

# COVID-19 Vaccine Drug Reactions: Eye and Vision Disorders

Preliminary Notes – Reactions Listings Start on Page 2 Below

1. Eye and Vision Disorders cases Reported through June 4, 2021 in the United States to the Vaccine Adverse Event Reporting System (VAERS).
2. In order to understand the two charts above:
  - a. The VAERS COVID-19 vaccine drug reported cases + backlogged cases **versus** the flu vaccine reported cases
  - b. The VAERS reported cases versus the total cases in the United States

It is **crucial** to at least one time, carefully read through the two answers in the FAQs related to backlogged cases and then the VAERS reporting rate:

[https://www.covid19vaccinefacts.net/VAERS\\_FAQ.shtml#Backlog](https://www.covid19vaccinefacts.net/VAERS_FAQ.shtml#Backlog)

[https://www.covid19vaccinefacts.net/VAERS\\_FAQ.shtml#ReportingRate](https://www.covid19vaccinefacts.net/VAERS_FAQ.shtml#ReportingRate)

3. The cases listed below were pulled from the VAERS raw data files with a query that looked for eye and vision disorders. As you read through the cases below, it is possible that there will be an occasional erroneous case not related to eye and vision disorders. The exact query is as follows: (symptom\_text like "eye\*" or symptom\_text like "\* eye\*" or symptom\_text like "\* ocul\*" or symptom\_text like "\*vision\*" or symptom\_text like "\*visual\*" or symptom\_text like "\*blindn\*")

## *Eye and Vision Disorders: COVID-19 Vaccine Drugs*

<i>VAERS_ID</i>	<i>RECVDATE</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1373252	6/4/2021			F			INFLAMMATION IN THE RIGHT EYE; BROWN SPOTS AT THE INJECTION SITE; ITCHINESS AT THE INJECTION SITE; BUMP AT THE INJECTION SITE; INJECTION SITE PAPULE; WEAKNESS IN BOTH LEGS; SWELLING AT THE INJECTION SITE; REDNESS AT THE INJECTION SITE; INJECTION SITE RASH; This spontaneous report received from a patient concerned an adult female. The patient's height, and weight were not reported. No past medical history or concurrent conditions were reported. The patient received covid-19 vaccine (suspension for injection, intramuscular, batch number: Unknown) dose, start therapy date were not reported for prophylactic vaccination. The batch number was not reported. The company is unable to perform follow-up to request batch/lot numbers. Non-company suspect drugs included: adalimumab (solution for injection in pre-filled pen, subcutaneous, batch number was not reported) dose, frequency, and therapy dates were not reported for non-infectious intermediate, posterior and panuveitis, and moderate to severe rheumatoid arthritis. No concomitant medications were reported. On an unspecified date, the subject experienced inflammation in the right eye, brown spots at the injection site, itchiness at the injection site, bump at the injection site, injection site papule, weakness in both legs, swelling at the injection site, redness at the injection site, and injection site rash. The action taken with covid-19 vaccine was not applicable. The patient had not recovered from brown spots at the injection site, redness at the injection site, swelling at the injection site, weakness in both legs, and injection site rash, and the outcome of inflammation in the right eye, itchiness at the injection site, bump at the injection site and injection site papule was not reported. This report was non-serious.

1373827	6/4/2021	MI	81	F	4/21/2021	4/22/2021	Equilibrium affected; I could not hear; I woke up with pressure in both of my ears; Deaf in my right ear; arm soreness; This is a spontaneous report received from a contactable Nurse (patient). An 81-years-old female patient received bnt162b2 (BNT162B2, solution for injection, Batch/Lot Number: TR2613; Expiration Date: 31Jul2021), dose 1 via an unspecified route of administration, administered in left arm on 21Apr2021 at 09:00 as 1st DOSE, SINGLE for covid-19 immunization. Medical history included atrial tachycardia (From: 2015 To: Unspecified), macular degeneration diagnosed about 3-5 years ago, low thyroid hormone seems like she's had forever, high cholesterol just beyond normal has had for years, latex allergy since the 1980's, banana, avocado, and kiwi allergy (states all are interrelated because they are cousins to the rubber tree plant and also healthcare personnel allergic to latex can and may develop a cross allergy to psyllium which is Metamucil), Psyllium allergy (states she had an anaphylactic reaction to a metapower bar in 2015. About 7 minutes after eating the bar, she went into a severe reaction and ended up in the emergency room and stayed overnight. thankfully was at work). Reported having shingles vaccination in 2014 and had shingles 2-3 weeks later, can't remember details. States it was a mild case. NDC, lot, expiry unknown. She stated every flu shot she received, she has gotten the flu and only takes periodically. States she retired in 2017 and had to take in 2016 and 2015, she would have lost her job if she didn't take. It had been 5-10 years before that, and another 5-10 years before that. States she stays away from the flu shot. Concomitant medications included metoprolol ER from Jan 2016 for atrial tachycardia, SYNTHROID started about 15 years ago for low thyroid hormone, Simvastatin ongoing, started about a year ago for cholesterol slightly elevated, OCUVITE PreserVision(Ongoing) taking about 3 years for macular degeneration age related has not changed or gotten worse in 3 years, baby aspirin started Jan 2016 (Ongoing) as cardiologist thought it would be a good idea, Vitamin D3: taking for 3 years (ongoing) for bone health, calcium with magnesium been taking a long time. 5-10 years to prevent osteoporosis (ongoing), glucosamine chondroitin taking since late 1990s. about 20 years for joint health (ongoing), multivitamin taking since 1995 or 1996. about 25 years for general health,

vitamin C about 3 years ago started with the Ocuville (eye doctor though it was a good idea to take together. On April 28th2021 patient could not hear. She was deaf in right ear and the day before on April 27 it was like she woke up with pressure in both ears. It sounded like hell like she was in the airplane and by yawning she could not relieve the pressure and went to the doctor and was under treatment with steroids and antivirals and still deaf in right ear." She confirmed pressure is gone, but still deaf and under medical treatment with otolaryngology. She was kind of tossing whether to get the vaccine or not. First went to family doctor to see, didn't think she had an ear infection because no pain and was hoping maybe she would have wax in her ear, but ears were clean and no wax. So they sent her to an ear specialist and they did hearing test and she has pretty severe hearing loss in that ear. So she was still being treated. First the doctor put her on valacyclovir and methylprednisone for about 7 days and then that didn't seem to do anything and now she's getting dexamethasone injections into her middle ear. States she is due for one about lunch time. Pressure in both ears: patient reported has subsided, but then confirms it is a lasting effect comes and goes a little bit. Left ear is pretty much clear but right ear still has pressure and cannot hear and has not subsided. On an unknown date her equilibrium affected and stated has gotten slightly better, minuscule. Patient added she's pretty healthy and moves about, gardens takes care of business, goes to exercise class twice a week now partially participates because she gets dizzy from moving her head. Patient was treated with Valacyclovir: 1 gram tablet every 6 or 8 hours, states can't remember. Started 05MAY2021 for 7 days. Caller confirmed it did not help and she threw bottle away. Methylprednisone: 4 mg tablet by mouth started dose at every 4 or 5 hours, dose was a decreasing frequency of dose over 7 days. Confirmed she threw package away. Stated cortisone decreases irritation and inflammation. And Valacyclovir is an antiviral. Started dexamethasone injections last Thursday, 20 May 2021. Is scheduled to receive a dose today, will skip next week, and then one the following week, and then one the following week after that, states it is a series of four doses and then if that doesn't help she will have an MRI. Airborne: started taking about one week ago after first dexamethasone injection through

1373133	6/4/2021	CA	55	M	3/22/2021	4/3/2021	<p>tympanic membrane into middle ear. Relevant Tests: Hearing Test (Date: 05MAY2021)Result: pretty severe hearing loss in right ear, Test: Ear exam (Date: 03MAY2021; 05MAY2021) Result: Normal. Outcome for pain in extremity was recovered, for ear discomfort and deafness it was resolving, for hypoacusis and equilibrium affected it was unknown. Reporter seriousness for pressure in both ears and equilibrium affected: Medically significant, Deafness right ear: Disabling, Arm soreness: non-serious Reporter causality: deafness in right ear: Causality: strong suspicion it's related to the vaccine, maybe not necessarily the vaccine itself, but her immune system reaction to the vaccine. Causality for pressure in both ear, arm soreness and equilibrium: related; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events such as deafness,balance disorder and ear discomfort cannot be totally excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.</p> <p>Vertigo, dizzy, blurred vision, ringing ears</p>

1373308	6/4/2021	CO	70	F	2/20/2021	2/20/2021	Lightheadedness; This is a spontaneous report from a contactable consumer or other non hcp. A 70-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Solution for injection, Batch/Lot Number: EN5318), dose 2 via an unspecified route of administration, administered in Arm Left on 20Feb2021 as 2ND DOSE, SINGLE; dose 1 of bnt162b2 (Batch/Lot Number: EN5318), via an unspecified route of administration, on 30Jan2021 as 1ST DOSE, SINGLE for covid-19 immunisation. Medical history included, bell's palsy (when I took the shingles shot I did get Bell's Palsy, as reported). Reportedly, patient stated she saw on the website that Bell's Palsy is a side effect of the vaccine and it is an acceptable risk. She stated when I took the shingles shot (it was 8-9 years ago) I did get Bell's Palsy and though not serious, I still have lasting effects. I've heard it is more dangerous the second time. Right now I am scared to death and I need to address this right away. I came out rather fortunate. The caller asked am I am at increased risk of getting it a second time. There were no concomitant medications. Patient states she took the second dose of the vaccine 9 days ago, 20Feb2021, states that night she was a little lightheaded, that she called to report but she was on hold for so long she just hung up and then the next morning it was gone. States that yesterday (28Feb2021), and today (01Mar2021) she is experiencing some more light headedness, that it has been 9 days and wants to know if this is normal, states she is guessing the vaccine is kicking in but wants to make sure, caller states she does not have a lot of time for a report but would like to speak with someone quickly as she has been holding for one hour. On 20Feb2021, the patient experienced lightheadedness. The patient with a questions about the COVID vaccine that no one can seem to answer. She knows that bell's palsy is a possible side effect to the product. Years ago, after the shingles shot, she experienced this event. She is wondering if this puts her at an increased risk for this event due to having it happen previously and is it safe for her to take. Caller confirms she has not taken the COVID vaccine, she is only calling with a question about it. When asked about the shingles shot, she states that she does not know the manufacturer, NDC, Lot, or Expiry for the product but knows it was the original shot not the one given now with the 2 doses. This was 8-9 years ago and

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

she won't take that shot even now for obvious reasons. The caller remarks that she knows others that have had it with far more severe effects so she considers herself lucky. The bell's palsy started within a few weeks after getting the shot and lasted 7-8 months. She had to cover eye for that long because it wouldn't close. It has recovered but her eye is still not right, it is still light sensitive. They gave her steroids, which she deplores. She is sure they gave her prednisone but she has no NDC, Lot, or Expiry for that product. This really has her spooked as her state has issued guidance that people over 70 are up next to get the vaccine. PC filed for the prednisone as it was not explained why she deplores the product. The outcome of the event was recovering. Follow-up (31Dec2020, 04Jan2021 and 01Mar2021): The initial case was missing the following minimum criteria: no adverse effect. Upon receipt of follow-up information on 01Mar2021, this case now contains all required information to be considered valid. A contactable consumer reported that: patient details (height, weight), suspect product details, adverse event (Lightheadedness). No follow-up attempts are possible. No further information is expected.

1373328	6/4/2021			F			<p>We noticed changes in her speech and cognition and legs, after the first shot; We noticed changes in her speech and cognition and legs, after the first shot; We noticed changes in her speech and cognition and legs, after the first shot; The initial case was missing the following minimum criteria: No adverse event. Upon receipt of follow-up information on (04Mar2021), this case now contains all required information to be considered valid. This is a spontaneous report from a contactable consumer. A female patient of an unspecified age received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, formulation: solution for injection), via an unspecified route of administration on an unspecified date as single dose for covid-19 immunisation. The patient's medical history included multiple sclerosis for about 26 years, diabetes, covid-19 from an unknown date in Nov2020 to an unknown date, tracheostomy and has been in a nursing home. The patient's concomitant medications were not reported. The patient has had Multiple Sclerosis for about 26 years. Recently she has been in a nursing home. She had Covid end of Nov2020. Once she recovered, they urged her to get her vaccinated for Covid. Noticed changes in her speech and cognition and legs, after the first shot, but did not put two and two together, until after the second shot. In under 24 hours of receiving the second shot, 28Jan2021 at approximately 3pm, she could barely hold her head up and she could only move her lips, making a mumbling sound at best. She suffered optical injury, and as the hours passed unable to talk, unconscious, unable to move her body, etc. She had to receive a tracheostomy and food peg and is in a long-term acute hospital. She has since become more alert (awake versus sleeping and not responding), tracks people with her eyes, fairly consistently. As of 27Feb201, she is tracking better but not following commands and the biggest thing is she can turn her head a little, left to right. Today I saw her swallow, twice (she still has a tracheostomy). The teach can only come out if she can follow commands, this do some therapy with the respiratory therapist. The patient received the Pfizer gene therapy shot. Her primary care physician was the attending physician at the time was urged to give permission for her to receive the first shot. Following poor conditions at this facility and having found a 5-star</p>

facility/home near, the patient was moved before the second shot. The patient was currently at an acute care facility. We are hoping she won't need to have the tracheostomy much longer, so that she can return to another facility, a home which close to my residence. The acute care facility where she was at now. With no disrespect intended, but rather frustration, the regular or primary physician there who I've only spoken to (not their neurologist, because I have yet to speak to him), is useless- beyond her basic care or progress thinking in care. The reporter want to provide any treatment or care that could potentially reverse the garbage that was injected into her. She has had Multiple Sclerosis for decades, is diabetic, and she had Covid end of November. She should not have received this synthetic toxic serum. In other countries, they are advising people with MS not to receive this shot. There are some doctors I'm now learning about, one a MS specialist/neurologist, that has advised his MS patients NOT to get this shot, stating there are better shots or a real vaccine expected in summer. The outcome of the events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

1373331	6/4/2021	FL	67	F	2/23/2021	2/23/2021	<p>Felt like she had flu/mild flu like symptoms; congested; fatigue; BP shot sky high/after the vaccine her BP had gone to 190/105/BP is borderline high/sporadic or borderline high BP; face felt funny it was like tingling; Trouble Swallowing; felt like throat muscles closing; Dry mouth; This is a spontaneous report received from a contactable consumer (Patient). A 67-year-old female patient received first dose of BNT162B2(COVID-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in Arm Right on 23Feb2021 15:00 (Batch/Lot Number: EN6200) as 1st dose, single for covid-19 immunisation. Medical history included Type 1 diabetes, but she got it as an adult. They initially thought it was Type 2 but it was not gradually over time she Lost her Beta Cells, she tested for antibodies and its Type 1 Diabetes Lada. She was totally dependent on Insulin. LADA stands for Latent Autoimmune Diabetes of Adults. She also had Serious Allergy problems, she had had allergies since she was a child, they were respiratory and environmental, she was allergic to yeast she gets in trouble if she eats it, she was allergic to Mold, she had 2 autoimmune diseases. The type 1 diabetes was triggered by a night she spent in a Hotel, something in there bothered her in which she had a severe allergic reaction, she diagnosed as Type 2 diabetes at this point, before her A1C was good, but then weeks later to that event her Blood sugar was out of control. For the past 5 years she had been changing medications and foods and finally became insulin dependent that was precipitated by the allergies in the hotel, it was a bad exposure, even her eyes were puffy. She did not need a EpiPen or anything and it was not at that level, but allergies can do serious damage, this event triggered her Pancreas. She was also allergic to Dust, Tobacco in other words secondhand smoking, feathers, animal dander like dogs and cats, she is not allergic to pollen or has hay fever or anything. She also had Hyper-tension, High Cholesterol that was also controlled with medication, Hashimotos Thyroiditis, she clarifies that all is being treated for, all her number levels are good for all of it. Patient concomitant medication included insulin for type 1 diabetic. Patient has had No other vaccines on the same day or in the 4 weeks prior to the COVID vaccine. She had never really had other vaccine as an adult. She did not have to go to the</p>

emergency room, but she does think she will call her doctor. She had no relevant family history. After vaccination, she was advised to wait 30 minutes after receiving her first dose. In about 10 minutes of receiving the vaccine, on 23Feb2021, she had a really weird headache, the symptoms that were concerning to her was trouble swallowing, she wanted water, her face felt funny it was like tingling, it was a weird thing, and they took her Blood Pressure (BP), her BP shot sky high. She does have high BP and she takes medications and its well-controlled with Medications but after the vaccine her BP had gone to 190/105. They kept the cuff on her, brought her water. After drinking the water, she could swallow, she doesn't know if this was because her mouth got dry. They kept checking her BP, it took about 24 hours for her BP to go back to normal. She added that on 24Feb2021, she felt like she had the flu for 3 days after the vaccine, it was mild flu like symptoms, she had no body aches but just felt fatigue and was really congested. She felt these symptoms start. The patient underwent lab tests and procedures which included blood pressure measurement. She had no testing since the vaccine. But had just been testing her own BP at home. She had all of her BP result in the BP Machine, and she doesn't know how to access them, she has not kept a physical log, but she recalls from memory that her BP was 120/75 2 days after getting the vaccine and that was the lowest, she had had. Her highest was 150/95 within 24 hrs. of receiving the vaccine. Last night it was 140/90. This morning it was 128/80. The events Headache, face felt funny it was like tingling, Trouble Swallowing, Dry mouth, were recovered on 23Feb2021, flu, fatigue, fatigue, congested were recovered on 26FEB2021 and high blood pressure was not recovered. No follow-up attempts are possible. No further information is expected.

1373351	6/4/2021	KS		F	2/10/2021	3/1/2021	sinusitis; soreness in the shoulder on the side she received the injection; This is a spontaneous report from a contactable nurse (patient). This female patient of unspecified age received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE) via unspecified route of administration on 10Feb2021 at single dose for Covid-19 immunization. Relevant medical history included sinus infection on an unknown date ("before") treated with antibiotics ("generally the antibiotics help"). Concomitant medications were not reported. On an unknown date the patient experienced soreness in the shoulder on the side she received the injection. a couple of days ago, she reports soreness on the left side of her face, her eye was hurting and had a slightly sore throat. She noticed swelling in her eye, face, had a headache and pain. Clarified her eye was aching. Her left cheek and side of face was swollen. She visited the doctor who said it was sinusitis and gave her antibiotic: amoxicillin/clavulanic acid (AUGMENTIN) every 12hours for 10 days since 04Mar2021. The second dose of vaccine was planned on 08Mar2021. The outcome of the events was unknown. Information about lot/batch number has been requested.
1373354	6/4/2021	IN		M			eye fatigue after 1st dose; This is a spontaneous report from a contactable consumer reported for herself that. A 68 age and unit: unknown male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Formulation: Solution for injection, Batch/Lot number was not reported) via an unspecified route of administration on an unspecified date as SINGLE DOSE for covid-19 immunization. The patient medical history was not reported. The patient is sensitive to medication like Flu shot. Patient concomitant medications were not reported. He experienced eye fatigue after first dose eyes started feeling fatigued 2 weeks later and continued until getting 2nd dose. He is very sensitive to medications for example flu shot usually makes me feel yucky for about a week. Patient asking how long symptoms are expected to last. Outcome of the event eye fatigue was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

1373356	6/4/2021		51	F			lightheadedness; headache; vision changes; increased respirations; This is a spontaneous report from a non-contactable healthcare professional. A 51-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; Batch/Lot number: EN6205, Expiration date was not reported), intramuscularly on an unspecified date (at the age of 51-years-old) as 1st dose, single dose for COVID-19 immunisation. Medical history included asthma (often triggered by stress and does have albuterol inhaler on hand) from an unknown date. The patient's concomitant medications were not reported. On an unspecified date, the patient experienced lightheadedness, headache, vision changes and increased respirations. It was reported that during the 15-minute waiting period after the injection, the patient began to experience lightheadedness, headache, vision changes and increased respirations. The patient denied rash, hives, difficulty swallowing, wheezing, throat tightness and hoarseness. The patient has a history of asthma often triggered by stress and does have albuterol inhaler on hand but has not used today. The patient denied frequent use of albuterol inhaler. Treatment included was water and TYLENOL 1000mg. The followup response to treatment was good. The patient's symptoms all resolved prior to discharge. The patient's O2 remained 99-100%, denied difficulties breathing and respirations decreased while she was in the bay. The patient was discharged, stable to go home and for follow up with PCP. The outcome of the events was recovered. No follow-up attempts are possible. No further information expected.

1373395	6/4/2021	IL	83	F	2/24/2021	2/25/2021	eyes were showing bright silver snowflakes; severe abdominal pain; diarrhea; vomited 3x in 15 min; This is a spontaneous report from a contactable consumer (patient). A 83-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EN6201), via an unspecified route of administration, administered in arm left on 24Feb2021 14:00 (at the age of 83-years-old) as 1st dose, single for COVID-19 immunisation. Medical history included high blood pressure, kidney stones (controlled), penicillin allergy, allergy to antibiotics, allergy to trees, allergy to grass and sulfa and cataracts and surg to replace retina 6 years ago (as reported). Concomitant medications included simvastatin, metoprolol, amlodipinum, lisinopril and paracetamol (TYLENOL), all taken for an unspecified indication, start and stop date were not reported. On 25Feb2021 15:00 the patient experienced severe abdominal pain followed by diarrhea and vomited 3x in 15 min. On 26Feb2021 16:30 the patient had eye problem: she was not able to see because her eyes were showing bright silver snowflakes. Lasted about 15 minutes. Tearing and water made it go away. The patient did not received treatment for the other events. The patient did not have COVID prior vaccination and she was not tested post vaccination. The events were resolved on an unspecified date. No follow-up attempts are possible. No further information is expected.

A 29-year-old non-pregnant female patient received BNT162B2 (PFIZER BIONTECH COVID-19 mRNA VACCINE, Solution for injection, Batch/Lot number: EN6198, Expiration date was not reported), via an unspecified route of administration, administered in right arm on 05Mar2021 at 16:15 hours as 1st dose, single (at the age of 29-years-old) for covid-19 immunisation. Medical history included known allergies: avocado gives stomach aches, depression/anxiety and vitamin D supplements. Patient had no other vaccine in four weeks. Concomitant medication(s) included sertraline hydrochloride (ZOLOFT) at a dose of 50 mg/day taken for depression/anxiety; vitamin D not otherwise specified (NOS) taken for vitamin D supplements. On 06Mar2021, the patient woke up around 4:30 AM and experienced short of breath, feeling somewhat queasy, cold forehead. Checked pulse, heart was racing, around 120 BPM. Stood up, walked to next room, heart rate increased to around 160, hands shaking, cold hands and forehead. Called family doctor, given advice to apply pressure to one side of neck and keep an eye on it for half an hour. Did slow breathing and followed advice; heart returned to normal rate within half an hour. Patient received no treatment for all the events. Prior to vaccination, the patient was not diagnosed with COVID-19; Since the vaccination, the patient not been tested for COVID-19. The outcome of all the events was recovered on 06Mar2021. No follow-up attempts are possible. No further information is expected.</p>

Arm soreness (left upper); Facial numbness left side: cheek, eye, ear. Skin sensitivity left top forehead at hairline. Arm soreness (left upper); Facial numbness left side: cheek, eye, ear. Skin sensitivity left top forehead at hairline. Arm soreness (left upper); This is a spontaneous report from a contactable consumer or other non hcp. A 71-years-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Formulation: Solution for injection, Batch/Lot Number: IN6205), via an unspecified route of administration, administered in Arm Left on 05Mar2021 08:45 as 1st dose, single dose for COVID-19 immunization. Medical history included none from an unknown date and unknown if ongoing. Concomitant medications includes vitamin-D and multivitamins taken for an unspecified indication, start and stop date were not reported. The patient did not received any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19, prior to vaccination. The patient has not been tested for COVID-19, since the vaccination. The patient experienced facial numbness left side: cheek, eye, ear. Skin sensitivity left top forehead at hairline. Arm soreness (left upper) on 05MAR2021 09:00. The events were assessed as non-serious. The treatment was not received for the events. The patient had no known allergies medications, food, or other products. Caller had facial numbness on left side particularly the cheek, eye, and ear which happened 20-25minutes after receiving vaccine and subsided about 5 days after injection. Caller also had skin sensitivity on left top forehead at hairline which dissipated about 5 days after the vaccine. Caller also stated she had what she thinks is normal but arm soreness in left upper arm that went away about 3 days after receiving vaccine. Caller states that the arm soreness is nothing it is the numbness she is very concerned about. Caller has a question on if she should receive the second dose. 71-year-old caller confirmed she experienced side effects after getting the first dose of the Pfizer-BioNTech COVID-19 vaccine. She asked if she should receive the second dose. She explained she has already spoken to her HCP. Caller explained the Medical Information line is very misleading as it cannot provide a treatment recommendation regarding her second dose of the Pfizer-</p>

1373823	6/4/2021	IN	53	M	5/25/2021	5/26/2021	Whole lip swollen and numb; Whole lip swollen and numb; Nose swollen and numb; Nose swollen and numb/ Some of his cheek under his left eye was numb; Face had swelled/ some of his cheek under his left eye was numb and swelled; Doesn't feel well, sickness like just don't feel well/ feels sick, kind of; This is spontaneous report received from a contactable consumer (patient himself). A 53-year-old male patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Lot number: EW0186), via an unspecified route of administration on 25May2021 at 14:10 (at the age of 53-year-old) as a single dose to protect him if he would get the coronavirus/ COVID-19 immunisation. The patient's medical history included has something like ALS (amyotrophic lateral sclerosis) (has not been actually diagnosed. Doesn't have anything to do with his lip swelling and nose going numb). No new meds, not anything new eaten, no new detergents. Noting was different other than he got the shot. Has medical conditions but doesn't have anything to do with swelling in lips or face. Patient states he has something like ALS or Lou Gehrig's disease, but has not been diagnosed. It has nothing to do with the swelling or lips turning numb. Concomitant medications were reported as none. The patient previously received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for Injection, Lot number: EW0173), via an unspecified route of administration in left arm on 04May2021 (at the age of 53-year-old) as a single dose for COVID-19 immunization and experienced throwing up four days, sick for four days, slept for 17 hours straight and stayed in bed a total three to four days, tired. Family medical history relevant to adverse events was none. The patient did not administered additional vaccines on same date of the Pfizer suspect. No prior vaccinations (within 4 weeks) within four weeks prior to the first administration date of the suspect vaccine. No adverse events following prior vaccinations. It was reported that, patient was calling about COVID, the Pfizer shot, the second Pfizer COVID shot. Had gotten the shot on Tuesday, 25May2021 at 14:10. Noticed yesterday (26May2021) around 2'clock half of his lip was swelled, and some of nose, and left side of face, cheek, under eye. As time went on it spread. He later clarified it

was more around 14:30 after the 24hr period. He noticed his face had swelled, spread over time, and started with his upper left lip. His wife noticed that. Some of his nose was numb and swelled and some of his cheek under his left eye was numb and swelled. It went to other side of his lip, swelled and numb, and his nose was swollen and numb. Both lips are swelled and numb. He went to doctor yesterday, to walk in clinic that was in his doctor's office. They gave him a steroid shot yesterday (26May2021) and steroid pills today (27May2021). He had just taken his first steroid pill now. Confirmed dates and times, he stated the symptoms started after the 24-hour period. Whole lip swollen and numb: Big enough as of right now, that upper lip covers bottom lip, don't even see the bottom lip. Commented he has a sickness like does not feel well. He now feels sick, kind of, not throwing up. No investigation assessment. No relevant tests. No tests performed. Went to walk-in clinic downstairs from doctor's office. The doctor though his symptoms were from the shot and he got a steroid shot and steroid pills. The adverse events required a visit to physician office. The adverse events did not require a visit to emergency room. The outcome of the events was not recovered. Follow-up attempts needed. Additional information has been requested.

1373812	6/4/2021	CA	55	F	5/5/2021	5/8/2021	Second hematoma in eye; hematoma; This is a spontaneous report received from a contactable consumer (reporting on herself). A 55-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Formulation: Solution for injection, Lot number and Expiration date: unknown), via an unspecified route of administration in Arm Right 05May202115:30 as 1st dose, single dose for COVID-19 immunization. Medical history included ongoing arthralgia. The patient's concomitant medications were not reported. Previously patient received Tetanus Vaccine and experienced sore arm in 2016 or 2017. Patinet received the first dose of the Pfizer Covid 19 vaccine on 5May2021 and developed a hematoma in the right eye 3 days later on 08May2021. A few days later she developed a second hematoma in the right eye on 12May2021. Her vision has not been effected. she was concerned that this may happen somewhere else in her body if she gets the next dose. patinet at risk of it just causing more kinds of things like that if she get the second dose. Patient saying it called a subconjunctival hemorrhage- its kind of like a bleeding disorder right. Asking If she miss her dose do we have a certain window that we can get the second dose. She wants to know if someone can give her some guidance. She was hesitant to get the second shot. States it was like a vessel on the white part of her eye burst. States it did not effect her eye sight. States she didn't think much of it, but then her sister got the Covid shot and also developed a hematoma in her eye. Patinet states she was wondering why they had the same reaction. She was supposed to be going to get her second shot but was concerned if this was something that could happen somewhere else in her body. Outcome of the events were recovering. Information on batch/Lot number was obtained. Further information has been requested.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1373783	6/4/2021	FL	75	U	5/4/2021		Heart problem; It's a deep cough, it's in my throat itself, it was in my chest; Running eyes and my nose runny; Running eyes and my nose runny; Allergies; Cold; Hypertension; This is a spontaneous report from a contactable consumer (patient). A 75-year-old patient of an unspecified gender received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Lot number: EWO171), via an unspecified route of administration in right arm on 04May2021 (at the age of 75-year-old) as a single dose for COVID-19 immunisation. The patient's medical history included blood pressure, restless legs, hypertension. Concomitant medications included amlodipine for blood pressure, losartan for blood pressure, folic acid, ezetimibe (ZETIA), sertraline, ropinirole, isosorbide, gabapentin for restless legs, unspecified medications. Consumer stated, "I went and got my 1st shot and I had seen all the side effects, you know they are written on the paper. I didn't go into the site because I wanted to talk with someone personally. I have never had a flu shot which means that the virus, you know any part of a cold virus that's in the Pfizer vaccine will affect me, might affect me differently than others. What happened was two days after the shot, I developed a cough and running eyes and my nose runny on an unspecified date in 2021. 'The big thing the nose and the other stuff to be my allergies' (not clarified further), but I developed cough and it's a deep cough, it's in my throat itself, it was in my chest, it isn't quite down as far my problem was that I have an appointment tomorrow to get another shot my 2nd alright and I have colonoscopy and endoscopy two days later. And I just wanted to know if what I have was just the fact that I have never received a flu shot before and I am having that kind of reaction. Otherwise it's nothing 'for to see' (not clear nor clarified), so." Consumer stated, "because I do have the appointment tomorrow and because I do have that procedure happening." Consumer stated, "and the funny part of this whole thing was that I have not had a cold in probably 10, 15 years and all of a sudden this was what I call it, was a cold on an unspecified date in 2021, except was I have (incomplete sentence)." Consumer stated, "these things, I mean, you could not give me advice over the telephone but I was the person that stayed in and my husband didn't go anywhere and

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

so I felt very safe and finally I got the shot, and I had this reaction, I don't know I don't think it's COVID. But I don't know whether I could go to and have those two things it's somebody tomorrow." Consumer stated, "see, that's what I did that I talk to a lady, gave all my information to her and she gave me you, now you are giving me the same thing, you are giving me her. So, I don't know, I wanted to physically talk to somebody, I wanted to know if this was Pfizer had symptoms like what I had symptoms like what I have as a reaction to the product itself." Consumer stated, "two days after the shot (not clarified), the patient experienced adverse events." Consumer stated, "I am experiencing the cough, but it seems to not (statement incomplete) I still got a cough it's just I have no medicine in my house to take for cold because I haven't had cold in you know. So, it's strange I got like number of these, but I can feel when I take my breath, I can hear it in my chest." When probed for any other help, Consumer stated, "no and that's the thing I need to find out if a cough was cause of having COVID or if it's part of being like having an allergy or cold that was stimulated by medicine itself because I said I have never had a flu shot so that means my system has never adapted to bacteria being put in into my system. So, because it was so I interrupted or whatever you going to call it I ended up getting perhaps and yes, it's just I have so much to do in. I don't want to go out if, if something that, you know, was going to cause me a problem so I have the appointment for this next shot tomorrow and then 2 days later, so I have to cancel my appointments and endoscopy was that I have to call them today. So, that's the reason I am calling you guys." Consumer stated, "I have the list of the side effects, I had my first shot on 04May2021, and I am schedule to go tomorrow and have my second but one of the reaction I had to it, see I had never had a flu shot and I haven't had a cold, it has be 15 years. Now I went in get the vaccination and I was fine for 2 days and then all of a sudden, I have like my eyes were watering but that stuff could be related to my allergies, but I ended up with a cough, and it's a heavy coughing it's not in my chest it's my chest and throat area and I can't seem to get phlegm. So, I had appointments and I don't want to go out into the public if there was something wrong, you know, I have a COVID (shot) tomorrow and then 2 days later I am having two procedures at my Gynaecologist so, I don't

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

think I have got COVID I mean everybody that I have talked to had said symptom from shots and if anything was ever going to wrong with coughing it's me because every time I had something done or had happen so it's not my coughing, it's not as bad as it was 3 day ago, 4 days ago but it's to the cough and I don't know whether I should see anything, have you had that kind of reaction from people." Consumer stated, "I took an antihistamine, 'Zydol' (not appropriately paraphrased and clarified)." No investigation. Other medical conditions: Consumer stated, "I have 3 blood pressure medicines and I have heart problems (further clarification unknown) on an unspecified date in 2021, I do have stent as it wasn't anything major, but I am on a medication because I can't take statin so that's my heart medicines and then I am on a thyroid medicine and a 'Zetia' (not clear) and sertraline and then gabapentin and propranolol, might (not clarified)." Consumer stated, "I am on a whole list medications, when you get to this age that was you have a Pharmacy in your house. Anything in particular, I have blood pressure medicine, I have a 'heart pump' (not clear nor clarified) because I can't take a statin (unspecified medications) on an unspecified date in 2021. And I have a thyroid pill and something else. I don't have it in front of me, it's a thyroid medicine the last one. I take night pills too." The patient experienced hypertension on an unspecified date in 2021. The outcome of the events was unknown. Information on lot/batch number was available. Additional information has been requested.

<i>VAERS_ID</i>	<i>RECVDATE</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1373773	6/4/2021	OK		M	3/23/2021	3/1/2021	50% hearing loss; He is on the verge of suicide; insomnia; I cant live with this; can't think; it's driving me crazy; driving me insane; He is desperate; spike headaches; rash under my eyes/rash in his eyes appeared in the right eye and then got to the left eye; incredible ringing in my ears and a spike headache/high pitched ringing in my ears; This is a spontaneous report from a Pfizer-sponsored program via a contactable male consumer (patient himself). A male patient of an unspecified age received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Batch/Lot number was not reported), via an unspecified route of administration on 23Mar2021 as 1st dose, single for COVID-19 immunization. The patient medical history and concomitant medications were not reported. It was reported that, caller and his 20y/o son received their first dose of the Pfizer BioNTech COVID 19 Vaccine on 23 Mar 2021. His son had a runny nose for 10 days but was fine after. However, 4 days later, on an unspecified date in Mar2021, the patient developed a rash under his eyes and he woke up with an "incredible ringing in my ears and a spike headache". Caller claims that he has never experienced that in his life. He also reported a rash under one of his eye that later on spread to the other eye, as well as insomnia on an unspecified date. He has seen his HCP and was referred to an Audiologist, who he has visited 3 times since then. He was diagnosed with 3 times % loss of hearing and 10500 Hertz tinnitus, which the Audiologist mentioned is "really high". It was also reported that, this high pitched ringing in his ears that just won't go away and its driving him crazy. He was prescribed with high dose Prednisone for 7 days, but caller mentioned "it did not help and had no effect whatsoever". His HCP wanted to be "super cautious" and recommended a brain scan this week just to make sure he didn't develop a blood clot. Caller is upset that no one can give him answers. He has reached out to CDC and asked for medical advice, but he stated that everyone is giving him the same answers - there is not enough data. He is on the verge of suicide and said, "I can't live with this for the rest of my life. I can't sleep and can't think, it's driving me crazy" on an unspecified date. Patient stated "I'm just trying to get to the end of this. I cant live like this its driving me crazy." Patient went on to mention "I'm at

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

my wits end with this it is truly driving me insane on an unspecified date. I'm not kidding. I can't sleep, I can't think, I cant function with this ringing. The rash didn't even go away under my, I've been to the dermatologist twice and they just don't know..." Patient wanted to speak to someone because "I cant spend my life with this high pitch ringing in my ears it is driving me crazy". On an unspecified date, he was desperate for answers and even tried reporting to Vaccine Adverse Event Reporting System (VAERS) but there was no way to submit it. The patient also asked about what in the vaccine could affect the auditory complex. He added that he did not get the second dose of the Pfizer covid vaccine, that the rash in his eyes appeared in the right eye and then got to the left eye. Also he mentions that this is "all over the internet and you just have to google it", that the percentage that reported this is above 10% for both Moderna and Pfizer vaccines and he estimates that is about 17% all over the world and that the DNA vaccines started since the 90's. He also mentions that he knows at least 15 more persons affected with the same side effects as him and he lives in a small town and a CEO just committed suicide because of this. Sometimes he refers at it as "tinnitus". He says that he feels miserable and this is driving him crazy. He wants to make this public and that Pfizer acknowledges this. The patient underwent lab tests and procedures which included tinnitus: 10500 Hertz which the Audiologist mentioned is "really high". The outcome of the events, incredible ringing in my ears and a rash under eyes was not recovered and for other events was unknown.

1373724	6/4/2021	FL	43	F			<p>Apparently I have mild shingles and not a sty / Left eye hurt / Sensitivity to light; No (vaginal) infection or anything but I was in pain; This is a spontaneous report from a contactable consumer (patient). This consumer reported events for two separate vaccine doses. This is the second of two reports. This case is serious. The additional case is non-serious. This report is for the events related to the second vaccine dose. A 43-year-old non-pregnant female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), second dose via an unspecified route of administration on an unspecified date in 2021 (Batch/Lot number: Unknown, at the age of 43 years) as a single dose for COVID-19 immunization at a pharmacy drug store. Medical history included migraines. The patient has no known allergies. Prior to vaccination, the patient was diagnosed with COVID-19. Historical Vaccine included the first dose of BNT162B2 on 05Apr2021 at 09:45am for COVID-19 Immunization and the patient experienced left eye swelled up, sty and vaginal infection 3 days after the first dose on (08Apr2021). The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Concomitant medications were reported as none. The patient did not receive any other medications within 2 weeks of vaccination. Clinical course included: On 05Apr2021 at 09:45am the patient received the first dose of BNT162B2. On 08Apr2021, 3 days after the first dose of BNT162B2, her left eye swelled up. She went to the ophthalmologist and was told she had a sty. She was prescribed Neomycin and Polymyxin B Sulfates and Dexamethasone ophthalmic. The same day she woke up with what she thought was a vaginal infection. She went to the gynecologist and was prescribed Diflucan. The patient fulfilled both treatments and was fine. On an unspecified date in 2021, the patient received the second dose of BNT162B2. Then 3 days later, on an unspecified date in 2021, again the same reaction occurred, but this time her left eye hurt like someone was stabbing her with a knife. She had to go to emergency service. The ophthalmologist didn't know what she had because her eye looked normal. There was nothing related to a sty. She was prescribed Tobramycin. She saw a gynecologist as well and there was no (vaginal) infection or anything but she was in pain. She was prescribed Nystatin but it didn't work and after 3 days she was prescribed Medrol</p>

							4mg dose pak. The eye was still swelled up until today (19May2021) and it hurts. She has sensitivity to light. Tomorrow (20May2021) she has a follow-up visit with the ophthalmologist. She stated that apparently she has mild shingles and not a sty. The events resulted in a visit to physician or other health professional office, urgency or emergency room/department. Since the vaccination, the patient has not been tested for COVID-19. The outcome of event mild shingles with left eye hurting and sensitivity to light was not recovered. The outcome of event vaginal pain was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021568064 same report/patient, different dose/AE

1373716	6/4/2021	WA	34	F	5/7/2021	5/9/2021	decreased ability to make decisions; Dizziness similar to vertigo;dizziness set in maybe 48 hours after my second dose and worsened over the following week; Dizziness similar to vertigo;dizziness set in maybe 48 hours after my second dose and worsened over the following week; was stimulated by movement, visual changes, and sounds independent of each other; was stimulated by movement, visual changes, and sounds independent of each other; Brain fog; inability to focus my attention; confusion as well as decreased ability to make decisions; Anxiety that was severe/Heightened anxiety levels have remained for almost a week; describe as a severe panic attack; This is a spontaneous report from a contactable consumer (patient). A 34-year-old female patient received bnt162b2 (BNT162B2), dose 2 via an unspecified route of administration, administered in Arm Left on 07May2021 (Batch/Lot Number: EW0179) as single dose for covid-19 immunisation at the age of 34-year-old. Medical history included ADHD, allergy to Bactrim. She has felt dizziness when had the middle ear suctioned out while having a tympanostomy. The patient previously received the dose 1 administered in Arm Left on 16Apr2021 (Batch/Lot Number: EW0161) as single dose for covid-19 immunisation at the age of 34-year-old. Concomitant medications included amphetamine aspartate, amphetamine sulfate, dexamphetamine saccharate, dexamphetamine sulfate (ADDERALL) and sertraline hydrochloride (ZOLOFT). On 09May2021, the patient experienced dizziness that similar to vertigo, that was stimulated by movement, visual changes, and sounds independent of each other. The only time I've felt similar dizziness is when I've had my middle ear suctioned out while having a tympanostomy. The dizziness set in maybe 48 hours after my second dose and worsened over the following week and then started to lessen; also felt brain fog that included inability to focus my attention, switch between tasks effectively, and confusion as well as decreased ability to make decisions. This brain fog has lasted well over a week now but is starting to abate; and also experienced anxiety that was severe. A week after my second dose, I had what I can only describe as a severe panic attack. I have never had one this severe and have not had a panic attack in well over a decade. The panic attack was not preceded by any event that I would characterize as outside the realm

1373680	6/4/2021	RI	74	F	1/16/2021	1/16/2021	Generalised urticaria Upper torso; rash; potential anaphylactic reaction; A 74-years-old female patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: solution for injection, Lot Number: EI1284), via an intramuscular route of administration, administered in right arm on 16Jan2021 09:00 (at the age of 74-year-old) at single dose for COVID-19 immunization. The patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: solution for injection, Lot Number: EI 0140SCN), via an intramuscular route of administration, right arm on 27Dec2020 08:00 at single dose for COVID-19 immunization. The patient medical history included hypersensitivity. If there is a previous history of any allergies, does the patient take (or have readily available) any specific medication related to this: Adrenaline (Epipen), Antihistamine. The patient have a history of previous allergies to specific products or conditions indicative of an allergic medications were Sulfa, penicillin, ASA, The patient did not receive any recent vaccines for any other conditions prior to the event being. The patient did not receive any recent vaccines for SARS-COV2 other than Pfizer-BioNTech COVID-19 vaccine prior to the event being. The patient has not received any other vaccines around the time of Pfizer-BioNTech COVID-19 vaccine vaccination. History of all previous immunization with the Pfizer vaccine considered as suspect (or patient age at first attempt and subsequent immunizations if dates of birth or immunizations were not available. No additional vaccines administered on same date of the Pfizer suspect. Concomitant medications included famotidine (FAMOTIDINE), and losartan potassium (Cozzar), hydrochlorothiazide (HCTZ), levothyroxine sodium (Synthroid), omeprazole, amlodipine, taken for an unspecified indication, start and stop date were not reported, and On 11Dec2020, patient received, ibuprofen (advil) for headache (antipyretic use) as oral 23:30 after(as reported). On 16Jan2021 22:00 the patient experienced generalized urticaria upper torso and rash. It was reported that, all the signs and symptoms of the anaphylactic reaction, rash upper 10-12 hrs. The time course of the anaphylactic reaction (potential anaphylactic reaction) was 10-24 hrs after administration. Information on organ involvement: Multiorgan

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

involvement/Dermatological/Mucosal, were reported that, organ involvement were not respiratory, bilateral wheeze/bronchospasm, stridor, upper airway swelling, respiratory distress, tachypnoea, increased use of accessory respiratory muscle, recession, cyanosis, grunting, dry cough, hoarse voice, difficulty breathing, sensation of throat closure, sneezing, rhinorrhoea, cardiovascular, measured hypotension, shock, tachycardia, capillary refill time, reduced central pulse volume, decreased level of consciousness, Loss of consciousness, generalized erythema, angioedema, generalized pruritis with skin rash, generalized pruritis without skin rash, generalized pickle sensation; Localized injection site urticaria, red and itchy eyes, gastro intestinal, diarrhea, abdominal pain, nausea, vomiting. It was dermatological/mucosal generalized urticaria upper torso. The patient received for the event new medication or other treatment were benadril and avil. Treatment period completed. The reactions were not recurred on re-administration of product. It was reported that, reporter does not require medical intervention. The patient was not hospitalized and not seen in the emergency department. The patient not admitted to intensive care unit. Patient was not visited physician office. There were no any laboratory tests or diagnostic studies performed. It was reported, for lack of efficacy, provide information if not included in the initial report. It was unknown primary infection site, and culture performed. The patient provided information regarding the reported adverse event with the use of product. It was reported that considering the Pfizer product has a casual effect to the adverse event and reported that not willing to be contacted again by Pfizer on the reported adverse event. It was reported that, seriousness criteria as no. Causal relationship with the event was reported as yes. The outcome potential anaphylactic reaction generalized urticaria upper torso and rash were recovering. No follow-up attempts are possible. No further information is expected.; Sender's Comments: There is a reasonable possibility that the event "potential anaphylactic reaction" was related to BNT162b2 based on known drug safety profile and close temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of

1373739	6/4/2021	CA		M	4/16/2021	4/17/2021	<p>Collapsed day after vaccine first dose/Collapsed day after vaccine second dose; His left side still feels paralyzed and can't walk; legs wouldn't move, couldn't turn around; He had compression fractures L1 to L3 that were noticed on his x-ray; he collapsed and had a hard time getting up/felt bad; General malaise; His left side still feels paralyzed and can't walk; bedridden; Pain; Half of back is black from incident; Mobility got worse after first shot and then after second dose his mobility got even worse; felt like what I would call the flu; Collapsed day after vaccine first dose/Collapsed day after vaccine second dose; This is a spontaneous report received from a Pfizer sponsored program. A 72-years-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Solution for injection), via an unspecified route of administration, administered in Arm Left on 16Apr2021 (Batch/Lot Number: EP7533) as 1st dose, single dose and second dose via an unspecified route of administration, administered in Arm Left on 07May2021 14:00 (Batch/Lot Number: EW0182) as 2nd dose, single dose for covid-19 immunisation. Medical history included L1 to L3 compression fractures somewhere around 2008 to 2010, ongoing gout (from about 35 years ago) (pain in both hips and right shoulder, left shoulder some times), gouty arthritis (30 years constant pain), ongoing moderate emphysema (since 20 years ago), stroke (happened in 2010). States he was taking Warfarin at the time of the stroke and the stroke was permanent, cholesterol, smoker (20 years), excess uric acid, allergy in right sinus, cough uncontrollably, perirectal abscess and low blood pressure. Family medical history was none. States he is adopted. Concomitant medications included atorvastatin taken for blood cholesterol from an unspecified start date to unspecified date in 2021 (Taking for about 5 years, not sure if the dose is 30mg, 50mg, or 300mg, stopped after adverse event with covid vaccine), zolpidem tartrate (AMBIEN) taken for sleeping from an unspecified start date to unspecified date in 2021 at 10mg (taking for couple of decades, stopped after adverse event with covid vaccine, stated it may cause drowsiness) and allopurinol taken for gout at a dose of 300 mg, (taking for 6 or 7 years) and azelastine hydrochloride nasal spray taken for uncontrollable coughing via nasal route as 2 shots each nostril twice a day (uncontrollable coughing</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

caused perirectal abscess, had scope done, diagnosed as allergy. Azelastine works for cough). The patient previously took pneumonia shot and stated that it hurt like hell for a week, flu shot and got sick and also took warfarin. The patient reported that he received his first dose on 16Apr2021, then the next day he collapsed and had a hard time getting up. He also reports general malaise, "just felt bad", and "felt like what I would call the flu" for the next 5 days. On 07May2021 he received his second dose, and the same thing happened where he collapsed the next day. This time, he was not able to get up on his own and had to call 911. He was admitted to the hospital and "had 2 X-rays and a CT scan", CT of torso he reports his CT scan showed compression fractures at L1, L2, and L3 on his x-ray. He is taking a lot of Norco to treat his pain. States the music on hold is so uplifting that he wants to go cut his throat. Caller stated he was bedridden. He reported "I can't walk, I used to be able to, and now I can't". He spent 5 years in a computer testing laboratory and he knows a little about testing. He states a lot of the rules apply to conductors and automobiles. Caller stated he wants to know what happened to him. He says if he dies as a result of this, there will be mountains of paperwork. He also said if his condition is permanent, there will also be mountains of paperwork. He can't go to the bathroom and this is an issue. He was falling down and collapsing several times with both shots. He says this is a major problem. He declined being admitted to assisted living saying "if I'm going to die I'm going to die at home". Caller would like to know if anything like this has been reported before, if they got better, and what treatment they received to get better? He also asked if there were any reported deaths after vaccination? Events paralyzed, bedridden, can't walk, legs wouldn't move, couldn't turn around was reported as worsened, half of back is black from incident. The patient was taking Pfizer Covid Vaccine as needs to show he had vaccine to travel. He hasn't measured his height since compression fractures. Lost 20% on 3 vertebrae, so he might only be 5 feet 10 inches. He figures 20% would be an inch lost with his calculation. He can't reach around 180 degrees to measure himself. When asked to provide NDC, lot number and expiration date from vaccine card, caller stated he needed to use magnifying glass. He then stated that his vision is good.

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

He stated that he collapsed several times after his second shot. He says this happened approximately 2 to 3 days after the second shot. He called his doctor and was told to call 911. He went to the hospital. He was in the ER, but confirmed he was not admitted to the hospital. Outcome for collapsing after both doses, had worsened as mentioned by patient. Caller stated after the first vaccine, he noticed his left leg did not work very well. After first dose, he had trouble walking after 5 days. When he would try to move his left leg forward it would shake, not move and he had to slide it sideways across the floor. Right now he can get up and turn around before he pees all over himself and could not get to the bathroom before. Now he pees in a cooking pot. He asked to be excused while on call and stated he had to urinate again. Mobility got worse after first shot and then after second dose his mobility got even worse. Confirmed his compression fractures are an existing condition from 10 to 12 years ago. Reported he has gouty arthritis and it has been going on over 30 years and has constant pain for over 30 years but has always been able to walk and feed himself. The pain is not our fault. Reported that the malaise was better after 5 days, but his mobility went down. He has trouble walking. Sometimes knees would give out and he collapses. Caller states he now uses a walker, cane, and a wheelchair. If he has to go more than 10 feet, he has to have assistance. Treatment for Event: Norco 10-325: Takes up to 3 times per day. States the other day he had 45mg but was still in pain. This is discrepant but details were documented as provided. Caller states he is still in pain, but he can't get more without going to pain specialist. His doctor stopped atorvastatin and Ambien after adverse events with the covid vaccine. ER doctor wanted his primary doctor to review his medications since the ER doctor thought he was on too many medications. Caller tried to explain the reasons he was on the different medications. When talking about his gout: He has a picture after incident and half of his back is black, not blue, it is black. He was not in pain for about 2 years. Then he had the test to determine what was going on and that is when the pain got really bad. He has had bad pain for 35 years with gout in his hips especially, and in right shoulder. He cannot reach if something is in his right back pocket. Left shoulder sometimes. All the time with both hips. Also in

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

right shoulder but if he does not use right shoulder then there is no problem. He was even thinking about getting a hip transplant due to the pain. His doctor did blood tests to find out that he had excess uric acid. He was on a medication called Uloric and it worked wonders but it is no longer made. Then it was found out that some people had bad reactions with it harming their heart and that was the end of Uloric. Then he started taking Allopurinol, states it does work but it works so little that it is almost worth not taking. When the pain is at 10 or 11 on pain scale, states what is the difference. He has an allergy in right sinus that caused to cough uncontrollably and his uncontrollable cough let to a perirectal abscess. He suggested to his doctor to stop his coughing and not worry about the abscess. He then went to ENT and stuck a scope down his nose and told him his sinus is inflamed and there is no infection, there is an allergy and cannot tell what the allergy is and will probably never find out what the allergy is, and prescribed him the Azelastine hydrochloride nasal spray. The pharmacist thinks the nasal spray is too much but states the pharmacist is not a physician and ENT doctor prescribed it. The two sprays a day works and he has not had uncontrollable coughing since then. Out of an abundance of caution he was sent to a lung doctor to get breathing test. Testing: He had two x-rays and CT scan of the torso. He does not know what x-rays showed. CT scan shows kidneys, liver, pancreas, and gall bladder are normal. Everything is normal except for the heart. It did not explain what was wrong with him. Clarifies he had the same CT scan at another facility a couple of years ago and he was told that calcium around the heart is normal. He knows that he has low blood pressure normally. Attempted to clarify if x-rays were off his chest, stated they stuck something under his back. States nothing was mentioned about his x-rays and if they looked at the x-rays they could see he has a broken back. No other vaccinations was done within four weeks prior to the first administration date of the suspect vaccine. Got sick the next day after the flu shot twice. Will never take again (unspecified flu shot). Patient reported about 4 years ago he let his doctor give him a pneumonia shot and his arm hurt like hell for a week, states he is never doing that again. When discussing Allopurinol, caller stated it was not working very well, but it had positive effect and he will continue taking it as long as his

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

doctor will let him. States when taking it, the gout does not get better, it gets worse. Allopurinol, states it does work but it works so little that it is almost worth not taking. When the pain is at 10 or 11 on pain scale, states what is the difference. Caller states he was on a different medication before that worked better, but he could not continue to take it. Caller stated that microprint was difficult to read. He was able to give NDC number using magnifying glass. Product strength and count size dispensed: 300mg, 90 count. Expiration Date: Dec 2021. The sample of the product was available to be returned, if requested. Packaging was sealed and intact. Treatment for event was Norco 10-325: Takes up to 3 times per day. Caller states he is still in pain, but he can't get more without going to pain specialist. Confirms he has been in chronic pain for over 30 years due to gouty arthritis. Advised caller to retain sample of product in the event he receives Mailer within 3-10 business days for the return. Swap. Caller took 1st dose of Covid vaccine 16Apr2021 and collapsed the next day and then for the next 5 days he felt general malaise and weakness. On 07May2021 he took 2nd dose, 21 days after 1st dose, and again collapsed the next day. Stated that he needed to call 911 to help him get up and they took him to hospital where they did a scan of his torso and said he was fine. Doctor also told him that he did not have stroke, blood clot or aneurysm. Caller thinks it is neurological as he is still having trouble standing and walking and his left side feels paralyzed. He is wondering if these side effects were documented during clinical trials. Therapeutic measures were taken as a result of pain. The outcome of the events experienced collapsed day after vaccine first dose/collapsed day after vaccine second dose, legs wouldn't move, couldn't turn around, he had compression fractures l1 to l3 that were noticed on his x-ray, pain, half of back is black from incident, mobility got worse after first shot and then after second dose his mobility got even worse, felt like what i would call the flu was unknown, for the events his left side still feels paralyzed and can't walk, he collapsed and had a hard time getting up/felt bad, his left side still feels paralyzed and can't walk, bedridden the outcome was not resolved, for the event general malaise the outcome was resolving. Follow-up attempts are needed. Further information is expected.

A 47-years-old non--pregnant female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot: en6208), via an unspecified route of administration in the right arm on 17Mar2021 at 1:45 PM (at the age of 47-years) as a single dose for COVID-19 immunisation. Medical history included migraines. Concomitant medications included loratadine (MANUFACTURER UNKNOWN) and BENADRYL. No other vaccine was received within four weeks prior to the COVID vaccine. Prior to the vaccination, the patient was not diagnosed with covid-19 and was also not tested for COVID-19 since the vaccination. The patient experienced dry mouth and extremely dry eyes on 17Mar2021. No therapeutic measures were taken for the reported events. The clinical outcome of the events dry mouth and dry eyes were recovered on an unknown date in Mar2021. No follow-up attempts are needed. No further information is expected.
1373613	6/4/2021	MD	71	M	3/17/2021	3/17/2021	Blurry vision; Light headedness; Minor headache; This is a spontaneous report received from a contactable consumer, the patient. A 71 -year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Lot number: EN6207) via an unspecified route of administration on the left arm on 17Mar2021 at 15:00 hours as a single dose for COVID-19 immunisation. Medical history included elevated cholesterol and gout. Patient received other medication (unspecified) within 2 weeks of vaccination (unspecified). Prior to vaccination, patient was not diagnosed with COVID-19 and since the vaccination the patient has not tested for COVID-19. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 17Mar2021, at 19:00 hours, the patient experienced blurry vision, light headedness and minor headache. No therapeutic measures were taken as a result of the events. The clinical outcome for blurry vision, light headedness and minor headache were not recovered at the time of this report. No follow-up attempts are possible. No further information is expected.

1374341	6/4/2021	MI	23	F	6/3/2021	6/4/2021	?Pfizer-BioNTech Covid 19 Vaccine EUA? The night of getting the first shot I barely slept because I had chills all night long & my entire body was so sore it hurt to lay in any position. In the morning, I still had extreme muscle pain all over. I was extremely light headed & dizzy, I had a throbbing headache so I took 2 aleve pills. I was getting super nauseous and almost passed out while trying to get to my bathroom just in time to throw up only water. Just before throwing up my vision went fuzzy, my ears were ringing, I was dripping sweat, it was getting hard to breathe, & my hands were shaking. After taking a cold shower, laying down, & drinking some water I feel a bit better but not 100% normal.

1373858	6/4/2021	CA		F	2/20/2021	2/25/2021	like an affected brain function; intense chills/ severe chills so bad that she thought that she was going to have a convulsion.; intense chills/ severe chills so bad that she thought that she was going to have a convulsion.; symptoms like those for the flu/flu like symptoms; redness in her eyes; problems focusing her vision; pain in the eyes and very hard pain on the eft side of her skull that went down to the neck.; very hard pain on the eft side of her skull that went down to the neck.; pain in the eyes and very hard pain on the eft side of her skull that went down to the neck.; not thinking properly/her thinking processand her logic were affected; the muscular tone of the tongue was affected affecting her speech and swallowing; the muscular tone of the tongue was affected affecting her speech and swallowing; the muscular tone of the tongue was affected affecting her speech and swallowing; cry; This is a spontaneous report from a contactable consumer (Patient). A 78-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), via an unspecified route of administration on 20Feb2021 (lot number: not reported) as second dose, single for COVID-19 Immunization. Patient had received first dose of vaccine Pfizer BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 30Jan2021 (at the age of 78-years-old) for COVID-19 Immunization and she was feeling fine. The patient medical history and concomitant medications were not reported. On 25Feb2021, 5 days after the administration of the second dose of the vaccine, patient experienced symptoms related with her eyes, her nervous system and symptoms like those for the flu, Ophthalmological symptoms like redness in her eyes, problems focusing her vision, pain in the eyes and very hard pain on the left side of her skull that went down to the neck and Neurological symptoms like an affected brain function, not thinking properly, the muscular tone of the tongue was affected affecting her speech and swallowing, these symptoms always on the left side of her head. The patient reported that the flu like symptoms were intense chills, so much that she could not get warmed even when she used very warm material, she took her body temperature and she found it to be normal, then she experienced severe chills so bad that she thought that she was going to have a convulsion, then she started to feel afraid and she started to cry, noticing

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							that her thinking process and her logic were affected. Patient visited multiple specialists like Neurologists, Ophthalmologists, and Physicians for the events. The patient underwent lab tests and procedures which included body temperature: normal on an unspecified date in Feb2021. The outcome of the events was reported as recovered on 23May2021. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.

1373857	6/4/2021		78	M	4/6/2021	5/1/2021	<p>started seeing strange things- saw things that weren't there. The yellow wall in his bedroom came up but had all kinds of art work on it, the ceiling and doors too; couldn't remember things; Weird things happened in my brain; lost his vision while driving; CT scan it did show hardening of the arteries in his brain ,was told had a TIA (Transient Ischemic Attack) or some kind of a stroke; had issues with confusion as well; This is a spontaneous report from a contactable consumer (patient) via medical information team. A 78-year-old male patient received BNT162B2 (PFIZER BIONTECH COVID-19 mRNA VACCINE, Solution for injection), via an unspecified route of administration on 06Apr2021 as 2nd dose, single dose (at the age of 78-year-old) for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient previously took BNT162B2 as 1st dose for COVID-19 immunization. On 02May2021 (26 days later), patient lost his vision while driving and it came back good enough to drive within a half hour (medically significant) and when it recovered on 02May2021, patient started seeing strange things, saw things that were not there. The yellow wall in his bedroom came up but had all kinds of artwork on it, the ceiling and doors too (medically significant), patient couldn't remember things, had weird things happened in his brain. Patient stated that it didn't go away entirely until about 10 days later. Patient also had issues with confusion as well. Patient stated that he thinks he was back to normal now. A computed tomography (CT) scan was completed a week or so earlier and it did show hardening of the arteries in his brain. Patient saw his primary care physician and was referred to a neurologist. On unspecified date of May-2021, patient was told he had a transient ischemic attack (TIA) or some kind of a stroke (medically significant). Patient had a Magnetic resonance elastography (MRE) (like a Magnetic resonance imaging (MRI) of the brain) yesterday (27May2021), but it had not been read yet. Patient asked if he was the only one that had done this or had other people had this problem, even two or three people or he was an isolated case and in response it was stated that, unable to find information about his symptoms in resources and the Product Information (PI) for the vaccine does not contain information reporting his symptoms (vision loss, memory loss, confusion,</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							hallucinations) as side effects of the vaccine. The outcome of had a TIA (Transient Ischemic Attack) or some kind of a stroke was unknown, for lost his vision while driving was recovered on 02May2021 while recovered for rest of the events on May2021. Information about lot/batch number is requested.
1374312	6/4/2021	GA	37	F	5/18/2021	5/22/2021	She got her vaccine, nothing happened after the first 15 minutes, everything was fine. Her arm was sore for about 2 1/2 days and then 4 days later she was nauseous, had vomiting, and that next morning and ever since she has had a terrible migraine. Her vision has either started to swirl and miss some spots in her vision, and then migraine pain and nausea that starts shortly after that. She has not gone to her doctor for her symptoms. She has taken Tylenol, Excedrin, and a Goodies powder with some relief, but they have not relieved the pain entirely.

1374390	6/4/2021	CA	36	F	6/3/2021	6/3/2021	<p>Client received her first dose of the Pfizer Covid-19 vaccine (Lot # EW0187 Exp. 08/2021) on 6/3/21 at 2:48 PM. Client's husband whistled to EMT and paramedic, signaling that he needed assistance. Client was a 36-year-old female found sitting upright in an observation chair, alert and tracking and appeared to be in mild distress. Client had a chief complaint of throat irritation. Client's husband stated that the client was complaining of itchiness in her throat and on her chest. Client stated that she had a history of heart murmurs and frequent anxiety. Client denied prescription medication. Client had no known allergies. Assessment revealed no hives, swelling, discoloration, rash, accessory muscle use or other signs of anaphylaxis. Client stated that she began to feel the itchiness in her throat immediately after she received her shot but was hesitant to signal for assistance and waited a few minutes to notify staff. Client then added that her throat felt "swollen" and that she felt an itch on her chest as well. However, the client was able to make these statements without difficulty other than some mild fatigue. Airway, breathing and circulation were intact. Client was alert and oriented to person, place, date and event. Client's first set of vitals at 1503 were heart rate 138, respirations 28, blood pressure 152/98, O2 saturation 100% on room air, eyes equal and reactive to light, lung sounds clear bilaterally, and skin signs were normal throughout her body. Client was assisted from the observation chair to an observation bed by her husband and EMT. After lying down, the client briefly fell asleep and was laid supine. Client was asleep for approximately a minute before waking up. The client was then sat up and her vitals were retaken and had improved with a blood pressure of 138/98, heart rate 88, respirations 24 and O2 sat at 100%. After some brief monitoring, the client consented to an RN's administration of Benadryl 50mg (Lot # 020020 Exp. 02/2022) Intramuscular at 1512 on her right arm. Client then remained lying down and stated that she felt "better" approximately 10 minutes after Benadryl administration. However, five minutes later the client complained of a headache and chest pain which she later described as itchiness on her chest once again. Client then briefly became extremely anxious again before becoming calmer and consenting to staff dialing 911. Client consented to 911 at 1522 and Paramedics arrived at 1530. Client's vitals were</p>

							assessed at five minute intervals until paramedics arrived: 138/100 (BP), 112 (HR), 99% (O2), 24 (RR); 1512 - 138/100 (BP), 88 (HR), 100% (O2), 20 (RR), 1517 - 130/92, 76, 100%, 20, 1522 - 128/94, 76, 99%, 20, 1524 (Anxiety episode)- 158/98, 92, 100%, 28 1529 - 130/ 98, 76, 99%, 24. Client consented to transport with paramedics at 1540 to the nearest hospital.
1374391	6/4/2021	IN	16	F	5/28/2021	5/28/2021	Bleeding & bruising happened instantly as the injection was given. Within 2 minutes (walking to the waiting area) she was feeling dizzy. By the time we sat down she said she felt like she was going to be sick. She began sweating - it was dripping off her head and neck and her eyes kept closing. She was extremely pale and her lips were white. She was like this for approximately 10 minutes.
1374416	6/4/2021	IL	24	F	6/4/2021	6/4/2021	Dizziness and lightheaded constantly since getting the shot, also have had tunnel vision and a head ache
1374454	6/4/2021	VA	17	F	6/4/2021	6/4/2021	Patient experiences blurred vision, hot, dizziness at the observation area after the vaccination. Her pupils were dilated and her lip was pale. She felt better after zip of water and felt normal after few minutes.
1374502	6/4/2021	MA	29	F	6/2/2021	6/3/2021	I had fever of 99° after taking ibuprofen 600 mg throughout the day on June 3. I had chills and sweats alternating from the evening and throughout the night. I woke up completely drenched in sweat I had to change my clothes. The chills were so severe that I could barely move (also because my bones hurt). All of this was over the course of approximately 6 PM until the next morning around 5 AM. More significantly, I experienced severe bone, joint and muscle aches all throughout my body. I had severe pain especially in my ankles, feet and knees. I also experienced pain in my spine, hands, arms, stomach, ears, and eyes. I felt mild nausea and a very mild headache. I am also nursing an infant, and my milk production was reduced from 30 ounces a day to approximately 15 ounces on the day of June 3.

experienced deaf in my right ear, I woke up with pressure in both of my ears, I could not hear and arm soreness. The patient drug history included synthroid from an unknown date to ongoing (started about 15 years ago) for low thyroid hormone, simvastatin from an unknown date to ongoing (started about a year ago) for cholesterol is slightly elevated, ocuvite presersvision from an unknown date to ongoing (taking about 3 years. Macular degeneration has not changed or gotten worse in 3 years) for macular degeneration age related, vitamin D3 (taking for 3 years) for bone health from an unspecified date to ongoing, calcium with magnesium (it has calcium citrate. Been taking a long time. 5-10 years) to prevent osteoporosis, glucosamine chondroitin (taking since late 1990s. About 20 years) for joint health from an unspecified date to ongoing, vitamin C (about 3 years ago. started with the Ocuvite. Eye doctor though it was a good idea to take together), multivitamin (taking since 1995 or 1996. about 25 years) for general health; metoprolol ER for atrial tachycardia from Jan2016 to an unspecified date, baby aspirin from Jan2016 to ongoing (81 mg daily, cardiologist thought it would be a good idea). The patient reported, she received first Pfizer vaccine on 21Apr2021 and equilibrium affected and on 28Apr2021 she could not hear in her right ear and the day before on 27Apr2021 it was like she woke up with pressure in both of her ears. It sounded like heck like she was in the airplane and by yawning she could not relieve the pressure and went to the doctor and was under treatment with steroids and antivirals and she was still deaf in her right ear. She got second vaccine on 12May2021 and on 16May2021 and 17May2021 her gums and the roof of my mouth became all inflamed and her teeth were so sore she felt like she had an abscessed tooth. My gums were so raw, couldn't brush my teeth. So she gargle with some peroxide and some saline and then her teeth were sore like you have an abscess teeth on lower jaw. And then that went away within two days. Pressure in both ears has subsided, but then confirms it is a lasting effect comes and goes a little bit from 27Apr2021 to ongoing. First the doctor put her on valacyclovir and methylprednisone 4 mg tablet by mouth started dose at every 4 or 5 hours, dose was a decreasing frequency of dose over 7 days. Started 05May2021 for 7 days. And then last week he started me

on the dexamethasone injections through tympanic membrane into her middle ear last Thursday, 20May2021. Is scheduled to receive a dose today, will skip next week, and then one the following week, and then one the following week after that, states it is a series of four doses and then if that doesn't help, she will have an MRI. States cortisone decreases irritation and inflammation. Adds she is pretty healthy and moves about, gardens takes care of business, goes to exercise class twice a week now partially participates because she gets dizzy from moving her head. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Outcome of the events I am still deaf in my right ear, I have a very hard time hearing you was not recovered; equilibrium affected, some kind of side reaction was unknown; my teeth were sore/teeth were so sore she felt like she had abscessed teeth on lower jaw, inflamed gums, abscessed teeth on her lower jaw, my gums and the roof of my mouth (incomplete sentence)/my gums were so raw, I couldn't brush my teeth, my mouth became all inflamed was recovered on an unspecified date in 2021. Information on lot/batch number was available. Additional information has been requested.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events, unilateral deafness, non infective gingivitis, tooth abscess, toothache, balance disorder cannot be completely ruled out. The impact of this report on benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethic committees, and Investigators, as appropriate

1374256	6/4/2021	TX	46	F	3/9/2021	4/12/2021	<p>Blurred vision; Extreme vertigo; virus on vestibular nerve; Extremely dizzy all day; Could not open her eyes for 4 days; Felt like she was wearing a tight sweat band; Throwing up; Pain in left ear; 2 weeks to regain balance; Neck pain, lot of bad neck pain; arm developed large red spot warm to touch and hard; Itchy; felt like she was wearing a tight sweat band; Chills; This is a spontaneous and simultaneously regulatory report case was received via an unknown source (no reference has been entered for a health authority or license partner) on 26-May-2021 and was forwarded to Moderna on 26-May-2021. This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of VERTIGO (Extreme vertigo), VISION BLURRED (Blurred vision), DIZZINESS (Extremely dizzy all day), ASTHENOPIA (Could not open her eyes for 4 days), FEELING HOT (Felt like she was wearing a tight sweat band), VOMITING (Throwing up), EAR PAIN (Pain in left ear), BALANCE DISORDER (2 weeks to regain balance) and NECK PAIN (Neck pain, lot of bad neck pain) in a 46-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 037A21B and 029A21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 09-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 12-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 12-Apr-2021, the patient experienced NECK PAIN (Neck pain, lot of bad neck pain) (seriousness criterion hospitalization), RASH MACULAR (arm developed large red spot warm to touch and hard), PRURITUS (Itchy), FEELING ABNORMAL (felt like she was wearing a tight sweat band) and CHILLS (Chills). On 03-May-2021, the patient experienced VERTIGO (Extreme vertigo) (seriousness criterion hospitalization), VISION BLURRED (Blurred vision) (seriousness criterion hospitalization), DIZZINESS (Extremely dizzy all day) (seriousness criterion hospitalization), ASTHENOPIA (Could not open her eyes for 4 days) (seriousness criterion hospitalization), FEELING HOT (Felt like she was wearing a tight sweat band) (seriousness criterion hospitalization), VOMITING (Throwing up) (seriousness</p>

criterion hospitalization), EAR PAIN (Pain in left ear) (seriousness criterion hospitalization) and BALANCE DISORDER (2 weeks to regain balance) (seriousness criterion hospitalization). On an unknown date, the patient experienced VESTIBULAR NEURONITIS (virus on vestibular nerve ). The patient was hospitalized for 1 day due to VERTIGO, then for 5 days due to ASTHENOPIA, BALANCE DISORDER, DIZZINESS, EAR PAIN, FEELING HOT, NECK PAIN and VOMITING. The patient was treated with NACL at an unspecified dose and frequency; ZINC at an unspecified dose and frequency; MECLIZINE [MECLOZINE] at an unspecified dose and frequency; PREDNISONE at an unspecified dose and frequency; DIAZEPAM at an unspecified dose and frequency and ONDANSETRON (ZOFRAN [ONDANSETRON]) at an unspecified dose and frequency. At the time of the report, VERTIGO (Extreme vertigo), VISION BLURRED (Blurred vision), DIZZINESS (Extremely dizzy all day), ASTHENOPIA (Could not open her eyes for 4 days), FEELING HOT (Felt like she was wearing a tight sweat band), VOMITING (Throwing up), EAR PAIN (Pain in left ear), BALANCE DISORDER (2 weeks to regain balance), NECK PAIN (Neck pain, lot of bad neck pain), RASH MACULAR (arm developed large red spot warm to touch and hard), PRURITUS (Itchy), FEELING ABNORMAL (felt like she was wearing a tight sweat band), CHILLS (Chills) and VESTIBULAR NEURONITIS (virus on vestibular nerve ) outcome was unknown. After 3 weeks of receiving the second dose the patient experienced extremely dizzy all day and throwing up. She went to ER and was kept in ICU for 1 day for extreme vertigo. The patient experienced blurred vision which took 2 weeks to clear and 2 weeks to regain balance. The doctors are treating her as if she had a virus on vestibular nerve. Relevant concomitant medications were not reported. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Nevertheless, an alternative probable diagnosis was provided (confounder) during hospitalization that could explain some of the events (LLT: vestibular neuritis). Action taken with mRNA-1273 in response to the event was not applicable.; Sender's Comments: Based on the current available information and temporal association between

1370653	6/3/2021	GA	17	F	4/2/2021	4/4/2021	Fever; Joint pain; facial and tongue swelling/broken out in a rash broken out in a rash that moved to her face and lips/anaphylaxis/daughter's eye started to swell; Serum sickness; elevated CRP; Hives/an allergic reaction/lip and face swelling; This is a spontaneous report from a contactable consumer (the mother) reported for her daughter. A 17-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via intramuscular, administered in left arm on 02Apr2021 10:00 (Batch/Lot Number: EN6207) as 2ND DOSE, SINGLE for covid-19 immunisation. Medical history included Colitis ulcerative from 2014 and ongoing, Genetic immune deficiency, additional Information for other conditions: Caller describes it as "22q". patient was born with this but wasn't actually diagnosed until patient was 11 years old. They checked with patient's Immunologist before getting the vaccine especially with her daughter's history. Thyroid disease from 2015 to an unknown date, additional Information for other conditions: patient didn't have a thyroid- her thyroid was removed. Concomitant medications included cetirizine; famotidine; montelukast sodium (SINGULAIR); and epinephrine (EPIPEN) all taken for an unspecified indication, start and stop date were not reported; aloe vera, pramocaine hydrochloride (ATARAX ANTI ITCH LOTION) taken for itching, swelling and hives, start and stop date were not reported. The patient took first dose of Pfizer COVID vaccine on 12Mar2021 10:00 (Lot: EN6207) for COVID-19 immunization and patient had no side effects after the first dose. No additional vaccines administered on same date of the Pfizer suspect. No prior vaccinations (within 4 weeks). The patient just saw her Immunologist and her Immunologist instructed her to report what is going on with patient. Caller clarifies patient's immunologist plans to call and report as well but also instructed her to call and report the side effects her daughter is experiencing. Her daughter was cleared to have the COVID vaccine. The caller explains they always check with her immunologist because of her daughter's immune issues. Her daughter received the second dose of the COVID vaccine on 02Apr2021. On the evening of 04Apr2021, her daughter broke out in hives. They didn't think it was a big deal, they thought it was just an allergic reaction. She tried Benadryl and several other things. They went and saw her daughters regular general practitioner and the

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

doctor believed it was just a delayed skin reaction, which seems to be common with the Pfizer COVID vaccine. The doctor told her he's seen one other person with this delayed reaction. He gave her daughter a steroid injection, a Steroid Dose Pack and Pepcid. She was also placed on Benadryl as needed. About 2 weeks after this, her daughter and lip and face swelling and ended up in the Emergency Room (ER). At this ER visit, they initiated the allergic reaction protocol and it was not an anaphylactic reaction at that point. Her daughter received IV Benadryl and IV steroids, the caller is not sure what else. She confirms she has no NDC, Lot number and expiry dates for the medication her daughter received in the ER. The ER doctor contacted the Immunologist on call and the Immunologist had seen a few cases with a delayed reaction. Caller clarifies the ER doctor discussed her daughter's delayed skin reaction with the on-call Immunologist. The oncologist put her daughter on generic Zyrtec, 20mg in the morning and 20mg at night. The following week, her daughter woke her up with facial and tongue swelling. She clarifies further her daughter had fever, joint pain, and had broken out in a rash that moved to her face and lips. She immediately took her to the ER. The ER followed the whole anaphylaxis protocol and was given an EpiPen. She explains her daughter was diagnosed serum/covid sickness. This has been going on for over 6 weeks. The reaction will come and go. She was told as her daughter's body develops immunity, she is basically allergic to it. She clarifies at her ER visits, they checked her daughters liver and kidneys. It was noted her daughter had an elevated CRP, which is an inflammatory marker. The caller was told they thought her daughter had serum sickness from the vaccine which may last 4-6 weeks or it may be prolonged, so they just went with it. They told her as long as it didn't move to her lips or affect her daughters breathings, eventually it would wax and wane and go away. Her daughter started breaking out on her arms and legs and last Saturday, she woke up and her face was swelling. She clarifies her daughter's eye started to swell and her tongue. She took her straight to the ER and the ER followed the anaphylaxis protocol and injected her with an EpiPen. They contacted her Immunologist to check and make sure it wasn't anything else and consulted with the Covid Vaccine Clinic and it was found

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

3 other patients had this happen. No further details were provided regarding the 3 other patients. Right now, her daughter is on 4 different medications and an EpiPen. They contacted her insurance about her being placed on a biologic because not even the current medications her daughter is on is making everything going away. Caller verifies her daughter was never admitted into the hospital. When she was last seen in the ER Monday, she her daughter was monitored for 4 hours after the EpiPen was administered. The events require a visit to Emergency Room (total of three ER visits) and Physician Office. She known the last/third ER visit was Monday, 17May2021. The second ER visit was 04May2021. She believes the initial/first ER visit was probably a week or so before the second one. She clarifies she broke out in hives on 04 Apr2021 and went to the doctor on 07Apr2021 or 08Apr2021 so the ER visit was around the next week. Since her daughter had such a good response from the EpiPen the ER doctor took pictures before and after. She clarifies the name of the biologic they want to put her daughter on is Xolair, it is a monthly injection. She explains the current cocktail they have her daughter on is not working. She provides the following product information for these 4 medications and EpiPen. Relevant Tests included she knows they are testing for any other thing that it could be to rule it out. She knows they ran a CIS-tray, a complete CIQ , a Histamine release something and Tryptase. She knows they checked her CRP (inflammatory marker) because it was elevated. Every time her daughter went to the ER, they did a CBC and all of that was normal except for the CRP inflammatory marker, however her CRP was normal at the last ER visit. The outcome of events was unknown. No follow-up attempts are needed. No further information is expected.

1370544	6/3/2021	NV	52	M	5/15/2021	5/15/2021	dizziness; nausea; He did not feel well at all and was not able to feel well enough to stand up.; definite lack of coordination; he vomited on himself; his cholesterol was high at 208.; had very little strength; started feeling like something was wrong; just had sort of a feeling like being really drunk; passed out (fainted) in his car 3 times; He was told he had a vasovagal reaction; This is a spontaneous report from a contactable consumer (patient). A 52-years-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in Arm Left on 15May2021 10:50 (Lot Number: EW0173; Expiration Date: 31Aug2021) as 1ST DOSE, SINGLE DOSE for covid-19 immunisation. Medical history included vasovagal reactions in high school. No other vaccinations within four weeks prior to the first administration date of the suspect vaccine. The patient's concomitant medications were not reported. Within 2 minutes of receiving the Covid 19 vaccine he started feeling like something was wrong. He pulled to the side in the parking garage and as soon as he stopped the car he passed out. He woke back up and was able to put the car in park and he passed out a second time. He woke up again and his foot was on the gas pedal and he tried to roll down the window. He was able to roll down the window but he wasn't able to get anyone's attention. He passed out a third time. When he woke up again he wasn't able to get the door open and he was nauseated. He basically had nausea, dizziness, and a definite lack of coordination. He just had sort of a feeling like being really drunk. He doesn't drink. He had very little strength but he was able to push his car horn. He was out of it. He could see someone in his car mirror a little ways behind his car and the horn didn't get the person's attention so he honked a second time and someone came to help him, maybe from the fire department and maybe some emergency medical technicians. He was placed on a golf cart or ATV to be transported downstairs to a waiting ambulance and while on the ride he vomited himself. He mentioned that the EMTs called it a vasovagal reaction. He was brought to the hospital in which he had a lot of tests done. He did not feel well at all and was not able to feel well enough to stand up. He had tests done at the hospital, a chest x-ray and his blood was drawn. He had a cardiac ultrasound later in the afternoon the next day

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT

on 16May2021. The doctor's didn't find anything wrong other than his cholesterol was high at 208. He was admitted to the hospital on 15May2021. He continued to have his blood drawn through the night and the next morning, on 16May2021, he had a CAT scan. For his cholesterol he was told to eat better and maybe follow up with a doctor in a couple months to check his cholesterol again. No one had any answers to the effect of what happened to him. Everything was fine, his tests were normal. He was told he had a vasovagal reaction. He's had vasovagal reactions before and he can tell this was much different than the vasovagal reactions he's had before. In the past when he's had vasovagal reactions the world went black like looking through a small circle, his vision got blacker and blacker and then he'd pass out. He did not have this feeling with the Covid 19 vaccine. He can only describe this feeling that he had like an occasion in his past when he's drank to much and he's stumbling around. He may have passed out briefly to someone helping him move to a bed and his arms are weighted and he can't lift them and he's disoriented but still has a sense of what's going on but he feels like he could vomit at any second. He's comparing his experience to the Covid 19 vaccine to drinking to much alcohol and then falling asleep or passing out. He was pretty much out of it for 5 hours. Between the fourth and fifth hours after receiving the Covid 19 vaccine he was comfortable enough to stand on his own for brief moments. He was feeling better and was able to use the restroom. By the next day, around the 24 hour period after the vaccine he was feeling almost normal. He was released from the hospital the next day, 16May2021 at around 4:00PM. He was maybe in the hospital for about 27 to 28 hours. At the hospital he had all these tests and he was found to be healthy with no problems. He also had a Covid 19 virus test, he never asked what the results were but he's going under the assumption that if he was Covid 19 virus positive the hospital staff would have told him. Passing out, nausea, dizziness required a visit to Emergency Room. The outcome was unknown.

1370590	6/3/2021	NC	41	F	4/30/2021	5/14/2021	Bell's Palsy; This is a spontaneous report from a contactable consumer reported for herself. A 41-year-old female patient (not pregnant) received 2nd dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) at single dose via an unknown route on 30Apr2021 10:00 for Covid-19 immunization. Medical history and concomitant drug were not provided. Prior to vaccination, the patient was not diagnosed with COVID-19. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Historical vaccine included 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 09Apr2021 for Covid-19 immunization. The patient reported events diagnosed as Bell's Palsy, left sided facial droop, inability to move the left forehead, left facial numbness, inability to close the left eye. The adverse event started since 14May2021. Treatment included prescription of a seven-day course of Prednisone, etc. The adverse event result in Emergency room/department or urgent care. Outcome of the event was not resolved. Since the vaccination, the patient has not been tested for COVID-19. The report was not assessed as serious. Information on the lot/batch number has been requested.

1370548	6/3/2021	NY	58	F	3/17/2021	4/8/2021	stroke like symptoms/minor stroke; high/extremely high blood pressure; blood sugar numbers were very high in the 700s; face on the left side felt paralyzed like she couldn't feel if something was in her mouth; trouble seeing on the side of her eye/can only see straight on the left side; Blurry vision; fall; splintered hand; losing her balance; numbness in her arm; Soreness/sharp pain on her arm; dizzy spells; fatigue; This is a spontaneous report from a contactable consumer (daughter). A 58-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration in the left arm, on 17Mar2021 (at the age of 58-years-old) as a single dose for COVID-19 immunisation. Medical history included stroke in 2012 (first stroke was from a heart attack), heart attack in 2012, stroke in 2017, stroke in Dec2020, high blood pressure from 2012 and ongoing, diabetes from 2013 and ongoing, glaucoma from 2009 and ongoing, ongoing at risk for heart failure, ongoing tumor in her stomach (23 years, benign and hasn't been surgically removed due to other issues and not harming her), ulcers (3 ulcers in the past and none currently), broken ankle in 2014, preeclampsia attack in 1990, baby being strangled during birth in 1994, broke her pelvis during birth in 1996, and complicated birth in 1996 (which she was in a coma for). The patient had no family history. Concomitant medications included labetalol (MANUFACTURER UNKNOWN) taken for heart condition from Dec2020 and ongoing; acetylsalicylic acid (BABY ASPIRIN) taken for stroke from 2012 and ongoing; furosemide (MANUFACTURER UNKNOWN) from an unspecified date and ongoing; atorvastatin (MANUFACTURER UNKNOWN) taken for stroke from an unspecified date and ongoing; ascorbic acid, betacarotene, biotin, calcium, chromium, copper, folic acid, iodine, iron, magnesium, manganese, molybdenum, nicotinic acid, pantothenic acid, phosphorus, pyridoxine hydrochloride, retinol, riboflavin, selenium, thiamine, vitamin B12, vitamin D, vitamin E, vitamin K, zinc (CENTRUM WOMEN 50+) from an unspecified date and ongoing, and unspecified eye drops for glaucoma from an unspecified date and ongoing. The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient experienced stroke like symptoms/minor stroke, high/extremely high blood

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

pressure, blood sugar numbers were very high in the 700s, face on the left side felt paralyzed like she couldn't feel if something was in her mouth, trouble seeing on the side of her eye/can only see straight on the left side, and blurry vision on 08Apr2021, which all required hospitalization from Apr2021 to Apr2021 for 4 days. The patient also experienced losing her balance, numbness in her arm, soreness/sharp pain on her arm, dizzy spells, and fatigue on 08Apr2021 and fall and splintered hand on 30Apr2021. The clinical course was reported as follows: It was reported that the patient had stroke like symptoms, which were reported to be not a result of the vaccine as the patient had a lot of health issues. The patient had the vaccine and was completely fine and then right around the time she was supposed to get her second dose she was showing signs that could have been a minor stroke. She just had high blood pressure and her blood sugar numbers were very high in the 700s on 08Apr2021. It affected her face. It was not a full on stroke, she got to the hospital in time. The patient had strokes before. They thought it was better to stabilize her blood pressure and blood sugar before getting the next shot. She was in the hospital for 4 days. They gave it time to stabilize and come to a normal number. When it did and they went back to the pharmacy, they said they did not feel comfortable administering the second shot after 42 days. Now it was pushing more than 42 days. The reporter stated she would not necessarily call it a stroke. Her mother had symptoms leading up to a stroke but not a full on stroke. She had numbness of her arm and blurry vision, but not a full on stroke. She was in the hospital the week of 07Apr2021. She was supposed to have the second shot on 14Apr2021. She was discharged from the hospital the week of 12Apr2021, either that Monday or Tuesday. She had trouble seeing on the side of her eye. She can only see straight on the left side. Her face on the left side felt paralyzed, like she couldn't feel if something was in her mouth. She has been losing her balance. Her blood pressure was through the roof on 08Apr2021, as well as her blood sugar. She did a video chat with the doctor the night before going to the emergency room (ER). They monitored her symptoms, and they started within the first 72 hours before going to the hospital. She had a blind spot in her left eye. The other one she can see just not as great as

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

before. Before this instance she did not have a blind spot, and now she does. The patient walked with a cane now. If she is outside, she is held with someone and cannot just walk along because she does not see well by herself. She had to sit at a certain angle to see clearly. Her vision is not well. The numbness in her arm comes and goes. Sometimes it is a sharp pain and sometimes it is numb. It was definitely worse when she was at the hospital. The numbness and sharpness level goes hand in hand with when her blood pressure is too high and fluctuates with her blood sugar and blood pressure. With her face feeling paralyzed, her left eye socket is closed a little bit. She has more mobility than when it happened. She has been working on it with physical therapy trying to get it back. Her balance was off when she wasn't seeing well and was unassisted. She would get dizzy spells and fall. Now she is more aware of when she will feel dizzy and will let them know. The cane helps her balance. The dizzy spells came at the same time as the other symptoms. They fluctuate. They have stabilized over time. When it first happened, they were a lot more frequent. Now they almost never happen. The patient underwent lab tests and procedures, all in 2021, which included bloodwork: unknown results, computerised tomogram (CAT) scan: unknown results, and x-ray: unknown results (on her hand when she broke it in the past 2 weeks). The clinical outcome of stroke like symptoms/minor stroke, soreness/sharp pain on her arm, fatigue, fall, and splintered hand was unknown; high/extremely high blood pressure, blood sugar numbers were very high in the 700s, face on the left side felt paralyzed like she couldn't feel if something was in her mouth, losing her balance, numbness in her arm, and dizzy spells was recovering; and trouble seeing on the side of her eye/can only see straight on the left side and blurry vision was not recovered. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up.

1370743	6/3/2021			U	5/24/2021	5/30/2021	Incredible Dizziness; Vertigo; This is a spontaneous report from a contactable consumer reported for self. A patient with unspecified age and gender received first dose of BNT162B2 (Pfizer Covid-19 Vaccine, Batch/lot number: unknown, Expiration date: Unknown), via an unspecified route in the left arm on Monday, 24May2021 at 16:15 as a single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. On 30May2021 today at 13:00, patient experienced various side effects which included incredible dizziness and patient can barely keep eyes open. When paraphrased the concern, patient stated vertigo. It's been 7 days since patient had the first vaccine. Patient wanted to know if it can be a late side effect. It was unknown if the patient received any treatment for the events. The clinical outcome of the events was unknown. Information on the lot/batch number has been requested.
1371124	6/3/2021	MD	27	F	5/22/2021	5/23/2021	On the second dose of Moderna done on 05/22/21 the next day which was 05/23. I woke up with a headache, could barely open my eyes, so I laid for a few minutes. Once I woke up, I was very hungry, and dizzy and tired. Later, I started cooking, and the smell of the food was gross to me. I had to sit because I was starting to get dizzy again. The head ache came back, and the pain was above my eyes. The side effects were like a pregnancy symptoms, but was NOT and I am NOT pregnant.

1370532	6/3/2021	WI	57	F	5/14/2021	5/1/2021	red rash wrist, itching, about a 3-4 inch area; red rash wrist, itching, about a 3-4 inch area; Jaw up to ear, under eye, eye lid, down her neck, left side of windpipe, back of neck, shoulder and left side of forehead lost sensation, lost sensation in part of arm above elbow.; tingling sensation in mouth, tingling lip; upper lip went numb; tingling half face; Headache; left arm swelled up; Elevated Heart Rate; Brain fog; dry mouth; funny sensation in her mouth; This is a spontaneous report from a contactable consumer (patient). A 57-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot Number: EW0158, Expiration Date: 31Jul2021), via an unspecified date of administration in left arm on 14May2021 at 09:35 (at the age of 57-year-old) at first dose, single for COVID-19 immunization. The vaccine was administered at hospital. The patient did not receive other vaccine within four weeks prior to the first administration date of the COVID-19 vaccine. Relevant medical history included dental work to left upper molar done on 11May2021. She was given anesthesia and stated all this resolved. She had the procedure at 10:00. The patient was not receiving concomitant medications. On 14May2021 within 10 minutes of receiving shot the patient experienced tingling sensation in mouth, tingling lip, half face, and upper lip went numb. Her jaw up to ear, under eye, eye lid, down neck, left side of windpipe, back of neck, shoulder and left side of forehead lost sensation. Left arm swelled up and lost sensation in part of arm above elbow. The patient went to the emergency room for these symptoms and she was monitored there. The patient stated she is about 90% resolved of these symptoms, but they are not completely gone. On 14May2021 had headache that has resolved but she keeps having a sensation like she is about to get a headache on the left side of her forehead and also had elevated heart rate. She stated that her heart rate was elevated for many hours. It was still higher than normal for her when she left the emergency room. On 17May2021 had right red (rash), very itchy area on right wrist. Came on all of the sudden and was fire red and very itchy, was about a 3-4 inch area. Dissipated within an hour. She is still experiencing brain fog since an unspecified date in May2021, it is improving; but she had to take a half a day off of work the day before reporting to rest. Dry mouth and a funny sensation in her mouth are

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							still lingering since an unspecified date in May2021. The patient stated that she called her doctor's office the day before and is awaiting a call back. She says the emergency room doctor told her to follow-up with her doctor and that the emergency room doctor also advised her not to get the second vaccine. They stated that she could potentially have a long-lasting vaccine effect. The patient asked what are the risks of her getting the second shot since she had such a severe reaction that is taking so long to resolve. Rash resolved on 17May2021, headache resolved on 14May2021, final outcome of heart rate increased was unknown, dry mouth and a funny sensation in her mouth had not resolved, while all the remaining events were resolving.
1370609	6/3/2021			F	5/19/2021	5/19/2021	I am freaking out and don't want to be permanently paralyzed.; 25 min ago my left eye became slightly blurred; left side of my face and left my eye were/are tingling/the left side of my forehead/temple area started tingling; I am freaking out and don't want to be permanently paralyzed.; This is a spontaneous report from a contactable consumer (patient). A 27-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), via an unspecified route of administration, administered in arm left on 19May2021 (Batch/Lot number was not reported) as 2ND DOSE, SINGLE for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. Historical vaccine included BNT162B2 dose 1 on an unspecified date for Covid-19 immunization. It was reported that the patient received her 2nd Pfizer dose, in her left arm 2 hours ago (on 19May2021) and then she noticed the left side of her face and left her eye were tingling. She stated this started about 1 hour and 40 min after receiving her 2nd vaccine dose, 25 min ago her left eye became slightly blurred and the left side of her forehead/temple area started tingling. She was freaking out and doesn't want to be permanently paralyzed. She asked if these are expected side effects and what she should do. The outcome of the events was unknown. Information on the lot/batch number has been requested. Further information has been requested.

1370837	6/3/2021	FL	27	F	6/2/2021	6/2/2021	At 6:25pm after patient received vaccine EMT observed patient appeared pale with her eyes closed. Medic walked over to patient in which patient informed that, "I don't feel good, I feel nervous and dizzy." Medic took patient to medic area where vital signs were done and water was given. After 15 mins. patient recovered.
1371032	6/3/2021	SC	55	F	6/1/2021	6/2/2021	Woke up the next day my eyes were extremely sensitive to light , headache (all day), body aches low grade fever and no energy.
1371038	6/3/2021	OH	36	M	6/2/2021	6/2/2021	A few minutes after giving vaccination, patient's mother and caregiver stated that he was having a reaction. Patient can only use his eyes to respond "yes" or "no" since he is non-verbal and when he would not respond to his mother's questions with his eyes she became very panicked and alerted the pharmacy staff. When I got to the patient he was very clammy, sweating, and breathing heavy. She said his eyes had rolled back in his head and his tongue had turned blue. I propped his legs up on a chair and took his blood pressure with an automatic blood pressure cuff and it was 164/124 with pulse 95. I decided to contact EMS for assistance. Retook BP few minutes later and it was the same. EMS arrived and stated it was most likely a reaction to being afraid of needles but would take him to get checked out.
1371042	6/3/2021	IA	26	M	5/28/2021	5/28/2021	Approximately 10 minutes after receiving the injection, patient states that he felt hot, lightheaded, and had stomach pain. As he was moving to a recliner, patient passed out. The pharmacist called 911, and raised patient legs onto a chair. Patient woke back up, and the pharmacist said that his eyes were "not normal". Paramedics arrived, and transported patient to the emergency room. Patient states that he was at the ER for approximately 2 hours, and then discharged. While at the ER, he received IV fluids and blood work was performed. He has not had any other complications besides a sore arm at the site of injection.

1371175	6/3/2021	DE	15	M	6/2/2021	6/2/2021	Reports ate a few peanut butter pretzels today. Reported lightheadedness that resolved within about 1 minute, followed by seeing spots for about 2 minutes resolved, momentary tightness on inspiration that resolved, and ringing in ears for about 3 minutes resolved. Later reported nausea on ambulation post vaccination to seat in observation area that resolved upon sitting down. Also, reported has history of similar s/sx with flu vaccination. Denies chest pain and other s/sx. Nurses responded with emergency cart. 01:47pm LUE 96/70 pulse regular R20, lungs clear, lips noted to be dusky/purplish. Benadryl 50mg PO x1 administered. Lips color reassessed and after few minutes returned to usual pink color. Reports nausea, lightheadedness, visual spots, and ringing in ears resolved, all s/sx resolved, stated "I feel normal". Counseled follow up with pediatrician, urgent care or emergency department for any return s/sx, Mom verbalized understanding. Observed for 30 minutes. Ambulated with steady gait off floor with his parent and sibling.
1371198	6/3/2021	MO	48	F	1/8/2021	1/8/2021	The day of the vaccine I had the return of the dry cough, which I previously with COVID-19. I also had mild chest pains. I had fatigue and felt sleepy. Within the first 24 hours of the vaccine, I had burning in the eyes. Within the next week I had more fatigue and sleepiness. Within a few weeks I had a more intermediate cough. The cough was not every day but every few days. About a month after the vaccine, I have had a cough every day. The worsening of other conditions, in late February into March, I had worsening of restless legs. I also had increased of my asthma symptoms which I had to increase my medication for the asthma. I had chest tightness until April 10th. On April 29th, I had increased fatigue and montenect jerk of my arm and legs. After a week or so of those symptoms, I saw my Rheumatologist she put me on a steroid of 6 days. The abnormal fatigues and fatigue improved after I started the steroid. I still have a little fatigue and intermediate dry cough. Also, with had a symptom of monocular diplopia, the doctor I saw thinks that was to the increased dry eye symptom. I think the symptoms have increase my autoimmune system to flare up. I still have to use the inhaler also more than I use too.

1370520	6/3/2021	FL		F	3/11/2021		<p>just went out cold; fell flat on tile in bedroom; still have pain being treated by plastic surgeon that operated in hospital; The initial case was missing the following minimum criteria: reporter with firsthand knowledge. Upon receipt of follow-up information on 18May2021, this case now contains all required information to be considered valid. This is a spontaneous report from a contactable consumer (patient). An 80-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), via an unspecified route of administration, administered in the right arm on 18Feb2021 (Batch/Lot Number: EL9267) as 1st dose, single and via an unspecified route of administration, administered in the right arm on 11Mar2021 14:00 (Batch/Lot Number: EN6205) as 2nd dose, single for COVID-19 immunization. The patient had no prior vaccinations within 4 weeks. The patient's medical history included heart attack from 25Aug2017 to an unknown date (stent right coronary artery (RCA)). Concomitant medications included escitalopram; vitamin D NOS; cyanocobalamin (B-12); ubidecarenone (COQ 10); calcium; omeprazole; fluticasone furoate, vilanterol trifenate (BREO ELLIPTA); ketotifen fumarate (ZADITOR); ticagrelor (BRILINTA); alprazolam; telmisartan; atorvastatin; montelukast; fluticasone; salbutamol sulfate (VENTOLIN HFA); and unspecified probiotic; all taken for an unspecified indication from an unspecified start date and ongoing. The patient reported that she has never passed out or fainted. On an unspecified date at 07:30 pm, she had no warning and just went out cold. Emergency room visit was required. The patient further reported that she fell flat on tile in the bedroom. There was no warning. The patient reported the events as serious with seriousness criteria hospitalization (in the hospital for 5 days) and important medical event. The patient stated "Both knees, left eye, left arm (shoulder, left) 3 layers of stitches in the upper lip. Still have pain, being treated by plastic surgeon that operated in hospital". The patient was hospitalized for 5 days and she was treated by plastic surgeon - underwent plastic surgery and reconstruction of lips. The outcome of the events was unknown.</p>

1370343	6/3/2021	NJ	69	F	1/29/2021	4/1/2021	not getting any sleep; Involuntary movement of her arms and legs/body is just jerking; Felt like she was having an alien pop-out/felt like something in her body was squeezing her inside; Cataracts; This spontaneous case was reported by a consumer and describes the occurrence of CATARACT (Cataracts) in a 69-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 013A21A and 007M20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included Cataract extraction (on her right eye ) on 21-May-2021 and Cataract extraction (on the left eye ) on 06-May-2021. Concomitant products included MAGNESIUM and VITAMIN B12 [VITAMIN B12 NOS] for an unknown indication. On 29-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 26-Feb-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. In April 2021, the patient experienced CATARACT (Cataracts) (seriousness criterion medically significant). On an unknown date, the patient experienced INSOMNIA (not getting any sleep), DYSKINESIA (Involuntary movement of her arms and legs/body is just jerking) and FEELING ABNORMAL (Felt like she was having an alien pop-out/felt like something in her body was squeezing her inside). The patient was treated with Surgery (Cataract surgery of right eye on 21MAY2021 and of left eye on 06MAY2021) for Cataract. At the time of the report, CATARACT (Cataracts) outcome was unknown and INSOMNIA (not getting any sleep), DYSKINESIA (Involuntary movement of her arms and legs/body is just jerking) and FEELING ABNORMAL (Felt like she was having an alien pop-out/felt like something in her body was squeezing her inside) had not resolved. Treatment information was not provided. The patient was scheduled to a neurologist. Company comment:Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. However the patient's increased aged is also a risk factor for cataracts. This case was linked to MOD-2021-185661 (Patient Link).; Sender's Comments: Based on the current available information and temporal association between the use of

1370380	6/3/2021	CO	74	F	2/22/2021	2/22/2021	<p>eye was swollen and itchy for 4 days; eye was swollen and itchy for 4 days; mildly sore arm; Left arm itching, red, and swollen; Left arm itching, red, and swollen; Left arm itching, red, and swollen; her arm was sore and swollen at the injection site for a couple of days; her arm was sore and swollen at the injection site for a couple of days; This is a spontaneous report from a contactable consumer. A 74 age female patient (unit- unspecified) received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EN06201), via an unspecified route of administration, administered in left arm on 22Feb2021 13:30 (at the age of 74-years-old) as a single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. When she gets the Flu vaccine sometimes gets a sore arm. One time she felt like she had flu symptoms, but it didn't last long and was right after the flu vaccine. It varies from time to time. Has no NDC/Lot/Exp for any past Flu Vaccine. The patient's appointment was at 13:20 so somewhat after that. She left the facility at 13:50, which was after waiting 15 minutes. Didn't have any kind of allergic reaction. The patient received the 1st dose of the Pfizer vaccine on a Monday, 22Feb2021 at 13:30 and experienced a mildly sore arm that evening that lasted for about 24 hours as it went away the next evening. Yesterday, she got up and noticed that her arm was itching, red, and swollen. The symptoms are still persisting but the itching was going away. It doesn't really hurt, but it hasn't gone away. Yesterday is a week from the COVID Vaccine. It is quite unusual to have a reaction a week later. On 01Mar2021, She states that her arm was sore and swollen at the injection site for a couple of days and then the soreness went away. A week later her eye was swollen and itchy for 4 days and then those symptoms went away as well. She noticed yesterday that her arm started getting a little sore again and she noticed there is a "bump" where the vaccine was given and notes this as "feeling swollen." She also states that she has had similar reactions to the flu vaccine in the past with her arm being sore and swollen at the injection site but she has never experienced those symptoms returning once they have gone away. Her arm was sore for 24 hours. A week later her arm was swollen and had a red area and it itched. She called Pfizer a week ago yesterday. She didn't know why it was so long for that</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							<p>reaction. They told her it could be seven to eight days for that reaction. It was like that for 4 days. Yesterday morning she woke up and it was itching and swollen, but it was not as swollen as it was previously. There was a pinkish red area. It came back again after 2 weeks. Her concern is whether she can get the vaccine. She could get it in the other arm. She is supposed to get the second vaccine on 18Mar2021 considering her recurrence of injection site swelling and soreness. The clinical outcome of the event eye was swollen and itchy for 4 days was resolved; her arm was sore and swollen at the injection site for a couple of days was resolved on 23Feb2021; while that of left arm itching, red, and swollen was not resolved; mildly sore arm was unknown. Description of Product Complaint: One time she felt like she had flu symptoms, but it didn't last long and was right after the flu vaccine. Has no NDC/Lot/Exp for any past Flu Vaccine. She got a letter yesterday from Pfizer that said she filed a complaint. She doesn't consider it a complaint, but considers it a concern. Reference number: 5709643. There is a complaint number but it is very long and the reference number should be enough she would think. On the vaccine card she was given it says one dose. No follow-up attempts are possible. No further information is expected.</p>
1369973	6/3/2021	TN	45	M	6/2/2021	6/2/2021	<p>Pt reported lips tingling, tight throat, Benadryl 25mg tab administered, no difficulty swallowing, VS stable. No symptom improvement at 20 minutes and expressed a feeling of having a golf ball stuck in his throat, denied SOB, itchiness, no noted hives, denied chest pain/tightness, dizziness, vision changes or anxiety. Benadryl 25 mg tab administered, no noted or voiced difficulty with swallowing. VS stable. Pt observed another 30 minutes and symptoms began to resolve. Full resolutions of symptoms at 3 hours, pt discharged home @ 13:20. Emergency situations reviewed with instructions to call 911 if reoccurrence of symptoms.</p>

1369996	6/3/2021	OR	26	F	5/21/2021	5/24/2021	I got the regular side affects that were warned about, however, I also got allergies for the first time in my life a few days after. I lived somewhere else this time last year and was not affected by the pollen, but after I got the shot I got allergies every time I went outside. I am not sure if it is a coincidence or if the shot had messed up my immune system in any way. My allergy symptoms occur when I go outside and consist of runny nose that turns into stuffed nose, sneezing, and eye irritation. it is worse when it is cold and have occurred every day since it started. regular side effects that I was warned about that I experienced was pain in the shot area and barely able to lift my arm for about 24 hours. heavy body flu type of symptoms the first night, second night I started having a runny nose and felt a little sick. then the next day or a day after I started having bad allergies when going outside that I am still experiencing 13 days after my first shot.

1370248	6/3/2021	OR	36	F	3/10/2021	3/22/2021	<p>Body temperature decreased; Myalgia; Atrial fibrillation; Alopecia; Nasopharyngitis; Vision blurred; Vasculitis; Dizziness; This case was received via FDA VAERS (Reference number: 1124402) on 25-May-2021 and was forwarded to Moderna on 25-May-2021. This regulatory authority case was reported by an other health care professional and describes the occurrence of ATRIAL FIBRILLATION (Atrial fibrillation) in a 36-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 029A21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Drug allergy (Codeine, hydrocodone and tramadol.) and Autoimmune disorder. On 10-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 22-Mar-2021, the patient experienced ATRIAL FIBRILLATION (Atrial fibrillation) (seriousness criterion medically significant), ALOPECIA (Alopecia), NASOPHARYNGITIS (Nasopharyngitis), VISION BLURRED (Vision blurred), VASCULITIS (Vasculitis), DIZZINESS (Dizziness) and MYALGIA (Myalgia). On an unknown date, the patient experienced BODY TEMPERATURE DECREASED (Body temperature decreased). At the time of the report, ATRIAL FIBRILLATION (Atrial fibrillation) had resolved and ALOPECIA (Alopecia), NASOPHARYNGITIS (Nasopharyngitis), VISION BLURRED (Vision blurred), VASCULITIS (Vasculitis), DIZZINESS (Dizziness), BODY TEMPERATURE DECREASED (Body temperature decreased) and MYALGIA (Myalgia) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Concomitant product was not provided by the reporter. Patient vaccine administration arm coldness and temperature drop. Patient reported the symptoms to her doctors and they recommended she get the second shot. Treatment information was not provided. Company comment: Very limited information regarding this event has been provided at this time. Details regarding autoimmune disorder and concomitant medications are required for further evaluation.; Sender's Comments: Very limited information regarding this event</p>

regarding this condition), GIANT CELL ARTERITIS (Diagnosed him with temporal arthritis), SWELLING FACE (Swelling on left and right side of temporal areas of the face), DIPLOPIA (Double vision in both eyes) and OFF LABEL USE (Did not receive my second dose of the Moderna COVID-19 Vaccination per health care provider's recommendation due to) outcome was unknown. Not Provided mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was withdrawn on an unknown date. On 17Mar2021, the patient began to experience double vision in both eyes as well as swelling on the left and right side of the temporal areas of the face. The patient underwent a biopsy of both sides of the face, results were not provided. Ultimately, the patient was diagnosed with "temporal arthritis" along with "having high levels of inflammation in his body" by his rheumatologist. On 16Apr2021, the patient was admitted in the hospital for four days until 19Apr2021 for observation. The patient received high doses of steroids/prednisone for treatment including 60 milligrams for one month and then 40 milligrams starting 25May2021. It was recommended by the patient's physician that he not receive his second Moderna COVID-19 vaccination which was originally scheduled for 07Apr2021. Further clinical course is unknown/not reported at this time. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Most recent FOLLOW-UP information incorporated above includes: On 25-May-2021: Non-significant follow-up received. Follow-up contained no new information.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

1370361	6/3/2021	WI		F	2/2/2021	2/2/2021	rash on left arm is gone now; arm achy at injection site; coughing up old mucus; This is a spontaneous report from a contactable consumer. A female patient of an unspecified age received bnt162b2 (BNT162B2, Batch/Lot number was not reported), via an unspecified route of administration, administered in Arm Right on 02Feb2021 as SINGLE DOSE for covid-19 immunisation. Medical history included rash and patient states that her whole life she had asthma and allergies, had hypereosinophilia syndrome, and year round allergies, normally her lungs are pretty congested, sinuses are normally they are swollen shut, normally her eyes have a lot of discharge and are watery and they are not watering, her lungs are clear and her sinuses are clear. The patient's concomitant medications were not reported. The patient experienced rash on left arm is gone now on 03Feb2021, coughing up old mucus on 02Feb2021, arm achy at injection site on 03Feb2021. Patient knows she read that there is an RNA teacher cell is what she calls it and wants to know it, it taught her body to not fight the other stuff. Has this been reported before. Other thing that happened, got vaccine yesterday around lunch, both last night when she came home and early this morning, was coughing up little nodules of mucus. States another thing that is interesting, yesterday when she got the injection, she asked to have it in the right because she had a rash on her left arm and today it is gone. Only thing she got was arm at injection site was a little achy. started this morning. States that she remembers hearing in clinical trials they did not test the vaccine on pregnant people or people with allergies so she thought they would like to hear from someone with severe allergies. Information on the lot/batch number has been requested. Follow-up (16Apr2021): This follow-up is being submitted to notify that the lot/batch number is not available despite the follow-up attempts made. Follow-up attempts have been completed and no further information is expected.
1371225	6/3/2021	PA	17	F	6/3/2021	6/3/2021	Patient developed warmth, clamminess, nausea and lightheadedness shortly after her shot. She admitted to near syncope, but there was no LOC. No tunnel vision. Symptoms resolved on their own. VVS throughout. No orthostasis.

1370519	6/3/2021	FL	65	F	3/17/2021		<p>nausea; burping; diarrhea is watery, then soft, then hard, all kinds; gassy; pancreatic enzymes were 3 points higher than normal; it has aggravated her stomach problems; more like constipated; This is a spontaneous report from a contactable consumer (patient). A 65-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: ER2613), dose 2 via an unspecified route of administration, administered in Arm Left on 17Mar2021 14:30 (at the age of 65-year-old) as 2nd dose, single for covid-19 immunisation. Medical history included ongoing gastroesophageal reflux disease (GERD), nausea with the burping. Concomitant medications included famotidine (PEPCID). The patient previously took clindamycin and experienced itchy eyes and a rash. The patient previously received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN6198) on 24Feb2021 10: 30 administered in arm left for COVID-19 Immunization. The patient experienced nausea, diarrhea is watery, then soft, then hard, all kinds, burping, gassy, pancreatic enzymes were 3 points higher than normal on an unspecified date. The patient who was 65 years old, had her shots of the vaccine last March 16-17. She mentioned that they experienced diarrhea, all kinds and form (liquid, mild to severe). She also said that they already filed a report with safety about this. She mentioned that after getting the vaccine, she had her bloodwork done and it showed 3 points increase than the normal pancreas enzyme level. The patient was calling about the Covid 19 vaccine. She and her husband have both received their second Covid 19 vaccines. She had hers on 17Mar2021. She reports she has been having nausea and diarrhea. Her diarrhea is watery, then soft, then hard, all kinds. She is asking if other people are experiencing this. She has had lab work done and a stool test. She doesn't know if it's related to the Covid 19 vaccine but her lab work showed that her pancreatic enzymes were 3 points higher than normal. When probing weight she reports she doesn't know if her weight is related to the pandemic or from being at home, her weight is 130 lbs. now but this time last year she was 147lbs. She thinks it started about 2-3 weeks ago after eating a meal, not when she's eating. She'll burp a little, she's gassy, and she has nausea. She thinks it has aggravated her stomach problems. She does have</p>

---

GERD. She's better now, she's improved only. The other day she went to the bathroom normal and then the next time she went to the bathroom her stool crumbled. She's never certain what will happen. This morning she went to the bathroom more normal, more like constipated. She doesn't know if later it'll explode. Meaning she doesn't know if later the diarrhea will come back. She reports when she experiences the nausea with the burping she takes Famotidine or Pepcid 10mg and that takes care of it. She's never had elevated pancreas levels before. She's been referred to a gastroenterologist. She reports she is allergic to clindamycin. She experienced itchy eyes and a rash. This happened about 3 years ago. There is no prior vaccinations (within 4 weeks), no AE following prior vaccinations. The AEs (nausea, diarrhea) require a visit to physician Office, tele visit. The outcome of "nausea, diarrhea is watery, then soft, then hard, all kinds, burping, gassy" was resolving, the outcome of the other events was unknown. No follow-up attempts are possible. No further information is expected.

1370391	6/3/2021	NY	84	M	1/23/2021	1/25/2021	after his first dose he had one day where his blood pressure went "very low"/Low blood pressure; This is a spontaneous report from a contactable consumer (who is the patient, reported for self). This 84-year-old male patient received his first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Solution for injection, Batch/Lot number: EL9262, Expiration date: UNKNOWN), via an unspecified route of administration in the left arm on 23Jan2021 (at the age of 84-year-old) as a single dose for COVID-19 immunisation. The patient's medical history included high blood pressure and that he was taking pills, it was under control. Patient says occasionally he develops rapid heartbeat, for which he has medication and mainly these are things taking medications for. No further details provided about these medications; Cholesterol and open heart surgery nine years ago and macular degeneration in each eye and puts eyedrops in and occasionally they give him injections. The patient received his second dose on 13Feb2021 (Batch/Lot number: EL9266). Concomitant medications included that he takes Lipitor 10mg every day for his cholesterol. Estrogen 10mg every day for his open-heart surgery. No further details provided about these medications. The patient initially stated that he has practically had no symptoms with either shot. He said he basically had no symptoms other than after his first shot. The patient then stated that after his first dose he had one day where his blood pressure went "very low" but by the time he talked to his cardiologist it had "gone back to normal" on 25Jan2021 in the morning, that was the only side effect he experienced. He did not have any other recent vaccinations nor started any new medications. Investigation assessment was not provided. Outcome for the event was resolved on 25Jan2021. Follow-up (02Mar2021): This is a Follow-up spontaneous report from a contactable consumer. This consumer (patient) reported which included clinical course of events. No follow-up attempts are possible. No further information is expected.

1370392	6/3/2021	MI	80	F	2/26/2021	2/26/2021	Headache; Sever pain behind left ear; Stiff neck/ Neck stiff and behind left ear it hurt; just in the back of the neck; started bother me; cold made it worse; This is a spontaneous report from a contactable consumer (Patient, self-reported). A 80-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Solution for injection, Batch/Lot Number: EN6198), dose 1 via an unspecified route of administration on 26Feb2021 (80-years-old at the time of vaccination) as 1ST DOSE, SINGLE for covid-19 immunisation; paracetamol (TYLENOL), via an unspecified route of administration from an unspecified date (Batch/Lot Number: SLA071) to an unspecified date, as 500mg for an unspecified indication. Medical history included High Blood Pressure and glaucoma. Concomitant medications included clopidogrel bisulfate 75mg (patient stated, that is the blood thinner. It's generic is clopidogrel bisulfate, that's the blood thinner); perindopril erbumine 8mg (This is the generic of Aceon); amlodipine besylate 5mg (Patient take its Generic of Norvasc); timolol maleate 5mg (take eye drops for glaucoma. Patient take twice a day from 50 years). Reportedly, patient had vaccine shot Friday, I am taking Tylenol. Sever pain behind left ear. Can I take ibuprofen. Stiff neck going on five days. I've been using heat. I don't have the chills, nausea, joint pain. her husband was 82. Not on walker/canes. Tylenol doesn't affect, it doesn't do anything for me but they tell not to take Ibuprofen because of the virus. Reason for no lot number of Tylenol: patient stated, I don't have that on here. On 26Feb2021, the patient experienced sever pain behind left ear, stiff neck/ neck stiff and behind left ear it hurt; just in the back of the neck; started bother me; cold made it worse, on an unspecified date headache. Therapeutic measures were taken as a result of sever pain behind left ear, stiff neck/ neck stiff and behind left ear it hurt; just in the back of the neck; started bother me; cold made it worse, headache. Outcome of the events was not recovered. Additional Context: Patient stated, I just talk to you and we got hung up. When probed for the concern, consumer stated, I would like to know if I am taking a reaction to the vaccine shot. I got it on Friday the 26th. I had a, my neck start getting stiff on Wednesday and Thursday, Friday it wasn't, it went away but now I got the only thing side effect really I got is just stiff neck, now

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT

while when I came home (incomplete sentence), stiff neck, my neck is stiff and behind the left ear it hurt but headache and all that, I don't get a headache. It is just in the back of the neck. I don't have a fever, I don't get nauseous. I don't get any of the symptoms only that I have stiff neck. Consumer stated, I want to know really. What could I do about it? I put cold on it (treatment) and it made it worse. The "phone" (not clarified) says put heat on it that what's I have been doing and Tylenol doesn't affect, it doesn't do anything for me but they tell you not to take Ibuprofen (Ibuprofen captured conservatively) because of the virus you know. When probed for Email address, consumer stated, I don't have one. Consumer stated, I took it (first dose) on 26 and I am supposed to take on the 19th (second dose). When probed for vaccine expiration date, consumer stated, It doesn't show the expiration date. When probed for Tylenol LOT# and expiration date, consumer stated, I don't have that on here. It has my birth date and it has the day I took it was 26Feb2021 and I just gave you the other number that was on here. The other number is I was supposed to take it on 19Mar21. That's the only number I got. When probed for start date of the problem, consumer stated, The night at 26th (Feb2021) is when it really started bother me. I was fine all day long until late that night. When probed still having the problems, consumer stated, Yes. When probed to confirm treatment, consumer stated, Tylenol, cold and heat. Cold made it worse so I put heat on it. Description of complaint: Tylenol doesn't do anything for her. Patient wants to know what to do and how long will it last. patient had a stiff neck. She had it a few days prior to getting the vaccine. It went away. On Friday night after getting the vaccine she had a tremendous pain in her neck that went down in the shoulder. They want her to take Tylenol. She has been drinking extra water. Tylenol doesn't do anything for her, only Ibuprofen. She tried using a cold water bottle. No follow-up attempts are possible. No further information is expected. Follow-up (02Mar2021): This is a follow-up spontaneous report from a contactable consumer reported that: patient details (weight, height), medical history, suspect product details (start date, lot number), concomitant drugs, events.

1370503	6/3/2021	VA	56	F	2/26/2021	3/13/2021	Summary from patient: On 13. March 2021, I had to be taken with an ambulance to the Emergency Department, due to uncontrolled vomiting (vomiting by each head movement) and severe headaches. I was unable to move any longer and experienced severe dehydration. Since childhood I pass out, when I need to vomit, which made the situation extremely serious. A MRI done in the evening was normal. Diagnosis: Severe Migraine Attack Low Platelet count noticed by attending Physician (mild, rebounded) I had to stay in the hospital overnight. For the following two weeks, I experienced constant nausea and irritation of both eyes, dizziness on and off, headaches at the back of my head on and off. ?Feeling the eyes?, eyes easily strained (phone + computer), light sensitivity. On 27. March 2021, I was referred to a Neurologist, due to my ongoing symptoms, who confirmed diagnosis, Severe Migraine Attack. Neuro Exam: normal. He stated that it is extremely unusual to get such a severe event at my age, particularly, since I had never experienced anything like this before. He gave me an intravenous injection of Solu Medrol 500 mg, which resolved most of my symptoms, except the issue with my eyes. In addition, he prescribed some Migraine prophylaxis, which made me drowsy and therefore I stopped the medication after two days. On 3. April 2021, I went for a follow up visit with the Neurologist. He said, he gave me these strong medications, as I had a Status Migrainosus. My eyes continue to bother me, getting strained on screens and they are still light sensitive. My head is more sensitive, for example to abrupt movements and heat.

1370508	6/3/2021	TX	47	F	4/5/2021	4/6/2021	<p>Huge headache right side of eye; This is a spontaneous report from a contactable consumer (patient herself). A 47-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Formulation: Solution for injection Batch/Lot number was not reported, Expiration Date was not reported), via an unspecified route of administration, administered in left arm on 05Apr2021 (at the age of 47-year-old) as 1st dose, single for covid-19 immunisation. The patient medical history and concomitant medications were not reported. It was reported that, 06Apr2021 patient experienced huge headache right side of eye. Caller is calling regrading the Pfizer Vaccine, clarified as the Pfizer Covid-19 Vaccine. She got her first dose was administered on Monday 05Apr2021 in her left arm. Now she has a huge headache, on the right side of her eye. She has taken Tylenol and it does not go away. She initially stated she took Benadryl and it did not go away. She also initially stated she took Zyrtec and it feels like it is getting stronger. She later stated the Benadryl seemed to help alleviate the pain, but made her sleep. She cannot take it now because it will knock her out. With the Zyrtec it is like the headache is throbbing now. She does not know what to take to make it go away. Stated she does not know how much Zyrtec she can take. Caller later clarified details. She clarified and confirmed with Benadryl the huge headache went away. She took it at night time and it made her go to sleep. She is working from home today and does not want to take it right now because it will make her sleep. She clarified and stated the Zyrtec helped to alleviate it a little bit, for like 2 hours, but now it is coming back strong. When probed for outcome of huge headache right side of eye she confirmed as improved. Details captured as provided. She stated she is still feeling a throbbing feeling. The Zyrtec is wearing off. She can still function with a little pain. On a scale of 1-10, the pain is like a 6. Caller asked for lot/exp/NDC of Tylenol, Benadryl, and Zyrtec. She stated she only has the Benadryl and Zyrtec with her. Tylenol Lot/exp/UPC: Did not have with her to provide. Benadryl: Lot: STC123, Exp: 8 2022, NDC 50580-415-01, 25mg tablets. Zyrtec: Lot: 1741995, Reason for no lot number: of Pfizer Covid-19 Vaccine: Other: Husband has the paperwork and he is not there with her. Therefore, unable to provide. Therapeutic measures were taken as</p>

1370509	6/3/2021	NY	54	M	4/2/2021	4/3/2021	<p>Feeling unwell, General body aches; he does every once in a while get an asthma episode; Fever; Feel a bit achy; Mild headache; vision is hard to focus; Not feeling right on and off; This is a spontaneous report from a contactable consumer or other non hcp (Patient himself). A 54-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE solution for injection, Batch/Lot Number: EW0150, expiry date: unknown), via an unspecified route of administration, administered in right arm on 02Apr2021 as 1st dose, single for covid-19 immunization. The patient's medical history included Type 2 Diabetes mellitus, patient reported that it was diagnosed at least 10 years ago, and his sugar levels had been in very good control, Covid-19 from unknown date in Nov2020 to unknown date in Dec2020. The patient's concomitant medications were not reported. On 03 Apr 2021 maybe started Saturday after the vaccination the patient experienced with mild Headache and not feeling right on and off for 6 days. Patient reported that his head feels worse since he got the slight fever, he took Tylenol to deal with the fever in morning, like 11:00 AM then he did not feel quite right, probably feels worse to next day, sometimes his vision was Hard to focus he was to struggle a bit to focus or just worse because of the fever. since he got the vaccine, in the first couple days, he might have just felt like things were a little blurry and again it was very mild, but it seems worse than it had. on 08Apr2021 the patient feels little achy, and he took the Tylenol and only felt worse because of the fever and later felt better and had general body aches the patient did have COVID back in the end of November, then he recovered in the beginning of December, he got an asthma episode still that he believes was triggered by the COVID. The patient reported that he had a blood work on 03 MAR 2021, he saw his doctor on 10 MAR 2021 and his blood work was pretty normal. His blood sugar was very good, and he also has been very active, he walks every day. The patient enquired second dose was scheduled for 23 APR 2021, was it fine to have a second dose. The patient did not visit Emergency Room or No Physician Office. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient did not test COVID-19 positive prior to vaccination. The patient had not been tested for COVID-</p>

reported that on 09Apr2021 she had the lightheadedness comes and goes and she also experienced a headache and her arm soreness inflamed; swelling on 09Apr2021 in Friday. She reported that her arm pain was so bad that she couldn't not sleep. She could not lay on it. she states it is a little better now, it still hurts, but she is able to roll off of it and get some sleep. Patient experienced chills and a fever from 101.7 up to 103 degrees and Feeling hot and cold on Saturday 10Apr2021. she stated that she was taking Ibuprofen for pain and fever, and was told she shouldn't take Ibuprofen, she should take Tylenol to break the fever and she took some Tylenol and her fever broke after taking Tylenol. Patient stated that on 10Apr2021 she had also felt foggy, nauseous and tired. She reported that she had COVID in Jun2020 and felt like COVID all over again. she had the same symptoms; really tired, could sleep for days. patient thinks she had a bit of an allergic reaction on her arm. It has improved, but now she has a red swollen splotch on her arm, and it is not even where they put the needle it is down a little bit lower. Patient reported that her heart rate was elevated as well. Patient reported that 12Apr2021 she felt like equilibrium is off, and had blurred vision, feels fine right now, but all she has done was slept since she got home from work yesterday and hasn't exerted herself today yet and right now she is not tired, she slept for 12 hours. Patient reported that she felt sick all-day and had diarrhea on 10 Apr2021 in Saturday, nausea started on Saturday, all she could eat was chicken noodle soup and she experienced it yesterday. she states yesterday she took some Tylenol, and got a chicken sandwich, since she had taken some medication, and then wanted to throw it up when she got home and she is not foggy now, but it comes and goes, the symptoms are intermittent, she doesn't know if she will be ok. she can still feel on 10 Apr2021 her had sinuses feel off and she had chronic sinusitis and whenever she gets sick her sinuses get attacked. she states she didn't think she would get side effects because she already had COVID, but apparently it is the opposite. Patient reported that she was being told so many different things and now she was scared to get the second shot and is freaking out. she reported that she had to cancel all the appointments at work yesterday day because of the events and she thought she would have the weekend to recover from any side effects but

							dry soon) and OCULAR DISCOMFORT (Have eye problem) outcome was unknown and INCOMPLETE COURSE OF VACCINATION (Did not receive the 2nd dose of vaccine) had resolved. mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown) was withdrawn on an unknown date. Patient visited the Neurologist, and the Infectious Disease Physician. Concomitant product use was not provided by the reporter. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded for the event of Bell's palsy got worse. Company causality for Incomplete course of vaccination was assessed as not applicable.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded for the event of Bell's palsy got worse. Company causality for Incomplete course of vaccination was assessed as not applicable.
1372320	6/3/2021	NM	76	F	5/21/2021	6/2/2021	Fatigue, feeling dizzy, not having good vision, leg cramping/hurting, HA, and SOB. She was diagnosed with myocardial Infarction in the ER with SOB adverse effect of the vaccine. She has no prior cardiac history
1371946	6/3/2021	NE	29	F	3/20/2021	3/29/2021	Tingling and numbness on left side (arm and leg), then a week later, tingling and numbness also started on right side (arm and leg). A few days later, I developed some facial numbness and the sensation of the skin tightening and that has stayed to some degree consistent. A week or so later, I noticed my legs and arms felt weak at times and I was incapable of normal levels of exercise, like I'd been able to do previously. Around the same time I noticed my blood vessels were more prominent. This included the blood vessels in my extremities as well as one on the left side of my neck and some around my eyes. I had a few days of throbbing pain and the feeling of inflammation around the blood vessel in my neck, but that went away eventually. I have had a feeling of tightness in my neck, that makes swallowing a little more difficult at times.

1372017	6/3/2021	MA	75	F	1/11/2021	1/17/2021	Around the 6th day after the vaccination I experienced an aura while watching television. I began to experience a very bad headache my vision became very blurry and I could not speak.
1372023	6/3/2021	TN	61	F	6/3/2021	6/3/2021	Patient received her first moderna vaccine on 6/3/21, pharmacist advised patient to wait in the waiting area for 15 minutes. The patient was waiting near the pharmacy, she went to the restroom and approach one of our associates saying she felt tired. The pharmacist went to check on the patient to see how she was feeling, the patient wanted to leave the store but the pharmacist advised against and had the patient return to chair. Patient informed the pharmacist that her legs and arms were weak. The pharmacist ensured patient knew who she was, where she was, the date and year. Patient then stated that her vision was blurry. The patient was able to answer all of these questions with no problems. Pharmacist asked the patient if she was comfortable with her calling an ambulance to check patient, the patient was resistant to calling an ambulance, the pharmacist did call the patient's son so he could come to the store to assist his mother. We decided it was best to call an ambulance after multiple minutes of the symptoms continuing. Pharmacist inquired about health condition, patient is diabetic so we attempted to get the patient's blood sugar and got the patient a soda to help with low blood sugar. Patient stated she felt slightly better after the soda but she was still very weak when ambulance arrived, the EMT advised the patient it was best to go to the ER to be examined. Son of the patient stated that she has episodes before where patient will be overstimulated and gets quite fatigued.

1371934	6/3/2021	CA	26	F	6/3/2021	6/3/2021	Patient received first dose of Pfizer on 6/3/2021. She said she had ringing in her left ear 10 minutes after. She waited for 15 minutes of observation and left with her husband. She started to feel numbness on the left side of her face, involving her eye, cheek and chin. She decided to come to COVID vaccine clinic rather than return to the clinic where she received the vaccine. Denies shortness of breath or lip/throat swelling. Nurse practitioner on site assessed patient, did a neuro assessment and found it to be normal. Nurse practitioner ordered 10 mg Zyrtec sublingual, it was administered. Symptoms slightly improved but did not subside completely. Patient observed for an hour. Symptoms did not progress. Nurse practitioner discharged patient with instructions to return if symptoms progressed or started to involve airway.
1372312	6/3/2021	CT	17	M	6/3/2021	6/3/2021	Approximately 10 minutes after receiving 1st covid Pfizer shot, patient reported feeling light headed and dizziness. He reported blurry vision, ringing in ears and was looking very pale. He was evaluated and monitored any other symptoms until paramedics came. Water and ice was given to patient while he waited. paramedics came and monitored patient and left
1372065	6/3/2021	TX	47	F	4/27/2021	4/28/2021	Blurry vision and( flashing light in peripheral vision )right eye the next day after receiving the second dose on April 27,2021. Flashing light lasted for a week. Afterwards just blurry vision until May 30th vision became distorted and dark. Visited eye specialist 06/04/2021 and was advised to report to the CDC that blood clot was found in right eye. Treatment is now needed that involves injections to the right eye . (3 treatments in span of 10 weeks) with possible laser treatment if injections are not as effective. Eye Specialist -
1372325	6/3/2021	NY	51	F	5/25/2021	5/28/2021	i receive the moderna vaccine i went to ER on 6-3 2021 because the hives and red and itch does not stop i have been taking benadryl and it is not working the hives come and go it stop when im sleeping as soon as i get up it starts up again it doesn't stay in one place it goes from top of my head to all over right now as im typing is on my lip and eyes itching and redness i also been having heart burn i am not scared to to take the second dose

1372341	6/3/2021		71	U	4/17/2021	4/17/2021	Patient exited the building after vaccination. Pt had a witnessed episode of blurred vision. Immediate assistance was provided. Vital signs were taken BP 151/88, HR 59, O2sat 91% on RA. EKG NSR. Pt obeys all verbal commands. Upon discharge BP 135/84, HR 55 BS 95. Pt denies blurred vision at this time. He is advised to F/U with PCP. He verbalizes good understanding.
1372346	6/3/2021	MO	75	F	5/28/2021	6/2/2021	pt called 6/3 and stated she developed a rash on her upper back shoulder on 6/2. she noticed today 6/3 it's across her chest. told her to keep an eye on it and see how bad it gets and might have to see dr but right now take some benadryl and hydrocortisone cream etc.
1372356	6/3/2021	CA	15	F	6/3/2021	6/3/2021	RN vaccinated client and within 30 seconds noticed client started moving to the side. RN held client at chair, RN responded while two other RNs set up anti-gravity chair. Between all nurses, lifted client and laid in chair. PHN joined, client oriented to self and situation, pale, diaphoretic. Vitals at 1412: blood pressure 100/60 pulse 76, oxygen 97%. Client stated feeling dizzy, denied headache, blurry vision, nausea, shortness of breath, chest pain. Client given water and juice. Father present stated no reaction to first vaccine, allergies to peanuts and seafood. Vitals at 1414: blood pressure 106/70, pulse 79, oxygen 98%. Client alert and oriented x4, stated felt dizzy but did not lose consciousness. Per client same thing happened years ago when having blood drawn. Father informed we would observe for 30 mins. 1417: blood pressure 108/72, pulse 81, oxygen 98%. Client stated feeling better. Vitals at 1422: blood pressure 106/74, pulse 79, oxygen 97%. Client stated symptoms resolved. Alert and oriented x4, color normal for ethnicity. Per Father, client's blood pressure is on the lower end. Vitals at 1427: blood pressure 100/70, pulse 85, oxygen 99%. No complaints. Vitals at 1437: blood pressure 100/70, pulse 85, oxygen 98%. Per client feeling fine, everything resolved. Client and Father given ER precautions and advised to follow up with provider. Last vitals before client leaving blood pressure 106/78, pulse 87, oxygen 97%. Client able to stand up with no complaints. Client left facility with steady gait at 1444.44.

1372544	6/3/2021	CA	25	F	6/1/2021	6/1/2021	All of the following side effects occurred for 36 hours following my vaccination: Extreme fatigue; headache; fever; chills; night sweats; nausea; vomiting; dizziness; blurred vision; weakness; muscle aches throughout entire body; pain at injection site (only experience 24 hours after injection)
1372547	6/3/2021	CA	79	M	2/24/2021	3/20/2021	Sudden and complete loss of vision in left eye for about 1 minute followed immediately by sudden and complete recovery of vision. No other symptoms. Lovastatin increased from 20mg/day to 40mg/day. Aspirin increased from 81mg every other day to 81mg every day. I have not subsequently experienced any symptoms to date.
1372593	6/3/2021	CT	50	F	4/25/2021	4/25/2021	First shot: immediately dry mouth and itchy throat. Within 1/2 hour eyesight was very slightly blurry. Second dose: Immediately after receiving shot had itchy inner ears and a dry, itchy throat. Within 1 hour after my face swelled up and I looked sunburned and had no wrinkles. (I am 51, so I definitely have wrinkles and all the lines in my face disappeared.) Swelling and symptoms were gone within 4 hours.
1372906	6/3/2021	IL	14	M	6/3/2021	6/3/2021	Patient fainted approximately 5 minutes after receiving the vaccine. He fell to the ground hitting his head on some shelving while falling. He was quickly revived by his father, but still felt dizzy and complained of blurred vision. Patient was given a bottle of water and comforted by his father and brother. When I checked on him about 20-30 minutes later, he said he felt fine. He looked a lot better too.
1372922	6/3/2021	TX	25	F	6/2/2021	6/3/2021	No issues the day of the vaccine. Woke up the next morning with what I believe is called ?COVID arm? I had a large red rash around the injection site. The red circle is raised and tender to touch and very warm. Additionally I noticed several tiny speckled bruises on my body. Some on my chest and some under my arm. I also have a swollen tender left eye lid. My eye could be vaccine related or not, I just noticed it the morning after I got the shot.

1373089	6/3/2021	NC	38	M	4/23/2021	5/16/2021	3 weeks after initial dose (4/23/2021), I started experiencing dizziness and a constant mild headache. With the dizziness, there was no visual perception of moving or spinning objects and no proprioception problems. The dizziness is more like a sense of being unsteady and an inability to maintain balance. The feeling has never gone away and persists in any position. On different occasions, many times per hour, there is a sweeping feeling that is never in a persistent direction. On the first day of symptoms, the headache was moderate with a feeling of facial puffiness with an elevated blood pressure near hypertensive crisis levels... which was on a Sunday. The following Wednesday morning, I visited the Emergency room at 0034 EST 5/19/2021 because the dizziness was not getting better. A review of systems was performed with no abnormal results. EKG was normal. Cranial CT scan showed no indications of stroke either although I have not looked at it myself yet. Blood sugar level was at 90. Chem12 test was normal. Well for more details, please contact me. Session is about to time out and I don't know how to extend it on my phone. I have tried vestibular therapy motions. None improved the dizziness. I also have intermittent fog and below normal focus capacity.
1373103	6/3/2021	AZ	33	M	6/1/2021	6/2/2021	Head ache, body ache, chills, moderate fever, stomach cramps, vomiting, diarrhea weakness, ear ache, eye ache all within 4 hours of vaccine and continues on to now 48+hours
1371236	6/3/2021	VT	35	F	6/1/2021	6/2/2021	I was dizzy, weak and nauseous. It felt as if I was going to vomit and then I went unconscious. My husband saw that I had collapsed back into the bed I was leaning against, with my eyes rolled back and I was making a gurgling sound. He attempted to get my attention several ways by loud yelling of my name and lightly hitting my cheek. I was unconscious for a few minutes and when I regained consciousness I had had broken into a heavy, soaking sweat. He described it as looking as if i had a seizure. I have no history of seizures and have never had one prior to this event and vaccine.

1370731	6/3/2021		65	M			Rash on eyelids and arms after 2nd Pfizer COVID vaccine; Rash on eyelids and arms after 2nd Pfizer COVID vaccine; This is a spontaneous report from a contactable consumer via Pfizer sales representative. This consumer (patient's friend) reported for a 65-year-old-male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), Solution for injection, Lot number: not reported), dose2 via unspecified route of administration, on an unspecified date (at the age of 65-years-old) as single dose for COVID-19 immunization. Patient previously took first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), Solution for injection, Lot number: not reported), via unspecified route of administration, on an unspecified date, at a single dose for COVID-19 immunization. The patient's medical history included leukemia as a child and had not had a reaction to a vaccine before. Patient's concomitant medications were not reported. On an unspecified date, the patient experienced rash on eyelids and arms after 2nd Pfizer COVID vaccine. He had been to allergist who provided a steroid cream for arm and said not to put on eyelids. The reporter stated that this occurred close to 3 months ago and still has not resolved. He has a dermatologist appointment on 03Jun2021. The outcome of events was not recovered. No follow-up attempts are needed; information about lot/batch number cannot be obtained.

1372152	6/3/2021	WI	46	F	6/3/2021	6/3/2021	The patient received the first dose of the Moderna Covid-19 vaccine. The patient was administered the vaccine in the immunization booth. The PQCF was reviewed by the administering pharmacist and the patient marked no for all questions including Question 5 concerning seizure disorders. The patient remained in the immunization booth due to the immobility of the patient. The immobility of the patient was not related to the following event. The patient's mother within 5 minutes of the vaccine being administered called that the patient was having a seizure. Code White was called to the pharmacy to support the pharmacy staff in the needs of the patient. The patient was monitored and associates were stationed near the patient as she remained seated during and after the seizure. The patient was monitored closely. The patient's mother stated after the seizure that the patient has seizures regularly and was "due for one" meaning a seizure. The patient was continuously monitored for 20-25 minutes at which point she attempted to walk under the supervision of the pharmacy manager. The patient was able to walk under her own power and it was determined at this point she was able to leave the pharmacy area. Follow up with the patient will occur later in the evening and the next day to ensure the patient is doing well.

1371351	6/3/2021	RI	33	F	4/10/2021	4/10/2021	Later the evening of vaccination I had a high fever of a 104.2, chills, cold sweat. I took a Tylenol to bring it down. Two days after the vaccine in my right eye was cloudy and I couldn't see properly. Also, pain at the injection site.
1371429	6/3/2021	IL	51	F	4/9/2021	4/22/2021	Patient developed Shingles on head, face, and in eye. Symptoms started 12 days after vaccine.
1371467	6/3/2021	MO	62	M	5/26/2021	5/26/2021	Eyes open in fixed stare for approximately 30 seconds. Would not respond verbally. Was pale and skin clammy. Cool cloth to base of neck. Waiting in personal van with passengers seat partially reclined. Back to normal state by end of 15 minutes wait. VS were BP 97/66, pulse 57, pulse ox 97% Held for additional 15 minutes to further monitor. Was able to lay down for first Covid vaccination and had no adverse reaction(s). States his mother also reacts porky to any injection.
1371487	6/3/2021	AR	33	F	5/27/2021	5/28/2021	About 3 hours after receiving the first dose, my right eye began to itch but there wasn't any thing physically seen on the day I received the vaccine. When I woke up the next morning on Friday, May 28th, I noticed my eyelid (the part that's closer to the lashes) had swollen up. Saturday morning, it had swollen more than it had the previous day. I tried placing a hot wash cloth over my eye. My eyelid was super tender and the slightest touch to the eyelid hurt. Sunday, I decided to make it to the ER. Although they couldn't confirm that it was an allergic reaction (even though I told them it was), the doctor saw how it was swollen and tender. I was given 3 different medications to take. It is now day 5 and it seems as though it has worsened because it's now the whole eyelid. It's painful. When I had to get something off the floor or tie my shoe, it feels like drainage is rushing towards the front of my head and causing the pain in my eye.

1371498	6/3/2021	FL	54	F	4/21/2021	4/22/2021	Dose 1 on 4/21/21- woke up next day and my eyes were hard to open/keep open. Vision okay, just could not keep open, not dry-very hard to describe. Also sent me into a Cluster Headache Episode that is increased severity/frequency/unlike other episodes (this is my assumption-that it was trigger by vax as not at all normal for me and all other things remained the same. Dose 2 increased the episode again and continues on as of today
1371519	6/3/2021	TX	14	M	6/3/2021	6/3/2021	The patient complained about feeling lightheaded, sweaty, and blurred vision. Spo2 99 HR 96, BP 124/98 T 95.1 The patient's mother stated that he always gets that way when he receives a vaccine or donates blood. The clinical staff attended to him. He stated that he felt fine after about 5 minutes.
1371524	6/3/2021	MD	64	M	4/3/2021	4/13/2021	About nine days after the first Pfizer vaccine I noticed a pain in my left tooth where is was difficult to chew. I thought perhaps it was a cracked tooth or abscess but it spread throughout my mouth making it painful to chew any food. It seems that the nerves above the teeth were somehow infected or something. I had pain around my eyes and once in my left ear. I suspected Sinusitis or something but was not sure as I had never had this happen before. I had my dentist look at it. The metal tapping tool showed no cracks. The xrays showed no tooth problems, nor any sign of sinus inflammation. I reported it to me doctor and he told me to report it on VAERS as a possible side effect of the vaccine. It was severe for about two weeks and has since returned to normal.

1371570	6/3/2021	NY	63	F	3/15/2021	3/15/2021	A series of inflammatory events occurred which began with the first dose of the Pfizer vaccine. I initially developed a rash at the injection site of the first dose within hours of the injection. That was my only symptom after the first dose. The nurse at the vaccination site suggested that the second dose be administered in the other arm due to the rash which was still vivid. Within hours I also had a rash on the second arm as well. Over the next few days rashes appeared in the crook of my elbows and at my waistline. Shortly thereafter I developed "dry eye". My eyes were dry and sensitive to bright light. Then I started to have discomfort when I took a deep breath. On April 29, 2021 I had severe discomfort when breathing and was diagnosed by my doctor with pleurisy and possible pericarditis. I could not lie down for ten days and had to rest sitting up. Over time, and with the help of a great deal of ibuprofen I have improved. I no longer have discomfort when breathing and the rashes are 99% gone. The "dry eye" is slowly improving.
1371619	6/3/2021	IL	36	M	5/21/2021	5/23/2021	Systemic: Confusion-Severe, Systemic: Dizziness / Lightheadness-Medium, Systemic: Exhaustion / Lethargy-Severe, Systemic: Headache-Severe, Systemic: Hypertension-Severe, Systemic: Numbness (specify: facial area, extremities)-Medium, Systemic: Shakiness-Medium, Systemic: Stroke-Severe, Systemic: Tingling (specify: facial area, extremities)-Medium, Systemic: Unable to Sleep-Severe, Systemic: Visual Changes/Disturbances-Severe, Systemic: Weakness-Severe, Additional Details: 2 days after receiving 1st dose had a stroke, went to Hospital had 3 more light strokes, loss of vision in left eye, shuffles to walk, BP not under control, patient was discharged and following up with PCP.
1371635	6/3/2021	NY	43	M	4/18/2021	4/1/2021	Primary symptom is tinnitus in both ears (more left) that has increased slowly since second vaccination. Of possible relevance, two additional temporary symptoms occurred roughly one week following second dose: two separate incidences of scintillating scotoma (bilateral visual artifact on left side of visual periphery; each episode lasting approx. 40 minutes; occurred two days apart); and two or three incidences of very brief (5 sec.) SSHL (sudden sensorineural hearing loss) in right ear (incidences occurred approx. two days apart).

1371853	6/3/2021	WA	31	F	3/29/2021	4/5/2021	After receiving the first COVID vaccine, about a week later My neck started to get really rashy and itchy. With some time and cream it did heal. After receiving the second shot, and being in the hot sun for several days the rash returned but was a lot worse, and looked more like a bright red sun burn. I went to urgent care because it was unbearably itchy, and my face, ears, eyes started to swell. My blood pressure at urgent care was in a dangerous spot 188 over 55 I believe. Luckily they checked it again before I left and it has gone down to 155 over 55. They prescribed me a Epi pen, Pepcid and antihistamine. A week later after being in the hot sun again, The rash came back. More like a rash this time and less like a sun burn. It wipes me out for an entire day because of how puffy, itchy, and uncomfortable I am. It brings on this extreme fatigue that I am not used to. What helps the most is sitting with an ice pack on my neck for the entire day, getting rest, and staying on anti histamine. Even in less severe sun It can easily gets triggered. I am doing everything I can to stay out of the sun, because of course everyday life makes that impossible. I am concerned because I have never experienced a reaction to the sun, or vaccine, or anything on my neck like this before. All three reactions have been different on my neck, but what remains the same is that itchiness, and hot ears, and puffy eyes. It all started after getting the COVID vaccine, and the doctor in Urgent care told me that when I am due for a booster shot to get competitor instead. Please advise on what I should do, or if there is any insight on this. Thank you!

1371768	6/3/2021	SC	56	F	3/19/2021	3/21/2021	I received the first vaccine Friday March 19, 2021, I woke up Sunday, March 21, 2021 with severe vertigo. It lasted over 3 1/2 weeks. I saw a neurologist, was sent to vestibular physical therapy. It was determined I was experiencing BPPV. The extremely disabling vertigo subsided but I still felt off. I received the second vaccine Friday April 16, 2021. I was very tired and nauseated. I had occasional episodes of dizziness and nausea. On Monday April 19, 2021 I continued to deal with dizziness and nausea but it was intermittent and not as severe as the first episode of vertigo. I have experienced dizziness and nausea daily since. It comes and goes. I returned to the neurologist and the vestibular physical therapist, this is not BPPV. My eyes are displaying a down-beat movement. Nothing is relieving the dizziness and nausea at this time. A CT scan has been ordered.
1371738	6/3/2021	NY	54	F	5/17/2021	5/17/2021	Within minutes of receiving the shot, I started getting a headache and just feeling generally off...almost a feeling of an adrenaline rush. Felt a bit antsy and foggy for 1 hr. A couple of hours later, I got a small hive on the bottom of my right eye, followed by small hive in my left shoulder. My nose started to run a bit and I called my sister who brought me over some Benadryl. When she arrived, I felt the inside of my bottom lip begin to tingle and mildly swell. Stayed awake for a bit and then took the Benadryl before going to sleep. In the morning, the inside of my bottom lip felt like it had a series of small canker sores which resolved within 24 hours. I had a telemedicine visit with my doctor's office, and they felt it was a local reaction, perhaps anxiety induced; they ok'd 2nd dose. Discussed with vaccination site coordinator, and they consulted with the County Health Department who will not administer a second dose due to CDC guidance regarding hives, etc.

1371683	6/3/2021	WA	38	F	4/8/2021	4/9/2021	The day after, I woke up with a bad headache and I had the headache for a good 19 days. The doctors thought I was over-reacting. It was a bad headache on left side of head. I was just not feeling well. On the 19th day, it went away. I still from time to time I do still feel pain in the head on the left side. I had a lot of tightness in my left leg. In previous years, I have had blood clot in my leg and after birth in my stomachs - so with the pain in calf I called a doctor and went. They did a visual. After a lump appearing in my leg, an ultrasound was scheduled. I went Urgent care on May 10 - she ordered an ultrasound but her office didn't ever follow up with me. On 17th, I saw my Primary care and she sent me straight to get an Ultrasound - on the 18th, it revealed I had a blood clot.
1371782	6/3/2021	VA	28	M	6/3/2021	6/3/2021	28 year old male presented for initial dose of Pfizer-BioNtech at 1100 AM on 6/3/21. Pre-assessment form was filled out and reviewed with nursing student administering the vaccine. The client stated no known allergies to medications, food, venom, or environmental elements. He also stated no allergic reactions to previous vaccines. The client also stated that he had no known health issues. After administration the patient stated he was dizzy and then immediately became unresponsive, diaphoretic, eyes rolled back, and head hyperextended. Family was present and we asked if he had any seizure history and his family declined. At this time the patient and family informed us that after vaccines in the past he does faint but didn't inform staff before this vaccine was administered. The patient remained unresponsive for 45 seconds. Then his feet were elevated and he asked to lay down. At 11:11 AM his HR was 60 and O2 was 97% on pulse oximetry. He felt hot and was still diaphoretic and felt very fatigued. Once he started feeling better we sat him back up and his HR was 89 and O2 was 99%. We gave him 2 bottles of water and crackers. He remained in our care for 45 minutes. He then waited an additional 30 minutes in the post vaccine area. His family stated they were going to drive him home and get some food. The patient is expected to return June 24, 2021 for his second dose of the Pfizer vaccine. We provided additional discharge instructions

1370392	6/3/2021	MI	80	F	2/26/2021	2/26/2021	Headache; Sever pain behind left ear; Stiff neck/ Neck stiff and behind left ear it hurt; just in the back of the neck; started bother me; cold made it worse; This is a spontaneous report from a contactable consumer (Patient, self-reported). A 80-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Solution for injection, Batch/Lot Number: EN6198), dose 1 via an unspecified route of administration on 26Feb2021 (80-years-old at the time of vaccination) as 1ST DOSE, SINGLE for covid-19 immunisation; paracetamol (TYLENOL), via an unspecified route of administration from an unspecified date (Batch/Lot Number: SLA071) to an unspecified date, as 500mg for an unspecified indication. Medical history included High Blood Pressure and glaucoma. Concomitant medications included clopidogrel bisulfate 75mg (patient stated, that is the blood thinner. It's generic is clopidogrel bisulfate, that's the blood thinner); perindopril erbumine 8mg (This is the generic of Aceon); amlodipine besylate 5mg (Patient take its Generic of Norvasc); timolol maleate 5mg (take eye drops for glaucoma. Patient take twice a day from 50 years). Reportedly, patient had vaccine shot Friday, I am taking Tylenol. Sever pain behind left ear. Can I take ibuprofen. Stiff neck going on five days. I've been using heat. I don't have the chills, nausea, joint pain. her husband was 82. Not on walker/canes. Tylenol doesn't affect, it doesn't do anything for me but they tell not to take Ibuprofen because of the virus. Reason for no lot number of Tylenol: patient stated, I don't have that on here. On 26Feb2021, the patient experienced sever pain behind left ear, stiff neck/ neck stiff and behind left ear it hurt; just in the back of the neck; started bother me; cold made it worse, on an unspecified date headache. Therapeutic measures were taken as a result of sever pain behind left ear, stiff neck/ neck stiff and behind left ear it hurt; just in the back of the neck; started bother me; cold made it worse, headache. Outcome of the events was not recovered. Additional Context: Patient stated, I just talk to you and we got hung up. When probed for the concern, consumer stated, I would like to know if I am taking a reaction to the vaccine shot. I got it on Friday the 26th. I had a, my neck start getting stiff on Wednesday and Thursday, Friday it wasn't, it went away but now I got the only thing side effect really I got is just stiff neck, now

while when I came home (incomplete sentence), stiff neck, my neck is stiff and behind the left ear it hurt but headache and all that, I don't get a headache. It is just in the back of the neck. I don't have a fever, I don't get nauseous. I don't get any of the symptoms only that I have stiff neck. Consumer stated, I want to know really. What could I do about it? I put cold on it (treatment) and it made it worse. The "phone" (not clarified) says put heat on it that what's I have been doing and Tylenol doesn't affect, it doesn't do anything for me but they tell you not to take Ibuprofen (Ibuprofen captured conservatively) because of the virus you know. When probed for Email address, consumer stated, I don't have one. Consumer stated, I took it (first dose) on 26 and I am supposed to take on the 19th (second dose). When probed for vaccine expiration date, consumer stated, It doesn't show the expiration date. When probed for Tylenol LOT# and expiration date, consumer stated, I don't have that on here. It has my birth date and it has the day I took it was 26Feb2021 and I just gave you the other number that was on here. The other number is I was supposed to take it on 19Mar21. That's the only number I got. When probed for start date of the problem, consumer stated, The night at 26th (Feb2021) is when it really started bother me. I was fine all day long until late that night. When probed still having the problems, consumer stated, Yes. When probed to confirm treatment, consumer stated, Tylenol, cold and heat. Cold made it worse so I put heat on it. Description of complaint: Tylenol doesn't do anything for her. Patient wants to know what to do and how long will it last. patient had a stiff neck. She had it a few days prior to getting the vaccine. It went away. On Friday night after getting the vaccine she had a tremendous pain in her neck that went down in the shoulder. They want her to take Tylenol. She has been drinking extra water. Tylenol doesn't do anything for her, only Ibuprofen. She tried using a cold water bottle. No follow-up attempts are possible. No further information is expected. Follow-up (02Mar2021): This is a follow-up spontaneous report from a contactable consumer reported that: patient details (weight, height), medical history, suspect product details (start date, lot number), concomitant drugs, events.

headache, get a little and eyes hurt. She went to work Wednesday, she had a horrible feeling and felt like the walls were crawling in. She is supposed to go in three weeks for second dose. The second shot would be worse, and she feels like that will be a danger. She expressed her concerns about the second shot as she read in the paper that the second one is more stronger. She doesn't plan to get the second one. Something could happen to her with the second shot. The paper said the second shot would have side effects. The people that have done the second shot got sleepy, dizzy, and weak. She want to make sure she can get to work but was still experiencing the adverse events. The outcome of eyes are hurting was not recovered, while with other events was unknown. No follow-up attempts are needed; information about lot/batch number cannot be obtained.

I have had no congestion, itchy eyes, shortness of breath while exercising or a running nose. Nothing has changed other than the vaccinations.; This is a spontaneous report from a contactable consumer. This 66-year-old male consumer (patient) reported that he received first and second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, formulation: Solution for injection, Lot Number: Unknown, and Expiration date: Unknown), via an unspecified route of administration on unspecified dates in 2021 as 1st dose, single and 2nd dose, single for COVID-19 immunization. The patient medical history included ongoing allergies, hay fever; and congestion and stuffy nose during pollen season (since childhood). The concomitant medications for patient were not reported. The patient reported that he had history of allergies, hay fever, congestion and stuffy nose during pollen season since childhood. He completed the two doses of Pfizer COVID vaccination along with his wife in 2021. This spring, despite of very heavy pollen, the patient had no congestion, itchy eyes, shortness of breath while exercising or a running nose. Nothing had changed other than the vaccinations. The patient wanted to make aware of this in the event this was a possible positive vaccination side effect. The outcome of the event was unknown. No follow-up attempts are needed. No further information is expected.

1367312	6/2/2021	PA	39	M	5/20/2021	5/23/2021	Fever; Chills; Headache; I have both my eyes swollen; This is a spontaneous report received from a contactable consumer (reporting on himself). A 39-years-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Formulation: Solution for injection, Lot Number and Expiration Date was not reported) via an unspecified route of administration in Arm Left on 20May2021 11:45, as 2nd dose, single dose for COVID-19 immunization. The patient medical history nad concomitant medications were not reported. Patient previously took first dose of BNT162B2 29Apr2021 11:45. Prior to vaccination, the patient was not diagnosed with COVID-19 and did not receive any other vaccines within 4 weeks prior to the COVID vaccine and any other medications the patient received within 2 weeks of vaccination. He had his second shot on 20May2021 11:45 and he went to fever, chills and headache until Saturday morning. 23May2021 late in the evening he noticed his eyes started swelling up a little bit; they went down a little bit and he went to bed; 24May2021 he woke up with swollen eyes again. He clarified that he already reported this information; but he was unable to obtain reference number from that report. He had questions regarding these side effects after the Pfizer Covid Vaccine and wanted to know about recommendation on taking histamines like Zyrtec Benadryl after the vaccine Response. Since the vaccination, the patient has tested for COVID-19. The outcome of the event i have both my eyes swollen was not recovered and for rest events was unknown. Information about lot/batch number has been requested.

and her second dose on 22Apr2021. After second dose she developed blisters on the inside of her mouth. The blisters have resolved, however, she reports that . She also says that she has pain, especially with swallowing, and experiences worsening hoarseness throughout the day which results a loss of voice by the end of the night. The caller reports that she has called her doctor and he told her to swish and gargle with Mylanta and swallow, swish with warm salt water, and also swish with Listerine. She states that she has not tried the Listerine yet because she is afraid that it will burn too badly. She has also taken Benadryl. She states, "I have to shut my eyes really tight to drink water. It feels like I am pouring acid in my mouth, it doesn't feel like water. By the time that night time comes I've lost my voice completely. that part doesn't bother me as bad as the pain does." The caller also states that she is concerned because when she received her first dose by the Pharmacist and she states that dose in the syringe was "less than half the syringe full" and then when she went back to receive the second dose she states that it was given to her by "the clerk" instead of a Pharmacist because the Pharmacist was not available that day. When the caller was given her second dose she states, "that syringe was nearly full and it did not look like the first dose did." Caller states she is having a really bad reaction and her family doctor has been working with her on it but she doesn't think he really knows what she should do. Caller states her first vaccine was 31MAR2021 and her second was on 22APR2021 and within an hour of getting it, maybe not even that long, she developed blisters all inside of her mouth, and now her mouth is bright red like she was drinking cherry Kool-Aid. Caller states she is closing her eyes and forcing herself to drink water and eat applesauce. Caller sates this all happened on 22APR2021. Treatment: Mylanta in the fridge and then swish it around in her mouth, gargle, and then swallow the Mylanta and to do gargle with warm salt water and Benadryl. The events were not resulted in Emergency Room was or Physician Office, she talked to him on the phone, but she has not seen him in person because she has to ride the bus and she has to book her appointments in enough time to book the bus, and she doesn't feel like going if he doesn't know what to do for her.

1367239	6/2/2021	CA	49	F	4/29/2021	4/29/2021	Why was the patient taking Covid-19 vaccine (Verbatim): because she is diabetic; swelling under eyelids; swelling on chin and left cheek; had an allergic reaction with a rash; rash from neck up on chin and cheeks; This is a spontaneous report from a contactable reporter(patient herself). A 49-years-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Batch/Lot Number: EW0176) via an unspecified route of administration, administered in right arm on 29Apr2021 at 14:30 as single dose for COVID-19 immunization. Other vaccinations within four weeks prior to the first administration date of the suspect vaccine was reported as none. History of all previous immunization with the Pfizer vaccine considered as suspect (or patient age at first and subsequent immunizations if dates of birth or immunizations are not available) was reported as none. AE(s) following prior vaccinations was reported as none. Medical history included type 2 diabetes mellitus. It was reported that she ran out of medication and was not taking anything for diabetes. Family Medical History Relevant to AE(s) included that her father had a positive result after getting the vaccine. Her father has rheumatoid arthritis including pain all over. After getting the vaccine, the pain went away. Her father also had a rash on his arm that cleared up after getting the vaccine. No relevant tests were done as reported. Concomitant medication included Azo from 27 Apr 2021, ongoing and Nerve taken for nerve relief from 27 Apr 2021 and stopped taking it on 03 May 2021. It was reported that she was fine but had an allergic reaction with a rash from her neck up that was on her chin and cheeks around 1700-1800 on 29Apr2021. She had swelling under her eyelids on 30Apr2021 and on the bottom of her cheek on 30Apr2021. It was also reported that the patient took Covid-19 vaccine because she is diabetic. She was scheduled to get the second injection today(20May2021) and was asking if she should get it. She mentioned that she does not have a physician. She thought she had a reaction to it. Lot 1069C95021, Expiry Feb 2023.. The outcome of the events, off label use was unknown and rash from neck up on chin and cheeks and swelling on chin and left cheek was recovered on 11May2021, rash from neck up on chin and cheeks was recovered on 03May2021. Follow up attempts are needed. Further

1367223	6/2/2021	NY	52	M	5/8/2021	5/8/2021	feels like there are little tiny baby hands pinching his internal organs throughout his abdomen; Eyes swollen and his vision was diminished; Eyes swollen and his vision was diminished; On his injection arm- 2 inches away from the injection site appeared a size of a gigantic golf ball/A huge lump appeared a few inches from injection site; Numbness from his ankle to his feet and from his knees to his feet/numbness in legs and feet; feels like it's cold and tingly; feels like it's cold and tingly; ringing ears; pressure in his neck to his injection site; back pain/pain in back; vision is blurry; throat was swollen.; Toes locking up; Really dizzy and really lightheaded; Mind has been foggy; Glands were swollen; Arm soreness; Nose is bone dry; tiredness/tired; injection site pain/injection site soreness; This is a spontaneous report from a contactable consumer (patient, self-reported). A 52-years-old male patient received first dose of BNT162B2 (PFIZER-BIONTEC COVID-19 mRNA VACCINE, Solution for injection, lot number: EW0173 and expiry date was not reported), via an unspecified route of administration, in Arm Left, on 08May2021 at 02:38 PM, as a single dose for COVID-19 immunization. The patient did not receive any other vaccine in four weeks. The patient's medical history included Bug bite (happened 5 days prior to 30Apr2021 and regimen of an antibiotic). He was completely done with the rotation for a least 8 days before he got the vaccine. It might have something to do with this. concomitant medication included dicloxacillin (started it on 30Apr2021 and it was for 5 days. He did not know what it did was). The patient reported that on 08May2021, day one, he experienced, tiredness and injection site pain. On day 2, until now side effects which had not gone away. It hadn't gotten worse, but it was not any better. The patient felt like congestion, but his nose was bone dry, like crusty dry. It hurts a little bit because it was so dry and he had arm soreness, nothing out of the ordinary. The arm soreness was just normal injection stuff. At first it was a little tender on the injection spot. It went away after about a day. On 10May2021, the patient felt like there were little, tiny baby hands pinching his internal organs randomly throughout his abdomen. It was not a sharp pain, more like a little squeeze all through his abdomen. It felt like his whole throat was swollen. It was not visually swollen, it more felt like a football in his neck. Stretching it was helping. His

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

toes have been locking up like a pre-clamping. He had numbness from his ankles to his feet for 8 days, and now he has numbness from his knees to his feet. It was not completely numb, but it was not normal. The feeling of baby hands pinching his internal organs started the second day after the vaccine and has stayed consistent. The patient's eyes swollen, and his vision was diminished. Day 2 through today, it felt like his eyes were swollen, his vision was seriously diminished, he had a golf ball sized welt on his arm not at the injection site but 2 inches from it, and he was really dizzy and really lightheaded and almost fainted at the corner store. The feeling like his eyes were swollen started on day 3 after the vaccine. The crease of his eye below the eyebrow and on top of the socket got red and puffy and looked like sunburnt skin does. It was at the point that now it feels swollen all the time almost like he had pink eye and his vision has been diminished about 30%. He had a test done yesterday and his vision was 20/25. Some-times he could not even read a text and had to stare at his phone for 10 minutes to make out words. He did not have these issues before. The feeling of his eyes being swollen was a little better in the mornings and about 1300 it gets worse when he gets lightheaded to where was when it started. His vision became diminished about day 3 after the vaccine. It was a little better in the morning, but in the afternoon, it goes to exactly the same as when it started. He noticed the golf ball sized welt on his arm about 3 days ago. The doctor seemed to think a drop of the injection might had travelled from the injection site and his body was creating a defense to it. It was scary to take a shower and then see that. It didn't hurt. It was not painful, but it was a weird foreign entity. The cramping in his toes started probably day 3 and was consistent. The numbness started on day 2 after the vaccine, and up until 3 days ago it was just his ankles and feet. 3 days ago, it got to the point where it was from his knees to his feet. It has gotten worse since it was now travelling up his legs. On his injection arm- 2 inches away from the injection site appeared a size of a gigantic golf ball - when asked with his doctor he said that he thinks that a drop of the vaccine travelled and his body building a reaction to it and it was very abnormal. The patient also had numbness from his ankle to his feet worsened and from his knees to his feet- almost feels like it was cold and

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

tingly. The patient also had dizziness and lightheaded about day 2 after the vaccine and it was the same. It came in waves but was consistent throughout the day. He would be fine then had a wave of dizziness. He has been laying down so much because he was so tired, ringing ears, felt like his glands were swollen, pressure in his neck to his injection site, and back pains. The patient stated that his doctor was only form urgent care. The patient Felt like whole throat was swollen, toes locking up, really lightheaded, mind has been foggy, and arm soreness. The patient had bizarre side effects from the Covid Vaccine for 11 days now. He thought it was the smart thing to report them to Pfizer. He didn't like to give personal information. He declined to give his mailing address or his email address. He hated when asked for race, but he guessed it might be important. He did not have a mailing address, phone number, or email address handy for his physician. He went to Urgent Care yesterday to have it checked and they did an EKG and said he had to be sent by ambulance to the ER. The doctor did bloodwork, and she said everything looked alright and to rest a few more days and keep hydrated. The patient underwent the lab work and procedures which included chest X-ray with unspecified result. He thinks it was on 18May2021. His mind has been foggy with all of that. It was yesterday or the day before. He could not be sure. He has been sleeping so much and was in a complete daze. The fogginess he had the whole time as his other symptoms, and it was the same. He has been eating well and hydrating and taking a multivitamin and Gatorade, all the things' people say to do. He asked if Pfizer has heard of this before. He was panicked it might be chronic, and he worries about the safety of the second shot for him. He was sure many people haven't reacted, but these are freaky side effects. He asked for advice and if Pfizer had heard of this before or if he was some weird anomaly. On his way to get the vaccine he asked 2 people at the city health line if they had taken it and they both said no. He asked 3 other patients and they said they took the Pfizer. One woman said she will take it when they make her. The guy who gave him the shot lied and said he wasn't eligible. It might have been his way of not having to discuss it. The events resulted in doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care. The patient

1367182	6/2/2021	MD	53	F	5/6/2021	5/1/2021	<p>pain all up the arm/As time passed the pain progressed up her arm. She couldn't straighten arm at all/When she lifts her arm up, it is still sore/her right arm wrist also has pain; now she also has pain in her right wrist/pain has started to increase in her left arm wrist/her right arm wrist also has pain; swelling at the injection site; left shoulder inoculation site edema/edema is minimal; left ear was burning; left eye had floater; left hand and wrist were double the size of right hand/it was so swollen it was a bite/because of the swelling. She couldn't even bend her knuckles at all; swelling in the right wrist/wrist doubled the size of right hand/it was so swollen it was a bite; entire arm where the vaccine was given was red and swollen/swelling in her left arm has increased; entire arm where the vaccine was given was red and swollen.; arm was warm; she has cried; intramuscular pain; This is a spontaneous report from a contactable consumer (patient). A 53-year-old female patient received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot Number: EW0182), intramuscular at the age of 53-year-old administered in arm left on 06May2021 10:40 at single dose for covid-19 immunisation. Medical history included chronic anemia, pulmonary embolism in both lungs (doesn't remember the years but she had 4 or 5 of them/maybe between 2016 and 2019), didn't have a bladder from Apr2020 (cystoscopy performed in Apr 2020), dehiscence of wounds, gastric bypass from Jul2007, two major blood clots in right arm from 2019 (because of infiltrated IV. One was 7mm and one was 8mm. A piece broke off of one of them within 24 hours and went into right lung), Smoker, allergy to antibiotics, slightly topical itch reaction to Morphine, cat scratch infection, had a reaction to IVP dye for kidney scan where her eyes started swelling. Concomitant medication included gabapentin (NEURONTIN) taken for left knee nerve pain from Mar2021 and ongoing. The patient previously took Doxycycline and experienced anaphylactic reaction, morphine and experienced slightly topical itch reaction. She received her first Pfizer COVID19 Vaccine on 06May2021 which was a Thursday. Everything was fine. Shot was in left arm. Wednesday, last week, which was six days later she woke up with her entire left hand and wrist doubled the size of right hand on 12May2021. A friend of hers is her in home nurse because caller has underlying health issues. They</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

thought because it was so swollen it was a bite. Caller did Benadryl and RICE treatment. As the day progressed, she had pain all up the arm on 17May2021. She had an appointment with physical therapy. They said to get to the hospital. Her nurse met her for lunch and caller's arm was warm in May2021 and her nurse said to get to the ER. They wanted to rule out a blood clot. They didn't want to admit her, but she had severe issue with her arm that day. She was given pain medication, Benadryl, and had CT scan to rule out blood clot in ER. She couldn't move her neck to the left. She was there 8 hours. While there, her left ear was burning (on 12May2021) to the point it felt someone was ripping it off. In her left eye she had floater on 12May2021, like black fuzzy lines. Everything was on the left side. She didn't hit anything in the time between receiving the injection and 6 days later. She had not done nothing out of her normal routine. It is too much of a coincidence that this is the only thing she has had in the left arm. For 2 or 3 days since last Wednesday the entire arm where the vaccine was given was red and swollen in May2021. She didn't have an immediate side effect, but 6 days later she had a great amount of side effects. She can't say it is the vaccine. She has had a flu shot every year and pneumonia shot every 5 years with no side effect. She is anaphylactic or resistant to every oral antibiotic. Even with IV antibiotics there are only certain ones that can be use, but she has to be pretreated with 50mg of IV Benadryl. She was on Doxycycline all last summer oral and IV. After 4 weeks on it she was sent home with a temp medline for IV infusion. Within 3 hours of her giving herself the next dose she had an anaphylactic reaction. Her body does not immediately react to any side effects or adverse reaction. It can be days out and it hits all of a sudden. On last Wednesday she woke up around 7AM. She felt like it woke her up because of the swelling. She couldn't even bend her knuckles at all. As time passed the pain progressed up her arm. She couldn't straighten arm at all. Everything was on that Wednesday and on the left side. She had full range of motion on the right side. The hospital said it was intramuscular and she read that could possibly be side effect. This was her first dose. Left hand and wrist were double the size of right hand: It resolved. She noticed it around 7AM as the day progressed the swelling went down a little bit. That is

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

when the arm started hurting and the swelling would come back. The swelling wasn't as significant as it was first thing in the morning. She has pictures she can provide if needed. Pain all up the arm: the pain has resolved except for the top of the arm where she received the vaccine. When she lifts her arm up, it is still sore. It wasn't sore the first 2 to 3 days or immediately following the inoculation. It is still very mildly sore. They also did an ultrasound when in the ER. At home she takes, not for this issue, Gabapentin 3 times a day. It was just filled and is in the pharmacy vial and she doesn't have NDC, lot, and expiry. Caller clarified that it is Neurontin 300mg not Gabapentin. She has been on Neurontin since Mar2021. She takes it for left knee nerve pain. For the pain meds she was given in the ER and the Benadryl she doesn't have NDC, lot, or expiry. The hospital administered 100mg of Benadryl. When they did the CT scan they did it with contrast. 40 years ago she had a reaction to IVP dye for kidney scan where her eyes started swelling. Anytime she has contrast solution she is always treated with 50mg of IV Benadryl. She has a slightly topical itch reaction to Morphine. In the ER, they gave her 40mg of IM morphine because they couldn't get a line going. She basically has no veins. They gave her 50mg of Benadryl subcutaneously in the inner area. Then before the CT with contrast, they gave her another 50mg of Benadryl. What she took at home was off brand. It is called Banophen Diphenhydramine HCl 25mg antihistamine. She took one when the reaction happened. The manufacturer is Major. NDC: 09045551-59. When providing NDC caller states, "Come on eyes." Lot number: P121325. Expiry: Aug 2022. Caller just found a sugar cookie from Panera Bread to eat. She was in (withheld) in mid October to late October. Unfortunately when she was down there with her best friend her cat scratched her and caller ended up in the hospital because of cat scratch infection. Even though they were very cautious and following all the CDC guidelines and wearing mask when she came home for 5 days she had many COVID symptoms. She went for a rapid test and it came up negative. She has been tested 15 times since last year because she has had so many surgeries. The reason she got the vaccine was with her underlying health conditions she doesn't want to die. What is interesting is her husband and son both after she

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

felt ill coming home had the same symptoms she did. She is scheduled to get her next dose 27May2021. Is that normal to be scheduled 3 weeks apart? Her greatest concern is her nurse provider is not familiar with her. Her GI doctor and orthopedic surgeon said she should be ok. She wants to receive both as recommended. Her concern with the second vaccine is if the side effects that she experienced could be dramatically worse or result in a horrible outcome. When she spoke to the physician and the nurses and the medical care team they said there are no studies or reports where the vaccine is causing blood clots and what she was experiencing was not associated with the vaccine. When she looked up the vaccine, it said that intramuscular issues could be a rare side effects. Her thought was that it wasn't reported that it hasn't happened. Could intramuscular issues be a rare side effect? Caller clarified that she does not have the Doxycycline or any other antibiotics that she is resistant to or had reaction with to provide NDC, lot, and expiry. The last time she had it was when she had the temp medline put in. She had the reaction and spoke to the infectious disease doctor only in hospital. She threw all the vials and all the bags away. She torn up the lot numbers. The actual bottles she soaked them and then flushed the labels down the toilet. She has chronic anemia. It has been brought to her attention lately that she has critically low iron saturation. Low saturation should be 18 and her iron saturation level was a three. She had the blood test on the same day of the vaccine on 06May2021. On the 7th she had iron infusion. The vaccine was given at 10:40AM. The blood work was drawn at 02:40PM. The iron infusion was at 9:30AM on 07May2021. She received one unit. Adds she previously reported she had gotten the Pfizer COVID 19 vaccine and six days later she had severe side effects. States she was encouraged by her health care professional to go to the ER to rule out a blood clot which she did and the result was negative. Adds when she had the first dose of the vaccine 06May2021, intramuscular in the left shoulder; she had no side effects or anything. Six days later her left hand was swollen to double the size of the right had. She took a 25mg Benadryl that did nothing, which she previously reported. Adds at lunch yesterday she spoke to a friend who is an in home care nurse who has taken care of her before because of her other

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

medical problems; and she encouraged the caller to do RICE treatment; rest, ice, compression and elevation for her wrists. This friend saw the hand at lunch and noticed that the caller was unable to straighten the left elbow and arm; she had great pain in the left elbow and from the hand up the arm. All of these events were previously reported. Caller mentions she is in so much pain and her symptoms are getting worse. New events reported today include the pain has started to increase in her left arm wrist; swelling in her left arm has increased. Caller mentions the physical therapist saw the edema especially on the left shoulder at the vaccination (inoculation) site on 17May2021 and said there is still swelling and she had not noticed this before. Caller clarifies later that day around 1700PM 17May2021, the caller attended a physical therapy treatment and the therapist noticed swelling at the injection site on 17May2021 which was not previously reported. Adds as the day went on yesterday, her right arm wrist also has pain; since yesterday through last night and today it has been at a 10. Adds she has cried in May2021. Mentions she feels she has limited use of her fingers that she noticed yesterday when she had the wrist pain; even picking up things or trying to chop chicken, she can't; she doesn't think she mentioned particularly the left wrist yesterday. Her main concern today is that the pain in her left wrist has increased and now she also has pain in her right wrist on 17May2021. Caller adds she put muscle rubs on; and ice. Her pain in her wrists has not responded to the Gabapentin. She applied three different topical solutions with no improvement in her pain: Generic muscle rub from store; Natureplex Ultra Strength muscle rub; NDC 67324002-01; Jul2022; Topical 5% pure lidocaine cream; Lot 20G13C1; Jul2022; OTC from the pharmacy, no box. Voltaren Gel; Dec2019; lot WN791; unable to locate NDC due to pain in her wrist. Adds the swelling on both wrists is minimal but the pain is incredible; excruciating. Just the edema is minimal; she has kept ice on it on and off; 20 minutes on and off. Adds she has never had pain like this before. Caller mention she did speak with doctor yesterday. Adds she was greatly upset when they told her after she had explained all of her symptoms, that intramuscular joint pain had been detected in May2021. The events results in Emergency Room Visit. The patient underwent lab tests included blood test: unknown results

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							on 06May2021, Iron saturation: low (Low saturation should be 18 and her iron saturation level was a three) on unknown date, CT scan (to rule out blood clot): unknown results, ultrasound: Unknown results, COVID test: negative. The outcome of event left ear was burning and left eye had floater was recovered on 12May2021, the outcome of event Swelling of wrists, Vaccination site oedema and Wrist pain was not recovered and other events was unknown.
1367379	6/2/2021	OK		M	3/23/2021	3/1/2021	runny nose; This is a spontaneous report from a contactable consumer or other non hcp. A 20-years-old male patient received BNT162B2 (: PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration on 23Mar2021 (Batch/Lot number was not reported) as a Single dose for covid-19 immunization. The patient past medical history and concomitant medications were not reported. The patient experienced runny nose 10 days but was fine after on Mar2021. However, 4 days later he woke up with an incredible ringing in my ears and a spike headache that he has never experienced that in his life. He also reported a rash under one of his eyes that later spread to the other eye, as well as insomnia. He has seen his HCP and was referred to an Audiologist, who he has visited 3 times since then. He was diagnosed with 50% loss of hearing and 10500 Hertz tinnitus, which the Audiologist mentioned is high. He was prescribed with high dose Prednisone for 7 days, but caller mentioned it did not help and had no effect whatsoever. His HCP wanted to be super cautious and recommended a brain scan this week just to make sure he didn't develop a blood clot. He has reached out to CDC and asked for medical advice, but he stated that everyone is giving him the same answers - there is not enough data. He is on the verge of suicide and said, I can't live with this for the rest of my life. I can't sleep and can't think, its driving me crazy. The event outcome was recovered on Apr2021. He is desperate for answers and even tried reporting to VAERS but there was no way to submit it. No follow-up attempts are needed; information about lot/batch number cannot be obtained.

1367232	6/2/2021	AZ	78	F	3/18/2021		<p>Tooth reinfected between the two doses; Fever and chills; Fever and chills; This is a spontaneous report received from a contactable consumer (Patient). A 79-year-old female patient of an unspecified age received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; formulation solution for injection; Lot number: ER2613), via an unspecified route of administration on 18Mar2021 (at the age of 78-year-old), as single for Covid-19 immunization. Medical history included thyroid cancer from 1979 to an unknown date, osteoporosis, back surgery, car accident prior to the pandemic, broken wrist and nerve damage, head and neck cancer, stroke, Brain tumor (inactive), vestibular issues, corneal transplants (two), tooth infection/ like slow infection from 2018 to an unknown date; she was visually disabled; her root canal that got infected and her thyroid was removed surgically, both from 2018 to an unknown date. The previously took bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; formulation solution for injection; Lot number: EN6202), via an unspecified route of administration in Arm left on 25Feb2021 (at the age of 78-year-old), as single for Covid-19 immunization and Shingrex vaccine with horrible reaction. The patient's concomitant medication included levothyroxine (LEVOTHYROXINE) taken for thyroid hormone replacement therapy and zoledronic acid (RECLAST) infusion one time in a year, taken for osteoporosis. On an unspecified date, after the second dose the patient experienced tooth reinfected between the two doses, fever, and chills. She stated that she went to a site where vaccines were being administered by nurses and mentioned that she was diagnosed with cancer there in 1979. When she got the first dose of the vaccine, she had to fill out a health history form, had to talk to a nurse about it, then she got a shot while at the second time around it was different because the nurses leaned in the back window to talk to her and gave her the shot, and she did not have to fill out a form during second shot. The nurses told her that her vaccine would only be 40% effective because of her cancer history as her PSH scores showed that she had a weakened immune system. she was a thyroid cancer patient survivor as her thyroid was removed surgically and was on hormone replacements for that, prior to the vaccines. They also tested her TSH scores. She has not had chemo but a</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
-----------------	--------------	--------------	----------------	------------	-----------------	-------------------	---------------------

month before the pandemic the doctor started doing labs to track her PSH levels and was going to change her thyroid hormone doses. She took a thyroid hormone replacement, levothyroxine. She stated sometimes if the dose was wrong, got heart palpitations. She stated she used to be on 112 mcg and now was on 75 mcg. She was hoping that doctor knew about endocrinology and had figured out why her hormone replacement was not as effective as it should be. They checked her labs but had not called and said that she had a better immune system. They kept pushing her procedures further and further without diagnosing her. They tested her for covid antibodies, but she tested negative. She had stoke, brain tumour that was inactive, vestibular issues, two corneal transplants, and she was blind. Additionally, she had a horrible reaction to the Shingrex vaccine in the past and mentioned that she got vaccines for everything as she was trying to live to be 90 years old. she was also on Reclast infusion one time a year for osteoporosis and wanted to know if that could affect the vaccine, she was recovering from back surgery, was in a car accident prior to the pandemic, she typically would get shots in her weaker arm as she had a broken wrist and nerve damage, prior to the vaccines; she was visually disabled, since before vaccines; she was a head and neck cancer, and stroke, prior to vaccines. She had a root canal that got infected in 2018 and it was like a slow infection, started prior to the vaccine which was reinfected between the two doses, had fever and chills. She thought it was a reaction to the second dose then realized it was the infection in her mouth. Hence, she saw her dentist. The outcome of the events was unknown. No follow-up attempts are needed. No further information is expected.

1367406	6/2/2021	FL	55	F	5/3/2021	5/4/2021	<p>it is freaking burning; open wound; Soreness; Little blister; She stated her whole body was shaking; Skin falling off/It got like an open area besides my pinky on the left side of my face next to my left eye; Exhausted; I had diarrhea.; I had headaches/It has caused a extreme headache.; Shingles in my eyeball/stated her shingles were coming out. She felt like the Shingles were coming through her shoulder blade and 6 days after the shot her shingles were coming out of her left eye.; I have been getting chills since shot two.; This is a spontaneous report from a contactable consumer. This 55-year-old female consumer (patient) reported that. A 55-years-old female patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Solution for injection), via an unspecified route of administration, administered in Arm Left on 03May2021 13:52 (Batch/Lot Number: ER8730) as 2ND DOSE, SINGLE for covid-19 immunisation. Medical history included shingles, ongoing asthma and breathing. Concomitant medications included budesonide, formoterol fumarate (SYMBICORT) taken for dyspnoea, fluticasone propionate, salmeterol xinafoate (ADVAIR) taken for dyspnoea. The patient previously took first dose of bnt162b2, administered in left shoulder on 12Apr2021 (Lot number: Lot number: EN6208) for covid-19 immunisation and also took breo and experienced shingles. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient reported that she took Valacyclovir which is like Valtrex because of shingles coming out my eyes and took a painkiller it's a naproxen painkiller for headache during the day since may 4th. She also took Symbicort and Advair for like top of the years now because of my breathing. Dose of Valtrex was stated by the consumer as 1000 mg (Not confirm hence not captured). The patient reported Last night, I had diarrhea and I woke in a little while with chills and this morning I woke up with more of my, more of the skin fell of my face and the worst thing is like that. She stated she felt soreness, a little bit of a headache coming and her shingles were coming out. She felt like the Shingles were coming through her shoulder blade, 6 days after the shot her shingles were coming out of her left eye and went on for two weeks, she thought it was gone and then they came back. She stated that she was looking at on her skin; it was falling</p>

off and it was freaking burning. She has an open area the size of her pinky for 3 days now. She reported that her skin is coming off her her left side of her face, clarified right next to her left eye. Diarrhea started 04May2021 and it comes and goes. She also mentioned she woke up with chills last night. She clarified the chills came on shortly after the shot on 04May2021 and went away. She stated her whole body was shaking and she did not had chills like this since she can remember. She was an hour and half late for work because she was so exhausted A section of skin fell off her face. Caller mentioned the shingles in her back were coming out on 04May2021. She took Valtrex she had leftover from before. She stated she had shingles in her eye ever since she took the product called BREO. Sunday, 6 days after she received the second shot, she felt the shingles coming out of her left eye. She went to see her doctor because she was out of Valtrex and he gave her more Valtrex to take. The vaccine pushed the shingles out and made it open up, initially on her back the day she got the second shot. The skin falling off her face started 22May2021. She developed a little blister that fell off. Yesterday the skin also came off. This morning another section of her skin came off. She clarifies there was another bubble that was attached to her skin. The area of her face was an open wound. She took Naproxen to control her headache, at night occasionally she took a nerve block and Singulair and Advair for a couple of years depending on her asthma and allergies. Therapeutic measures were taken as a result of i had headaches/it has caused a extreme headache and Shingles in my eyeball/stated her shingles were coming out. She felt like the Shingles were coming through her shoulder blade and 6 days after the shot her shingles were coming out of her left eye. The outcome for the event diarrhoea, skin falling off/it got like an open area besides my pinky on the left side of my face next to my left eye, it is freaking burning, open wound, soreness, little blister and she stated her whole body was shaking was unknown, for the events i had headaches/it has caused a extreme headache, shingles in my eyeball/stated her shingles were coming out. she felt like the shingles were coming through her shoulder blade and 6 days after the shot her shingles were coming out of her left eye, i have been getting chills since shot two and exhausted outcome was not resolved. No further details

1367439	6/2/2021	CA	39	M	5/21/2021	5/21/2021	This is a spontaneous report from a contactable consumer (Patient himself). A 39-year-old male consumer received bnt162b2 (BNT162B2, COVID-19 VACCINE; formulation: Solution for injection, Lot number: unknown, Expiration date: unknown) via an unspecified route of administration on Friday, 21May 2021 (at the age of 39-years-old) as Unknown dose, single dose for covid-19 immunisation. The patient medical history and concomitant medications was not reported. On the day of vaccination, he felt a slight numbness of the face, on the right side, above the eyebrow and the outside corner of eye and ending up in the jaw, he was let it go at that time when he leaving the vaccination center, But these days he felt that tingling or numbness again. Also felt tingling in hand. Patient was asked whether any reports on this. Events were considered as non serious. The outcome of the both events was reported as not recovered. Information about lot/batch number has been requested.
1367453	6/2/2021			M	2/16/2021		fatigue; brain fog; depressed; anxious; double vision; dizziness; This is a spontaneous report from a contactable Nurse (mother) reported for her son. A 46-years-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, formulation solution for injection, lot Number unknown, expiration date unknown), 1st dose, via an unspecified route of administration on 16Feb2021 as single dose for covid-19 immunisation. The patient medical history and concomitant medications were not reported. Caller which was a mother of patient was inquiring about the side effects which had been experienced by her 46-year-old son since receiving the first dose of the vaccine. She stated that 1-2 weeks after the first dose patient began having fatigue and brain fog. Gradually since then he has become depressed and anxious. She also mentions double vision and dizziness. Caller has questions regarding if these side effects have been reported. Patient inquired about the best way patient can stay updated on the vaccine as new information comes out. The outcome of all the events was unknown. Information on the lot/batch number has been requested.

recovered; pain all over her body on an unspecified date in May2021 with outcome of not recovered; muscle pain on an unspecified date in May2021 with outcome of unknown; lost her appetite on an unspecified date in May2021 with outcome of unknown; tired in the beginning, sleeping all day on an unspecified date in May2021 with outcome of not recovered; right side of her head, neck, back, all her arm tingles on her right on an unspecified date in May2021 with outcome of unknown, right-sided back/neck/shoulder pain on an unspecified date in May2021 with outcome of unknown, all reported as worsened. Clinical course reported as follow: Patient was calling to ask if taking ibuprofen (ADVIL) or naproxen sodium (ALEVE) to treat side effects was better than taking paracetamol (TYLENOL), which was what she has been taking. Patient received her first dose of the Pfizer BioNTech COVID-19 vaccine and experienced side effects that were worse after receiving the second dose. Patient reported pain in her eyes after the second dose. Patient was very concerned about the shot she has gotten. She was in such painful. She stated the whole right side of her head, neck, her back and all her arm tingles on her right. She stated the one she got, the second one, it made her have a headache. When she got the second shot, her arm, she couldn't take her arms in one position, like when she's driving, she has to move around or something. Patient stated but something she's really concerned about was about three days ago, after she take that shot, she had such a headache, the pain in her arms was getting worse. She felt a pain in her ears, its painful/sound in her ear and stated they were painful, not all day, but sometimes, but it was getting really strong. The most concern was her eyes, when she has such a headache, it's like needles in her head, and her eyes were feeling like she put some lemon inside her eyes (11:00 in the morning), it really hurts. She closed her eyes because she couldn't leave it open. When she opens her eyes, she saw something like she's blind and was really concerned, the first time it started was Saturday, 15May2021. Yesterday and Sunday, it happened three times, today two times already. It was ongoing, persisting, and was happening more often. It's getting worse since yesterday. Patient already talked to the doctor in the hospital, but they gave her prescriptions because they said for the pain all over her body that it

							was the symptoms for the shot, so they gave her prescription for the muscle pain and they said it was gonna be gone like a couple of days, and it was still there for more than two weeks, so it was too much. Patient stated another thing that concerns her was she has lost her appetite. She still took her vitamins, but she didn't know what the pain was from. Patient confirmed all symptoms have gotten worse since they began. Patient then decided she would like to be transferred to facility because she has pain now and would like to speak to someone. Patient reported of right-sided back/neck/shoulder/arm pain that began after her first Pfizer COVID vaccine and worsened when she received her second dose. Patient stated the doctor sent her some medicine, like anti-inflammatory and muscle pain relievers, but it didn't help. No family medical history relevant to AEs. No relevant tests. AEs did not require a visit to emergency room and physician office, just talked to physician on the phone. Follow-up attempts are needed. Information about lot/batch number is available.

1366973	6/2/2021	DE	60	F	1/8/2021	1/8/2021	<p>First covid vaccine 21Dec2020 Had second shot 08Jan2021; Rash in groin / lower abdomen; This is a spontaneous report from a contactable physician. This Physician reported for a 60-year-old female patient in response to HCP letter sent in cross reference case. A 60 year old female patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Lot number: EH0899, Exp. Date: 31Mar2021, NDC: 59267-1000-01), via intramuscular in left arm on 08Jan2021 at 10:29 at a dose of 0.3 ml as a single dose for COVID-19 immunization. The patient had no history of allergies to vaccines or injectables. The patient did not receive any recent vaccines for any other conditions prior to the event. The patient did not receive any recent vaccines for SARS-CoV2 other than Pfizer-BioNTech COVID-19 Vaccine prior to the event. The patient did not receive any other vaccines around the time of Pfizer-BioNTech COVID-19 Vaccine. The patient's BMI was 26 to 99. The patient had no AE's prior vaccination. The patient's medical history and concomitant medication refer the case 2020512502. Previously, the patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Lot number: EL1284, Exp. Date: 30Apr2021, NDC: 59267-1000-01), via intramuscular in left arm on 21Dec2020 at 12:52 at a dose of 0.3 ml as a single dose for COVID-19 immunization. After the second dose of vaccination in less than six hours, the patient had no new areas of rash irruption but had new rash at groin, went to her R sternal border and under her breasts, worked its way up to lower abdomen over a few days. A week later occurred on a couple of places on my right chest, sacral area, and nape of neck. The rash was extremely pruritic, red, raised and took another shot prednisone taper and took Benadryl. The patient did not undergo laboratory test. No other symptoms were present. The patient was letting know this in case anyone else has had this issue, that the vaccine can cause a rash. The patient was not sure if this was a side effect or an allergy but if a yearly vaccine was needed, the patient did not think the patient should get the Pfizer vaccine. The patient did not hospitalized and admitted to an intensive care unit (ICU). The patient felt well and declined exam or further medication. No further action was required, and patient was explained that it</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							was difficult to say what the rash was due to but this was not a contraindication to further COVID vaccines and rash may not be vaccine related. The predisposing factors were cestice history and multiple medications. Culture was not performed. The patient did not use any antipyretic. The patient had not experienced any anaphylactic reaction and just a rash 24hrs after both COVID vaccine doses. The patient had no multiorgan involvement, dermatological/mucosal, generalized urticaria (hives), generalized erythema, angioedema (not hereditary), generalized pruritus without skin rash, generalized prickle sensation, localized injection site urticaria, red and itchy eyes, gastrointestinal. Outcome of the event rash in groin / lower abdomen was recovered and other event was unknown. Follow-up (14MAY2021): Follow-up attempts completed. No further information expected.
1366590	6/2/2021	CA	53	F	5/30/2021	5/31/2021	Right ear pain, shooting/stabbing, around 8:40 pm May 31. Woke from sleep around 4 am June 1, severe pain right ear. Walked around 5:20 am, pain outside and top of left foot. Right side ear pain continued through morning, as did foot pain. Foot pain eased around 10 am. Scalp on right side hurt too much to brush hair. Eye pain/discomfort started before noon. Felt like bruise and burning, especially bottom lid and inside half of eye. Went to ER around 2. Ear pain had lessened, only jolts of pain, certain facial expressions exacerbated pain. Eye discomfort more prominent. Scalp most painful right side, rear half.
1367895	6/2/2021	OR	16	F	6/1/2021	6/1/2021	Systemic: Allergic: Difficulty Breathing-Mild, Systemic: Chills-Mild, Systemic: Dizziness / Lightheadness-Mild, Systemic: blurry vision-Mild, Systemic: Shakiness-Mild, Systemic: Weakness-Mild, Additional Details: Patient reported leg weakness and blurred vision and dizziness/slight difficulty breathing upon getting ready to leave observation area. Said she hadn't eaten in a while and felt cold due to A/C in the store as well. BP was low and HR high, so called 911 to get her emergency help as she didn't feel like she could walk out of store safely. Felt strange and that her legs might give way. EMS arrived, vitals looked good, pt refused ambulance.

1366556	6/2/2021		21	M	5/21/2021	5/21/2021	c/o no appetite,nausea,fatigue, weak, cold sweat, epigstric pain, redness on both eyes with visual change sicne 21May2021(s/p J&J Vaccination).
1366564	6/2/2021	AZ	46	F	5/13/2021	5/14/2021	Initially no symptoms, however the next day I had a terrible headache and warped vision. On day 2, I felt sluggish in the morning and by the afternoon I was nauseous and had a fever. The fever continued for several days from 99.5 to 102.9. On day 3, I began vomiting and was unable to keep down water. On day 4, I reported to the ER where I was treated for dehydration. The ER department also ran extensive lab and it showed I had high liver enzymes. They did a sonogram to check my gall bladder and determined my liver was enlarged. My temperature was 98.5 upon leaving the ER. After leaving the hospital, I began having diarrhea. At this point, I had not eaten for almost 2 days. I went on a liquid only diet to help keep hydrated and stop the diarrhea. On day 5, I woke up with very red and hot hands and feet. They were painful to the touch. Also on this day, my fever returned to 100.2 and began fluctuating until the evening of day 6. The diarrhea continued on day 6, probably because of the medicine at the hospital for acid reflux and indigestion. They hydrated me with 2.5 IV bags in less than 9 hours. On day 7, I had my first 'real' meal and notice the redness and pain were replaced with a measles like rash on my hands. Which caused constipation. On day 6 and the 2 days following, I didn't have a fever, my hands and feet had returned to normal, but itched, and I didn't have many symptoms, but felt very sluggish and fatigued. On 5/29/2021, more than 2 weeks after the 2nd shot, I noticed blisters on my fingers. I have made no changes to any health and beauty products or done any work to cause this. The blistering has continued today, 6/1/2021. I'm also having reactions to food I could once eat so it seems I've developed food allergies. I don't know what is causing stomach pain and nausea eating foods I've never had a problem with. I'm also still feeling very fatigued. I have to take frequent breaks when completing simple tasks.

1366572	6/2/2021	MO	48	F	4/8/2021	4/13/2021	2 events : 1st-4/15- Hives on both arms. Just watched them and kept an eye on them and used Benadryl and anti-itch cream, postponed allergy shots from Friday 4-16 until Monday 4/19. Hives went away in the next day or two. 2nd event-Lower right back pain achy off and on and eventually wrapping around to the right side. Went to urgent care on 4/29. They did a CT with contrast and found a large kidney stone that I would not be able to pass without surgery, referred to neurologist. Saw neurologist on 5/3, kidney X-ray confirmed an 18 mm kidney stone in my right renal pelvis. Scheduled lithotripsy with stent placement on 5/10. Had that done on 5/10. Had follow up kidney X-ray and stent removed on 5/17. Then on 5/24 another follow up kidney X-ray. Results weren't easy to see due to gaseous distention but he thought I had passed most of the larger particles. Will see him in 6 months. May see him sooner because I'm still experiencing achy pain in the same areas off and on that same side.
1366577	6/2/2021	IL	14	F	6/1/2021	6/1/2021	Patient felt dizzy immediately after the shot was given. She said she was going to pass out, and did for about 10 seconds. She was sitting up in a chair during this time, with her mom holding her up. She came to, the about 20 seconds later, she passed out again for another 10 seconds. She came to, and was given some water to drink, but 20 seconds after that she threw up the water. I took her blood pressure, and it was 60/40, with a pulse of 60. She was very pale. After resting in the chair and taking deep breaths, her color returned and she felt much better. she also said her vision wasn't blurry anymore. Ten minutes later, she left with her mom, feeling ok. She was very anxious about getting the shot, and told me she had passed out in the pass after giving blood.

1367081	6/2/2021	ME	74	F			<p>headache; tired; sore arm; This is a spontaneous report from a contactable consumer (patient, self-reported). A 74-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTEC COVID-19 mRNA VACCINE, Solution for injection, lot number: EN6203 and expiry date: Jun2021), via an unspecified route of administration, on an unknown date, as a single dose for COVID-19 immunization at hospital. The patient received first dose of BNT162B2 (PFIZER-BIONTEC COVID-19 mRNA VACCINE, Solution for injection, lot number: EL9261 and expiry date: May2021), via an unspecified route of administration, in Arm Right, on an unknown date at 11:00 AM, as a single dose for COVID-19 immunization at hospital and had pain in esophagus, tightness in throat and joint pain, headache, and tired. The patient received first vaccine at 11 AM, left hospital and picked up lunch and came home. After eating meat ball sandwich soon after her throat was tight and painful. The patient's medical history included oral Lichen planus, chronic dry eyes for long time, and extreme dry mouth. The patient mentioned that she had a difficult intubation, unable to swallow large pills and had EpiPen (for Peanut intolerance). Concomitant medications were not reported. The patient was treated by oral Surgeon and biopsy was done on 13Nov2020 of inside of cheeks, sores on tongue, salivary gland, and lip which resulted in not being Sjogrens, oral lichen planus. The patient reported some mild symptoms like Sjogrens disease, joint pain (took Ex strength Tylenol), and throat felt like it was closing which lasted- 3 to 4 hours (no treatment received). Second vaccine side effects were mild in comparison to first headache, sore arm, tired. On an unknown date, after unspecified time, the patient experienced headache (seriousness: hospitalization), tired (seriousness: hospitalization) and sore arm. The patient received Tylenol for headache and no treatment was received for tiredness. The outcome of events was unknown. No follow-up attempts are needed. No further information is expected.</p>

1367157	6/2/2021	FL		F		4/1/2021	skin blisters; skin peels; eyes are puffy; recurring rash on the cheeks and forehead/cheeks and forehead, get red; This is a spontaneous report received from a contactable consumer (patient). A 62-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), first single dose at the end of Mar2021 and second single dose on an unspecified date, both via an unspecified route of administration (Batch/Lot number was not reported) for covid-19 immunisation. The patient medical history and concomitant medications were not reported. Caller reported that about 10 days after she got the first vaccine, she got a recurring rash on the cheeks and forehead, around the second week of April, which comes and goes, and when it comes back, her skin blisters and peels. Caller states it may not be a coincidence, and it started after the first vaccine. Caller states it has continued after the second vaccine. Caller reports that when she gets this rash, her eyes get puffy, and her cheeks and forehead, get red. Caller states the rash goes away and comes back again. Caller states she has ruled out, other causes, like soap, shampoo, makeup and food. Caller states her sister told her it looks like a Lupus butterfly rash, and she believes that she does not have Lupus. Outcome of the events was unknown. Information about Lot/Batch number cannot be obtained. Additional information has been requested.

1367153	6/2/2021	PA	74	M	3/31/2021	4/20/2021	<p>Unable to use left arm or hand; Seizure; Lost vision in left eye; This is a spontaneous report from a contactable consumer (patient wife). A 74-years-old male patient received bnt162b2 (BNT162B2), dose 2 via an unspecified route of administration, administered in Arm Right on 31Mar2021 10:00 (Batch/Lot Number: ER8730) (at 74 year old) as 2ND DOSE, SINGLE DOSE for covid-19 immunisation. Medical history included slight stroke from 2012, seizure disorder from 1972 and ongoing (She says her husband did have a seizure disorder since his car accident in 1972, but he hadn't had a seizure in years), road traffic accident from 1972 (Caller says her husband had a car accident in 1972 and had some injuries from that), injury from 1972 (Caller says her husband had a car accident in 1972 and had some injuries from that). The patient's concomitant medications were not reported. Historical Vaccine included first dose (LOT: EN6199) of BNT162B2 (Pfizer COVID-19 vaccine) for COVID-19 immunization on 10Mar2021 10:00AM in his right arm at 74-year-old experienced tiredness and arm soreness. The patient experienced seizure on 20Apr2021 with outcome of recovered in 2021, lost vision in left eye on 20Apr2021 with outcome of recovered on 21Apr2021, unable to use left arm or hand on 20Apr2021 with outcome of recovered on 21Apr2021. The events caused Emergency Room Visit, and were serious due to hospitalization since 20Apr2021 to May2021 for 19 days. The patient underwent lab tests and procedures which included magnetic resonance imaging and scan brain: no evidence of a stroke said it was a seizure on 20Apr2021. The consumer reported that her husband ended up going to the ER and spending 2.5 weeks in hospital after the second dose. She says it started out like a stroke, he lost vision in his left eye temporarily then couldn't use his left arm, couldn't raise it or use his hand or wiggle his fingers. She says that ended up being temporary too. She says he then took a seizure before the ambulance got there, so when he got to the hospital they assumed it was stroke and a seizure and he ended up in intensive care unit. She says as days went on and they did MRIs and brain scans, stuff like that, they found no evidence of a stroke said it was a seizure that caused it, and that next day he got his vision back after he was there overnight in the intensive care unit, and could use his arm, raise his arm, and hold things with his left hand. She says it was</p>

1367152	6/2/2021	CT	43	F	5/11/2021	5/12/2021	sharp shooting pain; she can barely walk; felt like she was hit with a cannonball; bedridden; to be isolated in part of her lower back and her glutes/back is destroyed/it dissipated to her lower back and glutes and is extremely painful; She can barely move/can barely move, barely get in and out of cars, barely stand up from sitting position; Arm is not sore anymore at all; transverse myelitis; barely stand up from sitting position; panic; inflammation of my lower spine; kind of distracted; difficulty with normal everyday functions; She had muscle aches/All caller's muscle are sore/she had muscle pain in all of her body; fever; Eyes weren't burning anymore/burning eyes; to be isolated in part of her lower back and her glutes/it dissipated to her lower back and glutes and is extremely painful; This is a spontaneous report from a contactable consumer (patient). A 43-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in the arm left on 11May2021 at 15:00 as single dose for COVID-19 immunisation. Medical history included stomach issues, ongoing lyme disease (this condition started and diagnosed about 10 years ago), hay fever, dust allergy, pollen allergy, animal dander allergy, motion sickness (this condition started probably before Lyme), patient said she got sick when she goes on boat; every time she was on a boat she lost her lunch. Family medical history included diabetes, but the patient has never had diabetes. Concomitant medications included ongoing promethazine for stomach issues (it is antihistamines, nothing radical and taking it since got Lyme disease about 10 years ago), ongoing Belsvia. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in the left arm on 21Apr2021 at 14:30 (at the age of 43 years old) as single dose for COVID-19 immunization. The patient previously also received the flu shot several months before. No additional vaccines administered on same date of the Pfizer suspect. No prior vaccinations (within 4 weeks). No AE(s) following prior vaccinations. The patient got her second Pfizer covid vaccine on May 11 and felt like she was hit with a cannonball and was bedridden for a day. She had muscle aches on 12May2021 which she expected but now they seem to be isolated in part of her lower back and her glutes and it

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

seems to be getting worse. Patient can barely move, sit down or stand up and it was a sharp shooting pain. All her other muscle pains have resolved. On 12May2021, patient had muscle aches which though was normal for the first couple of days and so most of the muscle aches went away except the patient back was destroyed that reported as worsened. Stated it was that side of the body in pain. The patient was trying to sit up right now and was having really sharp shooting pain on back. The patient figured this would have resolved itself by now. Stated she was kind of scared this might not go away. On 12May2021, patient arm was not sore anymore at all and eyes weren't burning anymore. The arm was sore day the day after receiving the second dose Pfizer Covid Vaccine, 12May2021. On 12May2021, patient had a fever and about 24 hours the fever lasted; could barely move; burning eyes that back to normal and also lasted for 24 hours. The patient can barely move after receiving second dose Pfizer Covid Vaccine, sharp shooting pains, really, really bad. The patient can barely move, barely get in and out of cars, barely stand up from sitting position. The patient assumes this was a side effect of the second dose Pfizer Covid Vaccine and was it would dissipate by now, but it was getting worse and worse. The patient stated the pain was now isolated to the lower part of her back on the gluts. All muscles were sore, started to get worse, all muscles in whole body were sore but it was now isolated to that area. That was a really big deal, patient can barely function. Thought it would get better, thought it would resolve but it is getting worse. The patient can barely stand up or sit down, that's how bad the pain was. Patient stated it was a pure, really sharp pain and the patient got stuck. The patient got stuck taking a piddle on the toilet for like 15 minutes after the patient first received the second dose Pfizer Covid Vaccine. Patient thought it would go away. All patient's muscle were sore. Noticing it was isolated in that specific area. Pretty much the patient's whole body function was like lower back, whole gluts almost, mainly on injection side. Stated all soreness in whole body, like hit by a cannon ball. The pain in rest of muscles dissipated, they felt normal but the muscles above the gluts, patient's whole function, whole body function was obliterated right now. Whenever the patient tries to move, had a sharp piercing pain. The patient tried to make sure she slept

---

good and in good positions and everything. The patient states she was kind of distracted. Patient can barely walk, she's experiencing sharp shooting pain and difficulty with normal everyday functions (she's been bedridden because even going to the toilet was a big deal, she got stuck and was unable to get up and sit down), she's concerned because the other side-effects resolved but she got the vaccine a week ago and it's getting worse, she had muscle pain in all of her body and it dissipated to her lower back and glutes and was extremely painful. Patient also had burning eyes but this symptom went away and fever. She would like to know if anyone else has experienced anything like this and if it's normal to experience these side-effects, particularly the severe debilitating muscle pain 7 days after the second dose of the vaccine because she still has this symptom and it's getting worse. Patient said she was stuck lying in bed. She said if she switches sides she got the sharpest pain and it was like she gets it in her organs, like her lung was being punctured. Her primary care didn't know her well enough to give her anything for the pain for a couple of days. The pain was sharp, shocking. She felt like it's in her hips; she can't even use toilet on her own, it takes forever. She was un-functionable and obliterated. The walking issue started a couple days after the vaccine. It was with all the muscles in her body, she was bedridden. She expected it to resolve. She said it isolated to that area, ironically her arm wasn't sore anymore, nothing else, but she was extremely sore in that area in her glutes. It was getting worse and it made her panic, she was not walking, she was handicapped, she was completely crippled. Also said the muscle pain started the day after her vaccine and went for 7 days after. The difficulty walking start day was hard to say; it was a gradual manifestation and it was not like all of the sudden she got the shot and can't walk. It was several days getting worse and now was is sort of in demise. Clarified these events occurred after her second vaccine, she had no problems with the first. Patient also stated she thought she had developed transverse myelitis, inflammation of her lower spine from the vaccine, from second Pfizer vaccine, side effect, she can barely move. AE(s) did not require a visit to emergency room, for events not being able to barely walk and being in extreme pain that resulted in physician office visit and she went to the

1367138	6/2/2021	IL	66	F	3/22/2021	3/22/2021	Fast heart beat; Palpitations; it make me feel real bad and it is going; Stress; Tired; This is a spontaneous report from a contactable consumer (patient herself). A 66-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in left arm on 22Mar2021 (Batch/Lot Number: ER8727) as 1st dose, single for COVID-19 immunisation. Medical history included blood pressure high, asthma, thyroid, cholesterol, allergy. Patient stated "I take medications. I have high blood pressure. I am asthmatic, I have asthma and allergy. I take lot of medications. I take thyroid medicines, I take inhaler for my asthma (Captured as per verbatim), I have eye drop latanoprost (not spelled, further clarification unknown) and I take cholesterol medicine." Patient stated "I had rapid, fast heart beat the same day. They gave me a paper and I took it that if I have any of these features then I should not have the second vaccine. I had one of those, I had palpitations and it made me feel real bad and it is going, I don't know what is going on so when I had after an hour I had the shot, I still had the palpitations. I drive back home I live by myself so I feel really bad I didn't know what happened so finally the next day I went to the emergency care because I figured out that I might be having palpitations they say yeah you have and there is nothing we could do about so finally after 3 days they stopped they used to come off and on right after the shot like three 3 days in a row and then it finally stopped, then I went to the Cardiology, they telling me I guess I have age but now I have the real stress and tired. So the shot, I guess, it started it for this started to happen to me when I had the shot. So, I would not take the shot but I have my doctors, and when I called them to talk, they would tell me just take the second shot. When I read the CDC guidelines, I should not take it, and then there are my doctors. I am trying to say that I wouldn't take it and my doctors, some of my family members, so what do I do? I don't want to go through that again and it was really bad, I thought like I was going die. I didn't take my second shot and my doctor, they were little upset with me and my children that if you have that bad reaction and you feel that bad then you should try to take it anyway I guess the second one would kill me so it's okay, I don't have to worry about the virus because I won't be there. I had a EKG right after because of my heart palpitation.

The occurrence of additional non-serious events is detailed below. No medical history was provided by the reporter. Concomitant products included AMLODIPINE and LOSARTAN for Blood pressure management, ATORVASTATIN for Cholesterol, POTASSIUM for Hypokalemia. On 16-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 22-Jan-2021, the patient experienced BRAIN STEM STROKE (Acute brain stem stroke) (seriousness criteria hospitalization and medically significant), BLINDNESS (Lost vision in both eyes) (seriousness criteria hospitalization and medically significant), DYSPHAGIA (Couldn't swallow) and COVID-19 (Covid-19). In February 2021, the patient experienced NODULE (Lumps on biceps of both arms). The patient was hospitalized on 22-Jan-2021 due to BLINDNESS and BRAIN STEM STROKE. On 01-Mar-2021, BLINDNESS (Lost vision in both eyes) had resolved. At the time of the report, BRAIN STEM STROKE (Acute brain stem stroke), COVID-19 (Covid-19) and NODULE (Lumps on biceps of both arms) outcome was unknown and DYSPHAGIA (Couldn't swallow) was resolving. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): In January 2021, SARS-CoV-2 test: positive (Positive) Covid-19 positive. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Treatment information was not provided. Company Comment - Based on current available information and the temporal association between product use and the start date of the events a causal relationship cannot be excluded.; Sender's Comments: Based on current available information and the temporal association between product use and the start date of the events a causal relationship cannot be excluded.</p>

1367090	6/2/2021	CA	40	F	4/22/2021	4/23/2021	I woke up to the worst migraine in my right eye the day after my 2nd COVID shot. The next day, I had what looked like blinds (white/black) lines in my vision, then half moon shape in my vision in my right eye for days. Dizziness (I felt like I was on a boat dock), confusion, tiredness and pain the back of the eye for two weeks, numbness of the eyes. I went to the Ophthalmologist who stated that I was having an ocular migraine. My Neurologist also said I was having an Ocular Migraine, but I'm stuck in the Postdrome Stage. Gave me Topiramate daily and told me stay away from screens and reading (that means no working and no TV). With the meds, I'm 70% back to my old self, I can drive again, run errands, do yard work, but I can't work. We increased the dose, still can't use screens and side effects pushed us to find another drug. Started new drug Amitriptyline on May 30, and symptoms are not disappearing. I have had symptoms (mostly eye numbness, vision issues, dizziness) continuously all day, everyday for 3 39 days and counting

1366884	6/2/2021	CT	68	F	2/20/2021	4/9/2021	<p>Fever; Permanent vision loss/ Permanent vision loss in the right eye; Another eye episode; This spontaneous case was reported by a consumer and describes the occurrence of BLINDNESS (Permanent vision loss/ Permanent vision loss in the right eye) in a 68-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 002B21A and 023M20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No medical history was provided by the reporter. Concomitant products included PANTOPRAZOLE, METOPROLOL SUCCINATE (TOPROL), AMLODIPINE and ALPRAZOLAM (ZOLAX [ALPRAZOLAM]) for an unknown indication. On 20-Feb-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 20-Mar-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 09-Apr-2021, the patient experienced BLINDNESS (Permanent vision loss/ Permanent vision loss in the right eye) (seriousness criteria disability and medically significant) and EYE DISORDER (Another eye episode). On an unknown date, the patient experienced PYREXIA (Fever). At the time of the report, BLINDNESS (Permanent vision loss/ Permanent vision loss in the right eye) and EYE DISORDER (Another eye episode) had not resolved and PYREXIA (Fever) outcome was unknown.</p> <p>DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On an unknown date, Biopsy: normal (normal) Biopsy of artery leading to right eye. Treatment provided included Prednisone. After the second dose patient had an eye episode that did not go away after few minutes. It continued over the weekend and the patient visited a primary physician who was concerned about a stroke even though there were no stroke symptoms. From there patient was referred to cardiologist, rheumatologist and retinal specialist. Patient had shorter eye episode which began 22 days after the first vaccine and permanent vision loss began 20 days after the second dose. After six weeks of test and physician visits, a biopsy of the artery leading to right eye, the consulted cardiologist and found no problem in the heart, vascular specialist found no issues in the arteries, rheumatologist found no systemic inflammation</p>

1367012	6/2/2021	OK		F			<p>a little tired; sore arm; This is a spontaneous report from a contactable consumer or other non hcp. A 71-years-old female patient received bnt162b2 (BNT162B2), dose 1 via an unspecified route of administration, administered in Arm Left on an unspecified date (Batch/Lot Number: EL3247) as 1ST DOSE, SINGLE for Covid-19 immunization. Medical history included dry eye, multiple allergies, food allergy to eggs. Concomitant medication included krill oil (KRILL OIL) taken for an unspecified indication, vitamin D nos (VITAMIN D NOS) taken for an unspecified indication, salmo salar oil (OMEGA-3 [SALMO SALAR OIL]) taken for an unspecified indication. The patient previously took Amoxil for pruritus and experienced drug hypersensitivity. The patient experienced a little tired, sore arm on an unspecified date with outcome of unknown. Therapeutic measures were taken because of sore arm (pain in extremity). Question: Attention DSU - Possible duplicate Caller is reporting that she received her second dose of Pfizer-BioNTech Covid19 vaccine on day 33 instead of the scheduled day 21. Vaccination was delayed due to medical reasons from 15Feb2021 to 27Feb2021. Also, caller states that the only AE she experienced was a sore arm for 24hours. She is concerned that due to delaying the dose, it may not be as effective, especially since the 2nd dose has a reputation of worse AEs than the first, and she's had increased energy and no reaction besides soreness. Follow-up (02Mar2021): This is a follow-up spontaneous report from a contactable consumer. This consumer (patient) reported that: Additional Context: Consumer says she is calling with concern about second Pfizer COVID-19 vaccine shot, who says she received it pretty late, it was delayed due to weather and she was supposed to have her second dose on 15Feb and she had it on 27Feb. She says it has been 72 hours, and she hasn't had any reaction, other than the sore arm for 24 hours, and nothing else, her energy level has been high. She says her question is was it effective since the second dose has the reputation of having a more powerful reaction. Email Address: Documented as provided. Provider Information: Caller declines to provide provider information. Pfizer COVID-19 vaccination NDC/EXP: Caller says that her vaccine card is a preprinted card created by CDC, and she wrote a number on there that she added that started with W44 that was</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

on an email she got in scheduling email from the health department. She says neither dose of the vaccine had an EXP or NDC provided for it on the vaccine card. She says that the first dose LOT was EL3247, and the second dose LOT was EL9266, and both doses were given in her left arm. Caller offered but did not provide date of first dose injection. AE: Sore arm: Caller says after both doses were given she had a sore arm that started probably about 4 hours later, and she took Acetaminophen, that was that. She says that there was little to none for both soreness after about 24 hours, maybe a little bit more that, with taking the Acetaminophen. Caller says she doesn't take meds often normally, she took two doses, each time as a dose two tablets 8 hours apart. She says actually she never took the second dose of Acetaminophen on her second dose of the vaccine. She says that the Acetaminophen tablets were 650mg each. UPC/LOT/EXP: not provided. Caller says after her first vaccine dose she woke up second day a little tired, and continued to feel a little tired through the day, which didn't cause her to go to bed or anything, she just did everything slower. She says this time after the second dose she cleaned closets and her garage and had no lack of energy. Concomitant Medications: Caller says she is not on meds at all, she only takes something for dry eye recommended by her optometrist, which is over the counter Preservision AREDS. She says she also takes krill oil, Omega-3, Vitamin D one 2000 IU a day, which seemed to be important, though none were new meds, they seemed important for COVID, she started some of the vitamins 6 months ago, and some she has been taking for three years. No further details provided about any of these medications. Other Medical Conditions: Caller says she has hay fever allergies, she is allergic to Amoxil. Amoxil NDC/LOT/EXP: Unknown, caller doesn't think she ever had that information. Caller says that they discovered her allergy to Amoxil because she had severe itching when she took it back in 1984. She says that they didn't test everything for every allergy back then. She says that she has a food allergy to eggs, which wasn't diagnosed, it started with her childhood doctor who basically said that if she gets a rash each time she is eating eggs, to stop eating eggs. Is there a Product Complaint: Yes Description of Product Complaint: Description of complaint: Consumer says she

Respirat inhaler "which helps you get rid of carbon dioxide from your lungs." She just expresses concern because "her body is compromised." She saw on TV that the CEO of Pfizer was discussing the possibility of a third booster shot. Patient was scheduled for next shot on 25Mar2021. She got first Pfizer dose on 25Feb2021 around 4:30 in the afternoon on Thursday, and when she got the first dose cheeks got really pink and they stayed like that for an hour or so and then they went away and she thought it was okay for her to (incomplete sentence). She had all different ones, the first one started right away, as soon as she got the shot she felt very 'loosie' (Not clarified) about 20 minutes later when she was sitting there and waiting. Then when she got, she noticed her cheeks were really pink. Some went away about an hour. Then she had some fatigue and a little sore arm for the next 48 hours but she was okay. But then on 28Feb2021 (yesterday) 48 hours after the shot, suddenly she had diarrhea, very violently and then that was last night and she was so having it and she felt like she was on fire, she felt like her body was on fire inside her body, and she kept drinking." She had pills she had to take every day. No she took nothing. When she had the diarrhea over night from last night almost 48 hours all night long she had diarrhea couple times, and she had diarrhea this morning. She felt like somebody lit a match inside her body and it's like burning from inside, and started drinking water. On continuous home O2, takes synthroid and lisinopril. She experienced flushed cheeks across her nose which lasted a few hours. The first 48 hours she had a minor sore left arm, fatigue, and brain fog. At 48 hours after the vaccine administration, she had to take lisinopril and 5 mins later she experienced violent diarrhea. Later that night felt "fire inside my body like someone had lit fire" started drinking water, "eventually it went away. She called to ask if it was ok to take peptobismol. On 01Mar2021 (Today) she felt way better. She experienced quite a lot of side effects after getting the 1st dose. She said that she was not easy going up. After she got home, she mentioned that her cheeks flushed for 1 hour. She gets flushed usually but this was more pink than usual which went through her nose. The flushing was not hot and swollen. She also experienced horrible burning feeling like a lit candle in the lower intestines and a fire in the stomach 4 days later after the

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

diarrhea on 04Mar2021. She was advised to take Pepto-bismol and water for that and she was fine. She was very tired, fatigued, and her brain was foggy for 4-5 days. She also mentioned that she took some of her high blood medications which made her stomach upset but she ensured to take it with food the next time and it did not happen again. It was challenging and was a wild day. It's been 8 days since and she has mentioned that she's okay now and is breathing better than she usually does, especially on 05Mar2021 (today). She also feels that she has more stamina, improvement in her lungs. She said that it was very strange but she is very happy and is wonderful. She has been on Oxygen for 24 hours a day for 3 years and is more at risk for COVID. She is asking if this is normal and for what to do with the 2nd dose. She was advised to refer to healthcare provider for further discussion. As soon as she had the shot, her cheeks turn pink and she couldn't see it until she got home because of the mask and she does not know if cheeks were pink because of the mask or what but it was only lasted for short time and then went away. She did not have any swelling or heat or anything but when she started, she had very few symptoms except fatigue. Then on the third day or fourth day, she started with diarrhea and a very severe stomach pain and now in the last couple of days she started with these red bumps on my right arm in Mar2021." She had the shot on left arm but has these red bumps in little clusters, cluster of red dots, you can feel them and they are raised up and she does not know if something bite her or if this a side effect. It has been several weeks now. It was on shoulder in two different places and it is kind of like three or four of them at one location. "Now, my cheeks are pink again and it has been two weeks now. She does not understand why. She should not be having any side effect at all and she was all (voice feeble) twenty-four hours a day. No treatment received for the adverse events. Since the vaccination, the patient had not been tested for COVID-19. The outcome of events stomach pain, stomach upset was not recovered; for other events was unknown. No follow-up attempts are needed. No further information is expected.

1367165	6/2/2021	FL	40	F	5/14/2021	4/23/2021	<p>blurred vision/After my 2nd dose my vision is substantially worse, to where I cannot drive even 3 days later; huge lump under where she received the vaccine; This is a spontaneous report from a contactable consumer (patient). A 40-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), 1ST DOSE, single on 23Apr2021 (Batch/Lot Number: EW0170) and 2ND DOSE, single on 14May2021 (Batch/Lot number was not reported), both via unspecified route at 9:50 am, arm left for covid-19 immunisation. Medical history included does wear glasses and mild psoriasis (just uses something topical if she has a flare up) from an unknown date and unknown if ongoing. The patient's concomitant medications were not reported. The patient historical vaccine includes: flu vaccine from unspecified date for immunization. No other vaccinations within four weeks prior to the first administration date of the suspect vaccine. The patient is calling about the Covid 19 vaccine. After she received her first Covid 19 vaccine on 23Apr2021, she had blurred vision starting on Sunday, 25Apr2021. She called the pharmacy and was told that blurred vision was a rare side effect and her vision should clear. She received the second Covid 19 vaccine on Friday, 14May2021 and she experienced the blurred vision again except this time she can't see anything unless it's about 2 inches from her eyes. She doesn't have a job she has to go to but she is a stay at home mom and she home schools her children. She can't even see the text in books. She can't drive, not even to the grocery store. She is asking how long is this going to last. Her arm has a huge lump under where she received the vaccine. The lump is still there from the first vaccine and she has another lump from the second vaccine. Her left arm now has 2 lumps. She thought that might be an allergic reaction but the same lady gave her both injections and stabbed her pretty hard when she gave the Covid 19 vaccine. The pharmacist did tell her she can get blurred vision with any vaccine but she always gets her flu vaccine and she's never had blurred vision before. She received her second Covid 19 vaccine on Friday, 14May2021 in the left arm. She can't find the vaccine record card, she had two vaccine records card because she forgot to bring the first vaccine record card to her second appointment. The NDC for the second vaccine is on her receipt. NDC 59267-1000-01,</p>

							<p>Lot/Expiry not known for second dose. First Covid 19 vaccine information is in the suspect product field. She received her first Covid 19 vaccine on Friday, 23Apr2021 and she had blurred vision on Sunday, 25Apr2021. She thought at first it was pink eye or conjunctivitis because her vision was blurry and she thought, what did her children bring home to her. Her eyes weren't pink though. She called the pharmacist and he told her it was a side effect. Her vision did get better about a week before the second Covid 19 vaccine but it wasn't completely back to normal. She received the second Covid 19 vaccine on 14May2021 and she experienced more blurred vision on Sunday, 16May2021 but it's much worse and it's not gotten better. She's trying to read from her coffee machine and she can't even see what it says. This can't be normal. Does she need to see an optometrist? She reports she could still drive after her first Covid 19 vaccine because the blurry vision wasn't that bad but this time it's scaring her a little bit. She reports she does wear glasses but only for night time. Her pupils don't dilate well so she tries not to drive at night. The reporter added that around 48 hours after my first dose I began having blurred vision, it got slightly better before my 2nd dose, however, it did not get completely better. After my 2nd dose my vision is substantially worse, to where I cannot drive even 3 days later. The outcome of the event was recovering for blurred vision and not recovered for the other event. The patient was did not required emergency room and physician office visit. Follow up attempts are needed. Further information has been requested.</p>

1368668	6/2/2021	CA	35	F	6/2/2021	6/2/2021	(DOB 08/10/1985) received the 1st dose COVID vaccine (Pfizer, lot # EW0187 and use by date 06/28/2021 @ 0945) at 11:00am. Patient reported having mild shallow breathing to (EMT) who immediately reported to Lead RN. Lead RN assessed the patient while (EMT) took a full set of vitals. Patient was apprehensive to receive vitals including BP and O2 saturation monitor but consented after further education from RN and EMT. Vital signs at 11:06 were BP of 132/82, HR of 94, RR of 16, and O2 Saturation Level of 97%. RN observed patient was A&O x4 with no wheezing, hives, or angioedema present. Patient denied chest pain, difficulty breathing, changes in vision, difficulty swallowing, and nausea. Patient denied benadryl, EMS, food, and transfer to a zero-gravity chair. Patient denied vitals every 5 minutes and explained that she has a history of SVT induced by anxiety. Patient reported that having vitals taken increases her anxiety and refused q5 minute vitals. Patient agreed to have vitals taken once more after 30 minutes of observation. At 1115 patient was drinking water and stated "I delivered my baby 3 weeks ago, so I am always tired." Patient explained that she has been quarantining over the last year due to her pregnancy and had increased anxiety being around so many people at the vaccine site. At 11:16 patient stated "my breathing is good now." Patient has NKDA, no chronic conditions, and a pertinent history of panic attacks and SVT induced by anxiety. At 1125, patient consented to one additional set of vitals. Vitals were BP of 144/88, HR 92, RR of 16, and O2 Saturation Level of 98%. At 11:30, Lead RN and (Co-lead) educated about Vaccination program, ER precautions, and f/u with PCP. At 11:33 patient stated that "water is making me feel much better." Patient denied SOB, dizziness, lightheadedness, and changes in vision. At 11:38 patient stated that her brother is driving her home and left the site. Co lead RN observed a steady and symmetrical gait as patient walked away.
1368686	6/2/2021	WI	78	F	4/6/2021	5/5/2021	Patient presented to the ED on 5/5/2021 for dizziness and double vision. Patient was subsequently hospitalized with vertebrobasilar insufficiency. These visits are within 6 weeks of receiving COVID vaccination.

1368730	6/2/2021	MA	66	F	2/15/2021	2/22/2021	Starting around a week after the second vaccine, I began to be more aware of my asthma. There was more awareness of SOB and coughing. In April, when seasonal symptoms started, I had a reaction that is not typical for me. I had asthma symptoms significant enough to make me use inhalers that I have not used for several years. I was going to take prednisone, but my inhalers kicked in so I didn't use it. Usually, when the pollen would flow, I would have dry eyes, or running eyes. I did not have any other allergies besides my asthma and breathing difficulties. All of this resolved after a couple of weeks and I'm no longer using my inhalers. I can still notice my asthma more than usual though.
1368742	6/2/2021	PA	40	M	6/2/2021	6/2/2021	While sitting five minutes after shot, pt turned white, eyes rolled back. Mother called for help. Reaction walking by an immediately laid pt on floor. 1368812	6/2/2021	TX	33	F	3/16/2021	3/17/2021	After the second injection, I was experiencing what I thought was a lupus flare up. I needed to get into a new rheumatologist so that took some time getting into with my current insurance. I was experiencing a tremendous amount of joint and muscle pain. I have a Low grade fever off and on as well as my lupus butterfly rash on my face and a few sores in my nose. All symptoms I have had when dealing with a lupus flare. One thing that was different was muscles being pulled for doing very little. My back and neck muscles kept getting pulled often. Extreme dry eyes/nose- all which was similar autoimmune symptoms I have had in the past. Extreme periods of nausea, but I have been unable to take certain medications I use to be able to take. I can not take any nausea medications because it now will give me a horrible migraine that last for days. My primary doctor gave me a steroid dose pack to help me until I could get into my rheumatologist and I had a horrible reaction to them with extreme diarrhea, nausea, vomiting, and migraines. None of those symptoms to medications has happened in my past. My symptoms started was a gradual increase over the time period after getting my vaccine. Not all at once. But after about a week after getting the vaccine it started to happen slowly to the point where I am today. The doctors ran various test for my lupus and all of my inflammation lab markers came back extremely high. But none of my lupus/autoimmune markers came back as active. I also ended up going to the ER concerned with chest pain- but after many test nothing was conclusive or found. I have a follow up with a cardiologist pending

1368877	6/2/2021	CT	39	M	5/3/2021	5/10/2021	1 week after the second dose, I was exercising in the early morning when suddenly my vision and hand-eye coordination were flashing, my hand appeared in a different position than where I thought it was. I tried to tell my sons to get help, but I couldn't say any words, just some repetitive mumbling. I was able to walk upstairs but couldn't speak for about 10 mins, and then everything was coming out slowly. It was about an hour before I could resume normal talking. I went to the hospital, where they gave me a CT scan, MRI, heart echo, and eventually a TEE. They said that I had a Transient Ischemic Attack, and they found a PFO in my heart that probably allowed a blood clot to travel to my brain. They also did an ultrasound of my legs when I mentioned the timing of the vaccine, to make sure there were no other clots. I am taking baby aspirin and crestor, and have an heart event monitor now for 30 days. I am also scheduled for more bloodwork and a pelvic scan. They say it is likely that they will want to close my PFO, but want to see all the test results first to rule out any other possible causes.
1368881	6/2/2021	CO	31	F	5/25/2021	5/25/2021	It was around 8:00pm on 05/25/2021 I was working at my job. My boyfriend was like you don't look good he said I had dark purple circles under my eyes and that inside my inside it looked yellowish reddish. I was walking but everything was spinning at the same time. The whole time I was trying to convince myself that I was feeling good and that I was okay. But I was like yeah I don't feel good at all. My job requires me to deliver packages but my boyfriend was like just sit down I'll do it for you. As I sat there people would come in and out of the elevator they looked all strange it was like I was hallucinating I felt like I was on drugs I was seeing things. I was seriously scared for my life I couldn't drive myself back home of course. I got home and kept going it last about 5hrs. Then I woke up like around 3am and was having a higher fever of 105.4 I took some medicine then when back to sleep but I had to get back up immediately as everything started spinning and I felt so nauseous. Then around 5am I started throwing up and threw up 4 times but it was just that yellow acid. I kept up with my medicine every 4 hrs. As the week when on and still to this day I just space out like I forget everything.

LEFT SIDE WAS NUMB AND COULD NOT HEAR FROM LEFT EAR. RINGING IN EAR, EYE TWITCHING. ARTHRITIC-LIKE PAIN IN LEFT HANDS (NEVER ON RIGHT SIDE). HAS NOT BEEN TO ER BUT STILL AS EFFECTS ON 5/27/21. NEVER ANY PROBLEMS W OTHER VACCINES
1367921	6/2/2021	VA	30	F	6/1/2021	6/1/2021	Pt experienced weakness in body and blurry vision 5 minutes after 2nd dose of COVID-19 Pfizer. Pt woke up the next day to sharp lower back pain, body aches, HA and stomach discomfort.
1366575	6/2/2021	GA	45	F	3/10/2021	3/10/2021	Developed an intention tremor about 7 hours after 2 nd dose. Noticed by my dentist same day as my vaccine. Noticed by myself and all of my coworkers. I am a nurse practitioner and my patient's notice is and comment during examination. Unable to do sports I have always done that require hand eye coordination. about 2 weeks after vaccination become numb over total body, Have had basic labs and auto immune panel. All have been completely normal. I have been referred to neurologist. Waiting to get an appointment.
1369954	6/2/2021	TX	41	M	6/1/2021	6/1/2021	I felt completely fine for the first 5 minutes. I left the store. After 5 more minutes I started feeling bad (I was seated). My whole body was sweating and my vision was affected (everything was bright). I was able to return to the store but was close to passing out. I sat down for about 10-15 minutes while the symptoms persisted and I was not able to see well. After that time the sweating stopped and my sight was no longer affected. This was not anxiety and I have no history of fainting with shots. This was a reaction to the shot. After about an hour I felt fine except for muscle soreness at the injection sight. If the reaction was any worse I would have passed out or asked for help. I am hesitant to get a second dose out of concern that the reaction could be worse.

1369801	6/2/2021	AR	33	F	4/3/2021	4/4/2021	Right eye lid swelled up within 24 hours of the shot and is still an issue as of this submission. Some days the swelling has been severe some days and less severe, but the swelling has never fully gone away in the last two months. The swelling can include the eyelid, the skin between the lid and the brow, and below the eye . The eyelid and skin near brow will often turn pink/purple. Beyond the swelling pain, no major main. Some pain on outer eye bone for both eyes. The swelling seems to get worse when I sleep longer or lay down horizontal. When I go to sleep propped up, the swelling is less severe. Or, if I sleep for 7 or less hours, sometimes the swelling can be less.
1369800	6/2/2021	CA	17	M	6/2/2021	6/2/2021	Vaccinating nurse noticed patient became pale and fixating his eyes after receiving first dose of pfizer covid-19 vaccine. Vaccinating nurse asked patient if he was okay and the patient responded "I feel lightheaded. I think I will faint." Vaccinating nurse guided patient to the floor and elevated legs on chair. Lead nurse and EMT responded to the patient in nurse station. Patient was alert and oriented x 4 during whole interaction and stated he felt better within two minutes. Patient was able to sit up against wall and was offered water. Vitals were taken: BP 130/90, HR 67, O2 SAT 98%. Patient offered gravity chair and patient stated he was ready. Patient was stood up with two person assist and after 10 seconds of standing patient was able to verbally state "I feel fine now, I can walk to the room." Lead nurse directed EMT to monitor for 30 minutes in gravity chair and take final vital signs and escort patient with father to car.

1369026	6/2/2021		49	M	6/1/2021	6/1/2021	Client (received the COVID vaccine (Pfizer dose 2, lot # EW0187, expiration 6/28/2021) at 1800. At 1829, the client reported itching on his skin and in his throat. EMT, EMT #2, PHN, and RN responded at this time. The client was sitting comfortably in his chair, alert and oriented x4. The client's vital signs were as follows: heart rate 57, O2 97, respiratory rate 14, blood pressure 150/92. The client's skin was pink, warm, and dry. The client denied any shortness of breath or chest discomfort. The client was able to speak in full sentences and had no visible swelling on his face or tongue. The client declined Benadryl at this time. The client stated he has environmental allergies and has had an anaphylactic reaction to trees in the past. The client stated he has a medical history of anxiety, acid reflux, migraines, and hay fever; he takes antacids, sumatriptan, and allegra. The client stated that he took 1 allegra at 1816, but stated he didn't know the exact dosage and did not have the medication bottle with him. The client was able to speak in full sentences. At 1835, the client identified a small, red, erythematous area approximately 1 centimeter in length on the left medial area of his elbow, which he stated itched. He also stated his eyes were itching; neither eye or eyelid appeared red. The client stated his throat was dry and was offered and accepted water. The client declined Benadryl again at this time. The client was transferred to the zero gravity chair at this time, denied any dizziness during ambulation or transfer. At 1839 the client's vital signs were as follows: blood pressure 142/84, heart rate 74, O2 97%. The client stated "I had an itchy throat this morning" and said that he had a migraine that morning but did not remember if he had taken any medication for the migraine. At 1849, the client's vital signs were as follows: blood pressure 122/84, heart rate 73, respiratory rate 16, O2 99%. At 1853, the client stated "I feel less itchy." At 1900, the client initially requested Benadryl, but then refused both the medication and vital signs when offered. The client stated that his arm "still itched" but denied that it was getting worse. The client stated "I wanted a Benadryl for the road but now I think I'm going to wait." The client denied shortness of breath, chest tightness or pain, or any difficulty breathing. The client did not appear to be in any distress and had no swelling visible on his face or tongue. The client continued to chat with staff and spoke

with a pleasant demeanor. Education provided by PHN, EMT, and RN regarding primary care follow up and when to seek medical care. At 1915, the client requested Benadryl and stated "I think my rash is growing." The client's vital signs at that time were as follows: blood pressure 138/92, heart rate 88, O2 99%, respiratory rate 12. At 1922, the client was given 50mg Benadryl orally. At 1927, the client stated "my wife is here, it's time for me to go." RN reiterated the importance of staying for a 30 minute observation time, but the client continued to leave the building. EMT accompanied the client outside, where he ambulated with a steady gait. He walked to the outdoor observation area and then sat down, requesting to be evaluated by EMS. EMS was called by RN at 1933. The client was sitting comfortably and denied any shortness of breath or chest pain. EMS arrived on scene at 1936. At 1938, the client's vital signs were as follows: blood pressure 140/90, heart rate 60, and O2 100%. The client stated at that time that he "felt better" and declined transport to the hospital. The client signed AMA paperwork at 1945 and ambulated to his car with a steady gait, accompanied by his wife, who he stated was going to drive him to an urgent care.

1369785	6/2/2021	WA	34	M	5/21/2021	5/21/2021	I am a healthy individual with no pre-existing conditions. I had Covid-19 in August of 2020. I was in bed for 5 weeks with most of the symptoms and regularly had fever exceeding 104. When I was allowed to return to work, the Dr. gave me light duty orders to not exceed 5 hours worked per day for 2 months. After receiving the first vaccination dose, my arm became incredibly sore. These symptoms lasted for almost 2 weeks. The morning following vaccination, my body began to ache and hurt on touch to the point where the cover woke me up in pain. These symptoms lasted nearly three days during both day and night. I became nauseous about 24 hours following the vaccination. These symptoms lasted almost 4, 24 hour days. I became dizzy, periodically, about 24 hours after receiving the vaccination. These symptoms lasted for almost 7 days. I had low grade fever on three occasions that I knew about, I treated with Tylenol. These symptoms lasted 3 days after vaccination. I had a horrible headache (I never have had headaches before) I could not open my eyes or expose them to light. Most of the pain was concentrated on the left side of my head. These headaches started 3 days after receiving the vaccination and lasted 5 days later until day 8. I used Tylenol, which seemed to have little effect and slept all day.

1369581	6/2/2021	CA	32	F	6/2/2021	6/2/2021	Client received 1st dose of COVID vaccine of Pfizer (Lot #EW0187, expiration 06/27/21). At 1806, Client reported a minor burning sensation at injection site (left arm). At 1807, EMT and EMT responded to this event. At 1807, vital signs are blood pressure 112/78, heart rate 75, oxygen saturation 99%. At 1808, RN responded to this event. Client reported in taking a Benadryl this morning for a runny nose. Client reports no past medical history and no medications taken routinely. Client reports no blurred vision, no chest pain, no shortness of breath, no dizziness, no nausea, no headache. RN educated Client about ED precautions and common adverse effects of COVID vaccine. RN provided ice pack compress to injection site (left arm). At 1827, vital signs are blood pressure 110/80, heart rate 73, oxygen saturation 100%. Client reports burning sensation is subsiding. Client stood up with no complains and walked out of facility with a steady gait at 1832.
1369347	6/2/2021	CT	22	M	5/20/2021	5/20/2021	Within minutes of receiving covid-19 vaccine, I became very excessive sweaty (my shirt was wet), felt eyesight was dimming, space perception was completely off, very pale, dizziness and unable to hear when being spoken too, felt faint. Both of my arms had a very tingly feeling and felt heavy and then became completely numb and I was unable to move to either arm for approximately 45 minutes. Movement slowly came back throughout the evening and over the next week. My legs felt tingly and heavy. I continue to have periodic tingly feeling in my joints through out my body. My chest felt heavy. I felt like I was doing to die. Large red swollen area where shot was given. I have COVID 19 in Feb, 2021. Health care profession suspects the reaction may have been related to having COVID-19, second dose not recommended. Likely to have antibodies. I have not felt 100 percent since receiving vaccine.

1369345	6/2/2021	OR	19	M	5/22/2021	5/23/2021	The following morning after I got my second COVID shot, I experienced extreme nausea, sweating, high-fever, weakness in my legs, lack on night vision (everything was unusually dark), light headedness, trouble hearing, extreme ringing in both of my ears, and trouble balancing. I felt like I was blacking out. I was treated by laying back in bed and I felt much better after about 20 minutes. 4 days later on May 26th at about 3:00 am, I experienced severe diarrhea (15-20) bouts for an entire day, I vomited 3 times by 9:00 am, severe dehydration, sweating, nausea, and stomach cramps. I was treated with 2 full bags of Iv's and nausea medication.

1369299	6/2/2021	CA	19	F	6/1/2021	6/1/2021	<p>Client received the 1st COVID vaccine (Pfizer Lot #EW0187 and 06/28/2021) at 1848. At 1859, Office Assistant was walking past the client when she noticed that the client appeared unwell. Assistant asked the client if she was feeling ok, the client responded, "I feel dizzy." Assistant alerted PHN that the client was feeling dizzy. PHN responded. The client appeared drowsy but was oriented to person and place. The client's eyelids were open halfway, and the client was mumbling answers to the questions. The client stated, "I feel dizzy and hot under my skin." Vital signs were taken by EMT at 1901 (Heart rate 92, Oxygen 99%, blood pressure 112/P?client was wearing a long-sleeved shirt). Client's skin was warm and dry. At 1902 client appeared more alert, and PHN gave the client juice to drink, which she accepted and drank. Client stated that she has a history of vasal vagal reactions to needles and was anxious about receiving today's vaccine. EMT and PHN transitioned client to zero gravity chair at 1904 and gave client chips and a granola bar to eat. The client accepted the snacks and started to eat them. At 1905 client stated, "my head feels weird like I want to lay back." PHN advised client to lay her head back onto the gravity chair head rest. Client laid her head back for less than 30 seconds than continued to eat. PHN offered the client Benadryl and she refused. Client stated that the last time that she ate was around 1100 or 1200. Client was wearing a beanie and long sleeves, we asked the client if she can remove her hat and outer layer, however, she refused. The client had a flat affect and was soft spoken. Vital signs taken at 1915 (oxygen 98%, heart rate 94, blood pressure 138/84). Client denied any shortness of breath. At 1919, client stated, "I feel like I'm going to throw up." The zero-gravity chair was positioned into a seating position and the client was given an emesis bag. Client did not vomit, and she sat with the emesis bag until 1923 and then stated that the feeling was gone. Client has a history of sickle cell anemia and stated that she receives blood transfusions every 2-3 weeks but had not received a transfusion in 8 weeks. Client is currently prescribed Metformin but has not taken the medication because "she does not trust it." Client stated that she was prescribed Lexapro 1 month ago and took her first dose the day before the vaccine but did not take it the day of the vaccine. She stated that she has anxiety but denied</p>

							any other medical conditions. She is allergic to Toradol. Vital signs taken at 1924 (oxygen 98%, heart rate 91, blood pressure 146/102). At 1925 she stated "my head hurts, it's a sharp pain." PHN called EMS at 1926. EMS arrived at 1928 and assumed care. EMS medic stated that her blood glucose levels were at 82 and advised her that they wanted to take her to the emergency room to be examined. The client refused transport to the hospital and stated, "I don't want to go to the hospital, it's so expensive." Client continued to refuse transport and stated that she will have her boyfriend take her to the hospital. Client's boyfriend entered the building and client signed an AMA at 1953. PHN provided education to client and boyfriend on life threatening symptoms and to call EMS if any symptoms appear on their way to the hospital. PHN also advised client to follow up with her primary care provider and to follow up with an allergist before receiving her second vaccine. Client left the facility AMA at 1954 with her boyfriend, unassisted and with a steady gait. Client and her boyfriend stated that they would go to the hospital.
1369802	6/2/2021	TX	12	M	6/1/2021	6/1/2021	After half an hour after i had left the pharmacy after the first dose of Covid Pfizer vaccine, Hamza(12 yrs) started clutching his neck saying its on fire, tears were coming from his eyes and he started choking and coughing. He barely managed to say that his throat felt like something burning hot was pouring down. I immediately gave him cold water to drink. He drank and continued to drink in small sips for the next hour and was feeling normal in an hour. He had not eaten or drank anything after his vaccine. He had also had lunch at 3 pm, a full 2 hours before the vaccine.
1369796	6/2/2021	WI	22	M	5/7/2021	5/29/2021	I have always had low grade tinnitus and migraine related visual issues, so this could be a completely a coincidence. However I feel the need to report it just in case. On the night of May 29, I had begun to hear a low noticeable hum in my right ear and a feeling of fullness. This humming disappeared and returned on Tuesday, June 1st 2021, and then continued on and became worse upon waking up on Wednesday June 2nd, 2021. I am scheduling follow ups with an ENT specialist in order to understand the root cause.

1368138	6/2/2021	DE	16	M	6/1/2021	6/1/2021	Reports did not eat today, usually eats. Reported lightheadedness that resolved within about 2 minutes, followed by nausea for about 2 minutes resolved - was followed by hunger, and muffled hearing for about 3 minutes resolved. Denies chest pain, change in vision, and other s/sx. 03:57pm LUE 112/62 P62 R20. Reports lightheadedness, nausea, and muffled hearing, all s/sx resolved, stated "I feel normal", drank a cola and ate a protein bar. Observed for 30 minutes. Ambulated with steady gait off floor with his parent.
1368597	6/2/2021	NY	58	F	3/19/2021	3/19/2021	After receiving the vaccination I went to bed had fever, chills, and a very bad headache. I started to drink tea and realized the tea was spilling down the left side of my mouth. My face was drooping and I could not close my left eye. I was not able to smile and had lost full sensation on the left side of the face. I phoned my physician and was placed on antiviral and steroid medications. Both Valacyclovir 1 gram 3xs per day, and Prednisone 60mg per day. I also was referred to an eye physician for further follow up and a Neurologist of whom referred me to Physical therapy and Acupuncture.
1367944	6/2/2021	PA	27	F	4/15/2021	4/17/2021	I received my first does of Pfizers on 4/15/2021. 2 days later i ate truffle fries and i was having trouble breathing, my eyelids were swelling up and i was out of breath. A week later I was working at my job again and this time i didn't eat or drink anything out of the norm and i had trouble breathing again and only one eyelid swelled up. In between the first and second shot i would periodically have trouble breathing for a few hours if that. I received my second shot on 5/13/2021. On 5/26/2021 I got lettuce wraps. I ate one lettuce wrap and my lips started to burn when i started eating the second one. By the time i was done with my second lettuce wrap I couldn't breath i instantly stop eating them, chugged water, took and allegra to help my breathing within 45 minutes my whole face was itchy and really red and my whole body was filled with hives from head to toe. I immediately went straight to urgent care, they gave me a steroid shot and a benadryl shot. I waited there for 15 minutes to make sure no reactions happened, thankfully it went away. On 6/1/2021 I was working and around 12:00pm when i went on my lunch break, I had 1 hot dog and the rest of the day I could not breath at all.

1368091	6/2/2021	TX	23	M	1/1/2021	2/1/2021	<p>My first dose of the pfizer vaccine was relatively asymptomatic. Received at local hospital. Sore arm that lasted a few hours, nothing too concerning. This adverse event describes my second dose however, received Jan 23, 2020, approximately 3 weeks after the first. Again, this was received at local hospital. The next day, I felt the expected side effects of terrible chills, whole-body myalgia, and a slight fever. Again, I was not too worried as this was expected. I could not sleep that night, but otherwise, I felt significantly better in the morning. Unfortunately, on Jan 25, 2 days after the second dose, I began to feel a strange tingling sensation in my forearms, and a pain in my lower back. This paresthesia felt as if the insides of my arms were vibrating, and rather than a "pins and needles" sensation, I felt electric shocks through my forearms and extremely discomforting tingles. I could not bend forward without terrible shocks through my arms, and my back pain can only be described as aching. I immediately scheduled an appointment with my doctor for Monday afternoon, That entire Sunday, it felt as if the tingling sensation, rated at 7/10 discomfort, grew to 10/10. I physically was wincing and turning, unable to find any position where my arms were not experiencing electric vibrations. My back pain, which was tender to touch, and if I pressed hard enough on it or laid on my back, caused the same electric sensation not just in the forearms but the entirety of my upper torso and my arm. Taking deep breaths was painful, as it elicited the same discomforting paresthesia. At the time, I was one of the first groups taking the pfizer shots, and it was still unclear if taking NSAIDs was a good idea to alleviate pains and the suppress the immune response. I agonized that entire Sunday and through Monday morning, the shocking expanding from just the forearms to the shoulders around the deltoid, and the back pain soon covered my entire upper torso. For whatever reason, waist-down I was completely fine. Even bending forward only elicited the pain upwards, nothing ever went down my legs. I had slight neck stiffness, a throbbing headache, intense back aches, bilateral upper extremity paresthesia, and pain on deep inspiration at the height of my pain on Monday morning. By this point, the pain had kept me awake for almost 30 hours. When I finally could see my doctor via telehealth appointment, he prescribed me 800 mg ibuprofen to be taken every 6-8 hours I</p>

1368106	6/2/2021	CA	49	F	1/15/2021	4/5/2021	<p>believe. After taking the ibuprofen, the pain lessened significantly, going from 10/10 to 2/10. I was finally able to go to sleep sitting up straight on a sofa chair. The paresthesia was gone, the pain on deep inspiration was gone, but the tenderness and dull ache in the lower back seemed to stay even on the ibuprofen. I noticed that if I laid down on my back to try and sleep, even with the medicine in full effect, the electric shooting and paresthesia would immediately return. If I quickly removed pressure from that area, it went away. The ibuprofen's effect lasted only about 5 hours. I would take another as it slowly crawled back up to 4/10 pain or if the paresthesia was returning. Over the course of an entire week, I constantly needed to be on ibuprofen. By Friday, so almost 6 days after the shot, the paresthesia and back pain could be completely suppressed by the ibuprofen and I was able to lay on my back with no problems. Without medicine, I was sitting at a dull 3-10 back pain, but the paresthesia was gone. The back pain finally vanished on Sunday, 8 days after the shot, and I no longer needed ibuprofen. No fevers, chills, nausea, vomiting, diarrhea, radiation of electrical pain down the leg, vision change, or loss of bowel/urinary control throughout the course of these symptoms. My experience reported to my primary care doctor, via our health messages. I did not return any contact to hospital or my vaccination site.</p> <p>Moderna COVID?19 Vaccine EUA? Diffuse scattered urticarial rash after first dose received on 01/2021 associate it with sore throat , face , lip , eye lid swelling , recurrent episodes affecting daily activities symptoms getting worse with each episode Afraid of having anaphylactic shock Been in doctor office multiple times, saw an allergist specialist as well . Received form allergist Xolair 2 injection , I'm taking Allegra and Benadryl every day , got 5 days treatment RX for predniSONE 40 MG Tablet. On 05/28/2021 I felt my throat was closing up , couldn't swallow but I was able to breath , happened again on 06/02/201 same episode with swelling face and eye lid and sore throat as well .</p>

1367975	6/2/2021	OH	58	F	5/8/2021	5/8/2021	Started a couple hours after I got it Chills I got really hot and really cold and shacking uncontrollable Muscle spasms couldn't hold cup without help All over body and muscles ache. Right arm was sore at the injection site Aching and tingling down arm to hand lasted about 8 hours Second day the shacking had stopped headache and body ache throughout the weekend A week later started with headaches persistent, still to this day having headache, mainly in back of head at the left side of head going into left ear a pinching and dull pain behind left eye felt like something was poking my eye. Made appt with doctor on the the 26 on muscle relaxers and a steroid X-ray of cervical spine MRI of brain taking migraine medication since yesterday 06/01/2021
1368197	6/2/2021	NJ	36	F	4/8/2021	5/16/2021	I don't know if this would be considered an adverse reaction to the vaccine, or being a recovered COVID19 patient, but I started feeling unwell on the afternoon of May 16th, a little worse the next day with a sore throat, congestion, runny nose and burning eyes. On Tuesday the 18th I had a slight fever, so I went to the walk-in clinic to be assessed and tested for COVID19 to make sure it wasn't that. The APN explained that I was experiencing seasonal/environmental allergies after having worked outside on May 16th and 17th. I have never had allergies before and it felt like I was coming down with a cold of some kind, so I wanted to be assessed and ensure I wouldn't get anyone else sick. The APN agreed the slight fever (99.6) was atypical and she understood why I came in. She prescribed allergy eye drops and nasal spray and told me to take an OTC allergy medication. I have continued to experience some allergy symptoms (runny nose, congestion, burning eyes) even after 2 weeks of taking medication. I am unsure if my immune system has changed as a result of having COVID19 in April 2020 or a reaction to the vaccine.

1368246	6/2/2021	MO	62	M	5/26/2021	5/26/2021	He got his vaccine, within 15 minutes he was staring, and was offered something to drink and some graham crackers and his wife said and the nurse came over to see what was going on, and said that he had an absent seizure, he was not responding to anything. His oxygen was 93, his BP dropped. The nurse was watching his eyes to see if there was any reaction, but there was not. They kept talking to him until he responded and he had no idea of what happened. He has not had any more seizures. He has never had any seizures in the past. He came out of it and they did not take him to the ER. He is fine now. He currently has cellulitis around his eye.
1368267	6/2/2021	CA	31	M	6/2/2021	6/2/2021	Patient was sweating, had headache, dizziness, blurred vision.
1368293	6/2/2021	TX	73	M	5/7/2021	5/23/2021	Serious skin rash over much of my body: face, trunk, arms, scalp, groin and neck. The most serious and troubling area is around the neck where t-shirt collar contacts the skin. Some areas don't itch, but the head and neck do. Facial areas that are normally oily are now very dry, scaling and itching. Pre-existing skin problems are now heavily exaggerated. Dry areas on the fingers are worse. Dandruff is much worse. First noticed as an irritation around the eyes. Tears were burning my face, as if acidified. Then I noticed the rash on my arms. Further inspection revealed it on my face, neck, trunk and groin area. There is dryness, scaling and flaking around the eyes, nose, mouth and ears. The neck is most troubling with heat, itching and burning causing lack of sleep. It is not abating and appears to be getting worse. I will be seeking medical attention for the first time this week. If this is related to the vaccine, I want to make that known. I had the second of two shots on the Moderna COVID-19 vaccine (lot #047B21A), on May 07 at noon, meaning I was fully antibody protected on 05-21, immediately before the rash was noticed. A bad body rash is associated with this vaccine, but I find no documentation that it has been observed this long after vaccination. Just the same, I am reporting this today in part because I want this to be documented as a possible reaction to the vaccine. Other possible causes have been ruled out. Currently taking Benadryl, NSAIDS, moisturizing cream, and hydrocortisone cream.

1368300	6/2/2021	MN	35	F	5/10/2021	5/10/2021	The day within 10 minutes I started feeling hot and feverish. Then I started to feel lumping and cramping in my left breast and it persists and it turned in to nausea, vomiting, and dizziness. I also felt body cramping and both of breasts became extremely hard and was not comfortable. I also had muscle aches along with a mild fever for about a week. The pain was persistent. Then on day 2, the headaches started and I couldn't sleep because every time I moved the headache would cause me to vomit. So, I couldn't. My vision was blurry and I was not sure if it was due to the headache or the vaccine. I ended up going to the ER on 05/16/2021 for cramping in my left leg which was down by my ankle and was bruised. I'm still experiencing heart palpitations, tiredness, cramps still happen in my breasts, and there are still moments when my vision goes in and out.
1368517	6/2/2021	WV	56	F	5/28/2021	5/28/2021	After vaccine that evening my head felt real dizzy and started having a bad bad headache like tightness in my head and felt like I was going to faint. I could hardly walk, my left arm got really tight feeling like a squeezing and it started getting really really red, then my heart started beating really fast and this never happens. Later that Friday night I felt like I had a fever I was up because my body started aching and was up all night, it felt like flu symptoms along with everything. My arm started getting very very sore and this went on Friday, Saturday, Sunday, Monday and Tuesday. My arm was still real tight and red and it moved down my arm these last couple days, down to my elbow, red very sore and tight. I took pictures because I was really scared on my cell phone but did not go to the doctor. Also, my vision started being blurry right now.
1368565	6/2/2021	CA	47	M	5/29/2021	5/30/2021	my eyes were swollen then following day after my second shot. my right eye was nearly swollen shut. It took 2 full days for the swelling to get close to normal. I took benadryl during that time. On my first shot I did have a red, itchy, hot spot at the site of injection but no other symptoms.

1368564	6/2/2021	CT	41	F	5/10/2021	5/12/2021	She got her vaccine, she had no reactions at all. On 5/12/21, she woke up 2 days with ankle and feet swelling, hand and face swelling, eyelid swelling. She had a fever up to 100.5. Her swelling has not gone down on any of the locations. She cannot even take her wedding bands off. Her feet are extremely cramped in her shoes. Her allergies have gone tremendously. She has been throwing up and have been nauseous a lot. She has not been taking anything but Benadryl for the reactions. She also has gained 7# since the vaccine. Her hands have also been shaky. She has not notified her doctor of any of these symptoms.
1368099	6/2/2021	TN	63	F	5/24/2021	5/26/2021	on may26,2021 woke up early and my right eye could not focus . felt like I had a heavy veil covering it. My husband called my eye doctor and made an appt. for Friday May 29. My eye doctor exam me and told me that I had CRAO, She said I need to see an eye specialist. I saw eye specialist on monday June 1st. He confirmed th dx. He also recommend that I should report this too you
1368333	6/2/2021	FL	27	F	6/2/2021	6/2/2021	Patient received vaccine at approximately 3:10PM. After receiving she seemed fine and was able to walk to the waiting area. After approximately 1-2 minutes she reported to her boyfriend that she did not feel well and "needed some water." Immediately following she began to lose consciousness and went completely limp with her eyes rolled back, according to her boyfriend who caught her and placed her on the ground. The boyfriend also reported some muscle tremors occurring during this. After another minute the patient regained consciousness and was awake and oriented to person and place but not time. She was able to see properly and was vocalizing effectively. 911 was called immediately following initial loss of consciousness and EMS arrived to collect vitals. Patient was given a few sips of water. No medications were given. Following EMS assessment, patient was hypotensive and unable to stand on their own; EMS transported the patient to the emergency department.

1368365	6/2/2021	SC	43	F	5/28/2021	5/28/2021	Within a half hour to 45 minutes post injection, I started having a sharp pain in my left eyebrow. over the next hour or so, the pain worsened around my left eye, and I noticed a numbness in my forehead and upper cheeks (Similar feeling to botox but also slightly tingly). The discomfort lasted throughout the evening. By bedtime, I was extremely fatigued and having feverish symptoms (chills, aches, headache, fatigue) though my body temp was not elevated much. When I woke up the next morning, my temperature was increasing, chills and body aches were worse. I was somewhat expecting that, given accounts from others. Highest temp was 102.8 over the next 24 hours. But most concerning was my resting heartrate was elevated all day (tracked via apple watch). My resting HR even while sleeping was from the upper 80s and as high as 103 bpm. After bedtime that night, I started having pretty severe body aches in my torso. Most of the other aches had lessened but these got worse, preventing sleep, and lasted through most of sunday 5/30. By evening, I felt much better, and by Monday, I was back to normal, all symptoms gone.
1368361	6/2/2021	TX	47	F	5/25/2021	5/25/2021	Approximately 35 minutes after her 1st dose of Pfizer COVID vaccine, patient's head started hurting and her eyes got really hot. She said the symptoms worsened that evening as her eyelids were both really swollen. Patient said she took a picture in case that was a reaction (I do not have that picture). She said it took about two days for her eye symptoms to resolve. Other reported side effects: being super sore and tired, however, the swelling was the concerning symptom for patient. Patient did not go to the ER or PCP or have to take time off.
1368355	6/2/2021	CA	55	F	5/1/2021	5/6/2021	Pt called 5/6/2021 regarding of covid vaccine side effects. Noted pt has no emergency s/sx. Pt stated she got 1st covid vaccine Pfizer 5/1/2021 and pt got headache(pain score 8/10), eye pan and burning sensation on eyes, cough, runny nose, sore throat, loss of taste and smell for 3 days. Pt is taking tylenol and OTC allergy medicine Zyrtec. Noted hx of DVT, asthma, severe obesity (BMI 51.2). Pt is taking wafarin regularly. Pt scheduled urgent care visit 5/6/2021.

1368341	6/2/2021	NJ	32	F	5/11/2021	5/13/2021	I have not had any issues with my pregnancy. My expected date of delivery is 07/09/2021. My adverse event occurred two days after I received my second dose. I woke up and couldn't really see. I had vision, but I couldn't see clearly. I did not have any other side effect though. I went to my OBGYN because they weren't sure if it was onset of rapid pre-eclampsia. They ruled that out and told me to go home and rest. The vision issue only lasted the day after I received my vaccine. The morning after my event, everything was fine. My doctor said that it may have been a "not typical" migraine.
1364494	6/1/2021	NC	54	F	4/13/2021	4/14/2021	I had, chills, fainting, left eye dropping, headache and body ached.
1364612	6/1/2021	NY	48	F	5/7/2021	5/10/2021	Central retinal vein occlusion right eye with cystoid macular edema right eye, requiring anti-VEGF intravitreal injections.
1364666	6/1/2021	NY	37	F	4/1/2021	5/14/2021	Patient's first day of last menstrual period was 3/23/2021. Patient has a predictable monthly cycle with an average length of 30 days. Patient reports two positive at home urine pregnancy tests on 4/30/21 and 5/1/21. Conception likely occurred on or around 4/6/21. Patient reports vaginal bleeding that started on 5/14/21. Patient had transvaginal ultrasound on 5/17/21. Impression: FIRST TRIMESTER ULTRASOUND, SINGLETON An early intrauterine singleton pregnancy is visualized. A fetal pole is visualized but fetal cardiac activity is NOT present. The fetal biometry is appropriate for gestational age. Anatomic survey is precluded by early gestational age. As the CRL <7mm (measures 2.6mm) a definitive diagnosis of a missed miscarriage can not be made I would recommend a follow up ultrasound in 10-14d. Follow up ultrasound on 5/27/21 could not visualize pregnancy. Impression: The endometrium measures 14.39 mm, with heterogenous echotexture suggestive of retained products. The right and left ovaries appear normal.

1364564	6/1/2021	NY	43	F	5/8/2021	5/9/2021	The night after the shot I developed COVID arm which burned and itched and swelled up. The next night a rash spread to my arms and trunk. The next night my right leg swelled up horribly and got a rash as well on my upper quad. My eyes burned for days after the shot and my eye doctor said my eye lids were inflamed and gave me steroid eye drops to help. The next night I woke up in the middle of the night itching my face. My whole face was covered in a rash that burned and was swollen. I had 4mg pills of methylpredisolone on hand at home and self treated with three pills (one each day for three days) and that helped with the swelling and Benedryl helped with the itching. I started having heavier periods at increments more than once a month (like once a week). I also have experienced significant weight gain - almost 10 pounds - in the month after the shot. I have weighed the same thing since I was in college and still wear the same clothes until after the shot. The periods have subsided but the weight is still here and I've done nothing else differently.
1364534	6/1/2021	AL	42	F	3/8/2021	3/12/2021	Four days after taking vaccine the right eye was swollen shut and she had extreme head pain. Pt went to Dr. She was sent for an MRI. This showed she had inflammation of the right lacrimal gland 5 X larger than it should be and prescribed prednisone. She started w/ 60mg and the swelling was starting to go down but by the time she was down to taking 20mg the swelling returned, Dr. told her to start taking 60 mg again and referred her to Dr. on 4/28/21. On 4/29/2021 he surgically removed the right lacrimal gland at Eye Surgery Center. She went for FU appt. The biopsy was not cancerous and surgery was success. Pt no longer has headache and her vision is returning to normal.

1364320	6/1/2021			M	5/26/2021	5/26/2021	absent seizure; This is a spontaneous report from a non-contactable consumer reported for her husband. A male patient of an unspecified age received bnt162b2 (BNT162B2, PFIZER-BONTECH, COVID-19 Vaccine, Solution for injection, Lot number and expiration date: Not reported), via an unspecified route of administration on 26May2021, as (Batch/Lot number was not reported) as 2ND DOSE, SINGLE for covid-19 immunisation. The patient medical history and concomitant medications were not reported. The patient experienced absent seizure on 26May2021. It was reported that, the caller states her husband received his second dose of the Pfizer COVID-19 vaccine today, 26May2021. and during the 15 mins wait time from after receiving the vaccine he had what she states the nurses there are calling and absent seizure. The caller states his eyes were awake but he was not responding, as she was getting ready to bring him to the ER, he became responsive so they did not go to the ER. She is wondering if there has been reports of this and what she should do next. A review of the Pfizer COVID-19 vaccine did not find information regarding seizures. The seriousness criteria of the event was reported as serious (medically significant) by the reporter. The outcome of the event was recovering. No follow-up attempts are possible. No further information is expected.

1364673	6/1/2021	FL	13	M	5/16/2021	5/17/2021	Was fine the night before. Woke up and his eyelids were swollen and his lips were swollen. Immediately, my wife called Telehealth and described the situation. They said to get him some Benadryl and we gave him that. He also had a headache - we might have give him a Tylenol. With Benadryl - he took four or five doses according to the protocol on the Benadryl. He did not go to school. The next day, he was swollen but not as bad. My wife bought him Claritin and he didn't do anything because he didn't know which to take (Benadryl or Claritin). His swelling went away quite a bit that day without taking anything and he went back on Wednesday -there was still a little bit of swelling but not much. He wasn't feeling great though that whole week. He was still tired and was a bit headachy until Friday or so. Somewhere on the weekend he felt back to himself. He is due for second vaccine this weekend and we aren't going to have him take it then. We're concerned and have decided to hold - the physician said he shouldn't have had a COVID vaccine two weeks before this Pfizer one (he received the Varicella) on the 29th of April- -Dr said it should have been a month or so of waiting still before he had this vaccine after that.

1364860	6/1/2021		42	F	5/28/2021	5/30/2021	Had reaction both times (broke out in hives) but did not realize they were the result of vaccines until the second dose. Started on inner thigh, looked like ringworms. Then it started turning into welts. Also had white bumps. The rashes started moving to the elbows on 5/31/21. Eyes started getting very itchy this morning (6/1/21) and looks like she has bug bites on eyelids. Hydrocortisone did not work well, tried using antihistamine but did not work well either. Has been using ice packs and minimize physical activity.

1364784	6/1/2021	VA	41	F	4/12/2021	4/13/2021	The day after I received dose 2, 04/13/2021, I started having pain behind my eyes. I was feeling very fatigued. I had to take painkillers to help get through the day. I had a lasting headache for a whole week. My right armpit became swollen and sore. On 04/15/2021, I felt tingling on the left side of my body with mild dizziness and anxiety. I had a virtual visit with Dr. on 04/16/2021. I also had knee pain which is unusual for me. During my virtual visit, Dr. informed me that she felt fatigue for the week after she received her vaccine too. I was told that if my symptoms continue to follow up with the doctor. As of today, 06/01/2021, I can still see where I received the vaccination. I have a red bump there. It does not hurt, but it is noticeable.
1364753	6/1/2021	PA	44	F	1/8/2021	1/9/2021	~~On 1/9 felt severe flu-like symptoms (chills, fever, nausea, dizziness, headache), and stayed in bed until 1/10. Felt fine midday, 1/12, then sudden, intense migraine, ear/sinus pressure/pain, dizziness, blurred vision, weakness, tired. Symptoms improved but were still present the next day.~~

1364731	6/1/2021	NJ	59	F	5/15/2021	5/16/2021	Outside of the typical symptoms of: Nausea, became lethargic as the day went on, arm sore, felt feverish, fell asleep 8pm earlier than usual. When I awoke I had tremors, my feet hurt upon standing and were heavy to walk. I felt as though something was weighting me down as I walk and was difficult and heavy to walk up stairs. I had pain in my lower back that was more of a dull heavy ache upon standing that got better as I walked. My eyes were dilatated and I felt faint. I rested the entire day and returned to work on Monday, but felt exhausted and like I had to spend more time for concentration on my work and work slower than usual. That lasted for about 10 days slowly getting better as time went on. after about day 8 the tremors had lessened were all but gone. Now about 15 days out, I am not at full energy but close, pain in feet has lessened and lower back better, but not fully healed and no more tremors.
1364843	6/1/2021	TN	27	F	5/18/2021	5/25/2021	Exactly one week after the second vaccine I developed a severe headache. It was a pulsing in my entire forehead and into my eyes. It started the morning of May 25 and I have woken up with the same headache since then. Advil sometimes works but it does not completely reduce the symptoms.

1363999	6/1/2021	PA		F	4/30/2021	4/30/2021	Swelling of eyes; Using bathroom alot; Nausea; Breathing problems; Swollen lymph nodes; Meningitis; Dizzy; Pain all over body; This spontaneous case was reported by a consumer and describes the occurrence of MENINGITIS (Meningitis) in a female patient of an unknown age who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Common variable immunodeficiency. On 30-Apr-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 30-Apr-2021, the patient experienced MENINGITIS (Meningitis) (seriousness criterion medically significant), DIZZINESS (Dizzy) and MYALGIA (Pain all over body). On 03-May-2021, the patient experienced RESPIRATION ABNORMAL (Breathing problems), EYE SWELLING (Swelling of eyes), MICTURITION URGENCY (Using bathroom alot), NAUSEA (Nausea) and LYMPHADENOPATHY (Swollen lymph nodes). At the time of the report, MENINGITIS (Meningitis), RESPIRATION ABNORMAL (Breathing problems), DIZZINESS (Dizzy), EYE SWELLING (Swelling of eyes), MICTURITION URGENCY (Using bathroom alot), NAUSEA (Nausea), MYALGIA (Pain all over body) and LYMPHADENOPATHY (Swollen lymph nodes) was resolving. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown) was unknown. No concomitant medication was reported. Patient was put on a steroid and also put on a Nebulizer for breathing problems. 1364216	6/1/2021	WA	75	F	2/18/2021		strong headaches; dry eyes; fatigue; upset stomach; the cough again changed from dry to wet but very severe; sometimes I had to cough hard that I couldn't catch my breath; my temperature went up to 99.7; could eat barely anything; she was very shaky; This is a spontaneous report from a contactable consumer or other non hcp (patient). This is the second of 2 reports from the same reporter involving the same patient. The patient experienced adverse events with both 1st and 2nd dose of the vaccine. This is for the second dose of the vaccine. A 75-year-old (age at the time of vaccination) female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection; Lot number: unknown), via an unspecified route of administration on 18Feb2021 as 0.3ml, single dose for covid-19 immunization. Medical history included hypertension, arthritis, normally a migraine sufferer, oesophageal disorder, irritable bowel syndrome, covid-19 (in Apr-2020), feeling abnormal, pneumonia, bronchitis, breathing difficulty, cough. Consumer stated that she had something with esophagus so she was taking for digestive because she had 'IBS', in April of last year she was diagnosed with corona virus. She had little bit of breathing difficulty and bronchitis was confirmed with X-ray. Covid was confirmed two days later. About 3 weeks later she felt bad again and she had to go to the emergency room the hospital here and she had pneumonia and received very good medication (treatment) and like the five pills which they give for pneumonia and they wanted to admit her to the hospital, she was in the emergency room for 6 hours and that was enough and they made another Covid test and that was negative but it was the X-ray shown that she had pneumonia. Concomitant medications included calcium (CALCIUM), colecalciferol (VITAMIN D [COLECALCIFEROL]), cyanocobalamin (VITAMIN B12 [CYANOCOBALAMIN]), fluticasone propionate (FLONASE [FLUTICASONE PROPIONATE]). Received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection; Lot number: FL9264), via an unspecified route of administration on 28Jan2021 as 0.3ml, single dose for covid-19 immunization and experienced fever, chills, fatigue, extremely dry eyes and felt hot, they were so dry she had to pull over on the side to drive home; arm was a little bit sore, slight headache,

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

Ice cold hands and feet, shaky, had absolutely no appetite, she was not thirsty and very little urine output, runny nose, she had almost from years a dry cough and this one turned wet, had a very upset stomach that she could not eat or drink anything, extremely tired and it felt like she had the flu, she had a heartbeat for three days which was faster than normal and that lasted for about three days. On an unspecified date, after the second dose of vaccination the patient experienced strong headaches, dry eyes, fatigue and upset stomach, though slightly shorter in duration than she experienced following the first dose. She again had dry eyes, the cough again changed from dry to wet but very severe and sometimes she had to cough hard that she could not catch her breath after second dose. The headache had changed from the first one, it was slight headache for few days but with this it was for three or four days she had headache, her stomach was a bit upset and she could not take a pill (Unspecified Medication). Her headache was severe as if she had a helicopter in there and then extremely tired. She had to go to the bathroom, and she went to bed and thought that she was going to lay down for about five minutes, but she woke about two and a half hours later. Every step she had to walk was almost too much and then my temperature went up to 99.7 and she was very shaky. The headache lasted for about 3 or 4 days and then it was over. She has never had any side effect from any vaccine. She could not take anything for the headache because she thought she will throw up. In the morning, she just took her regular medicine (Unspecified Medications). She could eat barely anything like she said after three or four days. Consumer stated that her height was 5 feet 3 inches, and she shrank some. The patient underwent lab tests and procedures which included sars-cov-2 test positive: positive, x-ray resulted bronchitis. The outcome of the event headache was resolved whereas the outcome of other events was unknown. No follow-up attempts are possible. No further information is expected.

1363774	6/1/2021	MN	61	F	3/12/2021		<p>PLATELET COUNT INCREASED; EXCRUCIATING HEADACHE; INTRAOCULAR PRESSURE DECREASED; ANGIOGRAM NORMAL; ARTERIOGRAM CAROTID NORMAL; THROMBOCYTOPENIA; ARTERY BURST BEHIND HER EYE; OCULAR DISCOMFORT; PERIORBITAL SWELLING; EYE PAIN; ACHES AND PAINS; This spontaneous report received from a patient concerned a 61 year old female, ethnicity unknown. The patient's height, and weight were not reported. The patient's past medical history included hypertension, hypothyroidism, and intermittent pancytopenia, and concurrent conditions included metronidazole allergy, hashimoto's disease, and microscopic colitis. The patient was previously treated with metronidazole. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, intramuscular, batch number: 1805018, and expiry: UNKNOWN) dose was not reported, administered on 09-MAR-2021 for prophylactic vaccination. Concomitant medications included amlodipine, levothyroxine, losartan, rosuvastatin calcium, and ubidecarenone. On 09-Mar-2021, the patient got the vaccine and after few days she had aches and pains (very mild reaction) and went to bed early. The patient thought she was fine. On 18-Mar-2021, 04:00, she woke up with an excruciating headache above her left eye in her eyebrow. The patient wondered if it was an aneurysm and took 2 tablets of extra strength Tylenol and it helped. The patient stated that after every 5-6 hours, excruciating headache came back. The patient had the same headache for over a week. The patient got tested for Covid-19 and it was negative. The patient thought she had sinus problems but had no other symptoms. On 30-Mar-2021, the patient woke up with headache. Her eye was killing her, was sore and swollen, and felt like it was going to burst and her left eye was swollen shut in a couple of hours. The patient narrated it was excruciatingly painful. The patient's husband drove her to urgent care, where ophthalmology tested the pressure: right eye was normal (she thinks it was 18-normal) and the left eye was 51 (normal is 14-19), units unspecified (intraocular pressure decreased). The eye doctor started prednisone and the patient had a CT scan and lab work done. MRI was also ordered but they were unable to do it right away. On unspecified date in Dec/2020 the platelets were 349 in December and came</p>

down to 64, which was very low (low threshold was 150) (thrombocytopenia). The CT scan was performed, they thought she had a cavernous carotid fistula and she was scheduled for an angiogram for a further diagnosis on 01-Apr-2021. The angiogram determined she did not have fistula. The patient was admitted to the hospital after the angiogram and on 02-April-2021, MRI was done. All throughout the process, the ophthalmologist, radiologist and internist all thought it was related to the Janssen COVID-19 vaccine. The prednisone started working and the pressure started dropping in her eye. The patient states that doctors think an artery burst behind her eye. After discharge, the patient was taking prednisone which was helping. On the 13th, she was watching television and saw that the vaccine was being put on hold due to the women with clots whose progression matched hers exactly (severe headaches, low platelets, and required attention). She was on prednisone for a month. Laboratory data (dates unspecified) included: COVID-19 virus test negative (NR: not provided) negative, CT scan (NR: not provided) Not reported, and Platelet count (NR: not provided) 64 (units unspecified). Treatment medications (dates unspecified) included: prednisone, and paracetamol. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from thrombocytopenia, intraocular pressure decreased, ocular discomfort, periorbital swelling, and eye pain, excruciating headache on 02-APR-2021, and aches and pains on 12-MAR-2021, and the outcome of artery burst behind her eye was not reported. This report was serious (Hospitalization Caused / Prolonged, and Disability or Permanent Damage). Additional information was received on 25-MAY-2021 following information was updated and incorporated into case narrative: Other identification number, patient contact details, events- Aches and pains, artery burst behind her eyes, excruciating headache, Tylenol drug was added, hospital details was added and narrative was updated accordingly.; Sender's Comments: V1: Additional information updated identification number,hospital details,events- Aches and pains, artery burst behind her eyes, excruciating headache,This updated information does not change the causality of previously reported events. 20210502268-COVID-19 VACCINE AD26.COV2.S-Artery burst behind her eye. 1364281	6/1/2021			M	4/21/2021	4/22/2021	two blood clots inside his brain, and one on the outside/ three blood clots in and near his brain; two blood clots inside his brain, and one on the outside/ three blood clots in and near his brain; pulled neck muscle; neck pain; fevers/ fever; severe headaches/incessant headaches; swollen lymph nodes; extreme migraines/ migraine headaches; could not move his neck without the assistance of his hands/ unable to freely move his neck; eyes are still swollen; Neck swelling; The initial case was missing the following minimum criteria: no identifiable reporter. Upon receipt of follow-up information on 24May2021, this case now contains all required information to be considered valid. This is a spontaneous report from a Pfizer-sponsored program. A contactable consumer, physician and non-contactable consumers reported that a 17-year-old male patient (also reported as 18 years old) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 21Apr2021 (Batch/Lot number was not reported) as 1st dose, single dose for COVID-19 immunisation. Medical history included prior COVID-19 infection. Before the shot, the patient was 100 percent healthy, playing and practicing basketball. There was nothing wrong with him. He didn't have a sore throat (or) any injury. The patient's concomitant medications were not reported. On an unspecified date, the patient was hospitalized with three blood clots in and near his brain that developed after he received the first dose of Pfizer-BioNTech COVID vaccine. The symptoms started after getting his first COVID-19 vaccination dose, and symptoms were initially dismissed as a pulled neck muscle. He received the vaccine on 21Apr2021 and began experiencing neck pain, fever and severe headaches on an unspecified date (also reported as "one day later"). The patient's pediatrician initially dismissed the symptoms as a pulled neck muscle. However, the patient's mother was convinced it was something else. After more than a week of symptoms and being unable to freely move his neck, the family got this diagnosis: two blood clots inside his brain, and one on the outside. The patient was healthy and well before. It was unclear how long the patient will be in the hospital. It was also stated that the patient experienced swollen lymph nodes and migraine headaches. Further reported that the day after his COVID-19 vaccine shot (on 22Apr2021), the patient

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

felt his neck swelling. In the coming days, he suffered from severe headaches. He also could not move his neck without the assistance of his hands few days after the shot (unknown date). Patient suffered from fevers and incessant headaches. He started to feel swelling and pain in his neck ("that night"). Days later, he got extreme migraines, so the patient's mother took him to the emergency room. It was reported that the patient plays competitive basketball seven days a week, which means high contact physical activity that could have possibly aggravated the swelling caused by the vaccine. On Thursday (unknown date), the patient left the ICU, but his eyes are still swollen and the road ahead is uncertain. On an unspecified date, the patient was out of intensive care unit (ICU) but the clots aren't gone. He has an magnetic resonance imaging (MRI, unknown date, unknown results) to see if they shrunk. The patient is currently at home recovering (as reported). Doctor recommended that patient have a COVID Nucleocapsid antibody level drawn to determine if he had been exposed previously to the Corona virus. On an unspecified date, the patient underwent test for nucleocapsid antibodies, patient is POSITIVE for SARS-CoV-2 nucleocapsid antibodies. This indicates that he had been previously infected with Corona virus prior to his receiving the BNT162 vaccine. There is a very serious concern that previously infected persons may be at higher risk of developing post-vaccine complications that un-immune persons. The doctor believed that the prior infection in combination with the vaccine led to the blood clots in the brain. Outcome of event "two blood clots inside his brain, and one on the outside/ three blood clots in and near his brain" was not recovered, while other events were unknown. Information on the lot/batch number had been requested.

1364086	6/1/2021	MI	70	M	1/29/2021	1/29/2021	feverish and chills; feverish and chills; arm was a little sore and a little black and blue; frequent urination / he started to pee every 20 minutes; arm was a little sore and a little black and blue; the site bled a little bit; little site soreness like a flu shot; This is a spontaneous report from a contactable consumer (Patient). A 70-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Lot Number: EL9262 and Expiration date was not reported), via intramuscular route, administered in Arm Right on 29Jan2021 14:30, as single dose for COVID-19 immunization. Medical history included shellfish allergy (had a weird shellfish allergy, he said that he can eat cooked shrimp and lobsters. He said that he was peeling raw shrimp and his fingers started to itch, he started to swell, and his eyes started to swell. He said that this happened twice and once with lobster. He was treated with Benadryl IV), diminished kidney function which was diagnosed in 2015 and ongoing (kidney issues run in his family, had a uncle on dialysis), kidney stone had it for years and ongoing and stated that they monitor it every once in a while and enlarged prostate. Concomitant medications included FLOMAX [MORNIFLUMATE], 0.4 mg, one capsule orally in the evening taken for enlarged prostate from an unspecified start date and ongoing. His next vaccine is due on 18Jan2021 at 14:30 (as reported). The patient did not receive additional vaccine on the same date of Pfizer vaccine and also he did not receive any vaccine within 4 weeks. On 29Jan2021, about 8 hours after receiving the vaccine, the patient started to pee every 20 minutes and this went on for most of the night about 05:30 30Jan2021. He wanted to know if this was a reported side effect of vaccine. He stated that he was overdue for urology appointment. He also enquired if it is more common to experience, increased side effects after second dose. He said that normally he would get up about every 3 hours to go pee. He stated that the next day he was fine. On 29Jan2021, the patient arm was sore and a little black and blue. He stated that he had a little site soreness like a flu shot that lasted about 2 days and was still a little blue and black. On 30Jan2021, that he felt slightly feverish in the middle of the night and little bit of chills. He stated that the next day he drank a bunch of water and he was fine. He stated that the feverish and chills was at about 03:00 in the morning 30Jan2021. The

1364099	6/1/2021			F	2/2/2021	2/1/2021	<p>patient reported that the lady administering the vaccine said that the site bled a little bit, but he said that it was nothing. The patient did not go to emergency room or physician office as a result of adverse events. The patient did not underwent any relevant tests. The outcome of the events recovered for feverish and chills, arm was a little sore and a little black and blue on 30Jan2021, frequent urination / he started to pee every 20 minutes on 30Jan2021 05:30, little site soreness like a flu shot on an unspecified date. Follow-up (27May2021): Follow-up attempts completed. No further information expected.</p> <p>Face is swole up around her eyes/ describes the swelling as water bags under the eyes; This a spontaneous report from two contactable consumers. This female consumer (patient) and her son reported. A female patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Batch/Lot number was not reported), via an unspecified route of administration, administered in left arm on 02Feb2021 at 17:30 as 1ST dose, single for covid-19 immunization. Patient medical history and concomitant medications were not reported. On an unspecified the patient experienced face was swollen up around her eyes, no difficulty breathing. Swelling was worse on the right side of her face, but she received the shot in her left arm. She described the swelling as "water bags under the eyes". She also reported having had a flu shot about 3 weeks ago. She was concerned about the side effects and the second dose. Swelling of face can be a sign of severe allergic reaction but would typically occur within the first hour. It was reported that patient might had a mild, delayed allergic response. The patient was also referred back to HCPs for treatment / to have a plan for the second dose and let vaccinator know about the reaction when she goes for the second dose. Outcome of the event was unknown. Information about Lot/Batch number is requested. Follow-up attempts are completed. No further information is expected.</p>

1364111	6/1/2021			F	2/2/2021		I got the vaccine yesterday and I have only had arm soreness as a negative side effect.; Cough; breathing is very clear today even though I have asthma/My nose would frequently swell shut and now my nose is very clear/now after the vaccine the rash is gone/My eyes would water a lot and now my eyes feel almost normal today; This is a spontaneous report from a contactable consumer or other non hcp. A female patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), via an unspecified route of administration on 02Feb2021 (Batch/Lot number was not reported) as UNKNOWN, SINGLE for covid-19 immunisation. Medical history included A\allergies, respiratory infection, asthma and rash. The patient's concomitant medications were not reported. The patient experienced "i got the vaccine yesterday and i have only had arm soreness as a negative side effect" cough and "breathing is very clear today even though i have asthma/my nose would frequently swell shut and now my nose is very clear/now after the vaccine the rash is gone/my eyes would water a lot and now my eyes feel almost normal today". It was reported that when the patient heard vaccines were being developed, she heard they were not including pregnant women or people with severe seasonal allergies. She informs that she might be an interest specifically for a study. Her allergies are in the 39,000 range. She got the vaccine yesterday and she has only had arm soreness as a negative side effect. However, she had had some very good side effects as well. Last night she coughed up a lot of old nodules from a respiratory infection she had a year ago. Her breathing is very clear today even though she has asthma. Her nose would frequently swell shut and now her nose is very clear. Her skin was broken out before the vaccine, so much so that she used a different arm because of the rash and now after the vaccine the rash is gone and is only a little pink where it was before. Her eyes would water a lot and now her eyes feel almost normal today. When she told her friend about this, she said her mom actually coughed up a lot of old infection nodules as well. Outcome of the events were unknown. Information on the lot/batch number has been requested. Follow-up attempts are completed. No further information is expected.

1365753	6/1/2021	ID	64	F	4/2/2021	4/9/2021	I tested positive for Covid-19 with no severe symptoms in February of 2021. One week after the vaccine on 04/09/2021 I broke out in hives after eating a meal. The hives were mostly on the right side of my body but there were some on the left. I also had some numbness and tingling in my mouth. I used some anti itch cream, and the hives were mostly gone the next day. Twelve days after the vaccine I started to unusual vision symptoms which included wavy zig-zag lines in my vision. My doctor advised that they were Ocular Migraines. I had a headache at the same time, but I have never had Migraines before. I was also fatigued with a little dizzy and nauseous. The headache lasted for one day, but I still felt a little nauseous the next day. The feeling of fatigue and tired ness lasted for about six weeks. Two to three days after Ocular Migraines I started to notice a bright red rash on the right side of my back. It quickly spread around my side to the midline and then up my right side to my Bra line in front. I consulted my doctor on 04/19/2021 and he identified the rash as Shingles I was prescribed Acyclovir 800mg for 7 days and then an additional 5 days. I saw my Dermatologist on 05/06/2021 and he said that the Shingles were still active so I was Prescribed Valacyclovir. The Shingles lasted about six weeks total with some fatigue before I felt normal. I still have some visible signs of the rash on my back. Dr., PCP, 04/21/2021 Dr. Dermatology. 05/06/2021 for Shingles
1365401	6/1/2021	MI	42	M	5/28/2021	5/28/2021	Patient received vaccine at 14 days after first dose rather than at 21 days after first dose. Patient reported that he experienced left sided body muscle aches/spasms, fatigue, neck pain and visual disturbances on 5/29/21. Stated his heart felt like it was racing for a short time but it may also have been anxiety because he knew his dose was given early. Symptoms resolved by 5/30/21.

1365527	6/1/2021	CA	58	F	4/9/2021	4/21/2021	On 04/21/2021, 12 days after I received the vaccine, I woke up with my entire left side feeling numb and I had a headache. I felt like I had pressure on my chest and I was really lightheaded. I got up for a little while and I felt like I was going to faint. I felt like I needed to eat something and I was very weak. I drank some juice and ate an orange. I was having a hard time swallowing and at times slurred my words. I realized that something serious was going on because I had pain like when I went through chemo. The base of my spine has been hurting every day since I received the vaccine and I have had headaches since as well. I was having heart palpitations and felt super weak. I didn't go to work for 2 days. That was 04/21 and 04/22. On 04/23 I had to do a zoom conference for work, for an hour, and my eyes starting hurting really bad like my eyes had been open for 24 hours. The light from the computer screen was really affecting me. At 5pm I did a tele-video appointment with the NP. She told me that she wanted me to go urgent care because it was the closest urgent care to me. After going to Urgent Care on 04/24, the doctor wanted me to go to the Hospital by ambulance. At the hospital the performed an EKG, CTA and MRA and they said that everything looked fine. They couldn't validate that my pain was from Johnson and Johnson vaccine. I was release at 10:30pm PT, I called Dr., my Oncology surgeon, and he referred me to Neurology doctor. I got an appointment with Dr., 04/27, and she ordered a CTA and an MRA. I had the scans completed on 04/28, with and without contrast. The radiologist found something. I was sent back home, but I was told that right vertebral artery was completely excluded. In January of 2020, there was a CTA performed, and I didn't have any numbness and my vertebral artery still have a steady flow even though there was a tear. It also showed that I had more stenosis in my carotid artery. I have now been referred to a new Neurosurgeon. Dr. never saw me because they couldn't view my records. The doctor told me to take Crestor and 81 mg aspirin. I did not feel that those medications helped at all. If anything, I felt worse. on 05/15, I was in the passenger seat of my grandson's car and I ended up throwing up and there was blood coming out with the vomit. He took me the Hospital. I had a video appointment on 05/11, with an NP, and she told me to up my aspirin to 325mg and continue to take

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							Crestor. She referred me to The Stroke Neurology Group and she referred me to get a CTA. She also referred me to a GI doctor. On 05/15, against medical advice, and was taken by ambulance to another hospital. I stayed there until 3AM 05/16. They performed an MRA, a CT, Stroke Angiogram, they MRI with and without contrast, a chest x-ray and a lot of blood work. They also performed are lactate test and at first it came back as 2.5, which made them think I had an infection, but they re-tested and it came back as 1.5 which they said to be normal. The results from the hospitals. On 05/19 I went to see a Cardiologist, and she took me off of Crestor and put on pravastatin. She order an echocardiogram and a treadmill test and an EKG. I did see a GI doctor and they told me that the aspirin that I was told to take is what was making me throw up blood. I do have a neurology appointment on 06/11 and I have an appointment with the neurosurgeon on 06/16. My last heart test came back normal.
1365529	6/1/2021	FL	36	F	4/29/2021	5/19/2021	blurred vision, headache,
1365564	6/1/2021	MA	36	F	1/10/2021	1/24/2021	The day after the vaccine I had extreme flu-like symptoms. Two weeks after the vaccine I had swollen Lymph Nodes. Two weeks later I then got a weird rash on the left side of my face. It was very painful and it started on my forehead to the left . It started to travel down my face and into my eye. I had a Telehealth visit and they said it was just a random rash. I then saw my PCP and they advised that I had the Shingles. I still have scars on my face especially on my forehead. I was prescribed anti-viral medication for ten days which was extended for five days and the rash started to improve within three days. I had the Chicken Pox as a child.
1365683	6/1/2021	CA	37	F	1/17/2021	1/27/2021	Around 10 days after getting my first dose, fever, chills Soreness in arm, Nausea, vomiting, headache, delayed period for 10-12 days late. I took Zophran for nausea, and Tylenol 1000mg, every 6 hours. I went to my PCP, they didn't take labs etc. They just told me to take the zophran and to just keep an eye on everything. After 3-4 days I started to feel better.

1365694	6/1/2021	CO	14	M	5/13/2021	5/29/2021	Woke up with blurred vision in left eye on Saturday, May 30. Went to see eye doctor after Memorial Day Weekend. 20/50 in left eye (was 20/20). So far diagnosed with inflammation of optic nerve. Going to a retinal specialist June 2. Talk of seeing a neurologist as well to figure out why there's inflammation - he's too young. Dr is wondering if it is due to COVID shot 3 weeks ago.
1365695	6/1/2021	CA	91	M	2/25/2021	3/1/2021	After the first dose my father got what the eye doctor thought was pink eye. After treating him it didn't clear up. It was later diagnosed as herpes of the eye and he became blind in one eye. Shortly afterwards I read an article from researchers who stated they had found fragments of the herpes virus in the vaccine. After the second vaccine he was fine one day and 2 days later started having seizures. He was hospitalized for the seizures. His personality totally changed. He no longer recognized my sister. He also became hostile which is not the person he was. He was released from the hospital and brought to a new facility. Then the lights went out. he just stared off into space. A day later he was dead.
1365719	6/1/2021	CA	33	F	4/27/2021	5/7/2021	33-year-old woman presented to the emergency room on May 7, during the second week of receiving J&J vaccine. She had decreased sensation/numbness in the left side of face in the cheek and jaw area, with an inability to speak. No pain. Symptoms lasted for couple of hours and resolved. On May 8, felt like she had swelling in her lymph nodes in the neck, making swallowing and talking difficult. The symptoms also resolved in couple of hours. On May 9, she woke up to similar decreased sensation/numbness in the right side of face in the cheek area. She has had mild headaches periodically since receiving the vaccine. No history of migraines. No focal weakness. No ongoing numbness or tingling. No double vision. No vertigo. No blurring of vision. No balance issues. No trouble walking. No memory issues.

1365541	6/1/2021	MN	18	M	6/1/2021	6/1/2021	Patient reported feeling dizzy shortly after receiving his vaccination. Tech notified pharmacist and remained with patient. Pharmacist grabbed water and a wet towel to put on patient's neck. Patient's mom got some gatorade for the patient. Patient said his vision was "going". Got patient seated on floor and put the cool towel on his neck and told him to take some deep breaths. He started to feel better within a minute or so and had some gatorade. His color returned and was little sweaty, but reported feeling better. He remained under observation with his mom for another 30 minutes before leaving without issue. Mom stated he has felt dizzy in past, but wasn't noted on VAR.

1365929	6/1/2021	LA	35	F	1/13/2021	1/14/2021	Memory fog, vision loss right eye, dry eyes, partial hearing loss in right ear. Multiple visits to eye center. Dr diagnosed me with Encephalopathy. Seen my Dr. an audiologist at Center. Dr. diagnosed with partial hearing loss in my right ear. I had the actual Covid 19 virus in August of 2020. At that time I lost my sense of taste and smell for approximately 2 weeks. I had no long term side effects related to the virus. I received my first COVID 19 vaccine in December 23 2020. I had no side effects from that vaccine. The day after receiving my second Covid 19 vaccine, I started having light sensitivity, right eye itching, and visual disturbance of the right eye. Weeks later I started noticing changes in my ability to hear out of my right ear. Then people started noticing that I wasn't hearing them appropriately. I've had multiple visits from specialist. I've had to buy new glasses, eye meds, contacts, take off work many times, and now I'm saving for a hearing aid. I was told by both specialist that the outcome is unknown at this time because there is not enough information on the virus and the vaccine to make that judgement.
1365933	6/1/2021	NJ	56	F	3/25/2021	4/1/2021	Since 1 week after my first Pfizer Covid19 vaccine, I have had dark circles under my eyes, swelling under my eyes and swollen glands in my neck (beneath both ears)
1365942	6/1/2021	OR	26	M	5/15/2021	5/16/2021	Regular symptoms from the shot, EXTREME back pain (lower) headache, felt cold and exhausted, on first day. The second day I had blurry vision and all those symptoms so I went to doctor. They said I was having a reaction and also gave me Toradol for the back pain. I started to feel better symptom wise but the following day I started to poop blood. That only happened for one day then went away after a day. But I've had one or two more bloody stools since then. The ER said that it's likely from the Toradol but to keep an eye on it. I have had 2 episodes since but it's been random. Haven't taken any more ibuprofen at all, was told to take omeprazole for a month and see how my body recovers

1365963	6/1/2021	CA	28	F	6/1/2021	6/1/2021	client complained of dizziness after receiving 1st dose Pfizer Covid Vaccine. RN responded with EMT. PHN arrived shortly. Upon arrival client sitting in chair, pale, alert and oriented x4. EMT was taking vitals. Client stated feeling dizzy and nauseous 5 mins after receiving vaccine. Vitals at 1526: blood pressure 124/80, pulse 81, oxygen 99%. Client denied blurry vision, headache, shortness of breath, chest pain. 1530 client able to stand and transfer to anti-gravity chair. Client stated feeling more dizzy after getting up. PHN gave client water and instructed to drink slowly. Per client no relevant medical history, current medication or allergies. Vitals at 1532: blood pressure 124/65, pulse 83, oxygen 95%. Client stated was on a diet and last time she ate was 6 AM. At 1533 client stated nausea and dizziness improving. Skin color normal for ethnicity. Client given juice and snack. Vitals at 1546: blood pressure 123/71, pulse 72, oxygen 99%. Per client dizziness improving, nausea subsided. Client denied blurry vision or headache. Client advised to eat prior to vaccine and follow up with provider. Last vitals at 1556: blood pressure 122/64, pulse 79, oxygen 97%. Client stated symptoms had resolved. Was not driving home, friend here with here and would take public transportation. ER precautions given. Client able to stand from chair with no complaint of dizziness. Client left facility with steady gait at 1558.
1366119	6/1/2021	IL	37	F	3/9/2021	3/9/2021	High blood pressure, heart fluttering and palpitations, migraine, visual disturbance, insomnia All of these lasted 6 weeks
1366121	6/1/2021	CA	54	F	3/11/2021	3/30/2021	During first vaccine I had a minor vision issue which went away with in 30 minutes, sore arm felt fine. After second dose I felt as though I had the flu and stayed in bed for several days, approximately two weeks later I lost my sense of smell, continued severe body aches, extreme fatigue and constant pressure in the back of my head. I'm now several months out and the symptoms are getting worse. I've always been very healthy, sleep for 6 hours a night and had high energy. Now after 12 hours of sleep I still fall asleep during the day. My headaches are increasing in severity. I can't smell or taste. I'm having joint issues with my jaw and limbs. I keep thinking I'm going to shake this but I'm starting to lose hope.

1366338	6/1/2021	CA	26	M	6/1/2021	6/1/2021	Patient just got the shot and immediately feel a weird sensation. He sat on the chair to be observed and passed out almost immediately. We rushed to him and called out for him. He opened his eyes and slowly told us that he thinks he fainted. I helped him elevated both legs on the chair and talked to him if he's hurt or any other weird feeling. He told me he's feeling fine again. I have him lay down with his legs elevated for another 5 minutes and helped him sit up. He was able to get up by himself and sat back on the chair. A couple minutes later, I took his blood pressure and it was 129/85 and pulse was 61.
1366345	6/1/2021	NM	56	M	1/21/2021	2/1/2021	On January 21, 2021, approximately 9 days after I received first vaccine I began seeing eye floaters. I went to eye doctor the same day and the doc thought retina looked good. The eye doc sent me home. On February 25 the I received second Moderna vaccine shot. Two days later, February 27th, I began having difficulty with my vision. On that same day I went to the eye doctor who indicated I had a spontaneous detached retina. Emergency eye surgery was performed on the following Monday, March 1st. Doctors do not know what caused my detached retina (right eye).
1366349	6/1/2021	PA	26	F	3/17/2021	3/20/2021	Four days after the vaccine, I started experiencing hives all over my body (mostly concentrated around my chest, stomach and face). My eyes swelled shut multiple times. I went to my primary doctor. I was prescribed prednisone and it was recommended I get the 2nd vaccine with the help of the steroids to help my side effects. I got the 2nd vaccine, and experienced a fever of 103 for 3 days with flu-like symptoms. The morning after my 2nd vaccine, I experienced a swollen tongue. I contacted my primary doctor, and decided to take Benadryl to see if it went down before going to the hospital. My tongue swelling went down after a 4-5 hours. I have been experiencing severe hives daily since March 20, 2021.
1366354	6/1/2021	ID	43	M	6/1/2021	6/1/2021	Patient was administered shot by RN and he immediately stiffened up and eyes became distant and twitched. He was like this for 10 sec and was disoriented when he became aware of surroundings. EMS was contacted. They assessed him and took him to the hospital

1366553	6/1/2021	TN	19	F	5/15/2021	5/15/2021	We left the store and got a bite to eat at the drive through. After driving about 7 minutes she grabbed her throat and started acting like she was not able to swallow. I asked her was she ok? She stated no in a raspy voice. She shook her head and said she felt like molasses was in her throat. She seemed pale and began to sweat. I am a former EMT-Paramedic. I remembered there was a store about 2 miles away. I called and got the Pharmacist on the phone. I ran into the after driving 92 miles an hour and she converted children's Benadryl for me and stayed on the phone. I gave her 1/2 a bottle. began to be more responsive. I had a medical bag with me with airways and other medical devices I use for work but no Epi Pen. After giving her all the Benadryl she said she felt better but she stayed hoarse for the remainder of the day and was sleepy. I kept an eye on her and Called her physician on Monday morning as this was a Saturday and they called in Epi pens in case this happens again. The first shot she felt like she swallowed a potato chip wrong and started acting the same way then through up but never got this bad. We just thought she ate something and it went down the wrong way. Never giving it a second thought. Then after the second shot it was much worse. Had I not the pharmacist on the phone, Benadryl liquid and a medical bag, I would have called an ambulance. In the county we live in though we do not have enough ambulances and I am afraid she would have went into full anaphylaxis and died. I did what I thought was the best for my only child.

1364153	6/1/2021	MA	48	F	1/28/2021	1/28/2021	Slight pressure like ears and eyes; Slight headache but it had become so bad that I never had; Did not feel well; Vision was blur; Hard to open eyes; it is like a pressure; Still I had at back of my head like a pressure little bit; concentration, everything was gone within like so fast; This is a spontaneous report from a Contactable consumer (patient). A 48-Years-old female consumer received bnt162b2(PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Batch/Lot Number: EL3247), via an unspecified route of administration on 28Jan2021 as an 1ST DOSE, SINGLE for COVID-19 immunization (age a vaccination 48-Years-old). Medical history and concomitant medications of the patient were none. On 28Jan2021 around one hour after vaccination, the patient had slight pressure like ears and eyes, slight headache but it had become so bad that she never had, hard to open eyes; it was like a pressure, did not feel well, vision was blur, concentration, everything was gone within like so fast, Still I had at back of my head like a pressure little bit. Clinical course was provided as follows: She had her first dose and started having some symptoms right like within an hour or so. It was a slight pressure like ears and eyes and little like slight headache but then it had become like at the end of the day, it was so bad that she never had, (intensity was more than before). It was sudden, and she could not keep her eyes open. It was to that point like hard to open her eyes and it was like a pressure. She went back to the site and checked blood pressure, she recorded it was fine, '100.2 and over' (not further clarified), pulse and everything was fine, but she did not feel well. Even she felt like her vision was blur her concentration, everything was gone within like so fast." She did not receive any medication, but she had sat down and was laid on until she felt normal. Follow-up attempts are completed. No further information is expected.

1364913	6/1/2021	DC	32	F	4/9/2021	4/29/2021	When I received the J&J shot I had typical side effects (headache, pain at the injection site, and chills) for the first 5-6 days. The side effects subsided and I felt normal. About 3 weeks later I started to have pain at the injection site again which started very mild and then built up to nearly the same pain level I felt after the injection. The pain has since decreased and the pain is in a different part of the muscle. I feel a strong pinch in the muscle, almost like a pinched nerve, when my arm is at certain angles or doing a motion such as lifting, tugging, throwing, etc. The pain has been persistent for over a month. I am able to do most daily activities with manageable pain, but the pain is persistent and frustrating. There is no noticeable swelling or rash, nothing to visually indicate that there's pain in the muscle. I scheduled a telehealth visit with my PCP who said that delayed reactions had been documented in some cases with Pfizer but there wasn't data on J&J yet. She recommended that I monitor my arm, take Tylenol as needed, and keep her updated with any developments. I took Tylenol twice and it didn't do much. I don't know anyone else who has had this type of reaction and without data on J&J, I don't know how long to expect the pain to continue.
1365722	6/1/2021	NC	48	F	6/1/2021	6/1/2021	1.) Severe constant headache top of head - Time onset @ 16:15 to present time Took Tylenol 500mg no relief 2.) Burning of eyes like if you are developing fever - Time onset between 17:44 to 18:30 Apply cold compress to eyes 3.) Headache covering top of head now to back of head. Treatment already took Tylenol so no other recourse Will drink plenty of Gatorade and water and rest the night
1365062	6/1/2021	NY	58	F	3/2/2021	3/18/2021	I have always had Tinnitus but it has greatly intensified since my second vaccine. Not medical attention required at this time. I developed Hypnic Jerks at night prior to sleeping that last for up to an hour on some nights and can be quite strong in nature always stemming from my lower back. I went to the doctor in April and he told me it's just stress and to keep an eye on it. I have an appointment scheduled with a Chiropractor to see if they can help on 6/7.

1365155	6/1/2021	CA	21	F	6/1/2021	6/1/2021	<p>Patient received the 2nd COVID vaccine (Pfizer, Lot #: EW0185 and expiration date: 08/31/2021) on the left arm at 0918. Patient hailed medics attention and complained of "nausea, seeing purple, and lightheadedness" at 0921. Patient was conscious, alert, and oriented x4. Patient's skins were normal for ethnicity, moisture and temperature. Pupils were equal, accommodating, and reactive to light. Patient appeared anxious and was coached by medic on her breathing. Signs and symptoms began about 2 minutes status post vaccine, but patient claimed no previous reaction with 1st dose. Patient denied any pertinent medical history, allergies, or medications. At 0923 patient was still conscious, alert, and oriented x4 and pupils were still equal, accommodating, and reactive to light. Patient then complained of "seeing everything in purple color," then stated she "could not see anything at all." Medic held up 5 fingers and patient advised she could not see them. Patient began to look pale and skins felt moist and warm. Patient was able to walk with assistance to anti-gravity chair. Nurse then responded to Medic with patient. Baseline vital signs were taken by Medic at 0926, while patient was sitting: blood pressure: 98/60, heart rate: 60, respiratory rate: 16. Patient stated that she runs cross country and that these vital signs were of normal range for her. Patient was given water to sip on. Color and moisture of skins were slowly pinkening/drying up. Patient initially experienced nausea and lightheadedness but denied chest pain, shortness of breath, headache, dizziness, or blurry vision. Nurse informed the patient's mother, who was waiting outside, of the situation and brought the mother inside to the patient. At 0935, patient was able to stand her own, with a steady stance. A second set of vitals were taken: blood pressure: 100/64, heart rate: 60, respiratory rate: 14. Patient was negative for orthostatic pressures. Patient stated that symptoms had resolved and that she "felt better, just tired." Patient remained in the observation area for an additional 15 minutes. Patient was conscious, alert, and oriented x4 and skins were normal for ethnicity, moisture, and temperature at 0949. Patient able to walk on her own accord with a steady gait. Mother was driving personal vehicle. Mother and patient were educated on when to contact their primary care physician with any other concerns and when to call 911 if symptoms warrant or</p>

1365117	6/1/2021	OH	24	F	5/20/2021	5/20/2021	Eyes went bright red, Heart rate went up to 187 on my fitness watch, 150 heart rate by the time the paramedics arrived, I couldn't feel my arms or legs, I had a high blood pressure and sugar level of 220. Went to the hospital and ran tests. Fever of 99.9-100.5 for two days straight. There was a red, warm, and inflammation in my left arm for two days. My heart felt like it was pounding out of my chest and I had a high rate for 5 days straight. I would be sitting down and it would be at 100.
1365173	6/1/2021	TX	50	F	5/9/2021	5/9/2021	Received 2nd vaccine on 5/9/2021 at 4:15 pm and became light headed after leaving the location. A few hours later I began to see a small line forming in my eye and it went away. The next day 5/10/2021 I woke up and the spot in my eye had gotten even bigger. I contacted my eye doctor and they scheduled an appointment for me on May 21st. I woke up on May 11th and my eye was even worse and I notified my eye doctor and they had me to come in immediately. I saw a Doctor who then referred me to a different eye doctor and I went back to my eye doctor on May 13th and saw Dr. I am now 4 weeks out and I still have no vision in my right eye. I am now under the care of that Dr.
1365383	6/1/2021	IN	71	F	3/11/2021	3/12/2021	The day after the 2nd shot, I started having floaters in my left eye. I checked with my optometrist, and was referred to a doctor. The floaters were numerous and monitored until they subsided somewhat. A procedure, using an injectable dye, was given to allow the doctor to see in the back of the eye. He was able to see what was described to me as an aneurysm. He told me a laser treatment was needed. And that is what was done. A follow up is scheduled for August, unless other symptoms start.
1365066	6/1/2021	IL	32	F	6/1/2021	6/1/2021	after patient received shot she was sitting in waiting area and within 5 minutes started fanning herself. I went to check on her and she said she was hot and started to close her eyes. I helped her to lay down and had technician get her a wet rag. Once she said she was ok we moved her out of the main aisle and let her lay with cold compress until she was feeling ok and her mother came to make sure she was ok.

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1365566	6/1/2021	TX	71	F	3/2/2021	4/4/2021	Woke up to drooping left side of face, 4-2-21, unable to close eye, went to ER, diagnosed as Bell's Palsy. Given prescription for Valacyclovir 1gm three times a day for 7 days, and Prednsone 20mg three times a day for 7 days. The palsy has not resolved as of this date, 6-1-21.
1364981	6/1/2021	NJ	45	F	5/5/2021	5/6/2021	5/6 1pm Immediately after shot administered had a small headache but barely noticeable. 5/6 11pm Fever started with body aches. Fever was low and then rose to ~102 for the next 24 hours. During this time for a short period of time, ~1 hr, my throat/back of my mouth went numb. The feeling in my mouth returned. During the fever I was dizzy but not as bad as a Vertigo feeling. (I experienced Vertigo 17 years ago - postpartum.). I also experienced slight stomach pains during this time. 5/8 starting on this day going forward for 2 weeks I experienced headaches, which came on in the evenings, just after work. From around 4pm till 8pm I was in bed daily with headaches. I usually do not get headaches unless..... unless it is my period times. During this 2 weeks I also added 5 lbs of weight, which I believe is water weight. Lately I have consistently been 125 lbs (up from 120lbs since I was a teenager) and I went to 130 lbs in 2 weeks. I feel as I am retaining water weight. Pain in my legs attest to the weight. The headaches ended for a few days and returned yesterday afternoon. I can tell my body is trying to fight this Covid-19 shot. I am hopeful these body changes will subside, weight gain and headaches overtime. Also, during the first 2 weeks after the shot I also experienced vision blurriness. This has since gone away and my vision has been self corrected. I have not gone to the doctors as I viewed all of this associated with the vaccine and normally I am a healthy 45 year old woman otherwise. I haven't needed to see a doctor in over a year. If these headaches and body aches/weight gain continues I will be at the doctors for help. I figured I would give it time to enter and exit my body first. Ibuprofen sometimes worked to lessen the headaches, but not always. You can email me any further questions you have. Thank you.

1365069	6/1/2021	MI	41	F	5/3/2021	5/29/2021	<p>Patient presents with ? SUICIDAL pt intoxicated and tried to hang herself on the shower curtain rod. boyfriend called 911. pt states this was a suicide attempt HPI: This is a 41y.o. female with significant past medical history of polysubstance abuse that presented to the hospital with chief complaint of suicide attempt. The patient apparently tried to hang herself on the shower curtain rod after reportedly drinking 1 liter of Captain Morgan's rum. She was found on the ground by her boyfriend whom reports she was 'blue in the face.' On examination she is resting in bed in no acute distress. She denies any fever, chills, chest pain/pressure, palpitations, shortness of breath, abdominal pain, nausea, vomiting, diarrhea, constipation, or urinary complaints. She denies any illicit drug use or ingestion of toxins. In the ED, patient mildly hypertensive, afebrile, stable SPO2 99% on room air. CBC, BMP, coags, UA unremarkable. Ethanol level 410. UDS negative. COVID positive. CT head and CTA neck unremarkable for injury. Admitted for further evaluation and management with psychiatry consultation. Suicide precautions implemented in ED. Pt seen and examined only by the attending physician. NP only responsible for chart review in an effort to limit exposure given the current pandemic and patient's COVID positive status. ROS: Constitutional: Denies fatigue, fever or chills. Eyes: Denies change in visual acuity, diplopia or pain. HENT: Denies nasal congestion, sore throat or tinnitus. Respiratory: Denies cough, difficulty in breathing or shortness of breath. Cardiovascular: Denies chest pain, palpitations or edema. GI: Denies abdominal pain, nausea, vomiting, constipation or diarrhea. GU: Denies dysuria, urinary frequency or hematuria. Musculoskeletal: Denies back pain, atrophy, spasticity or joint pain. Hematologic: Denies anemia, bleeding, or bruising. Integument: Denies rash or lesions. Neurologic: Denies headache, focal weakness, seizure or stroke. Endocrine: Denies temperature intolerance, polyuria, or polydipsia. Psychiatric: Denies irritability, +depression +anxiety. +suicide attempt</p>

1365302	6/1/2021	NH	15	M	5/26/2021	5/26/2021	1022am- Observed patient abruptly stand up and fall to floor, landing face down. Turned patient over on back with neck support. Patients legs elevated. Patient was unresponsive to voice, performed mild sternal rub and became responsive immediately after stimulation. Pulse strong and regular, respirations WNL - VS BP 126/82, SpO2 99% RA, P122, Temp 98.2 Infrared, AAO to person, place and time. Observed ~1" laceration above right eye, treated with bandage and bleeding controlled. EMS and parent called to scene. EMS arrival at 1033, I gave patient report and they assumed care and assessed patient. VS @1038- BP 120/68, SpO2 99% RA, P101, R17 AAOx4, Patient c/o headache. EMS sat patient up on floor, then to chair. EMS had discussion with parent and it was agreed that parent would take patient to Urgent Care for treatment and parent signed off for no EMS transport. Patient walked out with parent and EMS on own power to vehicle and left approximately 11:00 AM.
1365382	6/1/2021	WI	65	F	3/7/2021	3/12/2021	Day of the vaccine the body felt different, when home the arm was in pain for a day or two. By Friday even there was a headache and on Saturday it was worse. The doctor friend said to take Tylenol and lay down. On Sunday the left ear was swelling and the left side of the face was swelling. The doctor friend continued to recommend the Tylenol. The following Wednesday the sister took her to the hospital. The hospital said the face was disfigured and told her she has Bell Parsley. She will need to see an ear specialist. Her eyes were affecting her.

1362334	5/31/2021	CO	48	F	5/9/2021	5/29/2021	Ten minutes after I received the vaccine, my left arm and leg felt very heavy, like I was uneven. I started to feel very dizzy and my left eye became very blurry. I started feeling nauseous, as well. On the car ride home I noticed a rash. We thought it was an allergic reaction. After I got out of the car I noticed it went away. It came back later again, around my neck that evening, but it only lasted 5 minutes. It was a rash with white bumps and then it went away. At night I experienced chills. When I woke up I had a blistering headache with neck pain that lasted a couple days. The nausea and balance picked up and got worse. I spent two weeks being unable to see, walk, read or drive safely. I have had to take time off of work. I cannot view a computer screen without feeling nauseous. Most of the first week I spent on the floor because of the nausea and spinning issues. I sought medical treatment. I had a CAT scan and they ruled out a blood clot. I still have low grade nausea. I have regained peripheral vision in my left eye, which was missing for three weeks. I have been off work for more than 2 weeks. I still cannot work at my normal capacity. I still have a very strong chemical taste in my mouth. It is getting less and less, but I can still taste it. I've have a lot of swelling at the base of my skull, that has not resolved.

1362360	5/31/2021	PA	52	F	5/27/2021	5/27/2021	PATIENT DESCRIBED HAVING DIZZINESS, LIGHTHEADEDNESS, BLURRY VISION, AND A DROP IN BP TO 62/32
1362213	5/31/2021	NY	55	F	1/27/2021	1/28/2021	So at first I was just sleepy, fever, and Thursday/Friday of that week my fever was so bad I could not even get out of bed. I was shuffling to get to the bathroom. I was doing all I could do just to get water into me so I would not dehydrate. I was trying to move so I wouldn't get stiff but it was not good. I did not take Tylenol as it does not work for me. My roommate suggested Advil but I just felt like if this was the shot, that I needed to push through it because my immune system was working for me. The headache that I was having was the worst headache I have ever had, my eyeballs were popping out it felt like a mountain of headaches on my head. I felt like I was in serious trouble. I called my sons wife and told all my children that I love them, because I felt something was seriously wrong. When I came back downstairs Friday evening, after a birthday party for my older son, I was sitting on the couch and asked for some apple juice. I drank some apple juice and my friend got a phone call. One of the children at the phone call had been exposed to COVID positive person. I was not directly exposed to that person but I was down there right after, and he was all over the couch (that I was on). My immune system was obviously working hard already and weakened. SO my friend got us tests and we were both negative. But the DR said do to my symptoms she kept me out of work. The fever, I did just pushing through and drinking water. I started taking Advil after five days, but I just kept pushing fluids. I was so weak and my joint pain was bad, I could not get up. I tried to walk as much as I could but it was not much. The joint pain was very bad. The main issues were, no appetite, extreme exhaustion, fever of 102.7 and muscle aches and headache. I took one Ubrelvy at the beginning so I knew it wasn't a migraine, I knew it was from the shot. I took off two jobs, I work for two agencies and one paid me and the other did not.

1362156	5/31/2021	FL	35	M	5/8/2021	5/8/2021	The night after receiving the vaccine I started to develop a fever and headache. It lasted 3 days for the fever. On Tuesday I felt something different in my body. On Thursday I went to see an Optometrist. While there he found that there was something going on in my eyes. He noticed there was blood clot in the back of my right eye. I did go to the ER because of the blood clot. At the ER I had a CT scan and bloodwork completed. I was told that everything looked normal and I was told to go to a different hospital. I was transferred to Medical Center. While I was there they performed an MRI, CAT scan and Lumbar function test. I was told that everything looked fine from the neurology point of view. I need to follow up with an Ophthalmologist. I have gone completely blind in my right eye and my left eye is not clear anymore. On 05/20 I had an appointment with the ophthalmologist. There was something wrong with my optic nerve as well. There was a test performed 05/21. I went back to the doctor on 05/26 he said that the reports he received are not making sense to him. My next f/u appointment with Dr. is 06/09 because the doctor asked to have 2 weeks to read through my hospital reports. I saw a different doctor instead on 05/27, Dr. , and he said that this can happen from the vaccine. He said that there is a swelling and I need to see a different doctor about my retina. I was told that I need to see another physician. I saw Dr. . on 05/27 and he said that there are fluids there, but no one can confirm that this is because of the vaccine. He gave me the option to take prednisone 10mg and I feel that it is working, but it is very slow. It was moved to 3x per day. I can see objects now even though it's still not clear. I have a f/u with Dr. 06/03.

1362141	5/31/2021	AZ	33	U	5/29/2021	5/29/2021	Systemic: Fainting / Unresponsive-Mild, Systemic: Nausea-Mild, Systemic: Seizure-Mild, Systemic: Shakiness-Mild, Additional Details: Patient felt normal after the injection and for the remainder of the day. She woke up in the middle of the night to use the restroom and fainted in the bathroom. She then returned to bed where she felt like she "blacked out for a short period". Her husband reported that she was shaking uncontrollably and her eyes were darting back and forth (this lasted about 10 sec). She was encouraged to be examined by a physician for any further issues. She stated that she is currently feeling ok.
1362078	5/31/2021	WA	23	F	5/24/2021	5/24/2021	Tired shortly after my shot. Had chills and sweats overnight. Woke up to shower and passed out in the shower, had blurry vision, passed out again after getting out of the shower. Rapid heart rate and chills with migraine. No appetite, did not leave my bed for 24 hours, very lightheaded and nauseous. I have been having serious headaches for a week now after the shot

1362066	5/31/2021	TX	57	M	2/23/2021	3/1/2021	After receiving 2nd Vaccine, next morning I had very swollen and a painful knot at injection site, flu like symptoms as provider told me might occur, then on March 1, 2020, I starting having severe symptoms in which I was unable to go to work. I had A SEVERE migraine level 10 pain, severe joint pain all over body level 10 pain, dizziness, eyes burning, blurred vision, chills, extremely fatigued. Called PCP for doctor appointment. Went for doctor visit and told him all my symptoms, He was very concerned I had a reaction to vaccine. He prescribed prednisone 7 day pack for severe joint pain & inflammation, Nurtec disintegrating tablets, meloxicam, ordered bloodwork and had follow up in 2 weeks, after two weeks symptoms were still the same very severe, he referred me to Neurologist for evaluation, she ordered MRI as a stat to be done right away, and started me on meds for Severe Migraines and sent me to Ophthalmologist, she had a nurse get me an appointment the next day. I saw Ophthalmologist the very next day he did workup and diagnostic testing in his office and stated I had severe swelling and inflammation in the optic nerves in both eyes, and referred me and sent records to Dr., Neuro Ophthalmologist and contacted their office to get me in right away. I had my appointment with Dr. and she has ordered an ultrasound of my eyes by retina specialist which appointment is in June. I have follow up with her after ultrasound is done. Due to severe joint pain I am still having my PCP has referred me to a rheumatologist. My pain is severe. The vaccine has attacked my immune system. Doctors and specialists are doing everything possible and I am still off work. My return to work date has not been determined.
1362052	5/31/2021		79	M	3/1/2021	5/4/2021	A hazy, cloudlike coverage of a portion of my visual field. Possible only one eye but not sure. Difficult to see through. Lasted several minutes and then dissipated on its own. Occurred again two weeks later. Same. Unsure if it will occur again.
1362144	5/31/2021	PA	17	F	4/17/2021	4/24/2021	One week following the vaccine, there was uncomfortable pain in the left eye, upper and lower area.

1362087	5/31/2021	NH	35	F	1/1/2021	1/1/2021	8 hours past second dose: fever of 103, migraines and chills for 2 days. About 24 hours post injection : diarrhea and nausea. 14 days I could not tolerate much food. Since the vaccine ( 6 months now) watering eyes, nasal congestion intermittent fevers. Also migraines regularly, almost every day. Last check up one week ago bounding heart, rate of 150, irregular beat, PVCs on EKG. I feel chest pains at work intermittent however I work in ER and ICU so I can't stop to address them My PCP wants me to do more testing. I cannot afford it. Before this vaccine I was a healthy young woman. Now I struggle to make it thru days. I'll never do this again
1362585	5/31/2021	WA	19	F	5/31/2021	5/31/2021	Patient start having nausea and vomiting symptoms about 10 min after administration. She also mentioned blurry vision and loss of vision in one side. She was fainting too. Patient was positioned on her side in the waiting room Her blood pressure was 111/71 and pulse 60 when checked by the pharmacist. EMT was notified. They arrived and check her vitals, she was doing better. they didn't consider that any future evaluation is needed.
1362439	5/31/2021	MN	24	M	5/31/2021	5/31/2021	Patient received the vaccine around 9:38 AM and was placed in a chair for observation. Within 3 minutes the patient had fallen onto the floor on his side out of the chair. The pharmacist on duty at the time myself ran over and asked patient if he was ok and touched his shoulder. The patient regained consciousness and was moved to the vaccination room and put feet up for evaluation. The patient loss consciousness for 10 more seconds. Vitals were taken immediately (see below) and patient was interviewed for adr's. Patient had extreme diaphoresis, said he had no diplopia but did have blurred vision . Patient said his head hurt and was given 500 mg apap for one dose. He said his ears were hot. Patient said he had no pain other than his head hurting. Patient had no urticaria or redness . Patient appeared pale. He was given extensive amounts of water and a snack. He said that sounds were slightly muted. He said he had sensitivity to lights.
1362687	5/31/2021	NJ	49	M	4/5/2021	4/26/2021	I am feeling light headed and dizzy. I have been diagnosed with vertigo by my doctor. Rapid eye movement.

1362680	5/31/2021	WA	52	M	5/27/2021	5/27/2021	Received the vaccine and then sat in waiting area with no immediate issues. After about 10 minutes started to feel flushed and a couple seconds later blacked out. When coming around, felt disoriented and nurse was asking me questions as I was still sitting in chair. My wife reported that I was having a seizure and stiff against the wall with eyes rolled back and unresponsive for about a minute. My right arm was cramping, BP 220/180 and pulse 44. The clinic staff laid me on the floor and call an ambulance that took me to the ER for observation and testing.
1362679	5/31/2021	WA	36	F	5/27/2021	5/30/2021	She received her second dose of the Pfizer Covid vaccine on 5/27 and had expected fatigue/chills/myalgias for the first 2 days. On Sunday evening she developed a full-body rash which started on her back and torso. The rash was itchy, small, red, raised lesions which coalesced into multiple patches on her bilateral upper and lower extremities. The rash is worst now on her lower extremities. She took one half of a tablet of Benadryl at 11:00. She began to develop left-sided angioedema of her lips and bilateral eyelid swelling. She took a full tablet of Benadryl at 1600 and called to the nursing line for her PCP and was advised to present to the ED. She did not have any trouble breathing. She has no voice changes. She did feel lightheaded this morning. She has not felt nauseous or had vomiting or diarrhea. She has had no new exposures, no new detergents/soaps/clothing, has not spent extra time outside. She has no known allergies but notes sensitive skin and some food sensitivities. Upon arrival to the ED, she is afebrile with elevated heart rate and blood pressure, with normal oxygen saturation and no respiratory distress on room air. On exam, she has bilateral eyelid swelling, mild left lip angioedema, and diffuse maculopapular rash. Differential diagnosis includes anaphylaxis, vaccine reaction, allergic reaction to unknown allergen, viral process. She shows no signs of severe anaphylaxis, shock, or respiratory compromise. She was given cetirizine and famotidine for histamine blockade. Based on the lack of other systemic symptoms, steroids were not indicated.

1362571	5/31/2021	WA	44	M	5/7/2021	5/31/2021	Initially, the patient had dizziness, lightheadedness and a syncopal episode within 5 minutes of the vaccine. He returned to normal fairly quickly and went home by report. He presented to the ER shortly after with palpitations and shortness of breath and required a dose of IM epinephrine. Patient since had intermittent fatigue, dizziness, blurred and vision changes as well as tinnitus. On May 31, 2021, patient presented to the ER with headache, lethargy, weakness, diaphoresis and dizziness. Additionally, noted to have slurred speech by his wife. MRI of the brain done at 4 am on 5/31/21 showed the following "1. Acute bilateral cerebellar infarcts are seen with a right posterior 4.3 mm focus a left middle cerebellar peduncle 3.2 mm focus and a left superior cerebellar 7.9 mm linear focus. 2. Occlusion of the left vertebral artery extending into the basilar artery with reconstitution of the basilar artery via bilateral posterior communicating arteries. Findings are concerning for acute dissection occlusion. Consider further evaluation with MRA head and neck. 3. Question subtle area of restricted diffusion seen within the left dorsal medulla better appreciated on the maps measuring approximately 4.9 mm. Left lateral pontine 7.3 mm focus of restricted diffusion versus artifact. These infarcts are not definite and could be artifactual asymmetry.'. He required admission, heparin drip and neurology consult at that time, as well as permissive hypertension. shortly after 1 pm on May 31, he developed chest pain with ischemic changes on EKG requiring cardiology consult with possible intervention, though this was being coordinated with interventional neurology, as he also required basilar angiogram for his MRI findings. as cardiology and interventional neurology were coordinating taking patient for intervention, he became further unresponsive, though maintained his pulse, and required intubation and transfer to ICU, as well as repeat CT of the head to evaluate for continued thrombosis of his basilar system. Work up is still on going

1362448	5/31/2021	TX	64	M	5/26/2021	5/26/2021	The symptoms started 3 hours after the 2nd dose of COVID. I felt pain in my left arm ( the same arm where I was injected ), chills and fever across my body, sweating, numbness and electric tingling in head, dizziness and vertigo with sensation of wanting to vomit, a lot of pain in my joints, watery eyes and pain in my eyeballs, lack of equilibrium and orientation, and other symptoms.
1362542	5/31/2021	VA	60	M	5/28/2021	5/28/2021	On Friday, 5/28/2021 I had my second Covid vaccine. My first vaccine in my left arm on 4/30/2021 was accompanied by a sharp soreness under my left arm and 12 hours of iritis in my right eye. Both symptoms were mild. For my second Covid vaccine in my right arm on Friday, 5/28/2021, my symptoms included a headache and fatigue which lasted for Friday and Saturday. I also had a bad night on Saturday. I had trouble sleeping, was achy and may have been running a slight fever. I have been slightly more sweaty than normal. Today, 5/31/2021, I had some blood in my urine.
1362477	5/31/2021	PA	29	F	1/15/2021	1/16/2021	Starting on the day of the vaccine (2nd dose)- I felt really spacey, hallucinated at night and fever. I took ibuprofen. I woke up the next day and noticed blurry vision in my left eye. Also had pain when moving the eye. I developed left sided weakness and notice declining cognitive functions. I felt extremely fatigue, difficulty swallowing, tinnitus, difficulty walking and my left leg was weak and my balance was definitely off. After about 2 weeks, I decided to go to the Hospital Emergency Room. I had an MRI with and without contrast and diagnosed with optical neuritis. I saw ophthalmology on 2/9/2021 and they did all sorts of visual tests and referred me to neurology. I saw my PCP on 2/12/2021 and was referred to Neurology. I went to see a neurologist and was diagnosed with clinically isolated syndrome (precursor to multiple sclerosis) and had numerous MRI, blood work and EMG.

1361561	5/30/2021	MD	38	F	5/22/2021	5/26/2021	<p>Wednesday morning at 2 am, I broke out into itching hives all over my chest, stomach and under arm pits. I took a Claritin and applied Benadryl cream. They were gone when I woke up that morning. Around 3pm that afternoon, my neck started itching. By the time I got off of work at 5pm, my entire neck had broken out in hives and there were hives forming near both of my eyes. When I got home, my face had swelled and I was also breaking out on my arms, chest, stomach and upper thighs. I went to the hospital where they treated me for an allergy. I was given prednisone and Pepcid, a prescription for an EpiPen, and then told to take Benadryl and apply hydrocortisone cream which I had to purchase myself. I took two Benadryls that night and applied the cream and the hives were gone by the morning.</p> <p>Thursday, around 4 pm, my chest and stomach started itching. I came home and took 2 Benedryls, and a cold shower to help relieve the itch. I applied the hydrocortisone cream and took a nap. I woke up 3 hours later, itching again, this time all over my arms, face, thighs and back. My lips had swollen and my ears were itchy and red. I called the urgent care number and was instructed by a doctor to come into the facility since my lips were swollen. When I arrived, I was given a steroid (name unknown), Pepcid and Benadryl through IV. The hives did not respond right away and in fact because to spread further after treatment. After 2 steroid shots, they finally went away, though my lips were still slightly swollen. I was given a prescription for Prednisone and sent home. Saturday morning, my arms and chest began to itch and turn red. I applied hydrocortisone cream, took 2 Benadryls and the Prednisone as prescribed. The itching subsided after an hour, but the redness remained the rest of the day. As I am typing this on Sunday morning, I still have redness over my chest, stomach and arms, but no itching.</p>

1361398	5/30/2021	CA	42	F	5/13/2021	5/14/2021	One day after injection on 5/14/21, got intense painful ache under right ear. It went away after about a day. But then on the evening of 5/24, I found that my right eye was very scratchy. On 5/25, I realized it?s because the right eye would not close all the way. On the evening of 5/25, I found my food kept falling into my right cheek when I ate. On 5/26, I found that my right eye would not blink at all. And my right cheek was numb. My right eyebrow would not raise as high as the left and my smile was crooked. I went to urgent care and they diagnosed me with Bell?s Palsy.
1361678	5/30/2021	MD	31	F	5/29/2021	5/30/2021	Vomiting, upset stomach, weird pains in stomach, back pain, joint pain, muscle pain, odd headaches, foul smelling urine, body aches, light numbness in a extremities, fatigue, slight burning sensation in back, pain in lower left back that's tender to the touch, restless legs, shoulder pain (injection site), congestion, stuffy nose, running nose, earaches, smelling odd smells, slight chills, slight shaking, neck pain, aching eyes, slightly puffy face, odd feeling in chest.

1361694	5/30/2021	CA	56	F	5/28/2021	5/28/2021	Felt OK for about 12 hours, able to eat lunch/dinner do a bit of work. By 11 PM I had a fever of 102.8F, stabbing pains all over my body, and had to get in bed. Also chills, and my eyeballs hurt. The next day I spend nearly the entire day in bed, with fever ranging from 101.5 to 102.3 until late evening, slightly less stabbing pains, very weak, no appetite, could not stay out of bed for more than about an hour because I would become nauseous. I ate some toast and a handful of potato chips. Anything more complex than that seemed really not reasonable to attempt to eat. I have had influenza many times, and this vaccine reaction was physically more unpleasant than the when I got swine flu in 2009 (higher fever, too). I can count the number of times I have had a fever more than 102 on one hand. I am a bit better today. Perhaps you should consider adjusting the dose or schedule for middle aged people? My housekeeper had a 105F fever after her second shot. She is 45. I am not sure if she got Pfizer or Moderna. Might be Pfizer.

1361405	5/30/2021	MN	34	F	5/26/2021	5/27/2021	Starting at 1 AM Thursday (about 9 hours after receiving the vaccine), I started to feel very weak and had a headache. I had chills that would come and go all night, I felt extremely cold even though my house temp was set to 72 degrees and I had three thick blankets on me. I could barely get up the next morning. All of Thursday I had to be in bed. I had no strength to walk, and if I tried, I got dizzy and my headache got worse. I only got up to go to the bathroom. I had no appetite and felt like if I tried to eat, I would throw up. I was mildly nauseous. I could, however, drink water with no problems, so I drank as much as possible to stay hydrated. I felt a constant pain on my back and my ribs, but the worst of all was the headache. I had never felt a headache like that one before. My eyes and forehead area hurt the most, but it was like my whole brain hurt. I only took my temperature once, on Thursday, and it was 101.6 F. The symptoms continued until Friday morning. On Friday, I started to improve as the day went on. By Saturday, I was back to doing all of my normal everyday activities and felt strong again, with only a very mild and manageable headache. I took 10ml of Tylenol on Thursday night but it did not do anything for me.
1361529	5/30/2021	VT	26	M	5/26/2021	5/26/2021	Present at clinic with mother to offer emotional support. Justice suffers from anxiety related to receiving medical care. Today was his second attempt at getting the vaccine. Reported to clinic staff after the fact: Had blurry vision and dizziness prior to entering clinic. Had sat in warm car for several minutes trying to work up nerve to enter building. Dizziness increased at time of vaccination, client was moved to floor, legs elevated until dizziness passed. Slowly transition to sitting and then standing, monitoring vitals at transitions. Patient walked out of clinic one hour after vaccination. Patient remained conscious. Consumed 3 bottles of water, two bananas, two juiceboxes during recovery period.

1361412	5/30/2021	CA	36	F	5/28/2021	5/28/2021	<p>Patient received the 1st COVID vaccine (Pfizer, lot # EW0185 use by 06/24/21 at 0845) at 1446. At 1503, the clients boyfriend told PM that his girlfriend said she felt like she was about to faint. PM ran to patient at 1503 who was sitting upright and blankly staring in front of her. RN assessed the client who was alert and oriented to person and place for 90 seconds, but would go in and out of responding to questions during the 90 seconds. No loss of muscle tone was present. The client was unable to visually track an object during the 90 seconds of blank staring. RN instructed another RN to call 911 at 1504. Client was placed on a yoga mat in a supine position on the ground by EMT and PM. The client's legs were elevated by being placed on a chair. The client was diaphoretic and clammy. The client was alert and oriented x 4 at 1505. Radial pulse was bounding bilaterally. Vital signs taken at 1506, HR- 60, BP- 158/106, RR-12, oxygen saturation at 98%. The patient denied any drug allergies, any chronic medical conditions, or currently taking any medications. Client continued to be diaphoretic and clammy. Client did not hit her head during the incident and denied any shortness of breath, chest pain, or difficulty breathing. Vital signs taken at 1507, BP- 170/122, HR- 81, RR-14, oxygen saturation at 98%. The clients legs were immediately placed from being in an elevated position to a supine position. The client was speaking in full sentences and was alert and oriented x4. Vital signs taken at 1508, BP- 146/98, HR-86, RR-14, oxygen saturation at 98%. Client remained mildly diaphoretic and clammy. The fire department assumed care at 1510 when they arrived on site. Fire Department Personnel advised the client to be transported to a hospital, client declined transport to the hospital and signed AMA paperwork. Client stated, "My boyfriend will drive me to Emergency Room." The Fire Department and EMS left the site at 1532. RN educated the client about the importance of going to the emergency room immediately and to follow-up with her primary care provider. The client left the site at 1536, the client's boyfriend pulled the vehicle in the parking area and the client ambulated with an even and steady gait to the car.</p>

1361713	5/30/2021	VA	43	F	5/29/2021	5/29/2021	First felt light headed, then my tongue, throat, and neck felt sore within approximately one hour of injection. Then my eyes started itching and it was more difficult to breathe through my nose. Things looked funny/off and I felt off; heavy/like lead and fuzzy and spacey at the same time. My vision was blurry when I tried to look at objects up close - like my phone. I had to blink several times and hold the object further away to see it. By dinner time, around 5:30, I noticed raised bumps on the sides and back of my tongue. To my knowledge, they were not there prior to the injection, but I don't usually inspect my tongue. I did so around dinner because of how sore, puffy, swollen, and big my tongue felt. It looked splotchy in shades of white and yellow. My throat also felt puffy and swollen. At 3:50 am I woke up and my left eye was puffy and difficult to see out of. I was cold, clammy, and sweating. I had a really bad headache and felt nauseous. I took 2 ibuprofen and went back to bed. Around 7:30 or 8:00 am I got up and moved around. My left eye was no longer puffy and I could open it, but my eyes, nose, and throat were itching so badly that I wanted to scratch at them. My tongue, throat, and respiratory system felt puffy and swollen. I noticed it took much more effort to breathe. I got some water and took a Benadryl. I layed down and put my feet up. I covered up because I was cold. I fell asleep. A few hours later I woke up and could breathe easier. The itching was less intense and my tongue, throat, and respiratory system felt less swollen and more normal.

1361892	5/30/2021	FL	61	F	3/10/2021	3/11/2021	<p>Please note: 1st dose on RIGHT Arm, 2nd dose on LEFT Arm. First Dose, Moderna, Lot Number: 044A21A on 3/10/2021 1st day, 3/10/2021 only slight pain LEFT arm (vaccination arm) that evening. 3/11/2021 more pain in arm and just tired. 3/12/2021 body (achy) all over and dizzy all day. 3/13/2021 dizziness continued and tiredness set in (forced myself to get up and go!). 3/14/2021 extreme fatigue now in full force, no appetite and a slight metal fog. 3/15/2021 fatigue continued, dismissed appetite (forcing myself to eat) and still having body aches. 3/16/2021 still feeling run down, however dizziness dismissed. 3/17/2021 started to feel better but body ache continued. 3/18/2021 some symptoms started to improve but fatigue and lack of concentration continued. 2nd Dose, Moderna, Lot Number: 036B21A on 4/07/2021 on 4/07/2021 only slight pain RIGHT arm (vaccination arm) that evening, staying hydrated as suggested by the nurse 4/08/2021 no bad symptoms but injection site was bruised and raised, not sure why. 4/09/2021 started to feel tired and my right shoulder was hurting a bit. 4/10/2021 extreme pain under arm pit of right arm, achy all over and tired. 4/11/2021 swelling of lymph nodes under my arm and neck. Felt really sick and achy all over. Diminished energy and no taste. Forced myself to eat. I continued to stay well hydrated. From 4/11/2021 through 5/01/2021: The swelling under the right armpit continued to increase in size and the pain continued to increase. At one point I could hardly touch the area and I was having problems sleeping. My Right armpit and arm and my neck continue to bother me to no end. I could not sleep well and my Metal fog increased. Short Memory loss: I could not remember things that I did just a few seconds before. Since I had started a log to record my progress with my vaccinations, I kept writing all symptoms and problems down. I developed COVID Arm. My appetite has decreased, and I was very, very tired all of the time during this period. 5/02/2021 I started to feel better but unknown to me, my natural body defenses were down. Any little cut or scratch was not healing. And I was still having short memory lapses and occasional fatigue spells. I was relatively healthy before!! 5/04/2021 I had a run in with a wasp and I scratched my Left eye while trying to defend my eye from this insect. 5/07/2021 I had developed eye problems on my left eye and an infection on my face, left eye lid and</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

ocular ulcers inside my left eye. I also had macular abrasions. I went to my Primary Care Provide and she prescribed oral antibiotics Doxycycline HYC 100MG, 1 daily for 30 days and an antibiotic ointment Erythromycin OPTH Oin.t 3.5MG, 4 times per day for 5 days.

5/10/2021 My eye problem and infection got worse so I was referred to my Ophthalmologist. She confirmed that my Left eye and eyelid and cheek were infected and she added an antibiotic eye drop to the list of medications.

5/12/2021 My left eye hurts a lot and the left side of my face hurt a lot, so I was directed to proceed to the nearest Emergency Room. The ER Doctor changed my antibiotic to Clindamycin 300 MG, every 6 hours for 10 days. 5/26/2021 after finishing the Clindamycin antibiotics I had developed Thrush of the Mouth and I went to an Urgent Care facility, while there they checked my problems and drew a culture and prescribed Nystatin Oral Suspension, 1000MG, at 6 ML, every 6 hours for 7 days or until the Thrush causing Yeast Fungi is eliminated. I'm still suffering from a compromised immune system directly related to the COVID 19 Moderna Vaccinations. I'm still trying to put my life back together and I'm still dealing with the dangers of infections taking over my body from this fragile state. The Moderna Covid Vaccine has brought havoc into my life. Please use this information to warn others of side effects. Please provide additional information to the general public on steps that can be taken by the Covid vaccination recipients to make our immune system strong again. How do we now deal with metal fog? How can we deal with short memory lapses? How can we fend off infections? Please Help! 5/30/2021 In conclusion, the Moderna COVID vaccines have changed my life and I'm still living a nightmare filled with problems and infections from a greatly diminished and compromised immune system. I do not know how long will my body and health will continue to be compromised, all I know that I'm not the same. I still have to be careful with any little scratches and even paper cuts do not heal! I'm still taking antibiotics today and dealing with health problems that were not present before my COVID Moderna vaccinations.

1361861	5/30/2021	WI	14	F	5/29/2021	5/29/2021	Pt received her 1st dose of the Pfizer vaccine in the right arm at approximately 2:45 PM on May 29 at pharmacy. Pt was recommended to sit for 15 minutes in the waiting area after vaccination for observation, but she and mom opted to go shopping in the store. At approximately 3:37 PM, pt and mom came back to the pharmacy to tell me (the pharmacist) that she had hives and showed me red bumps on her left arm. I had the pt sit while mom went to go buy Benadryl. After 5 minutes, I checked on the pt. She had taken one dose of Benadryl and stated that she was dizzy and feeling itchy all over. After chatting with mom for 5-10 minutes, the pt stated that she felt like her symptoms were not worsening and were stabilizing. The pt then said she wanted to rest at home. I recommended she sit for a little longer, but mom stated she would keep a close eye on the pt and had an epipen at home. They then left the pharmacy. I followed up with mom on May 30th at approximately 4:00 PM to see how the pt was doing, and she stated that they were at the ER because the symptoms were not getting any better, and the pt "felt like she was having an asthma attack." Pt's mom states that the pt is doing much better after receiving IV meds.
1361757	5/30/2021	OH	62	M	5/29/2021	5/30/2021	Patient's wife reports a diabetic episode the morning after receiving the vaccine. The patient was fine going to bed the night before, but in the morning about 20 hours after receiving the shot the patient was unresponsive to wake up in the morning. He struggled to open his eyes, but was able to awake with some coaxing. His blood sugar was 175, but came down after taking measures to lower his sugar. He was able to get up and walk around, drive like normal within 2-3 hours after waking up. The patient's wife states the reaction was abnormal, nothing different occurred the night before, the only change was the vaccine administration.
1361779	5/30/2021	NH	20	F	5/25/2021	5/26/2021	Started to lose taste on half of tongue, pain behind right eye, right ear pain, and facial drooping and weakness. Couldn't emot properly .

1361783	5/30/2021	NC	65	F	3/18/2021	3/24/2021	*One week after 2nd vaccine, I had sharp headache pain lasting about 3 seconds every day for 2 months. I went to acupuncture so the sharp pains are about 2 times a week. *About 2 to 3 weeks after 2nd vaccine, my peripheral vision started seeing wavy lines on items that are straight lines, several times a week. It is occurring more often even after acupuncture.
1361795	5/30/2021	PA	46	M	4/30/2021	4/30/2021	DIARRHEA, BLURRED VISION, FEVER, CHILLS, VOMITTING
1361823	5/30/2021	FL	38	F	1/19/2021	1/22/2021	The day after my second shot, I noticed that my eyes felt very sore. But it seemingly resolved. However, two days later, I had severe photosensitivity.
1361845	5/30/2021	DC	59	M	4/27/2021	5/29/2021	Diminished eyesight
1361851	5/30/2021	WA	51	F	5/16/2021	5/18/2021	Between 24-48 hours began have reactions not expected. Pain in LEFT foot and toes. Severe pain in LEFT hand, fingers, wrist, and forearm. Then pain in BOTH wrists, hands, feet, and then lower back pain. The pain moved from scary levels to dull pain over the 2 weeks post-vaccination. I expect the pain will go away soon. The use of my hands was affected. Walking was affected. It felt like the lymph nodes around my ears, neck, face, eyes, chest, arms, abdomen, legs were all swollen. Can swollen lymph cause carpal tunnel like symptoms? Foot pain? Lower back pain? Began to have allergic like skin reactions 5 days post-vaccination. Burning eyes, itchy skin. Still experiencing itchy skin with red/warm face 13 days post-vaccine. Antihistamine relieves most symptoms. This vaccine does not seem sustainable for me as a yearly vaccine. (I had red palms after the 1st vaccine within hours. I am not sure if this was a reaction to the vaccine. I began taking antihistamine before the 2nd vaccine and did not get red palms. I have no idea if red palms were an early hint that I would be hyper sensitive to the vaccine.)

This consumer (patient) reported information for both mother and baby. This is the maternal case. This 30-year-old non-pregnant female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; lot number EP7533) via an unspecified route of administration in the left arm on 05Apr2021 at 16:00 (at the age of 30-years-old) as a single dose for COVID-19 immunisation. The patient had no medical history, allergies, or concomitant medications. Prior to vaccination the patient had not been diagnosed with COVID-19 and had not received any other vaccines in the 4 weeks prior to the COVID vaccine. On 25Apr2021 at 09:00 the patient experienced alopecia areata 2 spots on her head, and thinning eyebrow. The patient reported she was breastfeeding when she received the vaccine, then stopped breastfeeding "cold turkey" three days after receiving the vaccine. The events resulted in a physician office visit, and the patient was treated with a steroid injection. The clinical outcomes of alopecia areata 2 spots on head and thinning eyebrow were not recovered. The clinical outcomes of was breastfeeding when she received the vaccine were unknown. It was also reported that since vaccination the patient had not been tested for COVID-19. No follow-up attempts are needed. No further information is expected.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021487595 baby case

1360401	5/29/2021	FL	54	F	3/29/2021	3/1/2021	heavy headache; 101.7 fever; Muscles were burning, exactly like when she had COVID/muscle aches/Whole muscle ached and could barely move from the pain; back heavy; could not move; has no strength; can barely walk; She was sick from getting the shot; she got so sick, it looked like COVID started all over again; felt a little bit dizzy; chills; tired; This is a spontaneous report from a contactable consumer (patient). A 54-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), dose 1 via an unspecified route of administration, administered in the right arm on 29Mar2021 at 16:45 (Batch/Lot number was not reported) as 1ST DOSE, SINGLE DOSE for COVID-19 immunisation. Medical history included COVID-19 from Dec2020 to an unknown date. The patient's concomitant medications were not reported. The patient wanted to know if she should get the second shot. She previously had COVID by the end of December. She was really sick with COVID, so then she signed up for the vaccination, and had the first dose last Monday, 29Mar2021 at 4:45PM, and then around 6:00PM, she felt a little bit dizzy, she exercised herself and went to bed. Dizziness started on 29Mar2021 and ended after she worked out. The patient stated she felt better from like the bloodstream from the workout, that helped. The patient said it ended around 7:00PM that day. In the morning (30Mar2021) around 5:00AM, her whole muscles ached, and she could barely move from the pain. It was reported that she got so sick from getting the shot, it looked like COVID started all over again, it was that heavy. Her back felt heavy, she could not move, her muscles were burning, exactly like when she had COVID. She had a heavy headache that she had to take a drug; normally, she never takes drugs, she reacts very fast. On 30Mar2021 evening, it was unbearable at 9:00PM, so she took Diclofenac, the pill form of Voltaren and that helped and one hour later at 10:00PM, she got rid of the headaches and got rid of the 101.7 fever. With the fever, she took it an hour ago, it was 98, which is higher than normal. Her temperature is always 97.3, so it's a little bit higher than normal. The patient said she still has no strength, and she can barely walk which started on 30Mar2021 and ongoing. She has been bad the whole time, but it has improved. She said she could barely open her eyes and she could not hold the phone the day

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

before, but that day (31Mar2021), she can hold the phone with Pfizer. In Mar2021, the patient had chills and felt tired. She was thinking she should report this to Pfizer Drug Safety. She stated the CDC recommended to go for the vaccination 10 days after having COVID, and it's been three months. She said that she is still in bed that day (31Mar2021), she cannot walk. She described the side effects with the first dose of the vaccine as severe. Also, she was very sick with Covid by the end of December. She said she is a vaccine promoter, she is really standing behind it and she is the only one who got sick, not her friends or anybody else. The patient stated she doesn't have a doctor, and this is the first time she was really sick since December. The patient verified that she is speaking of the Pfizer BioNtech Covid Vaccine. The patient also believed that this reaction came because she was so sick with COVID in December. She stated she already had the antibodies and thinks she was too early for the vaccination. She was unsure if she wanted to proceed with the second dose of the Covid vaccine as she had a prior Covid infection in Dec2020. She said nobody can tell her, the second vaccination was on 19Apr2021, exactly three weeks, and she was asking what she should do. She would like to know what the second dose of the Covid vaccine does. She has talked to doctors and they don't really know. She asked whom she could ask, and what they would recommend on what she's doing with the second one. She said nobody can tell her, and the CDC Broward told her she should call 911 and she said absolutely not, she is not going to the hospital, she has never been and she's not going, and nobody can answer her. She does not believe the CDCs recommendation to receive the Covid vaccine 10 days after a person tests negative is a good idea. She said the doctor has no idea, new to the whole thing and one doctor said that he's never had any patient who had gotten sick after the first dose, he did not see that before, and this was the first time. She said she would love to talk to someone in research or something who would say yes, she can go, or would strongly recommend going. She said that at the very end, she makes the decision for herself, she would just like to hear from somebody who knows what they are talking about. No relevant tests were done. The events muscles were burning, exactly like when she had COVID/muscle aches/whole muscle

1360433	5/29/2021	NY	50	F			<p>flavors started changing; loss of taste; This is a spontaneous report from a contactable consumer (patient). A 50-year-old (she just turned 50) female patient received bnt162b2 (BNT162B2), dose 1 on an unspecified date (Batch/Lot number was not reported) as single dose (at age not specified if 49- or 50-year-old), and dose 2 via an unspecified route of administration on an unspecified date (Batch/Lot number was not reported) as single dose at the age of 50-year-old for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. Historical vaccine included: bnt162b2 (BNT162B2), dose 1 on an unspecified date (Batch/Lot number was not reported) as single dose for COVID-19 immunisation. The patient experienced flavors started changing on her and they continued to change, loss of taste on an unspecified date with outcome of unknown. The patient underwent lab tests and procedures which included ear, nose and throat examination: normal. The course of events was as follows: She started to notice a decrease in her taste after her first dose but it was not much, she was still able to taste salty things but for example she was eating a sandwich and she was not sure what kind of sandwich it was, she was having in and out with salt and sweet. Then she had her second dose and she noticed as time passed that her sense of taste has become less and less and not it was hard for her to taste salt, everything just became dull and duller and duller. She cannot tell if she was eating something crunchy like an apple or a turnip or something. She went to an ENT on 12May2021 as she realized flavors started changing on her and they continued to change and they put a tube up her nose and into her ears and said that visually everything looked normal and that there did not appear to be any cause for this loss of taste upon their exam. Now, it was hard to decipher to her what she is eating. She was concerned. The doctor said they are going to give her some vitamins and see if it helps. They asked if she had been vaccinated and when she said yes they told her to contact Pfizer as Pfizer would know more information that they did because the doctor said it was not on side effects listed. She wished to know if this has been reported and queried how long can this side effects last and if it is temporary. She stated no misconduct was done in administering the vaccine. No follow-up</p>

This 41-year old female consumer (patient) received BNT162B2 dose 1 via an unspecified route of administration, administered in Arm Right on 06May2021 (Batch/Lot Number: ER8730) as 1ST DOSE, SINGLE for covid-19 immunization. Medical history included allergic to shellfish and almonds from an unknown date and unknown if ongoing. The patient's concomitant medications were not reported. The patient experienced a head rush after the first dose of the Pfizer-BioNTech Covid-19 Vaccine and felt that they were giving a shot . Everything was normal but when she came home, within an hour and 20 minutes, she suddenly felt very hot, her ear started ringing and buzzing, and she could not hear well. She said she felt as if someone was trying to put her to sleep. When the caller went to wash her face, she noticed her face, lips, eyelids and around them were swollen. The right side of her face drooped a little, it looked different on the jaw than the other side. The caller's tongue was swelling and her throat felt like she had been talking all day and swollen. She felt heaviness in her body like a weighted blanket and in her chest and said it felt as if someone was lying on top of her, it was like she couldn't get a full breath because of the heaviness on her chest. She also noticed that her nose and mouth started to become gray and blue in color but she could still swallow. She also had residual symptoms such as numbness in her left arm , it,feels like its asleep and intermittent chest pain like her heart it felt achy at times. This has gone away but it would come and go and

feel like it was lightning, like thunder in her chest. Her fingers stay cold to the touch a lot from where they bend down to the tips more on her left than anything. She did not take herself to the emergency room or the doctor for the events. The caller didn't seek medical care because she had some medications at home that were for allergies from her allergist and it helped with the swelling. The patient reported the medicine was a powder tablet that is dissolvable, unknown name, she thinks she may have used it once, it has numbers on it. The swelling went down to where she felt like she was fine after taking them. The swelling in her face and her eye lids were puffy for a few days. The patient had blood work done the day of the vaccine, prior to receiving the vaccine and an electrocardiogram (EKG). Therapeutic measures were taken as a result of throat felt like she had been talking all day and swollen, tongue was swelling, face, lips, eyelids and around them were swollen, face, lips, eyelids and around them were swollen. The outcome of right side of her face drooped a little was unknown, recovered from head rush, felt very hot suddenly, ears started ringing buzzing, couldn't hear well, trying to put her to sleep, face was pounding, face, lips, eyelids and around them were swollen, tongue was swelling, felt like something was heavy on her body, heaviness on her chest, blue and gray around her nose and mouth, chest was hurting, trying to put her to sleep, and felt that they were giving a shot on 06May2021, recovered on 09May2021 from face, lips, eyelids and around them were swollen, recovered on 10May2021 from chest was hurting and recovering from fingers stay cold a lot and numbness in her left arm. No follow-up attempts are needed. No further information is expected.

1360482	5/29/2021	MI	47	M	5/1/2021	5/13/2021	getting lightheaded and dizzy all the time; Seizure; This is a spontaneous report from a contactable consumer (patient) and a consumer (patient's ex-wife/ roommate) A 47-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: ER2613 and expiration date not provided), via an unspecified route of administration, on 01May2021 (at the age of 47-year-old), at single dose, for COVID-19 immunization. Medical history included blood cholesterol, high blood pressure, ongoing seizures from 1991; patient was being hit in the head with a steel baseball bat 13 times, and had a lot of brain damage; and ongoing sleep. Prior Vaccinations (within 4 weeks) provided as no. Concomitant medications included ongoing topiramate (TROKENDI XR) for seizure, ongoing allopurinol (ELAVIL) for sleep, and medication for cholesterol and one for high blood pressure. Patient had been on topiramate a couple of months. They were working with him to get him better than he was because he was having a lot of the little ones. He got the pill packs. He tried the little compartment things and they weren't working. Roommate suggested they try the pill packs to make it easier. There was the time on the packs. The patient experienced seizures on 13May2021; getting lightheaded and dizzy all the time on unknown date. Patient's second dose was scheduled 22May2021. Due to symptoms that he experienced he was afraid to take second dose. Patient had petite mal seizure last night on 13May2021, he got ahold of the doctor and got an appointment with his family doctor. They don't know about the seizure yet. Patient was feeling ok until he got the shot. Now, he was back to getting lightheaded and dizzy all the time. Patient got social security and had a hard time remembering his phone number. Patient's ex-wife clarified that patient called the doctor and got an appointment. He had upcoming appointment. The doctor wanted him to go to the emergency room. She had known him since 2005. When he had a mild seizure the ER doesn't do anything for him. They just leave him in the bed and wait until he comes to his senses. She just told patient to go in his room and lay down and offered him paracetamol (TYLENOL) and all that stuff. She couldn't move him when he was having one of the worse seizures because he turns into a board. She tried to get him aware. They didn't last long. Patient had grand-mal

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

seizures since the age of 18 after being hit in the head with a steel baseball bat 13 times. He had a lot of brain damage. The brain can't fix itself. She was the only one that knows how to handle him. Patient's ex-wife listed at the doctor office because patient had a hard time explaining things and stutters a lot, he can't answer right away. The seizure patient had yesterday was a petite mal seizure. It wasn't a full blown grand mal seizure. He had three different phases of seizures. He had the staring one where he was looking out in space. Then he had the next one that happened in the car. He sat down and put his head back to relax. She thought he was taking a break, but it was a seizure. She touches him to focus and get him back. At night was when he has the worst ones where he loses control of his bladder, foams at the mouth, and turns into a board. He can't bend. He has only had 3 of those in the time she had known him. The other ones he had quite often. The quicker he comes out of it the less headache he has after it. If they let it run its course he has a bad headache and nausea. She tries to open his eyes because he comes out better. One time when he had grand mal seizure she couldn't get him rolled over and had to get help. Even though it was saliva and he was foaming at the mouth she was afraid he would choke on it. He had one starring seizure shortly before the COVID vaccine. He had them a lot. If they take blood or run scan it won't show patient had a seizure. For a little while patient and his roommate weren't together. If he did have seizure during that time he got himself out of it. He has only had 3 bad ones since 2005. Patient told his doctor that he thought it was related to the COVID shot. Patient's ex-wife didn't believe that was what caused the seizure (She thought if it was related it would have happened within 20 minutes of getting the vaccine). She thought he just had one. It played in his mind that he had the shot. Patient's brain stopped growing when he was 18 due to damage. The outcome of the events was unknown.; Sender's Comments: Based on known drug safety profile, there is reasonable possibility of causal association between the events Seizures, Dizziness and the suspect BNT162B2.

1360496	5/29/2021	OH	16	F	5/5/2021	5/6/2021	<p>passed out; BP was 70/44; could not sit or stand; EKG-Potential abnormal Twave; Calcium was low; This is a spontaneous report received from two contactable consumers reporting for her daughter. A 16-years-old female patient received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), vaccinated at the age of 16 years old, via an unspecified route of administration, administered in Deltoid Left on 05May2021 15:00 (Batch/Lot Number: ER8735; Expiration Date: 31Jul2021) as single dose for covid-19 immunisation. Patient received the first dose on unknown date. Her daughter had no reaction from the first one that was three weeks prior. The patient medical history included Attention deficit hyperactivity disorder. Concomitant medications included lisdexamfetamine mesilate (VYVANSE) taken for attention deficit hyperactivity disorder, start and stop date were not reported. Last Wednesday, at 3 pm, caller's daughter received the second vaccine. Her daughter had no ill effects. Her daughter got up the next morning, 18 hours after administration, and passed out. Caller states that they called the squad and her daughter's BP was 70/44. They pushed an IV, transported her daughter, and they were in the ER for 10 hours. The local hospital gave her daughter 2 1/2 bags of fluid and transported her daughter to Hospital. Caller adds that there were 4 liters of fluid given, and her daughter could not sit or stand without her blood pressure dropping for about 8 hours after the incident. There were 2 transports and 2 ER's. Caller asks why were they not told that this is a symptom. She was grateful that she could catch her daughter before she hit her head, but what about parents who leave their kids alone. Last Wednesday, caller's daughter received the vaccine 05May2021 at 3 pm and passed out 06May2021 in the morning. It was the only time she passed out and caller states she saw her daughter's head drop and then was trying and caught her. She was trying to talk to her and her eyes were in the back of her head, and was trying to arouse her. She was out for over a minute. She went to Emergency Room in. They were there for 6 hours. Then, when she could not sit up and her blood pressure was dropping, they recommended Hospital. She was there, this all took place, on Thursday from 9 am or around 8:50 am when she passed out and then they were discharged after 9 pm. It was a 12 hour</p>

situation where they were transported and she spent 12 hours in 2 emergency rooms. The only one she had at time was vyvanse but she did not take this before passing out. The last time that she took this would have been nine hours before administration of the vaccine on 05May2021. She did not take it on 06May2021 when the incident happened. She was just getting up. She had only been on this for about a week. It is a stimulant drug but it is out of the system in the evening so people can sleep. She asked each doctors if this had any role in it and they said no. They told her to take it again which they have not started back yet. She has no other medical conditions. Investigations: caller does not provide dates or specific test results. The first ER did bloodwork, urine, chest x-ray. They wanted a CAT scan of her head but caller declined because she thought it was unnecessary. They did an EKG at first in the ER. Nothing was abnormal. She did have some things out of range in bloodwork which is not surprising because she was taking in fluids. Her calcium was low. Nothing was way out of range, nothing was abnormal. The second ER did a follow up EKG but no other tests or bloodwork. According to three physicians, the EKG was fine. A cardiologist reviewed the 2nd EKG and she got a phone call that they wanted her to follow up because of potential abnormal T waves which could have been a result of that much fluid intake and electrolytes being out of sync after that much fluid. They are following up on this. Her father has as vasovagal response hat he has experienced 4-5 times in his lifetime. He has never passed out following a vaccine. Caller had no idea that was even a response to vaccine. He has passed out after giving blood, with severe pain, coming out of anesthetic, and with severe stress. He has never had an extended period of time where his blood pressure was low. She, they could not get, her blood pressure up with fluid after fluid which is why she was transported to the second ER because they thought they did not know what was going on there. Caller states does she think that there may be some relationship and her daughter has this tendency to vasovagal - yes. Was it brought on by the vaccine? Yes. She has never fainted in her life. Caller adds she can see how some many say this may not be related to the vaccine but 18 hours after administration, they can not get her blood pressure up and were in the ER for 12

1359883	5/29/2021	TX	31	M	5/28/2021	5/28/2021	Within a minute or less of receiving the shot, I experienced a rapid and intense onset of blurred vision, lightheadedness, profuse sweating, and extreme numbness all over but especially in my hands and feet. I came close to losing consciousness and was instructed to lay down with my knees bent to increase blood flow. I slowly came to over the course of probably 10 minutes while laying on the ground, but my hands and especially my fingers remained numb for 30-45 minutes while I experienced chills. My left hand and fingers were extremely pale and bluish during this time. I also had minor pains on the left side of my neck and left shoulder blade. Color came back to my left hand and chills subsided around an hour after my shot.
1359893	5/29/2021	CA	32	F	2/19/2021	4/2/2021	On 04/02/2021, exactly 6 weeks after receiving my second dose of the Moderna vaccine, I went blind in my right eye suddenly and had extreme light sensitivity in my right eye. I was hospitalized for two days at medical center and bloodwork was completed due to right monocular vision changes. Bloodwork was normal for the most part. I am now under the care of doctor and I am diagnosed with Central Retinal Vein Occlusion (eye stroke). I am still suffering with some peripheral vision loss in my right eye.

64 beats per minute. On 02-Mar-2021, Oxygen saturation: 99 (normal) 99%. On 02-Mar-2021, Respiratory rate: 20 (normal) 20 breaths per minute. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. No concomitant medications were provided. The patient remained in the vaccination chair for 5 minutes after injection and he reported feeling well and moved to the observation chair without any problems [~10ft]. After being in the observation chair the patient stood up and took 4-5 steps toward the wall and sat down on the floor. The patient stated he felt dizzy and then became limp and slumped to the right side, his eyes remained open with dilation of pupil fixed at 2mm with no blinking noted. The patient's breathing pattern became shallow and snoring sounds were noted. The patient did not respond when spoken to nor did he respond to soft shaking of the shoulders. The patient began to demonstrate large jerky body movements similar to seizure activity. The seizure like activity continued for 3-4 minutes before the patient was able to become aware of surroundings and answer orientation questions. The patient was diaphoretic, pale, shaking of hands and arms, restlessness of lower limbs with frequent repositioning/twitching of legs. EMS (emergency medical services) arrived to find the patient regaining stability. The patient reported to EMS that he is familiar with this type of response and declined to be taken anywhere. Treatment medications were not reported. Based on current available information and the temporal association between product use and the start date of the event a causal relationship cannot be excluded. The Company believes the event of Restless leg syndrome is not supported in the source documents and should be delete.; Sender's Comments: Based on current available information and the temporal association between product use and the start date of the event a causal relationship cannot be excluded. The Company believes the event of Restless leg syndrome is not supported in the source documents and should be delete.

1360081	5/29/2021	NY	80	F	1/28/2021	1/29/2021	Kind of vertigo; All of sudden she felt unbalanced; Like her head was heavy; she was holding onto things when she walked; This is a spontaneous report from a contactable consumer (patient). An 80-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), dose 1 via an unspecified route of administration, administered in Arm Left on 28Jan2021 15:00 (Batch/Lot number was not reported) as single dose for COVID-19 immunisation. Medical history included visually handicapped and could not read her vaccine card; vertigo before, a year ago. There were no concomitant medications. The patient had her first COVID 19 vaccination, on 28Jan2021, about 3PM and she will get the booster on 22Feb2021, but it seemed like she had kind of vertigo on 29Jan2021, this just happened in the last hour, all of sudden she felt unbalanced, like her head was heavy, and she was holding onto things when she walked, She did call her primary doctor, he didn't think it had to do with the vaccine, so she thought to call and ask, she was fine, and then all of a sudden she started to get this kind of vertigo, he asked if her head was spinning, but it's not, it felt heavy and she has had vertigo before, a year ago, but she doesn't know. Her doctor told her to rest, so she was laying down, and when she lifted her head she could feel, it was not spinning, she knew she was not feeling balanced. When asked to clarify her question, states she wasn't sure this happening had anything to do with the vaccination, she called her primary care doctor and he thought it wasn't, had nothing to do with it, so she thought since she called, she would wait and talk to Pfizer in case, that other people have experienced the same thing. States she was hoping this agent could tell her it would go away in a little while, but her primary care doctor said it has nothing to do with it, but it may have to do with it, it was somewhat of a coincidence that was happened, and she was fine for 24 hours, all of a sudden she started to feel this whatever. States she did not need anything else at this time. Outcome of the event vertigo was not recovered and all other events was unknown. Follow-up attempts are completed. No further information is expected.

Medical history included sinus tachycardia, panic disorder, depression, chronic fatigue syndrome, PCOS and allergic to Penicillin. The patient was not received any other vaccines within 4 weeks prior to the COVID vaccine. Concomitant medications included Metformin 500mg, Metoprolol 50 mg, Paroxetine 50 mg and Vitamin D, which were received by the patient within 2 weeks of vaccination and all were taken for an unspecified indication, start and stop date were not reported. The most recent COVID-19 vaccine was administered at nursing Home/Senior Living Facility. On an unknown date, 2 weeks or so after first shot, the patient was noticed severe itching on my left upper thigh with bumps and after this shot, itching has spread to face and arms. Clinical course was reported as: On 20Jan2021, Joint and muscle pain and extreme fatigue that started on days 3+ (slept over 20 hours day 4, plus 12 day 5 and still exhausted). Congested with runny nose and itchy eyes and just generally feeling ill. 2 weeks or so after first shot, she noticed severe itching on her left upper thigh with bumps and after this shot, itching spread to face and arms. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient been tested for COVID-19. The patient underwent lab tests and procedures which included sars-cov-2 test/ oropharyngeal swab test: negative on 01Feb2021. Patient did not receive treatment for the adverse event. The case was considered as non-serious as per reporter. Outcome of the events was not resolved. Follow-up attempts are completed. No further information is expected.

An 89-year-old male patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Lot number: EN5318, NDC number: Unknown, Expiration date: Unknown), via an unspecified route of administration in right arm on 09Feb2021 at 10:00 (at the age of 89-year-old) as a single dose for COVID-19 immunisation, second dose of immunoglobulins NOS (IMMUNE GLOBULIN, Formulation: Unknown), intravenously from 01Feb2021 at an unknown dose and frequency for CIDP. Patient received IV Immune Globulin within 2 weeks of vaccination. Recent DX and received 2nd IVIG infusion on 01Feb2021. The patient's medical history included ongoing CIDP (he was diagnosed with CIDP which was chronic inflammatory demyelinating polyneuropathy. The treatment for CIDP was IVIg infusion), hip surgery from 14Dec2020 (he had hip surgery on 14Dec2020. The surgery was at (Hospital name)), Sulfur drugs (allergies to medications, food, or other products: Sulfur drugs, known allergies: Sulfur drugs). Concomitant medications were not reported. The patient previously received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Lot number: EJ1686), via an unspecified route of administration in left arm on 19Jan2021 as a single dose for COVID-19 immunisation. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID- 19. It was reported that, caller calling on behalf of the patient. She was his wife of 63 years. He has a real problem. It was complicated. His birthday was (DOB) and he would be 90 years old this summer. He had hip surgery on 14Dec2020. The surgery was at (Hospital Name). He was diagnosed with CIDP which was chronic inflammatory demyelinating polyneuropathy. The treatment for CIDP was IVIg infusion. He had infusions for five consecutive days on 24Dec, 25Dec, 26Dec, 27Dec, and 28Dec (unspecified year). He wanted to get COVID vaccine. Pfizer does not have a lot of information for people who get IVIg

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

infusions. On 19Jan2021 he got Pfizer's COVID vaccine and had no problems. On 01Feb2021 he had IVIg infusion because he has to wait 28 days between infusions. They had checked with the neurologist and they said a week then they changed it to 10 days. The neurologist said to go ahead because it was nine days. On 09Feb2021 he got second COVID vaccine. That was Tuesday. He was feeling great and walked into the place to get it. He was ok. He woke up yesterday and he was aching all over especially where he had the surgical hip revision on 10Feb2021 at 07:00. It was six inches above the knee to the top of the groin. It was a sharp pain. When he tries to lift his leg to walk it was especially sharp. He was trying to call the surgeon, but he was in surgery all day. The neurologist said to call Pfizer for any information about people who get IVIg infusion and have chronic inflammatory demyelinating polyneuropathy and the COVID vaccine. He walked into (Name) which was where he got it and he felt great. He walked out and came home. He has had no falls or nothing. He just came home. It was like a mystery. There was not a whole lot of information from Pfizer for people that get IVIg infusions except it started with seven days and now wait 10 days. She was trying to research it on the computer and it only says vaccines in general. It says there might be problem with vaccinations with infusions and she has read the literature that pertained to that. The article she read was from three years ago. It may just be a real unusual kind of thing that a person would have IVIg and get the COVID vaccine. She has been on hold for an hour. She has medical power of attorney for her husband. He had no problem with the first one at all. On the vaccine card she could not read the person's handwriting. Waited to do COVID vaccine on 19Jan2021 when he was in skilled nursing facility. He was in the hospital for 18 days and then went to the skilled nursing facility for 12 days. The only thing that was relevant was did the IVIg have an effect with the COVID vaccine because nothing else had changed. That was the only different thing. Morning after - body pain with continued sharp pain in left leg groin area - site of recent hip replacement on 10Feb2021 at 07:00. Morning of 13Feb2021- rash on right leg - calf region. The adverse events resulted in doctor or other healthcare professional office/clinic visit. No treatment was received for the

1360140	5/29/2021	CT	65	F	2/9/2021	2/10/2021	Red, itchy, blotchy rash on face and neck; Red, itchy, blotchy rash on face and neck; Red, itchy, blotchy rash on face and neck; Bump under right eye; Bump on left side of neck under jawline; rashy around her cheeks/another reddish bump under her right eye; Little arm soreness yesterday in her left arm.; skin is so dry; This is a spontaneous report from a contactable consumer. This 65-year-old female consumer (patient) reported that she received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Solution for injection, Batch/Lot number: EM9809) via an unspecified route of administration into the left arm on 09Feb2021 13:00 (at the age of 65-year-old) as single dose for COVID-19 immunisation. The patient medical history included hypothyroid, little elevated blood pressure, allergic to shellfish, Benadryl allergy, allergic to everything such as trees, pollen, latex and shellfish. Concomitant medications included Adderall 5 mcg and Benadryl 25mg tablet (lot number: PF061, Expiry date: Aug2022). The patient received first COVID-19 Vaccine on Tuesday and was very allergic and told to take a Benadryl an hour before the COVID-19 Vaccine. She was fine. Last night she was sleeping and woke up with her face itchy. This morning, on 10Feb2201, the patient woke up and her face was red, itchy, blotchy rash on face and neck, bump under right eye, bump on left side of neck under jawline. Did not experience anything until last night, which was 36 hours later. Was sleeping and felt itchiness. Had redness and was blotchy. Had godzilla face and was not swollen. Does not really focus on this stuff. Did have a red bump on the left side of her neck below the jawline. She does not get pimples, but thought it was like a cyst. It was red and she put zit medicine on it. Went to bed and was itching in the night. It was weird. Got up and has another reddish bump under her right eye which was rashy around her cheeks. It was not as bad now as it was when she woke up this morning. She was not scratching. Put Bio Oil on this morning and a calming oil. She did take a walk but does not think it is rosacea. Has been walking outside all winter and has not experienced this. Thinks it was related to the COVID-19 Vaccine. Little arm soreness yesterday in her left arm, which received the COVID-19 Vaccine. Has a bump under her right eye. It was a fine rash, it was not raised. Bump on left side of neck under jaw line is completely

dissipated. Benadryl was just bought at the pharmacy on Monday. Hard to read with old eyes and has to get magnifying glass. Took one tablet before the vaccine. It made her sleepy. Did not want to end up on a ventilator in the emergency room. Has a little bit of elevated blood pressure and was asthmatic. Has a 98-year-old mother who got the Moderna first dose a weeks back. Treatments included zit medicine clarified as acne treatment. 5% benzoyl peroxide does work and has had it for 100 years. Had bio oil for a while. Sees date of May2010. It was not a medication, only supposed to help with skin and dehydration. Her skin was so dry. Used face treatment oil for dry or extra dry skin. It was a soothing oil if skin was red and agitated. No additional vaccines administered on same date of Pfizer suspect. Know they said people have reactions that last a few days. No further information provided. No prior vaccinations within four weeks. Had flu shot in Oct2020. AES follow prior vaccinations: had a ton of vaccinations two years ago because she went to had to get every vaccine under the sun. Had no problem with any of the vaccinations. No further details provided. Unknown investigation assessment. Blood pressure measurement showed 128/80. Outcome for the event bump on left side of neck under jawline was recovered while unknown for rest of the events. Follow-up (20May2021): Follow-up attempts completed. No further information expected.

An 88-year-old (reported as 88) female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number not reported), on 26Feb2021 as unknown, single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient reported receiving her vaccine the day before the present report (26Feb2021) and she had a slight toothache, but she stated she know this was not from the shot (and reiterated this multiple times). She stated her friend told her she heard on the television that paracetamol (TYLENOL) and ibuprofen were not supposed to be taken with the vaccine. She asked if she was able to take this. Seriousness criteria reported as non-serious. The outcome of the event was unknown. No follow-up attempts are possible; information about lot/batch cannot be obtained.

1359974	5/29/2021	TX	50	F	12/31/2020	12/31/2020	<p>difficulty breathing; still encountering vision issues; vomiting; feels weak at the moment; little headache; confusion; stomach cramps; fatigued; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of DYSPNOEA (difficulty breathing), VISUAL IMPAIRMENT (still encountering vision issues) and VOMITING (vomiting) in a 50-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 043L20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included COPD and Lupus erythematosus. Concomitant products included ALPRAZOLAM (XANAX), LISINAPRIL and EZETIMIBE (ZETIA) for an unknown indication. On 31-Dec-2020, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 27-Jan-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 31-Dec-2020, the patient experienced DYSPNOEA (difficulty breathing) (seriousness criterion hospitalization), VISUAL IMPAIRMENT (still encountering vision issues) (seriousness criterion hospitalization) and VOMITING (vomiting) (seriousness criterion hospitalization). On 27-Jan-2021, the patient experienced ASTHENIA (feels weak at the moment), HEADACHE (little headache), CONFUSIONAL STATE (confusion), ABDOMINAL PAIN UPPER (stomach cramps) and FATIGUE (fatigued). The patient was hospitalized on 31-Dec-2020 due to DYSPNOEA, VISUAL IMPAIRMENT and VOMITING. The patient was treated with ONDANSETRON (ZOFTRAN [ONDANSETRON]) at an unspecified dose and frequency; OXYGEN at an unspecified dose and frequency and MORPHINE at an unspecified dose and frequency. At the time of the report, DYSPNOEA (difficulty breathing), VISUAL IMPAIRMENT (still encountering vision issues), ASTHENIA (feels weak at the moment), HEADACHE (little headache), CONFUSIONAL STATE (confusion), ABDOMINAL PAIN UPPER (stomach cramps) and FATIGUE (fatigued) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown Route) was unknown. This case was linked to MOD-2021-020166 (Patient Link).</p>

1360947	5/29/2021	WA	40	F	5/22/2021	5/22/2021	On the night of the second dose (Saturday), I started feeling soreness on my entire back. This soreness lasted all Sunday. Taking ibuprofen, resting and laying down on a warm pad helped. The night of the Sunday to Monday was not comfortable, as the pain continued. On the Monday, the pain was gone, but I felt somewhat tired. I was able to work (on a computer), though. This is when the rash started on my face. I had what looked like an allergic reaction (at least, it manifested itself like when I get bitten by a mosquito and react badly). This first started on my forehead, above my right eye. It looked like a circle of 2cm in diameter. I also felt and saw some rash above my 2 eyebrows. What was interesting was also the rash I experienced on the back of my head. This lasted about 2 days. So, I took some Zyrtec. The rash on the front of my face then went away. The one on the back lasted a little longer. But then the rash went down the exterior of my left forearm, and to the stomach, also on the left side. This lasted a few days too. Taking Zyrtec again helped. Today, 1 week after the second dose, I still have marks from the rash on my belly, but the itchy sensation is gone.

1360951	5/29/2021	FL	60	F	5/29/2021	5/29/2021	60 y/o female with past medical history of HTN who presents with leg left numbness post vaccination. Patient states that this is her second vaccine in the two-dose series. Patient states that she had fever, weakness and right arm difficulty moving 8 days post vaccination, lasting 4 days. Patient states that she received the first vaccination to the left arm and experienced the symptom of difficulty moving post vaccination to the right arm. Patient states that she received today's vaccination to the left arm. NP and Paramedics at patient side. Patient was able to stand and sit in wheelchair without difficulty. Patient was able to ambulate from wheelchair to cot without difficulty. Within in 2-3 mins patient states that numbness to left leg improved. NP questioning if numbness was due to the way that patient was sitting post vaccination. Patient able to move all digits of her left foot, normal color and temp of left lower extremity. No swelling visualized. Patient initial vitals with hypertension noted, 170/77 BP R arm, 80 HR, 98% RA, 12 Resp. Patient monitored for blood pressure normalization. Patient BP decreased to 151/79, which is described as normal for patient. Patient able to ambulate without difficulty and states that she feels better and ready to go home. Patient discharged in stable condition with numbness resolved. Patient aware that if symptoms worsen or persist, to seek further medical care.
1360965	5/29/2021	IL	13	F	5/29/2021	5/29/2021	Patient had significant anxiety prior to administration. After administration, initially patient felt fine. A few minutes after patient felt faint, hands and forehead were clammy. Mom was present. Blood pressure was checked, diastolic was slightly high at 90mmHg. Patient's eyes closed for a second but patient was never unconscious. Patient did not fall. Patient did not hit head on anything. Patient was given water and sat there for about 7 minutes. Then patient was walked outside next to Mom and Pharmacy Grad Intern. Patient was not feeling well initially outside but did feel better after a while. Mom refused an ambulance. Mom and patient left at 10:50am and patient was feeling much better

1360888	5/29/2021	AL	30	M	5/18/2021	5/18/2021	Reporting primary symptoms: headache, fever, lightheadedness, elevated heart rate, arm soreness, muscle soreness, back pain, nausea, suppressed appetite, anxiety, and panic attacks. (see below for more information) Initially, felt faint and lightheaded. Stood up and the feeling worsened. Within five minutes, felt nauseated and clammy. Also, appeared pale in the face. Was given instructions to sit, close eyes, and take deep breaths. Applied a cool, wet rag to the face and neck as needed. Was anxious and may have had a panic attack triggered by the experience. Heart rate had elevated, but not to a concerning level. Within 30 minutes of initial vaccine administration, face was no longer pale and heart rate was lowering. Other symptoms mostly subsided within 90 minutes of the vaccine administration. The next morning (5/19/21), woke with a mild headache, low grade fever, some fatigue, slight nasal congestion, and very sore arm. Took Tylenol for fever and it was mostly gone by the next day (5/20/21). Felt well enough Saturday (5/22/21) morning for lots of physical activity (push-mowed lawn in humid conditions) and only had a mild headache and mild fatigue afterward. No notable symptoms on Sunday (5/23/21) morning, but had indigestion, gas pain, and some soreness (back muscle) late that night. Stayed up a little later than normal. Woke a few hours early (around 4:30 am) on Monday (5/24/21) with throbbing low-to-mid, left-side back pain and worsened indigestion and gas pain. Had anxiety that led to a panic attack. Did not feel well and tried stretching, taking Tums, deep breathing, used the bathroom, and walked around. This was helpful enough to return to sleep. Woke up again at 8:45 am and had a mild headache, some soreness in neck/shoulders, and anxiety about the situation. Took a shower, did some deep breathing, and tried to relax. Drank some caffeine at noon, but the headache was not relieved. Appetite was somewhat suppressed and was mildly lightheaded. Stomach became more unsettled by night. Stopped all caffeine intake and NSAID usage (and still no intake/usage at the time of this report). At night, anxiety over the situation worsened, so tried deep breathing, talking to others about the situation, and stretching. Panic attack occurred, but was able to manage with the aforementioned techniques. Woke the next day (5/25/21) with mild headache, muscle soreness in mid-to-upper

1361009	5/29/2021	VA	59	F	5/28/2021	5/28/2021	<p>back, shoulders, and neck, suppressed appetite, and anxiety. Was able to manage most symptoms with breathing, stretching, relaxing, and talking through the situation. No panic attack on 5/25/21. Went to bed earlier than normal (around 9:30 pm) and woke on 5/26/21 around 9:30 am. Had similar symptoms, but appetite was more decreased and worsened anxiety. Decided to see doctor that afternoon (see item 19 for more information on testing from that visit) and was told to give more time to recover from vaccine side effects. Did not give doctor information about anxiety or panic attacks at that time. Had a panic attack (less severe than previous) Wednesday night and managed with the aforementioned techniques. Thursday (5/27/21) morning woke with no headache and no fever, but still some soreness in neck/shoulder area, suppressed appetite, mild fatigue, and mild anxiety about the situation. No panic attack on 5/27/21. Friday (5/28/21) woke with similar symptoms and decided to visit doctor again about anxiety. Was prescribed Buspar and Zoloft. After taking Buspar (first time ever) at 2:30 pm, experienced an increased heart rate up to 160bpm and a low fever up to 100.2F. Experienced another panic attack during this time. Sought medical assistance from local ER around 3:30 pm. Was seen and monitored until discharge at about 11:45 pm. During stay, tests and levels were mostly normal except during a panic attack that was triggered after blood was drawn. Treated with Vistaril around 11:20 pm and monitored for about 20 minutes before being discharged. Anxiety was relieved after deep breathing and relaxing. Did not take Zoloft. Slept and woke on 5/29/21 with mild headache, unsettled stomach, and mild anxiety. Anxiety is more manageable so far and other symptoms were somewhat improved after eating breakfast. Currently, no plans to continue taking Buspar, but will consult doctor.</p> <p>Systemic: Allergic: Difficulty Swallowing, Throat Tightness-Medium, Systemic: Allergic: Swelling of Face / Eyes / Mouth / Tongue-Medium</p>

1361261	5/29/2021	TX	46	F	3/9/2021	4/3/2021	I had COVID-19 (diagnosed on 1/7/2021) and the main symptom I had was a total loss of sense of smell. I got the Pfizer vaccine on 3/9 and 3/30/2021 because it was available to me. I started having symptoms of irritated eyes (at the bridge of my nose), tinnitus, sensitive teeth (upper and lower) when eating or drinking and even when not eating or drinking, itchiness around my jaw line and upper arms after the second dose of the vaccine. I thought it was seasonal allergy-related, so I took Allegra for a couple of weeks, and then asked my PCP about a Kenalog shot on 4/15/21 for seasonal allergies. After the Kenalog shot, my symptoms heightened (itchy upper arms and eyes) mostly in the morning upon waking. I started taking Benadryl, and took the lowest dose 3 times per day from 4/17 to 5/20. I went to an acupuncturist on 4/28, 5/8 and 5/22 with some herbal tea formula prescribed. I went to an allergist on 5/27/21

1360614	5/29/2021	NJ	69	M	3/23/2021	3/1/2021	thought he was having a heart attack; It was all over his body and his left side, the pain/ left side hurts/ spread up his arm and down his hand and shoulders; left side hurts because that was where he got the shot; the first shot almost killed him, he has a defibrillator attached to his heart; This is a spontaneous report from a contactable consumer (patient himself). A 69-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection; Batch/Lot Number: ER8732) via an unspecified route of administration, administered in left arm, on 23Mar2021 (at the age of 69 years old), as 1st dose, single, for COVID-19 immunisation. The patient's medical history included stroke, weak heart, defibrillator/pacemaker insertion, impaired eyesight/ half-blind, pneumonia, headache, and ongoing prostate. The patient had a defibrillator attached to his heart, staples in his chest, and stitches. He got a weak heart from pneumonia which gave him a stroke and led to impaired sight. Patient stated everything else was working. The reason he's blind was because pneumonia hit his heart and caused a stroke along with the medication he was being given, and it happened before getting the COVID vaccine and has nothing to do with the shot. The stroke caused blindness, and they needed to add a defibrillator to his heart because the pneumonia weakened his heart even more than it was already weak. He had a defibrillator attached to his heart 14 years ago and it got took out about 7 years ago because his heart was better. He reported he had to get another defibrillator due a problem from pneumonia. The patient missed his first appointment for the first dose as he had back trouble and a headache. He called the hospital, and they listed off if you're feeling this or this don't come. The patient wasn't feeling well, so he didn't go; he did not seek medical treatment. The patient has compromising conditions; he has a defibrillator and he take blood pressure and heart medications. Every time they tested him, he was negative for COVID and he did not test positive. Concomitant medications included tamsulosin taken for prostate, start and stop date were not reported. The patient was also taking nearly 15 pills a day; 6 in morning, 2 in the afternoon/lunch, 6 at evening time and some at night before bed. He reported that he was pill popping because of his condition and he could sell and still have more than enough for himself to take, that is

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

how bad it is for him. The patient reported about number one and number two shots of COVID vaccine. The number one shot scared him, so he was scared of getting shot number two. He didn't know what the deal of it. He received it at the hospital on 23Mar2021 (Tuesday), and it woke him up on Wednesday morning around 2 A.M (24Mar2021) and he thought he was having a heart attack. The patient wanted the second shot, but he didn't want to get it. He wanted to know whether you have to take the first shot over again or can you take the second; he heard the second shot was worse. He missed his appointment on 15Apr2021 because the first shot scared him, and he panicked. The patient stated that the first shot almost killed him, he has a defibrillator attached to his heart, and he was scared to get the second. The patient wanted to know what the deal was, if he can take second dose safely. He stated no big deal, and he's leery after the first shot woke him up. He had a pain from Wednesday morning to Sunday afternoon, stated he had a pain grade of 6-12. The patient also stated that he has been going crazy with other things, staying away from other things, with the condition he's in, he's blind, and he stayed in the house. When he went out, he was covered. The pain lasted Wednesday through Sunday, he didn't go anywhere and makes precaution to make sure not to catch something, he's always masked and always home. The patient reported that he was having pain at times when he touches his side. When he goes to bed, he sleeps on his right side with his arm across his body laying on a foam block because that side hurts. He clarified that his left side hurts because that was where he got the shot. He was surprised, the pain was so sharp, he thought he was having a heart attack. It came from his elbow, started there and spread up his arm and down his hand and shoulders. His left side hurt when he touched and pressed down, it was a pain of 12. He thought he was having a heart attack, and it scared him, that's why he didn't get the second shot. He heard the second one was worse than the first one. If the first one made him feel he was having a heart attack, the second one would surely kill him. He was worried so he decided to stay home. He felt like a kid staying home from school. The pain went away, it just scared him for how he woke up. If he had a pain grade face in the hospital, it was off the chart. He knew how he felt and how he looked, it would

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

be off the chart. He thought in his mind he was dying, felt like he was having a heart attack, like he was dying. It took a little bit of time, he had to calm down and find where the pain was coming from, and where it was going. Pain was coming from his elbow, across his chest and hitting his defibrillator. Patient stated this was the reason he felt he was having a heart attack. The defibrillator woke him up, it had an effect on it, it woke him up and scared him. They had to put the defibrillator in because he needed it for his heart. He thought he was having a heart attack after all this, he was bugging. His son came in, and he told his son that he was in pain. His son told him not to get the shot and believed this was why the patient was hurting. His son said the vaccine and the defibrillator caused him to feel like he's having a heart attack, the shot did something to his elbow which caused the pain and when it hit, it hit everything and he had a pain grade of 20. It woke him up and scared him. He won't say what he wanted to say, it is personal, but it scared him that much he wanted to go there. The patient was supposed to get his second dose 15Apr2021 because the first shot scared him, and he panicked, he did not because he was scared to death. The patient reported that everything began on Wednesday, the pain was gone, and he has recovered completely. Patient stated his pain grade was a 6-12. The pain in his elbow has recovered completely. He stated his elbow showed pain when it gets cold or rains, when it gets wet. Patient wanted to make sure if he gets the second shot, does he have to get the first shot again since he missed the second shot appointment. Everybody was saying to get the COVID vaccine, to prevent him from getting COVID, they wanted everyone to get vaccinated. He was unable to read his vaccine card because he was half-blind and will have someone else look at it. The patient missed his second dose appointment due to the effect of the first dose of the vaccine; he had a bad reaction from the number 1 shot and that was why he did not get the number 2 shot because of him being compromised due to his condition and the medications he takes. He had the first dose on 23Mar2021 and scheduled to get the second dose on 25Apr2021 (more than 21 days). He believed the ingredients combined this caused it, when he had the event he thought that it did bother his defibrillator, he had pain that made him think he was

having a heart attack. That with the meds it may have added to the pressure he received when he got the shot, where he got the shot. His left side was bothering him, he thought he had a heart attack; his defibrillator was thumping, and he had pain that hit his elbow and his defibrillator woke him up. He knew it had to do with COVID shot. It was all over his body and his left side, the pain. His heart medication and blood pressure medication were nothing different. He had pain in his side, that he does not normally have which branched out from the elbow, to the hand, to the defibrillator. His left side was sore and he could not lay on it and could not touch it since it was so painful. Patient confirmed the pain was all down the left side and he got the vaccine in his left arm. The only last effect he was having is that he was afraid to get that second shot, he was afraid to go to sleep as he won't wake up after getting the 2nd shot or how he will going to react to it. He was paranoid in his mind to get the second shot. He reported that everything was wrong with him and that the shot had to fight with his medications and his body pain for it. He reported his body is paying the price. He felt like he was having a heart attack, pain going up and down arm, his fingers felt like needles going into his hand, like life was going back through his hand. His pain went to his chest his face was nowhere on the pain chart, his pain was like a 16 on a scale of 1 to 10. When he woke up that night it was like a 20, then if he touched his arm the pain was like a 14-16. The patient could not sleep, he could not sleep on his left side. Patient had to put a foam pad on his left side he got from his friend or sleep on his right side. That started Wednesday morning at 2 A.M to Sunday morning, he was surprised when he woke up that Sunday, he was not in pain when he woke up on his back. Patient reported he was half blind and can't find his medications. He reported he put his medications down earlier and was not sure where they were. Around that time he went to the hospital due to breathing issues, problems breathing. He went in twice and they discharged him on their own but, he had more problems breathing. What he did not know at the time he had because he did not look at the discharge paper and no one explained them to him was that he had Pneumonia when he went to the hospital. The outcome of the events vaccination site pain, heart attack was recovered on unspecified date in 2021; while

1360571	5/29/2021	TX	66	F	5/11/2021	5/12/2021	<p>She had swelling and redness that covered almost all of the front part of her upper arm not just at the injection site on her left arm; She had swelling and redness that covered almost all of the front part of her upper arm not just at the injection site on her left arm; Swelling and redness covered front part of arm; Swelling and redness covered front part of arm; This is a spontaneous report from a contactable consumer or other non hcp. A 66-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, formulation: solution for injection, Lot Number: EW0186; expiry date: unknown), via an unspecified route of administration, administered in the left arm on 11May2021 (at the age of 66 years old) as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient previously took BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, formulation: solution for injection, Lot Number: EW0171), first dose via an unspecified route of administration, administered in left arm on 19Apr2021 as a single dose for COVID-19 immunization and experienced redness and swelling for a few days at the injection site. On 12May2021, the patient developed redness and swelling to the top/front part of her injection arm. She wanted to know if she was ever needed to get a booster dose of this vaccine, will it be ok for her to get it based off this side effect. She had swelling and redness that covered almost all the front part of her upper arm not just at the injection site on her left arm. It was everywhere. It looked like a bad sunburn on one arm. Yesterday, it finally started going down. The redness has gone away. The patient did not have a prescribing doctor. She went to see the pharmacist after the swelling and redness lasted Wednesday, Thursday, Friday. She just popped in last Friday. She showed up, and the pharmacist's eyes got big like woah. He took a picture of it. She told him it had been there since Wednesday night. He said to call and report it, and to take Ibuprofen and Ice it. She did not take any other medication. She did take the ibuprofen for the swelling. The first shot did turn red at the injection site but not all over her whole arm like the second one. It was red and lasted a couple of days and went away. This one went days and days. It covered almost her whole upper arm. She stated that it finally resolved on 18May2021. The outcome of the events was</p>

1360583	5/29/2021	UT	12	F	5/18/2021	5/18/2021	clear fluid was accompanied with some blood thereafter; some of the vaccine leaked out of her arm; some of the vaccine leaked out of her arm; held the needle too long at the arm; This is a spontaneous report from a contactable consumer. This consumer (mother) reported for a 12-year-old female patient (daughter) that. A 12-years-old female patient received first dose bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Solution for injection, Batch/Lot Number: EW0185), via an unspecified route of administration, administered in Arm Right on 18May2021 17:00 as 1st dose, single for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 18May2021 the patient experienced clear fluid was accompanied with some blood thereafter, some of the vaccine leaked out of her arm, some of the vaccine leaked out of her arm and held the needle too long at the arm. Caller called for her 12 year old daughter who received her 1st dose of the Pfizer COVID Vaccine yesterday at 5:00pm MST at a Pharmacy. She mentioned that 5 out of 6 of them in the family were over 16 years old and had no problem with their vaccination as they received it at a different Pharmacy branch. She mentioned that the branch she went to yesterday for her daughter was very unorganized. The vaccination was held at a drive-thru in which she noticed that the Pharmacy Technician held the syringe too long on her daughters arm and when he pulled out, some clear fluid flowed out and ran down her arm and she started bleeding. She already went up to the Pharmacist and they mentioned that they will call Pfizer within the week. She is called for herself just to make sure and seeked recommendations for events such as these because she is doubtful that her daughter even got enough of the 1st shot. She is wondered if she should restart the dose, how long should she wait if she restarts, or just proceed with the 2nd dose. Consumer called about Pfizer COVID-19 vaccine who reports her 12 year old daughter supposedly received her first dose yesterday at a pharmacy at 05:00PM MST. Agent reports that caller also mentioned that 5 people in their family above the age of 16 received doses at another pharmacy and had no problems, but her daughter who took her first dose yesterday at a drive thru of a pharmacy had a

problem. Agent reported caller said that yesterday the tech who administered the first dose held the needle too long at the arm and when they pulled it out some of the vaccine went out, some clear fluid leaked out of her daughter's arm, and was accompanied with some blood thereafter. Agent reported that caller was advised to consult their physician and let them know Pfizer Medical Information's number so they can contact and discuss options. Caller said she would say that she was not very far from her daughter's arm when it happened since she was sitting next to her. She said she saw a fat drop of clear liquid run down her daughter's arm, and then after that came down, after it came a drop of blood that leaked down into it, so that it was clear at first then became pinkish. She said the person who gave the injection to her daughter had to grab something to wipe it because it was traveling down her arm. Caller said that there was no treatment done to her daughter's arm other than when he wiped it off and slapped a band aid on it, and then he didn't make eye contact with her and didn't want to talk about it. She understood that things like this can and do happen sometimes. She said she should have taken her daughter to a doctor but she didn't. Said her daughter did not have any other vaccinations yesterday or any other vaccinations in the last four weeks. The clinical outcome of the events was unknown. Follow up attempts are needed. Further information has been requested.

1360615	5/29/2021			U	4/2/2021	4/9/2021	Ocular ischemia that the blood flow into my eyes; Told me I am going to go blind; I could wake up blind or gradually go blind, that I was going to lose my sight; Black spots and a bunch of floaters; Black spots and a bunch of floaters; This is a spontaneous report from a contactable consumer or other non hcp. A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID – 19 mRNA VACCINE; formulation: Solution for injection), dose 1 via an unspecified route of administration on 02Apr2021 (Batch/Lot number was not reported) as 1ST DOSE, SINGLE DOSE for covid-19 immunisation. The patient medical history was not reported. The patient's concomitant medications were not reported. It was reported that patient just want to ask about some side effects from having the vaccine. He/she had the first Vaccine on 02Apr2021 and that was the Friday and the following Friday patient had to scramble for an emergency eye appointment. He/she woke up with some black spots and a bunch of floaters and by the time everything was done they told he/she had ocular ischemia that the blood flow into my eyes, it was kind of (incomplete sentence). He/she did not had the comorbid for the diagnosis, people who have that usually have high cholesterol or uncontrollable sugar and things like that but patient did not. And he/she was wondering if this was something that Pfizer has seen because basically they told him/her that he/she going to go blind. By the time patient got out successfully and everything they told him/her that he/she had ocular ischemia. And he/she did not have the comorbidity for the disease process. And frankly patient had been a little scared to take the second one because they told he/she could wake up blind or gradually go blind, that he/she was going to lose his/her sight and that was a huge change in life here. He/she did not know if it has occurred in other patients as well or had vaccinated or not. It was also reported that patient was supposed to be on the same day when he/she saw that specialist about his/her eye which was the 20th of, the 23rd and he kept him/her all day long, he/she am not kidding he kept him/her in his office from 8:45 till 16:30, he/she was all day long he was running test after test on me. Outcome of the events was unknown. No follow-up attempts are possible. No further information is expected.

1360634	5/29/2021	MA	13	M	5/13/2021	5/17/2021	rash all over his body including his eyes/rash all over his body including his eyes/still there on his toes; This is a spontaneous report from a contactable consumer (mother) via medical team. A 13-year-old male patient received BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE: Lot number: not reported) dose 1 via unspecified route of administration on 13May2021 as a single dose for COVID-19 immunisation (age at vaccination was 13 years). Caller was asking for guidance regarding getting the second vaccine dose after having a side effect following the first dose. She reports that her son received his first vaccine dose on 13May2021 and 4 days later on 17May2021 he began having a rash all over his body including his eyes. She reports that the rash lasted for about 6 days and is still there on his toes. She reports concern about what he may experience after getting the second dose, which is scheduled for 03Jun2021, and asks for guidance on if it will be safe for him to get it or not. Patient had a side effect after the first dose of the vaccine. Should get the second dose? Caller talking about her 13-year-old son, asking how much protection will my son get or what is the efficacy following 1 dose of the Pfizer covid vaccine? The outcome of the event was unknown. Information on the lot/batch number has been requested.

1360585	5/29/2021	NJ	67	M	5/18/2021	5/19/2021	Could not taste/ loss of taste; sore arm/Left Arm Hurts like Hell; Lethargic; This is a spontaneous report from a contactable consumer (patient himself) via a medical information team. A 67-year-old male patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Batch/Lot number: EW0182), via an unspecified route of administration in left arm on 18May2021 at 11:00 (at the age of 67-year-old) as a single dose for COVID-19 immunization. The patient's medical history included ongoing COPD, ongoing bad back, ongoing esophagus blockage, toe operation (he had a toe operation, and he could not walk), he could not walk (he had a toe operation, and he could not walk), took out his gall bladder (then they took out his gall bladder and his lungs are hanging where his gall bladder was), lethargic before because of my medicine, make him loopy. Concomitant medications were not reported. The patient previously received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, Lot number: EW0171), via an unspecified route of administration in left arm on 27Apr2021 (at the age of 67-year-old) as a single dose for COVID-19 immunization. Patient's medical history (including any illness at time of vaccination) was none. Family medical history relevant to adverse events was none. Adverse events following prior vaccinations was none. Prior vaccinations (within 4 weeks) was none. Additional vaccines administered on same date of the Pfizer suspect was none. States Dr. would know additional information for other conditions when that started. Caller states he was going next Thursday for his esophagus because something was wrong with it. Caller states last night he wasn't swallowing because the food was stopping at his throat because of the blockage, so he drank 6 cans of Pepsi to blow it through. States on Monday, he was going for COVID test, because they won't take him unless he has the test. Caller states last time he went to hospital for breathing, they made him suck 2 nebulizers and then he did two on his own and sat down and relaxed and he was okay after that. It was reported that, patient received both doses of the vaccine the first dose was on 27Apr2021 and the second dose was on 18May2021. Patient was lethargic on an unspecified date in 2021 and was lethargic before

---

because of my medicine. Now patient could not taste on 19May2021, and patient have a sore arm on 19May2021. Enquired was loss of taste from the vaccine or not. Caller states yesterday, he got his second one and today he has no taste. Caller states he was also lethargic, and he wants to know if that was part of it or not. Lethargy adverse event: Caller states the lethargy was from all of the medication he was on and he has had it for a while. Caller states he doesn't know exactly when it started. Caller states the drugs he was on make him loopy but states he has been functioning. Caller verifies it was not from the COVID Vaccine, he had it before, but he was still experiencing it. Caller states his doctor was trying to balance the drugs in him. States his primary has taken him off one and put him on half another. States when he got up this morning, he said whoa, he thought he saw blood out of his eye, but nothing was there. Caller states his doctor told him not to take the Prednisone one day and not to take another one at night. Names of Medications, NDC, Lot, Expiration: Unknown. He states a company puts his pills in a pack and he was supposed to take them, but they screwed up on this last one. Call handler asks for clarification on what he means by the screwed up on the last one and he clarifies by saying his doctor has been trying to get the right pills for him because he has COPD, a bad back, he had a toe operation and he could not walk, then they took out his gall bladder and his lungs are hanging where his gall bladder was. Left Arm Hurting like Hell adverse event: States he called some friends and they said, oh that was normal it would go away. No taste adverse event: Caller states he said what was this soda and said was in this because he couldn't taste it and he can't taste his cheese noodles or coke or anything he has tried to eat today. No investigation assessment. The adverse events did not require a visit to emergency room and physician office visit. No treatment medications was received for the adverse events. The events were considered as non-serious by the consumer. The outcome of the event could not taste/ loss of taste was not recovered and recovering for the other events. Follow up activities has been requested.

1357445	5/28/2021	PA	59	F	3/21/2021		SEIZURE; SLURRED SPEECH; LEG PAIN; HEADACHE; SORE ARM; FEEL WEIRD (NOT HERSELF); This spontaneous report received from a patient concerned a 59 year old white and not Hispanic or Latino female. The patient's height, and weight were not reported. The patient's concurrent conditions included hypothyroid. The patient did not do drugs. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1808609, expiry: 09-JUN-2021) dose was not reported, 1 total, administered on 20-MAR-2021 to right arm for prophylactic vaccination. No concomitant medications were reported. On 21-MAR-2021, the patient experienced sore arm the next day after receiving vaccine. On 22-MAR-2021, The patient had headache the following week that did not go away for about 5-7 days and nothing was relieving the pain. On 24-MAR-2021, the patient experienced leg pain and thought it was arthritis but she had never had leg pain like that before and her legs were really hurting. On 04-APR-2021, Sunday the patient was still feeling it. The next day woke up fine but still had leg pain and decided to take a hot bath and she really started to feel weird (not herself) and she was talking to the delivery woman and she was slurring her words (she did not do drugs) and was a healthy person. The patient laid down and her fiancé wanted to take her to the hospital. The patient's mom came over and she wanted to show her a new fridge and called it a fire place. 911 were called and the patient was taken to the hospital and admitted with seizure for 5 days. The patient had the seizure 15 days after the JnJ vaccine on 05-APR-2021, in the afternoon. The patient underwent 2 Magnetic resonance imaging (MRI) and a bunch of tests, computed tomography scan (CAT scan), electroencephalogram (EEG). No MD could claim this was from the JnJ vaccine. It was reported that the patient never had a seizure before in her life. A colleague told the patient that she read an article that said that she could have seizures and she was hypothyroid and thought that it a contraindication to the vaccine. The patient was admitted for 5 days and all tests came back normal. The patient was having speech issues but they were improving. The patient's mobility was fine and eye function was fine. The patient missed a lot of work. The patient had follow up with neuro in a month and would

1357031	5/28/2021	NY		M		5/1/2021	RESPIRATORY FAILURE FROM PROSTATE CANCER AND METASTASIS; HALLUCINATING, TALKING TO HIS DEAD MOTHER AND BROTHER AND CHASING SQUIRRELS; STOPPED EATING; LOSS OF VOICE; TROUBLE SLEEPING; HEALTH STARTED TO DETERIORATE; DID NOT FEEL GOOD; LOW ENERGY; MIGHT BE GETTING A COLD; AGITATION; This spontaneous report received from a consumer concerned a 77 year old male. Initial information was processed with additional information received on 19-MAY-2021, 21-MAY-2021 and 22-MAY-2021. The patient's weight was 140 pounds, and height was 68 inches. The patient's past medical history included prostate issue and kidney shut down in 2014 because he could not urinate. Patient was hospitalized and doctor ruled out prostate cancer; he did have a serious infection, sepsis, surgery to open his prostate for urination and Foley catheter for 6 months. On 21-JUL-2014, daughter took patient home. Doctor wanted to place him in nursing home, he needed 24-hour care, but daughter refused. He went home with a feeding tube, had metabolic issues described as low pressure but high heart rate, "insulin dependent/diabetes/sugar issues" due to the feeding tube; within 3 weeks, he was up functioning, no more feeding tube, gained 25 pounds he was doing good with home care OT/PT, and blood sugar issues were corrected. The pulmonologist or cardiologist told daughter that he did not have damage to his heart. An echocardiogram was completed during this time, any other results are unknown. On 16-APR-2020, patient had trouble breathing, thought he was getting a cold. Ambulance was called and he was responding to supplemental O2, but was taken to the hospital. He was calm and fine but waiting for antibiotics during a 6-hours visit to the emergency room. X-ray showed he had a slight infection in his lower lobe. Apparently, the patient was told he had COVID-19 disease and had an anxiety attack. A couple hours later the reporter was notified that her father was intubated and placed in a drug-induced coma for COVID-19 disease. The reporter stated that this was not true and the hospital had no evidence because a rapid COVID-19 test was not available at that time and they had no evidence of COVID-19 infection. Five days later, the COVID-19 test result was positive. He was hospitalized for 95 days. While in coma, he had 2 heart attacks, his right lung collapsed due to

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

hydropneumothorax with 85% of chest filled with loculated effusions; 900 mL of pleural fluid was removed from the lung. He received plasma antibodies during coma; he had hematomas all over both arms and hands. Daughter refused DNR (do-not-resuscitate). Daughter took her father home on 21-JUL-2020. Patient had a long history of hospital stays and health problems, was in coma from 16-APR-2020 to 24-JUL-2020. Patient was on ventilator. He was discharged and was still on feeding tube, He regained most of his abilities, but still was not able to retain information, and did not have a memory of what happened to him. He was not mentally capable. He was still recovering from his coma. On 05-SEP-2020, he had a bone marrow biopsy which ruled out cancer. Anemia treated with iron supplement. On an unspecified date in 2021, patient broke his hip and stayed in the hospital for another 11 days. Patient had chronic cough and was diagnosed with prostate cancer metastatic. The patient experienced rash when treated with morphine. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 206A21A, expiry: UNKNOWN) frequency 1 total, dose was not reported, administered on 05-MAY-2021 for prophylactic vaccination. No concomitant medications were reported. Reporter reported that her father received the Janssen COVID-19 Vaccine on 05-MAY-2021. He sat for the 15 minutes monitoring period at the vaccine facility. He did not intend to get vaccinated, but rather, was exchanging his glasses at the facility and proceeded to get vaccinated. The reporter stated that her father was escorted by the optical department associate to the pharmacy and that her father did not have the mental capacity to provide consent for vaccination. He was not capable of making medical decisions for himself. She was his contact person for informed consent. He went to pharmacy for eyeglasses and saw all the advertisement for JJ vaccine and went to get the shot. Even though He did not have the mental capacity to make decisions, the JJ vaccine was administered by pharmacy staff without any notifications to his family. There were no other risk factors or anything different that he did in those days. After 4 days of receiving the vaccine (on 10-MAY-2021) his health started to deteriorate and died within 24 hours after symptoms. On 07-MAY-2021 and 09-MAY-2021, the reporter was in

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

contact with her father and he was fine. On 10May2021, her father did not feel good and thought he might be getting a cold, however, it was nothing alarming. He had fatigue, trouble sleeping, agitation, and low energy. On 11-MAY-2021, he was not eating, lost his voice, had trouble breathing, and told his wife he was going to lay down. On an unspecified date in MAY-2021, patient's breathing changed. On 11-MAY-2021, he was hallucinating, talking to his dead mother and brother and chasing squirrels (coded as visual hallucinations), then died. He was feeling tired and wanted to rest, he lied down and he dropped dead in short time. Patient died on 11-MAY-2021. Family did not have time to take him to the hospital. Daughter believed JJ vaccine is a killer and it was a death sentence for her father. The cause of death was reported as respiratory failure from prostate cancer and metastasis, which the reporter disagrees. She denied the cause of death. Reporter was angry and disappointed, blaming the death of her father on JJ vaccine. She stated so many times that the vaccine was a death sentence and how was it still continued, it was killing people. Reporter mentioned after her dad's passing his doctor called asking why was he given the vaccine and that patient was not a candidate for it considering his past medical history. Doctor did not want him to get the vaccine. Reporter also looked at her dad's journal, according to it he thought vaccine was created to help with side effects instead of actually preventing it. She already called pharmacy and spoke to the pharmacist/district manager, it was a completely new pharmacy for him and he had only gone for eye glasses only. District manager said they made a judgement call about vaccinating him. Daughter was angry with them for not checking with her or his doctor first. On JUL-2014, Laboratory data included: Blood pressure (NR: not provided) low pressure, Echocardiogram (NR: not provided) No damage to his heart., and Heart rate (NR: not provided) high heart rate. On APR-2020, Laboratory data included: COVID-19 virus test (NR: not provided) positive. On 16-APR-2020, Laboratory data included: X-ray (NR: not provided) a slight infection in lower lobe. On 05-SEP-2020, Laboratory data included: Bone marrow biopsy (NR: not provided) ruled out cancer. An autopsy was performed on 11-MAY-2021. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The

1357979	5/28/2021	CA	22	M	5/27/2021	5/27/2021	Client received his first dose of the Pfizer Covid-19 vaccine (Lot # EW0185 Exp. 08/2021) on 5/27/21 at 1036 AM. At approximately 1045 the client walked up to the EMT asking for water and stating that he felt lightheaded. " Client was a 22-year-old male alert and tracking with his eyes and beginning to stumble. The client had a chief complaint of syncope. EMT managed to assist the client to the observation bed while an additional EMT and RN arrived for further assistance. The client was positioned supine on the cot and proceeded to lose consciousness. The client did not fall or injure himself in any way. He regained consciousness after approximately 15 seconds. He was alert and oriented to person, place, time, and situation immediately upon regaining consciousness. Client stated that he did not have anything to eat or drink before arriving at the vaccination site. The client had no known allergies and denied any medical history. The client was negative for hives, swelling, discoloration, signs or symptoms of shortness of breath, or other signs of anaphylaxis. The client's airway, breathing, and circulation were intact. The first set of vital signs were taken at 1045 and are as follows: blood pressure 110/76, pulse 52, O2 saturation 96%, skin pale, sweaty and hot. The client consented to stay an additional 30 minutes after his initial vitals were taken and his vitals were reassessed every five minutes until his symptoms resolved. After approximately 10 minutes, the client was fully pink in his face and denied any further lightheadedness. At 1051 the second set of vital signs were: bp 122/82, p 56, O2 96%, skins pink, normal, and warm. Client was assisted to an upright seated position and was given Pringles and juice. At 1059 clients vitals were - 124/84 BP, 74HR O2 99%, Resp 16. At 1109 vitals: bp 122/82, p 68, O2 97%, skins pink, normal and warm. At the completion of his additional 30-minute observation, the client stated that he was feeling better. All pertinent information was given to client by EMT and RN and he was encouraged to follow up with his primary before his next dose. The client was also instructed to call 911 if a severe allergic reaction occurred later in the evening and was reminded to eat before his next vaccination. RN educated client about the possible signs and symptoms of an allergic reaction. The client at 1115 in positive disposition with his mother.

1357959	5/28/2021	WI	62	M	3/26/2021	3/26/2021	3/26/21 After Pfizer vaccine noticing hives on chest and left arm as well as facial tingling and slightly left eye itchiness. Received 2 dose of Epinephrine during ED visit. 5/13/21 After Janssen vaccine he received at this morning around 8:10 AM. After that he had almost the exact same symptoms with a shooting pain in the left arm and neck some left hand tingling and swelling to the point where he can't get his wedding ring off and a sensation of pressure/tingling/fullness in the left side. Given Benadryl and steroids, initially there is no airway concerns or compromise. However after a period of time, he thought his voice was different. He did sound just slightly raspy, though I did question whether this could be related to dryness from the Benadryl. Regardless given that he did note a change, we opted to go ahead and give a dose of epinephrine, which did resolve his symptoms
1357950	5/28/2021	MI	78	F	5/21/2021	5/21/2021	Double vision - diagnosed as 6th nerve palsy in right eye. Could take up to 6 months for normal vision if then. Have seen eye doctor and neurologist. Have to wear eye patch.
1357942	5/28/2021	VA	14	F	5/26/2021	5/27/2021	On Thursday 5/27/21 her right eye swelled spontaneously while in the classroom. Both the upper lid and lower lid. No ocular involvement, or visual changes. Resolved with time and ice. Assumed that it was contact dermatitis. No other symptoms or complaints. The next morning 5/28/21 she woke up covered in hives on trunk/legs, minimal facial swelling. Lips/tongue/mucus membranes not involved. No SOB, dyspnea, cough or wheezing. No chest pain/pressure, no GI complaints or other complaints. I gave famotidine and levocetirizine. No worsening of symptoms noted and she attended school with close monitoring.
1357927	5/28/2021	CO	63	F	2/19/2021	2/20/2021	Severe headache, it was so bad I couldn't even open my eyes, could only lay down and stay in a dark room it was worse than having a Migrane. Had an upset stomach. Aching all over. Lasted for 2 days.

1357896	5/28/2021	OR	72	F	2/27/2021	4/12/2021	On April 19, 2021, I noticed complete numbness on right side of my face, above my lip and up through my nose, right eye and head. After several days, I contacted my primary care physician. She was concerned I may have suffered a stroke so on Friday, April 23, she sent me for a CT Scan at Imaging. The results of the scan were negative for a stroke. However, my PCP asked that I see my neurologist as soon as possible which was Thursday, April 29th at 10:15 am. A Neurologist sent me back to Imaging for an MRI. The MRI also proved negative for stroke and confirmed my brain tumor was staying the same size. I still have numbness in the right side of my face, eye and head.
1357765	5/28/2021	FL	56	F	5/24/2021	5/25/2021	Injection at 10:18 am. Got home -- explosive diarrhea by 11:30 am. Joint pain started this evening. Became severe (unable to open doors, walk) the following day (Tuesday, 5/25/21) followed by muscular pain, especially legs and buttocks. Tinnitus has peaked (exacerbation) since Tuesday as well (pulsatile). On Tuesday evening, right eye became red and inflamed. Continued into Wednesday with swollen eyelid and area surrounding eye (including right temple and right upper cheek). Had to call in sick on Thursday and today as swelling has not resolved. Using hot compresses.

1357860	5/28/2021	WI	44	F	3/16/2021	3/16/2021	shortly after receiving the vaccine, she developed lightheadedness, frontal headache and a feeling of "fuzziness." "I knew it was going to start." She describes a globus sensation. She developed nausea without vomiting. Took 40 mg of prednisone and 25 mg of diphenhydramine. EMS was contacted. She tells me that she lost vision and couldn't see the paramedics when they arrived. Discharged from ED, then returned on 3/17/21, when she began experiencing face itchiness and flushing, numbness of her mouth and lips, throat inflammation, and vision loss. Patient took Prednisone this morning with little symptom relief. Compared to yesterday, the only new symptom is throat inflammation. 4/30/21 Primary care visit: presents to the clinic for evaluation of globus sensation. Patient reports that this has been an issue ever since she got her first dose of Pfizer COVID-19 vaccine. She feels as though there is something in her throat and feels pain or discomfort, most often in the mornings and evenings for several weeks. She feels the need to "clear" her throat often. She denies any trouble eating or swallowing. She feels as though her neck and face still appear swollen compared to her baseline, since getting the vaccine. She reports occasional post nasal drip but denies significant nasal congestion and does not feel this is the typical time for her to struggle with her allergies. She has noticed frequent nose bleeds in the past 2 weeks, now daily. She states that she will sometimes bleed up to 15-20 minutes. She has been feeling more tired and "foggy" or more forgetful in the past few weeks as well and fears this is starting to affect her work performance.

1357924	5/28/2021	CA	43	F	5/27/2021	5/27/2021	Client received her second dose of the Pfizer Covid-19 Vaccine (Lot #EW0185 exp. 08/2021) on 5/27/21 at 09:41 AM. At approximately 1005 the client walked to the EMT station complaining of cramping on her right lateral side. EMT and RN responded. The client was a 43-year-old female who was alert and tracking with her eyes. The client had a chief complaint of shortness of breath. The client stated that she began to feel pain on her right side and that it was giving her mild shortness of breath. This was the client's second dose of the Pfizer vaccine. The client denied any known allergies or significant medical history. The client was not on medications. The primary assessment revealed that the client's airway, breathing, and circulation are intact. The client was negative for hives, swelling, discoloration, signs or symptoms of shortness of breath, or other signs of anaphylaxis. The client was alert and oriented to person, place, time, and event. The client stated that she "did not have anything to drink?" and was "feeling a bit nervous?". EMT had the client lay down on the cot and took the first set of vitals at 1007 and were as follows: Blood pressure: 124/88, Pulse: 68 and regular, O2 saturation 98%, and lung sounds clear, respirations 20. The client then consented to stay an additional 30 minutes after her initial observation. After 5 minutes the client stated she was feeling better after drinking some water. The second set of vitals was taken at 1014 and are as follows: BP 122/82, pulse 72, O2 saturation 98%, lung sounds clear., respirations 18. After her first 15-minutes of observation, the client stated that she was "feeling better?" and refused to complete the remainder of her thirty-minute observation. All pertinent information was given to her and her husband by EMT and RN. The client was also instructed to call 911 if a severe allergic reaction occurred later in the evening and was educated on the signs and symptoms to watch out for. The client departed at 1020 in positive disposition with her husband.

1357173	5/28/2021	WI	69	F	4/16/2021	4/17/2021	coughs; her face is so dry and skin is shedding off; her face is so dry and skin is shedding off; eyes were swollen/swollen around eyes; hive like bumps and streaks of red welts on her neck; face was extremely red from her forehead down to chin/ face became swollen and red; her face became swollen/ face was huge/ face swell up; face swell up; it was extremely itchy and painful; itchy face/ itching; sore arm; felt off/ mild lethargic; This is a spontaneous report from a contactable consumer (patient herself). A 69-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration, administered in left arm on 16Apr2021 14:57 (Batch/Lot Number: EW0164) as 1st dose, single for COVID-19 immunisation. The patient had relevant medical history and no concomitant medications. On 17Apr2021, the patient had a sore arm, felt off/mild lethargic but that was an expected result of a vaccine injection. Two weeks later in the evening on 03May2021, she had something that had never happened before. She experienced sudden onset itchy face, it felt warm, and her face was extremely red from her forehead down to chin. Her face became swollen, red and itching. This came on quickly. Her face was huge, swollen around eyes, itching like crazy. She was just sitting on couch after dinner and started itching all of a sudden. When she went to the bathroom to see, her face was the reddest and she looked like a tomato and her face was swelling. Her eyes were swollen the next morning and she had hive like bumps and streaks of red welts on her neck. Patient stated 'I got a terrible case of hives and my face swell up and it was extremely itchy and painful I mean really bad, I have never anything like this happen in my life.' Her face was literally on fire it was itching terrible, it was very swollen my eyes, where to the point that you could barely see out of them. The next day, she took a diphenhydramine (BENADRYL) but that did nothing. She confirms she got the first shot on Tuesday, 04May2021. The Benadryl, she confesses she threw it out because she hadn't used any since 2015 and it was expired. She did get a brand pack but did use this one. She has no UPC, Lot, or Expiry. The Benadryl didn't phase it. On 05May2021, it started to develop on the top of her hands. On 06May2021, she contacted the doctor and got an appointment where she was given prescribed

----------	-------	-------	---------	-----	----------	------------	--------------

prednisone - 20 mg for 3 days to treat it. It was in a pharmacy bottle, a round peach tablet, and says use before 06May2022 but there is no NDC, manufacturer, or Lot on the bottle. When she got the medication on Thursday she was told to take it only in morning because she could get jittery, people cant sleep sometimes when taking it at night. She started it Friday morning. She reported she got jittery from prednisone but that the swelling started going down. The patient coughs during the call and remarked the prednisone made her hoarse for some reason. After using the prednisone, she got funny things on her arm that looks like the measles. She started to develop a rash on her forearms that resembled measles and developed water blisters in between her fingers and down at her ankle. It was between her wrist and elbow on the underside of her arms. She was also really itchy over her body. There were water blister outbreaks on her ankles and between finger. She noted this was after the prednisone. Patient stated 'I am still itchy and stuff like as far other places on my body now the things are erupting.' She had an appointment with dermatologist next Wednesday. The redness, swelling and itching on her face has resolved at this point but her face was shedding. She explained that her face was so dry and skin was shedding off. She had not been outside and worried would she have a reaction to things since this has happened. It was noted she saw a nurse practitioners and next week she will have a head to toe dermatologist appointment. She was forwarding the information from this event to the dermatologist to review with her normal appointment that was scheduled months ago. She wanted to know if this had been reported before and if she should get the second dose of the vaccine after having this reported reaction. Patient stated 'At this point, I don't plan on pursuing going for the next injection until I get some really solid data about what is happen here that I had this kind of reaction. I have number or references going to find Pfizer vaccine I have various things in whatever but I yet to come across anybody that had just particular reactions.' She didn't take any lab test. They didn't draw any blood or anything like that they just looked at her face and stopped by. She was hoping to get blood drawn to try to figure out what happened here. Outcome of 'her face became swollen/ face was huge/ face swell up, itchy face/ itching, and face was extremely

inner ear, and Midodrine HCL 10mg for dropping blood pressure and 10mg Pregnisone for inner ear inflammation. Patient underwent VNG test had no inner ear inflammation and noticed micro movements of the eye No concomitant medication information were reported Caller wanted to report adverse event. Callers first dose was on 12apr21, LOT#040B21A, Expiration date 10/2/21. Caller said his life has been upside down since he got the shot. First week had intense headache and dizziness. Second week he had muscle aches and dizziness with limited headaches. Third week he is having a focusing and dizziness issue. Caller said he seen doctor and specialist. Caller had MRI and Stress test. Caller said MRI came back clean. Caller said they had a cyst but nothing that would cause symptoms. Caller said Brain scan came back negative. Caller said he was completely heathy. Caller said he also gets motion sickness now since he had the vaccine. Primary care doctor gave antibiotic for cyst. PCP thought had something to do with inner ear, 25mg 3xday meclazine, then the gave Midodrine HCL 10mg for dropping blood pressure. Caller said he got relief for 3 days then he started getting sick. Caller went to ER and they took him off the medicine. Caller when to a ENT doctor. Caller said took VNG test. He was prescribed 10mg Pregnisone for inner ear inflammation. The VNG test proved he didnt have inner ear inflammation. Caller said his symptoms have been going on for 32 days as of yet. Caller said he cant go to restaurants because of dizziness and sickness. Caller said during his VNG test they noticed micro movements of the eye. His ENT thinks this may be causing the dizziness and lack of focus. Caller said he will travel to anywhere to get help.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Further information regarding detailed medical history and diagnostics will help in assessment.

----------	-------	-------	---------	-----	----------	------------	--------------

Patient had oxygen currently in the low 80s to 96 depending on the lungs. Patient started to fall and lean over. Patient's sister had a hard time waking up patient. After the episode when patient's sister could not wake patient up, patient had developed a fever of 101.9. Patient alternated Ibuprofen and Tylenol as treatment for fever. Patient was short of breath and it was twice as worse as it was. Patient also mentioned that eyelid on left eye went down. Patient could not seem to return to normal and had written notes so that could keep on track and that patient had become very forgetful and that patient's sister had moved in to help after patient received the vaccine since patient was weak. Patient stated that had severe muscle cramps in feet, toes, arms and that hands clench up like a fist for a minute due to the pain. The clenching relieved the pain but as patient unclenches the pain started again. Patient stated that was in pain and hurting, had focus fog. The HCP had told patient of side effects and that symptoms would last for about 24 hours but patient had been experiencing them for a few days. Patient was worried and fever kept coming and going. Patient took meclizine for dizziness, as since patient received the vaccine, the dizziness was much worse. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient had not recovered from hypoxemia, and the outcome of muscle cramps in feet, toes and arms, cold chills, falling over, loss of consciousness, confused, dizzy, unable to focus, foggy thinking, fever, shortness of breath, pain, short-term memory loss, tired, weak, very forgetful and hard to talk was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0 - 20210544835 - Covid-19 vaccine ad26.cov2.s - HYPOXEMIA , LOSS OF CONSCIOUSNESS and FOGGY THINKING . This event(s) is considered unassessable. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the event(s).

1357241	5/28/2021	TX	42	F	4/22/2021	4/22/2021	<p>Feeling sensitivity in my veins like I could feel pulses in my veins in my whole body; irregular heart beat; Rapid Heart Beat palpitations; raising heart beat along with heart palpitations; irregular heart beat; Lymph node swollen; I woke up to a very neauseal senation and feeling that I was going to faint; Dizziness; I woke up to a very neauseal senation and feeling that I was going to faint; Shivering; Warm eye; Feeling like a very bad cold or flu; Feeling like a very bad cold or flu; Headache; This is a spontaneous report from a contactable consumer (patient) via Medical Information Team. A 42-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration administered in left arm on 22Apr2021 (at the age of 42-year-old) (Batch/Lot Number: ER8735) as UNKNOWN, SINGLE for covid-19 immunisation. It was unknown if patient was pregnant at the time of vaccination. The patient had no relevant medical history. Concomitant medication included multivitamins. The patient stated, "So, in chronological order I got the vaccine on April 22. Okay So, my first symptom that night on April 22 was headache, then on April 23rd Friday, I had symptoms of shivering body, headache, warm eye, just feeling like very bad cold or flu like. Then on Friday night to Saturday, so you can chronologically, April 24, 4 am I woke up to a very neauseal senation and feeling that I was going to faint which scared me a lot, I was supposed to go ER, but I didn't, I just you know calmed down, given it was 4 a.m. in morning and don't want to scare my family and that was very scary symptom. April 25 I felt my lymph node swollen and ever since April 24 I had dizziness. So, I would feel dizzy from time to time particularly in the middle of the night like 4 am that's when I felt the dizziest. The nausea was very very persistent like I felt like I needed to throw up but I didn't on the 24 of April but then on 25th and onwards I continued with dizziness felt without nausea just being dizzy. On Tuesday April 27, I started having a rapid heartbeat palpitations and that started scaring me even more. So on Thursday April 29, I started feeling sensitivity in my veins like I could feel pulses in my veins in my whole body along with raising heart beat along with heart palpitations so I went to a minor emergency room provider. They told me I had to hydrate properly, rest, not exercise and to allow for the vaccine to make it through</p>

my body because the symptoms that last up to two weeks and they suggested that if I still felt like I was gonna faint, I have to visit the emergency room. Fortunately, I didn't have to visit the emergency room but my heart palpitations, my regular heart palpitations have continued. So, I am now on beyond my 2nd week and today I scheduled the call with a cardiologist because I have a heart, you know pulse monitor, pressure monitor that takes your pressure and I wear a fitness watch and I can see in my fitness watch how my heart reaches over 120 palpitations. So, I scheduled with cardiologist for next week Tuesday and the dizziness has gone away for the most part. It's incredibly minor if I feel it but at times I feel it. But I don't like irregular heart beat and last night my pressure monitor told me, detected it because you have to detect it at right time, it's not all the time but the monitor was able to detect the irregular heart beat at 79 pulses and my regular heart beat is more like 64." The patient also stated that her doctor told her that what she was feeling her vein was reaction to her nerve system from the vaccine. So he suggested that she soak in bath tub salt, which she have been trying to as best as she can but that really was relief like she don't have feelings of sensitivity in the vein anymore the only thing that continues was regular heart beat. The patient took only Tylenol 500mg, one capsule every 6 hours, orally for the headache and after headache was gone, the patient stop taking Tylenol and then she have been trying soaking in of absence salt and she have been trying to drink plenty of fluids among which includes beverages with electrolytes. Therapeutic measures were taken as a result of headache, flu, and "feeling sensitivity in my veins like i could feel pulses in my veins in my whole body." On an unspecified date, the patient recovered from headache and "Feeling sensitivity in my veins like I could feel pulses in my veins in my whole body" and was recovering from dizziness. The patient had not yet recovered from irregular heart beat while outcome of the rest of the events was unknown.

1357298	5/28/2021	NV	58	F	1/8/2021	1/1/2021	I can't eat; can talk now unlike before; Vomiting; Nauseated; I had a Bell's palsy after the vaccine; temperature happened; body ache; My lymph nodes are swollen; This is a spontaneous report from a contactable consumer (patient). A 58-year-old female patient received bnt162b2 (Pfizer COVID-19 vaccine), dose 2 via an unspecified route of administration, administered in left arm on 08Jan2021 (Lot Number: EL1283) as single dose for COVID-19 immunization. Medical history included hypertension, asthma and gallstones from an unknown date and unknown if ongoing. Concomitant medication included lisinopril taken for an unspecified indication, start and stop date were not reported. The patient previously received 1st dose of bnt162b2 (Pfizer COVID-19 vaccine), via an unspecified route of administration, administered in left arm on 21Dec2020 (Lot Number: EH9899) as single dose for COVID-19 immunization. Second dose was on 08Jan2021 and then after that, the patient had those like lower mouth pain, experienced a headache and the temperature and the body ache and everything all happened. Lymph nodes are swollen already and so patient went to doctor and they gave Augmentin (treatment) on 17Jan2021. The patient saw how her face was looking, she had a Bell's palsy after the vaccine. She didn't worked since January until the time of report because of so many tests that she did and have spent a lot of money already. She was depressed for how many months and can't eat and face has droop and eyes was hurting a lot, it is kind of emotional thing and spending a lot of money already on tests and everything. Still experiencing Bell's palsy, still have some droop in face but can talk now unlike before but every time she talks there is saliva coming out in left face. For the treatment of events: they gave Augmentin, that is the antibiotic, the tablet, 3 times a day. The other one is Valtrex, 1 gram, three times a day also. There is another one, it is Medrol, one tablet three times a day. Also, as patient was having the headache that time, taking (not clear) two tablets every six hours. Anti-nausea over the counter medicine as needed because of vomiting and nauseated always that time. The Medrol they gave twice on that time after she finish the first Medrol, they gave her Prednisone three times a day also. Outcome of event Bell's palsy was not recovered, for event can talk now unlike before was recovering, for the

1357282	5/28/2021	NY	52	F	4/26/2021	4/26/2021	couldn't even function; I have been having really bad breathing problem; Loss of appetite; I just got bruised; double vision; couldn't stand; couldn't even focus; her eyes could not focus; could not see to drive, all of sudden my vision was gone away; diarrhea; blurred vision; vertigo; continuous dizziness; This is a spontaneous report from a contactable consumer. A 53-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), dose 2 via an unspecified route of administration on 26Apr2021 (at the age of 52 years-old) (Batch/Lot Number: EW0169; Expiration Date: Aug2021) as 2ND DOSE, SINGLE for covid-19 immunisation. Medical history included syncope Unspecified syncope, migraine Chronic Migraines, concussion history of severe chronic migraines and unspecified syncope due to have a concussion 3 times. The patient received first dose BNT162B2 for COVID-19 immunization on 06Apr2021 at the age of 52 years old. Caller said that since the second dose she has diarrhea that is coming and going, but she has been having it for 2 weeks and is treating it with Imodium AD. She has been having blurred vision, vertigo, and dizziness continuously. She has never had this before. She said that within an hour of getting the second dose, she was taking her dog for a walk and only made it a block before she had to come home because she thought she was going to fall. She states on Mothers Day she felt like she could not get her bearings and states it was "very, very scary." She said that she cant even walk down her staircase or drive her vehicle. Consumer further stated, I have been having a loss of appetite too not feverish or anything and you know I had the shot, I had no reaction there. I just got bruised and I had no hurt or anything. I have been having symptoms. I had several symptoms from Pfizer but the second vaccine I had been having sever symptoms, they haven't gone away. I was vaccinated for second vaccination on second dose was on 26Apr2021. I am pulling it on my screen here because I have a V-safe. I have been having really bad breathing problem. I have brain situation that my neurology check. I have underlying medical conditions. My pulmonologist asked me to get the Pfizer so that's what I did. I had the first dose 06Apr2021, I had the second dose 26Apr2021. Now basically just the second dose, I started having visions problem really bad and dizziness, it's kind of little

vertigo. I had severe diarrhea for at least I guess I am still having it little bit. So it was really severe for about a week or so. But I have it, I am having it still couple of days, 3 weeks still, 3 and a half days and week. The vision on modern days I had like double vision and dizziness and I got vertigo, the whole day. So my brother left with my granddaughter. I had to hold on to the banished couldn't stand. I couldn't even focus. I have unspecified think to the give more and I have a severe chronic migraine (Intent: History) since I am 4 years old but I have never had this happened to me until after I took the Pfizer second vaccine. The day that I took the Pfizer second vaccine, I went with my dog outside I only was able to walk a block and a half and then I had to walk back home because I felt dizzy. Now this is about an hour after I took the second vaccine. Also the next day I drove my car to the park, this is about maybe 10 minutes away and I was getting home run around the park and about an hour after that I had going to car and and surrounded and could not even get my barring's. She states the next day she took her dog to the dog park and experienced the same thing so she had to lay down in her car and states she "couldn't even function." She states that when she was driving later, she states her eyes could not focus and she could not see to drive. As she was driving home, all of sudden my vision was gone away, from what happen was is I had to call my son. Then I started to cry because I couldn't able to see. Now this has been continuing since the vaccine. Therapeutic measures were taken as a result of diarrhea. The outcome of the events was not recovered. No follow-up attempts are needed; information about lot/batch number cannot be obtained.

1357235	5/28/2021	NE	75	F	4/18/2021	4/1/2021	sodium was low; Intestinal problems; Trouble sleeping/difficulty sleeping; Blood pressure shot up/blood pressure elevated 197/85; Feel like I'm on speed or something/felt buzzy/she didn't feel right; So tired; Headaches; This is a spontaneous report from a contactable consumer (patient). A 75-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in left arm on 18Apr2021 16:45 (Batch/Lot Number: ER8735; Expiration Date: 31Jul2021) as 1st dose, single for covid-19 immunisation. Medical history included ongoing vertigo (diagnosed with vertigo so long ago that she can't even remember, she experiences vertigo with changes in barometric pressure when the weather was changing), ongoing arthritis a few years now, ongoing irritable bowel syndrome for a couple of years now, scar tissue in esophagus in 2019 (due to scar tissue in her esophagus, she was unable to swallow anything. and lost 33 pounds), h1n1 flu, sensitive to medications (she aren't allergic to anything, they just get side effects that they don't like), and blood pressure was really low and sick for months and blood pressure was probably low because she was dehydrated. Concomitant medications included meclizine hcl (MECLIZINE HCL) taken for vertigo, simeticone (GAS-X) and ibuprofen taken for arthritis. Patient stated that she can only tolerate half a pill of meclizine and she might take half of a 12 mg pill at noon and she's ok, but around 6:00 to 6:30 PM, the meclizine knocks her out. The patient received flu vaccine in Oct2020 and experienced several side effects. She never used to get flu shots, but then she got the H1N1 flu and her son was afraid that she might die because she got so sick. After she had the H1N1 flu, she has always gotten a flu shot. One time she got a flu shot and got side effects from it and the side effects all went away. She can't remember when she received the flu shot that she experienced side effects from or what her side effects were because it happened so long ago. Patient had the 1st dose last 18Apr2021, 20 minutes after receiving the 1st dose, she felt buzzy, blood pressure elevated 197/85 (around 17:05 to 17:10), trouble sleeping, and feeling so tired. She reported that she sat and waited for 15 minutes after receiving the Covid-19 vaccine and thought that she would stay for another 5-10 minutes. Within that time

---

frame, it felt like something changed in her, she went up to the nurse and informed the nurse that she didn't feel right; she couldn't explain it and didn't know what it was, but something wasn't right. The nurse at the vaccination facility took her into another area and took her blood pressure; and her blood pressure had just shot up and was 197 or something like that over 85. The staff monitored her and advised to call an ambulance. She did not call an ambulance and her blood pressure did not go back to normal at the vaccination facility but she left anyway. Since then, she feels like she was on speed or something and she can't hardly sleep. Her blood pressure taken 3 different times since 18Apr2021 and her blood pressure was still high in 2021. She was so tired, so tired, and went to the physician because she could hardly even stay awake. Other than that, she had a headache in Apr2021 and has some intestinal problems in May2021. She doesn't know if the intestinal problems were brought on from the Covid-19 vaccine or not. Her headaches were not that bad and reported that her headaches come and go. Her intestinal problems came on a week and a half ago and she has intestinal problems anyway. Her intestinal problems were really different and that's why she went to the emergency room on 12May2021. She put a call into her GI (gastrointestinal) doctor because she has intestinal problems, but she couldn't figure out why her problems were different. Her intestinal problems were more intense than what she usually has. She was trying to get an appointment with her GI doctor to see what's going on and if there could be no correlation at all between her intestinal problems and the Covid-19 vaccine. Patient reported that she went to the emergency room yesterday, 12May2021, because of the intestinal issues, and her blood pressure was 181/86. She relaxed in the emergency room while she was waiting for results of some of the test; she turned off the overhead light, was resting, and nothing exciting was going on. Before she left the emergency room on 13May2021, the nurse took her blood pressure again and it was 170/82. She had gone to the urogynecologist a week ago because she was having some problems that weren't associated with what was going on following the Covid-19 vaccine. Her blood pressure was elevated there as well, measuring 165/96. She even went to her physician's office on

21Apr2021 and her blood pressure was elevated. She has never had high blood pressure and she doesn't want to be stuck taking blood pressure medications for this because she knows that's what her doctor was going to do and she doesn't want to. She inquired if the elevated blood pressure, feeling like you're on speed, difficulty sleeping, and tiredness were side effects that people were experiencing. She stated that for the first couple of days, she had no side effects at all. She received her Covid-19 vaccine on Sunday, 18Apr2021; and on Monday, 19Apr2021 and Tuesday, 20Apr2021, she thought this was great and then she began experiencing the events. She further inquired if her thyroid has anything to do with feeling the way that she feels, like she was going 1000 miles per minute. She went to see her physician on 21Apr2021 because she was so tired/ tiredness that she could barely keep her eyes open. She was waking up tired and she was still waking up tired. Her physician ran a whole panel of blood work and everything was fine. When she went to the emergency room on 12May2021, she took the blood results with her so that they didn't have to run another panel. The only thing that was different about her blood work that her doctor wasn't concerned about was that her sodium was low. Her blood pressure was normally 134/78 or something like that. There was a time where her blood pressure was really low because she had been sick for months and her blood pressure was really low when she went in the one day to see her ENT and her ENT informed her that her blood pressure was probably low because she was dehydrated. She spoke to her 2 doctors and went to the ER yesterday (as reported). Her 2nd dose was supposed to be given last 09May2021 and she told her doctor that she was not going to take it because ever since she had the vaccine, her blood pressure went up. She mentioned that she never had elevated blood pressure until she got the COVID 19 vaccine. She also mentioned that decongestant gives her palpitations. Patient was asking if these were normal reactions from the vaccine. Prior vaccinations within 4 weeks was none. Outcome of events blood pressure shot up/blood pressure elevated 197/85, feel like on speed or something/felt buzzy/she didn't feel right, so tired, trouble sleeping/difficulty sleeping was not recovered; and outcome of the rest of events was unknown. No follow-

1357218	5/28/2021	GA	73	F	2/3/2021	2/3/2021	double vision, palsy of third optic nerve in right eye; Glycosylated Hemoglobin A1C 5.8; headache every day after second dose for 2 months; This is a spontaneous report from a contactable consumer (patient). A 73-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration administered on Arm Left on 03Feb2021 (Batch/Lot Number: EL3302) at the age of 73-years-old as 2ND DOSE, SINGLE for COVID-19 immunization. Medical history included ongoing tachycardia and blood cholesterol abnormal (reported as cholesterol). Ongoing concomitant medications included metoprolol (METOPROLOL) taken for tachycardia; rosuvastatin calcium (ROSUVASTIN) taken for blood cholesterol abnormal (reported as cholesterol); and clopidogrel bisulfate (PLAVIX) taken for prophylaxis, all taken since unknown dates. The patient received the 1st dose of PFIZER-BIONTECH COVID-19 VACCINE on 13Jan2021 (Batch/Lot Number: EL0142) at the age of 73-years-old as COVID-19 immunization. Then, the 2nd dose on 03Feb2021. After the second dose on 03Feb2021, she had a headache that started that day and every day for two months which she never got headaches before this. Her headaches have resolved about three weeks ago (Apr2021) and the doctor prescribed her medication, but she did not have to take it. Then on 18Mar2021 (6 weeks after the second dose), she woke up, got up, walked down her hall and saw three front doors - she mentioned that she was having double vision. She went to the hospital where she was admitted on 18Mar2021 to an observation decision unit for 26 hours (19Mar2021). She was tested for a stroke but was not having a stroke. She was then diagnosed with eye palsy in third optical nerve of her right eye. Her right eye was somewhat improved as she can move it up down left and right. Her right eye was no longer paralyzed, her eyelid will now open and close where initially it just wanted to stay closed, but her vision was still distorted. She was still treating it with patching her eyes off and on. The patient also had glycosylated haemoglobin (A1C) was 5.8 - borderline taken on unknown date and waiting for A1C results. The patient recovered from headache in Apr2021 while recovering from "double vision, palsy of third optic nerve in right eye~~

1357208	5/28/2021	FL	74	M	3/4/2021	3/1/2021	problems breathing; allergic reaction; rash on the left ankle; hypersensitive on certain frequencies was reported as worsened; hypersensitive on certain frequencies was reported as worsened; his vision since the shots was compromised/vision in the lower section had shrunk even more/gotten worse; he moved things, but couldn't remember where he moved them; residual neuropathy in feet was reported as worsened; This is a spontaneous report from a contactable consumer (patient himself). A 74-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), via an unspecified route of administration, administered in the right upper arm on 04Mar2021 at 11:00 (Batch/Lot Number: EN6199) as the 2nd dose, single for COVID-19 immunization. The vaccine was administered at the military facility. He previously received the 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; batch/lot number: EN9581) on 11Feb2021 at 2-3 pm (at the age of 74 years old) in the right upper arm and experienced a bout of diarrhea, but he took loperamide (IMODIUM) and it went away; he expected the first shot and last only about a day. Relevant medical history included ongoing legally blind, wherein his central vision was screwed up and this was something going on before the shots and with his peripheral vision, there were areas he could see clearly, and also had eye pain; his hearing was hypersensitive on certain frequencies, which was ongoing; and residual neuropathy in feet; all from an unknown date prior the vaccine. The patient had no concomitant medications. The patient previously took clonazepam (KLONOPIN) from an unspecified date in 2009; further reported that the patient had no information on this medication other than it was Klonopin that caused him to stop breathing and put in coma in 2009 and that he was given intravenous (IV) antibiotics, because he had 3 major infections and this was when the issue with his vision started. The patient previously received and stopped getting the flu shot years prior reporting when he got sick for 6 weeks. The patient had no prior vaccinations (within 4 weeks) other than the first dose. The patient had no family medical history relevant to the adverse events (AEs). The patient reported that he got the second shot of the Pfizer COVID-19 vaccine and within 5 minutes, he had a severe reaction. He was in an observation area at

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

the facility and less than 5 minutes after getting the shot, he had problems breathing on 04Mar2021, it was painful to breath; however, it was further reported that "painful" was not the word for the problems breathing. The triage team gave him shots and he went to the emergency room (ER) and ended up spending the night in the hospital. It was further reported that they gave him an epinephrine (EpiPen) and some other shot in the left arm and diphenhydramine (BENADRYL) in the right arm and put on oxygen on him. He was admitted to the hospital and released the next day. He was given the option to leave the next day and so he did. The doctor explained, they were concerned it was cardiac related, but did blood work and told them he was fine on an unspecified date in 2021. The doctor also told him they saw a rash on the left ankle on 04Mar2021 and therefore knew it was an allergic reaction. The rash on ankle was barely visible the next day, it had resolved though, but was not sure of the exact date. He couldn't have seen it anyway. There had also been other issues since then. He remarked that he moved things, but couldn't remember where he moved them on an unspecified date in 2021. On an unspecified date in Mar2021, the hypersensitive on certain frequencies was reported as worsened. Regarding the patient's hearing, he explained that while in church, they were playing music and it was pure pain. He went to the clinic and saw an otolaryngologist, who told him that his hearing was hypersensitive on certain frequencies, not all though. He stated he had this before, but never with music at the church or like this. He was in the car and a car beside him with heavy base playing was giving him issues; the same kind of the pain, but on the opposite end with base. This was something new and not like he had before. It was ongoing and he had not gone back to church, so as not to experience this again. This started within a week or 2 after the second shot. Since the shots on an unspecified date in Mar2021, his vision was compromised. There were upper and lower areas, "sweet spots," he could see. With his last check up, the vision in the lower section had shrunk even more; where he could see from about the 3:30 to 8:30 area before, currently it was from 5:00 to 7:00. He explained this was like on a clock. Also he was able to see the big E at the top of a vision chart, but in Mar2021 after the second shot, he noticed within days, he could no longer see the large E.

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

He had a regularly schedule appointment a couple weeks after the second shot and this was noticed. It had gotten worse. Additionally, he would stand in front of the eye chart and as part of the eye exam, they would hold out fingers to see if he could see them. Last year at 6 feet (ft), he could see them, but currently, he couldn't see them until 2 ft away. If he was in bright light, he had severe eye pain, to the point of crying. He had to leave and get out of that situation, it was so bad. Even going outside with a hat and sunglass without looking at bright light, it still impacted him. The lighting in his bathroom bothered him; he had to have the blinds closed and was home bound. His closet was the only way to get relief. This was all new since the Covid shot. On an unspecified date in 2021, the residual neuropathy in feet was reported as worsened. He had this previously, but currently had hypersensitive in his feet in those areas. The patient found some essential oils that help so he could get to sleep and keep it from itching in his feet. The patient was deducting that for whatever reason, it was impacting nerve areas that had issues previously. It was causing them to get worse. He could only find this commonality; the optic, auditory, and residual neuropathy, the shot was aggravating these things that he already had problems with previously. It was added that he had also noticed his eyes had a throbbing pain, like a feeling of wanting to explode. He has had this in the past, but not too often and currently, it was daily and it was getting worse. It started about 3 weeks after, but it didn't happen often at first. Currently, it was almost daily. The doctor told him that there was not a way this could happen, there was no evidence this could happen. There had been no treatment, nothing had been done. He said with his DNA, if something could go wrong even just 1% then it would happen to him. The AE "problems breathing" did require an ER visit. The patient was hospitalized for the event problems breathing from 04Mar2021 to 05Mar2021. The patient underwent further lab tests and procedures, which included hearing test with unknown results on an unspecified date. Therapeutic measures were taken as a result of problems breathing, allergic reaction, and rash on the left ankle. The patient recovered from the event "problems breathing" on 04Mar2021; he recovered from the events "allergic reaction and rash on the left ankle" on an

1357316	5/28/2021			F			<p>her eyes were glazed over/eyes were cloudy, blurry, and then blacked out /passing out; headache; nauseous; feeling unwell; wobbly/ felt a little weird; her eyes were glazed over/eyes were cloudy, blurry, and then blacked out; she said she started feeling kind of dizzy; This is a spontaneous report from a contactable consumer. A 12-years-old female patient (daughter) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number and expiration date was not reported), via an unspecified route of administration on an unspecified date as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the first dose of the Pfizer COVID 19 vaccine around 11:30 yesterday. She states that she felt fine for the remainder of the day yesterday but that this morning she had a headache and was nauseous. She states that they had plans to attend a lunch with family but had delayed it due to her daughter feeling unwell so they waited for few hours just waiting to see if she would improve then after few hour she said okay the nausea was gone and after a few hours the daughter was feeling better and they proceeded to go to lunch. When the daughter got out of the car to go to lunch the mother states that she was wobbly and her eyes were glazed over. Then all of a sudden she said she started feeling kind of dizzy like she said her eyes kind of looked cloudy, she felt a little weird and she ended up passing out and had to catch her as she was falling. She reports that she then lost her footing and fell to the ground but that she was able to catch her somewhat. She states that she whole episode lasted about 15 seconds and then she came to. The daughter reports that her eyes were cloudy, blurry, and then blacked out. She states that she is not sitting and eating a banana and feeling okay. Should she get the second dose since she had side effects from the first dose. Response: As noted in the Fact Sheet for Recipients, you should not get the Pfizer-BioNTech COVID-19 Vaccine if you had a severe allergic reaction after a previous dose of the vaccine or if you had a severe allergic reaction to any ingredient of the vaccine. The decision to receive the second dose for any other reason cannot be made by Pfizer. We refer you to speak to your healthcare provider about the risks of the vaccine compared to the risks of potentially not being fully</p>

1358730	5/28/2021	WA	32	M	4/23/2021	5/1/2021	I have been experiencing red, irritated eyes, something which has never occurred before. My eyes look inflamed almost and I've been using basic Visine to make it better and it does make it go away for a little bit but the redness has been coming back. It could be an eye infection but again I take good care of my eyes and contacts and I'm wondering if this is a weird eye allergy side effect from the COVID shot.
1358565	5/28/2021	NY	29	F	4/11/2021	4/22/2021	4/14/21 - noticed right flank pain and some lower right abdominal pain, but dismissed as common side effects. 4/22/21 - woke up with more severe right flank pain and lower right abdominal pain as well as blood in urine. Went to Hospital and was diagnosed with kidney stones (one 3mm and one 4mm on the right side), however the imagine done did not show they had left the kidney. Was discharged same day with ibuprofen (600mg) and Flomax (0.4mg; 7 days). 4/23-5/4/21 - pain continued on and off, spiking severely on 5/4. Blood in urine stopped being visible to human eye on 4/25/21. 5/7/21 Met with Dr. PA, to discuss continuing symptoms. Urinalysis in showed microscopic levels of blood were still present in urine. Sent to get scans and received a script for naproxen sodium (220mg) to take instead of ibuprofen, 5/17/21 - Imaging results from 5/13 (u/s of kidney) and 5/14 (KUB x-ray) confirmed a 6mm triangular calcium stone in the ureter, causing urine to back up into the kidney. 5/26/21 - Underwent a uteroscopy with the intent of a laser lithotripsy to remove the stone, however noticeable bacteria was present, so instead a stent was implanted and the kidney stone was left alone as to prevent sepsis. Sent home with flomax (0.4mg; 30 days and Cipro (500mg, 2x/day, 5 days) and told to take advil/aleve and tylenol for pain. Tentatively scheduled to go back in to remove the stent and the stone in early June.

1358727	5/28/2021	MO	51	F	3/13/2021	3/14/2021	1. 24 hours of chills, body aches, fatigue, and low grade fever on the day after my shot. 2. On March 20, 2021 I woke up with swollen lips and face, and hives on my arms, legs and trunk. I also had a cough, watery eyes and itchy throat, like typical allergy symptoms. I went to the emergency room and was treated for an allergic reaction. No one, including myself, considered the COVID shot as the reason. The hives were gone within 24 hours, but the other allergy symptoms lasted for one week exactly. They had not gotten any better with a variety of over the counter allergy medications. When I went to my primary doctor for a follow up visit on March 29th all of the symptoms were gone. They were the ones that recommended I sign up with the vaers system, and they suggested the possible/likely connection to the vaccine.
1358854	5/28/2021	ME	49	F	5/26/2021	5/27/2021	Patient states she woke up the day following her vaccine and had a really bad headache and felt "hungover". Pt. stated her eyes and ear lobes were very red and swollen. She stated her left eye was completely swollen shut. She states her eyes and ear were very puffy and itchy as well.

1358646	5/28/2021	IL	14	F	5/28/2021	5/28/2021	Approximately five minutes after the vaccination, patient became very light-headed and nauseated with loss of vision. She was offered water and hard candy while waiting for the paramedics to arrive. She took a small amount of each, but declined anything else from the store. She seemed to be in significant distress and had difficulty moving to the immunization room where she would be out of view from others in the store. Paramedics arrived and checked her vitals and said those looked ok, so they didn't seem concerned. Patient still seemed very unsteady when leaving, but did say that her vision had improved. Patients were advised to keep a very close eye on her.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1358629	5/28/2021	CT	41	F	5/21/2021	5/21/2021	THE PATIENT CAME TO THE PHARMACY TO BE VACCINATED FOR COVID-19, WITH JOHNSON & JOHNSON, ON FRIDAY, MAY 21, 2021 AT ROUGHLY 2PM. I GAVE HER THE VACCINATION IN HER DELTOID MUSCLE ON HER LEFT ARM. SHE ALMOST IMMEDIATELY COMPLAINED OF DISCOMFORT AND ASKED IF I HAD A COLD PACK. I PROVIDED HER WITH ONE, WHICH SHE USED WHILE WAITING THE 15 MINUTE POST-VACCINATION OBSERVATION TIME. SHE LEFT THE PHARMACY WITHOUT INCIDENT. ONLY A COUPLE HOURS LATER, SHE CALLED THE PHARMACY TO REPORT ERYTHEMA AT AND AROUND THE INJECTION SITE. I DID NOT KNOW AT THAT TIME WHETHER THE ERYTHEMA WAS DUE TO THE COLD PACK OR IF IT WAS A VACCINE-INDUCED RASH, SO I INSTRUCTED HER TO TAKE A DOSE OF ANTIHISTAMINE. AS SHE HAD CETIRIZINE IN THE HOUSE, SHE TOOK THAT. SHE WAS HOME WITH HER HUSBAND. I RECOMMENDED HE KEEP AN EYE ON HER AND IF SHE DEVELOPED ANY ADDITIONAL SYMPTOMS OR WORSENING RASH, SHE SHOULD GO TO THE HOSPITAL FOR EVALUATION. ADDITIONAL SYMPTOMS INCLUDED SWELLING, TROUBLE BREATHING, WHEEZING, CHEST OR THROAT TIGHTNESS, OR HIVES. THOUGH SHE DID NOT EXPERIENCE ADDITIONAL SYMPTOMS, SHE DECIDED TO GO TO UCONN HEALTH CENTER ER IN FARMINGTON. THEY DID BELIEVE THE RASH WAS VACCINE-INDUCED BUT DID NOT FEEL SHE REQUIRED ANY ADDITIONAL TREATMENT AND DISCHARGED HER (I.E., NO EPINEPHRINE). THE PATIENT NOTED THAT HER BLOOD PRESSURE AT THE ER WAS HIGHER THAN "HER NORMAL" AT 152/95. THE FOLLOWING TWO DAYS, THE RASH STAYED THE SAME AND WAS DESCRIBED BY THE PATIENT AS THE "WORST SUNBURN SHE'S EVER HAD". SHE ALSO HAD NORMAL SIDE EFFECTS OF BODY ACHES AND CHILLS/SWEATS. ON MONDAY, 5/24/21, SHE FOLLOWED UP WITH HER PCP. HE AGREED WITH THE HOSPITAL THAT THE RASH WAS VACCINE-INDUCED AND TOLD HER THAT HE DIDN'T WANT HER GETTING ANY COVID-19 VACCINES IN THE FUTURE. HE DID BLOODWORK TO RULE OUT PLATELET ISSUES, WHICH, PER PATIENT, WERE

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							NORMAL; SHE NOTED THAT HER RBC'S AND HEMATOCRIT WERE SLIGHTLY ELEVATED. HER PCP GAVE HER A MEDROL DOSEPAK FOR THE RASH. THE PATIENT IS RECOVERING. I BELIEVE IT IS WORTH NOTING, HOWEVER, THAT THE PATIENT APPLIED THE COLD PACK DIRECTLY TO HER ARM FOR AN EXTENDED PERIOD OF TIME AND DID NOT PROVIDE THIS INFORMATION TO EITHER THE ER OR HER PCP. SHE SENT ME A PHOTO OF HER ARM WHICH SHOWS GENERALIZED ERYTHEMA (THE SIZE OF THE COLD PACK) - THE ONLY PART THAT IS COMPLETELY NORMAL IS THE SKIN BELOW THE BAND-AID. I BELIEVE THE PATIENT CREATED AN ICE BURN BY USING A COLD PACK TOO DIRECTLY, FOR TOO LONG, AND THAT THE UNDER BAND-AID AREA WAS NOT RED BECAUSE IT PROTECTED THE SKIN FROM COLD BURN. I SUGGESTED TO THE PATIENT THAT SHE RUN THIS THEORY BY HER PCP, AS I BELIEVE IT IS IMPORTANT "MISSING INFORMATION", THAT COULD POTENTIALLY CHANGE THE DIAGNOSIS AND ALTER HIS RECOMMENDATION TO AVOID FUTURE COVID VACCINATION. WHETHER OR NOT THE PATIENT CONTACTED HIM AGAIN IS UNKNOWN.
1358622	5/28/2021	CA	65	F	4/5/2021	4/5/2021	Initially the back of my neck was itching. My face burned, my forehead , neck, and shoulders was visually burned. After that any food I ate the burned came back. If I am near sunlight the burns come back same place every time.

1358728	5/28/2021	CA	35	M	5/28/2021	5/28/2021	Patient had fainted after receiving the vaccine and when I came to see him, he was back on the chair. He said he felt faint. I asked if his breathing was alright, his sight and hearing was ok; he said everything was fine, but he still felt faint. Then I saw his eyes closing again and he slouched down on the chair and became unconscious. I helped him onto the ground, where he started shaking, so I rolled him onto his side. He felt clammy. It was a few seconds before he stopped shaking and opened his eyes again. I asked him to stay laying on the ground and asked him again regarding his breathing, heart rate, vision, how he felt. He asked if he passed out again and I told him yes and we're going to keep him on the ground until paramedics arrive. He said he felt better; his breathing and speech was fine, there wasn't any sound of shortness of breath, but he was sweating in cold sweats and he asked us to fan him. He said that he felt better and that he has a big phobia of needles, which his wife who was there, confirmed. He informed me that he's fainted several times at doctor's office and hospitals when they stick a needle in him. When the fire fighters arrived, they spoke to him prepared to get a EKG on him, to which he immediately told them that he doesn't want them to stick any needles in him and he became frightened that the EKG pads were needles. When paramedics came, they determined that they had to take him to the hospital because they said he wasn't able to stand up on his own without falling over and his heart rate was increasing.

1359862	5/28/2021	CO	67	M	3/17/2021	3/18/2021	Moderna COVID-19 Vaccine EUA: patient presented to emergency department with one day of rapidly progressive vision loss in left eye to no light perception and pain with extra-ocular movements, chemosis, and swelling around the eye. Optic disc swelling noted. Patient initiated on steroids, antimicrobials, and antivirals: the later two discontinued when infectious workup negative. Patient discharged on steroids. On follow-up with neuro-ophthamology, patient's left eye remains without light perception. Left optic nerve is pale and right optic nerve is normal. There is no improvement in the right eye and no recovery in the left eye. Patient diagnosed with severe left optic neuropathy consistent with optic neuritis. Steroids discontinued.
1357836	5/28/2021	ME	67	F	3/31/2021	4/2/2021	Neuromyelitis optica (G36.0) sudden change in vision OS and now OU 4-1-21
1359711	5/28/2021	CA	49	F	5/28/2021	5/28/2021	49 y/o female without significant PMH other than anaphylaxis from a dental procedure, who presents to the emergency room with multiple complaints after receiving her second SARS-CoV-2 Pfizer vaccination today at about 3-3:30 PM, lot number not current available. The patient's significant other/boyfriend was driving when he noticed the patient suddenly started to complain of shortness of breath with chest pain and a maculopapular rash which later was followed by expressive aphasia and left hemiparalysis. She received Pepcid, solumedrol and Benadryl for the rash in the ER with improvement. Code neuro was called and TPA was given. Post TPA she was alert and oriented and she could currently write with her right hand and think of the words she has to say. She had associated blurry vision which has resolved after TPA was administered. She also was not able to move her left lower extremity nor her left upper extremity which is also improving to some extent after TPA administration. So far CT/CTA head and CTA neck are negative and she has been admitted for likely acute cerebral vascular accident.

1359009	5/28/2021	VA	54	F	1/1/2021	2/21/2021	Almost one month after my second Moderna Covid 19 vaccination I had what I can describe as prickling sensations in my right side of the face. It resolved in a few days. About two days February 21st 2021, later my head started to hurt towards the front, both sides. Within a day this resolved. The next day a very sensitive tender sensation arrived underneath the arch of my right eye. Blinking, talking or touching this general area was very uncomfortable. I could not lie comfortably on that side of my face given it's sensitivity to fabric against it. On a scale of 1-10 most painful it was a 2 or 2.5 most of the time. Advil did not really help much. I figured it would just resolve on it's own. The pain was stable at no time completely going away. Mid April I decided to see my PCP who referred me to a neurologist. I also started Accupuncture to assist wondering if it was stress related. In fact I've intuitively thought it was a side effect of the inoculation. The neurologist gave me comparing at night I could not take after second night due to pain in my muscles it created. Then he gave me a trial on nortryptaline (pamelor) older SSRI to see if that would help it reduce. I am a week into this medication and it's not really doing much yet. However, I have had history of neuropathy in gyn region when lower receptor site gets triggered/inflamed. Nortryptaline has helped that in many years past. Have also used amytryptraline for same many years prior to that successfully. My neuro had me do a brain MRI also. No problems. My eye doc also saw no problems.
1359004	5/28/2021	CA	27	F	5/27/2021	5/27/2021	Patient reports start feeling shooting through her chest once they inject her with needle, start feeling little dizziness, it was her second COVID vaccine, Moderna, denies chest pain, SOB, palpitations, blurred vision, lightheadedness, swelling of the face, throat or tongue. denies weakness.
1359000	5/28/2021	WA	13	F	5/17/2021	5/17/2021	PATIENT DID EXPERIENCE A REACTION WITHIN 5MINS AFTER VACCINATION WITH PFZIER 1ST SHOT. SHE EXPERIENCED BLURRY VISION, LOSS OF HEARING AND DIZZINESS FOR 15MINS WITH HOT FLASHES. GAVE HER APPLE JUICE AND HAD HER PUT HER FEET UP ON CHAIR. AFTER 20 MINS SHE WAS FEELING FINE AGAIN AND LEFT WITH DAD.

1358078	5/28/2021	CA	33	F	5/27/2021	5/27/2021	Client received her first dose of the Pfizer Covid-19 Vaccine (lot # EW0185 exp. 08/2021) at 14:58. At approximately 15:14 the client walked over to the EMT station. The client was a 33-year-old female alert and tracking with her eyes. The chief complaint was arm numbness. The client stated that she started noticing arm numbness approximately 4 minutes after receiving her first Pfizer vaccination. The client was alert and oriented to person, place, time, and event. The primary assessment revealed that the client's airway, breathing, circulation were intact. The client denied any pertinent medical history such as medications and allergies. The client did not present with any hives, swelling, discoloration, signs, and symptoms of shortness of breath, or other signs of anaphylaxis. The client stated that her arm numbness started gradually and was only present on her inner forearm without any discomfort around the injection site. After the primary assessment was done the client agreed for EMTs to take a set of vital signs in a seated position. Vital signs are as follows: blood pressure 118/84, pulse 70, O2 saturation 99%, respirations 14. After the first set of vital signs was taken, EMT recommended the patient stay an additional 30 minutes for observation and the client consented. However, approximately 5 minutes into observation the client stated that she was feeling better and refused to remain for the remainder of the 30-minute observation. It was recommended that she contact her primary care doctor and received all pertinent information before her next dose. The client was instructed to call 911 if a severe allergic reaction were to occur. The client then departed in a positive disposition with steady gait at 15:20.

1358047	5/28/2021	CA	12	F	5/27/2021	5/28/2021	Client received her first dose of the Pfizer Covid-19 Vaccine (lot # EW0185 exp. 08/2021) at 11:28 AM. The client was brought to the EMT station by lead RN stating that the client was feeling "dizzy?" at 11:46 AM. The client was a 12-year-old female alert and tracking with her eyes and appeared anxious. The client had a chief complaint of lightheadedness. The client stated that she "began to feel lightheaded?" after her initial 15-minute observation had completed. This was the client's first dose of the Pfizer Vaccine and she stated reluctance to receive her first dose. The client denied any allergies and her parents stated that the client had a history of unspecified behavioral disturbances that require her to see a therapist. The assessment revealed no hives, swelling, discoloration, shortness of breath, or other signs and symptoms of anaphylaxis. The client denied a headache or wanting to throw up. The client refused to have her vitals taken by EMT but agreed at 1150 to remain lying down until she felt better. The client was encouraged to drink water while she waited. After 15 minutes and drinking a bottle of water, the client stated "I feel all better" but "I think I'm overthinking this" and stated that she was now experiencing a "headache?". RN asked the client's parents' permission to speak to the client. RN came over to reassess the client and that client finally agreed to have her vitals taken at 1208: 148/84 blood pressure, Pulse 94, 100% O2 on room air, Respirations 16, alert and oriented to person, place, date, and event. The client revealed to RN that she was experiencing anxiety from her vaccination but became much calmer after discussing her concerns further. Client also revealed that she engages in acts of self-harm but has no intent to end her life. The client's last set of vitals at 1216 were 128/76 BP, HR 96, O2 100%, Resp. 16. The client then stated that she was "ready to go?" after her last set of vitals. Lead RN asked to speak to client's mother in private. Lead RN provided mother with crisis hotline. Mother informed lead RN that client was in therapy and already seeking help. The client's parents were instructed to seek emergency care if a significant allergic reaction occurred later in the evening and were provided with all relevant vaccine-related information by RN. The client departed at 1220 in a positive disposition with her parents.

DROP IN BLOOD PRESSURE, FAINTNESS, PROFUSE SWEATING, BLURRED VISION, COLOR DRAINED FROM FACE, NEVER LOST CONSCIOUSNESS. WAS UNABLE TO GET BP DUE TO SMALL SIZE OF HIS ARMS. I HAD TROUBLE LOCATING THE PEDIATRIC CUFF. WHEN EMS ARRIVED THEY TOOK BP AND IT WAS 58/40. EMTS HUNG FLUIDS AND TOOK PT TO EMERGENCY DEPARTMENT. Pt called pharmacy at 8:30p reporting leaving emergency department feeling fine after fluids administered.
1358521	5/28/2021	OK	36	M	3/24/2021	3/25/2021	After vaccine, I had pain around my eye and developed MRSA around my eyes, and I felt "off". I had heart pains, and took a shower and had a heart rate of 130. I took Ativan and felt some better. I thought about going to the ER, but I emailed my doctor instead. He told me to rest. Dr. suggested I go to the ER if I felt worse. I did feel some better after hearing from him. He said he was not to concerned about it, he didn't think it was my heart. He said after I had Covid and the vaccine he wasn't surprised.
1358161	5/28/2021	NM	38	M	5/27/2021	5/27/2021	I nearly fainted. Had about 3 different moments of heart flutters (not sure how else to describe it) My vision was half blackened. I was light headed and had a little bit of breathing weirdness. It probably only lasted about 2 minutes. I laid down and all symptoms went away in about a minute. The only other time I fainted in my life it was from seeing blood shoot out of my body but it wasn't accompanied by heart flutters.
1358460	5/28/2021	TX	54	F	5/27/2021	5/28/2021	Hallucinations and severe room spinning, eye rolling, Hallucinations were in middle of the night, the spinning, eye rolling, nausea were at 6:30 am till noon

1358303	5/28/2021	FL	72	F	5/10/2021	5/19/2021	After the first dose, I had the usual tiredness and sore arm, I took Tylenol for the arm. Two days later, I had an episode with my Afib being active (the propafenone had been managing this). After my second dose, I had chills, low grade fever, feeling generally sick, all this was normal per CDC. However, on the 19th I woke with full scale Atrial Fibrillation and my blood pressure was elevated. Both kept rising until my BP was 173/108, I was very dizzy and faint. I called 911, who transported me to Hospital ER (because my heart rate was extremely elevated and BP high). My heart rate eventually went back to normal, BP still higher than it should be. For the past week, my BP has fluctuated between being normal to being high. The past two days, it has been normal. The only explanation was a result of the 2nd vaccine as they could find no other problems in doing x-rays of my heart/lungs and blood work. It was a bit scary because high blood pressure affects my kidneys and was the cause of the stroke in my eye last year.
1358519	5/28/2021	CT	31	F	4/26/2021	4/26/2021	I got the vaccine and I experienced very slightly blurry vision 15 minutes after. My vision deteriorated very bad so I couldn't read my phone or laptop in a weeks time. I contacted my primary care 2 days after this happened and she referred me to a Ophthalmologist, and then the Ophthalmologist referred me to a Retinal Specialist who said nothing seems wrong and to use reading glasses temporarily. And so after that I contacted the Optometrist to get the proper glasses because over the counter glasses weren't working well. There has been redness in my eyes so I've been using eye drops for more than a month. I'm nursing and also had the Lasik done 5 years ago because childhood distance vision problem. I used glasses when I was younger and did surgery to stop using them. Since vaccination my near and distance vision got really bad, now the distance is a little better but near is still very bad.

1358394	5/28/2021	CT	23	M	5/28/2021	5/28/2021	About 4 minutes after administering the vaccine patient was sitting down in the waiting area and stated that he was not feeling too good. I immediately went over to him, at which point I noticed he was sweating profusely and stated he felt a little light headed. Less than 1 minute afterwards, he stopped talking and his eyes began to roll back, at which point his upper body began to slide over to once side as if he was going to fall. I immediately caught him, motioned for someone to call emergency services and continued to call him name. He did not respond, was pale and blacked out for about 30 secs. He was still breathing thankfully. When he regain consciousness, he stated that he felt better but he felt some tingling sensation in his forearms bilaterally. Thankfully at this point emergency services were present and upon taking his vitals, realized that his HR and BP were significantly low for someone of his age.

1358387	5/28/2021	IN	48	F	5/28/2021	5/28/2021	The patient let us know that she had had a seizure after the first COVID shot and that she has them after every vaccine. This has happened since she was a little girl. The patient was visibly nervous before the vaccine was administered. During her observation time following the vaccine administration, she let provider know that she could feel her left arm tightening up. Provider provided the patient with an ice pack for her neck to try to calm her down. The patient asked for us to not call a rapid response yet and that "I'm trying to calm myself down." observed the patient's left hand starting to grasp and the patient became tearful so asked the patient if she was okay. The patient stated she was okay. Provider asked her to let her know if she felt like she was going to have a seizure. About a minute later, the patient let provider know she felt one coming. Provider called the RRT as the clinic Team Lead, let the patient know she was going to recline her in the chair she had been vaccinated in. Seconds after the chair was reclined, the patient's eyes started to roll back in her head and her eyelids started to flutter. Within about 10 seconds, the patient was jerking up and down in the chair. The clinic staff ensured the patient was safe until the arrival of the RRT. As the RRT arrived, the patient's seizure ended. The patient became alert to talk to the team that arrived to the clinic. She refused being seen by the ED. The clinic staff agreed to monitor her vitals until she felt comfortable to leave. After around 30 minutes after the seizure, the patient was in good spirits and stated she would like to stand and see how she felt. The patient stood up and walked around for a moment before saying she was ready to leave. Provider checked the patient out, and she left the clinic.
1358386	5/28/2021	AZ	77	M	4/10/2021	4/1/2021	I was unable to pin down onset of symptoms. Patient was vaccinated on 04/10/2021 and sometime thereafter developed dizziness and double vision. Patient visited his ophthalmologist on 04/22/2021 and was advised to contact his PCP to schedule and MRI to rule out stroke. Patient is insistent that this needs to be reported despite my explanation that his symptoms are probably not vaccine related. I strongly advised patient to see his healthcare provider for further evaluation or go to the ED of local hospital.

1358340	5/28/2021	IL	74	F	3/10/2021	3/31/2021	<p>She got her vaccine, had no reaction. She told them that she had a problem with apples and they made her stay for an additional 30 minutes, and was feeling okay and they went home. Then about 3-4 weeks and she woke up one morning, and her mouth was swollen like she had an overdose of Botox all the way around. Then it seemed like it was moving and half of her lip swelling was gone. She got on Benadryl right away and then she thought maybe she had eaten something that she was allergic to, had some fruit thinking that maybe it was in a container of fruit as that's reaction she had with apples. They called the doctor and he wasn't in, but a NP saw her and she gave her a shot of steroids and put her on the steroid dose pack. It took about 4-5 days and then it started clearing up and it was gone. Then all of a sudden 3 weeks later her face started swelling up, the jaw area was swelling up and it moved around. She went to the ER and was given another prescription for the steroid dose pack and was told to take Benadryl. Then it went away again. Then it started happening another day, her left eye was closing up completely and the eyebrow went all the way up and was swollen. For the first month or so it was in her face. They went to visit some friends in Arizona for a week and she was fine. Then, she started with her forehead swelling and she thought it may have been he sun, but she does not stay in the sun long as she covers her head, this lasted about 2 days and went away. Then they went home and she called him again and said that she had the reaction again on her face and her forehead and the top of her head in her hairline. In between this she saw an allergist and tested her and said that she had no allergy to apples, other fruits and nuts, and informed her that her blood work was fine. Then again, just recently 4 days ago she then broke into a rash, her forehead was rosy and her chest was red and itching. She saw her doctor and he gave her another allergist for her to see and referred her then, but has not seen that doctor yet. The rash seems to be gone at this time, no swelling at this time, but feels terrible. She has had 4-5 outbreaks since the vaccine, and they continue to keep happening, but in different areas every time. She is okay for today.</p>

1354095	5/27/2021	PA	17	F	5/26/2021	5/26/2021	<p>Less than 1 minute after received the shot, patient became clammy and pale while sitting in chair. Her eyes rolled back in her head and her body went slack. Myself (parent) and the nurse who had given the shot braced her on either side while she appeared to fade in and out of consciousness for several minutes (she seemed to occasionally interact with us, mumbling responses to 'yes' or 'no' questions). The nurse did not want to lower her to the floor, but wanted to keep her propped on the chair. Her head kept rolling to the side. At one point, she began to jerk rhythmically. Just as I was about to bring this to the attention of the nurse, the patient returned to consciousness. Patient was moved to a rolling recliner chair and taken to a recovery area where I (parent) did not see her for another 30 minutes as I was receiving my own shot. The chair she had sat in was wet, but it was assumed this was due to sweat (patient had sweated profusely). On the way out of the clinic, noticing a wet stain on the back side of patient's pants, I asked if she had wet her pants (quietly) two separate times. Patient denied it both times. However, upon returning home, patient confirmed that she had wet her pants. Patient was monitored during the evening for similar adverse events ; none noted. Patient ate lunch approximately 1 hour before receiving shot and was given crackers while at clinic. Patient is a well-hydrated individual, and also drank water while on-site. No fever either before or after shot. A slightly elevated BP the next day (135/83). However, patient complained of headache, fatigue, and pain at injection location; elevated BP may be related to headache and/or ordeal from day of the shot.</p>

1353760	5/27/2021	MD		M			<p>COVID-19 PNEUMONIA; WEIGHT LOSS OF 30 POUNDS; DIZZINESS; LEG SWELLING; BLURRED VISION; This spontaneous report received from a patient concerned a 65 year old male. The patient's weight was 148 pounds, and height was 65 inches. The patient's concurrent conditions included arthritis, recurring polychondritis (was on a lot of prescription medications, but did not disclose any particular medications), alcohol user (did not have any alcohol in 6 months, not even beer), and ex-cigarette smoker (was quitting and did not have a cigarette since 25-MAR-2021), and other pre-existing medical conditions included the patient had no drug abuse or illicit drug use. The patient experienced drug allergy when treated with infliximab, recombinant for drug used for unknown indication. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1803609, expiry: UNKNOWN) 0.5 ml, 1 total administered on 25-MAR-2021 for prophylactic vaccination. No concomitant medications were reported. It was reported that a receiving the vaccine on 25-MAR-2021, the patient was subsequently hospitalized for 19 days. He had a fever and started to feel bad the night of the injection. On the morning of 26-MAR-2021 06:30, his chest was hurting bad, had shortness of breath, and a fever of 102.7. His wife called an ambulance because they thought he was having a heart attack and he went to a local hospital where they ruled out a heart attack and gave something to bring the fever down. He checked himself out and came home. It was reported that four hours later, the fever came back, and he felt like he could not get any oxygen into lungs. He went to a hospital in a state, but was transferred to another hospital (in another town) due to insurance. He was in the hospital for 7 days, and was transferred to a different hospital that had better lung doctors for 10 days. He was in 4 hospitals in total. The patient checked himself out of the last hospital even though they wanted to keep him there. While hospitalized, the patient was tested negative for COVID twice. However, the third time he was tested, he was positive on Sunday night, 04-APR-2021. They tested him for the third time, because they were planning do to a procedure on his lungs, but they cancelled procedure after positive result. They had been treating him for pneumonia up until then, and that he was in the hospital</p>

----------	-------	-------	---------	-----	----------	------------	--------------

for 8 days before getting the positive result, though he had all the symptoms. He received full treatment for COVID, and got two intravenous a day for 8 days and received the plasma. The patient also lost 30 pounds while in the hospital. He was originally 153 pounds and went down to 124 pounds. The patient gained most of his weight back now. He had been at home for over a month. It was reported that the patient still required oxygen, but was not on it constantly. Though, if he tried to do anything, he was out of breath, and was not sure how his lungs were going to do in long-term and could not do too much without running out of breath. The patient had all of the symptoms listed on the fact sheet, including: difficulty breathing, fast heart beat (it still remained more than 100 beats per minute, and was typically around 115 beats per minute), dizziness/weakness, shortness of air (still happened), chest pain, leg swelling, pain in abdomen, headache, blurred vision, and bruised spots (still happened). He did not have a bad rash. He had a lot of different doctors helping him. After he was discharged, he had different doctors calling him every day for 2-3 weeks until he told them to stop. He had not seen any doctors in person since discharge. The patient had booked an appointment to see a doctor on 02-JUN-2021. Laboratory data included: COVID-19 virus test (NR: not provided) NEGATIVE, NEGATIVE, Heart rate (NR: not provided) around 115 beats per minute, more than 100 beats per minutes, and Weight (NR: not provided) 124 pounds, 153 pounds. On 25-MAR-2021, the subject experienced pneumonia, and was hospitalized. On 26-MAR-2021, Laboratory data included: Body temperature (NR: not provided) 102.7. On 04-APR-2021, the subject experienced confirmed covid-19 infection. Laboratory data included: COVID-19 virus test (NR: not provided) positive. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient was recovering from weight loss of 30 pounds, and the outcome of dizziness, leg swelling, blurred vision and covid-19 pneumonia was not reported. This report was serious (Hospitalization Caused/Prolonged).; Sender's Comments: V0; 20210545010- COVID-19 VACCINE Ad26.COV2. S – Covid-19 pneumonia. This event(s) is considered unassessable. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There

1353531	5/27/2021	CA	48	F	5/7/2021	5/8/2021	feeling tired/excessively tired; left arm was shaking a lot/left arm was shaky like a heartbeat; knocked her out; sleepy; her left arm was sore/still had some left arm pain; excessive, bad diarrhea; This is a spontaneous report from a contactable consumer (patient). A 48-year-old female consumer patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot Number: EW0170) via an unspecified route of administration, in arm left, on 07May2021 15:00 (at the age of 48-year-old) as single dose for COVID-19 immunization. Medical history included ongoing migraine; patient had another allergic reaction but she wasn't sure what it was from. Her forehead got swollen and she had hives all over her body. It wasn't from medication. Her friend had traveled overseas and brought back Arabian candy and she ate a piece of the candy. Within 20 minutes of eating the candy her eyes started to get itchy and the hives started. Concomitant medication included migraine medicine when she needed but she did not get a migraine with the Covid 19 vaccines and patient declined to provide the name of the medication. The patient previously had allergy to cefalexin (KEFLEX), she got really bad diarrhea when she took cefalexin (happened about 3 or 4 years ago). The patient previous receive the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EP7534), in arm left, on 16Apr2021 14:00 (at the age of 48-year-old) as single dose for COVID-19 immunization, then it was the next day she noticed, on 17Apr2021, her tiredness and her arm soreness, the arm soreness only lasted about 2 days, and the tiredness only lasted for a day. Patient received her second vaccine on 07May2021. She felt ok the day she got the vaccine but the following day (08May2021), she was sleepy and her left arm was sore and she thought that was normal. Then Saturday night, 08May2021, she got really excessive, bad diarrhea. She thought maybe that's part of the vaccine maybe it wasn't. The diarrhea continued into Sunday morning, 09May2021 and she called the appointment center for her primary care doctor. Her arm was sore, she was still feeling tired and her left arm was shaking a lot. She asked the appointment center to notify her doctor. She was supposed to work Sunday night, 09May2021, and she needed a work note. She had been leaving messages at her doctor's office and no one was returning

1353601	5/27/2021	NJ	66	F	5/11/2021	5/19/2021	<p>her calls. She was wanting to know if someone here at Pfizer could help her. She received the second Covid 19 vaccine on 07May2021 and the second Covid-19 vaccine hit her more and knocked her out the following day (08May2021). She was really excessively tired and her left arm was really sore. When she got up she was resting her arm and her left arm was shaky like a heartbeat. She still had some left arm pain but it's improved. Her left arm shaking lasted for about a day and a half. No AE require a visit to emergency room and physician office. No prior vaccinations (within 4 weeks). The outcome of the event "her left arm was sore/still had some left arm pain" was recovering, of other events was unknown.</p> <p>Tingling in face; headache; sneezing; itching; light headness and dizzy; lips swelling; eye swelling; like an allergies; This is a spontaneous report from a contactable consumer (patient). A 66-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EW0173 and expiration date was not reported), via an unspecified route of administration in right arm, on 11May2021 at 10:45 (at the age of 66 years old) as first dose, single for COVID-19 immunization in a hospital. Medical history included stage 3 kidney disease, systemic lupus erythematosus, high blood pressure and thyroidectomy. The patient's known allergies: penicillin. The patient previously took dilaudid and prednisone; and experienced drug allergy. Concomitant medications included levothyroxine sodium (SYNTHROID); hydroxychloroquine sulfate (PLAQUENIL); metoprolol; famotidine and alprazolam (ALPRAZ). The patient was not pregnant at the time of vaccination and did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient was not tested for COVID-19. The patient experienced tingling in face, headache, sneezing, itching, light headedness/dizzy, lips swelling, eye swelling and had like an allergies on 19May2021 at 09:00. This case was considered non-serious and no treatment was given for these events. The outcome of these events was not recovered at the time of report.</p>

1353540	5/27/2021	MN	48	U	4/12/2021	5/3/2021	can't even sleep at night.; couldn't diagnose that the part was either dermatitis or shingles; couldn't diagnose that the part was either dermatitis or shingles; This is a spontaneous report from a contactable consumer (patient). A 48-years-old patient of an unspecified gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2, via an unspecified route of administration, administrated in arm right on 12Apr2021 (Batch/Lot Number: EW0150) at the age of 48-years-old as single dose for covid-19 immunisation. Medical history included Hypothyroid. Concomitant medications included liothyronine sodium (CYTOMEL) taken for Hypothyroid from 2017 to an unspecified stop date; levothyroxine sodium (SYNTHROID) taken for Hypothyroid from 2017 to an unspecified stop date; venlafaxine hydrochloride (EFFEXOR) taken for Hypothyroid from 2017 to an unspecified stop date. The patient previously received the first dose of BNT162B2 ('EW/N 6207', is it E, don't know is it EN or EW) on 20Mar2021 at the age of 48-years-old for covid-19 immunization. Patient had the Covid vaccine on an April 12 and it went three week now and patient just recently started having a reaction and patient went to see my doctor yesterday and they couldn't diagnose that the part was either dermatitis or shingles. The patient had second dose of vaccine on April 12. Last Monday (03May2021), patient started having itchiness on only the right side of upper portion of face. Patient had shot in right arm, patient lymph nodes were enlarged. That's the one thing then second thing was last Monday, patient started this, this itchiness started and right side of nose and over to cheek up to a kind of outside corner of eye and next the itchiness was gone away for that well patient guess eye was still there for cheek portion is done. Now it's from that outside corner of forehead and on scalp and it was so itchy, it's like chickenpox patient mean like patient had to take two Benadryl every four hours to keep itching it's kind of that pain but patient do have some red spots on head but again they couldn't diagnose as shingles, they couldn't diagnose it really yesterday. The only thing patient had done making patient aware, patient could potentially have recurrence of shingles and patient did have that two years ago. Patient was loosing mind, it's so itchy. patient mean patient could even sleep at night. Patient had to put cold tampons on head and it just on right side, it is never

1354234	5/27/2021	MN	66	F	1/26/2021	1/26/2021	<p>move to left side only to right side which was so weird. The patient was just having a really bad reaction, first it was itchininess was on, it went from like the center of patient's forehead nose all the way over to right side. Patient had shot on the right side and it was on nose and cheeks to begin with, just itchy not a rash and now it's moved to forehead and in to patient's scalp and on patient scalp there are little red dots. Patient went on to primary doctor and they can't diagnose it because it didn't look like shingles, the patient was about out of my mind itchy, so bad. The patient was having to take 2 Benadryl's every 4 hours to kind of keep it at bay or a cold compress. Other treatment for the events included Valacyclovir and prednisolone. Valacyclovir 1mg, three times a day for 7 days. Prednisolone 20mg, 3 tablets for first 3 days then 2 tablets for three days, one tablet for three days, half tablet for three days and I am on my second day of that. Tablet, orally. The patient underwent lab tests and procedures which included computerised tomogram (CT) scan: negative on an unknown date, magnetic resonance imaging (MRI): negative on an unknown date. The outcome of the events was unknown.</p> <p>I got my vaccine on 1/26/2021 at 1:00 PM and at around 6:00 PM, I began having an adverse effect. I felt pressure behind my eyes and had trouble visually focusing. The eye pressure felt like a sinus cold, and the lack of visual focus felt kind of like eye strain from being on the computer for a long time. I also had a rash around both of my eyes that felt like I had had a reaction around my eyes from a topical treatment, and I hadn't put anything on my eyes. There were raised, scaly patches on the lids, and there was red, itchy skin around the eyes. I had a headache for a little while, but it went away by 1/27. On 1/27, I still had the eye pressure, lack of visual focus, and itchy eyes. I sent a text to the doctor explaining the symptoms. By the evening of 1/27, I still had not heard from the doctor, so I took Benadryl to help with the itching, and it seemed to help. The symptoms began to diminish after taking the Benadryl, and they were completely gone after 5 days. The doctor sent me cream for the itchy eyes, but I ended up not needing it.</p>

He declines EMS, says he will follow- up with PCP regarding drop of heart rate. His girlfriend picked him up and he went home.
1352758	5/27/2021	CA	56	F	5/14/2021	5/24/2021	I started having hives 10 days after the shot - about midnight. It has been spreading around my body, changing locations, but has now lasted for almost 48 hours. Last night it was around my ears, eyes and mouth, the first night around my bra and panty lines. Today it is affecting mostly my arms and hands. I'm not having any difficulty breathing, but I have noticed that my Raynauds has worsened since I got the shot. It was very bad of course when I had the chills and shakes 12 hours after being vaccinated. I am taking Benadryl and my doctor said she could prescribe me zyrtech so that I can work. I can't wear any clothes because any contact seems to make the hives worse.

1354225	5/27/2021	MO	70	M	2/8/2021	3/26/2021	Pt had moderna on 2/8/21, dose 1 and 3/8/21, dose 2. Was evaluated on 3/26/21 with loss of vision by Dr. neurooph at a different facility. Evaluated by myself 5/21/21. Pt reported to me that although he was able to see in February he noted increased foggy vision that gradually progressed over several weeks until it stabilized. Sx may have started in March. Patient did not correlate to either vaccination. He had an asymptomatic COVID+ test 8/26/20. He was diagnosed with bilateral optic neuropathy on 3/26/21 and had nerve pallor. Lab/imaging noncontributory. Patient sought evaluation with me for add'l work up recs. He reported to me 30# weight loss but reported to Dr 100# weight loss. No work up for weight loss or anemia as of yet. Referred back to Primary for this. Had previously declined colonoscopy. Anemia felt to be 2nd to COPD. Also tobacco use report was variable. Rare to me. Etiologies include post vaccination/ post covid/nutritional/anemia/idiopathic

1354207	5/27/2021	MO	12	M	5/27/2021	5/27/2021	PT was sitting with guardian and started to have seizure like activity for him which consists of audible and visual auras and Right arm twitching. This lasted about 1 min. Once we got him into a dark room he started having slurred speech and Left sided weakness that lasted about a min. He was A&OX1. Pt had a right sided slant in his eyes. His pupils were dilated to a 9 and were equal and non reactive. he became sluggish and kept starring off to the right side. This lasted about 2 mins and 45 sec. His pupils returned to 6 and were equal and reactive and he became less lethargic. He started to complain of a head ache. At 1302 he stated that he stated tapping his face and trying to speak. He began to have a right sided glance again and his pupils dilated to an 9 again and we equal and non reactive. he did not respond to his name. This lasted for almost 2 mins. He then stated he was foggy and his pupils returned back to a 6 and were equal and reactive. He was struggling to find sounds in the room. His Vital signs were initial B/p 138/98 resp 22 HR-78. at 1320 his B/P was 128/68 Resp 20 HR 80. Pt was transported by EMS for medical evaluation by his neurologist.
1354191	5/27/2021	OR	48	M	5/27/2021	5/27/2021	Patient felt faint within 2 minutes of vaccination. His vision went dark. When I walked back into the room he was pale and sweating, but responding to questions from the person he arrived with. His arm twitched a few times and his head rolled to the side for a few seconds. Then he regained consciousness, but momentarily looked confused. The patient has a history of seizures, but has not suffered from one in 10 years. After that, the patient remained alert, but continued to sweat and felt light headed for most of standard wait time post vaccination. After the 15 minute wait period the patient felt more normal and left.

1354187	5/27/2021	CA	37	F	4/17/2021	4/18/2021	4/18/21 - Patient reports waking @ 7 am with fever, chills, severe fatigue. and mental confusion. These symptoms progressively worsened over the course of the day until 9 pm when patient reports developing severe right sided facial pain 10/10 radiating from behind right ear, through TMJ to nose and up into right eye. Pain was accompanied with dystonia presenting as involuntary muscle spasms of the right eye and jaw muscles and progressed to palsy of the right eye. Patient reports fever and malaise subsided 4/19/21 but dystonia and palsy continued along with severe facial pain. Patient reports ibuprofen reduced pain level to 8/10, but pain level prevented patient from sleeping. Patient reports pain, dystonia and intermittent palsy were still present when she reported to our clinic on 5/1/21. After a course of 3 acupuncture treatments, patient reports all pain, dystonia and palsy have subsided.
1354181	5/27/2021	VA	23	F	4/10/2021	5/5/2021	Had shortness of breath, coughing, itchy eyes, runny nose and congestion. Went to get tested at Clinic to ensure it was not COVID-19, doctor there confirmed it was most likely allergies and/or the common cold. Treatment: taking decongestants and painkillers as needed, resolved within a week.
1354165	5/27/2021	NY	21	F	5/26/2021	5/26/2021	Patient apparently passed out while waiting after receiving vaccine. She was sitting in a chair and fell over to her right side. She appears to have had a petit mal seizure. Her pupils were very dilated and it took her several minutes to become fully responsive, although she was unresponsive for just a short period of time. She is a student and the EMS staff who responded to the 911 call reports that she is well known to them, as she has a history of "pseudo-seizures". Patient's BP was 138/84 and SPO2 was 98%. Pt was transported to ED around noon, and was back to the clinic by 1:15 to collect her eyeglasses that had been left where she was sitting.
1354297	5/27/2021	CA	12	M	5/26/2021	5/26/2021	Systemic: Dizziness / Lightheadness-Medium, Additional Details: Extreme lightheadedness, patient said vision went black

1353107	5/27/2021	VA	51	F	4/26/2021	5/14/2021	<p>Bell's Palsy; Soreness in arm; Cries all the time; Can't eat or drink right; Doesn't want to go out in public; Swelling; Redness; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of BELL'S PALSY (Bell's Palsy) in a 51-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 016C21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 26-Apr-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 14-May-2021, the patient experienced BELL'S PALSY (Bell's Palsy) (seriousness criteria hospitalization and medically significant). On an unknown date, the patient experienced PAIN IN EXTREMITY (Soreness in arm), CRYING (Cries all the time), FEEDING DISORDER (Can't eat or drink right), SOCIAL AVOIDANT BEHAVIOUR (Doesn't want to go out in public), VACCINATION SITE SWELLING (Swelling) and VACCINATION SITE ERYTHEMA (Redness). The patient was hospitalized on 14-May-2021 due to BELL'S PALSY. At the time of the report, BELL'S PALSY (Bell's Palsy), PAIN IN EXTREMITY (Soreness in arm), CRYING (Cries all the time), FEEDING DISORDER (Can't eat or drink right), SOCIAL AVOIDANT BEHAVIOUR (Doesn't want to go out in public), VACCINATION SITE SWELLING (Swelling) and VACCINATION SITE ERYTHEMA (Redness) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 14-May-2021, Computerised tomogram: Diagnosed with Bell's palsy. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Treatment included steroids, eye drops, and eye ointment which was given at the emergency room. It was reported that the patient was not taking any prior concomitant medications. The pharmacy where she received her first dose told her she should not get the second dose. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the</p>

1353154	5/27/2021	CO	39	F	1/25/2021	2/6/2021	<p>This is a spontaneous report from a contactable Other HCP (patient, self-reported). A 39-year-old female patient received second dose of BNT162B2 (PFIZER-BIOTECH COVID-19 mRNA VACCINE, Solution for injection, lot number: EL8982 and expiry date was not reported), via intramuscularly, in Arm Left, on 25Jan2021 at 04:45 PM, as a single dose for COVID-19 immunization at hospital. The patient received first dose of BNT162B2 (PFIZER-BIOTECH COVID-19 mRNA VACCINE, Solution for injection, lot number: EK9231 and expiry date was not reported), via intramuscularly, in Arm Right, on 04Jan2021 at 04:45 PM, as a single dose for COVID-19 immunization at hospital. The patient was not pregnant at the time of vaccination. The patient did not receive any other vaccine in four weeks. The patient's medical history included known allergies: mushrooms, Levaquin and cipro, hypertension, and thyroid cancer. The patient received medications Amlodipine, Levothyroxine, and fenofibrate in two weeks. The patient was not diagnosed with COVID-19 prior vaccination. The patient was not tested for COVID-19 post vaccination. The patient reported that in first 36 hrs, she was fine but by 06Feb2021 at 06:00 AM, she had the worst headache ever focused on her left temple. She happened to have an eye exam scheduled for that day and was told that her IOP was 21 in her left eye. She experienced photosensitivity for the following 2 days. Then she ended up in the ER from the headache and pressure she felt in her eye. Her blood pressure was 162/125. She was now 11 days post vaccine and currently still had a headache and experiencing light sensitivity focused in her left temple into her scalp and now had inner ear pain and jaw pain. At times, she felt short of breath as well. The events resulted in emergency room/department or urgent care. The patient received cocktail Compazine, Benadryl and Tylenol as treatment for the event headache. The patient also received unknown treatment for other events. Outcome of the events was not recovered. Follow-up attempts are completed. No further information is expected.</p>

1352781	5/27/2021	AZ	20	F	4/27/2021	5/23/2021	Headache onset 3-4 days after vaccine on 4/27/21. Subsequently developed visual changes (right homonymous hemianopsia/visual field cut) on 5/23/21 and presented to ED, diagnosed with cerebral venous thrombosis (left transverse, sigmoid and internal jugular thrombosis). On initial labs also had thrombocytopenia and mild leukocytosis.
1354213	5/27/2021	MO	25	F	5/27/2021	5/27/2021	SHOT GIVEN AT 9:20AM, DIZZINESS REPORTED WITHIN 10 MINUTES POST VACCINATION. AT APPROX. 9:40 AM PATIENT COMPLAINED OF INCREASED OCCULAR PRESSURE. NO SWELLING WAS NOTED. PATIENT ALERT AND ORIENTED X4, BP 128/82 PULSE 64, RESPIRATIONS 18. PATIENT REQUESTED TO STAY TO BE MONITORED LONGER. PATIENT MADE FOLLOW UP APPOINTMENT WITH PCP.
1354440	5/27/2021	UT	20	F	5/27/2021	5/27/2021	Patient received vaccine and said it was painless. She was accompanied by her mother, shortly in to her 15 minute waiting period her mother approached and said the patient felt light headed. I asked patient to remove her mask and assessed for any swelling of the lips or the face. Patient stated she did not have any issues breathing but felt very faint. Her eyes were very dilated, and she wanted to lay down. So we assisted patient to the floor, called Code White and 911. I stayed with patient as she lay down, she began to recover, but still looked very pale. I continually assessed patient for anaphylaxis, but patient reported no pain in injection site or issues breathing. Paramedics arrived and assessed patient, BP was normal, blood sugar was in the low normal range, paramedics determined that issue was not related to vaccine, but that she was dehydrated and had not eaten, which exacerbated the light headedness.

1353479	5/27/2021	IN	38	M	4/12/2021	4/14/2021	Other weird symptom; runny nose; Fever; cold; cold and flu like symptoms; headache; sinus pressure; Sinus drainage; congestion; nerve shoot through his head down to his arm; tingling sensation that would usually last for less than a second; head or eye movement; head or eye movement; dizziness like the feeling one gets before one passes out; This is a spontaneous report from a contactable consumer (patient). A 38-years-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot Number: ER8737), via an unspecified route of administration, administered in right arm on 12Apr2021 14:00 at age of 38 years as single dose for covid-19 immunisation. Medical history included mystery cough from 2018 and not ongoing, seasonal allergies, used an annuity inhaler for this, ADHD and depression. Concomitant medications included escitalopram oxalate (LEXAPRO) from Sep2020 to Apr2021 for depression; bupropion from Aug2020 to 20Apr2021 for depression; amphetamine sulfate (AMPHETAMINE SALTS) from 2018 and ongoing for attention deficit hyperactivity disorder. Around 14Apr2021, he had cold and flu like symptoms. He said he had headache, and sinus pressure, drainage and congestion. He said he felt dizzy, and he compared his dizziness to a feeling one gets before one passes out. He said it is associated with head or eye movement, and that there was a nerve shoot through his head down to his arm. This was accompanied by a tingling sensation that would usually last for less than a second. He said this reaction lasted for 2 and a half weeks. Patient mentioned that he consulted his physician, and was prescribed with doxycycline, which helped with the relief of his cold and flu like symptoms, as well as the congestion. He said it has been cleared for 5 days now. On 17Apr2021, patient said he had fever with a temperature of 100 F. He was concerned because the fever had not subsided ever since. On 17Apr2021 he had onset of fever which was ongoing. He was struggling to narrow down the choices here. He was grasping at straws trying to figure out if this ongoing fever fits in the realm of rare side effects of Pfizer Covid-19 Vaccine and asked for further information regarding the fever. He later mentioned he also had cold-like symptoms and an other weird symptom. Fever was typically in morning temperature was 100.2 to 100.5 degrees Fahrenheit then got to about 101 degrees

-----------------	--------------	--------------	----------------	------------	-----------------	-------------------	---------------------

Fahrenheit in the afternoon. Cold-like symptoms was for the first 2.5 weeks had headaches, sinus-related symptoms like runny nose, congestion, sinus pressure. He thought the sinus pressure in particular could be associated with the other weird symptom he had. One of patient's sons daycare had a cold going around his class on 14Apr2021; some of the kids went home with colds and fever so he initially chalked this up to that. Otherwise he did not think so. As a kind of cover her but his doctor did prescribe doxycycline which he just finished the last dose so been on that for 10 days at 100mg twice daily. He thought due to that any of the sinus symptoms he had have dropped. He felt cured of those other than fever; only fully recovered completely about 5 days ago (06May2021). Patient had COVID PCR test: First test in Apr2021, probably on 19Apr2021 or 20Apr2021. Not admitted to hospital, no ER visit, but went to hospital that his physician was associated with to have chest x-ray (Nothing notable found) and blood panel (Nothing notable found, didnt lead to anything. Standard blood work nothing notable found. White blood cell-nothing notable found.) done on 24Apr2021. COVID antibody test on May2021 was positive (IgG positive for COVID antibodies, IgM negative, no active COVID). COVID PCR test in Apr2021 and 26Apr2021 was Negative for COVID. AE (virtual visits for the fever) required a visit to physician office. Pfizer Covid-19 Vaccine delayed twice now; was supposed to get second dose on 03May2021 but since had a fever been told he can't. Outcome of event fever was not recovered and the other events was recovered on 06May2021. Follow-up attempts are needed. Further information is expected.

A 28-year-old female patient received bnt162b2 (Pfizer product), dose 2 via an unspecified route of administration, administered in arm left on 06May2021 11:45 (Lot Number: Ew0175) as single dose for covid-19 immunisation. Medical history and concomitant medications were none. No any other medications the patient received within 2 weeks of vaccination. The patient was not pregnant. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The patient previously received first dose of bnt162b2 (lot number: Ew0161) in left arm on 15Apr2021 at 11:30 for covid-19 immunisation. The patient previously took amoxicillin and experienced allergy. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient stayed for 20 minutes after getting the second vaccine and was fine so she headed to work. A total of 40 minutes after vaccine (06May2021 12:25), her vision went in and out while driving down the freeway. At 12:45, she started to shake all over her body and heart began to beat fast like it was going to beat out of chest. Her vision came back blurry and was able to pull over on the side of the freeway and call 911. They took her blood pressure and heart beat, both were high. After 30 minutes her heart beat and blood pressure returned to normal. For the remainder of that day the episodes happened 3 times, but only lasted 2-3 minutes at a time. Two days after (08May2021), her vision was blurry and eyes seemed to move quickly back and forth and she felt weak and had no energy. The adverse events result in Emergency room/department or urgent care. Unknown if treatment received. The outcome of events was recovered with lasting effects.</p>

1353456	5/27/2021	TX	59	M	4/2/2021	4/3/2021	Eyes swollen; big water bags underneath them; It is now worse than it was; This is a spontaneous report from a contactable consumer (patient) . A 59-year-old male patient received initial dose of bnt162b2 (BNT162B2) PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Batch/Lot Number: unknown; Expiration Date: unknown) dose 1 via unspecified route of administered on 02Apr21 as 1st DOSE SINGLE for covid-19 immunisation. The patient medical history and concomitant medications were not reported. On 03Apr2021 the patient experienced eyes swollen; big water bags underneath them eyes swollen; big water bags underneath them was reported as worsened and had been having problems ever since then. The patient did not have any trouble breathing or anything like that and laughs and says he just looks ugly when he looks in the mirror.The patient says that he called about a week ago and was told to go to the Emergency Room. He says he did not do a report at that time. On 03Apr2021, the patient states that his symptoms started on and it was now worse than it was and says he must be allergic to something. The patient was told not to get the second dose of the vaccine due to this reaction. the patient thinks he had Covid virus last year during the summer; he had a cough that would not go away. Caller states he was going to go get medical attention this morning to see if there was anything they could do about the swelling. States he has decided he isn't going to; he was going to tough it out. Also states that he just got done with his mother's funeral service. States she lived a long life. States he just seems to have a lot going on but it was going to all be okay. The patient says his neighbor took the same Covid vaccine and had told the caller to go get it. The patient neighbor didn't have any reaction.The Caller states he was glad he had Benadryl at home. The outcome of the events was unknown. No follow-up attempts are needed; information about lot/batch number cannot be obtained.

1353434	5/27/2021	RI	59	M	4/8/2021	4/13/2021	<p>the shingles on the right side of my face, extending from my right ear down to my chin, and up to my right eye.; This is a spontaneous report from a contactable consumer (patient). A 59-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: ER8729, expiration date: unknown) dose 1 via an unspecified route of administration in the left arm on 08Apr2021 at 13:00 (at the age of 59-year-old) as single dose for covid-19 vaccination at Pharmacy or Drug Store. Medical history included penicillin allergy. The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient was not diagnosed with covid-19 prior to vaccination. Since the vaccination, the patient had not been tested with covid-19. Concomitant medication included VITAMIN D [VITAMIN D NOS]. On 13Apr2021, after five days from vaccination, patient developed the shingles on the right side of my face, extending from my right ear down to my chin, and up to my right eye. He would like to know if it is possible that the Pfizer BioNTech COVID-19 vaccine could have "triggered" the case of shingles of that her husband experienced 5 days after receiving his first dose of the vaccine. Response was that there is no information to suggest that the vaccine causes shingles, shingles was not listed as a commonly reported side effect with the clinical trial participants, this list does not include all possible side effects with the vaccine. Also that they do not have the safety data to speak from since the vaccine has been released to the public. Her wife wanted to know if this was a common thing, Is it from vaccine, if he did get second dose, how soon can he get second dose. she also wanted to know With the Pfizer COVID vaccine, like with the flu vaccine, which has a flu component, does this also have a Covid component in the vaccines. Patient wanted to know wanted to know how soon can he get next COVID shot. Patient's second dose is due on 01May2021. His dermatologist advised he not have second dose. Dermatologist said not to get one on Saturday if the Shingles would clear up. Patient was not sure if he should get it. If so, how soon. Patient also reported that the first vaccine did trigger the shingle's because of whatever in his immune, is he at a higher risk for getting a worse case with second vaccine. Patient received unspecified treatment which was prescribed by</p>

1353109	5/27/2021	MS	78	F	5/11/2021	5/11/2021	<p>This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of ATRIAL FIBRILLATION (In and Out of Rhythms (Atrial Fibrillation).) in a 78-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 003B21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No medical history was provided by the reporter. Concomitant products included DESLORATADINE for Allergy, ASA and APIXABAN (ELIQUIS) for Anticoagulant therapy, LOSARTAN and METOPROLOL for Blood pressure, FUROSEMIDE for Diuretic effect, MACROGOL 400, PROPYLENE GLYCOL (SYSTANE) for Dry eye, FLECAINIDE from 14-May-2021 to an unknown date and CLONIDINE for Heart disorder. On 11-May-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 11-May-2021, the patient experienced ATRIAL FIBRILLATION (In and Out of Rhythms (Atrial Fibrillation).) (seriousness criterion medically significant), HUNGER (Unusual hungry feeling) and BLOOD PRESSURE FLUCTUATION (Fluctuations of Blood Pressure readings). On 15-May-2021, the patient experienced VACCINATION SITE WARMTH (Large, round, red circle, not bright red, warm to touch), VACCINATION SITE ERYTHEMA (Large, round, red circle, not bright red, warm to touch), VACCINATION SITE RASH (Rash in the circle) and VACCINATION SITE SWELLING (Circle 4 inches below the injection site, size of a golf ball). At the time of the report, ATRIAL FIBRILLATION (In and Out of Rhythms (Atrial Fibrillation).), HUNGER (Unusual hungry feeling), BLOOD PRESSURE FLUCTUATION (Fluctuations of Blood Pressure readings), VACCINATION SITE WARMTH (Large, round, red circle, not bright red, warm to touch), VACCINATION SITE ERYTHEMA (Large, round, red circle, not bright red, warm to touch), VACCINATION SITE RASH (Rash in the circle) and VACCINATION SITE SWELLING (Circle 4 inches below the injection site, size of a golf ball) outcome was unknown. 1353360	5/27/2021	FL	71	F	1/28/2021	1/1/2021	little bumps on her head like pimples, pooped up in new area turned into hives; Itching/ she was unable to keep her hands off them and scratching them; This is a spontaneous report from a contactable consumer (patient). A 71-years-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Solution for injection, Batch/Lot Number: EL9263), via an unspecified route of administration, administered in Arm Right on 28Jan2021 13:00 (at the age of 71-years-old) as a single dose, and second dose via an unspecified route of administration, administered in Arm Left on 03Mar2021 (Batch/Lot Number: EN6200) as a single dose for COVID-19 immunization. Patient had vaccination with varicella zoster second dose vaccine rge (cho) (SHINGRIX), via an unspecified route of administration on 31Dec2020 (Batch/Lot number was not reported). Medical history included first dose on 27 or 28Sep2020 for immunisation (as per doctor recommendation). Other medical history information included thyroid disorder, diabetes mellitus from 1963 and ongoing. Patient also had herpes zoster in the year 2011 where her head and arms broke out. She put up with it for weeks not knowing what it was. The doctor told her it was shingles. It was not always painful but itched. The patient also had itching that started in early Jan2021 before she got the Covid-19 vaccine along with little bumps on her head like pimples in mid of Jan2021. Concomitant medication(s) included insulin glulisine (APIDRA) taken for diabetes mellitus from 1985, 20 units or less a day; insulin detemir (LEVEMIR) taken for diabetes mellitus from 2001, 14 units in the morning, 3 units at night; timolol (TIMOLOL) taken for diabetes related (as reported) from an unspecified start date 1 drop each eye daily; levothyroxine sodium (SYNTHROID) taken for thyroid disorder from 1980, 112mcg daily; aspirin [acetylsalicylic acid] (ASPIRIN [ACETYLSALICYLIC ACID]) taken for prophylaxis (stroke prevention and diabetic related) from an unspecified start date, 81mg, takes two daily; metformin hydrochloride, sitagliptin (JANUMET [METFORMIN HYDROCHLORIDE;SITAGLIPTIN]) taken for diabetes mellitus from 1963, 50/1000 in the morning all the concomitant medication were ongoing. On 31Dec2020 she had the second Shingrix vaccine. The itching started in early Jan2021 before she got the Covid-19 vaccine.

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

She felt little bumps on her head like pimples. After which she was unable to keep her hands off them and scratching them, they turned into hives by the of mid Jan2021. A new area popped up two days ago. She thought she was getting shingles again. She had the first dose of the Covid-19 vaccine and from an unknown date it was worse. She had the first dose of the Shingrix vaccine on 27 or 28Sep2020. Originally stated she had the first Shingrix vaccine on 31Dec2020. Clarifies that the second dose was 29Dec2020. She received both doses at CVS. She saw a dermatologist two weeks ago. She had a biopsy on 28Feb2021 and was told that she had hives from something that she had been in contact with. She did not know what to do. The biopsy result was that she had hives and not shingles. The doctor will discuss that further with her at her upcoming appointment. Patient has hives on her head and on the top of her arm. It started around the time of the first Covid-19 vaccine. It got worse after the second dose. She was confused because last Sep2020 she had the first dose of the Shingrix vaccine. She received the second dose in Dec2020. She was told to wait a month after the Shingrix vaccine before she got the first Covid-19 vaccine. She was originally set up to receive the Moderna vaccine. She was told when she arrived that she was switched to get the Pfizer vaccine. She called her Primary Care and was seen over telehealth. The area was mainly on the right side of her head. The primary care provider suggested that she see a dermatologist for a biopsy. Patient provided Janumet as a concomitant medication. She had called that company. She read that you could get browns that causes hives. That happened to her years ago with the first break out. She took Aspirin 81mg, 2 daily. She did not take them for 3 days prior of getting the Covid-19 vaccine because she was afraid it would weaken the shot. She had an upcoming appointment on 11Mar. Patient condition did improve with cream prescribed by the derma. The one thing that works is Benadryl 25mg but it knocks her for a loop and makes her sleepy. There was a lot of stamped on the box and was hard to read. She stated they do not really want you to see it. She was able to provide from the bottle. Lot: KGL0000, Expiry: Jun2022. The outcome of the events was reported as not recovered. No follow-up attempts are possible. No further information is expected.

1353334	5/27/2021	MN	28	F	2/19/2021	3/2/2021	This is a spontaneous report from a contactable other HCP. This 28-year-old female other HCP reported for herself that she received bnt162b2 (BNT162B2, Formulation: Solution for injection), dose 2 via an unspecified route of administration, administered in arm right on 19Feb2021 09:45 (Batch/Lot Number: EL9266) as SINGLE DOSE for covid-19 immunization. Medical history included, hashimoto's, mitral valve prolapse, known allergy, gluten. The patient's concomitant medications were not reported. The patient previously took bnt162b2 for covid-19 immunization (dose number 1, Lot number: EL3247), erythromycin and experienced known allergy: erythromycin. It was reported that, the 11 days (02Mar2021) after she received her second vaccine, she broke out in a full body rash/hives starting around 2:30pm. The rash was around my eyes, chin, ears, arms, armpits, hands, torso, shoulders, back, legs, and thighs. She took benadryl immediately (took one dose at 2:30pm and another dose at 6:30pm). The rash lasted the rest of the day and when she woke up the next morning it was gone. Later that day (03Mar2021), the rash/raised hives came back around 10:30am on my legs, back, right arm, neck, and buttocks. She took Benadryl and prescription steroids again and the rash lasted the rest of the day. The following morning (04Mar201) the rash was gone and has not come back as of today (05Mar2021). The outcome of the events was unknown.No follow-up attempts are possible; information about lot/batch number cannot be obtained.

swelled past her elbow, and she was sick for a few days. Caller does not remember which injection it was, it was whatever injection she had to have to go to school, she was 5 years old. Caller doesn't recall the name of the injection. No prior vaccinations (within 4 weeks). The patient states that she does not take the flu shot or anything like that, ever. Vaccination facility was reported as outside the distribution center in the parking lot. On an unspecified date in Feb2021, the patient experienced My eye started to tear and I went like driving through an allergy attack with the runny eyes and nose, lymph nodes in the neck that made her hard to move her head, I did take a Benadryl for my congestion in the nose and then the eyes and that did not seem to help and she was sneezing; On 26Feb2021, experienced my chest has been beating like a 107 and it is normally like in the 70/Fast heartbeat, sleepy, palpitations; On 01Mar2021, experienced leg cramps; On 03Mar2021, experienced lymph nodes in the neck that made her hard to move her head; On 04Mar2021, experienced Jaw pain up into eye. The report received as, the patient was pleased where she had the injection it didn't have swelling or get red and she does have a history of allergies and her doctor said it was ok to get the shot. The doctor told her, that if she had any eye tearing, nasal drip, or other things like that, to take a Benadryl. Caller waited 12 hours, because her eyes did start to tear, and she was sneezing and so she took a non-drowsy Benadryl, but she waited 12 hours to take the Benadryl, because she didn't want it to interfere. The patient experienced fast heartbeat started in the evening on the same day. Patient also had fast heartbeat yesterday. She reports she had a fast heartbeat; it was in the low 90s, she knows that's not fast for some people, but it was fast for her, and it would come and go like palpitations. Patient does have a machine, her heartbeat was in the 90s, and her chest has been beating like a 107 and it was normally like in the 70s. Caller was in the kitchen when she felt it, so she sat down. The patient reports that she has not experienced the palpitations today. The patient states that she was doing something in the kitchen, she's very active. She normally gets up in the morning and does the breast stroke for 1.5 hours, and patient states that she only got up to the pool once this week, and she didn't stay at the pool long because of the leg cramps. The patient reports she did have a fast

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

heartbeat yesterday. The patient reports that she also started to have a lot of cramps in her legs, which she has never had before in her life. The patient states that 2 days ago, the lymph nodes in her neck must have been swollen, and it hurt so bad last night, she didn't know what to do, she took regular over the counter Tylenol and it did help. The patient states that it's not bothering her today. it's right down the sides of her neck. She looked on the internet for lymph nodes in neck, she knew she had lymph nodes in her neck and it was really, really tight. It was both sides of her neck. It's not as bad today because she couldn't stand it anymore last night so she could take Tylenol. She was to a point sitting in a chair, how could she stretch her neck because it hurt so bad. But this morning she can move it pretty good. She told her husband if it continued that she would go to hospital. She was concerned with if she should get the second shot or not. She was wondering did the first Covid shot cause this. She did take Tylenol this morning, she also reports jaw pain and up into her eyes, that started yesterday, and it has been relieved. She's concerned if she got this with the first shot, could she get it with the second which was scheduled on 19Mar2021, and she was a little doubtful about getting that second shot. The patient states that she was very seriously thinking of not getting the second shot, because she had an awful lot of discomfort with this first shot. The patient states that it wasn't that she was tired, she was just sleepy, she was sleepy on the day she got the vaccine, and then on Saturday, 27Feb2021 she had 3 naps, then on Sunday, 28Feb2021 she had 2-3 naps. Then on Monday, 01Mar2021 she was back to normal. The only things caller was concerned about was if she should get the second shot. She read about not getting the second shot if you had a fast heartbeat. She would call her doctor, but all the doctors are telling people to get the shot. The only reason she got it was because of her husband and his underlying conditions. No specify Antipyretic used around the dates of Vaccination. No relevant tests. The patient underwent lab tests and procedures which included Heartbeat: 107, 90s on 26Feb2021. Outcome of the event lymph nodes in the neck that made her hard to move her head was recovering; events palpitations, jaw pain up into eye recovered on an unknown date; event leg cramps recovered on 03Mar2021 and outcome for

1353180	5/27/2021	NY	87	F	1/21/2021	1/21/2021	headache for 18 days; vision problems where her eyes were glassy; her muscles of her legs the first day bothered her; chills on and off; This is a spontaneous report from a contactable consumer (patient). A 87-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Lot Number and Expiration date was not reported), via an unspecified route of administration, administered in Arm Left on 21Jan2021 as single dose for COVID-19 immunization. The patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Lot Number and Expiration date was not reported), via an unspecified route of administration, administered in Arm Left on an unknown date in 2021 on Thursday at 02:00 PM as single dose for COVID-19 immunization. Patient's medical history was reported as none. The patient concomitant medication included unspecified flu vaccine (NDC/LOT/EXP unknown) on an unknown date at the end of Oct2020. She stated that she was lucky to be so healthy, she was active. An unknown date, after receiving the first dose of vaccine, the patient experienced headache for 18 days; described as the headache was not a pounding headache, it was a sickly headache at the back of her neck, like we would get when had a temperature. She did not had temperature. She also experienced vision problems where her eyes were glassy and bothered her and could not do her reading. The patient also experienced chills which were on and off and her muscles of legs the first day bothered her. The reporter stated that her doctor told her that the cases and deaths of COVID-19 are high and it would be better for her to receive the second dose despite her reactions. The reporter wanted to know if the Pfizer COVID vaccine dosage is weight based. The reporter stated that her friend mentioned that a 400 pound man may be given the same dose, so she wanted to know if the vaccine can be given based on weight. The reporter stated that she was not sure of lot number as it was hand written and says Pfizer COVID-19 LOT EL or EC, 3247. The reporter stated that her brother and two of her friends had the Pfizer vaccine and they do not have any side effects. Therapeutic measures were taken as a result of headache and the patient received treatment with ibuprofen IB tablets (UPC: 09661988088-1, EXP:

1355298	5/27/2021	VA	76	F	4/7/2021	5/9/2021	Had noises in my ears like a clock ticking. I have titinus but this was not a ringing noise. A couple of weeks later I woke up with my right eyelid all swollen and bruised and went to the ER where there they did a CT scan to make sure I didn't have a blood clot and I did not. Also my platelets were in the normal range. It took a good week for the swelling and bruising to go down and the bruising even went down my face somewhat. I had an appointment with my eye doctor and he didn't know why it happened, but may have had something to do with my taking low dose aspirin. I did not have any contusion to the eye and it was not hit by anything.

1355129	5/27/2021	AZ	39	M	2/17/2021	2/26/2021	On 2/17/2021 I received my first dose of Pfizer Vaccination in my left arm. On 2/26/2021, I woke up with a swollen neck and a golf ball sized mass near my lymph node on the left side of my neck. I immediately went to an Urgent Care, who prescribed antibiotics and had an Ultrasound conducted on 3/1/2021, with inconclusive results. On 3/18/2021, I had a MRI of my neck, which resulted in the neck mass being possible malignancy and metastasis (cancer). On 3/28/2021, was admitted to hospital due to neck mass increase in size and symptoms getting worse. CT scan also stated the neck mass as possible malignancy, head and chest were negative. 3/29/2021, hospital conducted an IR biopsy, which resulted in negative for malignancy. 3/30/2021, I was released from hospital. On 4/2/2021, I went to the Emergency Room due to symptoms getting worse. 4/2/2021, had a CT conducted that stated possible malignancy and had a scope of my throat with negative results. On 4/5/2021, hospital conducted an IR Biopsy which resulted negative for malignancy, however favoring inflammation and an abscess. On 4/15/2021, symptoms got worse and fluid was able to be drawn from the neck and sent to the lab, with negative results. On 5/3/2021, surgery was conducted to remove the lymph node and the mass in the neck. Neck Mass was biopsied, was negative for malignancy and negative for infection. On 5/13/2021, hospital Infectious Disease Division, stated the COVID Vaccine could have triggered an immune response, which contributed the issues I was having. On 5/17/2021, Infectious Disease Division conducted more test and blood work for various infections, which all had negative results.
1355395	5/27/2021	OH	57	F	5/18/2021	5/24/2021	Patient asked me to look at her arm after vaccination. Had stated that it was sore at injection site area. Upon visually seeing her arm it appeared to be cellulitis. At that time I asked (co-worker) to please go see her pcp. She scheduled an appointment and started antibiotic for cellulitis later that day.
1355356	5/27/2021	NC	39	M	5/27/2021	5/27/2021	Patient reported losing feeling in extremities and eyes feeling heavy. Gave dose of benadryl and symptoms resolved within 5 minutes.

1355538	5/27/2021	AZ	41	F	5/27/2021	5/27/2021	Patient described reaction to first dose as follows: almost immediately after her first Pfizer COVID injection, she states that she felt nauseous and short of breath, then vomited. Per pt, EMS said her blood pressure was ?through the roof? (no exact vitals given). She was observed for 30 minutes, stated she felt much better and went home voluntarily. At no time was epi administered per patient. Today, patient gave her vaccination history from 4/14/2021, stated that she felt fine today and that she wanted to proceed with her second Pfizer dose. It was determined that there was no contraindication and the vaccine was given at 3pm. Within 3 minutes, patient stated that she was having difficulty breathing and was nauseous. EMS arrived immediately, pt coughed up some sputum, vitals as follows: 144/97 105 98% initial temp 101.7, but pt was in the back of a car with engine off and the warehouse was a little warm. EMS repeated vitals 140/88 100 98%. Pt was able to ambulated out of the car to a chair, eyes closed, but at no time did she appear SOB or in any distress, RR remained 16-18 bpm. Final by 128/88.HR 99 SaO2 99%, blood glucose 140, repeated temperature out of the car 99.1. EMS stated that she appeared to be stable, but pt insisted that she did not feel good, was nauseous and SOB, and that she wanted to be transported to a hospital. Pt taken to Arizona General by ambulance, with stable VS and in NAD, AOX3.
1355309	5/27/2021	GA	50	F	5/21/2021	5/22/2021	Patient had cataract surgery on 5/17/2021 on her left eye. She received her second COVID shot (Moderna) on 5/21/2021. Saturday night she started feeling under the weather. Sunday morning she had cloudy vision in her left eye. Monday her vision was almost completely gone. She was seen by the doctor that did her cataract surgery and he said that the vision loss was due to constricted vessels in her eye and that was caused by the COVID shot. The patient's vision has since fully recovered.

1355286	5/27/2021	FL	68	M	1/24/2021	1/24/2021	He got his vaccine, and had to go from the roof to the parking lot. He was in his car and thought he had put his car in park, but it was in neutral and he hit another car, which he thought he was hit. The gentleman informed him that he was the one that hit him as he had watched him slowly advance to hitting him. He did not know or was aware that he was even moving. He has headaches normally but they have gotten worse since then. He also has motion sickness but has learned to deal with it and get used to the side effects. He also has blurry vision and just not feeling normal. He did go see his PCP and she put him on Meclizine for the dizziness, which works about 50%, but not completely. He did have the 2nd vaccine on 2/22/21 and still had the symptoms, which have stayed since then as well. He then saw his PCP a week ago and she is scheduling for a CT scan to see if he has any blood clots. He did have an aneurysm in his brain 28 years ago and they felt that he would not be able to survive it and deemed that he would be left as a vegetable, but has survived that and does have a little residual headache, but nothing severe. He now is still having these three symptoms that he did not have prior to the vaccine.
1355235	5/27/2021	CA	26	F	5/27/2021	5/27/2021	Reported sleepiness and dizziness 2-3 minutes after vaccine. Eyes closed intermittently, BP 103-110/ 78-82, HR 87-94, O2 sat 97-98% on RA. Patient given juice, crackers, and rested on cot for 30 minutes. Able to walk and stand without dizziness after 30 minutes. Reported feeling 'normal' after observation period.
1355205	5/27/2021	MA	55	F	4/7/2021	4/19/2021	Develop shingles on the head with extreme headache mild rash, did not progress towards eye. Had the shingrix vaccine 4 years ago.
1355159	5/27/2021	IL	12	F	5/27/2021	5/27/2021	Patient stated was having blurred vision and couldn't see. Skin appeared pale, denied trouble breathing, no sign of swelling, rash, shortness of breath, cough. Patient layed down on the floor, with feet elevated. EMTs arrived, evaluated patient, patient began to feel better and was walking around okay.

1356502	5/27/2021	FL	39	F	5/23/2021	5/23/2021	Right after I got home, I was really thirsty and the water I drank didn't taste right. My tongue felt weird and I was excessively thirsty throughout day and night. Monday, I had a fever, body aches everywhere, my skin hurt to the touch and my left arm was very red & swollen and hot to the touch. Tuesday, no fever and my body wasn't as achy, but I still felt weird, my teeth started hurting and I had unquenchable thirst. Wednesday, my gums and tongue were now tingling with a burning sensation. This morning, that burning sensation spread to my lips, face, eyelids, scalp, forearms and fingers. And still excessively thirsty and everything tastes strange still and my mouth feels like I ate a bunch of black pepper. I'm very concerned about this
1356487	5/27/2021	VA	16	F	5/27/2021	5/27/2021	PATIENT EXPERIENCED DIZZINESS, BLURRY VISION, HEARING LOSS AND BECAME SHAKY AND PALE ABOUT 2 MINUTES AFTER GETTING THE VACCINE. SHE WAS STILL SEATED IN THE IMMUNIZATION ROOM AT THE TIME THE ADVERSE EVENT OCCURED. SHE REMAINED SEATED IN THE ROOM FOR ABOUT 20 MINUTES BEFORE FEELING WELL ENOUGH TO LEAVE. SHE WAS GIVEN WATER AND AN ICE PACK.

1356343	5/27/2021	CA	15	M	5/27/2021	5/27/2021	Client received the 1st dose of Pfizer COVID vaccine lot #EW0185 and expiration date 6/24/21 at 5:52PM. Per vaccinator, reports that client was saying, "Wow that was aniclimactic" after getting vaccine. Per vaccinator, she notices within 1-2 minutes client got quiet and then reported "I am not feeling well." Client received vaccine in left deltoid. RN requested PHN 1 to get gravity chair. PHN grabbed gravity chair and asked RN to get BP cuff and pulse ox. PHN arrive to assess client and found client alert and oriented x 4 in chair at 5:53PM. Client was already drinking water given by vaccinator when PHN arrived. Client reports he was experiencing "dizziness and slight shortness of breath." PHN ask client if he thought he was steady enough to switch to gravity chair. Client stood up slowly and sat in the gravity chair. RN 1 asked client if his throat felt tight-client responds- "No" and coached client to take deep, slow breaths. At 5:55PM vitals are: blood pressure: 130/90, pulse: 55 and oxygen: 98%. At 5:57pm client reports no longer feeling shortness of breath. Client is speaking in full sentences and able to answer all PHN questions about chest pain and headache and client reports having neither. At 6pm vitals: blood pressure:125/90, pulse:75, and oxygen:100%. PHN instruct RN to get Lead PHN or Co-Lead. Client reports he has slight dizziness and feels lightheaded and reports that earlier he had blurred vision but now is seeing clearly. At 6:03PM vitals are: blood pressure:160/100, client appears pale and heart rate:140, and oxygen: 100%. Lead PHN arrives to take over assessment and PHN starts calling 9-1-1 at 6:04PM as blood pressure is repeated by co-lead :180/90, oxygen100% and pulse 129 and upon auscultation hears clear lungs and heart palpitations. Client is then reports shortness of breath and dizziness, no headache and no blurred vision. Parent reports that client has a history of asthma but rarely needs inhaler so she does not have it on her and that client recently had been on antibiotics for Gastrointestinal history and a bad cough (not COVID)-all symptoms had been resolved before receiving vaccine. At 6:07pm Vitals: blood pressure: 170/90, pulse:100%; no change in symptoms. At 6:08pm vitals: blood pressure:170/90, pulse: 94, and oxygen: 100%, client reports experiencing tightness in chest and unable to complete breath. Client reports no chest pain. Vitals taken again by RN due to new symptom, blood pressure:

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							122/70, pulse:93 and oxygen: 100%. RN auscultate again and hears palpitations have slowed and lungs clear. At 6:10PM, vitals are blood pressure:124/74 and pulse: 96. Client reports feeling "shaky, tightness on chest" and could not take full breaths. Paramedics assumed care at 6:12pm. Client and parent left on stretcher with paramedics to be transported to Hospital. Tell security that mother is leaving blue pathfinder in parking lot. Security assures he will not tow vehicle.
1356336	5/27/2021	CA	87	F	5/27/2021	5/27/2021	Client received 2nd COVID vaccine of Pfizer (Lot# EW0185 expiration date 06/24/2021). Caregiver of Client asked EMT and EMT to check her blood pressure and her injection site. At 1754, RN responded to this event. At 1754, vital signs are blood pressure 163/84, heart rate 70, oxygen saturation 99%. Client reports she was anxious. RN answered all concerning questions in regards to COVID vaccine. Client reported to have a thyroid disorder, hypertension, high cholesterol. Client reports in taking Levothyroxine, Aspirin, Cilostazol, Amlodipine, Hydrochlorothiazide, Atorvastatin, Lantoprost. RN educated Client about ED precautions and common adverse effects of the COVID vaccine. At 1800, vital signs are blood pressure 162/80, heart rate 72, oxygen saturation 98%. Client reports no chest pain, no shortness of breath, no dizziness, no blurred vision, no headache, no nausea. At 1810, vital signs are blood pressure 160/79, heart rate 72, oxygen saturation 98%. Client reports no new symptoms and that all concerns have been addressed. Client is talking to staff and caregiver. At 1830, Client stood up with no complaints. Client walked out of facility with a steady gait using her cane accompanied by caregiver.

1356505	5/27/2021	CA	40	F	5/27/2021	5/27/2021	Client received the 2nd dose of Moderna COVID vaccine lot #026C21A and expiration date 5/27/21 at 4:08pm. Client's first dose reaction was reviewed by medical team and was approved to receive second dose. Client reports at 4:27pm to vaccinator that she was a little nauseated and dizzy 15 minutes prior. EMT took vitals at 4:28pm: blood pressure: 166/113, pulse: 86 and oxygen: 98%. EMT retook blood pressure and it was 160/110. Client reports she did not want to report because she did not want PHN to call 911. Client reports she still has nausea and dizziness and a mild headache. Vaccinator provides water bottle and offers gravity chair but client declines. Nurse assisted with vitals at 4:35PM: blood pressure: 138/98 and client reports no chest pain, no shortness of breath, mild dizziness, no blurred vision. Client reports her head hurts towards the back and she still feels nauseated. At 4:40PM vitals are: blood pressure: 136/90, pulse: 82 and oxygen:98%. Client reports headache is the same, no chest pain, no shortness of breath, dizziness still present, nausea improving, offer to call paramedics and client declines. At 4:45pm vitals are: blood pressure: 134/96, pulse:83 and oxygen:98%. Client reports no shortness of breath, nausea is improving and dizziness is slightly better. At 4:50pm vitals are: blood pressure: 138/92, pulse:88 and oxygen:98%. Client reports no changes in symptoms. At 4:55PM, vitals are: blood pressure: 134/94, pulse: 88 and oxygen: 99%. Client reports nausea is better, headache feels better and dizziness has resolved. Client walked out of the facility with a steady gait at 5pm.

1356065	5/27/2021	PA	19	F	5/27/2021	5/27/2021	After administration the patient stated that "it felt weird". She moved her arm around a little and said she was afraid to move it too much. A minute later she said she felt like she was going to pass out. She leaned against the wall and her eyes started to close. I noticed that she was starting to break out into a sweat. I asked if she was having trouble breathing, if her throat felt like it was swelling or if she felt nauseous. She said no, just dizzy and really thirsty and asked for some water. I asked again if she was having trouble breathing or was nauseous and she said no, then passed out. I took her blood pressure, which was normal. After a couple of minutes she started to wake up, although not fully, and asked what happened. I told her I had given her a COVID vaccine and asked if she remembered that. She said yes then seemed to pass out again. I then decided to call 911. A minute later the patient woke up. I asked how she was feeling and she said better. After a minute she asked if she could sit up and I said yes, as long as she felt she could. I took her blood pressure a second time. By the time EMS arrived the patient was fully alert, we were having a conversation and she said she felt fine. EMS checked her over but she refused to go to the hospital. I had her sit a few more minutes while I filled out her immunization card. When she left she said she felt completely fine.
1355771	5/27/2021	CA	65	F	5/27/2021	5/27/2021	Patient had shortness of breath, heavy chest, dry cough approx. 20 minutes after being vaccinated. She independently ambulated to assessment area. Vitals @ 1044 BP 162/90, P 104, R 22, O2 SAT 98%. vital signs at 1055 160/90 HR 61 RR 20 O2 sat 98% on room air. EMS called at 1045 and arrived at 1052 to facility. Patient stated her breathing did not feel any worse and declined epi pen. Per EMS, epi pen not recommended at this time. Patient monitored one to one till 1135 with no worsening symptoms. Patient called family and left under supervision of family member. Patient advised to follow-up with PCP.

1355760	5/27/2021	IN	58	F	5/25/2021	5/26/2021	On May 26th, 2021 from 4:30 to 9:00 pm I felt lethargic, my body ached, especially where I have arthritis my neck, thumbs and back, I felt hot inside and low constant headache. After 10:00 pm the headache was severe the pain then accumulated behind both eyes. The pain traveled to the right eye and eventually to the right area below the right temple to the upper right ear area. I could feel the pain moving. This all happened in increments until 5/27/21. The extreme pain subsided around 8:00 am. I felt dizzy and headachy all day. 5/28 I felt much better but very tired and somewhat dizzy off and on.
1355597	5/27/2021	PA	69	F	3/7/2021	3/17/2021	TSH level increased, Hashimotos flare up,.Cervical arthritis flare up causing pain. Need to go to physical therapy. May need steroid injections for neck pain. Constant stomach pains. LPR reflux has returned, unable to control, was under control. Lightheaded,loss of balance, blurred vision, headaches, tingling and numbness right hand and fingers, and right foot. Weight gain, tired, exhaustion. These all started around March 17th and continue to get worse. Vitamin deficiencies.
1355579	5/27/2021	NY	23	M	5/27/2021	5/27/2021	Patient was administered the pfizer covid-19 vaccine 1:24pm. After the vaccine was administered patient went to a designated chair to wait for 15 minutes post-vaccine. Pharmacist monitored patient, noticed patient sitting talking on the phone shortly after vaccine. However, after a couple minutes patient passed out and fell off of chair. After yelling patient's name he came to and did not lose consciousness again. Patient suffered injury on head with a substantial laceration on forehead above eye. Code white was called and patient was given an ice pack and advised to sit for 30 minutes following incident. Asked patient if he would like us to call 911, he refused. He sat with management while an incident report was filled out and while he didn't want us to call an ambulance it did seem as though his mom was going to take him to urgent care to have his cut examined.

1354709	5/27/2021	WA	25	M	5/21/2021	5/21/2021	Pt reported an anaphylactic history to bee stings with his last reaction being in 2017 during his screening. Pt was instructed to wait an additional 30 minutes following his vaccination. Pt was given his vaccine at 1134. Pt reported a sensation of "tongue swelling and chest tightness" at 1139. Pt reported it felt like his past anaphylactic reaction. Pt voice sounded muffled, tongue appeared swollen. Pt self administered 1 adult Epi Pen at 1139 with x1 RN and x1 medic supervision. VS were taken. HR was 107, BP was 137/92, SpO2 was 97%. Lung sounds were clear in the apices and diminished in the bases bilaterally. Periorbital swelling was noted at 1140. 911 was called and an ambulance was dispatched at this time. The pt denied a feeling of nausea, denied dizziness. Pt was alert and oriented x4/4 for the entirety of observation. VS were taken again at 1144. The HR was 97, BP was 131/85, SpO2 was 97%. Last reported oral intake of a "bagel and coffee at 0800". VS taken again at 1147, HR 101, BP 135/86, SpO2 98%. Pt reported a continued feeling of throat tightness, periorbital swelling was increasing. Ambulance arrived at 1154 and was given full report. Paramedic assumed care at 1155. Paramedic team deemed it safe to administer one more dose of epinephrine and transport patient via ambulance to ER. In ER, patient endorses mild chest tightness but denies any shortness of breath, oral pharyngeal edema, difficulty swallowing, wheezing, abdominal discomfort, nausea or vomiting, pruritus, or hives. He was given Benadryl, methylprednisolone, and famotidine while in the emergency department to finish the allergic reaction cocktail. He was observed for a total of 3 hours after his last epi injection and he remained HDS and asymptomatic. He was given a prescription for EpiPen autoinjectors with multiple refills. Patient was advised that he should not receive his second covered vaccination without discussing with his PCM. He was given strict return precautions and patient felt comfortable being discharged home.

1354568	5/27/2021	CO	61	M	3/17/2021	4/22/2021	About 1month afterward starting having facial swelling and tingling from jaw/lips to eyeball on the right side, with eyeball pressue. I also have tingling, numbness, burning to both lower legs from the knee down to the feet. I can have burning and sometimes my feet are freezing at the same time. Lower back pain also. The burning and sensations have gone on for awhile now. Also tinnittis which is currently off the charts with pain, lost 30 lbs as I get so ill from the noise I cannot eat---have nausea when the symptoms are to bad.

1354556	5/27/2021	VT	46	F	4/23/2021	4/30/2021	Developed transverse myelitis. She began to develop numbness in her feet starting 4/30 which worsened over several days. She presented to the emergency department and had a normal CBC, CMP, TSH. Normal vital signs. However on her exam she had decreased but not absent sensations in bilateral lower extremities to the mid calf, lack of positional sense of her bilateral toes. She had a lumbar puncture which showed 160 white blood cells with an 83% lymphocyte predominance but without elevated protein or glucose alteration the numbness found a ascending to just below her breasts at that time she was having no sensory or motor symptoms in her arms, no visual disturbance speech or swallowing difficulty. She was aware of bowel and bladder sensation but unable to sense her self urinating or defecating. She was listing to the left while walking. Her B12 was noted to be low at 232 and she was started on a B12 supplement. She is negative for Covid, RSV, influenza A and B. She also had her cerebrospinal fluid evaluated for IgG and oligoclonal bands. She was after having MRIs of her brain, C-spine, T-spine with and without contrast she was started on Solu-Medrol for 5 days. Imaging had no specific findings suggesting the diagnosis, Dr felt that she likely had some mild myelitis. She did improve with the Solu-Medrol. Since returning home patient has been feeling better but still has some limitations. Still has some limited sensation from her abdomen downward, gait is a little unsteady. The balls of her feet still feel numb, and she is to be very cautious about her footwear and how she walks.

1355119	5/27/2021	MS	26	F	5/27/2021	5/27/2021	15 minutes after receiving the vaccine in the left arm, patient stated that the left side of her face, around her cheek, under her eye was starting to feel numb. I asked about her throat and mouth and said it was fine. i observed her face for any swelling and no swelling was noticable. I watched her for about 1-2 min and asked her again and she said face still and numb. i asked about mouth and throat and this time she stated her mouth/throat were dry and starting to tingle. i asked if she was having trouble breathing and she said no. pt was not wheezing . pt was talking and laughing without problems. i checked her pulse. she had a normal pulse at ~70 bpm. i asked pt if she had someone to drive her if i gave benadryl. she stated that her mom was on her way to pick her up. at that time, 12:32, i gave her a 25mg dose of liquid benadryl. I continued to monitor her and ask how she was feeling. she continued to say the face was numb in same areas and mouth dry and tingles. she continued to talk and laugh without distress, breathing was normal. no labored breathing was evident. her mom and sister arrived at 12:45. with her permission, i reported to her mom the events that transpired. her mom said she would take her straight to dr office but did not tell me which doctor they were going to. pt left walking on her own with no help needed still talking and laughing without any noticeable distress

1355086	5/27/2021	MI	29	F	4/26/2021	4/30/2021	Had fatigue and fever of 102 the two days immediately after the shot (somewhat expected). Starting on that Friday/Saturday April 30/May 1st started feeling allergic with watery eyes, runny nose, headache, extremely tired and low grade fever of 101 with GI issues. It's been almost 5 weeks now and I still have a low grade fever, consistently around 99.8 - 100.8. Today as of the time of this writing (5/27/21) my temp is 101.4. My normal/baseline temperature historically is around 98.5. Along with this consistent fever, I'm now experiencing random muscle spasms and nerve pain throughout my body, something I have never experienced before. This started 2 weeks ago with back pain that turned into roaming muscle/nerve spasms. Last week I started having abdominal pain that lasted for 3 days. Yesterday, the injection site on my right arm started throbbing and continued throbbing until this morning. I've seen a doctor and am having some tests done, but largely this remains a mystery. Before the 2nd shot I was fine, no fever, no muscle/nerve pain, and wasn't nearly as fatigued as I am now.
1355038	5/27/2021	MN	63	F	3/31/2021	3/31/2021	Nerve pain and numbness of lips within 30 minutes of first shot. Second day complete flare up of fibromyalgia. It started to get better at day 16 so I went ahead and got 2nd shot. By next day full flare again that continues to today, 5/27/2021. Exhaustion, extreme muscle pain, weakness, nausea, nerve pain, blurred vision.
1355016	5/27/2021	UT	24	F	5/12/2021	5/12/2021	10-15 min after vaccination pt. c/o throat felt tight and closing, blurry vision, faint/ pale, slow to process cognitive and respond/ Pt. put in supine position/ given Benadryl 50 mg PO with no response. Epinephrine 1mg IM/RD / color improved, shallow, rapid respirations, lung sounds CTA in all lobes. EMS arrived 32 min after covid vaccine given. Pt. transferred to Hospital.

1355009	5/27/2021		42	F	5/23/2021	5/23/2021	Charge nurse called to attend to patient after receiving her second Pfizer vaccine. Family members reported she was anxious since yesterday about receiving her second Pfizer vaccine today. It was reported by patient that she had symptoms of nausea, dizziness and anxiousness today. As per her family same thing occurred with her 1st Pfizer vaccine. She denied any significant Medical hx , other than decreased vision, which she does not take any medication for. Charge nurse and vaccinating nurse, moved her to a private tent to vaccinate her and to be monitored. Charge nurse and myself elevated her feet, and had her take sips of water. Wet cool cloth was applied to the back of her neck. She confirmed she felt better after the cloth. She was left in stable condition with vaccinating nurse. I was called back at 1330, because she felt with SOB and more anxious. She did not have any emesis at any point while she was at vaccination site, and no syncope occurred. She was more relaxed after breathing exercises. She was walked over in stable condition closer to EMT to be monitored closely. Vitals were taken. At this time, she was more relaxed and denied any nausea, headaches, SOB or any other symptoms. Family members continued to give her water and she was able to sustain without any emesis. Pt left with family members at 1400, in stable condition.
1354999	5/27/2021	WI	52	F	2/2/2021	2/2/2021	Patient presented to her primary care provider on 2/11/2021 with right ear pain, numbness on right side of face and head, full feeling on right side of throat and right eye dryness. 1354909	5/27/2021	IN	36	F	4/11/2021	4/27/2021	On 4/27 around 5pm my leg was itchy (right leg), I scratch it and didn't think any thing of it that evening I got into the shower and on my right leg when I got into the shower I had bruising but it was same 5in wide 7in long and I took a picture of it and sent a picture to my doctor through the online portal and let him know what was going. and it look like little spots of blood under my skin , 9:37 was when the picture was sent. 4/28 8:27am my doctor responding back and asked me some question and asked if it was any where else outside of my leg and asked if there was any bleeding or bleed in my urine and then asked if I had got my covid vaccine. I responded that it was only on my right leg and I didn't see any blood in urine or stool but that I had got my vaccine 4/11 she did call me around 10:15am and wanted to walk through some questions and asked about stomach pain and I had been having some pain and diarrhea and he also asked about vision changes and migraines and he said at that point because of the recent concerns with the vaccine he did want me to get checked out considering my history petechiae . He advised me to go to the er because of vaccine induced thrombotic thrombocytopenia (VITT) and he wanted to run some blood test and diagnostics. I arrived at the Medical center around 11am and I was seen by Dr and explained everything that was going and he knew that they were concern about VITT and they ran a CBC, and Estimated Glomerular Filtration Rate, Lypaz, Liver profile, collected urine and did a culture with an analysis and a pregnancy's test, Vitals were normal. the test came normal. All blood work came back normal, platelet count was at 300, urine should a little bit of epithelial cells. They didn't feel like they needed to be concern about the VITT. I was discharged and then told to follow up with my family doctor and have had some communication, they asked that I followed up with a dermatologist and too look at genetics. 4/28 in the evening my left leg closer to my knee also started to itch it also developed a rash looking like strains but not as bad as what was on my right leg. but since then I have not had any more pop ups but I do still itch.

1354908	5/27/2021	NY	78	F	2/22/2021	3/8/2021	2 weeks after 2nd moderna vaccine forehead became numb, then within 2 weeks from that the numbness moved down through left eye,cheek and mouth area - the numbness comes and goes - no changes in cognitive function - still has been occurring occasionally
1354906	5/27/2021	OH	60	F	4/9/2021	5/2/2021	I am 61, received Pfizer-BioNTech Covid Vaccine on 3-19-21, & 4-9-21. On 5-2-21, after doing some gardening, I felt a sharp pain in my right eye resulting in the sclera part of eye becoming red/bloodshot. I saw PCP, then ophthalmologist on 5-5-21, diagnosing it as right sub conjunctival hemorrhage. I did not lose any vision, but as of today, I still have some residual redness in sclera. My younger sister who had the same above vaccine on same above dates, also experienced right eye redness on 5-11-21, stating no trauma to area.
1354970	5/27/2021	FL	52	F	4/21/2021	5/1/2021	My wife and I got the Moderna vaccine on March 24th. About 4 days after the shot, it hit us both very hard. We typically never get sick, but we were both down for about 4-5 days. As a precaution, She got tested for COVID and it came back positive. On April 21st, we got our second shot. Around May 1st, started feeling tingling in her toes. It slowly moved into her feet. As it gradually moved up her legs, we took her for blood work.. While we were waiting for the bloodwork results, she got to where she couldn't walk, so we took her last weekend to the emergency room. They now believe she has Guillain-Barre syndrome. She is currently taking IV treatments to slow / stop the progression. We've been advised to expect a long recovery process. We don't know what caused it. COVID, the vaccine, neither, both. But I wanted to share this info with you in case you know anyone who is tracking or hoping to study rare reactions. We seem to be getting good care, but we're in a relatively small town, and I'm sure they don't have the benefits of the broader field of vision and cases that you no doubt have. So I'm passing this info along, in case you are trying to find rare cases that could ultimately help us and/or others.

1353095	5/27/2021	IL	70	M	12/17/2020	1/1/2021	Blood infection; Sick; Didn't feel good; chilling; Patient received both the doses on same month; This spontaneous case was reported by a physician (subsequently medically confirmed) and describes the occurrence of SEPSIS (Blood infection), ILLNESS (Sick), MALAISE (Didn't feel good) and CHILLS (chilling) in a 70-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 030L20 and 035J202A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Co-suspect product included non-company product ADALIMUMAB (HUMIRA) for an unknown indication. The patient's past medical history included Aortic valve calcification in 2011, Alcohol use (6 bottles beer/week) from 1964 to 2000, Ex-smoker from 1964 to 2015, Eyes red (while on Humira) in 2020, Back surgery in 1996, Open heart surgery in 2003, Carotid endarterectomy in 2006 and Cataract in 2013. Concurrent medical conditions included Diabetes (DIABETES TYPE 2), Blood pressure high, Acid reflux (esophageal), Cholesterol, Plaque psoriasis and Bladder cancer (bladder cancer cells) since 25-Nov-2020. Concomitant products included OMEPRAZOLE for Acid reflux (esophageal), ACETYLSALICYLIC ACID (ASPIRINA) for Anticoagulant therapy, METOPROLOL and LISINAPRIL for Blood pressure high, ROSUVASTATIN for Cholesterol, METFORMIN for Diabetes, PLANTAGO OVATA (METAMUCIL [PLANTAGO OVATA]) for Digestion impaired, HYDROCHLOROTHIAZIDE for Diuretic therapy, NAPROXEN SODIUM (ALEVE) and PARACETAMOL (TYLENOL) for Pain. On 17-Dec-2020, the patient started ADALIMUMAB (HUMIRA) (Subcutaneous) 40MG/0.4ML(40 Milligram, Solution for injection in pre-filled. In January 2021, the patient received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. In January 2021, received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. In January 2021, the patient experienced INAPPROPRIATE SCHEDULE OF PRODUCT ADMINISTRATION (Patient received both the doses on same month). On 12-Apr-2021, the patient experienced SEPSIS (Blood infection) (seriousness criteria hospitalization prolonged and medically significant), ILLNESS (Sick) (seriousness criterion

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

hospitalization), MALAISE (Didn't feel good) (seriousness criterion hospitalization) and CHILLS (chilling) (seriousness criterion hospitalization). On 17-Apr-2021, ILLNESS (Sick), MALAISE (Didn't feel good) and CHILLS (chilling) had resolved. At the time of the report, SEPSIS (Blood infection) outcome was unknown and INAPPROPRIATE SCHEDULE OF PRODUCT ADMINISTRATION (Patient received both the doses on same month) had resolved. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): In April 2021, Catheterisation cardiac: aortic valve calcified (abnormal) Aortic valve calcified. In April 2021, Computerised tomogram: aortic valve calcified (abnormal) Aortic valve calcified. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Treatment for the event included ertapenem for the blood infection. Company comment: This report refers to a case of inappropriate schedule of product administration for mRNA1273, lot# (035J202A and 030L20) with no associated adverse events, however the patient experienced some reaction approximately three months later. Based on available information, there is no clear temporal association between the use of the product and start date of events, a casual relationship was assessed as unlikely related. the patient's advanced age and co-morbidities are strong confounders.; Sender's Comments: This report refers to a case of inappropriate schedule of product administration for mRNA1273, lot# (035J202A and 030L20) with no associated adverse events, however the patient experienced some reaction approximately three months later. 1349708	5/26/2021	NE	59	F	3/17/2021	3/1/2021	1. 3/21 leading up to 3/31 I had a low grade fever that would not go away. 2. 3/31 at 2am, hit with bout of intense nausea which continued through 4/-3. The most intense was 3/31-4/1. 3. 4/3-4/4 my right side under rib cage was screaming in pain Treatment -- went to doctor's office on 4/2 to make sure not covid (tested negative), given a perscription for nausea. Called Dr.'s office and advised to go to Primary Care Physician. Also, advised hot water bottle on organs that hurt. The hot water bottle soothed the intense pain. Had soup when could tolerate it. 4. Went to doctor's office on 4/5 regarding the intense pain on right side. An abdominal Ultrasound was ordered. April 25, 4am, my eye sight went to seeing 1/2 of objects and words, then went to tunnel vision. 1. I saw Primary Physician who referred me to an opthamalogist. 2. Opthamalogist saw nothing wrong with eye -- suggested taking baby aspirin and that there had been a TIA, referred me back to Primary Physician for a referral to Cardiologist / Vascular physician
1350385	5/26/2021	PA	49	F	3/10/2021	4/22/2021	Bells Palsy. Symptoms began on 4/21/2021 with alteration of taste. On 4/22/21, tingling on right side of the face began in the morning. At 2pm unable to talk, face drooping and eye tearing. Went to ER and testing ruled out stroke. Admitted for further observation and testing. Discharged on 4/23 with Prednisone 60mg x 6 days and Valtrex x 6 days

1350481	5/26/2021	NY	28	F	5/26/2021	5/26/2021	Shortly after receiving the 2nd dose of the Moderna vaccine, she was noted rubbing her eyes frequently. The observation RN walked over, and asked what was wrong, and the client stated her vision was blurry. She also reported she did not eat any breakfast this morning and she is approx. 2 months pregnant. Juice and graham crackers were offered and accepted. No improvement noted. Code Blue was activated and EMS was notified. The client also began scratching her upper body and complained of itchiness. EMS arrived and the client was transferred to Hospital via stretcher accompanied by EMS attendees.
1350710	5/26/2021	FL	56	F	4/24/2021	4/25/2021	On April 25, 2021 around 12:40pm I was just sitting at church reading my assignment. After reading it i stood up and in my right eye i was seeing objects. They looked like squiggle lines or worms. I do not see them as much now but the sight in my right eye haven't been the same.
1350287	5/26/2021	NY	40	F	4/30/2021	5/1/2021	Headache along with blurred vision and numbness on left side of face. Has history of migraines, but this was different and has now persisted longer than one week.
1350842	5/26/2021	OH	55	F	5/20/2021	5/21/2021	She got her vaccine, she only had her arm hurting. The next morning it itched where she got her shot and then she started breaking out with a rash that continued to get worse. She went to the doctor today as it was down both arms, on her hands, blotchy with bumps and this morning she started getting spots on her eyelids and the side of her face that started to swell. She saw a NP today who gave her a steroid shot as her right eye was starting to swell shut. Told her to continue taking Benadryl and to take Allegra in-between for the itching and to report this to VAERS. She has been taking Benadryl and the itching, which has helped some but not a lot, but was wearing long sleeves so she wouldn't itch it. She still has a large red circle at the injection site and that's where she initially scratched her arm.

1350802	5/26/2021	NM	18	M	5/26/2021	5/26/2021	18 year old otherwise healthy male, with mild asthma, and history of vasovagal syncope with prior vaccinations, IV's and any type of injection on multiple occasions. He has no history of prior seizures or seizure disorder. He received his vaccine at about 9 AM and walked to our 15 minute observation area. Within 5 minutes of sitting down, he stated he was not feeling well, became unresponsive, and had a series of 3 very brief, witnessed tonic clonic seizure activity, each lasting 5 seconds or less, with only a few seconds between. Following this he was minimally responsive, still sitting up, eyes opened, and only mumbled in response to questions. He was pale, confused, mildly diaphoretic, BP was 119/99 pulse was 61, O2 sat was 96% and resp rate was approximately 20. He was NOT incontinent of stool or urine. He was fully conscious and oriented to person place time and situation within 5 minutes. He soon regained his color and vitals continued to be stable. He does have a history of "low blood pressure" per his report. He was feeling well, but because of the history witnessed seizure activity the decision was made to transport to hospital. He was transported by Ambulance Service to Hospital. Prior to vaccination today was feeling well. He was accompanied by his girlfriend. Diagnosis per supervising MD, was Post vaso-vagal syncope seizure activity. Or seizure activity related to vaso-vagal syncope.

1350733	5/26/2021	AZ	62	F	3/30/2021	4/12/2021	<p>She got her vaccine, it was more painful, she had fever, she spent 2 days just sleeping due to being tired. She felt as if she was "out of it". She was not focused to work on the computer, to do school work and decided to not do that. She is a multitasker and was hard for her to get on her treadmill as she was off balanced and could not do that. She just had a brain fog, memory problems, was off doing her homework and reading things, but the clarity and focus was not there. She knew the answers to her tests, but when she was writing down it was not being written down as the answers in her head and was scoring low on her tests. She was also not sleeping. She has a fit-bit and averaging between 3-1/2 to 4 1/2 hours of sleep. She just felt out of it and this was through the month of April. Then on 5/8/21 she felt like something was in her eye, she had dyed her hair and put eye drops in her eye. She did correlate anything with the vaccine yet. Then Sunday morning (Mother's day), she observed something and was so tired and decided to go back to sleep. Then she woke up and the eye and the face started twisting and was paralyzed on the left side. Her speech was not clear and the automatic thing was to speak slower and it would fix itself, and what was going on. (She had a prior TIA). She thought of a stroke coming to mind, and decided she needed to take action and went to the ER by ambulance. Once she was in the ER, they did an EKG, did CT scan and an MRI to see if there was anything going on for a stroke or sign of a stroke, which there was not according to the paperwork and results. Not felt to be related to her heart either. They diagnosed her with Bell's palsy and sent her results to a neurologist for them to do their assessment. They were relieved that it was not a stroke. She went to the neurologist the following week and felt that there seemed to be some white matter on her CT. She finished the medication that she was given, and was told that he was going to do a phone appointment, and she refused to have that and said that he could not see the differences in her face and the progress over the phone. She was not able to breath out of her left nostril and was getting worse, having pain and wanted to find answers and they did see her in the office. They did EMG's, checked her eyes and said that she was fine, and asked why did it seem that it was getting worse. She felt like her skin was coming off her spine, and feels a pull. He suggested</p>

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

doing an MRI of her spine and her face, and suggested an EMI to see if there was damage to her nerves. She had shingles in the past and was already having difficulties lifting her arm and had suggestions. She also saw her acupuncturist who did not touch her face and did needling on her body and she was able to swallow better, and was informed not to do them on her face. She also had a telemed APT and was OK'd to have acupuncture on her head but again not her face. She was still on the steroids, and had information and paperwork that she had researched and asked him questions to educate her and help her. Her daughters have been doing research and told her that maybe she needed a different neurologist. She called the nurse line at the clinic who advised her to stay where she was and see what he had to offer. She is doing warm towels in the morning and evening and she's able to get some relief and sleep. She finds that her brain is working better and that it is going to take some time for this to heal. She had testing for AVM's during her chemo and she had no indication for that. In November and December 2019, she was really sick with URI and was on breathing treatments and was one step away from pneumonia and was not able to work. She took an antibodies test in March and had antibodies. She then had COVID in her household in December of 2019, but was tested several times and tested negative for that. She was diagnosed with cancer when she hit her head on a cabinet at work, and noticed that she had scarring, which she thought was from chicken pox and shingles. Her chicken pox left scars on her lungs and she did not take medication for that due to driving her kids back and forth to school and not wanting to be under medication effects. The ER followed up with her after telling her that she needed to see a doctor. She went to a cancer center and had biopsies and they lost her specimens at the hospital. She ended up having to get another test and was diagnosed with a very aggressive cancer, and told her she needed surgery. She had laparoscopic thoracic surgery and they removed 3/4 of her lung. She had chemo for 5-6 months, and was antibiotics the entire time due to infections. At one point she was excreting skin from the chemo. They inadvertently found out that a nurse had given other patient's wrong chemo and was fired from being a chemo nurse. She has been under a

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							great deal of stress. Now since doing the warm towels her symptoms are better, the nerve is not as tight. It goes from the top of her brow all the way to her chin on the left side, it goes in sections. It was in the middle first, from there it goes up above and bulges on the top of her brow, and then with warm towels it progresses to a bulge on her face. She can't breath out of her left nostril and uses saline to keep it moisturized. She can blow her nose if she pulls her nose towards the left. She uses the salt water rinses in her mouth as she feels everything is pulling to the right including her neck. She was given a salve from her acupuncturist that has helped as well. She does self pictures throughout the day to see her progress of this process.
1350688	5/26/2021	NJ	65	F	5/26/2021	5/26/2021	PATIENT FELT ODD AFTER APPROX 10 MINS. HER EYES GLAZED OVER AND IT SEEMED AS IF SHE PASSED OUT FOR A FEW MOMENTS. 1350522	5/26/2021	PA	54	M	4/22/2021	4/30/2021	ED Discharged 5/5/2021 - 5/6/2021 (3 hours) Last attending ? Treatment team Acute nonintractable headache, unspecified headache type Clinical impression Headache Chief complaint Triage Note: To ED c/o severe HA behind R ear since being dx w COVID 4/30. Denies cough, dyspnea, fevers. Reporting he has had 1 round of COVID vaccines. Has taken "alieve, tylenol, and advil" w/o relief. Last doses all "early this morning." pt awake and alert in triage. History of Present Illness Patient is a 54 y.o. yo male presenting to the ED with severe headache behind the right ear since 4/30. Patient was diagnosed with Covid at that time and has taken 1 round of the Covid vaccine. He has tried Aleve, Tylenol and Advil without relief. He states that his last dose were all early this morning. Denies any numbness or tingling, visual disturbances, ataxia, photophobia. He has no history of strokes, MI or blood clots. He states that prior to his Covid diagnosis he is otherwise healthy. ED Discharged 5/8/2021 (4 hours) Last attending ? Treatment team COVID-19 Clinical impression Fever Chief complaint Medical Decision Making 54-year-old male who presents today due to uncontrolled fever, diagnosed with Covid on April 30. Symptomatic for about 2 weeks now. On exam appears to be uncomfortable, is febrile and tachycardic, however remaining vitals are stable. Physical exam is also reassuring. Patient not complaining of any chest pain, shortness of breath, lightheadedness. Will provide patient with symptomatic relief including fluids and ibuprofen, if able to improve patient's symptomatology will have him discharged home. His labs also show some slight hyponatremia, he will likely improve from fluids as I believe this is secondary to his diarrhea that he has been having over the last few days. CK also slightly elevated, would likely benefit from fluids. After a single liter of fluids, patient symptoms improved, fever and tachycardia also improved, continues to endorse some generalized weakness, will give second liter of fluid and Tylenol at this time as he is due for this. After receiving a second liter, the patient states that his symptoms have greatly improved at this time, comfortable returning home. I advised the patient that she should take ibuprofen and Tylenol on 6-hour cycles very regularly, he can take it in a pattern where he takes Tylenol followed by ibuprofen 3 hours later followed by Tylenol again 3

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							hours later, as long as he keeps 6 hours in between doses, explained to him that he should not take this any sooner than this however he should be sure to take these regularly as these will help control his fever. Also encouraged him to hydrate appropriately as this will likely prevent him from feeling poorly. He is agreeable with this plan, I provided him with appropriate return precautions.
1350651	5/26/2021	NC	57	F	3/11/2021	3/12/2021	On the day of the vaccine, about 5 hours after, I started feeling fatigue. I felt like I had been awake for 24+ hours. That evening I was watching television, covered with a blanket, and my nose got very cold and tingly. I felt like I was breathing cold air. That did resolve later that evening. The next day I was really fatigued and felt dizzy. I felt this way all day. Later that day I started itching. My head, legs and arms were itching. At 11PM that night I called the Hospital and spoke with a nurse to see what I could take for the itching. I was told that since it was after 24 hours from the injection, I was able to take Benadryl. I had to take it every day for the week. I continued to have fatigue and dizziness for 2 days after receiving the vaccine. My psoriasis was healing and had almost gone away, but 2 days after the injection I had a flare. I stayed in psoriasis and psoriatic arthritis stayed in a flare until around 05/12/2021. I had to receive several steroid injections and B12 injections to calm everything down.

Has appointment with Dermatology & Pulmonolgy. Pictures taken to show dermatologist.
1350576	5/26/2021	MA	41	F	5/17/2021	5/17/2021	Within 2 mins of receiving injection, I experienced full body sweats, deadening of sound, blackness in eyes, lightheaded, unable to hold things in my hands, uneasy stomach, very pale all over, especially face. Talked/deep breathed my way out of fainting. Within 10 minutes all the above symptoms started to lessen. 15 minutes after receiving the injection, the near fainting experience was over and I was comfortable leaving and driving. But the 10 minutes were terrible and I came very close to passing out. My husband experienced the exact same symptoms 2 days later. I will be reporting that immediately following this submission.

1349096	5/26/2021	NJ	71	M	3/24/2021	4/25/2021	<p>Eyesight fading in left eye /; This has caused him great distress; Felt sick; Can't sleep; tinnitus; taking his concentration away/ life has been turned upside down; life has been turned upside down / Felt awful / Felt terrible; This spontaneous case was reported by a consumer and describes the occurrence of VISION BLURRED (Eyesight fading in left eye /) in a 71-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 045b21a and 008b21-2a) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Patients medical history was not provided. On 24-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 24-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 25-Apr-2021, the patient experienced TINNITUS (tinnitus), DISTURBANCE IN ATTENTION (taking his concentration away/ life has been turned upside down) and FEELING ABNORMAL (life has been turned upside down / Felt awful / Felt terrible). In May 2021, the patient experienced VISION BLURRED (Eyesight fading in left eye /) (seriousness criterion medically significant), EMOTIONAL DISTRESS (This has caused him great distress), ILLNESS (Felt sick) and INSOMNIA (Can't sleep). At the time of the report, VISION BLURRED (Eyesight fading in left eye /), TINNITUS (tinnitus), DISTURBANCE IN ATTENTION (taking his concentration away/ life has been turned upside down), FEELING ABNORMAL (life has been turned upside down / Felt awful / Felt terrible), EMOTIONAL DISTRESS (This has caused him great distress), ILLNESS (Felt sick) and INSOMNIA (Can't sleep) outcome was unknown. Patient received both doses of Moderna Covid-19 vaccine and he reported that he has felt terrible, awful and sick for 4 weeks. He cannot sleep and his eyesight is fading in his left eye. This caused him such great distress. He did not give consent for safety to follow up. No treatment or concomitant medication were reported by the reporter. Action taken with mRNA-1273 in response to the events was not Applicable. Company Comment: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. 1348855	5/26/2021	TX	25	F	5/8/2021	5/19/2021	Shortly after the second vaccination shot, I was feeling unwell and had major body aches and headaches for approx 4 days afterwards. I also had the feeling of a sinus infection that would not stop. About 11 days later I woke up with double vision and could not see properly. My left eye was fully dilated and visibly tilted to a different direction than my right. I went to the hospital and they did several tests and are unsure about what exactly is wrong and caused this and say that it is very rare. They shows in the MRI that there is a cavernous angioma in my brain and they think it is causing the eye issues. My other eye also has unusual blurry distance vision. While in the hospital they tried using 2 different steroids that did not seem to work. They discharged me from the hospital and basically just said to wait and they think it might possibly start to get better in a month. I am not sure what to do at this point and I'm worried it may be a result of the vaccine.

1349007	5/26/2021	FL	50	F	3/1/2021		<p>MEDICATION INDUCED COLITIS; RECTAL BLEEDING; RENAL INSUFFICIENCY; MUSCLE TENDERNESS; HEADACHE; NAUSEA; REDNESS AT INJECTION SITE; FEVER; GENERALIZED ITCHY RASH; SWELLING AT INJECTION SITE; DIZZINESS; RINGING IN THE RIGHT EAR; INTENSE MUSCLE/JOINT CRAMPING; JOINT TIGHTNESS; LUMP AT INJECTION SITE; BLOATING; UNABLE TO EAT OR DRINK; HAD POLYP; SMALL INTERNAL HEMMORRHOID; This spontaneous report received from a patient concerned a 50 year old female. The patient's weight, height, and medical history were not reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, and batch number: 1805029 expiry: unknown) dose was not reported, 1 total administered to left deltoid on 14-MAR-2021 for prophylactic vaccination. The patient received Benadryl unspecified (form of admin and route of admin were not reported, batch number: unknown expiry: unknown) dose and frequency were not reported from MAR-2021 for itchy rash. The batch number was not reported and has been requested. No concomitant medications were reported. On 14-MAR-2021, after eight hours of vaccination, the patient woke up with intense muscle cramping which she had anticipated but also had joint cramp. The patient had temperature of 103.5 (unit unspecified) and the patient's right side of face was itching down into under her ears which also started to swell. The patient had a rash on her legs, arms, face and everything was itchy for her. The patient took a diphenhydramine (Benadryl) and then she had headache, dizziness, ringing in the right ear, nausea, and her fever jumped to 104. The patient laid down her head into floor because the dizziness was so bad and she ended up in more muscle cramping. The patient's fever never went away but went down and did not go for about a week and three days; the fever was just hanging out at 100 (unit unspecified) the whole time. The patient's dizziness and ringing was going on and also had GI (gastrointestinal) problems and really bad headache. The patient called a healthcare company and ordered meclizine (Meclizine) but did not specified she administered it or not. On 26-MAR-2021, the patient could not take the stomach pain, cramping, diarrhea, high fever, rectal bleeding and mucousy and bloody stool.</p>

The patient had intense abdominal pain and GI (gastrointestinal) issues after three days of her fever and was taken to ER (emergency room) and was confirmed that the patient had renal insufficiency and medication induced colitis. The patient had colitis and was given with metronidazole (Flagyl), however she had low grade fever, dizziness, ringing in ears, really bad headache and was admitted to hospital on 28-MAR-2021. The patient's CRP (C-reactive protein) was up, lactic acid was elevated, hemoglobin went from 14 down to 12, WBC count elevated, occult blood was positive and also had rectal bleeding, a foggy headache and dizziness feeling. The patient felt something was way off in her body at the side, also had a small orange halo on arm at the injection site which got resolved after four days. The patient had undergone unspecified tests and the results was negative. The patient liver enzymes were too off which was hand in hand with medication induced colitis. The patient had a small internal hemorrhoid and removed a polyp. The patient's heart rate experienced some issues as well. The patient was hospitalized for 6 days. The patient was discharged on 02-APR-2021. The patient had a follow-up with her physician on the next day of this report. The action taken with covid-19 vaccine ad26.cov2.s was not applicable; and action taken with Benadryl unspecified was not reported. The patient recovered from had polyp on MAR-2021, generalized itchy rash on 16-MAR-2021, muscle tenderness on 06-APR-2021, and redness at injection site on 18-MAR-2021, was recovering from ringing in the right ear, rectal bleeding, medication induced colitis, joint tightness, lump at injection site, bloating, swelling at injection site, and small internal hemorrhoid, had not recovered from fever, headache, and dizziness, and the outcome of intense muscle/joint cramping, nausea, unable to eat or drink and renal insufficiency was not reported. This report was serious (Hospitalization Caused/Prolonged, and Other Medically Important Condition). This case is associated with the product quality complaint number 90000176228. This case is a duplicate of 20210429754. Additional information was received from patient on 13-APR-2021. It was determined that Manufacturer Case Number 20210429754 was a duplicate of this case. 1350885	5/26/2021	WY	35	F	4/8/2021	4/8/2021	I had an auto immune response to vaccine - felt numbing in arm right after vaccine; I noticed it going down my arm (the fluid from the injection). Once I left the building, I could feel that my face was numb and having tingling feeling .(Note: My neck sometimes causes me problems due to my pregnancy - before the vaccine - I was having an issue with my neck and that was going down into making my arms feel like they were going numb.) When my face went number, I had a hard time talking well for the next two or three days. My face and jaw were weak; my arms and hands were weak too. It went up my whole arm and on my torso (the numbness) - it was going up and down my body - it wasn't just staying in one place. I went to my mom's place and she gave me some juice. I did feel better when I had some juice but could tell I was having some kind of reaction. I did feel better when I drank the juice and some water. My husband met me for lunch and when I called him, I coughed - and I started seeing things around my eyes like I was going to pass out and I drank more water. I ate (burger) and I did feel a bit better. I was still having these issues with the numbness going from one part of my body to other. I drove home (30 minutes) and did feel a bit better. It felt like I was just "off" and not doing well - noticed I wasn't breathing as well. I noticed my heart was racing. I could feel my heart was having palpitations. I called the doctor for my pregnancy and she could tell I was trying to catch my breath. I was trying to stay calm through all of this and my mind wasn't racing. When I talked to her, she thought I should go to ER, she said I sounded out of breath and my heart was racing. At that point, I was nervous to drive, I was having some kind of vision problems - it was going in and out (like a disorientation). My husband drove me to ER. I drank some water though on the way and I felt better after doing that. I'm really sensitive to any kind of chemicals/drugs - I can be affected easily. (This is still within the first 2 hours after shot.) At ER, I drank more water. They told me not to take the 2nd vaccine at least while I was pregnant. They gave me Benadryl - IV 25 mg. And I felt so much better. Dr told me Benadryl can help with anxiety and with allergic reaction. The fast heartrate did go on for awhile - I did take Benadryl in the middle of the night that night and I had to take Benadryl through the next week or two to help sleep. I kept track of my heart rate because in the

-----------------	--------------	--------------	----------------	------------	-----------------	-------------------	---------------------

morning, I felt like I felt it more in the morning. I checked in with my doctor about it and she told me to watch it. It got up over 100 but it never got to the point that it was dangerous. Numbness finally went away eventually - it lasted about three or four days. My left eye was twitching - it took about three weeks for that to go away. I did get chills that night of the vaccine; I didn't get a fever. I slept - was so tired - I would get the meals for everyone but then take naps and I slept long at night and Benadryl helped with it. I did trip and fall the second or third day after the vaccine - I tripped on something - but I feel like I tripped because I was a little disorientated. I knew I had to be careful and take care of myself because of the symptoms. Four days after I had the shot, I got sick with COVID-like symptoms. Five days later I got a cough. I did not take a COVID test because other members of family tested and didn't have it. Pregnancy history - 6 pregnancies and 4 live births and the first one was a miscarriage. Due date: August 19, 2021

The occurrence of additional non-serious events is detailed below. No medical history concomitant information was provided. On 01-Feb-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) .5 milliliter. In March 2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 26-Mar-2021, the patient experienced BLINDNESS (Eye vision was lost 3 days after the second dose of Moderna vaccine; stopped working by 75%) (seriousness criteria disability and medically significant). On 12-May-2021, the patient experienced DIZZINESS (Every time, she walks now, she feels dizzy). On an unknown date, the patient experienced VISION BLURRED (sees everything cloudy\her vision started getting blurry) and BALANCE DISORDER (She started problem with her balance 3 days later). At the time of the report, BLINDNESS (Eye vision was lost 3 days after the second dose of Moderna vaccine; stopped working by 75%) had not resolved and VISION BLURRED (sees everything cloudy\her vision started getting blurry), BALANCE DISORDER (She started problem with her balance 3 days later) and DIZZINESS (Every time, she walks now, she feels dizzy) outcome was unknown. Concomitant and treatment information were not provided. 1349509	5/26/2021	IN		M		5/1/2021	<p>he's losing thoughts/his eyes didn't focus/his eyes wouldn't engage on what was happening; unable to put words together; tired; confused; changes in his cognitive and mental status; changes in his cognitive and mental status; This is a spontaneous report from a contactable consumer (patient's wife). A 74-year-old male patient received bnt162b2 (BNT162B2), dose 2 via an unspecified route of administration, administered in arm right on an unspecified date (Lot Number: EN6205) as single dose for covid-19 immunisation. The patient's medical history included wears hearing aids, multiple myeloma prior vaccine, and had trouble word finding and hard sometimes to remember names before the vaccines. concomitant medications included a normal list of medications he was taking but, it was lengthy. The patient previously received first dose of bnt162b2 on an unspecified date for covid-19 immunisation and no adverse effect. He did well with both shots, no reactions. The reporter's husband received his second COVID Vaccine and she started seeing changes in his cognitive and mental status on an unspecified date of 2021. He's had issues off and on of really unclear thinking and this week (May2021) he's losing thoughts, and unable to put words together. Symptoms began in early April, he maybe had small incidents in March but nothing that was worrisome. On Saturday of this week (01May2021), the patient could not put words together to make a sentence, and he was very tired. He was still tired even though he slept 12 hours night and he was confused. On 01May2021 in the evening he was off, but was repeating himself, not everything was making sense, but was able to attend baptism of their great nephew. He always sleeps 12 hours at night, but then just sat on couch with eyes shut, his eyes didn't focus and he would respond to his name but his eyes wouldn't engage on what was happening. This went on through 03May2021 by 04May2021. On 04May2021, he was in his chair and could not put words together still. Monday (03May2021) they played "Shut the Box,"- he has a masters degree but was unable to add two numbers that make ten. On Wednesday 05May2021 he went to the emergency room (ER) and they did a brain scan (MRI), extensive bloodwork and a urinalysis, everything came back normal and no sign of TIA or stroke. He had been improving since Wednesday (05May2021) at around 4:30 PM, after</p>

leaving the hospital, he started being able to put words and thoughts together again. On Thursday (06May2021) he was able to play "Shut the Box." She was calling to see if there have been any reports of mental reactions after the vaccines such as memory issues, or cognitive issues. She stated the neurologist was unaware of any neurologic issues following the vaccine. She stated he had no side effects after the vaccine and that she only had mild side effects for one night and then they resolved. She mentioned that her husband also had cancer. Prior to the vaccine the patient was seeing a neurologist for multiple myeloma, that was unrelated to the vaccine. The patient had a discussion with doctor about having a hard time remembering names and words like he used to, his doctor told him that it was typical with aging this was in January or February. Recently, in one instance, the patient handed the caller a pen and paper and asked the caller to put the battery in it. The caller asked the patient which one would it go in and the patient said either one. The patient wears hearing aids, and had for a number of years. He put transmitters in his ear instead of the ear piece. These instances both happened in the earlier part of Apr2021. His issues were still ongoing but, improving. The outcome of events was recovering.

1349636	5/26/2021	CA	70	F	4/1/2021	4/2/2021	Sore arm after the first dose of the Covid Vaccine; Felt Cold after the First Dose of the Vaccine; This is a spontaneous report from a contactable consumer or other non hcp (Patient herself). A 70-years-old non pregnant female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Solution for injection, Batch/Lot Number: ER8734), via an unspecified route of administration, administered in left arm on 01Apr2021 (age at the time of vaccination was 70-years-old) as 1st dose, single for COVID-19 immunization. Medical history included herpes from 1970 to an unknown date. Patient had been treated for Herpes on and off since the 1970s. Patient had undergone 3 surgeries in 2016 for knee revision. Patient had shingles three times in her life and received her shingles vaccine 3 years ago. Family history included that her husband had heart valve replacement in 2016. The patient's concomitant medications were not reported. On 02Apr2021, the patient experienced sore arm and felt cold after the first dose of the vaccine. The outcome felt cold was recovered on 02Apr2021 and sore arm was recovered on an unspecified date in Apr2021. No follow-up attempts are needed. No further information is expected.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1349619	5/26/2021	NH	73	F	3/24/2021		<p>Eye sight was getting worse; Big white spot that comes up on the image and that's not supposed to be there and it was quite large compared to what I have seen since last; This is a spontaneous report from a Pfizer sponsored program COVAX US Support. A contactable 74-year-old female retired nurse (patient) reported that she received second dose of BNT162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EN6204) intramuscular into the right arm on 24Mar2021 (at the age of 73-year-old) at single dose for COVID-19 immunization. The patient had received the first dose of vaccine on 24Feb2021 (lot number EL9266) in the left arm. Concomitant Products included Vitamin C complex as supplement. Patient history included arthritis and had a H-pylori test done recently, because of some gastritis she had, because It was abnormal last year that's why they repeated it this year but she had not gotten the result yet. The patient had a history of a retinal vein occlusion in her right eye, and she had this for about 3 years. She used to go and visit her doctor every 5 weeks, she can only go every 31 days because of Medicare and so she has been going for like 3 years and sometime she needed an injection, sometime I don't. The patient reported that she got her second vaccine dose and the several weeks later she went to her eye doctor to get an injection (further not clarified unspecified product) in her eye and when they did that apparently so her eye sight was getting worse so the result was not good between her injections. She went to get her second Pfizer vaccine injection for Covid and that's was fine. She had a little bit of reaction (Further clarification unknown), nothing big, and then when she went last week she noticed they took picture, computer generated pictures. So, they have to describe and she saw the difference in image from the last time she went in. She looked at all her papers that she had. She got a print out of this picture every month. There was a big white spot that came up on the image and that's not supposed to be there and it was quite large compared to what she has seen since last time. That kind concerned her and it took her a while to think about this. Why had changed so drastically. So, the patient was not sure if that had anything to do with the vaccine or not. The doctor was not sure if that had anything to do with it. When she noticed it, the only thing that was different was that she got the Covid injection the second one. It may</p>

A 60-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in Arm Left on 03May2021 (Lot Number: EW0171; Expiration Date: Aug2021) as 2nd dose, single for covid-19 immunisation. Medical history and concomitant drugs were reported as no. The patient previously received 1st dose, single of bnt162b2 on 12Apr2021 (Batch/lot number - ER8729, Expiry Date: Jul2021) for covid-19 immunisation, and she was fine but then the next day her arm was a little sore if she touched it. Caller stated she just needs to ask a question because she is getting concerned. Caller stated then she went Monday to get the second dose and right after the shot her arm started hurting really bad which is a common side effect and she felt really tired so when she got home she went to bed. Caller stated then she noticed on the side of her face felt like she had Novocaine where she had this tingling and numb feeling on the side of her face, above the eye and on her lip and she was also still sore on her arm on Tuesday. Caller stated then Wednesday she was still experiencing a little bit of this tingling and numb feeling, was exhausted, and her arm was killing her. Caller stated on Thursday she was like ok she is feeling really good and starting to get back to normal. Caller stated and she just wanted to let this DSU agent know she has not been sick with anything not even a cold for over three years so this is not common. Caller stated then last night (was early this morning on 07May2021) she woke up sweating profusely and she could not even move her body it was so sore like she got beat up as it was just like an ache from her head to toes (this was like she had exercised and was really sore like that type of soreness) and also her arm was killing her still and she had a fever of 100. Caller stated she was calling because she is not sure if this is common? By Thursday she started feeling better from tired and made it through the whole day until last night she got really tired again and is</p>

any hang over. He never had neurological issues and it terrified him because could not shake it right away, it lasted for about 15 minutes then it was gone. He asked if that is something that is a side effect that could be concern and should he be worried about it. Caller reports double vision for 15 minutes. He got the shot at about 10 am. This happened after the 2nd shot. He got the second shot on 28Apr2021. Caller confirms his first shot was on 07Apr2021. Double Vision: It lasted for about 15 minutes and he waited until it came back. It was scary. The double visions very disorienting, he couldn't see anything, he could not work, he could not do anything. For the double vision he just waited it out, by shutting his eyes and laying his head down, it did not work the first few moments but then it did. He was a little achy and had a headache after the second shot. He was achy from joint pain. He took Tylenol before he to went bed and the headache went away. After the first COVID vaccine he experienced the worst headache of his life: It was so bad it knocked him to knees he took Tylenol and it went away. Pain at the injections site, pain in his arm: Started right away after getting the 1st shot. He could not put weight on the arm or without feeling a little pain. After 09Apr2021 he did not notice much after that. Caller said he was achy all over after the first shot when mentioning the arm pain. He asked if this is all experimental right. He wants to find out as much as he can because he does not trust anything online or anyone that is why he called the source, which is Pfizer. Online there are reports from people against the vaccine and for the vaccine. Headache after the 2nd vaccine: He was achy, not as bad as the 12th. It went away on 29Apr2021 he took to some Tylenol before he went to sleep on 28Apr2021. and it went away in his sleep. The Tylenol took care of it. Achy and tired, like exhausted after the 2nd shot: Caller reports the event subsided on 01May2021. Gastro Issues: patient reports he had stool that was not fully formed, not diarrhea and not normal but, runny. It was not formed. He is feeling like he has to go after the second shot on 28Apr2021. It has not subsided yet, it is still kind of going right now. He is not rushing to the bathroom every 5 minutes, but its not comfortable, so its improved since the first time, he was very crampy and his stool was liquidy and now it is more solid, it is slightly improving. 1st Pfizer COVID vaccine Lot number:

1349638	5/26/2021	CA	40	F	4/9/2021	4/9/2021	Left arm numbness; hand tingling; left jaw pain; Left side of face and scalp began to burn; Internal tremor of the brain; dizziness; This is a spontaneous report from a contactable consumer reported for herself. A 40-years-old non-pregnant female patient received second dose bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE,; solution for injection, Batch/Lot Number: Er8730 and Expiration date was not reported), via an unspecified route of administration, in right arm (age at vaccination 40-year-old) as 2nd dose, single for covid-19 immunisation and patient received first dose bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE,; solution for injection, Batch/Lot Number: En6208 and Expiration date was not reported), via an unspecified route of administration, administered in right arm on 19Mar2021 09:45 AM for covid-19 immunisation. Medical history included hypervitaminosis, migraines, and prior to vaccination, patient was diagnosed with COVID-19. The patient was allergic to Levaquin. Concomitant medications that patient received within 2 weeks of vaccination included ferrous citrate (IRON [FERROUS CITRATE]). Facility where the most recent COVID-19 vaccine was administered in hospital. Patient did not receive any other vaccines within 4 weeks previous to the COVID vaccine. Prior to vaccination, patient became now not diagnosed with COVID-19. Patient underwent laboratory test which includes nasal Swab Pcr, covid test on 11May2021 and the result was pending. On 09Apr2021 10:00 the patient experienced left arm numbness 5 minutes after injection, hand tingling, left jaw pain. Left side of face and scalp began to burn one day after injection. Internal tremor of the brain and dizziness. Treatment was received for all event as medical supervision from hospital staff. Since the vaccination, the patient was not tested for COVID-19. The outcome of events was not recovered. No follow-up attempts are needed. No further information is expected.

1349523	5/26/2021	OH	65	M	4/13/2021	4/15/2021	<p>This is a spontaneous report from a contactable consumer (patient). A 65-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), dose 2 via an unspecified route of administration, administered in left arm on 13Apr2021 08:15 (lot number: EW0162) at the age of 65 years old, as 2ND DOSE, SINGLE for COVID-19 immunisation. Medical history included PKD (Polycystic kidney disease), hypertension, enlarged prostate, meningioma, swollen retina, and allergies to ace inhibitors. Concomitant medications received within 2 weeks of COVID vaccination included eplerenone; tamsulosin; metoprolol; amlodipine; all taken for an unspecified indication, start and stop date were not reported. Historical vaccination included bnt162b2 on 23Mar2021 at the age of 65 years old for COVID-19 immunization (product=COVID 19, Brand=Pfizer, lot number=ER8732, administration time=08:15 AM, dose number=1, vaccine location=Left arm). The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. According to the patient, he experienced "severe visual distortion starting two days after second shot (15Apr2021 at 08:00 AM). Blurriness and extreme horizontal distortion, with some vertical as well. Letters appeared crooked and having a melting drippy appearance. Straight lines appeared severely crooked. The severe distortion lasted 2 1/2 weeks, however my vision is still blurry in my right eye. All effects were in the right eye." The events resulted in Doctor or other healthcare professional office/clinic visit. Unspecified treatment was given. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. The patient underwent lab tests and procedures which included angiogram: unknown results on 2021, and 3 scans of the eyes: unknown results on 2021. The patient has not recovered from "blurriness/vision is still blurry in my right eye". The patient recovered from "severe visual distortion starting two days after second shot/extreme horizontal distortion, with some vertical as well. Letters appeared crooked and having a melting drippy appearance. Straight lines appeared severely crooked" on May2021.</p>

1352383	5/26/2021	MA	45	M	4/28/2021	5/1/2021	From hospital discharge summary: "45 y.o. right-hand-dominant male who presents with few hours of improving left arm heaviness/left hand cramping in the setting of getting his second Pfizer COVID-19 vaccination in his right arm 3 days ago and 3 weeks of mildly increased exercise/intermittent fasting. The patient reports getting his first Pfizer COVID-19 vaccination on April 7, 2021. Reports some mild symptoms afterwards. Around that same time, the patient reports having a checkup with his primary care doctor that was notable for a cholesterol elevation to 200. This prompted him to try and lose weight including intermittent fasting and increase in exercise, especially for exercises and cardio. The patient reports approximately 20 pound weight loss over the past 3 weeks. 3 days ago, the patient reports getting his second Pfizer COVID-19 vaccination in his right arm. Reports fever (maximum 103 Fahrenheit) and mild headache the subsequent 2 days after the vaccine. Last night, the patient went to sleep on his left side at around 8 PM. He woke up at 4 AM with significant left arm heaviness and left hand cramping. He tried to massage his hand with some slight improvement of the symptoms but otherwise the symptoms persisted. Hence, this morning, he called his PCP, who told him to come into the ER for further evaluation. Here, the patient reports improving left arm heaviness/left hand cramping. He also does report family history of heart attack and an uncle at a similar age and massive heart attack of his grandfather in their 60s. He denies fever, anorexia, unexpected weight change, headache, blurry vision, sinus pressure, cough, hemoptysis, orthopnea, PND, SOB, DOE, chest pain, pleurisy, changes in taste/smell, N/V/D, abdominal pain, flank pain, urinary sx's, genital sx's, black stools, incontinence, absence of flatus, calf pain, leg swelling, numbness/tingling, streaking redness/rash/skin changes, easy bruising. Also, deny history of HTN, DM, smoking, prior MI, prior PCI, prior CABG, prior TIA/CVA, or history of PAD. Further, denies recent trauma/fall, history of cancer, blood thinner use, recent drug use, recent travel, sick contacts, family history of connective tissue disease/congenital aortic anomaly, or family history of similar sx's. --- Hospital Course by Problem # Troponinemia (Likely myopericarditis) The patient has a family history notable for MI and CABG in relatives aged 50-70 on his mother's

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							side. The patient notes that most of these family members were heavy smokers and drinkers, which he is not (never-smoker, rare EtOH, never illicit drugs). His symptoms are notable for L arm heaviness/cramping that began around 8pm on 4/30/21 at 9/10 severity and subsequently was 3-4/10 severity on presentation to ED and is 0-1/10 severity at time of admission to the floor; he has no associated numbness, weakness, coolness, or pallor. His symptoms are non-exertional. He denies CP, SOB, lightheadedness, nausea, jaw pain, abdominal pain, fatigue. He notes that he recently got the second COVID shot in the R arm, and had a post-vaccine course notable for Tmax 103 ~3d ago and 101 as recently as yesterday. His EKG was notable for ST-elevation in II/III/aVF and his troponins were elevated 305 -- > 298 -- > 328. Of note, his CRP was elevated at 69. The patients symptoms and findings could certainly be compatible with atypical ACS and, given the low risk of bleeding associated with heparin, he was treated conservatively upon admission with heparin infusion, metoprolol tartrate 6.25mg q6h, atorvastatin 80mg (he received ASA 325mg in the ED). However, given his recent covid vaccination and elevated CRP and reported fevers, this could also be compatible with myocarditis or other inflammatory etiology. TTE on 5/3 demonstrated preserved EF 55% with no WMA. Given reassuring TTE, a cMRI was ordered to assess for myocarditis vs scar tissue from recent ischemic event. Cardiac MRI on 5/5 was notable for finding consistent with myopericarditis (see below). Aspirin and atorvastatin was stopped on discharge. Patient was discharged with metoprolol 25 mg daily.~~
1350866	5/26/2021	WI	21	F	3/27/2021	4/5/2021	blurred floaters in vision appeared a week or so after vaccination. Went to eye doctor about 3 weeks after vaccination and no cause was found and no treatment was given.
1350869	5/26/2021	WI	44	M	5/18/2021	5/19/2021	the first 36 hours was normal pain with flu type symptoms, now there's vision changes and I had to go to the ER because it was really bothering me. They only helped with the anxiety and did an eye exam. It seemed to have gone away some but now it's coming back and it's like having dirty contacts in and having hypersensitivity to light and dark textures.

1352381	5/26/2021	CA	55	F	5/11/2021	5/11/2021	<p>Client received the 1st dose of Pfizer COVID vaccine (lot # EW0182 and expiration date 5/15/21) at 2:47pm. Client walked over to EMT to report that she was having pain on the opposite arm where vaccine was given and that she would like her blood pressure taken (vaccine given in left arm, pain in right arm). PHN finds patient alert and oriented x 4 sitting in a chair. Client reports she had been waiting 20 minutes in observation. Client reports a history of hypertension. Per client, she was not sure about taking her nifedipine, so she did not take her medication at the regular time. Client states she takes Losartan and took it this morning. Client denies any chest pain, headache, blurred vision, dizziness, or shortness of breath. At 3:14pm vitals: blood pressure:173/103, pulse:60, and oxygen: 98%. At 3:20pm vitals: blood pressure:161/106, pulse:60, and oxygen:99%. Client reports no symptoms. PHN came to speak to client and patient reports she has her medication with her and took it out of her purse. Client thought she should not take medication because she was getting the vaccine. Client also stated when she does not take her medication 160-180 systolic is her regular blood pressure at home. PHN let client know that she should take medication as prescribed. Client took 2nd dose of hypertension medication (Nifedipine) at 3:24pm. PHN recommended client to stay for further observation as blood pressure is high. At 3:25pm vitals: blood pressure:155/94, pulse:63, and oxygen:99%. Client reports no more arm pain on right arm and that "she was a little nervous about the vaccine and that her blood pressure goes up easily.". At 3:30pm vitals: blood pressure:160/99, pulse:66, and oxygen:98%. Client reports she is feeling better and was provided with ER precautions and to notify her provider about her blood pressure readings. Also recommended client eating and taking medication prior to dose #2. Client reports no shortness of breath, no headache, no arm pain, no chest pain, no blurred vision. At 3:38pm, vitals are: blood pressure: 152/99, oxygen:99, and pulse:60. Client reports no symptoms. At 3:44pm vitals: blood pressure: 148/99, pulse: 60 and oxygen: 98%. Client walked out with a steady gait at 3:46PM.</p>

1352365	5/26/2021	CA	52	M	4/6/2021	4/12/2021	Tinnitus in left ear started the Monday after the vaccination, I have also had what I can only describe as "fuzzy brain" indicated by a difficulty concentrating on complex projects. I have also been experience intermittent headaches and pressure in my head. My left eye started watering and feeling irritated.
1352355	5/26/2021	CA	15	M	5/26/2021	5/26/2021	Nurse was giving pt the vaccine and pt was replying to questions well before the injection. After injection, pt rolled his eyes back and head went back. Dad came in and stated that this was normal and that it occurs sometimes from injections. Nurse rubbed pt's back and propped his legs up on a chair. Pt drank water and rested and slowly felt better. After about 20 minutes, pt felt fine and was able to walk out.
1352150	5/26/2021	WA	14	M	5/26/2021	5/26/2021	5/25/21 @ Approximately 12:03 pm, 14 year old Patient fainted while waiting in vaccination waiting area after his first COVID-19 vaccination (Pfizer). Patient stated that he started to have ringing in the ears and some blurred vision. Patient's father instructed patient to lay down on the three chairs in vaccination waiting area. At this time store employee came out to assist patient and patient's father. I (employee) came out to assist moments later when I saw what was happening (I had just finished a consultation with another patient). We elevated patient's legs, put and ice pack under his neck, and called 911. Patient was awake but not very talkative. Patient was very alert and talkative in Clinical Service room at the time of immunization, which was a big change from how he was immediately after fainting. Patient appeared sweaty and pale in color. Patient's blood pressure was taken at 12:09 pm and was 88/51 pulse 53 (patient was still laying down at this time). Respiration rate was 20 breaths per minute. At 12:12 pm blood pressure was taken again as patient appeared more responsive and talking more. His BP was 101/63 and pulse 63. Immediately after second blood pressure reading, EMS arrived and they took over. Patient was responsive and drink water and sitting up at this point. EMS checked patient out and was cleared shortly after. EMS stated that this will not defer patient from getting his second COVID vaccination. Before patient left he was continuing to drink water and was eating some crackers.

1352147	5/26/2021	IL	37	M	5/26/2021	5/26/2021	<p>SHORTLY AFTER RECEIVING VACCINE (APPROXIMATELY 1/2 MINUTE) PATIENT FAINTED. HE SLOWLY SLID OUT OF CHAIR AND I (PHARMACIST) CAUGHT HIM GOING DOWN AND HE LANDED ON HIS LEFT SIDE, ALMOST FACE DOWN. I SHOUTED OUT HIS NAME SEVERAL TIMES, ROLLED HIM ON HIS BACK, AND CHECKED FOR BREATHING. NO BREATH SOUNDS OR CHEST RISING, COULD NOT FIND A PULSE, AND THEN HIS EYES ROLLED UP AND BACK. A STORE CUSTOMER CALLED 911 AND I BEGAN COMPRESSIONS. AT COUNT 20 HE BEGAN TO MOVE AND TRIED TO TALK. STOPPED COMPRESSIONS, AND ROLLED PATIENT ON HIS LEFT SIDE. I WAS ABOUT TO CHECK BLOOD PRESSURE WHEN PARAMEDICS WALKED IN AND TOOK OVER. PARAMEDICS CHECKED VITALS, TEMPERATURE, BLOOD GLUCOSE AND RAN EKG. THEY SAID THEY COULD NOT SHARE RESULTS WITH ME, BUT STATED PATIENT REFUSED TO GO TO THE ER/HOSPITAL. AFTER ABOUT 30 MINUTES PATIENT WALKED OUT OF THE STORE ON HIS OWN.</p>

1352121	5/26/2021	NM	59	F	3/15/2021	3/15/2021	Within 2 minutes and her heart rate was over 112 beats per minute. Also felt dizziness, lightheaded, vertigo, brain fog, tinnitus, rash on upper back, puffy red lips, white spots on the soles of the feet, stomach cramps, had problems forming sentences, had a hard time even trying to call husband, itchy eyes, felt itchy and hot on her injection arm, had difficulty breathing, had to take deep breaths, chills, freezing, headache, tongue started to swell, neck started to swell in the thyroid area, started to feel tired and sleepy, had to get assisted to the bathroom, the walls started to move in. The patient took Claritin 1 hour and a half because they didn't want to give her her epi pen because her heart rate was too high and she is allergic to Benadryl. Stayed at the site for 2 hours, drank a lot of water, couldn't walk and she had to stay in a wheelchair. She said it took around 2 weeks to feel normal. She had spells of feeling dizzy and confused with brain fog for 2 weeks. Felt tinnitus for around 10 days after the vaccine. tinitis lasted 10 days brain fog 2 weeks: didn't know how to figure out how to turn car on. fatigue lasted about 4 weeks white spot on feet went away 2 weeks.
1351906	5/26/2021	TX	70	F	5/15/2021	5/15/2021	Patient received 2nd Moderna shot on 05/15/2021 and started feeling eye pain and believes her glaucoma to be worse now.
1352516	5/26/2021	CA	65	M	2/27/2021	2/27/2021	A few hours after my second shot I got a mild headache, tired, and a bit blurry vision. The next day things got worse with high fever, bad headache, and very tired. The bad side effects went away after 4 days but since then I often feel tired with a mild headache and a little chest pain now and then. Before my vaccination, I played tennis 3 times a week, each time I played about 2 to 3 hours continuously without feeling tired. But after the vaccination, it takes only 15 to 30 minutes for me to run out of breath so I have to slow down to catch my breaths. My stamina is adversely effected after my vaccination . I'm afraid that I have a case of Myocarditis, a condition similar to Pericarditis, which is an inflammation of tissue surrounding the heart, that caused by the vaccine.

1351041	5/26/2021		60	M	4/21/2021	4/21/2021	Per triage notes on 4/21/21: Pt had his 2nd COVID vaccine today at 0800. At 0900 developed lip swelling. Took two doses of Benadryl and has now developed chest tightness and throat swelling. Per doctor's notes: Patient is a very pleasant 60-year-old gentleman who comes in for evaluation after a possible allergic reaction today, possibly related to a second dose of Pfizer Covid vaccine that he got at 8 AM this morning. About an hour later he started to feel flushed. He felt like his face was warm and his ears were warm. He started to feel like the inside of his mouth had filled with a rubber ball. His tongue felt full and he started noticed progressively that he felt like he was having difficulty swallowing. States that he never actually had any lip swelling, contrary to the triage note, just felt funny in the interior of his mouth. Did feel like his tongue was slightly swollen, both based on the fact that it felt "thick" when he was talking, and on direct inspection, as well. Took 50 mg of Benadryl around the time that his symptoms started, and lay down to nap for a little while. When he woke up he was still feeling like he was having more difficulty swallowing. He also felt like his face was a little bit puffy, prickly under each eye. He also felt like he had a blotchy rash on his chest and upper back, which his wife corroborates. He felt like his chest was a little bit tight and that something was heavy on his chest, though he was not wheezing or acutely short of breath, per se. Took another 50 mg of Benadryl at about 2:15 PM, and presented to the emergency department for further evaluation. Currently still has a little bit of chest tightness and throat tightness. He feels flushed. Symptoms have not worsened, but they have not completely resolved, either. He has had anaphylaxis in the past and has had to be admitted to the hospital. And this was in relation to taking doxycycline, it sounds like. Patient presented again to the ED on 4/22/21 with the same symptoms. He was admitted with anaphylaxis. Per ED notes, also diagnosed with Angioedema, improved. Likely related to second covid vaccine. Cant rule out secondary to Lisinopril.

1351575	5/26/2021	CO	38	F	4/10/2021	4/10/2021	4/10 Vaccination. Within 4 hours I had body aches, fatigue, chills. 4/11 Migraine upon waking up. I took Excedrin. I had been out of my migraine medications. Rested all day. Pattern continued. 4/13 My BP had increased (200/140), racing heart, not well. I went to urgent care. They gave me migraine cocktail. I was having all over global pain and concentrated pain. Lidocaine Q-tips in nostrils as a nerve block to help with pain. The rest of the night I was ok but the next day the migraine was back. The medication was for onset of migraine but it was already there and didn't work. 4/13-4/18 migraine persisted 4/18 contacted PCM. They told me they needed to see me. I was having high BP due to the increased pain per dr. They did the same migraine treatment that day. The BP medication stayed same as they felt it was a migraine issue. They prescribed oxycodone that day. They couldn't give Toradol because I had had within 24 hours. I went home, slept and didn't work for 2 weeks. 4/18,4/21 I went to ER. Repeat of treatments for migraine. Was never fully gone when discharged. The migraine was always there, the night of the 20th I was throwing up, 21st my eyes were twitching and shaking which was new symptoms to my migraine. *This has triggered my history of migraines to flare up again since giving birth to my daughter 4 years ago.
1350899	5/26/2021	PA	31	M	4/20/2021	5/26/2021	After receiving dose 1, the patient developed a low grade fever that lasted 9 days (never more than 100 degrees F). on the 10th day, the patient developed an all over red rash, swollen lips and tongue, and trouble breathing. As patient is non-verbal, the family/caregiver reported that patient was visually uncomfortable. He was taken to a local ED and was admitted for 4 days. treatment at the hospital is unclear, but as of the day of this report, patient is stable, labs and vitals are normal.
1351961	5/26/2021	PA	47	F	3/17/2021	3/17/2021	Pt said after first dose lymph under arm felt swollen and experienced swelling. After receiving 2nd dose 2 weeks later she said her lymph system "blew up". She was in immense pain, had fluid retention and developed fluid blisters, experienced vision impairment and oil glands clogged in eyes, migraines, hair is falling out and fatigue. Patient said doctor gave her high dose steroids. She is still being treated by doctor for this. Still having multiple symptoms and trying to get them under control.

1351201	5/26/2021	CA	57	F	4/13/2021	4/13/2021	<p>She got her 2nd vaccine, the initial adverse reaction seemed like what they show in the movies as narcolepsy. She felt hot and flushed and they took her temp and it was 98.6, her normal temp is 96.8 for years. She could not get out of bed, she could not keep her eyes open, she was sleeping 16 hours a day. She had no strength, she could not walk, her husband had to help her walk. On standing up she was shaky on her legs. She could not step up a step on her porch to come into her house. This lasted almost 4 weeks, and she is still trying to regain her strength. She had a 3:00 PM APT that she missed, and had to reschedule it. She went to the doctor almost a month ago to her Rheumatologist to address the pain and get rid of taking the Tylenol. He did not address her sleeping, her BP yesterday was 180/100. She had rapid weight gain, a nervous wreck, and he was concerned about her BP and he started her on a clinical ketogenic diet and stopped all sugar from her diet and was feeling about 60% better within 3 weeks and lost 19#. She went to her PCP on Thursday 5/20/21 to see if she had any antibodies as she had a severe reaction and her husband was about to unmask to spend time with his unvaccinated grandchildren and have lunch with them, and she was not comfortable at that point in time to have secondary exposure and so she went to get an antibody test to see if she needed to quarantine. They tested her and they found that she has 0 antibodies and she is the first person that they have seen that has 0. She then spoke to the rheumatologist assistant, and said that they are having antibodies tests that are coming back with a 0 due to the pain medications that people are taking. The PCP's office was shocked that she had no antibodies especially after having the 2nd vaccine. She took another antibody test yesterday and sent it back to hospital to see if there was a lab error, and is going to do another test soon and to send to another lab and if that is negative she is going to have to do a lot of research to see what she has to do to get immunity against the virus. Where she lives, they mask and still are using precautions as her state has not opened up as much as other states. She is always fully masked and maintains social distance protocol, which she has done for a year. She feels that OTC Tylenol may have affected the efficacy of the vaccine. The CDC informed her of that after she had been taking the Tylenol. She is quite</p>

1346677	5/25/2021	MN	26	M	5/24/2021	5/24/2021	Received shot and waited for the 15 minutes as required, feeling no good with no symptoms. While driving home after leaving the pharmacy, I started experiencing light headed ness and dizziness. This eventually turned into tunnel vision which I thought was going to result in me fainting. This led me to start pulling over, but then the tunnel vision went away. During my short 10 minute drive home, this happened to me twice. After getting home, I had about 3 similar episodes during which similar light headedness happened. These all felt like they were getting close to fainting, and at one point while walking up the stairs in my house I could not stand. All of these symptoms started approximately 20 minutes after leaving the store, and then took place in a 20-30 minute timespan. Roughly 4-5 episodes in total, including the drive home and short time spent at home. No issues after lightheadedness stopped, besides feeling tired. I do not have a history of anxiety attacks due to needles. Donated blood and plasma in college, and have recieved many vaccines and never had this happen.

1346687	5/25/2021	ME	32	F	5/14/2021	5/17/2021	Burning/blistering rash developed abruptly on left arm, chest, lower legs and right arm that has continued to spread to entire body including lips and inside of nose. Numbness in hands and feet. Notes from all medical visits below. 5/17/2021 Walk-In. Patient present with a worsening rash x today. She received her second Pfizer COVID vaccine on 5/14. Patient reports a small rash at the vaccine site that evening. No worsening of rash over the weekend. Patient denies fevers, HA, ST, dyspnea. She reports a history of skin sensitivities. No new soaps, lotions or detergents. No new medications or supplements. No itching or pain from rash. She reports that her symptoms started with small, clear, "bubbles", then turn into flat, excoriated erythema. 5/19/2021 SMHC ER. 32 y.o. woman presenting with a rash. Patient had her second COVID-19 vaccine on 5-14. On 5-17 started developing a rash over her left arm at the site of the vaccine. Started with clear bubbles, that then look excoriated. She reports that they feel like they are burning. They have since spread to her chest and her back, her legs, her arms. She has put a little bit of antibiotic ointment on some of them, but this has not helped. No painful urination. Does report her eyes and her mouth feel dry. 5/19/2021 Dermatology Pt arrived from the ER admitting to significant fatigue. The burning in her skin has an abrupt onset which wakes her from sleep. She notes that starting Saturday 5/15 she has had intermittent pins and needles in her hands and feet. As of today her right foot is becoming more numb. She also notes the onset of burning at the left inside of her mouth. 5/20/2021 Dermatology. Assessment and Plan: 1. Neoplasm of uncertain behavior of skin. 32F with vesicular - petechial eruption with secondary crusting at trunk and extremities s/p 2nd Pfizer COVID-19 Vaccine on 5/14/21. Vasculitis vs DIC vs Stevens Johnson syndrome/ TENS in pt with symptoms consistent with coronavirus infection despite vaccination. SURGICAL PATHOLOGY TISSUE SPECIMEN: pending. Skin biopsies sent urgently on 5/19/21 for H&E and DIF. Prednisone started 5/19/2021 in ER: 60mg x3 d, 50mg x 3 d, 40mg x3 d, 30mg x3 d, 20mg x3 d, 10mg x 3 d (18 day taper). Out of concern for possible vasculitis compromise of the pt's kidneys I prescribed bleach baths and topical mupirocin oint rather than add systemic antibiotics for secondary infection of lesions. Given the

							worrisome and worsening presentation, the pt and her husband agree to present to the E.R. They declined transport by ambulance and will go to the E.R. now. Number and Complexity of Problems Addressed. 1 acute or chronic illness or injury that poses a threat to life or bodily function. Mild headache last evening, no blurry vision. Extreme fatigue with effort of getting up and getting dressed Interrupted sleep with persistent burning pains at LEs, pins and needles at hands and feet and worsening blue discoloration at LEs and numbness at 2nd & 3rd rt toes. Has been able to hydrate; urine light yellow. Appetite maintained but no stool since 5/17. Pt removed IV from rt antecubital which had been left by E.R. 5/20/2021 ER. This is a 32 y.o. female with a rash that initially developed over her injection site from her second COVID vaccine received 6 days ago. The rash begins as bubbles and then appears excoriated. Described as burning and have since spread to her chest, back, legs and arms. She was evaluated yesterday at SMHC ED and Dermatology. Placed on 60 mg Prednisone and admits that the pain has not really improved. Sent here today for concern of DIC/Vasculitis/SJS. Patient well appearing, VSS. Will repeat labs, provide 1 L NACL and Oxycodone for pain. Had today's dose of Prednisone. Does have decreased DP pulses, foot mottling and decreased capillary refill. Will obtain bilateral arterial US. Discussed with Dr. who also evaluated the patient and is in agreement. Labs improved from yesterday, only mild elevation of D-dimer. Some protein in her urine. Repeat evaluation after keeping her legs covered reveals normal cap refill less than 2 seconds. Still mottled and unable to palpate DP pulses bilaterally. 5/21/2021 Assessment. Prescribed Ondansetron Hydrochloride 4 mg For nausea.
1346560	5/25/2021	NY	40	F	5/19/2021	5/19/2021	About 20 minute after vaccine was administered I felt a subtle numbness feeling to the right of my mouth. Then it was felt on most of my right cheek. It lasted the whole day and the next morning it was mostly gone. Since then my right eyelid and under eye have been a little red which isn't normal for me. Some tingling in right leg felt as well. Mainly concerned about the face sensation and not sure if I should proceed with second shot.

1346406	5/25/2021	TN	47	F	5/20/2021	5/22/2021	Adverse event: Two days after first injection, both eyes swollen, hurt to touch and inflamed. Blurred vision in left eye. Previously had derma filler in 2017/2018. Treatment: Benadryl, Tylenol, cold packs Outcome: visited PCP on 5/24/2021, still recovering
1346427	5/25/2021	NY	63	F	3/14/2021	4/8/2021	Initially presented to emergent care on 4/8/21 for left arm pain, SOB on exertion, and intractable headache. Headache had been ongoing for 12 days. It was throbbing and in the frontal region with nausea. No phonophobia. No weakness. No vision loss. No speech impediment. She was somewhat less active given her severe headache. She was found to have a DVT in the left arm and bilateral PE with heart strain. Referred to Hospital and admitted. Started on lovenox 1 mg/kg every 12 hrs and elected to be transition to coumadin since her sister had another blood clot on Eliquis. Neurology started her on gabapentin. She was discharged and told to follow-up with hematology and warfarin clinic. Presented to the ER on 4/27/21 with SOB at night that had been worsening the past 2 nights. Denied dyspnea or chest pain. Sx were thought to be due to anxiety given her hx of panic attacks. She was discharged home and saw hematology the following day. Hematologist noted that her SOB was gradually improving and her left arm swelling and vascular changes had resolved. Repeat CT showed improvement in clotting burden and stable pulmonary and hepatic nodules.
1346418	5/25/2021	OR	33	F	5/24/2021	5/25/2021	My right eye is swollen. I have facial filler. It's right there

1346863	5/25/2021	RI	69	F	3/16/2021	3/22/2021	Intense UTI and urgency to urinate, no control of it. Fatigue/sleeping, brain confusion, aches, headaches everyday, old injuries became active again i.e. my broken hand 7 years ago began hurting and couldn't use it, my knee would not hold me up to stand and kept going out on me (from 2010 broken tibia and torn knee ligaments). Began a sinus infection, cough and eye pain with awful bouts of constant sneezing. Third round of antibiotics for the UTI and my bladder is still not right with leakage and urgency. Liver enzymes are high chart.
1346485	5/25/2021	VA	17	M	4/29/2021	4/29/2021	Patient received the Pfizer vaccine in the morning, then woke at about midnight. He went to get a drink of water, and was holding a glass of water in his hand. He started to feel as if the room was spinning, became very sweaty, had ringing in both ears, and lost consciousness, striking his head on the counter. The event was unwitnessed. He reports waking approximately 1 hour later with a bad headache. He had a headache and felt disoriented. He denies urinary/bowel incontinence or tongue biting. He was able to walk back to his room without difficulty, took ibuprofen, and went back to sleep. He woke the next morning with nausea and vomited, but this did not impact his headache. He has not had any notable neurologic symptoms since that time, but continues to have a minor headache. He has not had any further vomiting. Headache has not subsequently woken him from sleep and does not worsen with recumbent positioning. He denies visual changes, memory changes, difficulty swallowing, shortness of breath, ringing in his ears, or dizziness. He says his headache is located mostly around his forehead and at the top of his head that is now mild and feels like pressure ?like a tension type headache.? His mother is a nurse, and evaluated him the next day. The family did not feel that he needed to be seen in the emergency department, or prior to this visit. He has not had any previous episodes that were similar. Patient was evaluated in my clinic. Complete neurologic exam was within normal limits. He has been referred to neurology for further assessment.

On 04-Feb-2021, Oxygen saturation: 98 percent 98 percent at 14:38 99 percent at 15:58. On 04-Feb-2021, Pain assessment: 4 pain level 4/10. On 04-Feb-2021, Respiratory rate: 18 18 at 14:38 20 at 15:58. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Follow up received on 13-May-2021 was significant and included the completed VAERS form. The new events of missed second dose of covid-19 vaccine, angioedema, allergic reaction, flushing, sweaty, numbness top lip were added and medical history was updated. On 04-Feb-2021, it was reported that the patient developed perioral swelling and numbness that came on approximately fifteen minutes after receiving her first covid-19 vaccine. The patient was taken to the emergency department, and was kept under observation for two hours with no worsening of her condition. Treatment medication included 50 milligram of Benadryl (diphenhydramine). The patient was given a prescription for diphenhydramine and asked to follow-up with her primary care physician/ emergency department if symptoms worsened. Company comment This case concerns a 79-year-old female with a serious unexpected event of angioedema and nonserious hypersensitivity, hypoaesthesia oral, flushing, hyperhidrosis, vaccination complication, and product dose omission issue. Latency within 1 day after mRNA-1273 dose. Based on current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. Most recent FOLLOW-UP information incorporated above includes: On 13-May-2021: Follow up received included the completed VAER form and medical records from the emergency department. Additional information included medical history, patient demographics, age of patient, patient contact details, concomitant medication, new events with outcome of events, missed second dose.; Sender's

1345449	5/25/2021	WA	65	F	5/20/2021	5/21/2021	Severe pain, swelling hard lump and rash on vaccinated arm the day after vaccination. The rash spread almost down to my elbow also noticed the skin in my entire body felt like a bad sunburn but was not red just felt burned. Other symptoms were like when I had Covid low grade fever 101 and flu type symptoms, bad headache, pain in ears, jaw, gums and overall body stiffness and pain along with nausea, fatigue, stomach ache and diarrhea. Also noticed my eyesight was very blurry and on day 2 tiny moving glitter like spots in my vision. Vision is still very blurry day 5 and seems to have exacerbated Covid symptoms and fatigue I was already dealing with.
1345448	5/25/2021	CA	20	F	5/20/2021	5/21/2021	Swelling, soreness, hot flashes, lethargic, eye swelling
1345434	5/25/2021	CA	43	M	5/6/2021	5/9/2021	Mild case of shingles. Scalp tenderness, small rash around eye. Nerve pain. Antiviral valacyclovir prescribed 4 days after onset of symptoms. Cleared up after 2 weeks.
1345414	5/25/2021	CA	48	F	3/3/2021	3/10/2021	Beginning 1 hour after the vaccination I experienced the feeling of not being able to breathe. This lasted for approx 15 minutes. At approximately 6:00 PM I experienced extreme nausea. Nausea continued until about 10:00 PM on 3/4/2021. On 3/10/21 my face broke out in a rash around my ears and temple area. This has continued to date (5/24) At this point, the rash is also under my right eyebrow and on my neck and cheek on the left side of my face, and on both ear lobes. My face has an uncontrollable itch that begins from underneath the skin and terrible. I have never had skin issues prior to the vaccination.

1345959	5/25/2021	TX	51	M	1/25/2021	1/28/2021	heart races a little; feels flushed; checked his pulse and it was a little elevated; eyes are tingly; feeling feverish but no fever; This is a spontaneous report from a contactable consumer (patient) via medical information team. A 51-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, formulation: solution for injection, #lot: EL9262) via an unspecified route of administration administered in Arm Right on 25Jan2021 14:00 (at the age of 51-years-old) as single dose for covid-19 immunisation. The patient's medical history included blood pressure. The patient's concomitant medications included hydrochlorothiazide, losartan potassium (LOSARTAN HCTZ) ongoing at 12.5 of unknow units once daily for blood pressure and tamsulosin. The patient underwent lab tests and procedures which included heart rate: little elevated. He checked his pulse and it was a little elevated. It was reported as the patient received the first dose of the pfizer covid 19 vaccine on Monday 25Jan2021 but did not have any symptoms until Thursday 28Jan2021. The patient reported feeling feverish but no fever, heart races a little, eyes are tingly and feels flushed. The patient wants to know if what he is experiencing normal. The patient wanted to know if the rumor is true that the second dose has more side effects. He has had no allergic reactions to medicine. He takes a blood pressure medicine, anti-anxiety medicine, and cholesterol medicine. Starting yesterday he started to feel feverish but had no fever. His eyes started to feel tingly, like a feverish feeling. This started after lunch time. He took a nap for like an hour, slept fine, and then the feeling was gone and he was okay. Today, he woke up this morning around 6:30 AM and was fine. It was not until later this morning around 11 AM when he started to feel the same way again. It was like his heart raced a little. He checked his pulse and it was a little elevated, but nothing crazy. He felt flushed. His eyes were tingly. It is like something does not feel right. He was calling to see if these were side effects. Feeling like his heart was racing has subsided. It was worse earlier. The feeling flushed is minor now. The eyes tingly has almost subsided, but still there. The patient experienced feeling feverish but no fever, eyes are tingly on 28Jan2021, heart races a little, feels flushed and checked his pulse and it was a little elevated on an unspecified date. The outcome of the

							events heart races a little and eyes are tingly and feels flushed was recovering, while the outcome of remaining events was unknown. Follow-up attempts are completed. No further information is expected.
1346377	5/25/2021	NC	63	F	5/21/2021	5/21/2021	Bleared vision, ringing in the left ear
1346367	5/25/2021	NY	36	M	5/20/2021	5/21/2021	Received second dose of Moderna COVID 19 vaccine at 10AM Thursday 05/20. T+12-18hrs: Feeling flushed. Slightly confused. Body aches build over the night. Wake up with mild/moderate pain in back, knees, arm. Groggy. Went to work on something with a friend at 10:00 AM (T+24Hrs), but had to return home because.... T+24hr: ....headache growing. Went home and found fever at 102°. Slight chills, bit mainly just heat without sweating. Fever hit 103.2 at peak. Went through 10lbs ice to keep the fever in check. Headache from T24hr-T36HR feels like a spike through the top of frontal lobe to my left eye. T+32hr: Headache still intense. Only back pain now. Appetite slowly increasing. T+48hr (Saturday morning). Back pain persists, but mild. Headache gone. Have a relatively normal day. T+60hrs (Sat. Afternoon): Back pain increasing. Stop all unnecessary lifting/moving. T+68hrs (early Sunday morning): Go to ER with the back pain. Absolutely excruciating spasms from top of sacrum - roughly L1/12T. Lower back stiff as wood. Given shot of Toradol, dose/prescription to flexiril. I specifically request this plan because usually takes care of the spasms; basically, get me able to move and the pain/spasms will go away. NOTE: I have a history of back issues in this area, but I have not had an episode in years and certainly never had an episode that works like this with no relief. From about 2017-2019, I r T+70-78hrs: Feel normal. T + 78-88hrs: lower back pain comes back with an absolute vengeance. T+90hrs (early Monday morning): Return to ER. Back pain worse than Sunday morning. Receive toradol shot and prescription Prednisone. Back pain gone by around 10:30 AM. Decide to take prednisone Tuesday morning as its getting a bit late in the day by the time pharmacy fills the prescription. T+90hrs: Back pain returns in similar fashion as Sunday afternoon. Still. Barely mobile. T+96 hours: Wake up with lower back pain similar to Sunday/Monday morning. Took prednisone and flexiril this morning. Please help me.

1346028	5/25/2021	CT	80	M	2/8/2021	2/8/2021	his neck was stiff; it was very, very cold; a lot of pressure on his eyes; pain in arm the injection was given in; I got a lot of headaches and I still have them./unbelievable headaches; More back pain than usual; My blood pressure went up a little bit but not much; This is a spontaneous report from a contactable consumer (patient). Follow-up information received on 17Feb2021 was processed together with initial information. A 80-years-old male patient received first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Lot Number: EM9809, Expiration date: UNKNOWN), via an intramuscular route on 08Feb2021 (at the age of 80-years-old) as single dose in the left arm for covid-19 immunization. The patient medical history included and back pain. The patient concomitant medications were not reported. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 08Feb2021, the patient experienced blood pressure went up, More back pain than usual and on unspecified date experienced Stiff neck, Headache, pain in arm the injection was given in, pressure on his eyes, cold. The clinical course of the event was as follows: blood pressure went up a little bit but not much. It was reported that blood pressure was up which he was told by the nurse was normal. It was just a little bit high. The nurse at the facility said it was not that concerning and that it was fine. The facility let him stay a half an hour and then he was able to driven home. He hadn't wanted to stayed long because it was very, very cold. He had a lot of back pain. He does have back pain all the time, but not that much. It was more back pain than usual. The pain in his back increased/doubled, and the pain is still high. He clarifies he has had problems with his backed and have had backed pain normally, but after the shot it was liked a lot of pain in his backed and his neck was stiff very, very stiff hasn't knew if it's from vaccine or what. Patient stated that before the vaccine, he was okay and was able to worked in his house and outside. He believes the stiff neck began after 2 or 3 days of receiving the vaccine and it have had worsened. Patient stated that pain in his armed where he received the shot went away completely. He clarifies further the pain in his armed went away the second day. He got a lot of headaches and he still had them. The headaches began right away, and the headaches still c continued. He

mentions the headache got a little better last night. He was really worried about it and hadn't knew what to did. It was reported that he told his son everything and his son said to not went to hospital because there was a lot of people that had been in contact with covid and it's going to have been worse. He states his son told him to drink a lot of water and saw if he got better. He did that and he did got a little better but not that much. Patient mentions that he had a lot of pressure on his eyes. The patient did not went to emergency room because he was told it was normal to had headaches but they went away and his should went away in 2-3 days. His armed where he received the vaccine was also okay the next day. The patient did not visit to physician office. Patient mentions that he took blood pressure medication, and everything was under controlled and he took 10mg of a cholesterol medication. Patient declined to include these medications for the report, stating he gave all of this information at the facility he received the vaccine at. He had to filled the paperwork out. He confirms he hasn't had any NDC, lot number or expiry date for these medications at this time. It was reported that patient had a blood tests done about 3 weeks before he received the vaccine and the doctor said everything was okay at the time. The outcome of the events headache was recovering, backed pain and neck was stiff was not recovered and other events was unknown.

asthma is kicked up a little (asthma) (non-serious) on 22Jan2021, body aches (pain) (non-serious) on Jan2021, losing her voice (dysphonia) (non-serious) on Jan2021, hoarse voice (dysphonia) (non-serious) on 22Jan2021. She had a reaction to the Pfizer covid vaccine shot, she had the first dose on Friday 22Jan2021. She is still having a reaction. She is allergic to everything and she does not get flu shots for that reason. She is still sick, she still not feeling great. She experienced injection site pain, feeling tired, headaches, muscle pain, joint pain. She does not know if she had a fever. She has redness and swelling at the injection site but that is ok. She has nausea, dizziness, weakness, and sore throat. Reports her asthma is kicked up a little, she had to take a couple puffs of Advair and Ventolin right after she had the injection. She has chronic asthma. Her voice is hoarse from this, she is losing her voice. She threw up Sunday. She has no appetite. States all of her symptoms are improving very slightly. Treatment: She has been taking Emetrol for nausea. She is taking the generic for Lomotil called diphenoxylate/atropine 1 by mouth 4 times a day as needed. She is taking ibuprofen 800 mg, one tablet by mouth three times a day, she took that for the first two days. She was taking Tylenol extra strength for body aches, 4 tablets a day. Occasionally she takes Aleve. She was taking other medications for her stomach since she was getting over c-diff. She was having horrible pain in her stomach. She has been taking vancomycin once every three days, she has about a weeks worth of vancomycin left. She confirms she was diagnosed with c-diff a few months prior to getting the vaccine. She took pantoprazole 40 mg and dicyclomine 10 mg to help her stomach, to help with her stomach pain. She is sleeping with a heating pad on her stomach, her stomach hurts like hell. She reached out to her doctor and advised her to wait and see how she is doing. She was told if she was not better by today she should go to the ER. States she will not go to the ER for fear of catching covid. Question: Call transferred from another line. The caller received the first dose of the vaccine on Friday 22Jan2021. The caller stated she has been sick since Friday and got worse on Sunday. She has experienced nausea, dizziness, weakness, no appetite, a sore throat, she is losing her voice, she had to take inhaler right away after the injection, weepy eyes, and a lot of stomach pain. She is

taking Lomotil to calm spasms in her stomach. She described the stomach spasms "like someone hit you in the gut and constantly throbbing, I used to get that when I had the regular flu and I don't get any of the vaccines because I am allergic to the by-products in the vaccines but they assured me it non of that was in this vaccine." She was puking her guts out at midnight on Sunday night. She has been staying in bed with a heating pad and has been in bed all week. Her doctor told her if she is no better by Friday she should go to the hospital but she does not want to go to the hospital. She stated she doesn't know if she should get the second dose. The caller asked if these symptoms have been reported and if there is anything she can do for it. Other line; agent (withheld). The outcome for the events "sick" was not recovered. The outcome for the event "losing her voice" was unknown. The outcome for the remaining events is recovering. Follow-up attempts completed. No further information expected.

1345935	5/25/2021	NY	22	F	4/1/2021		SEVERE MIGRAINE; BODY ACHES; CHILLS; FEVER; This spontaneous report received from a consumer/non healthcare professional (patient's mother) concerned a 22 year old female. The patient's weight, height, and medical history were not reported. The patient received COVID-19 VACCINE AD26.COV2.S (suspension for injection, route of admin not reported, batch number: Unknown) dose was not reported, frequency 1 total, administered on 07-APR-2021 Vaccination site was left arm for prophylactic vaccination. The batch number was not reported and has been requested. No concomitant medications were reported. On an unspecified date in APR-2021, the patient experienced body aches, chills, weakness. fever and severe headache with eye involvement. Patient was taken to the Emergency Room and was told that the vaccine caused a severe migraine. The reporter sought compensation of patient's medical bills. Patient was hospitalized and discharged on 30-APR-2021. Patient was hospitalized for 1 day. Patient was hospitalized on 30-APR-2021. The action taken with COVID-19 VACCINE AD26.COV2.S was not applicable. The patient recovered from body aches, chills, and fever on 2021, and the outcome of severe migraine was not reported. This report was serious (Hospitalization Caused / Prolonged).; Sender's Comments: V0: 20210539285-COVID-19 VACCINE AD26.COV2.S- severe migraine, body aches. This event(s) is considered unassessable. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the event(s). 20210539285-COVID-19 VACCINE AD26.COV2.S- chills, fever. This event(s) is labeled per RSI and is therefore considered potentially related.

1345933	5/25/2021	FL	60	F		3/10/2021	<p>POSSIBLE SMALL STROKE; POSSIBLE TRANSIENT ISCHAEMIC ATTACK (TIA); SUPER DIZZY; THROWING UP; COULD NOT OPEN EYES; WIERDLY AND EXCEEDINGLY THIRSTY; COULD NOT WALK; NUMBNESS IN LEFT ARM; COULD NOT STAND; HEAVINESS IN LEFT ARM; NAUSEOUS; HEADACHE; FELT LIKE HAD CHILLS LIKE ONE GETS FROM THE FLU; This spontaneous report received from a patient concerned a 60 year old White, Not Hispanic or Latino female. The patient's weight was 175 pounds, and height was 65 inches. The patient's concurrent conditions included slightly elevated blood pressure, alcohol user socially and on weekends, non smoker, and penicillin allergy since childhood. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, intramuscular, batch number: 1805022, expiry: UNKNOWN) dose was not reported, 1 total, administered on 08-MAR-2021 for prophylactic vaccination. Concomitant medications included valsartan for elevated blood pressure, acetylsalicylic acid, and furosemide. On 10-MAR-2021, the patient felt like having chills like getting from the flu, for couple of hours might be, a headache for several days, might be for 3 days. For that the patient took some Advil 200 mg every 6 hours for the first couple of days. Then that passed and felt fine. On 24-APR-2021, around 04:00 in the morning the patient woke up and felt weirdly thirsty, exceedingly thirsty and super dizzy, nauseous thought was having a heart attack and heaviness and numbness in left arm but could still move the arm, however could not walk and could not open eyes until was in hospital. As a treatment Aspirin was given to the patient by husband. The patient was throwing up, could not stand. About 05:30 went to the hospital and ran many tests. Ruled out brain bleed, heart attack, anything cardiac did a CAT scan; bloodwork found that the patient was low in potassium and it was determined that the patient either had a small stroke or a TIA that dissipated on its own. The patient saw her cardiologist and wore a Holter monitor for 10 days. The patient also has an appointment with a neurologist coming up in June and having another CAT scan. Also seeing a vascular neurologist. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from possible small stroke, possible transient ischaemic attack (TIA), super dizzy, could not</p>

1345995	5/25/2021	KY	19	M	5/14/2021	5/22/2021	On the first day of the adverse effects I woke up to a rash on my legs. It was minor and I thought nothing of it. On the second day it had spread to my arms and was now a serious irritation. I rubbed Aloe Vera on it and that helped a little but wore off in an hour. By day three the rash was now spreading to my chest but I still wasn't sure if it was the vaccine. I took some Benedryll as an antihistamine and the rash completely dissapeared within an hour. 24 hours later at the time I had taken the Benedryll the night prior the rash reappeared and I he only possible explanation is some sort of allergic reaction to the vaccine. I have been allergic to it consistently and if it doesn't dissapeared entirely without me needing to take Benedryll I will be very concerned. The rash when it is present covers almost my entire body, spare my groin, head, neck, and some of my chest and back luckily. It itches very badly and constantly, and is very much visually present in large red splotches.

1347791	5/25/2021	CA	47	F	5/22/2021	5/22/2021	<p>Patient started to not feel well almost immediately after the vaccine was given per certified pharmacy technician on 5/22/21 around 4:05 P.M. Patient started to experience symptoms not related to anaphylaxis, but more so related to hypotension and/or anxiety. Symptoms include dizziness, body fatigue, pins/needles throughout her body, and also patient started to "see dark spots" when she had her eyes open. No other immediate symptoms were present. Patient's condition improved over time and was able to get up from the chair by herself approximately 15-20 minutes post injection. Patient initially had a normal body temperature of 98.6 F. Temperature was taken every 5 minutes starting from 4:11 P.M for a total of 5 readings, which gradually increased to 100.5 F. Patient's condition started to worsen approximately 30 minutes post injection after improvement and looked like she was going to become unconscious. Ambulance was called due to worsening of symptoms again, and patient's care was transferred over at around 4:45 P.M. Patient was called on 5/25/21 at around 2:40 P.M. for follow-up. Patient has not fully recovered, but is on her way to recovery. Currently, her only symptoms are feelings of pins/needles throughout her body while all other symptoms are gone. Advised patient to follow-up with physician for her current symptom. Patient acknowledged and will see doctor soon. No date was given.</p>
1347685	5/25/2021	KY	41	F	4/26/2021	4/27/2021	<p>My vision became abnormal the following day after receiving vaccine. I could see fine, but felt like both eyes were not in sync with one another. It comes and goes. It can last for hours at a time. It has been ongoing, everyday for 4 weeks. I have never had any vision issues prior to the vaccine. I have seen an optometrist and eye specialists. So far, they have seen no signs or not detecting any eye condition or problem. I am to follow up with the eye specialists in 5 weeks. They recommended giving it a few extra weeks to see if symptoms improved or went away before looking into further/other testing.</p>

1347900	5/25/2021	NC	30	F	5/20/2021	5/21/2021	While at my doctors office for a routine visit, I experienced my body attempt to pass out, suddenly, as a blood sample was taken for a vitamin D test. I lost hearing with a ringing in my ears, was sweating profusely, could not support myself to sit up and my vision was going in and out, as I couldn't keep my eyes open. My heart was racing, and the nurse said my lips went blue. The doctor and his nurses were able to get me into a bed and raise my feet above my head for 5-10 minutes to get the blood to come back to my head. I recovered within about 30 mins, as my heart beat slowly calmed, and my vision and hearing restored. The rest of the day and the following day I experienced severe fatigue and brain fog - it felt like I was moving and thinking in slow motion. A couple of days later I had a follow up with my primary care physician, as I was fearful from what I experienced. The doctor told me it happened because I had just been vaccinated with the 2nd shot the day before the blood was taken, and it somehow caused my body to go into shock. I have given dozens of blood samples over my life time and never experienced anything like that. I do not have fear of needles and am completely comfortable with having blood taken. What I experienced was scary. I genuinely felt I was going to die and it happened with no warnings, and at a seemingly random time. I experienced my heart racing uncontrollably after the first dose, but didn't report it as I wasn't sure it was significant. I want to share this experience because it was very traumatic for me.
1347898	5/25/2021	CA	49	F	5/1/2021	5/4/2021	Hives all over body, mostly on the trunk and buttocks. They develop in the evening and last into mid-morning. Sometimes they affect my face, swollen eye lids or lips. Also, I've had them on the palms of my hands and tops of my feet. They are very itchy and burn. It can be hard to sit on my bottom when they are in full effect. This started 4 days after my second vaccine and has only gotten worse with time. I am taking over the counter allergy pills around the clock that barely takes the edge off. There have been no changes in anything I'm doing to cause these.

1347877	5/25/2021	IL	26	F	5/25/2021	5/25/2021	RN note: Patient received vaccine at 1615, at 1620 patient stated she was dizzy and seeing stars, quickly after patient was unresponsive and eyes rolled back and patient postured and was shaking slightly. Patient remained in chair and did not fall, RRT and emergency responders notified. Patient recovered in under 1 minute. Initial vitals signs at 1622 BP: 98/64, HR 101, Respirations 34, SpO2 99%. Paramedics arrived at 1630 and BP at that time was 113/72, HR 114, Respirations 30, SpO2 99%. Patient stated no current medications or medical history. Patient handoff given to Paramedics and she left with them per our recommendation. Also reviewed that patient should follow up with her doctor regarding getting the second dose of the vaccine.
1347872	5/25/2021	VT	28	M	5/13/2021	5/20/2021	One week after receiving the vaccine I woke up on 5/21 with a mild rash. As the day went on the rash progressed and swelling of lips and uvula occurred around 5pm. I was taken to an urgent care who transferred me to a hospital via rescue. I spent the night at the hospital receiving multiple epi pen injections, and fluids. I was discharged 5/22 with a dose of prednisone. I was fatigued all day. On 5/23 I woke up to swollen eyes and lips and covered in hives again. I went to the ER where I was given steroids and fluids again. The hives went down but did not go away. One 5/24 I took multiple doses of Benadryl and dose of prednisone and in the evening time the hives progressed. Today 5/25 I woke up with swollen lips and checks and hives. I went to my doctors office to be evaluated.
1347870	5/25/2021	NC	58	F	1/27/2021	1/27/2021	I experienced after lunch time, I felt I was like drink, slurring my words. on 01-28-2021, the left side of my face was tingly and numb. When I went to work my coworkers noticed my left eye and face was dropping. I also started to drag my left leg. I went to urgent care and was treated as stroke like symptoms. I was admitted for one day at urgent care. My symptoms were gone within the next day. I have not had any symptoms since then.

1347920	5/25/2021	OH	21	M	5/25/2021	5/25/2021	<p>Patient received Janssen COVID19 vaccine (LOT#201A21A) in his left arm at approximately 14:43 on 5/25/21. During the 15 minute observation period, he expressed "I don't feel well" and endorsed dizziness/ lightheadedness, slight tingling feeling in fingers, and nausea. Shortly thereafter at approximately 14:50, he started to slouch and appeared faint while sitting in a chair with eyes closed. He did not fall or hit any part of his body. He was easily aroused with a touch on his arm and responded to verbal questions immediately. He denied trouble breathing, chest pain, palpitations, headache, muscle weakness, vision changes, skin reactions, swelling. He was oriented x3 and not exhibiting verbal or swallowing problems. His vitals were normal- HR 80 bpm and BP 105/80 mmHg. He was offered a receptacle to vomit in if needed; however, he did not vomit. This initial reaction was consistent with potential vasovagal reaction/ near-syncope after vaccination. Patient was encouraged and instructed to sit on the floor to prevent injury in case of fall but he refused. Staff offered him water, a fan, and opened windows while monitoring. Later while waiting for a ride at around 15:10, he endorsed headache (first above his eyes and then toward the back of his head) and clarified this did not feel like a typical migraine that he has had before. Then at around 15:20 he endorsed vision changes in his right eye- he could not see a portion of vision out of that eye except peripheral vision and described not being able to see writing on the right side of a whiteboard in front of him in the room. Later he described a resolution of that gap in vision but then had blurry vision out of that eye. He denied any vision changes in the left eye. Due to alarming symptoms of vision changes and onset of headache, patient was recommended to go to ER for further observation and evaluation. He was not in urgent distress and patient did not wish for EMS to be called but agreed to go to ER when his emergency contact picked him up. Patient's emergency contact came to pick up patient at approximately 15:40 and was recommended to take him to the ER. Patient and emergency contact were amenable to this plan. He was able to stand up and walk to the car without issues.</p>

1347867	5/25/2021	NV	69	F	3/15/2021	4/30/2021	4 days after the vaccine I started my period. light spotting and cramps 6 weeks after the vaccine I woke up with a typical burst blood vessel in my right eye. I realized my actual eye color changed from hazel to blue. As silly as this sounds the color change is not the typical "I was wearing blue, so my eyes looked blue" It changed from hazel to blue overnight. The blood vessel healed, the eye color change has remained. Its pretty but a little strange. It is over 3 weeks.
1348039	5/25/2021	VA	58	F	5/15/2021	5/15/2021	blurry eyes, fast heart rate, headCHE, FACE NUMBNESS,cataracts

1347719	5/25/2021	MD	60	F	5/15/2021	5/18/2021	05/15/2021 1300: Received first dose of Moderna COVID vaccine. No issues. 05/16/2021: No issues. 05/17/2021: No issues. 05/18/2021 0800: Some occasional vision blurriness as if my reading/computer glasses were smudged. I kept wiping my glasses all day. That evening, I was anxious and unable to settle down. I did not go to bed until 1:00 AM. 05/19/2021 0500: Brief strange chest sensation (not pain; not pressure; just a strange sensation). 05/19/2021 0800: Dizziness and more noticeable blurred vision which continued throughout the day. 1st BP at home 122/81 2nd BP at home 117/77 05/19/2021 0940: Brief strange chest sensation (not pain; not pressure; just a strange sensation) while driving to doctor's office. 05/19/2021 1015: I happened to have scheduled an annual wellness visit for May 19 at 10:15 AM with a new primary care physician because my previous PCP (in the same practice) has been on a very long medical leave of absence. I was dizzy and having some balance problems walking from the parking lot to the office. 1st BP 143/88 Temperature 97.2 Weight 222.1 EKG good 2nd BP 130/76 Heart: soft murmur Thyroid: symmetrical The blurred vision and dizziness were getting much worse during my appointment. Dr. said he thought the symptoms were likely a side effect of the vaccine but wanted to order an MRI to make sure my brain was OK. Dr. arranged a same day appointment at a Clinic for 3:00 PM. Dr. advised me to rest, stay well hydrated, and not skip meals. My balance was very bad leaving the office and remained bad for about 6 hours. Dr. called me with the results of the MRI and said there was no stroke or clot, and that he thought the symptoms would slowly dissipate. 05/20/2021 0800: I woke up with ringing in my left ear that sounded like a combination of soft static coupled with soft sounds at a higher pitch. The ringing lasted about 1 hour. I had dizziness and blurred vision throughout the day, but it was less severe than the previous day. 05/21/2021 through 05/25/2021: I have had much less dizziness and it usually occurs only in the morning. I still have occasional vision blurriness throughout the day. It is most noticeable when I am working at the computer. I feel as if I have a little brain fog because it takes me longer to figure out how to type some things such as my email address, passwords, etc.

1348333	5/25/2021	TX	49	F	5/12/2021	5/16/2021	Patient came to the pharmacy 5/25/21 at 1:20pm to alert us that she had reactions that started 4-5 days after getting her first dose of Pfizer. She reports that her blood sugar increased >400 and >600 4-5 days after the dose. The patient spoke with her Dr and the Dr told her to increase her Lantus and Apidra. The patient also reports getting pain in her right leg that caused trouble walking, bruising on hip that both started 4-5 days after the dose. Patient reports headache, insomnia due to pain and increased blood sugar. Patient reports now sleeping a lot because of exhaustion and having to check her blood sugar every 2 hours and drink lots of water as directed by her Dr. Patient says she finally got her blood sugar down below 120 on Friday 5/21/21. Patient reports she lost some vision and had blurry vision in her left eye that started 5-6 days after the dose. Patient says her A1C was 5.6 before the Pfizer dose and after the dose her blood sugar was uncontrolled. Patient says her Dr told her to go to the ER if her symptoms continued. Patient also spoke with someone at the CDC and they told her they would follow up with her regarding her symptoms and they will let her know if she should get her second dose.
1347327	5/25/2021	MO	34	M	5/25/2021	5/25/2021	Approximately 22 minutes after she received the second dose she began to have itchy, watery eyes, nasal congestion, and felt itchy. Had side effects for 3 days after she received the first dose of Moderna. Gave 50mg of Benadryl and observed for an additional 25 minutes (for a total observation time of 47 minutes). Was feeling better 20 minutes after taking Benadryl, no longer had itchy, watery eyes, and nasal congestion subsided. Advised to contact primary care provider as a precaution.

1348472	5/25/2021		18	M	5/25/2021	5/25/2021	<p>Patient received vaccine around 5 pm. For the first two minutes after vaccination the patient seemed to be fine. Starting around that 3rd minute the patient got very dizzy and nauseous. He was then seated to prevent further NV. I asked the patient if they were breathing ok and the patient stated his breathing was fine. After about another minute the patient's eyes got glossy and the patient seemed to be out of it. I asked multiple orienting questions such as his name, where he was, and what day of the week it is. He was only able to answer the day of the week and his head was bobbing. I then called 911 as the patient became very pale and started to profusely sweat. While on the phone with the 911 operator, the patient went completely unconscious and lost control of motor functions. I was able to confirm the patient was still breathing and still had a heart rate (although rapid) and thus compressions were not given. The EMT arrived quickly to the scene and took over care of the patient. After about 20 minutes of checking vital signs, the EMT gave the patient and his family the option on whether they want to go to the hospital or not for further examination. The family decided they wanted to take the ambulance to the hospital.</p>

1347231	5/25/2021	PA	25	F	5/24/2021	5/24/2021	Patient is a 25 year old female. She presented to the clinic for her second dose of Moderna LOT #003C21A. According to patient's husband she has no significant past medical history but has "passed out" with vaccines. No reaction noted with her first COVID vaccine. Approximately 10 minutes after receiving her injection today she told her husband that she wasn't feeling well. She said was light headed and nauseated. Patient then proceeded to become nonresponsive. Her eyes deviated upward and her whole body became stiff. Her skin had notable pallor. She was lowered to the ground by staff, myself, and her husband, and put in a supine position with her legs elevated. 911 was called. This episode lasted approximately 40-60 seconds when she became responsive and cried out for husband. Her muscles relaxed and she became notably upset. She kept saying she wasn't able to see or feel her extremities. Her lack of vision resolved within 10-15 seconds. She had weakness in her arms and legs but was able to squeeze her hands on command. She was alert and oriented X3. BP was 130/90. The patient was stable when the ambulance arrived to transport her to Hospital.
1347222	5/25/2021	MI	60	F	5/7/2021	5/7/2021	Patient bent down to pick something up and lost vision in her left eye, described it as a field of black with shooting colors like fireworks in her eye. She presented to her optometrist Dr. She also presented to the ER for further evaluation. She underwent lab work and a CT of the head without contrast. She was diagnosed with a retinal occlusion of the left eye.
1347196	5/25/2021	TX	54	F	1/22/2021	1/26/2021	Initially thought I was having a stroke. Went to ER. Not having stroke. A few weeks later started having: Loss of balance including falling, speech difficulty, memory impaired, cognitive functions diminished, vision irregularities. Went to see Dr. who prescribed Steroid IV infusion for 5 days. Trazadone for sleep, and has ordered IVIG infusions ( awaiting on someone to administer.

1347190	5/25/2021	MT	12	M	5/25/2021	5/25/2021	Patient received the vaccination at 1148. A few minutes after receiving the vaccine the patient became faint. The patient was placed in Trendelenburg, drank juice and remained laying for 20 minutes. VSS at 1103 when patient sat up. Patient did experience dizziness or blurred vision upon sitting upright. After sitting for several minutes his blood pressure was 100/59.
1347004	5/25/2021	CA	42	M	5/25/2021	5/25/2021	Patient had a vasovagal event approximately 2 minutes after receiving his 1st dose of Moderna at the vaccination table. Charge Nurse was immediately called over and patient was opening his eyes and looked a little confused. Patient was able to communicate and alert and oriented X4. Patient was sweating and said he still felt a "little dizzy". Vitals were taken at 9:24 am B/P 190/131 HR 45 O2 99% Resp. 14. Cot was brought over to patient and patient was able to transfer from chair to cot without assistance. After laying down for about 5 minutes vitals were repeated 9:30 AM B/P 114/66 HR 61 O2 100% Resp. 16. Patient then was able to walk to observation area and sat on a chair for the remainder of his observation time. He left without requiring any further treatment.
1347120	5/25/2021	WI	27	F	1/26/2021	2/12/2021	I was diagnosed with right side bells palsy, I was told to take use artificial tear drops in eye, Valtrex, prednisone tapered and pecid .
1347136	5/25/2021	KS	30	F	4/29/2021	5/6/2021	Flu-like symptoms for the first 3 days: fever, chills, body aches, headache, itchy skin, pain in injection site (left arm). A few days later I started my period. It was irregular with severe PMS, panic attacks, anxiety and depression, severe cramping, more bleeding and blood clots than usual, period lasted longer than usual. Every day since I have been having PMS symptoms (anxiety, depression, panic attacks) and cramping. The cramping feels like period cramps but I am no longer on my period. The cramps last all day long and are not going away. I also had severe eye pain in my right eye about 1 week after the injection. The pain lasted for about 2 days, and was a throbbing pain behind my eyeball. I have never experienced any issues with my eyes before. I also had covid January 2021 and did not experience any of these symptoms then.

1347102	5/25/2021	OR	30	F	5/20/2021	5/20/2021	Day 0 (injection) : soreness, pain, and heat at injection site. Swelling of lymph node under left armpit AND lymph nodes at throat and mouth. Headache, fever (99.8F), chills, very strong shivering, fatigue, strong aches and pains in muscles, unusual joint pain, loss of concentration or brain fog, disorientation, drowsiness. Increased tinnitus. Sore throat. Chest tightness. Increased appetite. Day 1: soreness and pain at injection site. Lymph nodes at armpit and throat/mouth still a little swollen. Headache all day. Disorientation or brain fog. Major fatigue. Sore throat. Tinnitus. Lack of appetite. Day 2-4: Insomnia (inability to fall asleep, easily awoken, unable to fall back to sleep, unable to sleep for more than 3 hours at a time). Minor psychedelic visual effects (auras around objects, long tracers following moving objects, brighter or more intense colors). Headache (minor, all day). Drowsiness. Loss of coordination (minor). Brain fog. Day 4 specifically: Irregular menstrual cycle, my period immediately began 1.5 weeks early and very heavy. Flow is unusually fluid and more like the consistency of blood, not viscous like usual.
1347074	5/25/2021	LA	35	F	5/25/2021	5/25/2021	began having severe itching, multi whelped rash all over body and swelling in face, hands, eyes, ears and feet. Went immediately to the ER where she received IM Benadryl, IM Steroid and oral pepsid. Given a Rx for oral Prednisone 20 mg po q day x 5 days and to continue Benadryl 50 mg every 4-6 hours for 3 days. Rash and itching last for 5 days. Patient reported reaction to her PCP on 3rd day.

1347109	5/25/2021	WA	55	F	5/17/2021	5/17/2021	Tingling left side of body, blurry vision, pressure behind left eye, foggy, dizzy, fatigued, hard time catching breath.
1347418	5/25/2021	TX	52	F	4/8/2021	4/8/2021	Later that day I had the worse headache ever. It was the number 2 worst headache I've ever experienced. The headache lasted about a week and a half but it wasn't as intense as it was initially. It gradually got lessened but it was constant and persistent. I had a pain and pressure at my fore head and my eyes hurt as in the muscle of my eye. I also had pain in the injection site with muscle soreness but that went away quickly. The itchiness was different than other vaccines and lasted for about a day. I also started to get congestion in my sinuses and my ears. I also experienced pain when trying to swallow. That lasted about 3 days. It felt like my glands were swollen. The combination of the headache and the ear pain and sinus pressure made me unable to work. Up until that point I was taking ibuprofen to manage the pain and maybe 1 or 2 doses of Benadryl which is what I usually take when I get allergy symptoms like itchy throat. It did not work, I contacted the doctor who said I had a sinus infection. I went to the doctor on 04/22/2021 and received antibiotics (amoxicillin) which lasted 10 days. Around this time, I developed a cough which is still present. The antibiotics did not help, the doctor then gave me steroids on 5/12/2021. They do not seem to be helping. I also took Aleve sinus medicine as well. The cough worsened and I lost my voice around 05/12/2021. My doctor said it was drainage that was causing my cough.
1347658	5/25/2021	CA	58	F	5/10/2021	5/10/2021	Adrenaline rush, chills, fever, vomiting, headache, facial swelling especially around eyes. Chills & fever from 9PM to 3AM the next morning was followed by vomiting 5/11 AM. The headache and swelling lasted 4 days. 5/14/21 I was almost back to normal.

1347440	5/25/2021	MD	35	F	5/21/2021	5/22/2021	Upon waking 5.22.21 around 6:30 PM, experienced headache, fatigue, stomach pain, and nausea. On attempt to rise from bed and travel to bathroom many feet away, experienced increasing dizziness. Nausea increased with dizziness, knelt to toilet - brief improvement in dizziness at that time. Stood and stepped into walk-in shower, dizziness disrupted my ability to perceive what I was seeing - everything appeared to be violent motion so I couldn't discern what was immediately in front of me, also extreme nausea. My balance was completely compromised such that I couldn't determine where I was placing my feet. I found a wall with my hand, and stumbled back to the bed. This entire process took about 10 minutes. I found my bed and vision cleared after lying prone for 30 seconds. I was able to use my phone then to call a family member to help; I was prone for one hour and twenty minutes - fatigued, nauseated, dizzy - while awaiting assistance. I was fatigued and dizzy but recovered after about 6 hours of sleep, hydration, and light eating without medical intervention.
1347504	5/25/2021	WV	66	F	3/11/2021	4/6/2021	I had a horrible migraine. After I described it to my Ophthalmologist, Dr. , he said he didn't believe it to be a typical migraine. I had vision disturbance in my right eye for about 2 weeks. After one week, I called my doctor. I'm not sure if it has cleared up or my brain has become used to it. I had a MRI and I followed up with a Neurosurgeon and he said I have a small brain tumor (meningioma), but it was not a part of the problem. I think that if the Janssen Vaccine hadn't been paused around the time I had my migraine, I wouldn't have been so alarmed and worried.
1347514	5/25/2021	CO	50	M	1/11/2021	3/8/2021	March 8th - Dizziness, heart palpitations, skipped beats, tunnel vision, hypotension. This was followed by 2 weeks of regular PAC's and PVC's noted by my self. This did not seem to be related to any kind of anxiety since I have never had anxiety problems. I eventually had an echo cardiogram on 03/30/2021 which resulted as normal I also wore a Ziopatch for 2 weeks from 03/30/2021 which resulted as normal. By the time I was able to be tested most of my symptoms had resolved.

1343428	5/24/2021	FL	62	F	4/28/2021	4/28/2021	<p>Approximately 5 minutes after shot was administered into my left upper arm, as I sat down to wait my 15 minutes as required, I started to feel a racing heart, lightheaded, shaky, nauseous and strange sensation in my body. I was with my mother and my husband. My husband noticed I was struggling and called over the paramedic on staff. He came over and asked me questions, as to what I was feeling, he brought over a bottle water and asked if I wanted some Cola for the nausea, apparently it helps with nausea. At first I didn't want it, then I ended up taking a few sips. The entire episode lasted approximately 30-35 minutes, and I felt my heartrate returning to normal, however, I continued to feel out of sorts, shaky. Upon returning home, the entire evening of the day in question, I felt a heaviness in my head, ache over my eyes, then my body continued to feel strange, I was very tired, and of course, my arm began aching, I barely slept through the night, feeling strange sensations in my body, aching arm, and headache, nauseated. I had taken Tylenol after getting home from the vaccine shot. I finally got what I remember, maybe 2 hours of sleep, waking up to go to the bathroom, and my legs felt like cement! I could barely walk! Pain was radiating up the back of my legs, thighs, and buttocks. I held myself along the wall to the bathroom and could barely bend. After using the bathroom, I once again felt a tremendous heaviness, cement-like legs, barely making it back to the bed. Throughout the entire day I could barely walk, severe muscle spasms lower back, thighs stiffness, down the back of legs, severe pain. I contacted my doctor, told him of what was happening and he stated not to go back for the 2nd shot due to my issues with the 1st. This has been ongoing since April 28, 2021, today is May 24, 2021 almost one month later and I am no better. Although I have had Fibromyalgia for several years and Chronic Fatigue Syndrome, since the vaccine, it has triggered a complete relapse of my condition, making it unbearable, painful. I have been living on pain meds, and icing/heating on and off. Now requiring physical therapy.</p>

1343421	5/24/2021		52	M	4/24/2021	4/24/2021	RN responded to a call for help in the observation room at about 1115. The pt was found to be on the ground next to his chair and diaphoretic. Someone was supporting his head and his eyes were open. The pt was was responding and A&Ox4. His initial vitals were 96/49, 42bpm, 96% on RA. The pt remained alert and said that he was trying to sit down in his chair, and then found himself on the ground. He had recently walked over from getting his Pfizer covid vaccine. He was unsure if he had LOC or hit his head. The pt said he felt "a little dizzy," but he denied any pain, including head, neck, back, and chest. He denied feeling SOB. The pt was able to sit up with minimal assistance, and then was able to get himself on to a cot that was placed next to him. He vitals were checked and can be found below. He continued to remain alert and respond appropriately. He said he "felt better." EMS was called due to the pt's dizziness, 61/40 BP, and 31 bpm pulse. AMR and a fire crew arrived at 1131, placed the pt on their gurney and monitoring equipment, and brought the pt in to the ambulance. The pt remained alert and was able to transfer himself to their gurney. Report and care of the pt was given to EMS personal. 1117: 96/49, 42bpm, 20RR, 96% RA 1120: 81/31, 47bpm, 18RR, 95% RA 1123: 61/40, 31bpm, 18RR, 95% RA 1125: 110/53, 53bpm, 18RR, 94% RA 1127: 100/61, 57bpm, 16RR, 94% RA 1131: 113/62, 66bpm, 16RR, 95% RA
1343403	5/24/2021	OH	46	F	5/20/2021	5/22/2021	Patient called today to report having hives on her arm after her 2nd covid shot on 5/20/21. She received moderna. I filled out the report. advised her to take benadryl and keep an eye on it to be sure it did not spread or worsen. Also advised her to report to vsafe. pt was going to call me back this evening to get website since she did not have paper to write on. She did not call back
1343375	5/24/2021	DC	15	F	5/14/2021	5/15/2021	Suddenly my vision got super bright and I could hardly see, and then I couldn't hold myself up and I slowly collapsed onto the ground. It only lasted a few minutes, and then I was perfectly fine. It came on very suddenly and didn't last long, but it was extreme during those few minutes. It was also very hot that day. And I had a mild migraine headache in the morning, but that wasn't very bad, and I get migraines fairly regularly.

1343229	5/24/2021	SC	13	F	5/21/2021	5/21/2021	Friday, 5/21 around 11:55 she received her first dose. 20 minutes later she complained that it felt like someone punched her in the face, and her left cheek was swelling. She looked woozy, with her eyes closing, and the nurses laid her down on the floor on a mat. Her tongue and throat began swelling, and she was having extreme difficulty breathing. She then could not feel anything from her neck down, like she was paralyzed. The nurse administered an EpiPen and EMS showed up minutes later. In the ambulance, EMS administered another EpiPen, gave her a steroid and Benadryl and rushed her to the hospital. Once at the ER, she was still having a hard time breathing, and could not feel anything from the waist down and could not move her legs. She also complained about her spine being in extreme pain around the mid to lower back. When her symptoms did not resolve, she was admitted to the hospital for observation and treatment. She had extreme pain in her joints - spine, hips, knees, ankles and toes, if someone tried to move them, she could not move on her own. She also had tingling and numbness that would travel up and down her body - weakness in her arms and legs. The medical staff continued with Bendryl - switched to Adderax, and Motrin and steroids (Prednisone?). She was discharged from the hospital Sunday, 5/23/21 in the afternoon. This morning (Monday 5/24/21) she is still experiencing back and leg pain, weakness and cannot walk with out assistance and it is extremely painful.

1343520	5/24/2021	CA	13	F	5/17/2021	5/17/2021	Patient received her first dose of the Covid vaccine without a problem. She was reading a magazine in a chair while waiting for me (her mother) to have the second dose in the same room. About 5 to 10 minutes has passed since patient had received her injection. I looked over at patient, her eyes had rolled back and she had slumped in her chair. I ran over to her - her face was very red and she did not appear to be breathing. Her eyes were open but were not focused. I sat her up as straight as I could while the technician who administered the vaccine ran for the pharmacist. This took a few minutes. By the time the pharmacist arrived patient was gaining consciousness but began throwing up (although mainly dry retching). Her face had gone pale. The pharmacist was very helpful - she gave patient some Coke to drink and took her blood pressure, which was low. After 30 minutes of observation we were allowed to leave. The event was very frightening. Patient was very pale for the rest of the day. She had a severe pain in her left arm (and leg) which gradually improved over the next three days. We are very worried about her taking the second dose of the vaccine.
1343276	5/24/2021	NV	58	F	5/12/2021	5/16/2021	Blurred vision suddenly onset. Right eye diagnosed with posterior vitreous detachment and left eye liquefaction. Both eyes have floater with right eye very significant visual disturbance. No safe treatment (surgical) so it is wait and see to determine if retinal will be affected
1343265	5/24/2021	FL	32	M	5/19/2021	5/19/2021	The first 10 minutes everything was fine then started sweating uncontrollably, vision went very white and hearing felt like I was in a tunnel. Felt some pressure in my heart and my heart still feels different, best way to describe it is I feel my heart beating which is something I never had before.

1343328	5/24/2021	MD	66	F	5/1/2021	5/20/2021	2nd shot. Work up next morning severe headache, fuzzy vision. Had reoccurrence of black floaters in both eyes still happening on day 5 no sign of them leaving. These floaters have been gone for 2 years. Day 1: floaters vision issues, headaches, slept 21 hours, leg cramping. Joint swelling Day2: slept 18 hours left knee swollen, could not put weight on it by afternoon. Eye floaters continued headache Day 3: left knee still swollen could not walk on it without brace, floaters continued, slept 14 hours Day 4: left knee swollen, swelling in bone of left hand that has arthritis. Floaters still in eye Day 5 left knee swollen but can put weight on it. Floaters in eyes still bad.
1343444	5/24/2021	MA	20	F	5/24/2021	5/24/2021	Patient received the Janssen vaccine at approximately 11:30 AM and was asked to stay sitting for a 15 minute observation period. After five minutes, the patient reported signs of blurred vision and upset stomach. The patient was also noticeably sweating. The pharmacy called 911 and medics came to assess the patient. Medics decided to take the patient by ambulance to the hospital because of "a risk of fainting".

1343467	5/24/2021	NJ	13	M	5/22/2021	5/23/2021	At first patient was fine just sore arm. Approx 2pm the next day we were at Aunt's house & he became very sleepy and fell asleep outside. I nudged him to see if he was okay and he couldn't lift his head up all he said was "I hate you" (he didn't want the shot and I had a feel well) I kept nudging him to go inside and he didn't react. Finally after 25 min I had my brother in law carry him upstairs. He didn't wake up for it (the kid is 13 that never happens). Every hour I checked on him and he wouldn't wake up. I am a nurse do figured the shot made him tired but I did start to get anxious I even sternal rubbed him and he reacted to pain but would not wake up. Finally around 445 I told my husband we need to make him drink something and I stood him up he would not wake up. I was trying everything but we got him up enough to gulp down some gatorade. We put on his sneakers and he basically sleptwalked down the stairs went right to car and fell asleep again. It was like he was too tired to stay awake. We got him home and around 515 kept him sitting up in kitchen. Took him about 20 min to fully open eyes and wake up. When he was fully awake he said it was like the shot moved from his arm to his whole body when it happened and that was it. He was sore and achy after that and even today to generalized body. But he was fine as far as not lethargic after.
1343477	5/24/2021	KS	31	F	5/22/2021	5/22/2021	10 minutes after injection I developed tingling to the left side of my face, initially only effecting my lips and mouth. This progressed over the next 24 hours to include my eye, and cheek. It continued to progress to my forehead and downward my left arm 30 hours post injection. I sought medical attention and was diagnosed with parsesthesia. 30 hours post vaccine when the tingling was at its worst I developed a fever, muscle aches, and general malaise, I treated with 600mg ibuprofen PO. The tingling now 48 hours post vaccine has improved however is not completely resolved.

1343390	5/24/2021	IL	37	F	1/28/2021	1/28/2021	On 1/28/21, immediately after receiving the vaccine, I had pain at the injection site on the left arm. Then I had a headache that turned into a migraine, starting at 5-6 PM on 1/28. When I woke up on 1/29/21 at about 9 AM, I had a migraine that was especially painful behind the left eye. Then I had numbness and tingling on the left side of the face, with swelling and a slight droop on the left side of my face, from the eyebrow, to the cheek and downwards. I also had spinal pain. I endured this for the next 3 days. On 1/31/2021, the drooping and swelling went away in the morning. I took ibuprofen and Tylenol, and the migraine went away on the 1/31 at between 6 and 8 PM. The spinal pain vanished at about the same time as the migraine. I called my doctor on 1/29, and I was told to go to the ER if the symptoms became unbearable. I never went to the ER, though. I just intermittently took Tylenol and ibuprofen to manage the pain between 1/28 and 1/31. When I went to get the second vaccine, the nurses refused on account of my previous experiences, because they didn't want to risk my becoming paralyzed. The nurses told me that if I received a release from my doctor, I could get the second injection at the hospital under my doctor's care. My doctor told me that if the nurses had concerns about paralysis, she could not authorize a second injection.

1343189	5/24/2021	MA	56	F	5/20/2021	5/20/2021	She got her vaccine, she told her about the medicine that she had anaphylaxis too, she asked if she had any lip fillers. She waited the 15 minutes and then left, then started with a really bad headache and nausea, which she was fine before that. On the way home her husband wanted to stop and she said no as she was sick, made it home and started throwing up, very tired and went to bed which she never does but was extremely sick. Had fever of 100.1. She would go from sweating to fever, aches and pains, flu-like symptoms, everything hurt, pain in the arm, couldn't use her dominant arm but has lymphedema in the other arm due to having her breast removed due to cancer. Her lips were hurting her and never has chapped lips and had a lot of pain in them. Looked in the mirror on Friday as her lips were really hurting and found they were swollen and her eyes looked like somebody had punched her in them. She called her doctor and they did not return her call. She didn't feel it was anaphylaxis as she did not have any other symptoms. She put ice on her lips, had take a Zyrtec before the vaccine, but did use the Nasacort and couldn't figure out was going on. She had not used anything new on her lips or anything. Was thinking she had partial anaphylaxis. Went online and saw the reactions as they did not give her a list of them. She called her doctor and they told her to go to the ER. She still has some swelling and redness with pain, but not an emergency for her to go to the ER. Her lips are swollen, very tiny flat things in her mouth. Wants to know if she's OK to get 2nd vaccine as her PCP will not call her back.
1343013	5/24/2021	CA	15	F	5/23/2021	5/23/2021	Systemic: Fainting / Unresponsive-Mild, Systemic: Shakiness-Mild, Additional Details: pt immediately said she felt dizzy& eyes began to roll. Mom stated she has a fainting condition. Her Mom & I eased her to the ground. she briefly passed out, but immediately came to and asked what was happening. Her right leg was bent back but we lifted her to straighten leg. I elevated her feet & got her some water. I also got her some gatorade & a cool wet paper towel for forehead. She leaned against her Mom for a little while, then she sat. Mom said not to call 911

1343051	5/24/2021	SC	56	F	4/19/2021	5/13/2021	?Brainstem Encephalitis? Patient admitted to inpatient on 05/16/2021. Presented to the ED with dizziness, nausea, general fatigue and diplopia. Patient also voiced an intermittent mild headache. Patient was evaluated at an Urgent Care on 5/14/2021 with a ?presumed viral type illness?. In the ED, the patient denied neck pain, photophobia, eye pain, one sided weakness/numbness, facial droop, cough, congestion, and SOB. Temperature max at home was 100.8F. The patient does have gaze deficit and nystagmus on exam. Negative toxicology screen. Negative SARS-COV-2 Antigen. ALT 86. Medical history includes: hypertension, depression, Vitamin D deficiency. Neurology- This is a 56-year-old patient referred to Neurology secondary to diplopia. The patient states that her symptoms started with generalized fatigue and "not feeling well". After 2 to 3 days [last Thursday 5/13/2021] she began having difficulty with double vision. She has double vision in multiple directions. The double vision is fairly constant. Along with the double vision she feels off balance to the point where she has difficulty with walking. She does admit to internal vertigo. Patient denies any recent viral infections. She is about 4 weeks out from her last COVID-19 vaccination which was Moderna. During the hospitalization the patient has developed urinary retention requiring a foley catheter. Hospital medications include IV Solu-medrol and subcutaneous heparin. Patient seen by internal medicine, neurology, infectious disease, and urology during hospital stay. The patient was discharged on 22MAY2021 after demonstrating ability to ambulate. Will continue with physical therapy outpatient. See Tests and Lab Results Below

1343052	5/24/2021	OH	64	F	5/5/2021	5/9/2021	She got her vaccine, she had no reaction that day at all, kind of laid around with no energy. She went to the ER on 5/2/21 due to her eyes, and then she continued to have problems with her eyes and went to the ER again on 5/12/21 she was completely broke out with little raised bumps, all over her body, her neck, her chest, back, legs, stomach, arms. Very itchy and her face and her eyes are staying real red and puffy. She gave her the prednisone and Pepsin and Benadryl, which she took for the entire course which did not help. Then I went this past Wednesday 5/19/21 to an UC and they gave her Cephalixin which she takes every 8 hours, and still trying to take Benadryl, but it's not helping her. She still continues with all of the rashes, and went and boat oatmeal bar soap and oatmeal bath trying to get rid of the rash, but that is not really working either. She even has sores in her head that are oozing, and was told to use baby shampoo which has not helped. She still continues and cannot get relief from the itching. She eyes are so bad and itching that she has to put cold compresses on them. She says that her skin looks like she has been burnt real bad, especially her eyes and face. She said that you can see the red bumps on her arms, and most of her body which is very noticeable. The UC suggested that she needed to see a dermatologist. She feels that she needs to be tested to see what she is allergic to. She continues with the same symptoms, has soreness around her eyes, and has not had any improvement with the antibiotics either. The skin of her eyes are so sore and says it looks like somebody has hit her hard and the skin is dry to touch. She bought some Vaseline to see if that would help the area as well, and would like something done as it is almost a month and nothing has helped.
1343101	5/24/2021	TX	37	F	5/20/2021	5/20/2021	My left eye started twitching 5/20 a couple hours after I received my 2nd COVID vaccine. It's been several days and my eye is still twitching. Sometimes it twitches several times an hour and sometimes I go a few hours without twitching. No other symptoms and only my right eye has the twitch. I do not have a history of eye twitching.

1342964	5/24/2021	KY	15	M	5/15/2021	5/23/2021	At approximately 6 PM on 05/23/2021, family was sitting down for dinner when all of a sudden she noticed that he was turning his head to the left and appeared to be falling out of his chair. Mom states that eyes were darting back and forth at this time. He was not responding to her shouting his name and his left arm was curled in towards his body with the rest of his body remaining stiff. This lasted approximately 1 minute, followed by a time of confusion and drowsiness. Approximately 1 minute later mom states that patient's eyes rolled back to his head and he had full body movement consistent with tonic-clonic seizures. Family were able to lay him onto the ground during this time. Mom denies any color change, apnea, or loss of bowel or bladder. States he did have one episode of emesis following the event, and 2 episodes of emesis in the ambulance on the way to ED. Patient has no previous history of seizures or seizure-like activity. No new ingestions. Has not been sick recently and denies any new sick contacts. There has been no head trauma. Per Mom, patient's dad has a history of "partial seizures" but never required any medication for them. At arrival to the ED he continued to be drowsy and not at his normal baseline. Continue to hold his left wrist up toward his body in a contracted manner and tended to have repetitive speech. Briefly, ER course significant for a CT head and evaluation by pediatric neurology. CT head was unremarkable for acute intracranial process. A CBC, CMP, and coags were also obtained due to patient's continued contracture positioning and the possibility of a stroke. CMP was unremarkable with a sodium of 139, potassium of 3.7, chloride of 107, bicarb 25, BUN of 12 and creatinine of 0.64. CBC was also unremarkable with WBC of 10.72, hemoglobin of 14.8, hematocrit of 44.4 and platelets of 370. There was 81.77% neutrophils after evaluation by neurology it was felt that the patient remained postictal and recommended that he be admitted on continuous EEG and possible MRI in the a.m.

1344362	5/24/2021	IL	15	M	5/24/2021	5/24/2021	Pt reported to briefly lose consciousness and stated that his vision changed. Pt did not fall completely from chair. Pt was gently lowered to the ground. Pt was alert and oriented x 3 and vision restored while lying on the ground. Patient was given water but then when he sat up, he soon became unconscious again and again was gently lowered to the floor. Regurgitated/ spit out the water. After initial confusion, was alert and oriented again.
1344068	5/24/2021	NC	69	F	1/15/2021	1/24/2021	I woke up in the morning, the site was swollen. It was as big as the palm of my hand. Raised and red. Extremely itchy. Glands in my face and upper neck were swollen. Eyes were swollen. Broke out in hives below my neck into chest. About 20 hives. Raised and oozy. I was told to get in to be seen very soon by a nurse I spoke to. I went in to the doctors office that afternoon. It was well into April until these symptoms left me. I had no problems with my second shot.
1344072	5/24/2021	NY	58	F	5/24/2021	5/24/2021	I waited 30 minutes after the shot, then left the building to head home. About 10 minutes after that, I developed hives on face, neck, chest & arms. I had a very bad headache, swollen glands, stiff neck and some upper back and abdominal pains, slightly blurry vision. I went back to the facility and was checked out there. Was advised "not to worry" and sent home. I took Benedryl that I had brought from home which helped with the hives. Took Tylenol after coming home.
1344074	5/24/2021	CA	24	F	5/20/2021	5/22/2021	Severe fatigue, starting one day after 2nd dose on may 21st, worrisome brain fog starting on may 22nd, constantly waking up in the middle of the night since may 20th, dry mouth and eyes since may 20th, slight irritation around lips

1344095	5/24/2021	CA	47	F	1/21/2021	1/21/2021	<p>Within 5 minutes, I felt soreness in my arm right away and my arm started throbbing. I got warm all over my body. My airway (not my throat or tonsils) in my chest area started to close and constrict. But it only went so far - it didn't finish closing. I got the sensation that I was going to faint. I was in my car. I yelled for help and went out of my car. I had no energy or ability to walk. I went down to ground and could barely lift my head up. I got very lethargic and was extremely tired and nauseous and I could hardly think. The person who gave me the injection and another lady who was helping out came to help me. My intuition told me I needed Benadryl and my hands were kind of moving to try to get Benadryl. But I could hardly get up. I wanted to call 9-1-1 but my toddler had my phone. I couldn't kneel up even to get my phone to from my toddler. I couldn't walk. They took my blood pressure and heart rate and noticed during the episode that they both had spiked. They said they couldn't give me Benadryl because then they told I wouldn't be able to drive. Then I had a second episode - where I started feeling like I was going to pass out again and a feeling of doom was coming over me and I think I asked for Benadryl again. I could barely hold up the pulse oximeter - I think I was dragging it on the ground; I was on the ground on the parking lot. I thought I was going to faint but I was able to finally get my phone and call my sister. My sister showed up and got dropped off. The ladies didn't help out at all and my sister was going to drive me away. My limbs were really cold and feet were really cold all the way to my knees. I asked for a heating pad. I couldn't get up for 30 minutes, and then for an hour. My tried to get better and I could barely stand up. It took me awhile to get into the car; my sister had to help me. The next day, I was still in the same predicament. I couldn't get up and walk around. After a really long time of resting, I could go a short distance to go to the bathroom alone. My sister (I was staying at her house since I couldn't take care of myself) finally said that my intuition had told me to take Benadryl and she said I should take one. I took a half of child's of Benadryl because the people at the vaccine site had not thought I should have one and that it would just go away. That 1/2 dose gave me hope that I could get better but I still didn't know if I should have a full dose. The Benadryl would help for a little while. I finally went home the the next day.</p>

---

I went to ER and I couldn't still walk very well on my own. On January 23, 2021 - t he ER. The doctor thought if she gave me an EPI pen but thought I might have more problems with it. She said that if Benadryl was helping than to keep taking it. The doctor didn't give me a dosage. I went back to ER on the 27th because I still was not getting better. I was taking Benadryl and I was taking inhalers and at first I thought I felt like my airway felt more open when I took these but it didn't last for long. I didn't know, without guidance, how to take the medication - how much and how often. I couldn't think straight. On the 27th, that doctor listened but he wanted to help me. He gave me Steroids for 5 days and Benadryl on top of that. And gave me Ativan to help me sleep. I had been going without sleep - I didn't have any other adult watching over me after the 3rd or 4th day when I left my sisters' house. Before the second ER visit, I didn't know when my airway was going to close. I could feel my heart racing/beating even when I wasn't doing anything. My heart rate would spike up to 119 or 120 randomly. I felt like my heart was beating out of my chest. About 5 or 6 hours after the Steroids there was popping sound out of my ears. It was loud and happening a long time, I wasn't sure I could sleep but I wasn't as aware of my heart beating out of my chest either. I could finally walk that next morning after the Steroids. I was trying to play with my toddler even though I felt fatigue and felt like crud - but I could walk without feeling I would collapse. So I over did - I tried to take a walk to the end of the street and I couldn't do it. My back hurt so bad after that. When I would lay down, I could not get the heaviness in my back to go away. It hurt so bad. I had a lump in my throat ( a little lower than my throat). That was scaring me. I went to ER again (third visit) - 28th or 29th - tests came back normal. I think it was the 28th. On that night, I was still on prednisone and I couldn't sleep with the pain. They gave me aspirin in case it was a heart thing. The aspirin may have helped with back pain. I took my Steroid pill and Ativan and that was my first night's sleep. The next morning, I could walk and I started to get a lot more hope at that point. I think I took Ativan for a couple of nights and got some good night's sleep. I took the Prednisone for 5 days and I didn't feel anymore like I couldn't stand up or that I was going to fall or that I needed supervision anymore. After about a month, I had

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							<p>enough energy to finally drive and go to the store. I had been scared to drive because of my symptoms before that. By mid February, I was able to drive out and I went to a couple of stores. At that point, I felt like I was going to get better. I'm a single mom and have been doing everything on my own for 20 years. I was talking to the doctor's office and to the nurse almost every day when I was sick. I don't get sick and I don't ever have to ask for help. I was disappointed with the lack of help I received.</p>
1344127	5/24/2021	PA	17	M	5/24/2021	5/24/2021	<p>patient was dizzy, pale,sweaty, blurred vision, and bp was low</p>
1344162	5/24/2021	CA	41	F	5/20/2021	5/20/2021	<p>Approximately 3 hours after vaccine, I began to have tingling on my upper lip (area where I typically get a cold sore). Tingling continued to spread to the left side of my face, including my eyebrow, eye and temple area of my head. Tingling has persisted to both of my arms, hands, legs and feet. It comes and goes, and has continued through-out the day. Itching has now developed on my arms, right breast (nipple area) and feet. I have a general "internal" itch that I can't seem to scratch on my arms, legs and feet. On Saturday 5/22, Sunday 5/23 and Monday 5/24 I have also experienced strong nerve pain in my left eye and the lower right side of my head. The pain is sudden, strong but goes away fairly quickly. My left large toe also has developed a numbness, started off with a lot of tingling in that toe. My head generally has a fullness feeling, specifically my ears have a throbbing sensation that I also equate to a similar feeling when my cold sores are active. There is a dull ache behind my ears and the lower back of my head. I developed a headache starting on 5/20 (over the counter meds helped with that) Pain at injection site lasted for 3 days, but was manageable and did not interfere with daily activities. I have not had a cold sore develop as my dr told me to take Valtrex, I have taken one pill of that on 5/24. I also have taken Tylenol on 5/20, 5/21, 5/22 - 500mg 2 times a day.</p>

1344397	5/24/2021	CA	48	F	4/10/2021	4/10/2021	I experienced first day of the evening, had a hard time standing, my legs were hurting really bad. As I was driving my left leg was getting stiff, got a spasm. No side effects on my left arm. I also had a bad headache at night. I drank plenty of fluids, I do massages to relieve the pain. I also did peppermint oil and my back upper back was hurting bad on Sunday morning and by the afternoon my right arm was swollen, my joints in my hands hurt and could feel and was having pain opening and closing my hand. The rest of the week, I had constant headaches. My headaches are more intense behind my right eyeball. As the days went by I started to feel tingling sensation to my right side of my face and jaw which lasts about 6 seconds. I've had it also on my left side of my face. My legs feel very heavy and weak and I feel my les feel like they will give out. I also feel my joints hurt, on my right foot, where my joints start fusing together, my doctor prescribed a cream for my joint pain to my feet. The pain I feel on my arms, back and legs is still present. On my left shoulder I feel pain to my collar bone. I also get this pain on my back on my shoulder blade, right side as well, like a pricking, poking sensation, this pain comes and goes. I also started to have bladder issues, where I've lost muscle control and will be seen by an urologist on 06-04-2021. These are pain that I did not experience before. My right knee also got inflamed, to the inside part of my knee and pain to my right calf that comes and goes. I had an U/S of the right calf which are still pending. I also did an anti body test; i do not have the virus for covid.

1343559	5/24/2021	KY	14	F	5/20/2021	5/20/2021	Approximately 2 hours after receiving her first covid vaccine, my 14 year old fainted. She was standing in our kitchen at home and became dizzy and started falling backwards. She said her vision was black, she was hot, her head hurt, I could see sweat on her face and chest, and she said she was having tightness in her chest/not able to get full breaths. She didn't totally lose consciousness, but she was disoriented. These symptoms lasted a few minutes, then she felt fine.
1344278	5/24/2021	KS	15	U	5/13/2021	5/13/2021	blurred vision, felt hot, pupils enlarged, loss of bladder function, no loss of consciousness, HIVES
1343722	5/24/2021	OR	47	F	3/3/2021	4/6/2021	She got her vaccine, was fine. The next day she was exhausted, but nothing unusual. Then about 4/6/21, a month later she started slowly losing her vision, and got her vision back for about 2 weeks, and then she slowly started losing it again. She went to her primary care who told her nothing, and told her to go to the ER. She went to two walk in clinics, the ER, an ophthalmologist, a neuro-ophthalmologist. She has been to a retina specialists, two other neuro-ophthalmologists, and a neurologist who do not know what is wrong with her. They tell her that her eyes look healthy and good but she cannot see. Her left eye she may have about 5% of her vision and 15-20% in the right eye. She was given dry eye drops by one of the earlier physicians. She has had some follow ups, and the neurologist told her to drink water eat low carbs. So, she is frustrated at this point that nobody knows what to do and treat her eyes and is depressed. She lives alone and is not able to see to read her credit card info to order food or to see what she has to eat. She was also given Xanax, which she has not taken yet.

1343747	5/24/2021	CA	40	F	5/20/2021	5/20/2021	When Observation Staff was releasing patient, patient reported not feeling well some itching on her neck, asked her if she could walk to the tent, she replied yes. She grabbed her belongings and walked to the tent, sat in the chair without assistance. I asked if she preferred to lay down on the cot, she replied, "yes, that is probably a good idea?". She complained of itching on her neck, hands bilaterally, and lower leg bilaterally for the last 5 minutes that "feels like a bad sunburn?". She reported this is has happened before, several times, and is seeing a "Functional Medicine Doctor" for the past 2 months to try and diagnose this condition. She mentioned the functional medicine doctor recommended she receive the COVID-19 vaccine. She also began to feel a headache, dizzy "but not because my head is spinning but because the ground is unstable?". No visual rash present on areas reported as itchy. She reported a history of low blood pressure, SVT, mitral valve regurgitation, hives, and Lyme disease. She mentioned her dad drove her here and is waiting in the parking lot. Reported she does not take any prescription medication only takes vitamin C, Zinc, a probiotic, and Claritin as needed for the itching. She mentioned she had some blood work done recently due to hormonal imbalance, digestive discomfort, and her history of Lyme disease. Orthostatic laying: BP 105/64, HR 90 SPO2 99, BPM 19, 4/10 pain with the burning sensation Sitting: BP 105/62, HR 90 SPO2 99, BPM 18 Standing: BP 117/64, HR 90 SPO2 99, BPM 18 able to stand with out feeling dizzy or lightheaded for 5 minutes Took vital signs and chatted with the patient about her symptoms and she reported this reaction is similar to what she has been feeling in the past and why she is seeing her Functional Medicine Doctor. She had not taken Benadryl for this reaction recently and said it made her feel "really drowsy" and does not remember it helping much. She brought Claritin 10 mg and took it since it what her fictional medicine doctor recommended. Since her vital signs were WNL, she denied feeling worse, history of similar symptoms and events, patient was escorted out in a wheelchair for safety. She said she felt like she could walk on her own but agreed to be escorted out in the wheelchair. Wheeled out by PHN, patient was able to get out of wheelchair and into the SUV without assistance.

1343777	5/24/2021	NC	18	M	5/24/2021	5/24/2021	Upon standing post-vaccination, patient fell into the floor, eyes rolled back into his head, and was convulsing. Upon regaining his whereabouts, patient stated he did not recall anything that had happened. He had impaired vision, tinnitus, and was ashen in color. I was able to get the patient into a chair and he experienced two more episodes within 5 minutes. 911 was called. Patient requested water and it was provided. Paramedics arrived and conducted multiple tests (blood glucose, blood oxygen, blood pressure, heart monitoring). Patient refused referral to the local hospital and left the pharmacy within 30-45 minutes after the incident without any further problems.
1343370	5/24/2021	MD	47	F	5/21/2021	5/21/2021	I received the injection at 10am. I felt fine until 3:15. Around 3:15, I started feeling like I was coming down with the flu. I could tell I was starting to run a fever because my eyes were feeling hot. That is how I always know I have a fever. By 6:30, I had to go to bed and was freezing cold with chills. My body was aching extremely bad as well. I was in flannel pajama's and covered in blankets but could not get warm. I just shook and shivered for hours. My highest temperature got to 101.7. I was not able to sleep during any of this time also. My body hurt no matter how I laid. At 12:15am, my fever broke and I was sweating. My body still ached and for a few hours I laid sweating. I was not able to go to sleep until about 3:45am that night. The next day I felt better but my body still ached some, but less than the night before. My neck however was really hurting. Could possibly have been due to the chills??? I had a migraine and had to take a Zomig to relieve the pain. Sunday my body was still aching a bit but better than the day before. Overall just tired and run down on Sunday.

1343687	5/24/2021	NY	40	F	5/22/2021	5/22/2021	10:38 patient experienced slight numbness of the right cheek. Obtained history, not very good at giving info about history. 10:40 took BP 132/92. Denies hx of hypertension. denies having tightness of chest or difficulty breathing. 10:48 given benedryl 50mg. 10:58 reports feeling facial swelling improving, but complains of tunnel vision similar to when she has migraines. 10:59 assessed by NP at site location. Moved to Exam room for closer observation. NP informed patient if symptoms worsen she would be transport via EMS. 11:27 BP 135/85 pulse ox 98% pulse 76. Reports no further symptoms at this time and existing ones resolved. 11:31 patient allowed to leave with NP informing patient that if any symptoms return to be seen by a doctor. Talked with patient today at 11:30, to which she informed me that her arm was swollen and he face was slightly this morning. I asked her to see a doctor. She was going to call the Clinic and see NP that saw her Saturday during the clinic
1343792	5/24/2021	TX	14	M	5/17/2021	5/17/2021	Patient (14 years old) fainted in the observation area receiving the first dose of the Pfizer vaccine. Patient fell from chair and had some scratches to right temporal region. Patient was accompanied by his mother. Patient was assisted to chair and appeared very pale and disoriented to time and place. EMS was called at 1138. Patient also stated his vision was blurred, reported nausea (emesis x1), and reported feeling very weak and ?really weird?. Patient also reported he was very sleepy and wanted to go to sleep. Patient was kept awake. Mother stated patient had history of ADHD and anxiety but no other past medical history. Paramedics arrived at 1145 and assessed patient. Blood glucose and VS were normal. Patient continued to report feeling unwell and wanted to go to the hospital but also wanted to ?stop for food?. Patient?s mother reported that patient was starting to sound like his normal self and that his color was returning. Patient?s mother agreed for the paramedics to transfer patient to ED for further evaluation. Patient left in ambulance at 1157.

1343961	5/24/2021	WI	17	M	5/21/2021	5/21/2021	Patient fainted (loss consciousness) a couple of minutes after receiving injection. Mom caught him and called for help and reported his eyeballs rolled up and he started down when she caught him. by time Pharmacist and store staff got there (less than a minute) he had regained consciousness but very lightheaded. No breathing difficulty. So got a chair and had him sit with head down and store staff observing. After another 10min he still reported lightheaded and nausea, so ambulance was called. When they arrived and checked him out everything checked out normal and he was feeling better so they released him to his parents care. Called on 5/24/21 at 10:10am and spoke to mom who reported he was doing fine and no apparent after effects.

1343863	5/24/2021	WA	38	F	5/8/2021	5/16/2021	Typical tiny bit sore arm immediately after injection that was relieved by Tylenol. whole body aches the next 2-3 days that also was relieved by Tylenol. All symptoms subsided by after the initial few days and I was back to normal. I am an athlete and was able to run and do my normal highly active routine after injection until 10 days later when I suddenly woke at 2:30 am unable to barely move. My whole body felt numb and super weak. I was severely dizzy and lightheaded so I went back to bed until 6:30 am and the symptoms persisted so much and scared my husband enough to stay home from work to keep an eye on me. I slept so much that day and severely lightheaded dizzy and body numbness even on 1,000mg Tylenol. I am a highly sensitive person and a red head. I waited this long to get the shot because I know myself so well and wanted to see everyone else's reaction. My husband got the Johnson and Johnson a week after mine and he was fine. No reaction. I called the cdc immediately after my reaction, I also had an odd swollen arm at injection site that wasn't there for 10 days that appeared out of no where and it was super tender and painful and hot and itchy. The CDC said to call my doctor who said they haven't seen or heard of this reaction yet and I should go to the ER if needed. We don't have health insurance and I wasn't having troubles breathing and felt they couldn't do anything for me so I decided to stay home and rest. I am 2 1/2 weeks out now and still dizzy and lightheaded but no swollen arm, that lasted day 10-12. I am concerned getting the second dose as I hear it way worse.
1343998	5/24/2021	TX	53	F		5/21/2021	05/21 intermittent breathing issues - full breath hard to take and caused a cough. happened once every few hours lasted through 05/23 05/22 started feeling warm - low grade temp 98.9 around 4pm only lasted about 4 hours 05/22 body aches around 6pm - lasted until 05/23 am 05/23 fatigue - could not fully wake up. even when up eyes were heavy and felt like closing. 05/24 nausea in the morning. included vomiting. brief dizziness when went back to bed 05/22 - 05/23 diarrhea 05/22 - present. injection site sore / upper arm hurts 05/24 - midday - muscular pain around midsection - hurts when taking deep breath or twisting 05/22 - 05/23 chills 05/21 - 05/24 just not feeling good

1343857	5/24/2021	DE	37	M	5/7/2021	5/21/2021	After first shot, had outbreak of psoriasis after 7 days on chest. Have not had an outbreak in that area in 10 years. 2 Weeks after second shot, had second outbreak of psoriasis on left side of body, also had outbreak of shingles on L arm and L side of Face, around and under the L eye Went to the walk in clinic on SAT 5/22/2021 after noticing purple colored blemishes/eczema on face , was diagnosed with shingles and prescribed Prednisone and Acyclovir
1345272	5/24/2021	TX	32	F	2/2/2021	2/12/2021	Headache, parathesias, visual disturbances, neurological impairments
1343827	5/24/2021	CO	39	F	5/24/2021	5/24/2021	At 10:58, patient reported feeling of "foggy ness" which she stated was "like air in my head" after receiving Janssen vaccination at 10:53. Patient was found sitting outside of vaccination bus, alert and oriented to person, time, place and event and did not appear to be in distress. Patient denied shortness of breath, dizziness, blurry vision, weakness to one side of body, feeling of syncope, and was negative to all signs of the Cincinnati stroke scale test. Patient's vital signs were monitored for the duration of event. After 15 minutes of monitoring, patient stated that her feeling of "foggy ness" had improved but that it still mildly lingered. Patient was offered a call for emergency services but patient denied them and stated that she would seek further medical help if her condition worsened, or continued. Patient stated that she was going to visit a medical facility after leaving vaccination clinic.
1343806	5/24/2021	KY	65	M	5/23/2021	5/23/2021	Systemic: Allergic: Difficulty Swallowing, Throat Tightness-Mild, Systemic: Allergic: Swelling of Face / Eyes / Mouth / Tongue-Mild, Additional Details: Patient came to pharmacy and stated that his doctor looked at his medical history and said he can get a COVID vaccine. Answered questionnaire and stated no allergies to anything. Gave pt the vaccine, and then patient told us that he had history of Guillain-Barre Syndrome. Gave patient cold water. Patient requested some table salts and 2 tabs of 25mg diphenhydramine. Patient refused EpiPen and calling 911. He sat for at 45 minutes to an hour before leaving. He said he was feeling okay when leaving

1343793	5/24/2021	FL	32	M	5/19/2021	5/19/2021	Site: Pain at Injection Site-Medium, Systemic: Cardiac Disorder (diagnosed by MD)-Mild, Systemic: Dizziness / Lightheadness-Mild, Systemic: Exhaustion / Lethargy-Mild, Systemic: Hearing and vision difficulty-Mild, Systemic: Flushed / Sweating-Mild, Additional Details: Vitals were normal after 30 minutes
1343878	5/24/2021	TX	21	F	5/24/2021	5/24/2021	After about 5 minutes of administering the vaccine, the associate overlooking the observation area came to tell me a patient was not feeling well. I immediately grabbed my carat and went out to the IMZ area next to pharmacy. The patient was still seated and she was conscious, but appeared very weak, sweaty, and slightly pale and cold to the touch. I immediately made sure she could respond to my questions. She was able to respond. I asked if she had eaten before coming in and she confirmed she had not eaten that day yet. I checked her blood pressure and it was 68/33. I stayed by her side and her mother was fanning her on the other side. I had her take several breaths in and out and could visually see her responses improving. She asked for water, which her father handed to her. I checked her blood pressure again and it was up to 125/68. She reported feeling much better and was able to joke around with her sister who also received the vaccine at the same time. I asked her to sit for an additional 15 minutes, on top of her original 30 minutes, and told her parents I would be back to check her blood pressure gain. I came back into the pharmacy and prepared another vaccine. After I administered the next vaccine, I checked her blood pressure again, which read 95/68 and her mom stated this was normal for her. I advised her to stand up slowly before walking. A few minutes later she came to the pharmacy window for her vaccine card and reported feeling normal and her parents thanked me and they all left.

Reviewed with parents well hydrated today and s/s anaphylactic reaction. Pt to be vaccinated 2nd dose in med eval area when he returns for 2nd dose, parents verbalized understanding.
1341934	5/23/2021	PA	72	F	3/25/2021	4/10/2021	I woke up 16 days after the second shot at 5:00 in the morning with no sight in my left eye. My husband took me to Hospital where I was admitted immediately. For the next three days I had a CT Scan of my brain. Arteries in my neck checked for any blockages, MRI, Heart study with Bubble and I wore a heart monitor for 3 days. I had no symptoms of anything before this happened. All test came out clear and diagnosed with an CRAO (Central Retinal Arterial Occlusion. No reason for what happened
1341840	5/23/2021	FL	27	M	5/23/2021	5/23/2021	After injection, patient jolted and eyes fluttered. He seemed to be having a seizure like reaction. He then slumped to side and head hit side of wall since we had chair with side rails positioned against wall. He lost conscious for maybe 30 seconds and then eyes opened. I asked if he was OK and the first thing he asked for was water. He said he felt light headed and dizzy. I had my intern who was working grab him water from the deli and had him sit and rest. He started sweating and asked for paper towels. I grabbed him a couple of towels so he can wipe his face. I continued to check on him while doing my work. He seemed fine after that. After 30 minutes, I checked his blood pressure. It read 100/63. I continued to monitor him and he left after that. He did have friend with him the entire time who helped him.

1341893	5/23/2021	TX	12	F	5/19/2021	5/19/2021	The patient is a healthy 12 year old female with no medical history or problems, she received the COVID Pfizer vaccine #1 on Wednesday, May 19th at 4pm and was asymptomatic at that time. Within about 5 hours, she began to experience extreme lethargy. By the following day, May 20th, she experienced profound lethargy that lasted 36hrs. During this time, she was asleep but arousable with effort, she described general myalgias, moderate left arm pain at injection site, mild headache, no other symptoms. Her profound lethargy lasted through midday on May 21st, upon which time she was able to keep her eyes open and began to regain her strength. By the evening of May 21st, she was fully recovered.
1341871	5/23/2021	PA	72	F	3/25/2021	4/10/2021	Lost the vision in my left eye. Taken to Hospital in on April 10th at 6:00 in the morning and over the next 3 days had a CT scan, MRI, Heart monitor and Heart Test w/ Bubble. and the veins in my neck tested. Nothing abnormal was found to have caused an CRAO. Since then I have had family members tell me of three other people who had a similar situation happen to them after the second shot and within several weeks of receiving the second shot. I have not regained the sight in my left eye. I had no symptoms of anything before this happened.
1341863	5/23/2021	OH	13	M	5/21/2021	5/23/2021	My son woke up the day following his vaccine and had mild complaints of headache and ?feels like I have a touch of the flu?. He hydrated with water that day very well and I gave him 500 mg of Tylenol. On Sunday (2 days after vaccine) we were at church celebrating outdoor Mass. about 20 minutes into church my son said he didn?t feel well and needed water. He was standing at the time he said this. He had been standing under and umbrella the entire time to shade him from the sun. About 1 minute later he fainted. He visually looked very pale at the time. We treated him with by having sit down, moved him to air conditioning. It took about an hour before he felt back to baseline.

1341725	5/23/2021	FL	94	F	2/11/2021	2/27/2021	Pt had acute ischemic stroke involving right vertebral artery 16 days after dose number one of Pfizer vaccine. She developed sudden dizziness and loss of leg strength, fell to floor. it took 7 hours until she was found and taken to hospital, so did not receive TPA. CTA on 2/27/2021 showed occluded V4 segment of rt vertebral artery. residual deficits currently include imbalance, loss of lower extremity strength (now in wheelchair), loss of hearing and discordant ocular movement.
1341723	5/23/2021	PA	37	M	4/9/2021	4/10/2021	1. Dizziness - Started on 04/10/2021. Continuing in 7th week since vaccination. 2. Tinnitus- Started 1 week after shot, continuing in 7th week. 3. Headaches and pressure behind the eyes - Started 1 week after shot, continuing in 7th week. 4. Ear fullness and pressure in ears - Resolved 5 weeks after shot. 5. Off balance during walking- Started on 04/10/21. Continuing in 7th week.
1341684	5/23/2021	VT	44	F	5/10/2021	5/19/2021	At day 9 after receiving the vaccination I started to have extremely itchy skin around mi mid area( thighs). At day 10, I was very dizzy/faint in the am. My eyes felt weird and The skin rash /itch was now at my thighs, hands and feet. In the pm my lips started to swell up and I noticed tiny red spots all around my stomach and back( lower and upper back). At that point i went to the ER.
1341538	5/23/2021	KS	47	F	5/3/2021	5/7/2021	Developed deep lowerchest/upper abdomen pain on right side 4 days after vaccine was administered. Pain got progressively worse and a rash developed on right thorax in the Thoracic rib 5 region; Visited Army doctor on 12 MAY. Based on visual exam of multiple, tiny water-filled blisters only on right side of thorax + description of pressing pain in chest similar to feeling of a heart attack, both doctors on shift diagnosed shingles. Forgot I received COVID vaccine 4 days before symptoms started so I never mentioned it to the doctor. TRX= 800mg acyclovir 5x/day x 7 days. Rash continued to get worse and spread more before finally subsiding and starting to crust over. Nearly 3 weeks later, rash is now a combo of scabs and open wounds. Pressing deep pain in right chest is persistent and only relieved partially with 800mg ibuprofen q 8 hours.

1341935	5/23/2021	IL	14	F	5/23/2021	5/23/2021	pt fainted/had seizure 50 to 10 minutes after covid vaccine. pt did not fall, dad held her.head and eyes rolled back, shaking and stiff for 2 seconds per dad. pt alert, breathing, and movement looked normal when I saw pt . pt mom called 911 and pt was taken to hospital . no history of fainting or seizures per dad
1341640	5/23/2021	VA	15	F	5/21/2021	5/21/2021	Site: Redness at Injection Site-Mild, Systemic: Allergic: Anaphylaxis-Medium, Systemic: Allergic: Difficulty Breathing-Severe, Systemic: Allergic: Difficulty Swallowing, Throat Tightness-Severe, Systemic: Allergic: Itch (specify: facial area, extremeties)-Severe, Systemic: Allergic: Swelling of Face / Eyes / Mouth / Tongue-Severe, Additional Details: pt's tongue felt funny, then her throat felt tingly, progressed to throat beginning to close. given 50mg benedryl and 20mg pepcid at pharmacy and she went by ambulance to ER. she will undergo further testing this week at allergist to see if she is allergic to polysorbate and peg.
1342331	5/23/2021	OH	18	F	5/23/2021	5/23/2021	Brother told doctor at clinic patient was feeling dizzy & lightheaded. Doctor assisted patient from chair to ground and layed her on floor. Cool compress was applied to forehead. No loss of consciousness and pulse maintained throughout conversation. No history of syncope in the past but brother passed out in eye doctor in the past. After few minutes patient felt better was able to sit up on the floor and take some fluids. after feeling better doctor assisted to walk to car.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1341981	5/23/2021	IN	51	M	3/10/2021	4/1/2021	Patient developed shingles after vaccination and required hospitalization. Shingles rash covered left eye, forehead, and scalp. Hospitalized due to bilateral eyes swelling shut and concern over swelling moving down towards airway.
1342339	5/23/2021	CA	24	F	2/18/2021	2/18/2021	Epileptic Encephalopathy. Severe increase in seizures (number and intensity). Some of the worse ones she has ever had. Started within 3 hours of receiving her vaccine. For 4 days she had some other weird odd side effects besides significant increase in seizures. Weird reactions and increase in seizures with movement of any kind (in wheelchair, in car, carrying her from chair to bed, etc). Never had this before. Looked odd in her face, glassy eyes for a few days, weird movements. Her doctor called it a cytokoline storm type reaction at first but then she never went back down to her baseline for her seizures as they kept getting worse and worse. Finally on March 24th we did a medication infusion via IV to try to break the cycle and then on April 1st we started her on another seizure medication. On April 28 we increased the new seizure medication trying to get her back down to her baseline. She has never gone back down to her baseline, she is still dealing with an increase in seizures. She has days where she is just seizing all day long off and on for no other reason. Her team of doctors and I are 110% (yes 110%) sure this is a reaction to the vaccine. They called off the second dose, considered J&J vaccine but then with the risk of clots and her not 100% stable due to the first vaccine reaction we decided to hold off. This is horrible because for the last year I lived for the day to get her vaccinated to be protected from COVID and now she can't be. I am devastated and so afraid for her life because as you see in her dx she is very high risk for COVID death. We love to travel and just started cruising as she loves it and now we can't because she isn't vaccinated. She can't go back to her life the way she knew it before the pandemic because of the vaccine not being safe for her. :(

1342095	5/23/2021	CA	78	M	3/30/2021	5/1/2021	My uncle had a stroke almost exactly one month after second moderna shot. He is/was one of the most healthy older men I have ever known. Avid bike rider and exercise buff usually runs circles around guys half his age. I?m talking biking in the hills fit. He does have a pacemaker now and has to tame things done, but I think he got the pacemaker because he pumped so much blood through that thing doing all those hills for all those years. Not on any other meds expect whatever might be expected for the pacemaker. He was at the gym on May 1 working out and sitting down doing some arm curls when all of a sudden he passed out, he regained consciousness as a couple of guys were helping him to his feet, that?s all he could remember. He managed to drive himself home and then couldn?t shake the headaches and on coming symptoms, so one of his sons took him to the emergency room. Within 30 minutes it was already determined the doctors needed to operate fast. The stroke nightmare and recovery has process has been ongoing ever since. He was transferred to a rehab on May 19th where it looks like he will stay for at least a couple weeks, hopefully. He looks like he aged fifteen years, speech is ok, but he?s slow almost as if he is not hearing me? I think his hearing is fine but it seems like he works to formulate the thought of what he wants to say as I write this summary on May 23rd. He?s got two staples in his head, one pretty much top center and the other just a little off to his right. Drain blood I assume as I?ve never seen a post stroke victim up close like that. Our family do not get strokes! Maybe too much tequila and stuff like that, but my huge family usually all live into their 90?s and a few into their 100?s like my grandparents and my 104 year old great grandma. But of course they did not grow up with flu shots and vaccines. My grandparent grew a substance and stored in jars of olive oil or canola oil and rubbed that stuff on their our bodies if ailments go really bad. Other than that it?s highly concentrate oil of oregano. Couple drops on your tongue will set your mouth on fire. That?s the concentration we are talking about! Anyhow, my uncle hasn?t done vaccines or flu shots in the past, but all this gloom and doom from the mainstream media convinced him to get the shot. This now make the second person to stroke out after these unicorn shots. Yeah thanks big pharma and you scandalous mainstream media for just

5/18/2021

5/18/2021

The injection did hurt quite a bit more than other injections I have had in the past but it began to feel better and I sat in a chair and was on my phone to send a message, spoke to a stranger who was looking for where to go, and was ok until the feeling of fainting began 10 minutes after the shot. I put my head between my knees but it did not help so I called for help and eventually was helped onto the floor to lie down which began to help. I had vision trouble and hearing trouble and could not speak. I was told my neck became bright red as my face grew white and my hands twitched and my eyes rolled around. I found out later that I had also peed my pants. I have fainted only once before in 1989, and found this reaction pretty frightening although I do not believe it happened as a result of anxiety or fear, the adverse effect itself was frightening and unexpected- not listed on any paperwork I received and was not aware it could occur.

5/23/2021

Immediately after the patient received the Janssen Covid-19 vaccine, the patient closed his eyes and became unresponsive for less than 10 seconds. Patient then opened his eyes and was conscious again. Patient stated that he always has this type of reaction every time he receives a vaccine. He did not disclose this information because he did not think it would happen since he had not received any vaccines for the last 3 year.s.

1342040	5/23/2021	WA	12	F	5/16/2021	5/19/2021	My 12 year old daughter has reported having twitching of the head and right eye. She reports it started last week and continues to this day. The twitching of the head happens as often as every hour or more. The twitching of the right eye is rare. Depending on how fast the twitch happens with her head pain is associated with it.
1342025	5/23/2021	VA	15	M	5/23/2021	5/23/2021	one minute after injection, pt started to fall forward in the chair. father caught him and I was immediately called into the immunization room. pt was laid onto the floor and his legs were elevated onto a chair. father stated pt had never had a reaction to a vaccine before. no health conditions. 911 was called..... but then parent decided he didn't want them. pt states his vision started to go black before he briefly passed out... probable vasovagal syncope. we waited for 911 to come since they were already alerted. pt sat in chair but then started to get lightheaded again, so he returned to a position where his feet were elevated in the chair. EMS arrived and monitored him. father and EMS made decision to return pt to home.

1342017	5/23/2021	OR	15	F	5/16/2021	5/16/2021	Received her first dose of the Pfizer COVID-19 vaccine on Sunday May 16,2021 at around 2:50 pm. At around 7:20 pm on May 16,2021 she stood up to walk to the bathroom. She began feeling nauseous when she stood up. While she was washing her hands, after going to the bathroom, she began to have difficulty with her vision. She describes white and blue dots obstructing her vision in both eyes. She also began to experience loud tinnitus. She described hearing multiple frequencies. The problem with her vision and the tinnitus continued as she walked through our house to a couch where she laid down. The vision problem and tinnitus continued while she laid on the couch. Her breathing was rapid but she thinks this may have been due to the stress caused by her other symptoms. This episode lasted for several minutes and then the vision problem resolved. The tinnitus continued for several minutes after the vision problem resolved. The intensity of the tinnitus slowly decreased until it finally stopped. The following evening, she experienced tinnitus for a few minutes but it was less intense than it was the previous evening. She very rarely has experienced tinnitus in the past. She has very infrequently experienced brief episodes of orthostatic hypotension when she was dehydrated. When this event occurred, she felt like she was well hydrated. This event lasted much longer and she has never experienced this problem with her vision in the past.

1342002	5/23/2021	CA	17	U	5/23/2021	5/23/2021	On 05.23.21 client received her second dose of the Pfizer Covid-19 Vaccine (LOT # EW0185 EXP. 08/2021). Client approached EMT and stated that they felt "nausea." Lead nurse and Co-Lead nurse also responded. Client was a 17-year-old non-binary individual alert and tracking with their eyes. Client had a chief complaint of nausea. Client stated that they noticed their nausea a few minutes after beginning their observation. This was the clients second dose of the Pfizer vaccine. Client denied any medical history and stated they only take melatonin at bedtime. Assessment revealed no swelling, hives, discoloration, shortness of breath or other signs of anaphylaxis. Client was complaining of nausea that came on abruptly after their vaccination. Client stated they had breakfast this morning but not very much water. Client also stated they felt nervous after their vaccination. Airway, breathing and circulation are intact. Client's initial vitals at 0915 were: 92/64 blood pressure, 68 heartrate, respirations 14, O2 100% on room air, alert and oriented to person, place, date and event. Temperature 97.8*f. Client consented to an additional 30-minute observation and was asked to lie down for at least 15 minutes. Client was provided with water and was reassessed every five minutes until their complaint was resolved. After lying down for 15 minutes, the client stated that their nausea had resolved. Client sat up in an observation chair for the last 15 minutes and stated that their nausea was all gone at the completion of their observation. Clients remaining vitals were 0920 - 110/74, 84, 100%, resp. 14. 0925 - 110/74, 84, 100%, resp 14, 0925- 110/74, 84, 100%, 0930 - 110/74, 88, 100% resp. 14, 0940- 120/78, 88, 100%, resp. 16, 0945 - 118/78, 80, 100% resp 14. Client was provided with relevant vaccine information and instructed to seek emergency care if a severe reaction happened later. RN and EMT worked together to educate client about possible symptoms they could experience. Client acknowledged what they were told and departed facility at 0947 with their mother in positive disposition with steady gait.

1342071	5/23/2021	CA	14	F	5/23/2021	5/23/2021	Client was feeling "cold." Client was a 14-year-old female sitting upright in her observation chair, alert and tracking with her eyes. Client had a chief complaint of dizziness and feeling cold. Client stated that she began to feel cold and dizzy a few minutes after her observation had begun. This was the client's first dose of the Pfizer vaccine. Client denied any medical history or known allergies. Assessment revealed no swelling, hives, discoloration, shortness of breath or other signs and symptoms of anaphylaxis. Client stated that she felt "cold" and "dizzy." Client stated that her only meal was the snacks provided at the vaccination site. Airway, breathing and circulation were intact. Client's initial set of vitals at 1006 was 116/78 blood pressure, 80 heart rate, respirations 16, alert and oriented to person, place, date and event. Temperature 97.8*f. EMTs present were unable to obtain an O2 sat due to client's nail but client was negative for signs of shortness of breath. Client was asked to lie down until her complaint was resolved. Client was provided with food and was able to eat without difficulty. Client was reassessed every 15 minutes due to her stability. Vitals were as follows: 1011 - 108/78, 84, resp. 14 1021 108/78, 88, resp 14 1029 - 108/78, 80, resp 16. After approximately 10 minutes, the client denied any symptoms and was asked to sit up in an observation chair for the remainder of her observation. Client and her mother were instructed to seek emergency care if signs or symptoms of an allergic reaction occur later this evening.

1340367	5/22/2021	RI	64	F	4/9/2021	4/1/2021	<p>This is a spontaneous report from a contactable consumer (patient) and a physician. A 64-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), dose 2 via an unspecified route of administration, administered in Arm Left on 09Apr2021 in the afternoon around 2 or 3 o'clock (Batch/Lot Number: EW0153) as 2ND DOSE, SINGLE for covid-19 vaccination. The vaccination was done in her building, a medical team came to them. She lives in subsidized housing. The patient's medical history included tendonitis; juvenile idiopathic arthritis from Dec 1969 and ongoing; lupus nephritis from 1989 (diagnosed ten years after SLE); systemic lupus erythematosus (SLE) from Dec 1979; discoid lupus; proliferative kidney disease stage 3; sjogren's; raynaud's; arthritis (since she was 13); bursitis; oral necrosis (this was from being on a calcium drug that they give menopausal women, it was out of her head right now when reporting. She could not think of the name. The drug was supposed to promote bone growth and keep her from getting osteoporosis); menopausal (because of chemo she started menopause at 42); vulvar lichen sclerosus; filamentary keratosis from 2015 and ongoing (this was since either Feb 2015 or Mar 2015); kidney cysts(one is benign and one is being watched); liver hepatic hemangioma; allergies (Allergies to aspirin, penicillin, dextrose IV, Biaxin, Levaquin, Cipro, band-aid adhesive, zofran, sulfa topical. The sulfa is a topical as opposed to being the sulpha with a ph.); adeno conjunctivitis from Jan2015 and ongoing (she had a really bad case of this in JAN 2015 and had to quarantine for three weeks. She lost her vision, she could not see for three days. She got a fever. It left her with a filament thing. It is just delightful. It is viral and really bad. She got it at her eye doctors office when she was there for an annual visit. She sometimes had to go there 3 times to have filament growing on her eye scrubbed off. It is wicked painful. It is quite an adventure.); she used to be three quarters but she shrunk a little; has been a couch potato for a year, it comes with the territory with lockdown and being depressed; she is immunocompromised and catches many things and is high risk She feels like a sitting duck; had issues on her palm of hands; had issues on her breasts, and chest; and various problems. Family Medical History Relevant to adverse events was none. No other vaccinations within four weeks prior to the first</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

administration date of the suspect vaccine. No other vaccines administered on same date with the Pfizer vaccine considered as suspect. Concomitant medications included vitamin b complex (B-COMPLEX 100) 100 as dose did not clarify units, has been on for years; hydroxyzine embonate (HYDROXYZINE PAM) Dosage 25 mg, she did not remember indication, may be allergies, if she is around a cat, she takes it prophylactically; acetylsalicylic acid (ASPIRIN) low strength, 81 mg twice a week, has been on for decades, nephrologist put her on it in the 90's and She did not remember why, he said it preserves kidney function or it is good for overall health; pentoxifylline ongoing at 400 mg, 3 a day, she has been on for years, her vascular doctor prescribed; prednisone dosage: 1 mg, she takes and alternates between 6 and 7 mg, If she takes lower than that, she is a "narcoleptic" (as reported, did not clarify); rosuvastatin Dosage: 10 mg, frequency not specified, it is a nightly thing; fish oil (SUPER OMEGA 3) overall supplement that was suggested by former nephrologist at some point some; estradiol (YUVAFEM) Dosage: 10 micrograms for menopause, vaginal dryness; there was no variable in her medication routine, she is on a long list of medications (she could not remember, one was blood pressure, with the last administration she was worked up and her blood pressure would not come down, she also takes Tylenol as needed), she provided the details as she knows them, but did not know full details for all of her medications. There was nothing new to her routine except like when Prilosec was taken off the market, she got a different medication for it. She has been on all of these for long term maintenance. Historical vaccine included bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), dose 1 via an unspecified route of administration, administered in Arm Left on 19MAR2021 (at the age of 64-year-old)(Batch/Lot Number: ER2613) for covid-19 vaccination, adverse events following prior vaccinations: none; and flu vaccine for immunization in last fall, 2020. She has a history of obscure side effects to medication, things that people have never heard of and she is the 1 in a million that has ever had these problems. The patient previously took ondansetron (ZOFTRAN), ("a chemotherapy treatment", given before chemotherapy), which gave her a homicidal migraine and they had to give her ice packs for her head;

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

9 rounds of "Cytox" (Cytosin or Cytoxan) she was not sure how this was spelled, and chemotherapy (9 rounds of chemo); azathioprine (IMURAN), she does not know if it was spelled Immuran or Imuran; prednisone a number of years and she said to her rheumatologist, "it did not make sense on an intellectual basis that the prednisone being effective in her body as it was once" and he said he would give her IMURAN which is given to kidney patients to cause less of a reaction with the organ, and patient mentioned she had barely an immune system after all these years on prednisone, she went through 3 rounds of steroids; Heparin IV, which made her arm feel on fire on the inside, which they would not give her a flush when she had IV treatment; Dextrose IV made her skin feel hot and itchy, her mouth felt like she put something in that had been soaking in rubbing alcohol; ciprofloxacin (reported as "Cipro"), she had a bad reaction to Cipro, she was given after she was bit by a dog on her calves, she knew it was attached to and is "hurting her calves the rest of her life/the podiatrist said if it has not gone away, she is kind of stuck" (as reported, not specified). The patient just wanted to give Pfizer a full picture of what she was dealing with and she is an unusual case. She added that chemo was in the 90s and that is when all of the medication reactions she mentioned were. She absolutely does not have any of the information about the products she mentioned she had previous reactions to. Every time they did "this", it "hurt" and she asked them not to do it anymore. She asked them to not do dextrose anymore with the chemo because it feels like it is on fire, and she asked them to mix it with saline. She did not have any additional information, did not have the NDC, LOT, expiration date, or manufacturer for any of these medications she reported historical adverse events on. The patient reported that she got her 2nd shot of the Pfizer covid vaccine on 09Apr2021. She has soreness at the site, more-so several hours after getting the vaccine (09Apr2021). Just her arm felt sore within moments after the second vaccine, but she did not get this after the first. She rested and took it easy that weekend. There was Sore, Tired, general lethargy, and fatigue (Apr2021): when she looked online, it really only told her what everyone knows about that you might be sore and tired and she had all that, she thought she was through with all

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

of that. She had no chills, just general lethargy and fatigue. She was sluggish and tired and not herself that weekend (Apr 2021). She stayed home so it is difficult to say. Her arm was definitely sore. For sluggishness and fatigue, she said that she has been a couch potato for a year, it comes with the territory with lockdown and being depressed, so it is difficult to decide if it is health or physically induced or a emotional base. She did not knowingly spike a fever, no chills or sweats. And on Monday (did not clarify dates but states it was Monday after 09APR2021, throughout the weekend she took it easy), she noticed with her foot, she had difficulty getting out of bed could not put weight on her right foot. She was alarmed. She stayed home and rested and did a lot of napping and taking it slow. It is still difficulty and moving certain ways hurts more if she flexes. She has a known history of tendonitis so she wore her brace in the meantime. She thought maybe she had tendonitis in both ankles and this was similar so maybe it was a different set of tendons. She would wear a brace, and eventually it will get better in time. She also was wearing braces like compression socks that toes stick out of. She thought she had tendonitis and that is what she has done in the past. It has been a month and she is not better. This was her left foot, most of the pain was focused on the sole of her foot towards the outer edge. That is where it started. Then it migrated over time. That was weird and had her worried. It was all in her arch in the initial spot. She notes it is not like the tendonitis she had the first time. She does not want to be an alarmist or have her doctor think she is a hypochondriac she waited. She was then rubbing her foot, the right one, and noticed it was tender on the top of her foot just like the left one. There was sore. There was pain in right foot, pain in feet. Pain in feet, her left foot had most of the pain on the top and bottom and a lot of it is along the outer part of her sole of the foot. In her right foot, the pain is mostly at the fleshy part below her toes and on top of her foot. The pain moved around into the other foot for about a month so she went to the podiatrist yesterday (06May2021) and doctor did x-rays. The night before (05May2021), the opposite leg had a line of black and blue dots on her right calf that went up her leg, she did not notice this until Wednesday (05May2021) evening because she never examines it. She soaped up a washcloth and she knew

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

where her parts are in the bath. Her mind wanders and she was not looking. She happened to be wearing something where her legs were not covered and that is how she knew. It did not hurt. It was strange, looking like bruising in a line. The doctor said it was all like one vein and he could feel it. She can not feel it, but he could. The doctor told her these could be clots. She still has them. Doctor said the other leg where she had the pain was only soft tissue pain. Doctor found that every place that hurt when he touched it and it still hurts where he had touched it. She was told she does not have arthritis and she has had arthritis since she was 13. The doctor did not know what it is. It was her left foot constantly, and the right foot hurt off and on during that period. The left for sure was kind of a dull ache and throbbing. The right was only a little bit. The left was worse. It appeared to be soft tissue that was hurting and he said there are so many side effects of this new vaccine and to maybe try heat or ice. Ever since the patient left doctor's office until now (the time of reporting) she did not know if she need to be concerned, that if she does not know what it is, can ice or heat make it worse? She did not know the next steps. Treatment, she tried to keep it elevated because that can not hurt but that is about it. She has not done heat and ice because if the doctor does not know what it is, how does he know it will not make it worse. He asked if she could take aspirin and she said no she is allergic to aspirin. Tylenol she does not take often, only when she feels like she needs it and she has not been doing it often. When she stays off it, it does not hurt as much as when she is walking. She wanted to know if she should be worried and she wanted to add (report this) to the database if this is a side effect and if Pfizer has ever heard of this before. There was also tired, general lethargy, and fatigue. At this point when reporting, she is single and lives alone, and said that "God forbid something happens, there is nobody to say let's get you to a hospital". She heard about blood clots on the news. When they said blood clot yesterday, it was a red warning light going on and a siren. At the time of reporting it was Friday and she did not know that if she need to rush to the hospital. Her primary care physician (PCP) said she had never heard of this and to call Pfizer. The patient asked if she is one of a small group of people this has happened to. She asked if she should not worry

and it will go away or should she get to a hospital. She thought she had a problem with her feet (foot problem) but her podiatrist does not know what was going on. She communicated with her physician office today and she said she has never heard of this. She wanted to know if her symptoms have been heard of and if she should go to the hospital. The events did not require a visit to emergency room. The patient underwent lab tests and procedures which included: height as "5 and three quarters of an inch feet (5'0.75")" on an unspecified date; rapid COVID-19 test on 06May2021: negative; regular COVID-19 test on 06May2021: negative; x-ray on 06May2021 to make sure she did not break anything: unknown results. She also went because she had not done it in a year and she had something from the health department saying to get tested weekly for the virus (clarified that she was talking about the COVID tests as what she went and got done). The outcome of the events was unknown.

1340418	5/22/2021	OR	66	M	4/20/2021	4/22/2021	This is a spontaneous report from a contactable consumer (patient). A 66-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE lot number: ER8730) via an unspecified route of administration, administered on the left arm on 20Apr2021 11:45 as 1st dose, single for COVID-19 immunization. The patient's medical history was not reported. Concomitant medications included sertraline; beta carotene, bioflavonoids nos, biotin, calcium ascorbate, calcium pantothenate, calcium phosphate, choline bitartrate, chromic chloride, colecalciferol, copper sulfate, cyanocobalamin, folic acid, hesperidin, inositol, iron amino acid chelate, lycopene, lysine hydrochloride, magnesium oxide, manganese sulfate, molybdenum trioxide, nicotinamide, phytomenadione, potassium iodide, potassium sulfate, pyridoxine hydrochloride, retinol acetate, riboflavin, selenomethionine, silicon dioxide, colloidal, sodium borate decahydrate, thiamine mononitrate, tocopheryl acid succinate, ubidecarenone, zinc oxide (MULTIVITAMIN & MINERAL); and ascorbic acid, beta carotene, copper, nicotinamide, selenium, tocopherol, xantofyl, zinc (LUTEIN +). On 22Apr2021, the patient experienced right eye "floater": posterior vitreous detachment. Doctor said probably not due to the vaccination, "just a coincidence". The event resulted to a doctor or other healthcare professional office/clinic visit. No treatment was received for the events. The patient did not receive any other vaccines within 4 weeks prior to the COVID-19 vaccine. Since the vaccination, the patient has not been tested for COVID-19. Prior to vaccination, the patient was not diagnosed with COVID-19. Outcome of the events was not recovered.

1340474	5/22/2021	FL		F			mild to moderate anaphylactic reaction; This is a spontaneous report from a contactable consumer (patient's husband). A female patient of an unspecified age received bnt162b2, via an unspecified route of administration on an unspecified date (Batch/Lot number was not reported) as 1st dose, single for covid-19 immunisation. The patient medical history and concomitant medications were not reported. She had a mild to moderate anaphylactic reaction. He just wonders if there is provisions. Reporter asked if Pfizer was helping with clinic and EMT (Emergency Medical Technicians) bills. It was protocol, they had to take her. Now they have a 1800 fee from the hospital, and 800 for the ambulance. That is a lot of money. The outcome of the event was unknown. Information on the Lot/Batch number has been requested.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1340465	5/22/2021	ID	43	M	4/22/2021	4/22/2021	Multiple visual hallucinations; Body aches; This is a spontaneous report from a contactable other Health Professional. A 43-year-old male patient received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) via intramuscular at age of 43-years, on 22Apr2021 (Lot number was not reported) as single dose for covid-19 immunisation. Medical history included hyperlipidaemia (HLD) and post-traumatic stress disorder (PTSD). There were other medications in two weeks but unspecified. The patient previously took morphine and experienced allergy. Historical vaccine included the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) via intramuscular on 01Apr2021 (Lot number was not reported) for covid-19 immunisation. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced multiple visual hallucinations and usual body aches occurring evening of vaccine on 22Apr2021, resolved by next day. There was no treatment received for the above events. The patient did not diagnose with COVID-19 prior to vaccination and not test for COVID-19 since the vaccination. Events outcome was recovered on 23Apr2021. Information on the lot/batch number has been requested.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported multiple visual hallucinations and the administration of the suspect, COVID19 vaccine, based on the reasonable temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

1340355	5/22/2021			F			<p>Cataract; This is a spontaneous report from a Pfizer sponsored program COVAX US SUPPORT. A contactable pharmacist reported for a female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection) via an unspecified route of administration on an unspecified date (Batch/Lot number was not reported) as a single dose for covid-19 immunization. The patient medical history was not reported. The patient's concomitant medications were not reported. The patient had cataract surgery on 04May2021 and was taking an antibiotic eye drop and a steroid eye drop. Her second dose of the Pfizer Covid 19 vaccine was scheduled for tomorrow (21 days). Reporter asked if safe for her to take the vaccine. The outcome of the event cataract was unknown. Follow-up attempts are completed; information about lot/batch number cannot be obtained.; Sender's Comments: Due to implausible temporal association, the event of Cataract is assessed as unrelated to suspect product BNT162B2. The patient has been on the medication for just 21 days, while it is known that the process of cataract is slow and takes months to years. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.</p>

1340457	5/22/2021	IL	26	M			<p>This is a spontaneous report from a contactable consumer (patient's parent). A 26-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date (reported as "this afternoon") (Batch/Lot number was not reported) (at 26-year-old) as first dose, single for COVID-19 immunisation. The patient's medical history was reported as no. Concomitant medications were not reported. Couple minutes into that he got light headed, his vision got blurred and then he had a complete vision loss. They cleared the room and called the paramedics. The paramedics came and said that both of his eyes were dilated and his blood pressure was high. They sat him for couple of minutes, then his vision return. So if they ask them make the total of vision loss lasted for seven minutes. His blood pressure went down. They kept him there and had a given a bottle of water and two container of fruit juice to bring his sugar level up. They made sure everything seems alright. And paramedics left and said that they thought it would be cause from some sort of blood reaction and allergic reaction to vaccine. And told them not to get the second shot. And let us want to he felt ok that it would be alright to go home. They did keep him there for about half an hour longer just to make sure he was alright and then sent him home. That was just a reaction and he should be ok now. No treatment received. The outcome of the events was resolved on an unspecified date. Information about batch/lot number has been requested.</p>

1340351	5/22/2021	SC	31	F	5/6/2021	5/6/2021	mild hallucinations; nauseated; extremely fatigued; eyes heavy with a slight burning sensation; eyes heavy with a slight burning sensation; in a head fog state; mild headache; sick; chills; nose run; sneezing; that were so cold it; This is a spontaneous report from a contactable consumer(patient). A 31-year-old female patient received first dose BNT162B2 (Pfizer BioNTech Covid 19 vaccine, lot number EW0176), via an unspecified route of administration at Arm Left on 06-MAY-2021 12:45 at the 31 years old at single dose for COVID-19 immunization. The medical history was not reported. The concomitant medication was ethinylestradiol, ferrous fumarate, norethisterone acetate(JUNEL FE) The patient previously took steroids and experienced known allergies Tendency. After the initial dose, the patient began to feel nauseated on 06May2021 14:00. The patient waited for the 15min period on site and then proceeded home. By time the patient arrived home, the patient was extremely fatigued and her eyes heavy with a slight burning sensation on 06May2021 14:00. The patient spoke to her mom briefly and she recalls that the patient told her that she got the vaccine. She also stated that the patient rambled off some strange vaccine name and statics on it which the patient have no memory of. During this time the patient had mild hallucinations on 06May2021 14:00. The patient saw her walk by and asked her where she went and she had never moved from her chair. The patient went to her room to rest/sleep immediately after where the patient remember hearing someone come in and lay down but there was no one. The patient also vividly remember waking up and checking the time which was incorrect as well. The patient was in a head fog state on 06May2021 14:00. The patient had a mild headache on 06May2021 14:00. Later that night the patient ate some food and was sick after. While going to bed, the patient had chills that were so cold it made my nose run and the patient was sneezing excessively on 06May2021 14:00. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine.Prior to vaccination, the patient was not diagnosed with COVID-19.Since the vaccination, the patient had not been tested for COVID-19. There was no treatment received for all of events. The outcome of the events was recovering. Information on Lot/Batch number was available. Additional information has been requested.

1340269	5/22/2021	MD	76	F	1/22/2021	1/27/2021	This spontaneous case was reported by a consumer and describes the occurrence of POLYMYALGIA RHEUMATICA (Polymyalgia Rheumatica) in a 76-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 025J20A and 013L20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Dairy intolerance, Drug allergy (allergic to Compazine), Hay fever since 1976, Osteopenia since 2000, Tinnitus since 2016 and Osteoarthritis since 1990. Concomitant products included MACROGOL 400 (BLINK TEARS) for Dry eye, VITAMINS NOS (MULTIPLE VITAMIN) for Multi-vitamin maintenance, VITAMIN D3, PROBIOTICS NOS, FISH OIL and HOMOCYSTEINE THIOLACTONE HYDROCHLORIDE for Routine health maintenance, CETIRIZINE HYDROCHLORIDE (ZYRTEC [CETIRIZINE HYDROCHLORIDE]) from 01-Jan-2020 to an unknown date and MOMETASONE FUROATE (FLONASE [MOMETASONE FUROATE]) for Sinusitis, MAGNESIUM CITRATE for an unknown indication, GLUCOSAMINE & CHONDORITIN. On 22-Jan-2021 at 9:00 AM, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 23-Feb-2021 at 9:00 AM, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 27-Jan-2021, the patient experienced ARTHRALGIA (severe leg pain (both)/Pain seemed to concentrate in back of legs/intense pain in joints and muscles of the legs). On 21-Apr-2021, the patient experienced POLYMYALGIA RHEUMATICA (Polymyalgia Rheumatica) (seriousness criterion medically significant). On an unknown date, the patient experienced CHEST DISCOMFORT (tightness in the chest). At the time of the report, POLYMYALGIA RHEUMATICA (Polymyalgia Rheumatica) and ARTHRALGIA (severe leg pain (both)/Pain seemed to concentrate in back of legs/intense pain in joints and muscles of the legs) had not resolved and CHEST DISCOMFORT (tightness in the chest) outcome was unknown. mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosing remained unchanged. Additional concomitant medication taken at the start of the events included OsteoThera 4 times per day. On 27-Jan-2021, the patient experienced intense pain in the joints and

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							<p>muscles of the legs. She applied ice as treatment. Over the next 2-3 weeks pain moved to other joints and muscles with varied intensity; fatigue and weakness noted. Overtime it became very difficult for the patient to stand up from a seated position, walk, turn over when lying down, or bend over to sit down. On 09-Feb-2021 additional daily supplements were started: Pea Protein, Calcium D-Glucarate, Digestive Enzymes (Digest Gold), GI Motility Complex, Glutagenics Powder, Sun Fiber. The patient sought medical attention from her Primary Care Provider (PCP). The patient's ESR and CRP were elevated, indicative of an inflammatory condition. The patient was referred to Rheumatology. While she waited 5 weeks for the appointment, she experienced tightness in the chest and continued loss of function. She eventually went to the Emergency Room (ER) and 1 lab result was slightly elevated, indicative of Lyme disease. The ER doctor administered ketorolac and iodixanol and the patient started treatment with doxycycline. On 21-Apr-2021, doxycycline was stopped as additional lab tests for Lyme disease were normal. The patient was diagnosed with Polymyalgia Rheumatica and started treatment with Prednisone 15 mg daily (gradual tapering off was planned), heat, light stretching, and exercise to regain leg movement. Based on current available information and the temporal association between product use and the start date of the events a causal relationship cannot be excluded. Most recent FOLLOW-UP information incorporated above includes: On 01-Mar-2021: Additional initial received on 12-May-2021. Caller would say patient recovered completely from symptoms associated with first dose. The patient experienced nurse stated it could possibly be blood clots on an unspecified date with outcome of unknown, patient is afraid he is going to have a stroke or scared he had one after the covid-19 vaccines on an unspecified date with outcome of unknown, brain fog: at times he can't do the simplest things. he will look at the clock on the wall and says he knows what it is, but can't find the words to say. cannot carry on a conversation intelligently on 12Apr2021 with outcome of not recovered, headache all over the back of his head/affecting his balance. in back of head, moves around, sometimes the front on 12Apr2021 with outcome of not recovered, feeling dizziness/had to stop driving on 12Apr2021 with outcome of not recovered, blurred vision in right eye that comes and goes on an unspecified date with outcome of not recovered, ringing in his left ear on an unspecified date with outcome of not recovered, fullness in face on 12Apr2021 with outcome of not recovered, body aches on 12Apr2021 with outcome of not recovered, very fatigued throughout the day, sleeping a lot/tired and sleeps a lot on an unspecified date with outcome of not recovered, date received first dose: third friday in feb2021/received second dose on 12apr2021, six weeks after first dose on an unspecified date with outcome of unknown. Patient was caller's husband. Had both doses and had the same problem. His experience is very bad with the second dose and has had it for a month. Within a day after the first dose, had brain fog, headache, and dizziness where he had to stop driving a couple times. This went away within a few days. Patient and caller were concerned about the second dose. They spoke with patient's doctor and the local Health Department, both said it couldn't be from the vaccine. Patient was advised to get the second dose. Had the same symptoms with second dose, but occurred within an hour of received second dose. Symptoms have continued. Also experiencing blurred vision in right eye that comes and goes. Patient had an appointment with his doctor this week, but the doctor basically didn't look at him. Doctor advised patient to see a neurologist. Another nurse stated it could possibly be blood clots. Caller is trying to find help. Caller wanted to add with the second dose, patient experienced ringing in his left ear, fullness in his

face, and headache all over the back of his head. Was feeling dizziness after second dose and had to stop driving. Patient is afraid he is going to have a stroke or scared he had one after the COVID-19 Vaccines. If the COVID-19 Vaccines woke up some other health issues, patient wants to get it taken care of. Received second dose on 12Apr2021, six weeks after first dose. Got second dose at a different location. Second dose COVID-19 Vaccine AEs: Started experiencing symptoms within an hour. Headache: Affecting his balance. In back of head, moves around, sometimes the front. Comes and goes. Brain fog: At times he can't do the simplest things. He will look at the clock on the wall and says he knows what it is, but can't find the words to say. Cannot carry on a conversation intelligently. Dizziness. Blurred vision in right eye: Doesn't know if this started on 12Apr2021 or a couple days after. States as the day goes on and he gets tired, it will worsen. It comes and goes. Ringing in left ear: Began on 12Apr2021 or a few days after. Fullness in face: Stated this comes and goes, but has stayed the same. Documented as provided. Body aches: Comes and goes. Seems to worsen as the day goes on. Very fatigued throughout the day, sleeping a lot: He's tired and sleeps a lot. It was hard for him to get out of bed. Caller stated patient's symptoms worse as the days goes on. Patient never experienced pain at the injection site. Guesses patient received COVID-19 vaccines in his left arm because the county was doing a drive-thru clinic. Since he didn't get out of his car, she believed patient would have received the vaccines in the left arm. The events REQUIRE A VISIT TO Physician office: Doctor doesn't think anything is wrong. ER: Not yet. Is considering going to the ER today. PRIOR VACCINATIONS WITHIN 4 WEEKS was None. RELEVANT TESTS: None. Events Clot blood and stroke considered medically significant. Follow up attempts are needed. Information of Lot/Batch number has been requested.

1339102	5/22/2021	CA	44	F	12/27/2020	1/1/2021	Swollen arm with redness, POTS (fatigue,, dizziness, lightheadedness, blurry vision, increased heart rate upon standing, shortness of breath, exercise intolerance, nausea)
1339064	5/22/2021	PA	36	F	4/6/2021	4/21/2021	I had recovered about 90% (with medication) since having COVID in December when I received my first dose of the COVID vaccine. Thirteen days after the vaccine I began to experience symptoms like when I had COVID. On day 13 I started to itch and my BP dropped and I became light headed. My vision started to go and I had a hard time breathing and forming words for my husband to help me with some water. This lasted about 20 min. Since then I have been having heart rate increases up into the 150s with minimal effort. Bending like doing dishes or putting away groceries makes me extremely light headed. I have become so tired just folding a little bit of laundry. It wasn't until a few weeks in that I noticed this was all exactly like when I had COVID. Including being okay in the morning but having so many issues by the evening. So weird. I'm 3 weeks and 4 days past my second shot and finally starting to have some better days again but no day has been symptom free. I wish could know if this is happening to other long haulers and that it will most likely resolve, I have been starting to wonder about disability and really having a hard time facing the fact that I no longer can complete simple house hold chores like I used to.

1340265	5/22/2021	FL	67	F	1/7/2021	1/26/2021	This spontaneous case was reported by a consumer and describes the occurrence of HYPOTHERMIA (hypothermia) in a 68-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 012L20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included Shingles (chicken pox and shingles in 2001). Concomitant products included ROSUVASTATIN for an unknown indication. On 07-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 26-Jan-2021, the patient experienced HERPES ZOSTER (Shingles). On an unknown date, the patient experienced HYPOTHERMIA (hypothermia) (seriousness criteria medically significant) and RASH (Rash on the side of face and around eyes). The patient was treated with VALACYCLOVIR HYDROCHLORIDE (VALTREX) ongoing from January 2021 for Shingles, at an unspecified dose and frequency. At the time of the report, HYPOTHERMIA (hypothermia), HERPES ZOSTER (Shingles) and RASH (Rash on the side of face and around eyes) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On an unknown date, Body temperature: 95 (Low) 95. Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. This case was linked to US-MODERNATX, INC.-MOD-2021-118918 (E2B Linked Report). This case was linked to MOD-2021-118638 (Patient Link). Most recent FOLLOW-UP information incorporated above includes: On 11-May-2021: Updated address and adverse events; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.
1341220	5/22/2021	NC	22	M	5/22/2021	5/22/2021	Approximately 5 minutes after receiving vaccination patient fell out of chair onto floor and was breathing but unresponsive to pharmacist. Patient opened eyes and was fully alert with in a couple of minutes of passing out. Patient waited for another 30 minutes, had someone come pick him up, and stated he felt fine.

1341231	5/22/2021	ND	32	M	4/8/2021	4/14/2021	6 days after receiving the vaccine I began to feel ill. My arms were numb, I was sweating profusely, and was having a bad headache while at work. Suddenly I began to get tunnel vision and felt as if I was about to pass out. I was transported via ambulance to Medical Center where I was given IV and medication to treat vertigo and massive head pain/migraine. Since that day I have continually dealt with severe neck and head pain leading to migraines causing visual issues (auras and blind spots), vertigo, and nausea.
1340718	5/22/2021	DC	13	M	5/22/2021	5/22/2021	Within minutes of getting his vaccine, he felt his throat tighten with mild itching of his throat. He was assessed with normal vital signs, no wheeze, no emesis, no rash. He felt better quickly without intervention. He was observed for 45 minutes and we practiced some calming visualization strategies.
1341078	5/22/2021	NY	15	F	5/22/2021	5/22/2021	Client vaccinated, said it was good then slumped in chair, eyes rolled back. Responded to verbal commands, opened eyes, pupils dilated, diaphoretic, took a minute for her eyes to come into focus. Paramedic to cubicle, client transported to treatment area. Observed by paramedic for 45 minutes, departed for home with Mom and brother.
1340754	5/22/2021	NY	14	F	5/21/2021	5/21/2021	moderna clinic - Patient sat for a bit after vaccine - fainted when got up to leave. I heard the commotion from the pharmacy while i was giving a vaccine. Patient had signed up online for the vaccine with the date of birth 6-20-2001 (showing 19 years of age). Patient came to quickly after fainting - felt dizzy, nauseated, warm and blurred vision (seeing spots). Patient did not hit her head during fall. EMS came to check her out. Took blood pressure and pulse - within normal limits for patients age. Being that she's 14 and received Moderna instead of Pfizer that could have been the reason. Patient faulted age during online sign up stating she was 19. I checked with the mom the day after the incident - patient feels fine - no flu like symptoms or feeling dizzy, nauseated or blurred vision.

1340887	5/22/2021	VA	71	F	3/3/2021	3/4/2021	My mom received her second vaccine on March 3 at approximately 2:00 PM. On March 4, approximately 16 hours after her vaccination, she woke with an excruciating pain behind her right eye. Her condition continued to decline and an ambulance was called and she was taken to our local hospital. Local hospital transported her via helicopter to another facility, a Level 1 Trauma Center, where she underwent an emergency craniotomy for a hemorrhagic stroke. During surgery it was discovered that she had an arteriovenous malformation (AVM). She spent over two weeks in Hospital and an additional three weeks at a Rehabilitation Hospital. She is home now undergoing home physical, occupational, and speech therapy. She suffers from significant left side neglect and is in a wheelchair, unable to walk or move her arm and hand. She vision in the lower left quadrant of both eyes. She was revived and resuscitated during her craniotomy. Prior to her stroke, she was a healthy, vibrant, independent 71 year old. Although the AVM can be congenital, a prior MRI of her brain in 2015 never picked it up and was reported as normal.
1337323	5/21/2021	VA	13	F	5/21/2021	5/21/2021	five minutes after 13 year old patient's first dose of Pfizer COVID shot, I was alerted that pt reported that her vision was "going black." when I arrived at our designated waiting area, she was sitting down with her father. parent stated that pt has never had any type of reaction to a vaccine previously, but stated that she had severe anxiety about this vaccine. pt was moved to the floor and raised her legs onto the chair. parent declined my offer to call 911 or rescue squad. her pulse was normal. parent and patient waited a total of 30 minutes before leaving the store. pt felt back to normal before leaving the store.

1336933	5/21/2021	MA	12	M	5/16/2021	5/16/2021	12 yo male presenting with bilateral lower extremity paresthesias and confusion. Admitted to the hospital. Pending discharge to rehab facility. ED Note 5/19/21 Patient is a 12-year-old male with hypogammaglobulinemia, asthma, IBS who presents with weakness in his lower extremities. 6 days ago, patient had seafood and later that night vomited once, nonbloody, nonbilious. 4 days ago, he received the first dose of the Pfizer SARS-CoV2 vaccination. That day, he also felt some burning over the anterior parts of his bilateral ankles. Over the past 3 days, he has been sleeping a lot and had a headache. He has not had a fever or other muscle aches, no subsequent N/V, abdominal pain. Last night, he reported ankle pain to his mom. Today at school, he was playing kickball when he had the sensation that his ankles were not working/gave out and he fell to the ground. He had difficulty getting up and required a wheelchair. He did not lose consciousness, denied CP, palpitations, SOB, headache, vision change during or before that episode. He was not incontinent of urine/stool and had no abnormal movements noted at the time. Since then he has noted twitching in his thighs, calves and toes. He reports weakness throughout both lower extremities and has difficulty with intentional movements at the toes/ankles/knees, weakness in hips. He reports a burning sensation over the anterior ankles/dorsum of foot b/l. Denies fevers, chills, cough, SOB, CP, palpitations, abdominal pain, N/V/C. He endorses diarrhea 3x daily which is his baseline. He has panic attacks 3x daily w palpitations/SOB that self resolve. He has been on keflex for an ingrown toe nail for the last week. MRI performed with normal brain and spine. However, on repeat exam patient has diminished sensation in the bilateral feet and diminished ability to dorsiflex or plantarflex both ankles with very limited toe range of motion. Still with preserved reflexes in the patella and Achilles. Discussed at length with neurology and the family. Differential diagnosis at this point of functional neurological disorder versus Guillaine Barré syndrome. Neurology note 5/21/21 Patient is a 12yo M with hypogammaglobinemia, IBS, and poorly controlled anxiety, presenting with 4 days of lower extremity paresthesias and 1 day of hyperacute onset of lower extremity weakness and perhaps some mild confusion. History notable for covid vaccine three

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							days prior to presentation and anxiety surrounding covid and return to school. His general examination is notable for anxious affect with difficult to localize neurologic exam. Exam shows possible bilateral lower extremity weakness of TA and hamstring>quad/IP that is very challenging to grade due to poor effort and giveaway, and decreased sensation in a bilateral stocking/glove distribution to all sensory modalities. MRI w/wo contrast brain and spinal cord normal on admission. LP performed in ED also normal. Given negative workup and history of anxiety with recent psychosocial stressors, most likely sudden onset weakness is secondary to a functional neurologic disorder. Plan for discharge to rehab pending PT evaluation.
1336824	5/21/2021	NC	19	F	5/19/2021	5/20/2021	The subject became symptomatic approximately 24 hours after her study injection. Symptoms included some swelling under her eyes, generalized body aches and apparently some hand swelling, as well as shortness of breath and stridor. She was given epi was given and EMS was called. Admission labs showed hypocalcemia and hypokalemia. She was treated with IV's and labs returned to normal limits, and she was given albuterol. She was hospitalized.
1336807	5/21/2021	NV	51	F	4/8/2021	5/11/2021	Patient presenting to Medical Center with progressive vision loss on 5/17/21, day prior to admission patient endorsing complete right eye vision loss and progressive left eye vision impairment. Prior to admission, she had presented to hospital for progressive right eye vision loss. Had right eye tonometry and ultrasound performed, pressure 24, ultrasound overall unremarkable. ESR and CRP normal limits. Referred for outpatient evaluation by ophthalmology and neuro-ophthalmology. Neuro-ophthalmologist referred her for IV steroids due to concern for ischemic optic neuropathy. She was started on IV solumedrol 1g daily for 5 days, with stabilization of her vision loss. No improvement in right eye vision loss, no worsening of left eye vision loss. Per patient, left eye vision blurriness able to see shapes and colors. Discharged on 5/21/21 on prednisone 60 mg until follow up with neuro-ophthalmology on 5/27/21.

1336300	5/21/2021	OH		F	5/11/2021	5/11/2021	acute anaphylactic shock; A.fib; blurry vision; swollen lips; Numbing sensation in her hands and lips; tingling sensation in her hands and lips; This spontaneous case was reported by a consumer and describes the occurrence of ANAPHYLACTIC SHOCK (acute anaphylactic shock) and ATRIAL FIBRILLATION (A.fib) in a 53-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 048B21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 11-May-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 11-May-2021, the patient experienced ANAPHYLACTIC SHOCK (acute anaphylactic shock) (seriousness criterion medically significant), ATRIAL FIBRILLATION (A.fib) (seriousness criterion medically significant), VISION BLURRED (blurry vision), LIP SWELLING (swollen lips), HYPOAESTHESIA (Numbing sensation in her hands and lips) and PARAESTHESIA (tingling sensation in her hands and lips). At the time of the report, ANAPHYLACTIC SHOCK (acute anaphylactic shock), ATRIAL FIBRILLATION (A.fib), VISION BLURRED (blurry vision), LIP SWELLING (swollen lips), HYPOAESTHESIA (Numbing sensation in her hands and lips) and PARAESTHESIA (tingling sensation in her hands and lips) outcome was unknown. mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was withdrawn on an unknown date. Treatment for the events included diphenhydramine, metoclopramide, ketorolac, prochlorperazine and prednisone. The patient was advised not to receive the second dose of vaccine by her healthcare provider. 1338614	5/21/2021	CA	42	M	4/17/2021	4/17/2021	<p>Within 3-5 minutes developed dizziness, tingling in feet and hands, elevated blood pressure, mild nausea. Within an hour started having trouble with focusing his vision. Was given IV fluids at hospital in ER 5 hours after the injection, while leaving the hospital developed a slight limp on right leg. Felt feverish when he got home, took Tylenol when he got home. Noted extreme fatigue. The next morning was lethargic, dizzy and right side of face felt heavy, around 11 am. Called for a telemedicine visit around 12:30p. Became weak and unable to use right side of body, upper and lower extremities and right side of face was drooping, visible to wife. Wife had support of right side of body to move around. Went to urgent care around 2p. During urgent care evaluation, his vision became more impaired and speech became unclear, had to really focus to speak. Transferred to ER. Lost ability to write name, couldn't respond when asked for SSN. Admitted as a "stroke 4". Had CT scan, CT angiogram, MRI, blood labs, cognitive tests, neurologic tests. Neurology consult. Had lost sensation to heat and pressure. All imaging and labs were normal. After MRI, had convulsions. Wasn't dx'd as a seizure. Neck felt tight afterwards. Admitted to hospital x 1 week. Had a burning, red, rash on hands, feet. No bumps, hives, but just a "splotchy" red discoloration on surface of skin that would burn and itch, often flaring at night. Rx'd ativan. Checked for autoimmune disease, Bell's palsy, followed by neurologists, repeat MRI normal. Started to improve, discharged after one week with no clear diagnosis. Discharged to rehab facility. Patient preferred to transfer care to outpatient rehab service closer to home with more social support. Repeat hospitalized 3 weeks later, less extreme, went back to ER, stroke eval neg. Developed more aphasia. Called back to ER for further evaluation of C-spine due to mild abnormality on first scan. On further evaluation not thought to be connected to symptoms. EEG report pending. +Right hemiplegia, aphasia persists. +Rash, itching, burning persist.</p>
1338833	5/21/2021	PA	19	F	5/15/2021	5/15/2021	<p>Immediately after receiving her vaccination client developed blurry vision and R arm pain. Denied cp/syncope/dizziness. She reported that she had not had breakfast in the AM. She was offered water and her symptoms resolved within 15 minutes of being observed.</p>

1338625	5/21/2021	NM	32	F	5/20/2021	5/21/2021	Outcome: unexpected/unexplained death Had first dose Moderna Vaccine 3/31/21. She described body aches and mild fever ? ?like I had COVID again for a day? ? lasting about 36 hours, and then felt fine. Had dose # 2 Moderna vaccine about 6:50 PM at Community vaccination site. She was driver, received left deltoid injection from Doctor. During observation period reported no symptoms, was happy and talkative with family and staff. Family reports later that evening she did not feel well ? ?just not hungry? and wanting to lie down. Slept well, then woke up feeling better except for left arm achiness at injection site. Did not report redness, rash, or any difficulty breathing. Was talkative, walking around, took a shower, and was planning to drive to the grocery store later that day. Mid morning ? maybe beginning about 11 AM, family said she went in and out of bathroom several times. She told them she had vomited three times and was feeling shaky. Her oral temperature was 101.3. About 1:30 PM, she was in her room and called out for her mother. When family went into the room, she was shaking ?like she was having a seizure? and then her eyes rolled back and she fell to her side and stopped breathing. Family called 911 and started CPR. CPR was continued by EMT?s once they arrived, but they were not able to resuscitate her.
1338575	5/21/2021	IN	15	M	5/21/2021	5/21/2021	2 minutes after administration, the patient was speaking to his father, dozed off to one side and had tremors. Patient immediately was able to open eyes and was shaking. Pharmacist advised patient to take deep breaths and relax until paramedics arrived. Patient had a few sips of water while waiting. Patient was fine after 15 minutes.
1338588	5/21/2021	CA	14	M	5/21/2021	5/21/2021	Patient appeared to be fainting, shook back and forth in a repeated manner after sitting down for observation following the COVID vaccination. Did not have any blurred vision, was responsive. To be safe, an ambulance was called. This occurred minutes after being vaccinated, the ambulance arrived about 30 minutes afterwards and picked the patient up.

1338386	5/21/2021	WA	31	F	5/21/2021	5/21/2021	Adverse event: PT abruptly felt lightheaded approximately 14 minutes after receiving Moderna COVID vaccine at 1235. PT lowered herself to the floor to lay on her left side. PT presented with pallor and diaphoresis. RN responding called for aid at 1249, aid arrived at 1251. SPO2 was 97% on RA. PT reported a history of syncope, especially after injections, denies significant medical history and was unsure of baseline BP. EMTs prompted PT to sit in chair, PT was able to rise without difficulty, but continued to c/o 'lightheadedness'. EMTs provided education on vaso-vagal response, provided juice and water to PT. PT reported feeling "stable, but a little warm" and then reported increasing nausea. PT provided emesis bag and chose to lay down once again, reporting that she felt better laying down. At 1304, PT reported that her nausea was resolved, and that she felt 'normal'. Denied vision changes, vertigo when moving head side to side. Color improved. EMTs medically cleared PT at 1313 to be driven home by husband. Treatment: Juice and water were provided, EMTs assessed/treated (Vitals at 1250: Bp 100/P laying, HR 106, SPO2 97% RA. 1255: BP 100/P sitting, HR 92, SPO2 99% RA. 1303: BP 96/52 laying. 1308: BP 102/60 sitting). Pupil check at 1300 WNL, PT declined CBG check. Education provided on s/s to watch for, when to seek medical care provided by RN. Outcome: PT was medically cleared by EMTs at 1313, driven home in private vehicle by husband. HCP Responding: RN, EMT, EMT, RN

1338339	5/21/2021	VA	14	F	5/18/2021	5/18/2021	I administered the vaccine, got one side of the band-aid on and that is when her head fell back. Her eyes rolled into the back of her head; she then leaned over the right arm of the chair. Her body stiffened next. I held her head and body with the help of a colleague. This happened for about 10 seconds, then she woke up and snatched her mask off with a confused look on her face. We asked her questions to see if she was aware. She was, then she went back out falling over to the side. I called 911. When she awakened the second time after about 7-10 seconds her face turned pale. We then moved her to the floor and propped her feet up. Patient said she was nervous and felt like she had to use the restroom. Her skin was clammy; patient said clammy skin is nothing new for her. The fire truck and ambulance arrived on scene. The workers began to assess patient. Vitals were good. She did not go in the ambulance, but stated her vision were blurry. She went home with grandparents.
1338133	5/21/2021	VA	16	F	5/21/2021	5/21/2021	Patient states she exhibited dizziness and blurred vision. Patient was given orange juice and symptoms were resolved.
1338106	5/21/2021	PA	59	F	5/21/2021	5/21/2021	Patient's doctor recommended and approved her to receive the Janssen vaccine following an adverse reaction to the moderna vaccine (1st dose). Patient reported she experienced hives and mild throat irritation from her first dose of moderna and successfully took benadryl to relieve the symptoms. The patient was asked to stay for 30 minutes following Janssen vaccine for monitoring. Within 10 minutes, the patient reported eye and body itching. The patient refused epinephrine and took benadryl. Within 15 minutes, the patient said she felt better.
1338099	5/21/2021	WA	13	M	5/21/2021	5/21/2021	Patient was administered vaccine at 3:20pm, symptoms started in approximately 10 minutes. (911 called and stayed on phone until paramedics arrived). difficulty breathing, shortness of breath, became less responsive, eyes closed, stopped speaking. Patient lying down with legs elevated. epinephrine 1.25mg injected into left thigh via auto-injector at about 3:25 continued to monitor patient with the help of parents. Patient started arousing in a couple minutes. paramedics arrived. paramedics transported.

1337614	5/21/2021	WI	63	F	5/19/2021	5/20/2021	Patient with hx of multiple sclerosis presented to ED on 5/20/21 with bilateral lower extremity weakness. Patient got her 2nd COVID vaccine on 5/19/21 (Pfizer), and since that time she developed bilateral lower extremity weakness. She generally uses a wheelchair and a walker but at baseline can ambulate with a walker and currently she cannot stand at all. She reports her last MS flare was about 6 months ago and when she has MS flares, she always has symptoms with her legs. She gets ocrelizumab injections every 6 months (last dose was 5/18/21). She denies any vision changes or difficulty with speech, no upper extremity weakness, numbness/tingling. Denies any bowel or bladder incontinence. She denies any chest or abdominal pain, nausea, emesis, diarrhea, urinary issues, cough, fevers, chills. SARSCOV2PCR test on 5/20/21 = not detected. She does report some mild stiffness in her right upper arm but states that also happened with the first dose of the vaccine. Case was discussed with neurologist who recommended admission and observation but deferring on steroids at this time. As of 5/21/21, patient is still hospitalized. Her lower extremity weakness is improving, but the medical team anticipates she will need short term inpatient rehab or possibly home PT/OT before being able to safely return home.
1337659	5/21/2021		39	F	3/23/2021	3/23/2021	Painful left arm around the deltoid and elbow. Radiating pain behind the left ear, radiating towards the neck area and around the left eye. The pain come and go, feels like pins and needles, lasts for about less than a minute the fade away. The kind of pain happens more than three times daily.
1337722	5/21/2021	WA	64	F	4/5/2021	4/22/2021	Two weeks after the vaccine I noticed that I had a strange feeling in my eye. When I looked in the mirror I saw a little line of blood. I went to the ER and after examining my eye they could not find reason for the blood in my eye. I was told it was a Hyphema. The following day I felt pressure in my eye which lasted for one day. I went to the Optometrist a week later but the blood was no longer visible. The doctor could not find anything wrong.

abnormal (abnormal) Worsened Ankylosing Spondylitis, Degenerative Spine disease and Radiculopathy. On 26-Mar-2021, Computerised tomogram: abnormal (abnormal) Worsened Ankylosing Spondylitis, Degenerative Spine disease and Radiculopathy. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter considered VACCINATION SITE PAIN (Vaccination site sore) to be probably related and ALLERGIC COUGH (Allergic cough), SEASONAL ALLERGY (Spring allergy attack due to grass and flowers), MALAISE (Not feeling well), RADICULOPATHY (Radiculopathy worsened), VASCULAR ACCESS SITE BRUISING (Bruising because of the blood extraction and recurred bruising because of the blood extraction with Humira), LYMPHADENOPATHY (Swollen glands) and FATIGUE (Felt tired) to be not related. No further causality assessments were provided for ANKYLOSING SPONDYLITIS (Spondylitis ankylosing aggravated), VACCINATION SITE PAPULE (Injection site got raised bump), VACCINATION SITE WARMTH (Injection site got warm), INTERVERTEBRAL DISC DEGENERATION (Degenerative spine disease worsened), SOMNOLENCE (Slept most of the day), HYPOAESTHESIA (Numbness in toes) and VACCINATION SITE ERYTHEMA (Injection site got little pink). No treatment information was provided. Company comment: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.

1332972	5/20/2021	MN	51	F	5/18/2021		<p>FAINTING; DIZZINESS; BLURRED VISION; PAIN AT THE INJECTION SITE; HEADACHE; This spontaneous report received from a patient concerned a 51-year old White Hispanic or Latino female. The patient's weight, height, and medical history were not reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1808986 expiries: UNKNOWN) frequency one total, dose was not reported, administered on left arm on 16-MAY-2021 for prophylactic vaccination. No concomitant medications were reported. After the vaccination Symptoms started on 18-MAY-2021 dizziness, pain at the injection site, and blurred vision. It was also reported she fainted while walking back home. All the symptoms resolved. The Patient was complaining of a headache at the moment of reporting. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from fainting, dizziness, blurred vision, and pain at the injection site on 18-MAY-2021, and had not recovered from headache. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: 20210534713-COVID-19 VACCINE AD26.COV2.S- Fainting. This event(s) is considered unassessable. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the event(s).</p>

1333213	5/20/2021	CA	14	M	5/19/2021	5/19/2021	Pfizer vaccine given 5/20/2021 Per mom/ pt the shot was given at 11:02 around 11:07 he leaned forward and became unresponsive. He was slightly drooling from the mouth. Mom says that his body was tight and that he was shaking a little. His eyes were closed and did not appear to be rolling back in his head. This episode lasted for less than 1 minute. He did not remember what happened and thought he wet himself after; which he did not. About 1-2 min after that episode mom states that he appeared to "passed out" for less than a minute. The ambulance was called and he was taken to hospital. He was evaluated and appeared well at that time. No fever. EKG was done and per pt it was normal. No EEG was done. He was discharged without admit That evening he has multiple episodes of vomiting > 10 times. No diarrhea or fever. Seen today at medical office for follow up. Vaccine not given at our clinic
1332870	5/20/2021		33	F	5/7/2021	5/10/2021	13 May - Pt called back saying that last night she developed R side facial numbness including right half of tongue with blurred vision, denied facial droop, muscle weakness. Pt took a benadryl last night fell asleep and in the morning sxs resolved. However, pt states she is starting to feel sxs return, lip is turning red, feeling numbness/tingling on face. Denies light sensitivity and pupil is reacting appropriately to light per pt. Patient described distribution of trigeminal nerve all branches and ophthalmic nerve. 20 May - all symptoms resolved expect right eye visual disturbance described as "haziness". Exam including CN2-12, lymph and visual acuity all normal.

Problems; POA, (Principal) Sepsis, due to unspecified organism, unspecified whether acute organ dysfunction present, Yes, Essential hypertension Yes, Chemotherapy-induced peripheral neuropathy, Yes. Overview Signed 5/10/2019 2:03 PM by MD, Pins and needles and numbness in tips of finger and toes, Lung metastasis Yes. Hypoxia Yes. COVID-19 Unknown, Acute respiratory failure with hypoxia Yes, Palliative care encounter Not Applicable, Declining functional status No. DETAILS OF HOSPITAL STAY; Presenting Problem/History of Present Illness/Reason for Admission, Sepsis, due to unspecified organism, unspecified whether acute organ dysfunction present. Acute hypoxemic respiratory failure due to COVID-19, Respiratory failure. Sigmoid perforation with abscess. Hospital Course; 71-year-old male prolonged admission for acute hypoxic respiratory failure secondary to COVID-19. No history of colorectal adenocarcinoma with lung mets. Prior resection of bowel, prior chemotherapy. Required management in the ICU due to worsening respiratory failure over the time that he has been admitted to Hospital (20 days). He had remained on BiPAP therapy throughout that time, received appropriate corticosteroids, and antiviral therapies. Approximately 1-1/2 weeks ago he began to develop mild left lower quadrant abdominal pain. In the last 48 hours this is significantly worsened. CT abdomen and pelvis was obtained on Friday, which displayed pneumoperitoneum, sigmoid abscess with sigmoid perforation. There is a prior anastomotic site distal to this. Given his overall complexity he was to be medically managed to avoid the need for OR and intubation. He did well through the initial 24 hours of IV antibiotics, fluids and bowel rest. This afternoon he became increasingly dyspneic, required implementing nonrebreather mask, and subsequently developed severe rigors, tachycardia. I obtained a stat follow-up CT scan which shows similar findings of free air within the abdomen. Given signs of impending sepsis, BiPAP therapy was initiated, bolus IV fluids were given. Blood gas, blood counts, lactic acid are pending. He is receiving empiric Zosyn. I discussed this with general surgery, whom is well-known to the patient. In agreement the patient likely needs surgical intervention. However given his overall complexity and in light of the fact that this area surrounds the ureter, and

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

we do not have urology coverage. It was felt he was most appropriate to be managed in Hospital. Case was discussed with Dr. at Hospital, patient will be transferred there via air transit. At this time his blood pressure appears stable, he is tachycardia, is currently on BiPAP which will be transitioned to CPAP for transport. He has received several doses of Dilaudid, for improved pain control. No further advancement of airway was performed prior to discharge. Case was discussed with family at length, all risks and benefits of transfer were discussed with wife and patient. It is recommended to involve pulmonary critical care services including surgical ICU care as if requiring surgery he is high likelihood for prolonged vent needs. Operative Procedures Performed: Treatments: See above; Procedures: Na Consults: pulmonary/intensive care and general surgery. Pertinent Test Results: CT abdomen pelvis with contrast [3279871876] (Abnormal) Resulted: 04/25/21 1811. Order Status: Completed Updated: 04/25/21 1812. Narrative: PROCEDURE INFORMATION: Exam: CT Abdomen And Pelvis With Contrast, Exam date and time: 4/25/2021 17:36, Age: 71 years old, Clinical indication: Abdominal pain; Additional info: Sepsis, bowel perf. HX of Covid19 +, malignant colon with lung metastasis. Bowel perf. TECHNIQUE: Imaging protocol: Computed tomography of the abdomen and pelvis with contrast. Radiation optimization: All CT scans at this facility use at least one of these dose optimization techniques: automated exposure control; mA and/or kV adjustment per patient size (includes targeted exams where dose is matched to clinical indication); or iterative reconstruction. Contrast material: 350 OMNI; Contrast volume: 80 ml; Contrast route: INTRAVENOUS (IV); COMPARISON: CT ABDOMEN PELVIS W CONTRAST 4/23/2021 16:46, FINDINGS: Tubes, catheters and devices: Catheter terminates in the right atrium in satisfactory position. Lungs: Moderate airspace opacities throughout the lung bases are similar to prior and consistent with Multilobar pneumonia consistent with the history. Liver: No hepatic masses. Gallbladder and bile ducts: Cholelithiasis. Pancreas: No ductal dilation. No masses. Spleen: No splenomegaly or focal lesions. Adrenal glands: No mass. Kidneys and ureters: 10 mm benign left renal cyst, no follow-up necessary. No renal masses or Hydronephrosis bilaterally. Stomach and bowel: Redemonstration of

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

perforated proximal sigmoid diverticulitis. Small pneumoperitoneum is stable. Predominantly gas containing, 25 x 28 mm collection adjacent to the inflamed sigmoid colon similar to prior; a fistulous tract extends toward the midline containing gas and fluid, with suspected fistula to adjacent loops of small bowel. Moderate to severe descending and sigmoid diverticular burden. Minor right diverticular burden. No small bowel obstruction. A somewhat clumped appearance of small bowel in the right lower quadrant near the colon enteric fistula. Appendix: No evidence of appendicitis. Intraperitoneal space: Mesenteric edema around the small bowel, slightly increased, however no new mesenteric collection. There is no extravasation of enteric contrast into the collection adjacent to the sigmoid colon. Vasculature: Mild aortoiliac atherosclerosis. Lymph nodes: No significantly enlarged lymph nodes. Urinary bladder: Unremarkable as visualized. Reproductive: Unremarkable as visualized. Bones/joints: Degenerative changes in the spine. Multilevel disc space narrowing. Multilevel central canal and neuroforaminal stenosis in the lumbar spine. No acute fracture or subluxation. Soft tissues: Small fat-containing right inguinal hernia. Small fat-containing left inguinal hernia. Large ventral abdominal hernia containing gas, which has replaced the previous contents of fat and bowel loops. Volume increased compared to prior. IMPRESSION: 1. Redemonstration of perforated proximal sigmoid diverticulitis. Small pneumoperitoneum is stable. 2. Similar perisigmoid collection; colon enteric fistula, probably at least subacute in duration. The perisigmoid collection is prominently gaseous and there is no frank abscess. 3. Suspected mild enteritis the small bowel loops or loops associated with the fistula. No obstruction. 4. Additional findings as described are similar to recent prior imaging. COMMENTS: Any incidental renal lesion less than 1 cm or classified as too small to characterize, or any incidental cystic renal lesion characterized as simple-appearing, is likely benign. No follow-up imaging is recommended for these lesions per consensus recommendations based on imaging criteria. DETAILS OF HOSPITAL STAY Presenting Problem/History of Present Illness/Reason for Admission Respiratory failure, acute, Hospital Course; Patient is a 71 yr.. male with history of metastatic colorectal adenocarcinoma with lung metastases, prior bowel resection and chemotherapy. The patient initially tested positive for Covid in early March. His symptoms at that time are mild and resolved. He was later vaccinated and that month. He started having severe symptoms again on 4/3 for which he presented to Hospital. Since that time, he has received full course of Remdesivir and steroids.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							<p>He had a CT scan performed on 4/23 which revealed pneumoperitoneum secondary to presumed perforated sigmoid diverticulitis with focal sigmoid abscess. Patient was weaned down to minimal nasal cannula settings but somewhat suddenly earlier on 4/25 patient had increased work of breathing, became tachycardia, and had rigors. Hospital ordered repeat CT scan which showed similar findings in the abdomen. Patient had been maintained on Zosyn. Repeat labs were sent which were largely unremarkable. Given concerns for worsening sepsis and potential need for surgery, he was subsequently transferred Hospital. On admission to hospital, he had a normal lactic acid and no leukocytosis. He did not have evidence of peritonitis. The decision was made to treat his diverticulitis conservatively. However, early on 4/26 the patient started to develop a lactic acidosis. An extensive discussion was had with the patient and his wife regarding surgery and the possibility the patient may never be able to separate from the vent given his worsening Covid pneumonia. The patient elected to undergo an exploratory laparotomy with with segmental resection of distal descending and loop transverse colostomy. However, as the days progressed the patient had worsening respiratory status that required deep sedation, paralytics and proning all of which were unsuccessful in maintaining his oxygen saturation greater than 88%. His wife, knowing that he would not want to have a prolonged course on the ventilator, elected for transition to palliative extubating with comfort care on 4/30 and the patient expired roughly 10 minutes after extubation.</p>
1333276	5/20/2021	WA	30	F	4/24/2021	4/24/2021	<p>Diarrhea, cold sweat at night, headache, eyes slightly swollen. At first was abdominal pain coupled with diarrhea. For the past week, I have been having cold sweats at night but no fever that I have been able to record. Sore throat, slight cough, and headaches also in this past week.</p>
1333303	5/20/2021	NY	17	F	5/17/2021	5/18/2021	<p>customer states she took her second shot of the vaccine and she has been having eye inches and running noise and not feeling well. Called her and she is ok.</p>

1333444	5/20/2021	AZ	65	F	3/30/2021	4/6/2021	One week after the first injection I developed some blurring of right eye but I thought I just needed new glasses. One week after the second injection I rapidly developed severe loss of vision in the right eye. I have been evaluated medically and was found to have right optic neuritis with significant loss of vision in the right eye. I had injection site redness and swelling after both injections and moderate flu-like symptoms for a day after the second injection
1333569	5/20/2021	CA	16	M	5/18/2021	5/19/2021	Site: Redness at Injection Site-Medium, Site: Swelling at Injection Site-Medium, Systemic: Allergic: Rash (specify: facial area, extremities)-Medium, Systemic: Allergic: Swelling of Face / Eyes / Mouth / Tongue-Medium, Systemic: Headache-Medium, Additional Details: Pt is a 16 yo male who came in for second dose pfizer vaccine on 05/18/21. His mother reported that the pt experienced redness and swelling of the left eye at 2am on 05/19/21. At 3am, the patient mother gave her son benadryl and ibuprofen. I called the patient at 11am on 05/19/21 to check up and he is currently sleeping with some swelling and redness present. He has made a doctor appointment later today.
1333625	5/20/2021	LA	47	F	4/6/2021	4/6/2021	Immediately felt dizzy & vertigo-ish, w/in 30mins I had to lay down, violent migraine, pain behind eyes, radiated through neck, upper back, shoulder. Felt better the next day, then one week later migraine persisted & all covid symptoms returned at an alarming rate. Fatigue, fever, hot/cold sweats. Freezing & burning up at the same time. Migraine w/vertigo, loss of taste, no appetite, restlessness, brain fogged, short term memory loss, blurred vision, ringing in ears. Vertigo/migraine also worsened w/change in weather, before rain, or a drop in barometric pressure, or increase in humidity, or a cold front coming in. Any drastic temperature change outside seems to prompt or increase the migraine/vertigo, dizziness.

1332860	5/20/2021	CT		F	4/12/2021	5/12/2021	has had 4 very brief episodes of syncope in the past 4 days/ dizzy and passed out; Test: On monitor for 24hr w/ no, Result: Arrhythmia; After each episode, she consistently describes dark and blurred vision for 15 min; arm twitching; then dizzy and passed out; she felt scorching hot for a few minutes; This is a spontaneous report from a contactable physician. A female patient of an unspecified age received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, lot number: EP6955 and expiration date were unknown), via an unspecified route of administration in arm right on 12Apr2021 as single dose for COVID-19 immunisation. Medical history included anxiety , depression from an unknown date and unknown if ongoing. Concomitant medication included escitalopram oxalate (LEXAPRO) taken for anxiety, depression from an unspecified date. Previously the patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection, lot number: EP6955 and expiration date: 30Jun2021), via an unspecified route of administration in arm right on 22Mar2021 as single dose for COVID-19 immunisation. It was reported that the patient who will be 20 years has had 4 very brief episodes of syncope in the past 4 days and spent 8 hours in ER Friday. Blood work, ECG, Echo, and MRI without contrast were normal. Doctors are baffled. Reporter enquired about the vaccine-related seizures 1 month after the second dose and asked for email address for a medical monitor supporting the vaccine trial. It was reported that the patient is perfectly healthy She does not drink or use any illicit drugs. She takes BCP to regulate her period and one month ago she started 5 mg/day Lexapro for test anxiety and COVID-induced depression. On Wed 12May2021 10 am while at work, she felt scorching hot for a few minutes, then dizzy and passed out; witnessed by 2 work colleagues. She will ask her colleagues tomorrow how long she was unconscious. On Thurs 13May2021 while at work she felt dizzy briefly but did not pass out. On Fri 14May2021 shortly after lunch while working in her cubicle, she woke up with computer keyboard imprint on her face. Unwitnessed, no warning whatsoever. Sat pm after dinner while in backseat of car, she felt dizzy and within a minute or so she had brief LOC lasting less than 1

minute. Sun 16May2021 after breakfast while bathing, she passed out. Unwitnessed. Her phone was nearby so she was able to call me. After each episode, she consistently describes dark and blurred vision for 15 min. Then she feels fine. No obvious seizure activity although last night her boyfriend said her right arm was twitching. No incontinence. Seen by her PMD on Thurs 13May2021 and we spent 8 hours at the ER Friday 14May2021: PE, orthostatics, CBC, Chem 18, pregnancy test, U/A, ECG, ECHO and MRI of brain without contrast was normal. No Neuro or cardiology consult (yet). Today her doctor is recommending she be admitted for observation, consults and further testing. The patient has not received any other vaccinations prior 4 weeks and has no history of allergies. All tests done at the hospital came back normal. Daughter is currently in the hospital being discharged today 17May2021. She will wear a Holter monitor for 2 weeks to record any further events. Cardiology and neurology both conclude the adverse events were not cardio or neurological origin. Physician does not think it was seizures. She did not intend to report seizures-it was syncope. She does not have any further adverse events or history to report at this time beyond what she already reported. The patient underwent lab tests and procedures which included blood test: normal, blood thyroid stimulating hormone: normal, electrocardiogram: normal, electroencephalogram: normal, investigation: normal, investigation: arrhythmia, investigation: normal, physical examination: normal, pregnancy test: normal, urine analysis: normal on 13May2021, echocardiogram: normal, electrocardiogram: normal, full blood count: normal, investigation: normal, magnetic resonance imaging normal: normal on 14May2021. The outcome of the events was unknown.; Sender's Comments: As there is limited information in the case provided, the causal association between the events syncope, arrhythmia, dizziness, feeling hot, vision blurred, muscle twitching and the suspect drug BNT162B2 cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified

1332676	5/20/2021	VA	19	M	3/25/2021	3/1/2021	heart failure; heart attack; fluid in his lungs; This is a spontaneous report from a contactable consumer (patient's mother). A 19-year-old male patient received the first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot Number: EP7534), via an unspecified route of administration, administered in Arm Right on 25Mar2021 (received at the age of 19-years-old) as 1ST DOSE, SINGLE for COVID-19 immunization. Medical history included ongoing seasonal allergies and cardiac murmur he had as an infant. When probing medical history, the consumer reported that as an infant, her son, had a heart murmur. Her son saw a heart specialist in (State) who did an ultrasound/sonogram of her son's heart. The specialist said the heart murmur was fine and nothing needed to be done. She also adds that for family medical history, she and her husband don't have any early onset heart issues in either side of their families. She also reported that her son has horrible seasonal allergies. Concomitant medication(s) included cetirizine hydrochloride (ZYRTEC [CETIRIZINE HYDROCHLORIDE]) taken for an unspecified indication, start and stop date were not reported; triamcinolone acetonide (NASACORT) taken for an unspecified indication, start and stop date were not reported; montelukast (MONTELUKAST) taken for an unspecified indication, start and stop date were not reported. The reporter stated that her son (patient) had a heart attack (26Mar2021) after receiving the first dose of bnt162b2. The patient also experienced heart failure on 28Mar2021 and had fluid in his lungs on Mar2021. She called regarding the COVID-19 vaccine on behalf of her 19-year-old son who received his first vaccine on 25Mar2021. Her son received his first Covid 19 vaccine at a PRIVACY where he attends college. On Friday, 26Mar2021, he was feeling crummy, on Saturday, 27Mar2021, he was feeling crummy. On Saturday night, 27Mar2021, her son started texting her around 11:30PM saying he had pain in his left shoulder and left arm. He had already taken 2 Advil and it wasn't helping with the pain, her son asked if he could take a third Advil. The reporter told her son he could take a third Advil because it had been an hour and a half since he had taken the first two Advil. The texts from her son continued. He was getting no relief. He took a hot shower and tried self-massage and warm compresses. He ended up throwing

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

up and he said he felt a little better. Her son tried to lay down and couldn't get any relief from his pain. The pain was tremendous in his left shoulder and arm. Her son told his mother, he thinks he needs to go to the emergency department. His mother is two hours away from him and told him to call 911. Her son had a friend take him to the emergency department instead of calling 911. Her son went to PRIVACY. While at the emergency department, the doctor thought that her son's pain was muscular. Her son received an injection of Toradol. Her son was discharged from the emergency room and went back out to his friend who had brought him to the hospital. Her son and his friend didn't even make it out of the emergency department parking lot when her son suddenly couldn't see anything. His eyes were wide open and all he could see was black. His ears started ringing. Her son went back into the emergency department. Her son received Benadryl and an Epi-pen thinking maybe he was allergic to the Toradol and having a reaction to the Toradol. Her son had blood work, an EKG, and vital signs done in the emergency department on 28Mar2021. His blood work were over 3000 which the reporter reports, indicates a heart attack. The emergency room doctor did not think the Toradol would have pushed his Troponin levels that high. With her son complaining to her about the pain in his left shoulder radiating into his left arm and throwing up, those are signs of a heart attack. Her son was maybe playing off the seriousness of the pain he was experiencing. It was agreed at that point it might be her son's heart. She was about 18 minutes away from the hospital when she received a call from the hospitalist, the doctor taking care of her son. And that doctor tells her that her son is not doing well and is not responding to treatment of the bag of saline fluids. The doctor is trying to get her son's blood pressure and heart rate back up. The doctor was afraid he might have to air flight him to the PRIVACY hospital. She told the doctor she is 18 minutes away and asked if he can wait that long or does she have to turn around and drive the opposite direction to the PRIVACY. At this point her son was having a COVID-19 viral test in case he needs to be transported to the other hospital. The doctor tells her that her son can wait the 18 minutes until she gets to the hospital. She arrived at the hospital and wanted to see her son, her son is on high flow oxygen and she has to

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

gown and glove up to be in his room for fear of Covid particles since he's on the high flow oxygen. His COVID-19 viral test results have not come back at this time. Her son was admitted to the hospital for heart failure. He was in the hospital for 5 days. He was admitted in the wee hours of the morning on 28Mar2021. During the time he was in the hospital he had chest x-rays and he was given Lasix to get the fluid off his lungs. His white blood cells were way up so he was given an antibiotic. He had an MRI, Chest X-rays, and a Heart Catheterization through his wrist that would indicate that he had blocked arteries in his heart. He had no blocked arteries. The heart catheterization revealed an artery going into his 4th heart chamber was slow to open and close. The cardiologist prescribed Metoprolol for six months with monitoring. The cardiologist feels the Metoprolol will repair his artery and get his blood pressure and heart rate numbers where they need to be. He was admitted to the hospital at around 3:00AM on 28Mar2021 and was discharged on 01Apr2021. Her son's COVID-19 viral test came back negative, but his COVID-19 antibody test showed that he did have COVID-19 antibodies. The doctor didn't know if that meant that her son had a previously undiagnosed case of the COVID-19 virus or if he developed COVID-19 antibodies that soon after he received the Covid 19 vaccine. She reported when her son was discharged, he was feeling better, but still had residual fluid at the bottom of his lungs. Her son did have to go for a chest x-ray on Tuesday, 06Apr2021, after he was discharged, to make sure the fluid was making its way out of his body. When he was discharged from the hospital, he had some shortness of breath and he was tired and weak feeling. The pain in his left arm began before he was admitted to the hospital. The shortness of breath started during his hospital admission. At this point in time she would say her son has improved. The Metoprolol he was prescribed by the cardiologist is one half of a 25mg tablet once at nighttime. She stated that she does not have any information on how low her son's blood pressure and heart rate were during his time in the hospital. Therapeutic measures were taken as a result of the adverse events. Outcome of the events was recovering.

Medical history included type 2 diabetes, stage 4 kidney disease, high blood pressure. Concomitant medications included unspecified drugs. Prior to vaccination, the patient was not diagnosed with COVID-19. On 14Feb2021, the patient experienced body chills, body aches, blindness, septic shock due to serratia infection (not sure how the infection came to be), kidney failure. The events required a visit to the emergency room. No treatment required. The patient was hospitalized due to the events for 18 days and condition was life threatening. The final outcome was fatal. The patient died on 06Mar2021. An autopsy was not performed. Cause of death was septic shock. No follow-up attempts are possible. No further information is expected.; Reported Cause(s) of Death: Septic shock

1332687	5/20/2021	CA	34	F	4/7/2021	4/7/2021	fainted; weakness in my legs/Arms fairly weak too; extreme fatigue/Exhausted; brain fog/felt as though someone was throwing cold water at me; I don't feel safe to drive/ missed significant work; shake with a lactic acid type feeling; had a racing heart; diarrhea; fevers of 100 degrees (101 the first night) lasting off and on for the first 11 days; parasthesia a pins and needles feelings in my hands and feet; Most side effects have been neurological; Sunlight hurts my eyes; hard to walk; impossible to exercise.; This is a spontaneous report from a contactable consumer. A 34-year-old female patient (Age at time of vaccination, 34-year-old) received first dose of BNT162B2 (BNT162B2) via an unspecified route of administration, administered in Arm Right on 07Apr2021 at 10:30 (Batch/Lot Number: ER8737) as SINGLE DOSE for covid-19 immunization. Medical history was reported as none. The patient's concomitant medications were not reported. The patient Fainted and experienced weakness in my legs/arms fairly weak too, extreme fatigue/exhausted, brain fog/felt as though someone was throwing cold water at me, i don't feel safe to drive/ missed significant work, shake with a lactic acid type feeling, had a racing heart, diarrhea, fevers of 100 degrees, parasthesia a pins and needles feelings in my hands and feet, most side effects have been neurological, sunlight hurts my eyes, hard to walk and impossible to exercise all on 07Apr2021 at 10:30. The patient reported; It is now day 27 post vaccine and I have weakness in my legs, extreme fatigue, brain fog. I don't feel safe to drive. I have missed significant work. Can't walk down my block without my legs getting so weak they shake with a lactic acid type feeling. Arms fairly weak too. Initially, when I got the vaccine my right leg went weak. The night of the vaccine, I fainted, legs so weak I could barely get off the bathroom floor. Had a racing heart and felt as though someone was throwing cold water at me. Had diarrhea. I had fevers of 100 degrees (101 the first night) lasting off and on for the first 11 days. For the past several days I've been experiencing paresthesia a pins and needles feelings in my hands and feet. Most side effects have been neurological. Sunlight hurts my eyes. Was in ER for the weakness in my legs. Neg for covid. CBC normal. It was deemed that since my reflexes work GBS is unlikely. Exhausted and still extremely weak and it is hard to walk, and impossible to exercise. The patient

1332699	5/20/2021	TX	29	F	4/22/2021	4/26/2021	stroke-like symptoms; not being able to see out of my left eye; the left side of my body was numb; pounding headache on the left side of their head; shooting pain up and down my neck; could barely turn my head with shooting pain down my body; shingles; migraines; This is a spontaneous report from a contactable consumer (patient). A 29-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection) (at 29 years of age), via an unspecified route of administration, administered in arm left on 22Apr2021 10:15 (Batch/Lot number was not reported) as 1ST DOSE, SINGLE for COVID-19 immunisation. Medical history included autoimmune disorder from an unknown date and unknown if ongoing. Concomitant medication included levothyroxine taken for an unspecified indication, start and stop date were not reported. The patient was not pregnant. The patient had no known allergies. She was not diagnosed with COVID-19 prior to vaccination. She has not been tested for COVID-19 since the vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. It was reported that the patient had stroke-like symptoms, not being able to see out of her left eye, the left side of her body was numb, and she a pounding headache on the left side of their head. Upon being checked into the ER, she was immediately put on stroke alert. After a CAT-Scan and two MRIs, blood clots were ruled out. She stayed under close watch, and an IV was administered. All her blood work numbers checked out and the doctors were puzzled. After three to four hours, the symptoms reduced. After ten hours, they were almost gone. She went home and didn't have any more complications that day. Fast forward to the 1st, new symptoms. She now has shooting pain up and down her neck. At first, she thought she strained her neck, but the next day she could barely turn her head with shooting pain down her body. This morning they went to their PPC to get checked out. Luckily, a diagnosis was given. She had developed shingles. The events started on 26Apr2021 10:00 AM. The events resulted to Doctor or other healthcare professional office/clinic visit and Emergency room/department or urgent care. The patient was hospitalized for the events. Therapeutic measures were taken as a result of the events. She was given IV for migraines but it did nothing. The outcome of the

1332715	5/20/2021	MD	35	F	4/25/2021	4/25/2021	entire intestines hurt her; back pain/sharp pain in the lower back; Back pain felt like nerve inflammation like sciatica; Back pain felt like nerve inflammation like sciatica; sore pain in the spine area/pain can change from day to day; it can be on both sides of spine, or tailbone; right side neck pain (felt like a pulled muscle); sharp shoulder blade pain/shooting pain in the hips when she walks; right ear, it felt swollen; hearing was muted-approximately 20% hearing loss, could not hear clear sounds/partial hearing loss/ dulled, similar to wearing a thick hat/transferred to her other ear; Feeling like a pressure on her ear; little pinkish rash/pinkish marbled rash; felt woozy; felt a little drunk or funny; felt a little drunk or funny; She currently has these symptoms, limited movement; difficulty walking, can't walk fast; felt like body could not hold her weight anymore; She can't bend over without pain and is unable to get things on the bottom of the refrigerator or pots in the kitchen; jerking muscle in the left thigh and right thigh; felt a heaviness on her face, felt like a heavy mask on it even when the mask was removed; Pain is a stabbing pain very painful and then the stabbing pains come and go and feels like a pulling pain, like a nerve pain; numbness in buttocks and central part of buttocks like tingling pins and pricks; numbness in buttocks and central part of buttocks like tingling pins and pricks/tingling sensation in both hands and both feet; pain in buttocks; This is a spontaneous report from a contactable consumer (patient). A 35-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in right arm on 25Apr2021 at 16:15 (at the age of 35 years old) (Lot Number: EW0176, unknown expiration) as 1st dose, single for COVID-19 immunization. Medical history included ongoing penicilline allergy since at the age of 17 years old (manifested by breathing issues, tightness in neck, all swollen up) and currently the patient does not have a thyroid. Concomitant medications included levothyroxine sodium (SYNTHROID) and liothyronine sodium (CYTOMEL), both ongoing as the patient does not have a thyroid. The patient previously took codeine and experienced allergy (at the age of 17 years old). A few minutes after receiving the vaccine on 25Apr2021, the patient experienced right side neck pain (felt like a pulled muscle) and sharp shoulder blade pain. She got the

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

vaccine in her right arm but had no arm pain. Then in her right ear, it felt swollen and her hearing was muted- approximately 20% hearing loss, could not hear clear sounds. Feeling like a pressure on her ear with partial hearing loss. It was dulled, similar to wearing a thick hat. Then it transferred to her other ear. Her face was feeling swollen, but it was not swollen, and she had a little pinkish rash but just under her mask. She didn't have any breathing problems. She asked the (name) staff member if these symptoms were normal. Patient was sitting in the waiting area of (name) pharmacy after administered the COVID-19 vaccine; all of these symptoms started happening around 3-4 minutes after receiving the vaccine. She would say within first 15 minutes after the COVID-19 vaccine was administered, it affected her other ear, where both ears had the muted hearing sensation which lasted about 2 hours. These side effects lasted about 1-2 hours and resolved on their own, no ointments were used. About 15 minutes after receiving the vaccine, she started having back pain, felt woozy, and felt a little drunk or funny. About 45 minutes later, she had sharp pain in the lower back, shooting pain in the hips when she walks. She currently has these symptoms, limited movement, difficulty walking, can't walk fast. After that, she was in bed all day and could barely make it to the bathroom. She previously was very healthy and regularly took long walks. Her back and hips feel sore. Back pain felt like nerve inflammation like sciatica where she got sharp pain in her lower back that felt like immediate inflammation. She got to the point where she was not able to sit straight, felt like body could not hold her weight anymore. She can't bend over without pain and is unable to get things on the bottom of the refrigerator or pots in the kitchen. She is unable to wash her hands together, she felt like her back can't support her weight. She had to wash one hand at a time. She is unable to get out of bed regularly, she has to roll out of bed. It has been 9 days from the vaccine and is still having shooting pains in her hips and jerking muscle in the left thigh and right thigh and it felt like nerves pulling string in the right leg which lasted only like 30-45 seconds. Before she went to the (name) pharmacy for the COVID-19 vaccine, she had never had any sorts of back issues, no strain, no health problems in that area. She told her husband she was going to have to lay on the

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

ground or go home, so they left. She can't walk more than 10-15 minutes. She left the pharmacy, and when she got in the car about 20 minutes after she had gotten the vaccine, she felt a heaviness on her face, felt like a heavy mask on it even when the mask was removed. She felt initially that her face was swollen, like it was pressed, but there was no visual swelling that she could see in the mirror. When she took her mask off the triangular area where the mask had covered she could see a little more of a rash, like pinkish marbled rash but it would go away in about 45 minutes to 1 hour, started to slowly fade away. She felt that if it was a rash it would be all over her face; but this area was only where the face mask had been. She had no injury that could have caused that. The pain the next day was so bad, she was not able to sit or stand. She was barely rolling out of bed, had to hold on to furniture and walls to make it to bathroom. She is still not able to fully bend down. She has limit in movement. She still has pain, it did improve since the first day; but she still gets like a sore pain in the spine area, lower spine like a shooting pain from hips to connection where her legs meet bone which is still there. The pain can change from day to day; it can be on both sides of spine, or tailbone, hips, joints from where her legs attach to the hip area. Pain is a stabbing pain very painful and then the stabbing pains come and go and feels like a pulling pain, like a nerve pain but there is constant soreness in that area; on top of that still has the stabbing pain; this has been going on for the last 9 days did not have a break from this. She has tried massaging the area, tried Bengay on her back, tried ketoprofen (Ketonal), tried Capsaicin patches, Voltaren for the pain but none of those have helped the pain. Pain is a deep pain. The only thing that has helped it is like hot or thermal water bottle that you fill up with hot water which helps mute the pain to where it is manageable and helps her fall asleep at night. She still feels pain at time of call feels like a spinal injury. She experienced for 3 days; she would say on day number 3 (in 2021), the pain moved from the lower back to the half of buttocks on both sides and started getting numbness in buttocks and central part of buttocks like tingling pins and pricks feeling for maybe a day or 2 then it resolved. She still has pain in buttocks and hips and the pain can move to lower back and will hurt in lower back. Then on 04May2021,

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

symptoms like entire intestines hurt her, she wasn't eating, it started at night when she was going to bed; so she is thinking maybe the pain is radiating to other parts of body to like her lower abdominal area; she used the hot water rubber bottle to relax muscles. She does not have the tingling sensation in her buttocks any longer; but does have tingling sensation in both hands and both feet that she sometimes feels, it is ongoing most of the time and is pretty severe. She feels pain getting up and down, still having pain; She is glad she can walk, because before walking was not very possible for her. She also tried a little bit of a back massage where she lay on her back and kind of wobbled on massager, but it doesn't help; the pain does not feel muscular it feels like something with the nerves. When she walks, she feels pain around her spine and lower back central part of spine, hips or lower back, like someone literally stabbed her in the back. She has seen her doctor on 03May2021 and was suggested seeing a neurologist before getting her second shot which is due 17May2021. Doctor ordered a blood panel and urine test and are still waiting for results (unknown results) taken on 03May2021. The patient asked if these are side effects of the vaccine. The patient did not know if she should or should not get the second dose relative to these events as of yet; second dose is scheduled for 17May2021. No additional vaccines administered on same date of the Pfizer suspect. No prior vaccinations (within 4 weeks). The events resulted in physician office visit. Patient was not hospitalized. The patient recovered from events right side neck pain (felt like a pulled muscle), "right ear, it felt swollen", partial hearing loss, pressure on her ear, little pinkish rash/pinkish marbled rash, and jerking muscle in the left thigh and right thigh on 25Apr2021. The patient also recovered from event numbness in buttocks and central part of buttocks in 2021. The patient was recovering from events limited movement, difficulty walking, and heaviness on face. Outcome of events "felt woozy, felt a little drunk or funny", and "entire intestines hurt her" were unknown. While the patient had not yet recovered from the remaining events. No follow-up attempts are needed. No further information is expected.

1332719	5/20/2021	OH	64	F	1/27/2021	1/29/2021	Bell's palsy; Eye twitching; This is a spontaneous report from a contactable consumer (patient). A 64-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in left arm on 27Jan2021 13:00 (Batch/Lot number was not reported) as 1st dose, single for COVID-19 immunisation. Medical history included high blood pressure and acid reflux. Other than those, patient was "pretty healthy." Patient was not diagnosed with COVID prior vaccination. Concomitant medications included irbesartan, pantoprazole, meloxicam, and biotin. Patient reported that she had Bell's palsy when she was in college. When she was teaching years later, she noticed that every year when she got the flu shot, her eye would twitch for about 8 or more weeks after the shot. She finally connected the fact that it was happening every year after the shot so she saw a neurologist. She was told that an egg derivative was used in the flu shot, which was connected to Epstein bar disease, which was connected to Bell's palsy. She was told to stop getting the flu shot so she quit getting the flu shot and never had another occurrence until after getting the COVID Pfizer shot. On 29Jan2021, the patient experienced bell's palsy and eye twitching. The twitch appeared a few days after getting the shot, but seemed mild enough, but as of late it has become quite an annoyance. The only thing she can attribute it to was the COVID vaccine. She was a little leery of getting a booster if necessary. No treatment was received. Outcome of the events was not recovered. Patient was not tested for COVID post vaccination. Information about lot/batch number has been requested.

1332725	5/20/2021	CA	55	F	4/26/2021	4/26/2021	<p>racing heart; dizziness; disorientation; blurred vision; forearm muscle pain/lower leg muscle pain; fatigue; loss of strength and coordination in fingers and arms/ residual arm &amp; leg weakness; loss of coordination.; right lower lip became numb; difficulty with concentration; This is a spontaneous report from a contactable nurse (patient). A 55-year-old female patient (non-pregnant at time of vaccination) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration administered in the right arm on 26Apr2021 at 02:30 AM as single dose for COVID-19 immunisation. Medical history included lumbar disc degeneration, spinal surgeries x2, stem cell injection (lumbar disc) a little over a year ago, allergies to shellfish. Concomitant medications reported as none. No other vaccine in four weeks. None other medications in two weeks. No Covid prior vaccination. No Covid tested post vaccination. On 26Apr2021 at 14:30 PM, (reported as after approx 15 min), racing heart, dizziness, disorientation, blurred vision (inability to focus), forearm muscle pain, fatigue affecting ability to perform my job, loss of strength and coordination in fingers and arms, right lower lip became numb, lower leg muscle pain and loss of coordination. Symptoms that continued to persist after 10 days were right lower lip numbness, difficulty with concentration and fatigue that was affecting my ability to perform my job, and some residual arm &amp; leg weakness and coordination. Events resulted in Doctor or other healthcare professional office/clinic visit, Disability or permanent damage. Unknown if treatment received for events. The outcome of the events was not recovered. Information on the lot/batch number has been requested.; Sender's Comments: As there is limited information in the case provided, the causal association between the events and the suspect vaccine BNT162B2 cannot be excluded. The case will be reassessed once new information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.</p>

A 59-year-old female patient received bnt162b2 (BNT162B2), dose 1 via an unspecified route of administration on 16Apr2021 (Lot Number: EW0153; Expiration Date: 31Jul2021) as 1ST DOSE, SINGLE for covid-19 immunisation (Age at vaccination: 59 years). Medical history included ongoing strokes, ongoing third and fourth Nerve Palsy. Concomitant medications included dabigatran etexilate mesilate (PRADAXA) taken for blood thinner; metoprolol for Stroke, Heart regulation; lovastatin taken for Stroke, Heart regulation. The patient states that she went to the Emergency Room on 17Apr2021 and then went again on either 18Apr2021 or 19Apr2021. The patient states she does not know if she was admitted or not. States that she thinks she just was in the emergency room the time that she was there. Says that after the Covid Vaccine she was having stroke like symptoms; similar to migraines; mini-strokes. She was passing out, had nausea, blind spots in her vision, and she believes it effected her memory. The events occurred on 17Apr2021. Also, she said on her first emergency room visit they did a CT Scan and on her second emergency room visit they did a MRI and both was not reported. States they told her there was no issues. The patient underwent lab tests and procedures which included CT Scan: and MRI: not reported on Apr2021. Outcome of the event vision impairment was not recovered while outcome of the event nausea was recovered on Apr2021. Outcome of the event memory impairment was recovering while outcome of the remaining events was unknown. No follow-up attempts are needed. No further information is expected.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1332760	5/20/2021	MD	22	F	4/4/2021	4/4/2021	Throat closing; Shortness of breath; Swollen throat; Dizziness/ Lightheaded; Wheezing; Allergic reaction; had a combination of allergies specially to PEG in the vaccine; This is spontaneous report received from a contactable consumer (patient's mother). A 22-year-old female patient received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, LOT number: EW0151, expiration date unknown) via an unspecified route of administration at left upper arm on 04Apr2021 07:30 AM (reported as 06:30 or 07:30, probably 07:30) at age of 22-year-old at single dose for COVID-19 immunization. Medical history included postural orthostatic tachycardia syndrome (POTS) from Jan2021 and gastro stuff. Patient was previously diagnosed with tachycardia, but this was a misdiagnosis. She had a cardiac implant, but they couldn't figure out what was wrong, so her daughter saw a new cardio, and she has been good. Patient was previously had a reaction to Miralax. Concomitant medications included metoprolol tartrate which was taken for several years for POTS, lorazepam (ATIVAN) for panic attacks (started taking 2-3 years ago, maybe 1.5 years ago, when she went off to college, caller clarified it was 2 years ago), escitalopram oxalate (LEXAPRO) for panic disorder and anxiety (started about two years ago and was off for about a month). There was no additional vaccines administered on same date of the Pfizer Suspect. There was no prior vaccinations (within 4 weeks). Caller stated the patient had a reaction to the first shot of Pfizer COVID-19 vaccine. She had a severe reaction. Patient had a combination of allergies specially to PEG in the vaccine. Patient spent the entire day in urgent care. She had a swollen throat and dizziness right after receiving the vaccine (04Apr2021). She was wheezing and lightheaded. Patient was given an ep-pen and Benadryl. It took a while to bring it down. Patient had Pfizer's COVID 19 vaccine on 04APR2021, and had an immediate allergic reaction including throat closing, wheezing, shortness of breath, dizziness, with the first shot, so caller needed to call to report it, caller's cousin is a pharmacist, and said to call. Patient was not taken to the hospital, caller ended up taking the patient to urgent care, they had talked patient out of it, and the doctor was livid, patient's doctor was working at the site that morning. Caller stated she is a busy worker, and today is

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

the first day she is getting to this, and getting things squared away. She knew her daughter has a 60-day window to decide if she was going to get the second, and she wanted to get it, but the reaction was horrible, it was in her daughter's best interest, they were talking at the hospital, and caller needed to talk to someone to figure it out. Patient's doctor didn't know. Caller's cousin is a pharmacist and talked to them and said, because caller stated her daughter had had a reaction to Miralax, too and her cousin said that has PEG, which her cousin said was what Moderna and Pfizer have, so caller didn't know. Her daughter ended up going to urgent care, stayed there, and was calmer, her vitals settled after the Epi Pen, and caller understood it is the protocol with Epi Pen, that she has to be monitored medically, so patient was monitored at Urgent Care until 1PM, and her daughter was like, it wore her out, so that was the response. Her daughter has recovered completely, but it took a few days, to go back to herself, patient has a cardiac condition, POTS, and gastro stuff, and caller was trying to get her medical stuff squared away, and this definitely didn't help. Caller stated they would be trying to wean her daughter off Metoprolol. caller stated it's Ivabradine, but her daughter has not started it yet, since it has side effects with vision, so her daughter was waiting to go to the eye doctor to take that, so she was taking Metoprolol. Lexapro was stopped trying to get ready for this heart medicine, so they were waiting to figure out all this, before they start that. No further details provided. Caller read from paperwork, which said allergic reaction NOS, drug reaction allergic. Then there was cardio stuff, then it said Cardiac monitoring, oximetry, CBC with automated differential; Hcg beta qualitative urine, IV saline lock. When asked for results, caller said she saw results, but that must be where it's connected with another hospital. Stated she can fax the results. It was reported that patient had a follow up at doctor's office for the events. Event throat closing was reported as serious as medically significant. Onset date of the events was 04Apr2021. Outcome of the events was recovered. Report 1 of 2. Caller was provided with phone number and hours of operation prior to cold transfer onto the line, due to a high call volume, to wait for the next available agent. No follow-up attempts are needed. No further information is expected.

1332795	5/20/2021	CA	54	F	3/3/2021	3/6/2021	got colitis; high infections; severe stomach pains; This is a spontaneous report from a contactable consumer (patient). A 54-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), first dose at the age of 54-years-old via an unspecified route of administration, administered in arm left on 03Mar2021 11:00 (Batch/Lot number was not reported) as 1st dose, single for covid-19 immunisation. Medical history included dry eye and dry mouth from an unknown date and unknown if ongoing. The patient's concomitant medications were not reported. The patient reported that they got colitis, and continue to have high infections, and severe stomach pains on 06Mar2021 12:00 for almost 2 months now since the time of the vaccine. The patient was hospitalized due to the events for 6 days. The patient's hospitalization was prolonged as a result of the events. The patient underwent lab tests and procedures which included Covid 19 testing PCR (Nasal Swab): negative on 23Mar2021. Therapeutic measures were taken as a result of the events which included treatment with IV and antibiotics. The patient did not recover from the events. Information on lot number/batch number was requested.

She was diagnosed with acute hypoxic respiratory insufficiency in the setting of Covid pneumonia with AKI, hyponatremia, troponin elevation, LFT elevation admitted to regular floor on high flow nasal cannula oxygen. Patient was intubated on 4/2/2021 for increased work of breathing and worsening hypoxemia and hypercapnia. Later patient was found to have persistent Candida fungemia. Hospital Course: Persistent Candida fungemia, now improving Blood cultures positive for Candida albicans from 4/12, 4/14 and 4/17/2021. Cardiology was consulted for TEE, done on 04/30 which was negative for vegetations. Ophthalmology was consulted and there was no evidence of fungal endophthalmitis. Blood cultures from 4/23/2021 so far no growth. PICC line has been placed. ID recommendations appreciated. -Currently patient on 6 weeks of IV micafungin, to be continued through 6/7/2021 as per ID recommendations. ID has therapy plan in system Moderate to severe pharyngeal dysphagia Post extubation SLP and modified barium swallow demonstrated aspiration with thin and thickened liquids. S/p PEG tube on 5/7/2021. CT head did not reveal any infarct. Repeat modified barium swallow done today , patient now advanced to level 3 soft diet with thin liquids. -Continue with tube feeds and alter tube feeds based on patient's diet advancement Type I Diabetes</p>

mellitus: Labile blood sugars in the setting of changes done to tube feeding. Patient currently on tube feeding and diet has been advanced today. Regimen at the time of discharge Lantus twice daily: With sliding scale insulin and standing dose of short-acting insulin with tube feeds bolus. -Patient will need close monitoring of her blood sugars given changes being done to tube feed and diet advancement, will need titration of insulin based on blood sugars. Lower extremity edema, improved Likely dependent lower extremity edema. Echo April 2021 reviewed: Normal EF, no diastolic dysfunction. -Elevate legs while patient is seated -Ace wraps -Restarted home dose of hydrochlorothiazide Acute on chronic anemia Received 1 unit of blood transfusion during this hospitalization Monitor hemoglobin Vitamin B12 and folate level normal. Hb on last check was 8.0 COVID-19 pneumonia Acute hypoxic and hypercapnic respiratory failure -resolved Status post extubation 04/06/2021 Treated with Remdesivir, convalescent plasma, Decadron as well as Tocilizumab. Treated with IV vancomycin, Levaquin and cefepime in the setting of possible secondary bacterial pneumonia. CT chest ruled out PE but showed extensive infiltrates on admission. Patient is off Covid precautions Currently saturating well on room air and stable from respiratory standpoint. Elevated d dimer, POA : Patient had elevated D-dimer on presentation. Lower extremity ultrasound 4/3/2021 was negative for DVT. CT chest ruled out PE. She was initially placed on intermediate dose of anticoagulation. D-dimer eventually trended down. Currently patient is on subcu heparin for prophylaxis. AKI POA now resolved Creatinine stable. -Continue to monitor renal function, electrolytes and urine output. Hypernatremia : resolved Acute Urinary retention, now resolved. Foley catheter was placed on 4/24 after patient had multiple straight cath done. DC'd Foley catheter on 5/3/2021. Patient is currently voiding without any issues. Chronic medical issues : o Essential Hypertension: On amlodipine, Coreg and hydrochlorothiazide. o Peripheral vascular disease status post femoropopliteal bypass: Restarted home aspirin, statin. \_ Admission Current 5/14/2021 - present (6 days) Hospital MD Last attending o Treatment team COVID-19 with multiple comorbidities Principal problem Physical Medicine and Rehabilitation History and Physical Date: 5/14/2021

hypertension and sleep apnea who became febrile with shortness of breath over several days. Her PCP, Dr, ordered Covid test which was positive. She presented to Hospital on 4/1/2021 for further work-up. On admission she was found to be in hypoxic respiratory failure requiring high flow oxygen which progressed to requiring a nonrebreather and eventually intubation with ICU care. She received remdesivir, dexamethasone, and convalescent plasma. Patient also received IL-6 inhibitor Tocilizumab recommendation of pulmonary critical care. Procalcitonin level was 35.32. Because of concern of superimposed bacterial pneumonia she was also treated with broad-spectrum antibiotics. Patient had a prolonged complicated acute care hospital course. On 4/12/2021 ENT evaluation showed poor phonatory effort but mobile true vocal cord without lesions. Patient was found to have a fungemia from cultures of 4/12/2021 of C albicans with positive blood cultures with C. albicans on 4/17/2021. Patient was placed on IV micafungin for a total of 6-week course. TEE showed no evidence of acute valve pathology. Ophthalmology was consulted and there was no evidence of fungal endophthalmitis. Repeat blood cultures from 4/23/2021 showed no growth. Patient had PEG tube placed by Dr of GI on 5/7/2021. Repeat modified barium swallow on 5/14/2021 showed improvement of swallowing and the patient was upgraded to a dysphagia level 3 soft diet with double swallows and thin liquids via cup or straw with aspiration precautions. Patient was evaluated by therapies while at Hospital acute care. She requires supervision to rise from sit to stand using a rolling walker and contact-guard ambulate 45 feet using a rolling walker with wheelchair follow and verbal cues for walker management. She continues to have some knee buckling. She needs minimal assistance for bathing and min mod assistance for lower body dressing. She is able to perform toileting with contact-guard. Acute inpatient rehabilitation was recommended. Patient is being transferred to the Hospital for comprehensive inpatient rehabilitation program.  Procedure Note Surgical Pre-Operative Patient  
 Identification Yes, after the patient was placed on the  
 operating room/procedure table, I confirmed the patient's  
 identity. Impression Overall Impression: Normal EGD up  
 to second part of duodenum. 20 French PEG placed  
 without any immediate complications. Recommendation  
 There is no recommended follow-up for this procedure.  
 Okay to use back for medications and water flushes.  
 Start feeding via PEG tomorrow after GI evaluation.

Indication Pre-procedure diagnosis: Pharyngeal dysphagia Post-procedure diagnosis: See impression Preprocedure A history and physical has been performed, and patient medication allergies have been reviewed. The patient's tolerance of previous anesthesia has been reviewed. The risks and benefits of the procedure and the sedation options and risks were discussed with the patient. All questions were answered and informed consent obtained. Details of the Procedure The patient underwent monitored anesthesia care, which was administered by an anesthesia professional. The patient's blood pressure, heart rate, level of consciousness, oxygen, respirations, ETCO2 and ECG were monitored throughout the procedure. The scope was introduced through the mouth and advanced to the second part of the duodenum. Retroflexion was performed in the cardia, fundus and incisura. The patient experienced no blood loss. The procedure was not difficult. The patient tolerated the procedure well. There were no apparent complications. See anesthesia record for more information regarding anesthesia administered. Specimens \* No specimens in log \* Implants No implants documented in log. I attest the accuracy of any implant/graft nursing documentation. Findings The cricopharynx, upper third of the esophagus, middle third of the esophagus, lower third of the esophagus, GE junction, Z-line, cardia, fundus of the stomach, body of the stomach, greater curve of the stomach, lesser curve of the stomach, incisura, antrum, prepyloric region, pylorus, duodenal bulb, 1st part of the duodenum and 2nd part of the duodenum appeared normal. PEG-G tube successfully placed in the body of the stomach using a deformable internal bolster via the pull technique after the site was identified via transillumination, visualized indentation and needle passed through abdominal wall; distance from external bolster to external end of tube: 3 cm; scope reinserted to confirm placement Staff/Assistant(s) Staff Role RN Other CRNA Other Other MD Other Disposition: PACU - hemodynamically stable. Condition: stable Attending Attestation: I performed the entire procedure. CT abdomen pelvis without contrast Result Date: 4/15/2021 PROCEDURE INFORMATION: Exam: CT Abdomen And Pelvis Without Contrast Exam date and time: 4/15/2021 12:00 AM Age: 65 years old Clinical indication: Other: Na; Additional

info: Distention, fungemia workup. TECHNIQUE: Imaging protocol: Computed tomography of the abdomen and pelvis without contrast. Radiation optimization: All CT scans at this facility use at least one of these dose optimization techniques: automated exposure control; mA and/or kV adjustment per patient size (includes targeted exams where dose is matched to clinical indication); or iterative reconstruction. COMPARISON: No relevant prior studies available. FINDINGS: Tubes, catheters and devices: Small bowel feeding tube noted. Lungs: Bibasilar patchy nodular airspace disease with ground-glass opacity. Liver: Normal. No mass. Gallbladder and bile ducts: Multiple gallstones. Pancreas: Normal. No ductal dilation. Spleen: Normal. No splenomegaly. Adrenal glands: Normal. No mass. Kidneys and ureters: Bilateral renal vascular calcifications. Stomach and bowel: Visualized bowels demonstrated a generalized constipation. Appendix: Not well seen. Intraperitoneal space: Unremarkable. No free air. No significant fluid collection. Vasculature: Moderate atherosclerotic changes. Lymph nodes: Unremarkable. No enlarged lymph nodes. Urinary bladder: Unremarkable as visualized. Reproductive: Unremarkable as visualized. Bones/joints: Degenerative changes within the lumbar spine. Soft tissues: Unremarkable. IMPRESSION: Bibasilar nodular airspace disease with ground-glass opacity. No other acute inflammatory process or obstructive uropathy within the abdomen and pelvis. THIS DOCUMENT HAS BEEN ELECTRONICALLY SIGNED BY MD X-ray abdomen 1 view Result Date: 5/4/2021 XR ABDOMEN 1 VW PORT IMPRESSION: Weighted enteric tube with the tip in the gastric antrum. Residual oral contrast throughout a nondilated colon. END OF IMPRESSION: INDICATION: ng tube placement ng tube placement. TECHNIQUE: AP supine portable projection of the abdomen was acquired. COMPARISON: AP abdomen on 4/15/2021. FINDINGS: The gas pattern is unremarkable. There is residual oral contrast equally distributed throughout a nondilated colon. There is a new weighted enteric tube with the tip in the gastric antrum. Small right lung base pleural effusion is present. No abnormal mass effect is noted. No significant radiopaque calculus is identified. There are no significant bony findings. This report was created using Voice Recognition software. Thank you for allowing us to

participate in the care of your patient. X-ray abdomen 1 view Result Date: 4/15/2021 XR ABDOMEN 1 VW  
 PORT IMPRESSION: Orogastric tube is in the stomach. Nonspecific bowel gas pattern. END OF IMPRESSION:  
 INDICATION: Feeding tube placement. TECHNIQUE: Single view of the abdomen. COMPARISON: Prior examination of April 15, 2020. FINDINGS: Orogastric tube is in the stomach. Nonspecific bowel gas pattern is noted. Osseous skeleton is grossly intact. This report was created using Voice Recognition software. Thank you for allowing us to participate in the care of your patient. CT head without contrast Result Date: 4/21/2021 CT HEAD WO CONTRAST IMPRESSION: No acute intracranial pathology. Mucoperiosteal thickening in the ethmoid sinuses as well as some opacification of the bilateral mastoid air cells consistent with chronic sinus disease and mastoiditis. END OF IMPRESSION: INDICATION: DYSPHAGIA DYSPHAGIA. TECHNIQUE: Spiral CT scan through the head from the skull base through the vertex was performed with 5 mm axial reconstructions. Images obtained without contrast. CONTRAST: No contrast was administered. COMPARISON: April 13, 2021 FINDINGS: No acute hemorrhage, mass, or mass effect. No abnormal extra-axial fluid collections are identified. There is preservation the gray-white differentiation. No evidence to suggest large vascular distribution infarct. The ventricles, cisterns, and other CSF containing spaces demonstrate normal size, shape, and configuration. The basal cisterns are patent and symmetric. Stable focal area of gliosis in the right frontal white matter. The calvarium is intact. The visualized portions the aerated paranasal sinuses mastoid air cells demonstrate bilateral ethmoid sinus mucoperiosteal thickening. Additionally there is scattered opacification of some mastoid air cells bilaterally. This report was created using Voice Recognition software. Thank you for allowing us to participate in the care of your patient. Fluoroscopy video swallow with speech therapy Result Date: 4/19/2021 FL VIDEO SWALLOW WITH SPEECH THERAPY MBSS IMPRESSION: Aspiration of thin and nectar thick liquid. Please refer to speech therapy report. END OF IMPRESSION: INDICATION: Dysphagia. Concern for aspiration. Covid 19. SUPERVISION: Procedure was performed by RRA under direct supervision by MD TECHNIQUE:

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

Fluoroscopy assistance was provided to the speech pathology department. Multiple consistencies of barium and food products were administered to the patient. Fluoroscopy of the oral and pharyngeal region was performed. FLUOROSCOPY TIME: 1.1 minutes  
COMPARISON: Modified barium swallow of 4/12/2021.  
FINDINGS: Aspiration of thin and nectar thick fluid. Hypopharyngeal residue with all trials provided. Significant dry secretions in the oral cavity and pharynx. Please see speech pathologist's report for further details and recommendations. This report was created using Voice Recognition software. Thank you for allowing us to participate in the care of your patient. Fluoro NG long tube placement Result Date: 4/30/2021 FL NG LONG TUBE PLACEMENT IMPRESSION: Successful fluoroscopically guided Dobbhoff placement. END OF IMPRESSION: INDICATION: Dobbhoff placement. SUPERVISION: Procedure was performed by staff member under personal supervision by Dr..  
TECHNIQUE: Fluoroscopic guidance for nasogastric tube placement. FLUOROSCOPY TIME: 2.2 minutes  
COMPARISON: None available. FINDINGS: Using fluoroscopic guidance, a nasogastric tube was placed from the left nares into the stomach. Upon placement of the nasogastric tube, 10 cc of Omnipaque contrast material was injected to confirm placement. Opacification within the stomach was visualized confirming appropriate NG tube placement. There were no intraprocedural complications and the procedure was well tolerated by the patient. The patient was discharged from the imaging department in satisfactory condition. This report was created using Voice Recognition software. Thank you for allowing us to participate in the care of your patient. X-ray chest 1 view Result Date: 4/26/2021 XR CHEST 1 VW PORT IMPRESSION: NG tube in the fundus of stomach left upper abdomen. END OF IMPRESSION: INDICATION: SOB evaluate NGT placement following advancement.. TECHNIQUE: AP projection of the chest is acquired. COMPARISON: 4/26/2021 FINDINGS: NG tube in the fundus of stomach left upper abdomen. Stable diffuse patchy infiltrates both lungs in the upper, mid to lower zones and left effusion. No pneumothorax. The heart size is normal. Rib cage is unremarkable. This report was created using Voice Recognition software. Thank you for allowing us to participate in the care of

was performed with grayscale, color and duplex Doppler imaging. Compression and augmentation were performed where possible. Permanently recorded images were obtained and stored. FINDINGS: The internal jugular vein, subclavian vein, axillary vein, brachial veins, basilic vein are normal. They demonstrate normal flow and compressibility. There is a thrombus identified in the right cephalic vein at the mid arm through distal forearm. This report was created using Voice Recognition software. Thank you for allowing us to participate in the care of your patient. CT angiogram chest pulmonary embolism with and without contrast Result Date: 4/22/2021 CTA CHEST PULMONARY EMBOLISM W WO CONTRAST IMPRESSION: No evidence of pulmonary embolus or right heart strain. Extensive parenchymal consolidation in both lungs, left greater than right consistent with severe pneumonia such as Covid 19 pneumonia. Moderate left-sided small to moderate right sided pleural effusions are seen with associated compressive atelectasis. Enlarged main pulmonary artery which can be seen in the setting of chronic pulmonary hypertension. Interval development of large mediastinal adenopathy particularly in the right paratracheal region and subcarinal region. These may be reactive in nature in the setting of as diffuse pneumonia. Enterogastric tube with the tip extending to just within the stomach. END OF IMPRESSION: INDICATION: pneumonia. Assess for pulmonary artery embolism. TECHNIQUE: Enhanced helical CT scan of the chest was performed from the lung apices to below the diaphragm. 2mm axial reconstruction with MPR coronal, oblique and sagittal images were created. 3D shaded surface images also created on a separate workstation and permanently stored. CONTRAST: 100mL of IOHEXOL 350 MG IODINE/ML INTRAVENOUS SOLUTION administered INTRAVENOUS. Quality of contrast opacification was adequate. COMPARISON: July 22, 2013 FINDINGS: Lung windows demonstrate extensive consolidation involving the lungs, left greater than right. There is a moderate left-sided effusion and a small to moderate right sided effusion with associated compressive atelectasis. The trachea and bronchi are grossly unremarkable. No endobronchial lesions are seen. Soft tissue windows demonstrate a grossly unremarkable thoracic inlet. The thyroid is unremarkable. Moderate

-----------------	--------------	--------------	----------------	------------	-----------------	-------------------	---------------------

bilateral axillary lymph nodes are seen with extensive bulky adenopathy in the mediastinum to include the right paratracheal region as well as the subcarinal region and to a lesser extent the hila. The largest lymph nodes are seen in the paratracheal chain demonstrating short axis of approximately 15 mm. Smaller lymph nodes are seen in the aortopulmonary window. These may be reactive in nature. The heart demonstrates a normal configuration. No right heart enlargement is seen. No pericardial effusion is seen. The thoracic aorta and great vessels demonstrate normal branching pattern. Normal course and caliber is seen. The pulmonary arteries demonstrate normal course. There is moderate dilation of the main pulmonary artery up to 3.2 cm. This can be seen in the setting of chronic pulmonary arterial hypertension. No filling defects are seen. Enterogastric tube is seen with the distal tip extending to just within the proximal stomach. The visualized portions of the upper abdomen are grossly unremarkable. The surrounding osseous structures demonstrate mild degenerative changes of the thoracic spine. This report was created using Voice Recognition software. Thank you for allowing us to participate in the care of your patient.

1334813	5/20/2021	NY	78	F	3/26/2021	4/1/2021	Felt lightheaded; Neurologic event; left cheek, arm and leg on the left side felt numb; can't stand on the left leg; falling; fell in the bathroom and cut eye and got black and blue, knocked head; pain; fever of 99 and something, which is high for her, usually her temperature is around 97; aches; sleeping a lot; weak, could not get up, right hand is weak, progressive weakness; This spontaneous case was reported by a patient family member or friend (subsequently medically confirmed) and describes the occurrence of ASTHENIA (weak, could not get up, right hand is weak, progressive weakness), HYPOAESTHESIA (left cheek, arm and leg on the left side felt numb), DYSSTASIA (can't stand on the left leg), FALL (falling) and INJURY (fell in the bathroom and cut eye and got black and blue, knocked head) in a 79-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 020621A and 003AZIA) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Diabetes, Hypertension and COPD. Concomitant products included GLIPIZIDE and METFORMIN for Diabetes, SERTRALINE for an unknown indication. On 26-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 23-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. In April 2021, the patient experienced ASTHENIA (weak, could not get up, right hand is weak, progressive weakness) (seriousness criteria medically significant and intervention required), HYPERSOMNIA (sleeping a lot), PAIN (pain), PYREXIA (fever of 99 and something, which is high for her, usually her temperature is around 97) and MYALGIA (aches). On 29-Apr-2021, the patient experienced HYPOAESTHESIA (left cheek, arm and leg on the left side felt numb) (seriousness criteria medically significant and intervention required), DYSSTASIA (can't stand on the left leg) (seriousness criteria medically significant and intervention required), FALL (falling) (seriousness criteria medically significant and intervention required) and INJURY (fell in the bathroom and cut eye and got black and blue, knocked head) (seriousness criteria medically significant and intervention required). On 30-Apr-2021, the patient experienced NERVOUS SYSTEM

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							<p>DISORDER (Neurologic event) and DIZZINESS (Felt lightheaded). The patient was treated with Rehabilitation therapy for Asthenia; Rehabilitation therapy for Hypoaesthesia; Rehabilitation therapy for Dysstasia; Rehabilitation therapy for Fall; Rehabilitation therapy for Injury; Rehabilitation therapy for Nervous system disorder and Rehabilitation therapy for Hypersomnia. At the time of the report, ASTHENIA (weak, could not get up, right hand is weak, progressive weakness) and NERVOUS SYSTEM DISORDER (Neurologic event) had not resolved and HYPOAESTHESIA (left cheek, arm and leg on the left side felt numb), DYSSTASIA (can't stand on the left leg), FALL (falling), INJURY (fell in the bathroom and cut eye and got black and blue, knocked head), HYPERSOMNIA (sleeping a lot), DIZZINESS (Felt lightheaded), PAIN (pain), PYREXIA (fever of 99 and something, which is high for her, usually her temperature is around 97) and MYALGIA (aches) outcome was unknown. Events began after second dose of vaccine. Treatment included ibuprofen. Patient was taken to an emergency room on 30-Apr-2021. CT scan (computed tomography) and blood tests performed. Patient was not admitted to the hospital, but was transferred to a rehabilitation center. Most recent FOLLOW-UP information incorporated above includes: On 06-May-2021: No specific follow-up information recorded.; Sender's Comments: Based on current available information and the temporal association between product use and the start date of the events a causal relationship cannot be excluded.</p>
1334512	5/20/2021	CO	13	F	5/19/2021	5/19/2021	<p>Body aches, loopiness, visual hallucination. The hallucination occurred around 10 hrs after the vaccination was administered while patient sat in a dark room. Patient (age 13) has a history of audio hallucinations, but no visual ones</p>

1334536	5/20/2021	TX	47	F	3/11/2021	3/22/2021	Sickness like the flu at first. Later in March, severe headaches, visual auras, sense of smell change. Continued on while April begin neck pain and severe nerve pain in right arm. Later in April, vision problems in right eye began. May, right arm completely numb, right eye vision problems, balance problems, right leg issues, memory problems, word retention problems. MRIs and x-rays by neurosurgeon in May showed collapsed disc in C5/C6 for no reason (no accident, no trauma) impinging the flow of spinal fluid. Continuing visit to neurologist and another MRI for suspected TIA. Treatment - multiple medications for nerve pain; surgery scheduled to replace collapsed disc and possible other disc (C4/C5) in June; 2nd MRI scheduled to review brain tissue last week of May.
1334594	5/20/2021	IL	15	M	5/19/2021	5/19/2021	After receiving vaccine, we were told to sit and wait 10 minutes before leaving. About 7 minutes into waiting, my son said he was thirsty and not feeling that good. we started to walk to get a water and he totally blacked out and exhibited mild like seizure activity. After he "came too", he complained of blurry vision and still didn't feel good as we waited for ambulance. Once ambulance came he was feeling a little better. Vitals all checked out good and were declined going to hospital. He doesn't remember anything that happened in Pharmacy, except that he thought he was going to die.
1334635	5/20/2021	FL	55	F	4/8/2021	4/8/2021	15 mins after getting the 2nd shot, I had a burning in my throat & lips. Also my ears clotted, vision got blurry& my face got numb. A pain on my left arm & my whole right side of face swollen. After being hospitalized the Dr. said I got Bell's palsy

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1334688	5/20/2021	WA	16	M	5/20/2021	5/20/2021	Immediately after injection Patient began to faint and clench his arms. His head tilted back and eyes were glazed over. Lips became pale and face was pale. He was clammy to the touch on the back of his neck. His blood sugar at the time of injection was 113. He had not eaten breakfast yet. This lasted about a minute or so. He was finally able to say that he felt ok, but asked what happened. This happened a second time about 4minutes after the first time. But didn't seem to last as long. I gave him some juice and saw that his blood sugar was dropping to 85. Then a few minutes later his blood sugar was at 62. He continued to drink the juice and had 3 4carb glucose tablets. He started to feel better about 15 minutes later. He states that he felt numbness in his hands and feet initially. All feelings returned and color to his face and lips. His blood sugar began to rise again and he was feeling better. No hives or rash was noted on his body and the injection site was normal.
1334721	5/20/2021	CA	39	M	4/8/2021	4/8/2021	Immediately while receiving my shot my mouth went dry, I have had continuing dry mouth since then, It made my blood sugar go up and I'm now a diabetic. Soreness for almost 2 week in my arm, blurred vision. I was extremely exhausted, and had a headache. I ended up going to the ER
1334732	5/20/2021	WA	67	F	3/19/2021	3/24/2021	Shortly after the second vaccination I started developing frequent occular migraines. I had them occasionally before, but they became very frequent. I also had very bad pain in my wrists, which is one of my indications of inflammation. I had none of the regular advertse symptoms, like chills, fever, etc, so didn't associate with the vaccine. Less than one month after the second shot I experienced intense occular migraine (no pain), dizziness and nausea. Went to ER the next morning, and I had had a stroke. The neurologist says can't tell if due to migraine, but there is a rare type of stroke caused by occulat migraine.

1334756	5/20/2021	NY	56	F	3/25/2021		POSSIBLE CVA; HIGH BLOOD PRESSURE; HEADACHE; POTENTIAL BLOOD CLOT; STOMACH PAIN; LEG PAIN; This spontaneous report received from a patient concerned a 56 year old female. The patient's height, and weight were not reported. The patient's concurrent conditions included polycythemia, and Meniere's disease, and other pre-existing medical conditions included no known allergies. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, intramuscular, batch number: 1805022, expiry: 25-MAY-2021) dose was not reported, 1 total administered on 10-MAR-2021 to right arm for prophylactic vaccination. No concomitant medications were reported. On 10-MAR-2021, the patient had no side effects right after the vaccination. On 25-MAR-2021, the patient felt a really bad leg pain in left leg behind the knee which had lasted for five days until 31-MAR-2021 or 01-APR-2021. On 31-MAR-2021, the patient had very bad stomach pain and felt if somebody was stabbing her until 11-APR-2021. On 23-APR-2021, the patient had pain in head, it woke the patient up in her sleep; the patient had no control over the right side of body and was not able to see, walk or talk. The patient did not know how long it lasted. On 24-APR-2021, the patient was lying in bed and felt that somebody taken the bottom of the bed and flipped her out; she also had blurred vision. On 26-APR-2021, patient went to the hospital. The patient underwent a CT (computed tomography) scan and found no bleeding in brain but a possible CVA (cerebrovascular accident-stroke). The patient was asked to admit in the hospital but the patient wanted to go back home. The patient's blood pressure was really high although she had a perfect blood pressure and never took medication before. The patient was scared to take the pill and left the hospital. On an unspecified date, after coming back home, the patient suddenly lost control over left side of the body while taking bath and had blurred vision. The patient was taken to the hospital and found no bleeding in her brain. On an unspecified date in MAY-2021, a week prior to this report, the patient undergone phlebotomy and had to draw 500 ml of blood because patient had polycythemia and her blood was super thick. The patient also had a CT (computed tomography) scan and the results were unknown. On 13-May-2021, the patient had MRI (magnetic resonance imaging) and all

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

were normal. On 14-MAY-2021, patient would be taking CT (computed tomography) angiography for finding out blood clot in brain. The patient was concerned about all events and was scared to find out if there would be blood clots in her brain. The PCP (primary care physician) of two hospitals she visited told her that she should not have taken the vaccine shot because of her polycythemia. On 14-MAY-2021, the patient's blood pressure was 175/112 (unit unspecified) and in the morning it was 156/117(unit unspecified). The patient was started with unspecified blood pressure medication and also acetylsalicylic acid (Aspirin) to thin her blood. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from stomach pain on 11-APR-2021, and leg pain on 31-MAR-2021, had not recovered from high blood pressure, and the outcome of headache, possible cva and potential blood clot was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0:20210530382-COVID-19 VACCINE AD26.COV2.S- Cerebrovascular accident, Thrombosis, Hypertension. This event(s) is considered not related. The event(s) has an unknown/unclear temporal relationship, is unlabeled, and has unknown scientific plausibility. There are other factors more likely to be associated with the event(s) than the drug. Specifically: MEDICAL HISTORY

1334483	5/20/2021	WA	37	F	4/11/2021	4/11/2021	Nausea - immediately after the vaccine was given - 1st nausea just lasted a few hours. And then no other symptoms. About 2 weeks exactly after the vaccine I got very very sick and went to the in , ER - I didn't have a fever but everything hurt on my body and I was nauseous and Had blurred vision. My hearing was off - ringing in my ears. I was pretty sick after that for about two weeks. I did a follow up with Dr. and he said it sounded typical this J & J vaccine. He said there was nothing he could do. During those two weeks, I kept taking lots of fluids and ibuprofen as needed. Headaches, body aches c hills, night sweats, blurred vision and I couldn't sleep - had insomnia. The night sweats were very weird - I never had that before and I could literally ring my clothes out they were so wet every night. I felt like I had a fever but I didn't the entire time. I felt like I was burning up but I had chills but there was no fever the whole time. Lately now, I have been feeling a little bit sick for about a week. It's a little strange because I have a cough and phlegm and very congested in my head.

A 64-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot: EJ1686), via an unspecified route of administration in the left arm on 17Jan2021 (at the age of 64-years-old) as a single dose for COVID-19 immunization. Medical history included ongoing preglaucoma diagnosed 3-4 years ago, ongoing anxiety and depression her whole life, bronchitis at age 5, sinus infections, ongoing sinus allergy "stuff" and allergies (now the patient managed the allergies and did not get sinus infections), "vaginitis" over 10 years ago and just essentially being dry, menopause a long time ago, both big toes have some fungus for probably 3 years (toenails look ugly, discolored and thick), ongoing arthritis and bone spurs to C5 and C6 to the area of the neck for which the patient did physical therapy (PT) for about 2 years, low on b-12 when she had shingles last time in 2016, "because I dont want to get Covid" (prophylaxis therapy), nearsighted and wore bifocals. Concomitant medications included bupropion for anxiety and depression for 5 years or longer, loratadine for allergies, COLECALCIFEROL (VITAMIN D3) for depression for 10 (maybe 20) years or more, vitamin b complex (SUPER B

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

COMPLEX) from 2016 and ongoing for "low on B-12", cyanocobalamin (VITAMIN B-12) from 2016 for low B12, latanoprost for preglaucoma, clonazepam from 2012 and ongoing for anxiety, ESTROGENS CONJUGATED (PREMARIN) vaginal cream for "vaginitis" and just essentially being dry, ascorbic acid (VITAMIN C) for "because I dont want to get Covid" and an unspecified complete multivitamin for women 50 and older from 2020 "so I wouldn't get Covid". The patient previously got the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot: EK5730) in the left arm on 30Dec2020 (at the age of 64-years-old) for COVID-19 immunization. Around the middle of Feb2021, the patient had a hard time sleeping. She still napped during the day most days. Also around middle of Feb2021, the patient noticed muscle jerks, which came and went. It had gotten worse. The doctor said these were myoclonic jerks. The worst was on 28Mar2021. In the middle of the night, the patient called her on call doctor and asked if it might be a seizure. The physician said it was not a seizure. The weekend of 06Mar2021, the patient started to not feel well. She did not sleep well that Friday or Saturday night. She could not access her memory (short term memory loss) as of 07Mar2021, was flustered and it was clear that something was off as the day progressed. On 07Mar2021, the patient felt her skin hurt, like when you had a fever and the skin hurts. This came and went. Around 07Mar2021, the patient felt intense anxiety which branched out into other intense emotional reactions (big emotions, big anger). On an unspecified date, the patient had a sore inside the mouth. Around 07Mar2021, the patient felt freezing one minute and so hot the next. On 07Mar2021 at 03:00, the patient experienced a bad headache. It was like her neck and her back and her shoulders had intense pain, cramping pain and she had to soak in Epsom salt. The severe headache happened twice, lasted about 2-3 days, moved from the right side of the head, or top of the head. She stayed home from work on 08Mar2021 and 09Mar2021. The patient was exhausted and felt achy, like the flu. She had an appointment with the doctor on 15Mar2021. She was not feeling well at this point. The patient developed shingles (one spot on the right-hand side on back of head) sometime after 15Mar2021 and was diagnosed on 22Mar2021. The patient had an itchy scalp due to the

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

shingles and claimed shingles caused memory issues and brain fog, since 07Mar2021, (it seemed like she got "COVID brain"). The patient was prescribed Valacyclovir 1 mg oral tablet every 8 hours, 30 tablets, for the shingles on 22Mar2021. The open spot on the scalp crusted over by 01Apr2021 when the patient saw the physician again. The patient stated that shingles has lasting effects: brain fog, can't find the words, short-term memory problems have been coming and going since 07Mar2021, felt liked she has attention deficit disorder (ADD) on steroids, worked really hard to keep focus. This has worsened, maybe manifested more so in the last 3-4 weeks or so. Sometimes when she got anxious, her prefrontal cortex did not function well. After being diagnosed with shingles, the patient began to take propranolol 40 mg in Mar2021 as needed (patient takes 1/8 or part of 1/8 of a tablet, just biting off a tiny piece). Initially when she had shingles, she had "some finger in the light socket, fight or flight internally"; the propranolol helped with this. She took it very regularly in Mar2021 and had taken once a week at most the last 2-3 weeks. The patient also took "Brain Goo" as of 22Mar2021 which caused the stinkiest gas in the universe, and the patient was bloated, (reported as from Feb2021) depending on what she ate, and because of that, the following week, the patient took an anti-gas pill, simethicone. She had muscle cramps (in the left upper thigh on the inside of the leg and outside of the leg) and tightness, in Mar2021, that made it hard to walk. The other area that tended to cramp up and cause problems were the arches, mostly the left arch. She reported it was probably 24Apr2021, she came downstairs in the afternoon or early evening and had such an intense cramp like a Charlie Horse and fell to the floor. Muscle cramps come and go, they shift around, it's in the left arch. It's not intensely sharp like it was that day. Right now, her left arch has a knot. The patient began taking tizanidine around 08Apr2021 at 4mg 1 tablet 3 times a day for muscle cramps and tightness, which can get painful, and tizanidine helps relax that. The patient experienced fatigue due to which the patient cannot go to the grocery store by herself very easily as she gets wiped out. The patient had to hang on to the cart because she does not have the energy. She described fatigue and stamina as she had energy for a while and then she crashed. She reported she had to

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

carry protein with her because she can literally crash. She reported her left leg gave out and she had to grab onto the counter and she almost went to the floor. On 24Apr2021, the patient couldn't talk and could barely open her eyes. It felt like her body was shutting down. She couldn't get herself up off the couch to go to the bedroom. This had not happened again. She told her physician about it who was sending her to a neurologist. On 02May2021, her left hand knotted up- had a cramped muscle and tightness. The base of her thumb hurt (underneath the thumb where the thumb attaches to the hand). The patient felt that sound can hurt her ears, which came and went. The patient had a hard time seeing the computer screen, which started between 01Apr2021- 08Apr2021. The patient mentioned this to the physician. She was nearsighted and wore bifocals and will take her glasses off to see the screen better). Food tasted extra intense as of 15Apr2021. On 06May2021, the patient was exhausted after being on the phone so long yesterday. On 06May2021, the patient reported staring off into space "like she could die and it wouldn't matter" and it felt like her brain was cramped up (like her brain was going to shut down). Caller reported that she has been staring off into space steadily, and it was kind of scary. Caller reported that the staring off into space has not occurred again like the first time where she felt like her brain was cramped. Caller reported that she feels like the staring off into space was connected in the same part of her brain that caused her to not be able to talk or open her eyes on the night of 24Apr2021. The patient reported that the staring off into space had continued on and off but not to that degree of intensity. She reported that the first time she stared off into space, she felt like she couldn't interrupt or stop staring off into space. Caller reported that she doesn't know how she stopped staring off into space the first time, but now when she stared off into space she can move her eyes. Caller reported that it felt like she had a cramp in her brain because she couldn't move her eyes. The staring into space was now better otherwise she would have gone to the emergency room. The patient underwent laboratory tests which included on 01Apr2021 which included: ALT 71 (normal 7-52), sodium 131 (normal 136-144), MCH 34.20 (normal 26-34), MCV 100.30 (normal 80-98), and on 02Apr2021, sodium 144, SARS-CoV-2

1334861	5/20/2021	MI	30	M	5/18/2021	5/18/2021	The patient received their vaccination and before my immunizing technician could apply his bandaid he fell straight back while seated in his chair. She was able to catch his fall and lie him on the ground. I went into the immunization room to assist immediately and he was apologizing for scaring. I asked him to lie there for a few minutes and take some deep breaths. He was talking and aware of his surroundings. I asked him about his medication history which was null. I asked him if he had been nervous and he said he didn't think so. She said that he did mention he did not like needles. He had not eaten since the morning (a bagel) and it was late in the afternoon. After a few minutes I asked him if he would like to sit up so I could see how he was doing. Management arrived and observed while I went to get a cold cloth for his neck/face. Management asked him if he would like to sit in a chair. He sat in a chair and before I came back after just a few minutes, he had slumped over to the side with his eyes rolling back. Management was concerned so they immediately called 911. fire department and EMS arrived. They tested his blood pressure, etc and said they believed he had just passed out. They asked him if he wanted to go to the hospital. He declined. He called a family member to pick him up who arrived about 45 minutes after his vaccination. He was walking around and coherent when he left.

1334940	5/20/2021	NY	53	F	5/4/2021	5/5/2021	pneumonia; I've been very very sick; body ache; chills; nausea; so tired/very exhausted; fever 99.3F; a very strong headache; sore throat; The arm is very hot and swelling; The arm is very hot and swelling; pain in the back, neck and everything; pain in the back, neck and everything; shortness of breath; My eyes are so hot and burning; earache; she is not feeling very well; she had a really sore arm in the area of the shot; her head is foggy this morning and all day; This is a spontaneous report from a contactable consumer. A 54-year-old female patient (Age at time of vaccination 54 years) received first dose of BNT162B2 (BNT162B2) via an unspecified route of administration on 04May2021 at 16:00 (Batch/Lot Number: EW0176) as SINGLE DOSE for covid-19 immunization. Medical history included back injury, neck injury, Knee Surgeries, 2 Bulging Discs, Heel Spurs and Sciatic all on the left ongoing since 2010 and Covid-19 on 29Mar2020. The patient's concomitant medications were not reported. The patient experienced pneumonia, i've been very very sick, body ache, chills, nausea, so tired/very exhausted, fever 99.3f, a very strong headache, sore throat, the arm is very hot and swelling, pain in the back, neck and everything, shortness of breath, my eyes are so hot and burning, earache, she is not feeling very well, she had a really sore arm in the area of the shot and her head is foggy this morning and all day all on 05May2021. Consumer reported "Since this morning I've been very very sick. I'm sick. I have body ache, chills, nausea, so tired, fever 99.3F, a very strong headache, sore throat. The arm is very hot and swelling. I had Tylenol this morning nothing is working. The body ache is so horrible, pain in the back, neck and everything. I had covid on march 29 last year, I had pneumonia. I have lingering issues, body ache and pain, I still get very tired, shortness of breath; I feel like it's coming back after getting the vaccine. My eyes are so hot and burning, you know the sensation when you have a fever. Commented how she felt like she was getting covid again after getting the vaccine. Yesterday, 04MAY2021, she was vaccinated with the Pfizer Covid Vaccine. States it was her first dose and she is having a lot of side effects. Her temperature is 99.2, she has body aches, earache, headache, a little bit of shortness of breath, very tired, very exhausted and she is not feeling very well. She is wondering if this is a normal reaction for

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

the first vaccine? States it feels like when she had Covid. Clarifies at she was fine last night other than she had a really sore arm in the area of the shot and it is really hot, like if she has a fever in the area. States at 9:30-10:00 a.m. this morning she started having a headache, chills, and nausea. She took a hot shower, and had some tea and took Tylenol. It is progressing worse and worse. States she has body aches and fever getting warmer and warmer, and her throat feels a little bit sore. States all of them are getting worse. She is staying home and laying down not trying to do a lot, drinking water and staying hydrated. States she spoke to a friend and she said she is not supposed to get these side effects with first one. Her body aches are horrible, it feels like when she got the virus, all the aches and pains. Her head is foggy this morning and all day, and she has issues with pain all over, so much body aches. States she is reporting her side effects and she read the side effects but it seems like when she had Covid last March and she is still going through a lot of issues with it, the pain Covid left her with. States she did a Covid test, and she had antibodies, but this feels like the virus again. States she has the same symptoms as when she got the virus. Treatment: Took 2 Tylenol and nothing seems to help. UPC and Expiration: Unknown Lot: 110856. Caller states the UPC and Expiration got erased because she has had it for awhile. Tylenol Rapid Release 500mg. Caller states she took a hot shower, and had some tea. Caller states she is staying home and laying down not trying to do a lot, drinking water and staying hydrated. The outcome of the event pneumonia was unknown. Outcome of all the other events was not recovered. Information on Lot/Batch number was available. Additional information has been requested.

1334943	5/20/2021	CA	33	M	4/13/2021	4/1/2021	<p>spinal cord swelling/ transverse myelitis; multiple sclerosis; lesions in the brain; It was hard for him to walk. He has to hold on to walls to walk.; Patient started to get terrible numbness in his feet. The numbness moved to up his left leg. Patient could not walk because of his left leg numbness.; patient cannot walk; Severe back pain; both feet have numbness and tingling; This is a spontaneous report from Pfizer. A contactable nurse (patient's mother) reported that a 33-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), via an unspecified route of administration, administered in left arm on 13Apr2021 13:30 (Batch/Lot Number: EW0153) (at the age of 33 years old) as 1st dose, single for COVID-19 immunisation. Medical history included surgery on his leg (when he was 17) and cold. There were no concomitant medications. Patient had a severe reaction to the covid vaccine. On 17Apr2021 at 08:00, the patient had severe back pain. On Sunday morning (25Apr2021), patient had severe back pain. Patient was a former college athlete. Patient was mentally healthy and physically fit. Patient did not remember getting hurt while playing golf. Patient iced his back and did some stretches. Patient called his friend who is a doctor, and his friend told him he did the right thing by icing and stretching. A few days later, either Tuesday evening, 27Apr2021 or Wednesday, 28Apr2021, patient started to get terrible numbness in his feet. The numbness moved to up his left leg. Patient could not walk because of his left leg numbness. Patient was able to get down a flight of stairs and then called an uber. Patient was taken to the hospital. It was his left foot and left leg initially. Now both feet have numbness and tingling. It was hard for him to walk. He has to hold on to walls to walk (also reported as Patient could not walk because of his left leg numbness. Patient cannot walk. Patient can now only stand if he is holding a wall). He went to the emergency department on 29Apr2021 and got an MRI of back and lower legs, "all was negative for slip disc or spinal cord swelling. Patient had an MRI of his lower back, and legs. The MRI results were that patient had no spinal cord compression that would cause his left lower leg numbness. Patient was admitted to the hospital, to the neurology department, with a consult for a neurosurgeon to see him. The doctors agreed that he had something going on since he had left lower leg</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

numbness. In the course of four days, Thursday through Sunday, patient was admitted to hospital in the neurology unit. Patient was in an overflow area. Several hospitals around that area have closed, so now the hospital is seeing so many more patients, and the hospital is over capacity. Patient was admitted by a hospitalist, and then was referred to a neurology team. The doctors said that that does not explain patient's symptoms, so the doctors ordered a head to toe MRI with contrast. He was admitted to the hospital and continued to have severe back pain then, the doctors did another head to toe MRI with contrast and then they said he has "MS due to brain lesions and spinal cord swelling the length of his spinal cord." They also did a spinal tap. The family kept telling the MDs that he had just received his Pfizer vaccine. The patient denies any weakness or numbness in past 6 months. He continues to have numbness in both feet and now the left leg is always numb. The doctors gave him an outpatient appt at the end of June. It felt like whenever he sits on his foot while watching TV, and it starts going numb. By the time that patient was getting testing done, the nurses covered patient's eyes, and told patient to tell them whenever he could feel it. The doctors and nurses were sticking pens in patient's feet, and patient could not feel it at all. Patient could only feel pressure. On Friday, 30Apr2021, patient had a head to toe MRI with contrast. Reporter thinks that patient got back to his room after the total body MRI about 22:15. The head to toe MRI with contrast revealed that patient had spinal cord swelling, and lesions in the brain. Doctors diagnosed patient with multiple sclerosis. Patient has never had any symptoms of multiple sclerosis. Reporter's husband feels like patient could have transverse myelitis, because some vaccines can cause that. Reporter's husband asked patient's doctor to contact Pfizer to see if there was anything in place about how to treat this. On Thursday, patient's doctor told reporter's husband that there had been no reported adverse effects of spinal cord swelling from the covid vaccine. On Sunday, whenever patient was discharged, patient's doctor told reporter's husband that he was not going to call and report about patient to Pfizer, and that there had already been 45 documented cases. This was a really big red flag to reporter. Patient cannot walk. Patient can now only stand if he is holding a wall. Before this, he was totally healthy. Patient was

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

discharged from the hospital on Sunday. The hospital sent his MRI results, lab work, and spinal tap fluid after his MRI to Clinic. The doctors did the spinal tap on patient to make sure he did not have an infection. Patient did not have an infection. The doctor started patient on Lyrica and some other drug. The hospital told patient to call back in two weeks, because by then they would have stuff back from Clinic, and then he could make a follow up appointment. Upon discharge, patient was told that maybe he could get a follow up appointment in Jun2021. Everything that reporter has read, says that patient's condition needs to be followed up on as soon as possible. Patient cannot walk. This is going to financially cripple patient. Reporter is sure that after this, patient will meet his deductible and is going to have to pay out all of this money to cover his hospital stay and testing. Before the COVID vaccine, patient did not have any problems at all. Patient had to have surgery on his leg when he was 17. Patient has no history of back pain. By the time the doctors and nurses did testing, that was late Friday evening, 30Apr2021 or Saturday morning, 01May2021. By the time that the testing was done, both of patient's feet and left leg were totally numb. The hospital said that patient's symptoms were terrible, and that he had something acute going on. The hospital ran tests on patient. Patient told the doctors at the hospital that he had recently received the COVID vaccine. Patient was never sick he might get a cold every once in a while. Other than that, patient only sees the doctor once a year for a physical. The hospital did preliminary lab work on patient. Patient's vital signs were stable, and he had no fever. After patient received three doses of IV Solu-Medrol, his back pain went away. Patient's doctors felt like patient's spinal cord swelling had diminished. Patient's doctors felt like patient's spinal cord swelling is what cause patient's numbness and tingling. The first dose of IV Solu-Medrol was given sometime on 30Apr2021. Patient received IV Solu-Medrol 1 gram, three days in a row. The doctors said that was all they were going to do at this time. The doctors wanted to wait to see what the lumbar puncture shows (unknown results). Patient was given IV Solu-Medrol while in the hospital. Patient was put on Lyrica and gabapentin. The doctors are hoping that those two medications will make his symptoms go away. Patient used to take a

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

multivitamin for years, but reporter does not know if patient still takes that. Patient is super healthy. Patient was admitted to the hospital on 29Apr2021, and discharged on 02May2021 after receiving his last dose of IV Solu-Medrol. The patient had no COVID prior vaccination. The patient had Nasal Swab (COVID test) on 28Apr2021 and was negative. Event relatedness to Pfizer COVID vaccine: Severe back pain and Patient started to get terrible numbness in his feet. The numbness moved to up his left leg. Patient could not walk because of his left leg numbness. Patient cannot walk. Patient can now only stand if he is holding a wall was related. Reporter stated that she thinks his symptoms are medically significant, but they could be disabling. If the COVID vaccine gave patient multiple sclerosis or transverse myelitis, this could be disabling. The outcome of the event back pain was recovered in May2021; event spinal cord swelling was recovering; events "terrible numbness in his feet. The numbness moved to up his left leg. Patient could not walk because of his left leg numbness and It was hard for him to walk. He has to hold on to walls to walk" were not recovered; and unknown outcome for the other events.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the multiple sclerosis, transverse myelitis and other reported events due to temporal relationship. However, the reported events may possibly represent intercurrent medical conditions in this patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including spinal MRI at baseline, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1336030	5/20/2021	WI	54	F	5/19/2021	5/19/2021	Patient got the vaccine at around 1 pm and around 6.30 pm patient had her eyes swelling up and itching and watering. She got a migraine too. She almost could not see as her eyes were shutting off. She thought she is having an allergic reaction and took two Benadryl. Today when she woke up her eyes are the same swollen and maybe 1/2 inch open. She is feeling nausea also. So patient called the pharmacy to inform . She wanted to see if she can take benadryl. she was advised to taken benadryl and also call her doctor and if the symptoms worsen to call 911 or go to hospital. She was advised to inform her family member who was not at home to let her situation be known so they can keep an eye on it.
1334467	5/20/2021	CA	14	F	5/20/2021	5/20/2021	Patient received Pfizer vaccine at 09:14, Mom noticed mild Left eyelid swelling at 09:25, notified staff. No other symptoms. Walked patient and mom to the ED (next building). Upon arrival, bilateral eyelid swelling noted by this writer. No other symptoms,.
1333757	5/20/2021	WA	15	M	5/20/2021	5/20/2021	Patient got shot on 05/20/21, waited in the pharmacy for 15 mins and felt fine. Patients mom called after about an hour and said patient fainted but recovered soon. He was not hurt, mom was advised to keep an eye on patient and call 911/ or urgent care visit. Per mom will wait. Called patient after some hrs per patient he is fine and has no adverse symptoms anymore.

1333833	5/20/2021	NC	53	M	5/4/2021	5/4/2021	After vaccine by 6pm husband had high fever all night long, we woke up he took Tylenol and fever went down. He went out side for a little bit, his body temperature was still hot without chills and this lasted for 3 days and night. I talked to the pharmacist and he recommended Ibuprofen and I gave it to him for two days but he kept the fever. He started shaking and by the 5th day I took him to the clinic and both his eyes were red and hands and feet were hot. I was told to take him home because all vital signs were ok, but I took him back to the ER on day 8 because he was not getting better, they said he had multi organ issues and now he's confused and he doesn't know who I am or where he is and cannot remember and confused. He is now on dialysis and he was on life support, he was never hospitalized or taken prescription drugs and now he's in this condition. He is still in ICU and his body looks so weird. He don't remember words or when I talk to him.

1334031	5/20/2021	CA	65	F	5/18/2021	5/18/2021	Reaction to 1st- 10 days after - achy muscles & bones , swollen glands, SOB - felt like I had Covid again. Lasted 3 dys Reaction to 2nd - super achy muscles & bones, SOB, breathing pain, swollen glands, low grade fever, headache, ears hurt, burning watery eyes, itching around injection site - felt like I had Covid again but worse
1334055	5/20/2021	DE	79	M	1/15/2021	1/28/2021	who sponsored the Vaccine site. Adverse event: Was starting to drive and was kind of lethargic and was slow reacting. My wife was asking questions but I was having slow responses. She said I had glazed stare and I was a little off balanced and the ambulance was called but the symptoms had subsided by the time the ambulance got there: Blood pressure - a little elevated; Blood Sugar was fine . At that time could follow finger across eyes (before when symptoms were still there, had not been able . Ambulance left and just said to keep an eye on him at home when I refused to go to hospital. We called the family doctor and she said to go to ER immediately. No return of symptoms since that episode.
1334062	5/20/2021	NY	41	F	4/9/2021	4/10/2021	I woke up 6 hours after vaccination and started getting the chills with a fever of 101.3. I took some Tylenol which brought the fever down for a few hours but it later shot back up to 104. I had a headache, muscle pain, and fatigue. On Monday, I got a sharp pain on the side of my head causing my eyes to hurt. I called doctor who said that it sounded like a sinus infection and prescribed me Azithromycin. Days later the doctor called me and I told him that I wasn't feeling better and was referred to take a Doppler test which showed nothing wrong. I went to another doctor that prescribed me Bactrim which cleared up my sinus infection and I felt a little better. I still feel fatigued, have brain fog, and double vision. I went to a neurologist and was given a CT scan. That was two weeks ago and I never heard about the results. I'm scared to drive because I don't know what will happen. The vaccine also threw off my cycle and I have gained so much weight since my vaccination.

1334118	5/20/2021	TX	60	F	5/11/2021	5/12/2021	<p>She got her vaccine, had no reactions. She woke up on 5/12/21 and had extreme headache, blood pressure was high, nausea and vomiting, extreme pain behind her eyes, blurry vision. Later in the afternoon she had diarrhea. She called her PCP that evening and he prescribed Ondansetron (Zofran). On Thursday she continued to have the blurred and double vision with some nausea and dizziness and headaches which have been on-going, especially on the left side of her head. She went to the ER on Friday evening 5/14/21 where her BP at it's highest point was 195/126 and a pulse of 99. They started doing some actions to determine if she was having a stroke. They did a CT scan and gave her medications to get her BP down, started an IV. She was then admitted to HCF that evening. They kept her overnight and did an MRI on 5/15/21, had to start wearing an eye patch on her left eye due to dizziness and was not able to walk without covering the one eye and needed assistance to walk across the room. Everything was clear on the MRI and CAT scan. She saw two resident internist and then she saw a neurologist while being in the hospital. The neurologist diagnosed her with left third nerve palsy as a result from the vaccine and the high BP. They released her that evening with instructions to see an Ophthalmologist the following week, which she did on 5/17/21 and saw Dr. He concurred with the neurologist diagnosis and felt that there was really nothing that they needed to do and for it to run it's course and let it heal which will take anywhere from 2 weeks to 4 months. She was informed to continue to wear the eye patch until the dizziness and double vision improve. There is pain still behind the left eye, and still has high BP and have prescribed medications for that. Her PCP started her on Amlodipine/HCTZ 10/12.5 mg. She then ended up in the ER again last night on 5/19/21. They put her on fluids as she started vomiting again and could not keep any of the medications down that she was prescribed. So they gave her fluids and started a steroid in the IV fluids to help with the pain and inflammation behind her eye, as well as headache medications as well. She was then sent home last night and now the pain in her eye is about a 5 since receiving the steroids. She was also started on Prednisone 20 mg to start today as when she was in the ER they told her to start that. She has not had any nausea or vomiting</p>

1329470	5/19/2021	FL	73	F	4/13/2021		<p>Bell's Palsy; She was worried it could be a stroke; This is a spontaneous report received from a contactable consumer reporting for herself. This 73 years old female patient received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 13Apr2021, in left arm, for COVID-19 immunisation. Medical history included Bell's Palsy 20 years before the report, shingles in Nov2020, ongoing blood pressure, ongoing cholesterol and ongoing indigestion. Concomitant medications included omeprazole orally, 20 mg, 1x/day (1 capsule every morning), lisinopril/hydrochlorothiazide orally, 1 DF, 1x/day (in the morning), for blood pressure and ezetimibe for cholesterol. The patient experienced Bell's palsy following the first dose, since an unspecified date in 2021. She recovered quickly on an unspecified date in 2021. The event was described as "drool down one side, make sure close eyes at night or they dry out". The patient was drinking and it was leaking out the side of mouth, smiled and nothing was moving on the right side, right side of face went saggy. It was the right side that was messed up, the right eye didn't have the muscle coordination that the left eye did. The patient was worried it could be a stroke. She stated she will most likely not receive second dose. Information on the lot/batch number has been requested.</p>

was PRIVACY she thinks. Prior vaccination (4 weeks prior) were none. The patient's sister reported that they both had their second dose and she forgot to tell the other woman she spoke to about herself because the caller's focus was on her elderly brother who was 72-years-old. They both received their COVID vaccines in the morning of 16Apr2021, a Friday, and within hours her brother felt very bad. She went downstairs and saw her brother vomiting in the trash can and he just said that he hurt and that he felt nauseated. This continued for a few days, in fact it continued for 4 days. He was beginning to feel better on Monday, but he was still not up to par. Then Tuesday she guesses her brother was feeling better. On Wednesday night she went downstairs and heard him around 2300 to midnight talking to the dogs and then the next morning she found him unresponsive (22Apr2021). Her first thought was that maybe her brother had a stroke so she called 911. In the emergency room he had a CAT (computerized tomography) scan and at first they said that he didn't have a stroke. But something very unusual was that her brother had a rapid heartbeat and his normal was around 60 but in the emergency room his heartrate was upwards to 120 to 130 to 140. He was then transferred to another hospital where they said the next evening that in fact he did have a stroke even though that first doctor said that he didn't have a stroke. The doctor didn't find any further information until 2 days later when the doctor thought her brother already had some blood clots that were thrown into the frontal, temporal and parietal region in his brain. She was a biologist so she can't say that the COVID vaccine caused this but she thought that Pfizer should be aware of his situation and then she was so focused on her brother that she forgot to tell the other woman the really bizarre things. She had asked certain questions to the doctor based on what her sister was telling her to ask. The caller asked the doctor if her brother was going to be seen by a neurologist and the doctor gave a rambling evasive answer and then turned on his heels and walked out and kicked her out of the hospital. They both had their COVID vaccines in the morning around 1000 or so and she doesn't know if he was vomiting still the next day or not but her brother felt really bad. He has chronic conditions and he generally just felt bad and he had thought that something was wrong with him. He felt

malaise, fatigue, his head hurt and he was nauseated. He ate one bowl of soup that the caller had made for him but he wasn't really eating. That lasted for about 4 days and then he started to feel better on Tuesday, confirmed to 20Apr2021, and then he felt even better on Wednesday, confirmed to 21Apr2021, because the caller did take him on some trips. He doesn't drive. Her brother said that he felt feverish and the caller says that he felt feverish to the touch as well but the thermometer said that he didn't have a fever because it had an error sign when she took his temperature. Unresponsive: Her brother was fine Wednesday night around 2300, maybe midnight, she had heard him downstairs talking to the dogs and she knew that he was okay. Then the next morning, 22Apr2021, she found him slumped into his rollator (his wheelchair with a seat) and he was slumped over and had stuff that looked like had came out of his mouth and he had vomit on legs. He was unresponsive so she called 911 and said that she thought her brother had a stroke. The operator said to lay him flat and the caller was finally able to get him up and then his arm got hung up and the operator said again to get her brother on the floor and get him flat. She understands that this was important and she was able to do it but they all fell down, her brother, her and the rollator. Shortly after this the ambulance had shown up. The ambulance took her brother to the emergency room in town and they said that her brother's heartrate was fast. She gave them all of the relevant information but she didn't think to tell them about the COVID vaccine. They said that her brother's heart was acting erradicate and it was very fast. Again, his normal heartrate is in the 60s and it was going from 110 to 140s and it wasn't coming down. She told them that when he was unresponsive that she thought he was having agonal breathing. In the emergency room, her brother's breathing was still not very good and she heard the doctor say that her brother had stopped breathing but then he came back so that's when he was intubated in the emergency room. They did a CAT scan of his head and his neck and the doctor comes back and said that her brother didn't have a stroke. But that was not the case according to a different doctor's later assessment. Approximately around 1430 to 1445 on that Thursday, 22Apr2021, they transferred him to PRIVACY, where he was in the ICU (Intensive Care Unit). His heartrate
