist into my fingers; lower calf to my feet and I had to go see my orthopedic surgeon - it was radiating down into my feet. He sent me to a podiatrist and he doesn't know. Those symptoms still haven't resolved. When I wake up - it's a low level and by night time my feet would get so numb and tingly it drove me crazy and then it went into my hands. Went to my doctor on March 2nd - my doctor thought I was having a histamine response in my body. I took an antihistamine - and half my symptoms went away. My esophagus is going into spasms - and I am trying to see a GI specialist. I was taking Benadryl last week but I got too tired. So I take 2 Benadryl at night now and I'm taking a Zyrtec (generic) at the day - it takes the edge off but doesn't resolve the symptoms entirely. Eleven day - I developed a floaty in my right eye - a black spot. I went to my eye doctor - it looks like my eye is healthy -but floaty is not going away. So talking on the phone, My throat is starting to swell up and feels like something back there and the more I talk pretty soon I start losing my voice (happening now on the phone). They added to my meds: Pepsid, Viscus lidocaine; Mylanta after every meal; Pantoprazole; Sucralfate; gave me another one but I haven't taken it yet: Hyoscyamine - for really bad spasms and I haven't had another really bad one since I went to ER (besides taking the antihistamines). I have seen 5 specialists all together.</p>

1084180	3/9/2021	IN	79	F	3/5/2021	3/5/2021	Patient came with husband to Vaccine clinic today 3/5 for 2nd dose of vaccine. Did well during and immediately after vaccine. Husband states patient has c/o severe chest pressure and pain for several weeks but has refused to come to ER for evaluation. Today, after getting vaccine dose and going to local bank, patient was in passenger side of truck when chest pain started again. Husband begged patient to let him take her to the ER but she said no, I?m fine and I don?t want to go. She then went unresponsive. At a stop light, he was next to a couple of cops who he was able to wave down and proceed to escort them in to ER. Upon arrival to the ER, patient was unresponsive and pulseless. CPR was initiated, 1 defib, and 1mg of epi was given. Return of pulse was obtained, but husband asked for no life support and only comfort measures. Patient was admitted for comfort measures. I do NOT think this was related to her vaccine, but rather the unfortunately end to a sub-acute chest pain patient that declined multiple urgings to seek care. Patient then expired on 3/5/21 at 2037.
1084163	3/9/2021	AL	92	F	3/3/2021	3/4/2021	Pt experienced altered mental status and chest pain the day after second vaccine. Pt was transported to Medical Center.

1080970	3/8/2021	VA	38	F	2/9/2021	2/10/2021	2/10/2021 during my lunch break I still was not feeling better so I took a nap at 12:30 woke up at 12:50 because I was having chest pains and my mouth bottom row left side from my lip to my ear felt like someone had hit me in the face with a hammer, on 2/11/2021 I called into my supervisor stating I would need to go to urgent care, my mouth and face was in awful pain and had swollen, I went to Urgent care and they sent me to Hospital for a possible stroke. While I was there, I was given Tramodal of pain observed for several hours then told that my impending facial paralysis was just a allergic reaction to the shot, to take Tylenol and Motrin for pain. For 2 more days my face continued to swell and I suffered in pain , I went back to the urgent care , where I was provided something for the ?supposed allergic reaction? pain and to help with the swelling, well a few days the new meds t last Thursday my mouth gushed with this fluid of Blood and puss mixed , very thick. I went back to the urgent care and they could not tell if this was coming from my jaw or my gum(also I have braces only on my top teeth and I went to the orthodontist the same day I received the shot, I go every for weeks) I was given more meds to take with the ones that I was already prescribed and told to contact my orthodontist because even though my face has gone down I have a hard knot in it that possibly holds infection.

1081152	3/8/2021	WA	56	M	2/9/2021	2/9/2021	My arm was sore. Then I had fatigue and then at about 14 hours after the injection, I started having chills - like I had temperature with hot and cold chills. I got very cold; my blood pressure dropped - I happened to have a doctor appt the day following the vaccine - the bottom level was very low of my blood pressure - it was 45. I couldn't warm up - my extremities were very cold. I had chest pain and it felt like my heart rate was going in and out of atrial fibrillation. I had shortness of breath. I measured my blood oxygen concentration and had dropped down to 90%. I didn't sleep well because I was so chilled and not feeling well. I felt like I had a bad flu. I rested the next day (10th) the symptoms slowly went away between 10 am and 1:00. At 3:00 pm, I saw my pain doctor and I told him about it but I was feeling much better although blood pressure was low. Fatigue lasted for 3-5 days afterwards but it wasn't anything last the first 24 hours. I didn't go to ER because it seemed to resolve itself in the day.

1080483	3/8/2021	MI	49	F	3/4/2021	3/5/2021	<p>Pt came to ED on 3/6/21 with allergic reaction symptoms (diaphoresis, facial swelling, nausea, vomiting, urticarial rash, tachycardia) due to 2nd dose of Moderna COVID-19 vaccination. This Moderna COVID-19 vaccine 2nd dose was received on 3/4/21 at Health Dept (Lot# 030A21A). On 3/6/21, "a 49y/o F with a past medical history of migraines and hypothyroidism who presents to the emergency department for syncope. Patient states she believes she is having an allergic reaction to the moderna COVID-19 vaccine. She received the vaccine two days ago and last night began to notice a few hives on her body. This morning she woke up with more hives diffusely throughout the body and swelling to the face and lips. She presented to urgent care for this and while at the urgent care, she began to feel lightheaded, nauseated and had a syncopal episode while sitting in the chair. She denies hitting her head. After she woke up, she vomited after. Her mother states she was diaphoretic and pale during this episode. She was given benadryl and solumedrol at the urgent care. Paramedic was called and patient was brought in for evaluation of the syncopal episode. Patient denies any chest pain or difficulty breathing. She denies any throat swelling. She has had some diarrhea with this. No abdominal pain. She denies recent fevers or chills. She denies prior cardiac hx. No significant family history. Non-smoker. Labs are notable for mildly elevated liver enzymes. D-dimer is elevated so CTA chest was obtained and is negative for PE. Patient was given solumedrol and benadryl prior to arrival. Symptoms improved during ED stay. No uvular swelling or oral involvement. Airway is patent. Patient advised to follow up with her PCP for re-evaluation and repeat labs. Rx for prednisone and pepcid. Continue benadryl." Pt was given NS 1000 mL IV x1, diphenhydramine 25 mg IV x1, and famotidine 20 mg IV x1 while in SCH ED. Pt did already received diphenhydramine and methylprednisolone at the Urgent Care. Allergy added to patient chart for Covid-19 MRNA vaccine. Then, on 3/7/21, patient did return to ED with continuing reaction (new upper lip swelling). Dr noted: "Presentation c/w allergic reaction to Moderna vaccine. New upper lip swelling, but lower lip swelling and urticaria have resolved. No airway compromise or acute bronchospasm. Discussed option of switching from Benadryl to Zyrtec, if overly sedating. Continue</p>

1080262	3/8/2021	TX	38	F	3/5/2021	3/6/2021	<p>Mar 5-2:30pm: arm began to feel sore. Mar6-12:00am I can barely lift my left arm above chest level. The soreness has traveled from the injection site down to my wrist and fingers. The injection site is slightly pink, not really noticeable, and warm to the touch. I start to feel a little nauseous and also starting to get body aches and chills. From 12:00am-4:00am i constantly wake up because of arm soreness and body aches. At 4:00am, I woke up to use the restroom and realized even the bottom of my feet hurt with every step I took. Took my temperature and it was at 101.5. I went back to bed and fell asleep even though I kept waking. At 7:00am, the migraine started. I was trying to avoid taking meds just to be able to get a clear picture of how my body responds to the vaccine. But by 9:30am (22hrs post vaccine) I ended up taking Tylenol for severe migraine. It feels like someone is stabbing my temples with a very sharp object. Turning or even slightly moving my head strengthens the migraine. My arm is still so sore that I can barely move it! Tylenol brings temperature down to 100.7°. 10:30am I began with extreme fatigue. By 12:30pm I went back to bed because I couldn't stand my body aches and migraine. I slept until 4:00pm woke up feeling a little better. Migraine was still there but not as bad. At 8:00pm I began to feel pressure on my chest. That pressure slowly turned into pain. By 9:20pm I was in excruciating pain, I was in tears and I literally thought I was going to die. It hurt to breath. I checked into the ER by 9:30pm the pain was sharp and it would come, last a few minutes, then slowly ease off a bit. On a scale of 1-10 if was definitely a TEN!!!! The ER said it wasn't cardiac so they sent me home. The DR did say that the chest pain could have possibly been caused by the vaccine, as many have seen different symptoms and everyone has reacted differently. I was home by 1:15am. The pains continued until 3:00am. By 8:30am on Sunday Mar 7, the only thing I was suffering from was soreness in the arm and my chest was sore from the pain. The pain in my chest was a 1 or 2 compared to the 10 that it was when I went to the ER, And that pain/discomfort has lingered all day. I'm currently 22weeks 4days pregnant with a boy and expected to deliver July 7th. I've been pregnant 19 times have 4 living children and suffered 14miscarriages.</p>

Fever did not break. BP @ 1200p - 130/76 100bpm, @ 08:00p - 140/84 80bpm. 03/07 am: Awoke with 100 degree fever, came down to 99.6-99.8 for the remainder of the day with 2 tylenol. Persistent headache, unresponsive to tylenol. Red vertical oblong patch surrounding injection site 3"x6". Site painful and tender to the touch. Joint aches subsiding gradually but still present at 22:00. Unusual chest pain upper right.
1080184	3/8/2021	MA	40	F	1/30/2021	1/30/2021	chest pain; loss of smell; fever; headaches; vomiting/nausea; vomiting/nausea; This is a spontaneous report from a contactable healthcare professional (patient). A 40-year-old female patient received first dose of bnt162b2 (Pfizer-BioNTech COVID-19 vaccine; lot number: EL9264), via an unspecified route of administration in the left arm on 30Jan2021 15:45 at a single dose for covid-19 immunization. Medical history included heart problems, migraine, anemia, asthma and unspecified allergies. The patient is not pregnant. The patient's concomitant medications were not reported. On 30Jan2021 19:00, the patient experienced chest pain, loss of smell, fever, headaches, vomiting and nausea. The patient did not receive treatment for the events. The outcome of the events was not recovered.
1080565	3/8/2021	LA	43	F	2/27/2021	2/28/2021	All the severe complications such as Fever, shortness of breath, headache, body ache, chest pains, heart palpitations.
1083076	3/8/2021	NY	40	F	2/10/2021	2/17/2021	Severe hypertension. Following the second dose I was having severe headaches. I checked my blood pressure on 2/17/21 and it was 212/116. I was having palpitations and parathesia in my right foot. I immediately contacted my provider and he confirmed my hypertension and I was prescribed two separate anti hypertensive medications. I began these medications however they have been ineffective at treating the high blood pressure. I began to have chest pains, headaches continued, and due to the hypertensive crisis I presented to the ER on 3/3/21 which required IVP BP medications, EKG, cardiac labs, etc. Prior to the COVID vaccination I have always had a normal blood pressure at all of my physical appointments.

1082868	3/8/2021	FL	71	M	2/12/2021		<p>felt so bad; severe chest pain; Chest pain and arm pain; A spontaneous report was received from a consumer concerning her husband, a 71-year-old, male patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced abnormal feeling, severe chest pain, and arm pain. The patient's medical history, as provided by the reporter, included the patient had a heart attack on 26 May 2020 and on October 2020 the patient had five bypass, two arteries they took. Since October the patient's condition was stated to be great. Concomitant medications reported included Insulin Bovine, Multivitamins [vitamins Nos], acetylsalicylic acid and Medication related to patient's heart attack. On 12 Feb 2021, unspecified days prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number:007M20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 12 Feb 2021, post receiving mRNA-1273, the patient had no reaction and did not feel bad. On unspecified day in Feb 2021 one week prior to the reporting the events, the patient experienced chest pain and arm pain, minimum that lasted for 10 minutes. 3 or 4 night prior reporting the event, the patient was feeling abnormal, went to ER and was hospitalized with severe chest pain. The patient was in a regular room and was transferred to ICU. Next day, Cardiac catheterization was performed to see the patient's heart and found that 3 arteries in the original surgery were failing. Treatment for the event, severe chest pain included morphine. Action taken with mRNA-1273 in response to the events was not reported. The event of arm pain was considered Recovered/Resolved. The events, abnormal feeling, severe chest pain were considered as unknown. The patient is still hospitalized.; Reporter's Comments: This case concerns a 71-year-old, male patient, who experienced severe chest pain, feeling abnormal. Cardiac catheterization was performed which showed that 3 arteries in the original surgery were failing. Very limited information regarding this event has been provided at this time. The patient's medical history of heart attack (May 2020) and bypass (October 2020) confounds the causality. Further information has been requested.</p>

1082735	3/8/2021	IA	76	M	3/5/2021	3/5/2021	Patient presented to the Emergency Department with fever and confusion. After receiving his second dose of Pfizer Covid vaccine, someone stopped in to check on him and he was confused. He had only had a donut since he got the vaccine 24 hrs ago. He was struggling to do his normal activities of daily living. Oxygen readings were in the 80s at home, heart rate was over 100, and temperature was over 100. The patient was complaining of diffuse body aches. He did not have a headache, chest pain, shortness of breath, abdominal pain, vomiting, or diarrhea. Past medical history is remarkable for chronic pulmonary disease due to asbestos exposure, Covid infection the last November. While in the ED, he was treated with a liter of normal saline, a liter of lactated ringers, 1000 mg of acetaminophen, and 600 mg of ibuprofen. His heart rate decreased and fever was gone after receiving fluids, acetaminophen, and ibuprofen. The patient was then discharged home.
1082714	3/8/2021	CA	44	F	1/13/2021	1/13/2021	After 10 minutes of my first dose vaccine, I began to experience chest pain and could not breathe. I felt nauseated. My BP went up to 150 and staff was monitoring me, my normal BP is 90/110. After two hours I started to feel dizzy, nauseated and i was in the ER room for four hours. I felt like passing out, my BP was 169/69 and my heart rate was also high. Then I started to feel cold and began to shivering while an EKG was performed. My BP never went down. After one week and for four days I had fever and weakness to my body also from my knees down felt weakness. Also one week after my vaccine, my lymph nodes got swollen, left ear. I communicated these symptoms to my PCP of my reactions.

1082544	3/8/2021		41	F	2/17/2021	2/18/2021	<p>o Complaint The patient is a 41 year(s) old Female complaining of allergic reaction, nausea. o Chief Complaint Quote Patient complained of allergic reaction that started about 45 mins ago. She got her 1st dose of Pfizer Covid vaccine yesterday morning. She complained of rash all over the body, swelling on the hands and face including eyes and lips. She denied chest pain, abdominal pain, fever, cough, vomiting and difficulty breathing. She complained of nausea that started 5 mins ago. She has not taken any meds yet for her symptoms. o Time Seen 02-18-2021 01:20 o Historian patient ADDITIONAL HPI: o Additional HPI Pt here with concerns of allergic reaction. Pt fell asleep on the couch approx 2200. She awoke 2 hours later with itching of her hands. Over the next hour she developed a full body rash, itching, and swelling of face. No wheezing, no difficulty swallowing. Upon arrival to ED pt started to feel nauseated. Pt had first dose of COVID vaccine approx 16 hours prior to onset of sx. No h/o allergic reactions, no h/o asthma. Emergency Department Course and Clinical Decision Making: Patient presents with urticaria and swelling to her face eyes and lips. Shortly upon being roomed she started to feel very nauseated and started vomiting. No stridor or wheezing, no immediate airway compromise but given both cutaneous and GI symptoms, significant concern for anaphylaxis. Patient was immediately given epinephrine intramuscularly, 0.3 mg. An IV was placed and she was given Solu-Medrol, Benadryl, Pepcid, and Zofran. Patient's urticaria and swelling started to nearly immediately improved after the epinephrine. She is feeling much better though slightly anxious. To be reaction from the Pfizer vaccine, no other obvious triggers, patient has no history of allergic reactions or other sensitivities. We will observe in the emergency department in a monitored setting for several hours to assure no rebound symptoms, patient updated on plan. 0500 Pt has been resting. Urticaria resolved, swelling to face resolved. Discussed with pt reporting reaction to CDC, info provided. Also discussed the second dose of vaccine, recommended reaching out to Epi response team or PCP to get recommendations. Will give short course of prednisone, 4 days, Benadryl as needed, ED return precautions discussed, will dc home.</p>

1079439	3/7/2021	NC	45	F	3/7/2021	3/7/2021	Patient received her vaccine at 1343. She was seated in the 15 minute waiting area. She went to the RN observation desk to check out at 1405 when her observation time was up. Nurse educated patient about signs/symptoms to watch out for in the next 48 hours, including tachycardia. Patient then shared that her heart rate had been elevated since her injection. She states she thought it was just nerves/anxiety, but thought that she should mention it now. Nurse directed her to EMS for evaluation. This RN accompanied patient to EMS where she was placed on a monitor. Patient stated she was tracking her own pulse via smartwatch, reported it to be in the 130's just after injection. She stated she was able to bring it down to the 80's while sitting. Per EMS, her pulse was stable in the high 90's. Patient reports a history of childhood tachycardia, but states she was cleared by her cardiologist 5+ years ago. She takes daily synthroid, prescription zyrtec, pantoprazole, and celexa. She has PRN ativan for anxiety, takes it infrequently. She took all of her scheduled medication this morning. She has an allergy to erythromycin (GI cramping) and penicillin (hives in childhood). EMS performed 12 lead EKG at 1421 -- Normal Sinus Rhythm, vital signs 118/78, pulse 89, oxygen 99%. Second set of vitals at 1430 were 109/78, pulse 86, oxygen 99%. Patient reports feeling fine, would like to go home if cleared. EMS agreed. RN reminded patient to watch for symptoms over the next 48 hours, to call 911 if she has any additional cardiac symptoms, any oral swelling, difficulty breathing or swallowing, hoarseness, chest pain or tightness. She will follow up with her primary care physician for direction about the booster vaccine. She requested that the notes be sent to her primary care and cardiologist (RN unable to find cardiologist in her record, patient could not recall his name at this time).
1079506	3/7/2021	MD	28	F	3/7/2021	3/7/2021	Right after vaccine injection, patient started having tingling in her face and feeling sob. Episode last about 5 mins. Afterwards, pt felt fine. Denies chest pain, rash, itching or dizzy. RR 18 BP 120/73 HR 74 and oxygenation of 99%.

1079725	3/7/2021	TX	64	F	3/5/2021	3/5/2021	This 64 year old female experienced an adverse event. At baseline, she presented in a wheelchair. Within 5 minutes after vaccination, she complained of a racing heart, a new onset tremor of hands and head, and slurred/stuttering speech. She denied chest pain, shortness of breath or itching. No facial droop or one-sided weakness was observed. The patient had a history of hypertension and history of an adverse reaction to albuterol in November 2020. The patient described being nervous to get the vaccine due to her previous reaction to albuterol which had the similar effects as today's. The patient's new tremor worsened, and speech became more slurred and stuttered while we observed her. The patient denied any pain and described a similar event that caused her to be hospitalized for a week with no definitive diagnosis. Her primary care doctor had cleared her to get the vaccine. Her Vitals were as follows: BP 160/90. HR 65, RR 20. Heart sounds were regular with occasional PVC's. Lung sounds were clear No visible rash on neck, trunk or injection site. Capillary refill was normal. Mild edema in both lower extremities. No swelling of the lips. No visible droop in facial muscles. Patient was tearful and struggled to speak. She repeatedly said she was tired. She reported nausea. EMT was called and found similar vitals and O2 saturation at 100% on room air by pulse ox. O2 via nasal canula was begun. Rhythm strip showed NSR. Patient refused transport to the hospital for further evaluation. She was informed of a possible Transient Ischemic Attack (TIA) could be occurring which could need a blood thinner and further work up. Patient was tearful saying her previous hospitalization was traumatic and did not want to return. EMS offered her transport to another hospital facility via private vehicle, and she refused. We offered to contact her primary care doctor and she also refused. She was concerned about the cost of a hospital stay if she signed out AMA. EMS left the facility and offered to return if the patient changed her mind. The patient's symptoms had not resolved by 4:30pm. The patient's son, by phone, confirmed she would be monitored until 5pm. She was driven home by one of our staffers. The next day, the patient told our staffer that she felt well. She said it took about 7 hours for her speech to return. She said her head, stomach and body felt better in the morning. She said she going to see

1077479	3/6/2021		19	F	2/26/2021	2/26/2021	In observation area, patient reported sharp pain in left arm at 0956 to lead nurse. Lead nurse assessed patient. Patient denied difficulty breathing, chest pain, and throat irritation. Patient reported history of similar reactions to prior vaccines. Patient's mother reported to lead nurse that the patient's has a history of similar reactions to prior vaccinations and that the symptom resolves on its own. Patient offered EMS. Patient denied EMS. Patient advised to stay 15 minutes for further observation. Lead nurse heard patient's mother ask patient if she wanted to go to Medical Center. Patient agreed to go to Medical Center. Patient left facility with mother at 1010 with steady gait and unlabored breathing.
1078073	3/6/2021	OH	77	F	2/23/2021	2/23/2021	Moderna COVID-19 Vaccine EUA Freezing cold, headache, arm swollen & hurt, fever, dizzy, Memory loss, chest pain, fatigue. No treatment. These symptoms lasted 4 days. (not all at once)
1077364	3/6/2021	AR	68	F	1/29/2021	2/1/2021	Bad chest pain, hard to take a deep breath, headache, dizziness, diarrhea. By the end of the day, because of chest pain and dizziness my doctor sent me to the ER. I was then referred to a cardiologist, who indicated he thinks these symptoms are from the second dose of vaccine. He has seen several patients with the same symptoms after the second vaccine dose. My family doctor now thinks the same thing for the same reasons.
1077635	3/6/2021	CO	55	F	2/11/2021	2/11/2021	Beyond a mild headache and very loud tinnitus that started about 45 minutes after the shot and only lasted about 1 hour, I developed severe chest pain at approximately 7 hours after the shot that awoke me from a sound sleep. Pain rated at 8 1/2-9 on 1-10 scale. It continued for 2+ weeks. Exponentially worse with any increase in heart rate. Diagnosed via email with cardiologist as probable pericarditis and instructed to take OTC NSAIDs until symptoms resolved. At 3 weeks out I still feel mild chest pain, but pain no longer increases with an increase in heart rate. IgG titers pulled 3/5/21 and I will get the second dose depending on my immune response to the first dose.

1078386	3/6/2021	PA	23	F	3/6/2021	3/6/2021	Patient reports a history of syncope with any sort of injection or vaccine. Five minutes after receiving her vaccine, she felt lightheaded and lost consciousness for a few seconds. Prior to losing consciousness she asked for assistance and somebody held her up when she lost consciousness. She did not hit the ground or otherwise injure herself. Upon awakening, she was fully alert and oriented and denied any chest pain or shortness of breath. Drank Gatorade. Felt better with no recurrence after observation period.
1078074	3/6/2021			U			I had my 2nd Moderna vaccine at 0900 on 5 March. Within 9 minutes, I had mild chest pain & wheezing and a couple seconds of fullness/pressure in my ears like when I'm about to pass out. I waited an extra 7 minutes and, when the symptoms didn't worsen, I treated it like my allergist does when I have the same reaction to my allergy shots: an extra dose of Zyrtec and my Albuterol inhaler. That took care of the allergy/asthma symptoms. That night at about 2200, the injection site pain was so bad I could barely move my arm. It was hot but not red or swollen. I had the worst fibromyalgia flare I've had in awhile- 8/10 pain (meds don't help and vocalizing in pain, but not vomiting (9) or passing out (10) from pain). EVERYTHING hurts- even tiny toe joints and all my skin. I took my usual meds last night, which include Robaxin and gabapentin, took a dose of Tylenol and was able to get some sleep. Pain is 7/10 today, mostly in my low back and hips, but still having a fibro flare where everything hurts.
1077325	3/6/2021	CA	69	F	3/5/2021	3/5/2021	2125-patient reports she is not feeling well, while sitting in the waiting room. Patient reports she feels a warm sensation all over her body and epigastric discomfort. Vital were assessed. Denies chest pain, shortness of breath, difficulty breathing, dizziness. Patient reports symptoms were not improving, patient sent to ER for evaluation at 2140. Report given to PA. no medication given in clinic. Patients airway is patent, alert and oriented to person, place, time. answering questions appropriately. walking on own. Husband transported patient to hospital.

1078589	3/6/2021	CA	54	M	3/1/2021	3/5/2021	Beginning about 16hours after the shot (the next morning) my stomach began to bother me a little, within half an hour or so I began to feel a little tingle from the top left arm (shot area) down to my stomach including my sternum area. It got progressively worse. By about hour 17 I was beginning to get cold sweats and stomach bothering me more. By hour 18 I was cold, sweating, nauseous, vomiting, hard tight pain in stomach /and sternum/chest. Stomach / chest pain persisted badly for about 30- 45 minutes then began to subside. By hour 19 most of the sever pain subsided. for the rest of the day (@and still 25 hours later) I still have a lingering miserable stomach and slight headache. I slept most of the afternoon without any medication.
1078625	3/6/2021	CA	49	F	2/27/2021	2/28/2021	24 hr post vaccine: fever, headache, chest pain 48 hr post vaccination: tingling sensation in arms and legs (bilateral), rash on chest, face, back

1078134	3/6/2021	TX	42	M	2/3/2021	2/3/2021	Pt complained of being "light headed" after vaccine administration. Patient denied chest pain or shortness of breath. EMS on site assessed patient, no treatment necessary, symptoms resolved and patient left site at 0925am.
1078117	3/6/2021		69	F	3/6/2021	3/6/2021	Patient c/o throat closing, SOB, and chest pain within minutes after receiving the vaccine. Her vital signs showed tachycardia, increased respirations, and elevated blood pressure. She had a hard time speaking in full sentences. She does have a history of anaphylaxis to certain medications. She was administered epinephrine auto injector IM and brought to the emergency department by rapid response team.
1078107	3/6/2021	FL	37	F	1/19/2021	1/19/2021	8 minutes after second dose - felt dizzy, tingling in left arm, numb tongue, more intense dizziness. Felt the need to lay down . BP extremely elevated diastolic above 100. Heart rate elevated . With in 5 -10 minutes vitals stabilized, NP reports I had panic attack. (However, I've heard of other people having similar reactions, they all went to follow up in ER, or primary care and all their cardiac labs and other tests were WNL.) Through out the day I experienced heart palpitations, fast heart beat, and some chest pressure. 3 days post vaccine I experienced some dizziness when walking through target. Afterwards I had some chest pain. the feeling of Heaviness on my chest . Took turns helped a little then the feeling came back. Went for a 2 mile walk helped a little then came back. Watched tv,, chest pressure was still there . By one week post vaccine I felt completely normal, no chest pain, no dizziness, no heart palpitations. I did not seek care with a primary care or other providers because I assumed this was a strong immune response elicited by the second dose of the Covid vaccine. However, I was encouraged to report these symptoms

She developed a pruritic burning rash to posterior right leg extending down the lateral lower leg. She had fatigue and myalgias. Diagnosed with shingles on 2/23. and informed to not receive the 2nd vaccine. She presented to the Emergency room on 2/27 with fatigue, numbness right side of the face, no reports of shortness of breath or chest pain. Ambulated in to ER. After her work up she was discharged home - she present back to the ER within 30 minutes. PTA arrival at the ER for the 2nd time - she complained of left neck and arm pain - then went unconscious. She arrived to the ER in full arrest - pronounced deceased after resuscitation efforts were not effective
1075653	3/5/2021	MI	34	F	2/26/2021	2/28/2021	Symptoms of weakness, tired, mild fever and headache starting the day after COVID vaccine. The following day woke up at 6am with chest pain, described as mild to moderate in severity with no radiation. Patient experienced a loss in family member within last 3 months and was under significant stress. Cardiology consult suggested stress may have caused elevated levels of adrenalin and COVID vaccine may have increased catecholamine levels which caused increase in troponins.

1074999	3/5/2021	CA	43	F	1/9/2021	1/11/2021	11th in the evening, I suddenly had gastric pain in Stomach and was belching a lot. Then it started hurting with a lot of chest pain. The pain started going behind my back and pressure and we went to ER and when I went to take my urine test and I threw up a lot. I felt pretty good after that. My reports from tests came back okay. They told me to take over the counter Prilosec and gave a prescription for Zofran.
1075744	3/5/2021	IN	52	F	3/5/2021	3/5/2021	Patient rec'd vaccine at 1400. She went to wait her 15 minutes in the car and after about 10 minutes noticed eye sensitivity and headache. When symptoms did not pass after an additional 10 minutes she came back into the office. While waiting when her husband was checking her in, she "passed out." Episode lasted less than 1 minute. She was easily oriented to person, place and time. It was noted that she had some swelling to bilateral eyes. Patient was brought back to room, VS were checked and all were normal. She denied any chest pain, shortness of breath, wheezing, tongue swelling, itching, or tickling sensation to back of the throat. She was able to tolerate sips of water without difficulty. 50mg benadryl IM was given in the left deltoid. Approximately 5 minutes after IM injection patient again "passed out." She was seated at the time and slumped to her right, resting her head on her husband and did not fall from chair. She aroused after approx 2 minutes, and was a/ox4. VS were rechecked and were O2 99% on RA. HR 101, BP 124/88, RR20, temp 98.5/oral. Patient stayed at the clinic for an additional 45 minutes after which her eyesight was reported to be back to normal, her headache had improved and the lower eye edema had resolved. It should be noted that both the patient and the husband were not concerned with her "passing out." She states it happens because of pain and she was fearful of the injections. Patient also states that her neurologist told her that when "she is in too much pain, she will pass out.~~

1077052	3/5/2021	OR	37	F	12/30/2020	12/30/2020	This is a 37 year old female. Within 10 minutes of her 1st dose Moderna, the patient developed a mild rash (location not specified). She took a dose of diphenhydramine with some relief. She went home. 2.5 hours later, she developed a facial twitching and reported to the ED. She reported involuntary facial muscle twitching, like spasms, that were painful. On ED presentation, BP=121/86, HR=93, RR=16, SpO2=98%. ED noted no swelling, itching, SOB, chest pain, N/V/D, or rash. The ED notes describe the symptoms as "Numerous and varying facial movements including contraction of the lower cheek muscles on the left and then the right along with movement of the tongue from side to side at which point she bites or gets the tongue in the way while trying to speak. Speech is therefore slurred however at times clear. Oropharynx is clear with mildly dry mucous membranes. No oral or pharyngeal swelling, difficulty swallowing, or stridor. Neck is supple and nontender without adenopathy. Differential diagnosis includes: allergic reaction, dystonic drug reaction (unusual to be varying from the left to the right), dyskinesia, anxiety, somatization or conversion disorder, among others. Her symptoms are not consistent with Bell's palsy, stroke, or clearly tardive dyskinesia. Subsequently given diazepam, fentanyl, and 500mL IV fluids." She was discharged home. Patient returned to the ED on 12/31 (within 24hrs) with ongoing symptoms. Patient was monitored and discharged home again. One month later, on 1/28/21, chart notes indicate that she has continued to have intermittent symptoms continue. A trial of steroids reportedly made symptoms worse. She reports that she also feels fatigued and with 'brain fog.' She currently has a neurology consult pending.

1077196	3/5/2021	PA	60	F	2/25/2021	3/3/2021	I noticed many days after getting the first shot a kind of sick all over feeling, loose stools and cramping lower GI, nausea gassiness, a lot of phlegm in throat, headache, and some chest pain, each evening just after dark and into bedtime. The last day I had it was yesterday and it was all day. My doctor asked me to report this to you. By the way I have the date wrong my vaccine was 02/19/2021 but the form won't let me go back to fix it. Symptoms came up suddenly 7 days later.
1076139	3/5/2021	WA	63	F	12/24/2020	1/10/2021	Sunday, January 10, I woke up with a headache and it stayed all day. Later I got a scratchy throat, cough, congested, chilled. Wednesday or Thursday - COVID test - that was negative. Friday night started having terrible chest pain - heartburn pain -and it went to my last side -I went to ER on January 16 - early morning got to ER - bloodwork was fine, etc. They had me start PEPSID. Cardiac Nurse Practitioner - saw her on January 25th - GI kind of pain - heart was pounding and racing constantly. I have a GI assessment planned - (Ordered by the Cardiac NP). Chills went away on 17th or 18th of January. I have a swollen gland in my neck. I never ran a fever. Temp was always normal. GI assessment will be this Tuesday, the 9th of March. (I had the second dose of vaccine on January 21.) My heart is still racing a bit. The GI pain is about gone.

Patient denies chest pain, SOB, rash, and itchiness. Patient provided with ice pack. Blood pressure 128/88, respiratory rate 16, and temperature 97.4F. Symptoms subsided at 1530 with ice pack, rest, and relaxing measures.
1077005	3/5/2021	IL	24	F	2/26/2021	2/28/2021	36 hours after injection: full body rash, chest pain, shortness of breath slowly worsened throughout the day
1076954	3/5/2021	PA	27	M	2/3/2021	2/6/2021	Patient is a 27 year old male with no significant medical history presents to MC on 2/6 from Urgent Care for further evaluation of chest pain. He states that he woke up at 5:30am with abrupt onset of chest pain with present like quality in the middle of the chest. It was non-radiating with associated nausea, small amount of emesis, and dyspnea. His pain lasted for about 15 minutes and he started experiencing it again after half an hour with numbness and tingling of his bilateral distal digits and diaphoresis. He decided to seek evaluation at local Urgent Care around 7:30am. States that he was immediately send here through ambulance due to findings of EKG changes. He was given aspirin and nitroglycerin with some alleviation of pain. Currently, he feels little better although continues to have chest pressure substernally every 45 minutes lasting 5-10 minutes. His dyspnea is resolved. He does not have pleuritic chest pain, fever, chills, nausea, vomiting, abdominal pain, diarrhea, leg swelling, rash. Additionally, he has been in normal state of health until this 2/2/21 when he received second dose of COVID-19 (Pfizer) vaccine. He had extreme fatigue with left arm soreness. He reports no sick contacts, recent illness, or travel. MRI cardiac done 2/9/21 with assessment reveals Infero-lateral myocarditis. Patient remained hemodynamically stable and was discharged with ibuprofen taper for 10 days, c/w colchicine 0.6 mg QD x 3 months and pantoprazole 40 mg QD

1076920	3/5/2021	CA	45	F	1/10/2021	2/15/2021	chest pain; Shortness of breath; This is a spontaneous report from a contactable other health professional (patient herself). A 45-year-old female patient (non-pregnant) received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration on 10Jan2021 (at the age of 45-years-old) in left arm at single dose for covid-19 immunisation. The patient medical history was not reported. Patient had no chronic illnesses and no allergies. The patient had no COVID prior vaccination and was not tested COVID post vaccination. Other medications in two weeks was none. The patient previously took the first dose of bnt162b2 (Pfizer) on 21Dec2021 12:00 PM via intramuscular in left arm for COVID-19 immunization. The patient experienced chest pain and shortness of breath on 15Feb2021 01:00 (as reported). Clinical course: She took her second vaccine on 10Jan2021. Two weeks after the vaccine she was admitted to the hospital with chest pain and shortness of breath x2, one on 19Feb2021 (as reported) and the second time was 24Feb2021. On an unspecified date, all the blood works and CT (computerised tomogram) scan came back negative. She was a healthy individual until she took this vaccine. She also did Echocardiogram which came back negative. Events resulted in doctor or other healthcare professional office/clinic visit, emergency room/department or urgent care, life threatening illness (immediate risk of death from the event). No treatment was received for events. Outcome of events were unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently provided, chest pain and shortness of breath occurred 2 weeks following the second vaccine are more likely associated with coincidental medical conditions unlikely related to the vaccine use. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1071111	3/4/2021	MT	66	F	1/10/2021	2/11/2021	Chest pain; Joint aches; Body aches; Fever; Chills; Fatigue; Nausea; A spontaneous report was received from a 66 year old, female patient who was participating in the mRNA-1273 Emergency Use Program and experienced chest pain, body and joint aches, fever, chills, fatigue, and nausea. The patient's medical history was not provided. No relevant concomitant medications were reported. The patient received their first of two planned doses of mRNA-1273 on 10-Jan-2021. On 11-Feb-2021, approximately 2 days prior to the onset of the events, the patient received their second of two planned doses of mRNA-1273 intramuscularly for the prophylaxis of COVID-19 infection. On 11-Feb-2021, the patient developed body and joint aches, chest pains, fever, chills, fatigue, nausea, and just hurt all over and felt terrible. On 12-Feb-2021, the patient's symptoms persisted, and she was in the emergency room (ER) to be treated. The patient received both scheduled doses of mRNA-1273 prior to the events, therefore action taken with the drug in response to the events is not applicable. The outcome of the events, chest pain, body and joint aches, fever, chills, fatigue, and nausea, was unknown.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.
1071838	3/4/2021	MD	69	M	2/25/2021	3/1/2021	Patient presented to the ED with SOB and substernal chest pain. He was tachypneic with use of accessory muscles. He was seen by nephrology and had HD. Pt felt better after HD with no further pain and improved breathing. Per the EUA, hospitalizations are to be reported irrespective of attribution to the vaccine
1071869	3/4/2021	MD	70	M	2/25/2021	3/1/2021	Patient referred from PCP office for abnormal EKG. Patient reportedly fell on the ice and has been having chest pain since then. Case was discussed with cardiology who recommended to discharge patient home. ACS was ruled out and per cardiology, the pain was likely due to the fall. Per the EUA, hospitalizations are to be reported irrespective of attribution to the vaccine

1071788	3/4/2021	MO	48	M	3/3/2021	3/3/2021	During observation period after receiving vaccine, client became nauseous, short of breath, and itchy. Our staff moved patient to lay down on a mat, shortly after that pt was no longer oriented x2. Client quickly became oriented x3 after that but began complaining of intermittent chest pain. SP02 was 94%, HR 94-97, client still short of breath and diaphoretic. Gave Bendadryl around 5:15pm with resolution of itchiness. Patient rated chest pain as 10/10 specifically on right side and his back. Complained of metallic taste in mouth. Heart rate up to 114 and SP02 sitting around 96%. Ambulance arrived at 5:25pm and took pt to hospital.
1071977	3/4/2021		46	F	3/4/2021	3/4/2021	Patient received her first dose of the Pfizer vaccine today. She had developed chest tightness and wheezing yesterday, she has a history of asthma. The chest tightness and wheezing increased after her vaccine. She also noted tingling to her lips and dizziness. She had no shortness of breath, cough, palpitations or chest pain. No angioedema, rash or pruritis. She was in no acute distress. She was talking in complete sentences and drinking water without any issues. Her lungs were clear through out with no bronchospasm, her heart rate was regular. BP 160/100, HR 66, RR 22, O2 99% on room air. I spoke with the RN at ICC who accepted patient to be seen at the ICC for further evaluation and monitoring. Patient declined ambulance transfer and felt comfortable enough to drive her self to the ICC. She was monitored at the vaccine clinic for 35 minutes after receiving her vaccine and left in stable condition. Her sister was notified.
1072129	3/4/2021	ID	33	M	3/3/2021	3/3/2021	03/03/2021 (0720-0735) Immediately following vaccination I experienced 2/10 sharp, constant substernal chest pain lasting for approximately 15 minutes. 03/04/2021 (0200-0400) Awoke with subjective feeling of fever, full-body muscle cramping, and uncontrollable, mild, full-body convulsions without loss of consciousness (not true seizure-like activity). These were not the typical "shivering" symptoms typically experienced by patients with high fever. All other symptoms experienced following severe symptoms more closely resembling flu-like symptoms that are to be expected following second vaccine.

1072549	3/4/2021	IL	83	F	2/17/2021	2/17/2021	<p>Pounding in head; Heart pounding; Elevated BP; bouncing off the walls, and going from side-to-side when she tried to walk; oxygen saturation level kept dropping; shaking; cold; Weakness; Tiredness; Throat tightness; Dry mouth; This is a spontaneous report initial from a contactable nurse and follow up from a Pfizer-sponsored program. This Nurse (patient) reported for self that the 83-year-old female patient received first dose of bnt162b2 (BNT162B2, PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN6200), via an unspecified route of administration on 17Feb2021 09:30AM on right arm at single dose for covid-19 immunization. Medical history included rheumatoid arthritis from an unknown date and unknown if ongoing Reported she was diagnosed with Rheumatoid Arthritis about 10 years ago, fibromyalgia from an unknown date and unknown if ongoing and stated when the doctor couldn't figure out what was causing her pain, the doctor said she had Fibromyalgia, carotid endarterectomy from 2014, pain in extremity from an unknown date and unknown if ongoing She said she has rheumatoid arthritis, and has had terrible leg pain for a long time. Family Medical History Relevant to AE(s) was not provided. Concomitant medication included cortisone (CORTISONE) for Pain in leg from 10Feb2021 and stated her doctor gave her a Cortisone shot in her right knee to help with her right leg pain. Reported she received a Cortisone shot in her right knee on Wednesday, 10Feb2021. She said the doctor gave her the Cortisone shot in her right knee to see if it would help her right leg pain. She said she has a problem with Cortisone, clarifying the Cortisone keeps her awake. She said the doctor wanted her to have another Cortisone shot in 3 months, and she is not going to take the Cortisone shot because she doesn't like how the Cortisone makes her feel. The patient experienced pounding in head (hospitalization, medically significant), heart pounding (hospitalization, medically significant), elevated bp (hospitalization, medically significant), bouncing off the walls, and going from side-to-side when she tried to walk (hospitalization, medically significant), dry mouth (medically significant) all on 17Feb2021 with outcome of recovering, throat tightness (medically significant) on 18Feb2021 with outcome of recovering, weakness (medically significant) on 19Feb2021 with outcome of not recovered, tiredness (medically</p>

significant) on 19Feb2021 with outcome of not recovered, oxygen saturation level kept dropping on an unspecified date with outcome of unknown, shaking on an unspecified date with outcome of unknown, cold on an unspecified date with outcome of unknown. He experienced terrible pain in the leg after the 1st dose and took a marijuana cookie and she was rushed to the ER because she was shaking and cold. The patient was hospitalized for events pounding in head, heart pounding, elevated bp and bouncing off the walls, and going from side-to-side when she tried to walk from 17Feb2021 to 18Feb2021. The nurse states that "I told her up until a Month ago, she was taking care of a huge house and husband that is blind. I've been having the pain in my legs for over a month, doppler was done, and I had an injection in my knee with cortisone, I won't do that again, it keeps me awake at night. There is no diagnosis yet on the pain, have an orthopedic appointment coming up. Caller states, I got the first Pfizer vaccine shot on Wednesday at 9:30 am in right arm. Never so much have felt it. or have not felt anything else since. My friend talked me into eating a marijuana cookie about 5pm that day, and at 6 or 6:30pm, I started feeling terrible, my head was feeling terrible, my heart was pounding, I could hardly walk, my mouth was dry as a bone. we called paramedics, we found out on Friday before the shot that I have a right bundle block. Woke up 4:30 in the morning the Friday before with chest pain. EKG found right bundle block, my blood pressure was 245/105, that night in the ER, they got my blood pressure down and sent me home. Wednesday, I had the covid shot in right arm, at 9:30am, that day about 4:30 - 5:00 had the cookie thing, about 6pm, had to call the paramedics, they kept me in the hospital overnight. because my oxygen saturation kept dropping, down in the 86% or 89%, I don't know. Gave me breathing treatments, CT scan for blood clots in lungs was done, Doppler for blood clots in legs, and a HgbA1C. They did an echo of my chest. I don't know all of the results yet. Even yesterday, in the hospital I felt better, but feel week and tired, while walking the hall in the hospital my Blood pressure went up a little bit. I told the nurse, my head feels like this when my blood pressure is up. They sent me home last night. Today, I am feeling okay. My mouth is still a little dry, got a little better yesterday. My legs are still killing me, I have an

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

appointment with my Cardiologist and Rheumatologist, I have Rheumatoid Arthritis. My question is , the doctor didn't know if it was from the cookie or from the vaccine. I am wondering if I should get the second vaccine." She stated she never had a sore arm after getting the COVID-19 Vaccine. She said she did something stupid after she received the COVID-19 Vaccine. She said she has rheumatoid arthritis, and has had terrible leg pain for a long time. She said her friend talked her into having a cookie that had marijuana in it. She said her leg pain was so severe at the time, she took the cookie with marijuana in it around 4:30PM-5:30PM on 17Feb2021. She said at 7:00PM she was bouncing off the wall (clarified as unsteady, and going from side-to-side when she tried to walk), her head was pounding, her heart was pounding, she was dizzy and shaky. She said she went to the hospital emergency room. She said the hospital kept her overnight because her oxygen saturation level kept dropping. She said she got home from the hospital last night (18Feb2021), clarifying she was discharged from the hospital at 6:00PM. She said she noticed her mouth was very dry when she went to the hospital on 17Feb2021, and her mouth continued to stay very dry all night. Caller asked if she should get the second COVID-19 Vaccine shot after experiencing what she did after receiving the first COVID-19 Vaccine. Reported her leg pain became severe about a month ago, clarifying she has had leg pain for a long time. Reported her blood pressure was up while she was at the hospital, clarifying she had one blood pressure reading of 145/82 that she recalls. She said her blood pressure is pretty normal, and she takes blood pressure medications. She said she believes her heart rate was up too, but was unsure what her heart rate was. Reported a couple days before receiving her first Pfizer COVID-19 Vaccine, she went to her doctor on 12Feb2021 because she was having severe chest pain. She said her doctor did an EKG and told her she had a right bundle branch block. She said her doctor sent her to the hospital Emergency Room. She said while she was in the Emergency Room she had an extremely high blood pressure of 245/105. She said she came home from the Emergency Room on 12Feb2021, and had a couple spells, but was OK. She said she was OK when she went to get her first COVID-19 Vaccine shot on Wednesday, 17Feb2021. Reported

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

she had difficulty reading her COVID-19 Vaccine Immunization Card. She said the Pfizer COVID-19 Vaccine Lot Number looked like EN6200, and there was no NDC Number, or Expiration Date listed on the card. Reported she had blood work done at the hospital. No further details provided. Treatment included she was given Albuterol breathing treatments while in the hospital, along with some other things that she can't remember. Reported she believes her symptoms were medically significant because she was nervous from recently being to the Emergency Room for her severe chest pain a few days before. Reported she did not think her symptoms were from the COVID-19 Vaccine. She said she thought the cookie with marijuana in it caused her symptoms because the symptoms happened about 1-1/2 to 2 hours after she had the cookie with marijuana in it. Reported she feels very weak and tired. Reported yesterday (18Feb2021) while she was in the hospital, her head felt like it was going to explode when the hospital staff tried walking her around. She said she asked the hospital staff to check her blood pressure because her head will feel like that when her blood pressure is up. She said when the hospital staff checked her blood pressure, her blood pressure was elevated. Reported the pain in her legs is driving her crazy, so she called for an appointment with an orthopedist today. Reported she is feeling better, but is still experiencing a tightness in her throat. She clarified she felt the throat tightness on Wednesday, 17Feb2021. She said she has no problem swallowing or eating, but her throat feels tight. Vaccination Facility Type was Hospital. History of all previous immunization with the Pfizer vaccine considered as suspect (or patient age at first and subsequent immunizations if dates of birth or immunizations are not available) was none. Additional Vaccines Administered on Same Date of the Pfizer Suspect was None. AE(s) required a visit to: Emergency Room (admitted to hospital), no Physician Office. Prior Vaccinations (within 4 weeks) was none.; Sender's Comments: The 83-year-old female patient had medical history included rheumatoid arthritis, fibromyalgia and carotid endarterectomy, and was on multiple concomitant drugs. Considering temporal relationship, a possible contribution role of vaccination with BNT162B2 to the onset of the reported events, cannot be completely excluded. The impact of this report on the benefit/risk

1071174	3/4/2021	CA	74	F	2/1/2021	2/1/2021	pain in chest through back; tongue swelled up; difficulty swallowing; This is a spontaneous report from a contactable consumer (patient). A 74-year-old female patient received first dose of bnt162b2 (Pfizer-BioNTech COVID-19 vaccine; lot number EL9764/EL9264), via an unspecified route of administration in the right arm on 01Feb2021 09:45 at a single dose for covid-19 immunization. Medical history included ongoing three stents in her artery, heart issue where they took test to see if she had a heart issue, and everything came back negative, high blood pressure, high cholesterol, overweight, penicillin allergy, IV iodine allergy, allergy to pollens, inhalants, dust and animals. There were no concomitant medications. The patient previously took phenytoin (DILANTIN), bacitracin;neomycin sulfate;polymyxin b sulfate (NEOSPORIN) and cefalexin (KEFLEX); all of which patient experienced allergies/ drug hypersensitivity. On 01Feb2021 09:45, immediately after receiving the vaccine, her tongue swelled up, she had difficulty swallowing, and she has a pain in her chest that went through to her back. The patient was sent and admitted to the ER and got an IV shot injection of diphenhydramine (BENADRYL) that got tongue back down. She didn't need an Epi pen, it wasn't that bad. They took the test to see if she had a heart issue, and everything came back negative. The patient was advised by the head of ER that she shouldn't get the second shot because of the reaction. It could be more severe with the second dose he said. The outcome of the events was recovered on 01Feb2021.
1072804	3/4/2021	MO	39	F	3/1/2021	3/1/2021	Pt received 1st dose of covid-19 vaccine during mass clinic. Pt was given 30 minute observation period due to history of allergic reaction to strawberries, which pt defined as tongue tingling. Approx 15 minutes into observation period, pt described feeling the same feeling of her tongue tingling with feeling slightly light-headed. Pt denied SOB, chest pain, itching. EMS evaluated pt and was not given any medication but instructed to take PO Benadryl once home and to call 911 if symptoms worsened. Her 4 Lead EKG was WNL. Pt left facility without issue though reported feeling "a little funny still" but denied feeling worse.

1074003	3/4/2021	AZ	21	M	2/27/2021	3/3/2021	Vaccine was Moderna COVID-19 Vaccine EUA 4 days after receiving the vaccine, two hours after I woke up, I began to have mild chest pain in the center of my chest. After that, the pain started to grow and grow until it was extreme pain, at around an 8/10. The pain radiated from my chest to the undersides of my arms. After two hours of pain, it started to subside and eventually was gone. There was no pain for the rest of the day. The next day, two hours after I woke up again, the mild chest pain returned. Still in the center of my chest, the pain grew into extreme pain again. This time however, it was slightly to the right and as the pain progressed it moved right until after two hours it went away again. The treatment I got at the Urgent Care was an EKG and they told me to go to a hospital. At the hospital, I got Toradol, aspirin and propranolol. My initial Troponin levels at admission to the hospital were 900 and grew to 1300. It lowered for a time, but at the last check, it rose again to 1420 after not getting Toradol for at least 12 hours.

1073717	3/4/2021	AL	73	M	2/26/2021	2/27/2021	Patient called this afternoon to report decreased oxygen levels after agency. Patient reports to have COPD and remains on oxygen. He reports after the administration his oxygen levels will dip as low as to 70 percent when oxygen is removed. Upon speaking to the patient he did admit to feeling bad several days before the administration in which he had a physician's office visit due to complaints of chest pain. The patient said the physician preformed x-rays and EKG to evaluate his symptoms. All test reported no abnormal findings. The physician changed his breathing medication and added steroid therapy for a few days to help him recover. This apt occurred on Tuesday 23rd. The administration occurred on Friday 26th. The patient said they experienced the "trouble breathing" during the weekend. He contacted his physician again on Monday the 1st and reported the vaccine had made him worse. Unfortunately he contacted them at 4:15 in the after before the office closed and they told him to report to the ER if he was in discomfort. He called me today the report the issue at 4:30ish. I was able to reach out to his pulmonary physician to confirm his therapy and previous apt and complaints. They instructed me to tell the patient to make an appointment if needed. The patient does not fill medication here. On the vaccination form he denied feeling unwell as well as denied the use of steroid therapy.
1073712	3/4/2021	WA	74	F	3/4/2021	3/4/2021	Pt developed circumoral paresthesia (tingling of her lips and tongue) shortly after injection into right deltoid without shortness of breath, chest pain, rash, sore throat, hives, myalgias, nausea, or vision changes. She reports feeling anxious regarding the crowded atrium while getting her shot. Patient symptoms improved after monitoring for 30 minutes with stable vital signs without administration of medications.

1073682	3/4/2021	NJ	80	M	1/28/2021	2/26/2021	pulmonary edema; Low heart rate; chest pain; This is a spontaneous report from a contactable pharmacist. An 80-years-old male patient received his second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular in left arm on 28Jan2021 at single dose for COVID-19 Immunisation. Medical history included dementia, high blood pressure, COVID prior vaccination. He had no known allergies. Concomitant medication included diltiazem hydrochloride (CARDIZEM), anastrozole (ARIMIDEX), simvastatin and lorazepam. Historical Vaccine included first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 07Jan2021 (at the age of 80-years-old) at single dose for COVID-19 Immunization. There was no other vaccine received in four weeks. The patient experienced pulmonary edema, low heart rate and chest pain on 26Feb2021. The events resulted in hospitalization and patient died. The patient was hospitalized from 26Feb2021 for 1 day. Treatment received for the events included Epinephrine, morphine, nitroglycerine. The patient underwent lab tests and procedures which included Covid test Nasal Swab post vaccination on 26Feb2021 indicated Negative. The patient died on 26Feb2021. An autopsy was not performed. information on the lot/batch number has been requested.; Sender's Comments: Pulmonary edema, low heart rate, and chest pain, all reported as fatal, are deemed unrelated to BNT162B2 vaccine, being rather accidental occurrences, likely favored by the patient's age and by the mentioned high blood pressure, known risk factor for cardiovascular diseases. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Low heart rate; pulmonary edema; chest pain

1073189	3/4/2021	IA	89	F	2/15/2021	2/21/2021	Moderna COVID-19 Vaccine EUA Pt received Moderna COVID vaccine 2/15/21 (per pt, was 2/8/21 but shows 2/15/21). On 2/25/21 patient presented to ED with a complaint of generalized weakness for about 1 week, reporting it was worse that day. Pt reported diarrhea on Sunday 2/21 but none at visit. Denies fever, chills, chest pain, shortness of breath, nausea, vomiting, abdominal pain, vision changes, headache, sore throat, cough, diarrhea since Sunday, constipation, dysuria, hematuria, altered mental status. Low grade fever of 100 F, BP 155/65. Pt was tested for COVID, resulted in positive, and sent home with instructions for care. 2/26: Pt was contacted regarding starting monoclonal antibody bamlanivimab infusion.
1073257	3/4/2021	MA	47	F	1/12/2021	1/12/2021	Over night on the night following the vaccination, I had headache, body aches, malaise and insomnia. Throughout the next day (1/13/21), I continued to have headache, body aches, and malaise as well as objective fever (up to about 101.5 degrees F), fatigue, dyspnea on exertion and lightheadedness. Later in the day (about 5:00pm) I developed significant shortness of breath at rest and chest pain. Later that evening I went to the Emergency Department because of concern over my extreme and persistent shortness of breath and chest pain. In the E.D. they did the following tests: EKG (normal), oximetry (normal), Portable Chest Xray (normal), rapid COVID test (normal), cardiac enzymes (normal), D-DIMER (ELEVATED), other bloodwork (normal). Because of the elevated D-dimer, a CT angiogram of the chest was performed to rule-out pulmonary embolism. The CT showed enlarged lymph nodes, but no evidence of pulmonary embolism. I was discharged home. By the next morning (1/14/21) I was feeling much better. And by the afternoon of 1/14/21 I was feeling completely back to normal without any symptoms.

1073535	3/4/2021	FL	68	F	1/24/2021	1/1/2021	she felt extreme pressure when she breathed, like an elephant sitting on her chest; Extreme chest pain/chest pain was not like a heart attack, but she felt a lot of pressure and weight when she was breathing in; heart rate went up (from 89 to 99); Pains; This is a spontaneous report from a contactable consumer (patient). This 68-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL8982 and expiry date unknown), via an unspecified route of administration on the left arm on 24Jan2021 09:22 at a single dose for COVID-19 immunization. Medical history included degenerative disc disease (first disc came out) from 2007, chronic fibromyalgia from 2005, rheumatoid arthritis from 2000 (went into remission for a few years; while in remission, she was diagnosed with fibromyalgia), vertigo (diagnosed when she was 24 years old; bout of vertigo about twice a year; last year, 2020, was the worst bout of vertigo she ever had), allergy to shellfish (hives, itching, welts), sulfa (anaphylactic reaction), and mostly pain related issues. There were no concomitant medications. No additional vaccines administered on same date of the Pfizer suspect. Patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Patient wanted to know if she should get the second dose of the COVID vaccine knowing that she had a reaction to the first dose. She had a reaction which she believed was from the vaccine she received. She felt something immediately but did not concern herself with it, was kept for 30 minutes for observation. Her heart rate went up (from 89 to 99) and then her heart rate came back down. She said after the 30 minutes had gone by, she felt better. On 25Jan2021 and 26Jan2021, she felt extreme pressure when she breathed, like an elephant sitting on her chest which lasted all day. Patient woke up the next morning and pains were still there. It was also reported that the patient had extreme chest pain on 25Jan2021. She said that the chest pain was not like a heart attack, but she felt a lot of pressure and weight when she was breathing in. By the time she went to bed in the night of 25Jan2021 night, she felt fine. When she got up the next day, Tuesday, 26Jan2021, and started moving around, the chest pain came back. When she woke up on Wednesday, 27Jan2021, everything was all gone. Patient is scheduled for her second COVID-19

1068964	3/3/2021	NY	77	F	1/21/2021	2/26/2021	Vaccinated with Pfizer COVID vaccine on 1/21/21 and 2/12/21. Unknown facility, lot number Hospital course 2/24 ? 2/26/21 2/24 Chief complaint: Chest Pain. Per EMS - CP and SOB started 1220. Mid CP radiating to left arm. semi-relief with nitro x 2. Reports N. Denies V and no other symptoms. Hx cardiac stents, MI. HPI: Patient is a 77-year-old female who presents to the ER for evaluation of chest pain. Patient states that her chest pain started this afternoon around 1230 when she was cooking lunch. She says it lasted for about 10 minutes and was a intense substernal chest pressure sensation with radiation down her left arm. She had associated shortness of breath and diaphoresis and also endorsed nausea without vomiting. Patient also states she is had some occasional dizziness which she described as a room spinning sensation is made worse when she is in positions and standing or moves her head. She has a history of 2 heart attacks and 2 stents placed which were done. She has no local cardiology follow-up and she lives at an apartment and follows with pace. EMS gave her 4 aspirin prior to arrival she takes no blood thinners but she does take Plavix. Patient has a history of COPD and also endorses some wheezing, she says they took her nebulizer away from her for fear of spreading coronavirus and she is oxygen dependent at nighttime. COVID positive 2/24/21 (this assay amplifies and detects The target rna using real-time pcr. Testing performed on cepheid genexpert) Patient states she tested negative for COVID 19 last week at her PCP and got her 2nd COVID 19 vaccine on 2/11/2021. She reports having dinner with a friend 3 weeks ago who just passed away from COVID 19. EKG shows normal sinus rhythm with incomplete right bundle branch block and no obvious ST segment elevations or acute ischemic intervals Troponin negative Patient admitted to the COVID unit. Home (baseline) O2 requirement 2.5L at night 2/25: 3L O2 nasal cannula continuously, reduced to 2L within 12 hours No fever COPD with acute exacerbation: Diffusely wheezing bilaterally and in tripod position on exam. Start IV Solu-Medrol COVID-19 viral infection: Start IV Remdesivir as she is now requiring supplemental oxygen. IV steroids as above. Chest pain, history of CAD with previous stenting --Denies any chest pain on exam. EKG negative for ischemic changes. Troponin negative x1. Continue to trend troponin x2 more occurrences. --Continue

1069253	3/3/2021	WV	75	M	3/3/2021	3/3/2021	<p>Patient was at clinic to receive his 2nd dose of the Moderna CoVID-19 Vaccine. Approx 13 minutes after receiving the dose, patient became weak, dizzy, and extremely diaphoretic. Rapid response was called. Patient was wheeled into exam room. BG checked immediately and was 110. Initial vitals showed HR 39 with BP 83/48. Patient was transferred to exam table w/o incident. He did not complain of CP or SOB. Denies any throat swelling or itching. He felt very weak and tired. He continued to be extremely diaphoretic. An 18G IV was introduced to the left forearm without incident. He was connected to 1 L bag of 0.9% Normal Saline which was hung to bolus, running well without pressure. EKG obtained and showed sinus bradycardia with a rate of 43. Possible ST changes in V1 and V2, but not diagnostic of ST elevations or depressions. There is IVCD noted. Patient has hx of AFib - not in Afib currently. Reports on Eliquis instead of Coumadin. EMS was contacted. Physical exam performed revealed a bradycardic HR which was regular. No murmurs. Lungs are clear. Patient is extremely diaphoretic and pale. He is alert and oriented x 3. He is not in respiratory distress and shows no signs of oral swelling. No hives noted on his skin. Vitals were rechecked at 3 mins and showed SaO2 at 95% and then 92%. NC O2 applied at 2 L/min continuous and there was improvement to 95%. He still denies any respiratory distress and was not manifesting any signs of respiratory distress. Still denied any chest pain. NS continued to infuse at bolus dose and BP recheck improved to 108/65 - patient was lying supine. HR remained between 40-42. At this time, the patient reported improved symptoms and he was not sweating as profusely as previously. At this time EMS arrived. Atropine was not administered in the clinic, but was prepared in expectation as a possible next step. As patient's symptoms improved, but his vital signs remained altered, he was agreeable to transport to the hospital by EMS. He was placed on stretcher and care was relinquished to EMS team. Patient transported out of clinic in guarded condition.</p>

1068484	3/3/2021	OH	23	F	3/2/2021	3/3/2021	Patient experienced nausea, vomiting, chest pain and seizures (history of seizures but experienced it more strongly after the shot)
1068293	3/3/2021		70	M	2/1/2021	2/1/2021	severe hypoglycemic event (POC=38)/hypoglycemia; chest pain; He was found driving the wrong way down the highway; no memory of the event; This is a spontaneous report from a non-contactable pharmacist. A 70-year-old male patient received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot EL9265) intramuscular, on 01Feb2021 at 08:00 (at the age of 70 years old), for COVID-19 immunisation. Medical history and concomitant medications were not reported. On 01Feb2021, after vaccination, the patient experienced severe hypoglycemic event (POC=38)/hypoglycemia and chest pain. He was found driving the wrong way down the highway with no memory of the event, once stopped by authorities. He was admitted to the hospital with hypoglycemia and chest pain. His home diabetes coverage was an insulin pump and there was denial of decreased PO intake. The insulin pump was stopped once the patient was admitted. His glucose improved and insulin regular SSI was initiated. He was brought for cardiac cath on 02Feb2021 with no new issues seen. The patient was stabilized, was set for follow-up with PCP and endocrinologist and discharged on 04Feb2021. The events resolved on an unspecified date in Feb2021. No follow-up attempts possible. No further information expected.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events cannot be excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1068256	3/3/2021	FL	74	F	2/15/2021	2/1/2021	my chest started hurting me at 3:50 a.m. this morning; stomach hurts; felt squeezed, I could not breath; had the feeling of being squeezed; This is a spontaneous report from a contactable consumer (patient). A 74-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, batch/lot number and expiry date unknown), via an unspecified route of administration on 15Feb2021 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient previously received the first dose of BNT162B2 on 25Jan2021 and experienced AFib, diabetic, COPD, stomach issues, chest pains and fever. About 20 minutes after the first dose, I had chest pains, from one side clear across the other side. She took a nitro, and had fever over a 100°F for 24 hours on Jan2021. She received second dose on 15Feb2021 and experienced they had her get an EKG. Patient felt squeezed, she could not breath on Feb2021. Her oxygen level and blood pressure were both fine on Feb2021. She had the feeling of being squeezed on Feb2021. Her chest started hurting at 3:50 a.m. (16Feb2021) this morning, stomach hurts like doing flip flops inside her. She did not have anything that would aggravate it. The outcome of the events was unknown. The events was reported as non-serious. Information on the batch/lot number has been requested.

1068247	3/3/2021	OH	75	F	1/28/2021	2/1/2021	AFib; Tingling sensation maybe her sinuses; Headache; Sore throat; Upper chest pain; aches (clarified as body or muscle ache in her arm or leg that occurred occasionally); aches (clarified as body or muscle ache in her arm or leg that occurred occasionally); Nausea; Heart pounding; Lightheadedness; tingling feeling below her neck on the flat area of her upper chest; This is a spontaneous report from a contactable consumer. A female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN5318), via an unspecified route of administration on the left arm on 28Jan2021 11:00 at a single dose for COVID-19 immunisation. Medical history included Afib (diagnosed about 4-5 years ago) and stress. There were no concomitant medications. It was reported that when she got her first COVID-19 Vaccine, her arm didn't hurt, but she had a headache, sore throat, an upper throat and chest type of thing, aches (clarified as body or muscle ache in her arm or leg that occurred occasionally), a little nausea, heart pounding, and lightheadedness on an unspecified date in Feb2021. She said she has AFib (atrial fibrillation) on an unspecified date. She said she is scheduled to get her second COVID-19 Vaccine shot next Monday (22Feb2021), and wanted to know if her side effects are going to be worse. She clarified that her upper throat and chest type thing to be a tingling feeling below her neck on the flat area of her upper chest on an unspecified date in Feb2021. She said she spoke with her doctor on a video call. She said her doctor said her tingling sensation would not be from the COVID-19 Vaccine shot, and the tingling sensation maybe her sinuses on an unspecified date. She said her doctor put her on antibiotics for 10 days (prescribed Cephalexin 500mg capsules, twice a day for 10 days. She said she started the Cephalexin 500mg capsules on 05Feb2021 and finished the prescription yesterday, 15Feb2021. She said the Cephalexin 500mg capsules were dispensed in a pharmacy bottle). The patient stated that she has no other medical conditions, except stress. She said she and her husband have been quarantined, and the quarantine has felt like the longest 2 weeks of her life. It was reported that the patient still gets heart palpitations. She said the other side effects lasted 5-7 days, and improved during that time. She said the side effects have all resolved with the exception of the heart

1070750	3/3/2021	OR	44	F	1/12/2021	2/10/2021	<p>very high Troponin levels (4.79 & 12.49); repeat episodes of chest pain; heart attack; thrombus formation; coagulopathy; myocardial infarction; This is a spontaneous report from a contactable nurse (reporting for herself). A 44-years-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# ELI283), via an unspecified route of administration single dose on 12Jan2021 for covid-19 immunisation. First dose was received on 22Dec2020 10:00 left arm (lot# EJ1695). Medical history included chronic skin condition. No other vaccine was received in four weeks. Concomitant medications included oxycodone for pain, colecalciferol (VITAMIN D). The patient experienced myocardial infarction on 10Feb2021 20:00, very high troponin levels (4.79 & 12.49) on 11Feb2021, repeat episodes of chest pain on 10Feb2021 20:00, heart attack on 10Feb2021 20:00, thrombus formation on 10Feb2021 20:00, coagulopathy on 10Feb2021 20:00. The patient was hospitalized due to the events from 11Feb2021. Patient reported to be a healthy 44 year old woman with no history of hypertension or high cholesterol. She was now on 7 different medications to protect her heart, including blood thinners and antihypertensives that result in daily headaches and fatigue. She had had several repeat episodes of chest pain which has required taking sublingual nitroglycerin. She was off work for an undetermined amount of time. Her primary care physician was baffled by her case and reached out to a number of experts who have agreed that her heart attack was caused by a thrombus formation/coagulopathy most definitely related to the Covid vaccines she received. The events outcome was recovered with sequelae.;</p> <p>Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported event of myocardial infarction and other events. However, the reported events may possibly represent intercurrent medical conditions in this 44-years-old patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including EKG at baseline and during subject drug therapy, echocardiogram, electrolytes, chemistry panel and coronary angiogram, and concomitant medications.</p>

I called my PCP who ordered an EKG, CXR, COVID swab, a metabolic panel, a CBC, and a D-dimer. My D-dimer was elevated and he called me to go directly to the emergency department, which I did and had a CTA chest. I was diagnosed with multifocal pulmonary emboli in my right lung with a slight pleural effusion on my left lung. I had a duplex ultrasound of my legs which was negative for DVT, and an echocardiogram which was within normal limits. I was finally diagnosed with acute unprovoked pulmonary embolism, given a Heparin bolus and started on a Heparin IV infusion. Ultimately, I transitioned to Eliquis PO and was discharged from the hospital within 24 hours.

1070519	3/3/2021	NY	52	F	12/19/2020	12/1/2020	chest pain; her lips were swollen/it is on and off; Palpitations off and on; she had a rash on her arms; she had an abnormal feeling in her throat/abnormal feeling in her throat comes and goes, off and on; maybe she is nervous and anxious; maybe she is nervous and anxious; This is a spontaneous report received from a contactable consumer (patient). A 52-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date unknown), via an unspecified route of administration on the left deltoid, on 19Dec2020, at single dose, for prevention/COVID-19 immunization, at the hospital. Medical history included allergies and allergies to propylene glycol 3350, polysorbate 20, polysulfate 20. It was reported that the patient had a "quick test" and confirmed she has allergies to propylene glycol and polysulfate 20. Her allergist gave her a list of things to stay away from and said to avoid those ingredients. She stated that COVID-19 vaccine has propylene glycol 3350. She clarified and said her allergist told her to stay away from propylene glycol products. Her allergist told her not to use the COVAX. On 19Dec2021, the patient got her first vaccine shot. Within 3 minutes of getting the vaccine, she had rash on her arms. 3 hours later, she had an abnormal feeling in her throat. She was told to go the emergency room and she was given a quick medicine (unspecified). The patient was unable to clarify what medication she received at the emergency room. On 20Dec2021 (the next day), her lips were swollen, on and off. The patient stated she uses dark shampoo and conditioners and maybe it has PEG in it or maybe she is touching something at the hospital. On 20Dec2020, the patient experienced palpitations. She asked the doctors and nurses about her palpitations and they said maybe she was nervous and anxious since she had a COVID patient in the unit. The patient reported that she thinks palpitation started when she went to pick up over the counter medications on 20Dec2020. On 02Jan2021, the patient experienced chest pain. The outcome of rash and palpitations were recovering; oropharyngeal discomfort, lip swelling, and chest pain were not recovered; and nervousness and anxiety were unknown. Information on the Lot/batch number has been requested.

1069560	3/3/2021	NY	61	M	1/15/2021	1/31/2021	<p>Hospital course 1/31 ? 2/20/21 1/31 in ED pt was at home when children noticed his lips were blue, ems arrived and found him to be 50% on RA, on Non-rebreather pt got to 78%, covid on 01/26 Shortness of Breath 61-year-old male presents with EMS for evaluation of shortness of breath hypoxia. History is limited due to the patient's current clinical condition and so is primarily obtained from EMS. EMS reports that he tested positive for COVID-19 5 days ago. He began developing shortness of breath yesterday and his family called because his lips and fingers were blue today and he appeared short of breath. On EMS arrival he had a room air saturation of less than 50% so he was placed on nonrebreather with improvement in his saturation to 70% and he was transported to the emergency department. Patient does admit to shortness of breath. He denies any chest pain. He is noted to have a cast on his left ankle and said that he broke his left ankle on 23 December but has not had surgery. He denies any new pain or swelling of the leg. In the ED he was placed on 15L nasal cannula and NRB mask with improvement in SPO2 to low 90s. Additional work up revealed troponin of 1.35, lactic acid 5.8, and d-dimer 14.4. He received dexamethasone and was placed on heparin gtt. 1/31 admitted to ICU Acute hypoxic respiratory failure due to COVID-19 vs heart failure vs PE. CXR with bilateral hazy infiltrates more pronounced in the bases and left periphery and suspected multifocal pneumonia. At risk for PE given LLE immobility in the setting of COVID-19 with significantly elevated d-dimer. RISK of CTA outweighs benefit given AKI and iodine allergy. Continue with empiric treatment with heparin gtt. Admitted to ICU with SO2 in 60s-70s on 15L and NRB. Attempted 50L 95% FIO2 high flow and nasal cannula. Given lasix 40mg IV with good diuresis however SPO2 still remained low 80s with RR 40s and PO2 42 so the decision was made to intubate. Oxygenation improved following intubation, with further improvement following recruitment maneuver and increase in PEEP. FIO2 weaned to 90% with SPO2 remaining in mid 90s. Will continue to wean FIO2 as able. ARDS net protocol as much as possible. Consider prone ventilation and/or epoprostenol if unable to improve. VAP Bundle: HOB >30 degrees; Oral care per nursing standard and on DVT/PPI prophylaxis Sedation: Target Richmond Agitation and Sedation Scale (RASS)</p>

of 0 to -2 with propofol and fentanyl. Check baseline TG levels. COVID - 19: Convalescent plasma: Not indicated Steroids: Dexamethasone 6 mg / day for 10 days Remdesivir: Not indicated d/t AKI IL-6 inhibitor: Meets criteria for tocilizumab Systemic AC: Heparin gtt. No signs of bleeding (Platelets and Hb stable). Antibiotics: Start 3 and 7 day course of azithromycin and ceftriaxone, respectively. Elevated troponin Suspect demand ischemia d/t hypoxia; EKG does not show any ischemic changes AKI: Suspect d/t hypoxia in the setting of COVID infection. Urine output and electrolytes acceptable. Closed fracture of left ankle Suffered fracture following a fall on ice in December. Cast was placed on 12/30 by SOS. He was due to be re-evaluated this week for possible cast removal. Inhaled epoprostenol started Considered for ECMO but not initiated due to not a candidate Vasopressors required at times Antihypertensive infusion required at times severe hypoxia with position changes switched from heparin drip to enoxaparin prophylaxis 2/20 discharge summary 61 y/o male admitted to Hospital on 1/31 with hypoxia. He was diagnosed with COVID 19 5 days prior to admission, and had worsening respiratory status. He was intubated after arrival, and was on ventilator for the entire intervening time, until he was extubated on 2/20 at the time of transition to Comfort measures only. Prior to developing COVID 19, he had received his first dose of the Pfizer vaccine, as a member of the school system. He had a fractured L ankle after a fall on 12/31/20, and had a cast in place at the time of admission. He received Tocilizumab on 1/31, and underwent several cycles of prone positioning, beginning on 2/2. He completed a course of Decadron, he received Ceftriaxone and azithromycin beginning on admission, and completed a course of these. Anticoagulation with enoxaparin was utilized due to coagulopathy associated with COVID 19. Vasopressor support was required at times, as well as diuresis for fluid management. He required high levels of sedation to maintain ventilator synchrony, and high levels of ventilator support with high oxygen levels throughout his stay. Tracheostomy was being considered, but family decided that since he was not going to have good recovery, withdrawal of support, and allowing death was the appropriate choice for the patient and for them. He was extubated at 2100 on 2/20/2021.

							Death was pronounced at 2123 on 2/20/2021. Children were at bedside.
1070939	3/3/2021	PA	61	M	2/11/2021	2/12/2021	Had COVID vaccine on 02.11.21. States the next morning his anxiety was very high. States he did not know who he was. Still experiencing a lot of anxiety at night. Admits to heart palpitations and hard time breathing. Can't sit still. Reports manic episodes and cycles of depression over the course of hours. Patient states it has gotten a tiny bit better. Tried trazodone which helps temporarily. Denies chest pain. Patient states he has no appetite. Palpitations resolved pretty quickly. Shortness of breath is described as tightness that comes with anxiety feeling. Resolves with shoulder massage. Occurring three times per day. Also admits to dry mouth. Patient admits to needing to sleep with multiple pillows or feeling like he had to sit up and couldn't lay down as shortness of breath would get worse. EKG in office on 2/24/21 showed ST-T changes and given symptoms patient was transferred to emergency room via ambulance. Work up in hospital was unremarkable and patient was diagnosed with pericarditis (unknown etiology) and prescribed NSAIDS from ER and discharged. Admission not required. Patient followed up to us as outpatient on 03.02.21. Patient felt much better and had not take motrin for 1 day. COVID testing obtained at this point (unclear why ER did not send it). Patient referred to outpatient cardiology given risk of cardiovascular disease, stress echo, and event monitor.
1070045	3/3/2021	IN	55	F	3/3/2021	3/3/2021	Patient received vaccination. Approximately 12 minutes following vaccination, patient complained of shortness of breath, chest pain, and weakness. Had some burning in the left, upper chest. Vital signs were stable throughout episode. EMS onsite. Baseline EKG normal. Patient requested transport to ED. Transported via EMS.

1069556	3/3/2021	WI	31	F	2/25/2021	2/25/2021	Background on first covid-19 vaccine dose: Patient received her 1st dose of Pfizer covid-19 vaccine at vaccine clinic on 1/12/21 (this clinic is outside of the Health- system). Pfizer vaccine lot# EN3249 left deltoid. She was sent to an emergency department due to dizziness, nausea (ondansetron given in route). Given diphenhydramine in ED. Work up in the ED suggested anxiety reaction/stress response surrounding vaccine rather than an allergic reaction to the vaccine itself. Reported incident related to 2nd dose: Patient received 2nd dose of Pfizer covid-19 vaccine lot #EN6206 on 2/25/21 at Vaccine Clinic (seen there instead of Center) to allow for closer monitoring. She pre-medicated with 50mg of diphenhydramine on 2/25/21 at 1200 per her PCP's recommendation. She was monitored in the covid vaccine clinic waiting area where at 1310, she felt shaky, pressure headache, and body feeling tight. BP 155/110, HR 90, RR 24, SpO2 100%. had patient lie down. 1325: BP 155/103 HR 90, RR 24, O2 99%. same symptoms as listed above. 1340: BP 150/101. patient reports shorter quicker breathing. O2 WNL and RR 24. 1400: BP 143/98. Patient reports body feeling very exhausted which is what happened with the first shot. No other change in symptoms. 1430: patient up the bathroom using wheelchair, able to stand on own two feet to void, but reports feeling weak. 1445: BP 135/91. Pt not feeling better, but states she feels ok to go home. encouraged patient to continue to rest and find a ride home. Pt is in agreement. 1515: BP 135/99. Patient rested until 1615 and a friend came to pick her up. Wheeled out in wheelchair and able to get into car on own two feet. Seen in PCP clinic on 2/26/21 for BP monitoring/follow up. Pt's BP 130/80. Pt reports feeling fine. Denied shortness of breath/chest pain/pressure/palpitations. Pt has never had this type of reaction to other vaccines. BPs in clinic over the past year have mostly been 120-130s/70-80s.

1069632	3/3/2021	MN	55	M	3/2/2021	3/2/2021	Presented to ED for evaluation of generalized lower extremity weakness, falls. The patient states that he carries a diagnosis of MS and typically is fully functioning without assistance of a cane or walker. The patient states that yesterday morning around 0900 he received the second dose of his Moderna COVID-19 vaccine and was otherwise feeling fine but by last night (12 hours after the vaccine) the patient states he tried to get out of bed and was transferring when he felt his bilateral legs give out, causing him to slide to the ground. His wife then came to help and states that the patient was completely weak in the legs, and was unable to even lift his legs up to get back into bed. They then tried to walk him again a short time later and he again stumbled with weakness in his legs. Since that time, the patient states he has been minimally ambulatory and has been using a cane, but still needs large assistance to get around his home. The patient states he has baseline foot drop but feels this is worse in his legs today. He went to clinic this morning for his symptoms where he was noted to have an elevated temperature and was diffusely weak in his lower extremities. Given this, the patient was referred to the ED for further evaluation. The patient denies any weakness in his upper extremities or facial asymmetry. He denies sensation change in his extremities nor any recent illness such as cough, shortness of breath, chest pain, sore throat, nausea, vomiting, urinary symptoms, or leg pain. He has no history of stroke. He denies any injuries or head injury, syncope from his falls. He was admitted to the hospital where he will receive further symptomatic treatment as necessary. No treatment provided in emergency department for weakness.
1069664	3/3/2021	MD	26	F	3/2/2021	3/2/2021	Starting later in the day of the injection she began having chills, fatigue, body aches and chest pain/tightness. The chest symptoms are more on the right side than the left. She does have some mild shortness of breath with significant exertion. She has not taken any pain relievers.

1066687	3/2/2021	MI	59	F	12/23/2020	1/11/2021	i woke up at 3am with chest pain on 01-11-2021. I went to the hospital and was diagnosed with pericarditis. At the hospital, an EKG, echocardiogram, US of the abdomen, MRI of the chest, lab work, cardiac marker series , CRP and a scheduled exercised test was done that picked up arrhythmia. I am now recovering and I am still taking Colchicine, a gout medication that treats inflammation and pericarditis. I am on this medication till mid April 2021 when I see my cardiologist for follow up.
1066058	3/2/2021	CO	68	F	2/14/2021	2/17/2021	Beginning 3 days after my vaccination I began to experience chest pain and tightness sporadically throughout the day and night for the next 5 days. No fever. Then at the end of those 5 days, it seemed my lungs, right one in particular, had pain and I developed a cough. I had a small amount of pain when breathing, especially breathing in. It felt very similar to an episode of Pleurisy I had quite a few years ago. I do have seasonal allergies and had been sneezing off and on in the days previous to the vaccination and also afterward. Symptoms have since lessened considerably and have almost disappeared. I am curious to know if this was in any way related to the vaccination, or purely coincidental.
1066055	3/2/2021	MN	33	F	2/19/2021	2/20/2021	Intense chest pain 15 minutes, shortness of breath 5 days
1066038	3/2/2021	AR	26	F	2/23/2021	2/23/2021	After my second dose of the Moderna Vaccine I started experiencing headache, chills, chest pain and fatigue. It is still happening 7 days in.

1066012	3/2/2021	IN	63	F	2/24/2021	2/25/2021	I woke up at 2 am to intense chest pains. They radiated from my left shoulder blade through to my left breast. Pain was worse when I breathed. I at first suspected indigestion, so sat on couch, took an antacid and that did not help. My husband awoke at 4 and gave me 3 baby aspirin which helped some what. Laid down for awhile, woke about 10 am to severe pain. Ended up in the emergency room at noon thinking it was a heart attack. My blood pressure was only slightly elevated and I have no history of heart problems. At the hospital all heart related tests came back okay. I was given morphine for pain and zofran. The medicine helped to ease pain and brought my blood pressure back to normal. I was released 4 hours later with no diagnosis for what caused the pain, the hospital told me to take Tylenol for pain as needed. When asked what caused it, they said that they didn't know. When I asked if it could have been the vaccine, they said they didn't know.

1065523	3/2/2021	NJ	41	F	2/19/2021	2/19/2021	Pfizer-BioNTech COVID-19 Vaccine EUA: The patient reported to have received 2nd Pfizer COVID-19 vaccine on 2/19/21. Unknown where the patient got their vaccine administered. Immediately afterwards, the patient developed hives, cough, and lightheadedness and was sent to Hospital. They were treated with steroids and diphenhydramine. Their symptoms resolved and they were discharged. On 2/20/21 patient came to emergency room in the morning with allergic reaction. They woke up in the morning with hives, swelling in face, and feeling of thickness in throat and shortness of breath. They were given dexamethasone, diphenhydramine, and famotidine. Their symptoms resolved and they were discharged. While at home the patient developed hives and took diphenhydramine. They had tingling and a rash over their face. On 2/20/21 the patient returned to the emergency room in the evening with a rash. The symptoms were pain and burning. They also complained of abdominal cramping, mild nausea, and left sided chest pain. Their symptoms improved and they were discharged. On 2/22/21 the patient returned to the emergency and was subsequently hospitalized. They presented with face swelling, general pruritus, and hives. She reported chest tightness and paresthesia involving her lips. Admitted on 2/22/21 to 2/25/21. She was given diphenhydramine, famotidine, and hydrocortisone.
1064674	3/2/2021	TX	40	F	2/9/2021	2/9/2021	Immediately after given vaccine - feeling of lump in throat. Unable to swallow, shortness of breath, rapid heart beat, flush feeling, intense shaking (especially in legs), pain in chest, lightheadedness, dizziness (ruled anxiety) and was monitored for 40 minutes. Was given orange juice and water and allowed to remove mask to catch breath. Almost everyday since this event, the same event keeps repeating it self (almost daily for 3 weeks). I am unable to control these episodes. Emergency department (ED) has been called and I have gone to see my nurse practitioner. Been trying to make an appointment with my doctor for this week. I have lost 5 pounds (down to 105 lbs. so I can't afford to loose more weight) since this first happened and I have also lost my appetite and unable to function normally.

						<p>already on breathing medications. Patient has had issues with CHF and lower extremity swelling. Patient was taking a diuretic for this. Due to patient's cerebral kidney function patient is not a candidate for certain medications or either influenza, Covid 19 and we are limited on antibiotics. Patient's past medical history, past surgical history, social history, family history, medications allergies were reviewed. 3/1/21 er to admission note: currently inpatient History The patient is a 65 y.o. female presents for evaluation of altered mental status. Notable PMHx: CHF, morbid obesity, diabetes, Patient is 3 weeks out from hospitalization for COVID-19 pneumonia. She has been more confused over the couple of days before admission. Because of altered mental status, patient was transferred to the emergency room. Patient also had some shortness of breath. In the ER, she had a chest x-ray which showed moderate interstitial infiltrate secondary to pulmonary edema or pneumonia. Lab work did show a UTI. BNP was normal at 45. Creatinine was near her baseline at 1.8. She did have elevated alkaline phosphatase at 452. White count was elevated at 14.7. Patient was difficult to arouse in the ER. On my exam, patient is difficult to arouse. After shaking her shoulder and yelling at her, she did open her eyes and say to me "I'm ok" before closing her eyes again. She is satting well on nasal canula oxygen.</p>	
1066880	3/2/2021	NJ	46	F	2/26/2021	2/26/2021	<p>Moderna COVID-19 Vaccine EUA: Vaccine recipient reported chest pain (7/10) 10 minutes after receiving the vaccine. They were sent to the emergency room. The chest pain lasted 1 hour. The EKG and cardiac labs were normal. The patient was discharged to home.</p>
1065704	3/2/2021	CA	46	F	2/11/2021	2/11/2021	<p>Known AE's in literature, however I wanted to report- Intercostal pain- severe. My entire rib cage, inside and out were on a complete flare that I have never felt before. It was hard to breath, not shallow or during extent of deep breath, but in between the two. I was getting false chest pains as the intercostal pain over the chest would flare. This was constant pain that started within 12 hours of the dose. It resolved to about 90% by day 20, however I still have lingering intercostal pain. This may be a flare of my lyme reacting to the vaccine. It is still worth it to get dose 2, but I am not looking forward to the AE's.</p>

1067369	3/2/2021	TX	43	F	2/24/2021	2/25/2021	after injection, pain at site, 4 hrs later, headache, 4 hrs after headache, arthralgia, 4 hrs after arthralgia, chills. In the morning at 0600, woke up with nausea and BM urgency. Shortly after N/V, chest pain and delerium start. Chest pain caused anxiety. No SOB. Upon standing, I blacked out and fell to ground. When I came to (5-10 minutes later) nausea disappeared but arthralgia and chills still present. I did not take any OTC/ pain relief meds at all since I did not want to blunt my body's immune response. Nausea does not return and the CP/ hypotensive/shock episode made me stick to sitting on the couch for the remainder of the day. I took 400mg IBU around 8 am and all SX disappear by 1800.
1067311	3/2/2021	CA	58	M	2/27/2021	2/28/2021	Pt began feeling short of breath and feverish the night after receiving vaccine, which worsened to right-sided chest pain w/ inspiration that radiated to his back. Pt returned to work 03/01/2021 then checked into urgent care the following day d/t worsening symptoms. Patient Plan written by PAC: "At this time the nature of your pain is not clear. Your cardiac enzymes are within normal limits except for myoglobin which often goes up with skeletal muscle pain. Your BNP test which can come up with congestive heart failure is elevated slightly from your normal. We will want to recheck this in a week or so. Differential diagnoses could be skeletal muscle pain/injury, herpes zoster or shingles. (This can sometimes have sharp nerve type pain that will develop into a rash within the first 7 days.) Your rapid COVID test was negative. We are sending a PCR test out just to confirm. While awaiting test results please isolate at home. We will call you soon as results are back. Refer to Mendocino County's packet/isolation order. Your potassium level is low at 3.2. It should be 3.6. We gave you some potassium to take in the clinic. I am going to give you some to take for an additional few days. When you follow-up next week plan to have your labs redrawn." Plan Orders: SARS-CoV-2 RNA (COVID-19), QUALITATIVE NAAT to be performed. URIC ACID to be performed. The patient had the following medication order(s) completed today: Potassium Chloride 40meq PO; Toradol 15mg IVP.

1067262	3/2/2021	NJ	25	F	2/26/2021	2/26/2021	My arm started hurting very bad after about 2-3 hours. At the 12 hour mark from my vaccine (11:30PM), I started to have chills, a fever, and feel nauseous. Around 1 AM I started to vomit and this occurred for about 15 minutes, and then repeated again about an hour later. By the morning of the day after I was no longer vomiting or had chills but still had a fever. The most prominent symptoms on the day after my vaccine were extreme body aches and horrible joint pain. My hands and feet felt swollen and stiff. I had terrible pains and aches in my whole entire body. I was also very tired and still had a low grade fever. On the second day after the vaccine I had bad chest and neck pain and started to have a mild cough. By the third day after the vaccine, the chest pain was gone but still had bad neck pain and a headache that radiated through my skull.
1066863	3/2/2021	KY	26	F	3/1/2021	3/2/2021	Fever, chills, body aches, chest pain, shortness of breath, pain at site of injection.
1067147	3/2/2021	MO	55	M	2/20/2021	2/21/2021	The afternoon following administration of the vaccine he began to experience chest pains. The chest pains continued throughout the rest of the day and throughout the night prompting him to present to the Hospital Emergency Department where he was noted to have a mildly elevated troponin and was admitted to the hospital. His troponins returned to normal and he was discharged with an appointment for outpatient coronary angiogram. Of note, he did have a Covid19 infection last fall several months prior to vaccination.

1066955	3/2/2021	CA	61	F	1/20/2021	1/20/2021	The patient received her second Moderna inoculation January 20, 2021 at 8 a.m. At around 7:30 p.m., she had a sudden onset of myalgias and chills. Within 30 minutes, she had a fever at 99.9° F. She went to bed without taking acetaminophen or NSAIDs based on new CDC recommendations of how to treat symptoms due to the COVID-19 vaccine. The patient hydrated and went to bed around 9 p.m. By 11 p.m., the patient?s fever was 100.4° F., accompanied by intense myalgias, chills and a migraine headache. She woke again at 1 a.m. with a fever of 101° F. At 2 a.m., she woke with right-sided pleuritic chest pain (severe pain with inspiration, some pain with expiration and no pain with holding of the breath), with her fever persisting at 101° F. And tachycardia to 109. By 7:30 a.m., her fever dropped to 100.4° F. But still tachycardia at 101. At this time, she took ubrogepant 50 mg, with resolution of her headache within about 30 minutes. Because she had rhinorrhea at this time, she decided to get tested for COVID-19 that day.

1062230	3/1/2021	NJ	30	F	2/11/2021	2/11/2021	<p>whole body felt sore and exhausted; whole body felt sore and exhausted; bad cold/flu; bad cold/flu; little chest pain; minor fever; blood pressure dropped; dizziness; backpain; left arm felt sore; sleepy/light drowsiness; This is a spontaneous report from a contactable consumer (patient). A 30-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL3247), via an unspecified route of administration on the left arm on 11Feb2021 15:30 at a single dose (at the age of 30-years-old) for COVID-19 immunization. Medical history included >13 years ago: diagnosed TB with no symptom, completed TB treatment 1 year-plan and has issue no since then; >16 years ago: Hepatitis-b positive but received treatment and cleared out on diagnostics afterward. The patient was not pregnant. Concomitant medications were not reported. The patient had no COVID prior to vaccination. The patient has no known allergies. The patient previously took the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL3247) on 21Jan2021 at 13:15 on the left arm at a single dose (at the age of 30-years-old) for COVID-19 immunization. After about 4.5h post-vaccination (20:00), her left arm felt sore and within the next 3h, she felt sleepy and experienced random light drowsiness. She woke up around 06:30 the next day (12Feb2021) only felt continued sore arm. However, at 08:30 to 09:30, her whole body felt sore and exhausted, especially back pain, as if she having a bad cold/flu. She also felt a little chest pain, had a minor fever and went sleeping from 12:00, woke up around 18:00-19:00. The whole body ache was almost gone but her back was still in pain and her blood pressure dropped with random dizziness when she was walking or standing up. The next morning (13Feb2021), the back pain was gone and she felt it back to normal except for a little random dizziness in movement. She did not take any medication to alleviate the adverse effects during the timeline. The patient was not COVID tested post vaccination. The patient recovered from back pain in 13Feb2021, the patient recovered from the remaining events in Feb2021.</p>

1062146	3/1/2021	VA	75	F	1/14/2021	1/1/2021	hurting in her chest, like she has to keep breathing; feeling kind of weird/ feeling bad; feeling kind of weird, off balance; Upset stomach; Chills; She cannot function very good, She is feeling so bad and cannot do nothing; At night time it is hard to try to do something and she cannot do it because she is tired; can hardly breathe at night; it kind of feels like she has an ear ache but she does not have an earache; This is a spontaneous report from a contactable consumer, the patient. A 75-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot number EL1283), via intramuscular route of administration on 14Jan2021 (at the age of 75-years-old) as a single dose in the left arm for COVID-19 immunization. Medical history included ongoing chronic obstructive pulmonary disease (COPD) from an unknown date (per patient diagnosed quite a while ago and she goes to a pulmonary doctor). Concomitant medications included unspecified inhaler at two puffs per day if needed and unspecified rescue inhaler one puff a day as needed, both ongoing for one year for COPD. The patient did not receive any other vaccines within four weeks prior to the vaccination or any other prior vaccinations or any vaccinations on the same date of the vaccination. The patient experienced chest pain, feeling abnormal, feeling off balance, upset stomach, chills, cannot function very good, tired, can hardly breathe at night and ear discomfort, all in Jan2021. The patient reported she received the vaccination on 14Jan2021 by her primary doctor. She is feeling kind of weird and has an upset stomach. She is asking how long this will last. She is worried about taking the second dose. She is supposed to have the second dose on 04Feb2021. She cannot function very good, states it kind of feels like she has an ear ache but she does not have an earache. Her balance is off and she can hardly breathe at night. All her symptoms started on the third day after getting the shot (Jan2021). She reports the feeling weird and off balance feeling feel like you are drunk. It aggravates her because she cannot function right. She also experienced chills started the third day after the shot and the chills have recovered completely. The patient reported that she was alright the first day. She has hurting in her chest, like she has to keep breathing which also started the third day after getting the shot and has been going on all this time.

						At night time it is hard to try to do something and she cannot do it because she is tired, states it is the worst part, She is feeling so bad and cannot do nothing. She has a hard time breathing. The events did not require a visit to emergency room or physician office. The patient did not have any relevant tests. The clinical outcomes of the events chest pain, feeling abnormal, feeling off balance, upset stomach were not recovered. The patient recovered from the chills in Jan2021. The outcome of the cannot function very good, she is feeling so bad and cannot do nothing, tired, can hardly breathe at night and ear discomfort was unknown.
1061975	3/1/2021	IN	72	F	1/25/2021	1/25/2021 chest pain; This is a spontaneous report from a contactable consumer. A 72-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EL9262) on her left arm, via an unspecified route of administration on 25Jan2021 at a single dose for covid-19 immunization. Medical history included Open heart surgery in 2006. There were no concomitant medications. It was reported that the patient had the COVID shot on the 25Jan2021, she and her husband, and she sat for 20 minutes, everything was fine, she got in the car, and was going down the road, she had chest pains, then it eased up and it stopped then probably another 25 to 30 minutes later is started again. The chest pains started probably a half hour after the shot. They went away, then she had it three times that day, and once today, and once yesterday, so they are ongoing. The outcome of the event was not recovered.

1064312	3/1/2021	MI	77	M	2/26/2021	2/27/2021	Reported via Nurse Triage / PCP: Fainted earlier, eyes rolled back, mouth was drooping. Nausea, weakness, and chills. BP was 107/75, HR in the 70s. Currently alert and resting. States that patient had his 2nd covid vaccine yesterday AM and then develop chills and clammy skin last night. Symptoms worsened today and patient became weak and fainted. Was unconscious for about 5 minutes and while unconscious, mouth was open and drooling and became incontinent and eyes rolled back in head. Is awake and alert now, but still weak and only able to take 1 or 2 steps. No chest pain or breathing difficulty and no fever. Feeling very nauseous. Caller requesting prescription for zofran. Yesterday AM 2nd vaccine. Last night chills. This AM feeling weak. Today at 11am he felt weak with ambulation. He fainted. Was unconscious for 5 min. Had drooping of the face. He was unresponsive during this time. Had incontinence of urine. Then became awake but very weak still. Only able to walk a few steps. He is communicating. No chest pain. No current fever. No shortness of breath. BP 107/75 with HR 70. He has been very nauseated. He is drinking only small sips of water. Does not seem like a usually COVID-19 vaccine reaction. Given the LOC with urinary incontinence and sustained weakness, I advised ER evaluation to rule out neurological issues. Pt's daughter in agreement. They will go to ER. From Emergency Department: Patient presenting with chief complaint of syncopal episode which was witnessed by his wife. He reported the got dizzy and lightheaded and then passed out while seated. The reported duration of his loss of consciousness was somewhat inconsistent, unclear how long he passed out for, there was however no postictal state. He was not noted have any shaking or seizure activity, he did have an episode of urinary incontinence. He has not been feeling well ever since receiving his 2nd COVID-19 vaccine. By the time of my exam patient states that he is completely asymptomatic, he states he is feeling much better after receiving IV fluids. His lab work is remarkable for a slightly low sodium, compared to his previous levels which were many months ago. Unclear of the acuity of this, although upon further discussion with the patient he has been drinking large amounts of water since his vaccine trying to stay hydrated. I advised him to substitute to some electrolyte balanced fluids and to have his sodium rechecked by his

1060751	2/28/2021	TN	40	M	2/5/2021	2/8/2021	Heart attack. Chest pain and numbness in both arms and back. The pain lasted from 3:00AM until 5:00AM at which time I as in the ER. Troponin levels were at 6.0 and I had a small abnormal finding on my EKG. The Cardiovascular physician on call said it could be something and they would do a cardiac cath to determine where a blockage may be. The angiogram came back with no blockages. troponin levels reached a 10 by the end of the first day. The Echo the next day showed no issues in structure. The Cardiac MRI showed fluid and 4% of my heart had myocarditis from the issue. Troponin levels reduced to 7, then 6 by the end of the second day. On the third day I went home with new meds, an order for a follow up and cardiac rehab.

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1060856	2/28/2021	KY	70	M	2/13/2021	2/26/2021	RECEIVED 1ST DOSE OF PFIZER COVID19 VACCINE ON 02/13/21. ON 02/26/21 WENT TO ER WITH COMPLAINT OF CHEST TIGHTNESS AND PAIN IN HIS BACK. HAD ABNORMAL EKG AND ADMITTED TO HOSPITAL WITH DIAGNOSIS OF CHEST PAIN AND ABNORMAL EKG.
1061009	2/28/2021	NC	58	M	2/28/2021	2/28/2021	Pt developed acute onset chest tightness and difficulty swallowing about 1.5 hours after his vaccination, and about 10 minutes after the completion of a test dose of iron dextran. He was acutely distressed. He was treated with IV benadryl and IM epinephrine. The difficulty swallowing resolved, but chest tightness persisted. Trial of nitroglycerin did not improve his pain so pt was given IV hydromorphone. After approximately 10 minutes he was relaxed and breathing comfortably, but still endorsing chest pain.
1061083	2/28/2021	CA	39	F	2/28/2021	2/28/2021	Patient c/o left arm itching and feeling "hot" noted to have erythematous rash left neck no SOB, itching, chest pain, or stridor.
1061105	2/28/2021	IL	27	F	2/28/2021	2/28/2021	Approximately 2 hours after vaccination, patient went to lunch and noted her face was numb, and could not feel when she chewed. Denies shortness of breath, chest pain, wheezing, or rash
1061608	2/28/2021	MD	77	F	2/17/2021	2/18/2021	The patient had her second Moderna shot on Feb 17, 2021. At 3 am the next morning she reported to the ED c/o being "fluish" and short of breath. She was found to be hypoxic to the upper 80's on RA, and a CXR was consistent with CHF. She stated she had some off and on chest pain for the last few weeks, especially with exertion. Ultimately it was found that she had an elevated troponin and was felt to have had an MI. She underwent cardiac cath and a stent was placed in a 95% ostial right coronary stenosis. Although she was reported as having had a "hyperimmune" response to the vaccine, I can only say for certain she had flash pulmonary edema due to cardiac ischemia that was due to a stenosis in her RCA that had been there for quite some time, but possibly just happened to become critical right after her second COVID vaccine. It would be hard to blame the vaccine, but it is also impossible I guess to absolve it from any role in her MI.

1060968	2/28/2021		25	F	2/26/2021	2/26/2021	100-103 fever for 26 hours, body aches, joint pain, lung pain, chest pain, injection site pain, heartburn, chills, slight sore throat, fatigue, nausea, headache, ringing in ears. Took 2 Tylenol every 6 hours, lots of fluids, took 2 ibuprofen about 30 hours after getting vaccine because fever would not reduce. Symptoms began to subside 32 hours after vaccine.
1061166	2/28/2021	FL	37	F	1/15/2021	1/15/2021	Immediately after vaccine felt flushed with high heart rate and lightheaded. An hour after, developed chronic mild headache, chronic mild lightheadedness, and chronic moderate fatigue which are expected symptoms with the immune response. HOWEVER, symptoms did not improve in 3 days and actually very slowly worsened until I couldn't function for work about 2.5 weeks after the vaccine. At this point, the lightheadedness and fatigue were severe and headaches varied between moderate to severe, resulting in me being out of work for 9 consecutive work days. Had multiple MD visits with tons of tests. During the time I was out, I developed severe lower abdominal pain for two days and severe lightheadedness/nausea/mild vomiting due to being nauseated with chronic headaches. OTC meds did not help much for the headaches nor other symptoms. I have never dealt with symptoms like these before and am very healthy. At the 4.5 week mark post vaccine, these symptoms finally started to very slowly improve, VERY slowly. Tests at MD were inconclusive. I'm still dealing with chronic mild headaches, lightheadedness, and this past Friday now unusual chest pains that move location and severity.

1059221	2/27/2021	MD	22	M	2/23/2021	2/24/2021	<p>Moderna COVID-19 Vaccine EUA The patient was in his usual state of health until he received his second dose of the Moderna COVID-19 vaccine on Tuesday 2/23. He had previously had no side effects from the first dose other than soreness at the injection site. After the 2nd dose, he noticed arm soreness at the injection site more quickly than before. 10-12 hours later, he noticed headache and subjective fever, which was relieved by Tylenol. On Wednesday he woke up with subjective fever and chills, and felt sternal chest pain during deep breathing and attempted cough, but did not notice any effect from positional changes. Other than attempting to cough to elicit pain, he did not experience any other symptoms such as runny nose, coughing, sneezing, congestion, shortness of breath, palpitations, abdominal pain, diarrhea, or dysuria. The following day, he noticed that the chest pain was more severe and persistent throughout the day. The pain location would vary from the sternal area to the left side of his chest. The intensity of pain would vary between a 2-3/10 to 7-8/10. When the pain peaked, it would be accompanied by feelings of fever, chills, and brief headache, and he felt that the pain would "spread" across his chest. The pain would persist for a variable amount of time but then eventually disappear before returning. The pain was not affected by deep breath, position, or analgesics (he took an ibuprofen at around 2 AM when he couldn't sleep). After he fell asleep he was not woken up by pain. On Friday, he pain continued to be intermittent, and peaked during a work meeting. At that point he told his boss and an MD co-worker, who recommended that he presented to the ED. The EKG that was obtained in triage showed sinus tachycardia widespread ST elevations, PR depressions, with reciprocal changes in aVR. At this time he was continuing to experience chest pain. After getting a room in the ED, he no longer felt pain. He received a 2nd EKG showing improvement in ST elevations in some, but no all leads. He received ibuprofen and he continued to feel no symptoms. He was found to have a troponin elevation of 8.84 that peaked to 11.2. Transthoracic echo showed no motion wall abnormalities, normal EF, no pericardial effusion. He was admitted to the CICU out of concern and workup for myopericarditis.</p>

1059445	2/27/2021	NY	47	M	2/11/2021	2/23/2021	<p>On 2/23/21, about 12 days after the vaccine was received, I felt chest pains in the late afternoon. At midnight, I woke up with uncontrollable chills and shakes, with a low-grade fever that hovered in the 99.5 -100 range. I attempted to get up and struggled to breathe,; it was as if my abdominal and lower back muscles were seizing. I had to crawl to a kneeling position to urinate. I took several Tylenol then went back to lie down; after a few hours, the fever subsided, and I was able to briefly fall back asleep. At 4:00 a.m. the fever and major chills subsided, with no fevers reported since then, and only occasional chills. However, the muscle fatigue, pain and stiffness have become frighteningly debilitating. On Wednesday - Friday, the three days after I first experienced symptoms, each day it took me between 1.5 - 2 hours to get out of bed and finally get to a standing position. During the day on each day following my first symptoms, I have been able to gradually walk around, go up and down stairs, use the bathroom, and perform basic tasks. However, when the evening comes, it is a different story. 12 midnight - 10 a.m. are the worst hours, as any extended period lying down results in my muscles seizing, freezing and stiffening up. After falling asleep for an hour, it takes 10-20 minutes to mobilize enough (using a crutch and assistance) to get to the bathroom. After falling asleep for 2-3 hours, it takes 30-40 minutes to do the same. And, if I fall asleep for 3+ hours (which is about as long as I've been able to sleep since the adverse reactions began), it will take 1.5 - 2 hours to get completely mobile. This is when I finally wake for the day, and it takes about 10 minutes to raise my head and turn my torso, then another 10-15 minutes to get my legs off the bed and assume a crouching position, then 30-60 minutes to stand on my own.</p>

1057978	2/26/2021	MD	77	F	2/26/2021	2/26/2021	Patient describes "dry throat" and "metallic taste in mouth" starting immediately after vaccination. Patient was observed to repeatedly clear her throat. Denies shortness of breath, denies difficulty swallowing, denies cough, denies chest pain. After 30 minutes, she's no longer clearing her throat. She continued to deny shortness of breath, difficulty swallowing, cough, chest pain. She was advised to follow up with her primary care provider. Discharged with her son. Son states understanding of all. Patient was afebrile, pulse 72, BP 140/85, RR 16. Patients states that she took her hypertensive medications today and that her blood pressure is normally in this range.
1057966	2/26/2021		69	F	2/26/2021	2/26/2021	Immediately following administration of the patient's second dose, the patient reported feeling "pulsation up to her neck". Vitals checked with HR in 160's, BP 116/80, pulse 96. Denied chest pain, nausea, SOB and all other major symptoms. Tried vagal maneuvers, HR remained elevated. Called EMS.
1056643	2/26/2021	TX	57	M	1/27/2021		shortness of breath; bad headaches; chest pain; rash on his neck and behind his ears; This is a spontaneous report from a contactable consumer (patient). A 57-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot number N5318), via an unspecified route of administration on 27Jan2021 as single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced shortness of breath, bad headaches, chest pain and rash on his neck and behind his ears, all on an unspecified date in 2021. The events were all serious as they involved hospitalization from 02Feb2021 to 03Feb2021. Details were as follows: patient received the first dose of the vaccine on 27Jan2021; he had a lot of bad side effects and went to the hospital: shortness of breath, bad headaches, chest pain, rash on his neck and behind his ears. All this happened a few days after receiving the vaccine. He had an appointment with his cardiologist and he will have a cardiac catheter placed on 19Feb2021. The second dose of the vaccine was scheduled for 18Feb2021. The outcome of the events were unknown.

1057750	2/26/2021	PR	69	M	1/20/2021	2/8/2021	<p>Started feeling unwell; Headaches; Body aches; Chest pain; Didn't had wishes to eat; Diarrhea; COVID-19 pneumonia; A spontaneous report was received from a consumer concerning a 69-year-old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced COVID-19 pneumonia, feeling unwell, headaches, body aches, chest pain, decreased appetite and diarrhea. The patient's medical history high blood pressure which was controlled with medication. Concomitant product use included nifedipine and fenofibrate. On 20-JAN-2021, approximately a week and a half or two prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 (Batch number 030L20A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. A week and a half or two later the patient stated feeling unwell, headaches, body aches, chest pain, decreased appetite and diarrhea for which patient was hospitalized on 06-FEB-2021. Since everything seemed to be fine the patient was discharged on an unknown date in FEB-2021 however, patient's family was not notified that it was a late reaction to the vaccine's first dose. Later, due to shortness of breath he was hospitalized again on 08-FEB-2021 and was diagnosed for pneumonia and was intubated on the same day. Due to COVID-19 situation patient's family could not be in the facilities and that there wasn't any follow up of the patient given to the family, so family did not have much information. During the first hospitalization(06-FEB-2021) the patient had a blood test which showed a normal result and was tested for COVID-19 and Influenza, both were negative. During second hospitalization (08-FEB-2021) the hospital said that the patient was stable. The patient's family did not know the results of the tests conducted at the time. The action taken with the vaccine in response to the events is not applicable. The outcome of COVID-19 pneumonia was fatal. The patient died on 14 Feb 2021. The cause of death was reported as COVID-19 related pneumonia. The autopsy was not done.; Reporter's Comments: Very limited information regarding this event has been provided at this time. The cause of death was reported as COVID-19 related pneumonia. Based on the current available information and the mechanism of action of mRNA-1237 vaccine, the events are assessed as unlikely related. Further information has been requested.;</p>

1057548	2/26/2021		55	M	1/2/2021	1/30/2021	<p>bilateral pulmonary embolism; multiple areas of infarct; back pain; ateltheisis; chest pain; left leg pain; deep vein thrombosis; pulmonary effusions; fever; Chills; myalgia; A spontaneous report was received from a physician who was also a 55-year-old, previously healthy male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced fever/pyrexia, chills, myalgia, chest and back pains, bilateral pulmonary embolism/pulmonary embolism, multiple areas of infarct/pulmonary infarct, ateltheisis/atelectasis, left leg pain, and deep vein thrombosis. The patient's medical history included daily exercise and no personal or family history of clotting issues and no trauma. Products known to have been used by the patient were not provided. On 02 Jan 2021, prior to the onset of the events, the patient received the first of two planned doses of mRNA-1273 (Lot number: 039k20-2a) intramuscularly for prophylaxis of COVID-19 infection. On 30 Jan 2021, approximately 28 days after the first dose, and prior to the onset of symptoms, the patient received the second of two planned doses of mRNA-1273 (Lot number: 012m20a) intramuscularly for the prophylaxis of COVID-19 infection. On 30 Jan 2021, the patient reports that for the first 18 hours, he experienced fever, chills and myalgia. On 01 Feb 2021, the patient reports that he thought the myalgia was continuing, as he had pain in his chest and back. The chest pains gradually worsened. On 05 Feb 20221, the patient went to the emergency room and was admitted. He was diagnosed with a pulmonary embolism. He was started on enoxaparin sodium but switched to apixaban. A computerized tomography study of the lungs showed that he had bilateral pulmonary embolism, multiple areas of infarct and atelectasis. His dimer was 4800. COVID-19 test was negative. An echocardiograph was performed, no results were reported. An ultrasound of the legs was performed and ruled out deep vein thrombosis. Date of discharge was not specified. On an unknown date two days after discharge, the patient experienced left leg pain and returned to the emergency department. Patient was diagnosed with deep vein thrombosis that ran the entire length of the femoral artery. Patient was switched back to enoxaparin sodium and taken off the apixaban. A repeat computerized tomography study was done to see if the pulmonary embolism was progressing and it was not,</p>

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

						however, it showed pulmonary effusions. All current lab work was reported as normal, except for an increased prothrombin time. COVID-19 test was negative. Patient continues to be followed by a pulmonologist and hematologist. Consent to contact patient, pulmonologist and hematologist was obtained. Action taken with mRNA-1273 was not applicable. The outcome of the events, fever/pyrexia, chills, myalgia, chest and back pains, bilateral pulmonary embolism/pulmonary embolism, multiple areas of infarct/pulmonary infarct, atelthesis/atelectasis, left leg pain, and deep vein thrombosis, was considered not resolved.; Reporter's Comments: Very limited information regarding this events has been provided at this time. Further information has been requested. Company assessed the events to be unlikely related to company product.	
1057062	2/26/2021	TX	30	F	1/8/2021	1/9/2021	1/8 vaccination 1/9 I woke up with severe HA, muscle aches, and fatigue. That evening I got chest pains. 1/10 CP resolved. Everything resolved. 1/17 positive pregnancy test 1/22 miscarriage. First pregnancy. 2/10 finally able to see dr.

1056852	2/26/2021	MI	78	F	2/22/2021	2/23/2021	Admitted to hospital for acute on chronic respiratory failure following covid vaccination. (patient significantly fatigued, slept most of the day after vaccine, not on BIPAP as needed) HISTORY OF PRESENT ILLNESS: patient is a 78 y.o. female with a history of oxygen-dependent chronic obstructive pulmonary disease, obstructive sleep apnea, and persistent atrial fibrillation who presents today with general malaise. She received her 2nd COVID-19 vaccination yesterday and complained of fatigue, body aches, and general malaise all day. Later in the evening she noticed that her blood oxygen level was low. She denies having any more shortness of breath abnormal. She has had no vomiting, headache, or chest pain. On arrival she was noted to be febrile and required 6 L supplemental oxygen via nasal cannula. She usually uses 2 L nasal cannula at baseline, occasionally increasing it to 3 or 4 with exertion. She also had elevated troponin levels and noted leukocytosis. There was radiographic evidence of congestive heart failure. On exam, she is tired and wants to go to sleep. She is still requiring 4 L of oxygen via nasal cannula. Her daughter is at bedside. Plans are discussed for admission and she is agreeable. ASSESSMENT / PLAN: * Acute on chronic hypoxemic respiratory failure (HCC) Assessment & Plan Admit to medicine- hypoxic requiring 6 L nasal cannula, utilizes 2 L nasal cannula baseline Hypoxia appears to be secondary to robust immune response to COVID-19 vaccination Increased hypoxia, fever, leukocytosis, elevated troponin, radiographic evidence of congestive heart failure Will repeat troponin level in the morning, daily chemistry and blood count, will treat congestive heart failure as below CHF (congestive heart failure) (HCC) Assessment & Plan Transesophageal echocardiogram from October 2020 noted preserved left ejection fraction, and had no evidence for diastolic dysfunction Radiographic evidence of congestive heart failure, normal BNP, elevated troponin with an increase of 18 at the 2 hour mark, will recheck in the morning As this is her 2nd hospitalization since that echo with hypoxia and concern for CHF, will obtain repeat echocardiogram Received 80 mg IV Lasix in the emergency department, will continue 40 mg IV Lasix 2 times a day Daily weights, 2 L fluid restriction Patient was admitted with acute on chronic hypoxic respiratory failure.

							I think this is due to acute on chronic diastolic congestive heart failure that was brought on after she was sleeping most of the day without her BiPAP. She says she got her COVID-19 booster shot and felt so tired she slept all day. She did not think she needed her BiPAP during the day even if she was sleeping. She has not had a recent sleep study. Patient is diuresing and will likely be able to discharge tomorrow.

1058239	2/26/2021	MN	49	F	2/1/2021	2/6/2021	Received COVID vaccine 1 on 1/13 and COVID vaccine #2 2/1. 49 y/o previously healthy female who had a COVID 19 exposure ~ 1/3. The person she was exposed to tested positive 1/6 (daughter had a fever and cough). On 1/11 the patient received the 1st dose of the Pfizer vaccine. 12-24 hours after the Pfizer vaccine she developed fevers, malaise, myalgias that lasted 2-3 days (Called off work). She then returned to a normal state of health. On 2/1 she received the second dose of the vaccine. On 2/6 she developed right pleuritic chest pain so went to an urgent care. COVID 19 PCR was positive and CXR unremarkable. She was told to take naproxen and her pleuritic chest pain slowly improved. On 2/8 she started to have general malaise followed by nausea. On 2/11 she developed increased nausea and vomiting followed by diarrhea-eventually that day she had a near syncopal episode prompting her presentation to the hospital. Seen at an outside hospital between 2/11-2/12. CT abd/pelvis showed patchy ground glass opacities at the base of the lungs and she was noted to have diffuse mural thickening. There was concern for possible cholecystitis so a perc cholecystostomy tube was placed. Ultimately she developed significant hypoxic respiratory failure and had to be intubated. She was transferred to another hospital on 2/12. Initially she was started on treatment with dexamethasone but continued to clinically get worse. Also on empiric antibiotics.

1058247	2/26/2021	NC	51	F	2/24/2021	2/24/2021	Patient presented to the ED due to shortness of breath and chest pain stating that the symptoms developed yesterday after receiving COVID-19 immunization. Patient stated that she has taken multiple albuterol and Benadryl doses yesterday. Pain is located at the center of the chest and bilateral ribs (right more than left). When taking deep breaths the pain increases.
1054319	2/25/2021	NM	63	F	2/24/2021	2/24/2021	After receiving vaccine the patient was waiting for her 15 min. She began to report feeling of numbness in her fingers. Her vitals were checked and she had an elevated blood pressure of 200/108. She was also was developing a redness on both arms and hands. Rechecking her blood pressure 5mins later her blood pressure was 190/110. Patient also had complaints of intermittent chest pain. After speaking to a provider it was decided to send patient to the ER to treat the elevated blood pressure.
1054158	2/25/2021	IL	55	F	2/18/2021	2/20/2021	Large area of swelling around injection site about the size of a softball measuring 14 cm in diameter. Treatment- anti-inflammatories- ibuprofen. It has now been 1 week and is down to 4 cm. Also, on 2/23 had a flair-up of the post CoVid syndrome and ended up in the ER with chest pain and severe shortness of breath. All cardiac tests came back within normal limits. Chest X-ray just showed atelectasis in bases remaining from bilat CoVid pneumonia 3 months ago. Diagnosis was post CoVid syndrome. Treatment - nebulizer and anti-inflammatories - more ibuprofen. Returned to baseline shortness of breath that has existed since having CoVid in November in about 8 hours. I'm not sure if this was a reaction to the vaccine, but thought I would include it.

1053871	2/25/2021	IA	38	F	1/13/2021	1/13/2021	COVID-19 Vaccine Pt received first dose of vaccine in December and states that she only had a sore arm. She received second dose 1/13/2021 at 0813 and had no side effects. Around 1500, she developed chest pain and wheezing. She used her albuterol inhaler (pt has asthma), which helped. That night, she developed a sore arm. She woke 1/14/2021 around 0100-0200 from pain and was unable to go to back to sleep. She had aching in her left arm, as well as shooting pains through her arm and into palm. She took APAP 1000 mg PO x 1 and doxylamine which helped, but she was still unable to go back to sleep d/t pain. The pain expanded into her chest (especially with deep breaths), and upper back. She developed headache, sore throat, sweats and chills, shooting pain in her ear, painful and swollen left axillary lymph node, and the right side of her tongue became numb (numbness subsided after 1-2 hours). 1/14/21 morning, pt has persistent left hand pain, as well as joint pain in her feet, hips, and knees. She took another 1000 mg of APAP, which helped her pain. by 1/14 evening, she took 1000 mg APAP again and was able to sleep, although pt still endorsed sweats/chills. 1/15: Pt reports her pain is better, less severe, though now she is very fatigued and feels like she has been "hit by a truck". Her left axillary lymph node is still painful and swollen, but less painful than before.
1054538	2/25/2021	NJ	35	F	2/24/2021	2/24/2021	Symptoms about an hour AFTER injection, facial numbness and mild soreness at the injection site. A few hours (~8hours) symptoms started with fatigue, body soreness, chills, low fever, malaise, mild chest pains/tightness, headache, dizziness

1053671	2/25/2021	TN		F	1/6/2021	1/7/2021	<p>inability to stand or walk; slurred speech; inability to stand or walk; left sided pain in chest; left sided pain in chest, neck & scapular area; left sided pain in chest, neck & scapular area; elevated BP; lightheadedness; left hand started become cold & felt heavy; left hand started become cold & felt heavy; This is a spontaneous report from a contactable other health professional reporting for herself. A 48-years-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection; lot number: unknown), intramuscular (arm left) on 06Jan2021 17:45 (05:45 PM) at SINGLE DOSE for covid-19 immunisation. Medical history included endometriosis from an unknown date. The patient's concomitant medications were not reported. The patient did not take other vaccines in four weeks and no other medications were taken in two weeks. Patient did not have COVID prior vaccination. The patient was tested for COVID post vaccination (Unknown results in 2021). On 07Jan2021 11:30 (also reported as less than 24 hours post vaccination), the patient experienced left hand started becoming cold and felt heavy. On 08Jan2021 12:00 (reported as around noon), the patient experienced inability to stand or walk, elevated BP, slurred speech, lightheadedness; and left sided pain in chest, neck and scapular area. The patient was taken to urgent care and emergency room due to events left sided pain in chest, neck and scapular area, inability to stand or walk, elevated BP, slurred speech and lightheadedness. BP came to baseline by 1am (unspecified date in 2021). Treatment was given for the events. Outcome of the events was recovering. Information on the lot/batch number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Dysstasia, Dysarthria, and Gait inability cannot be excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified</p>

1055459	2/25/2021	IL	94	M	1/21/2021	2/14/2021	2/14 Emergency room HPI Patient is a 94 y.o. male who presents with complaint of cough that started about a week ago, and was seen by primary care provider on the 9th February 2021. Patient was started on Augmentin and has taken it for about 5 days but said the cough is worse and productive of clear sputum. Patient in ER to get checked for pneumonia. Patient denies a fever or chills, shortness of breath, chest pain, nausea vomiting and no headache or dizziness. Transferred to another facility h&pHistory of Present Illness: 94-year-old former smoker with a history of paroxysmal atrial fibrillation not currently on anticoagulation, coronary artery disease, insulin-dependent diabetes, CKD 4, prostate cancer on surveillance, TAVR 2/17, with a son who is a doctor and a caregiver who is a Radiology NP by his report, who presents in transfer from previous Hospital due to a large right pleural effusion. He has had a cough for some time now, but thinks it may have worsened, at least per his caregiver, over the last 4-5 days. He was seen by his PCP on February 9th and placed on Augmentin, but nothing changed. He himself denies being short of breath, having any chest pain, fevers, chills, sweats, change in appetite, abdominal pain, nausea, vomiting, dysuria, diarrhea. Of note, on a chest x-ray in June he had bilateral pleural effusions, and on an MRI in July to investigate a renal mass, he was noted to have a small right-sided pleural effusion. On arrival to facility this morning, he was afebrile, normotensive, had a normal heart rate, sometimes mildly bradycardic, normal respiratory rate and saturations of 97% on room air. Labs demonstrated chronic anemia and thrombocytopenia, stable stage 4 kidney disease creatinine of 2.6, BUN 64, glucose 187. Chest x-ray demonstrated a moderate right pleural effusion, noting that underlying consolidation cannot be excluded. He was also felt to have bibasilar atelectasis. CT of the chest without contrast showed a large right pleural effusion with most of the right lower lobe being collapsed. Superimposed infection could not be excluded. He had a small left pleural effusion with adjacent atelectasis and a small pericardial effusion as well. EKG and procalcitonin were not performed. He was sent to our facility for thoracentesis. On arrival here, vitals remained stable. His bedside RN informed me that upon returning from the bathroom, he appeared

1055722	2/25/2021	CA	40	F	2/25/2021	2/25/2021	Client complained of warmth and dizziness after receiving first Pfizer Covid-19 vaccine. Client was sitting in post vaccine waiting area approximately 10 minutes before alerting EMT she was not feeling well. EMT alerted lead PHN to assist. Client alert and oriented, faced appeared slightly flushed, PHN asked client to lower mask to assess for any swelling or hives. Client denied shortness of breath, chest pain, allergies to vaccines in the past. Client stated room feeling warm. First set of vitals at 1020: blood pressure 124/80, pulse 79, respirations 16. Client was moved to chair near exit door for breeze of air and given water. Client walked with steady gait by herself. Shortly after being closer to open doorway client stated warmth feeling was improving. Per client only allergic to gluten products, only medication she takes is for thyroid and she had taken that this morning. Client asked if she could eat her snack she had in her purse, per client no breakfast this morning. PHN just instructed client to take small sips of water and eat slowly. PHN informed client her wait time would be extended to 30 min observation to make sure symptoms had improved prior to her leaving and client agreed. EMT stayed with client and reassessed vitals after 5 minutes. Blood pressure: 128/80, pulse 75, o2 98, skin color normal, alert and oriented, and client stated symptoms resolving. PHN and EMT reassessed client at 10:40, as client was approaching 30 minute observation. Vitals: blood pressure, 128/78, pulse 78, o2 99. Alert and oriented, client stated prior complaints had resolved. PHN had patient stand up by chair to assess for dizziness and client denied at this time. ER precautions given. EMT walked client out of building at 10:45, client walked out with steady gait.
1055368	2/25/2021		28	M	2/20/2021	2/21/2021	Patient presented with bilateral blurry peripheral vision that resolved over several days. He was found to have P1 PCA stenosis. Additional imaging showed this to be resolved and a normal variant. Additionally, patient diagnosed with myopericarditis. Found to have elevated troponin up to 6, diffuse ST segment elevation on EKG and chest pain. Started on ibuprofen and colchicine with relief. Discharged from the hospital on hospital day 2.

The outcome of events was recovering.</p> <p>arm is sore; pain in her chest as she had before/pain in chest to her left upper sternal border area (under collar bone); fatigued; chills; fever; body aches, it was more like body cramping; body aches, it was more like body cramping; This is a spontaneous report from a contactable nurse (patient). A 57-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EK9231 and expiry date: unknown), intramuscular on the left deltoid, on 14Jan2021 07:15 at a single dose for COVID-19 immunization. The first dose was received on 28Dec2020 (lot number: EK9231), intramuscular on the left deltoid and patient experienced sore arm, and left upper (under collar bone) pain in her chest. The patient medical history was not reported. There were no concomitant medications. She received the vaccine around 7:15 in the morning and by midnight on 15Jan2021 (she works nights), she started to feel the pain. By that point, she was like "ooh, my arm is sore". She also started to have the same pain in her chest as she had before (pain in chest to her left upper sternal border area (under collar bone). Her doctor ordered a chest x-ray on 25Jan2021. Patient stated it was not cardiac. It's just there. The pain was annoying and she can feel it when she moves or when she goes to get up, it's an ache. Its a pain in the neck. On Friday, 15Jan2021, she was real fatigued, had chills, a little bit of a fever, and body aches. She clarified it was more like body cramping and her body hurt so bad. She over that by Sunday. All of her symptoms resolved by Sunday 17Jan2021, except for the pain she was experiencing in her chest which was still ongoing and persisting. She had taken Tylenol, Aleve, and Ibuprofen, but it doesn't resolve the pain at all. Outcome of the event of sore arm was unknown, for pain in chest was not recovered while for the remaining events was recovered on 17Jan2021.</p>

1051370	2/24/2021	FL	57	F	12/28/2020		Sore arm; Pain in chest to her left upper sternal border area (under collar bone); Pain in the neck, its an aching pain, a nuisance type of pain; This is a spontaneous report from a contactable healthcare professional (patient). A 57-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number: EK9231; Expiration date was not reported), intramuscularly on the left deltoid on 28Dec2020 (07:15) at a single dose for COVID-19 immunization at the hospital. The had no relevant medical history and concomitant medications. On an unspecified date, after the first dose of vaccination, the patient had sore arm; pain in chest to her upper sternal border area (under the collar bone); and pain in the neck (further described as "an aching pain, a nuisance type of pain"). The patient had chest x-ray on 25Jan2021 (results were not provided). The patient had received paracetamol (TYLENOL), naproxen sodium (ALEVE) and ibuprofen as treatment for the reported events. The outcome of the events was not recovered for 'pain in chest to her upper sternal border area (under the collar bone)'; and was unknown for 'sore arm' and 'pain in the neck'. The patient had received the second dose of vaccination on 14Jan2021. The reporter believed that it was "highly coincidental" (pertaining to causality) considering the events happened with both vaccine doses. No further information was provided or obtained.

							general feeling of being unwell with Covid. She had all of that again, but she was told not to expect anything respiratory. She got concerned with the chest pain, cough, phlegm, and shortness of breath. She saw the doctor on 05Feb2021 and she was instructed not to take anything because it could affect the vaccine, but her symptoms went away within 48 hours. She said that she felt like the congestion felt like a allergic reaction for her, said that it was hard to swallow, and had a lot of phlegm in her throat. She said that it is not inherently different if you were allergic to flowers. Chest pain she described like you are full of phlegm and like there is inflammation. Shortness of breath: Feel panicky when you try to breath and you feel the phlegm. Patient said that when she gets sick she does have a tendency to get upper respiratory infections. Like with a cold that she would end up with a cough that would linger a little bit. She still thinks getting the vaccine was worth it. She just wished that it would have been a listed side effect, because when it is not, you panic. Most people are worried about the shortness of breath. She reported that her O2 levels were ok when she checked. Doctor gave her a vitamin IV to make her feel better. Told her that her lungs were clear and it was all upper respiratory.
1053177	2/24/2021	CA	25	F	2/24/2021	2/24/2021	At 9:40 started to feel like my heart was racing, a weight on my chest, pain in my left chest area. 1052873	2/24/2021	AK	38	F	2/24/2021	2/24/2021	<p>Patient came into clinic for first dose COVID-19 vaccine. Patient preferred to receive Moderna vaccine. Vaccine Screening checklist completed by patient, EUA Moderna Fact sheet given and reviewed with patient. Patient received Moderna Lot # 007M20A in Left deltoid Given by RN at 1120 AM. Informed to remain in clinic for 15 minutes after receiving vaccine. At 11:30AM patient reported to administrative assistant that she "wasn't feeling well." Administrative assistant notified RN. RN brought patient into exam room to assess patient reports "feels like my heart is pounding." Vital signs at 1133AM BP 133/93, O2 99% on room air, 99.1 F temperature, Heart rate 77, and respiratory rate 16. Radial pulse felt normal, not bounding or thready. Heart rate on auscultation was WNL. Patient denied any feelings of difficulty breathing, tingliness in lips or face, just states "I can feel my pulse in my ears." Patient sitting up and able to have a conversation with RN without difficulty. Patient states the only medication she takes is her inhaler for asthma, and she ate breakfast of grits this morning. RN brought patient some water. At 1145 patient stated she felt slightly dizzy. Patient was wearing a heavy jacket, and two sweatshirts, RN advised patient to take off a couple of layers to try and cool body down a little bit. Patient laid back on bed on right side and rested. Vital signs at 1153, patient back to sitting up, Blood pressure of 114/81, temp 98.9F, O2 saturation of 100% on room air, Heart rate 75bpm, Respiratory rate 16. RN opened window in exam room, patient felt better with some fresh air. Patient states she "isn't dizzy anymore and her heart still feels like it is pounding but not as bad." RN attempted to call Medical director to report but call from exam room phone did not go through. RN opened patient's chart and noted allergies of azithromycin (hives), seafood (severe but unknown response), and seed (anaphylactic reaction). On patient's vaccine screening form patient only notified or admitted to azithromycin allergy. RN educated patient on allergic responses and caution to take with vaccines, as patient has had an anaphylactic reaction in the past. Patient used to have an epi pen but does not carry one anymore. Patient still denies any tingliness around lips/face, difficulty breathing, no swelling noted. Vital signs checked 1215pm blood pressure 126/90, O2 saturation 100% on room air, Heart rate 74, temp 98.9, and</p>

1052392	2/24/2021	TX	46	F	2/22/2021	2/22/2021	respiratory rate 17. Patient denies feeling dizzy, states her heart doesn't feel like it is bounding, it's better but maybe not totally back to normal yet. Patient able to stand and walk around without getting faint or dizzy. RN called Medical director phone went through and notified of patient's response and current status. RN informed patient to call 911 or go to the ER if she feels dizzy again or like her heart is racing. PHN reviewed emergency signs of an allergic reaction (anaphylaxis) and patient able to teach back that she will go to the ER immediately if she starts feeling those symptoms of chest pain, difficulty breathing, tingliness around mouth/face/throat, or any swelling. RN suggested to patient to maybe receive her 2nd dose of the vaccine at the hospital. RN walked with patient out of clinic, patient doing well, and is feeling better.?
1053270	2/24/2021	UT	38	F	1/28/2021	1/28/2021	patient began feeling tingling sensation at injection site left arm. A few minutes later dizziness and (now stating shortness of breath) original evaluation, assessment and patient statements did not reveal shortness of breath. She was speaking softly, SaO2 was 98. Provided gatoraid and offered weather. Husband stated she had previous similar reaction post-anesthesia. at 1515. Patient began to feel weakness over entire body. Refused ambulance at that time. 1520- began having chest pain, tingling in legs and feet. Husband said he would take her to the ER due to BP continuing to be elevated. 1528- Unable to stand requesting an ambulance. a1530- EMS called at 1535 ambulance confirmed. 1540- Ambulance arrived. Turned over care to EMS
							Pt presented with itching and heaviness in chest 15 min after vaccine administered. Pulse regular. Denies chest pain. 10cc liquid Benadryl given PO, 25 min later itching gone and chest heaviness decreased, 15 min later feeling much better with no itching and chest heaviness gone, VS stable. Released 15 min later at 7pm to father and instructed to notify dr. Pt called nurse hotline the next day (1/29/21) experiencing 102.5 fever, achy, hard time breathing, HA and chills, appt with MD in 3 days. Given emergency protocol.

1052571	2/24/2021	MN	84	M	2/23/2021	2/23/2021	Resident came up to staff and approximately 1400 and said, "I have a fever" - temperature was assessed and was 98.4 resident came back several minutes later and stated again, "I have a fever" - temperature assessed again and was 98.2 - staff asked if resident had his window open, he stated no - staff suggested maybe he open up his window because it is quite warm in the building at this time. Resident said ok - went back into room - staff told writer he had c/o "I have a fever" while staff was in change of shift report and they assessed fever and it was 97.1. Around 1525, Resident noted to have sudden SOB. PRN albuterol neb given. RR before neb was 40 and did not improve. BP 136/66, pulse 158, temp 101.7 tympanic, and O2 sats 76% RA. Placed on supplemental O2 and sat came up to 86% on 3 L. Resident then started to complain of chest pain. Resident was weak and unsteady and insisted on standing but was guided to his chair to sit down. Resident said he wished to go to ER and daughter in agreement. 911 called. Writer assisting with transferring resident out to hospital. While waiting for ambulance, patient restless and visibly short of breath. Lips with blue discoloration, pale appearance, and breathing with accessory muscles. Changing positions frequently from lying to sitting and standing due to being uncomfortable. Temp 103.2 in left ear and 102.5 in right ear. Respirations 36. Blood pressure unable to be checked due to restlessness and moving around. Pulse 167. O2 92% with nasal cannula on 3L. Asked him to point to the pain and he pointed to his upper abdomen, but describes it as chest pain. Per EMTs he is being sent to clinic instead of the other clinic due to abnormal EKG readings. Received update from EMT around 1700 that patient arrived to ER and heart attack was confirmed so patient was being sent to cath lab for angioplasty procedure.

1049242	2/23/2021	MA	34	M	2/18/2021	2/20/2021	Patient received second dose of Pfizer vaccine at 5pm on 2/18/21 and experienced expected symptoms of fatigue, injection site pain and minor body aches. Patient began to experience difficulty breathing on the morning 2/20, at that time the patient attributed it to asthma. Patient reports that he has not had an acute asthmatic episode in 25 years and has not experienced any respiratory condion like this before. Shortness of breath, chest pain and dizziness increased in the day to follow. On Monday 2/22 at 8:30am patient was seen at family medical facility by Doctor presenting with a O2 SAT of 93%. Covid test was preformed and was negative. Dr prescribed a preventative inhaler and some prednisone and sent patient home. Patient continued to decompensate and at 6pm was seen by previously treating physician, presenting with O2 sat of 91% given a nebulizer and sent home. Patients condition worsened overnight and he was seen in the faility Urgent care at 9am on 2/23. Patient was given a repeat covid test, that was negative , flu test that was negative, and chest xrays that were clear.

1049389	2/23/2021	ID	74	M	2/9/2021	2/20/2021	Patient passed away Saturday at 14:04pm. Patient's wife reports his death was sudden, he passed away sitting in his chair his heart just stopped she said. They tried to perform CPR, 911 was called and paramedics arrived at the scene and he was given medication but never had any return of vital signs and so his death was called at the scene. Wife reports he was not ill, did not have any symptoms prior to the event. They are not going to be doing a autopsy. She wanted us to know based on timing that there may be some possible correlation with his COVID19 vaccine. He obtained the vaccine on 02/09/2021 - wife reports he had no symptoms, not even arm soreness after the vaccine. Had no fever, shortness of breath. Did not complain of chest pain. We can update chart to reflect the patient is deceased and lets make a card for the family.
1049325	2/23/2021	CO	70	F	2/22/2021	2/23/2021	I began getting chills and felt feverish. I also had body aches and pains as when ill with the flu. There was a sense of nausea initially but it went away. There was pronounced feeling of heat located subcutaneously on my right outer thigh. It came and went about every minute or so. (I counted the seconds in between each incident). I am still experiencing flu like symptoms (bodily aches, slight headache, mild chest pain, and general ill-feeling.) I will contact my primary care physician today about my concerns but felt it necessary to document these mild but disturbing side effects.
1049318	2/23/2021	NJ	83	F	2/17/2021	2/22/2021	Developed a cough with chest pain
1049313	2/23/2021	CO	70	F	2/21/2021	2/21/2021	2 hrs. After injection mild chills & fatigue. 14 hrs. After injection mild chills, mild headache, very tired/fatigue, moderate to severe upper body muscle aches, mild migratory chest pains for about 30 minutes. 24 hrs after injection just overwhelming fatigue& mild headache continued for another 12 hrs. 48 hrs. After injection symptoms gone.

1047801	2/23/2021	RI	68	F	2/6/2021	2/6/2021	I had the virus in August of 2020 for 30 days until symptom free. ON 2/6/2021 received first vaccine injection. within 3 minutes a light headache started. That evening, rash and itching on right fore-arm and under chin. took benedryl. Woke at 3:30 am on 2/7 not feeling well and left arm very sore and could not touch. 6:30 am - chills with severe body shaking and 101 temp. 7:30 am 102.2 took tylenol 8 hr 650 mg. Oxygen at 96, heart rate at 76 and BP 117/68. 8:00 am 101.9 temp. 10 am 100.6 temp. 1:30 pm 102.9 temp. 2:00 pm 103.3 Took Tylenol, extra strength 2 tabs. 8:30 pm used inhaler due to chest pains 101.3 temp. took benedryl. Oxygennn @98 HR-82 BP 145/77. 11.00 pm 103.3 temp. took 2 tylenol. Mon 8:00 Monday am continued/ 100.2 temp oxygen 97 HR-70; 99.2 temp BP 110/71. 7 pm. took Benedryl for congestion. Quit taking stats. Fatigue and rest took play at this point. Since then have had intermittent low grade fever in 99.2 to 99.9. Same with headache and extreme fatigue. Have high risk husband that I take care of . He had his first vaccine at same time. No side effect at all. I am scheduled for 2nd vaccine on March 6th. I am very apprehensive about taking it with this reaction. Please advise/recommend if I should proceed. My PCP stated that these reactions were evidence the vaccine is working. Is this because I had the virus??? Both the virus and vaccine have been really hard on me. I am usually a very active person and since August, I have been struggling with fatigue. First time in life. Thank you.
1049444	2/23/2021	MA	28	F	2/23/2021	2/23/2021	Pt stated she felt lightheaded. Denies SOB, chest pain. 1050065	2/23/2021	WA	35	F	1/6/2021	1/9/2021	<p>Around lunch time on the 9th of Jan . I noticed all over body rash, macular papular rash redish whitish throughout body, it became very itchy in my arms and legs, I noticed numbness in right and left arm and legs numbness, shooting pain in left side as well, I experienced neurological symptoms and went to ER. They did a complete blood count and basic metabolic panel, they said it was probably a immune response and was told to take antihistamines at home. symptoms started to subside after a couple of days, I then developed intermittent chest pains in the left side and the pain became more consistent and then a week later it was consistent with every breath and I went to the ER again, they did an EKG, Troponin, all cadiac workup and chest xray said it was not cardiac but possibly a chest wall issue, I was referred to cardiology, cardiologist thought I may have pericarditis, I started taking 800mg of ibuprofen for management. My pain has began to subside and now I only have a couple of minutes every other day that I still have pain but stopped taking medication the third week in February. Because of the intensity of my immune response they recommended I not take the 2nd dose. If symptoms subside I will let my dr know</p>

1050442	2/23/2021	PA	52	F	1/27/2021	1/27/2021	Patient is a 52 year old female who presents with concerns of headaches, nausea, fatigue, hives/itching, and SOB since receiving her Covid-19 vaccine 3 weeks ago. Got the Pfizer vaccine at the Center on 1/17/21 around 12:30PM. She had no side effects during the 15 minutes she was kept for observation after receiving the vaccine. She did develop a headache and fatigue approximately 1.5 hours after she got the vaccine and then later that day developed nausea. SOB developed the following day. She developed hives on her chest approximately 2-3 days after the vaccine. States she cannot recall the exact date that the hives started. Hives have appeared like pink raised plaques. Largest plaque was 1 inch in diameter she estimates. The hives have continued to come and go from different areas of her body including her shoulders, buttock, upper legs. SOB is present at rest and with exertion. She has had no chest pain/pressure/tightness/wheezing , palpitations, or feeling of her throat closing. States her exertion capacity is reduced.
1049583	2/23/2021	IL	66	F	1/18/2021	1/18/2021	Emergency room 1/25/21 HPI patient is a 66 y.o. female who presents with dizziness, nausea, and vomiting. Patient reports that she began having acute episodic dizziness and vertigo early this morning when she rolled over in bed. She states the dizziness became so bad it made her nauseous and she began vomiting. Patient reports she tried to take a Dramamine but was unable to keep it down, and thus it did not help. Patient denies any ringing in the ears, decreased hearing, or ear pain. Patient does report she has had episodes of dizziness and vertigo like this in the past. Patient denies any fevers or chills. Patient does report mild frontal headache. Patient denies any chest pain, palpitations, or shortness of breath.

1045720	2/22/2021	DE	68	F	2/2/2021	2/2/2021	Chest pains by heart once in the car; Itching by neck, shoulders, upper arms, legs, back; Throat closed up a bit; Sore upper left arm at injection site; Headache; Fatigue; Later on sharp pains in left calf upon walking; Numbness in left facial cheek and left side of tongue; Numbness in left facial cheek and left side of tongue; Difficulty swallowing; This is a spontaneous report from a contactable consumer (patient). A 68-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL9265, expiry date not reported), via an unspecified route of administration in the left arm on 02Feb2021 13:30 at single dose for COVID-19 immunization. Medical history included allergies or hypersensitivity. Concomitant medication was not reported. The patient was not pregnant at the time of vaccination. The patient was vaccinated at a health facility. The patient was not diagnosed with COVID-19 prior to vaccination. Since the vaccination, the patient has not been tested for COVID-19. The patient previously received second dose of varicella zoster vaccine (lot number and expiry date not reported) on 18Jan2021 at single dose for immunization. Five minutes after first shot of Pfizer Covid 19 vaccine, on 02Feb2021 13:35, it began itching by neck, shoulders, upper arms, legs, back; throat closed up a bit. The patient was administered 50 mg Benadryl, but itching continued. The patient had sore upper left arm at injection sight. They waited at the vaccination facility under care of 3 nurses for one hour. The patient was offered Epi-pen, but did not administer Epi-pen. The patient's husband drove her home. She had chest pains by heart once in the car. The patient had headache, fatigue, and later on sharp pains in left calf upon walking, numbness in left facial cheek and left side of tongue and difficulty swallowing. Clinical outcome of the events was not recovered.

1045523	2/22/2021	FL		M	2/1/2021	2/1/2021	AFIB; really tired; chest pain; A spontaneous report was received from a consumer concerning a himself, a 75-year-old male who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced atrial fibrillation, chest pain and really tired. The patient's medical history included atrial fibrillation with ablation 3 years ago. No relevant concomitant medications were reported. On 01 Feb 2021, the patient received their first of two planned doses of mRNA-1273 (Lo038A20A) intramuscularly for prophylaxis of COVID-19 infection. On 02 Feb 2021, the patient woke up at 2:30 a.m. with chest pain, which "has" subsided (date not reported). On 03 Feb 2021, the patient was really tired. On 04 Feb 2021, the patient felt great. On 05 Feb 2021, at 6:30 a.m., the patient went into atrial fibrillation. Action taken with mRNA-1273 in response to the events was not reported. The event of chest pain was recovered/resolved. The event of really tired was recovered/resolved on 04 Feb 2021. The outcome of the event of atrial fibrillation was unknown.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. However, the patient's age and history of atrial fibrillation with ablation are risk factors and confounds causality assessment.

1046052	2/22/2021	MO	50	F	2/14/2021	2/14/2021	02/14/2021 at 1130 am-I received my 2nd Dose of Covid Vaccine (Moderna) at work. Stayed at work for monitoring. I start getting dizzy and nauseated at 1330 and have told the provider about it. He questioned me if I had eaten anything, which I have not. So, I head home ate and took a nap. ? At 1000pm that night- I started having chills with Fever of 100 degrees, body aches. I took Tylenol 650mg 2 tabs and try to sleep. My fever broke at about midnight and was sweaty, groan and moan all night, ?coz of pain. ? 02/15/2021 at 0430am ? Started chilling again, with Fever of 101, severe body aches and joint pains, severe headaches. Took Tylenol 650mg 2 tabs around 5am. ? At 1100 am-Shivering, Fever 102 degrees, exploding headaches, joint pains, muscle pains, body aches, neck pain, diarrhea x 2, dizziness, nausea, extreme weakness, and little fingers are bending forward and painful. My headache was unbearable, I felt like my brain is going to explode. Tylenol 650mg 2 tabs taken. Ice compress to forehead and back of neck applied. Called Dr office which I was told to be in the clinic office at 1330 and I will be consulting with Dr instead. ? At the Clinic- I was told that I was having bad reactions from the Covid Vaccine and my symptoms will be treated as if I have ?Covid?. My Blood pressure was 150/100 as I am extremely in pain. He gave me a Toradol shot 1st thing and let me rest for about an hour with lights off. By then, my pain were tolerable including my headache. He gave me Medrol Dose (steroid) shot and Rocephin shot then. I was instructed to come back in the Clinic for f/u the next day. He wants to monitor me closely as he has seen uneventful cases of this that leads to death. He sent me a dose of Toradol for pain to be given between about 11pm if needed for pain. ? At 11pm -Started having chills again with fever of 100 degrees. My body aches/joint pain started to intensify and my head starting to ache. Took Tylenol 650mg 2 tabs for fever. My Sister who?s a Nurse gave me the IM shot of Toradol dose prescribed by the doctor. I was able to sleep all night without interruptions, but woke up with clothing wet because of too much sweats. ? 02/16/2021 at 0830-My body aches/HA are under control, but still extremely weak. As I was getting ready for 1000 am Doctor?s follow up. I started getting short of breath with simple activities such as dressing and walking. By the time I got to the office I am very

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

much short of breath, but my oxygen Saturations has been staying up above 90?s. He gave me an inhaler to ease my breathing. Prescribed me Dexamethasone and Azithromycin, Symbicort. He?s not releasing me to work until he sees me in a week, schedule for 02/22/2021. ? At 11pm that night- started to have mild chest pain lasted about 30 minutes. I took Ibuprofen 600mg and force myself to sleep. I roughly sleep that night. ? 02/17/2021 at 0930-Start having increased Short of breathe with talking, walking, dressing (simple activities). My lungs felt bruise and painful, but I have no cough nor phlegm. My headaches are back with intensity of 9/10. I felt very exhausted as I gotten up at 0500 and felt like I have not slept and unable to rest/calm my mind. Started having chest pain again on and off. I took all the prescribed medications and inhalers. My BP 149/98, Pulse 108, R 22, T 98 Spo2- 96%. Started having chest pain again on and off. My short of breath has ease a little at rest and after inhalers usage. ? 3:00pm-Gotten up to check Vital signs BP- 138/82, P-100, R 20, T 97.8, Spo2-95%. Lungs still painful, breathing?s better, headaches still there annoying but tolerable. Then I started seeing floater?s in my eyes. Checked Blood sugar-131. 02/18/2021- I feel like 60% better with breathing. However, I?m very weak and easily fatigue. Needs intermittent rest every 2-3 hours. My voice seems to be fading, can only speak in soft volume voice as if not enough strength with my vocal voice. 02/19/2021- Called Dr office for update of my condition and was told to come to Clinic at 5pm. EKG was done in clinic , spirometer. Due to new onset of chest pain and EKG result. Doc suggested direct admission for more lab works, cardiac work out and CXR. I was direct admitted at Hospital at 6:30pm at Cardiac/Telemetry unit. 02/20/2021 ?See data?s/documentations from hospital. I was discharged at 8:30pm to home. To f/u with Dr on Monday the 22nd. As I arrived home, I ate a little then vomited a lot. 02/21/2021- I have massive abdominal cramps with diarrhea. Very dizzy and very weak still, but no more short of breath at this time. My voice seems to be coming back to normal volume.

1047669	2/22/2021	IL	62	F	1/1/2021	1/23/2021	01/23 Hives began on thigh and progress to arms, torso, underarms and then both thighs. 01/25 Called dr and had a Telemed call with NP on Tues. 01/26. Predisone and Benadryl was prescribed. Thurs. 01/28 Call to let them know that it wasn't working. I went into the office for one shot of Solumedrol. This help and they were gone. They gave me second dose of Predisone to take in case it came back and to continue the Benadryl. 02/8 Second vaccine. Hives began that night: arms, torso, thighs, hair. Call the Dr. on 02/10 and suggested I go to an allergist. Went to allergist on 02/11 she said to only take one Predisone, Allegra one am and one at noon, then take zertek at nighttime. The Predisone created a major brain fog, I had to stop. Saw the allergist on 2/18, she agreed to get off the Predisone. 02/11 I passed out in the am and when I woke up with vomit running down my face. Still suffering with hives this entire time. 02/17 my face, lips, tongue started to swell and I had chest pain for 90 minutes. My feel swelled and I have hives so bad on my feet I could not walk or put on shoes. 02/20 Woke up with sweat on my chest. My hands were so swollen I had to have my wedding ring was cut off . 02/21 I went to the Urgent Care and received a shot of Solumedrol. They said this should last me for a few days. 02/21 woke up 3 time throughout the night soaked in sweat.

1047631	2/22/2021	NE	42	F	1/11/2021	1/13/2021	Two days after the 2nd injection I started to have chest pain and not feel right. I went to the Station where I volunteer. I did an EKG which showed Anterior Infarct. I went to the ER. They gave me 4 baby aspirin to take and some blood work. I was told the blood work showed elevated levels consistent with a blood clot as well. I had a CT scan to rule out a clot in my heart or lungs. Which it was negative. I was released and told to see a cardiologist in the next few days. I saw the cardiologist two days later who said I ended up with Pericarditis and that it should resolve on its own. I was feeling better until two days ago when I developed chest pain again. I again went to my fire station I volunteer for and did an EKG which showed Anterior Infarct. I am currently waiting for treatment from my cardiologist.
1047627	2/22/2021		20	M	2/18/2021	2/18/2021	20 YOM with prior COVID vaccine Dec 2020 presents 4 days after COVID vaccination (First dose) with constant substernal chest pressure, ST early repol vs elevation in ST segment and troponins 11. 1044217	2/21/2021	WI	43	F	2/17/2021	2/17/2021	?Moderna COVID-19 Vaccine EUA? Symptoms started at roughly 9:30 AM, 5 minutes after receiving the Moderna Covid vaccine. She first experienced mild throat tightness that has persisted since onset. After about 20 minutes she additionally began to experience perioral numbness. Symptoms were consistent with prior anaphylactic reactions during which she did not develop hives and shortness of breath until 4-5 hours later. Currently she reports vague heaviness with breathing though denies feeling short of breath. Associated symptoms include lightheadedness and fatigue. She denies fevers, chills, recent illness, chest pain, abdominal pain, or hives. She was initially treated with diphenhydramine 25 mg and was observed for a couple hours. Symptoms did not significantly improve and she began to develop nausea so she was given a second dose of diphenhydramine and 1 L LR bolus. Roughly 45 minutes later she continued to be anxious and began to report mild chest pain and abdominal pain. She was given Epinephrine 0.3 mg and prednisone 60 mg at that time given concern for developing anaphylaxis. Symptoms did not progress further over the next 2 hours of observation in the ED. Discussed with the patient that symptoms were likely not a result of anaphylaxis and she was comfortable with discharge at this time.

1042765	2/20/2021	MD	54	F	2/13/2021	2/14/2021	<p>Worst symptoms: During severe flu symptoms next day: racing heart, waking from severe joint pain in Right ankle, aching pain in abdomen. Starting after the flu symptoms resolved on Tuesday: After my fever went down I got a red ring around the injection site and stinging welts on arm, shoulder, neck, face. Prickly itches mouth, ears, scalp hands, feet. --- After injection, second dose, Saturday 3:25. NO issues, didn't even feel shot. expecting a day of flu, fever around 100 and no other issues based on 1st dose reaction (Moderna # 013L20A, 1/16/21). No respiratory symptoms this time, no runny nose, unlike last time. I didn't notice anything unusual about my heart rate. normally resting as low as 48 while sleeping, waking in the 50s per Apple watch, 100s, up to 120s with exercise. 9 AM Saturday Woke with resting heart rate of 97. Cross room to get thermometer and Tylenol. Heart rate 117. Fever 101.7 cross room to get soup from microwave and return to bed. Heart rate 123. Took 500 mg gel cap with broth and veggies. Woke 11 am. Fever 102. Drank 12 oz of water. Closed eyes, could not stay awake. Headache. Ringing in ears. very achy flu symptoms with strange symptoms, tenderness left lower abdomen palm width from Left hip. Arm felt hot, tight. My ligaments particularly in ankles felt loose. Woke with sharp ankle pain 3 times. I usually put the blankets under my feet and tucked under knees, like sleeping bag. it felt like my joints were hyper extended over the blankets. I tried to give them extra support and not move them or elevate them much. Continued gel cap of Tylenol at 3 pm (feeling dizzy and nausea started) , 9 pm (stood to get medicine and thought I was going to faint), 3 am, 9 am. Fever at 102. Sunday afternoon, felt like my GI tract had stopped. Nausea with food. Urine every few hours but no other output, even gas, until Tuesday. Heart rate closer to normal on Monday night. Pain in chest and abdomen resolved. Flu symptoms, joint pain resolving on Tuesday. Eating again. Slept most of Sunday and Monday. Moving around Tuesday Fever down to 100 Tuesday, continuing through Friday. Tuesday my Arm starts to feel worse, like the day after the first dose injection. Hot, tight, aching. Faint semicircle developed below 2nd injection site Tuesday. Stinging Welt develops 4 inches below. Other welts start and merge into pink band with pale transition zone. pale patches starting in other places. I start feeling itches on bottom of feet, in</p>

1042836	2/20/2021 MI	71 F	2/4/2021	2/4/2021	<p>scalp, on chest, on cheeks. Wed. I call the health department and my doctor. Pink ring around 2nd injection site Stinging welts on left arm forming a band almost all the way around arm on Wed. include first injection site. Pale band below, a transition zone, hurts a lot more than the warm pink welts. Stinging welts below injection site create bands of bright pink that stings like ant stings, hot to warm temp. Pale band below and patches sting like bees, much more painful. pain like hornet sting where they overlap as band wrapped around arm. Pink stinging at back and left side of neck .Ears itching and ringing. Some stinging in areas of hand, left fingers, space between thumb and index finger. Feels like Cold cream stinging on face, left cheek large patch under left eye, smaller patches around left side of eye and three small patches on left eyelid. Began turning pink a few hours later. Mouth started itching. Pale patch the size of my hand on my left shoulder and chest aches and stings, is tender. Feels like it is going to become a big welt like the pink one below the injection site. Stinging pricks of pain very occasional on left thigh, left side of back and even on right shoulder blade, left side of neck I brush my hair instead of scratching at my scalp. scabs on left shoulder and chest from stratching. Prolonged fever of 100 after most flu symptoms resolved, into Friday, Thursday my dr sent me to ER. Pale transition zone that hurt the most, below and in fold of elbow is darker, creases because there is more swelling. patch is expanding. Called ER for wait time. Went to Patient First Urgent Care. EKG normal limits. Started Methylprednisolone Pack, 6 day stepped down dosage. Told to use cortisone cream without getting in or near eye, not on lid. Told to take Benadryl. Tylenol. Friday the band on left arm signif diminished, welts forming on face are gone. Some areas still sting and itch, even without looking red. Mouth does not itch. some itches and sharp stings. Still some stinging in left eye and left eye lid. Sat. morning my temperature is below normal even for me. 96.7 Still some stings and itches. Pink ring around injection site fading. Heart rate normal. Still some chest discomfort occasionally.</p> <p>Patient complained of chest pain,Non-Cardiac . Onsite EMS was called vitals were taken BP 200/70 BG 82 100% O2 room air HR 58.Patient treated, transported by the EMS to the hospital .</p>

1043056	2/20/2021	NY	77	F	2/20/2021	2/20/2021	3-5 mins post 1st dose vaccination on the left arm, patient began having a "funny taste" sensation on her mouth, tongue, and throat. She had dry mouth and numbness in her upper and lower left lip. She was brought over for observation. Vitals were within normal limit. Neurologic exam was normal. She was given Benardryl 25mg one tab and post administration, the "funny taste" sensation in her mouth resolved but the numbness in her her lips remained for another 20 mins. She reported feeling anxious since she had several deaths in the family within one month. She also admitted to feeling a funny taste in her mouth after getting shots. She denies any chest pain, SOB, wheezing, dizziness or nausea. She declined medical transportation to the ER. She was monitored for over an hour. She was advised to follow up with the ER if worsening symptoms of anaphylaxis. She was informed to follow up with her PCP or allergist for further evaluation prior to having her second dose.

1043033	2/20/2021	TN	26	F	1/26/2021	1/26/2021	<p>Moderna vaccine 041L20A (I think) Given 1/26/2021 Adverse Events started 1/26/2021 ?? Symptoms at the time of the shot Tuesday January 26th: burning at site for twenty minutes, warmth shooting down my arm, up my neck, and across half my face, headache, vision disturbances. ?? Night one: sore arm, joint pain, headache, nausea, fatigue unfixed by rest, slept all night, chills, and intermittent fever. ?? Wednesday: sore arm, joint pain, headache, nausea and vomiting, fatigue unfixed by rest, slept all day, chills, and intermittent fever. Ate two bites of banana and sipped Ginger Ale and Gatorade. ?? Night two: sore arm, joint pain, nausea, fatigue unfixed by rest, slept all night, chills, and intermittent fever. The friend checked on me thought I died because I (a very light sleeper) didn't wake up at first. ?? Thursday: sore arm, joint pain, nausea, fatigue unfixed by rest, slept all day, chills, and intermittent fever. Couldn't stand for more than five minutes without rest. Ate two bites of toast and one cup of honey chamomile tea. ?? Night three: sore arm, intermittent joint pain (feet especially), last fever at 4pm, fatigue unfixed by rest, slept all night, chills. ?? Friday: achy all over, nauseous, brain fog, fatigue unfixed by rest, heart palpitations. I went to work, stimmed most of the day plus erratic emotions and behavior. Ate two bites of cereal, one burrito (over the course of three hours), and drank two cups of water. Blood Pressure 116/76 (6 more than normal of each) pulse 93 (33 bpm more than normal). I woke at 30% capacity. ?? Night four: brain fog, heart palpitations, achy, nauseous, exhausted. After work, I got home at 1% capacity and collapsed in bed, unable to do anything else. ?? Saturday: achy, heart palpitations, vision disturbances, brain fog, tinnitus, intermittent chills (maybe fever? Too tired to check), debilitating fatigue unfixed by rest. Not actively nauseous, but allowed to eat ONLY what my body craved (anything else would have been thrown up) a doughnut, French fries, two cups of tea. Woke at 5% capacity. Fed myself and pets, slept. I did not clean, brush hair, or anything else. ?? Night five: achy, heart palpitations, brain fog, headache, tinnitus, fatigue unfixed by rest. ?? Sunday: achy, heart palpitations, tinnitus, intermittent chills (maybe fever? Too tired to check), debilitating fatigue unfixed by rest. Woke at 10% capacity - fed myself and pets, cleaned dishes and litter box, brushed hair, and slept for the rest</p>

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

of the day. Ate 1/2 cup cereal, one kiwi, meatloaf, drank lemonade. ?? Night six: achy, heart palpitations, fatigue unfixed by rest. ?? Monday: achy, debilitating fatigue unfixed by rest. Woke at 15% capacity - ate, cleaned dishes, brushed hair, fed cat and cleaned litter box, did laundry, took out trash - slept for the rest of the day. Ate baked potato, meatloaf, kiwi, drank lemonade. ?? Night seven: achy, heart palpitations, fatigue unfixed by rest. ?? Tuesday: debilitating fatigue unfixed by rest. Went to a clinic and Tested Negative for Covid with a rapid test, Negative for antibodies. ?? Night eight: fatigue. I went non-verbal for a few hours. ?? Wednesday: heart palpitations, headache, intermittent chills (maybe fever? Too tired to check), debilitating fatigue unfixed by rest. ?? Night nine: fatigue, heart palpitations. ?? Thursday: debilitating fatigue unfixed by rest, nausea, headache. ?? Night ten: fatigue. ?? Friday: fatigue. Got checked at a clinic - normal labs, FNP thinks it is some kind of autoimmune response (due to my family history) and said it usually goes away in about a month. ?? Night eleven: Fatigue. ?? Saturday: chills (maybe fever?), headache, debilitating fatigue unfixed by rest. ?? Night twelve: Fatigue, heart palpitations. ?? Sunday: chills, headache, debilitating fatigue unfixed by rest. ?? Night thirteen: Fatigue. ?? Monday: went to work at 25% capacity. Left at noon. Sharp headache, nausea, heart palpitations, shaky, falling asleep at desk, sharp intestinal pain, stabs of chest pain, nausea, uncontrollable fidgeting, fatigue unfixed by rest. Work hour one: equilibrium. Completely out of touch with my body - immune to cold (I'm always cold) and everything else. Work hour two: moderate physical discomfort and mental strain. Work hour three: severe physical discomfort and mental exhaustion. Work hour four: felt like I was losing my mind, intense physical pain (NOT anxiety - I know what anxiety feels like - this was my body shutting me down by whatever means worked) ?? Night fourteen: heart palpitations, sharp chest pain, sharp intestinal pain, felt like I was going insane, headache, chills (no fever), fatigue. ?? Tuesday: 5% capacity. Nonfunctional. Heart palpitations, headache, aches all over, chills, debilitating fatigue unfixed by rest. Ate and slept. ?? Night fifteen: headache, body aches, chills (no fever), fatigue. Slept with a heating pad. First emotional meltdown. ?? Wednesday: 10% capacity. Headache, body aches,

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

						debilitating fatigue unfixd by rest. I had a two minute burst of energy, then off like a light switch, and slept for hours. ?? Night sixteen: chills, body aches, fatigue. ?? Thursday: Body aches, debilitating fatigue unfixd by rest. ?? Friday day seventeen - present 2/19/2021 with no end in sight. Debilitating fatigue unfixd by rest. I can?t read, can?t watch movies most of the time, get tired making myself food even when I sit in a chair in the kitchen, only drive if I absolutely have to, sleep 20ish hours a day, regular headaches (I almost never got headaches before), symptoms severely worsen with minimal or no activity, only resting in a quiet dark room helps. I am debilitated. I can?t work. I can?t grocery shop. I can?t cook without sitting down. If I take out the trash, I have to sleep the rest of the day. I have brain fog and can?t read. I can?t function.	
1041122	2/19/2021	CA	45	F	2/17/2021	2/18/2021	Had normal symptoms except tachycardia that was noticed 2/18/21 at about 10am. My heart rate is usually between 68 and 72 and it was between 110 and 120 all day yesterday. No chest pain, numbness, shortness of breath. Just felt like I was going to faint and found it when I checked my blood pressure (which was normal). Had an EKG 2 weeks ago as part of a screening and it was normal.
1041230	2/19/2021	SC	75	M	1/22/2021	1/26/2021	Patient received first dose of covid vaccine on 1/22/2021. Patient had no immediate reaction. Patient presented to the Emergency Department on 1/26/2021 c/o shortness of breath and chest pain. ECG showed a ST elevation myocardial infarction. Patient was treated and transferred to a cath lab where he died. Patient had significant coronary artery disease.

intact. Conjunctiva/sclera: Conjunctivae normal.
 Neck: Trachea: Trachea and phonation normal.
 Cardiovascular: Rate and Rhythm: Regular rhythm.
 Tachycardia present. Pulses: Normal pulses. Heart
 sounds: Normal heart sounds. Comments: Slightly
 tachycardia (103) Pulmonary: Effort: Pulmonary effort
 is normal. Breath sounds: Normal breath sounds and
 air entry. No stridor, decreased air movement or
 transmitted upper airway sounds. No decreased breath
 sounds, wheezing, rhonchi or rales. Comments:
 Speaking full sentences. Musculoskeletal: Cervical
 back: Full passive range of motion without pain. Skin:
 General: Skin is warm. Findings: No rash.
 Comments: Injection site w/o erythema or swelling. No
 adhesive reactions Neurological: General: No focal
 deficit present. Mental Status: She is alert.
 Psychiatric: Mood and Affect: Mood is anxious (
 slightly). Thought Content: Thought content
 normal. Judgment: Judgment normal. Re-
 evaluation of lung sounds and throat was done
 periodically about every 5-10 minutes. No acute findings
 seen/heard. Assessment/Plan Treatment included:
 albuterol, antihistamines, water and solu-medrol IM and
 pepcid, albuterol (pt used her own). Follow up response
 to treatment: excellent. Scale of 0-10 based on
 symptoms of tightness was 7 at first. Upon discharge was
 3-4/10. Patient discharge: Stable to go home and follow
 up with PCP and her allergist. Differential Diagnosis:
 Anaphylaxis/anxiety (dyspnea, stridor, drooling, tongue
 swelling) We discussed close monitoring at home and
 when/if she were to take her epi-pen and call 911 if
 symptoms were to worsen. She's to let her allergist know
 about her visit today. She may need to have other
 medications taken prior to her #2 dose of Pfizer
 according to her allergist recommendations. Pt
 appreciative and is ready to go home. Pt wheeled out to
 front door by security. Accompanied by husband.

Pt. recieved 2nd dose COVID vaccine on 2 Feb and was
 admitted to Hospital on 3 Feb with Chest pain; DKA
 (diabetic ketoacidoses); Diabetic ketoacidosis without
 coma associated with type 1 diabetes mellitus;
 Hyperglycemia. He was discharged on 5 Feb. His home
 course is unknown

1041473	2/19/2021	AL	59	F	2/19/2021	2/19/2021	Patient received vaccine at 11:02 am. During her observation period, her husband notified me at 11:14 am that the patient "felt like she was going to pass out". Upon assessment patient was diaphoretic. Denied any shortness of breath or difficulty breathing. Initial vitals at 11:15 showed blood pressure 110/70, Heart rate 70, spO2 87%. At 11:20 the pulse oximeter showed spO2 70% and HR 150 bpm. Ambulance was called. The pulse ox was moved to other hand and showed a reading of 81% and HR 140 bpm. Patient was still diaphoretic and described tingling in to fingers and toes. Fingers were very cold to the touch. Patient still denied chest pain and shortness of breath or difficulty breathing. Patient was awake and communication throughout event and when trying to sit up described her head as feeling "woozy". Additional reading on pulse oximeter at 11:26 showed HR 155 bpm and spO2 62%. Blood pressure 130/70. Ambulance arrived at 11: 30. Upon their initial assessment her spo2 was 100%, HR 76 bpm- sinus rhythm, and blood pressure 136/76. Patient declined ambulance ride to hospital and was driven by her husband in personal vehicle. Patient was alert and described symptom improvement at time of departure. Patient also stated that she "hadn't been feeling right for a while". I do not believe that this was a true reaction to the moderna vaccine.
1040694	2/19/2021	NY	41	M	2/8/2021	2/8/2021	Initial adverse events: night sweats, fever, body aches, muscle aches (Back pain). These all occurred about 12 hours after the second shot and subsided around 36 hours after the second shot. 8.5 days after the second shot I had throat and chest pain. This pain then continued and got worse to the point I went to the ER and was evaluated for potential heart attack. After testing - results were that I did not have a heart attack. I was still experiencing this pain, so the ER took a strep test. This was also negative. The diagnosis was "pulled chest muscle". I've had pulled muscles, I know what those feel like and it sure didn't feel like what I experienced on the night of the 16th and the day of the 17th of Feb. 2021.

1040918	2/19/2021	FL		M	1/16/2021	1/23/2021	Acute pericarditis; Soreness on the left shoulder (injection site); A spontaneous report was received from a consumer who was also a 75-years-old, male patient, who received Moderna's COVID-19 Vaccine (mRNA-1273) and who experienced soreness on the left shoulder (injection site)/ injection site soreness and acute pericarditis/ pericarditis. The patient's medical history was not provided. Concomitant medications were not reported. On 16 Jan 2021, seven days prior to onset of the events, the patient received their first two planned doses of mRNA-1273 (Batch number: 039K20A) intramuscularly for the prophylaxis of COVID-19 infection. On 23 Jan 2021, the patient experienced soreness on the left shoulder (injection site), tiredness, headache, and chest pain. On 02 Feb 2021, he had difficulty breathing even with his continuous positive airway pressure (CPAP) machine and called 911. He was taken to emergency room (ER) and was diagnosed with acute pericarditis. Treatment included ibuprofen, pantoprazole, and colchicine. Action taken with mRNA-1273 in response to the events was not reported. The outcome of events, soreness on the left shoulder (injection site and acute pericarditis, was not reported.; Reporter's Comments: This case concerns a 75 year old male subject, who experienced a serious unexpected event of Pericarditis and a non-serious expected event of injection site pain after first dose of mRNA1273 (Lot# 039K20A). Very limited information has been provided regarding the event of pericarditis at this time. Further information has been requested.
1040844	2/19/2021	OH	71	M	1/16/2021	1/30/2021	1/30/2021 Began with spiking BP and extreme pain in right shoulder - taken to ER. Given pain med, BP came down and sent home. 2/2/2021 - Spiking BP and chest pain, numbness and tingling in hands and feet. - taken to Medical Center. Admitted. Series of heart and brain assessments done. Each day he got weaker until he could no longer stand, walk, arm and hand strength depleted and dexterity issues. Spinal Tap on 2/8/2021 revealed Guillain Barre Syndrome 2/12 Admitted to Rehabilitation Center, 2/15 at Hospital plummeting BP, 2/18 return to Rehabilitation Center

1040532	2/19/2021			U	1/28/2021	1/29/2021	<p>Passed out and was unconscious for approximately 5 minutes; Nausea; Tightening or squeezing sensation of my chest; Tired; Vasovagal event; A spontaneous report was received from a healthcare professional who is the patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced tightening or squeezing sensation in my chest, passed out, unconscious for approximately 5 minutes, nausea, vasovagal event and tired. The patient's medical history was not provided. No concomitant product use was reported. On 28 Jan 2021, the patient received their second of two planned doses of mRNA-1273 (Lot number: not provided) for prophylaxis of COVID-19 infection. On 29 Jan 2021, at 01:30, the patient reported they started to feel a tightening or squeezing sensation in their chest. On 29 Jan 2021 at 02:30, the patient's symptoms worsened, they reported increased chest tightening and were nauseated. The patient went into their bathroom and "I passed out and ended up on the floor". The patient reported they were unconscious for approximately 5 minutes. The patient's wife called 911 due to chest pains and to rule out a mild heart attack. The patient stated, "all tests came back negative". The patient stated they had a vasovagal event while in the hospital with a blood pressure reading of 77/40. Patient feeling better now, but still tired". Treatment information was not provided. Action taken with mRNA-1273 in response to the events was not provided. The outcome of the events, tightening or squeezing sensation in my chest, passed out, unconscious for approximately 5 minutes, nausea, vasovagal event and tired, were considered unknown.; Reporter's Comments: This spontaneous report from a healthcare professional of unknown gender who experienced the serious events of unconscious, passed out and tightening or squeezing sensation in my chest and non-serious events of nausea, vasovagal event and tired. The events occurred 1 day after the administration of mRNA-1273 vaccine (Lot number: unknown, expiration date: unknown). Treatment given was not provided and outcome is resolved. Based on the information provided which shows a temporal association a causal association, between the reported events and the administration of mRNA-1273 vaccine cannot be excluded. The events of nausea and fatigue are consistent with the known safety profile of mRNA -1273</p>

1042342	2/19/2021	NY	72	M	2/3/2021	2/4/2021	cold and clammy; kept clearing his throat; blood sugar was 245; blood pressure 175/111; Runny nose; it could have been a delayed allergic response; This is a spontaneous report from a contactable nurse reporting for husband. A 72-years-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 03Feb2021 10:15 right arm at single dose for protection from virus. Medical history included diabetes from 2005 and ongoing, partial gastrectomy from Jul2016, stroke from 2015, allergic to various things, dementia. Prior Vaccinations (within 4 weeks): None. Patient previously received Shingrix vaccine (first dose) and experienced a similar reaction (have to clear his throat), flu or hepatitis vaccines and not had a reaction. The patient experienced cold and clammy, kept clearing his throat, blood sugar was 245, blood pressure 175/111, runny nose on 04Feb2021 02:00. Clinical course reported as: Her husband had the vaccine at 10:15am. She gave him some Advil. Sixteen hours later at 2:00am her husband was cold, clammy and diaphoretic. He was having to clear his throat. He did have a little dementia and was diabetic. His blood sugar was 245. His blood pressure was 175/111 and he had a runny nose. He did not have any chest pain. He was unable to explain what was happening. She checked his blood pressure again manually and the results were the same. She gave him another blood pressure pill though it was out of the usual time. Gradually his blood pressure came down. The diastolic stayed over 100 for the evening. The systolic came down. She kept trying to read but was unable to find information. She thought it could have been a delayed allergic response. She was going to take him to the hospital but took care off him herself. She gave him a Benadryl and it calmed him down. He was feeling better and was able to fall asleep. Her husband had a Shingrix vaccine (first dose) this summer and had a similar reaction (have to clear his throat). He went to the hospital and they monitored him. They said it was not because of the vaccine. Her husband has not had a reaction in the past to vaccines. He has had every kind of vaccine with no reaction. He has not had a reaction to the flu or hepatitis vaccines. Outcome of events cold and clammy, kept clearing his throat, blood sugar was 245, blood pressure 175/111, runny nose was recovered on

							04Feb2021. Events cold and clammy, kept clearing his throat, blood sugar was 245, blood pressure 175/111, runny nose were reported as serious medically significant. Events cold and clammy and kept clearing his throat was classified as related to suspect vaccine. Information on the lot/batch number has been requested.; Sender's Comments: Based on temporal association and profile of the product, the contributory role of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), to reported events cannot totally be excluded.
1042024	2/19/2021	TX	64	M	1/13/2021	1/20/2021	Report minor chest pain after receiving both first and second dose x 1 week later. Treatment: Visit to Cardiologist with stress test and EKG being unchanged from previous. Outcome: Continue to monitor. Employee continues to work
1041946	2/19/2021	MD	57	F	1/8/2021	1/8/2021	* ~10 pm on day vaccine given (Friday, 1/8/21), developed mild headache * Progressed to severe migraine with some nausea during night, and lasted all day Saturday (~20 hrs.) I took Children's Tylenol dye free liquid late in day which took slight edge off headache. * Developed severe central chest pain in night, which felt like pain I experienced with esophagitis/gastritis in past. This lasted for about 20-30 minutes, then resolved. * Awoke next morning (Saturday, 1/9/21) with low grade fever (~99.3 degrees F), and had fever for 2 days (never exceeded 100.3 degrees F that I detected)--no appetite all day * Developed central low back pain/ache on Saturday ~ mid-day, which lasted through at least Sunday * Awoke Sunday morning with rash on torso (same rash familiar to me when I have infections--biopsied in past and determined to be interface dermatitis). Rash progressed throughout day to portion of arms, neck, groin (as always does with illness), and faded until resolving Monday am/mid-day. Itching then occurred over next couple of days (as it always does with illness). Appetite still limited. * Sunday evening experienced acute abdominal pain and urgent diarrhea x 3 or 4 episodes * Monday I felt better, but was fatigued and trying to get back on my feet

1041707	2/19/2021	MI	46	F	2/17/2021	2/17/2021	CHIEF COMPLAINT: TONGUE SWELLING (patient had her second COVID vaccine today, later developed tingling in her mouth and tongue/lip swelling and dry mouth. Denies difficulty swallowing) Assessment/Plan: DIAGNOSIS at time of disposition: 1. Allergic reaction, initial encounter - Symptoms: Patient had second dose of COVID 19 vaccine today at 1230 p.m. She states at around 530 - 6 p.m. she started coughing and felt like that was a hair caught in the back of her throat, states throat is tingling and looked in the mirror and states her tongue is swollen. Feels that her heart rate is abnormal, but states it could relate to anxiety. COVID vaccine clearance needed if future booster needed. Informed patient to follow up with PCP if needed after ED visit. HISTORY OF PRESENT ILLNESS: The patient got her 2nd dose of COVID vaccine today at noon. At 5 she started feeling a bit of a tickle and scratchiness of her throat and her mouth felt very dry. She was concerned about allergic reaction. No shortness of breath chest pain rash itching hives or any other concerns. She has not taken any Benadryl. The patient is in no distress. Symptoms been going on for 3 hours. This could be a very mild allergic reaction. Therefore I am giving her 50 mg of oral Benadryl. Given the symptoms been going on for 3 hours and I do not see any angioedema I am comfortable letting her go home at this point in time. I do not think steroids would be beneficial. She will return here if worsening and I instructed her to use Benadryl 50 mg every 4-6 hours if needed. BLOOD PRESSURE SCREENING: Based on last blood pressure taken in the ED of 171/98, HTN (\geq 140/90), recommend follow up with PCP within 1 month.
1041701	2/19/2021	FL	63	F	2/19/2021	2/19/2021	15 minutes after receiving vaccination, pt reported it feels like "my throat is closing up", left sided neck, arm, and chest pressure, and nausea. Pt does report she has had chest pressure intermittently for past 2 weeks but throat closing feeling began after vaccination. Pt received aspirin 324 mg po x1, diphenhydramine 25 mg IV x1, famotidine 20 mg IV x1, Solu-Medrol 125 mg IV x1, morphine 2 mg IV x1, and nitroglycerin 0.4 mg SL x1. Following treatment, pt reports she is free of chest pain and throat symptoms have improved.

1039023	2/18/2021	CA	47	F	1/4/2021	1/4/2021	I experienced a rash in my face. It looked like mosquito bites almost. The normal pain on the injection - red on outside. Whole arm was red and swollen. That lasted several days. Next day after vaccine, Inside of my arm, I noticed rash (looked like chicken pox/mosquito bites) and then it went to chest, abdomen and legs. The rash continued. My face was flushed and had a 99.9 fever. I had foggy brain and chest pain (started day after the vaccine). The chest pain would last about a minute - I monitored my heart rate. From sitting down my heart rate when up to 120 and down to 37. This occurred for four days - four - six times a day. By the 3rd day after vaccine, I started feeling worse. I experienced dizziness, nausea, couldn't think, was disorientated, rash on my body, no appetite, couldn't sleep well and had no energy and chest pain - was in bed for next three days. I didn't call my Dr right away, I was monitoring the chest pain while I rested. That resolved (chest pains) by Saturday. The rest continued. My Monday, I called Public Health and they advised to call my DR. Spoke to Dr. on 11th. On the 12th, I had a telehealth appt with him. On the 13th had an EKG done. Everything normal on EKG. I continued feeling dizzy and no energy. I didn't work until Jan 19th. On the 20th, I felt foggy brain and rash wasn't gone and I went back to my doctor on January 21 and he put me off work for another week. At this point, within the last few days, my energy is back and rash is gone - I do still have dark spots on back and legs from the rash. On January 25th, I got the second dose. (The rash kind of flared back after second dose but nothing as bad.)

1037873	2/18/2021	MD	73	M	1/29/2021	1/29/2021	High pulse rate; Blood pressure low; Sweating; Clammy; wasn't feeling well; Chills; feeling feverish without having a fever; Fatigue/Tiredness; irregular heartbeat; he said the nausea started later on Friday evening; he had a sore right arm after getting the COVID-19 Vaccine; He said he already has stomach trouble; pain in his chest.; This is a spontaneous report from a contactable consumer (patient). A 73-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EJ1686, expiry date not reported), via an unspecified route of administration in the right arm on 29Jan2021 at single dose for COVID-19 immunization. The patient was vaccinated at a hospital. Medical history included heart rate irregular and blood pressure high. Concomitant medications were none. The patient said he had an irregular heartbeat after getting his first dose of the COVID-19 Vaccine on Friday, 29Jan2021. He said he had to go to the Emergency Room on Sunday, 31Jan2021. He clarified he checked his blood pressure at home and his blood pressure was low at 91/73. He said he also had a high pulse rate of 160, or better, for 9-1/2 hours. He said the only thing he can attribute his low blood pressure and high pulse rate to is the COVID-19 Vaccine. He said he hasn't heard anything about the COVID-19 Vaccine being related to having an effect on the heart, but he personally believes it was his first COVID-19 Vaccine dose that caused his low blood pressure and high pulse rate. He clarified after receiving the COVID-19 Vaccine on Friday, 29Jan2021, he had a sore right arm after getting the COVID-19 vaccine, fatigue, tiredness, and nausea. He said on Saturday, 30Jan2021, he wasn't feeling well. He said he recognized a small amount of chills, feeling feverish without having a fever, and sweating. He said his wife checked his temperature a few times on Saturday, 30Jan2021, and he never had a fever, but he felt clammy. He said he had noticed the nausea more than anything else. He said he maybe should have checked his blood pressure on Saturday, 30Jan2021. He said he didn't check his blood pressure until Sunday morning, 31Jan2021, and when he saw his low blood pressure and high pulse rate, he called the hospital and eventually drove to the Emergency Room. He said by the time he had got to the Emergency Room his blood pressure had went up to "100 and something", but his pulse rate never changed, and his

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

pulse was still 160. He said the doctor gave him several medications to try to get his pulse rate to come down. He said the doctor had given him a medication that was supposed to bring his pulse down. He said then the doctor had to add something else in a syringe to go with the other medication to bring his pulse down. He said he wasn't sure of the medication's name. He clarified he never noticed his pulse rate was high until he took his blood pressure on Sunday, 31Jan2021. He said he felt the nausea start later Friday evening (29Jan2021). He said he already has stomach trouble anyways that he takes medicine for, so he took a pill, but the nausea continued. He clarified he took 1 Omeprazole 20mg capsule that was dispensed in a pharmacy bottle, but stated the Omeprazole 20mg prescription looked like it expired in 2017. He said he knows he has a newer Omeprazole prescription, but did not know where the prescription bottle was. He reported on Saturday, 30Jan2021, he just laid around. He said he did not feel as bad on Saturday, as he did on Sunday, 31Jan2021. He said he called the Emergency Room on Sunday morning, and went to the Emergency Room. He said he didn't feel his 160 pulse rate. He said he was told by the doctor in the Emergency Room that his fast heart rate had his heart beating like he was having a stress test. He reported he doesn't know if he wants to get the second COVID-19 Vaccine shot after what he experienced this past weekend. He reported he only takes blood pressure medicine that he has been on for a while. He reported he had several EKGs done on Sunday, 31Jan2021, while he was in the Emergency Room. He said the EKG showed Atrial Fibrillation/flutter with a heart rate in the 160s. He reported while he was in the Emergency Room he was given IV Heparin, IV Potassium, Potassium pills, and Amiodarone in a pill and IV form. He said the doctor added another IV medicine in a syringe, but he doesn't know the name of the medicine. He said the doctor also gave him IV Morphine because he had pain in his chest. He said the doctor said his chest pain was being caused by his heart trying to go back into a regular rhythm. He reported he was in the Emergency Room for 11-12 hours before he was admitted to the hospital. He said his pulse rate wasn't coming down and stayed at 160 for 9-1/2 hours. He said the doctor wanted to admit him to the hospital, so he could have a procedure to make sure the

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

high pulse rate didn't damage his heart. He said on Monday, 01Feb2021, he had a procedure where they went through his wrist and put a dye in his heart to see if the stress from his high pulse rate damaged his heart. He said his heart wasn't damaged, so he was discharged from the hospital later in the day on 01Feb2021. He clarified his blood pressure was good by the time the first or second EKG was performed in the Emergency Room. He clarified he already had an issue with sweating before he received his first dose of the COVID-19 Vaccine. He said he is still sweating, but he doesn't know if that is because of the COVID-19 vaccine. Clinical outcome of high pulse rate and blood pressure low was recovered on 31Jan2021; nausea, fatigue/tiredness recovered on 02Feb2021; chills, feeling feverish recovered on an unspecified date; sweating was not recovered; while for the other events was unknown.

1037866	2/18/2021	TX	34	M	12/22/2020	1/9/2021	<p>Premature ventricular contractions; Postural Orthostatic tachycardia syndrome; Dizziness; shortness of breath; chest pain; This is a spontaneous report from a contactable physician (patient). A 34-years-old male patient received the first dose of BNT162B2 Pfizer-BioNTech COVID-19 mRNA Vaccine, Lot number EL0140, in Hospital, via an unspecified route of administration in left arm, on 22Dec2020 (at 34 years of age) at single dose for COVID-19 immunization. Medical history included prediabetes (glucose tolerance impaired) from an unknown date. The patient didn't have COVID-19 prior to vaccination. Concomitant medication included metformin and multivitamins. On 09Jan2021 the patient experienced premature ventricular contractions, postural orthostatic tachycardia syndrome, dizziness, shortness of breath and chest pain. The events resulted in Emergency room/department or urgent care access and hospitalization as life threatening events. The patient was treated with diltiazem, fludrocortisone, aspirin and atorvastatin. He remained in hospital 2 days and then he was discharged. The patient underwent COVID-19 test (nasal swab) on 12Jan2021 and 13Jan2021 and both gave negative results. The patient had not recovered yet from the reported events at the time of the report.;</p> <p>Sender's Comments: The causal relationship between BNT162B2 and the events ventricular extrasystoles, postural orthostatic tachycardia syndrome, dizziness, dyspnea and chest pain cannot be excluded as the information available in this report is limited and does not allow a medically meaningful assessment. The patient is a young adult with known prediabetes, but no other comorbidities reported. Information on tests done during admission, clinical course and working diagnosis would be helpful in further assessment of this case. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.</p>

1040066	2/18/2021	CA	54	F	2/17/2021	2/17/2021	Called to COVID -19 post vaccination observation area to see this patient. Received 1st vaccination of COVID 19 Moderna vaccine (lot 024M20A, exp 8/3/2021) at approximately 10a Was in observation area for 30 minutes (due to prior hx of anaphylaxis with immunotherapy shots as teenager). Pt initially felt well, until approximately 30 minutes after the vaccination, when she started to have sensation of constriction in chest, feeling of heart beating quickly, and mild lightheadedness. Pt awake and alert and appropriately responsive. Denied any itching, rash, SOB, throat discomfort or swelling or facial swelling. No rash or redness noted at vaccination site. Pt transferred to clinical reclining chair via wheelchair, with assistance, in private area. VS normal with HR 71 and BP 136/79 Sat 97%, normal respiratory effort, speaking in full sentences. Given po apple juice. Pt with persistent feeling of chest constriction, feeling face slightly flushed/warm (no rash, no visible erythema or flushing). Hx of coronary vasospasm with hx of elevated troponin 4 yrs ago post surgery, cardiac cath 2 yrs ago due to intermittent chest pain. Coronary vasospasm noted on cath per pt, current meds are diltiazem, ASA 81, a statin, and nitroglycerin prn. Last episode of chest pain was approx one year ago. Repeat VS HR 73 BP 130/89 Sat 99% on RA, awake and alert and appropriate 911 called due to chest discomfort with hx of coronary vasospasm in past. Paramedics given report including pt's medical history as above. Paramedics arrived at approximately 10:45a and evaluated patient: ECG done, normal per paramedics. Under their observation CP improved, slight flushing sensation improved, pt feeling better without intervention, no evidence of anaphylaxis. Per paramedics pt offered ambulance transfer by EMS, declined. Per paramedics/EMS, no indications for transfer to ED as ECG normal and pt feeling much better without intervention. Per their evaluation pt can be allowed to go home. They state that they have seen this often in patients post vaccination. When asked, they state that this is not an indication of severe reaction, and there is no contraindication to second vaccine. They discussed this with patient. Pt observed for an additional 20 minutes. 11:15a pt feeling very well, no chest pain or flushing or itching. Ambulating without difficulty. Pt left at 11:19a feeling well.

1039951	2/18/2021	NJ	66	F	2/11/2021	2/12/2021	Severe Headache; eye pain; earache on side of shot; itching both arms; severe jaw pain; severe chest pain; body ache; high fever; fatigue; profuse sweating; belabored breathing; hot; butterfly rash of face; This is a spontaneous report from a contactable physician (patient). A 66-year-old female (Not pregnant) patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), via an unspecified route of administration at right arm on 11Feb2021 14:30 at single dose for covid-19 immunization. Medical history included hypothyroidism, hypertension, hypercholesterolemia, breast cancer, osteoporosis, ligamentous RA, degenerative joint disease (DJD). The patient had known allergies to cilantro, cephalosporins, all morphine and morphine derivatives, Herceptin, astralogous mushrooms, gadolinium dye, fentanyl. The patient's concomitant medications reported as other medications in two weeks was yes. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced severe headache, eye pain, earache on side of shot, itching both arms, severe jaw pain, severe chest pain, body ache and high fever & fatigue - profuse sweating, belabored breathing hot butterfly rash of face on 12Feb2021 at time of 06:00 AM. AEs resulted in Doctor or other healthcare professional office/clinic visit, Life threatening illness (immediate risk of death from the event). The patient received Prednisone 80 mg and Benadryl 50 mg as treatment. Prior to vaccination, the patient was diagnosed with COVID-19. Covid was tested post vaccination. The patient underwent lab tests and procedures which included Nasal Swab and PCR test: negative on 09Feb2021. The outcome of events was recovering. Information on Lot/Batch has been requested.; Sender's Comments: Based on the compatible temporal association, there was a reasonable possibility that the vaccination with BNT162B2 played a contributory role in triggering the onset of the reported events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and

1039258	2/18/2021	WI	94	F	2/12/2021	2/15/2021	weak, sick, chest pains
1039433	2/18/2021	WI	75	M	2/17/2021	2/17/2021	On 2/17/21 at 1135 patient was sitting in a chair completing his 15 minute monitoring period. Patient dropped his educational materials, reached over to pick up his papers off of the floor, and as he was bending over experienced a right leg cramp causing him to drop to the ground on his hands and knees. Patient stated "I broke the fall with my hands." Client denied any chest pain, dizziness, heart palpitations, trouble breathing, or pain at the time of the fall. Patient had full active range of motion and was able to walk without difficulty to his vehicle following his 15 minute waiting period. On 2/18/21 at 1030 PHN followed up with patient via phone. Patient denied any pain, bruising, or injury at this time. Patient continues to have full active range of motion. PHN educated patient to follow up with his PCP if he would develop any pain or injury. Patient verbalized understanding.
1039481	2/18/2021	NY	45	F	2/18/2021	2/18/2021	Patient began feeling hot, "head pounding", facial flushing, and developed red rash all over her anterior chest wall. She was then transferred to the medical evaluation area and examined. She was evaluated and given Benadryl 25mg . Her vitals were within normal limits. A few minutes after taking Benadryl, her symptoms started to diminish and she was no longer feeling flushed or having pounding in her head. The rashes on her anterior chest wall remained. Patient denies any any shortness of breath, chest pain, wheezing, or having tingling in her tongue or lips. Her vitals within normal limits. Patient felt stable upon leaving the facility and advised to follow up with her PCP and an allergist for further care. Patient refusing to be transferred and evaluated by ER facility
1039510	2/18/2021	CA	80	M	2/18/2021	2/18/2021	Pt experienced chest pain while waiting in line for vaccine. 5 out of 10 chest pain persisted post vaccination. Reported feeling nervous, anxious, cold sweats. Pt with hx of HTN, on cardizem. Denied hx of afib. Denied other past medical hx. Pt with elevated BP 160s with labile pulse, ranging from 30-80s. O2sat 99%. Pt escorted to ED.

1039514	2/18/2021	CA	39	F	2/16/2021	2/16/2021	Day of vaccine I had a burning sensation at injection site. As day went on the burning sensation was felt through out my nervous system. It seemed every nerve and joint thru out my body was on fire. Every movement and touch burned. The pain became worse as evening hit. I also had nausea and headache. Day 2 the burning sensation had subsided but I now had muscle pain all over my body. I managed headache with exedrin but suffered through pain as I don't like to take to many meds at one time. Was still nauseas on day two. Ran a fever over night but broke by day 3. Today is day 3 and still suffering and fighting through headache and now fatigue. But that is to be expected with the amount of pain for past 2 days. Starting to get appetite back. Noticed some sneezing and some chest pain today but holding and doesn't seem to be getting worse. I treated my symptoms accordingly with over the counter meds. Try to drink plenty of water as I felt dehydrated form the ordeal. I read on the possible side effects and my experience seemed quite differrent. So i thought I would report it.
1039548	2/18/2021		60	M	2/16/2021	2/18/2021	60 y/o male presents to UC and reports itching rash on scrotum and swelling of both hands after he had the COVID vaccine two days ago. Patient denies chest pain, SOB, fever, chills, difficulties swallowing, testicular pain or other complaints or issues at this time.

1039926	2/18/2021	IN	45	F	2/6/2021	2/7/2021	Nearly passed out; Postural Orthostatic Tachycardia Syndrome; icy like pulsation through my blood occurred; fell to the ground; This is a spontaneous report from a contactable consumer reported for herself. A 45-year-old female patient (not pregnant) received the first dose of bnt162b2 (Pfizer-Biontech Covid-19 Vaccine), Lot number: EL9261, via an unspecified route of administration on 06Feb2021 12:30 at single dose in Left arm for covid-19 immunisation. Facility type Vaccine was Hospital. Medical history included anaemia, no known allergies. Patient had COVID-19 starting on 06Jan2021 and persisting through 16Jan. Her COVID symptoms were crushing chest pain, no fever, blood oxygen level never dropped below 98%. The patient's concomitant medications were not reported. There were no other vaccine in four weeks. Patient was experiencing Postural Orthostatic Tachycardia Syndrome. Nearly passed out going to the toilet when she first awoke. An icy like pulsation through her blood occurred first thing this AM, day after the vaccine. She fell to the ground and called for her husband to help her. He gave her 500mg acetaminophen and aspirin. She slept. Same thing happened with pulse 140+, he measured, as she showered. They stopped the shower, she laid down and recovered. When she got up immediately the pulse rises to 120+. Adverse events started from 07Feb2021 08:30 AM. Therapeutic measures were taken in response to the events. The outcome of the events was not recovered. Covid was not tested post vaccination.

1039929	2/18/2021	NY	59	M	2/6/2021	2/7/2021	Chest pain; shortness of breath; pain radiating down left arm; This is a spontaneous report from a contactable consumer (patient). A 59-year-old male patient received the second dose of bnt162b2 (Pfizer-Biontech Covid-19 Vaccine), via an unspecified route of administration on 06Feb2021 12:00 at single dose in left arm for COVID-19 immunisation. Medical history included allergies to iodinated contrast, chronic lymphocytic leukaemia (CLL), herniated discs. The patient didn't have COVID prior vaccination. Concomitant medications included tamsulosin hydrochloride (FLOMAX), sertraline hydrochloride (ZOLOFT), valacyclovir, ascorbic acid, betacarotene, biotin, calcium, chromium, colexcaliferol, copper, folic acid, iodine, iron, lycopene, magnesium, manganese, nicotinamide, pantothenic acid, phosphorus, phytomenadione, potassium, pyridoxine hydrochloride, retinol, riboflavin, selenium, vitamin b1 nos, vitamin b12 nos, vitamin e nos, xantofyl, zinc (CENTRUM SILVER). The patient previously received the first dose of bnt162b2 on 16Jan2021 02:00 PM in left arm for COVID-19 immunisation. There were no other vaccine in four weeks. The patient experienced chest pain, shortness of breath, pain radiating down left arm. Adverse events start from 07Feb2021 05:45 AM. The events resulted in doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care, and hospitalization for 1 day. Treatment was received for the events. The patient underwent lab test which included Blood tests, EKG on unknown date. The outcome of the events was recovering. COVID was not tested post vaccination. Information on Lot/Batch has been requested.

1039942	2/18/2021	VA	36	F	1/15/2021	1/21/2021	Fainting like episodes; Blurred vision; Severe vertigo; Chest pain; Fatigue; This is a spontaneous report from a contactable other health professional reported for herself. A 36-year-old female patient received first dose BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE) Lot # EL8982, via an unspecified route of administration in right arm on 15Jan2021 12:00 at single dose for covid-19 immunisation. There were no relevant medical history or concomitant medications. The patient was not pregnant at the time of vaccination. The patient had no allergies to medications, food, or other products. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 21Jan2021, exactly "4 1/2 days" after vaccine the patient experienced fainting like episodes, blurred vision, severe vertigo, chest pain, fatigue. The patient has been out of work since the 20th and she still had blurred vision. The adverse event resulted in Doctor or other healthcare professional office/clinic visit and Emergency room/department or urgent care. No treatment was received. The patient was not recovered from the events. She has been to the ER, cardiologist for an echography, ultrasonography of thyroids, Magnetic resonance imaging (MRI) of her head, went to ENT dr and neurologist in 2021. All blood work in 2021 came back normal as well. The reporter considered the event as non-serious. The patient was not diagnosed with COVID-19 prior to vaccination. She had negative Nasal Swab Covid test post vaccination on 22Jan2021.; Sender's Comments: Considering the temporal association, a causal association between administration of BNT162B2 and the onset of fainting like episodes cannot be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1034997	2/17/2021	CA	93	M	1/28/2021	1/28/2021	Disorientated; in a lot of pain in his chest and rib area; in a lot of pain in his chest and rib area; hurt to breathe and move; shaken up; Short of breath/It hurt to breathe; Concomitant medication:ongoing prednisone for immunotherapy; Concomitant medication:ongoing prednisone for immunotherapy; This is a spontaneous report from a contactable nurse. A 93-year-old male patient (reporter's father) received first does of BNT162B2 (Lot#: EN5318), via intramuscular on 28Jan2021 10:00 at single dose for COVID-19 immunization. Medical history included ongoing prostate cancer metastatic diagnosed a few years ago and immunotherapy. Concomitant medication included ongoing abiraterone acetate (ZYTIGA) at 1g, once a day for prostate cancer and ongoing prednisone at 5 mg, tablet, twice a day, by mouth for immunotherapy. The caller stated she is reporting a reaction her father had to Pfizer's COVID-19 vaccine. The patient experienced disorientated, in a lot of pain in his chest and rib area, hurt to breathe and move and short of breath/it hurt to breathe on 29Jan2021. The reporter seriousness for the events was medically significant. The events didn't require a visit to emergency room or physician office. The patient did go to urgent care. The caller explained her father became disoriented. He received the first vaccine on 28Jan2021. The next day, her father began to move his car around 12 pm and he became disoriented and stated he wasn't going to drive. Caller stated they were not aware of this disorientation until Friday, 29Jan2021. Her father was not sleeping and was up the night before because he was in a lot of pain in his chest and rib area. It hurt to breathe. He was short of breath. It hurt to move. Caller clarified further her woke up feeling so bad he thought he was going downhill. He thought his cancer got worse over night. He told the caller's brother after he became so disorientated that he was no longer going to drive because he was so shaken up. He was taken to urgent care on Friday, 29Jan2021. He was prescribed Naproxen, 500 mg Friday evening and he slept all night for the first night in years. He usually gets up in the middle of the night to use the bathroom. He woke up on Saturday morning, 30Jan2021, and he was feeling 100% better. He recovered completely. He was up moving around and in no pain. Caller verified she has no NDC, Lot number and expiry date for the Naproxen her father

care and or any referred specialist patient is agreeable and understands need for follow-up and repeat exam/testing. Patient is aware that discharge does not mean there is nothing wrong. Indicates no emergency is present, and that they must continue their care with their primary care physician and/or any referred specialist. They were given appropriate follow-up with their primary care physician and/or specialist. nurse had an extensive discussion on the expected clinical course and return precautions. Patient understands to return to the emergency department for continuation, worsening, or new symptoms. Nurse answered any of the patient's questions. Patient was discharged home in a stable condition. As of 14:11 EST Vitals: BP - 144/86, HR -79, Temp - 97.6 OF (36.4 (Tympanic) 02 SATS - 96%. DISPOSITION: DISCHARGE: Patient discharged in stable condition. Reviewed implications of results, diagnosis, meds, responsibility to follow up, warning signs and symptoms of possible worsening, potential complications and reasons to return to ER. Patient/Family voiced understanding of above instructions. Discussed plan for discharge, as there is no emergent indication for admission. Patient referred to primary care provider for BP management due to today' BP. Pt/family is agreeable and understands need for follow up and repeat testing. Pt is aware that discharge does not mean that nothing is wrong but it indicates no emergency is present that requires admission and they must continue care with follow-up as given below or physician of their choice. Schedule an appointment as soon as possible for a visit in 2 days. Medication List NO changes were made to your prescriptions during this visit. ED Treatment Team. Previous ED Visit: None. 1036212	2/17/2021	OH	46	F	2/12/2021	2/12/2021	Patient presented to the emergency room approximately 45 min after receiving her 2nd dose of Moderna COVID-19 vaccine (2/12/21 at 1652). About 15 min after receiving the vaccine, she began having a rash to her upper chest, she stated that she felt very shaky and had heart palpitations. Nurses in the vaccine clinic gave her a dose of 25mg of Benadryl, 975mg of Tylenol and 20mg of Pepcid. Patient was shaky, but breathing easily and able to speak in complete sentences without difficulty, denied any difficulty in swallowing and her O2 saturation was within normal limits as well as her heart rate is normal sinus rhythm. She states that her only allergy is to minocycline and she currently treats for depression, bipolar disorder and has a platelet storage pool disorder. She is currently on Symbicort, zinc, Vit C, and Vit D because she had COVID-19 several months ago. She still gets residual shortness of breath from it. She denies any chest pain, nausea or vomiting
1035813	2/17/2021	TX	90	F	1/26/2021	1/26/2021	Weakness, fell, chest pain
1037056	2/17/2021	PA	21	F	1/9/2021	1/10/2021	January 10, 2021 around 1:00 AM i woke up from a sound sleep with 10/10 midsternal chest pains. I was seen in the emergency room for the chest pains. The emergency provider ruled out the chest pains as NOT being cardiac or Gastrointestinal related after doing countless blood tests and other various tests. I then followed up with my PCP and they said to keep an eye on it to see if it got any worse and to seek medical attention if the chest pains did get worse. After 4 days the pain went away.

1036382	2/17/2021	NC	69	F	1/23/2021	1/23/2021	69 yo female reports AE after receipt of Covid vaccine #1 (EN 5318 13 FEB 21) via drive thru event. She reports within minutes she felt unwell but had difficulty being more specific. She states she felt a warmth in her chest which traveled to her stomach. A few minutes later she felt SOB, and could not catch her breath. She states her respiratory rate increased. She talked to staff and was told if got worse to honk horn or use flashers. She did not request additional assessment. She waited her required 15 minutes and drove home another 20-25 minutes. She states she noted her face swelling. She thinks she may have had some throat swelling, but then wasn't sure. She developed some nausea, but no emesis which continued for 2-3 days. She denied watery or red eyes, runny nose, pruritis, rash, palpitations, heart racing, chest pain, cough wheezing. She states the breathing symptoms resolved in a few hours. She was unsure of the facial swelling resolution time frame. She developed a headache and felt malaise for 2-3 days, then symptoms resolved. She never took any medications other than her prescriptions. She did not seek care during symptom time frame.

1037178	2/17/2021	NC	70	F	2/5/2021	2/5/2021	This was my 2nd vaccine dose. The first dose was on 1/15/21 at 12:30pm and my side effects that started in the evening were much milder: very sore arm, nausea, body aches, fatigue which resolved after 48 hours. The 2nd dose on 2/5/21 was at 2:30pm, but the side effects started in the evening were more concerning: same sore arm, nausea, body aches, fatigue, but I also started having chest pain at 9:00pm. This was frightening to me so I took aspirin because it was heart related. When the pain lessened, I went to bed. I awake the next morning to chest pain and now tachycardia. My normal heart rate is 68-70, but now it was up to 98-100. I took more aspirin, went back to bed, and tried to slow my heart rate with deep breathing. I called my nurse expert friend who told me to go to the ER if my heart rate went to 140. I stayed in bed most of the day, trying to slow my heart rate, hydrating, eating slow portions of food and taking aspirin. My chest pain & heart rate starting lessening by the evening into the next morning. Thank God it was mostly gone by Sunday evening. My biggest concern that I would appreciate an answer to from you is : will the next COVID vaccine that I take be even more dangerous to me? Am I allergic to this vaccine or would I be okay with a lower dose? Should I not take a COVID booster if it becomes recommended?
1037144	2/17/2021	OR	61	F	2/17/2001	2/17/2019	Patient was administered vaccine at 11:00 AM in the left deltoid muscle IM. Patient reported feeling chest tightness, heaviness as if someone was sitting on her chest, pressure on her chest, and found it a little hard to breath at 11:10 am. Patient had a history of congestive heart failure and suffers from anxiety, but wasn't sure if the chest pain was due to her past medical history or the vaccine. At 11:17 am the chest pain remained the same. At 11:30 she was still feeling chest pressure and her right arm was feeling weak. At 11:30 Heart rate was 56, Blood Pressure was 138/72, and respiratory rate was 12. EMS was called at 11:35. Patient was taken to the hospital once EMS arrived.

1036964	2/17/2021	OH	35	F	12/22/2020	12/22/2020	<p>Within a minute, there was a different taste in my mouth. Shortly after, began to feel incredibly hot, flushed, burning, and tingling throughout body. Throat and tongue also became tingly. It was like a wave that moved through my body. After waiting it for a few minutes to see if there was improvement, there was a strong ?wave? that came with all of the above, but my heart started racing with palpitations. HR was 120. The heat feeling became worse. Would describe the feeling as a CT contrast feeling, including the feeling of voiding or heat/burning of the bladder. Tongue and throat more tingly. A few minutes later the feeling all became stronger and this is what became the strongest ?wave? of the feeling with my heart beating incredibly fast. The heat/burning/tingling (including the mouth and tongue) were severe. HR 148. Nauseated and lightheaded/dizzy. Transferred to ED. In the ER, epi was administered due to the persisting flushing/burning of the skin/and tingling of the throat and tongue with tachycardia. IV fluid bolus, Benadryl, and zofran were also administered. Tryptase was obtained approximately 35 - 45 minutes after injection. Tryptase 10.8. Improvement in all symptoms following epi/benadryl. Was monitored in the ER and within approximately 1.5 hours, the burning feeling returned, but was centralized in my core (felt internal versus skin). Abdomen/chest area with intermittent burning. At approximately 2-3 hours, the tingling began to return. Slight tingling of the tongue, lip. The burning feeling continued to worsen, now back to the skin as well as the core, and additional benadryl was administered in addition to solu-medrol. Prior to this, the attending physician was concerned that my heart rate remained elevated into the 110/120s 3 hours after the epi administration and she recommended transfer to an adult facility for further evaluation. Due to the burning in my chest, EKG was obtained. Sinus tachycardia. Slight chest tightness, duoneb provided. Had not taken inhalers throughout the day and felt similar to tight chest/difficulty getting deep breath in relation to asthma. Relief after the second dose of benadryl and duoneb. BP remains elevated from shortly after vaccine administration. Transferred to MVH at 4-5 hours post vaccine. En route to facility, HR 130s and BP lower (90s/60 and 90s/50s) - Medic did not think was accurate BP. At MVH, cardiac rule out completed with additional EKG due to</p>

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

development of some chest pains and return of core burning sensation as well as ongoing tachycardia. EKG remains sinus tach, troponins normal. Requested anxiety medication to see if that would help with heart rate. Low dose ativan given. Minimal change to resting heart rate, still elevated. Also received 4 baby aspirin and tylenol for extreme headache. Oxygen saturations were 97-100%. Oxygen saturation at MVH was 90-93%. Attending physician not concerned with going home and saturation still being low 90s as long as there was no shortness of breath. Discharged home with methylprednisone 4 mg 6 day pack and pepcid prescriptions. Resting HR was low 100s at time of discharge. Instructed to continue with antihistamines every 6 hours. DX anaphylactic reaction. Husband checking on me while sleeping, oxygen saturation in sleep 89-91%. After awakening, saturation improved to 94-95%. At home, burning skin and core feelings persisted. Tingling of the throat/tongue/lips continued to be intermittent. Antihistamines helped to relieve symptoms. 26-28 hours after vaccine, symptoms were very strong, was suffering from extreme burning and tingling of the mouth/lips. Considered return to ER but oxygen saturation was okay. HR elevated. 125 at rest. MVH attending physician encouraged me to try to not use the prednisone packet unless necessary/return of symptoms. Started prednisone with the return of symptoms. Continued on routine Benadryl until myoclonic jerking became too pronounced, discontinued on 12/25/2020 and changed to hydroxyzine. Jerking remained but improved and was less bothersome. Continued taking daily dose of Claritin, daily pepcid, daily aspirin. Hives developed 12/25/2020. Return to ER on 12/29/2020 as the jerking was intense and felt to be in chest along with palpitations. EKG and troponin was good, only notable thing physician reported on labs was an elevated WBC count. Did not discuss jerking. To PCP on 1/4/2020 - discussed adverse reaction. Continued problems after vaccine include: intermittent tachycardia (low 100s at rest occasionally vs norm of 70s/ low 80s), higher heart rate when active, burning skin (feels similar to bad sunburn feeling), random pains and occasional brief numbness/tingling/tremoring in muscles/extremities, jerking (continues to improve - recommended change off of benadryl/hydroxyzine to zyrtec), increased need for inhaler, bubbling sensation in

1036561	2/17/2021	CT	39	F	1/6/2021	1/6/2021	<p>Pt has h/o HTN (not on medication) and occasional asthma(no hospitalizations), and allergies to Penicillin (tongue swelling), tree nuts (throat swelling), and Bees (local swelling); Pt notes she only takes benadryl for these reactions; she has never been prescribed or used epinephrine. Pt denies heart disease, strokes, diabetes, increased bleeding tendency. No early heart disease in family. LMP in the last week. Pt notes she was supposed to see allergist in past, but has not. Pt was feeling well this morning before she came to COVID vaccine clinic. Pt had received first Moderna Vaccine shortly before 0918am here. At 0938 Pt noted feeling "heaviness" in head and "lump in throat." Pt denied itching/swelling to mouth, itching/hives to body, dyspnea, chest pain, nausea. No lightheadedness/dizziness. Pt walked to stretcher. BP at right forearm was 223/151 and then 221/132 on repeat. Heartrate in 90s. Sao2 on RA 100%. RR 18. Pt notes having high BPs at times, but not often as high here. Pt speaking is slightly hoarse voice. No strider. Pt speaking in full sentences. No oropharyngeal edema. No urticaria. No tachypnea or wheeze. HRT RRR. 2+ left rad pulse. A/P: given Pt's h/o severe allergies and now new Globus sensation and change to voice I discussed with Pt that she was likely having allergic reaction. Given involvement of airway I recommended epi administration to neutralize reaction and transfer to ED for observation. I advised Pt that epi would increase heartrate and blood pressure. I determined benefit of treating anaphylaxis outweighed risk of elevating BP, even though she has hypertensive urgency BP values. Pt has some headache; she could be bordering on hypertensive emergency. I asked pharmacist to call 911 indicating early anaphylaxis and request of paramedic. ~5 minutes after Epi (given at 0942) Pt notes lump sensation and voice improved. I had RN place IV to left AC and gave verbal order for benadryl 25mg IV. Pt notes some nausea and dizziness. Lump sensation continues to improve. EMS arrived ~0950. I gave report to paramedic. I discussed with Pt that I would place referral to Allergy and Immunology; they will determine if and when Pt could receive second moderna vaccine.</p>

1032942	2/16/2021	FL	29	M	1/15/2021	1/15/2021	Patient come in to our office to get the first dose of COVID-19 vaccine on 01/15/21 . Allergies reviewed first , all documented properly . Patient reported that he wake up on the same vaccine date at 11:55 pm with pruritus in the trunk and back , he turn on the light and looking for a mirror to see what happen . He saw multiples hives in the trunk , back , inguinal area , internal area of the thigh , also he felt and saw swelling in the lips and trouble to swallow , denied difficulty to breath or chest pain .Patient immediately take 2 tablets of Cetirizine 10 mg orally and went to sleep, next day he felt bettercontinued
1032887	2/16/2021	FL	68	M	2/13/2021	2/14/2021	Sunday morning 2/14/21 - Mild Diarrhea from 4 AM till noon, and middle of mild to moderate chest pain when inhaling for a couple of hours and then it went away.
1032768	2/16/2021	CT	48	F	1/14/2021	1/14/2021	It started with tingling in my tongue (which I ignored), then it became numbness that spread down my throat I also became short of breath. That's when I notified one of the nurses. They checked my blood pressure. I vaguely remember hearing it was high (189/?). They called 911 and the paramedics came. Shortness of breath became worse and chest pains started. The paramedic gave me Benadryl and then epinephrine since I was increasingly getting worse. I was shaking and I felt lethargic. I could not control the shaking and I felt cold. I do not remember a lot of details when I got to the Emergency Room. Looking at my record they gave me: LORazepam (ATIVAN), methylPREDNISolone sod suc(PF)(SOLU-MEDROL) and famotidine. I went home that night with the condition that I see my primary care physician. I felt like I have the flu and soreness of arm the next couple days. I went back to work after four days.

1032574	2/16/2021	TX		M	1/26/2021	1/29/2021	Flu-like symptoms; fever; chills; headaches; myocarditis; A spontaneous report was received from a physician concerning a middle-aged, male patient, who received Moderna's COVID-19 Vaccine, and who experienced myocarditis, flu-like symptoms, fever, chills and headache. The patient's medical history was not provided. Concomitant product use was not provided by the reporter. On 26 Jan 2021, approximately three days prior to the onset of the symptoms, the patient received their second of two planned doses of mRNA-1273 for prophylaxis of COVID-19 infection. On an unknown date, the patient experienced flu-like symptoms, fever, chills and headache. On 29 Jan 2021, the patient developed substernal chest pain and came to the ED for evaluation. His troponins were elevated, but his cardiac catheterization was negative for acute coronary occlusion. Cardiac MRI findings were consistent with myocarditis and evaluation for covid 19 disease by PCR and serology were negative. Additional workup for other causes of myocarditis is still pending. Treatment information was not provided. The patient received both scheduled doses of mRNA-1273 prior to the event; therefore, action taken with the drug in response to the event is not applicable. The outcome of the events myocarditis, flu-like symptoms, fever, chills and headache was not provided.; Reporter's Comments: This case concerns a male patient, with prior cardiac risk factors, who experienced a serious event of myocarditis along with other non-serious events after receiving second dose of mRNA-1273 (Lot# unknown). Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. Further information has been requested.

1033848	2/16/2021	MD	27	F	2/12/2021	2/16/2021	Within 15 minutes of receiving the vaccine, I was dizzy, nauseous, and elevated BP (140?s/90?s). After about 30 minutes, these symptoms subsided. At 1:30 AM on 2/13, I woke from sleep with severe epigastric pain, chest pain, and pain between my shoulder blades. My arm (where I received the vaccine) was throbbing and I had severe under arm pain on the same side. Symptoms lessened with 2 extra strength Tums, 500 mg Tylenol, and 30 mL of Pepto, but were still present. I was able to sleep, I woke up later in the morning with these persistent symptoms, as well as fatigue. All of these symptoms continued for 24h. On 2/14, I had lessened arm pain and fatigue but continued to have epigastric/chest/back pain. I was seen at the urgent care near me and my physical was normal, they indicated that the chest symptoms were likely from epigastric pain since I was not having shortness of breath. I?ve continued to have these seemingly random chest pains and back pains, they?re very intense throbbing sharp pains in my chest and back that do not always coincide with exercise or stress.
1033835	2/16/2021	CO	63	F	2/3/2021	2/4/2021	Chest pain and burning in the chest and lungs, body aches, diffuse joint pain, and body stiffness

1034052	2/16/2021	PA	51	F	1/21/2021	1/21/2021	09:00 PM - every joint in my body hurt that evening. I had to leave work; I couldn't finish my eight hours. All my joints hurt - even my toe joints. I called my doctor. I had a fever. That went away in 2-3 days. Two weeks later or so- on February 5, I started feeling pretty bad. I started having chest pains. It progressed. No coughing. By the 10th, I ended up in ER. I thought I was having a heart attack - chest pain I was hospitalized. I am still dealing with that issue. I received morphine I'm diagnosed with Pleurisy -like virus - the lining of chest wall can become inflamed and when I breathe in and out it causes severe pain. Tachycardia - fast heart rate. I'm on anti-inflammatory - Naproxen - 500 mg twice a day and I'm already improving. I saw a cardiac dr today - he says my heart seems fine. I still have a fast heart rate. Pleural Rubbing - he could hear it on my chest wall. I had a positive antibody test - COVID -on January 20th. I'm recovering but I am not recovered.
1030321	2/15/2021	IA	53	F	12/18/2020	12/18/2020	Pfizer-BioNTech COVID-19 Vaccine Employee complained of feeling hot, tongue felt swollen, and weak. Patient was taken to Clinic for evaluation at onset of symptoms, approx 12 minutes after distributing vaccine. At Clinic, patient states her symptoms have improved. She states she thinks she got a little anxious and feels comfortable driving home at this time. Patient denies oral/throat/tongue/lip edema. No headache, vision changes, difficulty swallowing, difficulty handling oral secretions, chest pain, palpitations, shortness of breath, nausea/vomiting. No pruritus. Patient is sitting comfortably in the chair and drinking water without difficulty. Discussed ED precautions. Patient verbalized understanding. Advised patient to follow up with her PCP to discuss the second dose of the covid vaccine. Patient agreed to the plan. Patient ambulated out of clinic without difficulty. 1/1/21: Pt received 2nd dose of vaccine. Experienced some dizziness and slightly high BP. Both symptoms resolved within 30 minutes and patient was discharged home.

1030018	2/15/2021	MA	20	M	12/29/2020	1/26/2021	Myocarditis; Acute onset of chest pain; Soreness of the arm; A spontaneous report was received from a physician concerning a 20-year-old, male patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced soreness of the arm, acute onset of chest pain, and myocarditis. The patient's medical history, as provided by the reporter, included asthma, and allergy to egg, peanut and tree nuts. Concomitant medications reported included dupilumab, montelukast, budesonide / formoterol, cetirizine, albuterol and epinephrine. On 29 Dec 2020, the patient received their first of two planned doses of mRNA-1273 (Lot number: 025J20A) intramuscularly for prophylaxis of COVID-19 infection. On 26 Jan 2021, prior to the onset of events, the patient received their second of two planned doses of mRNA-1273 (Lot number: 028L20A) intramuscularly in the left deltoid for prophylaxis of COVID-19 infection. On 26 Jan 2021, after receiving the second dose of the vaccine, the patient reported soreness of the arm for 3 to 4 days. On 30 Jan 2021, the patient presented to the hospital with acute onset of left sided chest pain. The physician reported that the patient developed myocarditis. Consent for Safety to follow up was received. Treatment for the events, as reported, included patient's concomitant medications of dupilumab, montelukast, budesonide / formoterol, cetirizine and albuterol. No additional treatment information was provided. Action taken with mRNA-1273 in response to the events was not reported. The event, soreness of the arm, was resolved on unknown date. The event acute onset of chest pain and myocarditis was not resolved at the time of this report.; Reporter's Comments: This case concerns a 20 year old male with medical history of multiple allergies, who was hospitalized with serious unexpected events of chest pain and myocarditis and a non-serious unexpected event of pain in extremity. The chest pain and myocarditis occurred 33 days after first dose and 4 days after last dose of mRNA-1273. Based on the current available information and temporal association between the use of mRNA-1273 and the start date of the events, a causal relationship cannot be excluded.

1030551	2/15/2021	AL	85	M	1/25/2021	2/7/2021	No adverse effects for the first two weeks. The morning of 2/7/21 he claimed he was not able to sleep the night before. He was cold, but only wanted something cold to drink. He was not able to get through his normal morning routine. By 8 am we was beginning to get confused and weaker. By 9 am he vomited and was not able to stand up or walk. The confusion was increasing. We called 911. When they arrived he had chills and was agitated. He did not have a fever at that time. He was transported to the emergency room. We were not able to accompany him there, but were told he was confused, agitated and combatant. His fever was up to 101 degrees. The started him on antibiotics and began tests. He tested negative for COVID and the flu. By that evening they diagnosed him with viral meningitis and admitted him to the hospital. The next day we were told that they had ruled out viral meningitis as well as other infections. The infectious disease doctor said that all tests had come back negative, but they were continuing to give him antibiotics. A neurologist and cardiologist were called in and they were not able to find anything either. He did complain of chest pains, but it was determined that it might be heart burn. They did see a sign of Afib, but test were not conclusive. On Friday, Feb. 12th he was sent home with antibiotics and heart medicines. The confusion has improved, but he is very weak and not mobile without assistance.

1030129	2/15/2021	AL	57	F	1/20/2021	1/1/2021	<p>Nerve Damage Symptoms; its achy all on the left side; shoulder pain; Being lower back pain; the pain in shoulder went to the arms, back across to the front of the chest; dull aching pain; she didn't sleep; groggy; The pain in shoulder went to the arms, back across to the front of the chest; This is a spontaneous report from a contactable consumer (patient). A 57-year old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE lot number EK9231) (at the age of 57-years-old), via an unspecified route of administration on 20Jan2021 as a single dose for covid-19 immunization. The facility where COVID-19 vaccine was administered was at a hospital and anatomically located on the left arm. The patient medical history included acid reflux She has been good for last 2 months. She was on Pepcid but not anymore; uterine polyp removal in 2019 (reported as 2 years ago) polyps removed from uterine wall, it was done outpatient but they still put her to sleep, but it had took her 2 weeks to get over the reaction of being put to sleep, it was the anesthesia, it wasn't pain, but she was very tired and groggy after. She does not know the name of the Anesthesia or have any Lot or Expiry; receives flu shot every year with no issue. The patient was not taking any concomitant medications. She has had No positive antibody or Covid test prior to the vaccine. She took the first shot last Wednesday 20Jan2021, she had a weird, not the usual reactions like she had read about. She even went to the Nurse Practitioner yesterday because of it. She was told she has nerve damage from the shot and a high immune response to the shot, which is a good thing, but her question is does she take the second shot. The nerve damage started at 10 o'clock that night causing shoulder pain, back pain, being lower back pain, because of it she didn't sleep, only 3 hour Thursday night. She's a teacher and even had to miss school on Friday. It is just a constant dull aching pain. She was groggy. Some symptoms were typical. She never ran a fever, the pain in shoulder went to the arms, back across to the front of the chest, she can follow with the hand here, its achy all on the left side. She went to the Nurse Practitioner and she said it sounds like nerve damage. The NP did not do any test, she really just left the office hoping that it would resolve on its own. Caller states that this is not going away. She actually read to not even</p>

1032218	2/15/2021	MT	66	F	2/11/2021	2/11/2021	Vaccine (2nd dose) was give around 11:00 am on 2/11/2021. Around 9:30 that night I started to feel achy all over. Around 2:30 am I woke up with the severe chills and could not stop shaking. Fever of 100.7. I had severe headache, dizziness, n/v, severe joint and muscle pain. I had severe ear aches, my jaw and teeth even hurt. I started having left chest pain. My husband took me to ER (Billings, Montana). Chest x-Rays, EKG, and blood work were done. Everything checked out normal. I was released to go home. The symptoms were much worse than from the first covid shot and I thought the reaction from the first shot were horrible. I slept most of the day. Around 10 am on 2/13/2021 I felt better. I will never have that vaccine again!!
1032071	2/15/2021	ID	71	M	2/12/2021	2/13/2021	Chills, headache, nightmares, chest pressure, chest pain, heart pain

1029034	2/14/2021	WA	62	M	2/13/2021	2/13/2021	<p>a 62 y/o M who presents with concerns for an allergic reaction to the second dose of the Covid vaccine. According to him he got the vaccine around 8:45 AM. He has a history of anaphylactic type reactions with a swelling and urticaria in the past but has not had any symptoms in the last 5 years. He felt sudden onset pit in his stomach, tingling and warm sensations over his face and some chest tightness. He denies all the symptoms currently. He did get medications prior to arrival but states his symptoms were already getting better before he been given anything. He was given epinephrine as well as Benadryl beforehand. He denies any symptoms currently. Denies headache, change in vision, difficulty swallowing, lightheadedness or vertigo, chest pain, sore throat, wheezing, cough, nausea or vomiting, rash, falls or injuries. Denies any recent foreign travel or sick contacts. He did work a full shift yesterday and was coming off a 24-hour shift prior to getting his vaccination. He denies any significant reactions to the first vaccine.</p> <p>Medical Decision Making On initial presentation is an overall well-appearing 62-year-old male who has normal vital signs without fever or tachycardia. He is presenting with concern for allergic reaction of the field to a recent vaccination. The vaccine was given roughly 1 hour prior to arrival. He was given epinephrine intramuscularly as well as IV Benadryl. He states he is currently feeling mildly tired from the Benadryl. He denies any other recurrent symptomatology and feels better. Examination is not concerning for anaphylaxis at this time, no evidence of airway involvement or multisystem involvement. No evidence of local allergic reaction. Low clinical concern for occult infection, metabolic abnormality, ACS or arrhythmia for a cause of his symptoms. He is overall very well-appearing. Labs have been obtained as part of screening for reactions to the vaccination per CDC recommendations including a tryptase and C4 complement. They were drawn over an hour after the vaccine was administered. ECG was within normal limits. After observation patient remained asymptomatic. Did offer steroids, however he wanted to hold off on them as he just got his vaccination which seems appropriate at this time. He was sent home with a new EpiPen. We also gave him follow-up in the allergy clinic. He has any worsening symptoms we do recommend he use the EpiPen as well as call 911. He is</p>

						understanding. At this point he stable for outpatient management. I did tell him he should expect to feel aches and potentially have inflammatory response to the vaccine, he is understanding of this. Pt was discharged home/self-care. Pt provided strict return precautions, including but not limited to, any worsening symptoms or any new concerning symptoms. Otherwise, Pt instructed to see PCP on an as needed basis.	
1029209	2/14/2021	FL	33	M	12/21/2020	12/26/2020	On 26DEC (5 days after first injection), he started experiencing pain and weakness in the Right deltoid radiating down to the fingertips . Within a week, started feeling similar symptoms in Left extremity. No shoulder/neck pain. Pain starts at the deltoid at the injection site and has caused stiffness, pain, and tightness of the upper extremities alone. Decreased grip b/l. Symptoms have persisted since (almost a month now) but did seem to resolve while on prednisone, but returned after cessation. No respiratory issues, chest pain, paresthesias, or lower extremity symptoms.
1029751	2/14/2021	WA	31	F	2/5/2021	2/8/2021	Awakened with L superolateral chest pain radiating to L inframammary region in anterior axillary line on post-vaccination day 3 (Moderna dose #2). Pt presented for care on post-vaccination day 4. Pleuritic chest pain, 4-5/10, accompanied by lightheadedness and dyspnea on exertion. Chest wall locally tender, but pt also on ocp and with positive D-dimer and mildly elevated BNP, so chest CT angio obtained to evaluate for PE. Symptoms ongoing at time of discharge but treated with OTC analgesics. ***Concern here is (as noted in CT read) raised by interpreting radiologist not just for this patient, but for women with chest wall adenopathy in addition to axillary lymphadenopathy may be difficult to distinguish from malignancy on screening mammography and may lead to increased numbers of biopsies following this screening study if done within a few weeks of COVID-19 vaccination.

1029154	2/14/2021	PA	74	M	2/10/2021	2/10/2021	6 pm 2/10 I started experiencing severe chest pain. I went to the ER for the pain (no cardiac history). They did all the cardiac tests which were negative and administered morphine for the pain (not effective) and then fentanyl which was effective. I was admitted overnight and discharged at 2pm the following day (2/11). The attending cardiologist could find no explanation other than the vaccine. Although I felt fairly good in the morning (the pain had subsided after the fentanyl administration the previous night) I was tired and went to bed when I got home. Almost immediately severe chills started with violent shaking for several hours, followed by vomiting large amounts three or four times. About 7pm when I attempted to get out of bed to use the bathroom, I fell on the floor as I could not support myself. I was unable to get myself up due to extreme muscle weakness. My wife had to call my stepson to come over to help get me back into bed. A couple of hours later I tried to get out of bed very carefully and at that point I was able to stand with no problem. There then were no further symptoms other than headache. The following day (2/12) I felt much better but spent the day in bed. 2/13 I was up much of the day but still felt somewhat weak and tired. 2/14 (today) I am still much better but somewhat tired with slight malaise.

1028236	2/13/2021	AZ	42	F	2/10/2021	2/11/2021	Received vaccine at 1:48pm at PODsite. Initially, no reaction. By following morning, 2/11, woke with sore arm, slightly stiff neck, and heart palpitations that persisted throughout the day. Had trouble sleeping as palpitations continued throughout the night and varied in degree from a flutter to a thump. No chest pain, no chest pressure and no breathing issues. By morning of 2/12, symptoms were still present and numbness in both arms from elbow to finger tips occurred. Called my healthcare nurse's line for advice to determine if I should see my doctor or go to ER. I was advised to visit the ER. Arrived at ER at approximately 12:56pm where I was immediately admitted and assigned to doctor. After my first 30-60 mins of observation, I was informed that my heart rate and blood pressure were high. I informed doctor that I have never had high blood pressure, so that is unusual. Was discharged around 4pm and instructed to submit an adverse reaction report and to see my general practitioner in 2 days. I was informed the following: no evidence of an acute cardiopulmonary process. Heart size and contours are normal.
1028392	2/13/2021	AR	55	F	1/4/2021	1/6/2021	Abdominal pain with no determined cause. Pain was severe and progressively got worse with nausea. Pain became severe and was also behind Left shoulder blade and chest pain.

1027894	2/13/2021	IL	64	F	2/6/2021	2/6/2021	During the first 10 minutes of shot, while in the store, I got a mild chest pressure. Did not think anything of it at first. Thought might have been heartburn or nerve. However, it persisted along with periods of mild and sometimes a bit more moderate chest pain for about the next 8 hours but never got sever. Around 11:30 p.m., I decided to lay down and if not gone in a couple of hours, I would go to E.R. I feel asleep and when I woke around 2:00 a.m., the discomfort was gone. The next day I looked on internet because flyer given did not say anything about chest pressure and pain, just difficulty breathing, but I found a site that listed "persistent chest pain and pressure" as an adverse reaction. I am now wondering if this was considered an adverse reaction and if I need to be concerned for the next dosage. I have left a message for my physician, and plan to call pharmacy today. I want to get the next dose for protection but now I am nervous. Can you advise? I have listed my cell number, or please contact via email. I am so confused as to what to do. Thank you.

1028104	2/13/2021	NY	31	F	2/11/2021	2/11/2021	At approximately 8pm began feeling slightly nauseated. Tried going to sleep. Had some heart palpitations and what felt like acid reflux/chest pains. Slight headache before bed. Took some Tums before going to sleep. at around 10:00 began vomiting horribly. Nausea went away slightly, but returned around 12am. Started vomiting again at 12am and also 2am. Started feeling severe flu like symptoms, severe body aches (especially in legs). Tried taking Tylenol at around 12, but believe it was out of my system once I vomited at 2am. Did not sleep - every time I moved I felt nauseous. Also heart pounding, stomach pain, body aches kept me awake all night. Took Tylenol again at around 7am. Severe body aches kept me in bed all day. Diarrhea. Severe head ache also gave me sensitivity to sounds and lights throughout the day. Took Tylenol again at around 2pm. Started feeling somewhat better around 7pm on Friday 2/12. Sat 2/13 felt extremely tired and no energy. Have some lingering diarrhea.
1028167	2/13/2021		52	F	12/22/2020	12/22/2020	Patient received the Pfizer COVID immunization today, About 3 hours ago. About 15 minutes after the administration of the vaccine patient stated she developed mottling of the skin, paresthesias as well as palpitations and throat tightness. Was given 25 mg oral Benadryl after initially experiencing the symptoms. Subsequently 1 hour later was given another 25 mg of oral Benadryl because symptoms remain. Was subsequently transferred here to Urgent Care about 30 minutes ago. Patient stated that her symptoms remained of throat tightness however the palpitations and paresthesias as well as skin mottling resolved. Denies any rash at any point. Denies any swelling of the face, mouth, lips or body. Denies any shortness of breath or chest pain.

1026212	2/12/2021	IL	65	M	1/20/2021	1/21/2021	<p>History Chief Complaint Patient presents with ? Elevated Blood Pressure ? Dizziness multiple times a day Patient who presents to the emergency department today for evaluation of hypertension, head pain, blurry vision, and neck pain. He states about 6 months ago he had open heart surgery. Since that time he states that he has been having intermittent episodes of blurry vision usually lasts a few minutes and resolve on their own. Today however, he notes that the blurry vision lasted for greater than 5 minutes and he started to become concerned. During that time he also began to experience some pain in his neck and a headache in the back of his head. He took his blood pressure at that time and noted that his systolic blood pressure was in the 190s. This alarmed him and so they called EMS. When EMS arrived they rechecked his blood pressure again and his systolic blood pressure was over 200. Upon arrival here to the ER he states that he is feeling much better and his blood pressure appears to be better as well. At this time he states he still having some right shoulder pain and a little bit of right-sided neck pain but he does state that he had his Covid vaccine yesterday in his right arm. Currently patient states he still has a little bit of a posterior headache but it is much improved. He denies any fevers, body aches, chills, cough, chest pain, shortness of breath, palpitations, lightheadedness, nausea, vomiting, abdominal pain, diarrhea, constipation, dysuria, hematuria, or swelling of the lower extremities. He has no known drug allergies. ? ED Course: I discussed physical exam finding with patient. Apparently most of his symptoms have already resolved at this time. His blood pressure is back down to 142/98. I still advise since he was having some weird blurry vision I would like to get a CBC, CMP, troponin, EKG, and a chest x-ray. Patient agreeable to this plan of care. We will also continue to monitor his blood pressure to ensure that it does not spike back up. Patient's work-up was unremarkable. His blood pressures down to 123/60 and states he is feeling much better. This point time it sounds like what happened was a hypertensive urgency. I advised him he needs to contact his PCP and schedule close follow-up discuss if anything further needs to be done. At this time though he is safe to be discharged home with strict return precautions. ED Course Procedures Clinical Impressions as of Jan 20 2235 Hypertensive urgency</p>

1026063	2/12/2021	CA	53	F	1/30/2021	2/7/2021	Went to hospital for shortness of breath and chest pain after 2nd shot. Nurse had advised me that previous patient had come in with same symptoms as well after vaccine. Drs found no results to cause issues
1026251	2/12/2021	NY	65	F	2/11/2021	2/11/2021	About 10 minutes after vaccine patient reported shew as dizzy and felt nauseous. Her blood pressure at the time was 104/60, hr 76 and regular, SPo2 was 98% on RA. she was assisted to lay down. Her blood pressure and vitals were checked again and were 90/60, HR 78, SPo2 95% on RA. She complained of chest pain. EMS was called. they arrived at about 145pm and transported her to Hospital per the patient's request. She remained conscious, alert and responsive through the episode.
1025300	2/12/2021	WI	75	M	2/1/2021	2/1/2021	75 year old M, worsening weakness for the past several weeks. Seems to have gotten worse since Monday when he had his first Covid vaccine here at the hospital. Denies any headaches or neck pain. No fevers or chills. No cough or shortness of breath. No abdominal pain. No vomiting or diarrhea. No black or bloody stools. No dizziness. Today he almost fell and the son had to catch him. He did not suffer any trauma. He offers no symptoms of pain. Here he is fully awake and alert. Nothing to clinically suspect a stroke. His vitals are stable. Chest x-ray shows nothing acute. Creatinine is better than baseline. Electrolytes are stable. Troponin reassuring. He had no chest pain or shortness of breath to suspect angina. Spoke to the wife via telephone, he is getting so weak that he was unable to walk. Paramedics report they had lift him as he could not take a step. He was unable to ambulate here in the emergency room. At this time it does not seem like I can safely discharge him home.

1027025	2/12/2021	IL	46	F	2/11/2021	2/11/2021	After I received the shot, I went to the waiting area. While sitting down, I started to feel chest pain. Then, I felt dizzy. The dizziness lasted a very short period of time. Nevertheless, the chest pain lasted for about 30 to 40 minutes. The pain did decrease over that period of time to the point where it just felt like heartburn. About 20 to 30 minutes and while still having a little chest pain, I began to feel a tingling sensation with pain on my right hand. The tingling sensation did not last long, but the pain lasted for about 15 minutes. I did share my symptoms closer to 30 minutes after experiencing them because I thought they were typical side effects. After I got home, I still felt heartburn and pain in my left arm where I received the shot. At around 8 p.m., I remembered that I still had the bandaid that was put on my arm. I took it off in the dark. But, I decided to turn on the light because my arm still hurt. This is when I saw a huge, red, oval-shaped rash on the area where I got the shot. Again, it hurt but did not itch. The next day (today), I called my doctor. He said I got a local reaction and it would be okay as long as it did not increase. To my knowledge, it did not increase. I did take pictures of my rash today. I did not take any additional action since this is the only side effect that has remained. And, my doctor said that I would be okay.

1026588	2/12/2021	OK	70	F	2/12/2021	2/12/2021	5 minutes following injection, left ear began to feel 'itchy/tingling' in middle ear location, moving to inside upper throat area then to right middle ear. Approximately 2 minutes later, patient felt shortness of breath, mild chest pain and difficulty breathing. She immediately took 25mg Benadryl PO. 20 minutes following injection, RN at site notified of symptoms. HR 110, feeling flush, no change in other symptoms, patient escorted outside (15F weather) and second dose of 25mg Benadryl PO given. 22 minutes following injection, remaining outside, improvement in ability to breathe. HR 90. Tingling/itchy feeling still in left middle ear, right middle ear improving. 24 minutes following injection, no further change in symptoms except HR 80. 45 minutes following injection, HR 70, dull headache beginning, throat feeling 'scratchy', but no difficulty breathing or chest pain at this time. Patient is employee at site and remained under observation for one hour. No further change in symptoms.
1026560	2/12/2021	PA	31	M	2/11/2021	2/11/2021	Vaccine was administered without complications. approx 5 mins after vaccine was given, patient reported feeling light headed, feeling like they were going to pass out. Patient was laying down, eyes open but was lethargic, still responding but slow to respond. HR was 47BPM however patient reported he was a runner and normally had a low HR. Blood pressure was 66/44 , patient was pale and diaphoretic. Pt was conscious the whole time, was put in supine position, cold compress applied. Patient denied chills, shortness of breath, difficulty breathing, nausea, chest pain. Pt was monitored, given oral fluids, and within 15 mins after event, vitals returned to baseline, HR remained bradycardic less than 60, no additional treatment was given and patient left after observation around 8:00pm.

1022707	2/11/2021	GA	69	F	1/14/2021	1/15/2021	Beginning on January 15 and lasting for 18 days, I experienced confusion, extreme migraine-strength headaches, ripping pain in chest, ribs, upper back, shoulders, neck, head. I could not sit or lie down comfortably. I saw Dr. on February 1 who ordered a CT scan which was clear. He prescribed Prednisone and Robaxin 500 mg. I saw Dr. again on February 4 at which time most of the pain subsided but my body was very sore. It is now February 11 and I still feel a bit of cloudiness, but am much better. Hopefully, I'll feel like myself within a few days.
1022743	2/11/2021	NE	37	F	12/23/2020	12/24/2020	Received my vaccine on 12/23, woke up 12/24 and was really tired as morning went on I got really cold and could not get warm, throat started to hurt, body aches and had low grade temp of 100.5, 12/25 felt the same but throat was really sore, 12/26 tested positive for Covid, 12/27 lost sense of taste and smell, 12/28 had horrible shortness of breath and burned when I breathed. 12/29 and 12/30--was very tired, body aches and generally did not feel well. 1/1 woke up and felt well, 1/2 had shortness of breath with activity and not feeling well in general. 1/3 had severe shortness of breath and tachycardia at rest--had to report to ER. 1/4--still had shortness of breath and burning while breathing and then had nausea, vomiting and diarrhea throughout the night. 1/5 went to er because I was so nausea and could not keep anything down and was having heart racing and chest pain. received fluids in er and nausea medications. 1/6, 1/7, 1/8 and 1/9 was very weak and still did not feel well, short of breath. 1/10 woke up and had lung burning, chest pain, shortness of breath and heart racing--was seen in ER for chest pain. week of 1/10 was very tired and short of breath. finally returned to work 1/18---still am short of breath, heart races and tire easily
1022779	2/11/2021	PA	49	F	2/4/2021	2/4/2021	Started with brain fog, unable to focus, fatigue, chills and body aches. Continued to progress to temp 101.8, shaking chills, EXTREME arm pain, upper back pain, chest pain, wheezing, SEVERE headache, nausea, vomiting, diarrhea, EXTREMELY swollen axillary lymph nodes enlargement. Symptoms started approx 2 hours after injection and proceeded for 6 days then started to slowly improved then resolve.

1022804	2/11/2021	NC	38	M	1/26/2021	1/26/2021	He states he received the vaccine and within 2-3 minutes he experienced dizziness, chest tightness affecting breathing, tunnel vision, disorientation. He asked for help and first they walked him to a chair and then laid him down. He recalls the MD taking his pulse and reporting it as 140. He states his awareness was blurred, but he remembers receiving the epi pen and then feeling better. He recalls sweating but not sure if it was before or after epinephrine. EMS arrived, started an IV and transported him to ER. He denies recalling pruritis, urticaria, oral face throat or tongue swelling, watery eyes, chest pain, cough, wheeze, nausea or emesis. ER observed him several hours. His discharge diagnosis was syncope. He denies recent use of antihistamines or H2 blockers. Per chart review, provider at the event recorded patient c/o hot dizzy, tachycardia, erythema bilat arms, chest with extension to the neck, diaphoresis, difficulty responding (single word only); treated with epinephrine with improved response.

1023358	2/11/2021	CA		F	12/19/2020	12/19/2020	encephalitis-like symptoms; Hearing loss; memory loss; paresthesias; visual disturbances; taste disturbances; dizziness; L-sided chest pain; staggering; elevated SBP 190-200; severe L-sided chest tightness; pre-syncope; elevated BP; DDimer was elevated; fell; intermittent memory lapses; nausea episodes; cant smell that last 1-2 hrs; L neck /head pain; L neck /head pain; Left axilla lymphadenopathy; rhinitis; lightheaded/lightheadedness; had an episode of pain all over; SOB; This is a spontaneous report from a contactable physician (patient). A 46-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot/batch number and expiration date were unknown), via an unspecified route of administration from on 19Dec2020 at a single dose for COVID-19 immunization. Medical history included ovarian cancer at age 29, food allergy to clams and escargot, and allergy to sulfa. The patient's concomitant medications were not reported. The patient previously took bactrim and experienced allergies. On 19Dec2020, immediately after vaccine had rhinitis, lightheaded, given Zyrtec and water and observed for a duration of 30 min. Three hours postvaccination on 19Dec2020, at home had an episode of pain all over and SOB (shortness of breath). 3 days later (22Dec2020), patient had L (left) neck /head pain and left axilla lymphadenopathy. On 23Dec2020, she fell in the shower. On the same day (23Dec2020) the patient had intermittent memory lapses, lightheadedness, nausea episodes, can't smell that last 1-2 hours a few times a day. Symptoms worsened on 03Jan2021, with severe L-sided chest tightness, pre-syncope, was seen in the ER with elevated BP. DDimer was elevated, CT Scan of Chest/Abdomen showed L axilla lymphadenopathy, negative for PE. CBC, Electrolytes WNL (within normal limits), still on 03Jan2021. Observed in ER for 7 hrs. and then discharged home. Intermittent symptoms continued. On 08Jan2021, patient had another severe episode while at work. She was noted to be staggering, and again was complaining of left-sided chest pain. She was taken to the ER by her colleagues on 08Jan2021 and noted to have elevated SBP 190-200. On 08Jan2021, patient underwent CT head negative, MRI negative, w/u (workup) for pheochromocytoma negative and COVID negative. She was started on prednisone and Norvasc

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

and discharged home. She continues to have intermittent episodes however they have decreased in intensity and last for about 1 hour. She described her symptoms as encephalitis-like symptoms. These include memory loss, paresthesia, visual disturbances, hearing loss, taste disturbances, and dizziness. These symptoms when severe have been incapacitating. She had been hospitalized for a neurological and infectious work up (including Brain MRI and multiple COVID tests) but no diagnosis has been yet identified. This symptom complex (unspecified) has persisted to now. She has not received the second dose of vaccine. She is asking how long mRNA, the lipid nanoparticles and the protein spike lasts in the body. Outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the limited information currently available, a possible contributory role of the suspect drug in the reported events cannot be completely excluded given the implied temporal association. However, underlying medical conditions may provide the alternate explanations. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1023361	2/11/2021	CA	75	F	1/26/2021	1/26/2021	tingling of lip and face; tingling of lip and face; numbness on left side of face/numbness was not in her throat but it was on her neck behind her ear; blood pressure spiked; tired; she didn't sleep well; Chest pain; This is a spontaneous report from a contactable nurse (patient herself). A 75-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), lot number: lot number: E19262, via an unspecified route of administration, left arm, on 26Jan2021 10:00 at a single dose to not get Covid and to protect others around her. Medical history included mini stroke at least 8-10 years ago and neuropathy in face from ministroke. Concomitant medication included gabapentin for neuropathy in face from ministroke. The patient had no prior vaccinations (within 4 weeks). The patient previously took pregabalin (LYRICA): but was changed to gabapentin. On 26Jan2021, the patient experienced tingling of lip and face, numbness on left side of face, blood pressure spiked and chest pain. On 27Jan2021, the patient experienced tired. The events were described as: After getting the vaccine, she experienced tingling of the lip and left side of her face. She had numbness on the left side of her face. The numbness was not in her throat but it was on her neck behind her ear. Her blood pressure spiked. She drove herself to the emergency room. Her blood pressure was 160 something over 101. She was unable to specify the exact number. Then her blood pressure decreased to 104 over 80 something and it increased to 202 systolic. She was unable to specify the reading. She was tired on 27Jan2021 because she didn't sleep well in the hospital. She signed out against medical advice. The patient had a full work up to include a CT scan, MRI and doppler: results were not provided (unknown results). The patient wanted to know if recommendations were made in regard to taking the second dose if they have had adverse events. The patient was hospitalized from 26Jan2021 to 27Jan2021 (1 day) for tingling of lip and face, numbness on left side of face and blood pressure spiked. Chest pain was considered medically significant by the reporter. The outcome of she didn't sleep well was unknown. The patient was recovering from tingling of lip and face and tired. The patient has not recovered from numbness on left side of face. The patient recovered from blood pressure spiked and chest pain on 27Jan2021.; Sender's

1024583	2/11/2021	AZ	35	M	2/11/2021	2/11/2021	Develop headache and slight nausea approximately 5 min after vaccine dose. Progressed to chest pain radiating to L arm then abdominal pain and finally vomiting over the course of about 30min. Patient was placed in an ambulance and transported to the nearest emergency department. He received 1 dose of 0.3mL epinephrine IM in leg from an autoinjector en route to the ED. In the ED he received promethazine for nausea/vomiting and tylenol for the headache and chest pain. Vital signs were normal. Patient was monitored in the ED for three hours with improvement in symptoms and then discharged home.

1024070	2/11/2021	WI	28	F	2/11/2021	2/11/2021	At 0954 EMS requested by medical standby at City Hall for the COVID vaccination clinic with report of an allergic reaction. Upon arrival found patient who received the vaccine sitting up in a chair, breathing normally and complaining of being itchy and chest tightness. Patient also complained of pain in chest when taking a deep breath. At 0955 25 mg of Benadryl was given to the patient by liquid oral route prior to arrival of EMS. Patient did say that itch had improved but still feeling tightness in the chest. Vitals were done by EMS at 1012 which were as follows: BP 164/120, HR 104, RSR, O2 sat 97%, RR 20, Effort normal. Patient was given a 2nd dose of 25 mg of Benadryl at 1030 because she; This patient did have a similar reaction after receiving the 1st COVID vaccine on 01/14/21 but symptoms. Additional information for Item 18: reported itching returned. The itchy feeling did subside after the 2nd dose of Benadryl. 2nd set of vitals at 1020 were as follows: BP 140/86, HR 101, RSR, O2 sats 96%, RR 16, normal effort. Patient did contact her father to respond to the scene to discuss options. Patient did not want to be transported to the hospital and decided to go home with her father and that he would keep an eye on her until symptoms subside. Patient stated she would seek medical attention if things change for the worse. Upon leaving, the patient was given 2, 25 mg Benadryl tabs from the health department to take home and use if needed. Patient did sign a release with EMS. Patient's vital signs prior to leaving at 1032 were as follows: BP 143/82, HR 89, RSR, O2 sats 97%, RR 16, normal effort; symptoms subsided without the use of Benadryl. Patient was observed for approximately 1.5 hours after receiving the 1st dose of COVID vaccine and was able to go home without incident.

1020062	2/10/2021	IN	21	F	2/8/2021	2/9/2021	My first dose of the vaccine was on 1/14/2021. I had a mild headache and experienced dizziness and nausea the night of receiving the vaccine. My second dose of the vaccine was 2/8/2021. I felt tired the night of receiving the vaccine and went to bed at 8pm. I woke up at 6:10am on the 9th with a severe migraine, severe nausea and dizziness. I ate a small amount and laid back down. I got out of bed at 9am and noticed both of my eyes and face were swollen and my throat was swollen. At this point I called my doctor and spoke to a nurse on the phone, she was short saying I needed to go to ER. Personally, I did not feel it was necessary at the time so I took a Benadryl and Ibuprofen. Throughout the day I continually got worse experiencing the same symptoms as the morning including sharp chest pain, restricted breathing, a low grade fever of 100.4, severe lower back pain and leg numbness. I took more ibuprofen and placed heat on my back. I took ibuprofen PM and woke up the morning of the 10th feeling better. Still have headache, lower back pain and swelling but is better than yesterday. I will notify my doctor today of the event that occurred yesterday (2/9/2021).
1018618	2/10/2021	SC	47	M	1/18/2021	1/18/2021	Shortness of breath; palpitations/increased heart rate; palpitations/increased heart rate; Immediate left arm/chest pain; Immediate left arm/chest pain; fatigue; body aches; This is a spontaneous report from a contactable physician. A 47-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EL3246), via intramuscular, on 18Jan2021 at single dose on the left arm for COVID-19 immunisation, administered at Hospital. The patient did not have a relevant medical history. No known allergies. No relevant concomitant medications were provided. No other vaccine was received in four weeks. The patient developed immediate left arm/chest pain, and fatigue/body aches. On 23Jan2021 (5 days later), he developed shortness of breath and palpitations/increased heart rate. Post-vaccination COVID test was not performed. The patient was not treated for the events. The patient was recovering from the events.

1020457	2/10/2021	NJ	40	F	1/3/2021	1/3/2021	I got the 1st shot-I have fever, chills, and fatigue for 2 days. The 3rd day I had chest pains and high blood pressure and went to the ER. They sent me home. I never felt good. My doctor did an ANA test and it was positive. I have weakness, pain and tingling in my legs, arms, feet and hands. I went to a rheumatologist and they did more testing. I am elevated for Inflammation and was sent to now a neurologist. 2nd dose- hours later I had shortness of breath, numbness in the left side of my chest going down into my left arm. My mom had to call 911 and they sent me to the hospital. I have now made an appt to see a cardiologist because my resting heart rate is low. I have never had issues to this prior.
1018413	2/10/2021	VA	34	F	1/20/2021	1/23/2021	Chest pain/pressure; Flushing; General fatigue; Presyncopal event; Migraine; Left arm tingling; Chest pain/pressure; This is a spontaneous report from a contactable nurse reporting for self. A 34-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number=EL3302), intramuscular on 20Jan2021 10:00 at single dose for COVID-19 immunization. Medical history included coeliac disease, polycystic ovaries, migraine, drug hypersensitivity to Sulfa. Concomitant medication included clarithromycin (MACROBID [CLARITHROMYCIN]). The patient experienced flushing and general fatigue. Presyncopal event and migraine on day 3 without prior indication 23Jan2021. Left arm tingling and chest pain and pressure. Therapeutic measures Motrin were taken as a result of flushing and migraine. Patient had Covid test type post vaccination on 23Jan2021 with negative result. Outcome of events was recovering. All events resulted in emergency room visit.

1021203	2/10/2021	WA	85	F	2/10/2021	2/10/2021	Pt reported dizziness, flushing, numbness in both hands to patient monitor. This RN assessed pt, who also reported chest pain, described as "angina" but said she had not had this type of chest pain before. Said she takes nitro for other chest pain but that pain is sharp and stabbing. Pain today described as "dull" and on left side of chest. Also reported nausea. VS: BP 130/82, HR 86, SpO2 98%. EMS called due to chest pain. While waiting for EMS, patient reported that pain started radiating from chest around to left back. No SOB, talking in full sentences with RN and son. EMS arrived and brought patient to ambulance. Pt was not transported to ED, returned to car to go home (son driving).
1020826	2/10/2021	NC	42	F	2/10/2021	2/10/2021	During post vaccine monitoring, at 14 minutes, patient began c/o feeling faint, tingling, heart racing and hot. When asked she described her tongue as tingling and her heart racing. Heart rate at this time was in the 130s-150s, o2 sat 97-99%, BP 180/100 in L arm. Patient appeared pale and reported that she felt like she was going to faint. Pharmacist administered 50mg of Benadryl, cool towel was placed on patients neck. Continued to monitor for 15 more minutes. HR began to decrease, patient drinking water, color appeared to return to face. After 14 more minutes, she c/o faint feeling returning, with chest pain. HR spiked again 120s-150s, BP 168/108, EMS was called, O2 sat remained 97-99%, EMS advised to administer 325mg ASA. Patient chewed ASA as instructed and drink water. EMS arrived at the 26 minute mark. Patient reported sharp chest pain 7/10 at that time, BP, EKG and glucose were normal per EMS. EMS advised ER visit for further tests and evaluation.

1020308	2/10/2021	ME	25	F	2/9/2021	2/9/2021	<p>Patient called in to the nursing supervisor at approx 02:40. She was not on the schedule but was stating that she was having a reaction to the Covid vaccination she recieved the evening before. It was noted that while she was talking with the supervisors her speech was thick and she stated that her tongue felt swollen and larger than normal. She also stated that her significant other told her she sounded different too. She stated she had redness from her earlobe to her wrist on her R side, which is where she got the vaccination. She got it at appx 18:30 she had said, and when she got it during the observation period she was noted to have a very red and hot arm, but overall she felt fine. She also stated that she has had a covid infection recently. She stated she took 1 childrens dose of benadryl but was worried because she is breastfeeding. We advised her to call 911. ***</p> <p>1000am- #2 vaccine given on 02/9/21 @ 610pm. felt ok for the first 15 minutes during the waiting period; the site was examined by the Medical assistant & was very hot to touch & red about the size of a baseball. She was dismissed from the vaccine clinic. She went home and around 7:30 pm felt swelling in her tongue & mouth. She disregarded this symptom and went to bed, she awoke @ 2:30 am and felt her tongue was more swollen & then called the nursing supervisor. Patient took Benadryl 50 mg at 0230am. NO response from the Benadryl. Went to the ER @ 0400 called 911, B/P was 155/88 & O2 sat 89%. She opted to go to the ER by private vehicle. Went to ER. She was give IV fluids, Benadryl & monitoring. Discharged from ER this am. Hx of allergy of bee stings. Stated this reaction was the same as a bee sting reaction. Discharged from the ER to take tylenol & Benadryl & monitor. During this call she stated that her tongue is still a little swollen, speech is clear, Denied SOB. Temp 99.8 during this call. Lymph nodes in her in neck are swollen- she said there is 1 area near her right collar bone the size of a golf ball. Currently nauseated, denied chest pain. She does not qualify for testing since she had Covid on 01/8/21. A VAERS report will be submitted today & I will add that ID # to this documentation. :PLAN Clear to work; yet verifying with physician if any additional instructions.</p>

1016764	2/9/2021		46	F	2/3/2021	2/3/2021	Day of vaccination, throat became swollen, chest pain in the evening that resolved. Also severe fatigue and nausea.
1016737	2/9/2021	NY	48	F	2/1/2021	2/2/2021	Severe muscle and joint pain began 2/2/21, along with fever, headache and mild nausea. MSK symptoms progressed over the next 24 hours to include intense fatigue and pain chiefly of the larger joints and muscle groups. On 2/4/21 at approx. 1100, I developed severe ballooning chest pain, SOB and pain with breathing. I was clammy and tachycardic. The balloon like pressure subsided and was replaced by a sharp right sternal pain. I was taken to a local ER where major pathologies were ruled out. While there I developed a painful cough as well. I was diagnosed with non specific chest pain and sent home. Since then I have continued to have excruciating/ pleuritic type chest pain, intermittent headaches and pain involving the smaller joints and muscle groups, such as wrist/ forearm, scalp and neck. The larger joints and muscle groups remain achy and stiff. I am still experiencing intense fatigue.
1016704	2/9/2021	OH	29	F	2/8/2021	2/9/2021	c/o chest pain/pressure today after vaccination yesterday, along with fever, chills, SOB, body aches. She was instructed to call her cardiologist immediately to report.
1016689	2/9/2021	MD	49	F	2/9/2021	2/9/2021	Patient was walking to car after her 15 minutes of observation. Patient felt heart racing, shaky and "strange" feeling in throat. Patient came back in. Patient given bottle of water. Vitals checked. Patient rested until she stated she felt "better". Shaking stopped and her heart rate felt normal again. Patient denied any chest pain. No rash noted, no swelling. Patient encouraged to get ride home but stated she was fine to drive.
1016148	2/9/2021	IL	19	F	1/27/2021	1/30/2021	Patient is a 19yo female presenting to the ED with chest pain. Patient received her second Moderna vaccine two days. Since then she has been having symptoms of chills and myalgias. This morning she had severe chest pain in the middle of her chest. It made it difficult to breathe. Patient had no side effects from 1st dose of vaccine and denies any symptoms prior to receiving 2nd dose.

1018015	2/9/2021	KY	31	F	2/3/2021	2/6/2021	Received second vaccine on 2/3/21 and started having chest pain on 2/5/21. Went to ER on 2/6/21.
1017445	2/9/2021	IL	89	F	1/29/2021	2/3/2021	Patient is a 89 y.o. female with a history of a TAVR that presented to the emergency room few hours after having a 40 min episode of chest pain. The patient states she was just eating and suddenly started having sharp pain on the left side of her chest. There was a little bit of associated shortness of breath, but not much. She states it was sharp in nature and seem to stay about the same for about 40 min. She states that she does seem to get chest pain sometimes when she vacuums, but usually if she sits down it immediately goes away. She reports that she saw PAC about a week ago and was thought to be a little bit fluid overloaded. She was started on a little bit of oral Lasix and was supposed to come see provider later in the week. She states she has diuresed very aggressively the last few days and is feeling quite a bit less short of breath. In the ER, her EKG did not show anything acute. Troponin was normal. BNP was mildly elevated, but her imaging did not show any signs of acute congestive heart failure. Her D-dimer was elevated. However, she was not having any pain while she was in the emergency room. Her pulse was normal and her oxygen saturations were in the high 90s.

1012553	2/8/2021	WI		F	1/21/2021	1/21/2021	bronchospasms; This is a spontaneous report from a non-contactable pharmacist. A female patient of an unspecified age received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EL3248, expiry date: unknown), intramuscular on 21Jan2021 at a single dose for covid-19 immunization. The patient's medical history included chest pain in the past (has experienced this on and off unrelated to medication administration). Concomitant medications were not reported. The patient previously took first dose of bnt162b2 on unspecified date for covid-19 immunization. The patient is not pregnant. The patient was not diagnosed with covid-19 prior to vaccination and was not tested for covid-19 post vaccination. On 21Jan2021, the patient complained shortly after second dose of covid vaccine, having what she felt were bronchospasms. Medical Emergency Rapid Response call was made. RRT personnel arrived and administered 2 puffs of albuterol inhaler with subsequent improvement of status. No other complaints of chest pain, etc. It was reported that the event resulted in doctor or other healthcare professional office/clinic visit. Therapeutic measure was taken as a result of the event. Outcome of the event was recovered on unspecified date in Jan2021.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported event cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

1012564	2/8/2021	MI	52	F	1/29/2021	1/29/2021	52-year-old female presents to the emergency department with complaints of left arm tingling sensation which is radiating up her neck to her jaw. She had just received the second dose of her Moderna COVID-19 vaccine. She was resting in the 15-minute waiting area and only had a few minutes to go when she suddenly developed the symptoms. She then felt lightheaded and as if she was going to pass out. They did check her vital signs there and then decided to bring her to the emergency department for evaluation. On arrival here she states that the arm seems to get more tingling sensation into her fingertips now and she has some tingling on the left side of her face including the left side of her tongue. She denies any chest pain or shortness of breath. No cough fever or chills. No swelling of the lower extremities or calf pain. Patient received Diphenhydramine 25mg IV x1, Famotidine 20mg IV x1, Ondansetron 4mg IV x1, Acetaminophen 1000mg po x1, 1000 ml Normal Saline Bolus x 2 boluses Pt discharged from ER at 1800 1/29/21 MD note on discharge =MD went to the patient's room and discussed her work-up with her. MD discussed the finding on the CT scan. They also discussed the findings of the CTA head and neck. MD reexamined the patient, and she notes that she continues to have some numbness in her right upper extremity and in her mouth, but notes that the numbness in her tongue is improving. MD offered this patient observation admission, as well as evaluation by neurology with an MRI of the head, however the patient declined this, noting that she would prefer to be discharged home. Patient lives at home with her husband and child, she is a nurse by occupation, and overall is healthy. Given that she has understanding into the nature of her pathology, will have somebody at home to help her if she needs it, and will be reliable for follow-up, I am comfortable discharging the patient at her request. MD extensively discussed return precautions with her, and she verbalized understanding and agreement with the plan

1012665	2/8/2021	TX	48	M	1/27/2021	1/27/2021	Moderna Covid Vaccine - Received 2nd dose of vaccine and acutely developed fever, chills, diffuse myalgia, and fatigue. Patient felt week to the point he could not walk. Denies headache, photophobia, neck stiffness, SOB, chest pain, cough, N/V/D, abdominal pain. Denies recent illness or sick contacts. Wife and patients denied any symptoms prior to receiving Covid vaccination. Past Medical History includes: metastatic clear-renal cell CA; receiving nivolumab/ipilimumab. SoluCortef 15mgAM/5mgPM initiated on 12/31. Last chemotherapy received on 01/22/21; S/P left nephrectomy In the ED, patient was started on vanc/zosyn/azithromycin, SoluCortef 100 mg, IVFluid and levophed (for MAP 62-64). Patient was admitted to the MICU for undifferentiated shock. Hemodynamically stable after weaned off low-dose levophed. Etiology likely infectious vs Adrenal insufficiency vs reaction to COVID vaccine. SoluCortef decreased to 50mg q6H. Acute kidney injury; likely secondary to shock.

1011286	2/8/2021	NY	54	F	2/6/2021	2/7/2021	On the afternoon of the day of vaccination (2/6/21) I have developed a skin rash on my chest and neck, but it went away after few hours. On Sunday I felt a strong pain in my right arm. In the afternoon (2/7/21) I developed a severe headache, started to feel chest pain, a bit of nausea, flushed skin on my cheeks. By about 5:00 pm I felt really bad and I checked my blood pressure- using electronic meter. The reading was 171/105 with pulse 91. I have no history of high blood pressure. I called my physician but there was only recorded message to go to ER in case of emergency. I didn't feel that urgent need so I called my friend who is a nurse and she advise me to take aspirin. I did not have one on hand so my husband went to the store and I took it (325mg) after 6 pm. By 5:50 pm my blood pressure went up to 181/108, with pulse 98. At 6:54 pm it went down to 148/95 with pulse 91. The headache was becoming dull and I started to feel a bit better. This morning my blood pressure continues to be high- 149/95 with pulse 70.
1010737	2/8/2021	MI		M	1/23/2021		chest pain; This is a spontaneous report from a contactable consumer (niece) who reported for her grandfather A male patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# unknown), via an unspecified route of administration at single dose on 23Jan2021 for covid-19 immunisation. The patient medical history was not reported. The patient's concomitant medications were not reported. The patient experienced chest pain on an unspecified date. The patient was hospitalized for chest pain from 24Jan2021. The outcome was unknown Information on Lot/Batch has been requested.

1010639	2/8/2021	MI	75	F	1/15/2021	1/1/2021	<p>accompanied with very severe chest pain; Pericarditis; woke up with a severe headache; severe pain; continues to have muscle pain; weakness; shortness of breath when she walks; This is a spontaneous report from a contactable consumer. A 75-year-old female patient received first dose of BNT162B2 (lot number and expiry date not provided), via an unspecified route of administration on 15Jan2021 10:30 at single dose for COVID-19 immunization. There were no medical history. The patient was not pregnant at the time of vaccination. The patient's concomitant medications were not reported. On 16Jan2021 04:00, she went to bed at night and woke up at 4 AM with a severe headache. She took Aleve and went back to bed. When she woke up at 8:30 AM her headache was very severe and was accompanied with very severe chest pain. She immediately took her to the ER. They did a very thorough work up to check on her heart and Aorta. They managed her severe pain with two doses of morphine followed by two days of Dilaudid. The imaging and symptoms left her with a newly discovered diagnosis of Pericarditis. The medical professions were sure this was a result of the COVID vaccine. They continued to treat her for a few days and sent her home with anti inflammatories to help. She continues to have muscle pain, weakness and shortness of breath when she walks. She is scheduled to take her 2nd dose on February 5th but we are very concerned and hesitant as we don't want to cause any more damage to her heart. The patient was hospitalized for events 'headache', 'chest pain;', 'pericarditis' and 'pain' for 4 days. The patient did not receive any other vaccines within four weeks prior to the vaccination and did not received any other medications within 2 weeks of vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has been tested for COVID-19. The patient underwent lab tests and procedures which included imaging: pericarditis on 16Jan2021 and Nasal Swab: negative on 16Jan2021. Therapeutic measures were taken as a result of all the events which included Colchicine and prednisone, morphine and dilaudid. The outcome of the events was recovering. The events "headache", "chest pain", "pericarditis"and "severe pain" were assessed as serious due to hospitalization and disability. The events "myalgia", "asthenia" and "dyspnea" were assessed as</p>

1008919	2/7/2021	TX	51	F	2/4/2021	2/5/2021	information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped.

1010105	2/7/2021		38	M	1/14/2021	1/25/2021	Eleven days after the vaccination the patient developed 2 days of heartburn followed by a worsening nonproductive cough, substernal chest pain, diaphoresis, palpitations, and an episode of near syncope. These worsened over about 6 days and then slowly decreased. During this time he was referred to the ED and then admitted to a civilian host nation hospital. Echocardiogram and CT scan were performed and a pericardial cyst was discovered measuring 7.4 cm. He was then referred to another facility for evaluation. The pericardial cyst was confirmed, now 6.5 cm and laboratory tests were performed on 4 FEB, but there was at that time no elevation in inflammatory markers. Cardiology and Cardiothoracic Surgery consultations were obtained, but the consultants and the attending physician (who is an infectious disease physician by training) did not think that the crescendo-decrescendo symptoms could be explained by the pericardial cyst, which was likely an incidental finding. A milder cough may have preceded these events by up to a year, and this may possibly be related to the cyst. The heartburn, chest pain, tachycardia, diaphoresis, palpitations, and near syncope may well be adverse reactions of the vaccine.

1007694	2/6/2021	ME	85	M	1/21/2021	1/22/2021	Patient presents today with his wife and son. He was recently hospitalized having developed a fever the day after his Covid vaccine 1 with associated confusion and some ataxia. He was admitted to the hospital overnight where an MRI scan suggested no acute change showing only moderate cerebral atrophy and some small vessel occlusive changes. He tested positive for Covid by PCR in the emergency department on 1/22. His oxygen saturation was stable. He did have a fever and describes falling off the toilet because of some generalized leg weakness and uncoordination. He has had some chronic left greater than right upper extremity sensory loss following prior cervical spine stenosis requiring urgent surgery in 3/2019. He has had some chronic left foot drop as well. He reports being somewhat deconditioned having spent some time in bed to the above episode but is now ambulating with a cane at home and has occupational and physical therapy in place. He has been mildly dyspneic on exertion above baseline but attributes this to some deconditioning. He did have an episode of lower dental pain with ambulation in the office that was more than usual though denies associated chest pain or pressure and has had no jaw or shoulder pain with exertion. Review of systems is negative for headache.

1008380	2/6/2021	SC	67	F	2/3/2021	2/3/2021	An hour and a half I became dizzy. Within two hours nausea and diarrhea. For 24 hours could not eat it drink without being sick. Then numbness and tingling in arms and legs. Day two face was numb. nurse saw twitching eyes ,hands and I had it all over. Chest pains when I got up. During the night of day 2 I woke with my entire body trembling. My face was swollen the entire day. Today is day 3. My lips twitch occasionally, my face has an occasional tingle, still have diarrhea and nauseous, I am trying fluids and and I just tried an egg. I feel like I have worms crawling inside my arms and legs. I was told by the pharmacy and school nurse that it would take 3-4 days to feel better. I am healthy and a teacher. This is very concerning.
1008588	2/6/2021	CA	90	M	2/6/2021	2/6/2021	Shortness of breath, chest pain 10 minutes after vaccine administration
1008820	2/6/2021	CA	24	F	2/5/2021	2/5/2021	Patient complained of headache after receiving Pfizer Covid vaccine. Client was sitting in waiting area post vaccine. EMT responded. Vitals taken at 1528: blood pressure 126/82, pulse 87, respirations 12, oxygen 98. Headache pain 4/10. Per client history of brain injury (encephalopathy) and weakened immune system. Client informed EMT had ate breakfast this morning and hydrated all day. Denied shortness of breath, chest pain, vision changes. Client kept in observation for 30 minutes. EMT reassessed at 1540. Headache still 4/10, same, not worsening or new complaints. Per client felt well to leave. Vitals: blood pressure 118/78, oxygen 99, pulse 80, respirations 12, alert and oriented. Client left facility with a steady gait at 1545.
1008781	2/6/2021	TX	47	F	2/6/2021	2/6/2021	Pain behind left scapula (shoulder blade) has persisted since about an hour after the vaccine being administered. No chest pain but shoulder blade pain becomes worse with deep breathes. So about 10 hours later, my wife still has bad enough pain to require a heating pad. Pain level is a 6 on a 1-10 scale even with the pain medications she takes every day for chronic pain.
1008570	2/6/2021		57	F	2/5/2021	2/6/2021	Heart began racing suddenly, to about 120-140 bpm. No shortness of breath, chest pain, sweating or any other symptoms. Lasted approximately 2-3 minutes after which heart rate returned to normal (72-76 bpm).

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1008544	2/6/2021	TX	68	M	1/25/2021	1/26/2021	Beginning about 12 hours after receiving the vaccine I started having really bad headaches, behind my eyes radiating to the back of the head. At about 15 hours post vaccine I had chills, fever. The chills and fever were bad enough that in addition to sleeping under two blankets I had to put on a thick fleece ?hoodie? and pulled the hoodie over my head. I developed about 48 hrs of nasal congestion, and some retrosternal chest pain. I had one episode of nausea with vomiting about 8:00 am the next morning. I had to take two 325 mg Tylenol every 4-6 hrs to deal with the headache and fever. The most severe symptoms of headache and fever subsided in about 24 to 36 hrs after the vaccine was administered. I had a lot of fatigue for several days, along with aches and pains. It took me about 5 days to really start feeling normal again, but the fatigue lingered for a few more days.
1008473	2/6/2021	TX	37	M	2/2/2021	2/2/2021	Tuesday afternoon began with a headache. Chills followed in the late evening. Body aches by Wednesday morning with continued headache. Neck stiffness and soreness began Thursday evening. Severe chest pains early Saturday morning (3am). Taken to urgent care - EKG showed irregularity and high level of troponin. Transported from there to the hospital. They did angiogram, and diagnosed me with pericarditis. The on call physician believes this was most likely caused by the second dose of the vaccine.
1008449	2/6/2021	NY	55	F	2/6/2021	2/6/2021	Headache, lightheaded, dizziness, bilat foot and arm numbness, chest pain, SOB
1008400	2/6/2021	PA	62	F	1/28/2021	1/29/2021	Immediate redness in arm at injection site, tender to touch, swollen and hot. Day after vaccine- severe chest pains and stomach pain lasting for 4 days. Heaviness on chest. Blood pressure was OK. Random stabbing in foot as if someone put a needle in the top of the foot. All of which is now gone. Feb 4, approx 1 week after injection, there is about a hard lump at needle site. Pt describes a similar to mosquito bite, very itchy. Red area of skin approx 2 inch diameter, visible raised lump hot to the touch
1008385	2/6/2021		51	M	2/5/2021	2/6/2021	fever 102, headache, muscle aches, chest pain

1004492	2/5/2021	NC	75	F	1/9/2021	1/1/2021	severe chills; Fever; Dizziness; not feeling quite right; heart pains; Nauseated; threw up; Tiredness; muscle aches; a little swelling in her face; weakness; This is a spontaneous report from a contactable consumer (patient). A 75-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) (Batch/lot number: EK5730) intramuscularly on arm left on 09Jan2021 10:00 at a single dose for COVID-19 immunization. Medical history included heart problems from May1966 and ongoing (heart problems/She had open heart surgery at that time and had stents put in a couple of times since then), bone spurs and arthritis in her feet. Concomitant medications were none. Patient used to receive unspecified injections in her feet because she has bone spurs and arthritis in her feet. Patient experienced heart pains in Jan2021, dizziness on 10Jan2021, not feeling quite right on 10Jan2021, severe chills on 11Jan2021, fever on 11Jan2021, nauseated in Jan2021, threw up in Jan2021, tiredness in Jan2021, muscle aches in Jan2021, a little swelling in her face in Jan2021, weakness in Jan2021. The outcome of the events was unknown. Patient received her first Pfizer vaccine on 09Jan2021. Patient explains she has had adverse reactions to the vaccine ever since she received it. Patient confirms she took the vaccine on Saturday, 09Jan2021. On Sunday, 10Jan2021, she started having a little bit of dizziness and feeling just not quite right. Sunday night, she went to bed and woke up at around 3:30 a.m. with severe chills and a fever. Her fever was a little over a 100. She states it took about 2 hours to get her chills under control. She took 2 Tylenol at that time. That day (11Jan2021) she ran fever off and on all day. The next day (12Jan2021), she seemed to be better. She had a low-grade fever, but she was better. She was just kind of tired from the day before. But then, that night, she ended up with the same thing again- she woke up at 4am with chills. Her fever had gone up 101.7, and she ended up taking 2 Tylenol and so forth. She got up that morning around 10 am, and was nauseated. She threw up that morning. She felt really bad. She was experiencing tiredness, muscle aches. (At this point it was about Tuesday (12 Jan) or Wednesday (13 Jan). There was one day during the day, she felt better, but a day went by and she ended up having the chills and fever again. Every time her fever

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

kept going up. Her fever this particular night was 102 something. About Wednesday night, when she had the chills and fever, her fever went up to 103.8. That next morning, she called her doctor's office and tried to get an appointment. She could not get an appointment with the office. Her office ended up doing a televist and sending her a Prednisone pack to take for the reaction that it seemed she was having. She started the prednisone pack which seemed to take the fever down and the chills ended up stopping. Caller clarifies further she believes she has recovered from the fever and chills. The Prednisone pack seemed to kind of make those symptoms go away. However, she still felt really bad. This went on all weekend again. Tuesday of this week, (19Jan2021), she still felt really bad. She called her doctor again and her doctor wouldn't see her because of the symptoms she is having after receiving the COVID-19 vaccine are the same symptoms of the actual COVID-19 virus. She clarifies further the adverse effects of the shot are also same ones as the COVID-19 virus. Her doctor suggested she either go to the Emergency Room or to an Urgent Care. Patient called the Urgent Care and they were able to do a COVID test on her to check and see if she did have COVID-19. She confirms this test was on Tuesday, 19Jan2021. The results came back negative. However, they did another swab test. The patient is unsure what the second swab test was for but was told it would be a couple days before they would have the results of this test. At this point, they put her on a Z-pak. Patient mentions she has heart problems. She has nitroglycerin for any problems that she has. She started having some heart pains when she was down to about 3 tablets of that Prednisone pack she was taking. When she took one of the Prednisone tablets, within 30 minutes of taking it, she started having chest pains. She clarifies it started in her throat and went down to her chest. She took 2 nitroglycerin's to get her feeling back to normal/better. Caller doesn't provide NDC, Lot number or expiration date for the Nitroglycerin she took when probed. Patient mentions her cheeks had been pink. She doesn't really know but she may have a little swelling in her face. She can't figure that out herself. She was experiencing dizziness and weakness. Today is the first day which is the 13th day after receiving the vaccine, she has felt like trying to get this stuff together and her

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

thoughts together to try and figure out what is going on with her. She tried calling her primary doctor and this urgent care and she couldn't get anybody to see her. Patient got her Prednisone pack filled at (Pharmacy name), (Address details) The prescription was issued to her on Thursday, 14Jan2021, but she didn't start taking the pack until Saturday. On Saturday, that's when her fever had went up to 103 and she knew she needed to take the Prednisone pack. They are 4mg tablets and she started out taking 6 tablets the first day and then her dose decreased every day. NDC: 164793723369, Lot: 20K0041P, she believes the second digit is a zero and not a "D", Expiry date: Aug2022. Z-pak: patient states she no longer has the box, therefore she is not sure of the dose and how it was prescribed. She makes the comment she believes the first day it was 2 tablets. NDC: Unknown, Lot: 7996030, Expiry: Feb2022. She clarifies she did not take Tylenol as stated earlier. She took Kirkland's brand, Acetaminophen. They are 500mg tablets. She provides the following product information: Lot: 2GE1779B. The last digit is either a "B" or an 8/, Expiry date: May2015; patient clarifies she knows they just bought this bottle, but she thinks her husband put his extra pills in the wrong bottle. No further details were provided or obtained in regard to this statement. The patient wants to find out about this and what is going on with her. To her understanding and her reading information, she is scheduled to take her next shot 27Jan2021. She is not supposed to take it then, correct? Investigations: patient confirms she had a COVID-19 test done (she is not sure what type of test- PCR, Antibody, etc), they swabbed her nose and the results came back negative. She had a second test done, where they swabbed her nose again, but she hasn't got the results back. She isn't sure what that test is for. Vaccination Facility Type was Hospital. Additional Vaccines Administered on Same Date of the Pfizer Suspect was no. Did any AE(s) require a visit to: Emergency Room was No, she is trying to keep herself out of the hospital. Physician Office? Her doctor would not see her but offered a virtual visit. She did go to the Urgent Care. Prior Vaccinations (within 4 weeks): Caller states she went to the foot doctor on 22Dec2021 (pending clarification). She was given injections in her feet because she has bone spurs and arthritis in her feet. Patient does not know

1005620	2/5/2021	CA	25	F	12/29/2020	12/29/2020	About one hour after injection: I had a burning sensation in chest and throat and swelling feeling; I felt a bit of throat swelling. I got very tired about two hours after and arm pain. The throat and chest burning/swelling sensation slowly dissipated within an hour or so. Around 4 pm, I got pretty bad heartburn - very rare for me. Very distinct heartburn feeling; uncomfortable and that lasted about an hour. I had body aches at night time before I went to sleep. The next day I woke up feeling fine. One week later, I had another response. I had my throat start to swell again and this time it was worse. I had itchiness on my arm on the 6th night but I didn't really notice it but that seventh day, I realized there was a rash and itchiness in my arm. I had broken out all over my face - tiny pimples had broken out. I contacted an allergist - I was getting scared about my throat. The allergist said they had seen this a few times after the vaccine - told me to take Pepcid and Benadryl. I did that and that took away the feeling in my throat and made me feel better. I continued both those OT meds for 3 or 4 days. On fourth day, I started getting throat swelling again and the rash on my chest - these were more mild symptoms than earlier but I called the allergist and he advised I take Pepcid and Zyrtec instead of Benadryl for three or four more days. That helped. After that I seemed to be good. On 13th of January - shortness of breath and chest pain. I spoke with Dr and got a COVID test. I had my inhaler at that point (I haven't had asthma in years and I had to take the inhaler a couple of different times throughout this time). 14th of January - Chest pain. 22nd of January - Chest Monday. On Monday, the 25th, I started taking - in advance of my second dose of Moderna- Zyrtec and Pepcid twice a day on the 25th; twice a day on the 26th - on morning of 26th, I took Zyrtec again an hour before the second dose of the Moderna vaccine. I got the 2nd dose on the 26th. (The days that I had chest pain - I took ibuprofen and that seemed to help.)

						vaccination, the patient has been tested with nasal swab for COVID-19 and resulted negative on 15Jan2021. Therapeutic measures were taken as a result of events. The outcome of recovered in Jan2021.; Sender's Comments: A possible contributory role of the suspect products cannot be excluded for the reported events based on the known safety profile and temporal association
1004266	2/5/2021 TX		26 F	1/5/2021	1/1/2021	hard large lump that hurts at the injection site /Left arm has a knot in it from injection site; hard large lump that hurts at the injection site; chest pain; shortness of breath; This is a spontaneous report from contactable consumer (patient). A 26-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK9231), via an unspecified route of administration into the upper left arm on 05Jan2021 at single dose as a precaution because she works in nursing home (COVID-19 immunisation). Medical history included Covid positive back in Oct2020. Concomitant medication included biotin and one a day women's vitamin. Family members have medical issues. Dad has heart tumors, seizure, sleep apnea and osteoporosis. Mom has asthma, diabetes, has had cancer, neuropathy and macular degeneration. The patient received first dose of the covid vaccine on 05Jan2021 and had some symptoms after the vaccine. On unspecified date in Jan2021, the patient hard large lump that hurts at the injection site, chest pain and shortness of breath; similar to when she had Covid positive back in October. She still has a lump at the injection side which has gotten smaller in size but still hurts to touch. Left arm has a knot in it from injection site; does not required ER or visit to physician's office. It feels like a bump with something in her arm. She doubts that is the case. She wanted to see if that was normal and when it might go away, especially since she should be getting second dose on 26Jan2021. She is a speech therapist. There is no prescriber. They came and gave to everyone all at once. It was really big at first. It felt like someone punched her. It was a big giant lump, but it is getting better. The injection was given in the upper left arm and it felt like it went into the muscle. The outcome of the event vaccination site mass was recovering, and the outcome of the remaining events was unknown.

1004210	2/5/2021		62	F	1/24/2021	1/24/2021	Anaphylactic reaction; A spontaneous report was received from a 62-year-old, female patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced an anaphylactic reaction. The patient's medical history, as reported, included 4 previous anaphylactic reactions since she was 9 years old, history of throat problems and swelling, bronchitis, and her brother died in 1997 due to an anaphylactic reaction to poison ivy and bee stings. Concomitant medications reported included thyroid medication (not specified), blood pressure medication (not specified), gabapentin, sleep medicine (not specified) and curcuma longa rhizome. On 24 Jan 2021, about 15 minutes prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. On 24 Jan 2021, 30 minutes prior to receiving the vaccine, the patient took prednisone (dose unknown), per instructions from her doctor due to her history of anaphylactic reactions. She did notify the vaccinators of her history and there was an ambulance present. About 15 minutes after receiving the vaccine, the patient started coughing, had heavy chest pain, trouble breathing, and felt like her throat was constricting more than usual. No rash developed. She approached the ambulance and asked if she could take diphenhydramine. She took one dose, followed by 3 other doses, and felt a bit better. Consent given for Safety to follow up with patient. Action taken with mRNA-1273 in response to the events was not reported. The outcome of event, anaphylactic reaction was resolving at the time of this report.; Reporter's Comments: This case concerns a 62 year old female patient with medical history of included 4 previous anaphylactic reactions since she was 9 years old, history of throat problems and swelling, bronchitis, and her brother died in 1997 due to an anaphylactic reaction to poison ivy and bee stings. Concomitant medications reported included thyroid medication (not specified), blood pressure medication (not specified), gabapentin, sleep medicine (not specified) and curcuma longa rhizome. She experienced a serious unexpected event of Anaphylactic reaction that needed treatment diphenhydramine. The event occurred approximately 15 minutes after first dose of the study medication administration even though the patient took prednisone prior to receiving the vaccine. Based on the

1005868	2/5/2021	WI	80	F	2/4/2021	2/4/2021	80-year-old female with a history of atrial fibrillation and coronary artery disease, was obtaining her first dose of the Moderna COVID-19 vaccine today, and about 10 minutes afterwards began feeling warm and diaphoretic and developing left chest pains and nausea, at approximately 11 AM. This lasted about 5 minutes and then subsequently resolved. She then got up to leave and again began feeling the left chest pain, diaphoresis, and again lasting about 5 to 6 minutes and then subsequently resolving. She does state a history of anxiety but did take Xanax this morning preventatively. However, she states she has had similar pains in her chest over the past month. She states these are not necessarily associated with any exertion and seemed to be somewhat better after antacids. She notes she has not had anything to eat or drink this morning which is not unusual for her and her blood sugar was 117 this morning.
1004568	2/5/2021	NC	38	F	1/19/2021	1/21/2021	Chest pain; numb hands; This is a spontaneous report from a contactable consumer, reporting for herself. A 38-year-old non-pregnant female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 19Jan2021 at 10:30 (at the age of 38 years old) as a single dose in the right arm for COVID-19 vaccination. Medical history and concomitant medications were not reported. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient did not receive any other vaccines within four weeks prior to the vaccination. On 21Jan2021, the patient experienced chest pain and numb hands. The patient did not receive treatment for the events. The clinical outcome of chest pain and numb hands was recovering. It was also reported that since the vaccination, the patient had not been tested for COVID-19. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.

1007332	2/5/2021	CA	29	F	2/5/2021	2/5/2021	After the vaccine was administered, 5-10 minutes later I began to feel a rapid heart rate. One of the nurses came to check on me, I described to her my symptoms, and she let me know if they get worse to inform her. In the next 5 minutes, my head began to hurt, as well as, some chest pain. She checked on me again, and said to let her know if things got worse. Within the next 5-10 minutes after, I had difficulty swallowing and speaking. I raised my hand, and the nurse came over, then proceeded to get help. They then took my blood pressure and heart rate. My blood pressure was 185/103 and I believe my pulse was 156 bpm. I was still having a hard time swallowing and speaking. They proceeded to get an epi pen and the doctor on site, as well as suggested to send me over the ER/ call 911. The doctor checked my lungs, and they noticed my blood pressure and heart rate was not decreasing to a normal level. I was then put in a wheel chair and transferred to the ER. At the ER, my blood pressure and heart rate was still elevated, as well as difficulty swallowing. The doctor ordered Benadryl via IV, steroids, and the epi pen. After having a reaction to the Benadryl, the epi pen was put on hold. After about 15 minutes, I began to feel better. I was put on IV fluids and observation. I was able to leave the ER around 12 pm 2/05/21. At this time, 7:22 pm, I am feeling better with mild muscle aches, and fatigue.
1007178	2/5/2021		29	F	2/2/2021	2/2/2021	Chest pain that started the evening of the vaccine administration, intensity 6/10 on the evening of and all of the next day. Has persisted more mildly with waxing and waning intensity since for the last 2 days.

1006939	2/5/2021	MD	21	M	2/4/2021	2/5/2021	I obtained my booster shot on my left deltoid at 2:30 PM 2/4/2021. I had slight soreness in my arm til 8:00 which the soreness disappeared. Around 2:00 AM, I was awakened by a pounding headache, fever of 102, and my upper left chest (unilateral between the midline of my left chest and the axillary region) started to hurt. I took Tylenol 1000 mg at 3 and took a hot bath (recommended by friend who also displayed a fever and headache). After a while, my fever began to lower but my headache and chest pain did not disappear and I could not sleep until 7 AM. I woke up today (2/5/2021) at 10 AM with a fever of 101.4, another pounding headache, and still unilateral chest pain. I took another 1000 mg of Tylenol around 10:30 AM and it only helped with the fever. I went back to sleep and slept until 4 PM. I understand that the fever and headache are normal symptoms but my chest pain does not seem like muscle soreness. It doesn't hurt when I touch it, it comes and goes every few seconds, I have 4 or 5/ 10 on the pain scale for most of the pain but it turns into 6 or 7/10 occasionally (10 being the worst pain). What does help with my pain when it is 6 or 7/10 is when I clench my chest really hard like I am flexing it. It is a sharp pain that stays for a few seconds before it disappears and it feels like a deep pain. I didn't want to take Tylenol again because I am about to max out (can only take 2 more capsules until 2:00 AM because it states not to take more than 6 capsules in 24 hours, and each capsule is 500 mg) (Also, the Tylenol does not help with the pain so I am only taking it for my fever.) I was wondering if anyone else reported this and if this is an adverse side effect. This has not cause any issues regarding my breathing but just pain.

1002102	2/4/2021	FL	37	F	12/18/2020	1/2/2021	The first couple days just some arm discomfort. January 2 I woke up about 3:45AM with chest pain, I thought it was heart burn. It didn't improve so I ended up going to the Hospital, they did test to rule things out. I had a little bit elevated ESR,CRP and little high white count with a left shift. They did an echo and they found pericarditis. They started me on treatment and by the next day I was pain free.
1002115	2/4/2021	CA	42	F	1/26/2021	1/27/2021	Chest pain, palpitations, severe headache, chills, fatigue X33 hours, severe headache 9 days later as well on 02/03/2021 at 2300 hours.
1002174	2/4/2021	PA	55	M	2/2/2021	2/3/2021	Urticaria and pruritus of both hands and wrists. Denies dyspnea, chest pain, rhinorrhea, nausea, and dizziness.
1002244	2/4/2021	WI	45	F	1/27/2021	2/1/2021	She is here complaining of electrifying pain and numbness in her left axilla, underneath the arm to the elbow, sometimes traveling down to the hand. She received her 2nd COVID vaccine on 1/27/21 in the left arm. She was fatigued on Saturday and Sunday was feeling better. Her arm pain started on Monday 2/1/21. She is unable to abduct her arm past 90 degrees. She is having trouble lifting and moving her arm. Her strength is equal in BUE. She has taken ibuprofen, tried warm packs and ice packs without relief. She is not having any neck pain, chest pain, SOB or pain that radiates to her jaw. There is no swelling in LUE/axilla. There is no rash present.
1002274	2/4/2021	OH	35	F	2/3/2021	2/3/2021	Patient arrived at Center, where public health clinic hosts the COVID-19 Vaccination POD on 2/3/21 at approximately 4:20pm. Patient received her 1st dose of COVID-19 vaccine-Pfizer Lot #EM9810. Patient reported having myasthenia gravis and having a history of allergies and carrying an EpiPen. Patient was advised by medic administering vaccine and RN administering questionnaire to wait for 30 mins in parking lot near medic vehicle and to honk her horn if she felt any sort of reaction. While waiting in her car, patient began to have trouble breathing and honked her horn. Medics identified her vehicle. Patient reported having trouble breathing, chest pain, tongue swelling, and a scratchy throat. Medics administered Epinephrine and Benadryl to patient and transported patient to Medical Center.

1002325	2/4/2021	WA	51	F	12/23/2020	12/23/2020	<p>This employee sent me an email on 12/23/20. "Subject: Re: Attention Covid Vaccine Volunteers Hello, I had received my vaccine earlier today and just awoken to chest pains. I do not think it wise to be there for my shift in the next 8 hrs. I will stay and observe for additional symptoms. I was on vacay and had out-of-office notice set for my email. I discovered this email yesterday while catching up on emails. I immediately called her. She described the details of the events; stated she has not sought medical care; all symptoms resolved spontaneously but still has some intermittent, mild SOB> She sent me this email describing the reaction: Here explanation of the reaction: Thank you for the follow up. Below is a list of symptoms I experienced after I received my initial dose of the Pfizer vaccine. I am scheduled to receive my 2nd dose next week on the 13th of January. following up: I received my shot at 8:15 am, within approximately 45 min I felt a very slight heaviness to my breathing something similar to allergy season breathing, and a slight headache on my rt temple. This was nothing that stopped me or slowed me down that day. At ~ 10:30pm I awoke from a deep sleep with SHARP chest pains, at 11pm chills, 1am fever and discomfort, 2am muscle aches. I slept on my left side to keep blood circulating to my heart which seemed to ease some of my discomfort. My first night was rough. I awoke Thurs (12/24) with a swollen left foot and leg. some rt leg pain, joint pain in my left knee. I pushed myself to get up and move and go about my day. Friday, I still had a little left foot swelling and pain, knee pain, but kept pushing. The handout says if symptoms persist for longer than 24-48 to seek medical care, I have not. Friday, (12/25/20)was Christmas and much of the day was non eventful. At ~ 530pm. I felt a bulging not in the center of my chest which was tender to the touch. This concerned me. I gently massaged the area, rested a bit but continued to move up and down the stairs. That discomfort and the bulge decreased within a few hours. Saturday, (12/26) 4:am and I noticed much of the swelling in my foot and legs has decreased, however, I now have bruising. The sore arm is gone, and I am hopeful that all is well. I forgot to mention, I have had intermittent persistent cough with slight sob, something similar to the start of allergy season, but it is brief. I have been coughing at night." I advised she contact her PCP</p>

1001072	2/4/2021	MD	89	F	2/3/2021	2/3/2021	About 10 minutes after vaccination she experienced chest pain. This lasted for several minutes and then subsided, but she was transported to the ED for evaluation.
1001026	2/4/2021	IN	31	F	2/2/2021	2/2/2021	Fever of 99.0+ for over 24 hours and went up to 101.1 . This happened with my first dose as well but the highest it went was 103.6 . Also had chills and body aches both times as well. This time I also felt aching through the right side of my body as well as on and off chest pain but only for a short period of time.
1000997	2/4/2021	TX	88	F	1/29/2021	1/29/2021	Right after leaving hospital. Pain down back of left side down to knee. After an hour or so, it went away. Then, next day, many aches and pains; Chest pain and aphasic; Called 911. EMS came and examined her. They stayed awhile. Gave her liquids. Pt slept rest of day Saturday. Next day, Sunday, she still had some minor symptoms. On Monday, she felt better.
1000995	2/4/2021	ND	40	F	12/30/2020	12/31/2020	About 24 hours after the vaccination (NYE), my last knee was achy, first I did not correlate it to the vaccine, but by the end of the day I could not walk. The next morning (01/01) my knee was better but my left hand was very stiff and painful and in the afternoon my left shoulder was very painful and I could not lift my arm. Next day (01/02) my shoulder was better but my left hand was swollen and very painful. I went to bed with a swollen hand and next morning (01/03) the hand was a little better, maybe 80% better, but my right shoulder was ridiculously sore that I could not lift my arm and I could not go to work because of that. That day I also had stiffness on both hands. I went to bed that night and when I woke up my shoulders and knees were ok but my hands were still stiff and sore. My feet were painful and bluish. Woke up the next day and my feet were fine but then my right hand was like 5 times its normal size, I could not open or close it, and that is when I ended up at the ER with lots of joint pain, my feet and knees were hurting again and I also had shortness of breath and chest pains at that moment. They prescribed me prednisone for the swelling. The day after the ER my fingers were numb, I totally lost the feeling on my fingers until 01/28/2021.

She was looking around and she could not remember names she was trying to figure out name street; Spasms/spasms were like in her back where her shoulders were and it was bulging; It hurt from her neck and up into her head.; It hurt from her neck and up into her head.; This is a spontaneous report from a contactable consumer (patient). A 77-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot EL3246, expiration date unspecified), via an unspecified route of administration on 10Jan2021 (around noon) at single dose (left arm) for COVID-19 immunization. Medical history included ongoing diabetes, ongoing blood pressure high/blood pressure, ongoing heart problems; heart disease, kidney disease, history of itching, fluid (imbalance), stroke so taking for clotting, history of neck issues and she was allergic to a lot of medications. Ongoing concomitant medications included ubidecarenone (COQ-10), zinc, torsemide for fluid, clopidogrel for had a stroke so taking for clotting, insulin glargine (LANTUS) for diabetes and isosorbide mononitrate, carvedilol, irbesartan and amlodipine, all for blood pressure. Patient reported that she got the injection on Sunday and then later she started to get spasms on 12Jan2021. These spasms were like in her back where her shoulders were and it was bulging and it hurt from her neck and up into her head. She mentioned she was 77 years old and sometimes she has to think about a word before she gets it out, but yesterday (14Jan2021) it was different. It was like she went blank. She was looking around and she could not remember names she was trying to figure out name street on and this lasted 15 minutes and then it went away. She confirmed she does not have it right now. It did not last a long time, but it scared her so bad. Then yesterday evening (14Jan2021), she started to have funny chest pain. She told her husband if it did not go away she would go to the ER. However, after an 1 hour it went away. It was like a sticking pain. The chest pain lasted for an hour and started around 18:00. On an unspecified date, she started itching at night. She has a history of itching, but this was out the box. She had hives on the knee. It was</p>

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

crazy. She itched all over. She had to get out of bed and sit in a chair until 1:30AM. She was still itching, but it was not as bad. Patient reported that due to the kidney disease she has itching, but the itching she was having after this COVID Vaccine was different and more. It was out of the box. She confirmed this was the first injection and now she was scared to get the second injection. Patient reported that the itching started when she went to bed. She went to bed around 21:00 and around 21:30, she got out of bed because she was itching so bad. She stated there was not anything different on the bed. It was the same thing that was up there the night before. She did not change the sheets or anything. She had to get up and sit in a chair and she could not believe how bad her knee was itching. She was itching on her knee, leg, arm, neck, and ears. She stated she takes a lot of medications. She was very funny with medications and they have to work with her to get the right one for her. Due to having these other conditions was why she wanted to get the COVID Vaccine. She reported she will have her blood drawn next week. The two that had her most worried was the memory loss and chest pain. However, these passed and she did not go the ER or physician office. She was afraid if she gets the second injection this will happen again and she may not come out as well from it. Prior vaccinations within 4 weeks was none. Outcome of events spasms/spasms were like in her back where her shoulders were and it was bulging and itching/itching on her knee, leg, arm, neck, and ears was recovering; chest pain was recovered on 14Jan2021 at 19:00; and outcome of the rest of events was unknown.

1003486	2/4/2021	MI	27	F	12/30/2020	1/27/2021	She presented to the hospital with acute typical angina approximately 72 hours after receiving her 2nd vaccine dose. The morning following her vaccine she developed fever, chills, generalized malaise, myalgias, and fatigue lasting about 48 hours. The following morning, she was awoken from sleep by a crushing substernal chest pain with associated typical anginal symptoms. Her initial troponin-I was elevated at 7.47 ng/mL and peaked at 19.19 ng/mL. An ECG demonstrated minimal ST elevations followed by an echocardiogram demonstrated preserved systolic function and an ejection fraction of 60-65%. Due to her elevation in cardiac enzymes and persistent angina, coronary angiography was performed revealing no obstructive coronary artery disease. She was diagnosed with suspected myocarditis and treated successfully with anti-inflammatory medication. In follow-up, she had an uncomplicated treatment course with complete resolution of anginal systems and improvement in troponin and inflammatory markers.

1003206	2/4/2021		55	F	2/3/2021	2/3/2021	<p>Patient felt she had warmth at site of injection, 89 HR 81. Patient says normal BP 120's/80's. Patient states she is not anxious. She then started feeling like her throat and chest were getting itchy. Continued monitoring and she felt she needed to be evaluated in ER. Taken to ER. ED notes as follows: 55 y.o. female who arrived by to the emergency department for Throat and chest discomfort associated with voice change and pruritic rash. Past medical history of food and environmental allergies, Addison's disease, thyroid disease, primary immune deficiency disorder. Half an hour ago, the patient received her first injection the Covid vaccine. Seconds later, the patient started having a pruriti rash where the site of the injection was. She then noticed her chest getting red and warm. About 15 minutes later, the patient noticed her voice becoming hoarse her and associated with throat and chest discomfort. Reports that she is unable to take a deep breath. Denies any noisy breathing, nausea, vomiting, abdominal pain, shortness of breath, difficulty swallowing, drooling. She has never been hospitalized for anaphylaxis. She denies any past medical history of asthma or COPD Vital signs demonstrate hypertension with systolic blood pressures into the 180-190s. No oropharyngeal swelling. Hoarse voice. Scleral injection present bilaterally. Chest wall nontender. Mild, blanching, erythematous, pruritic rash on anterior chest. Shallow breathing when asked to take a deep breath. Injection site covered with bandaid with no other obvious rashes or swelling patient arrived to the ED in no acute distress and in stable condition. She was complaining of throat discomfort with voice changes. She has never had an anaphylaxis reaction before. She was given benadryl, famotidine, and methylprednisolone initially for her reaction. With her hypertension and reported chest discomfort, epinephrine was not given initially. Her symptoms mildly improved with the initial treatment. Patient complained of chest discomfort and EKG showing T wave inverted in leads V4-5. She was given aspirin. Initial troponin negative and repeat was ordered. After four hours of observation, the patient reports her voice change has resolved but continued to have pruritis in different, migrating areas of the body such as ears, neck, and arms. 1330: patient complaining of increasing chest and abdominal pain. Described as a cramping chest pain that radiated to her abdominal.</p>

997304	2/3/2021	NJ	26	F	2/2/2021	2/2/2021	I am a pharmacist for pharmacy and received my first dose of Pfizer Covid-19 vaccine while at work by another pharmacist. Vaccine given around 2:15 PM on 2/2/21 Less than 5 minutes after vaccine - arm tingling at site of injection, arm tingling spread from injection site to fingers, tingling and pins/needles traveled through underarm area and moved across left side of chest, slight chest pain on left side, whole body started tingling, dizziness, racing heart. While experiencing all of these symptoms, I sat on the ground, took two tablets of 25mg Benadryl, drank water, and tried to breath steady to make dizziness go away. Working in this healthcare setting, I was aware I was having an adverse reaction to the vaccine and was prepared with an epi-pen in case of any severe anaphylaxis shock - I did NOT have to use the epi-pen. Less than 15 minutes after vaccine - the chest pain, arm pins/needles stopped, I felt lightheaded still, another co-worker checked my blood pressure which had risen to 178/120 and pulse of 120. About 1 hour after vaccine - still felt light headed, blood pressure still elevated at 158/107, pulse of 107. Around 5:45 PM - After consulting personal friend physicians, I was instructed to go to ER and have an EKG of my heart since my blood pressure and pulse had spiked so high and suddenly. I was able to find coverage at work so that I could leave my shift and get a ride to the emergency room. After 6 PM (admitted into ER) - upon admission blood pressure of 176/117 and pulse of 113

997226	2/3/2021	CA	52	F	1/14/2021	1/14/2021	Bleeding/ gastro intestinal bleeding; Bleeding/ gastro intestinal bleeding; woke up with chest pain; tachycardia; body ache; headache; This is a spontaneous report from a contactable other HCP reported for self. A 52-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number: EJ1686), via an unspecified route of administration at left arm on 13Jan2021 12:00 PM (that is 14Jan2021 00:00) at SINGLE DOSE for COVID-19 immunization. No Covid prior vaccination. Medical history included allergy to shellfish and Iodine, Kidney and pancreas transplant 10 years ago. Concomitant medications in two weeks includes mycophenolate sodium (MYFORTIC), Tacrolimus, Prednisone, Trazodone. The patient previously received first dose of BNT162B2 (Lot number: EJ1686), at left arm on 24Dec2020 14:30. No Other vaccine in four weeks. On 14Jan2021 09:30 AM, patient woke up the next morning with chest pain, tachycardia, body ache, headache, bleeding. Symptoms lasted from Thursday to Monday. A total of 5 days. Patient have never suffered from a headache and as of 20Jan2021, patient still had it. Every day got better and no longer have the other symptoms. The only other one is the gastro intestinal bleeding. Patient only see few spots of blood when go to the bathroom. She believed that is gastrointestinal because almost never had a period as a teen. No treatment received. Not tested covid post vaccination. Outcome of "Bleeding", "Gastrointestinal bleeding" was not recovered, of "headache" was recovering, of other events was recovered.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events haemorrhage and gastrointestinal haemorrhage cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

996603	2/3/2021	OR	43	F	2/2/2021	2/2/2021	I'm still not sure what to make of my reaction. Started to feel ?out of body?, slow and had left-sided chest pain at around 8 minutes after administration. Then flagged down a nurse. They checked my blood pressure at 196/110 (first one may have been 210/110)- I was sort of disoriented. Sat there for about an hour with repeated blood pressure checks, until my pulse went from 118 down to 90. They let me go home at 170/100. I do t have hypertension. Then went and laid down in my office nearby and my left upper arm turned bright red and became painful and slightly swollen. Took five hours for my blood pressure to drop to 118/80- my normal is 114/78. Still have weird chest pain and some SOB with exertion (not normal for me).
996600	2/3/2021		32	M	2/3/2021	2/3/2021	Tolerated first vaccine one month prior without incident. Today, developed 10/10 headache with photophobia starting five minutes after receiving the injection. Developed a cough and then crushing chest pain. Initial blood pressure and heart rate were within normal limits, and continuous pulse oximetry showed consistent Oxygenation of 98%. Patient was able to speak in full sentences although unable to take a deep breath. Pain was physically limiting, and patient was transported to ER, for immediate evaluation and treatment. At the ER, pateint was normotensive and nontachycardic. He received IV epinephrine and dexamethasone. Per paramedic report while in ER, patient shortly afterward developed hypotension with left

999387	2/3/2021	AK	45	F	1/11/2021	1/12/2021	The day after the second shot, I developed upper right sided chest pain and pressure, lateral to the sternum extending at times to mid-clavicular line. Sometimes it felt deeper than surface. I do have a scar from my port which was removed in 11/2020 and the location of the pain correlated at times with the scar but not consistently. I thought the pain was sore muscles since I had done some light weight exercises with my arms the morning of the vaccine. But the pressure aspect of it was different than sore muscles. And I could feel a localized pain when I swallowed or burped, like it was on the inside of my esophagus. The pain didn't seem to hurt with deep breaths. I thought it'd get better if it was related to muscles and the vaccine, but it just seemed to linger. I tried mylanta to test the esophagus theory and it improved. Then after a few more days of not resolving, I saw doctor. My biggest concern and fear at that visit was breast cancer recurrence. I was envisioning and enlarged node in my chest or lung. Eek! I had had a couple episodes at some point of painful swallowing prior to all this that I recalled in the visit so we opted to do an EGD. He also prescribed omeprazole which seemed to help. Had EGD done on 1-27-2020. Normal except for a loose GE junction which wasn't a surprise since I occasionally experience reflux. I'm seeing my oncologist next week for my usual 3 month visit. Thankfully the pain has almost resolved. Pressure is no longer there. Feeling way less anxious about cancer recurrence.

998953	2/3/2021		43	F	2/1/2021	2/2/2021	<p>Patient developed tachycardia at 0600 on 2/2/21 and reported to the ED with heart rate in the 190's. ED notes as follows. Discharged in stable condition with a Holter monitor. Initial Vital Signs [02/02/21 0713] Blood Pressure 139/93 Heart Rate 126 Respiratory Rate 18 Temp 37.2 °C (98.9 °F) Temp src Oral SpO2 99 % 43 y.o. female who arrived to the emergency department for Palpitations and tachycardia. Patient states that the symptoms started approximately 545 this morning while getting ready for work. She states that palpitations started spontaneously with no inciting event. She denies chest pain or shortness of breath. She states that she felt the palpitations and looked down to her watch and showed a heart rate into the 190s to 220s. Upon arrival to the emergency department her heart rate is in the 190s. When she was brought back to the room, her heart rate was around 120-130. Still denying any chest pain or shortness of breath. She did receive her second for Covid vaccine yesterday. No reaction with the first vaccine. No changes in medication, caffeine intake. Denies smoking, drinking, drug use. No history of similar events. Father has a history of a heart block requiring pacemaker. Medical history of melanoma varicose veins but no cardiac or pulmonary history including pulmonary embolism. Patient is a nurse in the neurosurgical unit as one of the case managers. During initial evaluation, patient was sitting in bed in no acute distress. Vitals signs stable tachycardia although better than initially arriving. Physical exam unremarkable. Labs indicate elevated D-dimer. We will proceed with CT PE. CT scan of scan shows no signs of PE there is evidence of left axillary adenopathy which is consistent with her vaccination yesterday. Upon repeat evaluation, patient was updated regarding lab and imaging results. Heart rate had improved greatly down to the 90s to low 100s. She was able to ambulate around without becoming grossly tachycardic, dizzy, lightheaded or shortness of breath. Unsure of exact cause of palpitations and tachycardia. Recommend outpatient monitoring with Holter monitor. Follow-up with primary care provider or cardiologist. Return to emergency department if symptoms return or new concerning symptoms occur. Treatment plan was discussed with the patient who was agreeable and exhibited understanding. Questions were answered to patient's satisfaction. Through shared</p>

994756	2/2/2021	MI		F	1/15/2021	1/16/2021	My mom who is 75 had an adverse reaction on from the COVID vaccine she took on Jan 15, 2021. She went to bed at night and woke up at 4 AM with a severe headache. She took Aleve and went back to bed. When she woke up at 8:30 AM her headache was very severe and was accompanied with very severe chest pain. I immediately took her to the ER. They did a very thorough work up to check on her heart and Aorta. They managed her severe pain with two doses of morphine followed by two days of Dilaudid. The imaging and symptoms left her with a newly discovered diagnosis of Pericarditis. The medical professions were sure this was a result of the COVID vaccine. They continued to treat her for a few days and sent her home with anti inflammatories to help. She continues to have muscle pain, weakness and shortness of breath when she walks. She is scheduled to take her 2nd dose on February 5th but we are very concerned and hesitant as we don't want to cause any more damage to her heart. Please have somebody contact us and let us know how to proceed. Thanks.
994774	2/2/2021	MN	56	M	1/28/2021	1/29/2021	22 hours later I got chills, goosebumps, I felt terrible. I felt fatigue, a headache and muscle aches and chest pain. I Went home and laid down. My temp read 102.9. Called a nurse and she was concerned because of my heart condition. come in to the hospital if the chest pain lasts longer than 5 minutes. I didn't go in because I figured I could use a nitroglycerin pill if it got too bad. The following day I had chest pain every few hours or so. the waves of chest pain only lasted about 5 minutes a piece.
994783	2/2/2021	NY	37	F	1/30/2021	1/31/2021	Dizziness, spinal pain, Pain all over the body, the injection arm, and chest. The chest pain is extreme.
994816	2/2/2021		26	M	1/21/2021	1/21/2021	10 minutes after the second dose, patient developed headache, lightheadedness, dizziness, shortness of breath/anaphylaxis. Transferred to ED, and experienced chest pain, SOB, tightness in throat. Patient was sent to the emergency department. Received 25 mg Benadryl prior to arrival as prophylaxis. Received Combivent in the ED, and symptoms improved. Patient was observed for 4 hours in the ED. Eventually patient was discharged home.

994450	2/2/2021	MI		F			<p>Pulmonary embolism; Chest pain; Shortness of breath; Arm swelling; Soreness in her arm; Local reaction in the lymph nodes of the axilla; A spontaneous report was received from a physician concerning a female patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and developed pulmonary embolism, arm swelling and soreness, shortness of breath, chest pain and a reaction in the lymph nodes of the axilla. The patient's medical history includes pulmonary embolisms. Relevant concomitant medications were not reported. On an unknown date, approximately five days prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. The patient experienced a pulmonary embolism, arm swelling, arm soreness, a local reaction in the lymph nodes of the axilla, shortness of breath, and chest pain. CT scan showed small acute embolism. Action taken with mRNA-1273 in response to the events was not provided. The outcome of the events pulmonary embolism, arm swelling and soreness, shortness of breath, chest pain and a reaction in the lymph nodes of the axilla were not reported.; Reporter's Comments: Company Comment: This spontaneous report concerning a female patient who experienced unexpected serious event of pulmonary embolism and nonserious events of arm swelling and soreness, a reaction in the lymph nodes of the axilla, shortness of breath, and chest pain. The patient developed the events on an approximately 5 days after the first dose of the mRNA-1273 vaccine (Lot #: unknown, expiration date-unknown). Pulmonary embolism was confirmed via CT. There is not enough information to adequately evaluate and assess the event of pulmonary embolism. Swelling and soreness, a reaction in the lymph nodes of the axilla are temporally associated with the vaccine administration and in the absence of any other etiology, a causal association between these events and the administration of mRNA-1273 vaccine cannot be excluded. main field defaults to 'possibly related' for all events.</p>

994269	2/2/2021	MA	29	F	12/29/2020	12/29/2020	Developed severe headache nausea facial and neck swelling, chest pain and respiration. Called PCP. prescribed Benadryl next day, increased swelling to include left side of face and eye. DX Bell's Palsy
993806	2/2/2021	FL	73	F	1/13/2021	1/14/2021	bad headache; a lot of muscle aches and pain; body aches from her toes to top of her head; arthritis that was acting up because it was cold; arthritis that was acting up because it was cold; chest hurts, left center of chest sharp pains; This is a spontaneous report from a contactable consumer (patient). A 73-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date: not reported), via intramuscular route of administration on 13Jan2021 at a single dose in the left arm for COVID-19 immunization. The patient's medical history included blood pressure and arthritis. Concomitant medications included unspecified blood pressure medications and some "probiotic type thing". The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 14Jan2021, Thursday night, the patient had a lot of muscle aches and pain and has body aches from her toes to top of her head which were persisting. She thought it might be her arthritis that was acting up because it was cold but states it is more than that. Her chest also hurts, not constantly, towards the left center of her chest, what were like sharp pains but it was not normal. She is still having the chest pain, states it is not anything she can clock by time, it goes and comes back, only lasts a very short time, it hurts about a minute or two and then goes away. Last night (18Jan2021), she also developed a bad headache that went away when she slept but now that she is awake it is coming back. At the time of report, the outcome of the events not recovered. Information about lot/batch has been requested.

995017	2/2/2021	MN	45	M	1/12/2021	1/28/2021	On 1/28/2021 at 0545 hours as I was on my way into work when I started to have severe right side chest pain, so much so that I had to pull over. Shortly thereafter ambulance arrived on scene at which time it was determined that I would be transported to the hospital. Once there, a series of tests were conducted, one of which was a D-Dimer blood test to rule out blood clots. That resulted in an elevated count to which a CT scan was ordered. The result of the CT scan revealed that I had 2 Pulmonary Embolisms, one in the upper lobe of my right lung and one in the middle lobe of my right lung. Due to me being what the doctors said was a healthy 45 year old with no underlying conditions or signs of DVT (deep vein thrombosis) they deemed me low risk at that time and advised I was at low risk of dying in the next 30days. However, they advised that at any time, the clot could possibly become dislodged and cause worse problems, possibly death if time is not given to the body to dissolve the clots. Ultimately it was determined that I be discharged and prescribed blood thinning medications to help thin the blood to prevent further clotting should I have a clotting issue (undetermined at this time).
993142	2/2/2021	CA	50	M	1/19/2021	1/26/2021	On 1-26-2021, he presented to ED after waking up at 1AM with lip swelling and diffuse itchy rash. Rash involved both forearms, scalp, chest, abdomen, back, and legs. He took 50 mg of Benadryl at home, but woke up with worsened symptoms. Denied unusual foods, soaps, detergents, colognes, or medications. Patient denied shortness of breath, throat or intraoral swelling or pain, chest pain, palpitations, cough, sore throat, nasal congestion, rhinorrhea, fever, chills, loss of sense of taste or smell, abdominal pain, n/v, diarrhea or dysuria. Patient was treated with epinephrine 0.3 mg SQ, Solu-Medrol 125 mg, Benadryl 25 mg IV, and Pepcid 20 mg oral. Patient was re-evaluated an hour and a half after receiving medication and lipedema and urticarial improved. Patient was provided with an Rx for EpiPen kit, prednisone 40 mg daily for 3 days. He was told to follow up with his PCP.

<u>VAERS_ID</u>	<u>RECVDATE</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
994134	2/2/2021	NY	42	F	1/26/2021	1/27/2021	<p>I am going to describe all my symptoms so far in detail. Shortly after the shot in the medical observation area I experienced mild nausea that went away for the rest of the day. About an hour after the injection, I experienced nasal drainage in the back of my throat that lasted about 30 minutes. 3 hours after my shot, the arm pain at injection site began, followed by 6 hours later moderate to extreme fatigue that did not cause me to be sleepy or drowsy--simply fatigued. I had enhanced sense of taste and smell. On Wednesday, 1/27 I woke up seeming okay and tried to work at my computer from home. I experienced light-headed and dizziness, and a headache that feels like pressure, and sinus pressure at the bridge of my nose. I had to disengage from work. After lunch around 2 PM I had extreme fatigue and had to lie down in bed the rest of the afternoon and evening. I have moderate nausea that comes in goes in waves. This morning, Wednesday, 1/28 I woke up with nausea and ate breakfast with a heightened sense of smell and taste. I logged into work and the lightheadedness and dizziness began again (also sort of in waves, though the headache is more pervasive and less wave-like than the nausea), along with waves of moderate nausea and headache. The arm pain at the sight of injection has significantly abated from a punch to mild pain. The "sinus" or sinus pressure on the bridge of my nose seems only a fraction improved. The headache or pressure has moved from the back of my head to the right side of my head. I had no body aches, but this morning has mild to moderate body aches this morning in my legs and hip bones. 1/29 I woke up with 20%-30% reduced symptoms of nausea and headache, but the dizziness and sinus pressure on the bridge of my nose remain the same. I still have enhanced taste and smell (a sensory plus it's not a distorted or odd enhancement, simply the same flavors and tastes enhanced). The ache that began yesterday in my lower body, my legs still ache, though it feels more like numbness than an ache. I tried doing some stretches which felt good, but my legs still feel the same after stretching. Pain at the site of injection is reduced 90%. There are some strawberries sitting next to me, and I can smell them acutely. Yesterday, 1/30, I woke up with mild nausea and fatigue. This nausea dissipated in the morning, but I felt too fatigued to do Pilates. The waves of dizziness and</p>

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

waves of nausea returned mid-day and I had a low-grade fever of 99.4 (my temp. Tends to run slightly lower than 98.6, as I take it regularly). The pain/pressure in the bridge of my nose has reduced 30%, but still remains. The ache or numbness in my thighs remains the same. This morning, 1/31, my temp is normal at 98.6, but I have mild waves of nausea and moderate waves of dizziness. The pain/pressure on my nose remains the same as yesterday. I have some mild ear pressure. My thigh weakness remains the same. I am too fatigued to attempt Pilates. Acute sense of smell and taste remains the same. The headaches or pressure also seem improved since Saturday 1/30. Monday, 02/01 - ah back to work I woke up with moderate nausea and pretty intense body fatigue and muscle aches in my lower body. I had to work, and I just wanted to crawl back into bed. I worked anyway, also the fatigue tends to worsen mid-day. The dizziness is moderate in waves, and the headache is still mild, along with that mild sinus pressure on my nose. I was in bed after dinner but could have rested all day. 02/02 I awoke with a very mild nausea! The intense fatigue (which worsened several days past my vaccine) was mild. I was ready to attempt my regular Pilates routine, and I did it! My muscle aches are mild to moderate (also, why are my muscle aches mostly confined to my thighs and hips I do have vague pain at the injection site, but its vague, and I use my whole body in Pilates) dizziness waves are back as I sit here typing and get ready to login online to my job staring at the computer screen is jarring to the dizziness waves and reminds me of the mild headache. This is the best I've felt since 1/27 through mid-day I tend to worsen and dizziness that is moderate is disturbing. The heightened sense of taste and smell also seems to have waned a bit in the past two days, back to what I was per usual? I tend to have an acute sense of smell and taste. *I would like it noted in light of new evidence that many people that have had COVID are experiencing intense reactions to the first dose that it is quite likely that I had COVID back in March when my learning center (I work with students age 4-adult, some of which are learning disabled and have autism) emergency closed because a client called to say she was positive for COVID. I had taken her sons temperature the day before. Me, and my two co-workers on my management team were also feeling sick. I had a

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
993637	2/2/2021	IN	34	F	1/18/2021	1/18/2021	<p>sore throat and chest pains for approx. a month, but at the time COVID testing was not widely available. Since then, My co-worker has tested positive twice for the antibodies, and her husband, who was also sick at the same time, has tested negative twice. I tested negative once for the antibodies, though given my job, my commute on the subway during rush hour my co-workers positivity, and my intense reaction to the first dose I most likely had COVID. My boyfriend's roommate recently also revealed that he is positive to the antibodies, and he was literally sneezing and coughing in the same room with us this past summer and spring. I think a 2nd dose of the same vaccine will cause fainting and vomiting, and the need for two weeks off of my work. This dizziness is alarming. I'm also thinking not having antibodies means nothing in terms of my body and immune system recognizing the vaccine and the virus, making me more ill than when and if I actually had COVID in March or last year.</p> <p>Chest pain; Joint pain; Headache; Low grade fever; Body aches; dose number=1: 18Jan2021 07:00 PM; dose number=2 26Dec2020 04:00 PM; dose number=1: 18Jan2021 07:00 PM; dose number=2 26Dec2020 04:00 PM; This is a spontaneous report from a contactable nurse (patient). A 34-years-old female patient (not pregnant) received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration at left arm on 18Jan2021 19:00 at single dose for covid-19 immunization. Medical history included allergies to penicillin (reported as PCN), azithromycin (reported as Z-Pack), hydrocodone bitartrate, paracetamol (NORCO). The patient's concomitant medications was reported as none. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The historical vaccine included the first of BNT162B2 on 26Dec2020 04:00 PM at right arm for covid-19 immunization. The patient experienced chest pain, joint pain, headache, low grade fever, body aches on 19Jan2021 10:00 with outcome of not recovered. No treatment received for the adverse events. No COVID prior vaccination, since the vaccination the patient hadn't been tested for COVID-19. It was not reported as serious. Information on the lot/batch number has been requested.</p>

995224	2/2/2021	TX	92	F	1/14/2021	1/19/2021	Cardiac arrest; Pain on her upper right chest; Lot of pain in lower abdomen; Pain underneath arm; Thought it was muscle aches; A spontaneous report was received from a nurse concerning a 92-year-old, female patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and developed upper right chest pain and underneath the arm, severe abdominal pain, muscle aches and cardiac arrest. The patient's medical history was not provided. Concomitant product use was not provided by the reporter. On 14 Jan 2021, approximately five days prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 intramuscularly in the arm for prophylaxis of COVID-19 infection. On 19 Jan 2021, the patient developed upper right chest pain and pain underneath the arm. They thought it was muscle aches. Sometime later, the patient developed a lot of pain in the lower abdomen. The called emergency services and an ambulance arrived but the patient then suffered cardiac arrest. Treatment for the event included tramadol. Action taken with mRNA-1273 in response to the events was not applicable due to the patient was died. The patient died on 19 Jan 2021. The cause of death was reported as cardiac arrest. Autopsy were not provided.; Reporter's Comments: Company Comment: This case concerns a 92-year-old female patient who experienced unexpected serious events of cardiac arrest, upper right chest pain and underneath the arm, severe abdominal pain, muscle aches. The event occurred 5 days after the administration of the first dose of the vaccine mRNA-1273 vaccine (Lot #: unknown, expiration date-unknown). Although a temporal association exist between the events and the administration of the vaccine, in the absence of critical details such as the patient's medical history, any diagnostic test or autopsy result, adequate evaluation and assessment cannot be established. Main field defaults to 'possibly related' for all events.; Reported Cause(s) of Death: Cardiac arrest

993659	2/2/2021	WA	90	F	1/11/2021		<p>Chest pain; shortness of breath and difficulty breathing; This is a spontaneous report from a contactable consumer (patient). A 90-year-old female patient received their first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date not reported), via an unspecified route of administration on the left arm on 11Jan2021 at single dose for COVID-19 immunization. Medical history included atrial fibrillation from an unknown date (AFib, diagnosed around 10 years ago), pulmonary issues from an unknown date and unknown if ongoing (pulmonary issues started within the last year), bad heart from an unknown date and unknown if ongoing. There were no concomitant medications. The patient experienced chest pain, shortness of breath and difficulty breathing on an unspecified date. The patient further reported that she has a lot of the symptoms that she lives with daily, she has a bad heart, has A Fib, has a pulmonary doctor and she discussed this with her doctor and they told her to go ahead and get the vaccination, so she went ahead with the vaccine, about 3-4 days later, got these chest pains, she has not had any chest pains connected to her Afib before, she also had shortness of breath and difficulty breathing 3-4 days after the vaccination, when she sat down and waited for this to pass, when it did pass, does not know if it was 5 min or 10 minutes, when that went away she felt very good. The patient also reported that she has not had any more chest pains since the first episode, she is still struggling with the difficulty breathing but unsure if this is just her body and prior conditions or due to the vaccine. Does not know what it was, thought maybe she had a heart attack, wants to know if she should go ahead and get the second vaccine. Does not want to get any of the side effects worse than what she had, states someone told her the second one hits you harder and wants to know if this is true. The patient did not recover from shortness of breath and difficulty breathing while the outcome of the rest of the events was unknown. Information on the batch number/lot number has been requested</p>

1000858	2/2/2021		61	M	1/15/2021	1/15/2021	Angina Narrative: Pt presented to the ED with persistent chest pain and shortness of breath for 6 days after receiving 2nd dose of covid vaccine. Symptoms began morning after receiving vaccine. Negative work up, however pt is high risk of cardiac events. Given ASA and nitro for ongoing chest pain that is possibly cardiac in nature. Pt admitted.
996496	2/2/2021	MN	41	F	1/31/2021	2/2/2021	Around 10am today I started having chest tightness and pain, some shortness of breath. It was constant and every time I got up to walk around my BPM (on my Fitbit) went up to about 120. I am normally around 70 and even when sitting still it was 80-95. I went to urgent care around 1 and saw Dr. They checked my blood pressure several times and it was between 118-126/84 (normal for me is about 105/70). They did a PCR test for COVID but later called to tell me the sample was mislabeled. In the meantime I went to a rapid testing site and got an antigen test that was negative. Dr opinion was that the reaction was most likely an immune response to the vaccine. He said I should go in if symptoms last longer than 1-2 more days or if they get worse. They said I could repeat the PCR test if I needed to be seen again but felt pretty confident about the antigen test results. I am still having the same symptoms tonight, the same severity. I have no other symptoms of COVID and did not have any other vaccine side effects besides expected/mild ones. I had a little shortness of breath last night before bed but the chest pain didn't start until today. I've gotten all scheduled vaccines throughout my life plus some for travel and have never had a reaction. I have never had anything like this chest pain and have no history of heart issues.
996491	2/2/2021	OR	58	F	1/23/2021	1/24/2021	Patient had acute fever, mild chest pain and tachycardia about 12 hours after vaccine. Since then she has had mild chest pain, fatigue, lymphadenopathy

995250	2/2/2021	GA	64	F	12/28/2020	12/28/2020	felt really sick; chest pain; bad headache; it spiked blood pressure the very first day/Her blood pressure spiked the first day; This is a spontaneous report from contactable consumers (one is patient). A 64-year-old female patient received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL0140), intramuscularly on left arm on 28Dec2020 at single dose for COVID-19 prophylaxis. The patient medical history included: Chronic hypertension and elevated cholesterol levels. Concomitant medication included ongoing acetylsalicylic acid (BABY ASPIRIN) for chronic hypertension and elevated cholesterol levels, then developed GI problems and she skipped days. On 28Dec2020 she received the 1st dose of the Pfizer vaccine. She was scheduled for her 2nd dose on 22Jan2021 (Friday). The patient developed a bad headache on 28Dec2020 that evening was better by the next morning then came back, it spiked my blood pressure the very first day, it usually responded to the medication but this time it didn't. The patient's blood pressure stayed like that for 2 to 3 days, she felt really sick on unknown date, on the 3rd day on 31Dec2020 the patient had some chest pain, but later that day she was feeling back to normal. Right now she felt fine, her blood pressure was back to my normal, baseline. Weight 153-154 lbs. Reporter said that what concerned her most was that her blood pressure spiked. She said that has never happened in the past that with her blood pressure before. Her blood pressure did not respond to her medication. The patient was trying to research the high blood pressure and hadn't been able to find any information and want to know if there was any information can provide. The patient wanted to take the vaccine, she just wanted to be sure she would be okay. The outcome of event headache was not recovered. The outcome of events blood pressure increased and chest pain was recovered on unknown date. The event of rest event was unknown.

995544	2/2/2021	AZ	79	F	1/20/2021	1/28/2021	On 1/28/2021, starting having severe pain in chest/lungs and especially a quarter size area above rib cage located on top of right breast next to breast bone. This area was especially painful when pressure applied. No shortness of breath. Symptoms lasted for about 10 hours and subsided somewhat on 1/29/2021. Severe pain symptoms returned early morning on 1/30/2021 and resulted in my going to the ER at the local hospital around 10:00 a.m. An EKG , CT scan, and blood tests determined no heart attack or other life threatening conditions and I was released from the hospital around 4:00 p.m., still experiencing pain without a cause being determined. Pain and painful area were no longer present on 1/31/2021.
995366	2/2/2021	AZ	62	M	2/1/2021	2/1/2021	High temperature, difficulty breathing pain in abdomen and ribs. Shallow breathing to try and avoid cough as it hurts so much. Temp in the middle of the night reached 102.4F Chills and uncontrollable shaking.
995705	2/2/2021	PA	40	F	1/3/2021	1/3/2021	after the vaccine, I started to feel Body aches, chills, nausea, gum pain, I felt fine prior to the vaccine, I went to an Express Care they did a Covid 19 test, result was negative, I had a video visit with my doctor because I developed cough, chest tightness and shortness of breath, they did a 2nd Covid 19 test result was negative, The cough become persistent and the cough caused pain in my chest and back, The Doctor prescribed guaifenesin with codeine, albuterol and something for my gums. the cough and pain in chest was worsen and the Doctor gave me the zpack, I was out of work for 10 days. they said I had an acute URI
995711	2/2/2021		47	F	1/28/2021	2/1/2021	Moderate pain at site x 1 day, short intermittent sharp pain in chest, nausea; left side facial sensitivity to touch and cold, nausea, and diarrhea
995724	2/2/2021	AZ	37	M	1/19/2021	1/27/2021	A couple days later I began experiencing a slight sore arm. Several days later I had a constant headache. Around January 25 I began experiencing non-stop chest pain and on January 27 woke up with severe pain in my arm. I went to the emergency room and was diagnosed with an NSTEMI.

995929	2/2/2021	SD	27	M	2/2/2021	2/2/2021	Patient started experiencing chest pain, headache about 2 minutes after vaccine. He reported throat tightness, dizziness and difficulty breathing. Epi pen administered at 1405. Patient had nausea after epinepherine. No swelling or rash noted. EMS arived at 1415 and he was transported to the emergency department.
995505	2/2/2021		29	F	1/30/2021	2/1/2021	Started with body pains a few hours after injection. The next day I had chest pain but more like muscle chest pain.. took Tylenol with no relief. My bank gave out 2 days after vaccine without doing anything. I was just standing and it went out. My left low back became a little swollen and could not stand straight. The chest muscle pain is still happening. I was just prescribed muscle relaxers

996441	2/2/2021	ME	56	F	1/5/2021	1/13/2021	i HAD MY SHOT ON THE 5TH I STARTED TO HAVE ITCHY HANDS AND FEET ON THE 13TH. I HAD EATEN SHRIMP FROM RESTAURANT AND USED THEIR HAND SANTIZERS SO I THOUGHT IT WAS THAT. OVER THE NEXT THREE DAYS I STARTED TO SWELL AND ITCH ALL OVER AND HIVES FROM HEAD TO TOE. I WENT TO MY PRIMARY CARE AND THEY HAD ME GO ON PREDISONE AND BENADRYL THEN I HAS A DAY OF CALM AND THEN ON THURSDAY THE 21ST IT GOT WORSE MY FACE THROAT WHOLE BODY SWELLED WAS ITCHING FROM HEAD TO TOE DIFFICULTING BREATHING AND CHEST PAINS. I WAS TAKEN TO THE ER AT HOSPITAL AND WAS TREATED WITH A WHAT THEY CALL A POWER PACK. THEY THOUGHT THAT I MAY BE ALLERGIC TO THE SHRIMP NOW, THEY PUT ME ON PREDISONE AND BENADRYL WITH A PLAN TO WEAN OFF THE PREDISONE. MY REACTIONS CONTINUED TO GET WORSE. JANUARY 21ST I SAW AN ALLERGIST A FULL BLOWN ATTACK..THEY HAVE INFORMED ME THAT BELIEVE THIS IS DUE TO THE COVID SHOT THEY CHANGED MY MEDS TO ZYRTEC, BENDADRYL, PRESISONE AND ALLEGRA. THE NEXT DAY I WAS EVEN WORSE SO THEY INCREASED THE DOSAGE WHICH AT FIRST I WAS COMFORTABLE BUT AS I HAVE BEEN WHEENING OFF THE PREDISONE THE SYMPTOMS HAVE INCREASED AGAIN, I WAS SEEN AT THE WALK IN CLINIC ON SATURDAY THE 30TH IN WHICH THEY RECOMMENDED A NEW ANTIHISTAMIN, I WAS THERE BECAUSE I WAS HAVING THE CHEST PAIN AND SHORTNESS OF BREATH AND FULL BODY RASH I HAVE BEEN IN COMMUNCIATION WITH MY PRIMARY DOCTOR AND HE HAS PUT ME ON HYDROXYZINE HCL 25 MG AFTER TRYING THIS FOR ONE NIGHT IT DID NOT HELP I HAD TO TAKE BENDADRYL IN THE NIGHT NAD THEN ZYRTEC JUST TO CALM THE ITCHING TO WHERE I COULD TOLERATE IT, I HAVE BEEN USING OATMEAL BATHS AND COLD COMPRESSES ON MY HANDS AND FEET AS THEY CONTINUE TO SWELL ITCH AND HURT TO THE POINT WHERE IS HURTS TO WALK ON THEM. IN TALKING WITH MY DOCTOR AGAIN TODAY THEY HAVE PUT ME BACK ON 50 MG PRESDISONE

991623	2/1/2021	VT	76	M	1/28/2021	1/28/2021	Assessment: Individual stated he was feeling lightheaded approximately four minutes after receiving his first dose of the Pfizer vaccine via IM injection in his upper arm. Individual was seated at the time and was about to move from the vaccination station to the check out desk. PT attempted to stand and said, "Oh, I don't feel so good?", after which vaccinator inquired with PT on what was wrong. After a brief assessment, notified personnel of the situation. Individual remained with the vaccinator, who obtained a set of vital signs and continued an assessment. Vitals: (as I recollect, I gave the post it to the check out staffers who monitored the individual prior to his departure) BP: 126/54, P: 78, RR: 18, pale and sweating across his brow area. Denied chest pain, difficulty breathing, nausea, tingling, headache, stated only symptom was lightheaded ness which was dissipating. Provided the individual with bottled water to sip on, which he did. Individual's last oral intake was at ~0845 PTA at the clinic, a normal breakfast of eggs, toast and coffee. Individual stated he had several cups of coffee but had not had anything else to drink that morning. Individual receives dialysis three days per week. He had an appointment Wednesday, next appointment is Friday. Individual did not have anyone driving him to the clinic, stated he would be fine and did not have anyone to come pick him up. He stated he was feeling better already. After approximately 8 additional minutes, individual stated he thought he could get up and move to the check out station. Individual was able to stand and ambulate to the check out line. Upon arrival at check out, transferred the individual to the check out personnel and Exit workers to monitor the individual's condition for the remainder of the 30 minutes.

992026	2/1/2021	MD	21	F	1/28/2021	1/28/2021	Immediate burning in arm right after receiving shot. 15 minutes after receiving shot began to feel tired and got a headache. Later on in the evening I had discomfort in my chest and had to use my inhaler. Pain in arm worsened over night; couldn't move arm at all. Pains spread into armpit and back. Got up at 3am to my body shivering, thinking I was running a fever I checked my temperature and it was normal but upon standing I had extreme dizziness to the point of almost passing's out, I had to sit down right away. Had nausea and whole body felt very sore an achey. The morning after my shot I woke with a headache, extreme pain in my arm and armpit, soreness all over my body, stomach pains, and my heart rate was high. Throughout the day my symptoms got worse I ran a fever of 102.7 which broke but then came back later on in the evening. The following day my symptoms started to diminish, no fever and body was feeling better, arm pain and headache continued. Now I am on day 4 still experiencing pain in my arm and armpit, slight headache, but chest pains have started. It feels as if there is a brick on my chest, almost like a burning sensation with occasional pains in left breast as well as tightness in the left side of my neck.

I can open my mouth just enough to eat, which I believe is also contributing to the earache. patient denies chest pain, shortness of breath or hives. patient denies any other signs or symptoms. Patient plans to wait until Thursday February 4, 2021 and if symptoms haven't improved will consult his primary care provider. Patient notified if new or worsening symptoms develop to be seen right away for evaluation.
992117	2/1/2021	MD	51	M	1/15/2021	1/24/2021	chest tightness, shortness of breath and chest pain.All this symptoms occur during physical activity.
991402	2/1/2021	NC	26	F	1/28/2021	1/28/2021	Patient's reaction(s) noted during COVID vaccine observation period: hives and redness/itching to sides of abdomen. No SOB, chest pain noted. Actions Taken: Vital signs taken, observed for 30 minutes. Advised to monitor rash at home and take antihistamines as needed. Patient verbalized understanding. Disposition: Home
990109	2/1/2021	AZ	23	F	1/29/2021	1/29/2021	Symptoms: 01/29/2021 @ 11:21 AM: Shortness of breath, chest pain, and weakness. Two hours later, chest pain began to feel like chest tightness. Continued for the rest of the day. 01/30/2021: Mild irritation when breathing. Getting out of breath when minimal effort in an activity. A sensation of an increased heartbeat when in reality, it would be 92 BMP. General weakness and dizziness. 01/31/2021: Same symptoms as mentioned. While taking a deep breath, I feel a mild pain around my heart.
992048	2/1/2021	TX	45	M	1/13/2021	1/18/2021	I received the first dose on 12/23/20 and 1/13/21. 1-2 weeks after the first injection, I started to have occasional cardiac arrhythmia but I did not pay attention to. After the second dose, I found I have more frequent cardiac arrhythmia and now it is more frequent. Sometimes I also felt chest pain. As a scientist, I started to think about the possibilities. I think my current heart problem is associated with COVID-19 vaccine. It is possible antibodies raised against the spike protein generated from muscle cells cross-react with a protein in the heart and cause the problem. I am going to visit a family doctor or cardiologist to see what is going on in my heart.

This is a pleasant 22-year-old female with past medical history of anxiety and depression who presents for possible allergic reaction. Patient states that at 12:08 p.m. just prior to arrival she received the 2nd COVID-19 vaccine. She states that immediately following the administration of this she became hot, flushed and sweaty. She then began having itching and hives. She denies any difficulty breathing. She denies any swelling of the lips or tongue. No difficulty swallowing. No shortness of breath or chest pain. No recent illness. No nausea or vomiting. Patient is a nonsmoker and denies alcohol or drug use. She denies pregnancy with a history of IUD. Clinical presentation concerning for allergic reaction. This is a 22-year-old female who developed itching, rash and throat tightness following her 2nd COVID-19 vaccine. Patient is hemodynamically stable. She is anxious in appearance. No obvious edema of the lips or tongue. No respiratory distress. No stridor. She is 98% on room air. In IVs immediately established. She is given 125 mg of Solu-Medrol, 20 Pepcid and 50 of Benadryl. Following all of her medications, she no longer has any of her symptoms. Her rash and hives has completely resolved. I discussed this with Dr. who was in agreement that she is stable for discharge. She will be sent home on additional 3 day course of prednisone to be started tomorrow, clear 10 for 10 days and Pepcid for 10 days. Questions addressed and answered prior to discharge. Patient discharged home in stable condition.
992545	2/1/2021	SC	80	M	1/29/2021	1/29/2021	Pt. received Moderna vaccine at 10:45a.m. ten minutes later pt. started complaining of pain behind both ears. Pt. denied chest pain, SOB at the time. Pt. remained in the office. Approximately thirty minutes later, pt. developed chest pain on the left side. EKG was attempted but could not be performed due to pt. stated it was his chest was hurting when he laid back. Pt. was given 2 liters of Depo Medrol IM and placed call to 911. EMS arrived within fifteen minutes. Pt. was transported to ED.

989275	1/31/2021	KY	36	F	1/14/2021	1/14/2021	Pfizer COVID-19 Vaccine EUA Event Description: Patient at hospital to receive her first dose of Pfizer Covid vaccine in left deltoid at ~1105. ~15 minutes after administration c/o left arm feeling hot and appearing red. Patient was observed for 45 minutes and given Benadryl 25 mg IM, Solumedrol 125 mg IM, and Pepcid 20 mg po. The redness on her arm increased and her BP and pulse continued to be elevated. She was transferred to ED for further evaluation a 1148. patient walked to ED to be evaluated for allergic reaction. Pt. reports having an 1100 vaccine appointment. Pt. received vaccine, then c/o left arm redness/swelling. HISTORY OF PRESENT ILLNESS: patient is a 36y female who presents to the ED with an allergic reaction. Pt reports she received the Pfizer COVID-19 vaccine this morning at 1100, first dose, and noted a rash along the left arm where the injection site was. Pt notes she received the first dose of the Pfizer vaccine. Pt documents a rash along the left arm which she described as "itchy and tingling." Patient initially had an area of redness following the injection site and then it extended down her entire arm to the wrist. She states that she was wearing a tighter shirt and they had her change into a loose scribed top. Patient denies any tongue swelling, throat swelling, itching, sneezing, syncope, presyncope, chest pain, shortness of breath double cough, nausea, or vomiting. No prior history of allergic/anaphylactic reactions. Patient was monitored for 1 hr and had significant improvement of symptoms. She was discharged in good condition and to return with any new, concerning, worsening symptoms. Advised to follow up with PCP in 2-3 days. Dx: acute allergic reaction to COVID-19 Vaccine Provided Rx for Benadryl and Pepcid Seen by PCP 1/22/2021 and internal reported filed, prompting VAERS report

988312	1/30/2021	NY	39	F	1/28/2021	1/29/2021	12:20 given vaccine on 1/27/21 12:29 began to leave, felt dizzy 12:30 parked in vehicle at vaccination location I had sharp pain in center of chest, heart was racing, I saw hives on my chest, neck, throat and up to my mouth. My lips were getting numb. I was confused and unable to participate in a work phone call I answered. 12:45 I began driving as I felt a little better. Drove 2 miles and pulled over to park and wait it out. Heart still racing, hives still present, chest pains still there and could not inhale deeply. 12:50 I drove the rest of the way home. I took a double dose of liquid Benadryl and laid down waiting for symptoms to pass. They slowly resolved over the next 6 hours. It is now 1/30/21 and I still feel like crap, but not allergy wise. More like the flu.
988296	1/30/2021	PA	50	F	1/26/2021	1/26/2021	This is a female with a history of breast cancer on tamoxifen, hypertension, asthma who apparently received her second dose of Covid Pfizer vaccine 10 to 15 minutes prior to presentation who presented in ED with complaints of shortness of breath and tingling sensation over her face and neck. Apparently had rash over the first dose and now presented with shortness of breath. She denies any fever chills. No chest pain. EPINEPHrine (EPIPEN) injection syringe 0.3 mg (0.3 mg intramuscular Given 1/26/21 1547) sodium chloride 0.9 % bolus 1,000 mL (1,000 mL intravenous New Bag 1/26/21 1555) dexAMETHasone (DECADRON) vial 6 mg (6 mg intravenous Given 1/26/21 1548) diphenhydrAMINE (BENADRYL) injection 25 mg (25 mg intravenous Given 1/26/21 1548) famotidine (PEPCID) injection 20 mg (20 mg intravenous Given 1/26/21 1548)
988151	1/30/2021	OK	59	F	1/30/2021	1/30/2021	Hives began 5 minutes following injection, located on upper arm at site of injection. This spread to opposite arm within 5 minutes. BP at this time was 148/98, HR 90, no difficulty breathing, chest pain, SHOB, headache. Over following 45 minutes this spread to patient's back, abdominal area, then to upper legs, then lower legs. 25mg Benadryl chewable given to patient at 15 minutes following start of hives. No change in level of itching associated with hives, or progression of hives to other parts of her body. Additional 25mg Benadryl chewable given to patient 15 minutes after initial dose. 30 minutes after second dose of Benadryl, patient experienced reduction in itching in upper body.

988128	1/30/2021	PA	49	F	1/29/2021	1/29/2021	Patient was asked to be observed for 30 minutes due to a previous serious reaction to IVP dye. About 20 minutes after she received her vaccine, she felt chest pain and claustrophobia. She refused an epi pen. She took 50mg of diphenhydramine. She quickly said that she felt better, but we monitored her blood pressure, pulse, and pulse ox. We also called a paramedic, they arrived shortly and evaluated her. She refused to get treatment. Her vitals were all normal, she was drowsy from the diphenhydramine. The chest pain and feeling of claustrophobia were gone. She worked at a school and the school nurse checked on her throughout the rest of the day, and she was feeling fine. She was very nervous about the vaccine, and her reaction could have been anxiety related (although she felt fine after her vaccine).
988048	1/30/2021	KS	23	F	1/29/2021	1/30/2021	Both my first and second vaccines I have and am now experiencing heart problems and troubles breathing. I'm having chest pain and my arm feels like the achy pain of putting ice on a broken bone. The first vaccine I felt the pain start in my collar bone in the vein and move down. 2nd vaccine I feel like I've been running a marathon and feel pain in my chest. Fatigue both times.
987912	1/30/2021	NY	27	F	1/27/2021	1/28/2021	One day after vaccination, developed chest tightness and chest pain that is non-exertional. Self resolves, appears to be worsening. Advised ED referral for chest pain workup
987730	1/30/2021	IL	40	F	1/28/2021	1/28/2021	Moderate chest pain lasting 12 hours and hot/cold flashes, generalized achyness starting at 4 pm day of vaccine. Following lasted started day after vaccine and lasted 24 hours: fever, fatigue, achyness, hot/cold flashes, headache, sore arm, burning nose. Took Tylenol, left work early, went home slept on 1/29/21 additional 5 hours from 3 pm until 8 pm. Back to bed 12 am to 8 am following day
988338	1/30/2021		65	F	1/29/2021	1/29/2021	developed numbness/tingling of tongue, headache and also pain across chest, as well as high BP and HR. Given water, benadryl 50 mg IM with improvement of everything except chest pain. Sent to CSMC ER for further evaluation.

988744	1/30/2021	MA	41	F	1/27/2021	1/27/2021	Shot 1 given Dec 29 in the morning. I had no symptoms. I got very sick at about 4:30pm Symptoms: muscle aches, chills, fever, headache, SOB, chest pain, sore throat, cough. I ended in the ED because I couldn't manage my asthma and my HR was high on Wed. I was diagnosed with Covid as I found out my husband gave it to me. Then a couple days later my asthma got worse and I ended up in the ED overnight. They were able to get better management in my Asthma. I was sick for 3 weeks. Went back to work week four 1/25 Monday and 1/27 they cleared me to get the second dosage of the vaccine. I got the vaccine 3:20 pm and at 5:00 I walked my son in Kung Fu and then waited in my car. I ended up passing out in my car at approx 5:15 pm and my 8 year old son knew something was wrong and had to wake me up. I could barely drive home I felt very drunk. When I got home my temp spikes to 101.3. I had extreme muscle pain, fatigue, chills, sore throat, chest pain, cough, SOB. My left arm swelled up where I was injected and I couldn't move my arm. I was told I couldn't take anything tylenol or Ibuprofen for 8 hours. I suffered. Even when I could take something my body was very painful. This lasted wed, thurs, and Friday morning.

988372	1/30/2021	KY	64	F	1/16/2021	1/16/2021	COVID- 19 Vaccine. She was experiencing chest tightness, SOB, and dizziness. 50mg of Benadryl and 20mg of famotidine was administered around 1410. Patient was still experiencing chest tightness and was having difficulty breathing. 0.3mg of epinephrine was administered at 1420. EMS was called. Breathing improved. Pulse ox 100%, HR 68, BP 130/89. EMS arrived and assumed patient care. Pt seen in Emergency Room 1/16/2021 1513 CHIEF COMPLAINT: reaction to COVID vaccine HISTORY OF PRESENT ILLNESS: Patient is a 64y F with PMHx significant for Myopericarditis, Anxiety and HTN who presents to ER after developing tongue swelling, wheezing, tunneled vision and shortness of breath. Patient states that she was getting first shot of COVID19 Pfizer vaccine at 2:00 pm. After getting vaccine she waited 15 minutes like she was told and recalls room getting very hot at approximately 6 minutes after getting vaccine. She also states that her tongue felt swollen. She then noticed her vision started to turn dark and then she felt dizzy. She told pharmacist about symptoms and then she was given one pill of Benadryl. This did not help and actually made her symptoms worse. She recalls wheezing. She was given another pill of what she believes was Benadryl. She also recalls pharmacist measured her BP and her husband, who was present, reported that her blood pressure was in the 140s This did not improve so she was given 0.3mg IM epinephrine shot. This significantly improved her symptoms. However, she was sent to ER. She denies any hx of recent UTI or GI infection. She denies fevers, chills, nausea, diarrhea, chest pain, generalized itching, vomiting, abdominal pain, generalized swelling, headache or syncopal episode. She denies any past reactions to vaccines. She denies current SOB and feels like her symptoms resolved. Denies hx of COPD or asthma. Physical exam did not show any recurrent signs of wheezing or tongue edema. Her SaO2 was 100% on RA and BP was within baseline 140-160s. Given episode, we decided to obtain tryptase levels. We also observe patient to ensure she did not have any recurrence of symptoms. She remained hemodynamically stable and SaO2 remained in mid 90s to 100. She was given a rx for epinephrine pen should symptoms recur though this is highly unlikely as she remained stable throughout ER stay. She was also given

							instructions to pick up OTC Benadryl and Pepcid. She does have antihistamines listed as an allergy but patient states that she gets tachycardic upon taking tabs, so this could just be a side effect. We will follow up with tryptase levels but even if tryptase levels return as normal, it does not mean she did not have an anaphylactic reaction to vaccine. Her clinical picture puts this diagnosis high in the differential. Teaching and instructions were given to patient and her husband. She was advised to return to ER if symptoms recur. IMPRESSION: Anaphylaxis Anxiety attack

985999	1/29/2021	NC	37	F	1/7/2021	1/7/2021	Persistent shortness of breath; Chest pain; Runny nose; Dry cough; Dizzy; This is a spontaneous report from a contactable other healthcare professional (patient). A 37-year-old female patient received the second dose of bnt162b2 (COVID-19 vaccine, brand: Pfizer) via an unspecified route of administration in right arm, on 07Jan2021 09:15 at a single dose for COVID-19 immunization in a hospital. Medical history included narcolepsy from an unknown date and unknown if ongoing and ongoing persistent shortness of breath from an unknown date. No known allergy. Concomitant medication included armodafinil, sertraline hydrochloride (ZOLOFT), and dextroamphetamine (DEXAMFETAMINE). The patient previously received the first dose of bnt162b2 on 21Dec2020 12:00 in right arm for COVID-19 immunization at age 37 years old. The patient had no COVID prior to vaccination. On 07Jan2021, the patient experienced shortness of breath, chest pain, runny nose, dry cough, dizzy. The patient had 2 ER visits and admission, and ongoing work up. The events resulted in doctor or other healthcare professional office/clinic visit, emergency room/department or urgent care, hospitalization for 1 day. The patient received albuterol and alprazolam (XANAX) as treatment. The patient underwent covid test post vaccination: Nasal swab on 11Jan2021 and on 12Jan2021 with both with result negative. The patient had not recovered from the events. Information on the lot/batch number has been requested.; Sender's Comments: Based on temporal association, a possible contributory role of suspect BNT162B2 cannot be excluded for reported events shortness of breath, chest pain, runny nose, dry cough and dizzy. The patient's underlying ongoing shortness of breath and psychiatric disorder treated by sertraline may also be contributory. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

986105	1/29/2021	CA	38	F	12/29/2020	1/2/2021	gastritis; heart burn; Chest pain; The EKG said she had a heart attack; This is spontaneous report from a contactable nurse (patient). A 38-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 29Dec2020 13:00 at single dose at right arm for covid-19 immunization. Medical history included heart attack from Apr2019 to an unknown date, covid-19 from Jul2020 to an unknown date (really sick with it). The patient's concomitant medications were not reported. Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. Patient got the first COVID19 vaccine and a few days after started having chest pain on 02Jan2021 at 1:00AM, event was serious per medically significant. She went to the doctor and they did an EKG on 08Jan2021. The EKG said she had a heart attack. The heart attack was about the time she had chest pain after the first injection. Patient called her doctor on Monday, 04Jan2021. She had a televideo appointment on 06Jan2021. She went to the doctor's office and had EKG on 08Jan2021 and was sent to the hospital. She didn't get admitted because there were no beds. Outcome of the event chest pain, she would say she had recovered on 02Jan2021 with lasting effects because she was in the hospital again for the same thing. She went to the hospital the second time for chest pain that woke her up on 11Jan2021. It started at like 3AM. She thought it was heart burn. She tried to go back to sleep. It continued while she was at work. She told her supervisor who sent her to the hospital. They did not admit her. They did do an EKG on 11Jan2021 and it was abnormal, but not indicative of heart attack. Thought it was gastritis. Her doctor thought the heart attack was on the 02Jan2021. The same thing happened with her heart and she had a heart attack in Apr2019. History of all previous immunization with the Pfizer vaccine considered as suspect was none. No additional vaccines administered on same date of the Pfizer suspect. Patient stated she didn't go to the ER, but called doctor's office on the following Monday. There was no adverse event following prior vaccinations. Outcome of event chest pain was recovered with sequel, and outcome of other events was unknown. Information on lot/batch number has been requested.; Sender's Comments: Based on the available information, a possible contributory role of the

987090	1/29/2021	WA	58	F	1/15/2021	1/20/2021	Side effects started the same day I received the vaccine, which were reported on the V-safe app. Started with very sore arm, within 24 hours progressed to extreme fatigue, joint and body aches, loss of taste and headache. I also experienced some mild nausea. By Wednesday evening, I began to experience heart palpitations which I listened to as a nurse which sounded like PVC's. I have never had this happen to me before. I assessed my vital signs and noted that as the arrhythmia progressed, my O2 sat level began to decrease and my pulse began to increase. I could hear a definite pause in my heart rhythm. Within an hour, I had chest pain in the area of my left chest over my heart which progressed into a feeling of pressure as if someone was standing with a foot on my chest. As time went on, this sensation radiated into my back at an angle from left to right. It was at this point that I had my father take me to the emergency room. When I got there, my pulse was in the low 100's and my blood pressure was 230/130. I have never had this happen to me before. I ended up on a nitroglycerin drip. My magnesium level was low and my sodium level was low normal. I was kept in the emergency room until Thursday evening then transferred to Progressive Care Unit where I remained until early evening on Friday. I was sent home on 2 different cardiac medications, Coreg and Lisinopril. I am to follow up with my PCP and a cardiologist. Both are brand new to me. I am now feeling better, but I am very reluctant to have the second covid vaccine. Also, the Hospital does not know what happened to me. (Facility where I received my Covid vaccine.)
987045	1/29/2021	CO	37	F	1/19/2021	1/19/2021	Initial call, patient reported she had severe chest pain. She became frightened by the intensity and was seen at the ER. 982363	1/28/2021	PA	50	M	1/26/2021	1/27/2021	Date these symptoms started was 1/27/2021: About 12 hours after injection, developed fatigue and slight nausea as expected. Oral temperature 98.0. Commuted to work without issue. ~ 1400: As day progressed, nausea subsided, but fatigue grew more profound and developed pain in the right subscapular area with exertional shortness of breath walking any length of time. (Injection of initial and second doses were both in right deltoid). 1540 - 1800: Fatigue increased, developed a burning/tearing pain with every yawn and deep breath from the top of my trachea into both left and right mainstem bronchi and radiated to right arm. It literally felt like someone was trying to tear out my bronchial tree with each breath. 1800: Arrived home and medicated self-medicated with Motrin 400mg. 1800 -2030: rested at home with still some breathing pain, no shortness of breath, but incredibly tired. 2045: Went to bed and slept for the next 12.5 hours without any issues during the night. 0800: Woke up nearly all symptoms were gone, only some minor residual fatigue. No breathing pain, no nausea, no subscapular pain. I did not seek medical attention for symptoms, nor did I contact my provider. I experienced fatigue and a headache with the first dose, but no other symptoms. I never experienced fever or chills

981794	1/28/2021	FL	29	F	1/26/2021	1/26/2021	Time of vaccine maybe 10 to 15 minuets later i started feeling very hot, dizzy nauseous, tingling in my left arm from from finger tips all the way , vitals were 130/70 kept under observation the blood pressure went down and my temp was 98.3. After about half an hr i had tingling in my legs and nausea and tingling in my lips. I had taken two Zyrtec before the vaccine. Did feel itchiness inside my mouth. By 1:30 i ate lunch i felt worse and disoriented. found i was repeating myself a lot. went to the ED and vitals remained stable. nausea persisted and dizziness. was off work for 3 days. Still felt the same for the next day. on the 2nd day i started having a dry cough and chest pain with nausea and dizziness, headache that doesn't go away.

982549	1/28/2021	AR	48	M	1/20/2021	1/21/2021	1/20/21 vaccinated. 1/21 afternoon-itchy feeling on top of buttocks, tingling sensation consistent with herpes II/Zoster, nerve down right leg tingling, testing for all venereal diseases June 18, 2015, July 2015-Present married to wife no sexual activity outside of marriage, hyper sensitive to venereal disease. Wife is negative, PT is negative for IGA and IGE, PT received vacc and is now showing symptoms positive for herpes 2, PT is waiting for results as to if he is POSTIVE, blister on right side of penis-clear fluid filled, right sores/blisters crusty on buttocks, right inner thigh leg blister on scrotum with red dots in the middle, nothing on glands penis/urethra or anus. Thursday night, pt had intimacy and it was dryer than normal, uncomfortable on the right side with penetration-skin is compromised. Saturday, PT was not feeling great, shaft not showing, in a rush to urinate, scrapped scrotum and now has lesions. Sunday, fatigue, outbreak/whelp on legs, PT wore gauze/bandages to prevent chafing. Monday, shaft not showing, patient went to urgent care. PT was told it presented as Zoster. Nothing on penis at this point in time. Penis issues did not show until 1/26/2021. EX wife had herpes II. PT again was tested after in 2015 and was negative for IGE and IGA. Tuesday, patient started meds from urgent care. Wednesday morning, chest pain/pleurisy like-pain across chest. Arm vaccination site sore, bruised to this day. Herpes Zoster not typically going to end up on shaft, its unusual, PT is probable he has cross contaminated by itching his buttocks and then going to the restroom and touching right side of penis.

981229	1/28/2021	WA	26	M	1/26/2021	1/26/2021	So later that evening around 9:30pm I started with Chills, and a low grade fever lots of body ache and head ache, to the point I did not get much sleep the night of. It lasted the whole next day. But later in the evening of the next day I think to me the most concerning side effect was I started getting some chest pain as if I pulled a muscle around my chest or what not. And it has continued into the next day as well which is now 2 days after second dose of vaccine.
981210	1/28/2021	NC	45	F	1/6/2021	1/6/2021	Patient with a PMH significant for allergic rhinitis and cyclic neutropenia, as well a pre-syncope with previous blood donations received COVID-19 vaccine at 0645 and approximately 1 hour later developed a generalized feeling of warmth, followed by lightheadedness/dizziness. She denies frank LOC. She also reports palpitations and a rapid heart rate. She denied any rash, pruritis, dyspnea or chest pain, or N/V/D. Patient works in hospital and was transported to ED and upon arrival vitals were stable with HR of 79, BP 151/84, SaO2 of 100% on RA. Additional information for Item 18: Patient treated with IVF and released. Patient discharged to home and by 1:00pm that day was no longer symptomatic. She does endorse pre-syncope with previous blood draws.

980629	1/28/2021	OR	35	F	1/12/2021	1/12/2021	Fever; chills; muscle aches; pain at injection site; headache; chest pain; This is a spontaneous report from a contactable nurse (patient). A 35-year-old female patient received 2nd dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EK9231), via an unspecified route of administration in right arm on 12Jan2021 at single dose for covid-19 immunisation. Medical history included sulfa allergy, canteloupe allergy. The patient's concomitant medications were not reported. No any other medications the patient received within 2 weeks of vaccination. The patient previously received 1st dose of BNT162B2 (lot# EJ1685) via intramuscular in right arm on 22Dec2020 13:00 for covid-19 immunisation. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced fever, chills, muscle aches, pain at injection site, headache, chest pain on 12Jan2021 17:00. The patient was not pregnant. No treatment received for the events. The outcome of events was recovered on an unspecified date of Jan2021. This case was reported as non-serious. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19.

982897	1/28/2021	TX	32	F	1/27/2021	1/27/2021	Around 9:15am She began complaining of epigastric/midsternal chest pain, non-radiating. She was not short of breath or diaphoretic. She denied nausea but did heave and spit up clear fluid. She had elevated HR 131-86 during a 45minute time period and elevated blood pressure 165-135/90-103 during the same time period. She had what appeared to be a brief fainting spell and experienced some confusion. She was transported to ER/EMS at 10:47am. She was sent home from the ER later in the day.
982513	1/28/2021	NC	55	F	1/26/2021	1/26/2021	Chest pain bp elevated 212/95 on Tues night continued to have elevated bland chest pain went to ER to be evaluated bp on arrival was 218/98. ER Dr. Prescribed 4 baby aspirin, blood work, 2 Tylenol follow up with primary Dr. If not feeling better. Thursday still not feeling well feel weak as though I'm carrying another body on my back. Pressure in my chest is still there. Bp is 140/68 .
984031	1/28/2021	TX	38	F	1/28/2021	1/28/2021	Post vaccine, patient described chest pain, metallic taste in mouth, dry tongue and L foot tingling.
984019	1/28/2021	MD	63	F	1/20/2021	1/20/2021	13 minutes after the injection, experienced an intense whole body hot flushing, increased perspiration which lasted 2-3 mins then resolved. Headache. Then felt "odd", BP was 92/47. drank 8 ounces fluid, BP slightly increased then dropped again. Felt very faint chest pain, about 8-9 deep & sharp, but resolved quickly. Returned to work. Next day at 32 hours exactly, arm injection site felt slightly achy , return of off feeling. Headaches off and on. On day 3 fatigue began, and intense injection site sharp pains which woke me at night although not apparent in day. Over next several days, intense site pain continued to wake me in middle of night, very painful. On day 7, began to feel better, but then woke that night with extremely intense pain at site. Today is day 8, I found 2 red swollen, thickened and hard, pear shaped areas 4cm x 10cm; smaller one at site and a second larger area below that, area red and warm to touch indicating a cellulitis was developing. Call to primary doctor and CDC, instructed to complete this. Now concerned about whether to obtain vaccine #2.

983585	1/28/2021	CA	77	M	1/25/2021	1/25/2021	He was sent to the ER later that day when he complained of headache and palpitations and his blood pressures and heart rate were unusually high. He had at no time any chest pain. At the ER, he had two serial troponins at 0.06, representing a mild enzyme leak. He had no EKG changes concerning for ischemia or arrhythmia but his BP was noted to be in 170/100's which is higher than his baseline in the 140's. It came down on its own eventually. It was determined that if anything, he may have had some demand ischemia from his hypertension, and that in the future he should at least get a TTE, or if he can tolerate, a cardiac stress test. He returned without any medication changes.
983553	1/28/2021	MN	31	F	1/28/2021	1/28/2021	After vaccination, patient complaining of chest pain / pressure, and sense of impending doom. Medication administered per EMS EPI given x2 at 0956 and 1015 ASA 325 chewable given at 1004 for c/o crushing chest pain. Emergency response provider arrived present. Pt started with c/o epigastric and then crushing CP. Pt appeared to be unresponsive at 1020 but the several minutes later she is arousable and anxious, breathing labored and she is stating she is "going to die". Transported to ED where delirium was noted and due to elevated ammonia level current presumptive diagnosis is hepatic encephalopathy.

983050	1/28/2021	OK	52	F	12/18/2020	12/18/2020	By that evening my right arm went numb and I had a lot dizziness and brain fog. I was slow to stop at stop sign, and my daughter in law told me she wanted to drive me because I was scaring her and I was being mean to her, very snappy. The next morning I had a fever 100, muscle ache, heart racing, headache and I stayed in bed all day. I took 2000mg Ibuprofen, 800mg Tylenol, Benadryl 10mg. On the 20th I was still lethargic had body aches and heart was racing, I took 800mg Tylenol that day. The 21st I had dizziness, brain fog, heart racing, lethargic. The 22nd I contacted the work Nurse and let her know what was going on, my heart rate was 140. They told me I was probably having a reaction and would go away in a couple days. On the 24th,25th,26th,27th I started having chest pain, lethargy. I had a clinic visit with my PCP on the 28th and she said my BP was 160/90, I never had BP issues. She ran test. The 29th I still had brain fog, lethargy, chest pain. I could feel my heart beat in my ear especially at night, I have never has BP issues in my life. On the 30th my heart ponding sound was in my ear. January 16th I went to the ER my heart was 130 and BP 187/108, they did a full work up on me. She started me on Metprolol-50mg(extended release). I seen the cardiologist on 1/20 and told me I had left atrial enlargement , mitro-valve regurgitation . I had an echo-cardiogram on 1/25. The medicine has definitely helped me .

978069	1/27/2021	PA	63	F	12/19/2020	12/21/2020	<p>About 5:30 or so and I was going to go to lunch at work - I felt like a heartburn and I was looking for a tums. I didn't have any. I asked a coworker because my chest felt like I had heartburn. It was really bad. Protonic - a coworker gave it to me to see if that would help. And I took it. Diaphoretic - sweating - coworker noticed that I was sweating. I had pain in my jaw. I thought I was showing signs of a heart attack. A doctor came over and we told her what was happening with me. He recommended that I should be seen right away. Next thing I know, nurse is wheeling me down to ER in wheelchair as my chest pains weren't going away but ER told me I had to go through triage and wait. Finally got seen and I had an EKG - which was good. CDU unit - was admitted to and checked Troponin levels and did blood work. Everything came back fine. My EKG was being monitored all night. At one point I was feeling something and they gave me a dose of Nitro. It gave me a headache. There all night and then I did a stress test in the morning. And I was released that day. That was my day off so I was off all work. I went back to the work the day after. My granddaughter came to stay with me over Christmas and she started having symptoms of COVID. She wasn't feeling well. /She tested positive.Symptoms for COVID began for me on December 26th and was tested for COVID on December 27th - cough; sore throat; headache, fever, not got chills or lose my taste or smell (until after those symptoms were finished); belching - lots; diarrhea; upset; nausea. Extremely tired and muscles aches, joint pain - settled in my lower back and my hip. I still struggle with those joint pain and tiredness today. They put me off work until January 12 2021. I was scheduled to get the dose 2 at 9th but didn't get it that day because of COVID illness.</p>

976939	1/27/2021	NJ	50	F	1/12/2021	1/12/2021	<p>involuntary muscle contractions in her diaphragm; chills; cold; severe body aches; Involuntary muscle cramping; chest pain; Feels bad; severe joint aches; tremor; nausea; severe body pain in her back and knees; severe body pain in her back and knees; Weakness; Headache; This is a spontaneous report from a contactable Other HCP reported for self. This 50-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 12Jan2021 07:00 on Deltoid Left at single dose (Lot # EK9231) for covid-19 immunisation. Concomitant medications were none. The patient previously received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 22Dec2020 via Intramuscular at age of 50 years old on Deltoid, Left at single dose (Lot # EH9899) for covid-19 immunisation, experienced Tingling lips, Swollen lips, and the Benadryl took away the lip tingling and swelling, Tachypnea, Myalgia, Joint pain, severe headache, Weakness generalized, Nausea, she said she was really pale, so much so, that her husband was scared for her. She said the symptoms lasted for about 3 days, but the weakness lasted longer. Reported she took some Zofran disintegrating tablets for her nausea. Clarified she did have a PCR COVID-19 Virus test after she developed symptoms from receiving the first COVID-19 Vaccine dose. She said she had the PCR COVID-19 Virus test about 3 weeks ago and the test was negative. She said she thought she had the COVID-19 Virus after receiving the first COVID19 Vaccine dose because no one else she knew who had the COVID-19 Vaccine had any issues. Reported she received the second COVID-19 Vaccine dose on 12Jan2021 at 7:00AM in the left Deltoid. She said the adverse reaction she experienced after the second vaccine dose was slightly different from what she experienced with the first dose. She said about 10 hours after the COVID-19 Vaccine was administered, clarifying at around 17:00PM 12Jan2021, she started having severe body aches(disability), and involuntary muscle cramping (disability), like tetanus. She said even her diaphragm was cramping. She said she had chest pain on 12Jan2021(disability), tremors on 12Jan2021 (medically significant), and body aches, but doesn't think she had fever. She said the symptoms are still going on like with the first COVID-19 Vaccine dose, but she has more severe joint aching on 12Jan2021 (disability),</p>

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

weakness on 12Jan2021 (disability), and nausea on 12Jan2021 (medically significant). She said her knees feel like she was beaten severely. She said she aches so bad, it hurts having pants on. She said she does not have a headache or tremors now, but did have a headache on 12Jan2021 (medically significant) and tremors in the beginning. She said she feels the most pain in her back and knees. She said she feels really bad on 12Jan2021(disability). After the second dose on 12Jan2021, she reports severe body pain in her back and knees (disability). She reports almost feeling like she has tetanus- involuntary muscle contractions in her diaphragm on unknown date(disability), tremor, cold, chills, nausea, muscle cramps/chest pain. 'Felt like a heart attack. It was out of this world'. She still has nausea, severe pain all over my body, she can't be touched, and even wearing pants hurts. She said she is a healthy person with no chronic disease. She said she had nothing wrong with her prior to getting the COVID-19 Vaccine. Reported she hurts so bad, she can't even lift her arm. She completed a covid 19 PCR test after the first dose in Dec2020, which was negative. Treatment were received for the events severe body pain in her back and knees, involuntary muscle contractions in her diaphragm, tremor, nausea, muscle cramping, chest pain, Feels bad, more severe joint aching, severe body aches, Weakness, headache, chills, cold. Reported she has taken 1500mg of Motrin. Outcome of the severe body aches, Involuntary muscle cramping, Chest pain, severe joint aches, weakness, Nausea, Back pain, Knee pain, Feels bad was not recovered. Outcome of the event Tremor was recovered in Jan2021, Headache was recovered.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the reported events cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. 976916	1/27/2021			F	12/25/2020	12/1/2020	left chest pain; left chest pain/It was sharp and seemed to get worse with movement so assumed it was musculoskeletal; woke up in the early morning with severe pain; pain even sitting up and especially with taking in a little larger breaths than usual; body aches; This is a spontaneous report from a non-contactable consumer reported for self. This 49-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EC1284) via unspecified route of administration on 25Dec2020 at single dose for COVID-19 immunization. The patient medical history and concomitant medication was not reported. About 18 hours after injection (Dec2020), the patient started having left chest pain when she went to sleep. It was sharp and seemed to get worse with movement so assumed it was musculoskeletal. The patient fell asleep and woke up in the early morning with severe pain. It again was worse with certain positions but was extremely painful. The patient couldn't find a comfortable position. There was pain even sitting up and especially with taking in a little larger breaths than usual. Could not pinpoint the area of pain, but it seemed anterior in the lower left chest. No other symptoms otherwise, no shortness of breath. The pain improved with paracetamol (TYLENOL), and she was able to fall back asleep. The pain continued throughout the day and then the patient developed body aches that afternoon. By the next day, symptoms improved and were nearly resolved by the following day. The patient was not diagnosed with COVID-19 prior to and since the vaccination. The patient recovered from the events. No follow-up attempts are possible. No further information is expected.

977060	1/27/2021	ND	83	F	1/7/2021	1/23/2021	Per the ED Physician documentation and report from family, patient had been experiencing some chest pain for the last week to week and a half with SVT before presenting to the emergency department. patient had a holter monitor study earlier in the week that results were pending. 1/23/21- patient arrives to the ED via ambulance with complaints of sharp chest pain, palpitations and heart rate in 150's. Patients troponin level then elevated and it was determined patient was having a NSTEMI. 1/24/21- patient had recurrent episodes of SVT and family decided patient would benefit from further cardiac workup so she was transferred to a higher level of care. Unknown if patient has discharge from the facility we transferred her to. This patient is felt to be of significance since she is 1/3 patients currently in our facility who developed cardiac/blood issues post vaccination from the same pharmacy with the same lot number vaccine. VAERS reports were put in for all three to determine if further investigation is needed.
977482	1/27/2021	NC	32	M	1/19/2021	1/21/2021	Patient received first dose of Moderna on January 19, 2021. 48 hours later upon waking from sleep patient had myalgias, arthralgia in all distributions, and a frontal headache. Patient was instructed to rest and increase fluid intake and Ibuprofen as this was likely a known adverse reaction to COVID vaccination. At 72hrs from vaccination patient began to have fevers Tmax 101.9 orally. Continued rest, hydration and ibuprofen, started Tylenol. At 96hrs from vaccination patient began to have a dry cough, diarrhea, severe fatigue and inspiratory chest pain. Patients myalgias and arthralgias continued, and Tmax increased to 104.5 orally. At this time bedside ECHO, iSTAT chemistry, COVID antigen, COVID antibody and COVID PCR, Rapid Flu, and Viral Respiratory Panel were obtained. Administered 1.5 liters of lactated ringers, Toradol 15mg and Tylenol 975mg and patient was isolated. EKG, troponin and Chest Xray were obtained 12 hours later (108 hours from vaccination) at which time the patient reported improvement by 95%. Patient was afebrile and chest pain free. Only symptom at that time was fatigue. After another 12 hours of rest/sleep (hour 120 post vaccination) patient reports no symptoms and 100% well. See below for lab/rad/test details.

976965	1/27/2021	AZ	45	M	1/13/2021	1/14/2021	coronary spasm; STEMI COVID vaccine induced; slight 1-2/10 substernal chest pain on/off; fever of 101 to 101.7; diffuse severe muscle aches; tachycardia of 110 to 130; painful lymphadenopathy of the ipsilateral axilla and clavicular lymph node (LN); This is a spontaneous report from a contactable physician (patient). A 45-year-old male patient received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EL0142), via an unspecified route of administration in the left arm on 13Jan2021 at a single dose for COVID-19 immunization. The patient's medical history included benign prostatic hyperplasia (BPH). Concomitant medication included alfuzosin. The patient previously took the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899) in the left arm on 23Dec2020 16:00 at the age of 44 years old for COVID-19 immunization. On 14Jan2021, the patient started having fever of 101 to 101.7, diffuse severe muscle aches, and tachycardia of 110 to 130. Thursday evening (14Jan2021) through Sunday (17Jan2021), the patient also had painful lymphadenopathy of the ipsilateral axilla and clavicular lymph node (LN). Thursday evening (14Jan2021), the patient had slight 1-2/10 substernal chest pain on/off. Friday evening around 23:30 (15Jan2021), the patient had chest pain substernal 7-8/10 that lasted for one hour. The burning sensation was worse with cold air. It resolved with paracetamol (TYLENOL) and ibuprofen. Monday early morning at 04:00 (18Jan2021), the patient experienced STEMI COVID vaccine induced wherein the patient woke up with 10/10 chest pain and shoulder pain which lasted for 30 to 40 minutes and resolved with paracetamol and ibuprofen. The patient also decided to check blood work Monday morning (18Jan2021) while in the hospital. Trop came back 16.28 ng/ml. This is the old trop not high sensitivity. Normal high is 0.30 ng/ml. The patient went to the hospital. ECG showed ST elevation inferior lead. Left heart catheterization was done. The patient have clean coronaries. No evidence of any atherosclerosis. Echocardiogram showed normal EF. No wall motion abnormality. It was concluded that the patient also had coronary spasm. The patient underwent other lab test and procedure which included nasal swab COVID test showed negative on 18Jan2021. Outcome of the lymphadenopathy was recovered on 17Jan2021, of

979106	1/27/2021	MI	49	F	1/27/2021	1/27/2021	Was performing a COVID vaccine clinic at a skilled nursing facility. The patient states that at approximately 5 minutes after admin of her second shot, she started feeling short of breath. The nurse ran over to monitor her and take her BP. I arrived as well to monitor. Her breathing appeared fast and labored but patient was alert and oriented. She had no localized reaction to the vaccine. The patient's lungs were auscultated and were clear. Her glucose was checked, it was "low" for the patient at 80. She stated the center of her chest was radiating pain and her hands went numb. Her BP was 161/93 and HR 65 and OSAT was 94 but this was close to her normal range. Epinephrine was not administered - but instead diphenhydramine 25 mg. The patient reported feeling better at 12 minutes post immunization and her breathing improved. Her chest pain went away and numbness went away. The patient also ate a donut and drank a glass of water at this time and stated she felt much better. Her BP again at 15 minutes post immunization was 158/96 and HR was 61 and OSAT was 100. Monitored patient for 20 more minutes and no other issues were experienced. The patient is being paired with a nurse from the facility to monitor the rest of the day. After discussing with the pharmacist who reviewed the consent forms, it was noted that the patient marked yes on the portion that asks the patient if they've received a blood transfusion in the last year.
980021	1/27/2021	CA	56	F	1/25/2021	1/25/2021	2 min after vaccine, felt dizzy, nausea. some vertigo when turn your head. no respiratory symptoms, chest pain. felt heart racing. we gave her apple juice and had BP that was 142/96 HR 64-70 Sat on RA was 98%. Felt a little better after juice, and felt like could stand and then was able to turn head without vertigo. Then went to car, drank fluids, ate something, and sat in car for 30 min. Then felt no vertigo and safe to drive. That night had very bad headache, lasted about 24 hours. Dizziness lasted for 36 hours. HA was for 24 hours.
978962	1/27/2021	CA	69	M	1/24/2021	1/25/2021	01/25 Afternoon Body aches, evening severe chills, fever 101. 01/26 same as 01/25 and chest pain and unable to blow nose. Deep breaths ok. Took tylenol which help minimize the chills. 01/27 same as 01/26 but not as severe. Have been confined to bed all this time.

She has had similar episodes in the past thought to be related to her gallbladder. Tonight she took some Pepcid and Tylenol. She denies any shortness of breath, or persistent chest pain, states pain has resolved since arriving in the emergency room. She denies any recent fever however she was recently given the second vaccine dose for COVID, and is having myalgias and symptoms she believes are related to the vaccination. She is requesting a COVID test. Patient denies sore throat, cough or abdominal pain. At this time only symptoms or myalgias. She continues to have no symptoms, her workup is reassuring, low suspicion for severe significant pathology, however would have a low threshold to return to the ER if chest pain would return or any other symptoms were to arise. COVID test came back negative.
974296	1/26/2021	FL	80	F	1/21/2021	1/21/2021	Pfizer-BioTech COVID-19 Vaccine EUA Within 5 minutes, burning chest pain. Within less than 20 minutes BP measured at 203/185 and 15 minutes later 191/187. (normal for me is 128/65). Heart rate 130 (normal is 92) Lightheadedness. EMTs on site did EKG and subsequent BP checks. Recommended Emergency Room care, which I did. Aspirin given, blood work done (at 3 different times). 2 Additional EKGs done with no abnormalities noted.. BP and heart rate went down in approximately 2 hours, to 138/85 and 105, but not to normal status. Have been normalized since.

974547	1/26/2021	MI	32	F	1/20/2021	1/21/2021	HISTORY OF PRESENT ILLNESS: SHORTNESS OF BREATH (CHEST PAIN, SOB , BACK PAIN STARTING TODAY AT 0900, STATES ADVIL AT 1000, SSENCOND COVID VACCINE YESTERDAY AT 1500) 32-year-old female with past medical history of anxiety, asthma, Hashimoto's thyroiditis, psoriasis who presents the emergency department with chief complaint of body aches and shortness of breath. Patient is a nurse. She received her 2nd dose of the Moderna vaccine for COVID-19 the day prior to arriving in the emergency department. This morning she did feel some mild body aches but otherwise was feeling fine. Starting later today after her shift at work she developed severe body aches bilateral upper shoulders and down her spine, she also reports some shortness of breath, dizziness. She felt unsafe to drive home feeling like this. She had taken some Advil earlier in the day around 10:00. She denies any fever, nausea or vomiting. No history of severe vaccine reaction or anaphylaxis. She has had anaphylactic reaction to Enbrel prior. She denies any throat swelling, muffled voice, difficulty swallowing, abdominal pain. patient is mildly tachycardic and hypertensive. Likely due to pain. Patient is experiencing adverse reaction to the 2nd dose of the Moderna COVID-19 vaccine. I discussed with her she is having an immune response to the vaccine. She does have a history of rheumatoid arthritis which could contribute to the elevated immune response as well. The patient is given 30 mg of IM Toradol for body aches here in the emergency department. She is instructed to call PCP for close follow-up, rest, drink plenty of fluids. She has no signs or symptoms consistent with anaphylaxis at this point.
974856	1/26/2021	FL	43	F	1/16/2021	1/16/2021	As soon as patient received vaccination, her left arm became heavy, then she became dizzy with chest pain on deep inspiration. Initially became short of breath, which resolved prior to EMS arrival. EMS transported patient to the emergency room with non-urgent acuity.

973111	1/26/2021	MD	76	M	12/30/2020	12/31/2020	Mild Chest Pain Worse With Deep Breath/chest pain got worse; Felt warm and his temperature was 100 F; Now I have A-Fib; A spontaneous report was received from a consumer concerning a male 76-year-old patient, who was also the patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced chest pain, fever, and atrial fibrillation. The patient's medical history, as provided by the reporter, included coronary artery disease. Concomitant medications included carvedilol. On 30 Dec 2020, the patient received their first of two planned doses of mRNA-1273 in the right deltoid for prophylaxis of COVID-19 infection. On 31 Dec 2020, the patient experienced chest pain that got worse when he took a deep breath. He also felt warm, and his temperature was 100 degrees Fahrenheit. The patient visited the emergency room where an electrocardiogram (EKG) was normal and his COVID-19 test were negative. Because of his history of coronary artery disease, he stayed in the hospital overnight. On 01 Jan 2021, the hospital cardiologist called it a reaction the vaccine, and he was discharged. On 05 Jan 2021, on a follow-up visit with another cardiologist, another EKG was performed, and the patient was diagnosed with atrial fibrillation. The cardiologist increased his carvedilol dose to 6.25 milligram from 3.125 milligram and added apixaban, 5 milligram, twice daily. At the time of the report, he felt fine. Action taken with mRNA-1273 in response to the events was not reported. The outcome of the events, chest pain and fever, was considered recovered/resolved on 01 Jan 2021. The outcome of the event, atrial fibrillation, was considered recovering/resolving.; Reporter's Comments: This case concerns a 76-year-old male patient with medical history of coronary artery disease, who received their first of two planned doses of mRNA-1273 (Lot unknown), and who experienced the serious unlisted events of chest pain and atrial fibrillation and the non-serious listed event of fever. Based on the current available information and temporal association between the use of the product and the onset of events, a causal relationship cannot be excluded and the events are considered possibly related to the vaccine. However, the events of chest pain and atrial fibrillation may be explained by the patient's history of coronary artery disease.

973114	1/26/2021	NY		F	1/9/2021	1/10/2021	Hurts when she breathes; Unable to lift arm; On and off chest pain; Spasms; Fast heartbeat; Did not feel good; Headache; Vomiting; A spontaneous report was received from a consumer regarding a female patient who received Moderna's COVID-19 Vaccine (mRNA-1273), and experienced the events, did not feel good, headache, vomiting, chest pain, spasms, a fast heartbeat, unable to lift arm, and hurts when she breathes. The patient's medical history was not provided. Concomitant medications were not provided by the reporter. On 09 Jan 2021, approximately 24 hours prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. On 10 Jan 2021, the patient did not feel well and experienced a headache and vomiting. On 11 Jan 2021, the patient experienced on and off chest pain, spasms, and a fast heart beat. She was unable to lift her arm and it hurt when she would breathe. An emergency medical technician (EMT) was called to assist the patient. No further details were provided. Treatment for the events was not provided. Action taken with mRNA-1273 in response to the events was unknown. The outcome of the events, did not feel good, headache, vomiting, chest pain, spasms, a fast heartbeat, unable to lift arm, and hurts when she breathes, was not reported.; Reporter's Comments: This case concerns a female patient, who experienced serious unexpected events of painful breathing, and non-serious unexpected event of vaccination site movement impairment, chest pain, muscle spasm, malaise, and heart rate increased; and non-serious expected events of headache and vomiting. The event of malaise, headache and vomiting occurred 2 days after mRNA-1273 (lot # unknown) administration. The event of painful breathing, vaccination site movement impairment, chest pain, muscle spasms, heart rate increased, occurred day 3 after mRNA-1273 (lot # unknown) administration. Treatment details were not provided. Very limited information regarding this event has been provided at this time. Based on temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

973331	1/26/2021	AL	32	F	12/30/2020	1/1/2021	This is a spontaneous report from a contactable other health professional (patient herself). A 32-year-old female patient (non-pregnant) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# E11284), via an unspecified route of administration on 30Dec2020 11:45 in right arm at single dose for COVID-19 immunization. Medical history included COVID from 15May2020 to an unknown end date. Known allergies was no. Other medications in two weeks included pantoprazole, cholecalciferol (VIT D3), ascorbic acid (VIT C), zinc, fish oil, curcuma longa (TURMERIC). The patient experienced mild cold like symptoms (runny nose and sore chest) 3 days after vaccine on 02Jan2021, blood spots on right abdomen, chest 3-4 days after vaccine in Jan2021. Constant headache for a week starting 5 days after vaccine on 04Jan2021 and elevated blood pressure, racing heart, and chest pain 5 days after vaccine on 04Jan2021. All events resulted in doctor or other healthcare professional office/clinic visit. The patient underwent lab tests and procedures which included COVID positive on 15May2020. The patient had COVID test of nasal swab post vaccination and result with negative. Outcome of events were unknown. No treatment was received for events.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported bleeding cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Was sitting and working on CEs for work, had taken medications for the day, but added in hydrocodone, half of a 7.5/325mg tablet and ibuprofen 200mg. Felt a severe wave of nausea. Laid my head down on my arms on the table. Do not remember getting up, but remember walking through the kitchen in front of the refrigerator, reaching up to feel my pulse, felt two beats which were too far apart and thought to myself, "I'm going to faint". Apparently I was able to walk about 6 feet further, but I don't remember it. I don't know what time I fainted, but I think I must have fallen. I woke up sometime after 7, disoriented and my head hurt, lying on the kitchen floor. My husband came to my side after I called out to him about 5 times. I was drenched in sweat and very weak. When firefighters arrived they said my heart rate was 'all over the place', from 46 to I don't know what (did not hear). Ambulance arrived around 0730. Glucose was normal. Was taken for evaluation. Was given IV NS (I think 1000mls). Labwork was drawn. CXR, CT, and EKG. ER Dr recommended I follow up with my cardiologist, as she noted mitral valve regurgitation and thought a Holter monitor would be advisable. CXR and CT normal. EKG normal sinus rhythm, but showed anteroseptal infarct of unknown age, confirmed by cardiologist who read the EKG. Also seen by my PCP at 1430, he checked my ears, as they had been hurting as well, said they were clear. Advised alternating tylenol and ibuprofen Q4-6H. Friday and Sunday 1/15 and 1/16 night sweat, TMJ pain, nauseated, headache, neckache, fatigue, shoulders sore, eyes sore, inner ear pain Sunday, 1/17 0500 woke up,</p>

975834	1/26/2021	CO	40	F	1/4/2021	1/5/2021	I received the 2nd dose of the vaccine on Monday 1/4/2021 at 1600. Over the afternoon and evening I developed arm pain at the injection site. Since there were no other side effects in the morning, I returned to work for my regularly scheduled shift on 01/05/2021 at 0545. At approximately 0615 I began to get body aches and restlessness. At approximately 0725 in addition to the body aches and restlessness, I began to get severe nausea, weakness, light-headedness, headache, profuse sweating, and severe chest pain and shortness of breath. Because of the severity of my symptoms my manager immediately told me to go to the ED and a fellow co-worked brought me down via wheelchair. In the emergency department I was assessed and worked up and after several tests and xrays I was given a diagnosis of adverse reaction to drug/vaccine. I was discharged to home at approximately 1130 on 01/05/2021. Upon arriving home I continued to have body aches, and then developed chills, shaking and fever of 101.00. All of this combined became unbearable and I had to take 500mg of Tylenol at 2230 on 01/05/2021. On 01/06/2021 I still felt horrible with body aches, fever, nausea and fatigue. My weakness, fatigue are still present today 01/07/2021 at 0945.

976123	1/26/2021	NJ	58	F	1/21/2021	1/21/2021	Having Ehlers Danlos and Mast Cell Degranulation as well as Dysautonomia... Anaphylaxis is often referred to as slow roll and without the typical face swelling and rash. It is more subtle and can be harder to detect. And that was my experience: as follows: I became faint and briefly passed out within 2 minutes of injection. I stabilized quickly within a 30 minute hold although developed increasing nausea, I and med tech was satisfied that it might just be my dysautonomia. I spent the evening with severe headache vomiting as passed out again. I experienced throat tightening but not full closure. The next day I had flue like symptoms that I assume were normal and vaccine related. When this passed in the evening I again suffered nausea and dizziness, vomiting and throat tightening when I tried to eat. These symptoms were not similar to the flush feelings earlier in the day. The symptoms ebbed and waned for 2 days with increased frequency as I took chromalyn , Benadryl with some effect at first and ate with great care as not to introduce more allergens. I had increased chest pain, sweating, fainting, throat tightening became severe Benadryl was not effective. I was having trouble swallowing. I was forced to use an epi pen and call 911. This is a typical anaphylactic response for EDS< Mast Cell patients. It became clear that I could not get past this on my own and the symptoms were increasing. I started to shake with chills and feared shock as my chest pains increased. The epi pen injection and hospital visit via ambulance occurred Monday 1/25-1/26. I became very faint during the Ems intake with the techs having to hold me up to check vitals etc.. My HR dropped despite the Epi. At the ER I was given IV steroids, IV Benedryl and Potassium, tablets and fluids throughout the night, admitted for evaluation.
976135	1/26/2021	LA	74	F	1/10/2021	1/10/2021	Sharp pain in chest for a minutes the night of the injection and then went away. The next morning, sharp pain in the stomach for a few minutes and then went away.

970064	1/25/2021	MA	46	F	1/6/2021	1/1/2021	fever/had a 100.1 degree fever/temperature over 100.1; Sore ARM/Injection site; Headaches/massive headache; eye pressure/Pressure in eyes; Body aches; Muscle spasms/Cramping; tired/tiredness/fatigue/feeling rundown; hot and cold chills; tremors; coughing; chest pain; swelling; unable to work; This is a spontaneous report from a contactable consumer (patient). This 46-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EK9231), via intramuscular on 06Jan2021 09:45 at single dose on left arm for COVID-19 immunization. The patient's medical history included asthma, arthritis and COVID-19. No known allergies. The patient's concomitant medications were not reported. The patient previously took the first dose of BNT162B2 (lot number EH9899) on 16Dec2020 09:45 at single dose for COVID-19 immunization. Facility type vaccine was workplace clinic. Patient was not pregnant. No other vaccine received in four weeks. Prior to vaccination, the patient was diagnosed with COVID-19. Since the vaccination, the patient hasn't been tested for COVID-19. Patient was a PCT Patient Care Technician. Patient had not been feeling well/sick on 06Jan2021 since receiving her second vaccine dose. Patient said she was unable to work, and was still feeling sick. Patient experienced massive headaches, pressure in eyes, body aches, sore arm/injection site, muscle spasms/cramping, tired/tiredness/fatigue/feeling rundown, hot and cold/chills on 06Jan2021 11:00. These adverse events resulted in Doctor or other healthcare professional office/clinic visit. Patient stated she had reactions coughing, chest pain, swelling, tremors in Jan2021. Patient said she couldn't bend without having a muscle spam. Patient clarified if she tries to wipe herself after she goes to the bathroom, she has muscle cramping. Patient clarified if she tries to turnover in bed, she has charley horses everywhere. Patient reported walking hurts from having so many charley horses. Patient said the headache seemed like it was progressing. Patient was feeling rundown and tired. Patient reported she had hot and cold chills over the weekend. Something didn't feel right on 11Jan2021, so she took her temperature and she had a 100.1 degree fever. Patient clarified she did not check her temperature prior to 11Jan2021. Patient reported she has been taking ibuprofen 800mg to maintain herself as treatment. She

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

					<p>said she took some of the ibuprofen 800mg over the weekend, and then decided to take her temperature on 11Jan2021, and that was when she discovered she had a fever. Reported the ibuprofen 800mg was a prescription from her doctor and was dispensed in an amber pharmacy bottle. Patient stated she had lab work for, because of COVID her lungs has been messed up but before she had the shot she was doing pretty good. So, she would be getting tested periodically for her lungs and all that because she had COVID at one time. Patient stated the doctors gave her prednisone and antibiotics as treatment. For antibiotics name, Patient stated amoxicillin she believed it was and the doctors gave her another pill start with a M for swelling. Patient stated her doctor did said it had nothing to do with concomitant medication and other medication conditions. The doctor said it had to do with having the shot. Treatment for adverse events (headaches, pressure in eyes, body aches, sore arm/injection site, muscle spasms, cramping, tired, fatigue, temperature over 100.1, hot and cold/chills) included penicillin, amoxicillin, prednisone. Outcome of massive headaches, pressure in eyes, body aches, sore arm/injection site, muscle spasms/cramping, tired/fatigue, temperature over 100.1, hot and cold/chills were not recovered, outcome of other events was unknown.</p>		
971795	1/25/2021	MS	59	F	1/5/2021	1/8/2021	<p>4 chest pain events that mimic heart attack symptoms for a female, chest pain and tightness that radiates up in the jaw. After 20 min or longer the symptoms begin to dissipate. 1st event 1/8/21 in the evening. The following week another episode while driving home from work. During work 1/21/21 another episode took place and EKG done with negative result. That same evening during sleep another episode woke me up, although it was not as bad as the other ones and 20 minutes later i was able to go back to sleep. As of today 1/25/20 no other episodes. I do take Famotidine daily and have been for several years due to acid reflux and heartburn, but never have I experienced chest pain.</p>

971534	1/25/2021	CA	60	F	1/11/2021	1/1/2021	Temperature 101.7; Back pain/pain in her back; Right upper jaw pain that felt like sinus; Heart rate 130's; Oxygen Saturation dropping; Headache/head felt like it would explode; Ringing in the ears; Thighs are burning; calf pain/Calves were sore in back; Calves were sore in back and felt like DVT; Chest pressure; she sound like a hypochondriac; flu like symptoms; can barely walk; Nausea; Shivering; weak; felt miserable; dry hives; This is a spontaneous report from a contactable Nurse reporting for herself. A 60-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) Batch/lot number: EL1283, Expiry Date: 30Nov2021, intramuscularly into right deltoid on 11Jan2021 07:15 at single dose at the hospital for Precaution as frontline healthcare worker. Medical history included Wolff-Parkinson-White (WPW) syndrome from 2000, heart surgery in the past on unknown date, had surgery that was in 2000. Years of chest pain and PVC after that; allergic to Sulfa with hives: One time she mixed it up with a medication of her sons and took it by mistake and did not realize it and she did not have any reaction, she has not had in years. It was an injection and she doesn't have the name, lot or expiration. Family medical history included Mother was diabetic and sister was prediabetic and was 61. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (Lot E49899) on 18Dec2020 at 10:30 am injected in Right Deltoid for COVID-19 immunisation and experienced shivering; same body aches, she took TYLENOL; had major headache all night long, all over her head; It was a pressure headache; Someone gave her MOTRIN and within 3 hours she was totally fine. The patient stated she received the Pfizer COVID vaccine second dose on 11Jan2021 and has had problems since then. She has been miserable, took paracetamol (TYLENOL), headache, have ringing the ears, head was exploding, back aches, calf pain, temperature at 8 am 101.7 and 101.7 at 10:40 on 12Jan2021, feeling very weak, nausea, dry hives, Right upper jaw pain that felt like sinus, all in Jan2021. Her heart rate was in the 130's at 3:30-4:00 on 12Jan2021 and now down to 115-108. Her Oxygen saturation has been 91-95 %. She just had a miserable night (Jan2021). She had this pressure in her chest. Her heart rate was 130 and O2 was 93%. Her O2 saturation

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

last night (on 11Jan2021) was 91-94%, mostly about 93%. Chest Pressure began around 3am on 12Jan2021. She called healthcare provider and was waiting to get advice from them if she needs an EKG. She was still having a little bit of mild pressure. She noticed that her oxygenation was 93% when this was happening. It went up to 95% for a second last night. Her heart rate was now between 112-115. When she walked, it went to 125-130. It started around 3:30-4:00 this morning (on 12Jan2021) and was mildly improved. she was feeling the chest pressure back pain had lesson, but had pain in the upper jaw, flu like symptoms on 12Jan2021. she said she could not get out of the bed right. She did have a heart surgery in the past, her legs were burring, and week. she said after the first dose she did had a reaction but took MOTRIN and went to work the next day. The patient wanted to know about the heart rate being high and ringing in the ears. She wanted to know if it was supposed to drop your saturation and increase your heart rate. Is she just behaving like the norm or should her O2 be much higher. Her first shot was not as bad as this reaction. There was no prescriber. The temperature just began now as she just took it. Oxygen Saturation dropping began when she woke up in middle of night around 3:30- 4:00. She used her pulse oximeter and noticed it then. It was associated with her ears ringing and her head felt like it would explode at 3:30 on 12Jan2021. She felt better with headache but still had it. She was so weak on 12Jan2021, she did not want to go anywhere. Her oxygenation had worsened to 93% on average. She had a headache last time but did not have ringing in her ears. She woke up about 3:30 with it. The headache now was all over head from front to back and comes and goes. Last time she went to work after receiving the first one and today (on 12Jan2021), there was no way she could go to work. She took TYLENOL when she got home because she was shivering and took more at 3:30 because she felt miserable because of her chest. She took 1 gram. Her headache did not go away. She got to sleep after she took the TYLENOL. Her back and jaw was bothering her. It felt like the flu. She had upper jaw pain and pain in her back. She didn't have a good back and just aches. After the first one, it took 10 hours for the shivering to start. This time it was very similar. The shivering started about 10 hours later, at

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

9pm on 11Jan2021. Back pain starting at 05:00 on 12Jan2021 was stated as being sharp on right side scapula and feel like the flu. It is to the right of spinal vertebrae. She thought she would go to bed and lie down. She has had back pain before. The jaw pain started around 05:00 on 12Jan2021. She felt it in her cheek. It was a little bit better. Nausea started at 11:00 pm on 11Jan2021 and got worse at 03:30 when she got up to go to the bathroom around midnight. She felt like she could vomit and felt better, but she couldn't. Her thighs were burning at 03:30 on 12Jan2020. It was persistent weak and burning. She can barely walk. The areas that have hurt like when you get the flu, she was having now in the same places, so she thought it was from the shot. Calves were sore in back and felt like a DVT (Deep vein thrombosis), started at 03:30 of 12Jan2021 and was still sore. She said she sound like a hypochondriac. It was in back of calf towards knee. She did not think it was a blood clot. It was feeling better. It was still sore but nothing like it was at 03:30. It is just an odd pain. She did not want to leave the house and surprised that her oxygen saturation was low. She just wanted to go back to sleep for a bit. Oxygen Saturation dropping was reported as worsened. The outcome of events Chest pressure, Heart rate 130's, Headache/head felt like it would explode, Right upper jaw pain that felt like sinus, calf pain/Calves were sore in back and Calves were sore in back and felt like DVT was recovering. The outcome of events Oxygen Saturation dropping, Ringing in the ears, Shivering, Back pain/pain in her back, Nausea, and Thighs are burning was not recovered. The outcome of events Temperature 101.7, she sound like a hypochondriac, dry hives, flu like symptoms, weak, felt miserable and can barely walk was unknown. The reporter considered events Heart rate 130's, Temperature 101.7, Oxygen Saturation dropping, Right upper jaw pain that felt like sinus and Thighs are burning were related to BNT162B2. The reporter considered events Chest pressure, Heart rate 130's, Temperature 101.7, Oxygen Saturation dropping, Headache, Ringing in ears, Shivering, Back pain, Nausea, Thighs are burning, Right upper jaw pain that felt like sinus and Calves were sore in back and felt like DVT as serious due to Medically significant.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on

970324	1/25/2021	PA	68	F	1/14/2021	1/16/2021	<p>Patient is a 68yo female with a PMH s/f of osteoarthritis, CHF, TIA with right limb weakness and aphasia and HTN presenting with a 1 week history of bilateral upper and lower extremity pain, stiffness and weakness. Patient states that she received the Pfizer COVID vaccine on 1/14 last week at pharmacy. At the time of inoculation, she did not experience any symptoms and went home after the 15 minute waiting period. The next day, she developed a generalized headache that started in her neck and continued over her head. She states that this continued to get worse throughout the day and on Saturday, she woke up and described a constant, 10/10, dull-aching pain that started at her neck/back of head and extended down to her shoulders to the tips of her fingers. She also stated that she had the same pain starting around her groin extending down to her knees and ankles. Patient initially tried taking Tylenol and ibuprofen to treat the pain, and said that those treatments normally work for her osteoarthritis, but that her pain did not improve afterwards. In addition to the pain, she also states that she developed worsening weakness to the point where she could not walk around her home. She stated that she thought moving around and being active had helped her fight through the pain and tolerate it, but that laying down and resting actually seemed to make it worse. With her symptoms worsening and her inability to walk, she decided to come to the hospital to get further treatment. She denied ever having an adverse reaction to other vaccines she has received previously. She receives the flu vaccine every year, and received measles, polio and other childhood vaccinations that she could not recall. She was diagnosed with polymyalgia rheumatica and started on 20mg prednisone daily. She had a remarkable response to the steroids and her symptoms resolved within 24 hours. She was discharged on her 3rd day of admission. On ROS, she denies fevers, chills, night sweats, SOB, changes to vision, eye pain, cough, chest pain, sputum production, nausea, vomiting, diarrhea, dysuria or hematuria. She affirmed weight loss, headache, neck stiffness, dizziness, lightheadedness, muscle stiffness/pain, reduced ROM, and urinary urgency and incontinence.</p>

970113	1/25/2021	NM	25	F	1/11/2021	1/11/2021	Headache; Muscle soreness/ muscle soreness and knots; Muscle soreness/ muscle soreness and knots; Severe joint pain; Muscle tightness; Chest pain; Moderate chills; Exhaustion; This is a spontaneous report from a contactable other healthcare professional (HCP) (patient). A 25-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number: EL3248) via an unspecified route of administration on right arm on 11Jan2021 06:30 at single dose for COVID-19 immunisation. Medical history included nail patella syndrome. Concomitant medication included ethinylestradiol, levonorgestrel (LESSINA), escitalopram. There was no other vaccine in four weeks. The patient had not COVID prior vaccination. The patient had not COVID tested post vaccination. The patient previously took amoxicillin and experienced allergies. The patient received the first dose of BNT162B2 (Brand: Pfizer, Lot number: EH9899) on right arm on 21Dec2020 16:00 PM for COVID-19 immunisation. First dose came with moderate muscle fatigue and joint pain, chills, headache and fatigue. Events occurred 7 days post vaccination. Second dose had almost immediate side effects beginning post vaccination beginning with headache, then muscle soreness. Followed by severe joint pain and muscle tightness, including chest pain. Moderate chills. Exhaustion. Both instances were elevated with ibuprofen, water, and a night's rest. Upon waking after second dose side effects, muscle soreness and knots probably from muscle tightness night before. A muscle relaxant might have helped. All events started from 11Jan2021 17:00. No treatment received for muscle tightness and muscle disorder, treatment was received for the other remain events. The outcome of the event was recovering.

969632	1/25/2021	WI	23	F	1/9/2021	1/9/2021	Chest hurting; Breathing becomes painful; Tingling sensation on her tongue and says that it feels bigger than normal; Tingling sensation on her tongue and says that it feels bigger than normal; Feeling cold; A spontaneous report was received from a healthcare professional concerning a 23-year-old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced chest hurting, breathing became painful, tingling tongue, tongue discomfort, feeling cold. The patient's medical history was not provided. No concomitant medications were provided. On 09 Jan 2021, the patient received their first of two planned doses of mRNA-1273 (Lot Number: 012L20A) for prophylaxis of COVID-19 infection. On 09 Jan 2021, the patient experienced a tingling sensation on her tongue and felt that it was bigger than normal. She was given Diphenhydramine as an intervention. The patient started to feel cold. After 20 minutes, breathing became painful and her chest was hurting. The patient was given epinephrine and was transported to the hospital for continued monitoring. Action taken with mRNA-1273 in response to the events was not reported. The outcome of the events, chest hurting, breathing became painful, tingling tongue, tongue discomfort, feeling cold, was considered were not recovered/resolved.; Reporter's Comments: This case concerns a 23-year-old female patient who received their first of two planned doses of mRNA-1273 (Lot 012L20A), and who experienced the serious unlisted events of Chest pain and Painful respiration and the non-serious unlisted events of tingling tongue, tongue discomfort, and feeling cold. Patient was treated with Benadryl and EpiPen prior to being transferred to hospital. Based on the current available information and temporal association between vaccination and the onset of events on the day of vaccination, a causal relationship cannot be excluded and the events are considered possibly related to the vaccine.

969618	1/25/2021	IL		F	12/30/2020	1/4/2021	Pericarditis; Severe chest pain; A spontaneous report was received from a 56 year-old, female consumer, who was also the patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced pericarditis and severe chest pain. The patient's medical history was not provided. Concomitant product use was not provided by the reporter. On 30 Dec 2020, approximately five days prior to the onset of symptoms, the patient received their first of two planned doses of mRNA-1273 (Lot number: 0011JZ0A) intramuscularly for prophylaxis of COVID-19 infection. On 04 Jan 2021, the patient went to the emergency room due to severe chest pain. On 05 Jan 2021, the patient went to see the cardiologist and was diagnosed with pericarditis. Treatment information was not provided. Action taken with mRNA-1273 in response to the events was not provided. The outcome of the events, pericarditis and severe chest pain, was unknown.; Reporter's Comments: This case concerns a 56 year old, female patient. The patient's medical history was not provided. The patient experienced a serious, unexpected event of pericarditis and severe chest pain. The event of severe chest pain occurred 5 days and the event of pericarditis occurred after 6 days after first dose of mRNA-1273 (Lot number: 0011JZ0A). Very limited information regarding this event has been provided at this time. Based on temporal association between the use of the mRNA-1273 and the start date of the event, a causal relationship cannot be excluded.

971806	1/25/2021	OR	31	F	1/16/2021	1/16/2021	About 15 minutes after receiving vaccine symptoms started. Nauseous, dizziness, chest pain, shortness of breath, body aches (extreme), joint pain especially in hips and knees, extreme fatigue, headaches, ears constantly rang. Rash on my arm where I received it went down to my elbow and up to my shoulder and on to my upper back, about 3 hours for it show up. It red, raised and bumpy and it felt hot. This lasted for 4 days. I was very pale and my eyes were sunken in. I literally felt like I was ran over by a vehicle. I was sleeping for about 15 hours a day. I kept getting chills then I profusely sweats then it switch to freezing cold and back and forth between the two. I took Tylenol and Benadryl to control symptoms but still felt miserable. The symptoms all stayed with me to the end. I still do not feel 100%, I am still having ringing of the ears, moderate body aches and headaches. Someone else said they still see the rash but I cannot really tell. I was also having trouble focusing for a few days after receiving the vaccine, I felt highly medicated not the fun high the bad high.
970728	1/25/2021	NY	31	F	1/18/2021	1/19/2021	101 fever (w/tylenol), chills, body aches, fatigue, chest tightness and chest pain(only for 1 hour)--all resolved in 48 hours
970198	1/25/2021	GA	21	M	1/12/2021	1/13/2021	First day I was lightheaded, dizzy, sore all over, weak and had the chills. The second day i had severe chest pain and trouble breathing, I went to the ER and was admitted into the hospital because of this. After an EKG it was found that I had Myocarditis. To treat it they gave me an IV for the pain, then I was prescribed ibuprofen and 2 other meds for the inflammation around my heart.

972795	1/25/2021		26	F	1/25/2021	1/25/2021	As patient was waiting in waiting area approximately 5 minutes after receiving her 1st COVID vaccine, pt's friend called pharmacist over as patient felt she was about to faint. She had her eyes closed and said she felt faint. Notified incident command to call for provider. We moved her to an exam room so she could lie down. She said she felt warm and dizzy. Pt breathing heavily. Denied chest pain. Had stomach pain and some nausea. Pt was given water. ER provider arrived about 4:30 and listened to lungs, carotids, talked to patient regarding vasovagal reaction. Pt slowly began to feel better and was talking and laughing. Waited with patient until 4:50, able to stand on own, not dizzy anymore, felt okay to leave.
972765	1/25/2021	CA	75	F	1/25/2021	1/25/2021	Pt was initially cleared for no reaction after 15 minutes of monitoring, however, once she left our office and drove down the street, she has numbness, tingling and swelling in the left side of her face. she drove right back. declined chest pain, sob, throat swelling. pt vitals were stable, and after another 15 minutes of monitoring her symptoms started resolving
972754	1/25/2021	AK	70	F	1/16/2021	1/25/2021	Today woke up with raised area at injection site, about 1/2 dollar size, increased redness, increased warmth, itchy. Tender to touch. She also reported fatigue, chest pain since yesterday with activity intolerance. Noted irregular heart rate on my initial exam, converted to sinus by the time EKG was done.
972752	1/25/2021	NJ	30	F	1/25/2021	1/25/2021	PT RECEIVED THE COVID -19 VACCINE,WHILE SHE WAITING FOR HER 15 MINUTES AS MENDATED ,SHE BEGAN HAVING ARM PAIN/TINGELING. A FEW MINUTES LATER SHE STARTED GETTING CHEST PAIN.WE CALLED 911. AND THEY ARRIVED IN 10 MINUTES. SHE HAD HER CAREGIVER NEXT TO HER.SHE WAS THEN TAKEN TO THE HOSPITAL,WE CALLED TO CHECK ON HER LATER AND CAREGIVER STATED SHE WAS DISCHARGED FROM HOSPITAL AND THAT THIS IS BEHAVIORAL ISSUE, NO CARDIAC ISSUE AS PER CAREGIVER.

973021	1/25/2021		57	M	12/30/2020	1/25/2021	presents with sudden onset of subjective fever, chills, headache, n/d/ since yesterday. received a COVID vaccine at the end of Dec 2020. denies chest pain, SOB, abd pain. supposes to have 2nd vaccine on 28 Jan 2021.
972631	1/25/2021	CA	92	M	1/25/2021	1/25/2021	Felt like his throat was closing. He was given 25mg benadryl and then developed dizziness, heart racing, chest pain, shortness of breath, jaw pain. Was in SVT on arrival to ED
973029	1/25/2021	CO	48	F	1/23/2021	1/23/2021	Approximately seven hours after the vaccine was given, I started to get a headache. The HA was followed by extreme fatigue (around 2000). I went to bed with vaccine site pain (8/10), some chest pain (3/10) and back pain (7/10). I awoke about midnight (2400) with nausea and felt like a syncopal episode was imminent. My BP at the time was 115/75, HR of 75 (baseline is 125/75). I drank some water and elevated my feet. About 0230 on 1/24/21 another episode hit, with a corresponding BP of 105/72, HR 80. Again I elevated my feet and drank a glass of water. A third episode hit around 0600 with a BP of 96/65, HR of 87. I elevated my feet, drank a glass of water, ate something and considered going to the hospital. I began to feel a little better. That was the last episode. The nextday on 1/24/21 I felt fatigued and weak with unusual pains occurring throughout my body (5/10). By 1/25/2021 I was feeling pretty normal and went back to most activities (I did a short, flat walk instead of my usual 45-minute treadmill incline).
971976	1/25/2021	GA	96	F	1/25/2021	1/25/2021	Patient complaint of dull chest pain after leaving clinic room and walking to main lobby. Unable to pinpoint exact location of chest pain and unable to report exact duration of chest pain. When I arrived to the patient, she stated her chest pain had gone away. Vitals taken at 2:16 pm: BP-132/71, HR 71, 94% O2. Patient is on 2 Liters continuous oxygen via nasal cannula. Patient states she is taking "15 heart medications" and follows up routinely with cardiologist. Patient not experiencing difficulty breathing, and having no difficulty speaking with me. Vitals taken again at 2:22 pm: BP-140/74, HR 70, 93% O2. Patient was monitored 10 minutes after last set of vitals where she continued to deny chest pain or difficulty breathing. Care was then turned over to assistant living staff to ensure patient got home safely.

971856	1/25/2021	MI	38	F	1/25/2021	1/25/2021	1307 2nd dose Pfizer COVID-19 vaccine administered. 1327 responded to patient who had been sitting in her car post vaccine. Patient reported that she had noticed anterior chest pain (4/10) as well as a weighted pressure. I assessed the patient while she remained in her car. She has a history of high blood pressure, taking medication and has been under control. She also reported diagnosis of asthma. Lisinopril 5mg daily, she had taken this morning. Albuterol metered dose inhaler (not used today). She denies heartburn nor taking any medication for it. She had eaten a hamburger 30 minutes prior to vaccination. 1335 patient reported that her chest pain turned more into a warmth that spread across the chest and a tingling sensation down only the right arm. 1344 she rates the discomfort in chest as a 2/10 the tingling in right arm is gone. She denies the following symptoms: difficulty breathing, changes to vision/hearing, dizziness/lightheadedness, facial and throat swelling, & nausea. Patient remained very calm during this observation time and spoke in complete sentences. She was comfortable with her mask on. Patient denied these symptoms occurred with her first dose of COVID-19 vaccine nor any other vaccination. Obtained automatic blood pressure device measured 142/91 (63 beats/min) at 1351. Patient was able to teach back when she will seek Emergency care: difficulty breathing, face/throat swelling, persistent and or worsening chest pain/pressure. Patient and I both agreed she was safe to leave the vaccine clinic.
972741	1/25/2021	PA	72	F	1/16/2021	1/19/2021	1st covid shot on 1/16/21. Then on 1/19/21 I had ortho inject a steroid in my thumb. Right after the steroid shot, I started reactions---Severe headache, chills, nausea, cough, upper chest pain, severe weakness, blood pressure up and down. Went to family doctor 1/22 and covid shot in office showed negative. Worse on 1/24/21 and went to ED. They did a chest x-ray, CTA chest, lots of bloodwork and covid test that took 2 hours to receive results. All was negative except the D-dimer test. Thye thought it might be a result of the 2 injections within days of each other.

971920	1/25/2021	UT	24	F	1/15/2021	1/22/2021	A few hours after the first dose (1/15), a welt grew around the injection site about the size of a silver dollar. This went away after three days. Arm was sore for the first two days. One week later (1/22), injection site became itchy, red and was very warm to the touch. A welt formed as well. It started out the size of a silver dollar, and over the course of 48 hours the welt, itchiness, and redness grew to the size of a large russet potato (Friday 1/22-Saturday1/23). It was the most red around the injection site, with the most red being about the size of a silver dollar. After 48 hours, it remained itchy, red, and had a welt for the next 24 hours (Sunday 1/24). The next morning (Monday 1/25) redness and swelling were gone but site was still a little itchy. Site was only slightly tender throughout these three days but not painful. No other side effects were noticed i.e. fever, chills, chest pain. Slight dizziness was felt if I hadn't eaten anything.
972622	1/25/2021	CA	39	F	1/20/2021	1/21/2021	Hypertension, joint pain, chest pain , tachycardia
971986	1/25/2021	TX	42	F	12/26/2020	12/27/2020	The next morning after I had trouble getting up. I was achy and had a 99.7 fever. Took tylenol and rested. A few hours later the symptoms got worse and worse an my body ached so bad I could barely walk. The fever elevated as high as 103 during that time. And I had what felt like pressure on my neck which made my voice sounded really rough. I had chest pains, rapid HR and SOB and the symptoms got so bad I went to the ER where I remained for about 8hrs. While there I started getting a really bad headache which lasted from that Sun after to the end of the week on Friday. Benedryl, pepcid, tylenol was given. About 9:30pm I was released with a prescription for the headache and advised to take benedryl. Once home I noticed my arm was swollen and white in the center. I got a rash on that arm that carried to my face and was itchy and burning. I had lymph nodes that devoloped under both arm pits but the side where the injection was given hurt worse than the other. Had to wear the holter monitor for a week d/t the elevated HR which in turn made the healthcare specialist prescribe metropol to help lower the HR but to date I am still having issues with the rapid HR.

972390	1/25/2021		31	F	1/22/2021	1/22/2021	ED notes as follows: 31 y.o. female who arrived to the emergency department for Vaccine reaction. The patient presented to the ED after getting her second COVID vaccination. She reports feeling confused, nauseous, and having a racing heart. She has never had a reaction like this before. She reports having a tickling sensation in the back of her throat and both hands feel like they are tingling. The patient denies any other known allergies. The patient has a past medical history of anxiety, depression, PTSD, prior conversion disorder. Patient denies any shortness of breath or chest pain but does report a headache. The patient denies any drug use, alcohol use, tobacco use. Patient has no other complaints at this time. The patient was given Benadryl, Epi, solumedrol, for anaphylactic-like presentation. Patient also began on fluids and Zofran for possible vaccine reaction. Patient symptoms began to improve over the course few hours. At the 3-1/2-hour mark after initial arrival to emergency department the patient began to have similar symptoms to her initial presentation with tachycardia, dry heaving, and finger tingling. The patient was also hyperventilating. The patient was given 1 mg Ativan which relieved her tachycardia had resolved her hyperventilation signifying possible anxiety component to symptoms. Patient was allowed to relax for 20 to 30 minutes at which time she was comfortable and felt like she was okay to discharge home. Patient was instructed to follow-up with her primary care doctor that she could next week. Patient was informed to return to emergency department if new symptoms arise or current symptoms worsen. 972487	1/25/2021	AZ	24	F	1/13/2021	1/14/2021	In addition to arm pain for two days, I also had chest pains/tightness. I felt the chest tightness the morning after getting the vaccine. The chest tightness continued until 1/23. It was not a constant pain, but sometimes when I would move a certain way, my chest would hurt. The spot that hurt is right in the middle of my chest. It got worse when I would exercise and breathe heavily. The chest pain continued to stop and come back for several weeks. The night after I received the vaccine, I felt dizzy and felt as if I would pass out, but did not. This only happened one time and was better when I woke up the next morning. The weekend after I got the vaccine, I was worried I might have covid, so I got tested for covid, but the results came back negative.

968979	1/24/2021	KS	23	F	1/13/2021	1/13/2021	The day of the vaccine about 4 hours later, I started experiencing chest pain. It was not tightness or a heartburn feeling type of chest pain. I have asthma, and it is the type of chest pain I start feeling right before I get bronchitis, almost like breathing in mist and the irritation that comes from having a cough, but I had not had a cough that would have caused this sensation. The next day, I was extremely fatigued, had a headache, chills, started getting a cough, and was sent home early from work. The day after, Friday, I had a fever of 102 and was essentially bedridden. I started using my nebulizer and my dr called me in some prednisone. These symptoms continued through the weekend and began lifting that Sunday. However, on Monday, my lymph node under my ear started swelling on my left side (the same side as the shot), my ear became clogged, my sinuses on my left side had shooting pain every time I inhaled, and although I could breathe through my nostrils, they felt full and had immense pressure. Additionally my headache became worse and I began experiencing intense muscle pain right at the base of my skull on the left side near my occipital lymph node that was radiating into my head and making the headache and sinus pain worse. Now, 11 days after my first dose of the vaccine, I still have the ear pain, swollen lymph node under my ear/behind my jaw, sinus pain, muscle pain at the base of my skull, a headache, and extreme pressure in my head/sinus area that has not lifted. I started on an antibiotic Friday night (the 22nd) in hopes that this is a sinus and ear infection. Ibuprofen helps the headache slightly but makes the pressure in my head feel worse and makes the joints in my hands and forearms hurt and my fingers swell for some reason which has never happened before for me when taking ibuprofen.
968586	1/24/2021	PA	58	F	1/19/2021	1/22/2021	On Jan 22 I had fever, body aches and headache. Woke up on Jan23 and felt fine, no symptoms. At around 2:30 on Jan 23 I had an argument with someone and felt my heart race for a minute and then chest pain radiating to my back. Went to the hospital at 7pm and was being ruled out for an MI.

968950	1/24/2021	FL	69	F	1/21/2021	1/21/2021	I became weak and thought I was going to faint. I called the medical professional over and they brought me into a staged area for triage. My blood pressure was 171/ 104 or 114. I had chest pain. The EMT did an EKG, listened to my heart, and started an IV. The ambulance was called and I was transported by ambulance to the hospital. At the hospital another EKG was taken, blood pressure and blood work. Repeated blood work was taken. I was admitted to the hospital due to elevation of tyoponin level and chest pain. The following day 1/22/21 I saw my PCP and he thought it was related to the vaccine and recommended a cardiologist for the increased levels of tyoponin and chest pain. The cardiologist performed another EKG< more blood work and performed a cardiac catheterization and a ECO. Both were normal. Prior to that I was given a nitro pill as my chest pain was between a 7 and a 8; a few minutes later the nurse asked about my pain level and it was a 3-4. I was given another nitro pill and shortly after I felt extremely faint and my blood pressure was 56/32. I was immediately given a bolus of saline IV . The chest pain continued through the day. The following day, I had no further chest pain, my tyoponin levels returned to normal and I was released from the hospital.
969118	1/24/2021	PA	40	M	1/22/2021	1/22/2021	Provider HPI: "Presented to the emergency department by ambulance for an evaluation of allergic reaction. 967593	1/23/2021	TX	39	F	12/18/2020	1/8/2021	I had very slight nausea soon after the first shot, then started having chills and whole body ache from the night (12/18/2020) for 24 hours followed by spontaneous internal hemorrhage (lower GI, significant blood in stool) in the morning and in the afternoon of 12/20/2020. The hemorrhage lasted for about 24 hours. It started slowing down on 12/21/2020, then stopped. I was evaluated by Dr., (GI) who was not sure if the bleeding was vaccine induced vs. coincidence on 12/23/2021. Since the bleeding stopped, she cleared me for the 2nd vaccine and advised me for close monitoring for any other episode of bleeding. I had some fatigue for about 4-5 days since the first shot, then I felt normalized. Soon after the 2nd vaccine (in about 5-10mins) on 1/8/2021, I started having some discomfort/pain in lower rib region where spleen is. Initially I felt like some chest pain, but it was more near spleen region, I think... I also had slight intermittent dizziness for about 2 hours after the 2nd injection. The discomfort in left lower chest/rib improved and resolved in an hour or so. Then, similar pattern started including chills and whole body ache on the night of 1/8/2021 followed by internal hemorrhage again (significant blood in stool) in the morning and in the afternoon of 1/9/2021. The bleeding slowed down on 1/10/2021, then stopped. I reported it to again my GI doctor on 1/11/2021 who ordered CBC to monitor my platelet level. The result showed down trending from my baseline. I think the COVID vaccine transiently affected me with internal hemorrhage and lowering platelets/likely potential thrombocytopenia given the clinical symptoms (spontaneous internal hemorrhage). Platelet level is improving at this time and I feel normalized today.

968349	1/23/2021	AR	37	F	1/5/2021	1/10/2021	1/7/21: had thee COVID vaccine on 1/5/20 and developed symptoms an hour after administration chills, sweats and bodyaches. Also developed nausea, diarrhea and chest pain. Woke up this morning with cough and congestion. 1/10/21: called this morning to give us an update on her symptoms and see about a COVID swab. states that she is currently hooked up to an IV due to dehydration and no urine output. she has had zofran and pain medication for her severe abd pain. They have strep swabbed and flu swabbed but have not COVID swabbed. Encouraged getting a COVID. She states she will ask them for one and will call us with an update either today or tomorrow. 1/10/21: called and left voicemail stating that she was being discharged. they did COVID 48-72 hours for results. On ABX and Phenergan and Zofran alternating. Got two bags of LR has UTI and Kidney infection. CT with contrast lungs clear. Negative for flu and strep. Strep culture pending. added to spreadsheet since she was COVID tested. 1/14: Called regarding her Covid test. It was reported as negative. is still very sick with fever, sore throat, congestion, nausea. I spoke with Doctor regarding the extent of her symptoms following the vaccine. Doctor recommended that she be seen by her PCP as she has not improved. 1/14: called and went to her PCP as advised by Doctor. now has a UTI and URI. She is on Macrobid and Levoquin as well as Zofran and Phenergan. Her BP was 117/60 and dehydrated. Her PCP told her to monitor her BP and return to ER if not improved and also return to ER if symptoms became worse. will call on Monday 1/18/2020 and update us on her condition 1/17:COVID tests were negative, over 48 hours since a temp above 100.4, 99.1 was the last temp doing better. No more vomiting and no diarrhea. still has a cough and is still on ABX from all of her symptoms. Is on a cough suppressant so recommend her working from home since she is able and will update us towards the end of the week on how she is doing. 1/20: Received the COVID vaccine on 1/5/21. Released yesterday to work from home. No longer has vomiting or diarrhea. COVID, FLU and strep tests negative. Diagnosed with allergic reaction to COVID Vaccine. had kidney infection and UTI. CT of abdomen done with contrast. CXR to r/o pneumonia. continues to have a runny nose, no fever. Continues to have laryngitis and fatigue. called today to get released. Encouraged to call

						back when she gains more strength and can return. My PCP diagnosed me with a severe allergic reaction to the covid shot. I had the rapid covid test ran twice and the test sent out twice, all 4 tests came back negative. I had the flu test ran and it came back negative. So did the strep culture. I had 2 full lab workups ran and they both came back normal including my vitamin levels. The only thing that was out of alinement was my white cell count was high due to an infection. Today, I am currently running a fever of 99.4. I still have a cough that is rather irritating. I still do not have a voice. I am retaining color back in my skin. I am still tired and weak but have managed to work and do small things around the house such as cook dinner, wash laundry, clean dishes, and shower. These were daily tasks that I wasn't able to do during the first 2 weeks after taking the shot.	
968350	1/23/2021	CA	52	F	1/22/2021	1/22/2021	Each event was added with time lapse of 30 min. abnormality Preliminary CT abdomen pelvis revealed no
acute intracranial abnormality other than hiatal hernia
Chest x-ray is negative for acute pulmonary pathology
EKG Results EKG obtained at 0323 interpreted by me
reveals normal sinus rhythm, patient has diffuse T wave
flattening which appears similar to previous no STEMI,
no ectopy no heart block no WPW Brugada prolonged
QTC Emergency Department Course and Procedures:
Medications, IV's and Blood Products Ordered Sodium
Chloride 0.9% (Sodium Chloride 0.9% Bolus) 1,000 mL
once IV Bolus, Reason for Infusion = Abnormal fluid
losses Other Orders Nursing to Initiate Saline lock
Insertion Careset (Stat) Oxygen Therapy (Titrate for
SaO2 > 95%) Reexamination/Reevaluation: Critical
Care Note The high probability of sudden, clinically
significant deterioration in the patient's condition required
the highest level of my preparedness to intervene
urgently. Critical care was necessary to treat or prevent
imminent or life-threatening deterioration of the following
conditions: cardiac failure, circulatory failure, CNS failure
or compromise, dehydration, hepatic failure, endocrine
crisis, metabolic crisis, renal failure, sepsis, respiratory
failure, shock, toxidrome and trauma. I provided critical
care services requiring my management in the following
manner: chart data review, documentation time,
medication orders and management, re-evaluations, vital
signs assessments and reviewing monitor data, and
ordering and reviewing lab tests. Aggregate Critical care
time was 30 minutes. My time did not include minutes
spent treating any other patient simultaneously or on
activities that did not directly contribute to the patient's

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

treatment. It did not include time spent performing other reported procedures. Medical Decision Making: This is a 76-year-old female who presented ER today for evaluation of syncope. Patient was reportedly mildly hypotensive which improved with IV fluids. I suspect that patient had dehydration given 4 episodes of large watery stools. Patient had no recent antibiotic use and has no C. difficile risk factors, suspect this may be related to her Covid vaccine, she had no evidence to suggest anaphylactic shock, patient felt better after IV fluid bolus was able to ambulate around the emergency department without lightheadedness or near syncope. She had troponins x2 which were negative, her EKG was nonischemic and there was no evidence of ectopy or arrhythmia. Patient did have syncope and fell onto her side, she denies discrete head injury although patient is anticoagulated, CT head was obtained to rule out intracranial hemorrhage given the syncopal event. Patient CT abd/pelvis was negative for obvious cause of patient's abdominal tenderness may be related to her diarrheal illness patient will be prescribed Bentyl. She will call her primary care doctor in the morning to arrange close follow-up. She understands need for aggressive oral hydration at home. She will have low threshold to return should she develop lightheadedness syncope chest pain shortness of breath palpitations worsening abdominal pain bloody or dark stools any new or concerning symptoms. The patient presented to the emergency department with potentially life or limb-threatening symptoms. After my history, examination, and workup have decided that the patient is stable. My impression is that they are safe to go home at this time. I have reviewed ED return precautions with the patient. They understand to return if they are concerned for any reason. They will follow-up with their PCP in 1-2 days. Impression: Syncope, hypotension-improved, dehydration Plan: Discharge Follow Up Within: 1-2 days Comments: Please call your doctor in the morning to arrange follow-up with your primary care doctor in the next 24 hours. Please stay well-hydrated and eat regular meals. Please take Bentyl as needed for abdominal cramping with diarrhea. Please return to the ER if you develop worsening abdominal pain, feelings of lightheadedness passing out any new or concerning symptoms. Patient Education Syncope, Easy-to-Read

966154	1/22/2021	CA	49	M	1/15/2021	1/16/2021	<p>Received Vaccine on Friday January 15th 2021 at approximately 0715am after my Isolation and having had no symptoms for over a week. Received injection, was observed by our Physician staff for approximately 35 minutes with no adverse reactions noted at that time. Approximately 30 hours later on Saturday my left arm began to hurt and a very very strong fatigue came over me and I took a 2 and a half hour nap on the couch. I was still extremely fatigued upon waking, but my arm continued to hurt more and more up to the point it wasn't usable for anything heavy and/or strenuous at all, hurting just to use it for getting up from the couch. I was assisted to get me things like water, food and stuff. The arm pain began to radiate towards my left shoulder and eventually throughout the day the pain was spreading from my shoulder to include my left upper thorax and left rib cage. By Sunday, what had begun as left arm pain had now become stronger an approximate 5/10 pain. It started to present as atypical chest pain having the pain now fully encapsulated within my left upper chest. Felt what appeared to feel like intercostal pain and a general ache all throughout. By Monday the pain was still all throughout and assessed the situation from a cardiac standpoint and found that the pain was mostly positional and I wasn't exhibiting any cardiac symptoms such as shortness of breath, no sub-sternal pain, no jaw pain, no back pain. It hurt more as I would take a deep breath and began to move my left arm around and bringing it up from my side and did a stretch with my crooked elbow of my left arm I raised it to the ceiling and moved my thorax to my right side and found that this would make it hurt more, so I did some twisting of my thorax and abdomen and found that the pain would increase from movement, it was then that I began to think that it might be Pleuritic pain. Tuesday the 19th and Wednesday the 20th I had to call in Sick because I developed a severe muscle ache below my left calf between my calf and left ankle, as if it was in constant spasm and it affected my walking, like a Charley Horse feeling and wondered if it were the same kind of feeling that I had in my chest and I found it quite odd that all my symptoms were on the left side which is the same side I received the vaccine because my right side didn't have any muscle aches. The overall chest pain began to subside over the next couple of days, but the pleuritic pain that I described never decreased in</p>

964992	1/22/2021 NH	26 F	1/20/2021	1/21/2021	<p>intensity or pain level. I saw my Personal Dr yesterday January 21st 2021 at approximately 5:15pm as he was walking out of his office and we discussed my symptoms and believing that my symptoms seemed to indicate some kind of tentative diagnosis of a pleurisy issue as he had agreed that there didn't seem to be any cardiac involvement and am scheduled to see him again tomorrow Saturday January 23rd at 4pm As I write this the pain continues as before with no seeming end point and is not diminishing. I had phoned and talked yesterday afternoon and felt it best to check with my primary physician because he hadn't had any reports such as mine.</p> <p>At 0200 approx 10 hours after my vaccine I spiked a fever of 101. I had been taking Tylenol every 6-8 hours in hopes to avoid this. Later that morning I was light headed, fatigued, sore throat, nausea. The fever continued to increase. By 2200 that day my fever was 104.7 and that was with Tylenol on board. I also iced my groins and axillary areas to help cool my body. Today is the second day out from the vaccine and I have recovered from the fevers. My fever early this morning was still 102.5 but has since passed and I am normothermic. I am very fatigued with some chest pains.</p>

963898	1/22/2021		44	F	1/8/2021	1/9/2021	<p>woke up with left sided chest pain and thought she may be having an MI; Injection received in left arm, resulting in extreme left side pain and soreness; woke up with left sided chest pain and thought she may be having an MI; Left upper body continues to be sore, not only at injection site but also left axillary area; Left arm is still warm although vaccine was received 72 hours ago; This is a spontaneous report from a contactable pharmacist (patient). A 44-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EL1284), via an unspecified route of administration in the left arm on 08Jan2021 07:45 AM at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. Patient has no known allergies. Patient was not pregnant. Patient has no COVID-19 prior to vaccination. No other vaccines was given in four weeks. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EJ1685) given in the left arm on 21Dec2020 at 02:00PM for COVID-19 immunization. On 09Jan2021 at 03:00 PM, the patient experienced injection received in left arm, resulting in extreme left side pain and soreness. She woke up with left sided chest pain and thought she may be having an MI. Left upper body continues to be sore, not only at injection site but also left axillary area. This pain was not noted with her first vaccination. Left arm was still warm although vaccine was received 72 hours ago. This was not noted with her first vaccination. No treatment was given for the reported events. Patient was not tested for Covid post vaccination. The outcome of the events was recovering.; Sender's Comments: Based on the close temporal relationship, the association between the event myocardial infarction with BNT162b2 can not be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.</p>

966142	1/22/2021	WA	57	M	1/19/2021	1/19/2021	HPI from ED: 57-year-old male with history of reactive airway disease, T2DM, OSA presenting with shortness of breath. Patient states 2 days ago, he had to take his dog to the vet, and they accidentally ran away; he had to run "full tilt" to catch it, which caused him to become acutely short of breath. Since then, he has had worsening difficulty breathing with any type of exertion, progressing today to dyspnea at rest. He has been using albuterol several times per day (3-4 times today), as well as his BiPAP machine that he uses for OSA, during the day without relief. Denies chest pain, though he has chest tightness associated with difficulty breathing. History of similar difficulty breathing with exertion during the winter, but never this bad; has not been hospitalized or intubated for RAD. Got his second COVID vaccine 3 days ago, after which he had fevers, now resolved. Denies recent antibiotics; no history of COPD, slight cough today, not productive of sputum, no hemoptysis. Reports a month of right leg swelling; has a history of prior right knee surgeries; no posterior calf pain, no acute changes; no history of VTE, no history of cancer, no hemoptysis, no recent procedures/surgeries/immobilizations.
967221	1/22/2021	FL	41	F	1/15/2021	1/15/2021	Vaccine was received in the left deltoid. First symptom was right arm going numb at about 10 minutes. At about 25 minutes had full body severe itch. At 35 to 40 minutes had sudden onset of chest pain, tachycardia, shortness of breath, and hypertension. I had pre-medicated with Benadryl and Pepcid. No further interventions were needed. Symptoms resolve spontaneously about 30 minutes later.
967182	1/22/2021	AZ	26	F	1/18/2021	1/20/2021	I got the vaccine in 1/18/21 and started getting a body rash on 1/20/21 and had chest pains.

966073	1/22/2021	CA	40	F	1/21/2021	1/21/2021	Twelve minutes after receiving the vaccine injection, patient reported tingling in both arms and across her upper back. She had taken a dose of Benadryl, 50 mg p.o. prior to coming to the clinic, due to her prior history of allergies. Her blood pressure was checked in left arm, 134/94. She denied chest pain, SOB or feeling of swelling in tongue or face. After the tingling sensation, she began to experience pruritus of her arms, back and scalp. Visual inspection revealed no visible rash or hives. When she began rubbing on her left arm to relieve the itchy sensation, the area of rubbing became erythematous. She was observed for 45 minutes after the injection. Symptoms did not progress and she was discharged from the clinic. Phone follow-up 24 hours later: pruritus has resolved. She took 2 more doses of Benadryl 50 mg p.o. yesterday, at 2 p.m. and 11 p.m. Only symptom reported today is sleepiness.

967095	1/22/2021	NJ	41	F	12/28/2020	12/29/2020	Approximately 36 hours of fever of 101, chills, shivering, sweats, aches and pain in every joint in my body, back pain, headache, pain at the injection site, fatigue, weakness, dizziness, nausea, difficulty completing my daily work duties and household activities due to pain and not feeling well. This was not much helped by Alleve, therefore I took Tylenol which was mildly helpful. After the first 36 hours, the symptoms lessened in severity and lasted for about another 12 hours. After that, I felt well for several days in a row, then about 1 week later I felt sore, weak, tired and nauseous. This resolved in its own in about 2 hours. I have felt well since then. I am choosing to receive my second dose of moderna vaccine tomorrow, because I would rather experience these side effects then catch COVID ever again. I caught COVID19 in March 2020. With my COVID infection, I was sick for about 21 days with fever of 101 and more, bone pain, body aches, chest pain, back pain, headaches, nausea, shaking chills, sweats, trouble breathing, dyspnea, cough, runny nose, sore throat, pink eye, dizziness, tiredness, ?brain fog? and fatigue. I was not hospitalized. After about 21 days I began to recover, but the first week after my recovery began I was very weak and tired, and spent most of my time sleeping. I was 41 years old at the time, with health problems including well controlled asthma and being overweight. I never wish to experience this again and I am grateful that I am receiving the Modena vaccine. Thank you so much for logging my side effects.

966365	1/22/2021	TX	64	M	1/16/2021	1/16/2021	Patient had an argument about some issues, so he got excited while he was waiting for observation in the post vaccination area. He had a complaint of feeling of light headed and anxious . No SOB, no chest pain, no headache, no dizziness, no visual problems. Vital signs: BP-142/90 HR-84 O2 Sat-99% He had good color, good O2 saturation and was alert and active, Oriented X3 in NAD. I told him to relax ,take deep breaths and was watching him for almost 30 minutes after he reported feeling light headed. Lungs was CTA and heart rate was normal. H/O HTN. Informed patient to relax gave him post vaccination care instructions and told him to drink enough fluids and take Advil or Tylenol PRN for pain relief.
966422	1/22/2021	PA	30	M	12/30/2020	1/19/2021	I've prior had mild adverse reactions to flu shots where I'd feel slightly ill for a day or so afterwards, but no significant responses to question the initial COVID vaccine. About 3 weeks from receiving the vaccine, I started to develop an intense pain along my left chest/back/and posteriomedial arm which was clinically dx'd as Shingles by my physician. I have physical pictures to detail the areas of effect, but the symptoms remain as significant arm/chest pain with paresthesia along my scapula. Mild nausea and chills are also episodic. Having never exhibited these symptoms and the upcoming date for my second dose (1/27) I'm concerned if this is a triggered immune response which could worsen or prolong with a second dose.

962169	1/21/2021			M	12/22/2020	12/22/2020	Clotting event; Fibrin D dimer high; chest pains; Little injection site soreness; This is a spontaneous report from a contactable consumer reporting for himself. A male patient of an unspecified age received the 1st dose of bnt162b2 (BNT162B2, Manufacturer Pfizer -BioNTech), via an unspecified route of administration in the arm, on 22Dec2020, at single dose, for COVID-19 immunisation. Medical history was none. Concomitant medications were not reported. The patient experienced fibrin d dimer high in Jan2021 with outcome of unknown, clotting event on 03Jan2021 with outcome of unknown, chest pains on 03Jan2021 with outcome of unknown, little injection site soreness on 22Dec2020 with outcome of unknown. The events fibrin D dimer high and clotting event caused patient's hospitalization in Jan2021. The patient underwent lab tests and procedures which included fibrin d dimer: high in Jan2021. The patient was vaccinated on 22Dec2020 close to the evening and had a normal response with a little soreness in the arm at the injection site. Then on 03Jan2021, he reported to be having chest pains that he never had before and went to the emergency department (ED) due to a clotting event. Upon blood work, they discovered that his D-dimer was elevated and was really high for his age. He mentioned that he had no history and no issues with this whatsoever before. He received the 2nd dose on 11Jan2021. The information on the lot/batch number has been requested.

961843	1/21/2021	VA	52	F	1/7/2021	1/8/2021	Heart attack / she had a MI / diagnosed as a NSTEMI; This is a spontaneous report from a contactable healthcare professional (patient). This 52-year-old female patient received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) in left arm, on 07Jan2021, for COVID-19 vaccination. Medical history included autoimmune thyroiditis (Hashimoto's thyroiditis) from 1998 and vitiligo from 1988. She was overweight. She had really no other risk factors. Concomitant medications were not reported. On 08Jan2021 the patient experienced heart attack and she had a MI, then a cardiac catheterization that was normal and a normal echo as well. She said it was diagnosed as a NSTEMI and not a large MI, the smaller version. These events required hospitalization from 08Jan2021 to 12Jan2021. MI occurred after she finished clinic and she was not standing or doing anything, just sitting and she had chest pain. Her office was right next to the ER, so she received treatment within an hour and they were able to help her. She said that her hospital couldn't do a cardiac cath, so on 11Jan2021 they moved her to an hospital which was another treatment facility. When she had her MI they gave her acetylsalicylic acid (ASPIRIN) and sublingual nitroglycerin. They tested her troponin and did an EKG which was abnormal on an unspecified date in Jan2021. On 08Jan2021 troponin was increased. When they treated her with nitroglycerin and Aspirin, two hours later her EKG was normal and her troponin came down overnight on 09Jan2021, which was when they said for sure that she had a heart attack. The patient said it was very scary to have a heart attack, but thankfully there was not a lot of damage done and she was able to get treatment quickly. She did not think the event was disabling since they did not see much damage to her heart muscle, it was a near miss kind of thing. She said it was life changing in that she will now be on medication forever, she will be on at least a baby Aspirin and probably something like a statin for the rest of her life. She was recovering, it was unknown what the lasting effects may be, she felt normal but tired from her hospital stay. Heart attack resolved on 08Jan2021. Information on the lot/batch number has been requested.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the event acute myocardial infarction cannot be excluded. The

A 30-year-old female patient (pregnant: No) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL1283), via Intramuscular on left arm on 06Jan2021 at 14:00 at single dose for COVID-19 immunisation. The relevant medical history included known allergies: Penicillin and known allergies: Sulfa. Concomitant medications were reported as none. The patient previously took Ceclor and had known allergies. The day after receiving the first dose, on 07Jan2021 at 15:00 the patient had been having intermittent left sided chest pain. The pain was worsened with deep breathing. Additionally having palpitations. It had caused her enough concern that she went to the ED (Emergency room/department or urgent care). She had been encouraged to follow up in clinic. No other vaccine in four weeks. No other medications in two weeks. No Covid prior vaccination. No covid tested post vaccination. The outcome of the events was not recovered.</p>

963389	1/21/2021	NM	38	F	1/14/2021	1/14/2021	Patient received her second dose of the Pfizer COVID vaccine in the right arm 45 minutes ago. She was being monitored for the mandatory 15-30 minute period when she started feeling some increasing shortness of breath, scratchy throat, some swelling in her bilateral periorbital area. She was then taken to the ED for further evaluation. Patient denies any allergic reaction to the initial covid vaccine 3 weeks ago. She denies any abdominal pain, diarrhea, nausea, vomiting, chest pain, shortness of breath. She does have a mild headache. In ED, patient received diphenhydramine 25mg IV, epinephrine 0.3mg IM, famotidine 20mg IV and dexamethasone 10mg IV, and LR 1,000mL bolus @ 1228, ketorolac 15mg @1312, ondansetron 4mg @1312. Patient monitored and discharged at 1530.
963352	1/21/2021	TX	29	F	12/29/2020	12/30/2020	Heart Palpitations , Nausea , headache, arm hurting No appetite Chest Pain A lot of mild reactions Pulse was over 100
963339	1/21/2021	CA	67	M	1/20/2021	1/21/2021	Received call to the Advice Line from daughter at 10:47 am. Daughter was called back at 11:20 am by the Advice Line nurse. Reports some nausea yesterday after patient received the COVID-19 vaccine. This morning the patient was barely walking, dizzy, nausea, stomach hurt. Around 9:30 am vomited bright red blood. No fever, cough, chest pain, difficulty breathing. Recommended daughter take patient immediately to the ER.
963325	1/21/2021	NC	32	M	1/15/2021	1/15/2021	Approximately 5 minutes after receiving vaccination in his right arm, he reported itching of his right lateral thigh. He appeared pale. He denied respiratory complaints, chest pain or difficulty speaking or swallowing. Over the next 2-5 minutes while sitting on gurney, he reported progressive itching of his upper back and neck and then his buttocks. He was administered one dose of adult Epipen at 16:25 in his right lateral thigh. His vital signs were BP=130/84, PR= 80 and RR=18. His itching symptoms improved but he still had thigh and neck/upper back itching. At 16:33 he was administered 25 mg diphenhydramine IM in his left deltoid. Over the next 15 minutes he had continued improvement of his symptoms.

962682	1/21/2021	OR	62	F	1/14/2021	1/14/2021	Felt itchy and shaky after vaccine. Left after 30 min. She later developed hives and was seen at ED. Per ED notes, approx 1 hour after vaccine, she developed mild erythematous rash over upper chest/ collarbone region. Slightly itchy. She took benadryl PO x 1 with resolution of itching and rash within 1-2 hours. Patient has noted she is needing to clear her throat more often, feeling like it is "a little mucousy". She does not have a frank cough. She denies SOB, chest pain, difficulty breathing, stridor, wheezing or nasal congestion. She does not feel her mouth, lips, face or tongue are swollen. She has no difficulty swallowing. She denies abdominal pain, vomiting, and diarrhea. Denies myalgias, headaches, chills or fevers at this time. Discussed can use additional antihistamine as needed for further rash. Does not need epi IM at this time. Reviewed common side effects for 2nd vaccine to expect in next 24 hours. Reviewed elevated BP and asked to recheck at PCP or next medical visit to monitor for possible hypertension

963015	1/21/2021	MI	89	M	1/14/2021	1/14/2021	MEDICATION REACTION (Pt got his covid shot and immediately had a reaction to it. Diaphoretic, nauseous, dizzy. Was given 4 of zofran in route.). Comes to the emergency department today after getting his 1st Monday and a COVID-19 vaccine at 7:30 p.m. and about 5 minutes after while sitting down developing significant diaphoresis, nausea, dizziness and feeling very warm. The symptoms lasted for about 15 minutes and then resolved. Since then the patient has felt a little off in his stomach but has not had any difficulty breathing, difficulty swallowing, difficulty speaking, chest pain, diarrhea, rash or itchiness. With this episode the patient did not have any changes to his vision or feel like he was going to pass out. Patient will be given 25 of Benadryl, 125 of Solu-Medrol, 20 of famotidine of concern for possible allergic reaction. Additionally the patient will be given a small bolus of normal saline. Given the patient's reassuring vitals and reassuring physical exam he will simply be monitored here were sure. I do not feel any lab workup is necessary this point this is resolved episode seems either like a mild allergic reaction or a vasovagal episode.
963046	1/21/2021	SD	86	M	1/21/2021	1/21/2021	Resident received 1st dose Moderna Covid-19 vaccine at 11:06am. At 12:00pm, resident complained of feeling shaky "all over" and was visibly jittery. Denied shortness of breath, chest pain or throat tightness. Face had a pallor appearance. States he's had panic attacks in the past but this "doesn't feel like that". Blood sugar 189 (had just finished lunch). BP = 140/70, P = 106, O2 = 98%. At 12:07 resident states that tongue and lips feel numb and throat feels tight. 12:08pm Epi-pen administered into left outer thigh. 12:16pm resident states he's feeling better. Shakiness resolving. Numbness letting up. At 12:30pm resident reports feeling back to normal. T = 98.3, P = 80, BP = 114/72, O2 = 98% on room air. Event reported to the resident's medical provider.

963062	1/21/2021		33	F	1/19/2021	1/19/2021	Patient received vaccine at outside facility so uncertain of vaccine information other than Moderna. 33 y.o. female who arrived to the emergency department for Chest pain. Patient states 2 hours PTA she was getting her first Moderna Covid vaccine when she felt the onset of centralized burning chest pain and temporary shortness of breath while sitting in the car. She states shortness of breath has improved however she feels centralized chest burning that is constant. She denies any palpitations, nausea, vomiting, throat swelling, drooling, or lip swelling. She has no history of similar symptoms in the past. No history of GERD. She has not had no recent illnesses. She has not taken any new medications Symptoms clinically most suggestive of chest wall pain versus gastritis. Patient given GI cocktail and Toradol. Baseline EKG was normal sinus rhythm without any ST elevation or depression. Heart score 0 Pt with improvement with GI cocktail and Toradol, clinically confirmatory for chest wall pain vs reflux. Recommend home tylenol and/or pepcid if sx persist. Follow up PCP if recurrent sx or ED if severe
963114	1/21/2021	MO	45	F	1/20/2021	1/20/2021	Got it yesterday at noon, totally fine until 10pm. Worsening chills until midnight, then complete body ache, muscles, joints, everything, terrible headache. Was on couch and walked upstairs. By the time I got there, I was nearly vomiting and on the verge of losing consciousness. I laid down on the cold tiles and tried to stay conscious. I couldn't even talk. Saliva was pouring out of my mouth uncontrollably. After awhile it let up enough to scoot into the bedroom and climb into bed. Then an entire night of worsening chills, fever, aches, eye pain, sore throat, pulsating ringing in my ears. Little if any sleep. I tried to get up and sit in a chair this morning at 3am and within minutes was so nauseated and light headed I had to lay back down flat. Tried to drink some hot tea and Gatorade at 5am. Thought I heard someone walking around the house and then realized it was heartbeat pounding in my ears. This morning my feet are super sensitive, I have urinary frequency and urgency, and the pulsatile tinnitus is back. Later today had episode of sharp chest pains front to back that resolved after about five minutes. Treatment has been rest today.

957416	1/20/2021	TX	40	F	12/16/2020	12/22/2020	Hypertensive Emergency (BP 219/114) with no previous blood pressure issues; Radiating chest pain, left arm pain; jaw pain; This is a spontaneous report from a contactable other Health Professional (patient). A 40-year-old non-pregnant female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EX5170), via an unspecified route of administration on 16Dec2020 15:00 at single dose in left arm for covid-19 immunization. Medical history included symptomatic PVC's (Premature ventricular contractions), tachycardia, bradycardia, CVA (cerebrovascular accident) from 2018 to an unknown date, asthma and rhythm. Concomitant medication included flecainide, spironolactone, metoprolol for rhythm. The patient had known allergies included hydrocodone bitartrate, paracetamol (VICODIN), eletriptan and adhesive. Prior vaccination, the patient had no covid. On 22Dec2020 18:00, the patient experienced hypertensive Emergency (BP 219/114) with no previous blood pressure issues. Radiating chest pain, left arm pain, and jaw pain. Admitted to the hospital where an echocardiogram and angiogram was performed showing clear coronary arteries and no hypertensive remodeling of the heart. Issue has been ongoing since, despite interventions. The events result in emergency room/department or urgent care and hospitalization from an unspecified date for 1 day. The patient received the treatment for the events included frequent nitroglycerin, hydralazine and metoprolol. The patient underwent curative-SARS-Cov-2 Assay RT-PCR on 01Jan2021 with negative result. The outcome of the events was not recovered.; Sender's Comments: Based on the information available, contributory role of BNT162B2 ((PFIZER-BIONTECH COVID-19 VACCINE,)) to event "hypertensive emergency (BP 219/114) with no previous blood pressure issues" cannot be excluded. The events chest pain and pain in jaw are attributed to underlying medical conditions and assessed unrelated. BNT162B2 ((PFIZER-BIONTECH COVID-19 VACCINE,)). The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified

959470	1/20/2021	MI	72	F	1/20/2021	1/20/2021	Patient seated in observation area after vaccination at 1412. At 1422 patient reported feeling heaviness in chest rated at 7/10 pain scale, mandibular pain, appeared diaphoretic and fatigued, skin grey/pale, though remained alert and responsive to questions appropriately. Patient also communicates she was having some chest pain prior to the immunization today, though she indicated on her forms that she was feeling well today. Vital signs assessed, P72 R16 O2 99, patient denied difficulty breathing. Rapid response protocol initiated, applied 2L O2 via NC, transferred patient to wheelchair and taken to ED for evaluation by response team. ED assessment reveals calf tenderness and patient reporting TKA x 2 weeks ago, elevated D-Dimer, CT results pending at this time.

958921	1/20/2021	CO	48	F	1/13/2021	1/13/2021	This may be a duplicate report, as primary care notes state the process has been initiated. However, out of an abundance of caution, and as the facility the event was reported to, I wanted to enter this report for completeness due to the unusual events. Patient received 1st dose of moderna covid vaccine at an outside facility and (per patient) had a seizure at that site immediately following the injection (history of seizures due to past meningitis, no seizures in past 3 months per patient). No medications were given, 911 was not called, patient not instructed to go to ED (per patient). Patient went home. Once home, patient reported "stroke like symptoms" on her right side (weakness and inability to close right eye for 30 minutes, numbness in R thigh and heel). Then weakness moved to left side (numbness/tingling in L hand and eye, numbness in L lower leg) along with some swelling to face/tongue. Had back pain but no chest pain or difficulty breathing. Extreme dizziness. No additional seizures. The next day she called our nursing line to report these symptoms and was instructed to go to the ED and also scheduled a visit with primary care provider the next morning. Patient stated she was feeling better and apparently did not go to the ED, instead choosing to see PCP next morning. On presentation to PCP, injection site was red and swollen, itching and swelling in hands, itching in bottom of feet, widespread joint pain. No visible rash, no dysphagia, no difficulty breathing. Other symptoms had largely resolved. Patient was prescribed benadryl (no steroids due to allergy to prednisone), cold compresses for injection site and sent home with instructions to go to ED if symptoms reappeared. Also recommended making an appointment with a neurologist for additional follow up as patient currently does not see a neurologist for seizures and is treating with CBD/THC only.
959388	1/20/2021	NY	49	F	1/20/2021	1/20/2021	Pt reported feeling like her tongue was swelling 10 minutes after receiving vaccine. Physical exam normal. Vital signs stable. Benadryl 50 mg PO administered. Vital signs remained stable. Pt monitored by physician, NP and EMS. Pt tolerating liquids. Pt denies chest pain, shortness of breath, numbness/tingling, difficulty swallowing, nausea/vomiting. Pt reported resolution of symptoms within 10 minutes after Benadryl administered.

955759	1/19/2021		27	F	1/8/2021	1/8/2021	Severe headache from 12-36h post administration impairing ability to perform ADLs with inability to turn head from side to side or to change positions without lancing temporal pain and a/w photophobia; Severe headache from 12-36h post administration impairing ability to perform ADLs with inability to turn head from side to side or to change positions without lancing temporal pain and a/w photophobia; Severe malaise; Severe headache from 12-36h post administration impairing ability to perform ADLs with inability to turn head from side to side or to change positions without lancing temporal pain and a/w photophobia; loss of appetite; Transient dysgeusia; Mild nausea; Pleuritic chest pain; This is a spontaneous report from a non-contactable physician. This 27-year-old female physician (patient) reported that she received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number=E15249), via unspecified route at left arm on 08Jan2021 07:30 AM at single dose for COVID-19 immunization. Medical history was none. Concomitant medication was not reported. The historical vaccine included the first dose of BNT162B2 for COVID-19 immunization. Facility type of vaccine was hospital. No other vaccine in four weeks. No Covid prior vaccination. No covid tested post vaccination. On 08Jan2021 06:00 PM, patient experienced severe headache from 12-36h post administration (as reported), impairing ability to perform ADLs with inability to turn head from side to side or to change positions without lancing temporal pain and a/w photophobia (nearly meningeal signs); mild nausea; pleuritic chest pain; severe malaise; transient dysgeusia; loss of appetite. Treatment for events included initially NSAIDs until had difficulty tolerating was received. Outcome of events was recovering. No follow-up attempts are possible. No further information is expected.; Sender's Comments: Based on the time association, the possible contribution of suspect BNT162B2 to the events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and

954996	1/19/2021	IN	34	F	1/16/2021	1/17/2021	Had severe body aches m, fever, headache, progressed into dizziness and "foggy memory", started to have some chest pain. Felt as if I was intoxicated, lasted the whole day. Woke up the next morning and still felt "out of it" and weak but thought it would get better, went to work (im a nurse). Started having continous vomiting, shortness of breath and chest pain at work. As well as severe tremors. I was taken to the hospital, given fluids and my QT was prolonged with my heart which i have never had before . Was given iv magnesium and waited for my heart rhythm to improve. Was told not to take anymore of my prescribed medications or nausea medications and follow up with my pcp the next day. Im still feeling horrible, nausea, body aches, low grade fever and I am 72 hours out. Now I have huge hospital bill to pay, can't work currently because I still feel bad and my heart has a weird rhythm. Hoping this helps as if this was what I was expecting I would have never got it.
954745	1/19/2021	OH	41	F	1/13/2021	1/13/2021	Left Side Facial Numbness and Chest Pain
956399	1/19/2021	CA	44	F	1/14/2021	1/14/2021	I had moderate reaction to first vaccine where I had to go to the ER, for rash on my arm and chest/back, increase blood pressure and chest pain. Pepcid, benadryl and prednisone were given to me in the ER and a liter of fluids. VAERS number Date Form Completed: 01/06/2021 Temporary VAERS E-Report No: 223935 So on the second dose, I premedicated the night before 8pm with 20mg of prednisone, 10mg of claritin, and 40mg of pepcid. In the morning 9am I took 40 mg of pepcid, 20 mg of predisone and 30 minutes prior to second vaccine around 12pm, I took 25mg of benadryl. After vaccine , I had severe nausea at about 20 minutes (1240p), and increase blood pressure at about 30 to 40 minutes. 156/94 was my highest. I had fewer areas of itching and specks of rash and itching around my back than on the first dose that I took. If I did not premediate, I am sure I would have had a similar or worse reaction since I still had similar reaction but milder.

957278	1/19/2021	PA	21	F	1/13/2021	1/14/2021	I got the shot on 1/13/2021 around 4:45pm. I woke up around 1am on 1/14/2021 warm and gasping for air. I was barely able to speak, calling out for my brothers to get my mom. I was continuing gasping for air while they called an ambulance. The paramedics arrived and checked my lungs and oxygen. By the time they arrived I was back to normal. I didn't go to the hospital as they didn't seem it was necessary and I was feeling okay. Later on in the day I just had some slight chest pain and some shortness of breath but it was gone by the end of the night. I'm completely fine now. I had no other symptoms or side effects.
956924	1/19/2021	AR	38	F	1/17/2021	1/18/2021	fever and aches next morning. Worst part was the SEVERE reflux that started 26 hours later. Severe stabbing chest pain that came/went. Associated with excessive belching. Pepto tablets did not help. A cup full of liquid pepto finally calmed the symptoms after 3 hours. In total lasted 4-5 hours. Mild symptoms the next day.

956458	1/19/2021	MA	60	M	1/6/2021	1/14/2021	<p>Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenesin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.</p>

956584	1/19/2021	LA	45	M	1/18/2021	1/18/2021	Patient received a shot at 12:12. This was his second shot in the series. By 1530, his heart rate was elevated (120 to 130 beats/minute) . He was afebrile, with no shortness of breath or chest pain. He came back and reported the problem without wanting to go to the ED. He decided to go home. By later on that evening, his heart rate was normal. To note: He stated that with his first shot, he had nausea, fever and fatigue.
956602	1/19/2021	MA	36	M	1/16/2021	1/17/2021	(Day 1) - Headache, (Day 2)- Headache, fatigue, muscle pain, pain in right eye, slight chest pain (Day 3) - Headache, fatigue, muscle pain, pain in right eye, tingling in left arm/hand, slight chest pain(Day 4)- Headache, fatigue, muscle pain, tingling in left arm/hand/leg, tingling in right arm, slight chest pain. Have not been to Dr. for a follow up, I have been taking Ibuprofen which seems to improve symptoms.
956627	1/19/2021	NJ	34	M	1/8/2021	1/15/2021	Moderna COVID- 19 Vaccine. Vaccine recipient reported on 1/19/2021 that they received the Moderna Vaccine on 1/8/2021. The following week on 1/15/2021, they reported while driving, their area around their right eye became numb and they began to have blurry vision. The numbness spread to around their face/mouth. They pulled over and their spouse drove him to the hospital. Roughly 20 minutes after the initial symptoms, they developed chest pain and patient reported that the ED noted an abnormality on their EKG. The patient had to be admitted overnight for observation. The patient reported that on 1/18/2021, they still had mild chest pain and facial numbness remains around the right eye, left mouth/cheek area, and tongue. They did develop fever and a headache. The patient reported that on 1/19/2021, they are waiting on results, additional testing, and further follow-up appointment with their provider.

952818	1/18/2021	FL	68	M	1/7/2021	1/7/2021	Patient with sensation of generalized body warmth within 15 minutes after receiving first dose of Moderna COVID-19 vaccine No rash noted on exam No associated symptoms including but not limited to itching, chest pain, shortness of breath, difficulty swallowing, or any focal neurologic deficits We will monitor patient for 1 hour Patient states that his symptoms continue to improve and that he is feeling well Vital signs have remained stable throughout patient's ED course including oxygen saturation of 100% on room air Patient remains afebrile and nontoxic in appearance At the time of discharge the patient remained in stable condition. The patient was counseled to return the emergency department immediately with worsening symptoms. The patient voiced understanding and agreement with treatment plan. He is also aware that he may return to the emergency department at anytime for any reason for reevaluation, and should return with worsening or persistent symptoms.
952816	1/18/2021	TX	49	F	1/15/2021	1/15/2021	I had an array of symptoms that all lasted about 3-4 minutes and then another symptom would start about 10 minutes after. Started with feeling lightheaded but that symptom lasted about 10 minutes. The other symptoms I'm about to list each lasted about 3-4 minutes. Moderate Jaw pain, mild radiating pain down my left arm, moderate bilateral clavicle pain, radiating pain down my right leg. Moderate to severe pain at the base of my skull. Felt woozy with this pain. Then had severe sudden mid-chest pain with palpitations. I Had high blood pressures the entire time about 168/88 but when this chest pain happened Bp was like 148/110. O2 sat was 98%. ICU dr came to assess me but stated my HR didn't seem that fast to him and offered to take me to hospital - next door to get further checked but my symptoms started to subside. I did get chills and was shaking after this but after that resolved I felt a lot better. My BP came back down to like 118/72
952782	1/18/2021	IL	29	F	1/9/2021	1/12/2021	Patient presented to ED with complaint of chest pain, radiating down left arm, not relieved with Tums. Symptoms started at 0530 1/12/2020. Patient presented to ED b/c of strong family history of CAD, with father having MI in his 50s.

952887	1/18/2021	TX	61	F	12/30/2020	12/31/2020	o The next day, December 31, I felt like I did when I had the COVID virus (chills/fever/headache, weak feeling), but again with no chest pain, sore throat, coughing, trouble breathing, etc. I did not notice that I had a big red patch on my arm close to the injection site with fever until probably Saturday, January 2nd. I wore long sleeve pj's most of the time while I was sick and didn't bother looking at my bare arms when I was in the shower. The fever at the red site on my arm finally went away and so did the red patch, but the red patch never itched. o From December 31st to Saturday, January 2nd, I felt poopy and did not start feeling better again until Sunday, January 3rd. o I did return to work on Monday, January 4th and have felt good.
952706	1/18/2021	TN	32	F	12/23/2020	12/24/2020	Patient experienced swelling in her hands and feet and chest pain. Treatment included a strong dose of aspirin. Swelling went down within hours of treatment and rest.

952672	1/18/2021		61	F	1/12/2021	1/15/2021	61 y.o. female who arrived by Home presented to the emergency department for Evaluation of syncopal episode. Patient reports earlier this morning at 330 she awoke to go get a glass of water, states that she felt significantly weak and felt that she would drop the glass of water she was going to get it. She describes mild associated lightheadedness but denies vertigo, visual disturbance, chest pain, dyspnea. She that went to ambulate to the living room so she lied on the couch, but does not exactly remember what happened after this. She remembers that there is a chair and she thinks she may have fallen forward and hit her head against a chair and fell down to the ground. She notes that she had currently has a fat lip and feels slight abrasions on her knees bilaterally. History is notable for hypertension, dyslipidemia, states has been compliant with her medications. No recent illnesses, cough, colds. She underwent vaccination 3 days ago for COVID with the majority of vaccine and reported 2 days ago she had mild body aches and myalgias, however at present states she feels largely asymptomatic. She was encouraged to present to the emergency department at the request of her coworkers. Laboratory work-up largely unremarkable. CT head no acute process. EKG my read sinus rhythm, normal PR, QRS, QTc, no ST segment changes or T wave inversions concerning for ischemia. Discussed the work with the patient recommended that she follow-up as an outpatient with her primary care provider, also provided with a Zio patch and recommend to follow-up with cardiology. Patient extravascular fat study with plan felt comfortable for discharge home. Discharged in stable condition

951799	1/18/2021	MO	56	F	12/29/2020	1/1/2021	The patient received her first Moderna COVID-19 vaccination on 12/29/2020. However the patient was diagnosed with a positive COVID-19 test on January 4, 2021. Patient complained of nausea, vomiting, back pain, and sharp chest pain. On January 13, the patient presented to the emergency department again with shortness of breath and sharp, stabbing left-sided chest pain radiating to her back and right side. Initial work up ruled out cardiac etiologies. CTA chest demonstrated COVID-19 pneumonia. The patient complained of bilateral lower extremity weakness which had been progressing since her COVID-19 vaccination, per patient report. However, during her hospitalization the patient's bilateral lower extremity weakness began to accelerate. On the 13th, the patient was able to ambulate to and from the bathroom herself. Then on January 14 the patient required maximum assistance. Neurology was consulted and work up initiated for suspected possible Guillain-Barré syndrome (GBS) secondary to recent COVID-19 infection. On January 15, 2021, the patient became obtunded and unable to protect airway. She was emergently intubated for acute hypercapnic respiratory failure secondary to GBS. Neurology started GBS treatment with IVIG. Patient also developed NSTEMI and Takotsubo cardiomyopathy. Patient remains critically ill requiring mechanical ventilation.

947494	1/15/2021	FL	44	F	1/7/2021	1/7/2021	feeling badly; chills; fever/ 101.6 fever; terrible muscle aches; headache; arm was so sore; Her arm was so sore she couldn't even move it. She couldn't get herself dressed or undressed; chest pain; chest pain, going into her back, on her left side; This is a spontaneous report from a contactable other healthcare professional (patient). A 44-year-old female patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EK9231, NDC number: 5926710001), intramuscular on 07Jan2021 (around 10ish in the morning) at single dose at right arm for covid-19 immunization. Medical history included vertigo from an unknown date and unknown if ongoing. At the beginning of the week, patient had some vertigo but when she went in for her second vaccine, the vertigo was gone already. There were no concomitant medications. There was no adverse event following prior vaccinations. There were no additional vaccines administered on same date of the Pfizer suspect. Patient previously received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, NDC: 59267100002 Lot: EH9899) intramuscular on 17Dec2020 at single dose at right arm for covid-19 immunization. Patient received the second dose of the vaccine in the morning, around 10 something on 07Jan2021 at the hospital she worked at. She started feeling badly around 7:00 at night 07Jan2021 with chills, 101.6 fever, terrible muscle aches, a headache. Her arm was so sore she couldn't even move it. She couldn't get herself dressed or undressed. She was having chest pain, going into her back, on her left side. When probed for the outcome of these symptoms, patient stated she had a fever, but not quite as high. She had been taking paracetamol (TYLENOL) and it was not helping. Patient provided the following product information for the paracetamol she was taking: TYLENOL, 500mg NDC: 6984270778 Lot: 9MR0454 Expiry date: Oct2021. The back pain/muscle pain was still there. She had chills but not as badly. The soreness in her arm had improved. Her arm was still sore, but not like it was yesterday. Outcome of events feeling badly, headache and chest pain was unknown, outcome of events chills, fever/ 101.6 fever, arm was so sore she couldn't even move it was recovering, outcome of events back pain/muscle pain was not recovered. The report is considered as non-serious. The adverse events resulted in neither doctor or

946186	1/15/2021	MN	31	F	1/5/2021	1/8/2021	I developed atypical chest pain 3 days after the shot. Chest pain that was sharp as intermittent and has been on going since 9/8/21.
946072	1/15/2021	FL		M	1/6/2021	1/7/2021	coughs once in a while, may be a nervous cough every 40 min; voice hoarse; tested positive for Covid-19; tested positive for Covid-19; didn't feel well at all; bad headache; dry cough; This is a spontaneous report from a contactable consumer who reported for himself, a 70-year-old male patient who received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, lot number and expiration date unknown), via an unspecified route of administration on 06Jan2021 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient stated that he received the first dose of the Pfizer-BioNtech Covid-19 vaccine on Wednesday, 06Jan2021, and on that day he had no problem. On Thursday, 07Jan2021, he started experiencing dry cough. On Friday, 08Jan2021, he didn't feel well at all and had a bad headache. On Saturday, 09Jan2021, he felt better but he tested positive for Covid-19. Today, 11Jan2021, he stated he feels good, he coughs once in a while, may be a nervous cough every 40 min. He had not experienced fever or chills, he breathes well, he can hold his breath for 5-10 seconds, no chest pain or congestion, but his voice was hoarse. Patient wanted to know if this has been reported before, and wanted to know how long should he test himself again for Covid-19. The events were reported as non-serious. The outcome of the events was unknown. Information about lot/batch number is requested.

949661	1/15/2021	CA	30	F	1/14/2021	1/14/2021	Chest pain, predominantly on the right side, numbness in right arm and increased heart rate. Symptoms started about an hour after the vaccine. Each episode lasts 30-40 mins then subsides and symptoms go away completely. I had 3 episodes of these symptoms the first day and so far 3 the second day. My doctor recommended I go to the emergency room. Based off my EKG, vitals, and family history there was no reason to believe that the episodes were causing any heart abnormalities.
949611	1/15/2021	CA	49	F	1/6/2021	1/13/2021	At 6 days after my second COVID-19 Pfizer vaccine (first dose given 12/17/20), I had acute onset of chest pain and shortness of breath prompting a trip to the Emergency Department. A chest CT Angio to rule out pulmonary embolus was done and negative for pulmonary embolus. My EKG showed some mild ST changes and a troponin I level was elevated at 0.08 (normal 0.04). Subsequent troponin levels 90 minutes apart showed a rising troponin at 0.18 and 0.38. An echocardiogram was performed which showed regional wall motion abnormalities consistent with Takotsubo cardiomyopathy and an ejection fraction of 45%. I was then taken to cardiac catheterization lab for coronary angiograms which were normal. My LV angiogram was consistent with Takotsubo cardiomyopathy and my LVEDP was elevated. I was started on a beta blocker and sent home the following day.

948389	1/15/2021	NE	43	F	1/13/2021	1/13/2021	Patient to ED for evaluation of symptoms after a Covid vaccine earlier today. She had her second Covid vaccine here at the hospital where she works about 8:30 AM. About 10:00 she started having shakes and a headache and just not feeling right. She has had some periods of palpitations and feeling like her heart is racing as well. She called employee health and was referred in to see us. At this time she says she still has some headache and overall feels weird but no other new symptoms. No chest pain or shortness of breath or palpitations at this time. No trouble breathing. No fever. No visual changes but the light does bother her eyes. She does have a history of migraine headaches that are like this at times. The pain is in her forehead, not globally or in her neck. She has no neck pain or stiffness. She did not have much of reaction after her first vaccination. She does have a history of hypertension but has been taken off her medication because her blood pressures have been well controlled. She states that she does check them regularly at home and they have been okay. She denies any other recent sick symptoms. No other significant chronic underlying medical problems. Medications administered in the ED included ibuprofen 600mg and diphenhydramine 25mg orally at 1415, and acetaminophen 1000mg orally at 1000mg. Headache was better at 1540, blood pressure was lower at 139/90, no shaking. Pt discharged home.
948380	1/15/2021			F	1/4/2021	1/5/2021	1/5/2021 0718 Pt received 2nd COVID vaccine 1/4/21. Oral temp 100.6, near syncope, muscle aches and head aches. Per EMS NSR, denies SOB, and chest pain. 500 ml bolus received in route. In ED, Pt c/o nausea. Pt anxious, sweating and uncomfortable. 0855 Pt resting comfortably, reports decrease in pain/body aches 4/10. 1043 Discharge disposition: home. Accompanied By: self. Mode: walk. --Hospital

948237	1/15/2021	RI	33	F	1/15/2021	1/15/2021	Entered observation @ 1420. Patient voiced mouth tingling @ 1438. Stated that mouth had been tingling 5 minutes before she said something. Benadryl 50mg was given @ 1440. This nurse asked pt how she was feeling @ 1451. Stated that the Benadryl had alleviated some of the s/s of her mouth tingling, but she felt "light-headed". Around 1505, this nurse stated to pt that she looked very "flushed". Pt stated she felt very fatigue. This nurse and staff laid pt on stretcher in observation room. Cold compress applied to forehead and chest. Vitals were checked @ 1510 BP-133/93, P-89, O2-89%. Stated she felt better @ 1515. Explained to patient that she needed to lay down for a little bit longer, due to her feeling "woozy" upon standing up. @ 1530, patient stated that she felt much better. She stood up from bed and walked a short distance from bed to observation registration desk back to bed, balance was steady. Stated she felt a little "short-winded", and did take 2 puffs of her in haler, in which she does suffer from Asthma. Pt left observation @ 1535, accompanied by staff to her office. Denies any s/s of distress to mouth, feeling fatigue, SOB, nor chest pain upon leaving. Pt takes Singular daily for seasonal allergies. Does have allergies to Peanuts,Nuts, PCN, and Sulfa.
948206	1/15/2021	PA	35	F	1/11/2021	1/12/2021	Initially headache and body aches. Within 24 hours developed chest pain, dyspnea on exertion and shortness of breath. Patient still currently hospitalized.

947996	1/15/2021	OK	21	F	1/13/2021	1/13/2021	1/13/21: received second dose of COVID-19 vaccine. One hour later experienced sensation of arm numbness, resolved within hours. Later in evening experienced a sensation of burning in entire right arm. 1/14/21: woke at 2 a.m. with sensations of shortness of breath. At 5:30am developed muscle spasms in form of twitches in right arm and diffuse muscle discomfort. Additionally describes chest pain in substernal location with radiation to right rib cage. Chest pain reproduced and accentuated by direct pressure. Developed fever of 99.9 degrees and was turned away when going to work. Returned home and recorded temperature slightly above 100 degrees. 1/14/21: experienced continued muscle discomfort and right arm twitches. Remains short of breath but seems to be improving. 1/15/21: continued complaints of chest pain radiating from middle of chest to right side, continued shortness of breath, and whole body pain.

943543	1/14/2021	TX	38	F	12/28/2020	12/28/2020	<p>On 12/28/2020 at 1930 I had a throbbing HA, nausea, chills, no appetite, body aches, extreme fatigue and low grade fever. Temp was 99.4-100.3. 1 gram of Tylenol was taken that evening, to relieve HA pain. Zofran 4 mg ODT was also taken for nausea. The following morning, I felt extremely fatigued and had a persistent headache that was not consistently responsive to OTC meds. I developed a fever on 12/29/2020 in the evening. Low grade and ranging 99.3-100.6. Along with fever, my s/s were extreme fatigue, no appetite, headache, body aches, chills. On 12/30/2020, I spiked a Tmax of 101.0 around 11 am. Again, the same s/s were there. I went home from work early. Same s/s and low grade fever persisted past 7 days, so I called my PCP as well as the Pharmacy where I received the vaccine. On the 10th day after vaccination, I notified my Infectious Disease Dr. He advised me to wait 6 months to 1 year to receive the second injection. He stated that my s/s were likely vaccine related and would go away with time. Fever persists through every day for the month of January 2021, with exact same symptoms. Started to notice Shortness of breath with activity, occasional sharp pain in chest. Presented to ER on 01/09/2021 with chest pain and shortness of breath. Labs revealed Acute Kidney Injury and Transaminitis. Cardiac work-up was performed, all tests negative. I was hypotensive. MD recommended I either get transferred to hospital, or stay in ER for min 23 hours observation for monitoring of kidney function and blood pressure. I received 2 L of Normal Saline. BP eventually began to rise with SBP above 90 and DBP above 40. (Normal BP range for me is 120/60-70's. Baseline Creatinine is 0.9. Discharged from ER per patient request, after second Creatinine level came down to 1.5. MD advised patient to not return to work for the next 2 business days. Spoke with PCP on 1/11/2021 in AM, and informed him of the events over the weekend. Also informed him that I am still febrile with same symptoms as reported previously. Was told I could not return to work until I was fever free. Was fever free for about 12 hours, until evening of 1/12/2021. MD not allow patient to RTW.</p>

943498	1/14/2021	WA	68	F	1/13/2021	1/13/2021	.3After receiving the vaccine, being monitored for 15 minutes the patient returned home. At approximately 1530 she called clinic concerned about a rash, redness and itching on left arm. On arrival to the clinic she was found to have erythematous macules on her upper inner arm starting to extend down her left arm. She also had a large red macule on upper inner right arm and some small areas under her eyes, all that were itchy. There was no throat swelling, wheezing, SOB or chest pain. She was given 60 mg of prednisone and 50 mg of diphenhydramine orally and observed for 30 minutes. Her rash intensity reduced and the itching stopped. Advised she should not receive second dose of vaccine

944218	1/14/2021			F	12/22/2020	12/22/2020	trouble breathing; She had bad pain in her chest; Her oxygen saturation dropped to 92 and it is usually 98 or 100; not been feeling well; A fast heartbeat 5-10 minutes after initial dose; This is a spontaneous report from a contactable healthcare professional (dental assistant) reporting for self. This female patient with unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 22Dec2020 at single dose for COVID-19 immunisation. Medical history and concomitant medications were not reported. The patient previously had reactions with the flu shot in the past for immunisation and she only was able to take the vegan version of the flu shot due to the egg content in the regular version of the flu shot. She also stated not being able to take the flu shot in the arm, leg, hip etc. Patient stated she was scheduled to take her second dose of vaccine tomorrow. She received the first dose on 22Dec2020. She stated she was in the ER on Monday for 5 hours because she was unable to see her primary care physician because his office was filled with patients with Covid and they could not provide her with guidance. She stated after receiving the first dose of vaccine she had not been feeling well ever since. Stated she had had trouble breathing and this took her by surprise. She had bad pain in her chest and a fast heartbeat 5-10 minutes after initial dose (on 22Dec2020). Her oxygen saturation dropped to 92 and it was usually 98 or 100. She stated something inhibited her ability to breathe and this scared her because she was healthy prior to the vaccine and never been in hospital and wasn't born in the hospital. She stated the condition she was diagnosed with will take 6-12 months for her to recover from and go back to normal. She stated during her ER room visit there were a lot of tests done. She would like to know if she should receive the second dose of the vaccine. The outcome of events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the dyspnea, chest pain, oxygen saturation decreased and other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including chest x-ray, arterial blood

943034	1/14/2021	FL	33	F	1/13/2021	1/13/2021	about 10 hours after administration, I developed SOB, mild chest pain, hoarseness, and right sided wheezes. I self treated with albuterol (2 puffs) inhaler that I have on hand in case of environmental allergy triggers (I rarely have to use it- last use 3 years ago). The wheezing resolved and chest pain improved but the hoarseness remained. Over the next 2-3 hours I developed headache, malaise, mild dizziness, arthralgia, myalgia, and eventually fevers and chills (by 13 hours after vaccine administration). When fever reached 101 I self treated with naproxen 250mg. I slept for 4 hours and awoke diaphoretic, but the fever had resolved and I felt much better. However, I developed urticaria that started on my flexor surfaces of the elbows, hips, and knees, and spread to my abdomen, thighs, and face, with swelling about my right eye. I self treated with 25mg benadryl and itching and urticaria improved to the point that I was able to sleep. When I awoke the next morning my symptoms had largely resolved with the exception of mild headache, body aches, hoarseness, slight chest tightness, and mild residual swelling of the right eyelid.

942897	1/14/2021	PA	80	M	12/29/2020	1/1/2021	History of Present Illness: Patient is a 80 y.o. male who presents with chest pain. Patient reported that he 1st had the chest pain approximately 2 weeks ago when he woke from sleep. At that time patient pain lasted about 5 minutes or so and resolved when he got out of bed. He did well for the rest of the day up until yesterday. Patient reported that yesterday morning he woke up with the pain at the lasted about 30 minutes or so. Patient also had associated burping felt that it is likely GI in nature. The pain was located mainly in the left side of the chest without any radiation. No diaphoresis. No shortness of breath or palpitation. No radiation for the pain. Since yesterday morning he had another 3 episodes of pain the last after dinner tonight. Patient reported that this pain was located more on the left side of the chest, likely lasted about 10 minutes or so. There was no exertional component to the pain. No known history of heart disease. Due to rather recurrent nature of the pain patient was brought to the hospital by his son who is a cardiologist to be evaluated. No fever or chills. No cough . Patient reported that he got vaccination for COVID 2 days ago-of a concern that this may be a side effect of the vaccine. No dizziness lightheadedness. Patient with history of GI bleed in the past at that time patient was on NSAIDs. Patient with burping associated with the pain

944280	1/14/2021	IL	25	F	1/6/2021	1/6/2021	Heart rate shot up to 170 with numbness of feet.; Heart rate shot up to 170 with numbness of feet.; Chest pain; feeling like I was going to vomit and faint; feeling like I was going to vomit and faint; This is a spontaneous report from a contactable other hcp (patient). A 25-year-old non-pregnant female patient received the first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 06Jan2021 at 11:45 at single dose in left arm for covid-19 immunization. There was no medical history. Concomitant medication included valaciclovir hydrochloride (VALTREX), topiramate (TOPAMAX), lamotrigine (LAMICTAL), duloxetine hydrochloride (CYMBALTA), ziprasidone hydrochloride (GEODON). On 06Jan2021 at 12:30, The patient experienced heart rate shot up to 170 with numbness of feet, started to feel chest pain, and feeling like she was going to vomit and faint. The events required emergency room visit and were reported as serious per hospitalization. Heart rate at the hospital was 135-140 where two EKG were done and fluids were given. An x-ray of the heart was done and blood work was completed. The patient didn't receive treatment for the events. The patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination, and has not been tested for COVID-19 since the vaccination. The outcome of the events was resolved in Jan2021. Information on batch/lot number has been requested.; Sender's Comments: There is a reasonable possibility that the event "feeling like she was going to vomit" was related to BNT162b2 based on known drug safety profile. Based on the temporal relationship, the association between the other reported serious events with BNT 162b2 can not be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

945504	1/14/2021	CA	36	F	1/11/2021	1/12/2021	After first vaccine i experienced fatigue, body aches, headache and nausea for 2 days and injection site pain for two weeks. After second Vaccine given at 9:55am. tingling of feet for about 20 mins, 30 mins after the vaccine. Two hours later fatigue, body aches, headache and nausea began. At 0030 1/12/2021 I woke up with severe chills and left chest pain, temp was 101.6 and heart rate was 160. I began to see black and chest pain was severe feeling like i was having a heart attack and was going to pass out so i called 911. I then began to get short of breath and got numbess on my legs, left arm and left side of neck. Chest pressure/pain radiated to left arm and neck. I was taken by the ambulance to hospital. Arrived around 0130. My heart rate sustained at 140s in the ER so I was admitted at 0530 am. My D Dimer was a bit elevated as well as my lactic so I was given a bolus of fluids plus maintenance. I had a CXR done, CTA chest(negative for PE), UA, Labs, entire cardiac workup including an ECHO during my admission. I also began to have loose stools and wrist joint pain. MY heart rate sustained at 125-147 for about 30 hours. Fevers on and off. After everthing was negative we determined this was secondary to the covid 19 vaccine. I was discharged 1/13/2021 at around 1:30 pm. My heart rate is still not at baseline which is 87-90. I'm 100-130 and still get very fatigued with a simple slow walking. Still having tachycardia, fevers, body aches, joint wrist pain, chest discomfort and headaches. My potassium was 3.0 at discharge so will be needing labs in a week. Also bruised a little different than I usually do with lab draws so keeping an eye on them and will be checking my platelets again in a week. Ive been taking tylenol for my fever and pain and ativan for any anxiety when my heart rate goes up. (treatment during hospital stay was normal saline bolus, nomal saline maintenance fluids at 150 cc/hr, tylenol, ativan, ice packs, rest)
944297	1/14/2021		55	F	1/20/2021	12/20/2020	Patient developed chest pain 5 minutes after vaccine administration. Patient was transferred to the EC and was given ASA, EKG (WNL), chest x-ray (negative) IV fluids and then DC home.

945401	1/14/2021	WA	51	F	12/23/2020	12/23/2020	received my shot at 8:15 am, within approximately 45min I felt a very slight heaviness to my breathing something similar to allergy season belreathing, and a slight headache on my rr temple. This was nothing that stopped me or slowed me down that day. At approx 10:30pm I awoke from a deep sleep with SHARP chest pains, at 11pm chills, 1am fever and discomfort, 2am muscle aches. I slept on my left side to keep blood circulating to my heart which seemed to ease some of my discomfort. My first night was rough. I awoke Thurs (12/24) with a swollen left foot and leg. some rt leg pain, joint pain in my left knee. I pushed myself to get up and move and go about my day. Friday, I still had a little left foot foot swelling and pain, knee pain, but kept pushing. The handout says if symptoms persist for longer than 24-48 to seek medical care, I have not. Friday, (12/25/20)was Christmas and much of the day was non eventful. At approx 530pm. I felt a bulging not in the center of my chest which was tender to the touch. This concerned me. I gently messaged the area, rested a bit but continued to move up and down the stairs. That discomfort and the bulge decreased within a few hours. Saturday, (12/26) 4:am and I have notice much of the swelling in my foot and legs has decreased, however, I now have bruising. The sore arm is gone, and I am hopefully, all is well. I forgot to mention, I have had intermittent persistent cough with slight sob, something similar to the start of allergy season, but it is brief. I have been coughing at night. I have a history of whooping cough. And gastric bypass.

945353	1/14/2021	CA	30	F	1/12/2021	1/12/2021	Patient received her 2nd dose of the Pfizer-BioNTech COVID-19 Vaccine: At approximately 18:00 by RN. Patient walked out of the vaccination room after her 15 minutes observation period and did not complain of any symptoms. She walked to the main entrance and notified a clinic manager at the check-in desk that she was experiencing "chest pain." Clinic RNs came to observe and assess the patient. The patient communicated with no displays of distress. When asked what type of chest pain, she stated "heaviness pressing on her chest, localized on the left side and on the upper chest area." Patient denied pain radiating down arm and denied jaw pain. Patient denied SOB and had no signs and symptoms of respiratory distress. She was escorted to the ED via wheelchair at 18:33. The ED note states that symptoms were most likely related to anxiety (patient mentioned she was anxious about receiving her second dose) and as patient reported symptoms completely resolved, she was discharged home from the ED at 19:01.
945213	1/14/2021	CO	41	F	1/13/2021	1/13/2021	I was approached by a person in the center at approx 1000 stating she had an employee that received their first COVID vaccine and was not feeling well. I went over to find the employee sitting in the person's office in a chair. She was able to tell me she received her first COVID vaccine approx 30 mins ago. She stated she stayed there for the 15 mins after the vaccine with no reaction. She is now having ringing in her ears, feeling lightheaded, hot, nauseous, and "I feel like I am in a cloud." She denies allergies or past hx of vaccine reactions. Denies hx of anaphylaxis. She denied any SOB or chest pain. Employee was holding her head. She stated she had only had some coffee and juice today and was feeling hot. BP was taken and was 112/90 and she is not tachy and no resp distress observed. Patient was able to speak to me in full complete sentences initially. Another person came over and the employee was asked if she could stand and walk. Employee stated she felt she could stand and walk and when she did this she had to hold onto something to avoid falling and she was sat back down. Emergency services was called and employees speech was slow and almost slurred at times. Emergency services arrived and transported employee.

F

Good Evening, I have attached the VAERS form that I had trouble uploading to the VAERS. I have also quoted it below because the tablets we have on site will not allow me to type in those areas of the PDF. The adverse reaction occurred around 12:45 pm on 01/06/2021. Symptoms ceased within 3 hours after visit. On follow up, she said her symptoms felt like indigestion and anxiety. Thank you for your time and understanding. The note is as follows, Vaccine recipient came to the vaccination site at 12:45. She informed us of her medical history. She had one instance of anaphylactic shock as a baby. She has not had a reaction since. She has an allergy to latex, and two others that are no longer viewable in database. No one on site has access to her file now that she has successfully been vaccinated, so the following history was obtained from patient verbally. I did verify that she is not allergic to polyethylene glycol. Recipient has taken miralax before with no reaction. This morning before arrival, recipient took her normal dose of levothyroxine, and mesalamine. She also took one lorazepam before her appointment to treat the anxiety she was feeling leading up to her vaccination. She ate a normal amount for her, including nuts, crackers and three 16 oz bottles of water. Before her injection, medic reviewed all medical history and allergies. We discussed risks, and the expected positive outcome of getting the moderna vaccine. She verbalized her anxiety, but attested that she very much wanted the vaccine. After vaccination, recipient was speaking clearly, feeling okay, and she was instructed to wait for 30 minutes of observation. She told personnel on site that she was having chest pain. She pointed to her sternum describing a 3/10 pain that felt like pressure. She said it radiated to her right breast. She said it felt like indigestion, and she took 1 dose of her own pepsid in her car while she was waiting her 30 minute period. Vitals: SPO2 98%, pulse 55 bpm steady, strong. She was offered EMS, and she declined. Medical staff recommended calling her pcp ASAP and scheduling a virtual urgent care visit to mitigate her COVID concerns in hospital settings. Patient then said that she felt ready to go home, and she was advised to lay with her feet up, sip water, eat crackers, and use ice or heat to alleviate pain and reduce anxiety. Recipient felt confident in heading home. Patient information listed below.

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
944551	1/14/2021	CA	36	F	1/12/2021	1/13/2021	Headache,dizziness, sob, chest pain, nausea, vomiting, fever, muscle and joint pain.
944735	1/14/2021	WI	44	F	12/30/2020	1/1/2021	Per patient report: On 1/1/2021 she started to have a fever, HA, ear pain, neck pain (back of neck), and muscle aches in upper back. This continued through the weekend. On Wednesday, 1/6/2021, she saw a provider for ear pain, chest pain (radiating to right arm). She was not prescribed/given treatment regimen. On Thursday, 1/7/2021, night, she started to have vomiting diarrhea, and chest pain. On Friday, 1/8/2021, she went in to be seen for chest pain and r/o PE. States she has a history of PE and had a CT performed, no clots found. EE states does not have vomiting and diarrhea from 1/13/2021 for the first time since the start of this symptoms. Continues to have GI issues: decreased appetite and upset stomach. Also states she feels very fatigued.
944489	1/14/2021	VA	50	M	12/18/2020	12/28/2020	Feverish feeling and chills with myalgias and weakness at 4am on 12/18/2020. Took 800mg advil and 1000mg tylenol. Felt perfect by 7 am. Despite this, fearing covid, I did not go to work, was rapid trsted covid negative that day and pcr tested that day retirning negative 2 days later. Days later I began to have vague nagging chest pain with occasional sharp chest pain over my heart. I had what I would describe as chest tightness in addition in which it felt hard for me to expand my chest fully like pressure without being short of breath. This would last at most several minutes and perhaps occurred three or four times over a seven day period. Throughout this. I could exercise with no chest pain no increasing shortness of breath, including a PR on Peloton and two hours of tennis without cardiac symptoms. Yesterday, my smart internist heard a split S2 heart sound as I lay on my left side and held my breath; the EKG showed a depressed PR interval ad some ST elevstions consistent with pericarditis, which I am treating with motrin. I assume this is a viral pericarditis. I had two types of Covid tests during that time period. My second dose of the vaccine was January 8. The feverish feeling occurred before dose 2, as did some of the chest oains and tightness.

944885	1/14/2021	CO	52	F	1/11/2021	1/12/2021	Nausea, headache, body aches and pains, fever of 100.7 orally and chills, chest pain, feeling of burning at surgical scar site, malaise starting around 18 hours post injection and lasting about 14 hours. Minimal to zero relief with Ibuprophen, or Acetaminophen. No medical treatment required. Headache continues to persist but chronic headaches are part of normal history.
945022	1/14/2021	CA	28	F	1/11/2021	1/12/2021	About 27 hours after my vaccine (at about 9 pm on 01/12) I began having 8-10/10 chest pain. Mostly burning sharp pain, but some restricting tight pain as well, radiating to my back mostly. It would be relieved for maybe 10 minutes at a time but then flare back up for about 5 hours. I went to the emergency room, where they did a cardiac work up including blood work and EKG, vitals and a chest X-ray, all which were unremarkable. At about 0200 am on 01/13, the pain subsided. Previous to the chest pain, during the morning and afternoon of 01/12, I had a low grade fever (99.9 F), an intense headache, and fatigue. 01/14/21 sore swollen lymph node under L arm.
945087	1/14/2021	CA	44	F	1/12/2021	1/12/2021	Patient is a 44 Y female who presents reporting facial flushing and tongue soreness and dryness immediately after getting her first dose of the Pfizer COVID-19 vaccine at 1030 this morning. 26 minutes later the symptoms are followed by cold sweats. She feels much better now, does not now, did not have shortness of breath, nausea, vomiting, wheezing, change in voice, difficulty swallowing. Patient reports the symptoms are similar to but much milder than the symptoms she gets during rituximab infusion for her myasthenia gravis. Patient notes that she took Zyrtec and acetaminophen at 9:00 as premedication. Prior to this patient had been well, no fevers, nausea, vomiting, diarrhea, chest pain, shortness of breath, cough, sore throat, urinary problems, or other problems. Patient did not receive any additional therapy in the ED. She was observed for 2 hours in the ED and was subsequently discharged home.

940348	1/13/2021	IL	32	F	1/12/2021	1/12/2021	About 15 minutes after receiving the second dose of the Pfizer vaccine at Clinic, patient began complaining that she was dizzy and nauseated. Patient was seated on the exam table at this time, and was helped to lay down on the exam table. Vitals were obtained by RN. Patient began complaining of tingling of her lips while vitals were being obtained at 1110. PA was notified and brought to the room to evaluate patient. Patient denied having any difficulty breathing or swallowing, was not experiencing any itching of the mouth, tongue or throat, and did not notice anything else unusual, patient was still dizzy and nauseated. Patient stated that she had a similar reaction to the first dose of the Pfizer COVID vaccine, where the symptoms resolved within about an hour. Nursing staff and PA stayed with patient during the duration of her observation. Patients vitals ranged between pulse ox = 98-99%, pulse = 97-106 bpm, B/P = 114-121/80-89 mm hg. Patient also complained of some tingling around the lower jaw at 1147. Patient was observed for 1 hour and 26 minutes after vaccination was received. Symptoms gradually resolved, upon discharge patients lightheadedness had resolved, and the tingling around the lips and jaw were mostly gone. Patient still was not having any shortness of breath, chest pain, trouble breathing, rash or hives, swelling/tingling/numbness of the tongue, mouth, or throat. Discharge instructions were provided by PA, including when to seek further care at the ER or to call 911. Patient felt comfortable driving herself home and left at 1214. About two hours later, pt presented to ED. Pt endorsed throat tingling, lightheaded, nausea. She also stated that while the reaction post Dose 1 and Dose 2 were similar, the reaction after Dose 2 was much more severe. Assessed for transient Bell's Palsy presentation but determined unlikely as no facial asymmetry or deficits were appreciated. RR 24, other vitals WNL. Pt observed for about 1.5 hours before discharging home with instructions to call ED should condition worsen.

939625	1/13/2021	CA	34	F	1/10/2021	1/11/2021	LUE pain at injection site, muscle spasms of left arm, numbness and tingling of left hand, episode of burning across chest x 1 when symptoms first started. Brief period of muscle spasms along left neck, back left arm and left lower extremity on first day of vaccination. Brief episode of right hand numbness and tingling. On day 2 very flushed and hot feeling, temp 37.9 at 1am on 01/12/21. Sever muscle spasms and pain from left trapezius to sternocleidomastoid, to left upper extremity, left thorax and abdomen to left lower extremity with extreme fatigue. Headache throughout day. Now with residual left lower extremity numbness and tingling, pain improved and muscle spasm frequency decreasing although episode of chest pain with muscle spasm did occur yesterday evening. At this point the left lower extremity tingling is most worrisome. Muscle spasms and pain slightly improved.
940421	1/13/2021	MI	27	F	1/9/2021	1/9/2021	IMMEDIATE PALPITATIONS RATE 140 TO 160, CHEST PAIN. TREATED WITH BENADRILY, GLUCOCORTICOIDS AND PEPCI
939457	1/13/2021	MD	52	F	1/7/2021	1/7/2021	Chest pain; This is a spontaneous report from a contactable pharmacist. A 52-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number EL1284/expiration date unknown), dose number 1 intramuscularly on 07Jan2021 11:00 at a single dose on the right arm for COVID-19 immunization. The patient had no relevant medical history. There were no concomitant medications. The patient received the vaccine at a nursing home/senior living facility. No medications were received within 2 weeks of vaccination and no other vaccines were received within 4 weeks prior vaccination. The patient experienced chest pain on 07Jan2021 12:00. The went to the emergency room/sought urgent care for the event. No treatment was received for the event. The patient was not diagnosed with COVID-19 prior to vaccination and was not tested for COVID-19 since the vaccination. The outcome of the event was unknown. The event was assessed as non-serious. No follow-up attempts are possible. No further information is expected.

942044	1/13/2021	FL	27	F	12/14/2020	12/14/2020	Immediately after I got it I started feeling flush and hot in my face, I got dizzy and lightheaded, my HR went to 180, my legs felt weak, I was having chest palpitations and chest pain. I felt really dizzy and nauseated, I felt like I could not walk. I felt like I hit by a bus. The next day I had heavy flu symptoms, high fever, continuous chest pain and high HR, at the ER they gave me a high dose of Benadryl, steroids and fluids. I took Benadryl for about 7 days and I still felt light headed palpitations and fever for almost 2 weeks. I also was tested for COVID and it was negative. I was advised to not take the second vaccine. I still have a really bad fatigue. It is the symptom that is still on and off.
942004	1/13/2021	AZ	38	F	1/7/2021	1/8/2021	Recieved shot Thursday, FRiday night severe chills so bad your shaking. Then Since Saturday, chest pain and palpitations. Heart is fine as i had cardio look at it .
941335	1/13/2021	NY	34	F	12/26/2020	12/26/2020	Reported sharp chest pain on the middle/left side. Initially it was constant pain and hurt more when she took normal breaths. Symptoms resolved. She saw her PCP.
940968	1/13/2021	NY	39	F	1/13/2021	1/13/2021	Employee complained of dizziness after sitting for 10 min in observation area. Employee became lethargic and was unable to stand. She complained of R side chest pain and R sided weakness. Symptoms did not go away. Employee sent to ER.
942427	1/13/2021	PR	38	F	1/4/2021	1/4/2021	First instantly chest pain and a little difficulty breathing. I was like this for more than 30 min, then was relieved but Headache was added, Dizziness, sensation of nausea, neck pain, sensation of having inflamed organs, extreme tiredness, couldn't move the arm, pain all over the body, excessively dry mouth but felt the saliva very thick, several days with alternating symptoms. On the night of the vaccine the body extremely cold, nocturnal delirium. Took Tylenol every 4 hours, the neck pain was unbearable. I was feeling bad for about 3 to 4 days.

941499	1/13/2021	CA	36	F	1/11/2021	1/11/2021	Patient experienced a syncopal episode post vaccination, accompanied by feeling hot and tachycardic. Prior to the syncope, she reported hyperventilating. She remained unresponsive for about 10 minutes and was brought to the ED. There she became responsive, and reported chest pain and had sinus tachycardia episodes. She also had lower extremity weakness. This has improved per the latest neurology notes. She also had a negative EEG. Unsure if this is an allergic reaction or if the syncope was due to hyperventilation. Patient is currently on day 3 of hospitalization.
941665	1/13/2021	FL	48	F	1/11/2021	1/12/2021	Symptoms started mild after 14 hours after administration: body aches, after 22 hrs. I started to feel nauseous at first then I had chest pain, headache, chills, back pain, body aches (muscle pain) and dizziness
941718	1/13/2021	IL	37	F	12/20/2020	12/21/2020	Following vaccination, I had a headache for few days along with some pain on injection arm. The headache continued and soon some fatigue and tiredness accompanied it for 7-10 days following vaccination. Then ten days after, I had an increase in symptoms that included heightened fatigue, loss of appetite, feeling "cold"/ "hot" (no fever), and abdominal pain with nausea and some diarrhea. Two weeks after vaccination, I had an increased of fatigue and not feeling well, accompanied by a fever of (101.5 F) and chills, sore throat, and lethargy. My symptoms of fever, chills, sore throat, body aches, congestion, and fatigue remained over the next few days and soon included chest pain and some increase work of breath. With two negative Covid tests through work, it was recommended I go to see a physician, who instead sent me to Immediate Care. There I had an EKG which showed sinus bradycardia and they sent me to ER due to my symptoms of chest pain and shortness of breath. At the ER, multiple tests were run to negative results. ER Physician suspects that some of my struggles could be related to Covid vaccine but that I also may have caught a non-Covid virus on top of it which led to acute bronchitis.

Walked back to restroom - voided. 1523: Ambulated per self to personal vehicle. Gait steady. No lightheadedness. States chest pain resolved.</p> <p>On 01/12/2021, I was notified that the patient stated she had a rash on her left arm near the immunization site. I examined this site on 01/12/2021. Noted 2 in diameter area where vaccine was injected, that showed a faded induration, but no redness now. The patient states this was red at the site for several days but then faded to the current appearance. She states one week after administration of the vaccine, she developed a rash trailing to inner aspect of her left arm. Rash was blotchy in appearance, in small clusters. No induration or erythema noted. Patient reports mild pruritis. States she has been taking her allegra since the immunization, has not taken any benadryl or other new medications for this rash. Denies any systemic systemic symptoms. No shortness of breath, angioedema, wheezing, chest pain, or GI/GU symptoms. She states earlier in the day on 01/12/2021, she had site examined by her primary care provider, PA and was told to put hydrocortisone cream on site and to monitor. Patient denies taking any new medications since vaccine administration. On 01/13/2021, patient was examined by another provider at clinic, APRN. She noted, the arm is erythematous, mildly raised and with no induration or fluctuance at site. The patient complains of slight burning and significant pruritis. There are no excoriations. She has been using hydrocortisone and taking claritin. She encouraged patient to start taking benadryl as directed and continue hydrocortisone. Edges of erythema were marked and advised patient to monitor for progression today. If progression occurred within a few hours she planned to send RX for treatment of acute delayed reaction to vaccine. Patient was examined at 3:18PM by RN and she reported that it looked like the erythema had improved and had gotten smaller, it had not progressed beyond the pen markings. Pt complains of some itching still but had not been able to take benadryl yet today. She will keep an eye on it and will check back in with us tomorrow.</p>

941934	1/13/2021	ID	41	F	1/13/2021	1/13/2021	Patient was here for nurse visit for COVID vaccine. Administered Moderna COVID 19 vaccine in left deltoid at 09:30. No immediate reaction noted. At 09:47 patient stated that her left arm was tingling, and she was feeling hot. Patient states she feels like it's an anxiety attack and she has anxiety about shots. Patient became nauseous and shaky. Physician was notified. O2 97% P 76 T98. 09:53 received verbal ok by Dr to administer BENADRYL 25mg to patient, administered Diphenhydramine 25mg 1 PO without difficulty. I applied a cool compress to back of neck. 10AM patient stated she felt better. 10:02 she stated the tingling in her arm was gone. Patient did vomit at 10:06. She stated she felt much better. Patient stayed in office until 10:15 she stated she felt better. Per Dr patient is ok to return for 2nd dose of COVID vaccine. Let patient know that if she developed any other symptoms to call us or if she has difficulty breathing or severe chest pain she needs to go to ER. Patient stated understanding.
937821	1/12/2021	NY	41	F	1/8/2021	1/8/2021	Chest pain and SOB with onset about 40 min after vaccine and slowly getting worse (never severe, but definitely uncomfortable) over next few hours. Finally tried 2 puffs of my son's albuterol about 5 hrs post vaccine and felt relief within 20-30 minutes. The next day I had more expected side effects: headache, myalgias, chills and fatigue. No recurrence of the chest symptoms.

936386	1/12/2021	MN	50	F	1/5/2021	1/5/2021	Severe nausea; headache; sore throat; sweating with chills; sweating with chills; chest pain; injection site soreness; shaking hands; This is a spontaneous report from a contactable other HCP reported for herself. A 50-year-old female patient received first dose of BNT162B2 (lot number: ej1686), via intramuscular in right arm, on 05Jan2021 06:30 AM at single dose for COVID-19 immunization. The patient was not pregnant at the time of vaccination. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, patient hasn't been tested for COVID-19. Medical history included Known allergies: sulfa antibiotics, avascular necrosis, multiple joint replacements, anticoagulation, chronic pain, multiple hospitalizations in 2020 for diverticulitis. Facility where the most recent COVID-19 vaccine was administered was hospital. No other vaccines was received within 4 weeks prior to the COVID vaccine. Concomitant medications which patient received within 2 weeks of vaccination included warfarin, oxycodone, linaclotide (LINZESS), cyanocobalamin (VIT B12), ergocalciferol (VIT D) and iron. The patient experienced severe nausea, headache, sore throat, sweating with chills, chest pain, injection site soreness, shaking hands on 05Jan2021 07:00 AM. The events resulted in doctor or other healthcare professional office/clinic visit. No treatment was received for the events. The outcome of the events was recovering.

936212	1/12/2021		32	M	12/15/2020	12/19/2020	<p>suspected COVID-19; suspected COVID-19; Fatigue; Body aches; Headache; chills; The initial case was missing the following minimum criteria: no adverse event. Upon receipt of follow-up information on 04Jan2021, this case now contains all required information to be considered valid. This is a spontaneous report from a contactable healthcare professional, the patient, from a Pfizer sponsored program IBCC (Inbound Call Center for HCPs). A 32-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EK5730), intramuscular in the left deltoid on 15Dec2020 at 21:00 (at the age of 32-years-old) as a single dose for COVID-19 immunization. Medical history included ongoing hypertension from 2009 and COVID-19 from 10Jun2020 to an unknown date in 2020. Ongoing concomitant medications included fosinopril (MANUFACTURER UNKNOWN) taken for hypertension from 2017. The patient did not receive any other vaccines on the same day as the BNT162B2 vaccine. On 19Dec2020, shy of about 96 hours of getting the vaccine, the patient experienced fatigue, body aches, headache and chills. He did not have any fever. The patient stated that he recovered from the fatigue, body aches, headache and chills by 19Dec2020. The patient was fine from 19Dec2020 until 01Jan2021. On 28Dec2020, the patient had a COVID-19 PCR test that came back negative. On 01Jan2021, the patient suspected that he had COVID-19. He had a fever of 103.1 degrees Fahrenheit, body aches, chills like he was freezing to death, fatigue, diarrhea; however, he did not have nausea or loss of taste or smell. He had swollen lymph nodes, but no sore throat and his oxygen saturation was okay in Jan2021. He was also having chest pain but it was more like intercoastal pain. He stated that these current symptoms were significantly worse than the ones he had just after getting the vaccine and felt more like the symptoms he had when he had COVID-19 before on 10Jun2020 (positive IgG for COVID-19-tested in 2020). The patient had a COVID nasal swab (PCR) done at an urgent care (physician's office) on 02Jan2020 or 03Jan2020 and was awaiting the results. The clinical outcome of the suspected COVID-19 was not recovered.; Sender's Comments: A causal association between reported suspected COVID-19 cannot be excluded.</p>

938868	1/12/2021	VA	34	F	1/12/2021	1/12/2021	-0715 vaccine administered. -0735 started to feel dizzy/off and right side of tongue felt like it was mildly swelling and itchy. -0735 asked to have blood pressure taken as know when I am having anaphylaxis my blood pressure escalates. -0740 took blood pressure and it was 141/86 in right arm. Normal is 110s/60s-70s. No anxiety feelings. -0740 throat started to have increased mucous production. Had the tickle and tightness in throat. Asked and received 25mg Benadryl with cup of water. -0742 started clearing throat frequently and slight cough. Knew it was anaphylaxis and told the team I need to go to the ER. Asked for additional 25mg Benadryl. Also took 20mg Famotidine and 2 puffs Albuterol inhaler--this is my prescribed anaphylaxis routine. Had Epipens on standby. -0743 put on O2 saturation monitor and watched O2 drop into 90-92 range. Asked for epipen on standby as I know when I need to start it. Didn't want to take that when I knew I was about to get it in the ER and knowing self hadn't progressed that far. Felt chest tightness and shortness of breath. Voice started becoming hoarse. -0800 EMS arrived (delay as team didn't know if they were supposed to call 911 or a Code--they chose EMS even though in hospital). Then staff at COVID vaccine clinic kept emphasizing need to go in ambulance while EMS and self fought to go through hospital (much quicker route). Finally cleared to go through hospital to ER. To get some air via breathing in had to sit up leaning forward. Voice completely hoarse by this time. -About 0817 arrived to ER bay. At this time, frequently coughing and cough started to sound stridorous. Difficulty getting breaths in. Had chest pain near heart. Greeted by MD, 2 RNS, and technician. - 0819 received IM epinephrine. Attached to 5 lead EKG monitoring and O2 monitoring. Blood pressure done again. Higher than previous. -About 0821 had working IV (previous two attempts failed as veins were constricting). Given IV Solumderol. Started bolus of 1L Normal Saline. - Not sure how long after by cough subsided, increased mucous production subsided, as well as hoarseness decreased. -Held for observation for 2hours (would be longer if not resolved). - Discharged around 1015. At this time, hoarseness almost all gone. Minimal throat clearing. Cough resolved. -Prescribed epipen inhalers (mine expired) and Prednisone. Prednisone is PRN for mild breathing difficulties if it starts again tomorrow

938647	1/12/2021	TN	45	F	1/8/2021	1/9/2021	Received shot at 11:35 am Friday 1/8/21. Woke up 1/9/21 with chest pain, in SVT HR 140s-180s, persisting for 8+ hours until treated by cardiologist with addition of Flecainide. Flecainide 50 mg twice daily now part of medications.
934099	1/11/2021	IL	41	F	12/28/2020	12/28/2020	Patient is a 41 y.o. female who presented to the ED with complaints of a reaction after she took the COVID vaccine. Patient is an RN here and had earlier received COVID-19 vaccination (Moderna) around 0130 this afternoon. Soon after she experienced rash which was burning and itchy on her arms thighs and back. She reported to Occ health and was directed to the ED. While in the ED she experienced throat tightness and nausea. She had one episode of diarrhea. No tongue, lip swelling, SOB or difficulty swallowing. Denies any chest pain, palpitations, pre-syncope/syncope. No vomiting abdominal pain. H/o of allergy to fish mix and dust mite.
934899	1/11/2021			F			difficulty of breathing; chest pain; nearly passing out/fainting; This is a spontaneous report from a contactable consumer. A 50-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiry date unknown) via unspecified route of administration on unspecified date at single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The reporter called in behalf of her friend that has been experiencing serious adverse event. The patient experienced difficulty of breathing, chest pain, nearly passing out/fainting on unspecified date. They felt that the vaccination provider did not provide enough support about the adverse event that happened. Follow-up activities are possible, information on the batch number has been requested.

933265	1/11/2021	CA	26	F	12/23/2020	12/23/2020	<p>generalized itchiness; woke up with headache; feeling fatigued; anaphylactic reaction; right arm started going numb; right arm was tingling; A spontaneous report was received from a 26-year-old, female consumer who received Moderna's COVID-19 vaccine and experienced anaphylactic reaction, right arm numbness and tingling, headache, fatigue, and generalized itchiness. The patient's medical history was not provided. No relevant concomitant medications were reported. On 23 Dec 2020 prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: OU520A/011520A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 23 Dec 2020, within minutes of receiving the vaccine, the patient experienced an anaphylactic reaction and was rushed to the emergency room (ER). When transported to the ER she began to experience throat swelling, redness of arms and chest, trouble breathing with lower chest pain shooting into lungs, and numbness with tingling in her right arm. Treatment for the event included epinephrine, steroids, and diphenhydramine. She was released from the ER on 23 Dec 2020. On 24 Dec 2020 patient awoke with a headache, fatigue, and generalized itchiness. Treatment for the event included ibuprofen and diphenhydramine. Action taken with the second dose of mRNA-1273 in response to the event was not reported. The outcome for the events, anaphylactic reaction, right arm numbness and tingling, were reported as resolved on 23 December 2020. The events of headache, fatigue, and generalized itchiness were considered resolving.;</p> <p>Reporter's Comments: This case concerns a 26-year-old female patient who received their first of two planned doses of mRNA-1273 (Lot OU520A/011520A), and who experienced the unlisted events of anaphylactic reaction, right arm numbness and tingling, and generalized itchiness, and the listed events of headache and fatigue. The events were considered to be possibly related to the vaccine due to the temporal relationship with onset on the day of vaccination.</p>

935417	1/11/2021	OH	38	F	1/11/2021	1/11/2021	01/11/21 RN, the nurse in the Observation Room , called this RN (Occupational Health RN) because patient after 11 minutes in the room developed right sided head pain that radiated to right eye. She also c/o tingling in right arm from the elbow to the finger tips. AT 1348, on my arrival, caregiver c/o right hand numbness and tingling from the elbow to the fingers. Injection site in right deltoid inspected, bandaid intact; no swelling or redness noted and bandaid in an appropriate placement. Right hand with strong grasp and brisk cap refill. Arm strength strong with resistance. C/o head pain but denies shortness of breath, chest pain or swelling. Some anxiousness noted. Reassurance given. AT 1351 vital signs: BP: 101/68, HR: 69, RR: 16, Sao2 99% on room air. Headache rated 3/10 and tingling in hand/arm rated 6/10. RN left the observation room and RN in charge of patient observation. RN states at 1405 the vital signs were 102/63, 74, 16 and 98% on room air and assessed head pain at 3/10 described as dull. RN stated at 14:10, patient c/o tingling in left leg as well as right arm and head pain (2/10). RN states at 14:14 patient developed swelling in tongue but she noted that swelling was not visible. RN states there was no difficulty breathing but with the tingling in leg and arm and now swelling feeling in tongue, she administered 60mg Fexofenadine PO. Per RN BP: 123/68, HR:74, RR:16, Sao2: 99% on room air.. RN called for Occupational Health nurse to come to observation room. RN arrived at 1429 and found the caregiver slightly anxious. States headache is gone and right hand tingling is rated 2/10, leg tingling is gone, numbness/swelling in tongue is rated 4/10 and denies throat swelling or tightness. Occupational Health manager aware of situation and present with RN. AT 14:33 Sao2: 98% on room air and heart rate: 82. AT 1448, Caregiver ambulated to restroom per her request by RN. Gait is steady. When they returned at 1451, patient states the headache was gone as well as the tingling in the leg. She states the tongue numbness/swelling was rated 2/10 and right arm tingling rated 1/10. BP: 106/68, 74, 14, 100% room air. Advised patient to go to the emergency room for evaluation but she refused at this time. After letting her rest, at 15:06, patient states the tongue swelling/numbness is almost gone and the right hand tingling is almost gone. Vital signs 98/59, 68, 16, 100% on room air. Water given.

							Instructed that she will wait a little longer to see what time does for the symptoms. At 15:25, RN states that caregiver has no more numbness/swelling in tongue and the right hand tingling is very minimal . Discussed follow up with PCP regarding second vaccine and to seek medical attention if any symptoms develop after leaving the observation room. Occupational Health manager aware of all course of treatment and evaluation. :RN

932890	1/10/2021	CA	35	F	1/10/2021	1/10/2021	About 40 minutes after my vaccine, I felt sudden onset progressive weakness of my entire left arm with spasms/fasciculations of my forearm and hand (while driving from hospital where I work as a physician to where I live). I pulled over, felt a bit dazed and was unable to use my left hand purposefully to call 911 on my cell phone, but was able to call 911 on my Watch using my right (dominant) hand. While talking to the dispatcher, my symptoms resolved (total duration a few minutes) so I requested that they not send an ambulance but instead felt well enough to drive to my hospital ED. I discussed my case with the triage RN and ED attending who felt my symptoms were related to the vaccine, with no further work up needed, given then my symptoms resolved. My vitals were stable in triage. No chest pain or shortness of breath, with normal neurological function and sensation of my left arm. Note: I was not officially checked in or seen as a patient. Sudden onset weakness and spasms of left arm (side of vaccine administration) about 40 minutes after vaccine

931417	1/9/2021	FL	60	M	1/7/2021	1/7/2021	Myocardial Infarction: patient began to complain of severe chest pain 3 hours after the vaccine was given .. Vaccine NDC # 59267-1000-1. 0.3 ml given by RN. Patient called his PCP: "... I had very bad chest and shoulder pains, neck pains and slight fever from 9 pm until early this morning (Jan 8). My blood pressure was 155/95 mmHg. Should I see you today? Still feel sore all upper body. Above message received at 0720 am (Jan 8) and the patient was called back at 0757 am (Jan 8): patient was told that many of the side effects above were related to the vaccine but the chest pain was worrisome and the provider requested the patient go to the emergency room. Patient understood the importance to seek medical attention..... Emergency Room notes: seen by MD on Jan 9. Note at 0749: patient complained of chest pain on/off since received COVID vaccine on Jan 7. Pain was substernal and radiated to the left shoulder, assoc with some SOB. EKG obtained and revealed ST segment elevation and a "cardiac alert" was called.
991794	1/9/2021		41	F	12/29/2020	12/29/2020	Palpitations Narrative: Employee received vaccine at 8am on 12-29. 45 minutes later experienced flushed feeling, heart palpitations, chest pain. See in urgent care at work, EKG showed ectopy. She was sent to the nearby emergency room, where she was monitored and given iv fluids, oxygen and tylenol. She is feeling better today one day later, and will have follow-up with cardiology. Vaccine administration may have set off underlying predisposition for PVC's, ectopy. Was aware of PVC's previously but well-controlled on diltiazem. Has now been switched to metoprolol.

931759	1/9/2021	WI	50	F	1/9/2021	1/9/2021	Patient was given the first COVID-19 vaccination at approximately 1254 today in her left deltoid. She approached writer at 1310 in no apparent distress. She voiced symptoms that were concerning to her. She indicated about 5 minutes after she received the injection, her tongue felt like it was burning and tingling. She also stated her chest was burning. Denies every having these symptoms ever before. She currently denied shortness of breath, chest pain, shoulder pain, nausea, or throat swelling. No changes in voice were observed by writer. Last time patient ate was between 0930 and 1000 this am. Patient shared that she was feeling anxious about having the vaccine and wonders if this is the reason why she is having the symptoms. Vitals taken, all within normal range. Patient encouraged to remain for 30 for observation. No further concerns were verbalized to writer during her stay. Patient was encouraged to call 911 if she develops shortness of breath, chest pain, throat swelling or other concerning symptoms after she leaves. Patient verbalized understanding and was agreeable with plan.
931755	1/9/2021	MT	41	F	1/7/2021	1/8/2021	2nd Pfizer vaccine was given on Thursday Jan. 7th around 1240pm. That evening I experienced expected muscle aches, chills, headache, fatigue. The next evening, Jan 8th I experienced chest pain which felt like heartburn or gastritis (which I do not typically have) in addition to the muscle aches, chills and headache returning. The morning of Jan 9th I woke up with a swollen face in addition to ongoing body aches, fatigue and headache and took 50mg of Benadryl and went to urgent care for evaluation.
1011637	1/9/2021		47	F	1/4/2021	1/8/2021	Hypertension + chostochondritis left ribs 1-3 Narrative: Patient reported slightly elevated BP at 143/93 and reproducible chest pain on 1/8/2021 at 9:00am. Wanted to be examined as her 2 year boyfriend recently died of an arrhythmia. Has history of fibromyalgia and BP is "always is elevated when she see's a provider". BP improved to 138/76 on repeat after 15 min of discussion.

928670	1/8/2021	TX	51	F	12/22/2020	12/22/2020	I started few hours later started feeling thought it was stress. The next morning around 9am high moderate pain left leg jaw, chest hurt, sudden panic attack and I had to calm down for minutes. I informed my coworker I was having a reaction and then it stopped. Then I scheduled an appt with my PCP had lab work, EKG results was normal. On 12/24 still exp high mild left jaw pain, heart racing and chest pain .I was scheduled stress test on 12/30 was normal.
928662	1/8/2021	NY	50	F	12/23/2020	1/1/2021	On December 25th I had mild chest pain and then on January 1st, 2021 I had severe chest pain that persisted and on January 3rd I was admitted into the hospital. My Ddimer was elevated and my Troponin levels were elevated. An angiogram was performed and Dr. injected nitro into my arteries because they were constricted from Coronary Spasms.

929058	1/8/2021	NY	36	F	12/19/2020	12/23/2020	<p>Around 10:30pm I felt like my throat was closing and I was choking; Around 10:30pm I felt like my throat was closing and I was choking; I had chest pain, chest tightness; I had chest pain, chest tightness; Very SOB at rest; Throughout the day I was cough and my face started flushing so I took Benadryl/severe facial flushing; On 23Dec I got nerve blocks for my migraines.; Throughout the day I was cough and my face started flushing so I took Benadryl.; This is a spontaneous report from a contactable nurse who reported for herself. A 36-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot: EK5730) dose number 1, via an unspecified route of administration on 19Dec2020 11:30 at single dose for COVID-19 immunization. Medical history included von willebrand's disease, narcolepsy with cataplexy, IIH (Idiopathic intracranial hypertension), HTN (hypertension), GERD (gastroesophageal reflux disease), migraines. Patient also had known allergies: PCN (penicillin), shellfish, IV contrast, cefdinir and bees. On 23Dec2020, patient got nerve blocks for her migraines. Throughout the day patient was cough and her face started flushing so she took diphenhydramine hydrochloride (BENADRYL). Around 22:30, patient felt like her throat was closing and she was choking. She had chest pain, chest tightness. EMS (emergency medical services) was called and patient was brought to the hospital. On 25Dec2020, patient felt like her throat was closing, like someone was sitting on her chest and chest tightness still with chest pain. Very SOB (shortness of breath) at rest. Patient went to the ER (emergency room) and received IV dexamethasone (DECADRON) and diphenhydramine hydrochloride. On 26Dec2020, patient had the same symptoms but with severe facial flushing and patient went back to the ER and was given IV dexamethasone. Patient was sent home on a maximum amount of medications. I had seen her primary care, ENT (ear nose throat centre), Allergy, ID (infectious disease), and pulmonology. Her CT (computerised tomogram) of chest on 25Dec2020 was negative along with her COVID test. Patient SOB on rest and exertion still. Onset date of the adverse events was reported as 23Dec2020, 22:30. Patient received treatment for the events included multiple medications and high dose prednisone. Lab data on 25Dec2020 included CT of chest: negative, influenza</p>

927506	1/8/2021	MA	58	M	12/28/2020	12/28/2020	Heart rate increased; Swelling arm; Arm soreness; soreness at the vaccine injection site; This is a spontaneous report from a contactable consumer. A 58-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot number EJ1686, expiration date unknown) via an unspecified route of administration on 28Dec2020 at 13:00 (at the age of 58-years-old) at an unspecified dose in the upper left arm for COVID-19 vaccination. Medical history was reported as "no pre-existing conditions." He mentioned that he reviewed his allergies with a pharmacist prior to vaccination but did not specify what his allergies were. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient was a tobacco user from an unknown date. The patient also reported a history of pneumonia which was reported to have occurred on seven different occasions following each of seven different vaccinations with the flu vaccine (manufacturers unknown) prior to 2013. There were no concomitant medications. The patient did not receive any other vaccines within four weeks prior to the vaccination. He stated that after receiving the COVID 19 Vaccine he had side effects. He said the side effects went away at twenty four hours later, but he is still having one side effect, and has a concern. He clarified that he has an elevated heart rate since getting the COVID 19 Vaccine. He said he has never had an elevated heart rate before getting the COVID 19 Vaccine. He reported his heart rate is normally low, between 62-65. He said when he was at work on 28Dec2020 his heart rate was OK, but prior to going to bed that night his heart rate was 93 - 95. He said he thought at first he was just stressed. He also reported the COVID 19 Vaccine is the only thing he has taken. He mentioned that his heart rate has been down to 93, but then up to 105, and higher. He specified that he first presented with an elevated heart rate between 4:00 5:00PM on Tuesday, 29Dec2020. He said the elevated heart rate subsided enough for him to sleep later that day. He said he then started work around 10:00AM today, 30Dec2020, and felt the elevated heart rate in himself, and didn't say anything to anyone at work. He said when his heart rate got bad, it was about 12:30PM today and that today (30Dec2020) at work he didn't feel right at lunch, so he took his oxygen level and heart rate. He said his heart rate was 141. He said he called his

927426	1/8/2021		60	F	1/6/2021	1/6/2021	primary care doctor, but didn't go to the emergency room. He said he doesn't have chest pain. He said he said something about his heart rate to a staff member at work, and the staff member tested his heart rate, and told him it was 141. He said he spoke to the nurse at his doctor's office, and the nurse said the doctor couldn't do much, and that he could go to emergency room or their practice's urgent care that is open until 7:00PM. He said he tried to go to the hospital emergency room, but ended up driving by because the hospital was so busy they were triaging patient's in the parking lot. The patient also experienced arm swelling and arm soreness following the vaccination on 28Dec2020. He said he could feel the soreness at the vaccine injection site when he moved his left arm. He stated that the swelling was down to his biceps and it resolved within 12- to 14 hours after the vaccination. As treatment, the patient took a generic 81 mg Baby Aspirin (UPC Number: 050428323922, Lot Number: P110657 Expiration Date: May2020) on 30Dec2020 between 3:00 and 3:30. The patient stated that the generic 81mg baby aspirin was an expired product. The clinical outcome of heart rate increased was not recovered and the clinical outcome of arm swelling, arm soreness and vaccination site soreness was recovered on 28Dec2020.
							Chest pain Abdominal pain Fever, severe chills, diaphoresis Seizure like activity for two night

928344	1/8/2021	CO	79	M	1/3/2021	1/3/2021	Pfizer-BioNTech COVID-19 Vaccine EUA: Within fifteen minutes of receiving vaccine patient experienced lightheadedness and dizziness. Remained awake alert and oriented and able to stand and ambulate. Initial vital signs were within normal range except blood pressure 152/67 mmHg. Patient denied chest pain, palpitations, shortness of breath, difficulty breathing, nausea, vomiting, and pain. Patient stated they had not eaten yet that day and was immediately given juice, food, and water. One hour after vaccination patient stated symptoms were resolving. One hour and fifteen minutes after vaccination patient stated lightheadedness and dizziness returned and were slightly worse and developed a new symptom of "ear and head pressure". Repeat vital signs were within normal ranges except blood pressure was 139/92 mmHg. After discussion with healthcare provider decision made to transfer patient to urgent care/emergency department.
930555	1/8/2021	OR	42	M	12/21/2020	12/27/2020	Went to ED 6 days after vaccination. "42yoM with a hx of covid-19 infection in 3/2020 with sequelae of chest pain, insomnia, SIBO, and distant hx of testicular malignancy who presents with chest pain and chest palpitations. Pt received COVID vaccine on Monday, then started to have symptoms reminiscent of his original covid infection on Wednesday, including chills, myalgias, substernal chest pain, heart palpitations, and fatigue. Denies any fevers recorded at home. He feels like he has extra beats intermittently. Also reports some nausea, but denies vomiting or diarrhea. He has maintained good PO intake since symptoms started, but is worried he may be a bit dehydrated because he had a small AKI when he had covid back in March?. Etiology of chest pains unclear, but given all of the above workup, unlikely to be due to an acute cardiac or pulmonary etiology." He continued to have palpitations for the next week and had further EKG's don thru urgent care.

930353	1/8/2021	MN	16	F	1/7/2021	1/8/2021	Patient in clinic for chief complaint of possible side effect of the covid vaccine which she received yesterday. She states that she woke up at 0200 with chest tightness, achyness and headache. She rates the discomfort 7/10 last night and improved now to 5/10. She denies any worsening with any type of exertion and states that she can do simple things like take a shower, walk across the room, down the street or even stairs without any worsening. She denies any SOB or chest pain--just feels tight. Doesn't feel like she can't get a full breath or get the air out of her lungs either. She received her first of two doses of the Pfizer vaccine yesterday (4:23pm) and had no difficulty with the injection itself and then 9.5 hours later woke up from sleep with this chest tightness as well as achyness and headache. She states that she had the exact same symptoms when she had positive covid test back in August of this year with the addition of fatigue which lasted for 5 days. At that time it was not felt necessary to do any further testing nor treat with steroids according to cardiology. She does have history of LV non-compaction cardiomyopathy and her last visit with cardiology was about 2 years ago and she had a normal EKG and echo only showed "mild LV non compaction at the apex" at that time. He did not need to see her again until she is 18 unless she has problems. She states that she generally does very well and other than this tightness she does not have any other significant symptoms.

<u>VAERS_ID</u>	<u>RECVDATE</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
929845	1/8/2021	OK	42	F	12/31/2020	12/31/2020	immediately after to covid vaccine, client started c/o difficulty swallowing. She was transported to their emergency care area, vitals were monitored. Approx 10mins after this episode, she told them she has had this problem for the last 2 weeks. She denies shortness of Breathe or chest pain. Client was release to a family member. Her husband said she never had any other problems, except the shot made her "tired and achey". She was referred to her PCP for follow up>
929917	1/8/2021	SC	41	F	1/5/2021	1/6/2021	I woke up from sleep with severe chest pain at approx. 0400. It was sharp and radiated up to the left side of my neck. The pain was worse with breathing whether I was sitting up or lying down. My heart rate was 150 initially, but came down to 110's after a few minutes of waking up. My heart rate did not decrease with rest and the chest pain was not going away, so I drove to the emergency room to be checked. Before I left the house I used my albuterol inhaler once to see if it would make the chest pain and tightness any better. I received an EKG, mylanta mixed with lidocaine, IV pepcid and IV torodol to help relive the pain. The pain eased some (was a 8/10 when I awoke to a 2/10 after treatment). My blood was drawn, a chest x-ray was taken and the provider informed me all of my lab results, chest x-ray, and physical examination was normal. My EKG showed tachycardia and my heartrate did not drop below 100 beats per minute throughout the whole ER visit. My BP at the highest was 151/94. I have never had a problem with a fast heartrate or high blood pressure in the past. I was discharged with a diagnosis of pleurisy caused by a cough I have been having. I spent the rest of the day with chest pain and left arm pain from the site of the vaccination.
930035	1/8/2021	KS	55	F	1/8/2021	1/8/2021	Pt had tachycardia with a heart rate in the 160's after receiving the vaccine. She also had chest pain. EMS was called and took the patient to the emergency department for evaluation.

925429	1/7/2021	KS	59	M	12/18/2020	12/21/2020	Left Chest Pain that was sharp for about 5 minutes. Blood pressure initially was 196/96. Blood pressure came down, and I completed a full day of seeing patients. I then reported in the evening to the ER for testing. No Heart Attack or Blood Clot was diagnosed. So, this was musculoskeletal pain at the left costochondral region.
924954	1/7/2021	MA	57	F	12/31/2020	12/31/2020	Two hours after receiving the vaccine, I had extreme headache, this lasted for over 24 hours, after that the next 2 days was a lighter headache and some light brain fog feeling. The day after the vaccine had some mild chest pain, 5 minutes worth and than went away. Left arm hurt but just the usual with a shot. 6 days after vaccine, I had a rash and bump over my right ear, itchy arms and hands and neck area.
926108	1/7/2021	WY	22	F	1/5/2021	1/6/2021	Shortness of breath, body ache, headache, sore scratchy throat, chest pains, vomiting and nausea
924822	1/7/2021		82	F	12/29/2020	12/31/2020	PATIENT DEVELOPED PROGRESSIVE NEW DYSPNEA, DIFFERENT FROM HER BASELINE. SHE HAS BEEN HOSPITALIZED TWICE FOR PERSISTENT DYSPNEA AND CENTRALIZED CHEST PAIN, WHICH HAS OTHERWISE HAD NEGATIVE WORK UP.
925793	1/7/2021	MN	36	F	12/31/2020	12/31/2020	Immediately after injection, I felt a warm feeling flow from the injection site and across my chest. No shortness of breath or chest pain. Felt slightly light-headed. Drank water and ate some food to closely monitor. Very sore Left deltoid starting about 8 PM on 12/31/20 (same day as the vaccine administration). It was so sore that it woke me up a few times at night and 1/1/21 I had to take Ibuprofen 400 mg to alleviate the pain. Had a dull headache all day 1/1/21 and very tired. Slept that night from 9 pm - 8 am next day. No symptoms since 1/3/21.
926146	1/7/2021	MD	42	F	1/6/2021	1/6/2021	Immediately after the vaccination she experienced chest pain, tachycardia, and throat tightness. She was given benedryl and epinephrine and EMS was called.

<u>VAERS_ID</u>	<u>RECVDATE</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
925571	1/7/2021	NY	61	F	1/5/2021	1/5/2021	Immediately after receiving the vaccine, patient developed sensation of throat numbness in the back of the throat. Patient denied SOB, wheezing, throat swelling, stridor, rash, chest pain, tongue swelling. One dose of diphenhydramine 25 mg PO suspension and referred to the Mount Sinai emergency department. Sensation resolved after a total of 30 minutes (10 minutes after receiving diphenhydramine). Vital signs and physical exam were WNL with the exception bilateral submandibular adenopathy. Patient was observed in the ED for approximately one hour with no clinical change and was subsequently discharged home.
925558	1/7/2021		37	M	1/7/2021	1/7/2021	After receiving vaccine, pt complains of extreme dizziness, rapid pulse and chest pain that continued to get worse. Rapid response was called for pt assessment. After continued symptoms, pt was brought to ED for further work up
925542	1/7/2021	NY	30	M	12/28/2020	1/1/2021	On 1/1/21 (4 days post dose 1), patient developed sudden onset substernal chest pain that resolved and recurred the next day on 1/2/21. Patient was seen in the emergency department. VS were reported WNL, EKG with diffuse ST elevations and subtle PR depressions consistent with pericarditis. ECHO did not show evidence of effusion or tamponade. CXR and basic labs were unremarkable including troponin WNL. Patient sent home with colchicine and NSAIDS with plan for outpatient cardiology follow up. Of note, patient had COVID-19 in April 2020 with documented positive antibodies at that time.
925457	1/7/2021	TN	56	M	12/27/2020	12/28/2020	Pt diagnosed with COVID-19 on 12/9/2020 (symptom onset 12/6). Had fully recovered and completed isolation period. Had vaccine on 12/27, developed fatigue, dry cough and mild SOB after that. Developed chest pain (substernal stabbing discomfort) on 12/28 and presented to ED on 12/29. Work up was benign. Pt discharge home that same night.
925453	1/7/2021	VA	27	F	1/6/2021	1/6/2021	heart rate of 140, chest pain sharp right side of chest. started two hours after vaccine.

927174	1/7/2021	CA	35	F	1/7/2021	1/7/2021	<p>Three minutes after receiving the first dose of the Pfizer\BioNTech COVID19 vaccine today (time 11:34 am), this vaccine study participant developed swelling of both cheeks and "was able to bite on both cheeks" as well as vague flushing of the cheeks. She did not immediately report these symptoms but returned to the site of her injection (research study site) and reported the cheek swelling and facial flushing to our study nurse. She denied lip/tongue/airway swelling, difficulty breathing, nausea or vomiting, diarrhea, cough, wheezing, shortness of breath, rapid breathing, fever, headache, paresthesias, rapid heart rate, chest pain, or other symptoms at that time. I am a sub-I for Pfizer\BioNTech vaccine study and authorized an immediate dose of Benadryl 50 mg orally which she received. I examined her at 12:40 pm and she had a reassuring physical exam as follows: Constitutional: Appearance: Normal appearance; well-hydrated and alert; no retractions, tachypnea, nasal flaring, or audible wheezing/breath sounds. No pallor. HEENT: Head: Normocephalic and atraumatic. Nose: Nose normal without visible discharge. Mouth: Mucous membranes are moist. Cheeks: Minimal edema of both cheeks is present; no visible erythema on exam. Eyes: Conjunctiva/sclera: Conjunctivae normal. Pupils: Pupils are equally round and symmetric. Cardiovascular: Rate and Rhythm: Normal rate and regular rhythm, HR 80-90. Pulses: Normal pulses in left wrist 2+/2+; warm hands. Pulmonary: Effort: Pulmonary effort is normal; RR 12-14. Breath sounds: Normal breath sounds. Abdominal: General: Abdomen is flat. Neurological: Mental Status: She is alert; speech and comprehension are normal. The patient still felt unusual by 2:00 pm and was referred to our Emergency Room for further evaluation. In our ER, she had the following vital signs and exam findings: BP 140/87 Pulse 73 Temp 98.1 °F (36.7 °C) Resp 16 SpO2 100% Gen: well appearing, no apparent distress, speaking in full sentences, no dysphonia Head: normocephalic, atraumatic, no hematoma Eyes: pupils equal reactive to light, extraocular movements intact ENT: hearing grossly normal, oral mucosa moist without edema/angioedema Resp: speaking in full sentences, clear to auscultation bilaterally, no rubs/crackles/wheeze, normal effort Abd: normoactive bowel sounds, nontender</p>

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							nondistended, no rebound/guarding, no organomegaly, faint/resolving urticaria abd x2 Ext: no deformities, no joint swelling, no edema, faint patchy erythema bilateral upper arms Neuro: alert, nonfocal Psych: AAOX3, normal affect/mood I walked to our emergency room and reexamined her, and the only new finding were some pink small nonraised popular lesions on her abdomen and proximal arms, but she had no urticaria. Her lungs remained CTA and she was otherwise as before. The emergency room only gave famotidine 20 mg to her and discharged her with an EpiPen to use at home (they specifically felt she did not need it in the ER), but gave her oral cetirizine 10 mg to take daily for the next few days. I asked her how she felt upon discharge from the ER and she felt fine/normal.
927129	1/7/2021	OH	49	F	1/5/2021	1/5/2021	About an hour after the injection I had pain and burning going down my left side and in the left side of my chest that lasted about 45 min. I was fine for the next 12 hr. Around midnight I started with chills, joint pain body aches and a headache. I woke up around 2 am with a fever. All day on the 6th I felt horrible with body aches, joint pain and a severe headache. Around 10 pm on the 6th I started again with chills fever chest pain SOB Cough and vomiting (3 episodes throughout the night.) My lungs currently feel like they are on fire and I continue to have chest tightness, joint pain Severe headache and a cough. I am approximately 56 hr post second vaccination. I had no problems with the first vaccination
927098	1/7/2021	IL	55	F	1/7/2021	1/7/2021	Patient complained of palpitations 30 minutes after receiving the COVID19 vaccine. She had this same reaction after the first dose. She felt her heart racing and throat closing with chest pain. She received diphenhydramine 25 mg IV, famotidine 20 mg IV, and methylprednisolone 80 mg IV.
927087	1/7/2021	MI	52	F	12/22/2020	12/26/2020	12/22 vaccination. Felt fine. Arm sore 12 hours 12/26 - sudden sharp pain in chest, palpitations. HR irregular. waiting 15 min. Went to the ER. Frequent PVCs; occasionally over the years. Discharged home. Not sure if related to vaccine as under a lot of stress.

923684	1/6/2021	OR	38	F	12/30/2020	12/1/2020	Shortness of breath; Sore arm like she got kicked in the arm by a horse. Her arm felt like this today.; Chest pain; Headache; Body aches; Fever; Chills; fatigued; feels cold; This is a spontaneous report from a contactable consumer (patient). A 38-year-old female patient received bnt162b2 (lot number: EL3246), via an unspecified route of administration, at deltoid right, on 30Dec2020 07:45, at single dose, for COVID-19 immunization. Medical history included chronic asthma from an unspecified date, stomach surgery a year and a half ago, sometimes has stomach pain that feels like chest pain since her stomach has been surgically altered. Has had asthma stuff since she was very young. Is relatively healthy. No family medical history. No relevant tests. The patient's concomitant medications were not reported. No additional vaccines administered on same date of Pfizer suspect. No prior vaccinations within 4 weeks. The patient previously took flu vaccine on 01Oct2020 and experienced fatigued, tired, and sore arm like she got kicked in the arm by a horse. It was reported that received COVID-19 vaccine yesterday (30Dec2020). Been having some chest pain. Started a couple hours after receiving the COVID-19 Vaccine. Chest pain doesn't whole heartedly go away. Gets more intense and then relaxes. Wants to know if this is common or something she just has to deal with. Doesn't know if this is stomach pain. Had stomach surgery a year and a half ago. Sometimes has stomach pain that feels like chest pain since her stomach has been surgically altered. Has been taking heartburn and gas medications. Chest pain is not going away. Wants to know if this is common. Tried to look online and only found common side effects. Her husband looked it up and two people died from a heart attach after receiving the COVID-19 Vaccine. She is getting older, but is not that old. Caller works in behavioral health. Had an instant headache. Clarified chest pain: Is always lingering in the background. Doesn't fully go away. Comes and goes in waves. Gets intense and relaxes. Chest pain was pretty sharp this morning and it made her short of breath. Doesn't know if it was the pain that took her breath away. Occurred at 10:00. Indication: Has older people she takes care of. Her mother is super frail and has dementia. Her uncle is elderly and has heart issues. Wants to do her part so she doesn't catch it. No further details provided. In regards to

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

the two people who had heart attacks and died after COVID-19 Vaccine, caller has no patient identifiers or NDC/Lot/Exp to provide. Stated this people were in the UK and the information was just something her husband read on the internet. Also experienced body aches, fever, and chills between 14:30 and 15:00 yesterday, 30Dec2020. Is super fatigued. Doesn't know if she is febrile, hasn't checked temperature. Still feels cold and has chills today. Does not have a headache today. It was also reported that fatigued and tired with Flu Vaccine (historical vaccine). Sore arm like she got kicked in the arm by a horse. Her arm felt like this today (31Dec2020). Therapeutic measures in response to chest pain is received, treatment included heartburn and gas medications. Gas medication is Equate brand Simethicone Extra Strength Gas Relief (NDC: 49035-487-02, Lot:H22016, Exp: Sep2022) at 125mg liquid-gel. Heartburn medication is Equate brand Cimetidine 200mg tablet (NDC: 49035-820-72, Lot: Doesn't know if lot number is OJE2445C or OJE2445C, Exp: Jun 2022). Stated writing is so tiny. Gas and heartburn medication has not helped with chest pain. The outcome of the event chest pain was not recovered, of the other events were unknown.

923614	1/6/2021		26	F	12/29/2020	12/30/2020	Shortness of breath; chest pain; body aches; joint pain; headache; nausea; congestion; This is a spontaneous report received from a non-contactable nurse (who is also the patient). A 26-year-old female patient received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EI0140), intramuscular in right arm, on 29Dec2020 17:30, at single dose, for COVID-19 immunization. Medical history included spontaneous pneumothorax x2 on the right with VATS surgery on an unspecified date and multiple food allergies. The patient is not pregnant. Concomitant medication included montelukast sodium (SINGULAIR) and loratadine (CLARITIN). The patient experienced shortness of breath, chest pain, body aches, joint pain, headache, nausea and congestion, all on 30Dec2020 at 05:00. The patient did not receive treatment for the events. The patient did not receive any other vaccines within 4 weeks prior to BNT162B2. Prior to vaccination, it was unknown if the patient was diagnosed with COVID-19. Since vaccination, the patient has not been tested for COVID-19. The outcome of the events was recovering. The reporter assessed the case as non-serious. No follow-up attempts are possible. No further information is expected.

923601	1/6/2021	PA	44	F	12/22/2020	12/26/2020	developed chest pain with radiation into axilla, shoulder, scapula and down the arm; axilla discomfort; arm discomfort; Pain felt similar to sciatica; a full nagging pain and the muscles of my arm are fatigued from constant tension; a full nagging pain and the muscles of my arm are fatigued from constant tension; This is a spontaneous report from a contactable Nurse reported for herself. This 44-year-old female Nurse (patient) receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number=EL1685), via an unspecified route of administration on 22Dec2020 09:30 at single dose on left arm for Covid-19 immunisation. There was no known allergies, medical history nor concomitant medications. Prior to vaccination, it was not unknown if the patient diagnosed with COVID-19. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. 4 days following the vaccination on 26Dec2020 18:00, the patient developed chest pain with radiation into axilla, shoulder, scapula and down the arm. The chest pain and axilla discomfort subsided but the arm discomfort continued and intensified. Pain felt similar to sciatica. The patient took ibuprofen and paracetamol (TYLENOL) also placed ice pack under her arm and on top of shoulder. The following day the patient started on a methylprednisolone (MEDROL) dose pack. The patient received minor relief with the steroids and NSAIDs after 2 days she took a gabapentin (NEURONTIN) which was given to me by a family member. The gabapentin had given the most benefit. On day 4, the patient continue to have a full nagging pain and the muscles of her arm are fatigued from constant tension. The events resulted in doctor or other healthcare professional office/clinic visit. The outcome of the events was unknown. Since the vaccination, the patient had not been tested for COVID-19.
923901	1/6/2021	WI	54	F	1/5/2021	1/5/2021	LEFT SIDED CHEST PAIN, SHORTNESS OF BREATH, FELT WARM AND FLUSHED

923411	1/6/2021	WA	23	F	1/5/2021	1/5/2021	Received the vaccine around 9:15 pm PST. Arrived home and went to sleep. Around 11:15 PM PST, was awoken with extreme chest pains, nausea, and headache. Attempted to get up to get to the bathroom, and was unable to make it there prior to fainting. Was able to come to cognitively but was unable to move or get up. Had an overwhelming feeling of extreme muscle weakness. Was getting muscles spasms in the legs and extreme fatigue. Husband was able to get her up and dressed and took her to ER for a full work up. Was there from 12-3am PST.
923011	1/6/2021	KY	45	F	1/2/2021	1/6/2021	Patient had chest pain post administration of vaccine. Patient attributed this to heartburn after eating a large meal just before getting her vaccine (though she didn't typically get heartburn). Since the pain continued to persist her BP was taken and was 160/110. Patient said it may also be nerves but she didn't feel particularly anxious. She also stated she hadn't had her BP medication that morning. Patient took a couple of Tums and her BP was rechecked a few times. Each time the BP stayed above what the patient said was her normal even without BP medication. Due to the persistence of her hypertension and chest discomfort she was taken to the ED to be evaluated. Once patient was in ED she had an EKG, CBC with diff, CMP, and troponin. Provider eventually ruled it as an anxiety reaction (not cardiac related).
922904	1/6/2021	NJ	36	M	1/6/2021	1/6/2021	Patient A&Ox3. After patient received Pfizer 0.3mL COVID-19 vaccination on left deltoid, patient reported 7 minutes post vaccination, itchy burning on left eye spreading to right eye, minor headache. Patient denies SOB, chest pain, trouble breathing. Upon assessment, noted of left deltoid was warmth, swelling, and redness. Swelling also noted on left eye with slight redness at conjunctiva. Patient was medicated with 50 mg benadryl right deltoid.

922858	1/6/2021	ME	50	F	12/21/2020	1/3/2021	Presented in ED with a reddened and swollen area of her left deltoid region.. The patient states that she received the Moderna vaccine on 21 December in the left deltoid. She states that she had no problem with the vaccine initially. She states that she even hiked this last weekend and felt fine. She states that she developed a reddened area of the skin 3 days ago that has been increasing in size. It is now tender and somewhat warm to the touch. She states that she also felt some itchiness of her upper chest. She is not sure if she has any true hives in this area. She denies facial, tongue, or lip swelling. She denies difficulty breathing. She denies chest pain. She denies abdominal pain, nausea, vomiting. ASSESSMENT and PLAN Erythematous, hive-like region of the left deltoid that began 12 days after the Moderna vaccine. This is likely a localized delayed type IV hypersensitivity reaction. Bedside ultrasound performed by myself. I do not note any pocket of fluid to indicate an abscess. However, there is a small possibility that this could be cellulitis. A cellulitis would be much more concerning. From an allergic perspective, she has no evidence of anaphylaxis based on the timeframe and her current symptoms. As a result, she will continue on Benadryl for now at 50 mg every 6 hours and will be placed on doxycycline 100 mg twice a day for 10 days. May use prednisone taper but she should wait for 48 hours. If she has improvement with doxycycline and Benadryl, she should continue with this. The Benadryl is truly as needed and if it is improving, she does not need to continue on it. She will.

923977	1/6/2021	NY	48	F	1/6/2021	1/6/2021	I got the vaccine today. Unfortunately I did have a reaction, and had to cancel my patient load at work for the day. They said if you have food allergies you might have one, but I was willing to risk it. They observed me for 30 min after. After 15 min it felt like I was having a mild panick attack, but I?m used to that so I just breathed through it. Coughed a few times. After 30 min got up and was whoozy/dizzy, but shrugged it off, got my card and walked slowly to my car, drove 5 min home. By then my hands were shaking hard. It was like being shot with a crapload of adrenaline. I called my sister and when I talked I started sobbing. I don?t know, I just couldn?t stop. But I knew it was just the adrenaline and if I could calm down, I?d get thru it. She was awesome bc she kept her voice soft and low when she spoke, which helps. After 3 hours it has calmed down and I?m just really cold and exhausted and nauseous and only a little shaky. Being quiet and calm is helping. Also sitting on a heating pad bc it?s 74 in my apartment and I?m freezing cold. I?ll be ok by end of day. I got the Moderna vaccine and I?m still glad I did and thankful I could get it....but to those who are getting it...symptoms are that it feels like being shot full of adrenaline, you get a panic attack, but my O2 actually went up, not down. Chest pain, panting, high anxiety, shaking, nausea, dizziness.
924213	1/6/2021	NY	29	F	1/4/2021	1/4/2021	1/4/21 12 hr after vaccine fever of 101.3 bodyache and chills . On 01/05 Joint pain ,chest pain hot sweat chills and diarrhea

924072	1/6/2021	GA	25	M	1/6/2021	1/6/2021	The patient was administered the vaccination, observed for 15 minutes following the vaccination, after which he left to return to work at a pharmacy. The patient came back into the store about an hour later to pick up some things for his pharmacy and reported feeling a little chest pain. The patient was then informed to keep monitoring the pain and if it got any worse to go to the doctors office. About 2 hours later, the patient called when on the way to the emergency room and reported chest pain and a fever of 102 degrees (at the highest). Around 3pm, which was about 6 hours after the vaccination was administered, the patient reported chest pain was alleviated and that the emergency room treated him for a migraine/nausea with Tylenol #3, Fioricet and Zofran.
925669	1/6/2021	MS	36	F	1/5/2021	1/5/2021	01/05/2021 at 1451: Received Covid-19 Vaccine (Moderna) IM to L deltoid, during drive-thru 1512: Patient c/o feeling hot/flushed, confused/light-headed, states "heart racing." Appears pale in color. Patient was placed supine with legs elevated. BP 164/100, HR 94, RR 24, unable to determine O2sat, patient with gel manicure, would not register. Denies SOB. Denies chest pain. Patient remained A&O x4. Assisted and monitored by RN; second RN; third RN; and Fire Department. EMTs contacted. 1523: BP 142/86, HR 82, RR 20, color returned, A&O x4. Assited to sitting position. Reports "feeling better". Refused to go hospital/ER for further observation. 1523 patient contacted her father to come to Health Dept. to pick her up and take her home to avoid driving. Patient remained with RN until arrival of father. Fire Department remained with patient as well. 1545 Patient's father arrived to take her home, RN reports to writer that patient became SOB and light headed, and pain upon transfer to her father vehicle. EMS contacted, unable to obtain IV access x1 attempt. EMS placed patient on non rebreathing and transported to Emergency Department.

924320	1/6/2021	CA	55	M	12/24/2020	12/24/2020	<p> ~~EE reviewed contraindications and verbalized ~~"non~~" to all contraindications. Vaccine administrd at 1045. 1100 EE stated ~~"I feel weid~~". EE complained of SOB and dizziness. RN and LVN assisted EE to floor and elevated lower extremities. EE was taking deep breaths, pulse normal. RN, Called ED to notify them of EE situation. 1110 EE breathing normal and EE verbalized, ~~" no feeling of dizziness~~" and was assisted to sit in chair. 1113 RN escorted EE wo security golf cart and was transported to ED by Manager of security. EE was stable. ED Note 55-year-old male presenting with dizziness and anxiety after vaccination. This is a potentially seriously ill patient with significant medical complexity and risk who was assessed emergently on arrival given their concerning story. Differential includes but is not limited to orthostatic hypotension, cardiac dysrhythmia, atypical presentation of myocardial infarction, allergic reaction, adverse effect of medication. Fortunately, the patient denies any chest pain his troponin is not elevated with no ischemic findings on his EKG. He is nonfocal neurologically make me doubt stroke. He has no findings at this time to suggest an anaphylactic reaction and his vital signs are within normal limits. Orthostats were checked and negative. He has no anemia, leukocytosis or emergent electrolyte derangements that could be participating in his symptoms. Patient is tolerating oral intake and asymptomatic at this time. He was monitored and on serial reassessment developed no no recurrence of symptoms. He is safe for discharge at this time but ED read precautions were given and the patient was discharged from the emergency department in good condition. Impression: Acute dizziness anxiety, suspect adverse medication reaction~~ </p>

921253	1/5/2021	MS	49	F	12/28/2020	12/28/2020	throat sore and pain in neck; her throat is sore, feels like it may be swelling; some neck pain; it feels like muscle spasms; extremely tired; soreness in her arm; Chills; Nausea; felt weak/having some weakness; massive headache/mild headache; This is a spontaneous report from a contactable consumer (patient). A 49-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730) via an unspecified route of administration on 28Dec2020 11:00 on left arm at a single dose for COVID-19 immunization. The patient was positive for Covid back in Jun2020, it was a bad case that she was hospitalized for 6 days, that she did not have to go on respirator. She stated these days she still struggled with chest pains and still struggled with her taste, she went to the emergency room in Sep2020 with some issues from that. The patient concomitant medications were none. The patient stated she was retired who works security at a hospital that she got her first dose of the Pfizer Covid vaccine yesterday on 28Dec2020. She was calling to report some side effects from the vaccine. She was skeptical about shot but she went ahead and got the vaccine, she took it and waited the 15 minutes and everything was fine except some soreness in her arm, about an hour after the shot, she felt extremely tired, could not even read, by last night she was getting chills, nauseated and weak, all she wanted to do was sleep, she had a massive headache. She kept thinking she was going to have to go to the ER. She woke up this morning and her throat was sore, felt like it may be swelling, felt sick. She took two advil and her headache was better. She was taking tumeric and ginger root and honey with lemon for her throat. She knew she was not sick that it is just the vaccine and she would power through it but wanted to call. She was starting to feel better but still having some weakness, still tired, had pain in the arm of the injection site, a mild headache. She stated these side effects are still ongoing but are improved. She was also having some neck pain started this morning sometime, but does not know exact time, it feels like muscle spasms. Caller wanted to know if because she had Covid before her side effects are so bad. The patient did not do any relevant tests. The outcome of the events soreness in her arm, extremely tired, Headache was recovering, the outcome of the events Chills, Nausea was recovered in Dec2020 and the

							other events was not recovered.
921116	1/5/2021	KY	49	F	12/30/2020	12/30/2020	Patient received Pfizer COVID vaccine and waited for 30 minutes after to observe for reaction. Within the 30 minute waiting period, she felt like her lips and tongue were tingling and her throat was scratchy. She denied shortness of breath, chest pain, difficulty swallowing or difficulty breathing. Vital signs were stable. Due to her history of anaphylaxis reaction with various medications and shellfish, she was taken to the ER. In the ER she received IV Solu-Medrol, Benadryl and Pepcid and her symptoms resolved. She was observed for 6 hours and then released to home.
921091	1/5/2021	NH	54	M	12/31/2020	12/31/2020	Pt received vaccination and left after 15 min. observation symptom free. He drove a short distance away from the clinical site when he felt profuse sweating and had syncope (seconds) crashing into curb. He was aroused from impact and was able to stop car. He then developed profuse nausea and sudden urge to defecate. He went to restroom. Given these events he returned to the clinical site in another vehicle. Upon arrival he denied chest pain, shortness of breath or ongoing nausea or abdominal pain. He reported his AM blood sugar was 72 and does not take insulin. No history of coronary disease or syncope. EMS was activated and assumed care.
920877	1/5/2021	MI	57	F	12/30/2020	12/30/2020	Shortly after vaccination developed dizziness and nausea. Within 30 minutes had low blood pressure and pulse. Taken to ER. Also developed vomiting. Treated with epinephrine. Initially improved, then after 40 minutes heart rate dropped to low 40's and developed chest pain. Treated with 4 mg solumedrol, benadryl and more IV fluids. Slow recovery and observed over 5 hours. Went home.

921796	1/5/2021	TN	49	F	1/2/2021	1/2/2021	Started out vague. Started with headache at the base of her head and then it felt like a web that covered her entire head. By 10:00 she did not feel good. Went to sleep instantly. Slept for about an hour. Began to have nausea. Sunday headache got worse. Started ringing , buzzing sound in her head. Took Zofran because of nausea. Sunday night chest discomfort. Monday had horrible chest pain, headache was horrible, then vomiting. went to ER, doctor felt it was a reaction to the vaccine. was give medicine for nausea and Decadron for the reaction. Gave fluids for dehydration. Got medicine for headache. Keep taking Zofran for nausea. Still has headache. Has appointment with pcp in the morning.

918788	1/4/2021	CA	45	F	12/22/2020	12/23/2020	High blood pressure 187/95; Heart rate at one time 210 bpm; chest pain; Shortness of breath; This is a spontaneous report from a contactable pharmacist (patient) reported for herself that a 45-years-old female patient received first dose of BNT162B2 (lot number: EH9899), via intramuscular in left arm on 22Dec2020 07:00 AM at single dose for COVID-19 immunization. The patient was not pregnant. No known allergies. No allergies to medications, food, or other products. No other vaccine was received within 4 weeks prior to the COVID vaccine. No other medications were received within 2 weeks of vaccination. The patient was not diagnosed with COVID-19 prior vaccination and patient was not tested for COVID-19 since the vaccination. There were no medical history or concomitant medications. The patient experienced high blood pressure 187/95, heart rate at one time 210 bpm, shortness of breath and chest pain on 23Dec2020 10:00 AM. The events resulted in doctor or other healthcare professional office/clinic visit, emergency room/department or urgent care. Treatment was received for heart rate at one time 210 bpm which included lab works and medication given propranolol to decrease heart rate. The outcome of the event was recovering.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events hypertension, heart rate increased, chest pain and dyspnoea cannot be excluded. The information available in this report is limited and this case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

918755	1/4/2021	KS	58	F	12/21/2020	12/21/2020	patient began to experience dizziness/shakiness.; patient began to experience dizziness/shakiness.; This is a spontaneous report from a non-contactable other hcp reporting for a patient. A 58-year-old female patient received first dose of BNT162B2 (Pfizer product, lot number: EH9899), intramuscular on 21Dec2020 16:00 at single dose on left arm for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that during her 15 minute waiting period after the injection (21Dec2020 16:15), the patient began to experience dizziness/shakiness. This provider was notified of patient reaction and she was then transferred to the emergency bay via wheelchair where she was assessed. Monitored patient for severe reaction symptoms, including rapid progression of symptoms, respiratory distress with dyspnea, increased work of breathing, persistent cough and cyanosis, vomiting, hypotension, dysrhythmia, chest pain and collapse. Treatment included no therapy, but did continue with vital checks at approximately 5 minute intervals. Patient discharge: stable to go home and follow up with PCP. The outcome of the events was unknown. No follow-up attempts are possible. No further information is expected; Sender's Comments: Based on the compatible time association, the dizziness and shakiness are possibly related to suspect BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

use. Discharge instructions discussed. ASSESSMENT and PLAN This is a 40 y.o. female who presents with nausea vomiting diarrhea, myalgias, diffuse abdominal cramping, severe global headache, onset about 2 hours after first dose Moderna COVID-19 vaccine. Exam with intact mental status, neurologic system. Abdomen with some diffuse tenderness but no evidence of peritoneal sign. She had diffuse palpable soft tissue muscular type tenderness through her upper extremity shoulder and bilateral paraspinal back. She had no meningeal signs. She had no cardiorespiratory signs or symptoms. Her chest was clear. Voice normal. Swallowing normal. Oropharyngeal region normal. Initial ED ED management focused on rehydration, antiemetics and subsequent treatment for presumptive anaphylaxis with likely system involvement gastrointestinal and neurologic. She was treated with Solu-Medrol, famotidine and acetaminophen. She improved during ED course and did not require epinephrine. Symptoms at ED reevaluation/discharge were resolved. Clinical impression favors anaphylaxis over medication side effect given time course and abrupt onset of symptomatology and signs. She has a distant history of anaphylaxis to coconut-based product in her past. She has no history of ongoing allergic chronic history otherwise. Other organ systems appeared stable at onset and through ED course including cardiovascular and pulmonary. Plan is for discharge home with rest fluids. She will have a course of steroids/prednisone and famotidine. She was sent home with an EpiPen and understands use and precautions. Discussed ED "return immediately if" parameters with patient. Ongoing FOLLOW UP evaluation/care coordination via PCP recommended. Patient voices good understanding of current evaluation, follow-up & return recommendations and discharge instructions. Encounter Diagnosis Anaphylaxis due to vaccination, initial encounter Plan: - d/c home. No work next 2 days. Off work note provided - COVID-19 testing pending -rest with activity as tolerated - diet as tolerated & increased fluids as discussed - acetaminophen PRN -Prednisone 40 mg daily to finish 4 more days -Famotidine 40 mg daily to finish 4 more days - Zofran as needed (patient has at home) -Loratadine 10 mg OTC as needed -PCP f/u -ED return for interval worsening -instructions discussed & as documented

Around 2025, he stated that he felt better and the symptoms had stopped. Pt left observation @ 2027
919760	1/4/2021	NY	52	M	1/2/2021	1/2/2021	I tested positive for Covid-19 on 8/10/20. Symptoms were moderate (No hospitalizations/oxygen/interventions. Just flu like symptoms with significant chest pain. MI & PE ruled out in two ED visits, symptoms last about a month). Moderna Covid-19 Vaccine on 1/2/21 at 7:45 am. Developed significant chills at about 8:00 pm that evening. By 10:30 pm, chills, rigors, bodyaches, & fatigue (no fever). 1/3/21: Significant fatigue, chills, bodyaches, and now headache. Essentially stayed in bed the whole day; completely useless. Symptoms improved throughout the day. Was about 45% better by bed time. Severe diaphoresis in the middle of the night. 1/4/21: 75% better. Went to work and completed my shift. 95% better by the end of my shift.
919798	1/4/2021	TX	42	F	1/4/2021	1/4/2021	30 minutes after vaccination: numbed left side of face Around 4 pm started with ringing ears, lightheaded . Light chest pain but not too bad to go to the ER.

919211	1/4/2021		41	F	12/30/2020	12/30/2020	41 y.o. female presents to the ED with concern for possible allergic reaction to Moderna COVID-19 vaccine that she had received approximately an hour prior to arrival. Patient reports that shortly after receiving her vaccine in her left arm she developed the sensation of her throat closing and a "film "in the back of her throat. Patient has also reported feeling nauseated and having a throat clearing cough. No chest pain, headache, abdominal pain or development of a rash. Injection site appears to be unremarkable. Patient is given some antihistamine medications as well as steroids and observed here in the ED. The patient has improvement in her sensation of her throat closing and is able to be discharged. I discussed with the patient the usefulness of continued antihistamines over the course of the next few days and would likely advise on not receiving the second COVID-19 vaccine based on her reaction to the first. Discussed with the patient the use of epinephrine and EpiPen as needed. See discharge instructions. Patient is discharged home with her sister in improved condition.
919097	1/4/2021	MN	46	M	12/30/2020	12/30/2020	He stated he was fine for 20 minutes after the administration, but noticed driving home that the left side of his face felt funny/tingly. He says it progressed that evening to numbness and states his spouse noticed slight swelling to his face. He also complained of pain to his teeth and gums. He voiced concerns about bell's palsy, but stated he didn't notice any asymmetry or paralysis in his face and his symptoms have resolved entirely as of today 1/4. He was never seen or evaluated while he was having symptoms, unfortunately, and was able to continue working. Denied chest pain or difficulty breathing, no rash. He reports self-medicating with prednisone on sat/sun with improvement and as mentioned, is now asymptomatic.

916836	1/1/2021	MD	55	M	12/24/2020	12/30/2020	<p>Patient is a 55 year old male with no past medical history who presents with complaint of sudden onset of left-sided nonradiating chest discomfort of sudden onset approximately 1 hour prior to presentation while doing administrative work at rest. He describes the pain as a dull heaviness sensation and approximate 3/10 pain severity. Chest discomfort was associated with a feeling of flushing that was quite transient but chest discomfort was persistent. Patient immediately presented to the ED for further evaluation. He denies experiencing any chest pain upon waking up this morning. Does note that he did have a transient episode of epistaxis on his way to work for which he had to pull over and apply pressure to his nose but this subsequently subsided and he attributed this to dry air as he has experienced epistaxis in the past but with less severity previously. In the ER, vital signs noted for BP 133/76, pulse ranging 91-114, respiratory rate 16-20, 96% on room air. Initial laboratory parameters were completely normal including normal CBC, CMP, LFT, lipase, UA, and normal D-dimer. Initial troponin was negative x1. EKG with sinus tachycardia, heart rate of 115. Noted Q waves inferiorly. No acute ST or T wave changes appreciated. Chest x-ray with mild increased density in the left lower lobe. Given this, patient was tested for rapid Covid which was negative but PCR was positive for COVID. CT of the chest noted for focal subsegmental groundglass infiltrate at the superior segment of the LLL, likely infectious versus inflammatory. Also noted small nonspecific groundglass attenuation with focal septal thickening at the right upper lobe which could be infectious or inflammatory, bibasilar atelectasis. Patient was treated with aspirin 324 mg in the ED. Of note, patient actually just received the COVID-19 vaccination on 12/24/20. He denies any shortness of breath, no cough, denies any nausea or vomiting, denies any change in taste or smell nor change in appetite. Does note 1 single episode of loose stool but otherwise denies any diarrhea. Does report that he had approximate 48 to 72-hour period of fatigue and soreness at the site of the left deltoid injection following the vaccination but otherwise no further symptoms. It is also noted that he does have a positive family history of coronary artery disease as his dad had an MI at the age of 49. Patient has never undergone a cardiac catheterization in the past but does report having a</p>

							negative stress test at the age of 42. He is being admitted under the hospitalist service for further management. Patient was initially admitted under observation for chest pain obs. However patient's Covid test came back positive and patient also had dynamic EKG changes concerning for possible unstable angina. Patient was treated with aspirin Plavix full-strength Lovenox along with beta-blocker and a cardiology consult. Serial troponins were negative. Echocardiogram revealed normal EF of 55 to 60% with no hemodynamically significant valvular disease. Cardiology felt that patient likely has underlying coronary artery disease have recommended discharge home with aspirin and Plavix with outpatient stress testing given his positive Covid testing. At the time of discharge patient denied any chest pain or shortness of breath. Patient was borderline diabetic with a hemoglobin A1c of 6.1. Patient was discharged home with Metformin along with glucometer, glucose strip, lancets. Given patient's tachycardia patient's Metformin 25 mg twice daily was changed to Toprol 25 mg daily. (Please note clarification in comparison to discharge home med list. Toprol XL 25 mg daily was called to pharmacy in place of the metoprolol.)

914179	12/30/2020	NY	48	F	12/22/2020	12/22/2020	lips were tingly and swollen; lips were tingly and swollen; fatigued; allergic reaction; passed out; breathing fast; her brain felt like a rock, like she was there but not there; head was so heavy,wouldn't open her eyes; her throat started to tighten up; chest pain; nauseous; headache; felt a little lightheaded, a little wobbly; palpitations; sweaty; This is a spontaneous report from a contactable consumer (patient) via Pfizer Sponsored Program. A 48-year-old female patient (no pregnant at the time of vaccination) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899) via an unspecified route of administrationon 22Dec2020 on left shoulder at single dose for COVID-19 immunization. The patient's medical history included pernicious anemia and She had problems with B12 and Vitamin D like 10 years ago, she had none in her body, everyone said she was deficient and this year with her new primary care, they sent her to do some antibody tests, and found out she has pernicious anemia, allergy to MRI and CT contrast. MRI and CT contrast NDC, lot, expiry unknown. Her CT contrast allergy happened when she was 9 and 12 years old. It turns out to be her dad has an allergy the same way, his airways close. Whenever she needs a CT, they do without contrast, if she does need, they prep and give her Benadryl and keep an eye on her. This only happened once, that she needed with contrast, and with prep she was ok. With the MRI, this happened 4 or more years ago, maybe like 5 years ago. She needed an MRI, they said she would be fine, they injected contrast, she felt pretty hot, then she doesn't know, 20 minutes into it, she couldn't handle her gown, she looked at her chest, her whole chest was red like a burn. They gave her the IV Benadryl, she guesses, and it went away, now she knows, she doesn't know if her dad is allergic to MRI dye, but she knows she got the allergy from him for the CT contrast. The concomitant drugs was not reported. The patient was taken to ER with a severe allergic reaction. She had an allergic reaction on 22Dec2020: she passed out, said her brain felt like a rock, like she was there but not there, she then received an Epi Pen shot, when she got to the ER, her throat started to tighten up, lips were tingly and swollen, she was breathing fast, she had chest pain, she scaled it from a scale of 1-10, as about a 3 to 4 for chest pain, she felt nauseous, sweaty, and had a

headache. She went to bed last night, and woke up, feeling better but a little fatigued on 23Dec2020. She is wondering if she should take the second dose, and wants to be in the clinical trial for this type of reaction. She needs transfer to Regulatory Authority. Caller confirmed details. Caller states she works in a hospital, and all this happened at the hospital, and her doctor was not involved. Outcome of allergic reaction: asks what does lasting effects mean? Right now she has a little fatigue and headache, but she knows they are regular symptoms she can have with the vaccine, are those lasting effects? She was discharged from the ER to home. She mentioned to the nurse she has, she went to get the shot, she told the registration nurse, she said she has a severe allergic reaction to CT contrast, her airway closes and she has a severe reaction to MRI contrast, her skin burns, it turns red and feels like a horrible burn, she cannot handle anything to contact her skin, it burns, and she mentioned that to the nurse, she said, instead of staying 15 minutes, said to stay 30 minutes there to observe just in case. She got the vaccine, and 10 minutes after the vaccine, she felt a little lightheaded, a little wobbly, but she didn't think much, it was mild, and on the mark at 30 minutes, the nurse asked her to stand, and that is when she started feeling, like her head was so heavy, the only way to describe, was like her brain was like a rock, she had to lay down, and when they laid her down, she wasn't there, she was there but wasn't, and they didn't wait at all to give her the Epi Pen, she had a feeling of heaviness that got worse, she wouldn't open her eyes, she was able to answer questions, but it was not her there, it was weird, then she didn't have. she breathed fast, had palpitations, chest pain, so they called a Rapid Response team, they were keeping an eye on her breathing, which was super fast, and they rushed her to the ED, and the doctor did what they were doing, giving her IV of whatever medication, and she was also very nauseous, then at one point in the ED, she started feeling, like imagine if fists were on throat, pushing her throat, a little bit, and she tried to tell to the ED doctor, but guessed she was calling everyone to give her things, and didn't catch it, but it didn't last long, at the same time, she started to feel her lips tingly, so she thinks that, because they gave the Epi Pen so quickly, they wasted no time, she didn't have the airways closing like she does

914278	12/30/2020	AR	22	F	12/29/2020	12/30/2020	when she gets the CT contrast, they were quick. NDC/lot/expiry: She reads from the card they gave her: states first dose COVID-19 EH9899, states it doesn't specify lot, but she can find that out, they just gave her a vaccine record card. Epi Pen: NDC, lot, expiry unknown, states everything happened so quickly, she didn't think to get this information before calling, but she can get it. There at the hospital, she went to see the occupational health doctor, and based on guidelines from the CDC, he read supposedly she cannot get the second dose, but the doctor said because it is so new, and she has to wait the 3 weeks she guesses, things can change, and she wanted to be proactive. The outcome of the events, allergic reaction, passed out, throat started to tighten up, lips were tingly and swollen, chest pain, nauseous, headache, lightheaded, palpitations, sweaty was recovering. The outcome of other events was unknown.
914316	12/30/2020	OH	34	F	12/28/2020	12/30/2020	Chest pain, nausea, and fatigue. Chest pain has resolved. Currently has nausea and fatigue. Has not taken any medications.
914351	12/30/2020	IN	21	F	12/28/2020	12/30/2020	Given injection 12/28 at 2:36. Extreme arm soreness immediately. That night I noticed random bruising all over my body. Next day I had a major headache all day. Today, woke up with a major headache, full body aches, joint aches, chest pain, heart palpitations, and extreme fatigue.
							Rash on forearm of arm that received injection family doctor told me to take Benadryl. Also have a headache and mild chest pain.

914114	12/30/2020	VA	54	F	12/29/2020	12/29/2020	I received my first Covid vaccine 12/29/2020 around 1 PM. 14 minutes after injection I had a major dizzy spell and I almost passed out. My blood pressure was 184/101. No hx of HTN. They watched me for a while. My blood pressure/HR stayed up all evening and I felt just horrible. Did not have a good night. Bodyaches, low-grade fever, headache, nausea. A lot of pain at the injection site. I have to keep taking Tylenol every four hours in order to control symptoms. Blood pressure improving but still elevated based on my norm. I feel like my immune system is in overdrive. No airway and breathing difficulties, chest pain or shortness of breath or rash. Nausea but no vomiting or diarrhea. Drinking a lot of fluids. It was verified prior to vaccine administration that there was no counterindication receiving the vaccine with a history of having Covid. No timeline was given in between the dose and Covid recovery.
914109	12/30/2020		48	F	12/29/2020	12/29/2020	Patient felt chest pain, dizziness, lightheadedness approx 15 minutes after vaccination. She was taken to the ED on site and patient had normal ECG. Patient also complained of arm droop (opposite arm from vaccine site) so CT performed which was negative. Approx 1.5 hours into ED visit, patient complained of nausea, wheezing which was treated with IM epinephrine, methylprednisolone and diphenhydramine IV.

913912	12/30/2020	AK	29	F	12/18/2020	12/18/2020	BP of 176/126mmhg/persistent severe hypertension/continued severe elevation of BP of 178/130mmHg; intermittent chest pains; severe nausea; rash and hives on left side of arm where injection site was, as well as left side of face; rash and hives on left side of arm where injection site was, as well as left side of face; rash and hives on left side of arm where injection site was, as well as left side of face; rash and hives on left side of arm where injection site was, as well as left side of face; mild progressive headache; body aches; chills; fatigue; fever of 100 degree F; This is a spontaneous report from a contactable Other Health Professional (patient). A 29-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) lot number: unknown, intramuscular in the left arm, first dose on 18Dec2020 12:30 at a single dose for immunisation. Medical history included ongoing gestational hypertension in 2016 that never recovered, with controlled hypertension, asthma/COPD, and seasonal/animal allergies. Concomitant medication included sertraline hydrochloride (ZOLOFT) and losartan. The patient is not pregnant. The patient previously took and had allergies to erythromycin and nitrous oxide. It was reported that within 20-30 minutes of receiving covid vaccine on 18Dec2020, the patient developed mild progressive headache, body aches, chills, fatigue, fever of 100 degree F. At approximately 8:00 p.m. same day of vaccination, she developed rash and hives on left side of arm where injection site was, as well as left side of her face. Immediately following this, she had intermittent chest pains in which she took a BENADRYL 25 mg with some relief. Next day (19Dec2020), progressive headache persisted to a severe headache, severe nausea, persistent chest pains and a BP of 176/126mmhg. Reported to a place for evaluation with persistent severe hypertension and severe headache treated by toradol, compazine, and Benadryl. She was released from the ER with improved blood pressures and reduced headache. The following day Sunday Dec2020, progressive and severe headache occurred with continued severe elevation of BP of 178/130mmHg. Current treatment of losartan 50 mg was increased to 100 mg to attempt control. She was then placed on chlorthalidone/amlodipine. The events resulted in doctor or other healthcare professional office/clinic visit,

914798	12/30/2020	CA	54	F	12/18/2020	12/20/2020	On Dec. 20, 2020 around 11:30 PM, 2 days after patient received her COVID-19 vaccination, she was found on the bathroom floor , obtunded, very pale, diaphoretic, nauseous, and complaining of severe chest pain. Paramedics was called and patient was transported to the nearest emergency room. According to paramedics, on the way to the ER while patient was in the ambulance, she was noted with a sudden drop in heart rate about 19 beats/minute and have to be given Atropine IV Push, oxygen and was connected to transcutaneous pacing which improves her heart rate. In the ER patient continued to have chest pain and she was given Morphine, Oxygen, Nitroglycerine and Aspirin. IM had an EKG which showed Sinus Bradycardia with a Right Bundle Branch Block. She had serial ekgs, a chest x-ray, laboratory testing which included Troponin. Her first Troponin level came back elevated prompting her hospital admission to Telemetry. Her next 2 Troponin level improved and return to normal range and her chest pain has resolved.. She underwent a Stress Test which came back negative. Patient was admitted for a total of 20 hours in the Telemetry unit with Cardiology consultation before being discharged home last . She was re-evaluated by the cardiologist yesterday which diagnosed her a chest pain of unknown origin.

914591	12/30/2020	IL	53	M	12/17/2020	12/19/2020	Thirty six hours after vaccine I developed the most excruciating myalgias that continued for about a week. This was followed by 4 days of severe malaise, mild chest pain and generalized weakness requiring me to go to the ER for labs and fluid resuscitation. ER docs as well as my partners were unable to find any specific abnormality on exam. Had no muscle weakness. Test for orthostasis did show mild orthostatsis
914558	12/30/2020	ND	59	F	12/30/2020	12/30/2020	PATIENT WAS OBSERVED FOR 15-20 MINUTES IN THE PHARMACY POST INJECTION, AND HAD NO SYMPTOMS. PATIENT ALSO HAD BROUGHT ALONG HER EPI-PEN TO THE APPOINTMENT AS SHE WOULD BE PREPARED IF SHE HAD ANY PROBLEMS. ON HER WAY HOME, APPROXIMATELY 30 MINUTES AFTER HER VACCINATION, SHE HAD SOME MILD CHEST PAIN AND FELT SOME THROAT TIGHTNESS. SHE DID ADMINISTER 1 DOSE OF HER EPI-PEN 0.3 MG INJECTION AT THAT TIME. SHE EXPERIENCED RELIEF OF HER SYMPTOMS, AND APPROXIMATELY 1 HOUR AND 30 MINUTES LATER WHEN I CALLED HER, SHE WAS STILL FEELING UNUSUAL SENSATION IN HER THROAT, BUT WAS MUCH BETTER. I ENCOURAGED HER TO TAKE SOME HYDROXYZINE , WHICH SHE HAD AVAILABLE AT HOME, AND TO CONTACT THE EMERGENCY ROOM IF HER SYMPTOMS DID NOT RESOLVE COMPLETELY OR SEEM TO BE GETTING WORSE.
914530	12/30/2020	MD	43	F	12/30/2020	12/30/2020	about 5 to 10 mins after receiving vaccine pt felt dizzy, felt like she was going to pass out, seemed like everything was moving in slow motion. gradually developed some shortness of breath, nausea, (gagged but without vomiting), and within 30 mins lips felt numb , mild headache, no chest pain, felt like heart rate was beating fast but was 70bpm. 30 mins after receiving vaccine gave pt 1 25mg Benadryl had reaction to flu shot 2-3 years ago with shortness of breath, itchy throat, and went to hospital via ambulance with symptoms resolving. after 2hr pt was given one more dose of 25mg Benadryl , husband pick pick up with instructions to continue to monitor and if symptoms get worse call 911.

914494	12/30/2020	MT	46	M	12/18/2020	12/18/2020	<p>46-year-old male in the ED between 1 and 2 hours after receiving a COVID-19 vaccine, Pfizer, in the left deltoid with concerns for an allergic reaction. His vital signs notable only for mildly elevated blood pressure but the remainder of his vitals were in the normal range. At the time of his evaluation his symptoms had fully resolved and he had no ongoing complaints. I do not think this is an allergic reaction, no evidence of angioedema or anaphylaxis. Likely vaccine side effect perhaps with some anxiety. He was offered Benadryl, and further monitoring in the emergency department however his concern is low at the time of his evaluation and he does not feel he needs any treatment or monitoring at this time. Given his overall reassuring appearance, benign exam, and resolution of his symptoms I agree. We will have him go home, take 25 mg of Benadryl and closely monitor symptoms. If he gets any return of his symptoms get back in to the ED for evaluation. I recommend that he notify the clinic where he received the vaccine about this side effect so that it can be documented. I do not see any true contraindication to receiving his second vaccine. He could premedicate with Benadryl prior to his next vaccine. An alternative option would be to request the Moderna vaccine in place of the Pfizer brand vaccine.</p> <p>46-year-old male in the ED with concerns about a reaction to a COVID-19 vaccine. He presents with his wife today. He is generally healthy without any ongoing chronic health problems. He was in his normal state of health until that 1415, received a Pfizer COVID-19 vaccine in the left deltoid. About an hour after receiving the vaccine he started feeling poorly. Somewhat rapid onset of symptoms with dizziness, numbness and tingling in his arms and his legs which remained in the distal portions and was not associated with any weakness. He felt nauseous but without any vomiting. Developed chills which lasted for a few minutes and then resolved. He felt like his tongue was swollen but when his wife looked at it it appeared normal for her. There was no periorbital swelling, lip swelling, facial swelling otherwise. He did not develop a rash. His breathing was normal and he did not have any wheezing, shortness of breath. There is no chest pain or palpitations though he tells me he felt anxious. He called the on-call nurse line who instructed her to come to the ED. He has been in the emergency department for about an hour at the time of his evaluation</p>

913168	12/30/2020	CA	30	M	12/17/2020	12/17/2020	Fever; chills; body aches; headaches; malaise; chest pain in side-lying; cough; diminished appetite; This is a spontaneous report from a contactable healthcare professional. A 30-year-old male (also reported as female) patient received the first dose of BNT162B2 (Pfizer-BIONTECH Covid-19 Vaccine; Lot number: EH9899), intramuscular in the left arm on 17Dec2020 at 15:45 at a single dose for immunization. The patient had no relevant medical history. The patient did not have Covid prior to the vaccination and had no known allergies to medications, food, or other products. The patient's concomitant medications were not reported. It was reported that the patient had no other medications in two weeks and did not receive any other vaccines within four weeks prior to the COVID-19 vaccine. The patient experienced fever, chills, body aches, headaches, malaise, chest pain in side-lying, cough, and diminished appetite starting at 11pm (23:00) on 17Dec2020 and gradually decreasing mild symptoms still present on 22Dec2020. The patient received no treatment for the adverse events and was not tested for COVID-19 after the vaccination. The facility where the most recent COVID-19 vaccine was administered was at the hospital. The outcome of the events was recovering. The case was reported as non-serious (did not result in death, was not life-threatening, did not cause or require prolonged hospitalization, was not disabling/incapacitating, and did not result to any congenital anomaly/birth defect).

911795	12/29/2020		38	F	12/28/2020	12/28/2020	38 y.o. female who arrived by Clinic/physician office presented to the emergency department for Concern for possible allergic reaction. Patient was receiving the Covid vaccine today and while waiting during the observation. She felt some palpitations and was found to have some tachycardia. She was sent here for further evaluation. Currently she says she feels fine and denies any swelling, rashes, difficulty breathing or wheezing. She has not had any allergic reactions in the past and has never had any issues with shots or vaccinations before. She does not have any pain or swelling at the injection site. She was initially heart rate in the 120s but during exam is 100-105. She denies any shortness of breath, chest pain, lightheadedness and does not think she is feeling anxious at all. o ECG (My read): Sinus tachycardia, normal intervals, no ST elevations or depressions and no T wave inversions or signs of right heart strain o Patient did start to feel palpitations again, her heart rate periodically drops into the 90s and then jumps back up into the 1 teens. Considering this, did obtain basic labs all of which were completely normal. Her heart rate has improved, did order Zio patch for monitoring over the next 7 days and recommend she follow-up with her PCP for results on this. Otherwise appears well with no signs of allergic reactions or other emergent concerns. Discharged in stable condition with return precautions given
911770	12/29/2020	MO	57	F	12/18/2020	12/18/2020	Approximately 1 and 1/2 hours after the injection, her tongue became thick, lips swelled, chest pain, short of breath and headache. Injections site was red and swollen. She was traveling out of town and called an urgent care and was advised to take 50 mg of Benadryl q 4 hours till swelling was gone. She took it for 4 days. She saw here PCP on 12/21/2020.

911354	12/29/2020	HI	32	F	12/19/2020		<p>Dizzy; I felt really weak; Shortness of breath in getting up the stairs; The shortness of breath freaks me out, I think that's where the anxiety comes in; I think the midsternal chest pain was my anxiety but like a little bit; started feeling very like flu; Headache; Weakness; Fatigue; Muscle ache; I also have like really swollen lymph nodes, my lymph nodes feels like draining right now; The shortness of breath must have pain and issue for me; This is a spontaneous report from a contactable nurse (patient). A 32-years-old female patient received bnt162b2 (BNT162B2), via an unspecified route of administration on 19-DEC-2020 07:30 at single dose for covid-19 immunisation. The patient medical history was not reported. Concomitant medication included buspirone hydrochloride (BUSPAR), omeprazole (OMEPRAZOLE), lithium (LITHIUM), doxycycline (DOXYCYCLINE) for infection right now in her toe. The lithium cause 'sinus' reflux asthma. Nurse reported an adverse effect, was kind of confuse if it is related or not. She felt good for first 15 minutes and when she was about to leave. she was not afraid of shot. she felt dizzy and then she had to go upstairs and she felt really weak and Shortness of breath getting up the stairs, to get to her car. The shortness of breath freaks her out, she think that's where the anxiety comes in. she started driving home and she had bad shortness of breath. she think the midsternal chest pain was her anxiety but like a little bit. she am not sure. In '12' hours later she went to work she started feeling very like flu, she started flu like with headache, weakness, fatigue, muscle ache. she was working in ER and it is hard to work and then 20Dec2020 she was still feeling bad but little bit better than first day and shortness of breath that was still there like all day the day before. she also had like really swollen lymph nodes, her lymph nodes feels like draining right now. Nurse stated she was taking Omeprazole. That was wired because she have 'sinus' (Further not clarified, hence not captured in tab) reflux asthma, so the shortness of breath must have pain and issue for her but Omeprazole have stopped it, so before taking the vaccine she thought she was completely fine but then after taking the vaccine, it was like she have the issue again like it was controlled before the vaccine. Result of lab test: TSH was 8. So it was elevated but that was because of lithium and then she reduced the dose so it should be better now. So every</p>

911292	12/29/2020		33	F			hypoglycemia; dizziness; This is a spontaneous report from a non-contactable Other HCP. A 33-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) lot number HE9899, intramuscularly in the left arm on unspecified date at single dose for COVID-19 immunization. Patient medical history and concomitant medications were not reported. The patient previously took spironolactone and experienced drug allergy. During her 15-minute waiting period after the vaccination, the patient began to experience feelings of hypoglycemia. She checked her blood glucose with her own monitor and had 77 at 11:04. She chewed 1 glucose tab that she had in her purse. She noted some difficulty with swallowing it and notified clinic staff. The patient also experienced dizziness and was escorted by clinic staff to the emergency bay. This provider was notified of patient reaction and she was then assessed in the emergency bay area. She denied difficulty breathing and chest pain, history of adverse reactions with prior vaccinations or allergies to medications with the exception of spironolactone. Patient had already been given a bottle of water by clinic staff and reported that the glucose tablet went down easier following the water. She took a second glucose tab sometime before 11:13. The event was assessed as non-serious. Outcome of the events hypoglycemia and dizziness was unknown. No follow-up attempts are possible. No further information is expected.

912891	12/29/2020	CA	40	M	12/19/2020	12/22/2020	Received the COVID-19 vaccine 12/19/2020 and felt great the next few days with zero symptoms. About 3-4 days later I felt some chest discomfort especially when taking a deep breath in. This occurred on both the front side and back side of chest. This continued for the next 5-7 days. Kept experiencing pain with deep breaths and my exercise tolerance was diminished. When I would hike up a small incline I felt I was not getting enough air and was a bit winded. Finally made an e-visit with my healthcare provider on 12/28/2020 after 5-7 days of symptoms. Knowing I work in healthcare my provider asked if my pain felt like, "pleuritic chest pain" and I think that is a spot on description of how it felt. Based on my symptoms he told me the most likely diagnosis is a mild case of pericarditis and prescribed me ibuprofen 400 mg by mouth 3 times daily for a few days. After ~36 hours of ibuprofen I'm feeling 80-90% better but still have some discomfort with deep breaths or exertion.

913086	12/29/2020	WA	44	F	12/29/2020	12/29/2020	Patient noted sensation of "slightly swollen tongue" approximately 10-12 minutes after administration. Tongue not visibly swollen. Airway patent. Patient also noted a slight "tightness" to her chest. No acute distress noted. Patient denied any shortness of breath or difficulty swallowing. No drooling noted. Patient denied chest pain, noting some general "tightness" while pointing up and down both rib cages with her hands. Patient was speaking clearly and in full sentences. Skin warm and dry and color within normal limits. Patient stated that she has had this same sensation of tongue swelling and chest tightness after eating citrus fruit in the past. She stated that after eating citrus this sensation resolves within minutes of not eating the fruit. Advised that I was going to call EMS, but patient adamantly denied need. She stated that she was in no distress and would rather wait to see if sensation resolved. She verbalized understanding that if symptoms changed or worsened in any way EMS would be called. Patient monitored closely for additional 15 minutes, after which patient stated that she had to leave to meet one of her own patients. Patient stated that chest tightness and tongue swelling was greatly improving. No swelling of tongue, lips or throat noted. No acute distress noted. Patient was speaking clearly and in full sentences. Discussed after care instructions with patient noting to call 911 or go to ER if she had any further concerns after leaving. She verbalized understanding. Follow up call placed to patient 12/29 @ 1745. Spoke with patient regarding concerns. She stated that she felt complete resolution of symptoms after approximately 2 hours. She denied any current symptoms and verbalized understanding to call or go to ER if symptoms change or worsen.

912471	12/29/2020		40	F	12/23/2020	12/23/2020	Dizziness; Headache; chest pain; This is a spontaneous report from a non-contactable physician (patient). A 40-year-old female non-pregnant patient received BNT162B2 (Pfizer-BIONTECH Covid-19 Vaccine), intramuscularly on 23Dec2020 13:00 at a single dose in arm for COVID-19 immunization. Medical history included known allergies: roasted chestnuts. Concomitant medication included ascorbic acid, betacarotene, biotin, calcium carbonate, calcium phosphate, chlorine, colecalciferol, cupric oxide, ferrous fumarate, folic acid, iodine, magnesium oxide, manganese sulfate, molybdenum, nickel sulfate, nicotinamide, pantothenic acid, phosphorus, potassium chloride, pyridoxine hydrochloride, retinol acetate, riboflavin, selenium, silicon, thiamine, tin, tocopherol, vanadium, vitamin b12 nos, zinc oxide (MULTIVITAMINS & MINERALS PLUS LUTEIN) within two weeks of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced dizziness, headache, chest pain, all on 23Dec2020 21:30. No treatment received for the event. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. The outcome of events was recovering. This is a non-serious report. No follow-up attempts are possible; information about lot/batch number cannot be obtained.
912539	12/29/2020		37	M	12/18/2020	12/18/2020	Lightheadedness an dyspnea after receiving COVID 19 vaccine. Patient states that 5 minutes after receiving the vaccine, he felt "out of it." He felt like he was "in a dream." He reported feeling palpitations, shortness of breath, and chest pain. He denies feeling overly anxious. He states that the chest pain is substernal with no radiation. He reports it is pleuritic in nature. He states it is currently a 4/10, feels like a pressure on this chest; He received 50mg Benadryl and 0.3mg epi x2 by EMS and was brought to the ED for further evaluation. Admitted from ED for observation on 12/18/2020 and discharged on 12/20/2020.

910315	12/28/2020	CA		F	12/18/2020	12/18/2020	Anaphylactic Reaction; felt like something was in throat; felt tingling on both hands and fingers; voice started to change; face turning red to white to purple; everything in mouth as tongue felt like it was growing; having chest pain radiating to left scalpel, and jaw; couldn't think of the words to say as it was hard to breath; chills; heart rate is racing; This is a spontaneous report from a non-contactable nurse via internet source via Pfizer Sales Representative. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number: EH9899) via an unspecified route of administration on 18Dec2020 at single dose for covid-19 immunization. Medical history included had a lot of food allergies. The patient's concomitant medications were not reported. The nurse told that her manager (patient) had an anaphylactic reaction shortly after receiving Pfizer's COVID-19 BNT162b2 vaccine on 18Dec20. Patient stated via Social Media indicated that she received the Covid-19 vaccine right after work. Easy breezy didn't feel a thing. She was asked to wait for 15 minutes, 5-10 minutes of waiting, she felt like something was in throat, so she kept clearing it. Patient felt tingling on both hands and fingers. Her voice started to change. She informed the ER team there, the ER nurse described her face turning red to white to purple. ER nurse started an IV right on patient's right AC, gave her a shot of Benadryl, steroids and the epi pen right through pants. Patient felt everything in mouth as tongue felt like it was growing, but she can breath. Patient was route to the ED via wheelchair, everything started to look hazy, she was having chest pain radiating to left scalpel, and jaw. Patient couldn't think of the words to say as it was hard to breath. When got to the ED they gave her another dose of Benadryl, solumedrol, decadeon, HHN tx with epi and that worked. Patient felt her throat opening up and started talking but then came the chills. It took almost 3 hours to clear the symptoms, even though her heart rate is racing (prob due to the meds), she opted to go home. The outcome of "heart racing" was not recovered, of other events were recovered on 18Dec2020. No follow-up attempts are possible. No further information is expected.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of anaphylactic reactions with tongue swelling/voice alteration/hard breath/tingling/something in

910057	12/28/2020	CO	29	F	12/23/2020	12/23/2020	About 8 hours post vaccine, at 2300 as I was going to bed I felt what I would describe as breathing resistance. I would not describe it as chest pain/pressure/tightness or SOB. It was just upper chest resistance to inhalation when lying down for bed. 12/24 started with intermittent gnawing epigastric during the day. Persisted through the night with gnawing epigastric pain radiating through to my spine, i was unable to sleep due to the pain. Attempted tums (I do not have GERD), motrin & tylenol however, nothing was helpful. 12/25 & 12/26 same symptoms persisted both day and night 12/27 asymptomatic 12/28 cramping/twisting epigastric pain returned, much more mild
911552	12/28/2020	CA	35	M	12/20/2020	12/22/2020	Started with lower back pain in the morning when I woke up. Then my back and hamstring muscles tighten up. All that went away as the day went on. Just a lingering discomfort remained. That night I was awoken by 10/10 dull pain in both my hips. I don?t have arthritis, but I imagine that is what the pain must feel like. That eventually subsided over the course of the night and then the following morning I woke up with a stronger lower back pain and major stiffness in my hamstrings, but the hip pain was gone. Throughout the day the pain would come and go and move up and down my back and along my spine. It was the strongest on the night of the 22 and has since gotten weaker and the tightens in my back and hamstrings has since left. Now I just get random aches throughout my back that come and go during the day. Yesterday, the 27th, I was hiking down a hill and the impact from that caused instant discomfort in my spine, it felt like it was compressing like an accordion. Never had this happen before. After that my back was sore for hours. Today, the 28th, I tried jogging and the spinal discomfort was instantly there. Went about thirty yards before I stopped and my back has been aching down my spine for hours. Also been experiencing a couple mild headaches through the day since the 22nd. This also has fired up the endothelial dysfunction in my heart which causes some strong chest pain throughout the day. I?ve gone back in my heart medication, so hopefully that will fix that issue. I will be contacting my cardiologist in regards to this and seeing if the vaccine can affect that.

910710	12/28/2020	PA	44	F	12/26/2020	12/26/2020	approximately 3 hours after injection subject developed rapid irregular heart rate consistent with recurrence of her atrial fibrillation which she had not had for at least one year prior. Also noted chest pain and weakness. Took an extra dose of atenolol with some improvement. Symptoms completely resolved overnight without any recurrence since.
910216	12/28/2020		21	F	12/22/2020	12/22/2020	21 y.o. female normally healthy who arrived by to the emergency department for Post COVID-19 vaccination reaction. Patient states approximate 5 minutes after the vaccine, she started to feel lightheaded and nauseated. She does notice the sensation of throat irritation, but denies any shortness of breath or difficulty breathing. Denies any tongue/lip/airway swelling, abdominal pain, new rash/pruritus, diarrhea, emesis, fever/chills, chest pain. She has no history of anaphylaxis or use of EpiPen. No significant allergic reactions in the past Initial reevaluation approximately 30 minutes after arrival, patient status unchanged. She still felt lightheaded and nauseated with a sore throat. No new rashes, shortness of breath, difficulty breathing. Her voice was normal, and did not report any new GI symptoms. Heart rate was 109 with one half fluids given thus far. On reevaluation 2 and 3 hours after arrival, patient's heart rate normalized into the 60s-70s, she was asymptomatic. She was slightly fatigued from the Benadryl. She felt safe to go home. Follow-up call a few days later and patient was doing fine with no symptoms.
910976	12/28/2020	SD	61	F	12/17/2020	12/17/2020	She began to experience body wide tingling, headache and nausea. She did not have lightheadedness, chest pain, shortness of breath, pain at the injection site, rash or wheezing. She went to urgent care in the facility to be evaluated. Patient was placed on a monitor and observed. Vital signs remained stable. She never developed rash. For her nausea she was given Zofran 4 mg as a disintegrating tablet which was helpful. She received 650 mg of Tylenol for her headache pain. Observation continued during which time she was entirely stable. She requested to go home.

910690	12/28/2020	HI	58	M	12/23/2020	12/23/2020	Reported "funny taste in throat." Stated it was "metallic" and occurred five minutes after injection. No unusual foods in the morning prior to vaccination. No food allergies. Upon assessment by onsite MD, patient had mild heaviness in eye and frontal head area that began 15 minutes post-administration of vaccine. Had "wooziness/lightheadedness" 15 min after injection as well that resolved. Chest heaviness in left area that lasted 2 minutes, resolved. Reported some anxiety/nervousness. No history of cardiopulmonary disease. Negative EKG and stress test in 2006 that was conducted due to chest pain after walking. No history of GERD. Denied other signs and symptoms.
910705	12/28/2020	MS	46	M	12/22/2020	12/22/2020	Started having chest pain and shortness of breath approx. 10 hours after injection. Symptoms kept worsening. Taken to the ER. Cardiac workup performed. It was negative. Diagnosed with Pleurisy.
910996	12/28/2020	CA	64	F	12/24/2020	12/24/2020	Patient reports taking Pfizer Covid vaccine and 2 hours after that she reports feeling not well. She recorded that one of the side effects was heart arrhythmias and hence she had her coworker checked her rhythm and she reported that her heart rate was in 180s and hence she was brought to the emergency department for further evaluation. She reports at the time she had palpitations and felt mild lightheadedness and dizziness. She was found to be in SVT with heart rate in the range of 1 80-220 and she received 1 dose of 6 mg Adenoscan after which she converted to normal sinus rhythm. At the time of my evaluation she is in normal sinus rhythm with heart rate in the range of 90-100. She denies any further palpitations. She reports she had chest tightness for the last 3 days which was assumed to be secondary to asthma and for which she was prescribed prednisone. Currently with the prednisone she does not feel any further chest tightness. She denies any chest pain shortness of breath, fever or chills. She reports remote history of arrhythmia following her foot surgery in the past however does not recall what arrhythmia she had at that time.

910721	12/28/2020	UT	34	F	12/18/2020	12/18/2020	After receiving the vaccine I was immediately nauseated. I went back to my desk to work and was dizzy and felt like I would vomit. This went away after an hour or so. My arm felt totally normal right after the vaccine, but later in the evening it worsened and I had a dead arm for about 24 hours. The next morning when I awoke I felt there was an elephant sitting on my chest. I couldn't catch my breath or take in a deep breath. I tried to walk down the stairs to get my inhaler, but was so dizzy I had to hang on to the railing in order not to fall. When I got to my medication cabinet I had difficulty opening the cupboard. I took my inhaler and the chest pain seemed to ease up as the day progressed. I had such terrible body aches that I tried to open a bottle of Ibuprofen and had extreme difficulty with my fingers. Throughout the day my fingers were cramped up and I was unable to hold on to anything, even the steering wheel of my car to drive. My hands were so sore that I tried massaging them but nothing helped. I took ibuprofen and Tylenol every 4 hours to help and after about 48 hours the intense burning, aching, and cramping somewhat subsided. Over a week later, I am still struggling to use my cell phone and text messaging. My fingers are not working right so I am hoping that will go away. In addition, I have been achy with chills since the morning after getting the vaccine. I can not seem to warm up. I have tried warm baths and sleeping with hot pads, but I have terrible chills and aches. My joints and muscle hurt all over my body to the point that now I have made an appointment with a doctor to see if the vaccine caused some kind of autoimmune reaction. My fingers, hips, and knees are the areas that hurt the worst still. I am a marathon runner and was currently training and doing well. After the vaccine, my joints and muscles have been so painful that I haven't been able to maintain what I was currently doing with running. I have ended up icing or heating different parts of my body daily and gone through a lot of ibuprofen, naproxen, and Tylenol trying to find relief. My entire body is covered in medicine as that seems to help a little. I am unable to sit for more than a few minutes without pain.

909591	12/27/2020	CA	30	F	12/25/2020	12/25/2020	Covid vaccine received, was instructed to go to ?observation area? for 15 minutes. While walking, started to feel faint, sat down and started to feel okay. After 5 minutes, I started to feel faint again and felt my heart rate go up. My Apple Watch showed my heart rate at 144. I asked staff to check my vitals and I was instructed to go to the nurse area. Vitals showed heart rate of 140s-150 (Apple Watch registered my highest heart rate during that period was 160). Blood pressure about 135/90 (my normal is 115/80), SPO2 of 99%. After 5 minutes, heart rate down to 90, BP 120s/90s. Every 5-10 minutes I would feel faint, a sense of ?impending doom,? mild nausea, and my heart rate would go up to 140s, it would last about 2 minutes then go down to 90s. This cycle of heart rate going up and down kept repeating for 30 minutes. No chest pain, no shortness of breath. Prior to going home, heart rate was 90, blood pressure was 125/98. Total time being observed was 40 minutes from time of vaccine to leaving observation.
909632	12/27/2020	HI	44	F	12/26/2020	12/26/2020	approximately 1.5 hrs after my vaccine I started to feel lightheaded and flushed all over my body. My heart rate was 120's and my temperature was 100.2F. No difficulty breathing, SOB, chest pain or rash. I was checked into the clinic and monitored in the Nurse Treatment Center. I was placed on a bedside cardiac monitor, an EKG was done, labs drawn and IV fluids administered. I was there for approx 1 hr and discharged to home. Temp was 99.1 HR 100's.
909673	12/27/2020	TX	42	F	12/26/2020	12/27/2020	Fever on/off up to 101. Tylenol makes temp go down to 98-99. Chills, sharp pain in face, chest pain, muscle pain, joint pain, hx of covid in June, aching, headache, chest feels hot, HR up to 140
909691	12/27/2020	FL	20	F	12/26/2020	12/26/2020	Shortness of breath, chest pain, itching, near syncope, blood pressure spike

909770	12/27/2020	CA	43	M	12/22/2020	12/22/2020	Chills, shivering, migraine , body aches, painful tinnitus, fever, elevated resting HR of 90 (normal is 46), bounding heart beat, tightness in chest, elevated resting BP 150/80 (normal 124/72) 600mg ibuprofen & 500mg acetametaphine made me comfortable to get about an hour and half worth of sleep. Went to ED for elevated HR, BP and chest pain. ED took EKG and monitored vitals. ED discharged with 975mg acetametaphine and 800mg ibuprofen with 24hrs quarters. I was able to get about 3 hours of sleep.
909775	12/27/2020	WA	45	F	12/27/2020	12/27/2020	Received the vaccine at 1038a. 1045 developed minor tongue tingling. Called the RN she gave me 25mg Benadryl. By this time whole tongue became tingly and the roof of my mouth started to feel numb. A minute later throat started to feel full and it became hard to swallow. This feeling of it being hard to swallow, came with a painful headache and some chest pain. Once in ER, was given more Benadryl, Epi, Lorazepam, and Protnox. The feeling in my throat and the difficulty swallowing slightly improved 25min after the oral Benadryl. It took about a little over an hour from the onset of symptoms to start to feel they were resolving.
909163	12/25/2020	CO	22	F	12/18/2020	12/19/2020	Pfizer-BioNTech COVID-19 Vaccine EUA: Patient reports fever, body aches, chills, headache, and chest pain one day after receiving the vaccination. Patient had COVID before (November2020) and reports "this felt very similar to one of my worst days with symptoms". Patient reports only persistent symptom was feeling more tired than usual. On 12/22/2020, patient noticed a rash on back and under arms.
909143	12/25/2020	NV	48	F	12/17/2020	12/17/2020	Patient presented to ED states was sleeping when awoke with feeling of rapid heart. Has pulse oximeter at home and states HR was 150s felts sharp chest pain and sweat. Had husband bring her to Emergency room. Emergency room physician states patient is mildly anxious and mildly diaphoretic. Blood pressure 155/83 and pulse rate in 120 upon arrival. Patient was given Ativan 1 mg IV and 1 liter of normal saline HR in 90s upon discharge form ed. Admitted at 2134 discharged at 2353

909111	12/25/2020	OH	28	F	12/23/2020	12/24/2020	The evening of the 24th, I felt lightheaded, sore, and extremely fatigued. Waking up on the 25th, I had diarrhea, vomiting, headache, coarse cough, asthma exacerbation, chest pain. Chest pain subsided but other symptoms remained. Around 11am, I developed cervical neck pain in the back of neck, and lower pack pain. I started to experience loss of vision upon standing, tachycardia, tactile fevers, chills, and loss of appetite with extreme fatigue.
909107	12/25/2020	OH	45	F	12/24/2020	12/24/2020	Client began feeling flushed approximately 10-15 minutes following vaccination with COVID-19 vaccine. Client stated her "chest had a heavy feeling" and she was experiencing heart palpitations (which she also reports are normal for her). She was concerned as the heart palpitations were occurring along with chest pain. EMS on scene at clinic site (precaution) and escorted client to area where EKG was completed. Normal sinus rhythm was noted along with possible infarct age undetermined (as reported on strip)and client was asked if she would like to go to ER for additional evaluation which she refused. (Client signed refusal of medical treatment, transport and/ or evaluation form). Client was advised by EMS and health district staff to seek medical treatment or call 911 if symptoms persist or become worse. Client voiced understanding.
908599	12/24/2020	LA	52	F	12/18/2020	12/18/2020	diarrhea, shortness of breath, chest pain, headache
908592	12/24/2020	NM	47	F	12/23/2020	12/23/2020	The COVID vaccine was given at 2046. At approx. 2050 patient complained of tingling to her left leg and a headache. Her vitals were obtained at 2050. They are as follows; B/P 146/86, HR 111, Spo2 98 on RA. She denied any SOB, chest pain or discomfort, no difficulty swallowing. She was able to ambulate to the wheelchair without any issues. I called house supervisor at 2049. He came up to asses her and she was transported to the ED by 2 MA's and a nurse. She was transported via wheelchair on the monitor. She did not require supplemental O2

908263	12/24/2020	CT	45	F	12/18/2020	12/18/2020	started to feel a warmth in her chest and abdomen; She felt like her heart was racing; Developed chest pain; This is a spontaneous report from a contactable other HCP (healthcare professional). A 45-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot #: EJ1685), intramuscularly in the left arm on 18Dec2020 at 15:30 (at the age of 45-years-old) as a single dose for COVID-19 vaccination. Medical history included known allergies to apple, cantaloupe, peach, avocado and IV contrast dye; all from unspecified dates. The patient was not pregnant at the time of vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medications included ongoing famotidine and salbutamol (ALBUTEROL HFA) as needed (PRN); both for unknown indications from unknown dates. The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient previously received hydromorphone (DILAUDID) and triamcinolone acetonide (KENALOG); both from unknown dates to unknown dates for unknown indications and experienced allergy. The patient also previously received diphtheria vaccine toxoid/pertussis vaccine acellular/tetanus vaccine toxoid (TdaP) vaccine on an unknown date for immunization and experienced allergy. On 18Dec2020 at 15:45, the patient started to feel a warmth in her chest and abdomen, she felt like her heart was racing, and developed chest pain. It was reported that "patient started to feel a warmth in her chest and abdomen. She felt like her heart was racing. Developed chest pain. No shortness of breath or difficulty swallowing". It was unknown whether the patient received any treatment for the events. It was reported that the adverse events resulted in emergency room/department or urgent care visit. It was also reported that the events were non-serious and did not cause or prolong hospitalization. The clinical outcomes of the events started to feel a warmth in her chest and abdomen, she felt like her heart was racing and developed chest pain were all unknown. It was unknown whether the patient had been tested for COVID-19 since the vaccination.

908908	12/24/2020	WA	59	F	12/23/2020	12/23/2020	Was scheduled for 3:10 yesterday and received it at 3:25 ish. Did fine at first ? a little flushing/burning around neck and chest about 35 minutes after but then around 10:00 pm I had a full on inflammatory response throughout the entire body. Thankfully it was evening/bedtime but it was an awful night with significant pain everywhere with any kind of movement. Mild headache that has been intermittent. I wouldn't call it true chest pain but did have intermittent, weird stabbing pains in chest at times. I dosed up on gallons of water and Tylenol and certainly felt better by around 7:00 a.m. but if that was my response to round one I am hesitant to go back for seconds.
908883	12/24/2020	TX	29	F	12/23/2020	12/23/2020	EE states that she started feeling dizzy and fatigued but it quickly resolved. Today, 12/24/2020 at 1:20pm EE states that she was driving and started having chest pains, sternum area, pain 3 out 10, the pain comes and goes, it happens when she is moving and resting, when asked about other symptoms, EE states that the chest pain is her only symptom at this time, tested negative for Covid, no travel history. I advised the EE to go to the ER immediately for further evaluation. The EE stated that she prefers to go the Urgent Care.

907373	12/23/2020	GA	41	M	12/17/2020	12/17/2020	Employee felt totally fine before getting the COVID vaccine but then within 5-10 minutes of getting the vaccine while sitting, he felt extremely lightheaded, warm, flushed, and diaphoretic. He did not have a true syncopal event but felt near syncopal. He was rushed to the emergency department. He states that he felt immediately better after he was laid supine. He does not have any known medical problems he does not have a primary care physician. He denies any chest pain or shortness of breath, denies any neurologic deficits, no fevers chills or sweats. He has no history of allergies to any vaccines, he does have a documented history to fire ants.
907381	12/23/2020	TN	35	F	12/22/2020	12/22/2020	Received vaccine aprox 0745 am 12/22/2020, aprox 09:00pm 12/22/2020 while at work onset tachycardia at rest 140's-150s, , chills, flushing, and light headiness. Employee continued to work through her 12 hr shift, she advised tachycardia persisted throughout the night 140s. She reported taking Tylenol at 3am, and chills resolved. She reported to Employee Health at 0730am 12/23/2020, vitals HR 142, BP 103/72 (she advised that was her normal BP), resp 14, Temp 97.2. She denies chest pain, shortness of breath, weakness, headache, cold symptoms, n/v/d. Advised the chills, flushing and light headiness had resolved, but the tachycardia continues. Employee denies any medical history, takes no daily meds, reports recovered from COVID early November. Discussed with Employee the need to seek higher level of care, she was escorted to the ED.

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
907426	12/23/2020	NM	48	F	12/22/2020	12/22/2020	48 y.o female with history of atrial tachycardia who presents to the ED via EMS for a possible adverse reaction to Covid vaccine. Patient received her Covid vaccine around 1600 today, and soon became diaphoretic, shaky, and lightheaded. She had presented to the emergency department. Currently she denies any chest pain, difficulty breathing, throat swelling, tongue swelling, or any other symptoms currently except for palpitations. Allergic Reaction The primary symptoms are shortness of breath. The primary symptoms do not include cough, abdominal pain, vomiting, dizziness or rash. The current episode started 1 to 2 hours ago. The problem has not changed since onset. The onset of the reaction was associated with a new medication. Significant symptoms also include flushing. 48-year-old female with a history of atrial septal defect, status post atrial septal defect repair in 1980. She works as a nurse at Hospital and has been experiencing increasing rapid palpitations associated with chest pain, and hypertension. With her episodes, she experiences marked lightheadedness, dyspnea, and feeling marked anxiety, as well as chest tightness. She received the COVID-19 vaccine today and while waiting in the observation room, she started feeling unwell, with rapid palpitations, associated with lightheadedness and dyspnea. She last had a sustained episode 2 - 3 weeks ago and had presented to ER and Hospital. No syncope. No orthopnea, PND or increased lower extremity swelling. Active Hospital Problems Diagnosis ? Atrial paroxysmal tachycardia ? History of repair of atrial septal defect 1. Paroxysmal atrial tachycardia in setting of prior atrial septal defect repair - she is having breakthrough episodes through flecainide/digoxin - it is likely her atrial tachycardia is related to her ASD patch. Will hold flecainide/digoxin for now, and try to schedule an ablation during her hospital admission due to highly symptomatic episodes resulting in multiple ER visits. 2. Acute renal insufficiency - most likely pre-renal - iv fluids started. 3. Possible COVID-19 vaccine reaction - she probably had an incidental atrial tachycardia episode post vaccine administration, rather than an actual adverse reaction. Continue to monitor.

Orthopedics Cosigned by: MD at 12/22/2020 9:48 AM Patient: Date: 12/21/2020</p> <p>Subjective Patient is a 34 y.o. female who was seen at COVID Vaccine Clinic today for her first dose of the COVID 19 vaccination. She was given the Pfizer vaccination in the right deltoid muscle. During her 15 minute waiting period after the injection, the patient began to experience generalized feelings of "not feeling quite right" as well as anxiety/nervousness, nausea and chills. She denied difficulty breathing, throat tightness, dizziness, chest pain, or other GI complaints. This provider noticed her raising her hand from across the waiting area and tended to her where she noted the above complaints. she was then assessed in the emergency bay area. She was monitored for severe reaction symptoms, including rapid progression of symptoms, vomiting, hypotension, chest pain, collapse and Respiratory distress. Past medical history includes anxiety for which she takes Effexor on a daily basis as well as type 2 diabetes, diagnosed approximately seven or 8 years ago during a pregnancy. She is on oral medication during the day and insulin at nighttime. She did take her oral medication today and last ate a pasta lunch right before arriving to the vaccine clinic. Last A1c was 6.5. Patient states that she generally runs a postprandial blood glucose following a heavy meal of about 180. She reported a previous history of anxiety and nervousness following vaccinations in the past. Most recently, she experienced a 30-minute period of anxiety and nervousness following her flu vaccine this past October. These feelings passed without further incidents. Review of Systems Constitutional: Positive for chills. HENT: Negative for drooling, facial swelling, hearing loss, rhinorrhea, sneezing and trouble swallowing. Eyes: Negative for redness and visual disturbance. Respiratory: Negative for cough, chest tightness and shortness of breath. Cardiovascular: Negative for chest pain. Gastrointestinal: Positive for nausea. Negative for vomiting. Skin: Negative for color change, pallor and rash. Neurological: Negative for dizziness, speech difficulty and light-headedness. Psychiatric/Behavioral: Negative for agitation and confusion. The patient is nervous/anxious.</p>

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

Objective She ambulates into the emergency treatment bay under her own power and without difficulty. She is seated on the gurney, and continues to answer questions appropriately. Physical Exam Constitutional: General: She is not in acute distress. Appearance: Normal appearance. She is not toxic-appearing or diaphoretic. HENT: Head: Normocephalic and atraumatic. Nose: No rhinorrhea. Cardiovascular: Rate and Rhythm: Regular rhythm. Tachycardia present. Pulmonary: Effort: Pulmonary effort is normal. No respiratory distress. Skin: General: Skin is warm and dry. Coloration: Skin is not pale. Findings: No rash. Neurological: Mental Status: She is alert. Gait: Gait normal. Psychiatric: Mood and Affect: Mood normal. Behavior: Behavior normal.

Assessment/Plan Stress reaction secondary to vaccine administration and history of anxiety and nervousness following vaccinations. Vital signs obtained at 1352 with blood pressure at 154/95, mild tachycardia at 109 and 97% O2 saturation on room air. Patient denies any chest pain, shortness of breath time. She is given a bottle of water and assisted to lie down with the head of the bed slightly elevated. She continues conversating appropriately without any acute distress. Vitals reassessed at 1359 with blood pressure of 133/76, heart rate 97% on room air. Dr. at the bedside now. Suggested obtaining a blood glucose. Blood glucose obtained at 1405, elevated at 234. She continues to deny any chest pain, shortness of breath, chest tightness, swelling in the throat, nausea/vomiting or other GI complaints. Vital signs checked again at 1406 with blood pressure 133/77, heart rate 107 and 97% on room air. Vital signs last checked at 1415 to reveal a blood glucose of 219, blood pressure 127/82, heart rate 100 and O2 saturation of 97% on room air. Patient has no additional complaints at this time and reports feeling well. Her mother has driven her to the clinic today. She felt that she was able to safely walk out with any issues. She was assisted by nursing staff and ambulated out of the treatment bay independently. Treatment included routine surveillance of vital signs at about a 5-minute intervals following notification of her feeling poorly. Vital signs continued to normalize and remained stable through the duration of her 30 minutes following her vaccination. Follow up response to treatment: excellent.

906668	12/22/2020	AZ	29	F	12/17/2020	12/1/2020	pretty strong chest pain; heart pain; some kind of back pain, behind her heart; This is a spontaneous report from contactable consumer (reporting for her daughter). A 29-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 17Dec2020 at 10:00 AM at a single dose for COVID-19 immunization. The patient's medical history were not reported. Concomitant medications included unspecified bipolar medications. The patient experienced pretty strong chest pain on 18Dec2020 at 07:00 and heart pain and some kind of back pain, behind her heart in Dec2020. The pretty strong chest pain lasted about 10 minutes and then went away. The outcome of pretty strong chest pain was recovered on 18Dec2020 and of some kind of back pain, behind her heart and heart pain was unknown. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.
907052	12/22/2020	UT	41	M	12/22/2020	12/22/2020	Pt with dizziness and chest pain that started about 10 minutes after getting the Moderna Covid19 vaccine. No shortness of breath, no rash, no fever, no swelling, no weakness. Feels pain in center of chest and on L side. Pt also has been having stress with work. Pain started in the R side of the chest and migrated to the L side. It improved with Nitro and Aspirin but pt states he still feels, "fussy." He has no symptoms of allergic reaction or anaphylaxis. Pt has no known hx of cardiac dz, nonmoker, nondrinker. His Mom has a cardiac murmur but no other known history of heart disease.

Subjective Patient is a 33 y.o. female who was seen at COVID Vaccine Clinic today for her first dose of the COVID 19 vaccination. She denied any history of previous adverse reactions to vaccines. She was given the Pfizer vaccination in the left deltoid muscle. During her 15 minute waiting period after the injection, the patient began to experience feelings of hypoglycemia. She checked her blood glucose with her own monitor and had 77 at 1104. She chewed 1 glucose tab that she had in her purse. She noted some difficulty with swallowing it and notified clinic staff. Associated dizziness and was escorted by clinic staff to the emergency bay. This provider was notified of patient reaction and she was then assessed in the emergency bay area. She denied difficulty breathing and chest pain, history of adverse reactions with prior vaccinations or allergies to medications with the exception of spironolactone. Patient had already been given a bottle of water by clinic staff and reported that the glucose tablet went down easier following the water. She took a second glucose tab sometime before 1113. She rechecked her sugar and had slight increase of 79. She did eat breakfast this morning about 0800 and had a protein bar right before her arrival today. Monitored patient for severe reaction symptoms, including rapid progression of symptoms, respiratory distress with dyspnea and increased work of breathing, vomiting, abdominal pain, hypotension and chest pain. Review of Systems HENT: Positive for trouble swallowing. Negative for facial swelling, hearing loss, rhinorrhea and voice change. Eyes: Negative for redness. Respiratory: Negative for cough, chest tightness and shortness of breath. Cardiovascular: Negative for chest pain. Skin: Negative for color change, pallor and rash. Neurological: Positive for dizziness. Negative for syncope and speech difficulty. Psychiatric/Behavioral: Negative for agitation and confusion. The patient is not nervous/anxious. Objective Vitals There were no vitals filed for this visit. Physical Exam Constitutional: General: She is not in acute distress. HENT: Head: Normocephalic and atraumatic. Nose: No rhinorrhea. Cardiovascular: Rate and Rhythm: Normal rate and regular rhythm. Pulmonary: Effort: Pulmonary effort is normal. No

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

respiratory distress. Skin: General: Skin is warm and dry. Coloration: Skin is not pale. Findings: No rash. Neurological: Motor: No weakness. Psychiatric: Mood and Affect: Mood normal. Behavior: Behavior normal. Assessment/Plan Patient is a 33-year-old female who has a 15-year history of type 2 diabetes, and experienced a hypoglycemic event without complaint of chest pain or shortness of breath. Vital signs obtained at 1105 with blood pressure within normal limits at 132/88, heart rate 83 and 98% O2 saturation on room air. Patient continued to compensate appropriately and reported feeling slightly better. Glucose checks repeated by patient at 1117 was 84, vital signs were blood pressure 116/80, heart rate 89, O2 saturation of 98% on room air. She continues to deny chest pain, shortness of breath or difficulty swallowing at this time. At 1117 a 10 mg cetirizine was administered by mouth. Patient was able to swallow this with a small sip of water without any difficulty. 1121, patient continues to deny chest pain or shortness of breath. She continues to be compensating appropriately and sitting at the edge of the bed. She states that she is feeling better. Vital signs obtained at 1123 with blood glucose per the patient's own meter, continuing to elevate at 103, blood pressure within normal limits at 116/91, heart rate at 85 and 100% O2 saturation on room air. At 1126, the patient continues to feel better. She is provided a granola bar to eat. She does note feeling sleepy though attributes this to this being the first day she has had off after working 4 days last week. She notes that she has been sleepy even prior to her arrival at the vaccine clinic today. She is able to eat the granola bar and continues conversing appropriately without difficulty. She continues taking small sips of water without issues. Continues to deny chest pain or shortness of breath. Blood sugar is rechecked at 1138 and continues to elevate to 116. She reports that her meter says her sugar is "stable." Final set of vital signs obtained at 1138 revealed blood glucose within normal limits at 116, blood pressure of 119/84, heart rate 83 and 100% O2 sats on room air. Patient denied complaints of chest pain, shortness of air, nausea, dizziness or blurred vision at this time. She felt much improved and we discussed her leaving the clinic and heading home to have lunch. She had no further complaints. She was able to rise to standing on her own

905592	12/21/2020	MI	41	F	12/16/2020	12/16/2020	Started with slight headache and sore arm, felt tired and diarrhea about 5 hours past vaccination - 3 bowel movements within 1 hour. That night around 1:30AM (next morning) I felt a little itchy all over with a throat irritation and I took some Benadryl. Just itchiness and sore throat, no fever. Had pretty bad fatigue on the 17th and had nasal congestion, cough, chills, sneezing. I worked on the 17th but felt terrible throughout the day. Got home and I could not eat anything , could not hold anything on my stomach. On the 18th at night woke up with sweats, no fever, dry cough, nausea. Chest discomfort (minor chest pain - was sure was not cardiac, could be acid reflux). Woke up with nausea and irritation and intermittently felt fatigued and would feel better, throughout the day. Also felt back pains on the 18. That same evening I felt a little better and then on the 19th I had some shortness of breath. I then decided to go to the UC on Saturday the 19th and got a COVID test. Sore throat was gone but still feel back pain and nausea. Around 11PM on the 19th I got itchy again in my arms and chest. Also got chest pains and took a Pepcid and Benadryl. On the 20th I am feeling a little better, still have a cough and some stomach upset and headache (in the AM). About 1:30PM diarrhea came back again. Had it 2X and low back pain and abdominal pain and also chills. There was a time I could not take care of my kids I just had to stay in bed (19 and 20th - I spent in bed most of the day). My heart rate has been good. The evening of the 20th I felt a little bit better and able to eat a little bit easier. This morning felling a little better. Had diarrhea this morning and a headache that I can't get rid of. Took Tylenol but it has not helped. Also low back pain.

904101	12/19/2020	CA	35	M	12/18/2020	12/18/2020	Within minutes of getting the vaccine I experienced warm facial flushing followed by shortness of breath and palpitations. Symptoms lasted less than 5 minutes. No chest pain. Some mild dizziness during event. I was able to breathe through the event and I still drove myself home 30 minutes after receiving vaccine. I took 1000mg Tylenol before bed and went to work later that day. I admit I initially thought I was just having some anxiety but I have never had any history of anxiety or adverse reactions to vaccines.
904195	12/19/2020	SC	63	F	12/16/2020	12/16/2020	Headache, dizziness, nausea, chills, chest pain, fatigue, injection site pain. Started about 2 hours after injection. Took Tylenol. Symptoms resolved within 36 hours
904263	12/19/2020	CA	52	F	12/18/2020	12/18/2020	Within 5-10 minutes after vaccine given, patient started feeling tingling of the hands and fingers. Shortly after, she felt the need to clear her throat because she felt like there was a furball in her throat. She drank some water, which didn't help. She then started feeling hot and became flush. She then felt her inner ear and tongue swelling. Shortly later, she felt chest pain and felt like she couldn't breathe. She was given IV Benadryl 50mg, IV dexamethasone 4mg, and IV Pepcid 20mg without symptom resolution. Epipen was administered by vaccine clinic staff, and the patient felt a little better. Her shortness of breath continued and her chest felt heavy as she was transported to the ED. She also complained of blurred vision, which could have been due to Epipen administration. In the ED, the patient still felt that her throat was tightening up. She was given IV Pepcid 20mg, IV Benadryl 25mg, IV SoluMedrol 125mg, racepinephrine & albuterol nebulizer. By 2150, she felt better. By 2257, she did not have any more tingling in hands or weakness and she stated she felt she was back to normal. Patient discharged home in stable condition at 2336.

903357	12/18/2020	FL	50	F	12/17/2020	12/17/2020	Chest pain and tightness, generalized with stabbing pain intermittently elevated blood pressure 180/95
903413	12/18/2020	MS	30	F	12/16/2020	12/16/2020	On 12/16/2020, approximately two hours after administration of Pfizer BioNTech Covid-19 vaccine, patient developed SOB and chest pain. Patient reported to ED where she was given fluids, diphenhydramine, ipratropium/albuterol nebulizer treatment, magnesium, famotidine, and epinephrine. Of note, patient has anaphylactic reaction to corticosteroids. On 12/17/2020, around 3:00 pm the patient reports to the ED at a different facility (one closer to her home) with difficulty breathing and sensation of her airway closing. Patient again was given epinephrine, fluids, ipratropium/albuterol nebulizer, diphenhydramine, famotidine, and was also given a dose of lorazepam. The patient now has stated that she had an anaphylactic reaction to a prior flu vaccine, however this was not listed as an allergy prior to administration of the Pfizer BioNTech Covid-19 Vaccine.
903532	12/18/2020	TX	35	F	12/16/2020	12/17/2020	on 12/16 i was given the vaccine at noon and finished my day as usual, I had a beer before bed and fell asleep at 9pm, at about 1am on 12/17/2020 I woke up with severe chest pain like something was crushing me, like a car being crush it felt like. I went to the ER at 3am and I was told I had a severe reaction to the vaccine. I had a weird taste in my mouth, cough, watery eyes, pain in all limbs, jaw pain and neck pain. I am going to get tested today 12/18/2020 for covid
903537	12/18/2020	NM	41	F	12/18/2020	12/18/2020	Metallic taste, chest pain, coughing or throat clearing, bilateral arm numbness
903605	12/18/2020	NY	23	F	12/18/2020	12/18/2020	Headache and increased HR followed by dizziness (room spinning), and throat tightening. Evaluation in vaccination clinic revealed tachycardia and elevated BP. Brought to ER to monitor throat tightening. Upon trip to ER (roughly one minute), experienced nausea. Experienced chest pain after being admitted to ER, roughly 20 minutes after vaccination. Chest tightness and throat swelling lasted for roughly about 30 minutes. All symptoms subsided with the exception of the headache about an hour after injection. Discharged from ER and went back to work. Headache continued into the afternoon, along with general weakness.

902791	12/16/2020	KS	51	F	12/16/2020	12/16/2020	:1039: Responded to notification of potential adverse reaction after receiving COVID-19 vaccination. Pt had been escorted from observation area to emergency area with PA with c/o tightness in throat. On my arrival, pt was eupneic, p/w/d, ambulatory, NAD. Vitals @ 1039: P72, 100% pulse ox on RA Vitals @ 1056: P72, 98% pulse ox on RA, 112/78 seated. Administered 25mg diphenhydramine po per PA @ 1050, pt swallowed with water. Called 911 for EMS response @ 1103 per instruction from provider. Vitals @ 1103: 98% pulse ox on RA, P74, denies shortness of breath or pain. Off phone with EMS @ 1108, en route. EMS on site @ 1115, report given to medic. Pt left with EMS en route to ED @ 1116. Report called to ED Charge Nurse @ 1121. Patient presented to vaccination clinic. Patient received her vaccination at approximately 1021. Patient reports symptoms onset at approximately 1038 with tightness of the throat and difficulty swallowing. She described it as a swelling of the throat sensation. She states she had a sensation moving from her head to her toes as in a "wave ". Patient denied shortness of breath, chest pain denies nausea. Patient denies hives or rashes or pruritis. Patient was assessed and moved to the emergency area. Her symptoms continued with some improvement. At this point time 25 mg of Benadryl was administered orally. Approximately 10 to 15 minutes after administration the patient developed numbness tingling around the upper lip, the right upper extremity. She denied shortness of breath or chest pain. She denied increasing severity of the throat sensations. Pertinent past medical history: Reactions bee stings currently carries EpiPen. She is not had any previous reactions to vaccinations. Allergic reaction. The patient symptoms seem to continue with the numbness tingling around the lips after administration of the Benadryl. Hand tingling of the right upper extremity also continued although it was decreasing. Her symptoms of the tightness of the throat remain the same. She did not develop shortness or breath or chest tightness or pain. At this time I feel be prudent to evacuate the patient to higher level care. Patient was evacuated at 11:16 by ambulance service.
