1212311	4/15/2021	IN	30	F	4/13/2021	4/13/2021	Within 1-2 minutes of receiving the vaccine, I became tingly all over. I began seeing stars and then completely lost my vision - all I could see was bright white. It was difficult to breath. At the vaccine site, EMS came over to my car and took my blood pressure, which was 70/30. They took my blood pressure again and it was 64/30. They then took me via ambulance to the closest ER. They tested my blood sugar and oxygen levels, which were fine. I started to feel better and gained my vision back after about 15 minutes. Upon arrival to the hospital, my blood pressure had resumed to normal.

1211818	4/15/2021	IN	52	F	4/6/2021	4/7/2021	04.06.21 I received my 1st Pfizer shot at 3pm. At 5pm, I had a headache, my neck was hurting and I began feeling so weak I could barely talk, I couldn't hold my eyes open. I took 3 Aleve. At 8pm, I started with shortness of breath just going downstairs plus my entire body felt like I was hit by a truck. My 3lb. Chihuahua would get on me and it felt like I was hit by a bat with a ripple effect into the surrounding area. I took 2 Tylenol PMs. On 04/07, at 6am, I woke up to my limbs extremely swollen and throbbing, this included both feet and especially both wrists and hands. My hands were worse than my feet. My left wrist/hand also had tingling. I was so weak I could barely get out of bed or talk, this continued through to 5:30pm same day. I called an Urgent Clinic and told her all my symptoms, she said were all "normal" until I got to my wrists/hands and limbs. Urgent Care told me it would be best to be seen in ER and evaluated. I immediately went to ER. This approximate time was 6:30pm on 04/07/21.
1212332	4/15/2021	NC	28	F	4/9/2021	4/9/2021	Friday 4/9/2021- Nausea, Upper Body Pains (arms, chest, upper back, neck, stomach), Dizziness, unable to walk, fatigue, headache. Saturday 4/10- Same symptoms with little to no improvement Sunday 4/11- Same symptoms with minor improvement Monday 4/12- Same symptoms with no improvement, increased pains, dizziness, fatigue with headache and facial pain in eyes, cheeks, jaw, ear, nose, and back of neck, primarily on left side of face. Tuesday 4/13- Same symptoms, No improvements, increased nausea with severe headaches and facial pains Wednesday 4/14- Same symptoms, with diarrhea. Thursday 4/15- Ongoing same symptoms, little improvement with Tylenol. Less upper body pains, and nausea. Off and on facial pain and headaches but with facial numbness when without the pain. Dizziness while standing. Diarrhea has ceased. Still weak/fatigue.

1211429	4/15/2021		48	F	4/8/2021	4/10/2021	Two days after receiving the Moderna COVID-19 Vaccine EUA, I felt week, light-headed and had swollen eyes. I also started menstrual bleeding despite being in what I thought to be menopause, I had not menstrated for 6 months. Three days after the shot my left lymph node in my armpit began to swell and be painful to the touch. I am now seven days post vaccine and my armpit and lymph node are still very sore and swollen and I do not feel 100%, a general unwell feeling. I am having serious doubts that I will get the second dose.
1211217	4/15/2021	CO	26	M	4/2/2021	4/11/2021	Beginning on morning of 11th symptoms included moderate headache, pain/pressure behind the eyes, sensitivity to sound, pain in ears, nausea, fatigue, drain in thinking. continued, with some variability throughout day but responded to ibuprofen. symptoms continued on the 12th, with enough intensity to cause me to take a sick day from work. pain behind eyes was especially uncomfortable. continued to treat with rest. 13th and 14th symptoms gradually improved. only reporting here for completeness. I also hit my head on the 10th fairly hard. This could certainly have contributed to or caused my symptoms but given recent news about , reporting here to be diligent and contribute to any learnings visa aggregation.
1211201	4/15/2021	WA	49	F	4/10/2021	4/11/2021	Sore and achy body, no energy, slept for two days straight. Also right side of my face swelled up and became super itchy on the day after the vaccine, by the second day it was only my eye (swelled shut and looked like black eye). One day three after swelling down but still looks like black eye. Now on day 4 after- less swollen but still itchy and swollen and black.

1214373	4/15/2021	MI	70	F	3/3/2021	3/5/2021	<p>Patient suffered cardiac arrest two days (on 3/5) following first dose Moderna Vaccine at Rite Aid Pharmacy (3/3). The following is the Discharge Summary From 3/26. Resident Attestation: I personally saw and examined the patient on rounds with my cardiology resident team on the day of the resident's note. Management was discussed with the cardiology resident and I supervised the plan of care. I have reviewed and agree with the key parts of the resident evaluation including: Subjective information Objective findings on physical exam Impression and plan Gen: appears comfortable, sitting in bed Resp: clear. no wheezes, rhonchi, rales CV: normal rate, regular, no m/r/g Abd: soft, nt/nd Ext: warm, no edema. Pressure ulcer boots on. Pleasant 70-year-old woman who had a history of PVCs, left bundle branch block, and a mild nonischemic cardiomyopathy, came into the hospital following a VT/VF cardiac arrest. Her echocardiogram done while in the hospital showed a preserved ejection fraction. Her cardiac catheterization showed normal coronary arteries. She had implantation of an ICD. Hospital course has been complicated by watershed cerebral infarcts. In addition, she had an episode of C. difficile colitis. She has gradually improved over the course of the past 3 weeks. From a cardiovascular perspective, she is being discharged on carvedilol 25 mg twice a day, lisinopril 10 mg daily, and her home atorvastatin. With regards to her etiology of cardiac arrest, I would be suspicious about the possibility of sarcoidosis. However, we were not able to get a cardiac MR while she was inpatient due to her strokes and inability to consistently follow commands and hold her breath. Would recommend consideration of an outpatient PET. She is ready to discharge to subacute rehab today. I have spent greater than 30 minutes in discharge planning. Primary Discharge Diagnosis VT/VF cardiac arrest, s/p therapeutic hypothermia S/p AICD placement 3/16/2021 Secondary Discharge Diagnoses Anoxic brain injury, recovering, with persistent aphasia and dysphagia C. difficile colitis Nonsustained ventricular tachycardia, resolved DETAILS OF HOSPITAL STAY Presenting Problem/History of Present Illness 70 y.o. female, with history of nonischemic cardiomyopathy, admitted on 3/5/2021 after out of hospital VT/VF cardiac arrest. She completed therapeutic hypothermia protocol. Cardiac catheterization did not show any significant</p>

----------	-------	-------	---------	-----	----------	------------	--------------

obstructive coronary disease. TTE showed LVEF 55%. Patient underwent AICD placement on 3/16/2021. Had some recurrent nonsustained ventricular tachycardia afterward, which resolved after increasing her carvedilol doses. Her course was complicated by a C. difficile infection, treated with PO Vancomycin, with significant improvement in diarrhea. She has had gradual neurologic recovery. Neurology felt she had had several watershed infarcts, but felt that she would continue to have a prolonged recovery over the next few months. Had some recovery of language/cognition prior to discharge. Due to her waxing/waning encephalopathy, she did not qualify for inpatient rehab, but will be discharged to subacute rehab. Discharged with tube feeding continued, though she can begin sips with speech therapy supervision. Patient seen and examined at bedside on the day of discharge. She stated that she had no pain, though HPI/ROS still limited due to aphasia. Discussed above information with patient's husband, who understood and was in agreement with the plan. Problem-Based Hospital Course NEURO Acute metabolic encephalopathy, with gradual recovery -Due to neurologic injury from cardiac arrest. -Neurology consult: concern for anoxic brain injury with watershed infarcts, anticipate very gradual recovery over the coming months. No acute process on imaging. -Patient extubated on 3/11, following some commands. Continuing to regain conversational ability and motor function gradually each day. Has some waxing and waning of mental status, but overall her encephalopathy continues to improve. -Limit centrally acting/sedating medications -Speech following for language/cognition as well as dysphagia requiring tube feeding. Can begin some sips in addition to tube feeds. -Continue tube feeds via Dobhoff tube per instructions provided on after visit summary INFECTIOUS DISEASE C. Difficile Colitis: -C.Diff Positive 3/18. Continue 125 mg PO Vancomycin Q6H for 10 days (3/18 - 3/27), confirmed with infectious disease - Frequency of diarrhea has decreased significantly, was stable after rectal tube removed 2-3 days prior to discharge Pneumonia, likely due to aspiration, resolved - s/p 5 day course ceftriaxone (3/5 - 3/9 ) -CTA on admission showed significant RUL and RLL consolidation with air bronchograms, as well as some patchy airspace disease in LUL -Had copious tan sputum on suctioning

1212767	4/15/2021	PA	40	F	3/30/2021	4/1/2021	Symptoms began about 48 hours after the shot. I had diagnosed Covid in July 2020. I believe I am a long-hauler Covid patient as the symptoms flared consistently from July 2020 until present. They were getting fewer, less intense, and shorter in duration until I received the 1st vaccination. Now the symptoms have returned and seem to have worsened over the 2 weeks since the shot. They include: L eye twitching Blurry eyes Visual Disturbances (silver floaters) Neck/Jaw Pain Sporadic Chest pains, both sides Behind L knee pain Swelling in feet/ankles/legs, sometimes hands/face Trouble focusing/Confusion/Forgetfulness Heart Racing/Palpitations (125BPM Resting) BP Sitting: 143/94 L foot vein pain Toe pain Vertigo/Dizzy/Lightheaded GI issues: diarrhea sporadically, gas, reflux, gastritis, stomach pain Insomnia
1212764	4/15/2021	VA	51	M	3/31/2021	3/31/2021	s/p 15 minutes after vaccination, patient began experiencing blurry vision, seeing "halos", dizziness, bradycardia and diaphoresis. Symptoms worsened when sitting up or standing. BP 110/72 when symptoms first began. Pt placed in supine position with cold compress to back of neck. Given water to drink and stated he ate breakfast prior to his appt. Pt reports no h/o adverse reactions to other vaccines. No improvement in symptoms after 30 minutes, pt reported worsening "halos", so patient taken to ER via EMS.
1212750	4/15/2021	MN	52	F	4/8/2021	4/8/2021	All symptoms last for about 1.5 hours. Lightheaded, foggy vision and weakness in the legs: felt like going to faint.=> washed face and hands with cold water and these feelings disappeared. Then periodic palpitations started, each serious was weaker until they disappeared after about an hour. During the palpitations, felt weakness/ numbness in the low jaw and low lip with difficulties to talk but it lasted only for number of seconds. The last symptom during that 1.5 hour was some warm feeling in the inner part of the leg (thigh and calf) and the outer side of the legs filled just as normal. I did have some tightness in the chest with difficulties to have a deep breath but it wasn't significant while I was driving home
1212748	4/15/2021	MA	69	M	3/16/2021	3/16/2021	Light flashes in right eye

1212301	4/15/2021	WY	57	F	3/19/2021	3/22/2021	On the fourth day after the injection, I experienced blurry vision that was relatively mild over the course of maybe an hour. The next day, the same thing. The following day, March 25 (vaccine was 3/19) I experienced transitory vision field impairment in the left eye which came in from the left periphery. This came and went over the course of about 1-1/2 hour, including throughout the visit to my doctor. Prior to this, both my 21 year old daughter (who was vaccinated the same time as I was), experienced sudden migraines at the same time. On Saturday 3/27 I began to experience a twitch/pulse which is still happening intermittently in my left cheek. I received the second dose of the vaccine April 9th. The twitching continues. Additionally, I had sharp pain across the length of the sole of my foot that was brief. It recurred three times. I've had a thorough workout which does not indicate the source of the problem. I've begun taking baby aspirin, but experience minor bleeding if I take it more than once weekly.
1212708	4/15/2021	CA	60	F	4/6/2021	4/6/2021	In 15 min I felt my tongue was numb I left and my face on the right side was dripping My eye was cold because the bottom lid was dripping so I held it closed 3 hour later it went back to normal.

1212608	4/15/2021	NC	43	F	4/15/2021	4/15/2021	This was my second dosage of the Pfizer vaccine. Upon the first vaccine, I did feel symptoms of throat swelling and difficulty swallowing that subsided without intervention and quickly. For the second vaccine that I received today, I experienced dizziness in the store and began to sweat. I left because the pharmacy staff did not seem to want to be bothered. Upon driving home, within about 15 minutes of getting the vaccine, I began to have nausea to the point that I had to stop and pull over. I vomited a small amount of my breakfast. Continued to feel shaky, dizzy, faint, excessive saliva and tearing of eyes. Upon arriving in my driveway, it was hard to walk up stairs. The nausea continued for about 1.5 hours but the weakness and feelings of faintness continue still after 2 hours after the vaccine. I had some tachycardia. It's hard for my eyes to look up and my eyes hurt when I move them. I had moments of feeling like I had a parietal vice on my head. I called the pharmacy to report all of this and only spoke with a pharmacy assistant. No pharmacist called to check on me. I am an RN so I have the knowledge needed to care for myself and seek medical attention if needed, but I have sympathy for those that are not and have their report of symptoms dismissed just as I did from the vaccine provider.
1212584	4/15/2021	NC	63	F	3/19/2021	4/3/2021	Woke up with black eye that began in corner of left eye and progressed down to middle of lower lid, later that day I had sudden onset of throbbing pain on left side of upper gum and cheek area. The pain in mouth would come and go and responded to heat pack and extra strength Tylenol. I also had a headache on the left side of my head. The black eye went away in about three days. The mouth pain went on off and on for about 7 days gradually subsiding in intensity over that time frame. The headache only lasted for a few days. I also felt some pressure behind my left eye.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1212582	4/15/2021	MN	36	F	4/7/2021	4/9/2021	I did not receive treatment other than a prescription for a headaches. I ended up having a bad headache after my J&J vaccine. My headache developed at the base of my skull and radiated to the top of my neck. I had another headache above my eye as well. I also had intense joint pain from my upper leg all the way to my right ankle. I also experienced nausea along with my headache. An ultrasound of the right groin was performed to check any clots in my right leg. The doctor who saw me prescribed Emetrex for the headaches and there has been no follow up since then. I still have a headache today but is a lot less in intensity.
1212558	4/15/2021	GA	45	F	4/14/2021	4/14/2021	started on the date of vaccination, face and eyes were itching, throat closed up partially, tongue was prickly, lips were numb. On 4/15/2021, went to urgent care . abdominal and torso areas are itching, face is not and itching, tongues is prickly and lips are numb. No breathing difficult but throat is red and swollen.
1212555	4/15/2021	OK	75	M	2/4/2021	2/1/2021	After the client's second COVID vaccine, sometime in mid February, the client started noticing his eyes itching. His tears started feeling like acid, and will leave a rash where they have been. Client is having a rash on the right side of his head, and on the backs of both of his hands. He went to his PCP who advised to take Benadryl daily. Client reports the symptoms are ongoing and have not resolved.

1212530	4/15/2021	GA	48	F	4/2/2021	4/11/2021	No initial symptoms. Arm did not hurt. Felt fine initially. A week later, my left eye started to water profusely and itch as if I'd gotten something in it. Within the hour, lymph node in front of left ear swelled up to the size of a bean. The next morning, additional nodes swelled up under the ear by the jawline. The eye was no longer watering, but was and continues to experience sharp pain like pins stuck in it, very painful. Some blurring of vision. It is only in one eye still. Eye is not red. Eye is not watering. It shows no signs of visible conjunctivitis, but very irritated. The following day the left side of my face is swollen along with swollen glands. Additionally, a rash has developed along my hairline, on the upper bridge of my nose, and on forehead. The rash on my nose presents like blisters, almost like poison ivy rash. I was not exposed to poison ivy. I do not have acne, so the outbreak on my forehead is unusual. The rash has gotten progressively worse and spread every day since the onset of these symptoms four days ago. I still have no fever. No armpit swelling. Never experienced this before. There was no clear cause of this nor any known infection. Suspect it could be immune response to 1st covid-19 shot. I was very healthy when I took the first shot. Was advised to take a Covid-19 test as the eye hurting is apparently a rare symptom of the virus. Took test yesterday. Awaiting results. But I have no respiratory symptoms. No fever. Do have some mild diarrhea since receiving the vax. Feel fine physically other than these very painful facial symptoms.
1212529	4/15/2021	GA	40	F	3/14/2021	3/15/2021	I went on Sunday March, 14, 2021 to get the Johnson and Johnson shot offered through the school system. I noticed that my blurred vision intensified. I went to the eye doctor 3/16 and that is where they found blood clots behind my right eye close to my center. I was referred to a Retinol specialist 3/26/21 and sent me to get a physical to check for diabetes. It had started to heal a little. There was not clear diagnosis on what could have been causing the blood behind my eye. 4/2/2021 Went for physical at PCP and results of physical was good with no Diabetes.

1212509	4/15/2021		35	F	4/7/2021	4/11/2021	Starting Sunday April 11th I began having diarrhea in the afternoon it would need to frequent the restroom roughly every hour or so. As the day progressed The frequency increased and I began having a fever in the afternoon around 4:00 p.m. The fever continue to increase into the night and reached a point around 102°F and was paired with loss of energy/lethargy. Temperature reach just above 103°F over the night but bounced to a low as 98°F but stayed around a 101-102. The night was filled with chills and it was highly challenging to sleep. That Monday 4/11 brought serious headache to the frontal lobe and behind my eyes in a way of not felt before along with severe stomach cramps and frequent needs to go to the restroom due to diarrhea. There was also total loss of appetite. I was bed ridden and slept all day. The combined pain brought me to tears regularly. I went to urgent care that afternoon and also took a covid test. That night the fever broke. Tuesday 4/12 The fever dropped to roughly 99°F In the headache mostly went away But the stomach cramps became more severe . The stomach cramps may have been equally as bad the previous day but I don't recall due to the fever and lethargy. I began tracking the times of each stomach pain and restroom visit and my results show a frequency of stomach pain/craming every 10-15 min. These Pains also brought me to tears and i had no appetite. On Wednesday there were also stomach cramps in the morning through the evening but they were much less frequent going from roughly once an hour to once every few hours

1212716	4/15/2021	AZ	16	F	4/3/2021	4/9/2021	Admitted to hospital on 4/10 with 2 day history of mydriasis, diplopia with blurry vision, dizziness and balance difficulty. Found to have enhancement of 6th and 3rd CNs on MRI. Patient continued to have blurry and double vision during her stay and mild gait instability. She developed mild frontal headache managed with Tylenol. Her exam was remarkable for mydriasis, mild lateral gaze limitation R>L, mild dysmetria, dizziness and unsteady gait without notable ataxia. No papilledema. Her reflexes were 2+ in her BL UE and LEs. Pediatric Neurology and ophthalmology consulted and followed patient. Eye exam remarkable for bilateral cranial nerve 6 palsy but no other element of CN3 palsy and bilateral dilated but unreactive pupils. Patient treated with IVIG 1mg/kg/day x2 days for likely miller fisher syndrome variant of Guillain-Barre.
1215794	4/15/2021	TX	61	F	3/25/2021	3/25/2021	Broke out in itchy, swollen, red rash. Began as single spot on right eyelid withing 4 hours of receiving vaccine. Spread over first week, across temple and forehead and chin, later on belly (which spread to cover 1/4 torso below waist on front side), between legs on both sides at top of inner thighs, latter on outer thighs of both legs. Felt like needles pricking skin if fabric touched skin. Lasted three weeks. However, at three weeks I am sill not over the rash. I can now function normally, even though the skin is still red and slightly itchy. Oddly, the rash was strong on the right side of my body with a fainter mirror image on the left side. I reported all this on the V-SAFE app.
1215390	4/15/2021	CT	54	U	4/14/2021	4/14/2021	Patient was in observation following vaccination. At 19 minutes, acute changes observed. The patient's eyes rolled,, she became pale and dizzy, with reduced alertness. She was assisted to the floor and stated, "I can't breathe". She appeared to be in acute respiratory distress, labored breathing, wheezes audible without auscultation. Extremities contracted. 911 dispatched. Single epi pen (0.3mg) administered IM to right thigh at approximately 17:30 with good effect. Shortly after, breathing normalized, patient became more alert. She provided her name, place of employment, and stated, "My throat hurt". EMS arrived. Patient taken to ER for further evaluation and diagnosed with clinical syncopal episode.

1215979	4/15/2021	CA	23	F	4/15/2021	4/15/2021	12:30-12:45 Felt fine during 15 minute observation period 12:45-1:15 While driving home, a searing pain happened in the top of my head followed by pins and needles down the left side of my face and arm Vision went blurry for a second 1:15-1:45 Left arm weak, tingling, can?t move left side of face 2:00 -headed to ER 2:30- nurse took my vitals, everything fine. blood pressure 124/80 3:00 doctor saw me, said bell?s palsy 4:45 still cannot move left side of my face but regained feeling in left arm
1215939	4/15/2021	CA		U			Began 16 days after my injection. Hives began on my forearms, moved to my abdomen, chest, upper legs within 12 hours. By day 2 (Wednesday after initial Monday evening presentation) hives were on my face, chest, full abdomen and back swaths, full legs, hands and feet. Tuesday afternoon, I spoke with a Teladoc doctor who prescribed prednisone (40mg daily for 3 days). By Thursday, not much had changed so I went to my local dermatologist. He immediately said I should not get the second dose of the vaccine due to the hives being on my eyelids as well as having an itchy throat. I'm currently waiting for a call back from my primary care physician to balance the tie - even though I am giving the dermatologist's advice a little more weight due to being somewhat more risk averse and his suggestion to have an epipen on hand.
1215935	4/15/2021	NY	42	F	4/10/2021	4/10/2021	Patient said later the day of vaccination her hands, feet, eyes, fingers started swelling --NO issues breathing and NO tongue swelling. Patient took benadryl. Following day patient took benadryl again. When she told pharmacist about it they suggested she been seen at an urgent care or hospital, they may want to prescribe steroid treatment. Patient did go to hospital and reported they did put her on steroids.

1215932	4/15/2021	TX	57	M	4/12/2021	4/14/2021	On Monday night I tossed and turned, and I gradually realized I felt quite ill. By Tuesday morning I had what I understand to be typical reactions to the second dose: soreness at the injection site, fatigue, muscle aches, chills, overheating, loss of taste, and a touch of nausea. My head was swimming, and putting my hands to my forehead made my head feel a bit better. By midday Wednesday I was gradually improving. But Wednesday evening, at my desk, I noticed my vision seemed blurry. On Thursday morning, I verified that my reading vision (with glasses) was (and is) markedly worse. Now I cannot easily read from my smart phone or computer screen. I plan to see an optometrist as soon as possible.

1215891	4/15/2021	CA	55	F	1/14/2021	1/14/2021	I need to talk about my pfizer experience. I'm 56. January 15 I received my first dose. I had zero side effects. The night after that initial dose. I began having what I'd term as cognitive issues. Trouble focusing. Blurred vision. Confusion. My synopsis weren't synapping. My brain and mouth didn't work. I felt like inside my body was shaking. But visibly, outside, was nothing. At that time, I was managing diabetes and I figured it was related to victoza being stopped since I'm not a diabetic now. And it continued about 7 days. Then, dwindled for a few, but it returned. I then began getting panicked about it and having panic attacks. I'm afraid of dementia, and remembering was an issue. It continued 4 days off 4 days on. Oddly enough. The 3rd week, it went away about 3 days in. I had about 7 days of bliss, but on the 4th day I got vaccination number 2. At this point, troubleshooting, I quit all my medications. I thought the issue was meditation related. I got shot number two and 3 days later, it hit and stayed again. 4 days on. 4 days off. By this time, I figured it is not my medications. So I went to my Dr. We did an MRI. Carotid workup. We did every test known to man, including heavy metals and found no anomalies except I was dehydrated. So I increased water and raised kidney functions. Weeks went by like this. Off and on. Dr finally told me I had toxic metabolic encephalopathy and I could have died. All testing rules out everything except vaccination reactions. He said my body didn't recognize the vaccine and that my brain attacked the toxins and swellee and caused the TME because of that. I want others to know. TMEs can be deadly. Your brain can swell, and you can die. Fortunately I'm on the upswing. But I still worry about memory. I forget appointments. I still am for the vaccinations. But we never know how our own bodies will react. My physicians diagnosis is a TME caused by Pfizer vaccine. He has ruled everything else out. I advocate this vaccination. Do it. I think what I went through is rare. But interestingly enough, online, it states 23 percent of covid victims get TME. I didn't have Covid. I've tested negative. This is also not dementia or anything of that nature. I've been thoroughly examined.

1215581	4/15/2021	MN	25	F	4/15/2021	4/15/2021	At 2:43pm patient received the vaccine in her arm. At 2:50pm my pharmacy technician witnessed the patient standing up from her chair and walk up to the pharmacy counter then faint into the pharmacy immunization booth. My technician states the patient did not hit her head on a wall. At 2:51pm my pharmacy technician brought the incident to my attention and we both ran to the patient to address the situation. The patient was unresponsive, so I ran and dial 911 then instructed my tech to take the phone. I then ran back to the patient and patted her back, said her name and asked her if she could hear me. It was at that moment the patient's eyes flickered and the patient had what looked to me like a 10 second seizure in the chair inside the pharmacy booth. Once the patient was done what I could only identify as seizing, she came to and I asked her if she new her name and where she was. The patient answered correctly and then asked me "Have you had anyone with a reaction like this before?". I answered that I have not personally witnessed a reaction like this before. My technician had 911 still on the phone and they instructed her to stand out front of the store to await the ambulance. A first responding officer came in and asked about the witnesses to the incident then took over for caring for the patient.

1215429	4/15/2021	PA	43	F	4/15/2021	4/15/2021	Patient reported nervousness prior to receiving vaccine. Patient reported blurred vision, possible vertigo, slight nausea. Patient never lost consciousness. Patient was moved to fresh air, given ice pack, bottle of water. Left without issue.
1215427	4/15/2021	WA	49	F	3/31/2021	3/31/2021	My 15 minutes ended at 12:22p. About a couple of minutes I started feeling effect. First I felt dizzy, then like I was going to pass out so I sat down. Afterwards, I went to another office because our lobby was full and I didn't want to draw attention to myself. My coworker was watching me. My head and hands both became clammy. Then my coworker said my eyes were really red. Then she said my face turning red. She grab one of the workers and they took my blood pressure. I had gone to a surgeon the day before and my blood pressure there was 92/68. During 3/31, my blood pressure was like 113/98. Then they took my temperature and I had a fever. I didn't have trouble breathing or chest pain but they brought me to a healthcare facility. There they watched me for about an hour and a half and gave me an EPI pen. My symptoms of headache, nausea, chills, fever, muscle aches, inability to sleep for more than 30 min have continued since 3/31 minus a few hours on 4/7. The most constant symptoms are headache, nausea, chills and then the other symptoms come and go. For example today, I have headache, nausea, chills and then I spiked a fever even though I am taking Advil and Tylenol to help with the headache. Also today, in addition to feeling hot, my palms of my hands are hot. Last Thurs and Sat in addition to the headache, nausea, chills I was fatigued to the point where I slept 14 hours on Thurs and 16 hours on Sat. Another symptom that I have is on my injection arm. Occasionally it will hurt from my middle finger to my collar bone.
1215421	4/15/2021		33	F	4/1/2021	4/2/2021	abdominal pain since vaccine, found to be pregnant. headache 1 week after vaccine. normal exam. no change in vision. no personal or family history of clots. better with reglan

1215836	4/15/2021	NM	36	F	4/1/2021	4/12/2021	Felt fine at time of shot, a little achy afterwards but nothing concerning. My legs ached some a few days after but got better. About 3 days ago I started getting a major headache on the right side that also arrived with blurry vision, mental fog and mild dizziness. Nausea yesterday and today except the headache was much worse. I cried from the pain and this is when I became more concerned. My eyes, mainly the right side and a pressure in my sinuses were very difficult to bare with, subsided some with multiple doses of ibuprofen and Advil sinus but not by much. The headache is unbearable, painful to stand out bend over or move.
1216400	4/15/2021	CO	27	F	4/7/2021	4/14/2021	Rash on left arm one week after first dose of Moderna. Itchy, irritated eyes 3 days after first dose. Swollen tongue one week after first dose. Taking Benadryl for symptoms.
1215135	4/15/2021	CA	22	M	4/15/2021	4/15/2021	Patient was sitting in chair when he started feeling dizzy and noticed his vision was blurry. Patient fell to floor and hit back of head on the floor. Syncopal episode lasted for 5-10 sec. Patient awakened A/Ox3. Vitals obtained with BP 146/96, HR 75, O2 99%. Given water and cold compress to neck and head. Denies feeling bad at time. Vitals obtained again with BP 136/62, HR 68, O2 99%. Kept patient an additional 15 mins. Patient refused ambulance and EMS service. Patient left after sitting 30 mins total. Mentation still A/Ox3.
1214440	4/15/2021	TX	40	F	3/16/2021	3/22/2021	experienced a sudden pain to the forehead. Pain increased from 0-100 very rapidly, I became very nauseated to the point of having projectile vomit. Experienced blackout segments. Took 1 dose of 100mg Sumatriptan at about 930pm and tried to sleep w/the immense pain. Took 2nd dose at about 12am. Pain did not dissipate but fell asleep. When i woke up pain was gone but felt very sore, dizzy and disoriented. Fast forward to April 9th while laughing uncontrollably the right side of my face spasmed/cramped closing my right eye and contracting my right cheek as if having Bell's Palsy. I have never experienced this before. Face did not continue to droop but has left a tick/twitch sensation under my right eye.

1216559	4/15/2021	CA	34	M	4/14/2021	4/14/2021	<p>Main symptom: Around 10 hours after receiving the vaccine, my right ankle felt slightly numb. I also had a sharp, painful shooting pain in the middle of the sole of my foot that lasted less than a second. As the night progressed, the numb area spread slowly to other parts of my foot. When I woke up the following day (today), I was surprised to discover I was not only still numb, but the numbness had spread across the entire outside of my right foot (from my ankle to 3/4 of the distance to my pinky toe). Now, several hours later at 8:30pm, the numbness reaches all the way from near my pinky toe on my right foot up to the bottom of my calf. All of the numbness is isolated to the right side of my right lower extremities and has not crossed over to the middle of any of my extremities yet. I can also feel a slight numb sensation in my left index finger stretching to the base of my left thumb, but it isn't nearly as bad as my right foot. I haven't felt any addition sharp shooting pains.</p> <p>Numbness aside, I had a pretty bad headache from about 4pm to 10pm yesterday, and when I closed my eyes saw what appeared to be mild hallucinations (green and red streaks that disappeared pretty quickly, and were only visible when my eyes were closed). I'm no longer having the visual symptoms, but the numbness is getting worse by the hour. I have NEVER had any of these symptoms before in my life, and did nothing out of the ordinary yesterday or today in terms of food or physical activities. I take no medications.</p>

1216558	4/15/2021	NC	34	F	4/14/2021	4/15/2021	Had chills all throughout the night and suspect a low-grade fever although I did not take my temperature. Woke up the morning after the vaccine around 7 am with a severe migraine and eye pain. I took my temperature and had a low grade fever of 99.8. I took two over the counter Excedrine Migraines. Migraine got better but around 8am I started experiencing neck pain. As the day went on, the neck pain has become so severe that I am planning on seeing a doctor tomorrow if the symptoms don't subside. The neck pain feels like a severe stiff neck, when I turn to the side or look up or down. Even if I am not moving at all, there is a dull pain that is felt all the time. The pain has radiated to my left shoulder blade and jaw. I also feel a dull pain at the base of my skull. When I swallow, I feel the back of neck hurt. I have not taken any other meds and hoping this will subside on its own.
1216545	4/15/2021	WA	42	M	4/12/2021	4/13/2021	About 2-4 hours after shot husband had body aches and was sleepy. 12-14 hours post vaccination husbands vision would go blurry for about 10-20 seconds, happened about a dozen times over the course of the next 5-6 hours then stopped. At 30ish hours post vaccine woke up drenched in sweat, all bedding had to be washed, but said he felt better aside from mild Muscle pain/body aches that remained for about 48 hours from initial time of injection but was about return to work without issue on Wednesday. Still has mild soreness at injection site on Thursday 4/15.
1216537	4/15/2021	MT	19	M	2/3/2021	3/24/2021	Fatigue for 7 days. Fever 1 day. Chills 2 days. Body aches 5 days. Headache 5 days. Blurriness in eyes 1 day. Vomiting 1 day. Bloody nose 2 days. Dehydration 4 days.
1216535	4/15/2021	FL	48	F	3/20/2021	4/3/2021	2 weeks After the vaccination got a Very strong headache and vomit ; the next few days got mild and spacey out ; headaches also feel poor circulation on my right leg. At the beginning though headache were related to vision or the need to change prescription of my glasses until The J&J announce. I called my primary doctor and they say it is normal and gave me an appointment for the end of the month. Till today I still have sporadic mild headaches some of them only on the right side and eulment on my leg

1216453	4/15/2021	CA	35	F	4/12/2021	4/12/2021	Client had a chief complaint of chest pain. Client stated that she began feeling chest pain several minutes after the start of her observation. Client has a history of depression and other unspecified psychiatric illnesses. Client stated that she takes sertraline daily and has a history of taking Risperdal. Client stated that she regularly sees a Psychiatrist. Client denied any allergies or other underlying medical illnesses. Assessment revealed chest pain located in the center of the patient's chest. Client pointed to her sternum to indicate the exact location and stated that her arms felt "heavy." Client's airway, breathing and circulation were intact, however, client complained of shortness of breath. Client was alert and oriented to person, place, date and event while appearing slightly distractible. O2 saturation 100%. Client was negative for redness, swelling, hives, severe sweating or other signs or symptoms of anaphylaxis. Client denied any increase in chest pain or shortness of breath when breathing in or out and did not state any additional pain throughout her body. Client then added that she felt "anxious" after receiving her shot and stated some reluctance with even receiving the shot prior to her arrival. Client's mother was present and stated that client had been reading the Pfizer fact sheet she was given and had been focusing on the side effects portion before signaling for assistance. Client's initial vitals were as follows: Blood pressure:138/88, Pulse 76, Respirations 20, O2 sat 100%, Eyes equal and reactive to light, Lung sounds clear bilaterally. Client initially consented to staying an additional 30 minutes. She began to become anxious and impatient with her additional observation time. After 10 minutes of sitting the client began stating that she was afraid that her "heart would become too fast" when she got home if she "didn't throw it away." After some encouragement, the client was able to clarify "it" as "meth" which she had hidden at home. Client stated some reluctance to go home stating that if she smoked her "meth" that her heart rate would become too "fast." Client then asked EMT if he was willing to come home with her to help her "throw it away." All staff present praised the client for sharing this information and after discussing her concerns further, client became much calmer and stated that she felt much safer and that her chest pain, shortness of breath and anxiety had subsided. Client then stated that she wanted to go home

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							but consented to a second set of vitals before leaving. All of the client's vitals improved: blood pressure 132/88, pulse 68, respirations 16, O2 sat 98%. 1636 - 138/88, 76, 20, 100% 1651 - 132/88, 68, 16, 98%. Client was encouraged to discuss the incident with her psychiatrist and to seek further counseling. Client was also instructed to seek further medical care or the emergency room if symptoms returned. No medications were administered.
1215989	4/15/2021	HI	74	F	4/1/2021	4/2/2021	On Apr. 2, 2021 I awoke about 10:00 with blurred vision and feeling dizzy but since my husband and I had medication pick up, we left home. I made the pick up from pharmacy but, when I arrived back at the car I informed my husband that I felt dizzy that morning. We immediately drove to ER. After reporting symptoms, I was admitted. Receiving physician interviewed me and decided on essential tests (Blood Test, CAT SCAN, MRI, etc.) to be conducted. After each test, indications did not prove a definitive prognosis. After six hours we were finally discharged from ER and were instructed to contact PCP. We emailed PCP, and on Apr. 3, 2021 she called and did an on-phone interview. From tests PCP was privy to she decided to first prescribed another blood test followed by an Apr. 7 visit with ophthalmologist at 1:00 PM. The following day PCP informed us that eye exam showed signs of eye nerve/muscle damage, so, an Esophagogastroduodenoscopy (EGD) and colonoscopy procedure/s will be performed for Apr. 20, 2021, pre-ops to be accomplished before that date.
1216414	4/15/2021	IL	69	F	4/15/2021	4/15/2021	Patient has had anaphylactic reactions in the past and carries and Epi-pen on her person. About 10-15 minutes post vaccination, patient was able to detect swelling around the eyes, lips and tingling in the throat. She proceed to administer her own epi-pen. A second epi-pen was administered by the patient and pharmacy activated EMS with monitoring.

1216164	4/15/2021	MN	52	F	4/14/2021	4/14/2021	Injection was at 12 PM. At 12:15 PM I started to feel a furry throat like I had a hairball in my throat and a tickle. Within a minute or so I got a cough, a dry cough with a high pitch. I could not stop coughing. My face felt hot and was flushed, my lips tingly, and I started to sweat a lot. I was short of breath when I tried to talk. The staff on site put an oximeter on and my oxygen was fine but my pulse rate was around 130. My nose was dripping snot and my eyes were running. We walked over to ER which was just around the corner, And sat in the waiting room for about 10 minutes wondering if the cough and symptoms would update. I Peed my pants a little bit. I started to feel very nauseous and little bit scared, even though this has happened to me before. I was brought to a room and soon given a dose of Epi as well as Pepcid (about 1pm) soon after some Zofran. The epi took care of my symptoms within about five minutes. About 90 mins later symptoms came back full on and I was given another dose of Epi at almost 3pm. And agin at 630pm.
1216367	4/15/2021	SC	82	F	3/12/2021	3/29/2021	Large hemorrhagic stroke with severe headache & throwing up. Not sure when it actually happened but found her on bathroom floor when I woke up. Transported to local hospital & transported to Neuro icu at major hospital. Now in nursing home with rehab. Unable to assist yet with much therapy. Impaired vision, can't feed herself or sit unattended. Very groggy & sleepy. Never lost consciousness.
1216352	4/15/2021	TX	23	F	4/11/2021	4/11/2021	I received my vaccine April 11th at 3 p.m and began to have a fever around 9 p.m. My fever did not go away until the next evening. On April 12th I had a fever and woke up with red little dots around my eyes. At night the fever went away. The following day April 13th I felt my chest tight and had shortness of breath throughout the day. I also had stomach pains at times. April 14th and 15th (today) my chest still feels tight and I get tired very easily. My arm is also still very sore and sensitive, I have a little bump where the vaccine was put in.

1216146	4/15/2021	IA	32	F	4/9/2021	4/10/2021	Janssen COVID-19 Vaccine EUA Patient received Janssen vaccine 4/9/2021. Patient presented to ED 4/14/2021. Patient is a very pleasant 32-year-old female, with past medical history significant for taking bromocriptine for prolactin issues as well as metformin for type 2 diabetes, presents to the emergency department for evaluation of continued headache over the last 1 week. Patient also reports chills, sweats, body aches ever since receiving the Johnson and Johnson coronavirus vaccination 1 week ago. The headache started after receiving the vaccination and has been continuing ever since. It does not fluctuate in intensity. It is caused her blurred vision and difficulty focusing. No tinnitus or hearing loss. No slurred speech, vomiting, numbness or weakness or tingling to the extremities or any facial droop. No history of strokes or aneurysms. She is not on blood thinning medication at all. No upper nor lower extremity swelling or redness. No abdominal pain, nausea, vomiting or diarrhea. She reports the continued subtle shortness of breath and body aches since the vaccination as well. No rapid heart rate, long flights, long car rides, surgeries nor oral contraceptive use. Patient started on heparin drip. Neurologist recommended transferring patient to higher level of care. emergency department physician is willing to accept the patient at their facility. Patient transferred to the facility.
1216100	4/15/2021	NC	30	F	4/14/2021	4/14/2021	At approximately 7:30 pm (almost 9 hours after receiving the second Moderna vaccine), I began to have chills and a low grade fever of 100.4. My neck also became extremely stiff. The chills continued to persist and each hour my temperature increased. At 10:00pm my fever was 103 in the ear and I took 1000mg Acetaminophen. The fever went down to 101 overnight and eventually the chills subsided. The morning after the vaccine at 6:20am, I went to take a shower and nearly passed out in the shower - experiencing tunnel vision, ringing in ears, and extreme nausea. The rest of the day, I continued to have a low grade fever between 100.0-100.4, muscle and joint pain, bad neck stiffness, headache, occasional eye pressure, intermittent nausea, and fatigue. The symptoms improved by 8:00 pm (about 33 hours after the vaccine).

1216093	4/15/2021	OH	56	F	4/13/2021	4/13/2021	PT called and reported an itchy, red rash up through her neck - got vaccine ~1030:am, noticed around 1pm (about 2.5 hours post-vaccine) and has persisted since (4/15/21 around 8pm at the time of reporting) - also has little white bumps on the rash itself, and full body itching without visual skin rash elsewhere on body. Pt has had no issues with difficulty breathing. NO reaction at site of injection, only a little sore
1216084	4/15/2021	MN	19	F	4/15/2021	4/15/2021	Within the 7 min of the waiting period the patient felt lightheaded and had some visual disturbances. She came to the pharmacy and sat on the floor and when asked she explained what happened. She was told to lay down with feet elevated and she felt a bit better. She asked for water and she felt better. She laid down for 15 minutes and said she could leave but we asked her to stay seated and see how she feels and then after another 15 minutes she said she is fine and left and after an hour called to let us know she is feeling fine.
1216054	4/15/2021	GA	31	M	4/15/2021	4/15/2021	Today 4/15/21, patient was administered the Moderna COVID-19 vaccine. Prior to the vaccination, his wife mentioned to us that he has a severe phobia of needles and has passed out previously to other shots. He had no other issues on his PQCF preventing him from receiving the vaccine. The PQCF was reviewed with the patient by pharmacist. Tech administered the vaccine under supervision of both pharmacist and other technician due to his phobia. Patient received the vaccine with no issues except obvious nerves and a few minutes later while still in the booth, he reported not feeling well. We got him a bottle of water and he went to the post-vaccination waiting area with his wife. We were monitoring him closely and noted that his head was slumping into his wife's stomach when he was sitting down, and he appeared ill. Immediately, we got patient in supine position on the floor with his feet on a chair elevated. Cold ice packs were put on his head, neck, and wrists. Within 5-10 minutes, he was feeling much better. He sat back up in the chair, still with ice packs, and drank water. Patient was asked to stay for 30 minutes so we could continue to monitor him. After 30 minutes, he left with no issues.

1214586	4/15/2021	VA	81	M	2/15/2021	2/21/2021	<p>Patient received his 2nd dose of the Pfizer vaccine at on Monday, February 15. That evening, he experienced visual disturbances with slightly blurred vision. Not thinking anything of it at the time, the vision cleared, and he continued about their evening/week without telling anyone of his visual disturbances. On Sunday, February 21, he experienced additional visual disturbances including double vision and dizziness, and we had him visit a local ER for evaluation. He was discharged with a diagnosis of dehydration and vertigo. No scans were performed. The visual disturbances cleared up the following week and the only persistent symptom was a slight dizziness. An eye exam was performed on Friday, February 26 with no problems found. An MRI was performed on March 3, and he was diagnosed with the below conditions. Impression (3/3/2021) 1. Small acute to subacute infarcts in the left splenium of the corpus callosum and parasagittal left occipital lobe. 2. Trace subarachnoid hemorrhage in the parasagittal left parietal lobe. 3. Mild chronic microvascular ischemic disease. He was admitted to the hospital and remained there until Saturday, March 6. Follow-up scans and testing were performed with no underlying reason for the stroke being determined. Prior to the stroke, he had been a very active individual with osteoarthritis as is only health complaint. He was not on any prescription medication prior to the stroke. While in the hospital, the tests for high blood pressure, high cholesterol (LDL 92 MG/DL), sugar inadequacies (glucose 93 mg/dl, A1C 5.7%), etc. came back without major concerns. His follow-up CT scans also did not reveal the stroke shown on the MRI. No inquiry was made by any of his doctors or hospital staff as to his COVID vaccination status/dates to even consider the connection. Below are the results of the last CT scans: Impression (3/4/2021) 1. Age-related volume loss and white matter disease similar to prior exams. 2. Small infarct seen on MRI are not well seen on CT. 3. No acute intracranial abnormality demonstrated on the CT scan. Impression (3/5/2021) 1. No evidence of acute infarct or intracranial hemorrhage. No significant change. 2. Periventricular white matter disease is likely secondary to chronic small vessel ischemic changes.</p>

1214765	4/15/2021	AZ	63	F	3/17/2021	3/18/2021	My symptoms started 03-18-2021 at 11am where I developed chills, was very sleepy that I slept 15 hours straight. I felt very fatigued and my eyes hurt so much and I could not keep them open. On 04-06-2021 I still was not feeling well. I started to have problems with my right side of my face, eyes and mouth which gradually got worse so I went to the hospital. At the hospital they checked me for stroke, performed lab work, did MRI and CT scans and the the doctors came back and said it was Bell's palsy. I again went to the hospital 04-11-2021 but this time due to GI issues with pain. On 04-14-2021 through 04-15-2021, I started to experience neck pain behind my right ear. At the hospital they had prescribed my prednisone 50mg, so I took half for my pain. I still have trouble sleeping and have lots of pain.
1214756	4/15/2021		33	M	4/14/2021	4/14/2021	Rec'd covid vaccine dose 1 @ 1430. c/o nausea, dizzy, tachy @1440. taken from theater chair to gurney@1443 HR 114 Left BP 134/94 sats 94% on RA. 1446 given apple juice box, fruit snacks and water LEFT BP 136/94 HR 104 sats 94%increased drowsiness, bilateral arm tremor, nauseous, able to answer all questions, aaox3 however drifting to sleep eyes closed often during conversation. pt stated takes depakote, chart review revealed depakote, cogen, plenate with h/o schizophrenia. 1459 BP LEFT while sitting up on gurney 129/94 HR 120 RA 96% no longer dizzy or nauseous. 1502 sitting up, talking, recovered. 1504 LEFT BP 113/100 RA 94% ambulated to parking lot without assistance to depart in handivan.
1214755	4/15/2021	MA	62	M	1/1/2021	2/21/2021	I personally began developing left eye symptoms (eye pain, redness, decreased vision and seeing halos around lights in my left eye only) on February 21 and was subsequently diagnosed with pretty severe, acute left eye anterior uveitis on February 23. (Thankfully, it appears to have fully resolved with a course of ocular steroid eyedrops.) I received my initial Moderna vaccine on January 4, with my second dose on January 27. I have never had anterior uveitis before, and of course I have no idea if it is related to my vaccination. I am at increased risk for anterior uveitis as I have psoriasis and I am HLA B27 positive.

1214740	4/15/2021		18	M	4/7/2021	4/7/2021	Patient received the Pfizer COVID vaccine (Lot EW0150, exp 7/2021) dose 1 at 1400. At 1405, EMT approached patient who appeared pale and diaphoretic with his eyes closed. PHN approached to assess, patient had slow speech and pulse felt thready. Vital signs: O2 99%, pulse 56, respirations 24. Patient had thick sweatshirt on EMT had difficulty obtaining blood pressure. Paramedic approached to assist. At 1410, PHN, EMT, and paramedic transferred patient to zero gravity chair and placed in reclining position. Patient was offered water and he verbalized feeling better. Patient denied allergies, medical conditions, or medications. PHN assisted patient in removing sweatshirt partially to obtain blood pressure. Vital signs: O2 99%, pulse 51, blood pressure 92/60, respirations 24. PHN offered Benadryl but patient declined. PHN advised on when to call 911. At 1422, patient reported light sensitivity and blurry vision. At 1425, vital signs: pulse 52, respirations 18, O2 99%, blood pressure 118/84. At 1535, vital signs: O2 99%, pulse 58, respirations 18, blood pressure 110/66. Patient reported continued improvement in symptoms, only feeling tired. Patient reported working out, only sleeping 2 hours that night, and not eating before coming in. PHN called family member at patient's request to drive patient home. At 1439, patient assisted to seated position in zero-gravity chair by PHN and EMT. Patient reported symptoms had resolved and he felt back to baseline. At 1445, patient stood up, monitored closely by PHN and EMT. At 1449, patient left walking with steady gait to parking lot where family member was waiting to drive patient home.
1214733	4/15/2021	IN	60	F	4/1/2021	4/8/2021	Patient reports that she had pain behind her eye. Went to hospital and was diagnosed with having a stroke. Patient states she lost sight in her left eye and is still blind in her left eye. Optometrist states patient will not regain her vision in her left eye.

1214723	4/15/2021	AL	38	F	4/7/2021	4/14/2021	Patient presented to my office for a routine visit (as her family doctor) the very next day after she started noticing symptoms. First it started with some numbness of her tongue on the left and accompanying decrease in taste. The next morning (day of my appointment with her) she woke up with left side facial drooping involving the entire left face. I diagnosed her with Bell's Palsy today and discussed the case with a neurologist at the academic center nearby and started treatment of prednisone for 7 days. Also instructed other conservative measures such as eye wetting drops and eye patch.
1214719	4/15/2021	VA	35	F	4/13/2021	4/14/2021	The next evening following the vaccine, my right eye swelled (the white of the eye) and my cheek and above my eyebrow became inflamed on the right side only. I visited the ER the next morning and they told me it looked like an unrelated allergic reaction. She said it looked almost like the pattern of shingles but said that was unlikely. Visited another dr who said it looked like the possible beginnings of shingles based on the affected areas and that I should monitor. Face feels hot, eye swelling went away after Benadryl use the first night but cheek and eyebrow are still inflamed.
1214685	4/15/2021	CA	66	M	4/6/2021	4/9/2021	2 days after shot, fatigued, minor muscle ache, dizziness, blurry weak vision. Some nausea in a.m., then today, 7 a.m. nausea and weakness, chilly and extreme fatigue, in bed all day so far. Feeling like not enough air all week since shot.
1214683	4/15/2021	NV	23	F	4/2/2021	4/5/2021	Stye infection on left eye lasted 5 days. Appeared only 3 days after the vaccine and I had no previous history of Stye infections prior to this. I was vaccinated on my left arm and the Stye appeared on my Left Eyelid.

1214655	4/15/2021		54	F	4/8/2021	4/8/2021	Per RN report: patient received dose 1 of the Moderna COVID vaccine (lot 041B21A, exp 5/6/2021) at 1023. At 1025, EMT shouted across the room to RN "she's going to faint." RN approached patient to assess, the patient was diaphoretic, pale, and not responding to questions or making eye contact. RN squeezed her hand and patient made eye contact and verbalized feeling lightheaded. RN , EMT , and EMT transferred the patient to a zero-gravity chair allowing patient to recline. RN returned from helping outside and approached to assist at RN was taking care of another patient. At 1027, patient reported feeling faint, sweaty, with blurry vision, and ringing in the ears. Vital signs: 94/62, pulse 72, O2 93, respirations 22. Patient denied nausea, reported she had eaten breakfast that morning. Patient reported having a similar reaction when she donated blood previously. Patient denied allergies, medical conditions, or taking any medications. At 1035, vital signs: O2 99%, pulse 68, blood pressure 104/62, respirations 22. PHN offered Benadryl but patient declined. PHN encouraged patient to contact provider and when to call 911. At 1042, vital signs: blood pressure 98/62, O2 99%, pulse 74, respirations 22. Patient reported that she was experiencing numbness in both hands. At 1049, patient reported her symptoms were improving including the numbness in her hands, blurry vision, and lightheadedness. Patient reported feeling cold, weak, and shaky. PHN noted patient's facial color was returning. At 1054, vital signs: blood pressure 100/62, O2 99%, pulse 68, respirations 20. Patient reported her symptoms has resolved at this point. At 1059, vital signs: O2 99%, pulse 69, respirations 18, blood pressure 110/64. PHN and EMT assisted patient to seated position. At 1105, patient stood up with PHN and EMT close by. Patient reported no symptoms and back to her baseline. At 1108, EMT walked patient out. Patient left walking with steady gait.

1214498	4/15/2021	IL	37	F	4/1/2021	4/9/2021	My first dose of the Moderna vaccine was on 4/1/21. I had an very itchy, red rash at the injection site 8 days after (on 4/9/21). I used hydrocortisone on it for about 5 days. Today, it's almost all gone, but it spread over my entire left deltoid, about 5" vertically by 2" horizontally. Another strange side effect I noticed was on the way home after receiving the vaccine, my vision in my right eye was slightly blurry, but noticeable to the point that I wondered if I needed a new glasses prescription. Thankfully in a couple days, my vision returned to normal.
1214442	4/15/2021	PA	30	F	2/17/2021	4/1/2021	I initially developed a painful injection site, which was to be expected. A few days post injection I then developed a rash directly over the injection site which was roughly 1 inch x 2 inches in diameter. More than a month later, I noticed the return of mild soreness at my injection site. While examining the site, I felt and visualized an obvious depression in my arm, also about 1 in x 2 inches in diameter, which appears to be muscle atrophy.
1214635	4/15/2021	FL	55	F	4/15/2021	4/15/2021	About 25 minutes after injection I felt a pain and then numbness that claimed my neck into my jaw, cheek, nose, eye area, and forehead accompanied by a metal taste in my mouth. All occurred on the left side only. It is now 4:25 and I still have the same numbness. So far, other observations are soreness of muscle in upper left arm and stiffness in left side of neck. My husband was also vaccinated at the same time in a different pharmacy and is experiencing similar side effects with numbness is mouth/jaw and metal taste.
1215084	4/15/2021	CA	62	F	4/2/2021	4/6/2021	Right sided tingling, right sided weakness, flashes of light of the left eye, interrupted sleep, right pinky turned purple.
1210958	4/15/2021	NJ	64	F	3/31/2021	3/31/2021	7 pm feeling of tiredness so I lay on sofa 11 pm when I got up to go to bed, splitting headache, pressure behind both eyes, chills, fever 100.3, delirious dreams at night, not much sleep, fatigue 10 am Thur morning feeling of weakness, could not take a shower, could not concentrate, went to lay on sofa 12 noon made 2 eggs and lost energy again, back on sofa 11 pm went to bed, could not sleep, extreme pain in back (from laying down 28 hours?) walked around, drank water, took 2 tylenol

1215368	4/15/2021	AZ	65	F	3/31/2021	4/1/2021	<p>Wednesday, March 31, 2021 Moderna vaccine, 2nd shot at 4:00pm. Arm began to feel sore about 10pm. Blood pressure and oximeter reading remained normal throughout. Thursday, April 1, 2021 Insufficient sleep, sudden increase in sinus congestion, muscle soreness and increasingly sore arm upon arising. Fatigue, Imbalance and Brain Fog rapidly increased. Urinary incontinence 3 times - once upon awakening and twice in the afternoon. Temperature began rising and reached 100.2°F by 3:00pm (normal temp 97.5°F). Resting pulse rate 74 at 10pm (normal 54). Headache and weakness in the evening. Friday, April 2, 2021 Insufficient sleep, sore arm, sinus congestion, sneezing, moderate headache, moderate imbalance, muscle soreness, weak, moderate brain fog. Resting pulse rate 64 (normal 54). Temp at 7:30am 99.4°F (normal 97.5°F). NEW today: joint pain in both hips and Tinnitus suddenly spiking high. 10:00pm noticed mood began to change, feelings of irritation then anger for no apparent reason. *Saturday, April 3, 2021 Insufficient sleep. Temperature at 12:30pm 98.1°F then continued to fall until it reached normal range (97.7°F) at 10:00pm. Resting pulse rate 68 (normal 54). Increasingly painful hip joints, sinus congestion still high, sneezing, mild headache, canker sores, tinnitus spiking, brain fog, increased imbalance. *NEW today: 7:30am-10:00am mental confusion, hallucinations, auditory, increased imbalance. Afterwards, feelings of fear, anger and paranoia that persisted through Sunday. Evening: increasing blurred vision and diplopia (both chronic conditions but usually very mild). Injection site suddenly red and more swollen, itching. Still feeling uncharacteristically emotional at bedtime. Sunday, April 4, 2021 Insomnia. Volatile emotions - anger, agitation, crying - kept me awake Saturday night; slept 2:30am-8:30am Sunday morning. Brain fog, imbalance, sinus congestion, sneezing, right arm itching, hip joint pain, canker sores on tongue, spiking tinnitus continue. Temperature normal all day; resting pulse rate still high 64 (normal 54). Monday April 5 through Thursday April 15: Most symptoms continued to gradually subside over the next ten days. Spiking tinnitus, canker sores and injection site itching were the most persistent and lasted until April 15. Imbalance subsided on April 12. NEW Symptoms: Anxiety dreaming began on April 6th. Most nights had insufficient sleep. Concern about the cause of</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							the episode of delirium on April 3rd continues. Good news, no COVID-Arm like I had with the 1st vaccination. General observations: It seems as though my body's response to the 2nd vaccination was to temporarily trigger some of the symptoms of my chronic health conditions like MCAS, Dysautonomia and Diplopia, without causing an actual flareup of those conditions. This was quite unexpected and disconcerting. The episode of delirium was something I've never experienced and hope to never experience again.
1215098	4/15/2021	IA	45	F	4/7/2021	4/8/2021	Approximately 24 hours after receiving the Janssen COVID-19 vaccine, patient experienced central vision loss or "white out" vision as she described it. She could still see things in the periphery, but her central vision went completely blank. This lasted for four to five hours and over time her symptoms gradually improved. She still has some double vision and difficulty focusing. Of note, she saw the eye doctor last month and had her prescription updated but has not picked up her new glasses. She only wears her glasses for driving and occasionally at work. She has chronic headaches and has not had any new/different headaches than before. No weakness, but her right leg did feel heavier than normal after receiving the vaccine.
1215078	4/15/2021	WA	61	M	4/7/2021	4/8/2021	I got really cold, the first day and my eyes hurt pretty badly, Then the 2nd day I woke up from a nap in a puddle of sweat, Then the 3rd morning, I also woke up in a puddle of sweat. I slept a lot and took tylenol.
1215043	4/15/2021	TX	22	F	4/9/2021	4/9/2021	About 7 hours after receiving the vaccine I developed a painful migraine. The pain was very intense behind my left eye like there was a needle being poked in from behind. Some nights the pain is so bad it hurts to lay my head on a pillow or I wake up all through the night because of it. I took tylenol the first 4 days then stopped. I tried to see an urgent care about it but they told me they couldn't help me due to the vaccine type.

1215031	4/15/2021	TX	47	F	3/7/2021	3/11/2021	About 4 days after I started having abdomen pain, it was like having contractions, then bleeding and spotting, and it was a different type of color instead of a period color, more burgundy. it lasted 26 days, when I'd eat it would start again, I started having headaches, and had vision problems, then SOB started and I used the inhaler to help. I also had a low grade fever of 99.8 - 100 that lasted up until about 5 days ago. I started having bruising and leg pain, the bruising would be if someone helped me get up, I have little bruising dots over my body. I went to the ER 3/16/2021 because the stomach and headache pains, they did a MRI and Ct and said it was acute stomach pain and migraines and told me to see a OBGYN for the bleeding and gave me meds for stomach pains. Bentel for stomach and Floraset for headaches but it never worked. I had a nerve block on my head for the migraines but it didn't work. The GYN gave me something to stop the bleeding and she's wants to do a D&C. I'm waiting to see my PCP on the 19th. I still have the purple dots and headaches, I still get the contractions and the stomach issues have settled some.

1214904	4/15/2021	MT	36	M	4/15/2021	4/15/2021	After patient received his shot, while sitting during the 15 min waiting period. The patient began getting lightheaded and hot, his color went out of him and his eyes began rolling back in his head. His eyelids turned a purple color and he appeared to momentarily stop breathing. Myself and another pharmacist got him on the ground and supported his head with a coat. When he "came to" and was talking to us. He described feeling better on the cold floor and his color began coming back. I was speaking with him the entire time. While we were out with his 9-1-1 was called and paramedics arrived 15 min later. by the time paramedics had arrived the patient had gotten up and back into the chair himself, was lucid and had color back in his face. Paramedics arrived and took over. He was given the green light from them and remained in the pharmacy area for a total of about 30 minutes before heading home. The patient was admittedly nervous for the shot and had not eaten or had anything to drink the whole day to that point. I believe he passed out from a variety of factors not related to the actual ingredients in the vaccine but cannot confirm this.
1214980	4/15/2021	OK	67	F	4/12/2021	4/12/2021	Strange odor a few minutes after injection, followed by bitter taste, then nausea and spaciness. Dizziness, with vision looking 2D and flat by 15 minutes. Told Pharmacist, of spaciness who said stay as long as I wanted. Left at 30 minute point, still spacy and nauseous. Spaciness ended by an hour with nausea off and on. Chest pain - began around 7pm, continued to expand in area of chest, sharp stabbing pain later, pain from just above left elbow to hand and tingling of fingers, pain lower left leg and tingling of left foot. Irregular heart rate at different times. Checked into emergency room at 11:00. IV inserted, placed on continual heart and oxygen monitors, EKGs, chest X-rays (2), blood tests (3). Admitted to hospital sometime during the night. Given IV medications to counteract IV contrast allergy. These medications caused full body shakes, eyesight auras and extreme nausea with gagging. Heart CT taken with IV contrast. Discharged around 3:00 PM.

1214875	4/15/2021	SC	33	F	4/11/2021	4/13/2021	Received vaccination on Sunday, 4/11. Very lethargic and had mild chills on Monday, 4/12. Slight eye pain in right eye when putting in contact lens in morning on Tuesday, 4/13. Seemingly no issues throughout day. On Tuesday evening, eye pain when I would touch my eye or look in different directions, eye was very red. in the middle of the night, my eye pain woke me up. It hurt worse when I was laying on my back. Eye was watery/discharge. When I got up for the day on Wednesday morning 4/14, vision was blurry in right eye, pain, sensitive to light., and red. I was seen by an optometrist that morning who advised that I had uveitis with synechiae forming. I then went to another optometrist that afternoon in hopes to be seen by a specialist within their Clinic. Same diagnosis. I am taking steroid and dilating drops for at least one week. I found a medical article on the relation of vaccines to uveitis: <a href="https://www.ncbi.nlm.nih.gov/pmc/articles/PMC6139748/">https://www.ncbi.nlm.nih.gov/pmc/articles/PMC6139748/</a> I have never had a reaction to prior vaccines and I am up to date on all and almost always receive the flu vaccine. No known autoimmune disorders.

Woke up 4/11 around 3-4 am.. worst headache ever, my ears hurt, teeth like every individual one were infected,freezing, shaking, dizzy, nausated, whole body itching, not able to stand up without help because I couldn't balance.. took pain medication to help take the edge off the pain and bendryl.. couldn't stay awake, next day throat feeling like it was swollen, icy hot feeling similar to contrast put in me, cramping in my lower left leg, monday.. same conditons except not the constant headache, blurred vision better, still dizzy monday at 5 am chest feels slight pressure.. lower back pain like labor pains, sharp pain in stomach like the injection they give you to thin blood before surgery painful sharp pain.. later in day.. headache again, itchy body, throat sore, continual stoache pain, tuesday same.. wed.. my neck slightly swollen and sore
1208267	4/14/2021		16	F	4/13/2021	4/13/2021	Patient received vaccine around 4:30pm. After 10 minutes patient reported that she was having a headache, felt like her breathing was a little bit heavy. Patient was brought to exam room with mother present. BP was 150s/100, O2: 99%, HR: 65, RR 20. No distress noted. Patient was slightly anxious, continued to complain about headache. Denied any blurred vision, changes in vision, nausea, vomiting. Around 4:45, patient was asked to lay down for a while to be observed further and to give her time to relax. Patient was given cold wash cloths for forehead. Patient suddenly became more increasing anxious at 4:49, complained of excruciating headache and bilateral arm pain. Oxygen remained at 100%. 911 called at 4:50pm. Paramedics arrived at 4:55pm. Paramedics checked patient's blood sugar: approximately 345. Patient reported last meal around 12:30pm. Patient was crying and continually stating that her head hurt. She was alert throughout the entire process and able to answer questions. Mother elected to have patient sent to ER for further evaluation. Followed up with family on 04/14/2021. Mother reported that patient was held at hospital for 5 hours, was given norco for headache. Diagnosed with panic attack. Mother reports that patient is doing better today.

1208219	4/14/2021	TX	71	M	4/10/2021	4/10/2021	About 30 minutes after receiving the vaccine the patient started to have tingling and numbness in the left side of his face. He said even his left eyelid was affected. No droopiness or signs of a stroke. It could have felt like a dull headache, but with more of a numb feeling than actual pain. He worked outside in the yard the rest of the afternoon. He said that the feeling continued until Monday, 04/12/21 around the noon time. He has no continued side effects at this time.
1208217	4/14/2021	NH	77	M	4/14/2021	4/14/2021	Began as Dizziness on 3/31, then double vision, vertigo. Adm to The Hospital on 4/1. Diagnosed with TIA. Home next day. Now on hear monitor.
1208191	4/14/2021	GA	67	M	4/6/2021	4/6/2021	He got the vaccine, when she gave him the shot if felt like liquid fire going in, it was then fine. Two hours later the arm started swelling up and got so swollen he could hardly move the shoulder. Then it started moving into the shoulder quadrant, as far as your fingers can spread, all the way back onto the back itself. It then traveled up to the neck, to the spine to the ear in that quadrant and stops at the knot behind the ear. The pain is so bad that you press on the knot behind the ear the headache will go away. The headache is so intense it feels like it's going to blow off and takes migraine headache medicine which does not help it. It now has caused vision issues, he cannot read/blurry vision with large print things close up. He can see fine 5' or further with no problems, but nothing up close and he can't drive due to this or use the computer as he can't see the keyboard to type. The pain has continued even up until today, 4/14/21. The shot area is fine now. Originally when the symptoms started he could not turn his head as it hurt so bad, and has taken all this amount of time to actually turn his head some, but cannot turn it to the left much. He can gently and slowly turn his head but it is painful. He has gone to his doctor and went to the COVID clinic with the first vaccine who want to see him to a neurologist.
1208222	4/14/2021	MI	72	M	3/22/2021	4/12/2021	Per res. being taken to surgery for a perforated diverticulum. ICU, resident had made it through surgery, resident is off the vent, not really responsive at this time and will be keeping a close eye on him.

1208269	4/14/2021		60	F	2/26/2021	3/1/2021	Three days after receiving her first vaccine dose, patient developed a sore throat that felt like she had a foreign body in her throat. Throat began to swell, had trouble breathing. Patient was driven to urgent care where she received a steroid shot and antihistamine. Patient felt better the next day but woke with eyes swollen shut. She took Benadryl and made an emergency appointment with an ophthalmologist. Patient was prescribed prednisone drops.
1208279	4/14/2021	CA	16	F	4/13/2021	4/13/2021	Patient started feeling a numbness/tingling sensation in her right pinky that slowly moved up her arm and to her elbow about 20 minutes after she received the vaccine. Her right eye started to droop as well and her right pupil was slow to react to light upon assessment by EMT. Patient usually feels dizzy at baseline but felt even more dizzy after the vaccine. The numbness and tingling sensation in the right arm started to subside at 1500 and was completely gone by 1520. Vital signs were taken by EMT, BP 110/70, O2 99%, and P 73 which is patient's baseline. Patient's side effects subsided and she was escorted out to the car by her mother and EMT and her mother drove her home. RN and EMT advised patient to call her primary care provider to explain the adverse effects of the vaccine.

1208296	4/14/2021	IN	78	M	4/9/2021	4/13/2021	<p>Patient states on Friday, 4/9, he went to the pharmacy to receive his J&amp;J Covid-19 vaccine. He states on Saturday morning, his R nostril began to bleed, and continued to bleed until Monday. He states on Wednesday, 4/7, he noticed oral sores that at first were not painful, but large. He was worried about it interfering with his shot, but because he had waited so long to get it, he decided to proceed anyway. He denies any fever or chills, no frank diarrhea, but occasional loose stools, without blood seen. He denies HA, vision changes, or focal neuro deficits. On Sunday, 4/11, the patient ended up going to ED to evaluate his epistaxis, the MD attributed it to his elevated BP, the patient reports it being 160s/90s. They gave him new BP medications, which he took, but when he saw the Dr., he instructed the patient not to keep taking his BP meds. When asking the patient if anything correlates with foods he eats, the only thing he can pinpoint it to, would be pico de gallo. He states it has irritated his mouth before. He also reports recently taking his wife's supplement (unknown name) but thinks it is for cholesterol. He took that approximately 1 week ago. No new changes in food habits, mouthwash, or toothpaste. He states once his sores began to get a little painful, he went to buy a special mouthwash for oral sores (unsure name). His only reported allergy is to Lisinopril, which his reaction was a whole body rash. He states they did not pack his nose or do anything for his epistaxis at the ER, but eventually he let the nostril clot with blood. Now he feels fullness in the nare, but does not want to disturb the clot in fear that it will re-bleed. His wife also noticed a petechial rash that began on his BLE, he is unsure when that started. He presented to ED on 4/13, due to his PCP instructing him to be evaluated when he had outpatient labs done and revealed a PLT count of 4,000. In the ED, the patient had normal vital signs. He was transfused one unit of PLTs. He also had a negative head CT. He was also started on decadron 40mg PO daily by heme/onc. Patient tells me today his sores are less painful and feel smaller than usual. Heme/onc also ordered 2 IVIG 1,000 mg/kg/day x2 doses.</p>

1209030	4/14/2021	IN	20	F	4/9/2021	4/9/2021	<p>Started out with a headache and dizziness within a few minutes of the vaccine, along with nausea. I stayed put laying down with a lollipop and water bottle along with ice packs on me for about an hour until I was well enough they thought for me to drive back to my dorm. Once I started driving the headache was back but I was driving so I couldn't do much. Almost pulled over because I was getting over whelmed but ended up making it back to my dorm. Once I got back I changed and laid down in bed hoping to fell better. Things started getting worse from there. Throughout the rest of the day my head ache and dizziness got worse to the point where I was pretty unsteady on my feet. Chills and body aches also started and progressed rapidly despite no fever. My nausea was present in waves but eventually dissipated around 8 PM. I tried to go to bed around 11 hoping to sleep off the symptoms. I began tossing and turning. My chills were really bad and it got to the point where my skin was so sensitive that the clothes I was wearing touching and rubbing against my skin were hurting me. I was so dizzy and light headed to the point where it didn't matter if I was laying down or sitting up, I felt the same, extremely dizzy and lightheaded as if cotton were in my brain or as if it were working too slow. It was like trying to process thoughts through molasses. Then around 1:30 I couldn't take it anymore and thought maybe a quick shower would help me to at least feel better so I could sleep. When I got in the shower I immediately knew things were worse. My vision started going black at the edges and black spots in the middle to the point where at certain moments I couldn't see. I was fighting to stay on my feet and conscious and it was hurting to breathe. I knew I needed to get help so I stumbled to my dorm and collapsed when I got in the doorway to my room. My vision was spotty, my chest was hurting and I could barely breathe. My hands and feet went numb as well, I was shivering, and my body temperature was a little down to about 98.1 degrees Fahrenheit. I was transported to a hospital via ambulance my vitals were normal except elevated heart rate and O2 and was admitted at 2:40 in the morning. I received a chest x ray and my heart rate was better. The dizziness was under control by then. I was discharged at 4:50 in the morning.</p>

1207961	4/14/2021	UT	62	F	3/5/2021	3/7/2021	She received the Johnson & Johnson COVID Vaccine 3/5/2021 9:30am. 3/6/2021 She reports that she was weak and exhausted and flu like symptoms. Symptoms began on 3/7/21, woke up horizontal binocular diplopia at 8:30am. Has been constant since it started. It is worst when looking to the left and best looking the right. Worse in the distance. No other associated symptoms 3/13/21: Around noon, was just sitting in the chair. She reports that she got a bad headache and then the entire left side of the body from head to toe was numb and burning in the left side face. This lasted all day, but completely resolved by night time. Had never had anything quite like that in the past. She had a headache that started soon before the numbness, that also lasted most of the day. 3/15/21: was seen in ED with reported normal MRI, CT, and EKG MRI brain with a small left pons lesion near the cranial nerve 6 nucleus She was seen by Neuro-ophthalmology Dr. (attending), Dr. (fellow) 3/17/2021 "MRI brain on 3/15/21 did not reveal a structural etiology for diplopia. Differential diagnosis includes microvascular ischemic left 6th nerve palsy versus possibly post-vaccination cranial nerve palsy (received COVID vaccine 2 days prior). Also on the differential diagnosis but less likely, includes myasthenia gravis (she did not have expected abduction saccade slowing of the left eye typical of an ischemic cranial nerve palsy). Thyroid eye disease also would be less likely. We will obtain antibody testing for myasthenia and thyroid eye disease. Today we applied a 10 prism diopter base out prism over her left glasses lens. I instructed her to remove this when appropriate, as I expect her diplopia to gradually improved." 4/7/2021 acetylcholine ab receptor negative, TSI negative, TSH receptor antibody negative, LH/FSH normal,

1207966	4/14/2021	TN	31	F	3/16/2021	3/19/2021	I received the first Pfizer vaccine on 3/16/21 in the afternoon. I am a young, healthy woman with no pre-existing health conditions: I don't smoke, am under 120 lbs., no allergies, etc. Two days after the vaccine, I started to experience an eye twitch, which progressed into Bells Palsy by the following week: by 3/23/2021. I went to an urgent care clinic and was diagnosed as such, and they contributed to the vaccine and told me not to get the second shot. They also advised I get a CT scan to rule out a stroke, which I did, on 3/24/21. I expect that they also reported this. I have facial paralysis on the left side of my face, and developed an ear infection a week after this...I don't have allergy issues, and have not had an ear infection since I was a small child. This has been traumatic, uncomfortable and very scary because I thought I was having a stroke.

1207977	4/14/2021	KS	55	F	3/3/2021	3/4/2021	<p>3/4/21 - can't stand up, room is spinning. Headache, nausea, sensitive to light and sound, ears ringing.</p> <p>3/4/21 - Visit ER: Sitting up is painful, horizontal is the only ?comfortable? position. IV fluid, blood draw, pain meds, nausea meds. Bloodwork came back normal.</p> <p>?this is a reaction to vaccine. Could last 4-5 days, hydrate, given prescription for anti-nausea meds? 3-8-21(mon) Visit with PCP. He says bad reaction to vaccine. Just need to wait it out. Dizziness will eventually go away. Writes a doctor?s note for missing school. Anticipates unsteadiness lasting a week or so. Prescribes meclizine, 12.5 mg.(I only took this for a few days, was not noticing any improvement) 3-16-21(tues)5:00pm Go to ER. EKG and bloodwork come out fine. Horizontal is only comfortable position, still have headache. See the neurologist, she talks with me and does a few tests. We talk about migraines. Is this a massive migraine? She says I need to see ENT. Prescribes a ?migraine cocktail? ? magnesium, 2 benadryl and Zofran. 3-22-21(mon) 3:30pm ENT, hearing test. No changes since December of 2019 (went in for ringing in ears). Talked mostly with physician assistant, identified that I most likely needed the Epley maneuver on the right side. Audiologist, was not available that day (I was supposed to have appt with her, but they made a change). The earliest she had an opening was 3-24-21. Dr. recommended taking magnesium for head. 3-24-21(wed) 10:30 am appt. She performed the Epley on the right side one time. Said that she wanted my body to calm down. Keep head up for rest of day, sleep on two pillows. Don?t lean over with head down. Next day to walk around and use full range of motion on head so my brain/eyes get back to normal. Scheduled a follow up for afternoon 3-26-21(48 hours) to assess progress. She recommends to take ?preventive migraine? vitamin. Magnesium and riboflavin (I start taking 3/28/21). Able to roll over in bed without room spinning. 3-31-21(wed) 11:00 am. She runs the test where I am in a dark room and she spins my chair around, watching what my eyes do. Apparently I passed that test? Then she tests me to check the inner ear crystals. I am not in need of the Epley. But, I feel terrible. She says, something else is going on. We have gotten the crystals back in place, she has done what she can for me. 1:00 pm appt with Dr. Says chronic</p>

							<p>migraine. Recommends vestibular therapy. 4-2-21 (fri) 3:00pm appt with PT, DPT, ATC, MS. She identifies that my eyes are not tracking properly, the left one. ?VOR deficit? She says don?t google it b/c I have a mild case. Homework is brain exercises: pencil pushups and seated gaze stabilization with head rotation. We schedule 2 sessions per week for 4 weeks. She is hopeful of full recovery with work. Says I would not recover by sitting in a dark room. We need to retrain the brain and get back to normal. 4-7-21(wed) 10:00am appt for vestibular therapy. Work on brain exercises, she times me. Add some neck exercises to strengthen those muscles. I notice a ?pinching? sensation on left side. When I laid down on the foam roller, I had to put hands down to stabilize myself (room spinning). 2:00pm appt with deep tissue massage therapist. (I have been working with her for over a year) my head is very tender. My neck and shoulders are extremely tight. I have a large knot at the base of my skull on the left side. It took a long time for my body to calm down today. 4-8-21 (th) 2:30pm appt. Not feeling great - suspect that I have ear crystals out of position again. She sees me and says let?s test you. She performs several Epley maneuvers. 3 on right side and one on left side. Left me dizzy, unsteady and lightheaded. I need help walking to car after appt. go home and crawl in bed. Cold, exhausted. Slept for hour or so. 4-9-21(fri) don?t feel great. Still waiting on body to calm down after Epleys. 4-10-21 (sat) still feeling yucky 4-11-21 (sun) Rolling over in bed, room spinning (left side). when I sat up in the morning, my body swayed. Was very dizzy walking to bathroom. Headache. Pressure in head/ears. Those symptoms subsided slightly as the day wore on. Sleeping Sunday night was better. Rolling over was fine. 4-12-21(mon) headache, pressure, ringing in ears. Working on computer is fatiguing. Head feels full/ fluid. Rolling side to side / feel fluid move? / increases dizziness.</p>

1208013	4/14/2021	MD	41	F	3/11/2021	3/28/2021	Two weeks after getting the second dose of the vaccine, I had two episodes of vertigo. I have no history of vertigo. I also developed bouncy vision where it looks like things are bouncing up and down or moving side to side when I walk or turn my head. It has not resolved. I am scheduled with a neurologist on 5/4/21 to determine if I have any vestibular damage. It is possible this is permanent and at this current time it is very disabling. I am not sure if this is related to the vaccine but I thought it best to report it in case other reports of this come up.
1208092	4/14/2021	MA	45	M	4/9/2021	4/13/2021	Woke up with eyes swollen almost shut, red rash all around eyes. Blurry vision, eyes feel like they are on fire. Skin on eye lids are peeling. Fever and chills
1208189	4/14/2021	MD	25	F	3/8/2021	3/15/2021	Reaction began with swelling below the right eye on March 15, 3:45pm. Swelling progressed to below the left eye later that evening around 10:30pm. On March 16th, I woke up around 6 am with moderate to severe swelling of the face, eyes, hands, and feet. My throat was also closing and it was becoming difficult to breathe. I treated with 50mg of Benadryl every 6 hours for the next 3 days. The next day, March 17th, my left eye became red and inflamed. The eye symptoms and face puffiness subsided ~March 19th.
1208095	4/14/2021	GA	35	F	3/10/2021	3/13/2021	Doctors believe my wife has developed Gillian-Barre Syndrome as a result of the covid vaccine. We have visited the ER, 2 different Nuerologist, 2 different Internalist, a eye specialist (optometrist) and today the a spine Center. Healthy 35 year old pre vacine, post-first vaccine shot developed numbness and shooting pain in feet, it has spread to fingers, mouth and rectum. Eye prescriptions have changed drastically in last 3 weeks, extreme weight loss (down 20lbs), insomnia
1208130	4/14/2021	KS	76	F	4/9/2021	4/10/2021	Patient received the vaccine on 4-9-2021, on 4-10-21 patient felt "blah," on 4-11-21 patient got up and around and was ok, on 4-13-21 patient was not feeling real great, but was tolerable, on 4-14-21, patient was feeling worse with blurred vision, throwing up, aches, doesn't want to eat, dizziness. Recommended that patient contact their primary care doctor for further treatment. On 4-13-21 pt went to ER and was admitted for one night, on 4-14-21 pt was dismissed from hospital, and is feeling improved.

1208006	4/14/2021	FL	39	F	4/8/2021	4/8/2021	Date and time adverse event started: Patient started to experience symptoms on her drive home after taking the vaccine on 4/8/21 around 12:15pm-12:30pm. Patient stated she started to experience and feel symptoms on her drive home after the vaccine was given. Complains of soreness in arm at injection site, blurry vision, extreme headache and nerve pain, complete numbness in right leg (caused car accident), fever, body aches, chills, sweats increased neuropathy pain, left shoulder pain, n/v, extreme weakness and tiredness. No bowel movement since morning of 4/8/21. Appetite decreased tremendously due to n/v feeling. She has vomited twice on Thursday on 4/8/21 and once on 4/9/21. BP ON 4/8/21 around 4pm it was 178/122 and then at 7pm after taking bp medication it was 176/120. Patient experienced SOB and chest pressure/heaviness not painful on 4/8/21. Didn't take BP on 4/9/21. She took her normal medications for the day before the vaccine. When patient arrived at home she took Oxycodone, Buspar, Potassium tabs and Methocarbamol at 2pm on 4/8/21 (due time for her meds). On 4/8/21 at HS the muscle relaxer and pain killer was taken and it hasn't helped with the pain. As of 4/9/21 @2:19pm her neuropathic pain is 12 (on a scale of 1-10), she is breathing better today but still feels pressure, but still feeling all of the above symptoms. Recommended patient to go to an urgent care or ER, if she can't go then to make her PCP aware of what shes feeling. Advised her to take Tylenol for the fever, body aches, chills, and stay hydrated and eat light. 4/13- patient did not follow up with the ER/primary/urgent care as advised by prior entry. Patient states she has increased neuropathy from her baseline and continued nasal congestion. She took her rx medications but no additional medications for treatment. we will follow up with her next week to see how she is feeling. she is appreciative of the follow up call.
1209059	4/14/2021	MS	53	M	3/10/2021	3/11/2021	Lost vision in left eye on Thursday evening (03/11/2021) around 7:00 pm. My condition was not improved when I awoke the next morning (03/12/2021).

1209035	4/14/2021		82	M	2/15/2021	3/18/2021	82YM Admit 3/18/21 to hospital for small bowel obstruction within 1 week of second vaccine dose. PTA bowel obstruction led to a syncopal episode following use of laxative, and several episodes of vomiting in the days prior . Upon admission Patient was receiving conservative therapy for a partial obstruction when he developed increasing shortness of breath. The patient was transferred to the ICU for worsening respiratory status and eventually developed significant hypercapnic and hypoxemic respiratory failure requiring intubation. Neurology was consulted for altered mentation in the setting of respiratory failure. Patient with ascending paralysis. MRI of the head and neck as well as CTA were obtained x2. Patient was ultimately diagnosed with Guillain-Barre, variant and received 5 days of Intravenous Immune Globulin therapy. Patient's small bowel obstruction resolved and ultimately patient required percutaneous tracheostomy tube and gastrostomy tube placement for prolonged respiratory failure and neurologic compromise. The patient had uneventful ventilatory requirements and ultimately was performing intermittent spontaneous breathing trials; however, still had episodes of apnea, but improved. He was tolerating tube feeds at goal with resolution of his small bowel obstruction, which was thought secondary to his Guillain-Barre. The patient did develop abnormal LFTs which were thought secondary to cholecystitis not requiring operative intervention, with improving LFT findings on antibiotics. The patient had a nonobstructive cholecystitis. The patient's mentation was improving to the point where he was able to communicate and open his eyes upon discharge, as well as was working with Physical Therapy for strengthening. He was able to move his upper extremities and followed commands and lower extremities were improving in strength as well. Patient was discharged via private air flight to acute care ICU facility.
1208587	4/14/2021	OH	55	M	3/25/2021	3/25/2021	Extreme chills, nausea, terrible muscle ache, fatigue, diarrhea, intense abdominal pain, blurry vision on March 25th starting 7:30 pm - 8:00 pm for 6 days. Also, aggravated Crohn's disease to severe condition which still continues.

1208453	4/14/2021	TN	23	F	4/14/2021	4/14/2021	Patient started complaining of becoming very hot/over heated and showed slight signs of a mild seizure. Unresponsive for around 10 second and eyes rolled back into her head. Patient came to and then she became unresponsive again and eyes rolled back into her head once again for around 10 seconds. Patient woke back up and then vomited several times. Patient was fine afterwards. EMS was called to check vitals.
1208490	4/14/2021	AZ	28	F	4/5/2021	4/9/2021	The day I received the shot, I started to feel severe fatigue, headache, light-headed, and started running a fever about 6 hours after the shot was administered. The next day (4/6) was worse. Severe fatigue, muscle aches, headache, loss of appetite, fever (101.5 was the highest I notice but seemed to be around 101.1-101.3 all day), and general flu like symptoms. However, I also started experiencing abnormal menstrual bleeding. I am on the Depo shot and have been for some time. Due to this, I do not usually experience any menstrual bleeding so I found this to be a little odd. It was not heavy but it was noticeable and contained quite a few clots. Day 3 (4/7) was about the same except my fever came down and ranged from 99.8-101.1. Abnormal menstrual bleeding continued. New side effect this day included diarrhea. Day 4 (4/8) I started to see improvement. No fever (that I could tell). Remaining side effects included mild headache, fatigue, diarrhea, and abnormal menstrual bleeding. Day 5 (4/9), I had one of the worst nose bleeds I've ever had in my life. I apologize for the graphic description but it lasted about 20 minutes and my bathroom looked like a crime scene after. Blood was pouring out of my left nostril and I threw two large clots that were about the size of slug (or slightly larger than a fun size snickers... I wish I had a better way to describe it). I've had some bad nose bleeds, particularly when I was on Accutane, and this was worse! The rest of the day I felt like I was improving. Energy levels were better. No fever. Menstrual bleeding stopped. Only lingering side effect was mild headache and mild diarrhea. Since then I've continued to feel better and the diarrhea seems like it's improving. Mild headache persists. Only new item is an annoying twitch in my left eye that started on Monday (4/12).

1208491	4/14/2021	AR	43	F	4/2/2021	4/12/2021	Within 4 hours I experience chills, fatigue and a headache. Within 8 hours I had a fever and slept for the next 24 hours. I broke out in buckets of night sweats. The following 2 days I was generally fatigued and had sniffles. After that I was fine, until Monday night (Day 10). I suddenly experienced a sudden onset of a painful and raised red rash at the base of my spine on my lower back. Within hours it migrated up to my head, face and then to the front of my torso. My eyes and throat closed. I took benadryl with no relief. I called Dr. on Demand and they urged me if the symptoms got worse to head to urgent care/ER. The next day (Tuesday 4.13) I went to the ER where they gave me a steroid shot, and prescribed me predisone and Prilosec to block the histamines. I am still having rash symptoms,itchiness and burning. While I have a history of seasonal allergies they've always been stuffy nose at the most. We had no new dietary introductions or new habits.
1208495	4/14/2021	IL	39	F	4/10/2021	4/11/2021	Woke up with 100 degree fever around 5:00am, 1 day post-vaccination. Fever persisted 24 hours, with intense night sweats. Other flu-like symptoms included headache and eye pain. Eye pain persisting until time of this report. Eye movement is painful, but no blurred vision. Sore arm persists.
1208503	4/14/2021	NY	46	F	4/5/2021	4/5/2021	within minutes, I felt dizzy and my whole body felt heavy, like gravity had increased on me. my skin felt hot and firey for about 1 minutes, and I took off my jacket. my eyesight went a little into tunnel vision - but I did not feel faint... just completely off. i felt like I had to walk it off so I did. I go thome, but had the chills for 2 days. Then the left side of my neck hurt like I had pulled something and my arm selled and was so painful I had to walk with it in a sling and NOTHING could touch it for the next 2-3 days. Now its 9 days later nad I have a 3 in diamter rad spot, its dry and itchy, swollen and hurts again. And I feel tired and crampy again.

1208527	4/14/2021	WA	20	M	4/13/2021	4/13/2021	Patient received his second dose of Pfizer COVID Vaccine on 13 Apr 2021 at about 9:30 AM. That afternoon, he began to experience chills, body aches and back pain. Later that night, unable to sleep, he began to experience visual hallucinations, to include a demon to his immediate left, a candle in his far left periphery, shackles, the room going dark and feeling like he was stuck in a time loop. In addition he experienced auditory hallucinations, to include a demon yelling and people whispering. He took ibuprofen that afternoon for his chills. No known psychiatric history or drug use. He denied suicidal ideation. Has a history of back pain for which he has been seeing physical therapy for several months. Enjoys his job with no identifiable unique stressors. Work up in the Emergency Department included CBC, electrolytes, Urine drug screen, ETOH, procalcitonin and urinalysis. All were normal, with the exception of an elevated neutrophil count and low lymphocyte count. Head CT was normal as well.
1208551	4/14/2021	PA	31	F	4/14/2021	4/14/2021	PATIENT STARTED TO FEEL NUMBNESS IN TOUNGE AND FACE. PATIENT STATED BLURRY VISION WHEN LOOKING AT LIGHTS. PATIENT WAS GIVEN BENADRYL WATER AND PREZTELS. 1208557	4/14/2021	CA	49	F	3/27/2021	3/27/2021	Fever ranging from 103.8-106.6 for 3 days, chills, body aches, muscle cramping, nausea, severe headache, low back pain, red swollen painful arm at injection site, dizziness, blurry vision, and a large lump/infection under the arm near the armpit on the injection side with redness that extended about 6 inches.
1208776	4/14/2021	NC	54	F	3/31/2021	3/31/2021	Patient reports dizzy, "sensation in chest", blurry vision, and "feeling drunk" and short of breath occasionally about 20 mins after vaccine. blood glucose level checked -315, patient adjusted own insulin pump. Felt better at 1:06pm.
1208629	4/14/2021	CA	27	F	3/1/2021	3/12/2021	I had sparkles in my vision 5 min. after getting my shot. They went away quickly, so I wasn't concerned. I had a little bit of hotness up my neck and a little itchy, but both also were quick to go away. I went home and went to bed without issue. I woke up at 4am crying and in a lot of pain all over my body. I had a crushing headache, my back, arms and legs ached down to the bone. I had a fever of 100.7, and had to call in sick from work. I took 3 ibuprofen and it didn't help stop the pain or fever. I cried myself back to sleep after wreathing in pain for 3 hours. Woke up again crying again and the pain and fever continued on. I drank 2 beers to see if that would help relax my muscles and back around 3pm and by 4pm I finally felt somewhat better, but still couldn't get up out of bed. I had to call my brother over to help me and considered asking him to take me to the hospital several times because the pain was so intense. The spot where I got my shot wasn't inflamed, or if it was I didn't notice. It did seem a little stiff. I managed to fall back asleep and by the time I woke up again the next day around 5am, I felt completely fine. Fever disappeared and the body pain was gone. It was like nothing had ever happened.
1208644	4/14/2021	CA	35	F	4/10/2021	4/11/2021	Minor blurred vision on the next morning and lasted about 6 hours then vision came back at late evening

1207051	4/14/2021	PA	59	F	3/14/2021	3/14/2021	Fever, chills, severe headache and fatigue. It was exhausting opening my eyes. Even after two weeks I would try to convince myself to pull over in my truck and take a nap! I am still extremely tired. My Heart was pounding, throbbing in my ears?. I could hear it so loudly . 2weeks of brain fog ? could not stay on task (due to dehydration?) I still can't drink enough water and Gatorade to satisfy my thirst. Extreme Weakness, Nausea , especially when I would try to eat . Increased thirst/ urination . My ankles and feet swelled . My friend who is a pharmacist instructed me to take a Tylenol but I couldn't even get out of bed to get one to take. ? any movement made my head swim and I felt like I would throw up. I slept most of that day and also the next day
1207316	4/14/2021	WI	57	F	4/6/2021	4/7/2021	had the vaccine on the 6th and started the effects on the 7th. Had a bright red rash from top of head to toes, itchy red blotches, swollen shut and red left eye, vomiting, slept non stop could not get out of bed. Went to the doctor on the 9th, saw health care provider, got meds from her for the vomiting and the rash. This lasted for about until the 13th. of April. I still have a sore arm where the injection was. I still find myself being very tired.
1207132	4/14/2021		54	F	4/13/2021	4/13/2021	Patient reported chest pressure/pain rated 8/10 and dizziness at 14:07. Patient was breathing and talking. Patient stated her vision was going in and out. Patient offered EMS. EMS activated. Vitals assessed: BP 126/80 mmHg, HR 50 bpm, 94% SpO2. Patient stated she wanted water. Patient given water. EMS arrived and assumed care at approximately 14:15. Patient transported via ambulance. Patient left facility at approximately 14:25.
1206564	4/14/2021	TX	45	M	4/7/2021	4/7/2021	I started shivering uncontrollably in the evening. I could not warm up, and my body was shivering. I wasn't sure if I had a fever, but I did not feel well. My wife was trying to warm me up and she thought I was having a seizure because she had never felt someone shiver so violently. My eyes were watering abnormally as well. The shivering subsided after about 30 minutes. I was soar and weak over the couple of days, but I believe those are normal symptoms.

1207190	4/14/2021	NY	45	F	4/1/2021	4/7/2021	Severe headaches, nausea, dizziness, overheating, tired for several days. Eyesight seems strange too.
1207194	4/14/2021	OH	68	F	3/27/2021	3/28/2021	double vision became so bad with the 2nd shot that I had to wear an eye patch all the time in order to see normally. I tried taking Mestinon but it gave me really bad abdominal cramps. Went to neuro ophthalmologist. Lots of tests including an MRI with and without contrast. Showed no abnormalities. Am now starting a course of prednisone and am hoping my eyes will get back to normal someday.
1207201	4/14/2021		59	F	4/5/2021	4/7/2021	CRVO per ophthalmology note: States that she developed a headache on the right temple and right eye approximately 1 week ago. This resolved. This last Sunday 4/11/21 and later that day her vision in the left eye became suddenly dark and is what prompted her to be seen by an ophthalmologist. She was seen by Dr yesterday and was referred to Dr for further evaluation. Patient states that her right eye vision has been seeing "diamond" shapes that she noticed yesterday. She currently has an intense headache that is all over her head and eyes. She reports nausea since 4/11/21. States that she had floaters and flashes of light in the left eye on Sunday 4/11/21. She is worried about the vein in the back of her right eye as well, Dr told her it looked constricted. She felt that her jaw was strained and tight yesterday. States that she received her COVID Vaccine last week and she wonders if this caused her blood clot.

1207108	4/14/2021	FL	36	F	3/1/2021	3/2/2021	My exclusively breast fed son started showing signs of atopic dermatitis on his right cheek and legs approximately 24-36 hours after I received my second COVID-19 vaccine. His skin got progressively worse over the next 4 - 5 weeks--both cheeks were affected, his neck, his trunk and back, and his arms. His legs were least affected. We saw the pediatrician on 4/9/2021 because his rash/skin reaction was bright red and "streaky" on his arms. His face also looked a little puffy to me under his left eye. Due to the timeline of the events and the fact that his reaction progressed over the course of a couple of weeks, it seems likely that this could be a reaction from my breastmilk that contains antibodies. There is some primary literature available that describes IgA and IgE levels in breast milk over time after COVID-19 vaccination. One such research letter was recently published online on April 12, 2021: SARS-CoV-2?Specific Antibodies in Breast Milk After COVID-19 Vaccination of Breastfeeding Women.
1206408	4/14/2021	FL	53	F	4/8/2021	4/8/2021	Brought on an attack of MS. RBN Right eye.

1206394	4/14/2021	CA	50	F	4/13/2021	4/13/2021	The night of the vaccination (3/8), my body felt very hot (not fever) like it was going to catch on fire. I took Tylenol to be safe and went to bed taking it as a sign that the vaccine was working. I thought I was mostly over the next day, but four days later on 3/12, I started bleeding only two weeks after my last period, and the it was quite different than usual - very fresh blood and lots of it. This continued for 15 days at time with very heavy flow - I bleed non-stop, and I worried that I was going to bleed to death. The worst adverse effect happened 10 days after the vaccination on 3/18. Out of blue without anything unusual, I started feeling very dizzy, nausea, and vomiting. After much vomiting, nausea stopped, but the dizziness just got so bad, I couldn't move or even keep my eyes open (things were spinning even with my eyes closed). I couldn't even stand up by myself. This most horrible severe vertigo lasted two and got gradually better. It took about 5 days before I felt safe enough to be alone by myself. During this time, I had a excruciating headache on my left side. It was so bad, I quickly took some painkillers which knock me out for a day. The important thing is that I don't ever get headaches; this is the first one I had aside from one I had when going through IVF more than a decade ago.

1206553	4/14/2021	MD	70	F	3/17/2021	3/20/2021	<p>Had history of delayed reactions to allergy shots in past and staff administering vaccinations were concerned about whether that might possibly occur with the COVID vaccination. Many of the delay had been 48 to 72 hours. I didn't feel like going to the Farmer's Market and by 2 pm started getting a migraine headache which had be concerned. I had not had any fever but had had arm pain that I had used a heating pad for. I ate Saturday. I started noticing neck stiffness and some difficulty moving my head right and left. I had migraine headaches from age 13 - 50 with an increase during pregnancy so I knew what they were and what I had started to experience as the night went on into Sunday was more than I had ever experienced in my life. Flat on my back, ice, no intake, tylenol/codeine, nothing did anything and and the intensity kept coming. I vomited some Sunday evening which usually helps release the pressure, but nothing helped. I continued to have more difficulty turning my neck from side to side, visual difficulties and excruciating pain. I had a virtual appointment with my endocrinologist and she was concerned about what was going on and gave me some guidelines lines about managing my blood sugars and suggesting that I be on the Farxiga if I went in the hospital. I made it through another virtual meeting basically holding my head in my hands. I canceled all my dental and doctor appointments because of the unrelenting pain and my concern for my driving. I began having some spastic jerking of the head and neck, which with the mask on forced my teeth into my front gums and lacerated the wholes front inside of my mouth. On 3/23 my husband died unexpectedly, I canceled Wednesday's Funeral Home visit because of my concern regarding driving and the extreme degree of pain. I could barely move my neck past center. I was also having mobility issues and my right side was working as well as it should. Typing and writing were difficult. My pain level was off the chart. I had spoken with the doctor and once I did the required things at the funeral home, I took myself to the emergency room. My pain was coming off the right lower part of my neck, affecting my vision, my appetite, my balance--basically neurologically going downhill on a fast slide since Saturday night. I told the nurse that my pain level was 20+. The Spinal Tap in the ER was negative across the board and the fluid was clear. IV's were hung to help with hydration. Solumedrol</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							and methacarbamol were given IV to deal with the inflammation around the vertebrae and the pain muscle spasms. Ice packs were applied to the front and back of the neck to not only help with swelling, but with to relieve pain and help with neck alignment. Blood sugars were a real struggle with all the prednisone on board but were helped some with the arrival of my Frixiga from home. It was the new Neurologist in the practice that looked at my posture, listened to my history and said, I am going to get some X-rays which took all day to do. The X-rays showed that there had been swelling and shifting to make C1 and C2 put pressure on the nerve. There was also a problem with L3. A second neurologist added a morning dose of Topomax (50mg) which began to show some effect on Tuesday after being in the hospital for 5 days. These 2 neurologist, along with the one in the ER could not rule out that what I experienced was a delayed reaction to the Moderna Vaccination, particularly as I have had delayed reactions to allergy shots in the past. It was suggested by the radiologist that a MRI be done for a more definitive brain study as well as a spine study but the doctor on originally was doing much and didn't pick up on that. I have had to wean off of the prednisone at home which has meant wonderful monitoring of blood sugars. I have had to continue to wear the neck collar and slowly ween out of it. I have been exhausted--the doctors think some of that may be from the muscle spasms and the fact that it took 4 days before there was a significant decrease in the intensity in the headache. I still have to focus on posture and my right hand gets very tired of the board. Signatures are still not as neat as they were but better than they were when I was admitted.
1207322	4/14/2021	NV	26	F	4/13/2021	4/13/2021	I got completely numb on the right side of my face. I called a hotline nurse and she told me it could be bells palsy. My eye started to droop. Got worse and then got better. Face still a little numb

1207624	4/14/2021	FL	53	M	4/7/2021	4/7/2021	<p>Lost his vaccine card would not give him a new one. He got his vaccine, had burning sensation immediately after the needle was pulled out. About 5-10 minutes later he started sweating, and seemed to have calmed down and felt OK. He was observed for 30 minutes there and went for observation for another 30 minutes. He went to another doctors office and at about 15:00 started feeling light headed and weak. He drove back home, picked up some stuff at a grocery store, and outside the grocery store in 80 degree heat he felt the need to put on a jacket as he had the chills. he went home, went to bed feeling bad, his shoulder was still burning where he got hte vaccine. He had a little bit of site pain, applied topical and the pain went away. He woke up the next morning feeling really bad, felt like a major flu, his head felt like it was going to explode, but no problem with sinuses, no cough, no sneezing. His eyes were watering from the pain, and chills on and off. He had to change his sheets a couple of times due to sweating. He then developed a fever of 99 degrees at about 18:00 that night, and about 19:00 he went to 102 when he checked it. After that it went to 103, and about 15 minutes after that it was 104, and then higher at 104.+ He took some vodka, honey and lemon juice and took an alcohol bath and the fever had not broken yet. He called the clinic and they told him to call 9-1- 1 and to go to the ER. He went to the ER at about 10:00, gave him fluids, did a chest x-ray and released him about midnight. He apparently disoriented and tried to walk off and didn't remember this. They took him back to the gate and called his son. He went home, took another bath and woke up in sweat and was in bed for the entire weekend. He got up Monday morning, 4/13/21 feeling a little bit better and went to see his doctor, who does not believe he was having any side effects and that the information that is being reported is true. He is still feeling a little weak and still fatigued and on bedrest. He was taking Advil besides his regular medicines every 6 hours with 500 mg of Tylenol for the intense pain as every joint in his body ached, and the worst headache he had ever had, as well as the high fevers. His fever subsided on Saturday morning, and still had some sweats following that. Did have hot/cold flashes on Saturday and Sunday. He was given a COVID test in the ER and he was negative, but did not give him any other information regarding his lab work.</p>

1207650	4/14/2021	NY	63	F	3/20/2021	4/4/2021	On 04/04/2021 after having memory issues I went to the emergency room and was diagnosed as having 3 strokes. I woke up with a throbbing headache and then had difficulty remembering simple things like using the remote control for TV. My vision was also somewhat blurry. I then went to drive and my focus was off making driving difficult so I then went to the emergency room
1207653	4/14/2021	SC	35	M	3/30/2021	3/31/2021	One day after receiving my second vaccine, I started to get a tingling feeling on my nose and left cheek, near my sinuses. It would occasionally lightly burn. This persisted for a couple of days, then slightly improved. It never completely went away, and in the past day I have noticed it moving more to my head where I am having migraine like headaches behind my left eye.
1207679	4/14/2021	OH	67	M	4/5/2021	4/6/2021	26 hrs after 2nd shot vision became blurry in right eye (pain behind eye) and left and right could not focus together. Created an unsteady feeling and had to lie down.

1207779	4/14/2021	IL	26	F	4/13/2021	4/13/2021	Vasovagal syncope after three minutes of receiving first vaccine dose. Paleness, nausea, sweating, dizziness, and vision blackout. Treated by lying down, applying ice packs, and hydrating with water. Symptoms subsided within five minutes.
1207837	4/14/2021	OH	91	M	2/25/2021	2/28/2021	Two days after receiving second dose of the Pfizer COVID 19 vaccine, I began having blurred vision with irritation and inflammation in both left and right eyes, with the left eye being worse. These symptoms get worse as the day progresses.
1207854	4/14/2021	MD	60	F	4/11/2021	4/12/2021	Started on Monday morning at 8:30 am started feeling cold chills. Took 800mg of Ibuprofen and after an hour felt better. When going to bed around 9:00pm I noticed that my skin was soaking wet and that I had a hot feeling. When I woke up in the morning (tuesday April 13, 2021) around 7am I could not fully open my eyes. I looked in the mirror and noticed that my entire face was swollen and was red in different areas. I took some benadryl as I thought this was an allergic reaction and went back to bed. A litter later I started getting cold chills and then hot flashes. Around noon time I took another benadryl. By 2:30 I was not feeling any better and I also had body aches and pains and called my doctor. I was able to get in to the office. I was told that I was having a reaction to the shot and that I was boarder line for the hospital. They gave me a shot steriod shot and prescribed Metheylprednisolon tablets (24) to be taken as directed and to continue to take benadryl. It's now Wednesday morning April 14, 2020 and the swelling has gone down but not fully gone and I have stated on the prescription. I now have redness in my chest area. I still have a some chills and hot flashes.
1207872	4/14/2021	TX	55	F	2/26/2021	3/4/2021	1-WEEK AFTER RECEIVING THE VACCINE I DEVELOPED SPOTS AND LIGHT FLASHES IN MY RIGHT EYE. I WENT TO THE HOSPITAL AND HAD A ULTRASOUND OF THE EYE TO CHECK FOR HEMORAGE BEHIND EYE. IT WAS CLEAR. FOLLOWED UP WITH EYE SPECIALIST THE NEXT DAY AND WAS DIAGNOISED WITH Posterior Vitreous Detachment. I HAVE NOW SEVERAL LARGE FLOATERS IN THE EYE.

1207726	4/14/2021	CA	26	F	4/9/2021	4/13/2021	Had typical post vaccine symptoms right after - nausea, muscle aches, chills, fatigue. 5 days after vaccine those appeared to have dissipated. Went for a light walk in the morning. Completely lost vision in both eyes extremely blurry. Stumbled my way home running into trees, cars. Vision came back, thought it was migraine (had them before but nowhere NEAR as bad, never had vision completely blocked) Excrutating headache behind eyes and nausea, feels like pressure in head. Worst headache of my life, went to ER. Gave morphine (did not help pain at all which was horrifying) got a head CT scan which came out clear and discharged because clotting ruled out. It is now day 6 and my headache is persistent and still excruciatingly painful. I?m also extremely nauseous. I?m terrified because I know something is very wrong. ER doc said might be lingering side effect from vaccine but those effects felt very different.
1207439	4/14/2021	TN	38	F	4/7/2021	4/12/2021	On day 6 after the second shot , the right side of head (face and scalp) became uncontrollably itchy and burning. Only the right side of my face including right ride of the nose and chin and right eye, cheek and ear.

1207361	4/14/2021	FL	39	F	4/9/2021	4/9/2021	Felt cold wave on whole left side of body starting at the head and very quickly going down all the ways to toes. It happened as I was still in the car about 5 minutes after receiving shot. Immediately after felt numbness in left side of the face, left arm, and left leg (all mild). Numbness on the arm and leg stayed for about 4 hours, and numbness on the left side of the face stayed until the next morning. The numbness on the face was similar to when anesthetized by a dentist and also the tip of my tongue was numb. I could smile and close my eyes without a problem, and both right and left sides looked the same when doing so.
1207393	4/14/2021	PR	49	F	3/31/2021	4/9/2021	On April 9 in the afternoon, a severe headache began, which I had never experienced. This led me to vomit and even then the pain was unbearable. The pain persisted despite taking an analgesic and the next day still felt throbbing that was reflected in the head in general and in the eye area.
1207613	4/14/2021	IL	32	M	4/11/2021	4/11/2021	Was sitting in chair, fell over. Hit head on cement floor. Seized for 35 seconds. Eyes rolled in to back of head and foaming at the mouth. Awakened suddenly to confusion. Escorted off floor to wheelchair. Reoriented.
1207415	4/14/2021	MO	36	M	3/11/2021	3/12/2021	Experienced chest pain, neck pain, general muscle pain, joint pain, some abdominal pain, headaches, fatigue, some shortness of breath, lightheadedness, some vision change in left eye, severe heartburn flare up, nausea, digestive issues (urgent, but small stools), increased heartrate, irregular tachycardia responses and heart palpitations. The pain and heartburn were treated with over the counter medications - ibuprophen, Tylenol, Pepcid and Prilosec at advice of my primary care doctor. Most all of the symptoms resolved after about two weeks past vaccine except my heartrate/palpitations and heartburn. My primary care doctor prescribed Protonix to help with the heartburn. Three and half weeks past vaccine I visited the ER thinking I was having a heart attack.

1207610	4/14/2021	PA	40	F	4/8/2021	4/10/2021	On Friday after the shot, I felt ok, but my left arm was swollen to the point of taking off my wedding rings because they hurt. The leg pain started on Friday night. Saturday woke up with a groggy head and tired. Sunday I had leg pain, headache, and foggy brain. Saturday into Monday I had night sweats (pouring in sweat) fever, headache, body aches, tired (could not keep my eyes open) I slept all day and could barely move comfortably. Tuesday I was extremely exhausted, leg pain continuing, headache, and weird feeling. The swollen arm is back. Today is Wednesday, almost a week after with leg pain, headache, swollen arm, and weird feeling.
1207487	4/14/2021	ID	71	M	3/30/2021	4/2/2021	4/ 2 left eye irritation , rash on forehead, . Eye bloodshot with more extensive rash by Monday. Primary care gave drops for bacterial infection. Returned 3 days later as rash spread. Diagnosed as Shingles around eye , perscription given. Optometrist consulted - confirmed shingles around eye. Drops perscribed . Vision in left eye impaired - looking through fog.
1207515	4/14/2021	FL	70	F	2/4/2021	2/6/2021	Within 2 days, hives broken out on body that have continued to get worse. This is still persistent till present time,, 2 months, 1 week later. I have seen primary doctor, my allergist regarding this. Obid has run multiple labs showing all mostly normal except for allergic reaction and large increase in cholesterol form last July. Cholesterol has run almost same (normal)my entire life and now at 249. I am now in 4 (24 hour tabs Allegra) QID, Pepcid 40 BID, Vanicream, Triamcinolone 0.5% cream, and Tylenol for pain. The hives continue to run rampant most days, calm a few days. They burn like an iron burn on your skin, itch madly, and swell. At times, there is so much fluid retention from them that I am totally miserable and depressed. I was also put on Doxepin (for itching side use but unable to tolerate due to blurred vision. Treatment is not in control of hives, but does help somewhat. I always have quite a lot and much extreme discomfort. Unknown if this will be permanent or how long it will last.

1210472	4/14/2021	CO	31	F	3/26/2021	4/10/2021	I experienced stroke like symptoms on Saturday, April 10th, 15 days after receiving my first dose of the Pfizer vaccine. I experienced these symptoms starting around 1:30pm. First, my eyesight had been affected, I was seeing a black straight line aura in both of my eyes, I could not focus on any objects or people. I walked around my house and splashed some water on my face because I was feeling faint, I walked into the kitchen and said I'm going to pass out, I need to sit down, I sat on the floor... my partner was cooking me food and I asked him to get me water, but what came out was ?get me watermelon? from that point on, several of my sentences were not making sense and I was experiencing aphasia. I was starting to freak out and my right thumb began to tingle and feel numb. My partner gave me .05 mg of Xanax because I was shaking uncontrollably. I became very cold. It took about 20-25 minutes to calm down. In that time, I tried to read words off of his phone and I could not verbalize out loud what specific words actually said, it made sense in my mind, but when I would try to read it out loud, it was wrong. My episode ended in about 25 minutes, while I was eating and then I went to the urgent care.
1210507	4/14/2021	OK	23	F	4/14/2021	4/14/2021	Flush red rash on face and neck, Hot to touch on face, itchy throat and mouth, Slight shortness of breath, and itchy face/skin and eyes started around 1830 hours and is still active at time of filing at 2032 hours
1210512	4/14/2021		43	F	4/8/2021	4/10/2021	Began face numbness across cheek bones, eye pressure, dizziness when stood. Went to ER , everything in normal limits, CT clear. 3 days later blacked out driving, husband in car took me back to er labs still normal values had PVCs. Now wearing cardiac monitor waiting for cardiac consultation. No previous cardiac issues nor cardiac family hx.
1210529	4/14/2021	MD	48	M	4/2/2021	4/14/2021	I woke up this morning with a broken blood vessel in my left eye (a subconjunctival hemorrhage). I would never have thought of reporting this, but a friend who lives a mile away also got the same thing in his eye and he also got the J&J vaccination. (He already submitted a VAERS report). I understand that this could be a coincidence but thought I would still submit this report just in case.

1210406	4/14/2021	MA	49	F	3/22/2021	3/22/2021	I waited in the pharmacy for 15 minutes; soon after I got in my car to drive home and felt a strange sensation on the left side of my face. While driving, my entire left side went numb. I kept checking my face in the rear-view mirror to see if it was drooping. It was not. My upper lip appeared and felt swollen. Six days later, on March 28th, I came down with a really bad migraine. It started in my left eye and then was a really bad headache. I called the eye doctor the following day because the pain was not subsiding. The migraine lasted from Sunday, March 28th to Wednesday, March 31st. Following the migraine, I have been getting headaches (not as severe, but still painful) almost daily. The headache is not over my eyes or in the temple. Instead the headaches are on the top of my head and towards the back. Today is three weeks and two days after my vaccine, and I am still having headaches on the top of my head.
1210140	4/14/2021	GA	58	M	4/12/2021	4/13/2021	Moderna COVID?19 Vaccine EUA, Approx 18 hours after the shot I experienced intense chills, overall fatigue, fever, burning eyes and joint pain for the next 18 hours. I took no pain relievers and awoke on the second day with no ill effects.

1210043	4/14/2021	CA	64	M	4/9/2021	4/9/2021	Medical Summary - Friday, April 9, 2021 Patient received 2nd Moderna vaccination at Care Center. (1st Vaccination at Care Center unremarkable.) Approximately five minutes after vaccination, seated in Observation area patient leaned forward with elbows on knees, when asked stated he felt light-headed, put his head between his knees, wanted to lie down. He lowered himself to floor, with help transferred to different chair, sipped water, given lollipop, suddenly unresponsive, eyes glazed and rolled back, teeth clenched on lollipop stick, leaning to left side, incontinent of urine, no abnormal arm or leg movements, duration ~ or under 1 minute. Lollipop removed by staff, vitals: BP 1 Additional information for Item 18: Lollipop removed by staff, vitals: BP 117/72, P68, SpO2 Room Air 96%: now alert and oriented x4, no shortness of breath, no chest discomfort, able to sit in chair without support, was surprised by incontinence. Stated he felt sleepy, tired, and with staff assistance walked to next room for observation where he laid down on carpeted floor. He had no further episode of LOC, remained alert and oriented but continued to feel "tired". No complaints of chest discomfort or shortness of breath. ~ One hour post-incident BP 94/58 with repeat BP 120/82. ~ Two hours post-incident BP 118/80 (his usual he said) sipped water and electrolytes solution. Patient verbalized several times this event much different from previous events associated with blood draws which he described like typical vasovagal reactions with recovery within ~ 15 minutes. Drs. spoke with patient via telephone: PLAN o Can go home today o Do not drive today o Son will pick him up and stay with him for about 24 hours until wife returns from out of town o Appointment scheduled with PA at PMD office for Monday April 12 @ 8:00am – Patient called the office and I listened via speaker, his PMD is out-of-office till later in month, this is first available at the practice o Dr. recommend PMD work-up to also include EEG and CT Scan o R/O vasovagal event v. seizure v. other etiology o Dr. will contact him by phone later today PA-C MD

1210290	4/14/2021	NM	36	F	4/8/2021	4/8/2021	<p>Covid-19 Vaccine Clinic I was notified by EMT that they had given Benadryl IM to this patient. I went to evaluate patient who was sitting in a quiet corner attended by EMT and her husband. BP 150s/104, O2 100% RA Patient reported that about 5 mins after 2nd MODOerna vaccine today, she felt itchy eyes and noticed that her eyes were swollen and she notified EMT on site. They had given her Benadryl IM. She reports that she has h/o Anaphylaxis reaction to PCN. 3/12/21 Moderna 1st vaccine- given, patient noted getting tongue swelling and onsite EMT at BTR gave her Benadryl IM. Pt observed 30mins, Doctors note stated pt did not have throat/tongue swelling lung exams clear. He observed her during the episode and checked on her 3hrs later and pt noted to be felt fine. She reports that a week later, she had tongue swelling, went to ER where she was given Epi pen and admitted to ICU for 2 days. No intubation. Sent home on Prednisone taper- dosage unknown but she reports she is still taking 2 tabs daily. She reports she was told by her Hospitalist that she could go ahead for her 2nd Moderna vaccine dose. Gen: watery eyes, eyelids slightly swollen, very obese Throat: no tongue swelling, tonsils enlarged touching her palate Mallampati- Class III Pulm ctab no c,w,r Breathing comfortable, speech coherent, normal CV rrr About 10 mins of observation by this MD, I had consulted with our other on-site providers and we all agreed to give her Epi injection due to her prior history and current eye swelling immediately after vaccine was administered from EMS. Patient noted she felt shaky but denies sob/chest pain/throat pain/tongue swelling. She was not coughing. I accompanied patient to womens restroom for patient to void. EMS officer called EMS who came to pickup patient. Patient requested to be taken to Hospital ER. During the entire stay, patient denied feeling short of breath/chest pain/throat swelling. Treated in ER: IV Decadron/Benadryl/Famotidine and discharged in few hrs with discharge meds: Prednisone taper, Famotidine and Epi pen prescription 4/14/21 Called to check on patient and she reports took 2 days to settle down to feel normal but no throat swelling or any allergic reactions. States she is feeling well now. She followed up with her PCP (who is not from our facility).</p>

1210215	4/14/2021	MD	19	F	4/8/2021	4/8/2021	A few hours after I got home from getting the shot, my lower body started to ache super bad. My skin started to hurt like I had rug burn, but I wasn't surprised because that happens to me when I get the flu. My legs and groin region started to hurt more and more and I got the chills. It was extremely bad and I was sort of writhing but I told myself I was overreacting. At around 8 or 9, I decided I would sleep it off and went to bed. At 1:00 am, I got up to use the bathroom and I began feeling lightheaded. I thought I had just stood up to fast so I continued. As I walked, i got more and more dizzy and I couldn't hear well. When I sat on the toilet, I realized I wasn't going to be able to get back up, so I sat and waited. I started to get super hot so I took my shirt off. I finally was able to get up and walked towards the sink but I collapsed before I got there. I started drinking the sink water and ran my shirt under the water and put it on my head to cool off. This really helped so I went back to my room to call my mom. I have never fainted before or come this close to fainting. For the rest of the night I had the worst migraine of my life that gave me aura in my left eye and made my left arm and left side of my face go numb, as well as pulsing in my head. The pain on my skin, and in my legs and head was still there for two days after but it was manageable enough for me to go about my day. I tried to exercize to ease the muscle pain but this did not work.

1210604	4/14/2021	OH	28	F	4/2/2021	4/11/2021	On Sunday, 4/11 my eyelids were tingling, it then went to my forehead, entire face and both of my arms. My muscles stiffened and my hands/thumbs were cramping inward. My hands were also red and blotchy during this time. My face was tight and hard to move or talk. This entire incident lasted in total around 20 minutes or so. I seem to be okay since that incident, I have had a headache off and on. Not sure if it's related to the vaccine but I haven't experienced anything like this before.

1210117	4/14/2021	CA	50	F	3/13/2021	3/14/2021	The night after the night of my vaccine I had a tightening of my whole left side, from my eye, down my neck, into my shoulder and chest and down left arm. Then I started to get shooting pain all around my shoulder blades. I brushed it off thinking that most people had complaints of feeling pain or sick the few days after their vaccines and then they said it went away. Mine never went away. After about 5 days it really started to worry me. The pain was very intense- unbearable even- and i couldnt move my left arm or lie back in any way without incredible pain. I called urgent care and they told me I could come in if the pain was bad but that maybe I wanted to see my regular physician to see what was going on. I made an appointment with my doctor but it wasn't until the end of the next week. After 8 days, I couldn't take it anymore. I went to urgent care- they did an EKG and a chest xray and said all was normal. They gave me an anti-inflammatory (naproxen) and a muscle relaxer. They took blood and the only thing they noted to me was that I should have my doctor check my platelette count. They told me they thought it must be muscular. I went home. Neither of those medications seemed to help. The pain was less in the day when I was moving around, but towards the end of the day it was getting so bad (still is) that I can't sleep or get comfortable. My doctor did blood work and couldn't seem to find the source of what was going on with me either. She prescribed me a new anti-inflammatory (meloxicam), a new muscle relaxer (cyclobenzaprine) and a pain killer (hydrocodone acetamin). Sometimes those medications help- they knock me out- but when I wake up I feel the same. I can't take them in the day because they make me too loopy and tired. I don't know what is wrong. I can't seem to get answers and nobody can figure it out. It is definitely my left side. I feel it in ky head, my chest, my shoulder and down my left arm and it has been almost 5 weeks. It seems to be getting worse not better. Looking for help or direction please

1211301	4/14/2021	MI	38	F	4/13/2021	4/13/2021	<p>Patient was in observation area after receiving first dose of Moderna COVID19 Vaccine. Patient was asked to wait 30 minutes in observation following vaccine administration due to history of severe allergy to Codeine. During observation wait time, patient notified writer (observation nurse) that she was "not feeling well," and decided to lay on the floor. Writer assessed patient's vital signs and the vital signs were within normal limits. At 1310 VS were: BP 110/70, HR 85bpm, O2 95%, and RR: 20 bpm. Patient told writer that she does have a history of "blank seizures" during high stress situations. Soon after stating this, patient stopped responding to questions, and her eyes were noted to be "blank," and were staring off to the right side. No tonic/clonic activity noted. This seizure like activity was noted to last about 1 minute. Patient began answering questions again and was AOx4. Vital Signs remained stable during this seizure like activity. After a few minutes of talking with patient about her health history, writer noted patient having another "blank seizure," episode. Again, patient was not responding to questions and her eyes were noted to be "blank," and were staring off to the right side. No tonic/clonic like activity noted during this episode. Writer noted this episode to last about 2 minutes. Patient began answering questions again and was AOx4. Vital Signs remained stable during this seizure like activity. During this time, hives started to appear on patients left side of her face and front side of her chest and when patient began answering questions again after this seizure like activity, she started itching at the hives. 50mg Benadryl was given IM in her Right arm. EMS was called to site to assess patient and patient care was handed off to EMS staff.</p>

1211359	4/14/2021	NV	39	F	4/6/2021	4/6/2021	Immediately at 15 minutes: blurry vision; felt off and felt loopy (out of it); I was dropping food on myself as I was eating. My pupils were really small. I felt out of it. Finally I got home (son drove me). I had mild chest pains and heart racing (had this initially, too). And the chest pains and heart racing kept happening off and on through the night. I had headaches that night and I felt nauseated. Next day, I had to wear sunglasses inside my house as I was light sensitive and my pupils remained small. I still felt body aches and nausea but the eyes were the biggest concern...shining light by my eyes didn't make my pupils bigger. The light that came off my phone aggravated my eyes and my head. Thursday, I still had nausea but headache wasn't bad with Tylenol. Those full two days all I did was sleep. Friday, I felt like things were mild and Tylenol was helping. I called heathline for my eyes. As those still weren't improving. I got into my eye doctor for an exam (4/9). There was no inflammation and he decided to dilate my eyes. Of course, my eyes were blurry and my eyes responded to that dilation. I napped after returning home. My pupils after the nap were finally responding. I still had a little light sensitivity in my eyes but not as much as I had had and pupils were doing what they should with light. So this was 3 1/2 days later. I still do get mild headache and mild chest pain - it comes and it goes. I have a doctor appt - general check up - that was already scheduled for tomorrow and he will examine for chest pain.
1211372	4/14/2021	WI	63	F	4/14/2021	4/14/2021	After patient received vaccine she was accompanied by RN to observation area. In observation area patient was sitting in the chair with her head against the wall. RN asked patient if she was alright, patient stated, "she was not well". She was noted to be pale, glassy eyed. RN called for immediate assisatance. Pt was transferred with assitance to recliner. Patit responded to verbal commands, leaned back with feet elevated. Within Vitals 4 minutes were B/P 118/82, HR 99, Spo2 99% on room air, patient noted to be responsive. Patient stated she thinks she was having a panic attack. Vitals were taken B/P 56/40, unable to get reading for heart rate or pulse ox. Code called, Pt was transferred to ED, patient responsive.

1211229	4/14/2021	FL	28	F	4/10/2021	4/10/2021	I was fine for the most part after the vaccine. The only thing that hurt was my arm at the injection site. I started feeling nauseous about an hour later. Then at about 9:00 pm, I started to feel really sick. I felt very tired and my whole body hurt. I had a low body temperature, 95 degrees. Chills, fever, shaking, nausea. Very SEVERE symptoms. Felt very disoriented. I thought I was going to pass out and faint. Vision blurry and seen white. Pounding headache. Ears ringing. I could hardly walk that night, I was crawling on the floor. I felt out of breath. My heart was beating very fast. My left side of my chest hurt by my ribs. When I did wake up from sleep, I woke up with blood in my mouth and dried blood on my lips.

1210760	4/14/2021	MI	38	F	4/10/2021	4/10/2021	* Arm was very sore for about the first 10 minutes. Moving it reduced it pretty quickly and was no worse than a minor ache for most of the next day or so. * Had a mild headache before the shot (believe due to not having had caffeine that day yet) * At about 6 pm on 4/10, lost appetite due to mild nausea (just enough to not want to eat but not enough to vomit) * At about this time I noticed I also started to feel a little winded, akin to walking just briskly enough that you have to breath harder than if you're just sitting / resting. It did not get any worse than this however, so I opted to keep a close eye and see if it eased (which it would by end of Sunday, 4/11) * At about 8:30 pm on 4/10, noticed I felt warm, had a fever between 100.4 to 100.8 * Also around 8:30 pm I noticed that pain I normally feel from my herniated discs and pinched nerves (L4/L5 L5/S1) just ACHED and was more painful than normal. * Started feeling tired (I'm usually up until around 1-2 am, and I was ready to go to bed by 9pm on 4/10) Also felt a little forgetful / hard to concentrate on anything * When I went to bed, I noticed that my eyes were very sensitive to the white light from my monitor. This is usually a sign of a painless migraine with auras that essentially blind me for about a half hour. I did not have auras, though my headache was steadily getting worse to the point I suspect it might have actually been a migraine) * At about 12:30 am on 4/11, the headache got to the point where I could no longer ignore it (best I can describe is it felt like someone was trying to peel my skull of like you would an orange) so I took 200 mg of Ibuprofen. I also by this point had a fever of 102, though it would drop to 100.5 or so within a few minutes of taking the Ibuprofen. * At about this point the arm starting aching a lot more, I assume because I wasn't using it while sleeping. It felt like someone had punched me multiple times hard in the same spot. * I felt much better on the morning of 4/11. However as the day continued I felt more and more tired. My temperature was higher than normal but very mild; it stayed around 99.8 for most of the day that I took it. By Monday, 4/12 I felt mostly fine aside from my arm aching worse than it did when I first got the shot. Now on 4/14 its pretty much no longer achy.

1210633	4/14/2021	CA	46	F	2/8/2021	2/19/2021	She got the vaccine, she had no reactions at all and then approximately 11 days later she had a severe rash and swelling on her face, around her eye and around her mouth stemming from what she has concluded to be consuming wheat or yeast since the vaccine with no previous allergic reactions to these items. She has been to the hospital and they told her it was an allergic reaction. The rash is itchy and reoccurs when she eats those few things. She has been watching what she eats and then had something yesterday that had a tiny bit of wheat in it and broke out in hives again. She has been taking Claritin for this, which has pretty much no affect on reducing the reactions. The reaction is not sustained, it lasts for 4-5 days and then dissipates slowly as she treats with ointments, (Aquaphor). She has been in contact with dermatology center but was not breaking out at that time and is going to contact them when she is having an issue.
1210636	4/14/2021	NY	44	F	3/25/2021	3/25/2021	Immediate dizziness and nausea. Became tachycardic within an hour. This is still an issue 3 weeks out. Day after vaccine I felt mild flu symptoms all day and was struck with a severe chest pain and intense nausea in the afternoon. I went to the hospital emergency room and had multiple tests run. No cause was found for the chest pain. It began in the center of my chest and moved to the right side of my back. I have been dizzy, nauseous and extremely fatigued as well as a headache for the last three weeks. The doctor didn't know what caused the pain. He checked me for a pulmonary embolism because my clotting factors were slightly elevated. They have not been rechecked, though I requested my doctor have them and my platelets rechecked. I still do not feel well. My brain is foggy, my vision gets blurry at times, and I still have the dizziness, fatigue and nausea. I am no longer achy and I have not had another chest pain like the one I had on the 26th.

1210669	4/14/2021	CO	19	F	4/13/2021	4/14/2021	I woke up the day after my second shot completely weak and felt very feverish. I got out of bed and tried to eat yogurt, but felt nauseous and got lightheaded so I had to sit down. I drank some tea and water and went back to bed for 4 hours. I woke up again and still felt terrible and could not even walk short distances without getting very pale, sweaty, and my vision having spots. I feel chills, a headache, and have been lying down all day. I am most concerned about passing out and becoming unconscious. I called the Wellness Center and they said to just lie down and stay hydrated
1210693	4/14/2021	FL	26	M	4/7/2021	4/7/2021	Arm pain immediately after the shot. 3:45 PM. Headache, eye soreness, sinus pain - 11:30 PM. Chills and shakes - 2:30 AM. Sweats - 4 AM. Continued tiredness throughout the day.
1210694	4/14/2021		32	F	3/30/2021	4/7/2021	Fatigue for 2 days after shot. Headache starting 8 days post vaccination. Lasted 2-3 days (4/7-4/9/21) Dizziness, blurred vision, almost fainted on 4/9/21
1210700	4/14/2021	CO	21	M	4/5/2021	4/6/2021	The adverse events that occurred after this vaccination include the following: Severe headache, vision issues (i.e., loss of clarity, focus), muscle aches/cramps, chills, stomach/abdominal discomfort, upset stomach, loss of taste, loss of smell, sore throat, swelling of lymph nodes (underarms, groin region, and behind the ears), tiredness / loss of energy, and nasal congestion. The most adverse event, a headache, led to some dizziness, loss of clarity/focus (vision), and pain behind the eyes. The only treatment taken to lessen the severity of these events were acetaminophen and ibuprofen. The adverse events still occurring today are (as of now 04/14) include: stomach discomfort, muscle aches/pains, and discomfort under the arms (armpit area) near lymph nodes.
1210705	4/14/2021	CA	65	F	3/27/2021	3/27/2021	Had a very bad headache, right side of my brain felt frozen, then my right eyelid started twitching, eyesight becomes blurred until it stops, and the twitching has not stopped. The twitching starts and stops throughout the day. Always an on and off headache at the top and middle of my head.

1210848	4/14/2021	ME	52	F	4/3/2021	4/4/2021	1) Immediately after receiving the shot, during the "waiting period" before being allowed to leave the clinic, I experienced slight light-headedness and then a feeling of great hunger pains in stomach ... 2) Woke up at approximately 1:00am on Sunday, 4/4/21 with a very hot sweaty clammy feeling, had a headache, body aches, temperature was 99.9 - symptoms then proceeded to worsen with a heavy headache (light over the whole head, with a slight sinus headache feeling & increased pain on Left side of sinus, eye, forehead, ear, behind ear, down back of skull), this headache 'pulsed' mostly on the Left side of head; felt nauseous, runny nose, sore throat (felt strep-like), fatigued (slept alot), body/muscle aches, strange dull aching in Left leg which seemed to move around the leg at different times (had to keep moving positions of Left leg when sitting or laying down). These symptoms lasted without break for approximately 4 days/nights at which it tapered off. Also, on the morning of Sunday 4/11/21 I noticed a vein that seemed to 'inflate' on my Left upper forehead and pulsed for a few minutes and then subsided with the feeling of a slight headache mostly on the Left side.
1210863	4/14/2021	PA	18	F	4/14/2021	4/14/2021	unexpected swollen near my right eyebrow,

1210950	4/14/2021	TX	62	F	3/23/2021	3/28/2021	I got this information from a phone call with her today. This was five days after the injection and three days after starting a supplement African Mango. She was at work and felt cold all day and was drinking coffee all day Yes body aches and chills, "stomach was like a rock" and " whole body was hard like a rock" It felt as if she had had a really hard workout. No ER, swelling of tongues, lips, eyes or trouble breathing. Never had this before. She was seen in the clinic by and had advice from two providers including her "niece" ALLERGIES - tramadol causes nausea and shakiness. No food allergies or allergies to insects. When she took her bra off and her " breasts were standing up like rocks" and her stomach was very hard and lumps over the back of her neck. Legs were the last muscle to relax. These symptoms dissipated after three days. She did not check her vitals. She was taking tylenol and drinking lots of water. She reports her hands and feet were swollen and itchy. I asked her to sign up the vsafe.cdc.gov. I will contact the CDC to report.

1210759	4/14/2021	MO	62	M	4/9/2021	4/13/2021	Patient woke up the morning of 04/13/21 and explained to his wife that he felt "foggy" mentally. He went about his morning chores on the farm. He came inside to sit in his recliner with his feet elevated for almost an hour. At approximately 9:40 am, his wife observed that patient suddenly stiffened without warning and cried out. His arms stretched over his head in the chair and his legs stiffened like a board. His body was visibly contracted. He continued to cry out. His eyes were closed, he was salivating, and his forehead was sweating. His wife watched him move his arms suddenly to his lap, however, his fists were clenched tight. She tried to get his attention by calling to him. She noticed his lips were turning blue. She continued shaking him, shouting and then slapped him. Patient did not respond. She called 911. After 7 minutes, he finally relaxed some and started snoring loudly in the chair. He continued sleeping soundly for about 10 minutes while she waited for EMS to arrive. The wife did elevate his head, as she was told by 911 to do so. She was not able to wake him up during this time period. When the EMS arrived, he was just starting to move. They got him up to stand and he was able to verbalize his need to go to the restroom. They arrived at the hospital at approximately 10:25 am and was released after testing at approximately 2:30 pm.
1210748	4/14/2021	MI	57	F	3/29/2021	4/10/2021	On April 10th, 12 days after vaccination, at approximately 6pm, patient started having explosive diarrhea and uncontrollable gas. This subsided by the morning of the 11th. On the 11th, patient experienced extreme fatigue, sensitivity to light and sound, and nausea. Monday the 12th, at 3am, patient was woken up to severe migraines (patient has no prior history of migraines or headaches). She described her pain as radiating-- like a bright, light house was being shined directly into her eyes in her sleep. This was combined with a pounding, pulsating feeling in the frontal lobe. Patient reported hypertension, nausea, and tingles in the tips of her fingers. These symptoms persisted throughout the day. On Tuesday the 13th, the same symptoms persisted. Patient heard the new CDC warnings about the Janssen vaccine, and concerned for her well-being, called her physician. Her physician directed her to go to the emergency room as soon as possible.

1209580	4/14/2021	IN	51	F	4/9/2021	4/9/2021	- within the first 30-40 minutes: I could feel numbness creep up my arm on the side of the injection. It traveled as high as my eyebrow. It felt much like an injection would if you were getting a filling at the dentist. I couldn't see any swelling or puffiness but definitely numb. This passed within the first few hours. - first two days - I was very sore and achy in my muscles all over my body, but on the third day it was centralized to just the muscles on my upper arm and under the arm kinda into the "peck" area I believe it would be called. - day 6 - today I have mild diarrhea and a slight upset stomach.
1209514	4/14/2021	IL	51	M	4/12/2021	4/12/2021	This nurse noticed that the patient was coughing and clearing his throat around 11:10 am. This nurse asked if he needed some water and the patient replied he thought he may be having an allergic reaction to the shot. This nurse went to get a bottle of water and gave two Benadryl capsules at 11:15 am. 911 was called. This nurse notice the patient's eyes were looking swollen and red and that his face and neck were turning red around 11:20 am/ 11:25 am. Patient also stated his throat felt like it was getting tighter. This nurse then gave 0.3 mL of Epinephrine in right thigh at 11:30am. Almost immediately patient stated he was starting to feel better. EMS arrived, checked him over, asked questions, and offered to transport to the hospital. Patient refused the hospital and signed their paperwork. This nurse asked patient to stay an additional 30 minutes and patient complied. No other complications occurred. Patient's eyes still looked slightly red, but was no longer swollen. Stated he felt a little jittery. Gave patient a snack. Patient left around 12 noon/ 12:15pm. Patient drove self and walked without assist.
1209357	4/14/2021	IN	28	M	4/14/2021	4/14/2021	Patient received first dose of Moderna, within 3 minutes while sitting for post-observation. Patient's head went back as if he was falling asleep, but he began making gurgling noises and his eyes rolled to the back of his head. Helped him slide him down out of the chair, so he would not hit his head or fall. Once on the floor the patient began seizing. After a sternum rub, the patient raised up and was helped back into the chair. He was sweating and flushed. He was able to answer questions as we awaited the EMT to arrive.

1209544	4/14/2021	OR	66	F	3/18/2021	3/19/2021	The patient is a 66 y.o. female with past history of diabetes, GERD and HTN who presents to the Emergency Department with visual changes of the right eye and associated pain to the face and neck. Per interpretor, patient woke up feeling at baseline yesterday morning, when she had her COVID-19 vaccine. Yesterday around dinner time, she began having issues with vision in her right eye, causing her visual field in that eye to appear dark to her entire right eye. She told her husband that she thought she might have a hair or eyelash in her right eye and that she had an irritating pain radiating from her right eye to the right side of her face. Even after washing her eye with cold water, the sensation did not subside. At approximately 3-4 AM this morning, she also began to experience pain to the back of her head and neck bilaterally. This morning, the visual impairment improved from the entire visual field to now only just the inferior aspect of the right eye. However, she denies weakness to any of her extremities. Patient also denies chest pain, numbness, abdominal pain or nausea. She was seen at ophthalmology, at which Dr. diagnosed her with a right retinal branch arterial occlusion and decided to send her to SHE to be evaluated for the possibility of a CVA. She denies being on blood thinners or taking Aspirin. She denies any previous diagnosis of a CVA or TIA.
1209549	4/14/2021	TX	51	M	3/9/2021	3/13/2021	I started with rashes (red) on both ankles. then near arm pits. They I started with very itchy eyes which turned to Pink Eye. Additionally I got very congested, trouble breathing, phelm production. Tired or fatigued. Got back enough and went to the doctor and receive a steroid shot, and eye drops. I am still have issues still.
1209566	4/14/2021	MD	56	M	4/8/2021	4/9/2021	Since my vaccination, I've been experiencing itchiness all over my body. The most troubling adverse reactions have appeared in the last two days, five days after receiving the vaccination. Those reactions include the following: vertigo, general feeling of unsteadiness, nausea, visual focusing issues, mental focusing issues, and weakness that is mainly in my arms and legs.

1209577	4/14/2021	IN	63	F	4/3/2021	4/5/2021	BLURRED VISION, HEADACHE, CHILLES, SEVERE PAIN IN RIGHT ARM, SHOULDER AND BACK FOR DAYS. STILL HAVING BLURRED VISION AND LITTLE HEADACHES
1209506	4/14/2021	NM	40	F	3/15/2021	3/15/2021	Pain in right arm immediately after the injection, couldn't move it for 30 minutes, blurred vision, heart palpitations (first 30 minutes), throughout the day I felt foggy and strange, by 6pm I had a fever, horrible muscles aches and headache, became extremely nauseous all night and my muscles and joints hurt so bad I was crying (and I've had five kids with a high pain tolerance), fever, and at 6am my fever broke with a sweat. I felt clear headed but exhausted for the rest of the day. My chest has been tight and congested since then. Hard to breath and my voice is rough and raspy. This is ongoing and I still have chest tightness and a raspy voice. On 4/12/21 I started having horrible joint and muscle aches again throughout my body and felt so tired. Horrible headache and stomach pain, bloating and nausea.
1209258	4/14/2021	CA	92	F	3/24/2021	3/26/2021	on the third day began to feel headache, body aches, and extreme fatigue. On day 9 I saw that my face was drooping and mouth was crooked, my L eye did not close, L ear pain, L buzzing in ear. I was taken to emergency room and admitted to the hospital on 4/5/21. Was diagnosed with Bell's Palsy. Was discharged back home on 4/8/21
1209217	4/14/2021	CA	61	F	4/9/2021	4/9/2021	4/9/21-30 minutes to 1 hour after receiving 2nd dose of vaccine patient had bloody nose, clots, with bleeding sores on tongue and side of mouth. Began to have bruises on arms, feet and legs. Blood in urine and bruises on back. Presented to emergency department on 4/11/21. CT brain revealed a right sided posterior temporal hemorrhage. Patient was emergently treated with platelets, DDAVP, factor VII, Decadron, IVIG. 4/12/21, patient denies headache, changes in vision, double vision, change in sensation, including burning, pinprick, numbness, no focal or motor weakness. No change in bowel or bladder control. No sensory changes. Patient states she is now back to her normal state of health, save for the bruising described.

1209239	4/14/2021	SC	43	F	4/8/2021	4/8/2021	This nurse was called to the monitoring area to assist a patient that was passing out. Patient called out she felt dizzy at which time her eyes rolled back and she started to go limp. EMS was called immediately. Patient was assisted to the floor by multiple staff. Patient lost consciousness for 15-20 seconds. Patient regained consciousness spontaneously. Pupils were enlarged. BP 110/70, HR 65, Pulse ox 99%. Patient was s/p covid vaccine # 1 (Lot ER8727, exp. 7/31/21). Ice pack applied to patient's neck. Patient laid on floor and remained awake, alert, and oriented. Patient stated she felt better. She was sat upright and given water. Patient stated she has not had anything to eat or drink since last night. Patient was assisted to chair slowly. EMS arrived @ 12:24. Patient then had a second episode where she felt dizzy and started to pass out. She was again lowered to the floor. Patient was placed on a monitor by EMS, BP 74/44. EMS inserted IV line into her Left AC and started fluids. BS via fingerstick was 104. Patient was transported to ED without further incident.
1210782	4/14/2021	CA	43	M	3/27/2021	3/30/2021	Twitching up and down my left arm, where the shot occurred, and sometimes my eyes. I'm not sure about the eyes since that's happened before, but the left arm is consistent, visible, and once every few seconds.
1210035	4/14/2021	FL	58	M	3/13/2021	4/12/2021	Approximately a week after vaccine administration a rash developed on torso. Then on April 12, 2021 after working throughout the morning sitting in front of my computer, I took a lunch break. While preparing a meal, I felt discomfort in the left eye and it became very uncomfortable. When I checked in the mirror, I discovered my left eye was filling with blood. Upon seeing an eye doctor that same afternoon, the doctor explained that my left eye had ruptured a large vessel and hemorrhaged. However, the reason for the hemorrhage could not be determined because I was not under stress, had not lifted anything heavy, was not on blood thinner medication, was not constipated and have no underlying health condition.

1209241	4/14/2021	NC	55	F	3/10/2021	3/25/2021	next day extreme fatigue, fever lethargy. Got better but never got energy back and had some body aches and trouble sleeping. On Wed. March 25th an EXTREME headache began and I could find no relief with High doses of Tylenol or Ibuprophen or a mixture of both. It was my whole head. Stayed on the couch all day Saturday and Sunday 27th and 28th unable to move because of the pain and extreme fatigue. Monday the 29th made myself go to work but was not able to function or get much relief. On Tuesday the 30th went to see physician who said he thought it was Occipital Neuralgia and gave me prednisone and said use hot compresses. Told him I thought it was more due to other symptoms like hallucinations (shadows I would see) Mind not clear and made me worry about driving. Asked if the shot could be a possibility. He just said he couldn't rule it out. The doctor also mentioned I felt very hot but never took my temperature. I Took the prednisone. Headache did start to clear on Wed the 31st in the evening but my neck seized up where I could no longer turn it to the left and was very painful. Also felt like my lymphnodes were swollen. I called on call doctor and they prescribed a muscle relaxer. I did not start to get better until Sunday April 11th. Experience a couple occular migranes as well during this, Still experiencing some fatigue and almost to a fainting point in the mornings

1209245	4/14/2021	IA	66	F	3/12/2021	3/13/2021	6 hours after the injection I had a very sore arm at the injection site, body and joint aches, and a slight temperature. The next morning, 21 hours after injection, I got very lightheaded, faint, tinnitus, and nausea. All of these side effects subsided 30 hours after injection. The following day I had lightheadedness, tinnitus, and nausea, which has persisted for 4 1/2 weeks. 18 hours after the injection I woke up in the night with a strange sensation of movement when I closed my eyes. On the fifth day after injection I had an intense spell of lightheadedness, tinnitus, nausea, shaky arms and legs, and localized right side head pain, so I went to see a nurse practitioner. All of my vital signs, blood work, and urine sample were normal. I was advised to stay hydrated and get plenty of rest. After 4 1/2 weeks the nausea is almost gone, however, I still have times of lightheadedness and tinnitus. I have had some sort of "spell" on 19 of 29 days since the injection. The side effects seem to be getting less intense and less frequent. I have not had issues with any of this in the past.

1209362	4/14/2021	PA	38	F	4/14/2021	4/14/2021	At 3:11pm, 5 minutes post injection, patient began to feel anxious with dizziness and blurred vision. Moved to lie down on floor. Patient states she has not eaten today. Brought by litter to observation area at 3:45pm. Patient laid down, vitals taken. Given water. Patient notes mild nausea. 4:08pm, patient reports normal vision. Denies nausea. Given crackers to eat. Moved to edge of bed, vitals rechecked. Feeling well. Patient released by wheelchair.
1209289	4/14/2021	CO	73	M	2/10/2021	2/26/2021	On 26 Feb R eye became clouded. By the 28th, I had lost all sight in R eye. Suspected I had a torn retina, as I had in L eye several years earlier, I made an appointment on the 26th to see my optometrist. I saw him on 3 March where he diagnosed that I had a more serious problem. At that time some of my R eye sight had returned but I could only see the top line in the chart. He made an appointment that day for me to see an ophthalmologist. She checked me out. I had a severely inflamed optic nerve in the R eye and my L eye optic nerve was inflamed but not to the extent of the Right one. I was sent to get an echo cardiogram and a carotid artery ultrasound. I was referred to a neurologist ophthalmologist but couldn't get in until March 12. On March 10th I was told to go to the ER room for a workup prior to my 12 March appointment. I got an MRI CAT scan, lots of blood work, etc. I'm running out of time to finish this.
1209293	4/14/2021	AZ	17	F	4/9/2021	4/9/2021	The shot was given on Friday around 1 pm. Blurry Vision immediately after vaccination, then felt fine until 7 pm. At 7 pm she fainted at Lacrosse practice. The following day, Saturday, she fainted at work and was sent home. Sunday, she slept most of the day. Monday, she fainted at school and was sent home. Symptoms have been feeling of her heart racing, blurry vision, fainting, weakness, and major fatigue. No fever.

1209779	4/14/2021	NC	19	M	4/1/2021	4/12/2021	Developed "moderna arm" (raised inflammation with itching 1.5-2 inches long and 0.5-1 inches across) 7 days post vaccination from injection 1. Developed somewhat severe tension headache on day 1 post vaccination from injection 2 (all further events listed below are from injection 2). Headache responded to ibuprofen. On day 4 post vaccination, began experiencing minor and infrequent migraine-like headaches that lasted for a few seconds to a minute. Moderate pain and localized. Pain site changed but was generally on left side. Experienced 0-2 a day until day 12. On day 11 post vaccination, began experiencing full, moderate tension headache. In addition, had more frequent migraine-like headaches. Did not respond to 400mg ibuprofen or 10mg Claritin. On day 12 post vaccination, began experiencing photophobia. Mentioned to general practitioner out of an abundance of caution who recommended Excedrin. Took two Excedrin extra strength (total dosage: Acetomenaphin 500mg, Aspirin 500 mg, Caffeine 130 mg). Tension headache ended and most (but not all) migraine-like pain subsided. Some occasional pain ranging from 1-2 out of 10. On day 13 out of an abundance of caution following reports of other events I went to the ER. The doctor there examined for any cognitive symptoms (asked me to follow her finger with my eyes, squeeze fingers, checked ability to move extremities, etc) and concluded no risk of CVST. Determined that vaccine likely lowered my threshold for headaches and migraines (I have had very infrequent cluster headaches lasting for a few seconds in the past, never for this duration). Final diagnosis was migraines. Doctor prescribed Fioricet and gave me a long-acting steroid. Some pain is still there, but symptoms have mostly stopped. Waves of quick bursts of pain on localized areas on the left side of my head are still occurring.

1209969	4/14/2021	NM	41	M	4/14/2021	4/14/2021	10 minutes or so after injection, patient reported that he felt itchy all over his left arm and spine. His eye felt weird, and he was dry heaving. I gave him a chair to sit in since he looked unsteady, had him sit on the chair, gave him 10 mL of children's Benadryl (dye free). He threw up in a trash can and sat for 10 more minutes, and felt fine and left the pharmacy.
1210016	4/14/2021	TX	65	F	4/1/2021	4/1/2021	Rash, hives: legs, back, belly, arms, face, eyelids, around mouth, neck, genital area. I had 3 episodes of hives/rash. one daily after day of vaccination. I had to go to ER the day I received vaccine. (I received the vaccine at the Hospital where I work (in the Lab), went that same night to the ER where I also work in the Lab. I was given i.v. benadryl and 2 other medications. Later I was given a prescription for Prednisone 5 days and Atarax after being released. The second day I got worse. Third day symptoms subsided. Now it is 8 days after, I have only a small rash in my leg.
1210021	4/14/2021	WI	31	F	4/2/2021	4/9/2021	Swollen and painful neck nodes. Then itchy scalp (only on left side of head) rash on forehead. Again, only on the left side. The scalp then turned into more painful/tender/red and the rash on face itchy and also painful. Being treated for shingles as it is on my face and on the left side near eye. Causing me to wake up at night. Painful nodes in neck and in front of ear on the left side.

1210025	4/14/2021	MI	17	F	4/14/2021	4/14/2021	Patient arrived with mom for Covid vaccine at 12:48 pm. Mom reports a history of fainting so nurse decided to administer vaccine with client lying down. Vaccine was administered and client immediately stiffened arms and appeared to seize while her eyes rolled back. Nurse reported she turned the client onto her side and she "came to within 20-30 seconds." She reported blurry vision but could read when asked to do so. She quickly became alert and oriented. Her mother reported that she had a previous episode one time in the past year with painful menses. Her vitals remained stable but each time she attempted to stand up, she reported feeling "sick." She developed a headache within minutes of the vaccine and took 2 Tylenol while still there. Client left with parent to follow up at hospital.
1209671	4/14/2021	VA	60	F	4/6/2021	4/7/2021	All over rash and hives and itching on body including face around eyes and mouth, scalp itching and tongue feeling funny at times but no swelling as far as I can tell. As of 04/09/2021 I have started taken Benadryl in hopes that would help. A little headache here and there. Have taken Tylenol for that.
1209595	4/14/2021	OR	41	F	4/14/2021	4/14/2021	blurred vision (mild?)
1209607	4/14/2021	AL	33	F	4/12/2021	4/12/2021	Patient came to Urgent Care around 1800 4/12/2021 and reported that she got the first Moderna Vaccine that day at 3:22 pm, tried to go back to work, felt dizzy, short of breath, and her vision was hazy. Checked her blood pressure and it was elevated around 150/100. Reported still having chest tightness, SOB, and hazy vision at the time of visit. VS 97.7 temp, pulse 87, BP 143/98, resp 16, O2 98%. Physical exam unremarkable. EKG showed small negative T in aVF, negative T in III, slight inferior repolarization disturbance, consider ischemia, LV overload or aspecific change. Due to symptoms and abnormal EKG pt was sent to the ER for further evaluation.

Saw ophthalmologist who diagnosed idiopathic periorbital inflammation; no fistula or infection seen by mri/mra and carotid angiogram. Patient was treated with prednisone and platelets came up to 130,000 and improvement in pain and swelling and intraocular pressure dropped from 50 to 14.
1209611	4/14/2021	CA	53	M	3/22/2021	4/6/2021	Day 15 after covid vaccine I woke up at 12:30am with extreme vertigo and nausea. It woke me up with violent spinning. I could not focus my eyes at all. I felt very ill. I almost threw up multiple times during the day and could not move my head up or down and to the left without spinning out of control. I saw the ENT later that day and he performed the Epley Maneuver on me. I followed his directions for home care but am currently still experiencing vertigo. The doctor told me it should dissipate within one week. It has not. I have never had vertigo in the past.
1209674	4/14/2021	OK	32	M	4/7/2021	4/7/2021	Immediate loss of consciousness. I lost color in my face (pale white) I experienced chills and cold. My hands were shaking for about 4 hours following. From the fall, I developed right shoulder pain, right hip pain, jaw pain, right eye pain, right chest pain, right back pain, and a black eye. All symptoms have lasted a week.A I also had fever for about a day, along with generally feeling weak/unwell.A I
1209735	4/14/2021	CA	40	F	3/20/2021	3/21/2021	A day after the injection, almost 24 hours later I started to feel like I was getting sick. I was expecting it since that was the known symptoms and that it would go away 1-2 days later. well for me, it didn't go away. Few days later, the mild aches and pain on the body went away but the headaches did not. Instead, it progressed day after each day with more headaches, which felt like migraines plus dizziness. On March 31, I woke up and opened my eyes my whole room was spinning. I started to take Advil here and there to ease the discomfort. Apr 16 would be the day I come back for my 2nd shot but I am so scared of the increased migraines and dizziness I might not come back.

1209695	4/14/2021	TX	23	F	4/11/2021	4/12/2021	Fever, body pains, shivers, nose bleed, burning sensation of eyes
1209697	4/14/2021	VA	61	M	3/15/2021	3/27/2021	For the first time ever, I had what I determined (based on internet searching) to be an ocular migraine. My vision was distorted in both eyes, although the distortion was stronger when looking to the left. There was a circular area that was fuzzy and a bit wavy like looking through water. The circular distortion area seemed to be outlined by a ring of brighter light. No flashes or floaters. I did not have a migraine headache then or afterwards; I've never had a migraine headache. I followed the on-line advise and laid down and did try to use my eyes for about an hours. The distortion faded within an hour or two; it has not recurred. I did not connect it to the vaccine as a potential source at that time.
1209586	4/14/2021	MD	33	M	4/10/2021	4/13/2021	As soon as I woke up, I read the Janssen pause news from my bed. I got up to go to the bathroom and upon finishing, I felt my heart rate skyrocket and felt faint. I immediately went back to the bed where I lost consciousness. My wife said my eyes were open and my body was rigid. I came too within a minute of that and was breathing heavy and sweating and very fatigued. My wife had called 911 as I was coming back to consciousness. The EMTs checked my vitals and all was normal. They asked if I wanted to go to the hospital, and I said no. My back was extremely sore all day, and I developed small red spots around my eyes. I went to my doctor later that day and told them about it. They took my blood for tests, which I have not heard back about, and they did not conclude anything, but did set me up with an appointment for an MRI of my head, given my past history.
1209720	4/14/2021	CA	70	M	2/22/2021	2/26/2021	Sick for 4 Days with fever, chills, body ache, severe headache. After that developed rash on torso. Looked like chicken pox. Still have marks on torso. Also noticed that my eyesight seems altered. Nothing is clear and crisp as it was before. Wear bifocal lenses, and both near and distant affected.

1202027	4/13/2021	MN	48	F	4/6/2021	4/6/2021	Typical symptoms started about 12 hours after the injection. Very bad body aches, severe headache, eye ball pain (weird), chills. About 2 days after the vaccination, all of my previous respiratory symptoms that I have had well managed and under control have returned. I am wheezing, congested, ringing in my ears, coughing, chills, and anytime I eat, all the symptoms are exacerbated, which means I am having some sort of histamine or cytokine response/reaction. I can't eat normally, otherwise I feel really sick again: body aches, wheezing increases, feel like a fever is coming (it doesn't), very exhausted. These are all symptoms I dealt with about 3-4 years ago, though all of this was under control with my current med/supplement regimen. Have to say I am very very upset about all of this. I have no idea when or if these will subside but they don't seem to be going away.
1202037	4/13/2021	NC	20	M	3/10/2021	3/10/2021	Patient experienced vaso-vagal response immediately following injection. Eyes rolled back and he slumped over in chair. Made snorting sounds. Some tremors. Sweating. Legs elevated. Chair reclined. Aroused after about 45-60 seconds. Alert and appropriate responses to questions. Acknowledged that he had not had anything to eat recently, nor had he had fluids. Ice chips offered. Assisted to wheelchair and transported to Obs for VS. Ice water and coke offered.
1202115	4/13/2021	PA	41	F	4/10/2021	4/11/2021	Severe headache (stabbing pain right temple) caused body to sweat from pain night sweats severe joint aches and pain brain fog memory loss dizzy weak vision impairment tiredness fatigue nausea severe rib pain (left side) - hard to breath with it
1202127	4/13/2021		33	F	4/13/2021	4/13/2021	Dizziness - no focal weakness, numbness, headache, visual changes, chest pain, SOB, rash or pruritus. No abdominal pain History of asthma denies taking any medications. Reports she did not eat today VS: 120/79, HR 77 bpm, O2 Sat 95%, PERRL, heart and lungs clear to auscultation. Oropharyngeal clear with no swelling Pt resolved completely with rest and leg elevation. Pt was advised to seek immediate re-evaluation if symptoms return

1202338	4/13/2021	WI	76	F	4/13/2021	4/13/2021	<p>Patient is here today for her second Pfizer vaccination. She reports that after the first vaccine, she felt very cold and had a sore arm for about 4 days. States that she took a 3-4 hour nap after she got home and the chills improved/resolved. Reports that she received the vaccine at around 10:00 AM. Was in the waiting area and was having some blurring of vision that was "coming in and out" and dizziness. She was taken to the personal observation area to lie down at 10:36 AM. Vital signs monitored. Blood pressure elevated, even though symptoms of blurring vision resolved. At around 10:55 AM, patient sat up on edge of cot. Continues to reports symptoms have resolved. No return of symptoms with standing. Patient walked well without the need of assistance. Husband accompanied her out of facility. Advised that, should blurring of vision reoccur, she should be seen in ED. Advised to schedule a blood pressure recheck with her PCP before the weekend. Patient acknowledged understanding of above information.</p>

1202220	4/13/2021	TX	50	F	4/3/2021	4/5/2021	On 4/5/21, two days after my second injection, I was sitting at my desk working (at home) when I noticed my vision wasn't clear even with my glasses on. I had been feeling nauseous for a few hours and then my eyes started bouncing back and forth uncontrollably. I was unable to see correctly or move from my chair. Once my eyes stopped moving my vision became tunnel vision and everything around it became foggy. I felt weak and dizzy. I started getting a headache. I didn't think I could even call out for help as I was unsure my voice would work. Once it all calmed down I figured it must be part of a migraine, even though nothing this extreme had ever happened before. I moved to my bed as I was suddenly completely exhausted, and immediately fell asleep for almost 3 hours. Once I got up I was still very groggy and had to force myself my. I stayed up for about 3 hours and went back to bed for the night. The next morning I woke and was feeling better so I figured it must have been a migraine. However a few hours later the same problems started back up again. I was having a hard time seeing my computer screen, I had a foggy head and was finding it hard to concentrate and do work. My headache started again and my vision started as foggy and became tunnel vision again. This time my eyes did not bounce, but my lips started tingling. This lasted for about 1 minute. This time with everything I was making sure to take a mental note of everything going on because I was scared I was going to have to call 911. Because I was home alone I opened my phone to dial if it got any worse. The event backed off enough that I took myself to the ER. By the time I was in the waiting room my head felt like a balloon and my whole body just felt "off." I can't explain how it felt, it just didn't feel normal. My headache never got overly severe like it does with a migraine, but I was worried about a stroke. The ER did a CT scan and did rule out a stroke, but was unsure of what it exactly what it was, but guessed it was an abnormal migraine attack and told me to follow up with my PCM in a couple of days and to keep my appointment with my neurologist on April 15th. The symptoms lasted a full week off and on every day, with a tapering down of severity of symptoms.

1203426	4/13/2021	NY	41	F	4/10/2021	4/10/2021	Vaccine was administered and two minutes later patient reported to feel "weird." She kneeled over and started to breathe heavy. Pharmacist was asking if the patient is okay and the patient stopped responding so the pharmacist kneeled over to pick up the patients head and she looked flushed, her eyes were bulging and she began to sweat. The pharmacist asked the technician to call 911, asked the patient if she could breathe and the patient said yes but said she is not feeling well. She kneeled back over and the pharmacist was holding her hand telling her to continue breathing. The patient was very sweaty continued to breathe heavily. About two minutes passed and the patient was expressing she was feeling better and better as the pharmacist was speaking to her. The EMTs arrived 7 minutes after the call the patient had sat up already and was speaking and feeling alert. She expressed that she felt like she was underwater and the pharmacists voice was fading during the minutes after the shot and she felt like her heart was racing. She explained that she suffers from anxiety. The EMTs took her blood pressure when the patient was sitting and standing up, blood pressure was in normal range and also checked her blood glucose with a finger stick which was also in normal range. The patient had mentioned previously that she biked to the pharmacy. Later on the pharmacist called to check on the patient she said that she is feeling well and biked back home.

1203451	4/13/2021	WI	58	F	4/13/2021	4/13/2021	Client received the Moderna COVID-19 Vaccine at the mass clinic site for The Health Department. After approx. 5 mins, client approached writer with complaints of HA, nausea and dizziness. Client was assisted into wheelchair, then assisted onto cot. Client moaning with complaints of severe HA, body aches and nausea and experienced dry heaves. Client is pale. Client's position hindered obtaining a blood pressure. Client became more pale, weaker and not responding to verbal command/questions from the nurses. The nurses directed someone to call 911 at 10:07am. Nurses attempted to rouse client to get her to talk. She then stated "oh my head" "oh, my neck hurts", still not opening her eyes or aware of RN speaking to her. She then drooped on the bed with head into chin. At this point the team decided to administer Epi Pen 0.3 mg/0.3mL. It was visually inspected as clear and date checked. Epi Pen administered at 10:08am by RN. BP at 10:09am 102/80, pulse 88. Client then yelled and became responsive, eyes opened and asking for water. Client positioned on her side due to nausea. 10:11am p80. Client responds when roused. Nausea and severe HA continues. Color improved. Client reports taking medication for hypertension and high cholesterol. 10:14am BP 144/80, p76. Client rubbing thigh where Epi Pen was administered. States her "body burns". AT 10:18a, Fire Emergency Responders arrived and assumed care of client. Client transported to ER by emergency responders at 10:25am. Client was accompanied by her husband, who was being driven by son. He will meet client at ER.
1203491	4/13/2021	MN	56	F	3/10/2021	3/12/2021	Pt reported to the ER two days after vaccination on 03/12/21 with complaints of visual difficulties and gaze abnormalities. Stroke code was activated at 1445. After CT, pt was flown to Hospital for work up by neurology. Underwent CTA, thrombus in right PCA. Underwent thrombectomy. Complications from stroke and difficult airway led to intubation and mechanical intervention, extubated the next day. Pt discharged from hospital 03/17 on Eliquis.

ABNORMAL (did not feel good), SKIN EXFOLIATION (peeling all over her body) and PAIN (terrible pain/in a lot of pain). On 23-Jan-2021, HEADACHE (headache) had resolved. At the time of the report, ANGIOEDEMA (hives about the size of a quarter), SWELLING OF EYELID (very bad face and eyelid swelling), BLISTER (face has blisters), SWELLING (cheeks were swollen), ERYTHEMA (her whole face is burnt red/cheeks burn and are red.), BACK PAIN (back hurt), BURNING SENSATION (Face was burning), HYPOKINESIA (could not move her hands), FEELING ABNORMAL (did not feel good), SKIN EXFOLIATION (peeling all over her body), OCULAR HYPERAEMIA (Right eye is blood shot), SKIN BURNING SENSATION (Sensitive to sunburn and cannot put any sunscreen or cream on because it burns the skin), PAIN (terrible pain/in a lot of pain), ERYTHEMA (red down the neck/her whole throat on both sides and under her chin is burnt red) and ARTHRALGIA (Her knees-she can't walk like she used to/her knees do not work anymore/could not move her hands) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. After 3 days, she decided to go to the ER by ambulance because the events did not improve. Received a Benadryl injection in the ER and was better until the next day when the problem started all over again. This day her cheeks burn and are red and sensitive to sunburn and cannot put any sunscreen or cream on because it burns the skin. Around the eyes she has large dark circles. Relevant concomitant medications were not reported. Treatment information were included diphenhydramine (for oral) and diphenhydramine injection. Based on the current available information and the temporal relationship between the product use and the start date of the events a causal relationship cannot be excluded. Most recent FOLLOW-UP information incorporated above includes: On 07-Apr-2021: Follow-up included reporter's contact details, patient's age, medical history, prior drug therapy, suspect drug batch number, route of administration, events, events onset date and treatments.; Sender's Comments: Based on the current available information and the temporal relationship between the product use and the start date of the events a causal relationship cannot be excluded.

1203258	4/13/2021	CA	65	M	3/19/2021	4/5/2021	Starting on or about 4/5/21 severe headache that I treated as a sinus infection from seasonal allergies. Stayed inside. stopped smoking (marijuana), nasal mist. Very dry sinuses and eyes especially the left eye. The pain proceeded to worsen and I rinsed my sinuses with nasal mist which eventually relieved the pain. At one point during the rinsing I had a short flow of blood from my sinuses. I used eye drops for the dryness in my eyes. I had occasional pain in my legs during the week of the 5th followed by extreme back and leg pain on the 11th. This pain and spasms mainly effected regions where I have had long term weakness. I still have minor pain as is typical.

1200718	4/13/2021	NC	47	F	4/8/2021	4/8/2021	Later that day of the vaccine I woke up about 11pm with a fever, all joints hurting, my eyes were hurting and flu like symptoms which continued throughout the night. I was extremely thirsty which caused me to consume over 60 ounces of water overnight. Woke up about 7am and went to prepare coffee and blacked out. When I woke up I was on the floor and had a bursted nose and EMT was called. I was transported to the ER where I was administered IV fluids, EKG and CBC were done but clear and I was diagnosed as severely dehydrated. I was released about 5hrs later but the consistant feeling of constant thirst has remained even still today. I have also had a lingering headache also.

1200881	4/13/2021	OK	22	M	4/9/2021	4/9/2021	Patient reports history of passing out with lab draws and one other time with injection. Within 30 seconds of vaccine, patient reported dizziness, narrowed vision, and diaphoresis; he also appeared very pale. As we attempted to assist him to the floor, his eyes rolled back and he lost consciousness. Patient became alert within 10 seconds of losing consciousness. When safe, he was assisted to WC and taken to clinic where he was observed for a few hours. Patient discharged home with his mother when he was feeling better.
1200536	4/13/2021	AZ	56	F	4/11/2021	4/11/2021	at 6:00 pm. i started with light headedness and eyes blurred. by 830pm,started get cold and hot sweats together. i felt like my bones were going to break especially in toes. i was afraid to stand up, also it felt like my breathing was effected if i laid down, id cough and than get a sharp headache pain, so around 1230am, with still freezing and sweating started with sharp pains in left lower stomach and top left chest stabbing pains, felt like i have to vomit and go to the bathroom. ended up just vial vomit .this lasted until 0700am took a hour nap woke up sweating was drenched, continuing day on with left side stomach and chest pains and back shoulder pain. with nervousness. on 4-13-21 woke up to diarrhea and shaking still
1200894	4/13/2021	FL	25	F	4/12/2021	4/12/2021	Around 6pm I started to get a really bad headache and all I wanted to do was lay down because I was getting very tired. About an hour later my entire body was aching and I couldn't stop shaking with chills. I couldn't move or turn in my bed without my entire body just hurting. Even the blankets and clothes I had on were hurting my body. I tossed and turned throughout the night. At midnight I woke up to use the bathroom and my face and eyes were hurting. Once I got into my bathroom and looked in the mirror, my face was a little swollen and my eyes were a little puffy. My forehead and cheeks were a little red so I took my temperature and I was running a fever of 102.

1201021	4/13/2021			U			I received the vaccine at 11:05AM on April 9. That night, I felt some fatigue and a slight headache but I increased my water intake and woke up feeling OK. On April 10, around 7pm, I felt an intense pain located on a tiny area in the middle of the arch of my inner right foot. It felt like a charley horse inside of a blood vessel, which I visually saw swell up to the size of an M&M. It hurt for about 3-4 minutes. Finally, it flattened and the pain subsided, and right away a bruise about 1inch x 2 inch in area appeared where the lump was. I had never had that happen to me before. On Monday, April 12, I woke up and saw two M&M-sized circular bruises over the knuckle joint of two of my right fingers, and the skin on top of those bruises were dry and scaly. Also never experienced that before. Other random bruises that have appeared in the past are smooth on the skin. The evening of April 12, I started some vaginal spotting, which is also unusual because I just finished my cycle <2 weeks ago and not scheduled to start again until first week of May.
1201060	4/13/2021	IL	35	F	4/9/2021	4/10/2021	Woke up at 3am with the worst nausea and stomachache of my life. tried to get to the bathroom. all of a sudden had massive ear ringing in my left ear and then everything just went out. my hearing. my vision started to blur, saw black spots. Couldn't speak. felt cold all over and then started pouring sweat from my forehead. Ripped off my sweatshirt and laid in bed until it passed about 20 minutes later.
1201063	4/13/2021	OH	75	M	3/11/2021	3/13/2021	Extreme vertigo, weakness, unable to walk, extremely unbalanced when attempting to stand up, severe Headaches, blurred vision.. Also with sinus type drainage. Extreme nausea and fatigue. Literally couldnt even hold his head up. All syptoms started within 48 hours of injection and came on with a vengeance. He was so unsteady and unstable he fell with attempts to get up. Prior to the vaccine he was great! Strong and healthy for all of his underlying medical conditons. Completely Independant, driving , working around the house ect. Unfortunaley this is still going on. He is very weak, and still unsteady when he is up. Nausea continues. He is doing Vestibular therapy for the balance issues. Took a round of seroids.

1199758	4/13/2021	MD	38	M	4/8/2021	4/8/2021	<p>Hi I was vaccinated Thursday April 8th 2021 at approximately 9:15am. I kept a log so I could share my experience with my friends and family. After vaccination I was fine for a few hours but I randomly got a case of watery eyes that would last about 15 minutes and then clear up. This happened 4 times over a 9 hour period. Around 9 hours after vaccination I started to feel like I had a cold and my skin all over my body ached to touch and my heart started racing. I felt sunburned and nauseous and went to bed. 13 hours exactly after vaccination I was hit hard with intense chills to the point of teeth chattering and full body shivering. 15 hours after injection I woke up intensely hot and I had a massive headache, full body pain, a tickle deep in my lungs that made me cough, nausea, and a fever of 101. I also was having extreme heart palpitations. I have a laser thermometer and I discovered my fever was 101.5 at my forehead but my neck and chest were 103. I took ibuprofen and kept patting myself with cold wet wash cloths to combat the fever. At this point I debated going to the hospital. I had intense fatigue and I was too weak to move but too sick to sleep. This level of fever and symptoms went on for about a day and a half. Since my vaccination I am still fatigued, I get winded very easily, something small like feeding my dog makes me break out in a sweat, and I need to lay down. I am still weak and fatigued but not to the same level as before and it changes every day. I have a sore throat, headaches, occasionally my body will twitch in random places, fever will pop up and go away, I cough gag and get very weak under any physical stress. I did not have injection site pain out of the ordinary until 48 hours after injection and it felt like a shotgun blast to the arm.. I did have very unusual joint pain from the start. I was injected in my upper left arm, but my lower right ankle was painful and my left wrist... I am a 38 year old male with treated hypertension, obesity and sleep apnea. My mother who is 65 was vaccinated at the same time as myself and her symptoms were slow onset and much milder than mine but she too has headaches, upset stomach, fatigue, watery eyes, fever, chills, twitches, injection pain, etc.</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1203833	4/13/2021	IL	60	M	3/30/2021	3/30/2021	The patient reported severe pain in the arm of injection that started between 1-2 hours post vaccination. The following day he noticed floaters in his vision. He made an appointment with a regular eye dr (4/4/21) who referred him to a Retina specialist. At the appointment with the retina specialist they noticed holes in the patients retina. They dr had to preform freezing and gas treatment to prevent the retina from detaching. The doctor wants the patient to recheck in 3 months.
1202251	4/13/2021	WA	50	F	4/10/2021	4/10/2021	There were no side effects with the 1st dose. The 2nd dose resulted in the following: 4 hrs in: 2 hives on thigh 12 hrs in: More hives/welts on torso, feet, knees, elbows, hands, face, thighs 24 hrs in: fever, chills, body aches (expected) and extensive amount of welts, hives all over the body and swollen hands/feet, wrists/ankles to include itching and pain. The 2nd dose has triggered my Chronic Urticaria, which I first got in 2019 from what I believe was an ingredient in sunscreen (octinoxate). At that time it took me 1 long year to completely get rid of those hives and that was successful by using a series of prednisone (which was damaging to my system and hard to get off of) and then finally Xolair. I have not been off of the Xolair for even a year at this point and now, I am back to where I started. I believe that the PEGs in the Pfizer vaccine has activated my urticaria. I am now suffering with severe welts/hives and swollen hands. Prednisone is not an option due to it mixing with the vaccine and I managed to get a low dose of Xolair yesterday (4/12/21) but that shot is slow-absorbing and I might not see relief for 7-8 days. Additionally, my blood pressure was 160/100, which is consistent with presence of these welts/hives. This includes a rapid heart beat as well. Had I known this was a even a remote possibility, I would not have received the Pfizer vaccine. Chronic Hives is a life-altering issue as I have used a lot of sick time and missed events due to discomfort and swollen eyelids.

1199627	4/13/2021	CA	63	M	4/8/2021	4/9/2021	I received the shot around 9am, That evening my left arm was a bit sore as well as my neck muscles. The next day I had several of my old Shingles symptoms return, weird feeling in my left eye, itchy eyebrow muscle, itchy skin on left side. (I had the shingles about 15 years ago, LEFT side, not too bad, mostly itchy, with recurring odd things just mentioned maybe once a year) The the 2nd day I got a weird tingling, buzzing feeling in my left upper back above shoulder blade, like those TENS device electric muscle stimulators. This is similar to my shingles twitches, but different and NEW. Maybe I should have taken the shot in my right arm? I may take the second shot in my right arm.

1199682	4/13/2021	AZ	52	F	4/3/2021	4/4/2021	starting morning after vaccine: extreme fatigue chills / hot flashes (temp was up .7 degrees from normal) sore arm starting 24 hours after vaccine: - bad diarrhea - urination interruptions, taking a long time to vacate - cognitive numbness / severe brain fog / disinterest - loss of appetite - swollen sinuses all of this was very bad for 4 days, improved a bit each day since but the cognitive stuff and loss of appetite still not fully resolved starting second night, sleep effects: 1) hallucinations upon awaking from sleep periodically through the night - example: seeing dotted lines moving on the back of my eyelids 2) extremely disturbing nightmares 3) both arms falling dead asleep from shoulder to hands during sleep 4) very shallow rapid breathing also all very bad for 4 days and mostly resolved now except the breathing at night is still shallow and rapid but not as bad as first 4 days
1199704	4/13/2021	NC	19	F	4/8/2021	4/9/2021	Dizziness, Headache, Blurry Vision, Fever, Body/ muscle aches, joint pain, unable to drive/ function , and golf ball sized welt at sight of injection
1200640	4/13/2021	FL	51	F	4/11/2021	4/11/2021	Janssen COVID-19 Vaccine EUA: shot at 1:30pm by 9pm fever/headache eyes watering. by 11pm: Freezing /chills, headache still and feeling like sinus-nose stuffy. So very cold... had to put on sweat pants to sleep in took an Aleve at 2 am and again the next day at 8 am and 2pm and more more at 6 pm. ran a low 100 degree fever all day the next day. 6 am day two: Seems to be back to normal. Don't know about anything internally. I did feel the shot injected into my arm and it stung and I could feel it "run down" in the arm. Outside the arm, the injection site seems to just be a tiny sore... nothing that is detracting for me.

1199716	4/13/2021	NV	63	M	4/2/2021	4/5/2021	Nasal congestion, sneezing, Itchy/red eyes, progressed into bronchitis which included significant unproductive cough. Used generic "Claratin" at first. 6 days after injection, began prescribed NEO-POLY-DEX eye drops, Fluticasone Prop 50 mcg nose spray, Albuterol inhalations. 8 days after injection got an Albuterol breathing treatment and began prescribed 5-day Prednisone 20 mg treatment. Using over the counter DM cough suppressant since 6 days after injection. As of 10 days after injection, expect to start prescribed antibiotic (type yet unknown) and Tessalon Perles for cough. Note that I have "Hay Fever", but this event was notably more severe than have experienced in years. Also tend toward bronchitis annually.
1201144	4/13/2021	PA	33	M	4/12/2021	4/12/2021	Patient received first dose of COVID vaccine at 1:10pm without issue. During his 15 minute waiting period post vaccination, at approx 1:15pm, patient experienced a syncopal event, + for striking his head. He never lost vitals, and promptly woke up. at 1:22pm, his vitals were initially BP 90/42, HR 45, pulse ox 100% on room air, and RR 16. He complained of dizziness and blurred vision, but was AOX3 with all cranial nerves intact. 911 was called for patient to be assessed. Vitals were then checked again at 1:29 pm, BP 110/62, HR 62, pulse ox 100%, RR 16. At this time, all of patient's symptoms had resolved. EMS arrived at 1:39pm and checked his BS which was 114. At this point patient no longer wanted to go to ER. EMS spoke with on call provider who gave verbal okay for patient to not go to the ER, but gave strict ER precautions such as headaches, vomiting, vision changes, etc. Patient was able to teach back. Patient reports that this (passing out) frequently occurs to him anytime he has to get shots or blood work done and he has sought medical attention afterwards before with no resolution. Patient left at 1:46pm. He walked home.

1200482	4/13/2021	CT	55	F	3/8/2021	3/13/2021	I woke up on Saturday 3/13 and noticed that my vision on my left eye was very fuzzy and stayed that way for a few days. I made an appointment to see my optometrist on Wednesday 3/18 and he referred me to a retina specialist Dr. I saw Dr on Friday 3/19. He ran tests and diagnosed me with branch retinal vein occlusion in my left eye. This is typically caused by a blood clot in the eye. The occlusion caused swelling in my retina and macula which caused my vision loss. I was treated with an injection of Eylea (anti-VEGF) to reduce the swelling on my retina/macula. I will need to have these injections every 4 weeks to maintain my sight.
1199706	4/13/2021	NV	42	F	4/6/2021	4/7/2021	Blurred vision - I could see up close with my glasses off, but my vision blurred with them on.

1201830	4/13/2021	MN	25	M	4/9/2021	4/9/2021	In the span of about 40 minutes following the shot, I had severe reactions. I initially felt really warm in my arm and my heart started to race for a bit. That subsided pretty quickly. Then I got really dizzy, lightheaded and warm and sweaty while waiting the 15 minutes. Then my vision started to blur and I felt tingly in both of my hands and both of my legs. According to others with me, I also went grey. I was given a cool cloth and fanned which helped with a lot of the issues. I also had my legs elevated and was given some slightly sugary food and drink to help the vaccine disperse better. Paramedics and ambulance arrived to assess me. I was improving by the time they arrived and was deemed stable, so I did not go to the hospital for this incident
1201583	4/13/2021	NY	33	F	4/7/2021	4/8/2021	~~Janssen COVID-19 Vaccine EUA" This writer was having a session with a client and her mother at the playground on 4/8/2021 and writer felt weak towards the end of session. Per mother's report, writer's eyes rolled back into her head and writer was about to fall backwards off the picnic table, but the mother caught writer. This writer was unconscious and then came back alert, but could not see for two minutes. This writer experienced severe abdominal pain and needed to use the restroom right after and had a bowel movement. dehydration (J & J vaccine night before at 7pm) headache, difficulty breathing and blurred vision and a fever of 99.4 the next day. This writer was taken to immediate care and an EKG and Urine test was done. This writer was diagnosed with Syncopal Episode and dehydration.
1201609	4/13/2021	NY	32	M	4/6/2021	4/8/2021	Swelling in the neck started a few days after receiving the first dose of the Covid vaccine. Its not known if the swelling is related to the vaccine. Medical exam by primary said my thyroid is a bit full. Some post nasal drip as well. Discomfort from the swelling became gradually more significant over several days. Some tightness when swallowing food. At this time of year I typically get allergy symptoms of hay fever (sneezing, itch/watery eyes, etc.) but neck swelling has never been a symptom for me. Started taking Claritin once a day as I usually do this time of year as well.

1201778	4/13/2021	WA	39	F	4/6/2021	4/6/2021	About 2:30pm on 4/6/2021, same day as vaccine, began to have saline/metallic taste in mouth, about 1 hour later started to get cotton mouth and began getting tired; by 5pm same day I was fatigued and had a hard time keeping my eyes open, started getting chills about 7:30pm and took 2 ibuprofen and fell asleep, woke up some time before midnight because my heart was pounding in my chest, was so tired that I'm not sure if I passed out or just fell back asleep but woke up around 3:00am on 4/7/2021 with a fever and headache. The cotton mouth, fatigue, headache and fever of 99.9 to 101 lasted until about 8:00am on 4/8/2021., where I had a second set of chills and the fever broke. On 4/9/2021 I still had fatigue and had to leave work early as I couldn't multi-task and had a hard time staying focused. The inability to focus and fatigue lasted 4/10/2021 and 4/11/2021, just walking up and down my stairs at home exhausted me. On 4/12/2021 I went back to work, my focus is better but still not back to where it should be, I still get exhausted easily and everything is a bit too bright. On 4/12/2021 about 7:30am, I had a bloody nose that took a while to stop (about 30 minutes), that is not normal as I rarely have a bloody nose; I was late to work due to it and had another one while at work around 11:40am; it was not as bad as the first and stopped after approximately 10 minutes. Today is 4/13/2021- Things are still a little too bright and my energy level is not quite back to normal, I also have a slight headache.
1201122	4/13/2021	NJ	66	M	4/11/2021	4/11/2021	Brief episode of vision corruption.. perceived colors changed. White toilet bowl appeared pale blue. Preceded by strong headache behind eyes.

1201951	4/13/2021	TX	70	F	4/7/2021	4/7/2021	She got the vaccine, and where she got the shot it turned red, about the size of two silver dollars, very sore. Right above that a very big red spot popped up. She had itching and bumps on her feet and then over her whole body. she had red spots and a rash on her stomach, and a big rash on her back and all over her face. She had diarrhea, headache, flu symptoms with aches all over her body. The aches went away except in her feet and her toes, it hurt to walk due to the toe pain. She still has the bumps and the itching, but took the Benadryl, but cannot take that as it gives her restless leg syndrome, and is now takin Claritin. She now has itching in her lips, has allergies in her eyes, She has not call her doctor. She talked to the person who gave her the shot and also Wal-Mart pharmacist who told her to take the Claritin. These symptoms have continued.
1201822	4/13/2021	UT	21	F	4/9/2021	4/10/2021	I had the typical soreness about 12 hours after the injection. No worries there. The next morning, on the 10th, around 11:40 AM, I started feeling extremely dizzy. The room started spinning. I was standing at the time, and I kept standing, but other than that, I had no control. My hearing starting going fuzzy, starting with ringing in my ears until it sounded like I was underwater. My vision started blurring, as well, eventually going completely black. For a solid 5-10 seconds, I could neither hear clearly nor see at all. I was conscious, because I could think relatively clearly, and I could feel my eyes blinking and could wiggle my fingers, but that was it. Once the episode passed, I immediately sat down. About a minute later, I started having excruciating abdominal pain. The pain was wracking my whole body, causing me to go pale (as I later saw once I could hobble to the bathroom) and making me sweat. After about twenty minutes, the whole thing passed and I was left with minor dizziness and slight nausea. Now, three days later, I still have some of the dizziness, but none of the blindness, deafness, or pain has returned. All other side effects, such as soreness, have completely left.

Since mother is a RN we handled my symptoms at home. Symptoms continued for 3 days (I missed 2 days of work). Fever subsided on Day 3; other symptoms were milder day 4-10.
1201967	4/13/2021	TX	36	F	3/25/2021	4/9/2021	36 y.o. female referred for the above chief complaint. She has no significant medical history and presented with a headache that became severe 3 days ago. She received the Johnson and Johnson COVID vaccine on March 25th and had a mild headache following that which she attributed to the vaccine. 3 days ago the pain became excruciating and was associated with vomiting. This prompted presentation to the ED where she was treated with Dilaudid. She was discharged home and has been using her mom's headache cocktail with some transient relief. She presented back to the ED today with continued symptoms. MRV revealed a venous sinus thrombosis and neurology was therefore consulted. She has no history of clots personally or in the family. Her dad did have a stroke in his 50s. Patient otherwise denies any other associated speech change, vision change, extremity numbness, extremity weakness, coordination difficulty, or dizziness. Patient admitted to the neurology ICU and started on anticoagulation.
1201175	4/13/2021	VA	47	F	4/10/2021	4/10/2021	Janssen COVID-19 Vaccine EUA. I had a red spot appear in my left eye on 4/10. On 4/11 my fever increased to 101 and it felt as if I had a severe case of the flu. On 4/12 I felt fatigued, no fever. No appetite each day. 4/13 the injection site is still sore, red, and swollen.

1201211	4/13/2021	WI	60	M	4/9/2021	4/9/2021	Patient received Janssen COVID vaccine 4/9/21 around 9 am. Patient reported to emergency department around 10 pm that day (4/9)- says tongue began swelling since 7pm, he took a benadryl at 8pm with no improvement. Per ED physician, patient had "tremendous amount of tongue swelling, I am not even able to visualize the palate he has fullness to his left neck as well". Patient intubated in emergency room to protect airway. Patient admitted to ICU where he is still today (4/13). Per chart, the edema subsided on 4/12 and patient was extubated today (4/13). Patient received IV steroids from 4/9- 4/13 (discontinued this morning). Of note: patient does take lisinopril 20mg daily (start date July 2020). There is concern the angioedema was caused by this medication. Patient received tranexamic acid and Berinert in the emergency department to assist in treating this potential etiology.
1201212	4/13/2021	WA	52	F	3/14/2021	3/24/2021	on 3/24 I had a TIA with an intense heat pressure behind the right temple which resulted in complete numbness, heaviness, and tingling on my entire right side of the my body. I was transported by ambulance to the hospital. A CT and MRI was done, no signs of blood clots or stroke. I am still experiencing numbness and tingling in the right arm. Follow up appointments with the eye doctor indicate additional vision loss in the right eye with pressure behind the eye. I have a follow up appointment today with the neurologist for a brain scan and tomorrow for an eeg. My PCP, eye doctor, and neurologist believe it may be a blood flow issue. I have not had this type of event before.

1201255	4/13/2021	NJ	31	F	3/18/2021	3/19/2021	Pain in site of injection from the moment of injection. Pain/soreness in arm decreased with time, but was still able to feel a small amount of soreness up until 2-3 weeks. Vaccine was taken at 6:15pm, later that night after I had gone to bed I woke up with chills. In the morning, I tried to eat breakfast but immediately felt nauseous and began feeling really hot. I stood up to change into cooler clothes but the heat/nausea got worse and I began to lose my vision. I was about to faint, but felt immediately better once I lay down and elevated my legs. I had a temperature of 99F. Fever lasted a few hours (I took ibuprofen). I got a headache at around 11AM, but slept it off with a nap. By the end of the afternoon I was feeling much better, with the arm pain/soreness as my only remaining symptom.
1201293	4/13/2021	IN	65	F	3/16/2021	3/20/2021	03/16/21 - 1st Pfizer Vaccine 03/20/21 - Trouble with floaters in left eye 03/22/21 - Appointment with Optometrist - Floaters in both eyes & lens implant in right eye had slipped. Scheduled appointment with Dr. (Ophthalmologist) 03/29/21 - Appointment with Dr. - Confirmed floaters in both eyes and the lens in the right eye had slipped. Scheduled surgery for right eye on 04/20/21. 04/06/21 - 2nd COVID vaccination 04/10/21 - When I woke up, the floaters in my left eye were worse - eyesight in left eye was very poor 04/12/21 - Called Dr. office to report, but have not received a call back. 04/12/21 - Early evening, there was only a bit of light getting through to my left eye, so I went to bed. Ultimately, I am unable to see at all out of left eye.

1201320	4/13/2021	IN	34	F	4/2/2021	4/2/2021	I received the vaccination 4/2/21 at 11am and at about 6pm the same day - I felt a sudden flush and felt like I was going to faint in the middle of Grocery store. Got very clammy and sweaty and weak - immediately left the store and started projectile vomiting outside the store and all night the first night. Had extremely joint/bone pain throughout my entire body for 4 days straight in bed, very weak, chills and night sweats, day 2 I had a little energy and drove about an hour and immediately started vomiting again for day 2-day 5. Day 5 I woke up with swollen eye lids and hands and thought it was an allergic reaction to something in my house so took benedryl, but didn't help. The swelling went down on day 6. I've had no energy and very foggy brain and been very down. My chest has felt like an anxiety attack 24/7 all week. I am on day 10 since the vaccination and my chest pain has increased. I still have foggy brain and been very out of it and weak still. I vomited day 1-day 5. Really bad pain in my hips and arm where I received the shot.

1201333	4/13/2021	MT	29	F	4/8/2021	4/9/2021	Headache (turned into a migraine), extremely drained of energy, lack of appetite, and felt off all day (4/9/21). The next morning (4/10/21) felt the same as the day before, however, had several episodes where I would get really light headed, dizzy, and nauseous. Went to Home Depot at 2:15pm (4/10) and while there my vision blurred and started to fade, I had ringing in my ears and couldn't hear out of the right and barely was able to hear out of the left. I got very nauseous and I couldn't breathe. I managed to sit on something and put my head between my legs that helped. Fortunately my step- dad was with me and helped me outside while I could barely see and hear and he stated I was very pale. I was having a hard time talking or being coherent. Once outside the symptoms slowly cleared over about the next 6-7 hours. At 4:45pm my mom decided to take me to the doctor but the walk in had just closed and I went to the ER. They stated I had elevated d-dimer and did a chest CT scan to check for blood clots around 7:30pm (I believe not sure exact time) doctor stated they came back clear but when asked if he suspected that the episode and symptoms were due to a dissipated blood clot he would not directly answer it. I overheard him dictating his notes and he stated he believed as such. I have never experienced anything like this before. I still felt drained, headache (migraine), occasionally dizzy, and lack of appetite (4/11/21, 4/12/21) and still currently feel the same drained, migraine, lack of appetite, and occasionally dizzy.
1201566	4/13/2021	OH	40	F	4/7/2021	4/8/2021	left shoulder was the injection site- very swollen, red, the size of a fist, hot to the touch, very sore- a lot of pain. Hot, cold, chills, extreme body aches, blinding head ache, loss of clear site in left eye, vomit, nausea, tired, loss of taste, sores on the inside of mouth.
1201351	4/13/2021	CA	26	F	4/7/2021	4/9/2021	20 mins after injection felt dizzy and face numbness. 12 hours after injection felt nausea, chills, fever, fatigue. Fatigue persisted for 36 hours. 48 hours after injection, face numbness returned and persisted for about 3 hours. Localization around the eyes and nose.

1201469	4/13/2021	NY	53	F	3/29/2021	3/29/2021	Started to have tremors within minutes of shot; observer made me go to EM as said I did;t look good/was very pale and noted shaking. EMT took BP which was high (I'm typically on lower end of average). Observed me for 45 minutes as BP came down to normal range and asked if wanted to go to hospital. Declined as had appointment later that day with my electrophysiologist at Hospital. As day went on, became increasingly tired and had bouts of uncontrollable shaking. Thought it would wear off so just went home to rest. On 3/31/21, BP was high again, tremors were getting worse, had leg weakness, double vision, brain fog, dropping things, loose stools, felt off. Went to Hospital and was admitted for 3 days. Neurologst, Dr., said it was due to Covid vaccine and NOT to get the second shot, and the hospital internist agreed (MRI of brain and cervical spine showed no new lesions). Wanted todo heart procedure but they are not my private cardio group so checked myself out and went to Hospital the next day (admitted 4/3-4/5/21)
1201512	4/13/2021	WY	28	F	3/27/2021	3/31/2021	The day of the injection I felt tired and a little sick but nothing major. The next two days I felt totally normal. On the 4th day after my injection (Wednesday, March 31st) I was lying down at 2PM because I was feeling strange. All of a sudden my feet and hands only got super cold, then cold and sweaty. I was lying with a heating pad and sat up to drink some water. I got super dizzy, couldn?t catch my vision. I tried to get up and walk to the door for some fresh air. Standing and walking felt like I was super drunk... couldn?t get my balance. That happened for about 30-45 minutes. I was super nervous as well with adrenaline pumping. I went to urgent care after about an hour and a half when I felt it was safe to drive. They didn?t know why that happened or what it was.

1205386	4/13/2021	IN	38	F	4/7/2021	4/8/2021	I have been having dizzy spells where I feel very off balance. I am not dizzy to the point where I can't walk straight but I am dizzy where my head feels like it is in a fog. It is hard to explain, the only ways I have been able to explain it are my head is in a fog, or if you put your contacts in the wrong eyes and how things are blurry and off center. I have also described it as feeling like the items like people in front of me seem closer to me and the background is further away, almost like they are obviously separate from each other. Another way I have described it feels like I am standing in the room but not really there, it is a very weird feeling and it comes and goes. Sometimes it will last a few seconds other times a few minutes and one time longer than ten minutes. The light makes it worse and loud noises and lots of commotion make it worse as well.

1205617	4/13/2021	FL	32	M	4/13/2021	4/13/2021	Patient received Pfizer vaccine at 1445, patient walked over to the observation area at 1450 and stated he was not feeling well. Nurse noticed the patient was staring off and stopped responding to verbal cues. Patient placed in chair and blood pressure taken, 142/79. Sternal rub performed, no reaction from patient. Palpable pulse felt bilaterally. After 10-12 seconds patient opened his eyes and stated he felt weird. RN asked patient his name and date of birth, both questions were answered appropriately. RN noticed the patient clinched his eyes shut and stopped talking, after about 10-12 more seconds patient opened his eyes and stated he was still feeling weird. Patient placed in wheelchair and taken to infirmary with Sheriff Officer.
1205626	4/13/2021	NJ	28	F	4/5/2021	4/5/2021	After the vaccination was given the patient started to wait her 15 minutes. After 5 minutes of waiting the patient slumped over and passed out onto the floor. Her color was very pale and her eyes were rolling in the back of her head. She regained consciousness but her color was still poor and we called and ambulance because she was still feeling faint. The EMT's immediately took her blood pressure and it was extremely low. She acknowledged that she did not eat or drink anything at all that morning. The EMT's recommended she go to the hospital but she refused. After 30 minutes with emergency personnel she felt better and well enough to leave with her family member who was with her.
1205627	4/13/2021	NJ	63	M	3/12/2021	3/25/2021	Janssen shot on Mar 12, 2021. On Mar 25,2021 at 10 AM, I woke up with a headache, sore joints, nausea. Also blurry vision and inability to read words on a page. Sensing something wrong, my sister drove me to emergency room at Hospital where I was admitted. I was later told I suffered a stroke. I was in the hospital for 5 days, receiving various tests. (Hospital has all info on record). I am awaiting surgery to remove blockage from carotid artery. Doctor has all my information and should be reporting the event also to VAERS.

A 68-year-old female patient received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL3248) at the age of 68-years-old, intramuscular in left arm on 12Jan2021 at 08:40 at single dose for COVID-19 immunization and paracetamol (ARTHRITIS PAIN RELIEVER ACETAMINOPHEN, lot number: 9ER0473, expiration date: Mar2021), via an unspecified route of administration from an unspecified date at an unspecified dose and frequency for an unspecified indication. Medical history included narrow-angle glaucoma; arthritis probably on 2000 in which she had both knees replaced in 2016, she has had different issues with arthritis since then; and hypertension. The patient has no known allergies. Concomitant medications included lisinopril for hypertension and naproxen sodium (ALEVE). No additional vaccines were administered on the same date as BNT162B2. The patient received a flu shot on Dec2020. She experienced worst arm pain from the newer pneumonia shot. She thought it was the Pevnar. The older one she did not have. On 12Jan2021 at 18:00, about 8 hours after vaccination (as reported) which was administered in a hospital, the patient experienced a full-blown narrow angle glaucoma. She was told that she had narrow angle glaucoma before. She saw a doctor prior to this though, back in Nov2020, for a routine visit and everything was normal. She had not had any attacks and was not on any medication for it previously. That night of the vaccine, she had rainbow colored halos around both eyes. She called her ophthalmologist and spoke to the doctor who was on call that night. He wanted to see her the next morning. Her pressures were a little high and they started her on drops. She then saw her regular ophthalmologist that afternoon. She had been seeing him every 4 months for the narrow angle glaucoma previously and had been fine since her last visit in Nov2020. It seemed like a

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

coincidence. She reported since she knew it would take a while for all of the data to come back and she has not gotten the second one. The specialist said it could be triggered from the vaccine. Name of the drops she put on was Alphagan P. She no longer has it. She believed it was 1%, one drop in each eye, twice daily. She was taking a sample of that and currently, was taking generic Brimonidine 0.2% ophthalmic solution, 5mL, one drop in each eye twice daily. The patient was also on pilocarpine hcl. She went to an institute for a specialist. Nobody saw if there was anything in the literature. She reported to VAERS. She was calling to see if Pfizer has heard if there were any other cases. Someone did call her back and she tried to search the data base. She was not very tech savvy. She has not had any problems. Nothing like that before hand. No problem since then. She has no known allergies. The only other thing was weird was that on 12Jan2021 at 16:00, 6-8 hours later (as reported), both her hands and wrist got red and itchy, to the point she went outside and stuck them in a snow bank. She did not have an anaphylactic reaction. She then said maybe some transient itching in other places and mentioned some bumps on the back of her right leg that were itchy. She did not know if it was worthy of reporting. She used to be 5 feet. She shrunk and it occurred before the vaccine. It was age related. The next dose, she may get the Johnson and Johnson, something that does not have the MRNA in it. She did not have to go to the hospital, but saw 3 different doctors for appointments for glaucoma. She needed significant intervention based on that. It was the beginning of using eye drops, which she never had. When she went to bed, she still had the halo's and when she woke up, they were gone. So, they went away on their own some time during the night. Her pressures were still elevated in her eye though compared to normal. When she went in at 08:00, the visual check was not as good as it normally was. She did not know, but guesses she was 20/40 and normally was about 20/25. It just wasn't as good as it was prior. Now it was back to 20/25. She mentioned that she takes some over the counter stuff and lisinopril for blood pressure. She took ALEVE afterwards but she takes Aleve every day. About 4 pm, she also took TYLENOL. She could not take antihistamines or decongestant because they could trigger. She was looking at the vaccine to see if there

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

was an ingredient that could have caused it and she did not find anything. She wanted to make sure the TYLENOL did not cause it. She was just looking at other variables. That was the one thing that was not normal to her. She was just trying to figure it out. She almost never takes TYLENOL and may have gotten rid of it. She then clarified that it was generic, ARTHRITIS PAIN RELIEVER ACETAMINOPHEN. She only took one. Once you think you are itchy, then everything is itchy. She used a mirror to see the back of her leg and was able to see her hands. She did not see any other bumps or redness though. She did not do anything about itchiness or redness. It got her attention, but she did not talk to any doctor about it. It went away. When it happened, she was concerned. She did not know how to characterize it. Somewhere between not serious and medically significant. She did not seek treatment for it. She was unable to confirm seriousness of bumps on her leg as well but mentioned that it went away. She was unable to determine if it was going to get worse. She could not take BENADRYL because of her eyes. She could not even treat it and take an antihistamine. The action taken in response to the events for paracetamol was unknown. The outcome of the events was recovered on an unspecified date in 2021. The events "angle full-blown narrow angle glaucoma/ she had narrow angle glaucoma before/had not had any attacks and was not on any medication for it previously", "Hands and wrist got red and itchy", and "Hands and wrist got red and itchy/ Back of right leg was itchy" were assessed as serious medically significant.; Sender's Comments: Based on the close temporal relationship, the association between the events "angle closure glaucoma aggravation, erythema, and pruritus" with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

1205183	4/13/2021	MI	53	U	3/1/2021	3/23/2021	Bells Palsy; This is a spontaneous report from a contactable consumer (patient). A 53-years-old patient of an unspecified gender received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), dose 1 via an unspecified route of administration, administered in Arm Left in Mar2021 (Lot Number: EN6205; expiration date unknown), age at vaccination of 53-years-old, as single dose for covid-19 immunisation. The patient medical history and concomitant medications were not reported. On 23Mar2021, the patient experienced tingling on right side, drooping on right side, unable to blink right eye, bells palsy was diagnosed. Events resulted in Emergency room/department or urgent care. Therapeutic measures were taken as a result of the events and included administration of antibiotics. Facility type Vaccine: Public Health Clinic/Veterans; no other vaccine in four weeks, no other medications in two weeks; no Covid prior vaccination and patient was not Covid tested post vaccination. The patient had not recovered from the events.

1205195	4/13/2021	MA	51	F	3/29/2021	3/29/2021	I was brought to the hospital by the ambulance because my throat swelled up.; eyes are tired; My body is itchy and feel like crap; My body is itchy and feel like crap; she's allergic to the Covid 19 vaccine; I was wheezing within 10 minutes after receiving the first dose of the vaccine.; This is a spontaneous report from a contactable consumer (patient). This 51-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Formulation: Solution for injection, Lot/Batch number: ER8732 and expiry date: 31Jul2021) via an unspecified route of administration in left arm on 29Mar2021 at single dose for covid-19 immunisation. Medical history included Multiple sclerosis (from 1996 to ongoing), 2006-2007, it was because of an MS drug (Interferon (receiving 3 times a week)), it gave her mild cardiomyopathy. She just stopped taking another treatment for multiple sclerosis called Mavenclad. Mavenclad is a chemotherapy drug. She received her first dose in Oct2020, she took Mavenclad for 5 days. Then in Nov2020 she started taking the Mavenclad again for 5 days. She doesn't restart the Mavenclad again until Oct2021. She reports the Mavenclad takes the B and T cells out of her bone marrow. When she has the next dose of Mavenclad, the B and T cells will be depleted again and when the B and T cells come back they are "tricked" so they won't attack her body. Her hair fell out in clumps with the Mavenclad and her throat swelled too. She would really like a haircut to fix her hair. She premedicated prior to receiving the Mavenclad. She reports she was premedicated for 3 days prior and the day she received the Mavenclad, with Benadryl. Within 15 to 20 minutes of taking the Mavenclad she had a reaction. Concomitant medications included vitamin b12 (about a year) for vitamin b12 deficiency and vitamin d (10-15 years) with calcium for Vitamin D deficiency. On 29Mar2021 within 10 minutes after receiving first dose her throat swelled up. The next thing she knows is people are all around her, she's on a gurney and she's going to the hospital in an ambulance. She would say she's allergic to the Covid 19 vaccine. In the emergency department she had to have an IV with all kinds of medications. Yesterday in the emergency department the doctor wanted to give her an epi pen. She told the doctor she didn't want to have the epi pen. In her IV in the emergency department she received Solu-Medrol,

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

Benadryl (as needed), and Famotidine (20mg twice a day 10 days). She was prescribed Prednisone 20mg tablets, take 3 tablets orally every day for 5 days. She also reports she is allergic to egg whites, not deathly allergic. She can eat a hardboiled egg but she has to take Benadryl because her throat will start to close up. She can eat scrambled eggs just fine because the eggs are cooked different. The emergency room was watching her because if she didn't improve, they were going to give her the epinephrine. She started to improve, and she was thankful. She was afraid something else could have happened to her and her husband was in the parking lot and wouldn't have known. She's not sure how many hours she spent in the emergency room. She was not admitted to the hospital; she was discharged from the emergency room. Now she's taking medication for the next 5-10 days. She's not shocked, with her history and her reactions to medications. She didn't really think an allergic reaction was going to happen because the Covid 19 vaccine is not a live vaccine or anything like that. She's not going to look online for allergic reaction information because her eyes are tired. She's been up since 1:30 AM because of all the steroids she's on. On 30Mar2021, her whole body is itchy. She's taking Benadryl and the Benadryl has helped. The itchy feeling is moving on to different parts of her body. She had the swine flu when it came out and it was hellacious. She feels like Covid is much worse and she she believes in science. She knows Covid 19 isn't made up. She's all for the Covid 19 vaccine. Give her the Covid 19 vaccine so she can move on. She reports everyone in her family got the vaccine, and they were all fine besides aches and pains. When probing for specific information regarding the caller's family members, she reports her daughter, who is in nursing school had the Covid 19 vaccine. After her daughter's first Covid 19 vaccine, she had a sore arm that night and she was really tired. The next day her daughter felt a little lightheaded and she felt like she had flu symptoms. She had some body aches. Then under her daughter's armpit where her lymph nodes are were swollen. By the third day her daughter felt better. She was totally fine. She thinks her daughter may have reported her experience online. The outcome of event eyes are tired and I was wheezing within 10 minutes after receiving the first dose of the vaccine was unknown, the

1205228	4/13/2021	PA	75	U	2/26/2021	3/12/2021	<p>minimal injection site pain was recovered on 15Feb2021, blood pressure down recovering and unknown for other events.</p> <p>no vision on right eye; Torn retina; Little tired; This is a spontaneous report received from a contactable consumer (patient). A 75-year-old patient of an unspecified gender received bnt162b2 (BNT162B2), dose 2 via an unspecified route of administration at the age of 75-years-old, administered in Arm Left on 26Feb2021 16:55 (Lot Number: EN6200) as a single dose for COVID-19 immunization. The patient medical history was not reported. Concomitant medication included prednisone taken for Ruptured disc from 11Feb2021 to 19Feb2021 and from 07Mar2021 to 17Mar2021. The patient previously received bnt162b2 (BNT162B2), dose 1 via an unspecified route of administration, administered in Arm Left on 05Feb2021 04:55 AM (Lot Number: EL9265) as a single dose for COVID-19 immunization and experienced severe back pain and sore arm. The patient reported, "I chose to not fill this auto entirely with help. I had a sore arm after dose 1, little tired after dose 2. I reported I had a torn retina days after dose 2 but did not think it was due to the vaccine. Just wondered it happened 3-10, still can't see, under doctors care. I don't think the prednisone or the eye issue was caused by the vaccine but reported it." The patient experienced torn retina on 12Mar2021 and little tired on 2021. The patient underwent lab tests and procedures which included eye ultrasound: torn retina, no vision in right eye. Still no vision 22Mar2021 (under doctors care) on 12Mar2021, X-ray: hip degeneration on 10Feb2021. The outcome of the events was unknown. The event torn retina was considered as serious (medically significant). Vaccination facility type was Hospital. No follow-up attempts are needed. No further information is expected.; Sender's Comments: Based on the information provided, the reported torn retina is likely an intercurrent medical condition and unrelated to BNT162B2. The patient's advanced age have been assessed as a risk factor that could have contributed to the event.</p>

1205280	4/13/2021	CA	57	F	4/12/2021	4/12/2021	While walking a patient from urgent care to radiology at approximately 1632 on 4/12/21, I witnessed another patient (patient affected by event) fall to the floor by the pharmacy window. I rushed to the patient's side and began an initial assessment of airway, breathing, and circulation. No active bleeding or head injury detected. The patient was lying to her right side and appeared to be unconscious. No response when called or tapped on the shoulder several times. Patient's eyes appeared to be half-open without apparent movement. I asked for assistance from nearby security officer to call an ERT. Approximately 30-45 seconds into event, patient's daughter appeared on scene and attempted to call patient without response. While daughter assisted with supporting the patient's head, the patient suddenly took a deep breath and appeared to blink eyes several times (approx 5 seconds) before returning to previous unconscious state. No response when called by daughter throughout event. Another staff member appeared on scene at this time and recorded the second unconsciousness episode, which lasted for 90 seconds. ERT, urgent care providers, and other staff members were on scene at this time. 911 called. Vital signs taken and further assessments conducted. A pillow was placed under the patient's head and cervical collar applied. Patient appeared to be confused and in and out of consciousness at this moment. Patient was not able to identify name, date of birth, or current location but did state she had pain in her neck when asked in Spanish by another urgent care staff member. 911 staff on site at approximately 1645. Patient left in stable condition via ambulance gurney to higher level of care, accompanied by daughter and paramedics.

1206185	4/13/2021	TX	68	F	3/24/2021	3/24/2021	After 1 dizzy for about 5 minutes, then okay. After 2, dizzy a little after, then about 5 hours chills and low grade fever, then few days have been dizzy and muscle ache in neck, had an regular appointment with dr. on the 7th and told him about the dizziness and put me on medicine for vertigo and today still have it some times really bad, going to eye doctor on 20th as vision is messed up too. Then going from there. Really not good at all. Scared I might pass out.
1206042	4/13/2021	PA	55	F	3/14/2021	3/20/2021	Had migraines (frontal lobe with flashing lights-distorted vision and difficult to hold my eyes open) from 3/20-3/24. (one week after vaccine) I do not get headaches, so this was very strange. On 3/23, I woke up with a bright red Left thumb- it looked and felt like a sunburn. The next day (3/24), it was still bright red (fire engine red), swollen, hot to the touch and had a blister in my webspace. I went to the dr 3/23 pm who was not sure what was going on, but prescribed an antibiotic (Keflex). This reduced my pain and swelling. Today it is still red and is now flaky, but not swollen or hot to the touch. The main thing was the migraines as I do not get headaches. I'm not sure if that or the skin thing is related, but thought I should throw this information your way in case there have been others with similar symptoms.
1206052	4/13/2021	WV	39	F	4/12/2021	4/13/2021	Slight arm pain, headache, right eye pain.
1206080	4/13/2021	NE	42	F	4/12/2021	4/13/2021	4-12-2021 Facial tingling & numbness, tightness/swelling of throat, difficulty swallowing, Given Prednisone 40 mg, 2 Benadryl and 1 Pepcit at ER visit. Prescribed Prednisone 40 mg /5 days, Benadryl & Pepcid for as long as symptoms are present. 4-13-2021 Headache, itchy eyes, sneezing, small red blood blister like areas on arms, chest, back and thighs. When Benadryl wears off throat tightness returns. Visited ER on advice from nurse hotline to check out the red blood blister like marks as she thought it was a new rash type symptom. ER recomended remaining on previously prescribed course of meds and to watch for further symptoms.
1206083	4/13/2021	NY	49	F	3/1/2021	3/1/2021	Severe visual aura/disturbance similar to severe migraine, followed by immediate disappearance of symptoms

1206086	4/13/2021	AL	45	F	4/1/2021	4/5/2021	Dose 1.- 3/4/2021. Within 5 minutes stiffening of left side of neck and blurred vision on left side only. Only lasted a few minutes. Flu like symptoms developed night of 3/5/2021 through night of 3/8/2021, stayed in bed with body aches, chills, dizziness. Flu like symptoms ended on 3/8/2021 around 8:00pm after profuse sweating. Brain fog and cough remained until 2 days before 2nd dose. Nose bleeds. 2nd Dose 4/1/2021- flu like symptoms, in bed 4/2/2021. Profuse sweating overnight ended flu like symptoms morning of 4/3/2021. Skin rash on back and chest, Dizziness continued. Blood vessel burst in right eye 4/11/2021, ear pain, headache 4/13/2021
1206090	4/13/2021	CA	70	M	2/13/2021	2/20/2021	Lost my vision and felt very weak. Doctor concluded I had a mild stroke(TIA), also they found a DVT in my right leg and DVT in my left leg. My vision returned in about 1 hour. Was given 2 shots a day of Lovonox for 13 days and was immediately put on Warfarin
1206148	4/13/2021	MI	59	F	12/30/2020	12/31/2020	I woke up the morning after dose #1 unable to see out of my right eye. It was tho someone had placed a large amount of vaseline in my right ee. My left eye was blurred and extremely sensitive to light. The right eye began to clear up but took many days. Opthamalogist appoint was made. Now seeing a Retinal specialist. Vitreous Hemmorrhage in the right eye and an Aneurysm sitting on the optic nerve in the left eye.

1206151	4/13/2021	OK	41	F	4/7/2021	4/13/2021	When I first got the shot I noticed it in my throat. I told the nurses they had me wait 20 minutes before I could leave. I felt dizzy but not dizzy enough to not go home. It felt like it went to my stomach, then my head, and then I could feel it in my joints. I drove home from the city. Two hours pass, I notice a rash but I didn't think anything of it due to indoor allergens, springtime plus it went away within an hour. I started to get chills and fever. I had a lack of sleep due to pain throughout the first night. I was waking up feeling like my head was on fire from my ears to the top of the skull area and in front of my face by my eyes too. My eyes felt like they were going to burst. I layed in bed for 24 hours. Day two: pain, tiredness, headache, and sensitivity to light for the next few days. Symptoms come and go for days then wean off. Next, I had issues with anxiety, sleeping, yet being really tired as well coupled with problems sitting still. These are subsiding but still there. I am still very tired today and a bit anxious on April 13th, 2021. I also notice my typing skills, as well as testing skills, are not as sharp as before the vaccination.

1206163	4/13/2021	WA	23	F	4/6/2021	4/6/2021	I received the shot at 14:30, in which medical staff in the jail's medical center watched me for 20 minutes to ensure there were no immediate reactions. I went about my day afterward with no symptoms. At 21:30 when I went to sleep, I got some aches in my joints and took 1 dose of liquid capsule NyQuil to help with the pain and went to sleep. At 00:30, the 7th, I woke up groaning in my sleep to the extreme pain in my joints and feeling hot internally. I decided to get up and take a warm bath to ease the aches. I went and ran the bath and all of a sudden while it was running, I had a severe need to throw up, but could not naturally. Since this was concerning, I got up and walked out of the bathroom and all of a sudden in the hall I got a feeling of impending doom and that something was not right and I fainted. I laid on the floor for what I would approximate to be 5 minutes going in and out of consciousness waiting for the blood to fully return to the brain. After this, I instantly felt like I needed to survive and that I felt like I could be dying so I slowly crawled down the stairs to get to my military ID so I could call the military's nurse advice line. I had to take a break and lay on the concrete in my garage because I felt so dizzy and so hot and began to feel my vision disappear like I was going to faint again. I waited a few minutes before getting back up the stairs crawling to my phone to call. When I called them 00:58, they told me to call 911 because they believed I would be having a severe reaction, though I noted to them I did not have a rash or hives. I then called 911 at 01:08. They sent EMT's to my home which took my vitals. I had normal blood pressure, SPo2, and temp, but an elevated heart rate of just under 100 and a high respiration rate. EMT's made the decision for me to stay home since the hospital did not seem immediate in their opinion. After this I stayed on the couch for a few minutes and then felt very tired so I walked slowly to my room and fell asleep. I woke up at 06:00 for work, and arrived at 07:00. In the hour after waking up I was achy, sweating, and felt light headed. I got to work and my Sergeant told me to go home and sleep. I slept another 5 hours at 08:00 and when I woke up most of my symptoms went away other than aches and getting flush very easily for 5 days. At this current time all I notice is some random light headedness that quickly resolves and comes a few times a day at random and without cause.

1206019	4/13/2021	PA	33	F	3/9/2021	3/9/2021	<p>Started with chills pretty shortly after the vaccine was injected. After about 6 hours I could tell I was not feeling great. My husband said I looked very pale and out of it all of the sudden. I became extremely tired and disoriented. I don't remember driving myself home that evening after picking up my kids from dance. By the time I was home it was now around 8 pm. I was so cold my entire body was trembling. I kept taking steaming hot showers but I couldn't feel it, I was still freezing and shaking. I was very weak and started having extremely horrible body aches and pains. Specifically my legs were hurting the worst, I remember my hip joints felt like they'd buckle underneath me. I got a headache that was unbearable. It felt worse than a migraine. It hurt to move my head or use my eyes at all. I went to bed and was under several blankets and a heating pad while also running a space heater right next to me. I still could not get warm at all. I hallucinated that I could see each ache and pain on my body and watched them move through me. By 4 am I was now hysterical and crying. I was in so much unbearable pain and so scared. I had to call off of work for this day. I was so out of it I called my daughter off of school but also called for my mom to come get her and take her to school. I kept my youngest home with me. My head was still the absolute worst headache I have ever felt in my life. I couldn't open my eyes and it hurt to move at all. I had to call a friend to come pick up my youngest daughter because I was unable to take care of her, I could barely stay awake and alert. I tried another hot shower and everything still felt cold. I was now nauseous from the head pain. Around noon on this day I finally had the strength to drink some water and was able to take Tylenol. I laid on the couch for hours still shivering and in unbearable pain. I was still very scared that I was having such a bad reaction that I would die. I called my husband to come home from work and be with me because I was scared. I took more Tylenol a couple hours after the first dose. Around 6 pm I started to feel better. I was able to eat again that evening. I had a headache though for about 3 weeks after that gradually weaned away.</p>

1206215	4/13/2021	CO	36	F	4/12/2021	4/12/2021	<p>Once my vaccine was administered I felt tingling on my tongue and bottom lip. I waited the 15 minutes and felt that the tingling was diminishing. I spoke to the tech and felt ok to leave since I was not experiencing loss of breath or swelling. After about 3 hours I noticed the tingling sensation coming back. I immediately called the pharmacist who administered the shot. After explaining the tingling was mostly felt on my lips and tongue but had no swelling and could breath and swallow just fine. I explained that it felt like when you get a shot for Dental work and that every time I touched the area it would tingle more. He told me that was not a normal reaction and would call in a few hours to check in on me. Sometime around 7 we spoke again and I still had no changes with the tingling. Again, he said he would have the pharmacist who was in call again the next day to make sure I was ok. By 11:30pm the aches in my joints started and I had chills. I woke up for work at 3:25am and noticed the tingling sensation wasn't as strong as the day before. Once I ate the tingling became more noticeable and was mostly on the right side of my tongue and throat. I also started experiencing a headache and sinus pressure. After arriving I work by 6am I felt exhausted. As the day went on the exhaustion was becoming so strong I felt that I was fighting to keep my eyes open. The aches in my joints were becoming more intense especially in my hips and hands. At times I felt it hard to hold anything in my hand as closing my fingers became so painful it brought tears to my eyes. I also notice I was sweating profusely but had no fever. Once I was home I took a 2 hour nap. I woke up feeling the same the tingling in my mouth, aches still noticeable and headache still there. I could not stand and even tried to eat but had a loss of appetite. I called the pharmacy and reported the tingling was still noticeable. The pharmacist on duty explained the aches were normal but the tingling was not. I was advised to seek medical attention if I had trouble breathing or had swelling. The pharmacist told me to keep up on rest and fluids and I would recieve another call tomorrow to see how I was feeling. It's now 9:28pm and there are no changes to the tingling sensation in my mouth/throat. I still have aches and pains that are radiating throughout my body. My headache is still there but not as strong as this morning and I now have ringing in my ears. Every once in awhile I get some good</p>

1205680	4/13/2021	OH	49	F	3/19/2021	3/19/2021	Patient recieved vaccine at 10 AM at a school COVID clinic. She waited 30 minutes and went home. At around 11 AM, she felt pain in her neck and down her arm. She also stated she felt a little swollen in her throat, tongue, eyes, and ears. She said it was not swelling shut, but just an uncomfortable and never felt in danger. Her hands and chest also had a tightness and swelling to them. Later that night she had a headache behind her eyes. By Saturday she was fine with the "swollen" feeling. However, by Monday, she had a rash begin on her hands and stomach. The rash was described as a chicken pox rash. She said this just went away over the last couple of days and did leave very little scarring.

1205686	4/13/2021	PA	26	M	4/13/2021	4/13/2021	<p>Patient noted on form that he had a severe reaction to peanuts which causes him to have anaphylaxis. He stated that he does carry an EpiPen and any time anything with peanuts touches his mouth/lips he immediately notices his throat starting to close. He also is allergic to cats. Before administering the vaccine, the patient noted that he does not like needles and was not going to look. I administered the vaccine and the patient and I exited the vaccination room. I explained that he should sit in the waiting area for about 30 minutes due to his severe allergic reaction in the past. By the time that I walked back into the pharmacy, the patient's wife shouted "He's not breathing!". My technicians called 911 while I grabbed an EpiPen and rushed to the patient. I immediately administered a 0.3 mg dose of epinephrine and observed that the patient had passed out, was not breathing, but had a pulse. A few seconds later he regained consciousness and his breathing was erratic. I gave him water and he stated that he felt very lightheaded and dizzy. I instructed him to remain seated. He also noted that his vision was blurry and he saw a black dot. His wife was fanning him to cool him down while I tried to obtain the patient's blood pressure, but could not get a reading. The paramedics came and evaluated him thoroughly. His blood pressure, heart rate, EKG, and blood sugar were all within normal limits. They determined that the syncope was most likely due to the patient not eating during the day and not liking needles. The patient was feeling much better and declined further medical treatment, including going to the hospital. He was instructed to go home and relax.</p>

1205919	4/13/2021		23	M	1/4/2021	1/12/2021	<p>Approximately 7-10 days or so after receiving the first dose of the pfizer Covid vaccine I started to develop this red, nodule-like, painful "rash" on both of my forearms. Not only the left arm where the vaccine was administered. This did not go away after a couple of days, and I was instructed by a physician to being taking Benadryl. This appeared to alleviate the symptoms (no visible red nodules anymore) 4-5 days prior to my second dose, so I stopped the medication and presumed it was done. Then, within 4-5 hours of receiving my second Pfizer covid vaccine, I broke out into the same red, painful, nodule-like "rash" along both of my forearms. This time was worse than the previous reaction. I was instructed to take Allegra at the time by a physician, which I did for approximately 4 weeks. This seemed to get rid of the symptoms I was experiencing, and I could not visualize the nodules on my forearms anymore. However, after approximately 2 weeks, I noticed a painful and swollen vein in my right forearm, opposite arm to the one I received the vaccine in. I did not think much of it at the time, since I had no other associated symptoms. Then, over the next couple of weeks, it appeared to become more swollen and painful. Also, I saw another swollen vein near my knee. On April 6, I had labs drawn and CBC, CMP, TSH, and ESR came back normal, but the CRP was elevated. Thus, I was instructed to begin aspirin 325mg, which I took for 4 days beginning April 8th and ending April 12th. On April 13th, an official ultrasound confirmed a DVT in my right popliteal vein, a superficial thrombus in my proximal great saphenous vein, and a superficial thrombus in my right forearm where the pain originated from weeks prior. The initial presumption at this time is that the clots are vaccine-related, but could be linked to an underlying blood disorder that was triggered by the vaccine. Blood hyper coagulation labs have not yet come back. I was initiated on Eliquis starting April 12th for the DVT.</p>

1205922	4/13/2021	MA	51	F	3/8/2021	3/8/2021	About 10 to minutes after vaccine I had a strange wave warm sensation running through my body and tingling. I got this sensation about 4 times that day. Twice at vaccine facility and 2 more times at home that same day. Then in the past couple of weeks I've had numbness in the right side of my face, arm/hand and leg/foot. Sharp pains in my head, PVC, eye pressure, vision issues, shortness of breath, electric shock sensations through my body, head tingling. Not sure the cause of these symptoms but the only different/new thing was the vaccine.
1205933	4/13/2021	TX	63	M	4/12/2021	4/12/2021	20 minutes after injection shoulder area started to become numb at the injection site. 35 minutes after the injection my neck and face started to become numb. As the numbness traveled from the injection site (left to right) across my neck and face, the numb areas became a "tingling" feeling on face, lips, chin and below the eye. Again traveling from left to right (the injection was in the left arm). Day two the above symptoms have lessened but have not gone away. Starting the same evening of the injection I experienced a progressively worse headache. As of 4/13/2021 I still have some numbness and tingling on the left side of my lower face between my cheek and chin. Headache is going away slowly.
1205939	4/13/2021	CA	55	F	4/3/2021	4/11/2021	All was fine till day 9 evening when my right eye kept watering, and I brushed my teeth water shot out right side. Next day same thing with blurred speech. I went to hospital, had CT n MRI. No blood clot determined its bells palsy. I have been healthy except for mild seasonal allergies

1206005	4/13/2021	PA	24	F	1/25/2021	1/25/2021	24 yo female who presents to the ED for concern for anaphylaxis after receiving her second dose of the COVID-19 vaccine. Patients presents as a rapid response after receiving Epi pen to her thigh at 11:18AM. She reports that after getting the vaccine, she was sitting in the monitoring area. At the 10 min mark she noted that she had a slight cough and some eye tearing. She went to the bathroom and noticed that her eyes were swollen and she could barely open them. Someone told her that her lip looked swollen but she did not look at it in the bathroom. She also felt some throat tightness but no wheezing. She had nausea prior to vaccine, no vomiting. She had no lightheadedness or palpitations and no itching or rash anywhere. She got an Epipen at 11:18AM. A rapid response was called and she was brought to the ED. She has no personal or family history of allergic reactions and no known allergies.
1205669	4/13/2021	CA	55	F	4/9/2021	4/9/2021	Patient experienced a high fever (> 102*f), chills that cause chattering of the teeth, fatigue that has lasted up to 4 days, and pt states there is some blurriness in vision.
1205879	4/13/2021	IA	92	F	2/25/2021	3/3/2021	Had a mild stroke that stopped in her eye and missed her brain.
1204331	4/13/2021	CA	20	M	4/12/2021	4/12/2021	It is now the next day, and I feel significantly better. I have pain at the injection site, some muscle fatigue, a little bit of a depleted appetite, tiredness in my eyes and head (likely due to lack of quality sleep), and a bit of sweating, but my pain has reduced to maybe a 2/10 or 1/10 (i.e., not even uncomfortable). I did end up getting decent sleep between 2 AM and 12 PM with only a few interruptions of family members checking on me. The only notable pain that is worrying me is abnormal soreness in my right wrist that is not the result of overuse, overextension, etc., although I was able to take care of that pain with another 3 Advil pills. I am considering scheduling a doctor's appointment, as I know the J&J vaccine got recalled today for blood clots. My assumption is that because I am a healthy 20-year-old, my immune system overreacted to the vaccine, but I want to check to make sure that it doesn't cause any additional health problems.

1204243	4/13/2021	OH	26	M	4/9/2021	4/9/2021	Janssen COVID-19 Vaccine EUA. When I was going to bed, I had very bad chills, leg cramps, shortness of breath, and a pounding headache. my vision was a little blurry at times too.
1204254	4/13/2021		36	F	4/13/2021	4/13/2021	Client received the COVID vaccine (Pfizer, lot # ER8731, expiration date 7/2021) at 11:15. Client walked up to the EMT desk and reported dizziness and blurry vision, EMT and RN responded at 11:28. The client returned to her seat, ambulating with a steady gait, no visible distress, color normal. Vital signs obtained: blood pressure 122/78, heart rate 88, respiratory rate 12, O2 level 99%. Client stated she experiences these symptoms before she gets a migraine. The client stated that migraines are her only medical condition, she has no prescribed medications and no allergies. The client was alert and oriented and had no difficulty breathing. The client stated she hadn't eaten yet and just had a drink of water at 0740. She refused water and benadryl. At 1133, the client stated that she felt "totally fine" and wanted to leave. Encouraged the client to stay for 30 minutes from her symptom onset but she deferred. Education provided regarding mobile reporting system, emergency management and AMR activation, and primary care follow up. Client denied questions and left at that time, ambulated with a steady gait to her car.
1204258	4/13/2021	NM	65	F	3/27/2021	4/6/2021	I had what my daughter in the medical field called a subconjunctival hemorrhage in my left eye. The eye just suddenly started bothering me like there was something in it. When I looked in the mirror the whole white of my eye looked blood filled. This has never happened to me before. I contacted my daughter to see if I should go to a Dr. and she said I did not need to, that it should clear up on its own. A week later I am starting to get some of the white back in my eye.

1204296	4/13/2021	GA	58	F	3/19/2021	4/9/2021	04/09/2021 c/o mild headache, then 04/10/2021 severe headaches, sensitivity to light, slept with knit cap over eyes. Pt took Excedrin. 4:00 am and 9 am. Headache last until about 3pm on Saturday. Pt states "I did not feel right until Sunday afternoon, tired and sore from headache and tension." 04/13/2021 started with moderate headache around 3 am this morning, took Excedrin and the headache eased off.
1204311	4/13/2021	NM	61	F	3/8/2021	3/22/2021	Shortness of breath, stomach issues, muscle aches and pain, headaches, rapid heart rate, nausea, vision problems.
1204485	4/13/2021	NY	28	F	4/12/2021	4/12/2021	- visual disturbances (black dot and blurry vision) on drive home from vaccine - Fever (102.5), chills, extreme shaking started at 10:15pm and is still happening (tylenol is helping with the fever) - body aches in all joints - dizziness and lack of coordination / feeling confused - went to pcp and they did a cognitive test and didnt see any reason for concern, although I am a healthcare provider myself (pharmacist) and I know something is very wrong. I might go to the hospital, but dont have great insurance so am uncertain
1204326	4/13/2021	NY	45	M	4/11/2021	4/12/2021	Took the vaccination on Sunday woke up Monday morning with flu like symptoms and a fever of 101, woke up today Tuesday feeling fine until this afternoon with a sudden severe migraine with both eyes going blurry and feeling really weak.
1204192	4/13/2021	CO	26	F	4/2/2021	4/6/2021	Lost vision like 3 mins after vax at the drive through shot center, paramedics were with me for about 20 mins to make sure blood pressure was okay and vision was 100% better. Besides the body aches and diarrhea on 4/3 and 4/4, On 4/6 I had the worst migraine ever where I lost 1/3 of my vision for about an hour and my right side of my body went numb for about 15 mins. I've been having migraines more frequently than I ever have and unsure if it is vaccine related or just extra stress. I have been trying to reduce screen time as much as I can but hard when I work full-time and in grad school and use the computer all the time. I also have been taking motrin/tylenol for the pain and lay down to let the pain pass.

1204334	4/13/2021	TN	56	F	3/31/2021	4/12/2021	Yesterday, approximately two weeks after my vaccination, I had a dozen grilled shrimp for dinner and had a pretty severe allergic reaction. I had itching, hives, swelling around one eye and under my chin. I have never had an allergic reaction to any food before. I took a benadryl immediately at onset of symptoms and a second one before bed. It helped control the itching but now even 24 hours later the swelling is just starting to go down. Obviously I have no idea if this was due to the vaccine or not but it seems very coincidental that this would happen for the first time in my life within two weeks of getting the shot, I still plan to get the second shot but will avoid shellfish for some time.
1204336	4/13/2021	TX	34	F	4/10/2021	4/11/2021	Had seizure symptoms at 2:30 am the following day. Husband woke to our dog whining. I was very disoriented before it happened, I was freezing cold, aching, shooting pains, could hardly move or speak but got out the words, ?im not ok, I?m having a sever reaction? My husband said I then went into what he saw as a seizure. Head throat, neck, back tensed-unconscious, unable to arouse. Lasted about a minute. Where I lied unconscious and he didn?t think I was breathing. 30 seconds later I opened my eyes, but then had a similar but shorter episode 30 seconds and then was able to get me to come to. He called 911, and they took me to hospital. All vitals came back normal. Blood pressure was on the low side. I have no history of seizures.
1204348	4/13/2021	NM	31	F	3/24/2021	3/25/2021	The following day after my vaccination, I had a severe headache all over the top of my head and eventually only the left side of my head and face felt intense pain. It felt kind of like a stabbing or shooting pain down into my head. Then I started feeling a lot if pressure and pain in my left eye, eye brow, and the sinus area. I could hardly open my eyes. My left side of my face also tingled with tiny sharp pains or numbness. This pain intensified for about 5 days so I started taking aspirin. It would feel slightly better but then would feel even worse. I decided to use a netti pot to remove pressure. After about 5 days of using that I started to feel better. I would say I started to feel back to normal two weeks after the shot.

1203910	4/13/2021	LA	30	M	4/11/2021	4/11/2021	Patient c/o dizziness, palpitations, SOB. VS within normal limits blood pressure 100/60, pulse 71, 97-99% Oxygen saturation. Diaphoretic, responsive with GCS 15. Denies existing health conditions, medications, or allergies. Given 1 bottle of water. Patient asked to walk with nurse. After walking 15-20 feet, patient said "whoa" and nurse grabbed patient and lowered him to the ground. Patient was placed supine and bag placed behind his head. Nurse unable to palpate carotid pulse and patient completely unresponsive. Nurse instructed to call 911 at this time. Patient positioned for CPR and opened his eyes. Stated "I fell asleep while I was walking." Patient instructed to lie still and informed 911 had been called. At this time, RN positioned patient's legs upward to increase blood flow to chest and head. This nurse repeated blood pressure at this time 96/62. Nurse obtained heartrate 71-75 and oxygen saturation 98%. Denied pain. Stated he used a push mower in his yard this morning. Patient diaphoretic and chilled. Assisted into seated position to drink orange sports drink and a second bottle of water. Upon EMS arrival approximately 4 minutes after call, paramedics examined patient and took over his care. They measured a blood glucose level of 134. Nurses assisted patient into ambulance for paramedics to run an EKG. Patient later returned to his personal vehicle and remained on site for about an hour. He called his brother-in-law to assist him home. Nurses on site checked on patient every 10-15 minutes until his family member arrived.
1203918	4/13/2021	IL	63	M	3/17/2021	3/17/2021	3/17 Vaccination By 6PM, stiff shoulder, stiff neck. Got progressively worse thru night. The diarrhea went away within 24 hours. The floaters in L eye appeared that first night. It started to increase, swatting at 'flies'. 3/18 It got worse; floaters. I made appt with eye doctor. 3/30 Saw Dr. She stated was a lot of floaters in L eye. It is still a few every couple of minutes. Has improved but still ongoing.

1204212	4/13/2021	MO	49	F	3/19/2021	3/20/2021	After the first shot, I woke up with a blood red left eye. The eye doctor said it was a burst blood vessel (subconjunctival hemorrhage). We didn't think it was related to the vaccine. However, when I got my second dose, I woke up the next morning, and it happened again in the same eye. The left eye felt dry and heavy. The eye doctor gave me drops, and it improved within 2 weeks after the first vaccine. I have not gone to the eye doctor the second time. I am using eyedrops, and it is improving. I informed my primary care physician as well.

1204041	4/13/2021	CT	31	F	4/10/2021	4/10/2021	A few minutes after receiving the vaccine, while I was in the 15 minute observation period, I began to feel hot and cold at the same time, began sweating heavily, my limbs started becoming very weak and I started seeing spots. I called over a doctor and explained what was happening. He got a wheelchair and brought me to a room to lie down. During this time, my vision continued to get worse (seeing more spots and less peripheral vision). Upon laying down, the doctor put my feet up and a nurse took my blood pressure. If I remember correctly, it was 90/58. My normal blood pressure is around 112/68. A nurse also put ice under my neck. Immediately upon laying down, I started feeling better. I was observed for a while more and then a nurse took my blood pressure again (both laying down and sitting up). My limbs still felt weak when seated and my blood pressure was better but not normal yet, so I was told to lay down a bit longer. Then, a nurse checked my blood pressure again (laying down, sitting up and standing up). It was back to normal and I was feeling better. I was cleared to leave the vaccine clinic. Since leaving the clinic, I haven't had any abnormal side effects or reactions.
1204044	4/13/2021	PA	72	M	2/5/2021	3/6/2021	Event-Dizzy, unstable, vision blurry, almost lost vision in left eye completely, PTP5 cerebral artery blocked almost 100% when previously was only 50% - 75% blocked Treatment-Changed meds, added Eliquis and Repatha Outcome-Unknown for 3 months when he gets re-checked
1204061	4/13/2021		58	F	12/21/2020	12/21/2020	Immediately afterwards developed tingling to the corner of her left eye. Patient states over the course of the day she developed numbness to the left corner of her lip and ear fullness. Patient states once in a while she will experience tingling to the eminence of her left hand. Symptoms have improved over the course of 24 hours. Patient is in stable condition and offers no additional complaints at this time. Informed patient that tingling has been a reported side effect of the vaccine, but it's unclear whether her symptoms are due to the vaccination. Patient wishes to go home. Discussed with patient diagnostic results and differential diagnosis. Patient advised to return to the ED for new or worsening symptoms. Patient is agreeable with plan for discharge.

1204063	4/13/2021	NY	56	F	4/13/2021	4/13/2021	Patient received her Covid 19 Janssen vaccine at approximately 7:00am. At approximately 8:00am she started experiencing itching in her eyes. As time went on she stated she started to experience itching all over her body and a tickle in throat. She called her doctor and they advised her to take benadryl to manage the adverse reaction.
1204077	4/13/2021	IN	53	M	4/9/2021	4/9/2021	1) severe chills but no accompanying fever; covered with blankets to provide warmth; chills began to subside about 8 am on 4/10 and ended by 5 pm on 4/10 2) headache leading to cluster headache event; no other usual triggers present; symptoms included visual aura/tunnel vision, intense ringing in ears, and pressure/throbbing pain in head; treated with ibuprofen and acetaminophen, rest, fluids; symptoms began about 630pm on 4/9 and finally ended about 7pm on 4/10.
1204079	4/13/2021	AK	64	F	3/13/2021	3/23/2021	Had a normal morning, ate a protein breakfast and went shopping at about 10 am. After entering the grocery store, I had a sudden onset of dizziness and my vision became erratic. I could not focus my eyes properly - it was almost as if one of my contacts was out of the eye but that wasn't the case. Fortunately, I was near the furniture section of the store and found a place to sit. I stayed sitting for several minutes while I fought the dizziness and thankfully my vision came back into focus. Within a couple of hours, I developed a migraine headache that lasted off and on for 5 days. I do have migraines occasionally (the last one was July 2020 - I keep a log), however I have never had this type of precursor or warning sign of a migraine.
1204088	4/13/2021	PA	56	F	4/9/2021	4/9/2021	Hives on face 20 minutes after injection, angioedema follow with swollen face, eyes and itching on face. Within 5 hours all over itching, drainage from eyes throat itching

1204138	4/13/2021	RI	59	F	4/10/2021	4/11/2021	As described above, about 13 hours after the vaccine I woke up at 3 am with a severe pounding and constant headache. I was also extremely fatigued so much so that I did not get out of bed or do anything all day 4/11 and didn't start feeling better until the following Monday. Then I hear in the news about the 6 adverse reactions and the J&J vaccine shutdown, possibility for blood clots etc. and to keep an eye out for various symptoms over next 2-3 weeks! It was stressful enough registering and not being able to secure the Moderna or Pfizer so I just said ok and got the J&J. Now I have something else to worry about. Heart and blood clot issues are in my family. I do not take any blood thinners and don't plan to. But now am questioning whether I should have gotten the vaccine at all. I have had enough chronic illness in my life. In fact, December 2019 I was in another town taking care of my mother and her subsequent death when I caught someone's cough. Urgent care diagnosed me with pneumonia, fluid in the lungs, put me on course of antibiotics. I couldn't breathe, needed a nebulizer etc. They called me and said it was not pneumonia or flu a or b (I get the shot every year) and to go to the ER if it got worse. I couldn't eat or move much for three weeks and breathing was extremely difficult. I had to get a nebulizer. Eventually went away. Then in March Covid 19 became official. When I tested for Covid 19 here at a state site in 2021, I tested negative.
1204144	4/13/2021	CO	21	F	4/13/2021	4/13/2021	Patient in clinic to receive first dose of COVID-19 Vaccine. Per vaccinator patient oriented/alert, behaving and talking normally prior to vaccine administration. Pfizer dose administered in left deltoid, patient completed 30 minute observation period due to her medical history and previous allergic reactions (swelling after pain medication at dentist, anaphylaxis with carbonated drink and tuna). Per patient's report: was getting in to her vehicle ready to leave and vision in right eye became blurry, came back to clinic. Patient reports this is not the first time the blurred vision has occurred, reports blurry vision to right eye occurs anytime she is stressed or tired and typically lasts about 20 minutes.

1204777	4/13/2021	MI	64	M	3/27/2021	3/28/2021	I developed shingles around the outside of my left eye; painful stiffness in the injection site arm; felt a little tired; joint pain in the injection site arm; This spontaneous case was reported by a consumer and describes the occurrence of OPTHALMIC HERPES ZOSTER (I developed shingles around the outside of my left eye) in a 64-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 038A21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included Cataract (cataract surgery, left eye) on 26-Mar-2021. Previously administered products included for an unreported indication: SHINGRIX in 2020. On 27-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 28-Mar-2021, the patient experienced MUSCULOSKELETAL STIFFNESS (painful stiffness in the injection site arm), FATIGUE (felt a little tired) and ARTHRALGIA (joint pain in the injection site arm). On 01-Apr-2021, the patient experienced OPTHALMIC HERPES ZOSTER (I developed shingles around the outside of my left eye) (seriousness criterion medically significant). At the time of the report, OPTHALMIC HERPES ZOSTER (I developed shingles around the outside of my left eye) had not resolved and MUSCULOSKELETAL STIFFNESS (painful stiffness in the injection site arm), FATIGUE (felt a little tired) and ARTHRALGIA (joint pain in the injection site arm) had resolved. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown) was unknown. Treatment for the ophthalmic herpes zoster include sulfamethoxazole 160mg BID and valacyclovir 500mg 2 tablets TID. Company comment: Based on reporter's causality and recent history of cataract surgery the event eye herpes zoster is assessed as unlikely related to mRNA-1273. For the other events the causality cannot be excluded. On 05Apr2021, his eye Dr assessed the area with shingles and thought that the shingles was most likely due to the trauma to the eye from the surgery.

1205083	4/13/2021	CA	24	M	4/12/2021	4/12/2021	Patient had a brief syncopal episode w/flushing followed by muscle contractions. 911 was called. Blood Pressure 94/43. O2 sat was 98% on room air. Per patient, vision got blurry and then went black. Tingling in bilateral hands. Paramedics arrived and assessed patient. Per paramedics request patient was to wait another 20 minutes before leaving. 10:34am patient is alert & oriented x4. Walking and feeling back to baseline. patient was then walked to his vehicle and was informed that if he began to feel that way again, to call 911 immediately. from time of vaccination to time patient left was a total of 42 minutes.
1205118	4/13/2021	WA	38	F	4/6/2021	4/7/2021	April 7th about 6:30pm: I became very confused, having trouble remembering where I was or answering simple questions. Around that same time my vision became blurry, and my face in and around my mouth became numb, I began to slur as a result. The numbness and slurring increased over the next hour or so. After that hour or so, I realized I was exhausted and my head hurt so I went to sleep. I also had a strange emotional response to all of this, I behaved giddily and as though it were funny. April 8th about 8am: I woke up and the confusion, blurry vision, numbness, and slurring were gone. I had a mild headache, brain fog, and was still more tired than usual. Later that evening the headache developed in to something more like a migraine, intense pain focused behind my right eye and blurred vision. At this time I again decided to go to sleep. It would have been about 8pm. April 9th about 8am: I woke up still feeling a moderate headache focused on the right side, still tired, and brain fog. The symptoms weakened throughout the day and by the evening I was feeling mostly normal again. I have felt healthy and normal since.
1204980	4/13/2021	IN	25	F	4/10/2021	4/10/2021	Allergic reaction, hives on face and neck, eye and face swelling , all beginning the night of 4/10 and continuing

1204625	4/13/2021	TX	46	F	4/10/2021	4/10/2021	About five minutes after receiving the vaccine I began to feel something was terribly wrong. I then blackout for several minutes. From my son's description I believe I might of had a seizure. He said my eyes were wide open, I was slumped over, and gurgling. I was completely unresponsive to him. He summoned the paramedics who loaded me in an ambulance soon after I came to. They checked my vitals. My heart rate was 47 bpm and blood pressure was 80/40. They also checked my blood sugar. It was 116. They decided I needed to go to the hospital and began giving me iv fluids in route. At the hospital an EKG was taken, which came out normal, they continued iv fluids, and did a urinalysis on me. All test indicated I was healthy. It about three hours before my blood pressure and heart rate stabilized. Just as long for me to feel like I would be ok. They discharged me at this point. Since they I have just been extra tired and have had muscle discomfort.
1202143	4/13/2021	SD	58	M	3/24/2021	4/3/2021	Patient woke up on 4/3/2021 at 7:30am with the symptoms of Light Headedness, Dizziness, and not feeling like himself. He got up and continued with his normal daily routine until around 10:30 when his vision started to double and he was off balance on his feet. He was taken by ambulance to a Hospital at 11:15am upon arrival his vision trippled and his eye right started to veer outward. He was taken in for a CT scan immediatly and then was transfered to another campus to have a MRI scan done. He was then admited to the hospital for evaluation where he stayed overnight and was released the next afternoon (4/4/21)

1204745	4/13/2021	MD	69	F	3/21/2021	3/21/2021	high blood pressure; Arm bothered her; Congested; Right arm started tingling; Not feel well; Eyes are puffy/cannot see out of her eyes; headache/headache got worse; Chills/felt ice cold on one side; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of HYPERTENSION (high blood pressure) in a 69-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Diabetes, Kidney disorder and Blood pressure increased (High Blood Pressure). On 21-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 21-Mar-2021, the patient experienced HYPERTENSION (high blood pressure) (seriousness criterion hospitalization), LIMB DISCOMFORT (Arm bothered her), NASAL CONGESTION (Congested), PARAESTHESIA (Right arm started tingling), MALAISE (Not feel well), EYE SWELLING (Eyes are puffy/cannot see out of her eyes), HEADACHE (headache/headache got worse) and CHILLS (Chills/felt ice cold on one side). At the time of the report, HYPERTENSION (high blood pressure), LIMB DISCOMFORT (Arm bothered her), NASAL CONGESTION (Congested), PARAESTHESIA (Right arm started tingling), MALAISE (Not feel well), EYE SWELLING (Eyes are puffy/cannot see out of her eyes), HEADACHE (headache/headache got worse) and CHILLS (Chills/felt ice cold on one side) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 21-Mar-2021, Blood pressure measurement: high (High) it was 175/80 after 10 minutes of receiving the vaccine. and high (High) It was 195/90 after 15 minutes of first measurement.. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. The patient was hospitalized for 3 days. Treatment given was IV medication to lower blood pressure and Valium.; Sender's Comments: This case concerns a 69-year-old female with a serious unexpected event of hypertension, and nonserious unexpected eye swelling, nasal congestion, paraesthesia, malaise, limb discomfort, and expected headache, chills. Based on current available information and temporal association

1204564	4/13/2021	CA	39	F	4/13/2021	4/13/2021	Client received the 1st dose of COVID vaccine by Pfizer lot # EW0161 and expiration date: 4/17/2021 at 11:37am. At 11:50am client reported to EMT that she felt dizzy. PHN arrived and noted client had pale lips and eyes closed but able to respond to questions (alert and oriented x 4). Client reports not feeling okay and really dizzy like she is going to faint and hotness on her eyes. PHN offer client water. Client has no medical conditions and takes no medications and has never had a reaction to any vaccine before. Client reports she is not pregnant. Other PHN arrived to assist at 11:52 am able to get oxygen: 100% and pulse: 82. Shortly after client reports she needs to throw up, provided emesis bag and client vomits X 2. Right after client vomited color returned to her lips. At 12PM vitals are pulse: 70, blood pressure: 138/79. At 12:05pm pulse: 64 and blood pressure 120/82, client reports no headache, no blurred vision and no nausea. Nurse went outside to get husband and son of client and walked them over to client. At 12:15pm pulse was 62 and blood pressure 116/78, client reports feeling tired, no pain, no nausea and no headache. At 12:25pm client vitals were pulse: 60, blood pressure 120/80. Client left facility with a steady gait at 12:28pm.
1204523	4/13/2021	CA	41	F	1/21/2021	1/22/2021	Heavy vaginal bleeding with heaving clots since the first dose was administered. Vaginal bleeding continues as of today, April 13, 2021 at 2:36pm 2nd side effect was herpes outbreak on right eyelid, my primary care provider was notified.
1204605	4/13/2021	TN	51	M	4/7/2021	4/8/2021	Experienced same typical symptoms such as fatigue and nausea for two days only after getting the vaccine. But also had an adverse reaction to my left eye for week where it became inflamed and very bloodshot red. Eye continued to swell and drain fluids and was extremely soar and painful with blurred vision. Made appointment at my family physicians office on 4/13/2021 where doctor subscribed drops to be administered 3X daily. This is where I am now.

1204541	4/13/2021	OK	41	F	4/1/2021	4/1/2021	<p>P/C from patient. States she took the vaccine on 4/1/21 @ 1:30 PM. When she heard of the issues that were in the news about the vaccine she thought she should call.</p> <p>4/1/21 Thursday: That evening around 6 PM she started to have a rash. It started on her L arm where she got her vaccination traveled up her neck, covered her face and trunk. It started out as an itchy red rash but became raised hives. It resolved on it's own and on Saturday she did not have the rash anymore. Never had any difficulty with breathing. Her left arm where she received her vaccination still has some discoloration. States on Thursday evening she started having a "brain fog".</p> <p>4/2/21 Friday: The next morning she woke up and was unable to finish a sentence, states she was confused, "felt like I was on pain medication, like I was drugged". States she was confused, could not think and could not remember anything. Cried all day over nothing. Would tell her daughter something and then immediately ask what did I just say as she couldn't remember what she said. She was working on the graduation hooding ceremony and scribbled all over her papers like a 3 year old and the papers were strewn all over the floor. She reports that she had a mild headache all over her head dull pain and pressure 4/10. Took tylenol but that didn't help at all. Denies having any visual problems, trouble breathing or chest pain. Did have some abdominal dull cramping with nausea and even though it felt like she was going to have diarrhea there was no diarrhea or vomiting . The abdominal pain went away after friday but the nausea stayed through Sunday. She states she got lightheaded if she stood up too fast or turned her head too fast. This just happened on Friday. Denies having any weakness, lack of coordination, or speech issues. She states she was crying and could not stop all day on Friday. She told her boss she was having a mental breakdown and had to go home.</p> <p>4/3/21 Saturday: Patient states she felt stupid, could not think, could not remember anything she said. States that the horrible headache came on Saturday. It was so bad she had to lay down in a dark room with a wet washcloth over her eyes. The horrible headache lasted about 1 hour at a 10/10 level. Took some more tylenol but does not think it helped. Went to sleep and when she woke up the headache was still there at a rete of 4/10. She was still nauseate but the crying had resolved.</p> <p>4/4/21 Sunday: Again, had a</p>

severe migraine when she woke up. 7/10, not as bad as the one on Saturday. It lasted a couple of hours and then went back to the 4/10 headache that has persisted at the 3-4/10 level the entire time since she got her vaccination. The headache never stops hurting and stays 3-4/10. 4/5/21 Monday: Had a regular headache 3-4/10. Still felt "loopy" and with brain fog. Went to work on Monday and told her boss about it and that she still says she can't think straight. Her boss has been very supportive and has helped her to complete her assignments to get them in on time. 4/6/21 Tuesday: Still had a headache, it has been continuous ever since Friday. Still taking Tylenol and it doesn't seem to help. Yesterday she even tried Ibuprofen and it didn't help. 4/13/21 Today is day 13 and she still can't think straight. still has 3-4/10 headache, still all over her head. Feels that she still has brain fog, but not as "loopy". Feels like she can remember what she has said better. She called the nurse line at her husband's work. They told her that it was just a reaction to the vaccine. The patient didn't think to report it to the Health Center. She got the vaccine from the Health Center (she asked if employees could get the vaccine and said she would prefer that) She is not pregnant. She has no chronic health conditions and takes no medications routinely. She denies being allergic to any medications and states she has taken the Flu shot without any reaction in the past. NOTE: Tested positive for COVID on 2/4/21 and was told it was OK to get the vaccine. She lost her taste and smell and said she felt she had a mild flu for a couple of days. Has regained her sense of taste and smell and has had no residual symptoms. Instructed patient to go to the ER for an exam. She needs a full neuro exam and at least a C\_T scan of the head. She would like to contact her Primary Care Provider. States she hasn't seen him for a couple of years but feels like he would want to know. Instructed patient to call me with the outcome of her visit to her PCP or the ER. Patient verbalized understanding of and agreement with plan. 1204705	4/13/2021	NY	24	M	4/13/2021	4/13/2021	At 3:15 PM, pt entered observation immediately after receiving his second dose of the Moderna CV 19 vaccine. Pt reported to the RN that he was feeling dizzy (Client reported feeling dizziness after receiving his first dose as well.). Pt also complained of piercing headache above his left eye and pain on the right side of his neck. The pain radiated down his entire left side of his body. The pt also felt tingling in the arm he received the vaccine in. Vitals were initiated and water was provided to the pt. Ice packs were applied to the patients forehead and nape of the neck where he felt the pain. Vitals NOT within normal limits. O2 saturation fluctuating and blood pressure was a bit elevated. Pt reports having a history of hypertension, but could not accurately recall having taken the medication that morning. EMS was activated at 3:35 PM because the pts O2 saturated was fluctuating dangerously and interventions were not successful in relieving the patients symptoms. Vitals were taken approximately 10 minutes apart. Vitals were not WNL. Pt continually reported that the pain was increasing and beginning to feel unbearable. It was noted that the patient had increasingly poor circulation in the arm he received the injection. O2 was taken on the opposite arm and saturation levels appeared normal. EMS at 4 PM. Vitals were taken, all WNL. Patient left with EMS at 4:05 PM and was transported to Hospital.

1204662	4/13/2021	IA	57	F	4/7/2021	4/8/2021	Patient reports she had "metallic taste" in her mouth for roughly 3 hours post vaccination. Patient reported that on 4/8, she woke at 0100 with "toe cramps", she got out of bed, walked around and took some Tylenol, this resolved. Then on 4/9 around 1400, she had what she described as "the beginning of a migraine" in which she had blurry/wavy vision. She has had migraines in the past, however they are very infrequent. She is not treated for migraines due to their infrequency. In the past, she would take a Tylenol at the first sign of blurry/wavy vision and this would prevent a full blown migraine. On 4/10 at 0530, patient woke from "charlie horse" in left calf. She got up, walked around again and took a Tylenol, this resolved. Later that same day, patient developed the blurry/wavy vision again, took a Tylenol again and this resolved. On 4/11, patient reported soreness in left calf from previous day's cramp and used heating pad. Patient has had 2 more episodes of blurry/wavy vision yesterday 4/12 and today, 4/13, which both resolved with Tylenol. Patient has not yet spoken with PCP. Due to the nature of the events, and the recent update of J&J vaccines,
1204654	4/13/2021	OR	64	M	3/18/2021	3/30/2021	Symptoms: numbness/tingling and cold skin all over body (both sides of body), headache, facial droop, blurry vision. Stoke, CVA.
1204634	4/13/2021	FL	64	M	4/13/2021	4/13/2021	2:15 pm. Complained of dizziness, blurred vision and diaphoresis. Stated he has prior fear of needles. 2:20 VS 95/65; p79; Sat 97. R. 14. Offered water, cereal bar. Stated he felt better. Assessed by NP and onsite EMS. Remained in Observation for 30 minutes. Discharged home 2:50 pm. All symptoms resolved.
1204494	4/13/2021	NM	61	F	3/31/2021	3/31/2021	Blurred vision. Near vision suddenly and drastically became blurred and remains so. The degradation of my vision was so bad that I went from wearing readers that were only a magnification of only a 1.25 to suddenly, readers that are a 2.5 magnification just to be able to read standard font.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1205182	4/13/2021	WI	68	F	1/12/2021	1/12/2021	full-blown narrow angle glaucoma/ she had narrow angle glaucoma before/had not had any attacks and was not on any medication for it previously; full-blown narrow angle glaucoma/ she had narrow angle glaucoma before/had not had any attacks and was not on any medication for it previously; Hands and wrist got red and itchy; Hands and wrist got red and itchy/ Back of right leg was itchy; Back of right leg was itchy and had a couple of bumps; This is a spontaneous from a contactable nurse (patient). A 68-year-old female patient received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL3248) at the age of 68-years-old, intramuscular in left arm on 12Jan2021 at 08:40 at single dose for COVID-19 immunization and paracetamol (ARTHRITIS PAIN RELIEVER ACETAMINOPHEN, lot number: 9ER0473, expiration date: Mar2021), via an unspecified route of administration from an unspecified date at an unspecified dose and frequency for an unspecified indication. Medical history included narrow-angle glaucoma; arthritis probably on 2000 in which she had both knees replaced in 2016, she has had different issues with arthritis since then; and hypertension. The patient has no known allergies. Concomitant medications included lisinopril for hypertension and naproxen sodium (ALEVE). No additional vaccines were administered on the same date as BNT162B2. The patient received a flu shot on Dec2020. She experienced worst arm pain from the newer pneumonia shot. She thought it was the Pevnar. The older one she did not have. On 12Jan2021 at 18:00, about 8 hours after vaccination (as reported) which was administered in a hospital, the patient experienced a full-blown narrow angle glaucoma. She was told that she had narrow angle glaucoma before. She saw a doctor prior to this though, back in Nov2020, for a routine visit and everything was normal. She had not had any attacks and was not on any medication for it previously. That night of the vaccine, she had rainbow colored halos around both eyes. She called her ophthalmologist and spoke to the doctor who was on call that night. He wanted to see her the next morning. Her pressures were a little high and they started her on drops. She then saw her regular ophthalmologist that afternoon. She had been seeing him every 4 months for the narrow angle glaucoma previously and had been fine since her last visit in Nov2020. It seemed like a

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

coincidence. She reported since she knew it would take a while for all of the data to come back and she has not gotten the second one. The specialist said it could be triggered from the vaccine. Name of the drops she put on was Alphagan P. She no longer has it. She believed it was 1%, one drop in each eye, twice daily. She was taking a sample of that and currently, was taking generic Brimonidine 0.2% ophthalmic solution, 5mL, one drop in each eye twice daily. The patient was also on pilocarpine hcl. She went to an institute for a specialist. Nobody saw if there was anything in the literature. She reported to VAERS. She was calling to see if Pfizer has heard if there were any other cases. Someone did call her back and she tried to search the data base. She was not very tech savvy. She has not had any problems. Nothing like that before hand. No problem since then. She has no known allergies. The only other thing was weird was that on 12Jan2021 at 16:00, 6-8 hours later (as reported), both her hands and wrist got red and itchy, to the point she went outside and stuck them in a snow bank. She did not have an anaphylactic reaction. She then said maybe some transient itching in other places and mentioned some bumps on the back of her right leg that were itchy. She did not know if it was worthy of reporting. She used to be 5 feet. She shrunk and it occurred before the vaccine. It was age related. The next dose, she may get the Johnson and Johnson, something that does not have the MRNA in it. She did not have to go to the hospital, but saw 3 different doctors for appointments for glaucoma. She needed significant intervention based on that. It was the beginning of using eye drops, which she never had. When she went to bed, she still had the halo's and when she woke up, they were gone. So, they went away on their own some time during the night. Her pressures were still elevated in her eye though compared to normal. When she went in at 08:00, the visual check was not as good as it normally was. She did not know, but guesses she was 20/40 and normally was about 20/25. It just wasn't as good as it was prior. Now it was back to 20/25. She mentioned that she takes some over the counter stuff and lisinopril for blood pressure. She took ALEVE afterwards but she takes Aleve every day. About 4 pm, she also took TYLENOL. She could not take antihistamines or decongestant because they could trigger. She was looking at the vaccine to see if there

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

was an ingredient that could have caused it and she did not find anything. She wanted to make sure the TYLENOL did not cause it. She was just looking at other variables. That was the one thing that was not normal to her. She was just trying to figure it out. She almost never takes TYLENOL and may have gotten rid of it. She then clarified that it was generic, ARTHRITIS PAIN RELIEVER ACETAMINOPHEN. She only took one. Once you think you are itchy, then everything is itchy. She used a mirror to see the back of her leg and was able to see her hands. She did not see any other bumps or redness though. She did not do anything about itchiness or redness. It got her attention, but she did not talk to any doctor about it. It went away. When it happened, she was concerned. She did not know how to characterize it. Somewhere between not serious and medically significant. She did not seek treatment for it. She was unable to confirm seriousness of bumps on her leg as well but mentioned that it went away. She was unable to determine if it was going to get worse. She could not take BENADRYL because of her eyes. She could not even treat it and take an antihistamine. The action taken in response to the events for paracetamol was unknown. The outcome of the events was recovered on an unspecified date in 2021. The events "angle full-blown narrow angle glaucoma/ she had narrow angle glaucoma before/had not had any attacks and was not on any medication for it previously", "Hands and wrist got red and itchy", and "Hands and wrist got red and itchy/ Back of right leg was itchy" were assessed as serious medically significant.; Sender's Comments: Based on the close temporal relationship, the association between the events "angle closure glaucoma aggravation, erythema, and pruritus" with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

1202557	4/13/2021	OH	69	M	3/11/2021	4/4/2021	Reaction Report on Covid vaccine: I am a 69 year old male. On 3/11/2021 I received my first Covid-19 vaccine. It was the Pfizer vaccine. For a little more than 3 weeks I was fine, sore arm for a few days but that's all. Then all little more than 3 weeks later, on 4/4/2021, I started to feel chills, very tired and achy all over. I thought I was coming down with a cold but I never developed a cough, teary eyes nor a runny nose. I did have a headache but no sore throat and no cough, just the other symptoms of a cold. Those symptoms started on 4/4/2021 and lasted for about 3/4 days waning every day until 4/11/2021. That was the first day I felt back to normal. I was supposed to get my second shot on 4/8/2021 but canceled and rescheduled it for 4/21/2021. I am very concerned about getting the second shot and have actually considered canceling that shot too. I am very unsure what to do.
1196910	4/12/2021	OH	43	F	4/9/2021	4/9/2021	Patient became lightheaded and queasy. She laid down on the floor and her feet were elevated. She became more comfortable so she returned to a seated position and was given water to drink. After 30 minutes of observation the patient felt comfortable and left under the supervision of her mother (who attended the vaccination clinic with her).
1196867	4/12/2021	AZ	65	F	4/1/2021	4/9/2021	12 hrs later bleeding for nose, coughed up a blood clott, about 8 hrs after that went to the bathroom and had a little blood in toilet. During the next few days sore muscles and pressure in my sinus eye area, and little ache on top of my head.

1196925	4/12/2021	CA	42	F	4/6/2021	4/7/2021	I had a very bad case of Covid in January 2021 and have not regained my taste or smell. I was in bed for 2 weeks and had a prolonged fever up to 105 degrees--so high that I had visual and auditory hallucinations. I had hair loss in the following months and I also continue to be fatigued. I received the vaccination on 4/6/21 around 11am; a slight headache and face flushing occurred about 30 minutes after shot, but generally felt ok. Woke up at 4am on 4/7/21 with chills, extreme joint pain, body aches, migraine headache, and a fever of 101.5 degrees. Took Tylenol around 6am and went back to bed. The migraine headache, chills, body aches, and extreme joint pain continued. I was dizzy and extremely fatigued. Woke up around 9 am and fever was at 102.7 degrees. Joint pain and headache were almost unbearable at this point and I took a hydrocodone. Took temperature around 12 pm and it was 103.5 degrees. Fever continued rising to 104.4 degrees at 2:30 pm. Took another Tylenol and went to sleep. The next day, my fever had fallen back down to 102.5 degrees. I continued with Tylenol to control me fever to around 101 degrees. My fever persisted for 3 days. I still have extreme fatigue, joint pain, burning scalp (which will likely mean more hair loss), zero appetite and weight loss, dizziness, blurred vision, etc. The side effects are exactly how i felt when I got Covid in January.
1196805	4/12/2021	PA	55	M	4/9/2021	4/10/2021	Rash on face and neck and ears. Eyes are blood shot and itch.
1196944	4/12/2021	MA	87	F	2/23/2021	2/23/2021	I'm concerned about COVID vaccine possibly triggering a recurrence of post herpetic neuralgia in my mother, who hadn't had post herpetic neuralgia since 2015 14 hours after dose 2 of COVID vaccine administered on 2/23, patient awoke with sudden onset severe right ear and forehead pain, site of her initial herpes zoster rash in 2004. No visible rash or changes on eye exam (Pt is taking valtrex for eye sequellae of zoster). Other symptoms have included fatigue, bilateral axillary and neck lymph node tenderness, and some breathing discomfort. All symptoms are much improved but persist now (4/12/21).

1197687	4/12/2021	CA	88	M	4/2/2021	4/2/2021	About 15 min after the pt received the 2nd Moderna covid vaccine, he started complaining of dizziness. BP 118/66, HR 64, SpO2 98% RA. About 15 min later he is dizzy, eyes watering, with blurry vision. Pt waited about 30 min more BP 138/82, HR 58, SpO2 99% RA. Pt said vision still blurry but getting better. Dizziness resolved.
1197682	4/12/2021	WI	49	M	4/12/2021	4/12/2021	I counselled the patient prior to giving him the Pfizer Covid19 vaccine. He received the vaccine at 10:10am. During the 15 minute observation period, one of my technicians was standing next to him talking to another patient. She saw some papers slip out of patient's hand and noticed he was unresponsive when she tried to talk to him. She yelled out for help and I ran out and saw his head rolled back, eyes open, and he sounded like he was snoring. He never left the chair--just his head rolled back. We tried to rouse him awake and I had my other technician call 911. I also called for a store manager. The patient came to about 15-30 seconds later. I asked him his name, what day it was, and if he knew where he was. He answered all questions correctly. He told me that he's fainted before after vaccines, however he never disclosed this to me prior to the vaccine and had answered "no" under the question if you've ever had a serious reaction to the vaccine. We gave him some water and a cold paper towel. The paramedics came and evaluated him. He declined to go to the hospital and his wife came and picked him up.

1197645	4/12/2021	CA	25	F	4/10/2021	4/10/2021	<p>HPI: Patient is a * year old * who presents following administration of a single dose of J&amp;J COVID19 vaccine in the left deltoid. Patient states she started to experience ocular burning and tearing about 20 minutes following administration of the vaccine. She denies ocular pain. Patient denies wearing contacts, eye makeup, and face products at this time. She relates that she spent most of her day outside in the sun today but has never experienced these symptoms in the past. She reports an allergy to amoxicillin and numerous food sensitivities. She has never required epinephrine for treatment of aforementioned allergies. She denies a history of seasonal allergies. She relates that she has a past medical history of PCOS. She does not take medication on a daily basis. She denies chest pain, difficulty breathing, swelling of the face/lips/tongue/throat, skin rash/itching, cramping abdominal pain, nausea, and vomiting. Exam (update as needed): GEN: Alert and oriented x 4, NAD. HEAD: NCAT EYES: Conjunctival injection bilaterally. Tearing noted in the bilateral eyes. No purulence noted. No foreign body noted. Surrounding tissue nonedematous. Visual acuity grossly intact. PERRL, EOMI ENT: Ears normal, Nose normal, OP normal, no evidence of angioedema NECK: Supple, without LAD. CV: RRR, no m/r/g PULM: Clear to auscultation bilaterally, no accessory muscle use ABD: Soft, no tenderness. SKIN: No rashes, skin warm and dry. No erythema or edema of the injection site. MSK: FROM, MS 5/5 NEURO: Alert and oriented x 4, CN 2-12 grossly intact, no ataxia, gait steady Clinical Impression/Field Tx: Possible allergic conjunctivitis, bilateral eyes. Patient not displaying active signs or symptoms of anaphylaxis, to include facial edema and patient demonstrated ability to control airway. No foreign body was noted in the orbi to explain symptomst, nor was purulence noted, thus decreasing likelihood of infection origin. Visual acuity was not compromised at the time of exam. Conjunctival injection and epiphora, in addition to consistent sun and wind exposure, makes an allergic conjunctivitis more likely. Instructed patient to consult their PCP or follow up with urgent care regarding the post-vaccination reaction. Also instructed patient to consult an ophthalmologist if they are able to should the eye symptoms not improve. Recommended patient utilize visine or other normal saline eye drops for burning</p>

1197073	4/12/2021		43	F	4/4/2021	4/5/2021	Felt numbness in face the night after receiving first dose as well as the morning after that. Numbness left and then moved to swelling, particularly above the eyes, which is more subtle now but ongoing as of 4/12/21.
1197330	4/12/2021	NY	47	F	4/2/2021	4/3/2021	Starting on Saturday early morning, had severe chills and was very tired. Had a fever of 101 and slept off an on all day. Could not keep my eyes open and went to bed very early. I woke up the next morning (Sunday) feeling so so even though the day before I drank a bottle of gatorade, a bottle of water and 1/2 of a jug of a 3 gallon water. My legs were sore, like a feeling of being dehydrated, not flu like and my arm swelled up like a balloon, my eyes were very swollen, hands and feet as well. The swelling lasted until this past Saturday, April 10 and had a bunch of water weight on my body (4 extra pounds, which I have shed 2 of). I have a lot of memory loss as well as I ended up with my period, which I have not had in approximately 9 years. I had a headache for the first four days.

1197311	4/12/2021	OR	65	F	4/5/2021	4/5/2021	Within an hour after the injection my throat was scratching, eyes were itchy. At 7-8 pm, the symptoms of a usual shellfish allergic reaction started. My face was swollen, burning sensation, red, itchy. Hives appeared on my face, chest. I was dizzy and had a fast heartbeat. I took an antihistamine and within an hour or so I was better. I did not have an anaphylactic reaction as I normally would have if I ate any shellfish. 4/11/21 at 6:30 pm my face started to itch again, and have a burning sensation, eyelids itchy. I took my daily antihistamine and there was some improvement. I have some of the itch and burning sensation today 4/12 at 10:30 am. But not as bad as before.
1197293	4/12/2021	CA	47	F	4/10/2021	4/11/2021	Had the 2nd dose on april 10th at 130 pm side effects started around 10 pm that night, body aches, chills, sweats, head to use my inhaler 3 times during the night as i felt I wasn't getting enough air. Woke up the next day April 11th less achy, but very tired, around 4 pm on the same day i started noticing swelling under my right eye. April 12th woke up in the morning with more swelling on the right side, under the eye and bottom lip with some numbness around the area. Contacted my doctor following her directions at the moment
1197282	4/12/2021	OK	40	M	3/23/2021	4/6/2021	Blurred vision, sensitivity to light and trouble focusing sight. It began a few weeks. After first dose. I have no prior vision issues.
1197277	4/12/2021	OH	66	F	4/7/2021	4/7/2021	Less than time minutes blurvision,lightheadness,headache,4 hours later nose swollen at bridge with two big hives on both sides.Next morning severe cramp on right leg( Thursday). Friday morning severe pain in upper thigh couldn't work on it,called care source nurse 24/7 number. Called primary Dr. to report what effects I was concerned with. Following Dr.s advice.Today April 12th,2021 pain persists in right thigh
1197248	4/12/2021	WA	66	F	3/29/2021	3/30/2021	Day after 2nd shot: headache, chills, arm pain, swelling, rash on chest One week after 2nd shot: Extremely swollen eyes every morning starting one week after shot and continuing each day Two weeks after shot: Continue to have rash on chest and extremely swollen eyes every morning

1197228	4/12/2021	CT	30	F	4/8/2021	4/8/2021	30 year old femail received Janssen vaccine Lot# 1808982 exp: 6/23/21 at approximately 3pm in the left deltoid. Immediately after being vaccinated, pt. requested to remain seated. The nurse noted that the pt. was getting pale so she suggested the pt. take off the surgical mask to get some air. Before pt. had a chance to take off the mask she lost consciousness. Together with another nurse patient was lowered onto the floor. Pt. regained consciousness for 30-45 seconds and then began to have seizure like activity. Her eyes rolled back and her body became stiff and began a jerking motion. 911 was called. This seizure like activity lasted 4-6 seconds at which time pt. regained consciousness and immediately sat up. Pt was pale and diaphoretic. BP 98/64, HR 78, Pulse Ox 99%. Pt vomited multiple times. Ice was applied to the posterior neck and a cold compress to the forehead . EMS arrived and took vitals: BP 78/40. Pt. was aware of person, place and situation. Pt. was taken to Hospital accompanied by her husband. Pt was called by me Friday and she was home. All tests showed no sign of having a seizure.
1197200	4/12/2021		17	F	4/12/2021	4/12/2021	At 12:20 p.m, patient began to experience dizziness and the eyes began to roll back into the head. Initial blood pressure reading was 80/160 with a heart rate of 60 and an O2 saturation of 100%. This patient has a history with passing out with shots. Patient was given juice and multiple blood pressure screenings were recorded with results being 100/80, 112/78 and 104/75. At 1300, patient's heart rate was 68 bpm while sitting. Once the patient stood, blood pressure went to 90/60 and heart rate went up to 115 bpm. Patient was pale. Over next 15 minutes blood pressure and heart rate were routinely taken until patient felt better. Patient entered the vehicle safely and left with parents at 1:15
1197152	4/12/2021	GA	63	M	4/12/2021	4/12/2021	about 14 minutes into 15 minute post vaccination wait time, pt stated he was feeling dizzy and having blurred vision. Gave pt water to drink and observed pt for another 15 mins; he said the dizziness got better but still slightly blurry vision. Suggested he follow up with primary MD if that did not resolve.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1197122	4/12/2021	MI	42	M	4/9/2021	4/9/2021	My initial symptoms were light swelling a region around the shoulder of my injection arm and excessive sweating in the armpit on my injection arm side. Following this, symptoms similar to being on a hallucinogenic gradually manifested over the next several hours, including euphoria, a persistent urge to grind teeth, and some mild-to-moderate visual and physical effects. Following the date of the injection, the primary symptom has been a bruise/cramp hybrid pain in the upper arm of the injection site that is gradually receding (but still ongoing), along with random light bouts of nausea and headaches, random light pains throughout my injection arm, and occurrences of coldness in my injection arm (lasts about an hour)
1197115	4/12/2021	SC	38	F	4/8/2021	4/8/2021	About 2 minutes after injection, patient began complaining of being dizzy. She then lost consciousness in what appeared to be a seizure: body stiffness, eyes rolled back, shallow breathing, lock jaw. After 30 seconds, she regained consciousness and function. She was a little light-headed and nauseous. 3 minutes later she vomited and 5 minutes later EMS arrived. After the incident and prior to EMS arrival, spouse stated that the patient had a history of similar incidents with needle exposure. Patient left with husband. We have tried to get in touch with the patient for follow-up and she has yet to return our calls.
1197092	4/12/2021	PA	41	F	4/11/2021	4/11/2021	Patient with self-reported history of anxiety, syncope and near syncope with medical procedures/needles. Complained of feeling anxious, light-headed, jittery after vaccination. Became pale, placed in a supine position, provided oral fluids, including fluids with sugar, VS stable, hypotensive to 77/57, pulse ox 99%, blood glucose 185, NSR on monitor reported by EMT on site. Husband called, patient declined EMS transport, was able to ambulate with supervision to husband's car, husband transport to local ER in private vehicle. Follow up with patient <24 hrs post vaccination: patient reported feeling better. Admitted she was anxious about receiving vaccination since appointment was made one week ago.
1197088	4/12/2021	PR	53	U	3/23/2021	3/23/2021	Hypotension,dizzyness,blurred vision.

1197365	4/12/2021	TN	24	M	4/12/2021	4/12/2021	Patient reports that within 2-3 minutes (10:06 AM) after receiving the vaccine that he felt dizzy and light headed with blurry vision. PT pulse was 50 with BP 90/60. EMS called and evaluated patient. BP was 88/52 when EMS arrived and pulse was 60. Before EMS left BP was 100/74. Patient reported feeling better prior to EMS arriving but was still evaluated by EMS.
1195826	4/12/2021	CT	16	M	4/8/2021	4/8/2021	Patient felt warmth in his arm and became faint. He had his eyes open and remained sitting, but became pale and not responding appropriately. He was reclined with his feet up, cold cloth and returned to normal rather quickly. His vitals were within normal limits, drank water, was observed x 30 minutes. His mother, who was present the entire episode, stated he has had a similar reaction to a previous routine vaccine. Instructed to contact Primary Care MD to discuss further immunizations. Patient walked out with his mother feeling fine.
1196069	4/12/2021	NH	54	F	4/3/2021	4/4/2021	Stopped breathing while sleeping, my husband said I was snoring very loudly (which is not typical) and I just stopped. He tried waking me and I didn't wake right away. He got up, turned on the light, noticed that I had wet the bed and he continued to shake me and called my name several times, then I opened my eyes. My speech was a bit slurred at first, I got out of bed, felt nauseous, and my ears were ringing very loudly. I sat up for a while, then went back to bed. I didn't connect it to the vaccine, but wondered about the connection. Then I heard it happened to someone else, so I thought I should report it. I did not seek medical care.

1196057	4/12/2021	MN	35	F	3/17/2021	3/18/2021	at 1:30 am I started with the chills and feeling that i was going to vomit when i got up to go to the bathroom i because very dizzy and laid down and passed out this time i am not sure how long i was out for at approitmently 430 am I had the same feeling went to the bathroom and yelled for my husband as i was very dizzy again when he got into the bathroom he said i was passed out and was doing some convulsing I was out for over a minute and he was trying to get me to wake up. Prior to waking i could feel him touching me and i could hear noise but i could not make out the noise or open my eyes and was unaware at that momment what was going on after I woke i threw up and then went back and laid down. then again about 7:30 am I had to use the restroom so walked into the bathroom I went to the bathroom after I felt very dizzy again and laid down on the floor at this point i passed out again and this time i could feel myself shaking see bright light but couldnt stop the shaking or see anything else. I am unsure how long this lasted. After that I went and laid down again and felt better I then was only tired. After resting I felt good and didnt feel i should go in since i was feeling better I did call my dr a few days after and inform her on what happend. ** I had also started my period during this morning.

1196017	4/12/2021	IN	22	M	4/10/2021	4/10/2021	The patient (self) felt a soreness around the site of the injection begin immediately and grow throughout the day. The soreness continued to at least April 12 (at the time of this report). The soreness was immediate unlike a tetanus shot but the pain the following days was 2-3 times less that of a tetanus shot. By 4pm the same day, the patient felt fatigue and tired and had difficulty staying awake. Around 6pm the patient took 200 mg of ibuprofen by mouth because of a strong headache. At 7pm the patient was experiencing the following: headache, warm head to the touch, shivering/shaking, fatigue, mild aching. The patients pulse was consistent 100-104 bpm. The patients temperature at 8:30pm was 100.4 F. The patient then went to bed at 9pm. Patient had trouble falling asleep due to fever, shaking, aching. The patient slept intermittently until midnight. At midnight, the patient noticed the fever and shaking had ceased but the headache and aching were still strong. The aching was all over the body. The patients eyes hurt to move. The aching was constant and at times was throbbing. At 3am the patient could still not sleep well so he took 650 mg of Acetaminophen by mouth. The patient began to notice some relief approximately 30-60 min after. The patient fell asleep after the relief began and slept soundly til 9:15 am, April 11th. The patient awoke feeling much better. All side effects had stopped with the exception of a feeling of weakness and slight dizziness. The patient was able to carry on normally and took no more medications.
1195960	4/12/2021	NE	64	F	4/8/2021	4/8/2021	First my arm started to ache Then pain in lower back Then uncontrollable shivering and freezing - lasted 4 hours Next muscle pain, not just aching, severe pain and hard to move lower body - lasted 4 hours Next shooting joint pain, again not just an ache, severe shooting pains in lower body joints and feet - lasted a couple of hours Next 48 hours I was so tired I couldn't open my eyes Next 24 hours I was able to get up for two hours at a time, then sleep for two hours. Today? I am trying to work a normal day?

1195809	4/12/2021	NC		M	2/19/2021	2/24/2021	<p>Suspected Vaccination failure; Shingles around right eye / despite shingrix jabs x2 in 2018.; This case was reported by a consumer via other manufacturer and described the occurrence of suspected vaccination failure in a 64-year-old male patient who received Herpes zoster (Shingrix) for prophylaxis. Co-suspect products included Herpes zoster (Shingrix) for prophylaxis and COVID 19 VACCINE PFIZER for prophylaxis. The patient's past medical history included essential tremor. Concurrent medical conditions included hypertension, blood cholesterol increased and penicillin allergy. Concomitant products included propranolol (Propanolol), meloxicam, enalapril and atorvastatin. On an unknown date, the patient received the 1st dose of Shingrix and the 2nd dose of Shingrix. On 19th February 2021 15:30, the patient received the 1st dose of COVID 19 VACCINE PFIZER. On 24th February 2021, more than 2 years after receiving Shingrix and Shingrix and an unknown time after starting Valacyclovir, the patient experienced vaccination failure (serious criteria GSK medically significant) and shingles. The patient was treated with valaciclovir hydrochloride (Valacyclovir) and gabapentin. On an unknown date, the outcome of the vaccination failure was unknown and the outcome of the shingles was not recovered/not resolved. It was unknown if the reporter considered the vaccination failure and shingles to be related to Shingrix and Shingrix. Additional details were provided as follows: Age at vaccination was not reported. The patient received 2 shingrix vaccination in 2018. The patient received COVID vaccine in left arm. Despite of shingrix vaccination the patient experienced shingles. It was reported that the patient experienced shingles around right eye. The symptoms started day 4 after COVID-19 jab. It was reported that the patient did not received any other vaccine 4 weeks prior to COVID vaccine. The patient was not diagnosed with COVID-19 and not tested for COVID 19. The reporter consented to follow up. It was unknown if the reporter considered the ophthalmic herpes zoster to be related to COVID-19 vaccine. This case was considered as suspected vaccination failure since the details regarding laboratory confirmation of shingles was not provided.</p>

1195851	4/12/2021	MD	32	M	4/8/2021	4/9/2021	April 9 Morning: woke up with a mild headache. April 9 Afternoon (12 pm): feeling fatigued and headache grew worse. Plus chills. April 9 (5pm): feeling very cold and tired (worse than noon) April 9 (11:30pm): This time was the most severe for me in respect to side effects. I believe my headache woke me up. The headache was so bad that my eyes hurt as well (swollen almost). I think my fever broke. I felt very ?heavy? all over. The main concern was that around midnight I was having sharp pains on the right side of my body, near where my Liver is located. That was one effect that I did not read about. The sharp pains happened once every few minutes. I considered going to the ER but wasn?t sure. I ended up just changing my shirt, got some water, and went back to bed. April 10: My appetite was not normal, I ate but very little. The sharp pain on my right side went away but I had a minor headache for the rest of the day.
1196347	4/12/2021	WI	55	F	4/9/2021	4/9/2021	Patient passed out immediately following injection of vaccine. Her eyes rolled back and she was not able to speak. The vaccinator got help immediately, and patient's husband was in the room. She remained in a seated position with her husband holding her head up while standing behind her. Her blood pressure dropped to 78/80, heart rate was 45 bpm. She was unconscious for approximately one minute and 30 seconds. 911 was called immediately and she was transported to medical center. When I called the patient today, she did say that she was feeling better. She mostly felt nauseous and dizzy following her vaccination. She reports that her arm still feel itchy and that she has been taking Benedry
1196559	4/12/2021	DC	26	F	4/7/2021	4/8/2021	Fever of 101.1+ lasting 10 hours, on-and-off low-grade fever for 48 hours Headache, including eye and jaw pain, lasting 3+ days Dizziness; inability to stand or walk due to head pain and fear of fainting (dizziness lasted ~24 hours) Nausea and loss of appetite (ongoing) Body aches, including spinal pain and hip pain lasting 48 hours

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1196521	4/12/2021	NY	47	F	4/5/2021	4/5/2021	<p>5 April 2021, at 14:15: Approximately 45 minutes after my initial Moderna vaccine the left side of my face became freezing cold and numb. The progression was instantaneous yet started deep in my inner left ear and around the outside corner of my left eye and instantly moved up to my forehead (crossing the midline), then down the midline of my face encompassing my left eye, the left side of my nose, lips, roof of my mouth, gums, tongue, back over to my left cheek area all the way to my left ear. Simultaneously, I had a surge of metallic-tasting saliva, and I had a tingling vibration (tingling without the pins-and-needles) in both of my hands and on my left shin, just above my ankle to just below my knee. It all happened so fast that I could not talk and verbalize what was happening, I could only hold up my hand in a STOP position. My airway was open and I did not have any respiratory issues. The numbness in my face was about a 9 out of 10. Very numb, very frozen. We went back to the vaccination site and I was put under observation for an additional 15-20 minutes. The observation was 100% hands-off?no BP, no pulse ox, no temperature. I was released with the advice that if I developed any breathing difficulties that I was ?to go to the local emergency room.? 5 April 2021, at 19:00. The numbness receded to about a 5 out of 10. I did not have any respiratory issues, but was able to start noticing other parts of my body that were numb: the entire roof of my mouth; my teeth/gums from the midline-left; when I swallowed I noticed that my throat had no sensation on the left side and felt ?smooth?; both deep, inner ears ached without the any sharp pain. I had a massive headache and took 400mg of ibuprofen and went to bed. 6 April 2021, 09:00. After waking I got out of bed and noticed that my left leg was weak. I thought it was the position that I had been sleeping in, yet it did not?and still has not?gone away. The numbness in my face was still present and that it had extended down onto my lower lips and chin. Most of the left side of my face felt like heavy Silly Puddy, it felt swollen and stiff. The outside corner of my left eye, the left side of my nose, forehead creases and ear were stationary and not moving. My blinking felt off, but didn?t look off. I could now tell that the entire left side of my body was markedly weaker than my right side, my balance was off. I could not feel sensation in my chest/lung cavity as I inhaled and exhaled like I could on</p>

1196520	4/12/2021	NJ	51	F	3/30/2021	3/31/2021	<p>my right side. I did not have any airway or breathing difficulties. I rested and hydrated. 6 April 2021, 20:00. A rash of itching, burning hives erupted onto my lower left jaw from just outside my lip line and spread along the curve of my lower jaw bone to my hairline. By 22:00 the itch and burning had subsided, but I could feel that it was still there. 7 April 2021, 02:30. I woke up with excruciating, stabbing ear pain in my right inner ear. I took ibuprofen and tried to fall back to sleep. 7 April 2021, 09:00. My face felt increasingly swollen and stiff and the numb/tingling/vibration sensation in my lower left leg began to spread to my inner leg, around to my calf, up and over my knee to my upper thigh; my leg became so weak that it buckled. We spoke to a nurse advice line and she recommended going to the emergency room. 7 April 2021, 15:00. Dr. saw me. I was given to CT Scan to rule out stroke and an ultrasound to rule out blood clot. I was given the diagnosis of Bell's Palsy and was put on antiviral medication; I declined the steroids because they increase my allergic response reactions. 11 April 2021, 18:00. My face started to swell up over my left eye, left cheek, left ear and over to my right cheek. It did not restrict my airway. I went to bed. 12 April 2021, 17:30. My face?midline to left?is still numb; the left side of my body?especially my left leg?is still markedly weaker than my right; I get winded easily; I tire easily; my mouth still tastes metallic; I still have inner earaches on both sides; my eyes are extremely dry. I am also a yoga instructor. I know my body. I was perfectly able-bodied and healthy at 13:20 on 5 April 2021, 45 minutes later my world unraveled and no one knows how long it will last.</p> <p>101 degree fever for 2 days, blurry vision for 3-4 days</p>

1196479	4/12/2021	VA	59	F	4/9/2021	4/9/2021	Returned home around 4:30 PM from vaccine and felt a bit tired & not hungry for dinner. Iced my arm and took 2 Tylenol as my head began hurting. I went to bed at 9:00 PM and woke up around 1:00 AM with an excruciating headache and felt nauseous I took 2 more Tylenol, but could not fall back asleep. I felt very nauseous and was unable to go back to sleep. Oddly, I was sitting up wide awake and for a period of about 30 minutes, I began seeing brightly colored images that looked like they were floating in front of me. It was extremely odd as my eyes were open and I was awake. I finally fell back asleep around 5:30 AM and had horrifying vivid nightmares. When I woke up around 8:00 AM my headache was still there and I felt somewhat nauseous but not as bad as during the night. My headache continued through the day on Saturday and I continued to take Tylenol about every 6 hours. I attempted to go to bed around 9 PM when I experienced horrible chest pain that radiated through my chest and into the left side of my throat. This was frightening because the pain did not let up for 7 to 8 hours, even after taking a Tagamet. I've never suffered from heartburn previously other than when I was 8 months pregnant with twins. I was lucky to have any medication at home and that was only because my husband suffered from heartburn frequently. I finally fell asleep around 6:00 am for just a few hours and woke up feeling tired, but no headache or chest pain. Other than feeling tired, the symptoms appeared to all be gone. On a positive note, my arm never became sore!
1196477	4/12/2021		44	M	4/9/2021	4/10/2021	Day 1 after shot: body aches, headache, blurry vision. Day 2 and beyond: excruciating abdominal pains, no appetite, inability to have a bowel movement or even pass gas. Had I known this level of agony would happen, I would have refused the vaccine, and I will NOT take the J&J again.

1196447	4/12/2021	IN	24	F	4/10/2021	4/10/2021	Got the shot at 9:20am on Saturday (April 10th). By the time I sat down to do the 15min waiting period before I could leave. My arm from the back of my shoulder all the way down to around my thumb joint in my hand ached so bad. By around 3pm on the same day, I started to feel really tired and had a pounding migraine. By 4:30p I started to get really cold and everything started to ache. By 6p I was feeling hot but at the same time cold and shivering. My head was pounding. Every muscle ached all over my body, and by every muscle I mean even my eye muscles and pelvic floor muscles. My face had so much sinus pressure that it felt like it could explode. My skin, all over my body, was so sensitive that it hurt to the touch. On top of my skin being sensitive to the touch, off and on my skin would tingle, including the inside of my mouth and tongue. My lymph nodes were swollen enough in my neck that my throat ached. I was mentally confused and shaking. Everything got bad enough I started crying and hyperventilating. I felt sick to my stomach and felt digestive pain. My entire body felt so heavy. By the time it got to around 8p, my mom finally took my temperature, which at that point I had already been taking Tylenol all day and was no longer shivering, and I had a temperature of 101 degrees F. I finally went to bed around 9p. I was thirsty but my stomach felt sick. I still ached and woke up around 10 times throughout the night either feeling too hot or cold or hurting so bad. At 4am I took a Tylenol because it everything hurt bad enough to be able to fall asleep. The next day. I mostly better. I was still tired and a little achy and my lymph nodes under my arm pits were swollen. At this point my lungs felt strange. Harder to breathe than normal. I was starting to cough. The day after that (today) I have felt fairly normal except I'm coughing and my lungs still feel a little strained. No more aches or fever or anything like that though.

1196195	4/12/2021	FL	27	M	4/11/2021	4/11/2021	1 pill of acetaminophen was taken around 5 PM for arm and lower back soreness. Shivering, chills, radiating pain behind eyes started around 11 PM. Patient was kept warm and rested. May have developed fever throughout the night. Was given acetaminophen around 3 AM for headache. Adverse symptoms had ceased. Patient is now fatigued.
1196185	4/12/2021	NC	33	M	4/10/2021	4/10/2021	After administration of Janssen vaccine 0.5mL, pt reported arm was hurting and he began moving arm. CMA noticed that continued to shake arm after 5 minutes but patient was alert and oriented x 3. CMA thought the way he was shaking his arm seemed irregular so she advised pt he would be taken to an observation area for further observation. Half way to the observation area, pt reported to CMA that he was seeing spots and felt like he was going to get sick. CMA called for help. Patient experienced a syncopal event just as he made it to the chair. Several staff was helping to support patient. Legs were lifted to another chair. Patient was not responsive for a short time, very diaphoretic, breathing regular and unlabored. Patients eyes then rolled upward toward the ceiling and patient's entire body began shaking uncontrollably while staff managed to keep patient from falling to floor from the chair. Once patient was conscious, he was able to state his name but reported he was very confused and could not think clearly. He was able to sit upright. In the meantime while patient was shaking uncontrollably, staff sought urgent care provider to come and see patient. Patient was then taken over to the urgent care side of the building to evaluate and treat patient.

1196111	4/12/2021	DC	28	M	4/7/2021	4/7/2021	I received the first dose of the Moderna vaccine at 2:55pm on 4/7. An hour or two later, I started to get a sore throat. The sore throat was very painful by the early morning of 4/8. On 4/8 I went into a doctor to see if I had strep throat because of the level of pain and since I didn't think I could get a sore throat from the vaccine, but he said it was not strep and that it was likely just a side effect of the vaccine. On 4/8 I also had a fever topping 101.4, fatigue (I slept a lot that day), mental fog, pain at injection site, and all-around body pain. The sore throat lessened greatly by 4/9, so it clearly wasn't a strep infection and seems it was indeed a side effect of the vaccine. From 4/9 through 4/11 I had general "cold" symptoms: runny nose, phlegmy, watery eyes, redness and pain at injection site, muscle aches, elevated temperature (not fever), and general fatigue. By 4/12, these symptoms are nearly completely gone. Some of these symptoms seemed quite strange as side effects from the vaccine, but they started and perfectly paralleled the expected vaccine side-effects, which makes me think they were caused by the vaccine. I have no reason to think I had another illness at the same time as when I was experiencing these side-effects. I had had Covid-19 previously (in December 2020; I tested positive and had mild symptoms). Perhaps having had Covid-19 already provoked these strange side-effects.

1198838	4/12/2021	TX	39	M	4/12/2021	4/12/2021	After the 15 minute waiting period was up he was breathing deeply with his eyes closed and didn't respond to his timer going off. When I went out to check on him he said he had a sudden onset of chills and sweating, kind of funny feeling. The sweat was visible on his skin (arms & Face). I told him to sit another 10 minutes while we watched him. He was visibly nervous when he arrived and had told me this was his first vaccination in 20 years. After another 10 minutes he said he was feeling and was ready to leave.
1198815	4/12/2021	MD	70	F	3/16/2021	3/23/2021	Developed shingles 1 week after second vaccination. Erupted in left eye and traveled to area around eye on left side. Had 2 telehealth appts and got 2 prescriptions, one oral and one eye ointment. Lasted about 1 week. Mild case, thankfully.
1198811	4/12/2021	FL	51	M	4/8/2021	4/10/2021	Sudden onset of very intense vertigo with sweating, followed by immediate vomiting. During initial episode, control of eyes was hindered by an involuntary up/down oscillation eye motion, this lasted only approximately two minutes. Vertigo symptoms and vomiting persisted for 3-4 hours with vomiting turned to dry heaves associated with opening of eyes. After symptoms subsided, patient slept an additional 3 hours.
1198791	4/12/2021	TX	31	F	4/5/2021	4/5/2021	Difficulty breathing, chills, cold sweat, hives, swelling of face, severe headache, sensitive skin, eyes burning. Lasting a week. Swelling still occurring in face.

1198729	4/12/2021	CT	33	F	4/7/2021	4/7/2021	No symptoms until onset of chills and on/off severe sweating at 10 pm EST. By midnight, I had a fever of 100.2, nausea, intense headache (specifically around the eyes) and overall significant discomfort. The fever lasted overnight. Vomiting occurred on several occasions shortly after midnight for a few hours and again around 6 am. The following day, my fever did go down yet I maintained a headache and some nausea. After 3 days, adverse events were resolved. Treatment consisted of tylenol and fluids. I did not contact my a physician, so no medical tests/lab work was completed. For background, I have never experienced a serious event with a vaccine, besides general fatigue.
1198712	4/12/2021	NC	41	F	4/7/2021	4/7/2021	4/7/21 @ around 2:00 pm - dizziness, headache, "tunnel vision" and felt faint. I drank water, stopped activity (walking) and rested. It passed within about 30 mins. These dizzy spells have reoccured 4 times since then. 4/8/21 @ 2:15 am - fever of 101.8, chills, muscle spasms, extreme muscle aches all over body esp in back and legs, **unable to use my hands freely. My hands became very ridged and I could not open or close them well. I could not hold a glass of water to take a Tylenol. I finally did take a Benedryl and a 500 mg Tylenol. These symptoms lasted until around 5:00 am when I dozed back off. I woke at 7:00 am feeling tired and had a bad headache. My back and legs were still aching but were much better. 4/8/21 all-day - fatigue, bouts of dizziness, and nausea. 4/8/21 @9:00pm - diarrhea for about 4 hours. Stomach pain. 4/9/21 @ around 3:00 dizziness that last about 30 mins 4/10/21 throughout the day - diarrhea and stomach pain 4/11/21 - tired and headache persists. I started to feel more normal. 4/12/21- headache still there. Won't go away. I feel "foggy" and unable to think about things as I normally do. I returned to work today and still feel "yucky". I feel as though I'm recovering from the flu.

1198710	4/12/2021	GA	73	F	1/20/2021	1/21/2021	Approx 18 hours following vaccine, developed headache on left frontal side of my head. During that day also had an earache. The next day my skin in the area became hypersensitive, and prickly. I then developed Shingles in this area, with a few lesions around and above my left eye and in my scalp. My headache lasted about two and a half weeks. I have had shingles many years ago, and I would consider this a light case (I had the shingles vaccine a number of years ago, not the newer one requiring two doses). I plan to have the newer shingles vaccine.
1198705	4/12/2021	CT	49	F	3/27/2021	3/27/2021	My tongue started swelling. It did not get bad but I could feel it. Then my left eyelid felt like it had something in it so I believe it was also slight swelling. I was driving home. Both of these issues went away completely about 2 hours after they received vaccine.
1198697	4/12/2021	FL	18	F	4/6/2021	4/6/2021	She felt totally fine after the shot and many hours after. She felt fine to go to a horseback ride lesson at 4. Half way through the lesson she acutely felt like she was going to faint/nauseous (she had a ton to eat that day, had a bottle of water just before lesson, etc. so she knew it wasn't those kinds of things) and then had a crushing headache with a lot of "pressure behind her eyes", dizziness, and a really "strange" feeling like out of body, bawling crying, and started FREEZING. I got there 15 minutes later and she was under lots of blankets, white as a sheet, freezing, said her spine was sore from the top to bottom... just tons of symptoms. When I got her, she moved to my car and had seat heater on high and I had to put all the clothes from a suitcase I had in my car on top of her bc she was so cold and her skin was burning up. I gave her 3 200 advil and a bottle of water. ½ hour later i had a thermometer and even after that she still had 102.3 fever. She was rambling some nonsense and seemed very disoriented for a while. She went straight to shower and laid on the floor of the shower for ½ hour, took cold medicine, and eventually went to sleep. In the night she was freezing again and the fever had spiked and she took more advil. The next day she felt much better in the morning and fine by lunchtime. She was VERY sick/uncomfortable with basically every symptom under the sun.

1199469	4/12/2021	NY	41	F	4/10/2021	4/11/2021	14-15 hours after the shot received on 4/10 (my second dose), I started experienced severe flu-like symptoms. About 12 hours after the onset of the flu-like symptoms, I took about 87.5mg of trazodone (prescribed to help with sleep) and within 20 minutes I almost blacked out, with my vision becoming very fuzzy. I took my blood pressure and it was very low, about 74/70 with my heart rate in the high 40's. About 10-15 minutes later I vomited, and almost immediately felt my blood pressure return to normal (verified by blood pressure monitor). I have taken trazodone before - even the night before, the same night that I got my shot. I've also taken higher doses before and this has never happened to me. This leads me to believe there is some adverse reaction that happens when trazodone is taken while experiencing the side effects of the shot.
1199418	4/12/2021	CA	53	F	4/7/2021	4/7/2021	starting 30-45 minutes after injection, my right eye started twitching. By evening, I had mild flu symptoms and a sore arm that lasted for 24 hrs. One week later, my eye is still twitching numerous times daily and I am getting off and on headaches.
1199377	4/12/2021	NV	25	F	4/10/2021	4/10/2021	Approximately ten minutes after the vaccination, she passed out for a few seconds and came back. She experienced lightheadedness, loss of vision, nausea, and vomiting. We called 911 and they took her vital. Ten minutes later, she was fine and drove home.
1199059	4/12/2021	CA	31	F	4/10/2021	4/11/2021	swollen and redness in the under eye area for both eyes. I had dermal fillers (hyaluronic acid) in that particular area around two months prior to the vaccine. The symptoms are improving without any treatment.
1199342	4/12/2021	CA	68	F	4/5/2021	4/9/2021	This may NOT even be related to the JJ shot I had, but I got Conjunctivitis (Pink-Eye) 4 days after the shot. Blurred vision and severe itchiness sent me to get relief from Urgent Care

1199084	4/12/2021	GA	60	M	4/9/2021	4/10/2021	I was extremely tired on Saturday. My shoulder hurt. About 3 pm, while urinating, I felt very light-headed as if I was about to faint. I stopped urinating and went back to bed. That evening, about 8:30, I tried to eat dinner, but after three bites, I felt extremely tired. I leaned back in my chair, and I passed out. My wife woke me, but it took several minutes. She said my eyes rolled back in my head. She splashed water on my face. She said that I stopped breathing. I woke up, then pushed my plate away and put my head on the table. I could not hold it up. I was sweating profusely. After several minutes, I felt that I was about to have diarrhea. My daughter and wife tried to walk me to the bathroom, but I did not have the energy to get there. I collapsed in the hall and hit my head on the door jamb. After several minute of trying , they pulled me up, and I then got the strength to walk the rest of the way. I had diarrhea, not suddenly, but it was as if my GI system emptied. It was soft, not loose, and there was a lot. I went back to bed, and eventually slept. I felt queasy the next day (Sunday), and I felt lightheaded at times, so I just sat or laid down. But I was feeling better. Today (Monday) I feel much better. A little tired, but much better. I went to the Pharmacy this morning, and they referred me to this website. I did not see the doctor.

Back to Urgent Care 4.9.21 - this time with symptoms above plus cough, SOB, N/V. CXR (-) COVID (-). Patient received dose J&amp;J vaccine 3.23.21. HISTORY OF PRESENT ILLNESS: Patient is a 59 y.o. female who presents to the Urgent Care with COVID-19 (sick after receiving COVID vaccine x1week ago. Vomiting, headaches, nausea, chills) HPI: Patient presents today with complaints of nausea, vomiting, headache and chills intermittently over the past 1 week after receiving her 1st COVID 19 vaccination. She states that she got the Johnson Johnson COVID-19 vaccine. She states of then she has had an episode of vomiting daily some nausea. She has also had a headache every single day as well as some constipation. She denies any numbness or tingling, abdominal pain, diarrhea. She states that she has been taking ibuprofen, Pepto-Bismol, and Tylenol for her symptoms with minimal relief. She is drinking a lot of water as well. Medical Decision Making: No concerns for acute abdomen or neurological deficits are noted on exam today. Patient is reporting some symptomatic relief after receiving the Toradol injection today in urgent care. Educated the patient on the following: Zofran for nausea and vomiting. MiraLax and senna for any constipation symptoms. Motrin and Tylenol for pain or fever. Drink plenty of fluids. Follow up with PCP as needed. If symptoms worsen go to the emergency room such as you are not able to keep fluids down while taking the Zofran, if you develop any bloody stools, bloody vomit, or increasing abdominal pain. HISTORY OF PRESENT ILLNESS Patient is a 59 y.o. female who presents to the Urgent Care with COUGH (cough, SOB, congestion, vomiting everyday until about 1PM. headache off and on. x 2 weeks (since covid vaccine)) HPI: Patient is a 59 y.o. female who presents to the urgent care with cough, shortness of breath, congestion, nausea and vomiting and intermittent headaches over the past 2 weeks. Patient states that the symptoms started the day of her COVID vaccine. She states that she receive the Johnson&amp;Johnson 1 time dose. She states later that day after receiving the vaccination she had a significant headache that developed. She states that since then she has had a dry nonproductive cough with intermittent</p>

shortness of breath and morning nausea and vomiting that last till about 1:00 p.m.. She states that the headaches have resolved at this time but the cough, intermittent shortness of breath and nausea and vomiting have persisted. She denies any abdominal pain, chest pain, chest pressure or chest tightness. She states that she has not been experiencing any dizziness, vision changes or lightheadedness. She was seen in the urgent care about a week ago and was prescribed Zofran to assist with the nausea. She states that she was taking it twice in the morning and has now been able to only take it once, does feel that the nausea is improving but was out of the medication today, states that she was not able to take anything today and did have an episode of nonbloody nonbilious vomiting. She states that she was having some constipation she feels that this was related to the over-the-counter pain medications that she was taking for the headaches. She states that she was advised to take MiraLax at her last urgent care visit which she has been taking, had a normal bowel movement yesterday. She states that she has had pneumonia in the past, no history of asthma or chronic obstructive pulmonary disease. With the continued symptoms came to the urgent care for evaluation. She states that there have been to other coworkers who have had exposure or have now tested positive for COVID-19. Medical Decision Making: 59-year-old well-appearing female who presents to the urgent care with cough and nausea and vomiting over the past 2 weeks. Reviewed patient's previous urgent care notes as well as immunization record. Her vital signs are stable in the urgent care today and exam is largely benign. Given her history and current complaints did obtain a chest x-ray which appears negative, formal interpretation was pending at time of discharge. She was provided Zofran in the urgent care today which she did state helps with the nausea. Discussed with patient that I do feel that COVID-19 testing should be collected as at the time of her symptoms and given her continued symptoms she has not had full immunity from the vaccination and this could still be a COVID-19 infection. She is in agreeance and COVID testing is pending. Prescribed refill of her Zofran as well as Tessalon for cough relief and advised continued symptomatic measures and close follow-up with PCP for any persistent symptoms. She was

1199201	4/12/2021	CA	24	M	4/12/2021	4/12/2021	04/12/2021 03:00 pm Responded to a 24-year-old male found sitting on a chair in the 30-minute observation section with c/c anxiety/heart palpitations. Patient was a/o x 3 with GCS 15. As per patient, he had sudden onset heart palpitations and stated that he felt 'anxious.' Patient stated that he felt nervous to for the second vaccination and that he felt 'more nervous when placed in the 30-minute observation section.' Patient was taken into tent for further evaluation by HCP. Patient had history of anxiety. (-) allergies. (-) medications. (-) dizzy. (-) n/v. (-) MLAPSS. All vitals were normal. 13:15 -- 152/86 HR:75 RR:22 SpO2: 98 13:19 -- 138/82 HR:65 RR:20 SpO2: 97 13:24 -- 151/74 HR:66 RR:20 SpO2: 98 Patient was given water and food and stated that symptoms had resolved. Patient was escorted back to seat and left w/o incident. Entered medical area after being notified of patient in medical area by EMT. Upon arrival patient was sitting on cot with BP and Pulse oximeter on. No visual signs of distress. Could see patient pinching inside of upper arm and reported feeling anxious. His vital signs WNL EMT was chatting with the patient and patient was responding to all questions. Informed patient I wanted to check to see how he was feeling then excused myself outside of the area.
1199184	4/12/2021	NC	24	F	4/10/2021	4/11/2021	Lightheaded, nausea, tunnel vision, shortness of breath.
1199154	4/12/2021		50	F	4/9/2021	4/9/2021	near immediate lump in throat that increased to a sensation that I might not be able to swallow within approximately 20 minutes. I maintained the ability to swallow. Shortly after the throat swelling, my eyes began to itch. This was followed by general face itching. I also experienced a metallic taste in my mouth within 15 minutes of the dose. I took a Benadryl at around 8 PM after my throat and the itching had not resolved. The benadryl resolved the itching and ease the swollen throat. My throat remained tight feeling the next day, but was normal feeling by 4/11/21.

1198076	4/12/2021	PA	29	M	4/12/2021	4/12/2021	About five minutes after the vaccine patient reported that "he wasn't feeling well.". When I went to evaluate the patient he was very warm and was breaking out in sweats. He said his vision was very blurry. The patient lost consciousness and had convulsions/lower extremity rigidity for about 30 seconds to a minute. Patient regained consciousness and did not have any more convulsions. Patient was drenched in sweat but slowly regained color and he said his vision was returning to normal. Patient did not remember losing consciousness. EMS was called during the episode and patient was taken for further evaluation by EMS.
1198007	4/12/2021	CA	53	F	4/12/2021	4/12/2021	After about 7 minutes of getting the Janssen Covid-19 vaccines, patient husband said patient is not feeling well. I attended to patient immediately. She said she is not feeling well, and her eye was rolling (as if when she tried to look up and couldn't get their eye to remain open) a for about few seconds and then she her eye was open back to normal. She was sweating on both hands and face were cold to the touch. I got the manager from the store to help me lie patient flat on the floor's surface gently to prevent her from falling off the chair. Based on this our adverse event protocol, patient exhibited similar symptoms to Syncope (paleness, sweating, coldness of extremities), so I patient is lying flat on the floor, feet elevated, and cold compression was apply on her arms and face. Unfortunately, patient conditions was not improving as it seem but she was alert and able to breath (fast pace) the whole entire time the incident occurred where she answer all questions when we myself, then the paramedics asked her questions. Paramedic arrived at scene within 10 minutes after individual got off the phone with 911. They took her away around 9 am and said patient probably experience anxiety attack.

1198420	4/12/2021	FL	21	F	4/1/2021	4/10/2021	VASOVAGAL: The patient stated she wasn't "feeling good," she felt very dizzy and temporarily lost vision, she was sweating as well. I immediately grabbed another chair and raised her feet above her heart level. She immediately stated that she was "feeling better" and started regaining her vision. we then offered her a cold bottle of water. She appeared very stable within a few minutes. We did call 911 as a precaution, they arrived a while later and deemed the patient was stable and their additional services were declined by the patient. I insisted the patient stay and finish the bottle of water. All together I believe the event was about 30 - 35 minutes before leaving. I encouraged the patient to drink plenty of fluids and electrolytes and to take it easy for the rest of the day.
1198429	4/12/2021	NC	38	F	3/5/2021	3/5/2021	She reports she initially felt weird immediately after receipt and noted her heart was racing. She was waiting her 15 minutes, she felt hot, when she noted her face was flushed. She briefly felt dizzy but it passed. She asked staff if the flushing was normal and they got the medics. They noted flushing to her face, neck and chest. (She noted flushing to her legs when she got home). She denies pruritis or urticaria. Her BP and HR were elevated. She felt a little confused: they were asking her if she felt she needed eval, but she felt she had trouble answering. She noted tingling to her left jaw, and tongue. Providers did exam which was normal and gave her benadryl and monitored her for an hour. She felt better and was released. The flushing continued intermittently for brief periods (minutes) to sites such as her neck and face. She continued benadryl 50 mgs at bedtime. She routinely takes Claritin this time of year and had that morning. Symptoms resolved and have not returned. She denies pruritis, oral/face/throat/tongue swelling, globus sensation, red watery eyes, rhinorrhea, dyspnea, wheezing, CP, cough, n/v/d.

1198406	4/12/2021	WI	59	F	1/25/2021	1/26/2021	<p>Patient was previously healthy and got her second injection in the right arm on 1/25/2021. She had severe weakness of the right arm starting the day after the immunization, headaches across the whole head, severe fatigue, confusion (brain fog), worsening depression, body aches, and these all progressed and got worse for at least 14 days. She was unable to work any of those days due to weakness, confusion, and body aches. She saw me in the clinic on March 2 as she was still feeling weak, tired, confused. The clinic notes that day record: "On the next day, the 26th, she had severe pain and couldn't do much. Then she got super depressed and could not get out of bed for 2 weeks, had a lot of fatigue, body aches, and felt down. She tried going to the store one day and by the time she got done she could not get into her truck because she was in so much pain. That would have been about 2 weeks ago. She went back to work last week and was at work the whole week. She was told she does have leave time and that it did not cover the absence of work. She now needs new leave time forms completed. Currently she is in a lot of pain. She has her endocrine appointment on March 15th. The pain is getting worse. The cold is really hard on her. She is barely able to move her right arm at the end of the day, and that is the arm where she had the COVID shot. She is having a lot more weakness. She can not even take one flight of stairs now because everything hurts her. This is a huge difference than before. She used to be able to do several flights, and she can't do that anymore. She has also had vision changes. She has floaters but she is having a harder time focusing. She feels like no one would believe her, but she feels like this is all part of the reaction to COVID. She has a hard time focusing. She feels like she is going insane.~~</p>

1198527	4/12/2021	MO	58	F	3/25/2021	3/26/2021	<p>2 Events: Evening following 2nd injection, I went from having no dental issues to having severe tooth pain on lower left jaw, roughly 4-5 teeth in from back molar. Swelling began within hours accompanied by intense pain and sensitivity. By that Sunday evening, swelling had extended up to left eye, over to bottom of ear, and down neck to baseline and half way to center jaw line. Bruising present. Throbbing was constant. Made emergency dental appointment for Monday, but by that Sunday night, I could not stand it any longer and was afraid the swelling would extend to my throat. Went to ER, who diagnosed an abscess under the tooth root. Prescribed pain pills and antibiotics. Saw dentist Monday, who scheduled me for an emergency root canal on Tuesday. Got root canal on a tooth I never had problems with before, although there certainly could have been an issue brewing but not yet pronounced. Anyway, he also drained what he called an unbelievable amount of infection fluid (pus) after making an incision in my gum line and basically squeezing my face to get as much out as he could. Said he never saw anything like it. And for me to go from 0 to that in a matter of days was incredible. I thought perhaps it was an immune response? At the same time that I was experiencing the dental issue, I started to develop a strong dry cough. I have a light former smokers cough, and have had pneumonia many times, but this cough was different. Every day it has gotten strongly, but is very much intermittent. I now go into fits of coughing that last one to two minutes and so strong and to the point where I have either fractured my rib directly beneath my right breast, or something else is going on. These fits can last minutes, but never result in expulsion of phlegm. The coughing fits also occur if I take a deeper breath, walk too far, laugh, or talk too long. Very strange. I am very fatigued and have been since the onset of the dental issue reported above. While the dental issue is gone since the abscess was drained, the cough is still present, and wakes me up every single night too with coughing fits. The cough has loosened up a bit. I would go to the doctor, but I am in the middle of a move from MO to AZ, and just arrived in AZ after a 3 day drive. So, first off, I am reporting this issue. And next, I will seek a new doctor in Arizona if this cough continues.</p>

1198650	4/12/2021	FL	25	M	4/1/2021	4/10/2021	VASOVAGAL: The patient stated he wasn't "feeling good;" he felt very dizzy and his vision was blurry, he was sweating as well. I immediately grabbed another chair and raised his feet above his heart level. He immediately stated that he was "feeling better" and his vision was improving. I then offered him a cold bottle of water. He appeared very stable within a few minutes. We did call 911 as a precaution, they arrived a while later and deemed the patient was stable and their additional services were declined by the patient. I insisted the patient stay and finish the bottle of water. All together I believe the event was about 30 - 35 minutes before leaving. I encouraged the patient to drink plenty of fluids and electrolytes and to take it easy for the rest of the day.
1198567	4/12/2021	OH	26	F	4/11/2021	4/11/2021	Left eye twitching uncontrollably. No treatment, waiting and hoping it will go away.

1198614	4/12/2021	VT	40	F	4/10/2021	4/11/2021	Had a sore arm within hour of shot (got it at 7:30pm). Felt a little yucky before going to bed. I made sure to hydrate significantly before the shot and after. I woke up at 3am with chills and had them for about an hour. Woke up the next morning at 9am with with medium neck and head pain and feeling a little chilly and out of it. Mild ache in joints and body overall. At 10am I took one ibuprofen, but at 11am (200mg), kept pushing fluids. 11am headache got worse temp 98.7 (slightly high for me, I am usually about 97). Started having some gastrointestinal issues around noon. Felt nausea and sweaty palms loss of appetite. Had a bowel movement (normal in appearance). That all seemed to pass and I felt better, still tired, for most of the afternoon. Arm was sore to the touch and when moving. I managed to eat a few small meals, kept up hydration, and took a nap late in the day. I woke up at 5pm with headache and body aches all over. No appetite again. Had very little to eat, kept hydrating, At 7pm my vision got a little blurry and I had a minor vasovagal episode. Center of vision blurred, got chills and sweaty, nausea, and I had to poop (it was less formed). I rested, cool compress, and raised my feet. It all passed in about 20 minutes. I had major loss of appetite rest of the night (couldn't eat anything), kept hydrating, and went to bed. Slept through the night with no incidents. Woke up at 9am second day and had a small breakfast, though my appetite is still not back. Generally feeling exhausted, but no headache or aches in the body anymore. My arm is still sore. Had some more GI distress (another less formed poop around 11am). My appetite returned by early afternoon on the 2nd day post-vaccine. Still tired and generally feeling "off," especially mentally. Had brain fog all afternoon and my ears felt plugged today. Hard to concentrate on a task.

1198671	4/12/2021	CA	34	F	4/8/2021	4/9/2021	4/8/21: I receive the injection at 1:50pm on my left arm. 8pm: I begin experiencing normal side effects: soreness, body aches, and headache. 9pm: In addition to the soreness, body aches, and headache, I start having chills, which last on and off throughout the night. 4/9/21: 7am: I feel fatigued, with headache and body aches throughout the morning and afternoon. 3pm: I begin to have some itchiness on my forehead and both ears. My right knee cap feels hot and bruised, but there is no mark. 5pm: Visible hives appear on my forehead and right knee cap, and my ears are red. All of these spots are very itchy and uncomfortable. 9pm: The hives begin to be much more noticeable and itchier. I take one Benadryl before going to bed which helps the itchiness somewhat. 4/10/21 3:30am: I am woken up by pain in my ears and they have gotten incredible swollen, red, and hot. They are very tender to the touch. I take another tablet of Benadryl. 7am: There are more hives on my forehead and cheeks, as well as my knee and now on two of my fingers. A few spots also appear on my feet and on one toe. My ears are less swollen but still not back to normal, and they are still red, hot and tender. 9am: I have a video call with a Physician's Assistant who determines it is most likely not an anaphylactic reaction (no swelling in my throat or eyes or any of the other red flag symptoms. I also take my blood pressure with a home monitor and it is normal). He prescribes me a steroid pack. 12pm: The hives begin to be less and less itchy and red. 8pm: The hives are almost completely gone, save for a few spots on my feet. As I am breastfeeding my 14-month-old daughter, I had waited to begin the steroid pack until after our last nursing session of the day (around 7:30pm). As the hives seemed to be going away on their own, I decide to not take the medication. I do take one dose of Zyrtec. 4/11/21: 7am: the hives are completely gone

1198259	4/12/2021	NC	56	F	4/8/2021	4/8/2021	Became Lightheaded within 5 min of injection, progressed to severe dizziness, black spots in my eyes, could hardly lift my arms, progressed further to nausea, was given zofran on tongue by EMS, progressed to severe vomiting. EMS took blood pressure it was 93/50 hear rate was very low. Called ambulance and advised I go to hospital immediately. Blood pressured jumped to 150 then dropped again. Once in ambulance they put IV in and gave Zofran through IV, I don't know if they put anything else in there. Blood pressure stabilized around 110 which is normal for me, I normally have low blood pressure and heart rate. Nausea and dizziness dissipated by the time I got to hospital. They put EKG on also while I was in ambulance and said I was having PVC's advised dr to do another EKG once I got to hospital. Felt better by about 5:00 PM. Overnight I had slight fever and body aches, took Advil and symptoms subsided. Slight soreness in arm and armpit, but not major. Have been feeling fine now other than being traumatized by the whole event.
1198279	4/12/2021	OR	63	M	4/12/2021	4/12/2021	within 20 minutes after shot the left side of my face felt light the dentist shot me with a light does of novocaine . the left eye feels tired, tongue and lips feel slightly numb, left side of face feels strange along with a headache
1198289	4/12/2021	NC	30	M	4/12/2021	4/12/2021	30 yo M with h/o vasovagal events with lab draws was vaccinated with his first Pfizer Covid-19 vaccine (Lot# ER8729) in the left deltoid at 1202 4/12. Prior to vaccination, patient had had nothing to eat or drink. Pt became syncopal when moving from the vaccination chair to the observation area. When he fell, he hit his head. After the fall, pt remained on the floor and was placed in Trendelenburg position. BP - 105/63; P-40 to 51. Patient reports having a low heartrate. Patient 15 minutes patient attempted to sit up but was dizzy and laid back down. After 5 to 10 minutes, patient was able to sit up and eat some crackers and drink juice and water. After 15 minutes, pt was moved to recliner. Provider noted a bruise above his right eye. About 15 minutes later the pt vomited and started coughing. Provider called EMS and patient was transferred to ED. During ED visit, reaction assessed and thought to be vasovagal reaction.

1193660	4/11/2021	CA	58	F	4/1/2021	4/3/2021	I was the first J&J vaccine patient on April 1 @1pm at the pharmacy. I developed a bruise around the injection site (like a bull's eye) afterwards and I still have it on my arm though slightly lighter but still visible. I wonder if it is related to blood clotting that's been reported in the news lately. I thought I'd report it just in case. I also had a small itchy rash of tiny red dots for about 3 days which started about 4 days post injection. I have no previous issues with vaccinations or any bleeding concerns. This is odd. I developed alternating low grade fever ~99.1 F and chills with fatigue for 2 days after the jab too but that's not unusual for me after the seasonal flu vaccines.
1193635	4/11/2021	NH	64	F	4/10/2021	4/10/2021	Low Grade Fever (100.4), Burning Eyes, Headache, Body Aches, Lack of Energy
1193629	4/11/2021	MI	24	F	4/11/2021	4/11/2021	Almost immediately after COVID 19 vaccine administration, patient began experiencing warmth ,dizziness and faint, variable breathing shallow, deep etc. Cool compress applied to patient. Patient began to slump, tremors, and appeared to be passing out, eyes began to roll back. EPIPEN was administered and 911 was called. The 911 medics arrived and patient was transported to emergency room .
1193548	4/11/2021	WA	64	F	3/20/2021	3/23/2021	I first noticed an increase in mucus in my lungs, causing me to cough up phlegm. The vision issues have increased the MS Optic Niritis problems, losing vision in right eye! But its the headaches I can't stand. They come and go, and sometimes its sooo bad that I can't move my head and body. Sitting in the dark helps. Thus having MS and lowered immune system has the headaches causing me to be immobile during episodes, sometimes lasting only an hour, sometimes all day! And chills, but not as bad as the headaches. I don't want to lose my vision again due to having to do these vaccines every year with these side affects.

1193512	4/11/2021	CT	26	F	4/10/2021	4/10/2021	Had no side effects whatsoever for many hours. Felt completely fine until about 7:30 pm, while I was making my plate of dinner. Felt lightheaded, dizzy, and hot. I began to black out, so I sat down, which helped for a few moments to subside lightheadedness. I was still feeling hot, so I walked a few feet to my back door and sat down on the steps outside to cool off. Within minutes, my vision blurred completely, I saw stars, and completely blacked out. My mother, who was nearby, heard me fall on the steps. She said my eyes rolled back, my body was completely limp, I was not breathing but rather making gurgling noises from my throat. She propped my head up, which allowed me to breathe properly, and I came to. If my mother had not been nearby, I am convinced I would be dead right now. I saw the light, saw the other side, saw my relatives. I have had a near death experience once before, and this was exactly like that.
1193474	4/11/2021		19	F	3/31/2021	3/31/2021	19-year-old with no significant past medical history presenting to ED after experiencing lightheadedness, vomiting, vision changes after receiving her first dose of Pfizer Covid vaccine. History is consistent with vasovagal syncopal episode given resolution of symptoms in a quick period of time. Must also consider anaphylactic reaction to vaccine given patient had vomiting and low blood pressures following vaccine administration. However, this is less likely given that patient returned to baseline blood pressures without any additional interventions and has had no additional episodes of vomiting since presenting to the emergency department. Must also consider pregnancy given vomiting and recent Plan B usage

1193435	4/11/2021	CO	65	F	4/10/2021	4/10/2021	Reaction to Moderna vaccine #2 April 10, 2021. I had no reaction to #1 on March 11, 2021 11:00 a.m. I received my vaccine. I felt fine until about 4:00 p.m. 4:00 p.m. my arm was stiff and sore even though I had been massaging it and using it. I also was getting sleepy. I had a dull headache in my rt. Eye socket area. 8:30 p.m. my arm was very sore. 10:30 p.m. I fell asleep. 11:30 p.m. I woke up and felt feverish; I was hot but had chills, my body ached, my headache had worsened and spread to a larger area of my head, my skin hurt. 12:30 a.m. my reaction remained the same but more intense. This lasted until about 6:00 a.m. where it seemed to lessen. 10:00a.m. I was less achy and no chills. I still had a headache
1193460	4/11/2021	FL	28	F	4/11/2021	4/11/2021	0920: Patient noted to be slumping in chair- pale and diaphoretic. Assisted to floor. EMS and NP in attendance along with other RN staff. Completely unresponsive and not breathing. Airway opened (triple jaw maneuver) and turned on side. She started breathing spontaneously and opened her eyes. Initially confused but became OX3. Pt. taken to private observation area. VS: 0925: 125/81- HR 48 (double checked); R 12. Sat's 98% on RA. EKG shows sinus bradycardia. Pt later assisted to seated position on stretcher and vomited x2 undigested food. VS#2 @0940: 127/80; HR 52- Sat 94, R 14. Felt better after 2nd set of VS. Sent home w family member @10:00am. Teaching: recommended she inform vaccinator prior to #2 shot she faints easily after injections and perhaps have the injection performed while patient is lying on EMS stretcher. Patient agree to this - brother will follow up with her.

1193665	4/11/2021	IL	39	F	3/9/2021	3/19/2021	On March 10 (the day after my vaccine) I felt the normal body aches and had a pretty bad headache. That all went away in the evening on March 10. Since that day I have had off and on dizziness/lightheadedness. On March 19 I fainted in my kitchen. I hit my kitchen table and had a huge knot on my head and bruises all down my left side of my body. My left shoulder still hurts from the fall and I still have a small knot on my head (left side just above my left eye on my forehead). I went to my primary care doctor on March 24 and reported the event. I asked if it could be related to the COVID vaccine and she said she wasn't sure since the Jansen one was so new, but that she had seen these effects from the other two vaccines. At the doctor's office my blood pressure was on the lower end (110/60). My normal blood pressure runs about 118/70. They ran some blood work and that all came back normal. They did an EKG in the office, but my blood pressure stayed pretty close to the same as it was the first reading. They then sent me to get a CT scan on my head, which also came back normal. She did diagnose me with a concussion. I was out of work the entire week (March 22-March 26) due to this. She also ordered me to have an echo done. While at the office for the echo, my blood pressure ran 99/46 (this was on March 31). The results of the echo came back normal. I also got a monitor to wear for 72 hours on March 31. I took that to the doctor on April 5 and I am still waiting on results from that. Since the event on March 19, I have had headaches and body aches. I have also had slight lightheadedness off and on.
1193394	4/11/2021	TX	36	F	4/1/2021	4/1/2021	Soreness in arm almost immediately after second dose, fever and whole body soreness night of. Face swelling, face hot to touch, rosecaea really bad. Next day had right eye swollen and very painful, vision compromised in that eye. Day 3 had large internal sty in that eye. Never in my life had this happened. Day 4 back inflamed to where I can barely walk. Tired and weak for the next few days. On day 9 I woke up with a very sore throat and open sores in my mouth. I can barely chew anything this morning. In extreme pain, feel like my body is just swollen. I have been using ice, eyedrops, anvil, ibuprofen, heat for back, and mouthwash and saltwater for mouth. No insurance so I have not seen a doctor.

1193422	4/11/2021	CO	37	F	4/7/2021	4/7/2021	Out for a run that evening (8 hours after shot) after about 12-15 minutes of running I stopped to walk and started sneezing a lot, about 8 - 10 times. Then my nose started to run, eyes started to water a little followed by tingling & itching on the back of my tongue and throat, then swelling on the back of my tongue. I felt a little light headed a few minutes later, I slowed to an even slower walking pace. The swelling did not get worse. Blood pressure was fine when checked at home about 30 minutes after the start of the episode, a little high for me if anything, but normal. My nose become fully congested which was the only side effect that lasted for a couple of hours. Yes, it is spring here but I do not have allergic reactions beyond a few sneezes and slight runny nose to spring pollen. This was much more intense and I have never experienced tongue and throat swelling.
1193463	4/11/2021	IL	30	F	1/21/2021	1/28/2021	Eyelid swelling that has occurred about 4-5 times. Initial event was the following week after the second dose; bilateral eyelid swelling (one upper lid, other lower lid). Subsequent episodes are unilateral with left side occurring greater than right. Usually resolves in about 5 hours. Most recent episode was the largest it has been and it has persisted beyond 12 hours. No other associated swelling, no eye pain, no itching or irritation.

1193684	4/11/2021	NY	20	F	4/11/2021	4/11/2021	Otherwise healthy 20 yo female presented to observation area after her first vaccine dose. Within first 5 mins while seated, talking on phone to Mom he then fainted, falling on floor. Fall witnessed, witnesses deny patient hitting head. Patient immediately regained consciousness, and appeared to be shaking. Placed in WC, while in med eval tent vitals: P 88, R16, BP 120/75, Glucose via fingerstick glucometer is 98. Patient alert, oriented. drinking apple juice. Patient admits to history of fainting after procedures such as injections. Advised her to inform healthcare personnel before vaccines or blood draws. Denies Chest pain, SOB, nausea, or pain anywhere. Denies visual changes. Patient felt well enough at 12:45, stood and walked without difficulty. Departed with friend without incident, who drove her back to dorm.
1193383	4/11/2021	PA	33	M	4/2/2021	4/5/2021	Began to develop a slight brain fog one hour upon dose administration. Otherwise mild. Went to bed at 11:00 pm and woke up at 2 am with heart thumping with pulse beating around 70 beats per minute. Became highly attuned to it and experienced tachycardia at 118 (generally resting heart rate is extremely low). Seemed to return to 70 with some breathing exercises and returned to sleep. Woke up the next morning with flu symptoms and the works - felt worse than original Covid in October. Flu like symptoms seemed to pass by Monday. However, pulse remained elevated through the week by about ten points and noticed hypertension. BP 150/95 Wednesday and 160/100 on Friday. Went to ER Friday night with BP 188/117 and tachycardia. Vitals and blood work all normal however confusion as to why BP remains elevated despite Thursday before vaccine being 132/82. Left hospital with BP 154/95. Palpatations and thumping chest have continued throughout the week. As well as general fatigue and fog behind the eyes.
1193774	4/11/2021	OH	29	F	4/8/2021	4/8/2021	Fever and body aches beginning around 5pm, 7 hours after the vaccine. Nausea hit at 10pm and lasted until the next morning. I threw up 4 times throughout the night. I have red splotches all over my face from broken blood vessels I think. They are all around my eyes, but also on the rest of my face and neck. Fever of 100.4. Had a headache and was shaky all night. The next two days I have been fatigued.

1192835	4/11/2021	CT	68	F	2/26/2021	2/26/2021	Minimum soreness at injection site; however, sometime during that night I awoke with pain down my left side, particularly in the hip, thigh, and calf -- painful enough to take ibuprofen for relief. The pain came back for several subsequent nights before gradually occurring about once a week at this point. Also, two or three days after the vaccination, my left eye developed an irritation that resulted in a crustiness and dryness around the eyelid, the latter which persist. Then, about two weeks following the shot, my left hand, near the thumb and wrist, developed a weakness and extreme pain that came for around 24 hours, departed, and came back a few days later. I had four episodes of this, though that also has not made an appearance since the last week of March.

1192794	4/11/2021	CO	59	F	3/11/2021	3/11/2021	nerve problems behind left eye; nerve problems in face; lips had nerve problems; tongue was numb; throat felt swollen; Bell's palsy; lightheaded and dizzy; This is a spontaneous report received from a contactable consumer (who is also the patient). A 59-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN6207), via an unspecified route of administration in the left arm, on 11Mar2021 15:30, as single dose, for covid-19 immunisation. Medical history included known allergies to antihistamine (unspecified) and sulfur drugs. The patient was not pregnant at the time of vaccination. The patient did not have COVID-19 prior the vaccination and was not tested for COVID-19 post vaccination. Concomitant medications included levothyroxine sodium (SYNTHROID); omeprazole; and anastrozole, all taken for unspecified indications, start and stop dates were not reported. Historical vaccine included the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN6200) received at age 59 years, via an unspecified route of administration in the left arm, on 18Feb2021 15:45, for COVID-19 immunization. The patient did not receive other vaccines in four weeks. On 11Mar2021 at 15:45, 15 minutes after the second dose, the patient got lightheaded and dizzy. On the same day at 16:15, 45 minutes after the second dose, the patient experienced nerve problems behind left eye, then nerve problems in face, then lips had nerve problems, then tongue was numb, and throat felt swollen. The patient reported the side effects on the hotline, and she was transferred to a nurse who told her to go to the emergency room immediately as she could be getting Bell's palsy from the vaccine. The events resulted to emergency room visit and hospitalization (unspecified date in Mar2021). Treatment for the events included unspecified IV. The patient was hooked up to an EKG and her blood was drawn for checking in Mar2021 (results were unknown). The patient was recovering from the events. Follow-up attempts are completed. No further information is expected.

1192919	4/11/2021	MA	38	F	4/9/2021	4/10/2021	Around 8:30 pm on April 9th I started to feel tired and my muscles were starting to hurt so i went to bed at 9:00 pm. i woke up several times with muscle aches, head ache, chills and sweating. I got up at 1:30 am to go to the bathroom. I then went down stairs to take my temperature. I took it 2 times. It was 99.9 and 100.00. I went to the kitchen to get a drink because I was going to take some Tylenol. When I opened the refrigerator, I got lightheaded and my vision started to change. Within 2 seconds, I put the Lemonade on the counter and I got tunnel vision and i started to sweat. The next thing I remember was being on the floor. I could hear my husband calling my name but he sounded very far away. I felt like I couldn't respond to him. It took me about 30 seconds to become conscious but I didn't know where I was at first. I fell straight on my face and was bleeding from lacerations to my nose and forehead. My neck, which I already have an injury to was re-injured. I was taken to the Emergency Room. My lacerations were glued and was in concussion protocol

Then when feeling better, left under own power, with accompanying adult supervision.
1192840	4/11/2021	OK	57	F	3/21/2021	3/22/2021	Soreness at site X 3 days persistently and then continues off and on when body aches are present, prolonged severe fatigue and body aches persistently (still present as of today's date), severe and persistent headache, blurred vision
1193006	4/11/2021	CA	64	M	4/9/2021	4/11/2021	At 5:05 am on April 11, approx. 37 hours after I received the shot, I awakened to a rapid muscle convulsion in my left shoulder muscle, at the approximate location of the injection. I counted between 2 to 6 contractions per second (yes, it was a very quick twitch that involved my whole upper arm). It went on for at least 10 minutes, then paused for less than a minute and then resumed. This was a pronounced muscle spasm which I cannot remember having before. I have had twitching eyelids or facial muscle that would twitch for a few minutes in the past, but this went on for over 30 minutes, and I am not sure it is done. Also, this was much more intense than the above-referenced twitches. The location and time relative to my shot makes me fairly certain that this is an effect of the vaccine. I have not exercised or done anything to cause this to my knowledge. Of course, this seems like a harmless side effect, but my concern is that my heart muscle reacting to this in a similar fashion could be more serious.

1192796	4/11/2021	CO		M	2/1/2021	2/1/2021	patient got nerve problems in his face, lips, tongue and then his eye and started drooping/talking like his face was paralyzed; This is a spontaneous report from a contactable consumer. A male patient (reporter's brother) of an unspecified age received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number and expiry date not reported), via an unspecified route of administration, administered in the left arm on Feb2021 as single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. Historical vaccine included first dose of bnt162b2 on an unspecified date at single dose for COVID-19 immunization. On Feb2021, the patient got nerve problems in his face, lips, tongue and then his eye and started drooping and stayed like that as of today and was talking like his face was paralyzed. Clinical outcome of the event was unknown. Information on lot/batch number has been requested.
1192780	4/11/2021	CA	58	F		4/1/2021	WHOLE BODY SORE; SORE JOINTS; HEADACHE (FRONT, EYES, BEHIND THE EYES, AND MIDDLE OF THE HEAD); TIREDNESS; This spontaneous report received from a patient concerned a 58 year old female. The patient's weight, height, and medical history were not reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, and batch number: 1808980 expiry: UNKNOWN) dose was not reported, administered on 02-APR-2021 on left arm for prophylactic vaccination. No concomitant medications were reported. On APR-2021, the subject experienced whole body sore. On APR-2021, the subject experienced sore joints. On APR-2021, the subject experienced headache (front, eyes, behind the eyes, and middle of the head). On APR-2021, the subject experienced tiredness. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from whole body sore, and sore joints on APR-2021, and had not recovered from headache (front, eyes, behind the eyes, and middle of the head), and tiredness. This report was non-serious.

1192673	4/11/2021	MI	61	F	4/9/2021	4/10/2021	Noticed lips, chin and inside of mouth beginning to swell, all on left side of face. Swelling later went to eye, also on the left side, and swelled shut. Skin was red and puffy both around my mouth and eye. Took Allegra and went to local urgent care. Facility was so full of COVID patients that we felt uneasy there and left to come back home, as swelling was resolving itself after about two hours near my mouth. Eye is still somewhat swollen. Clearly an allergic reaction of some sort. I felt a lighter version of the same thing, also on the left side of my face after the first vaccine, but convinced myself that it was nerves and so I didn't mention it to the nurse before getting the 2nd vaccine. Clearly, I should have, as it was probably the same problem I experienced today.
1192649	4/11/2021	WA	40	F	4/7/2021	4/7/2021	Hello, Wednesday afternoon april 7th at 1630 I took the first dose of the moderna vaccine. A few hours later I felt like my eyeballs were "swimming" inside of my head, and I felt really dizzy and spacey with the colors on the tv screen seeming blurry. The following day I woke up and my fingers and toes were numb, headache, chills, dizzy, and felt forgetful, fatigue, and "out of it." I felt nauseous, like there were vomit chunks in the back of my throat. Friday I woke up, went to work and had to come home early because I could barely hold a conversation still like the day before, screen was blurry, felt nauseous, and fingers and toes are numb. I still have taste and smell. Saturday april 10th, i have a little bit more energy but still feel weak, dizzy, headache and fatigued. I am allergic to amoxicillan...does this tie in? My second dose is set for May 5th. Primary doctor received email from me tonight

1193206	4/11/2021	OH	22	F	4/7/2021	4/10/2021	Three days after receiving the first dose of the vaccine, I woke up with a hives-like rash. This was specifically concentrated at both my elbows and both my knees. Here there were red, itchy, risen bumps about 1 cm in diameter. As you moved along the limb away from the concentrated regions, there were similar bumps smaller in size, about 1/4 cm in diameter. I also have a few bumps on my lips. The edges of my ears are also red and itchy. It has been one day since these appeared and I have taken one allergy pill, one Benadryl, and have applied hydrocortisone twice. The rash/hives have not improved or worsened as they appear visually.

1193343	4/11/2021		60	M	4/7/2021	4/7/2021	Overview of symptoms in order of occurrence: Pain in the arm; Dry eyes; Fatigue; Nausea; Headache; Chills; Joint pain; Muscle aches; Dizziness; Measured Fever; and Arm rash. Symptoms of greatest concern: Nausea, Headache, Chills for 1-2 days; and the ongoing Fatigue is now in its 4th day. Details of symptoms with time of onset, duration and severity are provided below (Note: Injection with 2nd dose of Moderna vaccine took place at 9:24AM on 07APR21): 07APR21, 10:30AM ? Arm Pain: Onset of mild pain in arm that was noticed when not touching the arm; Level of pain was a ?1? out of 10). An annoying level of pain where the pain ramped up to 3 or 4 on a scale of 10 when the arm was moved about began at 7:00PM on 07APR21 and lasted 12 hours until 7:00AM on 08APR21. The pain diminished to a mild ache for another 33 hours until it became insignificant by 4:00PM on 09APR21. 07APR21, 1:00PM ? Dry Eyes: Onset of an intermittent feeling of very dry eyes that lasted approximately 1-2 hours at a time and continued over a period of 9 hours until 10PM on 07APR21. 07APR21, 3:30PM - Fatigue: Onset of mild fatigue that steadily increased until bedtime at 10:00PM on 07APR21; and was significantly more pronounced at 1:00AM on 08APR21 (was difficult to stand and walk 20? to closet to obtain a thermometer; could not walk straight and bumped into hallway on left 4-5 times). Fatigue was rather frightening and severe from 3:00AM to 3:30AM on 08APR21 when I crawled to the bathroom, but could not get off my knees and collapsed on the floor until I could return to bed by crawling on the floor. Was able to stand again at 7:00AM on 08APR21 and walked (slowly) 30? to a sofa. Slept from 10PM on 07APR21 to 1:00AM on 08APR21; 4:00-7:30AM on 08APR21; 8:30-10:30AM on 08APR21; 11:00AM to 3:00PM on 08APR21; 7:00PM on 08APR21 to 3:00AM on 09APR21; 3:30AM to 7:30AM on 09APR21; 9:30PM on 09APR21 to 9:15AM on 10APR21; 6:40PM on 10APR21 to 7:00AM on 11APR21. Ongoing weariness continues as I write this at 11:00AM on 11APR21. 07APR21, 7:10PM - Nausea: Onset of continuous nausea that lasted 13 hours and 20 minutes until 08APR21, 8:30AM. Nausea was particularly bad with intermittent dry heaves for the 7.5 hours lasting from 1:00AM to 8:30AM on 08APR21; Nausea then came in waves for 23 more hours until 09Apr21, 7:30AM when it was finally gone. 07APR21, 7:10PM - Headache: Onset

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1193312	4/11/2021	FL	61	F	4/5/2021	4/6/2021	<p>of headache that has lasted 4 days (as of 11APR21, 10:30AM). Finally gave in and took one extended release tablet of 650mg Acetaminophen tablet about 25 hours after the vaccination (i.e., took painkiller at 10:30AM on 08APR21). Took two Ibuprofen at 9:00AM on 11APR21. 07APR21, 7:15PM ? Chills: Onset of chills that increased to intermittent shivering by bedtime at 10PM on 07APR21. Awoke at 1:00AM on 08APR21 and could not get warm. Two hours later, at 3:00AM, I felt completely opposite and could not feel cool. These symptoms gradually subsided and were gone by 7:30AM on 09Apr21. 07APR21, 7:15PM ? Joint Pain and Muscle Aches: Onset of joint pain and muscle aches that occasionally became annoying with twinges of pain. These symptoms subsided by 7:30AM on 09Apr21. 07APR21, 7:15PM ? Dizziness: Onset of mild dizziness that lasted 12 hours until 7:15AM on 08APR21. 08APR21, 1:00AM ? Measured Fever: Decided to measure temperature due to significant chills and shivering and found temperature was 101.0 at 1:00AM on 08APR21. At 3:00PM on 08APR21, my temperature was 100.2 (this was 4.5 hours after taking one extended release tablet of 650mg acetaminophen). At 3:00AM on 09APR21, my temperature measured 98.6 degrees and has remained near there ever since. 09APR21, 4:00PM ? Arm Rash: First noticed presence of a rash measuring about 2? x 3? on upper arm near the area that received the injection. Mild itchiness was present about an hour later and a topical 2% diphenhydramine gel was applied. The rash had dissipated by 5PM on 10APR21.</p> <p>Full-blown flu-like symptoms: fever, muscle pain, swollen lymph nodes, chills, tiredness, fatigue, sensitive skin, sensitive eyes, headache started in the evening of the vaccination date; acetaminophen caplets and liquid NyQuill were taken, to alleviate the symptoms; the symptoms took three days to subside On the third-fourth day ?Moderna Arm? appeared: red hot fist-size area on the shoulder of injection; resolved itself in two days On the fifth day severe skin itch all over body (back, legs, arms, scalp); and severe itch in both eyes appeared; Benadryl and cortisone cream were used on skin, which helped slightly;Visine was used in eyes, with no positive effect; The itch on skin and in eyes is still present at the time of filling this form</p>

1193307	4/11/2021	MI	25	M	4/9/2021	4/9/2021	I experienced all of the listed side effects (except, I didn't have an actual fever, I felt like I had a fever, but my temperature was normal). The chills and muscle pain were extremely intense 6 hours after I received my vaccine. I could not stop shivering, or get warm enough. That would be followed by a feeling that I was too warm and I would begin sweating profusely. I also experienced a few additional side effects I could not find listed: I felt especially sensitive to stimuli as if normal sensations were heightened (e.g. hot water in a shower felt painful, running fingers through my hair felt like I was having my hair pulled, I kept my eyes squinted because the sunlight through the windows felt too bright.) I was extremely irritable and became extremely frustrated easily. I mean frustrated to an embarrassing degree over small things that didn't matter. It was inconsistent with my day-to-day temperament. It felt like an adrenaline rush came in response to the most minor of inconveniences.
1193291	4/11/2021	GA	58	F	4/7/2021	4/9/2021	Hives all over body including abdomen, back, neck, face, eyes, scalp. Symptoms started 4/9, 2 days after vaccination. Took benadryl for itchiness. Symptoms was severe on Saturday 4/10. Benadryl could not control hives. Went to urgent care because hives were so severe and causing body ache.

1193096	4/11/2021	GA	23	F	4/7/2021	4/7/2021	Within 30 seconds of the injection of my second dose of Moderna, I experienced extreme nausea unlike any that I have experienced before. Within 1 minute of the injection, my face, arms, chest, and neck flushed and I turned completely red. I felt hot and started to sweat. At the same time, I began having trouble breathing with the sensation that my throat was beginning to close. My eyes filled with tears and I was not able to talk to communicate what was happening. My mom, who was with me at the time of vaccination, asked the administering pharmacist if I could remove my mask because I was having trouble breathing. Throughout this reaction, the pharmacist froze and was visibly in shock of what was happening. Because of this, my mom began asking me questions to figure out what else I was experiencing. Once I was able to remove the mask and breathe deeply, the reaction subsided after two minutes. The pharmacist, after my reaction began to subside, stated that they had an epipen ready to administer if needed. I was never administered the epipen. The pharmacist asked me to wait 30 minutes instead of the general 15 minutes before leaving the site. Because the symptoms went away and did not return within the 30 minutes, I left the site. After the vaccination, I experienced a low-grade fever for 79 hours, chills, a headache, muscle aches, and extreme fatigue. After realizing my reaction was not considered ?normal,? I began to research and realized these symptoms align with anaphylaxis, even though they subsided quickly after experiencing them.
1193079	4/11/2021	PA	19	F	4/10/2021	4/10/2021	Patient began feeling dizzy immediately after administration. She said she could not open her eyes/ see. She became extremely sweating and pale. She never lost consciousness but could not regain her strength/ color.
1193064	4/11/2021		53	F	3/1/2021	3/15/2021	Extreme pain head to toe. Dizziness and I passed out 28 hours after my second shot. I passed out walking to the bathroom when I felt nausea. I have never passed out before. After the second shot in March, I have also experienced slight twitching in my legs and sometimes across my temples and other locations in my head. Not visual twitching but I can feel it. Now more than one month from second Moderna and I still feel it. Will this go away?

Pain is sharp, stabbing, burning. Pain radiates down leg, and right foot numb and tingly - Overheating - Lightheadedness, blurred vision, confusion - Fainting or loss of consciousness, falling to ground Timeline of events: 2021-04-08 13:00 Injected with Johnson & Johnson 13:00 - 13:15 Very slight nausea 13:15 - 22:00 Very slight nausea and fatigue 22:30 Lymph nodes in neck feel swollen, ears feel slightly clogged (typical early cold symptoms) 23:30 Insomnia and chills 2021-04-09 00:00 - 07:30 Insomnia, poor sleep, and cycles of chills and overheating while trying to sleep or sleeping. Stronger nausea than before 07:30 Wake up, knees feel slightly weak when walking 07:35 - 07:40 While walking inside a market. Right hip joint begins to hurt with sharp, stabbing, hot pain. The pain radiates down right thigh. Right foot begins to feel numb and tingle. This pain increased over 5 minutes, to excruciating levels, with right leg feeling numb, and sharp stabbing tingles in right foot. Difficult to walk normally 07:40 - 07:45 Pain becomes unbearable, and market counter used for support. Begin to feel light headed. Begin to feel hot, and begin to overheat within ~2 minutes. Walk outside market (outside temperature 32 - 40F) to cool down. Lean on car hood for support, and become increasingly lightheaded. Vision becomes blurry. Stumble and fall onto face. Regain consciousness after unknown time, groggy and with blurred vision, lightheaded feeling. Attempt to stand and fall again onto face. Regain consciousness after unknown time. No longer feeling extremely hot. After roughly 1 minute, regain clear vision and lucidity. Pain in hip and leg completely subsided 07:45 - 09:00 Driven to hospital. Treated by hospital staff for laceration in forehead requiring 7 sutures. EKG reports normal. Concussion check negative. 09:00 - 00:00 Occasional nausea, fatigue, weakness (same as weak cold) 2021-04-10 11:00 While walking and standing in line. Right hip joint begins to hurt, with pain radiating down right thigh. Right foot begins to feel numb and tingle. Begin to feel warm. Hip Pain remains at manageable level, and walking normally is easy. Hip pain is roughly 1/3 of pain of 2021-04-09. 2021-04-11 07:30 - 11:00 Occasional slight pain in right hip and left hip joints. Hip pain is sharp and

							burning, and roughly 1/10 of pain from 2021-04-09.
1194970	4/11/2021	WA	26	M	4/11/2021	4/11/2021	Patient was sitting for his 15 minutes. At about 5 minutes after his vaccine he passed out and fell off his chair to the floor. The Pharmacy intern noticed that the color of his skin was like a purple and he was passed out. When she started to approach him he started slowly moving his head and adjusting his eyes. He said he felt really dizzy and we had him lay down. He was very sweaty and was shaking a little bit. I took his blood pressure at 11:53 and it was approximately 124/93. He was responsive but feeling dizzy and warm and I stayed with him until the paramedics arrived at about 11:54
1195167	4/11/2021	MA	69	F	4/8/2021	4/8/2021	Left eye watering and slight loss of eye sight in left eye. Pains, body aches and upset stomach. The first dosage did not have any of these affects
1194950	4/11/2021	NY	24	M	4/8/2021	4/10/2021	Began feeling delirious around 7:00pm - uneasy and strange. Upon walking to the subway station, I felt overwhelmed with sudden depressive thoughts and anxiety. On the Subway, I had a very severe, and disturbing panic attack. My vision became blurred and distorted, my heart rate spiked, and I became nauseous and extremely frightened. I sat down to try to maintain a sense of calm - but got off the subway after a few stops and met with a friend whom I had texted, to take care of me. From the point on, I was very shaken and agitated, and have been since the event. I have never experienced anxiety, depression, or any such symptoms in my life before, nor was I nervous or anxious about having received the vaccine. The onset of the event was sudden, and seemingly out of nowhere, without real purpose, hence my conviction that it may have been spurred as a side effect from the vaccination. I went to Urgent Care Sunday morning, April 11th, the morning after the event. My resting pulse was 97 BPM (normally 52-54) - and my blood pressure much higher than normal - 175/110. The doctor insisted I go home "and relax". I still feel uneasy and shaken from the event.

1194931	4/11/2021	CA	54	F	4/7/2021	4/7/2021	I am allergic to bananas usually my teeth start to hurt and my gums hurt and then my left eye swells up. I also get pain in my left eye. Approximately 4 hours after the covid-19 vaccination 1st dose I experienced the same allergic reactions except from my left eye swelling up. I felt the same exact symptoms when I eat banana teeth hurt gums hurt and then my left eye started to hurt but my left I did not swell up like it usually does when I eat the banana. The itching and pain in my mouth I completely went away after about 2 hours
1194900	4/11/2021	NJ	34	F	4/7/2021	4/7/2021	Radiating pain on the arm to the face; decrease facial sensation to the left; tongue deviates to the right; numbness on the left side; face, eyebrows, mouth all are drooping; left side weakness
1194898	4/11/2021	UT	58	F	3/12/2021	3/12/2021	When I got to the car my face felt hot and flushed, but went away. then about 45 mins later I felt dizzy and my feet, hands and tongue were tingling . I kept having dizzy feeling and light headed. The next day I felt nauseated and had blurry vision with not tingling in hands or feet. I felt Anxious and my heart was vibrating, I still felt light head and would have dizzy spells. On the 3rd day after the vaccination I felt like I was having a hard time breathing.
1194891	4/11/2021	NC	58	F	4/9/2021	4/9/2021	Vaccinated at 12:00pm Around 6:00pm started to get a really bad headache at the back of my head. This lasted all night, preventing me from sleeping. Finally fell asleep around 5:30am still with a really bad headache. Woke up at 11:00am. Brushed my teeth and started to feel nausea. I went back to my bedroom and I got lightheaded to where my vision was blurred. Layed on the bed and felt really bad with a sweaty face and still nauseas. Had someone bring me grapes and some tea and layed there. I felt bad for about 45 min. then I fell asleep. Got up about 3:30 hours later feeling better, but not 100% Still a bit of a headache but nausea went away. Today I feel back to my normal self. I thought you'd like to know I did experience some of the side effects for your records.

1195385	4/11/2021	IA	48	F	3/19/2021	4/1/2021	My first on 03/19/2021 went smoothly, just sore area of shot. They had me wait 15 minutes after just in case adverse reaction. On 04/09/2021 came back for second round. The nurse gave me my 2nd shot and said they don't make patients wait after injections, I left the facility and by the time I reached my car my tongue had swollen up, went home and later that night my husband and kids asked what was wrong with my eyes - both my eyes were bloodshot red and swollen. On 4/10, my left eye was better but not my right. I have had brain fog, not being able to remember short memories all weekend. I plan to call my doctor in the morning. As a woman, I felt morally obligated to share my side effects.
1194321	4/11/2021	NJ	24	M	4/10/2021	4/10/2021	Worst headache I've ever had (8 out of 10 pain scale), could not sleep due to the headache, very lightheaded, entire body ached (could barely move), eyes hurt, highest fever temp 102.8, nausea (at times I thought that I may have to puke). These symptoms lasted all night, but felt better in the morning. These symptoms were like COVID but x5. When I had the COVID-19 virus, my symptoms were not as bad as yesterday's adverse effects from the vaccine. At 3 AM, I was considering going to the hospital and I have never been hospitalized before. I could barely open my eyes since the headache was so bad.
1194256	4/11/2021		41	M	4/11/2021	4/11/2021	Presyncope (lightheadedness, nausea, blurry vision). Normal vitals. Symptoms improved with supine rest and oral rehydration.
1195497	4/11/2021	GA	46	F	4/8/2021	4/8/2021	in about 5 hours after the shot, I started having very strong chills, body aches, headache, nauseous, eyes hurt, abdomen pain. Symptoms continued for about 20 hours (bed rest, not capable to do anything). horrible headache at night time. No fever. Felt chills and feeling hot sweating during the night. Took Tylenol 2 times. dull pain in the shot area, pain distributed under arms around breasts. tender breast and nipples on 3rd day (Sun) after the shot. Lost appetite for about 2 days (body weight 3 pounds less).

1195480	4/11/2021	TX	27	F	3/25/2021	3/25/2021	Was administered covid vaccine J&J on left arm felt a burning sensation just after it which i knew it normal you just got a vaccine. Walked to the observatory area where we are supposed to wait 15min until you are released to go. Well less than 10 min in the observation area that?s when i started to feel un well my body started sweating excessively and thats when i felt numbness on my right side of my head with a tingling sensation couldn?t hear with my right ear and i freaked out when i started to get blurred vision thats when i knew something was wrong i got up to ask for water once i got up i felt like i was going to faint and felt really dizzy. Once i got to the lady that was there in the observation area she was shocked at how i looked she told me to go sit down and brought me water as she called the ambulance. Once i was sitting down and was brought water i drank like more than half of the water and the numbness was going down from my right side of my head but still had blurred vision and just felt disoriented and not my self. The ambulance took me to the ER once i got there i felt a little better but still disoriented and dizzy. So disoriented that i left the hospital with me actually realizing i had to stay there to get checked because they kept saying i was fine.
1195425	4/11/2021	NY	38	F	3/31/2021	4/2/2021	Vertigo Started in the morning all day Felt dizzy ,off balance , eyes were heavy Took Tylenol and gravel for motion sickness did not help lasted all day. Later in day I took a THC medicinal gummy helped me feel a lot better. Symptoms went away by night. I was exhausted from the vertigo. Scared me because it affected my eyes.
1195095	4/11/2021	CA	57	F	3/14/2021	4/5/2021	Shingles affecting the left eye and surrounding area. No prior experience with shingles.

1195267	4/11/2021	WA	35	M	4/6/2021	4/6/2021	DURING COVID VACCINATION CLINIC, DIVISION 1 EMPLOYEE ASSISTING WITH POST-VACCINE OBSERVATION REPORTED TO PHARMACIST THAT A PATIENT WAS FEELING LIGHTEADED. SHE IDENTIFIED PATIENT WHO WAS DISTRESSED AND APPEARED UNSTEADY. THE PATIENT REPORTED THAT THEY HAD TUNNEL VISION AND FELT VERY LIGHTEADED. PHARMACIST ASKED THE PATIENT TO REMAIN SEATED AND TRY TO TAKE SEVERAL DEEP BREATHS WHILE THE PHARMACIST HELD THE PATIENT'S LEFT SHOULDER TO ENSURE HE WOULD NOT FALL IF SYNCOPE OCCURRED. THE PATIENT HAD FLUTTERING EYELIDS AND APPEARED LAPHORETIC AT FIRST, BUT AFTER SEVERAL MINUTES RECOVERED SOMEWHAT. THE PATIENT REPORTED THAT HE HAD RARELY HAD SIMILAR EPISODES IN THE PAST DURING SOME MEDICAL PROCEDURES, BUT NEVER ASSOCIATED WITH A VACCINATION. PHARMACY TECHNICIAN HAD A D1 EMPLOYEE RADIO FOR A CODE WHITE AS SHE CONTACTED 911 ON HER CELLULAR PHONE. PARAMEDICS ARRIVED AND ASSESSED THE PATIENT'S HEART RATE, SEATED BLOOD PRESSURE. AND STANDING BLOOD PRESSURE. THE PATIENT REPORTED FEELING SLIGHTLY LIGHTEADED WHEN FIRST STANDING, BUT MUCH IMPROVED OVERALL. THE PARAMEDICS INDICATED THAT THERE DID NOT SEEM TO BE A MEDICAL EMERGENCY BY THIS POINT AND EXPRESSED CONCERN THAT THE PATIENT MAY BE DEHYDRATED BUT THE PATIENT REFUTED THIS POSSIBILITY. HE ALSO STATED THAT HE HAD NOT RECENTLY OVEREXERTED HIMSELF AND HAD EATEN LUNCH EARLIER THAT AFTERNOON. PHARMACIST PROVIDED THE PATIENT WITH GATORADE AND ICE TO IMPROVE BLOOD SUGAR, ELECTROLYTE, AND HYDRATION STATUS AND THE PARAMEDICS DEPARTED. THE PATIENT REMAINED FOR APPROXIMATELY 30 MINUTES UNTIL HE WAS FEELING CLOSE TO BASELINE AND FELT COMFORTABLE LEAVING.

1194417	4/11/2021	FL	57	F	4/11/2021	4/11/2021	<p>Patient received vaccine at 1153am in Left Deltoid, walked 20feet to observation area to wait 15 minutes in an armchair with arms under observation of staff. Was alert until 1156am when husband alerted staff that she was feeling very light-headed and nauseated. Pharmacist rushed over with hand-fan, but noticed Patient had started to become unresponsive. 911 Emergency response activated, ambulance on route. Pharmacist noted open eyes, glassy, there was no response to voice. She was sitting stable in chair husband and pharmacist at side. Pharmacist noted normal breathing and pulse. She was warm and sweaty to the touch. We kept talking to her, keeping the fan on her to keep her cool. Purse strap was removed from around her shoulders. Pulse and breathing still normal. She then came out of the syncope episode at 1159am. She was alert and oriented to time/place/person/self. Color returned to normal. Emergency services arrived approximately 3-4 minutes later. She was advised that it was a syncope episode that should be followed up at hospital/urgent care. She signed AMA with emergency ambulance services. She stayed in pharmacy under care of pharmacy support and store staff with water/fan staying seated whole time for additional 30 or so minutes until she and husband elected to leave the store.</p>

1194766	4/11/2021	CA	62	F	2/11/2021	2/11/2021	As I was driving away from vac site, I became increasingly disoriented and could not navigate a very easy route home which should take about 40minutes. Suddenly unable to read freeway signs or judge distances, or speed on the freeway. Light began to hurt my eyes, headache pounded & became extremely nauseous and tired. Got off fwy, because I didn't feel safe, planned to take surface streets, but became so disoriented (on a route I know well) it took about 1 1/2 hours to get to a familiar location that should have taken 20 mins. Kept making wrong turns even when using maps. Finally, had to call my husband to pick me up. Couldn't make it home & I use this route often and have been for over 20 years. Once home, extremely tired for about 3 days. As the weeks went by my disorientation did not completely go back to normal. I still am impaired (compared to my normal functioning). Unable to juggle a few items in my head as I normally do. My brain feels foggy & I am having memory issues with things that are routine. When I went to have my hair colored on 2/26/21 my hair looked the same as always afterward, but when I returned 4/1/21, I had lost about 1/3 of my hair -- it began falling out each time I brushed it or washed. It seems to have stopped falling out for now.
1194744	4/11/2021	NY	64	M	4/6/2021	4/9/2021	Partial facial Paralysis--eye wont close; eyebrow unaligned with other, eye tearing; side of mouth distorted, cant smile, drooling from side of mouth
1194694	4/11/2021	VA	26	F	4/11/2021	4/11/2021	Patient walked to her seat in the observation ear and sat down. Within 1 minute she jerked back and fell to her right side hitting her head and face on the glasses display and landing sprawled out on the floor. She had her eyes wide open. She was not aware she fainted and was completely conscious. Her blood pressure was 123/70. 911 was immediately called. The EMTs took her to the ambulance due to low heart rate when they arrived. She ended up leaving on her own accord
1194676	4/11/2021	OH	33	F	4/10/2021	4/11/2021	I woke up at around 3:30 in the morning to get some water and take Advil. While walking to the couch, my husband stated I dropped the water, basically blacked out, and he said I was unconscious, eyes opened and kept walking until I ran into the wall/tv and fell to the ground when I became conscious again.

1190419	4/10/2021	CA	32	M	4/10/2021	4/10/2021	Approximately 2 minutes after the patient received the vaccine, the patient had other questions and while talking about the vaccine, the patient's eyes rolled back and he experienced a vasovagal reaction (syncope). Although he was sitting in a chair, his head fell to the left and his forehead bumped the table. The patient's legs were elevated and his upper body was laid back. Ammonia inhalant was crushed and immediately placed under the patient's nose. The patient came back to consciousness approximately 30 seconds after passing out. Patient was asked what symptoms he felt leading up to passing out. He said that he suddenly felt dizzy and does not remember much after. Patient states that he did not eat breakfast prior to receiving the vaccine and has a history of not doing well with needles or vaccines. He states that he now feels completely fine, however, the patient was advised to stay 30 minutes for monitoring, and once he felt comfortable standing up, a nurse walked with him to the observation area. Patient was provided an ice pack for his forehead. Observation nurse was notified of the adverse event and is now monitoring the patient.
1190299	4/10/2021	GA	43	M	4/9/2021	4/9/2021	Pt had 1st dose of Moderna vaccine yesterday 4/9. Less than 5 min after vaccination pt had some jerking of limbs lasting about a minute per nurse & wife account. No LOC, no foaming at mouth, no incontinence. Did have eye deviation upwards & was groggy for about a minute but quickly was alert & able to answer questions & had a normal MSE. Vitals stable. Pt reports he is afraid of needles/blood. No hx of seizures & not on any meds. He also reported he felt faint after receiving vaccine. He was sent to ER by ambulance for further evaluation of possible seizure. Spoke to pt at home today 4/10, had ER evaluation - lab tests and heart studies; no radiological studies. All results normal. Pt reports he is feeling fine and has had no further symptoms or side effects. Recommended pt to discuss with PCP whether to take 2nd dose Moderna.

1190306	4/10/2021	FL	35	M	4/9/2021	4/10/2021	Severe joint stiffness and pain, mild relief with Aleve. Severe Headache/ Migraine, so far with Aleve, Tylenol and Hydrocodene, no relief. Cold compress over the eyes seems to help with comfort but pain remains. Considering ER visit.
1190325	4/10/2021	IA	62	F	4/9/2021	4/9/2021	After the shot i had slight swelling in my neck glands, not too bothersome. Severe insomnia up from 10 pm to 5 am , really bad headache, pain pressure in my ears, { Couldl feel my heart beating in my ears } Took acetamiphen and cold compress to the head and eyes, seemed to help. Awake at 10 with no further symtoms so far.
1190348	4/10/2021	IL	49	F	3/31/2021	4/8/2021	8 Days after first injection almost fainted while driving. Heart raced and felt hot/clammy/dizzy/blurred vision. Lasted for 20 minutes. Continue to feel light headed, occasionally dizzy, and brain fog since then..
1190368	4/10/2021	IN	42	F	4/8/2021	4/8/2021	-Recieved shot about 3pm -During the 15 min waiting period my eyes felt kind of dry and "weird". I honestly didn't even consider it could be a reaction, I thought the way I was breathing through my mask must have been drying my eyes out. -Left clinic after 15 mins, only symptom at this point was dry eyes -about 5 mins in to our drive home my face was feeling very funny and kind of numb. I was feeling worse and worse. -looked in mirror and noticed face was bright red and swelling up. Also my throat was fire red. -it was getting worse and worse, also was starting to get itchy. -My entire face was bright red -Stopped at Sister-in-law's house (cause it was on the way home and she is a nurse) and took two benadryl. Was observed for another 20 mins there and the reaction started to calm down. The redness was still there, but the swelling seemed to have stopped. -went home and kept a close eye on it the rest of the night. - became itchy, but no rash. The bright redness went away after about 20 mins, but my face stayed red (like a sunburn) most of the evening. Throat was red as well. - felt fine when waking up on 4/9 and no other instances of these symptoms -sore arm 4/8-4/10

1190639	4/10/2021	TN	61	M	4/7/2021	4/9/2021	Morning of 4/9/2021, mild headache. Also cough that lasted about 10 minutes. That night, headache become more severe, swelling, inflammation in right eye. Also burning in right eye, similar to peeling onions. Damp clothe to eye provided relief. Acetaminophen relieved pain.
1189999	4/10/2021	GA	27	F	2/2/2021	2/1/2021	I contracted pink eye and was treated with steroid drops around the same time as my shot. I believe it was 02/10 when my first pink eye symptoms appeared. My mother and son also had it a week prior so I was not alarmed. However, since then, I've been diagnosed with uveitis after the pink eye infection cleared, and have had continuous issues with extreme dry eye and vision changes. My eye doctor is thinking potentially an autoimmune issue, I'm seeing the diagnostic clinic to hopefully uncover this, but I've never had such eye issues before. I've had some eye fatigue that affected my vision in college due to sleep deprivation, but nothing like this. The chronic pain I'm dealing with has been worsened. This could be autoimmune and a random event, or it could be autoimmune undiagnosed that was trigger by the vaccine, or it could be just the vaccine. But since I believe in medicine and vaccines, I believe it is my duty to report the potential issue so that others and research could benefit from my experience should this be related.
1190501	4/10/2021		69	F	4/8/2021	4/9/2021	24 hours after the 2nd shot I got tired, dull headache, low grade fever, and neck & shoulders were achy. Eyes felt like I was sick. I rested all afternoon and evening and was fine the next morning. None of the reaction was severe just uncomfortable. It was worth it if the shot works.

1190245	4/10/2021	GA	55	F	4/7/2021	4/7/2021	Three waves of discomfort... felt like ice water was poured inside of my body. Extreme weaknesses of arms/legs. Visual issues. First wave within 60 seconds of shot (ended up on floor - embarrassing!). Second, and most severe, wave about 10 minutes later while sitting in chair. Apparently, I passed out with my eyes open. Hubby got nurse. They said I was unresponsive. Nurse checked blood pressure and heart rate after second wave - both normal. Third wave, much less severe, hit after 10 more minutes. Ice water/weakness feeling in arms and legs and not so much in chest area. Nurse speculated it could be low blood sugar (based on medications). Have never had low blood sugar event previously AND had eaten about an hour prior to vaccination. However, drank 4 ounces of orange juice, just in case. Went home about 20 minutes later... no other significant side effects. No swelling/redness at injection site. No other illnesses, etc.
1190107	4/10/2021	GA	40	F	4/8/2021	4/8/2021	2 hours after injection I had blurred vision, which led to a migraine. Prior to the vaccine, I haven't had a migraine in over 10 years. While having blurred vision, sat down with tea and lost my sense of taste and could not taste anything until my vision got back to normal. (approximately an hour later.) I took Ibuprofen as soon as blurred vision started. Next morning I woke up to mouth sores all over the inside of my mouth.
1190642	4/10/2021	MN	19	F	4/9/2021	4/10/2021	I woke up with a headache at 7:30 am and a dry mouth. I got out of bed to get my water bottle, which exacerbated the headache. I tried to go back to sleep but kept waking up to drink water every half hour or so, until 10:18 am. I got out of bed to fill my now-empty waterbottle. The headache rotated and became more intense as I got up. I could only walk very slowly and tried to keep my eyes closed. Around 12:00 pm I took one tylenol. The headache is still present. It is not located in any specific part of the brain but moves around depending on if I'm sitting, standing, or laying down. During that time I also felt nauseous, but I no longer do.

1190944	4/10/2021	NJ	75	M	2/3/2021	2/19/2021	Two weeks after the first dose he was hospitalized with Covid 19; Two weeks after the first dose he was hospitalized with Covid 19; The only thing that got worse was the kidney problems after he came out of the hospital; The only thing that got worse was the kidney problems after he came out of the hospital; He cannot see too good (visual impairment); lost weight (weight decreased); This is a spontaneous report from a non-contactable consumer. A 75-year-old male patient received bnt162b2 (BNT162B2, Lot Number: EL3302), dose 1 intramuscular, administered in Arm Left on 03Feb2021 (at the age of 72-years-old) as SINGLE DOSE for covid-19 immunisation. Medical history included blood cholesterol, blood pressure measurement, cardiac disorder (He was taking medications for cholesterol, blood pressure and his heart) and glaucoma (They were started prior to the vaccine and he did not think they were relevant. He has issues with Glaucoma), diabetes mellitus (He checks his sugar and is diabetic), renal disorder and prostatic disorder (He has issues with Glaucoma, Prostate and Kidney). The patient's concomitant medications were not reported. The patient experienced two weeks after the first dose he was hospitalized with covid 19 (drug ineffective), (covid-19) (hospitalization, medically significant), He cannot see too good (visual impairment), lost weight (weight decreased) on an unspecified date. It was reported that his father received first one the beginning of Feb2021. By the second week in Feb2021, he got sick with COVID and was in the hospital for almost a month. He missed the second dose. He would like to know where can he get second dose. When can he get second dose and how long does he have to wait before getting after having COVID. He also wanted to know if it will still be effective after waiting this long. He is out of the hospital after going in. His father's name is (Name) He lost weight while in the hospital after he got the first COVID vaccine. After he got the first COVID vaccine, he ended up in the hospital with COVID virus. There was no prescriber. Where he lives, it is a senior housing center, and they were giving it out there. He could have been sick a week before, but when he came to see him, he immediately called the ambulance and they took him in. Since he has ben out of the hospital for a few weeks, he cannot see too good. It started a couple of days before he got out and since then

A 56-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Formulation: Solution for injection, Lot number: EL9261), dose 1 via an unspecified route of administration on 27Jan2021 as single dose for COVID-19 immunisation. Medical history included COVID-19 (in fall) and allergic to Penicillin (a very long time ago as child and she got a fat upper lip from it). There were no concomitant medications. She had her first dose 27Jan which was 90 days after she had COVID. On 27Jan2021, 30 minutes after the vaccine, the patient experienced she had COVID and also had COVID like symptoms after receiving the first dose, tingling sensation on the mouth/ sensation of tingling around her lips, skin very tight/ face very very tight/face got very tight around her nose, cheeks, and under her eyes and first half of her tongue started feeling thick. The physical assistant examined her and said it didn't not look swollen. She asked her doctor about this and she was given 50 mg of Benadryl at the vaccine site, approximately 1 hour say after the shot or either 1 hour after her symptoms but it was approximately during that time period. She was wondering if she can take the second dose. The patient did not used any other product. The episode lasted about 3 hours she would say. She is not one to have a lot of allergies. She is in good health. She does not have any issues or diabetes or any type of medical condition. She says it has recovered completely. The patient asked whether to take this vaccine every year and wanted to know if she absolutely needs to take the second shot for full protection. According to her she had COVID and also had COVID like symptoms after receiving the first dose. Would she have developed enough antibodies to protect herself that the first dose would be considered like a second shot. She heard people generally have COVID like symptoms after receiving the second shot. She is just trying to understand if she need to take a second dose or one dose is enough. She has been reading what the</p>

1190734	4/10/2021	OH	58	M	3/20/2021	3/29/2021	palsy bell; This spontaneous case was reported by a consumer and describes the occurrence of FACIAL PARALYSIS (palsy bell) in a 58-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 006B21A) for COVID-19 vaccination. The patient's past medical history included No adverse event (No Medical History was reported). On 20-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intra-arterial) at an unspecified dose. On 29-Mar-2021, the patient experienced FACIAL PARALYSIS (palsy bell) (seriousness criteria hospitalization and medically significant). The patient was hospitalized on 29-Mar-2021 due to FACIAL PARALYSIS. At the time of the report, FACIAL PARALYSIS (palsy bell) had not resolved. Not Provided For mRNA-1273 (Moderna COVID-19 Vaccine) (Intra-arterial), the reporter did not provide any causality assessments. The patient went to the ER on 29MAR2021 because he had facial paralysis, trouble talking, couldn't shut his eye or smile. Patient was diagnosed with bells palsy (ongoing) tx: prednisone, antiviral for a wk - bells palsy, facial issues tylenol 500 mg for headache
1190628	4/10/2021	WA	50	F	4/8/2021	4/10/2021	I woke to my eyes looking weird. The whites of both eyes are not white as they normally are. It appears that all the small blood vessels in both my eyes are bloodshot. No pain or itching so I'm reporting as a side effect of the vaccine. I was very fatigued and achy post injection so remained inside and resting until this morning. I am currently more fatigued than normal but not enough to cause concern. I checked my body and there is no bruising or unusual discoloration to my skin. I have no ?hot spots? or irregular limb swelling. My temperature is normal for me at 97.54. Post injection, yesterday, I was very achy, headache and back of neck pain lasting 24 hours and a slight fever. I did not take any medication.

1190505	4/10/2021	CO	48	F	3/25/2021	3/25/2021	3 minutes - racing heart, then dry mouth 7 minutes dizziness and legs weak with low BP, 15 minutes headache and photophobia, 12 hours worsening weakness moving into arms, following day diarrhea, blurred vision, by the 2nd day constipation dysuria, worsening ataxia by day 3, 1 week after unable to move R leg, admitted to hospital 4/1 and discharged next day. Readmitted 4/6 unable to move arms and move bowels/urine.
1190637	4/10/2021	VA	58	M	3/27/2021	3/28/2021	On the morning after the second vaccine, I awoke with a bad headache. I was expecting something like this so I didn't worry about it. Within a couple of hours, however, the headache began to include migraine-like visual disturbances primarily in the left eye field of vision. The pain got worse. I took Tylenol as I was advised not to take ibuprofen. The headaches and visual disturbances continued intermittently for a couple of weeks. (The headaches are still here at a low level. The visual disturbances/flashes disappeared after 12 days.) While I was having the migraine-like symptoms, after about two or three days, I developed additional visual problems in my left eye. There was like a gray nebula of strands in my visual field. I went to the ophthalmologist on 4/6/21, 10 days after the shot. She diagnosed Posterior Vitreous Detachment (PVD). While she knew of no mechanism for the vaccine to cause this, I am reporting this as the headaches, visual disturbances/flashes, and the PVD developed immediately after the second Pfizer shot, headache rolling into flashes rolling into PVD nebula. The doc said this may or may not go away after a while. We shall see.
1190620	4/10/2021	ME	37	M	4/10/2021	4/10/2021	Patient was administered the COVID vaccine and felt fine. He relocated to our pharmacy waiting area for observation. Once there he started to read the provided material (EUA, V-Safe) and started to feel anxious. He said the next thing he knew he was sweating and had tunnel vision. He wasn't 100% sure he passed out. A fellow associate helped him to the ground and elevated his feet. We got ice for behind his neck, and a cold cloth for his forehead. We took his blood pressure and it started to come back up. He waited for about 30 minutes before leaving. His color had returned and he stated he felt fine.

1190618	4/10/2021	NY	26	F	3/20/2021	3/20/2021	About 12 hours after injection, I started feeling achey 13 hours later, I had a spell where I could not hear anything and felt as if I wasn't in control of my body- in talking to medical personnel they say what I'm describing is what happens right before one passes out. I came out of it within 10 minutes. 16 hours later I had a 102 fever. Took Tylenol Felt fine 24 hours later 32 hours later I started to get a headache and light sensitivity. Fever back to over 99- low grade for me. 35 hours later I had such a bad headache and light sensitivity. I couldn't watch tv, be on my phone, or look at a computer screen. I also started to get bouts of nausea. 38 hours later, I vomited for the first time. Same symptoms as what I described last. 42 hours later, I vomited again. 48 hours later - 5 days later, light sensitivity and migraine symptoms continued , but improved slowly each day. 6 days later, all previous symptoms were gone. I woke up with a bump in my inner eye. Slowly went away throughout the day, then developed a itchy, red bump in between my lips and nose, that progressively got bigger throughout the day and made my lip swell. Bump was about 2 inches in diameter at its biggest. Took Claritin, cleaned face with alcohol, and by 24 hours later it was not noticeable. 8 days later, the bump appeared again in between lip and nose on the opposite side of my face. Took Benadryl, bump slowly went down throughout the day. By 24 hours later it was gone

1190573	4/10/2021	CA	22	F	4/10/2021	4/10/2021	<p>HPI: Patient is a * year old * who presents following administration of a single dose of J&amp;J COVID19 vaccine in the left deltoid. About 20 minutes following administration of the vaccine, the patient started to experience numbness in the left shoulder to the left neck and post auricular region. Patient denies allergies to medication, food, and other vaccines. She states she has never had a similar experience. She declares a past medical history of asthma that is controlled with rescue inhaler and oral medication. She has not taken the medication for the past week and uses her rescue inhaler 2-3 times per week, particularly when she exercises or coughs too much. She affirms numbness of the left neck, left shoulder, She denies chest pain, difficulty breathing, swelling of the face/lips/tongue/throat, skin rash/itching, cramping abdominal pain, nausea, and vomiting.</p> <p>Exam (update as needed): GEN: Alert and oriented x 4, NAD. HEAD: NCAT EYES: PERRL, EOMI ENT: Decreased touch sensation in the left post auricular region and left posterior neck region. Normal ROM and 5/5 strength of the neck. Right ear normal, Nose normal, OP normal, no evidence of angioedema NECK: Supple, without LAD. CV: RRR, no m/r/g PULM: Clear to auscultation bilaterally, no accessory muscle use ABD: Soft, no tenderness. SKIN: No rashes, skin warm and dry. No erythema or edema of the injection site. MSK: FROM of the bilateral upper extremities and neck, MS 5/5 bilaterally NEURO: Alert and oriented x 4, CN 2-12 grossly intact, no ataxia, gait steady. Decreased sensation of the left post auricular region, left posterior neck region, left shoulder, left bicep compared to the contralateral side. Clinical Impression/Field Tx: Possible peripheral nerve injury secondary to vaccine administration. Patient not displaying active signs and symptoms of anaphylaxis. Patient demonstrated ability to adequately control airway and secretions. The patient was experiencing decreased sensation on the ipsilateral side of the vaccine site compared to the contralateral side. Muscle strength was 5/5 bilaterally. CN II-XII were grossly intact. Patient offered further evaluation by EMS, however, patient declined as she has an appointment with her PCP on Monday and would prefer to address it there. Instructed patient to consult their PCP regarding the post-vaccination reaction. Patient states she has an appointment on Monday. Patient instructed to go to</p>

							emergency department should the area of decreased sensation increase in size or if they develop chest pain, difficulty breathing, difficulty swallowing, swelling of the face/lips/mouth/tongue/throat, or cramping abdominal pain with nausea/vomiting, as these are signs of possible anaphylaxis that requires immediate intervention. Medications administered: None Disposition: Home
1190551	4/10/2021	IL	18	M	4/8/2021	4/8/2021	Patient had the injection, reported that is wasn't bad and then within a few minutes when in the waiting area, he reported feeling very light headed, nauseous, and lost his vision and hearing was fuzzy. He was cold and clammy. He never lost consciousness. It took him a couple minutes to "come back" to alertness and feel better. Severe headache, chills starting and began asthma symptoms (wheezing) at 11:30pm the night of the injection.. 2 extra strength Tylenol did not help. He was very cold and the headache did not let up after several hours. Eventually he had a bout of sweats and he reports he was soaked. In the morning, at 8 am the headache was still severe...was sensitive to noise, light and touch. He was given 2 extra strength Tylenol at 8 and then 2 Advil at 10am, which finally began to reduce symptoms. He was not hungry, felt weak, and finally by late night he was feeling better. In the morning on Saturday he awoke with a swollen left eye and blood shot in that eye.
1190532	4/10/2021	CA	27	M	4/10/2021	4/10/2021	This vaccine is extremely illegal. Terroristic. I have been having such an extreme headache. Blurnyness, to the point where I have blindnesss. I am unable to think. My speech is completely off. I try to say something, but what I say is not what I was thinking. Don't you dare say I have something wrong with me, in regards to unable to articulate what I want to say, and what is actually being said. I understand what is happening to me with this reality. Which is why this vaccine is terroristic. Im going to make it my life endeavored goal to resolve this in legal entities. For that. This is not helping anyone. Causing more pain. And. Allowing the government to lie even more. I hate this Country!

1190527	4/10/2021	GA	44	F	4/9/2021	4/9/2021	We had a member come back for her second dose of the Moderna vaccine. It was administered and she was given a timer to wait her 15 minutes. She turned in her timer at the end of the 15 minutes and told us she was leaving. A few minutes later she came back and stated that she was not feeling well. I told her to have a seat and went to check on her. She stated that she was having pain down her arm where she was given the vaccine and down her left side. Then she stated she was itching. I could see her starting to turn red with hives/rash on her left arm where we administered the vaccine. stayed with the patient in front of the pharmacy while I ran into the pharmacy and got the blood pressure machine, Benadryl, EpiPen, adverse reaction chart, and cold pack. I asked to grab pen and paper and take notes as we ran back out. Her itching was becoming more severe, and she stated she was feeling lightheaded. We immediately began checking her blood pressure (which was extremely high at 187/120) and administered 50 mg of Benadryl. We applied a cold pack to her neck as it appeared she was sweating and then applied a cold pack to the injection site. She continued to progress with the itching moving to other sites on her body. I asked one of the technicians to get the other pharmacist to call 911 and a code white was called. She was in a chair without arms, and I needed to have her lay down. I also had five more people waiting for vaccine administration, so we moved her to the break room. We continued to monitor her blood pressure, which was dropping, and watch for signs of anaphylaxis. She stated she was feeling really tired and began closing her eyes. We continued to have her talk with us and not go to sleep. We had EpiPen's ready for administration if needed. The EMS arrived as we were checking her BP once again and they took over. She was placed on a stretcher and taken into the ambulance. Assistant had a curbside delivery a little while after the incident, at this point the EMS decided that her blood pressure had normalized, and the Benadryl was enough to control her allergic reaction and she was released to go home.

1188469	4/10/2021	AZ	61	M	3/19/2021	3/26/2021	<p>March 26, 2021: One week to the day after receiving my second dose of the Pfizer COVID19 vaccine, my right eye suddenly had double vision and facial pain behind the right eye and all around the right eye (forehead, right temple, around to under the right eye on the cheek). The right eye would not move correctly. March 27, 2021: I went to see Optometrist. He performed an eye exam with dilation and stated that the right eye was slow to track, and that the nerve behind the right eye was inflamed. He recommended blood work, CT scan, and an MRI. March 27, 2021 ? March 28, 2021: We went to ER at 9:00pm. After waiting six hours, I finally was able to see an ER doctor. No medical history was taken. No bloodwork was done. ER Dr performed a CT scan as Dr requested. CT scan w/o contrast showed no masses or hemorrhages. ER suggested to follow-up with Nuerology. March 29, 2021: Went to Neurologist and he examined me. He called in another Dr for a second opinion. They stated that it may be a possible cranial nerve palsy and ordered multiple MRIs. March 29, 2021: The earliest MRI appointment available was April 7, 2021. Scheduled the MRI. April 1, 2021: Had blood drawn at lab as Dr requested. April 2, 2021: Two weeks from the day of COVID19 vaccine #2, my right eyelid would not open at all and the pain was getting worse. April 5, 2021: Went to ER at 4:30am. Triage nurse sent me straight to an ER room and within minutes an ER doctor was there. Within 15 minutes after seeing the ER doctor, a Neurologist was examining me. The nuero doctor was very thorough. While waiting for the MRI, other neurologists and residents also examined me. MRI scans with and without contrast were performed. MRI images were clear ? no tumors, no aneurisms, and no stroke. They concluded that it was a micro-vascular injury to cranial nerve #3. (Similar to the Bells Palsy that I had in 2015.) They prescribed gabapentin to help calm the nerve pain. Follow-up will be with nuero-ophthalmologist.</p>

1188812	4/10/2021	NJ	21	F	3/3/2021	3/3/2021	serious allergic reaction; breathing was labored; red scratch marks all over her upper body; heart beat was getting very rapid; vision was wonky; right eye was swollen; face was beet red; nauseous; A spontaneous report was received from a consumer's mother who state's a 21 year female experienced a serious allergic reaction(hypersensitivity) to the vaccine. The patient's medical history was not provided. Concomitant product use was not provided by the reporter. On 03-MAR-2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Batch number: unknown) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 03-MAR-2021 around 15:00, she received the Moderna COVID-19 vaccine in her left deltoid muscle at Shop Rite Pharmacy. 6 hours later she noticed red scratch marks all over her upper body, her heart beat was getting very rapid, her breathing was labored, her vision was wonky, her right eye was swollen and her face was beat red. 911 was called, upon arrival the EMT administered IV diphenhydramine (Benadryl) 50 mg and at the emergency room they gave her famotidine (Pepcid) and a steroid drip (methylprednisolone). After receiving treatment, the reporter states the patient felt great and was discharged. The doctor prescribed her methylprednisolone. Additionally she states the patient was also nauseous last night which went away around 2:00am. They told her to consult her primary care provider about the second Moderna COVID-19 vaccination. Action taken with mRNA-1273 in response to the event(s) was not provided/unknown. The outcome of the event, serious allergic reaction is unknown.; Reporter's Comments: This case concerns a 21 Y/O F with serious unexpected events of hypersensitivity, dyspnea, and nonserious unexpected heart rate increased, vision blurred, eye swelling, erythema, scratches and expected nausea. Event onset on Day 1 after first dose mRNA-1273. Treated with diphenhydramine and methylprednisolone. Hypersensitivity resolved. Based on current available information and temporal association between use of the product and start date of the event, a causal relationship cannot be excluded.

1189925	4/10/2021	PA	42	F	4/5/2021	4/5/2021	About 3 hours after the vaccine was given, I had chest pains and started running a fever. I had acute lower back pain and felt overall very lethargic. The fever continued through the night and broke around 3am. The next morning I felt okay but by 10am started to run a fever again for the remainder of the day and chest pains and headache/body aches were now VERY present. It is now 5 days after the shot and I'm just starting to feel like myself again. The headaches and overall body aches lasted for days. I also had blurry vision on and off during this time. My husband and I workout every day and eat very well. We're not overweight and don't smoke. The injection site is still sore 5 days later. I will complete another form for my husband but he experienced the EXACT SAME reactions....every one of them.
1189896	4/10/2021	TX	46	F	4/8/2021	4/8/2021	Dizziness, nausea, uncontrollable shaking lasting for 4 hours, chills, lethargy, barely able to walk, feeling of being on fire, feeling of being unable to catch a breath, dry eyes and mouth, severe sweating, not being able to control leg movements, unusual thoughts, confusion, stabbing pains in different parts of the body, all over aching in joints and muscles, rapid heartbeat.
1189889	4/10/2021	TX	39	F	4/8/2021	4/8/2021	Very bad chills, puking, nausea, migraine, body aches, very sore left arm. At time of injection of vaccine it hurt and my arm started hurting. About 20 mins after vaccine I was slightly dizzy and vision a little blurry. I sat down a few more minutes. About 3 hours later that even is when the chills, body aches, migraine started. All thru that night I was in pain. Next day still felt like my head was in a vice with a migraine. The chills had gone away. still had body aches just not as severe. Day 3 after vaccine. SLight headache (nothing like the vice headache) , arm is still very sore. body aches have subsided considerably. I treated with taking Tylenol and using a heating pad on my arm and back to help with body aches and pain,.

1189716	4/10/2021	IL	45	F	3/4/2021	4/1/2021	My eyes and lips has swollen up. I broke out with weaps/ marks on my body I had to take Benadryl sue to my throat started to close
1189714	4/10/2021	IL	50	F	1/15/2021	1/15/2021	Nausea within an hour of shot. Body aches, Headache, arm pain and 3 days after shot hives on arm/ looking like mosquito bites all over that arm. took Benadryl and used benadryl cream for the itching, it was gone in about 24 hours after use of benadryl. After second vaccine ~ no reactions except headache. but I am having allergic reactions to all kinds of antibiotics that I have NEVER been allergic to before. Red face and eyes, Peeling and blistering skin, lips and face, major itching, rashes (on face).
1189707	4/10/2021	DE	26	F	4/2/2021	4/3/2021	12 hours after vaccine around 3:30am on Saturday I woke up with sever chills, shaking uncontrollably for an hour or 2. I fell back to sleep and woke up about an hour later burning up and sore head to toe. I threw up and had a migraine that lasted the rest of the day. I was able to fall asleep around 6:30am and when I woke up around 9 I was just exhausted, sore all over, nauseous, with a headache. This lasted about a day. On sunday afternoon my toddler lightly hit my right arm where the vaccine was and it became sore, red, and swollen. By the late evening that day the soreness and redness increased. Monday-Thursday the redness and swelling increased to about 2 inches round and felt very tight with a lump in the swelling and it was warm to the touch. By friday the redness and swelling reduced to about an inch, but there is still an inch small lump at the injection site and hurts when anything touches it. The redness has faded and there is no visual bruising.

1189650	4/10/2021	IL	40	F	1/29/2021	1/31/2021	<p>slept over 20 hours day 4, plus 12 day 5; Joint and muscle pain; Joint and muscle pain; extreme fatigue/exhausted; Congested with runny nose; Congested with runny nose; itchy eyes; generally feeling ill; This is a spontaneous report from a contactable other healthcare professional reported for herself. A 40-year-old female patient (patient was not pregnant at the time of vaccination) received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot number: EL3247, Expiry date: unknown) intramuscular, administered in Arm Left on 29Jan2021 09:45 am (at the age of 40-years-old) at a single dose for covid-19 immunisation. Medical history included sinus tachycardia, panic disorder, depression, chronic fatigue syndrome, PCOS. Allergies to medications, food, or other products was Penicillin. Concomitant medication patient received within 2 weeks of vaccination included Metformin 500mg, Metoprolol 50 mg, Paroxetine 50 mg and vitamin D. The patient previously took first dose of BNT162B2 (lot number: EL0140) on 08Jan2021 on right arm at a single dose for covid-19 immunisation and 2 weeks or so after first shot, noticed severe itching on my left upper thigh with bumps and after this shot, itching has spread to face and arms. The patient experienced joint and muscle pain, extreme fatigue/exhausted on 31Jan2021, slept over 20 hours day 4, plus 12 day 5 on 01Feb2021 and congested with runny nose, itchy eyes, generally feeling ill in 2021. The event was considered as non-serious. Facility where the most recent COVID-19 vaccine was administered was Nursing Home/Senior Living Facility. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has been tested for COVID-19. No treatment was received for the adverse event. The patient underwent lab tests and procedures which included Oropharyngeal: negative on 01Feb2021. The outcome of all the events was not recovered.</p>

1191997	4/10/2021	AL	35	F	4/9/2021	4/9/2021	I had absolutely no symptoms prior to receiving the vaccination. After receiving the injection, I was directed to an extended 30 minute waiting area due to existing health conditions (MCAS). Within the first five minutes I began to feel strange pvc-like cardiac sensations in my chest (which I have not had for almost a year until now). Additionally, I began to feel quite dizzy, like I might pass out, and had immediate brain fog. I told the attending nurse that came to check on me and she called the on-site physician over to do a check up. I was told I seemed flushed on my chest and neck but I couldn't feel much at the time, so we weren't sure if it was related. I was given a snack and water after the clinician asked if I may need to eat. I also took my afternoon beta-blocker a little early as a preventative measure. I began to feel quite hot and symptoms continued until the 30 minute window was up. My pulse was stable, however I was repeatedly asked if I wanted to call EMS services to the center (there weren't any on site due to time of day). Since my symptoms weren't seeming to get any worse and I didn't want to go to the hospital, I decided to carefully drive myself home. After leaving the clinic, my cheeks began to flush a very bright red, along with both ears, which were a dark reddish-purple. I began to experience a headache but no other symptoms. Later that night I began to feel very tired and generally unwell. I experienced increased muscle pain and fatigue along with multiple strange, vivid dreams. This morning (the following day), I have felt extremely fatigued. I've experienced headache, tinnitus, dizziness, as well as a disturbing feeling of pressure from my chest down to my lower abdomen, and blurry vision (that began in the afternoon). I have had several episodes of severe brain fog and hot flashes.

1192128	4/10/2021	NC	37	F	4/10/2021	4/10/2021	Upon administering Janssen COVID19 vaccine, patient experienced vasovagal syncope approximately 5 seconds after administration. This occurred at approximately 11:15 am on 4/10/21. After approximately 5 to 10 seconds, patient opened eyes, became alert and was assisted to a sitting position where she was observed for approximately 30 minutes. Patient left pharmacy and was contacted at 1:10 pm to check up on condition. Patient said she was feeling fine and was thankful for pharmacy's concern. Patient instructed to contact pharmacy with any questions or change in status.
1192108	4/10/2021		36	F	3/25/2021	3/25/2021	One hour after the shot, I felt a choking sensation at the top of my throat/back of my mouth. This happened right after I drank water for the first time after the shot. My father looked in my throat and said it was my uvula, which was enlarged and swollen. I also had a lot of red streaks and veins on my uvula and throat, similar to what it looks like in your eye when you have conjunctivitis. I could swallow, talk, and eat, so we did not go to the ER. However, this choking sensation and swelling did not dissipate at all for 13 days. I could technically eat, but I often didn't because it was painful. I also had a tight heavy chest and was exhausted after small movements. After a week, a nurse suggested taking Benadryl and Pepcid for two days. I didn't feel any difference, so I went to urgent care. A covid test was negative. The doctor there said to consult UAB and the CDC before getting the second shot because he was not sure if it was an allergic reaction. I have not been able to get in contact with anyone from either place. My symptoms sometimes go away and I get some relief now, but it hasn't gone away completely. I would really appreciate some help in making the decision to take the second shot. It is scheduled for April 15 and I have been desperately asking for someone to call me. I've left a message on the CDC's phone line. The UAB hospital just tells me to call the CDC. The state health dept said I should have the second shot administered inside a hospital instead of the drive-thru but did not help me get this arrangement. I am on my own with no advocate and I am disabled. The process of getting the first shot also contributed to what seemed to be an increase in sensory processing difficulties that are part of ASD.

1192061	4/10/2021	RI	47	F	4/10/2021	4/10/2021	EMS was summoned to a 47 year old female patient for an elevated heart rate. On arrival at patients side. EMS found a 47 year old female patient AOx4, skin warm, pink and dry. Patient was complaining of feeling light headed, and feels anxious. On assessment patient looks fatigued and diaphoretic. Patient was asked if she would like to be further evaluated out of the public eye. Patient was escorted where EMS did a thorough evaluation. Patient complains of feeling anxious and says she has history of anxiety attacks and arrhythmia that she says is prolonged QT Interval. Patient normally takes Klonopin for anxiety but did not take it today because she did not feel comfortable with how it would interact with her Moderna Vaccination. Patient is not complaining of any chest pain, no shortness of breath, no uticaria or decreased blood pressure. Patients vital signs were stable BP: 124/84 Pulse: 84 Irregular, Oxygen saturation 97% and RR: 16. Patient was observed for a total time of 40 minutes. Patient said she feels a lot better after she was able to sit and relax. Patient was asked if she would like to be transported to the hospital. Patient is refusing to be transported at this time. When patient left the care EMS patients diaphoresis was gone, she said her anxiety has subsided and feels much better. Patient was left in her own care and left with her husband.

1192048	4/10/2021	MA	58	F	4/9/2021	4/9/2021	<p>Prior to receiving her COVID-19 vaccine, the patient was already having symptoms from anxiety/nervousness about the vaccine. Patient was given her injection and within 1-2 minutes, she began feeling dizzy and lightheaded. The vaccine administrator came to me (pharmacist on duty) to notify me that she was not feeling well. I went to go check on her and she stated that she felt as though she was going to faint. I advised her to stay seated, asked if she would like an ice pack and water, and stepped out to get those for her while remaining vigilant (because I wanted to be in the same room as her for observation/safety). I brought her the ice pack, she held it on her chest and head and said it felt nice. After about a minute I stepped out again to ask a technician to get a water for her. When I came back, the patient was still seated but had a blank stare and her mouth was slightly open. I repeated her name out loud and nudged her shoulder several times, however the patient was unresponsive completely. I immediately looked for the red emergency kit in the consultation room but did not see one (I later found out that there was an EpiPen on the table in the room, but I did not see it at the time due to the urgency of the situation). I rushed back into the pharmacy, told the technicians to call 911, and took an EpiPen off the shelf in the pharmacy. I ran back into the room and the patient's face was very red, her eyes were bulging slightly, and it looked like she was trying to reach her hand up or move it, but was unable to. I injected her with the EpiPen immediately, and within roughly 5 seconds she came back to consciousness and looked at me and said "I'm sorry". EMS arrived extremely fast and was there a few minutes after using the EpiPen. She was then taken by ambulance to the hospital. Patient had a friend, with her at the store who was scheduled to receive the vaccine as well, but after the incident she decided otherwise. Later that evening I gave patient's friend a phone call to check and see how patient was doing, and to also let her know that patient's vaccination card was at the pharmacy if she wanted to pick it up. That evening around 6:30-7pm, patient's husband came to the pharmacy to get her card, he updated us that she was being discharged from the hospital and that she was okay.</p>

1191978	4/10/2021	CO	38	F	4/2/2021	4/2/2021	headache; blurred vision; couldn't stand without assistance; a band of numbness and tightness in my right arm that migrated down my arm from the site of the vaccination all the way to my wrist; a band of numbness and tightness in my right arm that migrated down my arm from the site of the vaccination all the way to my wrist; The site of injection also became very sore; a band of vice-like grip appeared around the lower part of my head, near my jaw, and it migrated up my head until it settled around my temples and eyes; faintness; strong vasovagal response; narrowing field of vision; rushing sound in ears; dizziness/severe dizziness; nausea; This is a spontaneous report from a contactable consumer (patient) reported for self. A 38-year-old female patient (not pregnant at time of vaccination) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 02Apr2021 at 16:30 (Lot number: EP7533) on the right arm at single dose for COVID-19 immunization. Medical history included chronic lyme disease, hypothyroidism, allergies to cephalosporin antibiotics. Concomitant medications included levothyroxine, metronidazole, sertraline, clonazepam (KLONOPIN); that all received within 2 weeks of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient did not diagnosis with covid-19 and patient had not been tested for covid-19 since the vaccination. Patient experienced a strong vasovagal response within 30 seconds of receiving the dose with narrowing field of vision, rushing sound in ears, faintness, dizziness, nausea; all of these symptoms improved after lying on the floor for 15 minutes. 2 hours later, a band of vice-like grip appeared around the lower part of patient head, near patient jaw, and it migrated up patient head until it settled around patient temples and eyes. The patient developed a headache, blurred vision and severe dizziness such that he couldn't stand without assistance. Patient also felt a band of numbness and tightness in his right arm that migrated down his arm from the site of the vaccination all the way to his wrist. The site of injection also became very sore. There was no treatment received for the adverse events. The outcome of events was recovering.

1191965	4/10/2021	CA	45	F	4/1/2021	4/2/2021	Watery eyes (3days straight), fatigue (1 week) sore throat/headaches (1 week), sore injection site (1 week)
1191964	4/10/2021	FL	60	F	4/10/2021	4/10/2021	Pt reported feeling dizzy, blurry vision, chest pain directly after vaccine administration, while sitting in chair, 911 called, , ambulance arrived, pt refused ER transfer. Pt reported feeling better and went home with husband.
1191945	4/10/2021	VA	21	F	4/10/2021	4/10/2021	Immediately after receiving the Moderna COVID-19 vaccine the patient began to feel nauseous, hot and her arm was hurting. I kept her in the immunization booth and monitored her. Within a minute of her initial feeling she stated that she was having trouble seeing and was "going to black out". She immediately lost consciousness, her eyes rolled back, and her head went limp and fell back. She then began a twitching movement, made a snorting noise and then all of her limbs went rigid and extended straight out. At the first sign of her reaction we paged management and then as soon as she had loss of consciousness we contacted 911. She regained consciousness and was able to start answering my questions within 30 seconds to 1 minute. We did get the patient water and began to fan her to help cool her off. She was able to tell me who she was, where she was and why she was here. We also gave her some chips and had her eat slowly and drink small sips. She had stated that she was very nervous at the beginning of our pre immunization questions. She told us after that she had not eaten a lot before coming for the shot, but did eat more than normal because she knew she was coming in. She contacted her parents to inform them of the situation. She was able to recount everything prior to her loss of consciousness. When EMS arrived she was able to answer their questions. They took her vitals and all were in normal range, BP=119/66, pulse=98. They asked her to stand and she was able to stand and maintain balance on her own, but stated her legs felt a little "shaky". She refused transport to the hospital by EMS, but did call her roommate to come pick her up. I had her wait in the COVID waiting area until her roommate arrived. I called her around 4pm (same day) to check on her and she said she is feeling much better. Her mom (a nurse) also came down to stay with her and was with her when I called.

about an hour and a half and she called a family member to take her to the hospital; states about 2:30am that same day she was admitted the morning of 12Mar2021 and was discharged on 13Mar2021. They ran every test known to the patient and for a while her blood pressure went up to 198/203 in the emergency room (12Mar2021) and she is not on any medication; caller states she does have Crestor but has not started on it and has not taken it yet. The tiredness and difficulty swallowing like her throat is still tight began the same time she was having the chest pain and she is not having any chest pain or anything like that right now but the tiredness and difficulty swallowing like her throat is still tight is still ongoing; states she did go get cardiac clearance to make sure which was this past week and she does not feel well and like for her the tiredness is bugging her. The tiredness and difficulty swallowing are better but she knows they are there and she tries to swallow something and is like boy her throat is still tight. They did an ultrasound in her left leg because she was limping from a fall she had over two months ago but still has a sore ankle from that and they sent her down for the ultrasound and a CT looking for blood clots in her lungs because she was short of breath (12Mar2021); caller states she thinks they were running everything they could to rule out things; states everything was negative for the CT and ultrasound and she believes the CT and ultrasound were done on 12Mar2021. She has no idea when she was diagnosed with silent heart attacks but they kept asking her about this when she went in for eye surgery and asked her when she had a heart attack and she said she had never had one and they said yes she had and she never knew. She just set up a HCP appointment after the reported events with a gastroenterologist because she has Barrett's and because of the esophagus she did not know if it flared up by the Pfizer vaccine and that caused the pain because the two pains of the heart and esophagus mimic each other with pain going up into the jaw so they were ruling out which one it was; states she went out as an atypical chest pain and called the cardiologist and went in and went over her records from the hospital with the cardiologist. She does not know what caused what in terms of the pain. The outcome of the event blood pressure increased was unknown, chest pain and pain in arm was recovered, other events was recovering.

A 43-year-old female non-pregnant patient received the second dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in Arm Left on 24Mar2021 at 08:30 AM (Batch/Lot number was not reported) as single dose for covid-19 immunisation. Medical history included gastric bypass from Jul2018, high blood pressure prior to gastric bypass but has had regular BP (blood pressure) since then, and allergy to penicillin. The patient's concomitant medications were not reported. The patient previously received the first dose of the same vaccine in left arm on 03Mar2021 at 08:30 AM for covid-19 immunization. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 25Mar2021 at 05:00 PM, a day after she received the Pfizer vaccine (2nd dose), her eye had a hemorrhage - it got worse the next day (26Mar2021). She felt light headed and head/face was tingly/cold. Took her blood pressure and it's in a normal range (109/77 111/77). She spoke with a relative that was a nurse practitioner and was advised hemorrhage could be related to vaccine. The events resulted in doctor or other healthcare professional office/clinic visit. No treatment received for the events. The outcome of the events was not resolved. The patient was not diagnosed with COVID-19 prior to vaccination, and the patient has not been tested for COVID-19 since the vaccination. Information about batch/Lot number has been requested.

1192621	4/10/2021	IN		U			Thursday night chills and achy, Friday beyond exhausted couldn't keep eyes open, Friday night spiked a fever of 101.8, fine on Saturday. Red, itchy spot on arm with a knot. Still have small area of red as of 4/10
1192620	4/10/2021	TN	23	F	4/8/2021	4/9/2021	Janssen COVID-19 Vaccine EUA. About 1am I woke up short of breath. I sat up in bed to catch my breath and immediately felt nauseous. I went to the bathroom because I thought I was going to throw up but only ended up dry heaving. After sitting for a minute to catch my breath again I started shaking really bad and couldn't stand up without having blacked out vision. Luckily I grabbed my phone when I went to the bathroom so my mom could come home to help me. Until about 5 am I was shaking going between being extremely hot and extremely cold. After that my body SEVERELY ached all day with off and on sweats and headaches. I took Tylenol all day. I started feeling better with just some fatigue around 6pm.
1192615	4/10/2021	NY	51	F	4/10/2021	4/10/2021	Fever (102), Chills, Dizziness, blurred vision, body pain, hearing issues, severe headache
1192605	4/10/2021	DC	37	F	3/31/2021	4/9/2021	Rash on the arm of injection; become noticeable nine days after the injection; slightly itchy; no treatment (keeping an eye on it)
1192571	4/10/2021	MI	27	F	3/31/2021	4/1/2021	Body aches, fatigue, brain fog, severe rash on face especially around eyes and cheeks. Lasted more than a week and only got better with topical steroids
1192570	4/10/2021	FL	57	F	4/9/2021	4/9/2021	Within 15 min of receiving vaccine, patient reported watery eyes and slight SOB. Patient was still able to talk and was given 50mg of diphenhydramine. After approx 20 min. patient reported being better and left pharmacy
1192559	4/10/2021		40	F	4/7/2021	4/10/2021	Fatigue on-going. Retinal/ocular migraine - left eye sight blurry, flashing, spinning zig zag lights without bad headache. Never experienced the vision issue before.

1192555	4/10/2021	IL	49	F	4/9/2021	4/9/2021	I got the 2nd dose about 2pm. I stayed for over the 15 min because I was talking with a friend and we were there closer to 20 min. I had a headache right after the shot was administered and my arm hurt. I was fine earlier that day. By about 2:25 I was heading home and wanted to get some McDonald's because I had an hour drive. I noticed in the drive through that my eyes felt they were being sunken in. My right eye and side of nose started to tingle. It started spreading on my right side down to my lips and up to my scalp. Then down my arm to my fingers and down my right leg. I was dizzy and nauseous and confused. I managed to call my boss at triton who said to come back to the office. The nurse met me in the office where I had laid on the floor to try and help the pressure. By then I was numb on my whole face. Teeth and tongue but was able to swallow and talk. They called an ambulance to have me checked out. My blood pressure was high while there. They asked if I had been anxious or having a panic attack. I was neither. I just felt dizzy and numb.

1192137	4/10/2021	MA	39	F	4/10/2021	4/10/2021	The shot was administered by a young woman at pharmacy, who I later learned was an intern. She injected the shot less than two fingers down from my shoulder bone, much higher than I have ever had an injection given before. I immediately felt intense pain, and the intern had trouble pushing the syringe down fully. She said ?I need help!?, and her male manager ran over, and quickly jabbed the syringe further into my arm, and pressed extremely hard down on the syringe, forcing the remaining contents into my arm. I immediately felt a shooting, searing pain down my entire arm, into my wrist, and my arm went numb, felt heavy, and tingly by my hand. The manager pulled the needle out of my arm, and said ?you must have hit bone, the needle is bent?. I then felt extremely nauseous and woozy, and my vision started going in and out. I fanned myself and after about five minutes my vision stabilized, and I felt less nauseous. It is now 9 hours later and I have intense shoulder and neck pain, and limited range of motion of my shoulder.
1192450	4/10/2021	WI	30	M	3/15/2021	3/18/2021	As a person who has never had any kind of allergies--including seasonal allergies--as of the week I received the vaccine, I appear to have developed a new allergy to dust mites. When resting my head against a pillow (especially near the open end of the pillow case), I develop sneezing, complete sinus congestion (to the point I am not able to breathe from either nostril), runny eyes, and similar histamine responses. The symptoms have responded well to diphenhydramine and loratadine, as well as use of allergen-resistant pillowcases, but they have reduced my sleep quality in the weeks since they developed, and I feel this new allergy has negatively impacted my quality of life.

1192362	4/10/2021	VA	20	F	4/1/2021	4/1/2021	While the vaccine was going in my arm it was stinging and burning. I fainted about 30 seconds after the injection. I waited at my vaccination site for about 30 minutes after that. My vision was blurring and turning black and white and my hearing went out. I felt lightheaded and fainted for a few seconds. Afterwards, I was lightheaded for quite some time and my blood pressure was a bit low.
1192350	4/10/2021	CA	28	F	4/10/2021	4/10/2021	HPI: PT 28 y/o F feeling light headed after J&J vaccination. PT with her mother, became light-headed and dizzy while walking from vaccination site back to vehicle for 15 minute wait. PT became unresponsive with mother and fainted. Parking staff alerted rapid response team, PT regained responsiveness and was given chair to sit on, water to drink. Rapid response team arrived to a responsive, A&Ox4, pale female who was still feeling weak and light-headed. PT was transferred to a cot (in the shade) where she was placed in supine position with legs elevated on a chair. Pt was given water and hard candy to suck on while vitals were taken,, Airway, breathing and circulation were all WNL. PT states she presently has a strep infection (throat area) and has been afebrile, and is to begin oral antibiotics once she picks RX up from pharmacy. PT began feeling significantly better over 10-15 minutes of laying down in the shade. EMS LAFD was called and transfer of care to EMS Station 93 for further work-up was instituted. PT felt much better and was able to stand and ambulate from cot to EMS vehicle without issue. PT chose to go home with her mother instead of being transported by EMS to medical facility. Exam (update as needed): GEN: Alert and oriented x 4, relaxed in appearance. HEAD: WNL EYES: PERRL, EOMI ENT: Ears normal, Nose normal, OP normal, no evidence of angioedema, no cyanosis NECK: Supple, without LAD. CV: RRR, no m/r/g
1192341	4/10/2021	NY	28	M	3/16/2021	3/18/2021	First day I only had a sore arm Second day, typical malaise, flu-like symptoms Third day I saw improvement but still malaise. I tried a 500mg tumeric curcumin supplement which was new for me ~5 hours later I noticed brain fog and my vision was not as clear. Over the next 3-4 days my brain stem/back brain started to throb/vibrate occasionally, and I got very bad tinnitus.

1192315	4/10/2021	NY	22	F	4/10/2021	4/10/2021	<p>Patient was sitting in observation area 5 minutes post vaccination, scheduled to be observed for 30 minutes total due to history of anaphylaxis. She was seated in the recliner. She reported to have itchy watery eyes, chest tightness. Breath sounds were clear, with good air movement bilaterally, no wheezing or crackles, no accessory muscle use, normal speech. Patient's boyfriend noted her tongue and eyelids to appear slightly swollen compared to baseline. Patient denied dizziness, chest pain, shortness of breath, body rash or itching. Patient maintained normal speech and normal unlabored respirations. BP was checked and noted to be normal. O2 sat 99%. Patient received benadryl 50mg PO. She was observed for about 10 minutes before her tongue appeared more swollen and she complained of difficulty breathing. At this point, the patient appeared pale, 911 was activated. EPI-pen was administered via autoinjector in the left lateral thigh. O2 sat was 99%. Patient has increased chest tightness and new onset shortness of breath for which she was given an Albuterol nebulizer. Breath sounds were clear, no wheezing. O2 sat reassessed which decreased to 73%, she had bilateral cramping of hands and digits. Non-rebreather was applied, oxygen saturation improved and hand cramps resolved. 911 was called for a second time to report rapid desaturation. Patient's O2 saturation and HR fluctuated, BP remained stable throughout. EMS arrived. A right AC IV was placed, Solumedrol 125mg IVP was administered by EMS. Patient was transferred onto EMS stretcher, still requiring nonrebreather. Patient was escorted to ED for further management of anaphylaxis post Moderna vaccine.</p>
1192293	4/10/2021	CO	28	F	4/10/2021	4/10/2021	<p>Pt stated she had blurry vision in her right eye shortly after the vaccine. She was visibly shaken and had elevated blood pressure for her (140/85, 154/95 after first and second readings). Pt came in off wait list and was excited to receive vaccine, stated did not have any known medical conditions, after waiting her 15 minutes she came to the counter and said her right eye was blurry. We gave her cold water, placed her in the clinical services room with dimmed lights for 15-20 minutes. Her sight wasn't returning, she did not want us to call any additional help. We walked her to her car and will follow up with her at 9:30am 04/11/2021.</p>

1192239	4/10/2021	IL	26	F	4/8/2021	4/8/2021	26-year-old female with past medical history of asthma and anxiety, and syncopal episode after her first Covid vaccination, presents to the emergency department after syncopal episode after her second Covid vaccination. Patient states she received her shot, and about 45 seconds later started feeling similar to the way she felt during the first syncopal episode. She started having tunnel vision, and her mom who is with her this time, notes that she was getting more pale. Mom notes that patient was talking about what she was feeling and was slowing down, until she passed out for about 30 seconds. During her LOC, she was shrugging her shoulders repeatedly, and after she awoke, she returned to her baseline mental status after about a minute or 2. As she was returning to her baseline mental status, she was talking about how she was feeling and it was appropriate. No urinary incontinence or tongue biting. Denies any recent chest pain, shortness of breath, other episodes of lightheadedness or syncope. She is not had syncopal episodes after shots before. After her last injection, she had a syncopal episode and fell flat on her face, thus had a CT head. At the time her CT head is negative, she had a D-dimer that was also negative. Her labs at the time were notable for hypokalemia 3.3, and in preparation for that she states she has been eating a lot of bananas this week. At this time she does not want any lab work, and feels as if this was a similar vasovagal episode similar to last time. syncopal episode right after a COVID vax. Same thing happened with the first dose. Prior to passing out felt sweaty, lightheaded, body tingling then passed out. Didn't fall this time as she was expecting it. Never had fear of needles before. No abd pain, back pain, chest pain. No h/o PE, DVT, OCPs, calf pain, SOB. No cough, SOB, palpit, diaph, chest pain/pressure, headache. No abd pain, no back pain, no vomit, no diar. No urinary complaints. No rash. No numb/weakness. No URI Sx. Mom noted a few shoulder twitches but not GTC type symptoms. rapid response called, pt went to emergency department

1192210	4/10/2021	MD	32	F	4/8/2021	4/9/2021	<p>Around 3:00am-4:00am I woke up with extreme chills. And it felt as if my blood flowing was cold. I had a fever of 100.8 F .... My migraine came a few hours later after I slept for another two hours so around 630am and I was told not to take ibuprofen or aspirin. I used a cool rag to cover my eyes and that helped my head pounding as well as helped lower my fever a little bit it was 100 F around 8am .... Through out the day Friday it was as if my symptoms spiked and got worst before they got better. Lymph nodes on side of the injection site were very swollen and tender. My muscles and body was aching pretty badly. I felt very weak and extremely tired. I slept almost all of Friday away, it was hard to get out of bed and bc I was so weak and tired and slept so so long, I was not keeping myself hydrated and that def made it worse. My fever has remained between 100-102(at it's highest) ... Today is Saturday and around 3-4am on Sunday will make 48 hours since the symptoms began. The time is 7:45pm right now and again most of today I spent in bed. I do feel the symptoms are beginning to slowly diminish. Even the fact I am up and able to report all this is proof I am getting better bc just this morning I still could hardly get up from bed. I have showered and ate some soup and made myself drink plenty of water all of which helped me have relief from my symptoms. In conclusion the worst of it all I believe is over but it took me by surprise just how bad it has been. My advice would be plan at least a day or two to possibly have any symptoms or reactions and rest, and hydrate as much as anyone can, bc it seemed to work for me.</p>

1192209	4/10/2021	MI	20	M	4/10/2021	4/10/2021	<p>Patient was administered Janssen COVID vaccine. Patient was fine immediately post administration in the IMZ room but witness stated he fell sideways (within a few minutes of receiving the vaccine) out of post-administration observation chair (which is in front of the pharmacy). Technician called code white and patient was immediately met with management and the pharmacy team. Patient was laying on his stomach on the floor, supporting himself upward with both hands/forearms. Patient had blood dripping from forehead and nose. Gauze was applied to laceration on forehead to help with bleeding and once patient was able to roll over on his back, an ice pack was applied to his forehead/nose area. Patient said he felt "pain" after the injection and then he felt light-headed. He remembered blacking out for a few seconds. Patient stated he felt "ok", then later stated he felt better but just had a bad headache. Patient stated he felt "it starting to hurt" and that it triggered his anxiety. Dad was in the store and arrived a few minutes later; dad said son/patient has a "fear of needles" and "he hasn't had anything to eat today in quite awhile". EMS arrived to examine patient and asked him if he needed to go to the ER; dad felt going to the ER was for the best since they had a 3 hour car ride home. Paramedics then transported patient to the ER and said he would likely need a stitch for the cut above his eyebrow.</p>
1192202	4/10/2021	MO	77	F	3/22/2021	3/23/2021	<p>Following the vaccine, my day progressed normally. Started feeling a bit tired and dizzy in the evening. Next morning, upon rising became very dizzy. Sat in my chair and promptly passed out. Eyes rolled to back of head. Husband could not rouse me for several minutes. Following that experience, became very tired. Returned to bed. Was dizzy, fever of 100.2, headache for a few days. Minor arm pain.</p>
1192495	4/10/2021	IL	18	F	4/10/2021	4/10/2021	<p>Initially: Severe arm pain at the site immediately and then within minutes of vaccine: hearing loss and then tunnel vision to vision loss to feeling that could pass out: Hearing and vision came back in about 5-10 min and with taking off sweatshirt at that time 12 hours later: 101 fever and chills</p>

1191277	4/10/2021	NY	33	F	4/10/2021	4/10/2021	Patient had a moderately severe syncope reaction. Patient had trouble communicating, reported loss of vision and hearing, light headedness, dizziness, semi consciousness. Patient was seated when the episode began. By the time staff were notified, patient was barely conscious, and could not be safely told to put their head between their legs for fear of falling. Patient came out of the episode within 10 minutes before emergency services could arrive.
1191260	4/10/2021	CA	66	F	4/10/2021	4/10/2021	Pt reported Pressure in eye, tongue felt numb and some trouble swallowing. Speaking in full and complete sentences. Able to swallow water. Pt given Benadryl 25mg PO and stated 5 minutes after symptoms resolved. Pt educated on the importance of calling 9-1-1 is symptoms worsen at home. Pt monitored for an additional 20 minutes.
1191251	4/10/2021	CA	49	F	3/12/2021	3/12/2021	Approximated 12-13 minutes after receiving the shot; my respiration increased, heart rate, and my vision became blurred. I reported the blurred vision to the Pharmacist and she said they have not heard reports forth this symptom. Based upon events following the injection relative to my blood pressure; it is likely that my blood pressure became elevated following the injection, resulting in blurred vision. My blurred vision resolved several minutes later. However, my heart rate increased later that evening to the point I slept upright in my recliner that evening. During sleep, I awoke from my sleep gasping because my heart felt like it was beating too slowly. It has not been several weeks since receiving the injection, and during this time period, my Blood Pressure (BP) has been fluctuating from "very high" to normal. Yesterday, I presented to the ER due to High Blood Pressure (145/100), by the recommendation of a NP. I have NEVER had any history of high BP prior to the injection.

1191126	4/10/2021	NJ	45	M	4/8/2021	4/10/2021	Approximately 15 minutes after receiving the vaccination, my throat became dry and my eyes began watering. It was hard to tell but my throat felt slightly swollen also. I drank some water and a few minutes later things seemed to clear up. Randomly throughout the afternoon I had similar dry/itchy/tingling in my throat but not as strong as the time right after the vaccination. I didn't suspect this was directly related to the virus since I have allergies to grasses, trees, pollen, etc. and take over the counter allergy medicine as needed. At 3:30am today (4/10/21) I woke up having to use the restroom and when standing up out of bed I was extremely dizzy. After laying down in bed the dizziness disappeared. When waking up later in the morning the dizziness/light headed feeling was still present when standing. I also have noticed random strange pinching pain in my legs that only last for 1-2 seconds and sends a quick short pain sensation throughout my body. I have no clue if any of this is related to the vaccination received, but after noticing news articles with issues in a few folks receiving the Janssen vaccine, I decided I would pass this info along just in case.
1191125	4/10/2021	TN	29	F	4/10/2021	4/10/2021	Patient reports vision became blurry about 5 to 10 minutes after vaccine. Husband reports "she was talking, then she was out". On arrival to car, patient was pale, awake, a little confused. Cool air, cool compress, and reclined seat applied. Color returned. VSS. Patient reported feeling better though with nausea. Gradually improved. Able to take Gatorade. Observed for 30 min. Vss throughout. D/c home in care of husband.
1191115	4/10/2021	OH	42	F	4/8/2021	4/8/2021	By 8 pm Thursday I had chills and a fever. Poured sweat the whole night. Nauseous most of that day and the next. Very low energy and spent quickly the whole day on Friday. I've been shakey. Vision blurred at times. Body aches constantly

1191037	4/10/2021	NC	32	F	4/10/2021	4/10/2021	Patient arrived at pharmacy to receive her vaccine. Patient seemed nervous. Pharmacist asked if she has any questions and whether she's eaten or drank anything today. Patient states that she's had a little something. Pharmacist engaged patient in conversation during vaccination. Patient was able to raise her arm and walk to waiting area after vaccination to wait her required 15 minutes waiting time. After around 5 minutes, pharmacist went to check on patients at the waiting area, and patient got up and mentioned that she's not feeling too well. In the next second, she had fainted on the floor. Associates in the store called 911 while pharmacist and pharmacy tech stayed beside the patient to monitor breathing and heart rate. Pulse was faint but breathing was steady. Patient was completely unconscious for a good 3-5 minutes, but she started opening her eyes when EMS arrived. After EMS took over, patient was able to sit up with assistance, talk, and respond. Patient was taken out of the store on a stretcher. EMS recorded that patient's BP was 132/82.
1191023	4/10/2021		24	M	4/10/2021	4/10/2021	At 10:12am client received the Janssen COVID-19 vaccine and at 10:14am client the stood up and walked to the front of table waiting for his vaccination card. His eyes then rolled to the back and he fell backwards on the floor hitting his head. Onsite MD was called out to the floor for triaging. Client stated he did not have anything yo eat or drin today. Client was put in a wheelchair, paramedic arrived at 10:30am and client refused to go to the hospital. Client mother was present with him today and she drove client home.

1190985	4/10/2021	TX	77	M	3/24/2021	3/24/2021	PT devolved occlusive DVT to left femoral vein; This is a spontaneous report received from a contactable physician. A 77-year-old male patient received second dose of BNT162B2 (Batch/Lot number and expiry date was not reported), via an unspecified route of administration on 24Mar2021 at single dose in the left arm for COVID-19 immunisation. The patient's medical history was not reported. Concomitant medication(s) included azithromycin (Z-PAK) taken for an unspecified indication, start and stop date were not reported. The patient experienced "devolved occlusive DVT to left femoral vein" on 24Mar2021 with outcome of unknown. The adverse event resulted in Doctor or other healthcare professional office/clinic visit and Emergency room/department or urgent care. Therapeutic measures were taken as a result of occlusive dtv to left femoral vein which included apixaban (ELIQUIS). The patient did not receive any other vaccines within four weeks prior to the vaccination. Prior to the vaccination, the patient was diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. Information on the lot/batch number has been requested.; Sender's Comments: Based on the close temporal relationship, the association between the event "occlusive DVT to left femoral pain" with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

----------	-------	-------	---------	-----	----------	------------	--------------

was admitted at night to the hospital. Body ache happened 24 to 36 hours after vaccine not that severely unusual as it went away, and she has a chronic illness and is in a wheelchair from chronic pain. Reporter stated she could not swallow liquid or eat food and she was scheduled for a cat scan, but she could not go since she has been on the phone with Pfizer to get truth and fairness. Reporter stated yesterday this started getting better. Reporter stated was discharged from hospital last Tuesday but had pain at home. Developed acute delirium: stated when she woke up in the ER the next day in few hours she was admitted and in the ER she was crazy and tried running even though she cannot run because she is paralyzed and she did not remember nothing. Reporter stated no she did not get it that when she was discharged, it had been 48 hours. Pain started 48 hours after the vaccine. She has chronic pain the pain is not that excruciating, and it has stopped. She could not remember what happened but just knew it was redness and hurt a lot. Her memory and everything came back. States she had MMR (as provided by Reporter ) done, because of pain in her whole body and everything came back negative. She had terrible pain, she asked to be given pain medication, and was given pain medication. Reporter stated it disappeared about one week now it disappeared and has recovered completely. Reporter stated black and blue inflammation and it does not hurt and the pain it went away. She was discharged from the hospital and discharge paper said second vaccine on 26Mar2021. She has been taking Oxycodone pain medication, reporter thinks she even got a higher dose since the pain was excruciating. The patient did not take any vaccines with 4 weeks. No Relevant Tests were performed. While providing an AE for the COVID vaccine she took Tylenol and Motrin as treatment, on top of it, but the pain didn't go away. She has been taking Oxycodone pain medication, reporter thinks she even got a higher dose since the pain was excruciating. The clinical outcome of events gained 16 pounds, passed out at home, depressed, anxiety, panic attack, body ache/pain, vomited and loss of appetite, right arm swelling, screaming, scary, developed acute delirium, redness in arm was unknown whereas of memory gone it was recovering/resolving.; Sender's Comments: Based on known drug safety profile, there is reasonable possibility

1191227	4/10/2021	IN	22	F	3/21/2021	3/22/2021	My left eye swelled shut exactly 24 hours following the shot in my left arm. It didn't completely resolve until 48 hours after onset
1191658	4/10/2021	KS	51	F	4/8/2021	4/9/2021	L arm hurt within a few hours. By midnight felt like I had 10 tetanus shots. At that time could not get warm but didn't have chills yet. By 2 am had chills and all bones and joints hurt head to toe so I took acetaminophen. Was able to get a little bit of sleep but pain and malaise increased overnight. By 10 am chills and low grade fever (101.8). By 12:30 pm, nausea and higher fever (102.7). Pain became excruciating so I took one 200 mg advil around 2 pm (>24 h post vaccination; figured immune response already had ample time to kick in). Within an hour fever reduced back to around 101. Felt some reprieve by 4 pm, enough to get out of bed but still pain, malaise, low fever. Return of symptoms/signs by 9 pm (low grade fever, more malaise and body/joint pain, piercing headache - new symptom: seeing some blurry spots in field of vision). Took one more advil (200 mg) some time before bed (before 11) so I could sleep. On 4/10 - random body pains and soreness. Teeth sensitivity and pain. Either rash or beginning of pitting edema on L arm near injection site. Very drained and tired physically but functional mentally.

1191773	4/10/2021	AZ	57	F	3/6/2021	3/6/2021	<p>my gums were slightly inflamed or puffy, particularly the upper gums; Left side of face slightly swollen/left side of face was slightly puffy; full muscular control of my face; Polyneuropathy symptoms were stirred up; Throat felt slightly itchy; Left upper forearm pain; Pain upper arm; This was a spontaneous report from a contactable consumer, the patient. A 57-year-old female received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, formulation: Solution for injection, Lot number: EN6205), via an unspecified route of administration in left arm on 06Mar2021 at 08:11 (at the age of 57-years-old) as a single dose for COVID-19 immunisation. Medical history included ongoing seasonal allergy, asthma (very mild), polyneuropathy from Aug2020 and ongoing, anxiety, and sinusitis. Patient was tested positive for Covid in Jan, she tested positive on 14Jan2021. This was a mild case and antibodies were confirmed afterwards. It was 7 weeks after she tested positive that there were confirmed positive antibodies. Concomitant medications included bupropion (MANUFACTURER UNKNOWN); gabapentin (MANUFACTURER UNKNOWN), guaifenesin, pseudoephedrine hydrochloride (SUDAFED) (MANUFACTURER UNKNOWN) and Wilson's Wash (MANUFACTURER UNKNOWN). The patient previously took theophylline for asthma and experienced swelling face and pharyngeal swelling. On 06Mar2021, the patient experienced throat felt slightly itchy, left upper forearm pain, pain upper arm. On 09Mar2021, the patient experienced polyneuropathy symptoms were stirred up. On 12Mar2021, the patient experienced full muscular control of my face, at 05:30 she experienced left side of face slightly swollen/left side of face was slightly puffy. On 14Mar202, the patient experienced my gums were slightly inflamed or puffy, particularly the upper gums. It was reported that patient received the 1st dose on 06Mar2021 and Friday on 12Mar2021, when woke up, the left side of face was slightly puffy, face looked normal and had full muscular control of face, but it just went from the jaw all the way to the eyelid only on the left side. On 14Mar2021, gums were slightly inflamed or puffy, particularly the upper gums. Patient called neurologist the next day, 15Mar2021, went to see him on Thursday to have him take a look. He confirmed there was no muscular damage, but the left side of my face when poked was</p>

1191194	4/10/2021	IN	21	F	4/10/2021	4/10/2021	<p>duller than the right side. It started 2 weeks ago today, it hasn't gotten worse and hasn't gotten better. Patient was scheduled to get 2nd dose this Sunday but going to hold off because she was concerned about this side effect. Patient tried using Claritin and Benadryl to see if that might make it go away, but it didn't. Her face does not look disfigured in any way. It's not getting worse or better. Just staying the same. She also has polyneuropathy. She got it in Aug2020 from a needle biopsy of the lymph node in her left breast. It was supposed to decrease over time over one or two years. Prior to having Covid she didn't think about it most days. When she got Covid it stirred up the symptoms. When she got the vaccine it also stirred up the polyneuropathy symptoms. She started to notice it being stirred up 09Mar2021. Her neurologist said it was her immune system working and it was aggravating it. On 12Mar2021, she had the left face thing, which was completely new, she never had symptoms like that. It has been 2 weeks and hasn't gotten worse, hasn't gotten better. She was super healthy. She doesn't drink, doesn't smoke, and exercises every day. On the needle biopsy last year by the radiologist in Aug2020. She got small fiber polyneuropathy, which causes tingling prickly sensations in different parts of the body. It was acute form and will go away in a year or two. By Jan it had minimized, but Covid stirred up the symptoms. The neurologist said any illness can cause polyneuropathy symptoms to increase. Then they started to subside. When she got the vaccine, by that Tuesday the polyneuropathy symptoms were greatly aggravated, by the 09. She was confident that they would resolve and have lessen in severity. The clinical outcomes of the left side of face slightly swollen, throat felt slightly itchy was not resolved, for the throat felt slightly itchy, left upper forearm pain was resolved on 06Mar2021, for the pain upper arm was resolved on 07Mar2021 and for event Polyneuropathy symptoms were stirred outcome was resolving. No follow-up attempts are possible. No further information was expected.</p> <p>Throat swelling, itchy tounge and lips, difficulty breathing, dizziness, full body hives, vision difficulty, hospital visit</p>

1191407	4/10/2021	MI	25	M	4/8/2021	4/9/2021	Thursday 4/8: 3:20pm: COVID injection given in right arm Friday 4/9: ~1:00 am: woke up shaking with chills and severely cold; had slight headache. Had insomnia all night. 6:00 am: woke up with bad headache, slight fever. 7:00 am: got out of bed and had vertigo and was running into walls trying to walk to my living room, along with the worst migraine I've ever had. Also had dizziness, nausea, chills, 100+degree fever, aches, skin sensitive to touch, and severe tinnitus. All of the veins were visibly popping out of my head. As the day went on, everything got worse. Any time I moved, my head would throb so bad that I thought I was going to have to go to the hospital. 3:45 pm: the headache started to finally go away. It would only hurt if I moved fast. At this point my fever was only slightly high, about 99 degrees. I was still unstable when I walked and dizzy. I went from being super cold, to being super hot and sweaty. And I was alternating between cold & hot and sweaty for the rest of the night. Was also having some memory issues, repeating things when I was having a conversation with someone over the phone. I was sweating all night when I was sleeping. Saturday 4/10: 7:00am: woke up with a slight headache; still out of it and dizzy. 8:00am: after being awake for about an hour or so, I looked in the mirror and my whole face (around the lips, cheeks, and jawline, and under the eyes) was really swollen and puffy. My face was even mis-colored. Under my eyes was purple and yellow, and my cheeks were white. Some confusion persisted throughout the day as well as dizziness.

1191767	4/10/2021	OR	36	F	4/8/2021	4/8/2021	At 15 mins I was released. As I drove away from the clinic, 20 mins, I was flooded but a wave. My heart started pounding, my throat and mouth were tingling and tightening, my face and ears turned red and flushed. At about 45 mins, I became extremely dizzy like I was intoxicated. My mouth and throat kept tightening and tingling in waves. My skin was itchy and red in patches. I felt like I was having a stroke on the right side of my face. My right eye and face felt odd. Over the night and next days, my chest was tight on the left side and pain in my left arm and sharp stabbing pain in my left back and side. The next day I had heavy chest and shortness of breath and remained dizzy.
1191752	4/10/2021	FL	28	F	4/1/2021	4/9/2021	Migraine headache beginning 4/09/2021. Extreme light sensitivity, pain around and behind eyes, nausea, extreme fatigue, increasingly worsening tinnitus particularly in right ear since 4/09 continuing through 4/10 so far.
1191741	4/10/2021	OR	65	F	2/25/2021	2/25/2021	Fever, severe fatigue, nausea, facial swelling around right eye and visual impairment in right eye, (flashing white light) Severe fatigue and aching-had to have friends take dog out, unable to walk any distance. I am very healthy with no health issues, so for me this was very unusual. I did not seek any medical assistance, I was too sick to even consider.
1191738	4/10/2021	PA	25	F	4/10/2021	4/10/2021	During observation of patient after receiving vaccination, she became quiet, stopped talking, her eyes were open, crossed, then closed. I assisted patient who was seated in a chair, I continued to speak to her, calling her name. Her Mom was present, and came into room to assist. We were able to help patient to lie down on the floor. Ice packs were used, and when patient was alert and conscious, she was given a popsicle at her Mom's request. Patient did experience, she had her own zofran odt tablet, which she did take. Episode did last about 20 minutes. Pt. did recover, was able to walk to her car, her Mom drove them home. Patient did express she has experienced this before while receiving shots or giving blood.

1191664	4/10/2021	VA	33	F	4/10/2021	4/10/2021	About 15 to 20 mins after receiving shot, patient experienced difficulty breathing, brief blurry vision and difficulty hearing. Was given some water to drink, and EMT was called. After drinking some water patient felt better. Blood pressure and pulse were checked - both were within normal limits. Patient mentioned not having drank or eaten anything prior to appt. She felt better at the time when EMT arrived about 10 minutes later. EPIPEN administration was not necessary. Mother was present and helped patient home. Advised patient to get something to eat.
1191772	4/10/2021	AR	66	F	3/5/2021	3/5/2021	After getting vaccine, I walked to the waiting area and sat down. After a few minutes my vision started getting strange and got worse for several minutes. In my peripheral vision I could see colors and patterns seeming to move and melt. Psychedelic. Very bad in my right eye, but also could see it in my left eye. Didn't check them by closing one, I was just trying to figure out what was happening to me. I could still read straight ahead. I stayed 10 minutes past my 15 min waiting period & felt well enough to leave. It probably took 1-2 hrs total before my vision seemed back to normal. No other symptoms after that. Researching on the internet I found kaleidoscope vision which seemed to describe it perfectly. Second dose did not produce any problems.
1191620	4/10/2021	NC	37	F	4/10/2021	4/10/2021	As the vaccine was being administered into my left deltoid, the vaccine hurt at the injection site and I immediately felt very strange and felt a rushing sensation to my head and throughout my body, with a concentration in my upper body. It felt like an out of body experience: I fainted, hitting my head on the adjacent wall and fell to the ground, where the impact caused a bruise to my shoulder and back. It was reported to me that I lost consciousness for about 10 seconds. I felt disoriented, but lucid when I came to. I was not exactly sure what happened, but I could feel that I hit my head on the right side and asked if I fainted since I was disoriented and on the floor. With assistance, I was able to sit back on the bench, but felt extremely dizzy, light headed, fuzzy/strange type of blurry vision, and intense sweating. I did not feel well and knew I would have an unsteady gait if I attempted to stand. After about 15 minutes, I felt well enough to return home.

1191495	4/10/2021	FL	19	F	4/10/2021	4/10/2021	After receiving her vaccine, patient moved into our waiting/observation area at my request to wait for 15 minutes of observation. Within a few minutes I heard the patient's mom calling out for help. I quickly ran over to help. I observed the patient who was now sitting on the floor. Her eyes were wide and she looked shocked. I helped her mother to calm patient and asked her to remain seated. I asked her mom what happened and she stated patient twitched a couple of times and began to fall off of her chair at which point mom caught her. Mom had blood on her arm and I noticed it had come from patient's ear where a couple of earrings were pulled as she fell. I asked if she wanted water and quickly provided her a bottle of water. Mom stated that patient had fainted from vaccine(s) in the past, but mom stated that this appeared to look like a seizure. Mom went to get a chocolate bar since patient had had nothing to eat and they were worried about low blood sugar. After patient looked like she was back to normal I left to administer another vaccine but asked mom to remain until she felt necessary. Mom and patient advised my tech that they were ok and they left the store.

1185233	4/9/2021	CO	54	F	4/8/2021	4/8/2021	Experienced very itchy eyes approximately 25 minutes after the injection which lasted for about 3 hours.
1185263	4/9/2021	CA	34	M	4/8/2021	4/8/2021	Patient given COVID J&J vaccine and within a minute complained of being dizzy/faint. While seated, patient fainted, eyes rolled, arms and hands clonic/tonic activity which caused him to fall from chair. Doctor was able to hold on to upper back of patient as both fell to the floor. Patient hit head on carpet with not traumatic injury. 911 was called and by time of paramedic arrival the patient was alert and oriented. Patient was assisted to wheelchair and taken to ED for evaluation.
1185241	4/9/2021	NC	51	F	1/23/2021	1/24/2021	I got the shot on Saturday and then that evening, my arm was sore as expected. I had a little something under my eye. Looked like a little bite. On Sunday, on my face I had what looked like sunburn under each of my eyes and on the side of both of my face. It felt tingly. The redness was there day into Sunday night. I took some Benedryl. On Monday, the red was gone but my eyes were puffy and had some swelling to my face and still had tingling in my face. I called my PCP and she asked that I come in and see her. On Monday, I had a visit with my PCP, there was still some swelling around my eyes. She was going to report it and would let me know if I could take DOSE 2. I was advised to not take DOSE 2. It was all better by Wednesday.

1185351	4/9/2021	NY	46	F	2/25/2021	2/27/2021	About I experienced headaches and no fever in 24 hours following my first dose of the Moderna COVID19 vaccine, but about 48 hours later I experienced pain and itchiness with no rash on the soles of both feet and the palms of both hands. This pain and itchiness did lessen in intensity over time, but it has never gone away. I am also experiencing itchiness without a rash all over the skin of my body, including my vagina. When I scratch, red marks rise up on the skin and remain far longer than what is typical for my body. Areas of my body that itch include scalp, inside eyelids, lips, inside ears, outside ears, neck, between breasts, back, stomach, buttocks, thighs, legs, and especially my ankles and the tops of my feet. The itchiness travels and I have learned to resist the urge to scratch. I went to see my physician for the first time yesterday since the sensation has not abated. I did take my second vaccine on schedule on March 26th (Moderna COVID-19 vaccine, Lot Number 038A21A.). I experienced headaches and a fever of 101F starting about 12 hours after the shot that lasted for 24 hours. The itchiness did not intensify, but it has also not abated.

1185216	4/9/2021	NY	50	F	4/5/2021	4/6/2021	<p>4 am: 2 hours of chills and violent trembling. My teeth were clenched so tight for so long, my jaw ached. 6 am: I couldn't lift a glass of water. Someone brought my cup and straw, which I nestled between my face and pillow. I sipped what I could. 6:30: Sleep 8:am: Woke up thinking it was 6pm. I couldn't roll over. Dizzy and weak, I collapsed back into bed from trying to stand. Someone walked me to the bathroom. Once there, I wheezed and gasped for air. Then I got scared and cried, which made it even harder to breathe. It felt like my body wasn't absorbing the oxygen it took in. 8:05: Sleep 9 am: Woke up hoping the day was almost over and I slept through it. The cruelest part is sleeping what felt like the deepest sleep only to wake up an hour later ? over and over again. My spine and neck ached, which made my head hurt ? or my head hurt all on its own. 12 pm: Sharp abdominal pains with any movement. If I did move, I had fits of gasping for air. Had to ask Someone for the phone sitting just a foot away. I couldn't look at the screen. My eyeballs were too sore, head too achy, and brain too fogged. The phone was only to ask for help while someone worked in the other room. 12:30: Abdomen sore to touch. Hard to talk. My bowels became so shut down it hurt(s) to move straight water through them. The rest is kind of a blur. Lots of sleep. In the afternoon, someone walked me to the bathroom. Back in bed, I had another breathing fit. My abdominal pain felt inescapable. Through was happy for his company, I think I fell asleep during our conversation. At some point, someone brought me broth but I didn't get much down. By evening, I could walk to the bathroom alone, albeit hunched like a 120 year old in need of a walker. My guts just hurt too much to stand upright. Day 2: I still suffer from abdominal pain, a headache and muscle aches, but I CAN roll over, lift a glass of water, and focus on a screen for short stints. (I documented this in stages.) I can walk slowly but still painfully to the bathroom without help, but I get winded beyond that. I'm afraid to eat with my digestive tract so inflamed, but I have far more energy today, 32 hours after my last meal, than I did yesterday. I've also lost 6 pounds. Day. 3: 10 pounds down, still with diarrhea, but eating again. Restless sleep. Significantlt winded and dizzy after mild activity, like walking from one side of the house to the other.</p>

1185197	4/9/2021	NY	25	F	3/29/2021	4/7/2021	I'd had Bell's Palsy (BP) twice in my life (once in 2013 and once in 2015). I have not had it since 2015 until I got vaccinated on 3/29/21 and began to develop BP symptoms on the evening of 4/6/21 (headache on right side of my head/temple, odd sensation on right side of my tongue, almost like I burned it on a hot beverage) but I didn't think anything of it. I went to sleep and then, on the morning of 4/7/21, I woke up feeling extremely fatigued, brain fogged, and weak. I didn't notice any of the BP symptoms until I went to brush my teeth and realized I had lost motor function in the right side of my mouth. I immediately made a telehealth appointment with an Urgent Care doctor in order to get an Rx of Prednisone. I began taking the Prednisone around 3pm on Wednesday, 4/7/21. I also have been taking vitamin B-12 and a Women's Multivitamin to help regenerate nerve function. However, since starting the prednisone, my symptoms have continued to develop. Symptoms currently include: right side of my face is extremely swollen; I have lost mobility on the right side of my face, the right side of my tongue still feels numb; right eye tearing non-stop; some mild ear pain in right inner ear; slight pins-and-needles sensation in my fingers on my right hand; difficulty eating and drinking; still feeling fatigued. I have recovered from BP twice before so I am not too worried about having it again. I just think the FDA needs to put out a warning to the public that there may be a correlation between the COVID-19 mRNA vaccines and Bell's Palsy recurrences. I know this is not a coincidence, and my BP relapse was a result of my body experiencing an immune reaction from the vaccine.
1185178	4/9/2021	MA	26	F	4/9/2021	4/9/2021	Pt experienced the sensation of having a "lump" in her throat, symptoms resolved on their own without treatment shortly after the symptoms developed. 1185168	4/9/2021	SC	45	F	4/1/2021	4/7/2021	Visited ER as I thought I was having an allergic reaction. Treated with Pepcid, prescribed prednisone and streeted. Visited personal allergy physician 4/9/21. per MD Allergist/Immunologist DXd = systemic immunological vasculitis. Most probably a delayed hyper immune response to my vaccine. Legs, arms and sides covered in innumerable petechial eruptions beginning 6 days post vaccination and 3 days post vaccination side effects (chills, headache nausea) subsided. Eruptions spread consistently for 36 hours and are constant not intermittent. They are hot, painful to the touch, and do not blanch. I'm on 60mgs of prednisone for 5 days (the highest dose given outside a hospital) and then 40 for 5 days and then 20 for 4 days. If I get any mouth nose or eye or interior genital irritation I have to go to the hospital and be admitted for higher dose steroids and constant monitoring. Dr advised this will take weeks to resolve and the eruptions will likely fade slowly and possibly peel.
1185160	4/9/2021	IN	22	F	4/7/2021	4/7/2021	At 15 min mark after receiving vaccine: sudden loss of hearing (extremely muffled, underwater sounding), profuse sweating, and then lost vision and passed out entirely when attempted to stand up for help. After laying down, quickly regained consciousness and felt better. After effects and soreness have been minimal. Have not fainted during/after vaccine before.
1185114	4/9/2021	NY	42	F	4/8/2021	4/8/2021	heart rate was noted to be high in the 146-150 range. The patient was able to talk and respond to questions but kept her eyes closed and was crying. 1186296	4/9/2021	MN	52	M	4/7/2021	4/7/2021	Patient did say before vaccine that he has fainted in the past from previous vaccines. I had a Representative administer vaccine while i stood next to patient and talked with him as a distraction from the shot. After Representative gave the vaccine patient asked "did you give vaccine?", he then immediately started to sweat very hard and said he was light headed (he was sitting down), then his eyes rolled back and he slouched down in chair, at which point I held him so he did not fall on floor. He started to jerk and twitch, perhaps was having a seizure, and was sweating very hard. I held him in chair so he would not hit his head or get hurt. After about 30 seconds he regained consciousness and asked how long he was out. His T-shirt was soaked in sweat and he said he felt very dizzy. The Representative got him an ice pack and placed at base of neck, which he said helped alot. I sat with him for 10-15 minutes until he said he felt fine. I asked if he needed medical care and he said he did not, just needed to sit for awhile, and said this has happened before. I gave him a chair to sit in after he was fully alert and he sat for close to half an hour, at which point he said he was back to himself and felt fine. I did offer he could stay as long as needed and I could call anyone if he needed me too, he insisted he was fine and after about 45 minutes he left. I did call him the next day to check on him and he said he was fine.

1186197	4/9/2021	OR	71	F	3/1/2021	3/2/2021	second vaccine was at 10:30AM on 3/29/21. I experienced increased frequency of ocular migraines (Kaleidoscopic irregular frame in field of vision that starts small and increases in size till it disappears over 15-30 minutes. That is followed by a mild headache and mild disorientation. This has been the usual symptom of an ocular migraine for me. Difference was a big increase in frequency.) Ocular migraines occurred in PM of 3/2/21, AM on 3/3/21, AM and PM on 3/5/21, PM 3/6/21, PM 3/7/21, AM 3/11/21, PM 3/15/21, PM 3/19/21, and AM 3/20/21. I had one instance on an ocular migraine after the second Moderna dose on 4/1/21. I contacted both my PCP and Opthamologist on 3/8/21. Doctor followed up with me to find out whether the migraines were always occurring in the same field of my vision from instance to instance later in the week as well. I told him they seemed to be occurring in different spots including a perceived difference in which eye. Only treatment was to watch and see if it stayed as frequent or subsided in frequency. It seems to have resolved itself by today 4/9/21.
1186174	4/9/2021	MO	38	F	4/7/2021	4/7/2021	Vaccine administered in left arm. Pain spread down left arm into middle 3 fingers at 10 minutes. Pain spreading up to left shoulder at 10 minutes. Told I could leave facility at 15 minutes. Tingling and facial tingling starting at left jaw line and spreading up to left sinus cavity then around left eye and back to left ear at 30 minutes. Tightness, tingling and discomfort described above lasted 48 hours. Tightness and Tingling turned into swelling, numbness and drooping all on the left side of the face and left side of tongue at 48 hours post dose. Medical attention sought at advice of PCP at Urgent Care at 50 hours post dose. Diagnosos: Bell's Palsey Treatment: Steroid and antiviral, plus home care. Return or go to ER if symptoms worsen. Referral to neurologist, if needed.

1185954	4/9/2021	FL	54	F	4/7/2021	4/7/2021	Around 10pm on 4/7 I felt a sudden onset of body aches. I had similar symptoms after the first vaccine so I knew this was an expected side effect and decided to take two Tylenol 500mg and go to bed. I had a restless night with pain on the injection site, chills, and severe body aches. At 8:30am on 4/8, I got out of bed and still feeling sick, thought of taking Tylenol again. I didn't want to take medication on an empty stomach so I took two sips of milk and coffee and two bites of a cookie, when I started feeling severe nausea. It was a very strong nauseous sensation. I started sweating. I stood up from the table to take the cup to the sink and my vision turned partially black. I thought I had stood up too quickly, so I sat down again. I walked back to the table and sat down. I felt I was losing control of my body. I stood up again with the intention of going back to bed, and started walking towards my bedroom. I told my husband that I was seeing all black. I don't recall what happened next. My husband says that he was asking me if I was alright but didn't answer. He walked towards me and I fainted against the pantry door and he was able to hold me. I lost consciousness for a few seconds. Paramedics came and took me to emergency room. I was released 2 hours later. Had a fever of 100.4C in the afternoon with chills and body aches.

1184107	4/9/2021	PA	56	F	3/17/2021	3/18/2021	<p>Angioedema; swelling face, eyes, lips and throat; swelling face, eyes, lips and throat; swelling face, eyes, lips and throat; swelling face, eyes, lips and throat; This is a spontaneous report from a contactable nurse (patient herself). A 56-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot Number: EP7534) via an unspecified route of administration on 17Mar2021 06:00 PM as single dose in right arm for COVID-19 immunisation at Pharmacy or Drug Store. The patient's medical history included idiopathic angioedema and no chronic health conditions. Patient had allergies to medications, food, or other products included Zithromax - anaphylactic, several other antibiotic - rash, hornet and wasp sting allergies. Patient was not pregnant at the time of vaccination. Concomitant medications were not reported. The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient did not receive any other medications within two weeks of vaccination. On 18Mar2021 at 10:00 AM, the patient experienced angioedema - swelling face, eyes, lips and throat which occurred 16 hours after injection. Event resolved with use of Benadryl. Prior history of angioedema. Since symptoms resolved with Benadryl, I did not seek further medical care. The patient had no COVID prior vaccination and was not tested COVID post vaccination. The clinical outcome of the events were recovered in 2021. No follow-up attempts are possible. No further information is expected.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported events occurred in a plausible temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p>

1184098	4/9/2021	NC	45	F	3/17/2021	3/18/2021	On Thursday 3/18 around 5:00 I started feeling tired, went to bed early woke up Friday with my eyes burning, the skin around my eyes was red, creapy, and was burning and itching. It was mainly my eyes, but my face felt puffy. My torso felt hot from inside. My throat felt swollen towards the top. By Friday night it was getting worse so I took Benadryl and sat with ice packs on my eyes, and put hydrocortisone around my eyes and eyelids. I continued that til Tuesday when it finally subsided. I did take pictures of my face, and I contacted my doctor to ask about the second shot. They advised against it, so I've cancelled my appointment. I might try the J & J shot in a few months.

unspecified date with outcome of unknown, 10 mg 3 times a day wasn't enough (therapeutic product effect incomplete), on an unspecified date with outcome of unknown, he'd switch and do a couple doses of 15 mg and it was better but not enough (intentional product use issue) on an unspecified date with outcome of unknown, after he received the COVID vaccine, he experienced a bad reaction (unspecified) on an unspecified date with outcome of unknown. The events were reported as serious as involved hospitalization. The patient passed away on an unspecified date in Feb2021. It was not reported if an autopsy was performed. The clinical course of the events included the following information. On 21Sep2020, a spontaneous report was received from a consumer, via a company representative, regarding a 74-year-old male who was being treated with FIRDAPSE 10 MG (amifampridine). On 22Sep2020, additional information was received from a consumer. On 02Oct2020, additional information was received from a consumer and chemotherapy was added as a co-suspect. On 01Feb2021, additional information was received from a consumer via a company representative. On 09Feb2021, additional information was received from a consumer, and this case was determined to be the master case for cases 2021CAT00039 and 2021CAT00052 (both invalid, duplicate cases) and the information was merged into this case (2020CAT00505). This case was re-assessed as serious/unexpected, and COVID vaccine was added as co-suspect. On 18Feb2021, additional information was received from a consumer via a company representative. On 19Feb2021, additional information was received from a patient ambassador via a company representative. Medical history included LEMS (Lambert-Eaton myasthenic syndrome) and migraines. Concomitant products included: an unknown statin, pantoprazole, and acetylsalicylic acid (ASPIRIN) 81 mg. On 18Sep2020, the patient started treatment with FIRDAPSE 10 mg at 10 mg, 3x/day orally for LEMS. On 19Sep2020 and 20Sep2020, after starting the product, the patient experienced moderate headaches. On 21Sep2020, the patient did not experience a headache. On 22Sep2020, the patient experienced a headache that was "4/10." He had taken acetaminophen; aspirin; caffeine (EXCEDRIN) and ibuprofen as treatment and it "helped." The patient

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

had not spoken to his HCP (health care provider) about the event but was going to call his HCP and ask to increase his dose of FIRDAPSE. The product was working and he was walking better, but he had heard people taking up to 80 mg a day. As of 22Sep2020, product use was ongoing and headaches were improved. On 02Oct2020, it was learned that his medical history included being prone to headaches (also reported as migraines ever since he was a kid) and "chemo" for small cell lung cancer stage 4 which was in his liver and lymph nodes. Concomitant products included furosemide. It was noted that the patient had been on the product for 4 to 5 days when he experienced his moderate headaches. He had the headaches for just a couple days, but he wasn't sure if it was due to the FIRDAPSE or it was the chemo. He took "a couple" of ibuprofen and he was "alright." On an unspecified date, the patient was in contact with his HCP and he was told to "keep an eye on it" (presumed headaches) and see if it got worse. They agreed that it could have been the chemo or a "fluke" thing. He also spoke to his HCP about his FIRDAPSE dose of 10 mg, 3x/day not being enough. He would switch and do a couple doses of 15 mg and it was better, but not enough. His HCP thought he should be taking 20 mg 3x/day, so he was working with the patient's insurance and pharmacy to get it changed. As of 02Oct2020, FIRDAPSE and chemo treatment were ongoing and moderate headaches were resolved (reported as he'd been good for a few days). On 01Feb2021 and 09Feb2021, it was learned that on 02Oct2020, the patient's FIRDAPSE dose increased to 20 mg, 3x/day. On an unspecified date, the patient received the COVID vaccine at an unreported dose, route, and frequency of administration for an unreported indication. After the patient received the COVID vaccine, he experienced a bad reaction (unspecified). Since 27Jan2021 (reported as since Wednesday, relative to 01Feb2021), the patient had been sick. On 31Jan2021, the patient went to the emergency room, and they thought he had a blood clot on his lung. Subsequently, he was admitted to the hospital. Initially, when the patient was in the hospital, they took all his medications away, including his FIRDAPSE, as the pharmacy was managing his medication. The patient wife was able to get the doctors to let the patient keep his FIRDAPSE in his room with

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

him before he missed any doses because he could not walk without his FIRDAPSE. On an unspecified date in 2021, the patient had radiation of his head and lung for his cancer (previously reported medical history), and "they" (presumed his medical provider) said he could have a raspy voice and headache, which he did experience but then resolved. While in the hospital, the patient's blood pressure was not stable. It went "up and down, up and down." He had fluid in the bottom right lobe of his lung, where the cancer was, and they could not "tap it" due to the blood pressure issues. They were trying to get the fluid out every other way they could. The doctors said he had inflammation in the bottom of his lung. He was given a "good dose" of prednisone, but he was just exhausted. They were trying to control his blood pressure and his pulse. When they got one of them "up," the other went "down." The doctors said that the patient's LEMS had nothing to do with why he was in the hospital. His wife expressed her gratitude for the FIRDAPSE and how it had helped him. As of 09Feb2021, treatment with FIRDAPSE was ongoing. The patient was still in the hospital and not doing well, also reported that he was still the same, he had not improved but he had not worsened. The blood clot on his lung, blood pressure fluctuation and pulse issues, fluid in the bottom right lobe of his lung, inflammation in the bottom of his lung, and exhaustion were not resolved. The status of the bad reaction to the COVID vaccine was not reported. No additional information was provided. On 18Feb2021 and 19Feb2021, it was learned that the patient's medical history included: muscle weakness and lung cancer with brain metastases. On unspecified dates, after starting FIRDAPSE, the patient's muscle weakness began severely progressing, and he experienced fatigue. The weakness was worsening significantly, even after being on the medication (presumed FIRDAPSE). On 14Feb2021 or 15Feb2021, the patient was discharged from the hospital. On 18Feb2021, the patient took his last dose of FIRDAPSE. On 18Feb2021 or 19Feb2021 (reported as last night, relative to 19Feb2021; yet also reported as either 18Feb2021 or 19Feb2021), the patient passed away. The cause of death was unknown. A 74-year-old male, with a history of migraines and chemotherapy for metastatic small cell lung cancer, was taking an unknown statin, furosemide, pantoprazole, and

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

Aspirin. He added FIRDAPSE for LEMS on 18Sep2020 and experienced headaches for a couple days, but he wasn't sure if it was due to the FIRDAPSE or chemo. After COVID vaccine, he experienced a bad reaction (unspecified). Since 27Jan2021, he was hospitalized with a blood clot on his lung. He had brain and lung radiation for cancer. While in the hospital, he had fluid and inflammation in the bottom right lobe of his lung, where the cancer was, which could not be drained due to labile blood pressure. His muscle weakness began progressing and he experienced fatigue. In Feb2021, he was discharged on FIRDAPSE. A few days post-discharge, he died. Based on the information provided, the events were assessed as unrelated. Information on the batch/lot number has been requested.; Reported Cause(s) of Death: Passed away

1183570	4/9/2021		43	M	4/8/2021	4/8/2021	Client received the COVID vaccine (Moderna, 1st dose, lot #041AB21A, exp. 5/6/2021) at 1527. EMT observed the client to be pale and diaphoretic; he and RN responded at 1532. The client complained of dizziness, feeling clammy, and ringing in his ears, as well as spotty vision. His vital signs were as follows: blood pressure 96/78, heart rate 50, respiratory rate 20, and O2 99%. The client stated that he has hypertension and he takes losartan. He takes no other medications, has no other medical conditions, and has no allergies that he is aware of. The client was alert and oriented, and his pupils were equal and reactive to light. He stated that he ate breakfast and a snack at 11 am, but nothing for lunch. The client was offered water. At 1536, the client complained of tingling in his arms and numbness in his tongue. His color had returned to normal. No difficulty breathing, no swelling observed around his mouth or tongue, no complaint of metallic taste. Repeat vital signs were as follows: blood pressure 110/80, heart rate 87, O2 99%. He refused benadryl. At 1541, the client stated that his tongue was no longer numb but his arms were still tingling. He was less diaphoretic. His vital signs were as follows: blood pressure of 116/82, heart rate of 92, respiratory rate 14, and O2 97%. At 1545, the client stated he was no longer dizzy and his symptoms had resolved. Education provided regarding, emergency response and AMR activation, and primary care follow up. At 1550, the client was able to stand up and walk without any dizziness or feeling lightheaded. At 1558, the client's repeat vital signs were as follows: blood pressure 140/99, heart rate 99, respiratory rate 16, and O2 97%. The client was escorted outside by the EMT, and stated he was walking across the parking lot to get some food to eat before returning home. The client left the facility ambulating with a steady gait.
1183564	4/9/2021	MN	28	F	4/7/2021	4/7/2021	Dizzy, light headed, blurred vision, weakness, difficulty breathing: these lasted more severely about 2 hours after the vaccination and then got worse again the next day which is when I ended up going to the emergency room. I was given benadryl a steroid and a antihistamine there.

1184610	4/9/2021	CO	31	F	4/7/2021	4/7/2021	Within about 30 mins of the shot I became extremely lethargic. Hard to keep my eyes open. The injection site was extremely hot to touch and very sore. While the rest of my body was of normal temperature. Shortly after, I'd say about 45 minutes after injection, came the cold chills. I was freezing cold and shaking followed by a fever. I became very foggy. It was hard to keep a conversation and had extreme waves of nausea. My mouth would salivate like the vomit was coming. I never actually vomited. But that continued for the next 36 hours. I had to call out of work yesterday. Starting 24hrs after injection. I could not get out of bed. My body was very weak. Aches everywhere, I was freezing cold shaking with chills yet waking up in my bed covered in sweat. I was extremely restless and kept waking up to put a cold towel on my head to try to break my fever. At this point my headache was so severe. Any movement felt like my head would explode. It's now 48 hours after the injection my head is still pounding and my body still full of aches. Left arm is still really sore. I truly regret taking the vaccine. And would recommend others to not take it until further testing goes into this product.
1184249	4/9/2021	MA	82	F	3/26/2021	3/30/2021	Symptoms started around 3/30/21, after her second COVID vaccine. Presented to ED with evidence zoster in the V1 distribution of the ophthalmic nerve. Rash on the face was classic for zoster and involved swelling of her eyelids. Started patient on treatment for zoster infection. On acyclovir 10mg/kg q8h.
1184445	4/9/2021	NY	59	F	4/8/2021	4/8/2021	Pt. received her 2nd dose of the vaccine and while waiting in the pod she complained the left side of her tongue was tingling. She was given some water to sip. Then stated that she felt her left cheek droop and her left eye is not focusing as well as before. Stated she did not have a reaction after her first dose. A droop was not noted on her face. Pt. initially refused (thought it would take too long) but then agreed to be taken to the E.D. and ambulated instead of using a w/c. Upon arrival, she stated that her tingling seemed to have worsened and it was now on her buttocks, she reported to an RN who came to triage her.

1184852	4/9/2021	UT	73	M	2/9/2021	2/12/2021	Clouding in left eye severe. Some noted in right eye. Ophthalmology indicated small cataracts and that sometimes the administration of vaccines cause the clouding to occur. I am now scheduled for cataract surgery. This occurred starting 3- 4 days after the 1st vaccine and worsened over a two week period.
1184322	4/9/2021	MA	61	F	3/25/2021	3/27/2021	About 36 hours after my first dose, I woke up very thirsty and with "gummy," sticky eyes. My moisture-producing glands, particularly my salivary glands were significantly affected and I had, in effect, (drug-induced?) Sjogrens Syndrome. My salivary glands felt uncomfortable, perhaps because they were swollen. The symptoms have diminished somewhat in the past two weeks, but have not resolved. I visited my PCP on 04/02/2021 and she advised to see her again if the symptoms did not continue to resolve on their own. Note that in 2014, I had a similar, but more severe reaction to a single dose of Nitrofurantoin and regained nearly complete salivary gland function after 9-12 months.

1184384	4/9/2021	GA	34	M	4/7/2021	4/7/2021	After vaccination, patient appeared to be slouched over in chair in observation area. Two bystanders approached him and held him to prevent him from falling from his chair. Patient was diaphoretic and eyes half-closed. Attempt was made to arouse patient by talking to him and rubbing chest. His head and body moved erratically for approx. 3 seconds. Patient was lowered to the floor. Nurse continued speaking to patient and rubbing his chest. He then opened his eyes and was startled. Patient abruptly sat up and said, "what happened and where is my phone?" The nurse reassured him he was being taken care of and she asked if he knew where he was? Patient replied, "I have no idea." A paramedic approached and asked the patient if he knew his name. The patient correctly replied. The patient had no recollection of what had taken place, but did know where he was. Patient was then evaluated by the paramedics. All tests performed were normal and patient refused to be transported to hospital. Patient was driven home by his wife. Follow up phone call to patient yesterday evening with no answer. Follow up phone call to wife (listed as emergency contact), 4/7 at approx. 6 pm. Per wife, patient experiencing fatigue and still very pale. She said he just wasn't himself. Patient was concerned that they did not know what to expect a week or two from now. I advised patient that if she had concerns, she needed to have patient evaluated in ER.

1184397	4/9/2021	OH	29	F	3/31/2021	3/31/2021	Vaccine was administered at 4:50pm and at approximately 5pm, the patient came to the pharmacy technician's station at the Drop Off Window stating she "didn't feel good." She stated she was feeling light headed and experiencing "tunnel vision and hearing." The pharmacy technician and a customer standing behind her noticed that patient was beginning to faint and the customer grabbed her. The pharmacy technician grabbed a chair from the Waiting Area and the two helped patient to the chair. The patient was given a bottle of orange juice and stated she felt better. The pharmacist asked the patient whether she was diabetic and if she was anxious prior to the vaccine. The patient stated she wasn't diabetic but hadn't eaten that day and that she has an anxiety disorder and occasionally feels lightheaded after vaccines. Patient sat for 30 minutes before going home on her own.
1184398	4/9/2021	NC	55	F	4/7/2021	4/7/2021	Pt is a 55 yo F with no previously documented encounters. On 04/07/21, pt presented to clinic for immunization. At 0819, pt was administered COVID-19 J&J (Janssen) Vaccine 0.5 mL in left deltoid (Lot #043A21A; exp: 6/21/2021; NDC #59676-580-15). After injection, pt became lightheaded and reported throat soreness and a "feeling like her vision was closing in." Vitals assessed with BP: 61/39. Pt was placed in reclined position and feet were elevated. On exam, pt denied any itching or hives, denied any previous allergic reactions or anaphylactic reactions, but reported having lightheadedness after a prior injection. Pt reported feeling well prior to arrival, but acknowledged not eating much and anxiety about injection. Pt was monitored for 45 minutes with BP recovering to 124/82. Pt was discharged in stable condition and escorted to her vehicle by staff.

1184431	4/9/2021	WI	55	F	1/20/2021	1/20/2021	1/20 vaccination 30 Minutes later, my tongue started to go numb. Within 15 min, from eyebrow down to my neck was completely numb on L side. Lasted for 2 weeks. I called back to facility and they said they had never heard about it. Then thru the weekend, I recorded everything on an app and did telehealth with PCM. By 3-4 days later before 2nd vaccination, it got better. 2nd vaccination, little numbness, fatigue, tightness across chest. No course of treatment advised by PCM but faired better with second vaccination; 2/10/2021.
1184531	4/9/2021	WV	61	F	3/12/2021	3/14/2021	Weakness Confusion Falling down Vision impairment Legs really weak All of the above symptoms started on March 14, 2021 On March 18,2021 she was not out of bed except for just a few minutes. On March 19, 2021 she was on the floor laying beside of the bed and my father noticed blood looking stuff on her shirt and bed covers. She was really confused and lethargic. She was really weak and could not stand. She was extremely fatigued. At around 10:30 she fell again on the floor and my father and sister in law was able to get her back up and put her in a chair and she went to sleep. At 12:55 my father noticed she was not breathing and called 911. When they did CPR blood was coming from her mouth and nose. When the ambulance arrived they immediately took her to the hospital where she was pronounced dead at around 3:30 pm.

1184485	4/9/2021	NJ	54	F	4/8/2021	4/8/2021	About six minutes after shot, I experienced a sudden drop in blood pressure and heart rate, became dizzy, faint, and disoriented and experienced a period of complete blindness for 1-2 minutes. Paramedics were sent to my vehicle, they laid me back, took vitals and assured me that eyesight would return, which it did. They monitored me for 30 minutes and gave me a granola bar which I ate. When I was stable, I drove home.
1184498	4/9/2021	FL	56	M	3/22/2021	3/24/2021	Patient stated 2 days after she received the vaccine she started c/o hives, very itchy all over the body, left eye swollen shut, no fever/body aches or chills, no n/v or sob, very fatigue and tired. As of 4/6/21 the patient is feeling better and the hives and itching are subsiding and getting better everyday. Patient went to ER on Thursday 3/25/21. ER MD gave an rx for Prednisone 20mg but stated to not use if she doesn't need it but to continue taking the Benadryl. Patient is also using the Benadryl cream and Hydrocortisone spray (both are helpful). MD ER called the CDC and he as informed by the CDC that the patient shouldn't receive the 2nd dose of Pfizer and it was recommended to get the JJ vaccine.
1184273	4/9/2021	LA	23	F	4/7/2021	4/7/2021	Received Janssen COVID-19 Vaccine EUA. Had blurred vision, nausea, red rash on arms ,neck and face. I took hydroxyzine 25mg
1184426	4/9/2021	PA	38	M	3/14/2021	3/28/2021	3/28/21 started to have jaw pain. 4/2/21 a lump started to form in neck. 4/3/21 lump in the neck and evening broke out with lesions on the left side of forehead, nose and temple. Went to ER for evaluation, CT scan with contrast. CT confirmed lump was swelling of lymphoid. ER thought maybe shingles, but it crosses over slightly over to the right with lesions.They determined maybe a virus and follow up with a dermatologist. 4/4/21 lesions now on left eye lid. ER visit again to ensure eye is ok, the ER dr. believes its shingles. 4/5/21 visit to dermatology and swab of lesions on face taken (still waiting on results). Dermatology believes some kind of herpes, but not sure. Went to Eye specialist to ensure eye does not have virus on same day. Eye dr believes shingles. Virus is not in the eye, but on left eyelid.

1187880	4/9/2021	CA	56	F	4/7/2021	4/8/2021	Body aches, chills, joint pain, fever between 100.4 and 101.8; headache, fatigue, eye burning/watering; stayed home in bed, hydrating, still not feeling well today; fever down to 99.8
1187860	4/9/2021	FL	65	F	2/9/2021	2/17/2021	2/9 vaccine; 2/17-erythema,edema ,and hard welts at injection site to elbow and including inner arm area accompanied by intense itching. Treated with hydrocortisone cream, benedryl cream and OTC diphenhydramine 25 mg tab q 6 hrs. 2/23- resolved. 2/26- developed floater in right eye; 2/28- developed edema, erythema with burning, itching rash on upper chest, anterior neck and bilateral lateral face. Treated as above for arm, 3/4- resolved. 3/9- 2nd dose followed by mild rash at injection site, severe chills, headache and left arm pain from evening until morning followed by fatigue until following day when it resolved. 3/24 developed erythema, edema, burning, itching, painful to touch rash on entire face, neck and upper chest more intense than previous instance worsening over next several days to include very edematous eyes and bruising of right eyelids and painful rash continued. Treated as above but self treated with additional 5 day course of prednisone 10 mg already on hand as well as oral diphenhydramine tabs due to severity of symptoms. 3/30-Resolved.. Concern whether to accept booster or additional future vaccines.
1187859	4/9/2021	NY	37	F	4/8/2021	4/9/2021	Left eye is swollen. Puffiness is around the whole eye socket, but more so below the eye. No pain, but it feels as swollen as it looks. I've taken one Aleve, two allergy pills (the Walgreens version of Allegra) , and used a cold eye compress. It is still swollen as of 7:47 pm ET. It has not improved that much, but it has not gotten worse. I don't know if this swelling is due to the vaccine, as my arm feels sore but okay, or possibly a poorly timed mosquito bite in the middle of the night (as there was one in my room last night).

1187834	4/9/2021	OH	69	M	3/30/2021	3/30/2021	At ~ 5:30 pm, while driving my vision suddenly went, for lack of a better term, haywire. Perhaps ?Vertigo?. Vision was such that I had to pull over so as not to cause an accident. It was as if each eye was looking at the same view differently and all jumbles. Perhaps like looking through a prism and seeing multiple views of the same image , Able to stabilize it by covering one eye and viewing with the other, and vice versa. Was able to drive again approximately 2-3 minutes away by keeping left eye closed; and able to see ok with one eye. When stopped and opened other eye the incident stabilized and went away. Was able to get out of vehicle and walk ok. The following day, experienced feverish symptoms throughout the day and had 101 degree fever by 9:30 pm. Temperature settled down to 99 by 11 pm after resting. That is the extent of the symptoms other than a slightly sore arm at the injection site which was fine by the next day.
1187832	4/9/2021	FL	48	F	4/5/2021	4/5/2021	Within 7 minutes she started feeling a very warm sensation in her neck moving upwards which slowed down her breathing. She checked her pulse and it was low. She experienced blurry vision and extreme fatigue for 3 days.
1187811	4/9/2021	CA	21	F	4/3/2021	4/3/2021	Numbness in Left Side of face, so far has persisted for 6 days after the vaccine. Included Left side of mouth, left cheek/cheekbone area, and left eyebrow to midline. Felt like there was lidocaine in my face. Dizziness: still getting bouts of dizziness while sitting down and walking, world feels like its spinning Brain Fog: struggling to maintain train of thought, memory problems Fatigued Feels like there is a knot at the base of my throat, feel it when I swallow liquids, does not inhibit swallowing but is a nuisance Fever- lasted for 3 days Chills- lasted for about 24 hours Muscle pain and aching, soreness at injection site, intense shoulder and neck tension is still present but decreasing Headache- 4 days Ventolin Inhaler needed to be taken twice during the worst of the effects, asthma symptoms, specifically coughing and wheezing, have been continuing but decreasing Felt like vaccine exacerbated asthma symptoms Chest tightness, as though someone is sitting on my chest(not one of my usual asthma symptoms)

1187318	4/9/2021	TX	38	F	4/5/2021	4/7/2021	Had vaccine Monday, Woke up Wednesday with left side of my face swollen and a couple of bumps around my knee. Swelling was minimal by bedtime. Took two doses of Benadryl once in the AM once before bed. Woke up Thursday with facial swelling predominately on the right side and it was about 4 times it's usual size, lip was majorly swollen, had a rash all over the back of my legs around my knees shoulder, lower back onto butt. Went to urgent care Thursday morning at 8, rash had subsided on it's on for the most part. She gave me a steroid, took the steroid 2 times Thursday. Woke up Friday morning with a little swelling still under my right eye and cheek. No rash
1187780	4/9/2021	CA	57	F	4/9/2021	4/9/2021	Client received first dose @12:18 pm, felt flushed with tunnel vision @12:54 pm. Client's vital signs stable, no symptoms by 1:04 pm. Able to go home by 1:14 pm.
1187903	4/9/2021	IN	32	F	4/9/2021	4/9/2021	About one minute after the woman sat down from getting her COVID shot she told our cashier she was feeling ill and was going to the bathroom. I went in the bathroom and found her sitting on the floor with her head between her legs. She said she started feeling ill and hot and sweaty. Her palms were sweaty as well. She was dizzy and she was starting to black out and then got tunnel vision. I tried twice to take her blood pressure and could not get a reading from the machine. We got her a glass of water that she wanted. She said she did not eat that morning. During our conversation she started feeling worse and laid down. She felt that 911 did not need to be called. After a few minutes she started feeling better and was able to stand. She said she has previously passed out after getting a shot. She answered no on the questionnaire and to the direct question of have you ever fainted after getting a vaccine before the shot. She went back out to sit in the waiting room for 15 more minutes. Before she left she came to me and said she felt better. We went to the HIGI machine to get her BP. It was 116/79

1187462	4/9/2021	IA	67	M	3/29/2021	3/31/2021	Patient started to get a twitching of the eye and some mouth tightening and loosening two days after vaccine. He went in and was seen by the physician twice. The first time was for a CT and other blood tests to ensure he didn't have a stroke. The second appointment was to tell him that it wasn't a stroke and nothing else was wrong, so they assumed it was the vaccine. He also went to the eye doctor during this time to ensure that it wasn't going to affect his stigmatism due to the fact that he couldn't wear his contacts only his glasses and his stigmatism is so bad he has to wear hard contacts. Due to the twitching he couldn't wear the contacts. It was reported to us on 04/08/2021 and he was still have some eye twitching, but not bad and his mouth symptoms had pretty much resolved. The physician said that it should go away in 1-2 weeks and if not he was suppose to see her one more time.
1187453	4/9/2021	CA	54	M	4/7/2021	4/7/2021	Left vaccination facility at 1:10PM, March 7th, 2021. About 2 hours later, hives and rash appeared on my upper torso and top of both thighs. When I woke up the next day, the hives and rash covered everywhere except my head. I took a shower and it became hard to breath, my eyes were very light sensitive, nauseous, and very dizzy. I tried to make it back to my bed, but fell twice. The second time I fell I stayed on the ground for about 5 minutes. When I got up, everything was back to normal. I left soon after to the Hospital emergency room to get checked.
1187425	4/9/2021	MN	26	M	4/9/2021	4/9/2021	WHILE PATIENT WAS WAITING 15 MINUTES, HE STARTED LOSING FEELING IN HIS ARMS AND LEGS, NEXT HE LOST ALL STRENGTH IN ALL EXTREMITIES, STATED PAIN IN ARM AND SIDE OF RIB CAGE, STARTED LOSING VISION TO TUNNEL VISION AND BLURINESS. 1187350	4/9/2021	NV	50	M	4/7/2021	4/8/2021	2nd phizer vaccine- normal side effects started around 9-10 am but progressively got worse during day and into evening. Aches, chills, fever, headache- around 5:30 pm had an issue with blurred vision in my left eye for approx 15 mins, similar to a migraine apparently (never had one before)- blood pressure spiked to 164/104 and resting heart rate was between 90-104, normally 52-60. Headache persisted for nearly 9-10 hours and all symptoms improved dramatically after two Tylenol
1187349	4/9/2021	AZ	58	F	4/8/2021	4/9/2021	immediate sinus nose and rear eye pain, immediate slight breathing problem, all subsiding within 15 minutes. Next morning - slept over 10 hours, after 9:15 am experienced chills, nausea, headache, joint and muscle pain, severe injection site pain, lightheadedness with swaying when walking, lethargic, sneezing, slight lower lung heaviness. Some symptoms went away by 3:00pm. Still subsiding now at 3:32pm.

1187344	4/9/2021	FL	36	F	4/9/2021	4/9/2021	<p>Patient presented at Hospital for COVID19 Vaccine administration on 04/09/2021 at 1:21 pm. Upon checking in for her appointment, she was provided with COVID19 vaccine screening and consent form in which she denied the following: ? Having allergies and reactions to any medication, foods, vaccines, or latex. ? Carrying an Epi-pen for emergency treatment of anaphylaxis. ? Having had a severe reaction to previous dose of this vaccine or to any of the ingredients of this vaccine. After the vaccine administration, Patient was guided to the observation area for a 15-minute observatory period. At approximately 2:00 pm- while in the observation area, approximately 15 minutes from vaccine administration, Patient, began to feel faint after family member was being treated by our medical alert team and sat down while hyper ventilating triggering a panic attack. At this time husband, also in the observation area, was asked by our medical team if patient had a history of panic attacks where he preceded to confirm that patient indeed has a history of panic attacks. Vitals were taken while patient was sitting in the presence of a nurse. 2:02 pm Vitals ? Blood pressure 130/80 ? Oxygen saturation level 98% ? Pulse 83 2:04 pm-Paramedics were called by Lead Medical Assistant 2:14 pm -Paramedics arrived. While the paramedic team assessed patient, EKG normal, vital signs normal. Patient was hyperventilating, became rigid, unable to open eyes with a locked jaw while grinding her teeth. Patient never lost consciousness. At this time, patient?s husband and paramedic began speaking to her, comforting her, and assisting her with breathing exercises. Patient?s husband confirmed that was she was experiencing was one of her usual panic attacks that usually can last 30-45 minutes. As a precaution, paramedics offered to transport patient to the nearest hospital to which the patient refused. 2:30 pm- patient was fully recovered and deemed stable by the paramedics? team. At 5:00 pm- Center Administration called patient, she stated that she felt fine. No other symptoms reported.</p>

1188405	4/9/2021	CA	65	F	4/8/2021	4/8/2021	^ hours after injection my arm was aching. Then Head ache set in by 7pm. pain with neck and head and fever progressed quickly. by 9pm it was 103.7 By 11:00pm my fever was 105.4. By midnight it was 105.9 I took Vicks NyQuil because it was the only pain med that had Tylenol in it. Fever reduced to 105.4 by 2:30 am fever was at 104.5 and I felt safe to try and sleep and not die. A nurse friend was telling me to go to the emergency room. I applied and Ice pack to my splitting headache and eyeballs felt like they were going to pop out. also Icepack to neck. ate a popsicle. I hydrated emencely before the shot and All day with the shot. I kept moving my arm and it was fine after a few hours. THE FEVER SITUATION WAS QUITE FEARFUL AND STRESSFULL. My throat felt a "little" tightening. I swallowed every few minutes to make sure it did not progress. I had Benadryl on hand just in case. I slept from 3:00am until 9:30 am. My morning fever was between 103.7 and 104.5 It was 102.4 at 3:00pm it is 8:45 pm and my temp is 102.2 now. head ache is at 50% of yesterday.
1186384	4/9/2021	PA	41	F	4/6/2021	4/6/2021	Pfizer-BioNTech COVID-19 Vaccine EUA first dose administered approximately 2:52pm. Reaction started approximately 2:57pm after seated in observation area; sense of feeling "not right" then heart started racing, chest felt tight, vision got strange and I couldn't really move. Once this episode passed I got up and told a volunteer I thought I was having a reaction. Moved to secondary observation area, hooked up to machine that tracked heart rate and blood pressure. Next episode occurred at approximately 3:10pm; heart rate shot up to 160 (unsure of BP), same feelings of immobility accompanied with urge to pee/poop. These episodes continued for 4-5 rounds until approximately 4pm and lasted multiple minutes each time.

1188329	4/9/2021	CO	37	M	4/9/2021	4/9/2021	Patient was waiting in designated waiting area following vaccine administration. About 5 minutes after vaccine I heard wife calling for help. When I went out to assess patient I found him laying back in chair with his head back, shaking, eyes open, and making fists with his hands. I asked him if he wanted me to call 911. He was able to respond through clenched teeth that he felt very strange and to call 911. He remained conscious and knew his name. We contacted 911 and I supported pt from opposite side of wife. After a few minutes he calmed down and asked for water, he appeared to be sweating around head area. He took a few sips of water until operator on phone asked us to withhold further liquid until EMTS arrived. He was completely back to normal status within 5 minutes, EMTS came and assessed pt and allowed him to leave of his own accord. After the incident her relayed that similar reactions including full fainting spells have occurred to him in the past when receiving vaccines. this was not indicated on his intake form
1188324	4/9/2021	WV	30	M	4/8/2021	4/9/2021	I had received the Janessen vaccine around 3:30pm. Around 1 am I woke up to shivering and chills. My head felt extremely pressurized inside. My eyes felt like they were being pushed out of their sockets. My body hurt. It hurt to move. My neck, knees, ankles and back were in shooting dull pain. It took everything I had to stand up. I couldn't get to sleep. I had a fever. I started to shiver. My thought raced. It began to hurt to breath. My lower chest is sore on the inside where the lungs meets the rib cage. I could not go to class or do any work. Was easily one of the worst nights of my life.
1188290	4/9/2021		34	F	3/1/2021	3/7/2021	Outbreak of urticaria approximately 5-7 days post injection #1. Had several months of no hives prior to shot but presented with a significant amount urticaria afterwards and through second shot. Weals on legs (primarily) but also trunk, lower arms, back of neck, cheek/face. Minimal angioedema in eye areas but only occasionally on random days. Symptoms (urticaria) present past four days post shot #2 but easing in severity, amount, and duration

1188271	4/9/2021	WA	66	M	2/26/2021	3/8/2021	Symptoms: headache, loss of vision in left eye, vertigo. Stroke took time to diagnos, I thought it was a vision problem. Long time delays occurred while scheduling further testing (CT and MRI). Summary from MRI: "Study Result Impression: There is diffusion restriction along the left thalamus consistent with subacute ischemia, greater than 6 hours in etiology but less than 2 weeks." Outcome: Vision is slowly improving, headache is mostly gone, vertigo & mental status slowly improving.
1188270	4/9/2021	OR	39	F	4/9/2021	4/9/2021	Flushed face, itchy lips, tounge, roof of mouth, and head. EMT checked and advised Benadryl. Took benadryl at 10:54am symptoms continued to progress itchy eyes, began to feel tightness in throat and chest but benadryl began working. Still was itchy and flushed but not as bad. Around 4pm began to feel lightheaded and dizzy, eyes and face itchy. Felt like throat was blocked and like i was going to faint. Took more benadryl and went to er because I was having problems breathing. Was given steroids and pepsid. Placed on a course of benadryl, pepsid and steroids for the next 5 days instructed to follow up with PCP in 2 days.
1188265	4/9/2021	PA	28	F	3/26/2021	4/3/2021	8 days after getting the Pfizer COVID-19 vaccine i got a tingling headache on the right side of my head near my temple and the next day it spread to my whole right side of my head, creating a painful bed-ridden migraine. The next morning after that, the 3rd of April it turned into a rash that eventually turned into blisters and went down to the tip of my nose, down my forehead and near my eye, to which it swelled. I went to the doctor to get help and was diagnosed with shingles a day afterwards. I have gotten medication and am still on it to this day (currently 4/9/2021)

1188011	4/9/2021	NY	36	F	4/7/2021	4/7/2021	I received my vaccine at 10am and by 5 pm I was feeling extremely tired couldn't keep my eyes open. For the rest of the night I had a fever of around 102 and chills and stomach pain and nausea. These symptoms lasted the entire next day along with extreme fatigue and dizziness that also has lasted up until and ongoing on 04/09/2021 at 8pm fever is on and off at about 101.
1188103	4/9/2021	CA	53	M	4/8/2021	4/8/2021	Patient was scheduled for an appointment for a Johnson & Johnson covid-19 vaccine through a drive thru Thursday April 8, 2021 @12:45pm. We arrived early and he received the vaccine at 12:15pm, waited 30 minutes for reaction and he was feeling fine. Later that same evening, the patient was driving to work on the freeway when he felt a dry throat so he coughed hard, at that cough he felt a massive pain in his head, like his "head was going to explode." He immediately had tunnel vision closing in on him, so he pulled over and later woke up in our parked car with flashing emergency lights on, parked on the shoulder of the freeway. Disoriented and confused why he was there, he looked at his watch and saw he lost 15 minutes when he had passed out. MY HUSBAND COULD HAVE BEEN SERIOUSLY INJURED OR KILLED IF HE HAD NOT PULLED HIMSELF OVER WHEN PASSING OUT. Today we reported this to our doctors office and to you!
1188249	4/9/2021	NJ	39	F	2/12/2021	2/14/2021	Scleritis of the left eye which lasted approximately three weeks

1188127	4/9/2021	CA	30	F	4/9/2021	4/9/2021	PT c/o dizziness/lightheaded at 12:44 & taken to room to lie down. Note by MD: Notified by Nurse that the patient had just received COVID 19 vaccine and is feeling dizzy and not feeling well. Patient was already brought to exam room 1 for further monitoring and assessment. In the exam room, patient is sitting up talking to MA . reports that patient's O2 Saturation is 98%. While I was talking to the patient, patient states the lips and face are having symptoms of tingling and with sensation of swelling. Patient also states feeling dizzy, sleepy, nausea, and lethargic. I asked patient to lay down on exam table instead of sitting up. I immediately place patient's legs up with the help of patient's friend. On exam, patient is becoming more pale. No diaphoresis. Patient has sign of becoming less arousable. Patient states vision becoming more blurred and patient was near passing out. Due to above progressing and escalating symptoms, possible anaphylactic reaction to COVID 19 vaccine is considered. I immediately call for assistance from nursing staff to bring EpiPen. Dr.arrived with EpiPen in the exam room. Patient continues to have progressing symptom of difficulty with arousal in a near syncopal state. Patient is becoming less alert. Decision is to give EpiPen injection to reverse potential progressive and impending anaphylactic reaction with sign of progressive hypotension. Blood pressure was not able to be taken before the EpiPen was given due to patient's rapid progressing symptoms. EpiPen injection to right thigh done by Dr.. After the injection of EpiPen patient had nausea with dry heave. No vomiting. BP taken in right arm in supine position. BP is 110/70. Pulse Oximeter: Pulse 93. O2 Saturation 96%. Heart exam: RRR no murmur. Lungs: no rales. no wheeze. breath sound equal and bilateral. Few minutes after the injection of EpiPen, patient states is having improvement of blurred vision and blurred vision has gradually resolved. Patient is also more arousable and alert. Patient still has nausea. Patient reports feeling improvement. Paramedic arrived and evaluated the patient. Patient transported to ER by paramedic around 1:22 pm. At time of transport, patient is in stable condition. Patient is awake, alert and answer all questions appropriately. Per patient's friend, patient had symptom of tingling sensation of the lips and face and also urticaria 3 hours after

							receiving 1st dose of Moderna COVID 19 vaccine which was 1 month ago. Patient's friend learned about this 1 day after the patient had the vaccine. Unclear if patient received any treatment for such. Patient states never had other vaccine reaction in the past.
1188228	4/9/2021	PR	58	F	4/8/2021	4/8/2021	patient indicates she is starting to feel hot in neck area up to her arm. She had watery eyes. Pharmacist assisted her and asked if she has any condition in her eyes : she said no. She said she felt weird and drowsy. Pharmacist asked if she was allergic to something and she said yes. Pharmacist administered 50mg of Benadryl IM on arm. She started to feel better.
1188151	4/9/2021	MA	49	M	4/2/2021	4/2/2021	I went with my wife, whom we were more concerned about possible reactions to the vaccine given her history of anaphylaxis reactions to bee and wasp stings, has had to carry a Epi-pen always, so we stayed an additional 15 minutes for 30 minutes total before we left. She was completely fine throughout, I however as we were walking out I began to feel a little ?Off?, not necessarily nauseous or dizzy, just a bit Off. Told my wife that and that I wasn?t sure I should drive us home (I drove us there), so she drove. About 15-20 minutes into the drive, it got worse and I passed out. My wife says my eyes rolled in the back of my head with my eyes open but no responsive. She says she kept hitting my chest but I didn?t respond. I came to about 2 minutes after passing out. She asked me if I felt like I needed to goto the hospital, I told her I needed to eat, that I felt like what I needed was food, then we go from there. I did eat breakfast, an English muffin at about 8am that morning, it was almost 12:30 by that point. When I finally got food in me I felt much better and have had no adverse reactions since.

1188158	4/9/2021	VA	35	F	3/25/2021	3/25/2021	Conjunctivitis formed in my left eye suddenly (same side of the body where I got the shot). I only noticed when I got out of the shower and looked in the mirror. After that I noticed my eye was tearing and goopy. It was very red for an hour or two and then it started to improve. The redness went down considerably by 10:30pm, but my eye remained slightly goopy and irritated for 2 days. I was able to continue wearing the same pair of contacts. It just went away on its own. I wore my contacts as a test to see if it were truly a bacterial or viral conjunctivitis I contracted by coincidence, but I knew it was not. I don't go anywhere. The fact that it went away on its own so quickly was confirmation that it was a side effect. It is worth saying that I have also experienced pink eye from a virus in the past. Maybe my body is more susceptible.
1188198	4/9/2021	NJ	51	M	4/7/2021	4/8/2021	I received the vaccine at 12:15 PM. I was a little tired but generally fine the rest of the day. I woke up at 2:30 and didn't feel well. I got up to go to the bathroom. I started getting the chills and feeling dizzy. I passed out. My wife found me passed out on the ground and bleeding. I needed six stitches in my head and have a black eye as well as other facial lacerations. I have no recollection of anything until my wife woke me. I have never passed out in my life prior to this.
1188207	4/9/2021	FL	33	M	4/5/2021	4/5/2021	Major headache, pain around eye, dizziness and nausea.
1188209	4/9/2021	CA	64	M	4/8/2021	4/9/2021	I was driving a car and suddenly I experienced extreme blurred vision and disorientation. the event lasted for about 2 minutes. It then cleared up with no lingering ill effects.

1186522	4/9/2021	CA	71	F	4/7/2021	4/8/2021	Noon the day after the vaccine I was suddenly overcome with nausea, and dizziness that sent me stumbling to bed and vomiting into a bucket next to me. Vomiting lasted for one session, but dizziness and nausea stayed for about 3 hours, and then nausea, fatigue and general sick feeling kept me in bed until the next day. April 9 I woke up still feeling out of sorts, but not as bad. Note: 28 minutes after having the vaccine, once I started driving home, the vision in my left eye suddenly went blurry, and I nearly lost vision in that eye. I tried to find a safe place to pull over but couldn't. After 5-8 minutes the vision came back but stayed a bit blurry for a couple hours. Never had any such thing happen before.
1186759	4/9/2021	SC	21	M	4/6/2021	4/6/2021	1. Vasovagal syncope almost immediately after vaccination, little to no warning of oncoming syncope 2. Extremely fast acting fever (temperature went from 98.6 to 100.5 in roughly 30 minutes) followed by nausea, pounding headache, and body aches/chills. Remedied by alternating very high doses of ibuprofen (800mg) and acetaminophen (1000mg or 1g) every two to three hours. This did not ever bring down the fever below 100 degrees. 3. Blurred vision around 29 hours after vaccine - advised to go to ER by triage nurse. ER doctor determined not to worry about, likely due to headache but not 100% sure.
1186749	4/9/2021	OH	22	F	4/8/2021	4/8/2021	~3PM Immediately after injection - intense pain at site of injection. Several minutes after injection - lightheadedness. ~10PM - sudden overwhelming full body symptoms. Started with lightheadedness, fever, headache, and nausea. After laying in bed, the headache became extremely painful/throbbing. Full body aches (back, neck, legs) began. Ears got sensitive to sound, eyes got sensitive to light. Stayed in bed experiencing pain until ~1 pm the next day. After taking aleve around 11 am, the headache and fever subsided, but the remainder of symptoms still persist.

1186730	4/9/2021	OR	67	F	3/1/2021	3/15/2021	About an hour after having the shot, I was nauseous, dizzy and light headed, I thought I was going to pass out. I had to lay down. My eyes swelled and they started to tear up, I felt weak all day and into the evening. I never had a bad reaction to a vaccine before, so this was surprising. I contacted the health department as they came to my house and gave me the shot, but I could not get through to anyone. I had to leave a message. After I was contacted back, I was told that someone would contact me that very same day, but no one ever did that day or any other day. .Because of that, I thought it must not have been a big deal, but after reading today that people in a specific had some of the same reactions I did, I thought I should report it.

1186723	4/9/2021	MD	51	F	4/7/2021	4/8/2021	I had eye strain all day April 8, 2021 - the day after I received my first dose of the Pfizer COVID-19 vaccine. My vision wasn't blurry, but my eyes definitely had to work harder to focus and by the end of the day were sore and tired. I'm filing this report on April 9th and the eye strain seems to have diminished considerably. It is almost 5pm and I'm noticing now that my eyes are a bit tired and very slightly sore.

1188377	4/9/2021	CA	18	M	4/8/2021	4/8/2021	Perfectly healthy, fit, thin 18 year old young man with no allergies and no previous reactions to vaccines or medications... immediately upon receiving J&J injection his eyes rolled back into his head and he was unconscious for two to three minutes, then in and out of consciousness for another eight to ten minutes. He convulsed for around ten seconds after about two minutes of being unconscious. Four to five healthcare workers attended to him, asking him to "stay with us." They called an ambulance, and the medics monitored him for awhile. Heart rate dropped to 34 bpm, clothing drenched with perspiration. Blood sugar was slightly low, although he had eaten a late brunch of two fried eggs, sourdough toast and fruit salad. The last thing he remembers is a cold sensation shooting down his arm and into his left hand. He tried to talk to say he wasn't feeling well, but he couldn't form the words, so he raised his arm and then fainted. He felt generally unwell the rest of the day, and today he is still not fully recovered.

1186456	4/9/2021	NC	19	F	4/8/2021	4/8/2021	Janssen COVID-19 Vaccine EUA Immediately after getting the vaccine, I experienced severe nausea for 10-20 minutes. I experienced no symptoms for 3-4 hours afterward, but then began to develop a low-grade fever, muscle aches, a headache, and became nauseous again. Around 12 hours after getting the vaccine, I developed a fever of 102 F, I began to experience severe muscle aches and cramps in my calves and abdomen. I also began to develop a much worse headache and lost partial vision in my right eye for a few hours. This is when I became violently nauseous, but I was unable to throw up, or defecate. I was unable to sleep during this time, and at 2 am, my nausea peaked, and I threw up incredibly violently and incredibly suddenly. It was so violent, it caused me to pop a blood vessel in my eye, and gave me a sore throat. However, after throwing up, most of nausea subsided. At this point, the vision began to return to my eye. 20-40 minutes after throwing up, I began to experience chills that lasted for up to an hour. Eventually, I slept at 4 am, but slept fitfully, and woke every 40 minutes to 2 hours. At 7 am on the 9th, the nausea was completely gone the day after my vaccination, but the muscle aches and headaches were back. My fever was down to 101, and I took some Tylenol and slept fitfully until 2 pm when I woke up feeling significantly better.
1186575	4/9/2021	AL	71	F	4/8/2021	4/9/2021	She got her vaccine yesterday, no problems initially, then today 4/9/21 started having chills, loss of appetite, fever, headaches and eyes hurting as well, and aching joints. Chills to the point that she has turned her heater on but it's in the 80s outside. She has not taken anything for her symptoms.

1187113	4/9/2021	CO	47	M	4/9/2021	4/9/2021	Patient was coherent during initial injection, as I removed my gloves and asked he remain in the waiting area for 15 minutes his chin fell to his chest and he began to breath heavily. I spoke to him and there was no response. He then began making snoring type noises and lifted his head but again was unresponsive. Patient then slumped sideways in the chair. I made one last attempt to arouse him with firm strikes to the chest and calling his name. I retrieved the EpiPen from the e-kit and as I removed it from the box he became conscious. He opened his eyes and gasped and tremored slightly. He was not immediately responsive verbally. I observed him carefully to evaluate if he was going to have a seizure, but he then became coherent. He was alert and oriented to time and place but did ask how long it had been since the vaccine. He admitted to having a problem with needles and stated that was the root of the reaction. He does not remember any reactions to previous vaccines but also could not recall his last vaccination. We brought the patient water and offered snacks while he recovered in the patient care area. Approximately 20-30 minutes after the initial event the patient began vomiting. After a few minutes of vomiting he said he felt a little better and wanted to go to his car to lay down. Multiple times we asked if we could call someone to come pick him up and offered to have him seen by paramedics that happened to be shopping in store. He declined both offers and stated he would lie down in his car and call someone if he did not feel well after awhile. Staff checked on him in his car and he was instructed to call in before leaving. Upon trying to check on him again it was noted his car was gone. I called the patient and he assured me he was ok and he was now at home.

1187061	4/9/2021	CA	35	M	4/9/2021	4/9/2021	<p>HPI: Patient is a 35 year old male who presents following administration of a single dose of J&amp;J COVID19 vaccine in the left deltoid. Patient started to feel light headed and nauseous while walking to his car. About 20 minutes following vaccination, a vaccinator had walked passed his vehicle and noted that he was unconscious. Patient was still unconscious upon medical response team arrival and unresponsive to stimuli. Once the patient awoke about 30 seconds later, he continued to state that he was nauseated and "did not feel good." Patient was unaware that he had lost consciousness. He further disclosed that he had been working in the sun planting trees all day and had not consumed any food or beverage. He denied allergies to medication, food, and other vaccines. He relayed that he had passed out from vaccinations in the past as a child. He affirms lightheadedness and nausea. He denies chest pain, difficulty breathing, swelling of the face/lips/tongue/throat, skin rash/itching, cramping abdominal pain, and vomiting. Exam (update as needed): GEN: Upon arrival, patient unconscious and not responsive to stimuli HEAD: NCAT EYES: pupils unreactive and mydriatic ENT: Ears normal, Nose normal, OP normal, no evidence of angioedema NECK: Supple, without LAD. CV: RRR, no m/r/g, palpable strong radial pulse PULM: Clear to auscultation bilaterally, no accessory muscle use ABD: Soft, no tenderness. SKIN: Skin pale, cool, and clammy. No rashes. No erythema or edema of the injection site. MSK: FROM, MS 5/5 NEURO: Patient unconscious upon arrival. CN 2-12 grossly intact, no ataxia, gait steady Clinical Impression/Field Tx: Vasovagal syncope. EMS called immediately to respond to the site for further evaluation. Patient placed into a reclined position. Patient not displaying active signs or symptoms of anaphylaxis. Upon regaining consciousness, patient was alert and oriented x4. Once the patient demonstrated ability to control airway, he was given candy and water. EMS arrived and an EKG and BGL were performed, both of which were normal. Vital signs were stable. Instructed patient to consult their PCP regarding the post-vaccination reaction. Patient instructed to go to emergency department should they develop chest pain, difficulty breathing, swelling of the face/lips/mouth/tongue/throat, or cramping abdominal pain with nausea/vomiting, as these are signs of possible</p>

1187025	4/9/2021	CA	53	F	4/9/2021	4/9/2021	<p>Patient received first dose of Pfizer at 12:50 pm on left deltoid, lot # ER8731, expiration date on 07/2021. Patient has a history of rheumatoid arthritis and asthma, both of which are controlled with medication. Patient waited in outdoor EMT waiting area for approximately 20 minutes. At 12:09 pm, patient entered indoor EMT waiting area and asked the lead nurse, if she could check her blood pressure. Upon assessment, patient was alert, oriented X4, clear speech. The patient's primary complaint was "feeling tired". The patient sat down in a chair in the observation area while RN took her blood pressure. At 12:09 pm, the patient's BP 156/102 sitting, HR 68, SpO2 97% RA, RR 17 res/min unlabored. Patient denies tightness in chest or throat, difficulty breathing, or trouble swallowing. Patient states she did not drink water today. RN gave patient a water. Patient consumed 16 oz of water at 1:13pm. Patient reports she is "feeling better" at 1:13 pm. At 1:16 pm, the patient's BP 156/102 sitting, HR 75, RR 18 res/min unlabored. Patient states her blood pressure "is usually low" because she runs daily, but she "can't remember" her usual range. At 1:20 pm, BP 150/100 sitting, HR 66, RR 18 res/min unlabored. Patient states she is "feeling tired and cold". Patient was transferred to anti-gravity chair at 1:25 pm with assistance from EMT. At 1:25 pm, patient's BP 167/115, RR 20 res/min, HR 64. At 1:32 pm, patient called her brother to come pick her up. Patient was provided with education related to signs and symptoms of allergic reaction, such as tightness in throat, tingling of tongue, and shortness of breath. Patient denies experiencing such symptoms. At 1:32 pm, BP 150/90, HR 70, Spo2 at 99%, RR 20 res/min. Patient states "I felt like something bad was going to happen" after receiving her vaccine. EMT talked with patient calmly and encouraged deep breathing. At 1:39 pm, BP 164/88, HR 84, Spo2 at 98%, RR 20 res/min. At 1:42, the patient requested to leave. Lead RN, advised patient to stay laying down and deep breath to help her blood pressure go down. Patient states "I want to leave". Patient was provided with education about normal blood pressure ranges. Patient verbalizes understanding and states she is aware she needs to call her doctor if she is experiencing headaches, vision changes, and/or chest pain. At 1:45 pm, patient got up out of chair and followed by EMT to car. Patient's gait was steady and balanced. Patient states she is "okay to</p>

1186956	4/9/2021	NY	49	F	3/20/2021	3/21/2021	drive". Patient declined having more vitals taken. Patient left with brother in passenger seat of car at 1:47 pm.  (Pharmacy was the pharmacy that provided the Vaccination.) I had fever, headache and body aches that started 24 hours after and they lasted about 36 hours. OTC cold and pain medication was taken for those. I had significant swelling under my left arm in the armpit. That lasted for about a week. At the same time as the fever, headache and body aches started, I had swelling under the eyes that started in the upper eyelids for about a week and that went down to the lower lids about a week post vaccination and since then it has been upper and lower eyelids - significant swelling and on March 30th (started me on the Prednisone on this date) - it initially helped and then it went back to worse than it was before. and on April 7th Benadryl and Neomycin- a topical steroid I've been applying under the eyes for that. The swelling was significant until this last Wednesday when I got on these two meds. Today I had a phone call visit with my doctor as a follow up to how the meds were doing. Recovery is progressing at this time.

1186863	4/9/2021	CO	36	F	4/7/2021	4/7/2021	Beginning approximately 2 minutes after receiving shot, experienced the following in sequential order: - Mild but Sharp pain (2-3 on pain scale) in my right elbow (same side as injection) - Slight lightheadedness - Sweating Profusely - Extremely blurred vision - Muffled hearing/Deafness I recovered within 10-15 minutes and was sent on my way by the paramedics. Was not particularly nervous about getting the shot, and I don't have any history of fainting. Felt perfectly fine the rest of the evening.
1186871	4/9/2021	VA	44	F	4/9/2021	4/9/2021	Approximately 3 to 4 hour after the vaccine my left eye started to hurt and feel like there was something in it and it swelled up.
1186876	4/9/2021	MA	41	M	4/9/2021	4/9/2021	I got the vaccine at about 12:55pm. About ten minutes after getting the vaccine, while sitting in a chair, I began to get tunnel vision and felt extremely tired. I broke out in a cold sweat all over my body. I began to lose my vision like I was fainting and I momentarily blacked out or dozed off, then came back awake. I started to get tunnel vision again for a minute, then it faded away. Then I continued sweating for a minute and then it faded away. After a couple minutes I felt fine again. I sat for another several minutes then left at 1:15 feeling ok with just a sore shoulder.
1186887	4/9/2021	TX	65	F	4/2/2021	4/5/2021	Monday 4/5/21 about 8am I woke up eyes Buffy Didn't think anything of it As the week progressed I noticed my face itching and little fine rash starting. Still not thinking about the shot at that time By Tuesday and Wednesday I had to take Benadryl Because the rash was itching and beginning to spread and I startled sneezing and feeling like I was having Allergies from being outside Like high pollen count or something. I really noticed the rash spreading in my face Around the eyes and everything prominently by Thursday. I itch a little bit under my breast and chest but no rash It really feels like allergies which I'm used to except the rash I only get this creepy itchy rash when I have eaten something I'm allergic to like anything citrus. I am taking Benadryl and if it persist over the weekend. I'll make an appointment to see my doctor on Monday 4/12/21

1180614	4/8/2021	IN	18	F	4/6/2021	4/6/2021	Initially she passed out following the vaccine - within 90 seconds- she has a history of passing out with injections and blood draws. Around noon she had a seizure. She describes a feeling of darkness and dread closing in on her and she was unable to speak or move. She was on the stairs at the time. I witnessed her stiffen, then go limp and fall between the electric stair hair and the wall. She hit the hardwood floor face first then she began to shake/twitch. She was unconscious. She awoke screaming, incoherent speech, and flailing limbs. It took about 5 minutes to calm her and be able to understand her speech. She only remembers the darkness and waking up scared and feeling awful. She was put supine on the floor with feet elevated, blood pressure monitored, given juice to drink, and vitals checked routinely. After about an hour supine and conscious, she felt good enough to sit up. She sat up for 15 minutes before she was able to stand with assistance. Family physician was notified immediately and we are still waiting for a response. She has a goose egg sized knot on her forehead, a bruise on the side of her face and a black eye from hitting the floor. She has a huge bruise on her outer thigh and lower leg where she hit the stair chair and then seized and it it repeatedly on the metal. She has underarm pain from where her armpit hit the edge of the stairs when she fell and seized. She has no history of any types of seizures.

1180197	4/8/2021	PA	39	F	4/7/2021	4/7/2021	I felt fine initially and felt good enough to leave 10 min after the shot. I decided to get some food to make sure I wasn't hungry on the hour and thirty min drive home. Unfortunately about 40minutes after receiving the second vaccination I started to get severe nausea, my tongue started to tingle and I felt a strange metallic taste in my mouth. I then started to get a severe headache and began vomiting profusely while driving home. My eye became extremely light sensitive and I was not even able to keep water down. I became so extremely tire that I had to pull over. I then called my husband to help talk to me over the speaker phone so that I could get out home as soon as possible. It was awful. I was vomiting while talking to him, and had to pull over again. I was so tired and in pain the entire drive home. When I got home I was so tired I just fell asleep on the couch and couldn't stay awake or eat/drink anything. I started to feel better around 7pm, and then I felt fine. Today I'm just a little tired and my arm hurts and has a bump, but other than that I feel fine.
1180172	4/8/2021	WI	42	F	4/7/2021	4/7/2021	Patient rec'd Janssen COVID-19 vaccine at 0912. Immediately started vomiting. Stated "arm burned all the way to her hand with injection". Reported felt dizzy, lightheaded, hot". BP 98/62. Assisted to cot and side-lying position. Continued to vomit/dry heave. At 0921, pt stated she was "really tired" and couldn't keep her eyes open. Able to answer questions, but not always able to finish sentence. EMS called. BP returned to normal limits within about 5-10 minutes. Patient contiued to dry heave and c/o feeling cold and nauseous, as well as "really tired" until EMS transported her. 4/8/2021: Nurse called patient. Patient stated she "feels foggy today". States her arm is "extremely sore".
1180171	4/8/2021	GA	25	F	4/7/2021	4/7/2021	Pt complained of dizziness and loss of vision. Then eyes rolled back and she began having jerking motions lasting a few seconds. She remained at the vaccination location for approx one hour to be monitored before leaving on her own.

1181471	4/8/2021	MI	30	F	4/6/2021	4/6/2021	<p>April 6th, 2021 Today at about 2:43pm, one of our technicians came to me and stated that a customer (employee too) had just got her second COVID-19 shot (Moderna), and she was at her car and not feeling well. The patient's co-worker had told us that her finger tips were numb and that she had a headache. The technician asked the customer to come back in, which she did and sat down in a chair immediately in front of me. I went directly to talk to her, as another technician was helping in the clinical services room, drawing up more shots. I asked the patient how she was feeling, and what she was feeling. She said she did not feel well, that her finger tips were numb, and she had this incredible pounding in the back of her head, and she ran her hand over the lower back part of her head and neck. She looked down and I asked her again how she was doing, she said not well, that she was beginning to get light headed and was looking a little pale. I called to the pharmacy team for help, to clear out the clinical services room and asked the technician to help me slowly walk her to the room. As we got her in the room I asked her if she would be ok to lay down on the floor and put her feet up in a chair, briefly explaining that this would help with the dizziness and keep her safe should she faint, because she would already be on the floor. another technician popped in and asked her if she could get her a cold cloth for her forehead, Patient said yes and the technician did so. an employee was working at the computer and just quietly stayed working (for another store). I moved around him and got the Blood Pressure Machine. I asked the patient if it would be ok if I monitored her blood pressure, she said yes. Patient was always 100% coherent and helped move her arm for me. I asked the employee for a piece of paper to document the reading, but the technician ran and got me one. Her first set of vitals were high. I marked them down and the employee told me the time. I just sat on my knees next to the patient for a while and tried to comfort her. I asked her a couple of times if she felt any change, and she said yes, Shot given 2:40pm 2:45pm BP 149/99 Pulse 71 SX: fingers numb, pounding in the back of her head cool cloth placed on forehead calmed area down &amp; quietly talked to the patient to determine how she was doing  ***** (Patient volunteered that she had just gotten tested for COVID-19</p>

----------	-------	-------	---------	-----	----------	------------	--------------

and that she tested negative.) I asked patient how she was feeling and she said that she was feeling a little worse. She said she was starting to get the shakes. I asked her if she had gotten anything to eat on her lunch and she said no. I asked her if she felt like it and if her BP was good, how would she like a sip of juice.

\*\*\*\*\* I asked the patient how she was feeling and she stated that her tight felt ever so slightly tight, but she said "I am asthmatic, and it did not feel any different than what she had experienced before. I took her BP/P again... 2:55pm BP 157/105 Pulse 68 I looked at the employee and he looked at me, and I told the patient that I would be right back. I quickly went and consulted with the technician and we decided that we should call 911 due to the increased in BP, pulse lower and the change in symptoms. The technician called 611 and talked to an employee and I called 911 and explained what was going on and what our need was. (The technician and I quickly discussed that neither of us felt that she was having an allergic reaction, just an adverse reaction, Epi was not called for. ) Employee stated that the clinic recommended we give her Benadryl. I did a fast check w/ the technician, it was not on our standing order/ protocol. Antihistamines can exacerbate asthma.) Then I went back to the patient. By the time I had gotten off the phone with 911, 2 more employees were in the room, and the patient was just getting off the phone with her father. Once I got positioned in the room, one employee left, I asked one employee sit down in a chair and the other employee was by the door leading to the pharmacy. I told the patient that we had called for an ambulance. I briefly explained due to her BP/P and her symptoms changing. I asked her if she wanted another cool cloth and she said yes. I asked an employee to get one for her from the sink in the pharmacy. I was again kneeling at her side. I saw her eyes well up with tears and a few tears were running down her face. I asked another employee to get me a paper towel, which he did, and I handed it to the patient. I tried to reassure her that things would be ok and this was just to ensure that she was safe. She stated that she felt a little nauseated. I then took her BP/P again. 3:05PM BP 146/99 P 66 2 employees and I remained with the patient, all calm and I made sure she knew we were there for her. I am not

							sure the time the EMTs arrived, but another employee let us know and we opened the door to let them in. They asked the patient a lot of questions and I gave them my sheet of what I had recorded for her blood pressure and pulse (BP/P). They asked the patient if they would help her into a sitting position, she said yes, but it was an awkward position, so I asked the patient if it would be ok if I helped support her back, she said yes, and I did just that. I stayed with the patient until they got her situated on the gurney and I helped cover up her legs. I went back to work when the EMT's wheeled the patient away. The BP/P is the best of my recollection, as the EMT's took my sheet of paper. At no time did the patient ever exhibit difficulty breathing, labored breathing or any change in her breathing. She was calm and her chief complaint was the numbness in her fingers and the pounding headache at the back of her head.
1180112	4/8/2021	NV	62	M	3/19/2021	3/20/2021	A day after the vaccine subject started experiencing blisters all over head and eyes and then spread to arms and legs. Subject went to urgent care on March 21 and was prescribed a medication for itching. On March 22nd subject had no relief so he went to ER because he wasn't getting any relief. Doctor stated he wanted to keep the subject for observation but subject did not want to stay. Subject states the progression stopped about day 7 but still has scabs and wounds that are healing.
1180138	4/8/2021	TX	55	M	3/31/2021	3/31/2021	Patient's mother stated: patient was fine until about 10 minutes post-dose, she stated he was slightly shaking, his eyes were rolling around and he was drooling and had nasal discharge. The mother stated he has never done this before and the 1st COVID vaccine dose went good. I was made aware ~30 minutes post-dose and went outside to check on the patient, he seemed to be doing fine at that point.

1181635	4/8/2021	HI	26	M	4/7/2021	4/7/2021	Written by Doctor: April 7, 2021 2:09 p.m. DOB 2/07/1995, male, received his second dose of Moderna Vaccine (Lot 019B21A) at 1:13 p.m. He stood up and walked to the usher's table to have his vaccine card completed. Approximately one minute after receiving his vaccine, he had a syncopal episode falling directly backwards striking his head on the floor. I, MD did not directly witness the fall, but everyone who witnessed the fall said that he fell completely unimpeded to the floor. I was notified and immediately assisted the patient who was with his girlfriend. Patient initially appeared ?out?, but almost immediately opened his eyes and asked what happened. His skin was cool and clammy. A pulse oximeter was placed on his finger registering 98% o2 and a pulse of 53. I kept him lying on the floor until he was completely awake and aware of his surroundings. At the time he said his neck was not sore, but his head was sore. Approximately 2-3 minutes later, we were able to assist him in standing to immediately sit down in a wheelchair. He was taken to the cot in the hallway just outside the Medical Observation where I was able to help him to stand and then lie down. An icepack was provided to put on the back of his head, he was provided water, Gatorade, and two cookies. Patient said that he hadn't eaten all day and had been feeling slightly hungry prior to his vaccination. I had patient move all extremities and asked his questions to verify that he was full awake and oriented to person, place, and time. Patient girlfriend stayed with patient while he ate his cookies. I addressed my concerns about patient striking his head on the floor and the possibility of a closed head injury. Girlfriend felt that patient was now completely back to his normal state of mind. I had patient remain lying down for 20 minutes. When I returned to check on him, he was sitting up and wanted to leave. I told him that he needed to be able to walk up and down the hallway before I would feel comfortable letting him leave. He stood up and walked halfway down the hallway before saying he was lightheaded. I immediately went to him to lead him back to the cot, but he insisted that he needed to use the bathroom to urinate. Both girlfriend and I stood in the doorway to assist patient if he needed, but he was able to finish urinating, then returned and sat in the wheelchair. I spoke to both Doctors via a phone call and had spoken to someone earlier. After letting them know that patient

							<p>did not want an ambulance called, but I was going to strongly recommend he go to the nearest ER before returning home, I returned to the patient. Vital signs at 1:53 were Pulse Ox of 98%, pulse 78, and blood pressure sitting of 140/75. Again, I strongly recommended that girlfriend drive him to an ED for an evaluation and possible cat scan. Patient also now had some paracervical neck pain which I also said should be evaluated. Patient and girlfriend both insisted they didn't want an ambulance called and girlfriend felt comfortable taking patient out of the clinic. Patient said he was hungry, and they were going to get food first. Girlfriend gave me her phone number (xxx)xxx-xxxx and I gave her my phone number (xxx-xxx-xxxx). I told her I was going to call her every hour to check on patient and told her to call me at any time. I recommended acetaminophen for the headache and other vaccine symptoms but no ibuprofen because of the possible head injury. I recommended to immediately call an ambulance or go to an ED for nausea, worsening headache, confusion, or drowsiness. Girlfriend is not to let patient sleep longer than 30 minutes at a time. Patient was able to walk out of the clinic easily under his own power without any assistance. He stated he was feeling much better.</p>

1181385	4/8/2021	WA	55	M	1/19/2021	1/19/2021	I received the vaccine about two - three inches from the center of the muscle and in back of center - it was more in back of deltoid than the front of my deltoid. When I first got the shot, I had a burning sensation from the site of needle to back of neck to behind my ear area. It felt like a burning aching feeling. My ear felt like it was clogged up and aching. I told the medical site about it and the doctor on site said that more likely they hit a nerve. My blood pressure was very elevated. They had me stay to be observed for 45 minutes. I went back to work. I still felt it at night. The next day, I started feeling up my neck and my collarbone and my left side of my face and my head - my face felt tight and my lip felt numb on the left side and I had a slight confusion too. I went to Emergency room. They did CAT Scan and exam. After that, I noticed it was going all the way down my arm, all the left side of my body to toes. It felt like numbness - like neuropathy type feeling. It felt like constant pain. I went to the Urgent Care and they gave me Prednisone steroid (5 days of it) 5 mg to help with inflammation. I took that for the five days. I started noticing a little black bruising on my body. After that, I went to the Urgent Care again and they gave me Naproxen and Dr gave me more Naproxen to take. He took bloodwork, too. I went to the ER and I was still feeling sick and hot. They said it was anxiety. I am still going through it - I feel it on the spot where I got the shot - and on my neck and on my head and on my left eye and down on my legs a lot - some days are worse than others but not as bad as when I had the first symptoms.
1181380	4/8/2021	TX	28	M	4/7/2021	4/7/2021	?Janssen COVID-19 Vaccine EUA" About 3 minutes after administration was experiencing lightheadedness, dizziness, and blurred vision. Turned very pale and heart rate dropped to 47. About 8 hours after administration body aches and body temperature began to rise.

1181335	4/8/2021	PA	44	M	3/31/2021	3/31/2021	Blurred vision, "heavy" feeling in the throat, nose became mostly numb, lips had some numbness, extreme paleness. No issues with breathing (even while wearing a mask). Reaction started with blurred vision while reading (during the waiting period at the vaccination clinic). Started within 10 minutes of receiving vaccine. Then the throat heaviness started, nose became numb, and lips were somewhat numb. It occurred in waves, with a few minutes of symptoms, then a mild relief of symptoms (but not total relief), then symptoms returned. This continued for 30-45 minutes. Received water and 2 Benadryl at the vaccination clinic from RN. Benadryl didn't seem to have any impact on symptoms.
1181303	4/8/2021	FL	56	F	3/2/2021	3/27/2021	I woke up on Saturday after feeling fine the night before. I could not see and my eyes darted to the right. I could not make my eyes focus. I was extremely dizzy and nauseous. I tried to go back to sleep to see if improved. I woke up again with same issues but now having numbness and tingling to arms and legs. It felt like my nerves were on fire. I am a nurse and was worried i was having a stroke. My husband rushed me to the hospital as now my face was numb also. I was throwing up and still unable to open my eyes. I had IV and fluids with meds for nausea and dizziness. I had a cat scan of head and MRI which are normal. My blood work was reportedly normal also. I was discharged to home. I have very little memory of Sunday, Monday or Tuesday. I was very foggy in my thinking but the nausea and dizziness was resolved. My gait is still off and I walk with an unsteady gait. I had a very sore arm after my first injection only. I did feel for two weeks or so that my nerves were on fire. Just keyed up over nothing and very irritable. I had told my husband my right eye had bothered me for a week. pain in the outer corner. I had done lots of yard work and thought possibly got something in my eye. I had also had a tic attached to my left arm. I told all this to my doctors. I am just not sure any of this is related to the extreme vertigo I was diagnosed with. I am very nervous to take the second vaccine.

However, she was still responsive by nodding her head or providing one-syllable answers. She was hypotensive, lightheaded and dizzy, broke out in cold sweat, nauseous, felt tingling sensations in her extremities, and had slight abdominal pain. She began to feel better after laying her down and propping her feet up while waiting for paramedics to arrive.
1180856	4/8/2021	NV	50	F	4/7/2021	4/8/2021	Was fine all day after the 10a vaccine . Woke 3am trembling and fever of 101.5F Spouse says was moaning in my sleep and restless for about an hour prior to this. Took tylenol. Fever only reduced to 99F. Still 99F at 10a after taking second dose of tylenol. Face red. Circles/bags under eyes and whole body aches. Arm injection site pain.
1180841	4/8/2021	CA	37	F	4/8/2021	4/8/2021	Patient notified staff at 0955 she had developed sore throat. she did not have prior to vaccine. right eyelid swelling appeared at 1000. facial swelling at 1005.
1180797	4/8/2021	IL	46	F	2/22/2021	2/23/2021	Immediately after the first Moderna shot my eyes turned red, I was in th eye doctor on March 12th because they were not getting any better. It was listed as a cornea ulcers infection, along with COVID arm and other mild side effects. Second injection, side effects, fever, chills, headaches, COVID Arm, I was down for two days. Eyes seemed fine but again a week later and I am back at the eye doctor with ulcers and a major infection. My eyes are/were very healthy until the vaccine, I change my contacts out daily so there is not other explanation.

1180679	4/8/2021	NY	63	M	2/25/2021	3/5/2021	Seven-eight days following vaccine I experienced ptosis in my right eye. It has been diagnosed as either Ocular Myasthenia or Myasthenia Gravis. First, I was examined by an ophthalmologist. He referred me for CT scans of the head and neck. They were negative. Second, I was examined by a neuro ophthalmologist. He prescribed a blood test which was positive for Myasthenia Gravis. Third, I was examined by a neurologist. We will follow up in two months to note progress of the disease. I am currently scheduled for a chest CT scan to rule out thymoma.

1179527	4/8/2021	FL	60	F	3/17/2021	3/31/2021	Patient reported that she had pain and soreness to the left arm that evening of rcvding her 1st dose on 3/17/2021. On the next day, the left arm was sore to the touch. The pain and soreness went away on the 3rd day. Patient also reported that approx. on Wed (3/31/2021) or Thur (4/1/2021) she noticed her left arm have a patchy red appearance and it was itchy. She also stated that 4/3/2021 that area got really red, and it is still red this morning with her skin on the upper left arm area appears to be swollen/puffy. Patient reported she cleaned her upper left arm area with witch hazel and applied cortisone cream in the morning and evening. This helped with the itchiness, but not with the redness. Recommend patient to keep her eyes on that area, and if her symptoms is getting worse or not better to call her health care provider, urgent care or emergency room per based on what she report she may be asked to seek medical care. Also recommend that she can take Benadryl if needed before bed to lessen the feeling of drowsiness, and for any pain or soreness she can take Tylenol. Also advised that based on the reactions she described, this is not a contraindication from getting the 2nd dose which she is scheduled for on 4/16/2021. If she is concerned about rcvding the 2nd dose recommend that she contact her PCP to discuss further. Please follow up with patient after 2pm 4/5/2021 per she stated she will contact her PCP tomorrow.

1179306	4/8/2021	WI	65	F	2/15/2021	2/16/2021	anaphylactic; reactions are allergic; Terrible airway swelling, it felt like breathing through a straw, narrowing airway; Sensation of throat closure/narrowing of airway; significant shortness of breath/difficult to breath like through a straw; Pain in both lymph nodes, under both the armpit; Pain in both breasts; Dry cough; Itching, airway/trachea itchy; Hoarseness; Dizziness; This is a spontaneous report from a contactable nurse (patient). A 65-years-old female patient received the first dose of BNT162B2 (Pfizer-BioNTech COVID-19 vaccine, lot number: EL3248), via an unspecified route of administration, administered in the left deltoid on 15Feb2021 at 15:30 as a single dose for protection against Covid. Medical history included ongoing obesity as she gains and loses it, ongoing hypertension, ongoing asthma (at 59 she was bumped up to moderate degree asthma), ongoing significant food allergies, was born with and had ongoing eczema so she was allergic to milk (was given soy milk since she could not tolerate milk, when she drank milk, it produced phlegm/caused increase in mucus, ongoing significant environmental allergies wherein she would have allergies in the fall, from August through September and would have sneezing, congestion and itchy watery eyes. The patient also had a history of getting bronchitis but has not had it for a long time. The patient got stung by a bee when she was 40ish and her upper thigh got red, itchy and it lasted for 10 days and she and no other symptoms and was now careful around bees. The patient reacts to the smoky matches that blow out and make smoke, from the sulfa in the matches, fireplaces, wood burning and firepits. Concomitant medications included cetirizine hydrochloride (ZYRTEC) taken for an unspecified indication, start and stop date were not reported; montelukast sodium (SINGULAIR) taken for an unspecified indication, start and stop date were not reported; fluticasone propionate, salmeterol xinafoate (ADVAIR) taken for asthma, start and stop date were not reported and fluticasone (manufacturer unknown) taken for asthma and allergies, start and stop date were not reported. The patient was on significant medications for her asthma, allergies and blood pressure. The patient previously got a flu shot at the end of Oct2020. The patient also previously took Aleve in her early 40's and was taking them for a neck injury for 2-3 months and at

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

the end of the treatment she broke out in a rash. The patient also previously took aspirin 3 years ago and broke out in a rash. The patient also has an albuterol inhaler but has not taken it for years. The patient was careful, handwashing normally, wipes the shopping carts as they are germ. The patient stated that after receiving the vaccine, one main event was terrible airway swelling, itching and it was difficult to breathe. The terrible airway swelling felt like breathing through a straw and narrowing airway. She stated that it started 18.5 hours after the vaccine, on 16Feb2021 at 10 am and lasted for 4 hours between 10 to 2 pm. The patient also had itching wherein her airway and trachea were itchy which also started on 16Feb2021 at 10 am to 2 pm. The patient experienced narrowing of airway and sensation of throat closure also between 10 am to 2 pm. The patient also experienced that it was difficult to breathe but she did not feel like she needed to go to the hospital. If it got any worse she would have went to the emergency department. She stated that she was sitting up, walking around and she would have had a significant shortness of breath and she was trying to wait it out. It was difficult to breathe like through a straw which also started from 10 am to 2pm. She did not feel like she wanted to walk or do daily activities. She was on the phone with her mother and her mother could hear her difficulty in talking and her heavy breathing. The patient also experienced pain in both lymph nodes, under both armpits and pain in both breasts which started also on 16Feb2021 at 10 am and lasted for 24 hours the 10 am the next day. The patient had dizziness which started about noon and when she woke up the next day it was gone which she considered as medically significant since she is never dizzy and it was not due to her blood pressure and she has been on pills for a long time. The patient had dry cough and hoarseness also on 16Feb2021 from 10 am to 2 pm. The patient was afraid to take the second vaccine and she spoke to her pulmonologist who knows her history and was told that she would benefit. She thought that if she felt bad, she would go to the emergency room if it got worse but it did not. The patient stated that she thinks these reactions are allergic, the itching and narrowing of throat can be anaphylactic. The patient did not require any medical intervention and was not seen in the emergency department and was not hospitalized. The

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

events lasted for 4 hours and stayed at that level. The patient did not get any treatment and it went away. The outcome of the events terrible airway swelling, it felt like breathing through a straw, narrowing airway, Dry cough, Itching, airway/trachea itchy, Hoarseness, Sensation of throat closure/narrowing of airway, reactions are allergic and anaphylactic was recovered on 16Feb2021 at 14:00. The outcome of dizziness was recovered on 17Feb2021 and the outcome of pain in both lymph nodes, under both the armpit and pain in both breasts on 17Feb2021 at 10:00. The patient reported that the events were considered as medically significant. The relatedness of the drug to the reactions from primary source reporter (method of assessment: Global Introspection) for the events was related.; Sender's Comments: A contributory role of vaccine BNT162B2 to reported events cannot be fully excluded since it is part of the product safety profile. Potential contributors include patient's advanced age, as well as underlying obesity, hypertension, asthma, eczema, multiple allergies and other co-morbidities. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

1179304	4/8/2021	NY	33	M	3/21/2021	3/21/2021	facial paralysis/facial drooping/facial palsy/eyes started drooping and then mouth started drooping; strange feelings in face; This is a spontaneous report received from a Pfizer sponsored program.This contactable consumer patient himself and a contactable physician psychologist, (parent of patient reported) that a 33-year-old male patient received BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine), dose 1 via an unspecified route of administration, administered in left arm on 21Mar2021 16:15 (Batch/Lot number was not reported) as single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. Patient had no known allergies. Prior to vaccination, the patient was not diagnosed with COVID-19. Patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Patient did not receive any other medications within 2 weeks of vaccination. On 21Mar2021 at 07:30 PM, after receiving his first dose, he began noticing facial drooping, which began to intensify, on the right side. He was advised by a medical professional to immediately call an ambulance and he was then taken to an emergency room where received a CT scan and full bloodwork on Mar2021. Luckily, the facial palsy began to subside and he was able to return home after the test results came back and a stroke was ruled out - it was stated that this was some kind of immuno-reaction to the vaccine. He still felt as though his face was still not 100% back to normal and still felt a bit droopy (noticeable in the mirror) yet it does feel better than on 21Mar2021 evening. Patient had a nasal swab on 22Mar2021 with negative result. One of the reporters is a psychologist and reported that her son received Pfizer-BioNTech COVID-19 Vaccine. Psychologist asking about risk of Bell's palsy, incidence, and outcomes and if these patients received their second dose of the Pfizer-BioNTech COVID-19 Vaccine. She read about 7 cases of Bell's palsy in a Dec2020 article in the [Redacted], 4 of them on the Pfizer vaccine. The reporter further clarified and described that at 6pm (2 hours after dose), patient reported he felt fine and was happy he got the vaccine; but then sometime after that, he reported "strange feelings in face" and then eyes started drooping and then mouth started drooping, all on right side of face. They called the university clinic and was instructed to go to ER. Brain scans and blood work were done; they ruled out

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							stroke and said it was a possible reaction to the vaccine. He was discharged at midnight and by then, paralysis was 80-85% resolved. He is an otherwise very healthy young man. The psychologist wanted to know the efficacy after just one dose and stated that a friend suggested to perhaps not get second dose and consider getting a dose of the non mRNA vaccine like Johnson and Johnson. The outcome of the event was recovering. Information on Lot/Batch number has been requested.

1178984	4/8/2021		30	M	3/31/2021	3/31/2021	Joints began feeling achy and body felt tired within a few hours of vaccination. About 10 hours later body began to feel warm and then within an hour began uncontrollable shivers and aching in testicles followed shortly after by a throbbing headache and pain behind eyeballs. I put on extra clothing and jumped into bed as symptoms persisted. Later in the night I began sweating profusely and removed the clothing. The headache and pain behind the eyes persisted. I also began feeling nauseous and almost vomited when I went to the bathroom. My body was so tired and achy I could barely move. I tried to wake up for work but my headache and pain behind the eyes was so bad I went back to bed for another four hours. I did not have any appetite for the rest of the day. My headache subsided that afternoon and I went for a walk that night and my body still felt incredibly tired and achy. The pain behind my eyes persisted. The following day I felt somewhat better and could work. That night I went for a jog and my body felt extremely heavy, my joints ached, and I could not catch my breath. My symptoms continued to improve but I have had no sex drive for a week.
1178980	4/8/2021		32	M	4/7/2021	4/8/2021	allergic reaction. Patient reports blurry eyesight, headache, fever, feels like he cant think clearly, patient reports balance has been off, and back pain x 6 hours. Received J&J vaccine at 1800 last night. Denies vomiting and diarrhea.History: pt had J&J COVID-19 vaccine yesterday evening and here with headache, lack of balance (but able to walk), blurry vision with loss of peripheral vision, fever, back pain, some nausea, here for eval. Says he was in his usual state of health before vaccination and no recent sick contact or COVID-19 hotspot visit. No prior co-morbidities and denies recent illness/injury, use of any meds.

1180103	4/8/2021	IL	36	M	3/23/2021	3/23/2021	Within one minute of receiving the shot I felt disoriented and had trouble determining if I had buttoned my shirt correctly. For the next two and half hours I had trouble recalling basic things that I should have been observing such as which highway my driver had taken me home on although I knew where I was at. I also experienced irregular breathing. To be specific, I would take a very large breath, a very short breath, or miss a breath. This started as a series of one to three irregular breaths every five minutes or so. My breaths became more irregular in the next hour. While driving to my employers office about fifteen or twenty minutes after my shot, my right eye closed and I could not open it for about seven seconds. My breathing also became deep and the pace was not under my control. Once at the office I sat in my manager's office to be observed. I experienced more intense episodes of the above listed symptoms such as both eyes closing and the left one watering. The watering continued into the next day periodically. At least two times while my eyes closed I had to put my elbow on the desk and my hand on my head to make sure I didn't fall out of the chair. I also felt very uncomfortable causing me to moan. This happened one time. After this my manager called my parents and they came to take me home. It took them one hour to get there. While waiting I felt light headed and the breathing irregularities became less intense. When they got there I mainly felt disoriented. The disorientation could be best described as slightly impaired or slowed decision making. I would also like to know if I should receive the second vaccination.
1180032	4/8/2021	NM	39	F	2/1/2021	2/12/2021	In addition to the known side effects of fever, chills, body aches, headaches, and brain fog, my menstrual cycle occurred about 10 days post what it should have started in February. In March menstrual cycled started about 5 days later than in February. On April 3, 2021 started to have eye pain, was diagnosed with a chalazion cyst on April 7. Cyst is on the eyelid of left eye. I have never had issues with cysts or swelling of any kind.

1180026	4/8/2021	CA	45	F	1/21/2021	1/21/2021	Within 5 minutes I lost hearing (right eye) felt as if full of water in my canal. One of my colleagues checked my ear for fluids on Thursday and prescribed me antibiotics by 1/26 it was gone. I exp nausea next day vomiting 6 times and also felt burning sensation in throat. I had no arm pain and no fatigue.
1179999	4/8/2021	NJ	18	F	4/7/2021	4/7/2021	Patient with known allergies to PEG. Had a slight reaction of hives following 1st dose. Patient consulted with her PCP and oncologist and her oncologist was adamant that she was to receive her 2nd dose, not an option to not receive despite documented PEG allergy. After receiving 2nd dose approx 5-10 min later in monitoring area reported to EMS RN feeling dizzy, flush, and eye flutter. EMS evaluated, vitals HR 104, RR 21, BP 137/98, PulseOx 97%. RN noted patient was very anxious and this contributed to the patients symptoms. However, the patient did begin developing mild flushing and small red patches on arms, legs, trunk. Hives and flushing resolved within 30 minutes. Approx 45 minutes post reaction symptoms, patient reports feeling better, flushing resolved. Denied wanted further workup or transfer to ER and left with her mother.

1179948	4/8/2021	PA	37	F	4/7/2021	4/7/2021	Shot given at 3:47- approximately 3-5 minutes later started to experience blurred vision, rapid heart rate, difficulty breathing, and dizziness. Blood pressure was taken and was low 86/52. Pulse rate was 110. Became increasingly dizzy, stabbing chest pain, and lethargic. Was transferred to an ambulance with great assistance, because when I stood up I became so dizzy I couldn't stand. In the ambulance the chest pain/ stabbing became unbearable. I was started on IV fluids, and also had an EKG done, and was put on oxygen. While en route to the hospital I had a horrible feeling of nausea and dry heaving. Upon arriving at the hospital I was worked up for cardiac issues and everything came back normal. I was also given benadryl. Nothing helped the dizziness or nausea and I still felt short of breath when I was discharged. I was able to get some interrupted sleep. This morning I am still feeling very dizzy and light headed. I'm extremely cold and have the worst headache I have ever had. I feel foggy and I am having trouble concentrating. I have been drinking a lot of fluids and also been taking tylenol.
1179930	4/8/2021	ND	36	F	3/29/2021	4/2/2021	Itching and hives started at 8am on 4/1/21. Both eyelids swelled. Hives on face, neck, chest, arm, stomach and legs. Took 2 Benadryl. Next morning, symptoms were gone.
1179911	4/8/2021	WI	36	F	4/7/2021	4/7/2021	Patient received Janssen COVID-19 vaccine and presented to observation area. After a few minutes, complained that "her heart felt like it was racing". BP checked: 128/72, P 72 and regular. HRR. Stated she was nervous and maybe she felt like her heart was racing r/t anxiety. Sat uneventful for rest of observation period. Stated she "felt fine" after her 30 minute wait time was over. Ambulated to the parking lot. Clinic staff noticed she did not get in her car, but had her husband pick her up. Staff called patient after clinic and patient stated that "when leaving her eyes felt dizzy and she felt like she couldn't keep conscious".

1179864	4/8/2021	LA	51	F	3/25/2021	3/25/2021	Headache. Began with pains at my temple near my eyes, night of the vaccination. Had a headache that night, overnight. Have had a combination of sporadic pains near my temples, and a headache that feels like a band around my head, particularly around both temples. Mostly okay upon waking, pains start after a couple of hours, then actual headache is present from about 1-2 p.m. until I go to sleep. This description applies to second vaccine, administered 3/25/21. For the first vaccine, administered 3/4/21, I had pains by my temples that early evening, then a headache that night until bedtime. I think that headache only lasted one day. I had fatigue for a day following each dose.
1179863	4/8/2021	FL	60	F	4/7/2021	4/7/2021	1358 60 y/o female received 1st Covid vaccine and was sitting in observation room for 30 minutes. At the 30 minute mark pt stated that she felt dizzy when she tried to stand up. Brought Pt to backroom for evaluation she stated that her tongue felt thick and her lips felt numb. Vitals BP 136/75 P 74 Temp 99.3 . Pt was evaluated by Dr and he determined that she needed to be observed. 1412 Asked pt how she was feeling "Right eye feels funny like pressure and her throat was tight. At this time Dr determined that pt needed Epi Pen. 1413 Epi Pen administered to right thigh EMS was called. Vitals BP 174/86 P 75 R 22. Denied difficulty breathing. Pt became very emotional and stated she was scared. Reassured pt she was going to be fine and provided additional blankets for her chills. 1419 EMS took over her care

1179483	4/8/2021	MI	40	F	4/6/2021	4/6/2021	My vaccine was administered at 12:30pm. I waited until 12:55 at CVS after the vaccine to make sure there were no reactions. I also move my arm around a lot after the injection to keep it from hurting. I drove home, at lunch and about 2:45 was hit with a very noticeable headache. I never get headaches and eat healthy and consume about a gallon of water a day. I knew it wasn't from dehydration or being hungry. Headache was in the temple area and made my eyes hurt in the same way they would if you had cried for an extended period of time or were overtired. At 3pm a wave of exhaustion hit me. I was sitting working trying to combat the headache and felt almost wiped out. I got through the rest of my work day (4:30) and went to lay down immediately. I passed out almost instantly until 7 pm. I work up and showered, ate dinner and started to feel a little warm. It should be noted it was an unseasonably warm day and got up to 77, so it was a tiny bit warm in my home. I put on loose fitting clothes and slayed on the couch still with the bad headache and the injection site started to throb so I placed and ice pack on for 20 minutes. I could only stay awake until 8:45 and got in bed. I could not get comfortable for several hours feeling very warm. I tried a fan on high and drinking more water but i felt very warm like how you feel with the flu. I took my temp at 1130pm it was normal. I continued to toss and turn and feel very warm and slightly dizzy, in the sense that I hadn't been able to sleep and with the headache my body was just exhausted. Around 2 am i woke up for more water and got in the shower because I had sweated so much my sheets were wet and my clothes. I got out of the shower around 10 minutes later, changed and got new sheets and got back in bed. Around 330 I felt very hot again and opened the windows and got another ice pack for my arm which was throbbing again. I finally fell asleep after 3:45am. I got up for work at 6am. I felt slightly foggy, and very hot. But no fever. My temp is normally around 97.4-97.9 and it was 98.4. Still normal but I was running warmer than usual. It took a long time to get ready and despite hot water in the shower I was freezing. i got dress and debated going to work. Got in the car at 6:45 and my drive to work is 30 minutes. 1/2 way into my drive I got very sweaty again and went home to change my clothes because they were too warm. Got to work around 7:20 and still felt warm but they take our temps at the door and

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							min was still okay, no fever. I drank a lot of water and ate, and at 8:30 am all of a sudden the exhaustion was gone and I felt normal. I got home from work at 5:30p and took a 3 hour nap and felt normal again.
1179831	4/8/2021	CA	34	F	4/6/2021	4/7/2021	Significant lip swelling more than 24 hours after injection. Also itchy, swollen eye.
1179537	4/8/2021	MD	68	F	3/31/2021	3/31/2021	pt stated she felt nauseas after taking the vax. Later that day she developed a headache, diarrhea, hives, her throat and face were swelling. Her breathing was compromised, vision was off, and she was itching. Today 4/8/2021 she still has headaches, nausea and hives. She says the swelling in her face is going down and breathing better. Pt had a televisit w/ her PCP and she was instructed to take Benadryl. Pt took her flonase, albuterol and levocetirizine 5mg for her symptoms.

1179659	4/8/2021	MA	48	M	4/6/2021	4/6/2021	He got the vaccine, started to get the headache within 45 minutes, ran some errands and after a couple of hours he felt like something was burning on his buttock, and noticed a really bad red rash on the left side on the left cheek from the crack outward. It was extremely hot to the touch and very sore, kind of throbbing and swollen and progressively got worse. He was just not feeling well, nauseous and dizzy and went to sleep but when he woke up it had spread to the other cheek. It looks like he got burned or scalded red/purple in color. He has no reaction on the arm itself, but only on the buttock and a blister, blood red, leathery feeling rash/blotch on his entire buttock to both hips on both sides. It is difficult for him to sit. He also had headache, the muscle pain, joint pain, chills, nausea. He did not vomit but had not eaten anything. He has had a high fever up to 103 until this morning 4/8/21 which is about 99-100. He woke up soaking wet today. He has not been able to turn his neck, and not able to lift his arm above his waist level since the vaccine, and not able to turn his neck to the left at all. He can turn it 5-10 degrees, but right is okay. He took some Benadryl over the last 2 days for the reaction but it has not. He also has taken aspirin/Aleve for the fever. He was so sick and had no energy and could not sleep but could not keep his eyes open either, was not able to open them. He did write his doctor when the rash was only on one side, which they did not give him any advice as he was not feeling any worse at that time. He was at 101 fever throughout the day and then at night went to 102. He was hoping that the rash would be better, but actually worse as described above. He has not had any appetite, trying to drink fluids but made him nauseous, and he normally drinks water all day long. His normal temp is 97.7. He has been taking showers to try and keep his fevers down and the water hitting the rash feels like somebody is pouring scolding water on it. He did call Moderna on 4/6/21 asking if this was a reaction that anybody has reported, and he is waiting for somebody to call him back.

1182834	4/8/2021	TX	41	M	1/4/2021	1/9/2021	The night of January 9th around 2330 I noticed that the left side of my face was acting a little funny. As the night progressed into the morning I noticed that it was starting to get worse and my face was drooping. By the evening of January 10th the left side of my face was really droopy. I had heard that a small percentage of the new COVID-19 vaccines had caused Bell's Palsy in a small percentage of the clinical trial patients. I did some research on Bell's Palsy and found what to do in the event of an onset. I took Advil 2 to 3 times a day for about a week and kept a close eye on it to make sure that it wasn't getting any worse. After about 2.5 to 3 weeks the symptoms of the Bell's Palsy went away on its own. I did not see any physicians for treatment.

1183030	4/8/2021	CA	53	F	4/6/2021	4/6/2021	Tuesday 6 go the first Pfizer Covid vaccine at the race track. In the past I have had angioedema and breathing issues but never severe enough to warrant going to hospital with several injections and from over the counter meds and prescription meds. So I was wary but decided to risk a jab. Straight up got tingling tongue and lips but after 15 min was just dizzy and roughly the same feeling. I am a slow up taker and excreter though. By the time I got home, about 20 min after the 15 min wait my neck on the injection side and swelled so much I no longer had a jaw and my eyes and cheeks were pretty puffy. Then the breathing issue started. I called the gp who said Tylenol, benedryl. Usually have them made because I have problems with additives but i don?t have any right now. So I used two ea kids chewable which allow me to have a dosage that works for me as I am sensitive to larger doses which can cause pvcs. Things were better but not good enough so took Zyrtec 10 ml/24 hr. If I had not had a similar experience with other injections this would have completely freaked me out. Thank goodness my quick treatment worked well enough that I felt confident worse was unlikely to happen, though the gp and allergist both wanted me to go to the er. Yesterday I did a repeat of Tylenol and benedryl in the morning and Zyrtec in the afternoon at two pm then Tylenol and benedryl again in the evening as I still had angioedema and felt tight in breathing. Repeat benedryl and Tylenol today but no Zyrtec as felt good enough to ride stationary bike a very slow Five miles. As to fever and other typical symptoms it has been hard to tell what is reaction and what is simply the vaccine doing its job. I did not take my temperature but have felt hot no general malaise. I recognize my symptoms are unusual but felt you should have them.

1183092	4/8/2021	WI	49	F	4/8/2021	4/8/2021	The patient received a Janssen COVID vaccine on 4/8/21 at around 5:00 pm. The patient was nervous during the administration and reported never receiving a flu vaccine in the past. The common side and serious side effects were discussed with the patient. The vaccine was administered to the patient without issue. The patient and husband instructed to wait 15 minutes after the administration of the vaccine as is the recommendation per the CDC. About 5 minutes after the administration of the vaccine, the patient's husband notified the pharmacy staff that his wife was not feeling well. Pharmacist responded to the patient. The patient reported shortness of breath and feeling hot and stated she was about to pass out. Pharmacist was instructed to retrieve the Epi-Pen from the immunization cart and assist. Code White was called and Division 1 staff responded and assisted. The patient was lowered to the ground and her feet were elevated. It was at this point that it was determined that the patient was not experiencing anaphylaxis based on the symptoms she was reporting and exhibiting. The patient was instructed to remove mask to help obtain better breaths and remove the patient from hyperventilation. An icepack was obtained and placed on the patients neck once she was able to sit up. The patient's symptoms improved to the point of moving to a chair. The patient sipped water and continued deep breathing. The patient's symptoms continued to improve and she was able to leave.

1182813	4/8/2021	TX	51	F	3/22/2021	3/22/2021	Pain at the injection site shortly after the injection. Pain and tenderness in bicep began generally later the first day and lasted 2 weeks; I still have some bicep stiffness and tenderness today on Day 18. I had tenderness under the right armpit for about a week (assumed swollen lymph nodes).I had redness on the bicep below the injection site on Days 5-7. I also was tired on Day 2, 3, and 16 and took short naps. I experienced some muscle twitching in the bicep on Day 1, which still continues. On Day 6, I woke up with muscle twitching all over my body, randomly and intermittently. I was able to go about my day normally, but every few minutes something would twitch for a few seconds (my right arm, my left arm, my left knee, my right hip, my lower back, my left pointer finger, my left eyebrow, my diaphragm, etc). I drank a lot of fluids and took magnesium, zinc, D, B, C, omegas, turmeric, a multivitamin, and ate a banana for potassium on Day 6 and 7. Day 7 and 8, I only had muscle twitching in the right bicep again. Starting on Day 9 and continuing through the present, I continue to have intermittent twitches lasting a few seconds all over my body again. It is less frequent than on Day 6, but continues.
1182812	4/8/2021	OK	45	F	4/6/2021	4/6/2021	Severe nausea, cold sweats, and severe dizziness which caused inability to comprehend or understand what was going on around me and almost loss of consciousness. I was laid on the pharmacy floor immediately after reactions with a cold pack under my neck and my feet elevated. Within 5 minutes I was able to open my eyes and able to stand. I left with some dizziness and a headache that remained for a few days. I also had severe body aches for a couple of days and fatigue. Only thing is the arm pain and a little tiredness today.

1182756	4/8/2021	CA	50	F	3/8/2021	3/1/2021	She experienced Bell's Palsy; dizzy; bleeding out of my nose; earache; eyes are kinda blurry; My face went numb; This is a spontaneous report received from a Pfizer Sponsored Program. A contactable consumer, the patient reported for herself that a 50-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), via an unspecified route of administration on 08Mar2021 (at the age of 50-years-old) as single dose for COVID-19 immunization. The patient medical history was not reported. Concomitant medications included prednisone (MANUFACTURER UNKNOWN); valaciclovir hydrochloride (VALTREX) (MANUFACTURER UNKNOWN). On an unknown date, the patient experienced bell's palsy but upon contacting her physician she was prescribed an immunosuppressant which is Prednisone. She was asking if she can take the second dose. Patient stated, after about a week of first dose on an unspecified date in Mar2021, she got dizzy and started bleeding out of nose. On an unpecified date in Mar2021, 2 weeks in, she thought she had an earache. It started on Sunday, Monday and Tuesday. On an unspecified date in Mar2021 (Wednesday), the first thing she noticed while driving was eyes were kinda blurry and her face went numb and she couldn't close eye. Within 2 hours of numbness she saw the doctor who put her on Valtrex and later her doctor put her on prednisone. She has the 2nd dose scheduled for Monday 05Apr2021 and she is worried about taking it. The clinical outcomes of the she experienced bell's palsy, dizzy, bleeding out of my nose, earache, eyes are kinda blurry, my face went numb were unknown. Information about lot number has been requested.

A 66-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), dose 1 via an unspecified route of administration, deltoid right on 10Mar2021 (batch/lot number EN6208 and expiry date not reported) at 66 years of age as single dose for covid-19 immunization. The patient's medical history was not reported. Concomitant medications included some over the counter B12 (unspecified). The patient informed that she developed an anterior uveitis which started 2 days post her COVID injection (12Mar2021). The patient informed that she will be reporting online but she can't see well enough (Mar2021) to report online. The patient informed that "it was getting better, but it was not happy". The patient informed that in response to the vaccine she was on Prednisolone 1 percent ophthalmic eye drops. The patient confirmed that she was taking Prednisolone as a treatment (for the events) and was still on it. The outcome of the event anterior uveitis was not recovered, while unknown for the other event. The physician informed that causality was "yes";. Sender's Comments: Based on temporal association, the causal relationship between bnt162b2 and the event iridocyclitis cannot be excluded. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

An 81-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration in right arm on 09Mar2021 (Lot Number: EL9266) at single dose for covid-19 immunization. Medical history included arthritis, respiratory issues, allergies, Eczema of the nipples and breast, arthroscopic surgeries, she lost her voice. Caller stated she exercised everyday, she did yoga. Caller reported the last 2 years she hadn't been able to climb the mountain on the stairs. Caller states she didn't catch a cold, she was fine, she was very active. She was good except arthritic conditions, she has had arthroscopic surgeries, that was a side effect of that. Caller reporting she was a first responder and had some respiratory issues. Caller stated she had some allergies, if with dust or smoke, her throat constricts, it was just small, like her throat. She cannot be around that. She got once in a while, when she got in a rush. Caller stated before the vaccine, she had eczema in her nipples, on her breast. Caller stated she never got sick, besides the rash she got once in a while. Caller states but she was very healthy otherwise, no medication, no smoking, no drinking. Caller stated she was from 9/11, this was what happened with her voice once in a while, she lost her voice. Caller stated she had had some respiratory issues and allergies and so on. Caller stated she was here for 56 years and her mother died of old age so she was not sure. There were no concomitant medications. The patient previously took advil. Caller stated she used to take Advil when she went to the gym and had problems but she hasn't taken Advil for a while. She didn't take meds. Caller stated she didn't drink or smoke because what it did was it gave you a release. Caller stated she was not taking none, she was pushing through and hoping it will heal itself. The patient experienced blood clot in right leg on 26Mar2021, break in rash on an unspecified date, headache on 09Mar2021, slight fever on 09Mar2021, veins are swollen on 12Mar2021, right

knee got swollen on 12Mar2021, sore throat on an unspecified date, ear ache on 10Mar2021, nausea on 09Mar2021, rash in mouth and throat on an unspecified date, felt like burning/ sore in her mouth like she was burned on 10Mar2021, sore in her mouth like she was burned on 10Mar2021, dizzy on an unspecified date, weak on an unspecified date, felt like sleeping all the time on an unspecified date, couldn't walk on 12Mar2021, pain in her arm on an unspecified date. Was a first responder, sometimes break in rash once in a while. Got Pfizer 1st vaccine 09Mar, was scared to have difficulty breathing however had headache, slight fever, right knee and veins were swollen, sore throat, ear ache, nausea, rash in mouth and throat also felt like burning also was dizzy and weak and felt like sleeping all the time. Caller stated she was told by her doctor to take the shot on 09Mar2021. Caller stated she had headache, slight fever, then her head was ok the fever was gone but the headache persisted as of today. Caller stated she still had headache and ear ache and her knee got swollen, her right knee. Caller stated for a few days she couldn't walk. Caller reported she has arthritic conditions in knees, she exercises everyday and no problem, but she couldn't walk for a few days. Caller states now she is able to walk on something, but the veins in the knee were still there and she didn't know. Caller stated she was due for second next on Tuesday and she was wondering what to do. Caller stated she was honestly worried about this reaction after the first shot. Caller stated she was told the 2nd had a worse reaction, so she was really weary and worried. Caller stated she only slept 5 hours at night, but now she wanted to sleep all the time. Caller stated she had such a headache and earache. Caller stated it made her nauseous, like in a sea or something. She stated she didn't know how to explain. She didn't vomit like when you were nauseous, it wasn't that feeling. Caller stated it was just lingering like when you were in the ocean. Caller reported headache has gotten better. It has gotten worse and then gotten better. Caller stated the earache was so painful and was still there. Caller reported she got it during the day and when she lied down, but the severity had subsided. Caller stated she didn't measure fever. She wanted to say after that, her mouth was sore after fever from the heat or from the vaccination. Caller stated her mouth was still today, still sensitive. Caller reported it

----------	-------	-------	---------	-----	----------	------------	--------------

was like her throat and her mouth was so sore like a burn. Caller reported her headache was mostly on the left side, but went to the right side too. Caller reported she could feel it in her eye, it hurt and her ear hurt. Caller reported her sore throat, the upper part, was still sensitive. Caller stated she couldn't swallow, but it was clear, her mouth was clear, only the upper top she would say. Caller stated it's 99% gone, its healing. Nauseous, like in a sea, its not like she has it all day long- nauseous- maybe once a day, nothing severely like what she had for a few things. The patient had a pain in her arm and she had that symptom one night and the following day she had nothing. Her arm was cooperative. Since she had been diagnosed with a blood clot. She saw her doctor on Friday and was recommended that she took some medications. She continued to have headache which she reported, though not as bad. She also reported that she had a sore mouth and earache. She was still fighting symptoms and didn't know what to do with the blood clot. She was scared to take the blood thinner Eliquis and that she will have side effects that it will do her harm she felt Eliquis will do her harm if she received the second dose of the vaccine or takes Eliquis. She was supposed to 20mg daily which she felt will kill her given her body was not healed from receiving the first dose of the Covid-19 vaccine. There was no prior vaccinations within 4 weeks. She was prescribed Eliquis Film-coated tablet (Lot Number: ABN4449S, Expiry date: Feb2023) 20mg daily for blood clot but had not started because she felt it will kill her was scared to take the second dose of the vaccine. The patient underwent lab tests and procedures which included Sonogram: blood clot in right on 26Mar2021. Therapeutic measures were taken as a result of blood clot in right leg. There was Physician Office Visit for all events. The outcome of the event blood clot in right leg, veins are swollen, right knee got swollen, couldn't walk was not recovered, of event slight fever was recovered on 10Mar2021, pain in her arm was recovered, of event ear ache, nausea, felt like burning/ sore in her mouth like she was burned, sore in her mouth like she was burned was recovering, of other events was unknown.

1182717	4/8/2021		23	F	4/6/2021	4/6/2021	Client received the COVID vaccine (Janssen, Lot# 1808980) complained of feeling dizzy at 1424, EMT and RN responded. The client was sitting in a chair with her head in her hands, stated that she felt dizzy and was having a "hot flash." The client stated that she is anxious around needles and has a history of syncope after blood draws. She also complained of experiencing tunnel vision and hearing. The client's vital signs were a temperature of 96.7, blood pressure of 122/82, heart rate of 92, and O2 of 99%. The client stated she did eat that morning, and refused a set of repeat vitals, but agreed to wait 30 minutes for observation after her symptom onset. Per the client, she has no allergies or medical conditions, and takes no medications. At 1435, the client accepted some water to drink. At 1440, the client stated that she no longer felt dizzy. The client's color had returned and she was no longer dizzy. She agreed to have repeat vital signs at this time: blood pressure of 118/82, heart rate of 90, respiratory rate of 16, and O2 99%. The client refused benadryl at this time. At 1454, the client's vital signs were as follows: blood pressure of 116/82, heart rate of 90, respiratory rate of 12, and O2 of 99%. The client stated that she felt "back to normal" and called her sister to drive her home. She was escorted to her car by the EMT, she ambulated with a steady gait. Education provided regarding emergency response, V-safe, and the importance of following up with a primary care provider.

1182699	4/8/2021	WI	32	M	4/8/2021	4/8/2021	Patient had an episode of fainting about 10 mins after vaccine administration. after regaining consciousness he had rolling eyes and seizure and 2nd episode of fainting. The fainting episodes were for few seconds (30-45 sec). Patients feet were elevated and paramedics were called. while waiting for the paramedics we had patient drink water and orange juice as he was on diet and had taken only 300 calories per patient. Used cold compress on his face and neck, patient was comprehending well afterwards. paramedics arrived and examined the patients vital and asked if he would like to go to the hospital even though patient seemed fine. Patient denied going to the hospital and paramedics left afterwards. patient waited for 30 minutes afterwards and then left. we called the patient later and he was doing fine.
1182678	4/8/2021	MI	20	M	4/8/2021	4/8/2021	Dizziness upon standing and walking, nausea, clammy and warm skin, sweaty, pale, tunnel vision, loss of acute memory, vision, and hearing. Patient was watched from 3pm (right after dose) to 3:30pm. He was feeling these symptoms from 3pm to about 3:15pm. He was given water after 5 minutes and cold wash rags to put on his forehead and neck. He was also told to breath deep breaths slowly. He said his throat felt sore and was provided with a throat lozenge. Color in his face returned after roughly 10 to 15 minutes and he verbally said he was feeling much better. Pharmacy associates watched him for another 15 minutes to make sure he was okay.
1182632	4/8/2021	PA	19	F	4/7/2021	4/7/2021	Within the hour after receiving shot, migraine formed along with fatigue. Both progressively got worse through out that day(4/7/21). On 4/8/21 I woke up many times through out the night with a migraine that felt as though my brain was burning and sinus pressure, causing immense eye sensitivity. Throughout the night I became increasingly more sweaty, but didn?t have the proper thermometer to take my temperature. I took ibuprofen (at 6:45 AM on 4/8/21) which helped those two side effects subside (around 8 AM). Fatigue has been constant throughout both days. Around 5:00 PM on 4/8/21 I ate broccoli and rice for dinner, small amounts, and encountered bad diarrhea. It lasted for about half an hour. Migraine is reduced significantly (at 6:41 PM), but there is slight nausea, weakness, and fatigue.

1183342	4/8/2021	FL	55	M	4/8/2021	4/8/2021	Patient could not breathe, was very stiff, sweating, salivating from the mouth, his eyes were rolling in the back of his head, he was incoherent and he could not sit up on his own. I administered an Epi-pen injection and called an ambulance. He was taken to the hospital.
1183302	4/8/2021	CO	28	F	4/8/2021	4/8/2021	Difficulty breathing, sweats, feeling dizzy and like I was going to pass out (vision went dark a few times), nausea. Oral liquid antihistamine administered. Recovered within 20 minutes.
1183297	4/8/2021	TX	26	F	3/31/2021	3/31/2021	Less than five minutes of receiving vaccine: Eyes rolling back, feeling of fainting, tinnitus, blue lips, blue fingers, really hot. Thirty minutes after receiving the vaccine: bad chills/shakes/shivers/teeth chattering, diarrhea, confusion
1183286	4/8/2021	SC	34	F	4/8/2021	4/8/2021	Pt felt very anxious but thought she was ok after receiving the shot. When she stood (approx. 2 minutes after receiving shot), she immediately felt light headed and her throat felt tingly, but pt continued to talk without any issues and sat back down. She became flushed and had facial swelling within 10 minutes. Pharmacist administered diphenhydramine liquid (25mg dose) at this point and patient wanted to wait to see if that helped before taking the second recommended dose to equal 50mg. Patient continued being able to talk and facial swelling improved within 10 additional minutes. Patient remained under pharmacist supervision and walked a few aisles to ensure she felt normal before walking patient to her car where her husband was waiting (at 10:30am). Patient reported she was very anxious and has had panic attacks in the past, but never to a vaccination. Patient appeared to have returned to her normal state before pharmacist left. Facial swelling was resolved but patient still reported mild throat tingles. Pharmacist followed up with patient at 3:15pm and she reported she was feeling much better and experienced no additional adverse events nor required additional interventions.
1183275	4/8/2021	WA	38	F	3/20/2021	3/21/2021	Tinnitus (high-pitched ringing in the ears) starting after vaccination. Doctor's visual inspection of eardrum indicates everything looks normal. Wait and see if tinnitus gets better/worse/same. Recommended to contribute with second vaccination dose.

1183269	4/8/2021	IL	21	M	4/8/2021	4/8/2021	5 minutes post vaccination client had vision changes, lightheadedness, mild nausea, sweating. Symptoms resolved after 10 minutes. Client's treatment was elevating legs, applying cold packs to neck and staying close to client and not allowing client to leave until he was 100% normal per client's report of normal.
1183057	4/8/2021	NM	29	M	4/8/2021	4/8/2021	gave patient vaccination in designated vaccine area after going over possible side effects. vaccine was given in left arm. I asked patient if he felt ok to move to observation area. patient said yes and stood up and walked to observation area. he sat down and I told him I would be right back. I turned around and was walking back into the pharmacy when I heard a loud crash. I turned around and patient was slumped side ways about to fall out of chair. He had fainted or had a seizure (he was very stiff, redness to face, eyes open and fixed). I ran over to him and a pharm tech and I got him to the floor immediately. He regained consciousness within 5-10 seconds after placing him on floor. he asked how long was he out. he stated he had this seizure happen before but never after a vaccine. he said he has had multiple vaccines like hepatitis b and this never happened. he states it happens when he has something done to him that causes intense pain. he said it happened after hurting his ankle or when he hit his hand in a fan. checked his BP-172/100 pulse-65. paramedics came to check him out. BP still elevated. he walked out with paramedics.
1183255	4/8/2021	SD	55	M	3/31/2021	4/4/2021	Second shot Wed. Awoke Sunday to aches and pains, extremely dry and itchy eyes, runny nose, dry cough, slight fever. Finally today, Thurs., the symptoms are subsiding. Have used otc meds including cold and flu syrup, tablets, and allergy relief. Writing as I am finding comfort from FEXOFENADINE WHEN OTHERS DID LITTLE other than make me totally useless from extreme drowsiness; and because these symptoms are not the typical reported issues that come and go within a day or two of injection. Specifically, the store brand product is apparently highly effective and without the drowsiness issues.

1181931	4/8/2021	NJ	18	F	4/8/2021	4/8/2021	<p>Patient is an 18 year old female with no PMHx that presented with lightheadedness and three subsequent episodes of syncope approximately 3-10 minutes post-vaccination. Patient was found to have an abrasion to the outer corner of her right eyebrow following an unwitnessed. It was unknown if patient was seated or standing at the time. The nurse first on scene states the patient lost consciousness briefly again and experienced approximately 10 seconds of upper extremity muscle contractions (described as convulsions). Patient experienced a loss of bladder control upon loss of consciousness. Patient was lowered to the ground to be in a supine position by healthcare staff. At this time, patient was alert and oriented without agitation or confusion. Patient denies memory of the event. She states she had prior episodes of fainting after blood draw. Patient has no allergies to medication or food. No past surgical history. No prior hospitalizations. Denies personal and family history seizure disorders, cardiac disturbances, and hypoglycemic or hyperglycemic events. Patient was hooked up to cardiac monitor and found to be in normal sinus rhythm with a heart rate of 64bpm. Vitals Orthostatic BP measurements Lying supine - 110/72 Seated - 124/76 Standing - 128/72 HR: 64 bpm RR: 16 breaths/min without distress SO2: 99% On examination, patient was A&amp;Ox3 without lethargy, agitation, or confusion. Patient has an abrasion to the superior aspect of the right orbit (outer eyebrow) without laceration or bleeding. Patient was diaphoretic and pale following event. Normal cardiac rate and rhythm. Radial pulses intact, strong and equal bilaterally. No obvious nystagmus. Upon standing, patient steady on her feet without abnormal gait.</p>

1182093	4/8/2021	CA	23	F	4/8/2021	4/8/2021	At 1158, RRT was initiated for a 23 y/o F with c/o of feeling to pass-out, had burry vision, and was diaphoretic. Vitals: BP ? 110/72, HR ? 96, RR ? 14. Vaccinated on the L arm at 1150. Has anxiety, NKA, and did not take any medications today. Head-to-toe assessment completed. During monitoring period, client?s condition improved. By the end of monitoring period, client was in stable condition. Client left vaccination clinic at 1210 in stable condition, ambulatory, breathing even and unlabored, accompanied by her boyfriend. Boyfriend drove client home. Client was not diaphoretic anymore and her vision was normal and clear.
1182083	4/8/2021	MD	63	F	3/27/2021	4/3/2021	On the 7th day after receiving the Moderna shot (dose #1) at approximately 11:00 pm while watching television, I suddenly started hearing loud cricket sounds that I thought were coming from outside. Initially, I turned off the television then after a short period of time, I walked around the house, basement, and garage to see where the noise was coming from. After returning to bed, I turned off the television again, then realized the noise was coming from my ears! Initially, I was startled because there was nothing I could do and I could not fall to sleep. In the morning, after thinking what had been different in my life, I remembered the vaccine. I then researched and found that there had been others with the same or similar experience. Diagnosis: Tinnitus On April 9th, I have an appointment with my Primary Care Manager, to discuss the situation. I have a serious concern about taking the 2nd dose scheduled for Saturday, April 22. Following my doctor's appointment, I will request an appointment with an Otolaryngologist.
1182069	4/8/2021	MI	25	M	4/8/2021	4/8/2021	Patient passed out and hit his head on the floor cause a laceration above left eyebrow which needed medical attention at local hospital. Also may have needed a concussion test done.

1182052	4/8/2021	LA	50	M	4/8/2021	4/8/2021	The patient came in for J&J vaccine. He said he had no history of severe allergic reaction to anything, including meds, food, vaccines or any injections. He said that he did not receive any other vaccine in the past 14 days. According to the patient, he did not have test positive for Covid or was in contact with anyone with Covid for the past 2 weeks. He appeared perfectly fine prior to receiving the vaccine. Once the vaccine was given, within about 5 seconds, he said that he was seeing spots, he closed his eyes and made sounds that were similar to snoring. His neck was completely down on his right side and he almost fell off his chair. I held him so he would not fall off the chair and called for help. A few of the co-workers came to hold him. He was non responsive and my co-workers helped to put his legs on the chair. At point, I gave him an epipen. Once the epipen was given, he opened his eyes in about few seconds and became responsive. The nurses came and took over at this point. I stayed with him and the nurses for a few minutes. The patient was fully responsive and talking by the time I left the nurses and the patient. 911 was activated after the first epipen was given. The patient was then evaluated by EMS and the onsite nurses. The patient was AOx4 with stable vital signs. The patient had orthostatic vital signs taken and were within normal limits. The patient demonstrated that he was able to ambulate with no assistance. The patient signed a refusal for transport to the hospital and was driven home by a colleague. The patient remains in care of that colleague for monitoring. The patient was instructed that if he were to begin feeling the previous symptoms that he is to activate 911 and be seen in a hospital. Patient understood the instructions and went back to his residence.

1181838	4/8/2021	CT	33	F	4/8/2021	4/8/2021	On 4/8/21 Physician was administering Covid-19 vaccines at our clinic in the lawn and garden center. She had a patient who was there to receive her first dose of the vaccine. After the vaccine was administered, she was okay and went to sit in the waiting area. Shortly later she came back up to the pharmacist table and reported feeling dizzy, lightheaded and nauseous. Physician then told the patient to sit right by her so she could keep a better eye on her. The patient said she was okay and then suddenly she passed out. Physician was able to catch her as she was falling out of the chair and was able to lay her down on the floor. She may have bumped her head slightly on the ground during this process. Physician then reports that the patient's breathing sounded labored, and the patient was not conscious. At that point Emergency department was called. Physician removed the patients mask and was preparing to administer an EpiPen due to the labored breathing but then the patient regained consciousness. The Emergency operator advised her to keep the patient on the ground until EMS arrived on scene. Patient was conscious and okay on the ground. EMS then came and took care of the patient. It was deemed that the patient gets lightheaded when she gets bloodwork done usually and believes this may have been an anxiety event. She did not want to go to the hospital. She felt a bit dizzy once she was sitting back upright and EMS approved the patient drinking some water. This seemed to help, and the patients color came back. The patient sat with Physician for a while and then felt back to normal and left on her own accord.
1181830	4/8/2021	CA	19	F	4/8/2021	4/8/2021	Patient was ambulating to waiting area chair and became weak. Patient was assisted to floor with nurses help. Eyes closed and was responsive with sternal rub to upper chest wall. Respiratory rate even, unlabored. Patient opened eyes and started talking. Alert and oriented x 3. Skin color grayish white with lips white. Water was given. Vitals obtained with BP 92/58, HR 64, 100% O2 on RA. Placed in wheelchair and pushed to private area. Patient refused for EMS to assist. Denies pain. No acute distress noted. Patient left vaccine site with no further incident.

1182571	4/8/2021	PA	34	F	3/19/2021	3/20/2021	headache; swollen lymphnodes in both armpits; woke up with mastitis in left breast; chills; 102 fever; Migraine ocular headache (seeing zig zag lines in vision); trouble breathing--one dry cough after breathing deeply; fast heartbeat; developed a sore left arm; body aches; This is a spontaneous report from a contactable consumer (patient). A 34-year-old female patient (not pregnant) received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Lot number: EN6204), via an unspecified route of administration in left arm on 19Mar2021 at 16:30 (age at vaccination 34- year-old) at single dose for COVID-19 immunization. Medical history included drug hypersensitivity to penicillin, sulfa drugs, levoquin, some fish oil supplement. The patient's concomitant medications were not reported. Vaccination history included: first dose of bnt162b2 for covid-19 immunization on 26Feb2021 at 16.30 (lot: EN6202) in right arm. On 20Mar2021, patient experienced woke up with sore left arm and body aches. Patient took ibuprofen and felt better. On 21Mar2021, patient woke up with mastitis in left breast, chills, and 102 fever, migraine ocular headache (seeing zig zag lines in vision), trouble breathing--one dry cough after breathing deeply and fast heartbeat. On 22Mar2021, patient had still a headache. She went to doctor for mastitis. A mammogram and ultrasound showed swollen lymphnodes in both armpits (first shot was on right arm). On 23Mar2021, patient had still headache. Patient received antibiotics as treatment for adverse events. Outcome of events was recovering. Additional information has been requested.
1182583	4/8/2021	MO	18	F	4/8/2021	4/8/2021	The patient reports experiencing blurred vision, vertigo, throbbing unilateral headache upon arrival to her seat. The medical team assessed her and found her HR to be 76 bpm, BP 142/80, BG of 72, and her oxygen saturation was 99%. She reported that she had not eaten all day and had not had a lot of water during work. She reported that she typically gets migraine headaches lasting for several hours. She was given some water and her symptoms started to resolve. She asked if she was able to go home.

1182608	4/8/2021	PA	74	F	3/8/2021	3/8/2021	Eye swelling; This is a spontaneous report from a contactable nurse. A 74-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in arm left on 08Mar2021 (at age of 74-year-old)(Lot Number: EN6206; Expiration Date: 30Jun2021) as single dose for COVID-19 immunization. Medical history included detached retina, cataract, eye surgery on 12Feb2021, and hit the head on the freezer door. Concomitant medications included hydrochlorothiazide (HTZ) taken for an unspecified indication, start and stop date were not reported; potassium chloride taken for an unspecified indication, start and stop date were not reported; vitamins NOS (MULTIVITAMINS) taken for an unspecified indication, start and stop date were not reported. There was no History of all previous immunization with the Pfizer vaccine considered as suspect or additional vaccines administered on same date of the Pfizer Suspect. There was no prior vaccinations (within 4 weeks). The patient experienced eye swelling on 08Mar2021. The reported seriousness criteria was medically significant. The events did not result in emergency room visit or physician office visit. Time the Vaccination Was Given: 2:15-3:00 pm. The patient had the vaccine then she went to her retina specialist right after, she had a detached retina prior to receiving the vaccine. At the retina appointment before the vaccine she didn't have edema within her eye, at this appointment she had new onset edema inside of her eye. The edema was on the right, the vaccine was on the left. The patient knows there are lymph nodes around the eye and she has a weird body. The patient wants to know if other people have experienced this. There is edema inside the eye. The patient wonders if the vaccine interacted with the oil given during the retina exam. The patient had cataract surgery done and then had a hole in her retina following the surgery. The hole got worse and she had to go for surgery on 12Feb2021, then she had 3 month appointments. The patient didn't not know if she still has the eye swelling, she went back to her retina doctor on 19Apr2021. The retina doctor put her on eye drops after they found the eye swelling. The patient mentioned that she stopped the eye drops that she was taking after her surgery a week before she received the

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

vaccine. The patient hit her head on the freezer door right before her retina detached, the doctors said that it did not cause the retina to detach but she thought it was related because she hit her head really hard. Therapeutic measures were taken as a result of eye swelling (eye swelling). The outcome of event was unknown. The patient thought this eye swelling may be related to the vaccine but she is unsure.; Sender's Comments: Based on the available information, the company considers that a causal relationship between eye swelling and BNT162B2 vaccine cannot be excluded due to plausible temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1182552	4/8/2021	CA	28	F	4/8/2021	4/8/2021	After receiving the shot, I was required to sit down for 15 minutes. About 5 minutes in, I started to become dizzy, my vision started blacking out, my hearing was muffled, I became clammy, sweaty, and experienced mental disorientation. It became harder for me to breathe, but I never struggled to take a breath. I drank some water and waited for the symptoms to subside. I remained seated and these symptoms went away within 5 minutes. After feeling better for about 5 minutes, I felt cold and was shivering. The woman sitting next to me was completely fine after her shot. I've since felt a slight burning sensation on my skin in areas that I have scratched lightly. I'm also experiencing strange feelings throughout my body- specifically my head, leg, and hand. It feels like I can feel something in each area for a bit and then it subsides after several minutes.

1182517	4/8/2021	IL	35	F	4/7/2021	4/8/2021	The following morning my Entire body aching, muscles and joints very weak hard to walk for hours. Intense headache and eye pain with extreme light sensitivity. Fever of 102.5 for hours. Eventually after about 8 hours my stomach began to hurt nauseous. And fever dropped to 101.
1182506	4/8/2021	TX	53	F	3/24/2021	4/6/2021	4/6/21 I awoke with symptoms of numbness/paralysis on left side of face limited to upper lip and cheek area and both eyes would not stop watering. Movements to drink or make facial expressions were limited due to the numbness. Because I have sensitive skin I thought I may have had some type of reaction to something. So I waited to see if it would clear up through the day. I was not experiencing any other symptoms. By that evening it was apparent that I was not getting better and possibly getting worse because I began to experience some noticeable drooping in my cheek area. I decided to call my doctor in the morning. Because I am currently out of town, my home doctor suggested I see a local ER to rule out a stroke and determine if I was experiencing Bell's Palsy. I went to an ER clinic on 4/7/21

1182491	4/8/2021	IN	60	M	1/6/2021	1/6/2021	large left horseshoe tear on the retina in the left/tear on the right retina/small tear right eye; detached retina on the left; vision loss/can't see at all/thought he was going blind; streaks of lightening; section of vision lost in the left eye; Posterior Vitreous Detachment; floaters; sick; This is a spontaneous report from a contactable consumer (patient wife). A 60-years-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Solution for injection) dose 1 via an unspecified route of administration on 06Jan2021 (Lot Number: EJ1685, expiry date not reported) as single dose; and dose 2 via an unspecified route of administration on 29Jan2021 (lot Number: EL8982, expiry date not reported) as single dose; for covid-19 immunization. Medical history included eye surgery (he already had surgery once) from an unknown date and unknown if ongoing. The patient's concomitant medications were not reported. Patient received first dose of the Pfizer vaccine on 06Jan2021 then on 29Jan2021 the 2nd dose. He experienced side effects: floaters on 06Jan2021, and streaks of lightening then vision loss on 15Mar2021. There was a large left horseshoe tear on the retina in the left and a detached retina on the left and a tear on the right retina on 19Mar2021. He already had surgery once. He will have 2nd surgery on the other eye. Reporter reported a follow up. He can't see at all. He was recovering and has to lay on face for 2 weeks. Reporter stated she read about retina problems related to the virus but not to the vaccine, could not find information. Patient was a retail pharmacist. He deals with customers and several customers stated they had vision problems with the vaccine: double vision, loss of sight. "There was a problem out there, but maybe they were not reporting it took reporter 2 hours to report so they may not have the time to sit there to report". Reporter knew they can't prove it was the vaccine that caused it. Reporter don't believe in coincidences. It seemed quite obvious to them it's related to the vaccine. Reporter appreciated all the help and stated they didn't have all the answers. Reporter sure it was the vaccine because it was within hours after the first vaccine, but since there was no information regarding the sight problems related to the vaccine patient didn't think about it. Then the floaters got worse and started to block his vision, after the 2nd

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

vaccine it was dramatically; within hours it was worse. He's never been sick in 36 years (2021). Patient hoped no one else has to deal with what he has to deal with. Patient also reported that on 10Feb2021, patient had section of vision lost in the left eye. It was then reported that patient was well versed in the virus and the vaccine. He was unable to speak on the phone at this time as he was recovering from surgery. Patient received the first dose of the Pfizer COVID 19 vaccine on 6Jan2021 and right away began seeing hundreds of floaters. He didn't correlate it to the vaccine but it didn't go away. Then he received the second dose of the vaccine on 29Jan2021 and within hours he thought he was going blind. He went to an optometrist 01Feb2021 who sloughed off the idea of it being related to the vaccine and diagnosed him with Posterior Vitreous Detachment. It was previously reported to Pfizer when he got the diagnosis of the PVD and all the events mentioned were previously reported. Reporter stated that from that day on the floaters got larger; the around 15Mar2021 he noticed every time he bent over he saw streaks of lightning; and he started to have a black hole, a loss of about 20% of his field of vision in the left eye. He went to another local optometrist 19Mar2021, who saw a large horseshoe tear in on left retina; and a detached left retina. The local optometrist sent him to a specialist and who verified the tear and the detachment and said the other retina in the right eye also has a small tear. Patient then had eye surgery, Monday at 0700AM, 22Mar2021 by outpatient surgery, to drain the fluid in his eye; insert a gas bubble and a silicone band to repair the retina; and did laser surgery on the tear. The specialist advised that the surgery damages the lens so he will need the lens replaced in the future. Now her patient has to lay down with his face down for 23 hours a day for two weeks and take 6-8 weeks off work. He had a doctor's visit yesterday and the doctor seemed satisfied with his progress but he can't see out of the eye, everything was cloudy so he doesn't know if the floaters are gone or the eye sight is recovered yet. The doctor was planning to do the right eye tear repair on Thursday 25Mar2021. Reporter had searched online to see if other people have this, but she can't seem to get the stories online about problems with the retina and the vaccine. She wanted this to be known and documented. Reporter was asking if company have information about if other

1182234	4/8/2021	CO	34	M	4/8/2021	4/8/2021	Moderna COVID-19 Vaccine EUA: patient brought in by ambulance to emergency department (ED) after reporting tongue and lip swelling immediately after vaccination. Epinephrine (EpiPen) administered at vaccine clinic and diphenhydramine administered en route to ED. On arrival to ED patient denies headache, chest pain, blurred vision, shortness of breath, nausea, and vomiting. Initial vital signs within normal ranges except for blood pressure 138/75 mmHg. Physical exam documents no acute distress and no rashes. Patient observed, repeat vital signs all within normal limits, symptoms improved, prescribed EpiPen and diphenhydramine, and discharged home stable with follow-up in place.
1182236	4/8/2021	FL	59	F	3/11/2021	3/22/2021	Blurry vision, light sensitivity, intermittent light headedness starting 3/22/2021, Headache's starting day after vaccine.
1182229	4/8/2021	MD	58	F	4/2/2021	4/5/2021	24 hours after the injection I had a blood shot patch on my left eye which I believe is a subconjunctival hemorrhage. It has gotten smaller but is still visible today on 4/8/21, six days after the vaccine. Additionally, my lymph nodes under my left arm swelled 36 hours after the injection and were swollen for 4 days. I took two 500 mg of tylenol daily for 4 days. I was very fatigued for 48 hours 24 hours after the injection.
1182273	4/8/2021	CA	33	F	4/8/2021	4/8/2021	At 1343, RRT was initiated for a 33 y/o F with c/o dizziness, blurry vision, and was diaphoretic. Vitals: BP ? 98/62, HR ? 52, RR ? 19. Vaccinated on the R arm at 1340. No PMH, has multiple allergies (PCN, wheat, pineapple, dairy products, eggs, quinoa, cranberries, barley, and rye), and did not take any medications today. Head-to-toe assessment completed. During monitoring period, client's condition improved. By the end of monitoring period, client was in stable condition. She was not dizzy anymore, had normal and clear vision, and she was no longer diaphoretic. Client left vaccination clinic at 1425 in stable condition, ambulatory, breathing even and unlabored, accompanied by her husband. Husband drove client home.

1182294	4/8/2021	CO	35	F	4/8/2021	4/8/2021	I really think this was a result of my anxiety regarding needles rather than from the actual vaccine. I have had fainting spells after blood draws. After about 5 or 10 minutes from receiving the shot I started feeling warm and nauseous. The on site nurse came over and I did vomit. I felt better almost instantly. She was wonderful, but had me stay in the supervision area for an additional 20 minutes to make sure I didn't have any more nausea or other symptoms.

1176139	4/7/2021	IA	49	F	12/18/2020	12/18/2020	approximately 8-10 minutes after first dose-experienced flushing through head, down throat some sensation in throat, had to take deep breath, went down arms, felt very heavy, improved after about 15 minutes then very mild recurrence about 35-40 minutes after dose Because of throat symptoms took benadryl and pepcid 30 minutes prior to 2nd vaccine. 1hr 40minutes after 2nd, difficulty swallowing water, flowing/flushing sensation then my lips were tingly and eyes itchy briefly. My HR was 90's which is high, my resting is 40's-50's. Arms would feel heavy with this. This happened later in the day again, Very unsettling, was in contact via text with cardiologist I work with ( I am an ARNP) and my Dr that is listed on this form. They told me I could keep taking Benadryl and Pepcid q 6-8hrs. I was also given prescription for prednisone if needed. Following day went about 8 hrs between doses, same symptoms took Prednisone that eve, I believe 10mg this was in addition to Benadryl and Pepcid. These episodes kept happening for about 5-6 days. On Friday, 3 days after 2nd dose, I tried to space out meds. then in afternoon about 4:40 was actually short of breath and felt tight with breathing. So took meds and actually considered using my son's old inhaler. Symptoms resided in about half hour after meds. Last dose of meds was Sunday 8 PM after 2nd vaccine. Ran in morning and HR would not come down, stayed in 110's very unusual for me, I felt SOB. Had EKG when I went to office but just prior to EKG symptoms resolved and I was SR in 70's Had BMP and Mg these were NL. I run daily and had noted increased SOB and HR after first vaccine this continued until just a few weeks ago. We feel this was some type of allergic reaction with possible mast cell activation. I had internal "tightness" no appetite and felt like constant state of adrenaline for about 1-2 weeks. Concerned if booster needed and for my son who is 18 that has some allergies

1175625	4/7/2021		22	M	4/7/2021	4/7/2021	Patient experienced nausea without vomiting several minutes after receiving first dose of COVID-19 Pfizer vaccination. VS remained wnl during observation period. No associated weakness, paresthesias, abdominal pain, vision changes, SOB, wheezing, swelling, or hives. Patient reports not having eaten today. Suspect secondary to vagal response. Patient given Zofran ODT with improvement of symptoms. Tolerated Capri-Sun pouch. Patient cleared to discharge from clinic and provided SIQ for today.
1175611	4/7/2021	MA	27	M	4/4/2021	4/5/2021	After 14 hours of receiving the vaccine, I woke up shivering with chills around 2:30AM. Fell back asleep and woke up with a horrible headache and migraine (primarily behind my eyes). Entire body ached and had a fever of 100.5. This lasted the entire next day after receiving the vaccine. The second day, the headache subsided but my neck and lymph nodes were swollen and very sore.
1176684	4/7/2021	MN	17	F	4/2/2021	4/2/2021	Patient passed out, fell out of her chair and hit her head hard after receiving her shot. Once she went down, two nurses ran to her assistance where they propped the patient's feet up on a chair and got her some water. Patient reported blurred vision, had a goose egg on the back of her head but did not appear to be mentally foggy.

1175599	4/7/2021	MO	41	F	2/1/2021	3/4/2021	<p>On 2/25/21 I received my first Moderna vaccine. Later that day, I started to experience some brain fog and fatigue. this resolved itself after approximately 4 hours. On 3/3/21 I took my dose of Humira that I use for Crohn's Disease and about 3 hours later experienced extreme fatigue. I have been on Humira for 3.5 years and I have never experienced a reaction to the Humira like this. On 3/4/21, the next day after taking my Humira, I once again experienced extreme fatigue, a very bad headache and horrible brain fog to the point where the things I was reading on my computer and things people were saying to me was not making sense. I was also very nauseated and had severe diarrhea. I was tested for Covid just to be sure and I was negative. I went home and fell asleep and slept for 6 hours. I did feel better upon waking up. Approximately one week later I experienced a sever migraine with visual disturbances. On 3/15/21 I began having a Crohn's flare. I had been in remission for 3.5 years with my last colonoscopy in October of 2019 showing this and that my Crohn's ulcers had improved. I went to the ER on 3/16/21 in severe pain, was found to be in a flare with inflammation and swelling in my small intestine and a partial blockage. I was admitted to the hospital for 2 days where I received IV steroids and fluids. I was sent home on oral prednisone and now have to add additional medication to my Humira regimen for my Crohn's. I am sure that some will say that none of this is related to the Moderna vaccine I received, but I have had no issues with my Crohn's in 3.5 years until I had this vaccine. All of my issues this past month coincide with receiving the vaccine and I have never had any side effects whatsoever from the Humira. In fact, it's always made me feel better when I've been due to take it, so I know that my symptoms are not from the Humira. I cannot say for sure if the vaccine caused my issues, however, it's pretty coincidental that I was feeling good and otherwise healthy until I had this vaccine.</p>

1175004	4/7/2021	PA	73	F	2/16/2021	2/16/2021	Got her eye bulging; Woke up with bells palsy in lips, nose, eye on the left side; Headache; A spontaneous report was received from a consumer concerning a 73 year old female patient, who experienced eye bulging (exophthalmos), bells palsy in lips, nose, eye on the left side (facial paralysis), and headache. The patient's medical history was not provided by the reporter. Concomitant medications were also not reported. On 16 Feb 2021 at 13:30, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: 023M20A) for prophylaxis of COVID-19 infection. On 16 Feb 2021 at 16:00, after receiving mRNA-1273, the patient experienced eye bulging and a headache (intermittent). The headache lasted 3 days until she took a Tylenol. The patient reported that she woke up with bells palsy in lips, nose, eye on the left side. The treatment details for the event of headache included Tylenol (paracetamol). Action taken with mRNA-1273 in response to the events was unknown. The outcome for the events of eye bulging (exophthalmos) and bells palsy in lips, nose, eye on the left side (facial paralysis) was considered as unknown. The event of headache recovered on 18 Feb 2021.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.
1175587	4/7/2021	AR	61	F	3/4/2021	3/6/2021	Eyes swollen and red since vaccine. Swollen on second day after vaccine and went to DR thought it was pink eye. They did Covid test and I was negative but been putting drops in eyes and still red. One week after that I started having ringing in the ears. Went to my primary health care provider but never thought about it being because of the vaccine. Said that if it continued would need to see ENT. Constant ringing and am seeing ENT today.
1176883	4/7/2021		37	F	3/20/2021	3/20/2021	persistent fever despite Tylenol, started a few hours after vaccination, "blood shot" eyes, admitted to hospital

1176824	4/7/2021	IA	33	F	4/7/2021	4/7/2021	Shortly after receiving the vaccine, patient complained of coughing, shortness of breath, neck pain. HR=119 and unable to auscultate blood pressure. C/o warmth and feeling of throat swelling, burning in throat after coughing. Patient was placed on floor initially supine and then onto right side. Bluish discoloration around eyes and lips, and encouraged patient to use her inhaler. O <sub>2</sub> reading 98% after a few minutes. EMTs present and took blood sugar, 87 and given dextrose orally followed by water. Patient stated that she had a donut and waffle for breakfast. Encouraged to eat lunch with some protein. Relayed that she had an ablation and tubes tied last week. Received allergy shot recently but not new formulatin. She also mentioned that she received a steroid injection for her migraines.
1176805	4/7/2021	OR	42	M	3/31/2021	3/31/2021	10:45am patient became unconscious and was laid on the floor with legs elevated. Heartrate 50 BP 76/60 10:50am BP systolic 90 HR 60 weakly responsive 10:52am BP systolic 92 10:55am More responsive, eyes open, speaking, HR 64, BP systolic 100. 10:58am EMS arrived, patient declined transport.
1176775	4/7/2021	MN	66	M	4/2/2021	4/2/2021	patient started experiencing blurry vision, black spots, and next day loss of vision in that eye
1176738	4/7/2021	MA	63	F	3/30/2021	4/1/2021	Two days after receiving my shot, I began to experience mild dizziness. Four days after my vaccine, the dizziness began to intensify to the point where on day 5 (Sunday), I could not get out of bed. I attempted to go to an urgent care facility, but none where open. I called my PCP and talked to the covering doctor. I was told that it might be BPPV and was given a prescription for meclazine. On day 6, I was a little better and tried to make an appointment with my PCP (I was unable to get one until this coming Friday), so I went to an urgent care. They seemed to agree with the BPPV diagnosis and told me to look on T.V. for how to do the Epley maneuver. It has now been 8 days since my vaccine and I am still experiencing dizziness, but am able to function with some limits (I haven't driven my car as of yet). The Epley maneuver did not seem to help. Besides the dizziness, my ears feel full and especially in the morning, I have a bit of a problem with my eyes focusing correctly.

Declined further medical evaluation offered by writer. Patient waited in monitoring area another 15 minutes with Paramedics on standby. Left vaccination site with friend.
1176213	4/7/2021	WI	41	F	3/26/2021	3/26/2021	I experienced slight nausea, awake all night, felt like a stimulant to me, fever, chills, sweating, migraines. I felt super tired but my body would not let me sleep. I also had muscle aches and cramps with lower back and leg with a throbbing sensation. This was within 12 hours. About 5 days later, my eye started to hurt, went to see my eye doctor and they found out I have ocular herpes. I am on now on some antiviral eye medication. I could tell after the vaccine I had a viral type infection. I still have not recovered and I will see my eye doctor tomorrow.

1174294	4/7/2021	AZ	62	M	3/19/2021	3/19/2021	'blood pressure had been up to 180/increase in blood pressure'; he was freezing; he was cold; "he is usually up at work every day and he hasn't been able to work the last few days"; feels like he can't think", "tired; "he may be getting in for breathing treatments today"; so sick; feels like he can't think", "tired; Feeling lousy; Lethargic; Running temperature; Chills; Hives; Anaphylaxis; fell asleep for 16 hours. Caller reported that he doesn't normally sleep for 16 hours; Throat scratching; Eye itching; Bags under eyes; This is a spontaneous report received from a contactable consumer (patient). A 62-year-old male received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Solution for injection, Batch/Lot number: EN6207), via unspecified route of administration on right arm on 19Mar2021 13:09 as a single dose, for COVID-19 immunization. The patient medical history included Ongoing COPD (about 5 years ago), high blood pressure (about 10 years ago and still ongoing) extensive allergies to food and insect bites. The patient was diagnosed with the allergies when he was a little kid, allergic to penicillin ongoing. Concomitant medications included lisinopril at 20 mg once daily in the morning for high blood pressure and albuterol at 2 pumps in AM and 2 in PM before going to bed for COPD (Chronic obstructive pulmonary disease). The patient previously took historical vaccine ampicillin for infection. On 19Mar2021, the patient experienced, ended up feeling really sick right after the shot. He has a lot of allergies and he was advised to take his Epi-Pen kit and stay an additional 30 minutes past the recommended waiting time after receiving his vaccine. His throat began scratching after getting the shot and lasted for about 3 to 4 hours for which the patient received Benadryl and resolved completely. His eyes were itching and lasted for 24 hours, and bags started to form under his eyes like anaphylactic shock. It was reported that the bags under his eyes would normally stay after anaphylaxis for a day or two. His eyes were still a little puffy at the bottom. He did not see a rash but started to get hives, the paramedics were called and monitored him for another 30 minutes. The paramedics administered a shot of Benadryl. After the Benadryl was administered, his body and blood pressure started to come down. The paramedics reported that his blood pressure had been up to 180. It was reported that on 19Mar2021, afternoon,

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

when the patient got home, he was sick, laid down and fell asleep for 16 hours. He does not normally sleep for 16 hours. He was unsure if his eyes were itchy in his sleep. Later in the call it was clarified that this might have only lasted 3-4 hours, he was so tired he just went to sleep. It was reported that he was not a sleeper, that he was usually up at work every day and he had not been able to work the last few days. It was reported that he started feeling the side effects of the Covid-19 vaccine at 13:20 on 19Mar2021. On 20Mar2021, he felt lousy ever since he received the COVID-19 vaccine. On the same day, his wife took his temperature, and his temperature was hovering around 100-100.9. He felt lethargic, running a temperature between 100.5 and 100.9 pretty consistent every day. On an unspecified date, his wife took his temperature, and it was 99.9. He felt like his mind was in a fog, intoxicated and he had not felt good since receiving the first dose of the Covid-19 vaccine. It was reported that the mental fog made him felt like he cannot think. The paramedics gave him a test and asked him to add 5+7. The patient answered 14, even though he knew that the answer is 12because he could not think, and he felt punch drunk. He reported that he can concentrate a little more, but he still felt drunk, this was hanging around the same now. It was reported that the paramedics were asking him questions and gave him things to do, addition and subtraction formulas, to keep his mind. He could not finish those formulas and that he told the paramedics that he felt foggy or punch drunk. He spoke with his health care provider at the VA and the provider advised him not to get the second dose of the Covid-19 vaccine. It was reported that the patient was inquired if he had any immunity to Covid-19 without taking the second shot and if he was protected with just the one dose of the Covid-19 vaccine. It was also reported that, the reporter also looked through the list of side effects for Covid-19 vaccine and it was like patient had all of them. The patient experienced chills, he was freezing, and he was cold. The patient had the whole list of them. It reported that he had doctor appointment on Monday, 29Mar2021, and that he may be getting in for breathing treatments today. He was waiting for his insurance to finalize the approval for the breathing treatments in the evening. The outcome of the events throat scratching and eye itching was recovered on

1173972	4/7/2021	OH	70	F	2/27/2021	2/27/2021	Tiredness; Headaches; Chills; Fever; Nauseated; Dizziness; Weakness; felt sick; can't see as good, her eyes are weak; Difficulty breathing; thought she was having a heart attack; dehydrated; fast heart beat that felt like her chest was full; fast heart beat that felt like her chest was full; Injection Site Pain; blood pressure fluctuated; This is a spontaneous report from a contactable consumer (patient). A 70-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), dose 1 via an unspecified route of administration, administered in left arm on 27Feb2021 12:00 (lot number: EN6202; expiration date: 30Jun2021) as single dose for COVID-19 immunisation. Medical history included ongoing high blood pressure and stroke from 2012 to an unknown date. Concomitant medications included aspirin [acetylsalicylic acid] (ASPIRIN) taken for stroke from 2012 and ongoing; clopidogrel bisulfate (CLOPIDA) and simvastatin both taken for high blood pressure from 2012 and ongoing; ongoing amlodipine, lisinopril, and metoprolol all taken for high blood pressure. On 27Feb2021, she took the first vaccine. From that day, for 2 days, she had injection site pain. On 07Mar2021, she started having tiredness, headaches, chills, fever, felt nauseated, had a fast heart beat that felt like her chest was full and thought she was having a heart attack, dizziness, weakness, felt sick, and difficulty breathing. The patient added that she can't see as good, her eyes are weak. She was going to make an appointment to get her eyes checked. For dizziness event, she has to sit on the side of her bed for 10 minutes and she was still dizzy. She has to hold on to something because she feels like she is going to fall. She was given meclizine three times a day for this event. For tiredness event, she stated that it fluctuates during day. After she takes a paracetamol (EXTRA STRENGTH TYLENOL) and lays down for a while, she feels ok and then she feels tired again. For fast heart beat that felt like her chest was full and thought she was having a heart attack event, it comes and goes, she had it yesterday (21Mar2021) but hasn't had it today (22Mar2021) but she doesn't know if it is gone. Her symptoms were usually in the morning when she first gets up. She has been to the emergency room (ER) on 07Mar2021 and on 13Mar2021 and they say that nothing is wrong. On 07Mar2021, they gave her an IV because

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
-----------------	--------------	--------------	----------------	------------	-----------------	-------------------	---------------------

they thought she was dehydrated. On 13Mar2021, she went back to another hospital ER. She felt worse and her son came and got her and took her to the ER. They did a whole workup MRI of her head, x rays, blood work and everything. They didn't know what was causing it because it had it been over a week since her vaccine and they sent her home. She has been laying down and staying hydrated. She couldn't hardly get up and they asked her what has she done different and the only thing different was the vaccine. Everything listed on the risk factors [side effects] is how she is feeling. She was not hospitalized, they gave her medicine and told her to stay hydrated and sent her home and was told to follow up with her physician. She finally got an appointment for tomorrow (23Mar2021) with her physician. She can't drive because of the dizziness. All of her tests came back normal. They said her blood pressure fluctuated on 2021 but that is normal. Outcome of the injection site pain was recovered on 01Mar2021, of the difficulty breathing was recovering, of the headache, chills, fever, dizziness, weakness, and felt sick was not recovered, while of the remaining events was unknown.

1173911	4/7/2021	MA	33	F	3/13/2021	3/14/2021	the back (mostly left side) of her head gets so tight and sore; felt like the back of her skull was fractured/the back (mostly left side) of her head gets so tight and sore; all color drained from her face; tunnel hearing; tunnel vision; felt the worst feeling about to faint; felt a "static" feeling all over her body; throwing up; fever; migraine; aches; Chills; hot sweats; This is a spontaneous report from a contactable consumer (the patient). A 33-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number EN6207), via an unspecified route of administration in the left arm on 13Mar2021 12:00 (at the age of 33-years-old) as a single dose for COVID-19 immunization. The patient's medical history included: asthma and lactose Intolerance- not allergy though (as reported). Prior to vaccination, the patient was not diagnosed with COVID-19. The patient was not pregnant at the time of vaccination. Concomitant medications included: fluticasone propionate/ salmeterol xinafoate (ADVAIR), loratadine, bupropion hydrochloride (WELLBUTRIN), and vitamins (as reported), all taken for an unspecified indication, start and stop date were not reported. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number EN6200), via an unspecified route of administration in the left arm on 20Feb2021 12:00 (at the age of 33-years-old) as a single dose for COVID-19 immunization. The patient stated that 24 hours after her second dose (14Mar2021 12:00), she felt the worst feeling about to faint, all color drained from her face. She got tunnel vision/hearing and felt a "static" feeling all over her body. Then started throwing up. She took a nap and woke up an hour later with 101.2 (degree) fever (14Mar2021) and fought that, along with migraine, aches, chills, hot sweats (14Mar2021). About 8 hours after initial fever (14Mar2021), it spiked to 102.4 (degree) for two hours. It came down quick. The next day, 15Mar2021, it felt like the back of her skull was fractured. And since then (unspecified date), the back (mostly left side) of her head gets so tight and sore especially when laying down. She has been sleeping on heating pad for 10 days now, and it got a little better but still super sore (head). The events involved a doctor or other healthcare professional office/clinic visit. Treatment was received for the back (mostly left side) of her head gets so tight and sore.

1176961	4/7/2021	FL	30	F	4/6/2021	4/6/2021	Within minutes of receiving the injection I began to feel dizzy. My heart rate quickly began to drop according to my Fitbit. My heart rate is normally around 68. When the dizziness began I noted my heart rate dropped to 57 then 52 within seconds. The dizziness continued to get worse over the next minute or so until I completely lost my vision. One of the workers brought me water and within a minute of drinking my vision began to come back slowly. After sitting for another 10-15 after regaining my vision I felt better. I am concerned about getting my second dose of vaccine after this first experience. Please advise.

This 27-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration on 10Mar2021 10:15 (Batch/Lot number was not reported, reported as "one number on there is EN and then she does not know if it is a G or 6 and then 204") as a single dose for COVID-19 immunization. Medical history included ongoing anxiety from 2020, ongoing acid problems from 2020, high cholesterol levels from 2020 (she was not prescribed any medication and the advice given was just for diet and exercise), and ongoing gallbladder problem for years. There were no concomitant medications. Patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. No additional vaccines administered on same date of the Pfizer suspect. On 10Mar2021, patient had eye puffiness in her left eye. Patient asked if it is safe to take the second dose. Her eyelid got puffy which began 30 minutes after having the Pfizer COVID Vaccine and it is not ongoing but resolved completely after a few minutes. She did not require treatment for the eye puffiness and the puffiness was mostly on her upper eyelid of her left eye. Patient stated that she does not know in terms of causality if the Pfizer COVID vaccine is related to the reported events and was worried because a week after she got the vaccine, she had other symptoms and was not sure if they are connected with the vaccine. She also reported that she does not think the eye puffiness itself is that serious but it is medically significant and the other symptoms she had were chest pain, chest heaviness, and abdominal pain. These symptoms are not ongoing anymore and began around Friday, 19Mar2021 and resolved after a couple of hours of when they began. For the chest pain, chest heaviness and abdominal pain, she just took an antacid Prilosec for treatment. She thought about going to the emergency room but also thought she was having an anxiety attack and was close to having to go to the emergency room that night. She did get pretty anxious easily and that probably exacerbated it. AEs did not require a visit to</p>

1175523	4/7/2021	AL	31	M	4/6/2021	4/6/2021	At approximately 9:00 PM (roughly 11.5 hours after vaccination) I became extremely light headed with slurred speech. I experienced tunnel vision and dizziness. My face turned white, and my lips were a blue color. I sat down immediately, which improved my condition temporarily. But, within 2 minutes I began experiencing tunnel vision and dizziness again while sitting upright. I laid down on my back and elevated my legs. My vision returned and but I remained dizzy and pale. I experienced some numbness and tingling in my extremities. My wife attached a fingertip pulse oximeter to my finger at this time (we did not have a tool to check blood pressure on hand). My blood %SpO2 read between 95 and 98% and pulse ranged from 95 to 101 bpm. I did NOT experience: difficulty breathing, swelling of the airway, nor itching. Since I was not having difficulty breathing, and my symptoms seemed to indicate low blood pressure or potentially low blood sugar I decided to wait it out and see if my symptoms worsened. While laying on the floor, I consumed a glass of milk and a few oreo cookies, hoping to counter hypoglycemia (if that's what was going on). After approximately 15 minutes my condition began to improve - I could sit up slightly with only mild dizziness and color began returning to my face. After approximately 30 minutes, I was able to stand and walk to my couch and lay down. After around an hour, I was feeling almost back to normal with only a slight dizziness and tiredness remaining. 12 hours after the adverse event (24 hours post vaccination) I feel okay, slightly lightheaded but generally fine. I intend to call a doctor and discuss if any further tests are necessary.

1175510	4/7/2021	NY	16	F	4/7/2021	4/7/2021	<p>Patient presented for her first COVID-19 vaccine. Approximately a minute after vaccine was given, she was noted to be seated upright in the passenger seat of her car, with head bent forward and eyes open. She was unresponsive, stiff posture, and was placed into a reclined position. She then had some posturing with head turned to the left, no eye deviation or nystagmus, no tonic-clonic movement. Radial pulse was thready, bradycardia was noted, with normal respirations. She was noted to become diaphoretic and pale/ashen color noted to the face and arms. She became responsive within a few minutes, however initially was not able to answer questions clearly. She had no loss of bowel or bladder function. EMS assisted with evaluation. Initial blood pressure 78/31, HR 54, SpO2 100%. EMS then transferred her to the stretcher and she was transitioned from her car to the ambulance. She continued to improve spontaneously with BP 94/61 then 103/60 and HR 86 then 74. SpO2 remained stable at 100%. Skin color improved. She had normal responses to questions, no complaints of headache, dizziness, chest tightness, shortness of breath, numbness or tingling. She had some shaking/voluntary movement of the limbs and body noted, but she could control and stop this voluntarily, no myoclonic or tonic-clonic jerking noted. After syncopal event occurred, mom reported that the patient has a history of syncope routinely with blood draws and vaccines in the past, however this episode was slightly more prolonged and seizure-like activity was different. She has had some jerking movement previously with syncope which lasts 20-30 seconds, different from today's response. No known history of seizure disorder.</p>

1175509	4/7/2021	TX	50	F	3/3/2021	3/3/2021	Both my ears began ringing during my 5-10 minute drive home after leaving the vaccination center with a simultaneous, difficult to explain, "stuffed-up" feeling (almost like when changing elevations, yet not exactly the same as that). They rang loudly for hours that day and have never fully stopped since that day. They wax and wane in intensity and duration but there is always a low-level ringing audible bilaterally. When they surge from soft to loud, it then becomes difficult to hear conversation, television, etc over it. After 30 minutes to two hours, it usually slowly fades back down to a soft background ringing once again. Previously in my life, never experienced this problem. No other new or recent medication changes for me at that time.
1175398	4/7/2021	TX	59	F	1/20/2021	1/23/2021	Left arm cellulitis x 2 weeks spreading to neck, scapula, and breast. Treated with Doxycycline x 2 weeks. Already reported. Drooping of right upper outer eyelid with visual changes. 4 days after vaccine. Recently diagnosed with Posterior Vitreous Detachment, no retinal detachment, tears, or holes. Could not explain the drooping.
1175365	4/7/2021	CA	50	F	4/5/2021	4/6/2021	On 4/5/21 I got nausea and chills for about an hour. I woke up on 4/6/21 and my right eye and all bone structure on the left side were very painful. It did get worse throughout the day. I woke up on 4/7/21 and the same symptoms with my face and eye but appear to be lessened. But as I am trying to fill out the form it is starting to hurt a little more. Slight swelling in the left eye.
1175348	4/7/2021	FL	73	F	3/24/2021	3/24/2021	Massive headache and blurry vision. Slight body aches and mild tiredness. I stayed in bed, drank water for 2 days starting at onset. No food until nearly 24 hours had passed. Headache remained but I had a slice of bread with peanut butter. I did not take Tylenol because I had read mixed messages that it would reduce the efficacy of the vaccine. Some messages said do not take Tylenol before vaccine and other messages said not to take Tylenol after vaccine. After 2 days, headache was more tolerable but it was not fully gone until after 4 days.

1175162	4/7/2021	NC	69	F	3/20/2021	3/21/2021	Vertigo; nausea; vomiting; diarrhea; loss of consciousness; inability to control limbs; unable to open eyes and focus; unable to open eyes and focus; This is a spontaneous report from a contactable consumer (patient). A 69-year-old female patient received BNT162B2 (BNT162B2, Solution for injection, lot number: EN6204), via an unspecified route of administration in the Left Arm on 20Mar2021 09:30 AM (received at the age of 69-years-old) at a single dose for COVID-19 immunization. The vaccine was administered at a Pharmacy or Drug Store. The patient did not receive any other vaccine within four weeks prior to receiving BNT162B2. The patient was not pregnant at the time of vaccination. Medical history included diabetes mellitus. She had no known allergies. The patient had no prior history of COVID-19. Concomitant medications included dulaglutide (TRULICITY), insulin degludec (TRESIBA), atorvastatin calcium trihydrate (ATORVASTATIN [ATORVASTATIN CALCIUM TRIHYDRATE]), hydrochlorothiazide (HYDROCHLOROTHIAZIDE), and losartan potassium (LOSARTIN). On 21Mar2021 07:30 AM, the patient experienced vertigo, nausea, vomiting, diarrhea, loss of consciousness, inability to control limbs, unable to open eyes and focus. The reported adverse events resulted in emergency room/department or urgent care and hospitalization. The patient was hospitalized for one day. Therapeutic measures were received as a result of reported adverse events; Medicine for nausea, CT scan, IV. Outcome of the events was recovering. The patient was tested for COVID post vaccination on 21Mar2021 through nasal swab with result of negative.
1175143	4/7/2021	FL	18	M	4/6/2021	4/6/2021	Client stated he experienced blurred vision following vaccine administration. Fire Rescue evaluated patient. Patient's symptoms subsided. Per Fire Rescue, no further evaluation needed. Client left at 1:22 pm.
1175139	4/7/2021	OH	47	F	3/31/2021	4/7/2021	One week after receiving vaccination patient woke up with swollen red eyes/puffy. No pain or itching. No other subsequent swelling at time of assessment over the phone. No other explanation to symptoms besides vaccine per patient. Patient referred to doctor for follow up and instructed to call 911 if a medical emergency.

1175021	4/7/2021	CA	52	F	3/6/2021	3/11/2021	cheek drooping, face hanging, lip pulling and eye won't close, lip twitch, headache; Nausea; rash chest, neck, full body; This spontaneous case was reported by a consumer and describes the occurrence of FACIAL PARALYSIS (cheek drooping, face hanging, lip pulling and eye won't close, lip twitch, headache) in a 52-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. unknown) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included No adverse event (No medical history reported). On 06-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 11-Mar-2021, the patient experienced RASH (rash chest, neck, full body). On 21-Mar-2021, the patient experienced NAUSEA (Nausea). On 25-Mar-2021, the patient experienced FACIAL PARALYSIS (cheek drooping, face hanging, lip pulling and eye won't close, lip twitch, headache) (seriousness criteria disability and medically significant). On 18-Mar-2021, RASH (rash chest, neck, full body) had resolved. On 27-Mar-2021, NAUSEA (Nausea) had resolved. At the time of the report, FACIAL PARALYSIS (cheek drooping, face hanging, lip pulling and eye won't close, lip twitch, headache) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Based on the current available information and temporal association between the use of the product and the start date of these events, a causal relationship cannot be excluded.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of these events, a causal relationship cannot be excluded.

1175225	4/7/2021	MA	47	F	3/24/2021	3/29/2021	24hrs after - tired and minimal tenderness where shot was administered. 4 days after - woke at 1am with itchy scalp, swollen ears and hives mostly upper body. Called Dr. and sent pictures and was told to take Benadryl. 5th day - woke to swollen eyes, upper lip and full body hives. Went to ER and was given IV, Benadryl and steroid and continued to take Benadryl and Prednisone for 5 day. Day 3 of Prednisone, hives had subsided.
1178103	4/7/2021	NY	43	F	3/28/2021	3/29/2021	At time of shot, felt stinging pain in the elbow and wrist of left arm, later 5 mins. At some point the next day, I developed Spinal pain. Pain in SI joins, several distinct spots along the spine and the base of my skull, spinal stiffness, difficulty touching knees or putting chin to chest. Lasted 2 days. Night of 3/29/2021, I woke up with tooth pain in multiple teeth on both upper and lower and right and left sides of mouth. Pain great enough to wake me up and caused difficulty returning to sleep, after 600 mg ibuprofen, able to get to sleep and completely gone in the am. Starting 3/30, pain along nerve paths in upper right side back around scapula, felt like burning, intermittent. Now resolved to tingling / numb feeling and some tingling / decreased sensation in upper lip left side and under eye left side
1177972	4/7/2021	NE	73	M	4/1/2021	4/4/2021	On late afternoon of 4/4/2021 spouse noticed slight paralysis on the right side of face (mouth) and sagging of check/neck. No other symptom was felt. On 4/5/2021 paralysis was still obvious and right eye was tearing. Still no other issues. On 4/6/2021 paralysis seems to interrupt chewing on right side. Went to emergency thinking maybe it was a slight stroke. Diagnosis was Bell palsy.

1178231	4/7/2021	IL	54	F	3/20/2021	3/20/2021	Within minutes of getting the shot I got a metal taste in my mouth and my mouth/lips/cheeks ON THE LEFT SIDE ONLY started getting numb. Paramedics took my blood pressure (usually normal) and it was very high (around 150/105). Paramedics monitored my blood pressure until it went back to normal (30-40 minutes), then I went home. The numbness got worse for 2-3 hours (eventually the area of my face around my left eye also got numb). Then the numbness started to slowly fade and it was totally gone in 48 hours.
1178229	4/7/2021	MN	32	M	4/7/2021	4/7/2021	Vasovagal syncope - occurred about 3-5 minutes after administration. Patient slouched in chair, eyes rolled back slightly and patient was snoring. Patient was guided to the floor by pharmacist and significant other and regained consciousness after just a few moments. Patient was unaware of what happened. Patient was given water and remained lying on the floor for a few minutes and then was able to sit up and recover.
1178219	4/7/2021	CO	67	F	4/2/2021	4/3/2021	At 1 AM on 4/3/21, I got up to take some Tylenol since I woke up feeling like I had a temperature. I walked to the kitchen (which isn't very far) and had an extreme feeling of overwhelming weakness and fainted. (only fainted one other time in my life). I hit my head and eye and now have bruising from my hairline and down my cheek on my right side. My eye and eye lid are black and blue. I had 101 temp and chills and body aches. Immediately starting vomiting and had diarrhea for 6 hours. Had a temp of 100 the whole day of 4/3/21. Then 99.5 on 4/4 and 4/5/21 and still tired and achy. By 4/6, I felt better. Although my symptoms were just a few days, I would have never taken the second Moderna shot, in hindsight. In fact, lots of people I know have had strong reactions to the second Moderna vaccine. I have to say I have never gotten so sick so fast in my life. No way to fight it - I felt took weak and vulnerable.

1178213	4/7/2021	TN	64	F	2/23/2021	2/23/2021	Within 45 secs to 2 mins of receiving the Pfizer vaccine #1, patient (myself) experienced tingling in Lt. eye then swelling in Lt. eye lids, lt. cheek, lt. corner mouth which progressed. This was witnessed by the team giving vaccine and later on by EMT on the scene. Post feeling dizzy along with swelling the EMT person had me leave my car & placed me on litter in ambulance waiting in parking lot. Within 5 -6 mins. of the shot, I then felt severe HA, and swelling in my throat. EMT immediately started IV - gave IV Benadryl, then gave 1 shot of Epinephrine. Called EMT which took me via ambulance to hospital. There EM MD assess then gave me Solumedrol IV push & admitted me to ED OBS formally. Felt better but then few hours later all symptoms returned along with severe pain in hand with red palms & cyanotic finger tips. ED MD treated me again with higher dose of Benadryl & add Prilosec for potentiation of Benadryl and observed me. Felt better after several more hours. Was discharged on 50 mg Prednisone X 5 days & prescription for Epinephrine pen. Followed up w/PCP couple days later.
1178202	4/7/2021		33	F	4/7/2021	4/7/2021	Female patient received her covid-19 Janssen and approximately less than 10 minutes after, she had a panic episode. She fell off of her chair onto her left shoulder. Pharmacist was there immediately trying to assist her. Her eyes were open but patient was unresponsive. Approximately, 10-15 seconds later she came back to it and tried to get up. I asked her to stay down and relax. patient was asked if she was aware of where she was and time and she responded properly. Then she mentioned she has had panic attacks previously. Emergency services was notified immediately and Market director. Patients vitals were taken and her blood pressure started at 135/95 mmHg 85 hr. 5 minutes later her vitals were done to 127/87 mmHg 82 hr. By the time, emergency services arrived she was sitting done on her chair and feeling much better. She refused Emergency services. She sat in the observation room for 20 minutes after and was checked on by the pharmacist. She was stable and in good spirit when she left.

1178045	4/7/2021	MN	24	F	4/7/2021	4/7/2021	Patient received her Janssen COVID vaccine and was sitting in a chair in the conference room when she slumped over in her chair and became unresponsive. Patient had just received her one dose Janssen vaccine and was sitting in a chair approximately 3-5 minutes after receiving the vaccine. She began to slump over in her chair and was unresponsive. Two RNs responded to assess the patient. Patients feet were elevated and ice packs applied to her neck and axillary areas. Patient was breathing and had a pulse. Patient responded to her name once and then passed out again. Patient was unable to respond after this. Her eyes were open. Patient was lifted into a wheelchair by three nurses and brought to a private area. Patient was warm and sweat was running down her face. Her sweater was removed and ice packs again were applied to her neck and axillary area. Patient continued to have a pulse and was breathing. EMS was called. Patient slowly began to come around and could answer questions after about 5 minutes of being unresponsive. She was confused and had no memory of what had occurred. She reported feeling light headed and seeing spots in her vision. She continued to feel light headed. EMS assessed patient. Vitals were stable and blood sugar was WDL. Patient reported feeling much better. She denied feeling light headed or dizzy any longer. She was able to answer all questions asked. Patient did not want to go to the hospital and refused transport to the hospital via ambulance. She was observed for an additional 20-30 minutes at which time her boss arrived to pick her up. She was educated on calling 911 if she began to feel light headed or dizzy again. Patient verbalized understanding. She was walked to the car by an RN.

1178138	4/7/2021	TN	74	F	4/6/2021	4/6/2021	Instructed patient to wait 30 minutes due to previous history of allergic reaction of penicillin. Patient waited 30 min period with no apparent symptoms. Pt was asked if she was ok, pt stated she was. Patient was then instructed she could leave. Pt then returned in approximately 15 minutes and stated that when she removed her mask she noticed that her nose and around here eyes were red and possibly swollen. She removed her mask for immunizer and it was noticed that her cheeks nose and lips did appear to be red and possibly swollen. She stated that her nose felt tingly and her mouth and lips felt tight, but did not complain of a swollen tongue. Immunizer administered 50mg of liquid diphenhydramine . Pt also given one dose of Famotidine 40mg. Took blood pressure and found it to be elevated to around 200/90 with pulse rate of 65 bpm. Instructed the patient that we would need to call medics to come check her out. She begged immunizer not to call due to the anxiety it would cause her husband who has , possibly, some issues understanding. Pt was monitored for approximately with epipen on standby for approximately two hours by pharmacist immunizer. Patient began to feel better redness and and puffiness subsided patient went home. Pt returned on 4/7/21 with normal blood pressure and no issues. Pt state BP was high due to fear of going to hospital.
1178671	4/7/2021	MS	40	M	3/13/2021	3/17/2021	Onset of all symptoms began on March 17, 2021. Symptom (1) Dry mouth: symptoms are still active; (2) Extreme thirst: symptoms are still active; At the minimum, I consume 366 fluid ounces (2.859 gallons) of water per day. 1175368	4/7/2021	TN	83	F	1/18/2021	1/24/2021	Moderna vaccine #1 administered on 1/18/21 Adverse event observed 1/24/21 @ 1am: soft tissue swelling eyelids, cheeks, lips. No swelling of gums, tongue or throat. Severity: Moderate. No airway obstruction. Severe itching of eyelids, face. Interference with speech due to swelling. treated with OTC diphenhydramine 25 mg oral every 6 hours. Adverse event lasted 72 hours. Moderna vaccine #2 administered 2/22/21 Adverse event observed 3/2/21 @ 1am: severe edema peri-orbital tissue, intense redness peri-orbital tissue; intense itching of eyelids. Skin changes over few days to "lizard skin". Chronic redness, itching, swelling, texture changes; Scheduled for dermatologist tomorrow, 4/7/21. Approximate length of time adverse reaction has existed > 30 days.
1176986	4/7/2021	PA	30	M	4/7/2021	4/7/2021	Patient arrives to observation at 14:15 following feeling lightheaded, having tunnel vision, feeling tingly, and sweaty after receiving the vaccination. BP 111/64 HR 61 oxygen sat 99% on room air. She was given some graham crackers and water. 14:25 BP 127/73 HR 75 Pulse oxygen 97% on room air. patient stated he feels better and was escorted to the exit in a wheelchair
1178912	4/7/2021	WA	53	F	4/4/2021	4/5/2021	Woken up in the middle of the night with a pounding fast heart beat aprox 14 hrs after injection. Other symptoms that were not as serious for the next day were a left side armpit lymph node with swelling and pain, soreness at injection site, chills, head swimming, eye puss , and intermittent nausea.
1178888	4/7/2021	CA	34	F	4/7/2021	4/7/2021	About 25 minutes after receiving the shot, I suddenly felt weak and dizzy. My vision started to go dark. I broke out into a cold sweat all over my body and could barely see anything or move my body and I felt very nauseous. I was nearly unconscious and barely able to talk. This lasted for about 20 minutes and then slowly started to recede after that. I felt able to stand after about 40 minutes, and was eventually able to walk out of the store and be driven home. I am very very healthy and have no major medical conditions.

1178884	4/7/2021	MI	37	F	3/25/2021	3/26/2021	Woke up at 2am and felt dizzy, passed out, when I came to I was dizzy every time I opened my eyes I was spinning counter clockwise for the next 6hrs. Now (2 weeks later) I get dizzy every time I move too fast and I have a constant ringing in my ears.
1178882	4/7/2021	NY	46	F	3/1/2021	3/17/2021	About 2 weeks after the second dose, i started to get hives and swollen areas. They come out almost every day still. I went maybe 4 days without this happening in the last 3 weeks otherwise it's like every day. My eyes, bottom lip and side of mouth have swollen like a was having a bad allergic reaction to a bee sting. No itching. And my arms legs and breasts have all gotten very itchy hives multiple times.
1178867	4/7/2021	CA	49	F	3/27/2021	3/28/2021	Rash along jawline on face. Rash above left eye, rash on upper back
1178866	4/7/2021	CA	63	F	4/2/2021	4/4/2021	I had a horrible, lengthy Charley Horse cramp (on my right leg), followed by stomach pains, dizziness, diarrhea, fever, sweats, blurry vision, nausea, then I fainted/collapsed. When I came to, I was disoriented, had more diarrhea, chills, followed by my second Charley Horse cramp, this time on my left leg. When I woke after a few hours of sleep, I was tired, weak and had a slight headache but generally felt ok. By Tuesday, other than little/mild muscle aches, I'm back to normal.
1178853	4/7/2021	MN	40	M	4/7/2021	4/7/2021	Approximately seven minutes after the patient received the Janssen COVID vaccine, he had called out to his wife/pharmacy technician at the pharmacy stating he did not feel well. His head had fallen back and his eyes were starting to roll back into his head. Patient had saliva starting to foam at the corner of his mouth and it appeared to be the onset of a mild seizure (per wife, patient has had seizure once before after a head injury) and he was turning very pale. Patient seemed to be unresponsive at that time - not answering to questions. At this point, one of the pharmacists ran to the clinic to get help and the other pharmacist administered an Epi-pen to patient's thigh. Patient immediately came around after the injection, looked up and began talking. Staff called 911 and patient was monitored by pharmacy and clinic staff. When the paramedics arrived, the patient was doing better and was able to ride home with his wife.

1178845	4/7/2021	FL	37	F	4/2/2021	4/2/2021	Received 2nd dose on 4/2/21 at 12:15 pm. By 6 pm, I was absolutely exhausted. Woke up next day (Saturday at NOON, which is not like me after having very vivid dreams is someone in my past. Felt like I had been run over by a semi truck. Had body coaches and couldn't stop sweating. Finally took Motrin around 2 or 3 pm. An hour later my temperature was 99.3 F. By 7pm I had to take more Motrin because my temperature was 99.3 again. By 8 pm, I almost fell over walking to the kitchen to warm up soup. Sunday, did not trust myself to drive to my mothers for breakfast. Freezing cold all day. No shiver just cold. Temperature was 97.3 all day. Monday and Tuesday, 4/5 and 4/6 I had a splitting migraine which felt like I had alternating pouring from a hammer or an axe. Tuesday woke up with what felt like my head was split open. Severe pain behind my eyes and the entire head. Stiffness in my neck, especially left side and down the left shoulder. Slight lingering headache on Wednesday 4/7
1178812	4/7/2021	NY	62	F	3/11/2021	3/11/2021	Stroke symptoms, double vision, numbness of lips, tongue , mouth and gums. General weakness, shaking and confusion. Symptoms began receding after 20 minutes. As EMS arrived

1178580	4/7/2021	IN	25	M	4/7/2021	4/7/2021	Patient stated they didn't feel well at all and was sweating. I told him I should give him an Epi Pen, but he preferred receiving generic Benadryl. At approximately 12:50pm he was given 50mg of diphenhydramine since he wasn't having any swelling to inhibit swallowing. He drank half the bottle of water. He stated his vision was spotty, but getting better. I told him we should give him the epi pen and call 911. He asked us to call girlfriend to let her know he wasn't feeling well. After another few minutes he stated his vision was getting better and feeling much better. At 1:12 we took his blood pressure 102/67 pulse of 47. He stated the pressure and pulse were normal for him since he is a runner. (He had run a marathon the previous weekend). He was monitored for 30 minutes. After the 30 minutes, he felt fairly normal and was going to be with someone the rest of the day working at home. He was given more benadryl and advised to seek emergency medical attention if symptoms returned and were worse. Around 7:30pm I called to check on him. He had taken another dose of benadryl 50mg. He still felt comfortable not seeking er attention since he was going to be with friends the rest of the evening and night.
1178643	4/7/2021	CA	66	M	4/7/2021	4/7/2021	3 min after vaccination, pt complained of blurry vision. endorsed tingling down his back and arms. felt he was getting very hot. itching down back of his head into his arms. reported pain in his throat, difficulty swallowing, felt like something was stuck in his throat. felt he had an upset stomach but did not think he was going to vomit. denied trouble breathing in his chest. no lip swelling, no eyelid swelling, no hives. pulse regular. 74. BP 150/70. O2 sat 98%. 0.3mg Epi given to right thigh at 1432. pt complained he still had globus, still had blurry vision, itchiness and was feeling even hotter. BP 180/90 at 1435. reported "hammer to his head" headache at 1437. cotnined blurry vision and globus. BP 172/94 at 1438. 0.3mg Epi given to left thigh at 1438. 1440 pt getting very shaky, handoff given to ambulance.
1178627	4/7/2021	NY	16	M	4/4/2021	4/4/2021	About 5 minutes after shot he said arm is tingling then fell off chair and hit the floor. He passed out for a couple of minutes and then opened eyes and said my throat is closing up. The EMS gave Benadryl and used the Epi Pen. He was transported by ambulance to the hospital.

1177178	4/7/2021	TX	77	F	3/30/2021	4/1/2021	I started feeling weird in my head, terrible ringing in my ears like 10x's worse than normal, spaced out that I can hardly function, dizziness, misplacing things, disoriented, left eye twitching, vision is more blurry than normal. (patient stated she didn't know if she can live like this because it makes her want to take her life)
1177147	4/7/2021	ID	75	F	3/1/2021	3/16/2021	Rosacea became violent since 2nd vaccine. Heat, pain, covering forehead, nose and cheeks with blisters. Spreading to side of face and close to eyes.
1177143	4/7/2021	RI	68	M	2/19/2021	3/31/2021	About a month after my second Pfizer inoculation I awoke one morning with almost no vision in my right eye. I was diagnosed April 1 with a blood clot in my retina that has changed my vision from 20/30 in that eye to 20/125. My left eye remains 20/20. I'm in excellent health and never had any kind of clot or eye issue. The traditional causes of Retinal Vein Occlusion don't pertain to me - no heart trouble, high blood pressure or diabetes. I'm thin and physically active, never smoked, drank or used drugs.
1177111	4/7/2021	PA	40	M	4/7/2021	4/7/2021	Patient was witnessed on the ground following his vaccination. He has a loss of consciousness for about 30 seconds. we arrived to find the patient pale diaphoretic with abrasions on his left side of his face and his eye glasses broken. he was placed on the back board and taken to observation area two. He is currently alert and oriented and by 3. BP 133/90, HR 85, Resp 20, oxygen sat 100 on room air. once in the observation area patient removed from the backboard. he is sitting up on the bed and calling his significant other. He was given apple juice and crackers. he states he his feeling better. The medical team at this time is encouraging the patient to be seen in the emergency department due to the the unwitnessed fall from seating position and the fact that he had a positive loss of consciousness. Pt is not wanting to go to the ED due to the fact that he has bad insurance and currently unemployed. 12:50 Bp 138/86 HR 87 Resp18 Oxygen sat 100: on room air patient is feeling better however we are concerned about his LOC and wanting him to be evaluated. His partner arrived BP 133/87 pulse oxygen 100 HR 76. Once he was here he convinced pt to go to the ED. EMS was called and arrived to take patient to the ED at 1343

1177084	4/7/2021	ME	67	F	4/7/2021	4/7/2021	Immediate itchy eyes, tearing, and generalized pruritus. No injection, rash or any other symptoms.
1177043	4/7/2021	CA	34	M	4/5/2021	4/6/2021	Sore left arm, muscle soreness, fatigue waking up the next day. Around 24 hrs after vaccination, headache started, and lasted for ~8 hours. I took some advil around an hour before the headache stopped (really wish I'd taken it when I first felt the headache). I could feel the muscle soreness go away before the headache did. The headache felt like it moved from behind my eyes to the back of my head. I decided to only eat bits and pieces of stuff when I was feeling my worst because I was concerned that would make me feel nauseated (never did feel that way, so no idea if that made a difference). I drank probably 200oz of liquid throughout the day, but still felt dehydrated, even though I wasn't sweating. Did pee a lot though. Generally it was what I expected, but a friend who works at a hospital said I should report the info.
1177013	4/7/2021	MA	47	F	3/30/2021	3/31/2021	Swollen arm, red arm, headaches, nausea, chills, fever all within 24 hours. Two days later heliotrope rash around eyes, lesion on left hard palate in mouth, additional rash on face and neck, continued nausea and chills. Heliotrope rash lasted one day. Overall, sick for 7 days.

1177951	4/7/2021	IL	55	M		3/28/2021	DIARRHEA; NAUSEA; This spontaneous report received from a patient concerned a 55 year old male. The patient's weight was 390 pounds, and height was 68 inches. The patient's past medical history included benign cranial pherengioma, legally blind, history of multiple shunt revision., sigmoid colostomy, rectal fissure, and neoplasm of unspecified nature of brain, and concurrent conditions included latex allergy, allergy to strawberry, non alcohol user, non smoker, and non drug user. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, intramuscular) dose, start therapy date were not reported for prophylactic vaccination at right deltoid on approximately 26/Mar/2021. The batch number was not reported and has been requested. Concomitant medications included phenoxymethylpenicillin potassium. On 28-MAR-2021, the subject experienced diarrhea. On 28-MAR-2021, the subject experienced nausea. Laboratory data included: Blood test (NR: not provided) Negative for C-Diff, and Stool culture (NR: not provided) Negative for C-Diff. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from diarrhea, and nausea on 29-MAR-2021. This report was non-serious.; Sender's Comments: V0: Medical assessment comment not required as per standard procedure, since case assessed as non serious
1178604	4/7/2021	CT	55	M	3/22/2021	3/22/2021	About 30 seconds after receiving my injection I started to feel dizzy, nauseous, blurry vision and a few minutes later my lips and fingertips became tingly and numb. My cousin let an attendant know and they sent a Paramedic over to our vehicle. The Paramedic took my vitals (which I believe were all normal) and gave me a bag in case I needed to vomit. I started to feel a little better about 20 minutes after the injection and chose to go home and rest rather than go to the hospital. The 2nd day my arm hurt where to injection was given, I had a headache and was still a bit nauseous although I never did vomit. I still did not feel 100% on the 3rd and 4th day and better on the 5th day.
1177030	4/7/2021	DE	59	F	4/3/2021	4/6/2021	Extremely sore arm. Tuesday 3:00AM woke up with diarrhea, chills then sweats feeling like I was going to throw up. Slept the whole next day and night, couldn't keep my eyes open.

1171849	4/6/2021	ME	34	F	3/8/2021	3/28/2021	3/28/21 STARTED WITH HEADACHE - INCREASING IN SEVERITY ON 3/29/21, WITH PAIN BEHIND THE LEFT EYE. WENT TO ED ON 3/30/21 FOR BLURRED VISION IN LEFT EYE. TREATED FOR MIGRAINE, DISCHARGED. WENT TO HER OPHTHALMOLOGIST, DIAGNOSED WITH LEFT OPTIC NEURITIS. RETURNED TO ED FOR MRI OF BRAIN AND OPTIC NERVES, DIAGNOSIS CONFIRMED. TREATED WITH IV SOLUMEDROL AND ORAL MEDROL. PATIENT'S 7 MONTH OLD DAUGHTER AT SAME TIME DIAGNOSED WITH CROUP (VIRAL ETIOLOGY NOT IDENTIFIED). PATIENT IMPROVING POST STEROIDS.
1171776	4/6/2021	NY	16	F	4/6/2021	4/6/2021	Patient is a 16yo seen for her first dose of the COVID-19 vaccine. She was seated in the back seat of the car. Shortly after receiving her vaccine (within a few minutes), she chose to move to the front passenger seat of the car, and after sitting in the passenger seat she became lightheaded and lost consciousness. Syncopal event was witnessed and lasted a few seconds. She spontaneously regained consciousness, and complained of some lightheadedness and tunnel vision. No significant confusion was noted, her responses to questions were appropriate. Initial pulse was thready and heart rate initially difficult to auscultate. Pale color noted on the face. Initial pulse approximately 50bpm. Breath sounds clear with good air exchange. Patient was placed in a reclined position with feet on the dash. She quickly recovered and repeat heart rate was auscultated at approximately 70bpm, stronger pulse noted. She was noted to have improvement and she was then driven out of the vaccine site after obtaining consent from her mother (who was the driver) and parked beside EMS. BP was 100/50 and HR 68-72, SaO2 97%. Lightheadedness resolved and she was feeling well, at her baseline. She was monitored for 30 min then allowed to leave with her mother, she was at her baseline at last evaluation. Per history review with her mother, she has had 2 prior episodes of syncope with pin removal from hand after surgery and IV placement.

1171793	4/6/2021	IA	39	F	4/5/2021	4/5/2021	Light headed, runny nose, sore throat, tiredness, watery eyes. Started to get a sore throat about 11 pm on 4/5 and by the time I woke up at about 6:30 am on 4/6 turned into "cold-like" symptoms. Seems to be getting worse throughout the day.
1171725	4/6/2021	CA	66	F	2/12/2021	2/12/2021	I had the same arm issues, along with an unusual feeling in my head. My BP was higher than it's ever been at 184/88. I started seeing a gray area in the eye where I had my surgery and the doctor discovered that my retina was detached. I also had a red, blotchy area on my face. He said the increased BP could've caused it. I had to undergo surgery twice after that. They reattached it, but I had scar tissue so it became detached again. They're waiting for it to stop creating scar tissue before they try again.
1171692	4/6/2021	CT	58	F	3/20/2021	3/21/2021	Received the vaccine in Left Arm on Saturday, March 20, 2021 at Mall . Slight medicinal taste after receiving shot. No pain at injection site. Sunday, March 21, 2021 woke with a feeling of numbness in lower lip on left side only and a feeling of numbness (or heaviness) in the left eye. Later in the day fever. Overnight - fever accompanied by joint pain. Monday morning (03/22/21) all symptoms subsided except for the numbness in left lower lip and left eye. Tuesday, 03/23/21, Red "Covid Arm" rash on Left upper arm around injection site. (NO PAIN or ITCHING). To date (04/06/21) I am still experiencing numbness in my left lower lip and a "heaviness/numbness" in my left eye. I am scheduled to see a GENERAL PRACTITIONER I have a NEW PATIENT appointment on Thursday, April 22nd @ 9:30. I am concerned about having the 2nd shot on Saturday, April 17.
1171604	4/6/2021	IL	26	F	3/10/2021	3/26/2021	Increased reactions to existing allergies. The skin around my eyes became very inflamed and my skin has been non-stop itchy for 24 hrs. all over my body. My skin gets hives as well. I have never had allergic reactions like this in the past to any of my allergens. Normally, I would take Allegra and this would help my allergies (I have done this for years). Now even Allegra doesn't help anymore all of a sudden. My allergist told me to increase my dosage of Allegra and start taking Pepcid to help control the itching.

1172338	4/6/2021	GA	38	F	4/6/2021	4/6/2021	Patient stated she was extremely nervous prior to getting her vaccine. She grabbed her husband's arm to ensure he was close by. She was fine while the vaccine was being administered at approximately 1:00pm. A few minutes later, approximately 1:03pm, she appeared to pass out. Her husband stated this reaction is normal. He then mentioned that she has a history of passing out and tends to drift off for 15-30 minutes. She would come and go saying she was tired and that she wanted to go to sleep. I repeatedly asked her to open her eyes and tell me her name. The patient did not respond. I checked her breathing which was normal, she was not having any difficulty breathing. I looked for other symptoms of allergic reaction but couldn't find any. This continued for about 20-30 minutes and then the husband stated she has never been in this state for this long. I reached out to my store manager to ask him to call the paramedics. The patient opened her eyes for a few minutes but then would return to her unresponsive state. After the paramedics arrived, she vomited a small amount of liquid into a trash can. She ultimately was taken out of the store on a stretcher with the paramedics by her side.

1171871	4/6/2021	TX	50	F	2/5/2021	2/7/2021	Starting about 2 1/2 days after the first dose I had aches, significant fatigue, nausea, some subjective fever and slight chills. All of this last 12 days. About 1 week into symptoms also noted some mild shortness of breath and cough. All eventually resolved after 12 days with the nausea being the last symptom to resolve. With the second dose, I felt fine aside from a large red, tender knot on my arm. About 4 weeks later started developing several sizeable pink, indurated areas which did not hurt or itch. the first 3 happened to be in surgical scars- one on right calf, one on left anterior thigh and largest one on right wrist which was 3-4 inches long and felt maybe 1/2-1 inch deep. Then developed similar on right lower eyelid. I did not have a previous scar here. Last to develop was on left upper eyelid and felt shaped more like a BB. At this point, I asked opinion of one of my partners (we are family medicine physicians) and he agreed that it seemed like a reaction to something. I started taking some ibuprofen for anti-inflammatory symptoms and then took prednisone 20 mg daily for 5 days which did seem to help them resolve, however I still have small palpable areas on right leg and wrist. I have never had an adverse reaction to another medication or vaccine. My vaccines are all current and the last time I was sick enough to miss work was 2004, so I didn't have any other obvious explanation for this.
1172390	4/6/2021		64	F	3/23/2021	3/30/2021	One week subsequent to vaccine, eye stye in left eye. On 13th day, eye stye in right eye. Blurred vision in both eyes, itchy eyes. Watery nose- need to blow nose regularly.

1171029	4/6/2021	WI	22	F	3/9/2021	3/9/2021	I received the first dose of the Pfizer vaccine at 9:15 AM on March 9, 2021. I then returned to work. At about 4:30 PM on that same day, I started feeling dizzy. I felt like I was going to faint at work. Every time I would stand up, I would feel like I was going to pass out. I had someone drive me home because I felt that I was too dizzy to drive. I arrived home at 6:00 PM and began to vomit profusely. I threw up all night and had the chills. In the morning, I felt better but still had a dizzy feeling. The dizziness and vomiting completely subsided by March 11, 2021. On March 12, 2021, I noticed that I had floating black spots in my left eye accompanied by a painful migraine. I have never had eye floaters or migraines previous to this vaccine. My migraine lasted for 5 days straight and I had to be off work to go to the emergency room because I started to loose vision in my left eye. They were unsure of the cause because I did not have any pre-existing health conditions. The migraine finally subsided after the 7th day. I have had eye floaters every since I got the vaccine. I?ve been to an eye doctor and my primary and they all have told me that it could be from this vaccine because I have never had the problem until I received it.

1171145	4/6/2021	MI	63	M	3/9/2021	3/20/2021	<p>DETAILS OF HOSPITAL STAY: PRESENTING PROBLEM: Stroke-like symptoms [R29.90] HOSPITAL COURSE: A 63 y.o. male who presented with chief complaint of left facial droop, left forehead droop and slurred speech. Patient reports his symptoms started on Saturday and failed to improve. He contacted his PCP and he was recommended to go to the ER for evaluation. Patient had his COVID-19 vaccine-1st dose 2 weeks prior and was concerned that he might be having 1 of the rare side effects from the vaccine. On admission patient had normal vitals. His labs were within normal limits. Patient's presentation was discussed with Neurology who recommended admission for stroke workup given his comorbidities-hypertension, hyperlipidemia, diabetes and obesity. Patient received 1 dose of prednisone 80 mg in the emergency department for treatment of Bell's palsy (patient's symptoms more consistent with Bell's palsy presentation). Patient was admitted to medicine service for workup of stroke with MRI brain without contrast and monitoring for any worsening of neurological symptoms. Patient's CT head on admission was negative for any acute abnormality. CTA head and neck showed near occlusion of intracranial left vertebral artery. MRI brain without contrast was negative for acute infarct. Patient's facial paralysis slightly improved with 1 dose of 80 mg prednisone. Patient's presentation was consistent with Bell's palsy. Patient worked with PT OT and speech therapy and was recommended outpatient physical therapy and speech therapy. He was discharged home in stable condition on oral prednisone 80 mg daily for 7 days and valacyclovir 1000 mg 3 times a day for 7 days. Patient was recommended to follow-up with Ophthalmology as outpatient for possible left eye patch if his symptoms fail to improve. Patient's Lipitor dose was increased to 40 mg daily from 10 mg daily due to finding of atherosclerotic changes on CT head and neck. Active Issues Requiring Follow-up Issue: Bell's palsy and abnormal finding on CT head and neck. Recommended follow-up provider/specialty: PCP What is needed: 1. Referral to Ophthalmology for an eye patch if symptoms fail to improve. 2. Referral to neurovascular surgery for CT head and neck findings. 63-year-old male with history of hypertension, hyperlipidemia and diabetes mellitus admitted for workup of stroke-like</p>

1173782	4/6/2021	IN	28	F	4/1/2021	4/2/2021	I awoke at 6:45 a.m. feeling a bit sore in my arm, but relatively okay. I was up for approximately ten minutes and then extended my arms over my head to stretch out some of the achiness and immediately regretted the action. I began to feel dizzy and nauseous and saw black spots encroaching on my peripheral vision. I washed my face to relieve some discomfort with no change. I walked toward the bedroom to grab my glass of water when the black spots increased, clouded my entire vision, and I collapsed on the bed. I then began to hyper-salivate and after waking my husband and catching my breath, I returned to bathroom, experienced diarrhea, and simultaneously vomited into the trash can. The vomit tasted chemical and extremely acidic. My body was also shaking uncontrollably during this time and I kept switching between chills and being too hot. After I felt comfortable leaving the bathroom, I crawled back in bed but was shaking so much that I couldn't stop my teeth from chattering and could not get warm no matter that my husband placed an extra blanket over me. I had taken my temperature before while I was in the bathroom and it read 94.6 degrees Fahrenheit. I took it again in bed about twenty minutes later and it read 99.4 degrees Fahrenheit. My head was splitting and my arm ached, but I was eventually able to go back to sleep. I felt better after sleeping for a few hours and drinking more fluids.

1173943	4/6/2021	TX	25	F	3/8/2021	3/9/2021	The morning after I got the vaccine, I felt very tired. Within two hours of waking up, I felt body aches all over. After another hour or two, I felt a massive headache behind my eyes and around my head. It felt like I was hit with a brick. I also felt nauseous on and off. On March 10th, two days after the shot, I woke up around 6am soaking wet in sweat. My hair, clothes and blankets were drenched in sweat. The bodyaches and nausea were gone by this date. The headache lasted a whole week.
1173752	4/6/2021	NC	22	F	4/6/2021	4/6/2021	Patient received Covid 19 Janssen vaccine, about 10 minutes after administration patient started to get really hot. We applied cold clothes to the neck and head and patient felt like she was going to vomit so we also gave her a bag just in case she got sick. She started looking very pale so we layed patient on floor. She started to panic that she wasn't going to go to work and eyes were rolling in the back of head. Called 911 for patient and I stayed with patient, I took her blood pressure which was normal. Patient became fully alert again and stated she was feeling a little better. The ems checked her blood pressure and blood sugar and released the patient.

1173998	4/6/2021	CA	46	F	4/6/2021	4/6/2021	Client received 2nd Moderna COVID vaccine (lot # 026B21A and expiration date 4/29/21) at 9:37AM. Nurse administered vaccine and after she walked client over to observation station and gave report to EMTs. PHN asked RN after she returned why client was walked over and RN informed lead of history of reaction to first moderna. PHN went to observation room, EMT had taken baseline vitals when she arrived at 942: blood pressure 126/82, pulse 84, oxygen 94%. PHN spoke with client who stated at this time feeling well. Per client first dose was given at location, client stated headache , throat itchiness, metal taste, flushing, blurry vision, and high blood pressure. That time she was given Benadryl and stayed 2hrs post vaccine for monitoring. Per client had spoken with primary doctor who recommended she still receive second dose. EMTs stayed with client. At 1002 client informed EMTs of flushed feeling and metallic taste. PHN informed and joined EMTs. Vitals: blood pressure 116/70, pulse 85, oxygen 97%. Client stated same symptoms as last time returning. Alert and oriented. Client denied shortness of breath. Face and hands flushed. PHN offered client Benadryl and client accepted, wanted PO only. Benadryl 50mg given PO. Client's sister was present, client was not driving. Allergies to Vit B. Medical history of hypertension, client did not take medication this morning. Vitals 1016: blood pressure 124/88, pulse 92, oxygen 98%. Client stated headache to frontal are, metallic taste, flushing in face and hands. 1021 vitals: blood pressure: 120/78, pulse 85, oxygen 98%. Client stated symptoms improving. Face flushing improving. Client alert and oriented. At 1026 client stated feeling hands were swelling, specifically right index finger. Client able to move hands, denied pain or tingling. Vitals: blood pressure: 116/78, pulse 85, oxygen 98%. At 1030 client wanted to use restroom, sister and EMT accompanied client. Client walked with steady gait there are back. After sitting down client stated feeling dizzy again. Vitals 1034: blood pressure: 126/82, pulse 80, oxygen 97%. No headache, no metallic taste, right index finger swollen and palms flushed. Client stated feeling tired. 1039 vitals: blood pressure: 120/80, pulse 79, oxygen 98%. 1044 vitals: blood pressure 122/80, pulse 81, oxygen 98%. Symptoms improved, swelling of right had same. Vitals 1053: blood pressure 124/82, pulse 82, oxygen 98%. Vitals 1109: blood

1173769	4/6/2021	CA	24	F	4/6/2021	4/6/2021	Client complained of complained of flushed face, swelling to hands, headache, vision changes and dizziness after receiving Janssen Covid vaccine (lot 1808980 exp 6/20/21). Client was walking out of waiting room and approached the PHN to inform she was not feeling well. Client assisted to closest chair, EMT joined in and started vitals as PHN did assessment. Per client started feeling mild symptoms after 5mins and by 15 mins symptoms had progressed. Client did not alert anyone until her time was done and she began to walk at 1125. Client alert and oriented, flushed face, mild diaphoresis, per client spots in vision, swelling to hands, left hand more, and headache. Client denied shortness of breath, chest pain. History of allergy to penicillin. No other pertinent medical history. Vitals 1125: blood pressure 140/98, pulse 99, oxygen 100%. Client transfered to gravity chair and given water. Client wanted to call husband to come pick her up. 1134: pulse 97, oxygen 98%. Client stated pressure behind eyes. PHN offered client benadryl, flushed face continued, headache, swelling to hands. Client accepted as husband was on his way. Benadryl 50mg PO given at 1137. Vitals 1139: blood pressure 150/90, pulse 95, oxygen 98%. Per client dizzy, felt warm across face, headache, pressure around eyes, swelling on hands and flushed face. Client denied shortness of breath. Client asked if she wanted 911 to be called for further assessment, client denied, she stated she would continue waiting. Vitals 1144: blood pressure 130/90, pulse 97, oxygen 90. Per client headache gone, no flushing, felt tired. 1148 swelling on hands was improving. Vitals 1152: blood pressure 110/80, pulse 89, oxygen 96%. No headache, just pressure on forehead, no flushing, blurry vision improving. Vitals 1157: blood pressure 126/90, pulse 90, oxygen 97%. Per client all symptoms improving. Wanted to sit straight on chair. Client stated felt well enough to go home. Pressure on head was only symptom at this time. Client given ER precautions. Husband was going to driver her home. Last vitals at 1205: blood pressure 120/90, pulse 86, oxygen 97%. Alert and oriented, stood up with no complaints of dizziness. Client walked out of facility with steady gait

1174158	4/6/2021	MD	59	F	4/5/2021	4/5/2021	5 min- blurred/wavy vision 10 min- lightheaded 15min - body shakes, stiffened and painful spine. Over next hour, went through 10 min waves of feeling hot and cold. 30 min- given 25mg Benadryl; no effect At 45 min- Pharmacy called 911. Taken to hospital/ER.
1174153	4/6/2021	PA	59	F	4/5/2021	4/5/2021	Injection at 9:55 am. Itchy eyes and root of mouth started 15 minutes after injection. I waited for an additional 15 minutes at facility and the symptoms went away on their own. At 12 noon at home malaise set in. I rested off and on for the remainder of the day. At 4 pm, pain and swelling in right arm. No treatment. Also, at the same time pain in vaginal area started. Pain remained for remainder of the evening and night. The next morning the pain had lessened some, however not totally. I can not think of any cause for the vaginal pain, just that it started several hours after vaccine was administered.
1174135	4/6/2021	PA	38	F	3/11/2021	3/11/2021	Pt came to my office (urgent care-type setting) 4/6/21 for possible adverse event following COVID vaccine. No active symptoms at time of exam. She wanted guidance regarding whether she should receive her second COVID vaccine scheduled in 2 days. She reports she received her 1st Moderna COVID-19 vaccine on 3/11/21. about 2 hours later felt like right side of face was puffy/droopy but was not visibly droopy. She did not report this symptom to any healthcare provider or VAERS at the time and did not seek any treatment. Symptoms went away 2 weeks later. This past week felt it again but went away. Last week left eye felt like it was moving and caused transient visual disturbance. Did not have a headache at that time. Shut eye and went back to normal. Sees a neurologist for migraines but states symptoms were not similar to her migraines Cannot see her neurologist until June. Never had Bell's Palsy in past. No known tick bites, rash or recent viral illness. Denies difficulty closing or opening her eye, mouth asymmetry or slurred speech. Symptoms described may be Bell's Palsy. no treatment initiated since Greater than 3 week since onset and symptoms resolved currently

1173925	4/6/2021	IL	72	F	3/4/2021	4/4/2021	<p>Shortness of breath, cough onset Sunday April 4th. DATE OF SERVICE: 04.06.2021 CT ANGIOGRAPHY, CHEST (CPT=71275); PULMONARY EMBOLUS PROTOCOL; 3-D RECONSTRUCTION CLINICAL INDICATION: SOB (shortness of breath) COMPARISON STUDY: 10/9/2020 TECHNIQUE: Axial images of the chest were performed during dynamic contrast enhancement for the optimization of the opacification of the pulmonary arteries, following IV administration of 80 mL of Isovue 370. Three-dimensional reformation into the coronal plane was performed. Automated exposure control and ALARA manual techniques for patient specific dose reduction were followed while maintaining the necessary diagnostic image quality. ADVERSE REACTION: None FINDINGS: PULMONARY ARTERIES: There is a large filling defect within the right interlobar artery, extending into the lobar, segmental, and subsegmental branches of the right lower lobe. There is expansion of the right interlobar artery by this thrombus. Small filling defect is noted within the distal left main pulmonary artery, with some extension to the left upper lobe and left lower lobe lobar segments. HEART AND VASCULATURE: The heart is normal size. No pericardial effusion. There is no evidence of right heart strain. MEDIASTINUM AND HILA: There is no mediastinal or hilar lymphadenopathy. LUNGS AND AIRWAYS: Heterogeneous densities are seen in the right lower lobe, new since the prior exam. Scarring is noted in the superior segment of the right lower lobe as well as in the anterior left lower lobe.. PLEURA: Small right pleural effusion. CHEST WALL, LOWER NECK, AND AXILLA: Grossly unremarkable. UPPER ABDOMEN: Grossly unremarkable. OSSEOUS STRUCTURES: Degenerative changes are seen within the visualized spine. IMPRESSION 1. Bilateral PE, with extensive thrombus on the right and minimal thrombus on the left as detailed above. 2. Small right pleural effusion and heterogeneous right lower lobe consolidation, likely reflecting pulmonary infarction.</p>

1174078	4/6/2021	NY	26	F	3/18/2021	3/18/2021	I got my first r my first dose of the pfizer vaccine dose at 9 am that morning and around 10 hours later around 8 pm I got hives on the left side of face and hives/ swelling around left eye and my nose was literally dripping mucous like a faucet onto the floor and I started getting a super itchy and tight through. Obviously an allergic reaction, I took two benedryls fell asleep and woke up fine. I am not sure if I should get my second dose tomorrow.
1174077	4/6/2021	CA	75	F	4/6/2021	4/6/2021	Client received the Janssen dose lot # 1808980 and expiration date 6/20/21 at 11:01AM. At 11:16AM client had already waited their 15 minutes and reported to EMT that she was having shortness of breath and anxiety. Vitals were taken : Oxygen: 97%, Blood Pressure: 130/80, pulse=75. Client reports to EMT s that she has a history of bradycardia and anxiety. Client reports medications are amlodipine 5 mg, Irbesartan 50 mg, Aspirin 81 mg PO, inhaler for asthma. Client also reports that on January 8th of 2021 she tested positive for COVID-19. PHN was notified at 11:28AM of client's symptoms. PHN arrived to find client sitting upright and alert and oriented x 4. Since client had shortness of breath reported PHN offered 9-1-1 but client declined, stating she was already feeling better. PHN advised client to stay an extra 30 minutes since she had a reaction. Client reports she thinks it is because she forgot to take her inhaler dose this morning. Vitals were taken: respiration rate=20, Blood pressure 130/70 and oxygen 96% and pulse 55. Client then reports she also has a history of high blood pressure. Client reports that earlier she felt a little lightheaded but did not report to EMTs. At 11:31AM vitals were blood pressure: 146/80, oxygen:97%, pulse: 65 client reports she no longer had shortness of breath, no dizziness no headache, no blurred vision and no chest pain. Gave client water bottle. At 11:41AM vitals were pulse:70, blood pressure: 130/80, oxygen: 97%- client reports no shortness of breath and "feels great." PHN advised client of emergency precautions and to follow up with provider. At 11:46AM: blood pressure: 132/90, oxygen: 98%, pulse: 68. At 11:50AM client left facility with steady gait.

1174049	4/6/2021	IL	59	F	3/9/2021	3/10/2021	All covid symptoms as illness but much more intense then experienced with actual Covid 19 illness. Headache exploding out of top of head plus out of eyeballs. Nausea, chills, exhaustion, sore neck, painful arm , confusion- couldn't concentrate or keep numbers straight (work =accounting & payroll) , wearing mask is almost suffocating now. Indigestion, burping.
1174048	4/6/2021	WI	19	F	4/5/2021	4/6/2021	I've been fevering and shaking since 4am on 04/6/2021 and it is now 8:51 on 04/6/2021. I have dizzy spells, a runny nose, aching joints, a pounding headache, my eyes ache and burn, I constantly feel like throwing up, and I haven't been able to sleep at all.
1174037	4/6/2021	OR	21	M	4/6/2021	4/6/2021	Within a minute of receiving the vaccine, patient slumped back in the chair, head back, eyes open. He was unresponsive and shaking in the chair. After about 20 seconds he came to and leaned forward but wasn't oriented to time and place. As I was talking to him, trying to assess his breathing, he slumped back in the chair and began shaking much more violently. I asked the store director to call EMS at that point, I took his mask off at that point to better assess his breathing. After about 15 seconds, he came to again. At that point, I had him lean forward with his elbows on his knees, and he didn't lose consciousness after that. I took his blood pressure (70/22) and pulse (52, light and hard to find). EMS arrived soon after and at that point patient felt much better. EMS decided not to transport the patient to the ER. They instructed patient to follow up with his provider. Patient left the vaccine area under his own power about half an hour later.
1174025	4/6/2021	FL	48	F	4/6/2021	4/6/2021	she became weak and pale. She was very diaphoretic and kept saying she could not see. Gave her water to drink and wanted to call911. She declined. She sipped water and said was feeling better. She was still pale and we gave her crackers to eat. She said her vision was back and wanted to sit awhile. We kept checking on her and then she said she was able to leave on her own. We called her later to check on her and she said she felt better and was going to discuss with her physician.

PT states getting the J/J vaccine at 1300 yesterday with body ache, fever, sore throat, and headache starting at 1900, states taking tylenol (500mg) at 1900 with no relief. HISTORY OF PRESENT ILLNESS: 21 yo M p/w fatigue, body aches, subjective fever, sore throat, headache nausea after receiving J&J COVAX yesterday at 1300. Acute onset of symptoms, constant, mild muscle aches. Nausea without vomiting. Denies recent illness, cough, vision changes, chest pain, dyspnea, weakness/numbness.
1172601	4/6/2021	CA	54	F	3/18/2021	3/18/2021	Within 5 minutes of injection, seated for 15 minute watch period, I felt nauseous, followed by lightheadedness, racing heart, felt like I couldn't get enough air, and slight tightness in my chest, and was concerned I was going to pass out / fall off of my chair. I was double masked, and removed one mask to get more air. No medications were administered to treat the adverse event. After about 7 minutes, symptoms started to subside. Within 20 minutes was mostly back to normal, but was nauseous the remainder of the day. Stayed for a 30 minute watch period. Upon returning home, within 1 hour of receiving vaccine, first I felt like I was getting the flu, and took a Sudafed. Then I was exhausted and could not keep my eyes open, and slept for 3 hours. No recurring symptoms that evening or the following day. Injection site became very sore about 24 hours after injection, with minimal heat emanating from skin. Soreness changed to tenderness in 2-3 days, and completely subsided within 4-5 days. Took Tylenol and Alleve for soreness.

1172803	4/6/2021	WA	78	F	2/1/2021	2/2/2021	**Please note that this form continues the story of diarrhea after my first Covid shot (1/11/2021). See earlier VAERS form for the first incidence.** I had my second Covid-19 shot on 2/1/2021. The following morning, I awoke with diarrhea, and this continued for nearly three months, with a brief gap from 2/11 to 2/14. At first, my stool was lumpy, with mucus, but it gradually turned quite watery. It was also clear by eye that I was having trouble digesting higher fiber foods (salads, fruit & vegetable skins, et al.), so I worked to keep to a lower fiber, bland diet. Episodes of diarrhea varied with the day, but they usually occurred first thing in the morning, with some additional episodes during the day or in the middle of the night. By the end of this period, I had lost about eight pounds.
1172788	4/6/2021	ME	70	M	3/31/2021	4/4/2021	We had a call today to the clinic to report a potential adverse reaction. received his first vaccine on 3/3 and his second on 3/31 (Moderna). On Easter 4/4 he reported that he had a change in his vision and yesterday he went to the eye doctor and he suffered an issue with a blood vessel in his eye. It is unknown if this is relating to the vaccine but they wanted to report it.
1172784	4/6/2021	NC	63	F	4/2/2021	4/2/2021	Symptoms very like a bad flu began that early evening and lasted approximately 36 hours. My normal body temperature is about 96.5. During the early morning hours of Saturday, April 3, my temp was 100.7. Headache, chills, body aches, painfully sensitive skin; upset stomach, painful vision and hearing. Bad pain in the entire right arm, into which the injection was made. Even today, 4 days after the injection, I'm chilly (though it is 75 outside), tissues in my mouth/gums are painful, I had stomach cramps, diarrhea and a bloody stool. I'm much better, but not quite back to normal. I think it may be significant that I am 5 foot 2 inches tall and weigh 110 pounds. I wonder if the doses should be matched to body weight, and if that would cut down on side effects. This was pretty brutal.
1172718	4/6/2021	CA	35	M	4/5/2021	4/5/2021	Syncope, dizziness, BP 130/90 (pulse 61), O2 sat 99%. Hit left forehead, 1.5 inch gash along eyebrow. Sent to ED.

1172810	4/6/2021	FL	20	F	4/5/2021	4/5/2021	<p>On 3-15-21 patient received 1st dose Pfizer vaccine on L deltoid, states that 2 days after the jab she developed a pruriginous rash on ventral aspect of L forearm above wrist area. Rash faded away on its own. Denied SOB, wheezing, cough, facial swelling. denied any rashes on other areas of her body. she did not disclose that rash to us at the clinic. On 04/05/21 she came to the clinic for 2nd jab, on screening and immunization documentation she mark no on "like to speak with health care provider" but prior to HS providing 2nd jab she brought to her attention the previous symptoms. I intervene and discuss with the patient and asked the nature of the previous symptoms. Due to a miscommunication and misunderstanding, on my part, I thought that her rash was initially on site of injection and that it spread distally, discuss with her Covid arm for about 10-15 minutes with patient as I thought initially that it was a COVID arm and proceed to allow 2nd jab and order to keep her in observation for 30'. 2nd jab administered on R arm this time. About 3 minutes after jab, she developed three lesions on forearm, 2 bumps approximately .2 cm diameter, with mild hyperemia on dorsal aspect of proximal forearm which states were itching. Stated one hyperemic non raised lesion on proximal ventral forearm (that latest lesion was not visualized by me). I extended the observation period and at 45' the lesions started to fade away and the "bumps" got smaller. I did a full evaluation of the patient and there was no other skin lesions on rest of her body. she was breathing normally, no wheezings, no laryngeal stridor, no facial/neck/lips/tongue swelling, no complaints of tingling on lips or tongue. She was not on distress. No treatment provided to patient. Patient was discharge home with specific instructions to call 911, go to neares ER, or call the Duty HS if at any point she develops any new symptoms, breathing problems. Around 6:15 i call patient and told me she was doing good, no new skin lesion, no laboured breathing, wheezing, swelling, problems with swallow and that the lesions were gone. Today 4/6/21 I call patient to come to the clinic for re-assessment and there was no skin rashes, no swelling, her exam was completely normal. she complained of tender arm and that previous night she had some mild headache, took tylenol and better. There was no redness around injection site. Patient was discharged with same</p>

							recommendations provided previously, to call 911, go to nearest ER, or call Duty HS if any new skin lesions, SOB, wheezing, difficulty swallowing or talking. Just spoke with patient via phone today at 4:25 PM and states she is doing well, no rash, no SOB, completely asymptomatic. I understand the magnitude of these events and I have to say the the misunderstanding was all on me and I take responsibility. Here in our clinic we have immunized over 600 patients and no major issues prior to this. I am available to discuss at any time. Thanks,
1172624	4/6/2021	GA	34	F	4/6/2021	4/6/2021	Patient mom reports patients eyes rolled back into head and she slumped in her seat for 20 seconds during her first 15 minutes of observation. Mom brought patient to me for assessment. When patient presented to me, patient was alert and vitals were normal. I asked patient to remain seated for 15 more minutes of observation. Mom did say patient exhibited this behavior once before at the eye doctor. I informed mom to please check with patients doctor for follow up. Patient exhibited some mental disability and thats is why the mother is involved. I dont believe patient is capable of taking care of herself.
1172639	4/6/2021	CA	75	F	4/6/2021	4/6/2021	within 3 minutes of injection within 3 minutes had a seizure with (per nurses) generalized increased tone, gasping and unresponsive. Patient with multiple medical problems including sz disorder (off meds past 6 months), copd, anxiety, glaucoma, pacer When I got there patient breathing well, slumped back in wheelchair, not gasping and not seizing. VSS (110-120/54-68, pulse 70s, RR 18-20, O2 sat initially 95% on room air, put on oxygen while watching her), skin color pink. Initially unresponsive but when I was discussing with husband that we were going to call 911 and have her taken to ER, she opened her eyes and responded. Both patient and husband refused 911/ER saying that patient with sz disorder (also dissociative convulsions) and that she has a seizure at least daily, sometimes due to stressful situations, and that afterwards sometimes awakens quickly and sometimes takes longer. Usually sleeps for a few hours afterwards. As patient and husband refused transfer and VSS, patient was monitored for about 45 mins and released.

1172599	4/6/2021	PA	31	F	3/12/2021	3/12/2021	Within 2 hours I was dizzy, nausea an light headed. Within 4 hours I had a fever (uncontrollable), I laid down. I wasn't able to get up and my arm swelled up really bad. I was having streak in my vison and really bad dey eyes and mouth. I had a fever on going for about 3 weeks straight. I called my Doctor the following day and she said it was a normal reaction, if it get's worse to call her again. I called her again because it got worse, my neck got swollen. left arm was trembling, lymph nodes were swollen, leg leg was pulsating. I started having chills and hot flashes ( I still have some till this day). My Doctor recommended seeing a specialist- Neurologist, Infectious Disease Dr. The Neurologist said he can see where I get the trembles but does not want to put me on medication and see if it goes away on it's own. I have a follow up with him regarding trembles, headache, flashing in my eyes. The Infectious Disease Dr. I'm following up her her again regarding my arm swelling, they prescribed me steroids but had not gone down. Since all of this I have been very fatigue, this is everyday.
1172597	4/6/2021	IN	45	F	4/5/2021	4/5/2021	I had burning with the actual injection. It burned as it went in and went down a small ways into my left arm. The rest of the day I had the normal symptoms- Pounding headache, nausea, horrible body aches (couldn't lay down or stand to be comfortable). That night around 11:45pm I got up to let my dog in and I started seeing small black dots- blurry vision. I felt nauseas. I ended up falling on the floor. I was able to get up. I then ended up waking up in the bathroom on the floor and had no idea how I had gotten there. My hands were vibrating. I called my husband from work to come help me up. I was able to sleep and didn't seek medical attention. I am not sure if it was low blood pressure or what could have happened I have never experienced that before. I did contact my doctor?s office this afternoon via (online) but haven?t had a response yet. I have been in bed all day today. - Body aches, nausea, pounding headache

1172584	4/6/2021	MS	18	F	4/6/2021	4/6/2021	Within 5-10 minutes after receiving vaccine, patient began to become very pale. Her symptoms included dizziness, syncope, stomach ache, foaming at the mouth, vision disturbances. 911 was called and paramedics arrived.. Her vital signs were all normal. Patient did not wish to go to hospital, and her mother took her home. Other pertinent information is that patient has a history of seizures and had been off of her seizure medication for 4 weeks. I believe that I understood her mother to say that her neurologist knew she was getting the vaccine today. Patient reported no allergies to any other vaccine, medication, or other.
1172576	4/6/2021	MA	70	F	4/3/2021	4/4/2021	On second night following the second dose, I experienced racing thoughts and images (not hallucinations) while awakened from sleep. I could not control the thoughts and it felt like what I imagine a bad recreational drug experience would be like. It was frightening because I never experienced anything like it. It was as if my mind was trying to solve visual word and number problems in flashes. I was drowsy but not asleep. I was sweating but did not have a fever. I had some nausea but did not vomit. Over the course of the night, it gradually resolved and felt like a "fever" had broken, even though it was not a fever. I wanted to report it because I have not heard of such cognitive symptoms and there is no other explanation I know of. Prior to this episode after the second shot, I had a variety of minor headaches, body aches, and chills but nothing significant. I had no symptoms after the first shot. I woke up exhausted the following day and am still tired but almost back to normal (third 24 hour period after shot). Thank you for your consideration.
1172566	4/6/2021		23	M	4/6/2021	4/6/2021	After receiving the vaccine he developed lightheadedness, and blurred vision. He also felt as if he was going to faint. He denies chest pain or shortness of breath. Denied loss of vision. He did not have a weakness. Blood pressure 106 / 68, 78, oxygen saturation 98% on room air on April 6th 2021 at 2:25 p.m. In general patient is without distress oh, but he does look anxious Heart: rate and Rhythm, as one has to, no Gallup or murmurs or rubs Lungs: CTA bilaterally neuro: 5 / 5 bilateral upper and lower extremity strength, cranial nerves 2-12 intact No gait dysfunction

1168679	4/5/2021	CA	51	M	3/24/2021	3/30/2021	Double/blurred vision, left eye limited motion. Ophthalmologist diagnosis: left sixth cranial nerve palsy, cause unknown. No treatment available, 1 - 2 months required to recover nerve function.
1168744	4/5/2021	KS	55	M	4/1/2021	4/2/2021	AS SOON AS THE VACCINE WAS ADMINISTERED I WAS WINDED AND FELT TINGLING AROUND MY MOUTH. ON FRIDAY NIGHT I HAD A RACING HEART, WAS HAVING TROUBLE CATCHING MY BREATH AND BLURRY VISION. THAT SETTLED DOWN AFTER 3 HOURS. I WENT TO BED. SATURDAY MORNING AFTER BEING UP FOR ABOUT 1 1/2 HOURS MY HEART STARTED RACING, SHORTNESS OF BREATH AND BLURRY VISION STARTED AGAIN. I WENT TO THE ER. I WAS GIVEN INTRAVENOUS DRUGS TO HELP WITH THE ANXIETY. WAS EXHAUSTED BUT OK FOR SATURDAY AFTERNOON AND EVENING. I DIDN'T TAKE ANY cold medicine OR STEROID MEDICATION ON SATURDAY. SUNDAY MORNING AFTER BEING UP FOR 1 1/2 HOURS IT ALL STARTED AGAIN AND I WENT BACK TO THE ER FOR MORE INTRAVENOUS DRUGS FOR ANXIETY. I WAS GIVEN AN EKG ON BOTH SATURDAY AND SUNDAY TO MAKE SURE I WASN'T HAVING A HEART ATTACK. ON SUNDAY I WAS ALSO GIVEN A CHEST XRAY. SUNDAY I WAS SENT HOME WITH A PRESCRIPTION FOR VALIUM.

1168974	4/5/2021	TX	70	F	2/6/2021	2/6/2021	Vaccine more of a brownish color/discoloration/Brownish yellow honey colored; Wasn't that much in the syringe; Injection site feels "warm to touch"; Got feverish like a normal shot would do; A spontaneous report was received from a consumer, who was also a 70-year-old female patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and reported that the vaccine was not white or clear, more of a brownish yellow/honey colored /product color issue, she got feverish/pyrexia, there wasn't that much in the syringe/accidental underdose and injection site feels warm to touch/vaccination site warmth. The patient's medical history was not provided. She had no allergies. No relevant concomitant medications were reported. On 06 Feb 2021 at 8:30 am, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (batch number: 013M2014) intramuscularly in the right upper arm for prophylaxis of COVID-19 infection. The patient reported that the vaccine administered was not white or clear, but more of a brownish yellow (also reported as honey colored). There was a discoloration but had already been administered. When the patient looked at the syringe on television, it was clear. She stated that the website said it should be white, but this was more of a yellowish brown. The patient also reported that there wasn't much in the syringe but knew it was supposed to be the 0.5 ml. The patient also reported that she didn't even feel the shot being given when it was administered. As the day went on, the patient got feverish like a normal shot would do, which she said lasted a couple of days and through this week. She did not contact her primary care physician about her concerns because she doesn't really go to the doctor. The patient felt comfortable that the vaccine was administered the right way, intramuscularly. She was not sure if the vaccine was spoiled at that color. In addition, the patient reported that the injection site felt warm to touch. No treatment was provided for the events. Action taken with mRNA-1273 in response to the events was not reported. The events, vaccine was not white or clear, more of a brownish yellow/honey colored and wasn't that much in the syringe were considered resolved on 06 Feb 2021. The event, got feverish, was considered resolved on an unknown day in February 2021. At the time of this report, the outcome of the event, injection site feels warm

1169012	4/5/2021	TX	55	M	2/19/2021	3/19/2021	<p>ears were popping like as if being on an airplane and they were constantly ringing; vision was blurry like there was a film over it and as if things were grayed out; felt the room spinning; closed his eyes and fell asleep and woke up much later in the evening feeling a little bit better.; felt very dizzy again and was back to his original symptoms; This spontaneous case was reported by a consumer and describes the occurrence of DIZZINESS (felt very dizzy again and was back to his original symptoms) in a 55-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 002B21A and 011M20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included Fracture. Concomitant products included DOLUTEGRAVIR SODIUM, LAMIVUDINE (DOVATO), PREGABALIN and MODAFINIL for an unknown indication. On 19-Feb-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 18-Mar-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 19-Mar-2021, the patient experienced DIZZINESS (felt very dizzy again and was back to his original symptoms) (seriousness criterion disability). On 20-Mar-2021, the patient experienced TINNITUS (ears were popping like as if being on an airplane and they were constantly ringing), VISION BLURRED (vision was blurry like there was a film over it and as if things were grayed out), VERTIGO (felt the room spinning) and SOMNOLENCE (closed his eyes and fell asleep and woke up much later in the evening feeling a little bit better.). At the time of the report, DIZZINESS (felt very dizzy again and was back to his original symptoms), TINNITUS (ears were popping like as if being on an airplane and they were constantly ringing), VISION BLURRED (vision was blurry like there was a film over it and as if things were grayed out), VERTIGO (felt the room spinning) and SOMNOLENCE (closed his eyes and fell asleep and woke up much later in the evening feeling a little bit better.) outcome was unknown. No treatment information was provided. This case concerns a 55 Y/O M with a serious unexpected event of dizziness and nonserious unexpected vertigo, tinnitus, blurred vision and somnolence. Event onset on day 2 after second dose</p>

1167870	4/5/2021	MA	24	F	4/3/2021	4/3/2021	At approximately 0945 this nurse witnessed patient sitting in the observation area with her head tilted to the left side and her body leaning to the left. The medical assistant was with her holding her body up. Her eyes were closed and she had no color to her face and lips. She was not able to respond to questions being asked. As her head was shaking she was making grunting noises. She was diaphoretic and tremulous. This episode lasted for approximately 60 seconds. Pt then opened her eyes and was able to respond to questions asked but with a delayed response. Pt was moved to the stretcher to lay down. Her color came back to her lips and her blood pressure improved. She was responding to questions appropriately. Pt was diaphoretic for approximately 10 minutes. Ice packs and water were provided. Pt was observed by the medical assistant for 30 minutes. Her HOB was elevated gradually until she was able to dangle her feet and sit on the side of the stretcher. Pt stated that she was feeling better and was ready to go be with her roommate. Vital signs were taken and BP 91/54, HR 70, O2 97%. At 0952 HR was 62. 1005 BP 102/67, HR 57 O2 99%.
1167824	4/5/2021	MI	42	M	4/2/2021	4/2/2021	Patient suddenly became diaphoretic eyes rolled back in head, almost passed out . Onsite EMS was called vitals HR 42 BP 95/59 98% O2 refused glucose check. Patient felt better and reluctantly was transported to local hospital. No reaction to 1st vaccine on 3/12/21

1167811	4/5/2021	PA	25	F	4/1/2021	4/1/2021	At about 5 pm same day I started getting fever it was 101. I decided to drink some orange juice and when I went to sit back down I started feeling extremely dizzy, I got a very bitter taste in my mouth, my whole body started tingling and my lips and tongue and hands especially started feeling numb.I managed to get to bathroom floor where I grabbed some water and wiped it over my neck but I continued to feel worse where I couldn?t even control what my body was doing and I had diarrhea. The ?snow? in front of my eyes got worse too where I couldn?t almost see anything for over probably 3 minutes and I broke in cold sweat.After the diarrhea I had a very sharp pain in my lower abdomen. That all lasted a few minutes and I didn?t have phone on me and I was alone so I helplessly sat on the floor through it all til I started feeling bit by bit better.The fever continued for 48 hours as well as extreme arm pain for 3 days where I got my vaccine.
1167794	4/5/2021	NM	25	M	4/2/2021	4/2/2021	Member presented with profuse sweating and said he did not feel well at all. Because I do not have aassigned to the clinic, I went to ask an to do a physical examination on the member. The went retrieved water for the member to help him cool down and another patient was in need of my assistance. As I returned I saw the conducting his physical examination of the patient where he started to examine the member where the member did not present with any hives on his body but his tongue was slightly larger than normal and he started to clinch his stomach and he could not physically drink the water and he then fell over gasping for air and eyes bulging(you could hear him

1167905	4/5/2021	KS	68	F	4/1/2021	4/1/2021	<p>Pfizer COVID 19 Vaccine reaction- First vaccination administered 3/11/2021 at 11:20 AM. Waited 15 minutes at the clinic. Only side effect was slightly sore arm.</p> <p>Thursday, Apr 1, 2021 11:20 AM Second/Booster Vaccine administered. Waited 15 minutes at the clinic as requested. No adverse reaction other than mild sting at injection site. 11:00 PM Awakened with waves of full body, convulsive chills, heart palpitations, shallow breathing, visual disturbances. Got up to go to the bathroom and was very unsteady. Took 500 mg acetaminophen. Friday, April 2, 5:00AM Chills ceased and nausea set in. My shoulder was swollen, hard, hot and bright red at injection site. Inflamed spot was the diameter of a tennis ball. I could not even drink sips of water without vomiting. Sternum aches, shallow breath. Noon: Took 500 mg acetaminophen. it came up a few minutes later. 4:00 PM Temp 100.6 5:00 PM vomited at least 3 times over the past several hours. Can't keep fluids down. became concerned about dehydration. After two calls to nurse practitioner, decided it was best to go to ER for rehydration. 8:00pm released from ER after 2 liters of saline and Zophran Saturday, April 3, 3AM Woke up with completely soaked pjs. Stayed in bed most of the day, though got up periodically to sit in a chair. I showered, nibbled on some dry toast, sugar free jelly, and soda. Was able to tolerate, but little appetite. Still very unsteady. Upper arm is now very inflamed from the shoulder almost to the elbow, half-way around. Hot and very tender. Sore to move it. Heart palpitations continue. By afternoon, I was able to drink more fluids and eat a few bites of a peanut butter and honey sandwich. 4:00 PM Temp 100.1 Sunday, April 4 6 AM Feeling better. Made a breakfast of scrambled eggs and tortillas, and tolerated that very well. No more nausea and feeling stronger, but still moving very slowly. If I move to fast I get dizzy. 2PM Red area on upper arm is starting to raise like hives. Sternum is still sore, likely from vomiting and dry heaves. Took a Zyrtec and 500mg of acetaminophen to counter. 5PM Arm not improved with meds taken at 2pm. Still moving slowly. Just moving from kitchen to living room is tiring. 6pm applied hydrocortisone cream to my arm to see if that would diminish the hive-like redness. Monday, April 5 6:00 AM Upper arm still tender and sore, but redness is somewhat diminished.</p>

1167715	4/5/2021	NY	59	F	4/2/2021	4/2/2021	Rec'd the shot at 2:45 on 4/2. By 5:00 PM, my left arm was swelling with pain. By 7:00 PM, the pain had spread to my left lymph node, shoulder, left breast, left torso, left hip, left buttock and left outer thigh. I became fatigued and tried to sleep. The pain in those areas intensified to a 10 (on a scale from 1-10) making it impossible to sleep or even move correctly. I was nauseous from the pain which was worse than any pain I have ever felt in my entire life. I developed a severe headache and dry heaves. I could not eat. The next day (4/3) I was able to sleep and I slept all day, rising only to use the toilet and sip water. I had a fever of 100.7. I continued sleeping the rest of the day. The pain continued but was more like aches. Severe headache remained until 3:00 on 4/4. When I awakened on 4/4, I noticed a light rash on my left side, mainly on my neck and chest. My left eye was bloodshot. The headache remained, but I was able to rise and function with minor pain and joint aches. 4/5 I am better.
1167676	4/5/2021	TX	22	M	4/1/2021	4/1/2021	I got the injection then went and sat down in a chair at the back of the room and started getting light-headed about 3 minutes after I sat down, so I called a nurse over. Then the inside of my chest started getting really hot and my vision started going white in both of my eyes, it took about 10 seconds for me to completely lose vision. Then I passed out, I have no idea how long I was out for but when I came too I had a sort of epileptic-type seizure but I do not know how long it lasted. I woke up completely disoriented, had no idea where I was at and had a severe cognitive dysfunction. I still have moments where I just can't follow or complete a thought or just kind of go blank.

1167648	4/5/2021	FL	38	F	4/1/2021	4/3/2021	On April 3rd at 6:00 am I awoke with difficulty breathing and intense abdominal pain. Took my eye medicine (Cyproheptadine 4mg) in the morning, difficulty breathing subsided, but abdominal pain remained. Became lethargic, noticed a fever around 9:00 am. Fever was 100 degrees Fahrenheit. Chills, muscle pains all over body, nausea, inability to eat, acid reflux, temporary loss of feeling in right toes. Around noon my fever was 102, and my walking heart rate was 146 bpm (according to fitbit sense watch). I took two Tylenol tablets (recommended dose 2 for adults according to bottle). Went to urgent care. Fever subsided, and bpm returned to mostly normal. Blood draw revealed thrombocytopenia. Platelets were at 72 (units of measurement), normal range is 150-450 (units of measurement). I was told recommended hospitalization occurs at 50 (units of measurement). April 4th. Painful abdomen, lack of appetite, nausea, headache. Took 1 Tylenol. Lethargic. Slept most of the day. Pain behind my eyes. Headache located in front behind both eyes. Dry throat. Constantly drinking water and Gatorade, Thirsty. April 5th. Headache remains. Pain behind eyes remain. Lack of appetite. Planning for second blood draw on April 7th to check Platelets.

1167385	4/5/2021	CA	59	M	4/2/2021	4/2/2021	Severe headache on first night, with chills and sweats. On first morning after inoculation, rashes covered genitalia, spreading to several places (silver-dollar-sized rashes elsewhere). On evening of day after inoculation, facial swelling, including eyes and lips. At no time was there any problem with swallowing or breathing. On advice of physician, began 50mg of antihistamine Benadryl at night, with daytime antihistamine during day.
1169127	4/5/2021	CA	58	F	3/30/2021	3/30/2021	Bruising at the injection site that is growing larger each day, with a small red halo around the actual injection. No visit to the doctor, just keeping an eye on it. Have applied arnica cream.
1167740	4/5/2021	NC	42	F	3/25/2021	3/25/2021	Day 1 (4:30 pm vaccination day). Clammy hands and metal taste for 15 minutes, dizzy feeling for 1 minute. Later that day, overall feeling of unwell, short lived muscle weakness, tired, sore arm, anxiety, loss of appetite, odd, bubbling sensation in left leg, slight itchy skin mostly in legs and at injection site. Day two. Unwell, nausea, loose stool in morning, anxiety, tired, slight sore arm, odd bubbling sensation in left leg, slight itchy skin, loss of appetite, red eyes, red itchy chin, slight itchy skin in legs and at injection site. Day three. Unwell, nausea, very slight sore arm, loose stool in morning, panic, tired, itchy red eyes, nausea, red itchy chin, slight itchy skin mostly in legs and at injection site, no appetite. Day 4. Loose stool in morning, more energy but still tired, itching continue slightly on chin and injection site and legs, appetite returning, slightly tired, very slight sore arm. Day 5. Woke up with indigestion, feeling unwell and tired, laid in bed and felt a jolt by means of noise in my head which only happened once and was quickly over, very slight sore arm, itchy at injection site, weird metal taste, upset stomach, leg and arm vein fullness. Day 6. Woke up tired with overall feeling of slight unwell but gained a good bit of energy as the day progressed, leg and arm vein fullness. Day 7:. Leg and arm vein fullness. Day 8:. Non localized Itchy skin Side note:. I'm beyond worried to get the second vaccination.

1168085	4/5/2021	RI	25	M	4/5/2021	4/5/2021	15 (09:50) minutes post vaccination, pt approached healthcare staff and indicated eye itchiness and thickening in throat. Per pt, facial swelling was not present. Pt was observed closely x 3 minutes, during which time pt indicated throat swelling was progressing. Diphenhydramine, 25 mg PO administered at 09:55. At 10:10 pt stated eye itchiness was worsening, and he was unable to swallow, could breathe comfortably thru his nose. At this time RN and MD decided to call for emergency support, and they arrived at approx 10:15. After initial assessment they determined the best course of action was to transfer to ER should airway management be needed. Pt and EMS left facility at 10:25.
1168361	4/5/2021	WI	40	F	3/1/2021	3/1/2021	4am the day after my first shot I woke up to swollen, blood shot eyes which were irritated and itchy. After an hour and a half the symptoms were not getting better so I decided to take claritin since it was similar to the allergic reaction I have to mold. An hour later my eyes were better but still sore around them. The next day they were completely better. Also, since taking the vaccine I seem to forget things easily, things that I put in the microwave are sitting there the next morning which is very unusual for me to be so forgetful so many times and even at work my focus was scattered and things that were routine were becoming challenging to remember to complete. After 2 weeks it seems to have faded, although once I became aware of what was happening I have made a conscious effort to remember things. I realize that these may seem like small events, but I feel that it is something that should be looked into as it was/is rather concerning since this was only my first shot and the second is supposed to react worse. I am still contemplating whether getting a second shot is wise for me.

1168265	4/5/2021	MI	59	F	3/29/2021	3/29/2021	<p>25 minutes Post injection: Left eye issues. Itchy, swollen behind the eye and feeling like something was in it or irritating it. It kept driving me to check if something was in it. I put in renu eye drops and did not think any more of it.</p> <p>40 minutes post injection: both feet red and swollen left foot about half of the top, the whole right foot looked like a giant hive or welted area across the whole top of foot. The injection site began being quite sore, and it also looked welted and felt hot to the touch. I kept checking my left rib cage and my left thumb as I was sure there was going to be hives, because I could not stop rubbing or scratching them as they itched so badly. I continued itching and feeling weird tingly sensations and either rubbed or scratched these areas to no avail. Even my head itched terribly by the second day.</p> <p>45 minutes post injection: Tightness and scratchiness in throat appeared and my throat was sore, my voice began going out and my voice got hoarse. There was about a two inch area of my throat in which I felt I needed to keep trying to clear something that was stuck. (This made no sense to me as I was able to drink water without any issues.) I had a slight cough every time I stopped drinking, so I continually drank water while I was not trying to sleep. My chest was tight, but because I have asthma I took albuterol and thought nothing of it. (This really did not help, but I did not get worse either.) About an hour after the shot, I constantly felt on the verge of shaking, much like when you have a fever, but I did not think to check my temperature until the following morning when I was extremely tired, felt like I had a sinus headache and possibly did have a fever. My temperature was 99.4 degrees farenheight. At this point, I felt very flu-ish and achy. My armpit area hurt a lot and I chewed two aspirin. I experienced wheeziness, chest tightness, and hoarseness the second and third day as well. I had the morning congestion and stuffiness as well as the need to keep clearing my voice still as of this morning but to much less degree as the initial onset. The skin itchiness is still ongoing, but to a much lesser degree than previously had.</p>

1168133	4/5/2021	FL	69	F	4/2/2021	4/2/2021	Around 8:00 AM she had the vaccine, felt fine. Then after dinner around 8:00 PM she had overall body aches, fever, shaking all over, left shin bone on the leg throbbled and ached on Friday and Saturday. Her nose is also itching badly. She was sneezing the entire time. She took Tylenol and aspirin on Saturday/Sunday, nothing today. She also took Benadryl for her itchy nose. Her eyes were also itching and also on fire. She is feeling much better. She had the feeling of getting hot and cold on Saturday.
1168367	4/5/2021		46	F	3/31/2021	3/31/2021	injection was administered at about 7:00pm; symptoms began during the night... started feeling uncomfortable aches and pains, by early morning symptoms of fever, muscle aches, joint aches, overall pain and hypersensitivity, nausea. Treatment - sleep; slept and drank fluids for about 24 hours. Fever reached about 102.2 on 4/2 at around 3:00am and broke shortly after that. Continued sleep and fluids until about 10:30 on 4/2. Slowly regained energy and able to stay awake as usual from about noon on 4/2 onward. Slight weakness until 4/3. Strong headaches and aching eyes on 4/3 and 4/4. 4/5 - back to mostly normal.
1168066	4/5/2021	FL	56	F	3/12/2021	3/12/2021	Leg cramps started about 1 hour after the vaccine was administered. About 6 hours after vaccine, debilitating headache. Numbing of hands and feet along with headache. On the next day: diarrhea, joint pain, burning sensation in hands and feet, nausea, mild rash on both arms, increased heart rate, eye twitching.
1168045	4/5/2021	NJ	31	F	3/22/2021	3/22/2021	Right at time of vaccination being administered, intense pain radiated from the injection site down through the wrist. Soreness throughout the first day, followed by intense soreness for 3-4 days afterward. Painful enough that arm hurt to use, and woke during sleep at night. Pain seemed to lessen after 6-7 days, but on 4/1 woke up unable to lift arm and in intense pain. Saw PCP 4/1 and was diagnosed with capsulitis in L arm based on visual exam, and practitioner seeing this in other vaccine patients. Discussed with practitioner and it is believed that person giving vaccine administered it too high on the arm.

1167923	4/5/2021	PA	32	F	2/19/2021	3/7/2021	2 weeks after second COVID vaccine, immediately after taking polyethylene glycol (Miralax) had severe pruritis of bilateral hands and feet with redness of the skin. Followed shortly by nausea and 1 episode of vomiting, hypotension (70s/50s), and chills. This passed over the subsequent couple hours then about 6 hours later developed sudden onset severe bilateral conjunctivitis which was so painful I couldn't open my eyes or see very well and ended up going to the ED. Seen by ophthalmology there and told it was likely viral conjunctivitis. Over the next couple hours this passed but then started to develop severe diffuse arthralgias which lasted about 1 day. This then passed and I felt completely fine. About 2 weeks later I tried taking Miralax again and about 6 hours after taking the Miralax developed the same severe diffuse arthralgias as the prior episode, which again passed in about 1 day. I had taken Miralax several times before getting vaccinated without any issue.

1170099	4/5/2021	AZ	35	F	3/25/2021	3/26/2021	I received the vaccination on 3/25. On 3/26 and 3/27 I experienced vaccination site soreness, which began to dissipate on 3/28. On 3/29 and 3/30 I experienced a persistent headache and also newly appearing red splotches at the injection site that went away within 48 hours. Then, on 3/30 I also began to experience extreme fatigue and felt "foggy," which persisted on 3/31. During the night of 3/31-morning of 4/1, I woke up multiple times during the night alternating between hot flashes and cold sweats and feeling slightly short of breath, and my eyes were very bloodshot upon fully awakening. I recorded a temperature of 99.9 degrees F the morning of 4/1 and still felt fatigued, so I called off of work and slept most of the day. By the evening of 4/1 I felt entirely better, as if nothing had happened. I want to note that I was diagnosed with a mild case of COVID-19 during early December 2020, so I wanted to submit my vaccination experience in case you are disaggregating side effect data by whether or not patients have previously had COVID-19. Of course I cannot be sure that my symptoms were definitively related to the vaccine, but if they were then the duration of symptoms seems quite lengthy.
1170091	4/5/2021	WA	50	M	3/24/2021	3/24/2021	Patient received first Johnson and Johnson, 2 minutes into a 30 min observation, patient began to have seizure like activity. Patient's eyes rolled back and he started to quickly shake for about 1 minute. Patient came to and was responsive. Provider arrived, vitals and physical exam were within normal limits. Patient was recommended to schedule an appointment with PCP and ask for a referral to Neurology, since patient had seizure like activity with a Tdap a few years ago.
1170089	4/5/2021	AZ	35	F	3/25/2021	3/25/2021	Facial swelling (Eye, cheek, lip and tongue) and facial numbness on side of injection (right side). - Eye swollen 4 hours afterwards. (Thought it was allergies). Woke to my full face swelling and numb in the morning following the injection. About 14 hours later. Took Benadryl immediately. Did not take the swelling down. Took a second Benadryl 2 hours later. Swelling started to go down then. Injection site discoloration (red) for about two weeks. As of last week, I think I could still feel tingling in my face on the right side. Not sure if that's normal?

1170511	4/5/2021	TX	35	M	3/29/2021	4/4/2021	I was working on a fence about 5-5:30 pm and suddenly developed blurry vision. I continued working for another 5-10 minutes, then I went inside for dinner with my wife kids and in-laws. I complained I couldn't see in my peripheral to my wife and mother n law. I ate dinner, salad and spaghetti. While eating my brother in law asked if I got a new car and that he hadn't see the white one before. I tried to tell him what happened to my old car but got caught and couldn't think clearly about the old car, the problems it had and the story. After dinner I want out to help on the fence again and my son was handing my brother in law boards and I tried to tell him the board wasn't cut with a bevel yet. But couldn't come up with any words to describe the board. I went to my wife explained my that my brain wasn't working right and I clearly had a problem. I developed some tingling in my right hand. She took me to local ER referenced. My symptoms subsided on their own and they weren't able to see anything on a cat scan. As I felt better I didn't take the next step to the larger ER with and MRI.

1170474	4/5/2021	CA	55	F	12/30/2020	3/3/2021	3 episodes of abrupt and transient hypertension (max measured 218/113) with fever (38.1 C), marked headache and dyspnea on March 3, 4 and 7, requiring visits at Emergency Department (ED) on March 4 and 7. Episode on March 3 and 4 lasted few hours and self-resolved (2 liters iv saline on 3/4 at ED). Episode on March 7 required use of iv Atenolol at ED and oral Atenolol for the next 5 days. Starting March 5, flashes and floaters (?oily? spot in the right eye). All symptoms disappeared after March 12, except for the floaters in the right eye.
1170473	4/5/2021	NY	61	F	3/13/2021	3/14/2021	26 HOURS AFTER RECEIVING THE VACCINE, MY VISION WITH THE LEFT EYE STARTED TO DETERIORATE. THE DOCTOR ON CALL SUSPECTED RETINA DETACHEMENT AND ARRANGED FOR A RETINA SPECIALIST VISIT NEXT MORNING. THE RETINA SPECIALIST DOCTOR CONFIRMED THE RETINA DETACHEMENT AND PERFORMED SURGERY TO REPAIR IT THE SAME EVENING. EMERGENCY SURGERY WAS PERFORMED. I AM STILL RECOVERING (RECOVERY IS ESTIMATED TO TAKE 6 MONTHS), WITH DISTORTED IMAGING FROM LEFT EYE AND DOUBLE VISION.
1170459	4/5/2021	CA	49	F	3/30/2021	4/1/2021	Woke up before 6am on 4/1 to severe itching from what felt like a hundred bug bites, it was a systemic allergic reaction beginning from my scalp to my feet. These continued to grow into massive, red, itchy welts that covered most of my body all over. Throat became restricted, felt harder to swallow but not impossible. Chest pains started evening of 4/1 with every swallow. Took two Benadryl and slept on 4/1. Woke up on 4/2 with left eye swollen shut, lip swollen, and hives had settled into large, flat welts all over but less itchy. Went to Emergency Dept around 7:50am on 4/2 where I was given prednisone (60mg?) and Zyrtec. Observed for about 1 hr, 45 mins, and released feeling okay but still swollen with a few welts left. Have taken Benadryl every evening through tonight, 4/5. Welts disappeared on 4/4 and itchiness stopped then, too.

1170448	4/5/2021	FL	67	M	3/2/2021	4/5/2021	After the first dose, within a couple of days, purple patches started appearing randomly in my upper thorax, along my arms, across my chest,. I thought this was a typical "rash", but they are not. They are not antihistamine responsive, have developed a scaly crust-like surface, resembling psoriasis. On my face, I developed dry, scaling skin beneath both eyes and on the bridge of my nose. None of these symptoms have diminished. I had shot number 1 on March 2, and shot number 2 on March 23. The purple splotches are as large as 1.25 inches in diameter, but most are smaller than that. I am a registered pharmacist, and have never seen, nor experienced, anything like this. They itch, they are rough, like mild sandpaper, and they persist, now going on for about a month. I am hoping they resolve soon.
1170262	4/5/2021	AL	48	F	4/5/2021	4/5/2021	Patient was given dose in right arm; patient bled and stated that she normally doesn't bleed at all; held cotton ball in place for 30 seconds then applied bandaid when bleeding stopped; patient went to stand up and immediately felt dizzy and light headed and said this was abnormal. Pharmacist was called into the room to examine patient. ~1 minute later, eyes rolled back in patient's head and she was no longer verbally responsive. EpiPen was immediately administered and 911 was called. Pulse was faint but present, breathing was labored, and patient began sweating, Around 1 minute after giving epi, patient was responsive enough to give name, dob, time, etc. She could open her eyes, but was still very dizzy. EMT recommended to go ahead with Benadryl oral dose.. Patient was able to swallow 1 25 mg tablet. EMTs arrived within 5 minutes and took over care; her blood pressure was 80/65 and had improved to 108/80 right before she left. The patient told us that she could hear us talking to her the entire time. However, she did not feel the EpiPen injection or realize that she had loss responsiveness. She did agree to go with the EMTs to Medical Center.

1170339	4/5/2021	OH	57	F	3/29/2021	3/31/2021	On Mon 3/29/21, received first dose of vaccine. No adverse side effects. On Tue 3/30/21, upper left arm very sore at sight of injection. On Wed 3/31/21 am, arm no longer sore. Around 2pm, noticed ears were red, swollen and itching (3 out of 10). Took 25mg Benedryl. Didn't observe improvement in symptoms. Around 8pm, observed single dime- and quarter-sized hives at random parts of body (e.g. right front neck, right elbow, behind left knee). Took 25mg Benedryl and applied cold packs to help with itching. Cold packs temporarily helped with itching but there was no change to swelling or redness. By 11pm, eyebrows, eyelids, and under eyes starting to swell and itch. Took another 25mg Benedryl. At 3:30am, took 50mg Benedryl. On Thu 4/1/21 am, eyelids very swollen, ears still swollen, red and itchy, and now had red rash from head to toe. Went to urgent care. Dr. prescribed 20mg Prednisone (1/day), 20mg Famotidine (1/day), and 50mg Benedryl every 4-6 hours. Redness and swelling decreased throughout the day. During evening, itching increased; applied cold packs. During the middle of the night, intense itching (8 out of 10) and burning started on palms of hands and on tops and bottoms of feet. On Fri 4/2/21, eyes and ears less swollen and red rash mostly gone. Nose and lips were now swollen and red. Large groups of hives on neck, shoulder blades, buttocks, outer upper thighs, above both knees, palms of hands, and tops and bottoms of feet. Itching started at 8 out of 10 but improved after taking Prednisone, Famotidine, and Benedryl. Itching picked up in evening but not as bad (4 out of 10). On Sat 4/3/21, hands and feet still itchy. Took Prednisone, Famotidine, and Benedryl. Symptoms improved during day. Didn't need to take Benedryl every 4 hours; took 50mg at bedtime. On Sun 4/4/21, only minor itching on legs. Took Famotidine and Benedryl only in am and pm. On Mon 4/5/21, symptoms almost completely gone. Took Famotidine and Benedryl only in am and pm.

1169563	4/5/2021	CA	39	F	4/2/2021	4/2/2021	Patient received First Dose Moderna lot #030B21A Patient vaccinated without incident and sent to observation lot., RN in the observation lot greeted patient on arrival. Patient stated she was feeling "weird and a little dizzy" Jonetta had her recline her seat and open her window for air. She reported worsening dizziness and called APP (who happened to be very close). APP arrived to car and asked for observation / emergency supply cart. Found patient reclined in passenger seat c/o feeling weird and dizzy. APP noted increased respiratory rate and patient said she felt faint. She then slumped in seat and appeared to lose consciousness for a few seconds. She was breathing although breathing appeared mildly labored. She opened her eyes after a few seconds and began to shiver significantly. Pre-epinephrine assessment by APP: BP WNL, tachycardia and elevated respiratory rate. Skin cold. No wheezes. APP administered 0.3mg of epinephrine IM at 1237 to right thigh through jeans. Patient tolerated well. Vital signs post epinephrine showed an initially high BP and heart rate and then returned to within normal limits 5-10 minutes later. Patient feeling much better after epinephrine. I was assigned clinical site lead, I arrived on scene 3-4 minutes after APP. I called 911 and ambulance arrived within 3-4 minutes. Patient did not want to go to hospital but agreed to get in ambulance for 12 lead EKG and vital signs, all of which were stable. Patient refused hospital. Husband drove her home at approximately 1:30pm. APP called MD on call, they called patient at approximately 2:30pm and reported to APP that she was at home with no further symptoms

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1169848	4/5/2021	OH	31	F	2/20/2021	2/22/2021	2 Days after receiving my 2nd Pfizer shot, I began to have blurred vision in only my right eye. For the first week, it began to get worse a little bit each day making it difficult for me to see out of my right eye. By the end of the first week (February 22 - February 28), my eye sight had gotten so blurred/darkened with my vision in my right eye that I was uncomfortable operating a vehicle. During the week of March 1 - March 7, I did not drive and went to the Eye Institute on March 1st assuming it was a retinal tear or something more serious due to the lack of vision in one eye. There was blurred vision with a darkness that covered the center part of my eyesight. It was very difficult to see if it was bright outside and there were little floaters here and there. I explained this to the urgent care doctor at Eye Institute and they completed retinal scans and various other tests/scans. The doctor did not see anything physically wrong with the eye. For that next week (March 1 - March 7), my vision continued to remain exactly the same where there was a large, dark spot constantly when I looked out of my right eye. As I stated above, it was also very sensitive to light. I went on Monday, March 8th to get a second opinion, but they also could not tell me what was wrong. Exactly 2 weeks after the vision issue started, my vision began to return normally. During the week of March 8th, my right eye regain its vision back to its normal eyesight. By the end of the week (March 13th-ish), I would say my vision was at least 75% back to normal. It is 100% back to normal now and has been for a few weeks now.
1169833	4/5/2021	OH	46	F	3/27/2021	3/27/2021	Patient had peripheral vision problems and some anxiety. The worst side effect is the severe migraine headache she has had for 8 days and counting since she got the vaccine. She has a history of migraines but this one was untreatable and extended into her optic nerve. It was also on both sides of her head rather than just one (which is how it normally is). She went to the emergency room where they can usually treat it. However, this time, their treatment did not work. She said she also has a hard time finding words and is feeling more fearful when she rides her motorcycle. She does not want to ride her motorcycle right now, due to these vision problems and anxiety.

1169830	4/5/2021	OH	45	M	3/11/2021	3/11/2021	Injection was inserted very high in the shoulder. I think the injection may have gone into the bursa. The injection was quite painful. Significant pain within 2 to 3 hours post injection. I could barely move the arm for about 5 days due to overwhelming pain. There were no visual symptoms from this injury. It began resolving after about 5 days and has mostly resolved but I still have some discomfort in the shoulder joint after more than 3 weeks.
1169810	4/5/2021	MA	45	M	3/26/2021	3/27/2021	Moderna COVID-19 Vaccine EUA first dose given at 6pm. Mild pain at injection site within a few hours. 3am (9 hours after injection) I went to the bathroom, and while standing got dizzy and lightheaded tried to sit down. Collapsed while trying to sit down and hit head on bathroom floor. Cut right eyebrow on floor. Tried to get back to bed and was in and out of consciousness for 30-60 seconds per spouse. Vasovagal response symptoms. Cold sweats. I was very thirsty and drank a tall glass of water. 5 minutes later I stood up and went back to bed feeling fine. I slept the rest of the night and felt fine the next day, and for the rest of the weekend with no other symptoms.

1169787	4/5/2021	OH	82	F	2/23/2021	3/18/2021	<p>The patient received her FIRST dose of Moderna COVID vaccine on 1/26/21 and SECOND dose on 2/23/21. On 3/8, she first started to experience shortness of breath, which was attributable to cardiac etiology and diastolic heart failure at the time, but which in retrospect may have been her earliest symptom of new onset myasthenia gravis, which is the AE I am wanting to report. She was hospitalized from 3/8-3/13, and underwent extensive cardiac workup that was negative. She again developed shortness of breath on 3/17/21 and was re-admitted to the hospital on 3/18/21 for diuresis for presumed diastolic heart failure exacerbation, received diuresis from 3/18-3/22/21 but then developed new onset diplopia, at which point I evaluated her in neurological consultation on 3/22. Her brain MRI disclosed an UNrelated incidental small left cerebellar infract, but her neurological exam showed a new R lateral rectus palsy and new moderate to severe left eyelid ptosis, suspicious for myasthenia gravis. Anti-acetylcholinesterase antibodies--- binding, blocking, and modulating, were all sent off and came back all strongly positive on 3/26-27/21. The patient then called stating she had developed recurrent shortness of breath, new onset dysphagia, and worsening double vision. I urgently re-evaluated her in outpatient follow-up in my office on 4/2/21 and sent her immediately to the hospital to be readmitted, where she remains as of this reporting date and she has been receiving IVIG with improvement in her symptoms. She did NOT have any previous known history of eyelid ptosis, dysphagia, diplopia, or muscle weakness. In retrospect, the patient states that her current symptomatology began around 3/7/21 with the benefit of hindsight. I am reporting this event because it is very unusual for an 82 year old WOMAN to develop new onset of myasthenia gravis, and it is a known autoimmune disease, and a vaccine would be a plausible trigger for its development, or trigger for its first symptomatic manifestation. I was also especially concerned because my fellow neurologist, ALSO had a patient develop myasthenia gravis about 2 weeks or so following their second dose of the Pfizer COVID vaccine. It would be an EXTRAORDINARY coincidence for two instances of new onset myasthenia gravis to occur 2 weeks post- vaccination at essentially the same time in an institution of our size, so we both felt obliged to report both cases ASAP to the VAERS. I was not able to reach</p>

1169729	4/5/2021	IA	35	F	1/20/2021	1/20/2021	I had an instant reaction. Within mins of sitting after vaccine. I started feeling hot, and very itchy on my right arm (site). I then noticed I was very red, and itching more and more, around the same time. The nurse had looked over at me that gave vaccine and said you look very red and "are those hives" I had hives on my chest, arms, back, butt, and you could see the red rash/hives visually spreading. Roof of mouth also was itchy. They gave me 2 benadryl and water, asked me to stay and be observed for a half hour or so. I started feeling relief soon after benadryl. But, not full relief until much later that night. I also Had very painful and swollen lymph nodes at injection site, through my right breast and neck. for 3 wks or more. they might still be slightly swollen, but no more pain. Very scary. I had Covid back in November, I had symptoms of not being able to control my body temp since./ After I received vaccine, I also developed covid toes for a few wks and now my feet get very cold and purple almost black from just the slightest cold.
1169722	4/5/2021	MO	52	F	3/17/2021	3/17/2021	Moderna COVID-19 Vaccine EUA - Dose 2 Beginning 8 hours after shot (adverse reaction to first dose began 12 hours after shot), headache, fever, chills, fatigue, terrible all-over body aches, joint pain. Within 24 hours, developed rash on arm near injection site, with blisters and itching, followed by all-over body itching - but no rash other than on arm. This made me and my doctor consider that the first dose likely had a lingering similar effect, because from the time of the first dose I had unexplainable body itching with no rash, moving from place to place, in strange places like mons pubis, elbow pits, breasts, palms of hands/feet, scalp, leg creases, ears, eyeballs, neck...for the entire month. It was just resolving when I got the second vaccine, and the itching flared again...again with no rash EXCEPT at vaccine site. We believe I am having not only an immune response to the vaccine but also some kind of allergic reaction.
1169703	4/5/2021	CO	28	F	4/2/2021	4/2/2021	Headache initiated on day of injection remained dull for 36 hours then exacerbated to migraine type headache with photophobia, Left ocular area pain, x 24 hours persisting at time of visit

1165848	4/4/2021	LA	60	F	3/12/2021	3/1/2021	<p>my body is killing me; body pains; fever/Had a 101 fever at night; experienced ulcer on the side of her tongue; eye stye/I started with some kind of infection like stye something; felt terrible/ I am just feeling bad/Started freaking out; Swollen eyes/more puffy; irritable; stressed/Shot stressed my body; headache; Drug sensitivity/Reaction to medicine; I didn't have a taste; my 'eye' also started getting kind of sore; And then 3 days later, it started with an ulcer in eye; This is a spontaneous report from a contactable consumer, the patient. A 60-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Formulation: Solution for injection, Lot number: EN6204; Expiration Date: 30Jun2021), via an unspecified route of administration, in the left arm on 12Mar2021 around 1:15- 01:20 PM (at the age of 60-years-old) as 0.3 mL, single for covid-19 immunisation. Medical history included arthritis, anxiety and I had the virus in November. Concomitant medications included meloxicam (MOBIC) taken for arthritis as needed; alprazolam (XANAX) at 1 mg daily for anxiety. On an unspecified date in Mar2021, the patient had body pains, had a 101 fever at night, headache, ulcer on tongue, swollen eyes, stye in eye, felt terrible/started freaking out, irritable, drug sensitivity/reaction to medicine, shot stressed my body. Consumer stated, I had gotten the vaccine the other day, Friday. You don't know me but if you know me, I am going to have the side effects and it's going to happen, and it happened. From the next day my body is killing me. I had a 101 fever at night, felt terrible. Anyway, the next day, I felt better, whatever. And then yesterday, I felt pretty good except I started with all of a sudden, I got ulcer on my tongue. Now, I have got like, I don't know a stye happening on my eye and I know, it's all due to that vaccine because I have reactions to the medicines. I got to watch what I do. And I was scared to get this thing anyway, I already didn't want to get the shot and I did it. But anyway, right now, I am just feeling bad because of my tongue and I kind of looked up that and it did say that it can be caused from like a drug sensitivity. I do know it's all because of that." Consumer further stated, "Like 3 days later, I started with some kind of infection like stye something on my eye. Yesterday it started, and also, I have an ulcer on my tongue now. But I guess what I am afraid of, in less than 3 weeks, I have</p>

got to take this vaccine again. The patient had the virus in November, and I did test positive at some point for the antibodies and when I looked up something, as I was running a high fever. I started looking up stuff and it said if you already have a pre-existing immunity which I did due to the antibodies. I believe it's still there because it has been 4 months, but you might get. It says you will get side effects worse; you will get side effects. People that have never got exposed and have antibodies, don't get the side effects but I got them. So, I guess what I am afraid of because now I am like, I know it's a reaction to the medicine. And now I got ulcers on my tongue. And my eye, yesterday it started with the sty thing, and I never get them, it was swollen. I know this was a reaction from that vaccine, I know it was. I don't have fever and none of that no more, the body aches have left me. It was pretty bad, but it left me. But I am scared to get that next vaccine. Consumer stated, my 'eye' also started getting kind of sore and now it's swollen and I know this was a reaction to that because my body did not like that's all I can tell you. I am afraid if I get the next vaccine which was on 02Apr2021 (later confirmed), am I going to get, I am scared that something worse is going to happen to me. Because everybody knows if you had the vaccine, any of them, nobody and they say with the first vaccine usually you don't get anything, it's the second one. Well, I know, it was going to happen to me, and it did happen to me. So, I am scared what's going to happen with the second one. If my body still has antibodies from the virus, it did say or I read, maybe it's not true but what I read, it said 89 or 87% people that have already been having pre-existing immunity which would be me because I had the antibodies, you won't get the side effects more than people that never had the antibodies or had the virus. I didn't have a taste because I was having a high fever initially when I had the virus. It was weird. I cannot explain the feeling. I was laying down that night, that Saturday night, I thought let me check my temperature and it was like 99.5 and then maybe an hour later 100 and at 1:30 in the morning, it was 101 and then a couple of hours later, I checked it and it was like down to 100.5. I was calling a Pharmacist when I started freaking out on that. And they said no, nothing was going to happen. On Sunday morning, it was 99.5 and then when I checked it yesterday, I had nothing, no more fever. But then I

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

started with ulcer and I looked it online and it said that it could be due to the stress and I was very stressed out because of getting a shot. I didn't want to do it and I did it but one of the things, it said a sensitivity to foods and drugs can cause ulcers in the mouth and I know it was that and then my eye, I don't know about the eye, it's swollen underneath. I know this was a reaction, I know it was. Eye was a little worse. I guarantee you, it's due to the shot. Shot stressed my body. That was just my reaction to that shot because it started all the side effects. And then 3 days later, it started with an ulcer in eye. And I guess that it's just too coincidental. It just stressed my body bottom line. The eye was a little bit worse today. The ulcer was going to go away, but it is at its peak right now. I am worried about the eye. It started sore yesterday and then today it is more puffy and I kind of put my contact lenses on it. It's not in the eye. It's on the tissue of bottom lid near the edge of the eye. The patient underwent lab tests and procedures which included blood test which showed okay, everything was okay. Therapeutic measures were taken as a result of ulcer on the tongue included had a mouth wash that she used and had done great to my teeth. The ulcers are going to go away, but the eye was. I am just kind of watching it if it gets like whatever tomorrow. I might go to emergency room. It's not in the eye. It's in the lower lid. It's very tender and close to eye." Consumer further stated, "I want to know an answer. This is really important to me because this time, I have to take a nerve because as soon as they put the needle in me, my nerves, I just had a panic attack. I was scared. I need to know do I need to afraid to get next vaccine because I won't do it if I knew something worse going to happen, I won't do it. I already have the reaction, but I don't want to risk our lives again. I got the side effects. Consumer stated, I'm a little sensitive to the medicines. I keep a check on what do I take. The outcome of the events body pains and fever recovered on Mar2021, ulcer on the side of her tongue, felt terrible/ I am just feeling bad/started freaking out was recovering, swollen eyes/more puffy; eye stye/I started with some kind of infection like stye something; my 'eye' also started getting kind of sore; And then 3 days later, it started with an ulcer in eye was not recovered and other events was unknown. Causality assessment for events had a 101 fever at night, ulcer on

1165892	4/4/2021			U		3/17/2021	<p>were the labs that were run. All the labs came back normal. However, once patient got home after being in the ER for 5 hours, he is very weak, can barely stand and barely walk without human assistance and his walker. The way he is acting is more like he had a stroke. Onset of the events reported as 20Mar2021 11:15 AM. The events resulted in emergency room/department or urgent care. Outcome of the events was not recovered. The patient used walker due to can barely stand and barely walk; for other events, there was no treatment given. The patient was not diagnosed of Covid prior vaccination and has not been tested for Covid post vaccination.</p> <p>anaphylactic reaction; Had heartburn; significant rash; facial swelling; This is a spontaneous report from a contactable physician. A 58-year-old patient of an unspecified gender received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date: unknown), via an unspecified route of administration on 17Mar2021 as single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. It was reported that the patient got the Pfizer covid vaccine 2 days ago. Patient had heartburn then significant rash then facial swelling. Gave her Benadryl and ice and keeping an eye on it, did not give prednisone yet. They were asking for recommendation on how to manage anaphylactic reaction and the time course. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Considering the plausible drug-event temporal association and known safety profile, a contributory role of the suspect product bnt162b2 to the reported Anaphylactic reaction cannot be excluded. Case will be reassessed upon receipt of additional information.</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1165867	4/4/2021	NC	80	M	2/17/2021	2/19/2021	<p>rash all over his body; This is a spontaneous report from a contactable nurse (patient's spouse). An 80-year-old male patient received bnt162b2 (BNT162B2), dose 2 intramuscular at the age of 80-years-old, administered in Arm Left on 17Feb2021 13:30 (Lot Number: EN6201) as a single dose for COVID-19 immunization. Medical history included recently, the patient had retinal detachment and had surgery for that on 18Jan2021, then he had to go back 26Feb2021 to have surgery on the same eye, he has a pacemaker. Concomitant medication included unspecified eye drop. The patient previously received bnt162b2 (BNT162B2), dose 1 intramuscular at the of 80-years-old, administered in Arm Left on 29Jan2021 11:00 (Lot Number: EL9263) as a single dose for COVID-19 immunization. The patient experienced rash all over his body on 19Feb2021. Reporter's husband (patient) has a rash all over his body. The rash has not bothered him. Reporter noticed the rash 3 days after he received the second dose, clarified as she noticed the rash 2 days after he received the second dose. Reporter just happened to walk into the room while patient's shirt was off. She was like "Oh my goodness, what is that." She has looked a couple of more times at patient's rash. After patient first gets out of the shower, his rash is more pronounced. She is not sure if it is because of the warm water or washing up that makes it more pronounced. She can run her hand over the rash and still feel it. The rash had gotten slightly better. Reporter stated that the rash has not concerned her until it has not gone away. Reporter is trying to decide whether or not to take patient to the doctors office since the rash has not went away. The outcome of the event rash was unknown. The event was considered as serious (medically significant).;</p> <p>Sender's Comments: Based on available information, a possible contributory role of subject product, BNT162B2 vaccine cannot be excluded for the reported event of rash, based on temporal relationship and the known product safety profile. There is very limited information provided in this report. This case will be reassessed upon receipt of follow-up information. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any</p>

1165866	4/4/2021	NJ	69	M	3/12/2021	3/1/2021	Eyes began to water and itch; Eyes began to water and itch; Slightly blurred vision; Discharge in both eyes; Sensitive to light; Substantial Fatigue; eye irritation; Involuntary squint; This is a spontaneous report from a contactable consumer, the patient. A 69-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EN6206 and Expiration date: 30Jun2021), via an unspecified route of administration, in the left arm on 12Mar2021 10:45 (at the age of 69-years-old) as 0.3 mL, single dose for covid-19 immunisation. Medical history included high blood pressure, seasonal allergies (He controlled them with Zyrtec), hypertension-mild and pollen and grass allergies. The patient had no allergies to medications, food, or other products. Concomitant medications included amlodipine/losartan (MANUFACTURER UNKNOWN) taken for high blood pressure. The patient did not receive any other vaccines within four weeks prior to the vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. On 12Mar2021, 13:15 the patient eyes began to water and itch, slightly blurred vision, discharge in both eyes, sensitive to light, substantial fatigue. The patient had 2 major side effects. Both occurred about 2 hours after getting the vaccination. Both worsened as the day went on. The patient had involuntary squint because of itchy and watering eyes, dried discharge closing eyes in morning upon rising. They got significantly worse the following day. His eyes began to water and itch, and vision got slightly blurry. He attributed that to his eyes watering constantly. He does not wear glasses and has close to 20/20 even though he was old. He looks at computer and reads a lot. It got worse until Monday, then it abated slightly. It was still substantial. The right eye was worse than left. Two hours after watery and itching, he did not notice any blurry vision. That was later in the afternoon. As he was writing documents on computer and reading printed material was when he noticed it. There was enough discharge from the watering and tearing that when you wake up, you feel your eyes are glued closed. It has improved slightly in one eye. But it was the same or worse in right eye. Sensitivity to light began around 2 hours after the vaccination while he was in the car driving. Substantial fatigue got worse that night

and was moderately bad Saturday, Sunday and Monday. It had abated moderately yesterday and then was worse yesterday and today, but better than the weekend. IT comes and goes and is not continuous. He has never had malaria but thinks it was the same feeling of overwhelming fatigue. He does not have any previous pre-existing conditions. It began with the vaccination. He was not a person of hypochondria and was not particularly worried about this. He was not worried about dying. They are simple side effects with any vaccine. The patient was disturbed when he looked it up. He did not see any symptoms being advertised about eye problems and he was very educated about it. Then when he looked it up, he saw others that had the same thing if not worse. He does not have any information for people that experienced the same thing that he read about online on the internet. Many symptoms that people were reporting were much more severe such as: eyes puffy, face swelling and eyes itchy and crusty. He must have seen 30-35 on two websites that reported and many more on websites on the internet. He then said it could have been 35-40 that he read carefully. Everyone in his family had the vaccine. His son had first dose and experienced no real symptoms. His wife who is a nurse had it 3 weeks ago and only a mild twinge in her arm. She experienced some fatigue yesterday for second dose. It was not really important and nothing that has not been reported. He did not wish to complete report. He was the healthiest person in the family, and he was surprised that he got these side effects. After he got the eye issues, he took Visine. Visine Advanced only clears were up for 10 minutes and then it comes right back. He only used it a few times because it was useless. If the vaccine had not blinded him, he could see the lot number easier. Lot is JJB0300 with expiration Sep2021. It was a total size of 0.284 ounces or 8ml. Visine Advanced gets rid of bloodshot eyes like for drunks. He does not drink though. He would not be willing to send a sample and it was sealed and intact. The patient uses the cetirizine (tablet, 10mg, Lot: 0EE27118 and Expiration date: Jan2022) oral from 13Mar2021 at 10mg twice a day taken for eye problems related to vaccine. The patient has been using and thought it might help with eye irritation. The patient took antihistamine as treatment for the events. The outcome of the event sensitive to light was recovering, eye

A 52-years-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), via an unspecified route of administration, administered in Arm Left on 10Mar2021 (Batch/Lot Number: EN6207) at single dose for covid-19 immunisation. Medical history included Deficiency of Vitamin D. Concomitant medication included colecalciferol (VITAMIN D [COLECALCIFEROL]) at 2000 iU, once a day taken for hypovitaminosis. The patient experienced tested positive for covid-19 and drug ineffective (medically significant) on 16Mar2021. It was reported that patient had the 1st dose of the Pfizer-Biontech Covid-19 Vaccine last 10Mar2021 - 2 days after (12Mar2021) he experienced sinusitis then few days later he developed cough on 16Mar2021. He had tested positive for COVID using rapid test 16Mar2021. He was asking if he was still eligible to get the 2nd dose of the vaccine which is scheduled on 31Mar2021. Consumer also stated that he had symptoms on Friday which were sinus and then Saturday he was not that bad but on Sunday he had sinus, pressure behind his eyes and then slight headache and then his cough, he developed a cough once in a while, then on Monday he had the same symptom it felt like, he was really fatigue, he got tired very easily and then on Tuesday he woke up and it felt better so he work and then he still feel pressure, the slight of pressure and the cough and then he start to get tired again, so he went for the test that night, so yesterday he had and that was how he tested positive. Outcome of the event pressure behind my eyes was not recovered and outcome of other events was unknown.</p>

1165852	4/4/2021		59	F	3/15/2021	3/15/2021	<p>eyes were itchy; hard to breath; lips felt like they were getting puffy and they were bright red; lips felt like they were getting puffy and they were bright red; tongue tingled but didn't swell; heartrate was 112 / heartrate was high; dizzy / lightheaded; vertigo; brain fog; trouble focusing; right arm was itchy and hot where she got the injection; right arm was itchy and hot where she got the injection; had a hard time forming sentences; really tired and sleepy; really tired and sleepy; chills; headache/I felt like my head was kind of throbbing; where the patient's thyroid is was swollen; couldn't really walk; had no balance; ringing in my ears; lost my voice.; This is a spontaneous report received from a contactable consumer, the patient. A 59-year-old-female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 15Mar2021 (at the age of 59-years-old) as a single dose for COVID-19 immunization. Medical history included allergic to a lot of medications/ antihistamines. Concomitant medications were not reported. The patient previously took diphenhydramine (BENADRYL) and was allergic. On 15Mar2021, within 2-3 minutes of vaccination, the patient's heartrate was 112, she started getting dizzy, lightheaded, and had vertigo. Her oxygen level was okay. On 15Mar2021, the patient also had some brain fog and trouble focusing, the right arm was itchy and hot where she got the injection, her eyes were itchy. The patient was then taken back to lie down. It was hard to breathe and she had to take large deep breaths. Her lips felt like they were getting puffy and they were bright red, she had a hard time forming sentences, was really tired and sleepy, had chills and a headache (felt like her head was kind of throbbing). Also, on 15Mar2021, where the patient's thyroid is was swollen, the patient couldn't really walk and had no balance, had ringing in her ears, her tongue tingled but didn't swell, the walls started moving and she lost her voice. The patient was kept for 2 hours and was almost sent to the ER. The patient brought an epinephrine (EPIPEN) but there was concern administering it because her heartrate was high. The patient questioned whether she should receive the second dose as she almost went into anaphylactic shock after the first dose. The clinical outcome of "right arm was itchy and hot where she got the injection" was resolved</p>

1165633	4/4/2021	LA	89	F	1/28/2021		nose ran all day and night too of a clear liquid; sore throat; had a temperature at '98.3, which is a fever for [her]' because 'at 97 that's [her] normal; dry cough; feels a little tired; had some congestions; trouble sometimes with nausea; scratchy throat and the sinuses came; scratchy throat and the sinuses came; she thinks her allergies are acting up again; a little headache; This is a spontaneous report from a contactable consumer or other non hcp. A 89-years-old female patient received bnt162b2 (BNT162B2), dose 1 via an unspecified route of administration, administered in Arm Right on 28Jan2021 (Batch/Lot Number: EL9265) as SINGLE DOSE for covid-19 immunisation. Medical history included A Fib, the patient had a light stroke in Apr a year ago, and she was put on another medication that did not agree with her. But caller has been on Eliquis for over a year now. Her eyes are so bad that she does not read a lot. She has allergies, and the 1 degree fever is normal with her allergies. Concomitant medication(s) included apixaban (ELIQUIS) taken for blood disorder from an unspecified start date and ongoing; metoprolol (METOPROLOL) taken for atrial fibrillation from an unspecified start date and ongoing; losartan potassium (LOSARTAN POTASSIUM) taken for blood pressure abnormal from an unspecified start date and ongoing; acetylsalicylic acid (BABY ASPIRIN) taken for an unspecified indication, start and stop date were not reported. The patient had been on this product for years, more than two years for her heart, for the A Fib. She has been on Losartan potassium for years. The patient stated she is 89 years old, received the first dose of the COVID-19 vaccine on 28Jan2021. She said she didn't read the Fact Sheet until last night and went through the list of side effects of the vaccine. She explained that on Friday and Saturday, her 'nose ran all day and night too' of a 'clear liquid'. She added she had a sore throat. She said she had no fever or chills but had a temperature at '98.3', which is a fever for [her]' because 'at 97 that's [her] normal'. She added she 'developed a dry cough, not an allergy cough like having mucus in [her] throat'. She pursued saying she 'doesn't know about the shortness of breath' and sometimes she 'feels a little tired' but isn't sure if it's related to the vaccine, due to her age. She said regarding headaches, she thinks it was 'not a bad headache' because '[she] remembers putting something

VAERS\_ID RECVDDATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

on her head'. She added she 'had some congestions so [she] took an allergy pill'. She lastly described she had 'trouble sometimes with nausea' but did 'not vomit' and had no 'diarrhea'. She then said she is concerned with her 'clear runny nose' and her 'dry cough', which she also qualified as 'out of the ordinary'. She then mentioned that last night, her room was 'too cold' and therefore she had a 'scratchy throat and the sinuses came'; she said she took a sinus pill. She asked if it is normal to experience a 'clear runny nose' and 'dry cough' after the receipt of the COVID-19 vaccine. Caller asked if she should receive the second dose of the COVID-19 vaccine after her reaction to the first dose. Caller explained that while having her symptoms she was exposed to her son who will get married "on the 28th". She expressed her concern on potentially being infected with COVID and its impact on her son. She asked if you can get COVID from the COVID-19 vaccine. She also asked if she should get tested for COVID given her experience. Caller had her first dose of the COVID vaccine on 28Jan2021. By Friday night, caller had a dry cough, was tired, had a little headache, and a runny nose. Caller is wondering if she had a light case of COVID but caller is hesitant to leave her home to go to the doctor's office for a test because of the cold weather. Caller had her first COVID vaccine on 28Jan2021 at pharmacy and caller stated that the Pharmacist said that she might gets chills and kind of like a fever, but caller did not get that. But, caller states that a couple of days after receiving the vaccine, caller looked at the facts sheet that had been given to her. Caller states that she didn't previously read the facts sheet, until last night, as her eyes are so bad that she does not read a lot. Caller states that she has had a 1 degree fever, but she has allergies, and the 1 degree fever is normal with her allergies. Caller states that her fever is 98.3, so it is not considered a fever really, but she normally runs 97 degrees. Then caller states that few nights ago, Friday night maybe, she got a dry cough, no mucus, just a dry cough, and she coughed for a couple hours but she was in bed, as it was nighttime. Caller states that she was also tired for a few days, as she is 89 years old. But caller states that she is in reasonably good health, and she lives alone and takes care of herself. So caller just had the tiredness and had a little headache, but she did not lose her taste or smell. Caller states that she had a

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

sore throat, and some congestion, and her nose ran for two days. Caller states that her nose was running like clear water for two days, and then it just stopped. Caller states that it is cold and the weather is bad where she is, so she thinks her allergies are acting up again. Caller states that she is wondering if she had a light case of the virus and overcame it, or she is seeking advice about if it would be necessary for her to go out and get tested. Caller states that she can't tell if she got the virus or not, and she does not want to drive and go out in the cold to see her doctor. Caller states that a telehealth appointment is not possible because she got a new laptop but she does not like it, so the laptop is all wrapped up and set aside ready to be returned to (courier name). Caller states that she has two sons who could come over to help her with a telehealth appointment but she does not want them to get COVID, if that is what she has. Caller states that she is also concerned because her granddaughter is getting married on the 26th, and she does not want to give anyone COVID. Caller states that the symptom that really got her was that she had clear water running from her nose for two day and then just stopped, as the caller does not get this symptom with her allergies. Caller also has the sore throat. Caller is wondering if these could have been a side effect from the vaccine. But to be honest, caller thinks that what she has now, she is pretty sure is just her usual allergies. Caller states that she has just been staying home so that she would not get the virus, and so far so good. Caller just keeps herself busy around the house. Caller had no other vaccines on the same day as the COVID vaccine. Caller states that she has A Fib, but she has not been to her doctor in over a year because of the Virus she has not gone out. But caller states that she has not felt bad or anything, she just has not kept up with her yearly visit. No Investigation Assessment. Outcome of the event nose ran all day and night too of a clear liquid was recovered and outcome of all other events was unknown.

1165606	4/4/2021	LA	76	F	1/16/2021	1/17/2021	headache; This is a spontaneous report from a contactable consumer (patient). This 76-year-old female consumer (patient herself) reported that she received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Formulation: Solution for injection, Lot number: EL3246) via an unspecified route in Left arm on 16Jan2021 being 02:34 PM (at the age of 76-years-old) as single dose for COVID-19 immunisation. Relevant medical history and concurrent conditions included Blood pressure high started on 2009, Glaucoma, she had a car accident in 2009 where she got hit from behind that caused issues with her neck and she has this in her right eye, and her doctor put her on a new eyedrop in November, but other than that her meds stayed the same. Concomitant medications were not reported. Patient stated that her husband and her took the first dose of the vaccine on Saturday 16Jan2021. She says she was fine Saturday, then she woke up on Sunday morning with a headache behind her eyes that was not bad but she noticed it most of the day and then at night it was behind her eyes, the top of her head, and behind her head on 17Mar2021 at 07:00. She says she has had headaches all last week, and she took Advil and Tylenol which sometimes helped. She says she finally saw her doctor last Friday on the 22nd because she felt that was a long time for her to have headaches as a result of a vaccine and her doctor had her do a CAT scan to be sure, since she is 76, to check if she might be having a stroke or something. She says she has continued to have headaches, though not as bad as last week, and she was reading the material they got at the hospital because they are supposed to have the second shot 06Feb2021. She says she would like to know, have they had people report having headaches that long. She says she took both Tylenol, clarified to being Equate brand Acetaminophen, and Advil. Equate brand Ibuprofen 200mg: She says she normally doesn't take Advil. Equate brand Acetaminophen: She says she has two bottles one of which she keeps in the bedroom, so she doesn't know which bottle her doses came from. She says both of the Equate brand Acetaminophen bottles are extra strength, 500mg. She says when she took these two medications she was careful not to overtake or take too much, but she can't really tell how much she took. She says she thinks she first took one Tylenol and one Advil, then later that

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

night when it really bothered her, she thinks she took maybe two Advil's and one Tylenol, but she didn't write it down. She says now her headache is not nearly like it was last week. She says that she spoke to her doctor on Friday because she was starting to get concerned about it, but it was not unbearable all day long, she would wake up with it then take something, and during the day it was better, then at night it would be worse. She says this week it mainly bothered her that it was at the back of her head and neck area, since she does have problems sometimes with headaches at the back of her head after she had a car accident in 2009 where she got hit from behind that caused issues with her neck. She says she doesn't have sinus issues, so the headache behind her eyes was odd, and since the information said side effect, it is too big of a coincidence that she got the shot Saturday and she had a headache on Sunday. probably in 2009, and she started taking Amlodipine 5mg then, and then after she retired from teaching her doctor decided she didn't need it and she stopped taking it. She says she has been taking again since about a year and a half ago, in 2018 at the end of the year. Amlodipine NDC/LOT/EXP: Unknown, it was dispensed in a pharmacy bottle, it says use before 14Nov2021. Laboratory tests included CT scan resulted negative on 22Jan2021. The outcome of the event was recovering.

1165619	4/4/2021	OH	58	M	1/21/2021		<p>rash, very mild just itching a little bit on right arm just inside the elbow/rash on both arms; took some Benadryl, it helped him sleep; Swelling in eyes; Eyes watering a lot; eyes red, itchy, and swollen/he deduced that he was having an allergic reaction; eyes red, itchy, and swollen/he deduced that he was having an allergic reaction; eyes red, itchy, and swollen/he deduced that he was having an allergic reaction; This is a spontaneous report from a contactable consumer (patient). A 58-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in arm left on 21Jan2021 (Batch/Lot Number: EL9262) as a single dose for COVID-19 immunization. Medical history included cannot see well out of right eye. There were no concomitant medications. Patient had a rash that appeared a couple days after, very mild just itching a little bit on his right arm just inside the elbow. Patient received the vaccine in the opposite arm in the left arm. Patient is going back on 11Feb2021 for the second dose. It was reported that it is better than being on a ventilator. Patient ruled out everything else the rash could have come from, he didn't change his laundry soap, or anything else. He haven't changed anything since he took the vaccine. He didn't speak to his MD about the rash, because he didn't think about it. He is going to be talking to his Doctor on Monday (unspecified date). He is going to get some calamine lotion but he took some Benadryl, it helped him sleep. It was also reported that the patient had a rash on both arms and swelling in his eyes and he went to the eye doctor who has prescribed him some medication and cream from family doctor. He noticed the rash a couple days after the vaccine and the issues with his eyes too, they were also watering a lot, can hardly see out of the right eye, he had this problem prior to vaccination. The cornea specialist prescribed him some drops, that his eyes were red, itchy, and swollen, he deduced that he was having an allergic reaction. Outcome of the event "took some Benadryl, it helped him sleep" was recovering and of the other events was not recovered. Follow-up attempts are completed. No further information is expected.</p>

1165654	4/4/2021	GA	62	M	1/26/2021	1/27/2021	<p>This is a spontaneous report from a contactable consumer. A 62-year-old male consumer (patient) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Formulation: Solution for injection, Batch/lot number: EL3302, Expiration date: unknown) via an unspecified route of administration in left arm on 26Jan2021 at 14:30 at single dose for COVID-19 Immunization. The patient medical history and family history were none. No prior vaccinations within 4 Weeks. Current condition included, hypochondriac. History Of All Previous Immunizations was Not provided. Additional Vaccines Administered On Same Date Of Pfizer Suspect was reported as no. Concomitant conditions were not reported. On 27Jan2021 patient experienced sore arm, "more pronounced than normal flu shot" On 28Jan2021 patient experienced the events, "nose starting dripping/running", "eyes dry", "dry hacking cough". "sinuses swollen a little bit" the patient said that symptoms were similar to "cold symptoms" and still experiencing nasal drainage and "tickle in throat", "eyes dried out", Paranasal sinus discomfort. Nose dripping stopped after about a week and turned more into sinus pressure. Patient underwent lab test Swab COVID test on 01feb2021, results negative on 02Feb2021. No other testing since the COVID-19 Vaccine. His eyes are dried out and it feels like a cold that progresses into different stages. Arm soreness: lasted two day. More pronounced than flu shots he's received. Lasted through 28Jan2021. Tickle in throat with cough: Has a little tiny bit of irritation still. Not a constant cough. Is talking now and feels like he wants to cough, but doesn't. Nose is not dripping as much. Never been totally stopped up. Feels pressure underneath eyes. Adverse Events did not require Require A Visit To: no, it is just mild, but weird. Relevant Tests included Swab COVID test on 01Feb2021. Negative results came back on 02Feb2021. No other testing since the COVID-19 Vaccine. The patient did not received any treatment for these symptoms. Product Complaint was Yes. Not provided, if a sample of the product available to be returned. No information provided whether product Packaging sealed and intact. Outcome for all events were reported as unknown. No follow-up attempts are possible. No further information is expected.</p>

I have not yet seen a doctor about this reaction, but I did indicate to my eye doctor prior to the cataract surgery on 03/08/2021 that I would be getting my second Moderna vaccination 3 days after. He felt it should be okay. Similarly at the time of my first Moderna vaccination, I told the nurse practitioner that I would be having cataract surgery 3 days prior to the scheduled second vaccination. She also felt it should be okay, as well as having had a reaction to Amoxicillin for the first time about 11 months earlier. That reaction was hives all over the body that kept recurring for 3 weeks

1165739	4/4/2021	ME	51	F	1/20/2021		Memory loss, memory issues; Blurred vision; Severe headache down to her neck; still little bit stumbling/stumbling like couldnot keep her balance like tripping; Hard to get her words out; very lost and confused; very lost and confused; cognitive issues; This is a spontaneous report from a contactable consumer (patient). A 51-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Lot Number: EL3247), via an unspecified route of administration on 20Jan2021 (at the age of 51-years-old) as single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. Consumer stated, "she guess this was the number her doctor told her she needed to call to report side effects from vaccine. She got it on 20Jan2021, first Pfizer vaccine and then two weeks later, she started experiencing memory loss, memory issues, blurred vision and severe headache down to her neck, hard to get her words out, very lost and confused, stumbling like couldnot keep her balance like tripping/ still little bit stumbling, that was after her first vaccine and they sent her to the emergency room, she got an MRI and 'CAT' (not clarified) scan to see as she was having symptoms."Consumer further stated, " she have more information, two weeks after the first dose was when the cognitive issues started and then, a week to the day later, she started feeling herself again maybe 90 percent. Then this afternoon, she got the second vaccine dose and next day she was feeling okay and day and a half later, it all started all over again, headache, back of the head pain, memory loss, blurred vision, all started again. She got an MRI this time and the other day, since then she have severe headache all day, every day, pain down my neck and still little bit stumbling. She went to her neurologist and he said all of her symptoms were symptoms that someone would have with the concussion but she never felt like, she don't have a concussion (hence, concussion not captured as event as consumer was not sure). So, she wanted her to call this number as she said that she believed that memory cognitive issues were all from the vaccine and she guess it was needed to be reported."Outcome of the events were unknow.

1165809	4/4/2021	MO	63	F	1/23/2021	2/1/2021	<p>This is a spontaneous report from a contactable consumer (patient) and also received via Pfizer-sponsored program. A 63-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) on 23Jan2021 14:30 (Batch/Lot Number: EL3247) and second dose on 13Feb2021 14:30 (Batch/Lot Number: EL9264; Expiration Date: 31May2021) both doses given at the age of 63-year-old via unspecified route of administration administered on arm Left as SINGLE DOSE for COVID-19 immunization at the hospital (auditorium attached to a building at a hospital). Medical history included asthma. Concomitant medications included benralizumab (FASENRA) and budesonide, formoterol fumarate (SYMBICORT) both taken for asthma since unknown dates. The patient mentioned that she got both doses- first dose given 23Jan2021 and 2nd dose on 13Feb2021 2nd dose on 13Feb2021 and she was tested positive for COVID infection on 03Mar2021 (Wednesday). She narrated that she went to the doctor's office because she was having wet sneezes, coughing, tired, loss of taste and smell, and fatigue. The sneezing started either Friday or Saturday evening (26Feb or 27Feb2021). She noticed a little coughing started last week, but it was nothing drastic. The coughing would come and pas through. At times, a cough may take her into a deeper version. Then it would go away. Sometimes she would cough a few times back to back, but it was not constant. From when she first experienced the events, they continued to get worse, like the fatigue (felt more fatigued) and realized something was wrong. At She provided these symptoms to the doctor and the doctor informed her even though she had the vaccine still need to get tested for COVID. She did and she was positive for COVID on 03Mar2021 and started isolation. She does not have not fever (only 96 or 97) and she felt she should have had fever, but never did and her lungs were clear. She was given an antibiotic for my nasal passage. She was also given fluids, hydrate, and rest (would lay in bed). Outcome of the events were unknown. Investigation results were also received on 10Mar2021 for PFIZER-BIONTECH COVID-19 VACCINE INJECTABLE Lack Of Effect. Summary of Investigation: The initial scope of the investigation was limited to the reported finished goods lot. The final scope was expanded to include the reported finished goods lot</p>

EL9264, fill lot EL9255, and the formulated drug product lot EL9246. Manufacturing and packaging batch records were reviewed for the reported complaint lot. (Site Name) QO did not receive photographs or a complaint sample for examination. The complaint was not confirmed. There were no planned or unplanned deviations recorded during the manufacture of the complaint lot and associated manufacturing lots that may have caused a complaint of this nature. A review of the manufacturing records confirmed processing steps were performed within pre-established parameters. During formulation of PBS Buffer, there was an undercharge of disodium hydrogen phosphate dihydrate, but this was found to have no impact on product quality. All other raw materials used in the complaint batch were of the correct weight and identity. The drug product is stored at controlled refrigeration throughout the manufacturing process and a log is maintained documenting the elapsed time out of refrigeration. A review of the logs confirmed that all times were within allowable limits. The product also requires storage in ultra-low temperature freezers following the packaging of the product. A review of the freezer temperature log for the reported batch confirmed that all freezer temperatures were within allowable limits. The results of all analytical tests performed at the time of lot release confirmed that the batch meets potency specifications. Not process/vendor related. Final Confirmation Status: Not Confirmed. Batch record review included the reported finished goods lot EL9264, fill lot EL9255, and the bulk formulated drug product EL9246. Acceptable review of related documentation, including manufacturing and packaging batch records and review of release test results at the time of lot release confirmed that there were no issues which may have resulted in a complaint of this nature. Visual examination of a reserve sample would not be expected to indicate the potency of the drug product. A reserve sample was not sent to the QC-lab to determine the amount of active ingredient since the complaint was received within six months of the release date of the involved batch. The results of all analytical tests performed at the time of lot release were confirmed to be within registered specifications. All available stability results for this product were within registered specification and stability studies (including accelerated studies) are ongoing for this product. No lot

trend or other trend identified. As of 10Mar2021, a total of three complaints have been received for this lot and classification. No lot specific trend was identified that would require additional investigation. Conclusion: The complaint for lack of effect of the PFIZER-BIONTECH COVID-19 VACCINE lot EL9264 was investigated. The investigation included a review of manufacturing and packaging batch records, deviation investigations, and an analysis of complaint history for the reported lot and product type. The final scope included the reported finished goods lot EL9264, fill lot EL9255, and the formulated drug product lot EL9246. A complaint sample was not returned. No related quality issues were identified during the investigation. There is no impact on product quality. No root cause or CAPA were identified as the complaint was not confirmed. All release testing performed prior to the release of the reported batch was within specifications.

1167062	4/4/2021	TX	49	F	12/29/2020	1/15/2021	2 days after receiving the 1st dose, I woke up with palpitations. I noticed also that I've been burping too much and have frequent indigestion as if the food stays in my chest area or my upper stomach area. Not comfortable. 5 days after I felt weird so I checked my BP and it's high which goes up to 180's/98. I don't have headaches nor chest pain. When I told my husband he told me our BP machine is broken. So I just diverted my attention to something else. 2 weeks after at around 12:30pm-1:30 pm I was working that time at the hospital, I felt my left eye felt weird so I ask my co worker to look in my eye. I had a bloodshot. My charge nurse told me to check my BP and it was 158/85. I called my doctor and spoke to the office clerk. I went to eat lunch and at around 3:30-4pm, I rechecked my BP it was around 173/95. I called my doctor and was prescribed with clonidine. My husband picked up from pharmacy and I took it.

1166871	4/4/2021	MD	60	F	3/27/2021	3/27/2021	Day 1 - within 5 minutes I felt extremely sleepy and my eyelids were heavy 15 - 20 minutes of receiving the vaccine, I was experiencing itchiness - like hives or from allergic reaction (I had them previously from allergy test reactions and allergic reactions). It was generally all over, but then I started itching under my arms. At that point, we informed the medical person who was monitoring our waiting section. He asked if I had any Benadryl, and I responded that I did. I took 12 ml (?) of Benadryl liquid and the effects subsided somewhat. I slept and when I woke up, I was itchy again and my stomach was cramping. I took more Benadryl and over the next 5 days got better.
1166881	4/4/2021	CO	19	M	4/4/2021	4/4/2021	About 5 minutes after receiving the Moderna COVID vaccine, patient stood up to ask the pharmacy for a cup of water. His eyes rolled back and he gently fell to the ground. Opened his eyes almost immediately after, had a strong pulse and no shortness of breath. Patient states it was just nerves. 911 and store management was called just incase. The paramedics check patient out and released him. Patient's mom came to pick him up.
1166895	4/4/2021	IL	41	U	4/3/2021	4/3/2021	lightheaded, body hot, eyes tight. denies trouble breathing. no vision change
1166917	4/4/2021	CA	51	M	3/30/2021	4/1/2021	I got the vaccine on Tuesday morning. On Thursday morning when I woke up, the skin around my left eye was red (like in a rash) and the eye was swollen. By Friday morning, my other eye was swollen as well and I developed a rash on my upper right chest (very close to the collar bone). By Saturday morning, my symptoms had worsened slightly. I went to urgent care to see a doctor at 1 PM. They were not sure if this was a reaction to the vaccine. They asked me if I had exposure to poison oak, I didn't (although I do have severe allergy to poison oak). They recommended taking Allegra 180mg twice a day. Doctor recommended taking the second dose of the vaccine per plan on 4/20 but starting Allegra 1 day before that and continue to take it until 3 days later. I have occasional itching but no pain.

1166781	4/4/2021	OH	42	F	4/2/2021	4/2/2021	First day nothing really happened just I developed a Bad headache that I needed to sleep a little bit. Was a little bit weak. Did not take anything but felt hot but no fever. Second day I had to work so I woke up very early in the morning tried to go down to pick up some thing and I passed out. I waited 15 minutes and I tried to wake up back again wash my face and I close my eyes and your eyes and my blood pressure played around again and ran to the bed and went back to sleep. All through the day It was impossible for me to get up because of my blood pressure. I stayed sleeping all day almost was watching TV. I canceled school or work you can call it. Every time I would be watching TV I would be sleeping without knowing. So basically all throughout the day I fell asleep. I felt very weak And could not walk at all. The headache would not go away. I felt like I had a cold I felt hot but no fever at all throughout the whole day. My shoulder pain got really bad and my neck but then at the end of the night all that subsided and I got better that was way at night at 8 PM. I then went back to sleep Took a muscle relaxer to make sure that I would sleep throughout the whole night I woke up the third day and I still feel not myself but much way better. When I first got up it was very hard to walk but then I kept going and I survived lol. Just thought to share my story because my first vaccine was not like this at all actually the first date was the hardest for me for my first vaccine this time it was my second day for my second vaccine

1166779	4/4/2021	MD	49	F	3/30/2021	4/3/2021	I am having extremely watery and itchy eyes. Watery eyes is so that water is coming down my face and interfering with my vision a little. I am trying not to scratch my eyes so much. I am using my Olopatadine HCl solution 0.2% and Visine Red Eye Total Comfort Multi-symptom everyday since Saturday April 3, 2021. It is beginning to get very irritating.
1166383	4/4/2021	CT	36	F	4/3/2021	4/3/2021	It started with a sore arm. My left eye hurt to close and skin felt like pins and needles Then headache. Chills, fever, then got really hot. Throwing up body aches. I currently have a pounding head ache stomach hurts and my neck and head hurt.
1166402	4/4/2021	IN	44	F	4/2/2021	4/3/2021	Headache - started just after midnight ~8 hours after injection Muscle Aches - severe on left side Joint pain - severe on left side/elbow Fever - 102 degrees at 4am Took 2 extra strength Tylenol Headache, aches, pains continued not quite as bad Nausea started around 9 am Vomiting & diarrhea about 10 am Nausea continued most of day until 8 pm or so but no more vomiting. Aches, pains, headache continued all day and into the evening. Fever fluctuated between 98.4 and 102.5. Stayed in bed all day with no appetite, kept eyes mostly closed, but couldn't sleep more than ~30 minutes at a time. 9pm finally able to eat a little apple and took 2 more extra strength Tylenol. Still headache, Fever, aches, pains when I went to sleep for night but was able to sleep 2-4 hour increments. 4/4/21 morning ~8 am (about 40 hours post injection) muscle aches and pain improved a lot. Left arm & joint still a little sore. Fever and headache improved. Very weak and tired and no appetite after a day in bed with yesterday's symptoms.

1166368	4/4/2021	GA	54	F	3/18/2021	3/18/2021	Patient says 45 minutes after receiving the vaccine her eyes and lips started swelling, she was burning from head to toe and had localized reaction at the injection site. She had an Epi-Pen on hand due to the previous reaction she had to Shingrix (which again we were not aware of). She used the Epi-Pen, took steroids, and Benadryl.
1166474	4/4/2021	CT	27	F	4/1/2021	4/1/2021	Immediately after receiving the vaccine i began experiencing dizziness, blurry vision, and numbness and tingling in my hands and feet. At the vaccination center they monitored my vitals and made me lie down for 30-40 mins after which i felt much better. Then I took the train home. After getting to my apartment I lay down for a while and when i tried to get up i was very disoriented. I felt extremely dizzy, numbness and tingling was in my whole arms and legs and even my back. it felt like my skin was burning from the inside. Around 4 i began calling the university health center and covid hotlines because i wasn't feeling well at all. During this time i also experienced twitching of my face, hands and feet and a period of confusion - i wasn't able to keep the conversation with my nurse and tell her what my symptoms were. I also had trouble verbalizing. I was told to take Tylenol and ibuprofen. i took them but the fever came back. Severe Stomach pain and nausea I had fever till 4/2 - the highest temperature was 102.4 late in the night on 4/1. on 4/2 i ended up having to call the healthcare again, they thought i should go to the ER, Then i went to urgent who sent me to ER. At the ER i was told this was an extreme reaction due to the vaccine. They monitored me for a few hours and gave me Tylenol and anti-nausea medication and doctors note to rest till 4/5.

1166645	4/4/2021	NJ	32	M	4/3/2021	4/3/2021	<p>Felt a bit odd on the couch, little shiver and what felt like adrenaline. I got up and went into the bathroom where the incident occurred. I used to be on 10mg of Ramipril years ago and moved to 5 due to light headedness when standing up. Yellow tinted vision, bright and sparkly. Getting up too fast with heart pressure meds prescribed for albumin /T1D and not for heart pressure. The secondary use of Ramipril is normal for type 1 diabetes after 20+ years. So I went to 5mg and haven't had that issue since. I should also mention that when this used to happen to me I would lay down and recover with no problem. Back to the incident it felt exactly like that but on steroids. I was in the bathroom looking for Tylenol and I got light headed, yellow tinted vision, bright and sparkly, ringing in the ears, dizzy, and confused. I remember thinking I should probably get down on the tile floor and lay down like I'm used to from the episodes years ago with 10mg Ramipril causing the same symptoms but never anything so extreme. Next thing I know I'm on the ground waking up where I fainted and hit my head pretty hard on the way down. I probably have a minor concussion. Iced my head in the back where I hit it last night and this morning. Surprisingly 0 bumps, etc other than a little bit sore. Trying to remember going down is impossible. There is a strange, I guess it's not strange as I fainted, but to me being 1 moment thinking what I should do then the next moment still thinking that same exact thing but coming to on the bathroom floor with parents yelling over top of me as I was at their house is strange. I recall what almost felt like a dream while I was out but I was wondering why everyone was asking if I was ok, of course I'm ok I thought. Then I realized what happened and crawled around on the floor the rest of the night if I needed anything and was checked every hour through the night which was horrible but necessary. Also my blood glucose was a 220 at the time of the incident according to my CGM so it didn't have to do with low blood sugar. In any case I feel better today but in a fog with a slight headache.</p>

1166716	4/4/2021	VA	53	F	3/19/2021	3/19/2021	Day of vaccine I got a bad headache. I suffer migraines and it was not a migraine, it was my whole head. I had nausea and vomiting that evening and the next day. Headache persisted the next day also. Got chills. Knees hurt. On 3rd day, was better. then got congestion in nose and eyes, similar to allergic reaction to when I'm near a cat. Lasted two days. Knee still hurts and have been flushing for two weeks.
1166703	4/4/2021	IN	27	M	4/2/2021	4/2/2021	Chest pains and shortness of breath started within an hour from vaccination. 3 hours after shot dizziness and chills began. The following day symptoms progressed and lasted all day. Severe dizziness, blurred vision, muscle aches, headaches, chills, shortness of breath, chest pains, sore throat, cough, fatigue, fever(up to 102.5).
1166441	4/4/2021	PA	63	F	4/1/2021	4/1/2021	It was the pfizer vaccine, got a little tingly and light headed which I am accustomed to. I got very tired but I was able to drive home. At home I fell asleep for an hour or two, swelling started in my legs mostly but also arms and all over. They were swollen like balloons and it was difficult to bend the knee. Swelling was visible, white, no redness. Next day my face was swollen and dark bags under my eyes. I have had this swelling before and another bad episode was after surgery with anesthesia. It is still very tight and sore mostly in my knees. Not sure if it is autoimmune reaction or allergy.
1166652	4/4/2021	DC	43	F	3/31/2021	3/31/2021	Lip began tingling at 1PM. By 8PM that night, it was extremely enlarged. Face was swollen next day. Eyes and throat began swelling. Doctor told me to use the epipen on myself since I was salivating a lot. Called the ambulance and was taken to Hospital. Doctor told me that they thought the Lisinopril allergic reaction was activated. It is now Sunday (four days later) and I am experiencing muscle aches in my right arm and nerve pain in my right hand/fingertips. On Saturday, my right arm was twitching and cramping. Felt chills on Friday.

1166595	4/4/2021	FL	44	F	1/22/2021	3/1/2021	intermittent paresthesias and/or numbness of the extremities, varies in degree, location, and duration. The entire hand, arm, foot or leg could have the sensation, just patches and pieces. Initially started as a patch on the left arm but has progressed to the alternating areas and extent as mentioned above. Occasionally into the trunk region and scalp. Intermittent changes in vision/blurring of vision- so much that an eye doctor was seen. New contacts were prescribed, but still having intermittent visual changes where focus is not accurate
1166569	4/4/2021	TX	61	F	3/20/2021	3/31/2021	I developed an itchy red rash on my upper chest area. I took a dose of Allegra to alleviate the symptoms. Two days later I developed an itchy swollen patch on my left upper cheek around my eye and again took a dose of Allegra. Today, 04/04/21, after running 8 miles I developed raised itchy patches on my lower neck and upper chest once again, a raised, red bump on each cheek, as well as raised red itchy patches in three places on my left arm, including near the original vaccination site. Once again I have taken Allegra to alleviate the symptoms.
1166515	4/4/2021		25	F	4/3/2021	4/3/2021	Sweatiness and shortness of breath immediately after vaccination, stood up to go get snack & walked a short distance before getting blurred vision/ringing in ears and then fainted
1166493	4/4/2021	CT	27	F	4/1/2021	4/4/2021	Immediately after - dizziness, headache, blurry vision, numbness and tingling in hands and feet at 4pm - very dizzy and disoriented, tingling in entire arms and legs and lower back, felt like skin was burning (rubbing the area helped) twitching of hands, face and feet confusion and problems verbalizing - i was unable to explain my symptoms to the nurse fever - 100.2 at the time (it increased to 102.3 later in the night) Severe nausea and stomach pain loss of taste scratchy throat pain in lymph nodes severe pain in injection site joints and full body pain - severe
