

COVID-19 Vaccine Drug Reactions: Chest Pain

Preliminary Notes – Reactions Listings Start on Page 2 Below

1. Chest Pain cases Reported through June 4, 2021 in the United States to the Vaccine Adverse Event Reporting System (VAERS).
2. In order to understand the two charts above:
 - a. The VAERS COVID-19 vaccine drug reported cases + backlogged cases **versus** the flu vaccine reported cases
 - b. The VAERS reported cases versus the total cases in the United States

It is **crucial** to at least one time, carefully read through the two answers in the FAQs related to backlogged cases and then the VAERS reporting rate:

https://www.covid19vaccinefacts.net/VAERS_FAQ.shtml#Backlog

https://www.covid19vaccinefacts.net/VAERS_FAQ.shtml#ReportingRate

3. The cases listed below were pulled from the VAERS raw data files with a query that looked for chest pain reactions. As you read through the cases below, it is possible that there will be an occasional erroneous case not related to fainting because of the query criteria. The exact query is as follows:
 symptom_text like "*chest pain*" or symptom_text like "*breathing pain*" or symptom_text like "*pain in chest*"

1373293	6/4/2021	OR		F	4/22/2021	5/20/2021	<p>collapsed left lung; Does not feel good; tired all the time; Left arm pain; feel terrible; Pain spread to middle of chest; Painful to breathe; Hard to get a breath; This spontaneous case was reported by a patient (subsequently medically confirmed) and describes the occurrence of PNEUMOTHORAX (collapsed left lung) in a female patient of an unknown age who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 0470 2orZ 1A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 22-Apr-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 20-May-2021 at 11:00 AM, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 20-May-2021, the patient experienced PNEUMOTHORAX (collapsed left lung) (seriousness criteria hospitalization, medically significant and intervention required). On 20-May-2021 at 7:30 PM, the patient experienced FEELING ABNORMAL (feel terrible), CHEST PAIN (Pain spread to middle of chest), PAINFUL RESPIRATION (Painful to breathe), DYSPNOEA (Hard to get a breath) and VACCINATION SITE PAIN (Left arm pain). On an unknown date, the patient experienced FEELING ABNORMAL (Does not feel good) and FATIGUE (tired all the time). The patient was hospitalized for 3 days due to PNEUMOTHORAX. The patient was treated with PARACETAMOL (TYLENOL) at an unspecified dose and frequency; IBUPROFEN at an unspecified dose and frequency and Surgery (Tube placement in her chest) for Pneumothorax. At the time of the report, PNEUMOTHORAX (collapsed left lung), FEELING ABNORMAL (feel terrible), CHEST PAIN (Pain spread to middle of chest), PAINFUL RESPIRATION (Painful to breathe), DYSPNOEA (Hard to get a breath), FEELING ABNORMAL (Does not feel good), VACCINATION SITE PAIN (Left arm pain) and FATIGUE (tired all the time) outcome was unknown. Not Provided No concomitant medications were</p>

1373377	6/4/2021	IL	24	F	5/22/2021	6/4/2021	<p>Suspected bursitis with prolonged arm pain and weakness 2 weeks after first Pfizer dose. On the day of vaccination, I had a panic attack and nearly blacked out after vaccination, something that had never happened to me after a vaccination. Once the pain started a few hours after vaccination, it significantly increased. I experienced excruciating pain in my left arm like I had never felt after any other vaccination. Complete inability to move my arm without pain; the pain persisted even with zero movement whatsoever. Within the first 12 hours the pain spread to my entire left shoulder, and within 24 hours the pain spread to my neck, and general upper left quadrant of my body to the point where inhaling deeply would cause chest pain on my left side. This extreme pain persisted for about 3-4 days. After about the 5th day, my left arm still felt different and weaker than my right arm but little pain remained. After the 7th day, pain started back up whenever I tried to use my arm in any way. The days went on and the pain and arm weakness is not passing. It is minor pains, aches, and occasional throbbing compared to those first few days after vaccination but chronic pain nonetheless. My left arm continues to feel weak and I have a concentrated area of pain directly where the vaccination site was, it's as if I could still feel exactly where the needle went through my body. My arm feels okay pain-wise upon waking most days but I am unable to do anything as simple as chopping vegetables or washing dishes without feeling pain for the rest of the day. I am unable to even wear a backpack for more than 10 minutes without my left shoulder hurting and feeling fatigued.</p>

1373407	6/4/2021	TX	58	F	3/5/2021	3/5/2021	Fast heartbeat; chestpain; This is a spontaneous report from a contactable consumer (patient). A 58-year-old non-pregnant female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for Injection, Batch/Lot number was not reported), via an unspecified route of administration, administered in arm right on 05Mar2021 13:45 (01:45 PM) (at the age of 58-year-old) as a single dose for COVID-19 immunization. The patient medical history included COPD. Patient had no known allergies. Prior to vaccination, the patient was not diagnosed with COVID-19. The patient received unspecified concomitant medications. The patient did not receive any other vaccines prior to the COVID vaccine within 4 weeks. The patient experienced fast heartbeat, chest pain on 05Mar2021 22:30 (10:30 PM). The patient underwent lab tests and procedures which included heart rate was fast on 05Mar2021. The patient had not tested for COVID-19 post vaccination. The patient did not receive any treatment for the events. Outcome of the events was recovering. No follow-up attempts are possible. Information about lot/batch number cannot be obtained.

1373728	6/4/2021	VA	40	F	5/17/2021	5/17/2021	<p>doesn't have much of appetite; 148/70 on the blood pressure; allergic response; tongue was a little numb; hard to swallow; Throat was closing up; mouth feeling numb; couldn't really speak; Coughing; super shaky; feet was also feeling numb; face looked swollen; Chest tightness; chest pain; abnormal EKG; Her throat was a little sore; tired; This is a spontaneous report received from a contactable consumer (patient). A 40-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration, administered in the left Arm on 17May2021 12:30 (Batch/Lot Number: EW0167) as single dose (at the age of 40-year-old) for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. Historical vaccine included first dose of bnt162b2 (lot number EW0158) on 15Apr2021 at 12: 50PM (at the age of 40-year-old) in the left arm for covid-19 immunisation and on 15Apr2021 her arm was numb on the side where she received the injection for more than 24 hours, it went numb pretty quickly after the first dose - then it was numb for about 24 hours. It went away completely in two days, but the patient was unsure if that is an adverse reaction. The patient experienced tongue was a little numb on 17May2021 with outcome of recovering , hard to swallow on 17May2021 with outcome of recovering , mouth feeling numb on 17May2021 with outcome of recovering , throat was closing up on 17May2021 with outcome of recovering , couldn't really speak on 17May2021 with outcome of recovering, coughing on 17May2021 with outcome of recovering, super shaky on 17May2021 with outcome of recovering, feet was also feeling numb on 17May2021 with outcome of recovering, face looked swollen on 17May2021 with outcome of recovering, chest tightness on 17May2021 with outcome of unknown, chest pain on 17May2021 with outcome of unknown, abnormal EKG on 17May2021 with outcome of unknown, her throat was a little sore on 17May2021 with outcome of unknown, tired on 17May2021 with outcome of unknown, doesn't have much of appetite on 20May2021 with outcome of unknown. Details as described as follows: Reports she went to sit in the waiting area, after 5 minutes she noticed her tongue was a little numb. She took her card out of her purse, and noticed it was a little hard to swallow, this was within about 8 to 10 minutes.</p>

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

She sat for another 5 minutes and then decided to ask about her tongue feeling numb and was taken to the nurses station. She told them about her tongue, and as she was talking her mouth was feeling more numb and it was getting harder to swallow. As the nurse was talking to her it was like she couldn't really speak. The nurse said this is way past Benadryl and called to another nurse for an Epipen. Caller states she started to cough as her throat felt like it was closing up. They jabbed her with the Epipen within 15 minutes of receiving the vaccine. She got some relief for a couple of minutes and then her body went back into the allergic response. They put her on the oxygen finger machine and then her throat started to close again. They gave another Epipen and then the ambulance arrived. She is unsure how long after she got the second Epipen that the ambulance arrived but it was no more than 5 minutes. They told her they had to call 911 right after giving the first Epipen. When the ambulance team came, she felt like she had novocaine in her mouth, her mouth was super numb and she was super shaky. They said the shaking was normal from an Epipen. Adds her feet were also feeling numb. She didn't know before that the shaking was from the Epipen. She was able to walk to the ambulance and her husband came and the med team was asking him if her face looked swollen and he said her face looked swollen. States her mouth felt like it was moving funny and she was exaggerating her speech trying to make her mouth move right. Adds she was still unaware that this could be an allergic reaction and was just trying to remain calm. At the site, she noticed her vitals on the machine and she saw 148/70 on the blood pressure. Adds it was about the same in the ambulance, it was 148/64. She was not able to collect any information about the Epipen other than they were yellow with a blue cap and they held it in her leg for three seconds. No lot or expiration date known for the Epipens. In the ambulance she was treated with Intravenous (IV) steroids and dose of Benadryl 50mg. As she was being transported to the hospital, she started to have chest pain. They did an EKG in the ambulance with no remarkable findings. Adds she has a follow up with her Primary Care Provider (PCP) today. When she arrived at the Emergency Room (ER) they monitored her for a couple of hours. She had another EKG at the ER and was told that it was normal so they released her. She

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

has no product information for the steroids or the Benadryl that she received. No lot or expiration date known. When she got home everything was calming down. Her throat was a little sore and she was tired. The next morning her chest was still tight. She called the doctor who told her to just relax and come back to the ER if she has palpitations or difficulty breathing. Mentions she got the results of the EKG in ER now, and it said it was abnormal as compared to a previous EKG she had, and something about the T axis. Adds now she doesn't have much of appetite and her tongue still feels a little off. Caller interrupts the call to say her doctor just called and she needs to go. Unable to complete the report at this time. The outcome of other events was unknown. No follow-up attempts are needed. No further information is expected.

1373771	6/4/2021			F	5/15/2021	5/1/2021	<p>pain in her chest between her clavicle and top portion of her breast area/soreness in chest/fluttery sensation in her chest; She was feeling funny, never felt like that before; Experiencing shortness of breathe/rates her breathing as a 5; This is a spontaneous report from a contactable consumer (patient mother), who is a nurse. A 19-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot number was not reported), via an unspecified route of administration, on 15May2021 at a single dose for Covid-19 immunization. Patient medical history and concomitant medications were not reported. The patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot number was not reported) via an unspecified route of administration, on an unspecified date at a single dose for Covid-19 immunization. On 25May2021, the patient experienced pain in her chest between her clavicle and top portion of her breast area/pain or soreness in her chest and describes a fluttery sensation in her chest that "feels funny, uncomfortable, weird, and not right. The patient had shortness of breath on an unspecified date in May2021. The patient woke up with a "funny sensation in her chest" and does not describe excruciating pain or difficulty breathing and "rates her breathing as a 5."The patient did not eat anything out of the ordinary or participated in any lifting or exercising of her chest muscles. Patient had never complained of anything like this before. The outcome of events was unknown. Additional information has been requested.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events, Dyspnea, chest pain, feeling uncomfortable cannot be completely ruled out. The impact of this report on benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethic committees, and Investigators, as appropriate.</p>

1373781	6/4/2021	PA	64	F	3/5/2021	3/1/2021	<p>Breathing difficulty and felt that her heart was pumping in her chest, and this was making it hard for her to walk, after first vaccine.; Breathing difficulty and felt that her heart was pumping in her chest, and this was making it hard for her to walk, after first vaccine.; Chest Pain under left breast, after first vaccine; This is a spontaneous report from a contactable consumer (patient's husband). This consumer reported for his wife that a 64-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Formulation: Solution for injection, Lot number: EN6203, Expiration Date: unknown) via an unspecified route of administration in right arm on 05Mar2021 as 1st dose, single dose for COVID-19 immunization. Additional Vaccines was not administered on same date of the Pfizer Suspect. No other vaccines have been administered within 4 weeks prior to the first administration date of the suspect vaccine. Patient did not had AE(s) following prior vaccinations. Medical history included ongoing high blood pressure from Apr2020, ongoing High Blood cholesterol increased from Jan2020, ongoing asthma from 2020, ongoing Hepatic steatosis, allergies to multiple medications Codeine: headache Contrast medium: flushing, itchy skin. previously took Fexofenadine HCL: unknown effect. Iodine: skin reaction. Lansoprazole: skin rash Latex: skin rash. Lisinopril: itchy tongue. Metoprolol Fumarate: headache, nausea. Oxycodone: nausea and headache. Ongoing concomitant medication included (ASPIRIN) at 81 mg oral; colecalciferol (VITAMIN D3) from Mar2019 at 2000 iU, once a day oral; simvastatin (ZOCOR) taken for blood cholesterol increased from Jan2020 at 10 mg, once a day oral; carvedilol taken for blood pressure measurement from Apr2020 via oral at 3.125 mg, twice a day; olmesartan medoxomil (BENICAR) taken for blood pressure measurement from Apr2020 at oral 25 mg, twice a day; fluticasone propionate, salmeterol xinafoate (ADVAIR) taken for asthma from Apr2020 at 250/50, inhalation. In Mar 2021, The patient experienced breathing difficulty and felt that her heart was pumping in her chest and this was making it hard for her to walk and the next week chest pain under left breast, a couple of days after first vaccine around 11Mar2021 or 12Mar2021 as the chest pain would start again when she was walking and she occasionally feels a twinge, reclarified,</p>

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

and she had to go to the emergency room and get evaluated. Patient went to the emergency room had an EKG and a troponin blood test, which were all negative on 29Apr2021. The patient underwent lab tests and procedures which included cardiac stress test: normal on 21Mar2021, computerised tomogram: normal for age, enlarged spleen noted on 29Apr2021, electrocardiogram: normal on 19Mar2021, magnetic resonance imaging: enlarged spleen on 27Apr2021, troponin: normal on 19Mar2021. CT Scan was done first then the MRI was done after the CT Scan. she was still had chest pain, and the doctor thought, it could be from the vaccine, since all the tests were normal. It was reported that as about 5-7 days after the shot, around the 10Mar2021 or 11Mar2021 in afternoon and it was isolated to the same day as it started. After she was in the emergency room and saw the cardiologist, and after the recent reports of the vaccine's effected with the heart, the cardiologist thought the vaccine caused effects. Patient had the second vaccine, and then reclarified, all of the symptoms went away. Patient received second dose of vaccine on 26Mar2021 around noon (Lot: ER8730, expiration: unknown) via unspecified route of administration in right arm. After second vaccine patient had a fever, of 102 degrees and felt exhausted for two days, after the second vaccine on 26Mar2021, Enlarged spleen on 29Apr2021. Fever lasted about a day and a half later. Feeling exhausted lasted for about a week. Facility was hospital, off site location. It was reported that patient also saw a liver specialist, and that doctor, wanted her effects, to be reported. Because all of the heart tests were negative, the liver specialist ordered an MRI elastograph of the liver and spleen and that test showed she had an enlarged spleen. The outcome for the event Breathing difficulty and felt that her heart was pumping in her chest, and this was making it hard for her to walk, after first vaccine was recovered in Mar2021 and chest pain unknown, Chest Pain under left breast, after first vaccine and had an EKG and a Troponin blood test, which were all negative was unknown. Follow up attempts are needed. Further information has been requested.

1373805	6/4/2021			F	12/17/2020	12/17/2020	palpitation; lightheadedness; Nausea; HERO-TOGETHER: A POST-EMERGENCY USE AUTHORIZATION OBSERVATIONAL COHORT STUDY TO EVALUATE THE SAFETY OF THE PFIZER-BIONTECH COVID-19 VACCINE IN US HEALTHCARE WORKERS This is a report from a non-interventional study source and post authorization safety study for Protocol C4591008. This is a Non-Interventional Study report with non-serious event only. A 49-year-old female subject participated in above mentioned study. The subject received first dose of BNT162B2 (reported as Pfizer COVID-19 vaccine, lot/batch number has been requested) on 17Dec2020 via an unspecified route of administration as single dose for COVID-19 immunisation. Medical history and concomitant medications were unknown. The subject experienced adverse vaccine reaction on 17Dec2020 and reported as non-serious event. On 17Dec2020, the subject presented to emergency department with concern of palpitations and lightheadedness after receiving the COVID vaccine. Denied chest pain. She received the COVID vaccine and then a short while later began to have some palpitations and lightheadedness with some nausea. This was coming and going and currently denied symptoms while in emergency department. She had no other complaints. Vital signs at 12:42: pulse 95, respiratory rate 15, blood pressure 139/97. Vital signs at 13:49: pulse 62, respiratory rate 14, blood pressure 123/82. The subject was brought to exam room, interviewed and examined. An IV was established and labs obtained. EKG was sinus rhythm, rate 88, nonspecific ST-T wave changes without signs of acute ischemia. She was treated with normal saline bolus as well as ondansetron (ZOFTRAN) and diphenhydramine hydrochloride (BENADRYL). complete blood count (CBC) and chemistries were stable. She was feeling better on recheck and would be discharged home to follow-up with primary physician to recheck symptoms and return for worsening. Discharge code: T50.Z95A Adverse effect of other vaccines and biological substances, initial encounter. The subject received unknown manufacturer COVID-19 vaccine as second dose on 18Mar2021. The action taken in response to the event for BNT162B2 was not applicable. The outcome of the event was recovered on 17Dec2020. The reporter considered the event was related to COVID-19 vaccine.;

1373817	6/4/2021	CA	35	M	5/26/2021	5/26/2021	he experienced "chest and lung pain" from the vaccine among additional side effects/severe chest pain on the left side; more like a choking; he experienced "chest and lung pain" from the vaccine among additional side effects/moderate lung pain on both sides; throat sickness; hard to swallow; hands were really cold; face numbness; swollen inside the throat; Burning in lung on both sides; hard to breathe; itching in lung on both sides; allergic reaction; More like a pressure in the chest; This is a spontaneous report from a contactable consumer (patient) via medical information team. A 35-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Solution for injection; Lot Number: ER8734), via an unspecified route of administration, administered in Arm Left on 26May2021 at 04:10 as 1st dose, single dose for COVID-19 immunization. Medical history included ongoing high cholesterol from Dec2020, high low-density lipoprotein (LDL) from Dec2020 (not related to lifestyle or diet), and ongoing heartburn from Nov2020 (received omeprazole for couple of months, two weeks before vaccination for heartburn or acid reflux, for his ulcer, for GI), H-pylori (patient got two courses of antibiotics for 10 days and diagnosed with H-pylori in January), patient thought maybe the antibiotics harmed his body and allergy to grass (undiagnosed allergy to grass and it was more severe in spring in early summer). No prior vaccinations and no family history. The patient's concomitant medications were not reported. The patient previously took omeprazole on Jan2021 for heartburn (one pill one day during two-week period before vaccine administration. He took for two month and later had a break from it. He was not taking it lately). On 26May2021, the patient experienced chest and lung pain from the vaccine among additional side effects, severe chest pain on the left side, moderate lung pain on both sides, throat sickness, hard to swallow, hands were really cold, face numbness. swollen inside the throat and burning in lung on both sides, itching in lung on both sides, more like a choking, allergic reaction, more like a pressure in the chest. The patient experienced moderate lung pain on both sides. This was 40 minutes after vaccination. It was moderate. He felt a burning and itching in lungs on both sides. The patient experienced severe chest pain on the left side. Severe chest pain was 15 minutes after lung

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

pain began. It was on the left side, mostly to the ribs, where heart is located. Pain was moderate to maybe severe. Sometimes it was a little bit hard to breathe. It was more like he was afraid to breathe because of the pain. Confirmed there was not issue with his airway. More like a pressure in the chest. As the lung pain was going away then chest pain came in. Dime size pressure. He stated he got sickness in his throat a little bit after. It was hard to swallow. He was not worried about it. He stated he was able to breath and was able to drink water. It was more like a choking. It happened after he left the vaccination site. It was maybe like 20 minutes after he had the vaccination. His hands were really cold as well after. The patient severe chest pain was improved a little bit. The chest pain on left side lasted 25-30 minutes. After that it was kind of resolved. In a couple hours it came back. The reporter stated right now it was coming back, but more lighter. It was not a severe pain (mild to moderate). It was sort of like a sore muscle in the chest. The patient had sickness in throat, when trying to swallow. The face numbness felt right after chest pain. He also felt this one hour ago, maybe on left side. He felt it for a few minutes, but not sure if it was connected. The patient also got two courses of antibiotics for 10 days. His doctor diagnosed with him with H-pylori in January. He thinks maybe the antibiotics harmed his body. He read articles about heart inflammation that lead to myocarditis or something like that. The patient thought that what he was experiencing is maybe an allergic reaction. He read articles about heart inflammation that lead to myocarditis or something like that, kids and young adults experienced chest pain after getting the Pfizer-BioNTech COVID-19 vaccine. He then explained he also read about 68 cases, among which there were 20 individuals and 2 individuals who died: a 22-year-old female and 35-year-old male. Patient thinks maybe he was experiencing an allergic reaction. No Investigation Assessment. No relevant tests. Outcome of the event Lung pain and hands were really cold was recovered on 26May2021, for chest pain, throat sickness, hard to swallow, more like a choking, hands were really cold, face numbness and more like a pressure in the chest was not recovering while unknown for rest of the events. Information on Lot/Batch number was available. Additional information has been requested.

1374268	6/4/2021	FL	59	M	3/30/2021	4/20/2021	Pericarditis; Pain in their chest; shallow breathing; Fever; Chills; Inappropriate schedule of vaccine administered; This spontaneous case was reported by a consumer and describes the occurrence of PERICARDITIS (Pericarditis) in a 59-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 047a21a and 037b21a) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Molluscum contagiosum ('triamcinolone acetonide' as treatment) since 02-Apr-2021. Concomitant products included EZETIMIBE, PANTOPRAZOLE, IBUPROFEN and COLCHICINE for an unknown indication. On 30-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 20-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 20-Apr-2021, the patient experienced INAPPROPRIATE SCHEDULE OF PRODUCT ADMINISTRATION (Inappropriate schedule of vaccine administered). On 21-Apr-2021, after starting mRNA-1273 (Moderna COVID-19 Vaccine), the patient experienced PYREXIA (Fever) and CHILLS (Chills). On 11-May-2021, the patient experienced PERICARDITIS (Pericarditis) (seriousness criteria hospitalization and medically significant) and CHEST PAIN (Pain in their chest). 11-May-2021, the patient experienced HYPOPNOEA (shallow breathing). The patient was hospitalized on 11-May-2021 due to PERICARDITIS. The patient was treated with MORPHINE for Pain prophylaxis, at an unspecified dose and frequency and OXYCODONE for Shallow breathing, at an unspecified dose and frequency. On 20-Apr-2021, INAPPROPRIATE SCHEDULE OF PRODUCT ADMINISTRATION (Inappropriate schedule of vaccine administered) had resolved. At the time of the report, PERICARDITIS (Pericarditis), CHEST PAIN (Pain in their chest), HYPOPNOEA (shallow breathing), PYREXIA (Fever) and CHILLS (Chills) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (unknown) was not applicable. Treatment medications included morphine and oxycodone. Company comments: This report refers to a case of inappropriate schedule of product administration for mRNA-1273 (lot # 037b21a) with AEs

1374389	6/4/2021	NY	24	M	4/27/2021	4/28/2021	My daughter has had a full body rash, that nobody can identify, since the shot. They start as little dots and change into circles after a while. She had had chest pains and pressure and is very uncomfortable
							Irregular heart beat and chest pain ever since the first vaccine dose. Symptoms began about 2 days after the first dose was administered. Symptoms seemed to worsen again 3-10 days after the second dose. Still get sharp pains in my chest near my heart today. Today I looked up my symptoms and they seem comparable with Myocarditis so I decided to make this entry.

1374390	6/4/2021	CA	36	F	6/3/2021	6/3/2021	<p>Client received her first dose of the Pfizer Covid-19 vaccine (Lot # EW0187 Exp. 08/2021) on 6/3/21 at 2:48 PM. Client's husband whistled to EMT and paramedic, signaling that he needed assistance. Client was a 36-year-old female found sitting upright in an observation chair, alert and tracking and appeared to be in mild distress. Client had a chief complaint of throat irritation. Client's husband stated that the client was complaining of itchiness in her throat and on her chest. Client stated that she had a history of heart murmurs and frequent anxiety. Client denied prescription medication. Client had no known allergies. Assessment revealed no hives, swelling, discoloration, rash, accessory muscle use or other signs of anaphylaxis. Client stated that she began to feel the itchiness in her throat immediately after she received her shot but was hesitant to signal for assistance and waited a few minutes to notify staff. Client then added that her throat felt "swollen" and that she felt an itch on her chest as well. However, the client was able to make these statements without difficulty other than some mild fatigue. Airway, breathing and circulation were intact. Client was alert and oriented to person, place, date and event. Client's first set of vitals at 1503 were heart rate 138, respirations 28, blood pressure 152/98, O2 saturation 100% on room air, eyes equal and reactive to light, lung sounds clear bilaterally, and skin signs were normal throughout her body. Client was assisted from the observation chair to an observation bed by her husband and EMT. After lying down, the client briefly fell asleep and was laid supine. Client was asleep for approximately a minute before waking up. The client was then sat up and her vitals were retaken and had improved with a blood pressure of 138/98, heart rate 88, respirations 24 and O2 sat at 100%. After some brief monitoring, the client consented to an RN's administration of Benadryl 50mg (Lot # 020020 Exp. 02/2022) Intramuscular at 1512 on her right arm. Client then remained lying down and stated that she felt "better" approximately 10 minutes after Benadryl administration. However, five minutes later the client complained of a headache and chest pain which she later described as itchiness on her chest once again. Client then briefly became extremely anxious again before becoming calmer and consenting to staff dialing 911. Client consented to 911 at 1522 and Paramedics arrived at 1530. Client's vitals were</p>

1371198	6/3/2021	MO	48	F	1/8/2021	1/8/2021	The day of the vaccine I had the return of the dry cough, which I previously with COVID-19. I also had mild chest pains. I had fatigue and felt sleepy. Within the first 24 hours of the vaccine, I had burning in the eyes. Within the next week I had more fatigue and sleepiness. Within a few weeks I had a more intermediate cough. The cough was not every day but every few days. About a month after the vaccine, I have had a cough every day. The worsening of other conditions, in late February into March, I had worsening of restless legs. I also had increased of my asthma symptoms which I had to increase my medication for the asthma. I had chest tightness until April 10th. On April 29th, I had increased fatigue and montenect jerk of my arm and legs. After a week or so of those symptoms, I saw my Rheumatologist she put me on a steroid of 6 days. The abnormal fatigues and fatigue improved after I started the steroid. I still have a little fatigue and intermediate dry cough. Also, with had a symptom of monocular diplopia, the doctor I saw thinks that was to the increased dry eye symptom. I think the symptoms have increase my autoimmune system to flare up. I still have to use the inhaler also more than I use too.

1371212	6/3/2021	NY	13	M	5/15/2021	5/16/2021	Within 24 hours of the vaccine started to develop episodes of tachycardia (mom who is a physician measure heart rates as high as 130-140) with minimal activity. He noticed a couple of episodes of heart racing (was not noticing other episodes) but no HR obtained. He developed more pluetitic chest pain at the site of his rib pain and persistent fatigue. Seen in my office three times over the next 7-10 days. and symptoms persisted. Testing included CXR and ECG which were normal. COVID PCR NP swab was negative and blood work was normal (cbc, ebv/cmV titers, thyroid). He was evaluated by cardiology on 5/24/21 and diagnosed with POTS. Currently (early June) he continues to have fatigue significant enough that he can't get through an entire school day (very atypical for him) and has intermittent pleuritic chest pain (which had mostly resolved about 10 days after the vaccine) The tachycardia has resolved for the most part (within 2 weeks of the vaccine)

1370524	6/3/2021	MD	37	M	5/1/2021	5/2/2021	chest pains; shortness of breath, will walk up 3 stairs and gets winded; This is a spontaneous report from a contactable consumer(patient's wife). A 37-year-old male patient received second dose of bnt162b2(BNT162b2 PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Batch/Lot Number: EW0172), via an unspecified route of administration in right upper arm on 01May2021 at around like 11:00 or so as a single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient received first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Batch/Lot Number: UNKNOWN), Reporter stated the lot number for the first dose of the vaccine is either ER8734 or EK8734, she can't read the person's handwriting on the vaccine record card) via an unspecified route of administration in right upper arm on 10Apr2021 as a single dose for covid-19 immunisation. Reporter stated after the first dose of COVID 19 vaccine, her husband was pretty much out of it, like completely out of it. She was concerned and was like "are you going to wake up today?". The fatigue was very real and then his neck was super swollen on one side. and said that was the only side effects from the first one, it was nothing horrible. She confirms the fatigue was either 2 or 3 days after her husband received the first dose of the vaccine and it lasted a good 3 to 4 days where he was beyond fatigued. His neck being super swollen started pretty soon after the first dose, either the next day or 2 days later and lasted for a week or so was really sore when he touched it. The reporter stated Family Medical History Relevant to AE includes her husband mother had a heart attack in her 50s and his paternal grandpa died of hardening of arteries when he was 32 years old. On 02May2021 it was reported that patient started having chest pain really bad which it has not improved whatsoever. He was told to go to the urgent care on 03May2021 night and also reported the shortness of breath; will walk up 3 stairs and gets winded or walks across the room and his whole chest is in so much pain. The AE resulted in the visit of emergency room. The reporter reports concern and asks if she was supposed to report this to Pfizer or if any other patients have had really bad, painful chest issues. The patient underwent lab tests and procedures that included:

1370250	6/3/2021	IL	79	F	3/11/2021	3/11/2021	Atelectasis; Back pain; Cardiomegaly; Dizziness postural; Essential tremor; Fall; Lethargy; Mental status changes; Myoclonus; Pain; Sepsis; Somnolence; Spinal compression fracture; Tremor; This case was received via FDA VAERS on 25-May-2021 and was forwarded to Moderna on 25-May-2021. This regulatory authority case was reported by an other health care professional and describes the occurrence of ATELECTASIS (Atelectasis), BACK PAIN (Back pain), CARDIOMEGALY (Cardiomegaly), DIZZINESS POSTURAL (Dizziness postural), ESSENTIAL TREMOR (Essential tremor), FALL (Fall), LETHARGY (Lethargy), MENTAL STATUS CHANGES (Mental status changes), MYOCLONUS (Myoclonus), PAIN (Pain), SEPSIS (Sepsis), SOMNOLENCE (Somnolence), SPINAL COMPRESSION FRACTURE (Spinal compression fracture) and TREMOR (Tremor) in a 79-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 044A21A) for an unknown indication. The patient's past medical history included COPD, Atrial fibrillation, Hypertension, Diabetes, Obesity and Respiratory failure. Concurrent medical conditions included Allergy to allopathic drugs (Jardiance Lyrica) and Allergy to allopathic drugs. Concomitant products included CHOLECALCIFEROL and APIXABAN (ELIQUIS) for an unknown indication. On 11-Mar-2021, the patient received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On an unknown date, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 11-Mar-2021, the patient experienced ATELECTASIS (Atelectasis) (seriousness criterion hospitalization), BACK PAIN (Back pain) (seriousness criterion hospitalization), CARDIOMEGALY (Cardiomegaly) (seriousness criterion hospitalization), DIZZINESS POSTURAL (Dizziness postural) (seriousness criterion hospitalization), ESSENTIAL TREMOR (Essential tremor) (seriousness criterion hospitalization), FALL (Fall) (seriousness criterion hospitalization), LETHARGY (Lethargy) (seriousness criterion hospitalization), MENTAL STATUS CHANGES (Mental status changes) (seriousness criterion hospitalization), MYOCLONUS (Myoclonus) (seriousness criterion hospitalization), PAIN (Pain) (seriousness criterion hospitalization), SEPSIS

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

(Sepsis) (seriousness criteria hospitalization and medically significant), SOMNOLENCE (Somnolence) (seriousness criterion hospitalization), SPINAL COMPRESSION FRACTURE (Spinal compression fracture) (seriousness criteria hospitalization and medically significant) and TREMOR (Tremor) (seriousness criterion hospitalization). At the time of the report, ATELECTASIS (Atelectasis), BACK PAIN (Back pain), CARDIOMEGALY (Cardiomegaly), DIZZINESS POSTURAL (Dizziness postural), ESSENTIAL TREMOR (Essential tremor), FALL (Fall), LETHARGY (Lethargy), MENTAL STATUS CHANGES (Mental status changes), MYOCLONUS (Myoclonus), PAIN (Pain), SEPSIS (Sepsis), SOMNOLENCE (Somnolence), SPINAL COMPRESSION FRACTURE (Spinal compression fracture) and TREMOR (Tremor) had not resolved. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 21-Mar-2021, Blood gases abnormal: abnormal (abnormal) patient's ABG showed significant CO2 retention.. On 21-Mar-2021, Chest X-ray: abnormal (abnormal) shows new cardiomegaly. Mild bibasilar volume loss is again seen. Remaining lungs are clear. No pleural effusion is noted.. On 21-Mar-2021, Computerised tomogram: abnormal (abnormal) CT spine showed L1 compression fracture which appeared new. For mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown), the reporter did not provide any causality assessments. Because of the symptoms, patient came to the emergency room for evaluation. Chest x-ray imaging, was fairly unremarkable. She just feels achy. There were no chest pain, shortness of breath, abdominal pain, urinary symptoms or rash. On 26-Mar-2021, patient presented for evaluation of physical deconditioning. Patient presents to our facility yesterday after hospital stay from hospital. Patient tends to get confused and fall and has fallen twice. Patient has aches all over, dizziness when she stands up. In ER, patient's ABG showed significant CO2 retention. Pt is supposed to be using CPAP at home but admits it has not been used lately because of some problem with the m. Neurosurgery has ordered bracing for patient. No surgical intervention required. They also consulted neurology for myoclonic jerking and essential tremor. Patient is then to follow-up with neuro surgery and 3-4 weeks. On 17-Apr-2021, patient presented to the

VAERS_ID RECVDDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

emergency room with increased somnolence and lethargy. Patient was discharged from the hospital 2 days ago after having a stay on swing bed. She has multiple medical problems and was admitted following a hospitalization at Hospital. She has generalized debilitation and advanced COPD with CO2 retention. Patient has been instructed to utilize a BiPAP machine. According to her family, she has been none a compliant with this and did not utilize it last night. Patient noted this morning that she was somnolent and lethargic. Prior to that she had been doing well since discharge. Other than the lethargy and somnolence there are no other complaints. On 18-Apr-2021 she was diagnosed with sepsis. Action taken with mRNA-1273 (Moderna COVID-19 Vaccine) in response to the event was not applicable. Company Comment : Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. However, multiple underlying co-morbidities may re; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. However, multiple underlying co-morbidities may remain as confounding factors.

1370578	6/3/2021	WA	31	M	5/17/2021	5/17/2021	felt like he could collapse, He felt like he was going into cardiac arrest; heart beat increased really fast; He felt his heart beating up to his neck; had slight chest pain; feeling uncomfortable in his chest; anxious; This is a spontaneous report from a contactable consumer (patient). A 31-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in Arm Left on 17May2021 13:50 (Batch/Lot Number: EW0178) (at the age of 31 years old) as 1ST DOSE, SINGLE DOSE for COVID-19 immunisation. Medical history was none. There were no prior vaccinations within 4 weeks. There were no family history and no relevant tests. The patient's concomitant medications were not reported. Patient took the first dose of the COVID vaccine. About 25 minutes after, all of a sudden, his heartbeat increased really fast. He could not figure out what was going on. He had slight chest pain as well. It started out with him feeling uncomfortable in his chest. He told his wife that something was wrong. He was driving and had to pull over on the side of the road. The total episode lasted two to three minutes. He felt like he was going into cardiac arrest. His wife called 911. Within five minutes, they were there. They checked him out, and everything was normal. He thinks that normally his heart beats 70 to 80 beats per minute. His heart felt like it was beating 200 beats per minute. He felt his heart beating up to his neck. He felt like he could collapse. He clarifies that his heart was beating very fast for about 30 seconds. After that, his heart was still beating fast, but it started going down. Then after two minutes, it started going back to normal. His heart was still beating fast because he was still very anxious. He thinks the anxiety after ward was making his heart pump very fast. He was going to talk with his doctor next week to get checked out and find out if he has any underlying heart problems. He has never had any heart issues in the past. The outcome of events was recovered. No follow-up attempts are needed. No further information is expected.

1370580	6/3/2021	TX	73	F	5/8/2021	5/8/2021	Felt a slight pain, wasn't sure if it was her heart or chest. Went to hospital, was admitted, three days later was sent home.; vomiting; So weak she couldn't walk; Not feeling well; Extremely nauseous; Weight loss; Stomach pain; Fever; No appetite; minor ache and pain around area where injection was; itching around injection site; This is a spontaneous report from a contactable consumer (patient) under the same suspect products for 4 patients (including the reporter herself). This is one of the 4 reports. A 73-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot number: EW0169 (also reported as FW0169), dose 2 intramuscular, administered in Arm Left on 08May2021 (between 1430-1500) (at the age of 73years) as 2nd dose, single for Covid-19 immunization. Historical vaccine included the first dose of BNT162B2 (Lot number: ER8733) on 12Apr2021 (at the age of 73years) for Covid-19 immunization. Medical history included ongoing diabetes mellitus (Diagnosed 10-12 years ago), caesarean section (three C-sections), and hospitalization (due to taking of Aleve). Concomitant medications included metformin (METFORMIN) taken for diabetes mellitus from an unspecified start date and ongoing (started taking 10-12 years ago; Doctor told her that her A1c was so good she did not even need the medication but kept her on it since it's such a great medication); cannabidiol (CBD OIL) taken for an unspecified indication, start and stop date were not reported (Started taking 7-8 months ago); cyanocobalamin (VITAMIN B-12) taken for an unspecified indication, start and stop date were not reported (Started taking 7-8 months ago); vitamin d3 (VITAMIN D3) taken for an unspecified indication, start and stop date were not reported (Started taking 7-8 months ago). When mentioning vitamins, she states it was two weeks ago she finished them and didn't buy more. Did not specifically refer to which vitamin. The patient previously took MSG (monosodium glutamate) and experienced vomiting (was hospitalized for the same vomiting); Aleve and experienced violent vomiting and elevated heart enzymes (caused violent vomiting and hospitalization and elevated heart enzymes; They said it was a heart attack, but it was ruled out by the cardiologist. She had never taken Aleve before). It was reported that last Saturday, 08May2021, the patient received the second shot of the vaccine, she had minor

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

ache and pain around area where injection was. Sunday morning, she wasn't feeling well, thought she had a fever and had no appetite. She was only able to eat a small tablespoon of sweet potato. On 09May2021, Sunday night she started violently vomiting the whole night. Monday morning (10May2021), she was hospitalized. Two days later (12May2021) she was discharged from the hospital. She was home for a couple of hours and at night started vomiting again. When she vomits, she has to be careful. Felt a slight pain, wasn't sure if it was her heart or chest. She went again to hospital, was admitted (unspecified date), and three days later (unspecified date) was sent home. Yesterday (unspecified date) she was fine, but today (unspecified date) is feeling nauseous, eating crackers and being careful. She has lost weight, had minor pain around injection. The patient added that if she goes to the hospital again, she needs to find another one because she did not do the endoscopy. She knows this was not an endoscopy problem and she have no ulcer. She stated that the stomach pain is from the vaccine. She has not been checking her weight, she does not know when she started losing weight, but she knows that its going down because everyone has been asking her why she's losing weight. She has diabetes, her A1c is 5.3, with Metformin 500mg twice a day, time release. Her A1C is 5.3 (unspecified date). When she was in the hospital for two days, she was really like a zombie. Her children were so scared she was going to die. She is concerned and wants to know what else can she do to improve her health. With the vaccine, how long will the side effects last? How long will the side effects cause her to be down? This morning she hasn't eaten anything yet, except for a couple of crackers, is feeling extremely nauseous, and doesn't want to go to the hospital. It was further stated that she had pain and itching around injection site that started initially with pain. Added tat it was itching before; nothing is bothering her there and doesn't have pain now. Fever: She experienced it Sunday morning on 09May2021, it has gone away, she doesn't know when she had the fever in the hospital. No Appetite: is hungry now but afraid to eat, has just had crackers. Violent Vomiting: began in the evening and didn't sleep one second at all. Stopped when in the hospital after a couple of hours. She was given medicine and fell asleep. She woke up, was

U

nauseous, and would go back to sleep. She was like a zombie. Stayed in the hospital for two-and-a-half days, doesn't remember what day she was discharged. She was so weak she couldn't walk. Heart/Chest Pain: It could be psychosomatic. Two days after being discharged, she tried to vomit chicken tacos and thought she had mild pain. Could have been thinking she was having heart pain. Her heart was monitored the second time but doesn't know what they found, and she didn't have the mental alertness to ask. The hospital never mentioned anything, and she didn't ask. She further stated that she was told to see a gastroenterologist. She added that she does not take any Tylenol or aspirins or anything like that, because she is scared. The outcome of events vomiting, minor ache and pain around area where injection was, itching around injection site, fever, was recovered on an unspecified date; outcome of event no appetite was recovering; the outcome of other events was unknown. Follow-up activities are needed; information on the batch number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021565268 Same reporter/drug/event, different patient;US-PFIZER INC-2021564496 Same reporter/drug/event, different patient;US-PFIZER INC-2021564473 Same reporter/drug/event, different patient

I am having like severe chest pain; This is a spontaneous report from a contactable consumer (patient). A patient of unspecified age and gender received BNT162B2 (Lot number was not reported), via an unspecified route of administration on an unspecified date as 2nd dose, single for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the first dose of BNT162B2 on an unspecified date as single dose for COVID-19 immunization. The patient got the second dose of Covid vaccine and the patient was having like severe chest pain on an unspecified date. The outcome of the event was unknown. Information on the lot/batch number has been requested.

1372076	6/3/2021	HI	39	M	3/12/2021	3/13/2021	This is a 39 year old male presents to clinic for follow up on COVID19 vaccine allergic reaction. Patient received the first dosage in the right deltoid on 12MAR21. About 22 hours later, noticed right-side neck swelling and discomfort. The next day 14MAR21, noticed right ear pain and jaw pain. On 15Mar21, noticed right jaw pain/paresthesia and difficulty opening his mouth. No dyspnea. Went to ER on 15Mar21, observed, treated with Ibuprofen/Tylenol. 3weeks later, he went to the Block arena, was told get the second dose at the Tripler just in case of reaction, that he should be near the ER. Spoke with an Allergist (at the COVID screening tent). He still had some numbness on his jaw. Was told to wait until symptoms clearance before the second shot. Symptoms cleared by 2 weeks later. On 5/21/2021, he went to Covid tent. Was told not to get the second shot. He went to the facility. He seen the medical officer explained the situation. He received the second shot on his right deltoid. He was observed for 30 min and did fine. The next day, he had swelling of the right side of the neck for 4-5 days. Subsided by 5th day. He did not have ear or the jaw pain. Symptoms subsided and he felt normal. No concerns at this point. No chest pain, dyspnea. He can exercise without symptoms.
1372111	6/3/2021	OR	73	F	4/3/2021	5/7/2021	patient was admitted and managed for atypical chest pain with negative troponins, obvious diffuse ST elevations throughout most of the leads without reciprocal changes thought to be secondary to acute pericarditis. She had just been recovering from a viral illness about a week prior to presenting. Patient also had COVID 19 shot weeks prior to incident. Initial placed on IV heparin for unstable angina concern, but discontinued. Cardiology evaluation to start patient on 325mg of high dose aspirin 2X daily. Fentanyl discontinued and patient started on regimen of naproxen 500mg twice daily. Patient states chest pain has resolved with use of first dose naproxen.

1372753	6/3/2021		15	M	6/3/2021	6/3/2021	This information was reported to this writer. Immediately after receiving the second dose of the Pfizer vaccine, the patient reported a "weird sensation" in his chest. The patient became pale, and reported nausea and lightheadedness. According to the vaccinator it seemed as though the patient went into a syncopal episode. A nurse attempted to do a sternal rub to wake the patient up but was unsuccessful. The patient was then laid onto the ground and woke up; attempted to sit patient up and then went into another syncopal like episode. EMTs were notified and were on their way to attend to the patient. Patient's feet were elevated. No history of vaccine reaction. Patient had eaten and had fluids 2 hours prior to the vaccine. Patient was sat up again with assistance but immediately felt lightheaded and had another syncopal like episode. He was again placed in a supine position with feet elevated. Immediately reported improvement of symptoms. Patient had several sips of juice and was placed on a stretcher and taken to a back room. Patient had mom and sister at his side. As the patient remained in supine position, he denied nausea and lightheadedness; no chest pain, no dizziness. Patient was alert and oriented. Remained pale in color according to his father who just arrived. Per the advice of the EMTs, patient was transferred to hospital per ambulance.

1372907	6/3/2021	CA	64	M	3/9/2021	3/12/2021	The fourth night after my first Pfizer vaccination I awoke at 2:30 am with severe chest pain. It felt like my heart was being squeezed. I was worried I was having a heart attack. I sat up in bed and felt some reduction of pain. I decided to sit in a chair and see if I continued to get relief. After around 2 hours the pain reduced to the point I could fall asleep. The same thing happened for the next three nights. I concluded it was a side effect of the vaccination. I had an appointment scheduled with my cardiologist, the day before the second dose so I decided to ask him about this. Dr perform an EKG that he said was "Perfect". He said my pain was probably from acid reflux. I received the second dose the next day and the same chronology of symptoms occurred but the pain was a little less that with the first dose. I was now certain this was caused by the vaccination. My vaccinations were administered on a base. The lot numbers are hard to read on the vaccination card. The second dose lot number looks like ER9727.

1373108	6/3/2021	CA	13	M	6/3/2021	6/3/2021	Client received the 2nd COVID vaccine of Pfizer (Lot# EW0182, expiration 06/28/2021). At 1729, Client reports nausea and wants to vomit. RN, RN, RN, RN, and RN respond to this event. The registered nurses placed Client in an anti-gravity chair and provided an emesis bag. RN responded to this event at 1730. Client appears pale, diaphoretic, states being nauseated, wants to vomit, and dizzy. At 1730, vital signs are heart rate 89, oxygen saturation 99%. At 1733, vital signs are blood pressure 110/82, heart rate 62, oxygen saturation 99%. Client is offered supplemental nutrition and fluids. Client accepted both. At 1735, heart rate is 61 and oxygen saturation is 99%. At 1735, PHN responds and speaks to mother to educate her about ED precautions and common adverse effects. Client's mother reports Client has a history of ADHD, takes medications as needed, no known allergies, had a long day, as not ate much today, and was nervous prior to vaccination. At 1736, vital signs are blood pressure 110/78, heart rate 66, oxygen saturation 99%. Client reports no chest pain, no blurred vision, no headache, no shortness of breath, nausea is improving, and skin tone is returning to appropriate coloration of ethnicity. At 1742, vital signs are blood pressure 117/82, heart rate 82, oxygen saturation 99%. Client reports no new symptoms and improvement of nauseousness. At 1753 vital signs are blood pressure 112/68, heart rate 86, oxygen saturation 99%. Client reports all symptoms has resolved and is now hungry. Client stood up with no complaints at 1754. At 1754, Client walked out of facility with a steady gait accompanied by his mother.
1372311	6/3/2021	CA	33	F	6/2/2021	6/2/2021	SOB, Chest pain- pt. was monitored BP was taken read 142/82, O2 was 100% HR 91, RR24, was offered water and sat back in chair. Patient stated hx of complications in laparoscopic surgery with gallbladder that might have caused damage to heart. Pt also stated hx of mild anxiety to vaccines. Dr. checked on the patient and assessed pt heart, stated to monitor patient for 15 more minutes. pt vitals rechecked after 15 mins and read BP-138/80, HR72, O2100%, pt stated water and taking deep breaths helped her calm down. Pt has no PCP was referred to make an appointment with one to get checked up. pt stated she felt better and was good to leave.

1370557	6/3/2021	NY	18	M	5/10/2021	5/13/2021	myopericarditis; This is a spontaneous report from a contactable Physician. An 18-year-old male patient received his second dose of bnt162b2 (Pfizer-BioNTech Covid-19 vaccine) as an intramuscular single dose in left arm on 10May2021 14:30 (lot number unknown) for COVID-19 immunisation. The patient received his first injection as an intramuscular single dose in left arm on 16Apr2021 02:45 pm (lot number unknown) at age of 18-year-old for Covid-19 immunization. The patient's medical history included asthma and morbid obesity (BMI 47). Patient had no known allergies. Concomitant medications included salbutamol (ALBUTEROL HFA). The patient did not receive other vaccine in four weeks. Patient developed chest pain and was admitted to the hospital with myopericarditis. The event started at 03:00 am on 13May2021. He had elevated troponin and an abnormal EKG. He improved with NSAIDS and Colchicine. The patient was hospitalized for 3 days and recovered from the event on an unspecified date. The patient had no Covid prior vaccination and had real time PCR via nasal swab on 13May2021 with negative result. Information about the Lot/batch number has been requested.; Sender's Comments: Based on the available information and known product profile, the causal relationship between the reported event myopericarditis along with its symptoms and the use of BNT162B2 cannot be fully excluded. However, the patients state of morbid obesity and asthma maybe considered risk factors. The limited information available precludes further assessment. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Authorities, Committees and Investigators, as appropriate.
1371326	6/3/2021	MI	17	M	5/1/2021	5/19/2021	Woke up with severe chest pain two days after receiving the vaccine. Was taken to the ER and was admitted for elevated enzyme level and pain. Inflammation around the heart.

1371332	6/3/2021	FL	67	F	6/3/2021	6/3/2021	67 y/o female with past medical history of Migraines and Hypertension who presents with dizziness post vaccination. Patient states that this is her second dose in the two-dose series. Patient states that she received her vaccination to the right arm. Patient states that with the first vaccination she did experience dizziness, nausea and migraines. Patient denies headache, vision changes, sore throat, difficulty swallowing, difficulty breathing or chest pain. Patient denies feeling nervous or anxious with vaccinations. Patient initial vitals with Hypertension noted, 197/112 BP, 78 HR, 98 % RA, 12 Resp. Patient instructed to lay on cot and water bottle provided. Patient vitals continuously monitored with persistent hypertension present (186/103, 223/118 BP) at this time the NP requested the Paramedics to obtain the BP manually. Patient BP manually taken every 5 minutes x2 with readings as follows, 150/96 and 138/80. Patient states that she is feeling better and dizziness has resolved. Patient placed in sitting position for 5 mins and then instructed to stand for 5 mins. Patient stable on her feet with no dizziness reported. Patient discharged in stable condition and ambulated without difficulty. Patient has a follow up appointment immediately with HCP post vaccination, today.
1371348	6/3/2021		16	F	4/7/2021	4/22/2021	Myocarditis (with chest pain, shortness of breath, dizziness) starting after first dose, worsening after second
1371355	6/3/2021	FL	33	M	5/28/2021	5/31/2021	Woke up to chest pain 3.5 days after 2nd dose. Went to ER where elevated Troponin levels were found from bloodwork. Sent to another hospital in ambulance where I was put on a Heparin drip. After multiple tests (EKG, echocardiogram, CT scan) cardiologist diagnosed Myocarditis. Released from hospital after 2 days once they determined that the heart was healthy aside from the inflammation.
1371358	6/3/2021	CA	29	M	5/3/2021	5/10/2021	Constant muscle spasms throughout my body, especially at night. What started as painless muscle spasms that mostly effected my sleeping is beginning to turn into painful muscle cramping. I've also had lingering chest pain that comes and goes and radiates into my arm and back. Enough to take me to the emergency room. I am otherwise a completely healthy person and have not had issues like this until after the vaccine.

1371388	6/3/2021	NC	36	F	1/15/2021	1/16/2021	Days 1&2: Flu-like symptoms: chills, body aches, fatigue Day3-present: heart palpitations, shortness of breath with minimal exertion, mild tachycardia at rest and intermittent bouts of extreme tachycardia (150-218 BPM heart rate) which lasts only a few seconds but causes nausea, weakness and lightheadedness requiring 15-20 minutes to recover. Severe shooting thoracic level back pain occured within the first week but has subsided. Intermittent chest pain which changes with position, tachycardia exacerbated by sidelying position and muscle fatigue/cramping/twitching also occurring intermittently. I am currently on a 10 mg propranolol PRN (taking 2x/day most days) and trialing 25 mg of Zoloft. Propranolol has helped to control tachycardia but not fatigue and chest pain. Zoloft has not had enough time to take effect (1 week in).
1371391	6/3/2021	CO	73	M	2/1/2021	4/5/2021	One month later I began to have heart problems that led to stint put in vein. a month after that I had chest pains and two more stints in the same vein. I am still experienicing mild angina in spite of being on medicine to reduce or eliminate the chest discomfort.
1371421	6/3/2021	KS	44	F	5/21/2021	5/22/2021	8 AM THE DAY FOLLOWING VACCINATION, When she woke up, she had slight chest pain and cough (results from the shot). The chest pain got worse during the day (5/22/2021). Every breath by around 5 p.m., felt like she was getting stabbed in the heart and chest pain felt worse and then she sought out the Emergency room. By around 7 p.m., the ER reported it was not a heart attack, but a reaction the Covid 19 shot (Moderna). They proceeded to give her an IV (unsure of the doses) that calmed her and the chest pain was still there and not as bothersome. By 3 days later (72 hours), her chest pain went completely away..
1371917	6/3/2021		66	F	1/6/2021	1/11/2021	pt had/has severe fatigue, SOB, chest pain, headaches, feeling tired and weak. This has been going on for months and started after first COVID moderna vaccine

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1371501	6/3/2021	CA	25	F	6/2/2021	6/2/2021	<p>Patient received the 2nd COVID vaccine (Pfizer, Lot #: EW0187 and expiration date: 08/31/2021) around 1439 on the left arm. Patient walked up to the observation desk around 1449, during her 30 minute observation period, with complaints of "dizziness, rapid heart rate, and feeling hot." Patient was conscious, alert, and oriented x4 and claimed symptoms began 2 minutes status post vaccine administration. Patient denied any reaction after receiving the 1st dose of Pfizer vaccine and denied experiencing any chest pain, headache, nausea, vomiting, or diarrhea. EMTs had patient sit in the anti-gravity chair for further evaluation. Nurse responded to EMTs with patient. At 1455, EMT obtained baseline vital signs, while patient was sitting: blood pressure: 124/70, heart rate: 72, respiratory rate: 15. Pupils were equal, accommodating, and reactive to light. Skins were warm, dry, and normal. Chief complaint of "dizziness, rapid heart rate, and feeling hot" was reassessed and patient stated that symptoms had subsided. Patient explained that the symptoms had a sudden onset, but lasted less than 1 minute. Patient has a history of migraines and an allergy to Penicillin. Patient stated that she had a similar reaction after receiving a dose of Benadryl, earlier this year. Patient told EMTs that she had eaten toast, tofu, and salad about an hour and a half prior to coming to the vaccination site, with limited fluid intake. EMTs gave the patient a water bottle to sip on. At 1502 a second set of vital signs were obtained by EMT, while the patient was sitting: blood pressure: 116/68, heart rate: 74, respiratory rate: 15. Pupils were equal, accommodating, and reactive to light. Patient was advised to stay an additional 30 minutes in observation for continued evaluation. Patient stated she "felt better" and all symptoms had improved. Final set of vital signs were taken at 1514 by EMT, while patient was standing: blood pressure: 114/64, heart rate: 72, respiratory rate: 12. Pupils were equal, accommodating, and reactive to light. Skins were warm, dry, and normal. Patient was negative for orthostatic pressures. At 1540, patient stated she "felt normal and that all symptoms were gone." Patient had finished the water bottle provided. Patient was then educated on expected/ adverse reactions, when to follow up with her primary care provider, and the use of V- Safe. Patient ambulated with a steady gait on her own accord out of the facility.</p>

1371318	6/3/2021	CA	76	M	2/13/2021	4/1/2021	Rheumatoid factor elevated at 45, CRP 122 Patient was in good health, with distant history of Graves Disease until April 5 when he presented to Hospital with complaints of chest pain, worse with sitting up. CAD was ruled out with troponins and he was taken to the cath lab and found to have essentially normal coronary arteries. He was started on colchicine with improvement in chest pain. On April 30th he presented to Hospital with low grade temps, cough and right sided chest/abdominal pain. He was found to have moderate pleural effusion. Because he was on Eliquis, for episode of afib thought related to pericarditis, pleurocentesis was delayed until May 3 when 1.5 L of fluid was removed from his pleural space. He continued on colchicine and 3 days later reported feeling essentially normal. Blood and fluid cultures were negative. Pleural fluid cytology showed predominantly chronic, inflammatory lymphocytes and macrophages/monocytes, reactive mesothelial cells. There was no overt morphologic evidence of malignancy. Patient was feeling well. Dr stopped Eliquis, Cochicine and patient did well until May 17 when he again reported aches, chills and pleuritic chest pain. Pleural effusion recurred and patient restarted cochicine with improvement
1369973	6/3/2021	TN	45	M	6/2/2021	6/2/2021	Pt reported lips tingling, tight throat, Benadryl 25mg tab administered, no difficulty swallowing, VS stable. No symptom improvement at 20 minutes and expressed a feeling of having a golf ball stuck in his throat, denied SOB, itchiness, no noted hives, denied chest pain/tightness, dizziness, vision changes or anxiety. Benadryl 25 mg tab administered, no noted or voiced difficulty with swallowing. VS stable. Pt observed another 30 minutes and symptoms began to resolve. Full resolutions of symptoms at 3 hours, pt discharged home @ 13:20. Emergency situations reviewed with instructions to call 911 if reoccurrence of symptoms.

1370571	6/3/2021	NY	17	M	5/1/2021	5/5/2021	myocarditis; myocarditis; chest pain; shortness of breath; This is a spontaneous report from a contactable physician. This physician reported similar events for two patients. This is the second of two reports. A 17-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 01May2021 (Batch/Lot number was not reported) as 2nd dose, single dose (at the age of 17-years-old) for COVID-19 immunization. Medical history included myocarditis from 2019 to an unknown date. The patient's concomitant medications were not reported. The patient previously received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date (Batch/Lot number was not reported) as 1st dose, single dose for COVID-19 immunization. Patient admitted to hospital with chest pain and shortness of breath, diagnosed with myocarditis on 05May2021. The patient was hospitalized for 6 days. Treatment received for the adverse events include metoprolol, amiodarone, ketorolac, IVIG. The patient underwent lab tests and procedures which included sars-cov-2 test: negative on 05May2021. The outcome of the events was recovering. The events were considered as serious (hospitalization). The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has been tested for COVID-19. Information on the lot/ batch number has been requested.; Sender's Comments: Myocarditis is not uncommon disease in young population. This 17-year-old male patient had medical history of myocarditis from 2019. Based on information available, the reported recurrence of myocarditis with symptoms of chest pain and shortness of breath was not considered as causally related to the bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE). The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics committees and

1367905	6/2/2021	NJ	14	M	5/26/2021	5/27/2021	Patient received the Pfizer COVID-19 vaccine 3 days prior to admission, and felt weak with complaints of headache the following day, and the symptoms have since resolved. Mother mentioned that he has been complaining of intermittent midsternal chest pain that worsened after eating since the day prior to admission. She had been giving him peptobismol, thinking it was gas related pain. However, due to him persistently complaining of the pain after eating, she brought him to. She denied any fever, shortness of breath, weakness/fatigue. Of note, mother had COVID in march 2020 and she believed he might have been sick around that time as well. Patient is still in the hospital and continues to receive pain medication and treatment for myocarditis (NSAIDS and opioids)
1367812	6/2/2021	IL	50	M	4/28/2021	5/4/2021	I am a healthy 50 year old male who competes in endurance events including 15 Ironman triathlons and many ultra endurance races. I was diagnosed with acute Pericarditis 8 years ago, after 4 days in the hospital and a couple of weeks of rest at home all of my symptoms had subsided and I have had no reoccurrence of this condition since. Approximately one week after receiving my second dose of the Covid 19 Moderna vaccine I began to experience chest pain. 8 days post vaccination the chest pain was radiating into my Left shoulder and arm, I had significant pain on breathing and was extremely uncomfortable lying on my back and could not lie on my left side due to pain. I went to the ER on the evening of May 6th, they performed a chest x-ray, 2 EKG's as well as 2 separate blood work panels. While I did relate my history of having pericarditis and that this pain was very similar to what I had felt before, they, of course, were more concerned on if I was having a coronary event. The EKG and blood work showed I was not so I was simply sent home with a "we don't know why your chest hurts but your are not having a heart attack." After a follow up to a cardiologists almost 2 weeks later it was determined that it was more than likely a flare up of pericarditis but that it had subsided by that time.

1367727	6/2/2021	VA	33	F	5/23/2021	5/24/2021	I had fever and chills 12 hours after the vaccine was administered. I felt fine after 36 hours of the vaccine's administration. But on May 25-26, I started developing a tightness in my chest and had difficulty breathing. My chest hurt and hurt even more when I took deep breaths. The breathing issue came with a pain in my upper back for which I once took ibuprofen and another time I took half a painkiller [Diclogem]. I felt extremely tired/fatigued and weak, had irregular sleeping patterns, felt dizziness and lightheadedness during the day and this continued until Saturday, May 29. Thereafter, the dizziness during the day subsided but I still felt too tired to do anything. Over the long weekend of May 29-31, I have started developing painful acne on my buttocks. The left buttock in particular has multiple painful acne. I still have trouble breathing and my chest still hurts so much that I cannot wear a bra for more than a few hours a day as it feels very constrictive. The breathing issue and chest pain really worries me because I don't have the stamina to do errands or go outside for more than an hour or two on any single day. Today, June 2, is the 10th day since I got my vaccine.
1367795	6/2/2021	CA	41	F	6/1/2021	6/1/2021	Pt experienced vomiting & dizziness post vaccination. BP 119/76; HR 71; RR 21. Pt denies chest pain, swelling, SOB. Hx of vertigo. No medications given, pt stable & released from vaccination site, recommended f/u w/PCP

1368187	6/2/2021	IA	85	M	3/20/2021	5/12/2021	Moderna Dose 1 2/20/21 (023M20A) Moderna Dose 2 3/20/21 (045A21A) COVID Positive 5/12/2021 5/12/21: Presented to ED. The patient is a 85-year-old male with a past medical history significant for coronary artery disease status post multiple drug-eluting stents, hypothyroidism. Patient is coming in with chief complaint of weakness and fatigue which has been going on for the past 1 week. Patient states that he received his COVID-19 vaccination and completed the course of COVID-19 vaccination at the end of March 2021. He has a history of drug-eluting stents and goes for cardiac rehab and states that he has been extremely weak unable to perform much in the cardiac rehab program. At this current point in time he denies any fevers chills shortness of breath chest pain abdominal pain nausea vomiting diarrhea constipation. 5/15/21: Patient was admitted for generalized weakness and COVID-19 test returned positive. He had been vaccinated and received 2 doses the COVID vaccine the last dose being in March. Initially was on a couple L of oxygen however there was no evidence of pneumonia on chest x-ray. Was able to be weaned to room air on hospital day 2. Did have some issues with low sodium which may be related to the COVID-19 infection. Was placed on a free water fluid restriction of 1 L and sodium did improve at the time of discharge. Will be recommended to have a repeat BMP in 1 week. He was given 2 doses of remdesivir given his weakness as well as comorbidities making him at risk for worsening COVID-19 infection. Patient worked with PT and OT and had improvement in his strength. He does have a walker at home which she will use as needed. He will follow-up with his PCP and no medication changes were made. Home health was offered but he declined.

Patient reports symptoms started about 1 week ago with dry intermittent cough associated with shortness of breath, chest pain, generalized weakness body aches and worsening of chronic diarrhea. He was treated with Z-Pak but symptoms continued and he presented to the emergency room, found to be hypoxic requiring up to 6 L nasal cannula oxygen. Patient also had fever no chills or rigors. Reports he has received both shots of COVID-19 vaccine. In the emergency room patient was hypotensive which was responsive to IV fluids and received levofloxacin. Chest x-ray showed bilateral pneumonia. WBC 15.5, lactic acid 2.8 and the creatinine 2 which is patient's baseline.</p> <p>5/13/21: 84-year-old male with history of liver transplant for primary sclerosing cholangitis currently on immunosuppressive therapy with CellCept and sirolimus, colon cancer status post partial colectomy with colostomy, prostate cancer s/p androgen deprivation therapy, CKD stage 4 and obstructive sleep apnea presented with cough. Patient reports symptoms started about 1 week prior to hospitalization with dry intermittent cough associated with shortness of breath, chest pain, generalized weakness body aches and worsening of chronic diarrhea. Patient admitted for acute hypoxic respiratory failure secondary to COVID-19 pneumonia. Treated with dexamethasone and levofloxacin. With not a candidate for remdesivir based on poor renal function and ID consulted and did not believe patient qualifies for Actemra. Subsequently shortness of breath and hypoxia resolved and he was deemed stable for discharge and will complete 7 days steroid taper. Liver transplant team at pain clinic was consulted, recommended holding sirolimus while patient is on dexamethasone. I have clearly communicated to the patient and his wife to resume sirolimus after 1 week. On discharge patient was a febrile and hemodynamically stable. He was discharged home.</p>

1368345	6/2/2021	VA	19	M	4/28/2021	5/1/2021	19 year old with no significant past medical history presented to the ED with c/o chest pain. He was noted to have chest pain starting on 4/30. Patient stated that he had 2nd COVID vaccine on 4/29. He was noted to have one episode of vomiting and developed coughing. He has been c/o of sharp chest pain for the past two days. He was noted to have arm pain. He had chest pain when he breaths. He took advil and noted to have slight improvement in his pain. He was noted to have an elevated troponin and CK. Cardiology was consulted. His initial troponin came back 4.49 with a CPK of 294. Serial troponins were obtained. Troponin peaked to 44.8 and CPK to 1345, Echo showed newly reduced LVEF of 55%. Diagnosed with myopericarditis possibly related to the Covid vaccine and pt was transferred to the Hospital for cardiac MRI and further work-up. Upon transfer to the hospital, cardiac MRI was performed and showed acute myocarditis with no evidence of pericardial thickening or pericarditis. It also showed left ventricular function was at the lower limits of normal with a calculated left ventricular ejection fraction of 50% and no focal wall motion abnormality. He was treated with colchicine 0.6mg, pepcid 20 mg, and ibuprofen 600mg for the myocarditis and oral morphine 15mg and tylenol 1,000mg for chest pain. He was counseled on avoiding strenuous activity for the next 3 months and following up with cardiology upon discharge.

1367163	6/2/2021	LA	72	F	4/8/2021	4/1/2021	fever; fatigue; Numbness whole body; hardly breathe; headaches; chills; chest pain; This is a spontaneous report received from a contactable consumer (patient) and follow up from Pfizer via a contactable consumer behalf of his Grandma . A 72-year-old female patient received second dose of bnt162b2 (BNT162B2, PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in Arm Left on 08Apr2021 Morning (Batch/Lot Number: EW0158) as 2nd dose, single for covid-19 immunisation. Medical history included ovarian cancer from 1970 to an unknown date , neoplasm from an unknown date and unknown if ongoing (Tumor on her chest that she has had since she was 20, she lived on nuclear test site in NM and got cancer from that), diabetes mellitus from an unknown date and unknown if ongoing , myocardial infarction from an unknown date and unknown if ongoing , cardiac disorder from an unknown date and unknown if ongoing, covid-19 from 2020 to an unknown date. Family Medical History included Diabetes, Heart Attack, Heart Problems. He also shared that his grandma had COVID-19 last year (2020) and was hospitalized for several weeks. The patient's concomitant medications were not reported. The patient previously took first dose of bnt162b2 on 18Mar2021 in Left Arm for covid-19 immunization. The patient experienced hardly breathe on 10Apr2021 with outcome of not recovered, headaches on 10Apr2021 with outcome of not recovered, chills on 10Apr2021 with outcome of not recovered , chest pain on Apr2021 (about a week after the second vaccine) with outcome of not recovered, fatigue on 10Apr2021 with outcome of not recovered , numbness whole body on 10Apr2021 with outcome of unknown, fever on an unspecified date with outcome of unknown. The clinical course was reported as follows: Caller is calling on behalf of his 72 year old grandmother who received her first dose of the Pfizer BioNTech COVID-19 vaccine on 18Mar2021 and her second dose on 08Apr2021. Caller reports that on 10Apr2021 is grandmother could "hardly breathe", was having headaches, chills, numbness all over the body, chest pain, and fatigue. Caller states that he took her to the doctor who told them that these symptoms would go away i a few days but they never did. Caller reports that it has been a month of these symptoms still going on and states that it is very hard for his grandmother to breathe

5/26/2021

5/27/2021

and describes it as "almost needs a ventilator type breathing." Caller would like to know if it is normal for these side effects to last this long. The patient states it has been a month since her second dose and two months since her first dose. The patient states after the second dose, she still can hardly breathe, has headaches, chills, numbness, and chest pains and those side effects. The patient asking "is it normal for her side effects to be lasting this long and is there anything she can do about it?" Weight was unknown, states she is average. Treatment was none, states she talked to her doctor and he said they will go away in a few days and they never did. Caller states the doctor took the same vaccine. Consumer states 1Feb2020, he caught Covid and brought it back to his parish in Louisiana, he was one of first in his area to get it and his grandma caught it. Consumer states in SEP2020, he was in the hospital for 2 weeks and in quarantine in a sterile environment because he caught the strain virus and his grandma caught that too. Vaccination Facility Type: was Hospital. No Vaccine Administered at Facility. Additional Vaccines Administered on Same Date of the Pfizer Suspect was none. AE(s) required a visit to no Emergency Room but Physician Office and she goes every month for a check up and he said the symptoms will pass, but they haven't. States the doctor isn't that good. Prior Vaccinations (within 4 weeks) was none. AE(s) following prior vaccinations was none. Relevant Tests was none.

Next day and every day thereafter he started getting more symptoms of feeling sick. The arm pain began the next day after injection. Followed by runny nose, sore throat, croup sounding cough, shortness of breath, gasping, chest pains, vomiting, back of the skull pain. He described the head pain as a square from the base of the back of his skull to the crown of his head and back down. Felt more like a pressure in the bones of his skull and less like a standard headache. The chest pains are sharp and come on sporadically. At first they were accompanied by hacking cough but then progressed to sharp chest pains at random times especially when lying down. He has difficulty sleeping and staying asleep. Also, lower abdominal pain but no vowel issues.

ILLNESS (Sick as a dog). On 06-Mar-2021, the patient experienced ILLNESS (sick as a dog) (seriousness criteria hospitalization, medically significant and intervention required), DYSPNOEA (Could not breath/Very difficult to breathe) and FEEDING DISORDER (Could not eat anything). 06-Mar-2021, the patient experienced CHEST PAIN (Terrible chest pain). On 19-Mar-2021, the patient experienced DIARRHOEA (Foul smelling diarrhea). On an unknown date, the patient experienced ABDOMINAL PAIN UPPER (Unexplainable pain in lower stomach area), GENERAL PHYSICAL HEALTH DETERIORATION (Health declined quickly), CARDIAC DISORDER (Heart issue after first shot of vaccine), LUNG DISORDER (Lungs have gotten worse since the first shot), CHEST DISCOMFORT (grabbing and pulling at his chest) and INSOMNIA (Unable to sleep). The patient was treated with TIOTROPIUM BROMIDE (oral) on 05-Mar-2021 at an unspecified dose and frequency; SIMETHICONE ongoing since an unknown date at an unspecified dose and frequency; PREDNISONE at a dose of 10 mg and OXYGEN at an unspecified dose and frequency. At the time of the report, RENAL IMPAIRMENT (Kidney's almost shut down both times) had not resolved and MYOCARDIAL INFARCTION (had 2-3 attacks), ILLNESS (sick as a dog), DYSPNOEA (Could not breath/Very difficult to breathe), FEEDING DISORDER (Could not eat anything), DIARRHOEA (Foul smelling diarrhea), ABDOMINAL PAIN UPPER (Unexplainable pain in lower stomach area), GENERAL PHYSICAL HEALTH DETERIORATION (Health declined quickly), CARDIAC DISORDER (Heart issue after first shot of vaccine), LUNG DISORDER (Lungs have gotten worse since the first shot), CHEST PAIN (Terrible chest pain), CHEST DISCOMFORT (grabbing and pulling at his chest), PRODUCT DOSE OMISSION ISSUE (didn't take the second dose of the Moderna COVID-19 vaccine), ILLNESS (Sick as a dog) and INSOMNIA (Unable to sleep) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On an unknown date, Electrocardiogram: normal other. On an unknown date, SARS-CoV-2 test negative: negative negative. On an unknown date, Troponin: high (High) high. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine)

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

(Intramuscular) was unknown. Patient is on nebulizer treatment of tiotropium bromide and a lot of simethicone. Patient do not know if using either medication helped or not but that was my immediate reaction. Now patient is on prednisone and feels like he's taking it just to breathe. Patient has had to go on 24 hr. oxygen since the first shot. Patient was negative for Covid-19 over the past 3 months at three different times. He continued to have terrible chest pain where he was grabbing and pulling at his chest, pain creeping up to his chest, could not breath or eat anything for 1 week after his first shot. Patient was in the ER on 10Mar2021. Caller stated he has chronic pancreatitis and breathing issues for which he was prescribed steroids, his doctor told him to decrease the prednisone to 10mg for 2 days prior and day of vaccination. Caller thinks he had a week long stroke since he had high Troponin level which resulted in visit to the hospital where the doctors thought he had septicemia. Caller stated he has not been able to sleep because he keeps having attacks of chest pains that last approximately 15 minutes in the middle of the sleep which occurs 4+ times per night. Kidney's have gotten worse since 1st shot vaccine. Doctors said "the kidney's took a shot" after the first shot of vaccine. Patient was admitted to the Hosp twice after the first shot because his kidneys almost shut down both times. Unexplainable, excruciating pain in chest and very difficult to breathe for approx. 10-15 minutes each attack. New, unexplainable pain in lower stomach area since 1st shot of vaccine. Doctors cannot explain. Patient is seeking legal action against Moderna. Most recent FOLLOW-UP information incorporated above includes: On 18-May-2021: Follow up received on 18 May 2021, included patient demography (Ethnicity, race, height, weight), allergy to peanuts, citrus, dairy, Demerol, tramadol, lorazepam. Current medical condition kidney disease was updated. concomitant medications were buprenorphine, pantoprazole, ondansetron, losartan, Prozac with product indications were updated. Laboratory information EKG was updated. Events Kidney's have gotten worse, unexplainable pain in lower stomach area, my health has declined, lungs have gotten worse was updated. On 23-May-2021: follow-up appended, conmeds added, NF added to events, new events added, new allergies coded, generated narrative.; Sender's Comments: This case concerns a male patient

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

of unknown age who missed second dose due other adverse events experienced post first dose of mRNA-1273. The other events show temporal association with the use of mRNA-1273 and a causal relationship cannot be excluded. However, the patient has concurrent history that confounds the reported events to include chronic pancreatitis, COPD, kidney and heart disorder. Missed dose is assessed as not applicable

1366844	6/2/2021	FL	87	F	3/10/2021	3/10/2021	felt great weight and pressure on my chest; did not get the second dose of Moderna COVID-19 vaccine scheduled on 7APR2021; did not get the second dose of Moderna COVID-19 vaccine scheduled on 7APR2021/not going to get the second shot; couldn't swallow; antibodies absent; Fatigue/tiredness; Severe sore throat/not just a severe throat; Neck swelling; Facial swelling; This spontaneous case was reported by a consumer and describes the occurrence of CHEST PAIN (felt great weight and pressure on my chest) in an 87-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 044A21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included Type 2 diabetes mellitus since an unknown date. Concurrent medical conditions included Drug allergy (allergic to medications), Allergy to animals and Perfume sensitivity. Concomitant products included LOSARTAN and METOPROLOL for Blood pressure high, ESZOPICLONE (LUNESTA) for Sleep disorder NOS, GLIMEPIRIDE for Type 2 diabetes mellitus. On 10-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 10-Mar-2021, the patient experienced OROPHARYNGEAL PAIN (Severe sore throat/not just a severe throat), SWELLING (Neck swelling), SWELLING FACE (Facial swelling) and FATIGUE (Fatigue/tiredness). On 15-Apr-2021, the patient experienced DRUG SPECIFIC ANTIBODY (antibodies absent). On an unknown date, the patient experienced CHEST PAIN (felt great weight and pressure on my chest) (seriousness criterion hospitalization), INAPPROPRIATE SCHEDULE OF PRODUCT ADMINISTRATION (did not get the second dose of Moderna COVID-19 vaccine scheduled on 7APR2021), PRODUCT DOSE OMISSION ISSUE (did not get the second dose of Moderna COVID-19 vaccine scheduled on 7APR2021/not going to get the second shot) and DYSPHAGIA (couldn't swallow). The patient was hospitalized from 25-Mar-2021 to 26-Mar-2021 due to CHEST PAIN. The patient was treated with PREDNISONE at an unspecified dose and frequency. At the time of the report, CHEST PAIN (felt great weight and pressure on my chest) and OROPHARYNGEAL PAIN (Severe sore throat/not just a severe throat) had resolved

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

and SWELLING (Neck swelling), SWELLING FACE (Facial swelling), INAPPROPRIATE SCHEDULE OF PRODUCT ADMINISTRATION (did not get the second dose of Moderna COVID-19 vaccine scheduled on 7APR2021), PRODUCT DOSE OMISSION ISSUE (did not get the second dose of Moderna COVID-19 vaccine scheduled on 7APR2021/not going to get the second shot), DYSPHAGIA (couldn't swallow), DRUG SPECIFIC ANTIBODY (antibodies absent) and FATIGUE (Fatigue/tiredness) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 07-Apr-2021, Antibody test: negative (Negative) states that patient does not have any antibodies. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. The patient's HCP advised to wait for two more weeks to receive the second dose of vaccine. Med Info Agent: *Crosslink with MOD21-058959, MOD21-062129, MOD21-076250, MOD21-085519* Call received from consumer who stated she had reported a previous event, but is frustrated because on the form it says if you have a problem, call us, but there is no number to call. Caller provided her address and confirmed contact information, contact information updated. The consumer stated she does not leave her house, and she does not have a fax machine, so it makes it difficult for her to send it back. The caller would like the company to know about this, but did not have any further requests. Consumer stated she will eventually have someone send it out for her. Caller stated it wasn't just a severe throat as the form mentions, she couldn't swallow, but did not elaborate. Consumer stated she is not going to get the second shot per providers direction, and stated she had no antibodies from the first dose. No further information provided. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. This report refers to a case of Inappropriate schedule of vaccine administered and Product dose omission issue for mRNA-1273, lot # 044A21A with associated AEs. 1366864	6/2/2021	TX	58	F	3/12/2021	4/9/2021	<p>elevated blood pressure; elevated heart rate; severe chest pain; lots of fatigue; joint pain rotating around to different area; Cold hands and feet; Vomiting; Headache; Face was flushed; lips numb; body shaking; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of BLOOD PRESSURE INCREASED (elevated blood pressure) and HEART RATE INCREASED (elevated heart rate) in a 58-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 039A21A and 040A21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No relevant past medical history was provided. Concomitant products included MULTIVITAMIN [VITAMINS NOS] for an unknown indication. On 12-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) .5 milliliter. On 09-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 09-Apr-2021, the patient experienced BLOOD PRESSURE INCREASED (elevated blood pressure) (seriousness criterion hospitalization prolonged), HEART RATE INCREASED (elevated heart rate) (seriousness criterion hospitalization prolonged), HYPOAESTHESIA ORAL (lips numb) and TREMOR (body shaking). On 11-Apr-2021, the patient experienced FLUSHING (Face was flushed), VOMITING (Vomiting) and HEADACHE (Headache). On 17-Apr-2021, the patient experienced ARTHRALGIA (joint pain rotating around to different area) and PERIPHERAL COLDNESS (Cold hands and feet). On 14-May-2021, the patient experienced CHEST PAIN (severe chest pain) and FATIGUE (lots of fatigue). The patient was hospitalized on 11-Apr-2021 due to BLOOD PRESSURE INCREASED and HEART RATE INCREASED. The patient was treated with AMLODIPINE ongoing since an unknown date at an unspecified dose and frequency; LORAZEPAM (ATIVAN) ongoing since an unknown date at an unspecified dose and frequency; ASPIRIN [ACETYLSALICYLIC ACID] ongoing since an unknown date at an unspecified dose and frequency; HEPARIN ongoing since an unknown date at an unspecified dose and frequency; METOPROLOL SUCCINATE ongoing since an unknown date at a dose of 25 mg;</p>

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

AMLODIPINE ongoing since an unknown date at a dose of 5 mg and LORAZEPAM (ATIVAN) ongoing since an unknown date at a dose of .5 mg twice a day. At the time of the report, BLOOD PRESSURE INCREASED (elevated blood pressure), HEART RATE INCREASED (elevated heart rate), ARTHRALGIA (joint pain rotating around to different area) and FATIGUE (lots of fatigue) had not resolved and CHEST PAIN (severe chest pain), HYPOAESTHESIA ORAL (lips numb), TREMOR (body shaking), FLUSHING (Face was flushed), PERIPHERAL COLDNESS (Cold hands and feet), VOMITING (Vomiting) and HEADACHE (Headache) had resolved. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 09-Apr-2021, Blood pressure measurement: 210/114 mmHg (High) elevated. On 09-Apr-2021, Heart rate: 115 (High) elevated. On 11-Apr-2021, Blood pressure measurement: 257/120 mmHg (High) elevated. On 11-Apr-2021, Heart rate: 118 (High) elevated. On 11-Apr-2021, Hepatic enzyme: elevated (High) highly elevated. On 17-Apr-2021, Blood pressure measurement: elevated mmHg (High) elevated. On 17-Apr-2021, Heart rate: elevated (High) elevated. On 17-Apr-2021, Hepatic enzyme: elevated (High) elevated. On 14-May-2021, Blood pressure measurement: 176/111 mmHg (High) elevated. On 14-May-2021, Electrocardiogram: lv damage (abnormal) changed from before ad LV damage. On 14-May-2021, Heart rate: 114 (High) elevated. On 14-May-2021, Troponin: elevated (High) elevated. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. On 09/Apr/2021, the patient was taken to emergency room with blood pressure increased and heart rate increased and was released from ER without being checked. On 11/Apr/2021, she was admitted, was given a bunch of medications and was sent home by 13/Apr/2021. On 17/Apr/2021 she went to facility, with elevated BP and HR, liver enzymes were still elevated along with other events and received medications. On 18/Apr/2021 blood tests, computerized tomography (CT) scan, troponin levels, electrocardiogram (ECG) were performed (results not provided) . She was released on 19/Apr/2021. On 14/May/2021, she woke up with severe chest pain, elevated BP, and elevated HR and went to ER where they indicated her troponin level was elevated,

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

did another CT scan and transported her back to facility. The same day they did blood tests, CT scan, troponin levels (results not provided), and an ECG that changed from before with possible LV damage. She was released the same day. On 17/May/2021, she went to cardiology. She was to wear a Holter monitor for 30 days. She also saw a rheumatologist that wants her to get X-rays and a nerve conduction study for the joint pain. 1366897	6/2/2021	NY	62	M	4/19/2021	5/17/2021	palpitations; atrial flutter with RVR; This spontaneous case was reported by a physician (subsequently medically confirmed) and describes the occurrence of PALPITATIONS (palpitations) and ATRIAL FLUTTER (atrial flutter with RVR) in a 62-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 046B21A and 037A21B) for COVID-19 vaccination. The patient's past medical history included Ex-smoker and COVID-19 (was not hospitalized and got recovered at home) in December 2020. Concurrent medical conditions included Hypertension, Hyperlipidemia and Obesity. On 19-Apr-2021, the patient received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On an unknown date, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 17-May-2021, the patient experienced PALPITATIONS (palpitations) (seriousness criterion hospitalization) and ATRIAL FLUTTER (atrial flutter with RVR) (seriousness criterion hospitalization). The patient was hospitalized from 17-May-2021 to 18-May-2021 due to ATRIAL FLUTTER and PALPITATIONS. The patient was treated with DILTIAZEM (CARDIZEM [DILTIAZEM]) (oral) ongoing from 17-May-2021 for Palpitations and Atrial flutter with rapid ventricular response, at a dose of UNK dosage form and DILTIAZEM (CARDIZEM [DILTIAZEM]) (intravenous) ongoing from 17-May-2021 for Palpitations and Atrial flutter with rapid ventricular response, at a dose of UNK dosage form. On 18-May-2021, PALPITATIONS (palpitations) and ATRIAL FLUTTER (atrial flutter with RVR) had resolved. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): In May 2021, Heart rate: high heart beats per minute (High) > 120 bpm and high heart beats per minute (High) > 100 bpm. On 17-May-2021, Computerised tomogram thorax: negative (Negative) Negative for a pulmonary embolism (PE). On 17-May-2021, Electrocardiogram: inconclusive (Inconclusive) new onset atrial flutter with rapid ventricular response (RVR), no ST changes. On 17-May-2021, Full blood count: normal (normal) normal. On 17-May-2021, Heart rate: high heart beats per minute (High) 115-150 bpm. On 17-May-2021, Mean arterial pressure: inconclusive (Inconclusive) > 75. For mRNA-1273 (Moderna COVID-19 Vaccine)

(Intramuscular), the reporter did not provide any causality assessments. The patient denied any history of sleep apnea. He denied fevers, night sweats, shaking, chills recently and denied any other complaints of chest pain, dyspnea or lightheadedness. He was not an alcohol user and had no new prescriptions. He had no history of thyroid disease and had not been diagnosed with chronic obstructive pulmonary disease. No concomitant medications were reported. Patient was hemostable throughout his emergency department stay. The patient got converted to sinus rhythm overnight and got discharged to home on 18-May-2021. Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. Patient's cardiovascular risk factors are an important confounder for the event atrial flutter.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. Patient's cardiovascular risk factors are an important confounder for the event atrial flutter.

1366903	6/2/2021	NC	37	M	3/10/2021	4/13/2021	chest pain that was sharp; feels an occasional slight chest discomfort; Elevated troponin levels; Blood pressure was ranging around 140/90; achy; fever 102; felt tired; This spontaneous case was reported by a consumer and describes the occurrence of CHEST PAIN (chest pain that was sharp) in a 37-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 008B21-2A and 026A21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No medical history was provided by the reporter. Concomitant products included FLUTICASON PROPIONATE (FLONASE [FLUTICASON PROPIONATE]) and AZELASTINE for an unknown indication. On 10-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 12-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 13-Apr-2021, the patient experienced MYALGIA (achy), PYREXIA (fever 102) and FATIGUE (felt tired). On 16-Apr-2021, the patient experienced CHEST PAIN (chest pain that was sharp) (seriousness criterion hospitalization), TROPONIN INCREASED (Elevated troponin levels) and BLOOD PRESSURE INCREASED (Blood pressure was ranging around 140/90). On 24-May-2021, the patient experienced CHEST DISCOMFORT (feels an occasional slight chest discomfort). The patient was hospitalized on 16-Apr-2021 due to CHEST PAIN. On 16-Apr-2021, TROPONIN INCREASED (Elevated troponin levels) had resolved. At the time of the report, CHEST PAIN (chest pain that was sharp), MYALGIA (achy), PYREXIA (fever 102) and FATIGUE (felt tired) was resolving and BLOOD PRESSURE INCREASED (Blood pressure was ranging around 140/90) and CHEST DISCOMFORT (feels an occasional slight chest discomfort) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 16-Apr-2021, Blood pressure measurement: 140/90 (High) His normal rage is 120/70. On 16-Apr-2021, Catheterisation cardiac: normal (normal) normal. On 16-Apr-2021, Echocardiogram: normal (normal) Normal. On 16-Apr-2021, Electrocardiogram: normal (normal) normal. On 16-Apr-2021, Pulmonary function test: clear (normal) Lung test was clear.. On 16-Apr-2021, Troponin: elevated

1367692	6/2/2021	CA	17	F	4/25/2021	5/26/2021	<p>Thrombosis, Syncope, Erythema, Palpitations, Feeding disorder, Chest pain, Rash macular and Myalgia cannot be excluded, while company causality for Incomplete course of vaccination is assessed as not applicable.; Sender's Comments: Very limited information regarding these events has been provided at this time. Further information has been requested. Company causality for events Thrombosis, Syncope, Erythema, Palpitations, Feeding disorder, Chest pain, Rash macular and Myalgia cannot be excluded, while company causality for Incomplete course of vaccination is assessed as not applicable.</p> <p>Follow up report - The symptoms - severe headaches; shortness of breath; difficulty breathing; chest pain and throat pain with activities - even if he walked across the room he had this pain along with the shortness of breath; body aches and fatigue. He is an athlete and not able to do any of the sports - he starts breathing heavily when he walks across the room. He couldn't attend school for over a month. Has been to several physicians - a pulmonologist several times; cardiologist; gastroenterologist; his pediatrician. He got a steroid shot - 24th, given to him for the headaches. Last Monday, the 24th of May (the pulmonologist gave this to him). It (the headaches pain) was really bad on Tuesday, Wed, Thursday and he started feeling better with the headaches on Friday. He has been given an inhaler and Pepcid for acid reflux (gastroenterologist). These have given him a little relief - but he don't know if it's the steroid shot or the inhaler that is helping. Yesterday he tried to go to his Sports class and he couldn't do it - there was a problem with breathing; a lot of shortness of breath. The headaches and the breathing issues are still what are debilitating him the most.</p>

1367129	6/2/2021	CA	43	M	3/27/2021	3/31/2021	chest pain made him go to the emergency room because it was too much, it was multiple throughout the day not just one time; his penis sensations are a lot different; has had a bad headache where it feels like he has vibrating inside of his head, in his chest and in his abdomen; when he falls asleep he wakes up in an hour; getting shocked in the middle of the night when he is sleeping- in his chest and intestines; getting shocked in the middle of the night when he is sleeping- in his chest and intestines; limbs twitch; This is a spontaneous report from a contactable consumer. A 43-years-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 Vaccine, solution for injection, Lot Number: ER8732; Expiration Date: 31Jul2021), 1ST DOSE SINGLE via an unspecified route of administration, administered in Arm Left on 27Mar2021 for covid-19 immunisation. The patient medical history was not reported. The patient's concomitant medications were not reported. The patient experienced chest pain made him go to the emergency room because it was too much, it was multiple throughout the day not just one time, has had a bad headache where it feels like he has vibrating inside of his head, in his chest and on 31Mar2021, when he falls asleep he wakes up in an hour 31Mar2021, getting shocked in the middle of the night when he is sleeping- in his chest and intestines on 31Mar2021, getting shocked in the middle of the night when he is sleeping- in his chest and intestines on 31Mar2021, limbs twitch on 31Mar2021, his penis sensations are a lot different. It was reported that 5 days after he got the first dose of the COVID vaccine he started getting pains and the major thing is at night. If he falls asleep, he wakes up in an hour and that has been every night for a month and a half. That is the main thing that is pissing him off. He confirms that he is having issues with his chest and his intestines like he mentioned previously and he has started keeping track and has kept a journal of the pains. This stuff is new. He has never experienced this before and it has been happening every day starting 5 days after when he got the COVID vaccine. He had the COVID vaccine on 27Mar2021 and on 31Mar2021 he got the first shock in his chest at 0120 in the morning when he was sleeping. Then that went on for a week, he had it on 31Mar2021, 01Apr2021, 02Apr2021, 03Apr2021 and 04Apr2021 where he was getting shocked in the middle of the night when he is

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

sleeping. On 04Apr2021 he had to go to the emergency room and have them look at him. But since 31Mar2021 he has been getting up every hour after he falls asleep. This was all worse when it first started because he has never experienced anything like this. The first shock he had was a hard feeling in his chest and then he couldn't go back to sleep. It is so bad. After he went to the emergency room, that is when it started being not as much of a shock pain that woke him up but he was still waking up every hour. The pains are in his upper chest and in his intestines. Also his limbs twitch and he has had a bad headache where it feels like he has vibrating inside of his head, in his chest and in his abdomen. He confirmed that these also began on 31Mar2021 and have been happening whenever they want and he has never experienced all of that before. Never. Everything has all stayed the same. The sad part is that he just thinks that he is getting used to this "new normal" because he is now going on the second month of this and his body is adapting but this is not normal. Also, he guesses that he shouldn't be shy now but the last thing is that his penis sensations are a lot different and he didn't notice until the first time that he was having relations with his wife after the COVID vaccine and it is all different. He noticed and she did too as far as whenever they were trying to have relations. It has been more than once, it has been every time they have tried afterwards. He says his doctor is going to send him to a sleep lab but he wasn't expecting that. He thought that maybe he would need to go somewhere else. But there he will go to sleep and be hooked up and they will read his whole body and tell the reason why he is waking up every hour. The outcome of the event headache, sleep disorder, chest discomfort, muscle twitching was not recovered and penis order, headache was unknown. No follow-up attempts are needed; information about lot/batch number cannot be obtained.

1367190	6/2/2021	OR	67	F	2/18/2021	2/28/2021	bradycardia and tachycardia episodes; bradycardia and tachycardia episodes; sudden onset chest pain; small vessel stroke in her brain stem; diagnosed with dysautonomia; diagnosed with POTS; Shortness of breath; fine hand tremors; burning hand syndrome; GI burning and belching / burning abdomen; GI burning and belching; blood pressure issues; chest discomfort; exercise intolerance; little waves of hot flashes; O2 sat variations; not well; light headedness and profound weakness; light headedness and profound weakness; This is a spontaneous report from a contactable nurse (patient). A 67-year-old female patient received BNT162B2 (lot number: EM9809 or EM9509) second dose on 18Feb2021 (vaccination age 67-year-old) on left arm at single dose for COVID-19 immunization. Medical history included ongoing Trigeminal neuralgia from Dec2020 (diagnosed 5 month ago after shingles vaccine), continuously being worked up by her primary for autoimmune disorders, she had a stroke in her brainstem. Concomitant medications included carbamazepine (TEGRETOL) for Trigeminal neuralgia (Has been taking for 5 months since being diagnosed with trigeminal neuralgia. She mentions its the only thing that calms the nerve down). Historical vaccine included BNT162B2 (lot number: EN5318) first dose on 25Jan2021 (vaccination age 67-year-old) on forearm left deltoid for Covid-19 immunization and shingles vaccine Shingrix on 17Dec2020 (vaccination age 67-year-old) for immunization and developed a neuropathy (3-4 days later) and trigeminal neuralgia 4 days post-shingles vaccine. 10 days post second dose of Covid vaccine (28Feb2021), she developed sudden onset of chest pain and lightheadedness and profound weakness. She was driving to her son's house and got to the nearest hospital and she was worked up for a blood clot and a heart attack. Everything came up negative but she had bradycardia. So, she was put on a 20 day monitor and she had signs of tachycardia, bradycardic episodes with activity and exercise intolerance. She is still continuing with the chest pain and she ended up in the emergency room two more times, hospitalized once, and she had a angiogram. The cardiologist gave her a diagnosis of POTS and the internal medicine gave her a diagnosis of dysautonomia. She is continuously being worked up by her primary for autoimmune disorders. Finally, her

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

primary doctor threw up her hands and said "I don't know" because she continued to have other symptoms like light headedness, and shortness of breath. Of course, it is all linked to random surges of fine hand tremors and her heart would start racing where she may just be standing at the sink. Cardiology didn't want to do anything with her because she was in normal sinus rhythm. The caller explains she was told they saw a lot of tachycardia and bradycardia but she was in normal sinus rhythm, she didn't belong with a cardiologist. Five months ago, she got the shingles vaccine and developed trigeminal neuralgia 4 days post-shingles vaccine. At that point they did an MRI of the brain, thinking maybe she had MS because that is one of the side effects of MS, but she didn't. She had a normal MRI. She has been to neurology and has had a lot of testing done. She knows the long hauler's with COVID are coming up with dysautonomia. However, she has had multiple Covid tests and is very, very safe. She does not believe that she had Covid, but she does believe this may be a reaction to both the shingles vaccine with the trigeminal neuralgia and the Covid vaccine. Before these vaccines, she was on absolutely no medications and was completely healthy. These 2 vaccines, whether it's in her genetic system or whatever, but she continues to have GI burning, belching and burning hands. They did another MRI and found she had a small vessel stroke in her brain stem. There are so many things that are happening to her right now. She is also seeing rheumatology. She just is not well. Though the CDC doesn't know about her newer symptoms, she reported to the CDC what she had at the time. They haven't gotten back to her on either of them. Five months ago was the shingles vaccine and she would have thought they would have reached back out to her because it is truly too coincidental that she takes a shingles vaccine and 3-4 days later develop a neuropathy, and the shingles vaccine is supposed to prevent neuropathy. She is so active. She walked coast to coast, and now literally just even walking up a flight of stairs, her heart rate goes up to 115 to 120. She can be at rest and her heart rate can be in the 40's. She is also having blood pressure issues as well. Her blood pressure can be 89/46 and then be 152/90, so she is just kind of an "autonomic nervous system mess". Her primary care referred her to a neurologist and a rheumatologist whom

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

she will be seeing Wednesday. She doesn't know what other specialties she may ended up seeing. The MRI was supposed to help find reasons for all these symptoms, but in fact, all it did was add another condition to her already perplexing condition. She submitted one report via CDC for the shingles vaccine on 17Dec2020, which three days later, she had trigeminal neuralgia. Her symptoms are ongoing and it's not disappearing like she had hoped. It keeps progressing and she keeps getting new symptoms. Sudden onset chest pain: Was 10 days after the vaccine, while driving to her son's house. She also developed light headedness and profound weakness. She went to the hospital (ER) and was sent home. 3 days later, she was still having significant chest pain so she went back into the ER. She was on a monitor that was showing all of these tachycardic and bradycardic episodes. She wasn't getting contacted but she was still having pain. The third time she went into the ER, she was admitted to the hospital. They transported her to cardiac care and they did an angiogram, which is when she was given the diagnosis of dysautonomia and POTS. The neurologist says that she does not have POTS because she is not presenting with consistent orthostatic hypotension and tachycardia when he does the TILT test. However, she has a lot of autonomic symptoms, so the doctor decided to do an MRI. Her previous doctor was doing all of this autoimmune testing that was coming back negative. She was tested for an adrenal tumor and had urine tests which got ruled out because she is surging, it is obvious she is having adrenal surges. The caller doesn't believe her doctor was convinced he would see anything on the MRI, so when he called her and told her she had a small vessel stroke in the pons/ medulla area, he thought maybe it could attribute to the symptoms. However, these new GI symptoms she is having does not fit. Therefore, they are continuing to do more studies like gastric emptying, a skin biopsy, CAT scan and an angiogram. She is meeting with a rheumatologist on Wednesday. She also adds she will probably do an MRI of the abdomen because she is having such a burning abdomen. She is waking up in the middle of the night with her abdomen just on fire. It seems like she is continuing to just add new symptoms. The chest pain goes away and she only gets it when she gets tachycardia or when she is taking a walk- it's not

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

having it continuously. She had burning hand syndrome, it was burning hands in a bath, which that that lasted an hour when she was getting out of the bath and she hasn't had that since. Everything is kind of a weird conglomerate of dysfunction, like the blood pressure variations, O2 sat variations. She just wants answers. She is adjusting and adapting. But, she does want to bring this to Pfizer's attention because maybe genetically there is something in her that even though the COVID vaccine is not a live virus, the idea is to mimic the live virus to give you immunity, and long hauler's are experiencing some of these symptoms that she is having, Not that Pfizer is going to do anything differently- she is still encouraging vaccines and she is not telling many people because she doesn't want people to use this as an excuse to not get the Covid vaccine. Caller confirms the dates of all of these events were reported to the CDC. Her doctor would have all of the dates including the dates of the angiogram, ER visits, the findings, and then the testing dates. Dates are unknown by the caller. She confirms she was in the emergency room 3 times, she was admitted and transferred to Cardiac care on the third time. She believes she was admitted for 3 days. She believes she was admitted in the evening, they did the angiogram the next day and she was discharged the following day. The MRI that was sent in 01 Dec 2020 was negative for anything. The MRI that was done last Thursday, 07 May or 09May2021 showed an infarct. So, she did have an MRI that was clear in December and then the recent MRI showed the stroke. They are doing a CAT scan angiogram 28May2021. She explains she has no lifestyle history for developing a stroke. She wasn't even on baby aspirin or any statins. Now, they are now wanting to put her on statins. Before this, she had no history. She confirms her ER visits and one hospitalization were after the COVID vaccine and was all based on chest pain. The caller confirms the only thing that happened to her after the shingles vaccine was that she was in excruciating pain and then the doctor got an MRI going and determined she had trigeminal neuralgia. She was never hospitalized or went to the ER for the shingles vaccine. The chest pain she still gets on and off. Last night, she had it. She can get chest pain when she is walking. The chest pain is not continuous and consistent, it's more based on activity. Last night, her

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

whole intestines were burning and she noticed "oh I'm feeling some chest discomfort". She is not worried about the chest pain anymore because she knows it is either a bradycardia that her chest is unhappy with or tachycardia that her heart is unhappy with and it's giving her discomfort. Her heart rate can literally go from 50 (which is bradycardic) to 120 in less than 5 -10 seconds. Her heart just goes racing like she is having a marathon, that's how fast it goes. It will last this way for a minute and her heart rate will eventually meander it's way down so that's why she thinks she is getting chest pain. She works with elders and wanted to keep the world and community safe. She wanted to get back into the world and see her mother who is in a nursing home. Caller mentions she was taking 200mg twice a day of the Tegretol (before the COVID vaccine). She had to up her dosage because she had another outbreak so now her dose is 300mg, twice a day. She clarifies a tooth infection flared up her trigeminal neuralgia. All of the auto immune results were negative, except the MRI, which she thinks is the only thing that was positive. She is doing an autonomic test in September. At this point, her doctor has given a diagnosis of dysautonomia and she is presenting as such. Her neurologist is needing verification and so he is not giving her a diagnosis even though she has all of the symptoms of dysautonomia. Vaccination Facility Type: administered it to their elder care home. The event chest pain required a visit to Emergency Room and Physician Office (has weekly telephone visits because she keeps getting different symptoms. They are scratching their heads trying to figure out what other testing is needed. She is now developing little waves of hot flashes and is not having a fun time. She was living a very healthy lifestyle and was always energetic previous to this). The patient was hospitalized for 3 days. Family Medical History Relevant to AEs was No, other than her mother has hereditary angioedema. She hasn't been tested so does not even know if that is significant. She knows she has been reading about long hauler's having dysautonomia and a whole array of neurological symptoms. It is kind of intriguing as well as kind of suspicious. Everything is being managed well by her primary doctor who is very concerned and is doing everything she can to try and find and answer. The caller is very curious if there is a lot of

VAERS_ID RECVDDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

funding, would she be put into a link and a pool to be involved in some studies or something? Is it something genetic? There is certainly enough money out to do this work. Caller is questioning if she would get a booster given that she is questioning if she should get a booster because she doesn't know. She doesn't know if she is going to get the second shingles vaccine. She does not know what it could result in for her given these 2 complications with these 2 vaccines. Causality: Because she had the shingles vaccine and developed trigeminal neuralgia, which is a neuropathic, and then getting the Covid vaccine and having all of these symptoms, it is just too coincidental. She is going to talk to her doctor about MS since she is presenting with gut things which is more "MS-ish". MS is hard to diagnose so she doesn't know, they are still testing. At this point, because all the boxes checked besides the last MRI, she is leaning towards the COVID vaccine being the cause of her symptoms. The causality for event sudden onset chest pain was related. The outcome of the events was unknown. Information about batch/lot number has been requested.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events bradycardia, tachycardia, chest pain and brain stem stroke cannot be excluded. The available information upon initial assessment is limited, especially as a definitive diagnosis was not available. The patient was reported to have pre-existing trigeminal neuralgia and previous brainstem stroke and is being worked up for autoimmune disorders; the role of these conditions in the development of the symptoms also cannot be ruled out. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

1367240	6/2/2021	ME	18	M	5/7/2021	5/1/2021	Severe fatigue; Right hand started twitching uncontrollably; Had pain but it did not go across chest like after first dose vaccine; Had numbness down arms and legs; Had vertigo really bad; Was very hot, no fever, but radiating heat; Muscle pain; Mind numbing migraine pain in the caller's son's head; Body was hot all over, and his skin turned red; had periodic pins and needles with the numbness; Dizziness; Difficulty sleeping; Chest tightness periodically, but not consistently; Chest pain; Ear ringing; General malaise; Can't walk to the end of the block without coming back in pain; Found it hard to concentrate; Cloudy head; This is a spontaneous report from a contactable consumer (patient's mother). An 18-years-old male patient received of bnt162b2 (BNT162B2, Formulation: Solution for injection) via an unspecified route of administration in left arm on 07May2021 12:10 (Lot Number: EW0183; Expiration Date: 31Aug2021) as 2nd dose, single dose for COVID-19 immunisation. Medical history included Lyme disease ongoing from 2013 and it was reported that her son had no tick bite & was diagnosed through a blood test. Her son had fatigue, migraines, lethargy & the doxycycline made him sick as a dog. A chiropractor had success using various tinctures & after 1 to 1-1/2 years, her son went into remission. Her son has a low degree of pain & soreness & has learned to deal with the pain. When his immune system is triggered, his Lyme disease comes back & he takes tinctures for a week or 2 & his symptoms goes away. No further details provided. The patient's concomitant medications were not reported. The patient previously received first dose of BNT162B2 (Lot number: EW0164 and Expiry date: 31Aug2021) administered in left arm for COVID-19 immunisation and experienced chest pain, headaches and light-headed. Patient also had his first HPV Vaccine, laid out flat for a week and had no problems with the meningitis. On 07May2021, after second dose of vaccine administration, the patient had pain but it did not go across chest like after first dose vaccine, numbness down arms and legs, really bad vertigo, was very hot, no fever, but radiating heat, muscle pain, dizziness, mind numbing migraine pain in head, body was hot all over, skin turned red and right hand started twitching uncontrollably. On an unspecified date in May2021, the patient had periodic pins and needles with the numbness, difficulty sleeping, chest tightness

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

periodically, but not consistently, chest pain, severe fatigue, ear ringing, general malaise, can't walk to the end of the block without coming back in pain, found it hard to concentrate and cloudy head. It was reported that the caller's son had the pain but it did not go across his chest like after the first dose Pfizer Covid 19 vaccination. The caller's son had numbness down his arms and legs and her son's legs were real heavy. The caller's son had to help lift his legs to get his legs to move. The caller's son had vertigo really bad. The vertigo was so bad the caller's son had to lay down on the stretcher as the vaccination site. Even sitting up, the caller's son's world was spinning. The caller's son had to lay down. It was very hot, no fever, but radiating heat: The caller's son was very hot, no fever, but radiating heat. Part of that was the vaccination centre was not air conditioned and the caller's son was already a little uncomfortably warm when he went in. Dry ice packs were placed on the caller's son's head, went through three dry ice packs melting on the caller's son. The dry ice packs were on the caller's son's forehead and back of his neck and the injection site. The caller was trying to give her son coolness the best she could. He stayed about 30 minutes at the vaccination site and nothing improved or got worse. He was still very heavily dizzy or whatever and got in the wheelchair and got home. The caller's son did nothing for the rest of the day or weekend. The caller's son was just in so much pain and so much dizziness, it was just too much to do anything. The caller's son's symptoms gradually improved but very minute. The amount of dizziness the caller's son had was a little less so he could sit up at the computer, but even that the caller's son had to take breaks and couldn't do it for more than 30 minutes before laying back down. Had pain but it did not go across chest like after first dose vaccine: The caller's son's pain was a little less intense. The caller's son's numbness by Monday, 10May2021, had subsided for the most part. The caller's son is still having numbness down his arm, the opposite arm the caller's son received the second dose Pfizer COVID-19 Vaccine. The caller's son is also having numbness in his thighs sometimes, but not constantly. Clarifies the thighs or upper legs. The caller took her son to a Chiropractor and the Chiropractor gave her son a couple supplements to detoxify. That seemed to actually make things worse.

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

The caller also took her son to the doctor's office. The caller took her son to a Chiropractor and the Chiropractor gave her son a couple supplements to detoxify: The caller states these were Charcoal and Magnesium combination and Turmeric root extract. Reporter made her son hydrate and use the generic Acetaminophen 500mg Caplets, along with a pain tea. The pain tea was loose herbs of valerian root, peppermint, and skull cap and pain tea seemed to help her son more for his pain, and mask some of the general malaise, and allowed her son to study for his AP Calculus exam. Patient's pain went from an 11-12 and was now at a 6 or 7. patient had a high tolerance for pain, and could cope with the pain, but the pain made it difficult for him to concentrate. Patient's migraine pain was unbearable at times and made it difficult for him. The generic Acetaminophen 500mg caplet with the pain tea helped to manage so his migraine pain was not so extreme. Therapeutic measures included Liposomal Resveratrol 38mg Curcumin from turmeric root extract 100mg, dietary supplement (Lot: 00728B or 007288). She has reported that she had been giving her tylenol for muscular pain and migraine. Other treatment included: alternating between Advil (Liqui-Gels) and Tylenol (generic acetaminophen 500mg caplets), Advil Liqui-Gels 200mg Ibuprofen (UPC Number: 0573176914, Lot Number: R77157, Expiration Date: Mar2022), Generic Acetaminophen 500mg Caplets, NDC Number: 21130-111-90, Lot Number: 1AV1505 and Expiration Date: Nov2022). Reported in the evenings her son would take Advil PM (200mg Ibuprofen with Diphenhydramine Citrate 38mg), NDC/UPC Number: Unknown, Lot Number: EG1024 and Expiration Date: Jun2023. Reporter said that Advil didn't seem to work on her son's migraine headache like the Advil usually does. Outcome of the events pain but it did not go across chest like after first dose vaccine, numbness down arms and legs and vertigo really bad, muscle pain, mind numbing migraine pain in the caller's son's head, periodic pins and needles with the numbness, right hand started twitching uncontrollably, chest tightness periodically, but not consistently, chest pain and ear ringing as recovering, outcome of the event body was hot all over, and his skin turned red was recovered, outcome of the event difficulty sleeping as not recovered and outcome of the events

							sharp chest pain randomly; dizziness; slurred speech; severe joint pains; muscle pains; fast heart rate over 100 beats per min; This is a spontaneous report from a contactable consumer (patient). A 36-years-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), dose 1 via an unspecified route of administration, administered in Arm Left on 01May2021 15:00 (at the age of 36-years-old) (Batch/Lot Number: EW0172; Expiration Date: Aug2021) as single dose for COVID-19 immunisation. There were no medical history and concomitant medications. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient did not receive any other medications within 2 weeks of vaccination. The patient had no known allergies. Prior to vaccination, the patient was not diagnosed with COVID-19. Since 05May2021 13.00, the patient started experiencing sharp chest pain randomly, then had dizziness and slurred speech. Went into ER to check out and looked all fine per CT scans and MRI. Few days later, he started feeling severe joint pains and muscle pains. Last few days, he had fast heart rate over 100 beats per min (before his resting heart rate was 50-60). AE resulted in Emergency room/department or urgent care and Doctor or other healthcare professional office/clinic visit. No treatment received for AE. Reporter assessed the event as non serious. Since the vaccination, the patient has been tested for COVID-19. The patient underwent lab tests and procedures which included RT-PCR, covid test post vaccination (nasal swab): Negative on 11May2021. Outcome of the events was unknown.

1367314	6/2/2021	GA	45	F	4/12/2021	4/12/2021	second dose: past due; burning sensation on the left side of her chest and chest pain; rapid heart beat; dizziness; chest pain; This is a spontaneous report from a Pfizer-sponsored program a contactable consumer reported (patient). A 45-years-old female patient received bnt162b2 (PFIZER- BIONTECH COVID- 19 VACCINE, Formulation: Solution for injection, Lot number and Expiry date: unspecified), dose 1 via an unspecified route of administration, in the left arm, on 12Apr2021, as single for COVID-19 immunization in ambulance center. The patient's medical history and concomitant medications were not provided. The patient's family history included hypertension. No previous immunization with the Pfizer vaccine was given. The patient was not immunized in a long time. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 12Apr2021, immediately after receiving the vaccine, the patient experienced, burning sensation on the left side of her chest and chest pain, rapid heartbeat, dizziness and second dose was past due. No additional vaccines administered on same day. The patient did not visit to emergency room or physician Office. They told her to wait another 15 minutes. Caller received her first Pfizer Covid 19 Vaccine on 12April2021. Immediately after receiving the vaccine caller experienced a rapid heartbeat, dizziness, burning sensation on the left side of her chest and chest pain. Symptoms went away within 30-40 minutes. Caller questioned if she should receive the second Pfizer Covid 19 Vaccine. Got response. From the attached document no info under side effects/adverse reaction in reference to the chest pain & burning in the chest. Under who should not get the PFIZER-BIONTECH COVID-19 VACCINE and get response like you should not get the Pfizer-BioNTech COVID-19 Vaccine if you had a severe allergic reaction after a previous dose of this vaccine had a severe allergic reaction to any ingredient of this vaccine. Caller stated she believed she got the vaccine on 12Apr2021, but she was not sure. She no longer has the vaccine card with her to verify the vaccine date at this time. Caller states she was past due, she had something come up and couldn't get the second dose. She was scheduled to get the second one coming Thursday, on 27May2021. She was due two or three weeks ago for the second one, so she was past due. It was in April that she got the first dose. She was

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

supposed to get the second one the Friday before a holiday. Caller clarified her reaction to the Pfizer Covid-19 Vaccine as rapid heartbeat, some pain in chest and some burning. It was given in the left arm the burning stemmed from that side only. Also had a little dizziness. Her reactions started a couple minutes after receiving the vaccine and went away within thirty to forty minutes. No relevant tests were done. The outcome of the event second dose: past due was unknown and recovered for other events on 12Apr2021. Information about batch/Lot number has been requested.

There is no information on any other factors potentially associated with the event(s).
1368264	6/2/2021	HI		38 F	5/14/2021	5/14/2021	Within a couple of hours I had intense stabbing chest pain. It felt like constant heart attacks. Yes, I should have gone to the ER, but I was alone with my kids and was worried about calling an ambulance. The pain in my left chest around my heart was excruciating and pretty constant. I read that it may be myocarditis so I self-treated with OTC anti-inflammatories. That seemed to help. So I waited 4 days taking lots of Ibuprofen before I felt up to going to the doctor. They ran tests, but the symptoms had subsided greatly by then so they didn't diagnose it precisely. I am way too scared to get the 2nd dose. I feel like I wouldn't survive it.

1366971	6/2/2021	PA	66	F	2/2/2021	2/2/2021	This is a spontaneous report from a contactable pharmacist. This pharmacist reported for a 66-year-old female patient. A 66-years-old non pregnant female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot number: EI3246, Expiration date: unknown), via intramuscular route of administration, in Arm Left on 02Feb2021 at 09:00 AM (at the age of 66-years-old) as single dose for Covid-19 immunization at hospital. The patient medical history included migraines, depression, high cholesterol, melanoma, bladder carcinoma, cholecystectomy, hysterectomy. The patient received the medications within 2 weeks of vaccination included aspirin, Depakote, Lipitor, vitamin D, omega-3. The patient also received first dose of BNT162B2 (Solution for injection, Lot number: EI3246) via intramuscular route, in Arm Left on 12Jan2021 at 14:00 PM (at the age of 66-years-old) as single dose for Covid-19 immunization. Patient was not diagnosed with COVID-19, prior vaccination. Patient has not been tested for COVID-19, post vaccination. On 02Feb2021, she had her second dose of COVID-19 vaccine this morning. She was fine for 15 minutes and return to work. On 02Feb2021 at 09:15 AM, She felt flushed and her entire head felt numb. She also felt like her heart was racing. She did return to employee health, and they gave treatment as Claritin and Pepcid orally for the events. She stated that she was feeling better now. She denies any chest pain or shortness of breath. The patient went to emergency room/department or urgent care due to an adverse events. The outcome of all events was recovered on an unspecified date. No follow-up attempts are possible, No further information is expected.

1368390	6/2/2021	NC	36	F	5/25/2021	5/25/2021	85kg 5'4" 36yo WF with PMH asthma, anxiety, celiac dx, heart palpitations, lumbar disc dx, migraine sciatica, allergy to shellfish and fish and multiple drug allergies presented to get her second dose of Pfizer Covid-19 vaccine on 5/25. First dose had been given 5/2/21 (lot # #EW0179) in left deltoid. After 1st shot, patient had neck and arm pain and diarrhea the first 12 hrs. Sought medical attention at urgent care on 5/7 for back ache, low grade fever, sore throat, foggy headed feeling, mild intermittent nausea and diarrhea. Symptoms attributed to Covid19 vaccination. Second Covid19 vaccine (same lot) given in left deltoid at 1536 5/25. 5 minutes after receiving the vaccine, patient complained of tongue tingling, feeling flushed, sharp chest pain, burning on face, itching and SOB. Patient had rash on check and neck. Hives appeared. Patient wheezing. Patient reported reaction was similar to reaction to fish. Patient's own epinephrine pen was expired. Pt assisted to recline and legs elevated. VSS. BP 130/80s, HR 100's RR 20; O2 99% on RA. EMS was called. 0.3mg IM epinephrine given ~1550 while waiting. EMS treated with 50mg diphenhydramine, 20mg famotidine and ondansetron 4mg IV at 1610. Symptoms improved but returned so another 0.3mg epinephrine IM was given at 1620. Transferred to ED where patient c/o nausea, tingling of chest/lips and throat stinging. Epinephrine 0.5mg IM charted as given. Tachycardic from epinephrine administrations. Treated with dexamethasone 4mg po at 1941 as patient reported reacting to methylprednisolone. Patient discharged 5/25 PM. Patient reported recurrence of flushing, mouth tingling and nausea but refused to seek treatment at UC or ED. Advised to take Claritin or Zyrtec. Patient saw physician covering her PCP on 5/28/21. On that day, patient reported she was having waves of feeling flushed or hot over the last few days and her tongue is still slightly tingly but she denies swelling of lips or throat, chest pain, palpitations. Covid-19 vaccine allergy was added to this patient's allergy list.

1369026	6/2/2021		49	M	6/1/2021	6/1/2021	Client (received the COVID vaccine (Pfizer dose 2, lot # EW0187, expiration 6/28/2021) at 1800. At 1829, the client reported itching on his skin and in his throat. EMT, EMT #2, PHN, and RN responded at this time. The client was sitting comfortably in his chair, alert and oriented x4. The client's vital signs were as follows: heart rate 57, O2 97, respiratory rate 14, blood pressure 150/92. The client's skin was pink, warm, and dry. The client denied any shortness of breath or chest discomfort. The client was able to speak in full sentences and had no visible swelling on his face or tongue. The client declined Benadryl at this time. The client stated he has environmental allergies and has had an anaphylactic reaction to trees in the past. The client stated he has a medical history of anxiety, acid reflux, migraines, and hay fever; he takes antacids, sumatriptan, and allegra. The client stated that he took 1 allegra at 1816, but stated he didn't know the exact dosage and did not have the medication bottle with him. The client was able to speak in full sentences. At 1835, the client identified a small, red, erythematous area approximately 1 centimeter in length on the left medial area of his elbow, which he stated itched. He also stated his eyes were itching; neither eye or eyelid appeared red. The client stated his throat was dry and was offered and accepted water. The client declined Benadryl again at this time. The client was transferred to the zero gravity chair at this time, denied any dizziness during ambulation or transfer. At 1839 the client's vital signs were as follows: blood pressure 142/84, heart rate 74, O2 97%. The client stated "I had an itchy throat this morning" and said that he had a migraine that morning but did not remember if he had taken any medication for the migraine. At 1849, the client's vital signs were as follows: blood pressure 122/84, heart rate 73, respiratory rate 16, O2 99%. At 1853, the client stated "I feel less itchy." At 1900, the client initially requested Benadryl, but then refused both the medication and vital signs when offered. The client stated that his arm "still itched" but denied that it was getting worse. The client stated "I wanted a Benadryl for the road but now I think I'm going to wait." The client denied shortness of breath, chest tightness or pain, or any difficulty breathing. The client did not appear to be in any distress and had no swelling visible on his face or tongue. The client continued to chat with staff and spoke

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

with a pleasant demeanor. Education provided by PHN, EMT, and RN regarding primary care follow up and when to seek medical care. At 1915, the client requested Benadryl and stated "I think my rash is growing." The client's vital signs at that time were as follows: blood pressure 138/92, heart rate 88, O2 99%, respiratory rate 12. At 1922, the client was given 50mg Benadryl orally. At 1927, the client stated "my wife is here, it's time for me to go." RN reiterated the importance of staying for a 30 minute observation time, but the client continued to leave the building. EMT accompanied the client outside, where he ambulated with a steady gait. He walked to the outdoor observation area and then sat down, requesting to be evaluated by EMS. EMS was called by RN at 1933. The client was sitting comfortably and denied any shortness of breath or chest pain. EMS arrived on scene at 1936. At 1938, the client's vital signs were as follows: blood pressure 140/90, heart rate 60, and O2 100%. The client stated at that time that he "felt better" and declined transport to the hospital. The client signed AMA paperwork at 1945 and ambulated to his car with a steady gait, accompanied by his wife, who he stated was going to drive him to an urgent care.

1368812	6/2/2021	TX	33	F	3/16/2021	3/17/2021	After the second injection, I was experiencing what I thought was a lupus flare up. I needed to get into a new rheumatologist so that took some time getting into with my current insurance. I was experiencing a tremendous amount of joint and muscle pain. I have a Low grade fever off and on as well as my lupus butterfly rash on my face and a few sores in my nose. All symptoms I have had when dealing with a lupus flare. One thing that was different was muscles being pulled for doing very little. My back and neck muscles kept getting pulled often. Extreme dry eyes/nose- all which was similar autoimmune symptoms I have had in the past. Extreme periods of nausea, but I have been unable to take certain medications I use to be able to take. I can not take any nausea medications because it now will give me a horrible migraine that last for days. My primary doctor gave me a steroid dose pack to help me until I could get into my rheumatologist and I had a horrible reaction to them with extreme diarrhea, nausea, vomiting, and migraines. None of those symptoms to medications has happened in my past. My symptoms started was a gradual increase over the time period after getting my vaccine. Not all at once. But after about a week after getting the vaccine it started to happen slowly to the point where I am today. The doctors ran various test for my lupus and all of my inflammation lab markers came back extremely high. But none of my lupus/autoimmune markers came back as active. I also ended up going to the ER concerned with chest pain- but after many test nothing was conclusive or found. I have a follow up with a cardiologist pending

1367170	6/2/2021	CA		M	5/14/2021	5/17/2021	Shortness of breath/ woke up at 3am with shortness of breath; felt like he was having an angina attach; chest pain; chest pain and tightness; allergic like reaction; an aching pain; heart disease; This is a spontaneous report received from a contactable consumer (patient). A 57-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 14May2021 as single dose for Covid-19 immunization. Medical history included heart disease (patient had a history of heart disease and he had heart surgery in 2008. Patient did not take heart disease medications). The patient's concomitant medications were not reported. Historical vaccine included the first dose of BNT162B2 for Covid-19 immunization and was observed for 15 minutes and he felt fine and when he got home then he started feeling light headed and tired. Patient had the second dose on 14May2021 and patient woke up at 3am on 17May2021 with shortness of breath and he felt like he was having an angina attach which he had had before. Patient had chest pain and tightness, like an allergic like reaction. His chest was still having mild pain but not as severe. He woke up at about 03:00 this morning, on 17May2021 and started feeling shortness of breath. After the Pfizer BioNTech Coronavirus Vaccine shot on 14May2021 he was feeling great, fine. This morning the shortness of breath just hit him, an aching pain. He had heart disease for one thing; and he consulted with the nurse, informed her that he had heart disease; and she mentioned this won't affect anything to do with your heart disease. When he was feeling shortness of breath it was kind of like an allergic reaction so he wanted some more information on this, to see if that had anything to do with the Pfizer BioNTech Coronavirus Vaccine. Patient clarified he was not having the shortness of breath at time of the call, but had ongoing tightness of chest. Outcome of events shortness of breath was recovered and tightness of chest was not recovered and the other events was unknown. Information on the lot/batch number has been requested.

1369790	6/2/2021		14	M	6/1/2021	6/1/2021	<p>Client received his 1st Pfizer vaccination (Lot# EW0187, EXP 08/31/21) in his left arm at 19:15 from RN. Client's parents and sister were with him. Client's parents only spoke Spanish and an interpreter was present. After receiving his shot, client sat in a chair next to his sister while RN administered a shot to her. Five minutes later client stated he felt nauseous. RN immediately called out to Vaccine Runner RN and Check-in Nurse who were in the hallway to get an EMT. Check-in Nurse radioed for an EMT to come to station 3 while Vaccine Runner RN rushed to the EMT room to ensure an EMT got the call. Check-in Nurse stayed with the client and placed a trash can next to him in case he vomited. RN stated the client looked pale and clammy. At 19:26 EMT1 arrived at station 3 and collected the client's medical history. Interpreter was also translating the EMT's questions and statements to the client's parents. Client stated he had no known allergies, no underlying conditions, and is not currently taking any medications. Client also stated he was not experiencing shortness of breath, chest pain, or having trouble breathing. EMT2 arrived at station 3 at 19:27 and brought the client a vomit bag. The client had not vomited, but still felt nauseous. EMT1 gave the client a bottle of water and juice, and took client's vitals at 19:28 (HR: 64, BP: 120/70). Client stated he felt a lot better. While walking out of station 5 Lead RN saw individuals grouped together at station 3 with the EMT and arrived at station 3 at 19:28. Lead RN was updated on client's status. Lead RN observed that the client was mildly pale and clammy and asked client's mother if his current coloring was normal for the client. Interpreter translated to both parents and client's mother stated that the client did look a little pale. Client stated he felt better and was just nervous about getting the shot. At 19:30 Lead RN asked client to try and stand up. Once client was standing, Lead RN asked client if he felt dizzy and client stated no. Client stated he felt just fine. Lead RN and EMT's directed the client to the observation room to sit in a zero-gravity chair for additional monitoring of 30 minutes. EMTs walked the client and his family to the observation room and sat him in the zero-gravity chair. Client stated he felt much better and at 19:47 EMT1 took client's vitals (HR: 66, BP: 100/70, SpO2: 98). EMT1 stated client's color was returning. EMT1 took client's vitals again at 20:04 (HR: 67, BP: 104/78, SpO2: 99).</p>

Lead RN arrived in observation room at 20:10 with Lead Ancillary to check on client who stood up and stated he felt good. Lead RN observed that client was no longer pale or clammy. Lead RN educated parents and client on potential side effects vs adverse effects of the vaccine. Lead RN further instructed client and parents to see the client's HCP or visit urgent care if client started to experience additional common side effects for more than 24-48 hours and to call 911 if the client began to experience trouble breathing, shortness of breath, or chest pain. Lead Ancillary translated all the information to the client in Spanish. Lead RN observed the client leaving with his family at 20:15. Client left walking with a steady gait.

1368434	6/2/2021	OH	29	M	4/24/2021	4/25/2021	Chest pain with exertion beginning night of Sunday (4/25). Increased chest pain with exertion through Monday morning and afternoon. Went to ER to get checked Monday evening. Admitted due to elevated troponins. Stayed in hospital for 2 nights. During stay had echocardiogram and heart cath done due to troponins continuing to elevate. These showed clear and ruled out anything serious like a blockage. Discharged Wednesday afternoon to rest at home with MRI scheduled for Friday morning. Appointment with cardiologist Monday after the MRI and given the diagnosis of myopericarditis. Still resting at home and avoiding strenuous activity to recover fully.
1368447	6/2/2021	WA	47	F	5/4/2021	5/7/2021	3 days after receiving my 2nd Covid shot I had sharp pains in my chest that progressed to constant pressure. I went to Urgent Care when I also became light-headed and my left hand was going numb. They immediately did and EKG, which was abnormal, and sent me to the ER. I continued to have episodes of blood pressure and heart rate spiking with continuous chest pain. They did bloodwork, a chest X-ray, a CT scan of my lungs as well as 2 more EKG's. My bloodwork was elevated for heart enzymes and possible blood clot. 2 days later I was back in the ER for the same issues, 2 more abnormal EKG's and a chest X-ray. I saw a cardiologist 3 days later, he sent me to the ER right from his office and I had a cardiac catheterization later that same day. This whole time I'd been having chest pain and pressure, shortness of breath, fatigue, high blood pressure episodes. I was allowed to go home but have continued to have chest pain ever since with no explanation. I had bloodwork drawn again yesterday, now testing for myocarditis.

1368458	6/2/2021	IL	43	F	4/8/2021	4/8/2021	Patient came to clinic yesterday, June 1, 2021. Stated she had a itchy rash to her arms, chest, abdomen, and inner thighs that started the night she received the COVID 19 J&J vaccine. She received the vaccine on 4/8/2021, but did not report the rash until yesterday. She had no other symptoms - No throat tightening, dysphagia, hives, SOB, chest pain, or flushing. On exam she has a dark pink/red, maculopapular, excoriated rash to both forearms, right side of abdomen, and inner thighs. Rash is resolving but has been there for 2 months. She had no PMH and is not taking any prescription or OTC medications.
1368868	6/2/2021	IL	71	M	4/10/2021	5/8/2021	J&J Dose 4/10/21 (042A21A) COVID Positive 5/10/21 5/10/21: This is a 71-year-old male with history of left CVA, right minimal hemiplegia, diabetes mellitus, hypertension, right lower extremity DVT, depression and obesity. The patient is saying he feels excessively weak and fatigued in the last 2 days for which he decided to come to the emergency room. He denies any shortness of breath, wheezing, cough, chest pain. He is a former smoker and does not know any history of COPD. He thinks he is passing urine regularly. He denies any polyuria, nocturia, difficulty passing urine or any history of BPH. His diabetes was poorly controlled for few years and patient does not know how much insulin he is taking at this time. He took covid 19 vaccine on April 10. 5/15/21: Patient was admitted on the 10th with complaints of weakness, fatigue going on for at least 2 days. Patient was diagnosed with COVID-19 positivity. Chest x-ray showed bilateral airspace disease. Patient also had acute renal failure. Patient was given supplemental oxygen, started on IV remdesivir, IV dexamethasone, IV ceftriaxone, and IV Zithromax. The patient's oxygen use was attempted to wean down. Patient finished course of IV remdesivir, ceftriaxone, and Zithromax in the hospital. Renal function improved. Losartan was discontinued in the hospital. Home O2 walk was done today. Patient to finish oral dexamethasone. Home Health services were provided. Discharged home today. Advised to remain in isolation.

1368486	6/2/2021	IA	61	M	4/16/2021	5/19/2021	Moderna Dose 1 3/5/21 (029A21A) Moderna Dose 2 4/16/21 (027B21A) COVID Positive 5/20/21 5/20/21: Presented to ED. The patient presents with fever. 61 year old male presents to the emergency department for a fever with an onset of 1 day. Patient was diagnosed with pancreatic cancer in April 2021. Patient states he has had 2 rounds of chemotherapy but states he could not have his 3 round last week because his white count was too low. Patient is also complaining of dull chest pain that is exacerbated with deep breathing, cough, and a headache but denies vomiting, diarrhea, neck pain, dysuria, hematuria, and nausea. Patient was diagnosed with blood clots on 05/09/2021 but states that he is not having similar symptoms to when he was diagnosed with blood clots. Patient is taking Xarelto. He has never had COVID but is vaccinated. Patient sees Dr. (Name) at the UI Oncology clinic. 5/25/21: 61-year-old male on chemotherapy for pancreatic cancer, also recently diagnosed pulmonary embolism on rivaroxaban, presents with 1 day of fever. Initially, did not have any cough or shortness of breath, was admitted to the hospital, where a chest x-ray, urinalysis and examination failed to reveal an exact source of the fever. His absolute neutrophil count was less than 500, so he was admitted for neutropenic fever. Cultures were obtained. IV antibiotics started. COVID-19 was tested and, surprisingly, came back positive. The patient has actually had both of his COVID-19 vaccines and basically, does not have pneumonia, shortness of breath, or hypoxemia. We did not use any medications for COVID while in the hospital, watching for any signs of respiratory compromise, but none developed. Blood cultures were negative. He was switched from ceftazidime to doxycycline at time of discharge. Will follow up with Dr. (Name) for his next cycle of chemotherapy. Because of his COVID-19 positivity, we will not schedule any immediate followup appointments, although the patient will call if he has persistent fever, dyspnea, or signs of hypoxemia. For the past 2 days, the T- max has been 99.9, and most the time 98.6. He was seen the day of discharge, doing quite well. Blood pressure 153/80, pulse 90, regular, oximetry 95% on room air. Glucose was 210. Discharged on Rivaroxaban 15 mg b.i.d., doxycycline 100 mg b.i.d., Robitussin AC as needed for cough, Lantus 28 units at bedtime, atorvastatin 80 mg daily, aspirin 81 mg daily.

This is a 77-year-old male with history of hypertension, hyperlipidemia, dementia, paroxysmal atrial fibrillation, COVID-19 infection, chronic obstructive pulmonary disease and recent Pseudomonas pneumonia who presented to the emergency department with complaint of worsening shortness of breath. Patient reports that his symptoms started few days ago. He has been having cough and shortness of breath. Patient uses 2 L of oxygen at home. Patient reports that he was fully vaccinated for COVID-19 but then had COVID-19 infection after that. He has no chest pain, abdominal pain, nausea, vomiting or dizziness currently. In the emergency department, patient was found to be hypoxic. Patient was started on BiPAP with FiO2 of 45%. Labs showed potassium level of 5.4, negative troponin level and a normal WBC count. Chest x-ray showed patchy bilateral infiltrates along with marked background emphysema. He received nebulizer treatments and a dose of IV Solu-Medrol, azithromycin and Rocephin. 5/24/21: 77-year-old male with COPD on 2 L home oxygen, atrial fibrillation anticoagulated on Eliquis presented with worsening shortness of breath and increased oxygen requirement. Patient was admitted for acute on chronic hypoxic respiratory failure secondary to COPD exacerbation and pneumonia. Patient was treated with steroids, initially with ceftriaxone/azithromycin and later switched to levofloxacin based on sputum culture growing Pseudomonas aeruginosa. Subsequently his oxygen requirement and dyspnea improved, patient was cleared for discharge by Pulmonary team with a total 10 day course of levofloxacin and he was also given a script for steroid taper. Patient was having intermittent confusion and agitation during hospitalization, started on low-dose Seroquel 25 mg p.o. b.i.d. with good effect and discharged on same dose. Patient was discharged home with VNA and also have 24 hour care at home.</p>

1368531	6/2/2021	CA	13	F	5/14/2021	5/22/2021	On 05-22-2021, participant's mother states her daughter pain started at about 1:00AM. I took her to Urgent care because she was having chest pain, nausea and headaches. She also had 99.2F of fever but no congestion or cough. At the ER an EKG was done and it was a bit off, lab work was also performed, x-ray of the chest was also done and they gave her an Albuterol treatment. She was given IV fluids and steroids and a CT scan of the chest was also performed. After 9 hours, she was discharged home and could not find anything wrong. On 05-25-2021 I took her to her pediatrician who pushed on her chest and it hurt her when he did this, her pain level was between 5 and 8 out of 10 on VAS scale. EKG's were performed as well as lab work, x-ray of the chest at the pediatrician office. Her daughter also said her chest hurt her to exhale and inhale. The pediatrician said that her rib cage and breast bone were inflamed upon pressing on her daughter's chest and that she has s costochondritis. As of today my daughter still has nausea that comes and goes and also continues with the headaches and takes Ibuprofen as pain medication.

1368537	6/2/2021	NJ	31	M	5/5/2021	5/7/2021	I got my Covid vaccine on Wednesday, 5/5/21. That night I experienced the typical side effects (Chills, Aches, Pains, Soreness in the injection site on my right arm). By Thursday afternoon I was feeling significantly better. However, on Friday evening I started to feel a tightness and pressure in my chest and left arm and neck. The chest pain felt like I was having a heart attack but my heart rate was mostly normal. I felt shortness of breath where I couldn't get a good deep breath in and I was also nauseous and had no appetite. At times I felt lightheaded and weak. These symptoms continued over the next couple days. On Monday 5/10/21 I decided to go to the ER to get checkout since I was still having chest pains and tightness. They ran a series of tests and concluded that I was just experiencing typical aches and pains from the vaccine. My symptoms continued for another full week and at times the shortness of breath and chest pains felt really severe. By the following week I was starting to feel a little better on and off. I got my appetite back and I was able to start exercising again. After about 2 full weeks after receiving the vaccine most of chest pain and pressure + shortness of breath has disappeared and I feel better.
1368557	6/2/2021	TX	38	M	3/29/2021	3/30/2021	Mild chest pains throughout the day after the vaccine shot. Went away the following morning. No other adverse side effects except for a sore arm. No side effects upon second dose on 4/19/2021
1368778	6/2/2021	CA	45	F	5/21/2021	5/22/2021	I've been really dizzy, hard to breathe, chest pains, weird sensation going through my body and head. I've been to the e..r. twice in a week. My whole body aches.
1368468	6/2/2021	MA	19	M	5/22/2021	5/24/2021	Massive chest pain, went to urgent care told it was anxiety sent home, went to ER later due to increased pain in lower chest where ribs meet stomach, ended up with elevated ECG, then proceeded to be give anti-anxiety and a Troponin level check. Troponin was over 5 ng/mL admitted to hospital after an Echo which resulted in an MRI the next day and concluded that it was likely Myocarditis.
1368782	6/2/2021	TX	31	M	4/10/2021	5/1/2021	Minor chest pain and anxiety mostly at night.

1368614	6/2/2021	CA	22	M	5/12/2021	5/31/2021	Reason for Admission Patient 22-year-old male with a history of seasonal allergic asthma who presented to ER with a chief complaint of chest pain. He said he started having multiple episodes of vomiting/fever on Saturday morning, went to urgent care and diagnosed with sinus infection, prescribed amoxicillin, then he started having chest pain on Sunday at 4 PM, mid sternum, constant, pressure type of pain, 5 out of 10 in severity, worse with cough and deep breathing/lying down flat a lateral position, better with sitting up/ leaning forward. No radiation. Denies lifting any heavy weight or any heavy exercise. Never had similar symptoms in the past. He had his second dose Pfizer COVID-19 vaccine on May 12. He denies leg pain or swelling. His vomiting and fever resolved. ED: He was found to have troponin of more than 12,000, EKG showed diffuse ST segment elevation with possible repolarization. Transferred for possible cardiac cath/cardiac MRI. CT angio chest no PE, normal aorta, no infiltration. Pending second set of troponin, stat echo, aspirin po given in the ER. In addition to the above HPI, he reports having 2 days of fevers, chills, nausea, vomiting, diarrhea. T-max 103F. His chest pain began around 4 PM yesterday and he felt like it was initially consistent with his asthma, however it did not improve so around 1:30 AM he states they went to the ER. He states that the chest pain gets better with exertion, and is worse with deep breaths and lying on his side, or leaning forward. He did take Nyquil decongestant which contains phenylephrine. Hospital Course 22 yo M w/PMH exercise induced asthma admitted for evaluation of CP, elevated troponin to 21,292 with negative LHC. UDS Negative. EKG w/diffuse ST changes so consistent with Myopericarditis I31.9 given Recent Viral Illness resulting in first time myopericarditis, will treat per pericarditis algorithm, ASA+Colchicine w/90% response rate by 1 week. -ASA 650 to 1000 mg TID, weekly tapers if CRP normalized and sx free; will start at 650 mg dose -Colchicine 0.6 mg BID for 3 months, no taper (lowers recurrence rate, NNT = 5) -Glucocorticoid generally not indicated in first-time acute myopericarditis as observational studies suggest increased recurrence rate, but can consider if he does not adequately respond to aspirin and colchicine -Trend troponin to ensure downtrend continues -No strenuous exercise during recovery period

1368601	6/2/2021	GA	57	M	4/7/2021	4/7/2021	Severe pain in chest above my heart.
1368668	6/2/2021	CA	35	F	6/2/2021	6/2/2021	(DOB 08/10/1985) received the 1st dose COVID vaccine (Pfizer, lot # EW0187 and use by date 06/28/2021 @ 0945) at 11:00am. Patient reported having mild shallow breathing to (EMT) who immediately reported to Lead RN. Lead RN assessed the patient while (EMT) took a full set of vitals. Patient was apprehensive to receive vitals including BP and O2 saturation monitor but consented after further education from RN and EMT. Vital signs at 11:06 were BP of 132/82, HR of 94, RR of 16, and O2 Saturation Level of 97%. RN observed patient was A&O x4 with no wheezing, hives, or angioedema present. Patient denied chest pain, difficulty breathing, changes in vision, difficulty swallowing, and nausea. Patient denied benadryl, EMS, food, and transfer to a zero-gravity chair. Patient denied vitals every 5 minutes and explained that she has a history of SVT induced by anxiety. Patient reported that having vitals taken increases her anxiety and refused q5 minute vitals. Patient agreed to have vitals taken once more after 30 minutes of observation. At 1115 patient was drinking water and stated "I delivered my baby 3 weeks ago, so I am always tired." Patient explained that she has been quarantining over the last year due to her pregnancy and had increased anxiety being around so many people at the vaccine site. At 11:16 patient stated "my breathing is good now." Patient has NKDA, no chronic conditions, and a pertinent history of panic attacks and SVT induced by anxiety. At 1125, patient consented to one additional set of vitals. Vitals were BP of 144/88, HR 92, RR of 16, and O2 Saturation Level of 98%. At 11:30, Lead RN and (Co-lead) educated about Vaccination program, ER precautions, and f/u with PCP. At 11:33 patient stated that "water is making me feel much better." Patient denied SOB, dizziness, lightheadedness, and changes in vision. At 11:38 patient stated that her brother is driving her home and left the site. Co lead RN observed a steady and symmetrical gait as patient walked away.

1365963	6/1/2021	CA	28	F	6/1/2021	6/1/2021	client complained of dizziness after receiving 1st dose Pfizer Covid Vaccine. RN responded with EMT. PHN arrived shortly. Upon arrival client sitting in chair, pale, alert and oriented x4. EMT was taking vitals. Client stated feeling dizzy and nauseous 5 mins after receiving vaccine. Vitals at 1526: blood pressure 124/80, pulse 81, oxygen 99%. Client denied blurry vision, headache, shortness of breath, chest pain. 1530 client able to stand and transfer to anti-gravity chair. Client stated feeling more dizzy after getting up. PHN gave client water and instructed to drink slowly. Per client no relevant medical history, current medication or allergies. Vitals at 1532: blood pressure 124/65, pulse 83, oxygen 95%. Client stated was on a diet and last time she ate was 6 AM. At 1533 client stated nausea and dizziness improving. Skin color normal for ethnicity. Client given juice and snack. Vitals at 1546: blood pressure 123/71, pulse 72, oxygen 99%. Per client dizziness improving, nausea subsided. Client denied blurry vision or headache. Client advised to eat prior to vaccine and follow up with provider. Last vitals at 1556: blood pressure 122/64, pulse 79, oxygen 97%. Client stated symptoms had resolved. Was not driving home, friend here with here and would take public transportation. ER precautions given. Client able to stand from chair with no complaint of dizziness. Client left facility with steady gait at 1558.
1365526	6/1/2021	NJ	31	F	5/12/2021	5/15/2021	I was vaccinated on Wednesday, that day I felt fine, on Thursday I felt fatigue, fever, pain in my feet, in arm; on Friday I had severe back pain that radiated to my stomach, on Saturday morning 4:40 I was awakened by a tachycardia and afterward I had severe chest pain, I could not tolerate the pain. I went to the emergency room and they found my Troponin at 7000. They took good care of me in the hospital. They did tests on me and later on Sunday I had it again at dawn but not so strong, I am a healthy person and have not done anything out of the ordinary, the only thing different was the vaccine that I took in those days. Now I have to take medications (amlodipine, aspirin, omega, atorvastatin) I don't know for how long.

1366332	6/1/2021	NJ	44	M	4/13/2021	4/20/2021	1st shot 4/13, no issue with injection site. About a week later had trouble breathing, chest pain, felt like lungs were hurting in my back, weak, tired, couldn't catch my breath when i went upstairs and almost passed out. 2nd shot 5/04, felt pain at injection site (that was expected), that night started to get a bad headache and got worse and worse. Next morning, whole body aching, upper body, lower back, bad headache, Left underarm (lymph) swollen. 2nd day slight headache, neck ache, left underarm swollen. That night had rash on arms, chest, and stomach. 3rd day, nighttime rash arms, chest, stomach. Still red where band aid was over injection site. Over a week later still have redness shape of band aid, Seems I have sensitive skin since the 2nd covid shot. 10 days after 2nd shot I still have redness the shape of the Band Aid on my left arm. Got a red spot on my nose (looks like Rosacea). 4 weeks later, still have a red spot on my nose. I have itchiness between fingers left hand, on my face left side, neck, arms (left wrist, right arm in places) redness on chest, and rashes on back, left buttocks, and itchiness on legs. i noticed that it gets worse at night. As far as i know i did not get the Covid Virus, i did the rapid test and regular test and both were negative. But i was very sick with my stomach and had issues breathing in late 2019 and again early 2020, took medication (antibiotics) both times. I had to write on this form over and over again kept getting frozen with error from the PDF. Even if I hit OK, it keeps popping up and does not let me finish, so I can imagine that lots of people gave up, like I may. Pfizer 4/13/2021 EW0162. After 5pm Pfizer 5/04/2021 EW0170. After 2pm

1364566	6/1/2021	MI	44	F	5/28/2021	5/28/2021	<p>Patient went to ED with possible vaccine related reaction. CHIEF COMPLAINT: POSSIBLE ALLERGIC REACTION (sx p 2nd covid vax rec'd vax and was being observed developed sl dizziness and legs got weak and started shaking, en route w/ ems she felt like her tongue got thick 0.3 epi admisitered per EMS. on arrival pt is trembling but denies feeling cold, hypertensive, NSR oropharyx clear LS CTA b/l c/o feeling thirsty dry mouth after epi. obtained manual bp d/t trembling) The patient is an otherwise healthy 44-year-old female who presents to the emergency department today via EMS with concerns for an allergic reaction. The patient states she just received her 2nd Covid-19 vaccine (Pfizer) when about 15 minutes after, noticed a bilateral lower extremity weakness, dizziness, as well as dry mouth. EMS did provide IM epinephrine given at roughly 3:30 p.m.. The patient was further brought to the emergency department for further evaluation and monitoring. Patient states she has not noticed any rashes or itching, is not having any shortness of breath or trouble breathing. She states that she does have dry mouth, but is not having any sensation such as a difficulty swallowing or swelling. No headaches. No chest pain, abdominal pain, back or neck pain. No nausea vomiting dysuria or hematuria. MEDICAL DECISION MAKING The patient was seen upon arrival in the emergency department. She remained stable from a respiratory and hemodynamic standpoint. She presents status post IM epinephrine after feeling dizzy with a bilateral lower extremity weakness and shaking after the COVID-19 vaccine. On my initial evaluation, she does appear well, without any concerning propagation of an allergic response. She was monitored here in the emergency department for about 2-1/2 hours with no a change in her clinical status. She is almost 3 hours out from her IM epinephrine dose, and is feeling better. She is tolerating fluids. Does not have any posterior or pharyngeal swelling or sensations at this time, so I do feel comfortable with discharge home. Return precautions were discussed, the patient was discharged in stable condition.</p>

1364553	6/1/2021	MD	32	M	5/22/2021	5/25/2021	<p>from 5/25/21 note: 32 y.o. male with a history of DVT (left leg; on Xarelto), recurrent PE, EtOH abuse, anxiety, and depression presents to the emergency department complaining of right leg pain since the last two days. He reports to receiving his Moderna COVID-19 vaccination three days ago. Thereafter, he noticed his leg pain to occur. He also notes to intermittent pleuritic chest pain, but not currently. He notes that his leg is not as swollen compared to his previous DVT. He has full sensation and motor control of his digits. He admits to dizziness. He denies changes in breathing, abdominal pain, recent surgeries, recent travels, recent hospitalizations, or family history of blood clots. History is from the patient Old records reviewed. Last ED visit on 3/2/21 for pleuritic chest pain. Recent hospitalization 2/8 to 2/9 for pulmonary embolism in the setting of Xarelto non-compliance. US LLE Dplx (9/26/2020) DVT in the left popliteal, posterior tibial, peroneal and anterior tibial veins. US LLE Dplx (2/8/21) Nonocclusive thrombus in the left popliteal and posterior tibial veins. US RLE Dplx (5/25/21; today) DVT in the right femoral and popliteal veins. from 5/27/21 note: Patient is a 32 y.o. male with history of EtOH abuse and recurrent DVT/PE known to be noncompliant with Xarelto presenting to the ED with altered mental status. Of note patient was discharged from the hospital this afternoon where he was treated for DVT with heparin, previously on Xarelto but due to noncompliance was discharged with plan for Lovenox. Patient is alert and oriented x3, however intermittently not responding appropriately to questions and does not appear to be the best historian. Per EMS patient was found down, unresponsive in a bush. Patient admits that when he left hospital he went to gas station and drank "18 ounces of wine." EMS states when they arrived to scene patient had unsteady gait, frequent falls, no signs of significant head trauma. Patient was tachycardic in route and noted to be hypoxic in route. Patient currently complaining of mild headache but denies chest pain, shortness of breath, nausea, vomiting, diarrhea, abdominal pain, back pain or any further symptoms once again believe patient to be a poor historian.</p>

1363969	6/1/2021	CA	68	M	1/18/2021		<p>suicidal thoughts; Depression; Chest pain; Fingers go numb/my arm feels numb; lack of sleep and sleeping issues; Nightmares; Stressed out; Weakness; Runny Nose; very angry; Headache; This spontaneous case was reported by a patient (subsequently medically confirmed) and describes the occurrence of SUICIDAL IDEATION (suicidal thoughts) in a 68-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 027L20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included COVID-19 in November 2019. On 18-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 15-Feb-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On an unknown date, the patient experienced SUICIDAL IDEATION (suicidal thoughts) (seriousness criterion medically significant), DEPRESSION (Depression), CHEST PAIN (Chest pain), HYPOAESTHESIA (Fingers go numb/my arm feels numb), SLEEP DISORDER (lack of sleep and sleeping issues), NIGHTMARE (Nightmares), STRESS (Stressed out), ASTHENIA (Weakness), RHINORRHOEA (Runny Nose), ANGER (very angry) and HEADACHE (Headache). At the time of the report, SUICIDAL IDEATION (suicidal thoughts) and ANGER (very angry) outcome was unknown and DEPRESSION (Depression), CHEST PAIN (Chest pain), HYPOAESTHESIA (Fingers go numb/my arm feels numb), SLEEP DISORDER (lack of sleep and sleeping issues), NIGHTMARE (Nightmares), STRESS (Stressed out), ASTHENIA (Weakness), RHINORRHOEA (Runny Nose) and HEADACHE (Headache) had not resolved. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): In November 2019, COVID-19: positive Positive. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. No concomitant medications were provided. Treatment medications was not provided. Company comment: Very limited information regarding the events has been provided at this time. Further information is not expected. Most recent FOLLOW-UP information incorporated above includes: On 13-Apr-2021: Initial Additional information received On 04-May-</p>

On 17-May-2021: Initial Additional information received. On 20-May-2021: Initial Additional information received.; Sender's Comments: Very limited information regarding the events has been provided at this time. Further information is not expected.</p> <p>Pt is a 25M with PMH of GERD, ADHD, obesity who presented to the ED on 5/11 for chest pain. That morning he had noticed increased substernal chest pressure associated with palpitations, nausea, diaphoresis, and left arm tingling. He notes that early last year he was very sick and though he had COVID but confirmatory testing was not available at that time. After recovering from the illness he noted that he had occasionally episodes of chest pressure and palpitations. However yesterday was the worst his symptoms have ever been. He did receive his 2nd COVID vaccine this past Saturday and experienced fatigue, nausea, weakness. In the ED patient has HD stable, afebrile, saturating well on RA. Labs were notable for troponin of 5.2 which trend down to 3.1. ESR WNL, CRP elevated 2.4. EKG showed normal sinus rhythm with signs suggestive of possible pericarditis. CXR negative. CTA showed no pulmonary embolism, enlarged and prominent left axillary lymph nodes, nonspecific, cholelithiasis. Patient admitted for NSTEMI. Enlarged axillary lymph nodes likely reactive in the setting of recent COVID vaccine. Cardiology consulted. Patient underwent cardiac cath which was unremarkable. Cardiology recommends short course NSAIDs for possible pericarditis, however EKG changes unimpressive per cardiology. Discharged home on ibuprofen 400 mg TID for 5 days. Advise follow up with PCP within 1 week.</p>

1365216	6/1/2021	MD	30	F	5/21/2021	5/21/2021	I received my vaccine at 11:30 AM and had a 102 degree fever by 6 PM. I began to shake very hard and had significant chest pain in my left side by my heart. The shaking and fever subsided by that Sunday night. However, it is now 6/1/21, and I had to go to the doctor today for my chest pain. While the ECG came back clear, the doctor determined that I have Costochondritis. As this is nothing I ever encountered before, I know that is was caused from the COVID vaccine inflammation response during my fever. This is when it was first noticed. It also causes back pain since it is between the breast bone and rib cage.
1365241	6/1/2021	FL	28	F	1/30/2021	2/12/2021	Chest pains, breast pain,
1365248	6/1/2021	NH	31	F	5/15/2021	5/16/2021	The day after I experienced extreme muscle and joint pain that lasted about a week. And it started to get better but the following Saturday I got a very terrible headache. And over the course of that week I started bruising very easily and all the veins all over my body were very prominent. The headache wouldn't go away and I started to have chest pain by that monday. And at that point all the muscle and joint pain came back and it was very very painful. At that point I called my primary care provider and they scheduled me with someone else in the clinic because i was having the chest pain. And they did a test for covid and urged me to go to the emergency room, which i did. After that I went to the emergency room and sat for 5 hours, they did bloodwork to check clotting factor, basic blood panel and also a CT of my head. According to them, everything was normal and they sent me home with a terrible headache. My biggest complaint was the bruising all over my body but no one ever looked at that.
1364984	6/1/2021	MD	57	F	5/13/2021	5/13/2021	Left facial numbness, tongue numbness, lip swelling, and non-radiating central chest pain. BP and other vitals all stable. Benadryl 50mg poX1 given to offset allergic reaction prior to chest pain. When chest pain occurred, patient was advised that an ambulance was need, but patient refused. Patient stated that she would have husband drive her across the street to the emergency room. Two hours later, attempted to call number on file and phone line was disconnected.

1365276	6/1/2021	MI	41	F	5/27/2021	5/28/2021	<p>Symptoms started 5/28. Symptoms include: Constant Severe pt received the Moderna Covid-19 vaccine on 5/27 at 1930. Pt stating that pt's symptoms started this am. Pt developed fever (current temperature at 104.7 via forehead thermometer), severe head and neck pain, lightheadedness. pt feeling like pt's hands are "on fire". pt stating that pt's hands "feel weird". Pt passed out in pt's computer chair x 2 this am. Pt has not reacted to vaccines in the past. Pt A & O x 4. Pt c/o tachypnea. Patient Has tried prescribed "headache" medication with none improvement. Pertinent negatives include: No chest pain. No diarrhea. No vomiting. No injury. No rash. Pertinent Medical History: none Patient went to ED 5/28- This is a 41-year-old female with history of migraines 12 hours post 2nd mid during the COVID immunization who presents emergency department for evaluation of myalgias, fever at home, fatigue, headache. Headache is similar to previous migraines. Patient has a benign exam with a normal neurologic exam. Initially noted to be tachycardic at triage on recheck this is normal she is not tachycardic on my evaluation. Participant should decision making the patient. Symptoms thought to be likely related to immune response to immunization. She did note feeling dizzy earlier notes she has been eating and drinking normally. Offered her screening labs, EKG, migraine cocktail and she declined each. She notes she would prefer to go home and rest as this will often alleviate her headache symptoms. Given dose of Tylenol here. Provided with work note. Normal sequela of COVID immunization discussed return precautions discussed. Patient notes she had COVID the end of March and testing today could be a remnant positive from this would not recommend repeat She and husband are comfortable plan. Patient is reassured, agreeable with plan, educated regarding return precautions, discharged in stable condition, all questions answered.</p>

1364723	6/1/2021	MI	48	F	5/19/2021	5/19/2021	<p>She got her vaccine, they had her wait an additional 15 minutes. She had tingling sensation the entire time and she went home. Around 5:27 she looked at her arm, it was bruised, it felt like alligator skin, rough to touch when she touched it and started to get little blisters around it. It looks like her skin is burnt like she had been in a fire. She went to the Medical Center and they told her that it was a local reaction and outlined it with a marker, and gave her an ice pack, which seemed to make it worse. They gave her Naproxen and then she decided to leave as they didn't do anything, and said that she said it was a local reaction and that was going to get the second vaccine. She went home so on 5/20/21 she went to Hospital. She saw DO in the ER. She had chest pain, shortness of breath and two very large blisters on her arm with fluid in it when she was seen there. She was informed that whoever gave her the vaccine did not go in far enough and that they gave her the vaccine in the tissue and not the muscle. They did EKG, and they did blood work to see that it was no blood clots or in her lymph nodes, and said that it was a severe reaction from the vaccination, and that they had never seen anything like that before. On 5/21/21 she went to her PCP, she drained the numerous blisters that she had on her arm, she prescribed her Clindamycin, Motrin 600 mg, a skin cream Kenalog, she also gave her some aquaphor cream as well. She does not feel that this has helped much. Even after she drained the blisters, which the fluid was clear. She has been taking numerous pictures. The blisters came back, not as large but came back. The blisters would drain when she would take a shower and it was tannish in color and she called her PCP who told her to continue to take the antibiotics. She also bought some OTC cream, and an aloe vera plant which seems to be helping. She says that the dark skin has peeled off and the skin is pinkish and raw looking, which is a large area on her arm where every bump was. She said that the area is really really bad and is embarrassed to show her arm.</p>

1365214	6/1/2021	ID	19	M	5/28/2021	5/30/2021	Severe chest pain requiring a visit to the ER. Patient was admitted into the hospital and evaluated by the ER Physician and moved to Cardiology. He was diagnosed with Myocarditis. He was released midday on Monday. On Monday night, we returned to the ER with even worse chest pains (self rated at 10/10). He was re-diagnosed with both Myocarditis and Pericarditis.
1365334	6/1/2021	CA	44	M	4/27/2021	5/19/2021	Would occasionally have difficulty catching my breath while not doing anything. I occasionally felt my heart flutter or it would possibly skip a beat. Mild chest pain below above the sternum but I get that feeling from my Eosinophilic Esophagitis. I've become more concerned recently as I almost fainted once on 5/19 while working at my computer. I've had two other instances of feeling faint, most recently occurring on 5/27. I historically have had no heart issues and can ski and hike all day and feel great so this recent change has been concerning. After reading articles on the covid vaccines I realized that my symptoms are similar to the heart related issues and took ibuprofen when I felt additional chest pressure. That has helped to alleviate the pressure at least.
1365261	6/1/2021	OR	21	M	5/21/2021	5/25/2021	Reason for Hospital Admission Please refer to the record for full details. Briefly, this is a 21 y.o. male with no significant PMHx other than his 2nd COVID Pfizer vaccine on May 21st presented from urgent care with chest pain and elevated troponin. Found to have presumed myocarditis, possibly secondary to vaccine reaction. Hospital Course by Problem Chest pain Patient presenting with significant chest pain with significantly elevated troponin a few days after receiving second dose of Pfizer Covid vaccine on 5/21/2021. Troponin peaked at 2900. No recent illnesses at home and no known sick contacts.
1365392	6/1/2021	NJ	18	M	5/27/2021	5/28/2021	Dose 1: 4/29/2021 Dose 2: 5/27/2021 Symptoms onset began on 4/28/2021 and included fevers, cough, weakness, heartache, diarrhea, headache, dizziness. Symptoms temporarily improved on 5/29/2021. On 5/30/2021 at approximately 1:00 AM patient experienced constant, pleuritic chest pain/pressure and shortness of breath which prompted him to go to the emergency department.

1365396	6/1/2021	IA	30	F	3/11/2021	3/24/2021	Exactly 2 weeks after having the second moderna COVID vaccine, the patient developed acute chest pain and shortness of breath. She was evaluated in the ER. Negative troponins, normal EKG, negative CT angio PE. She followed up with a cardiologist. Echocardiogram was normal. She was treated for presumed pericarditis with colchicine and NSAIDS with no improvement in symptoms. She had very severe chest pain and shortness of breath at times to the point that it was difficult to breathe and do light exertion. There was a second ER visit a month later for the same symptoms negative for acute MI/ heart failure. Cardiac event monitor showed many PVCs and there is slight symptom improvement with metoprolol but she is still symptomatic to some degree 2.5 months later. She is following up with general cardiology and electrophysiology. There was also a TSH elevation at the time that symptoms started. This resolved upon recheck about 6 weeks later with no change in levothyroxine dose and a thyroid ultrasound was normal.
1365412	6/1/2021	OR	37	F	4/29/2021	5/3/2021	Patient with complaints of chest pain and nausea. Seen in ER. EKG normal, nausea resolved. Gastritis medication prescribed.
1365453	6/1/2021		18	M	5/30/2021	6/1/2021	chest pain starting at 7:30 AM, not relieved by Tylenol. Went to pediatrician office where EKG showed ST elevations in II, III, aVF. On arrival to ED EKG findings more consistent with pericarditis.

1365460	6/1/2021	WI	47	F	4/10/2021	4/11/2021	At first I had severe muscle aches all over my body. Very tired. I slept very long 2 days after the second dose and when I woke up my bed and I were drenched in sweat. Then I felt better for a few days and then I started to notice swelling in my neck. Then my in my mouth. Then my face. Mostly the left side of my face was severely swollen and very painful to move my face, talk, swallow, etc. When it became unbearable and completely swollen my husband said we needed to go to the emergency room. I'm a very healthy woman and only see a Dr. for routine physicals and annual mammograms. I was given allergy medication, anti inflammatory medication, and tylenol and had an iv with some other fluids going through. The swelling went down but did not fully subside for a week or so. Now it has been around 8 weeks since my 2nd shot and I'm having bad chest pains (mostly at night and early mornings) and my inner thighs feel swollen, and my under arms are swollen. I feel like I've gaining weight rapidly but I'm not. I'm not feeling like myself and most days have limited energy. The swollen areas under my arms is very uncomfortable.
1365515	6/1/2021	MD	15	M	5/27/2021	5/27/2021	Mostly nonverbal pt developed temp 100-102 evening following vaccine through following day, and on day 3 had significant chest pain warranting 911 call and ED visit. Labs were significant for leukocytosis (WBC 19.8) and CXR w R hilar pneumonia. Troponin level was normal. He has improved on ABX.
1365316	6/1/2021	KS	55	F	5/25/2021	5/25/2021	Chest pain, shortness of breath, joint myalgias, lower extremity swelling, low grade temp, cough, congestion started on 5/25/21. Admitted to hospital and given Xopenex treatments, tessalon Perles, IVFs,. Also had zofran, toradol, and acetaminophen as needed. Cough controlled with medication, myalgias to joints improved, afebrile, chest pressure improved by discharge on 5/28/2021

1365032	6/1/2021	MI	98	M	3/30/2021	5/30/2021	This is a 98y.o. male with past medical history of s/p covid on 4/20/21 and treated with antibodies and received pfizer x2, dementia, aortic aneurysm, MI s/p AICD, a fib hypothyroidism, presents to ED via EMS. Patient is alert and oriented to person and place but not time. He does not know why he is at the hospital or who called 911 or why they called. Most of history was obtained from son. He states that this morning the facility noticed that he was more confused than usual and that he seemed short of breath. When they checked his vitals his blood pressure was low an his oxygen saturation was low. Per EMS report he was short of breath while walking to the common area and his fingers turned blue. EMS sheet 104/54 and spo2 94% on room air. Patient states that he has no complaints. He denies any shortness of breath currently, chest pain, abdominal pain, diarrhea, melena, hematochezia, palpitations. He does admit to some back pain when laying too long. Son stated that he is supposed to see his cardiologist Dr. for his defibrillator having "weird signals". Son states that he usually aspirates once a meal when asked if patient has been coughing at all.
1365301	6/1/2021	CA	16	M	5/26/2021	5/27/2021	16 year old c/o mid-sternal chest pain x 2 days which worsens on inspiration. Pt had Pfizer vaccine #1 on 4/25. About 10 days later pt developed cough and around that same time his mother tested positive for Covid-19. On 5/8 the patient tested positive for Covid-19 and his 2nd vaccine dose was postponed. His symptoms resolved after appx 1 week. He then received his 2nd Pfizer Covid-19 vaccine on 5/26. The next day 5/27 (2 days PTA), pt c/o of mild chest pain. On 5/28 (1 day PTA) he was able to run a mile during PE but ran slower than usual and had some mild chest discomfort during the run. This morning pt felt worsening chest pain and parents brought him to ED. Since his recovery from presumed Covic-19 infection earlier in the month, the patient has not had any SOB/cough/fever/chills/rash. No pain radiating to extremities. No lethargy. Pt continues to have a normal appetite w/ normal u/o and normal BMs.
1365003	6/1/2021	OH	18	M	4/29/2021	5/31/2021	On 6/1/2021 patient presented to the Medical Center with C/O chest pain, diaphoresis, and nightmares during his sleep. Physical exam revealed mild tachypnea.

1365209	6/1/2021	WA	76	M	3/22/2021	5/20/2021	Patient received Covid vaccine in March (unknown date). He subsequently developed a burning chest pain and cough. Diagnosed with Covid May 20,2021. Admitted to the hospital May 27th with new stroke symptoms and myocarditis/NSTEMI
1365047	6/1/2021	WI	77	F	1/30/2021	4/24/2021	Client admitted to St Luke's for chest pain, SOB, and aortic stenosis requiring oxygen.
1365056	6/1/2021	AZ	12	M	5/15/2021	5/16/2021	Patient started to develop a cough on the second day of the vaccine around 6 pm. The cough was accompanied by shortness of breath, given his asthma we assumed this was some asthma related reaction to the vaccine. Nonetheless, that evening he started to complain about chest pain every time he laid back on his bed. This symptom is not common in previous asthma attacks. Sitting up alleviated the symptom, chest pain and shortness of breath lasted for 2 nights (Sunday and Monday evening), by Tuesday he felt better. We assumed this was an asthma episode, but recent reports of Myocarditis leads us to believe the had a mild myocarditis episode, given the chest pain while lying down. He also had typical COVID vaccine symptoms such as low grade fever (100F), pain in the vaccination site, congestion, and itchy throat.

1365155	6/1/2021	CA	21	F	6/1/2021	6/1/2021	<p>Patient received the 2nd COVID vaccine (Pfizer, Lot #: EW0185 and expiration date: 08/31/2021) on the left arm at 0918. Patient hailed medics attention and complained of "nausea, seeing purple, and lightheadedness" at 0921. Patient was conscious, alert, and oriented x4. Patient's skins were normal for ethnicity, moisture and temperature. Pupils were equal, accommodating, and reactive to light. Patient appeared anxious and was coached by medic on her breathing. Signs and symptoms began about 2 minutes status post vaccine, but patient claimed no previous reaction with 1st dose. Patient denied any pertinent medical history, allergies, or medications. At 0923 patient was still conscious, alert, and oriented x4 and pupils were still equal, accommodating, and reactive to light. Patient then complained of "seeing everything in purple color," then stated she "could not see anything at all." Medic held up 5 fingers and patient advised she could not see them. Patient began to look pale and skins felt moist and warm. Patient was able to walk with assistance to anti-gravity chair. Nurse then responded to Medic with patient. Baseline vital signs were taken by Medic at 0926, while patient was sitting: blood pressure: 98/60, heart rate: 60, respiratory rate: 16. Patient stated that she runs cross country and that these vital signs were of normal range for her. Patient was given water to sip on. Color and moisture of skins were slowly pinking/drying up. Patient initially experienced nausea and lightheadedness but denied chest pain, shortness of breath, headache, dizziness, or blurry vision. Nurse informed the patient's mother, who was waiting outside, of the situation and brought the mother inside to the patient. At 0935, patient was able to stand her own, with a steady stance. A second set of vitals were taken: blood pressure: 100/64, heart rate: 60, respiratory rate: 14. Patient was negative for orthostatic pressures. Patient stated that symptoms had resolved and that she "felt better, just tired." Patient remained in the observation area for an additional 15 minutes. Patient was conscious, alert, and oriented x4 and skins were normal for ethnicity, moisture, and temperature at 0949. Patient able to walk on her own accord with a steady gait. Mother was driving personal vehicle. Mother and patient were educated on when to contact their primary care physician with any other concerns and when to call 911 if symptoms warrant or</p>

1362087	5/31/2021	NH	35	F	1/1/2021	1/1/2021	8 hours past second dose: fever of 103, migraines and chills for 2 days. About 24 hours post injection : diarrhea and nausea. 14 days I could not tolerate much food. Since the vaccine (6 months now) watering eyes, nasal congestion intermittent fevers. Also migraines regularly, almost every day. Last check up one week ago bounding heart, rate of 150, irregular beat, PVCs on EKG. I feel chest pains at work intermittent however I work in ER and ICU so I can't stop to address them My PCP wants me to do more testing. I cannot afford it. Before this vaccine I was a healthy young woman. Now I struggle to make it thru days. I'll never do this again
1362081	5/31/2021	MA	25	F	4/1/2021	4/1/2021	All of the below occurred after Pfizer shot #2 administered on 4/1/2021. Pfizer shot #1 was administered on 3/12/2021 with minimal effects lasting less than 24 hours (arm soreness, flu-like symptoms, etc.). 1) Severe worsening of costochondritis (chronic chest pain) to the point of breathing difficulty and inability to lie down. Began 4/1/2021 and became unbearable the evening of 4/7/2021, requiring an ER trip the same night (see Item 19). This pain has since continued to come and go, worse than I ever had it before the vaccine. 2) Very severe worsening of tinnitus (ringing/pulsing in ears) - lasted 1.5 months, from 4/1/2021 to around 5/15/2021. 3) Severe hormone imbalance symptoms (waves of severe nausea occurring several times daily, extremely late and painful/heavy period, swelling in ankles & feet, etc.) for ~1.5 months, from late April 2021 to around 5/15/2021. I cannot identify any other changes or life factors besides the vaccine that would have caused these issues.
1362056	5/31/2021	IL	24	F	1/1/2021	1/1/2021	Fever and flu-like symptoms after second dose. Later on I developed chest pain and racing heartbeat/heart palpitations that lasted for at least a few days to a week. These symptoms have mostly subsided, but minor and occasional chest pain is still persisting.
1362684	5/31/2021	IN	17	M	4/21/2021	4/22/2021	Chest pain, heart rate in 140s

1362471	5/31/2021	CA	32	F	5/19/2021	5/23/2021	Moderna COVID-19 Vaccine EUA. About 3-4 days after the second dose, I experienced off and on moderate chest pain for about 1.5 weeks, so far. Symptoms seem to be declining now. It was a moderate aching in the center of my chest up to my left pec and shoulder. I also experienced off and on heart pounding (not necessarily elevated heart rate, and not necessarily concurrent with the chest pain). No fainting, mild headaches. *I also experienced off and on heart pounding 12-72 hours after the first dose, but no chest pain.
1362085	5/31/2021	CO	74	F	5/13/2021	5/14/2021	<p>~~Admit Date: 5/14/2021 Discharge Date: 5/15/2021 The patient is a 74 y.o. female, history of MS, history of cerebellar ataxia and gait instability at baseline who presents for evaluation of lower extremity weakness. Patient received her second Covid vaccine yesterday. Patient reports baseline right lower extremity weakness with foot drop. She reports she awoke today and has had bilateral lower extremity weakness. Patient reports she normally walks with a cane but has been unable to stand up and get out of her chair. She typically uses a cane for ambulation but states she has been unable to complete her ADLs secondary to immobility. She reports mild headache throughout the course of the day but no thunderclap quality or maximal headache at onset. No neck pain. No chest pain or shortness of breath. She reports otherwise, ~~"feeling achy.~~" No fevers. No chills.</p> <p>At discharge: #left lower extremity weakness: resolved overnight. MRI brain and L spine without acute MS flare, no signs of acute stroke or cord impingement. ? Reaction to Pfizer vaccination. Now returned to baseline. Cleared by PT for return home. #Multiple sclerosis: chronic right upper and lower extremity weakness. Unchanged. No active MS lesions no MRI brain/L spine as above. Recommended routine follow up with her neurologist. No changes to medications at this time #Hyponatremia: very mild, resolved on day of discharge #Hypothyroid: continue synthroid~~</p>

1362634	5/31/2021	CA	15	M	5/27/2021	5/30/2021	5/30/21 - Patient woke up feeling chest pain that was localized to the left side of his chest, pleuritic in nature. The problems persistent despite trying medications like tums for heartburn. Pain improved at night but never fully resolved. 5/31/21: Patient continued to have chest pain and mother became worried and brought the patient to the urgent care
1362653	5/31/2021	TX	17	F	4/6/2021	4/10/2021	Chest Pains Shortness of Breath Costochondritis - Per the Doctor These conditions were present after the first vaccine shot on April 6th and then again after the second shot on April 27th. Doctor initially thought it could be a simple case of Acid Reflux and gave her Nexium. Once that didn't work, she had her Chest X Ray done that came back all clear. She then had her blood tests done and that too came all clear except for Vitamin D3 that came in at 15 so doctor gave her a 50,000 unit Vitamin D3 dose. That also didn't do much to relieve the chest pains and shortness of breath so he had her EKG and Echo done and those were all clear as well. Finally, he gave her a day steroid course of Prednisone at 40 mg/day which is where she is currently. It is helping her a bit but she is still complaining of original two issues - chest pain and shortness of breath. She is also doing cold and warm compressions throughout the day that helps her temporarily.

1362473	5/31/2021	UT	18	M	5/28/2021	5/31/2021	It is thought to be vaccine-induced myocarditis. Myocardial infarction was ruled out. Patient does now have a reduced ejection fraction of 45%. Here is the note from the ED today: "He indicates that he was awakened from sleep with chest pain this morning around 2:50 AM. He ended up trying to sleep longer to see if it would improve and ended up going to his mother's room. She recommended that he drink some orange juice and gave him some Tylenol. He states that the pain continued to increase since that time and he asked her to bring him to the emergency department. The patient states that the pain is on the left side of his chest radiates to his left shoulder and down his left arm. He denies that it radiates to his back. He has had lightheadedness. He does not feel short of breath. He does have some pain into his left jaw as well. He has not had any vomiting. He denies abdominal pain. He denies diarrhea. The patient did receive his second dose of the Moderna vaccine on Friday to his left arm. He has had fevers over the past 24 hours to 103 at home. His mother and he indicate that the go away with Tylenol though seem to come back when the Tylenol wears off. He did complain of some headache, myalgias, malaise and sore throat which she states were all worse when he would have a fever and seemed to dissipate when his fever resolved. He states he did not and has never had chest pain like this until this morning. The patient does not have a history of Covid infection. He is active and has run track in the past. He has not had any travel. He denies any pain or swelling to his legs or calves. He has had no sick contacts. His mother received her second dose of the vaccine on the same day that he did and has not had any similar symptoms. ~~
1362805	5/31/2021	CA	65	F	4/2/2021	4/3/2021	chest pain, fever, chills, nausea, vomiting diarrhea, myalgias and hematuria. BP 170-195/76-89, BMI 30.3 kidney biopsy received on 4/26/21 showed: MPO-ANCA+ anti-GBM associated crescentic GN; also has C3 glomerulopathy

1362622	5/31/2021	OR	52	M	5/10/2021	5/14/2021	? 5/21/21: Pulmonary Embolism o Presented with chest pain, abdominal pain, breathing problems o CT showed pulmonary embolism o Stable for outpatient anticoagulation. Started on 10 mg Eliquis BID x 7 days and then 5 mg BID thereafter.
1362571	5/31/2021	WA	44	M	5/7/2021	5/31/2021	Initially, the patient had dizziness, lightheadedness and a syncopal episode within 5 minutes of the vaccine. He returned to normal fairly quickly and went home by report. He presented to the ER shortly after with palpitations and shortness of breath and required a dose of IM epinephrine. Patient since had intermittent fatigue, dizziness, blurred and vision changes as well as tinnitus. On May 31, 2021, patient presented to the ER with headache, lethargy, weakness, diaphoresis and dizziness. Additionally, noted to have slurred speech by his wife. MRI of the brain done at 4 am on 5/31/21 showed the following "1. Acute bilateral cerebellar infarcts are seen with a right posterior 4.3 mm focus a left middle cerebellar peduncle 3.2 mm focus and a left superior cerebellar 7.9 mm linear focus. 2. Occlusion of the left vertebral artery extending into the basilar artery with reconstitution of the basilar artery via bilateral posterior communicating arteries. Findings are concerning for acute dissection occlusion. Consider further evaluation with MRA head and neck. 3. Question subtle area of restricted diffusion seen within the left dorsal medulla better appreciated on the maps measuring approximately 4.9 mm. Left lateral pontine 7.3 mm focus of restricted diffusion versus artifact. These infarcts are not definite and could be artifactual asymmetry.'. He required admission, heparin drip and neurology consult at that time, as well as permissive hypertension. shortly after 1 pm on May 31, he developed chest pain with ischemic changes on EKG requiring cardiology consult with possible intervention, though this was being coordinated with interventional neurology, as he also required basilar angiogram for his MRI findings. as cardiology and interventional neurology were coordinating taking patient for intervention, he became further unresponsive, though maintained his pulse, and required intubation and transfer to ICU, as well as repeat CT of the head to evaluate for continued thrombosis of his basilar system. Work up is still on going

1361531	5/30/2021		57	F	5/10/2021	5/28/2021	<p>Patient is a 57 year old woman works as a cleaner with PMHx morbid obesity, HTN (on amlodipine, metoprolol, triamterene-HCTZ), CKD3 (baseline Cr 1.1-1.2) who presented to the ED on 5/28 with worsening shortness of breath, cough with yellow sputum, fatigue, and weakness, found to be COVID-19 positive. She was subsequently admitted to the MICU for acute hypoxic respiratory failure. At baseline, she is independent in all ADLs and works as a cleaner at an office building. She got the first dose of the pfizer COVID vaccine series 5/10, scheduled for second dose 6/2. She lives with her husband and nephew in a house with additional family members who live downstairs. She says she only really goes to work and always wears a mask while there. Her daughter (lives downstairs) helps with grocery shopping. No recent travel or sick contacts that she is aware of. She was in her usual state of health until 5/22 when she said she started to feel poorly. She had increasing shortness of breath over the next few days with worsening fatigue and cough to the extent that she was considering calling off from work. She continued to feel poorly and decided it was time to go to the ED on Friday, 5/28. Today, she says she is feeling better and is less short of breath. She still has coughing that is occasionally productive for clear sputum. No fevers, chills, lightheadedness/dizziness, chest pain, abdominal pain, nausea, vomiting, diarrhea. Her appetite is improved, and she is eating and drinking better today. Patient is a 57 year old female with PMHx obesity, HTN, CKD3 who presented to the ED with shortness of breath, cough, fatigue, found to have COVID-19. In the ED, she was hypoxic requiring increasing amounts of oxygen, ultimately with 40% FiO2 via Ventimask and HFNC when admitted to the MICU. CT chest with GGO/patchy consolidation in posterior lung areas and bases as is typically seen with COVID-19 infection. She has been started on remdesivir and dexamethasone and is now requiring HFNC for oxygen supplementation. Likely her single dose of vaccine has helped to lessen her disease severity. She meets criteria for addition of tocilizumab. Recommendations: - Continue dexamethasone and remdesivir - Can add tocilizumab - Health care maintenance: Screened for HIV 2009, HCV 2018, HBV 2018. Last TDAP 2015. I saw and examined the patient. I strongly agree with the resident/fellow's findings</p>

1361412	5/30/2021	CA	36	F	5/28/2021	5/28/2021	<p>Patient received the 1st COVID vaccine (Pfizer, lot # EW0185 use by 06/24/21 at 0845) at 1446. At 1503, the clients boyfriend told PM that his girlfriend said she felt like she was about to faint. PM ran to patient at 1503 who was sitting upright and blankly staring in front of her. RN assessed the client who was alert and oriented to person and place for 90 seconds, but would go in and out of responding to questions during the 90 seconds. No loss of muscle tone was present. The client was unable to visually track an object during the 90 seconds of blank staring. RN instructed another RN to call 911 at 1504. Client was placed on a yoga mat in a supine position on the ground by EMT and PM. The client's legs were elevated by being placed on a chair. The client was diaphoretic and clammy. The client was alert and oriented x 4 at 1505. Radial pulse was bounding bilaterally. Vital signs taken at 1506, HR- 60, BP- 158/106, RR-12, oxygen saturation at 98%. The patient denied any drug allergies, any chronic medical conditions, or currently taking any medications. Client continued to be diaphoretic and clammy. Client did not hit her head during the incident and denied any shortness of breath, chest pain, or difficulty breathing. Vital signs taken at 1507, BP- 170/122, HR- 81, RR-14, oxygen saturation at 98%. The clients legs were immediately placed from being in an elevated position to a supine position. The client was speaking in full sentences and was alert and oriented x4. Vital signs taken at 1508, BP- 146/98, HR-86, RR-14, oxygen saturation at 98%. Client remained mildly diaphoretic and clammy. The fire department assumed care at 1510 when they arrived on site. Fire Department Personnel advised the client to be transported to a hospital, client declined transport to the hospital and signed AMA paperwork. Client stated, "My boyfriend will drive me to Emergency Room." The Fire Department and EMS left the site at 1532. RN educated the client about the importance of going to the emergency room immediately and to follow-up with her primary care provider. The client left the site at 1536, the client's boyfriend pulled the vehicle in the parking area and the client ambulated with an even and steady gait to the car.</p>

1361555	5/30/2021	FL	54	M	5/27/2021	5/28/2021	Fever, Chills, Heart Palpitations - Heart rate was 126 Joint Pain Pain in Chest when taking Breaths More Pain when lying down, cant turn on the side Eye Pain with Headaches
1361859	5/30/2021	OR	28	F	4/4/2021	4/7/2021	3 days after first Pfizer dose, I experienced heart palpitations and mild chest pain. Heart palpitations happened while at rest. Heart rate would go from roughly 70-80 BPM to 30-40 for a few beats and then return to normal. It happened primarily when lying down. The palpitations occurred most prevalently on days 3-4 after the 1st Pfizer dose. It was sometimes accompanied by mild chest pain. It woke me up a few times per night for about a week with a similar sensation of skipped heart beats and pain. It has mostly resolved, and I am continuing to watch for persistent/recurrent symptoms.
1361977	5/30/2021	OR	16	M	5/26/2021	5/29/2021	myocarditis - chest pain with elevated troponin reequiring hospital admission. symptoms started 3 days after vaccination which was his second dose of the Pfizer vaccine. First dose was on 5/1/21.
1362028	5/30/2021	NY	30	M	4/1/2021	4/23/2021	04/23 - Heart Palpitations and Extreme Dizziness/Confusion 04/24 - Miraine Kicked in (Had Migraines before) 04/31 - 05/17 - Heart Palpitations come back for a day, go away, come back for a day. Dizziness/Brain Fog/Confusion is maintained the entire time. A few intense bouts of dizziness in public that feel like Panic attacks. Chest pains throughout this time as well. 05/18 - 05/30 - Heart Palpitations mostly gone, Dizziness and Brain Fog linger but appear to be managable.
1361945	5/30/2021	MD	58	F	5/17/2021	5/28/2021	Chest pain approx 24-48hrs after vaccine #2. Rash and pain on neck, shoulder, and chest started approx 5/27. Diagnosed with shingles on 5/29/2021. Started on Valacyclovir

1360491	5/29/2021	VA	77	M	2/11/2021	2/1/2021	Unexplained chest pain; Breathing difficulties; Weakness; Costochondritis; This is a spontaneous report from a contactable consumer (patient). A 77-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), on 11Feb2021 12:00 (Lot: EL9267) (at the age of 77-years-old) as 1 st dose, single then on 11Mar2021 11:00 (Lot: EL6204) as 2 nd dose, single; both via an unspecified route of administration in left arm for covid-19 immunisation. The vaccination facility type was reported as other. No other vaccines within 4 weeks prior to the COVID vaccine. Medical history included Parkinson's disease, high BP, high cholesterol and known allergies: penicillin. Concomitant medications included allopurinol; esomeprazole magnesium (NEXIUM); pravastatin and propranolol. The patient previously took sulfamethoxazole, trimethoprim (BACTRIM) and experienced known allergies: Bactrim. The reported events unexplained chest pain, breathing difficulties, weakness and initially diagnosed costochondritis, all in Feb2021. The patient considered the case as serious due to caused/prolonged hospitalization, did not result in death, not life threatening, non-disabling/incapacitating and no congenital anomaly/birth defect. 3 more incidents of increasing intensity led to 3 ER visits and 2 hospitalizations. The events resulted doctor or other healthcare professional office/clinic visit, emergency room/department or urgent care and hospitalization for 5 days. Treatment for the events included IV antibiotic, furosemide (LASIX), prednisone. Prior to vaccination, patient was not diagnosed with COVID-19 and since vaccination, patient was tested for COVID-19 with nasal swab on 29Apr2021 with result of negative. The outcome of the events was recovering.

1359899	5/29/2021	CO	18	M	5/12/2021	5/26/2021	Patient presented to urgent care with 3 days of pleuritic chest pain. He had abnormal EKG with T wave inversions in V1 to V3, elevated D-dimer and elevated troponin. Sent to ED. Patient received Pfizer Covid vaccine, first dose, approximately 2 weeks ago. About 3 days ago he developed chest pain with breathing, located at the anterior chest and radiating to the left shoulder. No associated cough, dyspnea, sputum production, hemoptysis. Chest pain is not associated with activity. He does not describe chest pain with the positional change or laying down. no fever or chills. He had 3 episodes of emesis this morning. No abdominal pain, no diarrhea.
1359871	5/29/2021	MN	15	M	5/21/2021	5/23/2021	On 5/23 two days after vaccine he was irritable, tired, fatigued, not sleeping well. He could not complete his track meet . He had abdominal pain, felt bloated, and he felt this nausea & discomfort. He thought he might be constipated, so he took MiraLAX and then he had diarrhea all day yesterday. on 5/26 he had a temperature of 99.2, he had acute chest pain retrosternal and feeling of compression on the chest, head fullness as if he is going to explode. He had nausea, insomnia. Ibuprofen was given to him by his mother and this helped a lot But he woke up on morning of 5/27 , but the chest pain returned with increased pressure, very nauseous, agitated, unable to be comfortable. No fever,, the pain was a sharp pressure. He had no syncope or chest shortness of breath He was seen at Hospital ER where a chest x-ray was normal. Echocardiogram was done, ,noted to have EKG changes. Troponin was elevated. He had a cardiac catheterization done emergently at hospital through the right radial artery and was noted to have normal coronaries. He also had a chest x-ray done which was negative for pulmonary lesions, and his abdominal pain he says was relieved after the MiraLAX and the diarrhea. His twin sister who received the vaccine 15 minutes after him is completely asymptomatic.

1361334	5/29/2021	CA	51	F	5/28/2021	5/28/2021	<p>Patient received the 1st COVID vaccine (Pfizer, lot # EW0185, use by 06/24/21 at 0845) at 1313. Client reported to EMT that she felt a headache coming on, and was a little nauseous. The client was given a bottle of water and RN was notified immediately. RN assisted the client to the anti-gravity chair, was placed in a semi-fowler's position, while RN assessed the client. The client was alert and oriented x 4. Vital signs were taken simultaneously at 1400, HR- 84, RR-16, BP-158/90, oxygen saturation at 98%. At 1402 the client stated, " My headache is a little better and my nausea is gone." Denied shortness of breath, chest pain, difficulty swallowing, lightheadedness, or feeling flushed. Denied drinking much water prior to coming to the site. Vital signs taken at 1405, HR- 86, RR-16, BP- 160/88, oxygen saturation at 99%. Client reported having an allergic reaction to codeine (anaphylaxis) and having type II diabetes mellitus, asthma, and a heart murmur. The client reported currently taking singulair, victoza, trulicity, lantus, metformin, and fenofibrate. Vital signs taken at 1410, BP- 160/88,HR-87, RR-16, oxygen saturation at 98%. The client was speaking in full sentences and was in no apparent distress. The client continued to drink water. The client reported not seeing a primary care provider for over a year. Denies any vision changes, headache, or lightheadedness. Vital signs taken at 1415, BP- 160/ 88, HR- 86, RR-16, oxygen saturation-98%. RN educated the client about V-safe, Emergency Room precautions, and to follow up with her primary care provider. RN advised the client to stay on site until 1430. The client stated, " I might be a little anxious, I'm sorry, I'm not trying to be a bother." The client was reassured to always tell the medical personnel on site if she felt unwell in anyway. EMT and PM remained in the observation area. At 1431, the client stated, " I feel a flutter in my chest that feels bounding." The client was cold and clammy, RN called 911 immediately at 1431. Vital signs taken at 1431, BP- 156/84, HR-83, RR-18, oxygen saturation- 99%. The client remained in the semi-fowler position, was alert and oriented x4, and was speaking in full sentences. Denied difficulty breathing, vision changes, shortness of breath. No rash or hives were present. Vital signs taken at 1436, BP- 140/88, HR- 80, RR-16, oxygen saturation- 99%. Client stated, " The heart fluttering is feeling better." The client was no longer</p>

						cold or clammy. Vital signs taken at 1441, BP- 142/88, HR- 82, RR-16, oxygen saturation- 99%. EMS arrived on site at 1443. The firefighter/paramedic assessed the client, had the client stand up from the anti-gravity chair, asked her how she felt, and she stated, " I feel a lot better." The firefighter/ paramedic asked the client if she still had the fluttering sensation in her chest, the client stated, " No." The EMS team did not complete a set of vitals or complete an EKG on the client. The firefighters left the site at 1447. RN re-educated the client about following up with her primary care provider and educated the client about emergency room precautions. Client ambulated to her car where her family members were waiting for her, she had an even and steady gait.

1361263	5/29/2021	CA	33 F	4/13/2021	4/14/2021	Difficulty breathing, chest pain, dryness in lungs. Continuing intermittently since vaccine up to and including date of report (5/29/21)
1361242	5/29/2021	VA	40 F	5/22/2021	5/23/2021	Symptoms started within 2 hours of 2nd vaccine when I started getting really tired. I slept off and on for hours. By the evening, I started getting chills and body aches. The following day, I had chills, body aches throughout my body to include into my fingers and ankles, a headache, a fever of 101, and heaviness in my chest. I was advised by the pharmacist who gave the vaccine that I couldn't take Tylenol or ibuprofen so I hadn't. When my fever got up to 102.2, I took Tylenol, which was around 2pm. The fever broke later that night. On 5/24, the body aches, chills, and headache subsided. The only thing that lingered was the heaviness/chest pain. It is 5/29, and I still have it. I came across this information and site while trying to research why I still feel this way.

Diagnosed with myocarditis and admitted to the hospital. ED attending note: Patient presents with acute onset of chest discomfort in the sternal area 2 days after the first dose of Covid vaccine. Patient's not had any fevers. No respiratory symptoms. No difficulty with respirations or any pleuritic chest pain. Denies any cough. No chest wall trauma. No back pain. No palpitations or syncope. No orthostasis. No peripheral edema. On physical exam he was mildly tachycardic in the 80s to low 90s with no murmur and no gallop. No JVD. Clear lungs. No rub. Bedside ultrasound performed by HCP had bilateral lung sliding and normal gross function based on 2 views. No pericardial effusion. EKG had ST changes. Chest x-ray was obtained without any effusions or pulmonary infiltrates. Normal cardiac silhouette. Troponin sent elevated. Cardiology consulted for possible postvaccination myocarditis. Child remained stable. Resting heart rates in the 70s and low 80s. Cardiology came to see the patient. Plan to admit to cardiology service. Presumed diagnosis of myocarditis. Cardiology admitting note: Pt. is an otherwise healthy 14yM who presents with acute onset atraumatic chest pain i/s/o recent covid vaccine, found to have mildly elevated inflammatory markers and troponin with borderline ST changes on EKG most consistent with mild peri/myocarditis at this time given overall well appearance on exam without hemodynamic or respiratory compromise and grossly normal function on POCUS, though plan for formal echo in AM. EKG w/ non-specific ST-T wave changes in precordial leads, no evidence of strain or block. Admitted to the cardiology service for serial troponins, ECHO, and close monitoring. HPI per cardiology consult note: "Patient is a healthy 14 year old with a history of alopecia who presented to the ED with mild chest pain 4 days following his first Covid vaccine (Pfizer). He had no symptoms in the days immediately following vaccine, and played basketball the day following with no symptoms, but after waking up today began having dull mid sternal chest pain. It was a 4/10, worse with lying down, non pleuritic, not sharp, and not radiating pain and not associated with any other symptoms including SOB, numbness, GI pain, cough, or anything else. Has not taken any meds for the</p>

1357817	5/28/2021	NY	93	M	5/27/2021	5/27/2021	Patient had requested a split dose of the 2nd Moderna vaccine due to prior history of having shingles soon after 1st dose. Received 0.05ml at ~3pm. Around 3.12 or 3.18pm he began to complain of L eye blurred vision. Pt was evaluated and noted to have no other headaches, dizziness, SOB, chest pain. He reported that R eye vision was okay. Unable to read first line of snellen eye chart with left eye. Visual fields were intact, EOMI, and PERRL. He denies a shade being pulled over his eye. Pt was taken to the ED where vital signs were stable. A brief check showed stable blood pressure and blood glucose. Pt then eloped from the ED and went to another hospital's ED. There he was found to have a left central retinal artery occlusion.
1357801	5/28/2021	NJ	47	F	3/3/2021	5/24/2021	Chest pain for over 24 hrs. I went to the hospital because I thought I was having a heart attack, all test came back negative. I have no family history of heart conditions, and I'm relatively healthy and active.
1357761	5/28/2021		45	M	4/28/2021	4/30/2021	chest pain, shortness of breath. Occurred within 48 hours of injection. Lasted 7 days.
1357638	5/28/2021	GA	20	F	5/20/2021	5/20/2021	Hives on arms, left side of face, severe swelling in left leg , nose bleeds, and chest pain.
1357872	5/28/2021	PA	29	M	5/5/2021	5/16/2021	The patient presented to his PCP's office with a 2 day history of chest pain associated with deep inhalation NOT relieved by heat or Tylenol. He was vaccinated with the Moderna COVID vaccine on May 5th which caused fevers and sore throat that resolved. His pleuritic left sided chest pain began 11 days from vaccination. Given the symptoms, the PCP ordered a CXR and d-dimer. Because of the elevated d-dimer and tachycardia while in the office, she ordered a CT chest for PE protocol. This showed bilateral pulmonary emboli so the patient was directed to the ER. He was admitted and started on anticoagulation therapy. Given the CT chest findings of adenopathy, Hematology-Oncology service was consulted and ordered labs.

1357170	5/28/2021	TN	38	F	4/30/2021	5/1/2021	about to faint; dizzy/light headed; numbness and pain in left arm; numbness and pain in left arm; on Friday ECG was abnormal, but on Sunday ECG was normal; chest pain became intermittently severe; develop slow and gradual trouble breathing/still having trouble breathing; This is a spontaneous report from a contactable consumer (patient's husband). A 38-year-old female patient received the first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot #ER8735, Exp date 31Jul2021) intramuscularly in arm right on 30Apr2021 09:45 (at the age of 38-year-old) at single dose for COVID-19 immunisation. Relevant medical history included wheezing (during school age she had trouble breathing/wheezing but has not had trouble since then). Family medical history relevant to the event includes that her father is diabetic and heart patient. Concomitant medications were not reported. The patient had not prior vaccination within 4 weeks. After receiving the first dose of COVID vaccine the patient began experiencing slow and gradual trouble breathing on 01May2021 and chest pain on 02May2021. Breathing difficulties worsened and chest pain became intermittently severe, it was on and off. The patient presented to ER on 07May2021 and 09May2021. She had no previous history of chest pain or breathing difficulties. Five days after the shot in the evening she felt dizzy and lightheaded and about to faint. Until then trouble breathing had been mild, that is when she went to the ER. Chest pain was severe on the day she went to the ER, prior to that it was mild. She also developed numbness and pain in left arm. The first day she went to ER (07May2021) they did blood work, ECG, and x-ray. After 3 to 4 hours she became a little normal and they came back home. It was busy in the ER and they were not able to meet the doctor on that day. She had to go back to emergency room on 09May2021 because of the same symptoms and the same trouble breathing. All tests were repeated and then they were able to meet the doctor on 09May2021. On 07May2021 ECG was abnormal, but on 09May2021 it was normal. When she had the dizziness and severe symptoms by the time she was waiting and relaxing her vital went back normal. Nothing was found in the test they did so far. Chest pain and issues with breathing had not resolved, while outcome of the other events was unknown.

1357232	5/28/2021	NY	57	F	4/30/2021	5/10/2021	A pain and intense pressure in her chest/ Chest pain; Extreme itching to the palm of her hand; runny nose; Some blotches on right hand; This is a spontaneous report received from a contactable consumer (patient reported for herself). A 57 year old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Solution for injection, Lot Number: EW0179, expiry date not reported), via an unspecified route of administration, administered in left arm on 30Apr2021 as a first dose, single dose for covid-19 immunisation. Medical history included mini strokes (wherein patient felt weird and dizzy prior to vaccine) from an unknown date and unknown if ongoing. Patient have an ongoing hernia, confirmed as popped up before the vaccine, they said she would need to have surgery, maybe in a couple of months. Patient had a family history of aneurysms. Concomitant medication included clopidogrel bisulfate (PLAVIX) at 75mg once a day by mouth taken for mini strokes, from Apr2021 (also reported as started two days before the Covid vaccine), as patient had mini strokes that showed up on the MRI in Oct2020, wherein patient felt weird and dizzy prior to vaccine. She did start Plavix 2 weeks prior to the vaccine, she was unsure if they knew that she was on Plavix when she got her vaccine. On 10May2021, patient experienced a pain and intense pressure in her chest/ chest pain and she went to the ED on Monday morning (May2021), they did testing on her, and had to be admitted from 10May2021 to 11May2021, everything was negative. Chest pain was completely gone by Monday night. On 12May2021, patient had extreme itching to the palm of her hand. She was looking for information about a side effect she was experiencing and she stated her hands were itching, that she got the vaccine on 30Apr2021, itching started yesterday 12May2021, and stated every time she thinks its getting better it starts up again and it was intense itching, that saw some blotches on right hand creeping up (2021), they did subside and the itching continued. She also noticed a runny nose, started Tuesday (11May2021), and seemed to be coinciding with the itchy hands states it was persisting. The patient recovered from chest pain on 10May2021 but had not recovered from runny nose and extreme itching to the palm of her hand. The outcome of the event some blotches on right hand was unknown. No follow-up

My blood pressure was 163 over 71; many, many locations of pain; sternum pain; Started having severe pain in my ribs like on the sides of my rib and then it came in my left arm, my left shoulder blade; Started having severe pain in my ribs like on the sides of my rib and then it came in my left arm, my left shoulder blade; Started having severe pain in my ribs like on the sides of my rib and then it came in my left arm, my left shoulder blade; severe chest pain like super severe; Tired; I am still a little strained from it, I am little weary from it; Experiencing a low grade fever; temperature was 98.1; Chills; Sweating; This is a spontaneous report from a contactable consumer (patient). A 62-year-old female patient received bnt162b2, dose 2 via an unspecified route of administration on 10May2021 (Lot Number: EWO175) as single dose for covid-19 immunisation. Medical history was reported as I have a condition with my heart, but it's like a premature beats or a premature rhythm and it has not been bothering me for a year or more but the symptoms I had were quite different, and not currently like 4 years ago I had an ulcer, I was even hit by a car walking across the street from an unknown date. There were no concomitant medications. The patient previously took the bnt162b2, dose 1 (Lot Number: EWO164) as single dose for covid-19 immunisation. The consumer reported: I received my 2nd dose from the Pfizer very, very enthusiastically on Monday afternoon. Monday I felt fine, Tuesday I woke up I fed the dogs and then we all went back to bed for most of the day. Wednesday I woke up I was tired but not bad, Wednesday night I was in the emergency room so it started after dinner, I started having severe pain in my ribs like on the sides of my rib and then it came in my left arm, my left shoulder blade and severe chest pain like super severe. Now when I say enthusiastically I got my

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

vaccine I really did, but I am one of those people that I don't take any prescription, I am not on any medications and I am not an alamaak so I have to, I know this sounds insane. I tried to go to bed and the pain was excruciating me I mean I was screaming in my bed, I was afraid of disturbing the neighbors. And I was asking myself the question would you rather die than go to the emergency room and I am embarrassed to say I thought about it and then I decided, okay you have to go to the emergency room and I did. I had super severe I mean excruciating pain they kept offering me Morphine but the chest pain has not been resolved, I mean the chest pain has subsided by this morning, they sent me home while I was still experiencing chest pain. I have the whole paper work and reports here, they had done extensive testing of my blood for enzymes for silent heart attack and all the imaging and at one point after they at some point maybe the 7th or 9th time they offered me Morphine for my pain. I don't know what made me say this but I told them it's my stomach and she ask me why I said that and I said my gut tells me. First there was great pain like right under my sternum but it was also higher up in my chest, it was not I guess what I just I described you is I have like many, many locations of pain so they gave me a GI cocktail which calmed the sternum pain but I still had chest pain and it was very frightening and very scary. I arrived in the emergency room, I arrived at 10 'o' cock at night but I didn't leave until the next morning. The date it started Wednesday the May12th and I apologize I am still a little strained from it, I am little weary from it. They seem at first to be gradual but then it escalated rather quickly and very, very, very intensively. It starts from the gut and that's exactly where most of my pain was, it was in the gut after they gave me that cocktail (Alum-Mag Hydroxide-Simeth or Maalox with Lidocaine) I was feeling excruciating pain but I wasn't screaming. The medication I was given is called Alum-Mag Hydroxide-Simeth or Maalox with Lidocaine and that was the GI cocktail that they gave me that relieved the pain in my sternum. And then I realized I still had severe pain in my chest like it hurt to breathe. I could only do shallow breathing I couldn't yawn, it hurts to talk, it hurts to move, so everything was in my chest. So, they mixed together the Maalox and the Lidocaine and that pretty much it was like it just numbed my stomach, my esophagus and stomach.

							Then I was also given, well this is for the imaging, for the contrasting I think it's Omnipaque and NS bolus that was for the contrast and then before they discharged me they gave me something called Ketorolac or Toradol and that's it. The patient stated no Morphine received, they offered me Morphine, but I did not want for me Morphine. I have a list of medications that they gave me and I have a list of imaging that's helpful. I also had chills and sweating. The lab test that were completed are B-type natriuretic peptide, A CBC undeferential, compressive metabolic panel, there were no abnormal finding except my blood pressure was little bit off and I was experiencing a low grade fever. This was when I left the hospital (not clarified further about hospital visit), it doesn't tell me what it was when I entered, unfortunately when I left when they discharged me. My blood pressure was 163 over 71, my temperature was 98.1, but my normal temperature is 97.1 but I also had ice packs on bac of my neck, I had ice packs on my face and I had ice pack on my chest and 4 blankets. The outcome of event severe chest pain like super severe and sternum pain was recovering, and outcome of other events was unknown. Follow up needed, further information has been requested
1357375	5/28/2021	CA	16	F	5/24/2021	5/26/2021	Patient developed left sided chest pain that lasted for approximately 12 hours. It then improved but she still had it with lifting heavy objects. Was seen in clinic. Went home and has follow-up with Pediatric Cardiology tomorrow.
1357376	5/28/2021	MA	26	M	5/13/2021	5/17/2021	I have had occasional brief chest pains, like a painful tightness around my heart that lasts a couple seconds at a time. They have been random and infrequent enough I have not done anything about it (also, I am currently uninsured), but v-safe suggested I should submit a VAERS report of it anyway. Obviously I cannot be entirely sure it is related, but it is not something I have experienced before.

1357122	5/28/2021	PA	70	F	3/25/2021	4/25/2021	<p>Blood clot in lung diagnosed, worry related to blood thinner use; Chest pains; Chest "didn't feel right"; Blood pressure increased; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of PULMONARY THROMBOSIS (Blood clot in lung diagnosed, worry related to blood thinner use), CHEST PAIN (Chest pains) and CHEST DISCOMFORT (Chest "didn't feel right") in a 70-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 021B21A and 047A21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included COVID-19 in November 2020. Concurrent medical conditions included Cholesterol blood excessive, Hypertension and Hyperlipidemia. Concomitant products included APIXABAN (ELIQUIS), CELECOXIB (CELEBREX), METOPROLOL SUCCINATE and LOSARTAN POTASSIUM for an unknown indication. On 25-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 22-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 25-Apr-2021, after starting mRNA-1273 (Moderna COVID-19 Vaccine), the patient experienced CHEST DISCOMFORT (Chest "didn't feel right") (seriousness criterion hospitalization). On 28-Apr-2021, the patient experienced PULMONARY THROMBOSIS (Blood clot in lung diagnosed, worry related to blood thinner use) (seriousness criteria hospitalization, medically significant and life threatening), CHEST PAIN (Chest pains) (seriousness criterion hospitalization) and HYPERTENSION (Blood pressure increased). The patient was hospitalized on 28-Apr-2021 due to CHEST PAIN and PULMONARY THROMBOSIS. At the time of the report, PULMONARY THROMBOSIS (Blood clot in lung diagnosed, worry related to blood thinner use), CHEST PAIN (Chest pains), CHEST DISCOMFORT (Chest "didn't feel right") and HYPERTENSION (Blood pressure increased) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 28-Apr-2021, Blood pressure measurement: increased (High) Increased. Concomitant medication included high cholesterol drug.</p>

1359301	5/28/2021	CA	13	F	5/22/2021	5/26/2021	On 28 Apr 2021, post second dose of vaccination patient experienced chest pains and went to emergency room. Patient reports a chest scan, chest X-ray, bloodwork, EKG, echocardiogram, and various tests were performed at the hospital. Patient was diagnosed with a blood clot in lungs. Patient reports being hospitalized several days and doctors indicated "she dodged a bullet". Patient reports the treating physicians could not determine the cause of the clot, nor determine if it was vaccine related. Patient reports concomitant medication, losartan dose was recently increased from 50mg to 100mg once daily. Patient attributes that the increased blood pressure was the worry related to being placed on blood thinners [Eliquis]. Treatment information included eliquis. Company Comment: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. This case was linked to MOD-2021-138094 (Patient Link).; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

1358593	5/28/2021	VA	30	M	5/21/2021	5/24/2021	Patient with no past medical history, presented to the emergency department with complaints of acute onset left-sided chest pain while getting ready for work. Pain was described as burning sensation that is somewhat improved with leaning forward. Notably patient had received his second dose of the COVID 19 vaccine series (moderna) 3 days prior to presentation. He also noted generalized weakness with hot and cold chills after the vaccination that resolved within 24 hours. ECG in the emergency department with concerning for ST-segment elevations in anterolateral leads and cardiac enzymes were positive. Patient then underwent cardiac MRI which found evidence of perimyocarditis believed to be due to acute inflammatory response to second dose of COVID-19 vaccine series as all other tests were negative and patient had no previous viral illness prodrome. The patient was treated with colchicine and later discharged home after a 3 day hospitalization.
1359311	5/28/2021	IL	37	F	4/9/2021	5/7/2021	I have been having heart palpitations and some slight chest pains for a couple weeks. I was not sure if caused by stress, but it has gone on for some time and really started a few weeks after my second dose.
1359312	5/28/2021	WA	19	M	4/23/2021	5/21/2021	left sided chest pain x1 week. Pericarditis on EKG. Troponin negative
1359510	5/28/2021	TN	17	M	5/7/2021	5/8/2021	Pt reported he was "aware of his heart" and that it "felt like when adrenaline is running through his body" that began approximately 24 hours after vaccination, and resolved 48 hours after starting. He reported this information at his second dose appointment 21 days after vaccination. He says his symptoms were hard to describe, but he overall felt poorly and says he could feel his heart beating more than normal. He denied chest pain, racing heart, excessing sweating, headache, agitation. Patient has no history of cardiac issues. After 48 hours his symptoms resolved with no intervention.

1358475	5/28/2021	CA	40	F	5/11/2021	5/11/2021	<p>She got her vaccine, within 10 minutes her heart felt like it was racing. She noticed over the next 2 days that she was unable to move with nausea and body aches from head to toe and had to lie in bed those days. She had been exercising regularly and now she had fatigue and had to stop exercising as her heart was acting strange and not able to do so. On 5/21/21 her heart was beating so fast and went to UC and they tested her blood work. She said that she had left chest pain, pain down her beds, and pain down her arms. They did blood work stated that she had very high troponin levels, and her BP was dropping to low levels and they called 9-1-1 and she was taken to another hospital and they did the same tests and found that her troponin levels were even higher, and that her heart was experiencing some kind of arrest. Her BP was dropping and she was admitted to the ICU where she was there 4 days. While she was there they did angiograms, echocardiograms, and every one came back stating that her heart was good. They told her that she may have had a mild heart attack and they did not know why and she said that she felt it was due to the vaccine. On 5/24/21 she was discharged and on 5/25/21 she called 9-1-1 again and her BP was high and her heart rate was high, and she was taken to the ER again. She was tested again and they did not see anything, and they felt that she had myocarditis or pericarditis and that she needed an MRI of the heart and to contact her cardiologist and her PCP. She came home that night and went to the ER again the next day and felt that she was having a heart attack, arm pain, heart racing, and did the same things again and told them what tests she was supposed to have, and they have not done an MRI of her heart yet. She is waiting to get a referral from her PCP for the cardiac MRI and she is experiencing the same reactions that she has been having. They have put her on a baby aspirin to take daily, Lopressor 25 mg twice a day, Lipitor 40 mg to take once a day. She continues to have the bouts of the chest pain, erratic heart beat, weakness and not able to take a shower due to the weakness and the heart racing and the shortness of breath. They were telling her during this time that parts of her heart were dying, and all kinds of other things, and that's when they put her in the ICU. She went to UC, and was transferred to ER and admitted to the ICU and stayed 4 days. She was</p>

1358097	5/28/2021	VA	23	M	5/11/2021	5/13/2021	discharged from there on 5/24/21. Then back to the ER on 5/25/21, and discharged from the ER. Then she went back again last night 5/27/21 to ER and they treated her partially, they did an EKG and tried to explain her situation and they told her that she was fine, and she told them that her troponin levels were high and he more or less dismissed her and said that his troponin levels would be high if he exercises excessively. She left the ER as they were not going to do anything for her. She has a phone appointment scheduled for Tuesday as they have nothing until later in June.
1358114	5/28/2021	MD	62	F	5/11/2021	5/12/2021	Patient developed chest pain symptoms on the evening of 5/13, he said symptoms waxed and waned but worsened on 5/16 which prompted him to go the Hospital ER. There he was found to have an elevated troponin 27.9 and ST elevations on ECG. This prompted an emergent evaluation by cardiology and patient underwent a Left Heart Catherization (LHC) on 5/16 which showed no obstructive disease. Cardiology suspected possible myocarditis which was confirmed on 5/18 with a cardiac MRI. Patient also had an echocardiogram that showed mildly reduced systolic function EF 50-55% and mild hypokinesis in the left ventricle (echo obtained on 5/17). Patient was discharged on two new medications: Losartan and metoprolol and has cardiology follow up on June 1.
							She got her vaccine, she did not have any reaction that day. Her arm hurt a little when she was sleeping. She woke up the next morning and had severe chest pain, which did not stop no matter what she was doing during the day, even sitting down. The following day when she woke up everything was back to normal. She waited one additional day to make sure it was not a microvascular issue she had, and did not get it again and still does not have any issues. She did call her cardiologist who told her not to take the 2nd vaccine. The day they were going on she just took her regular medication and monitored her heart rate and her BP.

1358550	5/28/2021	OR	21	M	5/21/2021	5/23/2021	d. This is a 21 year old male who received his 2nd dose Pfizer vaccine on 5/21/21. On 5/25/21, he presented to an urgent care for chest pain that began on 5/23/21. He had an elevated troponin, so was transferred to the ED. He described this as a dull ache in his left parasternal area. No radiation to his back, neck, or arm. He exercised after and the chest pain did not worsen, although he felt fatigued. He denies pleuritic pain, orthopnea or positional change in chest pain. Patient was admitted to hospital with concern for myocarditis following covid vaccination. Cardiology followed. ?Suspect myocarditis likely due to second Pfizer COVID vaccine, as patient has no history of recent illness, drug use, recent medication use to suggest hypersensitivity reaction, systemic illness. Patient does have a history of chest pain during childhood, however no work-up at that time and denies history of kawasaki?s or autoimmune conditions.? Symptoms resolved by 5/26 and patient was deemed stable for discharge. Patient will establish with a PCP and was referred to outpatient follow-up with cardiologist.
1358562	5/28/2021	CA	58	F	4/30/2021	5/1/2021	per patient, after she received the vaccine she developed SOB and chest pain. She said it resolved in about 2 days. she notified her pcp.
1358568	5/28/2021	WA	16	M	5/25/2021	5/27/2021	Chest pain dull in nature and constant without dyspnea, nausea, vomiting
1358573	5/28/2021	TX	25	F	5/20/2021	5/28/2021	PT SAID SHE IS FEELING SOMETHING IN MIDDLE OF CHEST. I ASKED IF CHEST PAIN SHE SAID NO, I ASKED IF ACID REFLUX BUT SAID NO. SHE IS NOT SURE HOW TO DESCRIBE. MAYBE ANXIOUS AFTER GETTING VACCINE. SUGGESTED TO CALL HER MD. PT SAID SHE HAD RASH AFTER VACCINE BUT GOING AWAY NOW.

1358471	5/28/2021	OR	21	M	4/24/2021	4/25/2021	Pericarditis diagnosis: This is a 21 year old male who presented to the emergency department on 4/27/21 with a two-day history of chest pain. He was seen in a emergency department on 4/26 and reported a normal EKG, blood work, and x-ray. He was discharged home. His was worsened so he reported to an urgent care in . That team had a concern for pericarditis, so referred the patient to the emergency room. He had a reproducible pain over the costal margin but did describe a positional component. Provider felt they still had to consider pericarditis as well as costochondritis. The suspicion for pulmonary embolism or acute coronary syndrome or very low. The suspicion also for myocarditis was low. His EKG did show some J-point elevation versus ST elevation in the anterior and lateral leads. There was no evidence of reciprocal depression. His troponin test was normal. His CBC and metabolic panel were normal. He had had CRP which was mildly elevated at 4.6. A bedside point-of-care ultrasound showed no evidence of a pericardial effusion. Provider felt it was reasonable to treat him for pericarditis although his EKG is not classic for this. It was recommended he use his scheduled ibuprofen 600 mg 3 times a day. He was also given a 1 month course of daily colchicine 0.6 mg. It was recommend he follow closely with his PCP to see if he needs to have this colchicine course extended. He will follow-up with his primary doctor in 1 week for repeat check.

1357812	5/28/2021		22	M	3/19/2021	3/20/2021	<p>Chest Pain, Myopericarditis; From EPIC: From cardiologist healthy man who comes to the ER with left anterior chest discomfort for the last 36 hours or so. Symptoms are made worse by deep inspiration. Were improved following self administration of 600 mg of ibuprofen earlier today. 2 days ago he received his second COVID-19 vaccine (Pfizer). Following day he experienced arm pain muscular aches and pains severe discomfort of the right arm (injection site) later in the day there was nausea and vomiting on one occasion (nonheme). By last night he was able to eat dinner but subsequently felt short of breath with worsening chest discomfort morning the left arm continued to ache with musculoskeletal pains. Developed more discomfort in the left anterior chest radiating to the throat made worse by deep inspiration. Does not describe typical sharp catching pain of pericarditis. No cough sputum bruising bleeding abdominal pain change in color or character of bowels. Sign in the emergency room he was hemodynamically stable, in sinus rhythm with a normal EKG. Torrey work-up notable for an initial troponin of 1.28 and a follow-up troponin of 2.14. Chest x-ray perfectly normal. Elevated d-dimer. CT angiography negative for pulmonary embolism vascular injury, cardiomegaly, pericardial effusion but the radiologist did note thickening of several right posterior and lateral axillary lymph nodes raising a question of recent right-sided vaccination or injury/infection to the right arm. Presently he is perfectly comfortable able to take a deep inspiration with mild chest discomfort, breathing easily. I met him in July 2018 He came to the emergency room with a 3-day viral syndrome manifested as headache nausea vomiting diarrhea and abdominal discomfort and then developed chest discomfort. He was found with diffuse mild J-point elevation on EKG consistent with a viral type pericarditis with troponins which rose to a maximum of 10.4. Work-up for myocarditis was negative. Echocardiogram perfectly normal. Symptoms responded to a course of nonsteroidal anti-inflammatory agents and colchicine. Seen in follow-up of repeat echocardiogram was perfectly healthy. Our diagnosis was myopericarditis. There is no history of shortness of breath dyspnea on exertion decrement of exercise capacity peripheral edema orthopnea PND palpitations lightheadedness syncope or collapse. No ill contacts. He works in a high security</p>

position and therefore qualified for early administration of the Pfizer COVID-19 vaccine. Graph past medical history notable only for the episode of myopericarditis and a remote tonsillectomy. There is no significant family history of sudden cardiac death or unusual heart disease. He takes no medications. Patient was recommended to take 4 weeks of ibuprofen and colchicine if needed for worsening chest pain. Patient was recommended to follow-up closely with his primary care doctor and check ESR, C-reactive protein as well as renal function. Needs close follow-up with cardiology as an outpatient.

1354485	5/27/2021	CA	38	F	5/25/2021	5/25/2021	Client stating she was dizzy and turning pale. EMT and Lead RN made contact with client who stated she was feeling dizzy and nauseous, client denied any other symptoms such as chest pain, shortness of breath, and tingling of mouth, tongue or lips. EMT provided client with an emesis bag and bottle of water. Client's skin turned ashen and then client had a loss of responsiveness. RN applied a sternal rub to client who regained responsiveness in <30 seconds. Lead RN applied an instant ice pack to the back of client's neck and instructed client to take deep breaths. Client was Alert & oriented x4 following loss of responsiveness. At 1230 baseline vitals taken with client sitting in folding chair at vaccination table: blood pressure (BP) 138/78, heart rate (HR) 44, Respiratory rate (RR) 14, skins pale, cool and clammy. Client stated she has a history of fainting with every injection or blood draw and that she failed to mention this to RN when she was asked how she does with shots. Ancillary brought the zero gravity chair to the table for client to recover in. Client denied any history of allergic reaction to meds/foods/environment. Denied any other medical conditions or medications taken. Continued complaint of lightheaded/dizziness and nausea. Clients skins remained pale, cool and clammy. At 1235 HR 76, RR 16 client was given a juice box. At 1240 client's skins returned to normal color for ethnicity and were warm and dry, she was alert and oriented x4, she was able to walk to observation area on her own where she was placed in the zero gravity chair and a second set of vitals were taken while sitting: BP 120/88, RR 16, HR 80. At 1250 EMT took a third BP 118/70. Client stated symptoms were fully resolved, skins normal for ethnicity, warm and dry, alert and oriented x4. At 1325 client was finished with observation, denied any other symptoms and walked away from the observation site with a steady gait

1354399	5/27/2021	OR	28	M	3/21/2021	3/24/2021	<p>~~History obtained from: patient Patient is a 28 y.o. male with hx of post-viral myopericarditis in 2013 but otherwise healthy who presents for recurrence of myopericarditis incidentally not long after receiving 2nd COVID vaccine Got the 2nd COVID vaccine on Sunday. Monday felt fevers and chills and malaise all day. Tuesday morning felt some retrosternal chest discomfort that lasted an hour or so and spontaneously went away. Was able to go to work all day and do fine. Works in a garage and lifts heavy tires. Yesterday took kids to day care, felt a little pain that morning which resolved. Picked them up in the evening and was going to hang out with them but had recurrence of pain and this time was quite severe. Tried to take some tylenol but threw this up. Came to the ED and had to wait 1-2 hours to be seen, but the time he was his pain had nearly resolved. Troponin taken around 10000. Cardiology consulted, think this might be reactivation / recurrence of his prior myopericarditis." H&P 3/24/21 "This is a 28 y.o. male with hx of post-viral myopericarditis in 2013 but otherwise healthy who presents for recurrence of myopericarditis incidentally not long after receiving 2nd COVID vaccine # Myopericarditis Had episode of post-viral myopericarditis back in 2013, at which time he had an elevation of Trop I (non-HS variety) to 7.3 and echo showing basal inferolateral, basal inferior and mid inferolateral wall motion abnormalities but otherwise normal LV function. Has been highly functional. Recently got 2nd COVID vaccine and had fevers/chills after that. Recurrent chest pain 3/24 w/o provocation, aborted on its own but has trop elevated to 10,000. EKG does not show STEMI and patient actually asymptomatic in ED. No infectious symptoms. Unclear but wonder if COVID vaccine could have caused recurrence of prior myopericarditis? Cards called in ED, they would like him admitted, to treat with colchicine and advil, repeat TTE and they will consult in the morning." A/P 3/24/21 from admission</p>

1354424	5/27/2021	IN	19	F	5/18/2021	5/21/2021	8:30 am - Sudden chest pains, pressure and shortness of breath. Came on suddenly and worsened as time went on. Shortly after 9am placed call to family Dr and was directed to go to ER. Arrived at ER around or shortly after 10am. ER immediately did a EKG then followed by all of the tests listed below. Blood work showed elevated heart enzyme which signaled there was an issue. As day progressed the heart enzyme continued to elevate. 2pm-2:30pm we had a diagnosis and were told she would need to stay overnight for observation while they started her on drugs to get her heart stabilized. She was hooked to a heart monitor throughout the night. Discharged with treatment plan the next day 5/22.

1354446	5/27/2021	OR	37	M	3/29/2021	3/31/2021	From f/u note 5/18/21: HPI/Subjective: patient is a 37 y.o. male with above past cardiovascular history who presents today for follow-up. He was hospitalized at hospital from 4/1/21 to 4/2/21 after presenting to ED with 12 hours of chest pain, found to have markedly elevated troponin (9,142). Of note, he received 2nd COVID vaccine a day before symptoms began. CT coronary scan showed calcium score of 0. Cardiac MRI on 4/2 showed myocarditis, with anterior and lateral subepicardial enhancement as well as abnormal T1 and T2 signal. He was started on colchicine x 6 months. Today, patient reports improvement in chest pain since discharge. He reports rare episode of chest pain with last episode ~3 weeks ago. He denies participating in very rigorous exercise, but did complete 20 mile bike ride recently. Denies palpitations, dyspnea, orthopnea, PND, abdominal distention, LE edema, fatigue, lightheadedness, dizziness, syncope or near syncope. Cardiovascular Problem List: #Myocarditis o 4/1/21. Echocardiogram: EF 60% o 4/1/21. CT coronary: Calcium score 0 o 4/2/21. Cardiac MRI: myocarditis, with anterior and lateral subepicardial enhancement as well as abnormal T1 and T2 signal. Assessment/Plan: #Myocarditis: During admission, echocardiogram was normal with EF 60% and CT coronary angiogram showed Agatston score of 0. Cardiac MRI showed myocarditis, with anterior and lateral subepicardial enhancement as well as abnormal T1 and T2 signal. Of note, he received the second Moderna COVID-19 vaccine the day prior, so - Monitor, will consider repeat MRI at follow up (more for activity recommendations given age) - Continue colchicine for total of 6 months (until Oct 2021)

1354679	5/27/2021	CA	34	F	5/24/2021	5/24/2021	Patient called pharmacy to report adverse reaction thursday 5/27/21 after vaccination monday 5/24/2021. Patient reported feeling tingling, like a pin prick and numbness similar to your arm falling asleep in her right arm, the opposite arm that was vaccinated. She noticed the onset about 2 hours after receiving the vaccine. She reported it was reoccurring, but on and off, the next few days. She feels is is a constant feeling today, 5/27/21. The feeling starts about at the elbow and is felt down through the hand. After vaccine, other side effects reported were headache and mild chest pain the first day only. I referred patient to her primary care provider after no other explanation could be determined over phone consultation.
1354480	5/27/2021	CO	56	M	5/27/2021	5/27/2021	Patient received vaccine without incident. About 5 minutes into the observation period, the patient began complaining of tightness in the chest that felt like allergic reactions he had experienced in the past. Patient had a history of severe ASCVD. He appeared calm without any trouble breathing, BP 140/80, pulse 84. Patient did not appear in distress, no clammy skin, no change in outward appearance of any kind. Patient denied chest pain. He stated that is was nothing like what happens when he has ASCVD-related chest pain. He was administered 50mg of oral diphenhydramine. Within 60 seconds of taking the oral diphenhydramine, he stated that he could feel it working and was starting to feel much better. Patient was advised to remain at the pharmacy for further observation but refused (documented). He left with his caregiver.
1354255	5/27/2021	RI	20	M	3/18/2021	3/19/2021	Pt presented with 2 days of chest pain in conjunction with the expected body aches, chills and fatigue after his second Pfizer vaccine. Found to have elevated troponin and diagnosed with myopericarditis. Treated with NSAIDs, colchicine. Had normal cardiac MRI and CTA coronary. Relatively preserved EF on echo (53%) with no focal wall motion abnormalities.

This case was received on 24-Mar-2021 (reference number: 5796050). This spontaneous case was reported by a physician and describes the occurrence of DRUG INEFFECTIVE (She has been on pantoprazole but that was not working for her, so she switched to Pepcid), TACHYCARDIA, HYPOAESTHESIA (Numbness), PARAESTHESIA ORAL (Tingling in her mouth) and RESPIRATORY TRACT CONGESTION (Feeling of congestion in the back of her throat/throat congestion) in a 34-year-old female patient who received Pantoprazole unk (batch no. Unknown) for an unknown indication. The occurrence of additional non-serious events is detailed below. Co-suspect product included COVID-19 VACCINE unk (batch no. Unknown) for COVID-19 immunisation. Previously administered products included for Depression: Meloxicam. Concurrent medical conditions included Gastritis. On 18-Mar-2021, the patient started COVID-19 VACCINE (unknown route), at an unspecified dose and frequency. On an unknown date, the patient started Pantoprazole (unknown route), at an unspecified dose and frequency. On an unknown date, the patient experienced DRUG INEFFECTIVE (She has been on pantoprazole but that was not working for her, so she switched to Pepcid), TACHYCARDIA, HYPOAESTHESIA (Numbness), PARAESTHESIA ORAL (Tingling in her mouth), RESPIRATORY TRACT CONGESTION (Feeling of congestion in the back of her throat/throat congestion) and DYSPHAGIA (She was able to talk in complete senses but was not able to swallow). At the time of the report, DRUG INEFFECTIVE (She has been on pantoprazole but that was not working for her, so she switched to Pepcid) and DYSPHAGIA (She was able to talk in complete senses but was not able to swallow) outcome was not reported and TACHYCARDIA, HYPOAESTHESIA (Numbness), PARAESTHESIA ORAL (Tingling in her mouth) and RESPIRATORY TRACT CONGESTION (Feeling of congestion in the back of her throat/throat congestion) was unchanged. DIAGNOSTIC</p>

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

RESULTS (normal ranges are provided in parenthesis if available): On an unknown date, Heart rate: heart rate was 130 so had tachycardia, the oxygen level was normal, no shortness of breath or chest pain. Pantoprazole (Unknown) was withdrawn on an unknown date. The action taken with COVID-19 VACCINE (Unknown) was not reported. For Pantoprazole (Unknown), the reporter did not provide any causality assessments. For COVID-19 VACCINE (Unknown), the reporter did not provide any causality assessments. Patient did notify the staff who provide with the vaccination. Patient was provided with Benadryl 50 mg, the symptoms improved, went home but when patient returned home developed numbness and tingling in the back of throat, throat congestion and reported to the urgent care where again they gave Benadryl, Claritin and they told patient to follow and prednisone 50 mg for five days, patient returned home again tachycardia continued, numbness and tingling, feeling of throat congestion continued. Patient called the urgent care, they recommended starting Albuterol nebulizer and following up with primary care. Patient was taking pantoprazole but when was put on prednisone gastritis got worst; had to put pantoprazole to Pepcid. Reporter Comment: The reporter's causality assessment was not reported for the events with pantoprazole and COVID-19 vaccine therapy. Company Comment: This is non-serious case report. Pfizer is a Marketing Authorization Holder in the country of incidence or the country where the product was purchased (if different). This may be a duplicate report if another marketing authorization holder has submitted the same report to the regulatory authorities.; Reporter's Comments: The reporter's causality assessment was not reported for the events with pantoprazole and COVID-19 vaccine therapy.; Sender's Comments: Based on the current available information, a possible contributory role of the suspect product Pantoprazole to the development of event Lack of drug effect cannot be excluded. Lack of drug effect is considered unrelated to the suspected drug of BNT162B2. A possible contributory role of both suspect products to the development of the other events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse

1354651	5/27/2021	OR	63	F	4/2/2021	5/13/2021	<p>H&P: Patient is a 63 y.o. female who presents for chest pain found to have NSTEMI. No prior cardiac history who presents with acute onset left sided arm, and jaw pain. Associated with diaphoresis. Looked up "heart attack signs in women" and came to the ER after reading this. In the days/weeks leading up denies any chest pain or pressure, LH, dizziness or syncope. No exertional dyspnea, orthopnea, PND or LE edema. BP at home are usually 130-150s. BP in the hospital is always higher because of white coat hypertension. ER course BP 170-190s systolic, HR in the 90s, AF. EKG Q waves in the inferior lead with no significant ischemia or ST elevations. Labs notable for a troponin ~ 2000. CXR within normal limits. Given aspirin, statin, nitro and heparin. Currently feels pain free. No other acute issues or complaints/ Smoked 3 mos after a divorce, otherwise no smoking history. No significant family history of CAD. " D/C summary: "Principal Diagnosis: o Myocarditis Secondary Diagnoses: o Type II MI o Hypertension o Hypercholesterolemia o Prediabetes mellitus o Obesity Procedures/Diagnostics: 5/13/2021. Coronary angiogram. o Normal left ventricular function o Normal coronary anatomy o Right radial loop Note: A right radial loop was encountered requiring a femoral access. 5/13/2021. Echocardiogram. ? Left ventricle size is normal. Mildly increased wall thickness. Normal wall motion. Normal systolic function. LV EF is 75 % , ? Nrrmal valve function. 5/13/2021. Cardiac MRI. Evidence of myocarditis, with subepicardial late enhancement at the mid chamber and apical lateral wall with associated regional edema and mild native T1 signal elevation. Normal right and left ventricular size. Hyperdynamic LV. No significant valvular abnormality. Hospital Course: In brief, this is a 63 y.o. year old female admitted on 5/13/2021 with chest pain, troponin elevation and found to have normal coronary arteries. Preserved LV systolic function by echocardiogram. She underwent an cMRI demonstrating myocarditis. She was started on colchicine and remained pain free for the rest of the admission. Myocarditis: Presented with acute onset chest pain and troponin of ~2000. Diagnosed via MRI after normal coronary angiogram. Normal biventricular function. Etiology is likely idiopathic as she had no other obvious inciting events. Pain free prior to discharge. o Colchicine 0.6 mg twice daily. o Follow-up with Dr. on</p>

1354673	5/27/2021		20	F	5/26/2021	5/26/2021	Client received the COVID vaccine (Moderna dose 1, lot # 024C21A, expiration date 6/26) at 2010. Client reported feeling "lightheaded" at 2016. EMTs and RN responded at that time. The client appeared pale and diaphoretic, and complained of the "room spinning". The client denied any shortness of breath, chest pain, difficulty breathing, changes in vision, or nausea. The client was alert and oriented x4 at this time. The client's vital signs were as follows: heart rate 56, O2 99%. The client was transferred to the zero gravity chair by staff with no difficulty. At 2020, the client's vital signs were as follows: BP 150/88, pulse 66, respiratory rate 12, O2 99%. The client had been given snacks, water, and juice by POD staff previous to her vaccination, but had last eaten a meal at 1445. The client stated she does have a fear of needles. The client stated she doesn't have any medical conditions and doesn't take any medications. The client has allergies to bees, cats, and penicillin. At 2030, the client stated her lightheadedness and "room spinning" had resolved. The client no longer appeared diaphoretic and her skin color had returned to normal. The client's vital signs were as follows: blood pressure 138/96, respiratory rate 12, O@ 99, heart rate 74. At 2040, the client's vital signs were as follows: blood pressure 138/86, heart rate 56, O2 99%. Education provided regarding AMR activation and emergency management, primary care follow up, symptom management, and v-safe. At 2048, the client's vital signs were as follows: blood pressure 130/84, heart rate 62, O2 99%, respiratory rate 14. The client left at that time, ambulating with a steady gait, with her partner who stated he would be driving her home.

F

experienced the event of atrial; This is a solicited report from a specialty pharmacy based on information received by Pfizer. A contactable other HCP reported that a 63-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) dose 2 via an unspecified route of administration on an unspecified date (Batch/Lot number was not reported) as single dose for COVID-19 immunisation; treprostinil sodium (IH TYVASO, delivered by Tyvaso Inhalation Device (TD-300/A)) oral from 06Mar2015 (Lot Number: 2101911; Expiration Date: 31Oct2021) and ongoing at 60-120 ug (10-20 breaths) 4x/day for pulmonary arterial hypertension. Medical history included ongoing secondary pulmonary arterial hypertension. Concomitant medication included warfarin. The patient got second coronavirus disease (COVID) shot and then went into atrial fibrillation about seven day later, so they were unsure if that had anything to do with vaccine or not. But, she would be going to get an ablation done on 17May2021. She had no issues with her breathing, no chest pain or other side effects. She had a history of atrial fibrillation a while ago. The action taken in response to the event for treprostinil sodium was unknown. The outcome of event was unknown. The reporter did not provide causality for the event of atrial fibrillation. Senders Comment: The company has assessed the serious adverse event of atrial fibrillation as not related to IH treprostinil and TD-300/A device. The event was likely due to complications of secondary pulmonary arterial hypertension. Underlying medical condition which led to secondary pulmonary arterial hypertension also likely contributed. The reporter's assessment of the causal relationship of the events with the suspect product was not provided at the time of this report. Since no determination has been received, the case is managed based on the company causality assessment. No follow-up attempts are needed. No further information expected.; Sender's Comments: The association between the event atrial fibrillation with BNT162b2 can not be completely excluded based on the temporal relationship. The pre-existing pulmonary arterial hypertension may have been contributory as well. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of

1353629	5/27/2021			F		3/18/2021	<p>Tachycardia; Numbness; Tingling in her mouth; Feeling of congestion in the back of her throat/throat congestion; She was able to talk in complete senses but was not able to swallow; She has been on pantoprazole but that was not working for her, so she switched to Pepcid; This is a spontaneous report from a contactable physician, based on information received by Pfizer. This case was received on 24-Mar-2021 (reference number: 5796050). This spontaneous case was reported by a physician and describes the occurrence of DRUG INEFFECTIVE (She has been on pantoprazole but that was not working for her, so she switched to Pepcid), TACHYCARDIA, HYPOAESTHESIA (Numbness), PARAESTHESIA ORAL (Tingling in her mouth) and RESPIRATORY TRACT CONGESTION (Feeling of congestion in the back of her throat/throat congestion) in a 34-year-old female patient who received Pantoprazole unk (batch no. Unknown) for an unknown indication. The occurrence of additional non-serious events is detailed below. Co-suspect product included COVID-19 VACCINE unk (batch no. Unknown) for COVID-19 immunisation. Previously administered products included for Depression: Meloxicam. Concurrent medical conditions included Gastritis. On 18-Mar-2021, the patient started COVID-19 VACCINE (unknown route), at an unspecified dose and frequency. On an unknown date, the patient started Pantoprazole (unknown route), at an unspecified dose and frequency. On an unknown date, the patient experienced DRUG INEFFECTIVE (She has been on pantoprazole but that was not working for her, so she switched to Pepcid), TACHYCARDIA, HYPOAESTHESIA (Numbness), PARAESTHESIA ORAL (Tingling in her mouth), RESPIRATORY TRACT CONGESTION (Feeling of congestion in the back of her throat/throat congestion) and DYSPHAGIA (She was able to talk in complete senses but was not able to swallow). At the time of the report, DRUG INEFFECTIVE (She has been on pantoprazole but that was not working for her, so she switched to Pepcid) and DYSPHAGIA (She was able to talk in complete senses but was not able to swallow) outcome was not reported and TACHYCARDIA, HYPOAESTHESIA (Numbness), PARAESTHESIA ORAL (Tingling in her mouth) and RESPIRATORY TRACT CONGESTION (Feeling of congestion in the back of her throat/throat congestion) was unchanged. DIAGNOSTIC</p>

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

RESULTS (normal ranges are provided in parenthesis if available): On an unknown date, Heart rate: heart rate was 130 so had tachycardia, the oxygen level was normal, no shortness of breath or chest pain. Pantoprazole (Unknown) was withdrawn on an unknown date. The action taken with COVID-19 VACCINE (Unknown) was not reported. For Pantoprazole (Unknown), the reporter did not provide any causality assessments. For COVID-19 VACCINE (Unknown), the reporter did not provide any causality assessments. Patient did notify the staff who provide with the vaccination. Patient was provided with Benadryl 50 mg, the symptoms improved, went home but when patient returned home developed numbness and tingling in the back of throat, throat congestion and reported to the urgent care where again they gave Benadryl, Claritin and they told patient to follow and prednisone 50 mg for five days, patient returned home again tachycardia continued, numbness and tingling, feeling of throat congestion continued. Patient called the urgent care, they recommended starting Albuterol nebulizer and following up with primary care. Patient was taking pantoprazole but when was put on prednisone gastritis got worst; had to put pantoprazole to Pepcid. Reporter Comment: The reporter's causality assessment was not reported for the events with pantoprazole and COVID-19 vaccine therapy. Company Comment: This is non-serious case report. Pfizer is a Marketing Authorization Holder in the country of incidence or the country where the product was purchased (if different). This may be a duplicate report if another marketing authorization holder has submitted the same report to the regulatory authorities.; Reporter's Comments: The reporter's causality assessment was not reported for the events with pantoprazole and COVID-19 vaccine therapy.; Sender's Comments: Based on the current available information, a possible contributory role of the suspect product Pantoprazole to the development of event Lack of drug effect cannot be excluded. Lack of drug effect is considered unrelated to the suspected drug of BNT162B2. A possible contributory role of both suspect products to the development of the other events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse

1353760	5/27/2021	MD		M			<p>COVID-19 PNEUMONIA; WEIGHT LOSS OF 30 POUNDS; DIZZINESS; LEG SWELLING; BLURRED VISION; This spontaneous report received from a patient concerned a 65 year old male. The patient's weight was 148 pounds, and height was 65 inches. The patient's concurrent conditions included arthritis, recurring polychondritis (was on a lot of prescription medications, but did not disclose any particular medications), alcohol user (did not have any alcohol in 6 months, not even beer), and ex-cigarette smoker (was quitting and did not have a cigarette since 25-MAR-2021), and other pre-existing medical conditions included the patient had no drug abuse or illicit drug use. The patient experienced drug allergy when treated with infliximab, recombinant for drug used for unknown indication. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1803609, expiry: UNKNOWN) 0.5 ml, 1 total administered on 25-MAR-2021 for prophylactic vaccination. No concomitant medications were reported. It was reported that a receiving the vaccine on 25-MAR-2021, the patient was subsequently hospitalized for 19 days. He had a fever and started to feel bad the night of the injection. On the morning of 26-MAR-2021 06:30, his chest was hurting bad, had shortness of breath, and a fever of 102.7. His wife called an ambulance because they thought he was having a heart attack and he went to a local hospital where they ruled out a heart attack and gave something to bring the fever down. He checked himself out and came home. It was reported that four hours later, the fever came back, and he felt like he could not get any oxygen into lungs. He went to a hospital in a state, but was transferred to another hospital (in another town) due to insurance. He was in the hospital for 7 days, and was transferred to a different hospital that had better lung doctors for 10 days. He was in 4 hospitals in total. The patient checked himself out of the last hospital even though they wanted to keep him there. While hospitalized, the patient was tested negative for COVID twice. However, the third time he was tested, he was positive on Sunday night, 04-APR-2021. They tested him for the third time, because they were planning do to a procedure on his lungs, but they cancelled procedure after positive result. They had been treating him for pneumonia up until then, and that he was in the hospital</p>

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

for 8 days before getting the positive result, though he had all the symptoms. He received full treatment for COVID, and got two intravenous a day for 8 days and received the plasma. The patient also lost 30 pounds while in the hospital. He was originally 153 pounds and went down to 124 pounds. The patient gained most of his weight back now. He had been at home for over a month. It was reported that the patient still required oxygen, but was not on it constantly. Though, if he tried to do anything, he was out of breath, and was not sure how his lungs were going to do in long-term and could not do too much without running out of breath. The patient had all of the symptoms listed on the fact sheet, including: difficulty breathing, fast heart beat (it still remained more than 100 beats per minute, and was typically around 115 beats per minute), dizziness/weakness, shortness of air (still happened), chest pain, leg swelling, pain in abdomen, headache, blurred vision, and bruised spots (still happened). He did not have a bad rash. He had a lot of different doctors helping him. After he was discharged, he had different doctors calling him every day for 2-3 weeks until he told them to stop. He had not seen any doctors in person since discharge. The patient had booked an appointment to see a doctor on 02-JUN-2021. Laboratory data included: COVID-19 virus test (NR: not provided) NEGATIVE, NEGATIVE, Heart rate (NR: not provided) around 115 beats per minute, more than 100 beats per minutes, and Weight (NR: not provided) 124 pounds, 153 pounds. On 25-MAR-2021, the subject experienced pneumonia, and was hospitalized. On 26-MAR-2021, Laboratory data included: Body temperature (NR: not provided) 102.7. On 04-APR-2021, the subject experienced confirmed covid-19 infection. Laboratory data included: COVID-19 virus test (NR: not provided) positive. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient was recovering from weight loss of 30 pounds, and the outcome of dizziness, leg swelling, blurred vision and covid-19 pneumonia was not reported. This report was serious (Hospitalization Caused/Prolonged).; Sender's Comments: V0; 20210545010- COVID-19 VACCINE Ad26.COV2. S – Covid-19 pneumonia. This event(s) is considered unassessable. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There

1354101	5/27/2021	NY	17	M	5/19/2021	5/24/2021	Patient hospitalized for overdose. Patient found to have potential myocarditis. Patient overdosed on antihistamines loratadine and doxylamine. Found to have rhabdomyolysis. CK levels have been trending downward. Patient found to have elevated troponin and ECHO showed decreased EF raising concern for myocarditis. Also with EKG changes. Patient is asymptomatic without chest pain or palpitations. Cannot differentiate cause of myocarditis, can be due to over dose and related to rhabdomyolysis or other causes.
1354142	5/27/2021	MN	27	M	5/5/2021	5/9/2021	Myocarditis requiring transfer to higher level of care and hospitalization x 24 hours, continued mild chest pain.
1354158	5/27/2021	NY	21	M	5/1/2021	5/18/2021	For the next few days after I received the second dose of the vaccine, I experienced muscle and body aches, fatigue, and a low grade fever. About 3 days after getting the vaccine I woke up at about 2 AM on the 18th with severe chest pain, the other side effects had subsided at this point. I ended up going to the ER after about a half hour of the pain not going away. They ran a Troponin blood test and found my levels to be high. They also tested me for Covid which came back positive. They ended up doing an ultrasound of my heart, using a catheter to take a look at my arteries, a chest xray, a CT scan, and an EKG. The final diagnosis was myocarditis of the heart. I had to stay in the hospital for a few days while my heart stabilized. I was given orders to only participate in light exercise and to take it easy for now. I have a follow up visit with the cardiologist in about a week from now. It was also found out through testing that I may have Wolf Parkinson's white syndrome.

1353528	5/27/2021	TN	34	F	5/11/2021	5/11/2021	Tingling in esophagus and chest.; warm/burning sensation in esophagus; warm/burning sensation in chest.; This is a spontaneous report from a contactable Other Health Professional (patient). This is the 1st of 2 reports for the second dose. A 34-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration and administered in right arm at age of 34-years, on 11May2021 14:00 (Lot Number: EW0173) as 2ND DOSE, SINGLE for covid-19 immunisation. Medical history included systemic lupus. And the patient diagnosed with COVID-19 prior to vaccination. She had not tested for COVID-19 since the vaccination. The patient was not pregnant. There were concomitant medications but unspecified (the patient received other medications within 2 weeks of vaccination). The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Historical Vaccine included the first dose of BNT162B2 that was administered in right arm at age of 34-years, on 22Apr2021 10:15 (Lot Number: ER8730) for covid-19 immunisation. The patient experienced tingling and warm/burning sensation in esophagus and chest on 11May2021. Treatment received included Benadryl for above events. Events outcome was unknown. No follow-up attempts needed. No further information expected.; Sender's Comments: Based on the available information the events Paraesthesia, Oesophageal pain and Chest pain are most likely related to an intercurrent or underlying condition which is not related to the subject drug. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate –data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1355350	5/27/2021	OR	35	F	1/5/2021	1/21/2021	<p>~~Summary: Patient is a 35 y.o. year old female with below past cardiovascular history who was evaluated today, face-to-face, via interactive videoconferencing (secure 256-bit AES encrypted bidirectional video session). Cardiovascular Problem List: #Suspected idiopathic myocarditis</p> <ul style="list-style-type: none"> o CTA chest 1/21/21: Normal CT angiogram of the chest. o TTE 1/21/21: LVEF 55%. Normal RV size and function. No significant valvular disease. o Coronary angiogram 1/21/21: Normal coronary arteries. LVEDP moderately elevated. o cMRI 2/16/21: No evidence of acute myocarditis. There was a small focus of delayed enhancement in the mid inferior wall of the LV in a nonischemic distribution. This is compatible with a focus of myocardial fibrosis, possibly from prior episode of myocarditis. Trace TR. <p>#Type 1 diabetes #Hx of gestational diabetes Assessment/Plan: #Myocarditis - COVID infection in 9/2020 and intense chest pain with positive troponin in 1/2021. CORS, Echo, CTA were negative for an etiology. CMR revealed a focal area of mid to subepicardial enhancement without evidence of active disease, suggestive of an old episode of myocarditis. Will treat supportively with colchicine BID. Will have RN call in 4 weeks to assess symptoms. If there is no improvement would get limited echo to make sure there is no decrement to LV function. - Colchicine BID - total of 6 mos Follow-up: I have scheduled a follow up appointment in 4 months to be with me. "Doctor~~</p>

1356323	5/27/2021	LA	29	M	3/31/2021	4/26/2021	Pericarditis and subsequent myopericarditis. Intense chest pain that worsened upon lying down and a low grade fever.
1356336	5/27/2021	CA	87	F	5/27/2021	5/27/2021	Client received 2nd COVID vaccine of Pfizer (Lot# EW0185 expiration date 06/24/2021). Caregiver of Client asked EMT and EMT to check her blood pressure and her injection site. At 1754, RN responded to this event. At 1754, vital signs are blood pressure 163/84, heart rate 70, oxygen saturation 99%. Client reports she was anxious. RN answered all concerning questions in regards to COVID vaccine. Client reported to have a thyroid disorder, hypertension, high cholesterol. Client reports in taking Levothyroxine, Aspirin, Cilostazol, Amlodipine, Hydrochlorothiazide, Atorvastatin, Lantoprost. RN educated Client about ED precautions and common adverse effects of the COVID vaccine. At 1800, vital signs are blood pressure 162/80, heart rate 72, oxygen saturation 98%. Client reports no chest pain, no shortness of breath, no dizziness, no blurred vision, no headache, no nausea. At 1810, vital signs are blood pressure 160/79, heart rate 72, oxygen saturation 98%. Client reports no new symptoms and that all concerns have been addressed. Client is talking to staff and caregiver. At 1830, Client stood up with no complaints. Client walked out of facility with a steady gait using her cane accompanied by caregiver.
1356339	5/27/2021	FL	60	F	5/24/2021	5/24/2021	chest pain, shortness of breath, fatigue, malaise, headache that occurred the evening after vaccine was given

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1356343	5/27/2021	CA	15	M	5/27/2021	5/27/2021	Client received the 1st dose of Pfizer COVID vaccine lot #EW0185 and expiration date 6/24/21 at 5:52PM. Per vaccinator, reports that client was saying, "Wow that was aniclimactic" after getting vaccine. Per vaccinator, she notices within 1-2 minutes client got quiet and then reported "I am not feeling well." Client received vaccine in left deltoid. RN requested PHN 1 to get gravity chair. PHN grabbed gravity chair and asked RN to get BP cuff and pulse ox. PHN arrive to assess client and found client alert and oriented x 4 in chair at 5:53PM. Client was already drinking water given by vaccinator when PHN arrived. Client reports he was experiencing "dizziness and slight shortness of breath." PHN ask client if he thought he was steady enough to switch to gravity chair. Client stood up slowly and sat in the gravity chair. RN 1 asked client if his throat felt tight-client responds- "No" and coached client to take deep, slow breaths. At 5:55PM vitals are: blood pressure: 130/90, pulse: 55 and oxygen: 98%. At 5:57pm client reports no longer feeling shortness of breath. Client is speaking in full sentences and able to answer all PHN questions about chest pain and headache and client reports having neither. At 6pm vitals: blood pressure:125/90, pulse:75, and oxygen:100%. PHN instruct RN to get Lead PHN or Co-Lead. Client reports he has slight dizziness and feels lightheaded and reports that earlier he had blurred vision but now is seeing clearly. At 6:03PM vitals are: blood pressure:160/100, client appears pale and heart rate:140, and oxygen: 100%. Lead PHN arrives to take over assessment and PHN starts calling 9-1-1 at 6:04PM as blood pressure is repeated by co-lead :180/90, oxygen100% and pulse 129 and upon auscultation hears clear lungs and heart palpitations. Client is then reports shortness of breath and dizziness, no headache and no blurred vision. Parent reports that client has a history of asthma but rarely needs inhaler so she does not have it on her and that client recently had been on antibiotics for Gastrointestinal history and a bad cough (not COVID)-all symptoms had been resolved before receiving vaccine. At 6:07pm Vitals: blood pressure: 170/90, pulse:100%; no change in symptoms. At 6:08pm vitals: blood pressure:170/90, pulse: 94, and oxygen: 100%, client reports experiencing tightness in chest and unable to complete breath. Client reports no chest pain. Vitals taken again by RN due to new symptom, blood pressure:

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							122/70, pulse:93 and oxygen: 100%. RN auscultate again and hears palpitations have slowed and lungs clear. At 6:10PM, vitals are blood pressure:124/74 and pulse: 96. Client reports feeling "shaky, tightness on chest" and could not take full breaths. Paramedics assumed care at 6:12pm. Client and parent left on stretcher with paramedics to be transported to Hospital. Tell security that mother is leaving blue pathfinder in parking lot. Security assures he will not tow vehicle.
1356345	5/27/2021	DE	20	M	5/24/2021	5/26/2021	DEVELOPED CHEST PAIN, LEFT ARM PAIN ON 26TH MAY 2021
1356505	5/27/2021	CA	40	F	5/27/2021	5/27/2021	Client received the 2nd dose of Moderna COVID vaccine lot #026C21A and expiration date 5/27/21 at 4:08pm. Client's first dose reaction was reviewed by medical team and was approved to receive second dose. Client reports at 4:27pm to vaccinator that she was a little nauseated and dizzy 15 minutes prior. EMT took vitals at 4:28pm: blood pressure: 166/113, pulse: 86 and oxygen: 98%. EMT retook blood pressure and it was 160/110. Client reports she did not want to report because she did not want PHN to call 911. Client reports she still has nausea and dizziness and a mild headache. Vaccinator provides water bottle and offers gravity chair but client declines. Nurse assisted with vitals at 4:35PM: blood pressure: 138/98 and client reports no chest pain, no shortness of breath, mild dizziness, no blurred vision. Client reports her head hurts towards the back and she still feels nauseated. At 4:40PM vitals are: blood pressure: 136/90, pulse: 82 and oxygen:98%. Client reports headache is the same, no chest pain, no shortness of breath, dizziness still present, nausea improving, offer to call paramedics and client declines. At 4:45pm vitals are: blood pressure: 134/96, pulse:83 and oxygen:98%. Client reports no shortness of breath, nausea is improving and dizziness is slightly better. At 4:50pm vitals are: blood pressure: 138/92, pulse:88 and oxygen:98%. Client reports no changes in symptoms. At 4:55PM, vitals are: blood pressure: 134/94, pulse: 88 and oxygen: 99%. Client reports nausea is better, headache feels better and dizziness has resolved. Client walked out of the facility with a steady gait at 5pm.

1355785	5/27/2021	IL	36	M	5/13/2021	5/19/2021	Felt like couldnt catch breath , skipping feeling in chest went to doctor he placed me on holter monitor. Interpretation: Underlying rhythm is sinus rhythm/sinus tachycardia, heart rate ranges between 58 beats per minute to 149 beats per minute, average heart rate 96 beats per minute. Episodes of sinus tachycardia are seen. QRS duration is within normal limits. Rare, Isolated PVCs. No significant arrhythmias or heart blocks were noted. Patient's reported symptoms of chest pain, skipped heartbeats, numbness in the hands, shortness of breath correlated with sinus rhythm or sinus tachycardia. Conclusions: 1. Predominant underlying rhythm is sinus rhythm with episodes of sinus tachycardia; average heart rate high normal at 96 beats per minute. 2. No other significant arrhythmias or heart blocks were noted. 3. Patient's reported symptoms of chest pain, skipped heartbeats, numbness in the hands, shortness of breath correlated with sinus rhythm and sinus tachycardia.

1354704	5/27/2021	MA	32	M	5/25/2021	5/25/2021	I received the COVID-19 vaccine at 9:30 am from vaccination clinic. I had just recovered from COVID-19 about two and a half weeks prior. I had no immediate reaction. I worked the entire day with no adverse effects other than a sore arm, which I expected. Later in the day at about 7:45 pm I went for a 6 mile run and got home at approximately 8:49 pm. Within half an hour of getting home, I quickly became feverish. The fever continued to rise until I was extremely hot, and hotter than I can ever remember as an adult or child. I did not have access to a thermometer so I cannot reliably report what the temperature was but I am estimating 103. It felt like every part of my body, including my legs, was hot to the touch. By 1 am I had serious chills and was shivering under winter blankets despite an outdoor temperature of 70-80. In addition, I had an extremely elevated heart rate and chest pain. I also had generalized muscle aches all over my body. I did not sleep at all that night. The fever began to slowly dissipate early in the morning but the elevated heart rate continued for approximately 24 hours. The discomfort resulting from my elevated heart rate was substantial and alarming enough that I sought advice from my primary care physician after a nurse at my Occupational Health clinic suggested potentially getting an ECG. Ultimately, by Thursday morning, the symptoms had decreased and I declined any follow up. However, this was the single worst reaction I've ever had to any vaccine and the single worst fever I've ever experienced as an adult or in my memory as a child. Although I am aware that people who have already had COVID-19 tend to have worse reactions to the first COVID vaccine, I am filing this report primarily because of my concern that exercise may trigger an especially severe reaction.
1354719	5/27/2021	NC	31	F	4/8/2021	4/8/2021	passed out, later had chest pains, high blood pressure, high heart rate and was checked for a PE via catscan. Still experience racing heart periodically almost 2 months later.
1354720	5/27/2021	WA	65	F	4/11/2021	4/12/2021	The day after the injection I started to experience symptoms of pleurisy. I am familiar with these symptoms as I had pleurisy in my youth. There was some difficulty breathing and chest pain. The chest pain continues to this day.

1354958	5/27/2021	NY	52	M	1/28/2021	2/22/2021	54 days after the first vaccination with Moderna Covid-19 Vaccine, and 25 days after the second vaccination, at approximately 0730 on Day 1, a 52 year old male, height 175.2cm, weight 95.5kg, without significant medical history or prodrome, had an acute onset of dyspnea manifesting as a small sigh at intervals of 4-6 minutes, which increased in frequency to intervals of 2-3 minutes over the course of the day. At approximately 1400 he had a one minute episode of tachycardia >120 bpm. At 1515, his forehead became diaphoretic. He had neither chest pain nor a pericardial friction rub at any time. He went directly to the local emergency department. Additional information for Item 18: Blood pressure at admission was 155/87, pulse 97, respiratory rate 22/minute, SpO2 98%, and Temperature 37.2. ECG at 1539 interpreted as: "NSR at 85, Lateral ST depressions; ST elevations in aVR, ischemia / Posterior wall MI". ECG at 1541 showed: NSR at 82, unchanged from prior ECG. ECG at 1552 interpreted as: "Sinus tachycardia at 102, ST depressions remain in lateral leads but now also in V3 and V4; persistent ST elevations in aVR CW evolving posterior wall MI". PR depression in leads II and V4-6, and reciprocal PR segment elevation in aVR (pericarditis ECG Stage 1) Atypically for pericarditis, ST depression, rather than ST elevation, was present in leads V3-V6. Owing to a working diagnosis of an evolving posterior wall myocardial infarction, an emergent cardiac catheterization was performed, which demonstrated non-obstructive CAD and a small myocardial bridge. Initial laboratory values were notable for a white blood cell count of 11.89 K/mm3 (4.5 - 11.5), monocytes 1.1 K/mm3 (0.0 -1.0), 9.4% (2.0 - 9.0), neutrophils 7.9 K/mm3 (1.5 - 6.6), 66.9% (40.0 - 75.0). Troponin was negative at admission and 18 hours later. D-Dimer was negative. Viral panels including SARS-CoV-2, Influenza A, Influenza B, and RSV were negative. He was admitted for overnight observation. On Day 2 an echocardiogram was normal with no effusion, and ECG was notable for the absence of PR depression and persistent ST depression in leads (PR segment normalization part of pericarditis ECG Stage 2)..... His dyspnea persisted, with a moderate sigh every 1-2 minutes at rest. He was discharged with a presumptive diagnosis of coronary vasospasm or a pulmonary etiology, and told to follow up with his pmd. Over the next several days, his dyspnea

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

was continuous and progressively worsened, and he had diaphoresis of the forehead every morning approximately 0900 until Day 20. Sleep remained normal. On Day 5 he was sighing deeply more than once per minute at rest, causing him distress, and ECG showed (?persistent ST depression in V4-6 with reciprocal changes in aVR). On Day 12, ECG showed T-wave inversion in V1-6 and ST depression in V3-6 (ECG Stage 3); a computed tomography of the chest was normal; and blood tests notable for normal monocyte count .57 K/microliter (0.0 - 0.8), normal CRP 2.15 (1.0-3.0), and an ANA titer of 1:80 (elevated) described as a speckled pattern, which is associated with several autoimmune diseases. Repeat echocardiography on Day 26 showed a small, generalized pericardial effusion and was otherwise normal. Cardiac MRI on Day 29 showed delayed gadolinium uptake. Pulmonary function tests on Day 38 were normal. Stress echocardiography on Day 44 was normal. Cardiac CT angiogram on Day 46 was normal. The patient was diagnosed with pericarditis of unknown origin and started on aspirin 650 mg p.o. b.i.d. An ECG on Day 80 showed PR depression in II and V4-6, continued ST depression in II and V3-6, without T wave inversion (T wave normalization c/w ECG Stage 4). Symptoms progressively worsened from onset to nadir around Day 12, on which he had continuous moderate dyspnea upon awakening with severe dyspnea with mild exertion. Symptoms then generally improved until after Day 47, he began to have alternating periods of several days without symptoms followed by several days of mild dyspnea. Clinical symptoms resolved on Day 85.

1355300	5/27/2021	CT	51	F	4/7/2021	4/7/2021	I was still having chest pain and breathing problems prior to getting it, so they wanted me to get the vaccine because if I got COVID, it would kill me. Over the weeks, my breathing worsened and I had terrible chest pains. They did another CT Scan to make sure I didn't have another embolism. The symptoms of my other conditions flared as well. I got the vaccine 3 or 4 days before the news was released about the blood clots. I'm still experiencing breathing issues, chest pains and dizziness. I'm now on additional meds for my lupus: Cymbalta and Lyrica. They're trying to help with the chest pain and polymyalgia. I was also given a Lidoderm patch to help with my chest pain. It just seems like everything got worse afterwards. I'm not sure if my lungs will ever function at 100% due to everything going on.
1355277	5/27/2021	WA	26	F	2/13/2021	3/1/2021	About 2 weeks after second dose started having chest pain, shortness of breath. Still having symptoms 3 months later, however, fewer and further in between and more mild
1355276	5/27/2021	NV	40	M	4/3/2021	4/17/2021	April 17th, felt chest pain and fatigue and shortness of breath. After about two weeks of it, I went to ER on the 26th. I was diagnosed with blood clot on my heart. I spent a week at the hospital Heparin blood thinners and antibiotics - discharged on May 2, 2021. They sent me home with Warfarin regiment. I am still on that. I still have some days where I'm good but some days, I can barely stand and get out of bed due to short of breath, fatigue but not as much chest pain. I think the blood thinners are working. I just have to take it easy and make sure to have some calm days. It could take weeks to months to have the blood clot totally dissolve from the system.
1355241	5/27/2021	CA	57	F	5/11/2021	5/13/2021	SOB, left sided flank pain, left sided chest pain, difficulty/painful breathing
1355142	5/27/2021	GA	16	M	4/29/2021	5/14/2021	Patient was admitted to healthcare facility on 5/23 with chest pain and elevated troponin. Normal biventricular systolic function. Cardiac MRI showed myocardial fibrosis

1355092	5/27/2021	OH	14	F	5/24/2021	5/25/2021	Started Tuesday evening with light headed, dizziness, headache, in the early morning hours pt said she felt as if her right side was going numb & asked to go to the hospital. Later in the afternoon she got worse along with bad chest pain & stomach & started vomiting
1355081	5/27/2021	OH	61	M	5/12/2021	5/12/2021	After administration of the vaccine at 9:50 AM, the patient went out to the waiting area to wait the 15 minutes after the vaccine. About 10 minutes into the waiting time, patient became very pale, and stated that were having chest pain. Patient was given water and their blood pressure was taken, it resulted in a BP of 70/60. The patient was laid down on the ground, and legs raised, and after another 10 minutes the BP was taken again and resulted in 118/78, at this point the patient was feeling much better. However, to be precautious, the patient was rolled out in a wheel chair to make sure hypotension did not occur again. Patient stated that at 11:30 they had a scheduled appointment already with their doctor and said they would discuss with them the adverse reaction of the previous couple hours.
1355011	5/27/2021	OR	40	F	1/10/2021	1/10/2021	Starting on the 1st day of the 2nd dose vaccine-elevated heart rate, chills, fever, body aches, nausea, neuropathy (hands, feet, arm and lower legs feels like pins and needles) and loss of appetite. Participant took Tylenol and Zofran. Fever and body aches resolved after 48 hours. Tachycardia and chest pains continued for up to 6 weeks. Participant had a follow-up already scheduled on 1/25/2021. Cardiologist doubled the dose of propranolol. As of now, cardiovascular symptoms and neuropathy are not resolved. MRI and stress test have been ordered .
1352713	5/26/2021	OH	28	M	5/14/2021	5/26/2021	Chest pain, dizzy, light headed, leg and arm pain, short of breath, tired, spaced out mentally/unable to focus. No treatment at this time.
1352538	5/26/2021	NV	30	M	5/21/2021	5/22/2021	Significant chest pain, shortness of breath, and extreme fatigue after little to no activity whatsoever. I am still experiencing these symptoms five (5) days after receiving my second dose of the Pfizer vaccine. Additionally, I can assure anyone reviewing this report that I absolutely did not exhibit these symptoms (or anything similar) prior to Saturday, 22 May 2021.

1352516	5/26/2021	CA	65	M	2/27/2021	2/27/2021	A few hours after my second shot I got a mild headache, tired, and a bit blurry vision. The next day things got worse with high fever, bad headache, and very tired. The bad side effects went away after 4 days but since then I often feel tired with a mild headache and a little chest pain now and then. Before my vaccination, I played tennis 3 times a week, each time I played about 2 to 3 hours continuously without feeling tired. But after the vaccination, it takes only 15 to 30 minutes for me to run out of breath so I have to slow down to catch my breaths. My stamina is adversely effected after my vaccination . I'm afraid that I have a case of Myocarditis, a condition similar to Pericarditis, which is an inflammation of tissue surrounding the heart, that caused by the vaccine.
1352515	5/26/2021	MN	46	F	4/12/2021	4/14/2021	Started with a mild headache which hasn't gone away despite otc pain meds. Then progressed to fatigue, swollen legs and ankles, shortness of breath, mild chest pain and several instances of abnormal heart rhythm (flutter in chest). Still having these issues

1352383	5/26/2021	MA	45	M	4/28/2021	5/1/2021	From hospital discharge summary: "45 y.o. right-hand-dominant male who presents with few hours of improving left arm heaviness/left hand cramping in the setting of getting his second Pfizer COVID-19 vaccination in his right arm 3 days ago and 3 weeks of mildly increased exercise/intermittent fasting. The patient reports getting his first Pfizer COVID-19 vaccination on April 7, 2021. Reports some mild symptoms afterwards. Around that same time, the patient reports having a checkup with his primary care doctor that was notable for a cholesterol elevation to 200. This prompted him to try and lose weight including intermittent fasting and increase in exercise, especially for exercises and cardio. The patient reports approximately 20 pound weight loss over the past 3 weeks. 3 days ago, the patient reports getting his second Pfizer COVID-19 vaccination in his right arm. Reports fever (maximum 103 Fahrenheit) and mild headache the subsequent 2 days after the vaccine. Last night, the patient went to sleep on his left side at around 8 PM. He woke up at 4 AM with significant left arm heaviness and left hand cramping. He tried to massage his hand with some slight improvement of the symptoms but otherwise the symptoms persisted. Hence, this morning, he called his PCP, who told him to come into the ER for further evaluation. Here, the patient reports improving left arm heaviness/left hand cramping. He also does report family history of heart attack and an uncle at a similar age and massive heart attack of his grandfather in their 60s. He denies fever, anorexia, unexpected weight change, headache, blurry vision, sinus pressure, cough, hemoptysis, orthopnea, PND, SOB, DOE, chest pain, pleurisy, changes in taste/smell, N/V/D, abdominal pain, flank pain, urinary sx, genital sx, black stools, incontinence, absence of flatus, calf pain, leg swelling, numbness/tingling, streaking redness/rash/skin changes, easy bruising. Also, deny history of HTN, DM, smoking, prior MI, prior PCI, prior CABG, prior TIA/CVA, or history of PAD. Further, denies recent trauma/fall, history of cancer, blood thinner use, recent drug use, recent travel, sick contacts, family history of connective tissue disease/congenital aortic anomaly, or family history of similar sx. --- Hospital Course by Problem # Troponinemia (Likely myopericarditis) The patient has a family history notable for MI and CABG in relatives aged 50-70 on his mother's

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

side. The patient notes that most of these family members were heavy smokers and drinkers, which he is not (never-smoker, rare EtOH, never illicit drugs). His symptoms are notable for L arm heaviness/cramping that began around 8pm on 4/30/21 at 9/10 severity and subsequently was 3-4/10 severity on presentation to ED and is 0-1/10 severity at time of admission to the floor; he has no associated numbness, weakness, coolness, or pallor. His symptoms are non-exertional. He denies CP, SOB, lightheadedness, nausea, jaw pain, abdominal pain, fatigue. He notes that he recently got the second COVID shot in the R arm, and had a post-vaccine course notable for Tmax 103 ~3d ago and 101 as recently as yesterday. His EKG was notable for ST-elevation in II/III/aVF and his troponins were elevated 305 -- > 298 -- > 328. Of note, his CRP was elevated at 69. The patients symptoms and findings could certainly be compatible with atypical ACS and, given the low risk of bleeding associated with heparin, he was treated conservatively upon admission with heparin infusion, metoprolol tartrate 6.25mg q6h, atorvastatin 80mg (he received ASA 325mg in the ED). However, given his recent covid vaccination and elevated CRP and reported fevers, this could also be compatible with myocarditis or other inflammatory etiology. TTE on 5/3 demonstrated preserved EF 55% with no WMA. Given reassuring TTE, a cMRI was ordered to assess for myocarditis vs scar tissue from recent ischemic event. Cardiac MRI on 5/5 was notable for finding consistent with myopericarditis (see below). Aspirin and atorvastatin was stopped on discharge. Patient was discharged with metoprolol 25 mg daily.~~

1352381	5/26/2021	CA	55	F	5/11/2021	5/11/2021	<p>Client received the 1st dose of Pfizer COVID vaccine (lot # EW0182 and expiration date 5/15/21) at 2:47pm. Client walked over to EMT to report that she was having pain on the opposite arm where vaccine was given and that she would like her blood pressure taken (vaccine given in left arm, pain in right arm). PHN finds patient alert and oriented x 4 sitting in a chair. Client reports she had been waiting 20 minutes in observation. Client reports a history of hypertension. Per client, she was not sure about taking her nifedipine, so she did not take her medication at the regular time. Client states she takes Losartan and took it this morning. Client denies any chest pain, headache, blurred vision, dizziness, or shortness of breath. At 3:14pm vitals: blood pressure:173/103, pulse:60, and oxygen: 98%. At 3:20pm vitals: blood pressure:161/106, pulse:60, and oxygen:99%. Client reports no symptoms. PHN came to speak to client and patient reports she has her medication with her and took it out of her purse. Client thought she should not take medication because she was getting the vaccine. Client also stated when she does not take her medication 160-180 systolic is her regular blood pressure at home. PHN let client know that she should take medication as prescribed. Client took 2nd dose of hypertension medication (Nifedipine) at 3:24pm. PHN recommended client to stay for further observation as blood pressure is high. At 3:25pm vitals: blood pressure:155/94, pulse:63, and oxygen:99%. Client reports no more arm pain on right arm and that "she was a little nervous about the vaccine and that her blood pressure goes up easily.". At 3:30pm vitals: blood pressure:160/99, pulse:66, and oxygen:98%. Client reports she is feeling better and was provided with ER precautions and to notify her provider about her blood pressure readings. Also recommended client eating and taking medication prior to dose #2. Client reports no shortness of breath, no headache, no arm pain, no chest pain, no blurred vision. At 3:38pm, vitals are: blood pressure: 152/99, oxygen:99, and pulse:60. Client reports no symptoms. At 3:44pm vitals: blood pressure: 148/99, pulse: 60 and oxygen: 98%. Client walked out with a steady gait at 3:46PM.</p>

1350522	5/26/2021	PA	54	M	4/22/2021	4/30/2021	ED Discharged 5/5/2021 - 5/6/2021 (3 hours) Last attending ? Treatment team Acute nonintractable headache, unspecified headache type Clinical impression Headache Chief complaint Triage Note: To ED c/o severe HA behind R ear since being dx w COVID 4/30. Denies cough, dyspnea, fevers. Reporting he has had 1 round of COVID vaccines. Has taken "alieve, tylenol, and advil" w/o relief. Last doses all "early this morning." pt awake and alert in triage. History of Present Illness Patient is a 54 y.o. yo male presenting to the ED with severe headache behind the right ear since 4/30. Patient was diagnosed with Covid at that time and has taken 1 round of the Covid vaccine. He has tried Aleve, Tylenol and Advil without relief. He states that his last dose were all early this morning. Denies any numbness or tingling, visual disturbances, ataxia, photophobia. He has no history of strokes, MI or blood clots. He states that prior to his Covid diagnosis he is otherwise healthy. ED Discharged 5/8/2021 (4 hours) Last attending ? Treatment team COVID-19 Clinical impression Fever Chief complaint Medical Decision Making 54-year-old male who presents today due to uncontrolled fever, diagnosed with Covid on April 30. Symptomatic for about 2 weeks now. On exam appears to be uncomfortable, is febrile and tachycardic, however remaining vitals are stable. Physical exam is also reassuring. Patient not complaining of any chest pain, shortness of breath, lightheadedness. Will provide patient with symptomatic relief including fluids and ibuprofen, if able to improve patient's symptomatology will have him discharged home. His labs also show some slight hyponatremia, he will likely improve from fluids as I believe this is secondary to his diarrhea that he has been having over the last few days. CK also slightly elevated, would likely benefit from fluids. After a single liter of fluids, patient symptoms improved, fever and tachycardia also improved, continues to endorse some generalized weakness, will give second liter of fluid and Tylenol at this time as he is due for this. After receiving a second liter, the patient states that his symptoms have greatly improved at this time, comfortable returning home. I advised the patient that she should take ibuprofen and Tylenol on 6-hour cycles very regularly, he can take it in a pattern where he takes Tylenol followed by ibuprofen 3 hours later followed by Tylenol again 3

1350637	5/26/2021	VA	16	M	5/23/2021	5/24/2021	<p>Previously healthy 16 year old male presenting to hospital as a transfer for chest pain and elevated Troponin levels concerning for myocarditis. Patient has otherwise been healthy. Two days ago he received his second dose of COVID vaccination. He initially felt fine, but later that day had some body aches. The next day he felt feverish off and on and had dull left upper sternal border chest pain intermittently. Today, he reports sharp 7/10 mid sternal chest pain, lightheadedness, sweating, chills, and intermittent non-productive cough. He presented to original hospital for evaluation. The patient admits to tactile warmth since Sunday with no documented temperatures. He recently received his second dose of Pfizer just before onset of these symptoms. He reports difficulty sleeping since Sunday, but no shortness of breath, rashes, syncope, nausea, or vomiting. He has not had any other recent illness, fevers, or known COVID-19 exposures. He denies any history of prior cardiac disease and there is no known family history of cardiac disease, arrhythmias, or sudden death in the child or adolescent period. He denies illicit or recreational drug use. In the ED, he was well appearing with pain now 1 out of 10. POC troponin was 16.8 ng/mL. He had labs pertinent for ESR 10, CRP 3.0, BNP 24. RP2 PCR was negative. UDS was negative except for opiates (s/p morphine). IV was placed and patient was started on IV fluids. EKG was obtained and showed questionable left atrial enlargement per ED read. Cardiology was consulted and performed Echocardiogram in the ED at bedside and was within normal limits. Cardiology resident team contacted for admission. Past Medical History: No major medical diagnoses Past Surgical History: Orchiopexy, T&A Family History: No cardiac family history Social History: Lives at home with mother. Has two healthy siblings not living at home Immunizations: Up to date Medications: None Allergies: NKDA Etiology of likely myocarditis remains unclear at this time. In his age group, this would most likely represent a viral myocarditis. He would likely benefit from cardiac MRI during this admission for further evaluation of myocarditis. His EKG findings with his age group are unlikely to be secondary to myocardial infarct. No arrhythmias or heart block noted on EKG at time of admission or telemetry in ED. There is no family history of autoimmune disease or cardiac disease to suggest an</p>

1350702	5/26/2021	CA	31	F	5/11/2021	5/20/2021	<p>autoimmune component or genetic etiology.</p> <p>A 31-year-old female received the first dose of mRNA Covid-19 vaccine (EW0179, Pfizer) IM on May 11th, 2021, without any reported clinical problem. Patient has no known medical illness and no previous history of DVT or PE. Patient had negative COVID-19 PCR on April 16th, 2021. She had 3 healthy pregnancies and no miscarriages. She did not have any long flights or car rides for the last several months, except for over 2 months ago. Patient denies any allergic problems, smoking tobacco or use any oral contraceptives. However, patient stated patient's father has a history of unprovoked DVT. On May 20th, 2021 patient experienced worsening of left-sided chest pain and shortness and visit ED on May 22nd, 2021. At the ED, physical examination was unremarkable. Blood tests (renal, hepatic function) were normal and labs resulted in D-dimer 0.86 mcg (FEU)/mL and platelet count 288k (Baseline of 200-250k). CT showed suspected very subtle segmental and subsegmental PE involving the left lower lobe. Duplex did not show evidence of DVT in either lower extremity. Given the family history of DVT, hypercoaguable workup was done with the following results: homocysteine level 5.5, thrombin time 14.9, negative factor II and V mutations, cardiolipin Ab IgG < 1.6 GPL (normal range < 20 GPL), lupus anticoagulant with reflex indeterminate, protein C activity 92 (normal range 70-130%) and protein S activity 67 (normal range 65-140%). Patient was admitted to the hospital. At the ED, enoxaparin 60 mg x 1 and morphine 4 mg x 1 were given. Later, it was switched to apixaban 10 mg BID on the floor and patient was discharged with apixaban 5 mg BID x 7 days and once daily BID. Patient is scheduled to follow up with her PCP in regards to the duration of therapy.</p>

1350830	5/26/2021	GA	22	F	4/16/2021	4/19/2021	For the first two days, I had sever body pain, fever, and migranes. On the third day, I had severe chest pain and breathing difficulty that lasted for two additional days. The chest pain went away on the sixth day but the breathing difficulty lasted for a few more days. I never recieved treatment for any of the side effects.
1350859	5/26/2021	IN	32	M	5/5/2021	5/12/2021	Intermittent Chest pains, left and right sides, at random times of the day. Goes away on some days, stays on others. Unsure if side effect of the the first or second shot.
1350881	5/26/2021	TN	25	M	5/13/2021	5/16/2021	Patient presented with chest pain. Troponins were elevated. Echocardiogram revealed decreased left ventricular systolic function with an ejection fraction of 30-35%, MRI was consistent with myocarditis.
1350891	5/26/2021	WA	16	M	5/17/2021	5/17/2021	The evening after the client received his first dose of Pfizer, he reported chest pain and fluttering in his chest while playing basketball. This event lasted approximately 5 seconds and resolved without intervention. The client is being followed by his pediatrician. Per his parent, these events have happened before, but this was the most severe.
1350895	5/26/2021	SC	46	F	3/3/2021	3/31/2021	After the first shot I had intermittent pain along the left side of my jaw, as well as intermittent pain on the left side of my chest. This sometimes would extend to my back. The chest pain was less often and less noticeable of the two. This lasted for a few weeks following the first shot. While I did have chest tightness.. I do not recall having the same sensations in my left jaw or chest following the second shot, but I did not write my symptoms down. In addition, I have seasonal allergies that were bad during the month of April and it is sometimes difficult to tell whether chest/lung tightness is related to that. I am now having what feels like heart palpitations or racing heartrate, particularly at night, sometimes during exertion, or if I have not slept well. I do not know that the heart palpitations are related to the vaccine, but I do believe the jaw and chest pain are attributable to it.

1349551	5/26/2021	MD	23	F	4/17/2021	4/1/2021	the back of her tongue felt numb/developed a numb tongue; throat was itchy then sore/her throat was sore and itchy; throat was itchy then sore/her throat was sore and itchy; chest pain; not quite normal breathing/uncomfortable breathing/heavy breathing that was more of an irregular breathing; Fatigue; her lungs felt swollen; This is a spontaneous report from a Pfizer-sponsored program via a consumer reported for a patient (reporter's mother). A 23-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in Arm Right on 17Apr2021 (Lot Number: EW0162) (at the age of 23-year-old) as single dose for covid-19 immunization. Medical history included asthma and diagnosed at age 2, allergy and allergy to bull dogs. Concomitant medications included budesonid taken for allergy, start and stop date were not reported; formoterol fumarate dihydrate taken for allergy, start and stop date were not reported. The patient experienced her lungs felt swollen in Apr2021, the back of her tongue felt numb/developed a numb tongue on 17Apr2021, throat was itchy then sore/her throat was sore and itchy on 17Apr2021, chest pain on 17Apr2021, not quite normal breathing/uncomfortable breathing/heavy breathing that was more of an irregular breathing/out of breath walking up the steps on 17Apr2021 and fatigue on 17Apr2021. A family member had some reaction to the first pfizer covid-19 vaccine. Wanted to know where can she find information to determine if the second vaccine shot is safe. 40 minutes from the time of the injection the back of her tongue felt numb and her throat was itchy then sore. About 40 minutes after that those symptoms went away. Later in the day she had chest pain and not quite normal breathing. After using her asthma inhaler twice in a short time this dissipated. Fatigue remained for about a week. Her daughter was prescribed Metronidazole 500mg (she initially thought it was penicillin) and the packaging information of the antibiotic says not to receive any vaccines. She was scheduled for her second dose next Tuesday (18May2021) and wanted to know if it would this be applicable to the Pfizer BioNTech Covid 19 vaccine. Mother calling on behalf of daughter who received the first dose of the Pfizer BioNTech Covid 19 vaccine on 17Apr2021. She was told to wait 30 minutes after the

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

vaccine and was okay, however after 40 minutes after the vaccine she developed a numb tongue, her throat was sore and itchy. This subsided within about 30 minutes (also reported as 40 minutes). About 4 hours after the vaccine she developed chest pain and uncomfortable breathing. Her daughter states her lungs felt swollen, and was out of breath walking up the steps. She did use her AuviQ and albuterol inhaler and the first dose of AuviQ didn't work so she repeated it and it helped. She called the doctor and used her peak flow meter and the doctor on call stated that her reading was okay and did not need further medical attention. After that evening those side effects went away. Caller has a past medical history of asthma and allergies to bulldogs. If she was even around someone who has been near a bull dog she will develop chest symptoms. Mother spoke with CDC and they told her as long as her daughter didn't go to the ER it was okay for her to receive the vaccine and wanted to know if she get her second dose of the Pfizer BioNTech Covid 19 vaccine. She is scheduled to receive it next Tuesday (18May2021). Her doctor said that some people react to the polyethylene glycol and want to know if she could get tested for that. After the patient received the vaccine, her tongue was numb and her throat was sore and itchy but it went away. This started 40 minutes after the patient received the vaccine. 4 hours after the patient received the vaccine, she had chest pain and heavy breathing. The caller is nervous because the patient has only had this chest pain during a severe allergic reaction in the past. The patient do about the second dose. The patient was also prescribed an antibiotic this week and the antibiotic paperwork said not to have any vaccines while taking that product. The patient is due for the second dose of the vaccine this week, is it okay to get because she will still be on the penicillin. This event happened after receiving the first dose of the vaccine on 17Apr2021. The patient also had fatigue for a week. The patient had the heavy breathing that was more of an irregular breathing. The patient's lungs felt swollen, it felt like there was weight on her chest, it was uncomfortable breathing. The caller felt out of breath walking up the steps. The caller used her inhaler twice. The patient underwent lab test included investigations: the on call doctor had the patient do the peak flow meter and it was fine, over 550 on 17Apr2021.

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

No more information was available. The doctor also had the patient press her chest to see if there was pain when she touched it and there was not so the on call doctor felt comfortable not making the patient go to the emergency room. Caller reports that her daughter received her first vaccine dose on 17Apr2021 and afterwards experienced a severe reaction with symptoms including, tongue swelling, sore throat, and Chest pain. Caller reported that it didn't getm severe enough for her to need an Epi pen. Caller reports that they have an appointment to see her doctor as well, for further discussion. She calls today to ask if symptoms with the second dose are expected to be worse than they were with the first shot and timing of the second dose. We refer you to speak to your healthcare provider about the risks of the vaccine compared to the risks of potentially not being fully protected against COVID- 19 infection. Your healthcare provider knows your health situation and has access to information that can better help inform this decision. The outcome of the event her lungs felt swollen was unknown, the event fatigue was recovered in Apr2021, the other events was recovered on 17Apr2021. Information on lot/batch is available; further information has been requested.

1349575	5/26/2021	PA	75	M	2/19/2021	4/10/2021	Chest pain; Shortness of breath; Shoulder pain; Temperature: 100.3 degrees Fahrenheit; Pericarditis; The diagnosis he has is acute Pericarditis, peritonitis; This is spontaneous report from a contactable consumer (patient). This 75-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot#: EM9810) at single dose in left arm on 19Feb2021 11:00 for COVID-19 immunization. The first dose was on 28Jan2021 (Lot#: EL9261) at noon in left arm. Adverse events following prior vaccinations was none. Additional vaccines administered on same date of the pfizer suspect was no. Prior vaccinations (within 4 weeks) was no. Ongoing medical history included controlled high blood pressure diagnosed around 2000; heart beat irregularities, diagnosed in his 20s, in 1971, he had his first EKG at that time. Concomitant medication was not reported. On 10Apr2021, patient experienced chest pain, shoulder pain, shortness of breath and ended up in the hospital. Temperature was 100.3 degrees Fahrenheit on 10Apr2021. It took a while to find out what was wrong, it was pericarditis, an inflammation and probably a viral infection of the pericardium. Patient was hospitalized on 10Apr2021, in the evening and discharged in the middle of the afternoon the next day, 11Apr2021, less than one day. The chest pain ended on 12Apr2021, but he had a relapse, and it was ongoing and persisting. Shoulder pain basically lasted for 24 hours. He was put on medicine and it got better, but he had a relapse last week and it was persisting. Shortness of breath had a relapse last week. When he was put on medicine, he felt better, but when he got off the medicine, he relapsed and he didn't know if it was persisting or getting better. Pericarditis was diagnosed on 11Apr2021 and it was ongoing and improving. Temperature was resolved the next day, the 11Apr2021 with the medicine. Patient was put on medication when he went to the Emergency Room. The medication was provided to deal with the inflammation. Ibuprofen was taken 600 mg by mouth, 3 times daily for inflammation, he took it from 11Apr2021 to 18Apr2021. The dose was lowered to 1200 mg per day, then 600 mg per day. When he went off of it, the symptoms came back. Caller was taking 200 mg tabs by mouth 6 times a day. Caller had a prescription dose that was higher before, the big ones, but that's over with now. Patient was taking colchicine at 0.6 mg by mouth

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

once a day. It was an anti-inflammatory. The ibuprofen was stopped and after 3 weeks, his symptoms came back and he was put back on the ibuprofen. The colchicine was a 30-day prescription. He would run out this week and would renew it for a 30-day supply. Patient added these medications tear up the stomach, so they put him on pantoprazole at 40 mg once per day. The ibuprofen was 600 mg tabs, NDC: 65162-0465-50, quantity 21 tabs, no refills, Rx: 6330005, it was just in a bottle, not a shrink-wrapped thing. The diagnosis he had was acute pericarditis, peritonitis and the cause was unknown, but was being treated as a viral infection. He was asked if he had a cold or upset stomach, which would then indicate the type of infection he had but he didn't have anything. These would help determine which type of virus it was. In his case it was unknown and unknowable. When the caller was weaned off the ibuprofen his symptoms came back with in a couple days. His temperature went up, he experienced shoulder pain and was short of breath. He was put back on the ibuprofen at that time. He was anticipating many more weeks of symptoms based of the way he was being treated by the doctor. The patient added the symptoms that presented were almost the same as a heart attack and he was concerned when he started to experience those symptoms. There was no clear evidence of what has caused his symptoms, he did not know if it was by Covid-19 or the Covid-19 vaccine but it was possibility. Patient hoped it was not the vaccine. All the adverse events required a visit to emergency room and physician office. Therapeutic measures were taken for all the adverse events. The outcome of event body temperature increased was recovered on 11Apr2021, the outcome of event pericarditis was recovering, the outcome of events shortness of breath and peritonitis was unknown. The outcome of rest events was not recovered. The information on the lot/batch number has been requested.

1349653	5/26/2021	MD	18	M	4/30/2021	4/30/2021	Tingling in his right hand and then subsequently developed tingling in his right leg and down to his foot; Chest pain; This is a spontaneous report from a contactable physician (patient's father) via Medical Information Team. An 18-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiration date were not reported), via an unspecified route of administration in the left arm on 30Apr2021 (at the age of 18-years-old), 1st dose, single, for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The vaccine was administered at a pharmacy. On 30Apr2021, the patient developed tingling in his right hand and then subsequently developed tingling in his right leg and down to his foot, and then developed chest pain. The reporter stated that the patient went to the emergency room and an electrocardiogram was done on 30Apr2021 that came back normal, so he was sent home. The reporter would like to know if there was any guidance that could be provided on the safety of the patient getting the second dose of the vaccine. The outcome of the events was unknown. No follow-up attempts are possible; Information about lot/batch number cannot be obtained.

1350924	5/26/2021	PA	51	F	3/6/2021	5/17/2021	<p>51-year-old female who presents today with complaint of Covid, apparently diagnosed with Covid about 1 day prior to presentation and has been having symptoms for about 3 days now. Sent in by PCP after being found to have heart rate of 140 and pulse ox of 79% from home pulse ox. On exam at this time, vitals stable, patient making complete sentences, does have some decreased breath sounds however likely consistent with her smoking history and possible COPD. Patient would prefer to return home at this time which I think is reasonable given her presentation, will provide patient with symptomatic relief, as long as she is able to demonstrate appropriate ambulation anticipate that she can likely be discharged home. History of Present Illness 51 y.o. yo female presenting to the ED with shortness of breath. Diagnosed with Covid yesterday, has been having symptoms for about 3 to 4 days now, primarily consisting of cough, decreased appetite, nausea, and diarrhea as well as sinus pressure. Yesterday she has she developed some chest pain and shortness of breath with exertion, scheduled a PCP televisit today during which she used a home pulse oximeter and was found to have a pulse ox of 79% and a heart rate of over 140 after ambulation at that time was instructed to present to the emergency department for evaluation. Currently she states that while at rest she does not feel so symptomatic however she feels significantly symptomatic with walking. She states that she has been able to eat some food however significantly decreased appetite. She does endorse a smoking history, denies a productive cough. Has not noticed any increased swelling in her lower extremities, not experiencing any chest pain today, this is primarily after having prolonged coughing fits. Has no other complaints at this time. She has a history of lupus for which she takes Plaquenil, does not take steroids. She has been taking some Tylenol on and off, and did not notice that she had a fever of 103.5 yesterday. Clinical Support RN (Registered Nurse) ? ? Encounter Date: 5/21/2021 ? ? Signed Patient is here for MAB Infusion Consent for infusion prior to this visit reviewed and verified. O2 sats > or = 90% Signs of potential reaction reviewed with patient. Tolerated IV start and MAB infusion without complication. Pt has access to pulse oximeter and thermometer for home monitoring Provided fact sheet for patients, parents and caregivers-</p>

1350470	5/26/2021	MI	70	M	3/12/2021	5/21/2021	71-year-old male with history of lymphoma on chemotherapy and heart transplant in 2011 on immune suppressants presenting with fever, fatigue, cough, shortness of breath x4 days. Patient is afebrile upon arrival with otherwise normal vital signs. He did desaturate to 88% while at rest and was placed on 2 L nasal cannula. He has clear breath sounds bilaterally without any focal findings. Work of breathing is not increased and very stable in my opinion. He appears clinically euvoletic and denies history of heart failure. No wheezing warranting treatment beta agonist. Patient will require admission given his acute respiratory insufficiency, will need to discuss appropriate Campus placement with the Heart Transplant Service and anticipate he will require transfer to Grand Rapids. Given his reported dyspnea, EKG ordered. Will obtain routine screening labs, COVID-19 swab. With his reported fever, although not objectively present during this visit, and current immunocompromised state, will treat via the emergency department sepsis protocol and collect blood cultures. Fri May 21, 2021 1059 EKG with a normal sinus rhythm, rate of 88 beats per minute, no acute ischemic changes are noted. Patient has a right bundle-branch block. EKG is unchanged from that of January 21, 2021. BNP is 404, no chest pain to warrant cardiac biomarkers. [SR] 1113 COVID-19 is detected. [SR] 1125 CMP was sodium of 128, chloride 95, glucose 303, creatinine 0.87. Magnesium is 1.9. Phosphorus 2.1. Urinalysis with trace blood, no urinary tract infection. Urinalysis without urinary tract infection. [SR] 1147 INR subtherapeutic at 1.2. [SR] 1149 Received a critical result from lab, white blood cell count is 0.04, patient is by definition therefore neutropenic. Platelets are 21 K without reported active bleeding. Hemoglobin is 9.3. Have a call out to Oncology to discuss need for IV cefepime given the reported fevers at home although etiologies presumably viral with COVID-19 test. Further, I do not know if IV Decadron is appropriate given his profound neutropenia, especially having recently finished a high-dose course of 100 mg prednisone orally x5 days. [SR] 1150 CXR: Airspace opacities are seen involving both the lungs, more prominent in the right lung, as described above. These are likely due to consolidation/pneumonia. Viral pneumonia can also have similar appearance. Correlate clinically. [SR] 1218

1349586	5/26/2021	NM	46	M	4/26/2021	4/27/2021	<p>nstemi; Myocarditis; This is a spontaneous report from a contactable physician. A 46-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number: unknown) via an unspecified route of administration on 26Apr2021, SINGLE for covid-19 immunization. The patient's medical history was not reported. The patient had no known allergies. The patient's concomitant medications were not reported. The patient did not receive any other vaccine within 4 weeks prior to the vaccine. On 27Apr2021, the patient reported to the hospital with complaints of chest pain with electrocardiogram (EKG) showing non-diagnostic diffuse ST elevations and elevated cardiac biomarkers. On 27Apr2021, the patient experienced non-ST-elevation myocardial infarction (NSTEMI) and myocarditis. The patient was hospitalized for one day, and the event required an emergency room/department or urgent care visit. The patient underwent lab tests and procedures which included blood test: negative on 02May2021, covid-19: negative on 02May2021, electrocardiogram: unknown showing non-diagnostic diffuse ST elevations and elevated cardiac biomarkers, myocarditis: unknown. Cath report did not reveal coronary artery disease (CAD). Therapeutic measures were taken as a result of NSTEMI (acute myocardial infarction), myocarditis (myocarditis), chest pain (chest pain), EKG showing non-diagnostic diffuse ST elevations and elevated cardiac biomarkers. The outcome of non-ST-elevation myocardial infarction (NSTEMI), myocarditis, chest pain and electrocardiogram (EKG) showing non-diagnostic diffuse ST elevations and elevated cardiac biomarkers was recovered on an unknown date. It was also reported that since the vaccination, the patient was tested for COVID-19 on 02May2021 and was negative. Information on lot number/batch number was requested.; Sender's Comments: The information available in this report is limited and does not allow a medically meaningful assessment of the case. Based on currently known drug profile it is unlikely that events non-ST-elevation myocardial infarction (NSTEMI) and myocarditis are related to BNT162B2. This case will be re-evaluated upon receipt of additional information. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety</p>

1351460	5/26/2021	NC	27	M	4/8/2021	4/23/2021	After like two weeks, before going to bed, I started having SOB and then a full-on chaotic panic attack. Chest pain, stomach was visually twisted and hurt, felt like I had a knot in my throat and full on anxiety. It took about a week for it to start going away after one Urgent Care visit, two ER visits, and a PC visit who prescribed me with clonazepan and Prozac. When I took both of them two weeks later, my symptoms and pain finally got better, but I am still having SOB, a little fatigue, my joints hurt once in a while, digestive problems, weird chest feeling. At least the heart pains went away.
1351472	5/26/2021	PA	48	F	1/23/2021	1/25/2021	2 days after the vaccine i went to the doctor, for something else, and i had significantly high blood pressure. 174/102, I have no history of high blood pressure. Doctor told me to watch my symptoms. I was not having chest pain, shortness of breath or any heart attack symptoms. Monitor it for the next 24 to 48 hours. The next day I checked my blood pressure, 185/110, At a clinic they did EKG, normal, Heart rate was fine. Rest drink water and rested. About 2 hours later they did another EKG. everything was normal, but my blood pressure was still high. I was given Clonidine blood pressure, and it brought down my blood pressure within an hour to 2 hours. I made an appointment for the next day. My blood pressure went up again that night 170/84, and I took another Clonidine. and it came down again. The next morning , I went to my doctor , 174/106 and a real bad headache by the time I arrived at Dr. office. Doctor reported hypertension. and ordered blood work. The friday before the vaccine, I had an annual check up and I was normal, The doctor did another EKG and it was fine. The doctor Lisinopril-hcz , diuretic , making sure she did not have a kidney infection that was causing my blood pressure to go up. Switched the meds bc my blood pressure was going to low. Feb. 8, he switched me to just lisinopril without the diuretic.

1351539	5/26/2021	MN	41	F	5/25/2021	5/25/2021	Client received vaccination around 2:15 pm and around 2:30 pm felt dizzy. Client laid back a little, drank water, and had crackers. After about 5 minutes she was feeling less dizzy, but then became upset, most likely due to anxiety as reported by client. Around 2:40 pm, client complained of chest tightness and pain. Vitals were taken. Oxygen saturations were 95%, heart rate was 97, and blood pressure was 116/70. Client stated that she had similar symptoms yesterday and laying down helped, but it was hard to lay down because she was in a wheelchair and couldn't tip very far back. The chest pain and tightness were not improving so an ambulance was requested at 2:45 pm. At 2:54, client said that the chest pain and tightness was a little worse. Client complained of a little throat tightness and feeling hot at 3:00 pm. Client complained of a headache at 3:05 pm and feeling weak at 3:07 pm. There were no visible signs of distress and client was able to take breaths whenever asked. Around 3:15 pm the ambulance arrived and took over. Client left in the ambulance around 3:22 pm. The EMTs thought it was most likely an anxiety/panic attack.
1351562	5/26/2021	NY	20	M	4/27/2021	4/30/2021	I received the vaccine on Tuesday, April 27. On Wednesday I had a fever of 102 F, body aches, and chills. By Thursday my fever had gone away and I was beginning to feel better. Friday morning at 6 AM I woke up to intense chest pain. I considered going to the hospital but by 10 AM the pain had gone away. Around midnight the intense chest pain came back and I went to a Hospital at around 1:00 Saturday.

1351585	5/26/2021	CA	16	M	5/22/2021	5/25/2021	Patient is a 16 y.o. previously healthy male transferred from different Hospital for chest pain and elevated troponin. He had received his 2nd dose Covid vaccine (Pfizer) on Saturday 5/22, then had a fever to 103 on Sunday and then 101 on Monday measured by laser thermometer to forehead, associated with chills. Mother gave him Advil for fever. States he was awakened from sleep on Tuesday 5/25 at ~4am by a sharp chest pain. He describes a non-radiating, aching pain with some sense of pressure in the LUSB that initially lasted 2 hours. Once he arrived to Hospital it went away completely, but then returned several times after lasting about 30-60min each. Denies pleuritic pain, positional pain, dyspnea, or exertional pain. Tried Ibuprofen which he feels helped, but then the pain returned 30min later. Also endorsed headache and fatigue. At Hospital he had elevated troponin concerning for mild myocarditis. EKG had diffuse ST elevation suggestive of possible pericarditis.
1351588	5/26/2021	HI	15	F	5/15/2021	5/15/2021	Prior to arrival, the patient received her first COVID vaccine at the clinic, after which she suddenly felt dizzy, described as lightheadedness, and felt warm. She was noted to be hypotensive with SBP at 67. She subsequently drank water with some improvement. No syncope, severe headache, numbness, tingling sensations, or focal weakness. Mother was concerned and brought the child to the ED for further evaluation. Currently the patient feels better. No similar symptoms in the past. The patient denies any chest pain or pressure, shortness of breath, or abdominal pain. No recent fever or cough. She is otherwise healthy and has a normal cardiopulmonary exam and reassuring EKG. The description of her symptoms and the environment which happened is very consistent with vasovagal syncope and she does not have any stigmata, and acute neurologic or cardiac emergency. I believe she is safe and stable for discharge home and she was discharged with return precautions and follow-up instructions.

1351403	5/26/2021	VA	19	M	5/13/2021	5/15/2021	Patient developed chest pain, shortness of breath and fatigue. Chest pain was worse with laying down. Went to Urgent Care and EKG revealed abnormal changes and was sent to ER for evaluation. Found to have minimally elevated troponin, WBC, Sed Rate, CRP and D-dimer. CXR and CT scan were normal with only small L axillary lymph node identified. Diagnosed with pericarditis and discharged home with Ketorolac for 5 days. Symptoms resolved.
1351606	5/26/2021	HI	48	F	5/14/2021	5/14/2021	Per patient. This is a 48 year old female with no relevant PMH who presents to the ED for evaluation of chest pain and palpitations after COVID 19 vaccination. The patient reports that approximately at 8:45 AM she received the first shot of the Pfizer coronavirus vaccine. Within 15 minutes she began to develop palpitations a flushed feeling, tickling in the back of her throat. There is no itching or rash. There is no difficulty handling secretions. The patient has never had an adverse reaction to vaccine in the past. Her only allergy is of ibuprofen, which causes hives. Patient reports ongoing palpitations since this started. No difficulty handling secretions. No leg swelling. No hx of cardiac disease.
1351401	5/26/2021	WA	16	M	5/21/2021	5/26/2021	patient presented w/ acute onset Chest pain, tachycardia Found to have cardiomegaly on xray elevated BNP, elevated CRP and Echo with severe decreased Left Ventricle Function
1351650	5/26/2021	WA	41	F	5/7/2021	5/9/2021	High fever - normally 97.6^F, fever 103.3^F; severe headache; lethargic to the point of severe exhaustion - no energy to walk more than 5 steps; central, focal chest pain/pressure at base of the heart/lower sternum that lasted approximately 20hrs, associated mild wheezing/SOB for the last 10 hrs or so of that window. No appetite for 3 days following vaccination. Chest pain/pressure and shortness of breath resolved after ~20 hrs. Headache resolved within 5 days. Fever resolved within 3 days. Fatigue and lethargic resolved within approximately 1 week.

1351684	5/26/2021	HI	16	M	5/22/2021	5/24/2021	Patient developed acute chest pain 2 days after administration of the 2nd dose of the COVID vaccine. Contacted PCP on the third day post vaccination. PCP directed him to be seen in the ED. Patient noted to have ST elevation on ECG with elevated cardiac enzymes (CKMB and troponin) thus was admitted to the PICU. Echocardiogram showed normal cardiac function. Troponin level increased further following admission, however CKMB started to trend down. Remained hemodynamically stable and did not require any significant interventions (IVIG, vasopressors, ECMO, steroids, etc). Chest pain resolved on admission to PICU.
1351721	5/26/2021	WA	26	M	5/10/2021	5/16/2021	Notes from my visit with him: May 17th 2021-- "Got his second dose of Moderna vaccine a week ago. Had some SOB afterwards, and then felt improved. But then yesterday started to have similar symptoms, as well as chest pressure, hurts to breathe all the way in, feels a twinge feeling on the inside. Also noticed a muscular pain as well in the same area, hurts to move down the middle of his chest. Also having pain on the right side. Symptoms are persistent, will wax and wane slightly but doesn't go away completely. Feels better when he is standing if feels better, has not noticed food triggers, no difficulty eating or swallowing. A few weeks ago also started a higher fat intake diet. No fevers or chills, no diarrhea, no rash, no sore throat, no runny nose. No known muscular injury that he can think of." May 20, 2021-- "Today is feeling some decrease in symptoms, but still feels like he needs to take deep breaths. Feels like "something is erratic" once in a while. Not feeling increased improvement. Laying down does seem to make it worse. One time he was leaning forward and then sitting up made it worse." May 26, 2021 -- "he reports that he is still feeling some chest pain, but overall is feeling better, symptoms are up and down. Feels like a "tiredness" in the chest wall area. The most pain is from twisting. Not worsening with acidic or greasy foods. Feels like pain is mostly in the muscle now. No SOB at all with increased exertion.~~

1351950	5/26/2021	LA	17	M	5/22/2021	5/23/2021	chest pain, nausea, sweating w/ alternate chills, and headaches onset at approximately 10-11 a.m. Sunday, 5/23/21. Because he was reporting for work to a camp, he reported to the camp nurse. After conferring with parents, he reported to Hospital for testing. EKG there was normal; minimal labwork performed - Troponin test requested by parent came back at 0.03. Advil taken earlier had resolved pain at that time, but pain was persistent the following day. Parent retrieved patient, and he reported to his pediatrician at the PCP Clinic and more labwork was performed at approximately 10 a.m. Troponin level had increased to 14, with other inflammatory markers elevated and abnormal EKG result. Pediatrician consulted with pediatric cardiologists, and parents were advised to proceed to the ER. Mother arrived with Hospital at approximately 5:30 p.m. Troponin results from 6:45 elevated to 16. Ped. Cardiologist performed echo-cardiogram, which showed no abnormal heart functioning. Ped. Cardiologist diagnosed myocarditis and prescribed 15-hour IVIg infusion. As of Wednesday, 5/26, at noon, troponin level had decreased to 10.8 and other inflammatory markers were improving. Patient is currently still hospitalized in the ICU Step Down Unit at Hospital.
1351955	5/26/2021	OR	12	M	5/12/2021	5/16/2021	He developed acute chest pain 4 days after the vaccine and presented to the ED. Pain was worse in recumbent position and improved with sitting. 1350946	5/26/2021	MA	26	M	4/22/2021	4/23/2021	A 26-year-old male with no past medical history presents to the emergency department (ED) with an acute episode of chest pain. He reports initially mild dull substernal chest pain for a day prior to an episode of acute sharp chest pain that radiates to his left neck and left shoulder accompanied by diaphoresis leading him to present to the ED. He had received the second dose of the Pfizer-BioNTech mRNA COVID-19 vaccine three days prior to presentation and reported myalgia and weakness beginning within 24 hours of vaccination. His blood pressure on arrival was 126/83 mmHg and pulse was 61 bpm. Electrocardiogram (ECG) on admission showed diffuse upsloping 2mm STE, no reciprocal changes, and PR elevation in aVR. Troponin-I on admission was 6.03 ng/ml prior to peaking at 21 ng/ml while initial CRP was 56.8 mg/L. Transthoracic echo (TTE) showed left ventricular ejection fraction (LVEF) of 55-60% with hypokinesis of the basal lateral wall. Cardiac magnetic resonance imaging (CMR) was consistent with myocarditis showing subepicardial late gadolinium enhancement (LGE) in the basal inferior wall, no edema on T2 sequences, and a mildly reduced left ventricular systolic function with an LVEF of 51%. He was started on colchicine, low dose beta blocker and losartan and improved symptomatically along with resolution of the EKG findings prior to being discharged with plan for close outpatient follow-up and repeat imaging. In addition, a respiratory viral PCR panel was obtained which was positive for Rhinovirus/Enterovirus on nasal swab. Although it is possible that his presentation was secondary to enteroviral myocarditis, the temporal relationship to the second dose of Pfizer-BioNTech mRNA COVID-19 vaccine suggests the possibility of myocarditis secondary to immunologic response to COVID-19 vaccine itself.

1351283	5/26/2021	VT	31	F	5/19/2021	5/22/2021	Chest pain and back pain around heart area and shortness of breath started Saturday morning, 5/22/2021, at 11:00am. At 2:30, decided to go to ER as pain was not getting better. Had blood work, EKG, Chest X-Ray, and CT with contrast done. Advised all tests seemed ok. Diagnosed with Inflammation, possibly pleurisy. Prescribed Ibuprofen 600mg up to 4 times a day and rest. Follow up with primary care if symptoms don't improve in 3-5 days with treatment. To date, symptoms come and go, but seem worse when lifting anything heavy or getting stressed out. Sometimes, symptoms such as chest pain or shortness of breath happen when lying down, or getting up, or doing normal activities, like cooking and cleaning.

1351319	5/26/2021	MD	24	M	5/8/2021	5/25/2021	<p>MYOCARDITIS. I experienced extreme chest pain, tightness, shortness of breath, painful heart beats, I could feel each beat. I hunched over in my bed groom grabbing my abdomen and fell onto my bed and almost passed out from whack I?d assume is lack of oxygen. I could barely breathe for about five minutes and felt relatively severe pain particularly in the right side of my chest. I could feel every muscle, tendon, and artery inflamed, enlarged, and hurting. My chest felt like it filled up with a balloon. Heart rate went up too. I have NEVER EVER felt ANYTHING like this in my LIFE. Not even close. It was a brand new sensation to me first time I?ve ever felt anything like this at all, and very intense and frustrating. Keeping in mind I am in perfect health. I am a body builder with a perfect physique. I work at a high end restaurant and have an extremely good diet. I have a normal sleep and sexual routine, I don?t use any medications whatsoever even Tylenol or ibuprofen. I have no pre existing conditions. I have no history of heart or cardio problems. My family has a history of low blood pressure. I have next to no stress or anxiety in my life. I am 24 years old I work out and run miles, five to six days a week. I don?t use nicotine, tobacco, and I haven?t had a drink of alcohol in ten years (14yrs old). I smoke marijuana on a daily basis. After about ten minutes the incident went down and I was able to breathe a little better but still had pain and tightness in my chest. I have had shortness of breath ever since. This is being written the day after the event about 26 hours later. I ran a mile last night and went to the gym it seemed to help both my breathing and the pain and tightness but it has not fully gone away. I feel my heart straining somehow as I am typing this. One thing to note is I did not want to get vaccinated but was pressured to do so, and before getting it I was very nervous and honestly upset. The woman administering it was not helpful at all and actually mocked my unsureness and was very rude and unprofessional. She didn?t answer any technical questions I had. During my interaction with her between my nerves and her behavior I?m absolutely certain my heart rate was elevated at the time of getting the shot. I have only had one shot. The episode of myocarditis occurred two weeks after my first shot. Two days after my scheduled second shot, which I missed because of work and was going to reschedule before this occurred. I am not going to be getting the</p>

1351322	5/26/2021	MI	19	M	5/5/2021	5/12/2021	second shot. Will be following up with my primary care doctor as soon as possible. Haven?t had time. patient stated suspected myocarditis (sharp pain in chest, worse on inhale), started 1 week after 1st dose of COVID-19 Pfizer vaccine. Took ibuprofen over-the-counter and symptoms subsided
1351325	5/26/2021	NJ	53	F	3/19/2021	4/7/2021	Patient started to develop chest pain, shortness of breath, cough approximately 3 days to 1 week following second covid vaccination. This continued to get progressively worse prompting visit to PCP on 4/7/21. Initially conservative treatment with medication for allergies and asthma didn't help. Symptoms worsened and led to a second visit with PCP on 5/17/21 where patient was sent over to the ER for additional evaluation. CT of the chest revealed bilateral pleural effusions, evidence of air trapping and bronchial wall thickening. Patient diagnosed with pleurisy, pleural effusions. She is still undergoing treatment with pulmonary and is started on furosemide, prednisone, inhalers. She continues to be short of breath and may be required to be out of work for as long as 4 months as per the pulmonologist.
1351362	5/26/2021	CO	35	F	5/13/2021	5/16/2021	Pfizer-BioNTech COVID-19 Vaccine EUA: patient presents to emergency department (ED) nauseated with intermittent chest pain and shortness of breath starting three days after vaccination. Initially experienced arms discomfort, throat tightness, chills, and numbness in face and chest that resolved. Seen at another ED three days after vaccination for chest pain and discharged. Followed-up by primary care the next day where vitals were stable and exam was not concerning. In current ED patient's vital signs within normal ranges and physical exam unremarkable. Patient diagnosed with pulmonary embolism, prescribed anticoagulants, and on follow-up with primary care provider patient reports no new symptoms and vital signs within normal ranges.

1351090	5/26/2021	OH	49	F	4/2/2021	4/2/2021	The patient is a 49 y.o. female who reports onset of flu-like symptoms including headaches, intermittent fever, nausea and vomiting, and chills within 3 hours of receiving her first COVID-19 vaccination on 4/2/2021. She reports symptoms increased in intensity such that it required her to seek evaluation in the ER on 4/4/2021. Patient states she was tested for COVID-19 and received positive results. She states she was diagnosed with viral pneumonia and COVID-19 and was discharged home. She received IV infusion therapy for the positive COVID-19 result on 4/7/2021, went home and took a nap and was awoken with severe chest pains and shortness of breath. She was taken to the ER via ambulance where she was diagnosed with atrial flutter with rapid ventricular response and acute hypoxic respiratory failure secondary to COVID-19 infection. Patient was admitted to the hospital.

1347666	5/25/2021		66	M	3/20/2021	3/23/2021	3/23 , admitted 3 days after covid vaccine with chest pain. Patient with history of hypertension, hyperlipidemia, CKD stage III, right-sided sciatica, bilateral carotid stenosis, and prostate cancer. Based on the presenting signs and symptoms as well as the available laboratory data, it appears most likely that the patient has acute chest pain with concern for stable angina. Patient was previously having chest pain and had an abnormal stress test on 3/18 showing anterior wall ischemia. Patient was scheduled for a cardiac catheterization on 3/25. Patient underwent cardiac cath and had DES to proximal LAD, patient will be starting on aspirin, Plavix, Lipitor 80, will continue bisoprolol and hold losartan/HCTZ for now. Patient will have Renal function lab with his cardiologist office in 2 days.

1347665	5/25/2021	OR	81	M	4/8/2021	5/22/2021	Patient presents to ER with chest pain that is constant, achy, occasional sharp stabbing, sometimes worse with deep breath and radiates to his back for the last 2-1/2 hours. He said it started at 10 PM. He said he has not had anything to eat since about 5 PM and says it does not feel like heartburn. Work-up included a CT angiogram of the thorax which showed findings consistent with pericarditis. Patient was noted to have diffuse but mild ST elevations on ECG. Cardiac enzymes remained negative however. Cardiology was consulted, and the patient was admitted to the hospital where he was started on colchicine and NSAIDs. Serial cardiac enzymes remained negative. The patient's chest pain steadily improved, and by last night it had completely resolved. He does have chronic shoulder pain due to osteoarthritis, and this is at its baseline. The patient will finish a 3-month treatment course with colchicine. I am discharging him on as needed ibuprofen for breakthrough pain. It should be noted that the patient did have a brief period of paroxysmal atrial fibrillation which resolved with 150 mg of amiodarone IV. The patient has been continuously monitored on telemetry, and atrial fibrillation has not recurred. After discussion with the patient and his wife, I have elected not to start the patient on aggressive anticoagulation as the period of atrial fibrillation was quite limited and occurred during an acute viral pericarditis episode. Patient's CHA ₂ DS ₂ score is 4. I recommended that he further discuss this with his primary care provider. Recommend considering an extended Holter monitor.

1347565	5/25/2021	WA	33	F	4/14/2021	5/2/2021	I woke up from a dead sleep and coughed, suddenly my heart rate jumped into high gear, my heart beat was over 120 beats per minute for one hour. I had chest pain and my jaw hurt and I could not lay down because it was very comfortable for my chest and felt like there was more pressure when I laid down. I came out of it by sitting upright, breathing deeply and drinking water. It took about 2 days for my chest to feel normal again, it felt like my lungs had been really overworked, I was exhausted and I started feeling normal again about the 4th day from the event.
1347549	5/25/2021	IN	12	M	5/21/2021	5/22/2021	headache, weakness, tactile fever 1 day after the 1st dose of vaccine. On day 5 (today) developed left arm tingling and chest pain, so seen at ED. Symptoms subsided on ED arrival.
1347537	5/25/2021	KS	17	M	5/21/2021	5/23/2021	Patient received 2nd Pfizer COVID vaccine on 5/21/21. He had fever and headache for about 24-36 hours, which he had also had after the first dose of the vaccine. On 5/23, he woke up with constant substernal chest pain, which worsened with exertion and deep inspiration. The pain increased throughout the day. In the ED, he was found to have elevated troponin ,CK-MB, elevated CPK, and elevated liver enzymes. EKG was concerning for ST elevation initially. Bedside echocardiogram showed low-normal function, normal coronaries, trace effusion, and no evidence of RV strain. Troponin and NT pro BNP were increased upon admission to our facility. Repeat ECHO showed borderline global hypokinesis of the LV with an LVEF of 51%. He received IVIG on 5/24/21 and also was started on ketorolac on 5/24/21. Troponin and CK were trending downwards at the time of this submission.
1347516	5/25/2021	NM	14	M	5/20/2021	5/21/2021	Myocarditis. Patient presented with chest pain and was found to have a troponin of 9.75. Pain resolved and troponin down-trended after treatment with IVIG and Solu-medrol. Patient's brother has history of MIS-C after Covid. Patient had documented Covid in 10/2020.

1347513	5/25/2021	NY	16	M	5/20/2021	5/21/2021	<p>Patient developed chest pain and difficulty breathing when lying down; symptoms started at 7pm on 5/21/2021. Seen in the emergency room at Hospital for chest pain, found to have elevated troponin level of 11.6 ng/mL (normal <0.05). CT chest negative for pulmonary embolism. Patient transferred to Medical Center. Initial high sensitivity Troponin-T level 1224 ng/L (normal <15), BNP 805 pg/mL (nl <300). EKG with diffuse ST segment changes. Echocardiogram (5/23 AM) with normal systolic and diastolic function, LVEF 58%; no pericardial effusion, no pathologic valve regurgitation. Patient admitted to telemetry monitoring bed (no arrhythmias noted during hospitalization). Patient treated initially with Ibuprofen 400 mg PO q6 hours and famotidine 20 mg PO q12 hours for presumed myopericarditis. Workup sent for viral causes of myocarditis: Respiratory viral panel negative. Infectious Myocarditis workup sent: CMV, Cocksakievirus A and B antibody, CMV IgG/IgM, Echovirus antibody, Infectious Mononucleosis Screen, Lyme C6 AB IgG/IgM, Mycoplasma IgG/IgM, Parvo IgG/IgM, Varicella IgG/IgM. Follow-up echocardiogram on 5/23 (PM) and 5/24 (AM) demonstrated no change in LV systolic or diastolic function. Cardiac enzymes, including high-sensitivity troponin T, CK and CKMB, were trended. Cardiac MRI was performed - preliminary results show evidence of myocarditis Lab Trends (earliest to most recent, as of 1 pm on 5/25/2021): High sensitivity Troponin T: 1224, 732, 664, 1058, 1332, 1141 CKMB: 65.6, 41.6, 19.3, 11.4, 6.3, 3.2 Pro-NT-BNP: 803,493, 392, 293 CRP: 58.2, 32.8, 28.6, 14.9. At the time of submission of this report, the patient remains in the hospital. Further results will be communicated to VAERS.</p>

Please contact the author with any questions or requests for clarification. CC/HPI Patient is a 50 y.o. female presenting to the ED with chief complaint of persistent cough and shortness of breath in the setting of Covid infection. This is a patient with pertinent medical history of asthma. Patient comes in for evaluation today mainly concerned that her asthma medications have not been helping with her breathing ever since being diagnosed with Covid. She was diagnosed about a week ago. She is not having some mild fevers as well as general achiness and fatigue. She is most concerned because she has been having persistent cough and some shortness of breath particularly over the past couple days. She is compliant with her daily Symbicort but has also been using her albuterol inhaler quite frequently. She reports she usually does not have to use her albuterol inhaler nearly as much. She also reports some lightheadedness which is mainly associated with position changes when she gets out of bed too quickly. Patient otherwise denies any previous history of blood clots; she has not had any recent calf swelling/tenderness. She feels that the shortness of breath has been progressively gotten worse

1347270	5/25/2021	NJ	26	F	5/25/2021	5/25/2021	0938 Patient presented for first dose of Moderna vaccination. Patient provided a 30 min observation card due to history of Penicillin allergy. At 1011 Patient complained of her throat itching and swelling, tongue swelling and tingling and chest pain. EMS called by assisting staff member. Assessment of throat and oral mucosa were unremarkable. Lungs clear on auscultation. Pulses bilaterally strong and equal. Patient coughing continuously with increased respirations. Skin pink, no redness or rash present. BP 126/88, P106, R22, O2 98%RA. Administered 50mg IM Benadryl into right deltoid. Continued to observe patient. 1024 EMS arrived, patient reported feeling better. Respirations were easy and unlabored, P84, O2 99RA. Patient declined emergency transport, refer to EMS call number 21-803376. Advised patient to seek immediate medical attention if symptoms progressed after episode, patient verbalized understanding.
1347247	5/25/2021	CA	56	M	1/10/2021	1/11/2021	A friend texted me today at 1231 on 1-11-21 asking me how I was doing following the COVID vaccination given 10 Jan 21 which we both received. In subsequent texts he disclosed that he was had difficulty sleeping last night due to fever and 7/10 chest pain. He took motrin 800mg and 1/2 of a Percocet, but did not relieve chest pain. He denied any SOB and he described his pulse as wnl. He also noted dizziness, sweating and left arm pain. He denied hx of HTN, but did relate a history of dyslipidemia which he felt was controlled. I then contacted him by phone and he verified his text messages. As he is over 50 yo and has symptoms suggestive of an Acute Coronary Syndrome he was advised to take aspirin and call 911...He was seen at Hospital, ER on 1-11-21. A mediastinal mass was noted on imaging. This mass was initially thought to be the cause of his chest pain and not related to his Covid vaccination. He was later seen by a thoracic surgeon with follow-up imaging showing significant decrease in the size of the mass raising the possibility in may be inflammatory or infectious in nature. He continues to be followed and has not had any surgeries for this condition. His thoracic surgeon is: MD thoracic surgery Specialized cancer program Hospital Name of a cancer institute Listed Address Listed phone number and fax number

1347246	5/25/2021	TX	57	M	1/12/2021	3/15/2021	Shortness of breath, Fatigue, Slight pain in chest.
1347419	5/25/2021	CA	43	F	5/9/2021	5/9/2021	2nd dose: Around 6pm of the same day of the shot, I started feeling nauseous, throwing up, body aches, severe headache, fever. The next morning around 6am, I was bleeding out of my nose and butt, feeling worse than the night before. Monday evening, 5/10/21, I started having pain on the left side of my neck and chest pains and my left arm was going numb and was rushed to the ER. An EKG was done and I was checked by the Dr, which he said my neck was swollen and my arm was most likely numb from a pinch nerve. The EKG showed normal. Was sent home to rest and take Tylenol. I continued to feel sick the rest of the week. I noticed my lower part of my legs were then turning purple, which by the end of the following week has spread up to my thighs. It looks like honeycomb under my skin from my butt to my thighs down to my legs and my arms are faintly purple. The temperature does not make a difference.

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1347920	5/25/2021	OH	21	M	5/25/2021	5/25/2021	<p>Patient received Janssen COVID19 vaccine (LOT#201A21A) in his left arm at approximately 14:43 on 5/25/21. During the 15 minute observation period, he expressed "I don't feel well" and endorsed dizziness/ lightheadedness, slight tingling feeling in fingers, and nausea. Shortly thereafter at approximately 14:50, he started to slouch and appeared faint while sitting in a chair with eyes closed. He did not fall or hit any part of his body. He was easily aroused with a touch on his arm and responded to verbal questions immediately. He denied trouble breathing, chest pain, palpitations, headache, muscle weakness, vision changes, skin reactions, swelling. He was oriented x3 and not exhibiting verbal or swallowing problems. His vitals were normal- HR 80 bpm and BP 105/80 mmHg. He was offered a receptacle to vomit in if needed; however, he did not vomit. This initial reaction was consistent with potential vasovagal reaction/ near-syncope after vaccination. Patient was encouraged and instructed to sit on the floor to prevent injury in case of fall but he refused. Staff offered him water, a fan, and opened windows while monitoring. Later while waiting for a ride at around 15:10, he endorsed headache (first above his eyes and then toward the back of his head) and clarified this did not feel like a typical migraine that he has had before. Then at around 15:20 he endorsed vision changes in his right eye- he could not see a portion of vision out of that eye except peripheral vision and described not being able to see writing on the right side of a whiteboard in front of him in the room. Later he described a resolution of that gap in vision but then had blurry vision out of that eye. He denied any vision changes in the left eye. Due to alarming symptoms of vision changes and onset of headache, patient was recommended to go to ER for further observation and evaluation. He was not in urgent distress and patient did not wish for EMS to be called but agreed to go to ER when his emergency contact picked him up. Patient's emergency contact came to pick up patient at approximately 15:40 and was recommended to take him to the ER. Patient and emergency contact were amenable to this plan. He was able to stand up and walk to the car without issues.</p>

1348817	5/25/2021	WA	21	F	4/24/2021	5/17/2021	This is a 21 year old female who reported to the emergency department on 5/17/21 at 0917 with complaints of intermittent chest pain since the previous Tuesday (5/11/21). She described it as light in pressure, pain 4/10, in the right upper chest/right breast area. The patient believed her chronic anxiety may be playing a role since she has recently started a new job that involves public speaking and she had stopped her paxil due to adverse effects. No pleuritic pain described, no pain on exertion described. Differential diagnosis included low risk for ACS, PE given oral contraceptives, anxiety. Given no evidence of abnormality in labs/work-up, the patient was discharged home with instructions to follow-up with PCP for any ongoing symptoms/anxiety.
1348652	5/25/2021	IL	24	M	4/13/2021	4/28/2021	2 weeks after my second pfizer dose I experienced intense chest pains for ~4 straight days. The pain was located in my upper-left chest / peck area. With each inhalation I experienced significant pain (a 5 out of 10, at least). This lasted for several days and slowly went away. However, about 2 weeks later and again 3 weeks later I felt this pain again. I've never had chest pain before. I am young, healthy, don't consume alcohol regularly, do not smoke, and I exercise often. I brushed off the chest pain as "the human body is weird and does weird things". However, now seeing that myocarditis may be an apparent side-effect, I want to report this strange occurrence.
1348650	5/25/2021	UT	34	M	5/23/2021	5/25/2021	Woken up by continuous chest pain at 5:30 AM, 2 days after vaccination. Breathing was also painful. Other symptoms: lightheadedness and fatigue continuing from 1 day after vaccination. Chest pain continued; going to a clinic was advised by multiple sources. At 9:00 AM, went to a clinic and got a CKG. The CKG was normal. I concluded that the problem was chest wall inflammation, and took ibuprofen. With ibuprofen, the chest pain was mostly gone by 8:00 PM.

1348645	5/25/2021	OR	20	F	5/17/2021	5/21/2021	[Chest Pain] This is a 20 year old female who received the 1st Pfizer dose on 5/17/21. On 5/21/21 at 1723, the patient reported to our urgent care facility with a chief complaint of chest tightness (hurts when laying down), difficulty breathing, and nausea since the evening of 5/20/21. Given a recent Nexplanon insertion the day prior (5/20/21), the provider had a concern for possible PE so the patient was referred to the Emergency Department. The patient arrived at the ED and was seen by the provider on 5/22/21 at 0416. The patient continued to report chest discomfort as a heaviness, squeezing, ache. The pain was constant and worse upon taking a deep breath. Following a review of labs, EKG, Troponin, physical exam, the ED provider diagnoses 'chest wall pain' and the patient was discharged home with instructions to f/u as an outpatient for any ongoing symptoms. No additional chart documentation as of this report date (5/25/21).

1348637	5/25/2021		15	F	5/25/2021	5/25/2021	Female 15-year old client received her first Pfizer shot (Lot# EW0185) at 15:02. She was accompanied by her mother and 12-year-old sister, who was also vaccinated at the same station with her. Client received her shot first and waited while her sister received her shot. After both girls were vaccinated, they were walking with their mother down the hallway to the observation room. RN1 stated that from the opposite end of the hallway she saw client?s knees buckle. RN1 walked toward client to ask if she was OK. Client straightened herself out, slumped onto her mother?s shoulder, and rolled onto her mother, who guided client to the floor. At 15:09 Lead RN heard client fall to the floor, went out to the client, and radioed for EMT assistance. Client was conscious and turned her face up. Client?s mother stated client passed out for 2-3 seconds and that her head did not hit the floor. Client?s mother stated that she cushioned her fall. Client was breathing adequately, appeared pale in face and lips, and stated she was OK. Lead RN and RN1 kept client lying on the floor and elevated her legs on a chair. EMT1 & EMT2 arrived at 15:10 and checked client?s pulse (HR: 74). Client denied head, neck, and back pain. Client was alert & oriented times 3 (person, place, & event). Client stated she was OK to stand up and sit in a wheelchair. Wheeled client to extra vacant breakroom where client vitals were taken by EMT2 at 15:17 (BP: 124/60, HR: 96). EMT1?s assessment found the client exhibited good circulation, sensation, and motor function in all 4 extremities. Client denied chest pain, shortness of breath, and nausea & vomiting. Client was leaning forward in the wheelchair resting her elbows on her lap. She stated she does not remember becoming nonresponsive and that she felt dizzy when lying her head back. Client stated she has a history of anxiety and panic attacks and is currently taking Prozac. Client stated she felt hot. Client?s mother stated client ate a full lunch at 12:35. At 15:20 Lead RN provided client with a bottle of water. Lead RN & EMT also observed client?s color returning to her face at that time. Client sat upright and stated that she felt better and was alert & oriented times 4. Client and mother declined going to the hospital and calling 911 for evaluation. At 15:23 client was wheeled to the observation room with her mother and sister where she remained seated in the wheelchair for 30 minutes for additional observation by EMT1. At 1600

1348622	5/25/2021	MD	37	M	5/1/2021	5/2/2021	Timeline just provided to neurologist. 5/1 - 2nd COVID vaccine (Pfizer) 5/3 - Went to Urgent Care for primarily chest pains 5/5 - GP sent to ER after continued severe chest pains and getting very winded after only a few steps. Weekend of 5/8 - vomiting, likely fever (felt like true vaccine side effects) - no vomiting/fever since. Since then, lots of tests/dr visits. Current symptoms: tingliness/numbness - left leg - midshin to foot/toes. Left arm - elbow to hand/fingers. Face started to tingle ~2 weeks post vaccine - left side. Extremely fatigued. Some brain fog/forgetfulness. Lack of motivation. Irritability some days. Headaches - some days really bad, other days none. Chest pains come/go throughout day. Was getting winded walking up 3 stairs but that has been slightly better. Some days - extensive muscle pain. Especially in lower back & left hip area. Some days - whole body aches. Chills - feels like body temp is off. Things come in waves - numbness/tingliness is pretty much all the time though. Also, insomnia. Did start to take 1.25mg of melatonin as needed but still very fatigued. 5/19 - Started acupuncture (plan is 2x a week) Around 5/21 - developed rash. Face (R&L side), neck/jaw area (L), inner thigh (L). Doesn't itch all the time but when it does, it really itches. Has continued 5/22 & 5/23 - headaches worsened 5/22 & 5/23 - developed diarrhea 5/23 - more tingliness developed midshin to right foot and more in right arm. 5/25 - joints began to hurt more - especially in elbow area Lung dr. Rx'ed albuterol (?) on Friday, 5/21 just in case something was going on in lungs. Has not helped. The lung dr. noted weakness in right leg during physical exam. Lung dr. and cardiologist discussed possibility of Guillain Barre Syndrome. Another blood test was ordered to check for some receptors. Awaiting results. Neurologist appt scheduled for 5/ 28

1348490	5/25/2021	CA	42	F	5/25/2021	5/25/2021	Client received the 1st COVIC vaccine of Moderna (Lot# 024C21A expiration 06/23/21). Client has completed 15 minutes in the observation area before feeling nauseated and a "slight headache". At 1803, EMT and Student Worker responded. At 1803, vital signs are blood pressure 146/100, heart rate 84, oxygen saturation 97%. At 1805, RN responds to this event. Client reports no known allergies, no medication, no past medical history. Client is offered supplemental nutrition and fluids. Client states "I was anxious coming here". RN addressed her concerns related to vaccines. Client denies nutrition, but accepts fluids. At 1812, vital signs are blood pressure 134/94, heart rate 74, oxygen saturation 97%. Client reports that nausea has resolved, no shortness of breath, no chest pain, but still has a "slight headache". RN educated Client about ED precautions and common adverse effects of the COVID vaccine. At 1819, vital signs are blood pressure 147/99, heart rate 79, oxygen saturation 98%. Client reports no changes and no new symptoms. Client reports her headache is the same and "manageable", and continues to drink water. At 1824, vital signs are blood pressure 129/93, heart rate 83, oxygen saturation 97%. Client reports no new symptoms and no changes. Client reports the present of the "slight headache" and continues to drink water. At 1834, Client stood up with no complaints and a steady gait. At 1835, Client left the facility with a steady gait.

1348485	5/25/2021	MI	48	F	3/23/2021	3/23/2021	At 1615 (3/23/21), experienced left leg heaviness, intermittent chest pain, body aches, fever 102.5, headache, chills, rigors, and tachycardia - most symptoms lasted only 36 hours. Left leg heaviness persisted and is still present. Intermittent chest pain x 10 days. Near syncope lasting from days 4-11 post vaccine - with one syncopal event occurring on day 5. Tachycardia and palpitations persist. April 14 - chest pain returned. On April 15 - Went to Emergency Department for heart rate of 172, shortness of breath, and palpitations. Persistent left leg heaviness since vaccination. Evaluated for potential pulmonary embolism, myocardial infarction, DVT, and post Covid vaccine infectious pericarditis, Admitted to Hospital overnight. Tested negative for Covid-19. Left leg heaviness persists. Intermittent tachycardia persists. May 10 developed a cold sore 1 day post sun exposure (normal for me). Evening of May 11 - fever, tachycardia, body aches, headache, chills. May 11 - negative Covid test May 20 - message from CDC requesting I fill out a VAERS.

1348482	5/25/2021	MA	36	F	5/15/2021	5/18/2021	<p>Patient is a 36 yo female with history of IVDU, Hep C, fibromyalgia who presents with left leg pain and swelling found to have significant left leg DVT now s/p femoropopliteal vein thrombectomy. HPI: Patient is a 36 y.o. female with history of IVDU, Hep C, fibromyalgia who presents with left leg pain and swelling. Patient woke up this morning with her entire left leg being painful, swollen, "tight", and "achy" throughout. She had been experiencing 1 week of left leg pain, followed by an acute worsening in the last 2 days. She denies any recent travel or leg trauma. She denied any fevers, chills, SOB, or chest pain. She denies any new tattoos, recent malignancies, or blood clotting disorders. Of note, she is currently undergoing evaluation for lupus due to fatigue and rashes. Per her IVDU, she injects heroin in her arm (last use 1 month ago after 4 years of sobriety), and is currently on methadone. This pain is different from her fibromyalgia. Of note, she got her first Moderna COVID vaccine last week. Highlights of ED course: Pertinent exam findings: tachycardia, marked LLE swelling (mid thigh 70 cm vs 64 cm on RLE) Warm bilateral LE, palpable pulses Important data gathered: LENI: left deep vein thrombosis extending from common femoral vein to distal posterior tibial veins, ESR 47, CRP 58, elevated d-dimer > 4000 Key treatments administered: heparin gtt, oxydone 5 mg for pain, vascular medicine, cardiology consult Patient was subsequently evaluated by vascular medicine, who brought her to cath lab for venography and endovenous intervention. She went to the cath lab. U/s guided access to L popliteal vein with micropuncture. J-wire into L CIV, serial dilation and placement of 12F sheath. Multiple passess with Penumbra lightning aspiration catheter. Femoropopliteal vein with restored patency, continued organized clot in iliac vein, infusion of 6mg TPA with 10 min dwell time. Further passages of aspiration catheter. Decision to leave 30 cm infusion cath. When seen on the floor, patient was hemodynamically stable. Still with pain in lower extremities and back. No chest pain or SOB. #DVT, s/p vascular surgery thrombectomy 2 days of acute left leg pain and swelling. Initial exam notable for purplish LLE in ED. LENIs notable for left DVT extending from CF vein to distal PT veins. Vascular evaluated and performed femoropopliteal vein thrombectomy with restored patency, continued</p>

1347672	5/25/2021	PA	76	M	4/12/2021	4/28/2021	ED to Hosp-Admission Discharged 4/28/2021 - 5/4/2021 (6 days) CRNP Last attending ? Treatment team COVID-19 virus infection Principal problem HPI: For complete history and physical see the H&P dictated by Dr. on 4/28/2021. This is a 76-year-old male who presented to the emergency department with upper respiratory symptoms for three days. He reports having cough, sneezing, runny nose and poor appetite. His caregiver had Covid recently and he was exposed. He was admitted for further evaluation and treatment. Hospital Course: Patient was admitted inpatient to the medical surgical floor. He was not on telemetry. Patient reports that his caregiver had recently tested positive for Covid and he was exposed. He has been having upper respiratory symptoms including cough, sneezing, and runny nose. His COVID-19 test was positive. He was started on the COVID-19 treatment protocol which included IV remdesivir and IV dexamethasone. He underwent a CT scan of the chest which showed small patchy areas of groundglass infiltrates in the peripheral portions of the left and right upper lobes and also the posterior aspects of the right lung base. These findings are probably due to pneumonia. Hospital course consisted of gentle hydration with IV normal saline. He was also started on antibiotic therapy oral azithromycin and IV Rocephin. He had completed the course of antibiotics while on the unit, therefore, at the time of discharge no antibiotics were prescribed. He initially was hypoxic and started on nasal cannula oxygen to maintain pulse oximetry greater than 92%. Eventually, oxygen was weaned and pulse oximetry on room air has remained in the 95-96% range. He has a history of diabetes mellitus and while on the unit blood glucose levels have fluctuated. His point-of-care glucose have been in the 80-500 range. He has had numerous episodes of hypoglycemia and insulin has been adjusted. The fluctuations of the blood glucose levels may be secondary to IV dexamethasone. At the time of discharge he will continue dexamethasone 6mg daily for the next three days. He was advised to increase insulin 70/25 insulin five units daily for the next three days. After that time he can return to his normal dose of insulin. He also had been treated with IV remdesivir and had completed the 5-day course. On examination today he has been asymptomatic. He denies any chest pain,

							dyspnea, abdominal pain, nausea, or vomiting. The initial lab studies showed an elevated creatinine level, although he has a history of chronic kidney disease. At the time of discharge the creatinine level trended downward and he was advised to follow-up with the primary care provider for possible repeat BMP in 1 to 2 weeks. All other lab studies have been within normal limits. The systolic blood pressure has been in the 120-150 range. The most recent systolic blood pressure was 151/66 mmHg with a heart rate of 66 bpm. He denies any lightheadedness or dizziness. He was advised to continue all of his current medications. While on the unit he was in isolation secondary to COVID-19. At the time of discharge he should maintain social distancing/isolation, mask wearing and good handwashing. He will need to follow-up with the primary care provider. He was also advised if the oxygen level dips below 89% he will need to return to the emergency department. At this time he is resting comfortably, offers no complaints and is stable for discharge. Patient is alert, oriented answering all questions appropriately. He is continent of bowel and bladder. He is able to make his own decisions. He is able to perform his own ADLs. . At this time he is in agreement with the plan and feels comfortable to be discharged home. Thank you.

1347853	5/25/2021	MN	22	M	4/23/2021	4/26/2021	<p>Patient is 22 year-old, admitted to the Cardiology 3 Emergency Department with acute myocarditis shortly following the receipt of his 2nd Moderna COVID-19 vaccination. He has a remote history of acute pericarditis (01/12/2014) following viral illness, which was treated with high dose ibuprofen 800 mg t.i.d. At that time, he presented with retrosternal chest pain worse with laying down and fever/myalgia, rigors and chills (T 103.3°F) with laboratory findings consistent with leukocytosis 17.3, elevated inflammatory markers (CRP 43, but normal ESR 12) with a negative influenza screen. ECG demonstrated diffuse ST wave elevations in leads I, II, aVF, V1-V6. He had resolution of symptoms with NSAID treatment. On this occasion, he presented with non-radiating retrosternal chest pain not responding to Ibuprofen 800 mg. At the ED, ECG demonstrated diffuse ST elevation, troponinemia 629/725/712/1319, elevated inflammatory markers (CRP 38.2, ESR 19). He had normal D-dimer and SARS-CoV-2 PCR was undetected. A cardiac MRI was obtained that demonstrated patchy subepicardial enhancement in the mid-apical lateral-anterolateral myocardium, suggestive of myocarditis. EKG showed diffuse ST elevation. He was treated with Toradol and fentanyl for pain management with improvement of symptoms. He was then admitted to Cardiology 3 for further evaluation and management. Upon admission, Infectious Disease was consulted given the novelty of his presenting symptoms and findings. Extensive evaluation including connective tissue cascade, respiratory viral panel and tick bone panel have not yielded any significant findings. They suspected this could be related to his recent COVID vaccine given that there have been reports of myocarditis that have occurred following COVID-19 messenger RNA vaccinations, though it is not clear whether there is a definite cause or effect. Moreover, the association of myocarditis and the messenger RNA COVID-19 vaccinations appears to be controversial, not supported by recent FDA reports. All in all, the Infectious Disease team recommended no specific therapies, but the case should be reported as a possible adverse event associated with the recent Moderna vaccination to VAERS. The center where the patient received this vaccination should make this report. Emergency Management Director was notified to report the event.</p>

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

They also felt that it may be reasonable to avoid the Moderna and perhaps even the Pfizer messenger RNA COVID-19 vaccination in the future to be conservative. While inpatient, his troponin level continued to trend up and peaked at 1707. An EKG was repeated and showed improvement in ST elevation from his initial EKG with no other acute changes. His case was discussed with Dr., who felt that a steroid taper would be appropriate. Additional chest pain was treated with PRN Ibuprofen 600 mg QID. After initiation of steroids, troponin markedly improved to 706. Due to his history of impaired fasting glucose, his blood glucose levels were monitored q.i.d. While slightly elevated, he did not require any sliding scale insulin while inpatient. We will plan to have his primary care provider assess his glucose level at his follow-up visit. Additionally, while receiving NSAIDs and steroids, his blood pressure was elevated to the 150s to 160 systolic. He was initiated on Coreg prior to dismissal. He was dismissed on 04/29/2021 given improving troponin and no concerning arrhythmias on continuous telemetry monitoring. He will follow up in the Cardiomyopathy Clinic in 3 months with a repeat cardiac MRI and stress ECG. We have recommended the patient to avoid heavy lifting or strenuous activity for the next 3 months until seen by the cardiomyopathy Clinic. He was provided with education and a letter delineating work restrictions.

1347846	5/25/2021	MN	31	M	4/15/2021	4/18/2021	<p>Patient is a very pleasant 31-year-old white male who previously healthy, he works with a maintenance crew, he was in his usual state of health last week, he did receive his 2nd dose of the COVID-19 Moderna vaccine on Thursday. Over the next 24-48 hours he began experiencing myalgias malaise and fatigue, he self treated with ibuprofen and Tylenol as needed. He felt a little bit better on Sunday and went to assist in picking up a brush more. During the process he became short of breath as well as midsternal chest discomfort. He presented to the ED. Evaluation found a CRP of 112, elevated troponins and a leukocytosis of approximately 20,000 along with elevated neutrophils. His influenza A and influenza B testing have been negative and his SARS COVID the PCR was negative. Given his elevated troponins, he was started on IV heparin and admitted for further evaluation. On admission to the floor, he was chest pain free. We were concerned for potential myo/pericarditis given his history and laboratory study findings. Cardiac MRI was performed which suggested active myocarditis with biventricular systolic dysfunction (LVEF 34%, RVEF 37%). Given his new LV dysfunction he was started on low dose lisinopril and metoprolol succinate. It is unclear whether this is atypical viral myocarditis or whether it potentially could be vaccine related, the MRI is consistent with that of myocarditis. We did not proceed with cardiac biopsy unless since there was no evidence for clinical decompensation, unstable heart rhythm or other worrisome features. He will plan to follow up with Dr. 1 week post hospitalization with repeat echocardiography and blood work. If at that time there are any signs of instability we would proceed with more aggressive workup at that time. Infectious disease was consulted who recommended infectious work up including serology testing for: parvovirus IgG and IgM was positive, Herpes Virus type 6, EBV, CMV (undetected) adenovirus, enterovirus (negative) and HIV (negative). He does not have any family history of cardiomyopathy. There is no family history of sudden cardiac death, he states that his family has been quite healthy from a cardiac standpoint he was previously healthy before this episode.</p>

1347811	5/25/2021	SC	41	M	5/21/2021	5/23/2021	Friday after the shot was good, just a sore arm. On Saturday I developed a fever of 101 and chills and was very tired. I felt a little better on Saturday night and Sunday morning after some Tylenol 500 mg. My fever would break then come back for a bit. By Sunday afternoon my back began to really hurt. I have some chronic back pain so didn't think too much of it just tried to massage it and stretch it out. However it just kept getting worse and the pain radiated into my chest around 9:00 PM Sunday night. It continued to get worse until about midnight, and I ultimately decided to go to the ER. The tylenol helped reduce the pain by the time I got into the ER but I went in anyway because I was concerned about the intensity of the chest pain I'd had earlier. I was tested for heart enzymes and they were slightly elevated, at .12. On this result, I was admitted to the hospital on suspicion of having suffered a heart attack. I was put on a heparin drip and my troponin levels were tested every 3 hours. They continued to rise to a high of .67. More testing was done, and the cardiology department concluded that I had not suffered a heart attack due to the low troponin levels but that instead I was dealing with heart inflammation. Every doctor and nurse there commented that there had been other patients coming in with cardiac inflammation from vaccines as well. Due to my family history of heart issues and my own existing risks, I was moved to the hospital where I was examined in the cath lab via angiogram. This found no blockages in my arteries, further confirming the cardiology suspicion of cardiac inflammation, and I was given a diagnosis of pericarditis and prescribed colchicine to treat the inflammation.

1347720	5/25/2021		62	M	3/10/2021	3/22/2021	3/22, admitted for NSTEMI 2 days after Covid vaccine. Patient was shoveling snow on the morning of March 22, 2021. Shortly after doing that, he developed chest pain. He did not immediately seek medical attention, however. Rather, he had a preexisting appointment with his primary care provider, which he went to later that morning. The PCP did an EKG and found him to be having an acute inferior ST elevation MI. The patient was subsequently transferred by EMS to the emergency room at the hospital and then was taken immediately for emergency cardiac catheterization. The catheterization revealed 100% acute occlusions of both the proximal LAD and the distal RCA. These were both opened and stented. There was 1 drug-eluting stent placed in the proximal LAD, and 2 overlapping drug-eluting stents were placed extending from the distal RCA into the proximal PDA. Postprocedure, the patient did well with resolution of his chest pain. His peak troponin was 38.6. An echocardiogram was done on March 22, 2021, and showed inferior akinesis and septal hypokinesis with an estimated ejection fraction of 45% to 50%. The patient was started on the usual medications post MI and PCI. On the morning of discharge, March 24, 2021, he is feeling well and is medically stable for discharge.

1347707	5/25/2021	PA	76	F	4/13/2021	4/28/2021	<p>Hypoxia & Shortness of breath Chief Complaint Patient presents with ? Shortness of Breath x 3 days, denies any cough, congestion, or fever. daughter is with her. Oxygen very low 74, provider notified right away and he came into room. ED to Hosp-Admission Discharged 4/15/2021 - 4/17/2021 (2 days) Last attending ? Treatment team Aspiration pneumonia of left lower lobe, unspecified aspiration pneumonia type (CMS/HCC) Principal problem Hospital Course HPI: a 76 y.o. female presenting to the ED with chief complaint of chest pain and shortness of breath. Patient is being seen in the emergency department for evaluation of the above, here with her daughter. Patient was seen and evaluated by local urgent care and referred here for evaluation. Is reported that patient was hypoxic. Patient's daughter also states that they have been monitoring her oxygen saturation at home and it has been in the 60s and 80%. Patient does report a cough. She has been using her inhaler more frequently. Received her Covid vaccination 2 days ago. Hospital Course: Patient was admitted and placed on supplemental O2. Chest x-ray 4/15/2021 showed some opacity at the left costophrenic angle effusion with some areas of atelectasis possible. Chest CT performed on 4/16/2021 revealed small areas of consolidation/infiltrate in the right upper and left lower lobes of the lungs, emphysema, and a 3 mm pulmonary nodule in the left upper lobe. Small bilateral pleural effusions have decreased since CT of 12/11/2020. Initial CBC revealed white blood cell count of 9.3. Hemoglobin and hematocrit were stable at 8.8 and 29.4. Renal function was stable as well. Glucose on 4/16/2021 fasting was 222. Magnesium was at goal at 2.5. Procalcitonin levels were performed and were 0.19. She was initially started on IV vancomycin and cefepime as well as Flagyl due to possible aspiration pneumonia. On 4/17/2021, patient was adamant on being discharged. She did discuss possibly signing out AMA. I did explain to her the ramifications of that. She voiced understanding. I also discussed this with her daughter, as well. She required 4 L of supplemental O2 and achieved an O2 sat of 93%. On room air patient was 78%. Therefore, home O2 was ordered. IV antibiotics were changed to oral Levaquin 250 mg to take 1 by mouth daily (based on renal function) for 7 days and generic Flagyl 500 mg to take 1 3 times a day for 7 days.</p>

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

She was instructed to take antibiotics as prescribed as well as use supplemental O2. She was also advised that if symptoms worsened she was to return to the emergency room. At time of discharge she was stable with supplemental O2 in place. ED to Hosp-Admission Discharged 4/28/2021 - 5/4/2021 (6 days) Last attending ? Treatment team Hospital Course HPI: a 76 y.o. female with a past medical history of systolic and diastolic heart failure, diabetes mellitus type 2, above-the-knee amputation of left lower extremity, who comes from home where her oxygen saturation as per the daughter was 25%. She was recently discharged from here on 4/17/2021 for left lower lobe pneumonia. She does not want to be in the hospital. She states that she felt fine when she came in this time. She was evaluated by the ICU who stated she is a DNR/DNI and felt that with BiPAP modification she was satting better. She was adamant that she wanted to leave the last time she was here and went home with oral Levaquin and Flagyl. When she arrived, nursing states that there was dried stool on her bottom. The patient denies any current shortness of breath. She wants her BiPAP mask removed as it is uncomfortable to her. After explaining it as needed she agreed to have it on. She denies any abdominal pain, she denies any chest pain. She denies any fevers or chills. Hospital Course: Patient was admitted for acute on chronic diastolic CHF, acute on chronic hypoxic respiratory failure secondary to CHF and COVID-19. Patient was also treated for elevated blood pressures. Cardiology was consulted, patient was placed on Lasix twice daily and was started on hydralazine for blood pressure. From pneumonia standpoint, patient started on Zosyn, for COVID-19 patient was started on Decadron and remdesivir. Patient finished a course of remdesivir in the hospital. Patient went from using 5 L oxygen to only 1 L, meanwhile chronically she has been using 3 L at home prior to coming into the hospital. Patient has not been requiring any further BiPAP. She has been afebrile for more than 48 hours. Today nephrology recommended to lower Lasix down to once daily instead of twice daily to avoid kidney injury. Patient is medically stable for discharging home today to finish her course of Augmentin and Decadron. Patient appears to be very hesitant about having to continue self isolating. Family understands the need for further

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

					isolation. Patient will receive a remote monitoring kit upon discharge. ED to Hosp-Admission Discharged 5/10/2021 - 5/17/2021 (7 days) Last attending ? Treatment team Pneumonia due to COVID-19 virus Principal problem Hospital Course HPI: Patient was admitted with hypoxia and pneumonia due to COVID-19 virus. For details please see the history and physical. Hospital Course: Patient had previously been diagnosed with COVID-19 pneumonia about 3 weeks ago and had been treated with remdesivir Decadron and antibiotics. She was now admitted with pneumonia and hypoxemia. Her oxygen requirement went up and she was at 1 point requiring high flow oxygen up to 15 L/min. Subsequently her oxygen requirement was able to be tapered. She was treated with steroids during this hospitalization. Her oxygen requirement is now down to 4 L/min. She is feeling better. She is now felt stable for discharge with outpatient follow-up with her PCP. Steroids have been stopped on discharge. Her daughter was regularly updated during this hospitalization. I called and left a message at the time of discharge today.	
1347216	5/25/2021	MA	47 F	4/27/2021	4/28/2021	Received 2nd COVID-19 vaccine 4/27. On the evening of 4/28, noticed chest pain especially with deep breaths. Felt like couldn't get air in, some improvement with position changes. Took 3 advil with some improvement. Off and on for days following. SOB position changed to improve breathing. Following day, audibly out of breath at a meeting meeting. Felt similar to last march- suspected COVID- periodic SOB. Advised to go to ED Had a rub murmur. Off and on SOB. Bedside ECHO did not show pericarditis but never had an official ECHO.

1348297	5/25/2021	PA	59	F	4/7/2021	4/11/2021	Second shot on April 7th ? Pfizer. On April 8, didn?t feel so great. 9th and 10th: Better, but not 100%. On April 11, BP very low (80?s), and I didn?t feel well. I had chest pain while walking for exercise. On April 12, BP again very low (90?s), and I didn?t feel well. I had chest pain while walking again, and excruciating back pain, which stopped when I stopped walking. Called my cardiologist. Stopped BP meds on the 13th, didn?t walk, felt better. Cardiology appointment on April 14. ECG was not normal ? ?New lateral T wave abnormality? ? sent me to the ER. There I had positive troponin tests. Echocardiogram showed reduced function. The left ventricular ejection fraction was 44%. Went to the cath lab. Arteries clear. Stent placed in 2018 beautifully open. Diagnosis: Stress induced cardiomyopathy -- no known cause. Treatment is a beta blocker, and reduced activity. I am starting cardiac rehab in June. I asked if the "stress" could have been the vaccine, and they did not rule it out, but they had no other cases. I thought with the recent news on myocarditis and the vaccine that I would report this.
1346421	5/25/2021	NC	38	M	5/24/2021	5/24/2021	Systemic: Allergic: Difficulty Breathing-Mild, Systemic: Chest Tightness / Heaviness / Pain-Severe, Systemic: Flushed / Sweating-Mild, Systemic: Hypertension-Severe, Additional Details: patient reported filling shortness of breath and chest pain. I checked blood pressure it was 174/103 with a pulse of 95 bpm. I gave patient a benadryl and called 911. 911 instructed me to give the patient a 325mg of aspirin.

1346496	5/25/2021	TX	52	M	3/16/2021	3/19/2021	I had COVID in early December 2020. I waited a few months to get the vaccine. I was fine the day of the vaccine 16 MAR. I took the next day off 17 MAR because I was running a fever and had body aches. I did not have any alcohol on St Patty's day. I pretty much slept the whole day. I went back to work on 18 MAR and was feeling better with only a mild fever. The night of 18 MAR I began to run a fever and had body aches. The body aches worsened during the night I could not sleep. The body aches became centralized in my upper back and shoulders, My neck was hurting too. I began to feel chest pains. The chest pains increased in intensity. I researched the symptom's which suggested I was having a heart attack. I took some aspirin to try to alleviate the pain. The pain continued and more severe so I drove myself to hospital. The staff gave me an EKG and took blood samples for testing. The EKG was normal. The blood test came back with elevated levels of Troponin. The Dr. advised that the Troponin level indicated that I probably had a heart attack. the first hospital did not have a cardiac unit so I was transferred to downtown location. The staff there ran more test. The EKG was again normal and the Troponin elevated so a Coronary angiography was conducted with catheter and dye. The angiography was also normal with no sign of a heart attack the doctor said I probably had a reaction to the vaccine. He suggested that I still get the second vaccine. I did get the second vaccine. After the second vaccine I only had fever and body aches, I pre-gamed with aspirin and plenty of rest for the second vaccine.

1345837	5/25/2021	CA	64	F	1/21/2021	1/1/2021	<p>Possible pericarditis; Tight chest; Sore throat; Chest pain; Sinus bradycardia; Laryngitis; Hypertension; Hoarseness/Hoarse voice/Loss of voice; Throat swelling; Palpitation; Shortness of breath; Burning sensation; This spontaneous case was reported by a physician and describes the occurrence of PERICARDITIS (Possible pericarditis) in a 64-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included Gastritis on 17-Apr-2020, Trigeminal neuralgia and Obstructive sleep apnea syndrome. Concurrent medical conditions included Hypertension, Hyperlipidemia since 21-Jul-2015, GERD since 31-Mar-2020 and Drug allergy (History of intolerance to multiple medications. Blood pressure test kit-adult extra large cuff.). Concomitant products included DIPHENHYDRAMINE HYDROCHLORIDE (BENADRYL [DIPHENHYDRAMINE HYDROCHLORIDE]), LORATADINE (CLARITIN [LORATADINE]), COLCHICINE (MITIGARE) and OSELTAMIVIR PHOSPHATE for an unknown indication. On 21-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. In January 2021, the patient experienced PHARYNGEAL SWELLING (Throat swelling), PALPITATIONS (Palpitation), DYSPNOEA (Shortness of breath) and BURNING SENSATION (Burning sensation). On 21-Jan-2021, the patient experienced DYSPHONIA (Hoarseness/Hoarse voice/Loss of voice). In February 2021, the patient experienced OROPHARYNGEAL PAIN (Sore throat), CHEST PAIN (Chest pain), SINUS BRADYCARDIA (Sinus bradycardia), LARYNGITIS (Laryngitis) and HYPERTENSION (Hypertension). On an unknown date, the patient experienced PERICARDITIS (Possible pericarditis) (seriousness criterion medically significant) and CHEST DISCOMFORT (Tight chest). In February 2021, PERICARDITIS (Possible pericarditis), CHEST DISCOMFORT (Tight chest), DYSPHONIA (Hoarseness/Hoarse voice/Loss of voice), PHARYNGEAL SWELLING (Throat swelling), PALPITATIONS (Palpitation), DYSPNOEA (Shortness of breath), BURNING SENSATION (Burning sensation), OROPHARYNGEAL PAIN (Sore throat), CHEST PAIN (Chest pain), SINUS BRADYCARDIA (Sinus</p>

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

bradycardia), LARYNGITIS (Laryngitis) and HYPERTENSION (Hypertension) had resolved with sequelae. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): In January 2021, Electrocardiogram: normal (normal) normal. In January 2021, Oxygen saturation: 98-99 (normal) 98-99. In January 2021, Physical examination: normal (normal) normal. On 17-Feb-2021, Blood pressure measurement: 149/62. On 17-Feb-2021, Chest X-ray: normal. On 17-Feb-2021, Electrocardiogram: Showed sinus bradycardia. On 17-Feb-2021, Heart rate: 59 (Inconclusive) 59. On 17-Feb-2021, Heart sounds: (normal) Regular rate and rhythm with normal S1 and S2. No murmur, pericardial rub.. On 17-Feb-2021, Physical examination: normal (normal) normal. On 24-Feb-2021, Blood pressure measurement: 130/58. On 24-Feb-2021, Heart rate: 53 (Inconclusive) 53. On 24-Feb-2021, Heart sounds: (normal) Regular rate and rhythm with normal S1 and S2. No murmur, pericardial rub.. On 03-Mar-2021, Blood pressure measurement: 133/54. On 03-Mar-2021, Heart rate: 61 (Inconclusive) 61. On 03-Mar-2021, Heart sounds: Regular rate and rhythm with normal S1 and S2. No murmur, pericardial rub.. mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosing remained unchanged. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter considered PERICARDITIS (Possible pericarditis), CHEST DISCOMFORT (Tight chest), DYSPHONIA (Hoarseness/Hoarse voice/Loss of voice), PHARYNGEAL SWELLING (Throat swelling), PALPITATIONS (Palpitation), DYSPNOEA (Shortness of breath), BURNING SENSATION (Burning sensation), OROPHARYNGEAL PAIN (Sore throat), CHEST PAIN (Chest pain), SINUS BRADYCARDIA (Sinus bradycardia), LARYNGITIS (Laryngitis) and HYPERTENSION (Hypertension) to be probably related. Treatment for the event included antibiotics, prednisone and colchicine. Medical Clinic Coordinator provided events were resolved in mid Feb 2021 with residual effects of hoarseness and tightness of chest. Company comment Very limited information regarding these events has been provided at this time. The events are probably related to the patient's comorbidities, further information required. This case was linked to MOD-2021-046995 (Patient Link). Most recent FOLLOW-UP

1345823	5/25/2021	WV	37	M	3/27/2021	4/24/2021	chest pain; Difficult breathing; fever; chills; body aches; Headache; This spontaneous case was reported by a patient and describes the occurrence of CHEST PAIN (chest pain) and DYSPNOEA (Difficult breathing) in a 37-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 037B21A and 006B21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 27-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 24-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 24-Apr-2021, the patient experienced PYREXIA (fever), CHILLS (chills), MYALGIA (body aches) and HEADACHE (Headache). On 06-May-2021, the patient experienced CHEST PAIN (chest pain) (seriousness criterion hospitalization) and DYSPNOEA (Difficult breathing) (seriousness criterion hospitalization). The patient was hospitalized on 06-May-2021 due to CHEST PAIN and DYSPNOEA. At the time of the report, CHEST PAIN (chest pain) and DYSPNOEA (Difficult breathing) was resolving and PYREXIA (fever), CHILLS (chills), MYALGIA (body aches) and HEADACHE (Headache) outcome was unknown. Not Provided DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On an unknown date, Computerized tomogram: negative (Negative) negative for presumed pneumonia. On an unknown date, Ultrasound chest: negative (Negative) negative for presumed pneumonia. No concomitant medication. Treatment medication were reported as prednisone and Aztec. Company comment: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. Further information have been requested; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. 1345822	5/25/2021	AL	28	F	4/8/2021	4/8/2021	slight delirium; racing heart; tachycardia at 120 bpm; not hungry but very thirsty; not hungry but very thirsty; lot of trouble sleeping; low grade fever; EKG at home and she was catching Afib; tinnitus - ears ringing; could'nt talk; could'nt move; TIA with eyes fluttering; TIA with eyes fluttering, couldn't talk or move; chest pain; shortness of breath; extreme hypertension 200/115; forgot name for about 15 minutes; sterile diarrhea; lost 20 pounds; This spontaneous case was reported by an other health care professional (subsequently medically confirmed) and describes the occurrence of ATRIAL FIBRILLATION (EKG at home and she was catching Afib), DELIRIUM (slight delirium) and TRANSIENT ISCHAEMIC ATTACK (TIA with eyes fluttering, couldn't talk or move) in a 28-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 003B21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included COVID-19 (For about a month.) in March 2020. Concomitant products included INTRAUTERINE CONTRACEPTIVE DEVICE (COPPER IUD) and MULTIVITAMIN [VITAMINS NOS] for an unknown indication. On 08-Apr-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 08-Apr-2021, the patient experienced WEIGHT DECREASED (lost 20 pounds). On 09-Apr-2021, the patient experienced DIARRHOEA (sterile diarrhea). On 10-Apr-2021, the patient experienced MEMORY IMPAIRMENT (forgot name for about 15 minutes). On 18-Apr-2021, the patient experienced CHEST PAIN (chest pain), DYSPNOEA (shortness of breath) and HYPERTENSION (extreme hypertension 200/115). On 19-Apr-2021, the patient experienced TRANSIENT ISCHAEMIC ATTACK (TIA with eyes fluttering, couldn't talk or move) (seriousness criterion medically significant), BLEPHAROSPASM (TIA with eyes fluttering), SPEECH DISORDER (could'nt talk) and HYPOKINESIA (could'nt move). On 20-Apr-2021, the patient experienced TINNITUS (tinnitus - ears ringing). On 27-Apr-2021, the patient experienced ATRIAL FIBRILLATION (EKG at home and she was catching Afib) (seriousness criterion medically significant). On an unknown date, the patient experienced DELIRIUM (slight delirium) (seriousness criterion medically significant), PALPITATIONS (racing

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

heart), TACHYCARDIA (tachycardia at 120 bpm), DECREASED APPETITE (not hungry but very thirsty), THIRST (not hungry but very thirsty), INSOMNIA (lot of trouble sleeping) and PYREXIA (low grade fever). On 10-Apr-2021, MEMORY IMPAIRMENT (forgot name for about 15 minutes) had resolved. On 05-May-2021, PYREXIA (low grade fever) had resolved. At the time of the report, ATRIAL FIBRILLATION (EKG at home and she was catching Afib), DELIRIUM (slight delirium), TRANSIENT ISCHAEMIC ATTACK (TIA with eyes fluttering, couldn't talk or move), CHEST PAIN (chest pain), DYSPNOEA (shortness of breath), HYPERTENSION (extreme hypertension 200/115), BLEPHAROSPASM (TIA with eyes fluttering), PALPITATIONS (racing heart), TACHYCARDIA (tachycardia at 120 bpm). WEIGHT DECREASED (lost 20 pounds), DECREASED APPETITE (not hungry but very thirsty), THIRST (not hungry but very thirsty), TINNITUS (tinnitus - ears ringing), DIARRHOEA (sterile diarrhea), INSOMNIA (lot of trouble sleeping), SPEECH DISORDER (could'nt talk) and HYPOKINESIA (could'nt move) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 13-Apr-2021, Dehydroepiandrosterone test: increased (High) Elevated. On 18-Apr-2021, Blood pressure measurement: 200/115 (High) Extreme hypertension. On 18-Apr-2021, Urine analysis: increased (High) High leukocytes in urine. On 18-Apr-2021, White blood cell count: increased (High) Elevated.. On 19-Apr-2021, Body temperature: increased (High) Low grade fever. On 19-Apr-2021, Heart rate: 120 (High) 120 beats per minute. On 20-Apr-2021, Neutrophil count: increased (High) high. On 27-Apr-2021, Electrocardiogram: atrial fibrillation catching atrial fibrillation. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. On 09-Apr-2021, the patient reported that she consulted her primary care, followed by an OBGYN consult on On 13-Apr-2021, and unspecified blood work was done. The patient reported that she visited the ER (emergency room) on 18-Apr-2021, 19-Apr-2021 and 20-Apr-2021 with a follow-up visit with her primary care on 19-Apr-2021. The patient also reported that she started

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

consulting her primary care physician since March 2020, for abnormal weight gain and blood tests were done for thyroid levels. It was reported that this whole period the patient lost 20 pounds. The Treatment medications included Tylenol (acetaminophen), hydroxyzine and propranolol. The patient reported that she had taken buspirone and quetiapine for insomnia, but stopped the medications on an unspecified date. On an unspecified date, Ativan (lorazepam) was discontinued. Company Comment: Based on the current available information which shows a temporal association between the use of mRNA-1273 and the onset of the other events, a causal relationship cannot be excluded. Fever is consistent with the product known safety profile.; Sender's Comments: Based on the current available information which shows a temporal association between the use of mRNA-1273 and the onset of the other events, a causal relationship cannot be excluded. Fever is consistent with the product known safety profile.

On 04-Feb-2021, Oxygen saturation: 98 percent 98 percent at 14:38 99 percent at 15:58. On 04-Feb-2021, Pain assessment: 4 pain level 4/10. On 04-Feb-2021, Respiratory rate: 18 18 at 14:38 20 at 15:58. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Follow up received on 13-May-2021 was significant and included the completed VAERS form. The new events of missed second dose of covid-19 vaccine, angioedema, allergic reaction, flushing, sweaty, numbness top lip were added and medical history was updated. On 04-Feb-2021, it was reported that the patient developed perioral swelling and numbness that came on approximately fifteen minutes after receiving her first covid-19 vaccine. The patient was taken to the emergency department, and was kept under observation for two hours with no worsening of her condition. Treatment medication included 50 milligram of Benadryl (diphenhydramine). The patient was given a prescription for diphenhydramine and asked to follow-up with her primary care physician/ emergency department if symptoms worsened. Company comment This case concerns a 79-year-old female with a serious unexpected event of angioedema and nonserious hypersensitivity, hypoaesthesia oral, flushing, hyperhidrosis, vaccination complication, and product dose omission issue. Latency within 1 day after mRNA-1273 dose. Based on current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. Most recent FOLLOW-UP information incorporated above includes: On 13-May-2021: Follow up received included the completed VAER form and medical records from the emergency department. Additional information included medical history, patient demographics, age of patient, patient contact details, concomitant medication, new events with outcome of events, missed second dose.; Sender's

1345603	5/25/2021	CA	28	F	2/10/2021	3/7/2021	Pericarditis occurred end of February and was seen by a doctor early March and was diagnosed. Still ongoing side effect and taking colchicine for the inflammation of the pericardium. Ongoing chest pain and pressure is present with pain radiating to the left side of my shoulder blade. There is also neck pain present. These symptoms are ongoing and still being treated for.
1345445	5/25/2021	CA	13	F	5/19/2021	5/19/2021	Chest pain shortly after the vaccination. Swallowing and throat. Long lasting and was sent to the emergency room. Labs and EKG were normal. Sore throat lasting up to five days after the vaccine. Tightness in throat and chest experienced
1346428	5/25/2021	IN	15	M	5/22/2021	5/23/2021	Patient began to have chest pain 12-24 hours after administration of vaccine. Chest pain worsened over 48 hours. Pain described as constant pressing sternal chest pain. He also had associated fatigue. Initial work up consistent with peri/ myocarditis. Chest pain has no longer been persistent during admission. No chest pain at rest any longer. Patient describing some ?throbbing? heart pressure with walking.
1346910	5/25/2021	CA	35	M	4/27/2021	5/18/2021	Received his second Pfizer COVID vaccine Tuesday 5/18/2021. On Wednesday started developing systemic symptoms such as chills, headache, myalgia. Also developed constant sub-sternal chest pain. Worse with movement or deep inspiration. No clear positional component. CP persisted until he came to the ED today. Initial ECG showed concave ST elevations lateral leads. Given his history this was felt to be most consistent with pericarditis. He received toradol, morphine and SL NTG with near complete relief of the pain. Repeat ECG showed resolution ST elevations. Troponin was elevated, peak 9.08 ng/ml.

1347148	5/25/2021	CT	65	M	3/30/2021	3/31/2021	Heart pain/ chest pain. Hard to breathe Swollen legs Erratic heart rate Outcome: death 3 days after. Heart failure
1347147	5/25/2021	NC	38	M	3/3/2021	4/6/2021	More than 30 days after receiving the Janssen vaccine, I tested positive for COVID-19. Symptoms began as runny nose, sneezing, and sinus pressure/burning on April 6, 2021. Tested for COVID-19 on April 11, 2021 (nasal swab, PCR test) after a family member tested positive. Symptoms worsened on April 12, 2021, including shortness of breath, chest pain, complete loss of taste and smell. Sought treatment for breathing difficulty at ER on April 13, 2021 (Vidant Medical Center and was instructed to rest at home. Sought treatment for breathing difficulty at PCP on April 14, 2021 (Medical Center) and prescribed Prednisone. Symptoms worsened on April 15, 2021, including shortness of breath, chest pain, numbness in face/arms/legs, dizziness, loss of balance, memory and speaking difficulty, near fainting. Sought treatment at ER on April 15, 2021 (Vidant Medical Center, Greenville, NC). Held for three days, treated with Remdesivir (3 doses) and supplemental oxygen. Discharged from hospital on April 18, 2021. Symptoms did not improve following discharge. Sought treatment for ongoing symptoms at ER on April 21, 2021, instructed to rest at home. Symptoms continued to worsen on April 24, 2021, including shortness of breath, chest pain, numbness in face/arms/legs, dizziness, loss of balance, memory and speaking difficulty, near fainting, and slurred/incoherent speech. Sought treatment at ER on April 15, 2021, admitted to hospital on April 25, 2021 diagnosed with probable TIA. Treated with Optiflow high-flow oxygen therapy, nebulizer, and steroids. Received a variety of tests and scans of head, neck, spine, chest, heart; none showed signs of any serious cardiac, vascular, or neurological problems. Transferred to in-patient rehabilitation on May 1, 2021 for physical and occupational therapy. Discharged from in-patient rehabilitation on May 6, 2021. Prescribed out-patient physical and occupational therapy to resolve remaining dizziness, balance, and endurance deficits.

1346862	5/25/2021	CA	41	F	4/15/2021	4/21/2021	On 4/16-4/18 minor soreness and fatigue that temporarily disappeared. Then on 4/21, I experienced High Fever (103.8), Body aches, headache, extreme fatigue that lasted through Monday 4/26. Through that time I went and got a Covid test on Friday 4/23 and it came back negative. On Thursday 4/29, I started having pain on the right upper side of my abdomen. Friday evening, the pain grew even more intense which I could not lay down to sleep and no pain meds were taking it away. Saturday, 4/30 at 6 am ended up in ER at Facility. They were testing me for blood clots due to the chest pain and sever right side pain and the results showed no blood clots and my heart was fine. CT scan showed pneumonia, scarring in my lungs and a nodule growth on my lung. The doctor asked me if I was in the dessert recently if I had ever had valley fever. Valley Fever came back negative, another Covid 19 test came back negative. I completed taking 2 antibiotics and now on 5/25 (day 40) I am still feeling bouts of fatigue, wheezing in my lung and pain in my lung. I was healthy prior to getting the 2nd dose of Moderna and can't help but feel the vaccine triggered something in my system. Reporting this just in case it is an adverse effect from the vaccine.
1346837	5/25/2021	KS	24	M	5/20/2021	5/23/2021	Developed severe chest pain, admitted and found to have myocarditis, troponin 8, cardiac cath negative

<u>VAERS_ID</u>	<u>RECVDATE</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1346832	5/25/2021	ND	25	F	3/27/2021	4/15/2021	After receiving my second dose, I was seen by my primary doctor for suspected Celiac disease (which came back positive). I had a strange medical episodes during the bloodwork (April 15th) that they originally assumed was anxiety. Symptoms were shortness of breath, lightheadedness, and loss of feeling in extremities. I'm a first responder and did not feel this was anxiety, but didn't argue and forgot about it until it happened again. I had my second episode on April 20th, and debated going to the ER for it. A third episode on April 23rd did put me in the ER. I proceeded to have more episodes on almost a daily basis after that and started monitoring blood pressure, pulse, blood sugar, and food intake at home (some of my bloodwork levels were off due to the celiac). I purchased a heart rate monitor, a blood glucose meter, and a smartwatch to monitor some of my symptoms. Both devices (monitor and watch) would later flag me as having a suspicious heart rhythm (heart monitor could be for fast/slow rhythm or for arrhythmia, smartwatch flagged me as Afib twice). I could not recreate these results when my husband wore the devices. Episodes could be as brief as 45 mins or last more than 12 hours. I have a high pain tolerance and illness tolerance, and had to leave work several times due to my symptoms (extremely abnormal for me). After several more appointments with my primary doc and another visit to the ER (where they did another EKG, an X-ray, and more bloodwork), things were still coming back inconclusive. After about April 28th, I started having significant chest pain with my episodes. The ER checked me for possible clotting related to the heart issues and my birth control pills. My arrhythmia could not be captured on their devices. My doctor has since diagnosed it as suspected myocarditis (pending more testing). We've ruled out all possible things related to my Celiac diagnosis, and can't seem to find a cause for this. I had a few things I brought to her attention that may be the cause (pinched nerve at chiropractors, covid vaccine) and she says it may be the vaccine, and said I should report it to you.

1346800	5/25/2021	CA	44	F	2/5/2021	2/8/2021	I did not seek medical care but about 3 days after the second dose of Moderna, I started experiencing intermittent, left-side, anterior chest pain (dull). It felt like pain was localized to my heart. I took OTC ibuprofen during the first week for pain, up to 800mg per day. Pain was worse (5-6 out of 10) during the first week and began to improve thereafter. The pain fully resolved by mid-March.
1346785	5/25/2021	WA	46	M	4/29/2021	5/6/2021	Chest Pain, High Blood Pressure, Shortness of breath
1346784	5/25/2021	CO	45	F	4/12/2021	4/17/2021	I experienced chest pain/pressure, shortness of breath, rapid/irregular heartbeat approximately 5 days after receiving my first dose of the Moderna shot. I had been exercising outdoors (as I normally do) when it came on. It subsided some and returned in intensity the following day following a long walk. It was mostly mild pain and pressure during the week. However, on 4/24, following exercise, I had pronounced symptoms and acknowledged that I needed to go to the emergency room, as I thought I was having a heart attack. They admitted me and ran various heart tests and ruled out a heart attack or blood clot.
1346733	5/25/2021	FL	14	M	5/18/2021	5/22/2021	Patients mom stated her son got the vaccine on Tuesday 5/18/21 and about 4 days later he ate seafood and then started to get an allergic reaction about 2 hours later. Patient started to feel that his lips swelled up along with a rash all around chin, neck and around mouth, on forehead between eyes. He took Benadryl which helped symptoms subside. He also complained of a little chest pain that lasted less than an hour but no shortness of breath. As of Monday 5/24/21 he feels fine no other symptoms. No c/o fever, fatigue, nor headache, body aches. Pain at injection site from vaccine was also reported but that subsided.

1343997	5/24/2021	TX	40	F	5/12/2021	5/16/2021	After first covid shot (L arm), got a little bit of chest pain, went away 9 days after, got a large whelp on L deltoid, eventually went away Had 2nd shot 5/12/2021 (R arm), next day had some malaise "completely what I expected" The Sunday after, had pain on R FA and veins were larger/darker than normal Some ankle pain Repeat on chest pain again Would be worse after deep breathe or laying down, other times no apparent rhyme or reason
1343994	5/24/2021	TX	59	M	4/8/2021	5/1/2021	Vaccine 3/15, 4/8. Admit 5/1. Admit for hypoxia d/t COVID PNA. H/O RA w/interstitial lung disease. In ER temp 100.1, SpO2 94%. WBC WNL, later elevated. CXR shows interstitial lung disease. Treated w/steroid, dose of convalescent plasma, supportive care, oxygen. Brief History: Patient who presented with the above complaints. Patient with a history of longstanding rheumatoid arthritis who presents to the ER with above-stated symptoms. Patient reports history of chronic dry cough which she attributes to having lung disease related to rheumatoid arthritis. Patient has received both doses of Pfizer COVID-19 vaccine, 2nd dose on April 8th. About 2 weeks ago he started having low-grade fevers with worsening of cough and shortness of breath. Patient was tested at an urgent care center and tested negative for COVID-19. Denies any known sick contacts. No recent travel history. Symptoms worsened about a week ago with persistent fevers, increasing cough and shortness of breath. Patient went to see his rheumatologist and diagnosed with interstitial lung disease this week and referred to see pulmonology. He was monitoring his oxygen saturations at home which have been dropping down to 88-89% on room air that made him come to the ER. Patient tested positive for COVID-19 in the emergency room. CT angiogram of the chest showed no evidence of any pulmonary emboli but evidence of interstitial lung disease bilaterally. He is currently being admitted for hypoxia secondary to COVID-19 pneumonia. Patient denies any chest pain Hospital Course: Patient was admitted. Kept on steroids and oxygen. Seen by Infectious Disease. Got a dose of convalescent plasma This morning he is on room air. Past the walk study. Feeling lot better. Seems to be stable for discharge on oral steroids to finish up the course.

1343870	5/24/2021	AR	29	F	1/15/2021	1/18/2021	I got my second vaccine on Friday January 15, 2021. On the following Monday (January 18), I started having chest pain around 5:00 pm before leaving work. The chest pain got worse until I woke up in the middle of the night afraid I was having a heart attack and vomiting. I got up and planned to go to the hospital at around 5 am but the pain started to subside. I made an appointment to see my PCP the following Friday (January 22nd) and had cardiac labs drawn. My heart enzymes were elevated that day so my PCP chose to admit me into the hospital. I had a heart cath, wore a heart monitor, had EKGs, had my enzymes trended, and had a heart ultrasound. The cardiologist discharged me with possible myocarditis. I took a regimen of ibuprofen and symptoms subsided. I had been having chest pain off and on for about a month before this episode but thought it was heart burn because it was very mild.
1343689	5/24/2021	IN	17	F	5/16/2021	5/16/2021	My child was accidentally given moderna instead of Pfizer even though she is under 18. After the mistake was made she began to have nausea and vomiting, headache and lethargic. After 6 days she began to have chest pain, rapid heartbeat and the nausea continued. We have ended up in the hospital admitted because of the tachycardia.
1343845	5/24/2021	NH	19	M	5/12/2021	5/14/2021	Typical side effect symptoms experienced and cleared within 24 hours. Same symptoms returned (chills, low fever, heavy sweating, tense breathing) approx. 60 hours later along with severe aching chest pain. All symptoms resolved by next morning besides chest pain, which was severe enough to warrant emergency room admission about 72 hours after vaccination. Admitted to hospital overnight with an episode of palpitations around 6pm on the first night, being given motrin and colchicine throughout stay. Pain somewhat resolved and was discharged aprox. 100 hours after vaccination. Continued use of ibuprofen and colchicine in weeks following as pain slowly resolves.
1344133	5/24/2021	TN	29	M	5/7/2021	5/12/2021	Heart/chest pain. Doesn't seem to relate to activity, occurs multiple times per day but only lasts a minute or so. 3/10 pain

1343709	5/24/2021	TX	16	F	4/15/2021	4/19/2021	Vaccine administered at outside facility. Patient is a 16 yo girl, admitted on 4/19 with myocarditis, s/p IVIG (4/19) after presenting with progressive new onset chest pain. She was in usual state of health up until 2 days ago when she started developing body aches, and chest pain. Patient received her 2nd Pfizer COVID vaccine last week (4/15). No known history of COVID infection. Parents brought her to the ED yesterday after she complained of dizziness, SOB, chest pain, and had a near syncopal event. EKG showed non-specific ST abnormalities with labs showing elevated troponin, mildly elevated CRP, normal CXR, negative COVID PCR. Denies fever, GI symptoms, GU symptoms, headache, rash. Once transferred to our PICU, she was worked up for myocarditis vs MIS-C. Troponin has been trended q6 and is trending up (now 11). Of note, there have been no fevers. Patient is a 16 yo girl, s/p admission (4/19-4/23/21) with myocarditis, s/p IVIG (4/19), has now been readmitted on 5/10 with myocarditis after presenting with headache and neck pain for 2 days. Following discharge from the PICU on 4/23, patient states that symptoms have lingered (low grade fevers, feeling tired, on and off chest pain). After developing a progressive headache and neck pain, she came back to the ER for re-evaluation. Upon readmission, her troponin was elevated (2.06 on 5/10). Her CBC and CMP were reassuring. Blood culture collected on 5/11 and urine culture collected on 5/10. ID consulted for workup.
1343694	5/24/2021	LA	66	F	2/12/2021	3/30/2021	acute pericarditis, chest pain and fatigue
1345393	5/24/2021	FL	52	F	4/24/2021	5/4/2021	Initial presentation was chest pain for 3 days. I was seen by a cardiologist. Diagnosis: Unstable Angina I was given a loading dose of Heparin, Aspirin, Concor and Crestor. Chest pain persisted and I was admitted to hospital on May 7, 2021, treated and sent home on May 9, 2021. Intermittent bouts of chest pain over the last 2 weeks. I returned to the cardiologist on May 19, 2021. Diagnosis: Pericarditis. I am currently being treated with Arcoxia.

1343848	5/24/2021	VA	17	M	5/20/2021	5/22/2021	17-year-old male with no medical history, no allergies and no surgeries presented to the ER on 5/22 at 11 PM with concern for chest pain. The patient received his 2nd COVID-19 Pfizer vaccine on Thursday, 05/20/2021 in his left arm. The patient developed a temperature of a 102.5° with aches, chill, and pain overnight. The symptoms subsequently dissipated. Around noon on 5/22 he began to experience an achiness and pressure beneath the sternum and it has been constant since. The pain does not radiate into the back. No associated ripping or tearing sensation. No shortness of breath or difficulty breathing. In ED, EKG showed normal intervals, no ST changes and no STEMI. The patient underwent a CT angio of the chest and abdomen and did not show any dissection of the aorta. The left and right proximal coronaries are visible, however their path could not be seen on the studies performed. No pneumomediastinum both pneumothorax was observed. He had an elevated troponin of 3.1 and it increased to 7.3 prior to transfer to the ICU. VS were stable with HR 80 - 90 and normal BP. Repeat ECG was normal but his troponin increased x 2 with maximum of 16. His CRP was mildly elevated and BPN upper limits of normal. Echo was normal. Cardiologist consulted and pt diagnosed with myocarditis. As of 5/24/21, patient remains hospitalized as troponin was 13.1 at 9:00 am.
1344847	5/24/2021	CA	29	M	5/20/2021	5/23/2021	Second dose of vaccine received 5/20 at 5:00 PM. At approximately 4:00 AM 5/21 the patient began experiencing flu like symptoms (fever, chills, body aches, headache) for entire day which had resolved by morning of 5/22. At approximately 6:00 AM 5/23 the patient began experiencing substernal chest pain 5/10 that lasted approximately 3 hours. He sought medical treatment at an urgent care facility and was referred to Hospital for higher level of care. At the hospital he was found to have an elevated troponin level with a peak of 1.50. He underwent Coronary Angiography to rule out coronary artery disease. The procedure found no evidence of coronary occlusion and was completed without complication.

1345283	5/24/2021	NJ	17	F	4/29/2021	5/3/2021	Patient developed substernal chest pain that began about 3 days after her first Pfizer Covid shot. It was worsened by laying flat and relieved somewhat by sitting upright or forward. NSAIDS were slightly effective at improving the pain. It took about a week to totally resolve. The patient went to a walk-in clinic initially and they noticed right-axis deviation on an EKG and sent her to the Hospital for further workup. She was discharged from the ER several hours later with no clear diagnosis but a suggestion that it sounded clinically like a viral pericarditis.
1345265	5/24/2021	TX	24	F	4/30/2021	4/30/2021	Within 20 minutes I felt like I couldn't breathe my whole body went numb and I felt like I was gonna pass out. I had chills, cough, nausea, body aches, loss of appetite , shortness of breath , accelerated heart, and chest pain. Since the day of the vaccine I have been struggling with my physical and mental health. I've been in and out of hospitals, doctors, specialist.
1345255	5/24/2021	NY	24	M	5/5/2021	5/9/2021	I was woken up by severe chest pain, which continued for the next few hours. I felt the pain above my stomach, below my sternum, and above my heart, and it was a sharp, stabbing pain. My heart was also beating faster than normal. The stabbing chest pain continued for the next few hours before eventually subsiding. However, for the next few days I occasionally felt a fleeting, stabbing chest pain. After a few days, it went away completely. I had never had such a sustained chest pain before.
1345072	5/24/2021	WV	56	F	4/1/2021	4/3/2021	Chest pain, short of breath, fatigue, sore throat, diarrhea, feeling faint. I did not connect this to the vaccine until I heard on the news today, 05/24/2021. I am an active person but wasn't able to exercise and when I did I felt sick. On a hike, I felt like I was going to faint and throw up because my heart was beating so hard and fast. I regularly hike and have never had these symptoms before. I am back to doing cardio and don't have any of the symptoms 7-1/2 weeks later.
1345058	5/24/2021	NY	70	M	2/20/2021	2/21/2021	Fever to 100.8, Nausea and vomiting, Pleuritic chest pain which was worse when supine and improved with sitting up. Symptoms started within 24 hours of the vaccination. Symptoms improved a few hours the initiation of treatment with anti-inflammatory agents.

1345055	5/24/2021	WA	31	F	5/23/2021	5/24/2021	I started having chest pains today around 3:30pm. When I came home from work, I decided to take my blood pressure since it feels like my heart is overworking itself. I checked three times, and all times my blood pressure was in the Stage 1 HTN range. Decided to take a break and try to relax. Took my blood pressure again and it is still in the Stage 1 HTN range. I have no history of HTN. My blood pressure has always been normal. The only other notable symptom after the vaccine is an odd feeling at the frontal part of my head. Not necessarily a headache, but my brain has a weird tingly feeling in the frontal area. My chest still hurts and feels like it is overworking itself.
1345051	5/24/2021	AL	30	M	5/6/2021	5/8/2021	Got shot Thursday May 6th, ran 103 degree temp Friday, Saturday had temp of 100 and felt like was going to pass out once around lunch, then a dizzy spell. Sunday morning (6:00 am) presented with chest pain for about ten minutes that subsided. Sunday night/ Monday morning at approximately midnight (12:00 am) presented again with chest pain that continued as we sought medical attention from local fire department, to which an ambulance was called, meds were given and diagnosis was heart attack from labs drawn at hospital. Took him back for a heart cath and there was no blockage. From everything I was told they couldn't figure out what caused the chest pain. He spent 2 days in CCU. He discharged Wednesday the 12th of May. He is now on Plavix, Coreg, a low dose aspirin, and Atorvastatin.

1344312	5/24/2021	OH	14	M	5/19/2021	5/23/2021	Patient developed maculopapular uticular rash day of vaccine that started on his lower extremities and progressed over a few days to include part of his trunk and his proximal upper extremities. Parents gave benadryl at home. It began to self resolve 5 days after vaccine, with complete resolution on day 6 after vaccine. Additionally, on day 5 following vaccine, the patient had one, isolated, episode of chest pain and SOB that lasted 2-3 minutes. Patient believed he was having a panic attack. Patient's mother took BP during event which was 190/95. Patient subsequently brought to ED where all his vitals were diffusely within normal limits including BP. No persistent chest pain and physical exam unremarkable. Troponin was obtained in ED and found to be elevated at 1951. Patient was admitted, troponins were trended, and patient remained in stable condition without further adverse events, and was subsequently discharge home with diagnosis of suspected myocarditis.
1344267	5/24/2021	OR	19	U	5/14/2021	5/16/2021	Patient developed severe 8/10 chest pain 2 days after the 2nd COVID Pfizer vaccine. Troponin elevated 4. Cardiac MRI was consistent with myocarditis. Echo is normal.
1344220	5/24/2021	TN	19	M	4/28/2021	4/29/2021	Patient was admitted approximately 24-36 hours after vaccination with chest pain, fever. Had elevated troponin, decreased ejection fraction. He was treated with corticosteroids and high dose aspirin in addition to colchicine. He did require oxygen.
1343673	5/24/2021	TX	41	F	4/8/2021	4/1/2021	The morning after I received the vaccine, I started having chest pressure and acid reflux. There was a hard pressure in my chest and my heart was beating weird. I started to develop a headache. I had low blood pressure a couple days later. I went to the clinic and they said I may have a blood clot. I also went to Hospital and they took some blood and did an X-ray and they told me I was fine. I was told that it may be anxiety or stress. The chest pain started to go away, but now my teeth are hurting and are sensitive. I feel that the adverse event lasted for three weeks.

1344914	5/24/2021	TX	68	M	1/15/2020	1/21/2020	My husband had the shot at a center. A few days pass I noticed his strength deteriorated. By that morning he passed out with chest pains. We went to the er. Then off to the hospital. He had inflammation around his heart. 24 ounces of fluid! After being released with in a few days again chest pain back to the hospital. This time fluid around the sac of one lung. So questions were asked. Our cardiologist said she had another younger patient who got the Moderno shot as well and had the same issues. So weeks of steroids, meds to clear up the liquids as well as the inflammation. This had already caused scarring. They did a cath on him and unrelated to the reaction and inflammation and scarring. He needed a several bypasses. Because of the scarring they couldn't find arteries to get my husband back into shape. I believe this has set my husband back, on returning to the hospital and talking to several cardiologist there?s a 10% rise with patients in the hospital right now with the same issues! Why arnt you sharing this! I now feel that my husband is living on borrowed time. I wish we never got the shot! Now younger adults are having issues.
1343016	5/24/2021	FL	21	M	5/21/2021	5/22/2021	chest pain, dizziness started next day
1343221	5/24/2021		53	M	3/10/2021	3/15/2021	Vaccine Received on Wed 3/10/2021. On Saturday - shortness of breath, very elevated resting pulse (by 25 bpm) reduced oxygen saturation (87 on oximeter vs 95), moderate ongoing chest pain. Primary care doctor advised to go to ER. ER visit resulted in misdiagnosis of Heart Attack which was later changed to heart inflammation. Troponin levels elevated and stayed elevated and continue to be elevated 8 weeks later. AFter 8 weeks Troponin levels still elevated and pain occurs upon anything more than modest exercise. Patient has a history as an edurance athlete. All other tests on heart function - stress test/ Ekg, perfusion, echo - show a high performing heart - no other defects other than heart inflamation.
1343218	5/24/2021	MA	34	F	5/5/2021	5/7/2021	Pt received the second dose of Pfizer vaccine on 5/5/21 815 am left arm, on 5/7/21 pt experienced some chest pain which got worse on 5/8/21 with chills, body ache. Then on Monday went to see cardiologist, labs, cat scan, echo & ekg were performed.

1343163	5/24/2021	ME	43	F	5/11/2021	5/19/2021	Patient presented with 3-4 days of increasing shortness of breath/chest pain. Was found to have a pulmonary embolism. started on Heparin drip, transitioned to apixaban after 24 hrs and DCed home
1343140	5/24/2021	NY	51	F	2/27/2021	2/28/2021	Since receiving the vaccine I have extreme lightheadedness requiring me to grab things to avoid falling over until it passes. I passed out once. I have chest pain and fullness as well. My doctor told me to drink juice, wear compression socks, eat salty foods and drink more water. I began tracking my BP and my diastolic is in the 40s and 50s when these incidents occur which is often. The chest pain is consistent. I saw a cardiologist who told me to drum more water and eat more salt. EKGs are fine. I?m going to the Clinic on June 2nd since we all know women?s heart issues are dismissed. The pain and fullness in my chest are becoming annoying and distressing. Since taking the vaccine my exercise fell off almost completely except for pickel ball and when I did play I couldn?t play as I had before at all. I?ve now stopped playing and I?m walking as I used to so that I keep moving. I can?t run. :(
1343128	5/24/2021	NC	28	F	5/14/2021	5/17/2021	Brain fog for a week long. Heart palpitations and sever Chest pain a week after vaccination. Seem to be getting better now but not totally gone yet

1343069	5/24/2021	IN	27	F	5/21/2021	5/21/2021	Pt was extremely anxious prior to injection. Pt experiences chest, nausea, extreme anxiety immediately post injection. Immediate post injection symptoms and monitoring included pulse ox 99% for entirety of monitoring, BP 187/97 not typical for patient. 10 minutes into monitoring period, chest pain 6/10, BP 154/82. 15 minutes into monitoring CP 6/10, bp 167/84. Initiated EMS. EMS Arrived at 12:30. Transported to ED
1343067	5/24/2021	AL	49	F	1/11/2021	1/12/2021	The first night symptoms included insomnia, joint pain, stomach cramps, sweats and general malaise that continued until the following evening. Over the next six days low energy, headaches and brain fog. Then random muscle twitches began. One week after the injection frequent muscle twitches up to 30 through the night that would wake me from sleeping. The next few days significant increase in heart rate upon standing or with any physical activity. Increased blood pressure up to 179/108 with headache. Heart Palpitations became almost constant with strong and painful skipped beats and bounding heart rate which caused chest pain, light headedness and shortness of breath. Within the following week I was experiencing gastric reflux, bloating and pale stools. Tingling and pain in feet and lower legs.
1343693	5/24/2021	TX	23	M	4/9/2021	4/15/2021	About 2 days after I received my first dose of the Pfizer vaccine, I started experiencing chest pain and muscle cramps. On day 6 I experienced it the worst, my chest tensed up and all at once my left side of my body started cramping. Most noticeable of the pain was coming from my heart. It got better as the day ended. Noticed serious muscle cramps for the week after.

1343641	5/24/2021	CA	43	F	5/6/2021	5/7/2021	Patient states she woke up from sleep after receiving the vaccines with chest pain. Per provider note: "having a tightness in her chest in the middle and to the left. She experienced the same thing after her first dose. It has been on and off since the first dose (she did not make the connection until she got the second dose). No association with foods. She is able to breathe okay and is taking it easy today. Last night she woke up at 3am and she has had it since that time. Feels like a muscle pain that seems to go away and come back.~~
1343640	5/24/2021	NC	16	M	5/8/2021	5/17/2021	16yr old patient (Wt = 92.6kg) administered both doses of COVID-19 Pfizer vaccine (1st dose: 4/17/2021, LOT # EW0169 IM via right deltoid; 2nd dose: 5/8/2021, LOT # EW0170 IM via right deltoid). Patient with past medical history per chart review. On 5/18/21, patient presented to urgent care complaining of non-radiating chest pain (7/10), tightness in center of chest since the previous day which occurs at rest and with activity. Symptoms worse when taking a deep breath. Other symptoms denied including fever/chills, cough, sore throat, nausea, vomiting, fatigue, and myalgias. After second COVID-19 vaccine on 5/9, patient had fever, fatigue and similar chest pain, but it had resolved until 5/17 when it returned. ECG obtained noting "Normal sinus rhythm, ST elevation, consistent with pericarditis". Labwork including D-dimer (0.353), troponin (< 0.019) and CBC (WBC 4.2), were all non-concerning. Upon discussion with cardiologist, recommended indomethacin 50mg TID with meals x 10 days (# 542899912) and colchicine 0.6 mg PO BID (# 542899913). Patient presented to Peds Cardiologist on 5/20, noting colchicine had not been started due to prior authorization issue. On 5/20, ECG noted "ST elevation" and transthoracic echocardiogram (no obvious defects or abnormalities). Patient to return for peds cardiology check up within 4 weeks or sooner if needed with repeat ECG. Plan to continue indomethacin however, patient instructed not to start colchicine at this time.

1343627	5/24/2021	MO	34	F	3/27/2021	4/6/2021	Around 1:30pm on Tuesday April 6th, I was sitting at my desk in my home office, working. I began experiencing moderate chest pain and shortness of breath. These symptoms continued to worsen for the next hour. I had difficulty breathing, and taking a full breath was painful enough to prevent me from doing so. I drove myself to the ER. While waiting in the ER, I began experiencing chills, severe joint pain, and moderate pain generally throughout my body beginning around 4:00pm, which I advised ER staff. While being examined by the ER doctor around 7pm, there was some tenderness noted in my right upper quadrant. My blood pressure was extremely high (205/130) and I developed an intense headache. I was admitted overnight and discharged the afternoon of April 7th. While the chills and pain improved on April 7th, my chest pain and shortness of breath continued for another week or so. The night of April 7th at home, I woke up several times with difficulty breathing and ended up sleeping fitfully while propped up at a 45 degree angle so I could at least breathe mostly normally. The chest pain and difficulty breathing slowly improved over about 10 days until I was no longer experiencing symptoms.
1343617	5/24/2021	FL	20	M	3/2/2021	3/4/2021	2-day history of progressive chest pain, 2 days after receiving his second dose of the Moderna vaccine.

1343353	5/24/2021	MA	24	M	5/5/2021	5/6/2021	Initially I had experienced the standard adverse effects of drowsiness, a little difficulty sleeping, minor chills. The next day following my Dose 1 of the Moderna Vaccine, I started noticed chest pains on both sides of the chest. It wasn't from breathing and not very consistent or something I could re-create on command. It seemed to happen every hour for a few seconds and was a sudden, sharp pain. That was a concern for me so I did some basic internet searches and found that Chest pains are a symptom of the vaccine. I didn't think too much of it after that but It was a concern I kept in my head. My timeline gets a little foggy here but either that same day or the following day, the chest pains were still happening and I wasn't feeling 100%. One evening I went to take a bath. As I was laying in the water, my heart rate felt off, almost as if it was skipping a beat or not in the right rhythm. I remember laying in the bathtub, trying to count my pulse or seeing if I could "catch" the incorrect beat. Rather than one normal heartbeat it felt like there was 2 beats very closely timed with each other. My heart rate felt faster than normal considering I was only laying down in water and didn't do any exercises the past few days. Unfortunately I never was able to find a good way to track the pulse and timing, but I was sure that something was wrong. I had difficulty sleeping that night because I kept feeling something wrong with my heart rhythm. I got worried that I would need to go to the emergency room, but I told myself to sleep it off and if the chest pains and awkward heart beat continues for 5 days, I would go see a doctor. As for an outcome, thankfully I stopped noticing it around day 4 and haven't had chest pains since. I am extremely worried as to how my body will react to Dose #2.

1343566	5/24/2021	CA	18	F	5/18/2021	5/20/2021	This is a 18 Years old Female presenting with chest pain for [a couple hours last night]. Pain started [gradually]. It is described as [dull and aching], radiating into [nowhere]. Pain is described as [moderate] upon onset and is currently [mild]. [No] history of the same. Pain [is not] worse with exercise. Patient [has no] decrease in exercise tolerance recently. Patient states that she received her second dose of her Pfizer vaccination 3 days ago, and last night she started to experience chest pain, headache, palpitations, and shortness of breath, and feeling dehydrated.
1343698	5/24/2021	CO	31	F	2/26/2021	3/1/2021	I began having very mild tachycardia and occasional shortness of breath after I had Covid 19 in the middle of December. My symptoms were very mild and did not require a doctors visit. I improved and went to get my first covid vaccine on 1/26/21. I started noticing some more mild tachycardia and shortness of breath a few days after my vaccine but I assumed I was just out of shape from not working out & being sick. I got my second vaccine on 2/26/21 and began having more severe tachycardia and shortness of breath with lightheadedness a few days later. I went to the ED March 12th due to heart rate in 160s at rest, chest pain, and difficulty breathing. I saw the cardiologist March 18 and was told I most likely have myocarditis. No treatment other than rest and no exercise. I began feeling back to normal again around the week of April 12.
1342121	5/23/2021	MD	22	M	2/23/2021	2/26/2021	Chest pain turned out to be myocarditis. Was hospitalized for a 2-3 days were I received treatment to lower heart rate and inflammation. Discharged on March 1st with little chest pain and prescribed Colchicine for 3 months to continue to lower inflammation.
1341490	5/23/2021	OR	12	M	5/20/2021	5/21/2021	Pericarditis, temp 100, chest pain

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1341538	5/23/2021	KS	47	F	5/3/2021	5/7/2021	Developed deep lowerchest/upper abdomen pain on right side 4 days after vaccine was administered. Pain got progressively worse and a rash developed on right thorax in the Thoracic rib 5 region; Visited Army doctor on 12 MAY. Based on visual exam of multiple, tiny water-filled blisters only on right side of thorax + description of pressing pain in chest similar to feeling of a heart attack, both doctors on shift diagnosed shingles. Forgot I received COVID vaccine 4 days before symptoms started so I never mentioned it to the doctor. TRX= 800mg acyclovir 5x/day x 7 days. Rash continued to get worse and spread more before finally subsiding and starting to crust over. Nearly 3 weeks later, rash is now a combo of scabs and open wounds. Pressing deep pain in right chest is persistent and only relieved partially with 800mg ibuprofen q 8 hours.
1341698	5/23/2021	MD	40	M	4/13/2021	4/28/2021	Fever, chills, chest pain, shoulder pain, short breath. Recommended to see cardiologist and GI doctors. Admitted into emergency hospital and found out that my lungs and hearts inflammations. it was pericarditis and treatment given for this and still on medication and still PCR report shows the inflammation high count.
1341717	5/23/2021	MA	23	M	5/19/2021	5/22/2021	One day following second dose of vaccine, patient developed chest pain. Was admitted to the hospital with concerning ECG features and high troponin elevation. No wall motion abnormalities, so less concern for STEMI. Likely diffuse myopericarditis. Full workup still pending
1341730	5/23/2021	KS	18	M	5/18/2021	5/19/2021	Chest pain episodes 1-3 days after vaccine, Cardiac MRI shows small area of acute myocarditis
1341769	5/23/2021	DC	26	M	4/30/2021	5/6/2021	10 days after the second dose, experienced minor chest pains, eventually almost fainted. Went to the ER and found troponin levels that peaked at 5.78, eventually trended down to 3.55 by the next morning. MRI revealed myocarditis in the left ventricle.
1341773	5/23/2021	VA	20	M	5/18/2021	5/20/2021	Pt developed chest pain on 5/20, 2 days after receiving the vaccination. It persisted and he presented to the ED on 5/21 and was found to have elevated troponins and ST elevation concerning for myocarditis/pericarditis. Symptoms improved with ibuprofen.

1341778	5/23/2021	NY	20	M	4/27/2021	4/29/2021	Experienced mild chest pain two days after vaccination. Visited the ER, and was Hospitalized due to a decreased ejection fraction and elevated cardiac enzymes. My ejection fraction returned to normal the following day, and I showed a decrease in cardiac enzymes. The pain also subsided about 36hrs after starting. I remained at hospital for a few days to have a cardiac MRI which showed patchy myocarditis. I was discharged that day, and have been taking metoprolol and avoiding physical exertion. Later, on May 13th I returned to the ER due to an increase in heart palpitations. They turned out to be PVC, which is generally harmless, but I began taking a potassium supplement since my levels were low. I've been taking it easy since. Currently, I am expected to avoid exercise and exertion for six months, but am waiting for a follow-up to get more details.
1341851	5/23/2021	CO	40	M	4/26/2021	5/15/2021	Pfizer-BioNTech COVID-19 Vaccine EUA: patient presented to urgent care reporting shortness of breath, cough, and chest pain. Transferred to emergency department then admitted to current facility for a management of new onset heart failure with possible etiologies of myocarditis or sarcoid. Also found to have LV thrombus, anemia, and lymphadenopathy. Patient initiated on medications to manage heart failure and anemia and anticoagulated. Patient improved and discharged to home medically stable.
1341479	5/23/2021	WI	22	M	5/15/2021	5/18/2021	Received second dose on Saturday, woke up on Tuesday at 5 AM with chest pains. Went to the emergency room around 4PM Tuesday, transferred to another hospital, diagnosed with myocarditis, and treated and monitored there for 2 days and then discharged. On medication for the next 3 months due to condition.
1342111	5/23/2021	IN	20	F	4/1/2021	4/23/2021	Two days after the vaccine, I developed a rash on my arm and severe pain. Then the day after I was having horrible chest pain and heart palpitations. I was given heparin directly to my heart to treat a possible blood clot.

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1341868	5/23/2021	FL	51	M	4/22/2021	4/23/2021	Approximately 4 hrs after vaccine administration, dark, red, raised rash appeared on torso, arms, buttocks, and legs. So severe that dexamethasone started. Rash did not improve for weeks and steroids continued during that time. Patient noted to then go into congestive heart failure, had 2-3+ pitting edema, "ground glass"/pulmonary congestion in lungs, rapid A-fib with RVR 170-180s. treated at Hospital with admission from 5/15-5/17/2021. Patient complained of chest pain and trouble breathing starting 5/13/2021. Patient has mostly recovered, and is at home now. Now on high dose beta-blockers and eliquis for the new onset A-Fib.
1342126	5/23/2021	TX	71	M	2/24/2021	2/27/2021	A few days after the second Covid shot I started having chest pains, shortness of breath, dizziness after just walking or mild exercise . This persisted fir a couple days until I went to a heart doctor had PET test , went to heart hospital for angiogram and had a stint placed into LAD heart artery on March 29. I am still having chest pains and shortness of breath. But not as severe as before the stint was put in artery. Before I had the second Covid shot I could exercise hard with no ill effects. After Covid shot I could barley walk 50 yards without severe chest pains etc.
1342174	5/23/2021	CA	43	F	5/15/2021	5/15/2021	I experienced chest pain, elevated heart rate an shortness of breath instantly upon receiving the second dose of the Pfizer vaccine. It did not get better until hours later, and I am experiencing these symptoms intermittently over a week later.
1342247	5/23/2021	CO	41	M	4/9/2021	4/10/2021	Acute myocardial infarction in the LAD. Chest pain migrating to left arm down through elbow. Cardiac catheterization s/p DES-pLAD. Chest pain started roughly 19 hours after the first dose of the Pfizer vaccine.
1342252	5/23/2021	NY	35	M	4/6/2021	4/12/2021	Random chest pain starting about 6 days after vaccination. Has been intermittent but persistent for over a month now. I've been to the er twice and had blood tests, chest x-rays and a CT, but no findings.
1342268	5/23/2021	PA	17	M	5/4/2021	5/7/2021	Patient complained of chest pain 3 days after his second Pfizer COVID vaccine and was diagnosed with Myocarditis.

1340286	5/22/2021	WA	36	F	4/14/2021	4/22/2021	hiccups back; she felt her head is hot to the top; Chest tightness; Headache got worse; left arm twinges; Chest started hurting bad; extreme itchy left inner ear/ itchy left side of the neck; swollen up the left jaw; swollen lymph node on left side of the face; Sensation of and in left arm that was buzzing with alcohol and occasional ache; Neck muscle Pain affects swallowing; continuing neck pain that some days is lighter,neck muscle pain going up to mouth, up to tongue, going down to clavicle/felt like whiplash on the neck/front of neck sore; Neck muscle soreness; neck muscle Pain; general pain and soreness coupled with twinges of more acute pain; general ache; heart squeezing and angina; Chest pain; Chest pain felt like heart burn; painful hiccups; felt chest tightness; This spontaneous case was reported by a medical assistant (subsequently medically confirmed) and describes the occurrence of ANGINA PECTORIS (heart squeezing and angina) in a 36-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 047B21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No medical history was provided by the reporter. Concomitant products included MESALAMINE for Ulcer gastrointestinal. On 14-Apr-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 22-Apr-2021, the patient experienced ANGINA PECTORIS (heart squeezing and angina) (seriousness criterion medically significant), HICCUPS (painful hiccups), CHEST DISCOMFORT (felt chest tightness), CHEST PAIN (Chest pain), DYSPEPSIA (Chest pain felt like heart burn) and MYALGIA (general pain and soreness coupled with twinges of more acute pain; general ache). On 23-Apr-2021, the patient experienced DYSPHAGIA (Neck muscle Pain affects swallowing), NECK PAIN (continuing neck pain that some days is lighter,neck muscle pain going up to mouth, up to tongue, going down to clavicle/felt like whiplash on the neck/front of neck sore), PAIN IN EXTREMITY (Sensation of and in left arm that was buzzing with alcohol and occasional ache) and MYALGIA (Neck muscle soreness; neck muscle Pain). On 29-Apr-2021, the patient experienced PRURITUS (extreme itchy left inner ear/ itchy left side of the neck), SWELLING FACE (swollen up the left jaw), LYMPHADENOPATHY (swollen lymph node on left side

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

of the face), CHEST PAIN (Chest started hurting bad) and PAIN IN EXTREMITY (left arm twinges). On 05-May-2021, the patient experienced HICCUPS (hiccups back), HOT FLUSH (she felt her head is hot to the top), CHEST DISCOMFORT (Chest tightness) and HEADACHE (Headache got worse). On 23-Apr-2021, ANGINA PECTORIS (heart squeezing and angina), CHEST DISCOMFORT (felt chest tightness), CHEST PAIN (Chest pain) and DYSPEPSIA (Chest pain felt like heart burn) had resolved. On 27-Apr-2021, HICCUPS (painful hiccups), PAIN IN EXTREMITY (Sensation of and in left arm that was buzzing with alcohol and occasional ache) and MYALGIA (general pain and soreness coupled with twinges of more acute pain; general ache) had resolved. On 01-May-2021, PRURITUS (extreme itchy left inner ear/ itchy left side of the neck) had resolved. At the time of the report, DYSPHAGIA (Neck muscle Pain affects swallowing), NECK PAIN (continuing neck pain that some days is lighter, neck muscle pain going up to mouth, up to tongue, going down to clavicle/felt like whiplash on the neck/front of neck sore), SWELLING FACE (swollen up the left jaw), LYMPHADENOPATHY (swollen lymph node on left side of the face), CHEST PAIN (Chest started hurting bad), HICCUPS (hiccups back), HOT FLUSH (she felt her head is hot to the top), PAIN IN EXTREMITY (left arm twinges), CHEST DISCOMFORT (Chest tightness), MYALGIA (Neck muscle soreness; neck muscle Pain) and HEADACHE (Headache got worse) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 01-May-2021, Chest scan: normal (normal) normal. On 01-May-2021, Electrocardiogram: normal (normal) normal. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. 1341385	5/22/2021	TN	51	F	3/20/2021	3/30/2021	Had chest pain, dizziness, arm pain, neck and jaw pain, nausea and pressure on the chest. Thought it was heart related and went to the ER -- kept overnight for observation but they could find no heart-related cause.
1341288	5/22/2021	NY	76	F	3/26/2021	5/18/2021	Pt received her 2nd covid 19 vaccine on 3/26. Patient is a 76-year-old female with a past medical history significant for hypertension, depression, hypothyroidism 2nd covid 19 vaccine on 3/26 who presented on 5/18 to the ER with complaints of lightheadedness and nausea that occurred over the weekend and was diagnosed with new onset rapid atrial fibrillation. She denied chest pain or shortness of breath but noticed intermittent bouts of palpitations. She went to see her PCP who referred her to the emergency room. EKG and telemetry in the emergency room were significant for new onset rapid atrial fib. She was given diltiazem and admitted to the hospitalist service. CT of the chest was negative for pulmonary emboli or focal consolidation. She had no electrolyte derangements she has no history of sleep apnea and no history of obesity. Her troponin and delta were unremarkable. She was subsequently admitted to the hospitalist service. She was treated with metoprolol and amiodarone along with Eliquis. She was seen by her cardiologist. Her recent echocardiogram was normal. Her TSH was actually elevated at 11.0 so her levothyroxine dose was increased to 175 mcg daily with a TSH in 6 weeks. At this time patient's rate is much better controlled but she remains in atrial fib. She will be following up with her cardiologist closely post discharge. She is also complaining of persistent R shoulder pain and weakness since her vaccine. Her shoulder x ray showed arthritic changes. She also c/o the worst headache of her life that lasted a week starting on May 4th. CT head was neg.
1341278	5/22/2021	OR	34	F	5/20/2021	5/20/2021	Chest pain. Difficulty breathing, upper back pain, numbness and tingling in right arm.

1340857	5/22/2021	WA	18	M	5/5/2021	5/8/2021	Three days after second dose of vaccination patient presented to ED with pleuritic chest pain and dyspnea. Patient found to have acute myopericarditis. Patient treated with IV toradol and acetaminophen with resolution of symptoms. Treated with metoprolol and colchicine. Patient was hospitalized for 48 hours then discharged in stable condition.

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1340331	5/22/2021	PA	47	F	1/20/2021	1/30/2021	2 weeks post second vaccine with pericarditis (classic positional chest pain and pericardial effusion); 2 weeks post second vaccine with pericarditis (classic positional chest pain and pericardial effusion); 2 weeks post second vaccine with pericarditis (classic positional chest pain and pericardial effusion); This is a spontaneous report from a contactable Physician (patient). A 47-year-old female patient (pregnant: no) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via unspecified route of administration in right arm on 20Jan2021 (lot number: EL3302) at 19:00 at single dose for COVID-19 immunization. The relevant medical history included CSF leak (Cerebrospinal fluid leakage) from an MVA, depression, asthma, reglan allergy and COVID-19 (Prior to vaccination, was the patient diagnosed with COVID-19?: Yes). Concomitant medications included fluticasone furoate, vilanterol trifenate (BREQ ELLIPTA), montelukast sodium (SINGULAIR), fexofenadine hydrochloride (ALLEGRA), fluoxetine hydrochloride (PROZAC), lamotrigine (LAMICTAL) and temazepam (TEMAZE). The patient experienced 2 weeks post second vaccine (as reported) with pericarditis (classic positional chest pain and pericardial effusion) on 30Jan2021 at 12:00. The event resulted in doctor or other healthcare professional office/clinic visit and emergency room/department or urgent care. Treatment included prednisone, colchicine, aspirin and anakinra, received for the adverse events. Since the vaccination, the patient had not been tested for COVID-19. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The outcome of the event was not recovered.; Sender's Comments: Based on known drug safety profile, there is reasonable possibility of causal association between the events Pericardial Effusion, pericarditis, Chest Pain and the suspect BNT162B2. The impact of this report on the benefit/risk profile of the Pfizer drug is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1340329	5/22/2021	TX	17	M	4/8/2021	5/2/2021	Acute chest pain; Elevated troponin 16; This is spontaneous report received from a contactable Healthcare professional. A 17-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) intramuscularly on 08Apr2021 13:15 (Batch/Lot Number: EW0151) (at 17-year-old) as first dose, single in arm left for COVID-19 immunisation. Other unspecified Pfizer vaccine was received via an unspecified route of administration on 08Apr2021 (Batch/Lot Number: EW0170) as second dose, single in arm. Medical history included ongoing hospitalization (Vaccine received during existing hospitalization). The patient's other concomitant medications were not reported. No other vaccines within 4 weeks prior to the COVID vaccine. Other medications received within 2 weeks of vaccination was reported as unknown. On 02May2021 04:00 AM, the patient experienced acute chest pain and elevated troponin 16, he was admitted to hospital. It's reported AE resulted in: Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care, Hospitalization, Prolongation of existing hospitalization (vaccine received during existing hospitalization). Prior to vaccination, the patient was not diagnosed with COVID-19. On 02May2021, PCR Nasal Swab was performed and showed negative. Ketorolac tromethamine (TORADOL) and ibuprofen (MOTRIN) were received as treatment. Duration of hospitalization was 4 (discharged on 06May2021). The outcome of the event was resolved in May2021.; Sender's Comments: Based on the strong temporal relation, the association between chest pan, troponin increased and vaccine administration cannot be completely ruled out with the information available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

1340322	5/22/2021		24	M	4/12/2021	4/13/2021	Started developing chest pain a week after taking the first dose. Progressively worsened since then till present/had bouts of sharp chest pain/CP; X-Ray showed pleural effusion and slight fullness of main pulmonary artery.; pleural effusion; Fatigue/tiredness/High fatigue and tiredness persisted from right after the vaccine till present; diarrhea; tiredness; high fever; chills; nausea; brain fog; This is a spontaneous report from a contactable consumer. A 24-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration on 12Apr2021 as 1st dose, single for covid-19 immunisation. The patient medical history and concomitant medications were not reported. The patient started developing chest pain a week after taking the first dose (13Apr2021). Progressively worsened since then till present. At present also have fatigue, diarrhea and tiredness. Yesterday, had bouts of sharp chest pain so got an X-Ray from ED which showed pleural effusion and slight fullness of main pulmonary artery. Doctor stated it was indicative of CP. In the initial few days after the first dose, had high fever, chills, nausea and brain fog. High fatigue and tiredness persisted from right after the vaccine till present. The patient was very healthy and have never had a heart complication before. The timing might be indicative of a causation between the vaccine and the present medical condition. Ae resulted in doctor or other healthcare professional office/clinic visit. There is no other vaccine in four weeks, no other medications in two weeks, no treatment for ae, no covid prior vaccination. The patient tested covid post vaccination (RT-PCR) with Nasal Swab on 03May2021, covid test result was Negative. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. List of any other medications the patient did not receive within 2 weeks of vaccination. The outcome of the events was not resolved. Information on the lot/batch number has been requested.

An 18-year-old male patient received second dose of BNT162B2 (BNT162B2), via an unspecified route of administration, administered in Arm Left on 04May2021 at 16:00 (Batch/Lot Number: ER8736) as 2ND DOSE, SINGLE for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient had no Covid prior to vaccination and was not tested post vaccination. The patient experienced Pericarditis, headache, fever, having trouble breathing, chest pain and tingling down his arms all on 06May2021. It was reported that the patient had all the normal reactions to a significant extent, the headache, the fever, etc. But two nights after the vaccination he was having trouble breathing, he had chest pain, and tingling down his arms. The next day, patient was taken to urgent care and was diagnosed with pericarditis. The patient underwent lab tests and procedures which included EKG (electrocardiogram): pericarditis on 06May2021 (EKG showing Pericarditis and 10 days of medication). Therapeutic measures were taken as a result of all the events. The outcome of all the events was unknown.

1340386	5/22/2021	CA	28	F	5/6/2021	5/6/2021	ear ringing; stomach and kidney pain; stomach and kidney pain; nausea; achiness; inflammation; light headed; vasovagal response; some chest pain; collapsed/fainted; low grade fever; congestion; chills; This is a spontaneous report from a contactable consumer (patient). This consumer reported similar events for two patients. This is the first of two reports. A 28-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration on 06May2021 11:00 (Batch/Lot number: EW0170) as 2nd dose, single, at the age of 28-years-old for COVID-19 immunization. The patient is not pregnant. The patient had no known allergies. Medical history included a few kidney stones and one surgery to remove stones. She reported she was very healthy and active otherwise and hadn't had any sort of cold or illness in 2 years. The patient's concomitant medications were not reported. Historical vaccine included first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), on 15Apr2021 09:45 AM in the left arm as 1st dose, single for COVID-19 immunization. The patient did not have any other vaccine in four weeks and no other medications in two weeks. At 06May2021 9:00pm (10 hours after her 2nd shot), she started having a low grade fever, congestion, and chills. She went to sleep at 12:00am, chills and fever were more intense at this point. At 2:00am on 07May2021, she woke up with a fever of 103, no chills, but intense ear ringing (a volume of 9/10) in her left ear, extreme stomach and kidney pain, nausea, and achiness. The ringing in her ears was the worst symptom. She sat up and drank water for the next 5 hours, to try to get the inflammation down. She went to the bathroom every hour and her ear ringing started to lessen. At 7:00am she went to the bathroom for the 5th time and began to feel extremely light headed. She had a vasovagal response and collapsed/fainted (luckily, she had a family member who was monitoring her). She went back to rest and have had on and off low-grade fever, some chest pain, and aches since then. She has a twin sister, who got her shot on the same day and time, and she also had a vasovagal response, but not nearly as many of the other symptoms. The patient had no prior vaccination and was not tested for COVID post-vaccination. No treatment was received for the events. The outcome of the events was unknown. Information on

1340403	5/22/2021	KY	82	F	3/4/2021	3/4/2021	leg swelling; ultrasound showed an occlusive clot in her femoral artery; femoral vein clot; had pneumonia; fever; developed chills; then chest pain; shortness of breath; This is a spontaneous report from a contactable physician. An 82-year-old non-pregnant female patient received bnt162b2 (BNT162B2 reported as PFIZER CORONA VIRUS VACCINES-COVID-19), dose 2 intramuscularly administered in the right arm on 04Mar2021 (Batch/Lot number was not reported) as 2nd dose, single for covid-19 immunization. Medical history included hypertension, hypothyroidism and osteoporosis. The patient was not diagnosed with COVID-19 prior to vaccination. The patient received the first dose of bnt162b2 (BNT162B2 reported as PFIZER CORONA VIRUS VACCINES-COVID-19) on an unspecified date for Covid-19 immunisation. Concomitant medications included levothyroxine sodium (SYNTHROID); calcium; acetylcysteine, calcium levomefolate, mecobalamin (METAFOLBIC PLUS); losartan; hydrochlorothiazide; denosumab (PROLIA) and trazodone; all indication, start and stop date were not reported. It was unknown if the patient receive any other vaccines within 4 weeks prior to the COVID vaccine. It was reported that in the evening of the vaccination (04Mar2021), she developed chills and fever, then chest pain and shortness of breath. The physician obtained a CXR (chest x-ray) on the patient on 04Mar2021 and found that she had pneumonia. She was treated with levofloxacin and prednisone. The physician rechecked her in one week and gave her Kenalog injection and Rocephin injection. The physician rechecked her on 22Mar2021 and she was improved, but she returned to the office 12Apr2021 with left leg swelling. The ultrasound on 12Apr2021 showed an occlusive clot in her femoral artery. The patient was admitted to the hospital (Apr2021) for 1 day and placed on heparin, then sent home on Eliquis. The adverse events resulted in doctor or other healthcare professional office/clinic visit and the patient received treatment which included antibiotics and steroids for pneumonia and blood thinners for the femoral vein clot. The patient has not been tested for COVID-19 since the vaccination. The outcome of the events leg swelling, occlusive clot in her femoral artery and femoral vein clot were recovered on Apr2021 while the outcome of the other events was recovered on 22Mar2021. 1340504	5/22/2021		58	F	2/27/2021	2/27/2021	severe allergic reaction; difficulty breathing; swelling of face and throat; swelling of face and throat; fast heartbeat; a bad rash all over the body; dizziness; weakness; pain at injection site on left arm/left arm started hurting; tingling hot pins all over; tingling hot pins all over; nausea; swelling on opposite shoulder on the right; back pain; chest pain; a cold sore on her lip; This is a spontaneous report from a contactable consumer (patient herself). A 58-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 27Feb2021 (Batch/Lot number was not reported) as 1st dose, single for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. Patient stated that side effects began on 27Feb2021. Side effects included tingling hot pins all over, nausea, pain at injection site on left arm/ left arm started hurting, swelling on opposite shoulder on the right, back pain, chest pain and a cold sore on her lip. She went to the doctor a couple times and reported to her doctor that all her symptoms stopped on 04May2021. She was scheduled to go back to the doctor on 14Jun2021 and they are going to test her for antibodies. She would like to know since her side effects lingered for so long, if she should receive the second dose? She wants to receive the vaccine and be fully vaccinated but she doesn't want to go through this all over again. Everyone in her family was vaccinated and they did not have any side effects. Her doctor didn't want to tell her yes or no if she should receive the second dose. After reading the severe allergic reaction side effects that include difficulty breathing, swelling of face and throat, a fast heartbeat, a bad rash all over the body, dizziness and weakness, the patient stated that she has all of those side effects in the middle of the night and worse. Her doctor told her that a lot of stuff happened to her and it lingered for so long in a person that doesn't usually have reactions so she should hold off and mask up and social distance and come back for her appointment in June where she will be tested for antibodies. Her doctor did blood work and took pictures and made a report and told her to call and make a report as well. Outcome of the events was recovered on 04May2021. Follow-up attempts are needed. No further information is expected.

Patient received the J&J vaccination (1 dose). Patient states that she did not mention to registration or nursing staff of her medical history of Venous Insufficiency. Patient denies reactions to previous vaccinations. Patient denies chest pain, itch or rash. NP and Paramedics at bedside. Patient provided with Benadryl 25 mg PO x1 and a bottle of water. Patient vitals within normal limits, 112/73 BP, 75 HR, 97% RA, Resp 12. Patient monitored by the NP over 30 minutes with resolution of symptoms. Patient with improvement of difficulty swallowing and difficulty breathing within 10 mins of Benadryl administration, but tongue numbness didn't improve until 25 mins post medication administration. Patient was able to eat a protein bar without difficulty (patient requested). Patient last set of vitals also within normal limits, 115/77 BP, 65 HR, 98%, Resp 12. Patient advised on concerning symptoms and when to seek ER evaluation. Patient discharged home in stable condition.

5/11/2021

Having long covid since May 2020, my lingering symptoms have been fatigue, shortness of breath, chest pain, loss of taste. All were subsiding and have come back since the first injection and have not abated for 2 weeks. Fatigue is particularly intense in the morning, loss of taste is now constant.

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1336832	5/21/2021	WI	26	F	3/13/2021	3/16/2021	Experienced 2 days of worsening fever, chills, myalgias, mild chest pain, fatigue and malaise. Went to the ER after having a low grade fever, chills, shortness of breath, mild chest pain, and an elevated resting heart rate. Was diagnosed with SIRS as a response to the covid vaccine and hospitalized for observation. Was discharged the next day. Diagnosed with SIRS, possibly due to the COVID vaccine with a secondary diagnosis of asthma.
1337141	5/21/2021	PR	21	M	5/13/2021	5/15/2021	Patient presented high fever around 5pm the day of the vaccination. He continued with high fever and joint pain all Friday. He then presented with respiratory difficulties and chest pain when lying down on Saturday morning. He noticed that pain was less intense if he was seated upright. Pain became more intense around 10pm Saturday night. He was taken to an Emergency Room and was determined after evaluation that a cardio evaluation was granted due to abnormal labs and EKG results. Patient was transferred to secondary hospital. He was admitted for further evaluation and treatment.
1336496	5/21/2021		30	F	5/17/2021	5/19/2021	Severe chest pain. Swollen breast on opposite side of vaccine injection. Urgent care diagnosed with Costochondritis. Severe breast swelling still needs to be diagnosed.
1336845	5/21/2021	WI	32	M	4/27/2021	5/1/2021	no notable previous history who presented 5/1/2021 ~0130 with chest pain and shortness of breath. History notable for Moderna COVID-19 vaccination 4 days prior (that would be 4/27/21) with subsequent development of fever, myalgias, sore throat. Then on 4/30/21 developed acute onset of shortness of breath and chest pain. Seen at ED. Exam and work-up revealed elevated troponin, unremarkable CTA of chest, EKG with diffuse slight ST changes. Patient was subsequently admitted to hospital for possible myocarditis. Per consult - Differential diagnosis includes pericarditis, myocarditis, acute coronary syndrome. Later in the day (~1530), had worsening chest pain and ST elevated noted on EKG. Pt did disclose at that time that he used cocaine about 8 days earlier. Pt transferred to Hospital for treatment of STEMI. Note: covid-19 vaccine info is pt reported, unable to access any Immunization records for this patient. Place where pt received vaccine is also unknown.

1337375	5/21/2021	CA	17	M	5/7/2021	5/8/2021	Second COVID vaccine was administered 5/7/21. Patient then developed chest pain and presented 3 days later to Hospital on 5/11/21. Admitted for treatment of myopericarditis.
1337339	5/21/2021	CA	42	F	5/21/2021	5/21/2021	Pt. received 1st dose approximately at 08:53 a.m. Pt. stated that she could feel her heart beating fast and complaint of feeling light. Pt. denied shortness of breath and chest pain. Pt's heart rate increased to 140-160m. Oxygen @3L via nasal cannula given by LVN. Oxygen saturation 100%, Respiration 20. HR started to improve and decreased to 84, BP taken manually 142/78. Pt. stated she was feeling better just weak. 09:19, pt's vital signs were monitored for 45 min. Pt. refused to see one of the providers at clinic. Stated she feels better. C/o of headache, 5/10. Pt. discharged in good spirits when discharged to son who took her home. Was advised to go to ER if symptoms of shortness of breath, chest pain, dizziness, lightheaded, or heart palpitations occur and to follow up with provider.

1337275	5/21/2021	MI	62	M	4/21/2021	5/10/2021	past history of diabetes, hypertension, hyperlipidemia and recent diagnosis of COVID-19. Apparently the patient received his initial dose of COVID vaccine on 03/31/2021 and subsequently developed loss of taste and smell. He was tested for COVID-19 at local Pharmacy and received notification that his result was positive. He subsequently had improvement in his symptoms and was retested 2 weeks subsequent with negative results. On for 01/20/2021 he received his 2nd COVID 19 vaccination and subsequently developed recurrence of feeling ill 2 days afterwards. He progressively had feeling of shortness of breath along with nonproductive cough. The patient then developed complaints of chest pain and rib discomfort. He presented to the emergency department where he was found to be hypoxic along with abnormal labs including a creatinine of 1.84 BNP of 12,699, elevated transaminase levels, hemoglobin of 8.9. Chest x-ray showed patchy airspace disease to the right lung consistent with COVID-19 pneumonia. At time of admission he was given IV Lasix and started on Rocephin and Azithromycin. The use of steroids as well as any antiviral treatment was withheld because of presumptive symptoms related to bacterial pneumonia (secondary to COVID 19.) He also did not require oxygen supplementation during his stay.

1337216	5/21/2021	UT	43	F	5/13/2021	5/13/2021	I immediately felt sharp pain and burning in my arm while being injected. The burning in my arm lasted for about 20 minutes. I got a severe migraine about an hour after the vaccine that lasted for about ten hours. I broke out in hives all over my body later that night, the same day as the vaccine. I also had intense heartburn. I never get heartburn so this is not normal for me. The following day, I was still having hives and started also having chest pains. I was consistently taking antihistamines to keep the hives under control. On Saturday morning, 2 days after the vaccine, I was still breaking out in hives. My throat also started to swell and I was having a hard time breathing. My heartburn was also getting more severe. I ended up going to urgent care. There I was prescribed 2 stronger antihistamines and prednisone to help with my reaction. I was also given an epi pen. Later that night, I ended up going to the ER as I was having severe chest pain. I have a history of DVT so I was concerned about blood clots. I had several tests done along with a chest CT scan. Thankfully everything came back clear for blood clots and heart attack. The ER doctor could not explain why I was having chest pain and advised me to monitor it and to come back in if it got worse. The following day, I was still needing antihistamines for hives and difficulty breathing. I woke up in the middle of the night with severe stomach pain and cramping. I had intense vomiting and diarrhea. The diarrhea started to have a lot of blood in it. I went back urgent care and they sent me for a CT scan which showed I now had colitis. The bleeding lasted for about 3 days.
1337070	5/21/2021	NY	38	F	5/20/2021	5/20/2021	The patient experienced pain, numbness and weakness to R UE and R LE and chest pain about 20 minutes following the vaccine which worsened over night.
1337028	5/21/2021		18	M	4/14/2021	4/17/2021	The patient presented to the emergency department with chest pain. Admitted the hospital and diagnosed with myopericarditis.
1336944	5/21/2021	IL	40	F	4/29/2021	5/3/2021	Fever, chills, headache, nausea, chest pain, leg pain, rhabdomyolysis

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1336939	5/21/2021	FL	35	M	3/17/2021	4/1/2021	started as severe dizziness and weakness, chest pain was hospitalized once I got to the ER because my heart was not working properly, after many test the found my heart was in heart failure with an output of 35% only, was in hospital for 5 days. Doctors couldn't see what caused such a sudden weakness of the heart, they did cardio path and arteries have zero blockage, they did ECO, and a EP Study. My heart now suffers from PVCs or arrhythmia and they are very irregular and frequent. Was given medicine to help the heart and control the PVCs, and discharged with wearing a safety vest, to follow up with the cardio doctors. Followed up with doctors and they have done an MRI which shows scarring of the heart. The doctor has determined that the diagnosis is myocarditis. There is no proof this direct relation with the vaccine, however symptoms started soon after the vaccine in a healthy young man. Now I still have to go to another electrophysiologist to see what he can do to help alleviate the PVCs and continue to take the medication to see of the heart can improve. I could not work for a month, and still cannot resume normal activities because my heart is to weak to sustain it.
1336148	5/21/2021	TX	23	F	5/19/2021	5/21/2021	24 hours later, shaking chills, diarrhea, chest pain
1337559	5/21/2021	IN	18	M	5/14/2021	5/18/2021	The patient was admitted to the hospital with chest pain, abnormal ECG, and elevated troponin. He underwent urgent cardiac catheterization, which showed normal coronary arteries. His left ventricular ejection fraction was reduced. His clinical picture was consistent with myocarditis.
1337251	5/21/2021	OH	67	M	4/15/2021	5/16/2021	To ED via ambulance for chest pain and shortness of breath. Decompensated during transport, hypoxic, cyanotic, hypotensive. Intubated in ED. CTA of chest positive for saddle embolism. 1/2 TPA/heparin given. Admitted to ICU. Change in mental status, CT of head showed intracranial hemorrhage. Patient had reportedly been sick about a week or 2 earlier, covid positive PCR on admission to hospital.
1337858	5/21/2021	FL	32	M	4/22/2021	5/18/2021	Chest Pain for 1 week leading up to event that got worse the day after 2nd vaccination. EKG with elevated ST levels from PCP same day - sent to ER same day.

1338137	5/21/2021	NV	52	F	5/14/2021	5/14/2021	Day of Vaccine Friday May 14 Almost immediately following the vaccine I had a severe headache and nausea. I was unable to eat anything the entire rest of the day. A few hours later I experienced severe diarrhea. Saturday May 15th Moderate pain at injection site Severe headache Moderate body aches Mild fatigue Moderate diarrhea Sunday May 16th During the day Mild pain and mild swelling at the injection site Moderate headache Moderate fatigue Sharp intermittent pain in both ears that lasted a few hours After bed I had a severe headache and moderate nausea that woke me in the middle of the night. I took tylenol and drank some gingerale. Monday May 17th Mild headache Mild fatigue Mild nausea Tuesday May 18th I was feeling ok with only mlid fatigue then later in the afternoon my heart started fluttering. My pulse kept dropping into the 40's then going high into the 120's. I was having chest pain's and my blood pressure was higher than normal. My oxygen level was good. Around 10pm my husband brought me to the emergency room. My BP was 181/98 when I arrived. They did an EKG immediately and said I had multiple PVC's. Then they did chest x-rays, a CT scan, blood work and an echo cardiogram. The heart monitor over the next few hours showed frequent PVC's and Bigeminy. They started me on heparin and admitted me. May 19th I was in the hospital and experienced a moderate headache and nausea. They continued the heparin and IV fluids and also gave me potassium. The PVC's continued but were less frequent. May 20th I was discharged from the hospital later in the day. I had a moderate headache and moderate nausea. The PVC's continued but less frequent. May 21st Moderate headache Moderate fatigue Moderate nausea I'm not thinking clearly and I'm having troubles concentrating. My headache woke me up at 2am and I could not get back to sleep until almost 3am when the tylenol finally took the edge off.

1337813	5/21/2021	IL	59	F	2/8/2021	5/11/2021	Patient presented to emergency department on 5/11/21 with report of worsening of shortness of breath and chest pain for previous one week. Patient reports that she had COVID-19 3 weeks ago and at that time was diagnosed with community acquired pneumonia. CTA performed in ED noted bilateral pulmonary emboli greater on the right than on the left. There was an embolus in the right main pulmonary artery with some evidence of right heart strain with RV/LV ratio 1.1. Peripheral ground-glass opacity in right lower lobe also noted. Patient treated with heparin. No thrombectomy performed as clot burden had decreased after receiving heparin. Patient was transitioned to Eliquis and discharged to home.
1334612	5/20/2021	WA	16	M	5/15/2021	5/16/2021	Chest pain, fever, headache and fatigue starting morning after vaccination. Progression of chest pain prompting evaluation in the emergency room where he was found to have a Troponin of 23,000 (nl less than 50). D'Dimer mildly elevated. ST changes on EKG. CTA negative. LFT mildly elevated. Sent to hospital where admitted to cardiology service pm 5/19 and given a diagnosis of myocarditis. Still under care at this time of report.
1334110	5/20/2021	WA	41	F	5/19/2021	5/19/2021	10:58AM Pt complains of heart rate "going too fast." Pt denies chest pain, SOB, dizziness or nausea. Vitals signs were obtained and pt was given water and juice. Pt reports "I feel fine except for my heart rate going fast." Aid (EMS) was called and attended to pt. Pt was cleared by EMS and was safe for pt to go home with her husband driving. Pt reported "I feel okay now." 11:15AM Pt reported a second time of feeling her heart rate "going fast again." Pt denies chest pain, SOB, dizziness or nausea. Aid was called and attended the pt. Pt remained alert and oriented, speech and gait at baseline. Pt skin warm and dry. Aid collected vital signs. Aid advised pt to seek medical attention if symptoms re-occur. Pt reports "feeling better" and agrees to seek medical attention if previous symptoms return. Pt driven home by her husband.

1334302	5/20/2021	CA	52	M	4/23/2021	4/24/2021	Within one day of receiving the 2nd shot started having heart palpitations in the middle of the night, Went to Urgent care, not help. Went back to hospital and a got a heartmonitor and wore that for a week. Thenon Friday, May 7th went to the emergency with sweats and almost passed out. They kept him there for over a day, ran tests, etc. Blood work came out fine. He was released the following day. No answers. One doctor there admitted that he believed it's related to the vaccine. Now here we are, May 20th, no answers and feeling the same, but now chest pain, shortness and breath. Never had ANY HEART PROBLEMS BEFORE THIS!
1334529	5/20/2021	CT	53	M	5/5/2021	5/13/2021	A 53-yo male patient with a nonsignificant past medical history presented to the hospital with worsening generalized muscle pain, and weakness. Patient reported that he received the Janssen COVID-19 vaccine 3 weeks prior to admission and symptoms began 8 days later. On the morning of admission the patient also developed pressure-like and pleuritic chest pain. EKG findings showed ST elevations in V5-V6 with depression in aVL. D-dimer was found to be elevated however PE evaluation was negative. Troponins were also found to be elevated. The patient was diagnosed with acute pericarditis and underwent left heart catheterization, selective coronary angiography and left ventriculography. The coronary angiography revealed no significant obstructive coronary artery disease, and left ventriculography revealed normal LV size and function. Patient was subsequently initiated on colchicine therapy for acute pericarditis. He remains admitted at hospital.

1334941	5/20/2021	FL	48	F	4/20/2021	4/20/2021	<p>arrhythmia; chest pain; felt like she had the flu; Body aches; fever; fatigue; arm began hurting; short of breath; This is a spontaneous report from a contactable consumer (patient). A 48-years-old female patient received bnt162b2 (BNT162B2), via an unspecified route of administration, administered in arm left on 20Apr2021 16:45 (Batch/Lot Number: ER8732) as 2nd dose, single for covid-19 immunisation. The first dose was received on 29Mar2021 (lot number: ER8730) on the left arm, and experienced sore arm and tired. Medical history included ongoing outbreaks on lips. Concomitant medication(s) included valacyclovir. Patient went to the emergency room on 21Apr2021 with chest pain that started on 20Apr2021. She was put through tests and the medical staff didn't know what was wrong and was discharged on 22Apr2021 and went back to the emergency room with chest pain on Friday, 23Apr2021. The medical staff could not figure out what was causing her chest pain during the second emergency room trip. Patient reported that the arrhythmia occurred when she got the chest pain on 20Apr2021. If she does any sort of activity, her heart rate skyrockets and her heart beats really super fast. She will become totally short of breath and feel like her lungs were burning. She experiences the arrhythmia and shortness off breath not even with exercise, but just activity within the house. On 21Apr2021, patient had a fever, body aches, and felt like she had the flu for 3 days following the second dose of the Covid-19 vaccine. She went back to the emergency room again at a different hospital on Thursday, 29Apr2021 until 30Apr2021. She was going to see a cardiologist this on 07May2021 because she can't do anything. Her chest pain didn't start off this way, but now the patient can't be active without having chest pain, arrhythmia, feeling like something is sitting on her chest, and shortness of breath. The chest pain was initially brought on by exercise, but as of time of report, if she moves around or does too much, the chest pain will be brought on. Symptoms have changed a bit as time has gone by. If she sits still not doing anything, she will be fine. If she takes a shower, walks around her house, walks upstairs, she will experience the chest pain, shortness of breath, and feeling like something is sitting on her chest. If she does absolutely nothing like an invalid, she's ok. Event chest pain resulted in physician's office visit. Patient had EKGs (21Apr2021, 22Apr2021,</p>

							23Apr2021, 29Apr2021 and 30Apr2021), a stress test (22Apr2021), CT of the chest (21Apr2021), CT of the heart and arteries on (30Apr2021), X-rays, and echocardiograms (22Apr2021 and 29Apr2021) which were all of the diagnostic tests have come back normal. There was no way that she could do a stress test now. Her fatigue began the day after she received the second dose of the Covid-19 vaccine on 21Apr2021. Fatigue was the most intense the first couple of days when she felt like she couldn't get out of bed but she still gets tired very easily. It was worse in the sense that now she has no fever and yet still can't function normally. Her arm began hurting on 20Apr2021 and was sore for about a week. Patient had covid-19 screening on Apr2021: negative. Outcome of the events of arrhythmia, chest pain, shortness of breath and fatigue was not recovered, while for the remaining events was recovered.
1335999	5/20/2021	AZ	16	M	5/16/2021	5/17/2021	Patient developed chest pain starting 3 PM on 5/17. Presented to a local ED for this on 5/18 and was found to have elevated troponin level. Transferred to a hospital with pediatric floor and was seen by a pediatric cardiologist. Echocardiogram notable for evidence of pericarditis but normal cardiac function. Given concern for development of arrhythmia, transferred to a hospital PICU. Chest pain was mild to moderate, stabbing, and was somewhat relieved by antiinflammatory therapy. He never had fever, chills, vomiting, diarrhea or rash. He had no ill contacts. He had no history of prior COVID nor did his family

1336007	5/20/2021	NJ	49	F	4/8/2021	4/8/2021	I received my vaccine at 5:35pm on Thursday 4/8/21. I started feeling arm soreness in both arms and developed a headache, I took Tylenol at 10pm. I woke up at 3am Friday morning with body aches and still had the headache. I took more Tylenol. By 9am Friday morning I had severe adverse reactions. I still had a severe headache and body aches with muscle soreness and extreme fatigue. I also experienced chills, light sensitivity and brain fog. Around 4:30 pm I developed chest pains that lasted about one hour. My headache, body aches and fatigue have not subsided as of today. I have had a televisit with my physicians office on may 10 where bloodwork. Some of my headaches rk was requested. The results showed elevated kidney function due to the amount of Advil I had taken to control the headache and muscle soreness. The recommended Tylenol did not alleviate my headache or muscle soreness so I have not taken either medicine. Some of my headaches have been accompanied with nausea and light sensitivity. I went for a physical exam on 5/18/21 and more bloodwork was requested. It has been 6 weeks and these adverse effects have not subsided.
1336040	5/20/2021	WI	17	M	5/13/2021	5/14/2021	About 18 hours after the vaccine was given, the patient developed chest pain. The chest pain progress over about 24 hours to 9/10. He presented to the ER where he was found to have elevated troponin (up to 15) and ST changes on EKG. Echo was normal x2. He was treated for myopericarditis with NSAIDs and colchicine. He quickly improved. No clear etiology of his myopericarditis was identified, raising suspicion that it may have been an adverse reaction to the vaccine.
1336042	5/20/2021		16	F	5/20/2021	5/20/2021	arrhythmia, heart palpitations, pain in left arm, pain in chest (particularly left side) radiating into shoulder blade, fatigue, muscle aches

1333629	5/20/2021	NY	16	M	5/12/2021	5/14/2021	Patient developed sudden onset of chest pain and shortness of breath worse with supine position. Patient went to the ER and ECG was done which was consistent with Acute Pericarditis. Patient was treated with Ibuprofen 600mg PO TID with resolution of his chest pain and SOB. patient was discharge home from the ER with cardiology follow-up 2 days later. Patient continues to have no chest pain or SOB and continues on Ibuprofen 600mg PO TID at this time. Repeat labs are pending.
1333689	5/20/2021	IN	21	M	5/7/2021	5/17/2021	Chest pain
1333699	5/20/2021	IL	35	F	4/30/2021	5/2/2021	2 days after vaccination (Sunday May 2) I began to feel slightly chest pain when I would breath on the upper left chest shooting downward to the bottom breast rib area. Every time I would take a deep breath I would feel the pain. Called loyola hotline to discuss and state worries I had. Pain continued the next day. Went to the loyola urgent care center Monday at about noon. Took EKG test there and everything seemed fine however they did mention my birth control and possible side effects. So they sent me to thenhospital for more test. Sent me to the ER. From the ER took several test and blood work. Another eck as well as D-dimer test, lots of blood work and a CT scan. Later that night I was told I had a pulmonary embolism (blood clot in my lung) and I needed to stay overnight. They continued to take addt. Exams the next day and more blood for test. Took a heart echo since pains were happening on my left side. As well as ultrasound on my leg to check for DVT and if more blood clots exist.. Addt. Test done that Tuesday, then was discharged Tuesday at about 5pm.

Problems; POA, (Principal) Sepsis, due to unspecified organism, unspecified whether acute organ dysfunction present, Yes, Essential hypertension Yes, Chemotherapy-induced peripheral neuropathy, Yes. Overview Signed 5/10/2019 2:03 PM by MD, Pins and needles and numbness in tips of finger and toes, Lung metastasis Yes. Hypoxia Yes. COVID-19 Unknown, Acute respiratory failure with hypoxia Yes, Palliative care encounter Not Applicable, Declining functional status No. DETAILS OF HOSPITAL STAY; Presenting Problem/History of Present Illness/Reason for Admission, Sepsis, due to unspecified organism, unspecified whether acute organ dysfunction present. Acute hypoxemic respiratory failure due to COVID-19, Respiratory failure. Sigmoid perforation with abscess. Hospital Course; 71-year-old male prolonged admission for acute hypoxic respiratory failure secondary to COVID-19. No history of colorectal adenocarcinoma with lung mets. Prior resection of bowel, prior chemotherapy. Required management in the ICU due to worsening respiratory failure over the time that he has been admitted to Hospital (20 days). He had remained on BiPAP therapy throughout that time, received appropriate corticosteroids, and antiviral therapies. Approximately 1-1/2 weeks ago he began to develop mild left lower quadrant abdominal pain. In the last 48 hours this is significantly worsened. CT abdomen and pelvis was obtained on Friday, which displayed pneumoperitoneum, sigmoid abscess with sigmoid perforation. There is a prior anastomotic site distal to this. Given his overall complexity he was to be medically managed to avoid the need for OR and intubation. He did well through the initial 24 hours of IV antibiotics, fluids and bowel rest. This afternoon he became increasingly dyspneic, required implementing nonrebreather mask, and subsequently developed severe rigors, tachycardia. I obtained a stat follow-up CT scan which shows similar findings of free air within the abdomen. Given signs of impending sepsis, BiPAP therapy was initiated, bolus IV fluids were given. Blood gas, blood counts, lactic acid are pending. He is receiving empiric Zosyn. I discussed this with general surgery, whom is well-known to the patient. In agreement the patient likely needs surgical intervention. However given his overall complexity and in light of the fact that this area surrounds the ureter, and

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

we do not have urology coverage. It was felt he was most appropriate to be managed in Hospital. Case was discussed with Dr. at Hospital, patient will be transferred there via air transit. At this time his blood pressure appears stable, he is tachycardia, is currently on BIPAP which will be transitioned to CPAP for transport. He has received several doses of Dilaudid, for improved pain control. No further advancement of airway was performed prior to discharge. Case was discussed with family at length, all risks and benefits of transfer were discussed with wife and patient. It is recommended to involve pulmonary critical care services including surgical ICU care as if requiring surgery he is high likelihood for prolonged vent needs. Operative Procedures Performed: Treatments: See above; Procedures: Na Consults: pulmonary/intensive care and general surgery. Pertinent Test Results: CT abdomen pelvis with contrast [3279871876] (Abnormal) Resulted: 04/25/21 1811. Order Status: Completed Updated: 04/25/21 1812. Narrative: PROCEDURE INFORMATION: Exam: CT Abdomen And Pelvis With Contrast, Exam date and time: 4/25/2021 17:36, Age: 71 years old, Clinical indication: Abdominal pain; Additional info: Sepsis, bowel perf. HX of Covid19 +, malignant colon with lung metastasis. Bowel perf. TECHNIQUE: Imaging protocol: Computed tomography of the abdomen and pelvis with contrast. Radiation optimization: All CT scans at this facility use at least one of these dose optimization techniques: automated exposure control; mA and/or kV adjustment per patient size (includes targeted exams where dose is matched to clinical indication); or iterative reconstruction. Contrast material: 350 OMNI; Contrast volume: 80 ml; Contrast route: INTRAVENOUS (IV); COMPARISON: CT ABDOMEN PELVIS W CONTRAST 4/23/2021 16:46, FINDINGS: Tubes, catheters and devices: Catheter terminates in the right atrium in satisfactory position. Lungs: Moderate airspace opacities throughout the lung bases are similar to prior and consistent with Multilobar pneumonia consistent with the history. Liver: No hepatic masses. Gallbladder and bile ducts: Cholelithiasis. Pancreas: No ductal dilation. No masses. Spleen: No splenomegaly or focal lesions. Adrenal glands: No mass. Kidneys and ureters: 10 mm benign left renal cyst, no follow-up necessary. No renal masses or Hydronephrosis bilaterally. Stomach and bowel: Redemonstration of

perforated proximal sigmoid diverticulitis. Small pneumoperitoneum is stable. Predominantly gas containing, 25 x 28 mm collection adjacent to the inflamed sigmoid colon similar to prior; a fistulous tract extends toward the midline containing gas and fluid, with suspected fistula to adjacent loops of small bowel. Moderate to severe descending and sigmoid diverticular burden. Minor right diverticular burden. No small bowel obstruction. A somewhat clumped appearance of small bowel in the right lower quadrant near the colon enteric fistula. Appendix: No evidence of appendicitis. Intraabdominal space: Mesenteric edema around the small bowel, slightly increased, however no new mesenteric collection. There is no extravasation of enteric contrast into the collection adjacent to the sigmoid colon. Vasculature: Mild aortoiliac atherosclerosis. Lymph nodes: No significantly enlarged lymph nodes. Urinary bladder: Unremarkable as visualized. Reproductive: Unremarkable as visualized. Bones/joints: Degenerative changes in the spine. Multilevel disc space narrowing. Multilevel central canal and neuroforaminal stenosis in the lumbar spine. No acute fracture or subluxation. Soft tissues: Small fat-containing right inguinal hernia. Small fat-containing left inguinal hernia. Large ventral abdominal hernia containing gas, which has replaced the previous contents of fat and bowel loops. Volume increased compared to prior. IMPRESSION: 1. Redemonstration of perforated proximal sigmoid diverticulitis. Small pneumoperitoneum is stable. 2. Similar perisigmoid collection; colon enteric fistula, probably at least subacute in duration. The perisigmoid collection is prominently gaseous and there is no frank abscess. 3. Suspected mild enteritis the small bowel loops or loops associated with the fistula. No obstruction. 4. Additional findings as described are similar to recent prior imaging. COMMENTS: Any incidental renal lesion less than 1 cm or classified as too small to characterize, or any incidental cystic renal lesion characterized as simple-appearing, is likely benign. No follow-up imaging is recommended for these lesions per consensus recommendations based on imaging criteria. Active Problems: Malignant neoplasm of sigmoid colon. Sepsis, due to unspecified organism, unspecified whether acute organ dysfunction present COVID-19. Perforated viscus. DETAILS OF HOSPITAL STAY Presenting Problem/History of Present Illness/Reason for Admission Respiratory failure, acute, Hospital Course; Patient is a 71 yr.. male with history of metastatic colorectal adenocarcinoma with lung metastases, prior bowel resection and chemotherapy. The patient initially tested positive for Covid in early March. His symptoms at that time are mild and resolved. He was later vaccinated and that month. He started having severe symptoms again on 4/3 for which he presented to Hospital. Since that time, he has received full course of Remdesivir and steroids.

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

He had a CT scan performed on 4/23 which revealed pneumoperitoneum secondary to presumed perforated sigmoid diverticulitis with focal sigmoid abscess. Patient was weaned down to minimal nasal cannula settings but somewhat suddenly earlier on 4/25 patient had increased work of breathing, became tachycardia, and had rigors. Hospital ordered repeat CT scan which showed similar findings in the abdomen. Patient had been maintained on Zosyn. Repeat labs were sent which were largely unremarkable. Given concerns for worsening sepsis and potential need for surgery, he was subsequently transferred Hospital. On admission to hospital, he had a normal lactic acid and no leukocytosis. He did not have evidence of peritonitis. The decision was made to treat his diverticulitis conservatively. However, early on 4/26 the patient started to develop a lactic acidosis. An extensive discussion was had with the patient and his wife regarding surgery and the possibility the patient may never be able to separate from the vent given his worsening Covid pneumonia. The patient elected to undergo an exploratory laparotomy with with segmental resection of distal descending and loop transverse colostomy. However, as the days progressed the patient had worsening respiratory status that required deep sedation, paralytics and proning all of which were unsuccessful in maintaining his oxygen saturation greater than 88%. His wife, knowing that he would not want to have a prolonged course on the ventilator, elected for transition to palliative extubating with comfort care on 4/30 and the patient expired roughly 10 minutes after extubation.

1333759	5/20/2021	FL	79	F	4/5/2021	4/7/2021	My mom, patient was a health 79 year old women, only two health issues were COPD and moderate dementia. She had even gotten her annual labs done recently which came back all with in normal range, she as far as we knew did not have any issues with her heart. After her first vaccination in March she started to lose interest in things and didn't have energy to be as active as she was. After the second shot with in two days she started to report pain in chest and head and trouble breathing, She went to her PCP on 5/12 and he wanted her to go to a cardiologist, this referral was made but by the 16th she was in the ER due to extreme chest pain and trouble breathing, a stent was placed in her heart on 4/17/21 my mom's 80th birthday. with in 4 days she died. Her heart just deteriorated. i feel that if she didn't get this shot she would be alive today, she was healthy, now she is dead.

1333926	5/20/2021	CT	24	M	4/14/2021	4/17/2021	<p>24-year-old male with no prior medical problems presents for evaluation of chest pain. Patient complains of midsternal chest pain that started approximately an hour ago. He states that it woke him up from sleep. Pain is sharp without any radiation or other associated symptoms including diaphoresis presyncopal symptoms or palpitations. He denies any significant air hunger or shortness of breath. He otherwise had been feeling better after what he tall was post COVID vaccine symptoms. Patient received a 2nd dose of pfizer vaccine 3 days ago. He states that within 24 hours he had symptoms of myalgia fever and feeling unwell. That has been resolving patient has been feeling better until the chest pain today. Patient otherwise denies any other medical problems in. He denies any history of drug use including any recent cocaine or other drug abuse. Elevated cardiac enzymes and chest discomfort are likely secondary to myocarditis and secondary to vaccination/ inflammatory reaction. Although there is low likelihood of obstructive coronary artery disease as well. I recommended cardiac catheterization for clarification. He does not want to have the procedure done, understands the risk of undiagnosed coronary artery disease and risk of MI. He would like to be discharged home. I reviewed the images of echocardiogram and it seems that he has a small area of hypokinesis in infero basal segment. Recommended to take aspirin and be seen in Cardiology office in 2 weeks. Advised to abstain from exercise and significant physical activity till that time and return to the hospital if any symptoms.</p> <p>Subjective: I saw patient in consultation for evaluation of chest pain and elevated cardiac enzymes. Patient is a 24-year-old healthy male who had COVID-19 vaccination with his second Pfizer shot 4/14/21. He developed fever, chills, nausea and vomiting 1 day after vaccination. He did not have any reaction to the 1st dose. He presented to the hospital with substernal chest discomfort which woke him up from sleep, radiated to throat and had a throbbing feeling. This lasted for 1 to 2 hours and subsided completely in the hospital. He smokes 5 cigarettes a day, is physically very active and exercises regularly. He is not on any medication at home.</p>

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1333963	5/20/2021	FL	27	M	5/10/2021	5/13/2021	<p>Starting at about 5pm on the day of vaccination, I experienced intense but expected side effects including full body muscle ache, fever, drowsiness, cold sweats, joint pain. These symptoms lasted for about 24hrs before subsiding completely by that Tuesday evening. On Thursday, 5/13, I woke up with moderate tightness in my chest that progressed over the course of 45 minutes to be severe chest pain. At that point, my wife drove me to the ER in where I was checked in at about 8:30am. By the time I was checked in the chest pain had subsided to be just a slight discomfort, overall the chest pain had lasted for approximately 2 hours. At the ER my bloodwork was done and the initial blood samples returned an elevated Troponin I level of 5.04 ng/ml. While at the ER at the I experienced one more incident of chest pain which lasted roughly 30 minutes and was moderately low on the pain scale. I was given multiple EKGs, X-rays, and Echocardiograms, all of which showed no abnormalities. Repeated troponin tests however showed an increase in my levels over the course of the day from 5 up to 12.6 and 13. I was placed on a heparin drip in the afternoon. By doctor recommendation I was air-lifted to later that night at 10:30pm so that further scans and a possible cardiac catheterization and CT scans. The following day, Friday, at 1am at my bloodwork was taken and troponin levels had increased to 14. I was scheduled for a CT scan, cardiac MRI, and echocardiogram to confirm the diagnosis of Myocarditis. By Saturday afternoon I was taken off of the heparin drip and told that they would not be able to perform any of the scheduled tests until Monday at the earliest. My most recent troponin level came back as a 9. At this point I decided to check myself out of against medical advice since they were not able to run the necessary scans and my wife and I do not live in . I returned home to and followed up on 5/19 with a doctor at the ER at since I was unable to find any available appointments with any cardiologists in the area for the next few weeks. My troponin levels and EKG taken at came back as normal, so I continue to follow doctor advice of bedrest and no alcohol for the next 4-6 weeks. My pulse is still elevated (roughly 85 bpm resting when it used to be at <65 bpm resting) and seems to easily increase with even moderate activity such as walking in the house up to over 100 bpm.</p>

1333710	5/20/2021	CT	23	M	5/15/2021	5/18/2021	Course of the Hospitalization: 05/18/2021 Today the patient was seen examined. Patient denies any chest pain, shortness breath, nausea, vomiting or diarrhea. Patient is in good spirits such time. Patient has any changes to vision/hearing/taste/smell. Patient will follow-up with his cardiologist from the hospital. Patient was told if he any discomfort in his chest, changes to vision/hearing/taste/smell go immediately to emergency room for further workup and evaluation as necessary. Patient was discharged on Pepcid 20 milligrams to be taken twice daily for next 14 days. Side effects, risks, benefits of medications discussed great length. I asked the patient to discuss with the pharmacist any questions comments or concerns he may have both this medication as well. Admitting ER Note: 23-year-old male presenting to emergency department for evaluation of chest pain. Reports pain started 2 nights ago. He received his 2nd COVID vaccine early Saturday morning, by Saturday night started having symptoms including chest pain. Other symptoms resolved the chest pain has persisted, and waxing and waning. Was seen at urgent care and found of ST elevations on EKG and sent to emergency department. While here in the ED again found to have ST elevations in anterior leads with reciprocal changes inferiorly. Troponin elevated to 11. Bedside echocardiogram performed by myself and cardiologist negative for tamponade or significant hypokinesis. Patient will require admission for further management and evaluation.

1332359	5/20/2021	AR	62	M	3/1/2021		CARDIAC ARREST (SEVER CHEST PAIN); CLOGGED VEIN; LEFT ARM GOES TO SLEEP; This spontaneous report received from a patient concerned a 62 year old white male. The patient's past medical history included blood clot, heart attack, lump in leg, and stents in main arteries, and concurrent conditions included heavy smoker, and heart issues. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1808025, expiry: UNKNOWN) dose was not reported, 1 total administered on 12-MAR-2021 to left arm as prophylactic vaccination. The patient was previously treated with clopidogrel bisulfate for blood clot. On an unspecified date in 2021, Laboratory data included: Echocardiogram (NR: not provided) unknown, and Lab test (full workup)(NR: not provided) unknown. On an unspecified date in Mar-2021, a week later vaccination, the patient experienced that left arm went to sleep which felt worse next day, on 25-APR-2021, patient experienced severe pain in chest, called ambulance and was taken to hospital. On same day patient was hospitalized. Patient went to full cardiac arrest twice same day. It was stated that vein that was 60 percent good earlier was 100 percent clogged (clogged vein) in one month after getting the vaccine. They tried to put stent in, clear vein out, and put piece of metal and expanded it, to make alley way for blood flow. Patient stated that patient would not take Plavix this time. According to patient, stent was reacting with Plavix, and decided to take something different. They did same job twice. It was stated that patient was discharged on 05-May-2021 from hospital. On 12-MAY-2021, patient went to consult the health care professional to make sure everything was okay. The patient gave lot number 1808025, then stated that, patient thinks it is 180, and then either 5 or 8, and next it was either D or 0, and then after the space it is 25. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of the cardiac arrest (sever chest pain), left arm goes to sleep and clogged vein was not reported. This report was serious (Hospitalization Caused / Prolonged).; Sender's Comments: V0: 20210523134-COVID-19 VACCINE AD26.COV2.S-CARDIAC ARREST (SEVERE CHEST PAIN), CLOGGED VEIN. This event(s) is considered not related. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							scientific plausibility. There are other factors more likely to be associated with the event(s) than the drug. Specifically: MEDICAL HISTORY, UNDERLYING DISEASE
1333696	5/20/2021	CT	23	M	5/14/2021	5/16/2021	23 y.o. male with no pmhx however did receive 2nd pfizer COVID vaccine 5/14/21 and began to experience fevers, body aches, and chills as of 5/15/21. He did have prn ibuprofen with good effect however 5/16/21, he experience anterior chest pressure that radiated into his back prompting his mother to bring him to the ER. He had negative EKG for acute ischemia however troponin 14.2 on lstate and 9.2 on lab work. Otherwise lab work unremarkable. Bedside echo w/ ERP w/ intact wall motion (Reported). No other recent illnesses or complaints. Low grade fever in ER. Patient did endorse palpitations w/ fever and his mother reports a pulse ox that read a HR of 122 at time of complaint. He is SR in ER. No further reported palpitations. Laying flat comfortable. No dyspnea Hospital Course: # myocarditis likely related to pfizer vaccine. Chest pain and fever now resolved. Noted to have elevated troponin at 14 with repeat is trending down. Abnormal EKG likely secondary to myocarditis . He was admitted with telemetry monitor without significant event. Was seen in consultation by Cardiology. Echocardiogram unremarkable. Underwent cardiac catheterization without occlusive disease, see report. He was advised to avoid NSAID, no strenuous physical activity. Follow up with Cardiology in 2-3 weeks.
1332424	5/20/2021	AZ	31	F	5/14/2021	5/14/2021	Heart pain 3-4 hours after injection. Heart pain subsides 13 hours after injection. Chest pain center near sternum, chest tightness in center of chest 8 hours after injection. Chest pain is ongoing since injection and is now day 5. The chest pain worsens when lifting heavy objects, bending over, and laying down.

1333197	5/20/2021	CA	16	F	5/15/2021	5/16/2021	<p>Patient received first dose of Pfizer vaccine (lot EW0170) on 4/24/21 at University and received 2nd dose of Pfizer vaccine (lot EW0182) on 5/15/21 also at University. Came to hospital ED on 5/16 AM with diagnosis of acute chest pain, acute dehydration, and adverse reaction to vaccine administration. Was discharged to home and returned to ED on 5/17/21 for continued chest pain (central, throbbing, non-radiating chest pain). Medical tests and laboratory results revealed elevated troponin level (1.546 at peak, then declined to 0.585 prior to discharge home). Patient was admitted to PICU for close monitoring. CT angiogram of chest was negative, chest x-ray was negative, EKG showed normal sinus rhythm, echocardiogram was done and it was a normal study. Dr. discussed with the cardiology department at Hospital. Possible myocarditis due to vaccine. COVID-10 IgG IgM antibodies were positive for the patient which indicates good efficacy of the vaccine. Patient to have follow-up with outpatient pediatric cardiology Dr. Discussion with father on 5/20/21 indicates that patient's symptoms were improving.</p>

1332563	5/20/2021	MN	32	F	1/28/2021	1/28/2021	<p>her period is now 11 days late; tired; stabbing shocks in her chest (chest pain) that lasted for 3 hours; heart started to pound; she had a metallic taste in her mouth; face was numb and warm; face was numb and warm; heart rate at 160 bpm; her mouth/tongue felt itchy; her mouth/tongue felt itchy; throat felt itchy; lips numb; This is a spontaneous report from a contactable consumer (patient) from a Pfizer Sponsored Program. A 32-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), dose 1 via an unspecified route of administration, administered in left arm on 28Jan2021 16:00 (lot number: EL3247) at the age of 32 years old, as 1ST DOSE, SINGLE for COVID-19 immunisation. Medical history included asthma from 3 years, allergies (all her life), Chiari malformation from 10 years, vocal cord dysfunction from 3 years, Vitamin D low, constipation and Ferritin low. Concomitant medications included albuterol [salbutamol] (ALBUTEROL) taken for asthma; clarithromycin (CLARITIN) taken for allergies; iron taken for ferritin low; magnesium taken for constipation; and vitamin d [vitamin d nos] (VITAMIN D) taken for Vitamin D low; all taken from an unspecified start date and ongoing. The patient reported she had the first dose of the Pfizer COVID 19 vaccine on 28Jan2021 at 16:00PM in the left arm. About 10 minutes into her wait period (28Jan2021), her heart started to pound; her lips numb and face went numb and warm; she had metallic taste in her mouth; and her mouth/tongue and throat felt itchy. She went up to the nurse to tell her about her symptoms and they hooked her up to an O2 monitor that showed her heart rate at 160 beats per minute but her O2 was okay, it was not under 97%. She was given a generic form of Zyrtec. They monitored her for an hour and her heart pounding stopped. The metallic taste was very brief, and lips and face numbness, and mouth and throat felt itchy all resolved that same day. The next day (29Jan2021), she was tired. Then about 50 hours after the shot, in the night on the 29Jan2021 to 30Jan2021 she started getting weird stabbing shocks in her chest (chest pain) that lasted 3 hours. She would wake up with the pain and then fall back to sleep. It happened several times for a few hours then went away. Lastly, she added that she never ever misses her period but now she is two weeks late (also reported as 11 days late) and she is not</p>

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

pregnant. She expected her period to start on 02Feb2021. She did visit her allergist before getting the vaccine and he said none of her allergies were related to any of the ingredients in the shot. Then she saw the allergist again after the shot and the allergist didn't think she needed to be concerned as the allergist said her symptoms are not in line with an anaphylactic reaction. She is planning to receive the second dose of the vaccine on 18Feb2021. Outcome of the event 'stabbing shocks in her chest (chest pain)' was recovered on 30Jan2021. Outcome of 'her period is now 11 days late' was recovered on unspecified date. Outcome of tired was recovered on 29Jan2021, while outcome of the remaining events was recovered on 28Jan2021.

1332734	5/20/2021	PA	59	F	3/22/2021	4/18/2021	Cardiac arrest; Heart attack; complete heart block; Chest pain; This is a spontaneous report from a contactable nurse (patient). A 59-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular on 22Mar2021 (Lot Number: EN51318) as 2nd dose, single for COVID-19 immunization. The patient previously received the 1st dose of bnt162b2 on an unspecified date (Lot Number: EL9269) for COVID-19 immunization. There were no medical history and concomitant medications. The patient reported her dramatic health change after she had the vaccine. On 18Apr2021, the patient end up in the emergency room with a heart block. She went to the emergency room with chest pain. Patient stated that it was more than chest pain. It was a complete heart block. The patient almost died. The patient was in the hospital for a week in intensive care unit. the patient was hospitalized from 18Apr2021 due to heart attack, heart block, and cardiac arrest, occurred on 18Apr2021. The patient received treatment for the events which included pacemaker in her chest. Outcome of the events was unknown, reported as being managed. Causality assessment by the reporter was reported as yes.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported heart attack, heart block, and cardiac arrest, and the administration of the suspect, COVID 19 vaccine, BNT162B2, based on the reasonable temporal association and lacking alternative explanations. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

1332858	5/20/2021			M		5/1/2021	just admitted to the hospital with chest pain; This is a spontaneous report from a contactable consumer (patient's relative). A male patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19, Batch/Lot number and expiration was not reported via an unspecified route of administration on an unspecified date as second dose, single for covid-19 immunisation. The patient medical history and concomitant medications were not reported. The patient got received the Pfizer COVID vaccine second dose recently and he was just admitted to the hospital with chest pain on an unspecified date in May2021. They did a heart catheterization and found that they didn't feel that the patient had any blockage, and they were keeping him in hospital for monitoring and that for the reporter had information of the heart, but didn't have much details. The patient just had been kept in hospital for administration through the weekend. Currently, the patient was still in hospital. The outcome of the event chest pain was unknown. Information related to batch/Lot no. was requested.
1333178	5/20/2021	HI	19	M	5/15/2021	5/19/2021	After having the shot, he developed left arm pain and did develop some lymphadenopathy in his left axillary region. He was dealing with nausea and dizziness, and the following day, he went to work, although he was feeling a bit ill. While at work, he was found to have a fever, so he was sent home. He has been having hot and cold flashes since then. He has had a poor appetite. He has had a dry mouth and trouble sleeping. One day prior to admission, he then developed a chest pain that became constant and persisted, so he came into the emergency department on 05/19/2021 for further care. He has developed myocarditis after receiving the first of his Moderna Coronavirus Disease 19 vaccines.

A 68-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), via an unspecified route of administration, administered in left arm on 15Mar2021 19:30 (Batch/Lot Number: 1621146-00) (at the age of 68 years old) as 1st dose, single for COVID-19 immunization. The patient had no other medical history and concomitant medications were not reported. The patient previously took polyethylene glycol and had known allergies to the medication. No other vaccine in four weeks. The shot given was at 19:30. At midnight (16Mar2021 12:00 AM), the patient woke up with severe chest pains. She thought she was having heart attack. It was severe gas (Gas in chest) and cramping. The patient had this almost daily for 2 weeks. She had nausea for one week. The patient reported that she never experienced this in her life and still happens at least once a week. There has been no change in her diet before or after the vaccination. Events usually will be relieved within 2 hours after taking GasX. No COVID prior vaccination and patient had not been tested for COVID post vaccination. The outcome of the events was recovering. No follow-up attempts are possible. No further information is expected.
1332411	5/20/2021	CA	47	F	4/27/2021	4/27/2021	Patient reports that during observation period status post vaccine she experienced lip swelling, tongue thickness and difficulty breathing. She denied symptoms other than ear redness and swelling to EMT following dose stating she did not want to be given Benedryl because she drove herself to the site for her vaccine. EMTs observed client and assessed for ear redness, vital signs were stable and client left the site after a 45 minute observation status post first vaccine. Client denied chest pain, dizziness and reported a headache later that evening that lasted 2 days. Client stated symptoms resolved on their own. She denied any other past medical history and stated she had anaphylactic allergies to gluten and latex.

1331123	5/19/2021		13	F	5/18/2021	5/18/2021	Client received the COVID vaccine (Pfizer dose 1, lot # EW0185, expiration date 5/22/2021) at 2010. The client's father accompanied her, and reported to EMT at 2022 that the client was "hearing echoes." RN, EMT, and another EMT responded at that time. Per the vaccinating RN, the client had stated that she is afraid of vaccinations and has felt dizzy with previous vaccinations, but the client deferred using the zero gravity chair previously. The client's skin was pink, warm, and dry; she was alert and oriented. She denied dizziness, shortness of breath, chest pain, nausea, or any changes in breathing. At 2026, the client's vital signs were as follows: heart rate 66, O2 98, respiratory rate 24, blood pressure 80/50 (using an adult cuff that was too large for the client). The client's pulse was normal. The client stated that "this usually happens with shots" and endorsed feeling anxious. The client was transferred to the zero gravity chair at this time and denied any dizziness with the transfer. The client's father stated that the client has no allergies or medical conditions, and that she takes no medications. The client stated that she ate lunch but no dinner today. The client was offered water to drink at this time. The father of the client deferred taking benadryl at this time. At 2030, the client stated that all her symptoms had resolved. She appeared to be sitting comfortably in the zero gravity chair and continued to drink water. Education provided regarding recommended observation time, activation and emergency management, and primary care follow up. At 2035, the client was able to stand up without any dizziness, denied any return of the "echoes" or ringing in her ears, and ambulated around the room with a steady gait. Vital signs were as follows: blood pressure 82/60 with an adult cuff, respiratory rate 22, pulse 64, O2 99. At 2040, the client reiterated that she felt "back to normal." Both the client and her father denied any further questions. The client ambulated to her car with a steady gait, and was driven home by her father.

Yes COVID-19 Yes Anemia, normocytic normochromic Unknown HPI: 81-year-old female with reported myasthenia gravis diagnosed with myasthenia gravis in 2016 noted 5 weeks after finding to have difficulty swallowing and breathing requiring intubation had Plex during admission she was subsequently placed on CellCept and prednisone for long-term but was subsequently weaned off and now follows with neurology Dr., history of thoracic stenosis neck arthritis, Hashimoto's thyroiditis hyperthyroidism on methimazole, heart failure with LVEF of 45%, and atrial fibrillation on Coumadin and rate control agents following with Cardiology who presented to the Hospital on 03/22/2021 with acute hypoxic respiratory failure. The patient reportedly received her Pfizer first vaccine [per patient's son unclear date-but was reported to be due for her second vaccine at the end of this month] and subsequently was found to have fevers and chills on Saturday for which she went to urgent care and was found to be COVID-19 positive for which she was recommended for Tylenol and supportive care. On 03/22/2021 it was reported that she was found by EMS to have acute hypoxic respiratory failure with oxygen saturation in the 50s unclear for how long this had occurred for for which patient was emergently intubated. There was a concern for possible aspiration as well given unclear how long she was hypoxic for for which she was started on cefepime and vancomycin protocol. Procalcitonin level was ordered. Hospital Course: Please see in details from H&P initially from critical care since patient was being they are almost 22 days. There is multiple consult including cardiologist palliative care note as well as urologist consult note In briefly this is a very pleasant 81-year-old female she had a history of myasthenia gravis currently treated with Dr. not in medication now for myasthenia gravis chronic atrial fibrillation long-term use of anticoagulation Coumadin history of toxic goiter currently on methimazole she was admitted initially on March 22 because she was having chills fever shortness of breath and EMS found that she is having acute hypoxic respiratory failure oxygen saturation is only 50% and emergently intubated admitted in critical care unit. Patient was intubated on March 22 meanwhile patient has a complicated series whilst she was in ICU. She was treated twice for septic shock she

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

was treated first Covid pneumonia respiratory failure with possible aspiration. She was unable to extubate almost 19 days. Eventually she was extubated on 1 April 9. After that patient initially on BiPAP and then she tolerated nasal cannula successfully currently 3 L of oxygen. Meanwhile because of sepsis aspiration pneumonia COVID-19 pneumonia respiratory failure patient was treated with and also urinary tract infection patient was treated with multiple antibiotic vancomycin and Maxipime. For COVID-19 pneumonia she also was treated for tract residual normal. And also Decadron. Patient was not a candidate for remdesivir at that point. After extubation patient, up very slowly patient was transferred to PCU because of tachycardia and hypotension unable to thread beta-blocker digoxin and Cardizem the medication was adjusted pretty slowly patient was started Lovenox injection for bridging Coumadin Coumadin was initially hold been longtime and then after Lovenox injection and Coumadin was started patient currently INR is 1.9 today. She was Coumadin been longtime because her Chad vascular score was high she also had a history of congestive heart failure in addition of chronic atrial fibrillation heart rate is fluctuated in the range of 80-120. She is currently on digoxin we will continue digoxin she is currently on Toprol which started 50 mg and currently 100 mg Toprol she also have a Cardizem with splitting the medication 120 mg p.o. twice daily. Heart rate is better controlled today blood pressure is low borderline this patient need to be watched even in the nursing home for further evaluation of medication adjustment. She also mentioned that she is having chronic hypokalemia potassium was replaced alert here and so then started potassium 20 M EQ p.o. twice daily may need to further adjustment and follow-up potassium in the nursing she she was tachycardic heart rate in module was started recently as 7 days ago now her heart rate is much better now this patient need to see endocrinologist also to follow-up. Patient was complicated with urinary retention and continue straight cath and finally ended up with Foley's catheter this patient must need to evaluate by urology for further evaluation of chronic urinary retention. Meanwhile patient clinically stable vitals are good she does not have any fever shortness of breath tolerable with 3 L of oxygen now she does not have any chest pain she is not in any

1331441	5/19/2021	IN	25	M	5/12/2021	5/13/2021	Pericarditis. Initial symptoms were noticeable upon waking up the morning after receiving the vaccine, ~ 20 hours after vaccination. Initial symptoms: extremely elevated heart rate (~160 bpm). Heart rate fell to more reasonable, but still high, ~120 bpm after 2-3 hours. Roughly 36 hours after vaccination, began noticing soreness in the chest. Upon waking the following day (~48 hours after vaccination), chest soreness had progressed to pain (rating: 4/10), which remained roughly 6 hours to roughly 1400 that day, when the pain subsided along with all symptoms. Later, at roughly 2000 the same day (~58 hours after vaccination), there was a sudden and extreme flair up of chest pain (rating: 8/10) which radiated down the inside of both arms, this lasted 1.5 hours and then subsided just as suddenly as it came on. I went to sleep, then was woken up by another extreme episode of pain (rating: 7/10) at 0230 the morning of 15 May, again extreme chest pain radiating down both arms.
1331836	5/19/2021	NJ	59	M	5/13/2021	5/14/2021	Received first vaccine 4/21/21. Within two days started having tightness in chest, but no other adverse reactions, happened a couple times a day. 5/13/21 received second vaccine....had tightness two more times, then 5/14:22 evening had a heart attack....ambulance to Hospital. 99% blockage in LAD. Hospital inserted stent. Spoke with all of the Cardiologists about my concerns as Heart problems ?Do not? run in my family. I have always had excellent blood pressure and low cholesterol....my father is 86 and was a smoker, and never been on blood pressure medication, same with my late Grandfather. I've ?never? had any type of chest pains in my life. Also, I am retired military and have had numerous vaccines, with no issues. The hospital cardiologists said that I could report this, but they believe the Heart attack is due to the fact that I smoke....I just don?t believe that....the Heart Attack occurred 36 hours after my second vaccine!!!

1331551	5/19/2021	IL	39	M	5/19/2021	5/19/2021	Patient discharged denied any adverse affects, was turning to walk out of event and fell to the floor. This was a witnessed fall, but he appeared to just bend at the knees and folded on to the floor without hitting head or losing total consciousness. Vital signs stable throughout observation, cool cloths applied to forehead and neck, feet elevated A & O xs 3 at all times. Within 15 minutes patient was placed in a sitting position, given fluids and a complex carbohydrate. Patient states he felt he was back at his baseline except for being tired. Patient remained for 45 minutes total, left with coworker with intent to return to supervisor and was going to go home. Walked patient to his vehicle, gait was steady, patients friend drove the vehicle. Pt advised to follow up with PCP if any symptoms return and to call 911 for an SOB, hives, chest pain or swelling of throat. Pt verbalize teaching.
1331832	5/19/2021	KY	20	M	4/22/2021	4/23/2021	Patient presented with substernal pressure like chest pain within 1 day of his second Pfizer vaccine associated with fatigue and dyspnea on exertion. He was found to have markedly elevated troponins without EKG changes. He was admitted to the hospital for evaluation and monitoring where cardiac MRI showed myocardial inflammation consistent with myocarditis. There was no other apparent cause based on patient's history. He was found to have a reduced ejection fraction on echocardiogram as a result of his myocarditis. He continued to have dyspnea on exertion at discharge.

1331323	5/19/2021	PA	70	F	3/11/2021	3/19/2021	ED to Hosp-Admission Discharged 3/26/2021 - 4/5/2021 (10 days) Last attending ? Treatment team Sepsis Principal problem Discharge Summary Inpatient Discharge Summary BRIEF OVERVIEW Admitting Provider: Discharge Provider: Admission Date: 3/26/2021 Discharge Date: 4/5/2021 Discharge Diagnosis Severe sepsis COVID-19 pneumonia Acute hypoxic respiratory failure Atrial fibrillation/atrial flutter with RVR DETAILS OF HOSPITAL STAY Presenting Problem/History of Present Illness/Reason for Admission patient is an 70 y.o. female with a past medical history of atrial fibrillation chronically anticoagulated with Xarelto, S/P ablation x3 at the Medical Center, and sinus bradycardia who presented to the ED for evaluation of general malaise, shortness of breath, loss of taste and smell, coughing, and shortness of breath and was found to have sepsis due to COVID-19 pneumonia in the ED. Patient states that over the past week she has been extremely weak, with nausea, diarrhea, but denies vomiting. She also reports that her appetite has decreased and noted that the symptoms has worsened and as a result she presented to the ED for further evaluation. Patient denies abdominal pain, lightheadedness, or chest pain. Upon further evaluation and tests in the ED, she was noted to have severe sepsis as indicated by vital signs and chest x-ray imaging indicating groundglass pneumonia typical of COVID-19 infection. She also had COVID-19 swab which returned positive result. Additionally, patient was noted to be hypoxia with SPO2 of 88% requiring oxygen supplementation. Hospital Course patient was admitted to a Hospital due to shortness of breath, with fatigue and weakness, and was found to have severe sepsis with endorgan damage of acute hypoxic respiratory failure due to COVID-19 pneumonia on admission. Imaging study showed no evidence of PE, but did show evidence of bilateral pulmonary infiltrates. Pulmonary was consulted, she was started on remdesivir with Decadron. She had an increase in oxygen requirement to the maximum of 10 L via specialty nasal cannula during the admission. With the treatment of remdesivir and Decadron she had improvement in her hypoxia, and was ultimately weaned to room air by the time of discharge. She underwent a desaturation study on the day of discharge and determined that she did not need any

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

supplemental oxygen. She completed her entire steroid and remdesivir course during the admission. She had no evidence of superimposed bacterial pneumonia. Her hospitalization was complicated by atrial fibrillation/flutter with RVR, that improved with metoprolol administration. This was thought to be precipitated by her severe hypoxia with acute illness. She was kept on metoprolol 25 mg twice daily on discharge, and will need to follow-up with her cardiologist at Medical Center to determine if she can come off of this again. She will continue to take her Xarelto as previously prescribed. She was medically stable for discharge on 4/5 in stable condition, and will need to follow-up with PCP within 7 days, with cardiology within 2 weeks at the hospital, and pulmonary within 2 weeks as well.

1329571	5/19/2021	FL	35	M	5/7/2021	5/8/2021	myocarditis; Chest pain; This is a spontaneous report from two contactable consumers (one is patient himself and the other one is patient's wife). A 35-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), dose 2 via an unspecified route of administration, administered in Arm Left on 07May2021 15:30 (Batch/Lot Number: EW 0171; Expiration Date: Aug2021) as 2nd dose, single for covid-19 immunisation, at a public Health Department. The vaccine was not administered at Military Facility. No additional Vaccines Administered on Same Date of the Pfizer Suspect. The patient's medical history included known allergies: Sulfa. No family Medical History Relevant to events. There were no concomitant medications. There was no other products. The patient did not receive any other medications within 2 weeks of vaccination. For historical vaccine, there was no prior vaccinations within 4 weeks aside from first dose: bnt162b2, dose 1 intramuscular administered in Arm Left on 16Apr2021 15:30 (Batch/Lot Number: ER 8737; Expiration Date: Aug2021) (at the age of 35-year-old) as 1st dose, single for covid-19 immunisation. The facility of vaccination was Other no AE. On 08May2021 02:00, the patient experienced chest pain. The event chest pain resulted in Emergency room/department or urgent care, hospitalization, and was life threatening illness (immediate risk of death from the event). On 13May2021, the patient's wife reported that her husband was in the hospital with myocarditis onset from 11May2021(also reported as three days after receiving his second dose of the vaccine). The patient was admitted to the hospital at 02:00 on Tuesday 11May2021, he was still in the hospital by the time of reporting. Also reported that the event myocarditis required Emergency Room visit. A lot of testing were done such as cardiac ultrasounds, several electrocardiogram (EKG)s and electrocardiogram (ECG)s, nuclear cardiac wall motion test or some kind of nuclear test she is unsure of the name, chest x-rays three times, several blood works, his troponin levels (heart enzyme) was critical. The patient did not have COVID prior to vaccination. The patient had been tested post vaccination, COVID test type post vaccination was Nasal Swab on 11May2021, result was Negative. The patient had full work up less than a year ago and everything came back completely normal (In 2020). Therapeutic

1329457	5/19/2021	IL	16	M	4/29/2021	5/2/2021	back was hurting; acute chest pain; elevated white blood count; acute pericarditis; Arm pain; This is a spontaneous report from a contactable other health professional (parent). A 16-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), dose 2 intramuscular, administered in Arm Left on 29Apr2021 15:30 at the age of 16 years old (Lot Number: E000167) as 2nd dose, single for covid-19 immunisation. The patient had no medical history, no known allergies. Concomitant medications received within 2 weeks of vaccination included vitamins nos (MULTIVITAMIN [VITAMINS NOS]), acetaminophen. The patient previously received the first dose of bnt162b2 (lot number: EN6208) intramuscular in Arm left on 07Apr2021 13:00 at the age of 16 years old for covid-19 immunisation. Facility where the most recent COVID-19 vaccine was administered was Other. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced Arm pain the first few days after receiving vaccine (2021). Then last night (02May2021), at 03:00 he came to his parent's room and said his back was hurting. His parent gave him one Advil. He tried to go back to sleep but came back an hour later saying it felt like his heart was being squeezed. The doctor on call recommended they go to the ER. At the ER, they performed 2 EKGs, bloodwork, chest X-ray and an echocardiogram on 02May2021. His diagnosis upon discharge: acute chest pain and acute pericarditis on 02May2021. His bloodwork showed an elevated white blood count on 02May2021. They were to follow up with the pediatric cardiologist later this week. This events happened three days after his receiving his 2nd Covid vaccine shot. The adverse events result in Emergency room department or urgent care. Treatment received for the adverse events included Two EKGs, bloodwork, chest X-ray and echocardiogram. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient hadn't been tested for COVID-19. The outcome of the events was recovering.; Sender's Comments: The causal relationship between BNT162B2 and the events cannot be excluded as the information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk

1329446	5/19/2021	IN	79	M	4/7/2021	4/8/2021	Chest pain; Pleurisy; discomfort in his chest (not in the lung) in the bone muscle around the lung, it feels like he has been punched right in the cardiac plexus; This is a spontaneous report from a contactable consumer (patient). A 79-year-old male patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration in left arm at age of 79-years, on 07Apr2021 10:20 (Lot Number: EW0153) as single dose for covid-19 immunisation. Medical history included ongoing moderate to mild asthma that sometimes bothered him when he tried to sleep and maybe wheezed a bit and he had to use inhalers during the day as he cannot go to sleep if he got a wheeze; diabetes 8 or 10 years ago and he took Insulin for it; he was allergic to aspirin. Family History included that his mother had rheumatoid arthritis. The patient's concomitant medications were not reported. No additional vaccines administered on the same date of the Pfizer suspect. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient received the first dose of the Pfizer COVID-19 vaccine on 07Apr2021, next day (08Apr2021) he started to have discomfort across his chest like a hernia starting on the left (he started to have chest discomfort, like a hurting across the chest starting on the left and now on the right), after being checked on a medical place he was informed that he has Pleurisy, they did a chest X-ray and then they sent the information to the hospital to have a doctor look at it so he had to wait a half hour. Mentioned they wanted to put him on pain medication but he declined because he was allergic to aspirin and he only took Tylenol. He described the sensation as: a discomfort in his chest (not in the lung) in the bone muscle around the lung, it felt like he has been punched right in the cardiac plexus, now was a minor discomfort that won't go away. He cancelled his appointment to receive the second dose of the vaccine (due tomorrow) and wanted to know if he should receive the second dose at all. The patient also experienced Chest pain that started on 08May2021, but now it had shifted, and it was more on the right side. First he noticed it on the left then it moved under his sternum and now almost all of it is on the right side. The pain got up to a certain point and then it had stayed the same. Sitting he isn't feeling it but when he got up out of the chair it was worse. Seemed to be worse

1330987	5/19/2021	CT	21	M	5/15/2021	5/17/2021	<p>Patient is a 21 y.o. male with no past medical history who got his second dose of COVID (Pfizer) vaccine on Saturday presented with chest pain since Sunday. Patient says that he was in his USOH until yesterday when he started having substernal chest pain which was getting worse with inspiration but also with specific movements. He does have pain even at rest sometimes but he thinks that it's exacerbating by breathing. Had some nausea/vomiting as well. Denies other symptoms. Not really SOB or leg swelling. In the ER, his Trop I was 10.7 and his WBC was 12.2. His EKG was NSR with short PR and STE I, II, III, AVF, V4-V6. Patient is a 21 y.o. male with no past medical history who got his second dose of COVID (Pfizer) vaccine on Saturday presented with chest pain since Sunday with some pleuritic characteristics. He was found to have a very elevated trop I to 10.7, leukocytosis to 12.2 and STE in I, II, III, AVF, V4-V6. His POCUS in the ER was without significant pericardial effusion and probably normal EF. Differential at this point includes pericarditis vs myopericarditis (there are some myocarditis cases reported in Israel post Pfizer vaccination, predominantly in young male patients) vs less likely ACS. Will need admission and further work up and treatment - Admission to Cardiology -NPO in case team tomorrow decides to proceed to LHC -Full echo and cardiac MRI tomorrow -Telemetry monitoring -Repeat EKG q4h overnight -send CRP, ESR -trend Trop to peak -would not start heparin gtt at this point -Please start tonight ASA 650 TID + Colchicine 0.6 mg BID. 21-year-old man admitted with signs and symptoms of acute myo-pericarditis or in the setting of recent COVID-19 vaccination. He apparently had the findings are vaccine 2 days ago and developed pleuritic chest pain. His ECG shows pathognomonic changes for pericarditis in the is a small troponin elevation. He has no past medical history or exertional symptoms to suggest CAD. Bedside echocardiogram showed preserved left ventricular systolic function. He was admitted and placed on aspirin and colchicine. A cardiac MRI today showed evidence of myopericarditis. He had 3 beats of nonsustained VT on tele.</p>

1330532	5/19/2021	NJ	50	M	5/12/2021	5/15/2021	Information below was sourced from the patient record in the hospital EHR system: Patient presented to ED with PMH of HTN and family history of premature CAD who presented with 2 hours duration of substernal chest discomfort. He had been in his usual state of health prior to this evening. He received the COVID Vaccine on 5/12/21. He went out with his wife for dinner and then upon return, started to have some substernal chest discomfort radiating down his arm. This is associated with some SOB and nausea. No vomiting, no diaphoresis. The pain continued for about 2 hours and then he decided to come to the ED. The EKG was consistent with inferolateral wall MI. States that he has been very active without exertional chest pain or dyspnea. He does have a history of HTN and is currently on lisinopril for this. No known history of hypercholesterolemia. Denies any diabetes. No smoking history. No history of PVD. His mother did have a bypass in her early 60s. At age 37, he did have a catheterization following an episode of substernal chest discomfort. The patient states this catheterization did not show any abnormalities. Following this, the patient proceeded for PCI stenting with a DES for an occluded OM2 . Patient received Aspirin, Brilinta, Atorvastatin, Metoprolol, and Heparin prior to PCI stenting. Cardiology note confirms acute inferolateral STEMI due to occluded OM@, successfully opened and stented acutely.

1330866	5/19/2021	IL	16	F	4/26/2021	5/10/2021	is a 16-year-old female patient admitted with tachycardia. Starting 1-1/2 weeks ago, mom notes that she has had episodes where she feels her heart racing. It began 1-1/2 weeks ago with her crying and her watch that her heart rate was 208. They went to the ED, where she was given some fluids and her heart rate improved so she was sent home. She had had prior episodes of mild tachycardia up to the 140s in the past but which has always improved with fluids. Mom states that she used to have a lot of trouble maintaining her hydration and would not drink a lot of water. Since the last 1-1/2 weeks, she has been having these episodes 1-2 times a day that last about 1 to 2 minutes with a max of 5 minutes. When it comes on, she feels dizzy and lightheaded, and after the episode she feels a big rush of blood to her head. She also has some associated shortness of breath. She denies having any episodes of chest pain at all. She has never passed out, she has never felt like she was going to pass out, she has never felt like she was out of balance. She denies any nausea or vomiting during episodes. She denies any headaches during the episodes. She does have history of migraines, but has not had one in the last couple weeks. Her prior resting heart rate was in the 80s per her watch, and lately it has been in the 110s to 120s while awake in 80s while asleep. Along with the episodes, she also feels some pulsating sensation in her abdomen. She does not have any abdominal pain. Today, her heart rate was again in the 200s, but it was worse than before because it lasted about 30 minutes total. Lately they have been using an app that continuously monitors her heart rate. Since these episodes started, she has cut down on her caffeine intake and she has increased her water intake. Does not feel that this helped. She has never had syncope in the past and has never had seizures in the past. Patient was started on carvedilol which has helped control heart rate and was encouraged to drink fluids. Per primary care team, her current episode of tachycardia was not due to the vaccine.
1330821	5/19/2021	RI	18	M	5/15/2021	5/18/2021	2 days of severe chest pain, EKG with ST segment elevation and troponin elevated to 7, consistent with pericarditis.

1330900	5/19/2021	NY	19	M	5/15/2021	5/17/2021	<p>Patient is a 19 y.o. male with a variety of minor past medical problems but without any significant PMH who presents with 24h of acute onset chest pains. He reports yesterday morning he was woken from sleep at 3-4 am with severe substernal chest pains that radiated to his arm and neck. This was worsened by laying flat and better if he waked around/pacing. He took ibuprofen and it got better so he went back to sleep. The pain returned about 6 hours later and was getting more severe so he went to see his doctor. There an EKG was abnormal so he was referred to the ED where a work up showed ST elevations c/w pericarditis and an elevated trop I of 24. The night prior, he reported a low grade temperature. He has not had any more fevers for the past 12-18 hours. He denies any other symptoms such as palpitations, shortness of breath, cough syncope. He denies sick contacts but did have a sore throat 4-5 days ago without any other associated symptoms. He has had recent negative COVID tests while at college. Of note he did receive the 2nd dose of Pfizer on 5/15 about 24-36 hours before onset of symptoms. Of note, he does boxing at school and has been participating in work outs until about a week ago. ED course: EKG w/ diffuse ST segment elevation in V3-V6, I, II, AVF. Troponin I 24. Creatnine 1.2 with baseline of 0.5 but BUN WNL (11). CBC WNL, CRP mildly elevated to 3.1, Transferred to another ED. Second ED Course: BP 120/64 Pulse 83 Temp 36.7 °C (98.1 °F) (Temporal) Resp 18 Wt 76.3 kg SpO2 97% exam non-focal, COVID ab notable for +spike neg nuclear capsid consistent with vax but no infection, D-Dimer, procal, ESR, ferritin, Coags all WNL, Trop T elevated to 1.46., ECG with consistent diffuse ST seg elevations, seen by ped cards who did echo in ED and notable for EF ~50%, admitted to PCICU for further management and treatment Admitted to the PCICU in stable condition. Placed on telemetry monitoring for the duration of the admission. Started on IV steroids and given IVIG on hospital day 1. Continued on toradol which was switched to motrin on hospital day 2. Cardiac MRI did not show signs of fibrosis. Troponin downtrended throughout his stay. At the time of DC echo showed normal function, ekg showed T wave inverions, and troponin was down trending to 0.57. Pt to be restricted from physical activity until cleared by cardiology. Infectious workup also sent, most of which was pending</p>

1326122	5/18/2021	SC	66	F	5/1/2021	5/1/2021	<p>Heaviness in Breathing/breathing problems; felt different; not feeling good; Aggravated Asthma; horrible acid reflux/ Aggravated Acid reflux; was in pain last night/she was really hurting; blood pressure was sort of up to like 185 over 186; Chest pain; back for stabbing pain; Pressure chest; Wheezy; This is a spontaneous report received a contactable consumer (the patient). A 66-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number not reported), via unspecified route of administration in the left arm on 01May2021 (at the age of 66 years-old) as a single dose for COVID-19 immunization. The patient's medical history included a "heart condition", asthma, acid reflux, hiatal hernia, and being "allergic to a lot of medications", reporting that she previously had to carry an epinephrine (EPIPEN). The patient had unspecified concomitant medications. The patient stated that immediately after the first dose, she started not feeling good (01May2021), and by the time she got home, she was really having some breathing problems (01May2021). She was monitored at the vaccination site for 30 minutes after administration, but did not report to them, because she did not know what to tell them. She a history of asthma, so she treated with her inhalers, and "it eased off a little bit". She reported she was really hurting, so she took a 5 mg dose of prednisone tablet. She also reported horrible acid reflux later that night (01May2021), which can trigger her asthma, she took some aluminum hydroxide/ magnesium hydroxide/ simethicone MYLANTA and felt much better. She slept propped up, took another dose of MYLANTA this morning, and was feeling better today, but not 100%. She wanted to know if the vaccine can cause acid reflux or asthma exacerbations? And if she should expect the same, but more severe reactions after the second dose? It was also reported, that after the vaccine, the patient stated for fifty minutes maybe she had what was like pressure in her chest (unspecified date May2021). She did not know what she was feeling, so she did not say anything. So she came home, and just as the day got work more the pressure, she had asthma and saw what was happening was an asthma attack, which started hurting really bad like an asthma attack, so she took her inhalers, and it eased it off a little bit. Then it just kept worsening. She was also a heart patient, so when she</p>

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

had asthma, some times it mimicked a chest pain. She was thinking if it was affecting chest pain or was it asthma, so had some prednisone, 5mg of prednisone (treatment) that she had to take for her asthma. It did not help last night (further clarification unknown). She was trying to get to the hospital. She was wondering if this shot had aggravated her acid reflux and aggravated her asthma (both 01May2021). When the patient went to bed, she got some aluminum oxide/ magnesium hydroxide (MAALOX), big dose of MYLANTA, and that eased it off. Before she got the shot, she felt fine; she would have no symptoms, and then when she got the shot "mean it went 30 minutes later and I just felt this and I still did not know what it was". Her husband told her to sit down. She did not know what was wrong, she just felt different. She thought it caused her asthma to act up. The patient stated that last night (01May2021), her blood pressure was sort of up to like 185 over 186, "but I think it was because I am extreme so bad by then I am and my chest in my chest and then I finally said okay let me take so (incomplete sentence) my acid reflux so let me take some MYLANTA so I take calcium carbonate/ magnesium hydroxide (ROLAIDS) and I immediately stop that pain that must be my acid reflux making triggering my asthma it is, I was like, I was in pain last night (01May2021), just administered for my asthma between my chest and my back for stabbing pain (01May2021) and that caused sometimes when I have heart condition, I always like it is my heart or it is my asthma what is it? and I got this one okay I will take a dose of MYLANTA just to make sure see that will help come down". The patient felt a lot better today, but still felt sort of wheezy (May2021) "like you know when you have asthma". Her bad asthma she would just get a wheezy sort of just heaviness in breathing. The patient was due to get the second shot on 22May2021. On an unspecified date, the patient had: a lab test "but have results before I had the following to chest by giving lastly", and routine blood work-cholesterol and all. The outcome of the events wheezy, heaviness in breathing/ breathing problems, horrible acid reflux/ aggravated acid reflux was recovering. The outcome of other events was unknown. Information about lot number has been requested.

1326102	5/18/2021	MI	63	M	5/1/2021		DIARRHEA; CHILLS; UNBREAKABLE FEVER OF 104F; CARDIOGENIC SHOCK; KIDNEY FAILURE; IMPAIRED LIVER FUNCTION; HIGH BLOOD PRESSURE (200/100); ABNORMAL WHITE BLOOD CELL COUNT (16000); BLISTERS ON CONJUNCTIVA OF BOTH EYES; This spontaneous report received from a physician concerned a 63 year old white male. The patient's weight, height and medical history were not reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of administration not reported, batch number: Unknown) frequency one total, dose was not reported, administered on 07-MAY-2021 for prophylactic vaccination. The batch number was not reported and has been requested. No concomitant medications were reported. The physician reported that one day after receiving vaccine, on 08-MAY-2021, the patient experienced nausea, vomiting, shortness of breath, diarrhea, fever, chills, sweats, and severe chest pain. The patient was admitted to hospital for suspicion of heart attack. He was checked and no blockages were found. Laboratory data included: Scan (NR: not provided) No blockages were found. On 10-MAY-2021, he was transferred to another hospital where he was currently on a ventilator. The doctor reported that he had had fever of 104 f that was unbreakable. His blood pressure was 200/100 mmHg and his pulse oxygen was not good. His white blood cell count was 16000 and he was tested negative for covid-19. The doctor also reported that patient was in cardiogenic shock and was in kidney failure. He reported that the patient's liver function was getting better and patient's face and chest was very red. The patient also had blisters on conjunctiva of both eyes. It was unknown where patient received the vaccine as of this time. No further information was available since doctor had patients to see. Laboratory data included: Blood pressure (NR: not provided) 200/100 mmHg, Covid-19 virus test (NR: not provided) Negative, Body temperature increased (NR: not provided) 104 f, Pulse Oxygen (NR: not provided) Not good, and White blood cell count (NR: not provided) 16000. The patient was admitted to the hospital on 08-MAY-2021 and the duration of hospitalization was 6 days. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient was recovering from impaired liver function, had not recovered from blisters on conjunctiva of both

1326170	5/18/2021	LA	63	F	4/14/2021	4/28/2021	D Dimer was high; Chest tightness; blood clots in the lungs; This is a spontaneous report from a contactable consumer. A 63-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), dose 2 via an unspecified route of administration, administered in Arm Right on 14Apr2021 10:30 (Lot Number: ER2613) as SINGLE DOSE for covid-19 immunization. Medical history included ongoing retinal tear from an unknown date (long ago, maybe 2005), Blood pressure, anxiety, reflux, irritable bowel syndrome, eye care. Three years ago, patient had a blood clot on the portal vein. She was treated with Eliquis, referring to Apixaban, for six months. Then they went into the D Dimer and found out she only had one gene for the blood clots, so they discontinued Eliquis, referring to Apixaban. The doctor said the protocol didn't call for it because she only had one gene. Eliquis, referring to Apixaban, was discontinued a year and half ago. The reporter mentioned the specifically didn't get the Johnson and Johnson shot due to blood clots. Family History included that her mother and sister had blood clots in the past unrelated to the vaccine, anxiety which her mom has. Concomitant medications included ramipril taken for blood pressure from an unspecified start date (for five to ten years) and ongoing; ongoing omeprazole taken for reflux; fluoxetine taken for anxiety (for what her mom has) taking for three years and ongoing; linaclotide (LINZESS) taken for irritable bowel syndrome taking for 3 year and ongoing; magnesium sulfate taken for eye care taking for 3 year and ongoing; latanoprost taken for retinal tear from 2005 and ongoing. Prior Vaccinations (within 4 weeks) was none. The patient previously received the first dose of the Pfizer COVID 19 vaccine on 26MAR2021 at 1000AM in the right upper arm (Lot number for first dose is ER8732; expiration date 31Jul2021). Last Wednesday she started to have tightness in her chest so they called an ambulance. She was admitted to the hospital 28Apr2021 and was discharged Saturday 01May2021. In the hospital they did a CT and it came out that she had bilateral blood clots in the lungs; the doctor said it was a shower of blood clots in the lungs, small enough not to occlude anything. They treated with a 72 hour heparin drip. They didn't do any more CT but they did put her on Eliquis, referring to Apixaban, for the rest of her life. For the Eliquis he

<u>VAERS_ID</u>	<u>RECVDATE</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1326264	5/18/2021	MN	48	F	5/5/2021		<p>headache; fatigue; dyspnea; chest pain; RV infarction; a large amount of clot in the RCA; This is a spontaneous report from a contactable physician. A 48-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 05May2021 as single dose for COVID-19 immunization. Medical history included chronic smoker 2 packs per day. Patient was not pregnant at the time of vaccination. Concomitant medications within 2 weeks of vaccination included paracetamol (TYLENOL) and ibuprofen. Patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) as single dose for COVID-19 immunization. It was unknown if the patient received any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, it was unknown if the patient was diagnosed with COVID-19. Patient developed headache, fatigue, dyspnea, and chest pain for 3 days. She was admitted to hospital on 08May2021 with a completed right ventricular (RV) infarction. Angio in May2021 showed clean coronaries with the exception of a large amount of clot in the right coronary artery(RCA). Given correlation to vaccine administration, unclear if this was related (as reported). Device Date: 11May2021 (as reported). The adverse events resulted in emergency room/department or urgent care. The events were assessed as serious, hospitalization and life-threatening. Since the vaccination, the patient had not been tested for COVID-19. Outcome of events at the time of last observation was recovering. Information on Lot/Batch number has been requested.; Sender's Comments: As a cautionary measure and considering the drug-event temporal relationship of three days, the company cannot completely exclude a causal association between the administration of the PFIZER-BIONTECH COVID-19 VACCINE BNT162B2 and the onset of all the reported events. Medical history of chronic smoker (2 packs per day) cannot be also excluded as contributing factor and additional information of medical history and concomitant medications concerning possible risk factors for cardiovascular diseases, should be also useful for an overall assessment of the case. The impacts of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern</p>

1327562	5/18/2021	AK	38	F	1/20/2021	1/20/2021	Right after injection, I got really hot and flushed. I thought I am not a fan of needles - so I thought it was anxiety. My throat got really dry. They gave me a Dixie cup of water and I asked for more. After I had finished the one cup, I was clearing my throat and it felt like I couldn't swallow and my tongue had swollen up and I couldn't swallow any water from next Dixie cup. I couldn't swallow - it felt like it would get stuck at the back of my throat. The nurse said she was going to stab me with the epi-pen but had me lay down first and my face started to feel slightly numb and I told her that and she stabbed me in right hip with the epi-pen. They called the ambulance to take me to hospital and after the epi-pen was given they had me sit up and put a mask on my face and I was in a state of panic. I wore an oxygen full face mask and was breathing into it. The paramedics came in and put me on stretcher - monitored for six hours. Because of the adrenaline from the epi- pen - I had high blood pressure and heart rates - everything was really high. After a few hours, she told me that my tongue was looking better and there was better color in my tongue. I was sitting there every six hours - I was monitoring as how to I was doing. They gave me Benadryl and I think they gave me something else but I can't remember what it was. I came home and it was late at night - 11:00 or 11:30 and from there until February 1st, I was extremely sick. I went back to ER on 23rd; and did telehealth visits - with my doctor (right after ER visit from Injection was first one; and then I went to the hospital on the 23rd; Telehealth on 24th or 25th and I - I was running fevers of 104, 103 and went up to 105 almost- on 23rd of January - 3 days after injection - I'm weak, I can't move - everything hurt. From head to toe. I couldn't sleep or do anything. I was so weak, I couldn't even move. It was difficult just to use the bathroom. I had the fevers that was causing my chills and my body aches were bad. I had been trying to alternate Tylenol and Ibuprofen; I was finally prescribed Hydro Codone just to sleep. I was told to take this during the day and the Tylenol and Ibuprofen combo at night. Shoulder surgery was about a month after the vaccine - 18th of February - And on the 22nd of February I went to the hospital again for left side chest pains. - I couldn't breathe - I was discharged February 25th - I was on blood thinners for three months. - the surgeon said that I developed clots and I developed these shortly after surgery and ended up

1326721	5/18/2021	NJ	17	M	5/13/2021	5/15/2021	in the hospital for three days. The clots are unknown - blood clots started in the legs and then developed the fluid/clot issue in the lungs - I had a pulmonary embolism in my left lung. Surgeon said it could have been caused by vaccine as he did not work on the lower part of my body.
1326716	5/18/2021	NC	58	M	4/20/2021	4/20/2021	5/14/21 - day 1 after vaccine dose #2 - had fevers, body aches, chills, fatigue. 5/15/21 - day 2 after vaccine dose #2 - began to have chest pain that started out at 5/10 and then became constant and persistent sharp, 10/10 chest pain that was worse with lying back and improved with sitting up and leaning forward. Pt went to Urgent Care, had ECG done and demonstrated ST wave changes where he was brought to ED and ECG confirmed ST/T wave changes and Troponin T was elevated to 1.62 - thus with these findings and the chest pain that was consistent with pericarditis - diagnosis of myopericarditis was made.
1326665	5/18/2021	IN	54	F	5/16/2021	5/17/2021	Patient reported having palpitations about 2 hours after receiving the first dose of Moderna. He continued to have palpitations and chest pain off and on for about 3 weeks. He went to see his doctor and the patient said the doctor said all tests were negative. The patient has not received any treatment for the adverse reaction and we are holding the second dose for now until confirmation from his doctor.
1326656	5/18/2021	IN	22	M	5/11/2021	5/13/2021	Fever Joint pain Sharp pain in chest and throath Tightness in chest, pain in chest, and shortness of breath. Started late May 13, subsided enough to get some sleep. Awakened by the pain and shortness of breath around 7:30 am May 14. Unable to get out of bed. Called 911 for ambulance. Patient was taken to Hospital Cardiac. EKG showed ST elevation, thus L & R Catheterization was performed. Negative for MI, but diagnosed with Pericarditis, kept overnight in hospital and prescribed Indomethacin (Indocin) 3 times daily for 14 days. Released from hospital May 15. Recovery continues at home.

1326646	5/18/2021	CT	16	M	5/13/2021	5/14/2021	Received second Pfizer Covid-19 vaccine on Thursday 5/13 without acute adverse events. The following day he developed substernal non radiating pleuritic chest pain that kept him awake all night. The following morning pain progressively worsened so he went to the emergency room.
1326564	5/18/2021	PA	42	M	4/15/2021	4/16/2021	Pt first began to notice left leg "stiffness" after receiving his first COVID vaccine (Phizer) several weeks ago. Pt states that after receiving his 2nd dose on 05/06, he noticed his leg stiffness got significantly worse. He tells me that he tried to "push through the pain" and mow his lawn but had to stop d/t severe cramping of the LLE and pelvis. He states he rested his leg and went to bed, and when he woke up he noticed that his left leg was severely swollen. Pt decided to take 3 days off work to continue to rest the leg, but ultimately came in for evaluation at the suggestion of his coworkers. Pt denies fever, chills, chest pain, or SOB. He denies history of smoking, prior clotting, long car travel, air travel, leg injury, or recent surgery. On exam, the left lower extremity is significantly swollen, erythematous, and hot to the touch. Physical exam otherwise unremarkable. Will admit to the hospitalist service for further medical management. ED Course: Hypertensive with BP 170/93. Initial workup significant for WBC 13, K 3.3, glucose 159. CT chest/a/p with findings suggestive of multiple PE's of the left and right lower lobes as well as extensive LLE DVT extending slightly into the IVC. Trop <0.03. BNP 66. ECG shows sinus tachycardia.

Pulse at 1638: 127. Vitals at 1640: blood pressure 118/70, pulse 124, oxygen 100%. Per client palpitations improving. Alert and oriented. 1644: client hands shaking, client stated only had breakfast. RN brought client juice and snack. Client began to eat. Father denied client having diabetes. 1648 vitals: blood pressure 122/80, pulse fluctuating from 110-120s, oxygen 97%. Symptoms the same with new onset o blurry vision, per client could not focus image. PHN offered Father to call paramedics for further assessment and he declined. PHN advised for client to follow up with provider. Per Father client's sugar lowers when he skips meals. PHN asked Father is he has followed up with provider or checks client's sugar at home, Father denied. Per Father he knows his son and "he needs to eat or sugar goes low". At 1656 client stated he wanted to vomit, emesis bag given. 1658 client pale, PHN asked client how to was feeling. Per client feeling like he "was going to pass out". At 1700 client stated he could not feel legs, RN assessed for sensory and motor. Per client felt like legs "were asleep". PHN assessed for level of consciousness, client unable to answer, client lethargic. 1701 client lost consciousness. PHN and RN lowered client to floor from chair. EMT called 911 at 1703. RN did sternal rub, client unresponsive, breathing normal, pupils reactive. 1704 client woke up with urge to vomit. PHN and RN turned client on side. EMT able to place emesis bag near. Client had 1 small vomit episode. Client's eyes open, blank stare, not answering questions. At 1707 client went unresponsive again. Paramedics arrived at 1709 and assumed care. Client transported to hospital at 1717

1327432	5/18/2021	MD	17	M	5/12/2021	5/14/2021	17 y.o. male who presents with chest pain, elevated troponins and diffuse ST elevations concerning for pericarditis vs myocarditis admitted for cardiac monitoring and evaluation. Pt states he has had 1 day of sudden onset L shoulder pain and chest pain. Endorses dyspnea due to pain with deep breaths, denies tachypnea, nausea/vomiting, diaphoresis. Endorses mild chills and aches after COVID vaccine 3 days prior to onset of symptoms, denies any fever, URI symptoms, diarrhea, rash, known COVID contacts. Pain continued to worsen and spread across his chest, causing presentation to ED this afternoon. No history of PE, DVT, long travel, recent surgery, malignancy, alcohol or cocaine use. Significant cardiac history in family: dad with CAD w/LAD blockage, both parents with hypertension. At ED, labs notable for elevated troponin 0.456, repeat 0.67 and diffuse ST elevations on EKG concerning for pericarditis. COVID neg, CXR unremarkable, blood cx drawn, no abx started. Patient was given toradol for pain with minimal improvement. Peds cardiology was consulted and patient was transferred to different ED for further care. At different ED, repeat EKG showed similar diffuse ST elevations in I, II, aVL. Repeat troponins uptrending (4.91), proBNP 562, ESR 43, CRP 18. Mildly tachycardic but otherwise hemodynamically stable. Given tylenol for pain. Cardiology recommended admission for trending troponins, echo and cardiac monitoring. CV: Troponins were trended every 12 hours with a max of 4.91. His last troponin checked on the morning of discharge was 0.41. He had an echo that showed normal cardiac function, an MRI that indicated normal ventricular size and function, with minimal or healing and inflammation or mild myocarditis. During his admission, he had continuous cardiorespiratory monitoring, that did not show any arrhythmias. Resp: On 2L NC for comfort, no respiratory distress or hypoxia. FENGI: Regular diet Neuro: Ibuprofen scheduled and tylenol PRN for pain. He was initially started on ibuprofen 800 mg every 8 hours, but was starting to have pain prior to being due for medicine every 8 hours so his regimen was changed to 600 mg every 6 hours which controlled his pain adequately. ID: Myocarditis panel sent with some results still pending. Thus far, he is CMV negative, EBV IgG was positive but not IgM. RVP was negative. This all occurred in the setting receiving the Covid vaccine 3

1323510	5/17/2021	UT	52	F	3/10/2021	3/20/2021	Soreness in my left arm at the injection site area. I treated with ibuprofen. It was fine the next day - used a lot of motion to help. I rubbed it and I guess I wasn't suppose to. I had no other issues until my typical seasonal allergies but a week an a half later - Saturday, I noticed I was having symptoms and was notified by a family member, that family member on Tuesday after I started having symptoms that they had a positive test. So I got tested at a Rapid Test site. I had productive cough and sinus congestion and some chest pain and shortness of breath. That went on for about a week and a half. I contacted my physician after the positive COVID test and because I have asthma related to the Hiatal hernia - and I increased to maximum dosage on Advair. That worked. Mucinex with Sudafed to dry that out. And started to use Cool Mist Humidifier and had that in my room constantly and I did self isolate to my bedroom during that time. Vicks vapor rub on my chest. I wasn't running a fever - it varied slightly but it never went over 99. My highest temperature I think was 98. I monitored my O2 with finger monitor - as I had shortness of breath doing stairs. Lowest around 88 but then it would return to 96 or 97 in about 15 minutes. Follow up with doctor (primary care doctor) - telemed appt.
1323456	5/17/2021	NJ	61	M	4/7/2021	4/8/2021	Within 24 hours pain in left side of left chest, in 48 hours pain on full left side of chest, within 72 hours pain through entire chest. Hospitalized within 72 hours, chest pains, catheterized within 120 hours, had a blood clotting issue, put into medically induced coma for three and a half days, followed by a pulmonary embolism and four (4) clogs, two (2) in either leg, within two weeks. Hospitalized twice, currently on three blood thinners, a beta blocker, pepcid, a statin, and one other. Expected to be on three blood thinners for at least three (3), most likely six (6) months. Start cardiac rehab on 5/19/21. Have chronic cough and chest discomfort. Expected recovery time: six (6) months.

1323410	5/17/2021	MA	12	M	5/13/2021	5/13/2021	From ED Note: 12 year old male with PMH of asthma on flovent, food allergies with epi-pen (has not required this) and pre-syncope/syncope who presents with concern for loss of consciousness and possible seizure-like activity following a COVID vaccine. Mom notes that he was in his usual state of health when he presented to COVID clinic to get his first vaccine. He got the Pfizer vaccine, seconds after getting in his left arm, mom noted that he looked very "wide eyed" and distraught. She notes that he slumped forward and had lost consciousness for approximately 5 seconds. She noticed shaking movements in his right arm and bilateral lower legs. She notes that his left arm was against her and therefore cannot comment on it. She notes that his eyes were closed. No tongue biting and no incontinence. No secondary trauma. She notes that when these 5 seconds were over he then had a period for about 30 minutes where he looked pale and was breathing heavy but was alert and answering questions. She notes that he has had presyncopal episodes and episodes of feeling faint when getting flu shots in the past. However, this time she noted that he had shaking which made her nervous for possible seizure activity. Patient denies any chest pain or headache prior to the symptoms. She came via ambulance for further evaluation. On arrival, he reports that he feels 90% back to his baseline. He notes that he does not feel quite ready to run around yet however denies any pains or discomforts, headache, weakness, numbness, or tingling. He had eaten a full breakfast prior to getting the shot. He had a normal night sleep and a normal day yesterday per mom. Medical History: as above Surgical history: none Family History: Reviewed and no pertinent related family hx pertaining to this visit Social History: Lives with family Allergies: food allergies Medications: flovent, epi-pen Immunizations: Up to date Medical Decision Making 12 year old male with PMH of asthma on flovent, food allergies with epi-pen (has not required this) and pre-syncope/syncope who presents with concern for loss of consciousness and possible seizure-like activity following a COVID vaccine. On arrival, he was alert, well-appearing, in no acute distress. His vital signs were normal for age on room air. His physical exam was very reassuring as above with a normal neurologic and cardiac evaluation. Differential includes vasovagal/syncope in the setting of a known

2/22/2021

2/22/2021

stressful trigger vs seizure given report of shaking in his extremities. We feel the latter is significantly less likely given the timeline of the events. Has no known seizure activity nor any triggers per history (fever, trauma, etc.). He also has a normal neurologic assessment. At this time we will defer neurology consults given low concern for seizure. It is possible that this represents a side effect of the vaccine however we also feel that this is less likely given the fact that his symptoms have been seconds after receiving the vaccine. Nonetheless we reported the symptoms to the pharmacist who recorded it in the database. We attained an EKG showing a known incomplete right bundle branch block (unchanged from 2013) and a slightly prolonged QTC of 477 (previously 451). I encourage patient to stay well-hydrated, well rested in the setting of his suspected syncopal episode this morning. I also suggested that for further vaccinations, that he lay down on the table and drink/eat well prior. We provided strict return to ED criteria in the setting of worsening symptoms. All questions were answered at the time of discharge. Mom verbalized her understanding and agreement of the plan. He was discharged in a stable condition with mom at side. **After patient was discharged, cardiology called the follow-up team due to the prolonged QTC to ensure that we were aware. I contacted the patient's PCP to do a follow-up EKG in 1 month's time.

84 y.o. male who presents with chills, weakness and low back pain that had onset approximately an hour and a half ago. Upon presentation, the patient's temperature was noted to be 102°. Patient's states that he had a similar set of symptoms several years ago was found to have sepsis of unknown origin. He denies anorexia malaise generalized body aches headache cough dyspnea chest pain nausea vomiting abdominal pain diarrhea or urinary tract symptoms. The patient has been covered vaccinated and reports no known exposures. Of note, the patient has been on cephalexin for the past week due to a postoperative infection related to his recent carpal tunnel release. Transferred to a different hospital for Severe Septic shock, on dopamine drip; remains inpatient as of 5/17/21

1323004	5/17/2021	CT	17	M	4/30/2021	5/10/2021	<p>17 y.o. male with non contributory PMHx presents with chest pain. Patient began not feeling well on Monday May 3rd with muscle aches, sore throat, dry cough, and headache. Received COVID vaccine on Apr 30. He woke up Friday May 7 he developed a fever to 102F. Went to urgent care yesterday was diagnosed with strep based on suspicion (negative rapid, culture pending) and started on amoxicillin. Rapid covid was negative at that time as well. Now presents for chest pain. He has woken up that last two mornings with chest pain (worse when laying flat), pain is substernal, sharp/throbbing, radiates to the left arm. Belching a lot. Palpitations and one episode of emesis prior to arrival. Suspected symptoms were from gas so took charcoal tablets prior to arrival without relief of symptoms. Has been taking ibuprofen for discomfort (400 mg every 4-6 hours for > 7 days). No shortness of breath. No abdominal pain. No diarrhea. No hematuria or dysuria. No family history of sudden cardiac death or significant for CAD. No known tick bite. Of note, received Pfizer dose 2 3d prior to symptoms starting. Presented to ED earlier tonight where exam was notable for: Low-grade temp, mildly hypertensive with otherwise stable vitals, appears uncomfortable, belching, neck is supple without meningismus, bilateral tonsils 1+ with exudate, oropharynx is erythematous, uvula midline, no trismus, no swelling, lungs clear, regular rhythm mild bradycardia, no murmurs rubs or gallops, abdomen is soft and nondistended with mild tenderness in epigastrium and right upper quadrant they did ECG, bedside Echo, Strep PCR, zofran, maalox, pepcid, IVF, tylenol, and labs which were notable for elevated troponin -> 13.58 d/w YSC Ped ED and tx</p> <p>Assessment: Patient is a 17 y.o. male previously healthy who presents with 1 week of malaise, and 3 days of intermittent substernal chest pain (now resolved), found to have elevated troponin and ST segment elevations in I and lateral leads c/f myopericarditis. Etiology is unclear at this time, likely viral vs post-vaccine. Exam notable for exudative pharyngitis, however Strep and CMV neg. EBV serology with positive EBNA only. Labs otherwise notable for elevated CRP 180, ESR 38, some transaminitis, ferritin/D-dimer wnl. COVID RNA neg, spike Ab positive c/w recent COVID vaccination. Normal function on ECHO. CRP continues to downtrend. Troponin has started downtrending again</p>

1324473	5/17/2021	OR	33	F	3/31/2021	4/29/2021	I received my Janssen vaccine on 3/31/21. On 4/29/21, I had a virtual appointment with a naturopath about a completely separate health issue (mold illness), and she asked me to check my blood pressure. I checked my blood pressure using my father in law's at home cuff, and it was 149/99. I continued to check over several days and had persistently elevated readings, ranging from 122-165/93-107. My last known normal BP reading was in February of 2021 and was 110/70, which is my typical BP. I had not checked my BP at any time between February and April because I had no reason to believe it would be elevated. On 5/2/21, I had a reading of 165/107, which prompted me to go to the ER. At the ER in triage, my BP was 188/144. EKG was normal and troponin I was normal. I was monitored for a few hours with BP around 155/100, and after a dose of Nadolol, my BP came down to 122/79. I also had chest pain/tightness during this experience, which may have been due to anxiety. My BP has continued to be persistently elevated (now coupled with anxiety about what is going on, which doesn't seem to be helping the numbers!), and I had to return to the ER on 5/5/21 after getting an at home reading of 180/122 (this was about 1 hour after taking a dose of Nifedipine). At the ER triage, my BP had come down to 140/109, so they sent me home. My BP has now remained elevated at around 135-140/95-100, while taking 30mg Nifedipine ER daily.
1324036	5/17/2021	AZ	48	F	4/10/2021	4/24/2021	on the 04/14 I started feeling pretty bad at home, I tested positive for covid because my daughter had tested positive on the 04/12. by the 04/16 I was sick short or breathe , coughing telehealth call on 04/17 was prescribed an inhaler by the 04/21 I was coughing uncontrollably I felt like I had a cold called my doctor he told me to wait it out on the 04/24 I wasn't feeling better went to the er I couldn't breathe short of breathe walking short distances, I was released on the 04/27 and I was diagnosed with covid phenonium hospital I had to go to 05/15 was re admitted to hospital for chest pain and I was having problems breathing

1324251	5/17/2021	NV	49	M	4/6/2021	4/14/2021	I started having a lot of pain in my right leg. I could actually feel and see that my veins were swollen. It progressed and started moving around. I started having chest pain and headaches. I ended up at ER. They gave me pain meds and did a CT Scan and ultrasound, which were both clear. The next day, I was walking around and my hand and arm started hurting and then went numb. My right wrist was swollen to twice its size. I went to care and they told me to go back to the ER. They eventually did another ultrasound, but the swelling had gone down by then. A few hours later, my left arm started to swell and lasted for about 4 hours. From there, I had pain in my arms and legs for a few days after that, but then I was fine.
1324462	5/17/2021	MI	19	M	3/24/2021	3/27/2021	Patient admitted to hospital 3 days later with chest pain, ECG changes, and troponin elevation and was ultimately diagnosed with myocarditis.
1324010	5/17/2021	TX	31	M	5/13/2021	5/13/2021	Patient received vaccine Thursday morning. Later that evening, he started experiencing chills, fever (>101F), and body aches for the next couple of days. Saturday morning, fever continued with body aches throughout the day but other symptoms subsided. Chest pain started Saturday evening but patient was unsure what it was. Saturday after midnight, patient went to sleep and woke up after 30 mins with chest pain, chest pressure, burning sensation in chest, and stiff neck. Patient couldn't lay down in bed and went to ED.

1324516	5/17/2021	CA	24	M	5/7/2021	5/7/2021	About 9 hours after getting my vaccine, I started noticing my temperature rising to ~99.0. About 1 hour later (12 AM), it had risen to ~103. I also noticed my heart rate was extremely high (on average 140 bpm, the highest was 225 bpm); this was also accompanied by chest pains which seemed like they were on the right side of my heart; I also had difficulty controlling my bladder and would randomly start to urinate. I had taken two Advil then slept. The next day (~9 am) my fever went down but 3 hours later it had gone back up to ~101, I eventually kept cooling myself (removing shirt, fan on high, etc.) and took one Advil and my temperature started to get normal. For about two days after that, I had pain in my left shoulder - but this was where the injection took place so I wasn't too worried. Currently I am feeling fine, but the initial day getting the vaccine was quite harrowing - I was quite worried I was going to have a heart attack.
1324997	5/17/2021	IL	38	F	3/15/2021	4/17/2021	Many weeks ago (end of March, into April) i noticed I was short of breath, and a few weeks later a cough developed (mid-April). Also mid-April, on April 17, I had a sudden conjunctive hemorrhage happen in my right eye for no apparent reason. There was no injury to my eye and my ophthalmologist told me it would heal in a few weeks. Two weeks ago (beginning of May) a terrible, nearly unbearable headache began. A few days later, I continued to feel strange and began to get more frequently short of breath and my cough worsened. On 5/5/2021 I went to my doctor , Family Medicine, and was then sent to the local hospital, and had a cat scan done of my lungs, around 9 AM. I was I was diagnosed with a Pulmonary Embolism in my right lung, that is so large that it is taking up 2/3 of the lung and its pushing on my heart. I am currently taking Eliquis and waiting to be seen by a specialist. I still have shortness of breath, headaches, and chest pain as a result of my PE.

1322069	5/16/2021	CA	18	M	5/14/2021	5/14/2021	<p>Patient (DOB 05-01-2003) received his 1st COVID vaccine (Pfizer, lot # EW0182 use by 5/15/21 at 0855) at 1539. The patient became pale approximately 30 seconds following the administration of the vaccine, EMT assisted the patient to the chair as he was standing up when he became pale, the patient loss consciousness for approximately 2 seconds. RN arrived at the station and assisted the patient to the ground, where he was placed in a supine position with his lower extremities elevated. The patients face mask was removed, he was alert and oriented to person, place, time, and situation. The patients color slowly returned to his face. Vitals were taken at 1540: BP: 155/70 (R arm, supine position), HR 70, RR 16, oxygen saturation at 97%, and pupils were equal. The patient had a history of fainting x 1 and his last meal was at 0800 and he stated, " I didn't drink that much today." Denied any chronic medical conditions, was not currently taking any medications, and denied any drug allergies. The patient was moved to the anti-gravity chair and he was given pringles and Gatorade. Vitals were retaken at 1545: BP 162/80 (R arm, sitting upright), HR 50, RR 16, oxygen saturation at 97%. Denied any dizziness, headache, chest pain, or vision changes. Vitals were retaken at 1553: BP 158/72 (R arm, sitting upright), HR 52, RR 16, Oxygen saturation at 97%. The patient was advised to eat a full meal prior to receiving his second COVID vaccine dose and to receive his 2nd dose in the anti-gravity chair. Vitals were retaken at 1558, BP 152/78 (R arm, sitting upright), HR 57, RR 16, and oxygen saturation at 98%. The patient was also given a bottle of water, as he did not consume many liquids during the day. The patient's color fully returned to his face and he denied any shortness of breath, dizziness, changes in vision, or difficulty swallowing. Vitals retaken at 1603, BP 150/75 (R arm, sitting upright), HR 60, RR 16, and oxygen saturation at 96%. The patient called his mother to pick him up, as we strongly advised him to not operate machinery/ a vehicle after fainting. The patient's vital signs were taken at 1608, BP 140/75, HR 60, RR 16, and oxygen saturation at 100%. The patient was advised to drink the entire bottle of water, as his blood pressure was slightly elevated and it was most likely due to being dehydrated, as he did not consume any fluid since 0800 earlier that day. The patient drank a bottle of water and his vital signs were retaken at 1614, BP 122/68 (R arm,</p>

specialists to seek assistance, she has seen a hematologist, and a rheumatologist. She has been on steroids and she was not yet done with the second dose of the Pfizer COVID 19 vaccine. Her doctor was very aware. When this started 3 months before, she 110 lbs but she has been taking steroids and her weight has shot up like crazy now she is 120 lbs, she told her doctor that she had no more fat clothes she will have to get off of the steroids, they blame everything on steroids. She said nothing else is relevant she was fine, in fact she was dancing the weekend before, that Saturday night she went to a Portuguese evening and was learning to do their dances and Monday morning she couldn't get out of bed. She refused to go to Emergency Room for the events. She has seen her doctor who requested she see a hematologist and a rheumatologist because she was having pain in her legs, she was having to use a walker. The hematologist found that her blood was out of whack. The platelets which was the ones that do the clotting, normal high is 200 and hers were higher than normal at 760, higher than what they call the high normal. The events pain all over body she had chest pain, leg pain, severe pain on her neck may have began a week after the vaccine in Feb2021. The pain was not ongoing, it was gone. They gave her massive doses of steroids she was taking 15 mg of steroids and right now they are lowering it. She had not the pain now but it was worse than childbirth. She has recovered completely from the pain, she felt fine now she has to wait until they take the steroids away again. She stated a lot of the blood, the red blood cell count was low, the hemoglobin was low, everything was low except for the platelets. So they told her to wait. She stated they blame everything on the steroids. Her anxiety started and her heart started racing, they said it was steroids, she was hungry they say it was steroids, she told the doctor she was gaining weight, they say it was steroids. No further information provided. She went to physician on 28Apr2021, the blood hematologist and they say it seemed that most blood work was back to almost normal everything was going down, the treatment she was receiving was working, the platelets were going down. She confirmed she had to wait to come off the steroids to get the second dose and she asked the doctor if she could get the second dose, she still wanted to get it but they told her she has to wait until she is completely

1320357	5/15/2021		73	F	2/1/2021	3/1/2021	cough; chest hurts; clots on both legs and stomach; hemorrhage; Blood sugar decreased; Oxygen saturation low; Blood pressure low; Skin discoloration; vein on her right leg was torn; Difficulty breathing; Tiredness; Breast pain; blockage all over the heart; This is a solicited report from A contactable consumer (patient) based on the information received by Pfizer from AbbVie (Manufacturer Control No: 21K-163-3840719-00). A 73-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 intramuscular on 27Feb2021 (Batch/Lot number was not reported) as 2ND DOSE, SINGLE for COVID-19 immunization; adalimumab (HUMIRA), subcutaneous from 2005 (Batch/Lot number was not reported) to Feb2021, at 40 mg/0.4 ml, then subcutaneous from 21Apr2021 (Batch/Lot number was not reported) and ongoing, at 40 mg 1 in 2 week for moderate to severe rheumatoid arthritis psoriatic arthritis. Medical history included patient consumed a pack of cigarette a day from 1967 to 2019, heart attack from 2003 to 2003, abstains from alcohol, and high blood pressure. Concomitant medication included metoprolol taken for high blood pressure. The patient previously took metformin to manage blood sugar. On an unspecified date, the patient experienced cough, chest hurts, clots on both legs and stomach. In 2010, the patient experienced breast pain and blockage all over the heart. She first tried to do the balloon and had three stents on her heart due to blockage sometime in 2010. In Jan2021, the patient had bypass surgery as treatment heart blockage as well. On 18Feb2021, echocardiogram/ECHO showed blockage all over the heart again. In 2021, the patient had difficulty breathing and experienced tiredness easily. In Mar2021, she was told to have an outpatient diagnostic heart catheter procedure and they had to take her by ambulance to be admitted in a hospital, when she moved during the procedure, a vein on her right leg was torn and also had hemorrhage, blood sugar decreased, oxygen saturation low, blood pressure low, skin discoloration. She experienced a recurring pain in between the breast bone after the triple bypass surgery that was done last 09Mar2021 while in the hospital. She also had blood transfusions while hospitalized as treatment for hemorrhage. The patient was hospitalized for the events for 28 days (also reported as 4 weeks). The event vein

on her right leg was torn was considered life threatening. The events breast pain, blockage all over the heart, difficulty breathing, tiredness, hemorrhage, blood sugar decreased, oxygen saturation low, blood pressure low, and skin discoloration were also considered medically significant. The patient underwent lab tests and procedures which included stress test and echocardiogram/ECHO with unknown result in Jan2021; echocardiogram/ECHO showed blockage all over the heart on 18Feb2021; blood sugar: decreased, blood pressure: low, and oxygen saturation: low, all in Mar2021. The action taken in response to the events for adalimumab was dose not changed. The outcome of vein on her right leg was torn was recovered in Apr2021; hemorrhage and skin discoloration were recovered in Mar2021; clots on both legs and stomach, difficulty breathing, tiredness, blood sugar decreased, oxygen saturation low, blood pressure low was recovering; breast pain, blockage all over the heart was recovered on an unspecified date, while other events was unknown. 1320301	5/15/2021	FL	22	M	4/26/2021	4/26/2021	myocarditis; Strange weird bilateral wrist pain severe; Pericarditis/inflammation around the heart; This is a spontaneous report from a contactable consumer (patient's mother). This consumer reported similar events for two patients (twins). This is the first of two reports. A 22-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EW0170), via an unspecified route of administration, administered in the left arm, on 26Apr2021 10:00, as 2nd dose, single, for COVID-19 immunization, at a pharmacy/drug store. Medical history included ongoing rare metabolic disorder. The patient's concomitant medications were not reported. Historical vaccine included the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: ER8735) received at age 22 years, on 05Apr2021, for COVID-19 immunisation. On 26Apr2021, the patient received the second dose of BNT162B2. In the evening of the same day, 26Apr2021, the patient experienced tiredness/fatigue, and headache. In the morning of 27Apr2021, the patient was feeling really crappy and they thought it was like the flu and it would pass. In the evening of 27Apr2021, the patient didn't sleep at all and was uncomfortable all night and pain. On the same day, 27Apr2021, the patient had severe chest pain, chest tightness, and lightheadedness. On 28Apr2021, the pain didn't go away, and the twins had elevated ST evaluation on the EKG (electrocardiograph). ST evaluation was done by the reporter's husband who is a retired firefighter emergency medical technician. The reporter decided to take the patient to hospital and said that the other twin had the same symptoms but kept saying his wasn't as bad as his brother's because he did not want to go to the hospital. The doctor advised the reporter to bring the other twin. The twins had the same echo cardiogram on 28Apr2021 (unknown results). On 28Apr2021, their troponin levels were elevated, and their cardiac enzymes continued to go up. On the same day, 28Apr2021, the patient had a strange weird bilateral wrist pain severe. It was reported that the twins were hospitalized on 28Apr2021 with myocarditis/pericarditis and inflammation around the heart. Treatment for myocarditis/pericarditis included ibuprofen and colchicine; and Toradol for breakthrough pain. The reporter stated that the twins are two identical males with the same DNA, had the vaccine at the same time, had the reactions at the same length of

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

					time, have the same lifestyle and live at the same house. The reporter said it would go a long way if they help her understand the complication. The patient recovered "strange weird bilateral wrist pain severe" on 29Apr2021. The outcome of the event myocarditis and pericarditis/inflammation around the heart was not recovered.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021487544 same reporter, suspect drugs and events; different patients

1320033	5/15/2021	CO	59	F	4/16/2021	4/1/2021	weak; blood pressure (BP) and it was 131/104, her pulse was 104; cognitive problems/forgetting words/forget what she was going to say it would take a while, like a brain fog; forgetting words/forget what she was going to say it would take a while, like a brain fog; she would forget what she was doing; she felt unwell; she was wheezing a bit; exhaustion; cough; body aches/bad pain; pain in all of her left arm where she got the injection; pain in the left side of chest; her heart was hurting; her heart was really pounding, like she was in a race/pulse was 104; her temperature it was not too high, it was 99.5 so not over 100; very severe headache with dizziness; nausea; very severe headache with dizziness; she could not fall asleep; pre-existing condition (chronic motility issues) got worse; pre-existing condition (chronic motility issues) got worse; upset stomach; severe abdominal pain; This is a spontaneous report from a contactable consumer (who is also the patient). A 59-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EW0170), via an unspecified route of administration, on 16Apr2021, as 1st dose, single, for COVID-19 immunisation. Medical history included hypotension from an unspecified date, and chronic motility issues from 2017 and ongoing. The patient's concomitant medications were not reported. On 16Apr2021, the patient received the first dose of BNT162B2 and got slightly dizzy immediately after the vaccine. Her arm did not hurt, and she was okay until she went home. She had nausea and headache. She went to sleep and woke up after 12 midnight (17Apr2021) with a really bad headache and her heart was pounding like she was in a race. She also had pain in all of her left arm where she got the injection, body aches and pain in the left side of chest, like her heart was hurting. She checked her temperature it was not too high; it was 99.5 so not over 100. She took Tylenol 100 mg. She woke up at 2:00 and still had headache. It took all night to help her headache and she took another Tylenol 500 mg. When she woke up next morning, she still had a headache but not as severe. She thought okay this is going to be the usual thing and go away in a couple of days. She reported that from 16Apr2021, she could not fall asleep and would get a headache which got worse as she was not falling asleep. On 17Apr2021 and 18Apr2021, the patient experienced really bad pain, her arm was hurting,

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

and she kept taking Tylenol. On 18Apr2021, she started coughing so she took Robitussin for the cough. On the same day, 18Apr2021, she had body aches, nausea and was exhausted. She mentioned that she is a very active person, an avid cyclist, and normally walks 10 miles, but when she walked a couple of miles, she was exhausted and could not do anything else. It was very difficult for her and it was unusual. She was still experiencing the events on 19Apr2021 and 20Apr2021. So, on 21Apr2021, she went to her primary care physician's office but saw another doctor who was available that day. The doctor checked if her legs were swollen and checked her lungs. The doctor stated the patient was wheezing a bit but did not see anything else. The doctor advised her not to take the second dose. The patient mentioned that her pre-existing condition (chronic motility issues) got worse. In Apr2021, experienced upset stomach, severe abdominal pain. On 22Apr2021, she woke up and felt totally fine. She thought the symptoms were finally going away. But at 17:00, she felt unwell, had body pain, headache, and she was coughing again. She went to sleep and woke up on 23Apr2021 at 04:30. She woke up with a severe headache, extreme nausea (no vomiting), was really weak, dizzy, absolutely exhausted. She still had exhaustion, nausea, body aches, and cough. She checked her blood pressure (BP) and it was 131/104, her pulse was 104. She took Tylenol 1000 mg and the symptoms did not go away so she took another Tylenol 500 mg. After an hour, her headache was not better, dizziness was bad, but her BP was going down. She called the nurse line and was advised to go to the ER. At the ER, she was given IV fluids to hydrate and pain medications. She was then tested for COVID-19 which came back negative. The patient also had cognitive problems. By the time she got to the ER, she was forgetting words (she would try to say something and she would forget what she was going to say it would take a while, like a brain fog) and she would forget what she was doing. She would catch herself forgetting and not remembering words. The patient wanted to know if she should get the second dose, how long should she wait until she gets her second dose, how long do the side effects last, will the side effects from the second dose be worse, how the vaccine works, asked the ingredients of the vaccine, and asked if there is a need for a third dose.

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

The patient assessed the events dizziness, nausea, headache, pain in arm, chest pain, fatigue, body aches/bad pain and cough as serious (medically significant). The patient was recovering from dizziness, headache, body aches/bad pain, hypertension, cognitive disorder, aphasia and memory impairment. The outcome of the events nausea, fatigue, and cough was not recovered. The outcome of the remaining events was unknown.

1320110	5/15/2021	WV	48	F	4/21/2021	4/21/2021	<p>This is a spontaneous report received from a contactable consumer (patient) . A 48-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot ER8735), in Arm Left on 21Apr2021 at 15:15 (at 48 years) at single dose for covid-19 immunisation. Medical history included urinary tract infection (UTI) and history of low blood pressure (not ongoing). She biked and hiked and eat healthy. Family history included high blood pressure in her dad and in her sister. Previously on 24Mar2021 (at 48 years) the patient received the first dose of the vaccine (lot ER8730) in right arm for covid-19 immunisation. Concomitant medication included ciprofloxacin taken for urinary tract infection from 10Apr2021 to 16Apr2021 (She just came off antibiotic a week prior to the second shot). On 21Apr2021 at 10:05 PM her heart rate was "extremely accelerated" (had accelerated heart rate) and patient stated that her chest, neck, and head felt "super hot" (her chest, neck, and head were hot) and also stated that she was feeling "weird" and "floaty". She stated these symptoms lasted about 15 seconds and went away but had another episode right after that she stated was "not as intense but pretty intense still." She had a couple of those situations and she kept getting a wave of like this floating feeling or sensation all over her body. She reported going to the emergency room (ER) on 21Apr2021 where she had a few more incidents like this and stated that she also got "real hot" and had a "sensation" all over her body all at once that she cannot describe (she states that it's different than a "pins and needles" feeling) that made her dizzy and caused her heart to race. She stated these symptoms continued for a couple of days. She reported that on 24Apr2021 she woke up and felt fine but on 24Apr2021 at night stated that the symptoms returned but worse, her muscles started "trembling and jerking" and reported having a hard time talking and walking; she got that all over sensation again all over her body, her heart was racing, her chest was tight and hot and her muscles were tremoring and her leg muscles started jerking and she had trouble talking and walking, her throat and neck were feeling tight and closing. She reported she took 2 Benadryl and drank some sugar 2 teaspoons of sugar water but her symptoms worsened so she went back to the ER. She stated that by the time she got to the</p>

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

emergency room, her symptoms had subsided except her legs were "still trembling"/ her legs were just shaky. At the ER they checked her heart and did a blood panel. They said everything was good, they sent her home. On 25Apr2021 and on 26Apr2021 she was dizzy, weak, shaky, and had other incidents of her heart racing that she stated weren't extreme and then started to feel better on 27Apr2021. She reported that on 27Apr2021 night she woke up and her chest was tight again, it was hot and tight on the left side, she had that floaty feeling again all over. She had left side chest pain from 23:00 until 5:40 in the morning then it stopped, everything stopped and she was fine all day. On 29Apr2021 afternoon she felt better but still had some slight dizziness "almost like vertigo" but on 29Apr2021 night she was back at the ER, she had that all over feeling again, that sensation all over, her leg muscles were jerking, she couldn't talk again, she took Benadryl and drank sugar water again because it worked before she really does not know if that was what worked but it calmed down after that the time before. She went back to the ER they checked her in and this time the sensation, the feeling that was all over stayed in the right arm and leg but it subside on left side, her heart was racing a couple more times. It was right when her legs muscles started trembling, they were having minor jerks, not as bad but every time that happened her heart rate would go up, her resting was 59 or 61 and it got up to 101. Her neck and chest would get hot. On 29Apr2021 night she was in the ER for quite a while, it subsided they sent her home with some Ativan for tremors and palpitations and told her to follow up with a cardiologist. Patient went to the cardiologist, she had blood and labs done and she had 2 conferences on the phone with her doctor. On 30Apr2021 morning she was super dizzy and weak and shaky and light headed and nauseous. She went to a cardiologist on 30Apr2021 and has been hooked up to a 7 day heart monitor. She reported that she still felt "real trembly" she has started feeling a little dizzy and floaty feeling. Event accelerated heart rate was ongoing, it just popped up whenever on and off. Dizziness was ongoing, patient said it was on and off but it was more on than off; she said sometimes it was worse or it was less but it had never left. Chest pain recovered on 28Apr2021 at 05:40. Outcome of the other events was unknown. Events heart rate increased ,

Pain when he touches; His left upper chest area has swelling and when he touches it he feels something hard. Pain when he touches; His left upper chest area has swelling and when he touches it he feels something hard. Pain when he touches; He feels pressure on his chest; It feels like pain on the heart. It's a sharp needle like pain in some spots; my left arm and also my back there is going to pain seems like needle anything from the back; my left arm and also my back there is going to pain seems like needle anything from the back; This is a spontaneous report from a contactable consumer (Patient) via a Pfizer sponsored program. A male patient of an unspecified age received second dose of BNT162B2 (solution for injection, Lot number: ER8735) via an unspecified route of administration on 25Mar2020, as 2nd dose, single for COVID-19 immunization. Medical history and concomitant medications were not reported. Patient received first dose of BNT162B2 (solution for injection, Lot number: CVS8601) via an unspecified route of administration on an unspecified date, as 1st dose, single for COVID-19 immunization. It was stated that everything was fine on the first day after second dose and then from the second and third day the patient had a pain which was weird clot, and it was not that area where he got the shot. It was like between shoulder and neck, left shoulder, and neck. A kind of in deeper area there was lot of bone and just like where neck was connected to shoulder but it was in front of right. Patient had pain when he touched there in like size of the corn was like he could feel something hard inside and then just started day prior to this report further on the evening and started having chest pain like whole that spot felt like he was having heart pain and his left arm and his back there was going to pain seemed like needle anything from the back. The pain was constant. It was not on chest, it was not like that would come and go, would say it was bearable thing, but it was constant and breath that goes inside his body it was still there when touched, it was still paining. Patient upper left chest area had swelling and when touched it, he felt something hard. It would pain when touched. Patient felt pressure on his chest. It feels like pain on the</p>

1320173	5/15/2021	NY	37	F	4/22/2021	4/29/2021	<p>her chest didn't feel normal/ she had shooting "things" in her chest, and she felt weird; really bad chest pain; when the chest pain first started, she couldn't move or breath; when the chest pain first started, she couldn't move or breath; she had shooting pains in her left breast area. She said after an hour, the shooting pains moved from her left breast area to the center of her chest; This is a spontaneous report received from a contactable consumer (patient). A 37-year-old female patient received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, LOT number: EW0169, expiration date unknown) via an unspecified route of administration at arm left on 22Apr2021 between 07:00-07:30 at age of 37-year-old at single dose for COVID-19 immunization. Medical history was reported as none. Patient had no history of all previous immunization with the Pfizer vaccine considered as suspect and no additional vaccines administered on same date of the Pfizer suspect. The events required a visit to emergency room. Physician Office visit was not required. There was no prior vaccinations (within 4 weeks). Concomitant medications included acetylsalicylic acid (ASPIRIN (E.C.)), paracetamol (TYLENOL 8 HOUR). Patient had her first COVID-19 Vaccine dose one week and one day ago on 22Apr2021. She said she was rushed to the hospital last night on 29Apr2021 (at around 11:00 PM) because she thought she was having a heart attack. She said she had really bad chest pain that lasted about 30 minutes. She clarified when the chest pain first started, she couldn't move or breath. She said she took an aspirin before she went to the hospital. She said she still had a shooting pain in her chest, today on 30Apr2021. She said she wanted to know what was going on. She said while she was at the hospital (Emergency Room), she had blood work done on 29Apr2021, and she had no blood clots. She said she had a (chest) x-ray done on 29Apr2021, and the (chest) x-ray was fine. She said her heart was monitored, and her heart was fine, but her left chest still had pain. She said she was a healthy 37 year old, who had no types of problems. She said the only thing she had recently was the COVID-19 Vaccine. She said she wanted to know if she should get the second COVID-19 Vaccine, or if the second COVID-19 Vaccine would kill her. The caller was advised she would be transferred to Pfizer Medical Information for further</p>

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

assistance. Patient reported she liked to Google, and was not sure if anybody had called Pfizer to go and report if they experienced chest pain after getting the COVID-19 Vaccine. She said she was not sure if the hospital was going to report what happened to her. She said she asked the (emergency room) doctor last night about people experiencing chest pain after getting the COVID-19 Vaccine. She said the doctor told her people with COVID complain about chest pain. She said what the doctor said didn't mean anything because he was talking about the COVID-19 Virus, and not the COVID-19 Vaccine. She stated she took 1 Bayer brand Aspirin 81mg (Lot Number: N8A94D0 or O, Expiration Date: Sep2022) before she went to the hospital for chest pain. She stated the hospital gave her Ketorolac to treat her chest pain. She said the Ketorolac was given to her in an IV form through an IV access in her arm. She said she did not have the Ketorolac dose, NDC, Lot, and Expiration Date. She reported that on 29Apr2021, the hospital took some urine and blood tests, a chest x-ray, and an EKG which was normal. She said beside the Ketorolac that was all the hospital (emergency room) did. Patient reported she took Tylenol 500mg caplet (Lot Number: AAA103, Expiration Date: Sep2024) if she had a headache, but usually didn't take medication. Reported while waiting for the doctor to see her at the hospital (emergency room) on 29Apr2021, she had chest pain for about 5-10 minutes. She said the chest pain calmed down, but she had shooting pains in her left breast area. She said after an hour, the shooting pain moved from her left breast area to the center of her chest. She said the chest pain was not as bad today (30Apr2021), as it was last night. She said her chest didn't feel normal on 30Apr2021, and she still had the shooting pains. She said after she had been talking with the Pfizer agent, she had shooting "things" in her chest, and she felt weird. No further details provided. Events were serious as hospitalized. Outcome of chest pain was recovering, of the other events was unknown. Communication: The caller was provided with phone number of option 3, and hours of operation of Monday through Friday, 8AM to 8PM ET & Saturday and Sunday 9AM-3PM, prior to warm transfer Follow-up attempts are needed. Further information is expected.

1320294	5/15/2021		38	M	5/1/2021	5/1/2021	Myocarditis; Pleuritic Chest Pain; Difficulty breathing; Myalgia; Headache; Flu-like symptoms; This is a spontaneous report from a contactable physician. A 38-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot number was not reported), via an unspecified route of administration on 01May2021 as second dose, single for COVID-19 immunization. Medical history and concomitant medications were not reported. The patient previously received the first dose of BNT162B2, on an unknown date, for COVID-19 immunization. The patient experienced myocarditis on 05May2021, and in May2021 (reported as started 2 and a half days after receiving the second dose) experienced pleuritic chest pain, difficulty breathing, myalgia, headache, and flu-like symptoms. The patient was hospitalized for the events from 05May2021 to an unknown date. The reporter assessed the events as life-threatening. The adverse events required a visit to Emergency Room. The reporter assessed that the patient's events were caused by the vaccine. The outcome of the events was unknown. No follow-up attempts are possible. Information about batch/lot number cannot be obtained. No further information is expected.; Sender's Comments: Based on the limited information currently available, a possible association of the suspect drug administration with the reported events cannot be excluded, due to a plausible temporal relationship. This case will be reassessed when additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1320193	5/15/2021	IN	74	F	3/18/2021	3/18/2021	This is a spontaneous report from a contactable consumer (patient). A 74-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration, administered in Arm Left on 18Mar2021 10:30 (Lot Number: ER2613) as 2ND DOSE, SINGLE for covid-19 immunisation. Medical history included supraventricular tachycardia from Dec2020 and ongoing; ongoing blood pressure high; she was diagnosed with high blood pressure post pregnancy. She said the last 6 weeks of her pregnancy she had toxemia. Her blood pressure was up, then went back down, and then shot back up. She experienced tachycardia at the time too. She took atenolol for 46 years for her high blood pressure. She was confident she had the COVID-19 Virus in Jan2020 before anyone knew about the pandemic. She and her husband got the COVID-19 vaccine so they could visit family, whose son was diagnosed with multiple myeloma. They were planning to go in Jun2021 for a visit, and her husband's family wouldn't let them visit unless both of them had the COVID-19 vaccine. No additional vaccines administered on same date of the Pfizer suspect. No Prior Vaccinations within 4 weeks. Concomitant medications included in the morning of 18Mar2021 she took atenolol 25 mg tablet that was dispensed in a pharmacy. She regularly took atenolol 25 mg, twice a day. She also took olmesartan 5 mg (NDC Number: 16729-320-15, Lot Number: M2015864, Expiration Date: Oct2022). She regularly took olmesartan 5 mg, twice a day. She clarified 4 days after her second COVID-19 Vaccine, her cardiologist's Nurse Practitioner increased her olmesartan dose from 5 mg twice a day to olmesartan 10 mg, twice a day. The increased Olmesartan dosage gave her a monstrous headache. The cardiologist's nurse practitioner told her she would also need a blood test to make sure the olmesartan increased dose wasn't affecting her kidneys. Her primary care doctor asked how she was tolerating the increased olmesartan dose. She told her doctor she wasn't happy that the olmesartan could affect her kidneys and the headaches were killers. Her doctor told her that headaches were a side effect of olmesartan. She stayed on the increased olmesartan dosage for 3 weeks before her primary care doctor decreased her olmesartan dose back to 5 mg, twice a day on 17Apr2021. She said she

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

had to go back to her doctor on 17May2021 for a follow-up appointment. She said her headaches were not as frequent since she reduced the olmesartan dose to 5 mg, twice a day. She still had headaches in the morning, and headaches at night, but was OK during the day. She treated her headaches with a cold cloth on her forehead. She said if her headache was extreme, she would take generic acetaminophen 500 mg caplet (100 caplets/bottle, NDC Number: 36800-484-78, Lot Number: GE2569C, Expiration Date: Apr2022) a couple times. She had to use a magnifying glass to read the Acetaminophen 500 mg caplet product label as the type was very tiny of the product label, and she was using reading glasses. She took regularly hydrochlorothiazide, triamterene (TRIAMTERENE/HCTZ, manufacturer Lannett) 37.5 mg/25 mg tablet, once a day. Primary care doctor kept her on regular visits to monitor her blood pressure. The patient previously received first dose of BNT162B2 (Lot Number: EN6205) Intramuscular in her left arm on 25Feb2021 had no reaction to the first COVID-19 Vaccine. She said within 30 minutes after getting the second COVID-19 Vaccine on 18Mar2021, her heart was racing. Her heart felt like it was fluttering in her chest. She said she felt very hot and was not comfortable. She said in the car, on the way home from getting her second COVID-19 Vaccine, her husband wanted to take her to the Emergency Room. She said she didn't feel it was critical, and her heart racing felt like the tachycardia she had experienced in the past. She said she called the COVID-19 Vaccination facility when she got home. She said she was told by them to lay down and rest for a while to see if that helped, and if she had chest pain or wasn't feeling better, to go to the Emergency Room. She said she went to bed, and laid down at their suggestion, and it took about 48 hours for her heart rate to settle down completely. She clarified when she first checked her heart rate, her heart rate was 116. She said prior to the COVID-19 Vaccine, her normal resting heart rate was 58, and now her resting heart rate is around 66. She said her blood pressure went out of control, too, and she had not been able to get her blood pressure under control since. She said she checked her blood pressure when she got home from her second COVID-19 Vaccine. She said her blood pressure would go up and then come down. She said the highest blood pressure reading she

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

experienced (after getting her second COVID-19 Vaccine) was 201/116, and her lowest blood pressure reading (since then) was 152/96. She said her blood pressure at 11:00 PM last night (29Apr2021) was 168/93. She said prior to getting the COVID-19 Vaccine, her blood pressure averaged 139/83 with her lowest reading being 121/79. She said now her blood pressure readings average between 155-165/80s. She said her primary care doctor, and her cardiologist were in touch with each other about her medications. She said she breezed through her first COVID-19 Vaccine, but the second COVID-19 Vaccine had took a toll on her. She said from 2021 she had no energy and couldn't get out of her own way now. She said she was not the typical 75-year-old. She said she didn't retire until she was 70-year-old and was very active up until the time she received her second COVID-19 Vaccine. The events require a visit to physician office. She didn't take any over-the-counter or prescription medications for Heart Racing, but went to bed, laid down, and rested. She was very cautious about taking over-the-counter medications with her prescription medications. She said she tried to limit taking over-the-counter medications because she thought it was safer to do so. She checked her blood pressure when she got home from her second COVID-19 Vaccine. She said she had been tracking and checking her blood pressure, and took her blood pressure readings to her primary care doctor. She said her doctor made a copy of her blood pressure readings and put the blood pressure readings in her medical file. She said her blood pressure would go up and then come down. She said the highest blood pressure reading she experienced (after getting her second COVID-19 Vaccine) was 201/116, and her lowest blood pressure reading (since then) was 152/96. She said her blood pressure at 11:00 PM last night (29Apr2021) was 168/93. She said prior to getting the COVID-19 Vaccine, her blood pressure averaged 139/83 with her lowest reading being 121/79. She said now her blood pressure readings average between 155-165/80s. She didn't take any medication specifically to treat the high blood pressure after the second COVID-19 Vaccine. She had already took her regular medications that morning (18Mar2021) before she went for the COVID-19 Vaccine. The outcome of event her heart was racing, her heart felt like it was fluttering in her chest, felt very hot,

she was not comfortable was recovered in Mar2021, of event she had not been able to get her blood pressure under control was not recovered, of events had no energy and tachycardia was unknown.

pericardial effusion tamponade; This is a spontaneous report from a contactable consumer (patient). A 67-year-old female patient received bnt162b2 (Pfizer-BioNTech COVID-19 vaccine), dose 2 via an unspecified route of administration, administered in Arm Right on 23Feb2021 (Batch/Lot Number: EN8208) at the age of 66 years old as 2nd dose, single for covid-19 immunisation. Medical history was not reported. The patient's concomitant medications were not reported. The patient previously received first dose of BNT162B2 on 31Jan2021, (Lot Number: EL9264) in the right arm at the age of 66 for COVID-19 vaccination. The patient reported that she began having signs and symptoms on 29Mar2021; heavy weight in throat like there was a softball in her throat; pressure in that area when she bent over; chest tightness; difficulty breathing; a lot of chest pain; chest stiffness; sharp stabbing pain in upper left chest. The patient stated that it took 13 days and 2 trips to the ER and multiple Doctor calls before they could diagnose what was wrong. She had visited her general doctor who thought she had an embolism and sent her to the Emergency Room on her second visit. They did a D-Dimer test, which they hadn't done on her first Emergency Room visit. The patient was diagnosed with pericardial effusion tamponade on 08Apr2021 as confirmed with the echocardiogram performed on 09Apr2021. On 09Apr2021 they removed the fluid, 700cc of blood, surrounding her heart. The patient was in the ICU from 08Apr2021 to 16Apr2021. The patient stated that she was hoping she would be able to transfer to a hospital but she was in too bad of shape to be transferred. The patient reported that she has some mild symptoms, residual symptoms, some pain in chest and some tightness, but it was much better now. She had an echocardiogram a week after getting out of the hospital which showed no fluid now. The patient was placed on medication. The outcome of the event was recovering. Follow-up attempts are needed. No further information is expected.

1320279	5/15/2021	CO	34	F	4/12/2021	4/22/2021	chest pain; pulse started racing; dizzy and light headed; significant allergic reaction to the vaccine/Respiratory tract oedema /Flushing/urticaria/swollen tongue/Pharyngeal swelling/Dizziness; mental fog; This is a spontaneous report from a contactable consumer (patient). A 34-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in arm right on 12Apr2021 14:45 (Batch/Lot Number: Er8737) as 2nd dose, single for covid-19 immunisation. The first dose was received on 22Mar2021 14:45 (lot number: En6208) on the left arm. Medical history included polycystic ovaries, thyroid and serious food allergies. Concomitant medications included levothyroxine sodium (TIROSINT) taken for an unspecified indication, start and stop date were not reported. Approximately 10 minutes after shot on 22Apr2021 15:00 (2nd dose only) patient was flushed, pulse started racing, and hives appeared all over her chest. Over the next hour hives worsened, heart rate stayed fast, had swelling in tongue and throat, and became dizzy and light headed. Patient's husband wanted to take her to ER, but patient was stupidly resistant. She took a large dose of Benadryl. As the swelling in her airway lessened and the mental fog passed it became more obvious that patient had been having a significant allergic reaction to the vaccine. She was instructed to wait at the pharmacy she received the shot at for only 5 minutes because she had not had an adverse reaction to the 1st dose. She was alone when the reaction began. Patient took a 2nd dose of Benedryl before bed. The next day on 23Apr2021, chest pain began again and patient did go to the ER. The doctor believed symptoms on day 1 were an allergic reaction to vaccine and on day 2 were a strong immune response to the vaccine. They did an EKG and monitored the patient. She reported she was okay at the time of report. Patient received treatment for the events. Outcome was recovered. Patient was not diagnosed with COVID prior to vaccination and had not been tested post-vaccination. Information on the lot/batch number has been requested.

1321144	5/15/2021	CA	14	F	5/14/2021	5/14/2021	<p>Patient received the 1st COVID vaccine (Pfizer lot # EW0182 use by 5/15/2021) at 1455. The client had a history of fainting (x3) with intramuscular injections. The client reported eating lunch prior to arriving for her appointment. The client was vaccinated in the anti-gravity chair at 1455 by EMT. The client became very pale about 1 minute following the vaccination administration and she loss consciousness for 5 seconds, during this time she had 2 myoclonic contractions. RN and EMT immediately placed the patient in Fowler's position in the anti-gravity chair during the syncopal episode. The patient immediately regained consciousness and was alert and oriented to person, place, time, and situation. The patient remained in Fowler's position and vitals were taken at 1456: BP 125/95 (R arm), HR 45, RR 18, and oxygen saturation at 95%. The patient denied experiencing lightheadedness, shortness of breath, dizziness, nausea, headache, or blurry vision. The patient was given a juice box. The patient's color slowly returned. Vitals were retaken at 1505: BP 123/82 (R arm), RR 20, HR 50, oxygen saturation at 98%. The patient stated, " I usually feel really bad after I faint but this time I feel fine." Vitals at 1510 were as follows: BP 130/70, RR 18, HR 67, oxygen saturation at 100%. The patient was speaking in full sentences and laughing with her friend. Vitals taken at 1515: BP 125/ 68, RR 16, HR 68, oxygen saturation at 99%. The patient was positioned from a Fowler's position to sitting upright. The patient's color returned to her face and she denied any nausea, dizziness, blurred vision, double vision, or chest pain. Vitals were taken at 1520: BP 125/70, HR 82, RR 16, oxygen saturation at 99%. At 1524, the patient's blood pressure was 125/68 and HR was 58. The patient continued to deny any shortness of breath, dizziness, nausea, or vision changes. The patient's heart rate was taken at 1531, HR 55 and again at 1536, HR 62. The patient's mother stated her daughter was currently taking an antibiotic for acne (dosage and name unknown) and denied having any drug allergies or chronic medical conditions. RN instructed the patient and her mother about emergency precautions and to follow up with their primary care provider. RN, also educated the patient and her mother about the importance of informing the healthcare provider about her history of fainting with injections when receiving the second COVID Pfizer vaccine. Gave the patient's mother V-safe</p>

1320140	5/15/2021	OH	48	M	4/20/2021	4/29/2021	Mini Stroke; Weakness on left side; memory loss; This is a spontaneous report from a contactable consumer (patient). A 48-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE lot number: EW0153) via an unspecified route of administration, administered on the left arm on 20Apr2021 10:30 1st dose, single for COVID-19 immunisation. Medical history included COVID (prior to vaccination), pre-diabetic, anxiety, chest tubes and chest pain. The patient's concomitant medications were not reported. On 29Apr2021 22:00, the patient had a Mini Stroke. Also have weakness on left side and memory loss. The events resulted in Emergency room/department or urgent care visit/hospitalization. The patient was hospitalized for 2 days. Treatment was received for the events which included bloodwork, MRI, CT scan. Since the vaccination, the patient has not been tested for COVID-19. The facility where the vaccine was administered was in a pharmacy or drug Store. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Outcome of the events was not recovered.
1321328	5/15/2021	VA	17	M	5/13/2021	5/15/2021	Intense headaches the day after taking the shot, back pain from the waist up. 2 days later I woke up with chest pain and the lingering headache, my chest feels heavy and maybe shortness of breath. I did a bunch of research however I did not find anything about chest pain related to the second dose of Pfizer. I am not sure if it is some type of tissue or muscle pain or something more serious. When I massage my chest it does not ache like the muscle pain from my shoulder so id assume it has to do with maybe my lungs or heart.
1321373	5/15/2021	NJ	45	M	5/10/2021	5/13/2021	Diagnosed with Myocarditis. Severe chest pain began at 2:30am. Went to hospital ER at 4am. Was given an ekg and blood test which showed a potential heart attack and was treated with Nitroglycerin at 4:30 am. Was given a cardiac catheterization at 6am that showed no heart attack and no arterial obstructions but showed one wall of the heart was not functioning properly. Heart issue was confirmed later in the day by an echocardiogram study. Was admitted to the hospital. Had an additional attack of chest pains at approximately 2:30pm the next day which was treated with 3 tablets of Nitroglycerin. Blood tests showed markers for inflammation.

1321408	5/15/2021	CA	24	M	5/12/2021	5/13/2021	patient had chest pain and SOB Day 2 after vaccine and in ER has signs of myocarditis requiring hospitalization
1321418	5/15/2021	NC	48	F	3/10/2021	4/10/2021	On Saturday, April 10, 2021, I had started having pain and swelling in my right calf that lasted for several days on and Tuesday, April 13th, I started having pain on the left side of my chest. On Thursday, April 15th, I went to the ER due to pain and swelling in my leg and it was discovered that I had 2 clots in my leg (on at my calf and a second one on the right side of my knee). Not realizing my chest pain was related, I discussed with my primary care at a follow up visit on Monday, April 19th, and a CT scan was performed confirming I have an pulmonary embolism (extensive pulmonary emboli in both lungs). I was immediately put on Xarelto blood thinner and sent home.

1316151	5/14/2021	FL	72	F	12/19/2020	1/8/2021	<p>This is a spontaneous report from a contactable other HCP (healthcare professional), the patient. A 72-year-old non-pregnant female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; solution for injection; Lot Number: E11283) via an unspecified route of administration on 19Dec2021 at 12:00 (at the age of 72-years-old) as a single dose for COVID-19 immunisation. Medical history included "HTH GERD" and sulfa allergy, both from unspecified dates and unspecified if ongoing. Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medications (received within two weeks of the vaccination) included pantoprazole sodium sesquihydrate (PROTONIX), losartan and anastrozole, all taken for unspecified indications on unspecified dates. The patient did not receive any other vaccines within 4 weeks prior to the COVID-19 vaccine. The patient previously received demerol for an unspecified indication on an unspecified date and experienced allergy (reported as "known allergies: Eli sulfa demerol"). On 08Jan2021 at 12:00 the patient experienced severe cellulitis on trunk anterior/posterior, elevated temp white count pain, fatigue, SOB (shortness of breath) and chest pain. All events were serious for hospitalization on an unspecified date, for 5 days. All events resulted in a doctor or other healthcare professional office/clinic visit and an emergency room/department or urgent care visit. The events required treatment with antibiotics for 6 weeks. The clinical outcomes of the events severe cellulitis on trunk anterior/ posterior, elevated temp white count pain, fatigue, SOB (shortness of breath) and chest pain were all recovered/resolved with sequel (recovered with lasting effects) on an unspecified date. Since the vaccination, the patient had not been tested for COVID-19. Information on Lot/Batch number was available. Additional information has been requested.; Sender's Comments: Based on the information available the reported events more likely represent intercurrent medical conditions that were unlikely related to BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE). The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as</p>

1317414	5/14/2021	ID	17	M	5/9/2021	5/9/2021	<p>17yo otherwise healthy male presents to clinic for worsening cough, runny nose congestion, and sweats starting 4 days ago. He received the COVID vaccine 5 days ago in the afternoon and initially had what he expected to be normal side effects from the vaccine that evening. Symptoms included body aches, runny nose and general malaise. However, over the last few days he has felt worse and developed more congestion, cough, and sweating. He did improve a little bit 2 days ago but then started to feel worse yesterday and had a worsening cough that is resulting in some chest tightness. Cough is productive sounding. Mom describes it as barking. No appreciable wheezing but he sounds hoarse. He has some SOB after coughing repeatedly. He states it simply feels like it is hard to breathe for 10-20minutes after a coughing attack but then it resolves. He developed sweating yesterday as well. He states he will just start sweating for no reason. No measured fever. No chills. Today he has dried skin and cracked lips from blowing/wiping his nose all the time. No fevers. No vomiting. No diarrhea. No numbness/tingling. No redness/swelling at injection site. No rashes. No HA. EXPOSURE: No one at home is sick, No known exposures prior to vaccine CHRONIC: None, no hx of asthma or allergies, hx of eczema. PCP: None UTD on immms. Vitals: Wt 163.4, HR 60, RR 18, Temp 97.8, O2 sat % 98 Past Results: Examination: GENERAL APPEARANCE: alert, no acute distress, non-toxic, mildly diaphoretic, talking and cooperating throughout exam, sitting comfortably on exam bed, able to talk in complete sentences. HEAD: no visible lesions or abnormalities. EYES: no eye, eyelid, or orbital abnormalities identified. EARS: BILATERAL TMs pearly gray without erythema, effusion, or purulence; EAC with normal amount of cerumen bilaterally, no mastoid erythema or tenderness. NOSE: patent nares, congested, clear rhinorrhea. MOUTH/THROAT: moist mucous membranes, uvula midline, mild pharyngeal erythema without tonsillar exudate, no soft palate lesions, no trismus, no soft palate swelling or erythema, no difficulty swallowing or drooling. NECK: supple, non-tender, FROM. CHEST: normal shape, good expansion, no visible lesions/abnormalities, no tenderness, no retractions, no</p>

A 61-year-old female patient received BNT162B2 (COMIRANTY; Solution for injection; Lot number and expiration date: unknown), via an unspecified route of administration in left upper arm on 22Apr2021 12:10 (at the age of 61-year-old) as unknown single for COVID-19 immunization. This report was not related to a study or programme. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Adverse events following prior vaccinations was first time had flu shot made her very ill, next year doctor suggested she should just have half of a shot instead of full shot to see if she tolerated it and she was able to tolerate that. She had not any other problems with flu vaccines in general. Some of the other vaccines, she was just supposed to take Benadryl with them because of some of the filler ingredients people put in things. She had previously had the 1 dose shingles vaccine, but she had gotten probably shingles probably a couple of months after that so they encouraged her to get the 2 part shingles vaccine at a later date and told her to do the pre-medicate routine like Benadryl day before, day of and at least 2 days after shingles vaccine doses and if any major problems call for help. She did not have a noticeable problem from the 2 part shingles vaccine. Some of the times depends on what filler ingredients people use. She was allergic to nutmeg which was used as an emollient oil or it's called Myristicin something or other oil; if something has too high a dose of mannitol it can cause a problem. She has a very long list of allergies and high sensitivities; if it was a high enough sensitivity it goes in allergies list, even though it may not be a true allergy. Family has lots of allergies. Regarding prescribed indication additional details: She had 3 doctors who initially advised her to get the vaccine including her primary care physician, oncologist and haematologist; this was because she was a high risk person because of

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

various health issues. Her haematologist 2-3 months ago when she had her last appointment with him he was saying to get the shot and prescribed the epi-pen at that time; no one was having it yet, but he expected she would have some sort of reaction to it not able to be covered by Benadryl alone. Medical history included ongoing platelet disorder Verbatim: Unidentified platelet disorder, Lots of allergies, cardiac murmur, ongoing asthma, osteoarthritis, glucose tolerance impaired, hypoglycaemia slow thyroid and back and neck pain. Concomitant medication(s) included diphenhydramine hydrochloride (BENADRYL) taken for hypersensitivity (50mg taken as needed), cetirizine hydrochloride (ZYRTEC [CETIRIZINE HYDROCHLORIDE]) taken for hypersensitivity (10mg daily), fluticasone propionate, salmeterol xinafoate (ADVAIR) taken for asthma (250/50 twice daily), levothyroxine sodium (SYNTHROID) taken for hypothyroidism (137mcg-1 tablet daily), methylphenidate hydrochloride (RITALIN) (20mg tablet twice daily), salsalate, colestyramine (QUESTRAN LIGHT) (2-500mg tablets 3 times daily), sucralfate (CARAFATE) (1mg tablet 4 times daily-dosage verified with caller as milligrams and captured as provided), loperamide hydrochloride (LOMOTIL [LOPERAMIDE HYDROCHLORIDE]) (2.5/0.25 takes 2 tablets of that 4 times daily), calcium carbonate (CALCIUM OYSTER SHELL [CALCIUM CARBONATE]) (Alternates dose of 500mg and 1000mg on days takes Vitamin D), vitamin c [ascorbic acid] (VITAMIN C [ASCORBIC ACID]) (250 mg), vitamin D (50,000 units every other day taken), vitamin B12 (1mg injection every 14 days), clonazepam (KLONOPIN) (2-1mg tablets at bedtime), montelukast sodium (SINGULAIR) taken for asthma (10mg tablets at bedtime) and cefixime (FLEXERIL [CEFIXIME]) taken for back pain, neck pain (10mg tablets 3 times daily as needed). On 22Apr2021, Onset time: She had a note saying her eyes itchy at 12:20, but they were itching before that because she waited long enough to report it; so onset time was less than 10 minutes when her eyes started itching. Then her pulse; she could feel chest pain; heart palpitations; pulse felt like her heart was racing very hard. They did check her pulse while she was in their initial observation and her pulse was only in the 70s, but oxygenation was at 96%.When at doctors office less than 1 hour before that reading, oxygenation was at

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

98%. Recorded at 12:30 eyes itching much worse, throat felt like it was starting to tighten, heart felt like it was starting to race. By 12:50 hands were starting to swell. She had already been pre-medicated with Benadryl before this before she went down to get the Pfizer Covid-19 Vaccine, she had Benadryl in her system. She had that same morning with her morning meds had taken Zyrtec and Benadryl in anticipation of getting the possibility of getting the Pfizer Covid-19 Vaccine because she has to pre-medicate for vaccines just in case she starts to react in anyway. History of all previous immunization with the Pfizer vaccine considered as suspect was none. Additional Vaccines was not administered on same date of the Pfizer Suspect. Emergency Room taken from the location where vaccine administered-they gave her Pfizer Covid-19 Vaccine shot had her sit for basic observation then sit for extended observation. In that time period telling them her symptoms were going on, increasing. They gave her another 50mg Benadryl even though she had already had 1 before and then called emergency room, took her down, left her in waiting area even though she had heart and chest palpitations. Physician Office seen prior to event on 20Apr2021, seen after event 27Apr2021. Primary Care Physician didn't hear anything in lungs either visit. Not admitted to hospital; seen in emergency room, theoretically she got treated; however her basic blood pressure and stuff even with what they were doing was higher than when she was triaged in the ER; blood pressure was up and something else, oxygenation level moderately reduced from when she came down to when she was just let go; however her symptoms were worse when she was leaving than when she got there. She knows what they gave her while she was there was IV of normal saline, solumedrol and IV Benadryl. Thinks they later gave her Tylenol tablets. Finally got them to do an EKG because kept saying her chest was getting worse but that was several hours after she was back there even though came there having chest pains. In her opinion this hospital was not taking reaction seriously. Not admitted to hospital even though symptoms were worse and blood pressure higher on discharge, well above her normal levels. Currently trying to get them to explain why they took so long to do anything for her. Finally did a chest x-ray on 22Apr2021: discharge papers say abnormal x-ray

and they gave a couple of different possibilities as to what that might be so Primary Care Physician wrote a prescription to get a follow-up chest x-ray to make sure that everything is fine and back to normal and not ongoing or progressing or anything because they gave some strange things: what their impressions were: findings: there is non specific interstitial disease in the right lower lobe that could represent atelectasis aspiration organomia. It says the left lung appears clear; cardiomediastinal silhouette is within normal limits; impression restates non specific right findings there is non specific interstitial disease in the right lower lobe that could represent atelectasis aspiration organomia. This was from front and lateral views of the chest x-ray at 19:00pm 22Apr2021. 2 ECGs: She guesses this is what they call EKG not, relevant point is that in the notes there for the records: Says abnormal ECG compared with blah blah blah, hard to find when exactly they wrote this, trying to get the exact wording for each of the two. Machine results CED, which caller explained is what they call themselves now instead of ER, notes for MD interpretation; one done at 17:53 , other at 21:32. They both say there was slightly different readings, however both say abnormal ECG. One of the wordings that is in both. She had no further details to provide regarding relevant testing/investigations. She had to be in the ER back in the room for several hours before they would do the EKG and that's only because she said I have chest pain and standard procedure is to do an EKG, had been back there for hours, they had done no tests, the only thing they did was basic blood panel, had not done a troponin or heart enzymes test, had not done EKG that's why she knows they were not taking her seriously at all; if someone says chest pains and you don't do anything in the standard protocol they are not taking you seriously. On this Monday, 2 days ago she had gone down to pick up the records from the ER to go to Primary Care Physician appointment 27Apr2021, finally actually got to speak to someone who said they would get back to her on 27Apr2021 to look into why the EKG tests were not done for someone having chest pains. That's one of the first things you do for someone having chest pain, no matter what the source. Frustrated with them because they're still not communicating back, they had not taken her seriously while she was there; unknown if they were

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

actually going to be reporting, as they were still trying to convince her to get the second dose of Pfizer Covid-19 Vaccine. If she reacted to the first dose in first 10 minutes, second dose could be much more of a reaction. With the amount of anti-histamines in her system with Benadryl and Zyrtec and she was still starting to react in under 10 minutes. It's possible to be one of the inactive ingredients but she doesn't see anything in the pamphlet provided that she could identify at first glance as being the culprit to the problem other than 2 possibilities: potassium chloride and other is monobasic potassium phosphate. There is a possibility of her having a reaction to those because she was known to react to certain potassium products; sometimes it was the inactive ingredients. She definitely would have wanted to get the second part of the Pfizer Covid-19 Vaccine series until after she was not getting the medical attention she needed after reaction to the first dose. Because ideally you're supposed to have it at the same location, that just made her very nervous at the prospect of worse reaction at location that did not take her serious the first time. She was a big fan of Pfizer thought they do a great job; she had not known it was a 2 parter, not that it should make much difference. When her Primary Care Physician was saying second dose of Pfizer Covid-19 Vaccine was out of the question and she had been saying to people that she did not think it would be prudent to take the second part, they kept trying to say oh you need to get the second part, talk to so and so so they can convince you to get it, and doctor is going no. She reacted to ringers lactate or lactated ringers whatever the name is, her retired nurse sister sat and watched her getting some ringers lactate prior to surgery for her tear duct and saw her starting to break out in red splotches, patient said she was itching. Action taken in response to the events was drug withdrawn. The outcome of the events was reported as unknown. No follow-up attempts are needed; information about lot/batch number cannot be obtained.

							needed. No further information is expected.
1315972	5/14/2021		26	F	5/11/2021	5/13/2021	Bodyache, headache, vomiting x2times and fever after J&J shot 2days ago. Denies abdominal pain, difficult breathing or chest pain.
1317260	5/14/2021	NY	49	F	4/10/2021	5/8/2021	Multiple pulmonary emboli on CT angio 49 yo F with a PMH IDA with menorrhagia, OSA on CPAP, HTN, and hypothyroidism who presents to ED on 5/10/21 with chest pain. She states her chest pain began during an iron infusion 2 days ago on Friday 5/8. The infusion was briefly stopped and she was given steroids and the pain went away. The next day, however, the same pain recurred and remained until she came to the ED. She describes it as a "pinching" chest pain, constant x 1 day, worse upon inspiration and exertion, and radiating down her left arm and lower back, 10/10 in severity at its peak. She denies chest pressure. Nothing improved the pain in particular but she acknowledges it at rest. Her pain is much improved after being in the ED but is still present. She does not recall having the pain before. She denies cough, wheezing, palpitations, fevers, chills, nausea, vomiting, abdominal pain, diarrhea, constipation, or dysuria. She has never had COVID-19 before but had the Johnson & Johnson vaccine (1 dose) about a month ago. Pt admitted to the hospital, placed on heparin drip and transitioned to Xarelto on discharge.

1314279	5/13/2021	KY	38	F	4/7/2021	4/12/2021	About a week after being vaccinated I started experiencing bad headaches, chest pains and pains in my leg. I went to the emergency department at Hospital to get checked out. They took blood and I had a high d dimer test result. They did an Ultrasound of both legs, and a CT with contrast of the lungs and a CT of the head. No blood clots were evident at the time. Over the next couple of weeks my left leg has continued to swell and hold fluid. On 5-11-2021 I had another ultrasound of the left leg again to rule out a possible blood clot. Again they did not find anything. After reviewing blood work from a coag profile all results were elevated but not worrisome per the dr. I continue to have more swelling in the left lower extremity, muscle aches and pains in that leg along with more busted blood vessels. I have experienced pains in places that I have never had before. Example a sharp pain started around my left pelvic area and shot up to the left shoulder and then burned for several minutes.
1314298	5/13/2021	WA	18	F	5/10/2021	5/13/2021	PATIENT'S MOM CALLED IN ON 05/13/2021 REPORTING THAT PT. STARTED TO HAVE CHEST PAINS THIS MORNING. SHE WAS EXPERIENCING THE USUAL MUSCLE PAIN AND FATIGUE YESTERDAY FROM THE VACCINE.
1314326	5/13/2021	WA	16	M	4/17/2021	5/6/2021	1. Right-sided chest pain and decreased aeration on Right lung (3 lobes) The pt was imaged to rule out spontaneous pneumothorax - MBI:XRY Chest, PA and Lateral (STANDARD) IMPRESSION: Large right pneumothorax with pronounced collapse of the right lung
1314360	5/13/2021	IL	78	F	2/28/2021	4/26/2021	Patient stated she developed clots during hospital admission with the complaint of chest pain. Patient stated at hospital admission, they discovered blood clot in her right leg and right lung. Patient was treated with oxygen and medication. Patient was inpatient for two nights and sent home lovenox injections for one week and continuing with Eliquis. Patient is currently on Eliquis for unknown duration. Patient will see cardiologist in three weeks and reevaluate.

1314482	5/13/2021	MD	14	F	5/13/2021	5/13/2021	Pt c/o of dizziness as the only symptom s/p vaccination. She denied any chest pain, shortness of breath, vision loss, or pain. Pt's mother stated that she previously gets dizzy after vaccinations, and seeing needles. Pt stated that she had a "fear" of needles, but wanted the vaccine anyway. The nurse moved the pt to the private area, and helped her onto the stretcher, where she laid down. After the pt was lying down, the nurse assessed her. The nurse then took vital signs every ten minutes, listened to her lung sounds, assessed the radial pulse, assessed her vision, and mentation. After 15 minutes the pt sat upright with her feet dangled. With the nurse and the mother ten minutes later, the pt was walked down the hall. No issues were noted and the pt was stable. All the vitals were within normal limits throughout the entire time. The previous dizziness was gone, and the mother stated that she looked great. Pt stated a total of 40 minutes and then was safely discharged.
1314519	5/13/2021	AK	82	M	1/12/2021	1/12/2021	Developing flushing of face within 15 minutes of vaccination, upon getting home, noted full body rash - itchy bumps. Headache and lightheaded with a slight little cough and able to taste something in mouth immediate. then one week later, 1/18/21 developed stabbing chest pain, medivac'ed 1/19/ 21 to tertiary facility hospital. had 2 stents placed on 1/20/21. Received second dose of Moderna on 2/09/21, again having flushing, headache, taste, smell of medicine, rash, less severe than first dose. Took a nap following. Hurt all over all night 2/10/21. 2/11/21 felt somewhat better. one week later, again experienced shooting chest pain on 2/16/21 (pain 'down my breast bone'). Has not followed up with medical care. Has been 'living with it' due to expense of Medivac. Finally does have a follow up appointment with Dr. on June 7th.

1314604	5/13/2021	CT	23	M	4/3/2021	4/17/2021	23 yo man in high school when standing, admitted with acute onset epigastric abdominal pain after a run, found to have mild elevation in troponin, flat at 0.04, dynamic EKG changes admitted or work-up 1. Acute epigastric abdominal pain/elevated troponin: The patient was chest pain free from the time of treatment with Pepcid, magic mouthwash, and Toradol in ED. His echo is without wall motion abnormalities, troponin is flat and remains chest pain free. The patient had a CT PE protocol study and CTA coronary without acute findings. He had a cardiac MRI which showed no acute myocarditis but may have had some delayed contrast enhancement and may represent prior myocarditis. He was started on low dose lisinopril 2.5 mg po daily for cardio-protection, will reduce physical activity with slow return to activity, and follow with cardiology with an urgent exercise stress test as an outpatient. His u tox shows cannabinoids and no other intoxicants, His lipid panel wnl, HDL 65, LDL 84, His TSH is wnl. His CRP and ESR is wnl. 2. Left axillary lymphadenopathy: Discussed with patient lymph nodes seen on CT scan in left axilla and left pectoral region. Patient confirmed he had a COVID 19 Moderna vaccine in the left arm on 4/3/2021. Epic documentation notes in the right axilla, but patient is clear that he had the vaccine in the left arm. Axillary lymphadenopathy is not surprising in this situation. 3. Small 4 mm nodules noted on CT scan: The patient had no infectious symptoms, no cough, no fever, and no elevated WBC. He does smoke marijuana but has no tobacco use. He can follow with PCP to further risk stratify the nodules, either with PPD, and consideration of repeat scan in 6-12 months as needed. 4. Mild bilateral gynecomastia: I informed patient this has been found. He is not bothered by this finding and it seems an incidental finding. He can follow with his PCP for further evaluation as needed for this finding. Inpatient Consultants and summary of recommendations: 1. Seen by Cardiology and CTA coronary followed by MRI and then plan for outpatient exercise stress test planned Discharge vitals: Temp: [97.4 °F (36.3 °C)-98.7 °F (37.1 °C)] 97.4 °F (36.3 °C) Pulse: [55-65] 65 Resp: [16-18] 17 BP: (108-114)/(61-72) 111/61 SpO2: [96 %-100 %] 99 % Device (Oxygen Therapy): room air Pertinent Findings of Physical Exam: as noted in exam Cognitive Status at Discharge: Baseline Alert and Oriented x 3 Discharge Physical

1314722	5/13/2021	CA	50	F	4/7/2021	4/7/2021	<p>Within 5 minutes from receiving my J&J vaccine, I went to sit down and I started feeling very hot in my body. My heart started to race, had chest discomfort and had trouble breathing, my trachea closed up, had blurry vision and pain in my chest. I felt like I could not breathe and when the nurse came over to ask me I could not speak to her, I went into a shock and I was placed on the floor and I could not hear anything nor could open my eyes, from my hips down to my feet I could not feel anything, my legs went completely numb and I had a syncope. What I was told from the nurse that I was given an Epi-pen to help with my reaction. When I came back my body was having convulsions, felt my head spinning, had pain in my chest that so very intense and the nurse got me up and took me to a nearby ambulance and the EMT staff placed like a heart monitor because my heart was racing super fast. I also felt heaviness in my chest and inside the ambulance I was given two injections on my left arm and when I slowly started coming back, I was already at the hospital. I was at the hospital from 2pm to 4:30pm more less being monitored. At the hospital x-ray of the chest was performed as well as lab work and I was discharged home. When I got home, I still did not feel good, I felt heaviness to my chest, still have trouble breathing and get chills during the night. I also could not stand up and have a nerve sensation to my body and the chest pain to my left side is still very present. I have blurry vision, dizziness, headaches, and my heart-beat continues to race very fast. I get headaches, have abdominal pain and I peed blood few times then that's when I was able to pee, my abdominal pain was painful like having a baby. On Friday 04-08-2021, I again went to the hospital because I had fallen to the floor on my kitchen floor and my daughter took me to the hospital. I let the nurse staff know that I still have continued chest pain and pressure, difficulty breathing and headaches, dizziness and they monitored and gave me three pills as medication. I was discharged home about 5pm with a referral to see a neurologist due to my chest pain, blurry vision, dizziness and fever which I had these past three weeks. I do not know why I felt all these symptoms after my J&J vaccine.</p>

Patient is a 51-year-old male with a PMHx significant for hemochromatosis, sarcoidosis and morbid obesity who initially presented to the ED for evaluation of chest pain, cough and shortness of breath. On presentation, vitals were mostly unremarkable other than some mild tachycardia and tachypnea. Patient was able to maintain adequate oxygenation on room air but was placed on supplemental oxygen for comfort. Blood work was mostly unremarkable. ABG was not particularly concerning. Troponin was negative x3. Patient underwent chest CTA which showed basilar atelectasis bilaterally and scattered groundglass opacities and scattered borderline size hilar and mediastinal lymph nodes consistent with patient's known sarcoidosis. Patient was treated with supportive care and monitored overnight. He was able to maintain sufficient oxygen levels. On the time my evaluation, patient continues to complain of bilateral rib pain worse with deep breaths consistent with costochondritis. I discussed with the patient that he will need to continue to take NSAIDs on a scheduled basis to help with his discomfort. Additionally I offered to prescribe cough medicine. I discussed possibly discharging the patient on steroids however he states that he makes a point to avoid taking steroids due to his history of hemochromatosis. At this point, patient

1314803	5/13/2021	MN	66	M	5/11/2021	5/12/2021	<p>no longer requires care in the hospital and can be discharged home. Patient is agreeable with the plan and all questions have been answered appropriately.</p> <p>Patient is a 66 y.o. male who presents to the ED for onset of substernal chest pain associated with nausea and weakness. Pain onset around 6 PM. Has been nauseous and weak all day. Relates this to second Covid shot obtained on Monday (5/11/21). Reports feeling fine yesterday. As the morning and afternoon progressed he noted that he was just more and more weak and was really not able to get around which he normally does with a walker. Endorses a past history of both pulmonary embolus and pancreatitis for which his chest pain feels like. Is not currently anticoagulated. Last PE 2 years ago. History of Parkinson's disease. Denies any fever. No other symptoms reported.</p>
1314878	5/13/2021	CA	64	M	4/14/2021	4/27/2021	<p>Patient presented initially to his PCP on 4/24/21 for on going muscle aches after his COVID vaccine. Pain is on other arms, takes tylenol for treatment but no relief. Blood pressure elevated at the time of visit, no limited ROM, bruising present. Patient denies sx of cough, fever, SOB or chills, chest pain/pressure, GI or GU issues, HA. Patient provided prescription for celecoxib 200mg PO daily prn pain. Presented to hospital emergency room on 4/27/21 for chest pain, found to have anterior wall STEMI. The patient was started on IV heparin and medical therapy with intravenous beta-blocker before being transferred to another healthcare facility. His initial troponin was 0.2. His CBC with diff and electrolytes are all within normal limits. Patient was immediately taken to the cath lab for PCI. In route to hospital the patient was given 1 dose of nitroglycerin, aspirin, morphine for pain. Cardiac catheterization was performed with placement of drug-eluting stent into the Mid LAD. Patient started on aspirin and Brilinta. Echocardiogram showed mild left ventricular hypertrophy, severe mid to distal anterior septal hypokinesis, apical akinesis with an EF of 45 to 50% and grade 2 diastolic dysfunction. Patient has had no return of his symptoms since the PCI, tolerated p.o. intake without difficulty. No nausea/vomiting, or shortness of breath. Able to ambulate without difficulty.</p>

1314702	5/13/2021	PA	74	F	5/13/2021	5/13/2021	Patient complained of numbness in both arms and then chest pain following injection. Ambulance was called and treated patient .
1313645	5/13/2021	NH	53	F	4/6/2021	4/6/2021	Over a 103 degree fever, hard time breathing, weakness in muscles so I couldn't walk or stand. Those symptoms went away after day 2, but my arm stayed hot and swollen for 3 weeks. On week two, I was having chest pain and left arm pain. My upper left arm was inflamed, hot, and swollen for weeks. Due to getting SVT from my bout with COVID in January, I went to the ER. They said the pain was from the muscles in my chest wall. The pain from the injection TWO weeks prior was still causing me issues by radiating out. 6 weeks later, I am still having muscle weakness in that left arm and pain in my shoulder. When I got my second vaccine in my right arm, my left arm was hurting worse and was hot again.

1312661	5/13/2021	CA	18	M	5/12/2021	5/12/2021	<p>Pt. received the first COVID vaccine (Pfizer, lot # EW0182 and use by date is 05/13/21 at 0930am) around 1123am. LVN, administered the Pfizer vaccine and approximately 10 seconds after the vaccine was administered, the patient became pale and the patient loss consciousness for approximately 4 seconds. LVN ensured that the patient did not fall off the chair while RN (and Co-Lead), RN (Lead Vaccinator), and EMT observer, immediately ran to assist LVN with assisting the patient to the ground. The patient was alert and oriented when the nurses assisted him to the floor and had him lie in a supine position with his legs elevated. The patient was alert and oriented to person, place, time, and situation. Vital signs were immediately taken at 1124 when the patient was supine on the ground with his legs elevated: blood pressure of 112/58 (right arm, supine) , heart rate of 48 beats per minute, respiratory rate of 16 breaths per minute, and 100% oxygen saturation at room air. The patient denied any headache, nausea, or dizziness. The patient was moved to the gravity chair and was placed in Fowler's position. The patient was given Gatorade, as the patient did not eat or drink anything prior to being vaccinated. Vitals were taken at 1131: BP 114/78 (Right arm, sitting) , 66 beats per minute, 16 breaths per minute, and 100% oxygen saturation at room air. Alert and oriented to person, place, time, and situation. Denied any history of fainting . Denied taking any medications or having any chronic medical conditions. The patient continued drinking Gatorade and was offered a granola bar, the patient did not have any known allergies to medications, foods, or dust. At 1141, vitals were retaken, BP 122/87 (Right arm, sitting), HR 63, RR 16, and 100% oxygen saturation at room air. The patient denied any chest pain, shortness of breath, lightheadedness, dizziness, or headache. The patient ate a breakfast biscuit at 1148. At 1153 the patient was positioned from a Fowler's position to sitting upright in the gravity chair. Instructed the patient to have a friend or family member drive him home, the patient then called a friend to transport him home. RN, went over the V-Safe app with the patient and instructed him to eat breakfast and drink fluids the next time he arrived for his 2nd Pfizer vaccine. RN also instructed him to inform the vaccinator the next time he is vaccinated (for his second dose), to inform him/her about his history of fainting with his first</p>

dose. The patient's vitals were taken at 1158 when he was sitting upright, BP: 138/80 (right arm), HR 67, RR 15, and oxygen saturation at 99%. RN instructed the patient about ER precautions and to follow up with his primary care provider. The patient's vital signs were taken a final time at 1210, BP 122/78, RR 16, HR 67, and 100% oxygen saturation at room air. The patient's ride arrived on site around 1215, and the patient had a steady and even gait when ambulating to the vehicle, where he was driven home by a friend.

Several hours after Covid vaccine pt developed his classic sickle cell crisis symptoms of severe pain and was hospitalized 3/ 27 to 3/ 31 with sickle cell crisis. No clinical evidence of thrombosis, treated with IV hydration and oxygen and improved in several days. Had a previous h/o sickle cell crisis and hospitalization while taking oral typhoid vaccine in 2017. After discharge, 5 days later had onset of chest pain, returned to ER, Chest CT negative for embolus, D- Dimer > 18,000. No clinical evidence of clot. pt hydrated again / O2 but was able to go home. Covid negative by PCR during both episodes.

1314240	5/13/2021	CA	53	F	4/3/2021	4/8/2021	April 3 - vaccine, April 5 - allergy patch test, April 8th - rash on back and stomach; dr prescribed hydroxyzine and Xyzal and Clobetasol lotion. April 18 - started experiencing rapid heart rate and chest tightness - lasted for 4-5 hours. April 19 - saw allergist, blood pressure was elevated, started with rapid heart and chest tightness again. Went to ED, did EKG and blood work. No issues. April 20 - same symptoms went back to ED, EKG and blood work normal. April 23 - Urgent Care, saw Cardiologist for blood pressure, prescribed labetalol. Said it appeared to be chest wall inflammation. April 24 - chest tightness and high blood pressure, went to ED. Gave me a shot of anti inflammatory. April 26 - dr had me go back to ED for CT scan. ED ran blood work and determined I did not need CT scan. April 27 - chest pain, difficulty taking a deep breath and feeling like food stuck in esophagus - went back to ED, gave me a GI cocktail to numb the esophagus. April 30 - chest pain again gave me another GI cocktail and referred me to gastroenterologist. May 6 - chest pain, back to ED, another GI cocktail. May 7 - endoscopy. Will receive results on 5/14
1313623	5/13/2021	OH	42	M	3/19/2021	3/29/2021	STEMI with 100% blockage in LAD with clot. Emergency cath lab with stents. Symptoms started at 330am on 3-29-21. Came to ED shortly after. Initial testing and labs were negative. Began to have severe symptoms shortly after. Multiple doses of nitro and morphine given for chest pain with no relief. Taken for emergency heart cath by 7am.
1312644	5/13/2021		22	M	5/10/2021	5/12/2021	HA, bodyache and chills since he got a J&J 10am this morning. Also having some left side pain without urinary issues or trauma. Has not taken any meds. Denies chest pain, difficult breathing.
1313706	5/13/2021	MA	17	M	5/6/2021	5/8/2021	Patient developed chest pain with onset 05/08/21, 3 days after receiving his second Pfizer COVID-19 vaccination (Lot EW0167) on 05/06/21; he had previously received his first Pfizer COVID-19 vaccination (Lot EW0170) on 04/15/21. Pain continued until presentation at Hospital on 05/11/21, where testing indicated possible myocarditis (see below). Symptom resolved under observation without specific treatment.

1313931	5/13/2021	PA	79	F	3/24/2021	4/4/2021	ED Discharged 4/4/2021 (4 hours) Hospital Emergency Department Last attending ? Treatment team Generalized weakness +4 more Clinical impression Weakness - Generalized ? Chills Chief complaint ED Provider Notes Emergency Medicine Expand AllCollapse All HPI Chief Complaint Patient presents with ? Weakness - Generalized ? Chills HPI 79-year-old female, history of COPD for which she wears oxygen at night and as needed, also with a history of leukemia and obesity who presents to the ED complaining of generalized body aches, fevers up to 103, feeling generally unwell and weak, poor sleep, onset 3 to 4 days ago. Patient reports that she received her second COVID-19 vaccine approximately 1 week ago. Tolerated this without any particular symptoms. She has had 2 days of watery/nonbloody diarrhea. Does admit to nausea with several episodes of vomiting earlier today. She is denying any particular abdominal pain. Does believe she felt her urine burning earlier today but has had no gross hematuria. Denies any flank pain. No ill contacts although her husband has been at home with a slight cough. Patient does have a cough presently but it is nonproductive. She is denying any particular chest pain or subjective shortness of breath. No rash or unusual lower extremity pain, swelling, or redness. ED to Hosp-Admission Discharged 4/6/2021 - 4/17/2021 (11 days) Hospital Last attending ? Treatment team Severe sepsis (CMS/HCC) Principal problem Discharge Summary Internal Medicine Inpatient DeathSummary BRIEF OVERVIEW Admission Date: 4/6/2021 Discharge Date: 4/17/2021 DETAILS OF HOSPITAL STAY Presenting Problem/History of Present Illness/Reason for Admission Patient is an 79 y.o. female morbidly obese with past medical history of chronic lymphocytic leukemia follow-up that was initially scheduled oncology follow-up for April 7 now postponed to the next 2 weeks, COPD on 2 L oxygen support at home, GERD, depression and anxiety. She was recently seen in the ED on April 4, 2021 with complaint of shortness of breath, nonproductive cough, fever, chills, nonbloody diarrhea, vomiting and weakness and subsequently diagnosed with COVID-19. She had however received a second dose of COVID-19 a week before and was discharged home due to lack of significant findings on imaging chest x-ray and lack of

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

requirement for higher oxygen support. She presented to the emergency via EMS for evaluation of progressive shortness of breath with associated with fever, chills, headache, persistent shortness of breath, cough productive of thick clear sputum, nausea, vomiting and diarrhea. She denies abdominal pain, chest pain, or dizziness. Denies recent antibiotic usage or recent travel. Apparently, she thought she was getting better upon discharge after being kept for about 12 hours in the last ED visit, however she was not feeling well after going to bed last night and asked the husband to call 911. Upon EMS arrival patient was saturating in the 80s and in respiratory distress. She received 1 DuoNeb and was eventually placed on 10 L oxygen support. She was noted to be in significant respiratory distress during speech. Hospital Course Patient was admitted to hospital due to shortness of breath, and was found to have severe sepsis on presentation due to COVID-19 pneumonia. She had evidence of acute on chronic hypoxic respiratory failure as well. She was started on IV antibiotics, as well as remdesivir and Decadron at high dose. Unfortunately she continued to have clinical deterioration, and ultimately required high flow oxygen therapy. She was then transferred to the ICU, and ultimately required intubation due to severe profound ongoing hypoxia despite optimal medical treatment. She did not respond to remdesivir or steroids or antibiotics. Post intubation, she also developed acute renal failure during the course of her admission. Multiple discussions were had throughout the hospitalization regarding goals of care, and initially patient and family wish to be continually aggressive. She received full medical treatment, including life support, with minimal improvement. Despite being on ventilator for roughly 5 days, she continued to have severe hypoxia. She was prone, and was unable to sustain oxygen saturations when supine even for short period. Her renal function continued to decline as well, and at that point discussion was had with family regarding goals of care again. They were explained that symptoms continue to be persistent, and her illness continues to progress despite aggressive medical therapy. Ultimately decision was made to not pursue dialysis, and to allow the patient to be kept comfortable and pass away naturally from this infection. She was terminally extubated on 4/17 and passed away

Worsening hypoxemia, Covid pneumonia. Encounter: Initial. TECHNIQUE: AP portable erect projection of the chest is acquired. COMPARISON: 4/4/2021. FINDINGS: Scattered pulmonary infiltrates is developed bilaterally, greatest in the right upper and right lower lobe. No change in the heart, mediastinum, or bony thorax. IMPRESSIONS: Developing pulmonary infiltrates. END OF IMPRESSION: This report was created using Voice Recognition software. Thank you for allowing us to participate in the care of your patient. X-ray Chest 1 View - Portable Result Date: 4/4/2021 Narrative: XR CHEST 1 VW PORT IMPRESSION: No evidence of acute pulmonary disease. END OF IMPRESSION: INDICATION: SOB, weak, cough SOB, weak, cough. TECHNIQUE: Portable AP projection of the chest is acquired. COMPARISON: 6/5/2020 FINDINGS: Heart size appears unremarkable. There is mild prominence of pulmonary arteries. This is stable. There is no focal consolidation or effusion. This report was created using Voice Recognition software. Thank you for allowing us to participate in the care of your patient. Transthoracic Echo (tte) Complete Result Date: 4/11/2021 Narrative: Gender: Female Age: 79 Procedure Date: 4/11/2021 10:19 AM Study Quality: Fair Ht / Wt / BSA: 66.00 in / 218.00 lb / 2.07 m2 Heart Rate: 77 bpm BP: 181 / 81 mmHg Indications: Arrhythmia Transthoracic 2D, Color Flow, and Doppler Echocardiogram Conclusions: The left ventricle is normal in size. Ejection Fraction 55% (normal range 50-70%). All wall segments showed normal motion. Mild concentric LVH. Trivial aortic regurgitation. No additional significant valvular abnormality. No prior study for comparison. Presentation and History: Indication: The patient presents for evaluation of arrhythmia. The patient has a history of obesity and chronic obstructive pulmonary disease. Findings: Procedure Information: Contrast agent, definity, is being given per protocol without apparent complications. Due to technical limitations in the assessment of the left ventricle, imaging was performed after the administration of intravenous Definity echocontrast, as per protocol. Left Ventricle: The left ventricle is normal in size. There is mildly increased left ventricular wall thickness. The left ventricular systolic function is normal. The visually estimated ejection

fraction is 55% (normal range 50-70%). Wall Motion: All wall segments showed normal motion. Right Ventricle: RV not well visualized. RV grossly normal in size and function by subcostal view. Atria: The left atrium is borderline dilated. The right atrium is normal in size. Aortic Valve: Sclerotic appearing aortic valve with no significant aortic stenosis. Trivial aortic regurgitation. Mitral Valve: There is trace mitral valve regurgitation by color flow and doppler analysis. There is no mitral valve stenosis by color flow and doppler analysis. Pulmonic Valve: There is no evidence of significant pulmonic valvular stenosis or insufficiency by color flow and doppler analysis. Tricuspid Valve: There is trace tricuspid valve regurgitation by color flow and doppler analysis. Great Vessels: All visible segments of the aorta are normal in size. Venous: The inferior vena cava is normal in size and collapses greater than 50% with inspiration. Pericardium/Pleural: There is no evidence of pericardial effusion. Prior Study Comparison: No prior study for comparison.

1313559	5/13/2021	MI	70	F	4/9/2021	4/27/2021	4/30/21: This patient comes in complaining of worsening low back pain. She has a history of severe degenerative disease in his had surgery. She was scheduled to see her neurosurgeon last year however it got canceled due to the COVID-19. Patient states she saw her neurologist on Tuesday and was given injections which significantly helped. She states that her pain has returned however. She has had no trauma. No footdrop. No difficulty with her bowel or bladder. Patient states she only uses Tylenol arthritis at home. 5/1/21:The patient is a 70-year-old female presenting to the emergency department for back pain. She has a history of chronic back pain and states that has been worsening. She was recently seen here for the same complaint. She currently rates her pain 10/10 intensity. She reports that she has chronic numbness and tingling of her bilateral arms/hands and legs/feet. She states that this is also worsening. She denies any changes in bowel or bladder function or perineal numbness. She states that she has been using a walker at home and that she has tried to make an appointment with her neurosurgeon who previously operated on her but that she has been unable to get through to their office. She reports that she only called 1 time on a Friday. She is taking Tylenol at home for her pain and reports minimal relief. She denies any fevers or associated concerns at this time. 5/2/21: This is actually her 3rd visit in less than a week with this complaint. She was seen 2 other times at a outside facility. She states that she had back surgery about 10 years ago at Beaumont. She states she was supposed to see her neurosurgeon last year but this did not occur secondary to COVID-19. Her primary care physician had referred her to a neurologist did some injections ahead some relief of her back pain for a week or 2 but this is since worsened. She states that over last several days she has had increasing numbness and tingling in her feet as well as increasing weakness of her lower extremities as well as some now some new incontinence of urine when she stands up. She today she also complains some chest pain she attributes more from just amount of pain he has from her back. She rates her back pain as a 10/10 intensity. She did have 1 episode of a week or 2 ago where she slipped down and fell on her knee but did not hit her back directly. She did not hit her head. She describes the chest discomfort in her upper abdomen

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

lower chest area. She is nauseated but not vomiting here. She denies any exertional dyspnea or orthopnea prior to this. She has had no recent fever chills. 5/11/21: The patient is an 70 y old female admitted on 5/4/2021. The patient was originally seen by Neurology on 05/07/2021 when she presented with diffuse weakness. She has a history of hyperlipidemia, hypertension and diabetes. The patient at that time described the acute onset of weakness ascending from the feet, then involving the legs and arms also associated with sensory symptoms that started about 2 weeks prior to her presentation. She also had persistent neck and back pain radiating to her arm and legs limiting her ability to walk. On neurologic examination at that time the patient had absent deep tendon reflexes in the lower extremities and trace reflexes at the biceps. She had significant weakness in the lower extremities and mild weakness in the upper extremities. She also had a dysarthric speech. Given the patient's CSF analysis showing protein elevation to 266 with no pleocytosis, wbc's were only for, there was support for a clinical diagnosis of acute inflammatory demyelinating poly radicular neuropathy or such variant. The patient was started on plasmapheresis and has received her 2nd session of plasmapheresis on 05/09/2021. She will have a total of 5 sections, one every other day. The patient also has hyponatremia, this can be seen in about 5% of patients with Guillain-Barre syndrome, we also do see pseudo hyponatremia but this is in patients that have received IVIG.

1309520	5/12/2021	CT	79	M	1/22/2021	3/5/2021	chest pains; cough; rash; This is a spontaneous report from contactable consumer (patient) via Medical information Team. A 79-years-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), dose 1 via an unspecified route of administration, administered in left arm on 22Jan2021 at 14:15 (Lot Number: EL3248) as single dose; dose 2 via an unspecified route of administration, administered in right arm on 12Feb2021 at 14:30 (Lot Number: EN6201) at the age of 79 years as single dose for COVID-19 immunisation. The patient medical history and concomitant medication was not reported. The patient did not receive any other vaccines within four weeks prior to the vaccination. On 05Mar2021 the patient experienced chest pains, and cough, which required hospitalization from 05Mar2021 to 08Mar2021. The patient informed that he had some stress with son and daughter to point where he had some chest pains. After a week or two of conversation involving patients son and granddaughter culminated into this. The patient informed that when he went to the hospital because of chest pains, patient was already use to that and wasn't worried about it. The patient stated he didn't want to go to the hospital, called the doctor but because of Covid, the doctor wouldn't see the patient. The patient stated he shouldn't have been in the hospital at all. In terms of the cough, he simply called the doctor because the patient wanted cough medicine or something for that, temporary thing coming on. Patient stated the cough did not linger, and it was never treated. The hospital got into the chest pain and jumped on the heart situation and patient thinks they saw dollar signs or something. The patient wasn't very happy with them. The patient informed that he was given a blood thinner, Heparin IV during time hospitalized. The hospital decided to hold the patient over and they gave the patient Heparin IV for a good part of three days. The patient reported that he was discharged on 08Mar2021, and on 10Mar2021 the patient noticed the rash. The patient reporting experiencing rash after receiving both doses of the Pfizer covid-19 vaccine. The patient was thinking the combination of Plavix and heparin only three weeks after having the Pfizer Covid Vaccine could possibly be a side effect of rash. Therapeutic measures were taken as a result of rash. The doctor gave the patient Clobetasol Propionate and patient did treat rash with that. The

							doctor said to apply for 2 weeks and come in on one week. It has already improved. The patient mentions that he was also taking Calamine lotion and some spray and they all seem to be working. Patient didn't want to keep taking Clobetasol because it is a steroid and he had been using for a month and didn't want to do that. The clinical outcome of rash was recovering. The clinical outcome of the remaining events was unknown.
1311249	5/12/2021	PA	58	M	5/3/2021	5/7/2021	tongue and face swelling occurring on 5/7/21. shortness of breath and chest pain 5/8/21. Confirmed pulmonary embolus and left lower extremity DVT on 5/11/21-5/12/21
1310682	5/12/2021	MI	62	F	4/1/2021	5/8/2021	6 days of shortness of breath, chest pain, cough productive of sputum, low-grade fevers, chills, nausea, vomiting, and diarrhea. See history and physical for full details. She was diagnosed with COVID pneumonia and admitted to the hospital.
1310712	5/12/2021	IL	84	M	3/22/2021	4/21/2021	Patient presented to ED on 4/21/21 for weakness that started one week ago. He also complains of decreased appetite and nausea. Patient denies shortness of breath or chest pain. Patient was diagnosed with COVID-19 infection and UTI. COVID was treated steroids and antibiotics, Patient improved and was discharged to ECF for continued convalescence.
1310719	5/12/2021	TX	16	M	5/5/2021	5/9/2021	presented to outside ED with complaints of new onset chest pain that radiated to the back and down his arms with concurrent nausea. Patient was sitting in the living room around 2030-2045 when he developed midsternal and epigastric region pain. Pain radiated to his upper middle back and down both left and right arms. There were no notable exacerbating or relieving factors. Pain was a 4-7 in severity. He was also nauseated. He was given tums by his mother without significant change in symptoms. After 45 minutes they decided to go to the ER. At ER labs were notable for elevated troponin (2-->15-->9). EKG with J-point elevation. Non-contrast CT chest/abd/pelvis was unremarkable. He was given ASA 325 and famotidine in the ED. Pain eventually subsided around 2345. He was transferred to another hospital for further evaluation of troponinemia.

1310885	5/12/2021	IL	83	F	4/16/2021	4/27/2021	Pt suffered diarrhea for two days prior to collapsing . she could not move that morning to get out of bed and could barely talk. She mentioned chest pain and an ambulance was called. Following her vaccinations she was very confused and had fallen in the kitchen the Thursday (22nd) prior to her heart attack. They took her to ER noted she was in shock and had very low blood pressure enroute to hospital. Her pulse was very low. She was life flighted to the medical center. It was determined a blood clot had blocked a major artery into the right side of her heart and it was removed and a stent was placed. She remained at hospital 3 nights and was transferred to nursing home for recovery and therapy where she currently is being assessed for mental issues and is on 4 different heart medications to control blood pressure and prevent future heart attacks. There is not a family history of heart issues. Pt was very healthy in spite of being 83 years old.

1311288	5/12/2021	WI	36	M	5/11/2021	5/11/2021	<p>Pt. requested and received the J&J / Jansen COVID 19 vaccination yesterday at 1317. While he was being monitored for any adverse reactions, Pt. asked if lightheadedness was a side effect of the shot. Writer advised that it could be and that everyone is different. Writer asked if he would like some water, and he declined. Pt. was advised to remove his mask so he could breathe better. Writer took his pulse while I gathered information. It was 96. Pt. reported that he did eat lunch, is drinking plenty of water and fluids. He relayed he is keeping food down and not having any other issues. Pt. is currently on opiate withdrawal protocol. Writer asked about his breathing and his chest. Pt. relayed he was not having difficulty breathing and denied any chest pain at all. Writer spoke with the Deputy to be sure that we kept an eye on him for a bit longer after his 15 minutes while he was in his cell, due to his lightheadedness. Pt. was talking with writer, answering questions with ease. Pt. was not diaphoretic and did have good color. His pulse was checked again, and it was 84. At 1333, when his 15-minute observation was done, writer went to assist pt. to his feet and informed him that I would escort him back to his cell because he was still feeling a bit uneasy. When he stood, pt.'s knees buckled, and he knelt to the ground. Writer helped pt. to lay down. It was a smooth transition, and he had no injuries to his head or body. Pt. had what appeared to be a short spell where his body completely tensed for a few seconds, then he relaxed. He was having a hard time keeping his eyes open, but when prompted, was able to open his eyes. The Deputy standing by was asked to call for the Public Health Nurses, who had moved on to the next POD to continue vaccinating. Once on the scene, pt.'s blood pressure was obtained. 142/80. His pulse was 82. During this time, it appeared that the tensing episodes became more frequent and a bit more severe. They were happening approximately every 30 seconds, and lasting between 5 and 10 seconds. EMS was activated at approximately 1340. Pt. was awake during these episodes, and communicated with the nurses attending to him. While attending to pt. and waiting for EMS, it was at that time that pt. admitted that this was not the first time this had happened. He admitted that about a week ago, the same thing happened. When that new information was</p>

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

						<p>explored, pt. reported that his wife thought he had "Serotonin Syndrome". Writer asked what meds he was taking on the outside and he reported that he only takes methadone from the clinic. He denied any other medications or street drug usage. He does not take any mental health medications at our facility. Collectively, the nurses that attended to him after this episode agreed that this is an isolated incident and not related to receiving the COVID vaccine. EMS arrived at approximately 1347, and report was given. He was transported to the hospital for evaluation. Pt. was returned from the hospital at approximately 1600. The Officer that accompanied him reported to facility that the hospital also believed this was an isolated incident, most likely related to withdrawals. They did not believe that receiving the vaccine was a factor in today's events. Labs were drawn at the hospital, and were all WNL. Once back in custody, writer spoke briefly with pt.. He was feeling much better, and was sent back to his cell without further incident.</p>

1312491	5/12/2021	PA	83	F	2/15/2021	3/6/2021	ED to Hosp-Admission Discharged 3/6/2021 - 3/7/2021 (29 hours) Hospital Last attending ? Treatment team COVID-19 virus infection Principal problem Hospital Course HPI: Patient is an 83 y.o. female in the emergency room with a headache that is been persistent for about a week. She is also having some increasing fatigue and weakness. Evaluation emergency room revealed she is positive for COVID-19. Chest x-ray showed no evidence of pneumonia. The patient did have her first COVID-19 vaccine approximately 3 weeks ago. She was due for her second dose of the vaccine this coming Monday. She denies any severe fevers at home. No shortness of breath, no chest pain. She was brought in for observation and started on dexamethasone. Hospital Course: Remained under observation and did not require any supplemental oxygen. He tolerated her diet and did not feel weak or fatigued. She denied any chest discomfort. I recommended that she postpone getting her second Covid vaccine until she is entirely cleared of her Covid infection. Should follow-up with her primary care office to assess breathing and when she is cleared for her second vaccination. Patient also have her family physician or gynecologist reevaluate her pessary which may have been dislodged slightly when she fell in recent weeks. She had noticed some blood tinge urine but generally no dysuria or major hematuria since that time. She left in satisfactory condition on the evening of 3/7/2021 with these instructions. She may use acetaminophen for the headaches which have disappeared over the course of this day.

1309581	5/12/2021	CT	49	F	4/23/2021	4/1/2021	was feeling some chest pain; she wakes up freezing; eyes felt really hot and dry; eyes felt really hot and dry; slight fogginess; achiness; I tested positive for COVID; Restless body; Nausea; Weakness; Fast heartbeat; Headache; Chills; Muscle pain; Feeling unwell; high fever couldnt shake it at all; got congested/ Stuffy nose; facing joint ache; extremely tired/ Tiredness; Pain in arm/ whole hand just felt achy; Heart hurt when laying on side; Dizziness/ lightheadedness; Swollen lymph nodes; This is a spontaneous report from a contactable consumer (patient). A 49-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), via an unspecified route of administration, administered in left arm on 23Apr2021 15:00 (Batch/Lot Number: EW0164) (at the age of 49 years old) at 1st dose, single for COVID-19 immunisation. Medical history included asthma and hypersensitivity (allergies). Concomitant medications included montelukast sodium (SINGULAIR) taken for hypersensitivity; formoterol fumarate, mometasone furoate (DULERA) taken for asthma; beclometasone dipropionate (QVAR); and levosalbutamol hydrochloride (XOPENEX). On unspecified date in Apr2021, she got pretty sick and swollen lymph nodes. On 23Apr2021, the patient experienced heart hurt when laying on side, high fever couldn't shake it at all, extremely tired/tiredness, headache, chills, muscle pain, feeling unwell, joint pain/ facing joint ache, dizziness/lightheadedness, fast heartbeat, pain in arm and got congested/ stuffy nose. On 24Apr2021, the patient experienced nausea and weakness. On 25Apr2021, the patient experienced restless body, her body also got extremely restless like she had restlessness lesions on whole body. On 26Apr2021, the patient tested positive for COVID-19. On unspecified date, the patient experienced chest pain, she wakes up freezing and her eyes felt really hot and dry and was exhausted, whole hand just felt super achy, slight fogginess and achiness. The patient had vaccination on Friday. On Friday night, she started not feeling well and then was like full blown all the Saturday all the Sunday (as reported). The patient got vaccination last Friday and had a severe reaction to the vaccination. She was extremely upset about it because now she tested positive for COVID. She was not really showing any symptoms and whatsoever before of any COVID like

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

symptoms. Allergy was bothering her but no fever, no chills, no tiredness, no achiness and no nothing. She was nervous because she did realize that it wasn't FDA approved and now she was suffering positive, she started feeling a little better but still tested positive. It was reported that the event started at the time of report, 26Apr2021. The patient had a severe reaction. She had every symptom except that her arm didn't swell. She didn't have any rash in her body. She got pretty sick. She had a high fever couldn't shake it at all, got congested, facing joint ache and extremely tired. Her body also got extremely restless like she had restlessness lesions on whole body she couldn't lay down. The patient reported that it was hurting her so bad and she had to keep moving like she couldn't relax fall free. She had a severe reaction and doctor said she could have COVID knowing it and then got a shot and then came out full blown. The patient stated she was taking Tylenol (50mg, Not clarified), Tylenol Cold and sinus (325mg) for like a flu and Motrin (500mg). She had some time to shake the achiness and the fever was just coming back. She took Tylenol to help rid of fever and achiness, it didn't help and then she tried Tylenol cold and flu that help the little bit then she tried Motrin the Motrin help more with achiness but not hundred percent. The outcome of the events heart hurt when laying on side and fast heartbeat, both recovered on 26Apr2021; events high fever, tiredness, chills, muscle pain, feeling unwell, swollen lymph nodes and dizziness were recovering; events nausea, restless body and stuffy nose were not recovered; and unknown outcome for the other events. No follow-up attempts are needed. No further information is expected.

1309527	5/12/2021	AR	49	M	2/3/2021	2/3/2021	<p>have some clots; Neuropathy; autoimmune disorder; Fell and hit elbow and 3 ribs on left side; lost 6 (lbs) pounds/Within 2 months, he has lost 47 lbs and eats all the time and is still losing weight; falling; felt super strong; dizziness; failed all the tests for motor skills for his arms and legs; Fell and hit elbow and 3 ribs on left side; Fell and hit head; Sensory nerves are all gone; Fatigue; scabs; delusional; tore tendons in between ribs; They are tender(ribs); hurting all over; Cannot walk or lift anything; chest pain; his arm was sore a little; Left arm injection site pain; Disoriented; This is a spontaneous report from a contactable consumer (patient). A 49-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), dose 1 intramuscular, administered in left arm on 03Feb2021 (batch/lot number and expiration date not reported) at the age of 49 years old, as 1ST DOSE, SINGLE for COVID-19 immunisation. Medical history included COVID-19 from Dec2020 to an unknown date, vascular disease, bilateral stents placement, cataracts since he was born. Concomitant medication included gabapentin taken for an unspecified indication from an unspecified start date and ongoing. On 04Feb2021, the patient experienced left arm injection site pain. The patient experienced dizziness, falling, and couldn't go to work on unspecified date. He was treated by his (MD) physician, was given a CT scan, echocardiogram, and found to have some clots. He stated he has a history of vascular disease and had bilateral stents placed a year ago. He was placed back on an aspirin/Plavix regimen and referred to a neurologist because he has no motor skills anymore. He stated he failed all the tests for motor skills for his arms and legs. He was advised not to take the second dose of the vaccine and was diagnosed with neuropathy and autoimmune disorder (caller does not specify which disorder). He reported being positive for Covid-19 in Dec2020. He wanted to know what else he can do for his symptoms and is offering to be tested by Pfizer for treatment. The symptoms come in really hard seven days later. He actually had to go to the (ER) emergency and they worked on him and a whole string of doctors. He went to the emergency room and something was going on and wanted him to go to a family practitioner. They sent him to vascular, neurological and now they want to send him to a research center. It was a</p>

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

whole week after receiving vaccine before he began having symptoms. With the neuropathy and autoimmune, he cannot work like he did. He can hardly walk. Unspecified autoimmune was diagnosed last week. He can't remember the name of it. They told him not to take second one because the first one did what it did to him. It hurt a little and it was quick. The next day (04Feb2021), he said his arm was sore a little. He is only taking 4 medications and they looked it up. He did not think they were relevant. He was disoriented and fell and hit his head a couple of times. They ran an MRI on his head trying to figure that part out. That was done last week. He doesn't know the date and said it may have been on Friday. Results were good. The date he was disoriented was Wednesday 03Feb2021, when he took the shot. He has been disoriented and has been that way ever since. They kept him for 15 minutes to make sure no one passed out. He has been disoriented since then. He could not think clearly, and he could not do his job. He tore tendons in between ribs. He first thought he actually broke his ribs, but did not. There were two different falls. He cannot feel feet or anything. His motor skills are OK but when they did neuropathy test, they put needles in and shocked him to make his motor fire. His reflexes were really bad. He fell and hit elbow to keep from falling on face and twisted going down hitting 3-4 ribs on left side. It has been over 3 weeks now for his ribs. They are tender but they are not like the initial blow. It feels like they are healing. He fell and hit head a week ago. He was unsure of the exact date. He did not go to the emergency room with this one because the bed caught him. He fell and hit his head. All he has left is scabs. He cannot walk or lift anything (11Feb2021). That next Wednesday, he got ready to go to work and was so delusional and could not go in. He slept from 5:30 all that day and all that night. Then Thursday, he gets up and goes to work and goes slower, just to see what happened on Wednesday. He had fatigue and was disoriented. He did not provide start date or outcome for fatigue. He walked in and said either call an ambulance or he would go home. He went home and that was the last day of work. He then stated he laid in the car for 30 minutes and he said he is going to the emergency room. He went straight there that day. He had stents put in lower part of his body a year before. The neuropathy and

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

the autoimmune kicked in 7 days later after the shot. The reason he went to the ER is because he thought it was his stent. He had bilateral, 4 of them. He was having chest pain and hurting all over on 11Feb2021. He thought he was having a heart attack. He was seen in the emergency room and released. It depends on how far he goes, how the chest pain worsens. Right now, he is ok, but when he gets up and moves around, it does the same thing. Within 2 months, he has lost 47 lbs and eats all the time and is still losing weight. He was about 200 something and was kind of built and now is skin and bones. He lost 6 (lbs) pounds within a week and is eating like crazy. Sensory nerves are all gone. If hit with a baseball bat and he would not feel it. It came on slowly almost that he did not know it was happening. That is why they want to send him to Privacy for a research center and he does not want to go. He never had this happen before. ER or physician's office required: 1st date was on Thursday, 11Feb2021, when he went to Privacy. He was having chest pain and hurting all over. He thought he was having a heart attack. He was released. The patient stated he wanted to change the information he had provided since he was not in his right mind since he had taken the wrong medication dose than the doctor had given him. He stated the medication dosage he wanted to change was for Amiripyin. He stated he wanted to say he told the representative the symptoms he had experienced was enhanced which they were yesterday because he was trying to fight everything and stay awake. COVID 19 vaccine: he stated the doctor did not want him to take the second dose of the vaccine. He stated one of the symptoms he had experienced after the vaccine that he wanted to change the outcome for is the neuropathy. He stated he is back to where he used to be and yesterday it was bad he could hardly walk or talk. He stated also the other symptoms he wanted to change the outcome for is the autoimmune. The patient has not recovered from neuropathy, autoimmune disorder, disoriented, can't walk or lift anything, chest pain, and sensory nerves all gone; while outcome of the remaining events was unknown. Information on the lot/batch number has been requested.

1310622	5/12/2021	OH	48	M	1/6/2021	4/26/2021	Developed symptoms around 4/25, presented to ED with complaints of chest pain and something being stuck in his throat. Subsequently died on 4/27.
1309576	5/12/2021			F	4/20/2021	4/22/2021	Severe chest pain; This is a spontaneous report from a non-contactable consumer (patient). A 17-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot number was not reported), via an unspecified route of administration, administered in right arm on 20Apr2021 13:00 as 1st dose, single for COVID-19 immunization. Medical history was not reported. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. Concomitant medications included buspirone hydrochloride (BUSPIROL); and medroxyprogesterone acetate (DEPO PROGESTIN), both taken for an unspecified indication. The patient experienced severe chest pain (medically significant) on 22Apr2021 16:30. The adverse event resulted in a doctor or other healthcare professional office/clinic visit, and emergency room/department or urgent care. Treatment received for the adverse event was pain medication. The outcome of the event was not recovered. Information on the batch/lot number has been requested.
1309415	5/12/2021	TX	45	F	4/11/2021	5/7/2021	Symptoms: Severe chest pain, shortness of breath Emergency Room screening, CT Scan, chest x-rays and blood work. Findings: Pulmonary embolism in the right middle lung. Treatment: Hospitalization, 24 hour heparin drip for 3 days
1310012	5/12/2021	WI	27	M	4/22/2021	4/25/2021	Patient reported chest pain for 2 days and intermittent jaw pain after receiving his second Pfizer COVID vaccine on 4/22, and presented to the ER on 4/25 with a headache and emesis. An ECHO was performed and LVEF was 45%, and an EKG showed possible ST elevation. Per the Safety and Efficacy of the BNT162b2 mRNA Covid-19 Vaccine study there were no reports of STEMI being an adverse effect. Given the patient's ejection fraction of 45%, there was likely a prior medical condition the patient was unaware of and may have precipitated the STEMI rather than the vaccine. Hospitalized for 2 days and diagnosed with pericarditis.

1310035	5/12/2021	MN	46	M	2/2/2021	5/5/2021	Developed L chest pain and headache late in evening 5-4-21 and diagnosed with pulmonary embolis 5-4-21. He was treated initially with high-intensity heparin nomogram and converted on 5-5-21 to oral apixaban. He has done well with this therapy. His risk factors for PE include immobility; however, the risk of a thrombotic event in quadriplegic patients should be that of the general population after the first year of disability, and he has been immobile for around 2.5 years. He has no known underlying malignancy, and his recent imaging of his chest and head are reassuring in this regard. The patient received his Moderna COVID-19 vaccine 12-23-20 and 2-2-21 with vascular events having been reported as being more common following this immunization. Without a clear cause for his PE, this will be reported on VAERS.
1310150	5/12/2021		50	F	5/12/2021	5/12/2021	Patient received vaccine at 0822, patient was in observation area and was about to leave. Patient told observer (RN), that she has chest pain/tightness and a headache at 0850. RN had her sit down and since the chest tightness/pain was intermittent, RN called the ED at 0854. ED RN came and escorted patient to the ED.
1310189	5/12/2021	KS	18	M	5/7/2021	5/10/2021	Patient presented as a transfer to our facility for Myopericarditis. He had received 2nd covid vaccine on Friday (5/7/21), subsequently had mild body aches the next day that improved with otc Tylenol. On sunday night he started to develop mild chest pain. Monday morning his pain acutely worsened with 8/10 chest pain, shortnes of breath, and emesis x1. He was ultimately found to have myopericaridits after being transferred to our facility for cardiac MRI. His troponin peaked at 5.71, had no pericardial effuison, and normal EF. Pain well controlled with colchicine and ibuprofen. After 2 days of observation he was discharged home. He did not have any viral prodrome or illness recently, no hx of family hx of rheumatological conditions.

1310381	5/12/2021	TX	48	M	4/12/2021	4/17/2021	I had some head pressure - dull headache each day for a couple of weeks starting about five days after vaccine; I didn't notice until the evenings when I was relaxing. From day 5 or so - for about two weeks I noticed this head pressure. My blood pressure did rise - at that time-it was elevated - within about two weeks after the shot, I couldn't control my blood pressure. I went to the doctor - they had to raise my blood pressure medication to the max because I couldn't get my blood pressure down and I even donated blood. Today I am at 135 over 90 which is good for me but at that time when I noticed the rise after the vaccine - I was running 165 over 115 . I'm still taking the maximum blood pressure medication that I can take currently but it is at a good level currently. I was taking 20 mg pills and after the vaccine we tried to raise it to 25 mg and then raised it up to 30 mg and then they finally said up to 40 mg a day. It's the most I can take. I have chest pains on the right side of my chest -it will start (on a scale from 1 to 10 - it's about a four) - it's shooting pain - in my chest for about 10 minutes and then it will move to my left side - not my pecs - it feels like it's my heart. It's not enough that I feel like I'm having a heart attack - it happens about four days a week. It doesn't last real long - but it's intense. A "4" pain for me is intense. It goes on for about 5 minutes - switch sides and then another five minutes - I try to relax/watch tv during that. I did have leg pains in the middle of all of this time - hand, inner thigh, then on my right leg - single spots of pain that moved - like ant bites - that happened in the beginning - at day five and after - the same time I was getting the head pressure. I would rub over the spot with my hands and then it would go away and go to a different spot.
1310442	5/12/2021	FL	18	F	5/5/2021	5/5/2021	immediately after the dose she developed chest pain that radiates to the upper back, lower back and hips
1310120	5/12/2021	OH	16	M	5/6/2021	5/10/2021	The patient developed severe chest pain on the 4th day after the vaccine, he presented to the local emergency room and had the abnormal tests as described below. His symptoms improved rapidly but due to active myocarditis was given recommendations for limited activity to reduce risk of fatal arrhythmia

1309531	5/12/2021	TX	39	F	2/4/2021	4/21/2021	blood pressure drop; nearly fainted; chest pain; jaw pain; loss of vision; Multiple bilateral pulmonary embolisms in my lungs; This is a spontaneous report from a contactable consumer (patient). A 40-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection) (at 39 years of age), via an unspecified route of administration, administered in arm left on 04Feb2021 (Batch/Lot Number: EN6202) as 2nd dose, single for COVID-19 immunisation. Medical history included MTHFR blood clotting gene mutation. Concomitant medications included citalopram, metoprolol, omeprazole and minastein fe24, all taken for an unspecified indication, start and stop date were not reported. Historical vaccine included BNT162B2 (lot number: EN9581) dose 1 on an unknown date (also reported as 04Feb2021) 01:00 PM in left arm for COVID-19 immunisation. The patient was not pregnant. The patient did not have any other vaccine within 4 weeks prior to the COVID vaccine. She was not diagnosed with COVID-19 prior to vaccination. She had not been tested for COVID-19 prior since vaccination. It was reported that 6 weeks after the second dose on 21Apr2021 12:00, the patient had a blood pressure drop, nearly fainted, chest pain, jaw pain, loss of vision. She went to emergency room (ER), they did tests and found multiple bilateral pulmonary embolisms in her lungs. The adverse events resulted in Emergency room/department or urgent care. Therapeutic measures were taken as a result of the events, Eliquis (reported as 'Eloquis') blood thinners given. The patient was hospitalized for the events for one day. The outcome of the events was not recovered. Information on the batch lot/batch number has been obtained.

1307438	5/11/2021	NJ	32	F	5/9/2021	5/10/2021	Approximately 12 hours after injection, I began to experience heart palpitations, heart racing and shortness of breath. This went on for several hours before finally falling asleep. The day following the injection, more and more symptoms began to arise such as muscle soreness, cold/hot sweats, low-grade fever (99.5%), chest pain/pressure, sweating, dizziness/disorientation and a headache. Monday night I experienced the low-grade fever however after going to bed, woke up around 5AM barely unable to stand, very disoriented and upon taking my temperature, I took note that I had a fever of 100.9%. Today, Tuesday May 11th, I am experiencing chest pain/pressure, low-grade fever, headache and am lethargic.
1307365	5/11/2021	MT	18	M	4/30/2021	5/4/2021	Pt developed chest pain on 5-1-2021, then went to the ER 5-4-2021, was hospitalized for pericarditis , elevated troponin 1 level, and hypokalemia. DC 5-5-2021 after 1 night in the hospital. Outcome: remains alive. TX management is colchicineo.6mg BID x 3 months and prn ibuprofen
1307315	5/11/2021	FL	18	F	5/5/2021	5/6/2021	5/5/21 Wednesday - got 2nd Pfizer Shot. 5/6/21 Thursday - 2am awoke with shakes/chills and throughout the day had body aches, temperature increased from 98.6 to 101.2, stiffness, nausea, headache, chills and sweats. 5/7/21 Friday symptoms continued from previous day but had strong abdominal pain. I went to my doctor and they suspected I could have appendicitis and also symptoms from the vaccine. They suggested going to the ER after 3 days if systems persisted. I went home after the doctor visit and was nauseous. I had sprite, ate white rice and chicken broth. My abdomen felt a bit better but I had a bad headache. 5/8/21 - Saturday I awoke at 6am with stabbing/burning chest pain that increased as time progressed. The chest pain was increasing and getting worse after 1 hour and 30 minutes. The pain was in the middle of my chest. My mom took me to the Emergency Room.

1307267	5/11/2021	IL	83	M	5/3/2021	5/3/2021	Presented to ED ~ 12 hours after receiving 2nd Covid vaccine. Chief Complaint: FEVER. (Pt had second COVID vaccine around noon. He presents via ambulance "feeling terrible" with fever, malaise. He is somewhat confused and uncomfortable here. Daughter in law here). No muscle aches, chest pain or cough. He has had loss of appetite. He has had dyspnea (chronic). He has had altered mental status (mild confusion). He has had skin rash (chronic LE). Pt was kept for observation x3. He was given IV fluids and a started 4.5 gm of Zosyn (Piperacillin Sod-Tazobactam So). Diagnosed with pneumonia - switched to oral augmentin at discharge. On home oxygen.
1307303	5/11/2021	NY	27	F	4/7/2021	4/18/2021	Initially presented with 5 out of 10 chest pain (substernal, no radiation, no exacerbating or relieving factors), nausea, vomiting, diarrhea, dyspnea on exertion, and fatigue. Further history obtained included decreased exercise tolerance since four weeks prior to presentation (noticeable during runs). She was found to have an abnormal EKG at an urgent care and was sent to an outside hospital emergency department. She ultimately was found to have heart failure with preserved ejection fraction (56%), Stage C, Class III, and myocarditis. The highest suspicion for the etiology of her myocarditis is viral vs. autoimmune (given response to steroids) vs. genetically-mediated myocarditis. She was discharged on aspirin, a prednisone taper, colchicine, metoprolol, and Entresto with cardiology follow-up. Patient discharged with 4 week monitor to monitor for arrhythmia as per EP service. Infiltrative cardiomyopathy evaluation pending as well- plan for SPEP/UPEP, serum/urine protein electrophoresis, immunofixation, and alpha-galactosidase (not sent due to specific tube not available).

1307481	5/11/2021	MI	48	M	4/3/2021	4/29/2021	Patient is a 48-year-old male with patient history significant for CAD, CHF, ICD, HTN, hyperlipidemia, and smoking who presented to the ED yesterday morning with 1 day history of chest pain. Patient described the CP as moderate aching in the substernal area that did not radiate. The pain was intermittent, with each episode lasting 1-2 minutes. The CP was associated with LUE numbness and SOB on exertion. The chest pain and LUE numbness have now resolved. Patient also reports a three week history of RUE swelling. The swelling gradually worsened and is now associated with pain and proximal RUE bruising. RUE pain is rated 5/10. In the ED, patient was found to have NSTEMI and small right lower lobe segmental pulmonary artery embolus. Venous Doppler was positive for occlusive thrombosis in the R subclavian, basilic, and cephalic veins. Patient was started on IV heparin. Patient is scheduled for cardiac cath today. Hematology is consulted regarding PE and RUE DVT. Patient denies personal or family history of blood clots or recent travel. Reports receiving COVID vaccine in LUE approximately three weeks ago. Also admits to being more sedentary recently due to being unemployed. Denies nausea, vomiting, bleeding, bowel changes, fever, or chills. Significant PE findings: RUE edema, firm and tender to palpation, ecchymosis on proximal RUE, distal sensation and active ROM intact

1307502	5/11/2021	NJ	18	M	4/13/2021	5/4/2021	<p>18M with no PMH s/p pfizer vaccination dose 2 on 5/4/21 who presented with chest pain. He initially had chest pain the day prior to admission with pain in his back and down his left arm. This improved with Tylenol and resolved prior to bed. On the morning of 5/6 the chest pain returned and was so severe it woke him from sleep. He was difficult for him to characterize, but he said it was all over his chest, sometimes sharp and pressure-like, most severe in mid substernal region and was so substantial that he had difficulty speaking properly. He feels that the pain is most severe when lying flat and is best managed when he is resting at a 45 degree angle. Patient was at ED he was found to have an initial ECG with ST depressions in aVR and elevations in II, aVF, and V2 through V6 raising suspicion for pericarditis/myocarditis. Initial troponin was elevated at 4.35 as well. Cardiology Dr. was contacted by ED physician, case discussed, and EKGs reviewed and felt this was more likely pericarditis, but not STEMI. Of note, he reports a family history significant for his mother having a?hole in her heart.?He was given Toradol with improvement in his pain and upon arrival to hospital his chest pain was markedly improved. He was noted to have troponins peaking at 39.415 that down trended and an elevated CRP of 4.8 on admission. D-dimer was 0.26. Covid PCR was negative. He was evaluated by cardiology again here who upon review of his ECG and cardiac enzymes as well as presentation was consistent with pericarditis. Echocardiogram showed normal LV systolic function with trace posterior pericardial effusion and telemetry was monitored without any arrhythmias. He was started on low-dose beta-blockers, aspirin 650 mg 3 times a day, and colchicine 0.6 mg every 12 hours for 2 doses followed by 0.6 mg daily. He is planned to continue this for approximately 3 months and will need to follow-up with cardiology in 1 to 2 weeks for repeat monitoring and management with plan to taper off aspirin once his CRP normalizes. Later that night, he even had a similar episode of sudden onset chest pain for which she received IV Toradol with minimal relief and oral Tylenol with relief of symptoms after that. No telemetry abnormalities were recorded at that time. ECG the following day showed improving ST changes and troponin of 26.328 with CRP 4.2. He had no further symptoms for over 24 hours and is responding well to</p>

1308074	5/11/2021	NC	40	F	4/6/2021	4/26/2021	Was diagnosed with a DVT 3.5 weeks after vaccination. Started experiencing symptoms of DVT 20 days after the vaccine. Symptoms were not atypical and were almost not checked for DVT at ER. Started with twinges in my right leg for several days. Then pain in my back right behind my heart. Then developed sporadic chest pain and heart palpitations. I was afraid to go to the ER because of COVID because my 12-year-old daughter has a heart condition. Then on April 30 mid-day my right thigh began to hurt like a pulled muscle although I had not injured it or pulled it. I couldn't walk on my leg the pain was so intense. My family was very worried about a blood clot because of the Johnson and Johnson vaccine. That night I had really sharp chest pains and my thigh pain was no better by the next morning. I went to the ER told them my symptoms. After the ER doctor examined me he said he was 99% sure I didn't have a blood clot because my pain was in my thigh and there was no redness or swelling. He told me my chest pain was probably due to anxiety. I asked if he would check my leg anyway. Once the ultrasound of my leg was done the DR came back and said I had a DVT. Then I had to have an MRI of my chest which he told me was a lot of radiation. I did not have a PE. They did not prescribe Heparin because they felt the DVT was from the vaccine. So I was giving Eliquis. Since then my family DR has run more tests and I do not have any genetic reason to have the DVT. I do not and have not taken birth control in the past 20 years. I am now on a blood thinner for at least 90 days if not longer and I am continuing to have twinges and chest pain twinges.
1307663	5/11/2021	KS	43	M	3/12/2021	3/12/2021	Per patient: Patient received vaccine around noon on the 12 of March 2021 at Community Church. Patient states about 10 -12 hrs later, began an adverse cardiac event. Patient states the day before he injured his knee at work and went to ED from an injury the day before. At the ED they gave Fentanyl and he got sick and told the nurse that he was experience chest pain. Felt burning or falling asleep sensation in arm and chest. Told the nurse he felt like he was having a heart attack. They came in ED with crash cart and confirmed that he was having a heart attack while in ED. Transported from church to hospital.

1306957	5/11/2021	NY	35	F	4/30/2021	5/2/2021	2 days after the vaccine (on 2 May), I woke with an accelerated heart rate, chest pain, tightness of chest and shortness of breath. I presented to MD where they took my vitals and an EKG. The doctor called an ambulance for me as she assessed I was potentially displaying signs of pulmonary embolism. The ambulance took me to the emergency department. I ultimately stayed there two nights, and following many tests was diagnosed with acute pericarditis versus myopericarditis. My admitting doctor and the cardiologist both advised that while they could not be 100% certain, the pericarditis could very well be an adverse reaction to the Moderna COVID-19 vaccine. The admitting doctor told me she would report it as an adverse reaction. I am now on colchacine anti-inflammatory medication for 3 months and have one follow-up with the cardiologist to come.

1306224	5/11/2021	NJ		F	3/23/2021	3/23/2021	she was very weak & still had chest pain.; On wednesday morning 3:30am she tried again to go to bathroom & this time was on floor for two hours with paralyzed legs, chills & pains in her chest; Pains in her Chest; Her legs became paralyzed; She become violently ill; She attempted to get out of bed to go to the bathroom & fell on the floor.; This is a spontaneous report from contactable consumers. A female patient of an unspecified age received second dose of bnt162b2 (Pfizer-BioNTech COVID-19 Vaccine), via an unspecified route of administration on 23Mar2021 11:00 as single dose for covid-19 immunisation. The patient medical history and concomitant medications were not reported. On Tuesday 23Mar2021 my wife and I took our second Pfizer vaccine at 11:00am. At 7:00pm 23Mar2021 she become violently ill. She attempted to get out of bed to go to the bathroom & fell on the floor. Her both legs became paralyzed. She stayed on the floor until I was able to maneuver her back on the bed. On Wednesday (24Mar2021) morning 3:30am she tried again to go the bathroom & this time was on the floor for two hours with paralyzed legs, chills, & pains in her chest. I wanted to call an ambulance both times she refused. By Friday morning 26Mar2021, her legs were no longer paralyzed but she was very weak & still had chest pain. She started to feel much better one month later. Just wondering if this particular vaccine was tainted in any way. Event outcome of legs became paralyzed was recovered on 26Mar2021, of the remaining events were recovering. Follow up attempts are needed. Further information has been requested.
1307084	5/11/2021	TX	22	M	5/6/2021	5/9/2021	Chest pain, myocarditis, elevated troponin levels.

1306200	5/11/2021	CT	53	M	2/3/2021	2/24/2021	DVT causing Muscle cramps; DVT causing Muscle cramps; fever; chest pain; This is a spontaneous report received from a contactable healthcare professional (patient). A 53-year-old male patient received the second dose of BNT162B2 (lot number: EL9261), intramuscularly in left arm on 03Feb2021 13:00 at single dose for COVID-19 immunisation. Medical history included gout. The patient's concomitant medications were not reported. The patient previously received the first dose of BNT162B2 (lot number: EL0142), intramuscularly in left arm on 06Jan2021 13:00 for COVID-19 immunisation. The patient experienced deep vein thrombosis (DVT) causing muscle cramps, chest pain, fever, etc 2-3 weeks after the second dose on 24Feb2021 12:00. Patient did not receive any treatment for the adverse events. Prior to vaccination, patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. Outcome of the events was not resolved.; Sender's Comments: Considering a positive temporal association, a causal relationship between the event deep vein thrombosis and suspect drug bnt162b2 cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate

1305814	5/11/2021	FL	42	F	1/11/2021	2/14/2021	Diagnosed with pericarditis and admitted to the hospital; This is a spontaneous report from a contactable other HCP (patient). A 42-years-old female patient received the second dose of BNT162B2 (COVID-19 VACCINE), via an unspecified route of administration, administered in right arm on 11Jan2021 (Lot Number: EL1284) at age of 42 years as single dose for covid-19 immunisation. Medical history included seasonal allergies coconut allergy. Concomitant medications included cetirizine hydrochloride (ZYRTEC ALLERGY). Historical vaccine included the first dose of BNT162B2 for covid-19 immunisation. Prior to vaccination, the patient was not diagnosed with COVID-19. Patient developed severe sudden chest pain. Taken to the ER via ambulance. Diagnosed with pericarditis and admitted to the hospital (3 days hospitalization). Given colchicine and high dose NSAIDs. Had to go on short term disability due to the pain. Then given steroids at home. No prior health history and healthy. Received the second dose of the vaccine 3 weeks prior to pericarditis. Adverse event resulted in Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care, Hospitalization, Disability or permanent damage. Since the vaccination, the patient had not been tested for COVID-19. Outcome of events was recovered. Follow up attempts needed. Further information is expected.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of event pericarditis cannot be totally excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

1305777	5/11/2021	WA	38	M	4/15/2021	4/17/2021	chest pains; short of breath; troponin at 4.6/Went up to 5.0/troponin peaked at 9.9; Echo shows decreased blood flow (50%); This is a spontaneous report from a contactable consumer (patient). A 38-year-old male patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), at same age, via an unspecified route of administration, administered in arm left on 15Apr2021 12:45 (Batch/Lot Number: EW0162) as single dose for covid-19 immunisation. The patient medical history was not reported. Concomitant medication included loratadine/ pseudoephedrine (CLARIDIN-D). The patient previously received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), at same age, administered in arm left on 25Mar2021 04:30 PM (Batch/Lot Number: ER8730) for covid-19 immunisation. The patient experienced chest pains, and short of breath both on 17Apr2021 22:00. Tried to sleep it off. 24 hours, didn't get better. On 17Apr2021, went to local ER, troponin at 4.6 ng/L. Doctors didn't believe it, did another blood draw. Went up to 5.0 ng/L. Ambulance to nearby hospital, troponin peaked at 9.9 ng/L. Echo showed decreased blood flow (50%) and EKG was irregular. Angiogram and CT scan show no blood clots or blockages. Patient was a healthy 38 male who was a distance runner. No history of chest pain or heart issues. Doctors determined incident almost certainly related to vaccine. The serious criteria for all events were hospitalization and duration were 2 days. The adverse events result in doctor or other healthcare professional office/clinic visit and Emergency room/department or urgent care. Colchicine received as treatment for the adverse events. Prior to vaccination, the patient was not diagnosed with COVID 19. Since the vaccination, the patient has been tested for COVID 19. The patient underwent lab tests and procedures which included COVID test (COVID antibody blood test): negative on 20Apr2021, Covid test (Nasal Swab): negative on 18Apr2021. The outcomes of events were recovering.

1308280	5/11/2021		50	M	5/3/2021	5/6/2021	Presented to ED today with complaint of right-sided CP onset yesterday. Patient has history of renal cell carcinoma with metastatic disease to the liver. He has had recurrent pleural effusions involving the right lung. Has worsened pain with breathing. Had a R tube placed due to pleural effusion and last week when the tape was taken off it pulled and caused pain. Endorses SOB. No significant cardiac history. No h/o DVT, PE. Has renal CA and had L kidney removed. Patient admitted. Pulmonary/critical care was consulted regarding Pleurx catheter. It is felt that his pleural effusion had decreased in size, and the catheter was likely contributing to his right-sided pleuritic chest pain. Catheter is removed with good results of his pain. Patient however did have recurrent fevers. Empirically placed on Rocephin. With this, he did improve. He was discharged in stable condition.
1308223	5/11/2021	PA	26	F	5/5/2021	5/6/2021	Presented with chest pain. Evaluation revealed perimyocarditis
1307949	5/11/2021	KS	23	M	4/22/2021	4/26/2021	Patient presented to ER 4/26/21 with sharp chest pain associated with SOB that started the night of 4/25/21. EKG suggestive of pericarditis. Troponin I peaked at 11 and trended down to 6, TTE showed normal EF, no structural abnormalities and no pericardial effusion. patient was observed overnight, did well, discharged 2nd day on Ibuprofen 600 TID PO for 2 weeks. chest pain persisted for two more days and now completely resolved off the NSAID.
1307043	5/11/2021	MA	57	M	5/5/2021	5/7/2021	Palpitations, sweats, nausea/vomiting, chest pain. Transported by EMS to hospital, found to be having massive MI requiring emergent open heart surgery.

1308691	5/11/2021	WV	81	M	1/1/2021	1/1/2021	Patient developed chest pain late March. Duration of 1-2 days. No medical follow-up. Patient developed chest pain and difficulty breathing 26 Apr. He reported to a facility like Urgent Care. HCP recommended CXR which revealed questionable findings. HCP recommended hospital visit but patient did not go that day. Instead patient called ambulance to home the next morning and was transferred to the local hospital. Chief complaint chest pain and difficulty breathing. Bloodwork ruled out myocardial infarction. Various other assessments done over the first three days of hospitalization, including a CT scan which purportedly showed about a pulmonary emboli. Most (if not all) of the emboli were in the right lung and were small and fixed/immobile. At least one was larger. Patient was started on heparin. Echocardiogram workup ruled out presence of DVT in the legs. Patient was discharged after 13-14 days in the hospital.
1307848	5/11/2021	CT	23	M	5/6/2021	5/8/2021	Myopericarditis requiring hospitalization and cardiac MRI. Patient experienced chest pain. Patient treated with Ibuprofen 600mg TID and Colchicine 0.6mg BID.
1307847	5/11/2021	TX	50	M	5/10/2021	5/10/2021	Patient complained of tingling to his hands 15 minutes post-vaccination. Patient had no other s/sx of reaction. Patient observed for another 15 minutes and tingling did not worsen. Patient left observation area and returned to work. Patient returned to observation area around 4:40 p.m. and complained that tingling to hands was still present and he felt tightness in his forearms. Patient is a coach for the children and was outside in the 90+ degree heat during the afternoon. Patient came into observation area to cool down. Patient's blood pressure taken and was elevated, although patient stated that he had HTN. Paramedics called on site to evaluate patient. Patient began to complain of dizziness and was transported to local hospital. On the way to the hospital, the patient developed chest pain and shortness of breath. Patient was diagnosed with a non-STEMI at the hospital and transferred to higher level of care. The patient is currently undergoing observation and tests to determine the cause of the MI. The patient received epinephrine 0.5 ml at the hospital to cover any underlying vaccine reaction.

1301827	5/10/2021	IN	56	F	3/22/2021	3/22/2021	shortness of breath; coughing problems; chest started tightening; hoarseness; chest hurts; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of COUGH (coughing problems), CHEST DISCOMFORT (chest started tightening), DYSPHONIA (hoarseness) and DYSPNOEA (shortness of breath) in a 57-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 006B21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Thyroid disorder NOS. On 22-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 22-Mar-2021, the patient experienced COUGH (coughing problems) (seriousness criterion hospitalization), CHEST DISCOMFORT (chest started tightening) (seriousness criterion hospitalization) and DYSPHONIA (hoarseness) (seriousness criterion hospitalization). On an unknown date, the patient experienced DYSPNOEA (shortness of breath) (seriousness criterion hospitalization) and CHEST PAIN (chest hurts). At the time of the report, COUGH (coughing problems), CHEST DISCOMFORT (chest started tightening) and DYSPNOEA (shortness of breath) had not resolved and DYSPHONIA (hoarseness) and CHEST PAIN (chest hurts) outcome was unknown. mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was withdrawn on an unknown date. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Treatment of these events included an epi-pen, Benadryl, Pepcid, water pill and an unspecified steroid. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

1303394	5/10/2021	NY	17	M	5/3/2021	5/7/2021	Chest pain with myocarditis
1303530	5/10/2021	UT	16	M	4/27/2021	4/29/2021	<p>Patient received his 2nd Pfizer COVID vaccine on Tuesday 4/27/2021; he had low grade fever (100.3 deg F) on Wed 4/28/2021. On Thursday 4/29/2021, he developed "heartburn", and on Friday 4/30/2021 he developed chest pain that radiated to his jaw and left arm. He presented to Hospital on late 4/30/2021 or early 5/1/2021 for evaluation; initial labs showed a CRP of 1.23, POC troponin of 6.56 ng/mL (03:18 on 5/1) and lab level of 17.6 ng/mL (03:05 on 5/1) that increased to 24 ng/mL later in the morning on 5/1. COVID-19 PCR was negative. He was transferred to another Hospital mid-day on 5/1/2021 due to concerns for myocarditis/myopericarditis. He was started on NSAIDs. His troponin level improved, had decreased to 9.69 ng/mL on 5/2/2021; at that point as his chest pain had improved and labs were improving, parents requested that he be discharged from the hospital. He had 2 echocardiograms at PCH which reportedly showed normal biventricular systolic function. He had an echo at the hospital on 5/2/2021 which showed normal biventricular systolic function, no pericardial effusion, and normal valves. As an outpatient, he had repeat troponin-I levels: 2.49 ng/mL on 5/3; 0.31 ng/mL on 5/5; the troponin level was reportedly normal on 5/10/2021 per his primary cardiologist</p>

The patient's height, and weight were not reported. The patient's past medical history included pulmonary embolism (left side of the lung), and concurrent conditions included lyme disease, alcoholic, non-smoker, and menopause, and other pre-existing medical conditions included the patient had no drug abuse nor illicit drug usage. The patient was previously treated with enoxaparin for pulmonary embolism (left side of the lung- difficulty/trouble in breathing, chest pain and stroke-like symptoms), and Pradaxa (dabigatran etexilate mesilate) for pulmonary embolism. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 201A21A, and expiry: Unknown) dose was not reported, 1 total administered on 09-APR-2021 on left arm for prophylactic vaccination. Concomitant medications included natural hormones for menopause (antiaging to keep menstrual period as long as possible). The patient felt left arm tenderness (injection site pain) not immediately but 1 day after the patient took vaccine, on 10-APR-2021. The patient had soreness of the arm and the pain was tolerable. Patient stated that on 25-APR-2021, nipple was hard as rock, mostly left nipple (nipple rigidity/hard and tender nipples). Patient called doctor and was prescribed Primrose (Oenothera Biennis) oil pill. On the same day, patient experienced breasts swelling and tenderness, which was worse on the left breast and right breast had minimal pain. Patient stated that wearing bra and T-shirt was painful. The doctor had prescribed anti-depressant to the patient, but patient had refused to take it, not unless needed. On 05-MAY-2021, the patient was diagnosed with rheumatoid arthritis. Patient felt inflammation and pain mostly in the hand. Patient was prescribed meloxicam for rheumatoid arthritis. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from left arm tenderness (injection site pain) on 23-APR-2021, had not recovered from nipple rigidity/hard, and tender nipples, and the outcome of breasts swelling, rheumatoid arthritis and breasts tenderness was not reported. 1301978	5/10/2021	PA	71	F	4/1/2021		SEVERE CHEST PAIN ON RIGHT RIBCAGE AND LEFT HAND SIDE; This spontaneous report received from a consumer concerned a 71 year old female. The patient's weight was 120 pounds, and height was 64 inches. The patient's concurrent conditions included rheumatoid arthritis since approximately 14 years, penicillin and IV contrast solution allergy, no alcohol use, and non-smoker, and other pre-existing medical conditions included the patient was not pregnant at the time of reporting and had no history of drug abuse or illicit drug use. The patient received covid-19 vaccine ad26.cov2. s (suspension for injection, intramuscular, batch number: Unknown, and expiry date: unknown) dose was not reported, 1 total administered on APR-2021 for prophylactic vaccination. The batch number was not reported and has been requested. Concomitant medications included adalimumab (Humira) for rheumatoid arthritis. On APR-2021, four to five days after the vaccination, the patient experienced mild soreness or discomfort initially and progressively worsened over time. Later the symptoms developed into a severe chest pain on right hand side of the ribcage, and it hurt to breath and move; the patient felt relieved only while lying flat. The patient had visited emergency room and physician room for severe chest pain on right ribcage and left-hand side. The patient went to the hospital after 6 to 7 days after the vaccination and got admitted. The patient was put on blood thinner immediately after the admission as the staff thought the patient had blood clot. On performing D-dimer test, the levels showed 3.49 (units unspecified) and was identified that the patient had no clots. The patient was discharged from the hospital on 28-APR-2021. The patient was pain free for 2 days; However, she started experiencing severe pain on left hand side of the chest on the day before reporting. The patient stated that the pain moved over. Rheumatologist suggested the patient to take Ibuprofen for the chest pain. The patient had reached out to her rheumatologist who advised the patient to take ibuprofen for the pain in her chest; However, the patient did not take before chest pain started. It was reported that the patient would be seeing the rheumatologist the next day of the report. The action taken with covid-19 vaccine ad26.cov2. s was not applicable. The patient had not recovered from severe chest pain on right ribcage and left-hand side. This report

1302486	5/10/2021	CA	32	M	5/5/2021	5/5/2021	The evening of Wednesday I began feeling chest pressure/discomfort and slight difficulty breathing. The same on Thursday, but a little worse. Friday morning at 4:30am I awoke from intense pain and pressure in my chest, difficulty breathing, and back/shoulder/neck pain. I went to the ER at 7:30 in the morning. Had tests taken, was given colchicine to help with the pain, and it did help lower the pain level a little bit. By Noon the pain was tolerable enough that I could go home. I was told to take ibuprofen to manage the pain. I took a nap but awoke at 2:30pm, this time with even more intense pain, my back/neck/shoulder muscles convulsing/twitching from pain and from being in a state of involuntary clenching as well as chest pain/pressure and difficulty breathing. I went back to the ER and after several more tests, an ECG gave the doctors cause to worry about the health of my heart (they were concerned I may be having a heart attack or heart failure). They kept me overnight and after taking more blood tests and ECG tests were able to diagnose me with Pericarditis on Saturday morning. I was prescribed colchicine, which I am to take twice a day for three months and ibuprofen to manage the pain.

1302521	5/10/2021	VA	40	F	2/24/2021	2/24/2021	Following the 2nd shot I had rapid heart beats and high fever. Within 48 hours the heartbeats and chest pain continued to intensify. In 2.26.2021 I went to the ER and my heartrate was in the 150s/160s and my heart presented to be in failure. I was admitted to the hospital for 2 days because my troponin level was high and indicated heart issues. I had multiple EKGs and other tests as well as a heart catheterization. The catheterization showed no blockages. My heart continued to have an arithmyia and PVCs as well as chest pain. I was diagnosed with myocarditis or pericarditis due to the effects of the vaccine and referred to a cardiologists. I have been seeing the cardiologist for 6 weeks. I had to wear a heart monitor, have an echo cardio gram and many EKGs. I have never had any heart issues prior to this vaccine. I am still under the care of the cardiologist and on heart anti-inflammatory medications due to the myocarditis. I have rapid, irregular heart beats and am unable to do any physical activity.
1302523	5/10/2021	TX	25	F	5/4/2021	5/4/2021	Night of vaccine had severe body aches, back pain, leg pain severe until legs went numb, then arm pain severe until also numb, chest pains/ trouble breathing. Following days had pains in arms and legs as if a tourniquet was left on and I cycled through severe pain and being numb. 5 days in I lost my vision (super blurry and seeing double) and lost complete control of arms and legs on top of headache and chest pains. Vision came back a couple hours later but the leg pains/ numbness continued even now. It feels as if my circulation has been cut off.
1302540	5/10/2021	NY	64	M	3/31/2021	3/31/2021	I felt dizzy and had problems with breathing right away after the injection. A doctor from that site who checked my vitals wanted to call an ambulance to take me to a hospital. I couldn't let this happen as I was 120 miles away from my apartment, where two dogs were left unattended. I decided to come back home and monitor my vital signs. Since that time, I had almost every other day a chest pain and high blood pressure and low level of O2 but was too busy at work to care of myself. On 04.30.2021 around 3am I decided to drive into ER at where I was admitted and had CABG surgery on Tuesday 05/04/2021.

1301470	5/9/2021	OH	49	F	4/6/2021	4/6/2021	The adverse reactions of light headedness, throat irritation, heaviness in my chest and difficulty inhaling began about 20 min after my injection, It lasted 5 minutes. About 30 min afterwards the 2nd wave of reaction came on, with the same symptoms but was even harder to inhale and lasted twice as long. I took a combination of benadryl, motrin and pepcid which alleviated the worst of the symptoms after about an hour. To this day, I still cannot take a deep breath in. About 72 hours after the vaccine I began to have diarrhea (and still have it 20 days later), lethargy, nausea and shortness of breath. The next day I had a little more energy, but still had continued shortness of breath. My vision had become less clear and my thought process a bit fuzzy. This is still happening today. Seven days after the vaccine, I suddenly became extremely light headed just simply walking. To the extent that I needed to sit or lay down before I began to pass out. After the light headedness came on heavily, I also noticed a very heavy weight on my upper chest and found it quite difficult to inhale. These moments would come and go throughout the day. Regardless of whether I was just sitting and relaxing or walking around. These symptoms would last anywhere from a couple minutes to a couple of hours. I found it very hard to catch my breath and could feel my heart flushing often. Additionally I would wake in the middle of the night feeling that I needed to gasp for air. I sought medical assistance from a clinic, an ER and even my allergist and I am scheduled to see my family physician later this week. I am not an anxious person, but have experienced many episodes in the last 20 days that have truly made me feel that I was going to die (no exaggeration!) due to the inability to breathe or that I may have been having a heart attack. I began to have chest pain that would travel from the center of my chest to my left shoulder. The pain also would move to my right lung area. During this I also had heaviness in my chest and felt I could not breathe in or out easily. I am still very light headed and have difficulty walking very far without taking a break because I feel I cannot catch my breath. I still have all of the same symptoms that I experienced 20 minutes after my vaccine. These symptoms have varied in intensity. I have often commented to my family that I feel the symptoms of the chest heaviness and heart flushing seem to come in waves. I am a health conscious

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							person and have never had poor health in my life. The events in the last few weeks have definitely taught me how terrible life must be for those who chronically suffer from heart or lung issues. I am still currently battling these symptoms, however, the last few days seem the symptoms have often been less severe.

1299336	5/8/2021	MD	39	F	4/21/2021	4/26/2021	acute pericarditis; Patient developed chest pain.; This is a spontaneous report from a contactable physician. A 39-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiration date were not reported), dose 1 via intramuscular route, administered in arm left on 21Apr2021 at 12:00 as single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient did not receive any other medications within 2 weeks of vaccination. Prior to vaccination, the patient did not diagnose with COVID-19. On 26Apr2021 at 03:00, the patient developed chest pain and she was taken to emergency department. She was admitted to observation. Electrocardiogram (EKG) changes and lab results consistent with acute pericarditis. The events resulted in emergency room visit or urgent care and physician office visit. The patient underwent lab tests and procedures which included PCR covid test with nasal swab on 26Apr2021 and result was negative. The patient received treatment included intravenous fluids, Toradol, indomethacin, and colchicine for the events. The outcome of the events was resolving. Batch/lot was unknown as not provided to reporter at the time of report completion. Information on the lot/batch number has been requested.; Sender's Comments: Based on the temporal relationship, A possible contributory role of the suspect product to the development of Chest pain and Acute Pericarditis cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1300157	5/8/2021	ME	36	M	5/5/2021	5/5/2021	Onset of feeling "wonky" 11PM after shot on 5/5. Awoke 4AM 5/6 with fevers and chills, which persisted for the whole day but resolved by Friday 5/7 AM. Chest pressure ("fast pounding") then began around 6PM which progressed to Chest pain around 8PM. Chills again at that time. Went to bed, woke up 5/8 chest pain still present at 6AM. Went away for 2 hours then around 8AM came back, prompting calling EMS.

1300103	5/8/2021	WI	64	M	3/20/2021	4/22/2021	On 04/22/2021, a patient was determined to have pericarditis, possibly secondary to COVID-19 vaccination. The patient received his first COVID-19 vaccination (Pfizer) on 2/27/2021. The patient reported feeling poorly and presented to ER on 03/02/2021 with chest pain and dyspnea. He states the chest pain he is experienced this week is similar to the 2 episodes of chest pain he had after each of the two-step Pfizer COVID vaccination that he received in February 02/27/2021 and March 03/15/2021. He underwent a stress test on 03/11/2021 which did not show any reversible perfusion defects. Of note, the patient had COVID-19 back in October 2020 which manifested with night sweats, malaise for a few days and then cleared completely without any "long hauler" symptoms. The patient was treated with ibuprofen and colchicine. I did not find any evidence suggesting a relationship between pericarditis and covid-19 vaccination. In clinical trials, pericarditis was not statistically significantly different between treatment arms. Other potential causes of pericarditis include atrial fibrillation.
1300080	5/8/2021	IA	51	F	4/15/2021	4/27/2021	I felt sluggish after my second Moderna shot on April 15th. On the evening of April 27th, I really started to feel horrible and was scared as it was hard to breathe and my chest pains were just horrible. I head to ER and am told I have blood clots in both lungs and 2 blood clots in lower leg. Taken by ambulance to the hospital.
1300044	5/8/2021	CA	28	M	5/4/2021	5/7/2021	Myocarditis. Developed severe headache (3 days) with chest pain (for 1 days). Noted to have high sensitivity troponin 6000 > 6000 > 8000. ECHO WNL. CTA heart, WNL.
1299978	5/8/2021	TN	46	M	5/3/2021	5/5/2021	Chest pains started on 5/5/21 around 4pm and worsened through 9pm. The next morning chest pains continued to the point where I went to the Emergency Room. There, a cardio ultrasound, blood work and a cardio catheter were performed. Tests for all respiratory viruses all came back negative. I was taken to the Critical Care Unit and remained under supervision overnight and through the morning 5/7/201, when I was discharged. I was diagnosed with Myocarditis and Pericarditis.

1299961	5/8/2021		16	M	5/4/2021	5/6/2021	<p>Patient is a previously healthy 16 year-old M presenting with acute onset chest pain, shortness of breath, nausea, vomiting, malaise, fever and myalgia to ED on 5/6/2021 at 20:44. He started experiencing symptoms on 5/6/2021 morning at 06:07 AM. He received his second dose of Pfizer COVID-19 vaccine on 5/4/2021 10:00 AM. In the ED, CBC, CMP and UA was within normal limits. EKG at 20:46 and again at 21:14 showed ST segment elevation in inferolateral leads with possible myocardial injury, ischemia or pericarditis. Troponin 0 hour was 835 and at 2 hours 1674. Patient was admitted to the PICU for further evaluation and management. Echo on 5/6/2021 showed normal LV systolic function with SF 31% . Cardiac MRI on 5/7 showed contrast enhancement of inferolateral wall consistent with myo-pericarditis with small pericardial effusion. Troponins were trended every 12 hours and plateaued in the 1800's on 5/8/2021. Patient was diagnosed with acute myo-pericarditis. Respiratory viral PCR and COVID-19 PCR on 05/06/2021 were negative. Thyroid studies were normal. ANA titer is pending. Viral serology for HbsAg was negative and HIV was non-reactive. Results for additional viral serologies for Coxsackie viruses, EBV, CMV and HHV6 are awaited. Patient was treated with NSAIDs and Colchicine. IVIG was not given based on clinical judgement. Pediatric Cardiology was involved in patient's care and clinical decision making. Patient remained hemodynamically stable on room air throughout his PICU course. He was discharged on 5/9/2021 with Pediatric Cardiology outpatient follow up in 2-3 weeks. He will continue Ibuprofen 600 mg every hours and Famotidine 20 mg 2 times daily until his follow up.</p>

A 58-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE lot/batch number and expiration date not reported) via an unspecified route of administration on the left arm on 09Apr2021 at a single dose for COVID-19 immunisation. The patient medical history was not reported. There were no concomitant medications. The patient previously received first dose of BNT162B2 on 18Mar2021 for COVID-19 immunisation (left arm). Patient stated, "the second was really bad my arm was sore for like over a week I mean it was sore. I don't know I have not felt the same since. I can feel like the drug was inside me like something was changing and I never had no problem for anything but now its been like at the last when I got the shot was 9th of April of this month, its been like 2 weeks now almost and it is like I feel crappy. I have headache I have like a chest pain u know in my chest. I have like my heart is I don't know its like I am having a heart attack or something I don't know it is stroke or something. I do not know it is feeling funny. I have no problem I do, may be I have may be heart burn something. I don't know because on every single day everyday I have chest pain my heart, headache I have slight headache now. I don't know why I can feel a pain where my heart is on left side now I got the pain on right side you know I have the pain there and I wondering what's going on so I don't know". Consumer stated, "First its both side that is what I am saying now right now so as I am talking to I have pain in my heart and like it feels the heart u know I don't know there is a weird thing in my heart. I feel like you have a heart attack or so, I you feel like a chest pain or you had a heart burn or something and then on my right side has started it is like something happening with my body you know now its the right side. I don't really know, I can feel me liver, my kidneys are like something is like I can feel something is going I don't know what's going on with my body. You know after getting the shot right now I have the slight headache. I</p>

1298760	5/8/2021	CO	77	F	12/21/2020	12/21/2020	30 minutes of rapid heart rate and fluttering; shortness of breath; supraventricular tachycardia; Dizzy; diaphoretic; Palpitations; Fatigue; nauseous; This regulatory authority case was reported by an other health care professional (subsequently medically confirmed) and describes the occurrence of CARDIAC FLUTTER (30 minutes of rapid heart rate and fluttering) in a 77-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 025J20-2A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 21-Dec-2020, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 21-Dec-2020, the patient experienced CARDIAC FLUTTER (30 minutes of rapid heart rate and fluttering) (seriousness criterion medically significant), DYSPNOEA (shortness of breath), SUPRAVENTRICULAR TACHYCARDIA (supraventricular tachycardia), DIZZINESS (Dizzy), HYPERHIDROSIS (diaphoretic), PALPITATIONS (Palpitations), FATIGUE (Fatigue) and NAUSEA (nauseous). On 21-Dec-2020, CARDIAC FLUTTER (30 minutes of rapid heart rate and fluttering) had resolved. At the time of the report, DYSPNOEA (shortness of breath), SUPRAVENTRICULAR TACHYCARDIA (supraventricular tachycardia), DIZZINESS (Dizzy), HYPERHIDROSIS (diaphoretic), PALPITATIONS (Palpitations), FATIGUE (Fatigue) and NAUSEA (nauseous) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 21-Dec-2020, Electrocardiogram: abnormal (abnormal) supraventricular tachycardia. On 21-Dec-2020, Heart rate: increased (High) increased. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. No relevant concomitant medications were provided. About 3 hours after receiving vaccine, patient had 30 minutes of rapid heart rate, and fluttering. She laid down, went to sleep, and it resolved. She didn't seek emergency care. Did not have chest pain or shortness of breath. Continued to have palpitations occasionally, fatigue, tachycardia. She presented to primary care professional on 07 Jan 2021 for symptoms and was transferred to for

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

additional cardiac workup and treatment after capturing supraventricular tachycardia (SVT) on electrocardiogram (EKG). Also diaphoretic, dizzy, nauseous, shortness of breath with palpitations. She was given IV metoprolol in ED with conversion to normal sinus rhythm (NSR). They suspect that the vaccine may have been her trigger. She was able to discharge without escalation of care. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

1299223	5/8/2021	MI	45	M	4/14/2021	4/15/2021	nearly fainted twice; I've been having weird pains in several spots inside my muscles all over the place in my legs, feet, arms, neck, chest, face and even my left hand ring finger tip. It's pain that is in spots, it feels; I've been having weird pains in several spots inside my muscles all over the place in my legs, feet, arms, neck, chest, face and even my left hand ring finger tip. It's pain that is in spots, it feels; pains in chest; catching my breath; very cold and clammy; This is a spontaneous report from a contactable consumer (the patient). A 45-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot number EW0169), via an unspecified route of administration, on 14Apr2021 at 11:30 (at the age of 45-years-old) as a single dose in the left arm for COVID-19 immunization. Medical history included cardiac disorder from an unknown date and unknown if ongoing, irregular heart beat and depression from an unknown date and unknown if ongoing. Concomitant medication included metoprolol (METOPROLOL) taken for an unspecified indication, start and stop date were not reported. The patient did not have any other vaccines within four weeks prior to the vaccination. The patient stated that when he first got the shot he actually nearly fainted twice and had to lay on the floor for a while. It was very scary, he thought he was going to die. He got very cold and clammy and had pains in chest and had a hard time catching his breath. They checked his vital signs a couple times and said they looked good. But he still felt sick and they said if he did not feel better soon they may have to call for an ambulance for him. Eventually he felt better enough to where he was able to get up off the floor and on handicap cart to drive out of there. Also, he's been having weird pains in several spots inside his muscles all over the place in his legs, feet, arms, neck, chest, face and even his left hand ring finger tip. It's pain that is in spots, it feels like mini-charley-horses that lasts anywhere from 20 something to 30 something seconds. Now it's mostly continuous pains in his thigh muscles between his legs. And a pain in one spot in his left arm bicep. This has been happening for days." The patient experienced "nearly fainted twice" on 15Apr2021 with outcome of not recovered, chest pain, got very cold and clammy and had a hard time catching his breath on 15Apr2021 with outcome of not recovered. He also

The patient previously received the first dose of BNT162b2 on 22Mar2021 on 08:45 in intramuscularly in the left arm (Lot Number: ER8727) for COVID-19 immunisation. The patient had not received any other vaccines within 4 weeks prior to the COVID-19 vaccine. In Apr2021, the patient developed transient fever, chills, headache, and body aches which resolved 24 hours after his 2nd Pfizer vaccine, followed by left-sided chest pain, shortness of breath (SOB), diaphoresis, dizziness, paresthesias to his hands; hypotension 3 days post 2nd vaccination, on 20Apr2021, patient was admitted to hospital with positive cardiac enzymes, initially troponin T baseline at 663, 1 hour follow-up troponin T at 943 with troponin T delta at 42%. A 3-hour troponin T at 1913 with a troponin T3HR delta at 189% and CPK >1000 with the diagnosis of myocarditis. Covid screen was negative, Covid antibody was negative, HIV was negative, drug screen negative and rest of work up for other causes so far negative. On 20Apr2021, he was transferred to another hospital for further cardiac care. Treatments for the events included pressor, cardiac medications, cath, etc. Patient remains hospitalized. In Apr2021, the patient recovered from the events, body aches, headache, chills, transient fever. The patient had not recovered from the events, positive cardiac enzymes, myocarditis, hypotension, left-sided chest pain, SOB, diaphoresis, dizziness, and paresthesias to his hands.; Sender's Comments: A contributory role of BNT162B2 to the reported events cannot be fully excluded based on temporal relationship</p>

and lack of alternate explanation at this time. Case will be reassessed if additional information is received. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

COVID SYMPTOMS/SICK/RUNNY NOSE/BREATHING ISSUE/SORE THROAT; LEG PAIN; CHEST PAIN; CHEST CONGESTION; This spontaneous report received from a patient concerned a female of unspecified age. The patient's weight, height, and medical history were not reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 201A21A, and expiry: UNKNOWN) dose was not reported, administered on 07-APR-2021 for prophylactic vaccination. No concomitant medications were reported. On APR-2021, the subject experienced chest pain. On APR-2021, the subject experienced chest congestion. Laboratory data included: X-ray (NR: not provided) X-ray was good. On 12-APR-2021, the subject experienced leg pain. On 20-APR-2021, the subject experienced covid symptoms/sick/runny nose/breathing issue/sore throat. On 05-MAY-2021, Laboratory data included: COVID-19 virus test negative (NR: not provided) Tested negative for covid test, Lab test (NR: not provided) Tested negative for bronchitis, Tested negative for flu, Tested negative for pneumonia, and Streptococcus test (NR: not provided) Negative. Laboratory data (dates unspecified) included: COVID-19 virus test negative (NR: not provided) Negative, Negative, Negative. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of the leg pain, covid symptoms/sick/runny nose/breathing issue/sore throat, chest pain and chest congestion was not reported. This report was non-serious.

1299360	5/8/2021	IN	40	M	4/26/2021	4/28/2021	Shortness of breath started later in day on day of second vaccine (4/20/21) . Presented to hospital 4/25/2021 with chest pain and shortness of breath. Found to have large pulmonary embolism and elevated troponin. Patient was discharged on 4/28/2021 on apixaban. Patient did already have lower extremity vein disease and previous ablation to right great saphenous vein in 2019. Has family history of pulmonary embolism in her sister. Patient was also on depot medroxyprogesterone acetate injections.
							This is a spontaneous report from a contactable consumer (patient). A 40-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration, administered in Arm Left on 26Apr2021 08:15 (Batch/Lot Number: EW0171) (at age 40 years old) as single dose for covid-19 immunisation. Medical history included high blood pressure, high cholesterol, carpal tunnel, absent vas deferens, all from unspecified dates. No COVID prior to vaccination. He underwent Covid test post vaccination (nasal swab) on 29Apr2021 with negative result. The patient's concomitant medications included unspecified prescribed and store-bought medications. No other vaccines in four weeks. On 28Apr2021 22:00, the patient experienced chest pains and shortness of breath testing of EKGs, echo, CT scan, and cardiac cath show- NSTEMI heart attack showing from damage to heart caused by blood clot. No problems with arteries or existing with heart. Also, lower lobe of left lung shows collapsed. The events resulted in doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care. The events were considered serious: hospitalization (2 days), life threatening illness (immediate risk of death from the event), disability or permanent damage. Treatment included blood thinners- apixaban (ELIQUIS) and metoprolol. The patient was recovering from the events.

1294518	5/7/2021		62	F	4/15/2021	4/16/2021	The day after I received the first dose of my vaccine, I felt numb on my tongue, around my mouth, and hands. In addition, I also experienced a low fever. Then on the third and fourth day, I stated to feel numb on my arms, thighs, fingertips and the bottom of my feet. I also started to feel chest pain, back pain, and experience migraines. I've felt very tired throughout this time, had a dry mouth. The tops of my feet and hands were slightly swollen and my veins were much more prominent as well. The palm of my hands are always very warm and have a visibly pink color. During this time frame, I've seen also seen my GP twice. As of today, overall, all of these symptoms have lessened in severity. Although the feeling of numbness has also lessened in severity as well, the slight feeling of numbness is still present as of today-especially on my tongue (23 days after my first dose of the vaccine).

1294745	5/7/2021	OH	60	M	4/10/2021	4/10/2021	Feeling terrible all over; aching all over; his urine started smelling bad; Hepatitis C; His chest was also hurting; Dizzy; his arm hurt just from the shot.; This is a spontaneous report from a contactable consumer (patient). A 60-year-old male patient (weight: 83.91 kg, height: 178 cm) received the second dose of BNT162B2 (Pfizer-Biontech Covid-19 Vaccine, Lot. ER8734, Expiration date: 31Jul2021) at single dose, in the right upper arm, on 10Apr2021 at 14:00, for COVID-19 immunisation. The patient had not received any other vaccines within 4 weeks prior to the BNT162B2 vaccine. Relevant medical history included arachnoiditis adhesive chronic from an unspecified date, in 1999 and ongoing, ulcerative colitis from an unspecified date, in 1996 and ongoing, chronic sinusitis from an unspecified date, venous reflux disease from an unspecified date and ongoing and polyps from an unspecified date (7 surgeries performed from polyps. Last surgery was Mar2016). The patient previously, on 20Mar2021, at 14:00, received the first dose of BNT162B2 (Pfizer-Biontech Covid-19 Vaccine, Lot. EP7534, Expiration date: 31Jul2021) in the right deltoid, at single dose, on for COVID-19 immunisation. He was good after the first shot, he had no problems. Concomitant medications were unknown. On 10Apr2021, the patient experienced dizzy ("after the second dose they got home and that evening while getting up off the couch, he got really dizzy") and his arm hurt just from the shot. On 13Apr2021, he developed chest pain (his chest was also hurting) and had hepatitis C ("he got blood work done and just got it back and was told he has hepatitis C"). On 20Apr2021, his urine started smelling bad. On an unspecified date, the patient also experienced generalised aching ("aching all over") and was feeling terrible all over. Relevant laboratory test, performed on an unspecified date, showed the following value: alkaline phosphate high, blood cholesterol high, eosinophil count 5.4 %, hepatitis C positive, low density lipoprotein (LDL) high and infectious mononucleosis (Mono) 13.5. The patient recovered from vaccination site pain on 10Apr2021, recovered from dizzy on 14Apr2021 and recovered from chest pain on 20Apr2021. The patient did not recover from hepatitis C and urine abnormal. Clinical outcome of feeling bad and generalised aching was unknown at time of this report.

1295094	5/7/2021	KS	44	M	5/5/2021	5/6/2021	I felt decent; just some sore muscles and where I was injected up until about 2 pm the day after the 2nd vaccine. Then all of my muscles began to ache badly & by 4 pm I was suffering from on and off chills/ sweating ; this lasted all evening. I checked my temperature & only once was the temperature above 100F. I did have some chest pain at times as well. I drank mint tea, took tylenol at regular intervals & used icy hot on the sore back and neck. Following morning I'm feeling a little better but still quite a bit of soreness but as of 7 am , the chills/hots have subsided. I did pee a lot over night; at one point I went to the bathroom about 5-6 times within an hour to 90 minutes.

1295367	5/7/2021	VA	53	F	5/7/2021	5/7/2021	Pulmonary Embolus Insidious onset of dyspnea on exertion with her daily walks, stairs, muscle fatigue the week after her vaccine Initially attributes sx to donating blood (3 days after vaccine) When sx persisted came to office for eval. D Dimer positive Chest CTA shows RLL PE No hypoxia, no chest pain, clinically stable Plan is for oupt tx with Eliquis and stop OCP
1296650	5/7/2021	KS	16	F	4/14/2021	4/17/2021	Patient was seen at the urgent care clinic on 4/19/2021 having congestion for a couple of days as well as cough, news throat the head and troubles breathing was noted to have normal oxygen saturation and was given an albuterol inhaler and told that she had a virus. She followed up in the PCP office on 4/21/2021 with worsening troubles breathing and was given Decadron in the office, 4days of prednisone, CXR and labwork. CXR showed possible reactive airway disease and was to do steroid and continue out albuterol every 4 hours. Had negative/normal lab work and positive Covid antibodies. History of Covid 10/2020. Felt almost completely back to normal by Sunday, her last day of steroids. On Monday had worsening of her breathing throughout the day, increased troubles breathing again after softball that night. Albuterol did seem to help up. Called the office as she woke up Tuesday morning with worsening and would started on Flovent. With no improvement return to PCP office on 4/29/2020 with marked inspiratory stridor. Was admitted to the hospital for work-up of return of stridor. Had a normal chest x-ray and neck/soft tissue x-ray. With continued troubles breathing and chest pains with decreased heart rate was elected to go to Hospital where she could have further work-up. When the ARNP came helicopter, was concerned about her airway and she intubated to fly to hospital. Was dx there with Sudden Acute Onset of Vocal Cord Dysfunction and is continuing with therapies.

1294733	5/7/2021	CA	29	F	2/24/2021	2/26/2021	swollen bottom lip; tongue ached; chest pains; itching in mouth after eating; swelling and tingling tongue; swelling and tingling tongue; tight throat after eating; felt like mucus was in throat; enlarged thyroid; lightheadedness; ocular migraines; throbbing lymph nodes in throat; Discomfort in throat; skin itchy; This is a spontaneous report from a contactable consumer (patient). This 29-year-old female consumer (non-pregnant) received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot En 6506), on 24Feb2021 at 10:00 AM, in left arm, for COVID-19 immunisation. Medical history included benign thalaseemia, irritable bowel syndrome, ocular migraines, peanuts allergy, tree nuts allergy, penicillin allergy, amoxicillin allergy. Concomitant medications were none (no other medications in two weeks, no other vaccine in four weeks). Covid prior vaccination: no. On 26Feb2021 at 11:00, 48 hours post vaccine, the patient experienced itching in mouth after eating, swelling and tingling tongue, tight throat after eating, felt like mucus was in throat, enlarged thyroid. 2 weeks post vaccine, on an unspecified date in Mar2021, the patient experienced swollen bottom lip, tongue ached, chest pains. 4 weeks post vaccine, on an unspecified date in 2021, the patient experienced lightheadedness, ocular migraines, throbbing lymph nodes in throat. Discomfort in throat and skin itchy were also reported. The events resulted in Doctor or other healthcare professional office/clinic visit, disability or permanent damage. Allergist recommended antihistamines 2x per day. The patient had a negative nasal swab on 28Feb2021. The events had not yet resolved.

1296953	5/7/2021	AZ	69	F	2/27/2021	3/1/2021	02/27/2021 -received vaccine #1. 03/01/2021 - began to have chest tightness. All through March I felt bad with symptoms of muscle aches, headaches, shortness of breath, loss of appetite, nausea. By the middle of March I felt so bad that on the 17th I had a covid test, which turned out negative. On the 20th I had nausea and vomiting and a fever of 101 to 102 degrees. I received instructions to use ondansetron for the Nausea/vomiting and Tylenol for the fever. On the 22nd I had a virtual with the nurse practitioner; she determined I had a GI virus and was not in need of anything further. I felt better on the 25th & 26th and decided to get vaccine #2 on the 03/27/2021. On the night of the 27th I went to the ER for worsening shortness of breath and chest pain, especially with deep inspiration, and nausea/vomiting. I was admitted to medical center with a (later) diagnosis of Bilateral Pleural Effusion. I was started on antibiotics and received multiple tests including x-rays, blood tests, cardiac function,Ct scan with contrast, images from nuclear med and more. A thoracentesis was done to drain a pocket of fluid in the left lower pleura - 700cc was removed and sent to the lab. Between the blood work and the pleura fluid it was determined that I had Systemic Lupus. I had no other acute s/s of Lupus although the Cutaneous Lupus had been diagnosed for many years.

1295429	5/7/2021	KY	57	M	5/4/2021	5/4/2021	Day of Vax: At about 2pm....I had a severe reaction forcing me to lay down for several hours....body aches and pains, mental confusion, really weird feelings throughout my body. I had to take sick time from work. I felt better in the evening. Day 2(wed): woke up with moderate/extreme fatigue....body did not feel good...could not work took more sick time...spent most of day in bed. Day 3(thurs): Was going to try to get back to regular schedule.....worked in the morning...did my usual lunch time hike.....in the afternoon suffered from another bout of moderate/extreme fatigue...could not work..took more time off....in the evening had chest pain in my back between my shoulder blades. Day 4(fri): I am filling out this form...woke up with pain in between my shoulder blades....that seems to be feeling a little better now....I am trying to get back to my regular routine and have been working this morning. I believe that I will continue to get fatigued for a few more days....and I'm very sensitive between my shoulder blades.
1296631	5/7/2021		71	F	4/11/2021	4/16/2021	Myocarditis Patient presented to the hospital with one episode of troponin positive chest pain. She was diagnosed with an NSTEMI for which she had a coronary angiogram which showed no significant coronary artery disease. She subsequently had CRP (normal)/ESR (mildly elevated) and DDIMER. Ddimer was elevated thus a V/Q scan was done which showed no pulmonary embolism. She went on to have a cardiac MRI which showed evidence of myocarditis.
1296591	5/7/2021	WA	42	F	4/27/2021	4/29/2021	Dull chest pain which increased with deep breath or bending over. Blood tests revealed extremely elevated Troponin-i and CRP levels. Required hospital stay, for 2 days

1295509	5/7/2021	TX	16	F	4/10/2021	4/14/2021	My 16-year-old daughter, very healthy without any health conditions, got her first dose of the Pfizer vaccine on Saturday evening, April 10th, at around 5pm. On Wednesday, she started complaining of shortness of breath, chest pains, which she described as a feeling of someone stubbing her heart. By Thursday, she began blacking out repeatedly throughout the day, each blackout lasting about a minute. These progressed and whenever she blacked out, she would not remember what happened. At first, she and I brushed it off as maybe lack of calcium since she rarely drinks milk. But as they intensified, I began to become more concerned. I told her I cannot leave her by herself in the house as I prepared to go pick up her young siblings from school then schedule an appointment with her doctor. On our way back home, she blacked out again, however, it was for more than a minute. Straight away, I drove to the ER close by. The doctor came back to inform me that her heartbeat was irregular and concerning based on her age. In that same moment, she began complaining of excessive pain like someone punching her heart out, and then she passed out again. Still with my two other children, the whole ordeal began to frighten them and illicit some heavy tears. Being that this ER was general admission, the doctors insisted they call in the paramedics to transport her to another ER for children. However, after being transported to the other ER, her condition began to intensify rather quickly and the pediatric doctor at the second ER informed us we would have to be transferred to Childrens intensive care unit where the cardiologists could check her heart, find the ultimate cause, and monitor her closely. In that moment, as a mother, I was speechless and extremely terrified. Seeing my daughter being transferred from ER to ER, made it even tougher on me so much that I could no longer hold myself together. Here she was in terrible pain and being moved around with no clear diagnosis and treatment. From there on, we spent a couple days in the Cardiac ICU waiting and praying with friends for answers and the best treatment she could get to ease the pain. By about the third day of being in the ICU, the cardiologists informed me, she had Acute Myocarditis. This was so shocking in a sense that both sides of the family have no history of heart issues. Secondly, she is a very healthy child.

1291449	5/6/2021	CA	31	M	4/22/2021	4/22/2021	Fever, chills, headache, sore arm, swollen arm, lethargy, sensitive and sore skin. These began within 6 hours of the shot and were debilitating for 48 hours. Severe for 49-72 hours and then fever broke and other symptoms gradually subsided over next 48 hours. At some (unknown) time after the vaccine, I developed viral pericarditis. In addition to the above, this manifested in chest pain (no difficulty breathing) which radiated from what felt like the lungs, through my windpipe, into a sore throat, jaw muscles hurting, inner ear and neck soreness. These symptoms lasted after all had subsided and didn't disappear until 14 days after the 2nd vaccine.
1293236	5/6/2021	PA	51	F	2/20/2021	3/7/2021	Emergency room transfer to telemetry; admitted from 3/7 to 3/18/21 with centralized Chest Pain that radiated to her right neck and shoulder, shortness of breath associated with the pain, loose stools - took baby aspirin. Cardiology consulted: heart catheterization was performed and negative; Discharged to home with AmLODipine, aspirin, atorvastatin, famotidine, imdur; follow up with PCP and cardiologist
1292616	5/6/2021	FL	60	F	4/6/2021	4/16/2021	I experienced after my J&J vaccine headaches for two days. Then on 04-16-2021 upon waking up I had a red rash which was warm, hot sensation when touching my arm. This hot sensation radiated up to my neck, trachea and down my forearm. I got concerned about the red rash and because I felt my arm hot sensation and I went to see my doctor who asked me if I had trouble breathing or if I had any chest pain. I told him I could breathe and I was concerned about my rash. He prescribed Prednisone medication which I took several days to go away. To this day I still continue with the headaches that come and go and I take 2 acetaminophen to relieve the pain. I do not know if my headaches are related to the J&J vaccine and the rash has gone away.

1293400	5/6/2021	CA	59	M	4/1/2021	4/7/2021	From Physician H&P: Patient is a 59-year-old man multiple medical chronic conditions, including known protein S deficiency not on anticoagulation, sinus bradycardia, hypercholesterolemia, chronic neuropathy of the lower extremities, who presented to the emergency room at the recommendation of his primary care office for possible stroke and persistent headache. He reports that his history of present illness begins on 4/7/2021, for which after he had received the COVID-19 Johnson & Johnson vaccine he started to have throbbing headache. He stated that it was diffuse and pounding in quality, up to 10 out of 10 pain. However this resolved on its own, and since then and has been intermittent with this type of headache. He did report 2 weeks ago, that he had a brief episode of tunnel vision as he describes it, where his vision seemed to narrow while he was looking at his phone. This only lasted no more than 10-30 minutes, and this resolved on its own as well. He continues to have intermittent headaches, again otherwise nonspecific with pounding quality however the intensity is improved. Humidifier regarding the Johnson & Johnson vaccine to report any side effects, for which she had notified his primary care doctor who then decided to proceed with MRI of the brain to evaluate for possible etiology. The MRI was done with and without contrast at facility on 5/4/2021, for which there was concern for possible left temporal posterior stroke, and if there was any concern for venous thrombosis, further imaging was necessary. He was then recommended to go to the emergency room for evaluation. He otherwise is in his regular state of health. He denies any recent fever or chills or cough, no chest pain or shortness of breath, nausea, vomiting, abdominal pain. No changes in bowel or bladder habits.
1293328	5/6/2021	CA	62	M	3/22/2021	4/29/2021	Hospitalized twice 4/18-4/21 and 4/24-28: Flu-like systems for 6 weeks. Nausea, headache, dizziness, muscle ache, inflammatory markers CRP 23.6, ESR 97, Chest pain, shortness of breath, pericardial effusion, pleural effusion, A-Fib. Manually drained right pleural cavity 400 cc. Fluid came back. Was put on prednisone for 10 days. Fluid was reduced.

1293311	5/6/2021	MA	89	F	3/10/2021	3/18/2021	She had her second dose of the covid vaccine approx 8 days ago, the day after she was very tired and slept all day. Then yesterday when she awoke she had a sense of discomfort in the left eye, and a friend who helps them at home noticed that her left eye was slightly bloodshot. Yesterday she went to see her eye doctor who dx her with an incidental small burst blood vessel but did not advise stopping eliquis and said it should resolve within weeks. She has no loss of vision. However, in the evening when at home she said she had difficulty forming words - husband did not particularly notice a problem - she ignored it basically and went to sleep . Then this morning went to the hairdresser, noticed the word finding/ speech 'garbled' slightly problem again and walked into her pcp office - she was eval'd there at approx 1140 am and sent to ER by ambulance. Code green not called given the initial deficit was last night, CT head suggested possible subacute infract. She had no chest pain or pressure, trop noted as slightly elevated at 129 , Platlets 84 Diagnosed with Bilateral punctate infarcts throughout the brain, in cerebellum, occiput, left temporal and parietal lobes
1293127	5/6/2021	CA	61	M	3/10/2021	4/19/2021	right leg DVT and bilateral pulmonary embolisms. Symptoms of cough, chest pain and dyspnea on exertion started on (about) 4/19/21. Patient presented to urgent care on 4/26/21 and again on 4/30/21 at which time the diagnosis was made.
1292824	5/6/2021	MD	46	F	3/22/2021	4/8/2021	On 4/8/21, experienced crushing chest pain. 911 called, EKG findings concerning for STEMI. Was rushed to cardiac cath lab. Diagnosed with Takotsubo cardiomyopathy.
1292713	5/6/2021	GA	14	M	4/28/2021	4/30/2021	Developed fever, SOB and chest pain 3 days after second vaccine dose.

1292638	5/6/2021	OH	28	M	4/30/2021	5/1/2021	Patient received COVID-19 vaccination (Moderna) on 04/30/2021 from a store pharmacy. Patient presented to the Emergency Department on 05/04/2021 with a chief complaint of chest pain. Patient informed the care team that he began feeling intermittent, non-exertional chest discomfort on 05/01/2021. Patient was then evaluated by the inpatient cardiologist due to concern for a myocardial infarction. The patient had a troponin of 8.9 ng/mL that climbed to 19.9 ng/mL the next day. Patient was ultimately diagnosed with Myopericarditis and initiated on treatment with carvedilol and colchicine.
1293707	5/6/2021	WA	34	F	4/16/2021	4/17/2021	Patient presented to her PCP office on 04/20 reporting that on 04/16 she received her 2nd Pfizer vaccine and the following day on 04/17 she started feeling muscle aches, fatigue and R calf pain from high ankle to the back of knee. On 04/18, all symptoms except the calf pain resolved. She continued to have 1-2/10 calf pain w/o skin changes but mild R > L enlargement of the lower leg. Reported a 3 hour car ride on 04/18 after the calf pain had already started. Denied chest pain, shortness of breath or palpitations. On exam, vital signs stable, right lower leg diffusely tender to palpation and noted to be 4 cm larger in circumference than the left side. Patient was sent for an urgent outpatient duplex ultrasound of her right lower extremity. Ultrasound showed distal DVT in right peroneal veins. She was immediately instructed to discontinue the use of the Nuva ring and started on Xarelto 15 mg BID, with good symptom improvement. Was followed up in clinic on 05/05 with plan to transition to the Xarelto 20 mg QD on 05/13 for a total of 3 months of anticoagulation.
1290020	5/5/2021	CA	46	M	4/3/2021	4/4/2021	For about 36 hours after vaccine - I started getting headaches and I never get them. I had backaches and my legs were hurting too. My blood pressure was elevated as well. And that was not going away either. I went to doctor. My headaches have decreased. But for the last two to three days I have been getting chest pains. I have called the doctor this morning and I'm waiting to call me back. It's not ongoing pain - just every now and then - I'm not sure what it is.

A 46-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in arm left on 05Feb2021 at 10:30 (Lot Number: EL9261) (at the age of 46-year-old) as single dose for COVID-19 immunisation. The patient was not pregnant. Medical history included infectious mononucleosis (Recent mono) in 2020 (Spring), urinary tract infection (UTI) in 2020 (Summer), venous Insufficiency on Dec2020, shingles in past on an unspecified date, lactose & gluten intolerance from an unknown date and unknown if ongoing, COVID-19 from Jun2020 to an unknown date (I had recovered from mild COVID in Jun and Oct2020 that required no hospitalization and was managed with DAYQUIL, XYZAL, Prednisone, Vit D and melatonin). Concomitant medications included ibuprofen at 2400 mg and 800 mg; pregabalin (LYRICA); progesterone; bifidobacterium bifidum/bifidobacterium lactis/bifidobacterium longum/lactobacillus acidophilus/lactobacillus rhamnosus (PROBIOTIC), all concomitants were taken for an unspecified indication, start and stop date were not reported. The patient experienced mild injection site pain, COVID symptoms in same order as the Oct2020

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

COVID (upper respiratory, less intense headache, shortness of breath, chest pain), dizzy, fatigue, vasovagal response, passed out, nausea, throwing up, tremor increased, chest pain & tightness to the point I could not move my arm to use my emergency inhaler prescribed after COVID/ I couldn't move, post COVID syndrome and orthostatic hypertension, tilt table testing confirmed COVID-induced POTS (postural orthostatic tachycardia syndrome) and lymph node pain, all on 05Feb2021 at 11:00. All events were serious disabling and required hospitalization. The patient underwent lab tests and procedures which included computerized tomogram (CT): unknown results on an unspecified date, D-dimer: 1300 is very elevated, it shows that I have a lot of inflammation in my body or I could have the clot, 1300, almost 3 times the normal value; magnetic resonance imaging head (MRI): unknown results on an unspecified date, SARS-COV-2 test (nasal swab): negative on 19Feb2021, tilt table test: COVID-induced pots on 05Feb2021 . Unspecified therapeutic measures were taken as a result of the events. The patient outcome of the event passed out was unknown and not recovered for all the other events.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of reported events cannot be excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1290465	5/5/2021	VA	70	F	3/8/2021	4/3/2021	STARTING AROUND 4/3 she started to experience dizziness, nausea and memory loss. On 04/06 She passed out while sitting in her chair, woke up and began throwing up. Had extreme short term memory loss and low blood pressure. On 04/08 while at her primary care Dr, he suggested a hospital visit with suspicion of possible stroke. Was admitted and released the following day. Dr advised possible mini strokes but could also be dehydration. CBC with differential showed other results than dehydration. Starting around 04/20 she started having chest pains and thought it was heart burn, after medication and another visit to her pcp she was admitted to the hospital again on 04/23. Her troponin levels indicated a possible heart attack. She had a heart catherization and was found to have a healthy heart. Again, her blood pressure has been decreased since, her hgb and hct has also been low with a history of it being high. A high WBC since all of this has started among other unexplained blood results.
1289990	5/5/2021	MD	18	F	5/5/2021	5/5/2021	Patient notes feeling of dyspnea that started a few minutes after getting second vaccination. No chest pain, palpitations or sensation of throat closure. VSS. Physical exam reassuring. She was observed for 30 minutes and during this time she notes symptoms have completely resolved.
1290102	5/5/2021	CO	35	M	4/29/2021	5/2/2021	Pfizer-BioNTech COVID-19 Vaccine EUA: three days after vaccination patient presents to emergency department (ED) reporting sudden onset severe chest pain, emesis, numbness/tingling of arms, and nausea. Initial vital signs: pulse = 90 beats per minute, blood pressure 142/100 mmHg, oxygen saturation 95% on room air. Patient admitted for management of NSTEMI: differential includes myocarditis.
1290227	5/5/2021		18	M	5/4/2021	5/5/2021	caller received second pfizer vaccine yesterday. today has headache, tired, low grade fever, chest pain above nipple on one side. has not received medical attention for chest pain.

1290235	5/5/2021	IL	21	M	4/23/2021	4/26/2021	21 year old previously healthy male had 2nd dose of COVID vaccine on 4/23. He had fever and chills over the next two days that resolved spontaneously. On 4/26, he began having palpitations with onset of substernal chest pain described as a piece of metal on top of his chest. He also had nausea and vomiting. After 1 hour, he took one ibuprofen which resolved symptoms. On 4/27, he again had chest pain but immediately took ibuprofen which resolved symptoms. He saw his PCP on 4/28 and had abnormal EKG with ST and T wave abnormalities, elevated troponin of 10, and he was sent to the ED for further evaluation. He was given 324mg aspirin and admitted for observation. He did not have any additional symptoms, and echo was normal. Troponins down trended to 2 by 4/29, and he was discharged on a 5 day course of indomethacin with follow up with his PCP, no cardiology follow up required.
1290256	5/5/2021	WA	70	M	5/5/2021	5/5/2021	Four minutes after his vaccination, patient reported feeling "hot", and sweating profusely. Some shortness of breath, and mild chest pain. Patient was responsive, and able to answer questions. By 2:50 PM, pt reported feeling "better" but still "groggy".
1290439	5/5/2021	CA	33	M	4/21/2021	4/21/2021	Post vaccine, a few hours later he had symptoms of an upper respiratory infection. It evolved into a fairly intense headache for which he took some ibuprofen. He had chills and fevers and felt very poorly. At 7 AM on Saturday, April 24 he suffered excruciating substernal chest pain. It was a burning sensation and it was so severe he wanted to die to relieve the pain. The pain was only minimally positional and it was nonpleuritic. He drove himself to the nearest hospital and even drove through some red lights to get there more quickly. When he arrived he had ST elevation in the same leads with his early repolarization which was perhaps a millimeter or so higher than the EKG we did in February. He had both an elevation of his troponin levels which were 5.07, 6.06, 5.72 and 5.73. A CK was 195 with an MB of 41.2. He was taken to the cath lab emergently. no coronary disease.
1290716	5/5/2021		24	M	4/17/2021	4/19/2021	Patient experienced fatigue, muscle aches, dyspnea and chest pain. Was told to go to ER and was diagnosed with myocarditis.

1290729	5/5/2021	CA	27	M	4/5/2021	4/15/2021	On day 1 (April 15) of noticing my body was very off after the vaccine I had Leg pain and severe headaches, I say severe because though I rarely get headaches and stay hydrated I could tell this headache really hurt and lasted the full day and several days after (something I have never had happen to me) Also on April 15, I had leg pain, If I took a step off a few inches curb or stair step I felt sharp pain shoot up my leg. On April 16th I still had the headaches and leg pain , but also while driving I began loosing my vision and started to pass out/faint. I Pulled over and waited at least a half hour. during that time I noticed I couldn't type or read anything on my phone as I was trying to reach a friend to help me. eventually after time had passed I was able to drive myself to a friends where I thought the best thing would be to sleep it off. the headaches and leg pain lasted a couple more days and I thought it was going to go away, but it is now May 5th and today and last couple days the leg pain feels more like someone has been punching my left leg. five had chest pain and headaches return. I do not have medical insurance and have avoided going to the hospital or primary care because I am afraid. today the pain is so irritating and sore I wish I could escape my body.

<i>VAERS_ID</i>	<i>RECVDATE</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1291203	5/5/2021	TX	53	F	4/19/2021	4/20/2021	<p>the right arm is roughly 2" bigger than the left arm around it.; inflamed; Thought it was dry skin. That area is prone to dry skin.; pretty tired; shortness of breath; chest pain; rash/rash around right arm; Redness in right arm at mastectomy site, and warm to touch; Welts; red bumps; Itching; Nauseated; This is a spontaneous report from a contactable consumer (patient). A 53-year-old female patient received the second dose of BNT162B2, via an unspecified route of administration in left deltoid on 19Apr2021 14:30 at single dose for COVID-19 immunisation. Medical history bipolar disorder, breast cancer, and slightly high blood pressure. Patient had a right mastectomy and had lymph nodes removed from the right side. In the spring, when everyone was mowing grass and it was real humid outside, she got welts on her body. It was temporary and went away. Patient would get really itchy. Concomitant medications included letrozole for breast cancer (the tumor in her breast was powered by hormones. This drug suppressed hormones) from 2017 and ongoing, omeprazole for constant heartburn from an unspecified date and ongoing, propranolol hydrochloride (PROPANOLOL) for anxiety from 2016 and ongoing, clonazepam for anxiety from 2016 and ongoing, and venlafaxine hydrochloride (EFFEXOR) for bipolar disorder from an unspecified start date and ongoing. Patient previously received the first dose of BNT162B2 in left deltoid on 29Mar2021 11:30 for COVID-19 immunisation and was really tired after the first vaccine. When she was a kid, her doctor put her on steroids. Never happened after age 12. Patient also got the influenza vaccine (flu shot) a couple of years before. The patient experienced redness in right arm at mastectomy site, and warm to touch, welts, red bumps, itching, and nauseated on 20Apr2021. Patient had a right mastectomy and had lymph nodes removed from the right side. In the area where that occurred, it had become red, inflamed, and a little welty. Not all of the welts were raised, they look like they were in the skin. There was redness and it was like someone scratched her and was kind of itchy. She took 2 diphenhydramine hydrochloride (BENADRYL). Patient was very sensitive to allergies, but was not allergic to anything. Sometimes she broke out in welts in the spring. Patient got the injection in the left side but the reaction was occurring in the right side. Patient was pretty tired, but she was concerned about the rash.</p>

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

Patient was concerned that the right arm was roughly 2" bigger than the left arm around it. Patient had been measuring the circumference, because nurses were paranoid about things like that. It was usually not 2" more around. Patient woke up this around 10:00 am. Around roughly 12:20 pm, or probably 10 after 12, she looked in the mirror and said there it was. She noticed the itching and thought it was dry skin. That area was prone to dry skin. The welty points of redness that were raised. It looked like someone had scratched across the area. It was red, and might be the end of one red scratchy area might be a bump. It looked like, if were to put hand where the nipple used to be and open up the area. That would all be covered. It included the upper arm and the inside of the shoulder, like the front side of the shoulder. It was raised and welty redness. Not all areas were raised and was bumpy. It was all pretty red and warm to the touch. The itchiness started more after she saw it, which was terrible. Patient took diphenhydramine hydrochloride because she was concerned about an allergic reaction. She also had scheduled medications that she took in the morning. Patient took 50 mg diphenhydramine hydrochloride this morning. Patient took at 12:10 pm when noticed these things. At first, she didn't think anything, she didn't think like it was the Pfizer shot or anything. It was just a normal day. Diphenhydramine hydrochloride had done nothing for the welts yet. Patient then felt kind of nauseated. It started when we first got on the phone. She couldn't put her finger on it. Patient went to the emergency room last Monday. The incident had nothing to do with any vaccine. She had chest pain and shortness of breath. They drew all of the labs. If she wanted to know if anything in the labs was different from then and now, she could. Everything was normal. She got an inhaler. They though it might be related to all of her allergies. The only way she would go see a doctor, is if she saw that the arm was getting much bigger, like it grew 2" more. If she had a hard time breathing, she would call 911. Patient had rash around right arm on 20Apr2021, in area of past breast mastectomy. Patient first noticed itching and the redness around 12:20 pm on 20Apr2021. Had gotten progressively worse. Patient did not see in the emergency department and was not hospitalized. Patient was not admitted to an Intensive Care Unit. Multiorgan were involved. Patient just noticed

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

new area that formed. There were lines coming out of the area and came below the sleeve line. The red rash was spreading. It looked like something invisible scratched it. There was a triangle of three dots with a little scratch mark below the sleeve. There was another dot area on the forearm that itches, just like the other stuff did. Stomach had been feeling a little jumpy. Patient had already eaten breakfast. It was not horrible. Patient would watch it and drink ginger ale. Patient was asking what parameters should be for calling 911. She was home alone. This was not life threatening but if it turned into something bigger or if she noticed getting a bigger rash, she might have to call 911. Outcome of the events was unknown. No follow-up attempts are needed; information about lot/batch number cannot be obtained.

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1291206	5/5/2021	TX	53	M	4/5/2021		<p>Chest pain; Back pain; The chest and back pain has worsened; Sore throat, like when you get a cold and it's kind of hard to swallow; Came back positive was the inflammation test; Couldn't walk; back inflammation; Diabetes is out of whack; Every joint hurt badly; This is a spontaneous report from a contactable consumer (patient). This 53-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE Lot number: EW0151), via an unspecified route of administration, on 05Apr2021 (at the age of 53-years-old) as a single dose for COVID-19 vaccination, in left arm. The medical history included: Diabetes. Concomitant medications not reported. The patient reported that he got the first shot on 05Apr2021 and something went wrong. Every joint hurt really bad (From: Apr2021 To: 18Apr2021, duration 17 days), and he couldn't walk. So, he went to the emergency room and the ER people told him he had arthritis and to go home and take Tylenol. He came home, took Tylenol, and then his chest and back started hurting. He went to the doctor and the doctor ran an arthritis test, lupus test, and all these tests, and it came back negative. The only test that came back positive was the inflammation test. He had 3 times the normal amount of inflammation a person is supposed to have. He stated his chest hurts really bad and his back hurts really bad. He keeps going to the hospital and then they keep sending him home. Caller states he is not sure if he's not going to die but all of his other items are out of whack, like his diabetes is out of whack. He can confirm after all the joint pain went away, then the chest and back pain/inflammation popped up. The chest and back pain has worsened. It's worse than yesterday. He has not taken any aspirin or anything. The back pain has worsened. It feels like he did chest exercises. It hurts to the touch. He has back inflammation. Treatment: He clarified that he was instructed to take Tylenol Arthritis and not aspirin. He confirmed he was taking Tylenol Arthritis. No additional details provided. He mentioned that someone told him he could not take Aleve. He does not know what to do and what he can and cannot take also has diabetes and his blood sugar seems to be extremely high, which it never is. They are working on getting his blood sugar under control, but it seems like it's been out of whack for a little bit. He later clarified that he switched medications prior in</p>

						March and he is on some new stuff and he expected it to be out of whack. He also adds that it's like he has a sore throat but he doesn't have a sore throat, it's like when you get a cold and it's kind of hard to swallow. He explains when arthritis issue/joint stuff cleared up, he had the sore throat, the chest pain and sore throat appeared. It's been 3 or 4 days and it has not gone away. ER Dates - 15Apr2021. Doctor's office - 16Apr2021. Lab tests included: 16Apr2021 Test: Muscle enzyme Result: normal; Thyroid test Result: normal; blood cell count result: normal; rheumatoid arthritis test Result: negative; Lupus test Result: negative; Inflammation Marker Blood test Result: High; 3x normal; EKG Result: Fine. The clinical outcome of the event Diabetes is out of whack, chest and back pain has worsened, Came back positive was the inflammation test, Couldn't walk, back inflammation was unknown; Every joint hurt badly was recovered; Chest plates, back pain, sore throat was not recovered. No follow-up attempts are possible. No further information is expected.

The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 25-Mar-2021 at 1:45 PM, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 25-Mar-2021, the patient experienced DRY MOUTH (Dry mouth). 25-Mar-2021, the patient experienced DEHYDRATION (Could not start hydrated). On 28-Mar-2021, the patient experienced CHEST PAIN (Chest Pain) (seriousness criterion hospitalization). The patient was hospitalized from 09-Apr-2021 to 10-Apr-2021 due to CHEST PAIN. On 10-Apr-2021, DRY MOUTH (Dry mouth) and DEHYDRATION (Could not start hydrated) had resolved. On 12-Apr-2021, CHEST PAIN (Chest Pain) had resolved with sequelae. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 09-Apr-2021, Blood pressure measurement: 192/99 (abnormal) 192/99. On 09-Apr-2021, Troponin: elevated (Inconclusive) elevated troponin levels. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Concomitant medications were not reported. On 25Mar2021, the patient reported initial minor side effects of dry mouth while sitting in her car, but no other noteworthy side effects immediately following injection. Then, 2 or 3 days later the patient experienced chest pain that she reported started out as very mild, however, it grew in intensity over the following weeks, and she presented to the Emergency Room (ER) on Friday, 09Apr2021 per the caller's estimation. Blood pressure taken at the ER was 192/99mmHg. Full hospital work-up performed with the patient noted that she was negative for blood clots but had elevated troponin levels. She said the hospital staff evaluated her heart's condition and found no sign of a heart attack. On 10Apr2021, she was discharged with a new prescription of metoprolol. On the Monday after discharge, the patient had felt symptoms of chest pain again along with elevated blood pressure levels, so she returned to the ER where she was discharged without hospitalization

and given a clonidine patch for any future blood pressure fluctuations. Since then she had visited her Cardiologist and he has substituted her prescription metoprolol for amlodipine and losartan combination therapy, and to discontinue her prescription for clonidine patches. Patient indicated her cardiologist is hopeful that her blood pressure should normalize over time and instructed patient not to receive her second dose of the vaccine. Additionally, patient reported that, from the time she received her vaccination, until she was discharged, she could not start hydrated. She reported drinking large quantities of water, electrolyte replacement liquids, and Gatorade with no success. Event of chest pain was resolved with Sequelae of elevated blood pressure. Treatment included clonidine patches and metoprolol. On an unspecified date, the clonidine patches and metoprolol were stopped and amlodipine and losartan combination therapy was started.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

1288138	5/5/2021	PA	37	F	1/18/2021	1/19/2021	Constant headache/migraine; Constant headache/migraine; Panic; Trouble sleeping; Chest pain; Fatigue; Trouble breathing; Feeling of doom; This is a spontaneous report from a contactable other healthcare professional (patient). A 37-years-old non-pregnant female patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Formulation: Solution for injection, Lot number: Not reported) via intramuscular, in left arm on 18Jan2021 as single dose for COVID-19 immunization (at the age 37 years). Patient previously took first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) via intramuscular on left arm on 28Dec2020 as single dose for COVID-19 immunization (at the age 37 years). The patient medical history and concomitant medications were not reported. Most recent COVID-19 vaccine was administered in Hospital. No other vaccine was received 4 weeks prior and no medication was received prior 2 weeks. Patient was not diagnosed with covid-19, prior to vaccination and since the vaccination the patient was not been tested for COVID-19. Patient did not have allergies to medications, food, or other products. On 19Jan2021, patient experienced constant headache/migraine, panic, trouble sleeping, chest pain, fatigue, trouble breathing and feeling of doom. Patient visited Physician's office for the treatment. No treatment was received in response to events. The outcome of the event was not recovered. Information on the lot/batch number has been requested. Follow-up (15-Apr-2021): This follow-up is being submitted to notify that the batch number is not available despite the follow-up attempts made. Follow-up attempts have been completed and no further information is expected.

13Feb2021. The dizziness started on the morning of 14Feb2021 and has continued and worsened since then and getting to the point where its getting dangerous and inconvenient. The other day, she lost her balance when going down the steps and almost fell. Her doctor suggested the Epley maneuver which she has been using for the past 2 weeks and it is not helping at all. She had buzzing in her ear or tinnitus (onset not reported). Her doctor has referred her to an ENT specialist for further evaluation. Discussed per Pfizer-BioNTech COVID-19 Vaccine EUA PI (LAB-1457-7.0, Revised: 06 April 2021) Adverse Reactions section (nothing found on dizziness, vertigo, tinnitus) and per attached CONS documents and VR re: 'dizziness and weakness' as part of possible allergic reaction, noting no specific information on duration as it may vary by individual. Referred to HCP for further discussion/guidance, based on medical history. Investigation Assessment: No Additional Context: The caller is calling about the COVID vaccine, Pfizer. She says she had her last vaccine on 13FEB2021 and got dizzy and it's not going away. She says she has seen her doctor, he suggested using the Epley maneuver but it its not helping any. She said that she is ordering if the Pfizer Vaccine is causing the dizziness? She is wondering if this is something she should be worried about it. Contact Details: She says she was a medical transcriptionist for many many years and a medical secretary. She does not have an email address. HCP: Caller does not have a full address or email to provide. Products: She reads EN6201, Pfizer EN6201. She says her first dose was on 23JAN2021 and reads EL8982 for that one. No expiry date for the first dose. History: She says it is hard for her to get around, she is so dizzy. She says she has nitroglycerin because she had chest pain back in 2019. She says her doctor is sending her to an ear specialist. VACCINE SUPPLEMENTAL FORM Pfizer Suspect Vaccine and Vaccination Details Time the Vaccination Was Given: 10:15 in the morning Anatomical Location of Administration of Pfizer vaccine considered as suspect: left arm Vaccination Facility Type hospital. No Vaccine Administered at Military Facility. No additional Vaccines Administered on Same Date of the Pfizer Suspect. AE(s) require a visit to no Emergency Room but Physician Office. Saw her primary doctor, she

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

called and told him about it, her appointment was for this past Friday but he had her come in that day. She does not remember which day. She says she put up with the dizziness, it got worse. Prior Vaccinations (within 4 weeks): No. She says she needs to get a lot of vaccines, she is behind in a lot of this, she just hasn't done it yet. AE(s) following prior vaccinations: No She says she has had reaction to 3 medications. Sulfa, she says the reaction was low blood pressure. Celebrex, she says the reaction was severe chest pain, she thought she was having a heart attack, she went to the ER they thought she was having a heart attack. Codeine, she says the reaction was an extremely low blood pressure, all her vitals dropped really low, dangerously low. She says there was another one she can't remember, her reaction was she broke out in real bright red hives. Family Medical History Relevant to AE(s) She says her mother had cancer and died of cancer and her husband died of cancer. She is wondering if this is something she should be worried about it, if this is a normal side effect and is it going to last much longer because it is terrible. No follow-up attempts are needed. Information on the lot/batch number cannot be obtained.

1288425	5/5/2021	FL		F	4/1/2021	4/1/2021	blood pressure went high to 163/blood pressure was elevated; dizzy; tightness in collar bone area; cold; neck tightness; freezing really cold for 30 to 40 minutes; pain at the bottom of my neck; exhaustion; it sounds like paresthesia; my body started shaking, involuntary shaking for about an hour; Disoriented; confused; my heart beating fast, tachycardia; This is a spontaneous report from a contactable physician, the patient. A 60-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), dose 1 via an unspecified route of administration on Apr2021 (Batch/Lot number was not reported) as single dose for covid-19 immunisation. The patient medical history and concomitant medications were not reported. On an unspecified date in Apr2021, the patient had the first Pfizer covid Vaccine 2 weeks ago today, and states, "I felt dizzy within first 5 minutes, my blood pressure went high to 163/, tightness in collar bone area, cold right away. I think I panicked at the same time. Not like a chest pain, but bottom of my neck tightness, it went away in half an hour on its own. I was freezing really cold for 30 to 40 minutes they brought me blanket and orange juice to drink and it went away about 5:30ish it took 45 minutes to feel better. The pain at the bottom of my neck went away the next day or a few hours later, it was at the bottom of my collar of my neck, my blood pressure was elevated, I was cold and freezing. Besides the typical side effects of exhaustion, I went to urgent care near my house, and they said it was vaccine stuff, a week ago Monday was when I went. I spoke with my doctor this Monday on virtual call, and she said it sounds like paresthesia, shaking of the body related to vaccine. My doctor called it paresthesia, my body started shaking, involuntary shaking for about an hour. I was disoriented, confused and my heart beating fast, tachycardia. The outcome of the events neck tightness, freezing really cold for 30 to 40 minutes and pain at the bottom of my neck was recovered on an unknown date in Apr2021 and all other events was unknow. No follow-up attempts are needed; information about lot/batch number cannot be obtained.; Sender's Comments: Based on a temporal association a causal relationship between the reported events and suspect drug BNT162B2 is assessed as possible. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer

1289434	5/5/2021		89	M	4/27/2021	5/1/2021	<p>Patient is a 89 y.o. male admitted on 5/1/2021 Please refer to the History and Physical report for information on presentation. 89-year-old male with past medical history of CAD, recent cath done in January, known disease that is not amenable to intervention, hypertension, BPH, diabetes mellitus came to ED due to chest pain. Patient had persistent chest pain despite nitroglycerin, however later reports relieved. Troponin negative initially, however later trended up. EKG unchanged. Patient became asymptomatic during hospitalization. Cardiologist Dr. evaluated patient, recommended no further management except for blood pressure control. Blood pressure medications were adjusted. Cardiologist said patient has known CAD, that is not amenable to any intervention. He will have underlying some chest pain and troponin leak. Patient needs to follow up with cardiologist in the office. He has known AV node block. Sometimes heart rate went down to as low as 30. Patient remained asymptomatic. Lopressor dose was decreased from 50 mg to 25 mg daily. Amlodipine dose increased. Patient understands, and agrees for discharge. Plan explained to family, wife present at bedside. All the concerns were answered.</p>
1289493	5/5/2021	IN	34	F	4/29/2021	5/4/2021	<p>I had covid in May 2020. Suspected second infection in October. Positive antibody test in January. Second vaccination 4/29. Positive antibody test 5/1. Became sick and tested positive for COVID 5/4. I have proof of all of this. I see some research suggesting people who've had covid do not need second shot. It seems important that I've had it and got it again after first shot (assuming I actually contracted it before my second). I am the sickest I've been. Sicker every time. No fever. Just headache, chills, chest pain, cough, runny nose, pain swallowing, sore throat, wheezing, weakness, fatigue.</p>

1289041	5/5/2021	MA	24	M	4/22/2021	4/25/2021	On Sunday April 25th 2021, I woke up with severe chest pain that went up to the right side of my neck, as well as having shortness of breath. I was admitted into the ER and they ran blood work, did a CT scan and x ray of My chest. When my bloodwork came back, it showed I had very elevated troponin levels. Because I was having continuous pain, I was given morphine but it didn't work. So they upped it and gave me dilaudid and that took the pain away. It was in the doctors best interest I get transported to a facility with a good cardiatric team. Upon arriving to the new facility, they further drew my blood and ran more tests. I got admitted as an in patient on the cardiatric floor. The cardiologists ordered for me to have an echocardiogram done, another CT scan with a special protocol to view my heart, and an MRI done of my heart. After my echocardiogram and CT scan came back fine, the doctors said they'd be surprised if the MRI DIDNT show something. When that result came back, it did reveal my heart was still inflamed. After ruling out all other possibilities they concluded that the 2nd Dose of Moderna COVID vaccination I'd received was the culprit behind my diagnosis. My diagnosis being, a case of myocarditis as well as a mild heart arrhythmia. For the next several months I am kn a medication called metoprolol 25mg, 2 half tablets a day, to correct my heart arrhythmia and relieve stress from my heart as well as minimize the amount of stress I encounter each day. No heavy lifting pushing or pulling of any sort for the next 3 months.

The batch number was not reported and has been requested. No concomitant medications were reported. On 03-MAY-2021, Laboratory data included: ECG (NR: not provided) normal, and X-ray (NR: not provided) normal. On an unspecified date, the subject experienced shortness of breath, and little chest pain. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of the shortness of breath and little chest pain was not reported. This report was non-serious.
1289448	5/5/2021		69	M	2/19/2021	5/1/2021	HPI: This is 69 years old man with extensive cardiac history including coronary disease status post CABG in 1995, stable from that standpoint with recent negative stress test. The patient also has a history of A. fib for which he is on Xarelto. He was on Lopressor for years and complained to his primary care provider that he had a rectal dysfunction so this was discontinued on Thursday and he was started on Norvasc. He went to a bar to wash therapy with friends and after he had to severe he started feeling dizzy heaviness in the head and blurry vision. He denies having any chest pain, shortness of breath, headache, focal weakness numbness tingling. He has had no palpitation. He got concerned so he came to the emergency room. He had no symptoms in the ER. EKG showed atrial fibrillation with nonspecific ST-T change. Chest x-ray showed no acute intracranial abnormality.

1284781	5/4/2021	VA		F		4/5/2021	<p>heaviness and pressure on her chest which got worse and worse. She went to the ER; heaviness and pressure on her chest which got worse and worse. She went to the ER; chest pain; sick; acid reflux; This is a spontaneous report from a contactable consumer. This consumer reported for a 58-Year-old female patient (Mother) received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 05Apr2021 at single dose for covid-19 immunization. Medical history was chronic bronchitis and allergies. Concomitant drug was not reported. Caller is calling for her 58 year old mother who received the 1st dose of the Pfizer COVID Vaccine on 05Apr2021. She mentioned that she was totally fine on the 1st day, but after 20 hours, she felt a heaviness and pressure on her chest which got worse and worse. She went to the ER and stayed there for 8 hours. Her mother had chronic bronchitis and allergies, so they did bloodwork on her, had an EKG, and other test but everything was normal. She was given a ventolin inhaler and was sick the whole week with chest pan and acid reflux. She is scheduled to receive her 2nd dose on 26Apr2021 and the ER told her to call Pfizer and ask if it was okay for her to take the 2nd shot. She mentioned that her mother was fine now. Outcome of the event heaviness and pressure on her chest was not recovered, for other events was unknown. Information on the lot/batch number has been requested.</p>

1284820	5/4/2021	NJ	17	F	4/15/2021	4/1/2021	This is a spontaneous report from a contactable pharmacist. A 17-years-old female patient received second dose of BNT162B2 (PFIZER BIONTECH COVID VACCINE, Solution for injection, Lot number was ER8731), via an unspecified route of administration on 15Apr2021 as single dose for COVID-19 immunization. The patient medical history and concomitant was not reported. Historical vaccine included BNT162B2 for COVID-19 immunization. It was reported that 48 hours after receiving the 2nd Pfizer Biontech COVID vaccine she woke up with chest pains and the next morning went to urgent care where she had an irregular EKG. The sent her to the local hospital where her troponin was 7. The patient underwent lab tests and procedures which included electrocardiogram irregular on 18Apr2021, troponin was 7. Event took place after use of product. The outcome of the events was unknown.; Sender's Comments: Based on the information available and a close temporal association, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported events of Chest pain.The case will be reassessed once new information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate

1284835	5/4/2021	NY	27	F	5/1/2021	5/2/2021	Approximately 12 hours after I received my second Moderna vaccine dose (around 4:30am EST), I began having chills, fever, body aches, nausea, moderate chest pain/discomfort, vomiting, and shortness of breath. I called 911 and asked for an ambulance because of difficulty breathing. Arrived at Hospital Center ER around 5:00am, given oxygen and several tests (blood, urine, EKG) and also IV fluids in my left arm. Vomited a second time around 8:00am. Continued difficulty breathing until around 11:00am and chest pain improved somewhat. Got chest x rays done and monitored until I could breathe more regularly without oxygen. Discharged around 12:26pm. Heartbeat was abnormally fast for this whole duration and did not return to resting heart rate until about 5:00pm later that evening, 24 hours after vaccine. All symptoms subsided within 48 hours. Diagnosis was nonspecific chest pain and UTI.

1284850	5/4/2021	TX	68	M	3/11/2021	3/12/2021	BP and oxygen all over; 06Apr went to ER been in and out of ICU battling covid/ pneumonia as they say; 06Apr went to ER been in and out of ICU battling covid/ pneumonia as they say; day one normal tenderness at injection site; This is a spontaneous report from a contactable consumer (patient). A 68-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in Arm Right on 11Mar2021 10:00 (Batch/Lot Number: EN6204) (at the age of 68-years-old) as single dose for Covid-19 immunisation. Medical history included chronic obstructive pulmonary disease (COPD) and weak immune system. The patient's concomitant medications were not reported. The patient did not receive other vaccine in four weeks. The patient did not have COVID prior to vaccination. The patient underwent nasal swab COVID test on 10feb2021 with negative result, nasal swab rapid PCR COVID test on 15Feb2021 with negative result. On day one (12Mar2021), patient experienced normal tenderness at injection site, by day 3 (14Mar2021), got sick, had daughter call in LEVAQUIN 7 days worth. The patient experienced continuing chest pain from continuous coughing, BP and oxygen all over, over next 2 weeks less physical activity. On 06Apr2021, patient went to ER, had been in and out of ICU battling COVID/ pneumonia as they say. He received plasma from recovered COVID patient and Remdesivir. The patient stayed so isolated in his home; his daughter did all his shopping meds everything. Her family had been tested and was tested several times. The patient stated that he was afraid his COPD and weak immune system couldn't handle the vaccine. The events required a visit to the Doctor or other healthcare professional office/clinic, Emergency room/department or urgent care and led to prolongation of hospitalization (as the vaccine was received during existing hospitalization (as reported)). The events were assessed by the reporter as life-threatening (immediate risk of death from the event). The patient was hospitalized for 21 days. The outcome of the events was unknown.

1284487	5/4/2021	CA	16	F	5/1/2021	5/1/2021	<p>Patient reported feeling lightheaded status post first dose Pfizer COVID vaccine (Lot: EW0167, expiration date: 08/31/2021) to medic. Medic noted that the client was CAOx4, her skin was pale, warm and slightly moist, pupils were equal, round, reactive to light and accommodating (PEARRL), respiration rate (RR) was 20. The client's sister stated the client had a history of anxiety and that "she gets this way whenever she gets a shot". Medic walked patient to the zero gravity chair. The client was given water to sip on. At 1213 baseline vitals were taken with client sitting: Blood pressure (BP): 110/82, heartrate (HR): 98, RR: 20, PEARRL. Medic reports she coached the client on her breathing to help alleviate her complaint of feeling lightheaded, mild nausea and anxiety. Client reported she felt anxious prior to her vaccination and that her last oral intake was 15 minutes prior to vaccine. Client denied headache, blurry vision and chest pain. At 1220 a second set of vitals were taken while standing: BP 108/80, HR 86, RR 16, CAOx4. Client stated her symptoms were diminishing. Client's RR slowed down to normal rate and rhythm, vital signs were trending to normal and client was negative for orthostatic pressures. Client was advised to stay for additional 30 minute observation. Client's symptoms resolved completely and she was able to ambulate away from observation site without assistance and with a steady gait.</p>

1284768	5/4/2021	CO	36	F	4/1/2021	4/1/2021	woozy, about to pass out/like you are going to pass out; heavy breathing/breathing was heavy, voice was deep, like she really had to work to breathe; racing heart/heart was racing; rash/ rash was under the skin/ it started in the thighs and spread down her legs; vascular rash/ rash was under the skin/ it started in the thighs and spread down her legs/ it seems like a vascular reaction; pain at the injection site./super painful injection site; felt really really poor; voice was deep; heavy chest, chest pain; heavy chest, chest pain; feeling woozy/woozy, about to pass out; This is a spontaneous report received from a contactable consumer (patient). A 36-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number ER8737), administered in left arm on 01Apr2021 01:15 PM (at the age of 36-year-old) at single dose for so she could be protected from COVID (as reported). It was reported that vaccine was not administered at military facility and vaccination facility type was hospital (reported as patient drove up to vaccine clinic). The patient's medical history included acute lymphocytic leukemia from 1992 to 1996 and not ongoing (she was immunocompromised when she was young, she was a cancer survivor). No family medical history relevant to events was reported. The patient declined being sick at the time of vaccination. No patient's concomitant medications were reported. No prior vaccinations reported within four weeks. No additional vaccines were administered on same date of the Pfizer suspect. The patient previously took gentamycin, amoxicillin and flu shot, culture specific to the flu (as reported), and she experienced allergy with all three on 1996. Patient said that she was immunocompromised when she was young, she was a cancer survivor. She said that right after remission she developed a gentamycin allergy and, because of the gentamycin and amoxicillin allergy she was allergic to the flu shot, not the flu but the egg culture, because the egg culture can be that reaction. Patient also said that she had a reaction to a flu shot back in 1996 or something, it was the same rash that was with the COVID vaccine. It was reported that patient had her first Pfizer Covid vaccine dose on 01Apr2021. She reported side effects of heavy breathing, racing heart, feeling woozy, rash, and pain at the injection site. It was reported that she would like more information and she wanted to know if she

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

should get the second dose of the vaccine. Patient had both an event to report and a question. She said she had done application, the first vaccine was 2 weeks before the present report and she was not supposed to get the second until this Thursday (19Apr2021), she needed to look at a calendar. She said 01Apr2021 was her first vaccine and that she did already report her events. She said she had a bad reaction that borderline sent her to the emergency room but she instead took a BENADRYL and she laid down and then felt really really really poor the next 5 days. She said she had a terrible reaction, she didn't feel like her throat was shut, her breathing was heavy, her voice was deep, her heart was racing, like she really had to work to breathe, not like losing her airway passage, just that she had to work to breathe, she had a heavy chest, chest pain, a racing heart. She said she could best correlate it to how feels like low blood sugar, like you are going to pass out. It was also reported that patient experienced woozy, about to pass out. She said she ended up what she'd call a vascular rash. She said it started in the thighs and spread down her legs. She said it was not a rash at the injection site, the rash was under the skin rather than a topical rash. She said she had a photo of it, that it seems like a vascular reaction. She would like to file a report with us because she said she felt like she did not get anything out, she had logged what happened to them and there was no correlation, no confirmation. She said she could send the photo to them. She said she was scared to get second vaccine, she wonders if she should do her due diligence to do second dose, or if she should skip it. She said there was no protocol in place, she had a telemedicine call with her doctor, there was no \$200 fee due, her physician said it sounds like patient had more than a normal reaction. She said there were other things that are scary, her doctor told her she should speak to an allergist, but she said it would cost her like \$600. She said she didn't feel good on immediate injection, she felt like she probably shouldn't be driving her car. She looked for her notes then she said her only normal reaction was a super painful injection site but not a rash. She said the vascular rash subsided with the use of BENADRYL. She said she could not afford an allergist to figure out what's going on. She asked why someone as small as her would get the same dose as a 200 pound man and why the doses of

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

the vaccine were not specific to size or weight based. She also asked if based on symptoms will someone in the medical information department advised her not to get the second dose. Events onset date were reported as 01Apr2021. The case was reported as non-serious by the consumer. No events required emergency room visit. She confirmed that she did have a telehealth meeting with her general practitioner (also reported as no events required physician office visit), she said she talked to them on the phone. No investigations assessment and relevant tests were reported. The outcome of events was resolved on 02Apr2021 for "rash/ rash was under the skin/ it started in the thighs and spread down her legs" and "vascular rash/ rash was under the skin/ it started in the thighs and spread down her legs/ it seems like a vascular reaction", resolved on 08Apr2021 for "heavy breathing/breathing was heavy, voice was deep, like she really had to work to breathe" and "voice was deep", and resolved on 05Apr2021 for all other events.

1284767	5/4/2021	TX	29	F	4/12/2021	4/12/2021	Hurts to move her arm; Felt like she had the flu; Congestion; Headache; Tiredness; lymph nodes in her underarm area are swollen, really achy; lymph nodes in her underarm area are swollen, really achy; Chest pain; Numbness in her face; Completely lost her vision; This is a spontaneous report from a contactable consumer (patient). A 29-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in Arm Left on 12Apr2021 (Batch/Lot Number: ER8729) as single dose for COVID-19 immunization. There were no medical history or concomitant medications. The patient experienced completely lost her vision on 12Apr2021 with outcome of recovered on 12Apr2021, congestion on 16Apr2021 with outcome of not recovered, chest pain on 12Apr2021 with outcome of recovered on 12Apr2021, numbness in her face on 12Apr2021 with outcome of recovered on 12Apr2021, felt like she had the flu on 17Apr2021 with outcome of recovering, lymph nodes in her underarm area are swollen, really achy on 13Apr2021 with outcome of not recovered, headache on 15Apr2021 with outcome of not recovered, tiredness on 13Apr2021 with outcome of not recovered, hurts to move her arm on an unspecified date with outcome of not recovered. lymph nodes in her underarm area are swollen, really achy was reported as worsened. Clinical course: the patient was asking for advice because she had the first dose of the Covid Vaccine 1 week ago and had a really bad reaction and had to go to the hospital. It has been a week now and the symptoms are continuously getting worse. It sounds like the side effects were all expected. She felt like she had the flu yesterday. She is really achy, her lymph nodes in her underarm area are really swollen, and it hurts to move her arm. She is familiar that these symptoms are expected, but it has been a week. She wants to know if she should see a physician or if there is something she should do. Event details: The flu like feeling was not until 6 days after she got the first shot. It is not as bad but she does have aches and congestion. Her lymph nodes are really swollen and she has a headache and tiredness. She had symptoms before, that was just the start of the flu like feeling. On the day of the shot she went to the hospital because she completely lost her vision and had chest pain. She got the shot on Monday, 12Apr2021. She had

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

1284665	5/4/2021 NY	58 F	4/19/2021	<p>numbness in her face, vision loss, and chest pain. From there she went to the hospital and that subsided. It was just like total exhaustion and body aches for the next couple of days. She lost her vision for 5 minutes total. The numbness to her face was right after the shot and is all gone now. The achiness is pretty bad now. It differs per day but her symptoms have probably gotten a little worse as time has gone on. She had slight pain in her lymph nodes and they weren't really swollen. It got progressively worse to now they are very swollen and it hurts to move her arm. It was the same arm where the shot was given. The headache is off and on. It started around Thursday 15Apr2021. It is sporadic when she gets it. It hasn't gone away. The tiredness has been the same since she got the shot. When she went to the hospital she went to the ER. She was not admitted. She spent 4 to 5 hours there. Treatment: In the ER she just had an IV (intravenous). Other than that they did a bunch of lab work. She had no medicine or anything. Investigations: They did a chest X-ray and lab work in the ER. Emergency Room Visit required for events completely lost her vision, chest pain, numbness in her face, felt like she had the flu.</p> <p>CHEST PAIN; CHEST PRESSURE; This spontaneous report received from a consumer concerned a 58 year old female. The patient's weight, height, and medical history were not reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1808978, expiry: UNKNOWN) dose was not reported, administered on 02-APR-2021 for prophylactic vaccination. No concomitant medications were reported. On 19-APR-2021, the subject experienced chest pain. On 19-APR-2021, the subject experienced chest pressure. Laboratory data included: Blood test (NR: not provided) Normal, and EKG (NR: not provided) Normal. Laboratory data (dates unspecified) included: Stress test (NR: not provided) not reported. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient had not recovered from chest pain, and chest pressure. This report was non-serious.; Sender's Comments: MAC not required as per standard procedure as case was assessed as non-serious.</p>

1284516	5/4/2021	AK	41	F	1/7/2021	1/7/2021	<p>About 15 mins after vaccine I felt a sudden onset of lightheadedness and feeling as if i would pass out, told the nurse I was going to throw up. I was given zofran and Dr monitored Vs. I continued to experience waves of dizziness, nausea, abdominal pain. Shaking followed (I felt so cold), along with frequent need to urinate and urgency to have a BM (loose) for several hours. I was given fluids and monitored. They gave Ativan 0.5mg 2.5 hrs later? I was discharged home at 8:45p.m. by Dr and told not to get the 2nd Vaccine. Symptoms continued and worsened on day 3 with Shortness of breath, chest pain and tingling in my arms that spread to my legs, back and neck. The first week I could barley walk and was seen in the ER 2 times for chest pain, shortness of breath, dizziness, tingling, heart racing, diarrhea, nausea, muscle weakness, insomnia due to shortness of breath (gasping) with heart racing, & unable to control my body temperature. Given Prednisone 40mg which exasperated symptoms. 1/13/21 In ER and given Benadryl 3 bags of fluids, potassium and sodium. Postural tachycardia was noticed. Referral to Neurologist.High D-dimer at ER on 1/16/21 CT scan performed to rule out blood clot in lungs. Referred to Cardiologist. Metoprolol and Colchicine was started in Jan by Cardiologist Dr . Weekly visits with Dr for the first couple months. More meds started to decrease inflammation. Furthur referrals to Immunologist, infectious disease, and Rheumatology. At 3 months worsening of tingling in my neck and headaches/burning that felt like shocks and shooting down neck and ears. Neurologist performed 3 view MRI to rule out transverse Myelitis. In ER early April for new onset of Petechiae, CBC labs normal. Immunologist states he felt i experienced an allergic reaction followed by secondary anaphalaxis. He is testing me for Mast cell activation syndrome (not diagnosed yet). Now almost 4 months later still unable to work. Waiting results to rule out POTS. Currently battle daily fatigue, chest pressure/pain, lung SOB, heavyness/pressure, with any exertion. I am limited with daily walking/normal activities. Symptoms that come and go are tingling, nausea, diarrhea, flushing of frequent urination, neck pain, regulating temperature.</p>

squeezing her, chest felt heavy (severe chest pain hard to breath, felt as if being smothered, throat closing in severe chest heaviness). Severe brain fog. Potential anaphylactic reaction and difficulty breathing were reported. On an unspecified date, the patient experienced angioedema, shock, stridor, dry cough, hoarse voice, sneezing, rhinorrhea, dizzy, nausea, hypotension, weakness, generalized erythema, generalized pruritus with skin rash, diarrhoea and vomiting. Decrease level of consciousness and loss of consciousness were not reported. The patient underwent lab tests and procedures which included oxygen saturation: normal on 06Mar2021 and blood pressure measurement: 140/80, slightly elevated, heart rate: 99, respiratory rate: 20 on 07Mar2021. The patient was not hospitalized and was not admitted to an Intensive care unit. The patient did not have COVID prior to vaccination and the patient did not test COVID post vaccination. The patient recovered from throat constriction, chest heaviness, potential anaphylactic reaction and difficulty breathing. Clinical outcome of angioedema, shock, chest pain, stridor, dry cough, hoarse voice, sneezing, rhinorrhea, dizzy, nausea, hypotension, weakness, generalized erythema, generalized pruritus, skin rash, diarrhoea and vomiting was unknown. Outcome of the other events was reported as recovering. Follow up attempts are completed. No further information is expected. Follow up (26Mar2021): New information received from a contactable Health Care Professional includes: adverse events added, clinical course and case seriousness updated from non-serious to serious. Follow-up (20Apr2021): New information received from a contactable Health Care Professional includes: medical history, concomitant medications details and additional adverse events added (Potential anaphylactic reaction and difficulty breathing added as additional adverse events). Follow-up attempts are completed. No further information is expected.; Sender's Comments: Based on known safety profile and/or temporal association, the contribution of the suspect drug to the onset of serious events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

The patient received the Janssen vaccine lot #1808980 exp 06/20/2021 at 0930am in the left arm. Patient has a history of asthma, high blood pressure, anxiety, and hearing voices. He takes lisinopril and zyprexa. He was in the hospital recently due to hearing voices but can not remember how long ago. He is living at a recuperative care shelter. Patient denied drug use, denies prior vaccine reactions, and said he was allergic to Geodon which makes him break out in a rash. The patient was sitting in the observation area after receiving his vaccine. At 09:35am he said he had 8/10 "sharp chest pain" that started after receiving the vaccine. He was warm to touch, non diaphoretic, no dizziness or nausea, and color was appropriate for race. He was AOX4. BP 139/90, RR 18, HR 91 and regular per palpation, Spo2 95% and no respiratory distress noted. At 0935 the patient said the pain "went away" and said it was now a 0 out of 10. He said he has had that sharp pain the past and has seen a doctor but he doesn't know what causes it. Vitals were rechecked. BP 130/92, RR 18, SpO2 95%, HR94. Patient remained alert and oriented. Patient remained with RN in observation area until 10am and continued to deny pain or any other symptoms. At 10am patient stood up. He denied dizziness or pain and walked away with a steady gait. The patient was educated to see his primary care physician about the periodic chest pain. Patient says he smokes 1 pack of cigarettes per day.

1286504	5/4/2021	NY	70	F	2/11/2021	3/6/2021	I had a "drop attack: on 3/8/21. suddenly went limp and fell to the ground, conscious, but not dizzy in advance. When comfortable, I walked into another room to get my BP cuff, and the same thing happened. I fell limp to the ground, unhurt. Then unable to get up because limbs felt like spaghetti for about an hour. I had a PET scan which was unremarkable on 4/9/21, with some hypoperfusion neurophalm exam unremarkable 4/16 3rd attack, falling backwards, unharmed 4/24 sudden transientbinocular diplopia.. 4/30 a cardiac loop placed. Afterwards, BP 180/98 and transient aphasia. Followed by chest pain. Hosp overnight. MI r/o.
1286431	5/4/2021	CA	73	M	4/8/2021	4/23/2021	Patient reported to ER on 4/23/21 with complaint of chest pain. Symptoms started that morning. Felt fine the evening before. No fevers, chills or productive cough. He also had associated shortness of breath.
1286171	5/4/2021		34	M	4/25/2021	5/1/2021	This patient was admitted on 5/1/21 with chest pain. He was found to have an inferior STEMI with a thrombotic lesion in the proximal circumflex artery that was stented. He was also found to have a chronic right gastrocnemius deep vein thrombosis on a lower extremity ultrasound on 5/3/21. He is currently undergoing a hypercoagulable workup. There is potential concern that the thromboses may have been related to his COVID vaccine, as he received the second dose on 4/25/21.
1286342	5/4/2021	OH	34	M	4/21/2021	4/23/2021	34 y.o. male with history of depression admitted to the hospital on 4/23/2021 for chest pain and leg pain found to be due to Deep Vein Thrombosis and bilateral Pulmonary Embolism. Patient started on heparin infusion in the hospital with stabilization of vital signs then transitioned to apixaban at DVT/PE dosing prior to discharge

1285561	5/4/2021	MI	79	M	3/12/2021	4/4/2021	<p>The patient presented with chest pain around 5 pm on 4/4/21. Patient reported "pain came out of nowhere." Patient reported pain was non-exertional and non-positional. He described it as "a constant burning sensation" located in the center of his chest with radiation upwards toward his jaw and shoulders, bilaterally. He was transferred to COVID unit, became hypotensive, hypoxic was seen by house MD. Lung exam crackles bilaterally. IV fluids stopped, patient was given 40 mg Lasix, Morphine 2 mg and started on a small dose nitroglycerine drip. POX 70s, low 80s so Bipap ordered. Patient developed v tach and arrested, resuscitated, defibrillated, received multiple meds, intubated by anesthesia, transferred in ICU on Levophed and Epinephrine. Arrested in ICU. Lines were placed by ICU team, arrested again in ICU. Was maxed out on 4 pressors, despite CPR, pulse could not be obtained, patient was pronounced dead 4/6/21 at 3:31am. 1. Triple vessel CAD 2. Moderately severe LV dysfunction with and EF 30% 3 The recent NSTEMI is secondary to the occlusion of the SVG-OM1. There is a large thrombus in the SVG which makes PCI of this vessel unlikely to be successful. 4 The native OM1 is chronically occluded. It may be possible to attempt to open this with CTO techniques, however, at this time continued medical treatment. 5. Perclose</p>

1286078	5/4/2021	DE	69	M	3/18/2021	3/18/2021	I was hospitalized 2Xs immediately after receiving the 2nd Covid-19 vaccination for coronary artery blockages: 3/19 and again 3/22. I had been experiencing what I thought was heartburn and was referred to by PCP to a cardiologist who ordered a stress test that I passed. After suffering severe pain in my sternum from 11:00 pm 3/18-1:00 am 3/19 I went to the hospital. An EKG showed no coronary issues yet at 7 am I was taken to the cardiac catheter lab where it was discovered i had a 100% blockage. A stent was implanted and i was released around 4:30 pm the afternoon of 3/20. The morning of 3/22 I once again experienced severe chest pain and called an ambulance. I was told by the EMT my heart rate reached more than 200. I was rushed back to the same hospital where a 2nd cardiac catheter was performed. It was discovered that the stent implanted 48 hours earlier had a 100% blockage. It was opened and several additional stents were implanted. I was kept in the ICU for 2 days for observation and then released. No one I've spoken with since can verify what caused the 2nd episode. Several people at the hospital speculated the cause for the 2nd attack may have been a single dose of Brilinta that had been missed Saturday evening because by the time my wife got me home from the hospital and settled our pharmacy was closed. She picked up my prescriptions first thing Sunday morning and I took everything as directed. My cardiologist agreed with me that missing 1 dose should not have caused such an adverse reaction.
1286057	5/4/2021	TX	65	M	12/29/2020	12/29/2020	Resident experienced chest pain the evening he received the vaccine and requested to go to the hospital as he stated his "chest is pounding".
1286019	5/4/2021	TX	88	M	4/24/2021	4/26/2021	Went to ER on 4/27 with c/o chest pain (~3 day history), resolved. Returned to ER on 4/30 for chest pain- diagnosed with a small LEFT lower lobe segmental and subsegmental pulmonary embolus on CT 4/30/2021, hospitalized until 5/2/21, discharged on Eliquis, metoprolol, pantoprazole, keflex (for sore throat, negative throat cultures), metoprolol, atorvastatin, amlodipine.

1281725	5/3/2021	FL	62	F	4/29/2021	4/29/2021	<p>She got the vaccine, she's healthy. Within minutes they took her VS and showed no signs of anything happening at that point. She had a care ride. At approximately 4:00 PM the EMS was at the facility, she could not breath or talk and EMS was called and it got worse in the ride to the ER. She had a severe headache to the point that somebody grabbed her around the throat and her eyes were popping out of her head. She had chest pains, and given nitro for that, and had trouble breathing. She had no voice. The attempted to give her aspirin in applesauce. Her temp was taken and it was 97, by the time she was admitted it was elevated. In the car, EMS was trying to get her veins and 11 attempts were made and she was bruised. She has waited a year and a half for surgery as she needs right knee replacement, and has spine, joint issues and was not able to move due to extreme weakness. She was given Epinephrine in her leg and it did not do anything. She was admitted to the hospital and was there a couple of days until she was able to help her walk. She had no anxiety and had anger over the nursing staff, attending physician and the way she was treated. She is a licensed CNA and has worked in 3 hospitals and has a grievance due to the lack of care that she received while in the hospital. The ER nurses were good, but going to the 6th floor was another issue. Her Dr. on Saturday ordered a swallow test as they could not determine why she had no voice and could not swallow. It was done and she was still having difficulty getting food down, but it was slow and did go down. Since he has been back at ALF she is now better, able to walk, talk and go about her life. While in the hospital she was having a hard time getting her medications, and was given a breathing treatment in the ER, and was still having problems on the floor and was having problems with them getting her medications so that she could breath. She finally got their attention and told her that she was not okay with her and the lack of the nursing staff care. She fought to get her Flonase, and by the time she was ready to leave on Saturday she had been given one treatment of Symbicort. She did have blood tests done to the point that it was excessive, but she had veins that were blowing and there was no access points. On Friday she refused them as she had been stuck 11 times. On Saturday morning they came to get more blood and she refused on Saturday evening</p>

1281336	5/3/2021	NY	32	F	4/8/2021	4/1/2021	Overly tired, shortness of breath, chest pain, leg pain After 3wks of symptoms patient(self) went to hospital and it has been discovered patient has (self) has a blood clot in Right lung. Patient (self) has no record or history of blood clots. Was treated with heparin while in hospital. Has since been discharged and sent home with a prescription for anticoagulant.
1281880	5/3/2021	WA	64	M	4/10/2021	4/23/2021	4/25/2021 - He was apparently well until 2 days prior to admission when he developed spontaneous left calf pain and swelling. He denies any associated trauma, recent travel and immobility. He is not taking any new prescription, including steroids. One day prior to admission, he started experiencing left-sided pleuritic chest pain up to 9/10 in intensity and exertional shortness of breath. He denies any fevers, hemoptysis, sputum production, diaphoresis, nausea, vomiting, abdominal pain, dizziness or lightheadedness. The pain was persistent throughout the day. Today, his chest pain persisted and his shortness of breath had progressed. He also noted left arm swelling with mild discomfort. He felt that his left leg swelling and pain had improved today. Nevertheless, given persistent symptoms, he decided to come to the emergency room for further evaluation management. In the emergency room, his initial blood pressure was 218/104 with mild tachycardia of 99, normal oxygen saturation and no fevers. CBC showed a white count of 12.35, hematocrit of 50.4 and normal platelet count 198. INR was normal at 1.06. BMP showed mild hyperglycemia at 148. Troponin was 5 and BNP was 8. Imaging studies show extensive left upper extremity DVTs that involved the left subclavian vein, left lower extremity DVTs and bilateral lower lobe pulmonary emboli. 4/30/2021 Presumed unprovoked extensive DVT of the left upper extremity and left lower extremity. However, he did recently receive Johnson & Johnson Covid vaccine. Now status post catheter directed thrombolysis to the left upper extremity.

1281053	5/3/2021			M		3/20/2021	ADVERSE EFFECT OF VACCINE; SHORTNESS OF BREATH; FATIGUE; HEADACHE; LOW PLATELETS; NIGHT SWEATS; DIAPHORESIS; BLURRED VISION; FEVER; BODY ACHES; This spontaneous report was received from a physician via a company representative and concerned a white nonhispanic or Latino 50 year old male. Initial information was received on 28-APR-2021, with additional information obtained via telephone follow up from a physician on 29-APR-2021. The patient's height was 73 inches and weighed 252 lbs; approximate body mass index was 32.68 kg/m2. Medical history included: lung infection in 2014 which led to aortic valve disease which required biologic aortic valve replacement (2014); prolapse of right coronary aortic valve cusp, severe aortic insufficiency. There was no history of hyperlipidemia and was positive for family history of cardiovascular disease. Concurrent conditions included attention deficit disorder (ADD), back and neck problem, other congenital anomaly of heart, hypertension, lumbago, shortness of breath and thyroid nodule. The patient received COVID-19 vaccine Ad26.CoV2.S (suspension for injection, intramuscular, batch number and expiry date unknown) on 19-MAR-2021 for prophylactic vaccination. The batch number was not reported and has been requested. Concomitant medications included: carvedilol, losartan and atorvastatin (all for aortic valve replacement). Also aspirin, Adderall (dextroamphetamine-amphetamine) both for unspecified indication. On 20-MAR-2021, the day after receiving the vaccine, the patient developed fevers, body aches and headache which resolved within 24 hours. Then a week on an unspecified date, he developed more symptoms which included fatigue, shortness of breath for the most part and some headaches. On 27-MAR-2021 the patient experienced a single episode of visual disturbance of blurred vision while driving. At a stoplight vision in both eyes were blurred and he had trouble see the road; he no longer could drive. The blurred vision resolved within a few minutes and not vertigo or headache occurred at that time; and there were no other reported visual changes. The patient visited his physician 28 days after receiving the vaccine on 16-APR-2021. He reported ongoing fatigue, body aches and headaches. No further visual changes or disturbances. He felt fatigue and shortness of

breath were the most noticeable. He denied chest pains and fevers but has been experiencing night sweats (unspecified start date); and generally feels unwell and described himself as "feeling off". No leg edema or leg pain currently. Also no coughing, wheezing or bruising. His concentration was stable and there was no loss of memory. No other neurological symptoms. Physical exam was positive for chills diaphoresis, fatigue, fever and shortness of breath; cardiovascular examine revealed a murmur present, and pulmonary examine was normal breath sounds, no decreased breath sounds, wheezing, rhonchi or rales. Vital signs: blood pressure 104/68, pulse 93, temperature 98. The physician's assessment also included an adverse effect of vaccine. Laboratory results form 16-APR-2021 included: Creatinine (normal range 0.50 - 1.30 mg/dl) 1.09, white blood count (WBC) (normal range 3.8 - 10.8) 3.4, red blood cell count (RBC) (normal range 4.20 - 5.8) 4.92, hemoglobin (normal range 13.2-17.1 g/dL) 13.9, glucose (normal range 71-99mg/dL) 109, D-Dimer elevated at 286 (normal range <230), elevated C-Reactive Protein (CRP) (normal range 0 - 5 mg/L) 32.3, fibrinogen (results not reported), Covid-19 Antigen Antibody negative, platelet count 123,000 (lower limit of normal <140,000). The patient has a baseline platelet count of 200,000 from JAN-2021 and for the past 9 years had ranged from 180,000 - 240,000. A heparin-induced thrombocytopenia (HIT) was negative anti-PF4 antibody. On 20-APR-2021, the patient received Computerized tomogram (CT) of the head with and without contrast which was normal - no acute hemorrhage, mass effect or abnormal enhancement. The patient also had a CT chest with contrast with no evidence of pulmonary embolism to the segmental level; a 16 by 16 mm nodule with small calcification was noted, this was nonspecific but could reflect primary lung cancer, correlation with PET/CT is indicated. Additional laboratory results on 20-APR-2021 concerning serotonin release stated as follows: Positive, 6%, 40%, 37%. HIT panel negative with less than 0.6 antibody On 27-APR-2021 additional laboratory results were as follows: WBC 4.1, RBC 4.95, hemoglobin 14.0 g/dL, D-Dimer 275, fibrinogen 427 and HIT panel negative with less than 0.6 antibody. A hematologist was consulted and a complete blood count and HIT panel were performed on 28-APR-2021. Results were platelet

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

						count of 159,000, D Dimer of 275, HIT negative anti-PF4 antibody screen and the SRA assay was pending. On 29-APR-2021 the duplex of left lower extremity was negative for deep vein thrombosis (DVT). Additional laboratory reports included a platelet factor 4 antibody test test methodology which used latex particle enhanced immunoassay to detect anti -pF4/heparin antibodies (reference range 0.0-9), with the patient's value was <0.6 (negative). A COVID PCR test was not performed. An enzyme-linked immunosorbent assay (ELISA) test was ordered for 30-APR-2021 for anti-PF4 antibodies. The action taken with COVID-19 vaccine Ad26.CoV2.S was not applicable. The outcome of the event blurred vision and fever were resolved; the outcome of low platelets, adverse event of vaccine, shortness of breath, fatigue, headache, body aches, night sweats and diaphoresis were not reported. This report was serious (other medically important condition).; Sender's Comments: V0.20210456790-COVID-19 vaccine Ad26.CoV2.S -Low platelet counts,blurred vision,adverse affect of vaccination. This event(s) is considered unassessable. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the event(s).	
1281031	5/3/2021	PA	16	M	4/30/2021	5/1/2021	The patient received the second dose of the Covid vaccine on 4/30/21, on 5/2/21 at 0230 the patient reported an episode of palpitations, chest pain, and left arm pain that was relieved after 1 hour. On 5/3/21 at 0230 the patient reported a second episode of palpitations, chest pain, and left arm pain that was not relieved, pt presented to the Clinic, to ED at 0340 on 5/3/21, the patient had an EKG and lab work done. Troponin I lab level was 4.52, which is over 100 times the normal limit. Pediatric cardiology was consulted and the patient was sent to Hospital via life flight.

1281481	5/3/2021	TX	42	F	2/26/2021	3/12/2021	<p>She got her vaccine, she started tasting the medicine first, and then her mouth got watery and started having little chest pains. She waited the 15 minutes and left, and did tell the pharmacy lady her symptoms. Her arm was red, and had a headache, but didn't think anything of it. After 2 weeks she had a red arm, hot, shiny and swollen. She went back to the store, and had the pharmacy lady look at it who told her she had an allergic reaction, take some Benadryl and go to her doctor. She took that and went to her doctor as the symptoms did not go away. She sent her to an allergy specialist. She did blood work and went to the specialist and still taking the Benadryl. It was kind of going away, but the rash was warm and he did allergy testing and told her that she had allergies to trees, grasses, etc. During the time of waiting for the test results of the allergy testing she continued to have the headaches and her mouth started getting dizzy. She thought maybe it was just allergies. She was at work cutting hair and almost cut a child as she felt dizzy and fatigued and it gradually came on her. She had to sit down for a while and that feeling did not go away. Her boss told her to finish and she was about to cut a child and went to her car, and laid in the car all day as she could not drive home. She was feeling that it was just some allergies. Called her husband and went to a store within walking distance, and she was holding onto the basket and feeling dizzy and fatigued and was facetimeing her husband and then she felt lost, did not know why she was in the store. She didn't remember where the car was, and walked around for an hour not knowing what to do or why she was there. She then sat down to try and get her senses and took something for her headache. She got to the car and zoned out and tried to drive home and was not able to due to the dizziness and fatigue, but could not remember to drive and telling herself to push the gas and was only going about 5 miles an hour. She called her husband and told him that she could not drive home, and stayed in the parking lot a little bit longer. It took her 3 hours to get home, which was normally at 20 minute commute. She went back to her PCP and told her what happened and told her that she did not feel safe, confused, watery mouth and headache. She then ordered an MRI to see what was going on. She then tried to get home again and had another episode and was not able to make it</p>

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

home. She went to the ER and they ran a lot of tests, CT scan, x-rays and told her that all tests were normal. He then looked at her and did a neurologic test and told her that he could not send her home and told her that she did not look fine. She told him that she did not feel safe, and was not able to function. She gave him a description of how she felt, and told him that she has short term memory problems, and that if she is driving she does not realize that she is. She was then admitted to the hospital and did 2 more CT scans, an MRI, blood work and ended up having a neurologist see her, and told her that all her tests were negative. It was even hard for her to walk and she had to see a therapist for that, and they put her on some medicine for the dizziness and fatigue. She was in the hospital for 3 days. She went back to the doctor on Monday and still having the symptoms, but the medicine did help some. The doctor saw that she could not walk and fell over. She called the neurologist again and did another blood tests to see if she had COVID prior to the vaccine and doubled up on the medicine for the dizziness which did help with that but the other symptoms were still there, but she was able to walk but not drive. She had her go to another neurologist to do an MRI of the brain with contrast of the ear part, and she is to go to the doctor today for those results. From 2/26/21 until now 5/3/21 she has been taking the medicine to function and be able to walk. She tried to wean herself off the medicine but she is not able to walk and the fatigue comes back. She still is not able to drive as the short term memory hits her and she forgets where she is and not able to keep up with the speed of the freeway and driving only 10 miles an hour. She then called the doctor again as she was still having the episodes, she has not been able to work and was told that she probably had to see a neuropsychologist. She also was filing out paperwork at one point and got a headache and was not able to fill out the paperwork correctly, and did not remember her 16 year olds information. She is not able to return to work as the company she was working sold the company and she is not able to cut 2 haircuts a day without breathing hard and used to be able to cut 30 a day. Her body hurts so bad that it feels like if you touch her skin it?s like she had a full work up. Her doctor told her that she did not have COVID but her body is reacting as if she did. She is also used to taking care of special

1283974	5/3/2021	OH	81	F	2/10/2021	4/21/2021	<p>Clinical Summary Patient is a 81 y.o. female with a history of HTN, IDDM2 w/ neuropathy, HLD, COVID-19 infection (11/5/20) and hypothyroidism who presented to hospital Observation 4/21/2021 from AL s/p fall with right knee/hip pain. Admit Hgb 12.0, COVID-19 +. CT right knee showed large hematoma in the prepatellar region measuring up to 16.4 cm. Evaluated by ortho, recommended supportive measures. 1. Traumatic Hematoma of Right Knee: s/p fall as detailed below. Patient endorsed immediate pain to her right hip/knee, described as sharp/aching with muscle spasms. Denied numbness/tingling. Admit CT pelvis non-acute, CT right knee as above. Held ASA. Pain control, ice, elevation. CBC remained stable. Ortho followed, recommend continued monitoring of skin integrity and local wound care. 2. Left Forehead Hematoma: s/p fall. Admit Hgb stable. CTH on admit with noted hematoma, otherwise unremarkable. Encouraged ice, pain control. 3. Mechanical Fall: Patient tripped and fell in the hallway at her AL facility while participating in fire drill. Denied LOC, did strike head on a nearby shelf. Initially reported dizziness that has since resolved, continued gentle IVF. 4. COVID-19 Infection: asymptomatic. Patient initially tested + for COVID-19 11/5/20, and received her 2nd vaccination 2/10/21. Denied dyspnea, chest pain, fevers/chills, cough. Discussed with infection prevention, will require additional 10-day isolation (last day 4/30/21). Isolation precautions, supportive care.</p>

1283185	5/3/2021	WA	16	M	4/30/2021	5/1/2021	Previously healthy 16 year old young man presenting with chest pain admitted for myopericarditis. He was in his usual state of good health until 2 days ago when he experienced fever, chills and myalgias after receiving his 2nd dose of COVID pfizer vaccine. He improved until 5/2 when he developed a crushing, non-radiating, substernal chest pain which was waxing and waning in nature without specific alleviating factors. He had shortness of breath, but no palpitation, dizziness, or changes in pain on exertion vs rest. Family activated EMS who gave 325 mg of aspirin en route to the ED. In the ED, he was afebrile and hemodynamically stable. He was mildly diaphoretic, but otherwise, unremarkable on physical exam. STAT EKG showed ST elevations in V5 and V6 and ST depressions in V1 and V2 as well as PR depressions, which persisted on repeated EKG. Given concern for myopericarditis, they ordered labs including CBC, CMP, troponin and inflammatory markers which were only remarkable for troponin of 1.94 and CRP 3.5. Chest x-ray was normal. Cardiology was consulted and they recommended transthoracic echo which is pending. Cards also recommended starting Ibuprofen 600 mg q8 hrs and admission to cards for further management.

1280871	5/2/2021		46	M	4/9/2021	4/10/2021	<p>Patient presented to the emergency department on 4/10 with a complaint of left leg pain. Patient reports onset of symptoms on Wednesday (4/7). He states that initially it just felt like a cramp in his calf. He states that over the past couple days, the pain has gotten significantly worse. He states the pain is now sharp and severe in nature. He states that he is having due to the severity of the pain. He states the pain is now moving up into his medial thigh. Patient states that around noon on 4/10, he began having chest pain and shortness of breath. Patient describes a tightness across his chest and states that he cannot breathe associated with this. Patient does have a history of asthma and states that he has had a couple of episodes like this in the past. Patient also reports a history of diabetes, hypertension. Patient does report a family history of coronary artery disease as well as a family history of blood clots. He received his Pfizer Covid vaccine 2nd dose on 4/9/2021 (Lot # ER8729) and 1st dose (Lot # EN6204) given on 3/12/2021 at an outside facility He does report arm soreness but is otherwise doing well. No recent travel. No recent immobilization. Upon evaluation in the ED, he was noted to have positive US for DVT in the LLE. Follow up CTA Chest was positive for bilateral lobar and segmental PE with right heart strain. CVM was consulted for possible PE intervention evaluation. Patient started on therapeutic Lovenox, but discharged home on 4/11 with Eliquis. . The next day 4/12/21 he returned to ED for SOB/Wheezing and LLE pain. On 4/15/21 he underwent EKOS, IVCF and iliac stent placement per Vascular surgery and subsequently sent home on Eliquis 4/16/21. Pt returned to the ER again 4/21/21 for recurrent SOB. CTA chest with no significant change in clot burden, no associated hypoxia.</p>
1280702	5/2/2021	AL	69	F	4/7/2021	4/15/2021	<p>Presented with chest pain on April 15, 2021, was evaluated in the ER, and discharged home. Presented again on April 18, 2021, and at that time chest pain is more persistent, therefore patient was admitted. Had serial enzymes performed and was discharged the following day to follow-up with cardiology. Unknown further outcomes beyond this.</p>

1280622	5/2/2021	SC	50	M	4/28/2021	5/1/2021	On 4/13 Patient underwent aortic root replacement with saphenous vein graft reconstruction of the right coronary artery. He had no prior coronary disease. This operation was done for an enlarging aortic root aneurysm in the setting of Marfan syndrome. The right coronary was anomalous and needed vein extension for reimplantation. He recovered very well and was seen in our clinic on 4/23, with no unusual findings. He had a normal echo, EKG and DVT study performed. On 4/28 he had his first Moderna COVID19 dose. on 5/1, he developed malaise, myalgias, painful lymph nodes, chills, and chest pain. He called my clinic and was instructed to go to the ER, but then felt better and didn't go. He was then found unresponsive later that afternoon and was pronounced dead on arrival of EMS.
1280254	5/2/2021		58	M	4/16/2021	5/1/2021	Patient received his first dose of COVID vaccine on 4/16/21, and he developed nausea, occasional chest pains, dyspnea, and fever ~ 4/21/21. Patient tested positive for COVID on 4/23/21 and his symptoms progressively worsened until he presented to the ED on 5/1/21. Patient was admitted to the hospital for COVID treatment, but was discharged on 5/2/21 since his symptoms rapidly improved.
1280421	5/2/2021	MA	52	F	4/29/2021	4/30/2021	52F with no known PMH developed progressive chest pain on 4/30/2021, admitted to Medical Center 5/2/2021 and found with NSTEMI with 95% proximal LAD occlusion w/ moderate thrombus successfully treated with drug-eluting stent x1. Pt received Pfizer vaccine #1 on 4/29. Of note, pt has not seen a doctor in several years, but labs notable for leukocytosis (WBC 14.0), polycythemia (Hgb 16.9) and thrombocytosis (PLT 959) concerning for undiagnosed polycythemia vera. If so, it is not clear whether her NSTEMI was a coincidence or whether the vaccine increased her risk of thrombosis.

1280493	5/2/2021	NC	16	M	4/26/2021	4/26/2021	<p>MYOCARDITIS. Patient is a 16 year old boy with ADHD who presented with fever and myalgias for 3 days, that progressed to sharp parasternal chest pain and some SOB. Patient received second dose Pfizer COVID-19 vaccine on 4/26, and after that shot experienced fever to 102 at home and myalgias. Subsequently his symptoms of chest pain have occurred. He underwent workup revealing of elevated Troponin, and EKG with some ST segment elevation, a slightly elevated CRP at 32, and a normal ECHO. Admitted for observation and concern for infectious myocarditis vs MIS-C. Cardiac MRI was done confirming Myocarditis, Troponin I was elevated and peaked at 23, 325pg/mL. Workup unrevealing of SARS. Other testing showed Resp virus panel negative, blood pcr for EBV, CMV, Parvovirus B19, enterovirus, and adenovirus all negative, HIV antigen/antibody testing negative. Patient treated with Ketorolac with steady improvement in symptoms over several hospital days. Discharged home 5/2 with Troponin I well down and symptoms resolved. Given reports in lay press regarding other cases of COVID-19 mRNA vaccine associated myocarditis, we are reporting this as a vaccine associated adverse event.</p>

1276626	5/1/2021		49	M	4/19/2021		DEEP VEIN THROMBOSIS; This spontaneous report received from a consumer concerned a 49 year old male. The patient's weight was 80.3 kilograms, and height was 182.9 centimeters. The patient's past medical history included post-operative deep vein thrombosis (more than 30 years ago), depression, heart murmur, and back surgery, and his concurrent conditions included non-smoker, no alcohol use, and marijuana abuse. The patient had no history of known allergies. The patient's mother had a history of aneurysm. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: unknown, and expiry date: unknown) dose was not reported, administered on 08-APR-2021 for prophylactic vaccination. The batch number was not reported and has been requested. Concomitant medications included fexofenadine hydrochloride (Allegra) for allergy, rivaroxaban (Xarelto) for venous thromboembolism, and omeprazole (Prilosec) for unknown indication. About one and half weeks after vaccination, on 21-APR-2021, the patient was taken to the emergency department and was admitted with the complaints of leg pain since 2 days with suspected blood clot in leg. Over the last days, patient's left leg looked swollen compared to the right leg. The patient also had pain, initially started in groin area and radiated down across the anterior portion of the leg, then to posterior leg, and into toes. The patient also had some intermittent tingling in toes. The patient denied of weakness, numbness or persistent paresthesia. The patient was concerned regarding the pain as it felt similar to the post-operative deep vein thrombosis he had in the past. The patient had been anxious since vaccination when hearing about the development of blood clots. The patient also denied of fevers, chills, chest pain, shortness of breath abdominal pain, nausea, vomiting, diarrhea, and difficulty walking. On 21-APR-2021 16:25, the patient's laboratory data included: Blood pressure (148/66 mmHg), Body mass index (24), Body temperature (98.8 F), Oxygen saturation (100 %) Pulse rate (88), and Respiratory rate (16). On 21-APR-2021 16:32, laboratory data included: Blood pressure (148/66 mmHg), Body temperature (97.8 F), Oxygen saturation (100 %), Pulse rate (91), and Respiratory rate (15). Other general physical examinations included: General: Well-developed well-nourished in no acute distress. HEENT

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

(Head, Eye, Ear, Nose, Throat) examination: normocephalic atraumatic extra ocular motions are intact. Neck examination: Supple without jugular vein distention or meningismus. Lung examination: Clear auscultation bilaterally without wheezes rales or rhonchi. Heart examination: Regular rate and rhythm without murmurs rubs or gallops. Abdomen examination: Soft no tender non-distended without rebound or guarding. Extremities: Without clubbing cyanosis edema, no lacerations or abrasions or ecchymosis noted, no appreciable size difference in the left leg compared to the right, the patient had some tenderness throughout palpation of the medial thigh on the left with radiation up into the left inguinal region, no calf tenderness or swelling, no erythema, palpable posterior tibialis pulse. Skin examination: Warm and dry and well perfused. Psych examination: Appropriate mood and affect. Neuro examination: Cranial nerves 2-12 are grossly intact, strength is 5/5 in upper and lower extremities, full distal sensation in the left lower extremity, full plantar and dorsiflexion of the left foot including the left great toe, sensation is grossly intact, awake, alert and oriented x3. On ultrasound Doppler venous lower extremity test, identified sub occlusive thrombus in the left superficial femoral veins, likely related to organizing/chronic thrombus, however no prior imaging was available at the institution for comparison, no evidence of occlusive deep vein thrombosis. The final diagnosis was made as Deep Vein Thrombosis (DVT). At no time the patient had ever endorsed any chest pain/pleuritic pain, shortness of breath or exertional dyspnea. Due to the nature of this clot, a course of anticoagulation was planned. Patient was prescribed with Xarelto at twice daily starting doses, with transition to 20 mg doses. During the initiation of treatment, the patient should be followed up by his primary care physician for further evaluation. The patient stated that he would call the primary care physician in the following morning for follow-up appointment. The patient was discharged from the hospital on APR-2021. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of deep vein thrombosis was not reported. 1276519	5/1/2021	MD	64	F	4/23/2021		<p>PULMONARY EMBOLISM/RIGHT SIDED MID BACK PAIN; This spontaneous report received from a health care professional concerned a 64 year old female. The patient's height, and weight were not reported. The patient's concurrent conditions included Crohn's disease. The patient was previously treated with infliximab for Crohn's disease. The patient experienced drug allergy when treated with infliximab (Remicade). The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, intramuscular, batch number: 042A21A, expiry: unknown) dose was not reported, 1 total administered on 31-MAR-2021 to left arm for prophylactic vaccination. Concomitant medications included vitamins nos, azathioprine, dicycloverine, and mesalazine for drug used for unknown indication. On 22-APR-2021 by evening, the patient experienced right-sided mid-back pain and shortness of breath and was presented to ED (emergency department) on 23-APR-2021. The patient's pain was sharp and worsened with coughing and deep inspiration; she felt that she was taking shallow breaths. Upon ED (emergency department) presentation, there was no shortness of breath, chest pain, dizziness, fevers, dysuria, or abdominal pain. The patient had reproducible pain on her right mid-back area. There was some mild diffuse tenderness in her abdomen, but it was reported that she always had a tender abdomen due to Crohn's disease. The patient had no peritoneal signs and had no recent travel history. On 23-APR-2021, the CTA (Computed tomography angiography) of chest was done with and without contrast and found out central and peripheral pulmonary emboli in the right lower lobe. The patient had no CT (computerized tomography) evidence of right heart strain. The patient's ground glass opacities within the right lower lobe was somewhat band like in appearance and concerned for early pulmonary infarcts. It was reported that this might also relate to sub segmental atelectasis or less likely an inflammatory/infectious process. The patient had also small right pleural effusion; no acute inflammatory process in the abdomen or pelvis. On 23-APR-2021, the patient's platelet count was 252 k/mcL and was tested negative for covid test. The patient was diagnosed with pulmonary embolism; she consulted hematology/oncology specialist and recommended with initiation of argatroban for treatment of pulmonary</p>

1275915	5/1/2021	WA	82	F	3/10/2021	3/22/2021	On 3/25/21, patient presented to the ED with several days history of nausea, vomiting, and upper abdominal pain, and 1 day history of shortness of breath and wheeze. Patient recently received her first dose of Moderna COVID vaccination on March 10. Patient's daughter first developed COVID symptoms approximately 1-2 weeks prior, and was tested positive. Patient developed nausea, vomiting, and upper abdominal pain 6 days prior on March 19. She was tested positive for COVID several days prior to admission (either the 22 or 23rd, patient not sure). On the morning admission, patient had significant worsening of shortness of breath and wheeze. Patient also became significantly more weak and fatigued, and was eventually brought to ED. Patient reported chills, but denied headaches, chest pain, or diarrhea. Patient admitted to the hospital on 3/25/21 with main diagnosis COVID-19 pneumonia and patient expired on 4/13/21.
1275906	5/1/2021	WA	46	M	3/14/2021	3/23/2021	Patient presented with shortness of breath and generalized body aches on 3/26/21. Patient has had symptoms for 3 days, with new diarrhea as well. No nausea vomiting, positive fever and chills, no loss of taste or smell. He has chest pain that is pleuritic in nature, central lower sternal region. Patient admitted to the hospital setting from 3/26/21 and still in CCU as of today (4/30/21).
1275900	5/1/2021	WA	92	M	2/27/2021	4/3/2021	92 y.o. male patient with past medical history of Factor V with history of pulmonary embolism who presented with shortness of breath and cough. He was vaccinated for COVID-19 with his first shot on 2/3 followed by 2/27 with the Pfizer vaccine. He reported his symptoms started on 4/3. Family members including wife (also vaccinated) all had similar symptoms, they had all tested positive for COVID-19 on 4/6. He reports having diarrhea, nausea, shortness of breath and cough. No chest pain. Work up in the ED revealed a WBC of 16.1 and infiltrates on CXR. Patient is admitted to hospital starting 4/9/21 and currently still here as of today 4/30/21.
1275899	5/1/2021	HI	56	M	3/30/2021	3/30/2021	2 days later had chest pain. admitted 4/6/21 for acute ST MI and had stents in LAD/RCA

1278990	5/1/2021	NJ		F	4/7/2021	4/7/2021	<p>She started to feel like she was fainting; chest pain; she was seeing stars; she had trouble breathing; She was very hot; She also had a sore throat and some congestion; She also had a sore throat and some congestion; This is a spontaneous report from a contactable consumer (patient's parent). A female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 07Apr2021 at 17:30 at a single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient had the first Pfizer covid-19 vaccine on 07Apr2021 and that night (as reported), patient had some troubling side effects; she had trouble breathing and was very hot. She also had a sore throat and some congestion. They thought these were very normal side effects; however, the side effects happened again on 12Apr2021, but it was worst. All of a sudden patient had trouble breathing, chest pain and she started to feel like she was fainting, she was seeing stars. She sat down, put her head down in her knees and the same thing stopped and it worked; it was about 5 to 10 minutes for her breathing to be okay again (for clarification). On an unspecified date, they called her health care providers and went to her urgent care location due to the events. They took her X-ray and EKG and was normal. They also did a Covid test which was negative. The reporter wanted to know if it is safe for the patient to get the second dose. The final outcome of the events she started to feel like she was fainting and she had trouble breathing was recovered (for clarification); while the other events was unknown. Information on lot/batch number has been requested.</p>

1278576	5/1/2021		16	F	4/23/2021	4/28/2021	Five days following her first Pfizer COVID vaccine, she woke up from a dead sleep with sharp chest pain, shortness of breath, and feelings of her throat closing. She was given one dose of oral steroids by PCP, but continued to have the feeling that she couldn't breathe due to her throat closing throughout the day so she presented to the ED. There, she reported continued chest pain, worsening SOB, and the feeling that she could not breathe. She was tachycardic to 140 bpm, but otherwise vitals were stable. She was admitted and monitored on continuous telemetry and pulse oximetry overnight. By the following day on 4/29, her symptoms had largely resolved and she was discharged.
1278551	5/1/2021	MA		F		4/9/2021	short of breath; chest pain; she had a blood clot and was diagnosed with a blood clot/diagnosed with DVT; Red splotches on leg; This is a spontaneous report from a contactable Nurse. A 62-year-old female patient received first dose of BNT162B2 (BNT162B2), via an unspecified route of administration, administered in Arm Right on an unspecified date (Batch/Lot Number: EW0150) as SINGLE DOSE for covid-19 immunization. Medical history included she had a blood clot after surgery 100 pounds ago, around 18 years ago, she had the heart attack at age 41 and thrombophlebitis from an unknown date and unknown if ongoing. Concomitant medications included aspirin [acetylsalicylic acid] (ASPIRIN [ACETYLSALICYLIC ACID]) taken for cardiac disorder from an unspecified start date and ongoing. The patient experienced she had a blood clot and was diagnosed with a blood clot/diagnosed with DVT on 10Apr2021 and red splotches on leg on 09Apr2021. She states she got the vaccine on Thursday 08Apr2021. She confirms that the painful red splotches showed up on 09Apr2021. The blood Clot was diagnosed on the 10Apr2021. She states that the doctors put her on Lovenox. She states that it is only significant if she gets short of breath and/or has chest pain. If it travels then it is significant. She states that her doctor said she had a good sized clot, but she didn't ask specifics. Outcome of the event was not recovered.; Sender's Comments: On the basis of the available information, the reported event DVT would seem most likely related to underlying medical conditions which is not related to BNT162B2.

The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Penicillin allergy. Concomitant products included TAFLUPROST (ZIOPTAN) for Glaucoma, LIOETHYRONINE SODIUM and LEVOTHYROXINE for Thyroid disorder. On 02-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 05-Feb-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 05-Feb-2021, the patient experienced ANAPHYLACTIC REACTION (anaphylactic reaction) (seriousness criterion medically significant), DYSPNOEA (difficulty in breathing\intermittent difficulty in breathing), URTICARIA (hives rash around throat and face), PARAESTHESIA (chest wall tingling/throat tingling/Tingling in her arms, legs, mouth, face), THROAT IRRITATION (throat burning), THROAT TIGHTNESS (throat closing), CHEST PAIN (chest wall burning), CHEST DISCOMFORT (chest wall closing) and DIZZINESS (light-headed). On 05-Apr-2021, the patient experienced DYSGEUSIA (metallic taste in mouth). On an unknown date, the patient experienced ORAL DISCOMFORT (mouth burning), BURNING SENSATION (face burning), DYSAESTHESIA (hot and cold issues with nerves), FEELING HOT (she gets burning hot and heat waves come up) and CHILLS (chills). On 05-Feb-2021, ANAPHYLACTIC REACTION (anaphylactic reaction) had resolved. At the time of the report, DYSGEUSIA (metallic taste in mouth), DYSPNOEA (difficulty in breathing\intermittent difficulty in breathing), URTICARIA (hives rash around throat and

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

face), PARAESTHESIA (chest wall tingling/throat tingling/Tingling in her arms, legs, mouth, face), THROAT IRRITATION (throat burning), THROAT TIGHTNESS (throat closing), CHEST PAIN (chest wall burning), CHEST DISCOMFORT (chest wall closing), DIZZINESS (light-headed), ORAL DISCOMFORT (mouth burning), BURNING SENSATION (face burning), DYSAESTHESIA (hot and cold issues with nerves), FEELING HOT (she gets burning hot and heat waves come up) and CHILLS (chills) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 30-Jan-2021, COVID-19: positive (Positive) Positive. On 31-Jan-2021, COVID-19: negative (Negative) Negative. On 02-Feb-2021, COVID-19: negative (Negative) Negative. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. She was not admitted to the hospital. She stated she had to go back to the emergency room a few times since then for symptoms of burning and tingling in her arms, legs, mouth, face, as well as hot and cold issues with her nerves, and tightening of her throat and chest. She immediately treated with Bedadryl (unknown dosage), Pepcid40mg, Prednisone 40mg, ongoing- Prednisone 5mg daily, Pepcid 20mg daily, Claritin 10mg daily. Company comment: This case concerns a 61 Y/O F with a serious expected anaphylactic reaction, and dyspnea, urticaria, paraesthesia, throat irritation, throat tightness, chest pain, chest discomfort, dizziness, dysgeusia, oral discomfort, burning sensation, feeling hot, chills, and nervous system disorder. Event onset immediately after second dose. Based on current available information and temporal association between use of the product and the start date of the event, a causal relationship cannot be excluded. This case was linked to US-MODERNATX, INC.-MOD-2021-087026, US-MODERNATX, INC.-MOD-2021-087026 (E2B Linked Report).; Sender's Comments: This case concerns a 61 Y/O F with a serious expected anaphylactic reaction, and dyspnea, urticaria, paraesthesia, throat irritation, throat tightness, chest pain, chest discomfort, dizziness, dysgeusia, oral discomfort, burning sensation, feeling hot, chills, and nervous system disorder. 1276728	5/1/2021	NJ	58	F	3/2/2021	3/4/2021	This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of ARRHYTHMIA (arrhythmia), TACHYCARDIA (tachycardia) and HEART RATE INCREASED (190bpm heart rate) in a 58-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 027A21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Arrhythmia (No symptoms over the past six years.). Concomitant products included OLOPATADINE HYDROCHLORIDE for an unknown indication. On 02-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 04-Mar-2021, the patient experienced ARRHYTHMIA (arrhythmia) (seriousness criterion hospitalization prolonged), TACHYCARDIA (tachycardia) (seriousness criterion hospitalization prolonged) and HEART RATE INCREASED (190bpm heart rate) (seriousness criterion hospitalization prolonged). On 23-Mar-2021, the patient experienced SUPRAVENTRICULAR EXTRASYSTOLES (premature arterio contraction) and SUPRAVENTRICULAR TACHYCARDIA (supraventricular tachycardia). On an unknown date, the patient experienced PRESYNCOPE (almost passed out), LIMB DISCOMFORT (legs feel heavy) and CHEST PAIN (chest feel sore). The patient was hospitalized on 08-Apr-2021 due to ARRHYTHMIA, HEART RATE INCREASED and TACHYCARDIA. At the time of the report, ARRHYTHMIA (arrhythmia), TACHYCARDIA (tachycardia), HEART RATE INCREASED (190bpm heart rate), SUPRAVENTRICULAR EXTRASYSTOLES (premature arterio contraction), SUPRAVENTRICULAR TACHYCARDIA (supraventricular tachycardia), PRESYNCOPE (almost passed out), LIMB DISCOMFORT (legs feel heavy) and CHEST PAIN (chest feel sore) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 04-Mar-2021, Tachycardia: 190 (High) increased. On 23-Mar-2021, Electrocardiogram ambulatory: abnormal (abnormal) abnormal. On 08-Apr-2021, Tachycardia: 190 (High) increased. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was

							unknown. On 23-Mar-2021, the patient saw the cardiologist and reported that testing, including Holter monitoring was performed. On 14-Apr-2021, ablation surgery was performed.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.
1277706	5/1/2021		16	M	4/27/2021	4/30/2021	Patient presented to urgent care with chest pain that started on 4/30/2021. EKG with diffuse ST elevation, consistent with Pericarditis. Sent to ED for further care and management.
1277488	5/1/2021	OH	52	F	4/27/2021	4/27/2021	She was admitted on 4/29 for altered mental status. She received her second dose of COVID vaccination on 4/27 at 0700 and her son reported that 2h after the vaccination she started to act strange with labile mood, but mostly intermittently tearful. Later that evening after 5pm she became confused (at times not recognizing who her son was) with worsening intermittent agitation, labile moods, singing, and reporting visual hallucinations. Denied SOB, chest pain, fevers, chills, n/v/d, new medications... Per son she is A&Ox4 at baseline and no history of mental illnesses.

1277266	5/1/2021	IA	44	F	4/5/2021	4/5/2021	diagnosed with coronary vasospasm; chest pain for 10 minutes and it went down through her arm and she was nauseous and thought she could walk it off and she was fine and did that for 10 minutes and got sick and she had to go; it was a pressure, painful but pressure; arm a little sore; tired; weird taste in her mouth; got nauseous; tingling pins and needles in her bottom jaw; This is a spontaneous report from a contactable consumer (patient). A 44-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), first dose via an unspecified route of administration, administered in Arm Left on 05Apr2021 11:30 (Batch/Lot Number: ER8737) as SINGLE DOSE for covid-19 immunisation. She added it is to protect herself and she takes care of her mom next month and she had hers and she also works with the public at store and it is the right thing to do to not keep spreading the awfulness. No prior vaccinations within 4 weeks and no additional vaccines administered on the same date as the COVID-19 Vaccine. Medical history included ulcer, irritable bowel with constipation, tired a lot and just that her doctor said to take a multivitamin and knows B and D are good, sinus infection 2-3 weeks ago and he told her to do sulfer antibiotics, risk factors of high blood pressure, overweight, and a smoker. Concomitant medication included linaclotide (LINZESS) taken for irritable bowel with constipation from an unspecified start date (started taking over 5 years ago) and ongoing; hydrochlorothiazide, lisinopril (LISINOPRIL HCTZ) taken for high blood pressure from an unspecified start date (started taking over 15 years ago) to 10Apr2021 (stopped taking on 10Apr2021, her last dose was 09Apr2021); colecalciferol (VITAMIN D3) taken for an unspecified indication from an unspecified start date (started taking about 1 year ago, after Covid came out and fiance, tested him and it was low and takes because going around) and ongoing; cyanocobalamin (VITAMIN B12 [CYANOCOBALAMIN]) taken for supplementation therapy (reported as tired a lot and just that her doctor said to take a multivitamin and knows B and D are good) from an unspecified start date (started about 6months ago) and ongoing; curcuma longa (TURMERIC [CURCUMA LONGA]) taken for as tired and heart healthy and she heard good things and thought she would try it from an unspecified start date (started about

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

6 months ago) and ongoing; vaccinium macrocarpon (CRANBERRY) taken for an unspecified indication from an unspecified start date (started 2-3 weeks ago) and ongoing. The patient also concomitantly took "Tantoprazole" (at 40mg once a day by mouth) started taking over 5 years ago and ongoing, states she took it that morning for ulcers; Dietary fiber (at 25.4 grams by mouth once a day) started taking over a year ago and ongoing after she lost her insurance and couldn't get the medication for her irritable bowel and was taking 2 a day and when she got insurance back and the medication back and still takes 1 a day and helps go to the bathroom; chewable immune support formula (by mouth daily) and ongoing and stated that it is like airborne, it has Vitamin C plus 13 vitamins and she started taking this about 2 weeks ago VitC plus 13 vitamins started about 2 weeks ago; ongoing Culturelle Probiotic lactobacillus rhamnosus (40 mg) started over a year to a year and a half ago when she lost her insurance and had problems with irritable bowel with constipation and figured it can't hurt to keep taking. The patient added that she was not taking anything new, she has been on them a long time but will list in case the shot counteracts with a medication. The patient further added she was taking Lisinopril HCTZ for the last 15 years and has had high blood pressure for 20 years and was 1st on Capazoid and was changed to this. She states it is in a pharmacy filled see through bottle and the pill had BO3 on one side and LL on the other side. States she stopped taking it, her last dose was 09Apr2021 and the cardiologist switched her to 2 new medications. The Capazoid, she is not sure of spelling, was for about 5 years and it was Captopril and HCTZ and it was 15-20 years ago and she does not know the dose. It was also stated that she took her morning pills the day of the shot but didn't take her 3 afternoon pills. She went to the doctor for a sinus infection 2-3 weeks ago and he told her to do sulfur antibiotics and took that and she had problems going to the bathroom and the prescription for the UTI was too expensive so she got the over the counter and figured she would take Cranberry to keep it at bay. The patient does not know the name of the antibiotic, the dose, NDC, lot or expiry date states it was about 3 weeks ago. The pharmacist told her fiance that the over the counter was just as good as the AZO. It was also reported that the

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

patient previously had prior vaccinations: sore arm with the flu shot, caller does not have name, dose, NDC, lot or expiry to provide. It was nowhere near the soreness from the Covid shot, it hurt to lift her arm. The patient can be heard asking if her fiance would like to make a report about being tired and having a sore arm after his shot. The patient and fiance decline to make a report. No further details provided. It was reported that the patient is calling to report the side effects she had with the 1st vaccine and what she went through after that and have it recorded and see if anyone else is having the same issue. She states if she can get answers that would be great. Her cardiologist can't confirm or deny if what she experienced was from the vaccine. States she had some immediately after and some happened a couple days later. States some of the stuff is on the sheet but not the severe stuff and if we have more information than when she got the sheet it would be great. The cardiologist she saw in the hospital that said he could neither confirm or deny that it is from the vaccine, states her primary is not aware of this. The patient states she didn't report right away as she didn't think it was a big deal and then she had big issues on Friday and she had the vaccine on Monday. The patient got the vaccine on Monday 05Apr2021, her appointment was at 10:35. The patient got the shot and right after the Band-Aid was placed a couple of minutes she got a weird taste in her mouth and she didn't say anything. She has donated plasma and knows there can be a metallic taste and it was just a shot and whatever it was a funny taste. She sat for the 15 minutes and was fine and got in her car and got nauseous and thought maybe she didn't eat so she started to drive and was calling her fiance to see what he wanted to eat. She started to get tingling pins and needles in her bottom jaw and that was weird to her and she told her fiance about it and got off the phone. She got to the place and ate and the nausea got a little better but she still had the tingling in her bottom jaw. She went home and laid down to take a nap. When she got up it was gone and everything was fine. The next day her arm was a little sore and she was tired but that is normal. Her fiance got his and he was tired and so she didn't think anything of it, she works 2 jobs, one at home and also at Target and her first day back was 09Apr2021. States most of the day she was fine but on her last break she

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

was having chest pain for 10 minutes and it went down through her arm and she was nauseous and thought she could walk it off and she was fine and did that for 10 minutes and got sick and she had to go. Her manager and coworkers were worried about her so she went to the urgent care across the street and was told there that she was having signs of a heart attack with her risk factors of high blood pressure, overweight, and a smoker. They gave her 4 baby aspirin and did an EKG and that came back fine and was told she could go up to the ER if she wanted, she asked what that would do and was told they would run blood work. The patient states it was a pressure, painful but pressure. She asked him if this could have to do with the Covid vaccine she got Monday and he said he didn't know but probably not. She told him her symptoms she has listed, the taste, nausea, pins and needles in the jaw and he hung his head and shook it and told her that is another sign of heart issue. The patient went home and laid down for a nap and when she woke up the chest pain was still there and her fiance said she was going to the hospital since the aspirin didn't help and she could go by ambulance or by car. He took her to the ER Friday and they really thought she was having a heart attack and did tests like EKG and X-Ray and those were fine. It was stated that they did a T enzyme for your heart and it was .03 and they said they wanted it below that, that it wasn't bad. She had that test again and it went up so she had a catheter the next day and was told it was not clogged arteries. The patient stated she was diagnosed with coronary vasospasm. It was clarified the name of the test as Troponin and it was .03 and they wanted it below that and had her stay for observation and said it can go up and is a sign of heart damage and heart attack 6-24 hours after the initial pain. The patient stated they gave her nitroglycerin and that helped with the chest pain and it opened all the blood vessels. Throughout the night her Troponin levels went up. She had a cardio cath Saturday and the cardiologist was surprised he thought there was blockage and would place a stent and there was not blockage and nothing wrong. He explained that her blood vessels were so constricted that her heart spasmed as it was not getting enough oxygen and was causing the pain. She asked him if it could be from the Covid vaccine and he said he could not confirm or deny as she is overweight, has high blood pressure and

1277146 5/1/2021 NJ

29 F

3/4/2021

4/29/2021

smokes but she has never had issues before. The reason she is calling is because the tingling in the bottom jaw started within 30-45 minutes after the vaccine and she had never had that before and she is not saying it is related or not. This may help other people may be having issues and may help give information to say maybe you shouldn't smoke right after the vaccine or if you have high blood pressure or are overweight you should stay longer. For the next one her cardiologist thinks she should get the 2nd one and she will pay more attention to the signs. She has an appointment tomorrow with her cardiologist and will double check and ask him as they ask you to let them know before the vaccine if you are on a blood thinner and when her Troponin was up they have her blood thinner Warfarin through the night in the hospital and wants to double check to see if that is still in her system and if it's ok to get the 2nd dose. The physician also changed her blood pressure medication she has been on for over 15 years (No further details provided). The patient added she was hospitalized on 09Apr2021 evening and discharged 10Apr2021 around 5pm. For the investigation the patient states after the heart cath. she had an echocardiogram where you lay on your side and they do an ultrasound of your heart. The patient does not know the result of the echocardiogram, assumes it's fine but doesn't know. She took a week off at work as she was told not to bend her wrist from the procedure and has a weight restriction so she is doing her computer job. It was also reported the normal arm soreness and tired are expected but the severe, it helps to report and keep track of and it may be isolated and it may not be. The outcome of the events was unknown. The events required emergency room and physician office visit.

Patient presented to the emergency department with right-sided pleuritic chest pain-she has a pulmonary embolism on CT angiogram. She was started on heparin and admitted to the medical center. She received her Johnson and Johnson vaccine on 03/04/2021.

Vaccine) (Intramuscular) was unknown. The patient was very panicky about getting the second dose for fear that she would have another heart attack. She went to the cardiologist for a follow up and the doctor could not determine why she had a heart attack. The patient reported that it was not a normal heart attack in that her blood pressure and pulse were not raised, but instead, were low. The patient agreed to follow up with her HCP (health care provider). Treatment for the heart attack included SIMVASTATIN and BABY ASPIRIN to prevent blood clots. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

Patient received her second dose of Moderna COVID vaccine on Tues, 4/27, then developed palpitations on night of 4/29. She woke up that night at 3am with vomiting and 7/10 chest pain. Chest pain was described a substernal and symptoms occurred at rest. Additionally noticed an elevated heart rate. Her chest pain did not subside so she presented to the Hospital ER where she was noted to have elevated trop from 1.8 to 3.5. TTE at bedside showed reduced EF to 40%, global apical hypokinesis. At healthcare facility, cardiac cath was normal and EF appeared normal on wet read of repeat TTE. She was started on captopril (transitioned to lisinopril on DC) and metoprolol. She will be discharged with follow up with physician.

1278758	5/1/2021	OH	62	F	4/15/2021	4/15/2021	Pericarditis; Pleuritis; This is a spontaneous report from a contactable consumer, the patient. A 62-year-old non-pregnant female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot: EW0162), via an unspecified route of administration in the left arm on 15Apr2021 at 12:30 (at the age of 62-years-old) as a single dose for COVID-19 immunization. Medical history included thalassemia minor, fibromyalgia, migraines, depression, Barrett's Esophagus, hiatal hernia, restless leg syndrome (RLS), asthma, hypothyroidism, moderate sleep apnea, osteoarthritis, valvular heart disease, hyperlipidemia, degenerative disc disease (DDD), osteopenia, benign essential tremor, hypertension (HTN). The patient was not diagnosed with COVID-19 prior to vaccination. Concomitant medications were not reported, but the patient did receive other unspecified medications within two weeks of the vaccine. The patient did not receive any other vaccinations within 4 weeks of the vaccine. The patient previously took morphine, pregabalin (LYRICA) and methylphenidate hydrochloride (CONCERTA) and experienced allergies. On 15Apr2021 at 21:30, the patient had shortness of breath and chest pain and could only tolerate leaning forward. She went to the emergency room and was admitted to the hospital for pericarditis and pleuritis. She was informed not to take the second vaccine as it would kill her. The patient was hospitalized as of an unspecified date for 2 days and treated with steroids, anti-inflammatory and pain medication. Since the vaccination, the patient was tested for COVID-19 via nasal swab on 16Apr2021 with negative results. The clinical outcome of pericarditis and pleuritis was resolving.

1274385	4/30/2021	CA	61	F	3/27/2021	3/31/2021	<p>~~Moderna COVID-19 Vaccine EUA" -- received 1st dose 3/27/2021 Received 1st Moderna vaccine in R arm on 3/27/21. Within first hour, she had a headache, R eye pain, and felt tired; symptoms subsided after she laid down. On 3/31 in early AM, felt sudden and more severe headache and same eye pain, and "electrical contractions down neck, back, and spine." Went to medical facility, then transferred to hospital, and transferred to another hospital via helicopter. 61-year-old female, generally very healthy, on no medications, here complaining of sudden onset right sided stabbing/electrical headache which began 30 minutes prior to arrival. She states she was standing at work when had sudden onset severe headache radiating into her right eye. Stating that it feels like my right eyeball is going to explode. She ranks the pain a 9 out of 10. She does have a history of migraine headaches which have never been evaluated with imaging or by neurology. They were normally frontal, and she has not had one in more than 2 years. She states that this headache is dramatically different than her prior migraines. Patient states associated with this sudden onset headache, she had bilateral neck pain, and substernal chest pain. Upon arrival to clinic, she points to her substernal region as the site of her chest pain. She denies associated shortness of breath, irregular heart rate/rhythm, presyncope. She does feel slightly weak. Of note, patient states she had a MODERNA COVID-19 vaccine on Saturday and subsequently had some right-sided shoulder pain. Her symptoms are on the same side. - 7:50 AM: BP 165/109 (R arm); pulse 86; no antihypertensives given, given a total of 100 mcg fentanyl over 1 hr - 9:04 AM: BP 150/92 (R arm); pulse 60; transferred to hospital and then transferred to another hospital via helicopter for SAH 3/31/2021 ED - given nicardipine IV, dexamethasone IV, levetiracetam, and antiemetics. Nero noted that no associated trauma, LOC, or seizure with the HA, Neuro assessment - day 4 (plus possible re-rupture within last 24 hours) of good clinical grade HH2 low volume aSAH due to ruptured R ICA ANR 4/1/2021 - completed successful and uncomplicated RICA oblong aneurysm coiling (successful coil elimination & preservation adjacent PcommA infundibulum). Patient was admitted to critical care for post procedure care, monitoring, and management of sodium, blood pressure, and headache.</p>

1274364	4/30/2021	ID	27	M	4/8/2021	4/11/2021	Levetiracetam discontinued since patient did not have any seizures. 4/7/2021 - discharged
1274344	4/30/2021	CA	51	F	4/11/2021	4/13/2021	Pt experienced malaise, subjective fever, chills, headaches, and myalgias following vaccination then on 4/11 (3 days post vaccine) experienced sharp chest pains radiating up left side of neck and down bilateral arms. Pt presented to urgent care clinic where EMS was activated for transport to the Emergency Department. Pt was evaluated for STEMI by cardiologist in the ED, cath lab was not recommended and pt was admitted for evaluation of possible myocarditis.
1274193	4/30/2021	CA	70	M	4/23/2021	4/26/2021	Urinary/stomach pain, muscle/back pain, joint pain, chest pain
1274110	4/30/2021	MD	39	F	4/21/2021	4/25/2021	Patient presented to the emergency room for evaluation of shortness of breath and chest pain that started two days prior (one day after receiving first Moderna vaccine). Symptoms worse with exertion. Chest pain is described as a heaviness, does not radiate. EKG in the emergency room that showed ST elevations in III and aVF and his troponin was found to be 40.5 and so code STEMI was activated. Patient had cardiac cath on an urgent basis and that showed triple-vessel disease, with a very short left main as LAD and left circumflex were almost coming from 2 separate ostia, subtotal occlusion of the LAD and left circumflex and 100% occlusion of the mid RCA. Evaluated for CABG, which was declined. Patient's echocardiogram showed global hypokinesia with EF of 20 to 25%. Patient underwent high risk PCI procedure using Impella support with 2 stents to the subtotally occluded LAD and 1 stent to the subtotally occluded left circumflex. Patient's symptoms subsided following procedure, however patient suffered mild CHF on initial CXR secondary to ischemic cardiomyopathy, successfully treated with Lasix as displayed by downtrending BNP. Patient's labs also displayed shock liver with AST and ALT liver enzymes both above 1000 on arrival; hepatitis and HIV titers came back negative. Patient suffered from AKI on arrival secondary to ischemia, with an elevated BUN and creatinine; CKD suspected due to lab values showing chronic anemia.
							Severe chest pain diagnosed finally as PERICARDITIS

1274031	4/30/2021	PA	25	M	4/27/2021	4/29/2021	Developed chest pain. Found to have myocarditis. Receiving NSAID for treatment.
1273909	4/30/2021	NJ	20	M	4/30/2021	4/30/2021	Patient was given vaccine and was told to wait in the monitoring area for 15 minutes post vaccination. Shortly after, the patient reported "feeling pale" and was told to remain seated. The patient then fell over from the chair and lost consciousness. We immediately called 911 and went to the patient's side with epinephrine. However, he recovered within seconds and was able to sit up and drink water. He reported feeling "pale [...], weird [...]" and said he felt like his "ears are sweating." He did not want epinephrine and remained seated and responsive. When asked, he said he had never received any adverse reactions to any vaccines in the past. A pharmacist then cleaned and disinfected his right temple that was bleeding, which he seemed to have hit when he fell. He later reported feeling chest pain and slight difficulty breathing but did not want epinephrine at that time. Emergency services arrived about 20 minutes after and assessed the patient and removed him in a gurney.
1281101	4/30/2021	CA	65	M	3/22/2021	3/26/2021	65-year old man with PMH notable for CAD s/p 3v CABG 2015, HFref (EF 54% 11/2020), CKD, T2DM (A1c 7.5% 9/2020), and OSA, presenting with 2 days of weakness, malaise, difficulties getting out of bed and walking. The patient was in his normal state of health until he got the 2nd dose of the moderna covid vaccine two days ago; since then he has been somnolent, weak, not eating or drink much, and slid out of his bed and woke up on the floor once. He came to the ED because he was so weak that he couldn't walk. He furthermore endorses suprapubic and generalized right-sided abdominal tenderness that started after two episodes of nonbloody emesis and chills while waiting in the ED. He denies fevers, chest pain, dyspnea, orthopnea, lower extremity swelling, palpitations, brbpr, melena, dysuria, rash, easy bruising/bleeening, headache, vision changes, and sensory changes.

1274796	4/30/2021	CO	49	F	3/20/2021	3/21/2021	Eleven Hours after the vaccine I got a fever body aches, chills and chest pain. The fever and flu symptoms went away after 24 hours but the stabbing chest pain lasted for 37 days. The pain was in the center of my chest in different places and it felt like tightening and clenching. The D-Dimer was elevated and other tests were normal. My Platelets were tested later and were normal. Doctors indicated it was an inflammatory immune response. I went to a Cardiologist for a Stress test which showed ST depression. The chest pain stopped after 37 days. I did have shortness of breath which came and went over the course of four weeks. I am normally in good shape and I run, dance and work out two to four times a week. I have been unable to work out since this began. I also had lightheadedness, chest pain and palpitations seemed to go together. I still have lower back pain and Tinnitus which started two and a half weeks after the shot. It has been five weeks.
1273679	4/30/2021	PA	70	F	4/22/2021	4/25/2021	Patient received her second dose of moderna on 4-22-21. On 4-25-21, patient states she began to experience chest pain when she took deep breaths. On 4-28-21, patient states she went to the emergency room. She states the hospital did a chest x-ray, a scan, and a heart echo. She was diagnosed with a lung clot. Patient states she was put on a blood thinner. On 4-29-21, the patient was discharged with a prescription of Eliquis.

1273447	4/30/2021	KY	20	M	4/22/2021	4/22/2021	1 day after the 2nd shot in the Pfizer COVID vaccine series he began to develop substernal pressure like chest pain . Patient was admitted into the hospital for 2 days (4/27-4/29) for this substernal chest pain. A CTPE, EKG, and CXR were ordered that were unrevealing as to the etiology of the chest pain. Troponins were elevated on admission with a slightly decreased delta (515->479). An ECHO was ordered that showed a LVEF of 35-40% with moderate global hypokinesis of the left ventricle, right ventricles moderately dilated, and no pericardial effusion. A Cardiac MRI was then ordered to determine etiology that showed subepicardial late gadolinium enhancement of the basal inferior and mid-inferior and inferoseptal wall consistent with acute myocarditis. Additionally, a small pericardial effusion without signs of inflammation, calcification, or cardiac tamponade physiology. Patient was then D/C on 4/29 after the cardiac MRI with no medical therapy with the recommendation to not partake in physical activity for one month. Will have follow up with cardiology clinic in 1 month and will participate in cardiac rehab.
1273359	4/30/2021	FL	68	F	2/13/2021	2/13/2021	Pt presented to ED after receiving second COVID vaccine. Pt states within 5 minutes of second dose, she began feeling lightheaded, shakey, diaphoretic and generally not well. Personnel noticed pt leaning over the back of her chair and brought her juice, gatorade, donuts, and candy. Denies ever losing consciousness, chest pain, SOB. Pt was taken to the ED where glucose was 176. Pt states by the time she arrived to the ED her symptoms had resolved. On presentation pt had negative troponin, however EKG showed mild T wave changes. Pt admitted to internal medicine for ACS rule-out. No acute overnight events. Troponins remained negative, no EKG changes. Discharged next day.
1273242	4/30/2021	PR	45	F	4/20/2021	4/20/2021	During the night, I had a really strong headache, nausea, chills, pain in my left arm that reached my chest, and then a lot of sweating. Wednesday I did not work, Thursday I still worked with the pains. Friday I woke up around 5:00 am with severe chest pain and nausea. The pain was not normal, I went to the Hospital, to the emergency room.

1273149	4/30/2021	GA	66	F	3/16/2021	4/26/2021	Patient presented to hospital with four days chest pain, dyspnea on exertion and weakness. Work up revealed an acute submassive pulmonary embolism without evidence of deep vein thrombosis in bilateral lower extremities.
1273145	4/30/2021	VA	25	F	2/3/2021	2/4/2021	I received the vaccine on February 3, on February 4 at 0100 I woke up with chills. The rest of the day I would have chills and sweats. I was nauseous and threw up twice. I had a low grade fever of around 99 degrees but at one point it did go up to 101.3. My entire body hurt including my head and Tylenol and ibuprofen did not help. On February 5 I was feeling a little better, I still had body aches but could eat a little. On February 6 at around 0500 I woke up with chest pain. I waited a little while to see if it would go away but it had gotten more intense. I am a cardiac ICU nurse so I knew what chest pain could mean. I got out of bed and at that time my chest pain was a 10/10 and I was having shortness of breath. I woke my fiancé up and told him I needed to go to the ER. At the ER they ran test and admitted me to the hospital. They later diagnosed with myopericarditis with a small pericardial effusion.
1273081	4/30/2021	CO	17	F	4/26/2021	4/29/2021	After receiving the vaccine on 4/26, she developed headache and temperature to max 99-100 as well as muscle pain in the arm where she received the vaccine. Progressed to diffuse myalgias on 4/27 and 4/28. Was having a slight cough that is typical for her during this time of year due to allergies, no other respiratory symptoms. Then acutely developed severe jaw pain that radiated to the throat and into her chest when she woke up on 4/29 in the morning. She had 10 out of 10 crushing chest pain.
1273017	4/30/2021	GA	33	M	4/10/2021	4/28/2021	PT REPORTED TO ED WITH C/O SOB/DYSPNEA, CHEST PAIN, PROBLEMS WITH INSPIRATION AND FATIGUE-TACHYCARDIA HR 119- BILATERAL LEG PAIN SINCE 4/26/21

1271040	4/29/2021	FL	51	M	4/23/2021	4/23/2021	<p>Within 30-minutes of vaccination, the patient reported a headache, slurred speech, and right side weakness. EMS evaluated the patient on-site. The patient was hypertensive (197/129) with a FSBG of 95mg/dL. During stroke assessment, the patient had new onset facial palsy/droop and need speech abnormality which signaled a stroke alert. 12-lead EKG was unremarkable. EMS transported the patient to Emergency Department. In the ED, the patient presented with a headache, chest heaviness, and slurred speech, but no aphasia. NIH stroke scale was 0. Patient remained hypertensive (170/109). Labs, tests, and imaging did not indicate rtPA administration. ED physician administered 0.4mg SL Nitroglycerin, 10mg IV Hydralazine, and 325mg PO Aspirin prior to admission for suspected Transient Ischemic Attack. Upon admission, differential was TIA vs. CVA vs. ACS. Admitting physician ordered HbA1C, lipid panel, MRI brain, CTA head/neck, 2D echo, and neurology consult. Throughout course of admission, patient had recurring midsternal chest pain that was relieved with Nitroglycerin. Imaging ruled out CVA. Given elevated TGs and Cholesterol, patient was started on Atorvastatin 40mg PO. Suspected TIA and ACS. Neurology consult reviewed the labs and imaging, and stated the episodes of stuttering are most commonly associated with anxiety or stress reaction. Neuro did not recommend any further workup unless this happened again unprovoked. Patient was discharged after a 3-day admission with diagnosis of cerebrovascular disease, unspecified. The patient was prescribed 81mg PO Aspirin, 20mg PO Lisinopril, and 40mg PO Atorvastatin.</p>

1270848	4/29/2021	NY	39	F	4/28/2021	4/29/2021	<p>Patient received vaccine at 2:15 pm at Public Health clinic. She waited the appropriate 15 minute observation period and was feeling well. She then came to PCP office for a routine medical exam and reported feeling well when she first came, although her blood pressure was slightly elevated but pulse was normal. She was taken to an exam room and left for approximately 5 minutes, at which time she presented to the nurses station reporting that she thought her tongue may be swelling. Nurse evaluated and got NP to evaluate immediately. Patient reported she could still breath normally and swallow but that she was still feeling the swelling increase. At this time NP left to get PCP while nurse elevated HOB as patient began to choke on her tongue. PCP ordered epinephrine, 1 mL administered immediately. 911 called. Patient reported she was starting to feel better, swelling began to decrease. She then started to feel shaky, was pale and diaphoretic. She lost consciousness for approximately 10 seconds and pulse was not palpable. Staff readied for CPR and AED brought to room but patient regained consciousness prior to any care being necessary. She began to speak in full, clear sentences and was alert and oriented. 2L o2 applied. She was speaking with staff normally for around 5 minutes while awaiting ambulance, began to feel hot and felt her heart racing. Her PCP advised her that this was a normal sensation brought on by epi. As EMS arrived, patient reported feeling intense chest pain radiating down left arm, intense headache, and tingling in her fingers. As she was being transported to stretcher, patient experienced a 1.5 minute seizure followed by an episode of vomiting. She then left the building via ambulance and was take to Hospital emergency department. There it appears that she received 2 more rounds of IM epinephrine, IV epi, CPR, and was intubated. She was transferred from there to ICU where she is currently admitted on ventilation under sedation and receiving cardiac testing due to continued hypoxia and tachycardia.</p>

1270761	4/29/2021		20	F	3/11/2021	3/18/2021	<p>After first vaccine: History: Moderna COVID vaccine on 3/11/2021. Arm soreness over the first day or two but nothing else that really struck her. A few days after she started to notice axillary pain that progressed up her right neck and down to her right hand. She saw a physician who thought she was having nerve pain brought on by the vaccine. Around the 18th she started to feel a snapping pain in her wrist. Went to ED on the 20th because she started to have arm shaking, she was given ativan, her arm shaking stopped and they discharged her home. That evening her fingers felt clenched. On the 21st she woke up in the morning, went to urinate and dropped to the floor because her legs felt like jello and felt like they kept giving out. They initially thought the ativan was just making her feel out of it. They waited until the evening but then needed to go to the ED. The concern was GBS and transverse myelitis. They ate dinner and decided to drive to ED, on the drive she was kind of falling asleep periodically. Then she suddenly couldn't lift her water bottle. She started to be completely out of it, Mom says she wasn't responding. Pt says that she felt like she knew what was going on, felt a little out of body and wasn't quite responding. Mom couldn't get her out of the car, she was carried into the ED and at that point she started to recover a little bit more. About 10 minutes later she started to feel better. She was admitted because she was still having trouble walking. In the hospital she had a normal CT head and video EEG but she didn't have any events while on the monitor. Discharged home the following day with the diagnosis of functional neurologic disorder and instructions to establish care with an adult PCP. They advised considering CBT as well. Since discharge her legs feels tired, going up the stairs feels much harder than it should. She has not had any falls and no longer feels like she is going to fall. She follows with a therapist, has had dissociative episodes and panic attacks in the past. Assessment: 20 YOF with PMH of panic attack, POTS, IDA and benign heart murmur who developed weakness of b/l LE and altered consciousness approximately 10 days after her first dose of Moderna COVID vaccine. Also had an episode of unilateral arm shaking the day prior that resolved with ativan in the ED. At this point unclear if directly related to vaccination. Differential includes mild Guillain-Barre 2/2 previous infection or vaccination,</p>

stress reaction/anxiety, POTS complication, myasthenia gravis, tick bite, infection, heavy metal poisoning, B12 deficiency, seizure disorder, atypical migraine. Functional Neurologic Disorder diagnosed by neurology after overnight admission for video EEG which captured no events. CT head also WNL per neurology discharge summary. Neurologic exam today WNL. After Second Vaccine: History: She had her 2nd vaccine on 4/15 (6 days ago). Had vaccine in right arm again, she did have some arm pain again. She had coffee without breakfast in the morning. Had finished her first virtual class, went to the restroom during her second class, felt strangely in the restroom, went back to her room. She then passed out. Her fall was unwitnessed. She called to her roommate when she came to but her roommate hadn't heard the fall. She thinks she was only out for a few seconds but cannot be sure. Called her Mom who advised her to eat something so she ate an orange sitting on the floor. She got up to make herself breakfast and she passed out again. Again unwitnessed but patient thinks it was very fast. She crawled over to the couch, sat on the couch for for 15 minutes then felt fine for the rest of the day. She did not feel nauseous at all. She denies palpitations, difficulty breathing and chest pain. Today in office after orthostatics and blood draw she fainted again, only out for seconds. BP elevated immediately after the event but WNL minutes later. These syncopal episodes reminded her of her syncopal episodes with IDA and POTS. They do not feel like the episode after the first vaccine when she lost feeling in her legs and was very out of it. She feels like her arm pain from the first vaccine never fully resolved. After the arm pain worsened from the 2nd shot she tried a 3 day course of aleve to see if that helped things. At this point it is mostly just her right wrist that is painful. Overall feels more localized to wrist than prior. She has since stopped the aleve, last was last night. She has not noticed redness or swelling in wrist or arm. LMP was 4/2-4/6. She went almost a year without menses so stopped her OCP, but her menses have returned recently and she has restarted OCP. Assessment: Right arm pain persisted from the first vaccination but otherwise sx had resolved. She got 2nd vaccination on 4/15, only arm pain but yesterday had 2 brief syncopal events and one today in the office. Orthostatic BPs not completely convincing for orthostatic hypotension today.

1270587	4/29/2021	GA	31	F	3/12/2021	3/24/2021	Started experiencing chest pain on March 26th in the evening. I went to my primary care physician that Friday and she performed an EKG that came back normal. She told me if the pain persisted to go to the ER to where they could further evaluate me. A week later I went to the emergency room. They performed a CT scan and EKG and ran blood work everything came back normal. They did state that I had a pulmonary nodule that was benign and to get it rechecked in one year. For aftercare I was Referred to a cardiologist. Upcoming appointment is May 14th 2021.
1270454	4/29/2021	NY	81	F	3/19/2021	4/21/2021	4/22/21 Patient presented to ED for evaluation of chest pain and shortness of breath of several weeks of evolution. Of note, patient had covid infection at the end of Dec 2020 - beginning of Jan 2021 and had pfizer vaccine, 2nd dose in mid march. Per patient she has been complaining of progressive SOB for the last 2 months. Denies recent travels or trauma. CTA in ED revealed bilateral Pulmonary embolisms and suggested possible right Heart Strain.
1270370	4/29/2021	OH	22	M	4/14/2021	4/17/2021	4/14/21- Vaccination Day 4/15/21- Headache, Chills, sweating & achiness. I took some Ibuprofen for the chills and rested pretty much all day 4/16/21- I felt better still sweating and sore but nothing out of the ordinary 4/17/21- A little tightness of the chest when I woke up but nothing crazy and then around 11 AM & 12 PM, I had serious chest pain. Exactly the way it was in 11/2019 (First episode of Myocarditis). Went the the ER for care 4/18/21- Ended up staying in the CICU (Cardiac ICU) for 2 days because I had more chest the morning of the 18th

1270306	4/29/2021	MA	33	M	4/9/2021	4/16/2021	33-year-old male without past medical history presenting with 10d of nausea and vomiting associated with disequilibrium. Patient notes he received his second dose of Moderna on April 9. On April 16th, patient woke up and started to feel disequilibrium, unsteady on his feet. This was associated with nausea and vomiting. Patient will vomit about 2-3 times per day nonbloody nonbilious. He notes that the vomiting is associated with movements of his head. He went to urgent care where he was given prescription of meclizine. This did not work. Was also given prescription for prednisone and Augmentin for question of vestibular neuritis. This did not help either. Patient then went to see ENT today. He was told that his symptoms were not consistent with a vestibular process. He was recommended to go to emergency room for further evaluation. Patient has not been able to really hold down any food or liquids. He denies any fevers, chills, headache, vision changes, neck stiffness, abdominal pain, constipation or diarrhea, chest pain, dyspnea. In the ED, patient afebrile, HR 67, BP 135/97, RR 18, SpO2 96% on RA. Labs notable for Hb of 17.3. CT head -10 millimeter periventricular hypodensity in right parietal lobe chronicity.
1270108	4/29/2021	MI	75	F	4/10/2021	4/25/2021	Patient was exposed to COVID positive person on 4/14/21 and requested test for screening. Reported no symptoms at that time, but was positive. Presented to emergency department on 4/25/21 with complaints of sudden onset difficulty breathing and chest pain. She was found to be in COPD exacerbation possibly caused by COVID-19 infection or allergies. She was admitted to hospital for further management until 4/26/21.

1271042	4/29/2021	MI	87	M	4/1/2021	4/20/2021	<p>BRIEF OVERVIEW: Discharge Provider: MD Primary Care Provider at Discharge: MD Admission Date: 4/22/2021; Discharge Date: 4/23/2021 Active Hospital Problems - Admitted for bilateral PE ? Acute pulmonary embolism without acute cor pulmonale, unspecified pulmonary embolism type (HCC) 04/22/2021 DETAILS OF HOSPITAL STAY: Patient is a 87 y.o. male with psoriatic arthritis, essential hypertension who presents today with right-sided chest pain. He reports onset starting yesterday. The pain radiated around to his back into the center of his chest. Thought he had pulled a muscle was having heartburn. Taking a deep breath made the pain worse. He tried Tums but no significant relief. It was not associated with shortness breath. Denied any, lower extremity swelling or calf pain. Today the pain was acutely worse so presented to the emergency department for evaluation. No prior DVT, PE, no FH of DVT/PE. No weight loss. No recent prolonged trip. On arrival to the emergency department his pulse was noted to be elevated to 120 but otherwise vitals unremarkable. CT angiogram thorax had significant findings of multiple bilateral pulmonary emboli involving segmental and subsegmental vessels. There was no evidence of right heart strain. He was started on heparin drip and transferred to another facility for ongoing care. He was switched to Eliquis 10 mg bid for 7 days, then 5 mg bid for 3 months. He has not sign of any malignancy, no weigh loss. He received Moderna COVID-19 vaccine on 3/4/21 and 4/1/21. It is conceivable that this PE could be complication of COVID-19 vaccine. He should follow up with PCP in 1 week. CTA also showed partial visualization of gas fluid collection within the right upper quadrant, likely reflecting a duodenal diverticulum which was present on 8/20/2012 CT abdomen, incompletely assessed. There is a small hiatal hernia. PCP to follow. Discussed with wife, and with daughter over the phone. Patient discharged home.</p>

1269942	4/29/2021	MN	44	M	4/1/2021		<p>CHEST PAIN (WHOLE CHEST HAD LOT OF PAIN)/THOUGHT THAT HE HAD HEART ATTACK; SHORTNESS OF BREATH/COULD NOT BREATHE; SEVERE CRAMPING IN LEFT SHOULDER AND UPPER BODY; DIFFICULTY IN STANDING; SINUS; THOUGHT THAT HE WAS ABOUT TO PASS OUT; BUNCH OF CLOTS IN THE BOTTOM SIDES OF BOTH LUNGS AND ON THE TOP OF ONE OF THE SIDES; BEGINNING STAGES OF PNEUMONIA ON BOTH LOBES OF THE LUNGS (COLLAPSED); CRAMPING IN CHEST; This spontaneous report received from a patient concerned a 44 year old male. The patient's weight, height, and medical history were not reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: Unknown) frequency 1 total, dose was not reported, administered to left arm on 06-APR-2021 at 12 noon for prophylactic vaccination. The batch number was not reported and has been requested. No concomitant medications were reported. On 6-APR-2021 at 12 noon, patient got vaccinated and was fine that day . Next morning on 07-APR-2021, patient woke up with sever cramping in same shoulder which he got the shot in, most pain was in the upper left quarter of his torso to down half way to chest up to the shoulder till the neck . By the end of the day it spread to his whole chest and upper body. Also he had shortness of breath ,could not breath .The cramping and shortness of breath came at same time. He took Advil and went along with his day . He took 3 tablet of Advil 200mg every 4-5 hours all day (total of 3 dose that day) . By night time the case was progressively worse as the whole chest had a lot of pain . He thought that he had heart attack . He thought that he was about to pass out . He could not stand on his own . So his wife took him to emergency room at mid night at 12:30 am on 08-APR-2021. He stayed there for 5 hours and they did bunch of tests , EKG which rolled out the heart attack .They did Chest X-ray which found things then did D-dimer which its level was very high . They found bunch of clots in the bottom sides of both lungs and on the top of one of the sides. They did ultra sound on the legs which had no evidence of blood clots . They discharged him from the emergency room as they felt that he was ok to be out . After couple of hours after discharge , patient's health care professional wrote for</p>

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

him Eliquis, antibiotic and pain reliver. He was given antibiotic because he had beginning stages of pneumonia on both lobes of the lungs (collapsed) . It was found air sacs in lung with signs of pneumonia in both lobes . He came home and started to monitor his blood oxygen . He stayed in the same position till recovery . He was better each day since last week but still had sinus and cramping in the chest (very minor but was still there). The lung capacity was very limited to take some steps. Patient stated that he needed a specialist to understand his condition. He had no medical history before that incidence . He was wondering regarding which type of blood thinner was good for this type of blood clots because he read that the regular blood thinners are not good for that type of blood clot which his HCP gave (regular blood thinner). Laboratory data included: Total lung capacity decreased (NR: not provided) lung capacity is very limited. On 08-APR-2021, Laboratory data included: Chest X-ray (NR: not provided) found things, EKG (NR: not provided) rolled out heart attack, Fibrin D dimer (NR: not provided) level was very high, and Ultrasound scan (NR: not provided) no evidence of blood clots. Treatment medications (dates unspecified) included: apixaban, and ibuprofen. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of the severe cramping in left shoulder and upper body, chest pain (whole chest had lot of pain)/thought that he had heart attack, shortness of breath/could not breath, thought that he was about to pass out, difficulty in standing, bunch of clots in the bottom sides of both lungs and on the top of one of the sides, beginning stages of pneumonia on both lobes of the lungs (collapsed), cramping in chest and sinus was not reported. This report was serious (Other Medically Important Condition),; Sender's Comments: This 44-year-old male patient reported blood clots of both lungs 2 days after receiving COVID-19 VACCINE AD26.COV2.S for the prevention of symptomatic SARS-CoV-2 virus infection. The patient denies any medical history/condition prior to vaccination. The symptoms reported were severe cramping of arm that spread to his whole chest and upper body and shortness of breath; the patient thought he had a heart attack, about to pass out and could not stand because of the progression of pain. EKG done at the emergency room ruled out heat attack,

1269712	4/29/2021			F			heart hurts; the feeling of fainting stopped; sore throat; trouble breathing; nasal congestion and felt very hot; nasal congestion and felt very hot; had chest pain/ heart hurts; seeing stars; This is a spontaneous report from a contactable consumer (patient's parent). A female patient of an unspecified age (age 27, unit: unknown) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot number was not reported) via an unspecified route of administration on an unspecified date at 5:30 pm at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. E-transmitting possible duplicate AE as caller stated they already reported AE to previous agent. Caller reporting on behalf of her daughter. The patient got the 1st dose at 5:30 pm, woke up with a jolt at 1:00 am with trouble breathing, a sore throat, nasal congestion and felt very hot. She took a COVID test since then which was negative. 5 days after that, this Monday 12Apr2021, she had trouble breathing again, that didn't get better, while in the shower. She had chest pain which she described as 'my heart hurts' when she got out of the shower started seeing stars. She put her head down and the feeling of fainting stopped. Both times, the trouble breathing lasted 5-10 minutes. And she felt okay after just a few deep breaths. On the 2nd time she felt better after deep breaths, cold water and felt fine. She had a Tele-visit with a different doctor than her usual physician. She was told to go to urgent care, where they did an X-ray and EKG (electrocardiogram) and COVID test, as mentioned earlier. By the time she went to urgent care she had no trouble breathing though. The outcome of the events trouble breathing and felt faint was resolved on an unspecified date, of other events was unknown. Information on the lot/batch number has been requested.

1269682	4/29/2021	TN	69	F	3/29/2021	3/30/2021	it'll feel like little flutters; Heart palpitations; Shortness of breath; Didn't feel like normal self; Site pain; Chest pressure; Difficulty sleeping because of heart rate; Fatigue; This is a spontaneous report from a contactable consumer (patient). A 69-year-old female patient received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number: EP7534), via an unspecified route of administration administered in right arm on 29Mar2021 at 09:20 (at the age of 69-year-old) at hospital facility as SINGLE DOSE for COVID-19 immunisation. The patient had no prior vaccinations within four weeks. The patient had no relevant medical history. Patient reported that she has people in the family that have had heart problems. Concomitant medication included unspecified vitamins. Historical vaccine includes first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number: EM9990 or EM9890) administered in the right arm on 08Mar2021 (at the age of 69-year-old) for COVID-19 immunisation and had a little fast heart rate but not constant, little fatigue and site pain. The patient previously took steroid injections 2 years ago (2019) and had heart palpitations before. The patient further mentioned that normally after the steroids wear off, the heart palpitations go away. The patient reported that she did not have any problems following the first dose of the COVID-19 vaccine. Caller reported that she had a little fatigue and site pain for just a couple of days but that everything was fine. Patient reported that she felt a little heart palpitations for maybe a day or two and then it was gone following the first dose of the COVID-19 vaccine. After she got the second dose of the COVID-19 vaccine on 29Mar2021, she noticed the heart palpitations again and a little shortness of breath. The heart palpitations and shortness of breath were nothing that she felt that she had to run to the emergency room or anything over. The patient reported that now it was getting difficult for her to sleep sometimes at night because of the heart rate. The patient also reported that she was trying to figure out that from this length of time between her second dose of the COVID-19 vaccine on 29Mar2021 and time of call on 14Apr2021, could the heart palpitations be a side effect from the COVID-19 vaccine. Patient also mentioned that when she experienced heart palpitations before, a whole work up was ordered and

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

she was referred to cardiology and that nothing was found during the work up after previous experience with heart palpitations. The patient also mentioned that she has been fine, that she has been able to work and walk and that she gets her 10,000 steps every day. After getting the COVID-19 vaccine, she was tired and didn't feel like her normal self. The patient also reported that when the time had arrived to get the second dose of the COVID-19 vaccine, about a week before, she may have had a little fast heart rate but not constant. It was also reported that following her second dose of the COVID-19 vaccine on 29Mar2021, the fatigue started about the same time as it did following the first dose, on the second day post-vaccine on 30Mar2021. Patient reported that she was kind of tired and just taking a nap during the day. The fatigue was still ongoing. It was also reported that patient was starting to feel better other than the heart palpitations. The patient reported that yesterday, 13Apr2021, she felt great and could do her normal routine, other than feeling chest pains and palpitations. The heart palpitations are not constant, but are more regular during the day than she was used to. The heart palpitations were really bad last night, 13Apr2021, and that she had difficulty sleeping because of heart rate (couldn't hardly sleep at all). The patient's doctor was scheduling her for an echocardiogram. The patient's doctor did an electrocardiogram (EKG) on her on 08Apr2021 and there was nothing there (normal). The patient's doctor was scheduling her for a stress echocardiogram. The patient also mentioned that after returning from the physician's office, her husband went back and looked at the symptoms from the COVID-19 vaccine information sheet. The patient reported that her husband thought that she needed to call to eliminate everything, that they are trying to figure out why the patient was experiencing the heart palpitations. The patient also mentioned that 2 days ago she got on her treadmill to walk and went for 30 minutes. Patient reported that it normally takes her 5 minutes to recuperate, but that time it took her 20 minutes before she felt comfortable after her walk. The patient also reported that the site pain was nothing serious following both doses of the COVID-19 vaccine. The site pain began shortly after receiving the vaccine and went away after the second day following both vaccines. The

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

shortness of breath probably started about 5 days after she got the second dose of the COVID-19 vaccine. The shortness of breath wasn't enough that she felt that she needed to run to the emergency room. It just felt like when she would breathe, especially at night as she normally breathes with her mouth closed at night, the patient felt like she had to open her mouth to breathe because she can still feel the pressure in chest. The patient was still experiencing the heart palpitations. The heart palpitations are a little worse because they happen so often. Patient reported that initially, she would have a few heart palpitations and then go for hours with none. Patient reported that now, she was feeling the heart palpitations quite a bit. Patient reported that it feels kind of like a little pressure in her chest and then it'll feel like little flutters. The patient further reported that she experiences a little pressure in her chest when she experiences the heart palpitations. At times, the chest pressure would go away, but she always feels the chest pressure there now. The chest pressure has gotten worse over the past couple of weeks and that she was thinking that it would go away like the first one did. Patient reported that she went to the doctor last week and was given an EKG. Patient reported that the EKG was fine and that her physician was scheduling other tests to make sure it's nothing with her heart. The patient didn't think that the heart palpitations and shortness of breath were from the COVID-19 vaccine, but that her husband looked at the vaccine information paper after her doctor's appointment and said she should call Pfizer. The patient had not yet recovered from heart palpitations, shortness of breath, fatigue, and chest pressure while outcome of the rest of the events was unknown.

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1269675	4/29/2021	CA	17	M	4/7/2021	4/8/2021	Patient was in his usual state of health. On Wed, 4/7/21, at 10:20am, he received the first dose of Pfizer COVID-19 vaccine. No immediate vaccine reactions. He went home, complained of pain at the vaccination site and took a nap because he stayed up late the night before. On Thursday morning, he woke up with chills and feeling like having a fever. He took Tylenol and then took a nap. On Thursday night, he began to have chest pain but he did not tell his parents. On Friday, he continued to have chest pain so he told his parents about it. His father told him that if chest pain got worse, they would go to an ER. On that night (Friday) at 1am, he told his parents that he was not feeling well, his chest pain had gotten worse and he wanted to be taken to an ER. He also had abdominal pain, dizziness, disorientation, and he vomited. He was taken to ER where he was found to have elevated troponin of 10. The ER recommended transferring for further work up and the father drove him to the hospital. At the hospital, he was found to have elevated troponins and NT-proBNP concerning for myocarditis of unclear etiology. He was monitored on telemetry and had no concerning ectopy. He had an echo on admission that demonstrated no structural abnormalities, trivial mitral valve regurge, and normal biventricular systolic function. EKG was unremarkable. Troponins were trended q6h and decreased from 32 -- > 23 -- > 17. NT-pro-BNP decreased from 439 to 322 at discharge.
1269641	4/29/2021	PA	49	F	4/22/2021	4/23/2021	Pleuritic chest pain and shortness of breath starting on the day after admission. Clinically suggestive of acute pericarditis. She has a history of this which was thought to be due to lupus.
1269606	4/29/2021	IL	35	M	3/12/2021	3/14/2021	Chest pains began one day after the vaccine and continued to worsen. The morning of the third day after the vaccine, chest pain became so strong that I went to the emergency room. I spent 3 days and 2 nights in the ICU.

1269557	4/29/2021	MO	36	M	3/11/2021	3/12/2021	chest pain; neck pain; general muscle pain; joint pain; headaches; fatigue/malaise; fatigue/malaise; shortness of breath; lightheadedness; nausea; severe heartburn flare up; abdominal pain; digestive issues (urgent, but small stools); heart racing/palpitations; elevated heartrate; vision changes in the left eye; This is a spontaneous report from a contactable consumer (patient). A 36-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot Number: EN6201), dose 1 via an unspecified route of administration, administered in Arm Left on 11Mar2021 13:45 (at the age of 36years) as single dose for Covid-19 immunization. Medical history included heartburn and known allergies: Penicillin, alcohol; all from an unknown date and unknown if ongoing. The patient previously took Cipro (ciprofloxacin) and experienced drug allergy. Concomitant medication included Ritual Multivitamin. The patient was not diagnosed with COVID-19 prior to vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 12Mar2021 (06:00 am), the patient experienced chest pain, neck pain, general muscle pain, joint pain, headaches, fatigue/malaise, some shortness of breath, lightheadedness, nausea, severe heartburn flare up, abdominal pain, digestive issues (urgent, but small stools), heart racing/palpitations, elevated heartrate, and vision changes in the left eye. The adverse events resulted in Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care, and Hospitalization. The patient was hospitalized from an unspecified date for 1 day. Treatment was received for the adverse events. There were many tests done/are being done. The patient has not been tested for COVID-19 since the vaccination. The outcome of events was unknown.

1269527	4/29/2021	NC	60	F	4/7/2021	4/7/2021	multiple pulmonary embolisms/Pulmonary embolism and subsegmental pulmonary embolus; felt sluggish directly; feeling discomfort in my lungs; pain in my lung/chest area; pain in my lung/chest area/right-sided chest pain under the rib; difficult and extremely painful to breathe/significant shortness of breath/shortness of breath due to extreme pain; blood clots; This is a spontaneous report from a contactable consumer (patient) and physician. A 60-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EP7534 and expiration date not provided), via an unspecified route of administration, administered in Arm Left second dose on 07Apr2021 17:00 at single dose for covid-19 immunisation. The patient medical history was not reported. The patient was not pregnant at time of vaccination. The patient's concomitant medications included cetirizine, diphenhydramine, and phenylephrine. The patient historical vaccine includes bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EN6203), right arm first dose on 10Mar2021 for COVID-19 Immunization. On 07Apr2021 21:30, the patient felt sluggish directly after receiving the second dose. The patient began feeling discomfort in my lungs about 5 hours after the dose. The pain in my lung/chest area grew worse throughout the night to the point where it was difficult and extremely painful to breathe. The patient went to urgent care in the morning, and they ran an EKG, urine analysis, and chest X-ray: all with unknown results. They were concerned it could be something worse along with potential pneumonia, so they sent me to the emergency room. In the emergency room, I received a CT scan where they found multiple pulmonary embolisms (1 large one in my right and multiple in my left lung). The patient stated that she had just had my yearly physical the previous week (Apr2021), with no signs of any health issues. With that, the doctors believed my condition to be related to my 2nd dose, so I was admitted to the hospital. I had to stayed for 2 nights. I am now on blood thinners, other meds (pain medications), and require oxygen during sleep (O2 levels drop too low). I have been referred to lung and hematology specialists. Also, reported that patient experiencing significant shortness of breath and right-sided chest pain under the rib. This persisted for some time until she presented to the

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

emergency department found to have segmental and subsegmental pulmonary embolus. Additionally, the patient experienced blood clots, chest pain, and shortness of breath due to extreme pain. Hypercoagulable work-up pending. The patient underwent lab tests and procedures which included COVID-19 virus test (nasal swab) with result of negative. The outcome of the events was recovering.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported events occurred in a plausible temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified.

1272164	4/29/2021	UT	46	M	4/14/2021	4/16/2021	46 year old male with history of depression, polio, HTN/HLD, chronic lung disease 2/2 remote PNA, and cirrhosis suspected 2/2 schistosomiasis, who presents with 1wk of dyspnea, w/ waxing waning subjective fevers. Per ED Note: Endorses chronic fatigue until 4/16 when he received first dose of Covid vaccine (Pfizer). Since then, pt reports persistent dyspnea, worsening fatigue. Reports 2 days of left-sided chest pain w/ periumbilical abd pain and enlarging abdomen. Pt believes these are 2/2 covid vaccination. Chest pain is described as constant generalized discomfort under left breast that worsens with pressure. Also worse with deep inspiration. No radiation or migration since onset. Pt describes abdominal pain as periumbilical tightness, "pain". Describes subjective, unmeasured fevers that "come and go" over last week. When asked to repeat the story of what happened on arrival to the unit, wife speaks for the patient since he is slightly dyspnic. States this morning, went to small clinic, husband had a headache and slight fever. Clinic said to come in to the big hospital. Fever and pain in legs and head, started a few days after he got the covid vaccine. The fever came and went. Didn't measure the fever. Also has some problems with Abdominal pain - doesn't know how to describe it. Feels like stomach ache. Stomach pain is getting better. Has since gone away since arriving to the hospital. He denies any cough, denies chills, denies nausea or vomiting. States he took some medications at home for constipation because he felt like he couldn't go. From the conversation it appears he does not take lactulose for HE, more for constipation. ED workup included an Xray, CT C/A/P with multifocal lung lesions suspicious for multifocal pneumonia. Lactate of 16. Na of 124. Noted to be anemic and thrombocytopenic. UA cloudy, pyuric, w/protien >100. Chest and abdominal pain resolved by the time pt was examined on the floor. Still tachypnic and tachycardic. Stated most bothersome was feeling anxious. Has anxiety at a baseline. Not complaining of any pain at the moment. Cannot describe chest pain in more detail, put his hand over the right side of his chest and presses on it but does not say if it hurt more when he would press on it, does not say if it was reproducible. Not painful when he touches or presses on it now. Per chart, patient recently re-established care after long-time from follow up during pandemic. At visits

						last month c/o gingival bleeding, fatiguem & found to have Hgb drop from 13 in 2018-> 9.7 on 3/2/21. Referred for EGD but cancelled due to anxiety. I am the Infectious Diseases attending asked to see him for septic shock. He developed septic shock and respiratory failure requiring mechanical ventilation and 3 vasopressors. He has evidence of DAH, DIC, acute renal failure, progressive liver failure and he has Klebsiella pneumoniae bacteremia.	
1272096	4/29/2021	CA	56	F	4/8/2021	4/9/2021	Ten hours after I got the shot I got violent chills and fever(100.4), muscle aches all over. My quad muscles are still a little achy and weak. It lasted 36 hours and then I felt my Vestibular Migraines. I was dizzier than usual. Under my left armpit was very painful reaching toward my left breast. The area of the shot was not painful. I also had dizziness chest pains under my right clavicle immediately after I got the shot. The chest pain went away for three days and then it came back. It was like an extreme muscle ache. It was a dull and intermittent pain. I was referred to a Respiratory clinic and I still had a low grade fever. My left arm was stiff two weeks before the shot and three days after the shot my left shoulder was frozen. I had an appointment with my Orthopedist and she confirmed an encapsulated shoulder problem. At present after three weeks my shoulder is still frozen and my armpit is still a little painful. The chest pains are less frequent.
1272011	4/29/2021	KS	50	F	3/22/2021	3/22/2021	Around 1 and a half hour after my 2nd dose of the vaccination, I started feeling chest pain a fast heartbeat. My friend and her husband were about to take me to the emergency room, but I told them if I could just rest first at their house. The chest pain and heartbeat lasted for about 2 hours. I was not able to sleep well that night due to headache, on and off fever, muscle/body aches, feeling nauseated and a general feeling of being unwell. I was absent from work for two days because of these adverse reactions/side effects.

1271389	4/29/2021	FL	31	F	3/14/2021	3/25/2021	Began on 3/26/21 with numbness in face. Woke up on 3/27 with numbness in feet. Spread to my feet and up legs and arms through next couple days. Fatigue increased dramatically, though it was present prior. Dizziness, sharp pains in left ear in skull, nerve issues. The following is a log from when the symptoms became most intense, so significant I have not been able to drive myself and been working from home due to balance issues, no feeling in feet, and neurological symptoms. After different a week and a half,, i sought medical care and began logging daily as follows: Fri 4/9: fatigue was high, neuropathy present. Balance was off. Stabbing sharp pains into the left ear but behind the ear in head. Dizzy spells with static feeling rush in forehead lasting a few seconds and passing. Gate while walking feels awkward and difficult. Think walking after sprinting on a treadmill plus's stiffness Sat 4/10: couldn't eat. General malaise. Fatigue. Neuropathy and balance issues present. Gate slightly improved. Noted increase in joint pain and popping in wrists elbows hips and knees. Needed white noise to cover ear ringing to sleep. Sun 4/11: feeling a bit better. Able to eat. Gastric issues after eating. Slightly more energy but neuropathy and balance was frustrating like superglue on my fingers and areas of my feet with no feeling at all surrounded by pins and needles. Aching in wrists and pain shooting down through to heel of my foot. Ear ringing more noticeable. Two instances of ice pick ear pain. Monday 4/12: neuropathy present, balance improved. No digestive issues. Feeling more stable while walking. Still numb in hands and feet and part of my face but less pronounced. Ear ringing unbearably loud and constant. Tuesday 4/13: slightly less energy but neuropathy still seems improved and not losing balance as much. Ears obnoxious, joints popping and cracking constantly. Pain in wrists and hands. One instance of ice pick ear pain Wednesday: same as Tuesday, but no ear pains. Had to take a nap in the middle of the day due to worn out feeling. Laying in bed felt something in my back snap, then a stabbing pain into my lower right side of my back. Aching like the skin was hurting for hours. Thursday: other symptoms same as Tuesday. Ears ringing crazy loud, stiff in the hips more noticeably. Neuropathy present with dizzy waves/vertigo. Low back skin pain right side continue. Also right hip. Gate while walking is

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

starting to feel like it did before after a few days of improvement. Friday: back still hurting. Neuropathy increased. More numbness than previous few days. Very stiff throughout lower back hips and legs. Low back pain. Gate while walking feels awkward and robotic. Ears ringing. Joints throughout cracking/popping. This is not historically common for me. While washing dishes got shooting pain down my left wrist back of hand almost shooting down the veins to in between my pointer finger and thumb. Painful to touch. Immediate strong increase in the pins and needles in my hand concentrated in finger tips but now radiating up forearm too. .numbness in feet and part of my face. Whole body aching. When trying to sleep kept getting head rush static attributed to Benadryl to sleep and staying up too late. Saturday: very tired. Back hurting in morning. Felt better after getting up. Kept feeling head rush like static in forehead continuing on and off throughout the day into the night with dizziness almost like I might pass out. Nausea and low appetite Fatigue higher than normal. Neuropathy still present. Ears ringing insanely loud and constant. Aching and stiffness in hands wrists and legs and feet in heel/sole. Chest pain in sternum. Had a few months ago almost daily for awhile. Went away til now. Sunday- neuropathy the same. Ears ringing the same. Stiffness throughout. Dizzy spells and static in forehead. Nausea and low appetite. Fatigue. Ice pick ear pain starting in evening a few times throughout the night. Monday. Neuropathy the same. Ears ringing the same. Slightly less pain and popping in joints. Fatigue high. No appetite. Ice pick ear pain starting in morning happening several times. PREDNISONE STARTED WEDNESDAY Wed April 21: feeling about the same. Ringing in ears, neuropathy same, fatigue high. Appetite improved. Ice pick ear pain a couple times. Neuropathy seemed to improve towards the end of the day, when it usually is worsening. Felt nauseas and sick to stomach before bed with digestive issues. Dizzy spells all evening with static feeling. Ears ringing constant. Thursday: neuropathy improved, still present and noticeable but I was able to walk normally and had more feeling than previous. Joints still cracking and popping. Not as nauseas or sick feeling throughout the day. No ear pain. Dizziness occasional, less than day before. Ears ringing constant. Friday: neuropathy still improved but present and noticeable, able to walk more

normally than previous. Joints still the same. Not as nauseas or sick feeling. Chest pains in sternum and stabbing ice pick ear pains on and off all day. Very painful in the ear. Light headed/easily motionsick, but better than Wednesday worse than thursday. Ears ringing constant. Saturday: Neuropathy still improved, joints are stiff but not in pain. Light headed easily, ears ringing constant. This is the worst day for the ice pick ear pain yet. Repetitive ?attacks? concentrated in the morning enough to make me have to drop and hold my head. It was very painful and higher frequency than ever seen previously. Sunday: Feeling sore in my hip joints. Ears ringing constantly. Ice pick ear pain only happened twice. Neuropathy slightly more than day previous but okay and balance still improved. Chest pains in sternum present. Episodes of blurred vision/double vision towards the end of the day.

1267303	4/28/2021	MD	18	F	3/29/2021	4/21/2021	<p>symptom started 4/21, with pain and tightness in the left arm, progressively spreading up the arm over the following 48 hours, and then to the distal right arm, and legs. The leg symptom were present when seen 5 days ago, though were not discussed as Patient wasnt sure if thats what was really starting. This is associated with a feeling of "not being able to feel muc" and "doesn't feel right", as if it "feels foreign... body says this is weird," and feels heavy. Also notes that different extremities feel different - left is worse than right. Seen 5 days ago, and noted to have been advised by hematology to stop eliquis approximately 2 weeks prior to onset of symptom after PE/Renal artery embolism 1/2021. At that visit was referred to ER, where workup for repeat clot was normal (CTA, b/l upper extremities dopplers, head/neck CT, CXR). EKG was notable for Sinus tach and nonspecific T wave abnormalities. Discharged home with close follow up. Since then the intensity of the symptom as worsened and the leg symptoms have gotten more pronounced and consistent with the upper extremities symptom. Today notes new difficulty getting dressed on because clothes were getting stuck/he couldnt pull them down. Also notes when his left arm is touched it causes burning pain that shoots up the arm. Reports headache. 2-4/day, last 30 minutes, 5/10 in severity. Worse with movement of head. Frequent nausea, no emesis. but not specifically associated with headache. No waking from sleep. Since PE, has complains of intermittent left sided squeezing chest pain, which he wonders may be due to his anxiety. Lasts a few minutes Received Pfizer COVID vaccine 3/29, hasnt received 2nd dose yet ROS: general: no fevers or weight loss. CHRONICALLY C/O FATIGUE AND TROUBLE FOCUSING. has had evaluation for executive function difficulty in the past (interdynamics), now purusing evaluation at Neurology and awaiting EEG with this. HEENT: no sore throat. + VISION CHANGES - TROUBLE FOCUSING, but not specifically blurry vision. CV: LEFT SIDED CP, NONSPECIFIC T WAVE CHANGES ON LAST EKG W/SINUS TACH. Pulm: SOB, with walking up and down stairs, since PE. not worsening. No Cough. GI: +NAUSEA, no vomiting, no abdominal pain. No current diarrhea. Neuro: + HEADACHES. + SENSORY CHANGES. + family h/o MS</p>

1266023	4/28/2021	NH		F	3/26/2021		<p>one that was send to the ER with shortness of breath and elevated D-dimer; one that was send to the ER with shortness of breath and elevated D-dimer; This is a spontaneous report from a contactable nurse. This nurse reported for a female patient that she received a dose of BNT162B2 (Pfizer-BioNTech COVID-19 Vaccine; Solution for injection; Lot number: EL9269; Expiry date: 01May21) via an unspecified route of administration on 26Mar2021 as a single dose for COVID-19 immunization. The patients past medical history and concomitant medications were not reported. On an unknown date, the patient experienced Shortness of breath and elevated D-dimer. The clinical outcome for the events was unknown. Caller is an RN (Registered Nurse), caller's title, Infection Preventionist, she is calling from the nursing home (300 bed long term facility) stated that she was trying multiple times today and she needed to speak to someone to report adverse reactions, she had been reporting to the VAERS system since they started giving vaccines in Jan, stated: "I had submitted probably 30 reports at this point of all different various things in any of our patients even if they were in hospice if they had a vaccine and proceeded to pass away, I've done all the reporting. I have a very abnormal large volume of patients that got vaccinated on 16th of Apr, with the first doses of Pfizer (PFIZER-BIONTECH COVID-19 VACCINE) one specific lot number and I have 7 adverse events in one group of patients out of 30. And it is way too complicated to get that information to you guys quickly, so I need to speak to somebody as there is a chance that those could be a significant events and I need to be able to tell somebody what is going on" Verified that caller was trying to get in touch with someone in our safety group to report that, wanted to speak to the live agent. Offered assistance. Caller stated: "I've actually left several messages that have gotten no callbacks, sometimes they don't even go through your phone system, or keep me on hold for 20 -30 minutes and then finally say please leave a message so I've had to do that already couple times" Both she and her colleague were trying to get through and her colleague phone started to ring so she transferred a phone to the caller. When attempted to determine what number they were calling, caller provided #, option #1 (I explained that was a number to FDA/CDC (VAERS)Vaccine</p>

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

Adverse Event Reporting System to report side effects) at this point caller stated that she also called # this morning and left a message as well. At this point attempted to warm transfer the caller to safety. All safety agents were busy (20 calls ahead of us). Due to the long hold time, e-transmitting AE. Caller aware of the option to submit the information online, aware of the fax # as well, wanted to share details to live agent. Caller stated: "because all those reports involving one lot # it is more suspicious than even all the other reports that I've ever done. This is just one whole group and now I have 3 deaths. I have 3 deaths and I have 2 strokes in this group" Caller stated that she will file reports online she just wanted someone to call her back about the side effects and the lot # involved. Stated" I've got this whole group, this whole entire group due to get their second dose on Friday, two days from now, so obviously I am not giving it to any of these people there is a 7 of them out of 33. I have 20 staff that have received it the same day I did not have any side effects in any of the staff but I am definitely little weary at the moment." Offered to forward provided information to safety. Caller provided lot# EL9269, exp. Date 01May21 (stated that it was weird because it was very close to the expiration date). Caller stated: "All those people were dosed on Mar 26th. Caller stated that she was going to give me just basics (in terms of information to start the process) and that she will file a forms online. Caller stated: "That day 31 patients received a vaccine and she had 7 patients worth investigating (caller stated that she had that portion written if there was a way to forward that to us? Explained that there was an option to contact us through our website (website withheld)) but for adverse reports specifically I would refer them to Pfizer safety (website withheld) explained that I also had a fax# but caller declined she already had that information. Verified that she was reporting adverse events [7 patients, gender: 5 females and 2 males; all (ethnicity), (ethnicity)] Caller stated" Three people (patients) were send out and subsequently passed away in the hospital, one (patient) we send with bradycardia, hypotension and she (female) passed away in the ER, critical labs, she didn't even make it one day, we send her out and she passed away in the ER. I have one male (patient) who had acute stroke I don't have all the details because he is still

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

hospitalized in ICU. I have one (patient) who we sent to the ER hypoxic, hypotensive, short of breath, she (female) she ended up passing away in the hospital, her diagnosis there was hypoxia and acute CHF. I have another male (patient) who had an acute CVA we send him to the hospital he had acute CVA, he had a right artery occlusion, he passed away. I had another female (patient) who we sent out with shortness of breath and increased confusion, she wound up in the ER with hypoxia and sepsis and she (female) passed away. I am sure there is more we do not have hospital records we only know what we were told. And then I have two others one that was send to the ER with shortness of breath and elevated D-dimer, she (female) actually returned to us her scans were negative, so she is one of those we are not really 100 % sure, but she did get send out to the ER. And we have another one (female) chest pain, shortness of breath, she was not send out her D-dimer and her studies that we have done here were within normal limits but definitely had some acute shortness of breath and chest pain, we did troponin and bunch of cardiac labs here, she did not go out. So those are the seven that I have at the moment that are concerning." attempted to warm transfer the caller to safety. All safety agents were busy (20 calls ahead of us). Due to the long hold time, e-transmitting AE/PC DSU/PQC: Caller requested callback from safety and product quality group regarding her concern about that particular lot# and reported adverse reactions. F/ u pending.; Sender's Comments: Based on the limited information, a causal relationship between the suspect drug BNT162B2 and the events dyspnea and d dimer increased cannot be ruled out. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate

1266355	4/28/2021	FL	47	F	3/11/2021	3/14/2021	<p>Patient stated she took the vaccine on Thursday 3/11/21 and about 3 days later she started to feel a cramp in both of her legs. On 3/27 patient stated she couldnt move and felt like a tingling sensation on the left arm (felt like ants crawling on body), felt dizzy, headache. She stated she then went to the ER on 4/15/21. CT scan (chest) and ultrasound(legs) was done and she wasnt sure of the results (the ER doctor only informed her that she wouldnt be #7). Then on 4/17 patient state she felt fine and was back to exercising and running. Then on 4/24 she stated she went to the beach to run and felt a sting/cramp on right leg, she looked and noticed a bruise and then as of 4/26 her leg is sore, it's not red, not hot and not hurting, just sore to touch. Bruising is going away but just uncomfortable to touch. Patient states she been feeling a little more fatigued and winded out when doing things now more than before and before taking the vaccine. Been a 1.5years since her last asthma attack. Since a month ago is when she started to feel that she needs to catch her breath more often. Patient stated she saw her PCP on 4/19/21 and she was prescribed another inhaler (can't recall the name) and antibiotic. CT scan was done when she was in the ER because pt had chest pain. No pulmonary embolism indicated on results but she states her scan came back with something on it but she wasnt able to explain what was on there. When she was in the ER the doctor didnt prescribe anything but when she went to see pcp her MD prescribed her an antibiotic (cant recall name, she picked up the rx but hasnt started taking it yet- wasnt home to obtain the name). As of 4/26 her headache, leg cramps have subsided, she just feels very fatigued. She stated that every time she has a headache she takes tylenol. The last time she took tylenol was on Sunday 4/25/21. Advised patient to start taking the antibiotic as prescribed by the pcp and to take the inhaler when she feels winded out. Also advised her that if she feels chest pain or extreme SOB then to either contact her pcp again or urgent care. She has no follow up scheduled with her PCP.</p>

1269148	4/28/2021	NM		F	4/8/2021		<p>ELEVATED D-DIMER; SHORTNESS OF BREATH; HEADACHE; CHEST PAINS; DECREASED APPETITE; FEVER; This spontaneous report received from a physician concerned a 25 year old female. The patient's height, weight and medical history were not reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of administration, dose and batch number were not reported) administered on 07-APR-2021 for prophylactic vaccination. Batch number will be requested via follow up. Concomitant medications included unspecified oral contraceptives. On 08-APR-2021, the subject experienced shortness of breath, headache, chest pains, fever, and decreased appetite. Physician saw the patient on 14-APR-2021 and ordered D-dimer which came back at "0.80" and again on 20-APR-2021 which came back "0.82" (units and normal range unspecified). Physician reported that the patient's platelet count had not been done yet, but the d-dimer was a little elevated and given her chest pains, he wanted to evaluate for a blood clot and possibly order CT (computed tomography) scan of her chest. The physician did mention VAERS report filed case # 446427. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient had not recovered from headache, shortness of breath, and chest pains, and the outcome of decreased appetite, fever, and elevated d-dimer was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: This case concerns a 25-year-old female who had elevated d-dimer test results 7 days after receiving the Janssen Covid-19 vaccine. Full medical history was not provided. Concomitant medications included unspecified oral contraceptives. The day after vaccination, the patient experienced shortness of breath, headache, chest pains, fever and decreased appetite. Seven days post-vaccination, she went to see her physician who ordered a d-dimer test which came back elevated at 0.80 (normal range not reported). Repeat d-dimer test 6 days later came back at 0.82. A platelet level had not been checked, nor other diagnostic tests to evaluate for possible thrombosis. As of the the time of this report, the outcome was unknown. Based on the available information, the relationship with Janssen Covid-19 vaccine is considered unclassifiable. Further information (e.g. full medical history, social history, family</p>
