1268109	4/28/2021	CA	43	M	3/26/2021	3/30/2021	<p>Pt received Pfizer COVID vaccine on 3/26 at facility. Pt presented to the ED on 3/30 for evaluation of chest pain at around 0722 on 3/30. Per ED provider note, "This patient is a 43 y.o. male who presents to the ED for evaluation of chest pain. The patient drove here two days ago and was feeling well when he went to sleep. He was awoken from sleep early yesterday morning with "intense" left sided chest pain with radiation and tingling sensation down his left arm. The patient says that his pain has since been fairly constant, waxing and waning in intensity. He says that his chest pain is still currently present, mostly localized in his left shoulder, but improved when compared to the pain that woke him up again this morning around 03:00. No reported vomiting, abdominal pain, fevers, chills, cough, or shortness of breath. Patient notes that he received the second dose of the COVID-19 vaccine 4 days ago. Patient reports family history of cardiac disease in his father. He denies any personal history of cardiac disease, and says that his last cardiac work up was a couple years ago for PVCs. The patient is not a smoker and denies any history of diabetes, hypertension, or high cholesterol. There are no other complaints. There are no other exacerbating or alleviating factors. There are no other reported associated signs or symptoms" Pt was given nitroglycerin ointment and aspirin chewable 324mg in the ED. " In addition, "This is a 43-year-old male presenting to the emergency department with just over 24 hours of left-sided chest pain with radiation into the left shoulder and down the left arm. Symptoms were more severe prior to the patient's arrival to the hospital. He was given nitroglycerin and aspirin upon arrival here. EKG shows subtle ST abnormality in the inferior lateral leads. Troponin is elevated at 11. Differential includes non ST-elevation myocardial infarction, myopericarditis. Patient will be admitted to telemetry. He will undergo a cardiac catheterization today." Pt was admitted, and per hospitalist note on 4/1, "Patient presented hospital with chest pain and EKG changes-there was initial concern for NSTEMI. Had cardiac catheterization with clean coronaries. Then thought to have pericarditis. Patient had trivial pericardial effusion on echocardiogram. Had MRI that demonstrated myocarditis as well. Patient improved on colchicine and NSAID therapy. Discussion had with cardiology will continue this and to be tapered in</p>

the office setting. Will continue NSAIDs for approximately 2 weeks then begin tapering. Will likely need colchicine for approximately 3 months. Patient was placed on beta-blocker to help with symptomatic treatment and help alleviate pain. Patient was started on metoprolol, was cautioned side-effects of hypotension, bradycardia, exercise intolerance. Patient should monitor heart rate and blood pressure daily. Hold if heart rate <50 or blood pressure less than 100 systolic and notify provider. Patient was advised he may follow-up with Dr. Caution GI upset, nausea vomiting diarrhea. If diarrhea with colchicine would recommend back down to daily from b.i.d. treatment. Patient was ambulatory and functional without significant symptoms, vital signs within tolerable limits, and agreeable to discharge plan. Patient ultimately discharged in stable condition. All questions answered to apparent satisfaction. Patient cautioned side effects of medications. Patient was instructed if reoccurrence or any concerning symptoms to contact provider or present to nearest emergency department based on acuity. Patient and family voiced understanding of recommendations and in agreement with discharge plan.~~

1268870	4/28/2021	UT	25	M	4/14/2021	4/17/2021	On Wednesday April 14th I got my second vaccination shot. The following day I had a 103 F fever, body aches, chills, migraine, sore muscles, couldn't walk, excessive thirst. Those effects lasted all day and I felt better on Friday. Saturday night chest pain started along with sore arm getting worse. I took ibuprofen and melatonin to sleep. Woke up Sunday morning and pain came back and gradually got worse until I went into the ER around 9 am. They gave me Morphine to put the chest pain at bay. Then transferred me by ambulance to a different hospital with a cardiology department. They treated me as if it was Myocarditis and also got an x-ray of my chest. The next morning I had an MRI and that is what confirmed it to be Myocarditis. I was then discharged with lots of medications to keep the inflammation down.

1269271	4/28/2021	PA	55	F	1/16/2021	1/16/2021	Arterial regurgitation; Cardiac changes/EKG changes were observed in heart; Sweating profusely; Hands went cold; Felt dizzy; Chest pain; blood pressure elevated 180s over 110s/hypertensive; doesn't feel well; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of AORTIC VALVE INCOMPETENCE (Arterial regurgitation) in a 55-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 028L20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 16-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 16-Jan-2021, the patient experienced AORTIC VALVE INCOMPETENCE (Arterial regurgitation) (seriousness criterion medically significant), CARDIAC DISORDER (Cardiac changes/EKG changes were observed in heart) and VACCINATION COMPLICATION (doesn't feel well). 16-Jan-2021, the patient experienced HYPERHIDROSIS (Sweating profusely), PERIPHERAL COLDNESS (Hands went cold), DIZZINESS (Felt dizzy), CHEST PAIN (Chest pain) and HYPERTENSION (blood pressure elevated 180s over 110s/hypertensive). At the time of the report, AORTIC VALVE INCOMPETENCE (Arterial regurgitation) and CARDIAC DISORDER (Cardiac changes/EKG changes were observed in heart) had not resolved and HYPERHIDROSIS (Sweating profusely), PERIPHERAL COLDNESS (Hands went cold), DIZZINESS (Felt dizzy), CHEST PAIN (Chest pain), HYPERTENSION (blood pressure elevated 180s over 110s/hypertensive) and VACCINATION COMPLICATION (doesn't feel well) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 16-Jan-2021, Blood pressure measurement: 180/110 (High) 180/110. On 16-Jan-2021, Electrocardiogram: abnormal (abnormal) EKG changes were observed in the heart. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Concomitant product use was not provided. The patient went to the emergency room due to sweating profusely, blood pressure elevated 180s over 110s/hypertensive, hands went cold, felt dizzy, and chest pain. She reported she will have to follow-up

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1263154	4/27/2021	MA	40	M	4/12/2021	4/12/2021	<p>with a cardiologist because electrocardiogram (EKG) changed were observed in her heart. The patient was not receiving treatment at the time of the initial report. The patient called back on 13 Apr 2021 and noted continual, ongoing cardiac changes and "arterial regurgitation." Most recent FOLLOW-UP information incorporated above includes: On 13-Apr-2021: Patient reported continual, ongoing cardiac changes and arterial regurgitation. Outcomes of initially reported events changed from not resolved to unknown. Narrative updated.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. However, Very limited information regarding these events has been provided at this time. Further information has been requested.</p> <p>The evening of the vaccination I began experiencing tingling at the site of the shot, then this extended through the night to chest pains and tightness in the chest. That continued through the night and into the following day. The following day and lasting until present (4/27/2021) I have continued to experience tingling at night, extending to my arm and fingers, random very sharp pains in my chest, and some feeling of strong heart throbbing. This subsides during the day-time (when I'm upright versus lying down) but all of these symptoms return during the evening. These are all things I never experienced prior to the vaccine. Also, I have tested regularly for COVID-19 since my company conducts covid-19 testing and I have not been infected with COVID-19 at any point during the past year. The continuation of these symptoms is concerning. There have been at least two instances where the sharp pains in my chest were much more intense than the other chest pains I have felt since the vaccine.</p>

1263085	4/27/2021	TX	34	M	3/29/2021	4/14/2021	SEEN ON 4/16/2021 WITH PROVIDER WITH THE FOLLOWING COMPLAINTS: Pt here for left sided low back pain; he gets it in different spots. Sharp - left mid back , left low back, left hip and left thigh. Does not radiate to foot. Does not cause paraesthesias, numbness, weakness or tingling. No problems urinating, dysuria. The pain started after janssen vaccine along with low grade fever; lasted for 2 days then went away for over 1 week. In fact he drove and hiked 10 miles as well w/o any recurrence of pain. He notes pain restarted 2 days ago. Massage and heat help. Exercising does not worsen. Pain for past 2 days is at a 2 level. No hx of back pain or arthritis. He does have hx of renal stones and cystitis but was cleared last year by his urologist. He has not drunk enough water today and would like to do his cbc on 4/22. He denies any heaches, vision changes, abd pain or leg pain. Most of the time his pain is low back area. It was more intense in the 2 days after vaccine. No hx of blood clots. No chest pain or SOB. No injuries to back. Pain is the same as post vaccine though milder. He denies straining his muscle. No easy bruising or bleeding. kidney stones feel much differently.
1263450	4/27/2021	MO	17	F	4/17/2021	4/20/2021	ON 4/21/21, SHE BEGAN TO EXPERIENCE SHORTNESS OF BREATH, COUGHING, CONGESTION, SEVERE BACK ACHE, WEAKNESS, FATIGUE, FEVER, CHILLS, VOMITING, DIARRHEA. I TOOK HER TO THE HOSPITAL WHERE WE WERE TOLD THAT IT WAS DUE TO VACCINE AND SHE WAS SENT HOME WITHOUT MEDS. SHE BECAME WORSE AND WORSE AND DEVELOPED HEART ATTACK SYMPTOMS: CHEST PAIN, WHEEZING, TIGHTNESS AND HEAVINESS IN CHEST, INTENSE BACK PAIN. WE RETURNED TO THE ER AND SHE WAS DIAGNOSED WITH PERICARDITIS. WE WERE ALSO TOLD THAT HER HEART WAS SLIGHTLY ENLARGED.

The patient's height, and weight were not reported. The patient's pre-existing medical conditions included the patient had no known allergies. The patient was not pregnant at the time of report. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 202A21A, expiry: 23-JUN-2021) dose was not reported, administered on 09-APR-2021 in left arm for prophylactic vaccination. No concomitant medications were reported. On 09-APR-2021 (following vaccination), the patient's area around the injection site was swollen, a large nodule formed, it was red, sore and painful. These local symptoms lasted for a week then disappeared. The patient felt very fatigued, and reports sleeping 14 hours that night. On 10-APR-2021 the patient experienced headache and felt like his head was in a vise around each cheekbone. The fatigue and headache was gone on 11-APR-2021. On 19-APR-2021 the patient had vomiting and diarrhea for about 16 hours. The local symptoms swelling, redness, pain at injection site reappeared. On 19-APR-2021 the patient was very fatigued and took Pedialyte (calcium chloride/glucose/magnesium chloride/potassium chloride/sodium chloride/sodium lactate) to get rehydrated. On 21-APR-2021, the patient visited the emergency room as new symptoms appeared stomach pain, chest pain, shortness of breath and dizziness and her blood work and electrocardiogram(EKG) was done. The health care professional(HCPs) ruled out heart attack and told patient nothing in the symptoms or blood work warranted a scan for blood clots. The patient received anti-nausea intravenous (IV) medication, diagnosis of stomach flu and was sent home. The patient reports that her blood pressure readings were 144/104 and a pulse was 119. The emergency room health care professional instructed the patient to follow up with doctor

shoulder back pain. This event(s) is considered unassessable. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the event(s).
20210436128 -covid-19 vaccine ad26.cov2.s -weakness, fever 102- 103 F, nausea, slight headache, allergic reaction. This event(s) is labeled per Agency and is therefore considered potentially related.

INCREASED HEART RATE; SEVERE CHEST PAIN;
This spontaneous report received from a patient via a company representative concerned a male of unspecified age. The patient's weight, height, and medical history were not reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: Unknown) frequency 1 total, dose, start therapy date were not reported for prophylactic vaccination. The batch number was not reported. The Company is unable to perform follow-up to request batch/lot numbers. No concomitant medications were reported. On an unspecified date, about 7 hours after receiving the Johnson & Johnson vaccine shot, patient's heart rate increased rapidly (coded as increased heart rate) and he had severe chest pain, resulting in hospitalization(date unspecified). Patient's discharge papers showed that doctors ran tests but couldn't identify a cause other than the vaccine. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of the increased heart rate and severe chest pain was not reported. This report was serious (Hospitalization Caused / Prolonged).; Sender's Comments: V0.20210444419-covid-19 vaccine ad26.cov2.s-increased heart rate,chest pain. This event(s) is considered unassessable. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the event(s). Workflow Notes: V0: completed. Case promoted.

1263828	4/27/2021	NM	54	M	4/8/2021	4/10/2021	I was admitted to the ER on 4/12/21 with dizziness, lightheadedness, vertigo, some auditory issues, shortness of breath, swelling/puffiness of legs and feet, unusual coldness in extremities, and some minor pain in chest. CT-Scan revealed DVT in left leg and PEs in both lungs. Was given two shots of heparin over a 24-hour period and then Xarelto 15mg (oral) the following day.

<u>VAERS_ID</u>	<u>RECVDATE</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1264426	4/27/2021	AZ	78	F	4/1/2021		BAD CHEST PAINS, PAIN IN CENTER OF CHEST; FEELING OF HEART NOT BEATING RIGHT; BLOOD PRESSURE OF 212; CELLULITIS IN HER WRIST; This spontaneous report received from a patient concerned a 78 year old female patient. The patient's height was 166 inches and weight was 138 pounds. The patient's concurrent conditions included white coat hypertension, asthma, severe allergy to codeine, abstain from alcohol, and non-smoker. The patient was not pregnant. The patient received vaccination with covid-19 vaccine ad26.cov2. s (suspension for injection, intramuscular, batch number: 1805020, and expiry: UNKNOWN) dose was not reported, administered on 02-APR-2021 09:00 in left arm as prophylactic vaccination. Concomitant medications included estradiol. The patient reported that about 15-20 minutes post-vaccination on 02-APR-2021 as she was waiting in waiting area of vaccination clinic, she started to get bad chest pain which was in the center of her chest. She experienced heavy pressure in her chest. No arm pain or sensation was reported other than her chest. The patient further explained that she could feel that her heart 'wasn't beating right' and reported as 'heart feeling wonky'. The patient felt the top of her heart beating faster than the bottom. The vaccination paramedic took her blood pressure which was 212 (patient did not have any other information on her blood pressure). The paramedics called ambulance and after a 15 minute drive patient arrived at emergency room at 9.30. The patient had an echocardiogram or 'an ultrasound' of her heart and was told that it was not functioning properly that her ventricle was functioning at 40% of normal. The patient was put on nitroglycerin and heparin drip. Blood test was also done which showed troponin levels at 113 or 116, 'somewhere in there'. The patient was told that 'some type of cardiac event had occurred'. The patient's tests were reviewed same night and patient spent the night in emergency room because there were no beds. On 03-APR-2021, the patient was transferred to a hospital where she was put on nitroglycerin and heparin drip. The patient was moved again to another hospital on night of 04-APR-2021. The patient had angiogram and CT of vein and arteries. No clot was found by that time. The patient was discharged on 06-APR-2021. The patient saw a cardiologist on 15-APR-2021 who told patient that 'he thought she had

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

some kind of clot that dissolved in the hospital'. Since patient has been home, she experienced pain and discomfort in arm and wrist with cellulitis in her wrist. The patient was taking cephalexin 500 mg three times a day for 10 days. The patient said it was due to angiogram she had because the angiogram team had hard time with her angiogram and had to go in twice. The patient had been taking percocet 5 mg tablet as needed for pain. The patient attempted to report these events online and left a message for someone to call her back but email did not work as she was unable to send. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of bad chest pains, pain in center of chest, feeling of heart not beating right and blood pressure of 212, and cellulitis in her wrist was not reported. This report was serious (Hospitalization Caused / Prolonged, and Other Medically Important Condition).; Sender's Comments: V0: This 78-year-old white (non-Hispanic/Latino) female patient was hospitalized for chest pain, palpitations, and blood pressure of 212 within the hour of receiving COVID-19 VACCINE AD26.COVID.S for the prevention of symptomatic SARS-CoV-2 virus infection. Concurrent illness included white coat hypertension, asthma, severe allergy to codeine; denies smoking and have abstained from alcohol. The patient complained of "bad chest pain" described as heavy pressure on the chest and that she could feel her "heart was not beating right/heart feeling wonky/top of her heart beating faster than the bottom". Blood pressure was 212 when it was checked, the patient was transported to the emergency room where echocardiogram showed that her ventricle was functioning at 40% of normal; Troponin was 113 (or 116). The patient was started on nitroglycerin and heparin drip. CT Angiogram of veins and arteries done 2 days after the vaccination showed no clot; by the attending cardiologist thought that some kind of clot might have been dissolved. Due to difficulty of doing the angiogram, the patient had cellulitis in her wrist with pain and discomfort in arm and wrist; the patient was taking cephalexin and percocet for the cellulitis and pain. No other details reported. The short latency and the advanced age confounded the event. The information available precludes a complete and meaningful assessment. However, considering the temporal relationship and recently evolving theories in the

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							literature about COVID infections and vaccinations, potential vaccine contribution cannot be excluded. Additional information was requested.
1264347	4/27/2021	CA	35	M	4/8/2021	4/12/2021	4 days after vaccination, patient presented with dyspnea and chest pain, was found to have bilateral pulmonary emboli. Was admitted the following day after re-presenting with worsening symptoms and hypoxemic respiratory failure. He was hospitalized one day and then discharged.
1264218	4/27/2021	VA	64	M	4/27/2021	4/27/2021	PATIENT WAS GIVEN THE JANSSEN COVID VACCINE. ABOUT 5-10 MINS LATER, PATIENT REPORTED HAVING SOME DIZZINESS WITH SOME CHEST PAIN. BENADRYL WAS PROMPTLY GIVEN @1202PM. THEN AT 1209PM, PATIENT BP WAS TAKING, IT WAS HIGH AT 160s/90s. PATIENT STATED THAT HE DOES HAVE HBP IN WHICH HE DOES TAKE MEDICINE FOR. HE ALSO STATED THAT, AT THAT PRESSURE, IT WAS NORMAL FOR HIM. PATIENT WAS MONITORED TILL AROUND 1245PM, HE STATED THAT HE WAS FEELING BETTER AND HIS WIFE HAS TAKEN HIM HOME. A FOLLOW UP PHONE CALL WAS CALLED AROUND 105PM. AT THAT TIME PATIENT WAS A HOME AND SAID THAT HIS SYMPTOMS HAS SUBSIDE BUT JUST FEELS SLEEPNESS FROM THE BENADRYL.
1264165	4/27/2021	MI	53	F	4/22/2021	4/22/2021	Patient developed nausea/vomited during 15 minute observation period, chest pain worsened and patient was taken by EMS to nearby hospital for evaluation due to recent history of chest pain prior to vaccine and 2 months prior. Diagnosed with MI when she arrived at the outside hospital.

1264528	4/27/2021	OR	67	F	3/2/2021	3/19/2021	My mom was very ill with fever like symptoms following her first vaccination on January 26th. The symptoms were even worse after her second vaccination March 2nd and included muscle cramping in her legs. Once she was recovered she only had a persistent cough which she attributed to allergies as the pollen count had been high. In the early morning hours of March 19th she was having difficulty breathing and chest pains. She was rushed to the emergency room where she subsequently died of cardio pulmonary embolism which the coroner indicated began within three weeks of her death.

1262159	4/27/2021	CA	32	F	4/27/2021	4/27/2021	<p>Client received her first Pfizer dose of 0.3mL in left deltoid on 04/27/21 at 09:32am with lot number EW0179 expiring on 08/31/2021. Client who is 32-year-old female with no race or ethnicity was disclosed, was brought to EMT station by ancillary staff after complaining of tingling in her toes. Client remained alert and tracking with her eyes and appeared in no apparent distress. Client had a chief complaint of tingling in her toes bilaterally at 10:01am on 04/27/2021. Client stated that she completed her 15-minute observation and was walking to her car, when she noticed tingling in her toes bilaterally and returned to the site/EMT station. toes that was painless and localized. Client's airway, breathing and circulation were intact. Client's initial set of vitals was blood pressure 132/84, pulse 80, alert and oriented to person, place, event and time, respiration 16, eyes equal and reactive to light and lung sounds clear bilaterally. EMT was unable to obtain an SPO2 due to client's acrylic fingernails. Client noted that she had spoken to her doctor recently and her doctor stated to her that she had "poor circulation," but did not specify any diagnosis. Client also stated that she tested positive for Covid in early January and has a history of seasonal allergies. No other pertinent medical history was noted or disclosed. Assessment revealed no swelling, pain, hives, shortness of breath, chest pain, discoloration, or other signs of anaphylaxis. Client consented to staying an additional 30 minutes for observation and vitals were monitored every 15 minutes due to the stability of the client and no signs or symptoms of allergic reaction. Vital signs at 1001 were blood pressure of 132/84, pulse of 80 and respiratory rate of 16 breaths per minute. Vital signs at 1016 were blood pressure of 128/80, pulse of 76 and respiratory rate of 16 breaths per minute. Client was provided with fact sheet and areas of interest were highlighted for convince. After approximately 15 minutes, client stated that her numbness had "gone away" and laughed stating "it's probably because I'm not walking." At the completion of her additional 30-minute observation, client remained stable and was instructed to follow up with her primary care doctor at the soonest possibility. Vital signs at 1031 were blood pressure of 128/80, pulse of 76 and respiratory rate of 16 breaths per minute. Client was also instructed to seek medical care or dial 911 if a severe reaction occurred in the future. Situation did not warrant</p>

1261491	4/27/2021	OH		M	3/20/2021	2/21/2021	<p>shortness of breath; chest pain; low humming in the left ear; abdominal fullness; headache; horizontal pain across back below the shoulder blades; pain in the left arm; This spontaneous case was reported by a patient and describes the occurrence of DYSPNOEA (shortness of breath), CHEST PAIN (chest pain), TINNITUS (low humming in the left ear), GASTROINTESTINAL DISORDER (abdominal fullness) and HEADACHE (headache) in a 68-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 077M20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included No adverse event. On 20-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 21-Feb-2021, the patient experienced BACK PAIN (horizontal pain across back below the shoulder blades) and PAIN IN EXTREMITY (pain in the left arm). On an unknown date, the patient experienced DYSPNOEA (shortness of breath) (seriousness criterion medically significant), CHEST PAIN (chest pain) (seriousness criterion medically significant), TINNITUS (low humming in the left ear) (seriousness criterion medically significant), GASTROINTESTINAL DISORDER (abdominal fullness) (seriousness criterion medically significant) and HEADACHE (headache) (seriousness criterion medically significant). On 24-Feb-2021, BACK PAIN (horizontal pain across back below the shoulder blades) had resolved. At the time of the report, DYSPNOEA (shortness of breath) and PAIN IN EXTREMITY (pain in the left arm) had resolved and CHEST PAIN (chest pain), TINNITUS (low humming in the left ear), GASTROINTESTINAL DISORDER (abdominal fullness) and HEADACHE (headache) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. No treatment is provided. No Concomitant list is provided. This case was linked to MOD-2021-080428, MOD-2021-080027 (E2B Linked Report). Reporter did not allow further contact; Sender's Comments: MOD-2021-080428:case for second dose MOD-2021-080027:case for wife</p>

1261825	4/27/2021	CO	19	F	4/8/2021	4/1/2021	Experienced life-threatening blood clots in both lungs (bilateral pulmonary embolism); chills; flu-like symptoms; difficulty breathing; chest pain; nerve pain in neck; severe rib pain; spitting up blood constantly; severe aches and pains all over my body; This is a spontaneous report from a contactable consumer. A 19-year-old non-pregnant female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in Arm Left on 08Apr2021 15:45 (Batch/Lot Number: ER8737) (at age of 19-year-old) as single dose for COVID-19 immunisation. Medical history included Polycystic Ovarian Syndrome, and eczema. Concomitant medications included ethinylestradiol, ferrous fumarate, norethisterone acetate (BLISOVI FE 1/20) and hydroxyzine, both taken for an unspecified indication, start and stop date were not reported. There was no other vaccine in four weeks. The patient previously took propylene glycol, scopolamine and experienced drug allergy. The patient previously took the first dose of BNT162B2, administered in Arm Left on 16Mar2021 12:00 PM (at age of 19-year-old) (Lot number: EN6207) for COVID-19 immunisation. It was reported on 09Apr2021 12:00, the patient experienced chills and flu-like symptoms that developed into difficulty breathing/chest pain. Nerve pain in neck, severe rib pain, and spitting up blood constantly. The patient started spitting up blood about two days after the vaccine. The patient experienced severe pain and difficulty breathing on 12Apr2021. The patient received help from urgent care on 14Apr2021. On 14Apr2021, the patient was directed to receive a CT scan which revealed severe blood clotting in lungs. Rushed to ER where the patient was then admitted to the hospital overnight for observation and to receive blood thinners and pain medication. In the week since leaving the hospital the patient has experienced severe aches and pains all over her body and have continued to spit up blood. The events were reported resulted in Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care, Hospitalization, Life threatening illness (immediate risk of death from the event).The patient was hospitalized for the events for 2 days. Events treatment included: O2, Blood Thinners, Oxycodone, and Morphine. No COVID prior vaccination.

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

COVID tested post vaccination on 14Apr2021, Nasal Swab, COVID-19 RNA - SARS Cov-2 test result was Negative . The outcome of events were recovering.

1261746	4/27/2021	MN	45	M	4/8/2021	4/8/2021	<p>Symptoms consistent with myocarditis; EKG showed very subtle diffuse ST elevations; chest pain; dyspnea; Troponin trended to 19; This is a spontaneous report from a contactable physician. A 45-year-old male patient received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), via an unspecified route of administration on 08Apr2021 (Batch/Lot number and Expiration date were not reported) as a single dose for COVID-19 immunization. Relevant medical history included chronic back pain, degenerative disc disease, and Clostridium difficile (C. Diff) colitis; the patient had no risk factors for cardiac disease other than obesity; all from an unknown date and unknown if ongoing. The patient's concomitant medications were not reported. The patient previously took cyclobenzaprine and pregabalin (LYRICA) and experienced allergies. It was unknown if the patient had other vaccine in four weeks. The patient had no COVID-19 prior vaccination. On 08Apr2021, 8 hours after the 2nd Pfizer vaccine was received, the patient developed chest pain with dyspnea. It was also reported that on 08Apr2021, troponin trended to 19; electrocardiogram (EKG) showed very subtle diffuse ST elevations; and the symptoms were consistent with myocarditis. All the adverse events (AE) resulted in a doctor or other healthcare professional office/clinic visit; an emergency room/department or urgent care; and hospitalization on an unspecified date for 3 days. The patient underwent lab tests and procedures, which included other/Xpert Xpress SARS-CoV-at assay: negative on 10Apr2021 (post vaccination). Therapeutic measures were taken as a result of all the events, which included colchicine and ibuprofen. The patient was recovering from all the events. Information on the batch/lot number has been requested.; Sender's Comments: Information provided was so limited to prevent a meaningful medical assessment. Other than a temporal association, there was no evidence or argument suggesting a causal relationship for BNT162B2 in the reported events, serious due to hospitalization. Otherwise, this patient did not show risk factors for cardiac disease, except for obesity. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. 1258182	4/26/2021	NC	39	F	4/23/2021	4/23/2021	At approximately 8:30 AM patient received 2nd dose of Pfizer vaccine in the right arm at the Public Health Center's drive through vaccine clinic. She was accompanied by her husband who was driving her vehicle. At 8:34 AM she notified staff in observation parking area that she felt dizzy, chest pain, and reported wheezing. Two RN's responded at 8:34 AM to observation parking area with emergency kit. Upon arrival, patient verbalized again that she felt dizzy, chest pain and tightness now, no audible wheezing heard, patient's skin was pale, and her respiratory rate was high. Advised patient to take slow deep breaths and to try to relax and remain calm. No improvement. At 8:36 AM called 911 for the patient to be evaluated. While one RN was on the phone with 911 operator, patient reports to the second RN throat pain/ tingling, difficulty swallowing, a feeling of a "lump in her throat", continued chest pain and tightness, and states that she feels she cannot breathe in or out well. Per standing order Epinephrine 0.3 mg administered in the right thigh IM. Both RN's remained on scene. No improvement, and patient continued to state it was getting harder to breathe, and that her throat was tingling and she could hardly swallow. At 8:44 AM 0.3 mg Epinephrine administered in the left thigh IM per standing order. At 8:50 AM EMS arrived. Patient had improvement. Vital signs stable upon arrival per EMS. Breathing difficulty improved upon EMS arrival. No further difficulty swallowing reported. Chest pain reported to be improved as well. 8:55 AM EMS transported patient to local hospital. Attempted to contact the patient on 04-26-2021 to determine outcome of event. Phone went to voicemail. Voice message left.
1258085	4/26/2021	VA	22	M	4/23/2021	4/25/2021	patient admitted for chest pain and code MI. elevated troponin with normal coronary, 0.5-1 mm ST elevation in inferior leads and V5 when troponin was positive at 0.5. MD stated patient is diagnosed with myocarditis.
1257818	4/26/2021	MI	26	F	4/23/2021	4/23/2021	Left arm numbness and pain post injection, post 2nd Pfizer injection. Felt very tired and fatigue. No chest pain or SOB or cough or rash or edema. Was given Loratadine 10 mg x 1 by another health-care provider at the clinic. Felt Fine Saturday April 24/2021. On Sunday April 25/2021, really tired and fatigue still. Did report a fever of 102 F on Sunday evening.

1258838	4/26/2021	NY	54	F	4/23/2021	4/23/2021	After receiving dose #2 of Moderna vaccine, patient had proceeded to waiting area for 15 minute observation. After approximately 5 minutes her brother-in-law approached staff asking for a nurse to check on patient. Patient walked on her own to triage area and laid on a cot. She c/o chest pain and heaviness, feeling faint, headache all over her head, shoulder tightness, dry mouth, and was visibly shaking. Vital signs were taken every 5 minutes while awaiting EMS. BP range: systolic 172-190, diastolic 80-94; Pulse 96-100; Respirations 24 per minute. EMS arrive and immediately did an EKG with was within normal limits. Patient was transported to hospital. Upon arrival at hospital patient c/o right sided headache, reported weakness on left side and slurred speech. CT was done and the decision was made to transport her to another healthcare facility. She was give TPA enroute. Patient was admitted. Healthcare facility contacted patient on 4/26/21 and patient reports that she was still in hospital but was expecting to be discharged that day. She stated that she was started on Plavix and aspirin and will be following up with her neurologist as she has had TIAs in the past. Patient reported feeling back to normal.
1257948	4/26/2021	MD	41	F	1/25/2021	2/17/2021	Patient woke up with jaw pain and left arm pain. When this didn't subside, she went to the ER and was found to have an NSTEMI. cath showed no abnormalities echo showed inferior/infeobasal hypkinesis differential: takotsubo cariomypopathy, viral myocarditis, vaccine reaction Patient wore a heart monitor for a week which showed no abnormalities. Since this time, she has had occasional chest pains, squeezing sensations and pressure. A return visit to the ER because of continued chest pains showed a normal EKG and negative troponin. She is scheduled for a cardiac MRI tomorrow on 4/27/21. She is currently taking 10mg Amlodipine, 25mg metoprolol, a statin and a baby aspirin. The amlodipine seems to have done the most with respect to helping with her symptoms. She does not smoke. 1 glass of wine per week. She is not overweight. She has low cholesterol and low BP prior to this. Only other medical condition prior to this was occasional migraines (2 per year).

1260626	4/26/2021		34	F	4/15/2021	4/16/2021	I am pregnant, due on May 20 and had the 2nd shot April 15. On the night of April 15, I experienced a slight fever of 100.5, chills, fatigue and dizziness all managed with Tylenol. On April 16 during the day I felt tired with a sore arm. Around 7 pm on April 16th I started to experience severe chest pain, it felt like heartburn/GERD but it was very very painful (8/10) and wasn't going away with tums or pepcid after about 3 hours. My doctor advised me to go to L&D at the hospital. They checked the baby who was fine and did an ecg also fine. They gave me lidocaine and milk of magnesia although by this time, around 7 hours after it started, it began to get better on its own anyway.
1260537	4/26/2021	MD	63	M	4/24/2021	4/26/2021	Patient (per family member) received 1st dose of Pfizer COVID vaccine on 4/24/2021. On 4/26/2021 at 6 AM patient presented to hospital with chest pain for 2 hours. EKG showed inferior ST segment elevation myocardial infarction (a "heart attack") and the patient was brought emergently for cardiac catheterization. Catheterization showed an occluded right coronary artery, and angioplasty/stenting was performed. Following brief restoration of blood flow to the heart, the artery re-occluded and the patient arrested. After 90 minutes of CPR, the patient expired.

1260530	4/26/2021	OH	49	F	4/6/2021	4/6/2021	<p>The adverse reactions of light headedness, throat irritation, heaviness in my chest and difficulty inhaling began about 20 min after my injection, It lasted 5 minutes. About 30 min afterwards the 2nd wave of reaction came on, with the same symptoms but was even harder to inhale and lasted twice as long. I took a combination of benadryl, motrin and pepcid which alleviated the worst of the symptoms after about an hour. To this day, I still cannot take a deep breath in. About 72 hours after the vaccine I began to have diarrhea (and still have it 20 days later), lethargy, nausea and shortness of breath. The next day I had a little more energy, but still had continued shortness of breath. My vision had become less clear and my thought process a bit fuzzy. This is still happening today. Seven days after the vaccine, I suddenly became extremely light headed just simply walking. To the extent that I needed to sit or lay down before I began to pass out. After the light headedness came on heavily, I also noticed a very heavy weight on my upper chest and found it quite difficult to inhale. These moments would come and go throughout the day. Regardless of whether I was just sitting and relaxing or walking around. These symptoms would last anywhere from a couple minutes to a couple of hours. I found it very hard to catch my breath and could feel my heart flushing often. Additionally I would wake in the middle of the night feeling that I needed to gasp for air. I sought medical assistance from a clinic, an ER and even my allergist and I am scheduled to see my family physician later this week. I am not an anxious person, but have experienced many episodes in the last 20 days that have truly made me feel that I was going to die (no exaggeration!) due to the inability to breathe or that I may have been having a heart attack. I began to have chest pain that would travel from the center of my chest to my left shoulder. The pain also would move to my right lung area. During this I also had heaviness in my chest and felt I could not breathe in or out easily. I am still very light headed and have difficulty walking very far without taking a break because I feel I cannot catch my breath. I still have all of the same symptoms that I experienced 20 minutes after my vaccine. These symptoms have varied in intensity. I have often commented to my family that I feel the symptoms of the chest heaviness and heart flushing seem to come in waves. I am a health conscious</p>

1259694	4/26/2021	WA	69	F	2/16/2021	3/1/2021	<p>Patient is a 69-year-old woman with newly diagnosed pericarditis in March 2021, hypertension, hyperlipidemia, and hypothyroidism, who presented to the Emergency Department (ED) with progressively worsening chest pain, dyspnea, and fatigue. Patient was in her usual state of health until 3/1/2021, when she developed sudden-onset pain "across the entire chest". She shares that her symptoms "came out of the blue", as "suddenly one day, everything just hurt". She saw her primary care physician, who initially felt her symptoms were due to acid reflux. As such, the patient started "eating antacids and omeprazole like candy". However, her chest pain persisted, prompting her to follow up with her primary care physician on 3/16/2021. At that time, ECG reportedly showed normal sinus rhythm and no acute changes. CT of the chest, abdomen, and pelvis with contrast showed abnormal enhancement and thickening of the pericardium with trace pericardial fluid, consistent with pericarditis. The patient was therefore started on colchicine and an ibuprofen taper. On 4/5/2021, Patient sent a myVM portal message to her primary care physician and cardiologist, expressing her belief that her chest pain has remained unchanged over the past month. She continues to experience a constant burning sensation throughout her chest, aggravated by deep inspiration and alleviated by lying flat on her back. She shares that walking up the stairs at home leaves her "breathless". Associated symptoms include subjective fevers, chills, and night sweats. Given these symptoms, Patient underwent a chest x-ray, which showed findings consistent with an enlarging pericardial effusion. Patient was then advised to present to the ED for further workup as an inpatient. At time of hospital admission, patient endorses persistent chest pain during inspiration. Prior to 3/1/2021, she has never experienced these symptoms and reports no history of pericarditis. The most strenuous physical activity she has undertaken in the last month include working in the garden and caring light boxes down the stairs. She is most concerned about the fluid around her heart. Patient reports no nausea, vomiting, palpitations, constipation, diarrhea, or abdominal pain. Of note, the patient developed pericarditis 10 days after her second COVID-19 vaccine.</p> <p>Hospital Course # Sub-acute pericarditis with enlarging pericardial effusion Pericarditis initially</p>

A 71-years-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Formulation: solution for injection, Lot number and Expiry date was not reported) via an unspecified route of administration on 15Mar2021 18:30 at single dose for covid-19 immunisation. Medical history included ongoing crohn's disease, colitis ulcerative. Concomitant medication included mesalamine taken for crohn's disease, colitis ulcerative from 15Feb2021.The patient underwent lab test blood cholesterol was abnormal. The patient experienced he thinks the vaccine may have affected the mefalamine or something (drug interaction), caller stated he was not eating much but did eat a banana, yogurt, and apple sauce, states that something in the vaccine aggravated his crohn's or ulcerative colitis, lost weight on an unspecified date. On Sunday 21Mar2021, he had a bout with vomiting, stomach pain, chest pain, back pain, skeleton pain on the right side. Caller stated he felt constipated and needed to go to the bathroom. When he finally went to the bathroom it was not solid or compacted, it was more stringy and long. Caller stated it was hard to swallow water and the pill he takes for Crohn's or Ulcerative Colitis, which is Mefalamine. Caller stated he was not eating much but did eat a banana, yogurt, and apple sauce. He thinks the vaccine may have affected the Mefalamine or something. He stated he felt lousy. He said he still feels weak. Caller stated he does not know his current weight but he has probably lost weight because of not being able to eat much and the vomiting. Caller stated he started vomiting at 7:00PM on Sunday 21Mar2021 until 7:00-10:00AM Monday morning. Caller stated the first time he vomited was at 7:00PM and it was solid. It looked like the banana, apple sauce and yogurt he had ate, brown in color. The second time he vomited it was a green liquid, like bile from the stomach. States that something in the vaccine aggravated his Crohn's or Ulcerative Colitis. The outcome of the event was unknown. Information on the lot/batch number has been requested.</p>

Upon receipt of follow-up information on 06Apr2021, this case now contains all required information to be considered valid. This is a spontaneous report from a contactable nurse (patient). A 36-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 17Jan2021 (Batch/Lot Number: EL3246) (at the age of 36-year-old) as single dose for COVID-19 immunisation. Medical history included migraine from an unknown date and unknown if ongoing. Concomitant medication included topiramate (TOPAMAX) at 250 mg, daily (2 DF 100mg and 1 DF 50mg at bedtime) taken for migraine, start and stop date were not reported. The patient previously received fist dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 27Dec2020 (Lot Number: EK5730) for COVID-19 immunization. The patient reported that since the second vaccination experienced tachycardia, palpitation, shortness of breath and basically blasting of air, difficulty breathing, dizziness and weakness, all on 18Jan2021. She reported pulse keeps raising, elevating to 148-157, she had palpitation complications without doing anything straight away. Elevated pulse and tachycardia, that all started and that was very concerning, pulse went to 209 and that was when she got transported to the emergency room. The patient reported also syncope episodes, costochondritis and chest pain on Jan2021. On 26Mar2021 the patient experienced having discoloration on her toes, numbness and tingling and that her extremities, from the knee down and both her hands and feet were cold, ice cold. The patient was transported to the hospital by ambulance three times due to the events (hospitalizations on 22Jan2021, 30Jan2021 and 25Mar2021). The patient underwent lab tests and

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

procedures which included Troponin, D dimer, electrocardiogram (EKG), Chest X ray, Full blood count (CBC), exercise electrocardiogram (TMT) all resulted: normal, nuclear stress test: unknown results and pulse 148-157, 209, all on unspecified date. The patient outcome of the events was unknown.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the tachycardia and other reported events due to temporal relationship. However, the reported events may possibly represent intercurrent medical conditions in this patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1257176	4/25/2021	VA	40	M	4/8/2021	4/12/2021	Early in the morning 3 days after receiving the vaccine, patient awoke with chest pain that carried down his left arm. He drove himself to the emergency room at 7am because he just wasn't feeling right. After two EKG's, the Dr. at Hospital located in the area decided to air lift patient to another Hospital for an assumed fatal heart attack. Upon arrival, he was given a heart catheter and no blockages were found. They determined the had myocarditis, inflammation of his heart. However, he had not been sick or battling any illness.

1256852	4/25/2021	NV	25	M	3/29/2021	3/31/2021	Received second dose of the Moderna COVID-19 vaccine on 3/29/2021. On 3/31/2021, I was awoken at approximately 0230 am with severe chest pain. I went to the emergency room later that day and medical staff stated a blood test showed my heart was under stress. My systolic blood pressure also dropped into the low 80's. I was admitted to the hospital and stayed for two nights as multiple tests were conducted. I was discharged from the hospital on 4/2/2021 with the diagnosis of myocarditis and pericarditis. It was determined the only cause of this condition for me could be the COVID vaccine.

1256617	4/25/2021	VA	39	M	4/11/2021	4/13/2021	I went to the emergency room at Hospital on April 14, 2021, after experiencing chest pain and shortness of breath. After an abnormal EKG, blood tests showed a high troponin level. An ultrasound determined my heart ejection fraction had declined to 35-40 percent. An angiogram was performed that showed no blockages or tears in my heart. I was diagnosed with Myocarditis and admitted to the hospital. Over the next 36 hours my troponin level rose to more than 11 before starting to decline. I have prescribed a number of medications for treatment. On April 22 I had a cardiac MRI which confirmed the Myocarditis diagnosis. My heart function has improved to 55 percent and an EKG showed normal rhythm. I have more tests and follow ups scheduled in the coming weeks.
1256458	4/25/2021	IN	49	F	3/27/2021	3/28/2021	Early the next morning around 6 am started feeling unwell with chills, headache took Tylenol but did not help symptoms increased. Took migraine meds. March 28-30th severe chills and headaches, chest pain on left side with tight chest increase cough along with increased joint pain. April 1st appointment with Dr. for my Xolair injection, discussed symptoms seemed to be resolving some and lung function test normal. Took xolair. April 2-5 th increased tight chest headaches, low body temp, arm and leg numbness, right side, later very sore. April 7 -15th right side leg pain comes and goes increase hip pain, chest tightness, extremely tired, lack of concentration with continues headaches. On April 15th went to ED after Dr contacted me to go there after information had been released about other cases of reactions similar.
1256384	4/25/2021	CA	21	F	3/8/2021	3/14/2021	chest tightness the last 6 weeks which started on 3/14/21 after receiving J&J COVID Vaccine (she received on 3/8., chest pain, tightness in character, noted to be intermittent, positional, occurring mostly at night, associated with some shortness of breath, episodes would last for about one hour in duration, then resolve spontaneously resolve. No associated fevers or chills.

1252704	4/24/2021	CA	16	M	4/24/2021	4/24/2021	<p>Patient started to feel dizzy for about one minute. His father states that patient was sitting up on a chair and he started to fall backward, so his father caught him and lowered him to the ground. He did not hit his head. He was not responsive for approximately 10 seconds, per the father. Clinical monitors arrived and patient was alert and oriented to name, place, date/time. He was slightly pale and clammy but he denied any dizziness, chest pain, palpitations, shortness of breath, headache, changes in his vision/hearing, or nausea. He was laying on his back on the ground with his legs elevated on a chair and he started to feel better, and his blood pressure and oxygen saturation were stable with mild bradycardia per the vital signs obtained by one RN. He said he was feeling better and he was smiling and joking with staff. He slowly started to sit up and sipped bottled water. Stated that he had not eaten since 11am, and he agreed to a snack. I left to get him a snack, and RN said that he started to "zone out" and he lost consciousness again for approximately 20 seconds. When I came back, he was sitting up, conscious, and had spit up saliva and water onto his shirt. His breathing was steady. He again stated that he was feeling better very quickly, again in good spirits, but his father and I agreed that it would be best to call 911 to transport him to the ER just to be safe. He did not hit his head. He denied dizziness, chest pain, palpitations, shortness of breath, nausea, changes in vision, and headache. He was alert and oriented to name, place, and time. EMS was requested and they arrived, took his vitals, and he was transported to the Emergency Dept for futher care. He and his father were confident that he would recover quickly as he had a history of syncopal episodes related to vaccines in the past.</p>

1254066	4/24/2021	OH	33	M	2/5/2021	2/5/2021	Long lasting chest pain, became quite severe at the one week mark; This is a spontaneous report from a contactable consumer (patient). A 33-year-old male patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, formulation: Solution for injection, Batch/Lot number: Not reported), via an intramuscular route of administration in right arm on 05Feb2021 at 09:30 as single dose for COVID-19 immunization. Patient previously had historical vaccine BNT162B2 as first dose for COVID-19 immunization. Patient medical history included covid-19 positive. The patient previously took Bactrim. There were no other vaccine same date details. Patient did not receive any other vaccines within 2-4 weeks. The patient took concomitant medications (there were other medications in two weeks). On 05Feb2021, patient experienced long lasting chest pain, became quite severe at the one week mark so that he went to the ER to get checked out. All his tests so far have been normal (CT scan of chest, blood work, EKG), but the pain is. On an unspecified date, patient underwent lab tests and procedures which included blood test, CT scan of chest and EKG all were normal. There was no covid prior vaccination and the patient was not tested with covid post vaccination. Patient received treatment for event. Outcome of the event was not recovered. Information on the Batch/Lot number has been requested.

1254076	4/24/2021	MN	76	F	1/30/2021	1/31/2021	Chest pain/stabbing pain on her chest wall at the right side; This is a spontaneous report from a contactable consumer. A 76-years-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Solution for injection; Lot Number: EL9269; Expiration Date: unknown), via an unspecified route of administration, administered in arm Left on 30Jan2021 at 11:00 (at the age of 76-year-old) as SINGLE DOSE for covid-19 immunization. Medical history included Lupus from 1976 to an unknown date. There were no concomitant medications. Prior Vaccinations (within 4 weeks) reported as none. History of all previous immunization and additional vaccines administered on same date with the Pfizer vaccine reported as none. Consumer reported that she had a side effect that she had never seen listed. She had no pain or redness at the vaccine site; but about 18:00 on Sunday night she had stabbing pain on her chest wall at the right side with no other symptoms. She took an aspirin and laid down because she couldn't move with the pain. The next morning she took another aspirin and laid in bed that day. It was bad for three days. The last time she noticed that the pain was on Monday. She was thinking that she had dodged a bullet because she was not having any pain at the site. Patient stated that she had friends, (name provided) and (name provided), in their 80s, who had pain from the elbow to shoulder, she spoke with them the day after they received their shots and they got there shot at the same time and place as the patient. Patient was scheduled to receive the second dose of the vaccine on 20Feb2021. She wanted to know that the chest pain a side effect and mentioned that she was concerned about getting the next dose. On 31Jan2021, the patient experienced Chest pain/stabbing pain on her chest wall at the right side. Therapeutic measures were taken as a result of chest pain and included treatment with aspirin. Patient did not required a visit to physician or Emergency room. Relevant test reported as none. The outcome of the event was recovered on 08Feb2021. No follow-up attempts are possible. No further information is expected.

1245325	4/23/2021	NJ	59	F	4/7/2021	4/18/2021	I got the JNJ vaccine on Wed 4/7/21 (a wk before FDA paused that covid vaccine). Initial response was Extreme Fatigue, but starting 11:45 pm on 4/18/21, I suffered headache, chest pain, short of breath. I could not sleep at all till 4/19/21 PM after asking my kids to pray for me. In case it's just heartburn, I took TUMS at 8:15 pm on 4/19/21 . Headache, short of breath comes and goes, but the chest pain persists, and I develop a hot flash. I never took birth control pills, but my OB/GYN prescribed daily Estrogen (to prevent osteoporosis) and every 3 month, Progesterone for 10 days (to prevent breast cancer). Estrogen & Progesterone happen to be the birth control pills' composition. On 4/17/21, I finished my 10 days Progesterone regime. I discontinued the Estrogen supplement on 4/19/21 or 4/20/21, now (4/23/21 1:20 am) no more chest pain, but still feel fatigue, feverish with a hazy/foggy head (not really a headache). I have a suggestion for JNJ, FDA, CDC on JNJ vaccine warning label. If indeed those 6 women are all on birth control pills which are composed of synthetic estrogen and progesterone, then the warning label should also warn people who take these hormone supplements, instead of just an age range.
1245315	4/23/2021	UT	45	F	3/6/2021	3/7/2021	Vertigo, body aches, headache first 2-3 days. Then a few days later major fatigue set in, chest pain, mouth breaking out in canker sores randomly, broke out in hives, rashes on my legs and arms, skin hurts to touch, dizzy, loss of balance, difficulty sleeping, night sweats, blurred vision, double vision this is probably the worst of all the symptoms, I lost my taste for 5 weeks. I have taken anti-viral homeopathic drops because it really felt like I was getting the chickenpox or something...like a nerve pain burning. I have documentation how perfectly healthy I was before this and now I am not.
1245310	4/23/2021	SC	19	M	4/22/2021	4/22/2021	Heart and chest pain, started about 8-9 hours after injection. Going to sleep, so I cannot continue to monitor until morning.

1245272	4/23/2021		19	F	3/16/2021	4/14/2021	Patient transferred from medical group practice for b/l PE. Patient reports chest pain and SOB x 4 days ago. Patient has also been having hemoptysis for the past couple days as well. Physical exam is remarkable for tachycardic heart rate and rhythm is regular. Patient given heparin bolus and infusion and admitted to hospital for acute large main vessel pulmonary embolism. 2D echocardiogram showing no signs of right heart strain. Patient was transitioned to oral Eliquis and given a 1 month supply on discharge. Patient told to stop birth control and avoid NSAIDS. Patient instructed to F/U with PCP and hematology.
1245250	4/23/2021	VA	22	F	3/24/2021	3/24/2021	About five to ten minutes after I received my first shot, I started to feel like my throat was closing a little. I knew it wasn't an allergic reaction because I could still speak, but I also became very dizzy and sweaty. I stood up to go see the nurse and she took my blood pressure and it was slightly higher than normal and my heart rate was extremely elevated. I sat down on a stretcher and felt incredibly light headed and gained a metallic taste in my mouth. I also felt very nauseous and started experiencing chest pains. It felt like a panic attack but more severe and more sudden. My throat felt very tight but I could still talk, and my cheeks felt like they were on fire. My face was bright red. They gave me some water and monitored me some more and encouraged me to go to the hospital, but my symptoms subsided after about 35 minutes. After that I just felt tired and didn't have any more symptoms.

February 9, 2021 11 AM she received Moderna vaccine. by 7 PM she had a severe headache, leg numbness, severe arthralgias in her knees, global paresthesias, pressure behind her eyes, she describes her head is very heavy and pressurized was very painful. Symptoms lasted for three days and gradually remitted. To a lesser degree the headache persisted longer but resolved March 10, 2021 received Moderna vaccine. On same day she developed headache, chest pain, back pain, leg numbness. She states that when she walked it exacerbated chest pain and headache and she had to walk very gently on her toes. She tried Tylenol, ibuprofen without effect. The symptoms persisted. She started taking two aspirin a day. March 14 she worked third shift as usual (despite symptoms) March 15, the symptoms were bad enough that she felt she had to go to the emergency room. March 15, 2021 18:56 CT Head or Brain C-: 7 mm rounded hyperdensity within the pituitary gland which may represent a hyperdense pituitary mass lesion. Associated hemorrhage is not excluded. March 15, 2021 22:34 MRI Brain C-/C+: There is 0.6 x 0.6 x 0.7 cm round structure in the anterior pituitary gland with high T1 signal, dark T2 signal, susceptibility artifact and no enhancement. This likely represents a hemorrhage within the microadenoma. Advise neurosurgical consult and follow-up MRI in 6 months.</p> <p>3/17/2021 I was consulted (while she was in hospital, chart review only. Patient not seen at that time) I wrote... PITUITARY ACTH Patient had ACTH stimulation test yesterday. Assuming she has received no steroid Rx during this admission prior to the ACTH stimulation test (as I have been told), then these results confirm that her adrenal gland has the ability to respond to ACTH and thus there is no reason to believe the underlying pituitary abnormality had resulted in chronic ACTH deficiency from the pituitary lesion that resulted in hemorrhage.</p>

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

3/16/2021 4:32 PM .Cort 30 min Stim Cortisol 30
Minutes Post ACTH 19.3 mcg/dL Cortisol 60
Min 27.6 mcg/dL As the pituitary
hemorrhage was an acute event, it is possible the
pituitary currently does not have the ability to make
adequate amounts of ACTH, despite the normal ACTH
stim test, but the situation is too acute to cause the
adrenal to atrophy (as a result of chronic ACTH
deficiency) and she still could have secondary adrenal
insufficiency. When there is a chronic ACTH deficiency of
sufficient duration, the adrenal gland will eventually
atrophy and the patient will then develop primary adrenal
insufficiency as well and then the ACTH stim test will
become abnormal. As we do not know if her pituitary can
make ACTH appropriately, I think it would be prudent to
treat the patient with PREDNISONONE 2.5 mg qAM for now
even though we do not know for certain whether her
pituitary can make ACTH. After discharge, she should be
evaluated by endocrine to assess for ACTH deficiency.
She should be advised to seek medical attention if she
develops symptoms of adrenal insufficiency like nausea,
emesis, abd pain, orthostatic symptoms. PITUITARY
TSH 3/15/2021 11:47 PM T3 Total 83
(normal: 60-181) nGm/dL T4, Total 7.3
(normal: 4.5-13.3) mcg/dL TSH, 3rd gen
2.160 (normal: 0.358-3.740) mIU/ml I think, based
on above admission TFTs, she should also be treated
with LEVOTHYROXINE 100 mcg qAM even though we
do not know for certain if she has central hypothyroidism.
This too should be reassessed in the future. PITUITARY
LH/FSH If she acutely or recently developed secondary
amenorrhea and FSH is not c/w menopause, then that
would suggest the lesion or hemorrhage has causes
hypogonadotrophic hypogonadism. This situation would
increase the probability she has central adrenal
insufficiency and central hypothyroidism. If menses
remains normal henceforth, the it is more likely her ability
to make TSH and ACTH are normal.
Patient was discharged on
levothyroxine 100 µg in the morning and prednisone 2.5
mg daily. She's also on iron pills. Past medical history:
Iron deficiency anemia. Treatment was an IUD, after
which she's gained a lot of weight. Medicines: IUD,
Levothyroxine 100 mcg QAM, prednisone 2.5 mg QAM,
ferrous sulfate 325 mg daily Allergies: none No cigarette

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

use, alcohol abuse or drug use Family social history: patient has three children. High school educated. Healthcare worker. REVIEW OF SYSTEMS: overall health is good. She feels well. No headache. No nausea. No nocturia Physical exam: Extraocular muscles intact. VF full Lungs are clear. Cardiac exam regular. Impression: hemorrhage into pituitary gland Temporarily, symptoms correlate with covid vaccination in a women who previously was (reportedly) dx with covid infection. Maybe the pituitary hemorrhage was the result of the coronavirus vaccination or the aspirin she was taking. At this point she's feeling well. It's been about one month since the event. I'd like to wait another month and then proceed with testing of a pituitary gland to try to figure out if she really needs to remain on levothyroxine and prednisone and reimage the pituitary. On the day of the testing she will take neither medicine in the morning. Will then measure LH, FSH, estradiol, TSH free T4 and cortisol and renal panel. Patient will then receive ACTH 0.25 mg IM and have cortisol measured at 30 minutes and 60 minutes. I will follow-up with her by phone. She scheduled to see Dr. April 26. I would like to do another MRI but I would prefer to wait another month as she is clinically doing well and I want to allow the pituitary more time to "heal"/stabilize. No follow-up is scheduled with me, if Dr. does not order an MRI and I will after I received next blood test. M.D. 4/22/2021 3:40 PM Electronically signed by: M.D. on 4/23/2021 2:47 PM

Patient is a 16 year old male alert and oriented x4 accompanied by his mother who complained of weakness immediately upon administration of vaccine. The patient and patients mother stated that this same type of event has occurred in the past with previous vaccinations. Patient was seated on a cot a vital signs stable. Patient stated the he immediately felt better and no longer had any complaints. No chest pain, shortness of breath, weakness, dizziness, signs of stroke or allergic reaction. The offer was made to call paramedics for further evaluation and transport but patient and mother politely refused. Patient and mother were advised of all risks and consequences and advised to seek medical treatment if any symptoms return. Patient left with his mother via private vehicle.

1247493	4/23/2021	CA	32	M	4/8/2021	4/16/2021	Covid-19 vaccine JJ: 32 y.o. male w/ no PMH presenting 2 weeks after receiving his Johnson & Johnson COVID vaccine after having severe L calf pain found to have thrombocytopenia. From H&P on 4/21, Patient reports that he had both fevers and aches after his vaccine (4/8/2021). Several days later developed low back pain radiating into his left leg which he initially attributed to sciatica. However, several days later, he went for a 6 mile hike, and felt that his left leg was hurting more. He went to PCP, where he received a blood test and was found to have a platelet count in the low 60s. This was initially thought to be a lab error, but he noticed that his left leg was swollen, somewhat red, and appeared that his blood vessels were swollen. This swelling resolves when he is lying down, and is worsened when he is standing. He received an US to r/o DVT, which was negative. However, after his repeat platelet count demonstrated thrombocytopenia, he was sent to the ED. He denies any recent leg trauma, though he has broken his leg before nearly 15 years ago. He denies weakness or issues going to the bathroom. Denies chest pain or shortness of breath. Denies chills, fevers, but did wake up last 2 nights drenched in sweat. He also reports a petechial rash on his legs. As of 4/22, medical team suspects Vaccine-induced thrombocytopenic purpura (VITT). VITT requires 1) thrombocytopenia, 2) documented clot, 3) positive PF4 Ab, and 4) recent AstraZeneca or J&J vaccine. He meets criteria 1, 3, and 4. He has clinical signs of DVT but does not have a documented clot. Patient has L calf tenderness and prominent pooling of blood and vein engorgement of the L leg when he stands up. Possible that he had a DVT or multiple that cleared and now he has post-thrombotic syndrome. This is consistent with the pooling of blood with gravity and relief of symptoms with elevation. As he has had 2 negative US for DVT, unlikely that he has an unresolved DVT. abdominal and head CT are neg for thrombosis.

1248045	4/23/2021	IL	39	F	4/10/2021	4/11/2021	J&J COVID Vaccine EUA J&J Vaccine 4/10/2021 4/13/21: Believes she is having a reaction to her Johnson and Johnson COVID-19 vaccination. This vaccination was given on 04/10/2021. Patient is 39-year-old female with a past medical history significant for ulcerative colitis that has been in remission since the patient was 21 years of age, epileptic seizures on Vimpat and clonazepam. Patient comes in as a transfer with a chief complaint of possible reaction to Johnson and Johnson COVID-19 vaccine. Patient presents with multiple complaints. The patient states that upon receiving the vaccine on 04/10/2021 she suddenly developed presyncopal episodes where she felt like she was about to pass out but that subsided later on. 12 hours following the shot she had intense headache which was frontal and then later on travel to the back of her head and traveled down her spine. Patient described the headache to be the worse headache of her life, stated that it was worse than going through labor. Patient stated that she received morphine which helped her with the headache. Patient also complained of chest pain which was left-sided with no radiation, constant. No history of previous myocardial infarctions. Her troponins that were conducted were negative. Patient also complained of experiencing blood in her stool. She stated that when she wiped herself on the morning of 04/13/2021 she experience blood on the toilet paper and blood in the bowel. However, her stool occult blood that was conducted was negative. Patient is being followed by Neurology, she contacted her neurologist and they recommended to come to the ED with concerns of thromboembolism. Patient's D-dimer was negative. Patient denied any recent travel anywhere or coming into contact with anyone sick. She denied developing any fevers cough shortness of breath abdominal pain nausea vomiting or any urinary concerns. 4/15/21: Patient is a 39-year-old female with a past medical history significant for ulcerative colitis that has been in remission since the patient was 21 years of age, epileptic seizures on Vimpat and clonazepam. Patient comes in as a transfer with a chief complaint of possible reaction to Johnson and Johnson COVID-19 vaccine. Headache: MRI brain and MRI venogram was ordered. MRI brain did show concerning signed for idiopathic intracranial hypertension. Neurology was consulted. Patient had high volume LP. Patient

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

responded well post LP. Patient will be discharged on topiramate with a taper instructions per neurology. Patient will make appointment with Ophthalmology. Patient will follow up with Neurology as well. Chest pain concerning for ACS: Negative troponin. EKG normal sinus rhythm. Concern for vaccine reaction: Patient has J&J vaccine. No clots were noted. Patient's symptoms are most likely are secondary to idiopathic intracranial hypertension and history of migraines. 4/16/2021: 39-year-old female presents emergency room with chief complaint of headache. Onset this morning. Headache is generalized. Headache is constant. Headache is worth with position change. Such as moving head side to side or with changing from lying to sitting and sitting to standing. Headache improves with lying supine. To has tried pushing fluids, taking over-the-counter medication, and also increasing her caffeine intake to offset the headache. She denies any of these helping with her symptoms. Patient's pain is right an 8 out of 10. The patient denies anything additional alleviating and or aggravating factors to chief complaint. Today when the patient's headache started. She contacted her neurologist. She was told to come to the emergency department for a blood patch. The patient added that her neurologist felt that she needs a blood patch not only because of the recent lumbar puncture but because there was at minimum 25 mL of spinal fluid removed at the time of her lumbar puncture. This lumbar puncture occurred under fluoroscopy. However, they had difficulty getting the pressure gauge on thus, more than 25 mL was removed.. Pain Pain Scale: 8 /10. Timing: constant. gradual. Character: mild. 4/19/21: patient reports intense headaches she attributes to the spinal tap. Ketorolac, DHE, ondansetron given.

1249622	4/23/2021	MN		M	3/23/2021	4/10/2021	Negative COVID test; nausea; passed out; chest pain; shortness of breath; Tested positive for COVID; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of SYNCOPE (passed out) in a 77-year-old male patient who received mRNA-1273 for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included Heart disease, unspecified and Atherosclerosis (blockage of artery was noted.). Concurrent medical conditions included Drug therapy (patient was on heart medications) and Drug therapy (patient was on antibiotic). Concomitant products included ATORVASTATIN CALCIUM (STATIN [ATORVASTATIN CALCIUM]), CLOPIDOGREL BISULFATE (PLAVIX) and MULTIVITAMIN [VITAMINS NOS] for an unknown indication. On 23-Mar-2021, the patient received first dose of mRNA-1273 (unknown route) 1 dosage form. On 10-Apr-2021, the patient experienced SYNCOPE (passed out) (seriousness criterion medically significant), CHEST PAIN (chest pain), DYSPNOEA (shortness of breath), SARS-COV-2 TEST POSITIVE (Tested positive for COVID) and NAUSEA (nausea). On an unknown date, the patient experienced SARS-COV-2 TEST NEGATIVE (Negative COVID test). At the time of the report, SYNCOPE (passed out), CHEST PAIN (chest pain), DYSPNOEA (shortness of breath), SARS-COV-2 TEST POSITIVE (Tested positive for COVID), SARS-COV-2 TEST NEGATIVE (Negative COVID test) and NAUSEA (nausea) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 10-Apr-2021, SARS-CoV-2 test: positive Positive. On 14-Apr-2021, SARS-CoV-2 test: negative Negative. The action taken with mRNA-1273 (Unknown Route) was unknown. This case concerns a 77-year-old male with a serious unexpected event of syncope, and nonserious unexpected chest pain, dyspnea, and expected nausea. SARS-CoV-2 test positive. Treatment with Regeneron antibodies. Event onset 19 days after first dose mRNA-1273. Event outcomes unknown. Based on current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.; Sender's Comments: This case concerns a 77-year-old male with

This non-serious spontaneous report (USASP2021052927) was reported on 06/APR/2021 by a consumer and involves a 29 year old female patient who experienced had shortness of breath/ chest pain/ burning throat and SOB/ diagnosed as allergic reaction or possible asthma flare [PT: hypersensitivity] while receiving Enbrel with Single Dose Prefilled Syringe and Aimovig with Single Dose Prefilled Autoinjector. No historical medical condition was reported. The patient's current medical condition included psoriatic arthritis, migraine, and asthma. No concomitant medications were provided. The patient's co-suspect medication included Covid-19 Vaccine. The patient began Aimovig with Single Dose Prefilled Autoinjector on an unknown date in JUL/2018. The patient started taking Enbrel with Single Dose Prefilled Syringe on an unknown date in 2020. On 15/MAR/2021, the patient received her first Pfizer COVID-19 vaccination. On 25/MAR/2021, the patient took her latest Enbrel injection. On 27/MAR/2021, the patient took her latest Aimovig injection. On 28/MAR/2021, Sunday, the patient started experiencing shortness of breath (SOB) and chest pain which lead her to see her physician the following Monday. On 29/MAR/2021, the patient performed electrocardiogram (ECG) at the physician's office which was normal. On 29/MAR/2021, on Monday night, the patient went to the emergency room with a burning throat and SOB and the patient was diagnosed with an allergic reaction or possible asthma flare, and she was prescribed a prednisone taper which she did not take and baclofen. The patient had been taking the baclofen and using her Xopenex (levosalbutamol hydrochloride) rescue inhaler as needed for SOB. The patient also reported that the SOB and chest pain was getting better but still had issues. On an unknown date in 2021, the patient also reported that she had been experiencing overwhelming fatigue and was scheduled to receive her second Pfizer COVID-19

1241375	4/22/2021	FL	70	F	3/25/2021	3/26/2021	Diagnosed with shingles; the rash is on my torso and in the back; I couldn't sleep at night; The pain was excruciating; Discomfort pains in center of chest; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of CHEST PAIN (Discomfort pains in center of chest), CHEST PAIN (The pain was excruciating) and HERPES ZOSTER (Diagnosed with shingles) in a 70-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 027A21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included No adverse event (medical history was not reported.). Concomitant products included LEVOTHYROXINE SODIUM (SYNTHROID) and HYDROCHLOROTHIAZIDE, LOSARTAN POTASSIUM (HYZAAR) for an unknown indication. On 25-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 26-Mar-2021, the patient experienced CHEST PAIN (Discomfort pains in center of chest) (seriousness criterion medically significant). On 27-Mar-2021, the patient experienced CHEST PAIN (The pain was excruciating) (seriousness criterion medically significant) and INSOMNIA (I couldn't sleep at night). On 28-Mar-2021, the patient experienced HERPES ZOSTER (Diagnosed with shingles) (seriousness criterion medically significant) and RASH (the rash is on my torso and in the back). At the time of the report, CHEST PAIN (Discomfort pains in center of chest), CHEST PAIN (The pain was excruciating), HERPES ZOSTER (Diagnosed with shingles), INSOMNIA (I couldn't sleep at night) and RASH (the rash is on my torso and in the back) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Treatment for the event included Famciclovir for 7 days initially and Acyclovir ointment for the Shingles rash and Celebrex for the pain. This case concerns a 70-year-old female with a serious unexpected event of chest pain and herpes zoster, and nonserious unexpected insomnia and rash. Event onset 2 days after first dose mRNA-1273. Event outcomes unknown. Based on current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.;

1243562	4/22/2021	IL	35	M	4/9/2021	4/14/2021	On 4/14/21 I started having chest pain and pressure. I was seen in Urgent Care that day and an EKG, Chest xray, and lab work was preformed. Everything was normal and I was sent home to monitor. I continued having chest pain 4/14-4/17. On 4/17 I was having chest pain and then started having numbness in the left side of my face. I proceeded to have left sided weakness, difficulty speaking, slurred speech, and loss of motor skills. I was taken to the ER. They did a CT scan, blood work, and an ekg. All were normal. I was admitted to the hospital and they did MRI or the head, MRA of the neck, MRI of the neck and spine, Echocardiogram, Stress test, and further blood work. Everything came back normal. I saw Neurology inpatient and was discharged to follow up outpatient. I still have coordination difficulty and I do not have all of my motor skills back yet.
1243643	4/22/2021	FL	50	M	4/11/2021	4/18/2021	We have information concerning a member that received the Moderna Vaccine (first dose) on Sunday April 11, 2021; Patient denied any side effect immediately following vaccination. However on Sunday April 18, 2021 , patient had complains of shortness of breath, chest pain. At which time presented to the Hospital and was admitted on Sunday April 18, 2021 with a diagnosis of Pulmonary Embolism. Patient remains hospitalized as receiving treatment of blood thinner, and embolectomy procedure.
1243834	4/22/2021	NJ	75	F	3/25/2021	4/18/2021	Initial reaction to vaccine in following days were weakness in legs with high fever. On 4/18/2021, she experienced pain in chest, shortness of breath and high blood pressure. Called 911 and ambulance arrived to transport her to Medical Center. She was diagnosed with congestive heart failure. No other symptoms or ailments that could have led to this event. Doctor couldn't find any blockages or any other indicators. Upon discussion with doctor we decided to report as a potential adverse event since no other factors present leading to congestive heart failure. She was treated with lasix and released on 4/21/2021.

1244212	4/22/2021	AZ	27	F	4/21/2021	4/22/2021	Pt. is a 27-year-old female who presents to the emergency department for evaluation of palpitations. Patient states that she got the 1st dose of her COVID-19 vaccine (Moderna) yesterday. Shortly after her vaccination, she began to experience palpitations. She associates her symptoms with intermittent lightheadedness. Lightheadedness worsens with movement. She also states that she is getting over a recent bout of gastroenteritis and has not been eating and drinking much at home. Given her persistent palpitations, she went to a local urgent care where she was found to be tachycardic in the 160s. She is concerned that she may be having a reaction to the vaccine. Denies fever, chills, nausea, vomiting, diarrhea, chest pain, shortness of breath, headache, neck pain, sore throat, abdominal pain, dysuria, hematuria, polyuria, dizziness or weakness. The patient has no other symptom complaints at this time. Timeline: 1049 Initiated care, patient seen and evaluated at bedside by me. Discussed treatment and evaluation options with patient who verbalized understanding. 1318 Diagnostic labs were notable for mild hypokalemia to 3.3. Diagnostic imaging revealed ?suggestion of fluid-filled structure in the region of the right adnexa? concerning for hydrosalpinx versus nondistended small-bowel. Will obtain pelvic ultrasound as recommended by radiology. 1530 Pelvic ultrasound grossly unremarkable. Re-evaluated the patient and her heart rate continued to fluctuate between the 120s to 150s. Will place consult for hospitalist for admission for unexplained tachycardia. 1600 Discussed patient's case with hospitalist, who accepts patient for observation on telemetry.

1243636	4/22/2021	IL	38	F	4/5/2021	4/6/2021	Around 1am Tuesday, April 6th (the day after the vaccination), developed acute onset fever (Tm 102), chills, extreme muscle aches, profound malaise/fatigue, nausea/vomiting, and diarrhea. Those symptoms lasted about 24 hours and, by midday Wednesday, she was back to her baseline of intermittent dry cough, shortness of breath, and no smell or taste. It wasn't until Sunday, two days ago, that she developed sharp, pinpoint right superior parietal scalp pain that, after a few doses of OTC Aleve, did somewhat improve. Other than two 220 mg OTC Aleve tabs twice daily, she has not been taking anything else for her symptoms other than prescribed asthma/allergy meds. She states that her shortness of breath has been helped from the use of albuterol as needed. Unfortunately, the Aleve has not helped with her chest pain, which she describes as a "constant ache." Initially, patient had some pleurisy, but that has apparently cleared up. No history of CVT, PE, and she does not smoke or take oral contraceptives.
1242195	4/22/2021	SC	63	M	4/10/2021	4/12/2021	Took my last shot of Pfizer on 4/10/2021 at 10:00 AM and on 4/12/2021 started having shortness of breath, tiredness, and chest pains this continue on until 4/15/2021 while I was at work at 6:15 PM my wife had to be called to come pick me and take me to the hospital where they did a Cat scan and discovered that I had Blood Clots In both Lungs and had to remove them at that time in order to save my life

1242735	4/22/2021	NE	28	M	4/10/2021	4/20/2021	ED NOTE is as follows...from 4/21/21 @ 21:47 a 28 y.o. male who to the emergency room with reports of a headache for the last 48 hours. He reports this as being one of the worst headaches he has ever had. He was seen at urgent care and given Toradol, Zofran and Benadryl and still rates his pain an 8 out of 10. He does feel pressure behind his eyes. And reports vomiting in the parking lot at urgent care. He denies abdominal pain back pain, neck pain, shortness of breath, chest pain, numbness or tingling or any other worsening concerns. Reports that he did receive a recent Johnson & Johnson vaccination. Patient states he does vape. He occasionally drinks alcohol he denies any illicit drugs. Patient denies any head trauma. Diagnosis management comments: This is a 28-year-old male arrives to the emergency room with reported migraine headache for the last 48 hours. He did report that he was go to urgent care in which he received a migraine cocktail of Zofran, Benadryl and Toradol. Patient reported that his headache was not resolved so urgent care sent him on for further evaluation. Patient upon arrival had a negative neurological exam however he did report that he had pressure behind his eyes. Was unable to see any papilledema on fundoscopic exam. Check patient's pressures bilaterally and they were 21 and 18. Patient did report to me that this was the worst headache of his life. I did administer IV fluids here as well as Tylenol and morphine. Patient did report some improvement. Patient did report in his past medical history had a recent Johnson & Johnson vaccination. A CBC and CMP was obtained. Did have thrombocytopenia with a count of 66. Since my exam was PERRL with normal extraocular movements. He had no eye redness or eye pain. Of low concerns for any iritis or uveitis. Patient's patient CT of his head did show a abnormal CT that had a dense appearing superior sagittal sinus that was representing a venous thrombosis. Radiologist did recommend a MRI MRV. An MRI and MRV was ordered. Patient MRI MRV did show findings are consistent with a venous thrombosis involving the right jugular right transverse sinus and superior sagittal sinus there is also a patchy edematous change within the subcortical white matter areas bilaterally and symmetrically. There was no CVA. With patient's reported migraine headache. Reported blurred

							vision, low platelets, recent vaccination I do believe patient has vaccine induced thrombotic thrombocytopenia. With this finding I did converse with my overseeing physician Calls were made out to neurology and then a call out did prefer to have patient started on IVIG at 1 g/kg daily for 2 days and blood thinner Xarelto 15 mg p.o. twice daily. These orders were initiated. Internal med services was consulted and with conversations of family, internal med services out possible transfer that an interventionalists could be available if patient needed it. Report was given at 2100 upon my end of shift.
1242450	4/22/2021	IL	67	F	3/15/2021	4/20/2021	4/20/21 ER HPI: 67 y.o. female who presents with complaint of shortness of breath since yesterday night when she went to bed and describes it as heaviness associated with lower chest pain both back and front. Patient says shortness of breath is worse with lying down and with activity. Patient also complained of cough that is nonproductive. No fever or chills, no nausea vomiting and no abdominal pain. Patient has been off her Coumadin is since for 04/09/2021 for back injection for back pain. Patient said the the shortness of breath is similar to the last time she had blood clot.
1242480	4/22/2021	TX	31	F	4/11/2021	4/11/2021	Severe headache, fever, chest pain, back pain, rash
1243822	4/22/2021	NJ	75	F	3/25/2021	4/18/2021	Initial reaction to vaccine in following days were weakness in legs with high fever. On 4/18/2021, she experienced pain in chest, shortness of breath and high blood pressure. Called 911 and ambulance arrived to transport her to Medical Center. She was diagnosed with congestive heart failure. No other symptoms or ailments that could have led to this event. Doctor couldn't find any blockages or any other indicators. Upon discussion with doctor we decided to report as a potential adverse event since no other factors present leading to congestive heart failure. She was treated with lasix and released on 4/21/2021.
1242435	4/22/2021		18	M	4/14/2021	4/16/2021	Patient presented with severe chest pain and after EKG, echocardiogram and MRI was diagnosed with acute myopericarditis. Testing for any other cause for myopericarditis was completely normal. From the time course it appears that it is related to his vaccination

1236801	4/21/2021	FL	78	M	4/7/2021	4/9/2021	the next day, dizzy , 2 days later sore throat pain, chest pain short lived (not like when he has had heart attacks in past) , fever 99.2, coughing. Advised may want to talk to PMD about breathing treatments, if chest pain seek medical attention. Placed follow up call on 4/16/2021 at 11:17: Pt reported that he is feeling much better today. Pt reported that the ADEs he had occurred within couple of days of rcvding his 1st Moderna vaccine, by the 3rd day all the symptoms had cleared up, and on day 4 he reported still had some running nose (which he contribute to his allergies). Pt reported for his symptoms he did not try anything to help alleviate his symptoms, he stated he is already taking Tylenol daily.
1237015	4/21/2021	IL	46	M	4/14/2021	4/19/2021	Started with dizziness then anaphylaxis like symptoms and lymph node symptoms of tingling lockjaw hard to swallow very difficult to breathe a little bit of chest pains, called EMS and paramedics to took blood oxygen levels, blood pressure which were all normal by then the symptoms had started to subside
1236791	4/21/2021	NC	31	M	4/8/2021	4/9/2021	Client awoke with chest pain and visited local ER for suspect M.I. Transferred to Hospital for angioplasty, related to thrombosis in R) coronary artery. Treated for 3 days and released to home with 3 months of follow-up cardiac rehab. Scheduled to return back to work as an auto mechanic on 4/26/2021.
1236958	4/21/2021	TN	53	M	1/19/2021	3/1/2021	At 3 months post second COVID-19 vaccine (Moderna), developed onset of intermittent left sided chest pain, syncopal episodes, intermittent vertigo, intermittent SOB, and lethargy. All symptoms can be exertional or non-exertional. Have underwent inpatient hospitalization for the above and undergone multiple testing. Have had a CT of the chest, CXR, echocardiogram, cardiac stress testing (chemical), EKGs, multiple labs, and heart catheterization. All testing has been essentially normal including ruling out inflammatory process.

1237026	4/21/2021	NY	36	M	4/6/2021	4/7/2021	Patient received the moderna covid vaccine on 4/6/21. Developed general malaise and fever 4/7/21 around 1pm. Then developed acute sharp, pinching retrosternal, non-radiating chest pain at 9pm on 4/7/21. Chest pain was intermittent and nocturnal. no relief with nitroglycerin. He was admitted to the hospital 4/9/21 and started on colchicine 0.6 mg PO BID and indomethacin 50 mg PO TID with improvement. Troponins trended down with significant symptomatic relief following anti-inflammatories. At follow up visit 3 days after discharge (4/15/21) , patient reported continued improvement, reporting sternal chest pain 1 out of 10 . Also reported dyspnea that has improved since discharge from hospital but still worse than baseline.
1237048	4/21/2021		24	M	3/26/2021	3/26/2021	Pt. reports left arm pain/heaviness after receiving 2nd dose of vaccine. Pt. was given 2nd dose in the right arm. Pt. described the feeling in his left arm as aches and mild heaviness. He reports pain in his left arm after the first dose that went away after a few hours. He denied chest pain and chest tightness, swelling, itching, and syncope. Pt. appeared stable after vaccine. He improved after further observation. Pt. given directions to go to ER if symptoms worsen.
1237091	4/21/2021	IN	56	M	4/1/2021	4/13/2021	Patient started having leg cramping on 4/13/2021, presented to the emergency department on 4/18/2021 with increasing shortness of breath and chest pain.
1237178	4/21/2021	FL	57	F	4/19/2021	4/19/2021	On 4/20/21, at 2:40PM Called clinic & reported numbness of lips and tongue that began on 4/19/21 after second Moderna vaccine. Also reported pain at "5" on 0-10 scale on entire left side of her body. Fever that reached 102 degrees the night of 4/19/21 but reduced to 100 degrees with use of Tylenol and Ibuprofen. States was also having headache at "6" on 0-10 scale. Denied any chest pain or shortness of breath. Reported blood pressure of 102/88 at time of phone call. Patient was directed to go to ER for immediate assessment but she refused. Followed up on 4/21/21 at 11:10AM. She stated headache and fever have resolved. Still has slight numbness of bottom lip and tip of tongue. Appointment with provider scheduled for 4/21/21.

1237482	4/21/2021	MI	23	F	4/7/2021	4/21/2021	My daughter is exactly 2 weeks out from administration. She called me today, stating her heart was intermittently racing. Felt like she has a fever, but none registered on the thermometer. Body aches, malaise present. No chest pain, shortness of breath, headache, or vertigo. She does have diarrhea x1 today. I am calling her often, to find out any other sx. I will take her for a covid test when I get off of work, if she still feels poorly.
1237338	4/21/2021	IN	40	M	4/2/2021	4/14/2021	Pain in chest and back began on Wednesday 4/14. What started out feeling like an uncomfortable pulled muscle in my back/chest area on Wednesday escalated rapidly to very sharp stabbing pains in my chest and back by Thursday afternoon 4/15. After discussing my symptoms with the office of my PCP Thursday afternoon, I was told to go to the Emergency Room for evaluation. I checked into the ER at approx 6pm that Thursday evening on 4/15. While there I underwent a blood test, EKG and a chest Xray. Upon evaluating the results of each test the Dr on assignment stated that there were no problems with major organs but could not diagnose. Small red marks began developing on the right side of my chest that same day and progressively expanded in quantity across the right side of my chest and back. A follow-up visit with my PCP was completed on Tuesday 4/20 and the diagnosis of Shingles was confirmed. Pain has not subsided and has only gotten worse as of 4/21. Prescription treatments began the evening of 4/20.
1236711	4/21/2021	NC	19	M	4/8/2021	4/8/2021	Developed Fever and chills during the night 4/8/2021. Felt fatigued with intermittent chills on 4/9/2021 and then fever and chills again that night. Felt fine Saturday 4/10 and then Sunday 4/11 developed low grade chest pain lasting 2 hours and resolved with Advil. Awakened at 5am on Monday 4/12 with severe diffuse chest pain requiring hospitalization and treated for myopericarditis.
1235664	4/21/2021	NC	22	M	4/17/2021	4/20/2021	Patient presented with severe chest pain x 2 1/2 hours, found to have EKG changes consistent with strain, dramatically elevated troponin to 13.2, ultimately peaked at 15. No pericardial fluid, diagnosed with myocarditis, treated in healthcare facility.

1235811	4/21/2021	DC	52	F	3/12/2021	4/4/2021	COVID pneumonia; Hematological; bleeding; having hemoxysis; slight troponin increase; GI bleed; headaches; COVID-19 test was positive; COVID-19 test was positive; nauseous; abdominal discomfort; body aches; This is a spontaneous report from a contactable physician. A 52-year-old female patient received her first dose of BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot number was not reported), via an unspecified route of administration at the age 52-year-old on 12Mar2021 at single dose for COVID-19 immunisation. Medical history included hemodialysis for many years, adherent to medical care, multiple DVTs and Pes (On anticoagulants), morbid obesity, Patient was on dialysis for renal failure and had lupus anticoagulant (positive), Afib, allergic to shellfish. Family history included renal failure and had lupus anticoagulant. Concomitant medications included warfarin sodium (COUMADIN); metoprolol; amitriptyline; calcitriol; ergocalciferol (VIT D); calcium; calcium acetate (PHOSLO); amiodarone; albuterol. The patient previously allergic to Cipro, clindamycin, doxycyclin, Lyrica, tetracycline. The patient previously was non-responder to hepatitis B vaccine. The patient previously received first dose of BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE) on 17Feb2021 for COVID-19 immunisation. The patient hasn't been treated with immunomodulating or immunosuppressing medications or received any other vaccines around the time of COVID-19 vaccination. The patient wasn't smoker/ former smoker. There was no any other vaccinations within four weeks prior to the first administration date of the suspect vaccine. A nephrologist who reported patient in her hemodialysis unit who were vaccinated with BNT162b2 but were recently diagnosed with COVID-19. More detail is below on each patient. The patient COVID results were sent to the local health department for genetic sequencing (pending) and SARS titers were drawn (pending). Unfortunately, the HD unit does not have B/L information (although the B/L # was put on the patient's COVID vaccine cards, a record was not kept in the HD unit). Day she came in for dialysis she was already short of breath she said she'd had body aches for 5 days, got short of breath on 05Apr2021. The day before, started getting cough, nauseous, chills, abdominal discomfort on 04Apr2021. The patient was sent to the ER from dialysis

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

and was admitted for SOB on 05Apr2021 and passed away on 09Apr2021 due to a GI bleed. Patient is over 500lbs so was unable to fit into hospital imaging equipment for CT scans or weight measurements. COVID-19 test was positive on 05Apr2021; the patient experienced COVID pneumonia on 05Apr2021. The patient admitted on 05Apr2021 to regular floor. The patient was moved to an Intensive Care Unit on 06Apr2021. The patient experienced short of breath on 05Apr2021 and required much more O2 than normal. Sometimes required BP support while on Dialysis and BP was 113/61 in ER. Pressure dropped to 100/70 and required mitrodine after fluid was removed. The patient needed 4 liters supplemental O2 vs. only needing 2 liters at home. The patient experienced tachypnea and hypoxemia and no Respiratory failure. Respiration was 22. After 5 litres of O2 improved. Pulse 93 in ER. Cardiovascular: There was no heart failure, cardiogenic shock, Acute myocardial infarction, arrhythmia and myocarditis. The patient Had chest pain which resolved when O2 was administered. Gastrointestinal/Hepatic: There was no Vomiting, Diarrhea. The patient experienced nausea but no vomiting or diarrhea and complained of abdominal pain. There was no Jaundice and acute liver failure. Neurological: There was no altered consciousness, altered consciousness, encephalopathy, meningitis and cerebrovascular accident. The patient had headaches a couple days before admitting to ER. Hematological: There was no Thrombocytopenia, Disseminated intravascular coagulation. INR was 3 due to large dose of coumadin, and platelets were 180 and white count 6.8. Slight troponin increased at 0.37 at admittance, BNP 39. The patient started coughing up blood, having hemoxysis and bleeding on unspecified date. Laboratory test or diagnostic studies was reported that test for SARS-CoV-2 by PCR, or other commercial or public health assay. Xray showed vascular congestion with superimposed infiltrate which could represent pneumonia. Blood count was 11 and 36.7% at ER. Clinical chemistry: Sodium was 133; BUN was 68; Creatinine was 10. Evidence of hypoxemia: Pulse oO2 was 90 in ER. CT scans: unknown results. Urinalysis: On dialysis so does not make urine. The patient had received Remdesivir, from 06Apr2021, Hydroxychloroquine/chloroquine, Azithromycin from

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

06Apr2021 and Corticosteroids from 06Apr2021 for COVID-19. The outcome of event "GI bleed" was fatal, the event "chest pain" and "body aches" was recovered and other events was unknown. The patient died on 09Apr2021. An autopsy was not performed. Information on the lot/batch number has been requested.; Sender's Comments: Based on temporal association, a contributory role of the suspect drug cannot be excluded for the events vaccination failure, COVID-19, COVID-19 pneumonia, and sepsis. However, the patient's multiple medical comorbidities including renal failure requiring dialysis, lupus, and morbid obesity along with the risk of COVID-19 infection in light of the current pandemic are the more likely explanations for the development of these infections. The events gastrointestinal hemorrhage, hemorrhage, hemolysis and troponin increased are attributed to intercurrent medical conditions, and are considered unrelated to the suspect drug. The patient is currently on warfarin which may increase the risk for bleeds. This case will be reassessed upon receipt of additional information. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.; Reported Cause(s) of Death: GI bleed

1235650	4/21/2021	CO	62	F	3/3/2021		<p>took 3 steps and just blacked out and passed out; coughing; black eye; didn't remember losing her consciousness; When she sneezes or cough her chest hurts; can't turn over while sleeping at night; she has not gotten back to normal; This spontaneous case was reported by a consumer and describes the occurrence of LOSS OF CONSCIOUSNESS (took 3 steps and just blacked out and passed out) in a 62-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 019B21A and 011A21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included No adverse event (No reported medical history.). On 03-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 01-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On an unknown date, the patient experienced LOSS OF CONSCIOUSNESS (took 3 steps and just blacked out and passed out) (seriousness criterion medically significant), COUGH (coughing), EYE CONTUSION (black eye), MEMORY IMPAIRMENT (didn't remember losing her consciousness), CHEST PAIN (When she sneezes or cough her chest hurts), MOVEMENT DISORDER (can't turn over while sleeping at night) and FEELING ABNORMAL (she has not gotten back to normal). At the time of the report, LOSS OF CONSCIOUSNESS (took 3 steps and just blacked out and passed out), COUGH (coughing), EYE CONTUSION (black eye), MEMORY IMPAIRMENT (didn't remember losing her consciousness), CHEST PAIN (When she sneezes or cough her chest hurts), MOVEMENT DISORDER (can't turn over while sleeping at night) and FEELING ABNORMAL (she has not gotten back to normal) had not resolved. Not Provided Treatment information was provided as tylenol. No concomitant information was provided. Patient mentioned she is a vegan no meat, dairy, does not take pills. Woke up next morning, she had a black eye, her reading glasses were broken, didn't remember losing her consciousness. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Further information has been requested. This</p>

case was linked to MOD-2021-076632 (Patient Link). Reporter did not allow further contact; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Further information has been requested.

he was a "full-blown diabetic" in an emergency situation/he wasn't diabetic until he got the shot; his sugar was "400 something"; chest pain; abdominal pain; felt awful; if he closed his eyes he would just go to sleep; This is a spontaneous report from a contactable consumer (patient's parent). A 51-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not reported) via an unspecified route of administration on an unspecified date as a single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The reporter was calling in behalf of her son. The patient had the first dose of Pfizer's COVID-19 vaccine on Saturday about 2 weeks ago, does not know exact date. The next Monday, on an unspecified date, he was a "full-blown diabetic" in an emergency situation and his sugar was "400 something". The patient also experienced chest pain, abdominal pain, felt awful, and if he closed his eyes he would just go to sleep on an unspecified date. Back in Dec (year not reported), his blood sugar was 88 in a general check-up, but he was not a diabetic as far as they knew. The reporter stated that he wasn't diabetic until he got the shot. They think it was caused by the COVID shot, he was told in the emergency room not to take the 2nd shot. The outcome of the events was unknown. Information about lot/batch number has been requested.

1235716	4/21/2021	CA	41	F	3/26/2021	3/26/2021	Heart was racing/ pounding heart; chest pain; chest pressure; shortness of breath; heart palpitations and fluttering; Two EKGs have shown shortened PR interval of 110; This is a spontaneous report from a contactable consumer (patient). A 41-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; lot number not reported) via an unspecified route of administration, administered in Arm Left, at the age of 41-year-old, on 26Mar2021 11:45 as SINGLE DOSE for covid-19 immunisation. Medical history included Pituitary adenoma, seasonal and penicillin allergy. The patient is not pregnant at the time of vaccination. The patient was not diagnosed nor tested for COVID prior vaccination. Concomitant medication included fluticasone propionate (FLONASE). The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; lot number not reported), via an unspecified route of administration, administered in Arm Left on Mar2021 as SINGLE DOSE for covid-19 immunisation; and Amoxicillin and Clindamycin and experience allergies. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 26Mar2021 at 12:15pm, her heart was racing about 30 minutes following vaccination. The patient felt pounding heart throughout the night as well as chest pain and pressure. Over the next several days in 2021, the patient felt heart palpitations and fluttering, intermittent chest pain, and shortness of breath. Two EKGs in 2021 have shown shortened PR interval of 110. No other testing has been done. The patient is currently wearing a Ziopatch. The patient did not receive treatments and required physician office visit in response to the events. Outcome was recovering at the time of the report. Information on the lot/batch number has been requested.

1235760	4/21/2021	GA	49	F	4/1/2021	4/4/2021	<p>my right leg was still bothering me, It feels a little bloated, so I am walking slower than usual; my right leg was still bothering me, It feels a little bloated, so I am walking slower than usual; I was afraid I was having a heart attack; Initial hyperactivity; tiredness; chest pains; urge to vomit; body aches all over; This is a spontaneous report received from a contactable consumer (patient herself). A 49-year-old non-pregnant female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Lot number was unknown), via an unspecified route of administration in left arm on 01Apr2021 at 16:00 (at the age of 49-year-old) as a single dose for COVID-19 immunization. The patient's medical history included issues with anemia in the past and known allergies: Tree nuts was all that I am aware of (allergies to medications, food, or other products: Tree nuts was all that I am aware of). Concomitant medications were not reported. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient did not receive any other medications within 2 weeks of vaccination. Prior to vaccination, the patient was not diagnosed with COVID-19. The patient did not receive other vaccine within four weeks of vaccination. The patient did not receive other medications within two weeks of vaccination. Since the vaccination, the patient has not been tested for COVID-19. No COVID prior vaccination. The patient was not tested for COVID post vaccination. It was reported that the, initial hyperactivity on 04Apr2021 (patient think it was the anticipation of the shot), followed by tiredness that evening on 04Apr2021, Friday, Saturday, and Sunday. With the exception of having lunch with a friend on Saturday and stopping by to check on her mom, patient stayed home all weekend because she was feeling very tired. Late Sunday night after going to bed she awoke with chest pains and the urge to vomit on 04Apr2021. Patient was up and down vomiting for several hours and began to experience body aches all over on 04Apr2021. At one point she was afraid she was having a heart attack on 04Apr2021. On Monday morning and throughout the day she was still experiencing body aches and stayed home from the office. Patient slept propped up on the living room sofa Monday night because lying down made her body aches worse. Today, Tuesday 06Apr2021, her right leg was still</p>

1236117	4/21/2021	FL	47	F	3/7/2021	3/27/2021	Immediately had flu symptoms the same night as vaccine that went away within 2 days. HOWEVER, twenty-one (21) days later, both eyes were extremely painful to move. Then I lost vision in right eye with extreme blurriness & partial blind spots resulting in a diagnosis of Optic Neuritis by Ophthalmologist and Neurologist. Confirmed optic Neuritis on MRI scan. Twenty-four (24) days later, numbness in legs, feet and right arm started. Hard to walk up and down stairs. Twenty-six (26) days later, extreme pain in in muscles and skin along with tingles all over and numbness. Weakness and Chest pain. Flu like symptoms without fever ie: aches, pains, skin pain, confusion. Dizziness, feeling of being extremely anxious and out of sorts in space. Had to complete round of Steroids and numbness and tingles got better, but did not dissolve. After completion of IV steroids, thirty-four (34) days later all symptoms returned full force and worsening. Checked into ER 4/10 and admitted into hospital. Have not been able to complete normal routine or work level since March 27th due to neurological disturbance and symptoms. Two (2) Eye exams, 3/30/21 confirming swollen optic nerves. MRI 3/31/21 Blood work 4/2/21 CoVid Test 4/9/21 Negative Hospital: April 10-12th. MRI Extensive Blood work Spinal Tap Neuro-Opt exam Outcome pending and further treatment pending results.

1239205	4/21/2021	WA	38	M	4/15/2021	4/17/2021	10:00PM Saturday, 4/17/21 Sudden chest pain. Tried to sleep it off, pain lingered all day Sunday 4/18/21. 8:00PM went to local ER with same chest pain, had not gotten better. ER took blood draw, my troponin was 4.6 and doctors thought it was an error since I am 38 years old and otherwise health with no history of chest pain or family history of heart trouble. Second blood draw showed troponin at 5.0 getting worse. They called an ambulance and took me to the hospital nearby. Third blood draw showed 6.0 and I spiked at 10.0 overnight. I had several EKGs, a CT scan, and an angiogram. None of these showed any obstructions or blockages in the heart or blood vessels that could have caused the heart trauma. I had an echocardiogram which showed that my heart is only pumping at 50% which is low for a healthy young person who is a runner. I was diagnosed with myocarditis and with having had a Non-ST Segment Elevation Heart Attack. Again, I have no family history of this, I am otherwise healthy, I do not use drugs and I did not have any trauma to my chest, such as a car accident, that could have caused this. The only explanation is that it was related to the COVID shot, which I had roughly 48 hours before my sudden chest pain
1239133	4/21/2021	NY	37	F	4/7/2021	4/16/2021	I received the vaccine on the 7th and in the night a migraine started along with fever on and off and on the 16th I went to the Emergency room with a migraine and chest pains and after running some tests I have pulmonary embolisms

1239131	4/21/2021	AR	24	M	4/1/2021	4/17/2021	DIAGNOSTIC STUDIES: 1. Chest x-ray that was normal. 2. CT angiography of the chest showing no abnormalities. 3. Echocardiogram showing no significant abnormalities. HOSPITAL COURSE: A 24-year-old male, primary care patient, received a second dose of the Pfizer COVID-19 vaccination 3 days prior to admission. Following this, he had a fever, chills, body aches, and then developed severe chest pain. The pain was worse lying flat, better when sitting up and leaning forward and worse with a deep breath. He had gone to an urgent Care and was recommended going to the emergency room. The patient's troponins were elevated and his EKG was fairly classic for pericarditis. He was felt to have probably viral myopericarditis and was admitted for observation. He was placed on aspirin and colchicine. He seems stable from Cardiology to be discharged on this regimen as well as symptomatic treatment. It was not known whether the COVID vaccine was implicated with this or not. DISCHARGE DISPOSITION: CONDITION: Stable and improved. MEDICATIONS: 1. Colchicine 0.6 mg b.i.d. 2. Aspirin 650 mg t.i.d. 3. Oxycodone/acetaminophen 5/325 mg every 4 hours p.r.n. for pain. 4. Zofran 4 mg sublingual q.8 hours p.r.n. for nausea. DIET: Regular. ACTIVITY: As tolerated. FOLLOWUP: With Cardiology on May 3rd. If worsened pain, shortness of breath, or high fever, return for evaluation sooner. In which case, steroids may be administered.
1239071	4/21/2021	CA	71	F	2/27/2021	3/6/2021	Patient developed severe left arm and chest pain within 1 week of receiving 2nd COVID vaccine dose. She presented to ER and was admitted given her prior cardiac history. Chest x-ray, echo, CT left shoulder and scapula were all negative for acute process during admission (3/6-8/21). Left arm soft tissue ultrasound on 3/12 was also normal. Pain improved with hydrocodone/acetaminophen as needed and over the course of 1 month after vaccine.
1239069	4/21/2021		46	M	4/18/2021	4/21/2021	3 days after the vaccine patient presented with headache, body ache and chest pain. Found to have elevated troponin, and abnormal EKG

1238341	4/21/2021	FL	64	F	4/7/2021	4/17/2021	<p>Patient claims "3 days" after vaccination she developed headache that worsened over the next two days to include dizziness, photophobia, scotomata. However, the state tracking system lists her date of vaccination 10 days prior to the symptom onset. Below is a more detailed description: This is a 64-year-old female nurse practitioner with coronary artery disease, uncontrolled (untreated) type 2 diabetes, obesity, and remote history of kidney donation who presented yesterday with a 5-day history of nausea and frontal headache with new recent dizziness /lightheadedness when standing. She describes her headache as starting out as temporal and periorbital and then persisting as a frontal discomfort radiating to the back and down the neck. Associated with this were complaints of blurry vision, photophobia and scotomata. She denies any focal weakness or numbness/tingling. There was no vomiting or reports of seizures. She denies no recent problems finding words or bouts of confusion. She denies a history of arrhythmia or palpitations. Patient received the first dose of the Moderna COVID-19 vaccination on 4/14/2021 into her right arm, 5 days prior to admission (But state records list 4/7/2021 as the date). She did not take any medication to pre-empt side effects such as NSAID, aspirin, H2 blocker, or Tylenol. Initially she developed a sore arm the night of the vaccination. Three days later the headache developed that did not respond to Tylenol PM although it helped her sleep. She noted taking more than the recommended dose and had mouth dryness. Patient denies any past history of COVID exposure and any illness c/w COVID where she was not tested. She has never had her antibody titer checked. She recently had a dental procedure for an exposed nerve and had a temporary filling placed. No antibiotics were given and denies having a dental abscess. She described that one of her sisters developed "blood clots from her heart due to atrial fib" after her Pfizer vaccination. She denies rashes or stigmata of endocarditis, no fevers, chills, or night sweats. She describes vaginal itching a few days ago and self treated with an anti-yeast cream (Monistat) that relieved symptoms and does not currently have dysuria, frequency or urgency. On admission, her UA was abnormal and culture is pending but she received one dose of Rocephin and is still without urinary symptoms. After admission CT scan and MRI of the</p>

1237573	4/21/2021	KY	67	F	4/14/2021	4/19/2021	PATIENT AWOKE WITH CHEST PAIN. Pain was anterior chest, a soreness, steady, lasted 15 min, non-radiating, and she is unclear of alleviating or relieving factors. She states she has been unwell since a day after she had her second Moderna vaccine 4/14/21. She states that since then she has had persistent fever, TMax 101.8, fatigue, nausea, anorexia, has been unable to eat or drink.
1237501	4/21/2021	NY	30	M	4/21/2021	4/21/2021	Primary complaint: chest pain. Patient received 2nd COVID vaccine and had 2 cups of coffee on an empty stomach this morning. Pain in center of chest. Worsens during inspiration. Stays in one spot. Does not move or change. Patient does not work out and no family history of heart issues. Vital signs taken once. Patient refused a 2nd set of vitals. Patient advised to follow-up with primary care in regards to heart issues.
1237667	4/21/2021	TN	22	M	4/15/2021	4/17/2021	Developed fatigue, back pain, chest pain, nausea and vomiting the morning after the vaccination. On Saturday 4/17, I awoke feeling some better. Performed my daily routines uneventfully other than just not feeling 100 percent. By that evening the chest pain returned. On 4/18, I awoke with severe chest pains. I then presented to the ER where was presumed I was having a heart attack vs. acute pericarditis/myocarditis.
1237686	4/21/2021	NY	55	F	3/9/2021	3/15/2021	6 days after shot I got a debilitating headache (the worst headache of my life 10/10 pain). I went to the ER and they proceeded to do a CT scan and blood work. Nothing abnormal was found. The next day I went to Hospital ER due to the head pain, shortness of breath, chest pain and high blood pressure. They put me on steroids and pain meds and I was referred to a Cardiologist and neurologist. 4 days later I was in the ER again for head pain, my BP was 220/125 due to pain when entering the hospital. After about 2 weeks, I saw a neurologist. He prescribed various pain meds including anti-seizure meds and shots. The cardiologist feels that it is not a heart issue. I remain having daily headaches 6 weeks later but the intensity is lower (5/10). My BP is now back at a normal level. I am awaiting 2 more tests. MRV and spinal puncture test.

1237803	4/21/2021	CA	31	F	4/8/2021	4/17/2021	Presented to ED 4/18 with severe L sided chest pain since 4/17. Arm weakness and numbness 4/18 that lasted a few hours but resolved. No vision changes. O2 sat was 100% on room air. Diagnosed with PE. No recent mobilization. Does not smoke or use illicit drugs. Was admitted to the hospital telemetry unit 4/18-4/20. Discharged on apixaban. I do not have any information on the vaccine Lot number received.
1237886	4/21/2021	VA	61	M	3/24/2021	3/26/2021	Angina-like chest pain and frontal headaches off and on for three weeks from date of 1st injection. I believed it to be vaccine side effects and continued normal daily exercise routine, which is quite rigorous in some instances. Exercise seemed to alleviate problem temporarily. I never considered angina or heart issues as a problem since I've had great exam stats, including low cholesterol, low triglycerids, normal EKG, not overweight, never smoke, exercise regularly, maintain healthy diet. Day of second dose, chest pain and headaches increased significantly. EKG performed by PCP and Emergency Room confirmed abnormal. Diagnosed with acute myocardial infarction, emergency angioplasty performed on right coronary artery. I felt this all to coincidental given timing and duration of side effect with 1st and 2nd shot. All EKGs in past, including one in August 2020, normal, and then abnormal six months later.

1238010	4/21/2021	CA	40	F	4/7/2021	4/7/2021	About six hours after the vaccine I had a headache. I woke up during the night with all over body aches that were very painful. I also had a headache and fever of 100-102 degrees. I was in bed for three days and I was still very fatigued for a whole week. My hands and legs were swelling off and on. I also had some shortness of breath, coughing and chest pain. I was dizzy and lightheaded. I have been very uncomfortable and unable to sleep. I still have tingling and pain in my feet. I get easily winded and I am still experiencing headaches. It has been almost three weeks. My feet and hands are still swelling and my hands are very red. I am seeing my doctor today for a breathing treatment. Everything seems to be slowly improving but the headaches are still coming and going. I have a weird feeling of bubbles all over.
1238082	4/21/2021	MS	74	F	4/6/2021	4/6/2021	On the night of my vaccine, 04-06-2021, I experienced chills all night long. I also had a terrible headaches, SOB, chest pain. I also experienced light headiness which lasted one week. I went to see a doctor on 04-13-2021, who performed x-rays of the chest, did lab work and did an EKG which the tests came back normal. To this day I still have light headiness, nausea and light-headiness.
1237505	4/21/2021	OH	59	F	4/7/2021	4/16/2021	Chest pain. Sent to ER via squad. Currently on vent in ICU.

1235397	4/20/2021	NV	22	M	4/13/2021	4/15/2021	Young healthy patient presented with chest pain starting 3 days after vaccine. Profoundly abnormal EKG and marked troponin elevation. Workup consistent with acute myocarditis of unclear etiology.
1235401	4/20/2021	CA	29	F	2/24/2021	2/26/2021	48 hours after the vaccine my mouth began itching after eating. It happened during breakfast and lunch this day, and then the next morning at breakfast, which is when I became worried. My throat began feeling tight, felt like it had mucus in it and I needed to clear it. My mouth was itching and my tongue felt tingly. Four days after the vaccine my tongue started to swell so I called my doctor. I saw him the Tuesday, 3/2 after the vaccine and he said my thyroid was swollen and felt I was having an allergic reaction to the vaccine. He did an allergy panel and lab work for my thyroid, all tests came back within normal limits. He referred me to an allergist and said to take benadryl every six hours. A few days later my bottom lip started to swell and my tongue ached. I was also having intermittent chest pains for about five weeks. Then my lymph nodes in my throat started throbbing. I saw the allergist on 4/6 and he advised to cancel the second dose. He did lab work to check for autoimmune disorders and inflammation but tests came back normal. He advised on 4/19 to take allegra two times a day for three weeks and we will follow up. Ongoing symptoms are mouth itching after eating, tingling in throat, and itching on throat and neck, and on and off swelling of my bottom lip. I have also experienced lightheadedness and ocular migraines.

1235464	4/20/2021	CA	50	F	1/2/2021	1/18/2021	I was exposed to Covid 5 days after vaccine. I tested positive 10 days after vaccine. 12 days after has headache , aches, diarrhea. Got the Regeneron monoclonal antibody infusion s 1/18 and had throat swelling about 1 hour into the infusion and got benedryl. Improved so went home then about 5 hours after the infusion. I had chest pain and chest tightness so went to the ER with concern if re action to this infusion. Took benedryl and xopenex and that help. I went home ER after PE and MI ruled out Had fever a few days later so got augmentin. The headache and aches from Covid slowly resolved. No further chest pain.
1234584	4/20/2021	NY	74	F	3/22/2021	4/19/2021	She is a 74-year female with history of morbid obesity, OA on chronic opioids, T2DM, CKD 3, HTN, and hypothyroidism who presents with 10 days of worsening fatigue and trouble ambulating. She reports that she started feeling unwell about 10 days ago with a sore throat and pain radiated to her left ear. She had trouble swallowing due to the pain and was generally tired, thinking she had strep infection or ear infection. Her sore throat resolved as did her ear pain, however her fatigue worsened and had trouble walking due to weakness. Felt like she had trouble functioning at home, soshe presented to the ED. In the ED, she is hemodynamically stable, satting low 90s on room air. Labs are significant for mild hyponatremia 133 and bump in creatinine 1.84 (previously 1.44). Found to be Covid positive, and CXR with possible right lower lobe infiltrate. Currently, reports feeling tired with poor appetite and body aches though no shortness of breath, chest pain, nausea. She has been eating foods that taste good to her, not following diabetic diet and sugars have stayed appropriate. Denies any sick contacts or leaving the house. Of note had her Covid vaccine (J&J) 3/22 in her house, and does not know where she contracted Covid.

1234787	4/20/2021	MA	73	F	4/18/2021	4/18/2021	At 8:00 PM I began having chills and a headache. I checked my temperature and it was 100F. By 8:30 I went to bed and coughed a lot. I became nauseous and had dry heaves. My left arm was sore. I was extremely thirsty. I spent the night going to the bathroom and it became harder to do because I had excruciating pain in my lower back. I could barely walk. My Afib seemed to be acting up and I had strong chest pain and was out of breath. This kept me up all night. By morning, I tried to get up but was unable to do so. I finally fell asleep around 1:30 p.m. and woke up at 6:00 pm. To my relief, most of the symptoms had subsided and I could get up and walk around.

1233041	4/20/2021	VA	31	F	4/8/2021	4/9/2021	The next morning I went to urgent care because I was experiencing really bad chest pains and body aches where an EKG and chest X-Ray were perform and I was released and advised if the symtoms got any worse to come back or got to the ER. For the next week the chest pain persist and got worse. I experienced severe chest pains, struggled with breathing at night, was extremely tired and felt worn out. I had sharp pains throughtout my body so I went to the ER where a EKG and D-Dimer test was peromed and was advised it was elevated and I left. I went to the ER later that day who checked the D-Dimer who advised it was normal and was I was released from there as well after monitoring. The next day I began having sharp pains in my stomach and diarreah which prompted me to now go to hospital where a CT scan, X-Ray and EKG was peromed there also which all results came back normal and advised I reach out to a Cardiovascular Specialist for the Chest pains and I have an appointment scheduled for 4/21/21 for further followup on that
1233074	4/20/2021	MN	23	F	4/17/2021	4/19/2021	Both my lips are swollen and I had to get rushed to the ER and I?m having chest pain
1232763	4/20/2021	CO	59	F	3/12/2021	3/17/2021	On 3/17/21 patient returned to clinic complaining of sudden onset of dizziness, weakness, shaking, some SOB and anxiety. Patient reports this started suddenly at noon. She reports associated lightheadedness and difficulty with focusing her vision. She reports "feeling like I am going to pass out and not wake up". Denies nausea, vomiting, head injury, fall, slurred speech, confusion, or chest pain. Last meal was previous night, has not eaten that day. She denies recent alcohol use, did admit to smoking marijuana prior to episode starting. She did have the Johnson&Johnson Covid vaccine on 3/12/21, only has had a sore left arm, denies other side effects. Patient was sent to the emergency department via ambulance for further evaluation. Work up at the emergency department showed bilateral pulmonary embolisms.

1231382	4/20/2021	MD	34	F	4/16/2021	4/18/2021	Other than the expected sore arm at injection site, I've been experiencing slight chest pain. It feels like something is sitting on my chest or stuck inside of my chest. This began early Sunday morning around 1:00am.
1231384	4/20/2021	IA	70	M	2/24/2021	3/13/2021	Sharp Chest Pain resulting in Death 2 hours later, 03/13/2021 @ 12:08
1231395	4/20/2021	WA	34	F	4/3/2021	4/4/2021	The day after my second shot, I felt like I was having a heart attack. My chest got tight around my heart and it came in waves. My heart/lungs in my chest in that area felt very heavy and in severe pain. It was hard to breath. I felt like someone was squishing me. I have a high tolerance for pain but this pain I thought I was dying. This started about 10:30 in the morning, my husband ran me to the hospital but had to pull over because I was screaming in pain and couldn't breath while I was in the middle of a ?wave? of pain. He called 911, they met us in the parking lot. They gave me 4 aspirin and then took me to hospital. By the time I got to the hospital, the aspirin had helped. This aspirin saved my life. I was then discharged with ?chest pain unspecified type?

1231560	4/20/2021	NJ	17	F	4/15/2021	4/17/2021	On 4/17/21 (ie within 48 hours of receiving COVID 19 Pfizer Shot #2 (4/15/21), my daughter began experiencing chest pain in the PM (PM of 4/17). It was initially mild so we did a watch and wait overnight but when it did not go away by morning of 4/18/21 we went to Urgent Care . Upon presentation at urgent care, she had an irregular EKG, we were advised to immediately do to a Hospital ER , upon arrival she presented with same EKG findings from urgent care, BW was run and her troponin level was a 7, this hospital recommended (after consultation with their cardiologist) that based on her age and urgency of the heart condition, we should be transported to a pediatric hospital with cardiology expertise. She was transported by ambulance to another Hospital, Cardiology Unit. . After a scary 24 hour overnight stay at the hospital she was released on 4/19/21.

1232498	4/20/2021	MN	64	F	4/17/2021	4/18/2021	Patient arrived to Emergency department of Medical Center 4/18/21 around 5:00 PM and reported that she had received a COVID vaccine dose #2 at outside clinic a day before this and today is experiencing significant side effects. She presents here with dizziness, headache, myalgias, and urinary incontinence. Around 1:00 PM today she had started to develop body aches, headache, myalgias in the hips, back and arms, chills and sweats. She had a urge to urinate but was unable to get up from reclining due to weakness in her legs and pain when moving. She states it took her an hour to get off the couch and then had difficulty walking due to severe dizziness, and she fell to the floor in her bedroom and fell back and hit the back of her head on the ground but denies any loss of consciousness. She has no visual changes, no nausea or vomiting, no chest pain, no shortness of breath, or hematuria or dysuria, also no numbness in the groin. She states it is painful to move.
1232001	4/20/2021	WI	23	M	4/15/2021	4/16/2021	Per patient, he developed chills, subjective fevers, body aches few hours after the vaccine on 04/15. Also developed chest discomfort that progressively got worse over the next 1-2 days which prompted him to visit the ED on 04/18. He was found to have troponin elevation with diffuse J-point elevation. He received aspirin and was started on heparin drip. Chest pain completely resolved by the next day. Coronary angiogram was negative. Cardiology attributed stroke elevation and chest pain to myocarditis secondary to vaccine. Echo was normal with no evidence of pericardial effusion.

1232048	4/20/2021	IN	64	M	3/25/2021	3/25/2021	This is a pleasant 64yo male that presents to Hospital with acute SOB. He states that yesterday morning he received his covid-19 vaccine and then went home. Later in the afternoon he developed acute SOB, not made worse by exertion or lying down. He has chronic COPD and checks his pulse ox multiple times per day. He typically runs 85-92% and states that he was running around 87%. Due to his SOB he sought medical care and was found to be hypoxic with an O2 saturation of 78% in the ER. He had a CTA of the chest which showed a chronic left lobe PE and an acute PE to the left subsegmental branch of the inferior lingula artery, small bilateral pleural effusions and cardiomegaly. There was no evidence of right heart strain on the CT readout. His first two troponins are WNL. He admits to being sedentary at home over the last year since he lost his job. He was also found to be in a-fib with RVR and intermittent a-flutter, both of which are new per patient report. He has been started on Cardizem and Heparin drips. Currently, he is up ad lib and comfortable. He denies overt shortness of breath and is able to carry on a full conversation. He denies chest pain, abdominal pain, m/s pain, bowel/bladder issues, n/v/d or diaphoresis. He is alert and oriented. He has a PMH of copd, chroinc hypoxia, tobacco use, ble pitting edema, htn, and hld.

1232350	4/20/2021	NY	27	F	1/8/2021	1/11/2021	1/11/2021: I experienced a bit of an itch on my right foot. 1/12/2021: Then felt it again the next day. 1/13/2021-1/30/2021: This itch traveled out of my foot and I started to feel this tingling sensations on my right leg. The tingling would come and go. It moved to my left leg and then my arms. I also felt the tingling in my elbows, fingers, neck, boob area, abdomen. My lower back felt tight too. I was also experiencing chest pains, like pressure on my chest that would come on throughout the day. Sometimes 1 a day sometimes 3 times a day. Pressure would come on for about 30 seconds to 1 minute then subside. I also had an increased heart rate (tachycardia). I received the second dose of Pfizer on 1/30 and experienced the ?typical? symptoms the next day. On 1/31/2021 I had body aches, fatigue, low grade fever. The symptoms disappeared within 24 hours, and I did not feel any tingling on that day. On 2/1/2021 in the evening, I started experiencing severe tingling in both lower extremities. On 2/2/2021: I felt the tingling all over my body: legs, torso, forehead, back of head, vagina, tongue, back. I was experiencing severe chest pains. Heart rate was extremely high. On 2/3/2021: I went to the ER, and they sent me home with a referral to see a neurologist. Blood Pressure was extremely high (153/110). On 2/5/2021: I felt this horrible pin pricking sensation up and down my spine that went on for hours. Additionally, my right leg went numb and stayed numb until the next morning. On 2/6/2021: My right leg went numb again in the evening. It resolved in an hour. I also began experiencing some muscle twitching. It started in my right leg but I can feel it in various parts on my body (thighs, buttock, calves, arms, hand, and right underneath armpit on my back). I have burning mostly in my thighs, forearms (near elbows area), and upper shoulders. I have pin pricking sensations around my body. And I have muscle twitching in my arms, legs, back, and hand. Chest pains have resolved, blood pressure is back to normal, and my heart rate isn't so elevated anymore. I also have been experiencing some bad diarrhea the past two months (beginning on 2/19/21 until current)!

1234044	4/20/2021	OH	72	F	3/4/2021	3/24/2021	<p>Patient called c/o shortness of breath on exertion, slight cough, runny nose, weakness and fatigue. States O2 sitting 97 and P 79-80 and O2 walking <88 and P 100's. States had covid vaccine # 1 on 3/4/2021. Completed viral/travel screen which was negative. Patient is a 72 y.o. female with chronic diastolic heart failure, hypertension, hyperlipidemia, hypothyroidism, vitamin D deficiency, depression with anxiety, who presented with shortness of breath on exertion. CTA chest was performed, showing filling defects in secondary and tertiary pulmonary arterial branches in bilateral lower lobes as well as right upper lobe. Patient was admitted for management of acute bilateral pulmonary emboli. Patient was started on Lovenox 1 mg/kg twice daily; transitioned over to oral apixaban for discharge. TTE obtained, without evidence of right heart strain. Patient is a 72 y.o. female who presents to the office today stating "I do not feel so good". She mentions noting blurry vision over the past 1 week right eye only with decreased vision. Denies any eye pain. Thinks her vision is worse outside in the sun. In addition, today she states she was up moving around getting ready for today's appointment when all of a sudden she felt a brief slight low light shock pointing to left anterior chest wall. Denies any chest pain or pressure but reports noting her heart rate was elevated up to 150. She states her O2 sat at home was 97% on room air. She checked her blood pressure which was not abnormal but cannot recall the number. She was recently diagnosed with a PE for which she was hospitalized, see previous note. She is concerned as she feels perhaps her Covid vaccine initially received on 3/4/2021 could have caused her blood clot. Her second dose was received on 3/31/2021 and has since not been feeling well EKG in the office with new onset A. fib relation noted, rapid ventricular rate with a pulse of 152 bpm. 911 was called and patient transferred to the ER for further evaluation and recommendations. Patient currently on Eliquis for PE Patient, with a past medical history of essential hypertension, mixed hyperlipidemia and grade 1 diastolic dysfunction, as well as acute bilateral pulmonary emboli 3/2021 diagnosed a few days after her first dose of the Pfizer Covid vaccination, now anticoagulated on Eliquis who presented to KMC emergency room on 4/14/2021 from her primary care provider's office after being found in newly diagnosed</p>

1233121	4/20/2021 MN	58 M	3/12/2021	3/22/2021	<p>atrial fibrillation with RVR, rate in the 150s. Of note, patient had received her second dose of the Pfizer Covid vaccine on 4/10/2021. She had scheduled this primary care provider appointment due to waxing and waning blurred vision of her right eye, with associated right-sided headache that had been ongoing over the last week. Patient reports that on the day of arrival she had not felt well, felt slightly weak and fatigued, but denied shortness of breath, chest pain or heart palpitations. Per ER notes, patient was instructed on vagal maneuvers while she was in the ambulance, and had converted to sinus rhythm by the time of her arrival to the emergency room. Per review of her telemetry on the day of discharge, patient did have one short episode of PAF on 4/15/2021, spontaneously converting to sinus rhythm, as well as intermittent PACs. Her home lisinopril was changed to Coreg, without further episodes of RVR and with good blood pressure control. In regards to her headache, patient underwent an MRI of the brain, which was negative for acute findings; she had no temporal tenderness, and ESR was within normal limits. She did improve symptomatically with administration of Tylenol and Zofran for her corresponding nausea/vomiting. On the day of discharge, patient was feeling much better, and stable for discharge. An appointment with doctor of ophthalmology was offered to patient for 4/16/2021, however due to transportation issues, this was rescheduled for 4/20/2021. She was instructed on changes in her medication, as well as encouraged to schedule an appointment with her established cardiologist. All questions and concerns were addressed.</p> <p>Received shot on 3/12. Starting having pain in chest on 3/22. Was diagnosed with blood clots in the lungs on 3/26 via blood test and CT scan.</p>

1233779	4/20/2021		58	M	4/13/2021	4/13/2021	The patient is a 58-year-old male who presents as a transfer from Hospital for evaluation and of recurrent syncope and management of a left-sided mandibular fracture. The patient reports that his symptoms first started after his first dose of the moderna vaccine. He reports that he felt recurrent nausea and diaphoresis however had no syncopal episodes. Following his second dose of vaccine on 4/13 he reports 3 episodes of syncope. He describes the sensation of nausea and diaphoresis followed by loss of consciousness. After the first episode he passed out and he hit him his jaw and has pain in his left jaw since that time. He had 2 further episodes of syncope 2 of which were witnessed. No seizure activity was described by by witnesses and the episode lasted approximately 1-1/2 minutes. He denies any palpitations or chest pain or incontinence or tongue biting. He denies similar symptoms previously.

1234017	4/20/2021	CA	18	F	4/17/2021	4/17/2021	<p>Patient came in for her first dose of Moderna vaccine today. I was called by MA to see Patient as Patient was having symptom(s) 15 minutes after the vaccine was given. I saw Patient at 0935. Patient stated that she feels pressure in her anterior throat, that it was hard for her to swallow saliva, and that her tongue felt big. I performed physical examination: Cardiovascular: RRR S1 S2 Pulmonary: Lungs clear to auscultation Mouth/Throat: Posterior pharynx doesn't look swollen, tongue doesn't look swollen MA and myself continued to monitor Patient. I asked Patient to call her mother who Patient stated was waiting downstairs. I asked MA to obtain vitals: BP: 128/79 HR: 102 bpm I explained to Patient and mother that I think Patient should be given the Epi-pen in order to prevent any of the symptom(s) from worsening. Patient and mother agreed to have the Epi-pen administered. At 0950, Patient stated that her tongue doesn't feel big anymore, but that she still feels pressure in her anterior throat. Patient asked for water, she was given a water bottle by MA. After drinking water, Patient stated it was hard to swallow the water. At 0955, I administered the Epi-pen in Patient's right thigh. Patient felt okay with the administration of the Epi-pen. I asked MA to observe Patient for 15 minutes, Mom was in the room with the Patient as well. At 1015, I went in to see Patient, and per MA and Patient, Patient was feeling much better. Patient stated that her symptom(s) had resolved, she was not feeling pressure in her anterior throat any longer, she was able to drink water normally, and she didn't feel that her tongue felt big any longer. I performed repeat physical examination: Cardiovascular: RRR S1 S2 Pulmonary: Lungs clear to auscultation Mouth/Throat: Posterior pharynx didn't look swollen, tongue didn't look swollen I asked MA to obtain repeat vitals: BP: 116/73 HR 94 bpm I have advised Patient to talk to her PCP about whether she should get the second dose of Moderna, or perhaps get another vaccine such as Pfizer in place of the second dose of Moderna. I have let Patient know that I will CC her chart to her PCP and will try to get a Telemedicine visit with the doctor for Patient during the next week. I have let Patient know that I will e-prescribe Epi-pen for her. I have advised Patient and Mom that if symptom(s) worsen or if new symptom(s) start (such as chest pain, SOB, hives, throat/mouth/face/tongue swelling or any other</p>

1234083	4/20/2021	CO	35	F	4/6/2021	4/10/2021	Four days after receiving my first dose, I developed hives covering my chest. These particular hives disappeared within a few hours, but following that first outbreak I continued to have hives every day for 10 days. The hives would occur at different times on all parts of my body, including my face and the palms of my hands and the bottoms of my feet. The hives were often itchy. There seemed to be a contact component, in that pressure on my skin would cause the hives to occur in a given spot, though contact may not have been the reason for all of the hives. At times, my entire torso would be covered, and when I woke up in the morning, my legs were often impacted. To treat the hives, I took Benadryl at night, which is often when the hives were worst, though I would still wake up with hives in the morning. It is difficult to say if the Benadryl was effective. On April 19th, I woke up with hives on my legs, but these disappeared after a few hours, per usual. I didn't develop any more hives throughout the day or evening, and as April 20th have not developed any more hives. Over the course of the 10 days, I considered whether external allergens may have been the cause of the hives, but numerous measures taken to alleviate the situation did not result in any change. (And the pollen on the trees outside eventually dissipated though the hives did not.) During this time, I also experienced some mild chest pain and coughing. I had a Covid-19 test on April 14th that returned a negative result on April 16th.
1234108	4/20/2021	GA	56	M	3/13/2021	4/19/2021	Went to the hospital with chest pain. They performed a catheter to check for blockages and instead found an extremely rare blood clot that ultimately caused a mild heart attack.

1234257	4/20/2021	CA	27	F	4/5/2021	4/16/2021	<p>a 27 y.o. female with a history of Covid infection December 26, 2020, positive covid test December 29, 2020. She had approximately 2 weeks of symptoms including generalized body ache and generalized weakness. Fatigue and some headache. Had some persistence of symptoms after that time. Had some benefit from ibuprofen. Was seen at emergency room on January 27, 2021 stating that she felt that all her symptoms of Covid had resolved except for some chest pain which awoke her on January 27. She presented to the emergency room. Had sinus tachycardia at 113 but otherwise unremarkable physical exam, laboratory studies with white blood count elevated 16,004-20, hemoglobin 13.7 g hematocrit 41.8%, MCV 87.1, RDW 12.7%, platelet count 329,000, segs 72.8%, lymphs 20.6%, monocytes 4%, eosinophils 1%, basophil 0.6%. BUN 10.1, creatinine 0.8, AST 24, ALT elevated 56, alkaline phosphatase 68, total protein 7.6, total bilirubin 0.3, albumin 3.6, globulin by subtraction 4.0, troponin less than 0.02, D-dimer quantitative 0.22, urine pregnancy test normal. Chest x-ray normal. Chest pain appears to be musculoskeletal and was reproduced by palpation of her chest wall. No evidence of deep venous thrombosis or pulmonary embolism. D-dimer was normal. Heart rate returned to normal after some intravenous fluids. Patient discharged on Zithromax 500 mg day 1 and then to 50 mg days 2 through 5. Also continued on ibuprofen. Received Johnson and Johnson vaccine April 5, 2021. Over the next week patient started having increasing soreness. Her joints hurt more than usual and her headache was worse. She had a sensation that her legs were "numb and tingly" starting at her buttocks and extending down her leg. Because of reported incidence of cerebral sinus thrombosis or cerebral vein thrombosis patient appropriately presented for screening in the emergency room and was sent for appropriate imaging. April 16, 2021 CT scan of head with and without contrast no acute intracranial hemorrhage, no mass-effect or midline shift. On contrast-enhanced images there appears to be a lobular nonocclusive filling defect in the far lateral right transverse sinus. Lobular occlusive filling defect is also likely present in the mid to central right transverse sinus. Short segment filling defect in the medial left transverse sinus. Remainder of sinuses and internal cerebral veins</p>

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

are patent. Focal lobular filling defect within the confluence of the right and transverse sinus most likely related to arachnoid granulation. No edema hemorrhage of the cerebellum or cerebrum. No other significant findings. April 16, 2021 confirmatory MRI angiogram of head without contrast with no restricted diffusion to suggest acute or subacute infarct. Contrast void in the middle to central right transverse sinus consistent with occlusive thrombus. Nonocclusive thrombus in the far lateral right transverse thrombus. Narrowing of the medial left transverse sinus without complete occlusion. April 16, 2021 2345 hrs. initial hematology consultation. D-dimer and fibrinogen levels have been requested stat and are still pending. If fibrinogen level is low will replace with cryoprecipitate. If D-dimer is elevated barely confirms diagnosis of possible vaccine related thrombosis. The fact the patient is not thrombocytopenic at this time is encouraging, however despite the lack of thrombocytopenia she still has clearly documented symptomatic nonocclusive and occlusive thrombus in her cerebral sinus. From UPToDate.com Ad26.COVS.2.S (Janssen COVID-19 vaccine, also referred to as the Johnson & Johnson vaccine) ? On April 13, 2021, the US Food and Drug Administration (FDA) and Centers for Disease Control and Prevention (CDC) recommended pausing administration of AD26.COVS.2.S to further investigate rare cases of cerebral venous sinus thrombosis and thrombocytopenia [33]. As of that date, six cases had been reported, all in females aged 18 to 48 years with onset 6 to 13 days after vaccination; during this period, 6.8 million doses were administered (with 1.5 million doses in females of that age range) [121-123]. Since some vaccine recipients have not been followed for longer than the time frame over which these symptoms develop, the incidence may change with additional follow-up. Initial symptoms included headache, backache, chills, and fatigue, and progressed to focal neurologic deficits. Intracerebral hemorrhage and thromboses at other sites were also seen in some patients. All of the five patients who were tested for the anti-PF4 HIT antibody tested positive. Another case, in a young male who was a vaccine recipient in one of the pre-emergency use authorization efficacy trials, had been previously reported. These cases appear similar to those reported following ChAdOx1 nCoV-19/AZD1222, another

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

adenovirus-vector vaccine. Although rare, the observed number of events exceeded the expected rate among females <50 years old. Given the extreme rarity of these events, the FDA and CDC acknowledge that they recommended the pause out of an abundance of caution and to ensure awareness of these rare events.

?Evaluation and management of possible thrombotic complications ? Recipients should be aware of the possible association and seek immediate care for signs and symptoms suggestive of thrombocytopenia (eg, new petechiae or bruising) or thrombotic complications (including shortness of breath, chest pain, lower extremity edema, persistent severe abdominal pain, unabating severe headache, severe backache, new focal neurologic symptoms, and seizures) [117]. In such cases, some experts suggest evaluation with complete blood count and differential (including the platelet count), quantitative D-dimer, HIT testing, and imaging of any suspected site of thrombosis [113,114,125]. Onset 4 to 20 days after vaccination, platelet count <150,000/microL, elevated D-dimer, and a positive anti-PF4 antibody (HIT antibody) suggest the diagnosis. Treatment with a non-heparin/non-warfarin anticoagulant (eg, argatroban or direct oral anticoagulant) and intravenous immune globulin has been suggested. The CDC recommends not using heparin in individuals with thromboses following receipt of Ad26.COV2.S unless HIT testing is negative [126]. (See "Cerebral venous thrombosis: Etiology, clinical features, and diagnosis" and "Clinical presentation and diagnosis of heparin-induced thrombocytopenia", section on 'Terminology and HIT variants' and "Management of heparin-induced thrombocytopenia", section on 'Role of IVIG'.) As stated above all the 6 cases were "all in females aged 18 to 48 years with onset 6 to 13 days after vaccination" this would certainly fit the timeframe that we are seeing in this case. Recommendations from national guidelines would be to start treatment with dexamethasone immediately while awaiting intravenous gammaglobulin. To pursue intravenous gammaglobulin treatment at 1 g/kg over 1 to 2 days. It is recommended to avoid heparin and instead use direct factor X inhibitor such as Eliquis, which this patient is already been started on. There is unfortunately considerable risk that even though patient's symptoms appear mild at this time, that she may

deteriorate in the very near future and I would recommend treating her aggressively at this time with dexamethasone and intravenous gammaglobulin while we are awaiting further testing. Patient clearly has had unusual thrombosis, especially in a 27-year-old. With the fact that she had headache dating back to January, it is impossible to determine the acute versus chronic nature of her venous sinus thrombosis. Covid infection does cause increase in coagulation as well. However, given the small risk of tragic outcome with cerebral vein and sinus thrombosis in the setting of Covid vaccinations, we will proceed aggressively with treatment starting tonight with intravenous gammaglobulin and intravenous dexamethasone. Will require rapid fasting glucoses to evaluate possible hyperglycemia from high-dose dexamethasone. Will consider stopping dexamethasone at 48 hours. Current recommendation for gammaglobulin would be single 1 g/kg or 500 mg/kg over 2 days. No recommendations for treatment beyond this point. Current recommendations for gammaglobulin dosing would recommend using an adjusted dose for patients with greater than 125% of their ideal body weight. This patient at 122 kg on a 5 foot 2 inch frame does qualify for adjusted dose and her orders reflect that. I appreciate the opportunity see this patient this evening and consultation requested by Dr. We will follow patient in hospital. Hopefully she will have gradual improvement and avoid any serious or tragic complications of her cerebral sinus thrombosis. We will have pharmacy report possible adverse reaction to Johnson & Johnson vaccine to the FDA as required by law. April 17, 2021 follow up. No new events. Laboratory studies remained excellent. White blood count is further elevated, however, this may be secondary to high-dose dexamethasone with a white blood count of 16,060. Hemoglobin 14.0 g hematocrit 42.8%, MCV 86.8, RDW 12.9%. Platelet count is actually increased slightly at 374 as of 9:10 AM this morning. Differential shows left shift as expected with dexamethasone. Results from yesterday showed fibrinogen normal at 369 (180?415) pro time normal at 10.4 seconds with INR of 0.97, PTT 26.7. D-dimer 0.23 (0.19?0.50). With platelet count, fibrinogen and D-dimer normal I am inclined to believe that this is not an acute post vaccination HIT-like phenomena. If it were I would still expect to see some

degree of thrombocytopenia elevated D-dimer and perhaps low fibrinogen. The other explanations for her cerebral venous sinus thrombosis are either idiopathic spontaneous and merely coincidentally associated at the exact same time as her Covid infection or more likely, cerebral venous sinus thrombosis secondary to hypercoagulable state secondary to her Covid infection from December 2020. Unfortunately there is no way to accurately date the acuity of the venous thrombosis in her cerebral sinus. HIT Testing is still pending and most likely will not be available for 3-4 more days despite being ordered stat. Have called the laboratory and asked them to check with our outside reference lab what the expected return time is on this test. (LabCorp says "Tuesday April 20, 2021). Patient refused intravenous gammaglobulin infusion which has been ordered last night. Patient has been receiving dexamethasone which was a bridge until intravenous gammaglobulin could be administered. Current guidance from the expert hematology panel (EHP) on Covid vaccine induced thrombosis dated April 7, 2021 from the public health would state that a patient who has a reduced platelet count without thrombosis with a D-dimer normal and normal fibrinogen or thrombosis with a normal platelet count and D-dimer normal and normal fibrinogen are "unlikely cases". They recommend for probable cases who have D-dimers that are elevated to send HIT assay and then give immediate intravenous gammaglobulin while awaiting results. They recommend fibrinogen supplementation, if needed. They recommend a direct acting antithrombin agents such as the Eliquis this patient is receiving. They recommend steroids particularly if there is a delay in getting intravenous gammaglobulin delivered. With the fact that we now have 24 hours in the hospital with no evidence of thrombocytopenia, no evidence of increased fibrinolytic activity or active thrombosis, and no evidence of hypofibrinogenemia, I would argue that her presentation is subacute. In this setting, I do not feel intravenous gammaglobulin would be necessary and does involve a small risk as well as considerable cost. Dexamethasone also involves small risk and negligible cost. I have discontinued both of these medications. My overall impression would be that this was not related to her Johnson & Johnson vaccination which was recent, but

rather her more distant Covid infection. It is impossible to definitively answer the question however. The next question is duration of anticoagulation. Risk of recurrent cerebral sinus venous thrombosis is relatively small but the morbidity can be high. Studies have been performed showing medications in the same class as Eliquis have been associated with a decrease in incidence of the recurrence. Most hematologist recommend 3 months of anticoagulation for provoked venous thrombosis including cerebral sinus venous thrombosis. I feel this patient's thrombosis is "provoked", with her association at the same time of her Covid infection (and possibly vaccination). I would recommend Eliquis (apixaban) 5 mg twice daily or Xarelto (rivaroxaban) 20 mg daily with food. I would feel comfortable in discharging patient for outpatient follow up IF Dr and other speciality services agree. Plan 3 months of full dose anticoagulation with direct factor X inhibitor. Circulation 2010 Jun 29;121(25):2740-6 "Long-term evaluation of the risk of recurrence after cerebral sinus-venous thrombosis", Background: The clinical course of cerebral sinus-venous thrombosis (CSV) is largely unknown because prospective studies with a long follow-up and with the goal to assess thrombosis recurrence rate and predisposing factors for recurrence are lacking. Methods and results: One hundred forty-five patients with a first CSV were followed up for a median of 6 years after discontinuation of anticoagulant treatment. End points were recurrent CSV or other clinical manifestations of venous thromboembolism. CSV recurred in 5 patients (3%) and other manifestations of venous thromboembolism (deep vein thrombosis of the lower limbs or pulmonary embolism) were seen in 10 additional patients (7%), for a recurrence rate of 2.03 per 100 person-years (95% confidence interval, 1.16 to 3.14) for all manifestations of venous thromboembolism and 0.53 per 100 person-years (95% confidence interval, 0.16 to 1.10) for CSV. Nearly half of the recurrences occurred within the first year after discontinuation of anticoagulant therapy. Risk factors for recurrent venous thrombosis were male sex (adjusted hazard ratio, 9.66; 95% confidence interval, 2.86 to 32.7) and, for thromboses other than CSV, severe thrombophilia resulting from antithrombin, protein C, protein S deficiency, anti-phospholipid antibodies, or combined abnormalities

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							(adjusted hazard ratio, 4.71; 95% confidence interval, 1.34 to 16.5). Conclusions: The risk of recurrent CSVT is low and is higher in the first year after discontinuation of anticoagulant treatment and among men. Mild thrombophilia abnormalities are not associated with recurrent CSVT, but severe thrombophilia entails an increased risk of deep vein thrombosis of the lower limbs or pulmonary embolism. April 19, 2021 Follow up, no change in condition. Discussed case with Dr, will order Factor V Leiden, prothrombin gene mutation, anti phospholipid and anti cardiolipin antibodies, if she will allow draw. Expect Heparin Induced Thrombosis testing result tomorrow, but with no thrombocytopenia after given heparin, expect will be normal. Will await result. If discharged, would recommend 3 months direct thrombin inhibitor (Eliquis/Xarelto/Pradaxa) at full anticoagulation dose. Then stop, no taper. Overall still feel "provoked" thrombosis due to December Covid, unrelated to J&J Covid vaccine, but can not definitively prove that..

1233196	4/20/2021	MA	20	M	3/12/2021	3/20/2021	Admission HPI: Right-sided chest pain began 2 days prior to admission (3/19) after getting out of car, without identifiable trigger. Pain was sharp, pleuritic, and worst with movement; didn't feel it when still. Pain not responsive to ibuprofen or heating packs. Reported 30-60 seconds of self-resolving heart racing during ocular migraine which has been his baseline for years. Not associated with SOB (at rest or with exercise), palpitations, presyncope, or syncope. No viral URI symptoms, N/V, or rash. He did receive his 2nd Moderna COVID vaccine about 1 week PTA, followed by 36hrs of fevers, chills, and body aches. Given persistence of pain, Patient asked his parents to present to urgent care. In UC, he was noted to tachycardic with CXR with bibasilar atelectasis and b/l effusions, per report. Given continued tachycardia, decision was made to transfer to ED to r/o PE. In ED, tachycardic to 104-116 and tachypneic 22-26. Had one episode of tachycardia to 182 iso ocular migraine. Endorsed chest pain but points to R middle abdomen when asked where worst. Exam was unremarkable. He received 1 dose of morphine which reduced pain from 10/10 to 0/10. Labs notable for leukocytosis (14.61), thrombocytopenia (422), elevated d-dimer (1.56), and elevated CRP (5.6). Otherwise normal chem and coags. COVID/RVP negative. CXR unremarkable. CTPA showed scattered PEs in b/l lower lobes with small pulmonary infarct in RML. No evidence of right heart strain. Heme was consulted who recommended starting him on lovenox and sending lupus anti-coagulant. Cardiology was consulted who recommended EKG, BNP, and troponin, all of which were normal and reassuring against right heart strain. ECHO was therefore deferred to the AM. The decision was made to admit. Upon arrival to the floor, Patient was tachycardic 114 and tachypneic to 22, otherwise stable vitals. He denied any pain since morphine. Denied any unexpected weight loss; reports that car ride was short. Mom reports that Patient has been less active d/t cold weather and baseball being on hold. Denies family or personal history of clots. Last seizure ~13 years ago. Hospital Course: (3/21 - 3/22) Patient was admitted to the hematology service. He was therapeutically anticoagulated with LMWH injections and his anti-Xa level prior to discharge was 0.92. (goal 0.5-1.0) Lower extremity ultrasound with Doppler showed patent veins

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

and no evidence of DVT and upper extremity ultrasound showed no evidence of DVT, though there was potential evidence of collateralization seen in mid and distal third of right subclavian vein and left internal jugular vein. Since this was an unprovoked PE, a full thrombophilia workup was sent and will be followed up by the outpatient hematology clinic. Cardiology consulted regarding possibility of right heart strain and the tachycardia during migraine episodes. Echocardiogram performed on 3/22 was technically limited but showed no gross abnormalities. The cardiology team requested a repeat echo scheduled outpatient for 1-2 months after discharge.

1233206	4/20/2021	NM	61	F	4/15/2021	4/15/2021	<p>DAY ONE April 15, 2021. On Thursday April 15th at 10:00 a.m. I received the first dose of the Covid 19 vaccine. They gave me the shot in my left arm. Within about 5 seconds, I started feeling nauseated and light headed like I was going to pass out. I asked to just sit there for awhile because I did not feel stable to stand up and go to the waiting area. I stayed seated for about 1-2 more minutes then the paramedics took me to the Medical area in a wheelchair. The paramedics checked my vitals. My blood pressure was 135 over ?? I don't remember. I told the medic my BP is normally 98/58. She said my BP was elevated. My pulse was in the high 80's. My temperature was 98.6 and my oxygen was 100. I started getting pain and pressure going up the back of my neck, into my head, eyes and ears. It was very painful and throbbing pressure. I felt dizzy and really high. It felt like I was floating on the top of the ceiling and the people were off in a distance. I was really woozy. I then got diarrhea. The nausea continued but I did not throw up. At times my thinking was spacey, so I talked to the paramedic to help me stay grounded. I narrated what was happening in my body. They did a glucose finger prick test because of my spaceyness, but it was normal. It was like my whole system was freaking out. I was there and then not there, feeling like I was floating. These symptoms continued for about 90 minutes and getting worse. The paramedics offered me to go to the hospital, but I thought eventually I would be fine. I did not want to go to the hospital and have a huge medical bill. At around 90 minutes, I started having pain in my heart left side, under my left breast on my left shoulder. The paramedics did an EKG and did not find anything but some irregular heartbeats. The heart beats felt like BA BOOM, then my heart would do a cartwheel. BA BOOM and another cartwheel. At this time, my husband arrived and took me to the hospital emergency room because the pain in my heart was getting worse. I stayed in the hospital emergency room until around 5:00pm on April 15th. They did another EKG and some lab work and did not find anything but low thyroid. I continued to feel drunk, nauseated, pain pressure and throbbing in my head neck, ears and eyes, diarrhea, and like I was High and going to pass out. The chest pain in my heart was off and on. It felt like muscle cramping in my heart, under my left breast and the left shoulder. I</p>

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

also got a pain in my left groin area, then behind my left knee. It was a sharp and throbbing pain for about an hour in each location, but eventually went away. While in the Emergency room, they tried to give me Ativan. I asked what it was for and they said Anxiety. I said I wasn't anxious; I was just having a reaction to my first Covid 19 vaccine. I said I did not want it because my body was already struggling to handle the Covid 19 vaccine. They said the doctor prescribed it. I said I had not seen a doctor, and they said it is protocol. The nurse then came in and wanted to give me a shot for nausea and I said no, I don't want any more chemicals in my body, it is really having a hard time already with the Covid vaccine. I went home, was wiped out, still feeling drunk/woozy/high, also nauseated, diarrhea, very dizzy, had a hard time walking. The pain, throbbing in my head, neck, ears and eyes was still there. By this time, I could not find clear thoughts, and could not make sense of things. I was very agitated and at the same time exhausted and only wanted to sleep. DAY TWO April 16, 2021 I woke up with a smashing head ache, neck ache, back ache and general feeling like Crap. The nausea and diarrhea were still there and had woken me in the middle of the night. I felt like a truck had hit me. I stayed in bed all day and tried to eat and drink as much as I could. I drank a lot of water that day. I felt horrible, but was able to stand without feeling like I was going to fall over. Had trouble finding clear thoughts at times. Still felt out of it and had chest pain off and on. Also had the BA BOOM heart beats and cartwheels in my heart. DAY THREE April 17, 2021 Very similar to day two. I felt weak, nauseated, diarrhea, pain all over, jittery, not able to have clear thoughts at times. It felt like my body was still on RED ALERT!!! I also had very shallow breathing on day 2, 3, 4 and 5. It tired me and I panted just getting up to go to the restroom. I am able to eat fine and keep food down. BA BOOM hear beats and cartwheels in my heart have lessened. DAY FOUR April 18, 2021 I felt a little better and made the mistake of thinking I was getting over the reactions and did too much. Shortness of breath. DAY FIVE April 19, 2021 I feel horrible again, Nausea is really strong as well as the diarrhea. I am feverish, sweaty and shaky. Shortness of Breath. Tight in my chest. I just took my temperature and it is normal, although I am hot, sweaty, feel feverish and shaky. I am

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

						exhausted. The headache is still here as well as the pains in my neck, ears and eyes. The aches in my body are still here. I have no energy. A wave of emotions is also here and I am weepy and crying. This is no fun. I am able to eat food OK and drink lots of water to counteract the diarrhea. DAY SIX April 20, 2021 Shortness of breath, very tight in my chest, having to take Benadryl and use my rescue inhaler to keep my breathing open. Feverish, chills, shakey, hot. Temperature 97.0 Blood pressure 90/66 Pulse 70. I feel like crap, just wiped out.	
1233239	4/20/2021	NY	31	F	3/12/2021	4/17/2021	31 year old female who presented to the ED on 4/17/21 complaining of generalized weakness. She reports that since receiving the Pfizer Covid vaccine approximately one month ago she's been feeling unwell. She received Covid vaccine on 2/19 & 3/12. Over the next week she developed began having episodes of nausea vomiting and diarrhea. She was considering issues such as pregnancy and had at least 10 pregnancy test over the last 2 weeks her symptoms worsened and she began having weakness and general malaise. She reports the weakness originally started with the lower extremities and then she was unable to walk and required 2 people to help her stand. She denies any chest pain or shortness of breath, she does have some dizziness and lightheadedness. She does report that she had palpitations over the last week that were gradually worsening increasing in both frequency and duration. Also reports a rash that started on 4/17/21. She has notable lower extremity edema. Clinical course worsened requiring hemodialysis, intubation and a transferred. Hospital on 4/20/21. Assessment indicates patients primary issue is the cardiomyopathy, as there is no evidence of thrombocytopenia, questionable viral cardiomyopathy with subsequent multiorgan dysfunction syndrome . Pt was vaccinated at hospital.

1233138	4/20/2021	MA	21	F	4/12/2021	4/13/2021	The first 2 days she had mild nausea and headaches. The 3rd day she developed chest pain, worse on the left than right, radiates to the back. She states chest pain has continued and has been constant since then. Worse with movement, deep breaths, and lifting a heavy case at work. Rates pain 3-6/10 and describes as sharp and "twinge" with movement. She has taken OTC medication for the pain without relief. There is no where that is tender to touch. She is able to do her usual activities and states she is very active at work. Feels the pain limits her breathing at times and causes some SOB. She is able to speak in full sentences over the phone without difficulty. No audible wheeze. Had asthma as a child but much improved as an adult. Denies left arm, neck or jaw pain, lightheadedness, dizziness, nausea, vomiting, cough, fever, or sore throat. She is eating and drinking normally. She notes she has a family hx of cardiac disease and stroke. No MI before the age of 50 or sudden cardiac death that she knows of. She has a nexplanon implant and is on norethindrone and estradiol.
1233354	4/20/2021		41	F	4/11/2021	4/15/2021	Patient presented for J&J Covid-19 Vaccination. Reported feeling anxious in anticipation of vaccination and stated that she felt like her heart was racing. 1233359	4/20/2021	TX	31	F	3/10/2021	3/17/2021	She initially had COVID infection in January with dyspnea, chest pains, and chills which persisted for months. On March 10th she was given Moderna first vaccine. Her chest pain and chills resolved a couple of days after that vaccination. 4 days after that, she developed the migrating arthralgias which improved with movement. Labs including inflammatory markers were unremarkable other than ANA 1:320. The joint pains persisted for a couple of weeks and are now improving, but now she reports recurrence of the chills. These are disruptive and occurring suddenly multiple times daily with no objective measurable fever. Second dose was postponed until resolution, which has not yet occurred.
1233366	4/20/2021	CA	54	F	4/19/2021	4/19/2021	Patient started having substernal chest pain non radiating at first. After 10 minutes she stated it was moving to her left arm. She complained of shortness of breath. Vital signs were taken and with exception of slightly elevated blood pressure they were within normal limits. Patient was on a gurney, VS taken every 15, she was given water. After 30 minutes she said she was still having pain and did not want to go home. A team alert was called at that time and she was taken to the emergency room. She was admitted to the Emergency department at 7:32pm and left at 8:39pm
1233372	4/20/2021	NJ	48	F	4/15/2021	4/16/2021	chest pains in center of chest/breast bone area started at approximately 3 pm on 4/16 and lasted about 1.5 hours. I felt the pain in my back as well directly behind the chest pain.
1233387	4/20/2021	OH	62	F	4/16/2021	4/16/2021	Patient received Pfizer vaccine and presented with history of allergic reactions to Sulfa and Contrast Dye. Patient is Type II Diabetic. Post-vaccine patient stated tingling and discomfort, respiratory distress, lethargy, difficulty speaking and chest pain. Vitals: B/P - 197/102, Blood Glucose - 138. Paramedic and RN agreed to dispatch for EMS as symptoms were not improving. Emergency responders arrived at 11:20am, patient transported to Hospital -

1233309	4/20/2021	TX	22	F	4/9/2021	4/9/2021	<p>Mother gave me lot # which is Moderna lot#201A21A, but the vaccination card says Janssen which does not match up with this lot#. Mother reports that she had the vaccine, had no symptoms, and then started with a fever that evening of 103. She was having cold extremities, numbness, tingling of the arms, face, legs. The fever dropped and went away and was having fatigue and getting winded doing regular activities. By Monday she continued with the shortness of breath and go increasingly worse as the days went on and also the. By Wednesday she was having chest pain, numbness and tingling of her extremities and shortness of breath. She went to the hospital, gave her IVs, says her BP was elevated and sent her home. Mother told her to sleep and see how she felt. By Thursday night 4/15/21 she screamed out because she was having chest pains and having chest and pains and not able to straighten out her hand and could not catch her breath. She was then taken back to the hospital and said that she her BP was high and said that she had the Janssen vaccine, and said that she was hyperventilation due to anxiety. Once they got her stable and released her again. Mother asked the doctor if he felt that this was normal, and could see her throat contracting and that she was stable and to go home, and he said yes and that it was anxiety and that sometimes we get ourselves worked up about things and that was causing it. The daughter has no history of anxiety, no breathing issues. They did labs and everything was okay, her counts were somewhat off but nothing felt to be abnormal. She then went to another Hospital as she was still not feeling well, and checked the other reports from the other hospital and they conferred with that information, gave her Valium and sent her home. As the evening progressed on Friday 4/16/21 she started having chest pains and her girlfriends mother is a nurse and came and saw her and called the mother and told her that she did not like how she was looking, and that her SOB and weakness in her extremities and the tightness in her chest was not right and that she felt that she had a PE. They took her to another location, she had extremely high calcium levels, and high blood pressure and her heart rate was high and she was admitted. She has been on flushes to reduce calcium, and her blood levels are improving. She is on Warfarin to prevent clotting. She has had a CAT scan and other</p>

1230869	4/19/2021	IL	34	M	4/5/2021		<p>BLOOD CLOTS IN LEFT LUNG; TIRED; FEVERISH; This spontaneous report received from a consumer concerned a 34 year old male. The patient's weight was 175 pounds, height was 67 inches and Body mass index (NR: not provided) 27.4. The patient's concurrent conditions included non smoker, no personal or family history of clotting disorders and no recent trauma or travel. The patient was active and ran for 30 mins every day. The patient received COVID-19 vaccine ad26.cov2.s (suspension for injection, route of administration not reported, batch number: 043AZ1A or 043A21A) frequency one total, dose was not reported, administered on 05-APR-2021 at 10:15 hours in left arm for prophylactic vaccination. The batch number was not reported and has been requested. No concomitant medications were reported. On 05-APR-2021 in the evening, the patient experienced "normal side effects", specifically tiredness and fever (temperature was not taken) and he took 2 Advil and went to bed. On 06-APR-2021 in the morning, he felt back to his normal baseline. On an unspecified date of APR-2021 (08-APR-2021 or 09-APR-2021), he felt pain and tightness in his chest and difficulty breathing. He noticed that he had to work harder to do his daily run. On 13-APR-2021, when the symptoms did not improve, he went to the emergency room. The patient had blood was taken (results not reported). A computerised tomography (CT) scan showed 2 blood clots in the left lung and duplex scans of both legs did not reveal a clot. A chest x-ray was done but results not provided. The patient's COVID-19 test was negative, and he was admitted to the hospital and treated with intravenous heparin. It was reported that no oxygen was given. On 14-APR-2021, he was discharged with Eliquis which he should continue for 6 months. On 16-APR-2021, the chest pain was gone, and his breathing was better in the morning but still difficult later in the day. The action taken with COVID-19 vaccine ad26.cov2.s was not applicable. The patient recovered from tired, and feverish, and was recovering from blood clots in left lung. This report was serious (Hospitalization Caused / Prolonged, and Other Medically Important Condition).; Sender's Comments: V0: This 34 year-old overweight male (BMI 27.4) was hospitalized for 2 blood clots in his left lung 8 days after receiving vaccination with Janssen Covid-19 vaccine. medical conditions, was a nonsmoker, no personal or family history of clotting disorders, no recent trauma or travel, and exercised every day. On the evening of his vaccination, he felt tired and fever (temperature not taken) and took 2 ibuprofen and went to bed. The following morning, he felt back to normal. Two or three days later, he felt pain/tightness in his chest and difficulty breathing; he found it more difficult to perform his daily exercise. Eight days after vaccination, when his symptoms did not improve, he went to the emergency department where a CT scan showed 2 blood clots in his left lung. Covid-19 testing and duplex scans of his legs were negative. Blood tests were performed but results were unknown. He was hospitalized for 1 night, treated with IV heparin, and discharged the following day with apixaban. As of the time of this report, the chest pain had resolved and breathing was improved in the morning but still difficult later in the day. Based on the limited information (e.g. absence of blood test results), the relationship with Janssen Covid-19 vaccine is considered indeterminant.

1230818	4/19/2021	TX	19	F	3/24/2021	3/25/2021	<p>legs. Patient had some mild blurriness of vision in the right eye. Symptoms have been persistent and patient began to have some difficulty with walking and feeling off balance. Patient describes the headaches as primarily right-sided. According to nursing staff, the patient has also had some incontinence of urine today. Patient has had some numbness over proximal legs and "private areas". 4/19/2021 ? Assessment as per Infectious Diseases physician; Pt with continued intermittent headaches. Has continued difficulty bearing full weight due to unsteadiness. No loss of sensation at arms/legs. Has action tremor, wide gait, hyperreflexia of arms/legs bilaterally. ADEM Hyperreflexia CSF pleocytosis Fatigue Headache, new onset Patient has nonspecific findings of CSF pleocytosis as well as clinical findings concerning for ADEM. No infectious cause for this problem; temporally associated with receipt of Janssen COVID vaccine. 4/19 Assessment as per Neurologist; Question of transverse myelitis/ADEM: Perhaps induced by the Covid vaccine On steroids MRI scan of the thoracic spine shows demyelination but no contrast enhancement Continue to work with therapy services No signs of CNS infection and antibiotics discontinued. The patient continues on methylprednisolone 500 mg iv q 12 hr at this time (4/19/2021).</p> <p>Essentially I experienced flu-like symptoms the next day after I took my first vaccine dose. My first symptom was my throbbing headache that lasted longer as well. My other symptoms were high fever, fatigue, chills, sweating, and sudden rapid heartbeat, a little chest pain in my left part of the chest, and muscle and body aches, and a little difficulty breathing. My fever also lasted for a couple of days and symptoms subsided at the end of the second day after the vaccination day. I would please, please like to know if it's safe for me to take the second dose? I know I would be able to handle the side effects but expected to encounter them on the second dose and not the first dose, so please let me know as my second dose date will be this Wednesday on the 21st of April.</p>

1231009	4/19/2021	CA	32	M	4/16/2021	4/16/2021	<p>Patient received the 1st COVID-19 Vaccine (Pfizer, Lot #: EW0162, expiration date: 07/31/2021) at 10:00. At 10:12 patient ambulated to Medic in the observation area, asking to use the restroom due to complaints of nausea. Patient was advised by Hospital that he would not be able to use the restroom due to his physical presentation of pale, warm, moist skin, pupils becoming greater than or equal to 9 mm, and a look of confusion. Medic attempted to assist the client with ambulation to anti-gravity chair, when the patient?s knees buckled and he was assisted to the floor. Nurse and Nurse responded to assist Medic. Patient lost consciousness and was then assisted into anti-gravity chair and sternal rub applied. Per Medic , patient?s loss of consciousness subsided after 3 seconds and became conscious, alert, and oriented to person, place, time, and event (CAOX4). Patient stated he has ?syncopal episodes every time he has a procedure done that involves needles.? Baseline vitals were obtained by Medic at 1015, while patient was sitting: blood pressure: 98/50, heart rate: 60, respiratory rate: 18, pupils equal and reactive to light at 5 mm. Patient claimed that about 2 minutes status post-vaccine, he began to feel ?lightheaded, nauseous, and had a hot flash. Patient stated he has similar reactions every time. Patient denied chest pain, headache, vomiting, abdominal pain, and blurry vision. Patient was given water to sip on. At 1020, second set of vitals were taken by Medic, while patient was sitting: blood pressure: 90/60, respiratory rate: 16, heart rate: 97, and patient was conscious, alert, and oriented to person, place, time, and event (CAOX4). Patient?s skin was normal color, warm, and dry. Pupils were 3 mm and equal and reactive to light. Patient claimed last oral intake was on 04/15/2021 with minimal fluid intake as well. Patient denied any complaints and claimed he was feeling better. ALS interventions offered by Medic for further evaluation and care, but patient refused. Third set of vitals were obtained by Medic, while patient was standing, at 1030: blood pressure: 118/76, heart rate: 82, respiratory rate: 14, and patient was conscious, alert, and oriented to person, place, time, and event (CAOX4). Patient was negative for orthostatic pressures and was released into the care of his spouse, after waiting in the observation area for about 1 hour. Patient drank a full 12 ounce water bottle and was able to walk out on his own, with a steady</p>

visited emergency room and was hospitalized. She was diagnosed with bilateral DVTs to the lower extremities and PE in both lungs. Details of the hospitalization were not reported. She was discharged after 5 days of hospitalization with prescription of enoxaparin injection twice a day for 6 months. The patient was recovering from bilateral DVT to lower extremities and PE in both lungs. Based on the available information, with risk factors of obesity and cancer, DVT and PE are assessed as indeterminate with causal association to immunization, per WHO causality classification for adverse events following immunization. Company causality is considered not related to JANSSEN COVID-19 VACCINE. Additional information has been requested for further assessment.

1227941	4/19/2021	OH	20	F	3/31/2021	4/1/2021	pericarditis; Chest pain; This is a spontaneous report from a non-contactable physician. A 20-year-old female patient received second dose of BNT162B2 (Batch/Lot number and expiry date was not reported), via an unspecified route of administration on 31Mar2021 as a single dose for COVID-19 immunization. Medical history included generalised anxiety from an unknown date. The patient's concomitant medications were not reported. The patient previously received first dose of BNT162B2 on 10Mar2021 for COVID-19 immunization. On 01Apr2021, the patient experienced pericarditis and chest pain. The patient was not pregnant at the time of vaccination. The patient did not receive any other vaccines within four weeks prior to the vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has been tested for COVID-19. The patient underwent lab tests and procedures which included Nasal swab and PCR: both negative on an unknown date. The adverse events resulted in doctor or other healthcare professional office/clinic visit and emergency room/department or urgent care. Therapeutic measures were taken as a result of pericarditis and chest pain which included High Dose NSAIDs. The outcome of the events was unknown. The events were assessed as serious which caused hospitalization. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: The events pericarditis and chest pain are most likely intercurrent conditions and unrelated to suspect vaccine BNT162B2. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1227974	4/19/2021	FL	50	F	3/18/2021	3/20/2021	DVT in right leg; chest pain; PE in right lung was found on CT scan; numbness in both legs; Back pain; This is a spontaneous report from a contactable consumer (patient). A 50-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) dose 1 via an unspecified route of administration, administered in arm left on 18Mar2021 13:30 (Lot Number: EP7534) as single dose for covid-19 immunisation. Medical history included breast cancer, hypothyroidism, diabetes. The patient did not have covid prior vaccination and no covid tested post vaccination. No known allergies. The patient was not pregnant. Concomitant medications in two weeks included metformin; atorvastatin (LIPITOR); levothyroxine sodium (SYNTHROID), vit d, multivitamin. No other vaccine in four weeks. Back pain started on 20Mar2021, chest and back pain on 24Mar2021 and chest pain continued until she went to the ER on 27Mar2021. When PE in right lung was found on CT scan on 23Mar2021 12:00 PM. The patient was hospitalized on 27Mar2021 and heparin was started and continued until 29Mar2021 when she was released. The DVT in right leg was found on 28Mar2021 with ultrasound after she mentioned numbness in both legs on 23Mar2021 12:00 PM. She started apixaban (ELIQUIS) on 29Mar2021 before leaving the hospital and still taking it now. She went to follow up appointment with hematologist that suggested that she remained on apixaban and return in 10 weeks for another checkup. The events resulted in doctor or other healthcare professional office/clinic visit, emergency room/department or urgent care, hospitalization, life threatening illness (immediate risk of death from the event). Number of days hospitalisation was 3. Treatment received for events included heparin and apixaban. The outcome of events was recovering. The patient received second dose of BNT162B2 in arm left on 09Apr2021 12:30 (Lot Number: EK8727).

1228145	4/19/2021	NC		U		3/11/2021	BODY ACHES; INJECTION SITE ARM PAIN; PAIN IN FINGERTIPS; NECK PAIN; CHEST PAIN; BACK PAIN; This spontaneous report received from a patient concerned a patient of unspecified age and sex. The patient's weight, height, and medical history were not reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1802070, and batch number: 1802070 expiry: UNKNOWN) dose was not reported, once a total in left deltoid administered on 10-MAR-2021 for prophylactic vaccination. No concomitant medications were reported. On 11-MAR-2021, the subject experienced body aches. On 11-MAR-2021, the subject experienced injection site arm pain. On 11-MAR-2021, the subject experienced pain in fingertips. On 11-MAR-2021, the subject experienced neck pain. On 11-MAR-2021, the subject experienced chest pain. On 11-MAR-2021, the subject experienced back pain. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from body aches on 11-MAR-2021, and had not recovered from injection site arm pain, pain in fingertips, neck pain, chest pain, and back pain. This report was non-serious.
1230923	4/19/2021	AL	57	M	4/1/2021	4/1/2021	Immediately upon being vaccinated, the patient felt weak, tachycardic, and had chills and nausea. He was observed for 20 minutes, at which time his symptoms abated and he left the vaccination facility. However, his symptoms returned later in the day. He presented to our office 15 days after vaccination. At that point, he was suffering coldness in his extremities with peripheral cyanosis of hands, feet, and nose. He reported chest pain and had an abnormal EKG with ST depressions in several leads. He stated that over the past two weeks, his symptoms would come and go, lasting for hours at a time and constituting weakness, extreme fatigue, cold extremities, and body aches.

1228285	4/19/2021	TN	34	F	4/2/2021	4/2/2021	I was given the vaccine at 11:10am and by 5:30pm I was beginning to feel tired and unwell. At 6:45 I had a fever, body aches, pain in my arm, headache, and chest pain. These symptoms continued for three days and my fever reached 102.7. After three days the fever and body aches subsided but the fatigue and chest pain continued. The chest pain has continued with increased heart rate during small bursts of activity. I called the clinic that administered my shot on April 9th and was told chest pain was normal up to 10 days and if it continued to be a problem to go to the ER. After 11 days of chest pain I went to the ER on April 13th and they did an EKG, CT with contrast, and blood work. They concluded I was fine. I was told it could be esophagitis so to take 2 15mg Prevacid a day which I have done with no relief. I was also informed it could be muscle related so I have iced, taken anti-inflammatory medication, and have not exerted myself. It is now April 19th and I am still experiencing chest pain and racing heart rate with minimal exertion.
1231218	4/19/2021	FL	45	F	4/6/2021	4/6/2021	I have had the same that most people complain about, soreness of arm, but nothing that concerned me. I have noticed changes to my vision and after one week, developing headaches that are not going away even with Motrin. I have also noticed after a few days after the shot a strange reaction, like if my heart jumped a beat and I had shortness of breath. It would be only one or two second episodes at a time, so I'm not too concerned, but if it continues, I will discuss this with my doctor. I had never felt that before. This is not chest pains, it's difficult to describe. It's like the heart has to "jump" a beat.. but only once or twice. It's scary, but it does not happen often and it's happening less in the past day. The headaches are not fun, but I hope they will go away after a few weeks. I don't suffer migranes or headaches on a regular basis.

By the time that he returned home he had opened up a soft drink was having some slight cough, trouble swallowing and had sensation of itching on his back. He asked his mother to check his back and it was discovered that he was starting to have rash over his

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

body. This seemed to be persistent and he returned to ER for further evaluation/treatment. He has not had reaction to vaccination in the past. He does have allergy to tramadol. He denies having any allergy to soap, detergent, or other chemicals. He denies having exposure to any chemical, fume, dust, plant material after receiving the vaccination. He denies having any new foods or drinks recently. He is not having any nausea or vomiting. He has felt somewhat sweaty. Allergy: tramadol H/O LE muscle weakness/atrophy, COPD ROS Const: No fever, chills, sweats. No unusual weakness (he does note "my leg is atrophying" when he is speaking about his LLE) HEENT: No runny nose, congestion, ear ache. Perhaps some odd sensation in the throat due to swollen uvula. CV: No chest pain, palpitations. No unusual shortness of breath. No edema to the ankles / legs. No pain with breathing. Abdom: No nausea, vomiting, diarrhea, or constipation. No abdominal pain. Lymph: No swelling to glands. Physical Exam: ? Physical Exam A&O, nontoxic. Pleasant. No pain distress. Mild physiologic distress. Appears to be overwt adult with component of chronic illness and with acute allergic reaction/process. Eyes: EOMI, nonicteric, conjunctiva clear. Throat: Moist mucous membranes. Symmetric rise of palate. No pharynx erythema. Tonsils normal size and without erythema or exudate. His uvula is moderately edematous and elongated. He is managing his secretions well. There is no angioedema of the tongue, soft palate, lips. No stridor. No blood in the oropharynx. No rhinitis/runny nose. Neck: supple, normal ROM, nontender. trachea midline. No cervical or supraclavicular lymphadopathy. Thyroid nontender and normal size. Back: No pain on percussion. No muscle spasm. Nontender palpation. No kyphosis. Lungs: fair to good air movement with quiet, fine primarily inspiratory wheezes in the mid to lower lung fields. nl effort, no rales, crackles, rhonchi. Normal resonance on percussion. Cough clear. Cardiac: borderline tachy RRR S1, S2, without murmur or rub. Posterior tibial, Pedal pulses 2/4 bilaterally. No ankle or pretibial edema. Skin: cool & dry extremities. cool & moist (not diaphoretic) back skin. Normal turgor. He does have confluent macular rash to the neck, (somewhat on face), arms, back/chest/abdomen. Some mild hyperemia to the legs/ankles. No urticaria. The right

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

deltoid injection site is involved with the hyperemia/macular rash but no urticaria at this location right now Abdom: Bowel sounds present x 4 Quadrants. Normal tympany to percussion. Soft. Non-distended. Nontender. Nonsurgical. Good muscle tone and moves all extremities. He notes he has his chronic weakness in his left lower extremity. Medical Decision Making: ? Discussed with another healthcare provider Discussed case with another healthcare provider ? Consultation Consultation 1, Consultation 2 ? Consultation 1 04/16/2021 15:54 ? Consultation 1 Comments discussed with RPh. He will come to ER to obtain additional information from patient. This is the hospital's first presumptive Pfizer vaccine reaction. ? Consultation 2 04/16/2021 15:41 ? Consultation 2 Comments discussed with Dr. we discuss presentation. he agrees pt will need monitoring with the persisting symptom/findings and the H/O COPD. 1617 Dr has been to ER and completed eval. pt to be placed on 2nd floor med/tele for additional monitoring and treatment. pt did have labs yesterday. ? Decision to Admit Based On 1446 Based on his symptoms and presentation presumptive acute anaphylaxis to component of the Pfizer Covid vaccine. We will begin treatment with 0.3 mg epinephrine IM once as well as dexamethasone, famotidine, diphenhydramine IV. We will continue to monitor with cardiac telemetry and pulse oximetry. He does have slight wheezing but this may be related to his chronic COPD. No respiratory distress at this time, but his symptoms seem to have been mildly progressive over the past hour (per his report). I believe inclusion of the epi to be prudent based on his presentation. Additionally, I will inform the vaccination clinic of this reaction. he agrees pt will benefit from continued monitoring and repeated IV antihistamine and IV steroid treatment. Pt will need IV fluid for hydration as well. Recheck: ? Recheck Recheck 1, Recheck 2, Recheck 3 ? Time 14:55 ? Recheck patient stable patient improving with treatment ? Comments He is improving. His skin is now warm and moist (not sweaty , not diaphoretic). The rash is receding from the arms. Good coloration to the legs/ankles. Back & torso rash starting to recede. no nausea/vomiting. no difficulty breathing. still with fading macular rash on the torso and upper back. Lungs: improved air movement compared to the initial exam, nl

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

effort, no rales, crackles, rhonchi. He has lower field (only) quiet fine inspiratory wheezes. Normal resonance on percussion. Cough mildly wheeze @ bases, with improved airflow. Cardiac: borderline tachy RRR S1, S2, without murmur or rub. Posterior tibial, pedal pulses 2/4 bilaterally. No ankle or pretibial edema. ? Time #2 15:05 ? Recheck #2 patient stable patient improving with treatment ? Comments #2 man from pharmacy is here and recognizes patient from the vaccination clinic. Patient rash has faded from his extremities fully and appears to have faded from his abdomen still somewhat at the malar area of the cheeks as well as the neck and torso portion of the chest. His pulse is 98?99 continues to have elevated blood pressure. Pulse oximetry 98-100% on room air, normal. Pharmacist will enter the reaction into the CDC/FDA/Pfizer database. Overall pt notes he feels tired (probably related to hydration & benadryl). He notes he has returned to home about 2 weeks ago after spending some time on the road in mountains playing guitar / touring with a small band , playing music. ? Time #3 15:37 ? Recheck #3 patient stable ? Comments #3 He has been resting. No respiratory distress. His blood pressure and pulse and pulse oximetry are reviewed at bedside and they are nonfocal at this time. Overall he is improving. He notes he still has malaise and feels about the same with itching in his back and the sensation in his throat. When I evaluate his back there is hyperemia/some macular rash that is in approximately the distribution of the trapezius muscle of the back this is where he notes he has the itching. Additionally when I evaluate his throat there is still some presence of uvula edema. There is no other angioedema. Perhaps he does have some mild hyperemia to the uvula and soft palate at this time. He is clinically improving but his symptoms have not resolved fully. Skin warm and dry normal turgor. No diaphoresis Lungs initially some coarseness/mucousy breath sounds to the mid lower fields but this clears after he coughs. Good air exchange at this time. No rales rhonchi wheezes or crackles. Cough initially mucousy then clear. managing secretions well. no stridor. no respiratory distress. Critical Care Times: ? Critical Care Time of minutes excluding, separately billable procedures 35 Disposition Summary: Arrival 04/16/2021 14:21 Disposition to be admitted Disposition Decision

1231134	4/19/2021	TN	56	F	4/17/2021	4/17/2021	Itchy skin that started yesterday after receiving 2nd dose on 04/17/2021. Then started having rash appear on my bilateral upper extremities on my forearms and hands. Skin: Positive for rash. APRN provided steroid shot while in clinic, recommended take OTC Zyrtec twice a day for the next 2 days then take daily, recommended over-the-counter Eucerin antiitch lotion twice daily; If not improving in signs and next 24 to 48 hours or if worsening return to clinic; Has any symptoms of feeling like cannot breathe, throat is closing, chest pain, etc, Recommend call 911;
1231106	4/19/2021	PA	24	F	4/7/2021	4/10/2021	pt had chills aches , chest pain, headache
1231063	4/19/2021	MO	64	F	3/29/2021	4/19/2021	Had mild pain and headache after 1st vaccine on 3-1-2021. Symptoms were even milder after 2nd vaccine on 3-29-2021. BUT scheduled a cortisone injection for knee pain on 4-19-2021, 3 weeks after last vaccine dose. About 10 minutes after the shot while leaving the building, I had a severe reaction which included chest pain, shortness of breath, dizziness, and a bright red flushing all over. Returned to orthopedic office where I was monitored until an ambulance arrived and transported to the hospital. After monitoring, blood tests, EKG was allowed to go home and requested to do a follow up with a cardiologist and primary care physician. Most symptoms had resolved prior to transfer to hospital. Still running a low grade fever this evening. I was concerned that the combination of my MS, MS medication, COVID vaccine and cortisone injection may have caused this extreme reaction.

1228238	4/19/2021	KY	91	M	4/15/2021	4/16/2021	Patient was seen and examined at the bedside. The patient is a 91 yr/o male with a history of CHF, NSVT, aortic stenosis, atrial fibrillation, HTN, hypothyroidism, DM2 who presents to the emergency room with complaints of chest pain and worsening shortness of breath. He reports he got his second Covid vaccine yesterday and was feeling well until about 1 AM when he woke up acutely short of breath. His wife checked his oxygen and reports he was 90% on his home 2 L. He felt he could not breathe unless he was sitting straight up. He changed over to his CPAP and was able to breathe and fall asleep comfortably. Today throughout the day his shortness of breath has persisted and he was due to see his cardiologist so they went to his appointment. While at the appointment he developed substernal chest pressure. It did not radiate. It resolved with 2 sublingual nitroglycerin. Patient was transferred to the emergency room for further evaluation. Patient denies any fever or chills. He has a chronic cough with clear sputum unchanged. He reports worsening lower extremity edema over the past few days. He reports he has been taking all of his cardiac medications as prescribed. Work-up in the emergency room concerning for acute on chronic CHF exacerbation. Troponins mildly elevated but are plateaued. No further chest pain while in the emergency room. Patient to be admitted for further evaluation and treatment

1229283	4/19/2021	IL	79	F	3/11/2021	3/11/2021	3/21 admit HPI: 80-year-old white female with a past medical history for oxygen-dependent COPD who presents to the emergency room today due to falls and possible confusion. According to the family member, he does not think her oxygen was set at the right level. He thinks it was set up higher because she tends to get confused and fall when this happens. The patient really has fallen twice of late. She said she aches all over. She also cites dizziness when she stands up. Because of the symptomatology, she came to the emergency room for evaluation. Workup, including chest x-ray imaging, was fairly unremarkable. The patient did not, however, feel safe going directly home. At the present again, she just feels achy. There is no chest pain or shortness of breath. No abdominal pain or urinary symptoms. No rash. 3/26/21 admitted 80 y.o. female with a PMH notable for COPD, atrial fibrillation, hypertension, diabetes and obesity who presented on 3/26/2021 for evaluation of physical deconditioning. Patient presents to our facility yesterday after hospital stay from hospital from 03/21 through 3/26/2021. Hospital course - The patient is an 80-year-old white female with a past medical history for oxygen-dependent COPD who presents to the emergency room today due to falls and possible confusion. According to the family member, he does not think her oxygen was set at the right level. He thinks it was set up higher because she tends to get confused and fall when this happens. The patient really has fallen twice of late. She said she aches all over. She also states dizziness when she stands up. Because of the symptomatology, she came to the emergency room for evaluation. Workup, including chest x-ray imaging, was fairly unremarkable. The patient did not, however, feel safe going directly home. In ER, patient's ABG showed significant CO2 retention. Pt is supposed to be using CPAP at home but admits it has not been used lately because of some problem with the machine. Since admit, patient admitted to pain in her back. CT spine showed L1 compression fracture which appeared new. PT worked with patient and felt she should go to rehab for continued therapies. Neurosurgery has ordered bracing for patient. No surgical intervention required. They also consulted neurology for myoclonic jerking and essential tremor. Patient is then to follow-up with neuro surgery and 3-4 weeks. 4/17 ER: 80 y.o. female who

1229081	4/19/2021	AZ	49	F	4/16/2021	4/16/2021	<p>Patient returned to observation area two hours post injection complaining of LA pain. Medic on site observed some swelling to the LA and proceeded to provide an ice pack. After further assesment patient did not appear in any distress and was instructed to stay in observation for an additional 30 min. At approximately 1300 the patient began scratching the vaccinated arm and mumbling in a language we could not understand. Immediately the interpreter was called and we prepared for an adverse reaction. Two of our LPNs began taking vitals, One RN began assessing the site where we noted possible infiltration to the subcutaneous tissues. We then moved the patient to a private room. RN chart note: "Patient crying sitting in chair, complains of L arm pain. Left arm swollen, softball size, hard to touch, patient sensation remains intact, left radial pulse +2 and present, patient can wiggle all fingers on command. Patient initially denied Benadryl, however after educated with safety and calling 911, patient denied ambulance, and agreed to IV placement. 20 g IV placed in Right AC, 50 mg IV push Benadryl once for swelling and itching of arm spreading in size, 500mL LR bag hung, Patient A0x4 on room air answering questions appropriately. Patient denied ambulance service at this time. Patient states headache is stronger and chest pain decreased." Patient then fell asleep and approximately at 1400 awoke with red eyes, continued headache that had gotten worse. BP retaken and was 162/102. At this point we decided we would need EMS to respond. With the language barrier and poor past medical history, we did not find it appropriate to continue treating the patient on site. She was still A&Ox4, denied restricted airways or significant chest pain. Our medical director was alerted of the event and instructed us to call EMS despite patient refusal. EMS arrived by 1430 and assessed patient, she finally agreed to transport.</p>

1229846	4/19/2021	OH	37	M	4/15/2021	4/15/2021	My left arm was sore about 2-3 hours after the shot. Later that evening, my arm was worse and I could not lift my arm up past my chest. Around about 11:00 p.m., I began to feel chills, aches and pains. I was sluggish, tired and had no energy. The next day when I woke-up around 10:00 a.m., I still had the aches and pains, all the way down to the bottoms of my feet. My body hurt to stand. The aches and pains continued that evening, along with diaherria and chest pains. The pains continued through Saturday and the chest pains got worse. The pain would radiate from my chest to my left arm, to my left shoulder, and into my back between my shoulder blades. Then by 7:00 p.m. or so on Saturday, my chest started to feel better and my aches and pains were not as bad. I was then woken up around 12:00 a.m. or so, on Saturday/Sunday with severe chest pains again with the radiation of pain. This also came along with the aches and pains and diahrrea. This has continued through to today, Monday. I tried to do simple putting my dishes away and loading up my dishwasher, and couldn't complete the task due to the chest pain and severe aches and pains all over my body. I have tried to treat the symptoms with over-the-counter medications which would include: Advil II, Pepto Bismal, Alka-Seltzer, hot showers, hot baths, luke warm baths, vapor bath soaks and a heating pad.
1229845	4/19/2021	IL	30	M	3/23/2021	3/25/2021	Patient presented to ED 3/25/21 for left sided chest pressure about 3 days post Moderna dose #2. Troponin elevated but patient had normal ECG. Patient admitted to the hospital for NSTEMI. Cardiac cath done 3/26 showed no obstruction. Patient had resolution of chest pain during stay and was discharged on 3/28. Discharge diagnosis myocarditis, discharged on ibuprofen tapering dose.

1229844	4/19/2021	FL	48	F	4/19/2021	4/19/2021	48 y/o female, with no past medical history, who presents with pressure to the side of her head/temples, weakness, dryness and numbness to mouth post vaccination administration. Patient received her 2nd vaccination to the patients Right deltoid. Patient denies previous reaction with 1st vaccination administration. NP and Paramedics at patient side. Patient appears pale, including her lips. Patient denies sore throat, difficulty breathing, itch or chest pain. Water was provided and patients legs elevated on chair. Patient vitals within normal limits (initial vitals: 136/86 BP, 99%RA, 83 HR, 12 Resp. Vitals prior to discharge: 123/85 BP, 99% RA, 79 HR, 10 Resp. EKG: NSR). Patient was monitored by the NP with no further interventions needed. Patient returned to baseline, with symptom resolution within 15 mins. Patient cleared to go home in stable condition.
1229809	4/19/2021	MI	45	F	4/14/2021	4/14/2021	15 minutes after the injection I had an intense allergic/anaphylactic reaction. I was watched and treated on site by EMS for 2 hours with Benadryl, oxygen and rest. We did not use epi because I was still able to breath (minus some wheezing, coughing, hoarseness and lung irritation). I felt the reaction hit when I started seeing green spots and my vitals dramatically increased (BP 181/111, HR 142 and weak). I then experienced the following symptoms: rash/hives on neck and chest, fatigue and weakness, dizzy and lightheaded and needed wheelchair for moving around, chills and shaking, blurry vision, nausea, stomach pain, headache, chest pain and increased urination. I also had elevated glucose (147). During those two hours my vitals decreased a little, but the rest of my symptoms persisted. I was not getting better and my vitals started to increase again at the two hour mark so EMS called an ambulance and transported me to hospital. I was treated with solumedrol and observed for several hours. The meds helped enough to send me home. (I did have to continue taking Benadryl at home that night and the next day because I continued to have an allergic response). I also had severe injection site pain and bruising.

1229754	4/19/2021		70	M	3/25/2021	3/27/2021	70YM w chest pain, lower extremity swelling, left arm pain and dyspnea started on 3/27, 2 days after Covid vaccine given on 3/25. Presented to Hospital on 4/7 complaining of shortness of breath and nausea and vomiting with elevated troponin and NSTEMI. Low suspicion that the vaccine caused this man's heart attack as his hear cath showed severe multi-vessel disease. Pt gave inconsistent history in previous COVID infection: he told some he did have it and others that he did not. CT surgery was consulted, and patient was not felt to have viable targets for CABG. Cardiology discussed risks and benefits of an attempt at a high risk PCI to the LAD, and patient and family opted for medical management. Patiet discharge home on 4/10/21 with medical management for his coronary artery disease and new onset systolic heart failure with an ejection fraction of 15%, including aspirin, clopidogrel, atorvastatin, Coreg, furosemide, Entresto.
1229377	4/19/2021	CA	44	M	4/17/2021	4/18/2021	PT RECEIVED A FIRST DOSE OF THE MODERNA VACCINE IN THE LATE MORNING OF 04/17/2021. PT'S DAUGHTER CALLED ON THE MORNING OF 04/19/2021 AND SAID SHE WAS CONCERNED ABOUT HER DAD AS HE HAD BEEN COMPLAINING OF A "VERY BAD FEVER, HEADACHE AND CHEST PAIN." PT'S DAUGHTER WAS ASKED IF HER DAD HAD TROUBLE BREATHING AND SHE SAID YES. WHEN ASKED ABOUT HOW LONG IT HAD BEEN GOING ON, SHE SAID SINCE LAST NIGHT. SHE ALSO SAID THE FEVER HAD REACHED 102 DEGREES. PT'S DAUGHTER SAID HER DAD HAD NOT TRIED TAKING ANYTHING TO HELP TREAT THE FEVER OR HEADACHE. SHE ASKED ABOUT IF SHE SHOULD HAVE HIM TAKE TYLENOL, BUT DUE TO THE COMPLAINT OF "SEVERE CHEST PAIN" AND "DIFFICULTY BREATHING," IT WAS RECOMMENDED THE PT SEEK IMMEDIATE MEDICAL ATTENTION AND GO TO THE ER. PT'S DAUGHTER CONFIRMED THAT SHE WOULD.

1229606	4/19/2021	CA	37	F	4/15/2021	4/16/2021	After a few hours of getting the shot, felt tired and started feeling pressure in left chest - thought maybe it was my heart, but it gradually spread to my right chest, so I thought maybe then it was my lungs. The next day I felt worse, like I had COVID all over again, achy, low fever, miserable, but cough also came back. All only lasted about 24 hours (still have a slight pain in chest and tired today, 4 days later) but I had not heard that the first dose would cause that type of reaction, and definitely could not find anything anywhere about cough coming back. After googling, found an article in NY times about a doctor who experienced similar reactions - https://www.google.com/amp/s/www.nytimes.com/2021/02/01/health/have-you-had-covid-19-coronavirus.amp.html . I was sick for about three weeks after flying to and from in November 2020, and tested positive for antibodies in mid-December and tested positive for antibodies again the day before I received the vaccine, so based on that and the few articles I found online, it seems maybe if you get the vaccine after already having COVID, you react to the first dose and not the second. I think this is important to note on the CDC website so everyone is informed and there are no surprises.

1225589	4/18/2021	DC	22	F	4/7/2021	4/14/2021	Vaccine received 4/7/2020. On Wednesday 4/14/2020, pt went to the gym and did high intensity interval training involving body weight exercises, specifically an exercise called "v-ups". Exercise was not more strenuous than usual, and pt was well hydrated. Pt reports that she exercises often and this was not a new exercise. Soon after workout, pt began having muscular pain in the hip, radiating into her inner thighs bilaterally with associated tingling. On 4/15, pain worsened and pt had difficulty ambulating. Denies any edema, erythema in her legs or unilateral leg swelling. Presented to the ED on 4/16 and found to have elevated CK of 127,768 with UA significant for large blood and protein, without RBC, indicative of rhabdomyolysis. Pt did not have any known risk factors that may precipitate rhabdomyolysis. On admission, fluids were initiated with downtrending CK, LFTs, and renal function remained stable. er D&C was done at on 4/2 and she reports there were no complications during or after the procedure. Her BHCG was elevated at the time and she tried an oral abortion pill but still had some fetal remnants so went for a D&C. She had the J&J vaccine shortly after on 4/7 and she reports no complications around and shortly after getting the vaccine. Denies vaginal bleeding or odor. Denies fevers, chills, abd pain, diarrhea, constipation, dysuria, chest pain, palpitations, shortness of breath, nausea/vomiting.

1225701	4/18/2021	PA	18	M	4/15/2021	4/16/2021	<p>History of Present Illness: Patient is a 18 y.o. male with no pertinent past medical history who presents to the ED with complaints of chest pain. The patient notes that he started noticing chest pain this AM after he woke up that is associated with nausea. The pain is described to be in the center of his chest and is persistent. EMS was called who administered 2 SL NTG and 1 dose of ASA 325 mg. He notes that he received his 2nd Moderna vaccine on Thursday April 15th. He is currently a senior in High school. He had no adverse reactions to his 1st dose of the Moderna vaccine but after the 2nd dose he notes that he was having fever, malaise, body aches, and decreased appetite. He also tells me that he has been so fatigued that he has not really gotten out of bed in the last 48 hours. In regards to his oral intake he had (1) 16.9 oz bottle of water yesterday and nothing else but did have a glass of orange juice and some cereal this morning. During my evaluation with the patient he notes that he is still having chest pain that he reports to be retrosternal any 5/10 in severity. He denies any radiation into the left arm or jaw. He feels the pain is worse with movement and better when he is resting. He has had associated nausea and shortness of breath. He has been having low-grade fevers at home but denies any coughing, abdominal pain, diarrhea, dysuria, burning or itching with urination, congestion, rhinorrhea. He denies any tobacco use, drug use, alcohol use. In the emergency department initial workup is notable for potassium 3.6, magnesium 1.7, phosphorus less than 1, troponin 7206 with repeat at 10,212. CPK noted to be 380. Initial EKG was nonischemic. COVID swab was noted to be negative. After I evaluated the patient around 1520 an RRT was called due to hypotension and bradycardia. His blood pressure had dropped to 80/40 and heart rate was in the low 50s and he was symptomatic with diaphoresis and feeling as if he was going to pass out. 1L fluid was given running wide open. Repeat EKG did show some diffuse ST segment elevations concerning for pericarditis. Cardiology and ICU team were notified and evaluated the patient. Response is likely that the be vasovagal from acute pain. History obtained from: ? patient ? outpatient clinicians ? family ? staff at facility ? other ? review of medical record as summarized below Pt unable to</p>

1225681	4/18/2021	OR	53	F	1/30/2021	2/1/2021	Chest pain (severe) and respiratory distress. Treated in the Emergency Room. Unresolved repeated attacks of acute shortness of breath since COVID 19 #2 vaccine. Currently under the care of Pulmonology.
1225474	4/18/2021	FL	33	M	3/24/2021	3/24/2021	Within 2 minutes of vaccine i became very light headed and needed to lay down and was sweating. This is common with me with any vaccine. Within 24 hours severe shortness of breath and severe chest pains. Went to 2 urgent cares. Was prescribed Prednisone and a Inhaler. Both did nothing. Symptoms got worse. went to my primary doctor who ordered a chest X ray which came back good. and a EKG which came back with a slight issue and referred me to a cardiologist next month. Was sent home to recover. Pain and shortness of breath got worse. Within a week after that i got severe headaches and the left side of my head arm and leg began to get numb and tingle sensation which lasted about 48 hours. About 2 weeks after vaccine i began to improve. Chest pain started to go away and my shortness of breath as well. As of today 4-18-2021 no chest pain, and shortness of breath still comes and goes but nothing compared to weeks before.
1225669	4/18/2021	CT	64	F	3/6/2021	3/7/2021	Started morning after with terrible headache, pain in the eyes, nausea and sore arm. Few days later felt tightness in the chest, shortness of breath and a cough started. Feeling unwell. Continued and went to urgent care. Covid 19 test negative. continued to feel the worse and went back again to urgent care. Same symptoms with nausea and headache on and off. another covid test negative and chest xray. looked ok. Continued with the same symptoms and went to Primary Care Cough worse and pain in chest. Blood work done. Looked ok. Woke up with terrible headache at 3am. Went to the ER. IV, Blood work, ct scan, ekg. No real answers BP elevated. Still struggling but cough improving.

1224528	4/18/2021	WA	70	F	3/22/2021	3/1/2021	she ended up in the hospital her blood pressure was way up, it was at 188; pain in chest; feeling sick and stuff; on her right arm she has a hidden rash between her hand and her elbow; This is a spontaneous report from a contactable consumer (patient). A 70-year-old female patient received the second dose of BNT162B2 (Pfizer-BioNTech COVID-19 vaccine, lot number: EP6955), via an unspecified route of administration, administered in the left arm on 22Mar2021 at 16:00 as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient previously received the first dose of bnt162b2 (lot number: EN6198) on 25Feb2021 at 15:00 on the left arm for COVID-19 immunization and reported that her blood pressure went sky high and it continued to be high and her heart rate was up and caused her to go to urgent care. The patient also previously received a flu vaccine on an unspecified date and her arm was sore for 3 weeks and she felt like she had the flu for 3 days. The patient reported that after she got her second vaccine she had the normal, what people call normal reaction, of feeling sick and stuff on 27Mar2021 then she ended up in the hospital her blood pressure was way up, it was at 188 and she forgets what the bottom number was. She went in because she felt like she was having a heart attack there was a pain in chest like right where the middle of a bra would be. It lasted about 15 or 20 minutes. That is her experience with the vaccine, it is raised blood pressure and she is still dealing with it her blood pressure is still high. She tries not to be scared but the doctors at the hospital made her a little nervous that is why she spent the night but that is a definite side effect. The patient was admitted to the hospital on 27Mar2021 and was discharged on 28Mar2021. They wanted to keep her for 2 nights and do a stress test and she said no way she is not staying for 3 nights in that hospital, the nurses were outstanding they were the most efficient nurses but the hospital food sucked and she got no sleep. Also, on her right arm she has a hidden rash between her hand and her elbow under the skin there is a rash that popped up with the vaccine on an unspecified date in Mar2021. The patient also stated that her blood type is O negative and she does not know she heard that O neg people weren't going to get COVID and she has never got COVID before. The patient also reported that they drew blood 6

1224828	4/18/2021	GA	66	F	2/17/2021	2/18/2021	<p>Odd Joint Aches; Stomach pain; Felt like an elephant was sitting on her chest, she thought she was having a heart attack.; chest pain is not as bad but it is still ongoing off and on for the past 7 weeks/generally at night but sometimes during the day; This is a spontaneous report from a contactable consumer (patient). A 66-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Formulation: Solution for injection, Lot/Batch number: EN6200), dose 2 via an unspecified route of administration, administered in left arm on 17Feb2021 at 16:00 as single dose for COVID-19 immunisation. The patient medical history included tennis elbow (20 years ago). The patient previously received first dose of bnt162b2 (Lot/Batch number: EL3247) on 27Jan2021 for COVID-19 immunization and old shingles shot for shingles and experienced arm swelled up like a baseball and got really hot (it was a long time ago probably 7-10 years). The patient's concomitant medications were not reported. The patient neither had any history nor took any other products. No additional vaccines administered on same date of the pfizer suspect. The patient felt like an elephant was sitting on her chest, she thought she was having a heart attack and chest pain is not as bad but it is still ongoing off and on for the past 7 weeks/generally at night but sometimes during the day on 18Feb2021 at 02:00, stomach pain on 28Feb2021 and odd joint aches on 01Mar2021. She further clarified that her chest pain isn't as bad, it doesn't feel like she is having a heart attack. The tennis elbow is back sometimes and then she will work out and then her knee hurts and she doesn't have knee problems. States it comes and goes. The patient states it is odd because she knows 4 other people that are having same thing. States 1 had the Moderna and 2 are Pfizer, and 1 had the Johnson and Johnson. They all felt like they were having heart attacks in the middle of the night. The patient was treated with Nexium and states she can only eat oatmeal, bananas, chicken and rice. She neither visit the emergency room nor the physician office due to the events. She is very healthy and in good shape. She called her physician's office and they said to go to the ER or a cardiologist office. There was no family medical history relevant to the adverse events. The outcome of the event felt like an elephant was sitting on her chest, she thought she was having a heart attack was unknown</p>

and was not recovered for the rest of the events. No follow-up attempts are needed. No further information is expected.

chest pain; heart attack; headache; blood pressure was high; This is a spontaneous report from a contactable consumer (patient). A 59-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 28Mar2021 09:15 at single dose in left arm for COVID-19 immunization. Medical history included Irregular heart beat. The patient had no Allergies to medications, food, or other products. Concomitant medications included acetylsalicylic acid (BAYER ASPIRIN), and metoprolol. The patient was not diagnosed with COVID-19 Prior to vaccination. The patient had not received any other vaccines within 4 weeks prior to the COVID vaccine. On Monday morning (29Mar2021 06:45), when the patient got out of bed she started having chest pain, took a shower and the pain got worse like she was having a heart attack, she was admitted to the hospital and treated for the pain and had EKG, stress test done, blood pressure was high, and she had a very bad headache; The events resulted Emergency room/department or urgent care. Tuesday morning (30Mar2021) the pain started to decreased and after another EKG and her blood pressure went down she was released and advised to follow up with her primary doctor as well as the cardiologist. Lab test included Nasal swab negative on 29Mar2021. Treatment was received for all events. The outcome of all events was resolved. Information on the lot/batch number has been requested.

This consumer reported similar events for 2 patients; this report refers to the events for the reporter with dose 2 of BNT162B2. A 81-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), dose 2 in Mar2021, as a single dose for COVID-19 immunisation. Medical history included ongoing Parkinson's disease (diagnosed 20 years ago) and ongoing high blood pressure (controlled with medication; diagnosed 30 years ago). Concomitant medication(s) included Levodopa, Carbidopa, taken for Parkinson's disease, start and stop date not reported. He takes lots of medications but stated the one that would be relevant is the Carbidopa Levodopa. The reporter stated he had some fairly serious symptoms since his shots. He had both vaccines a few weeks apart (specified as 3 weeks apart). The patient previously received dose 1 via an unspecified route of administration, administered in left shoulder on Feb2021 (Batch/Lot number was not reported) for COVID-19 immunization. The first one started his symptoms out mildly, but after the second vaccine, on days 2,3,4 each day they got worse. His symptoms were tremors of hand, feet, legs and when tried to move or get up in bed at night, he was frozen and couldn't move (onset Feb2021). He commented "it was really scary." His muscles were weak and he had trouble with balance especially when he got up (onset Feb2021), and it was more pronounced. Stated he also had Muscle cramps and excessive sweating, he just got soaked some nights (onset Feb2021). He didn't run a fever, so he doesn't think he has the virus. Stated he had a little bit of adverse effects after the first vaccine in Feb2021 but the main symptoms,

2/20/2021

the severe tremor and frozen all worsened after the second vaccine in Mar2021, about the second day after the second injection (onset reported as 28Mar2021). He had chest pains occasionally, especially when in bed (onset 28Mar2021). He thinks it is lung pain, not heart; he has had both pains and it feels different. The chest pains are associated with shortness of breath (onset 28Mar2021). Stated when he couldn't turn over, he was laying on his side and that didn't help his breathing. He commented that he has Parkinson's Disease, and knowing the symptoms, it included most of these but not all, but his have gotten worse. They do blood pressure tests every morning to monitor and temperature checks and he never had a fever during that period, never had anything higher than 97 range. There was no Emergency Room visit; they asked him about going and they were considering it when had the frozen muscles and couldn't move . There was no Physician Office visit; he talked to both his primary doctor and his Parkinson's doctor, over the phone and they recommended changes in the medication but he hasn't started them yet. The outcome of the events was not recovered. The patient further commented "maybe there needs to be a warning for people with Parkinson's because they both have had rather strong reactions." Stated people with Parkinson's disease should be able to make an informed choice; maybe it was just a strong reaction to the vaccine but they should have that information. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021370062 Same patient, different dose and event.;US-PFIZER INC-2021369249 same reporter/ suspect/different patient, similar events

A 77-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number EL3246), via an unspecified route of administration, administered in left arm on 04Feb2021 09:00 as single dose for COVID-19 immunization. Medical history included ongoing atrial fibrillation for a about 6 years , ongoing anemic for the last 20 years, glaucoma from 1998, had both eyes operated on and in 2016 she was operated on again, cataract had this 4 years ago in she says, in 1918, 1919, she clarifies 2018, Cardiac pacemaker insertion which pacemaker that controls her heart so the pulse does not drop below 65. She says that pacemaker was implanted, she thinks, 2014 maybe, blood pressure, arthritis throughout her body and had 30 operations, body doesn't absorb what she eats, anxiety, asthma, muscle spasms; she reported she has had a lot of surgeries, both of her ankles have had triple fusions, these were in 2005, 2010, 2014, 2018, both her ankles were fused, she had 5 surgeries on her feet; she has had both of her knees replaced because of arthritis, 2012 and 2015 she believes, had numerous other surgeries and she doesn't want to go through all of them, a right shoulder reverse rotator cuff repair, she had a rotator cuff put in, she doesn't have a rotator cuff, this happened in 2019, her left shoulder, because of an automobile accident, rotator cuff was so damaged that they couldn't repair it, she has minimum use of her left arm and has had operations on her left shoulder in 2005; had a pacemaker put in about 6 years ago, the next morning they kept her overnight, they came in, they took an Xray, she had to go back 2 days later because the lead had come of the heart, they had to go back in an reattach the lead to the heart; 2 years ago her

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

pacemaker was going all over her chest, the doctor did not believe her and it landed under her armpit, it was the size of an orange, the doctor thought it was a lump, she went to the hospital, her pacemaker started falling apart, they took it out and put a new one in, it was about 4 years ago; a lump in her breast, she has been put under 30 times, they were all necessary, nothing for glamorizing; had surgeries in her left arm and some fingers than were numb. There was no prior vaccinations within 4 weeks, no events prior vaccinations and no family history. Ongoing concomitant medication included baclofen taken for muscle spasms for about 2 years, calcium for arthritis and her bones degenerate for 30 years, ergocalciferol (CALCIFEROL VIT D) taken for gets anemic real easy for 20 years, duloxetine taken for anxiety, taking this about 3 years ago; ferrous sulfate taken for anemic real easy for about 20 years; folic acid taken to rebuild cells taking this she thinks in 2015, furosemide taken for a diuretic to get rid of fluid for 2 years, metoprolol tartrate taken for atrial fibrillation, and blood pressure, taking this since she had her pacemaker put in; montelukast for asthma for 20 years; hydrocodone bitartrate, paracetamol (NORCO) taken for arthritis for 20 years, and warfarin taken for blood thinner/thin the blood out so she doesn't get blood clots; and adults vitamins for bone supplement and metabolism for 20 years as her body doesn't absorb what she eats. She says she takes a lot of medications and when she does blood bloodwork she was low so they make her take them. The patient previously took rivaroxaban (XARELTO). On 06Feb2021, the patient experienced she thought she was having a heart attack. The patient reported that she had to call an ambulance at 11:30 at night, she thought she had a massive heart attack. She had chest pain, nausea, it was hard to breath, she got a sharp pain underneath her left rib cage. She stated that when the ambulance got here they thought she was having a heart attack, they did nitroglycerin, when they got to the house, when in the ambulance on the way to the hospital they did another pill of nitroglycerin when they got to the hospital. The pain was a number 10. She stated she broke out in sweat, once they got her all hooked up they got to the hospital 6 miles away to the hospital. She was there for 2 full days, they did Xrays, dye in her, checked her hears, and did bloodwork. When she had chest pain, she reported they

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

gave the morphine, it lasted about 6 hours; she still had problems breathing, they took her, she must have passed out because she didn't remember all the tests, she was in and out of it, the severe pain stopped after 6 hours, still had pain off and on, periodically. When she got pain in the ambulance then the nausea went away. After the hospital nitro and another shot for the pain, the nausea stopped. After the hospital after this they gave morphine and the pain subsided a little but didn't totally go away until 6 o'clock in the evening, she still had problems breathing because every time she breathed she got pain under her left rib cage. She says the sweat was at home, real bad, number 10, she broke out in a clammy sweat, on the 6th when she was having pain. She says that after the hospital, a couple days after that, she saw her cardiologists, he told her what happened, it was related to vaccine, it was the muscle that goes around her heart, it was having like a charley horse, he says it felt like you're having a heart attack, her tests said her heart was good. She talks about her blood pressure and heart rate, and says 102, 103, it went up to 200 in the ambulance. She says they thought it was a heart attack, her blood pressure was usually low blood pressure and all the symptoms she was having was because of her muscle having a charley horse that felt like it was coming from the heart, if they had contacted him, he said she would have just needed a massive amount of anti-inflammatory and it would have stopped the pain. The events required an emergency room visit. She wanted to know if anybody else has been hospitalized for massive heart attacks and says that's what she was having. The patient had her second shot on 22Feb2021. Outcome of event nausea was recovered on an unspecified date; and outcome of the rest of events was unknown.

1224634	4/18/2021	KY	64	F	3/16/2021	3/1/2021	Lymph nodes hurting a lot; Hypersensitive to light; A lot of dizziness; Nausea; Headaches; affecting all organs; Chest pain; Felt like the Covid-19 vaccine was hydrating eyes/Film on eyes; Losing vision; This is a spontaneous report from a contactable consumer (patient). A 64-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Lot Number: EN6208), first dose via an unspecified route of administration on 16Mar2021 10:30 (at the age of 64 years old), single dose for covid-19 immunisation. Medical history included ongoing thyroid (disorder) (Unspecified thyroid condition). It is the vaccines with aluminum and bovine extract that she knows that she can't handle. Caller reported that she got a flu vaccine at work and that she definitely got the flu within a few minutes of receiving the flu vaccine. Caller reported that another time after receiving the flu vaccine, she definitely got the flu but she was unsure of the time frame. Caller reported that she did have the flu vaccine several times but that two times, the flu vaccine definitely gave her the flu. She has 3 brothers and that one of her brothers that she is a caregiver for has Type 1 Diabetes. Her brother just felt like he had to have 2 vaccines several years ago and that he received the pneumonia and flu vaccines. Her brother was hospitalized within days of receiving the flu and pneumonia vaccines. Her brother was placed in the ICU for heart patients and the medical staff at the hospital was not sure if her brother was going to live. She couldn't remember how long her brother was hospitalized for, caller stated she thinks maybe around 10 days. She knows what she knows, her 2 other brothers were also hospitalized as children. She didn't know if her brothers had vaccines before they were hospitalized but that she would bet money that vaccines they had received are what resulted in hospitalization. When hospitalized, her second brother was not expected to live. At the time of the event, her brother was only 1 or 2 years old. Her brother's infection was so bad that the hospital sent blood to the CDC and that the CDC couldn't figure out what was wrong with her brother. The hospital kept giving IV antibiotics to her brother and he lived. Her third brother hospitalized around 5 years old with pneumonia during the summer. She didn't know if her brother had received any vaccinations at that time. She just thinks the vaccines did that to them but she doesn't know that.

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

Someone gave her first brother the information on the pneumonia and flu vaccines he received prior to his hospitalization. She didn't have information regarding the details of the vaccines that her brother received. The facility where her first brother was vaccinated with flu and pneumonia vaccines would not give her the information on the vaccines that her brother received. Caller reported that it was a really hard time to fight the facility for that information and she was shocked the facility wouldn't give her the requested information. Caller reported that they wouldn't give her any medication records or anything. Caller reported that it was a bad time for her to fight it, and that she will eventually go back and tell them they have to give her the information. Her brother that she is a caregiver for and that was hospitalized after receiving the flu and pneumonia vaccines also had the Covid-19 vaccine on 16Mar2021. Caller reported that she had been more concerned about her brother having a reaction as he has serious health issues, including Type 1 Diabetes and a heart condition. Caller reported that her brother stated that he's fine and to the caller, her brother seems fine. Concomitant medication included levothyroxine. Patient has experienced that the Pfizer Covid-19 vaccine made her hypersensitive to light on 20Mar2021. She is losing vision on Mar2021 because of the hypersensitivity to light. On 20Mar2021, patient had a lot of dizziness and nausea. It is effecting all of her organs. She has had headaches, chest pain. The Covid-19 vaccine is affecting all of her organs. Yesterday, 30Mar2021, her lymph nodes were hurting a lot, at least she thinks it was her lymph nodes. All of her organs that have been affected by the Covid-19 vaccine and that it seems like it moves day to day. She is mostly sensitive to UV light but is also sensitive to artificial light. She thinks that the hypersensitivity to light has improved a little bit but it's still a problem. The hypersensitivity to light was the absolute worst on 20Mar2021. She doesn't know how much she is still dizzy when asked if it was still ongoing. She added she has been taking Benadryl and ginger for the dizziness and nausea and it helps a lot. She has been taking ginger for the nausea, and if she still has a little, it's not as much. Today is an overcast day and that it's an easy day for her. Caller reported that bright, sunny days are the worst. She was unsure of when the vision loss occurred

VAERS_ID RECVDDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

but stated that she knew by 20Mar2021 that she had lost vision. She didn't know if she was continuing to lose vision but she can tell she lost vision. She did have a headache in the evening on 16Mar2021 after receiving the Covid-19 vaccine. She thinks the headache occurred in the evening on 16Mar2021. She may have had some headaches between 16Mar2021 and 20Mar2021, but that the headache she had on 20Mar2021 was a horrible headache. She is still getting headaches. She would say the headaches are a little better but she is still having them. She is having headaches that she doesn't think she would normally have. She wasn't having headaches before receiving the Covid-19 vaccine. She thinks she did have headaches between 16Mar2021 and 20Mar2021, but 20Mar2021 is when the headaches really hit her. The chest pain is intermittent and that the chest pain coincides with when the light is affecting her. When it's UV light, more so in the afternoon on sunny days, but technically the artificial light in the evening some days bothers her too. She doesn't think her lymph nodes were bothering her before 29Mar2021. Her lymph nodes are ok this morning, 31Mar2021. Different organs have hurt at different times. The effect on organs started within minutes of getting the Covid-19 vaccine. She could feel her eyes and that her eyes felt different within minutes of getting the Covid-19 vaccine. It felt like the Covid-19 vaccine was hydrating her eyes on 16Mar2021 but at the time it felt good. Afterward she was freaking out because she was concerned about her eyes. In the evening of 16Mar2021, it seemed like there was a film on her eyes and she had a headache. On 17Mar2021, 18Mar2021, and 19Mar 2021 she had headaches that she wouldn't have normally had. On 20Mar2021 different organs started hurting. Her biggest concern was the chest pain. After looking back on it, the chest pain may have started between 17Mar2021 and 19Mar2021 also. The effect on her organs from the Covid-19 vaccine occurs on different organs at different times on different days. The effect today isn't bad because it overcast outside and that her organs are really affected when she is exposed to a lot of light. She had 2 blood tests yesterday at her primary care doctor. The doctor ordered labs for VEGF and Leptin. She doesn't get vaccines. No Prior Vaccinations (within 4 weeks). The outcome of the event Photophobia, Nausea, Headache, Lymph node disorder was recovering; other

1224529	4/18/2021	CA	77	F	2/22/2021		<p> joints were sore; This is a spontaneous report from a contactable consumer (patient). A 77-year-old female patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; Batch/Lot Number: EN9581), via an unspecified route of administration, administered in Arm Left on 22Feb2021 09:15 (at 77-year-old) as single dose for COVID-19 immunization. Medical history included ongoing AFib (She has had this condition for a about 6 years), ongoing getting anemic real easy (She says she has had this for the last 20 years), Glaucoma from 1998 (She says that in 1998 she had both eyes operated on and in 2016 she was operated on again), Cataracts from 2018, Pacemaker insertion (cardiac) (She states she has a pacemaker that controls her heart so the pulse does not drop below 65. She says that pacemaker was implanted, she thinks, 2014 maybe), Concomitant medications included metoprolol tartrate (METOPROLOL TARTRAS) taken for atrial fibrillation, blood pressure measurement from an unspecified start date and ongoing; warfarin (WARFARIN) taken for prophylaxis from an unspecified start date and ongoing; duloxetine (DULOXETINE) taken for anxiety from an unspecified start date and ongoing; montelukast (MONTELUKAST) taken for asthma from an unspecified start date and ongoing; folic acid (FOLIC ACID) taken for prophylaxis from 2015 and ongoing; ferrous sulfate (FERROUS SULFATE) taken for anaemia from an unspecified start date and ongoing; furosemide (FUROSEMIDE) taken for diuretic therapy from an unspecified start date and ongoing; baclofen (BACLOFEN) taken for muscle spasms from an unspecified start date and ongoing; hydrocodone bitartrate, paracetamol (NORCO) taken for arthritis from an unspecified start date and ongoing; calcium (CALCIUM) taken for arthritis from an unspecified start date and ongoing; ergocalciferol (VITAMIN D) taken for anaemia from an unspecified start date and ongoing; ongoing adult vitamins since her body doesn't absorb what she eats. The patient previously took BNT162B2 (Batch/lot number EL3246, Dosage text left arm) first dose on 04Feb2021 for COVID-19 immunization and experienced heart attack; must have passed out; the muscle that goes around her heart, it was having like a charley horse; heart rate, 102, 103, it went up to 200 in the ambulance; chest pain; Nausea; hard to breath; she </p>

1227218	4/18/2021 CA	26 F	4/17/2021	4/17/2021	<p>didn't remember all the tests; sharp pain underneath her left rib cage/pain was number10/still had pain off and on, periodically; broke out in sweat, real bad, number 10, she broke out in a clammy sweat. The patient said she has to leave in 20 minutes to a doctor's appointment. She says her second shot was on 22Feb2021 and the only reaction was it felt like a truck hit her, all her joints were sore (unspecified date), it lasted 2 days then went away, she feels good. Patient was hospitalized. She says she got the second dose to make sure she gets all the doses so she doesn't get sick. The outcome of the event was unknown.</p> <p>Had tingling maybe like pins & needles throughout whole body: Mainly Arms, Legs & Face. This was almost immediate or started a couple minutes after shot. This was not my only symptom, but the symptom that lasted the longest. I felt weak and heart racing within the first 15 minutes after the shot. Then I had a short period (under 2 minutes) of left chest tightness. The chest tightness happened around 12:25 pm which was about 14 min after the shot. The chest tightness did not last and never came back after that. The main symptom was tingling pins and needles throughout body. I was escorted to my car around 1:45 pm or 2:00 pm and right as I got in car I started to have left wrist pain similar to the chest pain I had earlier. The wrist pain was off and on for about 30 min and then never came back. I would say all symptoms went 100% away after 3 hours. Besides the sore arm.</p>

1227172	4/18/2021	MD		M	2/1/2021	2/1/2021	<p>he has Parkinson's Disease, and knowing the symptoms, it included most of these but not all, but his have gotten worse; Tremors of hands, feet, and legs; muscles are weak and he has trouble with balance especially when he gets up, and it is more pronounced; muscles are weak and he has trouble with balance especially when he gets up, and it is more pronounced; excessive sweating, he just gets soaked some nights. States he doesn't run a fever; Muscle cramps; when tried to move or get up in bed at night, he was frozen and couldn't move; This is a spontaneous report from a contactable consumer (patient). This consumer reported similar events for 2 patients; this report refers to the events for the reporter with both dose 1 & 2 of BNT162B2. A 81-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), dose 1 via an unspecified route of administration, in left shoulder on Feb2021 (Batch/Lot number was not reported), and dose 2 on Mar2021; both as a single dose, for COVID-19 immunisation. Medical history included ongoing Parkinson's disease (diagnosed 20 years ago) and ongoing high blood pressure (controlled with medication; diagnosed 30 years ago). Concomitant medication(s) included Levodopa, Carbidopa, taken for Parkinson's disease, start and stop date were not reported. He takes lots of medications but stated the one that would be relevant was the Carbidopa Levodopa. The reporter stated he had some fairly serious symptoms since his shots. He had both vaccines a few weeks apart (specified as 3 weeks apart). The first one started his symptoms out mildly, but after the second vaccine, on days 2,3,4 each day they got worse. His symptoms were tremors of hand, feet, legs and when tried to move or get up in bed at night, he was frozen and couldn't move (Feb2021). He commented "it was really scary." His muscles were weak and he had trouble with balance especially when he got up (onset Feb2021), and it was more pronounced. Stated he also had muscle cramps and excessive sweating, he just got soaked some nights (onset Feb2021). He didn't run a fever, so he didn't think he has the virus. He had chest pains occasionally, especially when in bed (onset 28Mar2021). He thinks it is lung pain, not heart; he has had both pains and it feels different. The chest pains are associated with shortness of breath (onset 28Mar2021). Stated when he couldn't turn over, he was laying on his side and that</p>

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

didn't help his breathing. He commented that he has Parkinson's Disease, and knowing the symptoms, it included most of these but not all, but his have gotten worse. They do blood pressure tests every morning to monitor and temperature checks and he never had a fever during that period, never had anything higher than 97 range. States he had a little bit of adverse effects after the first vaccine in Feb2021 but the main symptoms, the severe tremor and frozen all worsened after the second vaccine in Mar2021, about the second day after the second injection. There was no Emergency Room visit; they asked him about going and they were considering it when had the frozen muscles and couldn't move . There was no Physician Office visit; he talked to both his primary doctor and his Parkinson's doctor, over the phone and they recommended changes in the medication but he hasn't started them yet. The outcome of the events Tremors of hands, feet, and leg, when he tries to move or get up in bad at night, he is frozen and can't move, muscles are weak and he has trouble with balance especially when he gets up, and it is more pronounced, and Muscle cramps, and Parkinson's Disease/ gotten worse, are not recovered. The outcome of the excessive sweating was unknown. The patient further commented "maybe there needs to be a warning for people with Parkinson's because they both have had rather strong reactions." Stated people with Parkinson's disease should be able to make an informed choice; maybe it was just a strong reaction to the vaccine but they should have that information. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021369249 Same reporter/drug, different patient/event.;US-PFIZER INC-2021370302 Same patient, different dose and event.

while watching movie the patient had all of a sudden started to have lots of pain on her chest (never had this before), then her heart was really raising, and blood pressure felt high. This lasted for about seven hours. Patient went to hospital because patient thought was having a heart attack. Patient was given nitroglycerin which helped within a few minutes. Then they gave her another nitroglycerin and pain went down and was feeling no more pain. However, subject was admitted to the hospital and they did lots of test with one of them was a cardiac catheterization, also echocardiogram and sonogram. Patient indicated her heart was fine, no heart attack, never experienced anything like that, and that next day, she had a rash all over my neck and chest. 1227239	4/18/2021	CT	33	F	4/15/2021	4/15/2021	Shot 2- 4/15/21- Thursday 6 hours after- nausea started 9 PM ? extremely nauseous, uncontrollable chills, 102 fever and skin hurt to touch (that didn?t last long) (Friday)Next morning- low-grade fever, mild headache, no appetite 2 pm- still no appetite, headache, neck pain and chills Bedtime- chills, low-grade fever Saturday- 4/17- woke up completely soaked- I?m thinking I must?ve spiked a fever during the night. I also woke up with sharp painful chest pain. Went to the ER my D dimer blood tests were slightly elevated so they did a CAT scan and didn?t find any evidence of blood clots. Saturday Evening- still no appetite, headache and neck pain Today -4/18- still no appetite,neck pain,headache and fatigue
1227320	4/18/2021	CA	71	M	1/16/2021	1/18/2021	about 2 days after the 1st dose of the moderna vaccine, felt very tired and unwell for several days. He felt okay for about 2 weeks then on January 29, 2021 he felt intense chest pain. Concerned it was a heart attack, he was brought to the hospital. He stayed one night and the hospital ran several tests like EKG, stress test and others. Found his results to be normal and was released on January 20, 2021. Even the moment he was released, he felt very dizzy but hospital was not concerned and thought maybe side effect of medication. He continued to feel dizzy, fuzzy brain and hard time staying awake during the day and sleeping through the night for the rest of the week. He passed sometime in the early hours of February 6, 2021. Doctor's suspicion is a blood clot. He has no history of blood clots, heart problems or any health issues.
1227323	4/18/2021		61	F	4/15/2021	4/15/2021	Developed chest pain, fever, chills, dyspnea, and diarrhea beginning a most immediately after the vaccination

1227333	4/18/2021		26	M	3/28/2021	3/30/2021	3/31/21 26YM admit with Acute issue: myocarditis, chest pain, extreme fatigue, body aches, SOB; Moderna (first dose on 3/28). No known prior COVID. Patient admits that approximately a month and a half ago, he was drinking a significant amount of alcohol with a 24-pack of beer daily and 5 drinks at night. He quit this approximately 2 weeks ago when he got back together with his girlfriend. He has had stress in his life with the death of a cousin approximately 2 weeks ago. The patient had been feeling well over the last week or so and received the Moderna COVID-19 vaccine on 3/28 Sunday. This was his first dose. Approximately an hour and a half after receiving the vaccine, he had symptoms of feeling dizzy with position change. He went home from work. He developed fevers, chills, rigors, diaphoresis, and headaches. He slept a lot due to these symptoms. On 3/30 Tuesday, he woke with mild chest discomfort that he described as a pressure sensation in his anterior chest. He states that it was bothersome, but not too significant. He woke up 3/31 at approximately 0200 hours with a stabbing left anterior chest discomfort. He notes that it felt like a hot knife stabbing him. He admits that over the last couple of days, he had a cough when he would lay back in bed. He admits to feeling more short of breath when flat and feeling like he had to put pillows behind his head. He came to the emergency department due to these symptoms. He was given a dose of acetaminophen and promptly had nausea and vomiting. He received a dose of aspirin 325 mg and states that his symptoms resolved shortly after that. 3/31 He now feels well and denies any further chest discomfort. He denies any dyspnea.
1227367	4/18/2021	NY	37	M	3/1/2021	3/3/2021	I get the first dose on March 1st 2021. Within a day later I started experiencing muscle pains, being extremely weak, being light headed and chest pains. It?s been about a month and a half and I am still experiencing these symptoms

1224197	4/18/2021	NJ	68	F	3/29/2021	3/29/2021	feels tired; She did have palpitations overnight that woke her up in her sleep for 15 minutes; head feels tight, like there is a band around it/head feels tight, like there is a band around it; Nausea; severely lightheaded; her limbs felt heavy; her blood pressure went way up and lasted a good 7 hours/blood pressure at this time was elevated to 190/86; it was hard to lift her arms; This is a spontaneous report received from a contactable two nurses (one nurse reported for herself). This 68-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EN6205 and expiration date: 30Jun2021), via an unspecified route of administration right arm on 29Mar2021 at 10:15 as single dose for COVID-19 immunization. Medical history included anaphylaxis (recovering), hypertension ongoing, gastroesophageal reflux disease (GERD), anemia (her hemoglobin dropped to 6.9 and ferritin was low), hiatal hernia surgery (had mesh), a latex allergy (her lips would start swelling) and food allergy (tuna fish). Family history included lung disease (her dad was diagnosed). Concomitant medications included hydrochlorothiazide (HCTZ) 25 mg, daily (been on it for 10 years) taken for high blood pressure from an unspecified start date and ongoing; losartan 100 mg, daily (for about 10 years) taken for hypertension from an unspecified start date and ongoing; iron (Tablet) 65 mg, daily (about 10 years) taken for anaemia, cetirizine hydrochloride (ZYRTEC) taken for an unspecified indication; The patient previously took cefalexin (KEFLEX) and experienced swelling on face and mouth, epipen, acetylsalicylic acid (ASPIRIN) (6 years ago aspirin sensitivity took place) and experienced haematuria, tolectin as nonsteroidal anti-inflammatory drug (NSAIDS) (about 30 years ago (received steroids, breathing treatments and benadryl) and experienced anaphylactic reaction, flu vaccine taken for flu (at 19 years old). The patient got first vaccine on 29Mar2021 and had an event. On the same day, she was severely light headed and her limbs felt heavy and her blood pressure went way up and lasted a good 7 hours. They had her in the emergency room. She did have palpitations overnight that woke her up in her sleep for 15 minutes but she had no chest pain or shortness of breath and then it went away. At first, she didn't feel anything, but then as soon as she got up to go to the sitting area

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

where she was supposed to wait for 15 minutes, she became very very light headed, almost like there was a band around your head. there was no dizziness, but she was lightheaded and all four of her limbs felt really heavy, it was hard for her to move her limbs, she experienced nausea while sitting in the waiting area as well. She did not throw up and it started about an hour after the vaccine and describes the nausea as fleeting and states it lasted about a couple of hours, but not as long as the light headedness and heavy limbs. her blood pressure at this time was elevated to 190/86. the doctor there told them to send her to the ER. The reporter stated that the vaccine was given at the hospital, so they just wheeled her to the emergency department within the hospital, the doctor in the emergency room told her they didn't think it was an allergic reaction. after about 6 hours around 1600 her blood pressure finally came down to 141/67. She was discharged from the emergency room around 16:00 on 29Mar2021. At the time of discharge, the heaviness of limbs and light headedness had went away, but when she was walking to get to her car in the parking lot the lightheadedness and heaviness of her limbs returned. it was hard to lift her arms. she went home and went to bed, the lightheadedness and heaviness of her limbs went away after she was able to lay down and rest. Last night around 2:30 or 3:00am she woke up with heart palpitations. Caller states that these palpitations went away after 15 min and that she hasn't had this experience in years since hiatal hernia surgery. she felt much better next day, the only thing she felt today was tightness in her head but not a headache and just felt tired. The outcome of the events severely lightheaded, her limbs felt heavy, her blood pressure went way up and lasted a good 7 hours/blood pressure at this time was elevated to 190/86 and head feels tight, like there is a band around it were recovered in 2021; nausea was recovered on 29Mar2021; palpitations was recovered on 30Mar2021 and other events were unknown. As reported causality : Feeling light headed; Limbs felt really heavy; high blood pressure Related; head feels tight, like there is a band around it; heart palpitations Related. Information on Lot/Batch number was available. Additional information has been requested.; Sender's Comments: Based on the reasonable temporal association, the Company cannot completely exclude the

The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.
1226442	4/18/2021	AK	29	F	3/30/2021	4/4/2021	About 24hrs after receiving the vaccine I had what felt like a lump in my right lung. It transferred to my left lung about 30 mins later. It eventually disappeared about 30 minutes after that. The day of the lump and the next 3 days I had severe chest pain and difficulty catching my breath, accompanied by parts of my body going numb (hands, cheek), dizziness, and migraine. These symptoms have since gone away, but I am still having difficulty drawing a deep breath.
1226126	4/18/2021	OH	48	F	3/26/2021	3/29/2021	April 4 - abdominal pain and some back pain. April 14, left leg pain, chest pain, light pressure on chest, left hip pain. April 16 left leg and foot pain. April 17, pain under rib cage and pelvic, stomach pain. April 18, left forearm and leg pain, left side back pain, slight stomach pain.
1226141	4/18/2021	MO	24	F	3/26/2021	3/26/2021	Patient reported that 3 days after her first dose of Pfizer COVID-19 vaccine she experienced severe chest pain. She went to the ER and was worked up, exam normal. ER doctor told her that it could be related to vaccine but still recommended she get the second dose, saying that they could not guarantee this event would not happen again.
							Started having chest pains, shortness of breath, and rapid heart beat that evening. Persisted for the next 2 weeks so I went to the doctor to have a D-Dimer test on 4/15/21. Test showed elevated D-Dimer.

1223914	4/17/2021	TX	29	F	4/17/2021	4/17/2021	At around roughly 7:00 pm my regular achy arm became body aches followed by chest pain and shortness of breath. I know I do not have COVID 19 I haven't left my house since March 2020 until October 2020 to have my baby and since then haven't been out again except to get vaccinated in March 2021. I also do not have any underlying conditions I've had full check ups because I had a baby 6 months ago. The only side effect concerning me are the shortness of breath and chest pain.
1222651	4/17/2021	IL	50	M	4/14/2021	4/14/2021	syncopal episode 1 minute after receiving second Covid vaccine dose. Patient had head down and slumped over, was diaphoretic. Patient also had a syncopal episode after his first dose at the end of March, and at that time fell and hit his head, requiring a CT head. Additionally at that time patient continued to have persistent nausea and vomiting afterwards requiring numerous antiemetics and IV fluids. He also had a full work-up, which did not reveal any concerning signs in relation to his syncopal event. Before syncopized today, patient denies experiencing any chest pain, palpitations, shortness of breath, nausea. He said he began to experience some lightheadedness, and then lost consciousness. This was witnessed by his husband, who is with the patient today. Denies any head trauma, neck trauma. He spontaneously regained consciousness shortly after, and felt clammy, however was not experiencing any other symptoms. Patient currently denies any symptoms. Endorses compliance with his medications.

1223730	4/17/2021	CA	46	F	4/17/2021	4/17/2021	1520 patient received COVID 19 vaccine. 1528 transferred patient to Treatment area via wheelchair accompanied by husband due to chest tightness and SOB. 1531 911 called due to worsening chest pain and persistent distress. 1535 Epi pen given to right lateral thigh. 1538 O2 at 2 lpm via N/C. 1542 Paramedics arrived and assumed care. Transported to ED.
1223703	4/17/2021	CA	30	F	2/2/2021	2/18/2021	On 2/18/21 I awoke with sharp transient chest pain. It awoke me at 2:00AM and subsided around 2:10AM and I went back to sleep. I was then awoken 2 additional times with chest pain that subsided in about 10 minutes after sitting up. I experienced chest pain every evening thereafter which awoke me and finally on 02/21/21 I went to the emergency department where the physician performed an EKG, Chest Xray, CBC, BMP, BNP and Troponin levels. All of the tests were normal and the physician did not determine a diagnosis for my chest pain. I felt as if the symptoms were similar to pericarditis and after my trip to the ED I experienced transient chest pain during the day along with at night. I took ibuprofen 800mg TID, which helped to alleviate the chest pain for most of the evening and day. The chest pain ceased on 2/26/21 and I have not experienced it since. I have never experienced this type of chest pain in the past and do not have any chronic cardiac conditions.

Still having his headache now. 9/10 pressure-like on the frontal head - constant States, "I never had this kind of headache before". 6/10 burning epigastric pain. Also has bodyaches. Has mild dizziness. Denies any photosensitivity, fever, flu-like sx, nausea/vomiting, chest pain, dyspnea, numbness, tingly sensation, slurred speech, back pain, rectal bleeding.
1223181	4/17/2021		67	M	4/2/2021	4/2/2021	Admitted 4/2/2021 with chest pain
1223729	4/17/2021	CA	60	M	4/12/2021	4/15/2021	On Thursday around noon, pt. had a headache, chest pains, numbness in left arm, the ER checked his heart rate and it was 215, they did blood work which came back normal & took more blood 4 hours later to check for heart damage, They admitted him to the hospital and did an EKG the next day that did not show any negative results (you'd have to get that from the hospital) They completed an Angiogram and found no blockage. Today, April 17th, I believe they did a cat scan of his lungs to check for blood clots and I am not sure of the results.

1223370	4/17/2021		25	F	4/15/2021	4/15/2021	I started getting heart palpitations that night that haven't stopped. I couldn't sleep and all day the next day I have having chest pain, heart palpitations, and physical feeling of panic although mentally I was fine. it felt like I kept having adrenaline rushes
1223374	4/17/2021	AL	56	F	3/31/2021	3/31/2021	chest pain post baccine
1223383	4/17/2021	TX	45	F	1/26/2021	1/27/2021	On Jan 26th 2021 around 3pm I had 2nd dose vaccine . I took Zyrtec 1 hours before vaccine and 12 hours later on 27 Jan 2021, around 3am . I had side effect. I felt chest pain, difficulty in breathing, facial swelling, some rashes in the neck and low grade fever, dizzy, headache and severe pain , chills and felt very weak for 48 hrs. I took Benadryl, Tylenol and Zyrtec per MD order. after 48 hours later I felt I was getting better. Weakness and dizziness lasted about a week then 1 week later I went back to normal condition. I had same side effect with my 1st dose of COVID vaccine as well. I went to see the provider at that time.
1223413	4/17/2021	CA	53	M	4/3/2021	4/4/2021	Adverse: Severe Chest, back & should pains. Chest pains come and going all day long on a scale of 3-8 in pain. Back pains correlate to the chest pains. Should has always in pain around a 3-4 Been seen by the doctor on April 7th. and they performed two EKGs, two CT Scan and two Ultrasound scans and found nothing wrong with my heart. Since April 4th until today April 17th the chest pains continue. They get much worse when I lay down, so I have to sleep in a chair to lower the pain. Even while sleeping in a chair the pain comes and goes all night long.
1223414	4/17/2021	FL	27	F	4/9/2021	4/11/2021	About 48 hours after first vaccine dose I started feeling really itchy. Followed by large patches of hives showing up all over my body. Individual patches last about 10 minutes but the hives are continuous throughout the day. Also possibly related, experienced stabbing chest pain a couple times throughout the week. Over 5 days after onset of hives, the severity and consistency has not decreased at all.

1223566	4/17/2021	WA	49	F	4/6/2021	4/9/2021	Immediate muscle tension in left arm following vaccine shot in left arm. The soreness persisted for several days. Painful to lift left arm higher than my shoulder. The morning of day 3, I woke up to feel a pronounced skin irritation under my left armpit. Later that day, I noticed a small welt on my left arm and the irritation had grown to include my upper left arm front and back. Over the next few days, the number of welts increased and the pain was increasing from the skin irritation. The tension in my shoulder started to give way to feeling tightness in my left chest. I reported the symptoms. I tried to report to the Health Department, but they wouldn't take a report stating that the symptoms I was reporting did not match "known symptoms". On 4/13/21, I went to the Urgent Care to have the rash examined. The doctor tentatively diagnosed as Shingles. However, because of the chest pain, he referred to the Emergency Room for blood tests to rule out a possible Pulmonary Embolism. The blood tests came back normal. I was prescribed 12 Hydrocodone-Acetaminophen for the pain and discharged. On 4/15/21 I returned to Urgent Care because the welts were continuing to spread and the pain was increasing. Including sharp pains associated with the shingles. At this visit I was prescribed 21 tablets of Hydrocodone-Acetaminophen and 21 tablets of ValACYclovir.
1218434	4/16/2021	FL	57	F	3/5/2021	3/16/2021	A few days after the vaccine I woke up with a headache and chest pain. The headache was like none I had ever had before. I went to the hospital for treatment and stayed overnight.
1218820	4/16/2021	OH	40	M	4/5/2021	4/9/2021	Had usual reaction on day two: chills, tired, sore, etc. On day 5 I experienced very painful chest pain quite suddenly- went straight to ER, turned out to be lung pleurisy. I've never had this, nor have I ever had chest pain or been to the ER before this.

1218744	4/16/2021	TX	18	F	4/7/2021	4/7/2021	<p>She got her J & J vaccine around 4:30 on April 7th ,2021. She was feeling fine up until around 10:00 that night when she began to have some of the regular side effects in addition to some unusual ones that were more concerning. She had chills was feverish and nauseous with flu like symptoms of her body aching. However, at around 10:30 that night she reported having difficulty breathing and having chest pains with pain when she would take breaths. She noticeably was taking very small but frequent breaths due to the pain. She described a pressure on her chest as if there was a bowling ball sitting on top of her chest. She was crying from the pain and her difficulty breathing. She also reported that her throat felt like it was smaller/ constricted. At that time, she was given Acetaminophen and later around 12:00 she was given Benadryl. When she went to bed that night, she was in pain but she also reported that her heart was racing and her resting pulse at the time was 110 bpm. She had the flu like symptoms into Thursday evening but by Friday she looked a lot better except for her difficulty breathing with complaints of chest pain when she breaths with continued pressure on her chest. She rested in bed for most of Friday and on Saturday she got dressed in the afternoon and took a walk around half a mile at which time she was exhausted and felt out of breath. When she walked back from her destination about a half mile, she needed to rest in bed to recuperate. The pain while breathing lasted into Sunday. Monday morning, she attempted to run and became winded from running a short distance of ¼ of the block and could not catch her breath having difficulty breathing and throwing up with a lot of subsequent chest pain that day. She was taken to the doctor by 10:00 that morning to run lab tests and get an examination. She is slowly getting better and taking it easy but Tuesday she still had some pain and by Thursday she is reporting that while the chest pain is still there it is more of a discomfort that she feels when breathing as compared to pain. She continues to report the discomfort when breathing till today 4/16/21 and is still limiting her physical activity but going about her daily routine.</p>

1218735	4/16/2021		53	M	3/17/2021	3/24/2021	Patient received 1st COVID vaccine on 3/17. On 3/24, he experience pleuritic chest pain and was admitted to the hospital for pericarditis confirmed by EKG. During this hospitalization, he was incidentally found to have left main stenosis 60-70% on the LHC, requiring PCI. Patient did not have an acute MI - hence Dressler Syndrome was thought to be less likely. He was discharged after a week on 3/30/21 with colchicine and other cardioprotective medications. He received his 2nd vaccine on 4/7/21. On 4/14/21, patient was readmitted for pleuritic chest pain attributed to recurrent pericarditis.
1218408	4/16/2021	WI	49	M	4/10/2021	4/10/2021	Chest Pain with Shortness of Breath
1218469	4/16/2021		72	M	4/12/2021	4/13/2021	death Narrative: Patient passed away on April 13, 2021 at home at 1810 He was 72 years old had severe aortic stenosis and hypertension and had an aortic valve replacement (TAVR) at hospital on Jan 20, 2021. He was readmitted to hospital for shortness of breath which was evaluated from Feb 19 - Feb 21, 2021 I spoke with his daughter today. She was with him at home when he went to the bathroom and since he had not come out for some time, she knocked on the door and found him collapsed in the bathroom. She called 911, who did CPR, however he had passed away. He was referred to the coroner. He had his first Moderna vaccine on March 15, 2021 after which he had not had any side effects. He received his second dose on April 12, 2021 and had not mentioned any side effects other than mild abdominal discomfort. Daughter said his shortness of breath had been improving after his discharge from the hospital. He had not complained of chest pain, cough, fever, diarrhea, in the last few days. I paid condolences to daughter and told here we would be reviewing the case to see if there was any relationship to him receiving the Covid19 vaccine and that the case had already been referred to the coroners office.

1219037	4/16/2021	OR	64	F	3/26/2021	4/1/2021	First dose on 3/5/21 in left arm - muscle tenderness & some fatigue. Second dose given on 3/26/21 in left arm. Some tenderness in left upper arm. About a week later (April 1) I had left upper back & chest pain (just left of thoracic spine area and forward to left of my sternum bone & left shoulder pain). The area of discomfort increased to under my left armpit. I used Tylenol every 4 hours but still had some pain. The pain was bad enough that I had trouble sleeping at night and reaching for objects in my home. I noticed an "engorged" feeling & tenderness in my left breast. Swollen lymph nodes were present under my left arm - breast was too tender to check for more lymph nodes. No fever. Wasn't sure if I should go to an ER so checked the internet & 4/14/21 Contacted & consulted with my family doctor (Dr - My Chart messages) to let her know. Found information on Web (internet) that some women are having this kind of reaction in lymph nodes so was less worried about something more serious like a heart attack). Afternoon of 4/15 and today 4/16 feel the symptoms are beginning to go away - pain in my axilla area is better, lymph nodes not as hard & tender, left breast and left side of backbone have decreased discomfort.
1219087	4/16/2021	VA	22	M	4/1/2021	4/1/2021	22 y/o previously healthy male who presents after a covid vaccine at 0940 with left sided facial weakness and numbness since shortly after that time. He stated that originally his entire left side of his face felt numb and was weak but it's been improving since that time, now only his lower face. He denies any other acute symptoms including fevers, chills, chest pain, shortness of breath, nausea, vomiting, diarrhea or any other acute concerns. VS wnl. PE remarkable for weakness in V2-V3 distribution of face with some sensation loss in the V3 distribution of the left side of the face. While forehead is spared, this appears to be more of a bell's palsy that's resolving rather than an acute central process. During evaluation his symptoms completely resolved Will discharge home with return precautions. (released at 1411pm) 04/01/2021 12:13 BP: 115/70. MAP: 85. HR: 61. RR: 12. O2 saturation: 100%. 1219210	4/16/2021	IA	60	M	3/25/2021	3/27/2021	Clinic visit 4/7/21: "60 y.o. year-old male who presents for left calf pain, swelling, and bruising that began on 03/27/2021. Patient states that 2 days prior to symptom onset he received the Moderna COVID-19 vaccine. He did have symptoms of fever 102 F for approximately 24 hours. After the resolution of his fever he notice swelling of the leg with tenderness any line of bruising going down the medial aspect of his leg. He noticed more prominence of varicose veins of the left leg and began using a compression stocking. His varicose veins seem to worsen with sitting as well as tenderness, and improves with walking. He notes a tenderness over the upper calf. He denies any history of DVT/PE. He notes that two brothers sustained blood clots, one he believes was in varicose veins which were ultimately stripped and the other he is not sure of the exact nature of the clots. He is unaware of any hereditary clotting disorder in his family. He denies any shortness of breath, difficulties breathing, or chest pains." He was sent home with aspirin 325mg daily. Hospital admission 4/11/21 " 60 year old male with no PMH comes in c/o LLE pain that originally started 2 weeks ago and intermittently getting worse. The pain started around the left calf and has moved its way up to his thigh/groin area. The pain is sharp, 7/10, worse when standing, slight improvement with aspirin. Pt denies tingling, numbness, CP, shob, N/V/D, blurry vision or weakness. Associated symptoms include erythematic rash around left inner thigh, tender to touch, and swelling of calf/thigh. He works with heavy machinery but is always sitting down 1-2 hours at a time. He does have family history of DVT/PE. He is not on any daily NSAIDs or other anticoagulation and denies smoking." he was started on a heparin drip then transitioned to Eliquis and discharged the next day.
1219198	4/16/2021	MA	65	F	4/8/2021	4/8/2021	65-year-old female presenting with reaction to the Johnson & Johnson Covid vaccine. Received vaccination in her home, about 5 to 10 minutes later, developed redness and swelling of the face. Thought she had some stiffness of the tongue and tightness of the throat. No chest pain, shortness of breath.

1220300	4/16/2021	NY	44	F	4/8/2021	4/8/2021	I will begin by noting that I am known for high pain tolerance and have been a strong, healthy, professional athlete for thirty years. The evening of the vaccination, I went to bed at 9pm feeling odd. By midnight, I became paralyzed with excruciating pain throughout my torso and arms with such an extreme fever that it felt as if my heart was going to stop. I had crushing chest pain which inhibiting my breathing ability in a way that could only be compared to being crushed under a burning truck. The paralyzation was so intense, with pre-existing pain multiplied by a thousand, that I couldn't even speak to alert my husband, who was right beside me. This continued for several hours until it subsided enough for me to pass out from exhaustion. The following day I battled residual aches throughout my torso and arms, accompanied by a mild fever. The trauma of fearing for my life that night and over the past week, exacerbated by the news of this vaccine I received being paused for issues related to my demographic, had made me too afraid to report my extreme side effects until now. With the encouragement and support of my family, I have worked up the courage to do so. It was the scariest, most intense pain and fever I have ever experienced in my life all at once and no one I have described this to has ever heard of the severity of what happened to me.

1218147	4/16/2021	SC	71	F	3/18/2021	3/28/2021	<p>Patient is a 71-year-old female with history of hypertension, hyperlipidemia, and obesity who presents with complaint of acute onset shortness of breath. She reports she was walking around her house earlier when she suddenly became short of breath. She denies any chest pain, numbness or tingling but states that shortness of breath persisted. She denies any tobacco, alcohol or drug use and states she has never had any symptoms similar to this before. Denies any lung disease or heart disease previously. She does have hypertension and hyperlipidemia and is on metoprolol and rosuvastatin respectively which she reports good compliance. Denies family history of MI or strokes. She also denies other symptoms such as nausea, vomiting, abdominal pain, fevers or lower extremity edema. In the ED vitals were found to be within normal limits. EKG was obtained showing diffuse T wave inversions, right bundle branch block, no ST changes, no hypertrophy. Troponin found to be elevated at 0.137, creatinine elevated at 1.3, BUN 26. Chest x-ray was within normal limits. Otherwise lab work was unremarkable. She was given aspirin and Nitropaste Hospital Course: Patient was admitted to the medical floor and remained hemodynamically stable throughout her stay. She actually remained asymptomatic and had no further shortness of breath. She was not hypoxic, at no point required supplemental oxygen. Her troponins however continued to uptrend to 0.389. Cardiology consulted, she was medically optimized with increased statin dose, therapeutic lovenox, and aspirin. Original plan was for cardiac catheterization. However, a d-dimer was ordered which returned elevated to 13.7. CTA was performed which revealed extensive bilateral pulmonary emboli with large clot burden and concern for right heart strain. Echocardiogram showed mildly dilated and hypokinetic RV with mild diastolic dysfunction with impaired relaxation. She was deemed not to be candidate for EKOS. Troponin elevation was felt to be type II NSTEMI 2/2 PE. PE was classified as unprovoked as she has no definite risk factors for this: no prior DVT/PE, no family history of clotting disorder, no evidence of malignancy (UTD with cancer screenings and visits PCP q6m for health maintenance), no cell line abnormalities, no prolonged immobility or long trips or surgeries, no trauma, no hormone or steroid therapies or even</p>

1218329	4/16/2021	OR	52	F	3/7/2021	3/17/2021	antidepressants. She is obese, and has mild CKD. She tested negative for COVID-19 by antigen testing. The only identifiable change in her health habits recently was receiving the first COVID-vaccine dose on 3/18. We discharged her with Eliquis with instructions to taper from 10BID to 5BID after 7 days. As she will be on anticoagulation, the benefit will likely outweigh the risk of receiving the second COVID dose. She will follow up with her PCP and hematology/oncology.
1218295	4/16/2021	AZ	34	F	4/9/2021	4/14/2021	About 10 days after the vaccine, I started having shortness of breath, fatigue, night sweats and some chest pain. The chest pain is mostly a constant chest discomfort, along with brief sharp or burning pains in the center of my chest. The shortness of breath, night sweats and chest pain have not gotten any better and is still continuing on this day, 4/16. These are new symptoms for me and I felt absolutely fine before getting the vaccine.
1218285	4/16/2021	IN	23	M	3/31/2021	4/12/2021	Dizziness, nausea, pinching pain in left thigh, and then I collapsed. I had to go to the hospital and all tests looked normal. Ultrasound for blood clot did not show any clotting. That was two days ago. Today my vision is blurred, body aches and chest pain on the right side (Injection side.)
1218275	4/16/2021	FL	38	F	4/5/2021	4/5/2021	THE PATIENT WAS SEEN FOR CHEST PAIN, CHEST PRESSURE, AND SHORT OF BREATHE. THE PATIENT WAS GIVEN A CHEST XRAY AND AN EKG. THEY WERE BOTH CLEAR. THE PATIENT WAS ALSO GIVEN A COVID RAPID TEST WHICH RESULTED AS A NEGATIVE. THE PATIENT WAS THEN RECCOMENDED TO GO TO THE NEAREST EMERGENCY DEPARTMENT TO OBTAIN FURTHER TESTING AND HE REFUSED - SIGNING A AMA.
							Since time of vaccine I have been experiencing rapid heartbeat, shortness of breath and chest pain. Went to emergency room and urgent care to confirm no PE in lungs. Confirmed none but symptoms still remain increasing daily since time of vaccine

1220464	4/16/2021	ID	37	F	4/15/2021	4/16/2021	Patient states they are experiencing tachycardia per her smart watch. Registering her at 120-130 BPM. Not experiencing chest pain or SOB. Patient reports a fever and chills. Per NP in the Health Clinic, patient should rest, drink lots of fluids, and go to the emergency room if they experience any chest pain or SOB.
1220465	4/16/2021	TX	24	F	3/10/2021	3/24/2021	Report hair falling out 2 weeks post vaccination and bruising of the right and left arm -noticed on 4/15/21 1 month and 6 days post vaccination. Report of chest pain 1 month 6 days post vaccination described as a pinch lasting 2 minutes. Denies SOB, leg swelling, headache or blurred vision. Treatment: Instructed to see primary care doctor
1220518	4/16/2021	NY	23	F	4/14/2021	4/15/2021	23 year old female presents with right sided neck pain x 1 day, reports associated symptoms of headache, coughing, sore throat and myalgias s/p first dose of COVID19 Pfizer vaccine yesterday. Pt reports she couldn't sleep because she felt her heart was beating faster. Pt reports she received COVID19 vaccine dose in left deltoid. Pt denies fever, coughing, emesis, diarrhea, chest pain, SOB, lower extremity edema, lower extremity tenderness. No known sick contacts, no recent travel history. She reports she took Tylenol yesterday and today, with moderate relief. Pt offers no other complaints. Vitals at time revealed normaltensive T98.4F, HR of 100bpm Cardiorespiratory exam on auscultation +S1/S2, tachycardic at 100bpm on repeat, lungs CTAB There was a palpable tender anterior right cervical lymph node that was mobile and well circumscribed around 1x1cm. Pt was advised to take Tylenol and/or Motrin for neck pain, headache. She was discharged home with anticipatory guidance and ED precautions should she develop chest pain, shortness of breath, dizziness, jaw pain, and/or chest pressure, slurred speech. Pt was receptive to advice. She was contacted the following day, (today on 4/16/2021) and she reports she feels much better: palpitations and headache has resolved, and neck pain is improving.

1220528	4/16/2021	TX	31	M	4/14/2021	4/14/2021	None immediate. No negative reaction to first dose (3/17/21). Swelling: 6 hours following second dose (4/14/21), noticed swelling on lower lip. Swelling continued overnight and through morning of 4/15. Took Benadryl around noon 4/15 and swelling receded by evening. Rib/back/chest pain: Around 11:30pm on date of injection, had strong acute pain around lower rib cage. No difficulty taking breaths but pain was intense for about 30 minutes. Hives: Woke up morning of 4/16 with hives on lower back. By 11am, hives continued to spread to hips, neck, under arms, chest, belly. Sought treatment at urgent care at 12pm and received steroid injection. Took 1 Zyrtec around 1 pm on doctor?s orders. Also applied some triamcinolone acetonide cream on some spots, not on doctor?s orders (he?d leftover from old prescription). Hives continued to get worse until about 3:30pm, have since steadily subsided.
1220565	4/16/2021	CA	37	F	4/16/2021	4/16/2021	Patient states that 10 minutes after getting her 2nd Covid vaccine, she started to feel her tongue swelling. Denies any difficulty swallowing , denies chest pain, denies palpitations. No observation of redness, swelling o face hnds or feet. Vitals signs obtained 0930 BP 117/72 HR 52bpm SpO2 100% , and 1006 BP 103/63 HR 52bpm SpO2 100%. No RRT called. Pt left clinic by herself 1010
1220590	4/16/2021	CA	45	M	4/13/2021	4/14/2021	- In the early morning of 4/14/21 Pt called Kaiser help line complaining of cold hands/ feet, restlessness, pallor, R arm pain. - Telephone visit 4/14/21 complained of chills, nausea, vomiting, abdominal cramping, diarrhea. Fluids and rest recommended. - 4/15/21 presented to Kaiser with chest pain, shortness of breath, abdominal pain. Diagnosed with late presentation of acute coronary syndrome / anterior ST elevation MI. Echo with low EF < 25%, LV apical thrombus - 4/16/21 heart catheterization showed 100% occlusion of LAD treated with PCI / DES x 2, IABP. Endotracheal intubation for respiratory failure.
1220611	4/16/2021	TX	31	F	4/16/2021	4/16/2021	Pt reports immediately after receiving her second dose, she felt the injection go straight to her heart. Approximately 15 min after the injection she complained of chest pain, as if being ?punched in the heart?. The pain was rated as an 8 on scale of 0-10. The pain never subsided during clinic visit prior to emergent transport to EC.

Mild chest pain; Body ache; Low grade fever (101°F); Head ache; Welt on the arm at the injection site about a week after being vaccinated; This spontaneous case was reported by a physician (subsequently medically confirmed) and describes the occurrence of CHEST PAIN (Mild chest pain), MYALGIA (Body ache), PYREXIA (Low grade fever (101°F)) and HEADACHE (Head ache) in a female patient of an unknown age who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included No adverse event (No relevant medical history provided). On an unknown date, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On an unknown date, after starting mRNA-1273 (Moderna COVID-19 Vaccine), the patient experienced CHEST PAIN (Mild chest pain) (seriousness criterion hospitalization), MYALGIA (Body ache) (seriousness criterion hospitalization), PYREXIA (Low grade fever (101°F)) (seriousness criterion hospitalization), HEADACHE (Head ache) (seriousness criterion hospitalization) and VACCINATION SITE SWELLING (Welt on the arm at the injection site about a week after being vaccinated). At the time of the report, CHEST PAIN (Mild chest pain), MYALGIA (Body ache), PYREXIA (Low grade fever (101°F)), HEADACHE (Head ache) and VACCINATION SITE SWELLING (Welt on the arm at the injection site about a week after being vaccinated) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. The patient has no know history of COVID (had 2 negative tests; no antibody test was completed). Concomitant product use was not reported. Treatment medication included dexamethasone which relieved the symptoms for a while. However, at the time of this report on 07-Apr-2021, the caller was on the way home from taking the patient back to the ER (emergency room) for the symptoms. This case concerns a female of unknown age hospitalized with serious unexpected events of chest pain, pyrexia, myalgia, headache, and expected vaccination site swelling. Event onset with unknown latency after first dose mRNA-1273. Treated

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

with dexamethasone. Event outcomes unknown. Based on current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.;
Sender's Comments: This case concerns a female of unknown age hospitalized with serious unexpected events of chest pain, pyrexia, myalgia, headache, and expected vaccination site swelling. 1220984	4/16/2021	NY	65	F	3/11/2021	4/5/2021	<p>pain underneath her breast; chest hurt; bacterial pneumonia on left lower lobe; This spontaneous case was reported by a consumer and describes the occurrence of PNEUMONIA BACTERIAL (bacterial pneumonia on left lower lobe) in a 65-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 038A21A) for COVID-19 vaccination. The patient's past medical history included Diabetes, Asthma, Hypertension and High cholesterol. Family history included Heart disease, unspecified. On 11-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 05-Apr-2021, the patient experienced PNEUMONIA BACTERIAL (bacterial pneumonia on left lower lobe) (seriousness criterion medically significant). At the time of the report, PNEUMONIA BACTERIAL (bacterial pneumonia on left lower lobe) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 05-Apr-2021, Computerised tomogram: abnormal (abnormal) Pneumonia on left lower lobe.. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. No concomitant medications reported. Treatment of the events included doxycycline. She had a CAT scan on 05Apr2021 because she had been having pain underneath her breast and her chest hurt. She had to cancel her second dose scheduled for 08Apr2021 due to the pneumonia. She had not been able to find appointment for her second dose and was concerned she may not be able to get the second dose. Company Comment: This case refers to a 65-year old female patient with relevant history of Diabetes, Asthma, Hypertension and High cholesterol who experienced Pneumonia bacterial, chest pain, and breast pain following the administration of Covid-19 vaccine and was assessed as Unlikely Related to study drug due to lack of temporal relationship. The subject's underlying disease history can be strong confounding factors. The pneumonia bacterial can be caused by bacterial infection and the immunocompromised system can allow the patient to higher risk for infections.; Sender's Comments: This case refers to a 65-year old female patient with</p>

1221330	4/16/2021		39	M	4/11/2021	4/11/2021	<p>Patient is a 39 y.o. male with no significant past medical history who came to the ED with a sudden onset of chest pain that radiated initially to his right shoulder then to his left shoulder, left arm and back with intensity of 7/10 starting Tuesday 4/13/21 associated with SOB that is worse when laying flat or taking a deep breath. States he received his second Pfizer vaccine on Sunday, 4/11/2021 at 11 AM and started experiencing fever, chills, headaches, body aches and uncomfortable around 11 PM. He finally decided to take Tylenol x2 on Monday between 2 PM and 11 PM with some relief. He felt a little better on Tuesday morning and did some work from home but later around 7 PM, he notes a temp of 100.2, experienced body aches which he attributes to Vaccine side effects because his wife was also not feeling well post Vaccine. He went to bed and woke up later with cold sweats, felt pain in his chest and back. He described his chest pain as constant pain/heaviness that "felt like someone is sitting on his chest", he later felt pain in his left arm and back prompting ED evaluation. He denies similar episodes in the past, denies abdominal complaints, denies lightheadedness or dizziness, palpitations, shortness of breath at rest, orthopnea, PND, syncope, denies urinary complaints, denies smoking, drinks alcohol socially. States his father has CAD and MI x2 with stent in his 50s, his mother is doing okay with no cardiac history. In the emergency room, his EKG is consistent with pericarditis, initial troponin noted as 4.24 with repeat noted at 8.91, his LFTs are elevated at 107/123. He received full dose aspirin, Lopressor 25 mg with improvement in pain. IMG cardiology is on board with plan for cardiac cath today by doctor. Echocardiogram showed EF of 35-40% with wall motion abnormalities with initial reading.</p>

1219519	4/16/2021	CA	39	M	4/14/2021	4/14/2021	<p>Patient received the 1st COVID vaccine (Pfizer, Lot #: EW0162, expiration date: 07/31/2021) at 1500. EMT made contact with the patient standing in the 30 minute observation area at 1507. Patient complained of ?blurry vision, headache, and slight tingling in the throat.? Patient reported the symptoms started ?10 minutes? status post vaccine. Patient denied chest pain, nausea, vomiting, or diarrhea and was presenting conscious, alert, and oriented to person, place, time, and event (AOX4). EMT assisted the patient to the zero- gravity chair for further evaluation. Nurse then responded and attended to the client and EMT. Baseline vitals were obtained by EMT at 1508, while patient was sitting: blood pressure: 150/88, respiratory rate: 14, heart rate: 80, pupils equal and reactive to light. EMT observed the skin to be dry, warm, and normal. Chief complaint was then reassessed and patient claimed his vision had improved and symptoms were subsiding. He stated the onset of symptoms were gradual and lasted less than 5 minutes.? Patient also reported his last oral intake was around 1300 with minimal fluid intake. Patient stated he has a history of headache and denied any past medical history or taking any current medication. Patient has allergies to seafood and shellfish. At 1515, a second set of vitals were obtained by EMT, while patient was standing: blood pressure: 154/90, respiratory rate: 14, heart rate: 85, pupils equal and reactive to light. EMT observed the skin to be dry, warm, and normal. Patient was negative for orthostatic pressures. Patient was advised by the EMTs to stay another 30 minutes in the observation area, totaling 45 minutes. At 1545, patient stated ?all symptoms have subsided.? Patient was released and ambulated on his own, out of the facility, with a steady gate. EMTs encouraged the client to sign up in order to document any additional symptoms.</p>

1219560	4/16/2021	FL	42	F	4/7/2021	4/14/2021	Patient received the vaccine on Wed 4/7/21 @945am and about a week later she started to experience itchiness, red, hot to touch and a lump feeling at the injection site along with pain at the site radiating down to elbow and up to the shoulder. Patient took benadryl on 4/15/21 around 930am and she states it didn't help. No fever, body aches or chills. Advised patient to take tylenol or ibuprofen for the pain, and she can also apply benadryl cream or hydrocortisone cream to help with itchiness. Advised if patient experiences any chest pain or SOB then to go to urgent care or ER. 4/16-***PharmD*** Placed follow up call on 4/16/2021 at 12:06pm: Pt reported that she feels a little fatigue today. She also reports the right arm is still really red and swollen, and still have big knot but not as itchy today. The bump is still hot to the touch, and pain still radiates from her right elbow up to her shoulder when that arm is being touched. Pt reported she had applied ice pack in the beginning for approx. 10-15 minutes on and off, but still had no relieve. Pt also reported that she took Tylenol, Benadryl, and applied cortizone cream as recommended on her initial call and that still did not help (except cortizone cream helped some with the itchiness). Pt advised she was not able to get an appt with her MD, but MD has sent prescription to pharmacy (pt not sure what rx was sent over). ***NOTE*** Recommend pt that if her symptoms did not get better to go to urgent care if she is not able to get into see her MD. Advised pt will follow up with her on Monday 4/19/2021 after giving her a couple of days to see if the rx the MD prescribed provide any relief, or if her symptoms resolve by then.

1219628	4/16/2021	IL	82	M	2/18/2021	2/28/2021	10 days after his 2nd Pfizer COVID-19 vaccine, patient developed upper extremity weakness and paraesthesia. From the discharge summary: Pt had his second dose of Pfizer vaccine on 02/18/2021. The patient complained of new onset of bilateral upper extremity tingling, numbness and weakness since 02/28/2021. The patient denied lower extremity paraesthesia or weakness. He has a history of chronic low back pain. He denied any neck pain, back pain or radiation sensation. He has no sphincter dysfunction or incontinence. He has been using walker in the past. Dr. of neurology did a nerve conduction and EMG recently. The study showed the evidence of peripheral demyelination, peripheral neuropathy. The patient was admitted for possible spinal tap and IVIG treatment. The patient had a ground level fall 7 to 8 days ago. He denied fever, chills, headache, dizziness, shortness of breath, chest pain, palpitation, abdominal discomfort, diarrhea, UTI symptoms or coughing. Pt had his last dose of IVIG yesterday. No side effects. Motor weakness improving and UE paresthesia nearly resolved. No side effects to IVIG. BMP normal. Patient symptoms improved after 5 days of IVIG and he was discharged after being in the hospital 7 days
1219753	4/16/2021	NC	76	F	4/10/2021	4/10/2021	Starting feeling bad about 4 hours after vaccination. By the next day (4/11) had difficulty breathing, nausea, severe bladder pain, stabbing pain in stomach, epigastric pain, chest pain, and alternating between severe chills and feeling hot. By 4/12 most of this had subsided and she was experiencing weakness and fatigue, in addition to loss of appetite. This resolved over the next few days.
1219812	4/16/2021	OH	54	M	4/14/2021	4/14/2021	Vaccine given to patient at 10:30am 4/14/21 and he called main office and left message that evening on nurse voicemail that he had symptoms starting at 4pm- Severe headache, chest pain, SOB, vomiting and diarrhea. Nurse practitioner called him back the next day when returned to office and retrieved messages and called patient back. He reported he has hx of Cardiac and lung problems and that he had a bad reaction to his flu shot when had in past. He replied no to all these questions on the questionnaire, and when asked by staff giving the shot. He was advised by Nurse practitioner to go to ER

1219819	4/16/2021	NJ	32	F	4/10/2021	4/13/2021	The first 24 hours were very difficult for me. I have never been so sick in my life. I got the typical muscle aches, chills, etc. In fact I got every side effect listed plus more. I want to discuss the other side effects. On day 3 I started to develop extreme chest pain and pressure. It is a dull pain as if someone is sitting on my chest that will not go away. I also started to experience sudden bouts of dizziness and vertigo. It will not go away. Today is Day 7 and I spent the night in the emergency room because my chest pains got so strong. However, all the work up came back okay. I also have this strange feeling of electrical shocks running thru my head, those last about .5 seconds and go away, but it is a very weird feeling I have never experienced. I also have a strange desire to constantly burp, when I do my chest pain feels better. If I don't burp my ears start to feel full and sometimes they ring. Its Day 7 and I still feel SO miserable. Why id no one speaking about these chest pains? I know 5 people who have experienced the same.
1219823	4/16/2021	NJ	18	M	4/14/2021	4/14/2021	~~At 1400 patient in observation, RN vaccinator, noticed young man's head drooped over. RN went over to the patients and tapped his arm. Did not respond to verbal or physical touch. RN called for help. After a few seconds patient responded and opened his eyes. Patient transferred via wheelchair to private area. BO 76/64, diaphoretic. RR appeared normal. Patient stated he did not eat all day. patient stated his throat hurt and felt tight and he had chest pain. Patient agreed to be transported via on-sight ambulance to Medical Center for assessment with brother.~~
1219854	4/16/2021	NC	21	M	4/16/2021	4/16/2021	Patient presented to Health Center after receiving COVID-19 vaccine at Health Center, and going back to work site. He stated when he got to work, he began feeling hot, dizzy, nauseous, and pruritic. Vitals stable. He denied chest pain, difficulty breathing. Pt given IM Benadryl 12.5 mg in office and oral hydration w/ water. He was monitored for about 30 minutes, and said pruritus had resolved, but he felt tired. EMS called to transport pt to ED. Pt called by Health Center staff about 2 hours later to see how he was doing. He stated he was on his way home as he had been discharged from ED and told to monitor symptoms.

1220421	4/16/2021	WI	41	F	3/28/2021	3/28/2021	Per Client received Pfizer COVID 19 vaccine second dose on 3/28/2021, at 1:00pm in left arm. Client C/O symptoms starting on 3/28/2021 around 9:00pm, fever and chills. ON 3/30/2021 started having difficulty with breathing, chest pain, racing pulse an increased blood pressure through 3/31/2021, so the Client went into the ER on 3/31/2021. In ER Client had a CT of chest performed and is currently wearing a internal heart monitor for other medical concerns present prior to vaccine. Per Client some of symptoms have subsided and Client will plan to follow up with PCP. PHN suggested that Client continue to monitor symptoms, follow up with PCP and go back to ER if needed and call 911 for medical emergency.
1219925	4/16/2021		71	F	2/25/2021	2/25/2021	0815 144/73, 99% O2. RR 20, HR 65/min. Patient then started to experience mid sternal non radiating chest "tightness" 3/10. States she experienced the same sensation after first vaccine. Prior experience started after discharge and lasted 3-4 hours , evenChills: Status post emergency room evaluation for atypical chest pain after her second Covid vaccination. No further symptoms. Work-up unremarkable.
1220303	4/16/2021	CO	20	F	4/9/2021	4/9/2021	Symptoms began evening after receiving vaccine. Patient reports headache which progressed into the next day to fever, fatigue, intense chills, chest pain. Patient had these symptoms over 2-3 days and had began to experience arm tingling in arm where vaccine was administered, which then spread to both arms. Patient reports arm tingling will come and go. Patient reports taking OTC medication (ibuprofen). Patient called a nursing line and was told to go to the ER. Patient went to ER on 4/14 and was admitted for observation. Chest X-ray was done with no remarkable findings. According to patient, additional testing was done. Patient was discharged on 4/15 and was told to return if arm tingling returns and does not go away.

On an unspecified date, the subject experienced chest pain, leg numbness, and high pulse rate at midnight. Laboratory data (dates unspecified) included: Pulse rate (NR: not provided) 192 {beats}/min. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of the chest pain, leg numbness and high pulse rate at midnight was not reported. This report was non-serious.
1213090	4/15/2021	PA	43	F	4/7/2021	4/7/2021	I had multiple side effects, which I will list below, but the one that was most concerning and which I have not seen listed as a typical side effect is that I got very dizzy and fainted, losing consciousness briefly. I got my vaccine around 10am. By 9pm I had severe chills and was achy. Around midnight I got up to use the bathroom and felt dizzy, then I fainted. Thankfully I had called for help beforehand, so my husband caught me and called my name until I regained consciousness. Immediately after coming to I started sweating profusely. My temperature at that time was 100.3. Through the rest of the night and for the following day and night I experienced nausea, chest pains, achy, sore arm, weakness, and fatigue. I felt relief from symptoms by about 48 hours after my vaccination.

Visited Emergency Room evening of April 11. Multiple tests revealed diagnosis of pulmonary embolism. Was immediately transferred to hospital early April 12. Received blood thinning treatment and catheter operation. Discharged April 15, with prescription of Eliquis for continued blood thinning.
1212987	4/15/2021	MS	87	F	1/9/2021	1/15/2021	With 1st vaccine on 1-9-21 I had severe chest pain, the NP diagnosed it as pleurisy, told to take Tylenol, on second vaccine 2-6-21 I had a very bad headache that went down my neck and right shoulder, and lower back, NP said it was arthritis, go to sports med. since that time the pain has covered all my joints, muscle spasms to the point of not being able to walk, completely bedridden at this time, severe pain, headache, insomnia
1212936	4/15/2021	MN	44	M	4/6/2021	4/7/2021	Got COVID (Janssen) vaccine shot on April 6th at noon. Felt fine Tuesday and went to bed as normal. Woke up April 7th at 7AM with sharp pains in my left shoulder (same side as shot) and slight shortness of breath, and slight chest pain in the left quadrant of my torso (same side as shot). Proceeded to take Advil and seemed to help a bit. Minor aches/pains and shortness of breath throughout the day until about 8PM. At this time shoulder chest pain became more severe, and breathing became very strained, short, and painful. Pain and breathing kept getting worse and at midnight on Wednesday night thought I was having a heart attack due to extreme chest pain, couldn't breath, lightheaded, dizzy, tingly extremities. My wife drove me to ER at 12:30 AM Thursday.

1212826	4/15/2021	IA	65	F	3/5/2021	3/28/2021	3/28/2021 at 6:00 a.m. patient reported chest pain to a family member. He arrived at her home at 6:15 and found her slumped to the right in her chair, unresponsive. Patient was taken to our facility via EMS. On arrival, patient could open her eyes but could not talk or move her extremities. She was treated with alteplase 100 mg and flown to a trauma center. She was released on 4/2 and is currently receiving rehabilitation services in our facility; she is expected to return home in 4-5 days.
1213225	4/15/2021	MT	36	F	4/2/2021	4/2/2021	4 hours following vaccine administration she experienced chest pain, tightness, inability to swallow and developed hives. She was home at that time. Called 911. Paramedics evaluated her, gave her benadryl, and ultimately she started to feel better. Rash/hives lingered for 24 hours. Breathing cleared up within 2 hours. Swallowing returned to normal following dosing with benadryl.

States went to bed and continued with these symptoms for 36 hours. Took nitroglycerin to relieve chest pain. Saw heart doctor today who told her to call us to report adverse reaction and advised to not take second dose.
1213379	4/15/2021	CA	45	F	1/7/2021	1/7/2021	I have had joint pain in my shoulders for six weeks straight and then intermittently for weeks after that. The pain is bilateral, and I have never had joint pain before. I had also had right upper quadrant pain in the two weeks after the second dose that is still bothering me on occasion. I am constantly nauseated, and my reflux was out of control. That seems to be resolved. I got tested after I experienced chest pain and my Potassium was very low. My EKG indicated a heart problem. That was seven weeks after my shot. Now my fingers turning white on both hands. I also had an issue with late periods. I was one week late after the first shot and two weeks late after the second shot. I have chronic migraines and since my vaccines I have had long lasting migraines that have lasted up to ten days. I have had multiple visits to the Urgent care and my primary care doctor. I have a GI scope scheduled 04/26/2021.

1212486	4/15/2021	OH	45	F	3/23/2021	4/1/2021	On Thursday 4/1, my heart felt as though it was flip flopping in my chest. This was not constant but at least 4-5times each hour. I have had infrequent and typical heart flutters or palpitations before but this was a different feeling. On Friday 4/2 I called my PCP to ask if they thought I should be seen. They did want to see me and scheduled an appt. for 4/16 (told me to seek emergency care if it got worse). The flip flopping sensation has continued but become much less frequent, only a few times throughout the day. I have no other symptoms with this - no chest pain or tightening, no arm pain, tiredness, shortness of breath, nor fatigue, just the flip flopping sensation of my heart. I am scheduled to receive my second dose today (4/15 at 5pm) and then see my PCP tomorrow.
1212484	4/15/2021	TX	61	F	4/15/2021	4/15/2021	8:48 AM- Patient complains of dizziness/chest tightness and SOB after second dose of moderna covid vaccine. States she experiences SOB sometimes but this time feels different. States she takes BP medication and has a hx of high bp. Denies throat swelling, assessed and all appeared normal. Vital signs at 8:51 AM- 118/88, 98%, 60. Assisted patient and husband to private room and assessed stomach, back and arm for rash and/or hives; none apparent. Patient states she is feeling better and not having difficulty breathing. Vital signs at 9:00 AM- 108/82, 96%, 58. Assessed throat for swelling, none apparent. Vital signs at 0905- 118/79, 98%, 60. Patient states she is feeling completely better and sob and chest tightness went away. Also had patient walk in hallway and states she is no longer dizzy. Advised patient and husband that all vital signs are normal and no other apparent signs of anaphylaxis, however if she still felt dizzy or any other symptoms she could stay as long as needed. Patient denies having any remaining symptoms and states she is ready to go home. Advised patient that if she experienced any other symptoms after leaving clinic such as sob, chest pain, rash/hives to contact emergency services. Patient and husband verbalize understanding. RN

1212477	4/15/2021	MD	61	F	4/2/2021	4/2/2021	At approx. 9:22 AM on 4/2/21, I began having problems swallowing my saliva and felt my throat begin to close. I also began having problems breathing, began coughing and choking, chest pain, and dizziness. The nursing staff at Hospital immediately got a wheelchair and rushed me next door to the ER. The nurses had called ahead so that the ER doctors were ready to assist me. I was given Epinephrine, steroids, nubilizer treatments, Bendryl, IV fluids and oxygen. After some time I began feeling a little better but then the reaction restarted and treatments had to be re-administered several times. It was quite frightening. I also had a severe headache and tightness of the chest. The ER doctor believed that I should be admitted which was done on 4/2/21 and was kept thru 4/4/21.
1212190	4/15/2021	IN	22	F	4/10/2021	4/10/2021	I had the Johnson & Johnson vaccine and had a bad headache two days after and still have a slight headache five days after. I also have pretty bad fatigue. All symptoms started 4/5 hours after getting the vaccine including nausea, headache, chills, fever (of almost 103), chest pains, fatigue, body/arm pain, ear pain. The ear pain started 3 days after the shot. I tried calling one of the doctors in our network around and they both denied me even though the symptoms were from the vaccine...
1212441	4/15/2021	PA	69	M	3/12/2021	3/13/2021	Searing, crushing chest pain starting in the upper left pectoral, solar plexus, extending to and down left arm and neck. Admission to ER for suspected cardiac event. Intense pain continues for 4.5 hours despite multiple administrations of fentanyl. ER tests negative for heart attack. CT interpretation does not rule out suspected aortic dissection due to fluid around aneurysm (later ruled out with second CT). Transfer to another Hospital for possible cardiac repair. Surgeon disagrees with CT reading. Three days in ICU and Step Down, CT, Cardiac Echo, Carotid Echo, Chest X Ray, Blood Tests all negative for cardiac event.

1212771	4/15/2021	HI	87	M	4/8/2021	4/8/2021	an 87 year old male with ESRD on PD, pAfib, CAD, HTN, HLD, hypothyroidism, who was brought in after a witness cardiac arrest. Patient apparently received the first dose of the Covid vaccine (pfizer) at around 11 am. He was doing fine the rest of the day until later in the evening when he had shortness of breath without chest pain, abdominal pain, nausea, vomiting. Upon EMS arrival, the patient appeared to have some agonal breathing and then went down, was in PEA arrest, received CPR with 1 dose of calcium, 1 dose of bicarbonate, and 3 doses of epinephrine with return of spontaneous circulation. Upon arrival in the ED, patient had an intraosseous line, on dopamine for soft blood pressure. Patient has been successfully intubated.
1212461	4/15/2021	VA	50	F	3/12/2021	4/14/2021	On 4/15/2021 patient presented with chest pain and left lower extremity pain, which started about 2 days prior to admission. CTA showed large volume multifocal bilateral pulmonary emboli throughout numerous right lower lobe, right middle lobe, right upper lobe, left upper lobe, and left lower lobe segmental branches. Left lower extremity venous ultrasound showed no evidence of deep or superficial vein thrombosis; the right lower extremity was not scanned. Patient denies personal or family history of VTE. She states that she does not smoke and has no history of smoking. Patient was treated with apixaban 10 mg po BID x7 d followed by 5 mg po BID. Platelets were 295 on admission.

1216453	4/15/2021	CA	35	F	4/12/2021	4/12/2021	<p>Client had a chief complaint of chest pain. Client stated that she began feeling chest pain several minutes after the start of her observation. Client has a history of depression and other unspecified psychiatric illnesses. Client stated that she takes sertraline daily and has a history of taking Risperdal. Client stated that she regularly sees a Psychiatrist. Client denied any allergies or other underlying medical illnesses. Assessment revealed chest pain located in the center of the patient's chest. Client pointed to her sternum to indicate the exact location and stated that her arms felt "heavy." Client's airway, breathing and circulation were intact, however, client complained of shortness of breath. Client was alert and oriented to person, place, date and event while appearing slightly distractible. O2 saturation 100%. Client was negative for redness, swelling, hives, severe sweating or other signs or symptoms of anaphylaxis. Client denied any increase in chest pain or shortness of breath when breathing in or out and did not state any additional pain throughout her body. Client then added that she felt "anxious" after receiving her shot and stated some reluctance with even receiving the shot prior to her arrival. Client's mother was present and stated that client had been reading the Pfizer fact sheet she was given and had been focusing on the side effects portion before signaling for assistance. Client's initial vitals were as follows: Blood pressure:138/88, Pulse 76, Respirations 20, O2 sat 100%, Eyes equal and reactive to light, Lung sounds clear bilaterally. Client initially consented to staying an additional 30 minutes. She began to become anxious and impatient with her additional observation time. After 10 minutes of sitting the client began stating that she was afraid that her "heart would become too fast" when she got home if she "didn't throw it away." After some encouragement, the client was able to clarify "it" as "meth" which she had hidden at home. Client stated some reluctance to go home stating that if she smoked her "meth" that her heart rate would become too "fast." Client then asked EMT if he was willing to come home with her to help her "throw it away." All staff present praised the client for sharing this information and after discussing her concerns further, client became much calmer and stated that she felt much safer and that her chest pain, shortness of breath and anxiety had subsided. Client then stated that she wanted to go home</p>

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							but consented to a second set of vitals before leaving. All of the client's vitals improved: blood pressure 132/88, pulse 68, respirations 16, O2 sat 98%. 1636 - 138/88, 76, 20, 100% 1651 - 132/88, 68, 16, 98%. Client was encouraged to discuss the incident with her psychiatrist and to seek further counseling. Client was also instructed to seek further medical care or the emergency room if symptoms returned. No medications were administered.
1216360	4/15/2021	OH	35	F	4/14/2021	4/14/2021	Very painful arm at the injection site. Dizziness for 12-24 hours, Chest pain, felt very tight in my chest, like my heart was hurting. General fatigue. Mainly wanted to make it known that my heart was hurting after the shot. I have never had any heart issues ever before.
1216052	4/15/2021	NY	34	F	3/31/2021	3/31/2021	Approximately 5 hours after the vaccine I developed a very bad headache followed by chills, sweats, congestion, chest pain, body pain, muscle pain, fatigue and fever. The muscle pain and weakness was so bad I would loose balance when walking. I then started to menstruate clots, not my normal cycle timing, which lasted about 2 days. The clots subsided but I am still bleeding today. I was in bed for 4 days with severe immune response symptoms. After those symptoms subsided the fatigue was so extreme it was hard to function.
1216288	4/15/2021	CO	65	M	3/20/2021	3/23/2021	Patient received first Moderna mRNA vaccine 2/20/2021, second Moderna vaccine 3/20/21. Severe flulike symptoms after Moderna vaccine intermittently over 1 day. 3/23/2021 chest pain hospitalized severe pericarditis 750 mL. Also cardiac Cath Lab one of his blood vessels 80% occluded (I do not currently have hospital report) coronary artery stented. Failed Plavix of in-stent thrombosis and myocardial infarction recatheterization fixed thrombotic stent. Following couple weeks has had recurrent pericarditis requiring several hospitalization recurrent chest pain including recently requiring pericardial window.

1214696	4/15/2021	FL	40	F	4/5/2021	4/5/2021	2 hours after receiving vaccination, patient had nausea and vomiting. She states she had a subjective fever for the next two days, along with headache, body pain, fatigue, nausea, diarrhea, acid reflux and intermittent chest pain. At time of visit on 4/14/21, patient reported still feeling fatigue, body pain, diarrhea, nausea, headache and acid reflux. She did not have chest pain at time of appointment, but did have it the day prior.
1215467	4/15/2021	TX	31	M	1/22/2021	1/23/2021	Sever chest pain following morning which was Jan 23rd 2021. Went to hospital and was told it was just a strong response to the vaccine since I had covid-19 on Dec 10th.
1214980	4/15/2021	OK	67	F	4/12/2021	4/12/2021	Strange odor a few minutes after injection, followed by bitter taste, then nausea and spaciness. Dizziness, with vision looking 2D and flat by 15 minutes. Told Pharmacist, of spaciness who said stay as long as I wanted. Left at 30 minute point, still spacy and nauseous. Spaciness ended by an hour with nausea off and on. Chest pain - began around 7pm, continued to expand in area of chest, sharp stabbing pain later, pain from just above left elbow to hand and tingling of fingers, pain lower left leg and tingling of left foot. Irregular heart rate at different times. Checked into emergency room at 11:00. IV inserted, placed on continual heart and oxygen monitors, EKGs, chest X-rays (2), blood tests (3). Admitted to hospital sometime during the night. Given IV medications to counteract IV contrast allergy. These medications caused full body shakes, eyesight auras and extreme nausea with gagging. Heart CT taken with IV contrast. Discharged around 3:00 PM.
1215461	4/15/2021	AZ	31	F	1/5/2021	1/9/2021	Approximately three days post vaccine I began having elevated, racing heart rate and chest pains/muscle/joint pains. This got to the point of being so uncomfortable I scheduled with my PCP and I was diagnosed with Costochondritis (cartilage inflammation in the chest wall/costal joints) on 1/15/21. I have had continued problems with muscle pain in my chest, back, neck and other areas, as well as joint pain, especially in my hands and feet. This has now been going on 3 months.

1215427	4/15/2021	WA	49	F	3/31/2021	3/31/2021	My 15 minutes ended at 12:22p. About a couple of minutes I started feeling effect. First I felt dizzy, then like I was going to pass out so I sat down. Afterwards, I went to another office because our lobby was full and I didn't want to draw attention to myself. My coworker was watching me. My head and hands both became clammy. Then my coworker said my eyes were really red. Then she said my face turning red. She grab one of the workers and they took my blood pressure. I had gone to a surgeon the day before and my blood pressure there was 92/68. During 3/31, my blood pressure was like 113/98. Then they took my temperature and I had a fever. I didn't have trouble breathing or chest pain but they brought me to a healthcare facility. There they watched me for about an hour and a half and gave me an EPI pen. My symptoms of headache, nausea, chills, fever, muscle aches, inability to sleep for more than 30 min have continued since 3/31 minus a few hours on 4/7. The most constant symptoms are headache, nausea, chills and then the other symptoms come and go. For example today, I have headache, nausea, chills and then I spiked a fever even though I am taking Advil and Tylenol to help with the headache. Also today, in addition to feeling hot, my palms of my hands are hot. Last Thurs and Sat in addition to the headache, nausea, chills I was fatigued to the point where I slept 14 hours on Thurs and 16 hours on Sat. Another symptom that I have is on my injection arm. Occasionally it will hurt from my middle finger to my collar bone.

1215095	4/15/2021	MN	62	F	3/18/2021	3/23/2021	Received her first COVID vaccine on Thursday, March 18. On 3/23/21 she started to have new onset of generalized muscles aches and weakness. She started feeling some pain in her back, which then spread to arms and legs. She is now beginning to feel weakness in her core and extremities. Having difficulty lifting arms above head. She is still able to walk without difficulty but legs do feel weak. Increase in SOB as well. Myalgias and chest pain resolved within a week, however she continued to feel weak, tired, and had DOE. She developed "brain fog" and talked to her boss about taking short-term disability as it had been hard to work. No appetite. On 4/1/21, she presented to the ED with 2 weeks of worsening generalized weakness, SOB, lightheadedness, dizziness and found to have acute anemia. Was admitted for further workup. Hgb at admission was 5.4. This admission diagnosed her with a new warm autoantibody hemolytic anemia. This is new since the COVID vaccine was administered. Upon admission there was no thrombocytopenia, so there was low suspicion for microangiopathic hemolytic anemia, TTP/HUS, or DIC. Peripheral blood smear at that time suggested a leukoerythroblastic blood picture (could be Bone Marrow recovery post chemo) but with marked normocytic, normochromic anemia, and with increased circulating erythroid precursors and increased red blood cell regeneration; spherocytes and fragments are present supporting hemolysis. DAT positive (both IgG and C3) along with other hemolysis lab including elevated LDH, Bilirubin, haptoglobin 3, and PBS c/w hemolysis; no evidence of MAHA. So warm autoantibody hemolytic anemia is the most likely explanation. She had negative cold agglutinin antibodies <1:32 on 4/9. Started on methylprednisolone on 4/2/21, but Hgb continued to steadily decline despite treatment. Continued on methylprednisolone 87.5mg daily. Rituxan 375mg/m2 was started on 4/6/21 with plans for weekly infusions for a total of 4 weeks. there was concern for a GI bleed on 4/10-4/11 due to bright red fluid appearing like blood in the toilet after a stool. This led to her receiving roughly 5 units of pRBCs. After these 5 units she started urinating red urine and we became highly concerned for hyperhemolysis. She did not have any further stools so we did not think a GI bleed was likely. She was given 1 dose of Eculizumab (Soliris) (4/12). This treatment is for

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

complement mediated intravascular hyperhemolysis. Unfortunately it did not appear to help her. On 4/14, we were thinking TTP could be contributory with numerous schistocytes on peripheral smear. Her T bili was up to 7.8, and her hemoglobin plasma was trending up, in the 380 -- > 610 and in the 800s today. Cr was worsening. Platelet count was dropping. With her worsening condition and concern for both hyperhemolysis and possible TTP, we decided to start her plasma exchange followed by her second dose of Rituximab. Unfortunately she became disoriented/confused following line placement and while receiving plasmaphoresis. CT head returned without acute findings. She then had an allergic reaction with a rash during PLEX which was stopped (4L completed with a goal of 5L). Improved with benadryl. She was then administered rituximab. Then she developed worsening sinus tachycardia and HTN. Her respiratory status deteriorated and she eventually required high-flow oxygen to maintain saturations > 90%. CXR showed bilateral opacities, not drastically changed from previous films. Rituximab was stopped halfway through its infusion in case this was an adverse effect to the drug. She was given 20 mg IV Lasix per the nighttime sign-out. She was initially given ceftriaxone and azithromycin IV to cover CAP but later ABx were broadened to vanc and Zosyn with rising lactate of unknown source. Ultimately she had acute respiratory failure with hypoxia and need BiPAP. She was eventually intubated and a code blue was called. She unfortunately died shortly after intubation.

1214954	4/15/2021	OR	51	F	4/2/2021	4/2/2021	A few hours after obtaining the vaccine, patient reported having shortness of breath, increased blood pressure and chest pain that lasted for a week. Given her history of aortic aneurism I asked her to contact her cardiologist. They had no advice on the issue. Patient had just been evaluated with an ECHO as the aneurism being stable. No follow-up is currently scheduled.
1214949	4/15/2021	MD	49	F	3/26/2021	3/26/2021	The patient received the 1st dose of the Moderna covid vaccine. After receiving the vaccine Approximately 5 minutes after receiving the vaccine she felt like her left hand/arm was heavy. She began to feel lightheaded and weak. This caused her to eventually have a syncopal episode in which she complained of dizziness, some jerking motions, some lightheadedness and then some chest pain. She felt like it was hard to get a deep breath. An EKG was done which was unremarkable, fingerstick blood sugar was 108. An IV was placed in her right arm and she received 1 liter of Lactated Ringers solution in addition to orange juice and crackers. She started to feel better after approximately 1 hour and was sent home. On 4/1/2021
1214943	4/15/2021	TX	35	F	4/15/2021	4/15/2021	Pt had redness to forehead and complained of nausea, shortly after dizziness, sweating, blurred vision with chest pain and all over not feeling well, could not hold head up, EMS called. Pt was given Epi-pen to right thigh and Benadryl 25mg IM to right deltoid approx 7min later. Pt transported by ambulance to hospital.
1214937	4/15/2021		68	F	4/15/2021	4/15/2021	Pt reports headache rating a 15/10 after vaccine and also having left upper chest pain with no radiation described as "something sitting on my chest" . Similar chest pain to past episode of "cardiac spasm" when she took nitro but not recently. Also has nausea with chest pressure improving to 5/10. Report to vaccinator. Daughter went to hospital with pt. Pt reports history of multiple cancers, rhabdomyosarcoma, MS, Hashimotos, Encephalopathy, digestive disorders, somatoform disorder

1207951	4/14/2021	FL	59	F	4/1/2021	4/8/2021	Patient received the vaccine on 4/1/21 but on 4/8/21 started to feel itchy and saw a rash around the injection site looking like bumps (no puss), extremely red. No c/o fever, body aches, chills, chest pain ,sob. Advised patient to take a Benadryl to help with the allergic reaction, also she can apply benadryl cream or hydrocortisone cream to help with the itchiness. Also informed her she can take Tylenol if she feels body aches/fever. 4/12-Patient feeling better today. Redness and pruritic rash resolved yesterday. On 4/8/21 patient took Benadryl at bedtime. No signs and symptoms at this time.
1207875	4/14/2021	WI	33	F	12/19/2020	2/10/2021	Miscarriage. vaccinated December 19th. no Side effects. noticed a bit of pleuritic chest pain. was not bothersome and resolved with ibuprofen. I was pregnant at the time of first vaccine but did not know. had second vaccine 3 weeks after my first without issue. Went to OBGYn for 10 week appointment and there was no fetal pole. Fetus stopped developing at likely 6-7 weeks. I likely miscarried shortly after my second vaccine. .
1209002	4/14/2021	IL	38	M	4/10/2021	4/11/2021	Flu like symptoms with severe stabbing chest pain. Started to feel achy and a twinge in chest around 12:30 am, went to sleep, woke up at 2 am with severe stabbing pains in chest that would come and go. Took some Advil around 3:15am and within a half hour flu like symptoms stopped but not chest pains. The chest pain were less severe. Continues to feel a slight twinge and slight aching in chest 4 days later.

1208926	4/14/2021	FL	19	F	4/14/2021	4/14/2021	<p>This is a 19 y.o. female status post 1st dose of Moderna vaccination on 04/14/21 at 130PM. Patient was outside under the tent waiting 15 minutes post vaccination when she fell out of her chair and onto the ground. Upon arrival, patient was lying face down and unresponsive. 10 seconds later patient regained consciousness, but was lethargic, clammy and pale. Patient is nauseous and vomiting. With assistance, patient was transported via wheelchair inside the modular unit in the parking lot. Reports eating a cookie this morning. Last meal was last night and it was a bowl of spaghetti. Patient reports having a syncopal episode and seizure 5 months ago after getting a COVID-19 nasal testing. Denies any medical history, no NKDA, no medications, no recent illness. Initial VS at 1400 was 90/56 HR 52, O2 sats 98% on room air. Denies SOB, denies difficulty breathing, denies chest pain, denies HA, denies dizziness. VS 1408- 90/56 HR: 57 BPM, RR: 12 BPM, O2 Sats: 98% Room Air VS 1425-91/57 HR 50 BPM, RR: 12 BPM O2 Sats 98% Room Air VS 1440- 94/57 HR: 54 BPM, RR: 12 BPM, O2 Sats: 98% RA Plan: Syncope and collapse- Patient was evaluated for 1 hour. Patient reports that she was feeling much better and was eager to go back to her room. Her pallor improved, she was AOx3 and speaking in clear sentences. , RN was advised to try patient with sips of clear liquids and provide her some crackers and have patient ambulate prior to discharge. When the nurse was repeating her VS and providing the patient the crackers, patient experienced another syncopal episode, but regained consciousness immediately. VS at 1450: HR 49 BPM, O2 Sats 99%, BP 82/50. Because patient experienced another syncopal episode, 911 was dispatched for ER evaluation. Patient asked that I speak to her mother, mother updated on patient's condition and that she needs to go the ER for further evaluation. Mother agrees and verbalizes understanding of care. Spoke to with the local health department and she reports that this case will need to be reported to VAERS. Patient is being transported by stretcher to the hospital. Will follow up with the patient. Nausea and Vomiting- Patient refusing Zofran IM, prefers PO. Zofran 4 mg SL given once at 1400 for nausea and vomiting. Nausea and Vomiting improved within 20 minutes. No nausea or vomiting upon discharge from the health center.</p>

1208676	4/14/2021	TX	55	M	4/3/2021	4/3/2021	Approximately eight hours after receiving the shot, I started getting a headache, body aches, and chills (April 3rd, 8 p.m.). I went to bed and had severe chills and body sweats for the entire night. The primary symptom to report is that my heart raced all night. It felt like it was beating at about 140 to 150 Hz or higher. When I woke up in the morning, it felt like my chest had been pounded on all night. The pain was in my sternum area. The headache and body aches took a little over a day to go away. The chest pain took a couple of days to die down. On April 12th, I walked my dogs in the morning and felt out of breath, which isn't normal for me. In the afternoon, while working at my desk at home, I started getting more and more severe chest pain and then started getting dizzy and felt weak. I drove myself to the local ER and they tested me for a heart attack. All tests came back negative. They suggested going to another facility to get checked for clots or to make an appointment with a cardiologist. The next day, after talking to a doctor friend, he suggested going to the ER facility to get imaged for clots and to get fully checked out. No cardiologist appointments were available till the next week. I went to the ER facility and was there for seven hours getting tested. They came back and said all test results were negative and that my heart looked fine. They did not have any suggestions for what might be causing the pain in my chest.
1208668	4/14/2021	AL	55	F	4/7/2021	4/7/2021	I received vaccine at 12:15 pm on 4/7/21. That evening I experienced severe chest pain /pressure a few times. Had headache next two days, fatigue and feel somewhat short of breath.
1208662	4/14/2021	OH	55	F	4/14/2021	4/14/2021	Resident initially started with some tongue swelling and feeling short of breath. Benadryl was administered, the resident continued with tongue swelling, chest pain and back pain. Tongues was noted a twice the size of normal. The resident has tremors from parkinsons disease that were also exacerbated.

1208654	4/14/2021	WI	87	F	3/12/2021	3/15/2021	Patient presented 3 days after her second DuoNeb vaccine with weakness dizziness chest pain or shortness of breath and was initially diagnosed with a pneumonia by chest x-ray obtained with antibiotics without improvement. Subsequently she was hospitalized and CT of the chest showed left lower lobe segmental pulmonary embolism. The patient never had history of venous thromboembolism in the past. She had weakly positive anticardiolipin antibody of IgG type of unknown significance. She was treated initially with antibiotics but after diagnosis of the blood clot she was started on anticoagulation with apixaban with improvement
1208641	4/14/2021	MO	75	M	2/26/2021	3/5/2021	1 week after receiving the second dose of the Pfizer vaccine, started to feel short of breath with chest pain, a week later showed up to the hospital with extensive bilateral PEs and new onset A. fib. Physician can not determine the etiology behind the PEs, but cannot find any malignancy. Referred patient to pulmonology and hematology for further work-up. Physician feels that this could be an adverse reaction to the Pfizer vaccine Heparin drip for pulmonary emboli 4/8
1208626	4/14/2021	AZ		F	3/27/2021	4/4/2021	7 days following the shot I had extreme fatigue, shortness of breath, GI issues, chest pain, sharp headache and extreme leg pain. Symptoms started about 6am and got increasing worse through the day. At night when I was in bed at about 6pm my legs and chest hurt so bad I couldn't take it, so that by 11pm I went to the ER. Because of where we live in and it was a hot day, I suggested that I was dehydrated and never thought about the shot or that it might be side effects. I was treated with IV fluids and pain meds, I have given chest Xrays and it was determined I had inflammation in my chest. Once my PVCs were under control (I had been in bi-Gemini) I was released with Zofran and Tramadol. I have felt extremely tired since. And I am unsure if I should contact a health care provider.

1206891	4/14/2021	MI	80	F	3/4/2021	3/1/2021	could hardly breathe; right side of chest hurt, like I pulled a muscle; dysentery; This spontaneous case was reported by a consumer and describes the occurrence of DYSENTERY (dysentery) in an 80-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 030A21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included Blood pressure high and Blood sugar abnormal. On 04-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. In March 2021, the patient experienced DYSENTERY (dysentery) (seriousness criterion medically significant). On 31-Mar-2021, the patient experienced DYSPNOEA (could hardly breathe) and CHEST PAIN (right side of chest hurt, like I pulled a muscle). At the time of the report, DYSENTERY (dysentery), DYSPNOEA (could hardly breathe) and CHEST PAIN (right side of chest hurt, like I pulled a muscle) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Concomitant products known to have been used by the patient, within two weeks prior to the event, included high blood pressure medication and medication for sugars. Treatment of these events included unspecified ointment. Very limited information regarding the has been provided at this time for the event. Further information has been requested. The reported events were considered possibly related to mRNA-1273.; Sender's Comments: Very limited information regarding the has been provided at this time for the event. Further information has been requested.

1207615	4/14/2021	OH	51	F	3/3/2021	3/7/2021	Presented to UCC on 3/7/2021 with complaints of left leg pain/swelling, had cervical block 03/02. when she got home she noted some groin pain,, and this morning left leg was so swollen. she is also complaining of mild shortness of breath. denies chest pains, was tachy at triage. She was then transferred to Emergency Department. Per their report: The patient presents with a swollen discolored left lower leg. She does have discoloration and I am concerned for massive DVT and cerulea dolens. She does have really minimal pain to the leg except to the groin, she has intact pulses, I have low suspicion for acute ischemia/arterial clot. She does complain of some mild dyspnea with exertion above baseline so I do have concerns for possible PE. She is hemodynamically stable, appears in no distress. She is on oral contraceptives, mild obesity, no other significant VTE risk factors. I am going to empirically start her on heparin, I have also ordered a CT PE and a CT abdomen pelvis to check for proximal propagation of the DVT along with a left lower extremity duplex Doppler ultrasound. Duplex ultrasound also showed extensive left lower extremity DVT up to the common femoral, she does have bilateral PEs without evidence of significant clot burden or heart strain, she is hemodynamically stable with normal pulse oximetry. The patient also has clots proximal up to her IVC. I discussed this with Dr. of vascular surgery for possible thrombolysis therapy of the left lower extremity. She was discussed with SOUND for admission.
1206961	4/14/2021	ME	55	F	3/30/2021	3/31/2021	Severe headache woke me up in the night after vaccine - resolved after putting ice pack on neck and head, night 2 woke again in the night with severe headache repeated ice pack felt better but I felt like something was wrong so made apt with my PCP that morning. BP was very high, was shaky and had low grade pain in back neck/ spine. BP slowly came down. Day 3 had 2 episodes of chest pain in am had an ekg later that day and it came out ok. No events detected. Going into week after vaccine (days 5-8) ongoing pain mid back/ spine and developed a cold sore (had not had one in over a year) 4/12 woke with Head and neck pain but not as severe as first couple days. Still don?t feel ?quite right? but functioning ok.

1207415	4/14/2021	MO	36	M	3/11/2021	3/12/2021	Experienced chest pain, neck pain, general muscle pain, joint pain, some abdominal pain, headaches, fatigue, some shortness of breath, lightheadedness, some vision change in left eye, severe heartburn flare up, nausea, digestive issues (urgent, but small stools), increased heartrate, irregular tachycardia responses and heart palpitations. The pain and heartburn were treated with over the counter medications - ibuprophen, Tylenol, Pepcid and Prilosec at advice of my primary care doctor. Most all of the symptoms resolved after about two weeks past vaccine except my heartrate/palpitations and heartburn. My primary care doctor prescribed Protonix to help with the heartburn. Three and half weeks past vaccine I visited the ER thinking I was having a heart attack.
1209017	4/14/2021	CA	28	F	4/9/2021	4/10/2021	heart palpitations and chest pain
1207378	4/14/2021	MS	59	M	3/10/2021	3/13/2021	severe ABD pain and chest pains that started 3-4 days after vaccine given, UA, CMP, CBC, US of ABD and CT ABD done, treated for mild UTI, s/sx did not improve,
1207352	4/14/2021	OR	34	U	4/14/2021	4/14/2021	DVT developed four days after vaccine administration. Patient seen in primary care office 4/13/2021 for palpable mass in the femoral artery, size approximately 4-5 mm per surface palpation. Patient denies dyspnea, chest pain, severe headache, and vision changes. Exam otherwise WNL. No previous DVT history. STAT labs ordered and aspirin initiated at discharge, treatment changed to Eliquis 10 mg PO BID x 7 days upon return of labs. Ultrasound pending.

1207054	4/14/2021	NY	72	F	4/4/2021	4/10/2021	Pt was admitted with chest pain and thoracic aortic dissection 6 days after her second covid 19 vaccination. CT imaging showing a dissecting mid descending upper abdominal aneurysm. She was transferred to the ICU on an esmolol drip and ultimately transferred to hospital MICU where she remains hospitalized
1207509	4/14/2021	FL	38	F	3/28/2021	3/29/2021	Lethargy, impaired cognitive function began on 3/29. By the morning of 3/30, the lethargy and cognitive function is back to normal. Slight headache, low fever and slight chest pain began. Felt better by the afternoon of 3/30 once I took ibuprofen. That evening at approximately 7 pm, I noticed my heart rate was high. My resting HR is about 70, but my HR was at 125 - 130 and I was not exerting myself and was sitting. My HR remained high after I went to bed, and chest pain became worse. By 12:30 am on 3/31, chest pain was getting severe and had pain in both arms. Went to ER at around 3 am on 3/31. Later learning I had a mild heart attack. Had EKG, Blood work, ECG, and Heart Catheritazion. No blockage and normal results except blood work. Blood work showed elevated enzymes. While in the ER, I was given blood thinner and glycerin tablets, aspirin. Since 4/2, my heart rate and blood pressure have returned to their norm without medication. I once again have perfect blood pressure readings and perfect HR. I have returned to normal daily activities as of 4/4.

1210290	4/14/2021	NM	36	F	4/8/2021	4/8/2021	<p>Covid-19 Vaccine Clinic I was notified by EMT that they had given Benadryl IM to this patient. I went to evaluate patient who was sitting in a quiet corner attended by EMT and her husband. BP 150s/104, O2 100% RA Patient reported that about 5 mins after 2nd MOderna vaccine today, she felt itchy eyes and noticed that her eyes were swollen and she notified EMT on site. They had given her Benadryl IM. She reports that she has h/o Anaphylaxis reaction to PCN. 3/12/21 Moderna 1st vaccine- given, patient noted getting tongue swelling and onsite EMT at BTR gave her Benadryl IM. Pt observed 30mins, Doctors note stated pt did not have throat/tongue swelling lung exams clear. He observed her during the episode and checked on her 3hrs later and pt noted to be felt fine. She reports that a week later, she had tongue swelling, went to ER where she was given Epi pen and admitted to ICU for 2 days. No intubation. Sent home on Prednisone taper- dosage unknown but she reports she is still taking 2 tabs daily. She reports she was told by her Hospitalist that she could go ahead for her 2nd Moderna vaccine dose. Gen: watery eyes, eyelids slightly swollen, very obese Throat: no tongue swelling, tonsils enlarged touching her palate Mallampati-Class III Pulm ctab no c,w,r Breathing comfortable, speech coherent, normal CV rrr About 10 mins of observation by this MD, I had consulted with our other on-site providers and we all agreed to give her Epi injection due to her prior history and current eye swelling immediately after vaccine was administered from EMS. Patient noted she felt shaky but denies sob/chest pain/throat pain/tongue swelling. She was not coughing. I accompanied patient to womens restroom for patient to void. EMS officer called EMS who came to pickup patient. Patient requested to be taken to Hospital ER. During the entire stay, patient denied feeling short of breath/chest pain/throat swelling. Treated in ER: IV Decadron/Benadryl/Famotidine and discharged in few hrs with discharge meds: Prednisone taper, Famotidine and Epi pen prescription 4/14/21 Called to checked on patient and she reports took 2 days to settle down to feel normal but no throat swelling or any allergic reactions. States she is feeling well now. She followed up with her PCP (who is not from our facility).</p>

1210554	4/14/2021	IL	65	F	3/16/2021	4/13/2021	Bilateral pulmonary embolisms requiring ICU admission. Patient presented to Emergency Room on 4/13/21 with presented to the ED with shortness of breath and chest pain. The patient notes that she developed shortness of breath, particularly with exertion, about 1 week prior to presentation. 2-3 days prior to presentation, she developed pleuritic chest pain on the right anterior chest. She denies any recent fevers, chills, weight changes, palpitations, cough, sputum production, abdominal pain, nausea, vomiting, diarrhea, constipation, lower extremity edema. She does note that she received her first dose of the COVID-19 vaccine on 3/16/2021 and was due for dose#2 on the day of admission. She denies a personal history of blood clots and denies current smoking, estrogen use, or recent surgery. She does note a history of blood clots in her sister, but she is unsure whether they were provoked or unprovoked. Patient required BiPAP on admission and was initiated on a heparin drip. Initial CT w/ some concern for R heart strain, however, echocardiogram showed no signs of R heart strain and she was hemodynamically stable. She was weaned from the BiPAP to Non-rebreather, and eventually nasal cannula. The heparin drip was transitioned to lovenox with plans to go home on a DOAC. Still hospitalized at time of event report.
1210399	4/14/2021	AK	46	F	3/5/2021	3/6/2021	Pt developed flu like symptoms within 24 hours of second dose of Pfizer COVID vaccine on 3/5/21 which included fever, body ache, headache, and chest pain. The chest pain was severe and on 3/7/21 she sought evaluation in the Emergency Room. She was found to have an elevated troponin test (repeated x 3), and T wave abnormalities on EKG concerning for a NSTEMI. CRP was also elevated. It was recommended that she be admitted to the hospital but she left the ER against medical advice.

1210822	4/14/2021	NJ	18	M	1/26/2021	2/3/2021	Patient started complaining of headache and chest pain soon after vaccination. Since then he has been to the Emergency Room 6-7 times for chest pain - workup is consistently negative He has seen two Cardiologists, a Neurologist and has had further workup. It should be said that I feel it is probably not vaccine related and is likely anxiety related - however patient insists that it is related to the vaccine - he has never felt like this before.
1210817	4/14/2021	FL	42	M	8/5/1978	4/7/2021	Headache fever leg pain left chest pain
1210794	4/14/2021	FL	43	M	4/7/2021	4/8/2021	Cold sweats starting Thursday evening, Friday sweating at night, and Saturday morning ~6:00 am with chest pain and sweats. Pain intensified and brought to Urgent Care at 8 am where an EKG was completed and showed signs of a heart attack. Was rushed to Hospital Emergency room. Admitted and examined. Completed an angiogram and noted that there was a blood clot that appeared to dissolve. Troponin levels were high showing damage to the left artery. Spent the night in the hospital. Prescribed medication for cholesterol, blood thinners, and seeing a cardiologist.
1210722	4/14/2021		45	F	4/14/2021	4/14/2021	Headache, chest pain. transferred to ER via ambulance
1210656	4/14/2021	LA	50	F	3/11/2021	3/30/2021	I begun experiencing leg and chest pain about three weeks after receiving the vaccination. On April 13, 2021 I contacted my PCP nurse triage; at which time I was instructed to dial 911 or go to the ER due to listed symptoms; thereafter my husband transported me to ER. I was examined by an ER physician who ordered an ultrasound of both legs; results were no concerns. I was instructed to take OTC Advil/Tylenol for pain along with an OTC acid reducer for chest pain and to follow up with my PCP as needed.

1210615	4/14/2021	NJ	63	F	3/8/2021	3/9/2021	On March 8th received the J&J shots, March 9, 10th & 11th was extremely nauseous in the morning. On the 12th had severe chest pains which I chalked up to a very bad case of heart burn. On March 24th, while driving I had two major (what I thought at the time) was panic attacks...body started shaking, heart was beating like crazy, couldn't catch my breath, felt like I was going to pass out or die. Had to pull over twice to calm myself down. (From what I read this could be a sign of a blood clot but I am not a doctor.) Had minor heart burn until April 5th....which ironically was the end of my 28 days until the vaccine fully kicked in. Just reporting what happen. I feel fine now.
1211143	4/14/2021	NY	59	F	3/17/2021	4/1/2021	On APRIL 1, 15 days after injection, I developed chest pressure and a burning sensation in the area of my sternum. The pressure worsened the next day to the point I asked to be taken to the ED at the hospital. My blood pressure was 187/92, I had some irregularities in my EKG. After lab tests for cardiac issues it was determined I was not having a heart attack. I then met with my PCP on April 7 to discuss this. We were wondering if it was anxiety. During this time from April 1 to present I have had marked soreness in both underarm lymph nodes and intermittent chest pressure. After another exchange with my PCP she confirmed that it could also be a possible response to the Moderna vaccine #1. Today, April 14, I had an echocardiogram stress test that was equivocal and it was determined to be safe, I should have a CT scan to make sure there is no issues in the arteries. The cardiologist also agreed this could be an "inflammatory response" to the vaccine even though I was highly anxious during the test. I say this to be fair and not wearing blinders. I would like to point out that the morning I awoke with chest pain, I was not experiencing anxiety. That came after my worry about what could be causing it. I am only completing this form now because I feel it warrants the idea that there is vaccine involvement. By the age of 59 you tend to know your body. Thank you.

1209544	4/14/2021	OR	66	F	3/18/2021	3/19/2021	The patient is a 66 y.o. female with past history of diabetes, GERD and HTN who presents to the Emergency Department with visual changes of the right eye and associated pain to the face and neck. Per interpretor, patient woke up feeling at baseline yesterday morning, when she had her COVID-19 vaccine. Yesterday around dinner time, she began having issues with vision in her right eye, causing her visual field in that eye to appear dark to her entire right eye. She told her husband that she thought she might have a hair or eyelash in her right eye and that she had an irritating pain radiating from her right eye to the right side of her face. Even after washing her eye with cold water, the sensation did not subside. At approximately 3-4 AM this morning, she also began to experience pain to the back of her head and neck bilaterally. This morning, the visual impairment improved from the entire visual field to now only just the inferior aspect of the right eye. However, she denies weakness to any of her extremities. Patient also denies chest pain, numbness, abdominal pain or nausea. She was seen at ophthalmology, at which Dr. diagnosed her with a right retinal branch arterial occlusion and decided to send her to SHE to be evaluated for the possibility of a CVA. She denies being on blood thinners or taking Aspirin. She denies any previous diagnosis of a CVA or TIA.
1209525	4/14/2021	MN	66	M	4/14/2021	4/14/2021	Client received 1st dose of Pfizer COVID-19 vaccine. Shortly after receiving the vaccine, the client experienced chest pain. Client has history of chest pain, previous cardiac arrest, and medication non-compliance. Patient does have prescribed nitroglycerin. Client was taken to observation area. Chest pain continued, blood pressure was 194/94, pulse in low 80s, oxygen saturation 100%. Client was given 1 nitroglycerin and chest pain reduced. Follow up blood pressure 164/90 pulse 80s. 12 lead ECG was completed which showed a previously known bundle branch block that was transmitted for ED physician review. Onsite EMS recommended evaluation in the emergency department. Client was transported by EMS to ED for evaluation.

1209445	4/14/2021	NC	55	F	3/26/2021	3/26/2021	4 hours after shot, I had soreness in the arm for 2 days and then it went away. I experienced chest pain and breast density 12 hours, 1 week, and then 2 weeks after the shot.
1209395	4/14/2021	MD	68	M	4/6/2021	4/13/2021	Developed chest pains, Rehabilitation Center moved to hospital on 4/13/2021. Took a turn for the worse in the evening of 4/13/2021. Hospital found fluid on lung x ray. He was placed on ventilator overnight performed CT Scan the afternoon of 4/14 and discovered several bloods clots in right lung. Patient still in hospital under sedation and on ventilator. Hospital has started him on Heparin.
1209623	4/14/2021	WA	22	F	3/14/2021	3/14/2021	History of Present Illness This is a 22-year-old female who was previously healthy with no significant past medical history presenting to the emergency department after a syncopal event. She was getting her COVID-19 shot today (Johnson Johnson). After her shot she was texting on the phone with her mom, felt slightly dizzy and the next thing she remembers was lying on the ground. Witnesses reported that she syncopized and had some convulsive like behavior afterwards. She was not postictal or incontinent however. She reportedly hit the front of her forehead on the left side. She denies any chest pain, abdominal pain, hemoptysis, recent surgeries, immobilization or recent travel. She reports that when she woke up her hands felt a little bit tingly. When the fire department arrived they found her to be bradycardic however by the time the medics arrived her heart rate had resolved. Her blood sugar was 110 on the scene. Medics noted that she was orthostatic on the scene as well. She currently is feeling well, has no complaints. States that she has gotten dizzy before in the past with COVID vaccines.

1209215	4/14/2021	CO	19	M	4/8/2021	4/11/2021	instructions. Per patient he received his second Covid vaccine 3 days prior to arrival and immediately following developed myalgias, subjective fevers and "viral symptoms" which she managed with ibuprofen 2 tabs q6h some improvement. On the day prior to arrival he developed increasing shortness of breath particularly with talking and with ambulation. He also describes chest tightness with deep inspiration, the tightness radiates to back, no radiation to left arm or jaw. Chest tightness is non-positional, but does feel worse immediately after he lies down from ambulation and then slowly dissipates. His last subjective fever was yesterday evening. He has never had a reaction to the vaccine before. He has no allergies. No prior medical conditions he is aware of, and takes no medications. He did not experience any of the symptoms following the first vaccine. He has h/o asymptomatic COVID infection in November 2020. Cardiology consulted for concern of pericarditis post COVID-19 vaccine. He does not have significant ST elevation or PR depression. He also does not have evidence of significant pericardial effusion at this point. The high sensitivity troponins are mildly elevated. He does have viral syndrome. Is unclear if Covid vaccination was causally related to his symptoms. We would like to improve his medications for better chest pain control and to prevent recurrent pericarditis in the future.
1209204	4/14/2021	MO	33	F	4/8/2021	4/9/2021	Severe headache, fever for the first two days and chest pain, fatigue
1209129	4/14/2021	NY	68	F	3/1/2021	3/16/2021	Bad chest pains, palpitations and high blood pressure. Ct scan found two small clots (pulmonary embolism)

1209122	4/14/2021	TX	29	F	4/9/2021	4/10/2021	<p>Provider's Notes for 4-10-2021 visit: 29 y/o F presents to Urgent Care with c/o possible side effects after receiving 1st dose of Pfizer BioNtech COVID-19 vaccine yesterday evening. Reports to feeling pruritis in R arm at time of vaccine administration but this resolved within few minutes. However, pt admits to waking up with headache and R sided body pain. Husband noted erythematous rash behind pt's ear; pt denies warmth, pruritis or tenderness at rash site. Symptoms of generalized body aches and chills have developed in the last few hours (similar to symptoms of cold). Took excedrin with relief to headache and myalgias. Denies recent use of antihistamine but adds that she was prescribed cetirizine and diphenhydramine by PCP for hx of random rashes that occur after being outdoors. Pt also states that she was recently prescribed cyclobenzaprine, meloxicam and norco for R "trapezius" pain. She was referred to physical therapy by specialist recently. Last use of pain medication was 1 week ago. Denies arthralgias, numbness, tingling, rash or pruritis at injection site (does have soreness), fever, sore throat, dysphagia, facial/neck swelling, chest pain, SOB, nausea, vomiting, diarrhea, inner or external ear pain, discharge from ear, rhinorrhea, post nasal drip, persisting headache, hx of anaphylactic reaction to meds or vaccine in past. Adverse reaction to vaccine product Due to acute onset of symptoms after recent vaccine administration (onset within 12hrs), pt's symptoms of myalgias, acute onset rash, chills are likely mild adverse reaction to the recent COVID-19 vaccine. No current signs of anaphylaxis and pt was reassured. She opted to take cetirizine while at clinic. PO or IM steroids will be avoided to reduce risk of suppressing intended immune response to vaccine. May apply topical hydrocortisone or topical benadryl if rash becomes pruritic. RTC if symptoms worsen or persist. ER precautions discussed for acute worsening. Pt and her husband voiced understanding. Start cetirizine 10 mg tablet 1 tablet as needed. On examination - erythematous rash See above recs. Cellulitis is low in ddx due to acute onset of symptoms, bilateral distribution, and lack of tenderness. Monitor closely. Muscle pain Can continue acetaminophen or NSAIDs with food as needed. RTC if symptoms worsen or persist.</p>

1209829	4/14/2021	IN	35	F	3/29/2021	3/29/2021	5 hour after vaccine , suddenly couldn't breath. Oxygen dropped to 84. Difficult breathing for an hour. Chills, body shakes, sweats, nausea . These all lasted 5 days besides breathing . On day 6, breathing got worse . Became short of breath. On day. 11, chest pain, random bruising , continued severe short of breath , head aches. Currently day 16, still short of breath , chest pain, headaches, fatigued
1210121	4/14/2021	PR	51	F	3/30/2021	3/31/2021	Dr. call the pharmacy to report that the patient has been experiencing headache, nausea, leg pain and chest pain since receiving the janssen shot.
1210100	4/14/2021	NV	48	F	3/23/2021	3/23/2021	On 03-23-2021, 5pm. my symptoms started with chills and lethargic by 530p had chest pain and i felt burning my body and felt restless. The next day i had pain in my kidney area nd rib cage, was nauseous, my body was still aching, had a bead headaches, had a temperature of 99.87 and my body was so sore. I still had the kidney pain. My fever had jumped to 101.7F. The next day I had fever, chills, dizziness, kidney pain on one side, strange pain under my rib cage and sore teeth and gums. My glands were swelled up in my neck, my taste was a little off. On 3-25-2021, had two large lymph node and my felt I had a ball in my throat. the pain on my right side, I might had a right kidney stone. an ultrasound of the right kidney was performed but I do not have the results yet.

1209602	4/14/2021	KY	46	F	3/8/2021	3/20/2021	3/20 - 3/22 - jaw, neck, shoulder pain and stiffness 3/21- through present date - hip and thigh pain/stiffness 3/23- 3/25- severe jaw/neck pain and stiffness 3/27-4/1 - elbow and below tenderness/pain 4/1 through present date - shoulder/upper arm pain and tenderness 4/4 - 4/8 - chest pain/breastbone pain when breathing, moving, and to touch. ER visit for this side effect in the AM on 4/5 bc later that day was my 2nd vaccine and I wanted to verify nothing serious was happening prior to the admin of the vaccine. Not being able to take ibuprofen after the vaccine really exacerbated the pain and inflammation, making it much worse. I took Advil early on 4/6 which did alleviate the inflammation and reduced the pain significantly. 4/14 - went to the urgent care ctr for treatment of symptoms, was told this type of side effect starting around 2 weeks after 1st vaccination has been common in patients coming to the urgent care ctr. Got an anti-inflammatory shot and a steroid shot to reduce my symptoms.

1209960	4/14/2021	TX	23	M	4/8/2021	4/17/2021	On Saturday night (4/10) I had some chest pains that seemed to not go away in my upper left chest and left arm. I tried to sleep it off until the pain was unbearable at around 7:00 am on Monday (4/11). I then admitted myself to the ER and was given an ECG and multiple EKG's as well. Upon lab results I had high triponin levels (28) leading the doctors to believe I had a heard attack of some sort, eventually they ruled it as acute pericarditis possibly due to my second dose of the Pfizer vaccine.
1211359	4/14/2021	NV	39	F	4/6/2021	4/6/2021	Immediately at 15 minutes: blurry vision; felt off and felt loopy (out of it); I was dropping food on myself as I was eating. My pupils were really small. I felt out of it. Finally I got home (son drove me). I had mild chest pains and heart racing (had this initially, too). And the chest pains and heart racing kept happening off and on through the night. I had headaches that night and I felt nauseated. Next day, I had to wear sunglasses inside my house as I was light sensitive and my pupils remained small. I still felt body aches and nausea but the eyes were the biggest concern...shining light by my eyes didn't make my pupils bigger. The light that came off my phone aggravated my eyes and my head. Thursday, I still had nausea but headache wasn't bad with Tylenol. Those full two days all I did was sleep. Friday, I felt like things were mild and Tylenol was helping. I called heathline for my eyes. As those still weren't improving. I got into my eye doctor for an exam (4/9). There was no inflammation and he decided to dilate my eyes. Of course, my eyes were blurry and my eyes responded to that dilation. I napped after returning home. My pupils after the nap were finally responding. I still had a little light sensitivity in my eyes but not as much as I had had and pupils were doing what they should with light. So this was 3 1/2 days later. I still do get mild headache and mild chest pain - it comes and it goes. I have a doctor appt - general check up - that was already scheduled for tomorrow and he will examine for chest pain.

1209747	4/14/2021	MN	82	F	3/5/2021	3/6/2021	Started feeling weak next day after shot. As days went by I became increasingly short of breath. This continued for over 2 weeks and then started having chest pain. Went to ER and admitted with pericarditis. 2 days later I went into Atrial fib. The next day I had a cardioversion. Home the following day. One week at home not feeling well, I was readmitted with increased chest pain and shortness of breath. Pulse very low and needed a pacemaker which was inserted Easter Sunday. Home now and still not feeling well.
1209730	4/14/2021	NM	43	F	3/24/2021	4/14/2021	Lightheadedness and exhaustion set in 15-25 minutes post injection. Later that same evening, experienced nausea, muscle, bone, and joint aches as well as chest pain that were much reduced by the following morning. Malaise continued as did symptoms of nausea without vomiting. 24 hours post injection, experienced a low grade fever of 99.6 F (for me, this is a low grade temp). Fever broke after another 24 hours. Experienced severe headaches in the middle of the forehead for 8-12 hours on 3/25/2021, 3/29/2021, 4/3/2021. Experienced difficulty breathing 3/30/2021. Woke up from deep sleep feeling starved for oxygen and a sensation that a deep enough breath could not be taken--the lungs could not expand enough. Respiratory rate seemed slightly depressed. It passed after about 30 minutes with focused effort on taking deep, regular breaths. Fell asleep again and did not consult a medical provider about it. The oxygen hunger / breathing issue did not repeat. Medical professionals were not consulted for any of the episodes described above.
1209692	4/14/2021	CO	28	U	4/12/2021	4/12/2021	tasted and smelled shot, chest pains and headache

1209666	4/14/2021	TX	33	F	3/10/2021	3/10/2021	From 4:00 PM - 5:00 PM my heart rate escalated from 72 bpm to 166 bpm with chest pains, trouble breathing, shortness of breath, nausea, dizziness. For the next 3 days my heart rate was very irregular and high over 115 bpm. I spoke with my supervisor to let him know I was not feeling well and he stated if I did not feel well to seek medical attention. At the time I was immobile and could not stand or walk.
1209978	4/14/2021	CO	49	F	3/20/2021	3/21/2021	I experienced the normal flu like symptoms. Fever, chills, body aches along with that I had chest pain. My chest pain was sharp, stabbing pain that comes and goes, intermittently. I am on day 24 with chest pain. I was referred to the heart doctor, they did an EKG which was normal. MY PCP did a tri-triponent blood test was normal, an also ordered a D-dimmer and it was elevated, i was sent to ER to check for pulmonary embolism which was clear. Another EKG was done and it was normal. My electrolytes were normal. I had stress test this morning 04-14-2021. My PCP ordered platelets due to my left leg pain and heavy feeling and burning feeling that comes and goes. My platelets were normal. My WBC is very low and I have an echocardiogram scheduled on Monday. The ER doctor said that the vaccine caused the inflammation on my body and my chest, having an auto-immune reaction. I still have chest pain.
1210636	4/14/2021	NY	44	F	3/25/2021	3/25/2021	Immediate dizziness and nausea. Became tachycardic within an hour. This is still an issue 3 weeks out. Day after vaccine I felt mild flu symptoms all day and was struck with a severe chest pain and intense nausea in the afternoon. I went to the hospital emergency room and had multiple tests run. No cause was found for the chest pain. It began in the center of my chest and moved to the right side of my back. I have been dizzy, nauseous and extremely fatigued as well as a headache for the last three weeks. The doctor didn't know what caused the pain. He checked me for a pulmonary embolism because my clotting factors were slightly elevated. They have not been rechecked, though I requested my doctor have them and my platelets rechecked. I still do not feel well. My brain is foggy, my vision gets blurry at times, and I still have the dizziness, fatigue and nausea. I am no longer achy and I have not had another chest pain like the one I had on the 26th.

1204003	4/13/2021	MA	37	F	4/10/2021	4/13/2021	After I got the vaccine my heart rate went over 100 and I had to lay down at the hospital to recover because I was so dizzy. On Saturday night and Sunday I felt some normal side effects like a severe headache, chills, nausea, and fatigue. Monday I felt better than normal and I thought I was in the all clear. Today (Tuesday) I woke up feeling like I had a stroke. I can still lift both arms and both sides of my face, but I can not think and feel like I am dying. I am scared to go to the hospital. I am unable to work. I feel incredibly emotional and unable to think. I feel so tired and the pain at the injection site is now even worse. I am getting chest pains, dizzy spells, really bad headache, and it feel like I am in a dream state unable to do things I normally can do. I am not okay and really regret getting the vaccine. I had no prior health concerns and probably would have survived covid, but it feels like I may never get my mental functioning back again.

1203266	4/13/2021	MA	31	F	4/3/2021	4/4/2021	All regular side effects on day 1 + day 2. (Fever, chills, bone and muscle aches, headache). Shortness of breath started the next day on Sunday , extreme, far beyond normal asthma or any asthma attack. Went to urgent care on Tuesday- they said it was likely a side effect of j &J and tested me for COVID, kidney disease other things, all came back negtative. Apparently I wasn?t the first person they had seen with shortness of breath. Blood in cough and spit on Wednesday after 2.5 days of shortness of breath. Dizziness (extreme) throughout and chest pain, sternum hurt, chest tightness. Went to Er. They ran a lot of tests and they too said they had seen others with shortness of breath from j and j. They ruled out many things like pneumonia, a birth control blood clot, any lung diseases with X-rays and blood tests. I was given torkeril to ease the chest pain and tightness which it did. Blood stopped coming up in tissues. Doctor said likely inflammatory reaction to the vaccine in lungs, (I have a piece of paper proving that) and cartilage and sternum., which hurt extremely when he touched it. Blood was likely from burst capillaries from overcompensation from trying to breathe. Recommended I return if more blood came up, which it hasn?t. Shortness of breath has not subsided. I can?t even hold a phone app without being winded. So email back, don?t call.

1204693	4/13/2021	OR	49	F	3/12/2021	4/8/2021	<p>presents with progressively worsening dyspnea on exertion for the last few weeks, much worse over the last one day. Patient reports feeling fatigued, having cough, and feeling more short of breath for the last day, and has developed central chest pain which is pleuritic in the emergency department. She reports that the chest pain is 4/10 in severity and does not radiate. Her caregiver at bedside reports that the patient has had worsening dyspnea on exertion for the last 3 or so weeks. Of note, she becomes dyspneic with limited exertion, such as going up a flight of stairs, at baseline. She had a fever of 101.4 °F at home earlier today, but denies chills or diaphoresis. He had 1 episode of nonbloody vomiting earlier today. Denies nausea at this time. She received her second dose of the Moderna COVID vaccine yesterday, 4 weeks after the first. They note that approximately 5 years ago, she had a prolonged admission for which she was transferred to OHSU and was on ECMO for a time before making a nearly full recovery. She has had the baseline dyspnea on exertion since that time. Review of Systems Constitutional: Positive for fever and malaise/fatigue. Negative for chills. HENT: Negative for sore throat. Eyes: Negative for blurred vision. Respiratory: Positive for cough and shortness of breath. Negative for hemoptysis, sputum production and wheezing. Cardiovascular: Positive for chest pain. Gastrointestinal: Negative for abdominal pain, diarrhea and vomiting. Genitourinary: Negative for dysuria and frequency. Musculoskeletal: Negative for back pain. Skin: Negative for rash. Neurological: Positive for weakness. Negative for tingling, sensory change and focal weakness. Endo/Heme/Allergies: Does not bruise/bleed easily. Psychiatric/Behavioral: The patient is nervous/anxious. Past Medical History: Past Medical History: Diagnosis Date ? Slightly anxious appearing. HENT: Moist mucous membranes. No posterior oropharyngeal erythema or exudates. NECK: Supple. No cervical or supraclavicular lymphadenopathy. CARDIOVASCULAR: Tachycardic rate and regular rhythm. No murmurs, rubs, or gallops. No pain with palpation of chest wall. PULM: Normal effort. No use of accessory muscles. Clear to auscultation bilaterally. No wheezes or crackles. ABD: Soft. Non tender. Non distended. EXT: No lower extremity edema. SKIN: No suspicious lesions noted on the exposed skin. EKG: 04/09/21 Rhythm: Sinus tachycardia Rate: 111 Axis: normal Intervals: normal Concern for possible inferior infarct noted, but felt less consistent with true ST depression Recent Imaging: Chest x-ray, 04/09/21: FINDINGS: LUNGS: Slightly low lung volumes. There is hazy reticulonodular interstitial opacity seen within the left mid and both lower lung zones suspicious for interstitial pulmonary edema. CARDIAC: Slightly worsened mild cardiomegaly. MEDIASTINUM: Normal. PLEURA: No pleural effusion or pneumothorax. LINES/TUBES: None. BONES: There is mild rightward convexity curvature of the thoracic spine along with minimal multilevel degenerative change. OTHER: Surgical clips overlie the left lung apex medially and the right upper abdominal quadrant. IMPRESSION: 1. See above. CT angiogram pulmonary: FINDINGS: Motion degrades image quality slightly. No pulmonary arterial filling defects are identified. Mild lower lobe predominant atelectasis and/or scarring. A single small bulla is present in the left lower lobe of the lung. Lungs are otherwise clear. Large airways are patent. Small bilateral dependent pleural effusions which are new relative to the comparison examination. No pneumothorax. Heart is normal in size. Relatively low

attenuation pericardial effusion is present which is new relative to the comparison examination. Pericardial fluid measures up to 1.7 cm in thickness. No thoracic aortic aneurysm or dissection. No mediastinal mass or lymphadenopathy. Two small enhancing foci are present in the liver, larger 1.8 in length which are similar to the comparison examination. Interval cholecystectomy. Visualized upper abdominal contents are otherwise without significant abnormality. There has been partial resection of the left 5th rib. Osseous structures are otherwise intact. IMPRESSION: 1. No evidence of pulmonary embolism. 2. Pericardial effusion and small bilateral pleural effusions which are new relative to comparison examination. 3. Two small enhancing liver lesions which are not further characterized by this examination but are similar to comparison examination. These could potentially represent hemangiomas. Assessment / Plan a 49 y.o. female with history of hypertension, developmental delay, DVT x1 not currently on anticoagulation, GERD, and anxiety who is being admitted for acute hypoxic respiratory failure, felt likely secondary to fluid overload from cardiomyopathy from pericarditis with associated pericardial effusion. #Acute hypoxic respiratory failure #Elevated Pro BNP #Cardiomegaly #Dyspnea on exertion #Pleuritic chest pain #Elevated D-Dimer Acute. Hemodynamically stable. On room air at home, and requiring 3 L via NC here. Considerations include new onset CHF, PE, PNA, PTX, pericarditis, pericardial effusion. Presentation most concerning for new onset CHF/cardiomyopathy from pericarditis with associated pericardial effusion, as demonstrated on CT angiogram. She has significantly elevated CRP which further supports pericarditis, and onset of symptoms approximately 7 to 10 days after receiving her first COVID-19 vaccine dose 4 weeks ago, which may be associated. Also possible viral or idiopathic. Mildly elevated BNP and pleural effusions suggesting cardiomyopathy. Patient had a fever to 101.4 °F earlier today, per caregiver at bedside, and has had shortness of breath and cough, and thus pulmonary infectious process strongly considered, though clinically I feel infection less likely. She has a chronic leukocytosis and WBC is 21 today. She received ceftriaxone and doxycycline for pneumonia today in the ED, and may

1204541	4/13/2021	OK	41	F	4/1/2021	4/1/2021	<p>P/C from patient. States she took the vaccine on 4/1/21 @ 1:30 PM. When she heard of the issues that were in the news about the vaccine she thought she should call.</p> <p>4/1/21 Thursday: That evening around 6 PM she started to have a rash. It started on her L arm where she got her vaccination traveled up her neck, covered her face and trunk. It started out as an itchy red rash but became raised hives. It resolved on it's own and on Saturday she did not have the rash anymore. Never had any difficulty with breathing. Her left arm where she received her vaccination still has some discoloration. States on Thursday evening she started having a "brain fog".</p> <p>4/2/21 Friday: The next morning she woke up and was unable to finish a sentence, states she was confused, "felt like I was on pain medication, like I was drugged". States she was confused, could not think and could not remember anything. Cried all day over nothing. Would tell her daughter something and then immediately ask what did I just say as she couldn't remember what she said. She was working on the graduation hooding ceremony and scribbled all over her papers like a 3 year old and the papers were strewn all over the floor. She reports that she had a mild headache all over her head dull pain and pressure 4/10. Took tylenol but that didn't help at all. Denies having any visual problems, trouble breathing or chest pain. Did have some abdominal dull cramping with nausea and even though it felt like she was going to have diarrhea there was no diarrhea or vomiting . The abdominal pain went away after friday but the nausea stayed through Sunday. She states she got lightheaded if she stood up too fast or turned her head too fast. This just happened on Friday. Denies having any weakness, lack of coordination, or speech issues. She states she was crying and could not stop all day on Friday. She told her boss she was having a mental breakdown and had to go home. 4/3/21 Saturday: Patient states she felt stupid, could not think, could not remember anything she said. States that the horrible headache came on Saturday. It was so bad she had to lay down in a dark room with a wet washcloth over her eyes. The horrible headache lasted about 1 hour at a 10/10 level. Took some more tylenol but does not think it helped. Went to sleep and when she woke up the headache was still there at a rete of 4/10. She was still nauseate but the crying had resolved. 4/4/21 Sunday: Again, had a</p>

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

severe migraine when she woke up. 7/10, not as bad as the one on Saturday. It lasted a couple of hours and then went back to the 4/10 headache that has persisted at the 3-4/10 level the entire time since she got her vaccination. The headache never stops hurting and stays 3-4/10. 4/5/21 Monday: Had a regular headache 3-4/10. Still felt "loopy" and with brain fog. Went to work on Monday and told her boss about it and that she still says she can't think straight. Her boss has been very supportive and has helped her to complete her assignments to get them in on time. 4/6/21 Tuesday: Still had a headache, It has been continuous ever since Friday. Still taking Tylenol and it doesn't seem to help. Yesterday she even tried Ibuprofen and it didn't help. 4/13/21 Today is day 13 and she still can't think straight. still has 3-4/10 headache, still all over her head. Feels that she still has brain fog, but not as "loopy". Feels like she can remember what she has said better. She called the nurse line at her husband's work. They told her that it was just a reaction to the vaccine. The patient didn't think to report it to the Health Center. She got the vaccine from the Health Center (she asked if employees could get the vaccine and said she would prefer that) She is not pregnant. She has no chronic health conditions and takes no medications routinely. She denies being allergic to any medications and states she has taken the Flu shot without any reaction in the past. NOTE: Tested positive for COVID on 2/4/21 and was told it was OK to get the vaccine. She lost her taste and smell and said she felt she had a mild flu for a couple of days. Has regained her sense of taste and smell and has had no residual symptoms. Instructed patient to go to the ER for an exam. She needs a full neuro exam and at least a C_T scan of the head. She would like to contact her Primary Care Provider. States she hasn't seen him for a couple of years but feels like he would want to know. Instructed patient to call me with the outcome of her visit to her PCP or the ER. Patient verbalized understanding of and agreement with plan. Signed by: APRN-CNP on Apr-13-2021 at 04:04 PM Locked by: APRN-CNP on Apr-13-2021 at 04:04 PM

1205963	4/13/2021	GA	43	F	3/17/2021	3/18/2021	Day 1-3 severe headache, fever, fatigue, body aches I was in the bed for 2.5 days. Day 5 - severe chest pain landed me in the ER at Hospital - pericarditis caused by the vaccine. Day 21- finally got into see a cardiologist, started colchicine to try to reduce the inflammation around my heart and prevent it from coming back. An echocardiogram is going to be performed on 4/14/21. Also, right upper quadrant pain when taking a deep breath, a ct scan is being scheduled. Ive not been able to sleep laying down since day 5 following the vaccine. Chest pain, shortness of breath and right upper quadrant pain are all a result of the vaccine.
1205986	4/13/2021	CA	36	F	4/11/2021	4/12/2021	Fever, aches, chills, slight chest pain one day after vaccine Mild chest pain, shortness of breath two days after vaccine
1205997	4/13/2021	CA	23	F	4/11/2021	4/11/2021	Approximately 4 hours after receiving the injection, I started developing a fever, within an hour it had reached 103.3 F. At this point I took 400 mg of over the counter ibuprofen which helped drop my temperature slightly to approximately 102.2 F. This fever continued into the night. I took another dose of ibuprofen before sleeping, about 6 hours after the first dose. Along with fever I experienced strong shaking/chills, muscle and joint soreness, headache, dizziness, confusion, and chest pain/feeling of pressure on the chest. The day after vaccination I continued to have a low-grade fever of approximately 100 F which subsided by evening. All other symptoms subsided as well except for the chest pain. On the second day post-vaccination my only remaining symptom is the chest pain.

1206044	4/13/2021	WA	39	F	4/13/2021	4/13/2021	39 y.o. female with history of asthma but no previous anaphylaxis to vaccines received covid-19 vaccine (Moderna) at 4:15pm today and within a few minutes developed tachycardia, nausea and vomiting No shortness of breath, no wheezing, speaking in full sentences No chest pain She has a history of asthma and hives to terbutaline, and anxiety reaction to gabepentin. No history of intubation or serious reaction from asthma Transferred to the procedure room by RN with my assistance Blood pressure 132/82 pulse of 135, O2 sat 100% on RA, speaking full sentences, stating she had some chills lungs clear, tachycardic, and moving air well, no wheezing. Patient stated said she had to the bathroom right away, was going to have diarrhea. Said she could walk, and was walked across hall with assistance to bathroom, where I stayed with patient. I accompanied patient to bathroom, she had one episode of diarrhea, and dry heaving, returned to procedure room, lied supine, IV started, NS bag hung. RN present, additional ARNP present, staff aware, anaphylaxis kit present. Patient tachycardic and continued with normal O2 sat and good air movement, EMS with request for ALS activated due to reaction to vaccine. I made decision to give epinephrine with her tachycardia and continued nausea with diagnosis of anaphylaxis, and as preparing epinephrine, patient stated she started to feel tight in chest, epinephrine given 0.3mg of 1:1000 IM. Lungs notable for reduced air movement lung bases. Patient denied throat tightening, rash, lip swelling, but she continued to have dry heaves, and stated she had a "sore throat". EMS had already been activated before first epinephrine dose. Awaiting medics, patient given Solumedrol 125mg IV, benadryl 50mg IV, and zofran 4mg IV Patient also given four puffs of albuterol MDI with spacer. Medics arrived, patient still feeling tight in chest, blood pressure 125/70, O2 sat 100%, lungs still tight with reduced air movement Patient given second dose of epinephrine 0.3mg, 1:1000 IM, approximately 7-8 min after the first dose. EMS transferred patient to gurney with transport to PEMC Patient alert during entire reaction. PEMC notified. To ED via ALS PEMC notified Timeline of anaphylactic reaction: 1615: Covid Moderna 2nd injection given RN notified of patient feeling rapid heart rate and nausea. Patient pulled back to procedure room. 1631: Vitals: BP 132/82, HR 135,

1201275	4/13/2021	CA	31	F	4/1/2021	4/6/2021	i have been experiencing chest pain, chills and 101-102fever since april 6. my arm joint are warm to touch. cramping on my stomach. still experiencing it today April 13th
1201320	4/13/2021	IN	34	F	4/2/2021	4/2/2021	I received the vaccination 4/2/21 at 11am and at about 6pm the same day - I felt a sudden flush and felt like I was going to faint in the middle of Grocery store. Got very clammy and sweaty and weak - immediately left the store and started projectile vomiting outside the store and all night the first night. Had extremely joint/bone pain throughout my entire body for 4 days straight in bed, very weak, chills and night sweats, day 2 I had a little energy and drove about an hour and immediately started vomiting again for day 2-day 5. Day 5 I woke up with swollen eye lids and hands and thought it was an allergic reaction to something in my house so took benedryl, but didn't help. The swelling went down on day 6. I've had no energy and very foggy brain and been very down. My chest has felt like an anxiety attack 24/7 all week. I am on day 10 since the vaccination and my chest pain has increased. I still have foggy brain and been very out of it and weak still. I vomited day 1-day 5. Really bad pain in my hips and arm where I received the shot.

1200929	4/13/2021	CT	52	F	4/6/2021	4/9/2021	Chest pain/heartburn, pressure in left ear with blood rushing to head, dizziness, nausea. Went to ER on 4/10. Released after EKG and cardiac enzymes ruled out MI, CT scan no PE. Told to follow up with primary care doctor. Still experiencing chest tightness, blood rushing to left side head/tingling and now tingling left leg. Seeing doctor this afternoon.
1201473	4/13/2021	VA	51	F	3/9/2021	3/15/2021	I was dizzy and could not keep my balance or walk. I was having chest pains and felt a heavy feeling in my chest. My husband took me to the ER. They ran blood work and did a CT Scan and chest x-ray. I told the ER that I had the covid vaccination the Tuesday prior but they said I would have already had symptoms. They didn't ask which vaccination. They said they thought I had vertigo and gave me Antivert. They said I should follow up with an ENT, Cardiologist and Gastroenterologist. When I went for the follow-up with a Cardiologist, they scheduled a stress test (May 21st) and an Echocardiogram (May 11th). The Gastro doctor wants an endoscopic and colonoscopy but won't schedule until I have clearance from the Cardiologist.
1201478	4/13/2021	AZ	29	F	3/27/2021	4/3/2021	I was having intense chest pain, weakness/faintness feeling a few days after second dose of Moderna vaccine. I went into the ER after 4th day of pain. ER did a CT scan and found a couple blood clots in my right lung (pulmonary embolisms) along with tissue on lung. An ultrasound of my heart and legs were done to find the source of these blood clots and neither tests found blood clots or indicators that this is where they originated. I am currently on blood thinners in order to reduce the clots.
1201559	4/13/2021	CA	43	M	4/7/2021	4/12/2021	Numbness and weird feeling in left arm (injected in left arm) started like 8pm got worse. Also still felt awful comes and goes cold and feverish again. Felt good a day and a half. Then bad again but was at work. Woke up 2am with pain in chest and arm felt numbness and very strange and pain in chest - which did subside but almost called 911. Will go to urgent care today to get checked out. Took BP at home and it was normal/ took an aspirin at 2am as well/

1201597	4/13/2021	WA	76	F	3/8/2021	4/2/2021	is here today for ED follow-up on A-fib. Patient stated she is not taking Eliquis. She had no side effects from her first COVID-19 vaccine. After the 2nd one she had muscle aches, headache, freezing cold, and "weird", and felt really badly then at 9:30 PM, 32 hrs after the 2nd vaccine dose she felt the a-fib started. She had not been in a-fib in many years. Cardiology had already recommended eliquis but she was holding off. She had diltiazem from 2017 that she tried but with out relief. They rate controlled her but she remained in a-fib, started eliquis, and she went home. For 2.5 weeks she had headache and chest pain, other muscle pain, felt horrible, until she stopped the Eliquis. Since stopping the Eliquis, she still has occasional mild chest pain, and headache, and flushing. Her current chest pain is left chest, not radiating. The quality varies, stabbing pain in a very small location at times, may be associated with eating. She did have a stress test years ago and was "fine". She had a dental appointment planned that she had to cancel, she has moved it to May 4th.

1203141	4/13/2021	AL	68	F	2/16/2021		chest pain; dizzy-headed; runny nose; slight headache; This spontaneous case was reported by a consumer and describes the occurrence of CHEST PAIN (chest pain) in a 68-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Heart disorder and Lupus erythematosus. Concomitant products included CLONAZEPAM (KLONOPIN) for an unknown indication. On 16-Feb-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 16-Mar-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On an unknown date, the patient experienced CHEST PAIN (chest pain) (seriousness criterion hospitalization), DIZZINESS (dizzy-headed), RHINORRHOEA (runny nose) and HEADACHE (slight headache). At the time of the report, CHEST PAIN (chest pain), DIZZINESS (dizzy-headed), RHINORRHOEA (runny nose) and HEADACHE (slight headache) outcome was unknown. Concomitant product included heart medication. Treatment information included Tylenol. This case was linked to MOD-2021-060644 (Patient Link). Company comment: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

Pt took 2 tabs of tylenol with some improvement of syptoms. Pt concerned for ability to perform duties at work.HPI: 26yo M presenting to ED for above complaints after receiving the second MODERNA COVID vaccine yesterday. He has no focal neuro deficits, no dyspnea or chest pain, or any other complaints.
1199686	4/13/2021		32	M	4/8/2021	4/9/2021	c/o subjective fever, N/V, h/a, chills, and generalized body aches after receiving 2nd dose of Moderna COVID vaccine yesterday AM. HPI: 32yo M presenting to ED for generalized malaise and HA. He received MODERNA COVID #2 vaccine yesterday. HA is not first/worst/max at onset, no chest pain or dyspnea, no focal neuro deficits. Pt has no acute neuro findings- unlikely CVA. Not likely PE/DVT, no evidence of dysrhythmias, unlikely anaphylaxis. F/u and return precautions discussed.
1199690	4/13/2021		26	M	4/10/2021	4/10/2021	J&J vaccinated @1030 today. HA, chills, fever and bodyache started @1600. Took tylenol 325mg po x4. Denies difficult breathing, chest pain or cough. History: pt here for fever of 104F at home since 1600. Had J&J COVID vaccine in the morning today. Has body ache, headache, light sensitivity, slight nausea. Denies any symptoms before vaccine and denies vomit/diarrhea, rash, cough, runny nose, ear pain, recent illness/injury, recent sick contact, recent procedure, prior co-morbidities. Took 4 tylenol pills at around 1830. Ibuprofen or NSAIDs make pt's throat swell up.
1199697	4/13/2021	WA	54	F	3/30/2021	3/30/2021	Two hours after injection I felt a fast heart rate and checked with an oximeter and my heart rate was over 100 up to 105. Then on 3/31 I recorded my heart rate throughout the day because I was getting scared feeling chest pain and feeling my heart pounding. I had readings of 115 to 120 and my normal is in the 70s. I tried to limit my activities, even walking, because my heart rate would increase when I was active. Again on 4/6 I was still having a fast heart rate of 113 to 115. Throughout this time my heart rate is staying higher than normal and I can feel it when it is beating too fast and strong. I have checked my heart rate with an oximeter today and it is still in the 90s, but better than it was a week ago.

1199753	4/13/2021	VA	52	F	3/8/2021	3/8/2021	Within 15-20 minutes of receiving vaccine, I felt something in my chest. A slight pain or pang for a few seconds then it went away. The next day, I had noticeable visible swelling of my left breast and lymph nodes under my left armpit even though injection was on rt arm. This was checked out by radiologist with a mammogram/ultrasound and lefts side looked fine, right side was suspicious of a legion which was biopsies and turned out to be fibrosis. Don?t know if there?s a connection to vaccine or not. What was equally if not more concerning were the chest pains which returned a few more times getting stronger that first week after the vaccine. It was a pulling sensation on the left side of my chest that, if 10x stronger, would feel (or be?) a heart attack. And that was after the 1st dose, so I am extremely hesitant to take the 2nd dose should those particular side effects intensify. I have googled it and can find no information about chest pains after the vaccine. On a side note, my first cousin went into cardiac arrest after receiving his vaccination. He was dead and they brought him back. I?d like to avoid this.
1199820	4/13/2021	CA	32	F	4/7/2021	4/7/2021	Chest pain for four hours after vaccine and worsening heart palpitations. No doctor was seen.

1200649	4/13/2021	MD	82	F	1/22/2021	1/22/2021	On 1/27/21, after receiving Dose 1, I had some chest pains, shortness of breath and a pulse rate as high as 190. I (foolishly) did not do anything but suffered through these symptoms at varying degrees of pain/discomfort for about an hour and a half. Recently on 4/9/21, I experienced these same symptoms. My heart felt like it was pounding out of my chest; pulse rate was up to 170 and BP was 190/86. I also had intermittent chest pains at different levels of severity. Called 911, ambulance took me to healthcare facility where I was advised that I had Atrial Fibrillation. I don't know if this is related to the Covid shots but I feel it should be documented. While I have had high blood pressure for years and I am an older adult, I have never had any heart problems, per se. I also know it would not be unusual for someone with my characteristics to develop Atrial Fibrillation, however, it is suspicious that this occurred only after the covid vaccines were administered. Pregnancy History; 1 child.
1200707	4/13/2021	NJ	39	U	4/6/2021	4/10/2021	I started having chest pain palpitation Tuesday night and wasn't able to sleep. Wednesday, body ache, and headache all day. Thursday headache still there but manageable. Friday no problem. Saturday, felt differently but ok... Sat around 5:50pm started to feel lightheaded, I tried to walk to my bed to lay down and fainted and hit the floor. I woke up on the floor confused and realized on what had happened. Chest tightness continues and back of the head still hurts as of today and exhaustion persists, Tuesday 4/13.
1200714	4/13/2021	IN	32	F	4/1/2021	4/1/2021	Immediate feeling of nausea and headache after receiving shot. Within 30 minutes those symptoms increased. By next morning on 4/2, symptoms were migraine headache, sensitivity to light and sound, full body aches, joint pain, decreased appetite, chest pain, shortness of breath, fatigue. The symptoms gradually decreased and then resolved over the next 5 days.

Patient endorsed seeing black spots, then nausea. Patient denied shortness of breath, difficulty swallowing, chest pain or other symptoms. Patient noted to be pale, diaphoretic, and fainted upon sitting down. Reporter observed patient shaking. Patient admitted to urgent care for further follow up. At 0904, BP 136/82, HR 79, 98% RA. At 0947, BP 93/61. Patient given NS 500mL bolus IV. At 1025, patient denied dizziness, weakness, or nausea. Patient denied dizziness, weakness, or nausea. Patient changed to sitting position with mild nausea. VS remained stable. At 1035, patient ambulating without issues. Patient discharged home in stable condition. Patient noted he had not eaten prior to injection. Urgent care provider indicated per physical exam consistent with vasovagal reaction to vaccine. POC = 142, given crackers and water x 2.
1202551	4/13/2021	TN	54	M	3/10/2021	3/16/2021	I suffered two heart attacks. First heart attack was on the 6th day after the vaccine, second heart attack was on the 9th day of vaccine. Both heart attacks woke me up from sleep. I went to the emergency room and was hospitalized each time. I suffered chest pain prior to each heart attack but have never suffered chest pain before. I am continuing to suffer from periods of chest pain at rest.

1201899	4/13/2021	KY	64	F	3/26/2021	4/1/2021	Had systems of fatigue and chest pain. Went to hospital of 4/12/2021 . Learned that had blood clots in lungs that I previously did not
1201914	4/13/2021	UT	51	F	3/11/2021	3/12/2021	I received the vaccine around 12:00pm. That evening I had severe chills and very bad chest pains. I also had body aches. The chest pains are the main thing I want to report. It lasted through the next day. I thought it was just me but my daughter's friend said the her friends mother also experience really bad chest pains the next day after her covid vaccine. Also, my husband just received a different covid vaccine and experienced chest pains. I thought it was worth reporting. Several weeks later I received my second dose of Shingles vaccine and also experienced chest pains the next day. This didn't happen with the first dose. I thought maybe they have similar ingredients?
1201931	4/13/2021	NV	61	F	3/31/2021	4/1/2021	Nausea, chest pain, diarrhea, headache, body aches, and fatigue. Symptoms start the next morning and lasted for 5 days. As of this writing, no symptoms persistent at this time.
1201956	4/13/2021	IL	64	F	4/1/2021	4/2/2021	Beginning the following morning after my vaccination, at approximately 8:30 am, I began having severe stabbing chest pains. Feeling as though I was being stabbed dead center of my chest and it came out my back. I had trouble breathing or felt like it hurt more when I tried to take a deep breath. This was very severe for about 2 hours then eased off and was off and on for about two days. My arm did not get sore until the third day after my vaccination and remains sore still. I've experienced a headache in severity ranging from a nuisance to temple throbbing since the day after vaccination. I have taken my naproxen for the chest pain and headache. I ran a temp of 99-100 occasionally but never for a long period of time. I'm still experiencing some chest pain occasionally but nothing as severe as the first two days.

1202033	4/13/2021	GA	22	F	3/23/2021	3/23/2021	<p>March 5, 2021: 1st dose of Pfizer vaccine. Severe site pain. March 23, 2021: 2nd dose of Pfizer vaccine. Felt very restless and sick during night, by the next morning symptoms really sat in. March 24, 2021: Went to Urgent Care due to fever. Had COVID-19 test (negative). Very close to passing out there (put head between knees and did not). Was sent to emergency room immediately due to heart rate (high 140s-150s. Highest known was 152 BPM). ER performed following: portable chest x-ray, blood tests, urine tests, EKG. Was told results were all normal with the exception of EKG (not told anything about it, form listed as abnormal). Passed out 2x at hospital. Was given one IV rehydration solution and released that night. Symptoms below lasted for several days: Headache Aches Nausea Aggressive shakes Shortness of breath Confusion Dizziness Site pain (also developed bump under arm) Fever - 103.8 (after 2 Advil, 2 Tylenol, 3 ice packs and eating frozen grapes) Heavy sweats Racing heart Restless March 30, 2021: Still having frequent heart palpitations (they come and go but happen several times during the day. Keep having very high heart rates). Went to doctor. While there, nurse noted irregular heartbeat that sounded like it was ?skipping a beat? and heart rate was also jumping all over the place (high pace, low pace, high, etc.). It was clear something was abnormal. Doctor gave EKG approximately 20 minutes later, EKG looked normal. Was told to come back next morning for blood work and to cut out caffeine. March 31, 2021: Came in for blood work to check thyroid. April 6, 2021: Thyroid results were normal. Still having palpitations among other symptoms (see April 12 for more info) so was told to come in. Was given ?work from home? note and referred to cardiologist. April 12, 2021: Appointment at cardiologist. Still having severe palpitations, occasional dizziness/ lightheadedness, nausea, shortness of breath, exhaustion and chest pain. Heart rate was recorded this day to have gotten up to 139 BPM-- was very high majority of the day. EKG was normal (with exception of high heart rate) but 30 mins later doctor observed high heart rate and abnormal rhythm. Was told to come back in a week and one day for a heart ultrasound and heart monitoring for three days. Still no caffeine intake since 3/30/21. Previous heart rates taken at doctor's visits over the years for comparison below. Never had any prior</p>

1196479	4/12/2021	VA	59	F	4/9/2021	4/9/2021	Returned home around 4:30 PM from vaccine and felt a bit tired & not hungry for dinner. Iced my arm and took 2 Tylenol as my head began hurting. I went to bed at 9:00 PM and woke up around 1:00 AM with an excruciating headache and felt nauseous I took 2 more Tylenol, but could not fall back asleep. I felt very nauseous and was unable to go back to sleep. Oddly, I was sitting up wide awake and for a period of about 30 minutes, I began seeing brightly colored images that looked like they were floating in front of me. It was extremely odd as my eyes were open and I was awake. I finally fell back asleep around 5:30 AM and had horrifying vivid nightmares. When I woke up around 8:00 AM my headache was still there and I felt somewhat nauseous but not as bad as during the night. My headache continued through the day on Saturday and I continued to take Tylenol about every 6 hours. I attempted to go to bed around 9 PM when I experienced horrible chest pain that radiated through my chest and into the left side of my throat. This was frightening because the pain did not let up for 7 to 8 hours, even after taking a Tagamet. I've never suffered from heartburn previously other than when I was 8 months pregnant with twins. I was lucky to have any medication at home and that was only because my husband suffered from heartburn frequently. I finally fell asleep around 6:00 am for just a few hours and woke up feeling tired, but no headache or chest pain. Other than feeling tired, the symptoms appeared to all be gone. On a positive note, my arm never became sore!
1197646	4/12/2021	CO	57	M	3/7/2021	4/11/2021	4/11/21 pt with pleurtic chest pain and worsening hypoxia. chest x-ray w/ bilateral pulmonary infiltrates. covid pcr + 4/11. pt admitted to hospital on 4/7 for alcohol withdrawal, minimal o2 requirements on admit. on 4/10 pt with low grade temperature and O2 requirements were increasing then, started on azithro 500mg daily x 3 days, patient did have chest ray that day with bilateral opacities.
1197801	4/12/2021	NC	18	M	4/7/2021	4/9/2021	Patient began having chills, fevers and sweats within 12 hours of receiving the vaccine. 2 days later he had severe chest pain prompting him to present to the hospital.

1197620	4/12/2021	NC	28	M	3/24/2021	3/25/2021	<p>Significant elevation of troponin of 12; chest pain; Vaccine induced myocardial injury; headache; myalgia; fever; This is a spontaneous report from a contactable physician. A 28-year-old male patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Solution for injection, Lot Number: EN6205), intramuscular, administered in left arm on 24Mar2021 at 1:00 pm as single dose for covid-19 immunization. The patient medical history was not reported. Concomitant medication(s) included keppra, lamictal same dose for more than 5 years. The patient previously took bnt162b2 on 03Mar2021 for covid-19 immunization at the age of 28-year-old at 1:00 pm. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has been tested for COVID-19. The patient stated 1-2 days after vaccine he developed headache, myalgia, fever, chest pain. Chest pain progressively worsened. He was presented to the hospital 3 days after onset. There was significant elevation of troponin of 12, ECG unremarkable. No prior history of hypertension/hyperlipidemia or diabetes. On 25Mar2021, the patient was diagnosed with vaccine induced myocardial injury. Treatment for events was inpatient monitoring, Heparin infusion while awaiting results of cardiac work up. Outcome of events was recovering. Follow up attempts are needed and Information on lot/batch number was available.; Sender's Comments: Based on temporal association and profile of the product, the contributory role of the suspect product bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Solution for injection, Lot Number: EN6205), to reported events is possible.</p>

1197275	4/12/2021	WI	22	M	4/6/2021	4/7/2021	22 Y male with past medical history of environmental allergies presents with a chief complaint of abdominal pain and nausea/ vomiting. He states that on 4/7 he had some nausea and one episode of non bloody nonbilious emesis that morning. He had previously received his first dose of the Moderna COVID vaccine on 4/6. He states this morning he awoke and had significant nausea and abdominal pain and then had approximately 10 episodes of non bloody emesis that eventually became bilious. He did have some diaphoresis. He states that he eventually did have some chest pain that he attributed to all of the vomiting. He went to urgent care and did receive Zofran but this did not alleviate his symptoms. He denies shortness of breath, cough, fever, chills, diarrhea, melena, hematochezia, genitourinary symptoms, or other pain. He states that he has been having a few episodes of loose stools, but did not have any bowel movements today. In urgent care CT was performed and was suspicious for pneumomediastinum within the partially imaged lower chest and a CT esophagram was recommended. Patient presented here for CT esophagram. He is admitted for further treatment, and required a three day admission with IVF, and IV narcotics and antiemetics to control his nausea and Abd symptoms. He denied dyspnea. On 4/11 the patient was tolerating a diet and stable to dc home.

1199225	4/12/2021	MI	59	F	3/23/2021	3/24/2021	<p>Patient reported: Difficulty breathing; severe headaches, vomiting/nauseous for 3 weeks and counting, plus chills. Went to Urgent Care 4.1.21. Back to Urgent Care 4.9.21 - this time with symptoms above plus cough, SOB, N/V. CXR (-) COVID (-). Patient received dose J&J vaccine 3.23.21. HISTORY OF PRESENT ILLNESS: Patient is a 59 y.o. female who presents to the Urgent Care with COVID-19 (sick after receiving COVID vaccine x1week ago. Vomiting, headaches, nausea, chills) HPI: Patient presents today with complaints of nausea, vomiting, headache and chills intermittently over the past 1 week after receiving her 1st COVID 19 vaccination. She states that she got the Johnson Johnson COVID-19 vaccine. She states of then she has had an episode of vomiting daily some nausea. She has also had a headache every single day as well as some constipation. She denies any numbness or tingling, abdominal pain, diarrhea. She states that she has been taking ibuprofen, Pepto-Bismol, and Tylenol for her symptoms with minimal relief. She is drinking a lot of water as well. Medical Decision Making: No concerns for acute abdomen or neurological deficits are noted on exam today. Patient is reporting some symptomatic relief after receiving the Toradol injection today in urgent care. Educated the patient on the following: Zofran for nausea and vomiting. MiraLax and senna for any constipation symptoms. Motrin and Tylenol for pain or fever. Drink plenty of fluids. Follow up with PCP as needed. If symptoms worsen go to the emergency room such as you are not able to keep fluids down while taking the Zofran, if you develop any bloody stools, bloody vomit, or increasing abdominal pain. HISTORY OF PRESENT ILLNESS Patient is a 59 y.o. female who presents to the Urgent Care with COUGH (cough, SOB, congestion, vomiting everyday until about 1PM. headache off and on. x 2 weeks (since covid vaccine)) HPI: Patient is a 59 y.o. female who presents to the urgent care with cough, shortness of breath, congestion, nausea and vomiting and intermittent headaches over the past 2 weeks. Patient states that the symptoms started the day of her COVID vaccine. She states that she receive the Johnson&Johnson 1 time dose. She states later that day after receiving the vaccination she had a significant headache that developed. She states that since then she has had a dry nonproductive cough with intermittent</p>

shortness of breath and morning nausea and vomiting that last till about 1:00 p.m.. She states that the headaches have resolved at this time but the cough, intermittent shortness of breath and nausea and vomiting have persisted. She denies any abdominal pain, chest pain, chest pressure or chest tightness. She states that she has not been experiencing any dizziness, vision changes or lightheadedness. She was seen in the urgent care about a week ago and was prescribed Zofran to assist with the nausea. She states that she was taking it twice in the morning and has now been able to only take it once, does feel that the nausea is improving but was out of the medication today, states that she was not able to take anything today and did have an episode of nonbloody nonbilious vomiting. She states that she was having some constipation she feels that this was related to the over-the-counter pain medications that she was taking for the headaches. She states that she was advised to take MiraLax at her last urgent care visit which she has been taking, had a normal bowel movement yesterday. She states that she has had pneumonia in the past, no history of asthma or chronic obstructive pulmonary disease. With the continued symptoms came to the urgent care for evaluation. She states that there have been to other coworkers who have had exposure or have now tested positive for COVID-19. Medical Decision Making: 59-year-old well-appearing female who presents to the urgent care with cough and nausea and vomiting over the past 2 weeks. Reviewed patient's previous urgent care notes as well as immunization record. Her vital signs are stable in the urgent care today and exam is largely benign. Given her history and current complaints did obtain a chest x-ray which appears negative, formal interpretation was pending at time of discharge. She was provided Zofran in the urgent care today which she did state helps with the nausea. Discussed with patient that I do feel that COVID-19 testing should be collected as at the time of her symptoms and given her continued symptoms she has not had full immunity from the vaccination and this could still be a COVID-19 infection. She is in agreeance and COVID testing is pending. Prescribed refill of her Zofran as well as Tessalon for cough relief and advised continued symptomatic measures and close follow-up with PCP for any persistent symptoms. She was

1198323	4/12/2021	TX	23	M	4/12/2021	4/12/2021	Janssen COVID-19 Vaccine: Vaccine administered by pharmacy staff at 1320, patient was observed for 15 minutes without complaint or concern. Upon check-out he stated he was "starting to feel sweaty". He denied dizziness, difficulty breathing, chest pain or other concerns. Systolic blood pressure was 76/40 (manual), heart rate 70. He remained awake, alert, skin pale, clammy, & cool. Sweat noted on forehead, in no acute distress. He was transferred to supine position and given cold water. BP increased to 124/82, heart rate 88, pulse ox 98%. He verbalized he felt much better, stated he began to have concerns about a reaction when he began to feel sweaty. He was unsure if it was anxiety or a reaction to the vaccine as the feelings began to escalate. He has no history of similar reactions but "doesn't like shots". He has no medical history, takes no medications/supplements and is otherwise "healthy". He ate lunch prior to appointment. Additional BP readings remained within normal limits, skin warm/dry, back to baseline. Observed for an additional 45 minutes and returned to work. Discharge vitals: 116/84, 90, 98%, 16.

1196329	4/12/2021	IL	31	F	1/11/2021	1/11/2021	After patient received the first dose of COVID vaccine she had left arm pain related to site injection. She also had costochondritis that seems to be related to the vaccine. Presenting for the second episode of intermittent chest pain and left arm pain. Patient saw MD for the first time on 2/4/21 for 2 weeks of intermittent chest pain and left arm pain after getting first dose. pain was pleuritic in nature and associated with exercise so got an EKG, Trop and D dimer which were all reassuring. Chest pain likely costochondritis and left arm pain nerve irritation from vaccine. Symptoms improved and not a problem with the second vaccine on 2/8/21. On 2/28/21 patient started having left arm pain and chest pain again-similar to prior but a little higher along sternum and its constant. Left arm feels weak and constant pain in left deltoid and radiates to left pinky. Could not sleep on left or right side after this started. Also reports that pain is radiating to left upper back and left neck. Also had left leg pain that has since resolved.
1195946	4/12/2021	KY	44	F	4/9/2021	4/9/2021	On 4/9/2021 five minutes after receiving second Moderna COVID vaccine patient became dizzy and had shortness of breath along with chest pain. EMS was called to the location and the patient was transported to the ER. There she felt jittery and lightheaded. Symptoms did resolve and the patient was discharge from the ER approximately 3 hours after arrival.

1192793	4/11/2021	FL	56	F	3/10/2021	3/13/2021	sinking sense of doom-death; high heart rate; BP is spiking to 165/100; mile fever; sore arm; Severe headache; blood sugar spikes of 200 fasting; Increased tahycardial suffer from that) but it was more frequent and severe; chest pains; This is a spontaneous report received from a contactable consumer (patient) reported for herself. A 56-year-old female patient (patient was not pregnant at the time of vaccination) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot number: EM6199) via an unspecified route of administration, administered in Arm Left on 10Mar2021 at 12:00 at a single dose for covid-19 immunisation. Medical history included had covid from 30Jun2020. Concomitant medication patient received within 2 weeks of vaccination included Metoprolol ER 25 mg cyclic, Armour Thyroid 30 mg cyclic. The patient previously took fluoroquinolones and experienced known allergies. The patient reported that on 13Mar2021 on Day 3 of vaccine BP starts to go up. My average is 100/50. By day 4 BP is spiking to 165/100 with a mile fever and sore arm, and a sinking sense of doom-death). Severe headache and continued blood pressure spikes throughout week along with blood sugar spikes of 200 fasting. I'm not diabetic. Increased tahycardial suffer from that) but it was more frequent and severe. Blood pressure spiked to 187/167, I took extra BP meds (which was low dose more for my tachycardia)to help with insane BP. Went to hospital and stayed for 2 days. No heart attack, Just insane BP with chest pains and high heart rate. Day 18 after shot and BP is going down and so is blood sugar. Every once in a while, it will spike to 160/100--last for about 1 hour and then drop to my normal BP before the shot. The events were considered serious with seriousness criteria hospitalization and medically significant. The patient was hospitalized for 2 days. Adverse events resulted in Emergency room/department or urgent care, Hospitalization. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has been tested for COVID-19. No treatment was received for the adverse event. The patient underwent lab tests and procedures which included Nasal Swab: negative on 23Mar2021. The patient was recovering from all the events. Follow up

1193539	4/11/2021		77	M	1/22/2021	1/22/2021	The use of telehealth was discussed with the patient who understands that telehealth services are provided by an Emergency provider at a distant site, not in the same room with the patient. The patient understands that his/her medical information will be discussed during the telehealth service. The patient consents to any additional persons on the patient?s end of the service hearing this information and is aware that he/she may exclude persons on their end of the communication if they so wish. The patient understands that at times the information and assessment gathered during a telehealth service may be insufficient given the nature of being remote from the patient, and that there could be equipment failures or security failures leading to a breach in privacy. A written consent was not obtained due to the nature of this telehealth visit as screening for COVID-19. Patient Location: ED Waiting Verbal consent obtained: Yes Patient Location: ED Waiting HPI and Screening Patient is a 77 y.o. male who presents asthma, pneumonia, sarcoid, on home oxygen, dm, htn, ttp, ulcer, presents after going to receive a Covid vaccine. After taking the Covid check he began to have central chest pain. He describes the pain primarily as discomfort or burning. This is his first Covid shot. Felt like when he had contrast dye in the past. He does have a documented contrast allergy. He states that his breathing in general is better today. But that was prior to vaccine administration. No itching hives difficulty swallowing. His speech is normal. No fevers chills sweats cough or cold no loss of taste or smell. Nausea vomiting or diarrhea.

1193189	4/11/2021	GA	22	M	4/7/2021	4/8/2021	Chest pain, tightness, shortness of breath, and coughing. Symptoms progressively cleared after a couple days. Pain started on Thursday the day after the vaccine, and continued until Saturday morning.
1193185	4/11/2021	CA	46	F	4/2/2021	4/10/2021	7 days after the second Covid vaccine shot, painful burning feet woke me up in the middle of the night, it wouldn't go away,, with pins and needles itching all day. Then again the following night (last night) my feet burned all night. In hindsight, I had had a very bad reaction after the second shot on 4/2 that started the night of the shot, when I woke up at 3 am feeling like my feet, legs and entire body was burning, then Saturday I had a high fever all day, 103.8, chills, burning sensation on and off, chest pain, heart pain, which I treated first with Tylenol then Motrin. It was a horrible two nights, but by Sunday 4/4 I was fine. I have been fatigued all week but didn't think much about it. Then Friday night into Saturday of exactly a week after the second shot, this has happened. The burning sensation on my feet is intolerable and I haven't slept for two nights.
1193132	4/11/2021	NC	48	F	4/10/2021	4/10/2021	The patient received her second dose of the Pfizer vaccine at 1607, was directed to the observation area to be monitored for 15 minutes per pre-vaccination screening, and complained of dizziness during her discharge at approximately 1625. First responders were onsite , vital signs were obtained and found to be WNL. Patient was discharged at this time and advised to have her spouse come pick her up due to dizziness, which she verbalized understanding and agreement. Prior to spouse arriving, patient began to c/o chest pain and difficulty breathing. VS at 1645 were B/P 167/80, HR 75, and O2 sat 98%. Due to responders having left the vaccine site , 911 was called at this time. After assessment and evaluation of the patient by EMS, it was agreed on by patient, spouse, and EMS that patient would be transferred to the Medical Center ED via ambulance for further evaluation and was discharged from the facility at 1700.

1192997	4/11/2021		34	F	4/10/2021	4/10/2021	1630: Participant presented after getting stuck twice by vaccinator and questioned if she received two doses of the vaccine. Per the vaccinators, this participant was the sixth and final dose of the vial. Vaccinator initially went to administer the dose and noted that there was nothing in the syringe when he went to push the plunger. After reviewing the vial with the pharmacy staff, there is still vaccine in the vial with enough volume for a possible seventh dose. With this information I discussed with the participant that participant did not receive two doses. Participant started crying and developing chest pain which prompted an evaluation by EMS team in house at the vaccination center. Due to chest pain, she was given nitroglycerin x 1, and sent to local hospital via ambulance for further evaluation. We received report from hospital that participant had an MI and was sent to catheterization lab.
1192988	4/11/2021	SC	50	M	4/9/2021	4/9/2021	Vaccine administered 9.20am. Fatigue shortly after vaccine was administered - slept most of afternoon. Injection site pain - feels like been punched in arm. Headache in the evening. Night chills and complained of "tight" (not acute) chest pain... but no breathing problems. Morning fever of 101F. Headache, Dizzy, Fatigue, Muscle Pain (esp in legs, asif he had "run a marathon"). He spent most of the day "resting". Evening on day two, we noticed a large bump under his vaccinated arm. Radius about 5cm - larger than what I know swollen lymph nodes to look like - almost looks like a bicep between his armpit and nipple. Tender to touch. Morning of day three (48 hours after vaccine) bump under his arm remains and all other symptoms seem milder.
1192940	4/11/2021	MN	42	F	3/19/2021	3/19/2021	Within 2 minutes of getting the vaccine I got the cold chill, light headed and dizziness,some trouble breathing, chest felt little tight and some chest pains not too bad, throat felt little constricted but not severe, cold chills lasted 2-3 days and head dizziness and chest for like 3-4 days

1189900	4/10/2021	KS	39	F	4/9/2021	4/9/2021	Racing heartbeat, extreme sweating (I've had to shower twice since 9pm), chest pains, shortness of breath, muscle tension and spasms
1189924	4/10/2021	OR	51	F	4/9/2021	4/9/2021	Approximately 5 hours after shot started getting sharp chest pain in left side of chest. The pain would come and go every few minutes. Felt nauseous as well. After a couple hours went to urgent care. When they took my vitals my blood pressure was very elevated 186/120. Usually it's low. EKG was normal. Felt lightheaded. They sent me to the ER. The hospital did another EKG, chest X-ray and blood panel. After a while blood pressure went back to normal and all tests came back fine. No explanation of what happened. Arm is extremely painful as well.
1189925	4/10/2021	PA	42	F	4/5/2021	4/5/2021	About 3 hours after the vaccine was given, I had chest pains and started running a fever. I had acute lower back pain and felt overall very lethargic. The fever continued through the night and broke around 3am. The next morning I felt okay but by 10am started to run a fever again for the remainder of the day and chest pains and headache/body aches were now VERY present. It is now 5 days after the shot and I'm just starting to feel like myself again. The headaches and overall body aches lasted for days. I also had blurry vision on and off during this time. My husband and I workout every day and eat very well. We're not overweight and don't smoke. The injection site is still sore 5 days later. I will complete another form for my husband but he experienced the EXACT SAME reactions....every one of them.

1189927	4/10/2021	VA	34	F	4/9/2021	4/9/2021	Patient was given her second dose of PFIZER covid vaccine lot number ER8732. Patient has a history of SLE, Breast CA and Autoimmune hepatitis. After the first dose of vaccine patient had felt unwell. 15 minutes after 2nd dose patient stated that she felt like her neck glands felt like they were swelling. At this time she was placed on the exam table. BP 100/65 P70. As patient was experiencing symptoms she was given 0.3mg IM Epinephrine and 50mg IM Benadryl. Patient was continuously monitored and after 20 minutes patient stated that symptoms had subsided. Patient denied any chest pain or SOB during this period. Repeat BP 120/80 HR 95. After a further 15 minutes no symptoms so patient was released with instructions to dial 911 if symptoms return. Advised patient have someone drive her home but no one in area. Patient was A and O X 3 with no drowsiness, ambulating well so discharged home.
1189949	4/10/2021	OH	62	F	4/5/2021	4/6/2021	On April 6th I awoke with fever, aches, weakness and a headache. The headache persisted all day. On April 7th beginning at 6:20 pm had chest pain radiating under my arms which prompted me to go to the ER. At the ER I had elevated cardiac enzymes which prompted admission to the hospital.
1189951	4/10/2021	PA	39	M	4/5/2021	4/5/2021	Chest pain, fever, body aches, headaches, blurry vision. All seemed to last about 5 days. Pain at injection is still sore. Wife had same exact adverse effects.

							Resting heart rate jumped to 100bpm when normal resting rate 8s 58 to 60bpm. Normal heart rate returned after 4 minutes. Jaw line, nose, back of the head and upper back went numb for 6+ hours after 1st vaccine. Second vaccine administered on March 18th at 1130. Jaw line and nose went numb for entire day. Woke up next morning and it was back to normal. A cough and chest pain started March 20th and it still is present today(April 9th) Primary doctor is useless and can't help.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1188524	4/10/2021	CA	63	F	4/2/2021	4/2/2021	extreme difficulty swallowing within 15 min after getting the shot, dizziness/lightheadedness, rapid heart rate and BP 150/60 (normally 90/60), chest tightness (relieved by 2 puffs albuterol), and left chest pain. Received 25 mg Benadryl PO, then wheeled to ER where I received 125 mg IV Solumedrol and 20 mg famotidine. Gradually improved swelling in throat over the next several hours. Prednisone 60 mg next day, weaned to 40, 30, 20, 10 then swelling of throat returned along with left subclavicular pain, numbness of left arm, ear, and face; swelling of left parotid and synovitis of the cervical spine blamed for this (by CT scan of head and neck). Back on Prednisone slow wean and improving at 7 days post-vaccine finally. Throat swelling recurs on the left when Prednisone dose is dropped too quickly.

1192239	4/10/2021	IL	26	F	4/8/2021	4/8/2021	26-year-old female with past medical history of asthma and anxiety, and syncopal episode after her first Covid vaccination, presents to the emergency department after syncopal episode after her second Covid vaccination. Patient states she received her shot, and about 45 seconds later started feeling similar to the way she felt during the first syncopal episode. She started having tunnel vision, and her mom who is with her this time, notes that she was getting more pale. Mom notes that patient was talking about what she was feeling and was slowing down, until she passed out for about 30 seconds. During her LOC, she was shrugging her shoulders repeatedly, and after she awoke, she returned to her baseline mental status after about a minute or 2. As she was returning to her baseline mental status, she was talking about how she was feeling and it was appropriate. No urinary incontinence or tongue biting. Denies any recent chest pain, shortness of breath, other episodes of lightheadedness or syncope. She is not had syncopal episodes after shots before. After her last injection, she had a syncopal episode and fell flat on her face, thus had a CT head. At the time her CT head is negative, she had a D-dimer that was also negative. Her labs at the time were notable for hypokalemia 3.3, and in preparation for that she states she has been eating a lot of bananas this week. At this time she does not want any lab work, and feels as if this was a similar vasovagal episode similar to last time. syncopal episode right after a COVID vax. Same thing happened with the first dose. Prior to passing out felt sweaty, lightheaded, body tingling then passed out. Didn't fall this time as she was expecting it. Never had fear of needles before. No abd pain, back pain, chest pain. No h/o PE, DVT, OCPs, calf pain, SOB. No cough, SOB, palpit, diaph, chest pain/pressure, headache. No abd pain, no back pain, no vomit, no diar. No urinary complaints. No rash. No numb/weakness. No URI Sx. Mom noted a few shoulder twitches but not GTC type symptoms. rapid response called, pt went to emergency department
1191964	4/10/2021	FL	60	F	4/10/2021	4/10/2021	Pt reported feeling dizzy, blurry vision, chest pain directly after vaccine administration, while sitting in chair, 911 called, , ambulance arrived, pt refused ER transfer. Pt reported feeling better and went home with husband.

1192028	4/10/2021	FL	70	M	3/24/2021	3/28/2021	Mid Scapular Stabbing Pain; Shortness of Breath; Chest Pain; diagnosed with Bilateral PEs; Headache; Fatigue; This is a spontaneous report received from a contactable consumer (patient). A 70-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number: ER8727), via an unspecified route of administration in the right arm, on 24Mar2021 (at the age of 70-years-old) as a single dose for COVID-19 immunisation. Medical history included pancreatic cancer from 2015, bilateral pulmonary embolism (PE) from 2015, and mild chronic obstructive pulmonary disease (COPD). Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient had no known allergies to medications, food, or other products. Concomitant medications, taken within 2 weeks of vaccination, included citalopram hydrochloride (CELEXA), umecclidinium bromide, vilanterol trifenate (ANORO ELLIPTA), and azelastine hydrochloride (ASTEPRO). The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot number: EN6198), in the left arm, on 03Mar2021 at 11:30 (at the age of 70-years-old) for COVID-19 immunization and experienced intense left sided neck pain and stiffness. The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient experienced headache and fatigue on 28Mar2021 and mid scapular stabbing pain, shortness of breath, chest pain, and diagnosed with bilateral PEs on 30Mar2021. The patient was hospitalized for all of the events from 30Mar2021 to 01Apr2021 for two days and the events were reported as life-threatening. It was reported that the bilateral PEs were diagnosed in the emergency department (ED). Therapeutic measures were taken as a result of all of the events, which included heparin (MANUFACTURER UNKNOWN) drip during inpatient stay and then transitioned to an unspecified treatment. The clinical outcome of headache, fatigue, mid scapular stabbing pain, shortness of breath, chest pain, and diagnosed with bilateral PEs was recovering. It was also reported that since the vaccination, the patient had not been tested for COVID-19.

A 37-years-old male patient received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), , administered in Arm Left on 20Mar2021 (Batch/Lot Number: ER2613) as SINGLE DOSE for covid-19 immunisation. Age at vaccination :37 years.The patient received the first dose on 27Feb2021 (Brand Pfizer,Lot number EN6203 , administration time 12:00 PM, Vaccine location Left arm).Medical history included none. There were no concomitant medications.The clinical course was reported as follows: "I received my second covid vaccine shot Saturday at noon, 20Mar. I had full body chills and aches Saturday and Sunday night. Monday evening, 22Mar, I started getting pain in my upper chest and throat. I woke up at 2:00am with severe chest pain. I called # and rode in an ambulance to the hospital. I spent 3 days in the hospital. I was diagnosed with myocarditis. The cardiologist believes my auto immune response to the vaccine attached my heart and caused my heart to get inflamed. I had a moderate heart attack from the vaccine".Th Adeverse events resulted in Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care, Hospitalization, Life threatening illness (immediate risk of death from the event.The patient received treatments for the events (ae treatment medication, cardiac MRI, cardiac catheterization).The patient was recovered with sequel from all events.No Covid prior vaccination , No Covid tested post vaccination: Yes (covid test type post vaccination Nasal Swab on 23Mar2021:Negative)</p>

1192061	4/10/2021	RI	47	F	4/10/2021	4/10/2021	EMS was summoned to a 47 year old female patient for an elevated heart rate. On arrival at patients side. EMS found a 47 year old female patient AOx4, skin warm, pink and dry. Patient was complaining of feeling light headed, and feels anxious. On assessment patient looks fatigued and diaphoretic. Patient was asked if she would like to be further evaluated out of the public eye. Patient was escorted where EMS did a thorough evaluation. Patient complains of feeling anxious and says she has history of anxiety attacks and arrhythmia that she says is prolonged QT Interval. Patient normally takes Klonopin for anxiety but did not take it today because she did not feel comfortable with how it would interact with her Moderna Vaccination. Patient is not complaining of any chest pain, no shortness of breath, no uticaria or decreased blood pressure. Patients vital signs were stable BP: 124/84 Pulse: 84 Irregular, Oxygen saturation 97% and RR: 16. Patient was observed for a total time of 40 minutes. Patient said she feels a lot better after she was able to sit and relax. Patient was asked if she would like to be transported to the hospital. Patient is refusing to be transported at this time. When patient left the care EMS patients diaphoresis was gone, she said her anxiety has subsided and feels much better. Patient was left in her own care and left with her husband.

1192114	4/10/2021	IA	52	F	3/31/2021	3/31/2021	got extremely weak, very weak in the shower and didn't know if she will be able to keep standing up; chest pain in my right side; my left leg started aching; my toes tingle like they have fallen asleep on that left side; heart was beating faster than what it should have been, they said she was tachycardic and her heart was racing; heart was beating faster than what it should have been, they said she was tachycardic and her heart was racing; Redness; back was all red, really red; The initial case was missing the following minimum criteria: unspecified product. Upon receipt of follow-up information on 01Apr2021, this case now contains all required information to be considered valid. This is a spontaneous report from a contactable consumer reporting for herself. This 52 years old female patient received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot EP7533) on 31Mar2021 at 09:30, for COVID-19 immunisation. Medical history and concomitant medications were not reported. The patient received the vaccine on 31Mar2021 at 9:30 and was fine all day until 7 o'clock at night. She went to take her shower and got extremely weak, very weak in the shower and didn't know if she will be able to keep standing up, so she got out of the shower, went upstairs; the weakness persisted and then she started feeling chest pain in her right side, her left leg started aching and her toes tingled like they had fallen asleep on that left side so she got scared and went to the emergency room where they kept her overnight. Her heart was beating faster than what it should have been, they said she was tachycardic and her heart was racing and that was why they kept her at the hospital. She also had redness, her back was all red, really red. They did lots of lab work and blood work, a stress test, an ultrasound on her left leg for blood clot and a CAT scan on her heart, all with unknown results. When probed about hospitalization, she stated to stay overnight. She was hospitalized on 31May2021 at about 19:30 and did not get out until 13:30 on 01Apr2021. Events outcome was unknown.

1191836	4/10/2021			F	1/11/2021	2/9/2021	chest pain; pain under arm pits; pain under arm pits, up neck, and down her arms; dizziness; pain is now in hands, elbows; pain is now in face; Pain in neck and throat; pain is now in upper pallet; different taste in her mouth; lips, tongue, and mouth numbness; tingling; shortness of breath; pain in her joints/elbows; This is a spontaneous report received from a contactable other HCP (Nurse, patient). This female patient of unspecified age reported that she received second dose of BNT162b2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot Number: UNKNOWN), via an unspecified route of administration on 11Jan2021 as a single dose for COVID-19 vaccination. The Patient was completely healthy before this with no history. The concomitant medications included zolofit, steroids, tylenol and protonix. On 9Feb2021 she began having the following symptoms: chest pain, pain under arm pits, up neck, and down her arms. She had visited the physician several times and everything was normal. symptoms got worse with dizziness, pain is now in hands, elbows, face, upper pallet, neck and throat. It did not go away. She has a different taste in her mouth. She has lips, tongue, and mouth numbness and tingling that comes and goes. She has shortness of breath and pain in her joints. At one point she was admitted to the hospital for 6 days- all labs, scans, xrays, MRI's were normal. She would see a rheumatologist and getting out lab tests done. She said her Rheumatologist was treating another nurse that now has paralysis due to the vaccine. The patient receive treatment for the events. The outcomes of events are unknown. Information on Batch number/Lot number can not be obtained.; Sender's Comments: Based on the information provided and plausible temporal association, the causality between the suspect drug and the events cannot be completely excluded. This impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

1192371	4/10/2021	CA	45	F	4/10/2021	4/10/2021	Client complained of shortness of breath and chest pain. ALS was called, MD and Paramedics on site assessed client. Symptoms self resolved. Client left medical facility did not want to go to the hospital.
1192315	4/10/2021	NY	22	F	4/10/2021	4/10/2021	Patient was sitting in observation area 5 minutes post vaccination, scheduled to be observed for 30 minutes total due to history of anaphylaxis. She was seated in the recliner She reported to have itchy watery eyes, chest tightness. Breath sounds were clear, with good air movement bilaterally, no wheezing or crackles, no accessory muscle use, normal speech. Patient's boyfriend noted her tongue and eyelids to appear slightly swollen compared to baseline. Patient denied dizziness, chest pain, shortness of breath, body rash or itching. Patient maintained normal speech and normal unlabored respirations. BP was checked and noted to be normal. O2 sat 99%. Patient received benadryl 50mg PO. She was observed for about 10 minutes before her tongue appeared more swollen and she complained of difficulty breathing. At this point, the patient appeared pale, 911 was activated. EPI-pen was administered via autoinjector in the left lateral thigh. O2 sat was 99%. Patient has increased chest tightness and new onset shortness of breath for which she was given an Albuterol nebulizer. Breath sounds were clear, no wheezing. O2 sat reassessed which decreased to 73%, she had bilateral cramping of hands and digits. Non-rebreather was applied, oxygen saturation improved and hand cramps resolved. 911 was called for a second time to report rapid desaturation. Patient's O2 saturation and HR fluctuated, BP remained stable throughout. EMS arrived. A right AC IV was placed, Solumedrol 125mg IVP was administered by EMS. Patient was transferred onto EMS stretcher, still requiring nonrebreather. Patient was escorted to ED for further management of anaphylxis post Moderna vaccine.

1190896	4/10/2021	CA	68	F	3/20/2021	3/21/2021	<p>Cold; Chest pain/Chest soreness under left breast to back and side, hurt like heck when she moved; Chills and feeling cold; Chills and feeling cold; Horrible nausea to the point where she feels weak and has no strength, the nausea took her appetite too; headache; Feeling unwell/sick; Horrible nausea to the point where she feels weak and has no strength, the nausea took her appetite too; Horrible nausea to the point where she feels weak and has no strength, the nausea took her appetite too; She needs something for her stomach, it is upset; couldn't even wake up sleeping more than usual- Hard for her to wake up because she was feeling sick; This is a spontaneous report from a contactable consumer (patient). A 68-years-old female patient received the first dose of BNT162B2 Pfizer-BioNTech COVID-19 mRNA Vaccine at Pharmacy, via an unspecified route of administration, in left arm on 20Mar2021 around 11:30-12:00, at 68 years of age, (Batch/Lot number EP6955) as single dose (0.3 dosage units unknown, injection) for COVID-19 immunization. Medical history included allergies - she had them all her life and she let her doctor know before receiving the vaccine: she was highly allergic to second hand smoke and severely allergic to cats since an unknown date, hypersensitivity from 2020 and ongoing, diabetes mellitus from 2005 and ongoing, hypertension from 2005 and ongoing and she had a family medical history of high blood pressure. Concomitant medications included metformin for blood glucose increased from 2005 and ongoing; glimepiride for diabetes mellitus from 2005 and ongoing; atenolol taken for hypertension from 2005, amlodipine for hypertension from 2020 (they switched her from another unknown medication - they no longer use that one anymore), all taken by oral route, and vitamins. On 21Mar2021 in the morning the patient woke up with the headache and nausea, she experienced chills (with no fever) and feeling cold, horrible nausea to the point where she feels weak and had no strength, the nausea took her appetite too, she had headache, was feeling unwell/sick, she needed something for her stomach as it was upset and she couldn't even wake up, she was sleeping more than usual, it was hard for her to wake up because she was feeling sick (caller explained when she gets sick and doesn't have the strength she needs, she does a lot of sleeping) and suffered from chest soreness</p>

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

under left breast to back and side, it "hurt like heck" when she moved. On the same day at around 16:00 the patient experienced chest pain that hit her so bad that she thought she was having a heart attack. Moreover, on an unspecified date, she experienced cold. The patient clarified she did not have a rash, redness, or itching - none of that. The patient didn't go to the Emergency Room or physician office. The patient reported that she called the doctor and he told her to wait it out for a week and if it gets worse or doesn't subside by the end of the week, then go to Emergency Room. The patient stated that she does not like to take pain pills, but that headache got her. She did not take anything, but she drank some ginger tea to help her stomach. The events "chest pain" and "chest soreness under left breast to back and side, hurt like heck when she moved" resolved on 22Mar2021 but the patient explained that when her chest pain subsided, it hurt her to move. The caller clarified she hasn't had that episode since Sunday [21Mar2021] and explained the only thing that lasted was the soreness and hurting to move, but the next day she didn't have that problem; no chest pain or soreness the next day (the next day, it was still a little sore, but as the day progressed she didn't feel it anymore, the soreness was very mild on 22Mar2021); the events "chills and feeling cold", "horrible nausea to the point where she feels weak and has no strength, the nausea took her appetite too", "headache" and "feeling unwell/sick" had not resolved yet at the time of the report (she feels like nausea was leveling out; it's not getting worse and it's basically balanced; she is hoping the nausea will subside as she doesn't like this), the event "she couldn't even wake up, she was sleeping more than usual, it was hard for her to wake up" was recovering and outcome of the events "needed something for her stomach as it was upset" and "cold" was unknown. Follow-up activities were performed for additional information.

1188814	4/10/2021	PA	63	U	2/12/2021	2/12/2021	Chest pain; Dizzy; Spasm; Memory loss; Ringing ears; Off balance; Headache; Sleepy; A spontaneous report was received from a consumer who was also a 63-years-old, patient of unknown gender who received Moderna's COVID-19 Vaccine (mRNA-1273) and who felt dizzy/dizziness, off balance/balance disorder, sleepy/somnolence, memory loss/amnesia, chest pain/non-cardiac chest pain, headache, ears ringing/tinnitus and spasm/muscle spasms. The patient's medical history included reflux, spasm and erosion gastritis. Concomitant product use was not provided by the reporter. On 12 Feb 2021, prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 (Batch number: 030M20A) intramuscularly for prophylaxis of COVID-19 infection. On 12 Feb 2021, the patient had chest pain, dizzy and spasm for which the patient had to take an ambulance to the hospital. No further details regarding hospitalization provided at time of report. The patient also had memory loss, ringing ears, sleepy, off balance and headache. Treatment for the event included pepsid, doxycycline at 100 milligram 2 dose a day and baby aspirin. Action taken with mRNA-1273 in response to the events was not provided. The outcome of the events was not reported.; Reporter's Comments: Very limited information regarding the events has been provided at this time. Further information has been requested. The events were consistent with increased risk of complications associated with history of comorbidities and confounded by age of patient. Company assessed the events to be unlikely related to company product.

1191193	4/10/2021	RI	33	F	4/10/2021	4/10/2021	EMS was called over to patient information table for a 33 year old female patient not feeling well. EMS found the patient sitting in the chair AOX4 , skin warm, pink and dry. Patient complains of feeling light headed with slight shortness of breath. Patient is not complaining of any nausea or chest pain. Patient is not on any medications at this time and only has a history of an ovarian cyst. Patient denies any allergies and no known drug allergies. Patient was transfered over from the chair to a wheel chair by standing and pivoting . Patient was then brought to a back hallway 100ft away to be further evaluated. Patient blood pressure was 120/90, heart rate 80, spo2 99%. Patient was put on oxygen via nasal cannula at 4lpm. Patients said her breathing started to improve. Patient then started to say her throat was feeling dry and described a lump forming in her throat. Patient had sip of water to see if she could swallow. Respiratory rate increased to hyperventilating 40 breaths per minute. Vitals were attempted to be reassessed, but then the patient began to experience nausea and dry heaving. At this time a paramedic who is administering vaccinations to patients stepped in to help administer epinephrine 1:1,000 .3mg intramuscular on the left thigh. Providence Fire/Rescue showed up and patient was then transferred from wheel chair to Providence Fire/Rescue stretcher with 2 EMT limb lift. Patient was then put on a Non-Rebreather at 15lpm of oxygen. Patient care was transferred over to Providence Fire/Rescue. Personnel on Providence Fire/Rescue names were not obtained and no signature was obtained.

1191828	4/10/2021	NY	44	F			nausea; vomiting; chest pain; myocarditis; thrombocytopenia; This is a Literature-spontaneous report 2021, 1-4; entitled Thrombocytopenia following Pfizer and Moderna SARS-CoV-2 vaccination. A 44-year-old woman was hospitalized for nausea, vomiting and chest pain on the day that she received the Pfizer vaccine (BNT162B2) via an unspecified route of administration on an unspecified date (Batch/Lot number unknown) at single dose (at 44-year-old) for COVID-19 immunization. Her laboratory values included a platelet count of 85 x 109/L and a peak troponin level of 4 ng/mL (normal < = 0.04 ng/mL). The patient was diagnosed with myocarditis but did not require treatment for thrombocytopenia. Her platelets were 61 x 109/L on discharge, but subsequent platelet counts were not reported. The outcome of the events was unknown. No follow-up attempts are needed. Information on Lot/batch number cannot be obtained.; Sender's Comments: The causal association cannot be excluded between the reported events and BNT162B2 vaccine use. The impact of this report on the benefit-risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for AE. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, ethics committees and investigators, as appropriate.
1191070	4/10/2021	IN	28	F	4/8/2021	4/9/2021	About 14 hrs after injection, I got really bad chills for a couple of hours, then got very hot and had a 3 timepoints of chest pains (I assume I had a fever at this time but didn't verify). By 7am when I got out of bed, it felt like a truck hit me. I had a major headache, very fatigue, fever (checked at this point and it was 101), nausea, hotness/chills. By 12pm, I had an 100 degree fever, chills/hotness, and headache. By 6pm, I was only tired. Next day, I was back to normal with a little soreness in my injection arm.

RN observer offered to call EMS at 12:34 but client's husband stated "let's wait a little." EMS offered again @ 12:54pm and was accepted. EMS fire arrived at 1:17pm and took over. followed up with client on 4/10/21. Client reported labs were done, x-ray and blood draw. All normal acc. to client. Was advised by hospital it was likely d/t aspirin allergy. Client recovered and was d/c same day as incident (4/7/21).
1191351	4/10/2021	IN	45	F	4/5/2021	4/9/2021	I reported previously that the day of the shot (that evening at close to midnight) I fainted. I woke up on my bathroom floor. I walked down my hall and saw black dots and felt dizzy with nausea. The next thing I knew I was on the bathroom floor and didn't remember how I had gotten there. It is Friday and I now am experiencing shooting pains in the side of my head. I also have been experiencing pains in my calf muscles and some chest pains. I am still extremely tired and having abdominal pain. I have contacted my doctor's office about the fainting but I am going to call Monday to get an appointment to get checked out. I am concerned about possible blood clots.
1191358	4/10/2021	OH	67	F	4/1/2021	4/9/2021	My adverse reaction began 1 hr post vaccine with sharp chest pain, dizziness, then headache, blurry vision, and hypertension. Was 165/107 at highest. Pulse reg 66-88. As RN I managed these symptoms with my heart meds(prn too), ASA 1 tab in eve and one in AM, Tylenol ES at night for headahe, I used complimentary health measures: Frequency Specific Microcurrent a lot and Emotional Freedom Techniques....helped alot. 24 hours after shot still hypertensive but mild 139/96. Angina stopped around mid day 4-10-21.All symptoms were moderate-severe for 20 hrs. Cont page not working. .Meds: Estradiol, Progesterone,, Valacycolvir prn., Supplements taken: Quercetin/Bromalain, Biotin, Mg, K,

1191824	4/10/2021	MI	78	F	3/11/2021	3/12/2021	it began working up her arm with arm pain and chest pain which persisted and she went to the hospital and was admitted for 23 hours; it began working up her arm with arm pain and chest pain which persisted and she went to the hospital and was admitted for 23 hours; blood pressure went up to 198/203; still has tiredness; difficulty swallowing like her throat is still tight; difficulty swallowing like her throat is still tight; short of breath; This is a spontaneous report received from a contactable consumer (patient). A 78-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Lot Number: EN6205), first dose via an unspecified route of administration, administered in Arm Right on 11Mar2021 11:00, single dose for covid-19 immunisation. Medical history included silent heart attack, ongoing Barrett's oesophagus from 2008, fall she had over two months (2021), eye surgery on an unknown date. She does not get any shots and can't have shots even for the flu shot because she had problems with two flu shots she had; states she had a problem with each one of the flu shots and does not know the names of the flu shots and has no lot numbers to provide for them; states she had the flu shots in the early 1990's and worked in healthcare and had to have them and they told her back then if she wanted to work she had to have the flu shots and then she got sick with both of the flu shots and they said they guessed they would not force her to have the flu shots. The patient's concomitant medications were not reported. Patient had the first dose administered and then about 14 hours after (12Mar2021) that she had no problems until it began working up her arm with arm pain and chest pain which persisted and she went to the hospital and was admitted for 23 hours. She does not know what to do about getting the 2nd dose of the vaccine and was at her cardiologist's this week and he said he is not familiar with the Pfizer vaccine causing chest pain; caller states she has a history of silent heart attacks. She still has tiredness and difficulty swallowing like her throat is still tight and they told her to mention if she does go for the second dose of the vaccine to mention that she had this situation. The chest pain and arm pain began 12Mar2021 and the arm pain is in her right arm where the vaccine was administered and the arm pain and chest pain have resolved; states the arm pain and chest pain stopped and she thinks that lasted

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

about an hour and a half and she called a family member to take her to the hospital; states about 2:30am that same day she was admitted the morning of 12Mar2021 and was discharged on 13Mar2021. They ran every test known to the patient and for a while her blood pressure went up to 198/203 in the emergency room (12Mar2021) and she is not on any medication; caller states she does have Crestor but has not started on it and has not taken it yet. The tiredness and difficulty swallowing like her throat is still tight began the same time she was having the chest pain and she is not having any chest pain or anything like that right now but the tiredness and difficulty swallowing like her throat is still tight is still ongoing; states she did go get cardiac clearance to make sure which was this past week and she does not feel well and like for her the tiredness is bugging her. The tiredness and difficulty swallowing are better but she knows they are there and she tries to swallow something and is like boy her throat is still tight. They did an ultrasound in her left leg because she was limping from a fall she had over two months ago but still has a sore ankle from that and they sent her down for the ultrasound and a CT looking for blood clots in her lungs because she was short of breath (12Mar2021); caller states she thinks they were running everything they could to rule out things; states everything was negative for the CT and ultrasound and she believes the CT and ultrasound were done on 12Mar2021. She has no idea when she was diagnosed with silent heart attacks but they kept asking her about this when she went in for eye surgery and asked her when she had a heart attack and she said she had never had one and they said yes she had and she never knew. She just set up a HCP appointment after the reported events with a gastroenterologist because she has Barrett's and because of the esophagus she did not know if it flared up by the Pfizer vaccine and that caused the pain because the two pains of the heart and esophagus mimic each other with pain going up into the jaw so they were ruling out which one it was; states she went out as an atypical chest pain and called the cardiologist and went in and went over her records from the hospital with the cardiologist. She does not know what caused what in terms of the pain. The outcome of the event blood pressure increased was unknown, chest pain and pain in arm was recovered, other events was recovering.

1191737	4/10/2021	MT	72	F	3/24/2021	3/24/2021	Vomiting , pain in chest which migrated to left shoulder. Across my back to right shoulder.
1191672	4/10/2021	LA	40	F	4/9/2021	4/9/2021	I suddenly became lightheaded and had extreme weakness, then collapsed, then immediately began having chest pain and pressure, shortness of breath, arm numbness, and uncontrollable shaking. All of these symptoms happened at the same time. We called the paramedics but all my vitals were totally normal. The severe symptoms passed after about three hours. I continued to have chest pain and pressure, but was able to breathe normally and had 100% oxygen saturation. I am not a smoker and don't have asthma or any breathing issues so the sudden inability to breathe coupled with the other symptoms all at once was very alarming.
1191681	4/10/2021	MA	19	M	4/7/2021	4/7/2021	Total loss of taste on the tongue. The (very few) taste buds in the other areas of the mouth remained minimally functional. For a point of reference, I can barely taste anything when I swish mouthwash around in my mouth. Pre-existing minimal chest pain (related to history of vaping) flared up to an extreme extent the night of the day I was vaccinated. Hurt more than the joint pain or headache I also have (but those are common side effects).
1191714	4/10/2021	IL	52	F	3/23/2021	3/23/2021	Immediately after injection, my heart raced, I got a metallic taste in my mouth, and my fingers got cold and tingly. The next day, I developed chest pain, racing heart, shortness of breath, and insomnia. I continue to have chest pain. On 04/08/2021, without injury or anything that I did, my right middle finger swelled and turned purple and it's still purple. The ER doctor said it was a hematoma.

Pt had a brief LOC and was initially hypotensive. IV was initiated by EMS 3 and NS was started. VS were WNL upon EMS arrival. Pt skin was still pale and clammy during assessment. Pt stated this has happened in the past with shots and blood draws, however, she has never fully lost consciousness. Pt was still c/o dizziness. Pt requested transport to REX ER. Pt was on the cardiac monitor upon EMS 14 arrival and a sinus rhythm was noted. 12 lead revealed a sinus rhythm with no STEMI criteria met. Pt was able to stand and pivot onto the stretcher without incident. Pt secured via straps and loaded into the unit. Once in the unit, VS reassessed. NS was reduced to a KVO rate due to improvement in BP. Pt had received approx 200mL of NS at the time. Pt denied any chest pain, SOB, N/V, or abd pain. Pt only complaint was dizziness. Pt was initially very anxious and was coached through breathing techniques which improved her anxiety. EMS left en route to REX ER. Pt was monitored during transport with improvement in her condition. Pt skin color and condition improved and her VS remained WNL. Pt denied any complaints during transport other than dizziness which she reported was improving. EMS arrived at REX ER. Pt was taken into the ER triage area and was able to stand and pivot onto a wheel chair. NS DC'd, pt received approx 300mL total. Report given to the triage RN and care transferred to same.

1183538	4/9/2021	AZ	52	F	3/25/2021	4/8/2021	Cyanosis to fingers and hands bilaterally with blueness noted lasting an hour on two separate occasions - 4/5/2021 and 4/8/2021. Patient monitored with no signs of central cyanosis or other problems. Discharged home to follow-up with PCP. Patient also reported chest pain and dyspnea on 3/28/2021, 3 days after vaccine with no emergent findings.
1183553	4/9/2021	CA	21	F	4/8/2021	4/8/2021	Pt received her dose of Janssen Cover 19 vaccine administered to left arm intramuscularly by RN given at 06:54 PM. Pt was seated for observation when scribe noticed pt being pale and sweaty. Scribe asked pt how is she, pt stated that she is dizzy, warm and nauseous. Scribe called RN to assess pt. Pt is alert oriented to self, time, date and location. Initial vital signs was taken by RN at 07:00 PM and it was 145/110mmhg, PR 138 ppm, RR20 cpm, Temp 98.1, Oxygen saturation of 99% at room air. RN assisted pt to lay patient down safely. No SOB and chest pain noted. Pt stated feeling better upon laying down for couple of minutes and stated that her dizziness comes and goes. Pt had no allergic reactions to any other vaccination but pt also stated that she has been feeling dizzy couple of times as her history. No history of elevated BP as well was stated by pt. Pt continuous to complain on and off dizziness, NP assess pt and Called 911 for further assistance. Repeat vitals check done by RN BP 135/100 mmhm, PR 81 ppm, RR 20 cpm, oxygen saturation 98% at room air. EMT came at 07:45 PM came assess pt, checked her vitals, pt requested if she could walk and have the EMT assist her to evaluate herself, no complaints of dizziness reported. EMT offered to bring pt to hospital for further evaluation, pt refused to go to hospital. Pt was advised to go to hospital if episode of dizziness happens again. EMT walked the pt to her car and have her sister drive. Pt left facility at 08:00 PM without any complaints. VAERS was filed and education provider RN was reported.

1187025	4/9/2021	CA	53	F	4/9/2021	4/9/2021	<p>Patient received first dose of Pfizer at 12:50 pm on left deltoid, lot # ER8731, expiration date on 07/2021. Patient has a history of rheumatoid arthritis and asthma, both of which are controlled with medication. Patient waited in outdoor EMT waiting area for approximately 20 minutes. At 12:09 pm, patient entered indoor EMT waiting area and asked the lead nurse, if she could check her blood pressure. Upon assessment, patient was alert, oriented X4, clear speech. The patient's primary complaint was "feeling tired". The patient sat down in a chair in the observation area while RN took her blood pressure. At 12:09 pm, the patient's BP 156/102 sitting, HR 68, SpO2 97% RA, RR 17 res/min unlabored. Patient denies tightness in chest or throat, difficulty breathing, or trouble swallowing. Patient states she did not drink water today. RN gave patient a water. Patient consumed 16 oz of water at 1:13pm. Patient reports she is "feeling better" at 1:13 pm. At 1:16 pm, the patient's BP 156/102 sitting, HR 75, RR 18 res/min unlabored. Patient states her blood pressure "is usually low" because she runs daily, but she "can't remember" her usual range. At 1:20 pm, BP 150/100 sitting, HR 66, RR 18 res/min unlabored. Patient states she is "feeling tired and cold". Patient was transferred to anti-gravity chair at 1:25 pm with assistance from EMT. At 1:25 pm, patient's BP 167/115, RR 20 res/min, HR 64. At 1:32 pm, patient called her brother to come pick her up. Patient was provided with education related to signs and symptoms of allergic reaction, such as tightness in throat, tingling of tongue, and shortness of breath. Patient denies experiencing such symptoms. At 1:32 pm, BP 150/90, HR 70, Spo2 at 99%, RR 20 res/min. Patient states "I felt like something bad was going to happen" after receiving her vaccine. EMT talked with patient calmly and encouraged deep breathing. At 1:39 pm, BP 164/88, HR 84, Spo2 at 98%, RR 20 res/min. At 1:42, the patient requested to leave. Lead RN, advised patient to stay laying down and deep breath to help her blood pressure go down. Patient states "I want to leave". Patient was provided with education about normal blood pressure ranges. Patient verbalizes understanding and states she is aware she needs to call her doctor if she is experiencing headaches, vision changes, and/or chest pain. At 1:45 pm, patient got up out of chair and followed by EMT to car. Patient's gait was steady and balanced. Patient states she is "okay to</p>

1187061	4/9/2021	CA	35	M	4/9/2021	4/9/2021	<p>HPI: Patient is a 35 year old male who presents following administration of a single dose of J&J COVID19 vaccine in the left deltoid. Patient started to feel light headed and nauseous while walking to his car. About 20 minutes following vaccination, a vaccinator had walked passed his vehicle and noted that he was unconscious. Patient was still unconscious upon medical response team arrival and unresponsive to stimuli. Once the patient awoke about 30 seconds later, he continued to state that he was nauseated and "did not feel good." Patient was unaware that he had lost consciousness. He further disclosed that he had been working in the sun planting trees all day and had not consumed any food or beverage. He denied allergies to medication, food, and other vaccines. He relayed that he had passed out from vaccinations in the past as a child. He affirms lightheadedness and nausea. He denies chest pain, difficulty breathing, swelling of the face/lips/tongue/throat, skin rash/itching, cramping abdominal pain, and vomiting. Exam (update as needed): GEN: Upon arrival, patient unconscious and not responsive to stimuli HEAD: NCAT EYES: pupils unreactive and mydriatic ENT: Ears normal, Nose normal, OP normal, no evidence of angioedema NECK: Supple, without LAD. CV: RRR, no m/r/g, palpable strong radial pulse PULM: Clear to auscultation bilaterally, no accessory muscle use ABD: Soft, no tenderness. SKIN: Skin pale, cool, and clammy. No rashes. No erythema or edema of the injection site. MSK: FROM, MS 5/5 NEURO: Patient unconscious upon arrival. CN 2-12 grossly intact, no ataxia, gait steady Clinical Impression/Field Tx: Vasovagal syncope. EMS called immediately to respond to the site for further evaluation. Patient placed into a reclined position. Patient not displaying active signs or symptoms of anaphylaxis. Upon regaining consciousness, patient was alert and oriented x4. Once the patient demonstrated ability to control airway, he was given candy and water. EMS arrived and an EKG and BGL were performed, both of which were normal. Vital signs were stable. Instructed patient to consult their PCP regarding the post-vaccination reaction. Patient instructed to go to emergency department should they develop chest pain, difficulty breathing, swelling of the face/lips/mouth/tongue/throat, or cramping abdominal pain with nausea/vomiting, as these are signs of possible</p>

1187893	4/9/2021	GA	49	F	3/31/2021	3/31/2021	0213A21A -(The lot number is hard to read and it could be this number or the one above.) Wednesday, Thursday and Friday - I had headaches and I had extra fatigue (I already do have fatigue because I have insomnia). My arm soreness was on the other arm not on the one that I had an injection. Friday and up until yesterday, I had nausea. Saturday, I had headache and being tired. Sunday, I had chest pain (woke up with it) like a burning in my chest. My left arm, I felt a tingling down my arm to my legs - it almost felt like a blood clot was there in my arm. I had to put heat on and then ice. I couldn't extend arm because it hurt. Midnight on Monday, the burning and the chest pain was too much and I was getting worried. The only thing I have is asthma, otherwise I'm healthy. I went to ER - they gave a Cocktail of Lidocaine; Malex and something else to see if it would help with the burning in my chest. Monday, I took Tylenol. Tuesday, the chest pains were more intense. 03:00 on Wednesday am - I went back to ER. They brought me to a full chest x-ray - front, side and back and a CAT SCAN and gave me another Cocktail and also put something in my IV. This time, they sent me home with four different medicines. The meds are: Generic of Nexium; Aspirin low dose of 81 mg - bayers children - one a day; Generic version of Bentil Triacetin - I take this when I want to be still; Generic version of Valium - they gave me four of these - and I have one left that I will take tonight so I can sleep. I am taking Vit D. I haven't taken Tylenol since getting on these. I try to stay hydrated. I still have a really really funny feeling inside me. Last night, I was very restless and couldn't sleep. It makes me on borderline and dizzy and my heart starts palpitating. It's a scary feeling in my chest.

1188050	4/9/2021	MA	22	F	4/3/2021	4/10/2021	Fever- 101.6 F High heart rate - 160bpm Nausea Chest pain
1188056	4/9/2021	NC	19	F	4/8/2021	4/8/2021	Symptoms started around 9:15pm on 4/8 ??Mild Arm Soreness initially ??Fever of 100.0 at 10pm. 101.4 at 11:30pm, 99.6 at 4am ??Chills/Tremors: Stop and Start after a couple minutes. Did not stop until 2am ??Hot Breath; Felt like fire after cold water ??Extra Discomfort on lower back/sides ??Jaw Pain after chills stopped around 11:50pm. Took Advil to help Symptoms for 4/9 ??Sharp pain in chest when breathe in too hard at 4:50pm ??Fatigue all day. Only got out of bed to pick up mail and use the bathroom ??Diarrhea at 6pm. Couldn't keep anything solid down except oranges and bone broth ??Chest Pain after 8:30pm: Put ice pack on chest and it relieved pressure. It feels like something is stuck down my esophagus, even though I have not been able to eat anything solid.
1188082	4/9/2021	CT	27	F	4/7/2021	4/7/2021	At time of vaccine (04/07 11:45 AM) was light-headed and had shoulder pain at injection site but no other adverse effects during observation period. While driving home, had some tingling/numbness in left arm and knees with persistent pain in shoulder. Felt fine other than shoulder pain and slight headache until that night. I went running after finishing work (around 7 pm) and started experiencing intense tingling/numbness all down left arm to hand as well as intense knee pain not typical during running, at which point I stopped running and went home. When I got home I noticed my left index finger had lost circulation (was white). That night I experienced moderate but increasing fatigue as well as chest pain and tightness. My hands both felt numb like they fell asleep/lost circulation, as well as my left arm and feet. The next morning I felt better but the fatigue and numbness in my hands and feet started up again around 10 am and lasted for several hours. I had some chest pain that night (around 11 pm) and a headache on and off throughout the day. Today (04/09) I felt completely fine. I did start my period the day before my vaccine (04/06) and was having heavy bleeding/cramps that day and a bit throughout the time described above.

1188416	4/9/2021	IL	24	M	4/7/2021	4/7/2021	First nausea, then vomiting, fever and headache during the day, took 400mg ibuprofen around 1PM. At night: chest pain, night sweats, continued nausea, fever and headache, took 500mg acetaminophen. Second day: headache and nausea continued, took 400mg ibuprofen. Second night: extreme night sweats.
1187971	4/9/2021	CA	23	F	4/9/2021	4/9/2021	23 yo FM who received first dose of Pfizer vaccine and then was noted to have shortness of breath and complaining tongue closing sensation immediately after at Vaccine Clinic --I was called to evaluate the patient. When I arrived patient was laying down on a chair with a friend, shaking with seizure like activity but alert and oriented to person place and time. Upon my arrival she was shaking, vomited x 1 and then complained about chest pain. Vitals upon my arrival: HR 58, o2 100% RR appeared to be around 22-24 (hyperventilating) BP 88 systolic (manual)--repeated by medics upon arrival minutes later 110/72. Given throat closing sensation, vomiting, shortness of breath I advised to call 911 and ordered Epinephrine x 1 which was given by RN immediately. Pt was then placed on the gown chin up, she continued to shake throughout entire body but continued to be alert and oriented. Medics then arrived on scene, started an IV, glucose by medics 84, IVF started by medics. Pt was transported to ER via medics. Pt is not a patient, last visit 2017. Pt did state she has hx of POTS and DRESS syndrome to Lamictal. Reports taking cetirizine this AM, Zofran and Oxycodone and Baclofen (prescribed by external PCP?). Prior to transport to ER pt continued to be alert oriented, but shaking and twitching throughout her body. MD verbally communicated to patient to not receive the 2nd dose given her severe anaphylaxis like reaction to the first dose of the vaccine. Pt can be referred to allergist after ER follow up by PCP. Denied pregnancy.

1186494	4/9/2021	IL	74	F	2/22/2021	4/8/2021	3/8: Admitted to hospital dx chest pain; 3/9 transferred to a different hospital, dx gallbladder necrosis. Hospital course: 74 y.o. female admitted on 4/8/2021 for abdominal pain. Notable PMHx: aortic valve replacement, HTN. On morning of admission, patient woke up with severe epigastric pain. Describes pain as a pressure. Has had vomiting. Had bowel movement after pain started. Patient came to the emergency room. Patient received an antiemetic and Demerol. Patient has continued to have pain in got a dose of morphine as well. Pain eased some but was still 7/10. In the ER, blood pressure was very elevated with systolic in 200s. Cardiac enzymes negative. EKG look good with normal sinus rhythm. Patient has aortic valve replacement and is on Coumadin with INR goal of 2.5-3.5. INR was elevated at 4.3. D-dimer was negative. Amylase and lipase negative. Creatinine normal at 0.9. Chest x-ray done which showed no acute disease. On the floor, we ordered a CT abdomen. It did show gallstones, but nonobstructing. It showed kidney stones in the renal pelvis, but none obstructing. No other inflammation or signs of bleeding. Blood pressure came down after medicines in the ER. Did have some lower blood pressures through the afternoon evening which was felt to be a combination of blood pressure low in medicines in the ER and pain medication. From 11:00 p.m. onward blood pressures were controlled. Patient continued to have severe abdominal pain. Hemoglobin down to 9.0 from prior 12.4 yesterday. Creatinine up from 0.9 yesterday to 1.8. White count up from 8.3 yesterday to 14.4. INR from 4.3 yesterday to 4.2. Coumadin was held yesterday. CT abdomen was repeated. CT abdomen was read as worrisome for necrotic gallbladder and small bile leak. Contacted transfer line at hospital. Surgery accepted and wanted transfer to go through the ER. Patient has PCN allergy. Surgery said that if reaction was not severe, they wanted Invanz given before she left. Patient says that she had a itching rash in the 70s. No trouble breathing or swallowing. No other reaction. Dose of Invanz ordered. IVF were increased. HPI from hospital: 74 y.o. female who presents with Chief Complaint Patient presents with? Abnormal Scan Patient presents via EMS as a medical transfer from hospital after having gallbladder necrosis seen on CT imaging. She was given IV Invanz there. General

1186809	4/9/2021	CA	35	M	4/9/2021	4/9/2021	surgeon was contacted by that facility and he accepted the patient for transfer to this facility. Apparently, the patient began having abdominal pain yesterday. Timing of onset was gradual. Severity is rated as severe at maximum intensity. Quality is described as aching abdominal pain. Symptoms have been improved after IV pain medicine. Symptoms worsen with nothing, and improve with IV pain medicine. History was provided by patient, EMS, transfer paperwork and EMR, and I spoke with treating doctor in general surgery who accepted the patient for transfer.
1186900	4/9/2021		57	F	4/9/2021	4/9/2021	Client was sitting in a 15 minute observation when he reported feeling lightheaded and dizzy. Stated he felt the room was darkening. Denied any other symptoms such as chest pain, dyspnea, urticaria or nausea. Client was observed for an additional 30 minutes and vitals signs were taken which were all within normal range. Client stated he feels this way when he is dehydrated and that he hadn't enough water. Client was offered a water bottle which he drank. At the end of the observation he stated symptoms were resolved and he left the site by self ambulation with a steady gait.
1186781	4/9/2021	TX	35	F	2/5/2021	2/6/2021	Approximately 2 hours following vaccine administration, patient began to feel short of breath and had chest pain, so they returned to the vaccine clinic. From there, she was taken to the ED. Was observed for 45 minutes following the vaccine without any signs or symptoms of reaction. On arrival to the ED, she had redness without hives on the anterior portion of her neck. At that time, patient denied shortness of breath or chest pain. Given 25 mg diphenhydramine po in the ED. Discharged home with instructions for use of Benadryl if needed.
							Rapid heart rate, chest pain, shortness of breath, heart palpitations

1186680	4/9/2021	MN	22	F	4/8/2021	4/8/2021	Around 5 hours (8:15) after receiving the vaccine, swift onset of chills, nausea, and fever. Symptoms progressively worsened and by 10pm experience rapid heart rate (110 to 130) and chest pain at rest and had trouble breathing deeply. Could not fall asleep due to difficulty breathing and headache and chest pain. At 11pm, began self-administering diphenhydramine (50mg) and Ibuprofen (400mg) every 4 hours. Was able to fall asleep at 4am. Symptoms improved upon waking at 8am, but chest pain and breathing difficulty remains as of 3:30pm April 9th (24 hours since injection)
1186649	4/9/2021	MI	61	F	4/7/2021	4/7/2021	I have hx of episodes of sudden elevation of BP and pulse with accompanying other symptoms from possible adrenaline surges. When I sat down for my observation period, it felt like the start of one of those episodes except I had tingling in my hands which was different and a metallic taste in my mouth. Pulse and respirations were normal. Took many slow deep breaths to help calm the possible adrenaline surge I thought I was starting to experience. Felt ok by the time I was released from the 15 minute observation area. After driving about 5 minutes towards home, I started to get chest tightness and my throat felt strange and swallowing was not normal. I didn't feel well in general. No rash or hives. Breathing was ok. When I got home, I took 2 Benadryl. After two hours I felt much better except for the chest pain which felt like my "normal" atypical chest pain and lasted a little while longer. The chest tightness was gone though and the throat and swallowing had improved also.
1186648	4/9/2021	AZ	62	M	4/2/2021	4/4/2021	Chest pains, shortness of breath, started 24 hours after 2nd injection, has continued for past 5 days
1186587	4/9/2021	CO	61	F	3/20/2021	3/23/2021	Patient presents to ED three days after receiving Moderna COVID-19 vaccine dose #1 at ER vaccien clinic reporting palpitations and lightheadedness. ECG similar to prior ECG. No chest pain, diaphoresis, nausea, or exertional symptoms. Blood pressure 139/96 mmHg, other vital signs within normal ranges. Patient discharged to home stable with symptom improvement.

1186561	4/9/2021	IL	64	F	2/19/2021	4/9/2021	65 y.o. female who presents with possible stroke-like symptoms. Patient reports a prior history of a CVA approximately 6 months ago. Patient states she has been left with some mild decreased grip strength in the right hand due to that stroke. Patient reports she went to bed feeling weak and fatigued last night. She reports she woke up at 3:00 a.m. and noticed her lips were numb and tingly. She stated she then noticed her right hand was slightly tingly as well. She states she went into the bathroom and looked at herself in the mirror. She did not observe any facial droop or slurring of her speech. Patient denies any headache, chest pain, or palpitations. Patient reports her symptoms are improving. Her right hand tingling has resolved and the numbness and tingling to her lips are much better. Patient does report she has been under a lot of stress and worry lately. She is uncertain that the symptoms are stroke related or due to stress and anxiety.

1179660	4/8/2021	PA	47	M	4/6/2021	4/6/2021	Approx 10 minutes after patient received vaccine, he began to complain of chest pains, dizziness, and blurry vision. His vitals were stable at BP 133/95, HR 90, Pulse ox 97% on room air. His symptoms persisted so 911 was promptly called. Dr. came and assessed patient and he was found to have clear lungs with no abnormal heart sounds. When EMS arrived, his vitals were very similar and still stable. Patient was taken to Hospital. I spoke with him the following day, 4/7/21, and he reported that his labs were all unremarkable and they treated him for a panic attack and he was feeling well by the time he got home.
1179946	4/8/2021	MN	57	F	3/27/2021	3/27/2021	Passenger in car going home. 30-40 minutes after injection had pounding headache, warm feeling all over, shortness of breath, difficulty breathing, rapid heart rate, chest pain, numbness and tingling in legs and arms
1179948	4/8/2021	PA	37	F	4/7/2021	4/7/2021	Shot given at 3:47- approximately 3-5 minutes later started to experience blurred vision, rapid heart rate, difficulty breathing, and dizziness. Blood pressure was taken and was low 86/52. Pulse rate was 110. Became increasingly dizzy, stabbing chest pain, and lethargic. Was transferred to an ambulance with great assistance, because when I stood up I became so dizzy I couldn't stand. In the ambulance the chest pain/ stabbing became unbearable. I was started on IV fluids, and also had an EKG done, and was put on oxygen. While en route to the hospital I had a horrible feeling of nausea and dry heaving. Upon arriving at the hospital I was worked up for cardiac issues and everything came back normal. I was also given benadryl. Nothing helped the dizziness or nausea and I still felt short of breath when I was discharged. I was able to get some interrupted sleep. This morning I am still feeling very dizzy and light headed. I'm extremely cold and have the worst headache I have ever had. I feel foggy and I am having trouble concentrating. I have been drinking a lot of fluids and also been taking tylenol.

Patient said he had received a his copied vaccine 3 weeks ago. No cough, no chest pain, no abdominal pain nausea vomiting, no palpitations and no fever or chills Shortness of Breath: Started 3 weeks ago and getting worse. Received covid vaccine 3 weeks ago and started then. No cough. Dyspnea on exertion. No fever. Early am he has had runny noses. No inhalers or nebs. Not smoker
1180089	4/8/2021	LA	38	M	4/6/2021	4/7/2021	He presented to hospital ED with new onset chest pain. He reports that he woke up this morning nauseous and he vomited after which he has started developing retrosternal chest pressure and some shortness of breath for which he came to the emergency room for assessment. In the emergency room he was given both a GI cocktail and nitropaste with wheeze the symptoms improved. He was transferred to a medical center for higher level of care. At present he is essentially symptoms free. The EKG showed right bundle branch block and all septal myocardial infarction. The right bundle branch block is new compared to his last EKG. The initial troponin was mildly increased at 0.18 and BNP was 118. The renal function is normal with a creatinine of 0.8 and the chest x-ray shows bilateral interstitial opacities which might represent pulmonary edema. He remains admitted

1182617	4/8/2021	WI	36	F	4/8/2021	4/8/2021	16:30: Pt was standing up to leave when she advised observer in room that she didn't feel right. I had just walked in after she sat back down and pt said she felt difficulty swallowing. We talked a little bit as I asked her about any other symptoms. Pt was given a drink of water and this helped. Pt told me she was 18 months pregnant. She did not have difficulty swallowing water. After a couple of minutes she felt improved. We walked to a separate room. Pt did not develop any other symptoms and was not light-headed. She did not report feeling light-headed or dizzy, had no chest tightness or shortness of breath, no rash/itching, no chest pain, palpitations or tachycardia, nausea or vomiting. Pulse 64, color pink, skin warm and dry. Alert and talkative throughout. Pt rated her swallowing difficulty at 2-3/10. Initially it was 6-7/10. Pt was advised to f/u with her physicians as to whether to have the second Moderna dose. Pt lives across from ambulance service. Driven home by her husband. Continued to feel no worse and was comfortable going home with her husband. At 17:40 pt called in to report she was continuing to improve. Now throat feeling is 1/10. Will call 911 if any worsening. Will sign in to mobile reporting program.
1182631	4/8/2021	ID	32	M	4/6/2021	4/6/2021	Immediately after patient was given the vaccine, patient stated that he was experiencing chest pain in the middle of his chest. Patient appeared very anxious even prior to the vaccine. Vitals were obtained and were within normal limits and patient was observed for additional 15 minutes with no progression. Patient was advised to seek medical care for his chest pain. On 4/8 patient came through Walk In to be seen for body aches.

1182815	4/8/2021	TX	49	F	4/8/2021	4/8/2021	I had administered the vaccine to the patient today. She stayed in the post-vaccination area for the full 15 minutes after her dose. She then left with her family & went walking around the store to shop. After about 5 minutes she returns to the clinic and let me know that she felt she was reacting to the vaccine. She described her symptoms as if she had just ran a marathon, she had palpitations and felt extremely fatigue suddenly. I sat the patient down in the post-vaccination area and took her blood pressure, with a reading of 188/88 and got her pulse, with a reading of 96. The patient's daughter brought her some water and after some questioning, patient revealed that she had not eaten for the last 8 hours. She was able to eat a protein bar while I was with her and drank some water. I observed her for about 25 minutes, and after then, she felt better, her daughter was going to be driving them home so I then released her, as she felt oriented, alert and her chest pains had subsided.
1182832	4/8/2021	MN	38	M	4/3/2021	4/4/2021	Patient stated that post vaccination on Sunday 4/4/2021, Monday 4/5/2021, and Tuesday 4/6/2021. Patient reported his reaction to clinic staff on Wednesday 04/07/2021 he was experiencing pain going down his arm to his fingers. Patient described it as a sharp burning pain that woke him out of bed for two nights. Patient stated that he also felt pain while trying to move his arm above his shoulder. Hives, rashes, and throat swelling were not noted on the patient. Patient denied difficulty breathing or chest pain. Treatment provided for the patient included using a cold pack for pain relief. Patient reported an improvement in his pain with the use of an ice pack. Patient stated that he would be following up with a physician to report his side effect.

1183438	4/8/2021	AK	46	F	3/23/2021	3/23/2021	16:03: Vaccine Administered 16:13 Patient received there 2nd COVID vaccine and was monitored. After 10 minutes the patient demonstrated that she started the" I feel different, I am having tingling in my throat and it feels very different then it did before." She reported feeling dizzy and nauseous. She declined lying down. Pts vital signs were obtained HR 104, 99% O2, BP 138/88. Pt was given a sip of water and advised that she would remain in the clinic for additional monitoring. I advised the I could administer an Epi-pen and call the paramedics which she stated she didn't want at this time as she has never needed something like that before. 1633 - Patient was reassessed for vitals 132/88 BP, 99% O2 and 87 HR. Pt stated that she feels like her tongue is weird maybe swollen and it still feels weird to swallow, she isn't anxious but has a bit of a groggy mental haze. She stated that she feels weaker then usual and has a pressure in her head. I called Dr. and got permission to administer 25mg of Diphenhydramine orally. Pt stated that she has taken this medication before and that she will be safe to drive after taking this medication. Pt was advised that she would be monitored for another 20 minutes to ensure that the medication kicks in and symptoms start to resolve. 16:52pm 132/92 BP, 99% O2, 88HR. Hoarse voice, scratchy throat tongue is improving doesn't feel as swollen. Pt was evaluated by Dr. 17:26 Patient was discharged and advise to closely monitor her symptoms for the next 3 hours. I received a call saying that patient was having some tingling in her lips and tongue and slight nausea. She was given 25 mg oral Benadryl by the RN. The patient was monitored for approximately an hour with serial vital signs. I briefly assessed this patient. She reports feeling some tingling in her lips with improvements in tingling in her tongue. She also reports feeling warm. Patient states that her throat feels scratchy and she feels like she has to clear her throat. Her heart sounds were normal and she has a normal respiratory effort and lungs clear to auscultation. No tongue swelling or posterior oropharynx swelling. Posterior oropharynx is pink and moist. Patient was advised that she is most likely having a reaction to the COVID vaccine. Patient should continue to monitor her symptoms at home. Patient states there will be someone at home with her. Patient was advised if she has any worsening symptoms such as tongue swelling, shortness

1181699	4/8/2021		46	F	4/3/2021	4/3/2021	After receiving dose of COVID vaccine, patient reported difficulty breathing and became shaky. Patient was transferred to wheelchair, given water and ice and was transferred by an RN to the ED. Per ED MD, patient developed throat tightness, nausea, fluctuance a shin after COVID vaccine. Concern this could represent of a allergic reaction. Less likely vasovagal reaction as throat tightening would be very atypical. There were no signs of any angioedema, she has no rash, no wheezing, no chest pain. At this time she does not have signs of anaphylaxis. Patient's symptoms have completely resolved by the time of evaluation. Per MD, this could have been allergic reaction to the vaccine and therefore would not recommend that she received a 2nd dose. She is recommend to follow up with her primary care physician for re-evaluation and to discuss other options for vaccine.
1181710	4/8/2021	IA	42	F	4/7/2021	4/7/2021	Pt had vaccination in right arm at 1:30 pm on 04/07/2021, started having pain in arm immediately but otherwise felt fine. 1181915	4/8/2021		55	F	4/6/2021	4/6/2021	Pt received Janssen vaccine at approx 1040. Within five minutes she began to experience a racing pulse, and c/o a "hot neck." She was taken to a treatment room and a provider was notified. 1049 diphenhydramine 50mg IM given 1053 c/o swollen lips, dry mouth, blurred vision, possible swollen tongue 1109 epinephrine 0.3mg IM given 1111 c/o throat dry, difficulty swallowing 1116 NS 0.9% bolus started 1121 pt reports feeling "much better. Denies swollen lips/tongue, denies difficulty swallowing, states her vision is clearer 1202 c/o "hot neck and face," dry mouth and difficulty swallowing 1208 epinephrine 0.5mg IM given 1211 diphenhydramine 12.5mg IVP given 1212 c/o chest pain 1225 EKG done 1239 taken via stretcher to ED
1181945	4/8/2021	NV	71	F	4/8/2021	4/8/2021	Patient received her Moderna vaccine. She waited the 15 minutes and went around the store to shop. She then started to feel sharp chest pain and shortness of breath and returned to pharmacy. Patient did not report swelling in the airways, was able to breathe however with some difficulty. Patient reported having history of asthma and high cholesterol when asked. With patients consent, took patients blood pressure and the reading was 130/87. Told daughter what was going on, most likely not an allergic reaction/anaphylaxis. Patient then started to have "pseudo-seizures." Asked daughter and patient if we can call ambulance, and they both agreed. Stood by patient in post-vaccination area waiting for ambulance. Patient was still able to breath and her chest pain has decreased per patient - said pain lessened when sitting down. Ambulance arrived and took patient away. Both daughter and patient thanked pharmacy for helping and taking care of patient.
1181950	4/8/2021	MI	40	F	4/8/2021	4/8/2021	Patient stated she was having chest pain and that her chest was getting tighter and tighter. Pulse and blood pressure were normal. ambulance was called and they took pulse and blood pressure as well it was normal. they preformed more tests (unknown to me in the ambulance) she did not leave with paramedics

1182305	4/8/2021	CA	41	M	4/8/2021	4/8/2021	client complained of headache after receiving 1st Moderna Covid Vaccine (lot 041B21A Exp. 5/6/21). Client was leaving after completing 20 min observation when he approached PHN and asked if he could leave. When PHN asked how he was feeling, client mentioned headache that begun after receiving vaccine. Client was asked to sit down for further assessment. 1238 vitals: blood pressure/90, pulse 77, oxygen 96%. Medical history: chronic migraines, sleep apnea, chronic back pain, and joint pain. Client unable to provide medication names. Client alert and oriented. Headache feels same as when a migraine is starting. Denied chest pain, blurry vision, no dizziness. Headache pain 1/10, described as "pressure" to back of head. Client wanted to leave, PHN spoke to client regarding high blood pressure, per client it was fine. PHN gave ER precautions and advised to see primary care provider regarding blood pressure. Client left facility at 1248 with steady gait.

1182449	4/8/2021	AL	68	F	2/16/2021	2/1/2021	Chest pain; Dizzy-headed; Runny nose; Slight headache; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of CHEST PAIN (Chest pain), DIZZINESS (Dizzy-headed), RHINORRHOEA (Runny nose) and HEADACHE (Slight headache) in a 68-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. Concurrent medical conditions included Lupus syndrome and Heart disorder (slight heart condition.). Concomitant products included CLONAZEPAM (KLONOPIN) for an unknown indication. On 16-Feb-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. In February 2021, the patient experienced CHEST PAIN (Chest pain) (seriousness criterion hospitalization), DIZZINESS (Dizzy-headed) (seriousness criterion hospitalization), RHINORRHOEA (Runny nose) (seriousness criterion hospitalization) and HEADACHE (Slight headache) (seriousness criterion hospitalization). The patient was hospitalized on sometime in February 2021 due to CHEST PAIN, DIZZINESS, HEADACHE and RHINORRHOEA. At the time of the report, CHEST PAIN (Chest pain), DIZZINESS (Dizzy-headed), RHINORRHOEA (Runny nose) and HEADACHE (Slight headache) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. This case was linked to MOD-2021-060612 (Patient Link).

1181987	4/8/2021	CA	68	F	2/11/2021	3/5/2021	12 hours after taking the second vax. her arm was swollen, red and painful. she some chills, nausea and fever that lasted about 48 hours. Weeks later these symptoms came back and were more extreme. 4/5/2021 pt has SOB w/ slight exertion. she developed numbness in her left side of her face including her ear down to her teeth. 4/6/2021 she started violently shaking with chills. her fever was about 102 and she had a severe headache. She had nausea w/ dry heaving. She had chest pain from reflux. She could stand but not walk. Ambulance was called and she was taken to ER. She had CT, Chest XRAY, EKG, Covid TESTs, Antibodies blood test. Lab work. O2 level was 98%. All test were normal/negative. She was discharged to go home. On 4/8/2021 her temp was 104. She had brain fog. She went back to same ER. They did the same test. This time the chest x-ray shows small right lower lobe infiltrate. Pt had no cough. Her white blood count was normal and was told she had viral pneumonia. She never had any type of symptom normal to having pneumonia. She was put on antibiotics and something for nausea. Her fever and headache finally broke after about 5 days. She had no strength and was basically laid up sick for almost a month. She feels like she had a bad reaction to the covid vax since she had a viral lung infection with typical pneumonia symptoms.

1182524	4/8/2021	CA	40	F	4/8/2021	4/8/2021	Client received the 1st dose of Moderna COVID vaccine lot # 041B21A, expiration date 5/6/21 at 12PM. At 12:03PM, EMTs received a report from client that she was feeling dizzy, mild headache and a little shaky. Vitals were taken-blood pressure:140/90, pulse:91 and oxygen 99%. PHN came to find client sitting upright in chair, alert and oriented x4, able to provide medical history of hypertension. Client reports she has never had any reactions to any vaccine. Client medication is Telmisartan and client reports taking her medication this morning and that her blood pressure is usually 120/80 when taking medication. Client reports to PHN that she is feeling more dizzy, PHN and EMTs transfer client to gravity chair. Offer client water and offer to call 9-1-1, patient declines and calls husband. At 12:09pm client reports feeling cold and shakiness is worse. Cover client with disposable blanket. Another nurse joined to assist. At 12:11PM vitals were taken oxygen 98%, blood pressure: 146/78 and pulse: 85. At 12:16PM client drank half a bottle of water and reports dizziness improving and no shortness of breath. PHN educate client about speaking to provider about reaction and discussion about next dose. Client also reports headache is better and able to have a conversation. At 12:17PM retake vitals blood pressure: 158/100, oxygen:96%, and pulse:83. client reports headache is worse, no chest pain, no blurred vision, no dizziness reported. At 12:23PM vitals taken-blood pressure 160/84, oxygen 98% and pulse 71. Client alert and oriented x 4 and still feeling cold. Client reports feeling chest pain and dizziness, PHN called 911 at 12:26PM. At 12:29PM client reports feeling numbness in both of her legs-pulse, motor, sensation intact in both legs, alert and oriented x 4, client reports no shortness of breath. Fire Department arrived at 12:30PM and assumed care. Client's husband arrived shortly after. Client left facility via stretcher with paramedics at approximately 12:43PM. At 12:59PM security notified PHN that client declined transport via ambulance.

1176249	4/7/2021	IA	62	F	4/7/2021	4/7/2021	Patient arrives by private vehicle with left anterior chest discomfort. Patient received the first dose of her 2 part COVID-19 Pfizer vaccine series this morning. Shortly after receiving the vaccine she developed left anterior chest pain under her left breast. Patient was evaluated by EMS personnel at vaccine clinic, and refused transport at that time. Shortly after, patient then arrived by private vehicle to Emergency Department with chief complaint of chest pain, left shoulder blade pain, and some shortness of breath per nursing notes. She reports she overall did not feel well. She felt sweaty and short of breath shortly thereafter. She denies having had the COVID illness in the past **At time of submission of report, patient is still in ED with results pending**
1176302	4/7/2021	UT	44	M	2/22/2021	2/23/2021	Experience chest pain on right side of chest near armpit which spread across chest one week after the first vaccine shot given on January 25, 2021. Pain was going away before the second shot. Received second shot on February 22, 2021 and had the chest pain return, extreme fatigue, headaches, rash at injection site and all over back, achy muscles mainly in upper body, dizzy spells, nausea, and abdominal pain. All these symptoms (minus nausea) continued for three weeks and some are still present (fatigue, chest pain and periodic headaches) after six weeks. I was tested for antibodies and the results came back greater than 400, which is the max limit for the test. The doctor has never seen results that high and we have no idea how high my antibodies actually are. Since my symptoms seem to be slightly improving, the doctor did not recommend further treatment. However, I am concerned as to any possible danger of antibody levels this high.

1176304	4/7/2021	IL	65	F	3/20/2021	3/20/2021	She got the vaccine, went home and about 45 minutes she got the vaccine she started having serious chest pains and her throat started to feel tight. She can't drive due to the brain aneurysm so she laid down. She had pain at the injection site and throat tightness for about 3 days, and she just generally did not feel good for about 3 days. The chest pain lasted for about an hour. She did not take anything for her symptoms. On the 3rd day she felt better. She is now afraid to get the 2nd vaccine due to her reaction. She tried to call Pfizer to report this and ask for their advice. She has contacted her allergist who is going to notify the college about the 2nd vaccine and they may send her up there.
1176362	4/7/2021	CA	42	M	4/7/2021	4/7/2021	Paramedic called to observation for 42 YO male with dizziness, lightheaded, and anxiety. Upon arrival PT found sitting in chair A&OX4, skins: pink/warm/dry, pupils: Equal and reactive. Pt speaks very little English and PT's wife translated for him. PT states that he started feeling symptoms 10 minutes after receiving his Pfizer vaccine. Upon assessment PT states he has 10/10 chest pain non radiating/dull in nature with increased pain on inspiration. Pt states that this has happened before a few months ago and was diagnosed with HTN but was not prescribed any medication by his primary care physician. PT does not take any medications and has no allergies. Pt status did not improve or decrease while in the care of the paramedic. Pt vitals then assessed and were as follows: 0943: BP 172/118, HR 71, RR 24, SPO2 99% RA, Lungs clear/equal bilaterally. 1002: BP 180/131, HR 80, RR22, SPO2 98% RA, Lungs clear/equal bilaterally. The paramedic made the decision to activate the EMS 911 system. Upon EMS arrival report given to responding paramedics and PT care transferred. EMS Paramedics began to treat patient for Chest Pain Protocol, and transported PT to Local ER.

1176248	4/7/2021	CA	36	F	3/27/2021	3/27/2021	In observation area, my tongue swelled up - nurse held be back for a bit to observe and gave me bottled water. The injection site arm went dead and unable to move (left arm stated on my vaccination card but it was the RIGHT arm that was jabbed. Another inconsistency of this whole process). I had weird tingliness shooting up to my neck/back of neck. After finally being released from the observation area when the tongue swelling went down, I was tired walking to my car. That night I was exhausted and couldn't get off the couch and nauseated. The nausea and fatigue hit in waves over the next day. On Monday (second morning after the shot), I could not get out of bed. After finally getting up, I went to work. At work I was still dealing with fatigued, shortness of breath, my head was dizzy and light, then mid-morning I had sharp stabbing chest pains under my left breast, the pain shot up to my left neck and jaw. I could not breathe. The more I tried to breathe, the sharper my chest pains became. I had emailed my primary care doctor twice that morning because of symptoms and never heard back so when the chest pains hit, I went to the ER. At the ER they ran EKG, blood work, XRays. Kept me all day. At the end, they told me I was healthy and let me go. The doctor had ZERO regard or interest in the fact that all of this started after the vaccine. No where in my notes was it noted that I had the vaccine. The nurses told me this was a trend with the patients coming into ER complaining of post-vaccine symptoms and not having them documented. I had breathing issues for almost two weeks after the vaccine where I would be short of breath and winded, not able to complete sentences without stopping for air. I still have awkward breathing moments. I called healthcare facility nightly to report this and again was told to just monitor my symptoms. I feel like this whole process has been an isolating, careless time where my vaccine side effects have NOT been taken seriously.

1176782	4/7/2021		51	F	3/16/2021	3/31/2021	51-year-old female presents to ED with left lower extremity edema. Patient reports left lower extremity swelling, particularly in the calf and ankle couple weeks ago. She denies any specific traumas or injuries, states she initially thought maybe she had sprained her ankle but is noted that the swelling had not improved. Says theres some slight pain but moreso the swelling that was concerning to her. Has not noticed any erythema or ecchymosis. No numbness, tingling, paresthesias. No fevers or chills. No chest pain or shortness of breath. She is currently on estrogen oral contraceptive, no recent travel, immobilization, medical procedure, surgery, or trauma, hemoptysis, malignancy, coagulation disorders, history of DVT or PE. States initially followed up outpatient and had an ultrasound that was done and she was instructed to come to ED for positive result. No further symptoms or complaints at this time. The patient's symptoms, exam, workup, and disposition were discussed with ED attending Doctor, proceeded with management accordingly. Physical exam as above. Patient afebrile, hemodynamically stable, well-appearing. Chart review from earlier today shows ultrasound positive study for subacute nonocclusive proximal DVT in the left popliteal vein, and subacute superficial thrombophlebitis in the left lesser saphenous vein. No evidence of cellulitis or infection at this time there's no warmth or erythema or streaking. No bilateral edema, JVD, or evidence of fluid overload. Suspect patient's symptoms of left lower extremity swelling and pain likely secondary to the DVT and thrombophlebitis. No bony TTP or injuries no indication for bony imaging. No cp, sob, tachycardia, hypoxia. Do not suspect PE. She does have a leukocytosis no urinary or respiratory symptoms lower suspicion UTI or pneumonia. No neck stiffness or pain to suggest meningitis. Area doesn't appear cellulitic at this time but could possibly be due to early cellulitis and the superficial thrombophlebitis. She's afebrile non septic appearing and will be started on abx nonetheless and she is given strict return precautions regarding this. She has no contraindications to anticoagulation including no thrombocytopenia, active hemorrhage, history intracerebral hemorrhage, chronic anticoagulation. No findings suggestive of phlegmasia cerulea dolens. Labs including kidney function, liver enzymes discussed with ED pharmacist matt nagar.

							Patient has no significant commodities and is an appropriate candidate for outpatient DVT treatment with eliquis. She is educated regarding eliquis by ED pharmacist. Discussed with patient the need to contact her doctor tomorrow regarding the oral contraceptives that she is currently taking, as there may likely need to be a change and/or discontinuation of this secondary to patient's DVT and starting on Eliquis. She is instructed not to make any changes to medication regimen until she contacted her PCP, and again reiterated that she needs to speak with them first thing tomorrow morning regarding her birth control. Patient expresses understanding. Given overall presentation and ED workup, believe patient is stable for discharge home at this time. Discussed at length strict written and verbal ED return precautions with patient. Patient will follow up with PCP, will start on eliquis and clinda. Patient expressed understanding and agreeable to this plan for discharge and follow up.

1175194	4/7/2021	WA	27	F	3/10/2021	3/10/2021	<p>anxiety attack/she did get pretty anxious easily and that probably exacerbated it; Chest pain; Chest heaviness; Abdominal pain; eyelid got puffy/puffiness mostly on her upper eyelid of her left eye; had eye puffiness in her left eye; This is a spontaneous report received from a contactable nurse (patient). This 27-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration on 10Mar2021 10:15 (Batch/Lot number was not reported, reported as "one number on there is EN and then she does not know if it is a G or 6 and then 204") as a single dose for COVID-19 immunization. Medical history included ongoing anxiety from 2020, ongoing acid problems from 2020, high cholesterol levels from 2020 (she was not prescribed any medication and the advice given was just for diet and exercise), and ongoing gallbladder problem for years. There were no concomitant medications. Patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. No additional vaccines administered on same date of the Pfizer suspect. On 10Mar2021, patient had eye puffiness in her left eye. Patient asked if it is safe to take the second dose. Her eyelid got puffy which began 30 minutes after having the Pfizer COVID Vaccine and it is not ongoing but resolved completely after a few minutes. She did not require treatment for the eye puffiness and the puffiness was mostly on her upper eyelid of her left eye. Patient stated that she does not know in terms of causality if the Pfizer COVID vaccine is related to the reported events and was worried because a week after she got the vaccine, she had other symptoms and was not sure if they are connected with the vaccine. She also reported that she does not think the eye puffiness itself is that serious but it is medically significant and the other symptoms she had were chest pain, chest heaviness, and abdominal pain. These symptoms are not ongoing anymore and began around Friday, 19Mar2021 and resolved after a couple of hours of when they began. For the chest pain, chest heaviness and abdominal pain, she just took an antacid Prilosec for treatment. She thought about going to the emergency room but also thought she was having an anxiety attack and was close to having to go to the emergency room that night. She did get pretty anxious easily and that probably exacerbated it. AEs did not require a visit to</p>

Outcome of the events had eye puffiness in her left eye and eyelid got puffy/puffiness mostly on her upper eyelid of her left eye was recovered on 10Mar2021, of the event "anxiety attack/she did get pretty anxious easily and that probably exacerbated it" was unknown, and of the other events was recovered in Mar2021. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information provided, the contributory role of the suspect bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) to reported events is possible.</p> <p>15 minutes after vaccination the room started spinning, felt fine after aprx 30 minutes. About an hour and a half after vaccination I had shortness of breath and chest pain. (went to ER). Had nausea at ER was given medicine. Aprx 8pm had the feeling of something hot and cold being injected into my right wrist that went through my entire body. Called 911. Paramedic stated it was the vaccine running it course and to breath through it. Next day. Little groggy, low grade fever, slight headache and shortness of breath, Saturday morning had another episode of feeling like something was being injected into my wrist. It settled at my chest. Was very painful for about 3-5 minutes. Slept rest of day. Shortness of breath. Woke up Sunday and felt 100% fine.</p>
1175360	4/7/2021	MI	28	F	3/26/2021	3/26/2021	<p>Patient felt chest pain after the vaccination. Onsite EMS was called BP 112/77 HR 68 97% O2. Patient set for half hour and was asked to goto the ER but she declined and said Dr. will see her soon at the same clinic we are at.</p>
1175537	4/7/2021	IA	52	F	3/31/2021	4/1/2021	<p>At 4am the day following the shot I woke up diarrhea, vomiting, a fever (101.4), chills/sweating, squeezing chest pain, tightness in throat, swelling of hands/feet, joint pain and throbbing headache- by later in the day I had also developed a blister type rash on my upper butt crack. I got the shot on Weds- symptoms finally subsided by Sunday evening except the rash which on Sunday had crusted over and is now/currently dark red, flat and feels sore/tingly. I'm currently waiting f or a return call from my doctors office about how to treat the rash. This rash looks very similar to shingles. My 18 yr old daughter got the shot one day before me and has this same rash on her cheek.</p>

1175930	4/7/2021	KY	36	F	3/18/2021	3/22/2021	Chest pain began on 3/22 around 2 pm with what initially felt like allergies--chest congestion and heaviness in chest. As the day progressed, pain set in to the degree that sleeping was uncomfortable both because of challenges breathing and because finding a spot that wasn't painful was challenging. Upon waking on 3/23, the pain was significant and continued to worsen between waking at 7 am with trouble breathing and being in a high level of pain along with disorientation by 9 am. I went to the emergency room at this time, where they performed a series of lab tests, imaging tests, cardiac monitoring, EKG 12 lead, and administered medications. No cause was found and I was sent home with prescriptions for an NSAID and an inhaler. The chest pain persisted off and on for two weeks prior to the emergency room visit.

1178025	4/7/2021		36	M	4/7/2021	4/7/2021	patient felt as if he was having an asthma attack following vaccination. he denied chest pain. no cough.
1178609	4/7/2021	MD	32	M	3/11/2021	3/14/2021	Cold like symptoms started 3 days (March 14) after shot. Reached fever of 102 on March 18 through the 20th, went to urgent care for help. Chronic cough, chest pain, shortness of breath, dizziness/lightheadedness, sinus headache and severe fatigue/weakness has continued ever since. Prescribed prednisone, albuterol inhaler, and cough syrup and antibiotics. No improvement. Went to ER April 3rd and 4th due to worsening condition and follow ups with primary doctor April 6th and 7th. Prescribed Doxicycline and Simbacort.
1178204	4/7/2021	MD	74	M	4/7/2021	4/7/2021	PATIENT RECEIVED SECOND DOSE OF MODERNA BRAND OF COVID 19 VACCINE AND STARTED COMPLAINING OF BACK PAIN, BACK SPASM, AND CHEST PAIN FIVE MINUTES AFTER VACCINE ADMINISTRATION. 911 WAS CALLED AND PATIENT'S BLOOD PRESSURE CHECKED WHILE WAITING FOR 911 TEAM TO ARRIVE. PATIENT'S BLOOD PRESSURE WAS ELEVATED WITH SYSTOLIC ABOVE 220 AND DIASTOLIC ABOVE 100. PATIENT WAS RESPONSIVE AND ALERT AND STATED THAT HE HAD NOT TAKEN HIS BLOOD PRESSURE MEDICATIONS FOR THE DAY OR EATEN ANYTHING. 911 TEAM ARRIVED, PERFORMED A BLOOD PRESSURE AND EKG CHECKS ON PATIENT. AT THIS POINT, PATIENT STATED THAT THE PAIN WAS SUBSIDING. THEN PATIENT WAS TAKEN TO THE EMERGENCY ROOM.
1178384	4/7/2021	PA	52	M	4/7/2021	4/7/2021	At ~3:10pm, patient received his vaccination for COVID (Janssen brand). Patient was directed to sit in waiting area for 15 minutes for monitoring; during this time, patient started to complain of the following: chest/abdominal pain, "pounding in his head", felt faint, and "scratchy throat" that was not improving. Around 3:35pm, 9-1-1 was called due to worsening chest pain and scratchy throat. EMTs directed me to administer 25mg of diphenhydramine (which as give at 3:46pm) to patient. EMTs arrived shortly thereafter, noting elevated BP (~154/90). Patient left pharmacy area ~4:10pm and was brought to ER via paramedics for further evaluation.

1177982	4/7/2021	MO	28	M	3/30/2021	4/3/2021	. Pfizer dose 1 on 3/30. Just had sore arm. Symptoms dizziness began on 4/3. Otherwise feeling well. Labs drawn 4/5 which revealed pancytopenia, rechecked today and numbers are worsening. Working to get him into hematology now. 28 yo male s/p Covid-19 Vaccine (Pfizer) on 3/30 with lightheadedness only when bending down and coming up returns for follow up today for pancytopenia found on labs obtained 4/5. He denies any recent viral symptoms. He did not have any episodes in past that made him question that he may have had Covid-19 viral illness. He is able to tolerate his normal daily exercise and bike without any symptoms. He has no dietary restrictions, eats dairy, meat, lots of vegetables/fruits, pastas and some breads/cereals. He drinks alcohol once per week. He abstains from ETOH every April. He has used edible THC in past, only once per month at most. He has not been tested for HIV in past. His girlfriend, in last semester of school advised him to ask about HIV testing. He denies any chest pain, SOB, HA. Upon review of his lab results yesterday, I called the hematology fellow, Dr. through program at hospital and he recommended the labs to be obtained and rechecking labs in one week. He felt the student was not exhibiting any emergent symptoms requiring emergent evaluation. Patient and I spoke on phone after this call with fell at 1557 4/6 and I advised him to seek emergent medical eval in ED for any CP, SOB, HA or any neurologic symptoms. Patient has not had any of those symptoms. He exercised this morning without difficulty. He notes raised papules on legs which he has had in past. They have currently been present for a few days. He believes it to be related to biking in sweatpants. He has been in a hot tub recently, but after the bumps were present. They do not itch. He has had them in past, more in winter months with heavier clothing. He also notices slight left arm pain today. This was site of his vaccine. He denies any swollen lymph nodes. He is notices only with arm movement. He denies any FH of blood disorder/ blood cancers/MDS. He denies bruising, bleeding or dark stools. He states he likely has not had a blood draw in past, unless one visit to ER, for HA/concussion in high school (9+yrs ago) resulted in any blood test.

1171757	4/6/2021	IA	65	F	3/18/2021	3/25/2021	Moderna COVID Vaccine EUA Pt received Dose 1 of Moderna vaccine 3/18/21. Developed symptoms 3/25/21. Presented to ED 3/28/21. 3/28/21: 65-year-old female with past medical history of hypertension, hyperlipidemia, and type 2 diabetes mellitus presented to ER with complaints of shortness of breath. Per patient she received her 1st COVID-19 vaccination last Thursday. Since Monday the patient has felt "unwell." Three days ago she started having shortness of breath which has progressively worsened, especially with exertion. She has developed increased fatigue, cough, nausea and decreased appetite. Denies chest pain. No vomiting or diarrhea. On arrival to ED patient she had a low-grade fever and was hypoxic at 87% on room air. Supplemental oxygen with 2 L NC with improvement in oxygenation saturation to 94%. Laboratory findings were significant for hypokalemia 3.0, transaminitis ALT 55, AST 44. COVID positive. Chest x-ray revealed bilateral airspace disease with obscured pulmonary vasculature. Favored to represent pneumonia over heart failure. EKG normal sinus rhythm, rate 74, QTC 472. Patient was given IV fluid resuscitation with NS 3 L bolus. Potassium 60 mEq p.o. given. IV Rocephin was initiated and DuoNeb treatment given in ER. 4/2/21: Pt received remdesivir, convalescent plasma, ceftriaxone, doxycycline, dexamethasone, vitamin C, zinc sulfate. Patient discharged on doxycycline course, PO zinc and vitamin C, supplemental oxygen. Instructed to follow up with PCP in 3-5 days.

1171835	4/6/2021	PA	35	F	4/2/2021	4/2/2021	<p>35-year-old female with history of asthma presents for evaluation of allergic reaction. Patient says she has a history of allergy to the flu shot. She received the first Covid 19 vaccination following her visit with her pulmonology provider today. Shortly after this she developed feelings of throat closure, wheezing and a hoarseness to her voice. She was brought down to the emergency department for further evaluation. She has no history of anaphylaxis and has never been given the EpiPen. She denies any history of chest pain, abdominal pain, nausea/vomiting, skin rash, lightheadedness or dizziness. Medications Given in the ED: 4/02 Meds 1:24 p Famotidine 20 mg IV Push; MethyIPREDNISolone 125 mg IV Push; DiphenhydrAMINE 25 mg IV Push 1:21 p Albuterol-ipratropium 3 mL Aerosolized 35-year-old female presents for evaluation of allergic reaction following Covid 19 vaccination. Overall she is in no acute respiratory distress. Initially when I walked into the room she did appear anxious, and her voice was a bit hoarse. Lung sounds show subtle wheezing bilaterally. Respiratory at bedside. On further conversation with the patient her voice clarity seemed to improve significantly and she seems to be talking at her baseline. She feels overall that the sensation of throat closure is improving. No other symptoms to suggest acute anaphylaxis and we'll hold on epinephrine administration at this time. Patient was administered IV Benadryl, famotidine, Solu-Medrol in the emergency department. She was observed for approximately 2 hours after which time she says she is feeling back to baseline. We'll plan to discharge with prescription for EpiPen, and instructions for use discussed with the patient. Also discharged with prescription for burst course prednisone steroids. Return precautions discussed and she was discharged in stable condition.</p>

1171870	4/6/2021	NY	57	F	3/12/2021	3/25/2021	On 3/25/2021, started seeing rash, hive and feeling itchy, got worse thru the night when it started throughout my body and feeling throat stuck, chest pain. Next day, allergic reaction started spread to my face, ear and eyelids. Went to urgent care immediately. The doctor immediately gave me steroid, Zyrtec, Benadryl tablets to calm down the allergic reaction and instructed that I continue to take them for 5 days. After 5 days, I still experiencing lingering and minor rash, itchy sporadically on my body mainly hands, arms, ankle and bottom of feet. Consulted gastroenterologist and allergist, inconclusive of the root cause. Was on prescribed Omeprazole 40mg, Vitamine De+K2, Probiotics prior the vaccination. Also took half of Advil tablet for 3 days to relieve tooth ache prior to the allergic event. Have stopped since then.

1172293	4/6/2021	FL	67	M	1/16/2021	1/18/2021	Spitting up blood. Spontaneous. Started 2 days after. has continued to this day on perhaps 15-20 days during that time, maybe more. Accompanied. by giant hives and rashes. Thick hives. Bizarre shapes and sizes. All over my body. Had CT scan of chest and Sinus - normal. ENT normal. Blood tests including many for sed rate and other blood or infectious related things, all normal. Urine normal. Phlegm and sputum cultures normal. Going to see pulmonary on April 19. Going for second opinion ENT April 7. Chest pains and general body aches and pains and straining pains in mornings four times including this morning. Dermatologist says he has seen hives from vaccine because there is no other cause when so many patients show up with it; however mine are the most extensive, large and thick he has seen. Suggested Claritin and Benadryl and hoped it would go away in time. I am a physical mess and had zero problems before the vaccines. Please contact me immediately I should have come too sooner.

1171668	4/6/2021	IL	63	F	3/11/2021	3/17/2021	<p>Pfizer COVID Vaccine EUA Patient received 1st dose of Pfizer vaccine 3/11/21. 3/27/21: Patient is a pleasant 63-year-old female past medical history of anxiety, documented history of hyperlipidemia came in from outside facility with complaints of dyspnea, COVID-19 pneumonia, bradycardia. Clinical picture started on the 17th patient tested positive for COVID-19 at that time was having symptoms myalgia, subjective dyspnea reportedly went to the emergency department, saturations were good she was discharged home with conservative measures. At home became more symptomatic and pulse ox was measuring in the low 80s so she went back to the hospital and was admitted to Hospital on 03/25. Per records patient was started on Eliquis, dexamethasone, azithromycin, remdesivir, p.r.n. Tylenol, p.r.n. Zofran, p.r.n. Toradol along with supplemental oxygen. Oxygen requirement was 5 L at the facility. However overnight and prior to arrival providers at outside facility started noticing bradycardia patient's heart rates were dropping into the 30s. Patient was asymptomatic during these episodes not complaining of any lightheadedness or chest pain. Reportedly cardiologist saw patient QT and QTC were reportedly appropriate recommended monitoring. However overnight heart rate continued to go down into the 30s, reportedly on telemetry was noted to be developing Mobitz 2 second-degree block, patient was administered atropine x2 and heart rates improved to the 70s however a year started going down again to 30s and 40s after a couple of hours. Outside facility requested transfer to another hospital for further management and possible EP intervention. Bedside patient is lying comfortably in bed currently denies any lightheadedness, dizziness, chills, fevers, nausea, vomiting, diarrhea, chest pain, palpitations, paresthesia, swelling of extremities. Though is she gets winded after exertion, is okay/comfortable on supplemental oxygen at rest. Patient was increased to 8 L during ambulance ride, was id saturating however medics increased because of bradycardia. Otherwise denies tobacco, recreational drug/marijuana, over-the-counter/herbal medication use. Social consumption of alcohol will have 1-2 beers a year. She reports sick contact 1 of her close friends was diagnosed with COVID earlier this month, husband also positive. She reports she received 1st dose of COVID-19</p>

							vaccination around the 10th or 11th of this month 1 day prior to known exposure. Otherwise no medication changes is only on sertraline. Currently no antihypertensive medication or rate-controlling agents.
							4/1: Patient was admitted after developing significant bradycardia after receiving remdesivir for COVID-19 pneumonia. Remdesivir was held and patient received convalescent plasma on 03/28. Dexamethasone was started at the outside hospital on 03/25. With also completed 5 days of empiric doxycycline and Rocephin. Patient CRP and D-dimer were followed and trended down at the time of discharge. EP Cardiology was consulted and initially the patient was on dopamine for the 1st 2 hospital days. Was able to be stopped and the last 2 hospital days the patient had no bradycardia. She will have a Holter monitor as an outpatient. Patient wore her BiPAP at night. Oxygen requirements trended down and was able to be on room air at the time of discharge. Home O2 evaluation was performed and did not require oxygen. She will continue on 5 further days of Decadron 6 mg daily. She will follow-up with her PCP.

1172292	4/6/2021	OH	19	M	4/3/2021	4/3/2021	Received Jansen COVID injection at approximately 11am 4/3/2021. Developed sore left arm, shoulder, and neck approximately 10 pm evening of 4/3/2021. Woke up 3:30am 4/4/2021 and informed parents he did not feel well-awake most of that night. Felt slightly better morning of 4/4/2021, but continued feeling feverish, pain in arms, shoulders, neck. Approximately 8pm Sunday night 4/4/21 he stated he felt it was hard to breath, chest pain, and his arms felt like they were on fire. Was taken to ER at Clinic. Blood pressure 149/98, temp 100.6 complain of feeling feverish and short of breath. EKG was taken which was abnormal and enzymes noted to be elevated. Transferred to main branch of Clinic approximately 4:30am 4/5/2021. Father states patient has inflammation around the heart. Had a cardiac catheterization today 4/6/2021-father states that was normal and patient was started on medication to reduce inflammation around his heart. Patients father states that patient was very drowsy from his catheterization and was fine with his father telling me the events as they occurred. As I was speaking with patient father, patient was going down for a MRI of the heart. This information was conveyed to me by father and mother. Patient is a college student and was home for Easter break. Patient currently remains hospitalized in Clinic and father thought he would remain hospitalized until Thursday 4/8/2021 depending on test results and his response to treatment. Both parents state they are willing to be contacted for further information.

1174194	4/6/2021	MI	31	F	4/1/2021	4/1/2021	Tongue on left side went numb within 10min. Then weakness/numbness on whole left side of face. Weird pressure moved from left to right across my neck/chest and settled over right side of chest. When they took my blood pressure it was high (not sure what and i usually have good blood pressure). I started having trouble finding and forming the words i wanted to say. The people at the site called EMT and they took me to ER. Symptoms reminded the same but started to get heartburn and migraine. After running some tests they gave me benadryl in my IV which made my body go heavy. Benadryl did not stop the numbness of left side of face and tongue. I was released about an hour after the benadryl with same symptoms minus the right chest pain.
1174186	4/6/2021	CA	55	F	4/2/2021	4/2/2021	A severe headache in the first hour followed by fatigue an hour later. Muscle aches and low grade fever in the evening. The next day I has a lot more fatigue and general muscle pain. I also developed irritable bowels and a loss of appetite. The left arm became very painful to the touch and while moving it. Low grade fever continued. The second day was much of the same but a new symptom which was concerning. Chest pain near breast and rib in the left side. The pains were shooting and intermittent. More fatigue and continued stomach issues and lack of appetite. Day 3 I felt greater fatigue and muscle pain but the arm pain and headache were better. I took the day to rest mostly. Day 4 (today) I fully expected to feel better but I felt the same and took the day off work to rest. Low grade fever fatigue and muscle pains. Stomach issues turned to diarrhea today. Headache returned for a while but chest pains better. For the record I've never experienced adverse reactions to any vaccine. I'm also very healthy and active running hiking and biking 20 miles a day.

1174104	4/6/2021		21	M	4/5/2021	4/5/2021	bodyache,headache,sore throat. PT states getting the J/J vaccine at 1300 yesterday with body ache, fever, sore throat, and headache starting at 1900, states taking tylenol (500mg) at 1900 with no relief. HISTORY OF PRESENT ILLNESS: 21 yo M p/w fatigue, body aches, subjective fever, sore throat, headache nausea after receiving J&J COVAX yesterday at 1300. Acute onset of symptoms, constant, mild muscle aches. Nausea without vomiting. Denies recent illness, cough, vision changes, chest pain, dyspnea, weakness/numbness.
1174077	4/6/2021	CA	75	F	4/6/2021	4/6/2021	Client received the Janssen dose lot # 1808980 and expiration date 6/20/21 at 11:01AM. At 11:16AM client had already waited their 15 minutes and reported to EMT that she was having shortness of breath and anxiety. Vitals were taken : Oxygen: 97%, Blood Pressure: 130/80, pulse=75. Client reports to EMT s that she has a history of bradycardia and anxiety. Client reports medications are amlodipine 5 mg, Irbesartan 50 mg, Aspirin 81 mg PO, inhaler for asthma. Client also reports that on January 8th of 2021 she tested positive for COVID-19. PHN was notified at 11:28AM of client's symptoms. PHN arrived to find client sitting upright and alert and oriented x 4. Since client had shortness of breath reported PHN offered 9-1-1 but client declined, stating she was already feeling better. PHN advised client to stay an extra 30 minutes since she had a reaction. Client reports she thinks it is because she forgot to take her inhaler dose this morning. Vitals were taken: respiration rate=20, Blood pressure 130/70 and oxygen 96% and pulse 55. Client then reports she also has a history of high blood pressure. Client reports that earlier she felt a little lightheaded but did not report to EMTs. At 11:31AM vitals were blood pressure: 146/80, oxygen:97%, pulse: 65 client reports she no longer had shortness of breath, no dizziness no headache, no blurred vision and no chest pain. Gave client water bottle. At 11:41AM vitals were pulse:70, blood pressure: 130/80, oxygen: 97%- client reports no shortness of breath and "feels great." PHN advised client of emergency precautions and to follow up with provider. At 11:46AM: blood pressure: 132/90, oxygen: 98%, pulse: 68. At 11:50AM client left facility with steady gait.

1168509	4/5/2021	WA	65	F	3/28/2021	3/28/2021	<p>The pt had her first Covid vaccine on 3/28 in the left deltoid. Within a couple hours, she began to have pain in the inner upper left arm, and then later migratory pains that traveled up her legs, across her lower abdominal surgical scar. She had chills, and fever symptoms. She developed marked myalgias. She has photophobia at baseline after her breast cancer chemotherapy, the photophobia is unchanged. She has chronic neck pain, and she came in wearing a soft cervical collar, but the neck pain is not new. No known Covid exposure. She first denied chest pain, but then she pointed to her central sternum and said that she had "bone pain" in the central chest. She also describes her migratory pain frequently calling it "red" pain. She denied abdominal pain, but she had a deep central pain deep inside her torso. Husband was interviewed and he stated that she was in good health before the vaccine. He did not note the "pale, fatigued, run down" complaint that she reported. She had the Pfizer vaccine #1 around 1130 hours. She then began to complain of a discomfort left upper inner arm. Sunday, 3/28, she began to take advil, first 400mg, then advancing to 800 mg q 4 h, and use of a hot water bottle. She then began to have the "searing pain" first in the areas where she's had surgery, both breasts and her lower abdomen. They talked to a RN on 3/30, and then to a tele-MD yesterday when her symptoms worsened, who Rx'd Vicodin. The husband (and pt) states that the pt gets an upset stomach and "muddled head" when she takes tylenol, and they didn't know that Vicodin had tylenol in it. Very soon after taking the Vicodin, she began to feel upset stomach and muddled head. She took two doses of the Vicodin, last dose yesterday. They spoke with a different tele-MD today, who called in a oxycodone 5mg tab for her, which she took at 1130 hrs and 1500 hours. Covid Symptom screen ?Cough YES, chronic, no change ?Fever (subjective or >100.4°F/38°C) YES ?Myalgia YES ?Headache YES ?Dyspnea YES, "sometimes" ?Sore throat NO ?Diarrhea NO ?Nausea/vomiting YES/YES ?Loss of smell or taste NO , abdominal pain "NO" (pt feels like she is having some discomfort "deep inside" her torso), and rhinorrhea NO</p>

1168291	4/5/2021	IL	71	M	3/30/2021	4/5/2021	<p>3/22/21 Admission HPI: 71 y.o. male with a history of poorly controlled diabetes mellitus and COPD. He presented to my office today acutely with a several day history of increasing shortness of breath. He has increased his prednisone at home recently and been increasing the frequency of his DuoNebs. Despite this, he states that his oxygen saturations have been staying in the low 80s. He has a hard time walking due to the shortness of breath. He states previous to about a week ago he was doing very well. He denies any fever. He denies any known exposure to coronavirus (COVID-19). In the office today his oxygen saturations were 88% on 4 L. Because of his failure of outpatient therapy, he will be admitted to the hospital for further evaluation and treatment. This patient has a history of severe respiratory decompensation that happens very quickly. Therefore, it is medically urgent we get him into the hospital.</p> <p>3/25/21 Admission HPI: 71 y.o. male with a known history of severe COPD and type 2 diabetes mellitus. He came to my office with a several day history of increasing shortness of breath. He had increased his oral steroids and breathing treatments at home and despite this was still having oxygen saturations in the low to mid 80s on 2-4 L of supplemental oxygen. In my office he was extremely diminished and had basically failed outpatient therapy. Therefore he was admitted to inpatient status for acute treatment of a severe COPD exacerbation requiring IV antibiotics and IV steroids. He was admitted and treated with IV treatments. He did recover nicely. However, he was found to be extremely physically deconditioned. Because of this he was thought to be an excellent candidate for swing bed and is being transitioned to swing bed.</p> <p>4/5/21 ER Practitioner Note: Upon arrival to ED trauma room I found patient to be in cardiac arrest, CPR in progress. History is that EMS was called to the scene for a patient with chest pain. Shortly after arrival at his home patient developed a cardiac arrest. They followed standard ACLS protocol and the patient was intubated. Blood sugar normal. As CPR was given, medications were administered consisting of epinephrine and 1 mg in 2 different doses along with 1 amp of bicarb. IV access via an IO. Patient was then transported to the emergency department. Upon arrival, CPR was continued and oxygen supplied via endotracheal tube with good tube placement verified</p>

							by auscultation and good sat readings. Monitor was placed and patient demonstrated initially a sinus rhythm but there was no pulse. Therefore, diagnosis was PEA and no reversible causes were identified. ACLS protocol was followed with epinephrine 1 mg IV every 5 min. He received a total that including EMS, 5 mg of epinephrine and 1 amp of bicarb. Monitor at this point revealed the rhythm changed to an agonal rhythm. When CPR was given, there was good results from the CPR. However, CPR discontinued and there is no pulse and patient had an agonal rhythm for several minutes, pupils were fixed but not dilated year. Lungs demonstrating clear bilateral breath sounds when he was bagged via the endotracheal tube. No external signs of any trauma noted. The patient's sister is here and she is a registered nurse. We had discussed management at this point with her and all were in agreement that the code be terminated. At 1015, patient was pronounced deceased.. ACLS protocol was followed. See nursing record for medication and vital sign details. Code outcome: Deceased CC time 20 minutes.
1168404	4/5/2021		81	F	3/17/2021	3/20/2021	Patient received her first dose of covid vaccine on 3/17 who comes to the hospital on 3/31 for increased fatigue and decreased appetite which began 3d after vaccine. In ER she tested + for covid and CXR was unremarkable, pt was discharged home. Patient returns to ER for increasing shortness of breath causing her to increase her home O2 to 3L and then ultimately 4L prior to EMS arriving. She notes she is dizzy and fatigued. She denies chest pain, n/v, but did have 1 episode of diarrhea PTA. This morning patient requiring 5L NC O2 and ID asked to evaluate for recommendations. Remdesivir withheld as symptom onset > 2 weeks ago. Tocilizumab 8 mg/kg and dexamethasone 6 mg daily initiated.

1167517	4/5/2021	TN	60	F	4/1/2021	4/1/2021	chest pain beginning 11:00pm after vaccine given at 9:30am with subsequently confirmed cardiac ischemia. There was associated shortness of breath and fatigue. Patient waited to call on 4/2/2021 and was seen in the office and subsequently sent to the ER after electrocardiogram was abnormal.
1168690	4/5/2021	NY	60	F	4/1/2021	4/1/2021	At 3:44pm, writer was paged to tend to patient who per monitor began having sudden hiccups. On writer's arrival to room, patient observed to have sudden onset abnormal breathing pattern and intermittent spasmodic hiccups. Writer called for additional assistance, oxygen and crash cart. Patient denied headache, dizziness, rash, throat discomfort, hoarseness, nausea, or chest pain. Patient was alert and verbal in between spasmodic hiccups with appropriate coloring; and she voiced that the active abnormal breathing happens when she gets an asthma attack. She simultaneously was reaching in her purse and worded "my pump". Oxygen via NC at 2Lpm provided to patient. Patient self-administered 2 puffs of her Ventolin rescue inhaler, though observed patient's inability to hold breath adequately after each puff. BP: 150/70 P: 98bpm RR: 22 Pulse oximetry 100% on 2LPM via NC. Dr. reached via telephone who ordered for patient to be sent out via 911 to hospital. Lungs and Heart auscultated by RN – no abnormal findings. At 3:55pm patient noted to have shallow rapid breathing, and voiced she felt lightheaded, weak and feeling a burning sensation in chest, and writer noted patient appeared to lose control over her head and neck. Patient repositioned to supine in recliner. Writer coached patient to control breathing with pursed-lip breathing technique and switched oxygen via NC to face mask, patient was able to follow commands well and remain alert. Dr. ordered Diphenhydramine HCl 25mg IM STAT. RN administered Diphenhydramine HCl per order at 4:00pm to right deltoid without incident. EMS arrived and assumed care at 4:00pm. Patient transferred self from recliner to stretcher with EMS assist. Patient left facility via stretcher and 3 EMS attendants at approximately 4:15pm, verbally responsive and oriented x 4 without supplemental oxygen and in adequate control of her head and neck muscles. VS: 170/60 P: 88 O2 Sat: 100% on room air.

1168120	4/5/2021	NJ	103	M	3/27/2021	3/27/2021	Patient had received second dose of the Moderna COVID vaccine. Within less than 5 minutes of his observation period, patient began having uncontrolled movements of his arms and legs. Patient was A/Ox4 and denied any pain, shortness of breath, chest pain and any other medical complaints. 911 was contacted and EMS was notified. Patient has not experienced this in the past and has no known history of neurological disease according to family member on scene. Patient had no adverse reaction after his first dose of the Moderna vaccine. Patient reports no unusual change to daily routine or medication regime. Patient had no abnormal breathing, radial pulse was within normal limits and skin was warm and dry. Patient was unable to safely sit in chair and was moved to reclining chair where he was left in the semi fowlers position. Patient continued having uncontrolled movements approx. once every 10-20 seconds. Patient was able to talk the entire time and had no change in mental status. EMS arrived on scene and patient care was transferred.
1167711	4/5/2021	IN	69	F	4/3/2021	4/3/2021	Chest pain / tightness; nausea; extreme fatigue; pain in left / right rib cages; headache; 48 hours to date
1170456	4/5/2021	MI	56	F	4/1/2021	4/2/2021	Symptoms began about 5 hours after the application of the vaccine and consisted on: fatigue, headaches and high resting hearth palpitations. During the night and the day after (Friday 04/02) symptoms worsened especially heart palpitations being all day above 120 up to 135 per minute. At moments it was difficult to breath and talk. By the end of the day I also experienced chest pain and signs of low oxygen (blue lips and pale colors) as well as mild fever. After calling paramedics, I was transported to the ER where blood, urine and Covid test were performed. I was told that some values of the blood test could suggest a blood clot so a CTscan was also performed with negative results. After a few hours in observation with infusion of fluids, potassium and magnesium I was sent home. Saturday and Sunday (days 3 and 4 after the vaccine) symptoms improved however heart palpitations were higher than normal and I still experience mild fever (98-99F). Insomnia and fatigue persisted for two more nights. Finally today Monday April 5, I could say that I feel back to normal.

1169842	4/5/2021	FL	39	F	3/31/2021	4/1/2021	the first 24 hours were very complicated with a lot of fever, headache, body aches, fatigue, chills, great thirst, and shortness of breath, chest pain. On the third day the fever decreased to 40% and the body aches decreased to 20% but the headache continued and the shortness of breath also. The day was no longer fever, the muscle aches were somewhat better, but the headache, chest pressure and breathing problems continued and I went to and was evaluated by a doctor and treated with some injections. The headache improved almost 100%, but I continued with breathing problems and for 2 days I presented as bruises on the body and face. Breathing and chest are definitely what worry me the most because I already have treatment and I'm not getting better.
1169865	4/5/2021	AL	75	M	4/2/2021	4/3/2021	Pt. reports the next day after the shot he was having difficulties standing and walking and required assistance for most of the day. Questionable palpitations as he was concerned it "affected his heart" but no chest pain or diaphoresis. No SOB. Pt. had a similar rxn to the first shot on 3/5/21 and had gone to the ER where CXR, EKG, base labs, vitals were all normal.
1169911	4/5/2021	NM	76	M	3/26/2021	3/26/2021	Patient states that he felt "floaty" after receiving the vaccine today. It began within about 5 minutes. No chest pain. No shortness of breath. NO numbness or weakness. He does note he tends to be emotional and has been quite emotional about the vaccine. He has been under a lot of stress for the last ten years. Vital Signs HR 69 /min, 39 /min, BP 181/124, 195/126, Ht 59, RR 18, Oxygen sat % 95, 96, Oxygen Liter(s) Patient had EKG which showed bradycardia and flipped T waves inferiorly. He was sent to the ER where his blood pressure remained high. Pulse remained low initially but gradually improved. Cardiac work up was normal and patient was discharged to home.
1169918	4/5/2021	IL	71	F	3/23/2021	3/27/2021	She developed symptoms of right lower leg pain 4 days after receiving the vaccine. It then progressed to right chest pain, tachycardia, and shortness of breath. She was diagnosed with a DVT and PE.

1170103	4/5/2021	CA	39	F	3/19/2021	3/19/2021	Within 30 minutes of first dose of vaccine reported fever/sweaty, higher blood pressure and lightheadedness. Went to the clinic and confirmed through nurse triage that fever and blood pressure were elevated. Blood pressure ~128/86 Patient's normal range is 90/60 Fever was 99 Next three days: On and off fever that never went above 99. Patient has chills, and normal symptoms when having a 99 degree fever. For the next 10 days continued to have elevated blood pressure (123-128/80), lightheadedness and vertigo. Blood pressure, lightheadedness and vertigo continued even when patient is laying down. Stronger adverse effects included numbness, leg pain and chest pain that felt like a heart attack, especially whenever bending leg at the knee. Symptoms remained constant and did not lessen over the 10 days. On the 11th day adverse effects drastically reduced though blood pressure was still higher than normal but closer to normal range.
1170129	4/5/2021	OK	21	F	4/1/2021	4/3/2021	1st dose Moderna adm 3/4/2021 developed mild flu like sx lasting 2-3 days. 2nd dose Moderna adm 4/1/2021 developed moderate flu symptom.. Left arm injection site swelled to size of a peach. On 4/3/2021 noted heart racing and chest tightness. Her pulse 90-120 by home pulse ox monitoring. Taken to ER by her mom. She had blood work, EKG and rec to f/u with her primary care physician for "adverse reaction to Moderna". 4/5/2021 had office appt. The PA stated an adverse reaction to the shot. Her pulse 133 in office. BP 138/70. She has received a referral to a cardiologst. Continues to feel like her heart races, approx. 6 times today, with sharp chest pain or tightness.

1170368	4/5/2021	CO	58	F	3/20/2021	4/3/2021	4am, 4/3/21, chest pain unresponsive to 2 chewed Gaviscon. 5 baby ASA taken po and drove to hospital ED at 4:30am. First EKG negative for changes. First tryponin lab 0 and negative. Approximately noon, 2nd tryponin elevated at 0.54. Right radial access heart catheterization at approximately 1pm shows small branch of LAD with SCAD. Medical management with IV heparin, Plavix, and daily baby ASA 81mg. Discharged to home 4/4/21.
1170001	4/5/2021	MO	61	F	3/24/2021	3/26/2021	Chest pains, migraine, difficulty breathing with mask on, out of breath easily, low grade temp, chills and body aches, runny nose ear pain Started with chest pains 4am 3/26 and lasted about 2 1/2 days
1170459	4/5/2021	CA	49	F	3/30/2021	4/1/2021	Woke up before 6am on 4/1 to severe itching from what felt like a hundred bug bites, it was a systemic allergic reaction beginning from my scalp to my feet. These continued to grow into massive, red, itchy welts that covered most of my body all over. Throat became restricted, felt harder to swallow but not impossible. Chest pains started evening of 4/1 with every swallow. Took two Benadryl and slept on 4/1. Woke up on 4/2 with left eye swollen shut, lip swollen, and hives had settled into large, flat welts all over but less itchy. Went to Emergency Dept around 7:50am on 4/2 where I was given prednisone (60mg?) and Zyrtec. Observed for about 1 hr, 45 mins, and released feeling okay but still swollen with a few welts left. Have taken Benadryl every evening through tonight, 4/5. Welts disappeared on 4/4 and itchiness stopped then, too.
1170463	4/5/2021	WA	54	F	3/19/2021	3/20/2021	The next day after the vaccine I had chest pains and severe headaches. After a week of this I went to Urgent Care and they send me to the ER with Chest Pain and High Heart Rate. They were not able to get my heart rate down in the ER so they decided to admit me to hospital and run some tests on me. Several hundreds of dollars later they have no diagnosis. I am now on blood pressure medicine for a month to see if this helps my blood pressure.

1169097	4/5/2021	CA	52	M	4/1/2021	4/1/2021	Pt got his first dose of Covid 19 vaccine with a Pfizer brand administered intramuscular at left arm at 01:11 PM. Pt sat down at 01:20 PM and pt verbalized that he is feeling light-headed/ dizzy. The EOA, RN stayed with the pt and asked admin to help patient lay on the floor. At 01:22 PM pt passed out. Admin placed pt laying on the floor with legs elevated and head on the side. Pt was unconscious with pulse and with breathing. Vital signs was checked BP 102/60 mmhg; PR 83 ppm; RR 18cpm, T 97.6 F, Oxygen sat 98% at room air, Blood sugar 128 as taken by RN. After 30 seconds pt regained consciousness, pt is alert oriented to self, time, place, date and location. Pt stated no complaints of chest pain or SOB. EOA assesses muscle strength in both upper and lower extremity and is 5/5. EOA assigned RN to continuously monitor pt every 15 mins until stable. Pt was advised to call family for us to inform and EOA highly recommended to have a family member stay with him. Admin called the wife and wife stated that she will here in an hour. Pt refused to call 911 as well but pt was advised to have a follow up appointment with primary care doctor. Pt stated he has an appointment the next day. Pt also stated he has no history of him passing out after any vaccination. Pt was transitioned from laying to sitting with latest vitals of 110/ 68mmh, oxygen sat 99% at room air, PR 72 ppm, RR 10, T 97.6 F. No complaints of dizziness. RN (EOA), and a admin stayed with the patient until family member arrives. By the time family member arrives, RN (EOA) discharged pt without any discomforts.
1169164	4/5/2021		45	F	3/26/2021	3/26/2021	Between 5-10 mins after receiving dose, patient started having R sided chest pain and difficulty breathing. patient was transported to EC. Blood test, urine test, CT chest w/o contrast. Was told pulled a muscle while sitting and doing nothing (@ holding area). Correlation can't be made with any degree of certainty if related to vaccine. Felt burning sensation in arm after receiving vaccine and then pain on right side right under armpit (stabbing sensation). Every time took a breath in, felt pain. Patient reported having a hard time walking. Wasn't given any medication in EC. Pain was manageable after 5 hours.

1166444	4/4/2021	CA	55	F	4/2/2021	4/2/2021	HPI: Patient is a * year old * who received a single dose of J&J COVID19 vaccine in the left deltoid. About 5 minutes following administration of the vaccine, patient started to develop a red and pruritic rash on the left forearm and left hand. Patient related that she has an alcohol sensitivity where she develops red and itchy skin following consumption of alcoholic beverages. She relates she also experiences cold urticaria where she develops a red, itchy rash following submersion in cold water. When this occurs, she typically takes Benadryl or Zyrtec/Claritin (depending on the time of day), of which resolves the itching and the rash subsides. She has an allergy to Bactrim. She relates a past medical history of asthma, which she takes a daily inhaler, as well as uses her rescue inhaler twice a week. She has not seen her PCP in about 1 year. She denies chest pain/tightness, shortness of breath, difficulty breathing, swelling of the face/lips/tongue/throat, skin rash/itching, cramping abdominal pain, nausea, and vomiting. Exam (update as needed): GEN: Alert and oriented x 4, in NAD HEAD: NCAT EYES: PERRL, EOMI ENT: Ears normal, Nose normal, OP normal, no evidence of angioedema NECK: Supple, without LAD. CV: RRR, no m/r/g PULM: Clear to auscultation bilaterally, no accessory muscle use ABD: Soft, no tenderness. SKIN: Erythematous, coalescing raised papules in the distribution of the left forearm and left dorsal hand. Small, erythematous wheal on the dorsum of the left shoulder. No erythema or edema of the injection site. Skin warm and dry MSK: FROM, MS 5/5 NEURO: Alert and oriented x 4, CN 2-12 grossly intact, no ataxia, gait steady Clinical Impression/Field Tx: Urticarial rash. Patient was observed for 15 minutes following 30 minute observation period. During that time, the skin manifestations stabilized. Patient did not display signs/symptoms of anaphylaxis. Vital signs were stable. Patient offered evaluation by EMS, however, patient denied evaluation and preferred to go home. Patient was driven to site by significant other and self-administered OTC Benadryl. Patient asked to follow up with PCP/allergist and to inform them of the post-vaccination reaction, as well as to further discuss asthma/urticaria management. Patient instructed to go to the emergency department should she develop chest pain, shortness of breath, and swelling of the face/lips/mouth/tongue/throat, as these could be possible signs of anaphylaxis that

1166237	4/4/2021	ID	46	F	2/12/2021	2/13/2021	She presented to the ER on 2/13 with a lot of chest pain and had some flattening of her T waves. She ended up getting a cardiac catheterization while she was there which was normal. The day prior to this she had actually received her second Covid vaccination in her left arm. She noticed achiness and soreness across her shoulders bilaterally into her chest and into her neck. She had some subjective fevers and chills and felt generally fatigued. She also had a lot of swelling in her left axilla and she ended up getting a CT scan during her workup which revealed some left axillary adenopathy. She returned to the ER on 3/16: while brushing her teeth, she developed right facial paresthesias that marched over approximately 20 minutes to involve the right arm and the right leg. She went to the hospital. She was seen in the ER. They felt this represented possible ischemia. They gave her tPA. She had a hemorrhagic nosebleed. Did not develop any other signs of bleeding. Her symptoms had not resolved. She was discharged from home. She had a headache at the time of her visit to the ER. Her headache had resolved by the time she was discharged home, but she continues to note paresthesias in the right side of her body, right face, and notes over the last day or 2, she has had increased dysarthria, dizziness and slurred speech, brain fog, a sensation of heaviness and inability to think. She states she currently does not have head pain per se, but she does note that she just feels generally poorly. She feels like her brain is working faster than her mouth muscles are. She is in today for neurologic followup, concerned about these ongoing issues. she continues to struggle with her speech feeling quite slow and deliberate, she feels like it is difficult for her to concentrate, she is forgetful, she still has intermittent episodes of paresthesias in her face, arm, and hand, she feels like she becomes heart and flushed and she has some heart rate variability with her heart going slow and fast, and she has significant disequilibrium. She is extremely fatigued where she is only able to get up for 1-2 hours before she is extremely fatigued and has to go back to bed.

I tested positive 07Feb; This is a spontaneous report from a contactable unspecified age female Consumer communicated to a Pfizer colleague that the patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Formulation: Solution for injection), via an unspecified route of administration on 29Jan2021 at single dose for covid-19 immunization. The patient medical history and concomitant medications were not reported. The patient stated that she lives with her boyfriend and her16-year-old daughter. While she did quarantine after diagnosis, she spent a lot of time with her boyfriend prior to her diagnosis. He tested negative when they should have been positive. The patient's daughter also was with her, in very close quarters for several hours (a car for well over 3 hours) and her daughter also tested negative. The patient was 6 days post diagnosis and felt almost normal again. The patient chest pain and headache on an unknown date. On 07Feb2021, she tested positive. The outcome of the events was unknown. Information on the lot/batch number has been requested.

1165575	4/4/2021	FL	67	M	1/6/2021	2/3/2021	<p>Pain in the chest; Water in lungs; Pain in the neck and left side of sternum; Soreness in arm; Fatigue; A spontaneous report was received from a consumer, concerning a 67 year old male patient, unknown race and ethnicity, who received Moderna's COVID-19 vaccine (mRNA-1273), and experienced pain in the chest (chest pain), water in lungs (pleural effusion), pain in the neck that went down the left side of sternum (neck pain radiation), soreness in arm (pain in extremity) and fatigue. The patient's medical history was not provided. Concomitant medications reported included warfarin sodium, ezetimibe, fiber, and vitamin D NOS. On 06 Jan 2021, the patient received the first of two planned doses of mRNA-1273 (Lot number: 011L20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 03 Feb 2021, prior to the onset of events, the patient received the second of two planned doses of mRNA-1273 (Lot number: 028L20A) intramuscularly in left arm for prophylaxis of COVID-19 infection. On 03 Feb 2021, an unspecified duration after receiving the vaccine, the patient experienced soreness in the arm and fatigue. On 08 Feb 2021, the patient experienced pain in the neck on the left side which radiated to the left side of sternum. On 12 Feb 2021, in the morning, the patient experienced a huge pain in the chest and called 911 for an ambulance. The cardiologist and pulmonologist stated that everything was fine except that there was some water in the lungs. The patient still has pleural effusion. On the same day, the patient underwent electrocardiogram (EKG) and heart CT without significant findings and no abnormalities. The patient was recommended for a computerised tomography (CT) arteriogram. Treatment medications included acetaminophen, codeine, fentanyl, and concomitant medications. Action taken with second dose of mRNA-1273 in response to the events was not applicable. The outcome of the events, pain in the chest, water in lungs, pain in the neck that went to the left side of sternum, soreness in arm, and fatigue were not reported.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.</p>

1167114	4/4/2021	NJ	37	F	3/31/2021	3/31/2021	After a few minutes, I started to feel chest pains which started to intensify, then my breathing started to get shallow. Next, I was feeling tingling in my extremities. Then like the flick of a switch, I went into anaphylactic shock. I couldn't breathe and struggled to get the words out to get an epi pen. I was then injected with 3 epi pens while the ambulance was called. I also felt tingling in my tongue and mouth. The following day at home, I had another reaction. It started with tingling in my throat then the shallow breathing again. Chest pains again, then anaphylactic shock again. The next day, allergy symptoms came back, but not anaphylactic shock. This time, the addition of burning in my biceps on both sides, which traveled down to my forearms. Later on, the burning traveled down my torso to my legs. There is also some burning in my ears and scalp. My breathing is shallow, and it seems like when the allergy meds start to wear off, the symptoms keep coming back. They're happening now as I write this

1167062	4/4/2021	TX	49	F	12/29/2020	1/15/2021	2 days after receiving the 1st dose, I woke up with palpitations. I noticed also that I've been burping too much and have frequent indigestion as if the food stays in my chest area or my upper stomach area. Not comfortable. 5 days after I felt weird so I checked my BP and it's high which goes up to 180's/98. I don't have headaches nor chest pain. When I told my husband he told me our BP machine is broken. So I just diverted my attention to something else. 2 weeks after at around 12:30pm-1:30 pm I was working that time at the hospital, I felt my left eye felt weird so I ask my co worker to look in my eye. I had a bloodshot. My charge nurse told me to check my BP and it was 158/85. I called my doctor and spoke to the office clerk. I went to eat lunch and at around 3:30-4pm, I rechecked my BP it was around 173/95. I called my doctor and was prescribed with clonidine. My husband picked up from pharmacy and I took it.
1167059	4/4/2021	CA	32	M	4/4/2021	4/4/2021	Eternal pleuritic type chest pain no other cardiovascular symptoms . No nausea. Settled within 10-15 minutes.

1166944	4/4/2021	CA	29	F	3/31/2021	3/31/2021	Pt got her 1st dose of Covid -19 vaccine, Pfizer brand at 06:35 PM. Pt sat down at the post vaccine area for the observation, pt stated that 5 mins after getting the vaccine, she felt warm and sweaty and light headed. Pt called the admin staff attention and reported what she is feeling. Staff assisted staff on duty and post vaccine RN checked pt. Staff and RN assisted pt in a laying position on the ground. Initial vitals was checked and recorded as BP 100/70 mmhm; PR 85 ppm; RR 20 cpm; Temp 97.3 F; oxygen sat of 99% at room air.EOA was notified as well and assessed pt. Pt is alert oriented to self, place, time, location and date. NO Chest pain noted, No SOB noted. quick skin assessment done and no hives or redness noted. Pt was monitored every 15 mins by RN until stable. Pt refused to call 911. Pt was assessed by EOA after 15 mins and pt verbalized feeling better and stated that she had history of being anxious. Pt was gradually transitioned to sitting position. Pt was advised to have someone pick her up but she refused. Pt was also advised to get an appt with primary doctor for follow up check but anything like chest pain or SOB at home to call 911 right away. Pt was checked once again before discharging pt. Pt is stable and no more complaints of lightheadedness. At 07:28 PM RN accompanied pt to her care. Pt verbalized appreciation and abrupt interventions of her concerns and reaction. EOA made incident report as per protocol.
1166919	4/4/2021	TX	33	F	3/24/2021	3/24/2021	Initially complained of dizziness, onset within minutes of receiving the vaccination. Within 5 minutes complained of chest pain. Stated she had a history of angina at the initial assessment. BP: 145/100. P: 83. O2 sat: 98%. Anaphylaxis ruled out by medical director. Pt was advised to have further evaluation for chest pain; chest pain was located in center of chest, described feeling as "a punch in the chest". Pulse increased to 100, BP remained elevated. EMS activated. Pt then recanted statement; said it was her sister that had angina. Pt continued to have dizziness and chest pain. Ambulance arrived at 4:13. Pt care transferred to EMS service for evaluation and possible transport to local emergency department.

1163566	4/3/2021	CA	40	M	3/20/2021	3/20/2021	<p>Patient came in to the clinic to receive his dose of the Janssen COVID vaccine. Within the 15 minute post-vaccine period, the patient reported feeling warm, sweaty, having clammy hands, and the feeling of almost "passing out". Patient was taken to a patient room to rest, vitals were taken at 13:16 PM with readings of BP: 91/57, HR 72, SpO2 98%, temp 98.5. Patient denies any past medical history, reports he only takes vitamin supplements, and denies any past history of anxiety. He denied any chest pain or SOB. Patient was provided water and was told to rest for a few minutes. Vitals at 1:42 PM were noted to be: BP 108/71, HR 72, SpO2 99%, and temp of 98.1. He says he feels much better and denies any symptoms at this time. ER precautions were given to the patient. Called patient again 4/2/21 at 09:59 AM - pt denies any ER visits, hospitalizations, or any visit to any other healthcare provider since his vaccine. The day after his vaccine, he says he developed a headache with left arm soreness (injection site was left upper arm) which was all improved by Monday, 3/22/2020. He says he took Advil, drank plenty of fluids, and rested for his symptoms of headache and arm soreness. He denies any other symptoms of near syncope after his near syncopal episode at the clinic. He denies any symptoms of fevers, CP, SOB, swelling, drainage, or pain at injection site, abdominal pain, dizziness, lightheadedness, or any other side effects/averse effects of the vaccine. He says he is doing well overall</p>

1163902	4/3/2021	WI	65	M	4/3/2021	4/3/2021	Pt had second Moderna vaccine around 1100. Because he had dizziness with the last vaccine it was requested that he wait 30 minutes. At the end of the 30 minutes the patient complained of severe dizziness. He also had nausea but stated that this was present prior to the vaccine. The patient was pale and sweaty. He denied any chest pain or difficulties breathing. Attempted to get vital signs. O2 was 96 on room air. HR was 52. Unable to get a blood pressure as the patient would not keep his arm straight. Rapid responders were called to assist and a wheelchair was brought over. When we were going to move the patient to the wheelchair he complained of even more dizziness so we did not move him. He declined any juice due to nausea. He was given a few sips of water and a cold pack was placed on his neck. Urgent triage responded and attempted to get vital signs as well. Manual blood pressure was 80/62, HR 47, O2 97% on room air, respiratory rate 14. Patient denied diabetes or blood sugar issues. He had eaten breakfast and took all of his normal medications. First responders then moved patient to the gurney to take him to ER.
1163787	4/3/2021	NE	75	M	3/23/2021	3/30/2021	Patient presented to our ED on 3/30/21 @ 1149 with complaints of SOB and chest pain. D-Dimer was elevated > 3 times upper normal limit so CTA was performed. CTA showed bilateral lower lobe PE with moderate thrombus burden. Patient was given Lovenox 1mg/kg (90 mg) x 1, pain medication, and home medications he had not yet taken at home on 3/30. He was then transferred to a higher level of care. Course at transfer hospital unknown at this time.
1163744	4/3/2021	LA	36	F	4/1/2021	4/3/2021	Initial fatigue the afternoon I received the second dose. Slight soreness in arm and itchiness around the injection site. On 04/03/2021, approximately 9:30AM, I began having sharp, stabbing chest pains in my left chest. I have experienced these pains before, typically following recovering from an illness. Likely pericarditis.
1163712	4/3/2021	MO	61	F	4/2/2021	4/2/2021	Pt reports severe left arm pain. Pt also reports left sided chest pain and difficulty getting a full breath.

1163187	4/3/2021	NY	72	F	1/18/2021	3/22/2021	Pt presented to the ER on 3/22/21 c/o sudden chest pain and fever of 101.1. She was transferred to the hospital due to concern for possible acute MI. She was ultimately found to have idiopathic pericarditis after further work up and discharged home on colchicine 2 days later.
1163082	4/3/2021	WA	42	F	4/2/2021	4/2/2021	Patient received Covid vaccine and approx 5 minutes later pt c/o symptoms of nausea and heart palpitations. Per patient, she had received an ear exam earlier that morning and had vertigo following the procedure. Patient also states she has history of cardiac arrest in June 2020. RN assessed patient along with volunteer MD assessed as well. Vitals showed elevated BP and transient elevated HR. Patient experiencing significant anxiety at this time as well. Patient given 20 mg famotidine for nausea. Symptoms did not resolve after an hour, and at this time patient began to feel chest pain that did not diminish. Patient did not wish our to call 911 but stated she would have her partner take her to the local ED. RN followed up with staff MD.
1163002	4/3/2021	IL	40	F	4/1/2021	4/1/2021	After I got the shot April 1 2021..less that 2 mins I felt my lips swollen and had a hard time breathing I ask for help the. They put me on the side.my lips gets more swollen and my tongue all the way to my throat that I can't breathe paramedics give me 2 benadryl and pepcid and oxygen my BP went high as well..stayed there for long hours to make sure ill.be back to normal.im reporting this incident that happen to Me, coz I don't knw if someone will report this incident. DR was the attending physician that day and she took care of me.today is my 2nd day after I got vaccine I'm feeling chest pain and episodes of difficulty breathing.i hope someone will get in touch with me about my severe reaction to the Moderna vaccine.they didn't tell.me what to do after I got home..if I need to see my family doctor?they just said continue to take benadryl. I really don't knw what to do.and I don't want to panic.

1162446	4/3/2021		56	F			chest tightness/ chest tightness worsening slightly; lightheaded; vaccine-related anxiety; chest pain; shortness of breath; nausea; vomiting; diarrhea; This is a spontaneous report from a non-contactable health care practitioner (other HCP). A 56-year-old female patient received the first dose of BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE solution for injection; Batch/Lot Number: EN6205; Expiry date was not reported) via an unspecified route of administration on an unspecified date (at the age of 56-years-old) at a single dose for covid-19 immunization. Medical history included chronic pain from an unknown date and ongoing. Concomitant medications included glipizide and lisinopril 10mg (taken at night) which were taken for an unspecified indication; and morphine taken two times a day for chronic pain. The start and stop dates of these medications were not reported. The patient previously took pioglitazone hydrochloride (ACTOS) and was taken off in the last couple of weeks and switched over to Glipizide. On an unspecified date during the patient's 15-minute waiting period after the vaccination, the patient began to experience chest tightness. The patient was transported to emergency department (ED). The patient also experienced lightheadedness and chest tightness worsening slightly while she was being monitored after the treatment was given. The events were reported as non-serious. Differential Diagnosis: Vaccine- Related Anxiety (include misc mental health, unspecified) and Red flag symptoms (CP (Chest pain), SOB (Shortness of breath), NVD (Nausea, vomiting, diarrhea), and unspecified Visual/Neuro concerns. Treatment included antihistamine, Cetirizine (Zyrtec), and water for the event chest tightness. The outcome of event chest tightness was not recovered (reported as worsening); while other events was unknown. No follow-up attempts are possible. No further information is expected.

1164029	4/3/2021	CA	26	F	4/3/2021	4/3/2021	Patient is a 26 year old female who presents immediately following administration of a single dose of J&J COVID19 vaccine in the left deltoid. Patient was walking with her mother to their vehicle when she lost consciousness. Per patient?s mother, the patient has a developmental delay and can be a poor historian. Patient states that she has never experienced syncope. She denies allergies to medications and foods. She has never had a vaccine in the past. Patient denies a medical history. Patient states that she takes Concerta and Lexapro on a daily basis. She denies chest pain/tightness, shortness of breath, wheezing, swelling of the face/lips/mouth/tongue/throat, skin rash/itching, cramping abdominal pain, nausea, and vomiting. Vasovagal syncope with loss of consciousness. Patient not displaying active signs and symptoms of anaphylaxis. Patient was transferred to a cot and very quickly regained consciousness. Patient was A&O x 4 and in NAD. EMS was called to the scene for further evaluation due to limited resources. EMS called to the site for further evaluation due to vasovagal syncope with loss of consciousness. EMS related patient was experiencing orthostatic hypotension. EKD and blood sugar levels were within normal limits. Patient transported to ER.
1164913	4/3/2021	FL	48	M	4/3/2021	4/3/2021	Patient received his first Moderna Vaccine today. The dose was given in his right arm and about 10 minutes after administration patient reported chest pain on the left side. Patient was monitored and reported no signs of breathing problems, also no swelling, rash or problems with airways. Patients Blood pressure was taken and recorded as 141/91. His pre vaccine temperature was 97.1, and he reported no allergies or health conditions. He is a 48 year old hispanic and smokes. Patient agreed to have ambulance called to check him out as he had no need for Epi-Pen or benadryl. Paramedics arrived at the store approximately 10 minutes after called and released patient with no further treatment and stated that patient possibly had anxiety after the administration as he checked out on all other observations.
1165098	4/3/2021	IL	34	F	4/1/2021	4/2/2021	High Fear, body aches, lower back pain and spina pain. Follow by chest pain. Left side where my shot was given it was extremely sore Home care- a lot of liquid and rested for 24-48 hrs

1164836	4/3/2021		31	M	3/26/2021	3/26/2021	Chest pain / Heart pain (localized to left side of chest). Most intense the day after the shot, but still continuing 8 days later. Was constant at first, at the 8th day it only comes on after physical activity, but does not subside for hours.
1164441	4/3/2021	MD	70	M	3/10/2021	3/10/2021	Routine home care provided by PA-C of MD 3/10/2021 11:40 am vaccinated at home since bedbound with myositis. Unclear when began to feel bad. 3/11/2021 9:07 pm EMS transported to Hospital Center ED for altered mental status following vaccination. ED physician note states "70 y/o male with pmhx of CAD, CVA, HTN, DM, myopathy and DVT on Xarelto presents to ED with complaints of generalized weakness and change in mental status onset yesterday. Patient received his COVID vaccine yesterday and since then, patients wife is concerned he is not behaving himself and appears confused. Wife is also concerned he has a decreased appetite and decreased PO intake. Patient has no complaints at this time. Patient denies chest pain, shortness of breath, abdominal pain and back pain. HPI is limited due to patients mental status." 4/3/2021 when being scheduled for follow-up dose on 4/7/2021 his wife informed us "He had a bad reaction to the first dose of the vaccine, had to go to the hospital, was admitted and had to stay for 3 days does not want the 2nd dose." 4/3/2021 Dr (one reporting) checked system and talked to wife to obtain this history. Agreed with her that he should not receive the second dose due to how badly he felt after the first. In addition, his prior history of COVID likely gives him sufficient protection against COVID-19.

1164475	4/3/2021	CA	44	F	4/3/2021	4/3/2021	Patient is a * year old * who received a single dose of J&J COVID 19 vaccine in the right deltoid. Immediately following administration of the vaccine, patient began experiencing the sensation of heart racing, difficulty breathing, and feelings of anxiety. Patient relates this has happened with vaccines received in the past, as she has postural orthostatic tachycardic syndrome (POTS). She feels as if this is an aggravation of her POTS. Patient states she has allergies/sensitivities to ciprofloxacin, bactrim, and sulfa drugs, but she has never needed to use epinephrine. She denies chest pain/tightness, wheezing, swelling of the face/lips/mouth/tongue/throat, skin rash/itching, cramping abdominal pain, nausea, and vomiting. She does not take any medications on a daily basis. POTS aggravation. Patient was not displaying active signs and symptoms of anaphylaxis. Patient's heart rate and breathing continued to slow down once patient was brought to a quiet place and started to enact breathing techniques. Vital signs continued to improve as patient sat. Patient encouraged to consult her PCP and inform them of their post-vaccination reaction. She was instructed to go to the emergency department if she should develop chest pain, difficulty breathing, swelling of the face/lips/airway, cramping abdominal pain with nausea and vomiting. Patient discharged to home
1163114	4/3/2021	WA	37	F	4/2/2021	4/2/2021	4 hours after vaccine, significant arm pain. 12 hours after vaccine, full body joint pain, low grade fever, chills, headache, mild chest pain.
1160253	4/2/2021	NY	46	F	3/29/2021	3/29/2021	Beginning 6 hours after, extreme fatigue, brain fog, weakness, arm pain at injection site, loss of appetite, nausea, mild sporadic chest pains, loss of breath once. Felt all this for 24 hours. Arm pain, chest pains, loss of breath decreased after 24 hours. Brain fog, weakness, fatigue started to decrease after 48 hours. I am still having fatigue, weakness and GI issues like loss of appetite, nausea and going to the bathroom frequently. I want to hold off on my 2nd shot for several weeks.
1159403	4/2/2021	MI	56	F	3/31/2021	3/31/2021	Patient complained of mid sternum chest pain after vaccination. Pain radiated down arm. Onsite EMS called HR 77 BP 130/79, patient stated at 4:17 pm pain was resolved and went home.

1160173	4/2/2021	TX	57	F	3/30/2021	3/30/2021	ASSESSMENT: 57 y.o. female with PMHx of HTN who presented today to the Vaccine site for her second COVID vaccine. She c/o only a sore arm for 1-2 days after her first vaccine but otherwise tolerated it well. NKDA. She states that about 5-10 min after the vaccine she developed rhinorrhea so she went to the bathroom and blew her nose and it improved some but did not resolve. She did not inform us of this until her 15 min timer went off so I completed an evaluation. I am the physician assistant on site at the vaccine clinic who monitors the patients and is there for emergencies. If a patient feels they are having a reaction I complete an exam on the patient. She states the rhinorrhea was still there but was better than it was. Associated with a sensation of "oil in my throat, like eating some butter" but denies throat itching or tightness. Associated with intermittent dry cough and throat clearing. Denies difficulty breathing, wheezing, tongue/lip swelling, mucosal or skin itching, hives, palpitations, lightheadedness, dizziness, SOB, headache, nausea, vomiting, diarrhea, abdominal pain. She has experienced similar rhinorrhea and dry cough in the past with certain medical masks like the one we provided her today. She also experiences this with her seasonal allergies. Her allergies have not been flaring up the last 2 weeks or so but they were before that. She states she has dry mouth and has to drink a lot of water or she will develop a dry cough and throat clearing like she has today. Reports she has never had an allergy to any vaccine or injectable medication in the past. ROS: Constitutional: Negative for chills, fatigue, fever, diaphoresis and weakness. Rhinorrhea - Airway remained clear, breathing was normal, circulation was good and mentation was good. - She was monitored for 60 min after the rhinorrhea began, vitals remained stable and WNL (despite slightly elevated BP). She drank 1.5 bottles of water which improved her dry cough. She stated she was feeling back to normal before she left the clinic. - Warned her that she likely was having a mild allergic reaction to the vaccine and warned that it is possible for allergic reactions to worsen. Reviewed signs and symptoms of anaphylaxis in detail and gave strict ER warnings if any develop, especially difficulty breathing, throat/facial swelling or any worsening symptoms occur. Warned her while driving to work (15 min drive) she keep an eye on her symptoms and pull over and call 911 if any signs or symptoms of anaphylaxis develop. - Advised she take a non-sedating antihistamine like Claritin on her way to work. I advised she let her colleagues at work now to keep a close eye on her at work. - She expressed understanding and stated she was feeling well and wanted to go to work - All questions were answered. I informed her PCP and sent them my note. I called 4 hours after the vaccine to follow up but had to leave a voicemail,. I spoke with her the following day on 3/31/21 and she stated she felt great besides localized soreness at the injection site. Otherwise she felt well. The rhinorrhea, cough and throat clearing had completely resolved after taking 1 claritin. Denied shortness of breath, difficulty breathing, wheezing, fever, chills, n/v/d, chest pain, hives, itching, palpitations, dizziness, syncope, near syncope or headache. She did not require any further treatment and did not need to have a visit with her PCP and did not need to go to the ER or hospital.

1158366	4/2/2021	CA	38	F	4/1/2021	4/1/2021	<p>On Thursday, 4/1/2021, client received her first dose of Pfizer COVID vaccine (LOT # EW0150, EXP 7/2021) at approximately 10:07 am by vaccinator RN. RN instructed client to self-monitored at the observation area. EMT found this 38 years old female in an observation chair sitting upright and requesting assistance. Due to the client needing translator, site manager present provided translation. lead RN came to assist EMT as needed. EMT reported client had a chief complaint of lightheadedness. Client stated that she felt like her head was "big" but that she did not feel like fainting. Client stated she had a history of high blood pressure and diabetes type 2 but did not take diabetes medication. Instead, she stated that she managed it strictly with her diet. Client had no known allergies. Assessment revealed no redness, hives, swelling, shortness of breath, chest pain or other signs of anaphylaxis throughout her body. Client denied having a headache but stated that she felt "hot" and that the heat was rising to her head. Client denied having a meal before her vaccination. Initial vitals were as follows: Alert and oriented x 4, Eyes were PERL (Pupils Equal and Reactive to Light) at 4 mm, pulse - 74, regular and strong at radial. O2 - 99%, blood pressure 160/98, Temperature 97 F, Respirations 20 and regular. Skins were warm and mildly sweaty. Client consented to staying present for an extra 30 minutes after incident onset. Staff present verified that client had no food allergies and was provided food to eat while under observation. Client's vitals were monitored at 5 minutes intervals after the onset of the incident as follow: 10:18 am: 160/98 (Blood Pressure), 74 (Heart Rate), 99% (Oxygen), 20 (Respiration), 97 F (Temperature); 10:23 am: 162/98, 68, 99%, 18; 10:28 : 162/98, 68, 99%, 18; 10:33 : 162/98, 72, 99%, 18; 10:38 am: 162/98, 72, 99%, 18, 98 F; 10:48 am: 162/98, 72, 99%, 18. Client reported at the end of her observation that she no longer felt hot and her head sensation was gone. Client's temperature improved from 97 degrees Fahrenheit to 98 degrees Fahrenheit and she ceased sweating at the end of her observation period. Client's husband was present and both were provided a Pfizer vaccine fact sheet and instructed to seek out medical advice or emergency care if a severe allergic reaction occurs later in the evening. Client left with husband in no apparent distress at 10:48 am with husband stating he would drive them home.</p>

1158710	4/2/2021			M		3/1/2021	Chest pain; difficulty breathing/having challenges breathing; have fluid around his heart; This is a spontaneous report from a non-contactable physician via Pfizer sales representative. A male patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration on an unspecified date (Batch/Lot number was not reported) as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. Patient experienced chest pain and difficulty breathing/having challenges breathing in Mar2021. He was hospitalized on an unspecified date. The doctor attributed the events to the vaccine and he was advised not to get a second shot. Patient was released from the hospital and upon-follow up with a cardiologist, he was found to have fluid around his heart on an unspecified date. The patient is currently getting more testing. Outcome of the events was unknown. No follow-up attempts are possible. Information about lot/batch number cannot be obtained. No further information is expected.; Sender's Comments: Based on the limited information provided, the reported events are likely intercurrent medical conditions and unrelated to BNT162B2. Of note, medical history, patient's age and concomitant medications were not provided to determine pre-existing risk factors or conditions that may have led to the events. Case will be reassess once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

1162874	4/2/2021	MI	55	F	4/1/2021	4/1/2021	possible anaphylactic reaction vs. anxiety. HISTORY OF PRESENT ILLNESS: This is a 55-year-old brought by EMS from vaccine clinic after receiving the Pfizer COVID-19 vaccine. She reports having history of anaphylaxis to bee stings, most recently needing treatment about 2 summers ago. Today after the vaccination she began developed symptoms that were reminiscent to her of that. Soon after receiving it, she said she was feeling sweaty, starting to become out of breath, and felt like she had swelling developing in her throat. She noticed that she was breathing with some difficulty and started to feel tingling in her face hands and feet. She received an epinephrine intramuscular injection and soon after her symptoms started to improve. EMS responded within minutes and brought her to the emergency department for further evaluation. She did not have loss of consciousness. She did not develop hives. She had nausea but no vomiting or diarrhea. She reports that with her previous anaphylactic reaction to bee stings, she did not develop hives or GI symptoms, but felt like she was puffy all over and had airway symptoms. Today she and her husband do not think that she started to have a change in her voice, but she did think that her throat was starting to swell. After arrival in the emergency department, she said it was starting to feel a little bit harder to breathe again and that she is developing some central chest pressure. CHIEF COMPLAINT: POSSIBLE ALLERGIC REACTION Assessment/Plan DIAGNOSIS at time of disposition: 1. Vaccine reaction, initial encounter 2. Acute chest pain MEDICAL DECISION MAKING From the description of her symptoms it is unclear to me whether she truly had an anaphylactic reaction to the vaccination or whether she instead had an acute anxiety reaction associated with hyperventilating. The sense of tingling around the lips, hands, the along with her not having any change in the quality of her voice would tend to support this. However she notes that with previous bee sting systemic reactions she did not necessarily have a change in voice if she gave her epinephrine quickly enough and typically did not develop hives then either. To treat for the possibility anaphylaxis, I will also give her IV dexamethasone, IV diphenhydramine, IV famotidine. Given her complaint of some chest discomfort, we will check an EKG, troponin x2, chest x-ray. Given her history of diabetes and now

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

						having chest pain, I would have some degree of concern for ACS and will give her aspirin as we do the workup. Her most recent workup was July 1, 2019 when she had a nuclear medicine stress test, with normal results. She does seem to be hyperventilating and feels nervous, in addition we will give a dose of lorazepam. If her symptoms improve, and her troponin is negative, based on her story EKG believe her HEART score would be 2 due to underlying risk factors and that she would be appropriate for outpatient followup of the chest pain. From the reaction standpoint, if she is feeling well few hours later without any recurrence of symptoms, it would be reasonable to discharge her. At this point her x-ray and labs are pending and I will sign her over to the oncoming physician.	
1162721	4/2/2021	WY	43	M	4/2/2021	4/2/2021	Patient complained of dizziness about 15 minutes after vaccine was administered. After another 5 minutes symptoms progressed to include shortness of breath and chest pains. Was sent to the Emergency Room immediately.

1155556	4/1/2021	MA	37	F	3/30/2021	4/1/2021	Pfizer-BioNTech COVID-19 Vaccine EUA. Expected adverse effect of sore arm was experienced March 30th, 2021 a couple of hours after injection. Chills experienced around 17:00-19:00 on March 30th, 2021. Sore arm continued from March 30th, 2021 to March 31s, 2021. Chest pain on both sides of front and back experienced on April 1st, 2021 starting around 02:00 until about 05:00. Chest pain can be described as tightness and two sharp pain sources inside the chest one in each chest side. The chest pain woke me up from sleep. Oxymeter shows normal 94-95%, heart beats at 89-110 bpm. It was enough pain to consider taking two Advils, but took one instead just in case I was having a heart attack. I have never experienced chest tightness or pain like that before. Pain slowly subsided after taking one Advil.

1155450	4/1/2021	CO	38	M	3/23/2021	3/24/2021	Moderna COVID- 19 Vaccine EUA: patient presents to urgent care reporting lower lip swelling for three hours one day after receiving vaccination. Patient also reports tongue feeling tight, tingly, and with pressure. Patient has been taking diphenhydramine. Vital signs all within normal ranges. No vomiting, diarrhea, drooling, rashes, shortness of breath, cough, chest pain, or nausea. Patient able to speak in full sentences and take full breaths. Patient prescribed Epi-pen to use as needed, advised to manage with antihistamines, and discharged to home stable.
1154232	4/1/2021	MA	48	F	3/11/2021	3/11/2021	48-year-old female past medical history recurrent neurocardiogenic syncope, Mobitz 1 AV block, hypertension, hypothyroidism, history of gastric bypass (2018), and anxiety presents from vaccine clinic with an episode of presyncope. Patient was at the vaccine clinic this morning to get the second dose of her COVID vaccine. Approximately 5 minutes after receiving the second dose, she noted gradually worsening palpitations, mild nausea, shortness of breath, and a sensation that she has been to pass out. Staff in the vaccine clinic were concerned the patient was having allergic reaction, so they gave her an EpiPen. Of note, however, patient denied any cough, chest tightness, sensation of throat closing, wheezing, abdominal pain, diarrhea. She reports that today's episode is nearly identical to multiple prior episodes of syncope/presyncope. She has been worked up extensively for these episodes, including echo, stress test, and Holter monitor. In the ED, she reports feeling back to her baseline. She denies any ongoing symptoms, including presyncope, chest pain, shortness of breath, palpitations, diaphoresis, nausea/vomiting.

1156096	4/1/2021	SC	73	F	3/19/2021	3/19/2021	nurse was called to the monitoring area to evaluate a patient at 1505. Patient was sitting in chair, AAO x 3, complaining of itchy ears and a lump in her throat. Patient had dose #2 of the Pfizer covid vaccine (Lot # EN6207, exp. 7/31/21) today. Patient stated she had dose #1 of the covid vaccine and needed to take oral Benadryl when she got home for similar symptoms. Patient had no visible rashes, denied any chest pain or feeling short of breath. VS were assessed: BP 120/78, HR 79, pulse ox 98%. Patient drank some water and stated she did not feel any worsening of symptoms. Patient was offered IM Benadryl but refused. Patient took her own Benadryl orally. Pulse ox was rechecked (98%) and HR was 74. No distress was observed. Patient was held for an additional 20 minutes for observation. Patient had no worsening of symptoms during this time. Patient left without further incident. She was advised to call Emergency responders should she have any worsening of symptoms including rash, hives, or shortness of breath. Patient verbalized understanding
1156066	4/1/2021	SC	53	M	3/24/2021	3/24/2021	This nurse was called to the monitoring area to assess a patient. Patient was sitting in chair AAO x 3. Stated he felt like his heart was racing and he felt dizzy. RN obtained VS: 158/100, HR 142, pulse ox 98%. This nurse informed patient EMS was going to be called. Patient reports a PMH of COPD and Htn. Stated he did not take his medications this morning which included Lisinopril. He was concerned the medications would interact with the vaccine. Patient had dose #1 of Pfizer Covid vaccine (Lot # EN6207, exp. 7/31/21). Patient was slightly diaphoretic. VS reassessed: BP 160/98, HR 131, pulse ox 99%. Patient denied any chest pain or tightness, no difficulty breathing. Patient reported feeling his throat was itchy. Stated he felt hard to swallow. At that time, this nurse advised she was going to administer the epi-pen. Patient refused. Stated he wanted to wait. Symptoms did not subside. Nurse offered Benadryl to which patient agreed. EMS arrived. They stated they would administer the Benadryl. Final BP was 160/100, HR 114, pulse ox 98%. Patient left without further incident.

1155918	4/1/2021	WI	79	M	4/1/2021	4/1/2021	Patient received first covid vaccination today, at around 1140. Volunteer monitoring patients noted that individual scooted down in his chair. She asked if he was okay and stated he was feeling dizzy. Vaccination clinic staff responded. Patient was able to assist to floor. Feet were elevated. He was provided water and ice pack. Patient did not appear to lose responsiveness at any point. He was able to state he was at the hospital as well as his name, DOB and where he was from, but patient was slow with answers. Patient then stated he was starting to feel better. He denies SOB or chest pain. As staff continued to interact with him, he was slower to respond again. He shared he had nobody in attendance with him and no family in the area. A code medical was called. BP cuff arrived BP was 164/110. ER nurse began assessment. Patient was able to get to standing position with staff assistance. He was taken to ER via stretcher for evaluation.
1155302	4/1/2021	NJ	38	F	1/14/2021	1/21/2021	A week after getting the shot the left side of my body went numb/tingling. My left foot felt like I was stepping in a puddle of water. Left facial cheek went numb, left side of my neck hurt, left eye went blurry, left ear pain and sore throat. Went to ER to rule out a stroke. They did blood work, CT scan and EKG. Since then I have seen a neurologist, ENT, Cardiologist and my primary doctor. I have had multiple MRI's and blood work done. I still am having chest pains, sore throat, ear pain, tingling in my left arm, and blurred vision.

1153962	4/1/2021			M	3/12/2021	3/15/2021	Acute myocarditis; Chest pain; A spontaneous report was received from a physician concerning (patient age: unknown) male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced chest pain, acute myocarditis (myocarditis). The patient's medical history included COVID-19 in Mar 2020 and was exposed and may have had it a second time in Nov 2020. Concomitant medications were not provided. On 12 Mar 2021, prior to the onset of the event, the patient received their first of two planned doses of mRNA-1273 (Lot number: 038A21A) intramuscularly for prophylaxis of COVID-19 infection. On 15 Mar 2021, the patient developed chest pain and was admitted to the hospital. The patient underwent cardiac catheterization, echocardiogram and cardiac MRI (magnetic resonance imaging). Results of the echocardiogram and cardiac MRI were not provided. The final diagnosis of the patient was acute myocarditis. COVID antibodies were positive, about 561 for the patient. The events chest pain and acute myocarditis lead to hospitalization. Treatment activities for the events were unknown. Action taken with mRNA-1273 in response to the events was unknown. The outcome of events, experienced chest pain and acute myocarditis, was unknown.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.
1155463	4/1/2021	TN	57	M	3/27/2021	3/29/2021	Chest pain onset day of vaccine, tested positive COVID-19 3/29/2021- 2 days after vaccine. Left heart cath placed 3/29/2021
1156405	4/1/2021	IN	51	F	3/12/2021	3/13/2021	I first had symptoms of nausea, chills, fatigue and wooziness for 7 days after the vaccine, then developed pneumonia a week after taking this vaccine. I had chest pain and pressure and ended up in the urgent care. After 3 weeks and zpak I am feeling better but not back to normal.

1154281	4/1/2021		45	F	3/20/2021	3/21/2021	I woke up at midnight and could barely move. I had extreme chills, fatigue and body aches and heart palpitations. My heart was beating so fast and hard, it felt like it was going to come out of my chest. I put a heating blanket and a heating pad on me to try to stop the chills. I took 50 mg of metoprolol to slow my heart beat. My heart beat was 75 beats per minute and it is usually 55-60 beats per minute. I went back to bed and woke up at 2:00am and did not feel better, I got some water, but my heart was still beating fast and I felt nauseas. I then vomited. I went back to bed and woke up at 4:30am in a big sweat, I felt even worse. I took my heated blanket off and my heart was beating at 85 miles per hours. I thought about going to have to go to the emergency room at this point but was scared of being exposed to COVID19 but I should have gone to the emergency room. I took 100 mg of metoprolol again and could barely walk due to the muscle aches and fatigue. I woke up again at 8:00am and my heart rate had gone down to 70 beats per minute but I was still fatigued and had muscle aches but at least the chills were gone. It took at least a week for my heart rate to return close to normal but I have been having chest pains ever since the vaccine. I had to stay in bed all of that next day to rest., I did not know that the side effects would be this bad because I would not have taken the vaccine. I would not take this vaccine again.
1157980	4/1/2021		78	F	4/1/2021	4/1/2021	Patient complained of dizziness and presented with substernal chest pain and mild shortness of breath within 15-20 minutes after receiving COVID-19 vaccine. History of hypertension and non-compliance with antihypertensive medications. Relative reports patient also with possible history of stroke with no anticoagulation. Patient hypertensive initially with Systolic in 180s and diastolic in the 80s, upon onset of symptoms. Chest pain minimized within 10 minutes after blood pressure came down to the systolic level in the 170s. Ground ambulance called to transport to Emergency Department, but patient declined ambulance transport and was taken to ED by car with son-in -law.
1157204	4/1/2021	WI	62	M	3/30/2021	3/31/2021	Patient developed chest pain at about 3:30AM the following morning. Ultimately diagnosed with anterior STEMI requiring stent placement.

1158035	4/1/2021	CA	46	F	4/1/2021	4/1/2021	<p>Patient is a 46-year-old woman with no known medical history who presents after receiving her 1 vaccine at the Clinic on 4/1/21. She received her dose at 15:01. Patient drove to the second floor for post-injection observation. Around approximately, 1520, patient honked her car horn for assistance. Subjective/Interval Events: - Upon arrival to patient's car, she was hyperventilating and appeared anxious, diaphoretic, warm, and clammy to touch on bilateral arms. She reported numbness and tingling in her bilateral hands, which radiated down to her lower extremities - Within minutes, patient began hyperventilating more and crying out loud "what's going on?" We were able to calm patient down for a few minutes. Her resp rate decreased - Moments later, patient began reporting severe chest pain and left upper quadrant abdominal pain. - At this point, 911 was called at 1528. - Patient was transported out of her car into a gurney. - A second set of vitals was taken at that time. She was tachycardia to 180s. She attempted to vasovagal. This was unsuccessful as it was difficult for patient to follow commands given anxiety. - Shortly after lying on the gurney, EMS arrived. - Patient was placed on oxygen. Objective: Initial Vitals @ 1521; SBP 128/103; HR 129; RR 30s; Sat: 100% RA; VS @ 1528 136/110; HR 186; RR 32. Sat: 100% RA; VS @1533 117/70; HR 130s; RR 40s; Sat: 100% RA; Initial assessment: Gen: Anxious, tearful, in acute distress, sitting in warm car with door propped open. Neuro: A/O x's 3; Cardiac: tachycardia ; HEENT: Airway clear, no angioedema, no oral swelling, no wheezing, no stridor. Speaking in short sentences with increased WOB, visibly using accessory muscles, hyperventilating. Bilateral upper extremities: bilateral arms warm to touch. Bilateral hands, cool, clammy, bilateral radial pulses present . Bilateral lower extremities: bilateral extremities warm to touch. MSK: MAE when transporting out of car into gurney. Sin: warm, pink, well perfused. No urticaria, not flushed. Plan: - Called 911 for cardiac workup, transported to local hospital for workup - Husband called and arrived on scene - Charge RN notified. Patient was stable upon transfer to EMS.</p>

1158062	4/1/2021	CA	58	F	4/1/2021	4/1/2021	<p>client complained of numbness to lip after receiving the 1st COVID (lot # EW 0150, exp. 4/3/21) at 1150. Client signaled PHN and informed her she was starting to feel her left lip going numb, pressure to her lower base of the head and palpitations. First set of vitals: blood pressure 140/80, pulse 80, oxygen 98%. Client alert and oriented with flushed skin. Client denied shortness of breath, chest pain, no swelling at this time. PHN offered client Benadryl, per client would call friend first if medication was given so she could be picked up. History of anxiety and hypertension, per client had an allergic reaction to flu shot in the past. Current medication: losartan. At 1200 client stated numb sensation was radiating to left cheek PHN offered client Benadryl again and client accepted. 50 mg/IM Benadryl administered to right deltoid at 1203. Client informed we would keep her for further observation and would take vitals every 5mins. Vitals at 1205: pulse 94, blood pressure 180/95 oxygen 97%. Numbness to lip and face same, pressure to head same, palpitations same. Alert and oriented. Vitals 1210: blood pressure 120/80, pulse 81, oxygen 100%. Per client previous complaints improving. Client stated could feel cheek again. Vitals 1215: blood pressure 140/80, pulse 102, oxygen 99%. Client stated feeling nausea, emesis bag given and water. Per client also starting to feel drowsy. Palpitations improving and more sensation to lip area. At 1219 client stated having chills, palpitations returning. Per client was not sure if it was her anxiety. PHN offered 911, get paramedics for further assessment and to transfer to hospital for higher level care. Client refused, she felt benadryl was helping at this time. Vitals 1221: blood pressure 140/80, pulse 87, oxygen 99. Client stated all complaints improving. Vitals 1228: blood pressure 142/80, pulse 80, oxygen 100%. Vitals 1234: blood pressure 140/90, pulse 78, oxygen 99%. Per client lip and cheek no longer numb, normal sensation. Nausea had resolved and palpitations improving. 1241 vitals: blood pressure 140/90, pulse 80, oxygen 97%. Vitals 1247: blood pressure 130/90, pulse 75, oxygen 100%. Client stated feeling good. All complaints had resolved. Per client just tired feeling. 1257 vitals: 130/90, pulse 78, oxygen 96. No complaints. Client advised to speak with primary doctor prior to second dose. ER precautions given. Friend arrived at 1300 and would drive client home. last set of vitals 1305: blood pressure 130/90,</p>

Dull pressing pain in the whole right side of his chest; Headache; Pain was radiating up his back and shoulders into his neck; Pain was radiating up his back and shoulders into his neck; Pain was radiating up his back and shoulders into his neck; Third night he started to shiver; he sweat a lot; This is a spontaneous report from a contactable consumer (patient) reported for a himself that. A male patient of an unspecified age received second dose bnt162b2 (Solution for injection) via an unspecified route of administration on an unspecified date as single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient historical vaccine included first dose bnt162b2 (Solution for injection) via an unspecified route of administration on an unspecified date as single dose for COVID-19 immunization. On an unknown date, the caller stated he had both doses of the vaccine. He stated he had a couple episodes of symptoms after the second dose. He had no problem with the first vaccine. 26 hours after the second shot he experienced dull pressing pain in the whole right side of his chest, kind of a pressure like on the lung spread over the whole area there. He took a TYLENOL and it went away and 10 days later had the same experience but it was the whole chest and the pain was radiating up his back and shoulders into his neck and he started having headache on an unknown date. He took a couple Tylenol and it went away but the next night had he same symptoms and the next couple nights he had the same symptoms and he took a couple Tylenol and went to bed. On the third night he started to shiver, like internal shivering and he couldn't get comfortable for about an hour and 15-20 min. Then he sweat a lot after that on an unknown date. At no time did he have a fever. He called the primary care physician and he suggested he call the cardiologist and had an appointment with him a couple days later. The next day he had symptoms again and he went to the Emergency Room and they performed tests as if he was having a heart attack, because he was having heart attack symptoms, and the tests were all negative. They were going to hold him over night but he had a stress test scheduled the next day so they let him leave and he had that test the next day and everything was negative and they couldn't find anything. Still when he wakes up he has the chest pain and they told him to

still take Tylenol. The doctor prescribed nitroglycerin pills and nitroglycerin pain patches. He has not used any of those because the pain is not severe enough. He is reporting these but also wondering if other people have experienced these symptoms and he asked if it is possible that he got the side effects from the shot or is it a coincidence. The outcome of the events were unknown

Chest pain-radiating pain on right arm; Chest pain-radiating pain on right arm Went to the emergency room-14Mar2021; This is a spontaneous report from a contactable consumer (patient). A 27-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: Eng199 and expiration date not provided) via an unspecified route of administration, administered in left arm on 12Mar2021 10:30 as a single dose for COVID-19 immunisation. The patient's medical history was not reported. The patient is not pregnant. The patient has no known allergies. Concomitant medications included fluoxetine hydrochloride (PROZAC) and ethinylestradiol, ferrous fumarate, norethisterone acetate (BLISOVI FE 1.5/30). The patient previously took the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) for COVID-19 immunisation. The patient did not receive any other vaccine within 4 weeks prior to the COVID vaccine. The patient experienced chest pain-radiating pain on right arm on 14Mar2021 19:30 and went to the emergency room. The event resulted in Emergency room/department or urgent care. The patient underwent EKG, Chest X-Ray, Blood work on an unspecified date with unknown results. The outcome of the events was recovering. The patient was not diagnosed with COVID-19 prior to vaccination and has not been tested for COVID-19 since vaccination.

1151443	3/31/2021	TX	49	F	1/22/2021		<p>fatigue, diarrhea, nausea, and cough were all ongoing and have gotten worse; fatigue, diarrhea, nausea, and cough were all ongoing and have gotten worse; fatigue, diarrhea, nausea, and cough were all ongoing and have gotten worse; fatigue, diarrhea, nausea, and cough were all ongoing and have gotten worse; fatigue, diarrhea, nausea, and cough were all ongoing and have gotten worse; Dilated cardiomyopathy; fever; chills; vomiting; severely low potassium; fluid build up around her heart and lungs; fluid build up around her heart and lungs; This is a spontaneous report from a contactable consumer (patient's husband). A 49-year-old female patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiration date not provided), via an unspecified route of administration (anatomical location; Arm) on 22Jan2021 13:00 as SINGLE DOSE for COVID-19 immunisation. Patient's medical history was not reported. Concomitant medication included biotin from an unspecified date and unknown if ongoing. The patient previously took 1st dose of the Pfizer COVID Vaccine on 29Dec2020 (around 10:00 am to 12:00 pm at a hospital) and had the usual side effects of a little bit of nausea, developed a dry cough, some fatigue, and diarrhea and that kind of stuff. The reporter called about the Pfizer COVID vaccine and was calling on behalf of his wife who was the patient. Reporter stated that before the Pfizer COVID vaccine, patient used to walk the dogs 6 miles a very fast pace and had no problem, then she got her 1st dose of the Pfizer COVID vaccine on 29Dec2020 and had the usual side effects of a little bit of nausea, developed a dry cough, some fatigue, and diarrhea and that kind of stuff. The reporter stated that after the 1st dose of the Pfizer COVID vaccine, the symptoms she reported have worsened and the cough, fatigue, nausea, and diarrhea began immediately after the 1st dose of the vaccine where the cough started a week or so after the 1st dose and then after the 2nd dose, the cough never went away and got worse and worse and worse. Reporter stated the fatigue, diarrhea, nausea, and cough were all ongoing and have gotten worse. Reporter mentioned that for the cough after the first dose of the Pfizer COVID vaccine, it was still there but was occasional and was not too bad but when the patient had the 2nd dose on 22Jan2021 and was knocked on her butt for about three days; also</p>

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

stated that the patient had fever, chills, diarrhea, vomiting, nausea and the works and had all the symptoms. It was also reported that the patient was very sick for 3-4 days with same symptoms. Reporter mentioned that fatigue was getting worse and the cough never went away and always had the dry cough which was getting worse and worse and worse with any activity and was a dry cough and she never had any phlegm. Reporter also stated the patient got to where she did less and less activity and was worse and the dry cough was worse with nothing coming up. It was reported that the patient sought treatment for everything she believed last week on Monday but was unsure of the dates. Monday of last week, patient went to the emergency room in a hospital and was told that they thought that the patient had an enlarged heart and severely low potassium and the patient was put on an IV drip of potassium because she could not tolerate the oral potassium and threw up the oral potassium so she was put on two bags of IV potassium. On an unknown date, it was reported that patient started having pain in her chest from the IV drip of potassium but she was released from the emergency room and the 2nd day of last week which was the next day, patient went back to the emergency room because she was having issues and everything was getting worse. Reporter also stated that the 2nd of last week, the patient collapsed and an ambulance came and got her on Tuesday of last week though reporter was unsure of the dates. Reporter also mentioned that patient went to a hospital and had severe chest pain and collapsed pressure on her chest. Reporter stated that the patient at that time had the dry cough and stuff and the hospital told the patient that the patient had fluid build up around her heart and lungs which was maybe due to the treatment from the IV potassium and was told she has a weakened heart. It was reported that with a weakened heart, the heart can't process fluid around the lungs and the heart and it puts pressure on heart supposedly. It was reported that on Wednesday last week, the patient went to the emergency room for the 3rd day in a row and already had an appointment with the HCP which was an appointment with her new primary Nurse Practitioner for the first appointment and she confirmed that the patient had fluid on the lungs when she saw the patient. Reporter stated that the nurse practitioner could not admit the patient

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

because the hospital she admits too was full so she sent the patient to a hospital emergency room where they did all the tests and everything confirmed what they said and they transferred the patient to another hospital where the patient stayed in the hospital a total of three days and was diagnosed with cardiomyopathy and they started treatment on the patient. The patient was started on Entresto later on and tomorrow there was a follow up visit with her primary HCP and they have to follow up because the patient was released from the hospital and was very weak and she has to wear a lifevest because she is a heart patient and has a weak heart. It was reported that patient is going to be taking medications and stuff and will go see the HCP and they gave her beta blockers and other stuff and she will follow up with the HCP. It was reported that any of the medications including the beta blockers the patient was taking, reporter has no names of the medications, dosages or lot numbers or other information to provide at this time and stated that the patient was treated with those medications in the hospital and that was the hospital in another city and state. Reporter mentioned that it was last week when the patient collapsed while trying to walk across the yard and she was diagnosed with dilated cardiomyopathy where part of the heart shrunk which is the expelling chamber of the heart and the HCP stated where a normal 20-30 year old would have heart function of 55, the patient had an output of 15. Reporter stated that the HCP said that stroke, disease or things like that can cause cardiomyopathy and there are various things that can cause it but they can't diagnose what caused this in the patient because she has not had various things and the only she had was the Pfizer COVID shots that hit her very hard and she just turned age 50. Reporter stated that the patient was age 49 at the time she began experiencing the symptoms that were reported and just turned age 50. Reporter clarified to state the potassium drip the patient had was not at this hospital but was at another hospital. Reporter stated he has no lot numbers, expiry dates or NDC numbers to provide as he does not have the patient card for the Pfizer COVID Vaccine that the patient received and that paperwork is with the patient who is staying at her sister's house so the sister can help monitor the patient. Reporter also mentioned that patient was not taking medications at the time she

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

						received the Pfizer COVID Vaccine at that time but was taking over the counter Biotin and states he has no lot, expiry date or UPC to provide. Reporter mentioned that patient has no family history of heart conditions but he thinks the patient's mother is diabetic but she is the only who is diabetic and there is no other history he is aware of. Outcome of the events was not recovered. Information on the lot/batch number has been requested.

1151921	3/31/2021	PA	79	M	3/6/2021	3/6/2021	Male patient who to the hospital on 3/15/2021 due to 10 days of shortness of breath on exertion and right-sided chest pain. He went to his PCP for follow-up and had a CT PE study today which was positive for right upper lobe and right lower lobe pulmonary embolism. He notes that he received a 2nd 50 COVID-19 vaccination on March 6th and since then has not felt well, feeling short of breath and generally fatigued. He notes that he has not been very active since receiving the vaccine. CT PE study showed an increased RV to LV ratio 1.2. He had no elevation in his troponin or BNP. His echocardiogram showed an EF of 60% and there were no wall motion abnormalities and grade 1 diastolic dysfunction. Patient would prefer Eliquis at this time. He will need a 6 month course of Eliquis. Given the setting of recent COVID vaccination and recent decreased mobility as possible provoking factors, this will be treated as a provoked pulmonary embolus. Per hospital COVID vaccine protocol, patient presentation will be reported to pharmacy for FDA reporting.

Adverse events did not result in either emergency room visit or physician office visit. No treatment received for events. The outcome of the events "foot became paralyzed" and "left foot grew completely numb" was recovered on 26Feb2021 17:30 (left foot and calf numbing and paralysis finally subsided 4.5 hours after injection) while for other events was not recovered. The patient was not diagnosed with COVID prior vaccination. The patient was tested for COVID post vaccination (LUMIRADXSARS-COV-2-AG TEST) via nasal swab on 06Mar2021 with negative result. The event "foot became paralyzed" was considered as serious (medically significant).
1152127	3/31/2021	MN	15	F	3/26/2021	3/26/2021	10 hours after vaccine, the mild soreness in my left arm increased in severity to constant pain, like I'd been hit with a baseball bat. Swelling and shooting pains in left armpit made it difficult to sleep. The following day, the pain continued, spread to my left breast, and any amount of pressure made the pain worse. The pain continued the third day, with constant chest pain that felt like bad heartburn. The worst of the pain subsided four days after vaccination.
							Pre-syncope. Chest tightness/short of breath. Sternal Chest pain. Symptoms started 30 minutes after vaccination. Serial vitals and exam x 2 were normal. Symptoms resolved after another 60 minutes of observation.

1149406	3/31/2021	KY	36	F	3/29/2021	3/29/2021	presents to the ED with complaints of chest pain that started yesterday. She states she got the first dose of the Covid vaccine in the morning. Several hours later she started having generalized body aches, fever/chills, shortness of breath, nonproductive cough, and pain in her chest described as a pressure, worse with deep breath. She states her symptoms have been persisting for about 24 hours, which concerned her so she presented today for evaluation. She has not taken any OTC medications for her symptoms. She is a smoker, but states she has not smoked since the onset of her symptoms. She has a history of SVT that was treated with a cardiac ablation. No known history of CAD. No known family history of heart disease. She did get a flu shot last fall.
1149812	3/31/2021	TX	26	F	12/22/2020	2/8/2021	Red rash all over my body with hives that were itching uncontrollably. Anytime I was touch my body or a red rash/whelp would appear. I felt nauseated, had chest pain and felt fatigued. This occurred at all times of the day and night and was worse when I wore loose clothing.

1150152	3/31/2021	IL	57	F	2/1/2021	2/2/2021	<p>Arm sore, swelling in arm, headache, fever, chills, body aches, nausea, diarrhea. Missed 3 days of work . Had a telemedicine visit with Dr. on Feb 5. Then arm was still sore and saw Doctor at Medical Center. on Feb 26th and then again saw another Dr. on March 4th and also have a appt on April 1st. The arm is still sore and hurts to move. Have added the additional information page with all the visit summaries from those visits. I have had a x-ray and also taking muscle relaxers, heat, ice and Tylenol still no relief. Feb 5-HPI Pt. female was scheduled for a video visit-(in response to COVID-19-pandemic) for. Fatigue, body aches.--needs letter for work. Patient reports she received her moderna COVID vaccine 1st dose on Monday February 1st, she started to have low-grade fever on Tuesday--99.6. Also had body aches and fatigue. Last night she had 2 episodes of diarrhea. Today her temperature is 96°, but she has severe body aches and her arm from the injection site is still very sore. She has been using ice every couple of hours. She is taking Tylenol 2 tablets every 6 hours for last 4 days. Denies cough, chest pain, change in breathing, sinus congestion, sore throat. Denies known exposure to COVID 19, but in the family has traveled outside. Works at Hospital. She never had a COVID positive test but she feels in March of 2020 she was sick with symptoms of loss of taste and smell and body aches but never had fever, therefore she did not qualify for COVID-19 testing. Would like to go back to work on Monday No vitals were taken since this is a video visit. Appearance--appears to be alert and oriented, face without gross asymmetry. Patient talks in normal speech and in full sentences, answer to questions appropriately. Mood and affect normal. Past labs/radiology --reviewed and discussed with patient . ASSESSMENT AND PLAN: Diagnoses and all orders for this visit: Vaccination side effects, initial encounter Encounter for issue of other medical certificate Advised to take Tylenol 1-2 tablets every 8 hours Cannot take NSAIDs due to history of allergy. Maintain hydration. If has fever again tomorrow--should be tested for COVID-19. Advised to call back on Monday to update, if she feels fine no fever for 48 hours then can return to work on Monday Feb 26th-Progress Notes NP D Cousins at 2/26/2021 5:00 PM Medical Decision Making: Assessment and Plan Diagnoses and all orders for this visit: Chronic right shoulder pain - XR</p>

1150247	3/31/2021		23	F	3/26/2021	3/27/2021	office/clinic visit. The outcome of events was resolved. Facility type vaccine was hospital. No other vaccine in four weeks. No COVID tested post vaccination.
1154606	3/31/2021	FL	69	F	3/3/2021	3/10/2021	Woke up at 12:35 AM with a fever, chills, body aches, and nausea. chills in the morning that went away, nausea was on and off and had an on and off headache. Started having intense chest pain around 10 AM- felt like pressure on my chest and almost squeezing, it kind of shot out and I could feel it in my throat and in my headache. It was still happening around 1 PM so I went to the ER after calling urgent care but the pain subsided once I was at the ER. Nausea, dizziness, haziness, and headache were on and off the rest of the day, subsiding around 6 PM.
							Patient began having symptoms 7 days after vaccination: chest pain, shortness of breath, feeling like a lump in the throat. Over several days symptoms worsened, and included upper back pain and some pain in the upper left arm. Patient went to urgent care clinic on the morning of March 15, where staff decided to send patient by ambulance to the hospital. She was admitted to the hospital and diagnosed with having 5 blood clots in her lungs. She was discharged March 16 in the evening on Eliquis 5mg twice a day. She states the hospital did not know what caused the blood clots, and were aware she had been vaccinated recently. She has not had a doctor visit in years, but is now established with a primary care physician for follow-up care. The second Moderna dose was given today 3/31/21.

1153495	3/31/2021	PA	59	F	3/3/2021	3/3/2021	coughing with a "wheezy sounding cough; she felt "not so good in my chest"; pain in chest; mild allergic reaction; a lot of pressure and pain and tightness in my ears; a lot of pressure and pain and tightness in my ears; This is a spontaneous report from a contactable consumer (reporting for herself) via the medical information team. A 59-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date: unknown), via an unspecified route of administration, administered in left arm on 03Mar2021 at 04:15 as single dose for COVID-19 immunization. The patient's medical history was not reported. There were no concomitant medications. On 03Mar2021 at 17:00 (reported as 05:00PM), the patient experienced mild allergic reaction. The patient waited for 15 minutes before leaving. On the way home, the patient experienced a lot of pressure and pain and tightness in her ears. She stated that she felt "not so good in her chest". The patient took 2 Benadryl to help. At 18:00 (reported as 06:00PM), the patient developed pain in her chest and was coughing with a "wheezy sounding cough". Her doctor instructed her to go to the emergency room where she was told she was having a mild to moderate reaction and was administered Albuterol. She states that the next day she was still coughing, but by the day after that, she felt fine. She states she already spoke with her doctor who recommended she not get the second shot. At the emergency room, they checked her pulse oximetry for the blood oxygen level. She had an albuterol treatment for her breathing. They listened to her chest with a stethoscope. The outcome of the event coughing, she felt "not so good in my chest", and pain in chest was recovered on 05Mar2021 while the outcome of the other events was recovered on an unspecified date. Information on the lot/batch number has been requested.

1154298	3/31/2021		20	M	3/24/2021	3/25/2021	Patient is a 20 y/o Male received the MODERNA vaccine on 24 Mar. He started developing substernal chest pain the day after his vaccination. Presented to the clinic with worsening chest pain and was in severe pain upon presentation. ST elevations noted on lateral leads with depression in anterior leads with elevated troponins. Had CT, echo, and cath which showed mild inflammation and normal cardiac cath. Patient diagnosed with myocarditis.
1154633	3/31/2021	NJ	60	F	3/28/2021	3/29/2021	Important to share: I had a strong case of Covid in March, 2020. No hospitalization and no need to go to hospital but I was very sick for three weeks. Oddly, after Covid I had odd heart pains and erratic high blood pressure. I saw a cardiologist and my heart was fine but it lasted on and off for months. I've been very well for months now. 1) The day after the shot, I felt tired and had a headache, which is expected and no big deal. The evening after the shot I experienced a lot of pain around my heart area. It was very similar to what I experienced post-Covid but more painful. It hurt enough that I went to the ER at Hospital in because of the chest pain. EKG, chest x-ray, and all blood tests were normal. 2) The next day, I fell asleep on a hammock in my backyard. I was wearing jeans and a sweater so the sun wasn't directly on me but I noticed later that the outside of my R leg and the inside of my L leg were covered in a red, lacey-looking rash. Oddly, my arms and torso had no rash. I called my Internist (Dr.) who asked me to email photos. She said it looked like an allergic reaction to the vaccine and advised me to submit info on this site and to take a benedryl. The rash was definitely where the warm sun hit me.
1154654	3/31/2021	MO	77	F	3/31/2021	3/31/2021	1:30 pm after shot at 11:30 heart started to beat rapidly and erratic. Wouldn't stop after an hour. Went to emergency part of hospital. Took ekg, drew blood to see if anything was not correct, had chest X-ray. All came out fine except ekg. Did not settle down. ER doctor called my doctor and he said other AFib patients have had this happen also. Er doctor agreed with my doctor. Also had no chest pains or shortness of breath or dizziness. Told to take Tylenol for a couple days and was released. The erratic and fast pace of my heart has eased some but still persists.

1154679	3/31/2021	HI	43	M	2/8/2021	2/25/2021	Patient reports he has noticed over the past week increased shortness of breath on exertion--at baseline able to exercise with walking 45-60 minutes without dyspnea, however noticed over the last week getting some shortness of breath even walking to the garage. No chest pain, no fevers, chills, cough. He saw his PCP for these symptoms who ordered EKG and CXR 1 day PTA which per patient were normal--plan was for referral to cardiologist. However on the morning on presentation around 6:45 AM after taking an elevator for work he began feeling lightheaded and lost consciousness, awakening on the floor. He went home as he was not feeling well however proceeded to have another 2-3 episodes of loss of consciousness at home witnessed by his girlfriend--the later 2 occurred while lying down and were not clearly associated with any presyncopal symptoms.

1153245	3/31/2021	MA	61	F	3/6/2021	3/1/2021	violent heavying, sweating for 2 hours; pain in chest; diarrhea; chills; sore; This is a spontaneous report from a contactable consumer (patient) reported that a 61-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in arm left on 06Mar2021 14:00 as a single dose (at the age of 61-years-old) for covid-19 immunisation. The patient had known allergies to flu shot, contrast dye, aspirin and codeine. She had a major reaction to flu shot so was scared to have this. She took Pepcid and Zyrtec 3 days prior and 1 week following. The patient was not pregnant at the time of vaccination. The patient had no COVID prior vaccination. There were no other vaccine in four weeks. There were other medications in two weeks. The patient received the first shot, day 1 and 2 was fine. On day 3 (09Mar2021 11:00), diarrhea started, day 4 (10Mar2021) - violent heavying, sweating for 2 hours then pain in chest. The patient thought she was having a heart attack. After many test it was not her heart, then more test that would not cause these issues. The physician determined it was the vaccine. On Mar2021, she still feel chills and very sore. The patient was scared to get her second dose. It was unknown if the patient received treatment for the reported events. The reported events resulted in: Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care. The patient was not tested post vaccination. The outcome of the events was unknown. Information on the lot/ batch number has been requested.

1147682	3/30/2021	GA	67	M	1/19/2021	1/20/2021	Transverse Myelitis; Could not go to bathroom in spite his bladder was full; Could not get out of bed; Could not walk; Chest pain; Pain in middle back; Pain in both of arm; The blood pressure went high; Pain was intense that cannot be describe; Pain across shoulders; A spontaneous report was received from a consumer concerning a 67-year-old male patient, who received Moderna's COVID-19 vaccine (mRNA -1273) and experienced events of chest pain, middle back pain, pain across shoulders/arthralgia, pain in both of arm/pain in extremity, pain was intense that cannot be described, the blood pressure went high/hypertension, could not get out of bed/asthenia, could not walk/gait inability, could not go to bathroom in spite his bladder was full/urinary retension and transverse myelitis. The patient's medical history as provided by the reporter included, quadruple bypass heart surgery, partial lung removal, back problem and neck problem. No relevant concomitant medications were reported. On 19 Jan 2021, approximately one day prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 (Batch number: 028L20A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. On 01 Mar 2021, the patient received their second of two planned doses of mRNA-1273 (Batch number: 002A21A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. On 20 Jan 2021, the patient reported that after receiving the vaccine he was taken to the hospital for chest pain, pain in middle back, pain across shoulders, pain in both of arm, pain was intense that cannot be described and the blood pressure went high. On 21 Jan 2021, in the morning, he could not get out of bed, could not walk and could not go to bathroom in spite his bladder was full for which a catheter was installed to go to bathroom and he got hospitalized for three days. The physician diagnosed him having transverse myelitis which is a side effect from vaccine. The patient received both scheduled doses of mRNA-1273 prior to the events, therefore action taken with the drug in response to the events is not applicable. The outcome of the events, could not get out of bed, could not go to bathroom in spite his bladder was full were resolved on 24 Jan 2021. At the time of reporting, (16 Mar 2021), the outcome of the event, could not walk, was recovering/resolving as the patient reported he was able to walk a little and was on physiotherapy. At the

1146786	3/30/2021	CO	67	F	3/19/2021	3/1/2021	<p>Extreme nausea; My symptoms were so severe I felt like I was going to die; I mean literally die; I thought I am going to have a stroke; My chest is still tight; I still feel low congestion; having hard time taking a deep breath; Chills; Headache; The chest pain was horrible; The joint and muscle pain were so severe; I am still little real nauseous; I feel like I mean like acid coming up constantly making me more nauseous; Unable to eat; The joint and muscle pain were so severe; My chest is still tight; I still feel low congestion; having hard time taking a deep breath; My chest is still tight; I still feel low congestion; having hard time taking a deep breath; This is a spontaneous report from a contactable nurse (patient). A 67-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), dose 2 via an unspecified route of administration, administered in Deltoid Left on 19Mar2021 (Lot number was not reported) as SINGLE DOSE for COVID-19 immunization. The patient previously had first dose of BNT162B2 for COVID-19 immunization. The patient's medical history was not reported. Concomitant medication includes supplements and multivitamins. The patient stated "I wanted to ask you and I have some horrible concerns I got my second COVID shot last Friday, and by Saturday night, I am not exaggerating, my symptoms were so severe I felt like I was going to die I mean literally die on 20Mar2021. I couldn't get to emergency room, I figured out I am just going to die, I just laid down and let my door open down so somebody could find me, the symptoms I was having was extreme nausea, chills, headache, the chest pain was horrible, horrible, the headache I mean I thought I am going to have a stroke, the joint and muscle pain were so severe. So I have been taking Tylenol, Advil (Treatment) finally this morning, yesterday was tiny, tiny bit better, this morning its little bit better but I am still little real nauseous and I feel like I mean like acid coming up constantly making me more nauseous and almost like unable to eat. Ever since Saturday all I will have been doing is three bites of chicken soup three times a day. What in the world is going on with this vaccine that it would cause those severe symptoms and my chest is still tight I still feel low congestion having hard time taking a deep breath in Mar2021". The outcome of the event "my symptoms were so severe I felt like I was going to die I</p>

1146669	3/30/2021	NY	54	M	2/25/2021	3/12/2021	Heart attack; A spontaneous report was received from a physician assistant, concerning a 54-year-old adult male patient who received Moderna's COVID-19 vaccine and experienced heart attack/myocardial infarction. The patient's medical history was not provided. Concomitant product use was not provided by the reporter. On 25 Feb 2021, prior to the onset of event, the patient received their first of two planned doses of mRNA-1273 (lot number unknown) intramuscularly for COVID-19 infection prophylaxis. On 07 Mar 2021, after first dose of vaccine, the patient had chest pain and shortness of breath. On 12 Mar 2021, patient had a heart attack and was airlifted to hospital. He was hospitalized from 13 Mar 2021 to 14 Mar 2021. Patient did not have history of heart condition nor was taking any medications prior to having the heart attack. During hospital stay, he had angiogram done, stents were placed. Treatment also included cholesterol lowering medicine, blood pressure medicine and acetylsalicylic acid. Action taken with mRNA-1273 in response to the event was not provided. The outcome of the event, heart attack was resolved on 14 Mar 2021.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the onset date of the event of myocardial infarction, a causal relationship cannot be excluded.
1148943	3/30/2021	WI	52	F	3/25/2021	3/25/2021	On the day of vaccination I was treated at the site for a reaction which started 40 minutes after the shot. I was hypertensive and Tachycardia and I had chest tightness . I was monitored for 90 minutes and I had taken some Prednisone and they gave me Allegra. I left there and six hours later I felt worse. I had been having intermittent chest pain. My chest pain got worse and my heart rate was elevated so I went the ED. I was given Benadryl and Pepcid. I was discharged after two hours but I still had some chest pain. I took another dose of Steroids after four days I felt better. I have a scheduled Stress Test at Hospital for follow up. I still have some burning chest pain on occasion.

1149164	3/30/2021		36	M	3/2/2021	3/9/2021	<p>Patient had flu-like symptoms while deployed at start of pandemic (approx. Jan/Feb 2020), but testing was unavailable. His symptoms (URI-like) completely resolved. He received Moderna dose 1 on 02 Feb 2021 without incident, and Moderna dose 2 on 02 Mar 2021. Approximately one week later, he developed mild, dull, diffuse chest pain and shortness of breath which has persisted since. He was seen in clinic for chest pain and dyspnea on 15 Mar 2021. Patient noted his chest hurt ?all over? especially with deep or with normal inspiration. Reclining, laying down, and sleeping on his right side increased his pain (he did not trial sleeping on his left). Leaning forward decreased pain. He endorsed feeling short of breath, and stated he felt light headed twice while going up stairs, without passing out. He denied recent illnesses and other symptoms. He is a very physically fit Active Duty Marine, who has continued running despite his symptoms. During this encounter and later f/u encounter, he expressed he did not believe running made his symptoms significantly worse. Vital signs were within normal range and he did not appear in distress. Cardiac and lung exam were normal, and no friction rub or murmur was appreciated. EKG showed sinus bradycardia, with HR consistent with his known, athletic-type normal variant heart rate. No other abnormalities were detected. Due to limited ancillary services within clinic, he was sent to USNHO ED for evaluation. There, he had basic labs (including Trop I) drawn, which were normal. EKG and portable chest xray were also unremarkable, and he was discharged with Motrin 800mg PO TID. He was seen in clinic again 29 Mar 2021 for continued, unchanged symptoms, and reported he had been taking his Motrin only in the mornings and afternoons. Vital signs were unchanged (normal limits). Exam, including heart and lung, were normal. EKG again demonstrated sinus bradycardia, consistent with his normal resting heart rate. He was started on empiric therapy for pericarditis. He was released from clinic and will follow up in several weeks.</p>

1149168	3/30/2021	PA	52	F	3/1/2021	3/1/2021	Spoke with patient on 03/29/2021 when she canceled her second dose of the Moderna COVID-19 vaccine. The patient reported that she received the Moderna COVID-19 in her left arm on 03/01/2021. By the night of 03/01/2021, she had arm soreness and began to feel itchy. On 03/02/2021, the patient woke up covered in full-bodied hives. She called her PCP and was told to take Benadryl. The patient took Benadryl 25 mg po as needed throughout the day and 50 mg po at bedtime. No epinephrine used. The hives continued x 1 week and the patient continued to take the Benadryl as needed. Patient denied any swelling, shortness of breath, gastrointestinal symptoms, dizziness or lightheadedness, chest pain, body aches, joint pain, fever, or any other symptoms. The patient has since fully recovered with no sequelae. Patient stated that her PCP felt she could receive the second dose of Moderna COVID-19, but another consulting provider told her not to take the second dose. The patient canceled her second dose appointment at our facility.
1149193	3/30/2021	NY	72	F	3/11/2021	3/24/2021	Wednesday night on 3/11/2021 around 9 pm dull chest pain under and around left breast. Called doctor on Thursday morning. Spoke with Dr in the afternoon. Office visit on Saturday morning. Administered EKG ... diagnosis ... Pericarditis ... prescribed Famotidine 40mg and Naproxen 250mg.
1146297	3/30/2021	KY	79	F	3/29/2021	3/29/2021	presented with chest pain onset around 1800 this evening. She describes it as "an elephant sitting on [her] chest" that began suddenly and was constant until she received pain medicine in the ED. She had associated shortness of breath and nausea. She did receive her COVID-19 vaccine today. She denies fever, chills, cough, vomiting, abdominal pain, diarrhea, constipation, urinary sx.

1147729	3/30/2021	IN	18	M	3/25/2021	3/27/2021	Patient presented to the emergency department early March 28, 2021 after experiencing 5-7 hours of chest pain. The chest started when the patient went to bed the evening of March 27, where he began having substernal non-radiating chest pain with inspiration. The pain was relieved by sitting upright and by taking some acetaminophen. He received his 2nd dose of the Pfizer COVID-19 vaccine on March 25 (first dose was March 5). He was initially treated with ketorolac 15mg IV and given 1 liter of lactated ringer's solution via IV. His chest pain resolved after this. He was eventually given colchicine 0.6mg twice daily and ibuprofen 600mg 3 times daily due to concern for myopericarditis. He was ultimately found to have no evidence of pericarditis after undergoing a cardiac MRI, thus colchicine and ibuprofen were discontinued. Due to findings of mildly reduced ejection fraction on imaging, he was started on metoprolol XL 25mg once daily at discharge.

1148365	3/30/2021	SD	61	M	2/24/2021	2/27/2021	Pt was treated in the emergency department for pleuritic chest pain, pneumonia, and nonspecific left greater than right lower lobe ground glass opacities found on CT scan on February 27, 2021 beginning at 1826.
1147829	3/30/2021	VA	44	F	1/12/2021	1/14/2021	At about 10:30p-11:30p on 01-14-2021 I went to bed and I woke up feeling weird. I had a rapid heart rate of 140bpm. I did not lose consciousness. I called 911 and they came to my home with an ambulance. My BP was 200/100. My heart rate was 130. They told me i had tachycardia with BP elevated and my husband took me to the ER for evaluation. At the ER, lab work was done, they hooked me up to monitors and I had an episode where my heart rate increased. I was discharged home and to follow up with my PCP and everything seemed fine. About two weeks later I had same episode where heart rate elevated and now with chest pain. I went again to the ER and they did more tests on me. I saw a cardiologist and he had me wear a holster monitor. With the holster monitor I had one minor episode where my heart beat elevated. I will see my cardiologist next week. I did not receive my second dose of Pfizer vaccine.
1147728	3/30/2021	IL	24	M	3/2/2021	3/3/2021	Patient had reported onset of symptoms 03MAR21 @1900 following 1st Dose of Moderna on 02MAR21. Patient reported to Emergency Department at 0000 04MAR21 with the symptoms of Vertigo, Lightheaded, Nausea, Chest Tightness, and SOB. EKG, UA, and Chest X-ray ordered by ED Provider. ED Provider notated that "CXR and ECG Normal". ED Provider diagnosis: "Acute Pleuritic Chest Pain, Dizziness, Immunization Side Effect". Patient received APAP and Ibuprofen in ED and reported that chest/pleuritic pain improved following administration but complete resolution did not occur for another 24hrs. Patient discharged from ED on 04MAR21.

1144561	3/29/2021	NJ	58	F	1/18/2021	1/23/2021	5 days after I started to have chest pain. It was variable and now I have been diagnosed with Prinzmetal angina; This is a spontaneous report from a contactable other healthcare professional (patient). A 58-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EL3247) via an unspecified route of administration, administered on the left arm on 18Jan2021 11:00 at a single dose for COVID-19 immunisation. Medical history included high BP that was under control and allergy: glue on tape used in hospitals. Concomitant medications included losartan, levothyroxine and hydrochlorothiazide. On 23Jan2021 02:00 PM (5 days after), the patient started to have chest pain. It was variable and now I have been diagnosed with Prinzmetal angina. Treatment was received for the events. The events resulted to a doctor or other healthcare professional office/clinic visit and emergency room/department or urgent care. The patient is in the process of stabilizing the angina. Prior to vaccination, the patient was not diagnosed with COVID-19. Post vaccination, the patient has not been tested for COVID-19. Patient was not pregnant. The facility where the vaccine was administered was in a hospital. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Outcome of the events was not recovered.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the event Prinzmetal angina cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

1144644	3/29/2021	MI	25	M	1/12/2021	1/13/2021	I had chest pains that felt like tightness of my chest. Friends and family said it sounded like a heart attack (despite being only 25 years old). It hurt to sit up or maneuver my chest/rib cage in any manner, for example, a sit up caused extreme pain. The pain was consistent throughout the day. After it began to dissipate, it was only reproducible when my chest/rib cage was moved or had pressure put onto it. Went to the doctor, diagnosed me with costochondritis. Received an anti-inflammatory shot. Reduced the pain. From initial pain to full recovery was about 3 days (if memory serves correctly, VSafe should have the correct dates as I responded accurately there). A slight discomfort in my chest did occur after my second shot, but nowhere near the same amount of discomfort.

1144781	3/29/2021		69	F	3/1/2021	3/1/2021	Pt was vaccinated at a clinic. Pt reports that while sitting in her observation time on March 1 at clinic, she started to experience physical neck swelling, and chest tightness, but did not report to the monitor at that time. The Pt arrived for her 2nd dose of Moderna on 3/29/21. Pt then reports that she had neck swelling and chest pain for the next 9 days post her 1st dose. Initially the Pt denied having talked with her doctor during that time. I called Dr. to consult with him about if we were able to administer vaccination to this Pt today. Pt denied troubles breathing or swallowing, rash, N/V/diarrhea, but did state she took her inhaler and Benadryl because of the chest tightness she was experiencing. Per Dr., he states to not give this Pt her 2nd dose of vaccination at this time as she had a mild anaphylactic reaction to the 1st dose of vaccination. Pt was not given 2nd dose and educated to consult with her physician to determine if and where appropriate to receive 2nd dose.

1142665	3/29/2021	TN	36	F	2/12/2021	2/14/2021	Working full time during this post injecting time but 2days later started with nausea and vomiting and then itching and then next day asthma started to flare up and by the next day it developed into full blown exacerbation. As everything worsened and couldn't control anymore with inhaler and even tried nebulizer, I went to hospital. I went to ER that day on 2/17. They did breathing treatments, several Blood tests, chest xrays, Epi injection, IV steroids and several other meds, oxygen, and was admitted. As it worsened I had to be intubated 3 different times, where I would get to point they thought could be weaned off and for a day or two and would be a little better and then would worsen again requiring me to be reintubated for a total of about 10 days on the ventilator. During this time on vent second time I developed pneumonia, staph/MRSA, UTI. After being put on vent 3rd time I had to be life flighted to bigger hospital ICU. Then after a few days they were able to wean of ventilator but during which time I developed laryngospasms. I continued to improve with breathing but mentioned I had leg pain and the said probably due to low sodium and lack of mobility. I was finally released on 3/5 and discharged home with home health but sent home in supplemental oxygen due to says dropping and poore tolerance without sitting O2 stay at hospital prior to DC home. After getting home the next day or two right leg pain worsened along with breathing worsenining and HH sent me to PCP who discovered blood clots and sent me to local er, that day which was 3/8. That hospital evaluated breathing issues and took blood work and chest xrays, started me on heparin drip and sepsis protocol and then called in life flight to send me to bigger ICU hospital within a few hours after arrival which they debated on ventilator or bipap but ended up on bipap and flown to hospital. There I was treated for breathing issues, infection, clot, vocal cord dysfunction from the multiple intubations then sent home when stable again with home health RN, PT, PT and ST. Also during all this hospital stay I was treated 4x for covid and all negative. Then after coming home this last time on 3/13 i had 15-20lb with gain in a little over a week and in 3 of those last days almost 9lbs with abdominal distension and chest pain/ nausea/ dizziness/low BP but fluctuating high at times / high Hr, so referred back to PCP 3/23 who sent me to ER that day concerned of abd blessed, kidney and

VAERS_ID RECVD STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

or liver issues/sepsis/etc. PCP sent to ER. They did blood work and Abd CT and xray not showing anything and blood levels of liver slightly elevated, with blood in urine and so they said nothing of concern even though I went from looking normal to 6/7 months pregnant in less than a week. Followed up with pulmonologist who said bases of lungs hypoventilated, PFT very poor, wheezing and tight and WBC still up and gave me more steroids and asthma meds. Went to urologist due to blood in urine and also having urinary retention. They advised me to self cath and I will follow up in 1 month to determine if they need to do more tests to look into it more. PCP still concerned about these new abd. And other symptoms, and referring to specialists (cardiologist, Gastrointerologist, and Nephrologist) along with others already seeing too find the root of what are causing these new problems and if other organs are being affected with this whole immune response. I work full time, had 3 kids and works out with no limitations in my daily activities or ability to function, however since all this and being the hospital for pretty much most of laar month, the ongoing breathing issues (which I'm still requiring O2 at home) and all the other medical issues and the physical weakness/ lack of cardiopulmonary endurance I am unable to work (on short term disability/FMLA) and limited to home with ability to do much at all. Now I'm left with decreased income and tons of medical bills to come which is very concerning in itself how I will even pay since i can't work right now, but the most concerning is I'm still in this waiting game to figure out why things are not improving that much and why these other symptoms are arising. I have worked my whole life and love my work and my life and was trying to protect from this horrible virus by doing my part and getting vaccinated. But it seems that my life went from nothing wrong to one crazy medical reaction to another after this 2nd covid-19 moderna injection.

1145524	3/29/2021	WI	58	F	3/24/2021	3/24/2021	Burning upon injection. After a few minutes the burning went down left arm. Then left cheek started to feel numb and flushed. Left cheek started swelling. Headache. Throat scratchy. Chest pain started 20 minutes after shot. Left arm felt heavy. Throat started to feel tight just before benadryl was given. Benadryl helped relieve the throat symptoms and the face swelling and numbness subsided.
1145546	3/29/2021	IL	61	F	3/29/2021	3/29/2021	Pt felt dizzy after vaccine. Denies any chest pain, SOB, nausea or vomiting. At this time patient feels better and does not want to go to hospital blood pressure 160/93, 98,16 150/88,84,18
1145313	3/29/2021	OR	70	F	3/18/2021	3/20/2021	By Day 2 I noticed new tinnitus sounds, louder and hauntingly disturbing. Roaring in ears different than before and scary. My blood pressure dropped when I stood up and although I did not faint, I had difficulty standing up and moving about. My chest burned and I coughed a lot, shortness of breath worse than usual, and my O2sat went down to 94 when it usually was no lower than 96. These mild but disturbing symptoms persisted, and then on Day 6 I had a sudden onset of dizziness and cognitive dysfunction that made me a "bobble head" that put me to bed for 3 days. I had a headache and chest pains and dizziness that wanted to become vertigo if I moved my head. I am afraid to get the 2nd dose because I'm concerned that these symptoms will be triggered again and become permanent.
1145656	3/29/2021	MT	31	F	2/26/2021	2/27/2021	A day after I got the first Moderna shot, I noticed chest pain. It felt like tightness and pressure. The pain felt the worst in between my breasts and radiated outward in a circle around my chest. It hurt when I pressed down on my chest. I tried massaging and stretching, it didn't help. Went to ER on 3/27/21.
1145519	3/29/2021		60	F	3/29/2021	3/29/2021	Patient immediately reported onset of a throbbing headache, consistent with her first shot. A few minutes later she noted that she had some "tingling" sensation along the back of her throat with the sensation of tightness, though she denied any shortness of breath, chest pain, or any difficulty breathing. Pt examined intermittently without any progression of symptoms. At 4:50 pm, pt checked out,

1145750	3/29/2021	OR	51	F	3/24/2021	3/25/2021	Fatigue, fugue, low fever, sever body aches, nausea and dizziness and chest pain (like a weight was on me). Considered going to urgent care during chest pain hours but did not have the energy to move. Total event lasted about 30 hours, peaked at about 24 hours after shot. By 48 hours after shot I was pretty much back to normal.
1145751	3/29/2021	NC	44	M	3/8/2021	3/12/2021	I have experienced two episodes of dizziness with sudden onset. The first hit me suddenly while sitting at my desk and the second while I was in the cockpit of an aircraft. The second episode felt like the aircraft had fallen on its side. The second episode being more severe than the first. An immediate change in axis it seemed. Both episodes left me nauseous with mild sweating. I experienced nausea and fatigue lasting between 24-48 hours afterwards. There was no chest pain or palpitations. I did have a lingering headache after each episode of dizziness. I was evaluated at an UTC after the first episode. I was treated with Meclizine but it has not alleviated the symptoms. I followed up with my doctor who advised symptoms were not associated with BPPV or vertigo. Requested an MRI of the brain which was completed and was unremarkable. The dizziness has continued since the onset of symptoms above.

1145022	3/29/2021	WI	43	F	3/19/2021	3/19/2021	43 year old female with a past medical history significant for asthma, anxiety, DM, migraines, thyroid papillary carcinoma who is presenting to the ED with an allergic reaction. She received her COVID vaccination at 1700. At approximately 1715 she felt a lump in her throat. Shortly after she felt as if her tongue/lips were tingling/becoming swollen and then she developed nausea. No rash or abdominal pain. No dyspnea or chest pain. All symptoms are consistent with prior episodes of anaphylaxis. She has had anaphylaxis to vaccinations in the past but was advised by her allergist to get the COVID vaccine today. On arrival patient is quite anxious. Vital signs are stable. Her tongue is enlarged/mildly edematous, additionally appreciated mild lip/perioral swelling. There is no stridor or wheezing, no evidence of respiratory distress. Given examination findings, symptom description, findings concerning for anaphylaxis. As such, epinephrine promptly administered as well as solumedrol, famotidine, and benadryl. Shortly after the epinephrine she endorsed improvement in her swelling, though during benadryl administration she endorsed a sudden onset of subjective throat swelling/felt as if she could not breathe. Patient was reassessed, no change in initial examination findings, within a few minutes she felt her symptoms improve without intervention. A short while later she again felt as if her throat swelling was worsening, as such epinephrine dose re administered. Following a 2.5 hour period of observation she endorsed continued improvement in her allergic symptoms, requested discharge home though continued observation offered. A course of prednisone prescribed, patient already with epi pen. Patient discharged home.

1145094	3/29/2021	WI	61	F	3/29/2021	3/29/2021	Signed Pt here for her initial Covid 19 vaccine. Denies Hx of allergies to any component of the Covid 19 vaccine, severe allergies to any vaccine or injectable or any Hx of severe allergic reaction to anything. Covid 19 vaccine given to left deltoid site. Pt tolerated well, but immediately after receiving the vaccine reported feeling dizziness. Pt was escorted to the sitting area, and reported feeling chest pain to left upper chest area. BP at 149/85, pulse rate at 62. No shortness of breath or facial swelling present. Due to reports of chest pain, dizziness and "feeling funny" pt was taken immediately to the ER per wheelchair.
1145177	3/29/2021	CA	54	F	3/27/2021	3/27/2021	Patient received her second dose of the covid-19 Moderna Vaccine today at Vaccination site. Pt began feeling ill about 10 minutes after receiving the shot. Assistant came to inform me as the RN on site. She assisted with translation as Pt is a native Spanish speaker. Pt stated that she felt numbness and tingling in her Left leg, numbness and scratchiness in her throat, and nausea. Pt was noted to be visibly diaphoretic. Pt denied any trouble swallowing, speaking, or trouble breathing. Pt denied any chest pain or pain anywhere. Pt received shot in her Left arm and denied any pain or tingling in her Left arm. Pt did not have any facial droop, slurring of speech, changes in vision and was able to demonstrate ability to lift both arms equivocally. Pt A&O x 4. I decided that calling the paramedics was best practice as Pt was borderline appropriate for administration of Epinephrine. Paramedics arrived on scene within 5 minutes of 911 call and assessed Pt. Paramedics stated that they did not feel that Pt necessitated taking to the hospital at this time and that it was good judgement on holding giving Epinephrine at this time. Pt son was brought in to speak with paramedics who informed him to monitor patient for the rest of the day and that if anything changed with her symptoms or became worse- that he needed to either call 911 or take her straight to the ED. Pt was released by paramedics and her son took her with him.

1145248	3/29/2021	NY	51	F	3/26/2021	3/27/2021	Patient reports second dose of Pfizer on Friday. Reports intermittent chest pain and pressure since Saturday. Reports she was dizzy on Fri and Sat., denies that she is dizzy currently. Denies any SOB but reports her pain does radiate into her L arm.
1145011	3/29/2021	IN	63	M	3/26/2021	3/27/2021	Started to feel a little different in the first 8 hours. Then the next 10 hours I got a headache in the front of my head & the back of my neck. Chest pain when I had to cough. My whole body ached & slept for the next 12-16 hours. I started to feel better after 48 hours from the shot. All I did was drink plenty of water & eat bananas & apples & blueberries, just like I did when I had Covid-19 back in first week of November 2020. The only difference between the shot & having Covid-19 is I slept for almost 96 hours with Covid-19.
1144783	3/29/2021	CT	49	F	2/21/2021	2/22/2021	After the first vaccine 3 weeks prior to this I had chest pains 3 days later but attributed it to anything else. The night of the second vaccine shot I had severe chest pains (which I later discovered was gall bladder attack). the morning after I woke up with a fever of 102.9 which maintained for 4 days along with accompanying symptoms, then a delayed allergic reaction started on day 5. I had hives and redness on arm. Took benadryl and called doctor, and was told by doctor to take zyrtec for a week. Approximately 3 weeks after the 4th shot I had the 3rd incidence of chest pains and went to ER. Turned out to be a gall bladder attack and the first two attacks were as well, had never had an issue prior to covid shots. So with the delayed allergic reaction, multiple days of high fevers and gall bladder removal I figured I should report it.
1141633	3/28/2021	CA	83	M	3/27/2021	3/27/2021	Pt sts to nurse that he "feels weak" 20 minutes after receiving vaccine. Radial pulse 67 and slightly irregular. Day was very warm and patient sitting in very warm vehicle. EMS called. Patient transported to hospital.. Remained awake and alert. No syncope, shortness of breath or chest pain.

1141205	3/28/2021	MD	62	F	3/27/2021	3/27/2021	Pt states approx 10 min after injection started with a headache and dizziness. Pt ate something around 0900. Patient was given a granola bar and water. at 1405 BP 171/90, HR 83, SP02 98%, RR 16. Pt states heart is "fluttery", pulse regular. 1416 pt states headache is better. pt denies chest pain or SOB. After sitting up from laying position pt states she was dizzy, repeated BP at 1427, no improvement. Gave pt juice b/c she felt shaky and thinks it's because she hasn't eaten. Had pt rest for 10-20 mins more and then obtained orthostatic vitals, no concern for orthostatic HTN, pt states she no longer has headache or is dizzy. Per pt's visitor her color had returned to normal, pt still feels a little shaky. Pt rested another 5 mins, repeated vitals and pts BP was elevated. Discussed with pt and visitor that due to her hx of HTN and her already being on BP meds, pt should be seen in ER and EMS called. Explained that she should have an EKG done b/c of flutters and HTN along with headache. Educated pt on importance of being seen in ED. Gave pt and visitor time to discuss suggestion, when returning pt states, "Talked to niece who is EMT and said I should be fine if I just went home, rested, ate, and checked BP and took another BP pill (1/2) like suggested with doc before getting ahold of physician. All they'll do in ED is continue to check BP". Advised pt that ED would do more than that. Pt refused EMS and wished to go home. Pt visitor stated that they would watch patient and if anything changed take to ED. Patient left clinic in wheelchair and assisted to vehicle. Pt denies any symptoms that she initially presented with but states she just feeling weak.

1142068	3/28/2021	CA	61	F	3/21/2021	3/22/2021	at 3am I woke up with a racing heart rate and mild burning in my belly. I couldnt go back to sleep. The next day the burning in the belly got worse. My stomach became bloated and I was having shortness of breath walking short distances. The racing heart and chest pain ebbed and flowed. I made a video appointment with my PCP group on Thursday and they prescribed omeprazole and asked me to come in for physical exam the next day. When I went in the symptoms persisted, they did blood work, did a chest x-ray and sent me over to the emergency room. At the ER they did an EKG, more blood tests and recommended I have a abdominal CT on an outpatient basis. They couldnt say my symptoms were a result of the Pfizer shot but they could not rule it out that it was related to the shot.

1141993	3/28/2021	NV	19	M	2/8/2021	2/9/2021	At 2-8-21 at approximately 1:00pm I recieved my 2nd shot. At 5:00am on 2-9-21, I woke up experiencing an extreme headache, nausea, body aches, and severe chest pain. I checked my heartrate with a PulseOximeter and found it to be elevated at 105-115. I called out of work and rested in bed for the day. On 2-10-21 most of my symptoms had subsided however the chest pain persisted through 2-11-21. On 2-11-21 at 2:00pm, I visited the Urgent Care. While there, the provider ran an ECG, Chest X-Ray, and bloodwork. Test results showed Troponin levels in my blood had reached critical levels of 7.72ng/ml. I was immediately transported to the ER at the Hospital, where upon arrival they did an EKG and bloodwork. I was then admitted and seen by a cardiologist, who ordered an CT Angiogram, more bloodwork, and an Echocardiogram. After I was admitted, my mother contact the nurses station to check on me and asked what was wrong. She was then told the hospital was treating me for an NSTEMI and Myocarditis. This resulted in a 3 day hospital stay where the results of the tests showed there was nothing wrong with my heart other than the increased Troponin levels. It should be noted that I have had ZERO previous cardiac issues, or any other significant health issues. I was discharged from the hospital with lower but still elevated Troponin levels, and told to follow up with my primary care doctor. I had no health issues and felt fine until I had my second dose of the Covid-19 vaccine. I have copies of my hospital records detailing all of this.

1139541	3/27/2021	IA	41	F	3/23/2021	3/23/2021	<p>Pfizer COVID-19 Vaccine EUA 3/23: The patient presents with facial swelling and facial swelling. Patient a 41 y/o female with a history of HTN and anxiety presents to the Emergency Department with facial swelling in her left cheek that began today after she received her first dose of the Pfizer COVID-19 vaccine. She had a panic attack prior to getting vaccinated today. She was also feeling anxious while receiving the vaccine and states that she experienced a tingly sensation on the inside of her cheek as well as having a dry mouth. The patient denies trouble swallowing and eating, sinus pressure, shortness of breath, rashes, and dental issues. She notes that she has gone to the bathroom more frequently today but is not experiencing any diarrhea. Additionally, she has taken hydroxyzine for her symptoms. She is allergic to penicillin.. The onset was abrupt. The course/duration of symptoms is constant. Location: Left cheek. The character of symptoms is swelling. The degree at present is minimal. The exacerbating factor is none. The relieving factor is none. Risk factors consist of none. Prior episodes: none. Therapy today: prescription medications including hydroxyzine. Associated symptoms: Dry mouth and tingly sensation on the inside of cheek. Associated injury none. She states she had a panic attack upon sitting down in the chair to receive her COVID shot in her left arm. She had to take her anxiety medication there and then later in the day. She states she felt as if the inside of her cheek was swollen and scratchy this made her very anxious and decided to come in to get checked out. She denies any hives any abdominal pain nausea vomiting shortness of breath chest pain or redness at the injection site. She feels mildly improved from an anxiety standpoint now compared to the onset but still mildly anxious. She has a very normal physical exam no neck tongue or lip swelling there is no redness at the injection site she has no hives abdomen is soft and tender or buccal mucosa is unremarkable ultimately patient reassured discussed it is important she get her 2nd COVID shot. She understands return precautions for signs of allergic reaction. She received no medications.</p>

1139491	3/27/2021	NY	45	F	3/22/2021	3/25/2021	I had my second vaccine on Monday, 3/22, and woke up at 1am on Thursday 3/25 with extreme chest pain, shortness of breath, sweating and chills. I went to the ER, and they discovered two blood clots in my lungs. I've never had pulmonary embolisms before, so this is a very strange coincidence. I am in cancer treatment, so my risk of PEs is higher, but the timing is too close for me not to think that the second vaccine traumatized my immune system, causing the PEs.
1139485	3/27/2021	WI	73	F	3/20/2021	3/23/2021	Pain in chest and neck. Headache with slight feeling of numbness on left side
1139295	3/27/2021	IN	50	M	3/23/2021	3/23/2021	Soreness in arm Tightness/pain in head Pain in chest when taking deep breaths (day 2) General fatigue Diminished appetite Symptoms continued for two days, took a Tylenol at bedtime on day 2. When I woke up on day 3 the symptoms were gone. Symptoms were similar to when I actually had COVID 3 months earlier, but not as numerous, severe, or long lasting.

1140959	3/27/2021	TX	28	F	3/26/2021	3/26/2021	10 hours after injection I immediately spiked a 101 fever I had chills, joint pain, nausea, vomiting, diarrhea, confusion, dizziness, blurred vision extreme chest pain, difficulty breathing, swollen fingers and toes, headache, loss of taste and smell , itchy throat , a cough and blood in my mucus. These side effects persisted until 7 am the next morning... currently I still have a headache , bodyaches, confusion weakness and extreme sensitivity to light ... unbearable I felt like I was dying... I tried sleeping it off but only laying bed all day drinking water was what I was forced to do as I could not drive myself to a healthcare facility
1140942	3/27/2021		40	F	3/27/2021	3/27/2021	lightheaded, dizzy, chest pain
1140786	3/27/2021	TX	31	F	3/22/2021	3/22/2021	Hour 2: numbness in right jaw, numbness in right leg, and abdominal cramping Hour 5: continued numbness in right leg, groin pain Hour 8: chills, shakes lasting 45 minutes), followed by fever for several hours, highest recorded temp of 103.8, took ibuprofen to reduce fever, numbness on right side continued Day 2: numbness on right side, low grade fever, patient stayed in bed and continued taking fever reducers Day 3: numbness on right side, now including arm and back, and abdomen pain brought patient to primary care doctor; strength, pinprick, and vibration tests came back normal. Patient was instructed to return home. That evening patient began experiencing numbness on left side in her ankles, and left calf. Numbness is described as electric pulsation, tingling, and dull feeling. Patient can walk, lift limbs, and control muscles. Patient then experienced breathing difficulties, tightness in chest, sharp pains in chest. Abdomen pain intensified. Mouth numbness and difficulty swallowing. Dizziness grew stronger when patient sat or stood. Day 4: breathing issues and chest pains resolved. Numbness throughout body continued and is described as moving in intensity from one area to another. Often intense in the legs, ?feeling like weights?. Day 5: patient goes to ER seeking answers. ER preforms routine lab work and collects a urine sample to test hydration and electrolytes. Patient shows some signs of dehydration. IV is given. Referred to neurologist.

1140751	3/27/2021	CA	56	F	3/26/2021	3/26/2021	March 26th 2021- Dose 2 Again within 10 minutes, I felt very dizzy and nauseous, tightness in the chest and palpitations. I was given anti-nausea medication. I found the longer that I spoke the tighter and more sore my throat felt. Symptoms of lightheadedness, headaches, brain fog, pain in throat, ear pressure, nausea, diarrhea, body aches and pain, chills, fever of 102 at 6am on March 27th, neuropathy was exacerbated, palpitations and sore left arm. I feel a sharp pain in my right arm, deltoid muscle, when I try to lift it, I can barely move it. It feels as if I had the shot there but I know it was in the left arm for both doses. March 27th all symptoms continue and my temp is fluctuating between 99.5 and 100.5 so far today. March 5th 2021- Dose 1 Within 10 minutes I started to feel the vaccine. I felt a few pangs, brain fog, and exhaustion. The first night I had terrible nightmares. The first three days I experienced dizziness, light headed and off-balance, headaches, brain fog, pain in throat, ear pain, tinnitus and pressure, nausea, diarrhea, body aches and pain, difficulty breathing, chills, fever of 99.5, neuropathy was exacerbated, heart racing and palpitations and sore arm. On the fourth day, I felt normal but was very tired. On the fifth day (March 9th) I again felt exhaustion, brain fog, throat and ear pain, loose stools, body aches and pain, sharp chest pain and neuropathy.
1140714	3/27/2021	SC	43	F	3/19/2021	3/19/2021	Fevers, Vomiting, Diarrhea, Migraines, Sinus, Wheezing, Wheezy Cough, Muscle and Joint Pain, Chills, Stomach and Chest Pains, Reflux and Heartburn, Flushing, Swelling/Edema, Dizzy, Lethargy, Brain-Fog// I've been trying to get diagnosed- have had some of these symptoms since September, but a couple/ few hours after the shot, I have been having all of those symptoms throughout the day and the ones I've had have been very-exacerbated; I've finally been able to hold down food.
1140437	3/27/2021	WV	27	F	3/10/2021	3/11/2021	Extreme body chills, slight fever, body aches, dry heaving, extreme headache, tired, pain in chest when inhaling. These symptoms lasted 2 days, then I started having vision problems went to eye doctor on 03/26/2021 and got diagnosed with asteroid hylalosis.

1140394	3/27/2021	AZ	69	F	2/25/2021	3/24/2021	<p>This is a 70 year old female with paroxysmal atrial fibrillation (anticoagulated on Eliquis), obstructive sleep apnea (uses CPAP), mitral valve regurgitation, remote tobacco use, hypertension and dyslipidemia who presents to the ED for worsening dyspnea, cough, subjective fever, chills and body aches that have been ongoing for the past several days. The patient indicates that her dyspnea is exacerbated with exertion but she denies chest pain, pleuritic chest pain, leg swelling or calf pain. She mentions that she has received both of her COVID-19 vaccines (Pfizer); the first immunization was on 02/25 followed by her second immunization which took place eight days ago on 03/18. She is not confident that she has had any contact with a known sick or definitive COVID-positive individual recently. Of note, the last documented incidence of testing for COVID-19 was performed on 10/31/2020 after the patient was seen at a Clinic after a exposure for a COVID-positive individual. Testing at that time had resulted negative. To her knowledge, she states that she had, in fact, tested positive for COVID-19 in late fall of 2020, but she was not hospitalized. Yesterday (3/26/2021), she was evaluated at a Pharmacy where she was testing for COVID-19 which has since resulted positive. The patient denies any other acute symptoms of illness. In the ED, the patient was found to have acute respiratory failure with hypoxemia and pneumonia due to SARS-CoV-2 infection. Review of Systems Constitutional: Positive for chills, fatigue and fever. Negative for activity change. Respiratory: Positive for cough and shortness of breath. Cardiovascular: Negative for chest pain and leg swelling. Gastrointestinal: Negative for abdominal pain, diarrhea, nausea and vomiting. Genitourinary: Negative for dysuria. Musculoskeletal: Positive for arthralgias and myalgias. Negative for gait problem. Neurological: Negative for syncope. All other systems reviewed and are negative. Vitals Blood pressure 159/79, pulse 65, temperature 36.4 °C (97.5 °F), temperature source Oral, resp. rate 18, height 1.6 m (5' 3"), weight 107 kg, SpO2 98 %. Physical Exam Vitals reviewed. Constitutional: General: She is awake. She is not in acute distress. Appearance: Normal appearance. She is well-developed. She is morbidly obese. She is ill-appearing. She is not toxic-appearing. Interventions: Nasal cannula in place. HENT: Head: Normocephalic</p>

					and atraumatic. Nose: Congestion present. Mouth/Throat: Mouth: Mucous membranes are dry. Pharynx: Oropharynx is clear. Cardiovascular: Rate and Rhythm: Normal rate and regular rhythm. Pulses: Normal pulses. Heart sounds: Normal heart sounds. Pulmonary: Effort: Pulmonary effort is normal. Breath sounds: Decreased breath sounds present. Comments: Diminished breath sounds in all lung fields. Occasional cough. Abdominal: General: Bowel sounds are normal. There is no distension. Palpations: Abdomen is soft. Tenderness: There is no abdominal tenderness. Musculoskeletal: General: Normal range of motion. Cervical back: Normal range of motion and neck supple. Skin: General: Skin is warm and dry. Neurological: General: No focal deficit present. Mental Status: She is alert and oriented to person, place, and time. Psychiatric: Behavior: Behavior is cooperative.		
1140299	3/27/2021	CA	47	F	3/24/2021	3/24/2021	patient was complaining of reaction s/p 1st dose covid vaccine approximately 15-20minutes after vaccine administration. Patient was alert and oriented and states that she is "itchy all over" including her throat. Her SBP at the time is 180s and elevated HR in the low 100s. O2 sat remained >98%. She denies any reactions to previous vaccinations but had an anaphylactic reaction to walnuts before. Patient examined with no visible rashes, patent airway, no enlargement or swelling of tongue or lips. Verbal order from Dr to start IV access and was given Benadryl 25 mg and Dexamethasone 4mg IV. Patient tolerated well. Vital signs rechecked every 2 mins with SBP trending down and HR stabilizing in the 90s. Patient denies any chest pain, SOB, cough, but complains of mild nausea. Patient was kept in clinic for observation for 2 hours and was discharged in stable condition. Spouse came to drive patient home as she was somnolent from benadryl 25mg IV administration. Spoke with patient again today 3/27 to check on her. She states there is still some pruritis at R deltoid injection site with some swelling. She notes it is about 50% improved in itchiness and swelling since the evening of vaccination. Patient reports that she did not have any swelling of tongue, lips, or throat during observation post vaccination and since being released from clinic observation.

1137784	3/26/2021	CO	74	F	2/2/2021	2/4/2021	Patient is a lovely 74-year-old female with a long history of PACs and hypertension. Her blood pressure has been getting a little bit worse over the past years. She was admitted through the ER with 1st known episode of atrial fibrillation and hypertension. She reports that on 02/02 she received her 2nd COVID vaccine. She had joint achiness and a low-grade temperature. She rested the following day but then on 02/04 went for her usual hour long runs/hike. She did not feel very well during exercise and started have a headache and some increasing palpitations. Later that evening she was watching TV and started to have significant tachycardia that was irregular. Symptoms persisted and she presented to the ER which sound to be in AFib with rapid ventricular response with a blood pressure of 215/158. She was started on a diltiazem drip and has converted to sinus rhythm with PACs. Blood pressure has improved significantly. Troponin negative x2. Her last evaluation at a Heart facility was in 2017. She had an echocardiogram in 2014 with normal EF, mild MR and mild TR with normal estimated PA systolic pressure. She denies chest pain or dyspnea. No history of syncope. Sometimes with palpitation she does get lightheaded. She gets occasional lower extremity edema that seems dependent in nature. She is still having palpitations but recognizes that she is no longer in atrial fibrillation as that was more severe in terms of symptoms of tachycardia.
1138002	3/26/2021		33	M	3/22/2021	3/23/2021	Patient received the J&J COVID vaccine around 10:00 a.m. In the evening began experiencing subjective fevers, chills, nausea, headache. He took ibuprofen around 4:45 a.m. in the morning and went to work. Symptoms do not improve and patient presented to ED for evaluation. Patient denies chest pain, shortness of breath, vomiting, diarrhea, dysuria. No Hx anaphylaxis. Denies sensation of upper airway stridor or other respiratory symptoms. Past medical history is unremarkable. He is not on home medications. Denies smoking or illicit drug use. Patient was given 1 gm Tylenol, 10 mg metoclopramide, and 1 L NS. Patient improved, and was discharged

1138017	3/26/2021	WI	20	M	3/22/2021	3/22/2021	ED COURSE & MEDICAL DECISION MAKING Patient is a 20 y.o. male who presents emergency department for evaluation of fevers, chills, nausea, and shortness of breath. Symptoms occurred approximately 3 to 4 hours after his Covid vaccination today. He has not felt symptomatic for symptoms related to COVID-19 prior to his vaccination. Nausea was noted without vomiting and he was given Zofran prior to arrival. No objective evidence of anaphylaxis or angioedema was noted at urgent care nor was this noted on physical examination. He does have a fever on arrival with Tylenol taken a little more than an hour prior to arrival. Chest x-ray negative for findings of COVID-19. There was no evidence of pneumonia. His blood counts were otherwise reasonable though he did have relative lymphopenia that can be described in COVID-19 infection. Metabolic profile was otherwise benign. Differential diagnosis of his fever include the possibility of a vaccine reaction though the timing is rather quick for this reaction. Certainly this remains in his differential. His he has history of asthma and felt short of breath he was given Solu-Medrol. He was given Toradol with improvement of symptoms as well as IV fluid. With differential diagnostic considerations that he may have Covid, he was swabbed and tested at bedside. With his well appearance he was ambulatory in the emergency department. He was discharged stable condition with recommendations for Tylenol and ibuprofen in the short-term. Procedures MDM CHIEF COMPLAINT Fever and Chills HPI The history is provided by the patient, medical records and the EMS personnel. Patient is a 20 y.o. male who presents emergency department with fevers, nausea, and shortness of breath. He has generally not felt well over the course of the last 8 hours after receiving his first Covid vaccination this morning at 9 AM. Fevers have been noted. He took Tylenol with 2 tablets an hour prior to arrival. He has had shortness of breath with a history of asthma. He denies productive cough, or chest pain. He denies abdominal pain, or diarrhea. He denies dysuria or frequency or hematuria. Seasonal allergies are noted without significant medication allergies. He denies a sensation of throat closing. He denies tongue or lip swelling. He was seen in urgent care and sent to the emergency department for further evaluation.

1135777	3/26/2021	FL		F	3/4/2021	3/1/2021	<p>potassium level was dangerously low (2.5); broken out in a rash that itches like crazy - from skull to toes; throat is closing up; can't swallow, drink or eat anything; Can't get the second dose; exhausted/tired; really sick; dry heaving so bad that her rib cage hurt; couldn't really eat for about a week; allergic to vaccine; Rib cage hurt; pink blotches in whole body; A spontaneous report was received from consumer, who was the husband of a 77-years-old patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced events really sick (vaccine complication), exhausted/tired (fatigue), dry heaving so bad that her rib cage hurt (retching), couldn't really eat for about a week (feeding disorder), potassium level was dangerously low (2.5) (blood potassium decreased), broken out in a rash that itches like crazy - from skull to toes/rash which almost looks like shingles, but it is not (rash pruritic), allergic to the vaccine (vaccination complication), throat is closing up (throat tightness), can't swallow, drink or eat anything (dysphagia), rib cage hurt (chest pain), can't get the second dose (intentional dose omission), and pink blotches in whole body (rash macular). The patient's medical history included allergy to morphine. Concomitant medications reported were hydrochlorothiazide, topiramate, tramadol, amlodipine, acetylsalicylic acid, alendronate sodium, and vitamins. On 4 Mar 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (lot/batch: 027A21A) Intramuscularly for prophylaxis of COVID-19 infection. On 4 Mar 2021, a few hours after the injection, the patient was really sick and exhausted. The husband stated, "you name it, she had it". She was dry heaving so bad that her rib cage hurt. Also, she couldn't really eat for about a week. Her husband (the reporter) "tried to help with electrolytes". The patient was also broken out in a rash that itched like crazy-from skull to toes. The rash almost looked like shingles, but it was not (per the husband). On 09 Mar 2021 (reported as after 5 days), he insisted the patient go to the walk-in clinic. There, they drew up blood. After a few hours they called back and told her to immediately go to the emergency room since her potassium level was "dangerously low" (2.5). They told them that the patient could have a stroke so she was admitted until they could get her levels back up again. In the hospital, they told</p>

VAERS_ID RECVDATE STATE AGE_YRS SEX VAX_DATE ONSET_DATE SYMPTOM_TEXT

the patient to take diphenhydramine hydrochloride "but they were worried about her levels, so they didn't pay attention to the rash." They told her she was allergic to the vaccine and "can't get the second dose." The husband said he had "never seen her so sick." The patient was in the hospital until 10 Mar 2021 (reported as 2 days in the hospital) with intravenous (IV) potassium. The reported said she was "still tired" after all that. The husband called back a few minutes after his first call and said his wife told him her throat was closing up and she couldn't swallow, drink or eat anything. He also reported that she had pink blotches in her whole body. Treatment for the events included IV potassium and methylprednisolone 4 mg for 6 days. Action taken with mRNA-1273 in response to the events was unknown. The events of really sick, dry heaving so bad that her rib cage hurt, couldn't really eat for about a week, rib cage hurt, and potassium level was dangerously low (2.5) were considered resolved on 11 Mar 2021. The events of exhausted/tired, broken out in a rash that itches like crazy-from skull to toes/ rash which almost looks like shingles, but it is not, pink blotches on body, allergic to vaccine, throat is closing up, can't get the second dose, and can't swallow, drink, or eat anything were considered not resolved at the time of this report.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

1135754	3/26/2021	CA	53	F	1/22/2021	1/23/2021	Severe chest pain; Severe headache; Racing Heartbeat; Vomit; Pain in my left side of my arm; Pain in my left side of my arm, Shoulder; Dizziness; Very tired; Sleepy; Anxiety; Not knowing where she was; This is a spontaneous report from a contactable healthcare professional (patient). This 53-year-old female patient received BNT162B2 (PFIZER BIONTECH COVID-19 MRNA VACCINE) on 22Jan2021 at 18:15 (at the age of 53-years-old) as a single dose for COVID-19 immunization. Medical history included anemia, gastritis, and peptic ulcer. The patient was not pregnant at the time of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the vaccine. The patient was not diagnosed with COVID-19 prior to the vaccine. Concomitant medications were not reported. The patient previously received penicillin from an unknown date for an unknown indication and experienced allergy. On 23Jan2021 at 21:00 the patient experienced severe chest pain, racing heartbeat, vomit, pain in the left side of her arm, shoulder, and chest, dizziness, very tired and sleepy, severe headache, not knowing where she was, and anxiety coming and going for more than a month. The patient went to a doctor or other healthcare professional office/clinic visit as a result of the events. The patient did not receive any treatment for the events. The outcomes of severe chest pain, racing heartbeat, vomit, pain in the left side of her arm, shoulder, and chest, dizziness, very tired and sleepy, severe headache, not knowing where she was, and anxiety coming and going for more than a month were recovered with lasting effects. It was also reported that since the vaccine the patient had not been tested for COVID-19. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up.

1138111	3/26/2021	NJ	36	F	3/1/2021	3/1/2021	On 3/1/2021, received second dose at 3:15pm and at 3:45pm driving home from work I developed chest pains and went to urgent care. I got there by 5:30pm and they ran an EKG; results were normal. On 3/2/2021, I left work at 2:30pm feeling ill and when I got home by 3:30pm I had flu symptoms. Symptoms were body aches, headache, fever, chills, nausea. This lasted for 24 hours. When I woke up on 3/4/2021, I was just tired with chest pains. I went to work and on my way home at 3:45pm shortness of breath started with increased chest pains. I went to urgent care and they told me to head to the ER. I got to the ER by 6pm. They ran blood work, EKG and Chest X-ray; results all normal. I followed up with PCP. I was out of work from 3/5/2021 to 3/12/2021. PCP thought I might have COVID. Took PCP test on 3/9 and results were negative. I was able to return to work on 3/15/2020 but still had shortness of breath and chest pains as well as feeling exhausted all the time. Due to no change, PCP provided me with script for Echocardiogram, Exercise Stress Test, inhaler as needed and to see Pulmologist. Waiting on insurance company to approve echocardiogram and pulmologist appointment is 3/29/2021. It has been challenging to complete daily living activities like washing dishes, showering, climbing 20 stairs to my apartment, laundry, walking to the postal mailbox, etc. I get easily tired and winded. Prior to 3/1, I was healthy and exercising 3x's a week, walking 4 miles and hiked with no issues for the past year ranging 3.5-7 miles with incline.
1138580	3/26/2021	MS	52	F	3/15/2021	3/15/2021	Beginning at 9pm on 3/15/21, I had sharp pains in my chest and an elevated heart rate. Every day since, I have had chest pain/pressure, sharp pains in my head accompanied by a burning sensation throughout the top and back of my head and a burning sensation throughout my upper back and arms.

1133509	3/25/2021	TN	48	F	1/13/2021	2/17/2021	early stages of pericarditis or the shingles; severe chest pain; early stages of pericarditis or the shingles; This is a spontaneous report from a contactable healthcare professional (patient). A 48-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection, Lot number: EL1283, unknown expiration), via an unspecified route of administration in left arm on 13Jan2021 at 13:00 (01:00 PM; at the age of 48 years old) at a single dose for COVID-19 immunisation. Medical history reported as none. There were no concomitant medications. The patient has no known allergies. The patient also received first dose of BNT162B2 (Brand: Pfizer; Lot number: EJ1685, unknown expiration) on 23Dec2020 at 01:00 PM in left arm (at the age of 48 years old) for COVID-19 immunization. The patient went to the ER with severe chest pain. After many tests were run, doctors believed that the patient was in early stages of pericarditis or the shingles on 17Feb2021 at 04:00 AM. The patient confirmed that she never developed shingles but have had all symptoms of pericarditis. The events resulted in emergency room/department or urgent care visit. The patient received NSAIDs and pain meds as treatment for the events. The patient had no COVID prior to vaccination and was not tested for COVID post vaccination. The patient did not receive other vaccine in four weeks. The patient is recovering from the events. No follow-up attempts are possible. No further information is expected.; Sender's Comments: Based on the available information, the Company considers the reported event pericarditis is unrelated to BNT162B2 vaccine, but more likely an inter-current medical condition. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1131182	3/25/2021			U			Pericarditis; A spontaneous report was received from a nurse concerning a patient of unknown age and gender who received Moderna's COVID-19 Vaccine (mRNA-1273) and experienced pericarditis. No medical history was provided. No concomitant medications were reported. On an unknown date, one hour before the onset of events, the patient received their first of two planned doses of mRNA-1273 (Batch number: nor provided) intramuscularly for the prophylaxis of COVID-19 infection. An hour after vaccination, the patient had chest pain and "decided it was pericarditis" (medically significant). No treatment information was provided. Action taken with mRNA-1273 in response to the event was unknown. The outcome of the event of pericarditis was unknown. The reporter did not provide causality assessment for the event of pericarditis.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of these events, a causal relationship cannot be excluded.
1133678	3/25/2021	MN	57	M	3/19/2021	3/19/2021	Patient started feeling dizzy and like his lips were tingling after dose. Given oral Benadryl and symptoms resolved. Presented to the ED the next day with a rash and intermittent chest pain and dizziness.

1134123	3/25/2021	NY	35	F	3/5/2021	3/5/2021	I immediately felt a strange sensation in my head, and the hearing in my left ear dulled as if I were listening under the ocean. My left ear has a constant feeling of fullness. I have experienced tinnitus and a persistent need to "pop" my ears in my left ear since, as well as bouts of vertigo. I am very sensitive to sound in my left ear, and background noise is amplified and sounds "spotlighted." I have intermittently been experiencing pain in both of my calves since the injection, as well as joint pain in my hands. I have been experiencing a flushed feeling in the evening, though it is not accompanied by a fever. My muscles in my hands, feet, and legs have been cramping often, which is not a usual occurrence. I have experienced intense chest pain in what feels to be my heart. I have also experienced very vivid dreams.

VS 136/82, HR 98, O2 sat 98%, Temp 98 degrees, Accucheck 86. Patient transported to Hospital for further evaluation. 1st responder arrived on site @ 3:38 pm left at 3:52 pm.
1134181	3/25/2021	IN	57	F	2/3/2021	3/16/2021	I had my second covid vaccination on 2/3/21. On the morning of 3/16 I woke up short of breath, chilling, chest pain, chest congestion and cough, and a fever of 101F which rose to 102.5F. I was monitoring my pulse ox which would range from 90 to 91% but at times dropped to 84%. I had to mentally take deep breaths to get my pulse ox to 90%. These symptoms lasted 12 hours. Next day, short of breath at times and tired. Called the health department on 3/18 and was told to get a rapid test which was negative. The NP thought I might have pneumonia or a pulmonary embolus. I was sent to the ED and a CTa scan was done and everything was normal including 12 lead ekg, pulse ox and vital signs. The physician thought it was GERD. I'm a nurse and have GERD, this was not GERD. The PA that took care of me agreed the symptoms were, 'weird' and I should report this incident.
1133372	3/25/2021	IN	66	F	3/15/2021	3/15/2021	Thank you for the ability to receive the vaccine, I am reporting this for your documentation. 11:00 very tired , followed by chills and body aches especially chest pains. 2:00 pm upset stomach , 6:00 pm started throwing up for 90 mins. Tuesday still had chills and body aches foggy thinking could eat later in the day. I have a big bruise on my arm still 10 days later and a line of 4 blood blisters at my injection site . I have pictures did not see where I could up load them. My partner (67) was great on Monday after the shot.. did 5 miles on the treadmill. Tuesday he had a low grade fever 101, severe chills and body aches. Wednesday we were both still a little foggy . Other than than great

1132108	3/25/2021	MI	88	M	3/4/2021	3/15/2021	Patient vaccinated with first dose of Pfizer with subsequent infection and hospitalization due to COVID-19 infection. Initial H&P reads in part as, "Patients symptoms began on or around Thursday 3/11 when he began to feel fatigued. After two days of fatigue, he presented to an urgent care facility on Saturday 3/13. He was noted to have a fever there and was diagnosed with a presumed UTI, though patient reports at bedside that he has not had any dysuria. He was treated with nitrofurantoin and increased his furosemide temporarily per urgent care's recommendations. He then presented to the ER on 3/15 with continued fatigue and a low blood pressure at home. We were unable to clarify the method by which the blood pressure measurement was obtained and/or if it was repeated. Antibiotics were changed to cephalexin at that time despite a relatively clear UA. His daughter brought him back to the ER today (3/18) due to persistent issues with low grade fevers in the 100-100.5 range, significantly worsening fatigue, anorexia, and oxygen levels of 92-93% on nonproductive cough. Does not have a home O2 requirement. In addition, he endorses feeling chilled during the admission evaluation. Denies any chest pain, nausea, vomiting, fevers, diarrhea, constipation. # Fever Progression of symptoms from Saturday 3/13 may constitute original presentation of Covid-19. Presentations on 3/13 and 3/15 with dyspnea and fatigue. Initially thought to be UTI and was treated with nitrofurantoin and cephalexin. UA on 3/15 in ED was negative for leuk esterase and nitrites. Tested positive for covid-19 on 3/18 with lymphopenia, 90-92% on room air. No home O2 req. Given duration of symptoms and worsening fatigue and fevers, will admit for treatment of Covid- 19. Also considered CHF exacerbation, COPD exacerbation as explanations for dyspnea. Possible CHF exacerbation as well given 1+ bilateral pitting edema to mid-shin and JVD to ear lobe. Suspicion for COPD is low given no report of increased sputum production and questionable history in chart to begin with. Would be beneficial to clarify history with collateral history 3/19.~~

1136061	3/25/2021	WA	28	F	3/15/2021	3/18/2021	3/18: Chest pain. It woke me up in the middle of the night with some dizziness. At first, I disregarded it, then I tried falling asleep again, but I was jolted awake again with worse symptoms - vertigo, palpitations. I measured my HR, it was all over the place and irregular. Went to the ER, they didnt find anything substantial on my EKG other than arrhythmia with short PR. No treatment was given, instructed to follow up with PCP. Left ER between 4AM-5AM. Was able to go back to sleep, but the chest pain woke me up around 7 AM. The chest pain remained fairly constant with severity changing throughout the day. Symptoms were worse at night and more: inability to sleep, sometimes restlessness - the need to move, increased chest pain/tightness/burning, palpitations. Saw PCP on 3/19, she didnt have any of the lab results, but prescribed metoprolol - this medication was misunderstood as to when I was supposed to take it, therefore didnt start it until another visit that I had with my PCP on 3/22. Over the weekend, I took some ibuprofen to try to lessen the chest pain, it helped a little bit but not for long. Began taking metoprolol 3/22. I didnt sleep more than 2-3 hrs from 3/18-3/22
1135874	3/25/2021	PA	62	F	3/12/2021	3/12/2021	ON 3/12/2021 I received vaccine at 12:15 pm. After it was administered I waited 15 minutes to see if I got an reaction to it. I was fine until about 3:00pm in the afternoon that I started to feel fatigue, body aches, also had chest pains on left side and in shoulder. pain stayed rest of the night. subsided on Saturday and returned on Sunday. Went to Hospital Sunday Night ground 7:00pm to get heart check out.

1135880	3/25/2021	MN	65	M	3/3/2021	3/9/2021	<p>Seen at the walk-In clinic on 3/9/2021 where he presented with complaints of right leg weakness, numbness, and tingling. He was transferred to ER for further evaluation and management. The symptoms (numbness in his hip and thigh) began around 1400 while he was working. He went about his day. The symptoms progressively worsened while he was ambulating around the hardware store. In the ER, his sensation of his right leg was dulled as compared to the left. The numbness extended from his hip to his toes. Felt a pressure-like sensation in his thigh and calf. Denies pain. Felt as though his right foot is floating 2 inches off the ground when standing with both feet on the ground. Reported his right leg is 1-2 inches shorter after a femur fracture many years ago. Nothing made his symptoms better or worse. Did have an episode of feeling generally hot and then cold the evening prior to admission. Denied any trauma. Denied any dizziness, lightheadedness, headaches, shortness of breath, cough, chest pain, palpitations, vomiting, diarrhea, constipation, blood in stools, urinary habit changes, hematuria, dysuria, pyuria, myalgias, arthralgias, recent illness, or fever. MRI showed T2 changes on the right side of the cord down of the thoracic spine concerning for her transverse myelitis. Patient did have Covid vaccine 7 days prior to onset of symptoms, one dose mRNA vaccine. He is on day 3 high-dose methylprednisolone thousand milligrams IV x3 days. He has noticed an improvement in the pressure sensation from the knee up the thigh on the right, no longer having tingling in the right lower leg or the left foot. He is still having numbness over the anterior right thigh. Yesterday when he went to bear weight on the right heel, he had a sharp pain with increase in weakness. That has since settled down. He did have a few involuntary myoclonic movements as described yesterday. This writer reached out on 3/22/2021 for information on his Vaccine lot number. He stated "At this point I am attending physical therapy, I am walking with the aid of crutches or a walker. There is improvement in the foot and lower leg regarding the numbness, but the upper thigh is still pretty much completely numb yet.~~</p>

1135954	3/25/2021	CA	51	F	3/25/2021	3/25/2021	Client complained of tingling on left arm after receiving 1st dose Pfizer Covid vaccine (lot# ER8732, exp 3/28/21). Client was sitting in post vaccine waiting area 30 mins when she alerted EMT of tingling of arm. EMT performed first assessment. Vitals 1445: blood pressure 128/92, pulse 81, oxygen 99. PHN joined EMT shortly after. Client stated tingling on left arm that began 5 minutes after receiving vaccine; did not alert EMT until later. Per client no shortness of breath, chest pain, numbness, palpitations, headache, or blurry vision. Client stated this was a new onset that she did not have prior to receiving vaccine. No history of reaction to vaccines in the past. Current medication include daily vitamin and nasal spray. Allergy to antibiotic, but unsure of name. PHN assessed bilateral strength, facial droop, and arm weakness. Per client feeling fine besides the tingling sensation. PHN asked client to stay additional 15 mins for observation. Vitals 1452: blood pressure 132/92, pulse 78, oxygen 100. Alert and oriented. Tingling sensation the same, no changes. Per client history of anxiety and also had caffeine this morning, which she usually does not take. Last vitals at 1515: blood pressure 128/90, pulse 80, oxygen 100. Per client no change in tingling sensation. Was not radiating or worsening. Client advised to follow up with provider prior to receiving second dose. Client instructed to seek medical care if symptom did not improve or worsened. ER precautions given. Client left facility with steady gait at 1517.
1135968	3/25/2021		21	M	3/18/2021	3/19/2021	fever,headache. PT got #2 moderna yesterday @ 1200. c/o headache and fever which started this morning. Pain localized around L eye.
