tolerance was pretty high, to see him double over with headache was unbelievable. He has had no other vaccines on the same day or in the 4 week period prior getting the Covid vaccine. He has had no issues with vaccines in the past. Treatment was Aimovig injection, it's a once a month injection, but she understood that it can take up to weeks for it to actually work. As an ER nurse, she has seen people with a headache and say their pain level was 10 but you know it's not, but in her fiance's case it was definitely 10+, they were also closer together in frequency and it worries her. At the end of the call, she asked that his doctor at VA mentioned the vaccines works with the immune system and can cause inflammation, caller asked if this was true. The outcome of the event was not recovered. Information about lot/batch number has been requested.; Sender's Comments: Considering the plausible drug-event temporal association, a contributory role of the suspect product bnt162b2 to the reported migraine cannot be excluded. Case will be reassessed upon receipt of additional information. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics committees and Investigators, as appropriate.

1261791	4/27/2021	NY	58	M	4/11/2021	4/12/2021	<p>Bells Palsy; This is a spontaneous report from a contactable consumer reporting for husband. A 58-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE) (lot number EW0153/expiration date: 31Jul2021), via an unspecified route of administration, on 11Apr2021 (at the age of 58 years old) as a single dose in the left arm for COVID-19 IMMUNIZATION. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE) (lot number EM8727/expiration date: 31Jul2021), via an unspecified route of administration, on 21Mar2021 (at the age of 58 years old) as a single dose for COVID-19 IMMUNIZATION. Relevant medical history included ongoing hypertension, when he was about 45, probably 10 years and was recovering from leukemia onset 2 years ago, in 2019 and he has been recovering from leukemia since about 2020; the patient had an ongoing history of being a little overweight, with onset unknown other than over 10 years ago. Concomitant medication included nebivolol hydrochloride (BYSTOLIC) 10mg tablet taken by mouth once daily for hypertension. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 12Apr2021, late afternoon the patient experienced swelling in his face, couldn't blink, drooping and was diagnosed with Bells Palsy which required an emergency room visit. He was not admitted to the hospital for this event, was kept under observation only in the emergency room on 12Apr2021. He was given some medication and then discharged. Bell's Palsy affected his right side of his face. The outcome was improved, the pain was a little less; but he still does not have, nothing works on the right side of his face. His right eye does not blink, eyebrow does not move, and he still can't speak very good. Treatment was received for the event. The outcome of the events Bells Palsy was recovering. Since the vaccination, the patient had not been tested for COVID-19.</p>

1261009	4/27/2021	MI	33	F	4/3/2021	4/3/2021	Extreme fatigue a couple hours after receive, maybe around 2p. Took a nap for maybe 2 hours, face started to feel itchy and tight. Around 8pm I look in the mirror and I notice my face looked a little puffy, and tiny bumps around my nose and mouth. The next morning, around 5am, my eyelids and lips were noticeable swollen and the hives (tiny bumps) were covering my face, it was itchy mostly around my nose and mouth. I took Zyrtec every day for three days. The swelling went down after the second day, the hives (tiny bumps) cleared up around day three, my skin was completely normal after about a week. On April 13, I started to feel fatigued ( same way I did after I got the vaccine on the 3rd), the next morning my eyelid and lips were swollen and hives and itchness returned. I contacted doctor and he suggested taking Allegra 24 during the day and Benadryl at night ) if I?m itchy. He almost prescribed prednisone for 3 days,but only take if my face was still swelling the next day. On the 14th, my face was still swelling so I started the prednisone. It took about 4 days for my face to clear up completely

---

patient's cognition seemed well. On 19-MAR-2021, the patient started showing symptoms of blood clot. On 19-MAR-2021 to 22-MAR-2021, the patient was not well. The patient was wearing slippers because she had level 4 pitted edema and was swollen from her knees down including ankle and toes. It was reported that, her swelling was greater on the left side than the right side and she had this swelling on 23-MAR-2021. Also, the patient's confusion returned. On 29-MAR-2021, the patient had confusion and her ultra sound of left leg was normal. On 01-APR-2021, the patient's laboratory data included: diagnostic ultrasound revealing contralateral femoral vein was widely patent. On 03-APR-2021 and 09-APR-2021, the patient was confused and did not know where she was. On 07-APR-2021, her electrocardiogram did not mention anterior infarct and it was abnormal ECG no significant change found. On 10-APR-2021, the patient could not remember where she was. On an unspecified date, the patient had cough and extremely warm sensation in chest and back. The patient was in rehabilitation center and was set to be discharged 16-APR-2021. On 13-APR-2021, the patient's platelet count was 171 (unit not specified). On 17-MAR-2021, In rehabilitation center the patient was no longer wearing shoes due to swelling of ankle, legs toes and feet. The patient's eyes looked puffy and her abdomen was larger. The patient was treated with Lasix (furosemide) in the rehabilitation center. According to the patient's physician, the patient had no sign of stroke. The patient was propped up on right side while at rehabilitation center so according to her daughter the patient was experiencing weakness. At rehabilitation center an ultrasound was ordered for left leg. The patient's both legs were swollen and one was more swollen than the other. The patient was having an issue with memory and confusion which was unusual as the patient had previously been treated neurologist for Alzheimer's disease and dementia and was highly intelligent. At the time of this report, the patient was being treated for low grade bladder infection. The patient's primary care physician reports that she had no concerns about the vaccine being linked to the patient's fall and hospitalization and reported that there were no blood clots, no stroke, no deep vein thrombosis, and no coagulation abnormalities. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The

patient recovered from not well on 22-MAR-2021, was recovering from platelet count decreased, and the outcome of cough, swelling in both legs including ankle and toes, extremely warm sensation in chest and back, confusion, fall, hallucinations, low grade bladder infection, could not feed herself, could not walk, felt tired, dizzy, unable to stand, level 4 pitted edema, could not remember, eyes looked puffy, abdomen was larger, weakness, short term memory loss, bibasilar atelectasis and cardiomegaly was not reported. This report was serious (Hospitalization Caused / Prolonged, and Other Medically Important Condition).; Sender's Comments: v0 This spontaneous report involves a 90-year-old white female patient with the past medical history remarkable for Alzheimer's and dementia who felt tired 3 days after the Janssen COVID-19 Vaccine Ad26.COV2 had administered. The next day the patient had fell, was dizzy and unable to stand. The next, the patient was taken to the emergency room and was diagnosed with a low grade bladder infection. The patient was confused and could not walk and was unable to feed herself. The next day, the patient had hallucinations and her platelet count was 130 (unit non specified), normal range 179-450. While hospitalized, the patient started showing symptoms of blood clot, had pitted edema, could not remember where she was. On an unspecified date, the patient had cough and extremely warm sensation in chest and back. The patient's eyes looked puffy and her abdomen was larger. The patient's primary care physician reports that she had no concerns about the vaccine being linked to the patient's fall and hospitalization and reported that there were no blood clots, no stroke, no deep vein thrombosis, and no coagulation abnormalities. Considering the patient's age, gender – predisposes to urinary tract infections, as well as the underlying Alzheimer's and dementia the causality for the events assessed not related to the vaccine.

1263468	4/27/2021	FL	41	M	3/31/2021	4/12/2021	Dr., reports that pt experience Bells Palsy 12 days post-vaccination. Dr., reported that pt went to Hospital on 4/17/2021 and released same day; pt was prescribed Medrol dose Pak and Acyclovir. Pt was seen by Dr., (general practitioner & ophthalmologist), Dr., discontinued the Medrol dose Pak and Acyclovir and prescribed Prednisone 60/40 to be taken for a week and Valtrex 1 mg to be taken TID x7 days; Dr., also ordered protein spikes for IgM and IgG Herpes Zoster & Herpes Simplex, basic blood test. Pt have follow up appt today with Dr., since pt is starting to develop dry eyes and he cannot close his eyes, pt is prescribed artificial tears drop for use during the day and CELLUVISC eye ointment to used during the night. Dr., recommends that pt refrained from getting the 2nd dose until more is known based on pt.'s condition; from his professional experience Bell's Palsy can dissipate in 4-6 months and not uncommon after post flu vaccination. Advised Dr. per CDC Bell's palsy is not a contraindication to getting 2nd dose of the vaccine. Advised we agreed with his recommendations that pt should postpone his second dose to see if his symptoms dissipate first. 4/21-Spoke to Dr. and he had concerns of patient receiving second vaccination shot. I advised currently per CDC there are no contraindications with vaccine and Bell's Palsy. Recommended for him to contact CDC hotline for further advice and transferred his call to CDC Covid hotline. Dx with Bell's Palsy; feeling more movement on the face today. Working with Dr. in regards to treatment and second dose of Pfizer vaccine. Will contact next week to follow up.

1263480	4/27/2021	MT	17	F	4/21/2021	4/22/2021	At 2am 4/22 patient started to feel sick and sent a text that I didn't read until 630 as I was asleep. She had severe muscle aches, hurt to move, hurt to breathe and felt like she was having a heart attack. She felt like she might pass out and had some blurred vision. At 630am, I saw her texts and immediately brought her 2 tylenol and a large glass of water. She went back to bed. She woke up around 10:45 and was feeling decent except for a headache but no fever or anything so we went to try on some Prom dresses. At the dress shop, she collapsed and had a seizure lasting around a minute. She lost her bladder and was completely confused and incoherent. She's never had a seizure before. I scooped her up, brought her to the ER where they ran every test and scan imaginable. Full blood work up and cultures, a chest xray, a CT scan of her brain and lungs. Her temp was high 103-104 and she had full body chills and a pounding headache. Her BP kept dropping and got as low as 81/36. They threw 2 bags of IV fluids into her and admitted her to the hospital. She had also developed a heart murmur. Over the course of the night, her BP stabilized but her temp continued to spike and come back down with Tylenol/Ibuprofen. She also had IV Tordahl for the headache. Her inflammatory markers were high at 15.3 which we were told should be less than 1. They reran labs in the morning but everything came back really low which they felt was a dilution effect from all the fluids so wanted us to follow up with her primary care on Monday. On Saturday night, her lymph nodes were swollen to the size of ping pong balls but have since slowly reduced in size although still there. Her labs were better from discharge and her white blood cell count was within range and her inflammatory marker was down to 1.7. Her blood sugar was a little low. She did pass out and have seizure like response to giving blood in the doctors office, lost bladder control again, shot pupils, etc. She is still stuttering over words, has some short term memory retention and has some motor function issues which they think is a result of the initial seizure and should resolve itself over time. Her liver function tests were totally normal in the hospital but are a high now so they will be checking her out again next week.

1263540	4/27/2021	IN	70	F	4/25/2021	4/25/2021	Within 10 minutes of getting the vaccine I started having hay fever- like symptoms. Sinus drainage, itchy, burning eyes, runny nose, scratchy throat, hoarse voice. This lasted for several hours. It again worsened during the night and next day I had bouts of nausea and some head ache.
1263944	4/27/2021	MN	37	M	4/8/2021	4/14/2021	4/8 Vaccination 4/14 7:30 in the morning, I was driving my son to school. I got this really bad HA on R side of head. Went away quickly. Left side of face was left numb. I quickly did a neuro check; I could move fingers, eyes, etc. I called nurse and told to go to the ER. At the ER, Covid test; neg, CT scan, MRI, blood work; all normal. Something happened to the nerve on that side of my face, trigeminal nerve. It took a couple days for the numbness to dissipate. But I do still have some pain on the L side of my face. Told to follow up with PCM; scheduled for 4/29/2021
1263949	4/27/2021	TX	45	F	3/11/2021	3/11/2021	Occurred over 3 days:nausea, tunnel vision, ringing in the ears, lightheadedness, racing pulse, clamminess but not diaphoresis. Pain, heat induration, redness and itching at injection site. Itching from injection site moving up arm to neck, side of face and hair. Itching to inside of mouth and lips. Feeling of heaviness and weakness to arms and legs. Chest heaviness and increased work of breathing. I wasn't breathing faster, but I was aware of the fact that I had to work harder to breath. As I said, these symptoms occurred over three days. The Friday I went to the ED at Hospital. I arrived around 14:45 and I think it was somewhere around 20:30 when I left.
1263965	4/27/2021	TN	16	F	3/22/2021	3/22/2021	Nurse was giving injection and small amount splashed into patient's eye. PT C/O BURNING. Mom flushed eye with bottle of water from car. Eye was flushed with saline by medical personnel. Eye was not red swollen or drainage was noted.

1264107	4/27/2021	CT	53	F	4/20/2021	4/20/2021	A few hours after the vaccination I started to feel dizzy and get a headache. I woke a few hours later about midnight and my head was swollen on top and a very bad headache on top of my head, above, through and around my right eye. I was throwing up and had shaking and chills. My knees and shins were very sore. My hips and lower back and groin area were very sore. I was not able to go to work the next day. Around 9PM the day after the vaccination my symptoms began to clear. However the next day my headache was still too severe to go to work and I had a rash with large itchy bumps on my right elbow which is the same spot I have scars from when I was 10 years old and a suspected case of shingles. Today it is one week after the vaccination and I am still getting headaches on my right head and eye and also my teeth and jaw are sore.
1264148	4/27/2021	TX	16	M	4/23/2021	4/25/2021	Extensive hives, joint swelling; swelling over left eye. I saw him on 4/26/21. He had some minor hives. I prescribed an epiPen, prednisone (40 mg daily), and benadryl (25 mg tid prn rash, hives). He came back on 4/27/21. He had more hives, swollen left upper eyelid, joint pain, difficulty walking because of hives on soles of feet. He had no respiratory distress. His chest was clear. I admitted him on 4/27/21 to the Hospital.
1264207	4/27/2021	IL	53	F	3/22/2021	3/23/2021	BP went up to 210/111 the day after vaccine was administered. On 4/24/2021 patient went to ER for double vision. BP was 200/100's again. Given IV BP meds, did CT scan that showed no abnormalities noted. K+ was 2.9. On Sunday, 4/25/21 back to ER for double vision again. BP 160/90's. Observed, given more BP meds and sent home again. Went to PCP, clinic 4/26 who referred to Ophthalmologist. Ophthalmology, found optic nerve damage and believes related to mini stroke possibly from Covid vaccine.

1264700	4/27/2021	TX	25	F	3/18/2021	3/18/2021	platelets were incredibly low at 16; RBC was 3.25; Autoimmune hemolytic anemia; Idiopathic thrombocytopenic purpura; yellowing of both eyes; felt tired/increasing fatigue; This spontaneous case was reported by a consumer and describes the occurrence of PLATELET COUNT DECREASED (platelets were incredibly low at 16), RED BLOOD CELL COUNT ABNORMAL (RBC was 3.25), AUTOIMMUNE HAEMOLYTIC ANAEMIA (Autoimmune hemolytic anemia) and IMMUNE THROMBOCYTOPENIA (Idiopathic thrombocytopenic purpura) in a 25-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 008B212A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 18-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) .5 ml. On 18-Mar-2021, the patient experienced FATIGUE (felt tired/increasing fatigue). On 27-Mar-2021, the patient experienced EYE COLOUR CHANGE (yellowing of both eyes). On 28-Mar-2021, the patient experienced PLATELET COUNT DECREASED (platelets were incredibly low at 16) (seriousness criteria hospitalization and medically significant) and RED BLOOD CELL COUNT ABNORMAL (RBC was 3.25) (seriousness criteria hospitalization and medically significant). On 05-Apr-2021, the patient experienced AUTOIMMUNE HAEMOLYTIC ANAEMIA (Autoimmune hemolytic anemia) (seriousness criterion medically significant) and IMMUNE THROMBOCYTOPENIA (Idiopathic thrombocytopenic purpura) (seriousness criterion medically significant). On 16-Apr-2021, PLATELET COUNT DECREASED (platelets were incredibly low at 16) outcome was unknown. At the time of the report, RED BLOOD CELL COUNT ABNORMAL (RBC was 3.25), EYE COLOUR CHANGE (yellowing of both eyes) and FATIGUE (felt tired/increasing fatigue) outcome was unknown and AUTOIMMUNE HAEMOLYTIC ANAEMIA (Autoimmune hemolytic anemia) and IMMUNE THROMBOCYTOPENIA (Idiopathic thrombocytopenic purpura) had not resolved. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 28-Mar-2021, Platelet count decreased: 16 (Low) Low. On 28-Mar-2021, Red blood cell count: 3.25 (Low)

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

Low. On 05-Apr-2021, Platelet count decreased: 90 (Inconclusive) 90. On 05-Apr-2021, Red blood cell count: 2.76 (Inconclusive) 2.76. On 16-Apr-2021, Platelet count decreased: 329 (Inconclusive) 329. On 16-Apr-2021, Red blood cell count: 3.47 (Inconclusive) 3.47. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. On either 23 Mar 2021 or 24 Mar 2021 (described as around the 5th or 6th day), the patient noticed bruises on both arms (described as 1 or 2 petechiae on chest, "a little bit on right leg," petechiae on both forearm but mostly on the left one, "a little bit on both arms but mostly on the left"). On 24Mar2021, the patient noticed a bruise on lower back. On 26 Mar 2021, the patient noticed bruising on both sides of both knees. On 27 Mar 2021, the patient had yellowing of both eyes. On 28 Mar 2021, the patient had increasing fatigue and saw their Nurse, who advised her to go to the emergency room to get blood tests. When the patient arrived at the emergency room, the patient had bruises on calves, and their platelets were incredibly low at 16, RBC was 3.25. While admitted, the patient had daily blood tests because the patient was notified that the "immune system started attacking red blood cells". The patient was initially treated with steroids, but didn't respond to steroids; then, the patient was treated with IVIG and responded. On 01 Apr 2021, the patient received a platelet transfusion and red blood cell transfusion. On 05 Apr 2021, the patient's platelets went up to 90, and RBCs were at 2.76. On 05 Apr 2021 around 1600, the patient was discharged with an official diagnosed with idiopathic thrombocytopenic purpura and autoimmune hemolytic anemia. On 16 Apr 2021, the patient's platelets were 329 and red blood cells were 3.47. Company comment: Based on current available information and the temporal association between product use and the start date of the events a causal relationship cannot be excluded.

1262430	4/27/2021	AZ	62	F	3/18/2021	3/19/2021	Day vaccine was administered to patient the only effective on that date was Tired and drowsiness were experienced. in the late afternoon this condition was only intensified . The next business day was difficult due to a Migraine that was in full force on that Friday. Patient was unable to perform any actions including Work from home. Patient slept for the next 20 hours. Other than sleep no other actions were committed. On that date 3/19/2021 it was noticed that her eyes were sensitive to Light and were also very puffy.. On the Sunday there was little and or no change still sensitive to light and the puffiness was still felt but the eyes were so swollen that it was almost impossible to open them. The Urgent care patient went to on the Sunday was the initial with Healthcare facility
1262258	4/27/2021	TX	21	M	4/26/2021	4/26/2021	Systemic: Dizziness / Lightheadness-Medium, Systemic: Nausea-Mild, Systemic: Visual Changes/Disturbances-Mild, Additional Details: Patient reported that he felt bad at the end of his 15 minutes seated observation time. He reported that he felt light-headed/dizzy, had some nausea, had red dots in visual field, and he appeared pale. Patient was encouraged to stay seated. He consented to transitioning to lying down on a couch and hydrating with a water bottle. BP was within normal limits. He did not faint. After ~15 minutes of lying down he felt recovered and normal. Patient was able to walk out fine with his friend.
1262196	4/27/2021	WA	57	F	3/14/2021	3/18/2021	I had a rash from the shot and an immediate headache in my temple right above my eye. I started to get Migraines which became very painful four days after the vaccine. I had to go to the ER because the pain was so bad one day that I almost passed out. It is a much different pain than my normal Migraines my left arm and leg were numb. I have been getting Migraines daily for five weeks now. I have been trying to control my diet and switched medication in an effort to control the Migraines. The medication helps a little if I take it early. I also still get a little of the numbness in the left side of my body. All services provided by insurance company.

1262233	4/27/2021	WA	45	F	4/17/2021	4/17/2021	Dr consult EMS called to assess via 911 Dr visit in person Urgent Care Trouble breathing, dizziness, heart pain, numbness and tingling in extremities, blurred vision, muscle spasms, poor muscle tone, rapid heart rate, drop in blood pressure, elevated heart pressure, trouble talking, brain fog, intestinal upset, cold sweats, tremor, poor coordination, restlessness, fatigue Onset at time of vaccine administration Labeled NOT anaphylaxis
1262222	4/27/2021	TX	35	F	4/21/2021	4/24/2021	I woke up with neck pain on the right side of the back of my neck on Sat 4/24. Thinking I just "slept wrong", I ignored this symptom initially. Over the course of Sunday and Monday, this neck pain worsened culminating in severe pain by Monday afternoon with significant decreased ROM (inability to turn my head from side). At approx 1800, while inactive and sitting, I lost vision in my left eye. Since I am fairly recently post partum (delivered 3/20/21), I took my blood pressure as a precaution. My initial reading was 161/108 with repeat 5min later 156/106. I was instructed to go to the nearest ER. My BPs there were 171/86 and 166/96. Labs and diagnostic imaging were performed and I rec'd IV fluids, Reglan, and IV Tylenol. I was discharged around 0045 with a diagnosis of Migraine Headache. I woke up on Tuesday 4/27 with a worsening headache. My BP was 148/91, 141/100 and 130/100 throughout the morning. I was seen by my chiropractor in an attempt to resolve the neck pain around noon, my BP afterwards was 149/99 142/97-No resolution of headache. At this point I was instructed to go to Medical Facility for further testing and admission to the women's services unit. My BP just prior to admission was 146/107. I was admitted, given an IV infusion of magnesium sulfate and am currently inpatient with plans to be discharged tomorrow.

1263321	4/27/2021	MN	42	M	4/2/2021	4/10/2021	On 4/10 I started feeling tired with muscle aches. A few days later my skin started to hurt. Clothing was uncomfortable when it moved across my skin. Those symptoms lasted about a week. Then as they started to lessen I had some back pain (Sciatic) and a sore throat. Also the muscles behind my eyes were slightly painful and bright lights were uncomfortable. Then about 4/21 most of the symptoms reduced and I was feeling close to normal. Then on 4/22 I was brushing my teeth and noticed that I couldn't spit water like normal. I called my GP doc and she recommended I head to the ER. After thinking about it I also remember on 4/21 while drinking something I had some water squirt out of my lips. At the time I thought I was just being clumsy but in hindsight the muscle weakness in my face started on 4/20. I checked into the ER on 4/22. When I checked into the hospital my facial weakness was very difficult to notice. By the evening of 4/22 it was noticeable if I tried to ?show my teeth? or make a big smile. By the morning of 4/23 it was very noticeable. The morning of 4/24 I couldn't move my lips, nose or eyebrows. My tongue, jaw and throat were not impacted at all. I was started on plasmapheresis on 4/24. I had another treatment on 4/25. I noticed facial weakness was very slightly recovering the evening of 4/25. By 4/27 my facial weakness is still healing with noticeable improvement day to day.

1264400	4/27/2021	RI	20	F	3/20/2021		<p>WORSE ASTHMA; RED SPOTS ON ARMS/LEG/CHEST/CHIN/NECK; CONSTRICTING PUPILS; DILATED PUPILS; SEVERE MIGRAINE; BLACK SPOTS IN VISION; NECK PAIN; LIGHT-HEADEDNESS; NECK WEAKNESS; NAUSEOUS; LIGHT BRUISING ON LEG/ARM; FELT LIKE HIT BY MACK TRUCK; SEVERE ABDOMINAL PAIN; FATIGUE; ALLERGIC REACTION; This spontaneous report received from a patient concerned a 21 year old female. The patient's height, and weight were not reported. The patient's concurrent conditions included asthma. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1808609, and expiry: unknown) dose was not reported, 1 total administered on 20-MAR-2021 to right arm for prophylactic vaccination. Concomitant medications included omeprazole for abdominal pain. On 20-MAR-2021 two minutes after the vaccination, the patient had allergic reaction started with itching and redness on arms and upper chest. After ten minutes, the patient felt something wrong and consulted onsite EMT(emergency medical technician). Later the redness turned to hives with itchy to burning sensation. The EMT (emergency medical technician) was given intravenous Benadryl to the patient and hives got disappeared and redness remained. On the same day the patient went to the Emergency Room(ER) and stayed around seven hours. Pepcid and prednisone was given to the patient in ER (Emergency Room). The patient experienced chest tightness and warm and again Benadryl administered to the patient. The patient was also given Epipen while going home. On 21-MAR-2021, the patient experienced fatigue. On 22-MAR-2021, the patient had severe abdominal pain with 7-8 on pain scale, the abdominal pain was lasted for 24 hours and went away. The patient has been on Prilosec for the abdominal pain since a month. On 26- MAR-2021, the patient felt like hit by mack truck and fatigue. On 29-MAR-2021, the patient experienced light bruising legs far more easily than usual and had a bruise where she wore watch, but it was not deep bruising. On 05-APR-2021, the patient experienced black spot on vision in both eyes around 18:00-19:00 at night until went to bed, and lasted for 4 days. On 05-APR-2021, the patient experienced lightheaded and motion sickness when sitting or standing still; the patient also</p>

							had neck pain. The patient's neck weakness was felt like the patient's head was going to fall off. The patient experienced neck weakness about once in a week around 15 minutes and also felt nauseous. On 09-APR-2021, the patient had severe migraine with light and sound sensitivity and had rapidly dilating pupils. The patient administered cocktail of medicine Benadryl, Toradol, and Compazine and this medicines helped the patient little bit with the pain. On 9-APR-2021, the patient experienced trouble reading for 2 days due to the dilatation of the both eyes. On an unspecified date, the patient experienced worse asthma than usual, and red spots on arms, leg, chest, chin, and neck. The spots were darker and shinier than usual. Other treatment medications (dates unspecified) included: Medrol for migraine. The patient had visited emergency room for allergic reaction. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from black spots in vision on 09-APR-2021, constricting pupils, and dilated pupils on 10-APR-2021, and severe abdominal pain on 23-MAR-2021, had not recovered from fatigue, light-headedness, nauseous, neck pain, severe migraine, light bruising on leg/arm, worse asthma, red spots on arms/leg/chest/chin/neck, and neck weakness, and the outcome of allergic reaction and felt like hit by a truck was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: 20210436540-covid-19 vaccine ad26.cov2.s-Allergic reaction. This event(s) is labeled per RSI and is therefore considered potentially related.

1263131	4/27/2021	NY	18	M	4/27/2021	4/27/2021	<p>Recipient received dose #2 vaccine today, and almost immediately had response with witnessed seizure-like activity, with posturing, tonic-clonic movement of his upper extremities, and eye movement with lateral nystagmus. Loss of consciousness was noted. Symptoms lasted approximately 15-30 seconds, and patient was placed in a reclined position. He regained consciousness quickly and became pale and diaphoretic. He was normally responsive and answered questions appropriately. Initial BP 74/32, HR 38, SpO2 98%. He drank some Gatorade and had improvement of symptoms gradually over 15-20 minutes. Repeat BP 100/58, HR 78. No past history of seizures. One prior syncopal event after pain response with sports injury. No prior difficulty with dose #1. After recovery, patient reported immediate pain with vaccine administration, then vision went blurry and he lost consciousness. Mother was driving the vehicle, and she witness symptoms as well as nursing staff in the vaccine pod. After recovery, options for further medical evaluation were discussed given complicated vasovagal response with seizure-like activity, mother called pediatrician to see if he could be seen, they recommended ER. Mother chose to drive by personal vehicle, rather than EMS transport. Symptoms were fully resolved and patient was transported to ER for further evaluation by personal vehicle.</p>

1263100	4/27/2021	FL	42	F	4/13/2021	4/14/2021	42-year-old female with previous history of chronic/refractory immune thrombocytopenic purpura (ITP). She received the Moderna COVID-19 vaccination on 4/13/2021 and subsequently developed headache, photophobia, diplopia and blurry vision. She had outpatient labs 4/14/2021 with a platelet count of 8000 and presented to the emergency room. She was seen by hematology/oncology and was started on high-dose dexamethasone for 4 days, IVIG x2 doses with an excellent response. Platelet count on discharge was above 200,000. Due to the headache and visual disturbance MRI and MRV was obtained which showed no evidence of cavernous sinus thrombosis however there was a question of idiopathic intracranial hypertension and ophthalmology and neurology was consulted. She had a fundoscopic exam with no evidence of papilledema. Her headache slightly improved with acetaminophen and hydrocodone. The patient was cleared for discharge home by hematology/oncology and will follow up with them in 1 week.

1257995	4/26/2021	NJ	36	F	4/20/2021	4/20/2021	Had vaccine, first feeling the cold, and stayed on the couch. Then a burning sensation was felt in her legs and throughout her body. She felt hot/burning sensation. She took off her clothes as she had that sensation to feel more comfortable as she felt the clothes felt like pins and needles. Then she had problems falling to sleep. Her arm was hurting as well, and then had a mild headache. She woke up early around 5:00 AM, and her arm was hurting to the point that she could lift it. She had pain in the muscles of her legs, thighs, calf and then her stomach started aching, and her whole body was aching. The arm was still unable to move, headache, and stayed in the bed all day, was very very tired as well. The next day she felt so tired, stayed in bed, body aches, headache, and then she started noticing her vision was going. Very very blurry vision on 4/21/21, and sensation to the light. She was this way all day Wednesday and still problems on the light. On 4/23/21, she was still tired, her arm was not hurting as much. When she woke up her extremities were shaky. Today her arms are shaking, her vision was tweeking and she could feel it, and also the headaches. She called her doctor on the 24th, and told him her symptoms. Her vision is bad to the point that she cannot use her phone as she cannot see, focus well and has blurry vision. Yesterday at 4:00 Am she went to the hospital and they kept her over night. They ran blood work, then they took an MRI of her brain, head MRI, and did not see anything of concern and told her to FU with a Neurologist. to have further tests done but as she is pregnant (5-6) weeks they would probably have to wait. Some of her side effects are still there, but has nausea and feels that her vision continues to be bad, and daily she wakes up and is worsening. She has slight dizziness, and headaches, and feeling shaky. She has not seen her doctor as far as her pregnancy yet, but has an APT on 6/10/21. She has an APT to see her PCP on Friday, 4/30/21 at 9:00 AM.

1258564	4/26/2021	NY	51	M	3/24/2021	3/26/2021	<p>State opened Covid vaccines to 50 and over on Mon, March 22. I immediately scheduled my appointment for a first shot at a Dept of Health site near me for Wed, March 24. I had no immediate negative side effects. When I woke on Fri, March 26 and commenced my day of remote work from home, I noticed my left eye vision was blurry. I proceeded to work that day and continued my normal activities into the weekend assuming my vision would self-correct. By Sunday, March 26, my left eye vision was still noticeably problematic so I scheduled to see an optometrist whom I had seen before. I saw him at 12:15pm on Tues, March 30. After running numerous vision tests, optometrist let me know my vision loss in the left eye seemed to be the result of a stroke that had cut blood flow in the optic nerve and damaged my vision in the lower portions of the left eye. The center and upper portions of my left eye were generally unaffected at that time. He suggested I see my primary care physician to check for vitals, such as blood pressure and do other blood work, and more importantly see a neuro ophthalmologist urgently. The next morning, Wed, March 31 I saw my PCP, who informed me my blood pressure was normal, requested blood work, and gave me a prescription for an MRI of my brain, with and without contrast. I am 6'2" and I weighed at 239, about where it has been for most of last 15 years. I also complained of pain and stiffness in my front right thigh and lower right back. She said if I didn't get an appointment to see a neuro ophthalmologist that same afternoon, she recommended I go to an ER. With the help of Optometrist's office, I was able to get an appointment that day with Dr., neuro ophthalmologist at 2:15pm on Wed, March 31. His office repeated numerous vision tests and confirmed the left eye vision loss (essentially the lower half excluding the center) and diagnosed it as a NAION - non arthritic ischemic optic neuropathy. With this diagnosis, there was no treatment, and I scheduled a follow-up for May 12. He said that my optic nerve into my left eye would slowly reduce its swelling over the next 6 to 8 weeks and in that time, my vision could remain the same, or improve. At that point, I didn't think it would worsen, but sadly that later happened. In addition to the the first MRI that PCP prescribed, Neuro ophthalmologist prescribed a second MRI of orbits, with and without contrast. He also</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

suggested I begin taking a low dose Aspirin daily, which I did. The next week, the blood work revealed a very slightly elevated cholesterol reading. I was told by my PCP on April 5 that this would normally not be considered as a problematic level of high cholesterol, but should be improved or lowered. The blood tests taken at Lab on Fri, April 2 revealed a LDL Chol, Calculated as 111, whereby <100 was considered desirable range. Other than that, there was nothing of concern in my blood work. The two MRIs were done on April 9 and April 20, and did not reveal findings which doctors felt would have impacted my optic nerve swelling or had caused the eye stroke. Out of precaution, I scheduled to see a cardiologist on Tues, April 13. She recommended I start taking Crestor for cholesterol, and do a series of tests which I completed on Friday, April 23 - echocardiogram; holter monitor; transesophageal echocardiogram; and ultrasound carotid bilateral. As of today, Mon, April 26 I do not know the results of the cardio work-up, but both neuro ophthalmologists I saw felt that a problem related to my heart would not have caused this stroke in my eye. Finally, on Fri, April 23 I had a consultation with a second highly recommended neuro ophthalmologist. After a series of vision tests, she agreed with other doctor's diagnosis of NAION - non arthritic ischemic optic neuropathy. She also said there was nothing I could do to treat except wait for the next 4 or more weeks for the optic nerve swelling to go down. She also confirmed my fear which was that my left eye vision had worsened since March 31 as my vision loss was no longer limited to the lower portion of my left eye, but now included blind spots throughout the upper range of my left eye vision, making my loss of peripheral vision worse and more widespread. She said in some cases with NAION, a patient's vision could remain the same, could improve or could worsen in the 6 to 8 weeks after the event. Four weeks after the March 26 event, by April 23 my left eye vision had worsened. I still hold out hope that it can improve some in the next four weeks... My right eye vision was not affected in any way, although one risk of NAION is that there is a 20% (?) chance it may recur in the next 5 years, and if it does, it most commonly affects the other, good eye. None of the doctors I saw directly attributed my vision loss to the Moderna vaccine taken on March 24; however, there has also not been a clear

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							cause determined by my doctors. While most of the doctors I saw seemed to think it coincidental, none also was able to absolutely rule it out either as a cause or a trigger. Dr. suggested I follow through with this idea, which other medical professionals suggested, to submit this vaccine adverse event report. Without a doubt, this was an adverse effect and/or problem that occurred soon after (36 hours approximately) taking the first dose of the Moderna vaccine.
1258196	4/26/2021	VA	33	F	4/1/2021	4/17/2021	Patient developed blurry vision and headaches 16 days after her vaccine. went to the ER a week later and was diagnosed with Optic Neuritis via CT imaging

1257362	4/26/2021	NY	68	F	3/2/2021	3/2/2021	The one that began on 3/2/2021 and continues non-stop is a headache with head pressure 24 hours per day, 7 days per week. Now, I was diagnosed with Shingles on 4/14/2021. Starting at 8:30 PM on 3/2/2021, I had dizzy spells that subsided on 4/14/21. I also had groin pain which lasted until recently. Other symptoms on 3/2/2021 which lasted a few days were: high temperature, intense arm pain at injection site, teeth hurt, neck hurt, sinus pain & pressure, ear pressure, chills, intense nausea, leg pains especially of right leg on which I could not put pressure or weight, balance issues, exhaustion, rash on face & around eyes, across nose & on cheeks
1258080	4/26/2021		80	F	2/24/2021	3/30/2021	Severe eye pain requiring prednisolone eye drops, per patient could have resulted in vision loss. One eye only.
1257709	4/26/2021	FL	59	M	4/18/2021	4/21/2021	Started not feeling well on Wednesday, April 21st. Have gotten worse and have had a fever (100) for the last 2 days. Body aches, head ache, congestion, burning eyes.
1257704	4/26/2021	IN	39	M	4/24/2021	4/25/2021	Dizziness, coughing, mild headache, and pain behind eyes - took Tylenol Daytime Cold Tablets twice during day - 4/25/21

1257661	4/26/2021	NY	34	F	4/22/2021	4/22/2021	around 2 hours after the shot I developed a headache. I suffer from chronic migraines but this way way more intense than my normal ones. the pain was all over my head, I had vision changes being very blurry and cloudy. the pain shot all the way down my neck. i had to go to urgent care expecting to get a toradol shot and go home. instead was sent via ambulance to the ER in fear i may have had a bleed. i ended up in the ER on saturday 4/24/21. they never gave me a CAT scan i was sent over there for. instead made me sit there for 2 hours in room before being seen. then came in said here's some meds and made me wait another 2 hours. i was discharged faster than it took them to take my copay for the visit! so for having a blinding headache for 2 days they didnt take it very seriously. on top of the headache i had sever muscle and joint pain to the point i couldnt move. i couldnt keep food down either.

1260371	4/26/2021	CA	62	M	4/1/2021	4/10/2021	Patient states he received J&J vaccine on 4/1; on 4/10 he had nonradiating persistent low back pain. A few days after that (on 4/13) he felt numbness and pain in his legs, in addition to ?decreased sensation in his inner thighs. These sensations were migratory and intermittent. Also noted in his upper extremities as well. He also had issues with temperature sensation in his lower extremities. On 4/14 he had slight haziness in vision while driving which resolved after 30-60min and has not recurred. He also had slight difficulty walking. On 4/15 he had an appointment with his PMD; had L-spine XR which revealed moderate lower lumbar facet arthritis, and was thought that change in sensation was likely d/t radiculopathy - was prescribed ibuprofen, muscle relaxant, oxycodone (took oxy x1, ibuprofen for a few days). Since then he has also had intermittent stabbing pains in various parts of his body which resolved spontaneously. On 4/17-4/18 his back pain resolved. On 4/18 at 4:30am he woke up with R-sided facial weakness. He has not had focal weakness aside from the face. Was seen in ED that morning for this R-sided facial droop involving the forehead, diagnosed with Bell's palsy and given prednisone/valacyclovir. Yesterday 4/19 around mid-day he started having L-sided facial weakness and slurred speech. This has progressed since yesterday. Reports ability to swallow, though a little difficult d/t cheek weakness. Low back pain has returned as well. Does report constipation and possible poor bladder emptying for the last few days. He was seen by a Doctor and referred to ED to rule out AIDP and other diseases after J&J vaccine.
1258765	4/26/2021	FL	73	F	3/25/2021	3/25/2021	I started feeling faintly, experienced headaches, flashing blackness in my eyes and head. I also had blurry vision , extreme fatigue, nausea and diarrhea. I sat down for 10 minutes to be monitored and then I went home. To this day I still have headaches that come and go and I have no energy whatsoever and still have nausea that comes and goes.
1258447	4/26/2021	NC	41	M	4/8/2021	4/24/2021	patient reported acute onset of left sided weakness with associated left visual field deficit with left sided lateral hemianopsia.

1259719	4/26/2021	IN	16	F	4/26/2021	4/26/2021	After RN administered vaccine she spoke to my daughter for some time afterwards 5-6 minutes and my daughter was fine answering her questions and just visiting with her. She directed us to the table to schedule her second vaccine which was directly in front of us. We went to this table and spoke with two other ladies choosing a date and time and she was also fine talking with them and answering questions of eat time offered and then suddenly she went straight back with warning passed completely out and struck the back of her head on the concrete floor. EMS and RN?s who were there went to her aid immediately and she was unconscious for a little over a minute. They initially couldn?t get her to respond and finally she came to and had no idea what happened and no recollection of falling. She had blurred vision and bleeding a bit from the back of her head and they wanted her to have CT of her head after hitting it that hard. They took her by ambulance to hospital and they assessed her and ordered a CT. The CT thankfully came back clear and she has follow up appointment with concussion doctor first thing in the morning. On discharge she was describing her pain from hitting head a 7/10 It was very scary and everyone around us was visibly upset as well. She has never fainted or had a reaction to any other shot, vaccine or needle before today so that was a very unusual reaction.
1259691	4/26/2021	PA	42	F	3/22/2021	3/28/2021	6 days after shot, I got what seemed like an Aura migraine, unable to see well out the front of my eyes, sides of my eyes had lights and line of geometric patterns. No pain in my head at this time. Lasted for 1-2 hours. For the next 2 weeks, I had light sensitivity and felt light headed on and off throughout the day with some fatigue. I had a headache a few times.

1259663	4/26/2021	NJ	72	F	3/30/2021	4/6/2021	Loss of vision in lower right quadrant of left eye. Swelling of optical disc observed by ophthalmologist, retinal specialist,, neuro-ophthalmologist. Patient presented at ER on April 14,2021 with above vision loss and pain in left ear and was later admitted. Was seen by neurology and vascular surgeons, who desired to biopsy the temporal artery (patient refused). CT scan, MRI and spinal tap were performed. Patient treated with IV steroid (1000 mg in 50 mL drip) daily for 5 days. Patient was released on April 20, 2021. Follow up visit with Dr on April 23, 2021. Further follow up with neurology pending.
1259619	4/26/2021	MD	16	M	4/26/2021	4/26/2021	Within 10 secs after injection patient said his body started having some adverse reaction. He said he didn't say anything until his eyes were black and couldn't see then he said he didn't feel so good. The color drained from his body and he went limp. Luckily a nearby paramedic caught him and he was wheeled to a recovery room to be monitored. Patient felt better after 15 Mins but it was so scary. We didn't expect any reactions as hes gotten all of his immunizations and never had any reactions. I was really traumatized by this whole event. The staff there were very nice and helpful and helped us ease thru his recovery. I wanted to report this incident so that way you have a log of adverse side affects from getting the vaccine. I hope the 2nd shot will be ok.... I'm very scared at this point. TBD
1259569	4/26/2021	IL	44	F	3/9/2021	3/19/2021	I went to the ER because I was having Ocular problems. Ten days after the vaccine on 01//19/2021 my vision became blurry. It was a feeling of trying to see under water. My distance vision was not as effected. It lasted a two hours and then it went away. I went to an Ophthalmologist, but it happened again two weeks later on, 4/02/2021 and my vision became blurred. This time it was blurred and almost like double vision. I was scheduled an MRI and my blood work.
1259559	4/26/2021	VA	17	F	4/23/2021	4/26/2021	After only an hour outside in low 60s weather, I had felt symptoms similar to heat exhaustion. My vision got extremely spotty, and couldn't see much. There was a loud ringing in my ears and everything else sounded muffled. I felt dizzy and my skin felt like tissue paper. It faded after I went inside and got water. However, I still have a headache, 6 hours later.

1259470	4/26/2021	FL	17	M	4/26/2021	4/26/2021	After I administered the vaccine, patient said to his mother "that was it", he also told his friend on the mobile that he just got the injection, then he said "I feel dizzy", I said "are you serious?" He said "Yes" and he just went out of consciousness in his mother's arm. I shout "call 911" and held his head which tilt backwards with eyes rolling back. together with his mother we lowered him to the floor and I supported his head at all times; as he was flat on the floor, he raised his own head and regained consciousness. Both mother and I tried to talk to him and keep him awake when he closed his eyes, he was laying on the floor flat and talking until EMT arrived at 16:42. EMT pulled him off the floor and took him to the ambulance.
1258916	4/26/2021	TX	65	M	4/10/2021	4/25/2021	On Saturday April 24, 2021, I began experiencing severe headaches, eyeball pain, light-headiness, weakness and lack of energy, pain at the injection site and flu like symptoms.

1260530	4/26/2021	OH	49	F	4/6/2021	4/6/2021	<p>The adverse reactions of light headedness, throat irritation, heaviness in my chest and difficulty inhaling began about 20 min after my injection, It lasted 5 minutes. About 30 min afterwards the 2nd wave of reaction came on, with the same symptoms but was even harder to inhale and lasted twice as long. I took a combination of benadryl, motrin and pepcid which alleviated the worst of the symptoms after about an hour. To this day, I still cannot take a deep breath in. About 72 hours after the vaccine I began to have diarrhea (and still have it 20 days later), lethargy, nausea and shortness of breath. The next day I had a little more energy, but still had continued shortness of breath. My vision had become less clear and my thought process a bit fuzzy. This is still happening today. Seven days after the vaccine, I suddenly became extremely light headed just simply walking. To the extent that I needed to sit or lay down before I began to pass out. After the light headedness came on heavily, I also noticed a very heavy weight on my upper chest and found it quite difficult to inhale. These moments would come and go throughout the day. Regardless of whether I was just sitting and relaxing or walking around. These symptoms would last anywhere from a couple minutes to a couple of hours. I found it very hard to catch my breath and could feel my heart flushing often. Additionally I would wake in the middle of the night feeling that I needed to gasp for air. I sought medical assistance from a clinic, an ER and even my allergist and I am scheduled to see my family physician later this week. I am not an anxious person, but have experienced many episodes in the last 20 days that have truly made me feel that I was going to die (no exaggeration!) due to the inability to breathe or that I may have been having a heart attack. I began to have chest pain that would travel from the center of my chest to my left shoulder. The pain also would move to my right lung area. During this I also had heaviness in my chest and felt I could not breathe in or out easily. I am still very light headed and have difficulty walking very far without taking a break because I feel I cannot catch my breath. I still have all of the same symptoms that I experienced 20 minutes after my vaccine. These symptoms have varied in intensity. I have often commented to my family that I feel the symptoms of the chest heaviness and heart flushing seem to come in waves. I am a health conscious</p>

							person and have never had poor health in my life. The events in the last few weeks have definitely taught me how terrible life must be for those who chronically suffer from heart or lung issues. I am still currently battling these symptoms, however, the last few days seem the symptoms have often been less severe.
1259416	4/26/2021	CA	57	F	3/7/2021	3/19/2021	Approx. March 19, I started having headaches under right eyebrow and begin to take some Advil. After a couple weeks of no sign of improvement, I contacted my PCP and she recommended a frontal xray which came back clear. I also started getting headaches in the back of my head, more of a throbbing and they have continued for weeks. On 4/16 I started taking a baby aspirin and still the headaches seem to come and go. I have never really had headaches, I consume lots of water regularly, so no chance of dehydration, am postmenopausal, but this seemed like a potential side-effect from the vaccine, so thought I'd pass along this info.

1254720	4/25/2021	FL	25	M	4/7/2021	4/7/2021	Temporary hearing loss; ringing of the ears; Extreme cold sweats; Blurred vision; This is a spontaneous report from a non-contactable consumer for a 25-years-old male patient received bnt162b2 (BNT162B2), dose 1 via an unspecified route of administration, administered in right arm on 07Apr2021 14:00 (Batch/Lot Number: EP7533) as SINGLE DOSE for covid-19 immunisation. Medical history included Covid-19 (Covid prior vaccination: Yes). Concomitant medications included sulfamethoxazole, trimethoprim. The patient previously took a tetanus booster on left arm. The patient had a Covid prior vaccination and not Covid tested post vaccination. On 07Apr2021 at 14:00, the patient experienced temporary hearing loss, ringing of the ears, extreme cold sweats, and blurred vision. The patient did not receive treatment for the events. The outcome of events was recovered on 07Apr2021. No follow up attempts are possible. No further information is expected.

1254717	4/25/2021		36	M	3/23/2021	3/23/2021	Tingling all over his body; body tingles; May have lost weight; Wheezing sound whenever he breathes; Feeling numb; Feeling weak; no energy; Hands are shaking; Electrolytes were out of whack; electrolytes were too low; Phosphorus level was too low; Throwing up; vomiting; Vertigo; head was spinning; looked like the building was going up and down; vision was spinning; Fell three times; Face pale yellowish; Feel like going to pass out; Nausea; Felt there is pinching on left side of his chest; Heavy sweating (sweating all over his body); Head felt heavier; head was heavy in the front side of his head, not in the back; Feeling hot; 99.9 degrees body temperature; pre fever; Head felt a little dizzy; no control to his body like he was going to faint; Arm soreness; sore arm; Headache; it is only a little bit of pain; frontal headache; head is hurting; This is a spontaneous report from a contactable consumer (patient). A 36-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot Number was unclear and reported as either ER8727 or ED8727), via an unspecified route of administration, on 23Mar2021, at a single dose, for COVID-19 immunization. The patient's medical history included asthma. The patient's concomitant medication included an unspecified inhaler. The patient was healthy. He has asthma, but other than that he has no health issues. He has never been hospitalized. The patient was calling to share his side effects after receiving the vaccine. He took the vaccine because it has been recommended. Most importantly, he took it for his elderly parents. He does not want to hurt them. He wants to help the community. The pharmacist told him he needed to call and report, so he googled Pfizer's phone number. On Tuesday (23Mar2021), the patient received his first dose of the COVID-19 vaccine. At first, he felt nothing. The patient's head felt a little dizzy (clarifies that it is a heavy feeling) and had a little bit of arm soreness at night (resolved about a day and a half later), but he could not complain. When the patient had the first dose, he experienced headache and sore arm the night on 23Mar2021. After the first dose, his head felt nothing like the day he went to the emergency room. He would say it was maybe 10% of the day he went to the emergency room. The next day (24Mar2021) in the morning, the patient experienced heavy sweating (sweating all over his body), feeling hot, headache, 99.9 degrees (also

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

reported as 9.8) body temperature, and more pain on the arm. On the morning of 24Mar2021, the patient's head felt heavier. He heard people get chills, he did not get chills. He checked his temperature and it was 99.9 degrees. The patient considers that a pre fever, anything over 100 degrees is a fever to him. Sweating all over his body has gotten better. But it comes back from time to time, along with tingling all over his body (unspecified date). His body tingles, he sweats a little bit and then it goes away. His body tingling and sweating go back to back. Time passed by two days and nothing. On the sixth day (29Mar2021), the patient's mother had a doctor's appointment. After the patient got home from taking his mother to the doctor, he started sweating all over his body (started sweating again). His head was heavy (head is a bit heavy again), but not painful. It is heavy in the front side of his head, not in the back. It (head) is only a little bit of pain. He feels like his brain is going to come out of the front of his head. He started throwing up as soon as he got home. He got vertigo. He was running through the house, trying to make it to the bathroom and he fell three times (before he went to the emergency room). His head was spinning, and he could not open his eyes. The patient clarified that he could open up his eyes, but he did not want too. It looked like the building was going up and down. On 29Mar2021, the patient's face was pale yellowish, feel like going to pass out, time to time nausea and vomiting, vertigo, vision was spinning, tingling sensation, no control to his body like he was going to faint, vomited a total of 3 times, felt there is pinching on left side of his chest (the left side of his chest was pinching in the emergency room), and frontal headache. He felt like everything around him was spinning. The patient took meclizine for vertigo and medication for vomiting. The patient's father has vertigo, so his father gave him some meclizine for his vertigo. The patient also took ondansetron (ZOFTRAN). The patient's family called the hotline and took him to the emergency room (ER). He has not fell again. He vomited three times, and then another in the ambulance, for a total of four times. When he got to the hospital, they started treating him. When he went to the emergency room, he did not open his eyes, and was talking with his eyes closed. All of his symptoms happened at the same time, when he came home from his mother's doctor

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

appointment. The doctor at the emergency room told him that his electrolytes were out of whack, and that his phosphorus level was too low. They gave him some sodium sulfate right away. The doctor recommended that he stay overnight. The patient did not want to stay overnight because his parents are elderly, and he takes care of them. The doctor told him since he was not willing to stay, to go home and drink a lot of water. Per laboratory works done on 29Mar2021, the patient's phosphorous and electrolytes were too low, so they gave him saline and sodium phosphate for management. Also, the patient had abdominal and heart X-ray and computerized tomography (CT) scan done and everything came normal. Also, both X-rays came back clear. The patient had no diarrhea. Heaviness of head started feeling better after his emergency room visit on 29Mar2021. Around 02Apr2021 or 03Apr2021 is whenever it started feeling better. It comes back, and he gets scared. On 30Mar2021, the patient was almost improving and was advised to drink lots of fluids. Every now and then patient was feeling weak and head is hurting, hands are shaking on 30Mar2021. Every single day, he feels dizzy, weak and tingles all over his body. When the patient went to the emergency room, the doctor could not tell him what caused his symptoms. The doctor told him that it could possibly be because of the vaccine. He has never felt like this in his life. He has never felt in his life. He felt hopeless and was crying. He was worried about his elderly parents, and who would take care of them. The patient's second dose of the COVID-19 vaccine is due 13Apr2021. He is debating on whether to take it or not. He cannot afford to take it if it is going to make him feel worse. He has read that the second dose of the COVID-19 vaccine makes people feel worse. He is scared. He is asking if he should get the second dose of the COVID-19 vaccine. Within one week (unspecified date), he may have lost weight. The patient has to use his inhaler more now as he has a wheezing sound whenever he breathes. He has been using his inhaler more often, whenever he starts wheezing. He always feels like his whole body is tingling. He has no energy. He has only visited this doctor once. His long-term primary care physician is not practicing anymore, he thinks that he may have lost his license. It is hard for him to get an appointment with his primary care doctor since

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

the pandemic. The patient is going to try to see his doctor through tele health. The emergency room doctor recommended that he follow up with a neurologist. The patient was advised to go to a neurologist. The patient reported these symptoms as side effects and asked how long the symptoms last. At the time of reporting, the patient currently still has that nausea and vomiting feeling, but it is better; and he feels heavy (pertaining to vertigo). If he starts to get vertigo again, he knows he will throw up. He can feel whenever the vertigo is coming, he begins to feel like the floor is moving. He can be standing still quietly, and the floor will start moving. The pharmacist told him to call Pfizer and share what happened to him. Since he took the first dose of the Pfizer COVID-19 vaccine, he spoke to the pharmacist. He was thinking of taking another company's vaccine of one shot. But they did not offer it in his area. The patient read that the first dose of the Pfizer COVID-19 vaccine gives him about 50-60% immunity. The patient was asking if he can take the other company's vaccine. The patient should have taken the other company's vaccine because it would have been one shot and done. He is nervous about taking the second dose of the Pfizer COVID-19 vaccine. He wishes he would have taken the other company's one shot because then he would not have to worry about having symptoms again. The patient's father received his second vaccine today. He asked the pharmacist there the same questions. He is still confused about if he is going to take the second dose of the COVID-19 vaccine. He cannot explain his symptoms. He can handle pain, but he cannot handle, vertigo, throwing up, and feeling numb (as reported; unspecified date). He feels like he had symptoms that people 90 and older should have. He kept falling. The patient further asked if he could take another company's COVID-19 vaccine as his second dose. Also, if it was okay if he was scheduled to get the second dose 4 weeks after the first dose. Lastly, if the company thinks that he is eligible for the second dose of the Pfizer COVID-19 vaccine despite these symptoms. The patient recovered from "Arm soreness; sore arm" on 25Mar2021; and from "Fell three times" on 29Mar2021. The patient was recovering from "Heavy sweating (sweating all over his body)", "Head felt heavier; head was heavy in the front side of his head, not in the back", "Throwing up;

1254681	4/25/2021	KS	18	M	4/7/2021	4/7/2021	<p>Passed Out; feeling light headed/lightheadedness/being lightheaded; Fell Down Stairs/falling; hit his head and his knee; hit his head and his knee; This is a spontaneous report from a contactable consumer (patient's father). An 18-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), dose 1 via an unspecified route of administration, administered in right arm at the age of 18-year-old on 07Apr2021 09:50 (Batch/Lot number was not reported) as single dose for COVID-19 immunisation. Medical history included ongoing congenital diaphragmatic hernia (that prevented his lungs from developing before he was born). There were no concomitant medications. The patient previously took influenza vaccine (FLU) for immunization and without a reaction. Caller is a consumer, calling about his 18 years son who received the covid vaccine this morning and had an adverse event afterwards. Caller reported that his 18 years son had his first covid vaccine dose this morning. He has had all of his vaccinations, even the flu shot every year without a reaction. After having his covid vaccination, on the way home he said he started feeling light headed. He was supposed to go back to school once they got home but the caller noticed that his son hadn't left yet because he drives himself. He reported that his son's room is downstairs and when he looked his son was laying down at the bottom of the stairs and appears to have passed out. He reports that now he is fine and he has eaten. Calling now because he was concerned and "wanted to make sure there was nothing else I should do in this situation". Caller stated that he took his two kids to get their vaccines. His son is 18 years old and his daughter will be 18 next Tuesday. Stated that they stayed at the site in case of a reaction to the vaccine and nothing happened. On the way back home the son became lightheaded. Caller thought maybe he needed to eat even though he had eaten a light breakfast before they went to get the vaccines. Stated his son got home and passed out. Caller had never seen his son pass out before. Said his son fell down the stairs while going to the basement where his room is located. Caller was concerned this could've been a reaction and is calling to see if there is anything further they should be concerned about. The son's vaccine, lightheadedness, passing out, and falling all took place today 07Apr2021. Caller said</p>

he nor his son are certain if he was injured during the fall. His son thinks he hit his head and his knee and noticed that his shorts where ripped behind the leg on 07Apr2021. Caller states his son says he is feeling back to normal and fine. The son was supposed to go to school after the vaccine but the caller had him stay home so he could keep an eye on him. Caller stated it was scary. The caller opened the door and saw his son lying on the floor with the gum he had bought at the drug store strewn out everywhere. Caller stated they are believers in vaccines. Stated his son used to have a part time job at the grocery store bagging groceries for customers and was wanting to go back to work. Caller also said that his son was born with a congenital diaphragmatic hernia that prevented his lungs from developing before he was born. Caller stated that due to this him and his wife felt it was best for the son to get the vaccine since if he got the Covid virus it could have been really bad for him. Caller denies any medications, labs, testing or treatments that are relevant to these events. Caller stated his son is healthy. Stated when his son mentioned being lightheaded in the car, the caller didn't think much of it. The outcome of events was recovered on 07Apr2021. Information on the lot/batch number has been requested.

1254673	4/25/2021			F			<p>internal bleeding; purple bruise on my left side on the skin of my left eye; rash all over my body; This is a spontaneous report from a contactable consumer. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), dose 1 via an unspecified route of administration, administered on left arm on an unspecified date (Batch/Lot number was not reported) at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient reported that she had a reaction to the first dose of Pfizer's COVID vaccine. She stated, "I had a reaction to the vaccine and developed a purple bruise on my left side on the skin of my left eye. I had the shot on my left arm. I described it like an 'old lady bruise'. It was very purple. I've never had this before. I called my doctor and she said it was some kind of internal bleeding. It wasn't large, but was a purple spot. She had sent me to the eye-doctor, even though it wasn't in my eye, but was close to my eye. I did go and see her, and a week later, she did say that there are some things with low platelets with vaccines, so she did to my blood work and checked some clotting things and everything seemed to come back fine. I did also get my antibodies checked. On day 16, I got my antibodies checked. They had a quantitative one and mine came back at 6.12. I did get a rash all over my body, but that may be from the sun because I do get a rash from being in the sun. I didn't know if it's not a good thing to get the second shot if I have a rash. Would I get that reaction and would it be worse the second time? " The outcome of the events was unknown. No follow-up attempts are possible; information on the lot/batch number cannot be obtained.</p>

1254667	4/25/2021	NC	76	F	3/24/2021	3/25/2021	This is a spontaneous report from a contactable consumer (patient). A 77-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; solution for injection; Lot Number: ER8730) via an unspecified route of administration on 24Mar2021 at 10:30 (at the age of 76-years-old) as a single dose for COVID-19 immunisation. Medical history included ongoing pollen allergy from an unspecified date and ongoing ribs sore from an unspecified date. The patient stated that the pollen was bothering her and that she had been taking Zyrtec in the morning and at night. Medical history (including any illness at time of vaccination) was also reported as none. Family medical history relevant to the event was reported as "her son also had a seizure after the polio vaccine when he was 7 years old". Concomitant medications were not reported. It was reported that the patient denied any medications or medical conditions relevant to symptoms. There were no additional vaccines administered on the same date as the COVID-19 vaccine and there were no prior vaccinations received within 4 weeks of the COVID-19 vaccine. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; solution for injection; Lot Number: EN202) via an unspecified route of administration on 24Feb2021 (at the age of 76-years-old) as a single dose for COVID-19 immunisation. The patient previously received the polio vaccine on an unspecified date for immunization and experienced seizure and the patient previously received the flu shot on an unspecified date (6 years ago) for immunization and 8 hours after the vaccine was achy, sick, in bed for 9 days. Developed bronchitis and coughed so hard she cracked her ribs. Stated her ribs were still sore at times to this day. The patient stated that she would never get another flu shot and that her doctor agreed with her on that decision. On 25Mar2021 the patient experienced headaches, dizziness, dizziness comes and goes but it affects her vision, numb, head feels fuzzy/fuzziness is constant and eyes are crossing. The patient stated that she got her second dose of the vaccine on 24Mar2021. She reported that after her first shot she was fine. She stated that she started having headaches and dizziness the day after her second vaccine and this had lasted for 14 days. It has gone on now for several weeks and was not getting any

----------	-------	-------	---------	-----	----------	------------	--------------

better. She felt her symptoms went in different degrees at different times of the day. She might go one day without a headache. Today her headache was more like a numbness all around her head. She stated that her headaches come and go, sometimes start when her eyes pop open in the morning or at 10 AM. If she was going to have a headache that day, it usually started by 10 AM and was a full-blown headache. Stated her head always felt fuzzy and woozy and sometimes she felt like her eyes were crossing. She stated that she never got headaches; not since her early 20s. Dizziness continued to come and go, but it affected her vision and she was scared to drive and have a wreck. She reported that the symptoms were driving her bonkers. She also reported that she had to hold onto walls when she walked. The dizziness did not go away even when she laid down. She was dizzy when sitting on the sofa. Her head also felt fuzzy and numb, the fuzziness was constant. She reported that she felt disabled and felt like she was turning 100 instead of 77. She cannot lay in bed all the time and wanted to know how long these symptoms would last. The patient denied any labs, testing or treatment relevant to symptoms. She had not been to the doctor or to the emergency room in relation to these symptoms. She stated that she thought about it at times. She stated that she would have to call an ambulance to take her since she was scared to drive. Yesterday she thought she was not doing so bad and drove to the store. She stated that while in the store, her dizziness had her to where she could hardly pay for her items. Stated that it kind of felt like she was drunk, but she was not drunk. The patient stated that her experience with the polio vaccine made her almost not get the COVID-19 vaccine for fear it would bring on a similar situation. The clinical outcomes of the events headaches, dizziness, dizziness comes and goes but it affects her vision, numb, head feels fuzzy/fuzziness is constant and eyes are crossing were all not recovered/not resolved. No follow-up attempts are needed. No further information is expected.

A 67-years-old male patient received the first dose BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration, on 31Mar2021 as a single dose for COVID-19 immunization. Medical history included: heart attack a few years ago and takes maintenance drugs for the heart condition and asthmatic and takes medication but the medications come and go depending on how he is physically. Concomitant medications were not reported. This case was from the same reporter; this case is for the husband. On 2Apr2021 he experienced difficulty breathing and they did not know if it was attributed to the vaccine but he did not have any breathing issues until he got the vaccine but it was a general feeling of something was different but did not think it was severe until the vision thing. Reporter stated there is no medication her husband takes that is related directly to the episode he experienced. On 5Apr2021, he woke up from being asleep, asked if the TV was on (which it was) because he could hear it, but could not see it. His symptoms have also resolved. He had no history of anything like that happening previously with the first dose pfizer covid vaccine. Hi wife stated that he experienced visual disturbances since then, with no prior history of vision impairment. The outcome of the events could not see, Visual disturbances was recovered; the outcome of Difficulty breathing was not recovered; the outcome of the event He woke up panicked was unknown. Information on the lot/batch number has been requested.

---

high versus low COVID-19 Virus antibody level, and that her COVID-19 Virus antibody level was a 6.12. She said she had her COVID-19 Virus antibody test 16 days after her first COVID-19 Vaccine. She said she made sure her COVID-19 Virus antibody test was done at least 2 weeks after getting her first COVID-19 Vaccine. Reported she also had a rash on either 04Apr2021 or 05Apr2021. She said in the past, she had a rash happen the first time she went in the sun, and she wasn't sure if her rash was related to sun exposure, or her first COVID-19 Vaccine dose. She clarified she was pretty sure her rash was from sun exposure. She said since she had been out of the sun, her rash was starting to go away. She clarified she had a rash only on the parts of her that were exposed to the sun. She said she seemed to get a rash after her first exposure to the sun. She said she had read up on having a rash to sun exposure, and the rash was like an immune reaction to the UVA rays. She said the rash was not itchy, and was only bumps. No further details provided. Reported she was one of those small percent of people who gets a really weird reaction to things, so her doctor wasn't surprised when she had the bruise after getting the first COVID-19 Vaccine. She said she was very small at 105 lbs., and always takes a children-size portion of things. No further details provided. Reported half of her wanted to get the second COVID-19 Vaccine dose, and the other half of her was afraid she would have some sort of weird reaction. She said since she was already protected with the COVID-19 Virus antibodies, did she need to get the second COVID-19 Vaccine. Caller asked how long do the COVID-19 Virus antibodies last, saying she heard their might be a COVID-19 Vaccine booster shot in the future. Caller stated she had so many questions she wanted to ask. Caller was advised she would be transferred to Pfizer Medical Information for further assistance. Outcome of event rash was recovering, of other was recovered in Mar2021. No follow-up attempts are possible. No further information is expected.

1255132	4/25/2021	MI		U			cerebral palsy; autism; This is a spontaneous report from a contactable other healthcare professional (mother) reporting for her child. A 16-year-old patient of unspecified gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Batch/Lot number was not reported) via an unspecified route of administration on an unspecified date at single dose for covid-19 immunisation. The patient took Flu vaccine eight years ago, eyes glued shut and was hospitalized, reported sticky. She does not know the ingredients but mentioned preservatives. The patient concomitant medications were not reported. On an unspecified date, the reporter stated that her child had cerebral palsy and autism and was looking for information on adverse events. Outcome was unknown for the events. Information on the lot/batch number has been requested.; Sender's Comments: Based on known drug safety profile, there is reasonable possibility of causal association between the events cerebral palsy and autism and the suspect drug. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

A 54-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration, administered in Arm Right on 07Mar2021 (Lot Number: EN6204) as single dose for covid-19 immunization. The patient's medical history included history of three spinal surgeries (takes no pain meds, she is not on pain meds, she has never been on or kept taking them); and has "neuropathy and nerve related issues" that were not this bad since ten years ago in 2011, clarified that what she has is not actually neuropathy, something with the peripheral nerve, she says she doesn't remember actual verbiage), since ten years ago in 2011, and the only difference was this vaccination, it was not this bad until this vaccination. She doesn't react well to pharmaceuticals anyway (unspecified). Her medications are that she takes the minimum amount of medications, very minimal (unspecified). There were no concomitant medications. There was no other products. Also, she has not had any other recent vaccinations or started any new medications. For past drug, she didn't take anything other than 5mg of zolpidem tartrate (AMBIEN) to sleep at night because of her spine. Patient previously also took pregabalin (LYRICA) and was off it, was also on gabapentin or neurontin (patient did not have those</p>

medications to provide NDC/LOT/EXP for either of them because she took them back to the pharmacy or turned them in to the police station because she doesn't keep medications in her house if she isn't taking them, and she couldn't take that medication). Historical vaccine included first dose of bnt162b2 on 14Jan2021 (at the age of 54-year-old; Lot Number: EN5318) in Arm Right for covid-19 immunization, and for her first dose the only thing was a sore arm, it was very sore, and she only experienced a slight bit of fatigue after her first dose. She received both doses of vaccine. Her first dose was LOT: EN5318 and was given 14Jan2021, and her second dose was LOT: EN6204 given 07Mar2021. The patient was reporting for Pfizer COVID-19 vaccine, for she was having a horrible reaction to it "45 days" (as reported) after taking 2nd dose, and had been in the ER, and her temperature still hasn't gone back down to her normal, her oral temp is still raised and her rectal is raised even more. She was not feeling well, she felt very bad, she would never get a vaccine again, that is how bad it was. Since "45 days" later she was still having significant pain and trouble flexing her right hand open and closed. For events treatment, she took over the counter Tylenol for fever and pain, strength unknown. Patient said she had not had this kind of disabling symptoms or anything before this vaccination. She had a slight fever almost the whole "45 days". On 08Mar2021, her oral temp was over 98 degrees Fahrenheit when her norm temp being 97.2 or 97.3degrees Fahrenheit. Her rectal temp stayed at 100 degrees Fahrenheit. The next day, actually on the 09Mar2021 (which was two days after her second dose), she had the slight fever, fatigue, and extreme pain through her right side. She said her right side means her shoulders, neck, torso, arm, and entire leg. She also had shortness of breath, and severe nerve pain. She called her primary care provider who said to wait 5 days to be seen. On day 5, or actually the whole five days (reported as in Mar2021), she was in bed and didn't leave her apartment because she was in bed and she was vomiting. On day 2 or within 6 hours of vaccination, she had a feeling of urination, like she had to urinate when she didn't, that feeling of urination was equivalent of having contrast dye (NDC/LOT/EXP: Unknown) put in her IV which makes her feel like she is peeing her pants but she did not, and that feeling has not gone away. On day

---

5 (11Mar2021), she was dizzy and fell. In Mar2021, she was disorientated and vomiting, she couldn't eat anything other than soup. On day two (Mar2021) she had some kind of eye pain that is still there "45 days later", it feels like pins and needles. Her skin was burning and painful to the touch, she couldn't keep an IV in her when she was in the ER. She was not admitted to the hospital. She was having headaches, and joint and muscle pain. She had nausea and vomiting at different times. She continued to have shortness of breath. She had a horrible lack of appetite. She had sores in her mouth and nose. She had anal hemorrhoid sores. Last night (05Apr2021 )she had a headache that was severe like someone put a knife behind her right eye, and when she got up (06Apr2021) her eye felt heavy and her eye was drooping. She also had difficulty speaking, with her words. She says she had passed out, and had been dropping things, she had broken glass. She has been to a neurologist and a gastroenterologist. She clarified that all of these events were after her second dose, for her first dose the only thing was a sore arm, it was very sore, and she only experienced a slight bit of fatigue after her first dose. None of her doctors know what to do, her gastro doctor was giving her an anti inflammatory suppository and was going to do some tests. She had blood done from neurologist and at the ER and no one knows what to do, they keep referring her to other doctors. She wished someone could explain to her, but no one know and they said it was uncharted territory, they didn't know what to do. She is now back on Lyrica which she was off of but the ER prescribed her 300mg three times a day. She wanted to know what the hell is going on with this vaccine, and that she doesn't think having these side effects "45 days" out is normal. She wanted to be transferred to speak with someone about what to do because her doctor's don't know anything. The outcome of the events was unknown. No follow-up attempts are needed. No further information is expected.

1254663	4/25/2021	MI	63	M	4/6/2021	4/7/2021	his eyes and feet are really swollen; his eyes and feet are really swollen; This is a spontaneous report from a contactable consumer. A 63-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), dose 1 via an unspecified route of administration, administered in right arm on 06Apr2021 at 09:05 (Lot Number: EW0150; Expiration Date: 31Jul2021), at the age of 63 years, as a single dose for COVID-19 immunization. Medical history included cerebrovascular accident, diabetes mellitus since 2008, hypertension since 2008, both ongoing. Concomitant medications taken within two weeks of vaccination included warfarin sodium (COUMADIN), acetylsalicylic acid (ASPIRIN), atorvastatin taken for blood cholesterol since 04Mar2021, carvedilol (CARVEDILOL ABZ) taken for blood pressure since 05Mar2021, and insulin lispro; all ongoing. The patient did not receive any other vaccines within four weeks prior to the vaccination. On 07Apr2021 at 10:15, when the patient woke up he experienced his eyes and feet are really swollen. The reporter informed that when the patient woke up today his eyes were really swollen. It looked like he was stung by a bee or something. The reporter was wondering if that is a common side effect of the Pfizer vaccine. The patient had not received any treatment. The clinical outcome of the eye swelling was not recovered, and the clinical outcome of swelling of feet was unknown. No follow-up attempts are needed. No further information is expected

1254752	4/25/2021	IN	61	F	3/19/2021	3/19/2021	<p>Her platelets are 200, which is very low; Bell's palsy; Shot on the top of my shoulder; excruciating pain/shoulder pain/given high on the top of her shoulder. It hurt; sore arm; This is a spontaneous report from a contactable consumer (patient). A 61-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), first dose at the age of 61-years old via an unspecified route of administration on 19Mar2021 10:10 (Batch/Lot number was not reported) as single dose for covid-19 immunisation. Medical history included systemic lupus erythematosus from 1985 and ongoing, arthritis and osteoarthritis from an unknown date and unknown if ongoing (She has osteoarthritis throughout her body and her feet). Family history included stroke (husband died at the age of 59, he was having stroke upon stroke). The patient's concomitant medications were not reported. It was reported that when she received the shot, it was given high on the top of her shoulder and it hurt. She could not move her arm for 3 days. The pain was excruciating. On the 4th day, her arm was sore, but she could move it. She had no fevers, she didn't get sick, but she just couldn't move her arm. The shot was given at at 10:10 am, and by noon she could barely move her arm. Her left side of the mouth doesn't want to work properly. Her Bells Palsy started on 05Apr2021. She was in her car and driving to the store, when all of a sudden her left eye was watering. She got home and she didn't see anything wrong with her eye, except it was watering. She could tell a difference between the left and right side of face when she touched it. Something was wrong with her right side. Her eye was not opening all the way, it's been dropping, and her lip was down. She can't smile, and when she drinks water it's comes out. The patient clarified that it was her left side that is drooping. She went to the emergency room due to Bell's palsy. She could not move her arm within 2 hours of getting the shot. The patient mentioned her whole body aches from the Lupus and arthritis, but the shoulder pain was different after the vaccine. The shot itself hurt, and she thinks the one who administered the vaccine might have hit something. There's not a day that doesn't go by that she is not in pain. Her platelets are 200, which is very low. The patient underwent lab tests and procedures which included activated partial thromboplastin time: unknown result, blood glucose: unknown result, computerised</p>

1254755	4/25/2021	CA	72	F	3/31/2021	3/31/2021	Tired, can't sleep; Tired, can't sleep; Heart racing, described as irregular arrhythmia; Heart racing, described as irregular arrhythmia/Heart pounding, hard pounding; Arm barely sore; This is a spontaneous report from a contactable consumer (patient). A 72-years-old female patient received first dose of BNT162b2 (Pfizer-BioNTech COVID-19 Vaccine), at the age of 72-years-old , via an unspecified route of administration, administered in Arm Left on 31Mar2021 11:40 am as single dose for covid-19 immunisation. Medical history included ongoing food allergy, she had anaphylactic shock from a food allergy (she was 40 at the time and she doesn't eat anything she is allergic to), sinus infection and then got horrible hives under her eyes. No Prior Vaccinations (within 4 weeks). Concomitant medication was eye drops every night. No additional vaccines administered on same date of the Pfizer Suspect. The patient previously took epipen had two episodes when she was 40. She is bad about carrying her EpiPen, she forgets it. She was allergic to Amoxicillin. At 11:40 am last Wednesday patient had the vaccine, and around 4 or 5 pm, her heart started pounding for 10 seconds, and it felt like forever. An hour later, her heart started pounding again. It happened twice an hour apart and the second time lasted longer. It described as hard pounding. It started at 4 or 5 pm and then for 4.5 hours there was nothing, but then her heart started racing. At around 4 or 5 pm her heart was pounding, than around 9:30 pm her heart started racing and beating fast, she could feel it. She lives in a rural community and her husband called the local fire station and asked if he could take her there, to the station, so that she could have her heart checked. She was hooked up to a monitor and the paramedics said that she had an irregular arrhythmia and needed to go to the hospital by ambulance. Her heart rate was 115 to 130 beats, then 140 beats, at the hospital. It was about 11pm when she was evaluated and then left in the ambulance, as she was 45 minutes from the hospital. The paramedics would have, the arrhythmia, on record and that 5 minutes before she got to the hospital, the paramedic said her heart rhythm was normal. She was not admitted to the hospital, but held in observation and left the hospital at 4:30 in the morning. She hasn't felt anything after that. it was only one time she thought her heart was going faster, after that, but it didn't happen

again. It is currently no problem and even at the hospital, the heart racing stopped and it was normal. The doctor in the emergency room said she was totally normal. Her arm was barely sore, when touched, and noticed this when she was being helped to the bathroom in the emergency room, maybe later in the afternoon, it was not hurting. But she didn't have any other events. She was tired the next day on 01Apr2021. She was up all night in the emergency room. people say that one will be tired, as an effect, but she can't say that it is because of the vaccine, or if she only had 3 hours of sleep. She hasn't been sleeping but she can't attribute it to the vaccine. She can't attribute this to the vaccine, that she has been tired lately and not sleeping. Event outcome of irregular arrhythmia and Heart racing, described as irregular arrhythmia/Heart pounding, hard pounding was recovered on 31Mar2021, of Arm barely sore was recovered on 02Apr2021, of the remaining was unknown. Information about Batch/Lot number has been requested.

1255081	4/25/2021			F	3/18/2021		begin to see faces one at a time/become grotesque looking and scary looking/hallucinations; This is a spontaneous report from a non-contactable consumer (patient). A female patient of an unspecified age received the first dose of BNT162B2 (Pfizer-BioNTech COVID-19 vaccine, lot number: ER8727), via an unspecified route of administration on 18Mar2021 as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient stated that she had one dose of the Covid vaccine and was supposed to have the second one on the day of the report. She was not sure whether or not to get the second dose. She felt okay after the first dose. She read all the information about side effects and said they were all general side effects and said that the information did not include the unusual side effects. The patient stated that when these happened to her she didn't relate it to the vaccine at first. The patient stated that when she would lay down at night to sleep and close her eyes she would begin to see faces one at a time. They would then become grotesque looking and scary looking. This happened a couple of times, over a couple of days, right when she would close her eyes. The patient mentioned that she had the light on in her room because she always has the light on in her room. The patient asked if it was a side effect people are having. She saw on the internet that it could be a side effect of vaccines. She mentioned it to a friend who told her that she was having hallucinations. She looked online and it said vaccines can sometimes cause hallucinations. She said she read online about one person who said that after their second dose they had bad hallucinations like as if they were on mushrooms. The outcome of the event was unknown. No follow-up attempts are possible. No further information is expected.

wrap around it. On 03Apr2021 experienced severe headache which led her to stay in bed all afternoon, she also has a flu-like chills body ache symptom which comes and go. On 04Apr2021 experienced nausea and took Tylenol for feeling so sick and felt well 2 hrs after. On 05Apr2021 woke up feeling all the symptoms like the other days, her headache is more severe and describe it as she would like to shot her head because of the ache, she also had a sore throat and could not swallow or eat for 2 1/2 days, she also feel nauseous and throws up water already, she already was feeling dehydrated. After which she called her doctor and mentioned that no organization or her doctor cant guide her well with regards the symptoms that she is feeling if this is common after receiving the vaccine. She asked her doctor and her doctor said that it could probably be a symptom of COVID19 infection. So she got tested and turned out she had a negative result. After a while she also experienced some sinus pain that was not normal for her, she also mentioned that her face and eyebrows hurt. She went to her ENT and ENT who she trusted and respected a lot as a surgeon because according to her is very well versed mentioned that these are not normal side effects that she is experiencing. She also consulted with a brain surgeon and the brain surgeon mentioned that if the side effects won't go away , advised that she need to go to an ER and that doctor feared that he could be having stroke or meningitis. In shock, patient called her cardiologist again and cardiologist advised her not to be alarmed about brain surgeon's advised. She was back to her BP management medication for 2 days already and cardio advised that she should get the vaccine still. On Wednesday and Thursday- her sinus pain went away she had experienced the worst pain ever and had her gripping her pelvis because of the pain, she also have massive diarrhea, had nausea and throw up viscusly that it is almost coming out of her nose and also went to sheer panic. Also felt that she almost faint, not dizzy not vertigo type for under a minute. Called her neighbor and neighbor said that she is not speaking well or understood well. She was profusely sweating and had whole body sweat drenched on the floor. Called her physician and physician said that it could be food poisoning. Patient even said that she is not blaming the above event with Pfizer. Also mentioned she experienced sore throat in

between. Patient states she is losing her mind, she is a highly anxious and panicky person, she was worried about getting the vaccine at first, but went ahead with it. States she has removed herself from her blood pressure medication, Bystolic, because there is an ingredient in there that is a beta blocker, polyethylene glycol or polysorbate or something. Worried of having an anaphylactic reaction now after the vaccine to the medication, states she has allergies to alot of foods. Patient states she had a very painful arm at first, that she had no symptoms for the first four days, states a week later she started getting sick, states last Saturday symptoms worsened significantly, that she had a headache and it wouldn't go away for 4-5 days, nausea, vomiting a couple of days, dehydration, a little diarrhea, chills, mild body aches. One day she was down for the count, then on Easter Sunday she took a Tylenol and was better. Later in the afternoon the nausea came back. Woke up Monday morning and couldn't get out of bed, wanted to die. States her baseline temperature is 94.6 and she went all the way up to 98 it was rising, body aches, sore throat. Went and got tested for Covid, flu, and strep and were all negative at urgent care. There the doctor told her because of her neck pain that she says she has had for years, she could die of a stroke or meningitis and so she called her ENT and they told her to wait a couple days and then to go to the emergency room if she was not better and the headache does not go away soon. patient states she does feel better today, only last night she woke up with gut ripping food poisoning, like she had the flu, Had worst menstrual cramps in that area, then she was throwing up, had diarrhea, felt like she was going to faint, went into this ungodly sweat. Saw on news that more people are getting sick a week or more after the shot, did not mention which shot they received. States she has a previous disability and a broken foot. Today she is feeling fine, just still very tired. experienced side effects between 1-1.5 weeks after the injection. She listed the following symptoms: headaches, chills, nausea, a sore throat, fatigue, ice-cold ends, vomiting, and diarrhea. She specified her sore throat was from hell, her temperature was up, but she had no fever, and both the vomiting and diarrhea were little. She added last Saturday was when she felt sick the most and it lasted 4-5 days. She said she tested for COVID-19 and the Flu.

headache was recovered on 09Mar2021; drainage and hard to breath was recovering while the remaining events was unknown. Clinical course was reported as follows got the first dose, throat swelled a bit on the outside. States she reacts a lot to different things now since she has gotten more sick. Clarified that her swelling was more in the lymph node area on the right side of her neck on the outside, her throat did not swell up on the inside like she would have trouble breathing. States her eyes were moving around and it felt like she could not focus, like her eyes were jumping around a bit. States it was mild and fine. She waited for the 30 minutes. Her eyes bothered her the most because she had to drive home. Also had a slight headache. The swelling was gone the next day, but her eyes were still doing that. States she doesn't know if it was from the vaccine or if her eyes got worse because she coughs all of the time. On the third day, she felt like she was having a hard time breathing and drainage which she gets a lot but it seemed worse than usual and then it went back to her original. Hard time breathing and drainage. She states it got worse for 2 weeks and then improved, she still has it like before. She had COPD and uncontrolled asthma, it could have been a reaction to that. These are typically happen but are a little worse after the vaccine. Also stated Her doctor said she did not have an allergic reaction and she could get the second shot. She doesn't know if these reactions were part of a shot reaction, because she has all those reactions on and off. She took her normal treatments with her nebulizer with Albuterol and that was it. States she took her normal Hydrocortisone and took all of her usual meds that she usually takes and some extra nebulizer treatments. The clinical outcome of the events Swollen lymph nodes, Neck swelling, and headache was recovered on 09Mar2021; drainage and hard to breath was recovering while the remaining events was unknown. Follow up attempts are initiated. Further information has been requested

1254512	4/25/2021	NC	66	M	3/18/2021	3/18/2021	a big old puffy bag under his right eye; face was swelling; left eye is a little bit swollen; lymph nodes are swollen coming down to his nose and down on his cheek; This is a spontaneous report from a contactable consumer reported self. A 66-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot Number: EP6955) on 18Mar2021 as single dose for covid-19 immunisation. Medical history included blocked artery that can't put a stent. None family medical history. None other vaccines administered on same date. Last vaccines were 50 years ago as a child and there were no issues. After his first dose, patient was asked to sit for 15 minutes and he was fine and got in the car and drove home which takes 5-7 minutes and by the time he got home, he had a big old puffy bag under his right eye which drew his attention to look in the mirror and he saw his face was swelling. It started under his right eye and his left eye is a little bit swollen and then on the side coming down to his nose and all the way down on his cheek, lymph nodes are swollen on both sides as well. He went to the pharmacist and they told him they don't recommend him taking anything so he left it alone thinking it would be gone when he woke up. His daughter asked him called an ambulance, so he did that at 2:00-3:00a.m. When they came they said that there is no swelling any other place, they could recommend to take Benadryl, following morning he got the tablets and has taken all 24 and it is still there. No emergency room or physician office visit. The outcome of events was not recovered. No follow-up attempts are needed. No further information is expected.

1254553	4/25/2021		31	M	3/16/2021	4/4/2021	drooping face; complaining of right facial weakness; has difficulty closing right eye; headache; neck pain; hard to get into sleep last night; This is a spontaneous report from a non-contactable Other-Healthcare professional. A 31-year-old male patient received of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Pfizer, Formulation: Solution for injection, Lot number and Expiration date were not reported) via an unspecified route of administration on 16Mar2021 (age at vaccination 31 years) at single dose for Covid-19 immunization. Reportedly, there were no known allergies to medications, food or other products other medical history. Patient did not have COVID prior to vaccination. Patient was not tested for COVID post vaccination. Prior to vaccination, patient was not diagnosed with COVID-19. Patient was complaining of right facial weakness since 04Apr2021 (the day before yesterday), drooping face, has difficulty closing right eye. It was associated with headache, neck pain. The neck and headache pain scale was 7/10 for 4-5 days. It was reported that pain comes and goes. The headache was less when he works and exercise. But the headache was more severe at night. It was hard to get into sleep last night. There was no n/v/c/d, blurred vision, cp, sob, doe, fever, chills, cough, sore throat, runny nose, etc. There was no rash, numbness. The adverse event resulted in Doctor or other healthcare professional office/clinic visit. The reporter assessed the case as non-serious with no seriousness criteria (Seriousness criteria-Results in death/ Seriousness criteria-Life threatening/ Seriousness criteria-Caused/prolonged hospitalization/ Seriousness criteria-Disabling/Incapacitating/ Seriousness criteria-Congenital anomaly/birth defect). No treatment was given for adverse events. Outcome of the events was unknown. Information about batch/lot number has been requested.; Sender's Comments: Based on the temporal association, a possible contributory role of BNT162B2 to the development of drooping face cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and

didn't really feel too anxious, but he felt out of place, kind of off and uneasy. The chills and body aches, kind of off and uneasy were disappeared on 30Mar2021. On 31Mar2021, brain fog and slight dizziness does not like he was going to fall over but cant stand still without lean a little/felt immediate rush to the head and feeling of fainting. On 02Apr2021, injection site pain was gradually faded away. The patient states that these events started after the Pfizer COVID 19 vaccine. Therapeutic measures were taken as a result of events included Tylenol. The patient underwent lab tests and procedures which included SARS-CoV-2 test (Nasal swab): Pending on 06Apr2021. The patient did not take any other vaccinations four weeks prior to vaccination. The patient was afraid to take second dose of Pfizer COVID-19 vaccine due to the events. Patient felt very hard to work with these symptoms and to get through everyday life, it is very tough. Patient knows plenty of people that died from COVID-19 and he does not want to have to make changes and fix things in his life that he did not cause and worries this will stick around for the rest of his life all because he took a vaccine. The patient had physician office and Emergency room visit. The outcome of the events insane rush from the bottom of his feet to the top of head, felt like he was going to pass out, pain at the injection, chills and body aches were recovered, while for tension headaches, anxiety attacks, dizziness, weakness, brain fog, hasn't felt the same; feels like something is off every day; not himself was not recovered, and for tunnel vision it was unknown. Information on the lot/batch number has been requested.

1256204	4/25/2021	CA	45	F	4/22/2021	4/22/2021	About an hour and a 1/2 after injection I was on virtual call with my sister and she asked what's wrong with my eye? I hadn't noticed anything. In looking in the mirror, my left eye lid was drooping, swollen and red. My right eye was a bit red and slightly swollen but not droopy. I double checked my vision but was not having any disparity. The droop, swelling and redness lasted for many hours but was gone by morning. Between getting the shot and the virtual call, I had gone to the store to pickup some replacement prescription glasses. It is possible they sprayed a cleaning agent on them (though I didn't notice them do that or smell any chemical agents, which I am sensitive to notice). I got pregnant (with donor sperm) in April 2014 with twins. Miscarried at 9 weeks. Got pregnant with (now) husband March 2015. Daughter born 7 lbs 3 oz. Did IVF this past winter/Spring. Now about 14 weeks pregnant. EDD 10/22/2021
1256207	4/25/2021	CA	16	F	4/24/2021	4/24/2021	After shot felt light headed, dizzy, Requested water. Sat down put head back started snoring loudly. Stating seizing, eyes rolled back in head. Nurse had to wake up with smelling salts. Low blood pressure 60/40 All happened within 10 minutes.

1256310	4/25/2021		38	M	3/27/2021	3/28/2021	After receiving the vaccine, about 12:30am on 03/28/21 I felt a chills, shaky muscles around my neck/shoulders..the room temperature was at 80F but I felt cold like 35F. The next morning, I felt very tired walking up stairs from the basement to my room on the 2nd floor..barely made it to the 2nd floor, felt like my body hitting a wall/ no energy to lift my legs up. I made to my bedroom but felt very dizzy, using my hands holding myself up on my desk and realized I might faint any seconds..my vision was bright and blurry. I slowly moved myself to a bed and laid down for a while. Later that day in the late afternoon, my muscles were sore (legs, thighs, back) I could not walk more than 10-15 steps which I needed rest. These conditions lasted me for 6 days since receiving the vaccine and felt better on the 7th day. Currently I'm ok.
1257229	4/25/2021	OR	79	F	3/17/2021	4/2/2021	Starting early February about 2 weeks after vaccine administration pt began having intermittent headaches and jaw pain, which progressed to rapid and complete painless vision loss 4/20/21 to right eye. Seen same day in ophthalmology clinic, diagnosed with optic nerve ischemia, likely GCA, Rx'd 80mg PO prednisone, lab evaluation started which revealed elevated CRP. This, in combination new new grey 'veil' over vision of L eye the next day 4/21/21, led to admission and initiation of 1,000mg daily IV methylprednisolone. Unfortunately pt then progressed to complete painless loss of vision of left eye as well on 4/23/21 while inpatient on high dose steroids. Patient is now completely blind in both eyes.
1255872	4/25/2021	MA	17	M	4/24/2021	4/24/2021	Systemic: Dizziness / Lightheadness-Mild, Systemic: Flushed / Sweating-Medium, Systemic: Hypotension-Medium, Systemic: Visual Changes/Disturbances-Severe, Additional Details: Patient received shot and vision went black after about 5 mins. Vision began to return blurry within 15 mins with paramedics.

1256713	4/25/2021	NY	34	F	4/6/2021	4/18/2021	Pt received vaccine on 4/6, on 4/18 started to develop paresthesias in legs, numbness, hyperesthesia, blurry vision and difficulty urinating. She was admitted on 4/23 and MRI of brain/C-spine/T-spine/L-spine showing widespread demyelinating lesions mostly in T-spine. ADEM was primary consideration. LP showed lymphocytic predominance with about 130 WBC, elevated protein and normal glucose. Viral PCR of CSF and nasal swab were negative. Culture negative. She had acute urinary retention requiring foley catheter. She will be discharged today 4/25 with plans to follow outpatient for final MS serologies and neuro/optho follow up for final diagnosis.
1256449	4/25/2021	VA	57	F	4/7/2021	4/15/2021	I contracted Herpes zooster in 1990, and was treated with Valtrex (3 times a day for 3 days) which help to keep control of the virulence of the episodes. Through the years the number of episodes went down (2-3 times a year). In the last 5 years they were so mild that I did not need to use any medication. However, after receiving the COVID vaccine I had a bad case of Herpes in the genital area but in addition and first time since I contracted it I also have blisters in one eye and the mouth. I first had a blister in the right side of my lips and a couple of days later I had another one on the left side of my eyelid. It is painful and I am alarmed because I never had these before.
1256810	4/25/2021	NY	18	F	4/22/2021	4/22/2021	Fever, chills, whole body skin sensitivity, swelling in throat, eyes and injection site

1256857	4/25/2021	MN	52	F	4/9/2021	4/9/2021	Had a headache within an hour, felt slightly flu-ish.. Developed a rash on my face on about day three. It kept getting worse and painful (swollen and near the eye) so I saw the doctor on April 16th. He treated me for shingles. The rash and pain was on the left side of my face and neck and in my hair. I felt better on about April 20th except the headache is still there and I still have nerve pain in my hair and one spot on the left side of my head, near my temple. It comes and goes.

1256896	4/25/2021	IA	52	F	4/20/2021	4/20/2021	With the first and second shot, I had major arm pain, then all Covid symptoms other than the respiratory issues...even worse then when I had Covid! I had it bad. I'm a long hauler. I have Interstitial Cystitis which got so much worse with Covid, and the same with the shots. I have pigmentary maculopathy and macular degeneration, which I'm losing my vision quite quickly. After Covid and the shots, it was also severely damaged and won't get better! I'm still dealing with muscle weakness,/atrophy, shortness of breath, confusion, major brain fog, like I'm lost in space, I'm more anxious and it was all so bad that I will never get the shot again! It made stop sick
1256955	4/25/2021	IL	16	M	4/25/2021	4/25/2021	Patient received the vaccine and sat down for 15 minutes. After the 15 minute wait patient got up to schedule their second dose appointment. While waiting in line, patient fainted and fell to the floor. Patient stated had blurred vision, was not showing signs of difficulty breathing , denied a soar itchy throat. Had patient lay down, feet were elevated. ambulance removed patient from pharmacy area via stretcher.

1255233	4/25/2021	TX	75	F	3/15/2021	3/30/2021	infection; Abnormal nose bleed with blood cloths the first day; Abnormal nose bleed with blood cloths the first day/6 more nose bleed that it was taking me to control up to 30 min; This is a spontaneous report from a contactable other HCP (patient). A 75-year-old female patient (not pregnant) received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Lot Number: EN6207), via an unspecified route of administration on 15Mar2021 10:45 (at 75 years old, not pregnant), single dose for covid-19 immunisation. Medical history included Type II diabetes, Hypertension, GERD and hypercholesterilymia, sulfa allergy, all from an unknown date. Concomitant medications included verapamil; rosuvastatin calcium (CRESTOR); metformin; omeprazole, unspecified blood thinners. The patient previously took tetracycline for known allergies: Tethracycline. Patient experienced abnormal nose bleed with blood cloths the first day (reported as 30Mar2021 0130). Five days later in two days had 6 more nose bleed that it was taking me to control up to 30 min. She went to ER in the morning and had a CBC having results normal with normal levels of platelets. She was referred to PCP. She saw a NP next day and gave me referral to ENT specialist. Using an scope could not find anything and ordered to have CT Scan. Results show negative for polyps, tumors and show only a shadow by eye socket which MD believe it was an infection that was leading to the bleed. Prescribe a very small amount of Amoxicilline 125 mg, twice a day for 7 days plus a saline gel. Patient had the last nose bleed at midnight. For 3 days did not have any bleeding until today, at 10:15 am, with heavy bleeding which took me 15 min. to control. She has no history of nose bleed, taking blood thinners, no head traumas either. No other vaccine in four weeks. No Covid prior vaccination. No Covid tested post vaccination. The outcome of the event infection was unknown, other events was not recovered.; Sender's Comments: Information provided was so limited to prevent a meaningful and definite medical assessment for the events. A causal relationship cannot be completely excluded for BNT162B2 injection and development of Thrombosis and Epistaxis, only based on a plausible chronological sequence. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including

A 44-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in arm left on 30Mar2021 16:00 (Batch/Lot number was not reported) as single dose for covid-19 immunisation. Medical history included Mild/moderate TBI in Oct1999 with herniated disk in lower lumbar region from auto accident (patient was a pedestrian and a car ran into her); fractured tibia/fibula from occurrence; low blood pressure which she had occasionally fainted from at blood draws (started after being active athletically during recovery from 1999 injury). Patient was not pregnant. There were no concomitant medications (no vaccine in 4 weeks and no other medication in two weeks). Patient did faint 15 minutes after receiving Pfizer Covid vaccine on 30Mar2021. Medical people at vaccination site made a vasovagal note on record. Patient reported that there were no body aches or fatigue or fever, only slight injection site soreness for a couple of days which was hard to notice through intense tingly whole body sensations that started after receiving vaccine on 30Mar2021 16:15. Still continuing to feel a week and a half later. It was very uncomfortable but not painful. Patient also experienced sense of pressure and tingling on eyeballs and increased sensitivity to touch. Menses were due one week after vaccination but 4.5 days after vaccination on 03Apr2021, nipples became very hard and sore. After a few days on nipples slightly sore still but mostly swollen breast tissue with soreness on Apr2021. Patient had not had this as PMS symptom since becoming pregnant almost 9 years ago and it never lasted 7.5 days with it still ongoing as of time of report. Her menses was late on Apr2021 and hasn't started but she was not pregnant. Patient's usual PMS symptoms have kind of started yesterday on 09Apr2021. It quickly formed bilaterally symmetrical lumps on the distal sides of her breasts which was also unusual on Apr2021. No</p>

A 49-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in Arm Left on 30Mar2021 11:45 (Batch/Lot Number: ERG213) as a single dose for covid-19 immunisation. The patient's medical history included ongoing systemic lupus erythematosus diagnosed 17 years ago. The patient's concomitant medications were not reported. On 30Mar2021, the patient experienced headache and nausea, arms went numb on 31Mar2021, legs went numb and feet burning on 01Apr2021. On 05Apr2021, the patient was diagnosed with Bell's palsy. It was also reported that before the bell's palsy diagnosis she felt like she was getting a cold. It was further reported that on the first day the patient had a headache and nausea. The second day her legs went numb for 3 days, on 05Apr2021 she got Bell's Palsy. Patient cannot talk, symptoms were not treated in any way. Patient had numbness in her arms first and then it went to her legs. She later clarified her arms and legs are still numb. The headache started soon as she got the vaccine. Her nausea started 2 hours after the vaccine and lasted 8 hours. Her legs still bothering her. She still has pain in her feet. Before the Bell's Palsy diagnosis she felt like she was getting a cold. She had a headache on the right side of the face. Her tongue was numb 3 days ago. She can't close her eye all the way, it was causing headache, dry eye and eye watering. It was going into her nose. Her lip was moving, she cannot talk. She went to urgent care last night after her daughter asked why she was winking. Her lip was sagging and thought it was a stroke. They said the Bells Palsy was definitely from the vaccine. The outcome of the event nausea was recovered on 30Mar2021, Bell's Palsy legs went numb, arms went numb, feet burning was not recovered and unknown outcome for the event before the Bell's Palsy diagnosis she felt like she was getting a cold.

1251397	4/24/2021	MI	40	F	3/8/2021	3/9/2021	The second shot was on March 8th. I started feeling very dizzy later on that night, and the next day I felt really dizzy and tired, over the week the dizziness, muscle pain & weakness increased, to the point I could not walk, my muscles were constantly spasming almost like convulsing, I was seeing double, my ears were ringing, and it was so bad by Saturday the 13th of March, I was admitted to the neurology unit at Hospital under the review of Dr neurologist. By day 4, I left the hospital to go see an ENT to see if my ears were the reason for my dizziness. Since then, I've seen my rheumatologist (who's tests showed an elevated SED and issues with my kidneys), I have another meeting with her this Monday. I have seen the ENT twice, and they told me my ears were normal and probably from the vaccine. I have seen an eye doctor, and she too found nothing wrong with my eyes to cause the hallucinations or dizziness. My eye sight has gotten worse in one eye. I am still suffering from dizziness, nausea, bone pain, and muscle spasms.

1251720	4/24/2021	NY	52	F	4/4/2021	4/5/2021	The day after I received the vaccin I experienced an extreme tension in my two eyes that I still have now but not as intense. My left eye is the most affected - The blood flows really fast in the eye and it is pulsing. I don't have the sensation every day now but still on and off. Both of my eyes feel tension not as much as it was at the beginning but still experiencing symptoms of pressure and pulsions. It feels like I am going to have an ophthalmic migraine. My eyes doesn't feel right either. Overall, I felt weak, highlighted and it felt like if I was experiencing feeling of "dissociation" - caused I think by my sight being affected. I couldn't do a lot as my energy was very low and it felt that my oxygen wasn't at its maximum. Every small activity required a lot of energy and I could barely walk around my block. It affected my work and I couldn't teach at the end of that first week. I wasn't feeling good. I went to my doctor on Monday, April 12th as I was concerned about blood clot or other neurological and pulmonary issues. My Doctor examined me and listened to me and concluded that the sides effects were taking longer than the average to go away. The following day I woke up reading about the blood clots due to J&J vaccin. I called back my doctor and we did a blood test. It came back negative and I got my eyes checked by my ophthalmologist too, and he didn't see anything.

1251318	4/24/2021	TX	29	M	3/25/2021	3/27/2021	on -03/25/21 I Injured my back doing an sitting dumbbell overhead press. The injury occurred while pulling the dumbbell from the ground into an overhead press position. The injury felt muscular in nature, there was no pain after the first few minutes, I was able to complete my workout without any pain. 03/26/21 - Received Moderna Vaccine first dose 03/27/21 - Worked out again with no pain, avoided aggravating the area just in case. 03/28/21 - Woke up with debilitating back pain, unable to fully stand, dull stabbing pain shooting from lower back into hip and then into knee. Following week I was unable to stand upright without intense pain, received Celebrex and muscle relaxers which did little to help with pain, Doctor then put me on 1 week of prednisone, an anti-inflammatory steroid which did not appear to do much. Four hours after starting steroid use I decided to stretch my psoas muscle, despite incredible pain I managed to get it stretched out, I could walk upright with reduced pain afterwards. For the next week the pain would gradually get better. 04/19/21 At this point pain had subsided to about 10% of pain at its worst point and has gradually gotten better, pain is almost non-existent at this point. I noticed that my right quadriceps muscle had atrophied in comparison to my left quadricep muscle. 04/22/21 Began self-administered rehabilitation, slight increase of pain during workouts. Noted that my right quadricep had gotten significantly weaker and had from visual inspection lost about 40% of it's muscle mass, left leg feels hard to the touch while flexed, right leg is mushy to the touch while flexed, one month prior I could do squats of 285x8, now my right quadricep could only complete 5 reps of 15lbs on single leg extensions, my left leg could still do 40+ reps without failure.

1252099	4/24/2021	MD	25	F	4/3/2021	4/3/2021	About 7 minutes of receiving my J&J vaccine, I started to feel nauseous while sitting down and waiting for my fifteen minutes of monitoring. I experienced pain in my left arm and my heart was beating fast. My vision was in and out, started seeing black and white spots. I then got up from my chair and I went to the counter and as I was talking to the clerk telling her I did not feel good, I just went down and fainted. I had fainted and when I came back, woke up a nurse was trying t put an epi-pen on me but I told her I did not need it. They called the ambulance and they monitored me there. The EMT said to me that my blood pressure had dropped and I had had a "vasovagal syncope" and that my body probably went into shock. I did not go to the hospital and went home. For the rest of the day I felt ill, and out of it. I also felt pain, an aching pain to the right buttocks region. The next day I still felt not good. Also I have noticed since the J&J vaccine, I had my menstrual cycle but normally my menstrual cycle lasts 5 days now this month it only lasted about 4 hours and I this concerns me. Before this vaccine, I did not have experience these symptoms.

1249838	4/24/2021	IL	63	F	2/4/2021	2/4/2021	face was swelling, bright red, and very itchy; face was swelling, bright red, and very itchy; face was swelling, bright red, and very itchy; Continued to worsen all day and night. Eyes and lips swelled shut; entire face and neck brilliant red; max amt of itching; neck still red and bumpy; Have been unable to sleep well; This is spontaneous report from a contactable healthcare professional (patient herself). A 63-year-old non-pregnant female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot Number: EL3246), via an unspecified route of administration on 04Feb2021 at 15:15 PM (at the age of 63-years-old) as single dose in left arm for COVID-19 immunisation. The patient's medical history included diabetes Type 2, hypothyroid, shingles 10 years ago. Patient had known allergies. Concomitant medications included Synthroid, Rosuvastatin, Metformin, Tresiba and Ozempic. The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient had no COVID prior vaccination and was not tested COVID post vaccination. On 04Feb2021 at 20:00 by midnight, the patient's face was swelling, bright red, and very itchy. She took one Benadryl. Her face and neck worsened, got into MD in morning. She prescribed Claritin and make appointment with allergist. Patient did both. Events continued to worsen all day and night. Her eyes and lips swelled shut, entire face and neck brilliant red with maximum amount of itching. Patient kept ice on face and neck all night but continued to worsen. She went into hospital Emergency Room at 9:00 AM, received IV Prednisone, Benadryl and one more. Also, prescribed with Famotidine, Prednisone, Benadryl and Tylenol if needed for home. Itching started subsiding, brilliant red remained everywhere, swelling was still significant around eyes and cheeks, neck was still red and bumpy. Patient have been unable to sleep well. She took appointment with allergist 08Feb2021 morning. She wondered if she should take second vaccine and reported that this has been an expensive and emotional nightmare. The outcome of the events was not recovered.

1249905	4/24/2021	CO	93	M	1/22/2021	2/1/2021	shingles in his forehead and close to his eye but not in eye; lesions; swelling, pain and inflammation; swelling, pain and inflammation; swelling, pain and inflammation; This is a spontaneous report from a contactable consumer. A 93-year-old male patient received the first dose of the BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; formulation: Solution for injection, Lot number: EL3302), via unspecified route of administration on 22Jan2021 at 14:00 (at the age of 93-years-old) as a single dose for COVID-19 immunisation. It was reported that patient had a lot of medical conditions and takes a lot of medications (unspecified) (but nothing she thinks is related to the vaccine). Additional vaccines administered on same date of the pfizer suspect was none. The patient did not receive any other vaccine within 4 weeks prior to the vaccine. On 07Feb2021 patient had lesions showed up and he was diagnosed with shingles he had symptoms 2-3 days prior: he was on a medical treatment with a viral medication, prednisone, ibuprofen and Tylenol. On Tuesday they went to see his ophthalmologist because he has shingles in his forehead and close to his eye but not in eye, his ophthalmologist said that after 10 days with the viral medication and 5 days with prednisone, he should be able to get the second dose of the vaccine. She would like to know if the vaccine could have caused him shingles. He was on a viral medication and was put on prednisone for swelling and inflammation on an unknown date in Feb2021. The patient was also alternating Tylenol and Advil for pain. The patient did not visit emergency room. The outcome of the events lesions, swelling, pain and inflammation was unknown while for shingles was not recovered.

1249692	4/24/2021	OH	77	F	1/26/2021		<p>Afib; Lightheaded/dizzy; nervous; Dehydrated; Problems with vision; Tachycardia; Problems concentrations; Fatigued/Tired; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of ATRIAL FIBRILLATION (Afib) in a 77-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 002A21A and 098K20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included No adverse event (No reported medical history). On 26-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 26-Feb-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On an unknown date, the patient experienced ATRIAL FIBRILLATION (Afib) (seriousness criterion medically significant), DIZZINESS (Lightheaded/dizzy), NERVOUSNESS (nervous), DEHYDRATION (Dehydrated), VISUAL IMPAIRMENT (Problems with vision), TACHYCARDIA (Tachycardia), DISTURBANCE IN ATTENTION (Problems concentrations) and FATIGUE (Fatigued/Tired). At the time of the report, ATRIAL FIBRILLATION (Afib), DIZZINESS (Lightheaded/dizzy), NERVOUSNESS (nervous), DEHYDRATION (Dehydrated), TACHYCARDIA (Tachycardia), DISTURBANCE IN ATTENTION (Problems concentrations) and FATIGUE (Fatigued/Tired) outcome was unknown and VISUAL IMPAIRMENT (Problems with vision) had not resolved. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments Treatment included metoprolol, digoxin and diltiazem. No concomitant medication was provided. The patient received both scheduled doses of mRNA-1273 prior to the event, therefore action taken with the drug in response to the event is not applicable.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. However, The patient's advance age may remain a risk factor for the event Atrial fibrillation. Further information has been requested.</p>

1249958	4/24/2021	CA	74	F	2/11/2021	2/11/2021	my arm was very itchy for 3-4 days/Itchy on arm where she bends her elbow; Arm soreness is in left arm, which received the COVID-19 Vaccine; This is a spontaneous report from a contactable consumer (patient) via medical information team. A 74-year-old female patient BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, formulation: Solution for injection, Lot Number: EL9265, expiration date not reported) via an unspecified route of administration in left arm on 11Feb2021 around 11:00 am (at the age of 74-year-old) as a single dose for COVID-19 immunisation. Medical history included patient was allergic to Ibuprofen and gets swollen eyes. Can't take any medications with Ibuprofen in it. Hasn't taken Ibuprofen in years. Has no NDC/Lot/Exp to provide. Patient had no family medical history. Patient did not receive any other vaccines within four weeks prior to the vaccination. No additional vaccines were administered on same date of Pfizer suspect. Reportedly, there were no other products. No investigation assessment. There were no relevant tests. On 11Feb2021, patient experienced arm soreness is in left arm, which received the COVID-19 Vaccine and on 12Feb2021, started itching where she bends her arm across her elbow about six inches. Had no rash. Was very itchy that day and then it decreased a little. Itching went on for three to four days. Patient was little better in the morning. It was very itchy. Wants to know if that is an allergic reaction. Patient was scheduled for second dose on 03Mar2021, but she doesn't want to get the second COVID-19 Vaccine. Heard all sorts of stories. Patient asked how much she is protected if she just received one shot. Patient asked if you get a reaction can you take Benadryl after getting the vaccine. Patient also asked for his son who has a Penicillin allergy. He was supposed to get his first vaccine tomorrow. He is 45, is it ok to get the vaccine. No further details provided. The case was reported as non-serious. There was no PQC present. Patient was recovered from itching on 16Feb2021 and was recovering from arm soreness.

1251238	4/24/2021	OH	47	F	4/8/2021	4/16/2021	tia in right eye, on Friday morning on 4/16/ 21, between the hours of 8 am and 9:30 am, I went from feeling fine and sleeping to waking up not being able to hear in both ears, not being able to see anything out of my right eye, my left arm was completely numb all the way up to my shoulder and neck, the right side of my tongue was numb and my blood sugar was over 611. Initially they thought it was just a reaction to my high sugar levels, since the mri's showed I did not have evidence of a stroke. It wasn't until I saw a retina specialist the following Tuesday that she confirmed that yes I did have a stroke in my eye. I have not recovered my vision fully in my eye or the sensation in my tongue. I didn't connect it to the vaccination until I spoke with a friend whose sister also got pfizer 5 days before me and suffered a stroke 3 days before me, and two days after we spoke they announced Johnson& Johnson pause due to clots in women. The retina specialist says we will have to wait and see if the damage heals on it's own in the meantime I need to see her on a monthly basis.

The patient medical history included Systemic lupus, RA, Minimal Stage Kidney Disease, mild heart failure, allergic asthma and allergies to Nafcillin, cleocin, celebrex, fluorescein dye, lasix, bactrim, flecanide. Prior to the vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The patient Concomitant medications included Prednisone 5mg, Plaquenil 200mg, APIXABAN (Eliquis), METOPROLOL SUCCINATE (Toprolxl) taken in two weeks. The patient did not receive any other vaccine in 4 weeks prior to the COVID vaccine. On 10Feb2021 05:00 PM, the patient experienced mild headache, nausea, painful knees, fatigue, red bumpy rash on face, itchy eyelids and eyebrows. The patient did not receive any treatment for the events. The outcome of the events was recovered.
1252377	4/24/2021	CA	26	M	3/27/2021	3/24/2021	Initial adverse reaction was a headache and impaired vision. My vision has continued to be impaired with it being similar to static and has caused headaches. After research I saw AstraZeneca had this in their files as a possible side effect. I understand it is different but made with similar technology so it may or may not be true for J&J vaccine, but this has continued for almost a month so I am concerned.

1252704	4/24/2021	CA	16	M	4/24/2021	4/24/2021	<p>Patient started to feel dizzy for about one minute. His father states that patient was sitting up on a chair and he started to fall backward, so his father caught him and lowered him to the ground. He did not hit his head. He was not responsive for approximately 10 seconds, per the father. Clinical monitors arrived and patient was alert and oriented to name, place, date/time. He was slightly pale and clammy but he denied any dizziness, chest pain, palpitations, shortness of breath, headache, changes in his vision/hearing, or nausea. He was laying on his back on the ground with his legs elevated on a chair and he started to feel better, and his blood pressure and oxygen saturation were stable with mild bradycardia per the vital signs obtained by one RN. He said he was feeling better and he was smiling and joking with staff. He slowly started to sit up and sipped bottled water. Stated that he had not eaten since 11am, and he agreed to a snack. I left to get him a snack, and RN said that he started to "zone out" and he lost consciousness again for approximately 20 seconds. When I came back, he was sitting up, conscious, and had spit up saliva and water onto his shirt. His breathing was steady. He again stated that he was feeling better very quickly, again in good spirits, but his father and I agreed that it would be best to call 911 to transport him to the ER just to be safe. He did not hit his head. He denied dizziness, chest pain, palpitations, shortness of breath, nausea, changes in vision, and headache. He was alert and oriented to name, place, and time. EMS was requested and they arrived, took his vitals, and he was transported to the Emergency Dept for further care. He and his father were confident that he would recover quickly as he had a history of syncopal episodes related to vaccines in the past.</p>

1246686	4/23/2021	IN	52	F	3/8/2021	3/17/2021	Vomiting, vision impairment (read very slow to me), and seizure(s). Rushed to ER in ambulance. Was put on a ventilator (sedation). Received a CT scan showing a CVST and hemorrhaging in her right temporal lobe. Life-Lined to Hospital. Wore an EEG on her head to monitor seizure activity for 4-5 days. Was put on 4 types of seizure medication and blood thinner for the clot. Did another CT scan which showed her Mid-Line shift was pushing into the left side of the brain by 15mm. Discharged from Hospital on 3/27/21 to Rehabilitation Hospital. She was discharged to home with a caregiver on 4/16/21. She will continue outpatient therapy at the rehabilitation hospital. She will see Speech, Vision, PT, and OT every week until further notice.
1246638	4/23/2021	PA	18	F	4/14/2021	4/14/2021	She received the shot walked a couple steps had a blank stare on face sat her in a chair where she sat for a couple seconds and just stared at me then head jerked and right hand curled and eyes rolled back into head. tried shaking her to respond she passed out .She came to opened eyes wasn't speaking but followed my command to spit out gum then again went limp with head shaking and hands twitching. Got her to the ground with help and called 911. She laid on ground then came to . She did not remember incident but was responding appropriately to questions. drank orange juice and placed ice bag under neck while laying. By the time paramedics arrived she was awake and appropriate. Pulse ox, blood sugar and EKG normal. Blood pressure was low but not unusual for her. Prior to shot she was well hydrated and had eaten. After being checked out by paramedics we denied need to go to hospital and she did walk out on her own. Observed her closely over night and had no further symptoms.

1246442	4/23/2021	NY	53	F	3/26/2021	4/14/2021	Muscle aches started about 12 hours after the injection. First my legs and back but after another 12 hours it was mostly my legs. Legs felt like the muscles were being pulled. (It felt like the beginnings of the extreme reaction I had to ampicillin 2 decades earlier, though not nearly as severe.) My arm swelled slightly, was warm at the injection site and ached about 12 hrs after the injection. The leg aches lasted about 2 days, the arm ache lasted about 1 day and the slight arm swelling lasted about 6 days... Reason for my reporting: I had an annual eye exam 4/14/21 where a retinal scan was done. The optometrist saw some blood spots in my left eye and referred me to an ophthalmologist. Ophthalmologist performed additional scans and tests including a Fluorescein angiography and determined I have BRVO (Branch Retinal Vein Occlusion) which is a series of blot clots in small vessels of the eye's main vein. He did not say it could be a result of the vaccine but I have no risk factors associated with getting BRVO. Since it is not affecting my vision yet, the doctor wants to monitor it in 3 months to make sure it has not worsened. Since the Janssen vaccine was put on hold for causing other types of blot clots in women in my age group, I am wondering if the vaccine caused the blood clots in my eye.
1246617	4/23/2021	NC	56	F	4/8/2021	4/8/2021	Patient has a history of allergic reactions to iodine and presented to the ED for evaluation of lightheadedness, dizziness, nausea, vomiting. Patient states that this afternoon she received the Johnson and Johnson COVID-19 vaccine at the Arena and within a minute she began to have a reaction. Patient describes the event as she got up to walk to the observation room and was unable to make it to her chair before she began to sweat profusely, become exceptionally nauseous, and dizzy. She describes her dizziness as so severe that she was unable to stand or move at all. Patient also endorses seeing "black spots" in her vision and saying that she was going to pass out. Patient reports several episodes of vomiting that did stop until the staff present placed an IV and gave her Zofran. Patient denies any throat swelling, wheezing or trouble breathing. On examination patient reports that all of her symptoms resolved within 40 minutes of onset without any other treatment than Zofran.

Experienced chills and consistent headache throughout the day Saturday 4/17 10 pm: Began to run a fever however did not check the temperature. Radiated heat and friend took care of me throughout the night as I sweated with confusion Sunday 4/19 Complete fatigue and tiredness, cramping in the foot seemed to have subsided. Still was running hot throughout the day. Monday 4/20 Took off work due to exhaustion and muscle ache and what seemed to be a fever Thursday 4/23 Followed up with General Practitioner Dr. Franco and was advised to report my experience with the Johnson and Johnson vaccine. Feeling better as of Friday 4/24 with slight fatigue but body temperature seems to be ok. No signs of the lingering cramping in the left foot but still slightly achy all over the body.

1247470	4/23/2021	AZ	55	F	4/5/2021	4/6/2021	4/5/2021--Received Janssen vaccine. Felt very hot during the day. 4/6/2021--Woke up with very bad headache and rash on the injected arm plus on my stomach. Went for a walk and felt pain in my left calf and achilles tendon. Went to work. 4/7/2021--Started my work day as a Personal Trainer/Fitness Instructor at 6am as usual. Taught cycling classes and trained a few clients. Went for walk. Still had a headache. When I got in my car to head home, my vision was super blurry and I felt very dizzy. I ate an orange and peanuts and hydrated more. I was not even sure I could drive home. I got home told my family how I was feeling. My husband noticed my eyes were very red and swollen. I took a shower, drank a smoothie and ate a salad. Used my aunt's BP cuff to check my BP and it was 148/99. I have NEVER had HBP. 4/8/21--Woke up feeling disoriented as if the left side of my face, body were off--neurological stuff. I went to reach for grapes in the refrigerator and could not grab them. I felt like I have never felt before and ask my husband to drive me to the ER. While at the waiting room at the ER, I felt chest tightness and pain and nauseous. My BP was 153/111. Again, I have never been diagnosed or been treated for hypertension. They did EKG, lab tests, chest X-ray. Once my BP came down, they sent me home. This is before all the JJ Janssen vaccine "news" came out and the reasons it was paused. I developed a very bad cough about two hours after I got home from the ER. 4/9/11--Made appointment with a brand new primary care doctor. Saw her on Monday 4/12/2021 as recommended by ER. I had never met her before. She prescribed a very low dose of BP medication, which I did not take because the number one side-effect is dry-cough. I was already coughing a lot, later on with blood. 4/11/2021--Still feeling pretty bad, I woke up to the news of the Janssen vaccine being paused. Frankly, I felt relieved that I was not going crazy. This truly has been one of the hardest things I have ever gone (and still am) going through. I became concerned about the pain in the left calf and heel could be a clot. Called primary care doctor. Had ultrasound of legs and chest x-ray the following day 4/12/2021--Had persistent cough with blood. Went to ER at 9pm. Had EKG, blood work, CT without contrast of chest, covid test--negative. Got home around 2am. 4/19/21--Followed up with primary care doctor who after

explaining to her I am extremely fatigued, still blurry vision, dizzy, cough better but not gone, chest discomfort on the left side, she referred me to an opthamologist and cardiologist. My insurance and this poorly established referral system is very difficult to navigate. Up to now I am still waiting for the referral and pre-aurhtorization to the opthtamologist. (4/23/2021). I want to say, I am pretty healthy. I have worked in fitness and wellness for over 30 years. I have never drank alcohol, smoked or done any drugs. Prior to this no physician has told me I have HBP or any issues for which I have to be medicated. I take zero medications. Even when I had the bad headache from the vaccine I took nothing. I have not worked in two weeks and had not driven until last saturday. If I don't work, I don't get paid. I pay for almost \$600/month for my insurance in the marketplace. This has been another stressor of this storm. Getting providers to really listen and insurance companies to take situations like this seriously. I could not drive at night. This has been rough and I look forward to being myself soon. This reaction felt like a heart attack/stroke with extreme fatigue, acid reflux, cough with some blood, muscular pain. The rash and headaches were the least of my concerns. I am not yet recovered from all of this. I sure hope there is no permanent damage and that this too shall pass. It is important to note that I have tried reporting this event several times to the VAERS website online. I completed the 4-5 pages multiple times and it would not let me submit. I also called the VAERS 1-800 number to report and they told me to go back to the online form. I left several messages when I could not get it done online and to this date no one has called me back. I called to report my adverse reaction and they told me they do not take that info. I also called the health dept. After several phone calls to them a nurse called me back but did not take a formal report. When someone is feeling pretty sick, this is a lot to ask of. I persisted because I feel this is important to be reported.

1247645	4/23/2021	WA	48	F	4/8/2021	4/8/2021	On the night of my J&J my vaccine , I felt very tired and sleepy but I could not sleep. The next morning I felt a burning sensation to my eyes as well to my right ear and that went away. I went to see my PCP that day as well because I was having a pressure sensation down my right calf and leg. On Wednesday I felt numbness sensation down my right arm and the right side of my body was weak. On Thursday, I called my PCP who advised me to go to the ER and to get monitored for thrombosis. I also began to have headaches and blurry vision. At the ER they performed an ultrasound and did lab work. The ultrasound exam did not show evidence of thrombosis or blood clots. The ER physicians told me to rest and elevate my legs. I also noticed that my BP was 130/90 which I never had before. To this day I still have throbbing sensation to my right calf and leg. I again went to the ER and thy monitored me. They told me to take Ibuprofen for pain and again did an ultrasound which did not show any blood clots. I then started to have a burning sensation to my skull and scalp and also my left arm. I have not fully recovered from my symptoms.

1247646	4/23/2021	WI	64	F	3/24/2021	4/13/2021	On April 13th, patient noted a black spot in her vision with her right eye. As the day progressed, she began experiencing a headache which worsened in severity despite treating with medication. She started treating with Tramadol; when that didn't help, she took her prescription oxycodone (5mg/325mg) 3 hours later, q6 hours x 2. That evening, patient experienced 1 episode of emesis and thought she may not be feeling well, so went to bed. When she woke the next morning, she felt better, but still noted the black spot in her vision. She sought care with her Ophthalmologist, who evaluated her, and he did not believe it was related to her vision. He referred her for an MRI, immediately. MRI revealed a stroke in the occipital region. She was admitted and given IV fluid along with another panel of testing. She was seen by Neurologist and Hospitalist; more testing was completed on Friday, including bloodwork which revealed high potassium levels which was treated. She was also given 1 unit of blood. She discharged on Friday and was started on Clopidogrel (75 mg). Follow up appointments are scheduled with eye doctor, neurology, internist. Right eye was affected and vision will not likely return, per her doctors.
1246437	4/23/2021	TX	16	F	4/20/2021	4/21/2021	eyes began itching in the middle of the night and patient woke up with swollen face and eyes
1245315	4/23/2021	UT	45	F	3/6/2021	3/7/2021	Vertigo, body aches, headache first 2-3 days. Then a few days later major fatigue set in, chest pain, mouth breaking out in canker sores randomly, broke out in hives, rashes on my legs and arms, skin hurts to touch, dizzy, loss of balance, difficulty sleeping, night sweats, blurred vision, double vision this is probably the worst of all the symptoms, I lost my taste for 5 weeks. I have taken anti-viral homeopathic drops because it really felt like I was getting the chickenpox or something...like a nerve pain burning. I have documentation how perfectly healthy I was before this and now I am not.

The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Sore throat (Patient reported that her throat was no longer sore at the time of vaccine just "scratchy."). Concomitant products included CODEINE PHOSPHATE, GUAIFENESIN, PHENIRAMINE MALEATE (ROBITUSSIN A-C) from an unknown date to 13-Apr-2021 for Sore throat. On 13-Apr-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 13-Apr-2021, the patient experienced DEAFNESS TRANSITORY ("I lost hearing in both ears for 20 min, on and off ever since") (seriousness criterion medically significant) and DIPLOPIA ("my vision doubled in size"). On an unknown date, the patient experienced TINNITUS ("It sounds like a buzzing nose, and feels like I'm on a plan and my ears need to pop."). On 13-Apr-2021, DIPLOPIA ("my vision doubled in size") had resolved. At the time of the report, DEAFNESS TRANSITORY ("I lost hearing in both ears for 20 min, on and off ever since") and TINNITUS ("It sounds like a buzzing nose, and feels like I'm on a plan and my ears need to pop.") had not resolved. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 13-Apr-2021, SARS-CoV-2 test: negative (Negative) Patient had received a negative COVID test on the day of the vaccination.. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Patient denies any treatment related to the events. REACTION (severe allergic reaction to the vaccine) (seriousness criterion hospitalization), INCOHERENT (became incoherent, could not function) (seriousness criterion hospitalization), APHASIA (I couldn't comprehend or process what my children were saying to me, I could see their lips) (seriousness criteria hospitalization and disability), VISION BLURRED (Vision blurry) (seriousness criteria hospitalization and disability), DIZZINESS (dizziness increased) (seriousness criterion hospitalization), VACCINATION SITE REACTION (Covid arm), VACCINATION SITE WARMTH (injection site hot), VACCINATION SITE PRURITUS (injection site itchy), VACCINATION SITE PAIN (injection site with burning sensation) and VACCINATION SITE SWELLING (injection site swollen). On 11-Apr-2021, the patient experienced PARAESTHESIA (face started tingling). On 11-Apr-2021 at 1:15 AM, the patient experienced TACHYCARDIA (heart was racing; 154 heart rate), PYREXIA (woke up with a "fever") and VOMITING (started throwing up). The patient was hospitalized from 06-Apr-2021 to 10-Apr-2021 due to ANAPHYLACTIC REACTION, APHASIA, DIZZINESS, INCOHERENT and VISION BLURRED. At the time of the report, ANAPHYLACTIC REACTION (severe allergic reaction to the vaccine), INCOHERENT (became incoherent, could not function), APHASIA (I couldn't comprehend or process what my children were saying to me, I could see their lips), DIZZINESS (dizziness increased), NECK PAIN (woke up with severe neck pain), SWELLING (neck to collarbones were swollen), DIZZINESS (became dizzy, the more I moved around, the worse it would get), AUTOSCOPY (It like an out of body experience), CONFUSIONAL STATE (I was confused), TACHYCARDIA (heart was racing; 154 heart rate), FEELING ABNORMAL (brain fog), VACCINATION SITE REACTION (Covid arm), VACCINATION SITE WARMTH (injection site hot), VACCINATION SITE PRURITUS (injection site itchy), LYMPHADENOPATHY (ymph node in both armpits and both breast were swollen and hurt to touch), CHILLS (chills), FATIGUE (extreme fatigue, had no energy at all), HEADACHE (headache), VACCINATION SITE PAIN (injection site with burning sensation), VACCINATION SITE PAIN (injection site was sore to the touch, it hurt bad, but looked fine), VACCINATION SITE SWELLING (injection site swollen),

PYREXIA (woke up with a "fever") and VOMITING (started throwing up) outcome was unknown, VISION BLURRED (Vision blurry) and PYREXIA (low grade fever, 101.9 degrees.) had resolved and PARAESTHESIA (face started tingling) had not resolved. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 02-Apr-2021, Body temperature: 101.9 (High) 101.9 degrees. On 11-Apr-2021, Heart rate: 154 (High) 154. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Concomitant product use was not provided. The patient was taken to the emergency room on 06-Apr-2021 and was then hospitalized. Treatment details included hydroxyzine and IV (intravenous) steroids, and dexamethasone as well as IV fluids. The patient was advised by her HCP (health care provider) to not take the second dose of the vaccine due to having an allergic reaction. On 10-Apr-2021, the patient was released from the hospital but her injection site was sore, swollen and getting bigger. The patient reported additional side effects on 11-Apr-2021 that are ongoing. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Reporter did not allow further contact; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

1245422	4/23/2021	PA	64	F	3/16/2021	3/28/2021	Diagnosed with Bell's Palsy; Stroke; Second dose scheduled 2 days past her 42 days; terrible dizziness; double vision; This spontaneous case was reported by a consumer and describes the occurrence of CEREBROVASCULAR ACCIDENT (Stroke) and FACIAL PARALYSIS (Diagnosed with Bell's Palsy) in a 64-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 010M20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included High cholesterol, Hypertension and Thyroid disorder. On 16-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 28-Mar-2021, the patient experienced CEREBROVASCULAR ACCIDENT (Stroke) (seriousness criteria hospitalization and medically significant), DIZZINESS (terrible dizziness) and DIPLOPIA (double vision). On 10-Apr-2021, the patient experienced FACIAL PARALYSIS (Diagnosed with Bell's Palsy) (seriousness criteria hospitalization and medically significant). On an unknown date, the patient experienced INAPPROPRIATE SCHEDULE OF PRODUCT ADMINISTRATION (Second dose scheduled 2 days past her 42 days). The patient was hospitalized from 28-Mar-2021 to 31-Mar-2021 due to CEREBROVASCULAR ACCIDENT, and then from 10-Apr-2021 to 13-Apr-2021 due to FACIAL PARALYSIS. At the time of the report, CEREBROVASCULAR ACCIDENT (Stroke), FACIAL PARALYSIS (Diagnosed with Bell's Palsy), DIZZINESS (terrible dizziness) and DIPLOPIA (double vision) outcome was unknown and INAPPROPRIATE SCHEDULE OF PRODUCT ADMINISTRATION (Second dose scheduled 2 days past her 42 days) had resolved. Not Provided The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Patient had a stroke that affected her right side and affected her vision. She stated she had a very mild case of bells palsy, her mouth and her left side was drooping a bit, her left eye did not blink and would not close, she could chew and she could talk pretty good, she had to drink with the right side with a straw. Products known to have been used by the patient, within two weeks prior to the event, included unspecified cholesterol medication, high blood pressure medication and unspecified thyroid medication. Treatment

1245356	4/23/2021	PA	48	M	2/16/2021	2/16/2021	<p>Suspected stroke; Bell's palsy; High BP; A spontaneous report was received from a healthcare professional concerning a 48-year-old, male patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced bell's palsy, suspected stroke, and high blood pressure. The patient's medical history, as provided by the reporter, included hypertension. The patient stopped taking hypertension medications since Aug-2020. The concomitant product use was not provided/unknown by the reporter. On 16 Feb 2021, approximately 9 hours prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Batch number: 004M20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 16 Feb 2021, approximately 9 hours of receiving vaccine, the patient developed left ear fullness/pain/pressure. On 17 Feb 2021, the patient developed left eye watery and pain behind left ear. On 18 Feb 2021, the patient dribbled when drinking water when working overnight shift. On 19 Feb 2021, upon awakening in the afternoon, patient's speech was "off" and noted left side of face drooped and unable to close left eye. The patient went to Urgent care and referred to ED for suspected stroke due to High blood pressure. The patient was diagnosed with bell's palsy. Treatment for the event included steroids, eye ointment and metoprolol. Action taken with the drug in response to the event was not provided. The outcome of the events, bell's palsy, suspected stroke, and high blood pressure, were not resolved.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.; Sender's Comments: US-MODERNATX, INC.-MOD-2021-026086: Same reporter</p>

1246360	4/23/2021	GA	19	F	4/9/2021	4/9/2021	<p>She has a history of Bipolar II, dx about 2 years ago. She has been in counseling for the past 5 years. She just changed from effexor to lexapro about 1 month ago. She has been on abilify 10mg for the past ~6months. On 4/8/21 she went to bed around 11pm and awoke on 4/9 around 8:30am. She had her JJ covid vaccine on 4/9/21. She had 2 handfuls of goldfish crackers on the way to her vaccine appointment around 11am. She had ~6-8oz of water when she awoke. She arrived at the Clinic on campus. She sat down for ~5 minutes and then the staff came to get her. She had the shot administered in left deltoid. When she first felt the pain her vision started to go black and she felt like she was going to pass out. She denies feeling hot or dizzy prior to event. Her vision went completely black, then when she "came to" she was bent over in her chair with arms drawn up to body and fists clenched. Immediately her body relaxed and she felt very confused. She was told she just had a seizure - bend forward and had whole body shaking for ~30 seconds. She felt extremely nauseated and had some dry heaving. Someone helped her to the floor and put up her legs. She was told she looked very pale. She felt much better within 5 minutes. Vitals were checked and were stable. She was given granola bar to eat and drank ~12oz of water. No one sided weakness, no incontinence, no tongue bite. She stayed there for ~45 minutes for monitoring. Someone walked her to her car, asked her if she was ok, and then she drove herself home. Of note, the room she was in was warm and they were going to open doors to get some air. She was not ill or tired at the time. After the event she drove for 5 minutes to her home. Once in her room she felt extremely tired and then slept until 7pm (~6-7 hours). She then called Mom. Mom reports that patient sounded different on the phone. Speech was slow and she seemed "off." Mom drove to her and was at her room by around 7:40pm. At that time, patient looked very pale to Mom. Mom took her home, gave her chicken soup. She did not have an appetite. She just wanted to go to sleep. Mom tried to have her stay up until around 10pm. She had ~8oz of water and then went to bed. She slept through the night. She awoke the next morning and reports that her brain felt like it hurt to work. She had chills, body pain, shakiness during the day on 4/10/21. This was easily managed by tylenol q4. Of note, she did</p>

1245504	4/23/2021	SC	59	F	1/14/2021	1/15/2021	<p>Her heart started pumping really hard; Fast heartbeat/Heart fluttering a lot; She also had pressure on the top part of her head which was tender and a pressure in the back part of her right eye.; She also had pressure on the top part of her head which was tender and a pressure in the back part of her right eye.; Anxiety; Eye felt red; This is a spontaneous report from a contactable consumer. A 59-years-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Formulation: Solution for injection, Lot/Batch number: E10142), dose 1 via an unspecified route of administration, administered in left arm on 14Jan2021 at 09:00 as single dose for covid-19 immunisation. Medical history included vitamin supplementation, supplementation therapy, cataract (Mother had cataracts; problems with her heart; had a couple of strokes before she died at 59 years of age), cardiac disorder, cerebrovascular accident, pain (Before she had the first dose of Pfizer COVID-19 Vaccine she was not so concerned because she figured she would probably get body aches or headaches, normal side effects), headache, normal side effects. Concomitant medications included ergocalciferol (vitamin d [ergocalciferol]), krill oil (megared omega 3 krill oil), vitamin c [ascorbic acid], nigella sativa seed (black seed [nigella sativa seed]), betacarotene, calcium carbonate, cyanocobalamin, folic acid, nicotinic acid, pyridoxine hydrochloride, riboflavin, sodium ascorbate, thiamine hydrochloride, tocopheryl acetate (one-a-day vitamin), cyanocobalamin (vitamin b12 [cyanocobalamin]), acetylsalicylic acid (baby aspirin), calcium, magnesium, zinc (magnesium/calcium/zinc) taken for vitamin supplementation and probiotics taken for supplementation therapy. No any other vaccinations within 4 weeks Prior to the first administration. No AE(s) following prior vaccinations: although she did get unknown Shingles vaccine in Sep2020, no AEs associated. She has not gone to get the second Shingles vaccine because she does not want to overlap vaccines while getting Pfizer COVID-19 Vaccine. The patient Was concerned for her 2nd dose which she was scheduled to take tomorrow on 02Feb2021 at 14:30, because of the side effects from her 1st dose. On 15Jan2020, a day after the 1st dose, her heart started pumping really hard and she had a fast heartbeat/ heart fluttering a lot. She also had pressure on the top part of her head which was</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							tender and a pressure in the back part of her right eye. She it was strange because this has never happened to her before up until she got the vaccine. She consulted her eye doctor and mentioned that she will be monitored for the pressure in her right eye. She is also getting anxiety because of this. She was asking if she can go tomorrow to take the 2nd shot. The outcome of events her heart started pumping really hard, she also had pressure on the top part of her head which was tender and a pressure in the back part of her right eye, anxiety and eye felt red was unknow where the outcome of events fast heartbeat/heart fluttering a lot was not recovered. Follow-up attempts are completed. No further information is expected.
1245779	4/23/2021	MI	34	M	2/17/2021	3/20/2021	I had a nasty zit on the back of my neck, popped it, and my immune response was extreme. Initial: Itching and burning through my neck and shoulders, and swollen lymph nodes in neck and collarbone. I began sweating at night profusely and losing weight. I have had a lot of trouble sleeping. These symptoms continued in 24-48 hour cycles of flare ups until 04/19/2021 but finally seem to be abating. Progression: secondary symptoms appeared over the course of the month such as full body joint soreness, weakness, stiffness, stabbing pains (in the neck, arms, chest, and abdomen), blood pressure spikes, dry/sore throat, dry eyes, difficulty swallowing. Symptoms are similar to arthritis or other autoimmune diseases. Night sweats continue but are lighter. Weight loss continues but slower. Sleeping remains irregular.
1245952	4/23/2021	PA	20	F	4/22/2021	4/23/2021	Woke up about 12hrs after vaccine and felt incredibly nauseous and had chills. I was walking downstairs to take Tylenol and I felt like I was going to pass out. Luckily I sat down and then proceeded to pass out, although I am not sure what really happened. My mom found me about 10 seconds later confirming I wasn't out for that long, but she was slapping my face and talking to me and I was unaware. She reported that my eyes were open. When I came to I was having cold sweats, I was clammy, and my ears were ringing. I was very scared and I don't know what happened to me. I felt like I was dreaming when I woke up, but once my Tylenol kicked in I felt better. But it still was a very strange out of body experience.

1246269	4/23/2021	CA	46	F	4/5/2021	4/5/2021	I'm writing this as a former, trained healthcare professional (physical therapist). 30sec-after injection I raised my left (injected) arm and my deltoid/bicep had a sudden hard spasm. I told my husband (who was in the middle of getting his shot) and the administrator that I was passing out. I blacked out. They ran over. They said 5 minutes passed in which my eyes were wide open and dilated. I suddenly began profuse sweating and convulsions/ severe full body shaking. They could not keep me lucid, and called 911. Paramedics came and got a systolic BP of 36 (I'm unaware of the diastolic BP) with blood sugar at 111 ish. I could not form words and kept going in and out of consciousness. I was transported by ambulance to the ER. A few minutes into the ambulance ride I was able to form words, and vitals started to return. I've passed out a few times and this WAS NOT a normal episode of syncope.
1246275	4/23/2021	FL	38	F	4/14/2021	4/21/2021	Fatigue, febrile, malaise times one week following vaccine. Developed shingles in right eye, and forehead one week post vaccine.

1245450	4/23/2021	MA	71	M	3/6/2021	4/3/2021	<p>Felt left side of face drooped, unable to close left eye, and could not control left side of face; patient woke up with 5-seconds chills and went away quickly, happened 3 times during the day; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of FACIAL PARALYSIS (Felt left side of face drooped, unable to close left eye, and could not control left side of face) in a 71-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 025B21A and 010A21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Bladder disorder. Concomitant products included OXYBUTYNIN HYDROCHLORIDE (OXYBUTININ ACCORD) for Bladder disorder NOS. On 06-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 03-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 03-Apr-2021, the patient experienced FACIAL PARALYSIS (Felt left side of face drooped, unable to close left eye, and could not control left side of face) (seriousness criterion medically significant) and CHILLS (patient woke up with 5-seconds chills and went away quickly, happened 3 times during the day). On 04-Apr-2021, CHILLS (patient woke up with 5-seconds chills and went away quickly, happened 3 times during the day) had resolved. At the time of the report, FACIAL PARALYSIS (Felt left side of face drooped, unable to close left eye, and could not control left side of face) outcome was unknown. Treatment Medications included prednisone 20mg 3 times daily for 4 days, valacyclovir 1 gm tablet 3 times daily for 7 days and artificial tears drops with directions instill 1 to 2 drops every 4 hours to left eye. On 04Apr2021, Emergency room and primary care doctors confirmed that it is Bell's Palsy. As up 16Apr2021, the neurologist assessed and confirmed of Bell's Palsy (severe facial paralysis). Based on current available information and the temporal relationship between product use and the start date of the events a causal relationship cannot be excluded. Action taken with mRNA-1273 in response to the events was not Applicable This case was linked to MODERNATX, INC.-</p>

The patient's weight was 185 pounds, and height was not reported. The patient's pre-existing medical conditions included no known drug allergies. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 207A21A, expiry: 23-JUN-2021) dose was not reported, administered on 08-APR-2021 in left arm for prophylactic vaccination. No concomitant medications were reported. On an unspecified date in APR-2021, Laboratory data included: Blood pressure (NR: not provided) 160/90 mmHg. On 08-APR-2021, within 5 minutes after vaccination the patient experienced dizziness, chills with shakes, nausea, anxiety and 20 minutes later she was evaluated by an emergency medical services onsite. On 08-Apr-2021, Blood pressure (BP) reading was 240/130 mmHg. She was kept under evaluation at the vaccination site until BP was 160/90. She experienced pain (body aches, shooting nerve pain in back with itching, arthritic pain from neck to spine and in hands) which began around midnight on 09-Apr-2021 and in morning she experienced full blown flu (ringing of ears, face swollen, sinus clogged, headache, body ache, chill). On 09-Apr-2021, Blood pressure (BP) reading was 153/87 mmHg. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from dizziness, blurring of eyes, and nausea on 08-APR-2021, had not recovered from increased blood pressure, itchy, arthritic pain, sharp nerve pain in spine, leg cramps, feeling like flu, and anxiety, and the outcome of sinus clogged/ sinus headache, shooting nerve pain in back, face swollen and shakes was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0 20210417592-Covid-19 vaccine ad26.cov2.s-Increased blood pressure. This event is considered unassessable. The event has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the event.</p>

1249132	4/23/2021	WI	29	F	3/31/2021		<p>PSYCHOTIC EPISODES; MINIMAL SLEEP FOR AT LEAST 50 HOURS; TIREDNESS; This spontaneous report received from a consumer concerned a 29-year-old white female. The patient's height, and weight were not reported. The patient's concurrent conditions included cognitive disability, but she was not on medication for anything. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 10805031 expiry: UNKNOWN) dose was not reported, administered on 17-MAR-2021 in left arm around 4:40 pm for prophylactic vaccination. No concomitant medications were reported. On 31-MAR-2021, the patient exhibited bizarre behaviors that raised eyebrows but not red flags, as her father thought she was goofing around, she was talking loudly and laughing to herself with nobody around. She seemed very tired, taking a long time in the bathroom (about an hour/an hour and a half). On 03-APR-2021, she was saying things that did not make sense and people could not make sense of what she was talking about. On 04-APR-2021, she started experiencing really bizarre behavior. She was hearing voices, talking to herself and seeing people that were not there, insisting that people were coming over to the house and she had to go there. By the evening, she experienced hallucinations and delusions. She was taken to emergency hospital. She had been awake for about 12 hours, possibly longer. She was tested for a urinary tract infection, but the result was negative. In the emergency room, she had a blood test and computed tomography (CT) scan that did not show anything. In the night on same day, her condition was bad. She was trying to get out of the house. On 05-APR-2021, at 6am, she went back to the hospital room and was admitted to the psych ward for psychotic behaviors. She had been there for 7 days. She had been on unspecified medications, which was helping the symptoms. She was examined by a doctor and admitted to the psychiatric ward. In the evening on same day, her behavior became more severe, showed signs of aggression, flipping furniture, throwing things, saying a light on the wall was watching her. On 06-APR-2021, the psychiatrist stated that she was experiencing psychotic episodes and she was put on antipsychotic medication and examined her. She did not sleep for almost 3 days, started 04-APR-2021 morning at 7:00 am until 06-APR-</p>

1247663	4/23/2021	CA	55	F	4/6/2021	4/6/2021	4/6/ 21 within hours of the vaccine: extreme sleepiness as if I had been drugged , excruciating headache for hours but I could not open my eyes or full wake up, trouble breathing, but could not open my eyes or fully wake up. 4/6/ 21 5pm awake but very groggy headache is not as bad. Took an alleve which helped but the headache did not go away. 4/7-4/12 bad headache exacerbated by going outdoors in sunlight. persistent grogginess every morning. very difficult to wake up. I run several days a week was able to complete 4 miles no problem . but headaches would be worse being outside in daylight. 4/13 I read news of headaches and clotting rx so I saw my Dr. did blood work and scheduled for MRI. blood work /platelets came back WNL . MRI was cost prohibitive for me so I cancelled MRI would follow up with MRI if headaches worsened and or developed other symptoms. 4/13-4/21 Persistent , annoying headache but improving somewhat. Still have difficulty waking up in the am. 4/22 First day that headache mostly was not present. Difficulty waking up in the am still. 4/17

1247692	4/23/2021	MA	43	F	2/9/2021	2/9/2021	<p>Date of office visit: 4/22/2021 2:15 PM Intake done by: LPN Reason for today's visit: New Patient 30 minutes HR: 80, regular rate &amp; rhythm BP: 136/78 (prehypertension) weight: 195 lbs 88.6 kg temperature: 98.5 F height: 5 ft 6 inch (measured) body mass index: 31.5 Obesity Classification: Class I, Simple obesity Progress Note xxxxx 4/22/2021 Patient is a 43-year-old female referred to me for management of hemorrhage into her pituitary gland. February 9, 2021 11 AM she received Moderna vaccine. by 7 PM she had a severe headache, leg numbness, severe arthralgias in her knees, global paresthesias, pressure behind her eyes, she describes her head is very heavy and pressurized was very painful. Symptoms lasted for three days and gradually remitted. To a lesser degree the headache persisted longer but resolved March 10, 2021 received Moderna vaccine. On same day she developed headache, chest pain, back pain, leg numbness. She states that when she walked it exacerbated chest pain and headache and she had to walk very gently on her toes. She tried Tylenol, ibuprofen without effect. The symptoms persisted. She started taking two aspirin a day. March 14 she worked third shift as usual (despite symptoms) March 15, the symptoms were bad enough that she felt she had to go to the emergency room. March 15, 2021 18:56 CT Head or Brain C-: 7 mm rounded hyperdensity within the pituitary gland which may represent a hyperdense pituitary mass lesion. Associated hemorrhage is not excluded. March 15, 2021 22:34 MRI Brain C-/C+: There is 0.6 x 0.6 x 0.7 cm round structure in the anterior pituitary gland with high T1 signal, dark T2 signal, susceptibility artifact and no enhancement. This likely represents a hemorrhage within the microadenoma. Advise neurosurgical consult and follow-up MRI in 6 months.</p> <p>3/17/2021 I was consulted (while she was in hospital, chart review only. Patient not seen at that time) I wrote... PITUITARY ACTH Patient had ACTH stimulation test yesterday. Assuming she has received no steroid Rx during this admission prior to the ACTH stimulation test (as I have been told), then these results confirm that her adrenal gland has the ability to respond to ACTH and thus there is no reason to believe the underlying pituitary abnormality had resulted in chronic ACTH deficiency from the pituitary lesion that resulted in hemorrhage.</p>

VAERS\_ID RECVD STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

3/16/2021 4:32 PM .Cort 30 min Stim Cortisol 30  
 Minutes Post ACTH 19.3 mcg/dL Cortisol 60  
 Min 27.6 mcg/dL As the pituitary  
 hemorrhage was an acute event, it is possible the  
 pituitary currently does not have the ability to make  
 adequate amounts of ACTH, despite the normal ACTH  
 stim test, but the situation is too acute to cause the  
 adrenal to atrophy (as a result of chronic ACTH  
 deficiency) and she still could have secondary adrenal  
 insufficiency. When there is a chronic ACTH deficiency of  
 sufficient duration, the adrenal gland will eventually  
 atrophy and the patient will then develop primary adrenal  
 insufficiency as well and then the ACTH stim test will  
 become abnormal. As we do not know if her pituitary can  
 make ACTH appropriately, I think it would be prudent to  
 treat the patient with PREDNISONE 2.5 mg qAM for now  
 even though we do not know for certain whether her  
 pituitary can make ACTH. After discharge, she should be  
 evaluated by endocrine to assess for ACTH deficiency.  
 She should be advised to seek medical attention if she  
 develops symptoms of adrenal insufficiency like nausea,  
 emesis, abd pain, orthostatic symptoms. PITUITARY  
 TSH 3/15/2021 11:47 PM T3 Total 83  
 (normal: 60-181) nGm/dL T4, Total 7.3  
 (normal: 4.5-13.3) mcg/dL TSH, 3rd gen  
 2.160 (normal: 0.358-3.740) mIU/ml I think, based  
 on above admission TFTs, she should also be treated  
 with LEVOTHYROXINE 100 mcg qAM even though we  
 do not know for certain if she has central hypothyroidism.  
 This too should be reassessed in the future. PITUITARY  
 LH/FSH If she acutely or recently developed secondary  
 amenorrhea and FSH is not c/w menopause, then that  
 would suggest the lesion or hemorrhage has causes  
 hypogonadotrophic hypogonadism. This situation would  
 increase the probability she has central adrenal  
 insufficiency and central hypothyroidism. If menses  
 remains normal henceforth, the it is more likely her ability  
 to make TSH and ACTH are normal.  
 Patient was discharged on  
 levothyroxine 100 µg in the morning and prednisone 2.5  
 mg daily. She's also on iron pills. Past medical history:  
 Iron deficiency anemia. Treatment was an IUD, after  
 which she's gained a lot of weight. Medicines: IUD,  
 Levothyroxine 100 mcg QAM, prednisone 2.5 mg QAM,  
 ferrous sulfate 325 mg daily Allergies: none No cigarette

use, alcohol abuse or drug use Family social history: patient has three children. High school educated. Healthcare worker. REVIEW OF SYSTEMS: overall health is good. She feels well. No headache. No nausea. No nocturia Physical exam: Extraocular muscles intact. VF full Lungs are clear. Cardiac exam regular. Impression: hemorrhage into pituitary gland Temporarily, symptoms correlate with covid vaccination in a women who previously was (reportedly) dx with covid infection. Maybe the pituitary hemorrhage was the result of the coronavirus vaccination or the aspirin she was taking. At this point she's feeling well. It's been about one month since the event. I'd like to wait another month and then proceed with testing of a pituitary gland to try to figure out if she really needs to remain on levothyroxine and prednisone and reimage the pituitary. On the day of the testing she will take neither medicine in the morning. Will then measure LH, FSH, estradiol, TSH free T4 and cortisol and renal panel. Patient will then receive ACTH 0.25 mg IM and have cortisol measured at 30 minutes and 60 minutes. I will follow-up with her by phone. She scheduled to see Dr. April 26. I would like to do another MRI but I would prefer to wait another month as she is clinically doing well and I want to allow the pituitary more time to "heal"/stabilize. No follow-up is scheduled with me, if Dr. does not order an MRI and I will after I received next blood test. M.D. 4/22/2021 3:40 PM Electronically signed by: M.D. on 4/23/2021 2:47 PM

1247714	4/23/2021	VA	81	M	2/15/2021	2/21/2021	Per the family: on Monday, February 15 he experienced visual disturbances with slightly blurred vision. Not thinking anything of it at the time, the vision cleared, and he continued about their evening/week without telling anyone of his visual disturbances. On Sunday, February 21, he experienced additional visual disturbances including double vision and dizziness, and we had him visit a local ER for evaluation. He was discharged with a diagnosis of dehydration and vertigo. No scans were performed. The visual disturbances cleared up the following week and the only persistent symptom was a slight dizziness. An eye exam was performed on Friday, February 26 with no problems found. An MRI was performed on March 3, and he was diagnosed with the below conditions. Impression (3/3/2021) 1. Small acute to subacute infarcts in the left splenium of the corpus callosum and parasagittal left occipital lobe. 2. Trace subarachnoid hemorrhage in the parasagittal left parietal lobe. 3. Mild chronic microvascular ischemic disease. He was admitted to the hospital and remained there until Saturday, March 6. Follow-up scans and testing were performed with no underlying reason for the stroke being determined. Prior to the stroke, he had been a very active individual with osteoarthritis as is only health complaint. He was not on any prescription medication prior to the stroke. While in the hospital, the tests for high blood pressure, high cholesterol (LDL 92 MG/DL), sugar inadequacies (glucose 93 mg/dl, A1C 5.7%), etc. came back without major concerns. His follow-up CT scans also did not reveal the stroke shown on the MRI. No inquiry was made by any of his doctors or hospital staff as to his COVID vaccination status/dates to even consider the connection. Below are the results of the last CT scans: Impression (3/4/2021) 1. Age-related volume loss and white matter disease similar to prior exams. 2. Small infarct seen on MRI are not well seen on CT. 3. No acute intracranial abnormality demonstrated on the CT scan. Impression (3/5/2021) 1. No evidence of acute infarct or intracranial hemorrhage. No significant change. 2. Periventricular white matter disease is likely secondary to chronic small vessel ischemic changes. Per daughter on 4/23/21 patient has improved significantly

1247785	4/23/2021	OH	57	F	4/8/2021	4/9/2021	ABOUT 15 HOURS AFTER INJECTION I HAD A EXTREME HEADACHE AROUND THE EYE AND NOSE AREA. I LAYED DOWN WITH A COLD PACK OVER MY EYES FOR ABOUT 2 HOURS. I FINALLY DECIDED TO TAKE A COUPLE TYLENOL AND DISCOVERED IT WAS HARD FOR ME TO SWALLOW. I TOOK A BENADRYL PILL AS WELL AND LAYED BACK DOWN. MY THROAT BECAME LESS RESTRICTED SO I JUST CONTINUED TO MONITOR MYSELF. THE HEADACHE BECAME LESS SEVERE BUT CONTINUED FOR ANOTHER 24 HOURS OR MORE. I CONTINUE TO BE TIRED BUT ALSO WORK LONG HOURS. TODAY, 04/23/21, TWO WEEKS AFTER INJECTION, I WENT TO URGENT CARE TO HAVE A ANTIBODY TEST DONE. BOTH THE IGG AND IMG CAME BACK NEGATIVE!

Client discharged 4 days later to home s/p CVA, bed-bound, remains aphasic, aphagic, non-communicative, no response to verbal stimuli. PLEASE NOTE: hospital admission. Unable to complete section 21. Admit for 4 days.
1247691	4/23/2021	AL	77	M	1/26/2021	1/27/2021	Started experiencing a bad headache behind the right eye on Wed 1/27 at night, and on Feb. 7th could not get out of bed, his left shoulder blade became so painful went to the ED Feb. 8. Sent home the next day. The pain was so bad he thought he was having a heart attack. Took NTG did not help. Returned to ED on the 10th - stayed in in hospital for 8 days. Specialists were seen and nothing could help with the pain. Consulted with cancer doctors, and neurologists, doing tests to diagnosis. Dr. gave a nerve block and a week later the pain started to get better a week later on a holiday. Pain still comes and goes. Pain Started getting worse today 4/23/21. Must lie down on right side to get any relief. Has lost 50 pounds is very weak and getting weaker every day. and it is very painful to walk 40 steps to the garage. The TENS unit is not helping with the pain. Getting a spinal test.

1248045	4/23/2021	IL	39	F	4/10/2021	4/11/2021	<p>J&amp;J COVID Vaccine EUA J&amp;J Vaccine 4/10/2021 4/13/21: Believes she is having a reaction to her Johnson and Johnson COVID-19 vaccination. This vaccination was given on 04/10/2021. Patient is 39-year-old female with a past medical history significant for ulcerative colitis that has been in remission since the patient was 21 years of age, epileptic seizures on Vimpat and clonazepam. Patient comes in as a transfer with a chief complaint of possible reaction to Johnson and Johnson COVID-19 vaccine. Patient presents with multiple complaints. The patient states that upon receiving the vaccine on 04/10/2021 she suddenly developed presyncopal episodes where she felt like she was about to pass out but that subsided later on. 12 hours following the shot she had intense headache which was frontal and then later on travel to the back of her head and traveled down her spine. Patient described the headache to be the worse headache of her life, stated that it was worse than going through labor. Patient stated that she received morphine which helped her with the headache. Patient also complained of chest pain which was left-sided with no radiation, constant. No history of previous myocardial infarctions. Her troponins that were conducted were negative. Patient also complained of experiencing blood in her stool. She stated that when she wiped herself on the morning of 04/13/2021 she experience blood on the toilet paper and blood in the bowel. However, her stool occult blood that was conducted was negative. Patient is being followed by Neurology, she contacted her neurologist and they recommended to come to the ED with concerns of thromboembolism. Patient's D-dimer was negative. Patient denied any recent travel anywhere or coming into contact with anyone sick. She denied developing any fevers cough shortness of breath abdominal pain nausea vomiting or any urinary concerns. 4/15/21: Patient is a 39-year-old female with a past medical history significant for ulcerative colitis that has been in remission since the patient was 21 years of age, epileptic seizures on Vimpat and clonazepam. Patient comes in as a transfer with a chief complaint of possible reaction to Johnson and Johnson COVID-19 vaccine. Headache: MRI brain and MRI venogram was ordered. MRI brain did show concerning signed for idiopathic intracranial hypertension. Neurology was consulted. Patient had high volume LP. Patient</p>

responded well post LP. Patient will be discharged on topiramate with a taper instructions per neurology. Patient will make appointment with Ophthalmology. Patient will follow up with Neurology as well. Chest pain concerning for ACS: Negative troponin. EKG normal sinus rhythm. Concern for vaccine reaction: Patient has J&J vaccine. No clots were noted. Patient's symptoms are most likely are secondary to idiopathic intracranial hypertension and history of migraines. 4/16/2021: 39-year-old female presents emergency room with chief complaint of headache. Onset this morning. Headache is generalized. Headache is constant. Headache is worth with position change. Such as moving head side to side or with changing from lying to sitting and sitting to standing. Headache improves with lying supine. To has tried pushing fluids, taking over-the-counter medication, and also increasing her caffeine intake to offset the headache. She denies any of these helping with her symptoms. Patient's pain is right an 8 out of 10. The patient denies anything additional alleviating and or aggravating factors to chief complaint. Today when the patient's headache started. She contacted her neurologist. She was told to come to the emergency department for a blood patch. The patient added that her neurologist felt that she needs a blood patch not only because of the recent lumbar puncture but because there was at minimum 25 mL of spinal fluid removed at the time of her lumbar puncture. This lumbar puncture occurred under fluoroscopy. However, they had difficulty getting the pressure gauge on thus, more than 25 mL was removed.. Pain Pain Scale: 8 /10. Timing: constant. gradual. Character: mild. 4/19/21: patient reports intense headaches she attributes to the spinal tap. Ketorolac, DHE, ondansetron given.

1248068	4/23/2021	CA	17	F	4/5/2021	4/6/2021	The day after the vaccine I felt very weak and fatigued on April 7th. A couple days later on April 9th I developed a fever. A few days after that my muscles started twitching and haven't stopped. I feel like something is crawling under my skin and the vaccine is extremely affecting my nervous system. I did not have this problem before I had the vaccine. It has not gone away and it is now April 23rd I still feel weak, not the same as I used to feel before having the vaccine, and my muscles are twitching all over my body. My face is twitching and my eye and there is nothing I can do to make it stop. I am so young and I thought the vaccine was safe but I am suffering from it. Especially in my feet I feel like they are tingling and vibrating and my calves are convulsing too. Meanwhile, my heart is fluttering and I feel like it is very hard for me to focus and I feel things crawling under my skin in my brain. The muscle convulsions are happening everywhere.
1248145	4/23/2021	PA	36	F	4/8/2021	4/18/2021	Migraine, stiff neck, vision problems, tingling in hand. Still on going
1248383	4/23/2021	NC	61	F	3/24/2021	3/24/2021	After I left after waiting I felt find. I went to work and about hour or two I took a tylenol 800 in case my arm got sore. But I was so sleepy my eyes felt like sand was in it. I had to call my daughter so I could stay awake. I was extremely tire. The next day I was not as sleepy but I was very tire. It just started getting better. I not as tired no more. But I didn't know how to report it until I seen on news and my sister told me how to report it.

1247847	4/23/2021	NV	16	F	4/22/2021	4/23/2021	Pt. received her second Pfizer dose at 3pm. By 11:30pm she had significant swelling on both of her eyes, mouth, and the start of red splotchy skin on arms and legs. We took her to ER. They gave her 50mg of hydroxyzine and sent us home. 5min after leaving the ER at 12:30am on 4/23 she felt a golf ball sized lump in her throat and was having difficulty breathing. We brought her back to the ER. At this time they gave her an ekg, and at around 1:30am gave her an epi pin and an oral steroid. Within 5min of the oral steroid and epi pin she no longer had difficulty in breathing and the lump in her throat was gone as was the res splotches. By 5am the swelling in her face had reduced drastically to 90% normal in her left eye and 70% normal in her right eye and 70% normal in her lip. She was released from the ER at 5:45am and went home to sleep. At 11:30am on 4/23 her swelling in her face remains the same and she is complaining of a headache. She was given 50mg more of hydroxyzine.

1248775	4/23/2021	CA	16	F	4/23/2021	4/23/2021	16 y.o. female who received the Pfizer-BioNtech COVID-19 Vaccine, mRNA, BNT162b2 (PF) 30 mcg/0.3 mL IM Susp, Lot EW0158 on 4/23/2021. The patient experienced the following reaction(s) during the immediate of observation: Tinglys, blurry vision, diaphoretic. Patient was treated/managed as follows: Pt brought to treatment area to lay down on mat with legs elevated. VS: 4:15 pm BP: 100/80 R: 18 HR: 58 O2: 98% Pt reports feeling much better after laying down. 4:30 VS: BP: 105/78 HR:60 O2: 99% Patient given educational material regarding vaccine and advised to continue to self-monitor per the CDC guidance. Pt escorted to car with mom by nurse.
1248719	4/23/2021	FL	76	F	3/28/2021	3/29/2021	The day after the vaccine I had a problem with one of my eyes and then the other. It was similar to ocular migraine symptoms. I then started to have stroke like symptoms. I looked at my friends and stated that I did not know their names. I went to a walk-in clinic and then I was hospitalized for three days. My blood pressure was extremely high. All of the tests were negative for stroke and I have worn a Holter monitor. I also had Neurology, Cardiologist consult and many different medications. I have stopped taking all of those medications. I have not had any more symptoms like that since that day and it only lasted less than 15 minutes.
1248715	4/23/2021	MN	60	F	4/2/2021	4/4/2021	After receiving the 2nd dosage of vaccine, 2 days later I began having problems with my vision, which was on Sunday 4/4/21, I went to bed thinking it would correct itself. I woke up on Monday 4/5/21 and had double vision so I immediately went to the ER at hospital where my BP was 190/95. At the hospital they did a CT Scan and an MRI which both came back normal, I was eventually diagnosed with 6th Nerve Palsy and referred to see a neurologist, I am currently under Dr's care at facility who is a neurologist in the specialty eye clinic. I am currently wearing a patch over my right eye to prevent the double vision which is still present.

1248696	4/23/2021	FL	65	F	2/2/2021	2/2/2021	Stress levels that get high; Her immune system gets lower; Left arm is in pain for a week and half like someone beat her with a bat; Doesn't want to experience this pain while she is working/pain behind ears; her neck and shoulder and the pain so she couldn't turn her head to the left; From her neck and shoulder and the pain so she couldn't turn her head to the left; She couldn't turn her head to the left; shingles attacked her head- shingles / herpes zoster virus/herpes zoster in her arm/Possible shingles after receiving the shingles vaccine; Arm where the shot was given shot is with a muscle ache / very bad muscle pain when she lifts her arm; shingles attacked her ear; Her lymph nodes in her neck and face swollen; Had pain in her ear / pain behind her ear; Headache; Her neck was swollen/she was all swollen; the pain in her ear, her right ear all the way to her shoulder she thought was a pinched nerve./massage therapist told her it was not a muscle it was a nerve/nerve in her ear gets attacked/nerve ending is there; This case was reported by a consumer via licensee and described the occurrence of herpes zoster otitis externa in a 65-year-old female patient who received Herpes zoster (Shingles vaccine) for prophylaxis. Co-suspect products included COVID-19 VACCINE (COVID 19 VACCINE) (batch number EN6198, expiry date 30th June 2021) for prophylaxis. The patient's past medical history included bell's palsy (patient had bell's palsy twice due to herpes zoster virus), meningitis (patient had bell's palsy twice due to herpes zoster virus) and nerve compression (patient had pinched nerve about 2 months from the time of reporting). Concurrent medical conditions included mitral valve prolapse (patient has mitral valve prolapse and her heart is a little enlarged in the middle) and esophageal acid reflux. On 2nd February 2021, the patient received the 1st dose of Shingles vaccine. On 23rd February 2021 15:30, the patient received the 1st dose of COVID 19 VACCINE. On 2nd February 2021, less than a day after receiving Shingles vaccine and an unknown time after starting Valtrex, the patient experienced headache. On 7th February 2021, the patient experienced neck swelling. On 25th February 2021, the patient experienced herpes zoster otitis externa (serious criteria GSK medically significant), lymphadenopathy cervical, ear pain, shingles and muscle pain. On an unknown date, the patient experienced

----------	-------	-------	---------	-----	----------	------------	--------------

stress, immune system disorder, pain in arm, pain, neck pain, shoulder pain, mobility decreased and pinched nerve. The patient was treated with valaciclovir hydrochloride (Valtrex) and ibuprofen + paracetamol (Advil Dual Action). On an unknown date, the outcome of the herpes zoster otitis externa, headache, neck swelling, lymphadenopathy cervical, shingles, muscle pain, pain in arm, pain, neck pain, shoulder pain, mobility decreased and pinched nerve were recovered/resolved and the outcome of the ear pain was not recovered/not resolved and the outcome of the stress and immune system disorder were unknown. It was unknown if the reporter considered the herpes zoster otitis externa, headache, neck swelling, lymphadenopathy cervical, ear pain, stress, immune system disorder, shingles, muscle pain, pain in arm, pain, neck pain, shoulder pain, mobility decreased and pinched nerve to be related to Shingles vaccine. Additional details were provided as follows: The reporter was the patient herself. The patient did not have much for medical history but one thing she had was mitral valve prolapse which worries her and her heart was a little enlarged in the middle. Another condition was acid reflux but she stated that everyone had that condition. In the past, patient had the bell's palsy and meningitis twice with the herpes zoster virus, the same virus that attacked her ear and her head- shingles. She had knowledge that those viruses attacked her in the past. The patient had pain that she had maybe about 2 months ago, the pain in her ear, her right ear all the way to her shoulder which she thought was a pinched nerve. Her son had a puppy and she played with him and she thought it was a pinched nerve. She went to get a massage and the massage therapist told her it was not a muscle it was a nerve. The nerve in her ear got attacked. She had gone to a walk in clinic and they didn't recognize that it was the herpes zoster virus. It could be the neck and then they didn't recognize the herpes zoster virus. The patient was given Valtrex and that medicine had helped her before as well, so then she took the Valtrex. The patient want an appointment with her doctor and she would have liked to have tests to check and see, but they didn't schedule her. The patient had received the Shingles vaccine around 2nd February 2021 before the Covid-19 vaccine in order to be preventive. The patient did not have NDC/Lot number or expiry date of Shingles

---

vaccine. The patient had a headache in the evening, then on Friday she did not have anything. She noticed then on Saturday that she had got the reaction, then on Sunday she was all swollen, then it continued into Monday, Tuesday and Wednesday. The patient also had received Covid-19 vaccine (Pfizer product) on 23rd February 2021 which expires on 30th June 2021. Two days after she had the Covid 19 vaccine, her neck was swollen, lymph nodes were swollen in her neck and face, she had pain behind her ear and her arm where the shot was given was with a muscle ache. When she had stress levels that got her high, her immune system got lower and hence she got a virus like bells palsy, meningitis and also some kind of shingles. She wont break out on the skin but the nerve ending was there behind her ear. She lifted her arms above and her left arm was in pain for a week and a half like someone beat her with a bat. The patient experienced possible shingles after her Shingles vaccine. She took ibuprofen and she called her doctor and they told her to take ibuprofen. She called her physician and with the nurse she was told to take an Advil, she further reported that her doctor and nurse don't care. She was apprehensive with the second dose of Covid-19 vaccine because she got reactive with the first one. She was 65 years old and she cannot afford to get Covid but she did not want to experience such pain while she was working. Her doctor took a week to respond, then she started reading on vaccines and its side effects, people were having those experiences on their first dose of vaccines. The reporter states that if someone experiences those kind of experiences, they should kindly call the hotline and seek help. The patient just wanted the vaccine to be beneficial to her. At this point she really does not know what was to be done, she did not want to be afraid of the Covid 19 vaccine as she knew that the benefits were greater than the risk. She was also apprehensive with the first Covid 19 vaccine. The patient want to take her second shingles vaccine after the second Covid vaccine. The patient was taking the ibuprofen for a little bit but then the pain came back. The patient would be getting the second Covid-19 vaccine on 16th March 2021. Later in the call, she clarified that the virus she was speaking of was the herpes zoster virus or also known as shingles. The patient was going to change her doctors as she did not like the little care they had for someone experiencing

---

something like those events. The patient thought if this was related to her Covid-19 vaccine so she started reading more about what the vaccine could do to the patient and it had a side effect and it said in there and she misread during her paperwork and it was considered severe if she had swelling on her face and throat and she ignored her paperwork. She read that and decided to call. That was what she experienced with her lymph nodes, and from her neck and shoulder and the pain such that she couldn't turn her head to the left, and she thought maybe it was a pinched nerve and she always thought something else was bothering her. She was taking Valtrex for the virus that caused bells palsy and that made it better (shingles/herpes zoster). She started healing with that medicine and she knew it wasn't a pinched nerve and that it was the shingles/herpes zoster that attacked her. She was better on the reporting date but still had pain behind her ear. She knew a doctor that had the same situation with this virus (shingles or herpes zoster) and she went blind. When the doctor did her eyes and got the Lasix surgery, she had the virus attack her and she called it the herpes virus, the secondary or whatever they call it. It was related to chicken pox and she got the virus when she was a kid, then it laid dormant and 10 to 15 years before the time of reporting, when that doctor went blind, if the doctor had known she would have taken the Valtrex prior to her Lasix surgery. She had been to the emergency room with her meningitis and the doctor explained it to her. The patient clarified again that she never had the shingles rash breakout on her skin, but had the nerve part of it., she had symptoms for 3 weeks and they wanted to send her for neurology and MRI and she told them to give her the Valtrex and she took it for 7 days and her symptoms disappeared completely. Only reason she thought it was the herpes zoster virus was because she got the Covid 19 vaccine in her left arm and it was the same area and the same thing only but this time it wouldn't go away completely, but it was her arm which felt like someone had hit her with a bat. She had very bad muscle pain when she lifts her arm. The reporter confirmed Covid-19 vaccine date as 23rd February 2021 (first dose). The patient was treated with Valtrex (Valacyclovir Hcl 1gm tablet 1 per day usually at night in a pharmacy bottle) which should be discarded by 5th November 2021. The patient also took

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							Advil Duo Action which had 250mg acetaminophen and 125mg ibuprofen (2 caplets in the morning and one caplet at night) with lot number DN7584 and expiration date of August,2022. The patient had product complaint regarding Advil Dual Action (Ibuprofen). It was unknown if the reporter considered the herpes zoster otitis externa, neck swelling, lymphadenopathy cervical, ear pain, stress, immune system disorder, shingles, muscle pain, pain in arm, pain, neck pain, shoulder pain, mobility decreased and pinched nerve to be related to Covid-19 vaccine. The reporter consented to follow-up and also gave consent to follow-up with health care professional.

1241226	4/22/2021	MI	52	F			<p>CEREBRAL INTRACRANIAL HYPERTENSION WITH FREE FLUID IN BRAIN BEHIND EYE; FLARED UP ARTHIRITIS; This spontaneous report received from a patient and concerned a 52 year old, White, not Hispanic or Latino, female. Initial information was received on 16-APR-2021 from the patient, with additional information received on 20-APR-2021 from the patient. The patient's weight was 170 pounds, and height was 65.5 inches. The most recent body mass index was 27.9. The patient's family history included rheumatoid arthritis in father, and concurrent conditions included arthritis (possibly rheumatoid arthritis), chronic back pain, and hip pain. The patient was due for a surgery, but it was cancelled due to pandemic. She had no history of headaches or migraines. Patient received several unspecified vaccines (had several vaccines 3 years ago before trip ) with no problems. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1805020 expiry: UNKNOWN) dose was not reported, administered on 15-MAR-2021 on right arm for prophylactic vaccination. Concomitant medications included acetylsalicylic acid 81 mg, daily, ascorbic acid, ergocalciferol, metaxalone, oxycodone, and zinc. The patient concurrently receives spinal/epidural pain injections every two to three months. Approximately 16-30 hours after the vaccination, she had a flare up of her arthritis (left hip, L3, L4, L5, sciatic pain on the left side going all the way down to her knee, ankle, and foot, where her normal arthritis hurts daily). Pain medication did not help. She also developed migraines which caused pain behind the left eye similar to severe sinus infection, light sensitivity, her face felt tingly and numb in her temples and cheeks (left side). She was concerned about a stroke, but did not have droopiness and could smile on both sides. On 29-MAR-2021 (day 14 post vaccination), the patient went to her pain specialist to receive her spinal/epidural pain injection because she was in a lot of pain and she was "overdue". In retrospect, the patient wondered if she should have waited longer after having received the vaccine before doing so. On 30-MAR-2021 (day 15 post vaccination), she awoke and was blind for several (12 - 14) hours. She thought she had a stroke and took 4 baby aspirins. She was rushed to the hospital and was hospitalized on 30-MAR-2021. After the initial 2-3 hours that she was completely blind, it</p>

----------	-------	-------	---------	-----	----------	------------	--------------

would come back within minutes. The vision came back in halos. It was blurry but if she moved or bent down, it would go again and then it would come back very quickly. Several tests were performed. The MRI (Magnetic resonance imaging) did not show clots, stroke, or tumors, but showed intracranial hypertension. After the CT and MRI, a lumbar puncture was performed (results not provided). The patient said that the hospital noted cerebral intracranial hypertension with free fluid in her brain behind her eye. In the hospital, bloodwork was normal except for her triglycerides which were high. Patient reported that her platelet levels which were "perfect" and provided "318" as a specific example. She was discharged on 01-APR-2021. Corrective treatments included: steroids in the hospital for the intracranial hypertension and prescription strength aspirin 325 mg. The patient was not certain if injectable blood thinners were given to her in the hospital. She was discharged with methylprednisolone, alprazolam, twice a day prn to treat her headaches, aspirin 325 mg daily, and rosuvastatin 5 mg, daily, for high triglycerides. After patient was discharged, she had 2 episodes of lightheadedness with the blindness. The first one lasted about 5 minutes maximum and the second one on 12-APR-2021 lasted approximately 30-40 minutes. She had to be sitting down and her vision returned in halos with a lot of fireworks like bright stars. The patient had ringing in the ears, especially the left ear and when she had these episodes. On 14-APR-2021, the patient patient went to PCP (primary care provider). She stated that alprazolam helps her headaches. On 20-APR-2021, she had a "good day", did not experience headaches, and did not take alprazolam. She will follow up with a neurologist and an ophthalmologist. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of the cerebral intracranial hypertension with free fluid in brain behind eye and flared up arthritis were not reported. This report was serious (Hospitalization Caused / Prolonged, and Other Medically Important Condition).; Sender's Comments: V0: This 52 year-old White female was hospitalized for intracranial hypertension 15 days after receiving the Janssen Covid-19 vaccine. Medical history includes an unspecified arthritis with chronic left hip and back pain for which she receives epidural injections every 2-3 months, and a body mass index of 27.9. She

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
-----------------	--------------	--------------	----------------	------------	-----------------	-------------------	---------------------

has no history of migraines or other headaches and has tolerated multiple vaccinations previously. Concomitant medications include acetylsalicylic acid 81 mg daily, metaxalone, and oxycodone. Approximately 16 hours after vaccination, she experienced a flare of her arthritis which her pain medications did not relieve. The next day, she began to experience migraine headaches which were associated with pain behind her left eye and sinuses, left-sided facial tingling and numbness without weakness, and light sensitivity. Fourteen days post-vaccination, she received an epidural injection because she was in a lot of pain. The following morning, she awoke and experienced visual disturbance, described as "complete" blindness. then return of vision with halos and blurriness, and intermittent loss and return of vision depending on her body position. She took 4 baby aspirins, went to the hospital, and was admitted. MRI showed intracranial hypertension but no clots, stroke, or tumors. A lumbar puncture and CT scan were also performed. Blood tests, including platelet counts (e.g. 318), were normal except for high triglycerides. She was treated with steroids and aspirin 325 mg and was discharged 2 days later. She was given methylprednisolone, oxycodone-acetaminophen and alprazolam prn for headaches, aspirin 325 mg, and rosuvastatin for high triglycerides to continue at home and will follow up with a neurologist, ophthalmologist and her primary physician. Based on the available information, the relationship of intracranial hypertension with Janssen Covid-19 vaccine is considered inconsistent.

1244979	4/22/2021	OR	43	F	4/10/2021	4/14/2021	Nueropathy (numbness weakness tingling) on right side. Loss of vision 30 minutes right side. Headaches, temple pain, sinus pain. Shots of random pain throughout body.
1243927	4/22/2021	PA	29	M	4/10/2021	4/11/2021	The night following my vaccination I ended up with a fever of over 100 degrees Fahrenheit and also suffered from a severe headache and sore throat. The fever and headache subsided after 24 hours, but the sore throat and ulcers on my gum line remained for the next 3-4 days. 9 days after I had gotten the vaccine, I started suffering from what I thought was a significant MS relapse. The left side of my face went numb and started drooping, my legs went completely numb, and my vision went blurry.
1243939	4/22/2021	IL	66	F	3/20/2021	3/29/2021	I can't say for sure but 9 days after receiving the vaccine, my condition called Erythromelalgia flared up terribly, which involved uncomfortable to intense burning of the outer ears 24/7 with no relief. It calmed down for a couple of days and then came back with other symptoms, including the burning ears, and parts of my neck and face. In addition to that, my eyes were bloodshot and had drainage coming from them and in the morning, it appeared that they had like a lining of film over them. Skin is peeling due to all the burning in the areas described. Several different treatments were tried but none has slowed down the flare-up. After another trip back to the NP, she said that it was inflammation and gave me a steroid shot along with prednisone tablets. I also went to an optometrist who found some things wrong with my eyes and prescribed some steroid eye drops. Before the vaccine, we pretty much had the Erythromelalgia under control with meds but this time, it's been hard to get things under control and more tolerable.

1244086	4/22/2021	VA	40	F	3/31/2021	4/16/2021	Patient was initially seen on 4/16 in the ED and discharged after complaints of myalgias. She was tested for COVID and discharged home and instructed to take acetaminophen. On 4/20, she returned to the ED with continued complaints including abdominal pain, nausea, and diarrhea. She also complained of dizziness when she stands, and that her skin and eyes were jaundiced. The patient was hypotensive and was not responding to IV fluids. She was started on vasopressors. She was found to be in acute liver and kidney failure. She was emergently intubated and ended up being transferred to hospital. Due to the nature of her condition, the above therapies were continued and CRRT was started due to acidosis. A bicarb drip was started and was continuous. Arrangements were made to transfer the patient to hospital once stable enough. It was thought that she was in HLH. She was also empirically started on hydrocortisone, later changed to dexamethasone. She was started on antibiotics - cefepime, Flagyl, and vancomycin. She has now been transferred to hospital. Outcome unknown at this time. 4/22

1244352	4/22/2021	NM	30	M	3/27/2021	4/2/2021	Friday night, Got a migraine and I had it all Saturday to night. I felt nauseous that night. It went away on Sunday. The following Saturday, I had a migraine and it lasted a full eight days - hanging out in my left eye (it was all in that eye - when I moved that eye from left to right, I would feel it) . I had taken Tylenol and ibuprofen but it didn't do anything. Some days it was intense and some days it was in the background. I did see and talk to a someone at my doctor's office - over video chat (on April 15th - that was day eight of migraine) and she told me to start taking Tylenol that night and I've been taking it one time in the morning since that day and it hasn't come back. I think the migraine went away on it's own. I haven't had a migraine ever in my entire life so it was very unsettling.
1244362	4/22/2021	TX	59	F	4/5/2021	4/6/2021	She reports red bumps on the back of her neck and under her eye. She thought it was from a new makeup. She went to her Primary Care doctor who thought it might be shingles, so patient was prescribed Bactrim and Valacyclovir. The bumps under her eye resolved quickly, however red bumps developed on her hands and upper arms, which steadily got worse over several days. On January 13, 2021, the patient went to the doctor and immediately diagnosed the reaction related to her COVID-19 shot. She stated she had seen this reaction numerous times. The patient was prescribed Clobetasol Cream 0.05%. Her hands and upper arms have improved, but her Thumb and fingers.
1244373	4/22/2021	VA	74	M	4/10/2021	4/17/2021	Had mild symptoms of headache, fatigue, nausea, light headedness for starting about 3 hrs. after shot given and lasting into evening of next nigh; No fever or shortness of breath experienced. Except for fatigue was generally OK for next 6 days. Then eyes started blurring down my vision, and started seeing double/triple vision... symptoms are intermittent; worse in evening when eyes are fatigued. Called medical center for info and course of action and was advised to report to medical center emergency Room. Will see what eyes are like in morning

1353934	4/22/2021		37	M	4/7/2021	4/15/2021	Narrative: 36 year old male with no pertinent pmhx who presented to ER on 4/19/21 with a four day history of headache and left eye visual blurring which began last night. Blurring peripheral in nature. Patient denied nausea, dizziness, no antecedent trauma. He reported no occupational exposure history nor migraine headache hx. Location of pain was the top of the head, intensity is 6/10, he had taken no medications to ameliorate symptoms nor had he endorsed any antecedent drug tobacco or alcohol use. Patient noted that he received the johnson and johnson covid 19 vaccine 4/7/21 (vaccine was not received from the specific facility). ER physician followed up with patient day after presenting to ED today, and patient reported he was doing well. ER presentation may represent a simple tension type headache given his single episode, relief with NSAID and the location that the patient described the pain.

There is a concern for Miller Fischer variant GBS. No history of tick bite no signs of systemic infections. Patient had a recent COVID-19 vaccine March 6th. On exam patient has pretty severe bilateral facial weakness in the lower motor apparent without any other cranial nerve involvement. There is numbness in the lateral toes of the right foot and sensory ataxia on exam. Patellar reflex and Achilles tendons were absent. Remaining reflexes were present. Multiple labs are pending lumbar puncture is pending. MRI brain is negative for enhancing lesions of the cranial and intra-articular portions of the facial nerve. After lumbar puncture will probably start the patient on IVIG if there was no signs of infection planning for 5-day course. Recommend artificial tears and supportive management to prevent corneal ulcers from facial weakness. OT and speech to see the patient. Assessment: 1. Acute facial diplegia with bilateral peripheral cranial nerve VII dysfunction concerning for AIDP. Symptoms started about 1 week ago. House Brackmann scale 5 bilaterally. Patient with metallic taste of tongue, pressure in his ears with some pain behind the ears. Unable to close his eyes, raise his forehead, puff out his cheeks, or purse his lips. No vibration sense to his chin. Also noticing new numbness of his right toes and has absent R patellar reflex. No recent noted infections although possible left mandibular tooth abscess noted on CT imaging and he reports a chronic "rotten tooth". Patient had a COVID-19 Johnson & Johnson vaccine on March 4. MRI brain with and without contrast is negative without noted enhancement of the facial nerve root. Planning lumbar puncture today and then will discuss further treatment. Will add moisture for his eyes and gabapentin for pain. 2. Neutrophilic leukocytosis. Unclear etiology. May need to have the dentist look at his tooth and consider removal. Will discuss further. 3. History of schizophrenia. Patient denies any acute complaints with this but is anxious to restart his lithium which is okay from our standpoint. 4. Tobacco use 5. Hypothyroidism. Continue home

levothyroxine. Plan: - LP, see orders - motor sensory neuropathy panel, b12, ANA, ACE, EBV Ab panel, RPR, Lyme reflexive panel, HIV, TSH, UA -Eyedrops and ointment to bilateral eyes -Gabapentin 100 mg 3 times daily -SLP to see History of Present Illness: 45-year-old male with a history of schizophrenia and tobacco use who presents with facial diplegia for the last 6 to 7 days. On Saturday night a week ago he had a fullness in his bilateral ears and thought he may have an ear infection. He woke up Sunday morning (March 21) with bifacial weakness and dysarthria. He has a metallic taste in his tongue. He feels somewhat swollen and sore in the posterior area. He still has a full feeling in his ears but no hearing loss. He cannot completely close his eyes. He has no movement of his forehead he cannot puff out his cheeks. He has had difficulty getting food to back of his mouth to swallow. His eyes are watering. He has some occasional stabbing, ice pick pains behind his ears, mild at present. He feels numb in his perioral area. Since occurrence this is not worsened or improved. He denies any illnesses in the last month or 2. He has had some diaphoresis at home since this occurred. No palpitations. No bowel or bladder issues. No difficulty walking. Denies shortness of breath. After transfer here and when he is asked he has noted some numbness in his third through fifth toes on the right foot which is new. He had a Johnson & Johnson COVID-19 vaccination on March 4. He has been on lithium since he was a child and recently was placed on Zoloft. He denies any new mental health issues but stopped his medications when the symptoms occurred as he was concerned there might be a potential side effect. At the outside hospital he had a CT of the neck which did note lucency around the root of his remaining left mandibular molar suspicious for abscess as well as large dental caries. He reports knowing he has had a rotten tooth on the back left for a long time. He is missing most of his upper teeth except a couple molars ("from bad decisions in his young years"). He had gone into the local ED about 3 days ago and they gave him a prescription for amoxicillin, prednisone, Zyrtec and Benadryl. He had a couple doses of amoxicillin and prednisone before he went back to the ED yesterday with ongoing symptoms. Day Smoker Packs/day: 0.50 Years: 30.00 Pack years: 15.00 Substance and Sexual Activity o Alcohol use: Yes Frequency: 2-4 times a month o Drug use: Not Currently o Sexual activity: Defer Patient is allergic to geodon [ziprasidone hcl]; haldol [haloperidol]; abilify [aripiprazole]; and latuda [lurasidone]. Review of Systems he has a history of low back pain with right leg radiculopathy for which she had a radiofrequency ablation done in the past. Physical Exam: Current Vital Signs: BP 139/77 (BP Location: Left arm, Patient Position: Lying) | Pulse 89 | Temp 36.6 °C (97.9 °F) (Oral) | Resp 18 | Ht 1.702 m (5' 7") | Wt 110 kg (241 lb 6.5 oz) | SpO2 97% | BMI 37.81 kg/m² Labs: Sodium 137 Potassium 4.4 BUN 16 Creatinine 1.05 Glucose 109 Lithium level 0.2 WBC 16.64 Hemoglobin 14.5 DISCHARGE SUMMARY Hospital Course: 45-year-old male with a history of schizophrenia who had 6 to 7 days now of complaints of upper forehead/facial weakness, eyes watering leading to blurry vision until he wipes away the excess and numbness of his lips and mouth and tongue feeling thick. He noticed that his speech was a little different and he felt muffled and cottonmouth. He had a little bit of issue eating as he states that he had to put his food in the back of his throat so that his tongue would not push the food out of his mouth. He denies any numbness around his maxilla or mandible or cheeks. He stopped all of his medications abruptly when he had the symptoms as he thought it may be a side effect from something. He denies any recent environmental or insect exposure. No fevers or chills. No URI symptoms. No ear pain. No nausea or vomiting. Patient was ultimately diagnosed with Miller Fisher variant GBS secondary to Johnson & Johnson COVID-19 vaccine. Neurology evaluated and started IVIG treatment for 5 total doses. He progressively improved with his symptoms throughout the 5 days of hospitalization. He completed IVIG therapy on 4/1/2021. I personally evaluated the patient on the day of discharge he was doing well and had no complaints. He is to follow-up with neurology in 1 to 2 months. FMLA paperwork was filled out. He was discharged with eye ointment solution and told to protect his eyes. It was neurology recommendation that he take at least 2 months off of work in order to do so. I had no changes in my physical exam—significant cranial nerve deficits associated with

							primary diagnosis. Otherwise no focal neurologic deficits observed in the upper and lower extremities. Heart was regular rate and rhythm lungs are clear. Abdomen had normal bowel sounds and was nontender. He has no peripheral edema to speak of. Miller-Fischer Variant GBS - F/u with neuro in 1-2months
1242617	4/22/2021	MI	20	F	4/6/2021	4/6/2021	Pt was anxious prior to the vaccine administration; became dizzy, pale ,clammy, weakness. Evaluated by paramedic, HR increased to 134, no shortness of breath or tingling/numbness noted. Paramedic called, patient declined, called brother to take her to her apartment, agreed to keep an eye on her.
1242701	4/22/2021	MN	35	F	4/9/2021	4/12/2021	the first 2 days had the expected fever, body aches. Day 3 and onward started experiencing new and building symptoms as each day progressed. Headache for 3 days (above right eye, caused some vision changes), then sore throat, cough, brain fog, difficulty sleeping, along with body aches continuing. Currently on day 13 and still have sore throat, coughing, brain fog, difficulty sleeping, muscle aches, congestion. Also on day 3, eczema has been building on my face/neck. Eczema has continued to get worse each day. when I got the shot, I communicated to the nurse, I was maybe pregnant. it was too soon to test. That was Friday. I had a positive pregnancy test the following Tuesday. I've since taken 2 more tests that were positive and have missed my period. So safe to say i'm pregnant.
1242711	4/22/2021	UT	57	F	4/8/2021	4/12/2021	Soreness in my legs - I have blood clot history in my family and was worried. I went to see my doctor. - 14th. He did a visual exam. He said I was developing immunity because the vaccine was working. On the 19th, in the middle of the night, I had diarrhea and wasn't feeling well at all. I had diarrhea for 18 hours - and I was sleeping and running a fever but it didn't go over 101: It was at 99 - 100.5. Diarrhea stopped yesterday -I was eating BRAT (bananas, rice, applesauce, toast) - no caffeine - diet. But this morning, I work up with diarrhea again and I have had diarrhea three times already today. I've had a ringing in my ears that started two days ago and it's still there.

1242735	4/22/2021	NE	28	M	4/10/2021	4/20/2021	ED NOTE is as follows...from 4/21/21 @ 21:47 a 28 y.o. male who to the emergency room with reports of a headache for the last 48 hours. He reports this as being one of the worst headaches he has ever had. He was seen at urgent care and given Toradol, Zofran and Benadryl and still rates his pain an 8 out of 10. He does feel pressure behind his eyes. And reports vomiting in the parking lot at urgent care. He denies abdominal pain back pain, neck pain, shortness of breath, chest pain, numbness or tingling or any other worsening concerns. Reports that he did receive a recent Johnson & Johnson vaccination. Patient states he does vape. He occasionally drinks alcohol he denies any illicit drugs. Patient denies any head trauma. Diagnosis management comments: This is a 28-year-old male arrives to the emergency room with reported migraine headache for the last 48 hours. He did report that he was go to urgent care in which he received a migraine cocktail of Zofran, Benadryl and Toradol. Patient reported that his headache was not resolved so urgent care sent him on for further evaluation. Patient upon arrival had a negative neurological exam however he did report that he had pressure behind his eyes. Was unable to see any papilledema on fundoscopic exam. Check patient's pressures bilaterally and they were 21 and 18. Patient did report to me that this was the worst headache of his life. I did administer IV fluids here as well as Tylenol and morphine. Patient did report some improvement. Patient did report in his past medical history had a recent Johnson & Johnson vaccination. A CBC and CMP was obtained. Did have thrombocytopenia with a count of 66. Since my exam was PERRL with normal extraocular movements. He had no eye redness or eye pain. Of low concerns for any iritis or uveitis. Patient's patient CT of his head did show a abnormal CT that had a dense appearing superior sagittal sinus that was representing a venous thrombosis. Radiologist did recommend a MRI MRV. An MRI and MRV was ordered. Patient MRI MRv did show findings are consistent with a venous thrombosis involving the right jugular right transverse sinus and superior sagittal sinus there is also a patchy edematous change within the subcortical white matter areas bilaterally and symmetrically. There was no CVA. With patient's reported migraine headache. Reported blurred

							vision, low platelets, recent vaccination I do believe patient has vaccine induced thrombotic thrombocytopenia. With this finding I did converse with my overseeing physician Calls were made out to neurology and then a call out did prefer to have patient started on IVIG at 1 g/kg daily for 2 days and blood thinner Xarelto 15 mg p.o. twice daily. These orders were initiated. Internal med services was consulted and with conversations of family, internal med services out possible transfer that an interventionalists could be available if patient needed it. Report was given at 2100 upon my end of shift.
1236117	4/21/2021	FL	47	F	3/7/2021	3/27/2021	Immediately had flu symptoms the same night as vaccine that went away within 2 days. HOWEVER, twenty-one (21) days later, both eyes were extremely painful to move. Then I lost vision in right eye with extreme blurriness & partial blind spots resulting in a diagnosis of Optic Neuritis by Ophthalmologist and Neurologist. Confirmed optic Neuritis on MRI scan. Twenty-four (24) days later, numbness in legs, feet and right arm started. Hard to walk up and down stairs. Twenty-six (26) days later, extreme pain in in muscles and skin along with tingles all over and numbness. Weakness and Chest pain. Flu like symptoms without fever ie: aches, pains, skin pain, confusion. Dizziness, feeling of being extremely anxious and out of sorts in space. Had to complete round of Steroids and numbness and tingles got better, but did not dissolve. After completion of IV steroids, thirty-four (34) days later all symptoms returned full force and worsening. Checked into ER 4/10 and admitted into hospital. Have not been able to complete normal routine or work level since March 27th due to neurological disturbance and symptoms. Two (2) Eye exams, 3/30/21 confirming swollen optic nerves. MRI 3/31/21 Blood work 4/2/21 CoVid Test 4/9/21 Negative Hospital: April 10-12th. MRI Extensive Blood work Spinal Tap Neuro-Opt exam Outcome pending and further treatment pending results.

1236825	4/21/2021	NJ	93	F	3/5/2021	3/10/2021	pt says her throat started burning immediately after taking the vax and she had some difficulty swallowing. her PCP came and checked her vitals. She was observed for about 30 minutes and was able to leave. About 4 or 5 days later she noticed her vision declining. She already has poor vision but seemed to be getting worse. She has a varicose vein on her right leg and her upper right leg is swollen. She will contact her doctors.
1236793	4/21/2021		29	F	4/20/2021	4/20/2021	Complained of nausea, blurred vision, tingling of hand and foot. Symptoms were resolved and patient went home.
1236794	4/21/2021	MI	42	F	4/20/2021	4/21/2021	I am reporting that I nearly fainted early in the morning. I woke up feeling uncomfortable and hot and went to the kitchen for an ibuprofen. I immediately felt wobbly and nauseous. I sat on the floor a minute in the kitchen. Took the ibuprofen and walked back upstairs to my bedroom. Again I felt nauseous and then felt my face get hot, lips tingle, vision get grey, realized I was about to faint and lied down on the floor. A minute later I went back to bed feeling the chills, slept two hours and felt fine when I got up. Checked my Blood Pressure and it was normal. I don't normally faint. It was unexpected.

1236420	4/21/2021	CO	4	M	4/10/2021	4/10/2021	<p>Around 4:00 pm on 4/12/2021 I began to feel a slight headache and my side effects worsened that evening. I lost my appetite due to the muscle pain, aches, fatigue, and chills that I felt. After taking a nap, I did not feel rested but instead restless. Because of the chills, I put on joggers and a sweatshirt, then proceeded to try and read a book while sitting under a blanket. I was unable to concentrate or focus on my book because of the chills, so I instead watched television. By 9:00 pm, I tried to go to sleep and took my last remaining dose of Tylenol. The aches and chills had only gotten worse and I was still dressed in joggers and sweatshirt as I tried to fall asleep underneath two blankets and quilt. All night long I tossed and turned because of the shivers, aches, and chills. I was unable to sleep for more than 45 to 60 minutes at a time before I woke up again. This happened repeatedly all night and it was very painful. On 4/13/2021 around 8:00 am, I got out of bed with continued shivers, aches, pain, fatigue, headache, and chills. I suffered from these symptoms all day long. Around 3:00 pm I tried to eat spaghetti with meatballs and steamed vegetables, but the spaghetti tasted like cardboard and I was only able to eat some of the vegetable mix. All day long I kept drinking water to stay hydrated and spent most of my time switching from my couch to my bed with restlessness, aches, shivers, and chills. The chills started to subside around 2:00 am on 4/14/2021 after I took a hot shower for about 15 to 20 minutes. Still dressed in joggers and a sweatshirt, this time I tried to sleep under two blankets, but the shivers and chills kept waking me up every 60 to 90 minutes. On 4/14/2021 around 10:00 am, I finally felt well enough to be able to drive to a store to buy ibuprofen. When I got home, I took some and was finally able to take a nap and get some rest. I felt much better after my nap, was able to eat, and go for a small walk. This was my Pfizer second shot and it is worth mentioning that I live alone with no friends or family and I am an COVID-19. I had nobody to call and ask for help or to take care of me. I had to deal with the additional psychological trauma of not being able to ask anyone for help as I worried how long the adverse effects would last. I did not call my doctor because the last time I went in to see him, the facility charged me \$170 for a 20-minute appointment and decided to take more than two months to let me know that I still owed \$119. Everyone at the</p>

CDC and other agencies have failed those of us who live alone, especially public health officials, who did absolutely nothing to prepare to help and support people like me during this pandemic. Your ideals of individualism are bad public health policy for those of us who are alone, have nobody to turn to, and do all the right things by wearing masks, getting vaccinated, and staying six feet away from everybody. Yet, we are the ones who suffer the most and have to struggle with adverse effects of pandemic trauma, depression, and other mental health issues in addition to loss of taste and smell. I have not enjoyed food in over six months. It sure would be nice if for the next pandemic you also put together a plan for people who live alone and have nobody to turn to for help because you've failed us in this pandemic.

1235663	4/21/2021	CA	36	M	3/27/2021	4/10/2021	information has been requested. I developed a viral infection in my right eye. My doctor suspects it is the herpes simplex 1 virus. I developed symptoms on Saturday that I thought were consistent with something being stuck in my eye or having a scratch on the surface of my eye. I saw my doctor on Monday and he confirmed that I had a viral eye infection. He believes HSV 1 is the most likely cause. I have never had another symptomatic infection from that virus (no cold sores or other eye infections). I started taking oral valtrex and prescription eye gel drops. I am still taking the medication and will consult with my doctor once I've completed the current course of pills.

1235592	4/21/2021	NH	34	F	4/19/2021	4/19/2021	Sore throat, headache, chills, sweats, itchy/burning eyes, feeling "off", nausea, diarrhea, lethargy, body aches. No treatment outside of home as of yet. Hydration, rest, OTC cold/flu medications to help decrease symptoms.
1235586	4/21/2021	MI	24	F	4/8/2021	4/8/2021	April 8th at 11pm I started to have slight body aches. I woke up at 3am with intense body aches/ chills/sweats, felt like I had a cabin fever for the entire day of April 9th. I felt dizzy, had a headache, my eyes aches and very very fatigued and couldn't eat. Night of April 9th I started to not feel so dizzy but I was very very hot and could not cool down. Ever since April 10th I've have runny/stuffy nose/ body aches, sore throat, I developed a cough week of April 12th, eyes ached and very very fatigued. Today, April 21st, I am still a little fatigued, little soar throat, but runny/stuff nose still, and body soreness/aches.
1235639	4/21/2021	CA	56	M	4/1/2021	4/2/2021	?Pfizer-BioNTech COVID-19 Vaccine EUA The following morning after receiving my first vaccination, I woke up with a few small hives around various parts of my body. My arms, chest, back, and legs. As the day went on and I moved around, the hives disappeared. Before going to bed, I noticed that my left eye was mildly swollen. The next morning, I woke up and the hives returned. Again, after moving around, the hives went away. Later in the late afternoon and into the evening, I noticed that both of my eyes were swollen and so was my upper lip. I woke up and the hives returned, only one eye was swollen and my lip was swollen. By later in the afternoon, the hives and swelling had just about disappeared. The following morning, I was back to normal with no hives and no swelling around my eyes or lips.

1235511	4/21/2021	NJ	66	F	3/18/2021	3/28/2021	Experienced very high blood pressure/blood pressure was 190/119; The blood vessel broke in her left eye/ there was blood in half of her eyes; Very high heart rate/heart rate was 126/heart rate was 150 and she did not even feel it; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of HYPERTENSION (Experienced very high blood pressure/blood pressure was 190/119), EYE HAEMORRHAGE (The blood vessel broke in her left eye/ there was blood in half of her eyes) and HEART RATE INCREASED (Very high heart rate/heart rate was 126/heart rate was 150 and she did not even feel it) in a 66-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 006B21A) for COVID-19 vaccination. Concurrent medical conditions included Crohn's disease and Colitis. Concomitant products included MESALAMINE for Crohn's disease and Colitis. On 18-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 28-Mar-2021, the patient experienced HYPERTENSION (Experienced very high blood pressure/blood pressure was 190/119) (seriousness criterion hospitalization), EYE HAEMORRHAGE (The blood vessel broke in her left eye/ there was blood in half of her eyes) (seriousness criterion hospitalization) and HEART RATE INCREASED (Very high heart rate/heart rate was 126/heart rate was 150 and she did not even feel it) (seriousness criterion hospitalization). At the time of the report, HYPERTENSION (Experienced very high blood pressure/blood pressure was 190/119) had resolved and EYE HAEMORRHAGE (The blood vessel broke in her left eye/ there was blood in half of her eyes) and HEART RATE INCREASED (Very high heart rate/heart rate was 126/heart rate was 150 and she did not even feel it) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 15-Mar-2021, Blood pressure measurement: 141/90. On 16-Mar-2021, Blood pressure measurement: 136/84. On 17-Mar-2021, Blood pressure measurement: 140/91. On 22-Mar-2021, Blood pressure measurement: 155/94. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Patient reported to be treated with beta blockers and test were performed and came out "okay".

1235802	4/21/2021		43	F	4/1/2021	4/1/2021	<p>I haven't slept in days; I had headache so badly that my right eye which is to the opposite side to where I got the shot/ like whenever I take a step to walk it's feels like my head is going to explode; really bad back ache; My face and my back started getting like hot, like heat, like very hot reaction/like radiating heat in my back it is like surrounding my spine, its right in the middle of my back; It feels like heat and pressure around my spine area; high pressure behind the right eye; My arm started hurting; the arm I got the shot in; This is a spontaneous report received from a non-contactable consumer (patient). A 43-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number ER8733), intramuscular (reported as in the muscle) in left arm on 01Apr2021 (at the age of 43-year-old) at 0.3 ml, single for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. Patient stated that initially, right afterward she meant her arm started hurting which was normal the arm she got the shot in, she wasn't worried about that. But then her face and her back started getting like hot, like heat, like very hot reaction. She did not know how to describe it, it was like radiating heat in her back it was like surrounding her spine, it was right in the middle of her back. It felt like heat and pressure around her spine area. And in her head, it had not lit up. She had headache so badly that her right eye which was to the opposite side to where she got the shot. She had very high pressure behind the right eye. It was literally like whenever she took a step to walk it was felt like her head was going to explode. It was for her a headache and really bad back ache. When paraphrased the above concern, patient stated It was for days at the time of this report. First adverse reaction was on the actual day that she received the vaccine that was 01Apr2021. Second shot was reported as 29Apr2021. When probed for if patient still experiencing adverse event patient stated that she was still experiencing. As per outcome of event patient stated for its persisting. As per treatment she took an ibuprofen (ADVIL) for the first-time last night before the present report. Just because she needed to get sleep. She had not slept in days. So, she took ADVIL to get rid of the pain last night that was only the things she had done since Thursday 01Apr2021. But it didn't even work. She woke up and felt the exact</p>

1235800	4/21/2021	IN	63	M	3/17/2021	4/1/2021	high fever (over 102, 103.7, 102.7, 99 or 100); Blurred vision; shaking like crazy; has no energy; it was double vision, like looking in a fun house mirror; he is still freezing; does not feel like himself; Had been feeling tired and rundown; Headache; horrible chills; night sweats; This is a spontaneous report from a contactable consumer (sister). A 63-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration on 17Mar2021 (Batch/Lot number was not reported) as single dose for covid-19 immunisation. Patient medical history: no. Family medical history: no. The patient's concomitant medications were not reported. Vaccination facility type: hospital. Vaccine administered at military facility: no. The patient experienced high fever (over 102, 103.7, 102.7, 99 or 100) on 04Apr2021, blurred vision on 04Apr2021, headache on 2021, horrible chills on 2021, night sweats on 2021, shaking like crazy on Apr2021, has no energy on Apr2021, had been feeling tired and rundown on 2021, it was double vision, like looking in a fun house mirror on Apr2021, he was still freezing on Apr2021, did not feel like himself on Apr2021. On Saturday, her brother was out shopping with her and stated that he felt very tired and run down and had a headache. He started running a high fever but stuck it out at home. On 04Apr2021, he was taken to the emergency room and admitted to the hospital. They had been running test after test and can't seem to find anything wrong. The doctor thought that it was some kind of reaction to the vaccine. The patient was still running a high fever over 102 and was still experiencing fatigue and headaches on and off, and horrible chills and night sweats. The patient wanted to wait until the day after Easter to go to the hospital but started experiencing new symptoms. He was starting to experience blurred vision. Was then taken to the emergency room. The fever went down with Tylenol but continued to go up again when Tylenol wears off. Temperature was 103.7 at one point and has mostly been over 102, stating that this morning was 102.7. It had been one week that he was still having these symptoms. It was strange because the patient was feeling all right for the first 2 weeks. At the hospital, they kept giving him Tylenol to bring the fever down. He had been shaking like crazy. Had horrible chills and night sweats. He had no energy. He had not had the second

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

dose. They cannot find anything else wrong. He was a health nut and run five miles a day. Took good care of himself. He seemed ok the first 2 weeks. Had been a week that he still can't break the fever. When looked up the symptoms, he had everything except for nausea. He also had blurred vision. They did a spinal tap, echocardiogram, EKG and blood work. He had seen 5 different doctors. The fever was highest at 103.7 and has consistently been over 102. With Tylenol, it had gone down to 99 or 100 but always shoots back up. 2 weeks after the shot, he took his temperature and wasn't feeling good all day. He stayed home from Wednesday until Sunday when he started experiencing new crazy vision symptoms. Stated that started Saturday. He was taken to the hospital on Easter and was admitted to the hospital, and was still there. The vision problem was new and it started to develop Saturday night. It was double vision, like looking in a fun house mirror. He still experienced the double and blurry vision now but only occasionally, when he tried to get up. It was on and off when he had to get up to go to the bathroom. He was still freezing and had shake and chills. He got night sweats and fever, chills, and did not feel like himself. The reporter didn't think he had high cholesterol or high blood pressure, diabetes, or anything like that. Tests: They did bloodwork, CT scans, MRI of the brain, echocardiogram, EKG, spinal tap. There were no white blood cells found in the spinal tap and that the echocardiogram was good. Everything came back normal. He had seen cardiologists, neurologists, gastroenterologists, primary care doctors, and no one can find anything. They did another kind of test regarding his vision. Her brother was depressed and wanted his energy back. It had been a whole week. The outcome of the events high fever (over 102, 103.7, 102.7, 99 or 100) and blurred vision was not recovered, outcome of the remaining events was unknown. The patient was hospitalized for high fever (over 102, 103.7, 102.7, 99 or 100) and blurred vision from 04Apr2021 to an unknown date. The reporter was not sure if this was happening because of the vaccine. Follow-up attempts are completed. No further information is expected. Information about lot/batch number cannot be obtained.

1235784	4/21/2021	IN	41	F	4/5/2021	4/6/2021	blood vessels in her left eye popped and eye looks bloody; Caller adds that it is gross; Caller adds that it looks like it is getting red, more red, it does not look like it is spreading but it is getting darker; This is a spontaneous report from a contactable consumer (patient). A 41-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), dose 1 via an unspecified route of administration, administered in arm left on 05Apr2021 10:15 (Lot Number: ER8732) at age of 41 years old as single dose for covid-19 immunisation, alpha-1 antitrypsin deficiency, liver disorder, lung disorder. Medical history included ongoing alpha-1 antitrypsin deficiency, ongoing factor v leiden carrier, ongoing bipolar disorder, diabetes mellitus (she did not know if it meant anything but it turned out they were both very very diabetic. She adds this scares her, she does not want a needle), iron deficiency, vitamin d deficiency, lung disorder, emphysema, chronic obstructive pulmonary disease, hypertension, insomnia, depression, dumping syndrome and acid reflux. There was no history of all previous immunization with the Pfizer vaccine considered as suspect. There was no vaccines administered on same date with the Pfizer vaccine considered as suspect. There was no any other vaccinations within four weeks prior to the first administration date of the suspect vaccine. AEs following prior vaccinations was none. Concomitant medications included fluticasone propionate, salmeterol xinafoate (ADVAIR) taken for alpha-1 antitrypsin deficiency, emphysema, chronic obstructive pulmonary disease from an unspecified start date and ongoing; colestipol taken for dumping syndrome from an unspecified start date and ongoing; dexlansoprazole (DEXILANT) taken for gastrooesophageal reflux disease from an unspecified start date and ongoing; iron taken for iron deficiency; lamotrigine (LAMICTAL) taken for bipolar disorder from an unspecified start date and ongoing; levomefolic acid (L-METHYLFOLATE) taken for depression from an unspecified start date and ongoing; lisinopril taken for hypertension; amlodipine besilate (NORVASC) taken for hypertension from an unspecified start date and ongoing; alpha-1-antitrypsin (PROLASTIN-C) taken for alpha-1 antitrypsin deficiency from an unspecified start date and ongoing (did not have dosage, she got an infusion into a

----------	-------	-------	---------	-----	----------	------------	--------------

port once a week. She got five bottles. She was on this for alpha-1, maybe 10 years); tiotropium bromide (SPIRIVA) taken for lung disorder, alpha-1 antitrypsin deficiency, chronic obstructive pulmonary disease, emphysema from an unspecified start date and ongoing (Caller thinks it is a standard, it is once a day. She has been on for 10 years. It does not say anything else, it just says Spiriva handihaler); temazepam taken for insomnia; vilazodone hydrochloride (VIIBRYD) taken for bipolar disorder; colecalciferol (VITAMIN D3) taken for vitamin d deficiency; olanzapine (ZYPREXA) taken for bipolar disorder from an unspecified start date and ongoing; multivitamin (Dosage text: Caller takes one a day, it does not really have a dose, she does not see a dose thing on it. has been taking for about 20 years, Caller states she eats like crap). The patient got her first shot yesterday (05Apr2021), and then woke up with the blood vessels in her left eye were popped, and her whole eye looked bloody. She added this was kind of tripping. She wanted to know if this had anything to do with the shot (Pfizer Covid19 vaccine) or anything else. It was gross, and she did not like looking at it. It looked like there was blood around her eye, and it started when she woke up this morning it was like that. It looked like it was getting red, more red, it did not look like it was spreading but it was getting darker. She clarified and stated that it was a lot of pets. She did start an allergy drop a week and a half ago, Pataday (lot number 102C5, expiration date Dec20211, over the counter) eye drop; it was a 0.2 % antihistamine. Treatment reported as: just the Pataday eye drops, which were for allergies. She did not know what was up with the pollen this year but it was trying to kill her. She started these a week and a half ago. The events did not require a visit to Physician office or Emergency Room. The outcome of events was not recovered. Follow-up attempts are completed. No further information is expected.

A 19-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number/expiration date not reported), intramuscular on 23Mar2021 as single dose for COVID-19 immunization. Medical history included seasonal allergies from an unknown date. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, it was unknown if the patient has been tested for COVID-19. Concomitant medication included fluoxetine 60 mg taken for an unspecified indication, and an unspecified oral contraceptive. It was reported that on 23Mar2021, the patient received Pfizer Covid vaccine and felt a little dizzy on 11:00. She also started noting mumbling, slurred speech, passed out for about 15 (unspecified) after using the bathroom, developed a "static" feeling in her head and then noted her left eye shutting and then weakness in her left arm and leg. She was taken to the Emergency Room (ER) for evaluation. Symptoms lasted about 5 hours. She fell asleep in the ER. Symptoms seemed to clear by about 8:30 PM. She had lab and head CT at the hospital which were essentially normal. She felt okay the next day, but had some nausea for a couple days starting on the 3rd day on 25Mar2021. She stated she feels fine at the time of report in the Student Health Clinic and asked whether she should receive her second Pfizer dose scheduled on 20Apr2021. The adverse events result in Doctor or other healthcare professional office/clinic visit and Emergency room/department or urgent care. No treatment was received for the adverse events. The outcome of the event nausea was recovered in Mar2021, and for other events was recovered on 23Mar2021 20:30. Information about lot/batch number was requested.; Sender's Comments: Based on the information currently available and temporal association, a possible causal relationship cannot be excluded between the suspect product BNT162B2 and the reported event Passed out. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation,</p>

including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

he was a "full-blown diabetic" in an emergency situation/he wasn't diabetic until he got the shot; his sugar was "400 something"; chest pain; abdominal pain; felt awful; if he closed his eyes he would just go to sleep; This is a spontaneous report from a contactable consumer (patient's parent). A 51-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not reported) via an unspecified route of administration on an unspecified date as a single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The reporter was calling in behalf of her son. The patient had the first dose of Pfizer's COVID-19 vaccine on Saturday about 2 weeks ago, does not know exact date. The next Monday, on an unspecified date, he was a "full-blown diabetic" in an emergency situation and his sugar was "400 something". The patient also experienced chest pain, abdominal pain, felt awful, and if he closed his eyes he would just go to sleep on an unspecified date. Back in Dec (year not reported), his blood sugar was 88 in a general check-up, but he was not a diabetic as far as they knew. The reporter stated that he wasn't diabetic until he got the shot. They think it was caused by the COVID shot, he was told in the emergency room not to take the 2nd shot. The outcome of the events was unknown. Information about lot/batch number has been requested.

1235791	4/21/2021	WA	33	M	4/5/2021	4/1/2021	<p>he feels like his throat is so raw; Second COVID-19 vaccine: sore arm; Second COVID-19 vaccine: feeling achy/ Her husband is still sore/achy today; Second COVID-19 vaccine: nauseous; Second COVID-19 vaccine: vomiting/ throwing up; Second COVID-19 vaccine: diarrhea; Second COVID-19 vaccine: fatigue; vomiting blood; Second COVID-19 vaccine: blood in the phlegm or just whatever he spit up / spitting up blood; Second COVID-19 vaccine: Chilly; Second COVID-19 vaccine: redness around his eyes, like under his eyelids; his pores looked red; This is a spontaneous report from a contactable consumer (wife). A 33-year-old patient (husband) received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration administered in right arm on 05Apr2021 15:40 (Lot Number: ER8734) at single dose for COVID-19 immunization. Medical history included atopic dermatitis. Concomitant medication included dupilumab (DUPIXENT), an injection that patient takes every other week to control his atopic dermatitis, he has been using this for 3 years at least. The patient previously received the first dose of BNT162B2 (Lot number: ER6207) in left shoulder on 15Mar2021 15:40, at the age of 32 years old, for COVID-19 immunization, and experienced arm sore and body aches. The patient experienced vomiting blood in Apr2021, blood in the phlegm or just whatever he spit up / spitting up blood in Apr2021, he feels like his throat is so raw on 05Apr2021, sore arm on 05Apr2021, feeling achy/ her husband is still sore/achy today on 05Apr2021, nauseous on 05Apr2021, vomiting/ throwing up on 05Apr2021, diarrhea on 05Apr2021, chilly in Apr2021, redness around his eyes, like under his eyelids; his pores looked red in Apr2021, fatigue on 05Apr2021. No treatment received for the adverse events. Outcome of the events pain in arm, ache, nauseous, erythema, fatigue was not recovered, of the other events was unknown. Clinical course as reported: Her husband got their second dose of the vaccine on 05Apr2021. Her husband was having a more severe reaction than the first time. The first time he got the vaccine his arm was sore. Last night (05Apr2021), the caller's husband was vomiting just over and over and had diarrhea, both at the same time. Wife added the thing she was worried about was that her husband was vomiting blood as well, and</p>

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

that her husband said it was from the phlegm, like he felt like his throat was so raw. Her husband did not really want to eat anything which she expected was normal. She was trying to give him fluids, and having him drink a little bit. Her husband had not vomited since around 4 am. And right now, he was sleeping. She did not know if she should give him medicine or take him to be seen or if this was a normal reaction to the vaccination. She did read side effects from the paper and she saw that some vomiting was expected but the blood was what caught her off guard. Around 10 o'clock last night (05Apr2021), her husband felt nauseous and went to bed. She actually fell asleep on the couch and heard her husband vomiting across the house, that was how bad the vomiting was. The vomiting started at midnight last night (05Apr2021). Her husband has been vomiting every couple of hours (2 hours), around the clock. Diarrhea had been at the same time. From her understanding, her husband had vomited at least 3 or 4 times, and had diarrhea 3 or 4 times. She kind of lost track after the 3rd time, but she had not heard him since around 4 am Her husband was still sore/achy today (06Apr2020) and was is still nauseous. She believed he was also feeling chilly. He was wrapped up in his blanket. Her husband did not have a fever, she has been checking his temperature. Wife stated no treatment yet, as she did not know what was safe. Her husband wanted to wait until he stopped vomiting because anything he put in his stomach came right back up. After the first time her husband was done throwing up, and was only dry heaving, he started to like kind of spit. When he would gargle or spit, there was blood in the phlegm or just whatever he spit up. The first time the wife went to check on him, she saw him spitting up blood. It was not like his vomit was red with blood in it, it was just the after effects, so she thought she should call and report this. Each time he has vomited, there was still that spit up of blood afterwards. The patient himself clarified the vomiting was last around 4 am (06Apr2020), give or take, and the last stool/bout of diarrhea was around 7 am (06Apr2020). He was still feeling nauseous and fatigued. He added that after the first time he vomited and the couple times he checked later on, he looked in the mirror and saw that there was this redness around his eyes, like under his eyelids. He adds it was red, it wasn't like splotchy, but it was like his pores looked red, like

pinpoints. The patient clarified that the fatigue and achiness probably started around the first time he vomited, and that was still hanging around. The wife stated this was better than him getting Covid. Wife added what she was trying to see was if she should take her husband to the hospital or not. She did not want to wait too long, but if this was something that was a side effect that was expected, then her husband could just sleep it off.

1238341	4/21/2021	FL	64	F	4/7/2021	4/17/2021	<p>Patient claims "3 days" after vaccination she developed headache that worsened over the next two days to include dizziness, photophobia, scotomata. However, the state tracking system lists her date of vaccination 10 days prior to the symptom onset. Below is a more detailed description: This is a 64-year-old female nurse practitioner with coronary artery disease, uncontrolled (untreated) type 2 diabetes, obesity, and remote history of kidney donation who presented yesterday with a 5-day history of nausea and frontal headache with new recent dizziness /lightheadedness when standing. She describes her headache as starting out as temporal and periorbital and then persisting as a frontal discomfort radiating to the back and down the neck. Associated with this were complaints of blurry vision, photophobia and scotomata. She denies any focal weakness or numbness/tingling. There was no vomiting or reports of seizures. She denies no recent problems finding words or bouts of confusion. She denies a history of arrhythmia or palpitations. Patient received the first dose of the Moderna COVID-19 vaccination on 4/14/2021 into her right arm, 5 days prior to admission (But state records list 4/7/2021 as the date). She did not take any medication to pre-empt side effects such as NSAID, aspirin, H2 blocker, or Tylenol. Initially she developed a sore arm the night of the vaccination. Three days later the headache developed that did not respond to Tylenol PM although it helped her sleep. She noted taking more than the recommended dose and had mouth dryness. Patient denies any past history of COVID exposure and any illness c/w COVID where she was not tested. She has never had her antibody titer checked. She recently had a dental procedure for an exposed nerve and had a temporary filling placed. No antibiotics were given and denies having a dental abscess. She described that one of her sisters developed "blood clots from her heart due to atrial fib" after her Pfizer vaccination. She denies rashes or stigmata of endocarditis, no fevers, chills, or night sweats. She describes vaginal itching a few days ago and self treated with an anti-yeast cream (Monistat) that relieved symptoms and does not currently have dysuria, frequency or urgency. On admission, her UA was abnormal and culture is pending but she received one dose of Rocephin and is still without urinary symptoms. After admission CT scan and MRI of the</p>

Patient rested on gurney and felt better. 1st BP taken at 10:45 BP 85/47, HR 56. 2nd BP taken at 10:55 BP 95/57, HR 61. Patient left the facility 30 minutes after his vaccination with stable condition.
1238581	4/21/2021	FL	73	M	3/3/2021	3/31/2021	On the evening of 3/31/21 I noticed 2 rashes on my inner right thigh that were hurting me. The next morning I called my dermatologist's office and they had me come in to see Dr that same day, 4/1/21. He confirmed that it was the early stages of the shingles virus. He prescribed Valacyclovir for me which I took for 7 days (3 tablets/day. The rash has improved every day and now it is still there but only very feintly. My doctor said it could come back or others might appear and to keep an eye on it.
1238525	4/21/2021	CO	81	M	4/1/2021	4/21/2021	Janssen COVID-19 Vaccine EUA; patient reports intermittent blurry vision and fatigue after vaccination. Presents to infusion center for chemotherapy, experienced blurred vision, found to be hypotensive and bradycardic, and transferred immediately to emergency department (ED). In the ED diagnosed with acute left lower lobe segmental pulmonary embolism and thrombocytopenia. Admitting to hospital for further management.

1238492	4/21/2021	OR	52	F	4/9/2021	4/10/2021	No pain or anything right after. They kept me an hour to observe due to past adverse event after vaccine. Body aches the next day - I took care of them with Tylenol. On Sunday, A rash started on my feet - little red dots. It didn't itch. Dr. on Tuesday. Thursday, I was super tired and the rash was continuing to get worse. My doctor called and said the labs were normal. I was getting scratchy throat, runny nose, rash moved to stomach, my back (mainly in my shoulder blades) my upper arms; and my face was bright red -looked like it was peeling, and rash was on my scalp (in my hair). The inside of my lips were swelling and my eyelids were swelling and I felt like I needed to cough. I called the doctor and she told me to go to the ER - Thursday, the 15th. I did. They gave me: Epi shot - IV with Benadryl, steroids, and Pepcid. I was there for about 3 hours. Everything worked with my reaction. Epi - Pen prescription; More steroids, Benadryl and Pepcid and I have been taking this through today (today is my last day of the steroids - I have two days of Benadryl left). My face is cleared up now, it's still super dry. I still have the rash all over my body. It looks like I rolled around in a fire ant hill.

1237836	4/21/2021	AZ	76	M	3/6/2021	3/7/2021	Woke up at approximately 4:00 am with headache and severe dizziness. It was so bad it forced me to go to Emergency Room at the Medical Center 3/7/21. They checked my eyes that were bouncing back and forth, gave me IV, did an EKG. Prescribed Meclizine 25 mg for the dizziness, three times a day. Absolutely no help. Went to Primary Care Physician, and he thought it might be an inner ear infection and gave me a prescription for progressive Steroid Treatment. No help. Got appointment for 4/9/21 with Ear, Nose and Throat specialist. At the same appointment was sent to see, an Audiologist in the same building. The two doctors determined it was not an inner ear problem. I was then advised to get a Cat Scan of my Brain and see my cardiologist. I am now in my 6th week of major dizziness which has affected all aspects of my life.
1238374	4/21/2021	IN	66	F	3/7/2021	4/16/2021	I had been sick since this past Friday; high fever, all over body pain, constant cough and frequent sneezing, migraines, eye pain and extreme fatigue. I tested positive for Covid April 21, 2021.

1237883	4/21/2021	NC	18	M	4/21/2021	4/21/2021	Patient got light headed and started having blurry vision. Pharmacist gave Benadryl and called EMTs. EMT's came and checked him out and his vitals were fine and he was feeling better.
1237846	4/21/2021	IN	28	F	4/5/2021	4/21/2021	Patient received the Johnson & Johnson / Janssen COVID-19 vaccine on April 5, 2021. Patient woke up overnight with severe headache that was different than her typical migraines headaches. Headache was "like I never had before", "it's really painful." When I asked if this was the worst headache of her life she responded "probably." No photophobia, no phonophobia, no nausea, and no vomiting, which she gets every time she has migraines. "This is a different type of headache," she said. "I usually throw up and my headaches get better." This headache feels like a "balloon in my head." She reported vision changes (blurred vision) 45 minutes prior to our visit which started at 8:19 a.m. on April 21, 2021. ("I was having a problem with peripheral vision, about 45 minutes ago," but not so much now. Patient denies loss of balance (dizziness), seizures, focal weakness, radicular symptoms, saddle anesthesia, sensory changes, slurred speech, numbness, chills, and fever. She was sent to the emergency department for further evaluation. She is a female patient with new, severe headache that is between 18 and 48 years of age, and has received the Ad26.COV2.S (COVID-19) vaccine within 3 weeks of headache onset.

1238419	4/21/2021	AZ	58	F	3/14/2021	3/1/2021	About the time I got the 1st vaccine, my chronic diarrhea (usually controlled by 0-1 loperamide 2mg qd) became severe. Gaseous, explosive diarrhea, 10-15 times/day. Even taking the loperamide with simethicone, up to 4 times/day, would not stop it. This went on and on. On 4-2-21 I took stool samples to lab, ordered by my healthcare provider. Those tests came back (or, I found out the results) on 4-14-21, 3 days after receiving the 2nd vaccine. They showed that I have Pancreatic Insufficiency. Fecal Pancreatic Elastase was 132 (norm >200, moderate pancreatic insufficiency 100-200 and severe is <100, per lab report). Occult blood, lactoferrin, and culture were all negative (stool). I have to wonder about this "coincidence". 36,000 units tid. I started these mid-day on 4-18-21 (pharmacy didn't have enough immediately and RX picked up and started when filled on 4-18-21).
1239088	4/21/2021	NV	31	F	4/9/2021	4/16/2021	Severe migraine for 4 days shooting pain in arm of injection site discomfort in eyes
1237386	4/21/2021	MD	36	F	4/5/2021	4/5/2021	4-5 7:30pm - chills, shaking fever 102.1 - took Motrin 4/5-4/7 - continued with high fever, chills, shaking and severe muscle pains in back and legs - took Motrin/Tylenol every 3 hours for fever 4/7-4/11 - severe brain fog - felt as if I could not think, dizzy, lightheaded, vision was off 4/11 7pm - starting with hives on the back of both arms. Quickly spread to arms, elbows, right butt/hip and legs - felt itchy and then burning. Very hot to the touch. I had a teledoc appointment at midnight that night. Took Claritin and Benadryl and slept with ice packs to cool my skin. 4/12 - hives were gone in the morning but came back that evening. Took Benadryl and made an appointment with my PCP for the following day. Still feeling dizzy and lightheaded. 4/13 - had appointment with PCP and was instructed to continue with Claritin and Benadryl for a week. At this point I was feeling EXTREME worry, panic and anxiety. Hear rate was elevated so I had to stay until that came down. 4/13-4/17 - Still dizzy and lightheaded - brain fog - continued with anxiety and worry. Set my alarm for every hour at night to be sure I would wake up. 4/18 - Finally feeling like myself - still a bit of worry but so much better!

1239281	4/21/2021	KY	26	F	4/12/2021	4/16/2021	developed shingles on eyelid 4 days after vaccine. patient has previous history of shingles, reports that this is 9th outbreak in 2 years
1239261	4/21/2021	CA	72	F	4/4/2021	4/20/2021	pins and needles, started in my left arm, on my extremities and starting up my torso, skin felt like it was crawling, irregular heart beat, lowered heart rate, low blood pressure, swollen eyes, throat clamping up, pain in left ear and around left ear in the neck, headache. The tingling started in the afternoon within an hour after the vaccine, and very slowly, slowly, slowly increased the next day and in the evening it got intolerable. They put me on an IV and within minutes it all started to go away.
1239238	4/21/2021	WA	16	M	4/21/2021	4/21/2021	Patient received Covid-19 vaccine (first dose) at our store today at 9:40 am. Patient was advised to stay in the area for 15 minutes for observation. Patient was sitting in the waiting area. At around 10:00 am, patient's mom knock on the door saying that her son might have an adverse effect. Patient stated he was feeling dizzy and was about to lose consciousness. He also stated he lost his vision. Patient was alert and was able to answer questions. Medics arrived and took his blood pressure. He was transported to the hospital

1238785	4/21/2021	NV	45	F	4/7/2021	4/15/2021	<p>The patient received the vaccine on April 7, 2021. Almost immediately after the vaccine, the patient developed some nonspecific complaints of headache, myalgias, arthralgias, fever and chills. The symptoms lasted for several days and then seemed to resolve. She was then at her baseline until approximately April 15, 2021 when she noted that she was becoming bruised. She had multiple ecchymoses on her lower extremities and this has never happened to her before. She apparently began taking aspirin at that time. According to the patient, she took 325 mg of aspirin on April 15th, 16th, and 17th. She did not take any aspirin on April 18th but then on April 19th, she took 650 mg of aspirin. On April 19, she had a telehealth visit. They recommended that she go to an urgent care. She went to an urgent care on the afternoon of April 19. They told her that they were ill equipped to take care of her and then sent her to the emergency department. On arrival in the ED on 04/20/21 she was afebrile. O2 saturation was 99% on room air. Her other vital signs were unremarkable. Her initial laboratory studies were notable for white count of 6.6 with a hemoglobin 15.2. Her initial platelet count was 5,000. Initial chemistry panel was completely unremarkable. She was not having any headache, dizziness, nausea, vomiting, blurred vision or any neurologic symptoms. She thinks that her lower extremities are swollen. She was not having any myalgias or arthralgias. Not having any abdominal pain, nausea vomiting, diarrhea, dysuria, urgency, frequency. . The patient has no other specific complaints. The patient was admitted on 04/20/21.</p>

1239064	4/21/2021	CA	58	M	4/16/2021	4/18/2021	He presented to the ER via ambulance after he had 3 witnessed seizures which included full loss of consciousness and rhythmic jerking lasting for an unknown duration. En route apparently he was seizing and prehospital personnel gave him 5 mg IM versed as well as 5mg iv versed which did seem to abate the seizure. He was apparently quite combative and has no prior history of seizures. In the ER the patient was apparently having right sided eye deviation and was given 2mg of Ativan. A stat CT of the head did not reveal any acute process. Telemetry neurology was consulted. During his work up the patient was found to have a urine toxicology positive for amphetamines as well as opiates. Telemetry neurology recommended loading the patient with Keppra, initiating regular Keppra doses and indicated they believed the etiology of his seizures was polysubstance abuse.

1236976	4/21/2021	NY	47	F	4/14/2021	4/15/2021	4/15- CHILLS, FEVER, BODYACHES, SWEAT POURING FROM BODY, DIARRHEA- CAME ON EXACTLY LIKE COVID DID AND VERY INTENSE. 4/16- SAME SYMPTOMS- SEEMED TO LIGHTEN UP. IN BED ALL DAY. HEADACHE AND DIZZY. 4/17- FEELING ALITTLE BETTER DURING DAY- EXHAUSTED. 4/18- WOKE UP AT 1:00ISH WITH EXTREME MIGRAINE, HEAD FELT LIKE GOING TO EXPLODE, VOMITTING. * THIS WAS WHEN I BECAME CONCERNED* USED ICE PACKS ON HEAD. WAS IN FRONT LEFT EYE, AND DOWN THAT SIDE OF HEAD , INTO MY NECK. 4/18 - MIGRAINE GONE BY 7AM, HEADACHE ALL DAY- EXHAUSTED 4/19 - SLIGHT HEADACHE THAT WONT GO AWAY- EXTREM FATIGUE 4/20- SLIGHT HEADACHE STILL STARTING TO FEEL BETTER 4/21- SLIGHT HEADACHE BUT FEELING MUCH BETTER NOTE- HAD COVID MARCH OF 2020 EXTREMELY BAD. DOCTOR AT CLINIC WHERE I RECEIVED VACCINE ADVISED WOULD GET VERY SICK FROM VACCINE. ALL SYMPTOMS WERE EXTREMELY BAD - HOWEVER MY CONCERN IS THE MIGRAINE AND HOW BAD IT WAS AND STILL HAVE LINGERING HEADACHE. MY QUESTION IS SHOULD I RECEIVE 2ND SHOT?
1237205	4/21/2021	MA	60	M	4/18/2021	4/20/2021	Because pt was uncomfortable he did not use his CPAP machine. 45 hours after second dose was administered my husband was sitting up in bed eating breakfast, He tilted his head back to swallow his his escitalopram and baby aspirin, sipped his coffee chewed and swallowed. He then went speechless and began staring off to his left. He lost consciousness. His chin stretched out to the left and his head rolled back as did his eyes. Eyelids remained open. His head and upper body began to tremble and seemed stiff though his hands remained down by his side. Time slows when in such an emotional situation but I think the complete event lasted about 35 real seconds. I wonder if his temperature being elevated a couple of degrees and with his absolute lymphocytes on the rise if his strong immune response revealed a family predisposition to dystonia?

1237108	4/21/2021	VA	66	M	3/6/2021	3/9/2021	3 days after receiving injection i lost my sense of smell and taste. no fever or chest congestion. taste and smell returned i 5 days 03/19/2021 woke up with vision loss i left eye. eye care assoc. diagnosis is NAION, optic neuropathy due to lack of blood flow to optic nerve damaged.
1237067	4/21/2021	IN	53	F	4/1/2021	4/8/2021	I first tasted a metallic taste, and then about a week later, had swelling not directly under my eyes, but right where the cheekbones are located. At first i tried allergy medicine, thinking it was allergies, but that did not work. After thinking about it, I realized it must have been a reaction to the shot. It is like someone cut open the area and poured 2 tablespoons of water in the area and stitched it back up. Also, the day the swelling started, i got a severe headache and it lasted for four days. The headache is gone, the metallic taste is gone, but the swelling is still there and i am extremely thirsty all of the time.

1237222	4/21/2021	FL	45	M	4/14/2021	4/18/2021	Noticed a quarter sized yellowish green spot on my abdomen and then on Tuesday 4/20/2021 I had a vision incident where I saw images of lines in the fire ground that lasted about 1 minute
1236995	4/21/2021	MD	28	M	4/6/2021	4/6/2021	Pt felt light headed and experienced slight vision loss within minutes after receiving the second dose of the Moderna vaccine. Pt assessed by EMT and recovered without intervention.
1237028	4/21/2021	DE	30	M	4/9/2021	4/20/2021	Woke up with double vision and pain behind left eye. No vision loss, but left eye was lazy. Pain behind left eye got worse over next 8 hours, but left eye regained alignment slowly over the same 8 hours. Referred to hospital for MRI and diagnosis. Awaiting results as of April 21st.
1236970	4/21/2021	OH	55	F	4/21/2021	4/21/2021	Pt stated after her first Pfizer dose she did not have any adverse reactions that she could remember. Pt. was feeling normal prior to vaccination and stated she had a granola bar and some water for breakfast. Pt was sitting in chair when she alerted technicians about her symptoms. Pt. then stated she began to feel dizzy and lightheaded while sitting in the chair. When asked, pt. said her vision was clear and normal. Pt. has Hx of DM type II, HTN, seasonal allergies and asthma. We assisted pt. to floor in semi fowlers position with a pillow behind her head in position of comfort. I asked pt. if anyone was with her and she stated someone had dropped her off, but was alone currently. Pt. was alert and oriented to person, place and time. I asked if she would like us to call the squad and she responded yes. We called emergency personnel. Pt. was warm to touch, but was complaining of chills. Pulse was 88 bpm, respirations 14. Per pt. she has an allergy to lisinopril and is currently taking several prescription medications, but could not recall any names. Pt. began to notice some wheezing and I asked if she had an inhaler for her asthma. She self-administered 2 puffs of Ventolin which helped with her breathing symptoms. EMS arrived on scene and a brief Hx was given to the squad. EMS took vitals and loaded pt. on cot and transported to Hospital.

1236962	4/21/2021	WI	67	F	4/20/2021	4/20/2021	Patient called to report that a few hours after receiving COVID vaccine she experienced tingling then numbness in the area of her eye. She reports she took benadryl last night and the problem has mostly resolved however she does have some residual tenderness in that area.
1236955	4/21/2021	FL	32	M	3/31/2021	4/18/2021	This is a comprehensive neurological evaluation for a very pleasant right handed 32 year old gentleman who denies any past medical history who presents to the hospital with several day progressive visual changes and facial weakness. Patient reports he noted on Saturday that he had somewhat of a headache, he does get headaches from time to time in particular while looking at screens the television, he did have some associated blurring of his vision as well. This was not the worst headache of his life. He had no other associated symptoms. He went to bed on Saturday, he awoke on Sunday and went out to eat and noted that he couldn't form his mouth around the utensil, his face and lips and mouth felt weak. He still did have an intermittent headache and perhaps some neck pain as well at this point. His vision was still blurry. He denies any recent trauma, no car accident no whiplash no falls. He did go to an outside facility where a CT brain was performed and was normal he was told. He has noted yesterday that he could not close his eyes unless he did it manually, also he notes the way his voice sounds is different to him. He has not appreciated any weakness of his arms or legs. He is able to lift up his head off the bed without trouble. He does not think he has a hard time swallowing or breathing per se however he does describe that he is more "aware" of his breathing. He describes paresthesias of his face and around his mouth. No recent URI or diarrheal/GI illness, he did receive the Johnson & Johnson COVID -19 vaccine March 31st. Seen and evaluated in the ED with ed staff. He does report he recently ran a virtual type marathon over the course of 16 days. Clinical context and exam most consistent with that of GBS type variant (?Miller Fisher). Treated with IVIG. Symptoms improved after 1 dose. 4 more doses pending.

1237803	4/21/2021	CA	31	F	4/8/2021	4/17/2021	Presented to ED 4/18 with severe L sided chest pain since 4/17. Arm weakness and numbness 4/18 that lasted a few hours but resolved. No vision changes. O2 sat was 100% on room air. Diagnosed with PE. No recent mobilization. Does not smoke or use illicit drugs. Was admitted to the hospital telemetry unit 4/18-4/20. Discharged on apixaban. I do not have any information on the vaccine Lot number received.
1238947	4/21/2021	CA	18	F	4/21/2001	4/21/2001	At 2:58 pm, Pt. reported feeling light headed and her vision getting blurred. Pt was alert and oriented X4, BP=137/82, hHR=88, RR=22. Pt. was laid on a flat surface, legs were raised, cold ice pack applied at the back of the neck, slow deep breaths were encouraged and performed. at 3:02 pt reported symptoms had subsided, pt. was offer room temperature water and observed further for 20 minutes. At 3:39 pt. was d/c home in a stable state with mom.
1236953	4/21/2021	PA	38	F	4/9/2021	4/15/2021	Moderna Covid-19 Vaccine EUA Rash on arm at vaccination site, legs and back began on 4/15/21 (vaccine date was 4/9/21). Rash was mildly itchy but symptoms were controlled with Benadryl. Did not seek care of doctor after internet search indicated rash at vaccine site and other locations on body was verified side effect. Visual hallucinations began on 4/17/21 (vaccine date was 4/9/21). These hallucinations have been sporadic- occurring approximately 3 to 4 times daily. Primary visual hallucination is seeing what appears to be an animal (something with 4 legs roughly the height of a small dog or cat) or a human roughly my height (around 5'4) walking towards me- usually on my left side. This report is being submitted on 4/21/21 and I am still experiencing visual hallucinations to date. Did not seek care of doctor. I do receive mental health medication management services; however, my diagnosis is completely unrelated to any psychosis and I have never before experienced visual hallucinations.
1236934	4/21/2021	IN	57	F	4/19/2021	4/19/2021	Had shot at 10:00 am. Came back home, took a nap. Woke up around 2:00 pm to itching in my ears, nose, eyes, mouth and throat and arm pits. Lasted till about 1:00 am.

1237019	4/21/2021	FL	57	F	4/19/2021	4/20/2021	Just after 3:00 am, I was very nauseous, vomiting repeatedly while every bone and muscle ached severely. My stomach muscles went into spasms and my head felt like what i imagine a migraine feels like. The pain behind my left eye was severe. My left side of neck felt like there was a knot and it took all my strength to try to massage it felt like no blood was moving. Strangest feeling I have ever had. Went from chills to sweats every 3-4 minute cycles. Did not feel like I had a fever though. I am O - blood type if that matters. Day 2 all but body aches are gone.
1237503	4/21/2021		53	F	2/13/2021	2/27/2021	Headaches, eye pain, dizziness 2 weeks after vaccination. Late uveitis seen about 2 months after.
1237710	4/21/2021		24	F	4/21/2021	4/21/2021	Patient denied symptoms during 15-minute required observation period. When she got up from chair to pick up vaccination card, endorsed near-syncope and bilateral lower extremity weakness like "she felt she was walking in sand." Denies visual symptoms, oral swelling, dyspnea, pruritis, nausea. Patient sat back down and was attended to. She was noticeably nervous (hand/leg shaking). SpO2 99%, HR 62. Patient endorses history of anxiety that is treated with beta blocker. Patient felt back to her baseline after approximately 15 additional minutes of rest and sipping on water. Trial of ambulation at that time with complete resolution of symptoms. She was cleared to return to work with return precautions.
1237645	4/21/2021	GA	41	M	4/21/2021	4/21/2021	patient reported he has previously fainted immediately following vaccine. His wife brought an ice pack and water. After vaccination i sat with pt a few minutes to make sure he was feeling well and ready to move to a chair in front of the pharmacy to sit for 30 minutes and make sure he is feeling well. I notified my manager that pt in front has fainted before and he kept a close eye on him. I was administering shot to the next pt and heard a sound. I left vaccination booth and saw pt on the ground. I placed his legs/feet in front of him and his wife held his head and ice pack. Our pt reported that he did not hit or hurt his head and did not need other assistance. we monitored the patient an additional 20 minutes and he was feeling well, vital signs good and accompanied by his wife.

1237307	4/21/2021	FL	85	F	4/20/2021	4/20/2021	This was 2nd dose of Moderna COVID 19 vaccine, patient didn't get any reaction after 1st dose. Patient was very conscious and in a good shape after 2nd dose too. However, while patient was under observation after the second dose almost 7 min. after the dose, pt started to fall from their chair to the floor while they were conscious as they put their hands front of them to touch the floor first. I stepped quickly on the floor to check the pt, cleared the air pathways, took their mask out, put them on their side, supported their head and was watching their vitals and called 911. Patient had a good pulse and breathing, they were conscious but their were closing their eye 1st for 2-3 minutes after falling on the floor. Then they opened their eyes and were moving their head to answer my question and check. Paramedic came within 5-7 minutes of the call while patient was in a better shape and we learned from the patient and the patient's son that pt didn't take any food since the day before the vaccine. Paramedic did their check on the pt and asked to take the pt with them to do more check, however pt said they feel far better and didn't want to go with the paramedic.
1237318	4/21/2021	NY	83	F	2/10/2021	4/12/2021	I awoke at 6 am with an extremely painful headache in my left temple on Monday, April 12, subsequently diagnosed by my GP,, Dr. , as shingles, It affects the whole left side of my face, including my eye. An article in the NY Post on Tuesday, April 20 lists shingles as a possible side effect of the Pfizer vaccine, with about 6 recent cases in the NY area. I am reporting with the hope that more information will be published about this so that anyone experiencing this will see their doctor immediately when antiviral medication is more effective. I will notify Dr. that I have reported to you.

1232779	4/20/2021	AZ	78	F	4/12/2021	4/12/2021	I got Bells Palsy within 15 minutes of getting the vaccine. I noticed that my cheek was going numb, and my eye was drooping. I stayed at the facility for 30 minutes. On the way home I couldn?t close my eye. I have had Bell?s Palsy in 2015 and I had mostly recovered with some residual effects to my eye and my mouth was a little droopy. It effects my eyelid, my mouth and the side of my face. Today my cheek was more numb even though my eye seemed to be getting better. The new effects are on the right side of my face in the same area as they were before. It has been eight days since my vaccination.

1232781	4/20/2021	MI	18	F	4/20/2021	4/20/2021	The 12:20 pm appointment today (4/20/21) had an adverse reaction to the IMZ. Patient was done receiving the vaccine at about 12:30 pm and I stated she would have to wait until 12:45 pm. Around 12:38 pm I noticed she looked a little pale and went to her side to check on her. The patient stated she was feeling light-headed, dizzy, nauseous, and had trouble with her vision. I had the patient lay down and elevate her feet. The technician also grabbed an ice pack to place behind her neck. Asked if she would like water. The patient then stated she was having trouble breathing/short of breath and her ears were ringing. Once the patient stated issues with breathing 911 was called. A code white had been called and management was in the pharmacy. The 911 operator continued to ask questions about the patient's status and stated to not give any water or medications. I continued to assess the patient's symptoms. Her vision improved; however, she continued to feel light-headed, nauseous, and having trouble breathing. A member of EMS was in the store and came over to assess the patient. He had the patient sit up but she continued to have the same symptoms. He assessed her IMZ site. She was not feeling itchy and had not developed any hives. The ambulance arrived. EMS evaluated the patient and then took her out of the store on the stretcher.
1232785	4/20/2021	IN	47	F	4/13/2021	4/14/2021	My arm was sore a couple days. Felt tired Wednesday, then Thursday, Friday and Saturday I felt exhausted. My muscles and joints hurt. On Saturday I had a little headache and the skin right below my eyes was red and felt like it was burning a little.

1232894	4/20/2021	CA	62	F	4/20/2021	4/20/2021	Client received the 1st COVID vaccine of Pfizer (lot # EW0171 and expiration date 4/25/21) at approximately 2:16pm . Client reported to EMT that as she was leaving the waiting room and "stood up she felt dizzy." Client was alert and oriented X 4 and sitting in a chair near EMT station when Nurse arrived. At 2:31PM vitals were oxygen:96%, blood pressure:132/88 and pulse:88. Transfer client to gravity chair. Client reports blurred vision, a slight headache and tingling in her right arm although she received the shot in her left arm. At 2:36 pm vitals were oxygen:96%, blood pressure:134/88 and pulse:91. At this time client reports dizziness is subsiding, arm tingling has resolved but now she is getting tingling in her left leg, sensation and movement intact. Client reports feeling weak and that her left wrist is also tingling. Offer client water. At 2:41PM oxygen:97%, blood pressure:136/86 and pulse:88. Client reports tingling in lower left leg and by left thumb. At 2:46pm client reports right foot tingling on the top. At 2:51PM oxygen:96%, blood pressure:134/86 and pulse:88. Client reports dizziness has subsided and that the tingling in her left leg is coming and going but right foot tingling has resolved. At 3:01pm vitals were oxygen:96%, blood pressure:134/86 and pulse:85 and reports that tingling has improved. Client reports having a history of asthma and environmental allergies. Client takes montelukast (singulair), wixela, ventolin, proventil, loratadine, and vitamins. Client was provided ER precautions and to follow up with provider. Client left facility with a steady gait at 3:04PM.

1232880	4/20/2021		60	M	4/9/2021	4/9/2021	Pt came in on 4/9 for first dose pfizer. Reports that he visualized the vaccine oozing out of post injection. cleared by public health nurse to restart vaccination series per CDC guidelines. Vaccine administered in opposite arm of first injection on 4/16/2021.
1232858	4/20/2021	VA	45	F	4/20/2021	4/20/2021	Patient received their first dose of Moderna vaccine today. After about 7-8 minutes, the patient said she was starting to feel dizzy. The pharmacist escorted her into the immunization booth to sit and monitor her. She attempted to take the patient's blood pressure but the machine errored out on the first attempt. The patient was sweating so the pharmacist applied a cold compress to the patients neck and wrists. The patient said she was possibly seeing a couple of spots, but said that this was a common reaction when she is nervous. The pharmacist took the patient's blood pressure again and got a reading of 92/57. The patient stated that her blood pressure usually runs low, though. About 30 minutes after the vaccine the patient stated that her symptoms had all resolved. She was no longer dizzy, no visual disturbances, and no longer sweaty. Her husband drove her home shortly after that when the patient felt she was better.

1232680	4/20/2021		38	F	4/19/2021	4/19/2021	Patient with complaints of tickling feeling over body, and feeling a little warm. She stated her head felt heavy, then she remembered people talking around her. Patient hit the floor, and hit right side of head, no notable injury. Patient denies blurred vision, dizziness, nor nausea and vomiting, but states has a slight headache. Patient remained oriented during evaluation period, and was accompanied by her coworker. She stated that she consumed a protein shake this morning before coming to the event. Patient stated she also had a headache last night and consumed two Ibuprofen tablets before bed. 12:48 pm vitals- B/P 120/74, HR 54 R 20. At 1:05pm, patient stated she felt better, and denies nausea, blurred or double vision, vomiting, but remains with slight headache. This nurse advised that her friend drive home, and patient agreed. Patient transported to car per wheelchair.
1232674	4/20/2021	NY	28	F	4/15/2021	4/15/2021	After 20 minutes, the tongue started to swell and lips. An hour later I had some hives on my stomach. This continued for a couple of days. 5 days later my face, eyes, lips and tongue are swollen. Difficulty breathing at times.
1232895	4/20/2021	FL	40	F	4/7/2021	4/7/2021	I received my first dose of the Pfizer vaccine on April 7th. The same day that I received it my eyes turned red, blood shot. Specifically the left eye, and I had my shot in the left arm. I thought it was odd but after a day or so it went away. On 4/17 I went to the beach, and my eyes got almost sun burnt even while wearing sun glasses with a hat, under an umbrella. I go to the beach all the time and this has never happened before. I do not know if any of this is related to the vaccine and my symptoms are not drastic enough to warrant a trip to the doctor yet, however I felt that I should report this.

1231617	4/20/2021	WV	70	F	3/17/2021		<p>OPTIC NERVE DAMAGE; DIARRHEA; BRUISED ARM; TINGLY FACE; STOMACH CRAMPS; SHIVERING/CHILLS/FELT COLD; SORE ARM; WEAKNESS; NAUSEOUS RIGHT ON THE SPOT.; TIREDNESS; HEADACHE; FEVER; This spontaneous report received from a patient concerned a 70 year old female. The patient's height, and weight were not reported. The patient's concurrent conditions included minor low pressure glaucoma, blood pressure, mild asthma, augmentin allergy, non alcoholic, non-smoker, and pre-diabetic. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1805018, expiry: UNKNOWN) dose was not reported, administered on 17-MAR-2021 10:00 on left arm for prophylactic vaccination. No concomitant medications were reported. On 17-MAR-2021, Patient stated that the shot hurt so bad not like any other shot she had before, she felt nauseous right on the spot. When she went home, she felt tired, weak and had headache, stomach cramps and her face was tingly but not red. At around 9 or 10 PM, She felt cold, had shiver, diarrhea, chills, and a fever of 100.8 F max. Her arm felt sore and looked bruised so she took Tylenol. By 21-MAR-2021, she had minor symptoms but fever went away, her arm was sore and she had diarrhea. Her symptoms completely resolved by 25-MAR-2021. On 08-APR-2021, patient went to see her Ophthalmologist to follow up on her minor low pressure Glaucoma and Dr. told her she had an Optic Nerve Damage. Dr. told her that her eye pressure is 10 or 11 and it did not make sense that her pressure was low but she had an optic nerve damage. Ophthalmologist suggested that this could be because her oxygen level was low or she had sleep apnea but patient regularly checked her oxygen (always around 98) and did not had sleep apnea. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from diarrhea, bruised arm, tingly face, stomach cramps, shivering/chills/felt cold, sore arm, weakness, nauseous right on the spot, tiredness, headache, and fever on 25-MAR-2021, and the outcome of optic nerve damage was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: 20210421255-Covid-19 vaccine ad26.cov2.s-Optic Nerve Damage. This event(s) is considered not related. 							compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There are other factors more likely to be associated with the event(s) than the drug. Specifically: UNDERLYING DISEASE
1232584	4/20/2021	SC	55	F	4/20/2021	4/20/2021	Fast beating heart beat, shortness of breath, tingling in face, lips, arms and legs and feet. Instant Dry mouth with tongue discomfort. Blurry vision, instant headache. Feeling like a floating feeling, feeling dazed.
1233268	4/20/2021		71	F	3/4/2021	4/3/2021	photo sensitivity to left eye odd numbness/pain in cheek bone below left eye. Now blind in left eye with drooping eyelid.
1233259	4/20/2021	FL	53	F	2/1/2021	2/14/2021	First dose was administered on 1/22/21 (lot#EL3302) after which I began with hormonal fluctuations consistent with pre-menstrual symptoms (would be normal for someone 2 Yrs POST-menopausal) On 2/15/21, following my second dose on 2/12/21, I experienced the onset of what could only be described as menses, which, although extremely light, continued for 3 days. Coincidentally, on 2/19/21, I had an annual exam scheduled at which I mentioned this odd occurrence. I was advised that post menopausal bleeding is not normal and I needed follow up tests. I am relatively informed and explained that my experience was not random bleeding, it was truly a menstrual period with all symptoms relating to such, but decided to follow through with testing to be sure. I had an ultrasound performed on 2/25/21 which noted an endometrial stripe of 5mm (1mm wider than ?normal?) and a hysteroscopy was scheduled and performed on 4/9/21. Biopsies taken and visual inspection showed NO abnormalities whatsoever and my bleeding occurrence was considered idiopathic. In speaking with the physician, she refused to acknowledge that the Covid vaccine could have had anything to do with the event, but several others I know in healthcare have stated that there is a possible link and there is documentation to support.

1233206	4/20/2021	NM	61	F	4/15/2021	4/15/2021	<p>DAY ONE April 15, 2021. On Thursday April 15th at 10:00 a.m. I received the first dose of the Covid 19 vaccine. They gave me the shot in my left arm. Within about 5 seconds, I started feeling nauseated and light headed like I was going to pass out. I asked to just sit there for awhile because I did not feel stable to stand up and go to the waiting area. I stayed seated for about 1-2 more minutes then the paramedics took me to the Medical area in a wheelchair. The paramedics checked my vitals. My blood pressure was 135 over ?? I don't remember. I told the medic my BP is normally 98/58. She said my BP was elevated. My pulse was in the high 80's. My temperature was 98.6 and my oxygen was 100. I started getting pain and pressure going up the back of my neck, into my head, eyes and ears. It was very painful and throbbing pressure. I felt dizzy and really high. It felt like I was floating on the top of the ceiling and the people were off in a distance. I was really woozy. I then got diarrhea. The nausea continued but I did not throw up. At times my thinking was spacey, so I talked to the paramedic to help me stay grounded. I narrated what was happening in my body. They did a glucose finger prick test because of my spaceyness, but it was normal. It was like my whole system was freaking out. I was there and then not there, feeling like I was floating. These symptoms continued for about 90 minutes and getting worse. The paramedics offered me to go to the hospital, but I thought eventually I would be fine. I did not want to go to the hospital and have a huge medical bill. At around 90 minutes, I started having pain in my heart left side, under my left breast on my left shoulder. The paramedics did an EKG and did not find anything but some irregular heartbeats. The heart beats felt like BA BOOM, then my heart would do a cartwheel. BA BOOM and another cartwheel. At this time, my husband arrived and took me to the hospital emergency room because the pain in my heart was getting worse. I stayed in the hospital emergency room until around 5:00pm on April 15th. They did another EKG and some lab work and did not find anything but low thyroid. I continued to feel drunk, nauseated, pain pressure and throbbing in my head neck, ears and eyes, diarrhea, and like I was High and going to pass out. The chest pain in my heart was off and on. It felt like muscle cramping in my heart, under my left breast and the left shoulder. I</p>

---

also got a pain in my left groin area, then behind my left knee. It was a sharp and throbbing pain for about an hour in each location, but eventually went away. While in the Emergency room, they tried to give me Ativan. I asked what it was for and they said Anxiety. I said I wasn't anxious; I was just having a reaction to my first Covid 19 vaccine. I said I did not want it because my body was already struggling to handle the Covid 19 vaccine. They said the doctor prescribed it. I said I had not seen a doctor, and they said it is protocol. The nurse then came in and wanted to give me a shot for nausea and I said no, I don't want any more chemicals in my body, it is really having a hard time already with the Covid vaccine. I went home, was wiped out, still feeling drunk/woozy/high, also nauseated, diarrhea, very dizzy, had a hard time walking. The pain, throbbing in my head, neck, ears and eyes was still there. By this time, I could not find clear thoughts, and could not make sense of things. I was very agitated and at the same time exhausted and only wanted to sleep. DAY TWO April 16, 2021 I woke up with a smashing head ache, neck ache, back ache and general feeling like Crap. The nausea and diarrhea were still there and had woken me in the middle of the night. I felt like a truck had hit me. I stayed in bed all day and tried to eat and drink as much as I could. I drank a lot of water that day. I felt horrible, but was able to stand without feeling like I was going to fall over. Had trouble finding clear thoughts at times. Still felt out of it and had chest pain off and on. Also had the BA BOOM heart beats and cartwheels in my heart. DAY THREE April 17, 2021 Very similar to day two. I felt weak, nauseated, diarrhea, pain all over, jittery, not able to have clear thoughts at times. It felt like my body was still on RED ALERT!!! I also had very shallow breathing on day 2, 3, 4 and 5. It tired me and I panted just getting up to go to the restroom. I am able to eat fine and keep food down. BA BOOM hear beats and cartwheels in my heart have lessened. DAY FOUR April 18, 2021 I felt a little better and made the mistake of thinking I was getting over the reactions and did too much. Shortness of breath. DAY FIVE April 19, 2021 I feel horrible again, Nausea is really strong as well as the diarrhea. I am feverish, sweaty and shaky. Shortness of Breath. Tight in my chest. I just took my temperature and it is normal, although I am hot, sweaty, feel feverish and shaky. I am

1233134	4/20/2021	FL	59	F	3/25/2021	3/26/2021	Client received Dose 1 of Pfizer Covid Vaccine Lot # EN6200 on 3/25/2021 as well as Pfizer Dose 2 Lot # ER 8732 on 4/15/2021. Client stated had mild eyelid swelling after both dose 1 and dose 2, but did not keep a journal of the exact days the swelling occurred. Client stated was unsure whether to report the reaction as she gets the same swelling after taking various medications. She stated she has been tested for allergies and does not have any. She reported the eyelid swelling was mild and came and went the weeks following the first dose of vaccine. She also had some swelling after the second but nothing that would keep her from getting future doses of the vaccine if they become necessary.
1232943	4/20/2021	RI	30	M	4/10/2021	4/19/2021	I observed a tiny red spot on left side of my scrotum which grew into hard mass which visually appear more like a tumor than a pimple. It does not pain on touching but I am afraid to check tenderness by pressing. I have recently moved to the area so I do not have a PCP. Is this something due to vaccine that I need to get checked in emergency?
1233124	4/20/2021	MA	55	F	4/13/2021	4/13/2021	I HAD CONTRACTED COVID-19 MID- DECEMBER 2020. Recovered from COVID, all of it's side effects, and COVID-related pneumonia by February 2021. My 1st injection took place at about 9:20am. Approximately 10 minutes later I had the 'FEELING' of my tongue swelling (although no physical sign of swelling), and I became quite light-headed/swimmy. This lasted a couple of hours, then went away. All was well until the next morning around 9:00am. I began to have flu-like symptoms including severe body aches, headache, chest tightness. As well my complexion became gray, and eyes glassy (according to those at work). By noon time I was sent home. These symptoms persisted until the next morning. I woke up feel almost normal again. Seems the whole course took place in about 36 hours or so.

1233122	4/20/2021	GA	37	F	4/8/2021	4/12/2021	Monday, 4/12 - Had first-ever (in my life) nosebleed; painful shingles rash emerged on right shoulder blade Tuesday, 4/13 - Had second-ever nosebleed; shingles rash painful + itchy Thursday, 4/15 - Went to urgent care thinking that shingles rash was spider bite; urgent care doc visually examined and confirmed it was shingles, prescribed Valtrex; went to primary care doc who confirmed shingles and took blood to test platelets Friday, 4/16 - Blood test confirmed platelets are normal Saturday, 4/17 - Had third nosebleed
1233118	4/20/2021	WI	48	F	4/14/2021	4/16/2021	Right Bell's palsy: unable to raise eyebrow, difficulty closing eyelid; unable to smile.
1233107	4/20/2021	NC	53	F	4/5/2021	4/5/2021	She got the vaccine, within the first night she woke up around 9:00 to 10:00 as she felt more fatigued. She had pulsing ringing (already has tinnitus), really loud ringing. Her skin was really hot (sunburn hot), tongue was sore, her eyes hurt (tissue burning sensation) feeling. Heft left arm was extremely painful, but went away. The headache all through the front, part of her forehead, eyes, head, and took 2 Tylenol. About 3 days after that her right wrist started hurting, throbbing pain. She has never had any joint pains. She has been taking Turmeric, the right wrist is still hurting. She did have body aches, throat, and all symptoms, felt like she had a flue/cold. She is completely dizzy, disoriented and not able to use her phone. She is not able to regain her balance at this point. The lingering effects are she cannot read, she always feels like she has been lost in space. The pain is improving, but is still present. When she looks down the dizziness is a lot worse. She has pushed back the 2nd vaccine. She has called her doctor and reported this who told her to call us. She took Claritin and it stopped a lot of the symptoms.

1233089	4/20/2021	SC	51	F	4/19/2021	4/20/2021	I received the second vaccine at approximately 10:45am on 4/19/21 at pharmacy; later that afternoon a very bad migraine started to develop, which I did not take medication for as I want to ensure nothing would interfere with the vaccination doing its job. The pain of said migraine has traveled to different locations in my head between 4/19 through the morning of 4/21 - from the base of the back of the head and neck area to the top/left of the skull and over left eye area. On 4/20/21 at 10:05am, I developed a very unpleasant ringing in both ears that I am very concerned about as it is exacerbating the migraine and is extremely painful.
1233055	4/20/2021	NY	62	F	4/8/2021	4/11/2021	I had the initial body ache that's been associated with the second vaccine injection, it disappeared after 36 hours, followed by excruciating pain in my right jaw, the lymph node behind my right ear shooting into my right temple. Within a day my right eye was involved. After 2 misdiagnoses, and increased pain and emerging blisters, it was determined that I had shingles (4/18/2021)
1233048	4/20/2021		61	F	4/18/2021	4/18/2021	strong headache focused behind eyes, moderate body aches and chills and fatigue, minor dizziness and nausea, slight cough. All beginning at around 6 pm (9 hours after shot) and ending around 5 pm the next day. Fatigue continues.
1233046	4/20/2021	TX	33	F	4/8/2021	4/9/2021	Initial onset of bilateral lower extremity paresthesias and nausea/vomiting on 4/9/21, lasting 2 days and 1 day respectively. Improvement then noted with return of right lateral leg paresthesia on 4/18/21. No treatment attempts made by patient. Mild right lower leg symptoms persist. No headache, vision changes, abdominal pain, petechiae or bleeding reported.
1233033	4/20/2021	OR	43	F	2/19/2021	2/19/2021	Intense severe flushing and swelling of face; face turned a deep purple hue and white rings around eyes and nose and mouth. Searing stinging pain in face with flushing. Lasted 6 hours. Severe tinnitus within 24 hrs, has continued and not abated. Disruption of menstrual cycle, delayed period by 10 days, spotting and stop in period cycle and starting again .

1233029	4/20/2021		39	F	4/8/2021	4/8/2021	Within 40 minutes approximately of getting the vaccine, my face became numb at the tip of my nose and the area above my upper lip. By one and a half hours later after the vaccine, the numbness had expanded from right below my eyes down to my jawline. This numbness lasted a few hours and by the following morning, the numbness had returned to just my nose and area above my upper lip. This numbness lasted about an extra day. Nausea lasted 15 minutes beginning approximately 40 minutes after getting the vaccine. Lightheaded and feeling somewhat disoriented began about 40 minutes after getting the vaccine and lasted two days. While I received the injection in my left arm, my right arm was actually sore, which started within a couple of hours after getting the vaccine and lasted about three days. Severe muscle aches beginning from my waist down to my ankles, which began about four days after getting the vaccine and lasted about three days total. No muscle aches above my waist was experienced. Soreness in my left arm at injection site as well as itchiness was observed about 8 days later. All side effects fully subsided about 9 days after the injection.

1233169	4/20/2021	KY	82	M	2/5/2021	2/8/2021	Per letter received from patient and phone interview, patient has long history of severe Glaucoma. Patient reports being blind in right eye for many years. Doctors have treated the left eye successfully with medications since the age of 35 to prevent blindness of the left eye. Patient reports pressure in left eye has been well controlled with 4 different Glaucoma eye drops daily. Pressure in the left eye has been maintained at 10 and 12. Patient states his vision was stable until second Moderna vaccination on 02/05/2021. Within a few days, the patient noticed change in his vision. After 1.5 weeks, patient reached out to doctor. Patient was seen by Dr. on 2/24/21 and found left eye pressure had increased to 30. Patient was immediately referred to a Glaucoma Specialist. That same day, about 4-5 hours later, he noted the pressure had increased to 40. Dr. agreed to perform shunt surgery, and did so on 3/10/21. Initially this reduced the pressure to 8. During the next week or 2, it increased to 11. During the patient's most recent follow up visit, the pressure was at 15. At that point, Dr. decided to remove a suture to reduce the pressure more. Patient reports vision has only slightly improved since this all began. Next follow up appt is on 4/28/21. Patient states in his opinion, he has sustained significant vision impairment as a result of the second Moderna vaccine.

1231450	4/20/2021	CA	74	F	2/24/2021	4/19/2021	Patient last vaccine 02/24/21. Received Juvederm treatment 04/12/2021 for facial wrinkling, dermatologist . Developed eye pain/ eye sensitivity (without visible conjunctivitis by husband reported who is MD) approximately 04/05/2021. Patient used Visine eye drops for irritated eyes. On 04/19/2021 developed redness and swelling nose bridge and forehead, went to see (dermatologist) thinking this to be from the Juvederm injections. In office diagnosed herpes/shingles, in meantime a pustule/herpetic lesion developed on forehead (picture available). Patient contacted Kaiser and went to Urgent Care, seen referred to dermatology prescribed Valtrex. see page 2Dermatology and seen: diagnosed with varicella zoster . Also referred to Ophthalmology and seen, diagnosed with Right Herpes Zoster Conjunctivitis. Prescribed Valtrex PO and Erythromycin opht ointment. Of concern is that patient received Zoster vaccine in 2009 (?Zostavax, and one dose Shingrix 2018. Has to her knowledge never had shingles or zoster. There is no other underlying morbidity specifically no autoimmune conditions such as rheumatoid arthritis or Sjogren disease. No known contact with persons with shingles or herpes zoster. The concern is development of zoster and herpetic conjunctivitis after recent COVID vaccination and Juvederm treatment, while having been vaccinated with Zoster vaccine and Shingrix, without known previous or apparent underlying autoimmune conditions.

1232469	4/20/2021	OH	20	M	4/15/2021	4/15/2021	Student passed out sitting in chair a few minutes after receiving the vaccine. This was witnessed and medical care was at student side immediately. SPO2-94% HR-80. 2:41p Student opened eyes spoke then passed out again while in chair. Student was lowered to ground x3 assist and legs elevated on chair BP-120/78, SpO2-96%, HR-57 cold and diaphoretic. 2:48p BP-100/72, HR-80, SpO2-99% student alert and talking legs repositioned on floor without issues. 3p assisted to standing position x2 assist then to chair. 3:10p ambulated with standby assist without issues. Vitals checked every 5-10 mins and remained stable. Student admitted to having similar episode in Summer 2019 with blood draw. Student had little to drink and nothing to eat this day. 3:15p Student?s roommate arrived to walk home with student. Encourage student to eat and drink plenty of fluids for remaining day and ensure that he eats and drinks fluids prior to 2nd vaccine dose. 3:30p Student was cleared by PA to leave at his convenience.
1232460	4/20/2021	IA	51	F	3/18/2021	3/19/2021	The day after shot was give (3/19/21) the client experienced a headache, sore throat. Then on Saturday she was achy and very tired. Then on Monday (3/22) she called her Dr and they said this was a normal side effect from getting the vaccine. Then on Tuesday (3/23) she got a large rash on her hands, feet, face and neck. Her eyelids were a purple color, she felt very weak and tired; she said her blood sugars were in the 400 range also. She then went to the Dr office on Thursday (3/25) that week and Dr checked blood work and told her it was an allergic reaction to the vaccine and that she shouldn't get the second one. He put her on Benadryl and steroid. She felt better 2 days later.

1232427	4/20/2021	FL	34	F	4/14/2021	4/14/2021	She got her vaccine, initially she had bruising on her forearm that was blue/yellow with a swollen vein connected running down to her hand. She had tingling and numbness in her fingers in a select few on the left hand. She also had drooping of her left eye for a short period and a sensation on her left leg, swelling and pain. She went to the urgent care on 4/15/21, they told her to go home and monitor it. She knew that somewhat was not right and called a nurse at Hospital and went to the ER shortly thereafter and confirmed that she had a blood clot in her jugular vein IJ-DVT. In the ER they gave her a shot of Lovenox in the ER into her stomach and run several tests. They also gave her an anti-inflammatory in her right arm. She was sent home with Eliquis for the next 3 months. She has extreme exhaustion, and in addition to that she has had a lot of swelling on the left side of her leg, and visited the ER again on 4/17/21. Her left foot became blue, very swollen, so they ran a number of tests which all came back negative. She thinks these are side effects in relation to the previous. She is still continuing with stiffness in her neck as well. She also has a severe headache, fever of about 100, and severe achiness. She has not been able to work due to these symptoms since 4/15/21. The ER told her to have a lot of rest, no heavy listing/straining due to the clot.
1232381	4/20/2021	FL	71	M	2/11/2021	4/18/2021	I developed facial stroke like symptoms starting on 4/16/2021 with a metallic taste in my mouth. On 4/18/2021 I noticed some difficulty eating experiencing some mouth numbness. The right side of my face was drooping and right eye would not close completely. I went to the Hospital Emergency Room mid day on the 18th. I was examined and after some tests it was determined that I was not experiencing a stroke, but Bell's Palsy. This was determined by the tests outlined below. I was admitted overnight for observation and discharged the next day. I have no idea if this is related to my Covid vaccination but report this only out of an abundance of caution.

1232355	4/20/2021	NH	35	F	4/17/2021	4/17/2021	<p>First vaccine was administered on 3/27/2021 in my left arm lot # EP6955. I experienced a sore arm and fatigue. On 4/4/2021 I began feeling ill with full body aches, fever (between 101-103), chills, sweating, sore throat, mild headache. On 4/5/2021 I wested tested for COVID 19, Flu A&amp;B, and Strep throat. I tested positive for both Strep throat an COVID 19. I was given azithromycin for the strep and took Tylenol to lower the fever. My symptoms lasted till 4/8/2021. After that I was just very fatigued and nausea came and went. under the strong recommendation of my PCP, I then received my second dose of the Pfizer vaccine on 4/17/2021. Approximately 8 hours after the vaccine I suddenly felt ill. I was dizzy, nauseous and felt like I was going to faint. I experienced chills and was shaking uncontrollably for approximately 30 minutes. I vomited once, took Tylenol and went to bed. Throughout the night I felt mild chills, body aches and moderate nausea. I got up at 7am on 4/18/2021 with had a migraine headache (a sharp pain behind my life eye that went straight through to the base of my skull. I spent the day taking Tylenol and relaxing on the couch. At approximately 6pm I began itching. a few little dots showed up on my neck and leg. An hour later my legs, arms and neck had many very itchy red spots. I took a Benedryl and went to bed at 8pm. I woke up at 2am 4/19/2021 completely covered with itchy red spots (arms, legs, torso, neck, genitals, scalp, butt, face). I took more Benadryl and went back to sleep. The rash was extremely itchy and seemed to keep spreading. I went to my PCP at 8:45am and she prescribed Prednisone. Throughout the day the rash continued itch and my left eye, both ears, bottom lip, and knees began to swell. I spoke with a nurse over the phone who said to continue with the prednisone and Benadryl. On 4/20/2021, I woke up and the rash is not as pronounced or as itchy but still visible and still pretty itchy. Both my lips, left eye and both ears are still very swollen.</p>

1232303	4/20/2021	WA	27	F	4/8/2021	4/12/2021	Day after shot, I experienced flu-like symptoms. I experienced a high fever and body aches. On the 13th of April, I began to experience severe dizziness, vertigo, and blurred vision. I have been experiencing this everyday since the 13th of April. I was submitted to the hospital on April 16th due to severe dizziness and blurred vision. The diagnosis was BPPV (benign paroxysmal positional vertigo) and I received 0.9% NaCl (NS) and Meclizine (Antivert). I am still experiencing severe dizziness and vertigo.

1232017	4/20/2021	MN	20	M	4/20/2021	4/20/2021	Patient was given dose 1 of the vaccine and instructed to wait at least 15 minutes in the chairs in front of the RPH for observation. He waived at us and sat down. We asked if he was ok and he waived again stating he didn't feel well. He sat back down and we proceeded to check on him. As we were coming to check on him, he fainted and fell face forward on to the floor. We called 911 and rolled him gently to his back. He had a laceration above his eye from the fall. EMT came and assessed the patient. After observation, he was allowed to be picked up from his friend and taken to a clinic for stitches.

1232248	4/20/2021	UT	68	F	3/9/2021	3/11/2021	A few days after my shot I started feeling very tired and groggy. My head was dizzy most of the day. Five days after the vaccination I started to go into a sweat if I exerted myself too much. I continued to have a dizzy head and my stamina was greatly reduced. I used to ride my exercise bike for 90 -150 minutes a day but after the vaccine I could only go 20 minutes the first week and then I got progressively weaker and more dizzy. I could barely walk a half block. I also experienced some shortness of breath and a racing heart at times. The third week out was the worse. I could hardly care for myself. I started to get a lot of pain behind my eyes and other sinus pressure. Also the lymph gland under my ear was swollen and painful. I was extremely tired for a couple of days at that point but have found it hard to sleep on most other nights. I have strange dreams that are almost like an hallucination. I also have head aches but they seem to have improved as the weeks have gone by, especially since I have been taking Aleve every day. I am unable to exercise and have very little energy still. The dizzy head continues to persist even 6 weeks out. I had this same kind of dizzy head in August when I had Covid but it went away in a week or two. I get dizzy just reading a book or looking at my piano music also. Having had Covid twice I am very confident that these symptoms were caused by this vaccination. It also seemed to make my blood sugar more volatile. The sad thing is that I was feeling perfectly normal when I went in! I am devastated by these symptoms and they have completely altered my life. I am so discouraged that they never go away. Some days I feel like I am improving and then they pop up again. I was a very active person and now I can hardly do anything. I think I got the shot too close to when I had covid and that it has triggered an immune response that is overwhelming my body. Will it ever get better? I can't stand to go on like this!

1232062	4/20/2021	MT	37	M	4/20/2021	4/20/2021	About 5 min after vaccination, the patient was leaning back in his chair with his eyes closed while in the waiting room after his vaccination. I approached him and asked if he was alright and gently tapped his shoulder. He did not respond. I spoke louder, he did not respond. I shook his shoulder and spoke very loudly, he opened his eyes and rolled his head around and told me that he felt really dizzy. His skin was warm and he was sweating. He reported that he was breathing fine, that he just felt dizzy and hot. Over the next 5 minutes his dizziness decreased. He reported that the site of vaccination felt numb. Vaccination site did not show any redness or signs of local reaction. He reported that he was still breathing fine. His dizziness continued to decrease, and 25 minutes after the vaccine he reported that he did not feel dizzy anymore. He asked for some water, which I gave him. He stayed sitting in the chair until an hour after the vaccine. He got up and walked around and reported feeling no more dizziness and that he felt fine driving home.

1232204	4/20/2021	NJ	28	F	3/6/2021	3/11/2021	I received the shot on Saturday, March 6th. Flu-like symptoms developed 12 hours after (aches, chills, extreme fatigue) and lasted about 12 hours -- pain in left arm lasted a full five days. On Thursday March 11th I started to develop a cold sore on my chin which was followed by malaise and swollen glands. I treated it with Zovirax. On Wednesday March 17th I developed what looked to be a pimple in the middle of my left eyelid. There was a small white/ fluid filled head about the size of a pin head. Over the next three days, three more fluid-like blisters the size of a pin-head began to develop on upper eyelid. By Tuesday March 23rd, I had over half a dozen fluid filled blisters that were painful and began to crust. The blisters extended from upper eyelid to below the brow (only on left side of face). On Tuesday March 23rd I went to the eye doctor. The eye doctor had asked if I ever had shingles (I have had the chicken pox vaccine, but never had chicken pox nor shingles). I have had HSV-1 since childhood and get the yearly cold-sore when stressed or immunity is low, but I never have had cold sores appear anywhere else other than lip/chin area. The doctor had suspected the eye blisters were a form of herpes and prescribed me 14 days of Valacyclovir. The blisters only affected the skin-- not the cornea or inside eye. Within a day and a half of the antivirals medication, the blisters were fully crusted over and started to clear up.

INFORMED PT THAT WE WILL REPORT THE INCIDENT.
1232122	4/20/2021	VA	50	M	4/1/2021	4/2/2021	Was flying on 2 Apr 21 at cruise about 1 hour into flight, experienced loss of color in vision, went from full color to red and gray, somewhat washed out, experienced lightheadedness and a bit of disorientation but not dizziness. Needed to use the bathroom and try to move to improve circulation and had to think about moving my body. I was not uncoordinated but my steps and balance were deliberate vs. unconscious and automatic. I was able to walk down the aisle to the lavatory without any problem but my vision did not immediately improve as I had hoped. I went into the lavatory and leaned against the side (I'm 6'4" and it was the rear lavatory on a 737). I was not dizzy and my lightheadedness began to clear up slowly as I urinated. The color was also coming back slowly as I finished up and walked back to my seat, again, I had to think about each step and my balance, although I was okay walking back. As soon as I sat down, I began sweating profusely. It lasted about two minutes or less, not long at all and I didn't get wet from the sweat. As suddenly as the sweat came, it went. My eyesight went back to normal and I felt nothing had happened. I am sure I was awake, aware and lucid the entire time, although it felt like what I imagine a psychedelic episode would be like (I've never used any form of hallucinogen, however). I was back to normal when I disembarked the aircraft, felt no adverse or lingering effects either. Nothing to report since.

1234129	4/20/2021	MD	63	M	4/15/2021	4/15/2021	Within 1 or 2 minutes after getting the vaccine I started to feel like the left side of my face was becoming flushed. Then I felt my face, and especially my lips, tingle; then I seemed to be having a neurological reaction--it was like the left side of my face was becoming numb. For the rest of the day, the left side of my face felt very different from the right-side. There was some pain around the temple. The next day, and even through today, 5 days later, the problem has been mainly around my eye. My eye often feels irritation when I blink and there is some muscular quivering of my lower eyelid. After speaking to my brother who is a radiologist he decided that it was unlikely to be an allergic reaction, and because the feeling of my face on the left side was reminiscent of the feeling I had a year ago when I had shingles around my left eye, he thought the reaction could very well be related to shingles. In other words, there was a activation of a response that resembled my shingles episode. This was bolstered by my speaking with my neighbor who also had the pfizer vaccine who said she had a very similar reaction affecting her face that lasted several days, and she,years before, had shingles on her face (as well as the shingles vaccine).
1234808	4/20/2021	TX	77	M	4/20/2021	4/20/2021	Patient became light headed and blacked out, did not know where he was. Indicated his right eye was red and swollen.

1234578	4/20/2021			U			<p>Patient was evaluated 4/14/21 during Doctors computer visit. I did not give her the vaccine and history is all as per her report and am not sure where exactly she received the vaccine. She noted having the Johnson and Johnson COVID-19 vaccine 3/13/21 in left shoulder. She noted having immediate lightheadedness and arm soreness at vaccine site by provider and was given water and stayed at vaccine site for an hour before going home. She noted nausea, diarrhea, and headache. She noted fever, chills, diaphoresis, abdominal pain, bodily shaking and progressive headache 3/13/21 and felt she has ?visual hallucinations and trouble speaking? transiently when at home later with husband. The headache pain did radiate down back and to all extremities but worse on right. She stated she did follow up with a chiropractor who Manipulated neck. She noted her right foot feeling more ?cold? than left and that since 3/13/21 she had dizziness with sensation she was ?falling to the right? since day of vaccine. She stated she did see a dentist on 3/17/21 and prescribed Amoxicillin x 10 days for suspected odontogenic infection for jaw pain that improved. She noted seeing her primary care doctor at an outpatient and was diagnosed with anxiety and had labs done (I did not have copy of results during visit over computer visit) and was prescribed alprazolam but did not take any. Severe headaches were persisting over this time since vaccine and unlike prior headaches and sense of imbalance was unusual for her and persistent from 3/13/21-4/14/21. Overall following the computer visit it was unclear what the cause of her symptoms was and was advised to go to the ER but declined and opted to attempt to follow up with her established neurologist the same day. Calls to this neurologist on that day were unsuccessful.</p>
1234575	4/20/2021	MN	24	F	4/20/2021	4/20/2021	slight blurred vision

1234557	4/20/2021	NJ	36	F	4/17/2021	4/17/2021	Immediately after the vaccine was given I felt a tingling feeling in my left fingers. Once I sat down for the 15 min evaluation I then felt tingling in left toes. at around the 10 min mark I had a wave of nausea and my hands got clammy. at around the 14 min. I had a burning sensation at the tip of my nose that lasted a minute or so. Right after was a burning numbness above my upper lip and then shortly after a numbness in both cheeks. I also then saw that my cheeks were flushed when I was able to look in a mirror. The flushed cheeks lasted over an hour as well as the numbness above my upper lip. at about 6 hours later felt a pressure between my eyes.
1234553	4/20/2021	PA	72	F	4/12/2021	4/18/2021	No reaction until the 6th day, Sunday. Expected reactions on Day 6: temperature 100.4, tiredness behind eyes, slightly achy body. Massive headache by Monday and ringing in ears. Took Naproxin and Mucinex Monday morning before going to work. At the end of the day I took Naproxin and Mucinex in order to sleep. By Tuesday I had chest congestion which has gotten only worse along with needle-like pain in the chest upon coughing. I spit up yellow phlegm, tiredness behind eyes returned, sneezing, choking on phlegm, and constant runny nose and ringing in ears. This has made working difficult, but not impossible. Please ignore if these are normal reactions. I'm just not sure.
1234551	4/20/2021	OH	37	F	4/12/2021	4/12/2021	First night from 11 pm to 6 am, 102 degree fever. Fever broke at 6 am. So tired i could not keep my eyes open. Slept that whole next day. 3rd day still extremely tired, pounding headache, stomach ache. By day 4 i felt better half way during the day. Pounding headache and extreme tiredness for 4 days.
1234881	4/20/2021	MO	57	F	3/21/2021	3/21/2021	Fever up to 101.8, runny nose, cough, covid headache, loss of taste and smell, tinnitus, eye socket pain, boxy aches, bone pain in femurs, nausea, diarrhea - the exact same symptoms I had when I had covid in December, and most had continued off and on for three months.

1234424	4/20/2021	CA	75	F	3/11/2021	3/23/2021	excessive swelling of bilateral neck lymph nodes with swelling of face so that vision was impaired. Exzema type blisters and welts covered my face and arms below elbows. This lasted with fluctuating intensity before finally abating on April 19. I took Benadryl and applied cortisone creme and used ice packs and other topical treatments.
1234420	4/20/2021	WV	56	M	3/17/2021	3/19/2021	I began to feel numb around my mouth and nose. It spread to most of my face, then chest, then arms, mainly left arm and leg, then to both legs. General weird feeling / numbness, no pain. I had trouble with limb control, not bad, but enough to notice. Mainly left side, but noticeable on both sides. From the onset on face numbness to the chest leg spread was just a matter of a few, maybe 5 minutes. I looked at my face in the car mirror, and appeared to have facial control. I was driving to a relatives house, and it worried me. On the way, I also noticed a lump in my right neck, about the size of a pea. When I got to my relatives house I told them I thought I had a small stroke, but wasn't sure. The numbness lasted until the next day, then slowly went away. It took about 2 days before the numb twitchy feeling went away from my left eye/upper cheek area. The lump in my neck also went away. rubbing on it actually made the numbness slightly go away. I did not go to a hospital, or seek any treatment. I think I should have. I do believe that I had a small stroke / blood clot, and that it should be reported. I think I am OK now,
1234221	4/20/2021	AZ	58	M	4/6/2021	4/14/2021	9 days after receiving vaccine started experiencing sore throat, swollen / infected eyes, bronchial irritation that progressively worsened. Went to dr after 5 days and tested for COVID which was negative. Symptoms continue to worsen. I have not been sick in over 5 years.

1235468	4/20/2021	TX	50	F	4/9/2021	4/9/2021	I received my 1st vaccine shot on 04.09.21 at 4:05pm CST. Around 5:15pm CST, my lower extremities and entire left side went numb. All feeling in my lower extremities returned by 11:00 pm CST. The facial and left arm/hand numbness remained with varying degrees of transient numbness. The numbness has ranged from 10% to 95% of feeling. I started doing research and determined my reaction was temporary and inflammatory and Bell Palsy like in nature. I missed work on 04.13.21 and notified my primary care physician, Dr by phone about the numbness. I was informed to go to the ER, especially if the numbness worsened. After taking Benadryl, by morning, the numbness remained transient, but subsided a bit. On 04.17.21, I started to feel a pull on my left eye muscle and a glare when I looked down. I notified my eye doctor, Dr I underwent an exam. My eye nerve was fine, however, my prescription in the left eye increased. As of today, 04.20.21, I am MUCH better, but the injection site remains little sore. The numbness remains transient in my left arm/hand, facial cheeks, and forehead with about 95% of feeling. My skin on my face (T-zones), also feels like sandpaper. I am making this report because I am apprehensive about receiving the 2nd shot.
1233320	4/20/2021	NJ	22	M	4/20/2021	4/20/2021	Patient fainted 15 minutes after getting his first dose of covid-19 vaccine. He fainted for about 15-20 seconds and came back saying his vision decreased and thought he was dreaming. He was breathing normal upon waking and didn't complain of anything else. he was lying flat until EMS arrived on site after approximately 10 minutes. He was able to get up and leave the facility by himself and didn't get transported to any medical facility.

1235447	4/20/2021	MN	33	F	3/22/2021	4/17/2021	Patient presented to the ER on 4/20/21 with headache. On Saturday (4/17/2021), the patient had "the worst headache I have ever had" along with severe inner left ear pain. Patient took an ibuprofen which helped with the pain for about an hour then the pain came back. Pain got worse 2 hours later when she drove home from work. She called the RN line and was told to take ibuprofen and follow up in the AM. The next day 4/18/2021, patient went to urgent care and received Toradol and was told it was a migraine. Today 4/20/21, patient still had pain and noted feeling left sided facial numbness and blurry vision that correlated with when she got the headache. Patient went to an urgent care today and CT scan revealed a blood clot. She was then sent to the ED for evaluation. In the ED, she has no headache and facial numbness and has minimal left ear pain. Her headache is localized to the left side of her head. Patient denies fever, chills, and COVID symptoms. Patient was started on argatroban drip per hematology recommendation.
1234875	4/20/2021	NY	34	M	4/9/2021	4/20/2021	I felt extreme fatigue and general malaise at 14:30. I took a Vicodin for my chronic back pain and lost consciousness at 15:00. I Went to bed and woke up at 16:25. 30 min later I slept again for about 90 min. Then I woke up and walked outside for some fresh air and got this extreme ice pick pain in the left side of my head for a few seconds. Then a few seconds later again. Now it just nags a bit behind my left eye and it feels a bit off in the left side of my brain. Bright lights hurt a bit. My back pain and Sciatica is also a lot higher than normal.
1235425	4/20/2021	OR	37	F	4/19/2021	4/19/2021	Initial left body pain with severe headache, after 35 min this transitioned to severe headache and left face numbness, slurred speech and left eye issues, combined with normal tiredness and ache at injection site (these latter symptoms abated within 24 hour). The facial numbness and headache have persisted and are still present.

1235408	4/20/2021	WA	47	F	4/3/2021	4/6/2021	Tiredness, body aches, chills, watery eyes, swelling in throat that lasted a couple days Very large, swollen and itchy rash around the injection site. Rash improved after several weeks.
1235221	4/20/2021	IN	42	F	4/6/2021	4/7/2021	The next morning my eyes were sensitive to light and then I became more exhausted by the hour. Full body Aches set in, foggy head, headache. By around two I began running a light fever. By about 3 pm I felt overall horrible. By four-five I became incredibly nauseated and began vomiting about an hour later. I kept vomiting throughout the night until it was only acidic bile left. During this time I was burning up if I had even a sheet on my skin, but freezing if I didn't. I was sweating late into the night. Vomiting stopped around 3 am. The next two days I managed rice, bananas and teaspoons of water but was always nauseated. Fever was gone, but headache and exhaustion remained. Daily nausea finally began to wane and was replaced by heartburn and gross feeling in my throat for about two days. About a week and half after the shot I finally regained my energy and had no stomach issues. Two weeks after injection today- The injection site still is bruised and burns/itches from time to time lightly.

1235219	4/20/2021	SC	71	F	3/9/2021	3/9/2021	EMS was called, because patient began to feel dizzy and extremely nauseous within about 1 minute of being vaccinated. She stood up to walk, but did not get more than 10 feet away before returning to sit down. Her face became flushed. Her BP was high at 177/87 with a pulse of 108, and she complained of having blurry vision. Her blood pressure lowered to 132/90 with a pulse of 82. Her final readings were BP 139/75 and pulse 77 when EMS took them. EMS was called at 1:22pm and arrived at 1:32pm. Pt was given some water and advised to get some rest at home. She refused to ride to the hospital with EMS, and claimed to feel better after another 10-15 minutes or so. EMS thought it was just an anxiety attack.
1235215	4/20/2021	NC	43	F	4/19/2021	4/19/2021	At approximately 5:00 pm thr day of vaccine my cheeks started to burn with a slight itch. It began to spread to other parts of my body mainly neck, back and arms. My skin is pink and felt warm to touch. It feels and looks as if I have a sunburn. 29 hours after vaccine my eyelids have now started to itch and burn. I have been taking 25 mg of Benadryl every 4 hours but symptoms persist.
1235203	4/20/2021	CA	49	F	4/20/2021	4/20/2021	Eye twitching and swelling six hours after administration of second vaccine. I have no face fillers or surgeries on face.
1235199	4/20/2021	CA	38	F	4/9/2021	4/11/2021	Deep pain in right leg, could not walk for a week. Slight pain still present. Fatigue, dizziness, nausea, blurred vision
1235152	4/20/2021	MO	35	F	3/20/2021	4/20/2021	I received the vaccine at about 9:30 AM. From about 8:00 pm - 8:45 pm I experienced a pattern of 30-90 seconds of normal vision, then 1-2 seconds of only being able to see light/colors/shapes (I had lasik in 2016, my prescription was -4.75, the 1-2 seconds of bad vision I experienced was like when I removed my glasses before having lasik correct my vision). This pattern of 30-90 seconds normal vision then 1-2 seconds of bad vision repeated for about 45 minutes. During this time I was also very dizzy and lightheaded. My other side effects were as expected (fever of up to 102, chills, VERY sweaty, did not have energy to remove my sweatshirt when I was hot, headache). I am only reporting this in case it is important/helpful for further studies/development of the vaccine and public health.

1233631	4/20/2021	TN	19	M	4/15/2021	4/15/2021	<p>Patient had parked in the COVID vaccine waiting area, and was observed to fall forward onto his steering wheel within a few minutes of parking by 2 other participants waiting in the car next to him. One of them immediately notified one of the parking lot volunteers who came and got me within 1 minute of this observation. 2 students and I came quickly to the open drivers side door and began talking to assess the situation. Mr. Bannister appeared pale, mildly diaphoretic (sweating) and slightly confused as to the passage of time, but was able to state and spell his name and talk coherently about his circumstances. He stated that he was not allergic to anything that he knew about, and that he had no prior history of similar reactions to vaccines or medicines although he had not taken any shots in several years. He noted that he had not eaten anything since breakfast (now mid-afternoon). He described himself as initially feeling weak, faint, and nauseated with his vaccinated arm feeling heavy and numb. He also reported that he had a sensation of blurriness before passing out, but denied any spinning sensation, visual loss or ringing in the ears. There were no obviously visible abrasions or bleeding on his face or forehead. The nursing students brought a chair, and we elevated his legs and gave him some water to drink during the time we were monitoring his vital signs. He refused a cupcake because of the nausea, but as time progressed he gained facial color and was more comfortable in conversing. His hands had equal muscle grip and strength, visible fingernail beds were pink and his capillary refill was less than 3 seconds. Towards the end of our monitoring, he did accept some nuts and M &amp; Ms to eat. A University Safety Medical Report was completed by the appropriate safety personnel. He was fully AAO x 3 at the end of our monitoring, and stated that if he felt better he would drive to his apartment (less than 5 minutes away) but would wait for his girlfriend to get out of class if he did not feel fully capable of driving. We encouraged him to eat something light when he got home, to use cool water/warm water soaks at his shot site, exercise his arm, and to take an NSAID for pain relief the next day. We recommended that he eat something light before his second shot (which had already been scheduled), that he bring someone with him the next time, and as a precaution to wait 30 minutes following the second shot.</p>

1233492	4/20/2021	IL	58	F	4/9/2021	4/13/2021	rash on face,neck & upper chest. eyes red, burning. watery. slight headache, lower back pain. Going away slowing almost gone have not gone back on xeljanz. seeing rheumatologist on 4-22
1233566	4/20/2021	NH	34	F	4/14/2021	4/15/2021	Severe throat tightening, itching body, mild hives on hands. I have to take Benadryl every 4 hours to keep these side effects tolerable. I emailed my doctor to see how long this would last or if there is anything I need to be doing. They called me and told me to come in right away. I was unable to see my doctor but was seen by another doctor. She said I was definitely having an allergic reaction after scratching my skin, looking in my nose, ears, and mouth. She asked if I had changed anything like soaps or laundry detergent recently, which I told her I did not. I said the only thing out of the ordinary that I have done in the past YEAR has been getting the COVID vaccine. She then told me it was probably just seasonal allergies.. which I have never had before. She wrote on my after care summary that I could use OTC eye drops for my eye symptoms (and I don?t have ANY eye symptoms), she also wrote that I could use Flonase for my nose symptoms (which I don?t have any nose symptoms), and to buy Zyrtec for keeping the seasonal allergies at bay. She didn?t even consider the vaccine to be an issue. I also didn?t even know throat tightness could be a vaccine side effect until I looked it up. I don?t know why I was brushed off and told seasonal allergies when my side effects don?t line up with that. I don?t think it was a coincidence I received the vaccine and started to have ?seasonal allergies?. I asked if I should be getting an allergy test to see what ?seasonal? things I?m having this reaction to and she said that doesn?t matter, just to keep treating the symptoms. So no tests were given.
1233467	4/20/2021	MA	54	F	4/9/2021	4/13/2021	She had some mild symptoms 1-2 days after the vaccine that resolved. 4-5 days after the vaccine she developed a headache, describes it as constant. She has taken tylenol and advil OTC without much relief. She denies any vision changes, worse with position changes, nausea or vomiting. Today is improved without intervention, but still present mildly.

1233440	4/20/2021	AL	72	F	3/11/2021	3/12/2021	She had the vaccine, when she woke up the next day her arm was really sore and kept bending it, and thought that she was going to be okay. Almost a week later it was swollen, parallel to it and big, beat red, and hot to touch. Over the next few days she was getting more and more tired, but the arm started getting stiffer. It kept getting more and more read and spreading to the elbow and wrist. When she got up over the weekend and kept putting it off thinking that it would go away and decided to touch it out. Then it started getting numb going into her fingers. On the following Saturday she could not move her arm up due to stiffness. She had some heart flutters, was not feeling right and decided she needed to see her doctor. She saw a NP and then she went to see her cardiologist the same day. He did an EKG and told her that she was fine. That is the provider that told her that whoever gave her the shot hit a blood vessel that caused all of her symptoms. The swelling was starting to go down and did some tests for blood testing, which she states was all negative. She went to an eye doctor who is now sending her to a neurologist. She has now recovered from it completely now.
1233428	4/20/2021	CO	45	F	2/12/2021	2/15/2021	Patient had a headache and vision changes, went to ER. They ran tests and found it was "stroke.~~

1234122	4/20/2021	FL	60	F	4/15/2021	4/15/2021	Approximately 1 - 2 hrs after receiving the 2nd dose of the Moderna vaccine, I started developing a red rash on my left cheek. It started tingling, and slightly itching, and was warm to the touch. A welt had also started on my left cheek approximately 1 inch down from my left eye. I immediately put Benadryl cream on the whole area and it quickly subsided within an hour. A cold compress helped as well. I also had a severe headache that lasted almost a day and felt extremely weak. I did not have those reactions after the 1st dose. My arm hurt after both doses, but I only felt very tired after the 1st dose.

1233493	4/20/2021	NJ	35	F	4/8/2021	4/12/2021	From 6-48 hours after: chills, headache, hot flashes, fever of 100.5 On 4/12/2021 I had to call an ambulance due to issues with vision including seeing weird color patterns and near black out along with racing heart and lightheadedness. I refused further medical care because I felt better once the ambulance arrived. I visited my primary care doctor on 4/13/2021 to follow up. He said it was likely an ocular migraine. A blood test was ordered and results came back as essentially normal. I have been continuing to have dizzy spells, headaches, blurry vision and light sensitivity. An MRI of my brain and spinal cord has been ordered for 4/29 to rule out other conditions.

1234044	4/20/2021	OH	72	F	3/4/2021	3/24/2021	<p>Patient called c/o shortness of breath on exertion, slight cough, runny nose, weakness and fatigue. States O2 sitting 97 and P 79-80 and O2 walking &lt;88 and P 100's. States had covid vaccine # 1 on 3/4/2021. Completed viral/travel screen which was negative. Patient is a 72 y.o. female with chronic diastolic heart failure, hypertension, hyperlipidemia, hypothyroidism, vitamin D deficiency, depression with anxiety, who presented with shortness of breath on exertion. CTA chest was performed, showing filling defects in secondary and tertiary pulmonary arterial branches in bilateral lower lobes as well as right upper lobe. Patient was admitted for management of acute bilateral pulmonary emboli. Patient was started on Lovenox 1 mg/kg twice daily; transitioned over to oral apixaban for discharge. TTE obtained, without evidence of right heart strain. Patient is a 72 y.o. female who presents to the office today stating "I do not feel so good". She mentions noting blurry vision over the past 1 week right eye only with decreased vision. Denies any eye pain. Thinks her vision is worse outside in the sun. In addition, today she states she was up moving around getting ready for today's appointment when all of a sudden she felt a brief slight low light shock pointing to left anterior chest wall. Denies any chest pain or pressure but reports noting her heart rate was elevated up to 150. She states her O2 sat at home was 97% on room air. She checked her blood pressure which was not abnormal but cannot recall the number. She was recently diagnosed with a PE for which she was hospitalized, see previous note. She is concerned as she feels perhaps her Covid vaccine initially received on 3/4/2021 could have caused her blood clot. Her second dose was received on 3/31/2021 and has since not been feeling well EKG in the office with new onset A. fib relation noted, rapid ventricular rate with a pulse of 152 bpm. 911 was called and patient transferred to the ER for further evaluation and recommendations. Patient currently on Eliquis for PE. Patient, with a past medical history of essential hypertension, mixed hyperlipidemia and grade 1 diastolic dysfunction, as well as acute bilateral pulmonary emboli 3/2021 diagnosed a few days after her first dose of the Pfizer Covid vaccination, now anticoagulated on Eliquis who presented to KMC emergency room on 4/14/2021 from her primary care provider's office after being found in newly diagnosed</p>

1234102	4/20/2021	NJ	54	F	3/28/2021	4/7/2021	<p>atrial fibrillation with RVR, rate in the 150s. Of note, patient had received her second dose of the Pfizer Covid vaccine on 4/10/2021. She had scheduled this primary care provider appointment due to waxing and waning blurred vision of her right eye, with associated right-sided headache that had been ongoing over the last week. Patient reports that on the day of arrival she had not felt well, felt slightly weak and fatigued, but denied shortness of breath, chest pain or heart palpitations. Per ER notes, patient was instructed on vagal maneuvers while she was in the ambulance, and had converted to sinus rhythm by the time of her arrival to the emergency room. Per review of her telemetry on the day of discharge, patient did have one short episode of PAF on 4/15/2021, spontaneously converting to sinus rhythm, as well as intermittent PACs. Her home lisinopril was changed to Coreg, without further episodes of RVR and with good blood pressure control. In regards to her headache, patient underwent an MRI of the brain, which was negative for acute findings; she had no temporal tenderness, and ESR was within normal limits. She did improve symptomatically with administration of Tylenol and Zofran for her corresponding nausea/vomiting. On the day of discharge, patient was feeling much better, and stable for discharge. An appointment with doctor of ophthalmology was offered to patient for 4/16/2021, however due to transportation issues, this was rescheduled for 4/20/2021. She was instructed on changes in her medication, as well as encouraged to schedule an appointment with her established cardiologist. All questions and concerns were addressed.</p> <p>I developed shingles as a result of this vaccine. Needed immediate care for my eye.</p>

1234099	4/20/2021	MO	18	M	4/20/2021	4/20/2021	Pt had a vasovagal response to the vaccine. It happened right after administration. Patient started shaking and closed his eyes. Just a few seconds later he woke up and said something along the lines of, "Oh did I pass out?" I caught him in my arms before he could fall to the floor. The same response where he started aggressively shaking and eyes closed happened a few seconds later. His legs straightened out and his head was headed backward. Again I caught him and stabilized him. Afterward, my 2nd pharmacist stopped over and spoke with him. He seemed to be feeling better, but to ensure the same reaction wouldn't happen again, we had him wait 30 min instead of the standard 15. He sat in his chair and did not have any issues. We offered food but he was not interested. I spoke w/ him again this afternoon via phone and he said he was doing fine. Pt said he has had this type of rxn before w/ previous vaccines.
1234096	4/20/2021	OR	36	F	3/10/2021	3/16/2021	6 days post vaccine patient started experiencing migraines and almost every morning since. Post vaccine 21 days right eye and right hand started to twitch . April 12th when vaccine paused became worried. Went to the ER on April 16th complaining of increased migraines/head pressure, numbness in right hand and off and on numbness in both legs, stiff neck, dizziness, mood changes, insomnia. April 19th more symptoms flushing burning in legs and numbness. Chest felt weird like someone put vicks on it.

1234080	4/20/2021	MI	34	F	4/8/2021	4/10/2021	<p>4/10/21 Patient presented to Urgent Care with Arm Pain (left arm painful and tingly since COVID shot 4/8; now pain is different and there is a lump on her forearm she can feel). 4/13/21 Contacted the office to schedule an appointment regarding worsening symptoms. Scheduled appointment. 4/14/21 cont. Seen in office by PA for: 1. Left arm pain - tender nodule L forearm, will get US due to recent birth, Johnson and Johnson vaccine, FH of DVT, to r/o DVT causing the lump, await results. Symptomatic care in the interim, may use warm compresses. - USV VENOUS UPPER EXTREMITY DUPLEX LEFT; Future 2. Paresthesia of left arm - site of reported injection and superficial induration 1.5cm from acromion process, suspect SIRVA due to sit of administration of vaccine, recommend symptomatic care with warm compresses, gentle massage if benefit noted, pt is breastfeeding so recommend local care at this time, consider PT, pt declines at this time as she will be on vacation next week. Discussed possible cortisone injection but deferred due to recent COVID vaccine 6 days ago, pt agrees as there is some recommendation to avoid steroids in close proximity to vaccinations to avoid blunting the immune response 3. Family history of DVT - see #1 4/15/21 After speaking with the DVT clinic Dr contacted the patient and recommended she take an 81mg low dose daily aspirin, until symptoms resolve, around one month. And repeating venus duplex in 7-10 days. Determined she would go prior to her leaving for her trip as she planned to be out-of-town during that time frame. (Per provider result notes.) 4/16/21 Patient was seen in emergency department for: Patient presents for evaluation of multiple concerns. Following the Johnson &amp; Johnson COVID-19 vaccine she was recently diagnosed with superficial thrombophlebitis in the left forearm by ultrasound, has been taking aspirin and symptoms have not worsened. Left upper extremity exam is quite reassuring today, I see no clinical evidence for DVT and she is neurovascular intact. I did not feel that repeat ultrasound was necessary at this time, but she does have this scheduled next week so I advised her to keep that appointment. She has a very slight headache which has been present since the day she received the vaccine, currently 2/10 without vision or other neurologic concerns. No abdominal pain. I have low clinical suspicion for CVST or PVT at this time.</p>

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

Advised return if she develops worsening headache or new neurologic symptoms. Patient complained of new onset left lower lateral breast pain and lump starting today. She is currently breastfeeding and notes decreased milk production today. She does have a tender fullness on exam but no redness or visible swelling, she is nontoxic and well-appearing without fever. She has history of mastitis in the past, but she states her PCP recommended she be evaluated for possible blood clot in the breast. Advised the patient that I have very little concern for that at this time, if anything it would be superficial and not amenable to anticoagulation but I did not feel that imaging was necessary at this time. I will cover her with antibiotics for lactational mastitis, she has cephalosporin allergy but states she had formal testing for penicillin allergy and tolerated this well so I prescribed Augmentin. She will use a warm compress and continue nursing, I did recommend she start on the right side to initiate let down on the left. 4/20/21 patient was seen in the office for: Patient presents for follow up of recent ED visit. She was seen here last week for left arm pain/nodule/paresthesia following her Johnson & Johnson vaccine. She also reported a slight headache that was present since day of vaccine. An US was performed and showed a left cephalic vein thrombus of LUE. She was advised to start ASA 81mg daily for the next month and get repeat US in 7-10 days. She then called in with left breast pain/swelling and was directed to the ED for evaluation of possible blood clot. She does have hx of mastitis several weeks ago. The ED did not pursue additional imaging of breast, they told her it was likely lactational mastitis and they did prescribe augmentin and warm compresses for this. Today, patient presents states he feels "a lot better". Regarding the left breast lump, redness, swelling she states this has completely resolved. She did not start the augmentin as she was worried about this potentially causing thrush for her daughter; she explains she had mastitis 7-8 weeks ago and was on antibiotics and then her and her daughter continually passed thrush back/forth to each other 3x so she was hoping to avoid this. She did treat with frequent feeding/pupping, and warm compresses and symptoms resolved. She was told to see us for elevated blood pressure in the ER, per review of EMR and her DC papers, her blood pressure in the ED

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							<p>was 130/75. Today her blood pressure is 122/78. Regarding her left arm symptoms, she states the numbness/tingling has nearly resolved; she will occasionally get a very mild tingling in her 4th/5th fingers that resolves after a few seconds. She denies pain or swelling of the arm. She no longer can palpate the clot and thinks that it is gone. She no longer feels swelling or tenderness in her left axilla. She stopped the ASA and started motrin/warm compresses as was advised by the ED. Her mild headache continues since the vaccine but is somewhat improved. She denies worsening or severe headache; denies vision changes, dizziness, lightheadedness, speech difficulty, etc. Phone encounter also from 4/20/21: Phone call placed to DVT clinic to get their guidance as Dr had talked with them last week. Reached RN, who reviewed with Dr. After review of patient's history/chart/growth of superficial clot, Dr recommended that patient not travel as planned and continue on 81mg ASA daily. They would like us to place a referral so they can see her later this week or early next week. They also want us to place order for repeat US either this coming Friday or Monday and they will coordinate to get this done at their office/same time as appointment. I did place phone call to patient to discuss and give their advice. They had just left this morning for another state by car. I reviewed Dr advice to not travel and she will discuss with her husband if they are going to run around or not. She was agreeable to continuing on the 81mg ASA Daily and repeat US/visit with DVT clinic in 5-7 days as recommended.</p>
1234074	4/20/2021	NC	32	F	3/8/2021	4/8/2021	<p>I experienced eye pain, cold hands, blurred vision, headache, fatigue, pain at the injection site after receiving the vaccine. I have recovered from all except intermittent cold hands and intermittent eye blurriness.</p>

1234070	4/20/2021	MI	34	F	4/8/2021	4/10/2021	4/10/21 Patient presented to Urgent Care with Arm Pain (left arm painful and tingly since COVID shot 4/8; now pain is different and there is a lump on her forearm she can feel). 4/13/21 Contacted the office to schedule an appointment regarding worsening symptoms. Scheduled appointment. 4/14/21 cont. Seen in office by PA for: 1. Left arm pain - tender nodule L forearm, will get US due to recent birth, Johnson and Johnson vaccine, FH of DVT, to r/o DVT causing the lump, await results. Symptomatic care in the interim, may use warm compresses. - USV VENOUS UPPER EXTREMITY DUPLEX LEFT; Future 2. Paresthesia of left arm - site of reported injection and superficial induration 1.5cm from acromion process, suspect SIRVA due to sit of administration of vaccine, recommend symptomatic care with warm compresses, gentle massage if benefit noted, pt is breastfeeding so recommend local care at this time, consider PT, pt declines at this time as she will be on vacation next week. Discussed possible cortisone injection but deferred due to recent COVID vaccine 6 days ago, pt agrees as there is some recommendation to avoid steroids in close proximity to vaccinations to avoid blunting the immune response 3. Family history of DVT - see #1 4/15/21 After speaking with the DVT clinic Dr contacted the patient and recommended she take an 81mg low dose daily aspirin, until symptoms resolve, around one month. And repeating venus duplex in 7-10 days. Determined she would go prior to her leaving for her trip as she planned to be out-of-town during that time frame. (Per provider result notes.) 4/16/21 Patient was seen in emergency department for: Patient presents for evaluation of multiple concerns. Following the Johnson & Johnson COVID-19 vaccine she was recently diagnosed with superficial thrombophlebitis in the left forearm by ultrasound, has been taking aspirin and symptoms have not worsened. Left upper extremity exam is quite reassuring today, I see no clinical evidence for DVT and she is neurovascular intact. I did not feel that repeat ultrasound was necessary at this time, but she does have this scheduled next week so I advised her to keep that appointment. She has a very slight headache which has been present since the day she received the vaccine, currently 2/10 without vision or other neurologic concerns. No abdominal pain. I have low clinical suspicion for CVST or PVT at this time.

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

Advised return if she develops worsening headache or new neurologic symptoms. Patient complained of new onset left lower lateral breast pain and lump starting today. She is currently breastfeeding and notes decreased milk production today. She does have a tender fullness on exam but no redness or visible swelling, she is nontoxic and well-appearing without fever. She has history of mastitis in the past, but she states her PCP recommended she be evaluated for possible blood clot in the breast. Advised the patient that I have very little concern for that at this time, if anything it would be superficial and not amenable to anticoagulation but I did not feel that imaging was necessary at this time. I will cover her with antibiotics for lactational mastitis, she has cephalosporin allergy but states she had formal testing for penicillin allergy and tolerated this well so I prescribed Augmentin. She will use a warm compress and continue nursing, I did recommend she start on the right side to initiate let down on the left. 4/20/21 patient was seen in the office for: Patient presents for follow up of recent ED visit. She was seen here last week for left arm pain/nodule/paresthesia following her Johnson & Johnson vaccine. She also reported a slight headache that was present since day of vaccine. An US was performed and showed a left cephalic vein thrombus of LUE. She was advised to start ASA 81mg daily for the next month and get repeat US in 7-10 days. She then called in with left breast pain/swelling and was directed to the ED for evaluation of possible blood clot. She does have hx of mastitis several weeks ago. The ED did not pursue additional imaging of breast, they told her it was likely lactational mastitis and they did prescribe augmentin and warm compresses for this. Today, patient presents states he feels "a lot better". Regarding the left breast lump, redness, swelling she states this has completely resolved. She did not start the augmentin as she was worried about this potentially causing thrush for her daughter; she explains she had mastitis 7-8 weeks ago and was on antibiotics and then her and her daughter continually passed thrush back/forth to each other 3x so she was hoping to avoid this. She did treat with frequent feeding/pumping, and warm compresses and symptoms resolved. She was told to see us for elevated blood pressure in the ER, per review of EMR and her DC papers, her blood pressure in the ED

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

was 130/75. Today her blood pressure is 122/78. Regarding her left arm symptoms, she states the numbness/tingling has nearly resolved; she will occasionally get a very mild tingling in her 4th/5th fingers that resolves after a few seconds. She denies pain or swelling of the arm. She no longer can palpate the clot and thinks that it is gone. She no longer feels swelling or tenderness in her left axilla. She stopped the ASA and started motrin/warm compresses as was advised by the ED. Her mild headache continues since the vaccine but is somewhat improved. She denies worsening or severe headache; denies vision changes, dizziness, lightheadedness, speech difficulty, etc. Phone encounter also from 4/20/21: Phone call placed to DVT clinic to get their guidance as Dr had talked with them last week. Reached RN, who reviewed with Dr. After review of patient's history/chart/growth of superficial clot, Dr recommended that patient not travel as planned and continue on 81mg ASA daily. They would like us to place a referral so they can see her later this week or early next week. They also want us to place order for repeat US either this coming Friday or Monday and they will coordinate to get this done at their office/same time as appointment. I did place phone call to patient to discuss and give their advice. They had just left this morning by car. I reviewed Dr advice to not travel and she will discuss with her husband if they are going to run around or not. She was agreeable to continuing on the 81mg ASA Daily and repeat US/visit with DVT clinic in 5-7 days as recommended.

4/20/2021

Received Covid vaccine. Woke up suddenly with a sharp pain in my right side, which hurt so bad I yelled for my husband who was next to me. The pain suddenly exploded through my right side and hurt so bad I screamed, then the pain immediately subsided. Everything else then seemed normal. No headaches or vision issues and no muscular issues.

1233865	4/20/2021	PA	22	M	4/15/2021	4/15/2021	Approximately 3 to 5 minutes after immunization, patient was observed in a waiting room chair unconscious, unresponsive and not breathing (respiration was not immediately observable or recognizable). Patient was carefully and quickly placed in a supine position on the floor. Pulse was present but the patient was completely unresponsive. Respiration was not observed. EMS was immediately notified. Pharmacist and staff prepared for resuscitation and utilization of Epinephrine if needed. Patients face was flushed, arms became flushed and the patients skin became moist. After approximately 45 seconds in the supine position the patients eyes opened and he became responsive to auditory communication. Respiration became reestablished. BP was recorded at 130/91 with a pulse of 91 BPM. EMS arrived on scene and provided further evaluation. After an additional 5-10 minutes, patient was completely conscious and coherent. Patient indicated that he had a similar experience in a grocery store over 1 year ago that was unrelated to immunization and was attributed to dehydration. Patient refused additional medical care or transport to ED. Patient was released to a friend who drove him home. Patient was observed 1 day later picking up his car from the pharmacy and has recovered. Patient was advised to seek additional medical evaluation to assess the root cause of this event.

1233882	4/20/2021	WA	39	F	3/18/2021	3/19/2021	Intermittent but fairly constant migraines beginning the night of and lasting for 3 weeks following vaccine. On Friday afternoon I noticed pressure behind my right eye, which I attributed to the migraine. By Sunday midmorning it felt like someone was trying to pry my eyeball out of the socket. I have a high pain threshold, but the pain was 8.5-10 out of 10. I called my mom who advised me to take some ibuprofen (I took two 220mg Naproxen tablets). The pain and pressure diminished for several hours, then came back. I repeated the dose and had no more problems with my eye after Monday morning.
1233923	4/20/2021	NV	22	F	3/26/2021	3/27/2021	Patient contacted for follow up regarding post vaccine status. On day 2 patient reported feeling very tired, more so than usual, body aches, cough, and a decrease in taste. Patient agreed to come in to the clinic on Friday to be evaluated for COVID testing. On the day of testing mother called clinic and stated to cancel appointment, patient had gone to the emergency department the day before. Mother reports that patient began complaining of increased facial pain on 04-14-2021. Soon the facial pain increased, and the patient noticed she was having trouble chewing her food and talking, as well as a facial droop to the right side of her face. As the mother was driving the patient to the hospital the patient began complaining of edema to her lips and tongue, and that her right eye was hurting and was very dry. After being evaluated in the emergency department the patient was diagnosed with Bell's Palsy and sent home with the following prescriptions: Prednisone 20 mg, Valacyclovir 50 mg, and eye drops.

1228946	4/19/2021	CA	50	F	4/7/2021	4/7/2021	pain in legs, pain in back, itching in eyes, little headache, insomnia
1229081	4/19/2021	AZ	49	F	4/16/2021	4/16/2021	Patient returned to observation area two hours post injection complaining of LA pain. Medic on site observed some swelling to the LA and proceeded to provide an ice pack. After further assesment patient did not appear in any distress and was instructed to stay in observation for an additional 30 min. At approximately 1300 the patient began scratching the vaccinated arm and mumbling in a language we could not understand. Immediately the interpreter was called and we prepared for an adverse reaction. Two of our LPNs began taking vitals, One RN began assessing the site where we noted possible infiltration to the subcutaneous tissues. We then moved the patient to a private room. RN chart note: "Patient crying sitting in chair, complains of L arm pain. Left arm swollen, softball size, hard to touch, patient sensation remains intact, left radial pulse +2 and present, patient can wiggle all fingers on command. Patient initially denied Benadryl, however after educated with safety and calling 911, patient denied ambulance, and agreed to IV placement. 20 g IV placed in Right AC, 50 mg IV push Benadryl once for swelling and itching of arm spreading in size, 500mL LR bag hung, Patient A0x4 on room air answering questions appropriately. Patient denied ambulance service at this time. Patient states headache is stronger and chest pain decreased." Patient then fell asleep and approximately at 1400 awoke with red eyes, continued headache that had gotten worse. BP retaken and was 162/102. At this point we decided we would need EMS to respond. With the language barrier and poor past medical history, we did not find it appropriate to continue treating the patient on site. She was still A&Ox4, denied restricted airways or significant chest pain. Our medical director was alerted of the event and instructed us to call EMS despite patient refusal. EMS arrived by 1430 and assessed patient, she finally agreed to transport.

1228755	4/19/2021	NY	66	F	3/29/2021	3/29/2021	Time line of events Got moderna at 10am on 3/29/21 130-3pm: feeling lightheaded 3pm to evening: severe fatigue 7pm: fatigue continued, developed severe itching/burning sensation above eyebrow w/ 2 half dollar sized swollen lesion, her forehead felt like ants were crawling around her skin, got numbness of thumbs Still having the ?ant crawling sensation on forehead?, fatigue and numbness of thumbs Had severe concussion in past and had similar nerve symptoms
1229103	4/19/2021	CA	69	M	3/24/2021	3/24/2021	I became and felt very medicated with glassy eyes. That lasted for four days. During that time, I experienced slight chill for about 30 mins/one day, and headaches off an on for about three days. I also felt somewhat tired - as if I never slept. That lasted about three days off and on albeit I went about my normal activities. For the headaches, I just took aspirin. The rest I let go it's course. I began to feel my real self about the fifth day, and then everything was fine.
1229420	4/19/2021	MD	36	M	4/5/2021	4/5/2021	Received first Covid 19 vaccine and was told to walk around by person who administered injection since they did not have enough chairs. Approximately five minutes after injection I was standing in an aisle when my vision became blurry and I felt a wave of heat come over my body. I began to crouch down and passed out hitting my head causing a concussion.
1228738	4/19/2021	CA	23	F	4/9/2021	4/10/2021	About a day after the vaccine I noticed my left hamstring was quite sore and cramping and a day or so after that I had intense twitching in my right bicep. Throughout the next week the pain had moved to both of my legs being achy and cramping and intense muscle spasms throughout all the muscles in my body. I have had no headache, vision issues, shortness of breath or swelling within my limbs.
1228701	4/19/2021	TX	51	F	4/12/2021	4/13/2021	ringing in ears for 2 hours with blurred /decrease in vision which still remains, frequent headaches
1228786	4/19/2021	SC	62	F	4/8/2021	4/13/2021	Had 3 vertigo attacks last one leaving me with constant blurred vision and dizziness

I couldn't sleep. Was sort of vibrating. Got up to 168/107. Was down to 116/88. Now bouncing around and up again at 150/96. My norm is 110/70ish. When I got the shot I had to sit with an EMT for 90 minutes because of the facial palsy. Then I was massively sick for 3 days. Vertigo, dizziness, and vomiting were the worst. Now the pain at concussion site and continuing dizziness is lousy, plus the BP increase started last night and is bouncing around. Maybe it will settle down like all the rest of the side effects. Seemed like each day brought on new side effects and they last from 12 to 48 hours.

1229229	4/19/2021	GA	64	M	3/15/2021	4/9/2021	Patient awoke 04/09/2021 with visual disturbance and limited field of vision. Went to eye center and was evaluated. MD at eye center sent him to ER and told patient that it appeared he was having a stroke. Admitted to medical center 04/09/2021. Patient reports he was diagnosed with a stroke affecting the occipital region that affects his vision. Patient was discharged from the hospital 04/11/2021.
1229216	4/19/2021	KY	19	M	4/1/2021	4/2/2021	Within hours of getting the shot, patients left eye started turning red. He visited a medical facility and they diagnosed him pink eye and gave him antibiotic drops. The drops did not seem to be working and by that Monday he went to see the eye doctor. Eye doctor said it was viral pink eye and thought it was strange that this came about right after the vaccine and in the eye on the same side he was vaccinated. Over the next days and weeks, the viral infection moved to the other eye. Both eyes stayed swollen, red and tearing constantly. He has lost some of his vision and says that things far away are very fuzzy looking. The doctor said it was the worst case of viral pink eye he has ever seen and that he would have it for the long haul of 4 to 6 weeks. He had to do a medical withdrawal from college due to missing too much of the nursing program he is enrolled in. The pinkeye is still ongoing and we don't know when it will be over.
1229213	4/19/2021	IL	16	M	4/16/2021	4/16/2021	Within 2 minutes of receiving the vaccine, he started sweating, he then vomited, lost vision and hearing. Had trouble breathing. Ambulance called

1227871	4/19/2021	TX		F			<p>symptoms started out with "the eyes"/"bloody eyes"; headache; allergies; runny nose; chills; This is a spontaneous report from a contactable consumer (patient). A 39-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) dose 1 via an unspecified route of administration on 2021 (lot number was not reported) as a single dose for COVID-19 immunisation. Medical history and concomitant medications were not reported. On 2021, the patient received the Pfizer BioNTech COVID-19 vaccine on Tuesday and has been having side effects and would like to know if she was able to take anything to help treat these side effects. Her symptoms started out "with the eyes" and a headache, and then reported symptoms similar to allergies, stating that she has had a runny nose and "bloody eyes". These symptoms had not stopped since she received her vaccine. She was having chills on 2021. She did not know if these symptoms were going to go away on their own or if she just had to wait them out. She would like to know if it was recommended she take the second dose of the Pfizer BioNTech COVID-19 vaccine based on the side effects that she experienced. The outcome of the events was not recovered. Information about the lot/batch has been requested.</p>

A 71-year-old patient of an unspecified gender received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration administered in left arm on 25Feb2021 10:00 (Lot Number: EN6200) as single dose for COVID-19 immunisation. Medical history included thyroid cancer, hypertension, Sjogren's syndrome, hyperlipidaemia. Concomitant medication included amlodipine, aspirin, atorvastatin calcium (ATORVAS). No other vaccine was received in four weeks. No covid prior vaccination. The patient previously took lisinopril and experienced allergy (caused cough). The patient underwent COVID test via nasal swab post vaccination on 08Mar2021 and result was negative. 2 days after receiving vaccine on 27Feb2021, the patient developed a continuous tearing and watery nasal dripping that lasted for 7 hours. At that time, the patient could not open eyes and the patient was not feeling well. and then one and off episode of paroxysmal hypertensive episode associated with tachycardia. Highest BP at home was 216/95 mmHg and worsening PR was 126/4min. Associated with mild flushed but not associated with clammy, no dyspnea, no nausea or vomiting, no diarrhea, no right side abdominal pain. This hypertensive episode lasted for 5 hours to 7 hours per day. The patient contacted to primary care doctor twice in different days. The patient was brought to ER where the patient got first Pfizer shot. Stayed one night 5 as observation patient on 08Mar2021 and next day 09Mar2021, the patient was admitted to Medicine floor. During hospitalization, this episodic parosymal hypertension was continued SBP was up to 211 and finally discharged from hospital on 21Mar2021. The events resulted in emergency room/department or urgent care, hospitalization, life threatening illness (immediate

1227954	4/19/2021	NY	56	F	3/25/2021	3/1/2021	Weakness; Lower abdominal pain; Low grade fever; felt lousy; Fatigue; Double vision; This is a spontaneous report from a contactable consumer (patient). A 56-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number: EN6208, expiration date: 30Jun2021) via unspecified route of administration in right arm on 25Mar2021 15:00 (at the age of 56-years-old) at single dose for COVID-19 immunisation. Patient medical history included Guillain Barre syndrome on Feb2017 and asthma on unspecified date. Concomitant medication included ongoing IVIG treatment, unspecified (one infusion every four weeks) for Guillain Barre syndrome. The patient previously received first dose of bnt162b2 (lot number EN6201) on 04Mar2021 at the age of 56-years-old for covid-19 Immunization, and experienced sore arm. On 25Mar2021, after the second dose of the vaccine, the patient felt really lousy. The patient was fatigued on unspecified date in Mar2021. On 29Mar2021, patient had lower abdominal pain and low grade fever. The left side has been the side that has been impacted by Guillain Barre syndrome CID and that was the side that was affected after the vaccine. On 28Mar2021, the patient experienced weakness; was too weak to care for herself and she and her husband decided to go into the hospital. The patient was admitted on 28Mar2021 by neurologist (for the event weakness) and she stayed 2 nights and then came home 30Mar2021. The patient had been tired and weak since discharge from the hospital. The patient was on a monthly course of IVIG but the round she got in the hospital was exactly 2 weeks in-between her scheduled monthly treatments. Complete fatigue and weakness were still ongoing. The patient also experienced double vision on unspecified date in Mar2021 which was ongoing, but this was something that starts flaring up with her condition. The patient's low grade fever experienced on 29Mar2021 lasted for 3-4 days. The patient has gone backwards in her Guillain Barre syndrome since she had the vaccine, her opinion is that this was a set back she is not sorry she got the vaccine and is grateful for it. Events resulted in emergency room visit and Physician's office visit. Outcome of the events (weakness, fatigue and double vision) was not recovered. Event (Lower abdominal pain) was recovering; event (low grade fever) was recovered

1227951	4/19/2021	GA	65	F	3/31/2021	4/2/2021	momentarily vision loss; This is a spontaneous report from a contactable female consumer. A 65-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Solution for injection, Lot Number: ER8728) via an unspecified route of administration, in left arm on 31Mar2021 11:00 (at the age of 65-years-old) as single dose for COVID-19 immunization. Vaccine was not administered at Facility. Facility type was Department of Health. Medical history included bone loss diagnosed more than 3 years ago from an unknown date and unknown if ongoing. Concomitant medication(s) included vitamins nos (Multivitaminum) taken for routine health maintenance from an unspecified start date and ongoing; calcium taken for bone loss from an unspecified start date and ongoing; vitamin d [vitamin d nos] taken for routine health maintenance from an unspecified start date and ongoing taking it for years. Also patient stated she started on her own because reading and recommendation vitamin D was so critical. This is vitamin D3 and she does not know if sun can provide. She has been taking it only about a year. Patient asked about a question on her vaccination questionnaire. She said it asked about every getting vaccines on a base, why was that question there. Caller stated this happened early in the afternoon and she was in the kitchen and was standing near island she was working up right. She was not bent over. All of sudden she looked up and maybe for a minute or two lost her vision. It was not too long, but long enough it certainly caught her attention. Caller stated when she was looking down at whatever she was doing on the counter she looked up and her line of sight was in the great room but she could not see anything and thought oh my gosh what happened. Patient reported that she and her husband both received their first doses of the PFIZER-BIONTECH mRNA COVID-19 vaccine on 31Mar2021. She reported that they've both experienced visual disturbances since then, with no prior history of vision impairment. She stated her husband was nearby and he was like what do you mean and she could not even see a foot in front of her. Reported that by the time she went through a conversation her vision had come back and she has not experienced it since. Her episode occurred on Friday (02Apr2021), during the day while at her kitchen island. She was unable to see, but it resolved

quickly. Her husband's episode occurred last night 05Apr2021. She reported that her husband (67 y/o, male) woke up from being asleep, asked if the TV was on (which was because he could hear it, but could not see it). His symptoms have also resolved. Patient explained her husband and she both, on different days experienced vision disruption. Momentarily, but they experienced it different day. They both had the general feeling that something was a little different but nothing severe and worrisome until the vision thing. Event blindness transient was considered serious (medically significant) based list. No treatment for the events was given. Outcome of the event was recovered on 02Apr2021 for female patient. Follow up attempts are completed. No further information is expected.

1227939	4/19/2021	CO	71	M	1/28/2021	2/2/2021	Stevens johnson syndrome/Small blisters first appeared in the nose and around the eyes a couple days; This is a spontaneous report from a contactable consumer (patient). A 71-year-old male patient received his first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in left arm on 28Jan2021 19:00 (Batch/Lot Number: el3247) as a single dose, and her second dose via an unspecified route of administration in left arm on 17Feb2021 11:30 (Batch/Lot Number: en7201) as a single dose for COVID-19 immunization. Medical history included allergies to sulfa and mycin drugs. Concomitant medications included Tamsulosin, atorvastatin, prasugrel, and acetylsalicylic acid (BABY ASPIRIN). The patient was not diagnosed with COVID-19 prior to vaccination. On 02Feb2021, the patient experienced Stevens Johnson Syndrome - small blisters first appeared in the nose and around the eyes a couple days after shot #1. It exploded with blisters all over face, neck and body a couple of days after the second shot. Patient had large blisters and open sores today and still getting new blisters 6 weeks after shot #2. Patient initially assumed that this was shingles in spite of the fact that he had the new shingles shot. He went to the doctor this morning and he diagnosed it as Stevens Johnson Syndrome. Biopsy was taken and sent to a lab. There was no other change in medication history, food, or exposure to potential allergens. Therapeutic measure included gabapentin to lessen pain. Events resulted in doctor or other healthcare professional office/clinic visit and emergency room/department or urgent care. Outcome of events was not recovered. The patient had not been tested for COVID-19 since the vaccination.

1227873	4/19/2021	LA	74	M	2/25/2021	2/25/2021	blood vessel had busted in his right eye; Black Floaters in right eye; Muscle and body aches; Muscle and body aches; Fatigue; Lost of taste and smell; Lost of taste and smell; Headache; Runny nose; Nausea; This is a spontaneous report from a contactable consumer (patient). A 74-years-old male patient received first dose of BNT162B2 (Lot Number: EL9267), intramuscular administered in the right arm on 25Feb2021 14:00 as SINGLE DOSE for covid-19 immunisation. Medical history included genetic/chromosomal abnormalities, endocrine abnormalities, diabetes, obesity, compromised immune status, respiratory illness, diagnosed allergy, High blood pressure, Heart problems (Family medical history: Father died early of heart problems), all from an unknown date and unknown if ongoing; and Allergic to Latex and rubber products diagnosed 1990. Concomitant medications included medications for high blood pressure. The patient experienced blood vessel had busted in his right eye on Mar2021 14:05; black floaters in right eye on Mar2021; fatigue on 28Feb2021; muscle and body aches on 28Feb2021 15:00; headache on 26Feb2021 09:00; lost of taste and smell in the early morning on 28Feb2021; runny nose in the morning on 26Feb2021; and nausea in the afternoon on 25Feb2021. The clinical course was reported as follows: The patient mentioned that he received his 1st dose of the Pfizer COVID19 Vaccine and 5 minutes after, they noticed a blood vessel had busted in his right eye, the same side where he got injected on his right arm. He thinks some blood had dried in his eyes and it was red that afternoon and the next day. He had a right eye busted blood vessel and it turned red. The whole white turned red. They watched him for another 15 minutes and it just stayed red. After a few days, the redness went away, but it left floaters in his right eye. He mentioned that he got 50-150 floaters in his right eye. He has a bunch of black floaters. Floaters are not directly in his sight, but he can see them all around. It has not impaired his sight. If they move in his line of sight, he can still see through them. He did not take second shot. He was scared to because he would get more floaters. It has been 3 weeks already and he still has floaters and it has not changed. Second shot was scheduled for 19Mar2021. Two weeks after first and a week before second one, he decided he did not want to get second shot. Fatigue got better 7 days after. Taste

1227870	4/19/2021	AZ	78	F	3/16/2021	3/29/2021	<p>Bell's Palsy/facial paralysis; Bell's Palsy/facial paralysis; This is a spontaneous report received from a consumer (patient's husband). A 78-year-old female patient received BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine), dose 1 via an unspecified route of administration, at age 78 years, administered in right bicep on 16Mar2021 09:00 (Batch/Lot number was not reported) as single dose for COVID-19 immunization. Patient's medical history includes bells palsy from 1997, lower right lobe of her lung removed in 2016, and removed for carcinoid tumor on an unspecified date. Patient did not have prior vaccinations in 4 weeks. Concomitant medications were none. There were no other vaccines administered on the same date as the suspect. Patient previously took quite a few medications but she hasn't been taking for years or that would affect it. It was reported that patient and the reporter received first dose on 16Mar2021 at 09:00 AM in the right bicep as recommended by the pulmonologist and oncologist. It was reported that on 29Mar2021, also reported as "13 days later from vaccination", facial paralysis started around noon. At the time of report, patient was experiencing Bell's Palsy from 29Mar2021 and asking for recommendation for second dose. Patient was also officially diagnosed with Bell's Palsy when she went to the ER on 31Mar2021. Patient has seen the doctor and been to the ER and the doctor refused to comment saying he had no opinion, they had asked him if she should do the second dose and he said he had no opinion. Reporter relayed that on the website there is no specific notable balance in the numerical groups to suggest a causal relationship to the vaccine. Reporter was asking if the second dose was prohibited, stating patient was scheduled for 06Apr2021 which is 21 days after her first dose. Patient's husband spoke from the FDA's briefing document that "Bell's palsy was reported by four vaccine participants and none in the placebo group. These cases occurred at 3, 9, 37, and 48 days after vaccination," and mentioned that there have been 4 reports of Bell's Palsy during the study and 1 of those was after the first dose and 3 were after the second dose. They wanted to know if it is allowed should she get it or could it be rescheduled to a later date. For tests, no testing was done they just did a visual exam on an unspecified date. Vaccine was not administered at</p>

and pressure in her ears and was dizzy. Hx of Hashimoto's - autoimmune disorder, vestibular issue, concerns with getting the second one (dose). Read about adverse reactions and dizziness was on the list of severe reactions. The instant, within a minute, patient could feel this happening to her, she instantly could feel she becoming dizzy, light headed, out of body experience like floating. (didn't mention this in report) felt like walking on air. While sitting and chit chatting with other people to distract myself. Patient didn't have any anxiety. She will admit she was reluctant to get the vaccine because of my health problems. She was more concerned, she instantly got a headache with the pressure, when she was leaving, she felt her eyes feel weird, almost like an allergy issue, burning, not quite burning either. Kind of like a burning, not quite like a burning, felt like when you walk into the wind that has lots of pollen, that feeling. She didn't walk out side, she was inside when this happened, the pressure was already starting, no headache in front of head, it was in back of my skull, at top of her neck and pressure within the ears and ache and pressure on back of her head. Not dizzy, not like when you are in the hospital and they give she something and patient can't walk, or where you tried to stand and you couldn't , it was more like light headed, like walking on air like. It lasted all yesterday. As the night progressed by 10PM or 11PM her arm started to really hurt, patient took Tylenol and went to bed, took Xanax as she did and slept, woke up fine. This morning it felt like she wanted to have a headache but haven't had it since. It's almost like patient had intracranial pressure, because she had these conditions, so she read a lot. Investigation Assessment was No. States she is calling to report a potentially strange side effect. She states as soon as she got the injection, approximately within one-two minutes, she could feel a rush to the back of her head and the lower part of her head which then made her feel like she had somewhat of her vision clouded, like a tunnel vision. Clarifies her vision was clouded on the sides but she could see forward. Caller states that she was not dizzy like falling over and she does have vestibular migraines and vertigo issues, but she had that feeling of dizziness and when she got up and walked, it felt like she was walking on a cloud. Clarifies she felt a heavy pressure in the back of her head. States as soon as the injection was over, she

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

could feel it. States she is concerned regarding the second dose because of her autoimmune and vestibular conditions. She states is caused immediate pressure in her ears. States that could've affected her and put her into a migraine, she doesn't know. States a friend said jeez you should report that and she read more on the list of side effects and saw something about an allergic reaction and dizziness, and she did have some sort of adverse reaction. States she doesn't know and it is concerning to her. States she is doing fine today, other than a little headache that comes and comes. States it was bizarre with the clouded, not cloudy, but tunnel vision. States she does not want to release any medical records; she declines for now to provide. She states CVS administered it, not her doctor. States she is going to discuss it with him. States she doesn't want to have a worse reaction with the second dose. Caller states a headache is a headache but the pressure she felt within one minute and continuing it concerns her on the second one with the larger dose. States she is also concerned with the second dose if dizziness is a severe allergic reaction, not saying she fell over and wiped out. Patient wondering if that was an allergic reaction. States as the evening went on and she took Tylenol, it improved. States the dizziness improved as the night went on but had a bizarre feeling when she went to bed. States her arm was sore in the evening and is still sore to the touch. Clarifies that her eyes felt funny. States like walking through a stream of pollen, not that she had itchy eyes, but it felt like she had been effected by something. States it was not like a tired and burning feeling, states she can't explain it but something felt like had an allergy type situation if she has a problem with seasonal allergies. Treatment included took Tylenol. States when someone has an autoimmune issue they have a lot of issues regarding the stomach and take a lot of vitamins and supplements. Caller states she wants to report she has a lot of food sensitivities and environmental sensitivities because of her Hashimotos. States anything can set off an immune response. States what happens with that is she would get on her face, angioedema near her ears and the gland secretes and the passage way swells up. States she takes Pepcid AC to treat it. States this did not happen with her first vaccine. States she was very hesitant on taking the vaccine because knows she has

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

these issues and she didn't want to have adverse reactions. States that her reaction to the first vaccine potentially concerns her for the second dose. States going to speak with the medical information department is a good idea. States the location she received her vaccine was very busy. States they did a nice and good job on getting people in. States the girl administering it did good, but she didn't mention unless you knew you had to wait 15 minutes due to possible adverse reactions, they didn't really check on people. States she just had to do whatever and she didn't know whether or not to report it then because she was not in distress. States she thought she just has to get home and drove 30 miles. All events (AEs) did not require a visit to Emergency Room nor Physician Office. The events of Tunnel vision, rush of pressure to back of head and the lower part of head, Headache, dizzy/Dizziness/light headed, cloudy and pressure in her ears/Ear Pressure, was recovered on 01Apr2021, of my arm started to really hurt/Sore Arm; sore to touch was not recovered, of other events was unknown.

1227863	4/19/2021	IL	86	M			He has double vision; Weakness; Tiredness; Headache; He had problem with lymph nodes; doesn't feel good; This is a spontaneous report from a contactable consumer (patient's wife). An 86-year-old male patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number: EN6207), via an unspecified route of administration administered in left shoulder on an unspecified date (at the age of 86-year-old) at SINGLE DOSE for COVID-19 immunisation. Medical history included blood pressure abnormal and blood cholesterol abnormal. Concomitant medication included lisinopril taken for blood pressure. On an unspecified date, the patient experienced he has double vision, weakness, tiredness, headache, and he had problem with lymph nodes. The reporter further stated, "Now I realize that was Wednesday, now this Wednesday afternoon it will be a week do these symptoms last these long normally I am calling because I mean he is not ready for the hospital or anything like that but he just doesn't feel good." The reporter also mentioned that the patient has no fever. The patient was afraid to get the second shot. They are scheduled for the second dose of vaccine on 06Apr2021. There was no treatment received for all events. The patient was recovering from all events.
1227836	4/19/2021	FL	30	F	4/13/2021	4/13/2021	Hypoesthesia in left arm & hand. Intermittent hypoesthesia in lips and jaw within 15 minutes of vaccination. Dizziness and vision impairment after 35 minutes. I attempted to return to the store and fell over twice while walking there due to dizziness/blacking out. Scraped my knees and chin. Was helped by store employees, they checked my blood pressure and cleaned the wounds on my knees (from falling). Hypotension (88/50) upon returning to the store. Drank fluid, ate, was taken to urgent care. At urgent care, normal blood sugar (104), still hypotensive (86/56) approximately 2 hours after vaccination but I felt less dizzy, no vision abnormalities since being helped at the store. Remained at urgent care for over 2 hours, blood pressure was 99/62 at release. Prior to release hypoesthesia largely resolved and was left with only arm pain.

1227874	4/19/2021	MO	56	F	3/23/2021	3/23/2021	Her voice was hoarse and raspy; She had about 10 canker sores in her mouth.; Facial paralysis; Her left calf felt numb; She said she saw more wrinkles on her face than she knew she had; This is a spontaneous report from a contactable consumer (patient). A 56-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) (Pfizer product, lot: EP7534) in left arm on 23Mar2021 17:30 at a single dose for COVID-19 immunisation. Vaccination Facility Type was Hospital. Medical history included ongoing genital herpes. Concomitant medications included valaciclovir hydrochloride (VALACYCLOVIR HCL) 1gram tablet for genital herpes. Stated she had genital herpes for over 10 years, and had an outbreak about 2 weeks prior to getting her 1st COVID-19 Vaccine. She said she hadn't had a herpes outbreak in over 10 years. She said she stopped taking her Valtrex medication after the COVID-19 Virus Pandemic started. She said she restarted the Valtrex when she had the genital herpes outbreak a couple weeks before her 1st COVID-19 Vaccine. She said she had taken a 1/2 Valacyclovir 1gram tablet, off and on, to treat her recent. History of all previous immunization with the Pfizer vaccine considered as suspect (or patient age at first and subsequent immunizations if dates of birth or immunizations are not available) was none. Additional Vaccines Administered on Same Date of the Pfizer Suspect was none. Prior Vaccinations (within 4 weeks) was none. Patient experienced her left calf felt numb on 23Mar2021 with outcome of recovered/resolved; the skin from under both her eyelids to her cheek bones felt like it was being pulled down on 23Mar2021 with outcome of recovered/resolved; her voice was hoarse and raspy on 24Mar2021 with outcome of not recovered/not resolved; she had about 10 canker sores in her mouth on 24Mar2021 with outcome of recovered/resolved; facial paralysis on 23Mar2021 with outcome of recovered/resolved; her skin felt tight on 23Mar2021 with outcome of recovered/resolved; She said she saw more wrinkles on her face than she knew she had on 23Mar2021 with outcome of unknown; cholesterol was high on an unspecified date in 2021 (either late Feb2021 or early Mar2021) with outcome of unknown. She is asking for a recommendation on receipt of second dose. Clinical course: patient reported she had her first COVID-

19 Vaccine shot last Tuesday (23Mar2021), and she had some side effects that were not listed on the COVID-19 Vaccine information sheet she was given. She said she was concerned about getting the second COVID-19 Vaccine shot. She said she sat for 15 minutes after she received her COVID-19 Vaccine, and was completely fine. She said she then had about a 5 minute walk to her car. She said when she was walking to car, her left calf felt numb. She said at first she thought maybe she had been sitting too long, and her left leg fell asleep. She said once she got to her car, the skin from under both her eyelids to her cheek bones felt like it was being pulled down. She described the feeling as being in the sun for days, saying her skin felt tight. She said she looked in her car mirror. She said her face wasn't red, but her face definitely looked like it was being stretched. She said she saw more wrinkles on her face than she knew she had. She clarified her face being stretched as a facial paralysis, and said the facial paralysis only lasted about 4 hours, and then disappeared. She said the next day (24Mar2021), she woke up, and her voice was hoarse and raspy. She said her voice continued to be hoarse and raspy for 2 weeks now. She clarified the hoarseness had been on and off and had improved from last week, but in the evenings her voice gets raspy. She said she had about 10 canker sores in her mouth. She said she gargled with Scope, and the canker sores would come and go. She said the canker sores were not painful like canker sores, but were just sores. Reported she had blood work done in either late Feb2021 or early Mar2021, and everything was fine, except her cholesterol was high. No further details provided. Treatment: Reported she spoke to the on-call doctor at her doctor's office on 23Mar2021 first, and then called the (name) Hospital Emergency Room and spoke with someone about her side effects on 23Mar2021. She said the doctor on-call at her doctor's office told her to take a 1/2 tablet of Valtrex (clarified as generic Valacyclovir HCL 1gram tablet). She clarified she had been taking Valacyclovir HCL since she was diagnosed with genital herpes about 10 years ago. She said she stopped taking the Valacyclovir HCL when the COVID-19 Pandemic started last year. She said she restarted the Valacyclovir HCL, taking a half Valacyclovir HCL 1gram tablet (500mg) daily. She said she spoke with her gynecologist today (02Apr2021), and he told her

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							to take the full Valacyclovir HCL 1gram tablet for 3 months and then go back to taking a half Valacyclovir HCL 1gram tablet (500mg). She said the Valacyclovir HCL 1gram tablet was dispensed in a pharmacy bottle, providing NDC Number: 1671469701. She did not have a Lot Number and Expiration Date. She said the generic Valacyclovir HCL 1gram tablet was manufactured by NorthStar Rx and had "(3/3)" after the manufacturer's name. Reported she gargled with Scope mouthwash for her canker sores in her mouth. She said she had finished the Scope mouthwash, and disposed of the product bottle, and didn't have the UPC, Lot and Expiration Date. Reported her gynecologist was the one who told her to call Pfizer to get further direction about getting her second COVID-19 Vaccine. Follow-up attempts are completed. No further information is expected.

1228627	4/19/2021	VA	44	F	4/15/2021	4/17/2021	I had a off and on temperature/fever, chills, total body fatigue, headache, nausea, sinus and eye pain, and intense arm pain in vaccination arm (right) the day following the 2nd vaccination dose. On the second day my temperature regulated but I still had a headache, nausea, body fatigue. Noticed heart palpations intermediately throughout the day, while moving, lying down and sitting. On the third day still had a slight headache, slim body fatigue and noticed more consistent heart palpations. Also started my menstruation cycle on Saturday as well. Experienced more intense menstrual cramps than normal. It's the fourth day now and still feel the heart palpations more sporadically than yesterday and intense menstrual cramps. Please note that I already had a irregular heart beat prior too covid but I noticed a significant increase in the occurence of the heart palpations. Normally I only have them once a month or once very few months. This has been several times a day and on Sunday seemed to be experiencing hourly.
1228606	4/19/2021	MA	35	F	4/5/2021	4/12/2021	On 4/12/2021, I began experiencing migraine-like symptoms: bad headache and irritated nerves at back of neck. By 4/14/2021, I had a small sore at the corner of my left eye, which at the time I thought was an outbreak of herpes (which I also have, and have had near my eye before). However, the symptoms got worse. By 4/16/2021, I had a second sore appear near my cheekbone and intense itching on my face, with nerve pain in my face. By the morning of 4/17/2021, I woke up with my left eyelid swollen and redness in my left eye, which led me to seek medical attention at an urgent care facility. At urgent care, was diagnosed with shingles with concern of eye involvement. Was prescribed valcyclovir and an antibiotic eyedrop, ofloxacin. Follow up appointment with an opthamologist has been booked.

Pt reported that the twitching has subsided and occurring less frequent than first reported. On 4/15/2021, she reported that her right toe still twitches a little, and this morning 4/16/2021 her left thumb twitched again. Pt reported that she spoke with her MD Thursday 4/15/2021, per MD this could have been a reaction from the vaccine. Pt also reported trouble sleeping since rcvding the vaccine, prior to the vaccine she reported no trouble with sleeping. Pt mentioned the insomnia to her MD; MD thinks this may be due to the possibility of pt experiencing peri-menopause but pt reports she does not have any peri-menopause symptoms except having low progesterone. ***NOTE*** Recommend pt to keep an eye on her symptoms, and if symptoms persist and does not get better to communicate info to MD.

1228541	4/19/2021	PA	37	F	4/16/2021	4/17/2021	Roughly 12hrs after receiving 2nd Pfizer Covid-19 dose I woke up with a stabbing headache, dizziness, lightheadedness, slight chills and bodyaches. As the day progressed I began to develop extreme bodyaches, extreme joint pain, I couldn't regulate my body temperature which fluctuated between feeling very cold and very hot/feverish. My eyes were bloodshot from having a fever of 102.5 at it's highest. I was in significant pain and unable to sleep and rest due to the severe bodyaches and joint pain in my hips, knees and wrists. I also had significant pain in my low back. I don't have pain anywhere in my body generally. The dizziness and lightheadedness also continued to worsen to the degree that I couldn't sit up or walk without losing balance. Around 11:30pm on Saturday 4/17, my fever broke and my aches and pains started to dissipate. As the aforementioned symptoms began to dissipate, I started having difficulty breathing. I felt as though I was having trouble breathing, specifically inhaling. I felt like I couldn't catch my breath at times, though I was sitting or lying down and not exerting myself. I also developed wheezing and a mild cough, both of which have continued to worsen. Today is Monday 4/19/21 and I'm still having mild lightheadedness and dizziness, mild headache that feels like stabbing pains and my cough continues to worse as is the wheezing and feeling like I'm having difficulty breathing at times, without exertion. Injection site continues to be sore. My first dose, I had fatigue and injection site soreness, both of which were completely resolved as of 24hrs after being vaccinated.
1228525	4/19/2021	AZ	64	M	2/16/2021	3/16/2021	Randomly approx 4-5 times over the next 3 weeks, first my left eye, and then my left eye would go black from the outside in, as though I was going to pass out. I would remain still and my vision would come back, first in the right eye and then the left eye. It always happened the same way. My left eye would begin to go black from the outside circumference to the middle, losing site, and then the right eye would start to do the same thing. It hasn't happened again after that first month of reoccurrences, and it never happened before the shots.

body. This seemed to be persistent and he returned to ER for further evaluation/treatment. He has not had reaction to vaccination in the past. He does have allergy to tramadol. He denies having any allergy to soap, detergent, or other chemicals. He denies having exposure to any chemical, fume, dust, plant material after receiving the vaccination. He denies having any new foods or drinks recently. He is not having any nausea or vomiting. He has felt somewhat sweaty. Allergy: tramadol H/O LE muscle weakness/atrophy, COPD ROS Const: No fever, chills, sweats. No unusual weakness (he does note "my leg is atrophying" when he is speaking about his LLE) HEENT: No runny nose, congestion, ear ache. Perhaps some odd sensation in the throat due to swollen uvula. CV: No chest pain, palpitations. No unusual shortness of breath. No edema to the ankles / legs. No pain with breathing. Abdom: No nausea, vomiting, diarrhea, or constipation. No abdominal pain. Lymph: No swelling to glands. Physical Exam: ? Physical Exam A&O, nontoxic. Pleasant. No pain distress. Mild physiologic distress. Appears to be overweight adult with component of chronic illness and with acute allergic reaction/process. Eyes: EOMI, nonicteric, conjunctiva clear. Throat: Moist mucous membranes. Symmetric rise of palate. No pharynx erythema. Tonsils normal size and without erythema or exudate. His uvula is moderately edematous and elongated. He is managing his secretions well. There is no angioedema of the tongue, soft palate, lips. No stridor. No blood in the oropharynx. No rhinitis/runny nose. Neck: supple, normal ROM, nontender. trachea midline. No cervical or supraclavicular lymphadenopathy. Thyroid nontender and normal size. Back: No pain on percussion. No muscle spasm. Nontender palpation. No kyphosis. Lungs: fair to good air movement with quiet, fine primarily inspiratory wheezes in the mid to lower lung fields. No effort, no rales, crackles, rhonchi. Normal resonance on percussion. Cough clear. Cardiac: borderline tachy RRR S1, S2, without murmur or rub. Posterior tibial, Pedal pulses 2/4 bilaterally. No ankle or pretibial edema. Skin: cool & dry extremities. cool & moist (not diaphoretic) back skin. Normal turgor. He does have confluent macular rash to the neck, (somewhat on face), arms, back/chest/abdomen. Some mild hyperemia to the legs/ankles. No urticaria. The right

----------	-------	-------	---------	-----	----------	------------	--------------

deltoid injection site is involved with the hyperemia/macular rash but no urticaria at this location right now Abdom: Bowel sounds present x 4 Quadrants. Normal tympany to percussion. Soft. Non-distended. Nontender. Nonsurgical. Good muscle tone and moves all extremities. He notes he has his chronic weakness in his left lower extremity. Medical Decision Making: ? Discussed with another healthcare provider Discussed case with another healthcare provider ? Consultation Consultation 1, Consultation 2 ? Consultation 1 04/16/2021 15:54 ? Consultation 1 Comments discussed with RPh. He will come to ER to obtain additional information from patient. This is the hospital's first presumptive Pfizer vaccine reaction. ? Consultation 2 04/16/2021 15:41 ? Consultation 2 Comments discussed with Dr. we discuss presentation. he agrees pt will need monitoring with the persisting symptom/findings and the H/O COPD. 1617 Dr has been to ER and completed eval. pt to be placed on 2nd floor med/tele for additional monitoring and treatment. pt did have labs yesterday. ? Decision to Admit Based On 1446 Based on his symptoms and presentation presumptive acute anaphylaxis to component of the Pfizer Covid vaccine. We will begin treatment with 0.3 mg epinephrine IM once as well as dexamethasone, famotidine, diphenhydramine IV. We will continue to monitor with cardiac telemetry and pulse oximetry. He does have slight wheezing but this may be related to his chronic COPD. No respiratory distress at this time, but his symptoms seem to have been mildly progressive over the past hour (per his report). I believe inclusion of the epi to be prudent based on his presentation. Additionally, I will inform the vaccination clinic of this reaction. he agrees pt will benefit from continued monitoring and repeated IV antihistamine and IV steroid treatment. Pt will need IV fluid for hydration as well. Recheck: ? Recheck Recheck 1, Recheck 2, Recheck 3 ? Time 14:55 ? Recheck patient stable patient improving with treatment ? Comments He is improving. His skin is now warm and moist (not sweaty , not diaphoretic). The rash is receding from the arms. Good coloration to the legs/ankles. Back & torso rash starting to recede. no nausea/vomiting. no difficulty breathing. still with fading macular rash on the torso and upper back. Lungs: improved air movement compared to the initial exam, nl

effort, no rales, crackles, rhonchi. He has lower field (only) quiet fine inspiratory wheezes. Normal resonance on percussion. Cough mildly wheeze @ bases, with improved airflow. Cardiac: borderline tachy RRR S1, S2, without murmur or rub. Posterior tibial, pedal pulses 2/4 bilaterally. No ankle or pretibial edema. ? Time #2 15:05 ? Recheck #2 patient stable patient improving with treatment ? Comments #2 man from pharmacy is here and recognizes patient from the vaccination clinic. Patient rash has faded from his extremities fully and appears to have faded from his abdomen still somewhat at the malar area of the cheeks as well as the neck and torso portion of the chest. His pulse is 98?99 continues to have elevated blood pressure. Pulse oximetry 98-100% on room air, normal. Pharmacist will enter the reaction into the CDC/FDA/Pfizer database. Overall pt notes he feels tired (probably related to hydration & benadryl). He notes he has returned to home about 2 weeks ago after spending some time on the road in mountains playing guitar / touring with a small band , playing music. ? Time #3 15:37 ? Recheck #3 patient stable ? Comments #3 He has been resting. No respiratory distress. His blood pressure and pulse and pulse oximetry are reviewed at bedside and they are nonfocal at this time. Overall he is improving. He notes he still has malaise and feels about the same with itching in his back and the sensation in his throat. When I evaluate his back there is hyperemia/some macular rash that is in approximately the distribution of the trapezius muscle of the back this is where he notes he has the itching. Additionally when I evaluate his throat there is still some presence of uvula edema. There is no other angioedema. Perhaps he does have some mild hyperemia to the uvula and soft palate at this time. He is clinically improving but his symptoms have not resolved fully. Skin warm and dry normal turgor. No diaphoresis Lungs initially some coarseness/mucousy breath sounds to the mid lower fields but this clears after he coughs. Good air exchange at this time. No rales rhonchi wheezes or crackles. Cough initially mucousy then clear. managing secretions well. no stridor. no respiratory distress. Critical Care Times: ? Critical Care Time of minutes excluding, separately billable procedures 35 Disposition Summary: Arrival 04/16/2021 14:21 Disposition to be admitted Disposition Decision

1 Day after the injection, inside my mouth began to swell, my throat began to close up and limit my breathing, wheezing was taking place, my eyes were also starting to swell shut as well as sneezing and runny nose. Coughing also took place. No rash was present and nothing present at the injection site. Allergy symptoms subsided over the next few hours as a result of Zyrtec being taken. Swelling of eyes remained until the next day after the event.

1228450	4/19/2021	NJ	73	F	4/10/2021	4/10/2021	<p>April 17, 2021 History of Present Illness The patient was admitted for a potential post vaccination reaction pattern. She received the majority of vaccine 1 week ago on Saturday within 24 hours start developing a pruritic process with a cutaneous eruption on the back of her neck this progressed over 72 hours to involve the entire body area. She does state that she felt something is in her mouth but was unclear whether they were truly ulcers. There was no involvement of any tongue or lip swelling, nasal (sneezing, rhinorrhea), ocular (tearing, injection of eyes, tunnel vision), respiratory wheezing cough, change in voice) or gastrointestinal symptoms (nausea, vomiting or diarrhea associated with the administration of the moderna vaccine. She does have a history of asthma as a child and through her adolescent years. She does not have a history of asthma at the present time she does have some mild seasonal allergies she had seen an otolaryngologist in the past and told her that she had nasal allergies. The reaction consisted of a progressive cutaneous eruption that started in her neck and went to her torso and upper arms and then progressed to her lower extremities and her abdomen as well as her back and neck and face over the course of 72 hours. The vaccination occurred on Saturday and the patient was seen by her primary care physician on Wednesday and given steroids which did not have any effect. She then came to the emergency department on Thursday where she was admitted for a reaction pattern and has been in the hospital since.</p>

Still blurry.
1228400	4/19/2021	IN	32	F	4/15/2021	4/15/2021	did not keep us the allotted 15-30 minutes after receiving vaccine. On the drive out, I immediately got a headache, hot/sweaty, blurred vision and felt faint. We were unable to pull over and the high curbs and single car line we were in, my husband pulled over when he could but thankfully my symptoms only last 2-3 minutes. I used a cold compress and had a fan on me when I arrived home about 10 minutes later. About an hour and a half later, my arm hurt bad enough to use a cold compress for two days. Today, 4 days later, my arm has a slight pain to the touch. I did report this to my family doctor, via email.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1228396	4/19/2021	IN	22	F	4/17/2021	4/18/2021	After receiving the shot I was fine for the first few hours. Then my arm started to get really stiff and felt almost swollen. I had my mom check it and it wasn't swollen but the day after I woke up and felt like something wasn't quite right. I felt where my lymph nodes are near my clavicle and there were very swollen almost the size of a golf ball, my lymph node under my armpit was also quite swollen. I had a headache on the left side of my head and around my eye. My lymph node near my clavicle is still quite swollen but I'm feeling a little better. I kept using a cold compress on my arm and lymph nodes as well as taking Tylenol. I did also have a slight fever of about 100 one night but it went away by the next day.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1228395	4/19/2021	FL	70	F	3/10/2021	3/10/2021	<p>Got the vaccine and waited the 15 minutes per their recommendations, and while driving her car home within 10 minutes felt that her face, bridge of her nose and spreading into her cheeks became numb and tingling. Then the lower part of her face, spreading down into her windpipe and clavicle area, then her (outer 2 toes on each foot, pinky and next finger) started to get numb and tingly, as well as the upper lip. As the day wore on that evening the feeling went to the either side of her spine, the numbness and tingling. She waited to see if it dissipated, and called her doctor on Monday 3/15/21 and saw a PA who felt that she may have upset her whole nerve system and told her that it was going to take a while for it to straighten out. She consulted with her PCP and gave her some samples of Horizant, but she did not try it as she has multiple allergies to medications. She also from the time of her vaccine that she started to get horrible burning and tingling throughout her body everywhere, (arms, stomach) woke her up from sleep. The other symptoms previously mentioned continued as well. On Wednesday 3/17/21, called her cardiologist who told her to call the hospital and perhaps go to the hospital and they told her to call her doctor. The cardiologist told her she needed to see a neurologist who she saw on 3/31/21. The patient was afraid she had Guillain Barre syndrome, and the neurologist felt that if that was the case and that she would not have been able to walk at this point. She did the neurologic testing, and she was going to give her Gabapentin (which she had already been given samples of and did not want to take). The burning and tightness of her face down to her throat/clavicle area was concerning to her and still continues. Her conclusion was that if she got worse to go to the hospital, and the basically do not know what to do. She herself is wanting to know if this is going to disappear, and what are the long-term affects. She is now hesitant to have her eyes dilated, is scheduled for some procedures and afraid to have them done as it has been 5 weeks since the vaccine and still having the same reactions, and does not know what she should do. Since the vaccine the worst is in the morning, and residual in the face/burning of her face to throat/clavicle, and also continues with the burning in her spine as well. The burning is not as bad as it was, but the face, throat/clavicle area is the worst.</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1228388	4/19/2021	FL	24	F	4/16/2021	4/17/2021	Swollen, redness, itchiness surrounding the area of injection. Body tremors, distorted vision
1228385	4/19/2021	NC	40	M	4/6/2021	4/8/2021	Shortness of breath. Disorientation, Dizziness, Gastrointestinal issues, urinary tract discomfort, blurred vision for extended periods of time during multiple days.
1228368	4/19/2021	KY	68	F	4/8/2021	4/8/2021	12 hours after vaccination eyes discharging and crusted overnight, headache, deep and constant muscle pain, joint pain, intestinal pain and discomfort, fever 101, painful, swollen lymph nodes
1228359	4/19/2021	RI	46	F	4/10/2021	4/10/2021	- 1-2 minutes after the moderna vaccine on 4/10, felt a shock in her head and then her eyes went blurry. Face felt hot. Then it came down to her throat and she felt like there was something big stuck in her throat. It was hard to talk. Husband was there also and noted that Pt had trouble speaking. Felt faint but did not faint. The thing that was stuck in her throat came down to her chest and felt chest tightness. Then a few minutes later, that sensation went away. Ears felt hot and red. - Pt was monitored following vaccination and BP was taken and was 140s (higher than normal). - Pt then decided to go to the ED and be monitored. ED provider thought reaction was due to anxiety as symptoms were not classic for an allergic reaction/anaphylaxis and Pt improved without intervention/symptoms resolved. Pt denies anxiety and feels reaction was an AE.

1228255	4/19/2021	PA	39	F	4/17/2021	4/17/2021	As soon as I received it, about 2 minutes after, it was a drive thru event and my mom was also with me in the car receiving the vaccine also. I was still waiting for the nurse to replace her bandaid since she was bleeding a little more than normal. As soon as the car got out of the tent, I was driving, it felt like my head was being drilled, my vision blurred, everything turned dark, I could not hear, I had a bad headache almost about to faint but I kept on driving slowly to get to the waiting area. By the time I parked, I removed my mask, open the car window and relaxed and just started inhaling deeply. I felt better soon after and spoke to the nurse there and she recommended drinking fluids the next 48 hrs. I felt dizzy, tired but not very sore like the first dose. 2 days later, I still feel dizzy, vision is blurry sometimes and occasional headache, a little tenderness on abdomen and feeling like I am catching my breath sometimes.
1228220	4/19/2021	NY	41	F	4/7/2021	4/7/2021	Numbness of face, arm and leg (right side of the face became droopy), closed-eye hallucination, vision blurriness, difficulty breathing, brain fog, tingling sensations on the chest and neck.
1228194	4/19/2021	CA	22	M	4/18/2021	4/18/2021	Systemic: Dizziness / Lightheadness-Medium, Systemic: Fainting / Unresponsive-Medium, Additional Details: Patient felt dizzy/light-headed within 1-2 minutes of receiving his 2nd dose of Moderna vaccine on 4/18/21 at ~12:30pm. Patient stood up from the waiting area, walked approximately 20 feet to the pharmacy window to request assistance where he fainted and hit his head on the counter ledge. He has a raised bump (approximately 2 inches wide) on his right temple above his eyebrow. Patient remained conscious, received water/juice/granola bar & was monitored by the RPh for an additional 30-40 minutes.
1228686	4/19/2021	PR	62	M	4/12/2021	4/12/2021	Headache Joint pain Back pain Eye pain Fever shaking chills Fatigue Tiredness After a week tiredness still present and moderate fatigue
1228461	4/19/2021			U			Left side face and eye paralysis. Diagnosed on Apr 15, 2021 with Bells Palsey at Emergency Room. I cannot work due to this and now may have permanent damage due to this vaccination.

1230961	4/19/2021	TN	52	M	3/11/2021	3/19/2021	<p>Mini-stroke transient ischemic attack; Room spinning; Winking eyelids involuntarily; Felt like he was falling to his right side; This spontaneous case was reported by a pharmacist (subsequently medically confirmed) and describes the occurrence of TRANSIENT ISCHAEMIC ATTACK (Mini-stroke transient ischemic attack), VERTIGO (Room spinning) and BLEPHAROSPASM (Winking eyelids involuntarily) in a 52-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 023M20A) for COVID-19 vaccination. The patient's past medical history included Open heart surgery. Concomitant products included POTASSIUM, FUROSEMIDE (LASIX [FUROSEMIDE]), WARFARIN, METOPROLOL SUCCINATE (TOPROL XL), MINERALS NOS, VITAMINS NOS (PRENATAL VITAMINS [MINERALS NOS;VITAMINS NOS]), CETIRIZINE HYDROCHLORIDE (ZYRTEC [CETIRIZINE HYDROCHLORIDE]) and ESCITALOPRAM OXALATE (LEXAPRO) for an unknown indication. On 11-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 19-Mar-2021, the patient experienced TRANSIENT ISCHAEMIC ATTACK (Mini-stroke transient ischemic attack) (seriousness criteria hospitalization, disability, medically significant, life threatening and intervention required), VERTIGO (Room spinning) (seriousness criteria hospitalization, disability, medically significant, life threatening and intervention required) and BLEPHAROSPASM (Winking eyelids involuntarily) (seriousness criteria hospitalization, disability, medically significant, life threatening and intervention required). The patient was hospitalized from 19-Mar-2021 to 21-Mar-2021 due to TRANSIENT ISCHAEMIC ATTACK. On 21-Mar-2021, TRANSIENT ISCHAEMIC ATTACK (Mini-stroke transient ischemic attack), VERTIGO (Room spinning) and BLEPHAROSPASM (Winking eyelids involuntarily) had resolved. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Patient received vaccine in right non-dominate deltoid muscle to prevent COVID-19. Patient was admitted to hospital from 19Mar2021 to 21Mar2021 for a magnetic</p>

							resonance imaging (MRI) and computerized tomography (CT) scan, with observation and Low-Dose Aspirin. Patient was feeling much better and his cardiologist recommended that he receives his second Moderna vaccine as soon as required and to take an extra Vitamin D supplement as a precaution. Scheduled second dose was due on 08Apr2021. Treatment included was low dose aspirin.; Sender's Comments: Based on the current available information and the temporal association between the product use and the start date of the events a causal relationship cannot be excluded.
1230895	4/19/2021	OR	28	M	4/7/2021	4/17/2021	The patient is a 28 y.o. male who presents to the Emergency Department with left sided body aches and 6/10 head pain that began approximately two weeks ago following the administration of the Johnson and Johnson COVID-19 vaccine. The patient is present with a chaperone at bedside who helps provide history and translates for the patient. Since the administration of the vaccine the patient states he's been experiencing these symptoms. The patient reports that he began experiencing his symptoms approximately 30 minutes following the vaccine administration and have worsened since onset. He reports that he took oral Tylenol yesterday with minimal relief. The patient states that movement and exertion exacerbate his symptoms and reports that he was not able to attend work today secondary to his pain. The patient denies any associated symptoms of fever, chills, nausea, vomiting, diarrhea, constipation, or any visual changes.
1230874	4/19/2021	NJ	47	F	4/12/2021	4/14/2021	I have an ear ache, nasal sensitivity, eye pain, slight headache all on the left side of head, shot was in left arm.

1230859	4/19/2021	AZ	30	F	4/7/2021	4/9/2021	Moderate Swollen face under eyes and chin for 3 days. Had vx on April 7th around 9pm. April 8th got body ache and chills (took Tylenol extra strength). April 9th-April 11th moderate swollen face. April 12th-April 14th mild swollen face. (Took Benadryl 50mg at night). Called doctor line and Health nurse line who recommended going to Urgent care.
1230848	4/19/2021	AZ	64	F	4/5/2021	4/12/2021	Exactly a week after receiving the J&J vaccine, I was out on my morning walk when my head became very fuzzy and my vision was altered (seeing jagged zigzags-fuzzy ones with my left eye). The vision issue persisted when I closed my eyes. The fuzzy head issue continued during a very difficult walk home and when I arrived and things didn't clear, my husband ended up taking me to the emergency room. I got in quickly because the symptoms I described sounded to them like a stroke. But, I didn't have a stroke. They did a CT scan. It was fine. The vision thing they thought sounded like the effect of a migraine. But, I've never experienced migraines. (Note: this incident occurred the day before the news of the J&J blood clots became public). Anyway, after a couple of hours in the emergency room, I was fine and went home. So, I don't know what happened and it probably didn't have anything to do with the vaccine. I'm not prone to being alarmist and I would only consent to go to the emergency room if I thought I were in a serious situation. The blood work indicated my platelets were in the normal range. And, I'm too old to be in the category of the six women who experienced blood clots. However, I just thought I should report this in case anyone else experiences something similar.

1231009	4/19/2021	CA	32	M	4/16/2021	4/16/2021	<p>Patient received the 1st COVID-19 Vaccine (Pfizer, Lot #: EW0162, expiration date: 07/31/2021) at 10:00. At 10:12 patient ambulated to Medic in the observation area, asking to use the restroom due to complaints of nausea. Patient was advised by Hospital that he would not be able to use the restroom due to his physical presentation of pale, warm, moist skin, pupils becoming greater than or equal to 9 mm, and a look of confusion. Medic attempted to assist the client with ambulation to anti-gravity chair, when the patient?s knees buckled and he was assisted to the floor. Nurse and Nurse responded to assist Medic. Patient lost consciousness and was then assisted into anti-gravity chair and sternal rub applied. Per Medic , patient?s loss of consciousness subsided after 3 seconds and became conscious, alert, and oriented to person, place, time, and event (CAOX4). Patient stated he has ?syncopal episodes every time he has a procedure done that involves needles.? Baseline vitals were obtained by Medic at 1015, while patient was sitting: blood pressure: 98/50, heart rate: 60, respiratory rate: 18, pupils equal and reactive to light at 5 mm. Patient claimed that about 2 minutes status post-vaccine, he began to feel ?lightheaded, nauseous, and had a hot flash. Patient stated he has similar reactions every time. Patient denied chest pain, headache, vomiting, abdominal pain, and blurry vision. Patient was given water to sip on. At 1020, second set of vitals were taken by Medic, while patient was sitting: blood pressure: 90/60, respiratory rate: 16, heart rate: 97, and patient was conscious, alert, and oriented to person, place, time, and event (CAOX4). Patient?s skin was normal color, warm, and dry. Pupils were 3 mm and equal and reactive to light. Patient claimed last oral intake was on 04/15/2021 with minimal fluid intake as well. Patient denied any complaints and claimed he was feeling better. ALS interventions offered by Medic for further evaluation and care, but patient refused. Third set of vitals were obtained by Medic, while patient was standing, at 1030: blood pressure: 118/76, heart rate: 82, respiratory rate: 14, and patient was conscious, alert, and oriented to person, place, time, and event (CAOX4). Patient was negative for orthostatic pressures and was released into the care of his spouse, after waiting in the observation area for about 1 hour. Patient drank a full 12 ounce water bottle and was able to walk out on his own, with a steady</p>

1230596	4/19/2021	MI	52	F	12/30/2020	1/11/2021	Severe itching of my inside my eyes (upper and lower inside lids); bloodshot eyes; swelling of lids themselves. Felt like an allergy. Felt extremely itchy. Also had like a grittiness to my eyes. It was very severe. It lasted for two weeks before I was seen by the doctor. 1/25 - Dr said my eyes were very inflamed. She rolled up my eyelids and said that I had bumps under my eyelids from severe inflammation. I had been using, at home, an OTC allergy eyedrop - Ketotisin Fumerate - that wasn't helping. Dr prescribed a steroid eye drop. They also gave me an Erythromycin ointment for outside of eyes because they said my skin was very dry and affected and she was trying to moisturize it. She described it as a toxic conjunctivitis. The steroid drops did help. I went back for a follow up and it was improved. Subsequent to that, I went back to doctor for an exam for eye glasses and she said there was still a residual of the bumpiness under the eye lids (March 17th). Now I have been experiencing problems with that again that started a week ago today - April 12th. Having a more itchiness (extreme but not quite as severe as the first time) - redness; bloodshot eyes. I tried the OTC med again and it didn't help. I used the Steroid medication again twice and it did help it a bit...I am trying not to use the Steroid medication too much - so just trying to get the symptoms at bay with sparse use of Steroid drops. (Received the 2nd dose - January 20, 2021.)
1230571	4/19/2021	RI	61	F	3/1/2021	3/27/2021	3 days after 2nd vaccine I had a large red itchy patch around the vaccination site. 8 days after the 2nd vaccine I had intense swelling under my eyes (about the size of a golf ball) Photos available by request.
1230547	4/19/2021	CA	68	F	4/15/2021	4/15/2021	Nausea, vomiting, diarrhea, severe trembling, headache, fever, swollen glands, swelling in eyes, lips, tongue, uglia. Bloody nose. Swelling and itchy at vaccine sight and still swollen on 4/19/2021. Pressure in ears and head.
1230810	4/19/2021	IN	51	M	4/17/2021	4/19/2021	Severe swelling of the left eyeball and eyelid starting at 2:30 am on 4/19/21. No pain, fever or itchiness. But there was flow of tears and couldn't open that eye. The swelling in the eye got worse in the morning and it was completely shut.

1231189	4/19/2021	IL	21	F	4/16/2021	4/17/2021	I started to have hives form along essentially my whole body besides my face starting 36 hours after my initial vaccine. My legs are the most concentrated with hives. I awoke up with swelled up hands, eye lids and wrists. Today, I woke up with a swollen upper lip and swollen bottoms of my feet.
1229531	4/19/2021		21	M	4/13/2021	4/13/2021	Patient received the vaccine and moments after passed out (head and eyes rolled back), starting slouching on his right side and started to show twitching/convulsions and turned pale. Regained conscience soon after his name was spoken to him. Called RRT, took vitals while waiting for RRT. Mother of patient explained that this happens every time the patient receives a shot or blood drawn. RRT showed up and assisted soon after.
1231024	4/19/2021	TN	36	F	2/2/2021	2/3/2021	Suddenly became hypotensive, diaphoretic and clammy, vision got swimmy. I was able to sit down and then lie down before passing out. Then I got the chills and fingers were a bit cyanotic. Blood pressure was checked--it was low 60s/40s. Pulse ox was checked--that was fine, 99 or 100. Temp was checked--that was also normal. Laid down for a few hours and drank lots of fluids, (water and juice). Blood pressure slowly came back up as the day progressed, but not back to normal. It took two weeks for my blood pressure to fully stabilize back to my normal range. I checked my blood pressure daily for probably three weeks and drank juice/gatorade daily to help.

1231333	4/19/2021	CA	29	F	4/2/2021	4/3/2021	Had hives on face, neck, ears, back, and upper arms. Hives started on face in the morning and slowly appeared in other areas over the next couple of hours. Lips and left eye were swollen. Generally feeling unwell. Went to doctor same day and received antihistamine and steroids for my symptoms. Hives and swelling went down by 11 am the same day after taking the steroids.
1231315	4/19/2021	CA	59	F	4/8/2021	4/15/2021	Rash on upper arm started 7 days after vaccine at the vaccination site. some itchy dots underneath eye. It was hot and itchy. Day 2 it was raised and larger. Day 3 it was at it's worst and I thought I had to go to the ER. The rash on my left arm was very bad and hot and raised. I had taken Benadryl at night and also applied cortisone cream on rash. The rash on my face underneath my eye got worse and it also was now underneath the other eye, My eyes were very red and felt scratchy and got very teary by the end of the day. Also some swelling and itching of upper lip. Day 4 issues in the face got better, but arm rash spread and even got some on the lower arm. Day 5 no more rash in the face or sensitive eyes or lips. It is day 5 now and my upper arm still feels warm and has a rash with red blotches, but it is getting better.
1231313	4/19/2021	CA	65	M	2/13/2021	2/17/2021	Within 4 days of 1st Pfizer vaccine for COVID, developed fatiguable diplopia confirmed associated with vertical eye misalignment.

1231233	4/19/2021	TN	30	F	3/29/2021	4/12/2021	About a week and a half ago I started feeling brain fog and was experiencing a floating sensation. Monday while on lunch I was driving and the world completely shifted and flipped in front of me causing me to pull over out of risk of wrecking my car. I do not have a history of dizzy spells or vertigo per se and there would be absolutely nothing that could have triggered this but the vaccine. I have an article where I am not the only one. Though I can still function im still scared to drive far and I occasionally feel like my eyes are floating

1231230	4/19/2021	MS	52	M	4/17/2021	4/18/2021	Patient reported blindness for 12 hours starting at 1:00am the following morning along with a "bad headache".
1231225	4/19/2021	TX	47	F	4/6/2021	4/7/2021	Site pain soreness, woke up with 100.7 fever, body aches, chill, nausea, headache and extreme fatigue and felt like this for 3 full days. Then 7 days later awoke with extreme headache behind left eye, sensitivity to light, sensitive/sore spot on top of head, exhausted but trouble sleeping, upset stomach.
1231218	4/19/2021	FL	45	F	4/6/2021	4/6/2021	I have had the same that most people complain about, soreness of arm, but nothing that concerned me. I have noticed changes to my vision and after one week, developing headaches that are not going away even with Motrin. I have also noticed after a few days after the shot a strange reaction, like if my heart jumped a beat and I had shortness of breath. It would be only one or two second episodes at a time, so I'm not too concerned, but if it continues, I will discuss this with my doctor. I had never felt that before. This is not chest pains, it's difficult to describe. It's like the heart has to "jump" a beat.. but only once or twice. It's scary, but it does not happen often and it's happening less in the past day. The headaches are not fun, but I hope they will go away after a few weeks. I don't suffer migranes or headaches on a regular basis.

1230968	4/19/2021	IL	62	F	3/11/2021	4/9/2021	<p>delerious; Fever; Rash; horrible body aches; Skin on fire; severe headache; pounding a rod into brain; dizzy; lack of concentration; eyes not dilating; ringing in ears; This spontaneous case was reported by a consumer and describes the occurrence of DELIRIUM (delerious) in a 62-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 037A21B and 001B21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included No adverse event (No reported medical history). On 11-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 08-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 09-Apr-2021, the patient experienced DELIRIUM (delerious) (seriousness criterion medically significant), PYREXIA (Fever), VACCINATION SITE RASH (Rash), PAIN (horrible body aches), SKIN BURNING SENSATION (Skin on fire), HEADACHE (severe headache), HEADACHE (pounding a rod into brain), DIZZINESS (dizzy), DISTURBANCE IN ATTENTION (lack of concentration), MIOSIS (eyes not dilating) and TINNITUS (ringing in ears). At the time of the report, DELIRIUM (delerious), PYREXIA (Fever), VACCINATION SITE RASH (Rash), PAIN (horrible body aches), SKIN BURNING SENSATION (Skin on fire), HEADACHE (severe headache), HEADACHE (pounding a rod into brain), DIZZINESS (dizzy), DISTURBANCE IN ATTENTION (lack of concentration) and MIOSIS (eyes not dilating) outcome was unknown and TINNITUS (ringing in ears) had not resolved. This case concerns a 62-year-old female with a serious unexpected event of delirium, and nonserious unexpected dizziness, pain, skin burning sensation, disturbance in attention, miosis, tinnitus, and expected fever, headache, vaccination site rash. Event onset 2 days after second dose mRNA-1273. Event outcomes ongoing or unknown. Based on current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.; Sender's Comments: This case concerns a 62-year-old female with a serious unexpected event of delirium, and nonserious unexpected dizziness, pain, skin burning sensation, disturbance in attention, miosis,</p>

1231185	4/19/2021	FL	18	M	4/8/2021	4/8/2021	Vision problem. My son has been a homeschooled student for many years, using computer for his schooling without any problems. He had a minor injury to one eye shortly before the vaccination (scratched with hand), but after the shot, he complained of vision problems in both eyes. Redness, dryness, pressure, uncomfortable. Unable to concentrate and stay reading for more than a few minutes at a time. His primary doctor is now treating with antibiotic drops, but will take him to the eye doctor if he does not get better by Thursday as he will be done with the eye drops. We have also added allergy medicine, which seems to help a little. He is due for his second shot on 4/29. I still need him to get the shot to be protected from Covid, so hopefully, he will be better.

1229954	4/19/2021	AZ	54	F	3/13/2021	3/13/2021	She got the vaccine, and got a racing heart, tightness and heaviness in her chest immediately. When she got to the nurse she relayed that to her. Later she felt unwell, and that her heard in a vice. She then went to the restroom and noticed swelling immediately under eye, and spread to the top of her checked and became dizzy around 1:00 AM that morning. Her lymph does swell and had to see a doctor a week later. Her doctor did an EKG, chest x-rays. She could not rid of the tightness of chest that would not go away. She gave her anti-inflammatory medicines and gave her a script for new inhaler, and is still having the tightness of the chest now. This was not on and off and had to see a doctor. She is taking her inhaler and taking Benadryl as she is now break and can't afford to go back if she has a problem. She got really, really ill and had 10 of the possible effects and then got the severe side effects. With the swelling, breathing difficulty and swelling of the face was advised not to get the 2nd vaccine. She told the nurse at the vaccine site what she was experiencing and was informed by her that it was pre-vaccine anxiety and was dismissed.

1229833	4/19/2021	PA	72	M	3/25/2021	3/30/2021	Five days after receiving the first dose patient was admitted to Hospital on 03/30/2021 with an acute left MCA M2 branch stroke requiring tPA that resulted in a small amount of hemorrhagic transformation. Tee revealed no cardiac source of embolism. He is left with some expressive and receptive aphasia. He also has some loss of L eye vision. There was no stenosis of the carotid arteries but the left M2 branch was occluded. He did not have any atrial fibrillation in the hospital but is wearing a 30 day monitor currently. We have no idea this was related to the vaccine but wanted to report. The Neurologist thinks it is just a coincidence. But we still want you to know it happened.
1229817	4/19/2021	OH	43	M	4/18/2021	4/18/2021	Fever, chills, fatigue, fuzzy vision
1229809	4/19/2021	MI	45	F	4/14/2021	4/14/2021	15 minutes after the injection I had an intense allergic/anaphylactic reaction. I was watched and treated on site by EMS for 2 hours with Benadryl, oxygen and rest. We did not use epi because I was still able to breath (minus some wheezing, coughing, hoarseness and lung irritation). I felt the reaction hit when I started seeing green spots and my vitals dramatically increased (BP 181/111, HR 142 and weak). I then experienced the following symptoms: rash/hives on neck and chest, fatigue and weakness, dizzy and lightheaded and needed wheelchair for moving around, chills and shaking, blurry vision, nausea, stomach pain, headache, chest pain and increased urination. I also had elevated glucose (147). During those two hours my vitals decreased a little, but the rest of my symptoms persisted. I was not getting better and my vitals started to increase again at the two hour mark so EMS called an ambulance and transported me to hospital. I was treated with solumedrol and observed for several hours. The meds helped enough to send me home. (I did have to continue taking Benadryl at home that night and the next day because I continued to have an allergic response). I also had severe injection site pain and bruising.

1230000	4/19/2021	WA	66	F	3/29/2021	3/30/2021	Starting 7 days after the 2nd dose I started having very swollen eyes each morning. That has continued and worsened. On Day 18 after receiving 2nd dose, in addition to swollen eyes, my whole face swelled. This has continued on Day 19, 20, and 21 (today being 3 weeks from having the 2nd shot). Also on Day 18, I noticed a hard lump on my neck which is still there and sore to touch. I continue to have a rash on the left side of my chest which started the day after I received the 2nd dose (March 30), and it is still there 3 weeks later.
1229717	4/19/2021	PA	59	F	3/12/2021	3/27/2021	March 27 woke with severe headache lasted 24 hours. Monday tops of my legs hurt so much it was hard to lower myself to sit. Lasted till Thursday. April 11 woken by severe headache, couldn't see clearly. Very dizzy blurred vision threw up went to er was admitted. Had. Ultrasound, CT scan, EKG, MRI. Left hospital Monday evening, still dizzy till Thursday. Head still doesn't feel right.

1229684	4/19/2021	FL	50	F	4/12/2021	4/13/2021	24 hours after second Pfizer vaccination, began to experience eye pain and swelling in the right eye / conjunctivitis; which escalated dramatically on 4/14/2021. on 4/15/2021 eye pain continued to escalate and began experiencing severe light sensitivity. Saw ophthalmologist on 04/15/2021 and began taking steroid drops to reduce eye inflammation. Pain reduced, but experiencing fuzzy vision on 04/17/2021 and 04/18/21. Unsure yet of resolution. 24 hours after second Pfizer vaccination experienced fever of 101.2 before reducing with tylenol (lasted from about 5pm to 9pm on 04/13/2021). Extremely tired with brain fog throughout the week (and still experiencing as of 04/19/2021)
1229668	4/19/2021	FL	35	F	4/6/2021	4/6/2021	about 30 minutes after the vaccine I had burning eyes/stinging went away after 15 minutes. About 1.5 to 2 hours after the vaccine I started to feel like my lips, roof of my mouth, and cheeks were numb and tingling. It felt as though they were swollen, but my face was not swollen. It's almost the sensation that you get when you put orajel on and it begins to wear off. I took 2 Benadryl around 8pm because I felt like I was becoming more numb on my face. The next day I still had residual numb/heaviness feeling in my lips and tingling on my cheeks but not nearly as much as the previous day. All reactions were gone by the 36 hour marker.
1229633	4/19/2021	GA	32	M	4/19/2021	4/19/2021	Patient reports dizziness, sore muscles, headache, and nausea that began at 10:30am this morning after receiving his first dose of Pfizer COVID 19 vaccine. He said between 10:30am and 11:00am his vision became blurred. At 2:30pm when patient called to make report he was still experiencing blurred vision. I strongly urged him to go to ER for evaluation or call his PCP ASAP. He verbalized understanding.

1229629	4/19/2021	TX	64	F	2/26/2021	3/6/2021	I have alopecia areata which had been in remission for 5 months or more. I had ahead full of healthy hair growing very well. After the first vaccine, in 7-10 days my hair sloughed. It took only 2-3 days to completely fall out to a slick bald head. After the second dose EP6955 Pfizer, in the days and weeks to follow, I noticed hair loss of eyebrows, eyelashes, nasal hair, and all body hair. Also, profound itching and tingling of skin on my abdomen, chest, arms and legs. My diagnosis has been updated to alopecia universalis. 1st vaccine 2/26/2021 2nd vaccine 3/19/2021 reaction start date 3/6/2021
1229626	4/19/2021	IL	38	F	4/1/2021	4/3/2021	Prior to receiving the J&J vaccine on April 1, 2021, my last menstrual period was noted in September 2019. I have an IUD in place (placed in December 2017). The first 24 hours after receiving the vaccine, I had mild symptoms of headache, low grade fever and aches from the neck up. 2 days after receiving my vaccine, my period began and continued as a light period until April 14, 2021. I continued with headaches in the temporal region and experienced light headedness and blurred vision throughout the day (still continues as of today 4/19/21). I went to my primary physician on 4/15/21 and was sent for labs (CBC, CMP, and TSH level), an EKG (after hearing an irregular heart rhythm), and a MRI of my brain. All of my labs and MRI were reported as normal. My EKG showed occasional PVC's.

1229582	4/19/2021	NY	37	M	4/16/2021	4/16/2021	Within five minutes of the vaccination, the patient expressed distress. Patient was slumped over in his seat, extremely labored breathing and his eyes were rolling to the back of his head. The Pharmacist spoke to the patient to see how he was feeling but he wasn't very responsive so we administered an EpiPen and immediately called 911. The paramedics came at around 6:20pm and checked the patient's vitals. EMT said the patient's vitals were normal and have the patient the option to go to the ER. Patient was alert and able to drink water. Patient refused hospitalization. We advised the patient to go directly to the emergency room if he was developing any symptoms once home and to follow up with his primary care provider.
1230538	4/19/2021	GA	38	F	4/13/2021	4/14/2021	Hopefully like symptoms and soreness in the arm after the shot. After waking the next morning I threw up 3 times. Over the course of the next few days for headaches nausea stomach cramps and developed multiple rashes throughout my body including I swelling and puffiness around my eyes that still remains.

1229654	4/19/2021	VT	41	M	2/18/2021	3/26/2021	I've been vaccinated for 2 months now. My new symptoms just started to really ramp up 3 weeks ago. Of course I had the initial symptoms of being sick for 2 and 1/2 days after my second shot?.but recently it started with leg aches and then it matriculated up into my upper body. My legs have since become less achy per say. Now it?s my upper body and mostly in my shoulders (more in the one I received the shots in), back pain, and general fatigue. Currently still dealing with the upper body ache discomfort, cold hands and feet but I noticed that I have a slight headache always and my vision has become a little blurry in one eye. The headache severity is day to day but what?s interesting now is I?m having ear ringing and sensitivity to sound. Headache seems to emulate from the back of my skull and the crown of my head. The other lingering piece is the fatigue after doing activities. I?m an active guy and recently my body gets really achy after I do anything super strenuous and I get tired. Also feeling a little shaky, some rapid heart rate, and some circulation issues in my legs and arms. Note; never experienced these issues before the Vaccine aside from the normal wear and tear of an active lifestyle.
1230001	4/19/2021	SC	26	M	4/19/2021	4/19/2021	t 1510 client received Moderna Covid-19 vaccination. At 1512 client reports syncope. Client is clammy to touch, pale, and reports blurred/loss of vision. Adverse reaction protocol initiated. EMS called at 1513 and arrives on site at 1521. Vital taken prior to EMS arrival are as follows: 1. 1514 BP 120/70, R 16, P 68. 2. 1519 BP 110/68 R 16 P 72. Client reports not eating prior to vaccination. Client given drink and consumes entire beverage within about 5 minutes. Client also consumes a pack of cheese crackers and two bottles of water. Client refused epinephrine, benadryl, and EMS transport to hospital. Client reports feeling better and being very nervous about needles. Client reports feeling fine.

1230059	4/19/2021		68	M	3/10/2021	3/12/2021	Pt has a history of CVA and aspiration pneumonia in Feb 2021. Pt had been on olanzapine since 2/24 at Institute. He was given his second Moderna Covid-19 vaccine on 03/10/21. Per note on 3/12, pt had seizure like symptoms at 0545 for approx. 45 seconds (eye rolling, lack of response, increased confusion) Per staff, there was no flexing of limbs or loss of bowel or bladder control. No noted stroke like symptoms but he appeared more confused at neuro check. Pt was back to baseline at 15 min neuro check. Pt reported to have had additional seizure, of approx. 4 minutes duration, during morning report that day-but when MD got to his room, he appeared ?post ictal with a mildly agitated restless delirium? rolling back and forth on the floor, moaning, and not making eye contact. Pt did lose control of his bladder. Olanzapine was discontinued on 3/12, due to potential to lower the seizure threshold. Divalproex was initiated for seizures. Per note 3/22-no additional seizure type symptoms have occurred.

1230104	4/19/2021	WI	45	F	4/13/2021	4/13/2021	Client report receiving first COVID vaccine on 04-13-2021 about 10:30 am, adverse reaction began on same day, hours later about 4:30 - 5:00 pm. Adverse reaction of blurred vision started. Client wears contacts and glasses, normally without issues. Blurred vision in both eyes, right eye feels dry. Client has not reported rubbing eyes, no drainage or redness in either eyes. Client has also reported symptoms of fatigue, headache and congestions. Took Tylenol for the headache on 04/14. No known history of allergies. Client plan to contact her PCP, regarding adverse reaction.
1230146	4/19/2021	NH	54	M	3/25/2021	3/30/2021	About a week after my first shot i experienced the start of a rash on my lower back.Did not think much of it at the time,assumed contact dermatitis. Rash started to spread slowly,used hydrocortosone daily as needed.Contacted my PCP on 4/09 virtually and he told me to keep an eye on it.After my 2nd shot I experienced the usual fatigue and arm.pain but my rash got worse.,Contacted local urgent care provider on 4/18/2021 @11:25 AM.My provider was Doctor. By this time my rash was all over my back and had travelled to my front.After full mock up she diagnosed me with a pityriasis-rosea condition .She prescribed me kenalog 0.1% predisone cream and Benadryl for itching.
1230018	4/19/2021	MN	31	M	4/14/2021	4/15/2021	Left upper eye lid swelled up for 3 days. Slight itchiness. Went down slightly after taking Acetaminophen
1230199	4/19/2021	OH	51	F	2/4/2021	2/4/2021	Approximately 10 minutes after receiving vaccine the patient's throat felt scratchy, tongue felt itchy, tingling occurred around lips and throat, and eyes felt itchy. Benadryl 25 mg was given immediately after patient complained of symptoms and after 30 minutes of observation patient felt better and left with her husband. Patient followed up with her allergist and allergist recommended her not to get the second dose. Patient reported she wants to get the second dose, therefore, I recommended she take Benadryl before receiving a second dose of the vaccine if she chooses to do so.

1229629	4/19/2021	TX	64	F	2/26/2021	3/6/2021	I have alopecia areata which had been in remission for 5 months or more. I had ahead full of healthy hair growing very well. After the first vaccine, in 7-10 days my hair sloughed. It took only 2-3 days to completely fall out to a slick bald head. After the second dose EP6955 Pfizer, in the days and weeks to follow, I noticed hair loss of eyebrows, eyelashes, nasal hair, and all body hair. Also, profound itching and tingling of skin on my abdomen, chest, arms and legs. My diagnosis has been updated to alopecia universalis. 1st vaccine 2/26/2021 2nd vaccine 3/19/2021 reaction start date 3/6/2021
1229905	4/19/2021	NJ	51	F	3/23/2021	3/23/2021	3/23 & 3/24 - Sore arm 3/23 & 3/24 - Severe diarrhea which did make me weak 3/23 - 3/26 - My Sjogrens Syndrome had a flare but I previously never had such dry hands and dry legs. - I did have fatigue 4/1 & 4/2 - I had COVID arm -> I can share a picture of my left arm 4/9 thru 4/11 - Bulging temple on my left side just above my left eye appeared -- I took aspirin from 4/9 thru 4/12 to reduce chance of a blood clot -- This never happened like this in my life before and I had no headache and I was not dehydrated -- I can share a picture of the temple by my eye. I did feel fatigue. 4/7 thru 4/17 - The left side of my upper lip twitched for about a minute; it usually occurred in the morning when I woke up. 3/23 thru 4/17 - My Sjogrens Syndrome dry eye inflammation and dryness increased in my left eye but has since gone back to pre-vaccine limited dryness
1225330	4/18/2021	IL	69	M	3/4/2021	3/14/2021	Patient was admitted on 4/14/21 for work up of complaints of dizziness, lightheadedness, one episode of syncope, balance and gait issues, blurred vision, tinnitus that has been present for a little over a month. Patient underwent a CTA 4/14/21: intraluminal filling defects within the superior sagittal sinus and draining dural veins to the right and left of midline near the vertex. There are findings consistent with chronic thrombosis of the left transverse and sigmoid sinus with partial recanalization of the sigmoid sinus and jugular bulb at the skull base. Still in hospital today

1224917	4/18/2021	MO	75	F	3/1/2021	3/1/2021	Exacerbation of COPD/having trouble breathing; extremely tired, couldn't get out of bed, couldn't move/tiredness; weakness; bleeding; Test: Iron; Result: Critically low; red blood cell was below 5; administered at the left upper forearm; This is a spontaneous report from a contactable nurse (patient) via Pfizer. A 75-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Batch/Lot number was not reported, NDC number: 59267-1000-02), via an unspecified route of administration, administered in the left upper forearm on 01Mar2021 at the age of 75-years-old as single dose for COVID-19 immunization. The vaccine was administered to the patient at a pharmacy (in a grocery store). The patient had no prior vaccinations (within 4 weeks). The patient's medical history included retired (retired registered nurse), ongoing depression (has had this condition for probably 20 years), ongoing lung cancer (has had this condition for probably 3 years), ongoing bipolar (has had this condition for about 4 years), ongoing emphysema (has been severe for about 4 or 5 years), and ongoing chronic obstructive pulmonary disease (COPD) (has been severe for about 4 or 5 years). Concomitant medications included duloxetine taken for depression from an unspecified start date and ongoing (been taking this probably for 15 years); and arformoterol tartrate (BROVANA) (started taking this probably 5 years ago), budesonide (started taking this probably 5 years ago), tiotropium bromide (SPIRIVA) (has been taking this for probably about 4-5 years), oxygen (has been using this full time for 3 years), and Trilogy machine (she sleeps with this, it is an invasive intubation. She puts a big mask on and it pumps air in, pulls air out, letting her lungs rest. Her oxygen hooks up to it), all taken for emphysema and COPD from an unspecified start date and ongoing. The patient reported that she received the vaccine on 01Mar2021 and sometime in Apr2021 around Easter, she went to the hospital for COPD exacerbation, tiredness and weakness. The patient required a visit to the emergency room due to the events and reported that she went by ambulance to the hospital. The patient stated that she has these events often and it has nothing to do with the COVID vaccine. She went to the hospital with exacerbation of COPD and missed her date to get her

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

last shot. She wanted to know whether she can get the 2nd dose of the vaccine with her experience after the 1st dose. The patient reported that she now weighs 177 after she has been pumped full of cortisone. The patient reported that her lung doctor was really the one that manages her medical. The patient reported that she thinks she came home from the hospital the day before Easter and she was in the hospital for 5 days (in Apr2021). She was sick before that, at home, and she finally had to call # to come and get her. She believes she had to call # the 5th day before Easter, but she was not positive. When asked to clarify what she meant by sick, the patient explained she was extremely tired, she couldn't get out of bed and couldn't move. She was having trouble breathing. She was on oxygen 24/7 and sleeps with a trilogy machine so she was having a lot of trouble, it was awful. She said she then found out at the hospital her red blood cell was below 5 and her iron was critically low. They had to give her 2 units of blood and an infusion. Then she went back yesterday and got another infusion and she has to go back next week for another infusion. The patient confirmed that she was hospitalized for COPD. She then stated she didn't know the exact date of when she was discharged from the hospital, but she was thinking it was the day she was scheduled for her second shot. She then clarified she came home Easter. The patient reported that she can't do much without having to sit down, catch her breath, and rest a little bit. She was improving but not as fast as she'd like to. While reading the vaccine record card, the patient stated "my eyes aren't as good as they used to be". Her pulmonologist stated she was going to die if she doesn't take the vaccine. If she catches COVID she was not going to make it, so her pulmonologist thinks her chances are better with the vaccine than without it. The patient said she goes all the time to the hospital; therefore, she doesn't think the events were related to the vaccine. She had been sick several times. They can't do anything about the bleeding, they can't go in to do anything because of her lungs, her lungs were so bad. No further details were provided regarding the bleeding she was speaking of. The patient reported that duloxetine doesn't come as 90 mg so she takes a 30 mg and 60 mg tablet; she mixes the Brovana and Budesonide and takes them at the same time, twice a day. She was given an

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

albuterol solution, 0.5mg PRN (as needed), for her emphysema/COPD. She says she just started taking this from her last hospital stay. The patient reported that she did not remember her iron count, just that it was critically low. She did remember asking the nurse what could happen, and the nurse said a lot of things such as infection. She confirmed tests were done in regards to the lung cancer. Her lungs were too critical for any kind of invasive tests. It was reported that the events Exacerbation of COPD and "extremely tired, couldn't get out of bed, couldn't move" were assessed by the patient as unrelated to BNT162B2. The outcome of the events "Exacerbation of COPD/having trouble breathing" and "extremely tired, couldn't get out of bed, couldn't move/tiredness" was recovering, while the outcome of the other events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the narrative information provided, the reported events Chronic Obstructive Pulmonary Disease, Fatigue, Asthenia, Blood iron decreased, Red blood cell count decreased and Asthenia are assessed as intercurrent medical conditions and unrelated to BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection). The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

1224818	4/18/2021	NJ	48	M	1/27/2021	1/28/2021	Heart stopped 6 times; unresponsive; soreness; felt like unwell; vomiting; Body aches; achiness; passed out 7 times; fever; chills; Left arm soreness at injection site and up back of shoulders; Left arm soreness at injection site and up back of shoulders; This is a spontaneous report from a contactable consumer.A 48-years-old male patient received second dose of bnt162b2 (Pfizer-Biontech Covid-19 Vaccine, Formulation: Solution for injection, Lot Number: EN5318), intramuscular, administered in left arm on 27Jan2021 11:00 at single dose for covid-19 immunisation. Medical history included asthma, myocarditis and allergies to Fruit or nut that grows on trees. Concomitant medication included esomeprazole magnesium (NEXIUM). The patient's heart stopped 6 times on 29Jan2021, he had a low grade fever, achiness and chills at 01:30, but they were gone the next day. Basically, at first, he took the shot and got the reactions that everyone else does, right arm soreness 01:30. On 07Jan2021 17:00, patient took the first dose of bnt162b2 (Pfizer-Biontech Covid-19 Vaccine, Formulation: Solution for injection, Lot Number: EL1042), intramuscular, administered in left arm. No prior vaccination was given within 4 weeks. He fell in the shower and passed out and hit his head at 18:00. He was not hooked up to a machine. About 18:30, his wife got him to the couch. He drank carrot juice and ate a granola bar. At 18:30 his eyes were wide open, but he was unresponsive. About every 30 minutes, he was going down. The third one came about 18:45-19:00. The pass outs lasted 15-20 seconds. and all he remembers was waking up to her screaming at him. The next one came at 19:15 and was in the ambulance on the way to the hospital and that is when he vomited in the ambulance and on the couch. Pass out number 3 was at home and 4 was in the ambulance. There was vomiting with both of them. Pass out number 5 was in the hospital when she was getting in the bed and was not hooked up in the room yet. Finally, they got him hooked up to a machine at 20:30 and into a room. They said if you feel dizzy, press the button. He found out his heart rate went from 80's down to 30's. That was the 6th pass out. This was the first time he was on a machine. His heart did not actually stop, it just went down to 30's and would come back. Then, it happened one more time on the machine and at that point, they were hooking him up to an IV and giving him medication to

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

keep him from vomiting. He does not have the name of that medication or the dose or lot or expiration. He got stabilized but they had him hooked up shockpads in case anything happened. They recorded his heart stopping 6 times during the night and of those 6 times, he does not have the times. 2 seconds was the longest time of all of the stops. He does not know how many each were. This was when he woke up on 30Jan2021. He later stated he was hospitalized 28Jan2021 at 7pm and those 6 stops occurred 29Jan2021 through the night previously. The patient was hospitalized for heart stopped 6 times from 29Jan2021 and discharged on 01Feb2021. The patient underwent lab tests and procedures which included body temperature was low grade fever, echocardiogram, brain scan and electrocardiogram shows normal, heart rate: 80 beats, heart rate was down to 30 on his heart beat. They gave shot in the leg for blood clots, nausea medication and a bunch of pills given as treatment. The outcome of heart stopped 6 times was recovered with Sequel, patient passed out 7 times, body aches, fever and chills, left arm soreness at injection site and up back of shoulders was recovering, unresponsive and soreness next day felt like unwell and vomiting was unknown, achiness was recovered. No follow-up attempts are possible. No further information is expected

A 68 years old female patient received first dose BNT162B2 (Pfizer BioNTech Covid 19 vaccine), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The medical history and concomitant medications were not reported. The patient was having some symptoms and she need to talk to someone about what to do about them. She had nausea and diarrhea, severe pain in her abdomen feeling like a knife stabbing her mostly left side. It was excruciating. She got the second vaccine yesterday and all the above events started last night. She had chills, headache, mental clarity and can't think straight and weak after the second dose. She fainted after the first shot and fell down face forward and busted her lip. She had quite a few side effects. Blurred vision, rash on arms, back and chest. Joint and muscle pain. Weak and having to walk with a cane. The outcome of the events was unknown. No follow-up attempts are possible; information about batch number cannot be obtained.

1224925	4/18/2021	MN		U	1/26/2021		<p>brain dysfunction; dysrhythmia; literally had to quit working because could not function; I got my second vaccine and my symptoms became much worse; weak; dizzy; Forgetful; I had quite severe cramps with muscle pains; I had quite severe cramps with muscle pains; Loss of taste and smell; Loss of taste and smell; I am having dizziness to the point where I am literally tripping over and specially; I can't see that is my eyes are closed or lights are off; a loop problem which was small irritation on finger tips; specially can't see that is eyes are closed or lights are off; joint pain; now had turned into a very pain full and persisting what appeared to be kind of infection; uncomfortable; was having all of the pain in my limbs, arms and thighs.; This is a spontaneous report from a contactable physician (patient). This 77-Year-old patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 26Jan2021 (Lot: EL3247) as single dose for COVID-19 immunisation and unspecified medication. Medical history included Myopathy, Sleep apnea diagnosed from 2006 (reported for 15 years ago, as of 02Apr2021), High cholesterol, Blood pressure high, first heart attack in 2010 and second heart attack in 2017, Trauma, Prostate enlargement from 2016, prostate enlargement that was biopsy that didn't have any cancer and some changes in PSA levels and then stating so on. But it was diagnosed about 5 years ago, acoustic neuroma. Concomitant drugs included tocotrienols nos at 200 mg, 1x/day, ascorbic acid (VIT C) at 2000 mg, 1x/day, pramipexole dihydrochloride (MIRAPEX) at 5 mg, ASPIRIN [ACETYLSALICYLIC ACID], lisinopril (NEOPRIL [LISINOPRIL]), Metoprolol at 50 mg, and aluminium sulfate, calcium acetate (BUROFIX) at 2.5mg. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 07Jan2021 at age of 77-year-old lot number: EK9231 for COVID-19 immunisation and experienced fatigue, not feeling well, muscle aches, dizziness. The patient got second vaccine on Jan 26th and symptoms became much worse. The patient literally had to quit working because could not function was weak, dizzy, forgetful, had quite severe cramps with muscle pains, had puzzling symptoms similar to long hour Covid patient, loss of taste and smell. The patient thought may have Covid. The patient got tested again for Covid the test result of the</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

active disease came negative. And then got Covid antibody test to see if any way that even the test was negative, so the patient had the infection and now the patient was having side effects and that came negative. The patient saw the neurologist and brain specialist, had the Brain scan saw the cardiologist as was having dysrhythmia. The patient saw back and bone expert the orthopedic doctor because was having all of the pain in limbs, arms and thighs. The patient saw rheumatologist as it was causing a lot of muscle pain, joint pain and things. Now, all of them basically said that the organ they were checking had minor problems. The patient had prior heart attack but there was no sign to do in the way of heart attack and heart failure had previous acoustic neuroma radiated in brain and that used to cause a little bit of dizziness but it was pretty much gone away and now was having dizziness to the point where was literally tripping over and specially can't see that is eyes are closed or lights are off. The patient further stated, this is more disturbing. Since the patient had the symptoms, did returned to work briefly at the end of Feb and after 3 days of work had to quit. The patient was not up to functioning so it's about a month now still feel a very, very strong presence of this function brain dysfunction and muscle pain. The patient had a course of steroids during this time to see if that would help had number of things pain medications (Unspecified Medications) and so on but nothing really is demonstrating any real help. The patient was having a loop problem which was small irritation on finger tips and now had turned into a very pain full and persisting what appeared to be kind of infection. And that still since the second shot. Outcome of the events was unknown. Causality included the patient believed they are. And would say that because a lot of people have the similar but less side effects.; Sender's Comments: Based on the information provided, known drug safety profile and plausible temporal association, the causality between the suspect drug and the events cannot be completely excluded. The impact of this report on the benefit-risk profile of the Pfizer product and on the conduct of the study is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly

							notified to regulatory authorities, ethics committees. and investigators, as appropriate.
1225579	4/18/2021	NC	60	M	4/17/2021	4/17/2021	Right eye developed a green line like a fat magic marker from inside of eye up towards middle of outside of eye. Changes color to Orange and red. Never had this before. Had symptoms for one hour on the night of injection then went away, returned mid day the next day. As I am writing this.
1225663	4/18/2021	FL	34	M	4/3/2021	4/4/2021	Pain and throbbing in arm where I received the shot, especially the following morning. It's been recurring pain especially when I move my arm in certain ways. No health insurance at the moment, haven't seen a physician about this or received an MRI. The more concerning though is recurring vertigo I've been experiencing. I have never had it before, but a few days after I'm receiving the dose my eyes started shaking involuntarily and I had difficulty keeping my balance. It went away after a bit, but has happened a number of times over the last two weeks. I'm obviously hoping it just goes away.
1225662	4/18/2021	NC	51	F	4/2/2021	4/3/2021	Muscle twitching daily starting day-of or day after shot. Day 1 was left quad and right tricep. Another day was groin and calf. Each day since, and night, various muscles, including gluts, quad, calves, triceps, both thumbs, groin, left eye I have had several incidents where muscle tightened like a Charlie Horse, usually at night but did not get very painful, and possibly restless leg one night but could have just been a lot of twitching in my leg. Now it has been over 2 weeks and it continues. I'm uncertain whether to get round 2. The twitching doesn't last too long but it does seem to be more frequent and more lasting. My thumbs just keep twitching. Very concerning.

<i>VAERS_ID</i>	<i>RECVDATE</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1224337	4/18/2021		43	F	3/24/2021	3/24/2021	<p>aphasia; difficulty speaking; Jaw: Trismus; This is a spontaneous report from a non-contactable other healthcare professional. A 43-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), first dose via an unspecified route of administration on 24Mar2021 (batch/lot number: ER8727) as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. On 24Mar2021 during her 15 minute waiting period after the injection, the patient began to experience difficulty speaking. She denied rash, hives, welts, difficulty breathing, difficulty swallowing, wheezing, throat tightness, hoarseness, stridor, itching, lightheadedness, dizziness, facial swelling, lip swelling and tongue swelling. Jaw: trismus present. Treatment included: no therapy. Follow up response to treatment: no change. Patient transported to ED by ambulance. Differential diagnosis: systemic reaction (hypoglycemia, hypotension, generalized rash) and red flag symptoms (CP, SOB, NVD, visual/neuro concerns). Patient with no other neuro deficits but aphasia was clearly present. AMR called to have patient brought to ED for further evaluation. Husband, will meet her there. The report was assessed as non-serious. The outcome of the events "difficulty speaking" and "trismus" was not recovered; and unknown for aphasia. No follow-up attempts are possible. No further information is expected.; Sender's Comments: The company cannot completely rule out a reasonable possibility that BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) caused the aphasia (speech disorder) and trismus due to a reportedly close drug event chronological association. Information on further evaluation would be necessary for a more meaningful medical assessment. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p>

1225450	4/18/2021	IN	35	F	4/15/2021	4/15/2021	On 4/15/21, that evening my arm became very sore and tender. It also felt very heavy. I started getting cold chills and at the same time being hot. I didn't take my temperature but did take Tylenol. On 4/16/21, all day my arm began to feel heavy, like there was a 50 lb weight hanging off of it. I was still having cold chills and hot flashes constantly throughout the day. I felt tired, groggy like a cloud over my eyes and head, achy all over too. In the evening, I was freezing cold, couldn't get warm. I had a heating pad on my arm where it was sore and my heated blanket. I went bed sleeping horribly and waking up freezing cold and then waking up again with a puddle of sweat around me. This happened constantly throughout the night. On the morning of 4/17/21, I was constantly having hot and cold flashes, the soreness moved from on top of my arm where the injection site was to my under arm, around my armpit. It hurt so bad to just apply deodorant to my arm pit. My armpit are hurt all day yesterday and last night. I took a 3 hour nap yesterday because I felt groggy and tired. Everything seemed cloudy. I woke up and felt better but my arm still hurt and definitely not 100%. I went to bed last night (4/17/21) sweating profusely off and on and being freezing cold inbetween. I had to change my shirt twice last night and my pants once because I was so sweaty. I woke up this morning on (4/18/21) with my armpit area still hurting.
1225434	4/18/2021		29	F	4/8/2021	4/13/2021	It started with bad brain fog, and has progressed to a constant mild frontal headache and brain fog that is causing fatigue and problems with vision. It feels like my eyes don't want to open all the way.
1225428	4/18/2021	CO	61	F	4/1/2021	4/3/2021	Fainted on day 2. Woke up with a bruise under eye. Extreme pain in entire chest, shoulders. No headaches, no fever. Did not injure myself during fainting spell. Pain in chest and arms, occasional chills continued for 2 weeks solid. I needed to take pain relief round the clock. Pain when sneezing or coughing, continuing for 2 weeks. Prior to the 2nd shot, I would describe myself as in very good condition. After, very weak physical condition. I feel like I need to recover from this shot.

1225414	4/18/2021	NJ	54	M	3/29/2021	3/29/2021	Drove to vaccination site. Had a coffee and muffin on way down; had a coffee and veggie wrap on drive back. Once back home and at my computer for day, room started spinning - I made it outside to back porch, then vomited all food and liquid from the morning. I could not stand - felt like a giant hand was pushing me down - so I laid on my back porch for several hours. When I did stand up, the vertigo (dizziness and nausea) was immense. Made it to couch inside and toward evening gradually made it to bed upstairs, crawling part of the way. By the next morning the spinning still present but about 50 percent less. Better if I kept eyes shut; spinning and nausea if I opened them. This eventually subsided later in day - I was able to hold down crackers and ginger ale. By the following day (Wed.) I was able to work - the room spinning and dizziness was finally gone. And by this point able to hold down food and liquids.
1225396	4/18/2021	WI	28	F	4/18/2021	4/18/2021	Patient presented to clinic today for 1st Covid vaccine. After receiving vaccine, patient complaining of seeing "colored spots". Patient brought to reclining chair from waiting room. Patient has multiple comorbidity's - please see list in CMR. Patient's aunt in room with patient. 0807: Patient c/o having a "heavy face". VS 159/98, 89, 96% on RA. Patient denies any issues with breathing. Per patient when she swallowed some water, she felt as if it was hard to get down. Patient given 50 mg PO Benadryl (own supply). 0811: Patient stating that colored spots are now gone. VS: 169/95, 87, 98% on RA. 0817: VS 133/90, 96, 93%. Patient had small seizure in room; patient eyes rolled back, patient appeared to be non-responsive. Total time for seizure was approximately 30 seconds. After seizure, patient responsive and alert X3.

1224349	4/18/2021	NJ		F	3/5/2021	3/21/2021	<p>vitreous detachment; 5 hemorrhages in her eye/hemorrhage on the eye (retina); This is a spontaneous report from a Pfizer Sponsored Program received from a contactable pharmacist (patient). A female patient of an unspecified age received bnt162b2 (BNT162B2 reported as PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration on 05Mar2021 (Batch/Lot number was not reported) as a single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. She mentioned that she got her first dose vaccine on 05Mar2021 at pharmacy. The patient reported that two weeks and two days after (21Mar2021), she experienced vitreous detachment, her vitreous detached from the retina and she already had had 5 hemorrhages in her eye. She mentioned that her second dose is due on Friday, 02Apr2021 and she requested information on this specific side effect to make an informed clinical decision on whether or not to get her second dose of the vaccine this Friday. She mentioned that she does not know if this happened because of the vaccine or not. She added that she had a hemorrhage on the eye (retina). The outcome of the events was unknown. Information on lot/Batch number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported vitreous detachment and retinal haemorrhage. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1224387	4/18/2021	CA	57	F	3/30/2021	3/30/2021	breathing out; cheeks, lips, and mouth started quivering/trembling; cheeks, mouth and lips started quivering and twitching; swelling sensation on her left side of her face; left cheek area felt swollen and tingly; pressure around the eye sockets; Could this be a sign of Bell's Palsy, and is it likely that she develop Bell's Palsy?; This is a spontaneous report from a contactable consumer (reporting for herself). A 57-years-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Solution for injection, Lot Number: ER8734, expiry date not reported), via an unspecified route of administration, administered in left arm on 30Mar2021 14:00 at a single dose for covid-19 immunization. Medical history included has back issues, but nothing serious probably for about 7 years and patient stated that she had a Pilates injury and after that her back has never been the same; and patient stated that she was pretty healthy, adding that she was allergic to sulfa, cow's milk, wheat, and almond. Family medical history relevant to events reported included mom has osteoporosis, and severe dry eye syndrome. The patient's concomitant medications were reported as she doesn't take any regular medicines but she does take regular supplements and herbs and stated that she was very lucky. Patient stated that Pfizer COVID-19 vaccine was the he one she trusted the most and she doesn't want to die from COVID if she gets it. Patient received her dose in her left arm, at the time of administration, on 30Mar2021 14:00, she was breathing out, then her "cheeks, lips, and mouth started quivering/trembling and it was definitely noticeable". Patient further stated that while it was being administered her cheeks, mouth and lips started quivering and twitching. She also reported that immediately afterward (30Mar2021), she experienced a swelling sensation on her left side of her face, "kind of how it feels when you have novocaine, but no visible signs of swelling or drooping". Her left cheek area felt swollen and tingly. She stated that it felt swollen but it didn't look swollen, like when you go to the dentist. She also experienced pressure around the eye sockets. She added that both areas under eye sockets felt a little bit weird, tight or something but not like a pain, hard to describe. All of these symptoms resolved within a few hours, and 24 hours later she's "pretty much back to normal". The pressure around eye socket, lasted for a

1224338	4/18/2021	PA	70	F	3/15/2021	3/15/2021	Lower chest partial atelectasis or scarring in the lung bases bilateral; Partial lung collapse (both upper and lower parts collapsed); Lower chest partial atelectasis or scarring in the lung bases bilateral; Beneath this area was a red circle where blood clotted or something; Wheezing; Shortness of breath; Swelling of the face; underneath the arm where the injection site was, a big red circle was noted and it was swollen/under her nose and left elbow were red; underneath the arm where the injection site was, a big red circle was noted and it was swollen; I would get hot and cold; I was sweating; Pain in her chest, stomach, back and head; Pain in her chest, stomach, back and head; Pain in her chest, stomach, back and head; Pain in her chest, stomach, back and head; Fatigue; Pain in left elbow; goes to bathroom and bowel was not emptying the way it should; rib cage is going on the side of body noticed this thumping; Her lips were red; Throat was red; Been sick and just laying around; Her eyes were red; Cramp in left arm where site of injection; Sharp pains were hitting her in her eye, thigh, chest, head, and the arm; Sharp pains were hitting her in her eye, thigh, chest, head, and the arm; This is a spontaneous report received from contactable consumer (patient). A 70-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via unspecified route of administration on 15Mar2021 (at the age of 70 years) at a single dose in the left arm for COVID-19 immunization. Medical history included lung issues and allergic asthma. Family history included brothers and sisters who died of lung issues and third sibling sister died many years ago due to allergic asthma. The patient previously took flu vaccine for immunization and experienced severe pain throughout her whole body. On 15Mar2021, patient received the first dose of Pfizer COVID-19 vaccine. Later on, that day when she got home after receiving the vaccine, underneath the arm where the injection site was, a big red circle was noted and it was swollen, beneath this area was a red circle where blood clotted or something, she would get hot and cold and take her clothes off because she was sweating but did not have fever, there was pain in her chest, stomach, back and head, wheezing, shortness of breath, fatigue, swelling of the face, pain in left elbow. She goes to bathroom and bowel was not emptying the way it should. She also noted that

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

her rib cage is going on the side of body noticed this thumping, lips and throat were red. She's been sick and just laying around, her eyes, under her nose and left elbow were red, had cramp in left arm where site of injection, and sharp pains were hitting her in her eye, thigh, chest, head, and the arm. Patient clarified that these symptoms began on 15Mar2021, the same day she received the Pfizer COVID-19 vaccine. On 23Mar2021, patient went to the ER and the findings were lower chest partial atelectasis or scarring in the lung bases bilateral and partial lung collapse (both upper and lower parts collapsed). At the hospital her temperature was 98.9 F on 23Mar2021, but 97.1F - 97.7F is her normal temperature. She went to the Pulmonary doctor also, but was getting a second opinion because she knew it could be life threatening. The pulmonary doctor made light of it saying they were just creases, like creases in pants. Patient said crease was a far cry from partial lung collapse on both bases and the Pulmonary doctor also said that it is in the upper part of the lung also. This scared her and made her think nobody cared. She did not know if she should provide the information because the doctor did not seem to believe that that her symptoms were coming from receiving the Pfizer COVID-19 vaccine. She guessed she should provide the information because Pfizer does research. She wanted to know how long do the side effects last and if she should take the second dose. The outcome of the events underneath the arm where the injection site was, a big red circle was noted and it was swollen/under her nose and left elbow were red, pain in her chest, stomach, back and head, wheezing, shortness of breath, fatigue, swelling of the face, pain in left elbow, goes to bathroom and bowel was not emptying the way it should, rib cage is going on the side of body noticed this thumping, lips were red, throat was red, been sick and just laying around, eyes were red was not recovered; while unknown for the other events. Information on the lot/batch number has been requested.

1224328	4/18/2021	NY	48	F	3/29/2021	3/30/2021	I have pain in the armpit area that started on 3/30 in the evening; visional swelling on in the left armpit area above the breast; This is a spontaneous report from a contactable consumer (patient). A 48-years-old non pregnant female patient received bnt162b2 (BNT162B2), dose 2 via an unspecified route of administration, administered in Arm Left on 29Mar2021 09:30 (Batch/Lot Number: EL3247) as SINGLE DOSE for covid-19 immunisation. Medical history included high blood pressure/ allergies. Concomitant medication(s) included probiotics (PROBIOTICS) taken for an unspecified indication, start and stop date were not reported; hydrochlorothiazide, triamterene (TRIAMTERENE HCTZ) taken for an unspecified indication, start and stop date were not reported. The patient also received Desloratin within 2 weeks of vaccination. The patient previously received bnt162b2 (BNT162B2), dose 1 via an unspecified route of administration, administered in Arm Left on 09Mar2021 09:30 (Batch/Lot Number: EL3247) as SINGLE DOSE for covid-19 immunisation. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. No covid prior vaccination. No covid tested post vaccination. Since 30Mar2021 17.30 (05:30 PM) evening, the patient had pain in the armpit area. The patient took Tylenol before going to bed. This morning (30Mar2021) there was visional swelling on in the left armpit area above the breast. Outcome of the event was not recovered. No follow up attempts are needed. No further information is expected.

1224275	4/18/2021	KY	53	F	3/19/2021	3/24/2021	constipation; Severe lower right side pain, felt like burning and stabbing, thought my appendix was rupturing; felt like burning and stabbing; appendix was rupturing; This is a spontaneous report from a contactable consumer (reported for herself). A 53-year-old female non pregnant received second dose of BNT162B2 (Pfizer Covid-19 vaccine, lot number ER2613, expiry date: unknown) via an unspecified route of administration at left arm at a single dose on 19MAR2021, for covid-19 immunization. Medical history included Gastroesophageal reflux disease, diverticulitis, Graves Disease in left eye, full hysterectomy, high bp, high cholesterol, depression, hypothyroidism, Gastric bypass and heart ablation. Concomitant medications included an unspecified 5 different medications and daily vitamins. Historical vaccine includes first dose of BNT162B2 (Pfizer Covid-19 vaccine, lot number EN6203, expiry date: unknown) via an unspecified route of administration at left arm at a single dose on 25FEB2021 06:00 PM, for covid-19 immunization. She did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, she was not diagnosed with COVID-19. Neither was she tested for it since the vaccination. On 24Mar2021 19.00, she experienced severe lower right sided pain, felt like burning and stabbing, thought her appendix was rupturing. On an unknown date, she went to an emergency room (ER), had a computerized tomography scan that showed constipation. Her pain was at a level 9, was doubled over for 6 hours while seeking care. She had complete sudden onset of pain, with no warning. She was treated with Fentanyl shot that took almost an hour to provide minimal pain relief. Had continuing pain for three days after the initial onset. No real treatment other than pain medication were given at ER. She was told to get collace and mirilax. The outcome of the events of severe lower right sided pain, felt like burning and stabbing, thought her appendix was rupturing was recovering. No follow-up attempts are needed. No further information is expected.

A non-pregnant 37-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), dose 2 via an unspecified route of administration, administered in the left arm on 21Mar2021 at 15:30 (Batch/Lot Number: EN 62v3) at 37-years-old as a single dose for COVID-19 immunization. The patient did not receive any other vaccine within four weeks of the suspect vaccine. The patient's medical history included gluten allergy from an unknown date and unknown if ongoing, COVID-19 prior to vaccination from an unknown date and unknown if ongoing. Concomitant medications were not reported. The patient previously received the first dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) for COVID-19 immunization on 28Feb2021 (Lot Number: EN6201, administration time 15:30, location: Left arm, dose number: 1). On 22Mar2021 02:00, the patient experienced: dizziness, blurred vision, joint aches, extreme pain, difficulty breathing, fever, chills, sweats, large rash; all of which required a visit to a doctor or other healthcare professional office/clinic, emergency room/department or urgent care and hospitalization. The patient was hospitalized for all of the events for 1 day. The patient underwent lab tests and procedures which included Nasal Swab: negative on 22Mar2021. Therapeutic measures were taken as a result of the events, which included intravenous (IV) fluids and pain medications. The clinical outcome of the events was recovered with sequelae on an unspecified date. Follow-up attempts have been completed and no further information is expected.

1224167	4/18/2021	OH	39	F	4/16/2021	4/16/2021	I started feeling random sharp "nerve stabs." I was walking and felt a bit odd just because I almost immediately tasted a metal taste in my mouth and commented on it and something seemed "off." As I kept walking it off, the pharmacist came to check up on me but I was still trying to figure out what was wrong. Over the next 15 minutes, I had a "heavy knee" feeling under both knee caps at the same time, tingling on the bottom of both feet at the same time like they were placed against a jet and both jaws tightened in one location...not at the TMJ but lower....like where my jaws misaligned from the accident. And then heavy eye brows would hit. And they wouldn't stay like this. It would come and go. Come and go. Not in seconds but 10 minute intervals or something? But I definitely was starting to feel more "nervy." Not prickly. Not pain. Just random sharp here and there or feeling like I could feel a nerve "wake up" here and there. Also, my hips/pelvis. On both sides at the same time they would not ache but get tight or say HI in a weird way but more towards the glute/pelvis region; it was an odd location. Also. My lower back was tight. It got really tight. That was the most annoying thing. It stayed tight. Also, my right shoulder/neck that had been locked up and inflamed from a flare-up...the pain disappeared just like my head pain. (The nerve issues sometimes felt like when I took rizatriptan the first few times and I could feel the nerve then too. Due to being used to weird nerve issues since the accident, I was concerned but not enough to go to the hospital and just wanted to wait it out. I had plans of going home and working out and doing my therapy and stretches. I got home and within 45 minutes of the vaccine my face was starting to feel cold. I was feeling nervy all over. And then my spinal cord lit up, just once, like electrifying....not painful....but like electricity....like nerve. A large section of it just lit up and then that was it. I didn't have any odd movements with it. It just lit up. Also, my head. There was a spot on the top of my head near the "soft spot" that I kept feeling a nerve burst. Like, as if I could feel the tendrils of the end of a nerve. It would just light up once and stop. Then light up and stop. It had stopped by the time I went to bed. I worked out and had no issues. I haven't had any more spinal cord issues. I went to my scheduled acupuncture appointment today and it settled some of what was still in my hands. I worked all day as well in retail with no

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>

issues. I haven't had any more issues with the "heavy feeling" and my lumbar region was fine by bedtime. My feet are fine now. I am having nerve issues now but it's hard to say if it's my normal issues or still aggravated by the vaccine. I'm having zero flu symptoms or anything from the vaccine they reported I may have. My arm at the injection site has no welt, redness, I can't find it, and is sore but it's like being hit by a softball. On the pain scale I'm used to: it's a 1/10. I really do live with horrid chronic pain now.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1224113	4/18/2021		61	F	3/11/2021	3/1/2021	My heart flutters; heart spasms; uncalm coming into my dreams viciously, morbidly gross; super watery bowel movement then went into clay like and drier consistency but still dark (I never had stool this dark.); I was dry/ I needed water; room seemed like it was so much further away, my stairs the spindles were larger in size, it was if I was high on something/feeling of peace, calm/high feeling; I was whistling in my breathing/ I had a loud whistle; feeling my eyes and hearing were sharp/ my eyes were changed eventually; had my eyes dilated; felt I like I was getting hemorrhoids/I woke up feeling like I had too much sugar; black stool; constipation; Chills; wanted to vomit; I got shaky; scares; There's a feeling of hardness in my lower abdomen and heart area (Belch); There's a feeling of hardness in my lower abdomen and heart area (Belch); reversed my beta blockers (it keeps it in the 50s) it went to 79; My energy was so much more.; The next day I gained 3.2 pounds then the next day lost 3 pounds; My injection site for the first 2 weeks,I had an itch/ extreme itch; injection site for the first 2 week/there's pain there on touch (no throbbing pain); My tooth broke; movement under my skin/shingles feeling; My skin is extremely dry; This is a spontaneous report from a contactable consumer (patient). A 61-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 11Mar2021 (Batch/Lot number was not reported) as SINGLE DOSE for COVID-19 immunization. It was reported that the patient vision wasn't as good. She also had glasses to read (eyeglass wearer and ongoing) and behind her eyes they were dry one (left) mostly. Concomitant medications included unspecified beta blockers. On 11Mar2021, she got chills on the same day. Right as she got the shot, she wanted to vomit also and got shaky. On 12Mar2021, she woke up with whistling in her breathing for a few minutes then it was done. At the same moment, her eyes were changed eventually. She had mucus in my eyes as her vision wasn't as good and behind her eyes, they were dry one eye (left). So, watching TV wasn't as good and became bothersome. She later noticed, the black in here eye was taken up most of her eye (as if her eyes were dilated). Her eyes and hearing were sharp also now sharp as she was reading better (without my read glasses) and had to turn down the volume in her TV. She also felt like she

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

was getting hemorrhoids for a few days but then it went away. She also had black stool, then constipation (harder stool) eventually went the day right after the shot (12Mar2021). Then around 5pm, she had feeling like she had too much sugar and was dry which she needed water. Once she sat down, her living room door seemed like it was so much further away, stairs the spindles were larger in size, it was if she was high on something. It was different nothing but this injection. She was also experiencing a feeling of peace and calm. As if nothing was wrong, no stress (stressing about something) she couldn't even think of- everything was gone, a calming effect. It was high feeling. The next day (13Mar2021), she had a super watery bowel movement then went into clay like and drier consistency but still dark (she never had stool this dark). In Mar2021, she also stated that there was a movement under her skin like a pre-herpes or a pre-shingles. She mentioned that she knew herpes and the movement under her skin was shingles feeling. Her skin was also extremely dry. On 17Mar2021 (a week after the injection), she woke up to my heart spasm. It was beating real fast (beating like right under her skin), no pain and heart attack but more than a heart flutter. She didn't know whether it was going to beat or stop. She also woke up with a loud whistle (louder than before) out of a dream. She stated that during the day she doesn't get the stressed, but in her dream, it was magnified and woke up in a violent vicious fury. She had 3 nights of this (uncalm coming into my dreams viciously, morbidly gross) started on 14Mar2021. The heart spasms come as a few seconds and goes away but that's happened twice which it scares her. She also stated that there was feeling of hardness in her lower abdomen and heart area (belch) in Mar2021. The injection almost reversed her beta blockers (which keep it in the 50s) it went to 79 (same as it was before she started taking beta blockers) but her blood pressure was normal 121/something (that was a good thing). She also mentioned that her energy was so much more while other people woke up early, cleaning up -would get sleepy and a little tired. But this (injection) gave her energy. Her injection site for the first 2 weeks also had an itch, that would come up (not constant) almost like a yeast infection which had an extreme itch. There's pain was there on touch (no throbbing pain) it took over a week before it was gone.

She also mentioned that the chills were off and on for 4 days. The vaccine also did something to her weight as she was expecting to lose weight, but she didn't. One day, she gained 3.2 pounds then the next day lost 3 pounds. Her tooth also broke (but no pain in her tooth) even she had a sensation of her teeth being weak which she could feel it. Her tooth broke eating a tortilla chip and that's weird. She wanted to know if other people had called in with the symptoms that she had experienced. The patient recovered from breath sounds abnormal and constipation on 12Mar2021; cardiospasm, chills and vaccination site pain in Mar2021 while the remaining events were unknown. No follow-up attempts are possible. Information on the lot/batch number cannot be obtained.

1224094	4/18/2021	WI	28	F	3/26/2021	3/26/2021	Swelling my eyes significantly; Having my tongue go somewhat numb; Difficult to swallow; Feeling worse; Some feverish feelings; Hives all over my body, especially on my face; Chills; Couldn't stop shaking; This is a spontaneous report from a contactable consumer (patient, self-reported). A 28-year-old female patient (who was not pregnant at the time of vaccination), received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, lot number: ER8732 and expiry date was not provided), via an unspecified route of administration, in arm left, on 26Mar2021, at 14:00 as single dose for COVID-19 immunisation. Patient medical history was not reported. She did not have any known allergies. Concomitant medications included estradiol valerate, progesterone and cyanocobalamin (VITAMIN B12). Patient stated that she first experienced some feverish feelings, chills and hives 30 minutes following her vaccination. She drove home from the hospital and was feeling a bit off, but mostly okay. By the time she got back, she was feeling worse, around 4 PM. By 5 PM she had broken out in hives all over her body, especially on her face, swelling her eyes significantly and having her tongue go somewhat numb, starting to make it difficult to swallow. She also had significant chills, and couldn't stop shaking, and ended up being admitted to the ER. After being given antihistamines, the swelling went down and eventually the chills stopped after monitoring in the hospital. The patient was hospitalized for the events on an unknown date in Mar2021. Treatment received for the events. The patient was not diagnosed with COVID prior vaccination. The patient had not been tested for COVID post vaccination. The patient did not receive any other vaccine in four weeks of vaccination. Outcome of the events was recovered on an unknown date in Mar2021.

1224055	4/18/2021	FL		F	4/7/2021		<p>TUNNEL VISION; CHEST PAIN/PRESSURE; WEIRD TASTE IN MOUTH; DRUNK FEELLING; CRAZY DREAMS; DIZZINESS; NAUSEA; SHOOTING INJECTION SITE PAIN; MUSCLE ACHE; HEADACHE;</p> <p>This spontaneous report received from a patient concerned a female of unspecified age. The patient's weight, height, and medical history were not reported. The patient received Covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, and batch number: 041A21A expiry: UNKNOWN) 1 total, dose was not reported, administered on 07-APR-2021 on left arm for prophylactic vaccination. No concomitant medications were reported. On 07-APR-2021, after vaccination the patient immediately felt dizzy and nausea. Later, she developed tunnel vision, chest pain/pressure, shooting pain in arm of injection up into jaw (left side) and weird taste in mouth for 6-7 hours. She felt drunk and developed muscle aches. She had crazy dreams and headache. She took Tylenol (paracetamol) about 3-4 hours after vaccination. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from chest pain/pressure, chemical taste in mouth, and shooting injection site pain on 07-APR-2021, tunnel vision, drunk feeling, nausea, and muscle ache on 08-APR-2021, and headache, was recovering from dizziness, and had not recovered from crazy dreams. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: 20210416274-Covid-19 vaccine ad26.cov2.s-TUNNEL VISION . This event is considered unassessable. The event has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the event.</p>

1225669	4/18/2021	CT	64	F	3/6/2021	3/7/2021	Started morning after with terrible headache, pain in the eyes, nausea and sore arm. Few days later felt tightness in the chest, shortness of breath and a cough started. Feeling unwell. Continued and went to urgent care. Covid 19 test negative. continued to feel the worse and went back again to urgent care. Same symptoms with nausea and headache on and off. another covid test negative and chest xray. looked ok. Continued with the same symptoms and went to Primary Care Cough worse and pain in chest. Blood work done. Looked ok. Woke up with terrible headache at 3am. Went to the ER. IV ,Blood work ,ct scan, ekg. No real answersBP elevated. Still struggling but cough improving.
1225382	4/18/2021	NY	30	M	4/16/2021	4/16/2021	At approximately 4:30pm, on the day I got the vaccine, I began to feel the effects of Encephalopathy and Encephalitis, in which I began to feel pressure in my skull, and felt confusional thinking. It became hard to discern my thoughts. I also, began to experience a difficult time with my vision not being able to control what my vision was focusing on, as well as seeing a blue tint in my vision. I am also experiencing mild pressure and aches on the right side of my back and left side of my chest. These effects have been continuous for the last 4 days. To treat these symptoms I have been using natural remedies, and have maintained a stable condition due to that.
1224256	4/18/2021	CA	48	F	4/6/2021	4/8/2021	Persistent headache for days, lightheadedness, blurred vision, heavy, almost vertigo-like. Fog

1224670	4/18/2021	IN	54	M	3/18/2021	3/1/2021	<p>This is a spontaneous report received from a contactable consumer (patient). A 54-year-old male patient (height: 193cm, weight: 99.79kg) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, batch/lot number: EN6207) via an unspecified route of administration at right upper arm on 18Mar2021 18:00 (54-year-old at time of vaccination), at single dose, for COVID-19 immunization. The patient's medical history included blood pressure, teeth cleaned (Shortly before the shot, went to the dentist to have teeth cleaned. Directly from Dentist went to pharmacy. Went to pharmacy's Drive Thru to pick up a little antibiotic from the dentist. It was 4 capsules of Amoxicillin. He was supposed to take the Amoxicillin before the dentist office visit, but he forgot to do that. Therefore, soon as he left the dentist office he went to pharmacy to pick it up so he could take it. While he was there, was offered the COVID 19 vaccine and that it was the last shot). Concomitant medications included atenolol tablet from 2016 (been taking for 5 years) and ongoing for blood pressure, and ascorbic acid/ cyanocobalamin/ ergocalciferol/ nicotinamide/ pyridoxine hydrochloride/ retinol/ riboflavin/ thiamine mononitrate (ONE-A-DAY). No additional vaccines administered on same date. No history of all previously immunizations. No prior vaccinations within 4 weeks. He got the shot Thursday and by Sunday, many different side effects were coming in. He has had side effects from the COVID VACCINE, but initially he does not want to file report, just thinks that everyone needs to get the shot. He does not have complaints. He is wondering how long the side effects will last, and when they go away. States that he is being treated as he has gone to the doctor's. Also states that he made an appointment with the doctor and almost went to the emergency room a couple of times. Right after the shot, he was getting in the car and his right leg started hurting (on 18Mar2021). It didn't go away for a couple of days. It went away but then noticed his shoes started feeling funny. He wasn't looking at his feet, put his shoes on they felt tight. Then he started to look at feet more. Below his knees, his legs are swollen. Swelling started within 2 to 3 days after the vaccine. The swelling is really severe when standing. Everybody at work has seen how sick he is and his legs. Swelling in the legs has him concerned, thinking maybe it's a blood clot. He was given medicine and</p>

---

would like to see it go away. He keeps his legs up. He has other side effects (all in Mar2021) and is having flu like symptoms. He basically has the flu. He has never had the flu shot. This is the first flu shot (He referred to the COVID vaccine as the flu shot as documented. However, confirmed suspect product as Pfizer covid vaccine) he has had that he knows of. He is questioning if he should get the second shot. He feels a little dizzy. Quick questions get him confused and that it comes and goes. Lungs felt full, gasping for air: not now but, since the doctor gave him antibiotics (unspecified injections, he was given 2 shots at the doctor's office, one in each arm), his lungs felt full. At times he was gasping for air. It went away but thought he was going to die. Now when he gets winded, it feels like he has a dry cough. Gets winded easily. The doctor ordered him an inhaler, Symbicort, but it was very expensive, so he did not get it at that time. He never picked it up because it was too much money. The fluid is not there anymore and he does not feel like he needs this as does not feel like it needs to be cleared. He is having wheezing. He can now take deeper breaths. Fatigue: initially, that he was feeling tired within 1 or 2 days, but he did not recall the next day feeling that way (later stated it was within 2-3 days he started to feel tired). He is still tired. Unable to clarify time frame of fatigue further. He feels bloated and full. Hasn't really eaten but feels real full and bloated. Hot and cold flashes started occurring about the same time as the other symptoms. He had these last evening. He does not get the flu very often and doesn't take the Flu shot. This is the closest thing he can remember having a pretty good episode with the flu. He was also given prescriptions for 2 new medications: Triamterene 37.5mg daily, for leg swelling; Clindamycin, 300mg, twice a day, an antibiotic. The odd thing is that it seems like his eyes are big, like really, really big, like they are really open. It is like big eye balls. States that he is just sick and his body is reacting to getting better. He has not been to work in the last 3 days. States that he is fine, just worried about work. Patient asked for personal advice about going back to work. The outcome of "his right leg started hurting" was recovered; outcome of "below his knees, his legs are swollen/ swelling in the legs/ put his shoes on they felt tight" and Fatigue/feeling tired was not recovered; outcome of other events was unknown.

1224634	4/18/2021	KY	64	F	3/16/2021	3/1/2021	Lymph nodes hurting a lot; Hypersensitive to light; A lot of dizziness; Nausea; Headaches; affecting all organs; Chest pain; Felt like the Covid-19 vaccine was hydrating eyes/Film on eyes; Losing vision; This is a spontaneous report from a contactable consumer (patient). A 64-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Lot Number: EN6208), first dose via an unspecified route of administration on 16Mar2021 10:30 (at the age of 64 years old), single dose for covid-19 immunisation. Medical history included ongoing thyroid (disorder) (Unspecified thyroid condition). It is the vaccines with aluminum and bovine extract that she knows that she can't handle. Caller reported that she got a flu vaccine at work and that she definitely got the flu within a few minutes of receiving the flu vaccine. Caller reported that another time after receiving the flu vaccine, she definitely got the flu but she was unsure of the time frame. Caller reported that she did have the flu vaccine several times but that two times, the flu vaccine definitely gave her the flu. She has 3 brothers and that one of her brothers that she is a caregiver for has Type 1 Diabetes. Her brother just felt like he had to have 2 vaccines several years ago and that he received the pneumonia and flu vaccines. Her brother was hospitalized within days of receiving the flu and pneumonia vaccines. Her brother was placed in the ICU for heart patients and the medical staff at the hospital was not sure if her brother was going to live. She couldn't remember how long her brother was hospitalized for, caller stated she thinks maybe around 10 days. She knows what she knows, her 2 other brothers were also hospitalized as children. She didn't know if her brothers had vaccines before they were hospitalized but that she would bet money that vaccines they had received are what resulted in hospitalization. When hospitalized, her second brother was not expected to live. At the time of the event, her brother was only 1 or 2 years old. Her brother's infection was so bad that the hospital sent blood to the CDC and that the CDC couldn't figure out what was wrong with her brother. The hospital kept giving IV antibiotics to her brother and he lived. Her third brother hospitalized around 5 years old with pneumonia during the summer. She didn't know if her brother had received any vaccinations at that time. She just thinks the vaccines did that to them but she doesn't know that.

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

Someone gave her first brother the information on the pneumonia and flu vaccines he received prior to his hospitalization. She didn't have information regarding the details of the vaccines that her brother received. The facility where her first brother was vaccinated with flu and pneumonia vaccines would not give her the information on the vaccines that her brother received. Caller reported that it was a really hard time to fight the facility for that information and she was shocked the facility wouldn't give her the requested information. Caller reported that they wouldn't give her any medication records or anything. Caller reported that it was a bad time for her to fight it, and that she will eventually go back and tell them they have to give her the information. Her brother that she is a caregiver for and that was hospitalized after receiving the flu and pneumonia vaccines also had the Covid-19 vaccine on 16Mar2021. Caller reported that she had been more concerned about her brother having a reaction as he has serious health issues, including Type 1 Diabetes and a heart condition. Caller reported that her brother stated that he's fine and to the caller, her brother seems fine. Concomitant medication included levothyroxine. Patient has experienced that the Pfizer Covid-19 vaccine made her hypersensitive to light on 20Mar2021. She is losing vision on Mar2021 because of the hypersensitivity to light. On 20Mar2021, patient had a lot of dizziness and nausea. It is affecting all of her organs. She has had headaches, chest pain. The Covid-19 vaccine is affecting all of her organs. Yesterday, 30Mar2021, her lymph nodes were hurting a lot, at least she thinks it was her lymph nodes. All of her organs that have been affected by the Covid-19 vaccine and that it seems like it moves day to day. She is mostly sensitive to UV light but is also sensitive to artificial light. She thinks that the hypersensitivity to light has improved a little bit but it's still a problem. The hypersensitivity to light was the absolute worst on 20Mar2021. She doesn't know how much she is still dizzy when asked if it was still ongoing. She added she has been taking Benadryl and ginger for the dizziness and nausea and it helps a lot. She has been taking ginger for the nausea, and if she still has a little, it's not as much. Today is an overcast day and that it's an easy day for her. Caller reported that bright, sunny days are the worst. She was unsure of when the vision loss occurred

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

but stated that she knew by 20Mar2021 that she had lost vision. She didn't know if she was continuing to lose vision but she can tell she lost vision. She did have a headache in the evening on 16Mar2021 after receiving the Covid-19 vaccine. She thinks the headache occurred in the evening on 16Mar2021. She may have had some headaches between 16Mar2021 and 20Mar2021, but that the headache she had on 20Mar2021 was a horrible headache. She is still getting headaches. She would say the headaches are a little better but she is still having them. She is having headaches that she doesn't think she would normally have. She wasn't having headaches before receiving the Covid-19 vaccine. She thinks she did have headaches between 16Mar2021 and 20Mar2021, but 20Mar2021 is when the headaches really hit her. The chest pain is intermittent and that the chest pain coincides with when the light is affecting her. When it's UV light, more so in the afternoon on sunny days, but technically the artificial light in the evening some days bothers her too. She doesn't think her lymph nodes were bothering her before 29Mar2021. Her lymph nodes are ok this morning, 31Mar2021. Different organs have hurt at different times. The effect on organs started within minutes of getting the Covid-19 vaccine. She could feel her eyes and that her eyes felt different within minutes of getting the Covid-19 vaccine. It felt like the Covid-19 vaccine was hydrating her eyes on 16Mar2021 but at the time it felt good. Afterward she was freaking out because she was concerned about her eyes. In the evening of 16Mar2021, it seemed like there was a film on her eyes and she had a headache. On 17Mar2021, 18Mar2021, and 19Mar 2021 she had headaches that she wouldn't have normally had. On 20Mar2021 different organs started hurting. Her biggest concern was the chest pain. After looking back on it, the chest pain may have started between 17Mar2021 and 19Mar2021 also. The effect on her organs from the Covid-19 vaccine occurs on different organs at different times on different days. The effect today isn't bad because it overcast outside and that her organs are really affected when she is exposed to a lot of light. She had 2 blood tests yesterday at her primary care doctor. The doctor ordered labs for VEGF and Leptin. She doesn't get vaccines. No Prior Vaccinations (within 4 weeks). The outcome of the event Photophobia, Nausea, Headache, Lymph node disorder was recovering; other

A 57-year-old female patient received first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot: EW0150; expiry: 31Jul2021), via an unspecified route of administration in left arm on 31Mar2021 01:30 as single dose for covid-19 immunisation. The vaccination facility type was a warehouse. The vaccine was not administered at a military facility. No previous immunization with the Pfizer vaccine considered as suspect. No vaccines administered on same date with the Pfizer vaccine considered as suspect. No prior vaccinations (within 4 weeks) and no following prior vaccinations. Medical history included covid-19 in Nov2020. The patient had no concomitant medications. The patient had the first dose of bnt162b2 on 31Mar2021 and 12 hours later (on 01Apr2021), sore arm, fever, chills and headache. Got a swollen lymph node in armpit, same arm as injection left side, today tip of left ring finger turned white and numb. She thinks it was Reynauds phenomenon. The patient called and told nurse in her doctor's office and they said if it was painful, it could be a pain clot. It was painful at first, that lymph node started 24 hours later with a sharp pain, and then she just assumed it could be a lymph node. Swollen lymph node started with a sharp pain and it was very sore. The nurse told the patient to call Pfizer. The patient was fine until the tip of her finger happened. The patient said If it was painful it could be a blood clot, would need an x ray and asked if did the shot cause this. The complete ring finger left hand, the patient looked it up and it said it could happen to her feet and she looked,

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

and her feet were modeled red, blue it was bizarre. Never happened before. The patient was not happy about getting the vaccine, she already had covid in November of last year (2020). The patient wouldn't have called if it wasn't for her finger. Not just her feet, her hands got like this too. The patient didn't want to get the second shot. The patient asked if there was any information or mandate on timing information for the second dose, should she needed to postpone it. The patient asked if what was the efficacy after first dose as she felt like she was immune because she had the virus and now the vaccine. She was very hesitant to get the Covid 19 vaccine. She thinks her body created Covid 19 antibodies. A couple days ago she was very sick. The swollen lymph node started with a sharp pain and could be a blood clot as far as she knows (in 2021). Even putting on deodorant she can tell it's there, it was very sore and there's a lump. Today (on 01Apr2021), she noticed the tip of her finger got white it was numb. She looked it up online and she thinks it was Reynaud's phenomenon. She has a picture if Pfizer needed it. The finger was on the same arm that she received her vaccine in. It was the ring finger on left hand. Once it started happening her finger felt funny and felt numb. She put her finger under warm water. She reported that the white color was maybe a third of the way down towards her knuckle. She was asking if this was normal or has this been reported. She had called her doctor today and spoke with the nurse who told her to call the CDC and report her symptoms. She needed her glasses trying to give her primary care doctor's phone number. The patient wanted to add that she has something like gout in her foot and on that side too, the left foot, it was pulsing and throbbing all night. She's had this pain in her left foot, she thinks its gout because it was all the symptoms of gout and she had it for a while, it hurts off and on but that night it was hurting and throbbing. She has not been diagnosed with gout in that left foot. She still has a headache but today she felt good except for her finger turning white and going numb. The lymph node in her armpit hurts. Her doctor's nurse told her if its painful to the touch it could be a blood clot so she was nervous about that. The tip of her finger was completely white and the rest of her hands were blue and red and white and yellow. She reported that her finger was back

1224599	4/18/2021	CO		F	3/20/2021		breathing/unresponsive; seizures; blood sugar was 35/Blood sugar dropped into the 60's again; This is a spontaneous report from a contactable reporter. A 75-year-old female patient (reporter's mother) received second dose of bnt162b2 (BNT162B2, PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 20Mar2021 at single dose for covid-19 immunisation. Medical history included parkinson's disease from 2018 to an unknown date, the progressive type, covid-19 from Nov2020 to an unknown date (She had mild case of covid in November), she was not symptomatic, rheumatoid arthritis from 2018 to an unknown date, Heart failure from 2018 to an unknown date(which she was diagnosed in 2018 with and was being managed appropriately), spinal operation from an unknown date and unknown if ongoing PRESS (Posterior reversible encephalopathy syndrome) Complication, posterior reversible encephalopathy syndrome from an unknown date and unknown if ongoing (Complication after Back surgery). The patient's concomitant medications were not reported. The patient had the first dose of dose of bnt162b2 (BNT162B2, PFIZER-BIONTECH COVID-19 VACCINE) on 27Feb2021 for covid-19 immunisation. The patient experienced breathing/unresponsive but breathing on her bi-pap (hospitalization) on an unspecified date with outcome of unknown, seizures (hospitalization) on an unspecified date with outcome of recovered, blood sugar was 35/blood sugar dropped into the 60's again, blood sugar low (hospitalization) on an unspecified date with outcome of unknown. The patient underwent lab tests and procedures which included lumbar puncture: proteins and white blood cells on unknown date, Presence of proteins and white blood cells, magnetic resonance imaging(MRI): something that happened with brain on unknown date, assault from something that happened with brain, white blood cell count: nothing crazy on unknown date. Therapeutic measures were taken as a result of seizures, blood sugar was 35/blood sugar dropped into the 60's again. The clinical course was reported as follows: She states, "Her mother was in a rehab facility up until the 26Mar2021, the CNA came in at noon and her mom wanted to keep sleeping. Thursday afternoon was the last time she got to talk to her. PT/OT came in at noon on Friday - found to be breathing/unresponsive. blood sugar

----------	-------	-------	---------	-----	----------	------------	--------------

was 35, gave her glucose, came up to 111. Still not responsive but breathing. Sent her to ER, she was breathing but still not responsive, then started she started having seizures. Blood sugar dropped into the 60's again, having seizures from Friday until Monday. managed it with Keppra and another seizure medicine and now she is in ICU. Her mother is 75 years old with degenerative Parkinson's Disease, wheelchair bound, and a history of PRES (Posterior reversible encephalopathy syndrome). She was about to be discharged but then all of this happened. The only thing that was really different is the vaccine that she received. She had mild case of covid in November, she was not symptomatic. Waited 3 months to get the covid vaccine after she had covid. The caller states that her mother received the first dose of the Pfizer COVID-19 vaccine on 27Feb2021 and the second dose on 20Mar2021. The caller would like to know if there have been any reports of low blood sugar associated with receiving the Pfizer COVID-19 vaccine. The caller wants to know if anyone has reported seizures as a side effect from receiving the Pfizer COVID-19 vaccine. Responded per page 23 of the attached EUA Prescribing Information LAB-1457-6.0 Revised: 25Feb2021: "Throughout the safety follow-up period to date, Bell's palsy (facial paralysis) was reported by four participants in the Pfizer-BioNTech COVID-19 Vaccine group. Onset of facial paralysis was Day 37 after Dose 1 (participant did not receive Dose 2) and Days 3, 9, and 48 after Dose 2. No cases of Bell's palsy were reported in the placebo group. Currently available information is insufficient to determine a causal relationship with the vaccine. There were no other notable patterns or numerical imbalances between treatment groups for specific categories of non-serious adverse events (including other neurologic or neuroinflammatory, and thrombotic events) that would suggest a causal relationship to Pfizer-BioNTech COVID-19 Vaccine. 6.2 Post Authorization Experience: The following adverse reactions have been identified during post authorization use of Pfizer-BioNTech COVID-19 Vaccine. Because these reactions are reported voluntarily, it is not always possible to reliably estimate their frequency or establish a causal relationship to vaccine exposure. Immune System Disorders: severe allergic reactions, including anaphylaxis, and other hypersensitivity reactions (e.g., rash, pruritus, urticaria,

----------	-------	-------	---------	-----	----------	------------	--------------

angioedema)". The caller has her best friend on the line with her in case the caller forgets something. The caller's is calling on behalf of her mother who had both doses of the covid vaccine. The patient is currently in the Intensive Care Unit. The patient was supposed to go home from a rehabilitation facility on 27Mar2021 and staff found the patient on 26Feb2021 unresponsive but breathing on her bi-pap. Prior to the patient being found like this she was tired at noon and asked the staff to hold her lunch for her because she was tired and wanted to lay down because she had been up late the previous night. When physical therapy and occupational therapy came in a couple of hours later to do therapy they found the patient unresponsive and the patient's blood sugar was 35 so they gave her glucose and the blood sugar came up to 111. Emergency medical services came and took the patient to the emergency room and then she was put in the Intensive Care Unit, this was all within 30 minutes. The glucose dropped one more time and she started having seizures. The medical staff stabilized the patient with Keppra and another seizure medicine that starts with a V on a drip. The patient has been off her sedatives since Tuesday and she has eye movement under the eyes, she withdraws from pain, and when (name withheld) was talking to the patient on speakerphone the patient moved her head towards the phone. The caller mentions that the patient was not protecting her airway when the emergency medical service showed up and so the staff placed a king airway and then the patient moved to a normal ventilator. Wednesday the patient was being weaned on the ventilator and was able to breathe on her own for 7 hours. The caller was only able to breathe on her own on the ventilator for 2 hours yesterday, split up into 2 different trials. The medical team is pressuring the caller talking about tracheostomy and peg tubes and the medical staff wants to talk about that next week if the patient is not coming around. Investigations: MRI showed basically an assault from something that happened with the brain from having a low blood sugar. The patient has no history with diabetes or low blood sugars. Maybe the patient had a seizure prior? The patient had signs of infections, her white blood cell count is nothing crazy. The patient's lumbar puncture showed proteins and white blood cells present. The caller is trying to figure out what may have caused this incident. The patient had 4 strokes

on her left side and has come back from that and has been driving and fine after. The patient's outpatient neuro person said it is from the seizures. The caller is trying to rule out if there is anything weird with this vaccine that may have caused this or been reported? PRESS is a rare complication after back surgery and the patient had that. If something is super weird and rare then the patient usually has it, she usually gets weird things. Is this related to the vaccine? The caller knows it may not be likely but it was the only thing she hadn't looked into yet. Information on the lot/batch number has been requested.

blood in her eye, like it busted; This is a spontaneous report from a non-contactable consumer reported for herself. A 56-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration on an unspecified date (Batch/Lot number was not reported) as single dose for covid-19 immunisation. The patient medical history was not reported. The patient's concomitant medications were not reported. The patient got her first Pfizer covid vaccine this morning she was doing fine but when she came home and looked in the mirror, it looks like there is blood in her eye, like it busted. It doesn't hurt or anything on unknown date with outcome of unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

1224396	4/18/2021	NY	72	F	3/29/2021	3/1/2021	<p>hoped she wasn't having a heart attack; Elevated Pulse/high pulse/pulse was 165 beats per minute/climbed up to 195; Drenched in sweat/sweating/sweating like a dog in the middle of the night; Wasn't feeling well; Tightness in chest; Cough; Sinuses congested; Sore; Puffy, bubbled up arms, inflamed; Puffy, bubbled up arms, inflamed; Feverish/felt hotter than usual; Really, really tired/wiped out tired; so sleepy; Sore Arm/her arm started to hurt; Nauseous; Sore Throat/throat hurts; eyes half closed/eyes closing; Puffy Face; blood clot; This is a spontaneous report from a contactable consumer (patient). A 72-year-old female patient received the first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number ER8733, expiry date: unknown), via an unspecified route of administration, on 29Mar2021 11:45, as single dose, for COVID-19 immunisation. Medical history included ongoing latex allergy (developed welts where the straps met the skin) diagnosed 20-30 years ago; ongoing dye allergy (developed warm soreness to leg, tightness in the chest, could not breathe) diagnosed many years ago; sulphite allergy (diagnosed about 1975-1980; cannot eat processed foods, bleached foods, frozen pre-made foods; tries to eat only single item foods; last anaphylactic reaction after eating olive oil at a restaurant because it had sulphites in it; Mother was possibly allergic to sulphites; Son also allergic to sulphites); and blood pressure that runs low. The patient previously took epinephrine and experienced epinephrine allergy; ciprofloxacin (CIPRO) and experienced Cipro Allergy (eyes closed, got puffy, couldn't breathe); amoxicillin for abscessed tooth and had a reaction because of the sulphites in it; epinephrine (EPIPEN) and experienced epinephrine allergy (does not use it anymore); plantago ovata (METAMUCIL) which she then found out the orange one had sulphites. Historical vaccine included flu shot for immunization and she experienced 104-degree temperature and was sick as a dog and she went to the emergency room (she had flu shot maybe 3 times). Ongoing concomitant medication included multivitamins. The patient got her first dose of BNT162B2 on 29Mar2021 at 11:45. On the same day, once she got home, she became really, really tired/wiped out tired; was so sleepy; experienced sore arm/her arm started to hurt; was nauseous; had sore throat/throat hurt; eyes half</p>

closed/eyes closing and puffy face. On 30Mar2021, the patient experienced elevated pulse/her pulse got too high/pulse was 165 beats per minute/climbed up to 195. Her heart rate was 194 at some point for a couple of minutes then stayed at 165 for a long time. She hoped she wasn't having a heart attack. She had tightness in her chest, wasn't feeling good and was coughing. She stayed in her bed to wait out her symptoms. These lasted for 10 minutes (as reported). She started meditating hoping her heart rate would decrease and it did after about 15-20 minutes. The patient also felt feverish/felt hotter than usual. Before she took the vaccine on 29Mar2021, her temperature was at 96. She stated that her temperature usually runs low as 95-06 degrees. She also felt like her sinuses were congested; was sore; had puffy, bubbled up arms, inflamed. The patient hoped it was not a blood clot she developed. At the time of the report, the patient stated that her heart rate was 61 beats per minute, earlier it was in the 70s; and her temperature was at 96.3. Her second dose is scheduled on 19Apr2021 and mentioned that if these were her reactions with the first dose, she is questioning getting the second dose. The outcome of "blood clot", "hoped she wasn't having a heart attack", "Wasn't feeling well", "Tightness in chest", cough, and sinuses congested was unknown. The patient recovered from "Drenched in sweat/sweating/sweating like a dog in the middle of the night", and "Elevated Pulse/high pulse/pulse was 165 beats per minute/climbed up to 195" on 30Mar2021; and was recovering from "Sore Arm/her arm started to hurt", and "eyes half closed/eyes closing". The outcome of the remaining events was not recovered. Information on the lot/batch number has been obtained. Additional information is expected.

----------	-------	-------	---------	-----	----------	------------	--------------

and the Covid test came back positive and boy were they surprised. Clarifies the antibiotic didn't work on the Covid. States it was Levofloxacin, dosage unknown. States the Hospital is normally good about putting the dose on there but they didn't put the dosage and they kept the bottle at the emergency room on Saturday. Caller states that he is also on these other medications; however he doesn't think they were taken within the 2 weeks before the vaccines. Acetaminophen as needed, albuterol as needed, Refresh Eye Drops as needed, Guaifenesin as needed uses when he gets a chest cold and gets them fairly often, and Sudafed as needed. States a surgeon once told him he had the worst bronchitis that he has seen in his career. States he has had a collapsed lung. States during therapy they were putting in a subclavian line and nicked his lung. States boy does that hurt getting a line put in. Caller states he had a kidney transplant in 2014 and he has been on immunosuppressant drugs for 18 years. Mainly Prednisone, CellCept and Tacrolimus. Treatment was giving him a boost of dexamethasone, simply relying on the vaccine to help him get better. States he had no adverse reactions, other than not sleeping on that shoulder, that is all he had. Emergency Room visited on Saturday 27Mar2021 and 23Mar2021. States they did X-rays and blood tests and that is when they told him on 23MAR2021 that he had Bronchitis and sent him home on the antibiotic. The patient underwent lab tests and procedures which included blood test: unknown result on 23Mar2021, sars-cov-2 test: positive, x-ray: unknown result on 23Mar2021. Therapeutic measures were taken as a result of positive covid test, sinus infection, bronchitis.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1224558	4/18/2021	AR		F	3/13/2021	3/1/2021	allergies due to the wind blowing outside; started having runny nose; sneezing; itchy eyes; This is a spontaneous report from Pfizer sponsored program and medical information team. A contactable consumer (patient herself) reported that a female patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection), via an unspecified route of administration on 13Mar2021 as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that, caller (name) reported that she received the 1st dose of the vaccine last 13Mar2021 and she was scheduled on Saturday for her second dose which was 03Apr2021. She was having allergies due to the wind blowing outside and started having runny nose, sneezing and itchy eyes on an unspecified date in Mar2021. She was consulting if she could take the second dose or if she needs to wait for a while. Also, wanted to know if a person would be hurt if they take a vaccine without knowing that they got the COVID-19. The outcome of the events was unknown. No follow-up attempts are possible. Information about lot/batch number cannot be obtained.

because they did not know what to do. Caller adds that the hospital thought that he had a subdural hematoma but the hospital does not have a neuro radiologist, so the hospital transferred to the other hospital that somebody with head knowledge can look at his CAT scan. The patient was misdiagnosed with a subdural hematoma because there were changes in his CT scan from his 3 previous brain surgeries. The patient had a traumatic brain injury when he was 29, and experienced changes. The patient was found to have submassive bilateral pulmonary emboli on 15Mar2021 described as central lobar sub segmental PEs in both lungs, PE was within the distal right main artery, pulmonary artery distal left main, left middle lobe, middle right lobe / upper right lower lobe and middle lobar, segmental and sub segmental pulmonary arteries. The patient also had pulmonary emboli in the distal left main pulmonary artery of left middle lobe and left lower lobe, pulmonary arteries. There was also some degree of right heart dysfunction which was diagnosed by contrast. On 15Mar2021, the patient also had right femoral vein emboli/ occlusive thrombus visualized in the right proximal femoral vein. The patient is in a nursing home, the doctor did not want to listen to the reporter because her brother is a nursing home patient and they just assume he is immobile but he is not. The patient underwent lab test and procedures which included Blood sugar very high (they think it was because of heart strain and acute injury because then it came down down down), A1C elevated, Haptoglobin elevated, elevated troponin. These results were all elevated and from acute injury. At the time of the report, the patient is feeling better and needs less oxygen. The events found down unconscious, unwitnessed fall and oxygen saturation low, pulmonary embolism, right femoral vein emboli/ occlusive thrombus visualized in the right proximal femoral vein, and some degree of right heart dysfunction caused hospitalization from 15Mar2021 to 18Mar2021. The reporter absolutely does believe the events and the suspect drug are correlated. Outcome of found down unconscious, unwitnessed fall and oxygen saturation low, pulmonary embolism was recovered on 18Mar2021 while it was unknown for the other events.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1224538	4/18/2021	WY	59	M	3/11/2021	3/18/2021	<p>Bell's palsy; eye sight in that eye is getting worse every day; right eyelid was sticking on his eye and wouldn't shut; he couldn't move his face on the left side and he can't control it at all; blood got really thin and wouldn't clot; left hand got really swollen; entire arm bruised; edema in his hand; edema in his hand got to the point where his skin was cracking; blood got really thin and wouldn't clot; face went numb; This is a spontaneous report from a contactable consumer (patient). A 59-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; lot number: EN6207, Expiration Date: Jul2021), via an unspecified route of administration, administered in Arm Right on 11Mar2021 (at the age of 59 years old) as single dose for covid-19 immunisation. Medical history included lupus from 2020 and ongoing, ongoing High Blood Pressure, Spinal Surgeries from 1999, Chronic Pain, Retention water, blood clot issue. The patient previously had tetanus shot. Concomitant medications included losartan potassium; allopurinol; hydroxychloroquine; methocarbamol; morphine sulfate (MS CONTIN); oxycodone; furosemide. Caller states he is calling about the Pfizer Covid 19 Vaccine. Seven days later the dose of vaccine (18Mar2021), patient developed Bell's Palsy which he has never had before and has never had any other problem with. He has seen an ENT, his pain doctor, and his medical doctor and they all say the Covid vaccine has caused the problem he is having. He was told by his ENT this is very possibly permanent. Emergency Doctors are who he went to because he thought he was having a stroke, because half of his face went numb. He has been to the doctor 10 times in the last 7 days, it has not been fun at all. He didn't put it together until he saw the ENT, who said Bell's Palsy is caused from a virus. States he had no idea until he said that, that it could possibly be from the injection. States he has never had Bells Palsy before and it started 8 days after the initial shot. His right eyelid was sticking on his eye and wouldn't shut and he couldn't move his face on the left side and he can't control it at all. Clarifies he couldn't shut his right eye all of the way. Since then they have told him he needs to tape his eye shut for 12 hours a day to keep from going blind. The thing that bothers him is his eye sight in that eye is getting worse every day even though he uses the cream and tapes it shut. His wife told him even with both</p>

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

eyes shut, it will not completely shut because his lower eyelid is hanging down too far. The ENT told him he needs a hearing test today at 2:00p.m. to see if this is going to be a permanent problem. He is getting ready to go to the ear doctor to find out more. At the same time he developed the Bells Palsy, his blood got really thin and wouldn't clot which seems really weird. Also on 18MAR2021, his left hand got really swollen and the entire arm bruised and they said the edema in his hand got to the point where his skin was cracking because his blood got so thin that it couldn't clot at all. He had a blood clot issue in the past. States his arm and hand have improved, he can move his hand again finally. The ENT said that since he has been on Prednisone, for recovery for Bells Palsy, for over a week and gotten worse instead of better, it may be permanent. Prednisone is not working, it has actually gotten worse. Prednisone 10mg for 7 days and to decrease by one tablet every day until gone but states he has gotten worse. Treatments (assessed as for all events): Prednisone. States that it has been two weeks since this happened and the doctor told him the only other option is skull surgery. The bones in his head would be drilled out to make room for the nerves in hopes he would be able to work his mouth again, so not a good thing. Eye cream. He is on disability and his house payment is 3/4 of what he makes, so he can't take care of the medical bills himself otherwise he wouldn't worry about it. It is very depressing. His medical doctor said he hadn't seen any cases of Bell's Palsy for 2 years, and he has seen 4 in the last week so that doesn't give him a lot of confidence even though he is still encouraging people to get the vaccine because it is safer than not. He has multiple visits to the ER 3 times between 18MAR2021 and 19MAR2021 within 24 hours; states he was in the ER for hours and hours but no admission. States they did a CT Scan, MRI, CT with contrast and then after that ended up 22 saw ENT who confirmed the fact that Covid Vaccine that gave Bells Palsy and on 22-23 saw his GM again. Prior Vaccinations (within 4 weeks): None within 4 weeks; states 9 months ago he had a Tetanus Shot. No AE(s) following prior vaccinations. The outcome of the event Bell's palsy, Visual acuity decreased, Eyelid disorder, Orofacial dyskinesia, numbness in face was not recovered; other events was recovering. All events happened on

didn't remember all the tests; sharp pain underneath her left rib cage/pain was number10/still had pain off and on, periodically; broke out in sweat, real bad, number 10, she broke out in a clammy sweat. The patient said she has to leave in 20 minutes to a doctor's appointment. She says her second shot was on 22Feb2021 and the only reaction was it felt like a truck hit her, all her joints were sore (unspecified date), it lasted 2 days then went away, she feels good. Patient was hospitalized. She says she got the second dose to make sure she gets all the doses so she doesn't get sick. The outcome of the event was unknown.

1224525	4/18/2021	CA	77	F	2/4/2021	2/6/2021	she and they thought she was having a heart attack; she must have passed out because she didn't remember all the tests; she got a sharp pain underneath her left rib cage/pain was number10/still had pain off and on, periodically; broke out in sweat, real bad, number 10, she broke out in a clammy sweat; hard to breath, she got a sharp pain underneath her left rib cage; the muscle that goes around her heart, it was having like a charley horse; heart rate, She says 102, 103, it went up to 200 in the ambulance.; chest pain; Nausea; hard to breath, she got a sharp pain underneath her left rib cage; This is a spontaneous report from a contactable consumer (patient). A 77-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number EL3246), via an unspecified route of administration, administered in left arm on 04Feb2021 09:00 as single dose for COVID-19 immunization. Medical history included ongoing atrial fibrillation for a about 6 years , ongoing anemic for the last 20 years, glaucoma from 1998, had both eyes operated on and in 2016 she was operated on again, cataract had this 4 years ago in she says, in 1918, 1919, she clarifies 2018, Cardiac pacemaker insertion which pacemaker that controls her heart so the pulse does not drop below 65. She says that pacemaker was implanted, she thinks, 2014 maybe, blood pressure, arthritis throughout her body and had 30 operations, body doesn't absorb what she eats, anxiety, asthma, muscle spasms; she reported she has had a lot of surgeries, both of her ankles have had triple fusions, these were in 2005, 2010, 2014, 2018, both her ankles were fused, she had 5 surgeries on her feet; she has had both of her knees replaced because of arthritis, 2012 and 2015 she believes, had numerous other surgeries and she doesn't want to go through all of them, a right shoulder reverse rotator cuff repair, she had a rotator cuff put in, she doesn't have a rotator cuff, this happened in 2019, her left shoulder, because of an automobile accident, rotator cuff was so damaged that they couldn't repair it, she has minimum use of her left arm and has had operations on her left shoulder in 2005; had a pacemaker put in about 6 years ago, the next morning they kept her overnight, they came in, they took an Xray, she had to go back 2 days later because the lead had come of the heart, they had to go back in an reattach the lead to the heart; 2 years ago her

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

pacemaker was going all over her chest, the doctor did not believe her and it landed under her armpit, it was the size of an orange, the doctor thought it was a lump, she went to the hospital, her pacemaker started falling apart, they took it out and put a new one in, it was about 4 years ago; a lump in her breast, she has been put under 30 times, they were all necessary, nothing for glamorizing; had surgeries in her left arm and some fingers than were numb. There was no prior vaccinations within 4 weeks, no events prior vaccinations and no family history. Ongoing concomitant medication included baclofen taken for muscle spasms for about 2 years, calcium for arthritis and her bones degenerate for 30 years, ergocalciferol (CALCIFEROL VIT D) taken for gets anemic real easy for 20 years, duloxetine taken for anxiety, taking this about 3 years ago; ferrous sulfate taken for anemic real easy for about 20 years; folic acid taken to rebuild cells taking this she thinks in 2015, furosemide taken for a diuretic to get rid of fluid for 2 years, metoprolol tartrate taken for atrial fibrillation, and blood pressure, taking this since she had her pacemaker put in; montelukast for asthma for 20 years; hydrocodone bitartrate, paracetamol (NORCO) taken for arthritis for 20 years, and warfarin taken for blood thinner/thin the blood out so she doesn't get blood clots; and adults vitamins for bone supplement and metabolism for 20 years as her body doesn't absorb what she eats. She says she takes a lot of medications and when she does blood bloodwork she was low so they make her take them. The patient previously took rivaroxaban (XARELTO). On 06Feb2021, the patient experienced she thought she was having a heart attack. The patient reported that she had to call an ambulance at 11:30 at night, she thought she had a massive heart attack. She had chest pain, nausea, it was hard to breath, she got a sharp pain underneath her left rib cage. She stated that when the ambulance got here they thought she was having a heart attack, they did nitroglycerin, when they got to the house, when in the ambulance on the way to the hospital they did another pill of nitroglycerin when they got to the hospital. The pain was a number 10. She stated she broke out in sweat, once they got her all hooked up they got to the hospital 6 miles away to the hospital. She was there for 2 full days, they did Xrays, dye in her, checked her hears, and did bloodwork. When she had chest pain, she reported they

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							gave the morphine, it lasted about 6 hours; she still had problems breathing, they took her, she must have passed out because she didn't remember all the tests, she was in and out of it, the severe pain stopped after 6 hours, still had pain off and on, periodically. When she got pain in the ambulance then the nausea went away. After the hospital nitro and another shot for the pain, the nausea stopped. After the hospital after this they gave morphine and the pain subsided a little but didn't totally go away until 6 o'clock in the evening, she still had problems breathing because every time she breathed she got pain under her left rib cage. She says the sweat was at home, real bad, number 10, she broke out in a clammy sweat, on the 6th when she was having pain. She says that after the hospital, a couple days after that, she saw her cardiologists, he told her what happened, it was related to vaccine, it was the muscle that goes around her heart, it was having like a charley horse, he says it felt like you're having a heart attack, her tests said her heart was good. She talks about her blood pressure and heart rate, and says 102, 103, it went up to 200 in the ambulance. She says they thought it was a heart attack, her blood pressure was usually low blood pressure and all the symptoms she was having was because of her muscle having a charley horse that felt like it was coming from the heart, if they had contacted him, he said she would have just needed a massive amount of anti-inflammatory and it would have stopped the pain. The events required an emergency room visit. She wanted to know if anybody else has been hospitalized for massive heart attacks and says that's what she was having. The patient had her second shot on 22Feb2021. Outcome of event nausea was recovered on an unspecified date; and outcome of the rest of events was unknown.
1224511	4/18/2021	IN	21	F	4/15/2021	4/17/2021	Day after vaccine normal chills and fatigue. Sore eyes and sore arm where vaccine was administered. Subsequent day woke up with extremely itchy eye (right only) and growing lump in eye which grew throughout day. Called health facility for university and on-call nurse said to go to ER. ER said some allergic reaction possibly due to season (patient has not experienced any allergic reactions to her knowledge prior).

1224494	4/18/2021	NV	62	F	3/26/2021	3/26/2021	<p>eyes rolled back/passed out; my throat area under my jaw line started to hurt; my left leg was achy and tingly; my left leg was achy and tingly; headache; nauseated; weak; fever; just didn't feel good; sick; became rigid; This is a spontaneous report received from a contactable consumer (patient). A 62-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (brand=Pfizer-BioNTech, lot unknown=true, lot unknown reason=unable to locate or read the details) via an unspecified route of administration in right arm on 26Mar2021 11:45 (62-year-old at vaccination date) at a single dose for COVID-19 immunization. Medical history included hypertrophic cardiomyopathy (HCM), a bruit, ventricularomegaly, gastrointestinal (GI) issues, many female issues (before she got a hysterectomy), cancer activity, hepatitis C (Hep C), COVID-19 since 18Mar2021 (diagnosed as extremely positive, remained sick until 25Mar2021), and allergies to medications, food, or other products included Motion sickness meds. The patient was not pregnant at the time of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Other medications the patient received within 2 weeks of vaccination was reported as yes but unspecified. About 25 minutes after the vaccine, her throat area under her jaw line started to hurt, her left leg was achy and tingly, and she was started to get a bad headache. She became nauseated and weak. She made it home, took paracetamol (TYLENOL), and got in bed. Saturday her headache was on steroids, she had fever, and just didn't feel good. Later that day, she was so sick she went to the bathroom and she guessed she passed out. Basically, her husband said he found her on the floor after he heard a thump. He asked me what was his name. He said she responded correctly, but then her eyes rolled back, she became rigid, and he called 911. she knew 2 sets of paramedics arrived w/ambulances. They monitored her vitals and stayed until she was normal. They were willing to take her to the hospital, but offered other options for her husband and she to consider. They suggested she see her Primary care doctor (she did on 29Mar2021). Her doctor believed she should not take the 2nd dose of the vaccine. Adverse event start date was 26Mar2021 at 12:30 pm. AE resulted in doctor or other healthcare professional office/clinic visit. It was reported no</p>

1224596	4/18/2021	OH	68	F	3/17/2021		<p>her MS symptoms exploded; head became foggy; blurred eyes; slight headache; This is a spontaneous report by contactable consumer(patient) from Pfizer Sponsored program. A 68-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) first dose on 17Mar2021 at single dose for COVID-19 immunization. Medical history included Multiple Sclerosis (MS) for 20 years and autoimmune disease. Concomitant medications included interferon beta-1a (AVONEX) for MS. The patient previously took Avelox for MS. Caller also states she would like to report that she has a history of Multiple Sclerosis (MS) and she goes to the clinic. Caller states since no studies were done on people with MS, she would like to report her experience. Caller states she received her first dose of the vaccine on 17Mar2021 and hours afterwards her MS symptoms exploded. Caller states she has had MS for 20 years and she doesn't even realize she has it because she is able to walk the dogs at the pound and she does 3600 steps a day and it doesn't keep her from doing anything. Caller states after the shot she has torn meniscus in her knees and her knees were so tight and she has heel spurs, and they were burning and hurt. Caller states she hurt her hand previously and her hand was tight, and it felt like it was going to explode. Caller states every injury she has ever had it felt like it was exacerbated and got worse. Caller states she was instructed by the Clinic to take Tylenol every 6 hours and these symptoms lasted for 12 days. Caller states she takes a medication called Avelox for MS once a week and she didn't take it after the shot because it is known to cause flu like symptoms, but she is back taking it now. Caller states she was working on the computer and her head became foggy and this lasted for six or seven days. The caller has MS and is on Avonex, it's a beta 1 interferon injectable that she has been taking for over 20 years. The caller's doctors told her it was okay to get the shot. Because of the caller's autoimmune disease, the caller's doctors don't know how effective the shot will be with an autoimmune disease. The caller has done well with Multiple Sclerosis; her Multiple Sclerosis was really good she was walking 3600 steps a day. The vaccine seems to have flared up everywhere the caller has been hurt. It made those spots worse. The caller had a torn meniscus and it felt like her knee was stiff like a board. The caller had a bone spur in</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							her foot that it began to hurt where that was removed. The caller broke her left hand and then it felt like it was going to explode. The caller also had head fog and blurred eyes. It took 6-7 days for head fog to get better. The other symptoms it was 12-13 days to get better. The caller also had a slight headache. The clinic said there were no studies in someone with MS who took the covid vaccine, they only reported to them about the autoimmune disease. Someone on the thing said the second dose was 10 times worse than the first one. Then the caller was told if she gets those symptoms with the first shot then the second one will be better because your body is used to it and knows what to do. It is kind of like a trial by fire and no one knows what to expect. The caller wants to know if Pfizer had any information on Avonex interfering with MS. The outcome of the events was unknown. Information on the lot/batch number has been requested.

1227004	4/18/2021	CT	27	F	4/7/2021	4/7/2021	I received my J&J COVID-19 vaccine at around 1:45 p.m. on April 7, 2021. The shot itself was hardly painful, and I felt fine in the wake of the vaccine. That same evening, I had a fever of around 100 degrees , along with chills and fatigue. My most notable symptom was a severe, pounding headache throughout my forehead. It seemed to be localized above my eyes, in the front of my head. This was surprising to me, as I never get headaches. I took some acetaminophen and went to sleep, and the next day the headache had subsided slightly. The headache did not subside completely until 3 days after the vaccine and even now, nearly two weeks after the vaccine, I still get a slight headache in the same location (above my eyes, across my forehead) unexpectedly. Again, I never got headaches until receiving this vaccine.
1226961	4/18/2021	WA	24	F	4/17/2021	4/17/2021	High grade fever, diarrhea, vomit, nausea, splitting headache, chills, loss of appetite, muscle aches, jaw pain, lethargy, blurred vision.
1226921	4/18/2021	MN	28	F	4/18/2021	4/18/2021	After receiving my second dose, about ten minutes after, I began to feel dizzy and very warm. I fainted and it lasted 5-7 seconds. During this time my arms seized up and my leg was twitching. I bit my tongue and my eyes were super dilated when I woke up (according to the attending nurse). I was very sweaty and had to wait and sit there for about a half hour. Then when I returned home I felt so sick and ended up vomiting. It was horrible. Now I have a slight headache, a sore arm, and am super tired.

1226843	4/18/2021		55	F	3/9/2021	11/1/2020	<p>Injections burn like crazy/ injection is extremely painful; Rash at the injection site; Experiencing flares; Blurry vision / blurriness; This is a solicited report received from a contactable consumer based on information received by Pfizer. This solicited report (USASL2020210290) was reported to Amgen on 23/DEC/2020 by a consumer from a commercial program (PSP00086) and involves a 55 years old, female patient whose injections burn like crazy [PT: injection site pain] and blurry vision/blurriness [PT: vision blurred] while receiving Enbrel with Single Dose Prefilled Autoinjector. No historical medical condition was reported. The patient's current medical condition included rheumatoid arthritis. No concomitant medications were provided. No co-suspect medications were reported. The patient began Enbrel with Single Dose Prefilled Autoinjector on an unknown date. On an unknown date, the patient's injections burn like crazy. For past three and a half to four weeks in Nov2020, the patient has had blurry vision. The patient saw an Ophthalmologist who stated everything looked fine with her eyes but blurriness persists. No treatment information was received. The outcome of the event vision blurred was reported as not recovered/not resolved. The outcome of the event injection site pain was reported as unknown. Action taken with Enbrel and Single Dose Prefilled Autoinjector was reported as unknown for the events injection site pain and vision blurred. The causal relationship between the events injection site pain, vision blurred and Enbrel with Single Dose Prefilled Autoinjector was not provided by the consumer. The reporter declined consent for follow up. No follow up attempts are possible. No further information is expected. ADDITIONAL INFORMATION RECIEVED ON 02Apr2021: This case is upgraded to serious. In this follow up, the patient was experiencing flares [PT: rheumatoid arthritis], injection is extremely painful [PT: injection site pain], rash at the injection site [PT: injection site rash] while receiving Enbrel, Single Dose Prefilled Autoinjector. The patient's co-suspect medications included covid-19 vaccine. On an unknown date, the patient reported that each injection was extremely painful and she gets a rash at the injection site with almost every dose. On 09Mar2021, she has been experiencing flares since having a COVID vaccine on 09Mar2021. She was not home to provide lot. No treatment information was received. The outcome of the</p>

events injection site pain, injection site rash were reported as not recovered/not resolved. The outcome of the event rheumatoid arthritis was reported as unknown. Action taken with Enbrel, Single Dose Prefilled Autoinjector was reported as unknown for the events injection site rash and rheumatoid arthritis. The causal relationship between the events injection site rash, rheumatoid arthritis and Enbrel, Single Dose Prefilled Autoinjector was not provided by the consumer. The reporter declined consent for follow up. No follow up attempts were possible. No further information was expected. Amgen's causality assessment: events injection site pain and injection site rash were related to etanercept, while events blurry vision and rheumatoid arthritis flare up were unrelated to etanercept. The reporter's assessment of the causal relationship of the events with the suspect product was not provided at the time of this report. Since no determination has been received, the case is managed based on the company causality assessment. Amgen Comment: This individual case report does not change the safety profile of the product.; Sender's Comments: Based on information provided, the time association and vaccine's safety profile, the possible contribution of suspect BNT162B2 to the events rheumatoid arthritis flare up ,injection site pain and injection site rash cannot be excluded. The event blurry vision occurred prior to the administration of vaccine BNT162B2, considered unrelated to vaccine injection. The causal relationship of the drug etanercept to the events injection site pain and injection site rash is possible given the implied time association, while the events blurry vision and rheumatoid arthritis flare up were assessed as unrelated to etanercept. The rheumatoid arthritis would involve in eye's disorder when the rheumatoid arthritis is in active status. The clinical course of rheumatoid arthritis would be helpful for further assessment. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1226740	4/18/2021	PA	59	F	4/16/2021	4/18/2021	I wasn't very concerned about having fatigue, body aches, slight fever, headache, chills, starting a few hours after this 2nd dose of Moderna, just took tylenol and drank about double the amount of water I normally drink, the water just stayed for a long time (?) It took a long time until I had to urinate. The worst of that was the day after, but the next day, left arm felt itchy, saw a large red splotch BELOW where the needle went in my left arm. I felt it and it felt like a swollen, raised area and felt hard. I had mild pain at the injection site since I got the 2nd dose Friday, but when it started to get itchy and a rash was there, I got concerned because I've had many severe and sometimes anaphylactic reactions to a red food dye called carmine, which often starts out with an itchy rash. Doesn't seem to be getting much worse though, like the severe allergic reactions I've had to carmine where I would get hives all over my body, eyes swell shut, lips swell up a lot, everything swells up, sometimes my airway, skin all red and itchy, have to use epi-pen and go to ER. But haven't heard of this kind of reaction to the vaccine from anyone I talked to.

1226492	4/18/2021	MI	28	F	4/9/2021	4/9/2021	<p>Got J&amp;J vaccine on Friday at 3pm (April 9) and felt Body aches, Muscles hurt, Stomach hurt, Dizzy, Nauseous , Heart rate fast, Clammy Chills, Didnt sleep, Chest tightness, Upset stomach, Fever, Head hurt, Arm hurts and chest tightness feels in-line with where I got the shot, by Sunday (April 11) Flu like symptoms went away, but still have chest tightness uncomfortable and Feels like i have to cough When I take a deep breathe it it feels tight. Have diarrhea everyday since vaccine Still feel weak and dizzy Most of the flu like symptoms have gone away but chest tightness still concerning When I bend over or lay on my right side feels constricted and tight and uncomfortable. Bilirueben associated with liver is elevated and white blood cell count is low. On Wednesday, April 14th I started to get super congestion, runny nose and sneezing and Eyes a little red. Rashes and Hives that were red, blotchy and bumpy started Wednesday April 14 at 6pm and worse at 9pm. Continues to get worse and hurt throughout Wednesday and Thursday night. Developed all over body, legs felt hot. The hives and blotches would disappear and would then reappear at different areas of my body. Called Nurse Triage line and suggested I treat at home with Benadryl since hospitals had 6 hour wait and were full of COVID positive patients. Unable to sleep Wednesday and Thursday due to hives, very comfortable feeling. Diarrhea on Thursday morning , cough and felt shakey. Noticed on Thursday April 15th, some skin on right foot looked like it was peeling. Thursday night noticed some blotching and hives but not as bad as they were the night before. Friday April 16, No redness on legs at 1130am, but Lips feel dried out and Feel a little dehydrated . Bilirueben associated with liver is elevated still and will need to follow up with Doctore in two weeks. However, when laying on right side or bending down feels like something is stuck un chest and need to cough still, with chest tightness. Still had diarrhea until Saturday, April 17th. Chest is still tight and feels like something is stuck. Sunday, April 18th, went for short walk and felt uncomfortable breathing and not normal. This has not resolved still and does not feel breathing is normal.</p>

shoulders and arms" (Flu-like symptoms), "aching of joints and muscles kind of like flu symptoms in shoulders and arms" (Joint pain), "aching of joints and muscles kind of like flu symptoms in shoulders and arms" (muscle pain), and foggy brain (foggy feeling in head). On 12Mar2021, the patient experienced headaches, chills, itching rash on arms, back, neck and chest (itchy rash). On 13Mar2021, the patient experienced blurred vision. It was reported that after the first shot, on 11Mar2021, patient experienced weakness, then she got home and she fainted, fell, and busted her lip and it was bleeding real bad. Then she began sweating profusely. She started feeling weak 30 minutes after getting the shot. Someone took her there because she would not have been able to drive. They brought her home and she was in the kitchen. While over the sink, she started to feel weak in her arms and legs. Before she could tell her husband that she was feeling weak, she dropped to the floor and everything was turning black. She fell face first and busted her lip and it was bleeding real bad. The weakness gradually started getting a little better on 30Mar2021. She is having to walk with a cane now because of the weakness. She was not using a cane before. Two days later on 13Mar2021, she was in the kitchen again and she felt that feeling coming and her husband was able to grab her and sit her down and she did not faint but she could tell it was coming. Patient also reported that from 12Mar2021, she is getting headaches every day off and on and in different spots of the head. Sometimes it is in the forehead, top, side and back. For about a good week, she had chills and it tapered off after the first dose. Also, on 12Mar2021, she experienced itching rash on arms, back, neck and chest. They were fine bumps and they just itch. The patient was recovering from the events faint, fall, bleeding lips, excess sweating, and itchy rash; and has not recovered from the events weakness, weakness of limbs, flu-like symptoms, joint pain, muscle pain, foggy feeling in head, headache, chills, and blurred vision. Follow-up attempts are completed. No further information is expected.

Sometimes it happen in my left arm. today brothering me again
1225674	4/18/2021	NY	19	F	4/8/2021	4/8/2021	A few minutes after getting the vaccine she started getting light-headed, nauseous, sweats, and blurred vision prior to getting up and informing the pharmacy staff. Pharmacist gave water. She had turned a yellow color. Mother gave liquid Benadryl - adult dose. Epi was offered - but not use. Decided to see if Benadryl got her back to normal. After the sweat she got chilled. Waited at the pharmacy for about an hour as her color came back to normal. Had pharmacists take her blood pressure prior to leaving. It was 106/70. Which would be close to her normal range. Pharmacist initially had trouble getting pulse and blood pressure but was also using the same arm the vaccination was put into. Pharmacist got that blood pressure off the alternate arm. She went to lunch with Mother afterwards. Mother stayed with her until around 4:00 p.m. Shot was around 12:30 p.m. She went to sleep when she got back to her dorm and missed evening class. She has not noted any other side effects other than the tiredness, but she is a college student that's known to have low iron, was on her period, that just went through a trauma event that probably would have jumped her adrenaline, and she was giving some liquid Benadryl. I'm sure any one of those could keep the fatigue. There was a call put into the doctor but she's procrastinating on getting back to them. No rash or difficulty breathing was noticed.

1227387	4/18/2021	NM	44	M	4/16/2021	4/16/2021	Approx 15mins after having the shot administered I sat in my car and felt the medication coming on by it clouding my vision then causing me to faint (and by description from my fiancé) I had what appeared to be a mild seizure. I was out for a minute or two and when I was conscious again my vision was blurry and I felt very drunk for the next 45mins - hour. I also felt like I could taste the chemicals from the vaccine when I became conscious again. The drunk/vertigo feeling subsided slowly over time but I was given a Benadryl from the pharmacist so I'm not sure when the dizziness stopped but I definitely could not drive home. My fainting was not due to any anxiety due to having a shot or anything, I was perfectly fine for approx 10-15 mins after the vaccine then I felt a cold feeling coming on from my right shoulder then up my neck then I got foggy and dizzy and passed out
1227376	4/18/2021	TN	46	F	3/15/2021	3/25/2021	Shortness of breath, nausea, headache, incident of blurred vision in one eye. 1227269	4/18/2021	MI	64	F	3/19/2021	3/1/2021	possible pinched nerve; TIA; heart rate is low anyways from the medications but it dropped to 35 when she was in the hospital/heart rate dropped; her right arm, the right side of her face, and her right knee were numb/ she has numbness in her right finger and right thumb; face feels like its burning; her vision was kind of blurry; sensational loss in her right hand; caller's sclera looked like her eye was bleeding and her pupil started turning a different color.; caller's sclera looked like her eye was bleeding and her pupil started turning a different color.; eye was super red; rupture of a blood vessel in her eye; blood clot in eye; This is a spontaneous report from a contactable nurse (reported for herself). A 64-years-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Solution for injection, Lot Number: ER2613, expiry date not reported), via an unspecified route of administration, administered in left arm on 19Mar2021 09:00 at a single dose for covid-19 immunisation. Medical history included ongoing hypertension from 1900 wherein blood pressure was high prior to her atrial fibrillation medications; A fib (atrial fibrillation) from 2016 and ongoing; and ongoing heartrate low. As a child the caller had the vaccine in the sugar cube (unspecified) and her mouth was swelling from it; and stated that patient's sister was hospitalized after receiving the same vaccine. Family medical history included mom has hypertension. Concomitant medications included apixaban (ELIQUIS) taken for A fib (atrial fibrillation) from an unspecified start date and ongoing at 5 mg twice a day; sotalol taken for A fib (atrial fibrillation) from an unspecified start date and ongoing at 80 mg, twice a day; and diltiazem taken for A fib (atrial fibrillation) from an unspecified start date and ongoing at 180 mg, once a day. The patient was a healthcare worker and she has had friends who have died from covid. The patient had no previous immunization with the Pfizer vaccine considered as suspect and no additional vaccines administered on same date of the Pfizer suspect. Patient had no prior vaccinations (within 4 weeks). The patient stated she had the first dose of the vaccine and had a TIA (Apr2021) and rupture of a blood vessel in her eye 20Mar2021. The TIA was on Monday (Apr2021) and she was supposed to have her second dose tomorrow (09Apr2021). She stated she may get it but she is not taking it tomorrow because she is still

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

having residual symptoms. She asked what the length of time she can wait to get it before she has to restart. Patient reported that after she got her first vaccine she had a ruptured blood vessel in her eye the next day (20Mar2021). She put warm and cool compresses on her eye then the ruptured blood vessel subsided. The ruptured blood vessel came back again a few days later and this time it was the entire sclera. She developed blood clots in her eye and the doctor said it probably wasn't from the vaccine (Mar2021). She was supposed to get her second dose of the vaccine tomorrow 09Apr2021 but she was going to hold off for now. She then had a TIA (Mar2021) and became hospitalized because of it from 06Apr2021 to 07Apr2021. The patient has ongoing atrial fibrillation but has been taking her medication religiously. She believed that the TIA was from the vaccine as there was no explanation as to why it happened. Her heart rate was low anyways from the medications (dates unspecified) but it dropped to 35 when she was in the hospital (Apr2021). The patient's primary care provide was not the attending in the hospital when the caller was hospitalized. Furthermore, it was reported that on 21Mar2021, patient's eye was super red but only on one side of her left eye. On Tuesday, 22Mar2021, caller went to see her primary care provider and they told the patient to put a warm compress and no eye drops in her eye, that helped. Then that Friday, 25Mar2021, the patient's sclera looked like her eye was bleeding and her pupil started turning a different color. Then last Monday (Apr2021), the patient woke up and her right arm, the right side of her face, and her right knee were numb she got up and went to see if she had a facial droop and did not. The patient thought it was from her sleeping wrong, but these symptoms did not go away. The patient went to the Emergency Room where they did a CT of her head and neck, with and without contrast which was negative. The patient was admitted on 06Apr2021 to the observation unit where they did an MRI and ECHO, which were both negative and she was diagnosed with a TIA and possible pinched nerve (Apr2021). The patient denied any heavy lifting prior to this event other than normal day to day things. The patient was discharged on Wednesday 07Apr2021. The patient's face felt like its burning, she has numbness in her right finger and right thumb. Physical therapy and occupational therapy said

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

the patient should be okay but to be careful with things that were hot because she was at risk of burning herself. The second time the patient's eye became red, her vision was kind of blurry (Apr2021) and she didn't know if the blood was in her pupil. The only deficit that the patient has now is sensational loss in her right hand (Apr2021) and that should improve per the occupational therapist at the hospital. The caller was supposed to get the second dose of the vaccine on 09Apr2021 but she doesn't want to take it while she is having these symptoms. Results of tests and procedures for investigation of the patient included: head ct with and without contrast: negative on 06Apr2021; MRI brain: negative on 06Apr2021; Echocardiogram: negative on 07Apr2021; speech evaluation: passed on 07Apr2021. The patient asked what the efficacy is after one dose and if a booster will be needed since she is only protected for 6 months. Patient asked if she needed to restart the series of vaccinations if she doesn't get the second vaccine tomorrow 09Apr2021. The events ruptured blood vessel in eye, blood clot in eye, sclera looked like her eye was bleeding, eye was super red were reported as serious medically significant, and heart rate dropped as life-threatening. As reported, the events required emergency room and physician's office visit. Therapeutic measures were taken as a result of the events rupture of a blood vessel in her eye, and eye was super red. The outcome of the events reported was unknown. As per reporter, the events ruptured blood vessel in eye, blood clot in eye, and heart rate dropped were related to the covid BioNTech vaccine.; Sender's Comments: Based on the temporal relationship, the association between the reported events with BNT162b2 use can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

1227216	4/18/2021	CA	33	M	4/10/2021	4/10/2021	I received the vaccine Saturday 4/10/21 at 9 am. By 8 pm of the same day I had fever, chills, headache and body aches. For about 30 minutes I saw a white spot on the peripheral view of my left eye. By Monday, I felt dizzy and bottom right part of my chest hurt when taking deep breaths. The dizziness and chest pain lasted all week, still feel it today 4-18. My doctors office told me vertigo was a common side effect. On Thursday 4-15 every time I bent down and tried to get up, my right leg hurt as if I had exercised. At the moment I haven't gone into work since Monday 4/12 since my job requires a lot of physical work. I have mostly been home resting but don't feel ready to go back to work. If someone calls can it be a Spanish speaking person please.

1227139	4/18/2021	OK	70	F	3/26/2021	3/27/2021	Shingles right eye; Shingles right side of face; swelling left side of face; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of OPTHALMIC HERPES ZOSTER (Shingles right eye) and HERPES ZOSTER (Shingles right side of face) in a 70-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 031A29A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included Stroke. On 26-Mar-2021, the patient received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 27-Mar-2021, the patient experienced OPTHALMIC HERPES ZOSTER (Shingles right eye) (seriousness criterion medically significant), HERPES ZOSTER (Shingles right side of face) (seriousness criterion intervention required) and SWELLING FACE (swelling left side of face). At the time of the report, OPTHALMIC HERPES ZOSTER (Shingles right eye), HERPES ZOSTER (Shingles right side of face) and SWELLING FACE (swelling left side of face) outcome was unknown. No concomitant medication were reported. On 27 Mar 2021, the patient reported "face blew up". The patient also mentioned that she had no other adverse reactions. The patient went to see the ophthalmologist and dermatologist on 06-Apr-2021 and was prescribed valaciclovir (Valtrex). On 07-Apr-2021, the patient saw another eye specialist and was prescribed prednisone. Treatment included for the events were valaciclovir and prednisone. Company comment: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. This case was linked to MOD-2021-073451 (Patient Link).; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.

1227131	4/18/2021			F		4/14/2021	<p>ARACHNOID GRANULATION; This spontaneous report was originally received from the patient's husband and concerned a 45-year-old female patient. Initial information was received and processed with additional information received in discussion with treating physician on 15-APR-2021. The patient's weight 69 kg and height 178 cm. Patient's medical history included smoking for 10 years and quit 10 years ago. Subject's concurrent conditions included insomnia. The patient was reported to be in good health, Body Mass Index (BMI) reported as 21.7. The patient had no family history of blood clots. On 08-APR-2021, the patient received vaccination with Janssen COVID-19 vaccine Ad26.CoV2.S (suspension for injection, route of administration not reported; batch number not reported and requested), dose unspecified, for COVID-19 vaccination. Batch number was not reported, will be requested. Non-company suspect drug included unspecified contraceptive pill (unknown, oral) for unspecified indication. Concomitant medications included cannabis sativa for insomnia. On an unspecified date 'just following' vaccination, the patient had influenza-like symptoms. On 10-APR-2021, patient started experiencing headaches. On 14-APR-2021 (6th day post-vaccination), the patient presented to Emergency Room (ER) with four days of worsening headache and diagnosed with suspected right transverse sinus thrombosis (later ruled out.) The patient was transferred to a second hospital's intensive care unit (ICU) on an unspecified date. On 15-APR-2021 (7th day post-vaccination), a magnetic resonance imaging (MRI) scan of the brain showed suspected cerebral venous sinus thrombosis (CVST). No other symptoms or neurologic deficits reported, and her platelet count was reported as normal at 268,000 on admission (units and normal range not reported). The admitting physician initiated argatroban whilst closely following the patient's platelet count. Testing for a panel for heparin-induced thrombocytopenia including anti-platelet factor 4 (anti-PF4) antibodies and other unspecified workup were also planned. On an unspecified date, MRV of brain showed an absence of flow in right transverse sinus highly suggestive of thrombosis, sluggish flow in sigmoid sinus and superior IJ. MRA showed non-visualized of A1 segment of right ACA, more distal segment supplied by Left ACA, this is a normal anatomic variant. Also non</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

visualization of R vertebral artery which is felt to be a normal anatomic variant as well. This read was reviewed on 15-APR with neuro-interventionalist physician and 3 radiologist who were all in agreement that this was instead a normal variant (arachnoid granulation.) Report was addended to clarify that there was never any thrombosis. Patient's blood pressure was 120/86 and heart rate 88. Patient was fully anticoagulated with argatroban. No heparin was received. Heparin induced thrombocytopenia (HIT) panel was sent and lab was requested to urgently process. Platelet count remained normal from 268 to 227 on 15-APR-2021. On 15-APR-2021, a CT venogram was performed which again confirmed no thrombosis; rather there was arachnoid granulation (normal variant). All imaging was confirmed with neuro-interventionalist physician and 3 radiologist who were all in agreement. Treatment with agratroban was discontinued on 15-APR-2021. As of 15-APR-2021, patient was clinically improving. Headache was resolved and neurologically intact. Patient was eating and was planned to discharge home later in the day. The action taken with COVID-19 vaccine Ad26.CoV2.S was not applicable. Action taken with contraceptive pill was unknown. The event arachnoid granulation was recovering This report was serious (hospitalization/prolonged hospitalization).; Sender's Comments: V0: A 45-year-old female experienced headache 2 days after vaccine and was hospitalized for suspected transverse venous sinus thrombosis (which was ruled out) 6 days after vaccine. There was no secondary hemorrhage, and after the imaging was reviewed with a neuroradiologist, it was determined that there was no thrombosis at all, but rather an arachnoid granulation (normal anatomic variant.) This was confirmed on follow up CT venogram the following day. Relevant concomitant medications included oral contraceptives. Platelet count was normal (268,000) on admission. No heparin was received, but a panel for heparin-induced thrombocytopenia, including ELISA for anti-PF4 antibodies is pending. The patient was initially anticoagulated on argatroban and symptoms improved one day after admission; the headache is resolved, she is neurologically in tact, and discharge is planned to home. Although the use of oral contraceptives is a risk factor for thrombosis, there was no thrombosis in this

1227238	4/18/2021	VA	56	M	4/17/2021	4/17/2021	<p>case.</p> <p>Inflammation and pain on left side of the body, beginning in the arm/shoulder and spreading to neck and left tonsil. Tonsil swelling was quite pronounced by 2am (nearly twelve hours after the injection) and blocked the airway when head was turned to the left, necessitating a makeshift pillow brace to keep head turned to the right overnight. Tonsil swelling began to diminish by about 6am and only slight enlargement remains thirty hours after injection. Additionally, a low-grade fever began at about 10 pm (~7 hours after injection) and reached a maximum of 100.5 degrees F approximately twenty-four hours after the injection. By twenty-eight hours, temperature was within normal limits (though still nearly a degree higher than typical for this patient). As of this writing, some thirty hours after the injection, headache, neck ache, and eye-ache persist, but none is severe. Symptoms appear to be continuing their improvement. I (the patient/recipient) hope the second installment of the vaccine is no worse than this one. The only truly alarming symptom was the swollen tonsil and some thought was given to seeking medical attention, but the pillow brace seemed to do the trick for keeping the airway open, so no assistance was sought. I have no doubt that these short-lived symptoms are much better than actual disease and I will not hesitate to follow up with the second vaccine installment?but I will monitor the tonsil situation very carefully.</p>

1227258	4/18/2021	CA	86	M	2/8/2021	2/8/2021	possible heart attack; High pain in left arm; This is a spontaneous report from a contactable consumer (patient). An 86-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), first dose via intramuscular, administered in left arm on 08Feb2021 13:00 (Batch/Lot Number: EL9264) as SINGLE DOSE for covid-19 immunisation. Medical history included atrial fibrillation from 2010 to an unknown date, hypertension from 1971 to an unknown date, both knees replace from May2011 to an unknown date, left shoulder replaced from Nov2011 to an unknown date, left eye cataract removal from Jun2013 to an unknown date, right eye cataract removal from Oct2013 to an unknown date, L4 & L5 disc repair from Aug2014 to an unknown date, Gall bladder removed from Sep2014 to an unknown date, Right shoulder, Kidney disorder, cramps, Virus fighter, Heart disorder, eye disorder, General Health, Blood thinner, R. shoulder pain, sleep disorder, constipation, Clear vessels. No any other vaccinations within four weeks prior to the first administration date of the suspect vaccine. The patient's concomitant medications were not reported. The patient experienced possible heart attack on 08Feb2021 with outcome of not recovered, high pain in left arm on 08Feb2021 with outcome of not recovered. High pain in left arm-possible heart attack on 08Feb2021. Reported it was not caused by shot, but result is possible pitched nerve- X-ray and CT scan Being done. AE required Scheduled X-Ray and then CT scan on neck. Treatment included the event did require the initiation of new medication/other treatment/procedure. Seriousness criteria reported as not serious. COVID-19 testing had not been conducted.; Sender's Comments: A contributory role of the vaccine BNT162B2 to the event possible heart attack cannot be fully excluded based on the temporal relationship. Patient's advanced age, underlying hypertension, atrial fibrillation, kidney disorder and other comorbidities provide alternate explanation for the event. Case will be reassessed if additional information is received. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly

1225874	4/18/2021	CT	60	F	3/8/2021	3/8/2021	I woke up on March 9th, 2021, and my left eye was swollen shut and my right eye was partially swollen. I am not an alarmist and I thought I was having an allergy reaction to food or the environment. It occurred to me that this may be a response to the Moderna vaccination. I did some research and discovered an adverse response is facial swelling and there was a photo of my exact adverse response. It has not gone away is today it has gotten worse. I went to the Clinic this morning. I did call Moderna and report this the last week in March. My second shot was scheduled for Monday, April 5th and I was hesitant to take the shot when I was still exhibiting an adverse response. I am starting to really be concerned as this has now started to go down into my entire face. It is extremely uncomfortable and very itchy. Never mind it is very unattractive -my swollen, red, and itchy eyes and now entire face. At this time it is impossible to know if this is a permanent condition. It has been 6 weeks and starting the 7th week with worsening condition.
1225969	4/18/2021	WI	85	F	4/16/2021	4/17/2021	Patient developed stroke-like symptoms (right flashing light/temporary vision loss, word-finding difficulty) 24 hours after completion of Moderna COVID vaccination requiring hospitalization for stroke workup.

1225964	4/18/2021	CA	60	F	4/17/2021	4/17/2021	A 60 yo female was in the observation area following a 1st dose Pfizer (Lot# EW0171, expiration: 08/30/2021) that she received at 1215. At 1248 she flagged the Medic with a complaint of feeling lightheaded and a non-radiating headache rated 1/10 on pain scale. Client denied blurry vision, shortness of breath, nausea, vomiting, or chest pain. Client stated she has an allergy to aspirin and morphine sulfate, denied any past medical history and medications. Client states symptoms started 15 minutes post vaccine. At 1250 the medic took baseline vitals with client sitting: Blood pressure (BP): 110/80, Respiration rate (RR): 12, Heart rate (HR): 75, client was alert and oriented to time, space, situation and person (CAOx4) and skin was normal for ethnicity, warm and dry, pupils were equal, reactive to light and accommodating (PEARL). Client stated headache increased to 3/10 and continued to deny any other symptoms. Client stated last oral intake was at 0900 and claimed minimal fluid intake. Client was offered a bottle of water. At 1301 second set of vitals taken with client standing: BP 112/80, HR 72, RR, 12, CAOx4, negative for orthostatic pressures. Client stated the lightheadedness was gone and headache remained at a 3/10, client attributed headache to lack of fluid intake. At 1315 client released from observation area. Client was able to stand and walk without assistance and left the observation site with a steady gait.
1225962	4/18/2021	CA	58	F	3/25/2021	4/12/2021	Itchy rash around eyes occurred 17 days after first vaccine.
1225933	4/18/2021	NY	74	F	2/13/2021	2/25/2021	On 12th day after vaccine, I began to have bizarre, frightening and persistent mental images about harm to my body. Not visual or auditory hallucinations. Not images that directed my behavior. Experience was unique in my life. After 10 days of symptoms I contacted a mental health professional with whom I had worked 15 months previous as a grief counselor. We spent 5 sessions exploring possible reasons for the problem and decided it might be a side effect of the vaccine because it did not seem to be related to any previous life experiences. Symptoms have lessened significantly but persist. 2nd dose of vaccine did not increase symptoms.

1226010	4/18/2021	WI	46	F	3/13/2021	3/13/2021	The first side effect was an extremely sore arm (not only at injection site, but a DEEP ache lasting three days--difficult to dress)--a few hours after the injection. Then, about 10 hours after, I began to feel run down and through the night, I felt feverish, and it was hard to sleep. I never had a fever through the entire length of my side effects. I also had a headache behind my eyes that was exacerbated upon moving my eyes. By day three, I had gastrointestinal symptoms and slight feeling of cough by day two. As the week progressed, I felt more and more fatigued and then I felt some mild shortness of breath. In total, the side effects lasted seven full days. I was sent for a COVID test by day six. I was negative. A few days later, I developed a mild rash (light-pink blotches on my torso--not itchy). I was prescribed a fluticasone cream to apply and they went away after about a week of application twice per day. I also took 12.5 mg of Benadryl for three nights during that time.

1226255	4/18/2021	SC	68	F	3/31/2021	4/11/2021	Patient present to Roper Hospital ER on the morning of 04/11/2021 complaint of skin rash and swollen right eye. Patient reported to Dialysis RN was informed by ER physician Covid-19 vaccine caused her to develop Shingles. Patient treated with a prescription for Valacyclovir.
1226242	4/18/2021	NC	59	F	4/2/2021	4/10/2021	Eight days after receiving the vaccine, my wife developed shortness of breath, headache, fatigue, and unusual vision problems. She was taken to the emergency room on 4/15 where she underwent a battery of tests (see details below). She was admitted to the hospital (where she currently is) and was diagnosed with blood clots in the lungs and two strokes in the area of the brain that affects vision. She then underwent ultrasound tests of her legs and carotid artery, which were negative for signs of blood clots. Although my wife's symptoms are different than the symptoms of others that led to the vaccine pause, her doctors strongly encouraged us to report it to the VAERS. My wife had no underlying or pre existing conditions that would lead to blood clots in her lungs, and stroke. After extensive testing there is no evidence that the blood clots in her lungs as well as the clot/clots that went to her brain initiated in her legs. They believe that some sort of "event" would have had to happen to cause these blood clots, and the only unusual thing in the time frame of this condition is the vaccine. As I mentioned earlier, my wife is still hospitalized.

1226241	4/18/2021	CT	26	M	4/18/2021	4/18/2021	Patient received dose 1 of Moderna COVID-19 vaccine. Approximately 5-10 minutes after administration, the patient's mother alerted me that the patient was feeling faint and sweaty. I came to check on the patient. He appeared pale and diaphoretic. Patient said his vision was narrowing and he subsequently lost consciousness for approximately 10-20 seconds. I checked the patient's blood pressure and initial result was 88/64. Upon regaining consciousness, patient reported immediately feeling better. His blood pressure was still low at 94/70. He remained seated and drank some cold water and a cool compress was applied to his forehead. I questioned the patient to determine if he was experiencing any other symptoms that may indicate anaphylaxis (skin itchiness, tight throat, stomach upset) and he denied any other symptoms. I continued to monitor the patient for approximately 30 minutes. During monitoring, the patient told me he is nervous of needles, and has fainted trying to give blood in the past. After 30 minutes of monitoring, diaphoresis had resolved, color returned to patient's face, blood pressure recheck was 116/84, and patient self-reported feeling fine. He was escorted home by his mother.
1226412	4/18/2021	CA	35	F	4/16/2021	4/16/2021	Severe headache at the top of the skull and behind the eyes, especially the right eye. Pressure sensation in sinuses and behind eyes - "like eyes were being pushed out of my head". Headache lasted 36-38 hours after the injection. Chills, night sweats, fever of 100F, aching muscles, restlessness, trouble sleeping due to physical discomfort - symptoms lasted nearly 12 hours overnight and into the next morning approximately 24-26 hours after the injection. Severe muscle pain in arm of injection site within 24 hours of injection. Pain has diminished within 48 hours but is still residual.

1226140	4/18/2021	CA	34	M	4/18/2021	4/18/2021	At 1140, RRT was activated for a 34 y/o M that passed out for a few seconds. He stated, "I felt like I was in a dream." His eyes rolled back before passing out. When he was alert after his fainting episode, he stated that his right arm was numb and had c/o nausea, weakness, a brief moment of blurry vision, and "feeling hot". Head-to-toe assessment completed. Client was diaphoretic and pale. Client also reported that he was feeling hot and then feeling cold all of a sudden and this was ongoing. Client vaccinated on the R arm at 1130. NKA, no past medical hx. Does not take any medications but smoked marijuana just prior to his appointment. Vitals ? BP: 138/98, RR: 20, HR: 65, 0/0 pain. EMS called. Client's condition improved during monitoring period but as EMS arrived, client began to feel same symptoms again but did not pass out. EMS arrived at 1149. Vitals when they arrived were: BP: 142/77, HR: 48. Client's condition did not improve significantly but did not get worse. Client opted to have ambulance transport to Community ER to be further evaluated and treated. Client left vaccination clinic via Representative, accompanied by Fire Engine and unit @ 1200. Girlfriend, who came with client, followed client to hospital. Client left in stable condition, AA0x4, breathing even and unlabored, in no acute distress.
1226092	4/18/2021		20	M	4/9/2021	4/10/2021	symptoms fever, chills, and fatigue first occurred 4/9 shortly after receiving shot, and lasted until 4/13 on 4/10 vomiting and temporary blindness after exercise occurred. the blindness episode did not last longer than 2-3min, but was described as complete vision loss and occurred 1-2min after intercourse. on 4/14 an incident of "blacking out" occurred during prolonged intense exercise
1226084	4/18/2021	NY	39	M	4/12/2021	4/18/2021	Initial reaction was achiness in arm for about 24 hours. No troubles since. However, today, 6 days later, in the morning, both eyes felt "heavy," swollen and puffy. I took a nap for about an hour around 11 am, and right eye significantly improved. Left eye remains the same: heavy, puffy, and swollen. I took a pill of Benadryl, and applied ice.

1226843	4/18/2021		55	F	3/9/2021	11/1/2020	<p>Injections burn like crazy/ injection is extremely painful; Rash at the injection site; Experiencing flares; Blurry vision / blurriness; This is a solicited report received from a contactable consumer based on information received by Pfizer. This solicited report (USASL2020210290) was reported to Amgen on 23/DEC/2020 by a consumer from a commercial program (PSP00086) and involves a 55 years old, female patient whose injections burn like crazy [PT: injection site pain] and blurry vision/blurriness [PT: vision blurred] while receiving Enbrel with Single Dose Prefilled Autoinjector. No historical medical condition was reported. The patient's current medical condition included rheumatoid arthritis. No concomitant medications were provided. No co-suspect medications were reported. The patient began Enbrel with Single Dose Prefilled Autoinjector on an unknown date. On an unknown date, the patient's injections burn like crazy. For past three and a half to four weeks in Nov2020, the patient has had blurry vision. The patient saw an Ophthalmologist who stated everything looked fine with her eyes but blurriness persists. No treatment information was received. The outcome of the event vision blurred was reported as not recovered/not resolved. The outcome of the event injection site pain was reported as unknown. Action taken with Enbrel and Single Dose Prefilled Autoinjector was reported as unknown for the events injection site pain and vision blurred. The causal relationship between the events injection site pain, vision blurred and Enbrel with Single Dose Prefilled Autoinjector was not provided by the consumer. The reporter declined consent for follow up. No follow up attempts are possible. No further information is expected. ADDITIONAL INFORMATION RECIEVED ON 02Apr2021: This case is upgraded to serious. In this follow up, the patient was experiencing flares [PT: rheumatoid arthritis], injection is extremely painful [PT: injection site pain], rash at the injection site [PT: injection site rash] while receiving Enbrel, Single Dose Prefilled Autoinjector. The patient's co-suspect medications included covid-19 vaccine. On an unknown date, the patient reported that each injection was extremely painful and she gets a rash at the injection site with almost every dose. On 09Mar2021, she has been experiencing flares since having a COVID vaccine on 09Mar2021. She was not home to provide lot. No treatment information was received. The outcome of the</p>

events injection site pain, injection site rash were reported as not recovered/not resolved. The outcome of the event rheumatoid arthritis was reported as unknown. Action taken with Enbrel, Single Dose Prefilled Autoinjector was reported as unknown for the events injection site rash and rheumatoid arthritis. The causal relationship between the events injection site rash, rheumatoid arthritis and Enbrel, Single Dose Prefilled Autoinjector was not provided by the consumer. The reporter declined consent for follow up. No follow up attempts were possible. No further information was expected. Amgen's causality assessment: events injection site pain and injection site rash were related to etanercept, while events blurry vision and rheumatoid arthritis flare up were unrelated to etanercept. The reporter's assessment of the causal relationship of the events with the suspect product was not provided at the time of this report. Since no determination has been received, the case is managed based on the company causality assessment. Amgen Comment: This individual case report does not change the safety profile of the product.; Sender's Comments: Based on information provided, the time association and vaccine's safety profile, the possible contribution of suspect BNT162B2 to the events rheumatoid arthritis flare up ,injection site pain and injection site rash cannot be excluded. The event blurry vision occurred prior to the administration of vaccine BNT162B2, considered unrelated to vaccine injection. The causal relationship of the drug etanercept to the events injection site pain and injection site rash is possible given the implied time association, while the events blurry vision and rheumatoid arthritis flare up were assessed as unrelated to etanercept. The rheumatoid arthritis would involve in eye's disorder when the rheumatoid arthritis is in active status. The clinical course of rheumatoid arthritis would be helpful for further assessment. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1222306	4/17/2021	NY	62	F	4/17/2021	4/17/2021	Immediately following administration (approx 3:15pm) patient mentioned having a "funny taste in her mouth". She described it as a metallic taste. This persisted for about 7 or 8 minutes. At that time, she stated that the taste went away and she had a headache just over her left eye. At about 15 minutes post-vaccination, the patient said the headache was "mostly better" and that she was ready to leave. I did advise her to take Tylenol to treat the headache if needed.
1222491	4/17/2021	AR	55	F	4/16/2021	4/16/2021	Pain in the arm from chest to hand, pain and tenderness of the lymph node in the arm of the injection, started near 7:00 pm. Became very sleepy + blur vision. Near 9:00 pm fever started. All night have troubles with sleeping: nightmares and waking up many times. In the morning: feel seek ( sensitive lymph nodes behind the ears, headache).
1222451	4/17/2021	TX	48	M	4/12/2021	4/14/2021	Swollen face, and eyes lids.
1222448	4/17/2021	VA	53	M	4/16/2021	4/17/2021	A fairly aggressive visual migraine, Episode lasted 15-30 minutes almost exactly 24 hours after injection. It would seem there was no mention of migraines as a side affect. So figured it best to report just in case it was a sign of something more. The floaters and flashes were similar to those I have gotten prior to migraine headaches. This was unusual as normally they normally do not interrupt my vision greatly and are simply in my vision and usually only in one eye. In this case it wasn't limited to one eye or one spot.. there were multiple and made it hard to focus and see. Usually when I get visual migraines, a headache comes shortly after. So far as of this writing, I only feel a tinge of a migraine coming on, but it is seeming to fade already. Should note, I do not get migraines often (maybe once every other year or so.. ) and when I do it is usually after extended exposure to the sun and not on a chilly morning when I first wake up. Thus this report.

1222447	4/17/2021	PA	79	F	4/16/2021	4/16/2021	Within five minutes of receiving the first vaccine, my mom had body aches, and her hands became sweaty. Within a couple of hours, she developed a fever that lasted 24 hours. The body aches remained, and her knees swelled seven days after the vaccine. Yesterday, she received the second vaccine, my mom's pain throughout her body is worse. She also has pain in her jaw and her left eye.
1222446	4/17/2021	IN	50	F	2/12/2021	2/12/2021	Syncope, collapse, seizure, amnesia, brain fog, migraine, nausea, vomiting, double vision; all ongoing since time of second dose administration
1222452	4/17/2021	IL	69	F	3/14/2021	3/20/2021	Severe headache (short-lived), vision issues, trouble breathing for about 10 hours, March 20-21st
1222401	4/17/2021	MD	24	F	4/16/2021	4/16/2021	The patient received the Pfizer vaccine, given by HCP. After the vaccine, the patient felt a little anxious with increased heart rate so she asked HCP for a bottle of water. HCP went to get the water and informed the pharmacist on duty. Both pharmacist and HCP came back to the patient. She got the bottle and was about to open the bottle, but closed her eyes and started shaking like having a seizure and passed out. She came back right after passing out but didn't know what happened. She then started shaking again for a few seconds but didn't pass out. Everything happened so quickly when she remained sitting on the chair. We called 911 and paramedics came. She mentioned that the seizure happened to her before, maybe once or twice a year. When paramedics came, they checked her blood pressure and it was ok. We asked her and she wanted to come to the hospital to check out to make sure that she is ok.
1222342	4/17/2021	CA	59	F	4/9/2021	4/16/2021	Initially I had a sever sore arm that advanced into my neck muscles. I had a severe headache and blurred vision. Six days later I developed small joint pain in both thumbs. I then developed abdominal pain and diarrhea on day 7.

1221644	4/17/2021	AZ	38	F	1/26/2021	1/27/2021	my daughter and I had itchy eyes; This is a spontaneous report from a contactable physician. This physician reported for two patients. This is 2 of 2 report. A 38-years-old female patient received bnt162b2 (BNT162B2), dose 1 intramuscular, administered in Arm Left on 26Jan2021 09:00 (Batch/Lot Number: EL9263) as SINGLE DOSE for covid-19 immunization. The patient is small, not overweight, a little on the skinny side. Patient medical history was none. Family medical history was none. There were no concomitant medications. The patient did not receive any prior vaccinations within 4 weeks. AEs follow prior vaccinations was none. Additional vaccines administered on same date of pfizer suspect was none. History of all previous immunizations was not provided. It was reported that caller, her daughter, and her husband, all received the first dose of the Pfizer COVID vaccine on 26Jan2021. Caller and her daughter experienced very itchy eyes on 27Jan2021-28Jan2021. It then subsided. Asked if this is an allergic reaction and would it interfere with getting the second dose. If it is an allergic reaction, would there be a worse allergic reaction to the second dose, which is scheduled for 26Feb2021. Has the same question for her daughter too. The reporter was concerned if it plays an relevance to the second COVID shot. The patient frequently takes care of the caller, who is 79, and caller's husband, who is 84. On that basis was offered the COVID Vaccine. The AEs did not require visit. Relevant tests was none. Investigation Assessment was none. The event was assessed as insignificant. Relatedness assessment of drug to event by unspecified company was unknown. Outcome of the event was recovered on 28Jan2021.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021116744 same reporter/drug/AE, different patient.

1221930	4/17/2021	IL	42	F	3/10/2021		dizziness; brain fog; vision issues; balance issues; This is a spontaneous report from a contactable consumer, the patient. A 42-years-old female patient received the second dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: UNKNOWN), via an unspecified route of administration on 10Mar2021 (at the age of 42-years-old) as a single dose for COVID-19 immunisation. The patient was not pregnant at the time of vaccination. Medical history included migraine from an unknown date and unknown if ongoing, kidney stones from an unknown date and unknown if ongoing. The patient did not have allergies to medications, food, or other products. Prior to the vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. Concomitant medications included tizanidine hydrochloride (ZANAFLEX); amitriptilina [amitriptyline] (AMITRIPTILINA); and topiramate (TOPAMAX), all taken for an unspecified indication, start and stop date were not reported. Tizanidine, amitriptyline, and topiramate were taken within 2 weeks of vaccination. The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient previously received the first dose of BNT162b2 on 10Feb2021 at 12:00 (at the age of 42-years-old) for COVID-19 immunisation. On an unknown date after the second vaccination, the patient experienced dizziness, brain fog, vision issues, balance issues. Therapeutic measures were taken as a result of dizziness, brain fog, vision issues, balance issues included anti-inflammatory steroid. Clinical outcome of the events dizziness, brain fog, vision issues, balance issues was not recovered. Follow-up attempts are completed. No further information is expected.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021284020 same reporter/ patient, different drug dose/ AE.

1221795	4/17/2021	FL	61	F	3/12/2021	3/13/2021	Loss of breath. Very hard to breathe; Vision degrade; Heart rate increase over 100 BPM; This is a spontaneous report from a contactable consumer, the patient. This 61-year-old non-pregnant female patient received the first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EN6206) via an unspecified route of administration in the left arm on 12Mar2021 12:30 (at the age of 61-year-old) as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient did not have any allergies to medications, food, or other products. The patient did not receive any other vaccines within four weeks prior to the vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The patient had not had symptoms associated with COVID-19 and was not enrolled in the clinical trial. On 13Mar2021 00:45, the patient experienced heart rate increased over 100 BPM, vision degraded, loss of breath and very hard to breath. As a result of the events, a visit was made to the doctor or other healthcare professional office/clinic with the patient's heart rate, blood pressure and oxygen (level) were checked. As of 14Mar2021, the clinical outcomes of the heart rate increased over 100 BPM, vision degraded, loss of breath and very hard to breath were resolved on an unspecified date in Mar2021. The expiration date of the lot number for the vaccine, BNT162b2, was not provided and will be requested during follow-up.

1221767	4/17/2021	IL		F			<p>tested positive for COVID; Severe pain; Problems with her eyes; pain in back; Nosebleed; pain in eyes; pain in neck; This is a spontaneous report from a contactable consumer. This consumer reported for a female patient of an unspecified age received bnt162b2 (BNT162B2, Solution for injection), dose 1 via an unspecified route of administration on an unspecified date (Batch/Lot number was not reported) as SINGLE DOSE for covid-19 immunisation. The patient medical history and concomitant medications were not reported. On an unspecified date the patient experienced tested positive for covid (sars-cov-2 test positive), severe pain, problems with her eyes, pain in back, nosebleed, pain in eyes, pain in neck. The patient underwent lab tests and procedures which included sars-cov-2 test: positive. She stated she is having severe pain in her eyes. The pain is also in her neck and back. She is also having nose bleeds. She further mentioned after the first dose she had a few pains in her eye and nose bleeds. However, this time after the second dose the nose bleeding is more and severe in her eye and neck. She also tested positive for COVID after getting the first dose of the vaccine. While providing details about herself, at the end of the call, caller stated she is not the only one with these problems. Another lady had the same problems she had. She further explained after the COVID Vaccine she took the last one and she had problems with her eyes and severe pain. She also had pain in right shoulder up to her back and neck. The action taken in response to the events for bnt162b2 was not applicable. The outcome of the events was reported as unknown. No follow-up attempts are needed; information about lot/batch number cannot be obtained.</p>

1221949	4/17/2021	CA	81	F	3/9/2021	3/11/2021	double vision; This is a spontaneous report from a contactable consumer (patient's daughter). An 81-year-old female patient received BNT162B2(Pfizer-BioNTech COVID-19 mRNA vaccine), dose 2 via an unspecified route of administration, at age 81 years, administered in the arm on 09Mar2021 16:00 (Batch/Lot Number: EP6955) as single dose for COVID-19 immunization. Medical history included ongoing chronic obstructive pulmonary disease (COPD) diagnosed from an unspecified date about 2 years ago but reporter was sure she had it before that. Patient did not have prior vaccinations within 4 weeks. There were no concomitant medications. Patient historically took the first dose of BNT162B2 (Lot: EL3302) on 09Feb2021 at around 12:00, at age 81 years on the arm for COVID-19 immunisation. Patient had a reaction to Pfizer's COVID vaccine where double vision happened 2- 3 days after her second vaccination, but clarified that it was on 11Mar2021. The patient did not initially mentioned double vision to reporter herself, patient told her daughter last Saturday that she had been having double vision but reporter did not find out about it until later. The reporter took her to the doctor regarding the double vision and the doctor sent the patient to the hospital emergency room for double vision on 15Mar2021. Patient was not admitted to the hospital, was kept under observation in the emergency room where she had testing performed. While in the emergency room the patient had a CAT scan, and MRI and bloodwork and all of those tests results came back clear on 15Mar2021. The patient was released home from the emergency room after probably about 5-6 hours. The reporter just thought the double vision seems to be a little suspect being that she had had the Pfizer-BioNTech COVID-19 Vaccines and they have nothing else to attribute the event to. The vaccine was not administered at military facility. Outcome was not recovered at the time of reporting. Case was reported as non-serious.

1221710	4/17/2021	MA	47	F	4/9/2021	4/10/2021	At 6 A.M on 4/10/2021 (the day after the vaccine) I woke up with a pounding headache. Similar to a hangover. I had chills, muscle aches up and down my legs, fever, extreme fatigue and hot flashes. Site of injection was not sore at this point. Throughout the day I felt weak and could not keep my eyes open for longer than 20 minutes. I fell in and out of sleep and took two aspirins every six hours. The headache went from very bad to a dull constant headache that lasted for three days. When the muscle aches in my legs subsided on 4/10 they then moved to my buttocks muscles. I could not keep my eyes open but kept waking up with chills, headaches, body aches, hot flashes and fever. On 4/11/2021 I woke up feeling better but still had a headache. I felt weak and tired. Symptoms eventually got better throughout the day. I did not feel any soreness in my arm until day three and four. Headaches subsided on day three.
1221954	4/17/2021	FL	63	M	3/13/2021	3/15/2021	Double vision; This is a spontaneous report from a contactable consumer (patient). A 63-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: was not reported), via an unspecified route of administration, administered in arm left on 13Mar2021 15:30 as a single dose (at the age of 63-years-old) for covid-19 immunisation. The patient had known allergies with shellfish and ragweed both from an unknown date. Concomitant medications included ibuprofen taken for an unspecified indication, start and stop date were not reported. On 15Mar2021 10:00, the patient experienced double vision 2 days after vaccine. The patient was seeing 2nd image vertically located from both eyes. Ongoing for 3 days. No treatment was received for the event. The outcome of the event was not recovered. Information on the lot/batch number has been requested.

1221598	4/17/2021	NV	24	F	4/11/2021	4/14/2021	Received second dose of vaccine on 4/11/2021 and felt fine after. On 4/12/2021, I had a headache and felt tired which I heard is common. What's uncommon is that on 4/14/2021, I began to get hives on my stomach and I've never had a hives break-out before receiving my second vaccine dose. On 4/15/2021, I wake up with hives all over my back, butt, stomach, shoulders and arms. My daily routine hasn't changed except for getting my second vaccine dose. On 4/16/2021, I wake up at 1am with hives all over my body in the same places as 4/15/2021 but now my face was slightly swollen especially around my under eye area. Throughout each day, the hives would go away but they would come back at night.
1221566	4/17/2021	MO	60	F	3/19/2021	3/29/2021	Noted blurriness/change in vision starting 3/29/21, became so prevalent could not read print by 4/5/21. Saw Retinal Specialist on 4/6/21, diagnosed with posterior uveitis in both eyes. Ran full blood and x-ray panel to rule out immuno compromise. All tests normal/unremarkable. Follow up visit on 4/15/21 showed clearing in right eye, doctor inserted corticosteroid injection in posterior of left eye.
1221551	4/17/2021	WA	23	M	4/12/2021	4/13/2021	Starting about 10 hours after receiving the second Modern vaccination I experienced a minor headache and drowsiness, which continued until about 30 hours after the vaccination. These symptoms resolved without treatment. Around 20 hours after the vaccination an itchy rash developed on the lower lip, around the left eye, and in the genital area (including: penis, testicles, and upper inner thigh). Rash continued to get worse until about 4 days after the vaccination. At this point I sought treatment at a local urgent care. The urgent care personnel said they believed the rash symptoms were caused by the Modern COVID-19 vaccination, did not identify any other possible causes, and encouraged me to report it to the VAERS system. The treatment followed was topical 1% hydrocortisone cream applied to the affected areas, and 12.5 mg of diphenhydramine taken orally before bed. The rash symptoms improved with treatment but have not fully resolved at 5 days after the vaccination.

1222079	4/17/2021	VA	35	F	4/4/2021	4/9/2021	According to the dr, my nerves are likely inflamed. Symptoms are feeling of numbness but no loss of circulation. Most often feelings of cold in random parts of my body but especially my left leg (same side as injection). Both sensations appear to only be that because to the touch nothing is colder and to the eye nothing appears cold (blue). This started Friday 04/09 and was initially tingling in my left leg and quickly changed to feeling cold. (Interestingly the day I was vaccinated a few hours later I felt what I thought was the vaccine go through this same leg) Since Friday the cold feelings have randomly been in both both legs, both arms and both hands, less often in my face (left side mainly) and the top of my head. It?s not everywhere simultaneously but sometimes different places at one. Sometimes it can actually associated with being a little cold, but other times with no cause. Regardless it?s an exaggerated cold feeling. First it was like ice cold water being poured into whatever spot it was. It?s now less icy but still cold. Very strange

1223493	4/17/2021	OR	39	F	2/5/2021	2/20/2021	Urticaria on upper arms and upper thighs and waist started Feb. 20. I took OTC Benaddryl and used hydrocortisone cream with no improvement. On Feb. 25 I saw an urgent care who gave me a course of prednisone with no help. The urticaria continually got worse and lasted all day with new areas effected. On March 8, I woke up to my left eye swollen shut and my whole body covered in hives and on fire and itching. I saw urgent care again who told me to see a dermatologist. March 9 saw dermatologist who gave me a clobetasol cream and hydroxyzine 10mg. I was told to also take claritin 10mg daily. Hives improved less body area and no swelling eye but still severe hives. March 19 my legs were swelling and I increased my dose of hydroxyzine to 20mg and claritin 30mg per my dermatologist orders. March 30 night I woke up to shortness of breath almost went to the ER. My dermatologist ordered me an epi pen. I had a CBC, complement 3 & 4 lab, metabolic panel, ASA, and h.pylori labs done all were within normal limits or negative. I had 2 punch biopsies done one from hives on each arm on March 25- results given April 15 of Urticaria.

No diaphoresis. Skin without pallor. Alert and oriented x3. Coworker Rn drawing up benadryl 50mg to be given IM by RN at 12:09 in right upper extremity. Vital signs 122/70 , HR 72, RR 16-18. Continued to assess patient at chair side who sipped on water. No nausea. Patient continued to complain of dizziness while itchy sensation diminishing. Vital signs BP 118/70 Hr 78, RR 16. . Color remains pink. No rash. Itching only in upper extremities. Legs elevated on chair. Pt refused to lay on stretcher. Stated she no longer felt dizzy and only left arm itched. Eating protein bar. Vital signs rechecked after standing patient upright. BP 116/78 HR 80 RR 20. Pt wanting to go home. Observed her for 30 minutes post benadryl injection. Ambulated out of observation area symptom free and insisted on driving self home. Warning signs reviewed regarding vaccine reaction and aware to react to the onset of further or worsening adverse vaccine reaction.
1223443	4/17/2021	WA	55	F	4/6/2021	4/9/2021	On April 9th, I developed a headache at 9pm while watching tv. About 15 minutes later I noticed my vision was changing so I called my daughter to come stay with me and took tylenol fast release capsules. I went to bed and woke up the next morning with the same headache so I asked my daughter to take me to urgent care. Upon arrival they did a Covid test. I told them about my previous stroke in July 2020 and that I had a PFO closure done in October and have been on Plavix (clopidogrel) since then so I wasn't worried about stroke. The dr sent me to the ER immediately and they performed an MRI scan and told me I had suffered a new stroke due to blood clot.

1223928	4/17/2021	MA	32	F	4/16/2021	4/16/2021	Approximately 2 hours after vaccine started to get foggy and dizzy. As time went on around 5 hours after the vaccine I got severely nauseous with a headache and general weakness. Slight blurred vision and general unsteadiness on my feet. Along with aches in neck and shoulders. Currently I have sought no treatment and the symptoms as of 937pm on April 17th have begun to dissipate with the exception of weakness, tiredness, confusion, and a little nausea
1224146	4/17/2021	ID	33	F	4/2/2021	4/2/2021	The left side of my face feels stiff and at times my eye my face below my eye is slightly painful. My lymph nodes down the left side of my body were more painful for a few days afterward and my pain levels on joints that were hurting before increased a few days too. The left side of my face still feel stiff, but how much it bothers me comes and goes. It gets worse when my histamine levels are higher.
1224136	4/17/2021	IL	38	F	3/19/2021	3/19/2021	(Approximate timings) 1 hr. after vaccine: chills; later that evening: intense aches and pains, escalating fever; at night: excruciating (level 8-9) pain in joints and entire body inside and out including skin and behind eyes, first ever sudden onset shooting pain deep in brain going straight down (blood vessel or artery), not alleviated by max. Excedrin migraine extra strength or usual aspirin dose, unable to sleep or get up to go to bathroom; symptoms mostly alleviated 24 hrs. later but mild/moderate headache persisted since then; shooting pain deep in brain returned approx. 2 weeks later and lasted less than 24 hrs. (would have immediately went to hospital if JJ blot clotting concern was reported at the time, esp. considering stent and May Thurner blood clotting concerns); 3.5-4 wks. after vaccine: first ever hay fever/allergies (nonstop runny nose, sneezing, sinus pressure, headaches) - sudden onset, no history of allergies to anything at any time or any level, no family history of allergies.
1224010	4/17/2021		74	F	4/8/2021	4/16/2021	Continuous facial nerve pain on one side. Including eye, cheek, side of nose and gums. Possible Trigeminal Neuralgia

1224004	4/17/2021	FL	64	F	4/13/2021	4/13/2021	I was ill for 3 days and could not get out of bed. For the first 24 hours after my shot, I was extremely nauseous (I eventually vomited which helped). I was running a temperature. I felt light headed when I tried to get out of bed. For the next 24 hours, I ran a temperature, had an extreme headache, had an ear ache in my right ear and my right sinus hurt. Again, I could not get out of bed. After around 48 hours, the fever broke, but I still felt like I had an extreme migraine, my right sinus hurt and my right ear hurt. Light hurt my eyes. I spent 72 hour sleeping. I drank hot tea and ate a little soup during this time, but that was all. I felt HORRID for three full days. This was MUCH longer than I expected. If you decide we need booster shots, I hope you figure out what was making me feel so horrible. I can't imagine going through this for three days every time I get a booster. Thank you for making the vaccine. I do feel like it will protect me.
1224002	4/17/2021	MD	43	F	4/16/2021	4/17/2021	Standard sore arm started within a few hours; other muscle aches and headache started as the day went on. These were expected. Potentially more unusually, I woke up on 4/17 with a wheal on my face, which could just be my chronic hives acting up independently, but then in the evening of 4/17 I noticed a raised red mark on my arm near the injection site, which also looks like a wheal, as well as a wheal in the shape of the sticky portion of the bandaid used post-vaccination (which I'd removed before bed on 4/16). I'd had a similar wheal on my arm a few days after the first shot (given 3/19), so seeing another one now makes me believe it may be connected to the vaccine. The wheal is below the injection site (about 7 o'clock if you're standing looking at the injection site) and seems to be raised like a bump and is both hot and tender to the touch. It is unlike my normal wheals in location (more commonly I get them on the underside of my forearm), size, and characteristics, and because it is NOT itchy like they usually are. The wheal on my face was darker than usual, more a wine than bright red, and not in a typical location (it was high on the cheekbone just under my right eye; I most often get one on the left cheekbone near my nose). However, it was itchy in the way my wheals usually are. It is faded but still present and no longer itchy as of this submission, which is normal for my facial wheals.

1223994	4/17/2021	CA	29	F	1/5/2021	1/24/2021	Everything started on January 24th at about 7pm exactly 20 days post first Pfizer vaccine. No other changes or vaccines given since October (flu vaccine) was scheduled for 1/25/21 for second Pfizer dose. It all started when I was working at ER when I started to feel cold like it was in an ice bath and numbness in both feet. I went to discharge my patients when I realized ascending numbness and coldness from the feet was traveling upward. Within 5 hours (around midnight) I went to hospital due to having severe weakness to where I couldn't walk and loss of bladder control. I was rushed to MRI of brain, cervical, thoracic, and lumbar. I also had blood work done and a lumbar puncture. I was admitted for a couple days to watching the ascending weakness and loss of feeling. My MRIs came back clear from any diseases such as transverse myelitis, MS, etc. My LP showed mild elevated protein at 54 (normal range 15-45), one tube elevated lymphocytes 100% (range 40-80%) and one tube elevated monocytes 50% (range 15-45%). Also CK-MB w/reflex was 352 (range 26-140). I was discharged on 2/26 at 5:30pm with a diagnosis of bilateral leg weakness and numbness. From this point on I was wheelchair bound at home and being cared for 24/7. After discharge some additional random symptoms started such as chills with no fever to where I slept in sweat pants and sweat shirts, leg spasms/ twitches, leg heaviness, severe lower back and hip pain, a loss of sensation while going pee or poo but not incontinent, and things like drop foot with the severe weakness and numbness . On 2/3/22 I started with double vision, blurry vision and pain behind my right eye. I went to ER and had repeat MRIs of brain, cervical, thoracic and lumbar with and without contrast and basic blood work and was sent home to follow up with Dr. on 2/9 and was discharged home. By 2/8 my strength started to get worse to where I couldn't lift my kids. Finally saw Dr. neurology and MS specialist 2/9, he ran detailed neuro exams from head to toe, looked at both scans from both hospitals, all the blood work and LP results. He reported that I had severe hyper reflexes in both legs and Hoffman's sign in both hands. My feet were completely numb and cold to where I couldn't feel them or walk. Literally felt like everyday I was standing in a ice cold bath with no feeling of touch hot or cold sensation or pin pricks. He realized my loss of sensation was from my bra

---

line down and included tingling in my hands and weakness in my arms. I was able to get up for the first time with a walker and take a few steps with assistance at this time. He then sent me to ER to be admitted and see their neuromuscular team to get further treatment. Upon arrival via wheelchair I was brought back to see the ER Doctor and re-did a neuro exam, some blood work and contacted the neurology team to come see me. I was then admitted to the hospital step down ICU under Dr with strict monitoring. On 2/10/21 The neuro team ordered another set of MRI of brain, cervical and thoracic with and without contrast due to a change in condition again since my last visit to hospital. They reviewed and compared studies with no changes. They scheduled me for MRI lumbar on 2/11/21 with and without contrast which came back no changes from previous MRI as well as another LP which everything that was off before was now normal. Everyday I would work with PT, OT and speech. I had no changes in speech and slowly got some strength back, and was able walk using a walker. I was then discharged home on 2/13 mid afternoon and was told I would do home health and follow up with their neurologist and Neuromusclar team once everything was resulted back. On 2/19/21 I saw my primary doctors office (nurse practitioner) where she checked up on the status of me, took me officially off work and on state disability, filled out paperwork for work and a handicapped pass. On 2/25/21 followed up with neurology, and discussed all my imaging and blood work. All CSF fluid came back normal, all labs were fine and wanted me to get an EMG to look for nerve damage. She also wanted a follow up with cardiology as my resting heart rate was 110-120 and would spike to 160s. On 3/1/21 Home health was started for physical therapy for strengthening and working on sensation for both legs. At this point I had almost full strength in my arms, still tingling in my hands and constant numbness and cold feeling in both feet and knees with severe sensitivity to cold, wind or touch on my legs. I had Home health twice a week every week for 2-3 weeks then started outpatient physical therapy which has been twice a week for 1.5 hours. On 3/5 I saw cardiology and was placed on a holt monitor for 48 hour monitoring. On 3/9 I had my EMG with Dr. and had a follow up with Dr. for 35 tubes of blood he had drawn for multiple diseases which both blood

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							work and EMG came back negative. On 3/16 symptoms started to change from numbness to severe hypersensitivity to touch, severe shooting nerve pains, burning sensations, non stop tingling in hands, issues with temperatures either hot or cold, and swelling of both legs. On 3/17 I saw rheumatology that looked into everything said it was not lupus related as none of my inflammatory markers or lupus DNA strands were elevated and no lupus symptoms like rashes, ulcers in the mouth or tongue, hair loss or joint pain. He ordered more blood work and confirmed it was not a lupus flare up. He suggested doing a small nerve fiber biopsies. On 3/19/21 saw spinal orthopedics who reassured it has nothing to do with my spine, prescribed gabapentin for all the nerve pain and told me that neurology is who should be following me. On 3/26 I had an echocardiogram done due to the leg swelling and heart rates which came back negative for any heart problems and was told since the tachycardia is getting better to just continue watching it and was prescribed trazodone 25mg to help with sleep due to severe nerve pains, spasms and severe back and hip pains at night. On 4/1/21 was followed up again with neurology. Ordered small nerve fiber biopsy for may 18th, increased the gabapentin to 300 mg- 3 times a day and had me wean off cymbalta. I am still dealing with tingling, burning hot and cold sensitivities in both legs, still tingling in hands all day but strength is back to full. I am scheduled to hopefully return to work 5/30/2021 after being off since 1/24/2021.
1223704	4/17/2021	TX	23	F	3/13/2021	4/14/2021	Throbbing/tension headache around and above eyes level, arms/legs muscle ache last for 2 days that did not go away when taking Tylenol 500mg.

1223549	4/17/2021	CA	62	F	4/16/2021	4/16/2021	At 1450 patient approached Paramedic with concern regarding left wrist pain and vein protruding more than right. This occurred approximately 10 minutes into her 15 minute observation period following a 1st dose Pfizer (Lot # EW0162, Exp: 07/31/2021). Client denied any other symptoms. Paramedic noted that client was able to ambulate to chair in observation without assistance and with a steady gait. Client rated the pain as 2/10 on a 0-10 pain scale and was non-radiating. Paramedic observed there was no asymmetry between left and right wrists, there was mild distention of left radial vein, negative for pain on palpation, negative for temperature difference between right and left extremity. At 1502 client began to complain of neck discomfort, then a headache on forehead which she rated a 5/10. Client reported a history of epilepsy and stated she has a headache aura prior to seizures. Paramedic advised client to sit in the zero gravity chair for further assessment and noted client was able to ambulate to chair on her own accord and with a steady gait. Client denied complaints of dizziness, shortness of breath, blurry vision. At 1508 client stated left radial pain was gone, headache was now rated a 3/10. Client was given a bottle of water. At 1510 vitals were taken with client sitting in zero gravity chair: blood pressure 110/80, respiratory rate: 14, heartrate: 78, client was alert and oriented to time, space, situation and person (CAOx4). Client stated symptoms were diminishing. At 1520 a second set of vitals were taken: Blood pressure: 112/82, Respiratory rate: 14, Heartrate: 78, CAOx4. Client stated she had no complaints. Client was advised to stay an additional 15 minutes. At 1540 client released from observation and she left the observation site on her own accord with a steady gait.

1222897	4/17/2021	MD	29	F	4/12/2021	4/15/2021	Got my vaccine on Monday in my right arm. On Thursday morning I had blurry spots in my eyes that lasted a couple of hours. It almost felt like i had something in my eyes. I kept rubbing and checking them. I called my primary care doctor and the office told me he would call me back. An hour later the blurs went away but the right side of my face down my neck had a numbing sensation. My right ear also felt like it need to be ?popped? like when on a plane that wouldn?t go away. Wasn?t completely numb but felt numb. When my doctor called me back i told him my symptoms and he told me to go to the emergency room. They ran blood work and did a CT and saw nothing abnormal beside my iron was a little low but I?m pregnant so that wasn?t surprising. I left not really knowing why I?m feeling this in my face. It still has that numbing feeling. And Friday i had a 10 minute nose bleed on my right side where I?m feeling the numbness.
1222863	4/17/2021	NC	28	F	4/17/2021	4/17/2021	Approximately 4 minutes after vaccination (12:55pm) patient experienced a syncopal episode. Characteristics observed: profuse sweating, clammy extremities, tonic-clonic seizure-like movements, eye rolled toward the back of the head. When the patient regained consciousness water and cold compress was provided. 911 was called (12:57pm); EMS arrived in approximately 3-4 minutes. The responders asked the patient a multitude of questions - she indicated she was fine and needed to lay down. A bench was provided for her to regain composure. The responders also collected her blood pressure reading once she was more comfortable . She refused transportation to the hospital.
1222853	4/17/2021	PA	40	F	2/16/2021	2/16/2021	Within hours following the shot I started convulsing and shaking. I had severe tingles all over my body and weakness. This went on for days. I notified my doctor and she said to monitor for the inability to walk or move my limbs. I never lost complete feeling of my body parts. 2 months later and I still have tingling all over my body. I've had blood work, eye exam and MRI. I've had appointments with doctors-including radiologists and neurologists.

1223124	4/17/2021	NC	61	F	4/3/2021	4/3/2021	Received shot around 1:10pm, a few hours later around 4pm felt tired. Pain at injection site lasted a few days felt like a bruise. Around 8:30pm lips became bright red, felt like there were sores on the roof of the mouth that were painful and interfered with eating for 3 days after shot ate soft foods, eyes really dry, extremely thirsty for about 2 days after shot. On 4/3/21 around 9pm took a 25mg tablet of Benadryl and that helped a little bit with the symptoms. On 4/13/21, 10 days after the shot, felt extremely fatigued, body and joint aches intense, nauseated, headache lasted a couple of days. By 4/16/21 felt better and was able to go to work in retail.
1222967	4/17/2021	OH	23	F	4/17/2021	4/17/2021	Patient experiences lightheadedness and blurred vision after vaccination, blood pressure taken and was 107/64 which the patient was unaware if it was average for her. Patient remained seated for an additional 15 minutes and felt normal after waiting. Pt was also given water. Patient was called at 10:45 to verify information regarding this report and felt "Perfectly normal.~~
1223104	4/17/2021	MI	56	F	4/2/2021	4/12/2021	Broke out with shingles within 10 days of receiving second dose. Shingles are on my right eye lid, nose, forehead and scalp.
1223097	4/17/2021	IL	78	F	4/15/2021	4/15/2021	Chills, severe aches in eyes, cheek bones, teeth, hands, feet, dizziness, weakness, gas, fatigue
1223086	4/17/2021	WA	39	F	4/15/2021	4/15/2021	I have had severe facial swelling under my eyes, where I had previously received Juvederm Voluma under eye dermal fillers. I have also had chills, body aches, sweaty, feverish, and felt like I have the flu for 2 days.
1223027	4/17/2021	MI	45	F	4/16/2021	4/16/2021	Became very itchy about 45 minutes after vaccine with small bumps around neck and scalp. Took Benadryl immediately. Developed swollen eyes and lips about 4 hours later, took more Benadryl. I still feel itchy today on my face one head but feel much better with no swelling or rash.

1218466	4/16/2021	SC	64	F	4/6/2021	4/9/2021	Pt is a 64yo F with no known PMH who presented today with Left side facial droop with left side neglect. She reports that around 1230, she felt like her knees became weak and she fell to the ground. She notes that the landlord found her and called EMS. Pt reports that she did not feel any other symptoms such as N/v, CP, dizziness, lightheaded, slurred speech, abd pain, visual changes, seizure like activity, incontinence, sore tongue, or SOB. It was noted by EMS that she had left side facial droop. Pt reports that she felt normal prior to this event and was able to do all ADLs and ambulate without assistance. She does not report any medical hx but admits to not seeing a PCP in years. She denies smoking and excessive etoh use as well as illicit drug use. She notes that she has a family hx of MIs with her brothers and sister all in the ages of 60. Her father had diabetes and HTN for which he passed from "GI blockage" and her mother passed from hemorrhage giving birth. She does not recall a family hx of stroke or abnormal bleeds. In the ED, her vitals were significant for a BP 231/114. She had an NIH of 12 and a HCT was ordered showing right basal ganglia hemorrhage concerning for HTN cause. NSY has been called with patient started on cardene gtt and keppra. CBC significant for hgb 12.6 and CMP with K low at 3.1. EKG was obtained showing LVH with potential ischemia. Cardiology was called and noted that changes were likely in relation to LVH. A troponin was obtained and negative. Lastly, she has had a Head and neck CTA without evidence of Carotid artery blockage but an occlusion present at the distal P2 right PCA.
1218317	4/16/2021	SC	61	F	4/15/2021	4/16/2021	About 9 hours after receiving 2nd dose of vaccine, patient awoke with quite significant itching (vaccine site as well head, neck, scalp, ears, trunk, arms, palms, and legs) , swelling around eyes (almost swollen shut), and tightness in chest. After 1st dose of vaccine, she had mild swelling around eyes and a little tightness in chest that she thought was related to pollen.

1218295	4/16/2021	AZ	34	F	4/9/2021	4/14/2021	Dizziness, nausea, pinching pain in left thigh, and then I collapsed. I had to go to the hospital and all tests looked normal. Ultrasound for blood clot did not show any clotting. That was two days ago. Today my vision is blurred, body aches and chest pain on the right side (Injection side.)
1218312	4/16/2021	NC	64	F	4/13/2021	4/14/2021	Chill , fever aches,pain,headache,weak joint pain numbness in feet could hold my eyes open and stayed in bed 2 days couldn't do anything except use bathroom taste off 3D day weak but up short periods diarrhea (hope tomorrow better)
1218186	4/16/2021	CO	40	M	4/14/2021	4/15/2021	Woke up with chills and fever of 102. Treated with ibuprofen and acetaminophen. Had fever and muscle aches all day Thursday. Woke up this morning with a strange pain in my left eye socket, felt like a headache but inside my eye ball, it goes away when I sit and lie down and comes back when I stand up. Vision in that eye was blurry, but slowly returning. Continue to have muscle aches and fever, but they are lightening.
1219047	4/16/2021	NM	71	F	3/24/2021	4/8/2021	As I was driving, I noticed that my vision was becoming blurred. I was ready to pull the car over to the side, when it cleared up. Total time of blurred vision was probably one to two minutes.

1218601	4/16/2021	SC	46	M		4/4/2021	<p>a 46-year-old male with no known past medical history who initially presented complaining of headache and neck stiffness with onset the morning of 04/03/2021. The patient states that his headache was initially gradual in onset and eventually decreased in severity on 4/5 however, on 04/06 after a day at the beach the patient developed a severe headache with rapid onset that he described as the worst headache in his life. He did try to medicate himself at home with 600-800 mg of ibuprofen every 6 hr with minimal decrease in his headache pain. As result he presented to urgent care for initial evaluation who sent him to the emergency department for possible brain bleed. On arrival to the emergency department the patient had a head CT which showed trace subarachnoid hemorrhage in the basilar cisterns likely due to ruptured cerebral aneurysm. He was transferred to for continued workup of the subarachnoid hemorrhage with CTA and possible IR intervention. At time my evaluation patient was resting comfortably in the bed. He continued to complain of severe headache and neck stiffness. He additionally notes that light and loud sounds make his headache worse. He denied any focal weakness, paresthesia's, numbness, speech difficulty, visual changes, or any other concerning neuro symptoms. Patient was hypertensive during my evaluation despite being on a Cardene drip. Patient's mother was at bedside and was able to assist with history.</p>
1218992	4/16/2021	WA	68	F	4/2/2021	4/4/2021	<p>Experienced severe migraines on 4/4, 4/6, 4/8. PCP prescribed rizatriptan rapid dissolve 5 mg Tbid. Was able to take this medication on 4/9 when I felt another migraine coming on. It worked. The migraines on 4/4, 4/6, and 4/8 began with an aura which lasted more than an hour. The headaches were so severe that on 4/8 I had my son stay the night. I never experienced such intense pain in the past. I do have a history of migraines, but had not had one since 2016. Typically, I would get the aura, lay down and close my eyes, and then the aura would diminish in 15 - 30 minutes. I never get a headache with the auras.</p>
1219005	4/16/2021	FL	24	F	4/15/2021	4/15/2021	<p>Stated that she "Passed Out." It was reported by observer individual exhibited rolling eyes activity.</p>

1219009	4/16/2021	AZ	31	F	4/10/2021	4/10/2021	Coughing, fatigue, shortness of breath, dizzy, sore arm, next day had no taste, fever, chills, hot flashes, blurry vision
1219015	4/16/2021	FL	23	M	4/16/2021	4/16/2021	Patient (002956225) - received Moderna vaccination (Lot # 0011A21A) on 04/16/2021 at 09:02 in the left arm by RN. 0904 Patient began walking from the Vaccine station towards Observation. After approximately 20? feet, LPN in another vaccine station down the line, noticed the patient stumbling towards the wall. She observed him stumble/fall into the wall, hitting his head, then began falling to the floor. LPN came around her partition, called for help and was immediately assisted by LPN. The two nurses assisted the patient to the floor. They reported his eyes were fully dilated and he began having light, full-body shakes. The two nurses turned the patient on his side and held his head. Waters said the patient was able to answer all questions appropriately. The full body shakes lasted approximately 30 seconds. The Patient did not lose consciousness. 0905 Lead Nurse arrived noting the patient was lying on the floor in the prone position exhibiting mild seizure like activity and his pupils were dilated. Patient was rolled onto his side until the seizure like activity subsided, lasting for approximately 30 seconds. 0905 IC/PSC called 911, PD. The site Medical Protocols plan was activated. 0906 Vital signs were obtained: Blood pressure: 96/80, HR 78, O2 at 91% on room air. A neuro check was performed on the patient and he was noted to be alert and oriented x3. Patient stated he had not eaten anything prior to coming in. Patient was assisted to a seated position while still on the floor. Patient was given water, juice, a banana and other snacks. Nurses in the Observation Station noticed the incident from across the arena and brought the EpiPens, AED, Blood Pressure Cuff and med bag. 0910 Vital signs were obtained: BP 104/47, HR 50, O2 98% on room air and respirations 18. Patient remained fully alert and oriented but noted to have mild tremors of both hands. 0915 TFD, followed shortly by EMS, arrived on scene at and assumed care of the Patient. 0926 Patient decided to be transport to the Hospital and was removed from facility via stretcher.

1218041	4/16/2021		44	M	3/19/2021	3/19/2021	Patient reported to medical clinic 24 hours after COVID 19 injection (03/19/2021) with symptoms of visual hallucinations, myalgia, rigors, headache, nausea, vomiting and dehydration. At the time of arrival to the medical clinic, he had refractory nausea and vomiting after receiving Zofran earlier in the day at another clinical site. Medical treatment consisted of IV Fluid bolus with maintenance fluids, IV Phenergan for the nausea and vomiting, and IV Ketorolac for headache pain. His symptoms resolved and he started to feel better so a clinical decision was made to discharge him home in the care of a close friend. He planned to follow-up the next day. The patient returned to medical Clinic on 03/22/2021 with no specific symptoms. Previous symptoms from initial encounter resolved according to medical chart. Patient returned on 03/28/2021 with right upper arm DVT proven on U/S. He was seen at Primary Care Clinic beforehand where diagnosis of DVT was made. He was then started on anticoagulation therapy by MD in clinic after specialist phone consult, and will be closely followed. He was sent to Evacuation to home station due to the complexity of the condition, medications, etc.

----------	-------	-------	---------	-----	----------	------------	--------------

raised to 90%. No wheezing. Not sick. I had a bad headache and nausea, and was not feeling good and went to bed. On 1/28/21 I woke up at 5:30 with severe vertigo and dizziness, nausea and a bad headache and could not walk due to the vertigo, and vomited when I was trying to have my head up. I had to crawl to the bathroom on my hands and knees. I called out sick for work due to this and contacted my DR. I was started meclizine 25 mg 3 times a day for vertigo, and was taking Zofran to help. 1/31/21 noted my Re upper eyelid was doing a lot of spastic twitching at times, that would stop and start, but did not think about it much. The vertigo was unrelenting and then I started to have Right arm and hand weakness noted on 2/3/21 and was still very dizzy, nauseated and had a constant headache since I got dose #2 of the COVID vaccine on 1/22. I was using a walking stick for the dizziness to be stable, and also felt weaker on the R side, and drifting to the right when walking. On 2/4/21 I had my first MRI (no contrast, unfortunately) and noticed I could not fully shut my Right eye in the MRI, and by 2/5/21 my face was drooping. I still had the constant headache, nausea and dizziness, and increased R hand, arm and R leg weakness and R hip weakness. I could not lift my R leg up to walk well, cannot grip well with the R hand, and uncoordinated, and cannot walk straight, and am unstable when trying to walk heel to toe, or even stand still with my eyes shut, and have had some double vision with the R eye. I was started on Prednisone and on Klonopin for the vertigo on 2/9 after seeing my neurologist. I took Prednisone for 5 days, from 2/9-2/13 and did not have improvement with the R facial droop or R side weakness and the headaches have persisted, along with some dizziness and nausea. on 2/14-15 I had increased shortness of breath and R lung felt like it was not inflating much, and got an xray, and went onto Zithromax for 5 days, which did help my lungs to improve, and I was able to breathe better, and got my Right lung capacity back. I stopped the Klonopin after a week (2/9-2/16), to manage through the symptoms without it, and have been doing physical therapy and Vestibular therapy. I had another MRI, with contrast on 2/25, after an in-person neurology appointment, and was having some improvement with the vertigo, so I started back to a desk job, not my RN job on 3/4/21, but I was still having the constant headache,

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							nausea, and some dizziness, R face droop, R hand weakness, R leg weakness and walk with a walking stick, and have increased issues with exertion, but have been walking and doing therapies to get stronger.3 I started to have increased R facial droop. EMG done on 3/23 of my R arm. Worse headache, nausea, dizziness at the desk, and fatigue, but R side weakness issues increased, so I started back onto Prednisone on 3/28/21 with 50mg day for 3 days, then 40mg for 3 days, 30mg for 3 days then 230mg for 2 days, but had increasingly bad headache,nausea and increasing R facial droop, and much worse R hand weakness, R arm weakness and pain, and R hip pain and weakness, worse walking, cannot lift my R leg or foot as high as the L, again, and am struggling to walk, and get worse with exertion with R side walking and weakness. I also had shooting pains in my R jaw start on 4/6-7, along with R jaw and face pain and increased numbness, more face droop shooting pains in my R hip, and arm and body pain and a worse headache making it hard to even sleep, and some increased issues with my R eye that I need to have checked. The prednisone last dose was on 4/7, and stopped due to the symptoms I was having, after a video visit with the neurologist. Increased R leg weakness, R weak hip vs left, R foot drag/drop, with increased issues to maintain walking with progressive walking, still using walking stick to try to walk, but now for stability and to keep from drifting, R facial droop increasing and now some R eye blurring 4/9 onwards, that is new.
1216699	4/16/2021	VA	37	F	4/14/2021	4/14/2021	Patient was injected with a new, unfilled/empty syringe. Patient was then injected with a new filled syringe with the appropriate dosage of the Moderna first dose vaccine. Patient was nervous, had blurry eyesight, and felt faint, vitals were checked by staff and by responding EMS. Patient felt better by the time EMS showed up after having some snacks. Patient has reported no adverse reaction other than initial blurriness and faintness as of 4/15/21

1216588	4/16/2021	WA	62	F	3/23/2021	4/6/2021	On Tuesday, April 6, 2021, about 11:45 am, I felt a sudden sharp pain in the right temple area just above eye level and about 2 inches posterior. I also felt some dizziness and wondered if I was having a stroke or some type of arterial inflammation. At the time I was treating a patient and wondered if I was going to have to leave to go home. I did get through the rest of my workday but had difficulty concentrating. I had recurring waves of pain in the same area several times that day and into the evening, was considering alerting my adult daughter that I might need to go to a hospital. Fortunately, resting and increased fluids seemed to resolve the pain and it was mostly gone by the next day.

The patient was recovering from hives, swollen eyes, and burning sensation in the arm. This report was non-serious.
1216648	4/16/2021	CA	50	F	4/1/2021	4/2/2021	28 hours after 2nd Pfizer vaccine administered: First symptom was inability to suck from a straw. Lips could not be closed together on left side of mouth. Second symptom noticed was left eye not blinking or closing all the way compared to right eye. Third symptom was drooping smile on left side of face. We did not connect the timing of vaccine to this event until the following morning. It was Saturday morning and the symptoms still existing. We observed and monitored through the weekend and called the Doctor's office on Monday. The Doctor asked us to go to Emergency Room right away for possible stroke.

1216591	4/16/2021	GA	48	F	4/8/2021	4/8/2021	About 3 weeks after my first dosis of the Pfizer vaccine, I started having constant numbness in both arms, hands and right legs, dizziness, pins and needles, extreme fatigue, lethargy, feeling the pulse of my heart rate in various part so my body in an oppressive kind of way like in my throat, under my right breast, in my back on the ribs usually. All these symptoms never subsided and became noticeably worse a few days after my second dosis on April 8th. My arms are always numb when I get up and become worse when hanging down, of course, but with different intensity. I am feeling extremely dizzy as I walk around and unstable. Walking feels like the ground is further than it is in a way. I do notice a slight shortness of breath but more of an oppression in the rib cage than panting. I have been avoiding walking far or walking my dogs all together. I am not seeing any improvements even after my visit to the Urgency Care where nothing wrong was found on blood work and EKG. I was told to reduce inflammation with dietary supplement and some vitamins. I cannot work of course and what is a bit frightening now is that I am not improving on day 8 of my second dosis! Same rotation of weird symptoms all day (feeling my blood not circulating normally if that can be described even, numbness, pins and needles in arms, and right leg. Sometimes it affects my right cheek. Dizziness and instability to walk around. Vision is lower as well. Too weak to do anything constructive. My legs feel like they are not reliable (never have had that feeling at my age). It is more than feeling like a zombie, it is feeling too weak to do anything and my head is sometimes spinning. The numbness can be painful as a sudden thrust in an arm ( this does not last more than a few seconds). It has now been going on since week 3 of my first dosis and today is day 7 of my second dosis! I had 0 symptoms on the first 2 weeks of my vaccine, dosis one. Now, I don't see any progress, rather a slight worsening of all the symptoms above. It is freakish not knowing what I have, of course. One can imagine, so stress adds to the mix sometimes during the day. I would not dare to even go walk my dogs now. A short grocery store visit at the most.

1216596	4/16/2021	AZ	48	F	4/8/2021	4/9/2021	Tremors shaking hot cold sweats elevated blood pressure fatigue confusion blurred vision couldn't quench my thirst dry mouth unsteadiness
1216599	4/16/2021	WI		M	4/8/2021	4/10/2021	Extreme fatigue onset after 2-3 days, difficulty staying awake/alert. Blurry vision & twitching eyes. Have difficulty being able to focus vision on close text & objects, and I'm a photographer who works through a camera and views a computer screen every day, so has been affecting my business. Have tried basic eye drops, but that doesn't help. Leg and upper/lower back muscles are extremely sore, even to the touch, especially upper leg muscles (and have not done any strenuous activities in the past week), and it's been painful to stand up or get out of my vehicle most of the time since my 1st shot exactly one week ago. Have also been having very bizarre dreams every night, and trouble sleeping, as well as bouts of hot/cold flashes every day. No cough, runny nose, headache, or other cold symptoms. Have never felt like this before, regret getting this vaccine, and am not sure I'll take the 2nd one, unfortunately. I have two close friends who had the same shot, and whom didn't even feel safe driving for 2+ weeks because of their similar reactions with fatigue and brain fog.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1216609	4/16/2021	AZ	49	F	4/5/2021	4/5/2021	About 3 hours after receiving the , vaccine on April 5 at 3:15 pm, I had uncontrollable shivers and chills, shaking violently through my whole entire body. I was freezing cold to the bone. I felt nauseous and threw up my entire dinner. That didn't make the nausea go away - I continued to throw up that evening 5 or 6 more times. The nausea continued the next day making me throw up 3 more times. And yet the nausea persisted for a whole entire week. I had a horrible headache that night that has stuck with me these last ten days. My muscles ached and shot strange pangs through my body. I was exhausted. I could not stay awake. I was so weak and tired. I had no energy and just laid in bed for a solid four days. My throat hurt, my neck hurt, my head hurt, my arm where the shot went in hurt so bad. Very strangely, my stomach was constantly bloated and hurt inside like a bad stomach ache - even if I hadn't eaten anything it still bloated and hurt. The painful stomach lasted seven or eight days. I had diarrhea for those seven /eight days. I was completely dehydrated. The diarrhea lasted way too long - it was difficult to return to work. The second day after the shot I woke up to my left eye red, like some blood vessels had burst. It took four or five days for my eye to go back to normal. my heart has a stabbing feeling randomly all the time now and it is hard to breathe. I wheeze and cough all the time. It is very uncomfortable. This heart issue has persisted the entire time since getting the vaccine.
1216610	4/16/2021	MN	70	F	3/31/2021	4/1/2021	Day of shot #2 (3/31/21) I experienced nausea in the first 15 minutes and felt confused while driving. Nausea passed in 2-3 hours and I felt fine. The next day I felt tired, foggy brain, and dizzy. Assumed it was from the shot. Side effects continued/worsened. 4/6/21 I saw my Dr. She checked me over, labs. found nothing wrong with me. Likely side effects from Pfizer. Unlikely that they would last two weeks. Rx Meclizine for dizziness, which didn't really help. Now it's Day 15. Tired and brain fog are gone. I don't feel as dizzy. BUT, when I try to drive, I feel QUITE dizzy with blurred vision. This side effect persists and clearly effects my quality of life.

1217053	4/16/2021	CA	30	M	4/15/2021	4/15/2021	<p>Client was vaccinated with the Pfizer Covid vaccine with lot #EW0162 at 11:59am on 04/15/2021. EMT observed client standing at the facility exit speaking to the interpreter. EMT noted upon approach client appeared alert, tracking with his eyes, in no apparent distress. Client had a chief complaint of numbness at his injection site. Client stated that he had completed his 15 minutes and had exited the site but began to experience numbness at his injection site while exiting. This was the client's first dose of the Pfizer vaccine. Client states he has a history of a deep vein thrombosis and hypertension. Client is not on any medications and denies any known allergies. Assessment revealed that client's left arm/injection site was clean, dry and bandage remained intact. Client was negative for hives, swelling, severe sweating, shortness of breath or other signs of anaphylaxis. Client was alert and oriented to person, place, date, and event; and airway, breathing and circulation were intact. Client had full range of motion of his arm and denied any tingling. Client denied any pain upon palpation of the injection site and stated that his numbness was strictly localized to injection site and did not spread to rest of arm. Client's vital signs upon entering EMT station for further evaluation revealed: blood pressure 180/140, respirations 18, pulse 68, 98% on room air; lung sounds clear bilaterally, temp 98 degrees F, eyes remained equal, round, and reactive to light at 5 mm. Client stated that he had his blood pressure taken last week and that his systolic was approximately 160. Client agreed to remain for an additional 30 minutes of monitoring per site lead nurse and was stable throughout observation. Vital signs at 1220: blood pressure of 180/140, respiratory rate of 18, heart rate of 68, and oxygen saturation of 98% on room air. Vital signs at 1235: blood pressure of 160/124, respiratory rate of 18, heart rate of 76, and oxygen saturation of 99% on room air. Vital signs at 1250: blood pressure of 158/118, respiratory rate of 18, heart rate of 76, and oxygen saturation of 99% on room air. At the completion of the client's observation, client stated that numbness was "better" and stated that it was "almost gone." Client's blood pressure improved upon reassessments, and all other vitals were remained within normal limits. Client was provided with vaccine information packets and encouraged to seek follow-up</p>

1217603	4/16/2021	FL	53	F	4/12/2021	4/12/2021	I got the moderna covid vaccine. About 2 pm the symptoms started with my arm hurting so bad that I couldn't use it. It then progressed very quickly and by the next morning I ached all over, my arm had visable swelling and felt hot to the touch. My eyes hurt and I had a migrane, the next day Wed, I had nausea and the aches continued with extreem fatigue and a general feeling of malaise. The eyes still ached with light sensitivity and nausea. Thursday saw all the same symptoms but to a lesser extent, the ache in the back of my thighs up into my buttock got a bit worse. I also felt dehydrated despite drinking extra fluids in the form of black, green and mint and ginger tea. I couldn't tolerate coffee, most food, and had thrown up on wed after eating some oatmeal. BRAT was all I could eat and the banana wasn't until thursday. Today is friday and I feel a bit better, tolerated coffee this am and have some appetite as well.

1217653	4/16/2021		44	M	3/19/2021	3/19/2021	Patient reported to medical clinic 24 hours after COVID 19 injection (03/19/2021) with symptoms of visual hallucinations, myalgia, rigors, headache, nausea, vomiting and dehydration. At the time of arrival to the medical clinic, he had refractory nausea and vomiting after receiving Zofran earlier in the day at another clinical site. Medical treatment consisted of IV Fluid bolus with maintenance fluids, IV Phenergan for the nausea and vomiting, and IV Ketorolac for headache pain. His symptoms resolved and he started to feel better so a clinical decision was made to discharge him home in the care of a close friend. He declined any other treatment modalities or medications at the time of the discharge. The patient returned on 03/28/2021 with a right arm DVT proven on U/S. He was then started on anticoagulation therapy after specialist phone consult and will be closely followed.
1217690	4/16/2021	NJ	17	M	4/15/2021	4/15/2021	Systemic: Dizziness / Lightheadness-Mild, Systemic: Visual Changes/Disturbances-Mild, Systemic: Weakness-Mild, Additional Details: After receiving vaccine within 10 minutes, patient complained of feeling light headed, dizzy, appeared pale. Assisted patient to lay down on the floor. Seen by EMS, Temp 98, Pulse 63, 90/70. Patient stated that he had taken medication for anxiety prior to vaccination. Per patients mother, he took \"Hydroxyzine 25 mg Tablet\". 2nd set of vital signs were taken, BP 100/60. Patient assisted back to chair and observed for an additional 10 mins. Refused transfer, patient went home with mother.

1220673	4/16/2021	OH	62	F	3/31/2021	4/2/2021	About 12 hours after first dose given on 3/3/2021 I developed tachycardia. Called doc, put me on low dose beta blocker. Stopped the following day. --- Following are reactions from 2nd dose given on 3/31/2021: (1) 2 days after receiving 2nd shot I woke up with extreme pain and swelling in all my joints (no issues/flare) before the vaccine! Extremely cold - NO FEVER - Later that morning I developed the Covid Vaccine Rash on my arm about 2 inches below injection site. Arm was not swollen but it was tender and a bit warm. Took benadryl, went away in two days. For the following 7 - 10 days, I had EXTREME JOINT PAIN, FATIGUE AND MALAISE. Went to my family doc - no fever, no cough, no headache. Doc felt the immune response from the Vaccine may have thrown me into an RA/Fibro Flare. Prescribed mobic and muscle relaxer for joint pain. On Day 10 after the vaccine, I developed a HUGE STYE in my left eye., being treated with antibiotic eye ointment. I am now 16 days out from the 2nd Moderna dose and am finally starting to feel human again. I hope I am on the Upswing now. Fatigue is diminishing along with extreme joint pain.
1220320	4/16/2021	OK	53	F	3/29/2021	3/31/2021	Reports face/neck rash beginning 2 days after 2nd Pfizer vaccine, different from her psoriasis rash. She felt very itchy, with redness of head/neck area with swelling of face and eyes; worst day was 7 days after the 2nd shot. Saw her rheumatologist 2-3 days after shot and received a steroid shot, Pred-pak and is using topical calamine lotion. States rash is improving but still present. Face is now "splotchy" and eyes only swollen in AM.
1220612	4/16/2021	FL	40	F	4/16/2021	4/16/2021	1:33 pm Patient complained of increasing dizziness and blurred vision. Immediate evaluation by onsite EMS and NP. 1:35 vs 148/96; p. 67. R 12. 1220562	4/16/2021	IL	55	M	4/13/2021	4/14/2021	I received the first Pfizer injection Tuesday, April 13th. I had signed up for the 12:15 slot, but when I arrived it was like a cattle call. I arrived in time for what I thought was a 12:15 appointment but ended up standing in line for an hour before actually getting the shot. I was fine the rest of that day aside from developing soreness in the muscles of my right arm. The following morning, Wednesday, April 14th, I was awakened to very noticeable soreness in both arms and the back of my neck. As the morning progressed, I developed flu-like symptoms, complete body aches, chills, fever, slight nausea, blurred vision, mild diarrhea.
1220680	4/16/2021		41	F	4/15/2021	4/15/2021	symptoms of dizziness, slight "disorientation", shaky, nausea; notes very sensitive to meds. 1340 BP 158/100, pulse 99, p ox 99%. 1220321	4/16/2021	NY	48	F	4/8/2021	4/13/2021	I am not sure if my event was caused by the vaccine I received on April 8, but I have a very strong feeling it is, as never in my life have I experienced anything like it. My day began normally, and I just had returned home from an appointment. I had some lunch, and a few minutes later as I was standing in my kitchen, I began sweating terribly, heart was racing, and I felt like I was going to pass out. I managed to make it to a large living room chair, and once I lay down and put my head back, I passed out. My daughter witnessed everything and said when I passed out, my arms were trembling and my eyes rolled back. This lasted for about 30 seconds. She was unable to arouse me for a bit, but when I came to my speech was slurred. I did not know what had happened. My daughter called 911. By the time medics arrived, I was feeling much better and aware of everything happening. The checked for signs of stroke, vital signs, blood sugar, and everything was normal. I was transported to the ER, and my work up there was normal, including EKG and blood work. The physician that I saw diagnosed me with vasovagal syncope and did not feel the event was related to the vaccine. I completely recovered, and like I said I?m not sure if it was related to the vaccine I received or not. I just feel that it may be worth noting since I?ve never had an experience like this and I?m pretty healthy with really no medical history.

1220585	4/16/2021	RI	20	F	3/20/2021	3/20/2021	Johnson and johnson covid-19 vaccine eau March 20th - allergic reaction to covid vaccine Johnson & Johnson. Allergic reaction started approximately 2 minutes after receiving shot. It started with itching and redness on my arms and upper chest. After approximately 10 minutes, I knew something was wrong and I signaled an attendant. They immediately brought me over to the EMTs on site, where they looks me over and started drawing up IV Benadryl. In the time it took for them to draw up IV Benadryl and insert the IV, the hives on my chest started to turn into burning and ice sensations intermittently. As soon as they administered the IV Benadryl, the itching redness and hives on my arms went away within a couple minutes, and I was left with only redness on my upper chest. They felt comfortable with me getting a ride to the ER from my dad and not getting emergency transport. At the ER, they gave me pepcid and prednisone. About an hour and a half later, I started developing chest tightness and hives and redness on the side of my face. They decided to administer more Benadryl and start epinephrine. I was discharged a couple hours later. March 22nd - I went back to the hospital, with complaints of severe stomach pain. The stomach pain lasted approximately 24 hours. March 20th to march 26th - I experienced extreme fatigue. I was exhausted to the point where on Wednesday I took a ten minute shower and by the end of it I had to lay down again because I was shaking from exhaustion. Symptoms improved slightly until April 5th where it started taking a turn for the worse. April 5th - I started noticing black spots in my vision that wouldn't go away. They didn't move and they stayed in one spot for hours until I fell asleep and then they'd be gone the next morning. They usually started around 8:00 or 9:00 at night. Sometimes a couple hours earlier. They came every day until Friday April 9th when they did not come. April 5th to present - I also started noticing light-headedness, motion sickness when I stood still or sat in a chair, nausea, neck pain, and periods of muscle weakness in the neck. These symptoms have not stopped. Friday April 9th around 6:45 p.m. I started having a bad migraine, I noticed in the bathroom at work my eyes were dilating over and over and over again rapidly. The pain was very high. I ended up leaving work early and going to the emergency room. While at the

1220454	4/16/2021	CA	29	M	4/14/2021	4/14/2021	<p>emergency room they treated my migraine with a cocktail of Benadryl, toradol, and compazine. It reduced the pain at the time, however it did not take away the migraine. Friday April 9th to present - My migraine has continued from April 9th and is still happening. I have been having severe light sensitivity, sound sensitivity, and trouble reading. The rapid dilation of my eyes stopped April 10th, however my eyes stayed dilated until April 12th. In addition to all of my other symptoms, there are others that I am not as positive are relevant. I have asthma and it has been worse over the past couple of weeks, it is not usually worse this time of year. I've been also been having quite a bit more light bruising than normal over the past two weeks and over the past one and a half weeks I have noticed red spots all over my skin. I was not sure if these red spots were normal or not because I do have them on occasion however these are darker than normal.</p> <p>This patient had received vaccination and was scheduling next appt in observation area. Medical alert called overhead. RN responded to alert. Pt conscious, but per RN, in observation area, she stated he had a loss of consciousness and although she tried to break his fall, he did hit his head on the wall. Pt was sitting in chair, vitals attempted to be assessed, no reading, but patient alert. Before vitals were repeated, 16:18 pt eyes drifted left and closing, another loss of consciousness, followed by convulsions and gasping sounds from the throat. Pt convulsed and left leg /foot turned inward torsion. Pt was removed from chair by 3 RN's to floor safely. approximately 15-30seconds of convulsion. pt regained consciousness AOX4. Pt remained laying, head propped on cushion. vitals taken 16:24 BP 108/69 86bpm, 100%O2Sat. MD assessed and pt stable. MD provided recommendation for pt to be evaluated at ED for further evaluation due to the convulsions. Pt accompanied by friend, friend agreed to drive pt to ED. Blood Glucose 90, which was taken at 1630. Wheelchair was provided for patient, RN rolled pt out to car and friend designated driver.</p>

1220769	4/16/2021	WA	38	F	3/26/2021	4/9/2021	Exactly two weeks after the 2nd covid shot, to the hour, my eyes became puffy and swollen. Eyelids, under eye, between eyes - all was swollen. Also, three small (about 2") rashes: under chin and inside both wrists. Stayed swollen 48 hours before seeking medical care. Could not think of anything I had a reaction to. No new laundry soap, pillow, food, drink, facial product. Only thing done that I'd never done or used or had before was I spent 2 hours on the deck of an indoor swimming pool. 48 hours after onset, I visited virtual care Doctor. Prescribed Zyrtec (once daily) and ophthalmic erythromycin. Started at bedtime, woke up to eyes more swollen than before. Visited walk in clinic and told to stop erythromycin, start famotidine (20 mg twice daily x5 days) and prednisone (50 mg qd x3 days) and continue Zyrtec. Cleared within 2.5 days.
1220469	4/16/2021	MI	37	F	4/8/2021	4/10/2021	High blood pressure, vertigo, lethargy, headache, blurred vision,
1220493	4/16/2021	TN	36	M	4/2/2021	4/13/2021	12 days after the receiving the vaccine I began to have adverse symptoms. Fever of 102.5 that goes away 6 hours or so if I take ibuprofen. I've had the fever for 3 days. Body and joint aches all over. Pressure in my face nice my eyebrows and stiffness of neck. I'm also very tired. I do not have a cough or any congestion.
1220496	4/16/2021	NJ	59	F	3/31/2021	3/31/2021	Started with headache about 20 minutes after shot, then gradually over the next 45 minutes itchy & puffy upper lip, cheeks, eyelids, tightness at back of mouth. all cleared up about 45 minutes after onset so all lasted about 1.5 hours

1220550	4/16/2021	CA	53	F	4/2/2021	4/2/2021	Muscle contractions mainly back Eye spasms
1220415	4/16/2021	LA	34	M	4/15/2021	4/15/2021	Within an hour of receiving the vaccine, I began to feel "odd" (i.e heart racing, spine tingling, strange sensations in my hands, and dizziness). At the hour mark, while trying to "walk it off" inside my backyard, things escalated quickly. As I came back inside, I suddenly collapsed and and lost consciousness. Luckily my best friend was with me and she described my behavior as a full on seizure (which I am not predisposed to). According to her, I was flopping around, spitting wildly and drooling all over my face, my eyes wide and glazed staring into nothing, lips turning blue. She immediately called 911 and within 5-10 minutes, two EMT's arrived and began to speak to me and take my vitals. For a good 15 minutes I couldn't sit up and had to lay on the ground, still extremely out of it - unable to think, merely in extreme discomfort similar to the most intense flu I've ever experienced. After a half hour or so, I sat up and was able to thank them for helping me and answer some of their questions. Over another 15 or so minutes they said all my vitals were perfect and they were not worried about me - sure I'd make a full recovery, which I hope I did. I am feeling MUCH better today. The reason I felt it so important to submit this report is because I had never heard of anyone experiencing side-effects that severe. Of course I had heard it could wipe you out, give you chills, aches, and exhaustion - but I had never heard that it could lead to a seizure so scary that my best friend thought I might be dying. I truly don't know what might have happened without her. People should know to have someone at home with them after the second dose. I am not over-exaggerating about my symptoms whatsoever. My body still hurts all over and I feel as if I went through some type of gauntlet yesterday. I absolutely do NOT want to discourage anyone from getting the vaccine, but I wish I had some notion that something so severe could happen to me.
1218188	4/16/2021	PA	46	F	4/10/2021	4/14/2021	Large patches of a red rash only on left side of face with significant swelling in left eye. Slight itching, no pain. Swelling of left eye lid much worse 36 hours later.

							(dizziness, lightheaded), BALANCE DISORDER (balance issues), ASTHENIA (weak), FATIGUE (tired) and VOMITING (vomiting) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 28-Mar-2021, Blood pressure measurement: 270/150 mmHg. On 30-Mar-2021, Magnetic resonance imaging: abnormal MRI showed stroke in cerebellum- left medulla part of brain.; Sender's Comments: Very limited information regarding these events has been provided at this time. The events are probably related to the patient's comorbidities
1221059	4/16/2021	WA	50	M	4/16/2021	4/16/2021	Patient made an appointment for the COVID-19 vaccine (Pfizer). Patient let us know that he has medical induced anxiety. He has passed out from random medical appointments in the past. Patient was sitting within eye view of the pharmacy. A passing by gentleman said "Dude, are you ok?". I looked over and the gentleman was no longer in his chair. Customer helped gentleman into the chair. The nurse who administered the shot and myself (pharmacist) ran out with the emergency kit. Patient was conscious, but had no color in his face. We gave him water, orange juice, and moist towel for his forehead. Nurse took pulse, it was within normal range. Called 911, EMTs arrived. Patient declined any more help. He walked out of the pharmacy area. Total time of event: 15 minutes.
1221063	4/16/2021	CA	47	F	4/9/2021	4/10/2021	Consistent non stop headache, sinus pain and inner ear ache, primarily on the left side of the body/ head. swollen lymph glands on the left side of the neck. Pain on sinuses and above eye on the left side of the head. Headache and ear pain have been present and consistent for 7 days. Abdominal pain started on day 6 and bloating of the upper abdominal area.
1221066	4/16/2021		30	M	4/14/2021	4/14/2021	Pt complained of numbness at injection site in L arm, radiating down to forearm. BP 151/90, HR89, RR18. No other symptoms or visual changes, self-resolved. Pt discharged in stable condition

1221098	4/16/2021	PA	25	F	4/10/2021	4/10/2021	Dizziness Lightheaded Nausea Muscle pain Nerve pain Joint pain (especially in my hips, legs, knees, ankles) Possible fever/low grade Felt hot while having chills/shivering uncontrollably Headache Nose, ear, and eye stuffed up/closed on the opposite side of the shot arm. Throat itchy and felt like it was closing up at times. Achey entire body. Keep feeling like i have to pee Peeing alot more than usual in terms of times and amount Stomach ache Spine and lower back pain on the left side Neck pain on the left side Sore throat Left leg pain more than right leg. Numbness and tingling in my hands and arms. More so in the left side than the right. Unable to hold a pen and write at one point *happened on wednesday* During wednesday. Had that weird pain in arm. Started as numbness and tingling then a hot pain ive never felt before when on the very left side of my chest area up/down into my arm and down the one side of the arm and into my ring and pinkie fingers. Felt like i was in a crushing bear hug and couldnt breath Then later the same type of pain entered my left leg. Not as serve pain/feeling in chest during the leg episode Today around 740 had the same pain (none in chest) in my right leg as described above Sudical thoughts/feelings. I know its not a right thought. Feels like when i had a reaction to another medication
1220759	4/16/2021	VA	26	F	4/16/2021	4/16/2021	About 5-10 minutes post vaccination, experienced severe dizziness, impaired vision, and shortness of breath. Experienced sore throat and nausea about 20-30 minutes post vaccination. All of these side effects lasted under 40 minutes. Shortness of breath and dizziness is still prevalent hours post vaccine, but is mild.
1221128	4/16/2021	NC	57	F	4/14/2021	4/15/2021	Symptoms first occurred approximately 26 hours after injection (4:30 pm following day). Initial symptom was mild headache progressively increasing in severity with pain between the eyes and at top of left eyeball. Pain in both shoulder joints, swollen fingers, inability to sleep, dry throat, abdominal pain in liver & spleen, pain in mouth, nausea, vomiting. Symptoms lasted approximately 14 hours until 6 am.

1221189	4/16/2021	MN	60	F	1/11/2021	1/20/2021	her eye looks like a bee stung her eyelid, it is swollen; hives on face; rash on her legs and her legs were itching; rash on her legs and her legs were itching; This is a spontaneous report from contactable consumer (patient). A 60-year-old female received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; solution for injection; Batch/lot number: EK9231; Expiration Date 30Apr2021) via unspecified route of administration in right on 11Jan2021 at 16:00 as single dose for COVID-19 immunisation. The patient medical history not reported. historical vaccine included BNT162B2 (First dose: 21Dec2021; Lot number: EL0140; Expiration Date: Mar2021) and concomitant medications were not reported. patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 20Jan2021, the patient reported hives on face that were red and bumpy. They are not as bumpy but it is still red like her face looks sunburned red and her eye is swollen, rash on her legs and her legs were itching, on 03Feb2021 her eye looks like a bee stung her eyelid it is swollen. Treatment received for the events with Prednisone. The outcome of the events (Urticaria, rash, pruritus) was unknown, her eye looks like a bee stung her eyelid, it is swollen was not recovered. Description of Product complaint: Caller was calling about the Pfizer COVID vaccine. She says she wanted to report having a reaction. She had hives, like a rash and her eye looks like a bee stung her eyelid, it was swollen. She had a rash on her face and her legs and her legs were itching, it was like hives on her face that were red and bumpy. They are not as bumpy but it was still red. She has been taking Prednisone and she was not sure if that is why its getting a little bit better but it was still really red and itching and the swollen eye was a new thing. Her Prednisone was in an amber color pharmacy bottle and does not see an NDC lot or expiration on there.

1220790	4/16/2021	OH	50	M	4/8/2021	4/10/2021	This is a 50-year-old male who got his first Covid vaccine last Thursday, April 8 and then he said on Saturday he began to feel weak and off balance. He also began to feel tremulous. He apparently said that on Saturday his right leg was shaking so bad he could hardly walk. He denies any numbness but again feels off balance. He has fallen down several times since Saturday. He apparently went to urgent care and then was sent to the emergency department for evaluation. His blood pressure was noted to be 194/130 on presentation. He does have an obvious tremor in his left arm. His significant other says that he at times had slurred his words. The patient does not know what type of vaccine he received on April 8. The patient due to these symptoms presents to the emergency department now for evaluation. He apparently drinks about 8 to 10 cans of beer per day and has done so for an extended period. He denies any loss of vision. Patient was not a candidate for alteplase. He was admitted on 4/12 and discharged on 4/14. Discharge medications included aspirin, atorvastatin, clopidogrel, and losartan.

1220814	4/16/2021	NY	58	F	4/10/2021	4/10/2021	Within 7 minutes of receiving shot, my vision was slightly impaired (darkening ) cold sweating, heart racing, head pressure and feeling I was going to faint. Emt?s and nurse assisted me. My blood pressure spiked to 176/100 and my legs and hands were shaking uncontrollably. Someone mentioned a hypertensive crisis and I was getting frightened. I requested an anti anxiety pill from my purse, which they let me have. It didn?t help me at all. I was taken to an ambulance and waited for a relative to come pick up my disabled daughter who was with me getting her covid shot as well. I asked if they were taking me to the hospital, and was told ? you don?t want to go there? after an hour, bp came down to 146/90? ..which is still too high and not typical for me.This was NOT brought on by an anxiety attack.i was not remotely anxious and was simply sitting and speaking with my daughter when I was stricken. The next 3 days my heart was racing. I wear a Fitbit to bed and my heart rate recorded spikes of 116 while I was asleep. Had bouts of bad stomach pain and diarrhea the next two days. Followed up with my GP 4 days later . Still having palpitations and following up with cardiologist.

1220932	4/16/2021	MS	70	M	1/6/2021		cranial nerve deficit 4, 6,9, 10, 11, 12; tongue deviation to right; double vision; tongue biting; difficulty swallowing; This spontaneous case was reported by a physician (subsequently medically confirmed) and describes the occurrence of CRANIAL NERVE PALSIES MULTIPLE (cranial nerve deficit 4, 6,9, 10, 11, 12) and TONGUE PARALYSIS (tongue deviation to right) in a 70-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 025L20A and 021L20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history was not provided. Concomitant products included ATORVASTATIN CALCIUM (LIPITOR), LISINOPRIL, ALUMINIUM HYDROXIDE GEL, DRIED, MAGNESIUM CARBONATE (PEPCID [ALUMINIUM HYDROXIDE GEL, DRIED;MAGNESIUM CARBONATE]), OMEPRAZOLE, NEBIVOLOL HYDROCHLORIDE (BYSTOLIC) and COENZYME Q10 [UBIDECARENONE] for an unknown indication. On 06-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 03-Feb-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On an unknown date, the patient experienced deficit in the cranial nerves 4, 6, 9, 10, 11,12 after been vaccinated with 1st dose of Moderna Vaccine and difficulty with mouth which resulted in him biting his tongue. The patient's tongue deviates to the right, double vision, difficulty swallowing (swallow test was negative). Physical Exam, CTA to rule dissection (result was negative), Stroke tests were negative. MRI with/without contrast of the brain & upper spinal cord which was conducted twice and the results were normal. the patient is undergoing a neurophysiology count (result is pending) The patient experienced CRANIAL NERVE PALSIES MULTIPLE (cranial nerve deficit 4, 6,9, 10, 11, 12) (seriousness criterion medically significant), TONGUE PARALYSIS (tongue deviation to right) (seriousness criterion medically significant), DIPLOPIA (double vision), TONGUE BITING (tongue biting) and DYSPHAGIA (difficulty swallowing). At the time of the report, CRANIAL NERVE PALSIES MULTIPLE (cranial nerve deficit 4, 6,9, 10, 11, 12), TONGUE PARALYSIS (tongue deviation to right), DIPLOPIA (double vision), TONGUE BITING (tongue biting) and DYSPHAGIA

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							(difficulty swallowing) outcome was unknown. Not Provided DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On an unknown date, Computerised tomogram: negative (Negative) Negative. On an unknown date, Magnetic resonance imaging brain: normal (normal) Normal. On an unknown date, Magnetic resonance imaging spinal: normal (normal) Normal. On an unknown date, Physical examination: negative (Negative) Negative. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Patient had difficulty swallowing (swallow test was negative), stroke tests were negative. His Neuro-physiologist is doing a neurophysiology count (result is pending). No treatment information was provided. Reporter did not allow further contact; Sender's Comments: Based on the information provided, a causal association between the reported event and cranial nerves deficit is assessed as unlikely based on diagnostic test. However, based on temporality, causality with the other reported events of dysphagia, tongue biting and deviation and double vision cannot be excluded.

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1219637	4/16/2021	CA	57	M	3/27/2021	4/8/2021	Developed right facial eyebrow sagging, inability to close eye, disappearance nasolabial fold, drooping corner mouth, and decreased tearing; onset 4/8/21; diagnosed with right Bells Palsy
1219519	4/16/2021	CA	39	M	4/14/2021	4/14/2021	Patient received the 1st COVID vaccine (Pfizer, Lot #: EW0162, expiration date: 07/31/2021) at 1500. EMT made contact with the patient standing in the 30 minute observation area at 1507. Patient complained of ?blurry vision, headache, and slight tingling in the throat.? Patient reported the symptoms started ?10 minutes? status post vaccine. Patient denied chest pain, nausea, vomiting, or diarrhea and was presenting conscious, alert, and oriented to person, place, time, and event (AOX4). EMT assisted the patient to the zero- gravity chair for further evaluation. Nurse then responded and attended to the client and EMT. Baseline vitals were obtained by EMT at 1508, while patient was sitting: blood pressure: 150/88, respiratory rate: 14, heart rate: 80, pupils equal and reactive to light. EMT observed the skin to be dry, warm, and normal. Chief complaint was then reassessed and patient claimed his vision had improved and symptoms were subsiding. He stated the onset of symptoms were gradual and lasted less than 5 minutes.? Patient also reported his last oral intake was around 1300 with minimal fluid intake. Patient stated he has a history of headache and denied any past medical history or taking any current medication. Patient has allergies to seafood and shellfish. At 1515, a second set of vitals were obtained by EMT, while patient was standing: blood pressure: 154/90, respiratory rate: 14, heart rate: 85, pupils equal and reactive to light. EMT observed the skin to be dry, warm, and normal. Patient was negative for orthostatic pressures. Patient was advised by the EMTs to stay another 30 minutes in the observation area, totaling 45 minutes. At 1545, patient stated ?all symptoms have subsided.? Patient was released and ambulated on his own, out of the facility, with a steady gate. EMTs encouraged the client to sign up in order to document any additional symptoms.

1219612	4/16/2021	CT	23	F	4/14/2021	4/14/2021	Immediately after injection, started getting black spots in vision. I was able to drive through the cones to the waiting area but the black spots were getting worse to the point where I could barely see. My ears also felt numb and I could barely hear anything. I got to the waiting area (drive-thru clinic) and they weren't making people wait the 15 min so I told them I could barely see and couldn't drive. I was attended to by medical personnel. My vision was almost completely full of black spots, slurry speech, I felt very sweaty and very weak. As I was being attended to, the only thing that helped was reclining my seat and closing my eyes with the A/C on. After about 20 min my vision was improving and my friend picked me up from the site. I proceeded to lay down and drink lots of gatorade and felt more normal in a few hours to the point of being able to drive home. I continued to feel weak and fatigued for the rest of the day. The next day I had very bad arm pain, but it seemed normal compared to other vaccines I've received. The third day (today) I have a massive headache all day that is not improving from tylenol and seems very different than the average dehydration headache. Not sure if that's related to the vaccine but seems possible.
1219785	4/16/2021	IL	67	M	2/13/2021	2/15/2021	retinal arterial occlusion infraction - 80%+ loss of vision in right eye

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1219630	4/16/2021	OR	50	F	4/14/2021	4/14/2021	12 hours after I received the vaccination I got fever and chill, and extreme joint pain. 24 hours after the vaccination I began vomiting, had a splitting headache, and then my vision blurring, I called my husband to be near me and completely passed out for about 15 seconds. I woke up with no recall of what happened. I thought I had had a heart attack or stroke. My left side ached where I had the injection. I have NEVER fainted before. We were unsure if I had fainted or had a seizure. Apparently my head was shaking and my hand was also when I unconscious. I stayed in bed with a 101 fever the rest of the day. Today, 2 days from vaccination, I am feeling better. It was terrifying and we were considering going to the ER. I am pro vaccine but was inadequately prepared for what could have been a dangerous reaction. I was sitting when I passed out. I was home. I had someone with me....otherwise it could have been really terrible.
1219491	4/16/2021	WA	48	F	4/14/2021	4/14/2021	Within three minutes of the vaccination I felt a warm rush to my head, followed by another rush from my feet to my head. Tingling sensation on my jaw as well as tightness and numbness on the jaw. There was some tightening of the throat. I had shortness of breath and felt dizzy. After 10 to 15 minutes later I felt a chill at my feet, progressing to my legs. After about 45 minutes the symptoms subsided and I left the facility to go home. I still felt dizziness on and off. The second morning I still felt on and off dizzy and felt like a bad hangover from alcohol. By the evening my right eyelid and cheek had swollen. Today that swelling was worse and somewhat painful.

1219684	4/16/2021	MN	36	F	4/16/2021	4/16/2021	Patient received vaccine, went to waiting room and sat down. Patient started to get hot, not feel well, and started swearing. EMT staff noticed beads of sweat on upper lip, patient stated her stomach was in knots. EMT gave patient water, placed an ice pack on her back, and had patient do deep breathing. Patient was wheeled to the doorway for cool air. Patient ate before the event. EMT gave patient an orange juice. Patient stated she was dizzy and vision was full of colors. EMT sat with patient. EMT did an eye test by using a test that evaluates a person's level of consciousness- passed. Patient started to feel extremely better = color pinked up. EMT walked patient to car after 15 minute wait.
1219688	4/16/2021	NY	61	F	3/31/2021	4/14/2021	Change in vision.. right eye... pain and white lines.. peripheral.. heaviness over both eyes still present from shot although nothing in comparison to first three days after shot.
1219700	4/16/2021	MO	60	M	4/5/2021	4/6/2021	Patient phoned and reported continued headache since vaccination, SOB, and continuous watering of unilateral eye.
1219708	4/16/2021	ID	56	M	4/16/2021	4/16/2021	Administered the Moderna COVID-19 vaccine today by IM injection to Left delt. Pt became diaphoretic, pale, dilated pupils, nauseated, feeling 'unable to focus' at 10 minutes with VS: BP 90/59, HR 40 bpm, resp 22, SpO2 95%. Cool cloth applied. Pt remained in chair with eyes closed until nausea passed within 2 min. Diaphoresis, palor, pupil dilation passed by 30 min but pt cont to feel 'shakey' so staff member was called to evaluate pt. Pt was advised not to have a second Moderna vaccine and was allowed to leave ambulatory at 35 min with BP of 159/96, HR 59. Pt was asked to call office this afternoon with update.

1219774	4/16/2021	PA	22	F	4/15/2021	4/15/2021	4/15; 11:30AM - Left arm began to have intense pain around the injection site (up to the shoulder and down to the inner elbow). 4/15; 11:30AM-onwards - more frequent urination despite lack of drink intake 4/16; 7:30AM - began to experience severe headache, some nausea, and an increase of pain the left arm 4:16; 8:12AM - headache and nausea intensify, eyes begin to hurt and light and sound sensitivity develop, pain in left arm increases and the inner elbow of the right arm begins to mirror the left arm.
1219621	4/16/2021	PA	51	F	3/18/2021	4/1/2021	Pain in left arm where injection was administered. Pain radiates down entire arm from the underarm to the hand when arm is extended or twisted. Linear bumps appeared visible to the naked eye from the underarm to the elbow.
1219400	4/16/2021	MI	61	M	3/18/2021	4/6/2021	The Jansen vaccine was given on 3/18/21. Patient began to experience symptoms of bells palsy on 4/6/21. Patient noted R hemibody numbness, which began with right-sided facial numbness when brushing teeth. He was evaluated by his PCP (no exam noted) and initiated on Bells Palsy regimen of doxycycline 100mg BID, acyclovir 800mg TID, and prednisone 40mg. On 4/9, a referral to neurology was made after pt returned to clinic w/ burning deep low back pain that radiates up to his shoulder, and his b/l temples. Pt again re-presented to urgent care on 4/12 due to severe burning back pain that resolved w/ activity. At this time again only L sided facial weakness noted (documented as reduced ability to close eyelid, raise eyebrow, weakness puffing out cheek, and reduced smile on L), no other weakness, drift, or sensory findings. Pt was instructed to continue doxycycline 100mg BID 10d course (4/6- 4/15), prednisone 40mg 7d course (4/6- 4/12), acyclovir 800mg TID 7d course(4/6-4/12).
1221132	4/16/2021	MD	42	F	3/31/2021	4/9/2021	I started feeling twinges of pain on my lip inside the roof of my mouth and in the corner of my eye on Friday April 9th. This got progressively worse through weekend and I started having a rash or raised bumps in those areas. On Monday April 12th I saw my dermatologist and was diagnosed with shingles.

1219210	4/16/2021	IA	60	M	3/25/2021	3/27/2021	Clinic visit 4/7/21: "60 y.o. year-old male who presents for left calf pain, swelling, and bruising that began on 03/27/2021. Patient states that 2 days prior to symptom onset he received the Moderna COVID-19 vaccine. He did have symptoms of fever 102 F for approximately 24 hours. After the resolution of his fever he notice swelling of the leg with tenderness any line of bruising going down the medial aspect of his leg. He noticed more prominence of varicose veins of the left leg and began using a compression stocking. His varicose veins seem to worsen with sitting as well as tenderness, and improves with walking. He notes a tenderness over the upper calf. He denies any history of DVT/PE. He notes that two brothers sustained blood clots, one he believes was in varicose veins which were ultimately stripped and the other he is not sure of the exact nature of the clots. He is unaware of any hereditary clotting disorder in his family. He denies any shortness of breath, difficulties breathing, or chest pains." He was sent home with aspirin 325mg daily. Hospital admission 4/11/21 " 60 year old male with no PMH comes in c/o LLE pain that originally started 2 weeks ago and intermittently getting worse. The pain started around the left calf and has moved its way up to his thigh/groin area. The pain is sharp, 7/10, worse when standing, slight improvement with aspirin. Pt denies tingling, numbness, CP, shob, N/V/D, blurry vision or weakness. Associated symptoms include erythematic rash around left inner thigh, tender to touch, and swelling of calf/thigh. He works with heavy machinery but is always sitting down 1-2 hours at a time. He does have family history of DVT/PE. He is not on any daily NSAIDs or other anticoagulation and denies smoking." he was started on a heparin drip then transitioned to Eliquis and discharged the next day.

COVID ANTIBODY TESTING ALL NEGATIVE: 4/30/20, 6/17/20, 11/18/2020, 12/22/2020, 4/1/2021 MODERNA VACCINE DOSE NUMBER 1: 3/13/2021 MODERNA VACCINE DOSE NUMBER 2: 4/10/2021 1:15PM 4/10/2021 9PM: INTENSE NAUSEA WITHOUT VOMITING. RIGHT ARM PAIN INCREASING WITH LOWER BACK PAIN. ROPINEROL IN EVENING 0.5MG X 2 4/11/2021 ALL DAY: SLEPT MOST OF DAY, FATIGUE, SOME NAUSEA, LOW BACK PAIN WORSE, OVER ALL FATIGUE. PLACED LIDOCAINE 3% PATCH ON LOWER BACK WHICH HELPED WITH LOW BACK PAIN. CONTINUE TO WITH OTHER BONE PAIN, FATIGUE, RIGHT ARM PAIN. 4/12/2021: SAME AS PREVIOUS DAY. 4/12/2021: 5PM, FATIGUE RESOLVED, BACK PAIN COMPLETELY RESOLVED. TOOK ROPINEROL IN EVENING 1MG 4/12/2021: Monday: I took Ropinerol 0.5mg at 5:30pm. The RLS symptoms were worse, and incredibly intense. This is the worst it has ever been. ----- BODY CHANGES: RLS worsened more than I've ever had experienced. I carry the genetic variables connected to AMLD/RLD. Symptoms usually worsen mildly 30 minutes after taking Ropinerol 0.5mg. I will usually wait for this augmentation, then 2 hours later i will take a second dose or ropinerol. The RLS was in my hips, thighs, legs. (normally they are in the lower extremities). This felt out of control where I wasn't able to sit at all. my lower extremities felt like I was having vascular changes, almost a tingling, decrease blood flow. No pain. I wear compression knee highs while working. The RLS continues through the night until around 11:30pm. First dose aroun 6pm. Second dose usually around 9pm. the RLS got progressively worse with each ropinerol I took. RLS symptoms with decreased sleep have progressively gotten worse with each day. Starts after taking the first ropinirole dose. Then worsens after taking second dose. It makes it nearly impossible to sleep. I have never experienced th worsening of these symptoms of this. a dramatic difference. Ropinerol is now making it worse, but I can't sleep without it.</p>

1219482	4/16/2021	PA	63	F	4/16/2021	4/16/2021	I received the vaccine on a Saturday evening and by Sunday morning, I was sick as a dog with flu like symptoms - massive headache, terrible backache (like someone kicked me in the back), chills and fever. Sunday evening in the middle of the night, in bed, I was shaking so badly from chills that I was afraid to get up to get Tylenol. I finally did and I couldn't even focus my eyesight and control my hands as I went to open the bottle of pills that my hands were shaking so badly that I spilled them all over the place. Finally I woke my husband who heated up blankets in the dryer and brought me hot tea. My husband helped me to the bathroom where I vomited. I cannot remember when I was so sick. I missed work that day at my part-time job and the next day at my full time job as a teacher.

1219352	4/16/2021	CO	37	F	4/5/2021	4/5/2021	She received J&J COVID vaccine on April 5 around 11:45 AM. That day afternoon she started noticing generalized headache acute onset and was continuously present for following 4 to 5 days. She had 1 day of headache free symptom. And she started noticing fluctuating intermittent headaches since that time until today. She still has headaches ongoing today. A week ago she also started noticing nausea which is been ongoing and blames mostly for headache. It is intermittent and denies any vomiting. No abdominal cramps diarrhea or constipation or blood in stool. She also started noticing dizziness 5 days ago which was more intense and frequent at that time but for the last 2 to 3 days it has become in less frequent. She walked to the clinic today for the fear of driving and dizziness. Denies any blurry vision but does have photophobia. She also complains about loss of appetite but she mentions it is coming back today.

1220230	4/16/2021	IN	22	M	3/24/2021	3/31/2021	On 3/24/21 received vaccine and then on 3/31 began breaking out in hives on face/hands front and back and in between fingers/hives on arms/elbows/legs/knees/feet too and bottom hives also around eyes.Pain really bad in hands and feet. Swelling around eyes/face/hands/some fingers in the joint area. Itching was all over except back and tummy. Priority Care seen by said serum sickness but had never seen from vaccine recommended to follow up with family Dr . I contacted Dr 's office was told no need to see him as Priority care diagnosed and prescribed predisone 10 mg. I still wanted some answers call back next day and we went in 4/12/21 was told need to get with Infectious disease dr at major hospital spoke with his nurse on 4/12/21 and she said I would get call back about a referral appt. I did get call back from Family Dr and they said they spoke with Dr and he said no need to see him it's very common and he can get the 2nd shot. Never saw him or anything. So we are finishing up predisone script on Saturday 4/17/21 and he is also taking benadryl and the hives disappear but come right back and sometimes worse. Please help
1220251	4/16/2021	IN	49	F	3/23/2021	4/11/2021	On April 11th, woke up with a swollen left eye and upper cheek, with redness. On April 12th, woke up with left eye nearly swollen shut, and entire left side of face red and puffy. As the day progressed, blisters appeared and began weeping. Which does sound like it could be a poison weed, right? I had zero contact with any poison ivy, sumac, oak, etc. I had not changed my diet, changed any soaps/detergents, etc. Contacted primary care provider who diagnosed issue as poison ivy and prescribed 40 mg of prednisone for 3 days, 20 mg for 2 days. By Thursday April 14th, issue was not improving and my entire face was swollen, red, hot and itchy. Went to the urgent care clinic who conferred with my primary doctor and they decided to increase my prednisone treatment to 60 mg for 3 days, 20 for 3 days. As of today, April 16th, the prednisone treatment does not appear to be helping, as face is still red, swollen, hot and itchy. This has also spread to my neck area, but not any where else on my body.
1220257	4/16/2021	TX	50	F	4/4/2021	4/5/2021	4/5 - Fever and chills started also severe headache. 4/8 eyes started to burn, blurry vision numbness in extremities.

1219805	4/16/2021	IN	78	M	2/24/2021	3/3/2021	Received his vaccine, he had soreness in the arm, but nothing else. On 3/3/21 he went to hospital ER with diagnosis of kidney stones, had a morphine injection, Flomax and a prescription for Oxycontin and Flomax. At that time he was experiencing also in his right eye swelling and it was reddish, and there was an itching around the eye, and there was a couple blotches on top of his head and his cheek, but did not mention it as he was there for kidney stones. On 3/9/2021 he saw a Urologist, Dr. and that morning he passed a kidney stone. The urologist took an x-ray and did not see any more. The eye then became an issue on 3/9/21 and he made an appointment to see the eye Dr., Dr. at Eye institute on 3/11/21 @ 9:00 AM. The doctor diagnosed shingles on the face and right eye, and she put him on 2 medications (Durezol ophthalmic drops). He is still on that medication still 4/16/21. The other medication that they prescribed for him was Valacyclovir which he took 3 times a day, they reduced it from 1000 mg to 500 mg twice a day. The swelling of the eye itself has gone down a little bit. He is still seeing the eye doctor, and has a FU on 5/5/21 as it is getting better but still has symptoms. He did get a single dose Shingrix shot a couple of years ago.
1219261	4/16/2021	LA	60	M	4/11/2021	4/12/2021	Within 24 hours of injection, fever of 101.0 for over 24 hours, headache, inability to keep awake or keep eyes open, worsened my IBS and my neuropathy to the point of screaming, my body couldn't detect temperature changes even when inside room temp went from 70 to 86 degrees. Three times I fell into semi-conscious state and awoke within minutes not knowing where I was at or what was happening to me. Symptoms went away around 60 hours after injection.

Blood pressure 99/70ish 98%O2 heart beats a bit high. Checked out by nurses at clinic By 3:53pm left clinic in stable condition. Symptoms didn't worsen. A bit of chest tightness and start of coughs. Took benadryl. It helped ease symptoms in about an hr. 4:20pm redness in face hands and chest. Tired feverish muscle aches. Eyes tired By 5pm the chest discomfort disappeared. By 1am April 16th the pain in throat had diminished, but a low ache and a sore sensation still persisted until 9am approx.
1220209	4/16/2021	CA	35	M	4/16/2021	4/16/2021	Patient had a syncopal episode approximately 5 minutes after receiving COVID 19 vaccine. Patient was immediately placed on gurney. Syncopal episode lasted approximately 10 seconds. Patient was under medical supervision the entire time and did not hit his head. Initial vitals signs were: BP 110/70, pulse 55, O2 100%. paramedics did arrive on scene and evaluate the patient. Patient felt much better and refused transport to ER. Patient signed out AMA with paramedics. Note: Patient admitted to history of syncopal episodes in the past during previous blood draws and vaccine administrations.
1219903	4/16/2021	PA	16	M	4/8/2021	4/8/2021	EMS providers approached by 17 y/o M pt complaining of rash local to injection site. Pt stated that he received the first dose of the Pfizer COVID vaccine at 17:21hrs today. Pt denied feeling any itching or pain at the site, and only noticed the rash upon visual inspection of the site. Pt denied chest pain, shortness of breath, nausea, vomiting or diarrhea. Upon inspection, (R) upper arm found to have slight, non-raised rash, warm to the touch. Full assessment performed and vital signs obtained. GCS 15, P 76 regular, RR 18 non-labored, B/P 146/P, PERRL, SpO2 99% RA. No other associated symptoms found. Pt administered Diphenhydramine 25mg IM in RA. Pt monitored and denied any worsening of condition. (See Attached)

1219868	4/16/2021	NC	46	F	3/21/2021	3/21/2021	Slightly blurry vision in 15 minutes. Then at the 31 minute mark, my throat started swelling and my chest was tight, so it was hard to catch my breath. My whole face and ears turned red and i was itchy on my arms. 2 doses of Benadryl made the allergic reaction ease. I was tired for the next two weeks, and then started having heart palpitations regularly. Went to ER was diagnosed with Tachycardia, Hyperkalemia, Hypomagnesemia, and Hypocalcemiaand. Corrected with intravenous drugs and overnight stay in the hospital. Slowing feeling some better, but struggling with inflammation and being exhausted. Felt 100% great before getting this vaccine. Advised by doctors not to get second shot and did not get it.
1219865	4/16/2021	IN	32	M	4/12/2021	4/15/2021	Patient noticed a rash that moved from the injection site down the arm to his fingers over the last 4 days. He is also experiencing numbness and tingling down that arm. The injection site is clearly in the center of the deltoid, and not too high. Today he started experiencing blurred/halo vision, as well as quite a lot of dizziness. He also said he was experiencing tightness in his jaw. We sent him home from work today. He was going to lay down.
1219850	4/16/2021	NH	82	F	3/6/2021	3/6/2021	Nausea, vomiting, body aches, episodic low-grade fevers, frequent chills, mild dyspnea on exertion, and sensation of being slightly short of breath, pain in legs, intermittent blurry vision, feeling jumpy.

1220024	4/16/2021	TX	69	F	3/22/2021	3/24/2021	The day after vaccine administered, I experienced severe fatigue and nausea, which was not unexpected. Two days later, I had a severe headache, especially above my right eye, which was not much reduced with pain reliever (Tylenol). The pain persisted and I saw my long time ophthalmologist on Friday, March 26. He noted that pressure in my right eye was 44 (approximately 3x normal) and that my cornea in that eye was swollen. Pressure and vision test for my left eye were normal. I was already taking Latanoprost eye drops, so I was told to continue that. In addition, he added Brimonidine Tartrate drops and Timolol Maleate drops to my treatment. I seemed to experience some fatigue after starting drops, which improved after a few days. However, because Dr. office did not respond to questions I submitted to office about various issues, I decided to seek a second opinion. I first saw second Dr. (information provided above) on March 31. He agreed with first Dr.'s diagnosis and generally with the treatment, but added a diuretic and substituted Rocklatan for the latanoprost drops I had been on. When I visited Dr., the pressure in my eye had reduced to 34. I continue on the treatment schedule and do feel much improved. I am next scheduled to see Dr. on April 27 for follow-up. Both Drs. do not think the vaccine caused the cornea swelling. Dr. stated that if it were the vaccine, it would have affected both eyes. Nonetheless, I am concerned the trauma in my right eye may not be a coincidence.
1220035	4/16/2021	TX	26	M	4/3/2021	4/3/2021	Patient states that 30 minutes after receiving covid 19 Pfizer vaccine, his eyes started watering and swelling to almost shutting on him. No trouble breathing and he did not have to use EpiPen. On 4/5/21 he was feeling normal.

1221361	4/16/2021	ME	55	F	1/26/2021	1/27/2021	fatigue from waist to feet posteriorly and bilaterally; gfr 47; headache; nausea; dizziness; facial tingling/bilateral hand and foot tingling; double vision; disorientation; joint pain; orthostatic hypotension; chills; photophobic/photophobia; This is a spontaneous report from a contactable nurse (patient). A 55-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) dose 2 via an unspecified route of administration, administered in left deltoid on 26Jan2021 15:00 (Batch/Lot Number: EL1283) as single dose for covid-19 immunisation. The first dose was received on 05Jan2021 15:00 (lot number: EL1284) on the left arm. Medical history included herpes simplex virus (HSV), Superior Oblique Myokymia, and Lyme Disease; from an unspecified date and unknown if ongoing. Patient was not pregnant. Concomitant medications included calcium citrate, magnesium citrate (CAL/MAG CITRATE), ergocalciferol (VIT D), fish oil (OMEGA 3), and paracetamol (TYLENOL). The patient previously took VICODIN and flu vaccine as a child, and experienced allergies. The patient experienced headache, nausea, dizziness, facial tingling, double vision, disorientation, joint pain, orthostatic hypotension, chills, photophobic from 27Jan2021 05:00. On 02Feb2021, she experienced dizziness, headache, nausea, photophobia, facial tingling, bilateral hand and foot tingling, GFR 47 all other CBC, cmp normal. There was headache, nausea, photophobia, facial tingling on 07Feb2021 and on 10Feb2021, tingling and fatigue from waist to feet posteriorly and bilaterally. She had lab test drawn and blood work done when she was sick and her GFR came back as 47, so everything else was normal, and her GFR was 47 which was out of range. On 03Feb2021 was the first test and it was 2 weeks that she had to repeat test just to make sure it was back in normal range which it was. Thee patient was still experiencing the events but 'not as bad', and stated she can still function. Her side effects were improving but she still have a daily headache and paresthesia. The events resulted in physician/ healthcare professional visit. Patient was recovering from the events. ZOFRAN was given as treatment for the events. Patient stated she takes Tylenol but her doctor want her not to take medication for a while but she had to take Tylenol. Patient had no covid prior to vaccination and has been tested (nasal swab) post

1221387	4/16/2021	CT	67	F	2/20/2021	3/14/2021	Approximately 3 weeks after 1st vaccine, on March 14, 2021, I developed a film over my right eye and experienced jagged multi colored lines. Experienced this every few days for anywhere from 15 minutes to 1 hour in length. Again 3 weeks after my second vaccine, I woke up with the same eye problem which has been constant now for 1 week. I am unable to see clearly out of my right eye. This is still ongoing and my retinal specialist believes a blood clot may have traveled to my eye and burst causing this problem.
1221399	4/16/2021	CA	40	F	3/5/2021	3/8/2021	My left eye started twitching within two days of getting the first dose. This persisted and accelerated after the second dose. While it has mostly subsided, the twitching does occasionally return.
1221428	4/16/2021	NE	53	F	2/24/2021	2/26/2021	Ended up in healthcare facility on 3-1 dehydrated and released Back to healthcare facility on 3-4 stayed until 3-7 Started hallucinating and given meds. very dehydrated Released and then family came to pick her up. Hallucinating on drive back to where she would be staying. 3-8 back to healthcare facility because she was slurring words ---gave fluids and released 3-9 Unit had to come to get her very weak and fragile. Couldn't move her ourselves. Ended up admitting her until 3-12 At house she was supervised the whole time, weak, needed assistance, slurring words off and on. 3-22 Eye doc appt found blood clot behind eye. Sent her to healthcare facility to be examined by Neugolist. Did CT Scan and MRV/MRI found. They found clots and ended up sending her to healthcare facility. Was in city where they run tons of tests. mini strokes lead to the Thrombosis which caused the blood clots. Released on 4-2 into the care of a home where she started to hallucinate even more. Back to healthcare facility on 4-9 still currently there where they are treating her hallucinations, memory loss and more.

1221527	4/16/2021	WA	47	F	4/3/2021	4/13/2021	I got the vaccine on Saturday, 4 /3/21. Not sure if this is a reaction from the vaccine or just something new I've developed in the last couple days. Tuesday afternoon (4/13/21), I was feeling twitching around the outside corner of my right eye/cheek area. I didn't pay it any attention. Wednesday morning it was happening again. I started paying attention after a couple times. It feel s like someone has a string from the top of my head area that passes down the outside corner of my right eye, down my cheek, to the outside corner of my mouth; then starts tugging on the string. Also, a pain starts in the lower part of my head, behind my right ear. It's happening more often, to where I'm getting annoyed with it. I got an automated call about the vaccine; if having any (insert list of symptoms) please contact your doctor or clinic. I contacted my doctor, she suggested I report as an adverse reaction, just in case, and to get checked out in the ER. I have not yet gone in.

THEY GAVE HER TYLENOL AND IBUPROFEN. SHE GOT HOME AT 6AM AND SLEPT AND TOOK TYLENOL AND IBUPROFEN ON AND OFF. FEVER FLUCTUATED FROM 101 TO 104 AND BACK, TYLENOL TOOK FEVER DOWN TO 99.7. BUT UPTO TODAY, SHE STILL HAS BODY ACHES.
1213459	4/15/2021	CA	61	M	4/15/2021	4/15/2021	This patient came in to the community center to receive his 2nd dose of his Pfizer vaccine at approx 10:06am. At approx 10 minutes after sitting in the observation area, the patient started to fee hot, dizzy, some tunneled vision and nausea. This attendee did not have any sort of reaction to his first dose. This was brought to the attention of one of the observing staff members. This nurse, was called over to the patient. The attendee was asked to lay down on the cot provided and we elevated his legs. RN, measured his vital signs: bp 110/70, HR: 60, Resp 16, O2 97%. This patient denied any shortness of breath. Lung sounds were clear, and no wheezing or rhonchi were observed. This patient stated he has a history of Asthma and took his asthma medications this morning as normally directed. This patient was directed to lay down for approx 10 minutes, then stated he felt much better and wanted to sit up and take a sip of water. The attendee tolerated the water well. This nurse, advised for this attendee to stay for another 10 minutes until he had no symptoms present. The patient quickly felt better and stated that his wife was out in the car and would be driving him home. This nurse advised for him to go to the Emergency Room if he felt any of these symptoms again.

1213141	4/15/2021	WI	80	F	3/23/2021	3/24/2021	She got her vaccine, and started with her arm hurting that evening. The next morning it was itching, and then blotchy. She then started scratching her arms, shoulders, back, chest, and there were little clusters of measles like areas. She scratched on her wrist that had fluid in it. She had them in both of her eyes, and has been horrid, and they jump all over and now she has clusters of scabs that are itching as well. She went to the doctor and they gave her steroids which did not help much, but was given Benadryl also which has helped some. She also saw her cardiologist who told her she could take up to 4 Benadryl a day. She was fine last night, and this morning she had the itching and scratching again in the same areas as before. No fevers and no other reactions other than the itching rash. She also had swelling of the palms of her hands and itching, which is the reaction she gets when she gets anaphylaxis. She said that they are all over her back, all over her chest. She said that yesterday it seemed to be calming down. She was told not to get her vaccine on the 20th, but to wait until things settled down a bit.

1213116	4/15/2021	CO	30	M	4/12/2021	4/13/2021	First day after vaccine: chills, fever, whole body aches, expected soreness at site of injection Second day after vaccine: tightness in back of throat (maybe even already in chest, hard to pinpoint) that felt a little like choking Third day after vaccine: moderate headache and general head discomfort, particularly behind eyes No treatments for any of the symptoms, I've just been letting them each run their course and they've each only lasted about 24 hours so far.
1213147	4/15/2021	CA	60	F	3/9/2021	3/24/2021	I experienced muscle and joint aches, headache and overall malaise. Approximately 14 days after the first vaccine , started having vision deficits in my left eye out of the blue. I experienced a fuzziness and haziness in the vision of the left eye and pain above the left eye brow. Was seen urgently in the eye clinic on 3/29/21 and had a battery of tests - a swollen and inflamed left optic nerve was observed and some deficits to vision and peripheral vision. Had second vaccine on 3/31/21 and eye seemed to get worse. Seen by Optical Nerve Specialist on 4/5/21 and had battery of tests and optic nerve worse. Dr. diagnosed as ischemic optical neuropathy likely due to giant cell arthritis (GCA). I had urgent/emergent temporal artery biopsy on 4/6/21 to determine if giant cell arthritis. Received results from biopsy on 4/13/21 and negative for GCA. Saw Optical Nerve Specialist on 4/14/21 and diagnosed with ischemic optical neuropathy but cause can not be specified. Optic nerve is still swollen and vision impacted. I am to return to clinic in 8 weeks and see if improvement. I have never had any issue like this in the past.

1213061	4/15/2021	PA	77	M	3/16/2021	3/20/2021	On Tuesday, February 16, I received my 1st Moderna Covid vaccine. On Tuesday, March 16, I received my 2nd Moderna Covid vaccine at 11AM and Eylea shots (one in each eye) at 2PM. I have been receiving Eylea every 3 months for about 3 years in one or both eyes. On Saturday, March 20 at about 11:30AM, while sitting at traffic light, I saw what appeared to be a translucent sheet of plastic cover the left driver's window and the left half of the windshield. This was only visible in the left eye. Twenty seconds later, a yellow opaqueness developed in the left eye, which eventually cleared, but vision was still blurry. When I got home, I called my retinologist. He recommended I go into a dark room and close my eyes. At this time, I had white translucent vision in the lower left quadrant of vision in both eyes. My retinologist sent me to Eye Hospital Emergency Department, which is part of Hospital. After being assess at Eye Emergency Room, I was admitted to Hospital for a right occipital lobe stroke that was confirmed by multiple MRIs of the head. I was told that I was experiencing an ocular migraine (although I had no pain.) I was discharged on Monday, March 22, on Eliquis. As of April 15, all of the yellow opaque and white translucent visions are gone. However my left eye vision remains blurred and hazy. I have since been diagnosed with age-related cataracts in both eyes and a fast-moving cataract in top portion of left lens. I will also report this occurrence to the reporting system.
1213171	4/15/2021	TX	67	F	3/22/2021	3/26/2021	4/15/21 Pt called stating that she has had some of the symptoms that everyone is talking about with the vaccine. She stated that Friday after her shot on Monday she had severe tremors, so bad it shook the car, and she went to the ER. They ordered an MRI without contrast and she is scheduled for an MRI with contrast soon. She cannot remember the date, but she began having blurry vision in her left eye. She went to her eye doctor and he stated she had an "eye stroke". She had injections in her eye today. I asked her to please call her primary physician as well and she agreed. I told her I was going to report her symptoms.

1213020	4/15/2021	CA	51	F	3/8/2021	3/17/2021	<p>* MAR 8th = Vaccine shot * MAR 15th = alleged "sore throat" * MAR 19th = watery eyes; dry eyes; tired eyes. Onset of right eye not blinking/closing. * MAR 21st = Emergency Room. Diagnosed w/ BELLS PALSY. [Ruled out stroke] The following week after my vaccination (approximately MAR 15th), I experienced a strange feeling at the back of my throat. It can best described as a "sore throat". I noticed it upon waking up. I could feel it at the back of my throat when swallowing; the act of swallowing would enable me to "feel" the sensation at the back of my throat. This was unusual and not normal for me. I thought I was coming down with a cold virus. I had not been sick for over a year and thought it was a strange feeling. I was concerned. With the recent schools, restaurants, and gyms opening up with less restrictions, I learned from coworkers that there was an increase of illnesses because our immune systems are not as strong and germs are easily transferable during the usual interactions. Therefore, I expected my sore throat to be the start of a harmless cold virus. Then, later in the week (MAR 19th), I noticed my eyes were abnormally dripping tears. It is my experience that I get this effect in the office setting or during winter when my eyes are "dry". However, I was neither in the workplace (office), nor was it winter. I was not sure why my eyes had excessive tears coming out. Finally, on SUN (MAR 21st), an obvious physical symptom finally became apparent to me and my family members. My speech was impaired. I could not chew properly. I could not drink from a cup. I struggled during breakfast. I was not sure if I was having a STROKE. I recited the alphabet to hear for a slurred speech. I looked in the mirror, and my smile was not perfect. I got dressed and went to the Emergency Room. The doctors performed physical PUSH-PULL tests, eye tests, etc. DIAGNOSIS = Bells Palsy. OTHER SYMPTOMS = + shortness of breath. + leg swelling. + headaches. + excruciating pain in the neck, especially during sleep (laying down).</p>

1214308	4/15/2021	OR	36	F	4/15/2021	4/15/2021	Patient noted beginning to feel a headache, dizziness, itchiness and scratchiness of throat and mild throat tightness at 9:27A. Vital signs were done and a brief history was taken. Patient reported history of tension headaches, and hay fever. Patient reported that she has had mild allergic reactions to soy, bananas, and cantaloupe. Patient reported that she take Claritin, Flonase, and anti-histamine eye drops every morning for allergy management. Patient denies history of diabetes, any cardiac related issues, and any other chronic conditions. Vital signs taken at the 9:31A, 9:46A, and 10:00A. At around 10:05A, Patient was taken to a private room to provide education for epi-pen use. ER precaution reviewed with patient and patient agreed with the plan of care. Patient verbalized understanding to seek care and medical attention should breathing become more difficult, the headache get worse, and if other symptoms worsened. Patient left the clinic to go to the pharmacy at 10:15A. Patient will pick up Epi-pen and then head home.
1214306	4/15/2021	WA	29	F	4/12/2021	4/12/2021	It started slowly with feeling extra tired and light arm soreness. Then rapidly became extreme shivering, a fever, headache and full body muscle aches. In the early morning I also got stomachache cramps and felt hungry, but food didn't help. It actually made me feel nauseous. By 6am the next day I had a serious migraine too - sensitivity to light. My eyes hurt. It actually was so bad I caved and took 2 liquid Advil's to help with the pain. From there I slowly got better over the day but still had the above mentioned symptoms, just less intense. Around 8pm the fever came back and I called it a night. Next morning I felt better, but still tired. Still had a headache but not a migraine. And occasional stomach aches. It's now 2 days later and the head aches, arm soreness and occasional stomach aches have not gone away.

1214231	4/15/2021	MI	70	F	4/3/2021	4/5/2021	Two days following first dose Moderna Vaccine at Pharmacy, she suffered a cardiac arrest. Below Discharge Summary From 3/26 hospital. Patient PCP Information Provider PCP Type DO General Discharge Summary by DO at 3/26/2021 12:42 PM Author: DO Service: Cardiology Author Type: Resident Filed: 3/26/2021 12:57 PM Date of Service: 3/26/2021 12:42 PM Status: Attested Editor: DO (Resident) Cosigner: MD at 3/26/2021 1:17 PM Resident Attestation: I personally saw and examined the patient on rounds with my cardiology resident team on the day of the resident's note. Management was discussed with the cardiology resident and I supervised the plan of care. I have reviewed and agree with the key parts of the resident evaluation including: Subjective information Objective findings on physical exam Impression and plan Gen: appears comfortable, sitting in bed Resp: clear. no wheezes, rhonchi, rales CV: normal rate, regular, no m/r/g Abd: soft, nt/nd Ext: warm, no edema. Pressure ulcer boots on. Pleasant 70-year-old woman who had a history of PVCs, left bundle branch block, and a mild nonischemic cardiomyopathy, came into the hospital following a VT/VF cardiac arrest. Her echocardiogram done while in the hospital showed a preserved ejection fraction. Her cardiac catheterization showed normal coronary arteries. She had implantation of an ICD. Hospital course has been complicated by watershed cerebral infarcts. In addition, she had an episode of C. difficile colitis. She has gradually improved over the course of the past 3 weeks. From a cardiovascular perspective, she is being discharged on carvedilol 25 mg twice a day, lisinopril 10 mg daily, and her home atorvastatin. With regards to her etiology of cardiac arrest, I would be suspicious about the possibility of sarcoidosis. However, we were not able to get a cardiac MR while she was inpatient due to her strokes and inability to consistently follow commands and hold her breath. Would recommend consideration of an outpatient. She is ready to discharge to subacute rehab today. I have spent greater than 30 minutes in discharge planning. Preferred Name: PATIENT PCP: DO Primary Cardiologist: MD Discharging Cardiologist: MD Admission Date: 3/5/2021 Admission Diagnosis: Cardiac arrest Discharge Date: 03/26/21 Discharge Summary Author: DO Primary Discharge Diagnosis VT/VF cardiac arrest, s/p therapeutic hypothermia S/p AICD placement

3/16/2021 Secondary Discharge Diagnoses Anoxic brain injury, recovering, with persistent aphasia and dysphagia C. difficile colitis Non-sustained ventricular tachycardia, resolved DETAILS OF HOSPITAL STAY Presenting Problem/History of Present Illness Patient is a 70 y.o. female, with history of nonischemic cardiomyopathy, admitted on 3/5/2021 after out of hospital VT/VF cardiac arrest. She completed therapeutic hypothermia protocol. Cardiac catheterization did not show any significant obstructive coronary disease. TTE showed LVEF 55%. Patient underwent AICD placement on 3/16/2021. Had some recurrent nonsustained ventricular tachycardia afterward, which resolved after increasing her carvedilol doses. Her course was complicated by a C. difficile infection, treated with PO Vancomycin, with significant improvement in diarrhea. She has had gradual neurologic recovery. Neurology felt she had had several watershed infarcts, but felt that she would continue to have a prolonged recovery over the next few months. Had some recovery of language/cognition prior to discharge. Due to her waxing/waning encephalopathy, she did not qualify for inpatient rehab, but will be discharged to subacute rehab. Discharged with tube feeding continued, though she can begin sips with speech therapy supervision. Patient seen and examined at bedside on the day of discharge. She stated that she had no pain, though HPI/ROS still limited due to aphasia. Discussed above information with patient's husband, who understood and was in agreement with the plan. Problem-Based Hospital Course NEURO Acute metabolic encephalopathy, with gradual recovery -Due to neurologic injury from cardiac arrest. -Neurology consult: concern for anoxic brain injury with watershed infarcts, anticipate very gradual recovery over the coming months. No acute process on imaging. -Patient extubated on 3/11, following some commands. Continuing to regain conversational ability and motor function gradually each day. Has some waxing and waning of mental status, but overall her encephalopathy continues to improve. -Limit centrally acting/sedating medications -Speech following for language/cognition as well as dysphagia requiring tube feeding. Can begin some sips in addition to tube feeds. -Continue tube feeds via tube per instructions provided on after visit summary INFECTIOUS DISEASE C. Difficile Colitis: -C.Diff Positive 3/18. Continue 125 mg

PO Vancomycin Q6H for 10 days (3/18 - 3/27), confirmed with infectious disease -Frequency of diarrhea has decreased significantly, was stable after rectal tube removed 2-3 days prior to discharge Pneumonia, likely due to aspiration, resolved -s/p 5 day course ceftriaxone (3/5 - 3/9 ) -CTA on admission showed significant RUL and RLL consolidation with air bronchograms, as well as some patchy airspace disease in LUL -Had copious tan sputum on suctioning 3/7 - respiratory culture negative CARDIOLOGY Out of hospital cardiac arrest, likely VT/VF -Pt's husband initiated chest compressions x 10 minutes, until police/fire dept arrival, when AED showed a shockable rhythm. Likely VT/VF arrest. -S/p therapeutic hypothermia protocol. -Troponin peaked at 1.09 -3/16 Successful single chamber ICD implantation Nonsustained ventricular tachycardia (NSVT), resolved Chronic left bundle branch block -Has had multiple episodes of NSVT noted on telemetry 3/19 - 3/20 -s/p ICD as above -Increased dose of Carvedilol to 25 mg BID with resolution of NSVT History of nonischemic cardiomyopathy, LVEF 55% -Echo in 11/2019 demonstrated EF 42% (nadir). -TTE on admission showed recovered EF to 55%, mild concentric LVH, normal RV systolic function, no valvular abnormalities - Was initially started on aspirin/statin due to high suspicion for CAD, but as cardiac cath 3/15 was unremarkable, these medications were discontinued. - 3/16 Successful single chamber ICD implantation Hypertension -Blood pressure now improved after restarting home lisinopril and initiating carvedilol -HCTZ discontinued as BP now well controlled on above regimen RENAL Oliguria, resolved -Pt initially had low urine output since admission, improved to 0.5 cc/kg/hr on 3/9. Continue fluids with free water flushes through tube feeds -Has had normal electrolytes, renal function, and urine output since initial renal recovery. RESPIRATORY Acute hypoxic respiratory failure secondary to cardiac arrest, s/p mechanical ventilation, extubated 3/11 - Patient successfully extubated 3/11, stable respiratory status. Protecting airway well. -Encourage incentive spirometry HEMATOLOGY Acute normocytic anemia, improving -Pt had Hgb drop from baseline around 13-14 at admission to 10.9, now around 10-11. -Has iron saturation of 11%. Normal LDH/bilirubin, ruling out hemolysis. -Started oral iron supplements -Consider

1213944	4/15/2021	CO	29	M	4/12/2021	4/12/2021	Patient was looking pale a minute after the shot, I asked how he was doing, he responded by saying he felt very dizzy. I asked him to take slow deep breaths, gave him some water. About after 1 more minute he passed out (very unresponsive but still breathing, pupils very dilated) pulse was slow but still palpable. Tried ammonium smelling salts, that did not bring patient around. Called 911. Tried patting patient and talking to patient to bring them back to consciousness. After about a minute or two patient was able to respond to me. He knew his name and date of birth and where he was. Asked him to wait for ambulance to check vitals. Patient said he still felt very dizzy. Kept his head down and eyes closed. Once EMS arrived they checked his vitals, determined BP was low (they did not tell me a number). They monitored patient's vitals for 10-15 minutes. BP did not "bounce back" per EMS so they took him to the hospital for IV drip possibly.
1213940	4/15/2021	IL	53	M	4/14/2021	4/14/2021	Face numbness on right side. I started feeling numbness in the right corner of my mouth within minutes of receiving the shot. Within a couple of hours it had spread to a larger area. From just below my eye to my chin including my lips on that side and inside my mouth and cheek. Symptoms were still there the next morning so I contacted my doctor. I was instructed to go to the emergency room. The ER doctor determined that it wasn't a stroke and said it was most likely a reaction to the covid shot. They also said it resembles a minor case of Bell Palsy but was most likely not Bell Palsy. It was probably an inflammation of the nerves in my face due to the shot. I was prescribed a steroid to use if the symptoms did not stop in a couple of days.
1213541	4/15/2021	CO	26	F	4/9/2021	4/10/2021	Extreme headache, lethargy, and fatigue morning after vaccine. Pale clammy skin, cold-sweats, diarrhea, nausea, vertigo, dizziness, fainting, lightheadedness, muffled hearing, and blurred vision, later that afternoon. Pale, clammy skin, cold-sweats, vertigo, fainting, lightheadedness, muffled hearing, and blurred vision spells 1-2x/day since vaccine 1 week ago.

1211805	4/15/2021	GA	53	F	3/17/2021	4/6/2021	Started having excruciating, painful headaches. On about 4/6/21, headache awoke me from sleep. Pain was through my left eye towards the back of my head down to my neck. Lasted for awhile. Took Tylenol and was able to get rest about an hour later. Woke up that morning pain was still there but it was bearable. Two days later it happened again. Awaken with excruciating pain. Didn't think it was related to shot because it had been almost 3 weeks since I had shot. On 04/15/21, it happened again. Never had any issues with headaches. Not only have I been having headaches, I've been having pain in my legs, feeling lethargic, etc.
1212299	4/15/2021	FL	65	F	4/14/2021	4/14/2021	13:50 Onset of headache and blurred vision. Immediate evaluation by EMS and NP. 13:52 VS: 1:52- 168/93; P 78;R 16- Sat 98% Fingerstick glucose 444. Offered water and cereal bar. 1415- VS 149-98; P 74- R 16. Sat 98%. Headache nearly gone. vision clear. Discharged home at 1420 with granddaughter.
1212286	4/15/2021	VA	40	F	4/12/2021	4/12/2021	Chills, fever up to 102.5, headache, fatigue, mild nausea, muscle aches, joint pain, minor shortness of breath, feeling of lightheadedness/dizziness, feeling like my vision was off/blurry and was... crowded, like the edges of my vision weren't entirely there?

1212270	4/15/2021	MD	34	F	1/4/2021	1/5/2021	The patient was reportedly in her USOH until she received the first dose of the Pfizer vaccine on 1/4. She woke up the following morning with a terrible headache and photophobia, later in the day developing myalgias and generalized weakness, followed by possible fever (did not take home temp). She describes the headache as a throbbing holocranial ache that is worse if she bends down. She states the headache never really went away fully over the ensuing days, and she did begin to notice blurred vision in her right eye; she eventually presented to Medical Center on 1/9, where she was tested for COVID-19 and found to be negative - her symptoms were attributed to a vaccine reaction and she was sent home. She continued to have a terrible headache and blurred vision, and so returned to Medical Center on 1/12. She then presented to another Hospital she was admitted for frequent falls in the context of elevated blood pressure. Workup there included a head CT, which was unremarkable. She was discharged with home PT. On the day of presentation, she fell at physical therapy. Now with pain from R knee down. No numbness in the leg. States leg twisted when she fell. No head strike or LOC. States pain with attempted ambulation. This resulted in her presentation to the ED at a Medical Center on 1/27/21. On evaluation, she endorsed a headache, holocranial, throbbing, 5-6/10 (has been 10/10). Denies frank positional component. Not worse at any certain time of day. +Blurred vision, worse on the R. +photophobia, not phonophobia. Also complains of pulsatile tinnitus happening almost daily, R-sided, worse when bending down. Denies nausea or vomiting. Denies neck pain or stiffness. Exam was notable for significant peripheral vision loss in R>L eye and bilateral papilledema. She was seen by ophthalmology with documentation of formal visual field testing (reports included). MRV with filling defects in straight, sagittal, and R transverse sinuses; MRI without FLARE changes, reassuring for no obstruction and/or infarct.
1212250	4/15/2021	FL	53	F	4/6/2021	4/6/2021	Dizziness, nausea, blurry vision. 114/70, HR 60, 99%. Exit time 1:25pm.
