conditioned to being very fast. He went from the emergency room to the ICU. Thursday when he got transferred to the ICU they didn't do any diagnostic tests that day, he was still intubated and his heartrate was still up into the next day, Friday, 23Apr2021. It wasn't until late in the afternoon that a doctor came in and said that her brother did have a stroke he has even had prior strokes too. They had done an MRI (Magnetic resonance imaging) on Friday of his brain, which was not what they did in the first emergency room, that showed that he had a stroke in his temporal, frontal and parietal regions of his brain. At first caller states that on Saturday, he opened his eyes but he was still unresponsive essentially but then she says that this statement was wrong because he actually didn't respond that quickly. He has gone into a coma once before and when he had came out of it a very unpleasant thing happened that was very personal so she was not going to tell it. On Saturday and Sunday the doctor didn't want to answer the callers questions, this was a different doctor than the first ICU doctor and this one didn't have good bedside manner. Finally on Monday, 26Apr2021, her brother started responding. He was moving his legs with purpose, he had tried to kick the nurse, and he had made some words. The day before this, on Sunday the caller had brought the priest in to bless her brother and he sort of nodded and he seemed to make movements but he was still not able to talk. Monday he said what sounded like words and then Tuesday he made, what seemed to her like, meaningful statements. She was told that he had an ultrasound of his neck to see if he had any clogged arteries or veins and the nurse said that the test results came back good that their were no clogs. But this was where the whole story just becomes awful. Caller discusses how there were issues with a cousin having power of attorney from 2015 that was supposedly no longer valid according to the caller and she had spoke with administration and then she got kicked out of the hospital on Tuesday because of a question she had asked the doctor about her brother seeing a neurologist. The doctor said that the neurologist makes his own schedule and it might be 10 days or more if he even decided he wanted to see her brother. When the doctor asked the caller how would she like her brother's care to be she mentioned that he was in a coma before and was being treated for similar circumstances

from PRIVACY and that he was seen by a neurologist and she said that maybe her brother should be seen by PRIVACY and the doctor walked out and within minutes she was being escorted out of the hospital for belittling the doctor and calling administration. Now they won't even let flowers be delivered to her brother. Unfortunately the person who has been involved with him the most, the caller, was now barred from him. She was not saying that this was all due to the Pfizer COVID vaccine but why were they saying that she has a blood clot too. She has had headaches but they may be due to stress. She didn't feel sick like her brother. She has a question and she was really scared about the answer. She was just now reading that if you're on immunosuppressant drugs then you're not supposed to have the COVID vaccine. She asked was that true. Well her brother was in remission for leukemia and he was on a cancer medication called imatinib. Caller declined to speak to medical information about this and says it was already too late because he was already taking it and she doesn't know why he didn't stop them. Her brother's friends have tried to call and they were all getting the same statement, which she believes the hospital was stone walling, but the hospital says that they don't have a patient by his name and they have even told the florist the same thing. So caller was unsure if her brother has been discharged or not. He didn't seem to be in the shape to be shipped to a care facility but she doesn't know. It was hard for her to piece it all together. The hospital wasn't feeding her brother enough before she left so for all she knows they could be starving him to death and holding nutrition from him. History/ Investigations: His medications were ones that he has been taking for years and she doesn't know exact start dates for any and if she needs to she can get the dosage information from the pharmacy. Her brother has hid his pills before and he puts them in different bottles, it was a nightmare. He takes a gout medicine and she doesn't know the name of it. Those were the main ones that he takes other than the cancer medicine she said earlier. And he also takes gabapentin for some of his neuropathic pain and he takes something at night and a few others she thinks. For medical conditions the only thing that she knows was that many years ago he had a blood clot but she can't really say what year it was. She does know that her brother wasn't on any blood thinners

----------	-------	-------	---------	-----	----------	------------	--------------

to he knowledge and not long ago he had an ultrasound of his legs to determine if he had a blood clot but she was not 100 % sure if he had that but she thinks he did. Her brother told her that years ago he had blood clots that were due to weight lifting causing varicose veins and later they collateralized and they found out that the other secondary vessels took over for pumping his blood so it wasn't a problem. Her concern was can someone from Pfizer talk to her about what's going on with her brother, she knows Pfizer doesn't have his records but how will Pfizer be able to determine if this was from the COVID vaccine. She guesses that she was curious about what may of caused the blood clots. She mentioned the COVID vaccine to one doctor and he didn't seem like she respected her knowledge. She asked was there anything that can be done to help her brother if it was a blood clot. She was upset that the hospital and her wanting her brother to see a neurologist and beginning with a claim that he didn't have a stroke and then a claim that he did. She thinks that they were not doing enough for her brother and they were just saying oh well, it was all due to a fast heart rate which can happen as a result of the COVID vaccine. She was going to be honest, she was exhausted and she can't keep talking for a long time. She asked if she can call medical information back later when she was more refreshed. Consumer further stated that her brother had complaints of feeling ill, feverish and having no appetite. Caller stated that the next Thursday she found her brother unconscious, heart rate was elevated 120 to 140 beats per minute and that her brother had a stroke. The outcome was recovered on 21Apr2021 for the events Malaise, Nauseated, Fatigue, Headache and Appetite absent; recovering for the event Vomiting; and unknown for the rest of the events. Information on lot/batch number has been requested.

1329450	5/19/2021	MD	43	F	3/30/2021	4/8/2021	It was itchy like hives but looked like measles; broke out in a rash on trunk that quickly spread from chin to toes that evening; It was itchy like hives but looked like measles.; It was itchy like hives but looked like measles.; left eye swelled shut and was itchy and red; left eye swelled shut and was itchy and red; left eye swelled shut and was itchy and red; This is a spontaneous report received from a contactable consumer (patient reported for herself). A 43-year-old female patient (no Pregnancy at time of Vaccination) received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in Arm Left on 30Mar2021 10:00 at the age of 43 years old (Lot Number: ER8730) as 1st dose, single for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. Facility where the most recent COVID-19 vaccine was administered at Pharmacy or Drug Store. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. No any other medications the patient received within 2 weeks of vaccination. The patient never had allergic reaction before. On 08Apr2021 (day 9 post vaccine), the patient's left eye swelled shut and was itchy and red. She assumed she had pink eye and was treated accordingly. It did not go away. On 15Apr2021 (Day 16), she broke out in a rash on trunk that quickly spread from chin to toes that evening. It was itchy like hives but looked like measles. The adverse events result in Doctor or other healthcare professional office/clinic visit and Emergency room/department or urgent care. Treatment received for the adverse events included Eye drops and steroid creams and antihistamine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient hadn't been tested for COVID-19. The outcome of the events was recovering.

1329456	5/19/2021	IL	57	F	4/14/2021	4/29/2021	<p>Bell's palsy; eyes pretty red; runny nose: second dose; eyes started bothering her, the right eye: second dose; her eye had a little burning sensation and was irritated; This is a spontaneous report from a contactable consumer (patient). A 57-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration, administered in Arm Left on 14Apr2021 11:30 (Batch/Lot Number: EW0151) as single dose for covid-19 immunization. The patient's medical history included she was a breast cancer survivor, its been 10 years, all she had was radiation and she also had Tamoxifen for 5 years, had a colonoscopy a couple of months, she had seasonal allergies, adverse event following prior vaccinations: when she was young, she would get vaccines and would always get a light fever and her arm would swell and turn red. The patient's concomitant medication was not reported. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient received the first dose of BNT162B2 (lot number: ER8733) in left arm on 24Mar2021 10:45 for covid-19 immunization and experienced fainted for just a few seconds, heart rate was very fast and headache, wasn't feeling well and lost consciousness. The patient experienced bell's palsy on 01May2021, eyes started bothering her, the right eye, her eye had a little burning sensation and was irritated on 29Apr2021, on the 30Apr2021 eye was pretty red, runny nose on 30Apr2021. The clinical course as following: This past Wednesday was two weeks and then Thursday, her eyes started bothering her, the right eye. She thought it was seasonal allergies, because she has those, that kept bothering her and and she had a very runny nose. Saturday she woke up she felt like her face was kind of numb. She called the nurse and they told her she should go to the emergency room. She was diagnosed with bells palsy and so they gave her treatment and they explained to her what it was all about. She had been working out in the yard and she came in and her eye had a little burning sensation and was irritated. She thought it was because she was outside. She also had a runny nose. She says again, she thought it was seasonal allergies because she has that. Felt weird around her mouth, felt kind of numb: second dose: This past Saturday, she woke up and stated she felt</p>

----------	-------	-------	---------	-----	----------	------------	--------------

weird around her mouth, it felt kind of numb, it was hard for her to drink, she couldn't smile correctly, her smile was lopsided, one side was droopy. Caller states this began 01May2021. She went to the emergency room that same day and they diagnosed her with bells palsy. She was discharged from the emergency room because this time the lady doctor gave her the procedure with a stroke. The doctor could tell that it was not a stroke because of the eye, the doctor did something with her finger, they say can you see my finger, can you touch your nose. The doctor told her what she had is bells palsy and prescribed some medication. The eye is worse, but she doesn't have a runny nose anymore. With her eye, she can raise the left one, but the right one not as much. They gave her a patch for the right eye. She has to wear it in the evening, because it doesn't close anymore. She has to wear it to sleep with and during the day she has to wear glasses and if she goes outside, she has to wear sunglasses. Her eye is not really irritated, just kind of stiff, it does not really do much, she did some exercises to try to stimulate the muscles. The eye is just there, it doesn't really blink, it is beginning to blink a little bit but when she tries to close both eyes, she can close the left but it's like she can't completely close the right, she has no control of that part of the face, it's numb. She clarifies her eye started on Thursday 29 Apr because it was the first day she was outside. on the 30 Apr it was pretty red but she kept working. On Saturday morning she worked and she had a runny nose then too. Caller states they gave her some medicine at the emergency room. That night, she took Acyclovir and after she took the first one, she didn't have a runny nose anymore. Her eye is a different kind of bother now, it doesn't burn, its just there. They told her to get artificial tears and put the patch on. When asked if her eye is improved, persisted or worsened, she says the eye is not burning anymore, it's just kind of stiff. Bell's palsy: Caller states it's ongoing, when she smiles its the same. Caller states it's lopsided and when she raises her eyebrows, she can raise the left one, but the right one only goes up a little bit, but not as much. Caller states it's persisting, it's not getting worse, not getting better. Caller states she just started the medicine yesterday. Acyclovir: It was 400mg 5 times a day by mouth, one tablet for 10 days. Methylprednisolone: the other thing they prescribed me

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

was Methylprednisolone. She tried taking both the Acyclovir and the Methylprednisolone yesterday, but she had a really bad stomach ache and couldn't eat anymore. She had no appetite and her doctor, she told him she couldn't take both it is too much, so he just said she should continue the Acyclovir so she is not going to take the Methylprednisolone. The Methylprednisolone is a 4mg dose pack, 6 day thing. Yesterday she was supposed to take two before breakfast, 1 after lunch, 1 after supper and 2 before bedtime. She couldn't take all of that, it was too much. Today would have been different, it tapers off. The emergency room visit on 01May2021, they didn't do any testing, she just had observation. the doctor did this thing with her finger where she could see her finger and she pushed back and held onto the doctor's hands and showed her strength. she raised her eyes, closed her eyes, smiled, but no other testing was done. she had her second emergency room visit on 01May2021. Therapeutic measures were taken as a result of bell's palsy included Acyclovir and Methylprednisolone, for events of 'eyes started bothering her, the right eye', 'her eye had a little burning sensation and was irritated', and 'eyes pretty red' included artificial tears and put the patch on, no treatment received for runny nose. The outcome of the event Bell's palsy was not recovered, the outcome of the event runny nose was recovered on 01May2021, the outcome of the other events was recovered on an unknown date.

1329474	5/19/2021	NY	56	F	3/30/2021	3/30/2021	left ear felt very sore; severe intestinal cramps; Severe diarrhea; mild hearing loss/partial hearing loss; fever; chills; headache; nausea; loss of appetite; Tinnitus/new tinnitus from the vaccine was much louder; This is a spontaneous report received from a contactable consumer (patient). A 56-year-old female patient (not pregnant) received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, batch/lot number: EP7533 and expiration date: 31Jul2021), via an unspecified route of administration, in arm right, on 30Mar2021 15:45 (at the age of 56-year-old, not pregnant), at single dose, for COVID-19 immunization. Medical history included myopic degeneration/glaucoma, mild tinnitus in both ears since childhood. Patient was not diagnosed with COVID-19 prior to vaccination. No other vaccines within 4 weeks prior to the COVID vaccine. Concomitant medications included brimonidine, timolol, latanoprost eye drops, and pramlintide. The patient previously took first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, batch/lot number: EN6202 and expiration date not provided), via an unspecified route of administration, in arm right, on 09Mar2021 15:45 (at the age of 56-year-old), at single dose, for COVID-19 immunization. Other past drugs included ciprofloxacin (CIPRO), cefprozil (CEFZIL), sulfamethoxazole, trimethoprim (BACTRIM), azelastine nasal spray. The patient experienced tinnitus in left ear started about 30Mar2021 17:00 (reported as "1 hour after vaccination"), it was much louder on 31Mar2021 (reported as "the next morning") with mild hearing loss. Patient woke up in the morning with the fever and chills, and was accompanied by headache, nausea, loss of appetite. Patient had severe diarrhea on 03Apr2021, 04Apr2021, 05Apr2021, fever and severe intestinal cramps on 07Apr2021. All symptoms improved except for severe tinnitus in left ear. Sometimes it was so loud it feels like patient's whole brain was getting affected. Patient's blood vessel in left ear was pulsing too. Pulsing tinnitus. 5 weeks in from second COVID vaccine. Patient had a very loud tinnitus, ringing in the ear and the left ear felt very sore, it was like partial hearing loss, which lasted for few days. So, now the hearing came back and my hearing was normal. Patient visited Audiological/ENT on 14Apr2021 and had hearing tests, it was normal but patient had very loud tinnitus. Patient had a severe

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							tinnitus. This new tinnitus from the vaccine was much louder with additional piercing hissing/whooshing sounds. Patient was still experiencing this discomfort, it is the same, this it is not getting better, it was very loudly. The adverse events result in doctor or other healthcare professional office/clinic visit. Patient stated she was finding that so many people those who have the same side effect (further clarification unknown), it was the tinnitus, the ringing in the ears and partial hearing loss either temporary or permanent and it is a pretty big side effect and its pretty much severe lasting many weeks and months. Patient had not been tested for COVID-19 Since the vaccination. The outcome of the event "tinnitus aggravated" was not recovered; of other events was recovering.
1329480	5/19/2021	FL	57	M	3/24/2021	3/25/2021	ear infection; hypertension 168/98; Branch Retinal Vein Occlusion; blurry vision in my left eye; This is a spontaneous report from a contactable consumer (patient). A 57-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Lot Number: EN6208), via an unspecified route of administration, administered in Arm Left on 24Mar2021 10:00 as 1st dose, single for COVID-19 immunization. There were no medical history and concomitant medications. No other vaccines in four weeks and no other medications in two weeks. No known allergies. No COVID-19 prior to vaccination and not tested post vaccination. On 25Mar2021 08:00, the patient had blurry vision in my left eye and was referred to a Retina Specialist. The patient was diagnosed with Branch Retinal Vein Occlusion and is receiving AVASTIN shots in the eye monthly in the hopes of getting the vision back to normal. On 02May2021, the patient visited a walk-in clinic for an ear infection and was diagnosed with hypertension. BP 168/98. Patient had several reading in this range after the visit. The patient visited his general practitioner (GP) and was started a regimen of Lisinopril 2.5 mg to help bring down the BP. The outcome of the events was reported as not recovered.

The patient medical history and concomitant medications were not reported. It was reported that patient did not have her medications, but she did state that she has had several Botox injections in the area on her face where she experienced the reaction. The 2nd day after the first dose of the vaccine (24Feb2021) she experienced white and pink bumps on her face around her lips. She also had some shortness of breath and called 911. She was admitted to the hospital. The ruled out COVID infection and Pneumonia. On the 3rd day while hospitalized she experienced aches and pain in her joints. She was discharged after 3 days. Her symptoms have subsided. She is only complaining on some blurred vision on and off. She received her first dose on 23Feb2021. Her Doctor told her she should not get the 2nd dose. Therapeutic measures were taken as a result of shortness of breath, experienced white and pink bumps on her face around her lips, she experienced aches and pain in her joints. The outcome of event she experienced aches and pain in her joints was recovering, while other events was unknown. It was reported that patient had several Botox injections in the area on her face where she experienced the reaction. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

----------	-------	-------	---------	-----	----------	------------	--------------

head. She stopped taking the steroids because she couldn't stop eating). Concomitant medications included amlodipine taken for blood pressure abnormal from an unspecified start date and ongoing (has been taking amlodipine for a year or a year and a half); hydrochlorothiazide taken for swelling from an unspecified start date and ongoing (she retired in 2005 and may have started taking hydrochlorothiazide before she retired); dorzolamide hydrochloride, timolol maleate (DORZOLAMIDE HYDROCHLORIDE AND TIMOLOL MALEATE) taken for glaucoma from an unspecified start date and ongoing (been about a year that she has been using the Dorzolamide/Timolol); latanoprost taken for glaucoma from an unspecified start date and ongoing (has been using the Latanoprost for longer than she has been using the Dorzolamide/Timolol); acetylsalicylic acid (ASPIRIN (E.C.)) taken for an unspecified indication from an unspecified start date and ongoing (she has been taking an aspirin daily religiously for about 6 months); famotidine taken for gastroesophageal reflux disease from an unspecified start date and ongoing (has been taking Famotidine for a couple of years); hydrocodone taken for pain from 2005 and ongoing. The patient experienced sore arm on 08Apr2021 with outcome of recovered on Apr2021, arm swollen on 08Apr2021 with outcome of recovered on Apr2021, everything in vision went white on 08Apr2021 with outcome of recovered on 08Apr2021, felt weak and sick on 08Apr2021 with outcome of recovered on Apr2021, swelling and pain on right side of body on 09Apr2021 with outcome of recovered on Apr2021. The events were described as everything went white: patient reported that everything went white in her vision while she was sitting and waiting after receiving her first dose of the Covid-19 vaccine. She thought that it may have just been her glaucoma. The white out of her vision lasted for 5-10 seconds and then her vision returned to normal. Felt weak and sick: when she left the vaccination facility on 08Apr2021, the sun was beating down and she got real sick. She got into her friend's vehicle and upon arriving home, the patient was unable to get out of the car because she felt like she was about to faint. She sat in the air conditioning in her friend's vehicle for 30 minutes. She was still feeling weak and sick but she went inside her house and got into bed. Swelling and pain on right side of body: when she woke

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

up on 09Apr2021, the whole right side of her body to include her face, arm, hand, and foot, were all very painful and very swollen for about 3 days. She has had multiple surgeries on the right side of her body and all of the sites were very painful. Felt weak and sick: she started sweating a lot while she sat in her friend's truck on 08Apr2021 after the first dose of the Covid-19 vaccine. She sat in her friend's truck for 30-40 minutes with the air conditioner running full force and felt a little better. She still felt weak and sick, but she went inside because her friend needed to leave. She took off her clothes and tried to eat some soup, but just got into bed and stayed there. Swelling and pain on right side of body: the swelling and pain was really bad for 3-4 days and eventually went away. The pain and swelling gradually diminished. The bones in her hands, knees, thighs, and feet were all very painful. She has a piece of wire that holds her foot to her leg and a spot on her thigh that was affected when she was being given pain blocks and the provider kept missing the site. She has rheumatoid arthritis in her hands, arms, and shoulders as well as a herniated disk in her neck. Patient reported that all of that was hurting and hurting at the same time. Felt weak and sick: patient reported that it took awhile to start coming back to herself. It took about a week and a half until she finally felt back to normal. The patient reported that she should have gone to the doctor or emergency room when she experienced side effects following the first dose of the Covid-19 vaccine. She didn't want to go to the hospital because her immune system wasn't right and she didn't want to catch anything. Information on Lot/Batch number was available. Additional information has been requested.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1329583	5/19/2021	CA		F	3/19/2021	5/7/2021	<p>she had an epidural placed for pain in the lower back; My Right eye was not blinking and it was watery/tearing; The right side of my face was not moving at all; Bell's Palsy; I had paralysis in my right eye and it went down to the chin area; numbness around my mouth and underneath my nose, the right side/under my nose felt numb; My tongue was numb and under my nose felt numb; This is a spontaneous report from a contactable nurse (patient). A 68-years-old female patient received the second dose of BNT162B2 Pfizer-BioNTech COVID-19 mRNA Vaccine via an unspecified route of administration, administered in right arm on 19Mar2021 (Batch/Lot number was not reported) as single dose for COVID-19 immunization. The patient's medical history included Bell's Palsy about 10 years before this report and they thought it was a stroke as it was a mild case without any facial paralysis at that time. Historical vaccine included the first dose of BNT162B2 Pfizer-BioNTech COVID-19 mRNA Vaccine administered in right arm on 26Feb2021 (Batch/Lot number was not reported) as single dose for COVID-19 immunization, after which the patient suffered from pain in arm only. Concomitant medications were not reported. The patient reported that she woke up on 07May2021 with numbness around her mouth and underneath her nose, the right side. She had paralysis in her right eye and it went down to the chin area. Her tongue was numb and under her nose felt numb. The left side of her lip went to the left when she rubbed her lips together and she also had right sided drooping of her mouth. She called a HCP and he said it was probably a reaction to her medications. He said to go through the weekend and see if it goes away. On 10May2021, it was still there. Her right eye was not blinking and it was watery/tearing. The right side of her face was not moving at all. Drinking coffee or liquids it would pour out on her chin. The reporter states she went to the ED on 10May2021 and the doctor diagnosed her with Bell's Palsy, he said it could have been caused by a virus, or the caller being stressed. Her Internist just said "I don't know" what was causing the Bell's Palsy. The caller stated she had an epidural placed for pain in the lower back on 14Apr2021. She has been taking prednisone 20 mg take 3 once a day since 10May2021 and valaciclovir hydrochloride (VALTREX), 1 g three times daily by oral route. Caller states she has been taking the prednisone 20 mg 3x/day</p>

1329439	5/19/2021	AR		F			<p>this type of reaction was not exactly anaphylactic even though they were considering it as such; heart racing/heart was racing; eyes swollen shut/eyes swelled shut; red arms/arms turned bright red; itchiness; This is a spontaneous report from a contactable physician (patient's father, a dermatologist) via Medical Information team the Pfizer-sponsored program, Support. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), via an unspecified route of administration on an unspecified date, 1.5 weeks prior reporting (batch/lot number and expiration date were not reported) as the 1st dose, single for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. On an unspecified date within an hour after vaccination, the patient had "red arms, heart racing, itchiness, and her eyes swollen shut." She was given diphenhydramine (BENADRYL), and was advised not to get the second shot. The reporter was seeking recommendation on how to proceed; if the patient could take another COVID-19 vaccine instead to complete the vaccination series. It was further reported that the patient had a Pfizer COVID shot a week and half prior reporting and she had a reaction to it, which included "arms turned bright red, heart was racing, and eyes swelled shut" on an unspecified date. They gave her a shot of Benadryl, and then she drove home. She had no problem after that. She had no trouble breathing. They told her not to get the second shot. So the reporter went and looked for more information and saw on one website that she could go ahead and get the Johnson and Johnson vaccine or just stick with the one Pfizer shot. The reporter was wondering what was the current recommendation for this and wanted to clarify. The reporter stated that this type of reaction was not exactly anaphylactic even though they were considering it as such. The patient recovered from all the events on an unspecified date. Information on the batch/lot number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the anaphylactic reaction and other reported events. There is limited information provided in this report. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the</p>

1329167	5/19/2021	LA	59	F	2/12/2021	3/13/2021	haze in left eye; pain behind left eye, and pain above left eye; Headache/pain in left temporal area; told symptoms consistent with encephalitis; Within 30-36 hours after second dose, she had stiffness of neck; This spontaneous case was reported by a nurse (subsequently medically confirmed) and describes the occurrence of ENCEPHALITIS (told symptoms consistent with encephalitis) in a 59-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 031A21A and 031M20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 12-Feb-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 12-Mar-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 13-Mar-2021, the patient experienced ENCEPHALITIS (told symptoms consistent with encephalitis) (seriousness criterion medically significant), MUSCULOSKELETAL STIFFNESS (Within 30-36 hours after second dose, she had stiffness of neck) and HEADACHE (Headache/pain in left temporal area). On an unknown date, the patient experienced VISION BLURRED (haze in left eye) and EYE PAIN (pain behind left eye, and pain above left eye). At the time of the report, ENCEPHALITIS (told symptoms consistent with encephalitis), MUSCULOSKELETAL STIFFNESS (Within 30-36 hours after second dose, she had stiffness of neck), VISION BLURRED (haze in left eye), EYE PAIN (pain behind left eye, and pain above left eye) and HEADACHE (Headache/pain in left temporal area) had not resolved. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 22-Mar-2021, Magnetic resonance imaging: for most part appears normal (normal) for most part appears normal. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. No concomitant medications were reported. Treatment medications included trigger point injections. The patient was evaluated in the ER for symptoms of stiffness of neck and headache and was told the symptoms are consistent with encephalitis, however, the diagnosis had not been confirmed. She was also evaluated by her primary doctor on 22Mar2021,

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1329496	5/19/2021	CA	60	F	4/9/2021	4/1/2021	I have been sick; couldn't eat anything down; lost consciousness; Trigeminal neuralgia attack; Trigeminal neuralgia attack; massive vertigo attack; eye was so swollen; This is a spontaneous report from a contactable consumer (patient). This 60-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 09Apr2021 (at the age of 60-year-old) (Batch/Lot number was not reported) as single dose for COVID-19 immunisation. Relevant medical history included trigeminal neuralgia, head injury, pulmonary problems, severe migraine and tumor in lymph node. Concomitant medications were not reported. On 09Apr2021, the patient lost consciousness; in Apr2021, she experienced trigeminal neuralgia attack, massive vertigo attack and eye was so swollen; on an unspecified date she experienced also sickness and couldn't eat anything down. The patient specified that right after she got the injection, they make you to sit there for 15 minutes to see. She lost consciousness, it was like they gave her a shot before you go on for surgery and the doctor had come over, they had to wake her up. She didn't know what happened, so that was the first thing and the doctor said that's out of all the 1000's of people they vaccinated she was the first one that passed out right after the injection. So, she thought may be that should be noted somewhere and she didn't get a headache that she has a condition called Trigeminal neuralgia which was extremely painful and it's like only 3% of the population get it and it's usually caused after major head injury, was the very next day her shot was on the Friday and then Saturday the pain was terrific and she had the trigeminal pain for a week, took a week to go away and then right after that the next week she had a massive vertigo attack. And she really didn't know all these things or side effects from her head injury. But her conditions are pretty rare, you only get them if you've got massive concussions and fractured skull and stuff like that which happened a long time ago. So she didn't know if the shot had anything to do with it. She has pulmonary problems so she was getting it no matter what because she can't go anywhere hery Pulmonologist won't let her leave the house unless she has to go to a doctor or an emergency room. And she did go to the emergency room because her pain medication wasn't working at all

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							(Unspecified medication). She used to have migraine but after the head injury the migraine went away which she was very happy because she had severe migraine. What she didn't know was this Trigeminal neuralgia the nerve pain. The consumer further specified that she was so happy with the vaccine and she mean she doesn't care what the normal side effects are, she didn't have any other side effects her arm never hurts, she never had any fatigue or headache but she didn't know it was odd, the very morning she woke up Saturday she was in excruciating pain, its nerve pain that went down to the jaw, right under her eye and over the forehead and it's the most extremely painful thing that people get. She takes medication (Unspecified medication) daily to try to control it but sometime the pain is really really bad. She had been sick for the 3 weeks, she did not think anything had to do with the vaccine except the trigeminal. But it could have caused a massive vertigo attack which lasted 8 or 9 days. Today was the first day she was eating food in a week because she couldn't eat anything down. The patient was on a lot of steroids, she was reducing but she was still very plump so she thinks it's about 270 pounds right now. At the time of the report, the outcome of the events was unknown. The information on the batch number has been requested.
1329163	5/19/2021	OR		F	5/16/2021		MEDICATION ERROR DUE TO ACCIDENTAL EXPOSURE INTO EYES; FREAKING OUT; This spontaneous report received from a patient concerned a female of unspecified age. 1329088	5/19/2021	PA	56	M	4/3/2021		<p>BLOOD IN THE STOOL; SHORTNESS OF BREATHE; TINGLING IN THE FINGERTIPS AND THE TOES; SORENESS IN THE RIBCAGE NEAR THE HEART/LEFT CALF SORENESS; PUMPING SENSATION IN RIGHT SIDE OF HEAD; TIREDNESS; RIGHT ARM SORENESS; COUGHING; LIGHT HEADEDNESS SENSATION; HEMORRHOIDS; This spontaneous report received from a patient concerned a 56 year old male. The patient's height, and weight were not reported. The patient had no relevant medical history and was not on regular medication. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1805022, and expiry: UNKNOWN) dose was not reported, once total administered on 01-APR-2021 on left arm for prophylactic vaccination. No concomitant medications were reported. Patient reported that, he received the vaccine on 01-APR-2021. Approximately 2 days after he coughed and felt lightheaded and noticed some lights around his eyes. Approximately 7 days after patient noticed a list of symptoms including a pumping sensation in the right side of his head, left calf soreness, soreness in the ribcage near the heart, a tingling sensation in the fingertips and toes (but not at the center), sense of tiredness, shortness of breath, blood in stool that he referred to repeatedly as clots, right arm soreness (although the injection was given in the left arm). Patient called his doctor twice and was told to go to the hospital. Patient went to the hospital on 04-MAY-2021. Arrived at 12 PM and discharged at 11 PM approximately. Conducted a chest x-ray, took a blood sample twice, and put some stuff on patient's chest. Patient was discharged on 04-MAY-2021 and given a prescription for Motrin 800 mg taken three times per day as needed, and for cyclobenzaprine 10 mg taken twice a day as needed for spasms. Patient decided not to take these medications as he was unsure if they were pain medications and felt apprehensive. He main concerns seemed to be the pumping sensation in the right side of his head and the blood in his stool which he repeatedly referred to as a clot. His family doctor is aware of the situation and says he thinks its hemorrhoids. He refers to the clot as darker red in colour and also mentions that there is regular red blood in stool alongside the darker clot. Patient notices this about 3 times per week. The action taken with covid-</p>

1329435	5/19/2021	NV	19	F	4/23/2021	4/25/2021	lost vision in both eyes; passed out; dizzy; severe nausea set in with severe body pain; severe nausea set in with severe body pain; worst migraine of my life; low blood pressure; This is a spontaneous report received from a contactable consumer (patient). A 19-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration (at the age of 19-years-old), administered in Arm Left on 23Apr2021 13:00 (Lot Number: EW0169) as 1st dose, single for COVID-19 immunization. Medical history included anxiety, and allergies to mosquitoes, hotdogs, and sausage. The patient was not pregnant at the time of vaccination. Concomitant medications included citalopram and drospirenone, estradiol (EOS), IUD, daily supplements. The patient previously took oxycodone ("oxycodone") and percocet [oxycodone hydrochloride;oxycodone terephthalate;paracetamol] and experienced allergies. The patient, 48 hrs later, lost vision in both eyes, became dizzy, passed out multiple times. Later severe nausea set in with severe body pain. Went to Urgent Care the following day and was told side effects. That night had worst migraine of her life, low blood pressure, and continued nausea. Given some meds and sent home to rest. Took 2 full days to feel okay again. Onset date and time of events reported as 25Apr2021 13:00. The adverse events resulted in Emergency room/department or urgent care. Therapeutic measures were taken as a result of the events. Treatment received for the adverse events included Toradol, Benadryl, and Reglan. The patient underwent lab tests and procedures which included sars-cov-2 test: negative (Nasal Swab) on 27Apr2021. The outcome of the events was recovered with sequelae. The events "lost vision in both eyes" and "passed out" were considered as serious (medically significant). Facility where the most recent COVID-19 vaccine was administered was Clinic/facility. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has been tested for COVID-19. No follow-up attempts are possible, no further information is expected.

1329314	5/19/2021	FL	72	F	2/17/2021	2/18/2021	Eye burns; chills; Pain; headache; eyes hurting; balance problems/balance off/equilibrium was off; This is a spontaneous report received from a contactable consumer (patient) via medical information team. A 72-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; Batch/Lot Number: EL9262), via an unspecified route of administration, administered in left arm on 17Feb2021 at 14:30 as single dose for covid-19 immunisation. Medical history included covid-19 in Sep2020. There were no concomitant medications. On 18Feb2021 at 11AM, she experienced, chills, pain headache, eyes burning, eyes hurting, balance problems/balance off, equilibrium was off. She had a bad reaction. It was 3 days of being in bed. She was fine now, she feels great since Sunday afternoon. She had covid in early Sep2020, and in Oct2020 she had 2 tests that came negative, so she knows it was not in her system anymore, but when she got phone the call for covid vaccine thought she should get it. In Dec2020 she did have the covid virus, and asked if this would have any influence on having the vaccine. She does not know that if she had the covid virus in the past, she didn't know if she should have gotten the shot. She called her doctor, and they told her that she should not have gotten the shot, she spoke to a NP, even though she had virus, she shouldn't have gotten it. She was told to rest comfortably as long as she was feeling better. She had 2 negative tests within a week before seeing her doctor. In order to even see the doctor 2 negative tests are required before an appointment can be made. Her second dose was scheduled on 11Mar2021 at 2:30pm. With experiencing these symptoms, she asked if she could get the second dose. The outcome of the events was unknown. No follow-up attempts are possible. No further information is expected.

1329327	5/19/2021	MA	78	F	2/4/2021	2/1/2021	<p>cataract; nausea; Diarrhea; nervous; This is a spontaneous report from a Pfizer sponsored program. A contactable 78-year-old female consumer reported for herself that she received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection; Lot number: unknown) via an unspecified route of administration on left arm on 04Feb2021 at single dose for COVID-19 immunization. The medical history of the patient included high blood pressure (Caller mentioned this was diagnosed in her late 50s or early 60s, and she was 78 now). She also had history of irritable bowel disease and hiatal hernia which was diagnosed years ago. She said that she did not had any other recent vaccinations or started any new medications. However she takes high blood pressure pills and stomach medicines and a medication for her bowels. It was reported that she had cataract in Feb2021 for which she underwent cataract surgery on 18Feb2021 taking eye drops- Prolensa every morning for 1 and half week. On an unknown date in Feb2021, she was nauseated and had diarrhea. She says she got the shot 04Feb2021 then a few days later she had diarrhea. She mentioned that she was scheduled to get the second shot today i.e. 26Feb2021 Friday, and her son saw on tv some people can get diarrhea, which she did not know before. She said that she had not gotten a temperature, and her BP was fine. She mentioned that she had irritable bowel disease anyway, and usually when she has that it clears in a week. She says that she would like to know if it is safe for her to get the second shot. On an unknown date in Feb2021, she experienced nervousness and it will have repercussions. She said that her son said there was some program on TV that listed all those things, some that were not in the paperwork she got. She had been nauseated or had diarrhea, and she called before, and some people get diarrhea, and she was supposed to check and see if she should get second shot. The outcome of all the events was unknown. Caller mentioned that she called her provider, but they were not going to get back to her in an hour and a half before she would go to get the second dose. She says she got the first dose of the vaccine at (Pharmacy) and says that she thought her diarrhea was better and then it came back the day before yesterday. She mentioned that her vaccine card was handwritten, and she could not read</p>

have some swelling in my face and throat and there was sometimes that I was feeling a little dizzy here and there, so what I am worried about is, if I am going to not have the next vaccination because I am scared of the disease too. That's why I called. When paraphrased the concern, consumer stated, Yes and now the swelling that I had was on my soft palate and my uvula. It started tingling and then I did have some swelling there and on my face, I have rosacea and, so was having the flare up with my rosacea anyway, and that made all the areas that I had the redness of rosacea really pop-up red and then my lips were just slightly swollen and it was a little swollen around my nose and around my eyes and the dizziness it was just here and there, it was not anything big but this is a kind of reaction that I have, the thing the soft palate of my throat I have had that before when I had eaten eat something yeast and something like that, so I do not know is the shot may be have yeast so but I have not had that kind of slight swelling there on my face before, that's what I called. When probed for other Medical condition, consumer stated, I actually have allergies, they were pretty bizarre (not clarified) and Allergist calls me his special patient and I have food intolerances, so that's, the things right they are a lot of them. The thing that has calls me the most trouble is yeast. It does not matter if it is baker's yeast or brewer's yeast or yeast extract and I have unusual one like spaghetti squash and hybrid pumpkin, the spaghetti squash was the pumpkin and having that spaghetti squash in the hybrid pumpkin mainly react to it. In response to other medical condition, consumer stated, "There are other medication, I do have some other health conditions, I have Hypermobility in my joints, and I have a lot of "weird" (not clarified) things that I had like surgeries for different thing too but the main, and I am considered insulin resistance and I have had reactive low blood sugar at a time. Shot at 09:45 on 13Mar2021, experienced Soft palate tingling then swelling including uvula (area tender from swelling), mild swelling around nose, eyes and lips (areas feel tight sort of burn), intermittent mild dizziness. Redness on rosacea area. Benadryl -1 at 10:30, 1 at 11am, 2 at 2:41pm experienced headache (pain, pressure) at 01:45, Advil -1 at 07:45 experienced face flushed/hot feeling. Benadryl was self-administered as treatment. No covid prior vaccination and the patient was not tested for covid

1329428	5/19/2021	VA	60	F	4/15/2021	4/16/2021	<p>Numbness; Headache; Dizziness; extreme fatigue; muscle aches; she saw white flashes in front of the eyes; She got some bumps that are itchy on the ankle; Bell's palsy; facial paralysis; Lyme disease/had a bunch a symptom and flare up; Lyme disease/had a bunch a symptom and flare up; This is a spontaneous report from a contactable consumer (patient). A 60-year-old female patient received first dose bnt162b2 (BNT162B2), via an unspecified route of administration, administered in Arm Left on 15Apr2021 12:00 (Batch/Lot Number: EW0158) at single dose for COVID-19 immunisation. Medical history included High Blood pressure, Chronic Lyme's Disease, Rocky mountain spotted fever, Psoriasis. She had Bells Palsy with her Lyme's disease 15 years ago. She also added that she was diagnosed about a year with rocky mountain spotted fever. Lyme's disease and rocky mountain spotted fever are both tick born diseases. She also had Bells palsy with the rocky mountain spotted fever. She had mild psoriasis, once a year she got little spots on both arms little patches of skin that were scaly, other then shots been. Concomitant medications included routine blood pressure medication .Patient stated she reported the side effects to the nurse on the other line. she wanted to know if you have information on the vaccine given to individual with Lyme disease. she received the first shot of the Pfizer COVID-19 shot on 15Apr2021. she had a bunch a symptom and flare up. she had facial paralysis which began 24 hours after receiving the vaccine. she worried about getting my second shot. Patient also wanted some clarification on the reported Bell palsy post vaccination. Patient stated that she was calling about the covid vaccine, she had had chronic Lyme disease for a long time and when she got the vaccine it triggered a lot of old symptoms. She was trying to call doctor and health department. She was scheduled for the second dose on this coming Monday 03May2021. She wanted to question if there was research on people with Lyme's diseased. The symptoms she experienced was bells palsy, noticeable numbness in lips to nose to cheeks that occurred about an hour and a half after shot, the bells ballsy was in the center of her face clarifying on both sides of the face. She spoke for a living and her face went numb that didn't make sense. She also still had a headache for 2 weeks every day, she saw white flashes in front of the eyes, some dizziness,</p>

1329434	5/19/2021	PA	84	M	4/15/2021	4/1/2021	Vision changes in right eye/vision complications/getting a dark spot in the bottom part of the vision of his right eye; loss of his peripheral vision; the peripheral vision in his right eye was getting cloudy/eyes go in and out of focus while reading; his vision was getting a little worse; This is a spontaneous report from a contactable 84-year-old retired pharmacist (patient). An 84-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; solution for injection; Lot Number: EW0164) via an unspecified route of administration on an 15Apr2021 at 12:00 (at the age of 84-years-old) as a single dose in the right arm for COVID-19 immunisation. Medical history included ongoing prostate problems from an unspecified date (for probably 15 years), ongoing high blood pressure from an unspecified date (diagnosed with high blood pressure 12-15 years ago), ongoing high cholesterol from an unspecified date (he cannot remember when he was diagnosed with high cholesterol. His cholesterol has been great, since he had been taking cholesterol medications, he has had normal cholesterol. He thought his total cholesterol last time was 170 and that his triglycerides were low), blood pressure from an unspecified date and unspecified if ongoing, heartburn from an unspecified date and unspecified if ongoing and eye problems from an unspecified date and ongoing. The patient did not have a history of adverse events following prior vaccinations. Family medical history relevant to the adverse event was reported as the patient's sister had eye problems. She had to get an injection in her eye every couple of weeks or once a month or something. He did not know if his sister had macular degeneration or what. Other than wearing eye glasses, that was the only family history that he could think of that might be relevant. Concomitant medications included morniflumate (FLOMAX; capsule) taken for prostate from an unspecified date and ongoing at 1 DF 2x/day (8-10 years ago, started with 1 capsule daily but now took 1 capsule twice daily; the patient reported that at his last report, his PSA was up to 9 and it was now down to 3.1); finasteride (PROSCAR) taken for prostate from an unspecified date and ongoing; hydrochlorothiazide/lisinopril (LISINOPRIL + HIDROCLOROTIAZIDA) taken for an unspecified indication from an unspecified date and ongoing (for quite a long time); omeprazole (PRILOSEC) taken for

----------	-------	-------	---------	-----	----------	------------	--------------

heartburn from an unspecified date and ongoing, as needed (if the patient knew that he was going to have something spicy or tomato based for dinner, he knew he would get heartburn, so he would take a Prilosec in the morning. He had used Prilosec for years off and on, since he was working as a pharmacist and he retired in 2013) and atorvastatin calcium taken for cholesterol from an unspecified date and ongoing (for about a year; he was changed from Zocor because the medication did not get along with his blood pressure sometimes). The patient previously received zocor on an unspecified date for an unspecified indication and experienced did not get along with his blood pressure sometimes. The patient did not receive additional vaccines on the same date or within 4 weeks prior to the COVID-19 vaccine. The patient received the flu (INFLUENZA VACCINE), pneumonia (PNEUMOCOCCAL VACCINE) and shingles (VARICELLA ZOSTER VACCINE) vaccines all at the end of 2020 (at the age of 84-years-old) for immunization. The patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; solution for injection; Lot Number: EB8730) via an unspecified route of administration on an 25Mar2021 (at the age of 84-years-old) as a single dose in the left arm for COVID-19 immunisation. In Apr2021 the patient experienced vision changes in right eye/vision complications/getting a dark spot in the bottom part of the vision of his right eye, loss of his peripheral vision, the peripheral vision in his right eye was getting cloudy/eyes go in and out of focus while reading and his vision was getting a little worse. The clinical course was reported as follows: The patient was a retired pharmacist who called to find out whether there had been any reports of vision complications after the COVID-19 vaccine. He received the second dose of the COVID-19 vaccine on 15Apr2021 and as of about 2 weeks ago, the peripheral vision in his right eye was getting cloudy and the patient was getting a dark spot in the bottom part of the vision of his right eye. He did not know if Pfizer had any types of reports on that type of side effect. He made an appointment with his eye doctor for tomorrow, 04May2021. He wanted to have any information that Pfizer might have. He knew that his eye doctor was going to ask him questions to try to determine what was causing the vision changes. He wanted to check with Pfizer before he went to the eye doctor so that

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

he had an answer to the doctor's questions. The patient reported that his vision was getting a little worse. He was now having a little trouble with the computer. He had to refocus every time he moved his eyes. Yesterday, 02May2021, he had what could have been a problem driving. He was driving on the highway and there was a lighted sign. He could not read the sign because it was on the right side of the road. By the time he could focus on the sign, he could not read it because he was right by the sign. Something like that could be a big problem. He reported that his eyes go in and out of focus while reading. He had to re-focus when he was going to the next line of text that he was reading. He just got an eye exam and new glasses in Feb2021. His problem in Feb2021 was with focus. He was having problems more or less with reading. In the bright light, everything was fine, but that in regular kitchen or incandescent light, he would only be able to read a paragraph or so. He would then have to refocus in order to read more. It became a real problem and the new glasses that he got were not solving it. The patient stated that the last Pfizer representative he spoke with said that Pfizer did not have any vision changes listed as a side effect of the COVID-19 vaccine that the representative knew of. The Pfizer representative informed the caller that there may have been calls that have come in reporting vision changes, but vision changes were not listed as a side effect yet. The patient stated that he saw about 5 doctors. His primary care physician did not know about the vision changes as the changes had just occurred in the last 2 weeks. The patient had absolutely no reaction to either dose of the COVID-19 vaccine. He did not even have a sore arm following the COVID-19 vaccine injections. The vision changes started about 2 weeks ago and he wanted to wait to see if it was going to clear up before he made appointments with his physicians. He reported that his vision did not clear up and that he was now getting concerned, especially with driving. The adverse events required a visit to the physician office. The clinical outcomes of the events vision changes in right eye/vision complications/getting a dark spot in the bottom part of the vision of his right eye, loss of his peripheral vision, the peripheral vision in his right eye was getting cloudy/eyes go in and out of focus while reading and his vision was getting a little worse were not recovered/not resolved.

1330974	5/19/2021		14	M	5/19/2021	5/19/2021	Dizziness, sweaty, blurred vision approx 2 mins after getting vaccine. Brought over to medical. Patient was alert, pale and diaphoretic. Patient was given water, crackers, alert and talkative, feeling much better. Patient sent home Past Medical Hx Had presyncope episodes with vaccine/blood draws in the past No recent illness and ate today
1330996	5/19/2021	TX	13	F	5/15/2021	5/19/2021	Patient developed changes in her vision that she reported as black dots on the left side of her vision that lasted roughly 2 minutes. She said she could not see out to the left side of her eye. This went away after 2 minutes and within 20-30 minutes she developed a severe headache and was in tears from the pain. She has no history of headaches and this has never happened before. She did not report light or sound sensitivity. She did not have any vomiting, but did not want to eat. We consulted her Optometrist and Pediatrician. I gave her Naproxen and caffeine and within 3 hours her headache resolved.
1330998	5/19/2021	IA	58	F	5/19/2021	5/19/2021	Patient felt lightheaded after receiving vaccination, upon standing, lightheaded ness increased. She sat down and we propped up her feet and gave her water. She then began to tremor and her arms were twitching. Her eyes rolled back in her head and she was unresponsive to questions, but breathing was normal. With fanning and cold compress she recovered and EMS did not need to be called. The time of vaccination to recovery was about 5 minutes total.

1331015	5/19/2021	CT	37	F	4/10/2021	4/26/2021	I started experiencing skin rash in face and flushing about two weeks after the vaccine about three times and had to take a Benadryl each time for the reaction even while being on Zyrtec on a regular basis. I started having under eye puffiness and body rashes right after these reactions that didn't go away even with regular allergy medication. I then started having a reaction similar to a nut allergy even though I ate something I made at home that had no nuts. I had some swelling on the right side of my face and eye. I also had some minor lip swelling and itching along with throat tightness. I had to take a Benadryl as well with this reaction. I have experienced episodes of this type everyday after eating or just in general and I'm on a high histamine regimen as prescribed by the doctor. I was placed on steroids Prednisone for three days with no results after that. I have episodes where I feel my throat swelled and tightness along with itchy swelled lips, nasal pressure and itchy body. I'm still taking the his histamines as prescribed and Benadryl when the bad reactions occur. I have a epi pen.

1331046	5/19/2021	CA	13	F	5/19/2021	5/19/2021	On 5/19/2021 client received her first dose of the Pfizer Covid-19 Vaccine (lot #EW0185, expiration 08/2022) at 12:42. Client was found sitting upright in her chair with her mother and appeared melancholy. Client was a 13-year-old female, alert and tracking with her eyes. Client had a chief complaint of headache at 12:48. EMT and RN responded. Client stated that she began to have a headache a few minutes after her observation had begun. This was the client's first dose of the Pfizer vaccine. Client's mother did not report any allergies or medical history. Assessment revealed no hives, rash, discoloration, shortness of breath or other signs of anaphylaxis. Client described a generalized headache with dizziness and stated that she had eaten breakfast this morning. Airway, breathing and circulation were intact. Client denied pain throughout the rest of her body. Vitals at 12:52 were blood pressure 122/74, pulse 84, respirations 18, O2 100% on room air, temperature 97.6*f, lung sounds clear bilaterally, and client was alert and oriented to person, place, date and time. Client's mother consented to allowing the client to lie down for 15 extra minutes but refused to remain for the entire 30-minute additional observation. Client's mother was instructed to seek emergency care or medical attention if condition becomes severe after leaving vaccination site. Client's final vitals were consistent at 13:07: blood pressure 118/78, pulse 84, O2 100% and respirations 18. Client's mother was provided with all vaccine related information and acknowledged that she already knew what signs and symptoms to look for as she was already vaccinated as well. departed facility with her mother at 13:07 with client's mother stating "I have another appointment.~~

1331290	5/19/2021	PA	23	F	5/19/2021	5/19/2021	Patient was very nervous about getting the covid vaccine. She sat for 15 minutes and after about 8 minutes she said she thought she was having a panic attack and felt hot. Tech administered vaccine and sat with her the whole wait time since she was nervous. Held an ice pack on her neck when she stated she felt hot. The 15 minute timer went off and she still felt nervous so she continued to sit. Rph also was present once the ice pack was given. She had a dry heave at about 12 minutes. After 20 minutes we moved her to the floor she said she was seeing light flashes. She was sweaty and hot. BP was taken at 420pm 162/109 and 98 pulse. Asked pt if we could call an ambulance, she felt she didn't need one. We got lead from Division 1, also suggested an ambulance and this time pt said ok. Now BP taken was 157/109 and pulse 108. Patient felt a dry heave and we put her on her side. Ambulance arrived and put pt on a stretcher.
1331267	5/19/2021	WI	19	M	5/19/2021	5/19/2021	Immediately after sitting down in the waiting area after receiving the shot, the pt reported feeling a strange pressure in their arm. Following this, the patient described the sensation of "blacking out". The pt fell off their chair and lacked alert consciousness for roughly five seconds. When the pt came to, they appeared confused and twitchy, with wide eyes and an overall appearance of shock. Pt remained in their state for roughly a minute, before stating that they felt completely better. The pt had developed a sweaty back but didn't state that they felt overally hot. They didn't mention being in any pain. The local injection site appeared a bit red but nothing of significant note. Pt did bump their head on the side wall behind the chair, receiving a minor bruise. Pt was given some water to drink and was monitored for 30 minutes. They pt stated they felt fine. They had no past history of fainting with vaccines, thought pt claimed to have passed out like this before but only after suffering a head injury. After their wait, the pt was allowed to leave and assured us that they felt completely fine.

1332217	5/19/2021	OK	15	F	5/18/2021	5/18/2021	First symptom was dizziness and nausea. Then, immediately began sweating profusely . Then began seeing spots that distorted her vision. Immediate pain in the ears, which felt as is the ears were very swollen and inflamed. It was difficult to talk because talking caused pain in the ears. Severe headache. Obviously her anxiety level escalated. We immediately found wet paper towels to place on her forehead and back of the neck to cool her. I found a hair tie and tied her hair up off her neck to keep her as cool as possible. She was sweating so much she soaked her t-shirt and was pouring sweat down her face, neck and body. We also moved patient from the chair, and placed her on the floor of the pharmacy, leaning against the wall with her legs stretched out. As a type 1 diabetic, the obvious concern was blood sugar during this reaction. Patient wears an insulin pump and Dexcom continuous glucose monitor. I was able to read her blood sugar levels during all the reaction time. Her blood sugar level spiked up. It then began to drop after a few minutes. I had an apple juice, and gave her the 15 carb apple juice.
1331735	5/19/2021	CA	15	F	5/19/2021	5/19/2021	Pt received vaccine with mother present at 1419, c/o dizziness, lightheadedness, blurry vision, difficulty hearing, at 1439. Pt states she did not eat lunch. Nursing team intervened by taking vitals, placing wet towel on forehead, lying pt in supine position with legs elevated. Pt VS stable, pulse in 80s, BP(120s/80s), 99% on RA, RR 16-18, no respiratory distress, no s/sx anaphylaxis. Pt states she did not eat lunch. Gatorade offered to pt. Dizziness improves in supine position but returns upon sitting. At 1532 pt states she has facial numbness. EMS called at 1535. EMS arrived at 1557 and assessed pt. Pt?s BG is 93, VS stable. Pt reports feeling dazed, unable to focus, blurry vision and difficulty hearing. At 1602 EMS informed pt that they will take her to Medical Center, pt immediately got agitated and started crying and hyperventilating. 1604 pt stated she had difficulty breathing and a light localized rash began to appear on her chest. 1605 EMS transported pt. Pt?s mother to follow.

1331797	5/19/2021	IL	18	F	5/19/2021	5/19/2021	Patient experienced sharp ear pain, tunnel vision, numbness of the hands and face, muscle tensing and shaking, and mild seizure like behavior (she was unresponsive for 5 seconds and then came back to responsiveness) starting 2 hours after her vaccine. She was taken by ambulance to the ER.
1331823	5/19/2021	IL	17	F	5/19/2021	5/19/2021	Patient was waiting in the waiting area for 6 minutes after getting the pfizer covid vaccine when she started to feel like she was going to faint. Her mom was with her. Her mom had already given her a snack when I was notified. Pt stated her vision was blurry and her hearing was "like she was in a tunnel". She was feeling cold and was feeling scared of that feeling. I asked if I could apply a cold pack and asked her to rest the back of her head against the wall and to close her eyes. I applied the cold pack to her forehead and observed her. She started to sweat and was calmer. She was feeling better and her hearing and vision was back to normal. I had her wait for a total of 30 minutes and had my technician stay with her at that time. She was feeling better and I asked her mom to hang on to her while walking to their car. I followed up with the patient 4 hours later and she was doing well. She said she was feeling well and her arm was not even sore just some fatigue.
1332231	5/19/2021	CO	29	F	5/19/2021	5/19/2021	PATIENT PASSED OUT WITH EYES OPEN. SHE COULDN'T SEE ANYTHING FOR A FEW SECONDS. SHE CAME TO AND THEN ABOUT A MINUTE LATER, IT HAPPENED AGAIN. SHE WAS COMPLETELY PALE BUT CAME TO WITHIN A COUPLE OF SECONDS AND THEN FELT BETTER. WE DID CALL PARAMEDICS, WHO CHECKED HER HEART RATE AND BLOOD SUGAR. THEY DID NOT TRANSPORT HER.
1331181	5/19/2021	CA	16	M	5/18/2021	5/19/2021	Around 1:30 am my son complained of his eye feeling swollen and tight. his right eye was completely swollen and closed. I gave him Benadryl and ibuprofen and water and he went back to bed. Woke up 12 hrs later with a less swollen but still swelled eye and blurred vision. Complained the left side of his face felt numb. Was extremely groggy and tired.

1330102	5/19/2021	MN	12	F	5/18/2021	5/18/2021	<p>Patient at the clinic for their first COVID-19 Pfizer vaccine today. Patient, sister and their mother were scheduling their second dose appointment when the writer heard a "thump" on the ground. The writer turned around to see the patient laying on the ground underneath a chair on her stomach with her eyes closed and not responding to voice command at approximately 1520. The writer and another nurse immediately rolled the patient to her side, a nurse moved the patient's hair from her face and the patient began to open her eyes. Patient began to become alert after less than 30 seconds of the episode. Patient remained laying down for approximately 2 minutes and stated she was embarrassed. Patient began responding to verbal commands and questions. Patient then began to go from a sitting and then to a standing position. Patient and her family escorted to the recovery room and assessed, refusing wheelchair transport. Patient's mother stated no history of this adverse event previously. Vitals taken x2 (See flow sheet). Nurses performed a head-to-toe focused assessment. Patient A &amp; O to person, place, and time. Pupils equal and reactive to light. Patient asked "what day is it" and responded "The 18th." Patient asked "where do you go to school" and responded appropriately with school location. Patient asked "what is your mom's name" and responded. Patient asked "what is your name" and patient responded with her name. Patient asked "how old are you" and responded "12." Nurse assessed the back and both sides of the patient's head and witnessed no bumps, bleeding, or swelling. Nurse noted redness and slight swelling on the right eyebrow approximately an inch in length. No laceration or bleeding noted. The patient's mother touched the site and the patient stated that it hurt. Nurse advised the patient to place an ice pack on the site and the patient declined. Patient denies any neck pain, headache, nausea, dizziness, lightheadedness, or trouble breathing. Patient skin warm and pink. Nurse offered ice, animal crackers, and juice and patient declined. Nurse offered EMS evaluation to patient mother and the patient's mother declined. Patient's mother and the patient educated on the s/s of a head injury and allergic reaction and instructed to call 911 or go to the nearest ER. Patient and mother also instructed to follow up with a PCP and inform them of today's episode at their next visit. The patient and the patient's</p>

1330478	5/19/2021	FL	78	M	5/19/2021	5/19/2021	First pt of the day was given an expired vaccine that was ?found? in a cooler. RN assumed that the doses were from the first draw of the day, even though she did not visualize the Clinical Lead bring in the first draw of the day. After the pt was vaccinated did the Clinical Lead realize that there were vaccines in a cooler that were expired from an unknown date and time. Incident Command was informed and, Field Lead, was informed. Per RN Field Clinical Director via phone, Pt was informed of the incident and that the pt was vaccinated with an expired vaccine and that we are in contact with our Medical Director to figure out what the next step will be. Dr called and informed us to go ahead and revaccinate the pt after she communicated with the pt and made sure that the pt understood what was happening. Pt was revaccinated and placed in observation. Pt left observation without further incident. V/S, BP:140/78, HR: 84, SPO2: 96% 2nd set of vitals BP: 138/78, HR: 84, SPO2: 96%
1330891	5/19/2021	MI	56	F	3/18/2021	3/18/2021	Began experiencing throbbing pain about 15 min after the injection that radiated down the entirety of the arm along with a headache and tunnel vision. The headache dissipated about 4 hours later and the tunnel vision dissipated about 30 min later. The pain and throbbing the arm lessen but the days to follow I did notice a loss of strength to my forearm as with as the tricep and bicep although there was no swelling on the injection site. The days to follow I applied heat, cbc, to try and heal alleviate the discomfort but have yet to fully gain the strength back in my arm. Some days are worse then others. About 2 weeks after the injection I began experiencing SOB and pain around my upper (r) ribcage, and shoulder.

1330904	5/19/2021	NJ	26	F	5/18/2021	5/19/2021	At 10pm on 5/18/2021 I started having side effects, 9 hours after vaccination. My face and ears were hot and my body was cold, I felt very fatigued. I took Tylenol before bed and woke up in the middle of the night drenched in sweat. I woke up officially at 8am and felt my face and eyes were swollen, I also had chest tightness. I looked in the mirror and it looks like I was punched in the face. My left eye (the side I was vaccinated) is significantly more swollen than my right side. Since 8am, the swelling and puffiness hasn't gone down in my face, however, the chest tightness went away. I took Benadryl. It is now almost 4pm on 5/19/2021 and I still have the same amount of swelling and puffiness in my face. It's extreme enough that I can't go out in public like this or else someone will think I got beat up. There isn't any bruising, rather, under each eye there are very prominent dark circles with almost a reddish tint. It seems like this possibly could be an allergic reaction but after reading online it seems like allergic reactions would have happened right after vaccine. I noticed this side effect 19 hours after vaccination when I woke up on 5/19/2021. If it's not better when I wake up tomorrow on 05/20/2021 I will go to urgent care.
1330716	5/19/2021	PA	14	M	5/18/2021	5/18/2021	Time to onset: 6 hours. Patient developed full body hives, severe congestion, lip, tongue, throat, and eye swelling. Wheezing. Difficulty swallowing. Treated with Claritin 20 mg po, Benadryl 25 mg po, albuterol inhaler 2 puffs, prednisone 50 mg po, and Asmanex 2 puffs. Within 1 hour hives and lip swelling began to resolve. 1 hr after taking prednisone, tongue and eye swelling resolving. As of 740 am on 5/19/21, hives resolved. Only continuing sx was mild throat swelling sensation.
1330687	5/19/2021	NM	40	F	5/14/2021	5/15/2021	The day after my Covid vaccine May 15, 2021, the pupil in my right eye was constricted compare to my left pupil which was fully dilated in direct light. The day after that, May 16, 2021, my pupil was back to normal.

1330667	5/19/2021	OH	52	F	3/6/2021	3/7/2021	14 hrs after injection I was freezing, three hrs later I was burning up this was at 3am, 4am still burning up and not able to sleep, 5am sat up and had a headache that was at least a ten on the pain scale, I went down our flight of stairs to get water and ibuprofen, I had to sit down before I could get the water, when I finally got up I went to the counter and was getting this stuff out and I started to sway and white spread across my field of vision and I grabbed for the counter to lower my self down and passed out before I could grab the counter, I laid there burning up and with a headache that was killing me. I finally got the water and 800mg of ibuprofen went back to bed and slept until 11am, got up no headache but since then I have been experiencing hot flashes daily the rest of March and into April a few in May. I realize that I am of the age to experience hot flashes heading into menopause but this was to coincidental and I had never had hot flashes before.
1330631	5/19/2021	WI	20	M	4/13/2021	4/20/2021	Pt is an otherwise healthy 20 year old male who presents with 2 weeks of blurred vision in R eye. The blurry vision developed suddenly 1 week after getting 1st dose of covid vaccine (moderna). He was seen in ophthalmology clinic on 04/29 and diagnosed with R optic neuritis; The patient reports that his blurred vision has not improved or worsened since onset. It affects both his near and far vision in the right eye only. He denies double vision, eye pain, headaches, nausea, vomiting, numbness, tingling, or weakness. This has never happened before. No recent illness including fever, chills, runny nose, cough, or sore throat. Pt admitted to hospital. Etiology of his optic neuritis is unclear, but possibility include demyelinating etiology (like clinically isolated syndrome). Infectious etiology was thought to be unlikely given no signs/symptoms of infection and reassuring lab workup. No family history of similar symptoms reported, making hereditary optic neuritis less likely. Other considerations included other primary ophthalmological disease, although otherwise reassuring ophthalmological exam makes that less likely. Unclear association with COVID vaccination.

1326742	5/18/2021	VA	61	M	3/8/2021	3/9/2021	The day after the vaccine I was working and later in the day I started to feel dizzy. Within an hour and a half I could not stand up and I was very dizzy. My coworkers said my eyes rolled back in my head. The ambulance transported me to the ER and my Blood Pressure was at 80 Systolic. I was given fluids and I was discharged after five hours. I still couldn't work the next day and I was still really tired for the rest of the week. It seemed to take a couple of weeks to feel normal but the fatigue was extreme for the first week after the episode of dizziness. I have two autoimmune diseases and a history of blood clots so I might not have gotten the Janssen vaccine if the risk was known. The blood thinner I was taking at the time might have helped but my blood pressure on discharge was still only 110/60.
1326748	5/18/2021	TX	68	M	2/20/2021	2/20/2021	I had double vision. Ejection fraction was at 40-40% at the doctor in August of 2020. Mid February I went into the hospital with the double vision. No treatment was given, just a change in medication for the ejection fraction. I was told to go home and it should clear up on it's own.
1326806	5/18/2021	NJ	38	F	5/13/2021	5/16/2021	A few days after my shot I began the most painful heavy period ive ever experienced. Extreme cramping lasting 2 days and extremely heavy flow. Normally my periods are light and last only a day or two due to my birth control which ive been on for 2 years. I am also still experiencing extreme fatigue 5 days after receiving my first dose and a throbbing localized pain in one part on the left side of my forehead making it hard to keep my eyes open.
1326830	5/18/2021	IN	57	M	5/12/2021	5/13/2021	blood shot eyes
1326551	5/18/2021	FL	63	M	5/18/2021	5/18/2021	Patient did not have any reaction to first dose of Moderna vaccine. After second dose he started to feel dizzy and had tingling effect on eyes, facial area , right arm . Also he lost his balance and fell from chair while waiting in post vaccination area after vaccination. Patient was given Benadryl and monitored for while . He felt better after 30 minutes but not completely. Patient refused to call 911. I also called him in the afternoon and he stated he still has tingling effect but he is getting better. I called doctor's office and spoke with nurse and informed her about adverse reaction.

1326508	5/18/2021	CA	24	F	5/7/2021	5/13/2021	I had a hives outbreak three nights in a row all over my body. I've never had that happen to me, I've never been allergic to anything except spring seasonal allergies that are mostly post nasal drip and dry eyes. It got worse and worse over time and on the third night after eating Thai food which I always eat, my face started to swell and I went to the ER. I'm taking a steroid and Benadryl now.
1326837	5/18/2021	IL	16	M	5/18/2021	5/18/2021	Patient started feeling dizzy about 5 minutes after injection. Was seated and lost consciousness for a couple seconds and popped back awake. Patient complained of nausea, dizziness and vision disturbance. No SOB or wheezing and no hives. Paramedics were called and patient was starting to feel better upon arrival of paramedics. Patients blood pressure was low 90/50, and vision still not normal. Paramedics recommended taking patient to hospital. Patient mom, consented and patient was taken to the hospital.
1326479	5/18/2021	MD	25	M	5/18/2021	5/18/2021	Pt, reported having blurry vision and dizziness denies SOB, dyspnea or itchiness and was instructed to put head down and encouraged to drink water and pt has no other co-morbidities but stated he was nervous to first dose, after a few minutes pt felt better and symptoms subsided. instructed to finish 15 min observation time and to notify team if symptoms return or worsen.

1326170	5/18/2021	LA	63	F	4/14/2021	4/28/2021	D Dimer was high; Chest tightness; blood clots in the lungs; This is a spontaneous report from a contactable consumer. A 63-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), dose 2 via an unspecified route of administration, administered in Arm Right on 14Apr2021 10:30 (Lot Number: ER2613) as SINGLE DOSE for covid-19 immunization. Medical history included ongoing retinal tear from an unknown date (long ago, maybe 2005), Blood pressure, anxiety, reflux, irritable bowel syndrome, eye care. Three years ago, patient had a blood clot on the portal vein. She was treated with Eliquis, referring to Apixaban, for six months. Then they went into the D Dimer and found out she only had one gene for the blood clots, so they discontinued Eliquis, referring to Apixaban. The doctor said the protocol didn't call for it because she only had one gene. Eliquis, referring to Apixaban, was discontinued a year and half ago. The reporter mentioned the specifically didn't get the Johnson and Johnson shot due to blood clots. Family History included that her mother and sister had blood clots in the past unrelated to the vaccine, anxiety which her mom has. Concomitant medications included ramipril taken for blood pressure from an unspecified start date (for five to ten years) and ongoing; ongoing omeprazole taken for reflux; fluoxetine taken for anxiety (for what her mom has) taking for three years and ongoing; linacotide (LINZESS) taken for irritable bowel syndrome taking for 3 year and ongoing; magnesium sulfate taken for eye care taking for 3 year and ongoing; latanoprost taken for retinal tear from 2005 and ongoing. Prior Vaccinations (within 4 weeks) was none. The patient previously received the first dose of the Pfizer COVID 19 vaccine on 26MAR2021 at 1000AM in the right upper arm (Lot number for first dose is ER8732; expiration date 31Jul2021). Last Wednesday she started to have tightness in her chest so they called an ambulance. She was admitted to the hospital 28Apr2021 and was discharged Saturday 01May2021. In the hospital they did a CT and it came out that she had bilateral blood clots in the lungs; the doctor said it was a shower of blood clots in the lungs, small enough not to occlude anything. They treated with a 72 hour heparin drip. They didn't do any more CT but they did put her on Eliquis, referring to Apixaban, for the rest of her life. For the Eliquis he

1326946	5/18/2021	ID	55	F	4/8/2021	4/10/2021	She got her vaccine, nothing happened. The next day she experienced extreme fatigue . She took the day off and slept all day. Then everything was fine for a day or two. Then she woke up on 4/10/21 and started getting slight rash across the face, and then by 4/12/21 in the morning inflammation started in her eyes and face and progressed each morning and has never subsided, and today is 5/18/21. There may be limited inflammation but always has the redness like a sunburn. She woke up this morning to inflammation in her eyes, tear duct area, and then bags under her eyes due to the inflammation, extending and extruding back and forth with stretchy skin and looks terrible. She went on 4/23/21 and saw physician who prescribed prednisone. She took it incorrectly for one week only taking 1 a day instead of one three times a day, and then had to get prescribed again a week and a half later and took it correctly. The 2nd time when she took it it seemed to have subsided the reaction, but it came back. On 5/15/21 around 2:00 she started getting inflammation and redness and it progressed badly throughout the day and into the evening. Now it's on a rampage and it reacts daily and she has pictures of what she looks like. Since this morning it was kind of swollen and now it's protruding and now has inflammation in her eyes and eye bag area.

1328261	5/18/2021	TX	14	F	5/18/2021	5/18/2021	immediately after the injection, pt appeared to have fainted, eyes closed, still breathing, body stiffed and jerked for a brief moment then became slouchy on the chair. we called 911 - as we waited for ems, pt opened eyes, said very sleepy, i kept her awake by taking about greys anatomy - ems arrived - mom wanted pt to be monitored at a facility - ems took pt away on stretcher.
1328231	5/18/2021	FL	46	F	3/19/2021	4/2/2021	Left eye started going crossed/turning towards nose on first day of side effects. Next day, both eyes would cross/turn into nose at different times through out the day. Called Neurologist, office stated to go to ER at Hospital to have an MRI. Was admitted to hospital. Ran multiple tests, CT and MRI. NO new lesions on MRI from MS. Doctor stated possible Myasthenia Gravis (MG). Appointment with Dr at Institute. Doctor did not agree with this was MG. Suggested botox injections into eye muscle. No relief from eyes crossed after 3 weeks. Dr stated possible Myasthenia Gravis after first stating he doesn't believe it to be that. Started Pyridostigmine to combat MG on 5/7 at half dose. No relief. after 1 week. Dr increased to full dose 5/14. No relief as of 5/18
1328059	5/18/2021	TX	12	M	5/18/2021	5/18/2021	Patient appear to have a mild seizure (faint, stiffness on the arm that got the vaccine injection, eye rolled) about less than 5 seconds. Patient became fully awake as being put to laying down on the floor. Patient was able to answer to all questions was asked. Patient stated that he was nervous and scared of getting the vaccine. Patient's mother stated that he had fainting history of seeing cut or bleeding. The event occur 30 seconds after received that vaccine.
1328024	5/18/2021	NY	15	F	5/18/2021	5/18/2021	Dizzy, displayed pupil, heart rate, pale with blue around eyes and fingers. No epi pen given as patient wasn't too short of breath and came out of it quickly. 911 was called

1328020	5/18/2021	WA	14	F	5/14/2021	5/16/2021	Vomiting second day morning followed by rash on face around eyes. Rash subsiding but left eye has blood hemorrhage ( blood shot eye). 24 hrs later second eye also blood shot. Tightness of chest also started third day but now improving. No discharge from eye, no discomfort as of now.
1328014	5/18/2021	MD	13	M	5/18/2021	5/18/2021	Patient began feeling lightheaded, describes fuzzy vision and feeling tired about 2mins after vaccination. He requested to lie down. Appeared pale. Assisted to cot by medical staff. Vital signs checked within normal limits. He began to feel better after 5mins. Accompanied by mother who drove him home after 30mins observation.
1327983	5/18/2021	MO	16	F	5/18/2021	5/18/2021	Right after receiving Pfizer Covid-19 vaccine, patient began to feel queasy. I asked her whether she had eaten recently and she said she hadn't. Her eyes rolled back and up then her head fell backward. I supported her head and her dad was checking her for awareness. I gave her a bottle of water and she drank some of it. She indicated that her vision was still not accurate. Her dad brought her a candy bar and she ate the majority of it and drank the majority of the contents of the water bottle. We gave her a few more minutes to feel comfortable then I asked whether she was ready to stand up. She was not. We gave her a bag of chips and she ate some and finished the water bottle. After a few more minutes, she stood up and was able to walk without assistance. Her father indicated that she had an incident like this before, but patient did not remember the previous incident.
1327803	5/18/2021	AR	14	F	5/13/2021	5/14/2021	Patient states she received the COVID vaccine on 5/13/2021 at 4:00pm, on 5/14/2021 around 10:30am or 11:00am patient started to have dilated eyes, hands froze and where purple with white Raynaud's, stuttering, twitching of the left eye. Patient is still having left eye twitching but other symptoms are better.

1327489	5/18/2021	OH	50	F	3/1/2021	3/20/2021	Hello, I received the J&J vaccine on 3/12/2021. Eight days later on the 20th when I went to bed I had a lot of pain in my left heel and left thumb. The next day, on a Sunday, the pain was now in my left heel, left thumb at the big knuckle and top and bottom below my thumb, and just behind the inside of my left ankle, and I had a terrible headache. I was unable to grasp anything or widen my grip because the pain was so intense in my thumb. It was so bad I went to my local ER who did xrays and told me it was just osteoarthritis. The next day, Monday, the pain was terrible. It was in my left thumb, the middle of my left hand, left ankle, the arch of my left foot top and bottom, the big knuckle at the bottom of my left big toe, my right hand was also now hurting at my middle finger the big knuckle at the bottom. I went to see my family doctor who really was unsure at the time what was going on and said it's still just must be the osteoarthritis. The next day on Tuesday I still have the headache I was out unable to open my own water bottles or prescription bottles because the pain was so intense in my left hand. It was now extremely painful to walk on my left foot and I had no appetite. The following day on Wednesday the pain was bad and my right hand that I was unable to touch my ring finger or my pinky with my thumb. As hard as I try my thumb just would not reach those two fingers oh. I now couldn't open any of the doors in my house unless I use the base of my Palms on both hands turn the knob. I now couldn't even comb my own hair or pull my pants up wipe myself properly. I couldn't hold a pencil or anything because the pain was so unbearable. I had no appetite and now I have diarrhea. I called my husband at work and had him come home and we went to the emergency room because it was a bigger facility. The doctor there told me he thought it was something more like rheumatoid arthritis or lupus. This was by far my worst day even though I was unable to work this entire week. Oh and did I mention the only reason I got that back who was because my boss with bullying me and pressuring me every day to get the vaccine. He even went so far as to come of my office and he wanted to use my keyboard to schedule my vaccine himself. The next day on Thursday I was still having a hard time walking I still couldn't touch my ring finger on my pinky with my right hand still unable to open anything with either one of my hands. My husband had to open all the water bottles

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

and prescription bottles and just set the caps on them before he went to work. I now had flashing light in my eyes which lasted about a week. The following day I had all the same symptoms but now my left foot was so swollen I couldn't even get a shoe on it. The big knuckle at the base of my right hand hurts so bad at this point and so does the big knuckle at the base of my left thumb. The swelling and the pain is just unbearable at this point. The following day on Saturday my mom had come up from Florida and stay with me for two weeks take care of me someday the next day on March 28th I start all the same symptoms but now my muscles were quivering on the back of both thighs. By the middle of next week I still had all of the same pain and now I'm realizing that I can't span open my fingers on my right hand and I'm unable to snap my fingers. Side note as of today I still cannot snap my fingers on my right hand. At this point I have been keeping a diary every day of where my pain was in what the pain level was each day. So strange that it's affecting joints on both sides but just in my hands the inside of my wrist and my left foot. Are April 28th I finally got into the rheumatologist. He had me go to the hospital and get blood work done and x-rays. On Thursday May 6th I was unable to go to work. It seems like I can go to work about 3 days a week and the pain is so intense that I'm missing about two days a week. Dr called me and said all of my tests came negative for rheumatoid arthritis. He told me not just because I was a patient but if I was his own sister he would suggest going to the Clinic right away. He said they have a larger database and if anybody else was having the same reaction to the covid vaccine they would know about it. My husband came home from work and made the four-hour drive to the Clinic. I was there Thursday and Friday they the blood work a sonogram x-rays the whole gamut of tests. The rheumatologist in the ER said that he thinks it's still something like rheumatoid arthritis or lupus but that was in the early stages and not showing up positive on the test. On Friday I met with dr. a rheumatologist oh, and the chairman at the Clinic. They said this is a very rare reaction to the J&J vaccine and they're hopeful by prescribing me a non-steroidal anti-inflammatory and Voltaren gel that hopefully I will have some relief within a week and they were hopeful that the symptoms will go away within 3 months. They also took me off work for the next week. Did I mention got the first

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

month that was going on they have me on 50 mg of Prednisone for one week then 100 mg of Prednisone for 2 weeks and then back down to 50 mg for one week. After being on that high dosage of Prednisone for an entire month I still have all of the swelling and pain in my joints. My joints are very stiff at this point. The prednisone maybe eased the pain just a touch but the pain and swelling was definitely there, and the pain is excruciating. I'm feeling so alone, and scared because I don't know anybody else that's having the same reaction. I'm also fearful I'm going to lose my job I'm missing so much work. But I also feel like my boss pressured me into this and now I'm suffering. If anybody is having the same reactions to Johnson & Johnson vaccine please reach out to me. I have my vaccination card I can show you and I have a ton of doctor and hospital records to verify my story. I'm really worried because I'm not sure what's going on with me, how long it's going to last, and is it going to come back if I do get these symptoms to go away. My work place offers no paid extended leave, and has repeatedly asked me I'd I was quitting my job. I'm only having these problems because I was pressured and bullied into getting this vaccine. I completely blame my boss. I would have never got vaccinated if he wasn't on me about it every single day repeatedly. I'm at a loss as to what to do from here. I have no income coming in. Do I qualify for unemployment or some sort of disability benefits? If anybody can please give me some suggestions I'm open to whatever you have to say

BP, pulse, O2 sats were all normal. Initial BP - 118/78, pulse-84, O2 sat - 99%. No orthostasis at dismissal. Home with mother with precautionary instructions.
1322531	5/17/2021	NY	39	F	3/19/2021	3/28/2021	I was diagnosed by my neurologist with Guillain-Barre Syndrome. 9 days after my 2nd Pfizer shot (Sunday, March 28th), I felt tingling in my feet. On Monday night I felt tingling and pain in my feet, but I was sure it was passing and said nothing since the pain was manageable at a level 2/3. On Tuesday I was getting concerned. My feet were now tingling and in pain all day, and the pain had escalated to a level 5. On Wednesday I suddenly realized that my life could effectively be over soon. The pain was at a 7-8, and I could barely get through my day. My body felt like there were tiny needles shooting electricity into me, and it felt all-consuming. It was unrelenting, and I suddenly understood why the CEO (a COVID survivor) killed himself after suffering through constant ringing in his ears. It became CRYSTAL clear how chronic pain made regular working life impossible, and I wondered how I would get by on disability and how long it would take to kick in after applying. I started panicking while focusing enough to book a doctor's appointment for that Friday. By the end of Wednesday my calves and thighs were severely cramped, and by Thursday my eyes were tingling and my hands and arms were tingling with pain. I feared MS since it runs in my family. I was terrified and confused and made an appointment with a PCP for Friday, April 2nd.

Patient described feeling light headed and does not recall losing consciousness. Fell face side down and had trauma of right knee and nose and above the left eye. Bruising on his nose. Reportedly hit the metal base of the curtain that separated the vaccination area from the observation area. EMS called for concern of facial fractures. BG 98/48 and HR 75 with O2 sats 99% post event. EKG negative. BG within normal limits. Patient did have sustained loss of consciousness. Followup BP 101/69 with HR 77. Event attributed to vasovagal reaction.
1323330	5/17/2021	CA	13	F	5/14/2021	5/14/2021	10 minutes after her first dose she had been sitting in a chair & developed diaphoresis, warm skin, loss of vision,& low blood pressure. Pt was initially not responsive, when transferred to a wheel chair to take her to a gurney, left arm & left leg jerk twice. Took her to lay down and check her blood pressure. En route, in the wheel chair within about 5 to 10 seconds, she became responsive and said she could not see. Her vision returned to normal within a minute. Her initial blood pressure was 97/64 with O2 Sat 100% on room air. Her skin temp was 95.5, and her HR was 95. She continued to be responsive with excellent oxygenation and When the EMTs arrived she had a blood sugar of 90 and improving blood pressure with a regular rate and rhythm. Her diaphoresis resolved, and she continued to improve, tolerating water. Had similar reaction last year to flu shot, no hx of seizures

1323081	5/17/2021	OH	15	F	5/16/2021	5/16/2021	After administration of vaccine the patient stood up quickly and passed out. The patient fell down and came to rather quickly. After she came to we helped her to a chair and sat her down, advised her to put her head between her knees, and got her some water that she requested. After a few minutes she appeared rather pale and went to ask her if she was ok and she asked for a trash can because she felt like she was going to be sick. We gave her a garbage bag and she did get sick in the garbage bag. We kept an eye on her for another 15-20 minutes and she stated that she felt better and that she thought she was ok to leave. We offered her help to her car but she denied it saying she would be ok with she walked slowly. Her father was with her the entire time. While talking with them the father did state that she had incidents like that in the past where she stood up too fast and got light headed and passed out.
1322949	5/17/2021	NC	14	F	5/15/2021	5/16/2021	Starting at 0300 5/16/21 Pt was awoken with pain in R arm, R arm pit, and along back. Pain kept waking Pt up, she slept fitfully. Pt stayed in bed until around 1300 5/16/21. She had a project for school due- had to video tape making a recipe. She was standing up videotaping the ingredients when she felt very dizzy. Pt then reported that she lost her vision- everything turned black. I had to rush to her to catch her- she had loss of consciousness for about a minute. She was very pale- lips turned blue. She had a pulse the whole time, BP was 117/60- when I checked it about 5 min later. Her temperature on a ear thermometer was 99.7. After she awoke, she was still very dizzy and stayed in bed most of the day. 5/17/21 AM- she woke up for school 0600- and was feeling better. No more dizziness, color was back in her cheeks, was able to eat and left for school.

1322550	5/17/2021			F	4/1/2021		NECK PAIN; LOW BLOOD CIRCULATION; SINUSITIS; STIFF LEG; VISION WAS VERY VERY UNUSUALLY SHARP; RASH ON LEG; HEAVY HEADACHE; COULDN'T CONCENTRATE; ANAPHYLAXIS; SWOLLEN LYMPH NODE; MUSCULAR PROBLEM; ITCHY LEGS; LITTLE ANXIOUS; This spontaneous report received from a patient concerned a 42 year old female unspecified race and ethnic origin. The patient's height, and weight were not reported. The patient's concurrent conditions included microcytic anemia (which was inherited). She had her period on the day of the vaccine. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin, and batch number: Unknown, expiry date: unknown) dose was not reported, 1 total administered on 07-APR-2021 for prophylactic vaccination. The batch number was not reported and has been requested. No concomitant medications were reported. On the first day of vaccination (07-APR-2021), she was feeling very alert and she had very heavy headaches, as if her head was heating up like the laptop when overheated. On the second day (08-APR-2021), she woke up with a very stiff leg, and a rash on the same leg, which went away after she took a cold shower. She blamed the walk from the day before. Her headaches continued, but her vision was very unusually sharp. She couldn't concentrate or be in front of the computer for very long, which was also very unusual. On Monday (unspecified date in APR-2021), she experienced more headaches and strange sensations on the left side of my face. However, she suffered from sinusitis so she blamed that. On an unspecified date, she was driving. Her leg was still stiff; it was less stiff than before but it, intensified with the driving. She made sure that she was taking regular stops and did some icing, which however didn't seem to help. Her blood circulation was quite slow. On an unspecified date in APR-2021, she suddenly had anaphylaxis (rush of heat all over the body, confused) which she never had before. Her head was still feeling very weird. She was taken to hospital that night. It looked like it could have been a delayed reaction from the vaccine, since she never had any of these episodes before. She had similar intense episode on 25-APR-2021. Very intense leg stiffness, followed by a rush of heat all over the body, headaches and neck pain. She was very confused and

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

scared because none of these intense episodes ever happened to her before. The hospital didn't find anything, other than muscular problems, but it seemed very weird to her that these effects happened so close to each other. She had a few lymphatic massages from a friend, who said the lymph nodes were very swollen, and that was possibly from the vaccine. The massages reignited the circulation, the legs were now feeling very itchy and she began to feel a little better. However, the doctors were investigating these events further with allergy tests. At the time of report, she felt like her body had returned to normal, she was just a little anxious (unspecified date) it would happen again. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from anaphylaxis, sinusitis, rash on leg, stiff leg, low blood circulation, swollen lymph node, couldn't concentrate, neck pain, muscular problem, itchy legs, and heavy headache, and the outcome of little anxious and vision was very unusually sharp was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: 20210511816-COVID-19 VACCINE AD26.COV2.S-Anaphylaxis. This event(s) is labeled per RSI and is therefore considered potentially related.

5/6/2021

5/6/2021 Pt received vaccination at 0955. At approximately 10;15 another patient came over to the admin desk and notified us that pt wasn't doing well. I went over to evaluate and pt told me she felt fine and she would take a Benadryl when she got to the car. I assisted her to the back where we further evaluate her. She had clear signs of anaphylaxis (blood shot eyes, hives, swollen tongue, rapid heart beat) but did not want EPI. I advised her that EPI is NEEDED quickly and that Benadryl was not enough. She then agreed to let me EPI her. Epi was administer in the left thigh at 10;18. A set of vitals were then taken and patient was places on o2. The emergency department was called at 10;20 and arrived at 10;25. During this time another set of vitals were taken. Patient expressed feeling better but jittery. Hives and tongue swelling had significant improvement but patient still had some symptoms so we advised the follow up team of our recommendation for second dose epi. Emergency team took control of patient.

1323410	5/17/2021	MA	12	M	5/13/2021	5/13/2021	From ED Note: 12 year old male with PMH of asthma on flovent, food allergies with epi-pen (has not required this) and pre-syncope/syncope who presents with concern for loss of consciousness and possible seizure-like activity following a COVID vaccine. Mom notes that he was in his usual state of health when he presented to COVID clinic to get his first vaccine. He got the Pfizer vaccine, seconds after getting in his left arm, mom noted that he looked very "wide eyed" and distraught. She notes that he slumped forward and had lost consciousness for approximately 5 seconds. She noticed shaking movements in his right arm and bilateral lower legs. She notes that his left arm was against her and therefore cannot comment on it. She notes that his eyes were closed. No tongue biting and no incontinence. No secondary trauma. She notes that when these 5 seconds were over he then had a period for about 30 minutes where he looked pale and was breathing heavy but was alert and answering questions. She notes that he has had presyncopal episodes and episodes of feeling faint when getting flu shots in the past. However, this time she noted that he had shaking which made her nervous for possible seizure activity. Patient denies any chest pain or headache prior to the symptoms. She came via ambulance for further evaluation. On arrival, he reports that he feels 90% back to his baseline. He notes that he does not feel quite ready to run around yet however denies any pains or discomforts, headache, weakness, numbness, or tingling. He had eaten a full breakfast prior to getting the shot. He had a normal night sleep and a normal day yesterday per mom. Medical History: as above Surgical history: none Family History: Reviewed and no pertinent related family hx pertaining to this visit Social History: Lives with family Allergies: food allergies Medications: flovent, epi-pen Immunizations: Up to date Medical Decision Making 12 year old male with PMH of asthma on flovent, food allergies with epi-pen (has not required this) and pre-syncope/syncope who presents with concern for loss of consciousness and possible seizure-like activity following a COVID vaccine. On arrival, he was alert, well-appearing, in no acute distress. His vital signs were normal for age on room air. His physical exam was very reassuring as above with a normal neurologic and cardiac evaluation. Differential includes vasovagal/syncope in the setting of a known

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							stressful trigger vs seizure given report of shaking in his extremities. We feel the latter is significantly less likely given the timeline of the events. Has no known seizure activity nor any triggers per history (fever, trauma, etc.). He also has a normal neurologic assessment. At this time we will defer neurology consults given low concern for seizure. It is possible that this represents a side effect of the vaccine however we also feel that this is less likely given the fact that his symptoms have been seconds after receiving the vaccine. Nonetheless we reported the symptoms to the pharmacist who recorded it in the database. We attained an EKG showing a known incomplete right bundle branch block (unchanged from 2013) and a slightly prolonged QTC of 477 (previously 451). I encourage patient to stay well-hydrated, well rested in the setting of his suspected syncopal episode this morning. I also suggested that for further vaccinations, that he lay down on the table and drink/eat well prior. We provided strict return to ED criteria in the setting of worsening symptoms. All questions were answered at the time of discharge. Mom verbalized her understanding and agreement of the plan. He was discharged in a stable condition with mom at side. **After patient was discharged, cardiology called the follow-up team due to the prolonged QTC to ensure that we were aware. I contacted the patient's PCP to do a follow-up EKG in 1 month's time.

1325018	5/17/2021	OR	66	M	4/8/2021	4/14/2021	Lost sight in left eye for 1 hour on 4/14/2021. Although the loss of sight and subsequent hospital visits MAY NOT HAVE BEEN DIRECTLY RELATED to the vaccine, the fact that this occurred 6 days following my 2nd dose makes me want to report it in case others have reported anything similar.
1324997	5/17/2021	IL	38	F	3/15/2021	4/17/2021	Many weeks ago (end of March, into April) i noticed I was short of breath, and a few weeks later a cough developed (mid-April). Also mid-April, on April 17, I had a sudden subconjunctive hemorrhage happen in my right eye for no apparent reason. There was no injury to my eye and my ophthalmologist told me it would heal in a few weeks. Two weeks ago (beginning of May) a terrible, nearly unbearable headache began. A few days later, I continued to feel strange and began to get more frequently short of breath and my cough worsened. On 5/5/2021 I went to my doctor , Family Medicine, and was then sent to the local hospital, and had a cat scan done of my lungs, around 9 AM. I was I was diagnosed with a Pulmonary Embolism in my right lung, that is so large that it is taking up 2/3 of the lung and its pushing on my heart. I am currently taking Eliquis and waiting to be seen by a specialist. I still have shortness of breath, headaches, and chest pain as a result of my PE.
1324801	5/17/2021	FL	25	M	5/17/2021	5/17/2021	Pt was lethargic, described blurred vision, tingling in both arms, sweaty, felt cold to the touch, BP at 7pm was 70/42, contacted EMS for help. EMS followed the pt home (came to pharmacy with his father), his BP had risen to 119/88 per call with father at 8:38pm. Father stated his symptoms had resolved and he was resting.

1324494	5/17/2021	WA	17	M	5/11/2021	5/11/2021	Pfizer-BioNTech COVID-19 Vaccine EUA ; On 5/11/21, Patient experienced tingling in left arm minutes after the vaccine was injected (4:07pm). Patient became nauseous. While in the vehicle to go home, patient's breathing quickened. After this, patient's vision became blurry and he was unable to see. Patient also experienced hearing loss with ringing in ears. The father of the patient pulled the car over in case medical attention was needed. Patient eventually passed out for about 30 seconds (about 4:22). Patient recovered, but complained about fogginess (thinking was unclear and unfocused). The next day, on 5/12/21, the patient experienced chills and nausea without a fever. Currently, the patient is doing fine with no further symptoms.
1323895	5/17/2021	WV	18	F	4/8/2021	4/9/2021	At first once I received the vaccine I felt completely fine. Later that evening I started to lose my breath and had a fever. By 9:00pm I was unable to move the left side of my body, had sharp pains throughout my body, and involuntarily urinated and vomited. This continues until 12:00pm Friday, the vomiting and urinating involuntarily stopped but the high fever, body pains, and numbness continued until Sunday evening. Now I still am experiencing random sharp pains and numbness on the left side of my body to the point where I cannot move it at all. I am throwing up occasionally (which has never happened before), and I have had a headache and insomnia since I got the vaccine. Pains behind my eye, loss of appetite and weight loss have occurred since.

1323709	5/17/2021	NC	17	M	5/5/2021	5/8/2021	<p>Pt was seen at ED on 5/8 for L sided weakness in the setting of a headache. Pt's mother reports that these symptoms began 2 days after receiving second dose of Pfizer COVID-19 vaccination in R deltoid. She says that on 5/6, pt complained of L arm weakness during cooking class at school, which was followed by a mild L sided headache later in the day. Symptoms resolved without intervention but recurred on 5/8 with associated L sided facial droop, slurred speech, L arm spasms, and L foot drag. Pt was seen at ED for this and had a HA (5/10 in severity) at that time -- workup was unremarkable with a normal head CT, laboratory workup, and resolution of symptoms. Pediatric Neurology evaluated the pt, deemed no further workup necessary, and advised outpatient follow up. Pt presented again to the ED on 5/10 with concern for full tonic/clonic seizure, witnessed by pt's mother. Mother reports that she heard pt fall and went upstairs to find pt seizing on his bed -- says that pt had shaking of bilateral upper extremities (in flexed position close to chest) and symmetric lower extremity shaking; eyes were closed without clear focality or eye deviation. Also some drooling, though no incontinence or tongue biting. Episode lasted for approximately 2 minutes; pt was confused and did not recall what happened immediately afterwards but improved within the next 8 minutes. He was taken to the ED by EMS. By the time he arrived in the ED, he had left sided weakness again. He was given Keppra 1g, placed on EEG, and was admitted. EEG overnight was read "normal" and additional workup was unremarkable. Pt had MRI brain completed showing cortical abnormalities in the R parietal lobe, suspected to be related to recent seizure. MRA showed patent intracranial cerebral vasculature. MRV showed no evidence of dural venous sinus thrombosis. Weakness resolved by the morning and pt was back to baseline on morning of 5/11/21. However, around 9 AM, L sided weakness (face, arm&gt;leg) with associated headache recurred. Mom says that this event was captured on EEG. He was then transferred to our facility. He was placed on pEEG and had repeat labs, imaging completed. Pt did have L sided facial droop, L arm weakness, and slurred speech on arrival, but this resolved within 24 hours. Pt had one additional episode of "wave" of L sided weakness including L sided facial droop and slurred speech at one other time during the</p>

							hospitalization, but no additional seizure like activity. He was discharged on 5/14 with a normal neuro exam--some labs (including labs of Rheum and Id workup were pending at time of discharge.) Primary and consulting teams elected to forgo steroids but reconsider should symptoms worsen or return. Pt was readmitted on 5/16--had an episode of expressive aphasia + headache while at a social gathering; states that he became overwhelmed by the noise. No additional seizure like activity.
1324804	5/17/2021	CA	15	F	5/17/2021	5/17/2021	client felt lightheaded after receiving 1st Pfizer Covid Vaccine. Client received vaccine at 1717 and RN kept client in chair a few mins as client stated feeling nervous. PHN brought client water. Per client had only ate snack prior to appointment. Client able to transfer by herself to anti gravity chair. 1722 vitals: blood pressure 122/68, oxygen 98%, pulse 81. Per client feeling nausea, RN gave emesis bag. Client appeared diaphoretic and pale. Per Mother only medical history is seasonal allergies and client takes Zyrtec as needed. No history of fainting with vaccines in the past or allergies. Vitals at 1728: blood pressure 118/72, pulse 82, oxygen 97%. Per client symptoms still there, but improving. Vitals at 1733: blood pressure 120/70, pulse 83, oxygen 100%. Client stated lightheaded resolved, nausea still same. Client denied blurry vision, headache, warmth feeling. Vitals at 1738: blood pressure 118/72, pulse 80, oxygen 99%. Per client all symptoms resolved. Last vitals at 1743: blood pressure 114/80, pulse 76, oxygen 99%. Mother driving client home. Advised to follow up with provider and ER precautions given. After completing 30 min observation client left facility with steady gait at 1750.

1322069	5/16/2021	CA	18	M	5/14/2021	5/14/2021	<p>Patient (DOB 05-01-2003) received his 1st COVID vaccine (Pfizer, lot # EW0182 use by 5/15/21 at 0855) at 1539. The patient became pale approximately 30 seconds following the administration of the vaccine, EMT assisted the patient to the chair as he was standing up when he became pale, the patient loss consciousness for approximately 2 seconds. RN arrived at the station and assisted the patient to the ground, where he was placed in a supine position with his lower extremities elevated. The patients face mask was removed, he was alert and oriented to person, place, time, and situation. The patients color slowly returned to his face. Vitals were taken at 1540: BP: 155/70 (R arm, supine position), HR 70, RR 16, oxygen saturation at 97%, and pupils were equal. The patient had a history of fainting x 1 and his last meal was at 0800 and he stated, " I didn't drink that much today." Denied any chronic medical conditions, was not currently taking any medications, and denied any drug allergies. The patient was moved to the anti-gravity chair and he was given pringles and Gatorade. Vitals were retaken at 1545: BP 162/80 (R arm, sitting upright), HR 50, RR 16, oxygen saturation at 97%. Denied any dizziness, headache, chest pain, or vision changes. Vitals were retaken at 1553: BP 158/72 (R arm, sitting upright), HR 52, RR 16, Oxygen saturation at 97%. The patient was advised to eat a full meal prior to receiving his second COVID vaccine dose and to receive his 2nd dose in the anti-gravity chair. Vitals were retaken at 1558, BP 152/78 (R arm, sitting upright), HR 57, RR 16, and oxygen saturation at 98%. The patient was also given a bottle of water, as he did not consume many liquids during the day. The patient's color fully returned to his face and he denied any shortness of breath, dizziness, changes in vision, or difficulty swallowing. Vitals retaken at 1603, BP 150/75 ( R arm, sitting upright), HR 60, RR 16, and oxygen saturation at 96%. The patient called his mother to pick him up, as we strongly advised him to not operate machinery/ a vehicle after fainting. The patient's vital signs were taken at 1608, BP 140/75, HR 60, RR 16, and oxygen saturation at 100%. The patient was advised to drink the entire bottle of water, as his blood pressure was slightly elevated and it was most likely due to being dehydrated, as he did not consume any fluid since 0800 earlier that day. The patient drank a bottle of water and his vital signs were retaken at 1614, BP 122/68 (R arm,</p>

1321777	5/16/2021	RI	14	F	5/14/2021	5/14/2021	Within 10 minutes after the vaccination, there were some body tremors and dizziness, then she lost vision, hearing and ability to speak for a few seconds, followed by difficulty breathing and a feeling of her heart ?jumping out of chest.? Eventually, she recovered, but her right hand (not the injection arm) still has involuntary tremors, which has not gone away.
1321904	5/16/2021	IL	14	F	5/16/2021	5/16/2021	Patient received her first dose of the Pfizer Covid-19 vaccine. While waiting for observation, patient started to faint and seized. She also reported being hot and asked to take off her sweater. Paramedic was called and patient was taken to the nearby hospital. Patient reported black out while sitting on her chair, though by the time paramedic finish with the transportation patient reported vision recovery.
1321962	5/16/2021	TX	29	F	4/22/2021	4/26/2021	I was driving when my vision in my right eye became blurry. The right side on my body started to go tingly and then numb. As I was driving my vision got worse I was starting to barley be able to see out my eye. I also developed a severe headache on the right side of my body. I drove to the ER and got checked in because I thought I was having a stroke. I was immediately put on stroke alert. I feared for my life as my condition was worsening. I was rushed back to have a Cat scan after some initial test. Then two MRIs. One doctor said it was a result of the vaccine another said it wasn't. After being observed for 10 hours I was discharged. My symptoms were almost gone at discharge. Six days later I began that severe neck pain. Then a day after the initial neck pain it becomes unbearable. I got to my PCP where I am diagnosed with shingles. I've never had shingles, I've never had anything like this. I am 100% pro vaccine but the hell this has put me through has been just awful.

1320244	5/15/2021	IL	59	M	3/12/2021	3/1/2021	Rheumatoid arthritis flare up; Pain in joint involving hand; Injection site papule; Bruising; Sprain; Dizziness; Loss of balance; Sickness; Vision decreased / Bilateral abnormal vision; Blurring of eyes; fatigue; bumps from the injector pen; Pain in extremity / ARM PAIN; This is a solicited report from non-Pfizer sponsored program received from a contactable physician based upon information received by Pfizer from company (21K-163-3820459-00). A 59-year-old adult make received the first dose of intramuscular BNT162b2 (solution for injection; Lot EL3248 expiry information not provided) as a single dose on 12Mar2021 (at 59-years-old) for COVID-19 immunisation. The patient also started to receive subcutaneous adalimumab (HUMIRA, unspecified formulation) 40mg at an unspecified frequency from an unspecified date for arthritis. Relevant medical history included rheumatoid arthritis, inflammation, high blood pressure, red face, red skin, used cane for walking because he could not walk (before adalimumab), and a loss of hearing in the left ear (one month prior to starting adalimumab). It was unknown if patient was enrolled in a COVID-19 Vaccine Trial. Concomitant medications included sulfasalazine for inflammation; lisinopril for high blood pressure; and another [unspecified] medication for inflammation. The patient previously received treatment for inflammation with steroids which were not good enough. On an unspecified date in Mar2021, after receiving the vaccine, the patient developed arm pain, it made him tired, he had dizziness, fatigue almost every time, and a loss of balance. The patient had bumps from the injector pen/ Injection site papule, Pain in joint involving hand, bruising, sprain, and sickness. On an unspecified date in Apr2021 the patient experienced bilateral abnormal vision/vision decreased and blurring of eyes. On 09Apr2021, patient received second dose BNT162b2 (solution for injection; Lot EL3302 expiry information not provided) as a single dose. The action taken with adalimumab was unknown. The outcome of the event Sickness was recovered on an unspecified date. The outcome of the events bilateral abnormal vision/vision decreased, blurring of eyes, and fatigue, was not recovered. The outcome of the events pain in extremity / arm pain, bruising, sprain, dizziness, loss of balance, was recovering. The outcome of the events Pain in joint involving hand, Injection site papule, and

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
-----------------	--------------	--------------	----------------	------------	-----------------	-------------------	---------------------

bumps from the injector pen was unknown. The reporter's assessment of the causal relationship of the event with the suspect product BNT162b2 was not provided at the time of this report. Since no determination has been received, the case is managed based on the company causality assessment. No follow-up attempts possible. No further information expected.; Sender's Comments: Based on available information, a possible contributory role of subject product, BNT162B2 vaccine cannot be excluded for the reported events of Injection site papule, Pain in joint involving hand, bruising, dizziness, loss of balance, fatigue and sickness, based on temporal relationship. Based on the information provided by the reporter, it appears unlikely that the subject product contributed to the RA flare and other reported events, which likely represent intercurrent medical conditions. There is very limited information provided in this report. This case will be reassessed upon receipt of follow-up information. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1320174	5/15/2021	NE	49	M	1/11/2021	4/30/2021	Bells Palsy; Facial numbness and drooping left side. Eye, cheek, lips.; This is a spontaneous report from a contactable nurse. A 49-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration, administered in Arm Left on 11Jan2021 15:00 (Batch/Lot Number: EK4176) as 2nd dose, single for COVID-19 immunization. The patient had no medical history. The patient's concomitant medications were not reported. The patient previously took the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 21Dec2020 15:30 in the left arm (lot number: EH9899). The patient did not receive any other vaccines within 4 weeks prior the COVID vaccine. The patient experienced Facial numbness and drooping left side. Eye, cheek, lips; had Bells Palsy on 30Apr2021 11:00 which resulted a visit in the emergency room or urgent care. Steroids and acyclovir were taken as treatment for the events. The patient was not diagnosed with COVID prior vaccination and has not been tested after vaccination. The outcome of the event was unknown. The event Bells Palsy was assessed as serious- medically significant.; Sender's Comments: Based on the information currently available, a possible contributory role of the suspect drug in the reported serious event cannot be completely ruled out given the known suspect drug profile and/or implied temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to the Authorities, Ethics Committees and Investigators, as appropriate.

---

an unspecified date patient contacted his primary care doctor and was told to take some extra Motrin, twice a day but Motrin was not effective for his headache. The patient was not feeling well he went to his primary care doctor. Caller states her husband was at his doctor on 07Apr2021, and he went to radiology for a Cat Scan on an unspecified date and the results was negative. He had lab work drawn and a CT of the head. Her husband was given a medication to help him sleep, medication not specified. Caller mentioned she rescheduled her husband's second vaccine. On 12Apr2021, in the evening when he was getting out of the shower, he developed numbness in his left hand, and added later in the report, numbness of his mouth. Patient went to the emergency room, where they performed several tests, Multiple Cat Scans. Results of the first Cat Scan, a blood clot was diagnosed, and an EKG because they thought he may be having a heart attack but it was confirmed he was not having a heart attack.. When her husband was in the emergency room, they did a Covid test and it was negative. The patient was diagnosed with a blood clot and got Tissue plasminogen activator. At 7:33 pm, when he was given tissue plasminogen activator. After the treatment, the headache went away, but she is not sure if he has lasting effects. He was admitted to the Intensive Care Unit and was in the hospital for two days and diagnosed with a stroke, but he was able to walk out of the hospital. The patient still gets an ache in his head, and it comes and goes. Caller states it seems that these events were not coincidental, as they all happened after he got the vaccine. Since her husband has been home from the hospital, he is sleeping better but normally does not get a full night of sleep, and he usually wakes up at night and husband gets constipated when he takes Motrin. Caller mentioned that her husband is not fully constipated anymore, but he feels that his system is not back to normal. Caller assumed the stroke has cleared up, but is not sure. Caller rescheduled her husband's second vaccine, and she is not sure her husband should get the second vaccine. Caller states if these events were caused from the Covid vaccine, what will happen in the future? The clinical outcome of the events Clot blood, Stroke, malaise and wakes up at night was unknown; Numbness of left hand and mouth was recovered on 12Apr2021, Fever was recovered on 04Apr2021, while

1320177	5/15/2021	MN		M	4/30/2021	4/30/2021	seizure; faint; feeling dizzy; drained again; his lips lost their color; difficulty hearing; nauseous; sweating profusely; This is a spontaneous report from a contactable pharmacist. An adolescent male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; Batch/Lot Number: Er8736), intramuscular, administered in Arm Left on 30Apr2021 20:30 as 1st dose, single for COVID-19 immunization. Medical history, none known. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. The patient's concomitant medications were not reported. The patient reported no previous adverse events with prior vaccinations, specifically dizziness or fainting. After the shot he went to the bathroom, returned fairly quickly & reported feeling dizzy and quickly took a seat and thought he might faint. Soon thereafter he seemed to have a seizure. His eyes remained open but rolled back, he stayed upright but was unresponsive. They removed his mask & his mother & they kept talking to him. It ended after about 10 seconds & he asked how long he had been out. His color was momentarily better, but drained again & his lips lost their color. They asked if he had any difficulty breathing and he did not. He reported that he had difficulty hearing (like he had headphones on) & was sweating profusely. His mother kept encouraging him to take deep breaths, they got him some water & asked if he had a history of hypoglycemia- he did not. They asked if they could get him a candy bar& they asked for a granola bar which they acquired. He was too nauseous to eat it & asked. The events started on 30Apr2021 20:30. No treatment was given. The outcome of the events was recovered.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the seizure and the other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including EEG and head CT/MRI, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety

1320185	5/15/2021	GA	75	F	4/6/2021	4/6/2021	<p>blurred vision; seeing blue and pink flashes in both eyes; seeing blue and pink flashes in both eyes; lightheaded; tingling feeling from knees to feet; got disoriented; joints aching, knees and arms; This is a spontaneous report from a contactable consumer (patient). A 75-year-old female patient received bnt162b2 (BNT162B2), dose 1 via an unspecified route of administration, administered in arm right on 06Apr2021 08:20 am (Batch/Lot Number: ENB200) as single dose at the age of 75-year-old for COVID-19 immunisation. The patient medical history and concomitant medications were none. No history of all previous immunization with BNT162B2. No additional vaccines administered on same date of BNT162B2. No prior vaccinations (within 4 weeks). On 06Apr2021, 10 minutes after she received the vaccine, she patient experienced blurred vision, seeing blue and pink flashes in both eyes, she was lightheaded, tingling feeling from knees to feet, got disoriented, joints aching, knees and arms. The events required a visit to Emergency Room. The events were considered medically significant. The outcome of joints aching, knees and arms was recovered on 27Apr2021, of all other events was recovered on 06Apr2021. The course of events was as follows: 10 minutes after she received the vaccine, she experienced blurred vision, seeing a blue and pink flashing in both eyes, she was lightheaded, from her knees down to her feet had a tingling feeling, and she got disoriented. She told her family member something was wrong with her and they got the EMS. The EMS checked her vital signs and suggested to take her to the main campus Emergency Room center. After the knees and arms stopped tingling, different side effects came up on her as she was sitting and waiting for 15 minutes. Patient did not know how long her eyes flashed exactly, but it stopped the same day. Patient had had some differences with her legs, like her joints aching. It lasted from 06Apr2021 to 27Apr2021 until she had to go back for the next vaccine. The joint pain/achiness in legs and arm lasted for 3 weeks on and off. Patient was not hospitalized. No relevant tests performed. Patient has an appointment scheduled with her physician on following Monday. She was scheduled to go back 27Apr2021 for second dose. No follow-up attempts are needed. No further information is expected.</p>

This nurse reported 2 reports for same patient, this is first of 2 reports. A 66-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), second dose via an unspecified route of administration, administered in left arm on 25Feb2021 11:00 (Batch/Lot number was not reported) as single dose for covid-19 immunisation. Medical history included ongoing asthma, she says she has been having respiratory problems and asthma since she was a teen; covid-19 from 06Feb2020 to 18Feb2021, She says she didn't see her doctor until the day she got better. She says she realized she was in big trouble and need help. She says she got her phone and it affected her brain. She says she she 5 sons and she flipped around her phone having trouble. She says he has had the same phone for 4 years. She says she was fine that day, 18FEB2021, that she had half of the symptoms, and her fever went down. She says the headache lasted a while; allergies; No thyroid gland, clots; thyroid cancer; tremors that started 7 years ago in one hand. She says she has no thyroid gland. She says she has been taking this since her surgery; she was around 33 years old, and she is 66 now, so for 33 years. She says she had clots. History: She says she takes a lot of medications, a lot of neurological medications. She says the only other pertinent thing is she does have tremors that started 7 years ago in the one hand. She says just before she got the COVID virus, a week before, tremors started in the other hand and progressed rapidly. It is remarked that she thinks she was infected when this started. She says the other one took 7 years to be once a day while this one progressed to be daily. She says she does not take anything for that, she is just trying to increase her activity levels. She says when she was 30 or 40 she was very active. She says the doctors think there is something wrong with her immune system. She says they are trying her on diff medications for asthma; they changed it, added more. She says Advair work beautifully and she doesn't use a breakthrough inhaler. She says ever since

COVID in 2020, the first week of FEB2020 she thought it was the flu. She says she didn't get any medical help, she was in severe shape, and her headache was severe. She says she crawled to the bathroom once a day, she had a high fever and it felt like a snake effect of a cobra all over, squeezing. She says her pulmonologist gave her Spiriva and that has opened her up, once a day. Caller had gotten to the point she couldn't take 5 or 6 steps and couldn't breath. She gained a ton of weight cause she couldn't move related to this breathing issue. She thought she wouldn't recover, he gave samples once a month. She says she saw him a week ago, 10 days ago maybe. She says she had shortness of breath and couldn't walk. She clarifies she is talking about when she had COVID last year, not this current shot report. She says she didn't consider these current side effects a problem, she expected some side effects and they went away. She says the shortness of breath walking problem was due to shortness of breath; that was what happened with COVID. She says her hoarseness is related to spring allergies and is due to the climate and it is usually from 10APR to 16JUN. She says she gets a sinus drip and congestion and that she is on 5 different medications for that. She says she has more trouble with inhouse allergies. She says she gets trouble as soon as the trees pop. She has had hoarseness for about a year and the allergies have really started around 10Mar2021 for this year. Concomitant medication included ongoing levothyroxine sodium (SYNTHROID) taken for thyroid cancer. She says something new was 8 weeks out she got the flu shot. She says she has a lethal allergy to egg white so she has never had a flu shot her entire life. She says she asked her doctor why they didn't get the one without egg whites. She says they made one without egg white in the 1990's. She says 08DEC2020 was her first flu shot. She says everyone wants her to take more shots but she won't take any more. She says COVID and the flu shot are enough for one year. She says if they have the COVID booster then she will take that one but not any other. She says no but she was told don't ever have anything with egg white in it so she never had the flu shot, she refused. The patient took first dose of BNT162B2 on 04Feb2021 for COVID-19 immunisation and experienced headache. The patient experienced trouble walking (Disabling) on 25Feb2021 19:00 (about

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

7:00pm in the evening) with outcome of recovered on 25Feb2021, trouble seeing (Disabling) on 25Feb2021 19:00 (about 7:00pm in the evening) with outcome of recovered on 25Feb2021, hoarse was reported as worsened (medically significant) on Mar2021 with outcome of not recovered, hoarse (medically significant) on Mar2021 with outcome of not recovered, slept a lot; 12 to 16 hours for the next 5 days on 25Feb2021 22:00 (10:00pm at night) with outcome of recovered on 2Mar2021. The caller is calling about the COVID 19 vaccine. She says she had side effects but she would consider them mild. She says the shot was wonderful. She says she has put off reporting this. Caller remarks she has shrunk, when providing her height. Caller apologizing when clearing her throat, says sorry she is so hoarse today. She says the second dose they came and went away. She says the second shot was at 11:00 am. She says the second shot was on 25FEB2021. She says she had a lot of water to drink then 7 hours after the second shot, about 7:00pm in the evening, she had 45 minutes of visual and neurological issues. She says she had trouble walking, she was stumbling with her feet, she had trouble with eyesight, different sections of her vision was together. She says this was like when she had 5 children. She says her pregnancy during the first 3 months she had neurological visual experiences of shadows put together and at the end of the pregnancy, 2 months after delivery, it would go away. She says she is in an apartment and she sat down then it was 45 minutes total for both occurrences at the same time. She also reports that she slept a lot; 12 to 16 hours for the next 5 days. She says on the 6th day she was fine, no symptoms and no sleepiness. She says it occurred the evening at 10:00pm at night, then it went up through the 5th day afterwards. When asked seriousness of the sleeping event she says none of the above. She says she lives in a senior housing area, they all got it at the same time, that there was only one person who declines. She says almost everyone had sleepiness for at least 3 days afterwards. She says she is still battling the COVID after effects, it was disrupting her breathing. She says she was glad she got the shot, she is glad she was able to do it. She says her second dose seemed to be around 11:00am. For the second dose lot number she reads GL92 then AA or 00. She does not see an

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

expiration date or NDC number for the first or second dose. She says her second dose was in her left arm up high near the shoulder, upper arm high. She says she didn't feel either of them. She says that she was put on BREZTRI Expiration date, lot number, and NDC number not provided. She says her doctors thought she had COPD but she didn't; it doesn't work for people over 70. She says the cardiac problem was with a respiratory medication. She says it was Trelegy. She does not have an expiration date, lot number, or NDC number for Trelegy. She says she is not sure where she put the container but she does have it somewhere. She says it affects the QRS. She says when she had COVID she was sneezing and in August her hair fell out. She says she had a fever for 4 days that week then she went away. She says she wondered if she had the long haul COVID. She says the doctor gave her something to make her lungs spring open. She says she is currently hoarse due to spring allergies, not because of the shot. A medication called Breeze didn't work for her. She says that she was put on BREZTRI Expiration date, lot number, and NDC number not provided. She says her doctors thought she had COPD but she didn't; it doesn't work for people over 70. No additional vaccines administered on same date of the Pfizer suspect. All events did not require a visit to Emergency Room or Physician Office. No family medical history relevant to AE. No relevant Tests. The reporter considered events trouble walking, trouble seeing, slept a lot; 12 to 16 hours for the next 5 days were related to covid 19 vaccine, event hoarse was unrelated to covid 19 vaccine. The outcome of other events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the available information there is not a reasonable possibility that the drug contributed to occurrence of the events, a possible contribution of the drug to the event pyrexia cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate –data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2021493623 same patient/drug, different

1320112	5/15/2021	NJ	46	F	3/21/2021	3/21/2021	states she cant sleep; cant concentrate; tinnitus, ringing of ears; Ear fullness; Tingling in right side of face, around eye and cheeks and everything; This is a spontaneous report from /Medical Information received from a contactable nurse reporting for herself A 46 year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EN6206) on 21Mar2021 at single dose via an unspecified route of administration on right deltoid for COVID-19 immunization. Relevant medical history included ongoing autoimmune disease from 2016 (diagnosed about 5 years ago). Concomitant medications were not reported. On 21Mar2021 the patient experienced Tingling in right side of face, around eye and cheeks and everything, started little bit the day of vaccination and then just kept going and got gradually a little bit worse. The events was considered as medically significant. On 23Mar2021 the patient started complaining ear fullness, started to get full like feeling in ear, like plugged under water kind of thing described as ongoing as improved slightly but it comes and goes (as such). The event was considered medically significant. On 27Mar2021 the patient also started experiencing tinnitus, clogged/plugged ears and ringing in the ears. The event was considered medically significant. This was not going away, she also mentioned can't sleep and can't concentrate. Patient also informed that she is part of a huge online Support group (1500-2000) for people who have developed tinnitus after covid vaccination with either of Pfizer, Moderna or Jansen and Jansen Covid vaccine. Patient declined to provide information on the persons other people who were experiencing the same symptoms, hopefully, those persons call Pfizer on their own. She also informed that was not be getting her second dose (as such). The patient recovered from 'Tingling in right side of face, around eye and cheeks and everything' on an unspecified date in Mar2021, was recovering from ear fullness, while have not yet recovered from tinnitus, ringing of ears. At the time of the reporting outcome of other events was unknown.; Sender's Comments: Based on the close temporal relationship, the association between the event "tingling in right side of face" with BNT162b2 can not be fully excluded. The association between the events "ear fullness" and "tinnitus" with BNT162b2 can not be fully

1320192	5/15/2021	MD	64	M	3/23/2021	3/30/2021	found out COVID-19 the 30th by the COVID; I was trembling; could not walk/with my legs, my feet's, can't hardy walk, use walker to walk around, it's causing my foot to not work properly. I cannot move my toes; It was standing low when I was in the hospital/I came home I don't know it's my neither or what I was 169 and 117 at the bottom; they give me down it was high couple of time and one time all I have my heartbeat was beating 131; they thought what patient had is a stroke; feeling chills; This is a spontaneous report from a contactable consumer (patient). A 64-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in left arm on 23Mar2021 (Batch/Lot Number: Unknown) as 1ST DOSE, SINGLE for COVID-19 immunisation. Medical history included diabetes mellitus and hypertension. Patient had got diabetes, hypertension and he got everything. Concomitant medications included insulin taken for an unspecified indication, start and stop date were not reported and unspecified drugs, concomitant Medications: Consumer stated he was taking 2 different insulin. Patient was taking a fast release insulin at the hospital and he did not know it will take but he got told to his primary doctor as he was first he was taking (medication name not clear and not confirmed) he was taking that's the insulin. he did not know what it was. Diagnosis date for diabetes and hypertension: Consumer stated they give he down it was high couple of time and one time all patient had his heartbeat was beating 131 so he called 911. So, patient did not know what caused it but they got everything under control and patient called 911 (Further clarification unknown hence not captured as event), they kept he in hospital for 11 days but patient know something was going on when he first got the Covid shot, he felt after his first injection 2 or 3 days later he was feeling chills and then that was it but by the time and patient took that on 23Mar2021 by the time, all of a sudden patient did not know the day it was it to be in the March because he went for testing and then later on 30Mar2021 the caller found out that he had Covid after getting the vaccine. Patient had the first shot on 23Mar2021 and patient was trembling, he could not walk, he was crazy. It took about 4 or 5 days he went to get out of the bed and he cannot walk at out. he came what at all his wife look and then

shut down because patient had not experienced that before and they thought what patient had is a stroke and patient had in my eyes, in so it was not a stroke, that major (Further clarification unknown) but they never told he what it could have been or what it was. Patient stayed in hospital for 11 days after he got that first shot. Patient had CAT (computerized tomography) scan and had MRI (Magnetic resonance imaging) and some other skin they did it with machines in your leg but before it could be they did all that and patient did not know what they did like what they did like he was about in Emergency room. Patient was still experiencing the events with his legs, his feet's, he could not hardy walk, he used walker to walk around because his equilibrity was going off and patient had no problem with his equilibrity (as reported). Patient was still experiencing events they tried to do surgery on his legs but they get his had got his diabetes patient was back on the control he take medications for that, patient could not carry out medications because he didn't know about the number and then they got his high blood pressure, they got down to control it was 118 last time patient had seen like 118-75. It was standing low when patient was in the hospital (Further not clarified hence not captured as event) So, when he came home he did not know it's his neither or what patient was 169 and 117 at the bottom so patient did not know what they got, what's going on. It was causing his foot to not work properly. Patient could not move his toes forward. The outcome of event could not walk was not recovered, of events was unknown.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021493685 same patient, same product, different dose and events.

1320265	5/15/2021	MD	66	M	4/26/2021	4/27/2021	my facial paralysis significantly worsened; This is a spontaneous report from a contactable consumer (patient). A 66-year-old male patient received BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration, administered in Arm Right on 26Apr2021 (Lot Number: EW0170) as single dose for covid-19 immunisation. The patient medical history was not reported. The patient's concomitant medications included unspecified products within 2 weeks of vaccination. The patient was not diagnosed with COVID-19 and has not been tested for COVID-19 since the vaccination. The patient previously received BNT162B2 lot EW0150 on 05Apr2021 14:00 at left arm for Covid-19 Immunization, 9 days later, on 14Apr2021, woke up with severe facial paralysis and MRI result determined it was Bells Palsy. He received 2nd vaccination on 26Apr2021, the following day on 27Apr2021 his facial paralysis significantly worsened. He cannot close his eye all the way, he cannot keep saliva in his mouth, his speech was impaired, it's difficult to eat and frankly he's mortified to go out in public and terrified that he might have to live this way for a while. The patient received Prednisone as treatment. The event resulted in: Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care. The outcome of the event was not resolved.
1319629	5/15/2021	TN	34	F	5/10/2021	5/11/2021	Extreme sensitivity to sunlight. Patient normally spends many hours a day outside doing various activities exposed to sunlight without getting a sun burn. The day after vaccine and since the patient can be outside for as short as 10-20 minutes and skin becomes visibly red and begins to quickly sun burn severely as if she was outside in direct sunlight for many,many hours. Eyes have also become very sensitive to sunlight requiring the use of sunglasses even indoors in a bright room. Causing great discomfort and unable to focus. Has previously never experienced these issues.

1319772	5/15/2021	CO	40	F	4/6/2021		<p>Cerebral venous sinus thrombosis; Pulmonary embolism; PLATELET COUNT DECREASED; Activated partial thromboplastin time shortened; Rash erythematous; Dizziness; Headache; ALANINE AMINOTRANSFERASE INCREASED; ANGIOGRAM PULMONARY ABNORMAL; ASPARTATE AMINOTRANSFERASE INCREASED; BLOOD ALKALINE PHOSPHATASE DECREASED; BLOOD ELECTROLYTES NORMAL; HAPTOGLOBIN NORMAL; THROMBIN TIME PROLONGED; ULTRASOUND SCAN NORMAL; VENOGRAM ABNORMAL; This spontaneous report received from a patient, concerned a 40-year-old. This case was described in a literature article, reference: outcomes of bivalirudin therapy for thrombotic thrombocytopenia and cerebral venous sinus thrombosis after vaccination: The patient's height, and weight were not reported. The patient's concurrent conditions included tonsil exudate, seasonal allergies, strain of cervical portion of right trapezius muscle, and migraine headaches. There was no history of thrombosis, clotting disorders, inflammatory bowel disease, collagen vascular disorders or cancers. The patient was not pregnant at the time of reporting, was not using estrogen-containing medications or tobacco and had no recent surgical history. On 01-APR-2021, the patient received covid-19 vaccine (suspension for injection, intramuscular, batch number: 042A21A, and expiry: UNKNOWN) dose was not reported, once total administered on left arm for prophylactic vaccination. Concomitant medications included cyanocobalamin, menatetrenone, and paracetamol. On post-vaccination day 5, 06-APR-2021, the patient developed a headache, sinus pressure, myalgias and sore throat with tonsillar exudate. On day 8, she presented to urgent care and was prescribed amoxicillin/clavulanate potassium, a methyl-prednisolone taper and methocarbamol. No laboratory evaluation was performed. She continued to have worsening headaches (different to her normal headaches), especially with movement, associated photophobia and intermittent dizziness prompting her presentation at the Emergency Department on post-vaccination day 12, 13-APR-2021. She denied fever, weakness, numbness, vision changes, speech difficulty, gait instability, seizure. Her initial vital signs were within normal limits, except blood pressure was 141/96 mmHg. Physical examination revealed small areas of petechiae</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

on her chest and right cheek of the face and mild tonsillar exudate without cervical lymphadenopathy. A detailed neurological examination was normal, and she had no leg swelling or pain. She was admitted to the hospital for further testing and management. The patient was found to have thrombocytopenia, an elevated D-dimer, normal fibrinogen, and mild elevation of the serum transaminases. Laboratory data on 13-APR-2021 included: alanine aminotransferase was 87 U/L, aspartate aminotransferase was 65 U/L, blood alkaline phosphatase was 25 U/L, other blood electrolytes were normal, haptoglobin was 208 mg/dL, partial thromboplastin time prolonged was 26.4 sec, platelet count was  $20 \times 10^9/L$ , and thrombin time was 14.9 sec, D-dimer was 27,150 to 47,570 FEU. Peripheral smear did not reveal schistocytes or other evidence of hemolysis. The patient's nasopharyngeal swab tested negative for SARS-CoV-2 RNA by reverse-transcriptase-polymerase-chain-reaction assay. An initial heparin induced thrombocytopenia antibody test, HIT IGG PF4, (HemosIL LIA assay) was negative. A confirmatory HIT PF4 ELISA resulted positive. While the patient did show a transient drop in hemoglobin (nadir of 12.3 g/dL on 15-APR-2021), there was no clinical evidence of bleeding. Mild transaminitis was present on time of admission; investigation for causes such as autoimmune hepatitis did not reveal an etiology. A CT angiogram of the chest showed a mild burden of acute pulmonary embolism with subsegmental filling defects in the right lower lobe. No right heart strain or lung infarct. A CT venography of the head/brain showed occlusive dural venous sinus thrombosis involving the left transverse and sigmoid sinuses extending into the left internal jugular vein. There is no associated infarct. There was possible additional nonocclusive thrombus in the right internal jugular vein. A lower extremity ultrasound was negative for DVT. A right upper quadrant ultrasound confirmed no portal vein thrombosis. The patient was treated with bivalirudin, a direct thrombin inhibitor with a short half-life. Infusion was started at 0.15 mg/kg/hr with titration parameters to target a PTT goal of 50-80 seconds. Additional pharmacologic interventions to aid in platelet recovery included intravenous globulin 1 g/kg/day for 12 days and prednisone 1 mg/kg daily. The patient demonstrated steady improvement until discharge on hospital day 6

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

and continued to show improvement. Platelet count was  $115 \times 10^9/L$  (at discharge on hospital day 6/post-vaccination day 18) and was  $182 \times 10^9/L$  (during outpatient follow-up on post-vaccination day 21). The patient did not demonstrate any sequelae of thrombosis. The patient was recovering well from the events of cerebral venous sinus thrombosis, pulmonary embolism, low platelet count, activated partial thromboplastin time shortened, dizziness, and rash erythematous, and vision changes was not reported. The event of headache resolved on an unspecified date. This report was serious (Hospitalization Caused / Prolonged). This case, from the same reporter is linked. Additional information was received from traditional media and the literature via a company representative on 07-MAY-2021. The following information was updated and incorporated into the case narrative: Literature citation, author details, company representative added as reporter, patient race, medical history, platelet count, clinical progression, lab data, corrective treatment, and outcome.; Sender's Comments: V2: Follow up from literature provided clinical details; company assessment remains the same. This case initially obtained concerns a 40-year-old White female who was hospitalized for cerebral venous sinus thrombosis, pulmonary embolism (PE) and thrombocytopenia 12 days after receiving covid-19 vaccine. Medical history included migraine headaches. There was no history of thrombosis, clotting disorders, inflammatory bowel disease, collagen vascular disorders or cancers. She was not pregnant, was not using estrogen-containing medications or tobacco, & had no recent surgical history. Concomitant medications included cyanocobalamin, menatetrenone, & paracetamol. Post-vaccination day 5 (PVD5), she developed a headache, sinus pressure, myalgias & sore throat with tonsillar exudate. PVD8, she went to urgent care & was prescribed amoxicillin/clavulanate, methylprednisolone taper & methocarbamol. PVD12, headaches worsened, prompting Emergency Department visit. She was hospitalized for further testing and management. Labs showed: Platelets (PLT)  $20k/uL$ , peripheral smear without schistocytes or hemolysis, d-dimer 47K, normal fibrinogen, negative Covid-19 PCR swab, positive HIT PF4 ELISA. CT of brain showed occlusive dural venous sinus thrombosis involving left

The occurrence of additional non-serious events is detailed below. No medical report history provided by the reporter. Concomitant products included VITAMIN A NOS and LUTEIN;VITAMINS NOS for Eye disorder NOS, HYDROCODONE BITARTRATE, PARACETAMOL (VICODIN) for Rib pain, DIMENHYDRINATE (DRAMAMINE) for Vertigo, COENZYME Q10 [UBIDECARENONE] for an unknown indication. On 31-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On an unknown date, the patient received dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) at an unspecified dose. On 31-Jan-2021, the patient experienced VISUAL IMPAIRMENT (Vision impaired/ distance vision is blurry/ vision is 'still so bad) (seriousness criterion medically significant). In April 2021, the patient experienced CHEST INJURY (injured left eighth rib/fractured left eighth rib) (seriousness criterion medically significant) and RIB FRACTURE (fractured left eighth rib). On 03-May-2021, the patient experienced DEPRESSED MOOD (still down from this), PAIN (pain due to left rib injury) and ASTHENIA (no energy/wracked our bodies). On an unknown date, the patient experienced VERTIGO (vertigo so bad/ still have vertigo, not as bad), BONE DECALCIFICATION (making my bones weaker / pulling calcium out of my bones), GAIT DISTURBANCE (difficulty moving around), SWELLING FACE (face very swollen), HEADACHE (headaches) and LYMPHADENOPATHY (Her glands swollen, hard as a rock). At the time of the report, VISUAL IMPAIRMENT

1320046	5/15/2021	CT	34	F	4/3/2021	4/1/2021	<p>This is a spontaneous report from a contactable consumer (patient) reported for herself. A 34-year-old female patient (not pregnant) received bnt162b2 (BNT162B2), via an unspecified route of administration, administered in Arm Left on 03Apr2021 12:00 at 34 years old (Lot Number: ER8734) as single dose, for covid-19 immunisation. Medical history included Anemia, Depression, Chronic Dry Eye, penicillin allergy. Prior to vaccination, the patient was not diagnosed with COVID-19. Concomitant medications included cetirizine hydrochloride (ZYRTEC ALLERGY) taken for an unspecified indication, start and stop date were not reported; lifitegrast (XIIDRA) taken for an unspecified indication, start and stop date were not reported; escitalopram oxalate (LEXAPRO) taken for an unspecified indication, start and stop date were not reported. The patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient previously took pseudoephedrine hydrochloride (SUDAFED) and experienced drug allergy. An hour after the vaccine on 03Apr2021, patient's fingers were red and swollen (like after exercise on a hot day) and she was itchy all over her body. No symptoms for almost 4 days-- then she started feeling intermittently dizzy/lightheaded, feverish every night (chills and hot flashes) for the next 4 nights. She got a wracking cough and was short of breath (couldn't climb a single flight of stairs without needing to lie down for several minutes). She was also extremely exhausted-- slept 20 hours in a single day. After multiple telemedicine and in-person appointments, a trip to urgent care, and a chest x-ray and CT, she was diagnosed with pneumonia and treated with antibiotics, vitamin D, and two inhalers. She missed her period, had an elevated d-dimer, and her white blood cell count dropped from 7.0 Thousand u/L to 3.6. She was incapacitated for 2 weeks-- the sickest she had ever been in her life. The events resulted in doctor or other healthcare professional office/clinic visit and emergency room/department or urgent care. The patient performed Nasal Swab, negative on 11Apr2021. Therapeutic measures were taken for pneumonia. The outcome of the events was recovering.</p>

1320101	5/15/2021	PA	35	M	4/6/2021	4/27/2021	left eye tingling and not able to close with Left side mouth not able to close; left eye tingling and not able to close with Left side mouth not able to close; loss of taste of left side of tongue; Bell's palsy symptoms; Cold with light sneezing; Cold with light sneezing; This is a spontaneous report from a contactable consumer (patient). A 35-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: ER8737), dose 2 via an unspecified route of administration, administered in left arm on 06Apr2021 15:00 as 2nd dose, single for covid-19 immunisation. The patient medical history and concomitant medications were not reported. The patient previously received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EP6955) administered in left arm on 16Mar2021 18:30 for COVID-19 Immunization. Cold with light sneezing developed on 27Apr2021 and Bell's palsy symptoms developed from 28Apr2021 around night before bed (22:45). On 29Apr2021, left eye tingling and not able to close with Left side mouth not able to close and loss of taste of left side of tongue. Doctor diagnosed on 30Apr2021 that it is early stages of Bell's palsy could be due to vaccine or shingles. No symptoms of shingles. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The adverse event result in doctor or other healthcare professional office/clinic visit. The patient received treatment (Bell's Palsy along with Shingles) for the adverse event. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. There is no COVID prior vaccination, no COVID tested post vaccination, no known allergies. The outcome of the events was not recovered. No follow-up attempts are needed. No further information is expected.

A 29-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; solution for injection) via an unspecified route of administration on 28Apr2021 at 16:15 (at the age of 29-years-old) as a single dose in the left arm for COVID-19 immunisation and ibuprofen (ADVIL) from an unspecified date to an unspecified date at an unspecified dose (2) and frequency for an unspecified indication. Medical history included anxiety/depression (mitigated with SSRi) from an unspecified date and unspecified if ongoing. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient had no known drug allergies. Concomitant medications (taken within 2 weeks of vaccination) included escitalopram orally taken for an unspecified indication from an unspecified date to an unspecified date at 10mg, daily. The patient did not receive any other vaccines within 4 weeks prior to the COVID-19 vaccine. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; solution for injection) via an unspecified route of administration an unspecified date as a single dose for COVID-19 immunisation. On 29Apr2021 at 03:00 the patient experienced fell unexpectedly, I injured my nose, tooth, my arm pain is 7 out of 10 and scared to get up. The course of events was reported as follows: "Got up at 3am in the morning to take some Advil. Took 2 Advil then fell unexpectedly. Partner was awake and stated that I did not trip on anything. I did not have any previous dizziness or indications that I was going to faint (no night sweats, no stars or blurry vision, no muscle weakness). I injured my nose, tooth (no significant damage), and was scared to get up. My arm pain is 7 out of 10. I have no previous medical history of fainting after a vaccine." No treatment was received for the adverse events. The clinical outcomes of the events fell unexpectedly, I injured my nose, tooth, my arm pain is 7 out of 10 and scared to get up were recovered/resolved on an unspecified date in 2021. Since the vaccination, the patient had not been tested for COVID-19. The lot number for the vaccine, BNT162B2, was not provided and will be requested</p>

1320023	5/15/2021	NY	29	F	4/15/2021	4/22/2021	during follow up. A retinal vein occlusion, and I noticed right away; I scheduled an appointment with a retina specialist, and I was told I had a small blood clot in my right away; Exactly seven days after, something happened to my right eye that caused me issues with my vision.; This is a spontaneous report from a contactable consumer (patient). A 29-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in arm left on 15Apr2021 18:15 (Batch/Lot Number: EW0162) as single dose for COVID-19 immunisation. Medical history included type 1 diabetes and thyroid issues, allergic to shellfish and to fluconazole. Concomitant medications included insulin and thyroid medication. Exactly seven days after (on 22Apr2021), something happened to patient's right eye that caused issues with her vision. Patient scheduled an appointment with a retina specialist and was told patient had a small blood clot in right away. A retinal vein occlusion and patient noticed right away because it was right in the middle of vision field/where the light enters through in the eye. Patient was type 1 diabetic with perfect control and patient had never had issues with vision (even got checked last year before COVID and no problems). Her endocrinologist did not think it was diabetes related either. The only different thing was the vaccine. Now patient was not sure if she should take the second dose and also her retina doctor wanted her to get checked for further blood clots to make sure she was okay. No treatment was received for the events. The events resulted in physician office visit and disability. Outcome of the events was not resolved.

1320048	5/15/2021	IL		M	4/24/2021	4/25/2021	AFib; has no appetite; all he wanted to do was sleep; felt like he was getting the flu; felt faint; lethargy; This is a spontaneous report from a contactable consumer. A 79-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EP6955 or GP6955), via an unspecified route of administration on 24Apr2021 as single dose for covid-19 immunization. Medical history included atrial fibrillation from an unknown date for 20 years. Concomitant medication included warfarin (MANUFACTURER UNKNOWN), taken for an unspecified indication, start and stop date were not reported. No prior vaccinations within 4 weeks were noted. The patient experienced AFib on an unspecified date with outcome of unknown; felt faint on 25Apr2021 with outcome of recovered on 25Apr2021 (elaborated as felt faint when his head was down by his knees, in which he had to quickly jerk himself up and go sit down), lethargy on 25Apr2021 with outcome of recovering (elaborated as lethargy/he was so lethargic, he could hardly keep his eyes open); has no appetite on an unspecified date with outcome of not recovered; all he wanted to do was sleep (elaborated as that he laid down and his eyes were so heavy in which all he wanted to do was sleep) on an unspecified date with outcome of unknown; felt like he was getting the flu on an unspecified date with outcome of unknown. The patient underwent lab tests and procedures which included body height: 180 (180 cm /5'11"), weight: 72.57 kg (160 lbs) on an unspecified date. Details were as follows: Details were as follows: patient got his first COVID-19 vaccine shot on 24Apr2021. He said he was fine on Saturday. He said on 25Apr2021, he was so lethargic, he could hardly keep his eyes open. He said he got faint, and had to lay down. He said on Sunday, he thought the lethargy and faintness were a side effect of the COVID-19 vaccine, but the lethargy was continuing through to 29Apr2021. He said he also had no appetite, saying his appetite was waning. He said he did not feel like eating anything on 29Apr2021. No emergency room or physician office visit was required. He had AFIB, and that was why he had to worry about blood clots, and the reason he took Warfarin. Lethargic treatment was declined. The lethargy had improved some. He first felt faint around 10:00 an on Sunday. Faint Treatment included cat naps during the day on Sunday, and didn't move around much. The

1320068	5/15/2021	NC	82	M	2/13/2021	2/13/2021	Covid-19 vaccine might have jump started Alzheimer's; Altered mental status; Patient meant he saw things, he talked to people and he was terrible; Depression; Shaking; Went berserk / He is just crazy. Saying and seeing things that was not there; This is a spontaneous report a contactable consumer (wife). An 82 years old male patient (Height: 170 cm and Weight: 66.68 kg) received the second dose of BNT162B2 (Pfizer-Biontech Covid-19 Vaccine, Lot Number: EN6201) intramuscularly, in the right arm, at single dose, on 13Feb2021 at 10:20, for COVID-19 immunization. Relevant medical history included high cholesterol, high triglycerides and high blood pressure, all from an unspecified date, all diagnosed at least 10 or 15 years and acid reflux (esophageal), from an unspecified date. The patient previously, on 19Jan2021, received the first dose of BNT162B2 (Pfizer-Biontech Covid-19 Vaccine, Lot Number: EL3249) at single dose, in the left arm, for COVID-19 immunization. After the first dose, the patient experienced shaking ("the patient was a little shaky following the first dose of the Covid-19 vaccine on 19Jan2021, but it was nothing major") and was nervous ("the wife reported that when it was time to get the second dose on 13Feb2021, the patient was so nervous to get the shot that he was too nervous to drive"). Concomitant medications included hydrochlorothiazide 12.5 mg, once daily, in the morning, from an unspecified date to Apr2021, for high blood pressure; eicosapentaenoic acid ethyl ester (VASCEPA) 1 mg, twice daily, from an unspecified date to Apr2021, for blood triglycerides; atorvastatin 40 mg, once daily, from an unspecified date to Apr2021, for blood cholesterol; omeprazole from an unspecified date, for an unknown indication; colecalciferol (VITAMIN D (colecalfiferol)) from an unspecified date, for an unknown indication and an unspecified multi vitamins. On 13Feb2021, the patient experienced altered mental status, illusion ("patient meant he saw things, he talked to people and he was terrible. He was saying people called to him. He wanted to go outside; vision illusions like people were calling him to come outside"), depression, shaking and he was feeling abnormal ("he went berserk. He was just crazy. Said and saw things that was not there. Patient was hearing people calling him to go outside"). The patient might have Alzheimer's. Patient's wife reported that the

physician stated that the Covid-19 vaccine might have jump started Alzheimer's. Treatment was received. Patient was prescribed donepezil, ondansetron, quetiapine, escitalopram, trazodone, and sertraline after he went berserk to help with altered mental status. None of the medications worked. Patient also received risperidone. Patient's wife reported that even with the risperidone, the patient was not his complete self like he was before he received the Covid-19 vaccine. Risperidone helped some. Relevant laboratory tests, performed on an unspecified date, in 2021, included: computerised tomogram head (CT brain scan) normal, lumbar puncture (Spinal tap) normal, and magnetic resonance imaging head (MRI brain) normal. Clinical outcome of the events was unknown at time of this report.

1320082	5/15/2021	FL	40	F	4/23/2021	4/1/2021	difficulty walking; difficulty with speech / slurred speech; fingers are going numb holding the phone; feels like she is coming down with a respiratory illness; nausea; vomiting; cough; sweating; headache; body pain, achy and uncomfortable; body pain, achy and uncomfortable; overall feeling badly; cognition was not there; Problems with breathing; aspirating; sleepiness; fatigue; stomach pain; her nerve response is strong/affected; swelling in hands and feet; had arm soreness; This is a spontaneous report from a contactable consumer (patient). A 40-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number: EW0162), via an unspecified route of administration in the left arm, on 23Apr2021 at 15:00 (at the age of 40-years-old) as a single dose for COVID-19 immunisation. Medical history included ongoing neuropathy (few years ago, at least since 2015 or 2016), seizures or epilepsy (had focal/absence seizures since a kid; not on any seizure medication, do have a neurologist), hard time with her vision, cancer from an unspecified date to an unspecified date (cancer as a teenager but has been cancer-free for a very long time), and glaucoma. The patient had a family history of cancer and heart problem. Concomitant medications included latanoprost (MANUFACTURER UNKNOWN) taken for glaucoma from Apr2021 and ongoing and gabapentin (MANUFACTURER UNKNOWN) taken for neuropathy from an unspecified start date and ongoing. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot number: ER8730), intramuscularly in the left arm, on 02Apr2021 for COVID-19 immunisation and experienced not very many side effects with first dose, not enough to be a problem; influenza vaccine (MANUFACTURER UNKNOWN) in 2021 (maybe) for immunisation; and polio vaccine (MANUFACTURER UNKNOWN) as a child for immunisation and experienced severe pain in her legs and she had trouble walking because of pain. The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient experienced difficulty walking and difficulty with speech / slurred speech on 23Apr2021, which required hospitalization from Apr2021 to 26Apr2021. The patient also experienced body pain, achy and uncomfortable, overall feeling badly, cognition

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

was not there, and problems with breathing on 23Apr2021; sweating and headache on 26Apr2021; vomiting and cough on 27Apr2021; feels like she is coming down with a respiratory illness and nausea on 28Apr2021; sleepiness, fatigue, stomach pain, her nerve response is strong/affected, swelling in hands and feet, aspirating, and had arm soreness in Apr2021; and fingers are going numb holding the phone on 29Apr2021. The clinical course was reported as follows: The patient stated that she works in healthcare support and she is a first responder; she identifies as a person with a disability (unspecified). She stated that she did not have very many side effects with first dose, not enough to be a problem. By dinnertime, closer to 18:00-19:00 on 23Apr2021, she started experiencing difficulty walking and with her speech. She was concerned about having a stroke but that she is active and generally healthy. This was unusual for her and she started feeling pain through her body and overall feeling like crap. She did not expect the neurological stuff. By the end of the night on 23Apr2021, she realized she was not feeling good and went to the hospital either that night on 23Apr2021 or early the next day on 24Apr2021 and was admitted to the hospital. The patient stated that her cognition was not there, and her speech was kind of slurry, she felt like everything was slowing, and did not feel like herself. She could not get up unassisted, could not get up out of the bed, chair, or go to bathroom, and still requires the use of a walker and bedside commode, but now with the walker and assistance caller can make it to the bathroom. She also had problems with breathing, but she had a negative COVID-19 PCR test in Apr2021 both arriving to and leaving from the hospital; she did not believe them to be COVID-19 symptoms. At the hospital they did an x-ray or computerized tomography (CT) scan and a magnetic resonance imaging (MRI) on her brain in Apr2021 with unknown results. They gave her 3 or 4 intravenous (IV) unspecified medications and she had her complete blood count (CBC) labs done in Apr2021 with unknown results. There was an issue with her lungs, and she is currently waiting for her doctor to read report to see if there is an issue there. The patient stated that she never experienced anything like this after a vaccine. She cannot even get up and move around it is pretty serious. Caller states that at first when she had the symptoms,

VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

she thought she was going to wait it out, maybe her immune system is overresponding, give it a chance to resolve. She reported that she could not stand up, legs were shaking and that she had pain that was from her breasts down; felt like a ton of bricks. The patient stated that she is cognitively alert now, speaking normal. There are times it goes in waves where she feels like she can walk with walker but then a few hours later that is not the case. On Tuesday, 27Apr2021 night, the patient had a light dinner but then she was vomiting. Caller states that the pain was throughout her body and felt like someone lighting firecrackers. The patient initially stated 28Apr2021 was when the cough started, but later clarified she first noticed it on 27Apr2021, but at that time she was vomiting and thought it was due to that. However, the next day 28Apr2021, she still had this cough and that the cough was getting worse. She felt like she has a respiratory issue and has been coughing. She was not able to stay awake, even without taking any medications. She does take medications regularly but did not take the medications those days and not having medications would not cause sleepiness. She thought the doctor gave her sedative, but they did not. She states she had fatigue to the point where she was dead asleep, and nurse would come in to take vitals or do whatever and she would wake up suddenly with someone in front of her. She was sitting up with the nurse trying to read the discharge instructions and she fell asleep sitting up. She also complained of stomach pain. The patient had not been to work and not been having to use her brain and talking like she would for 8+ hours a day. She stated that the cough hurts, it feels like somebody is lighting firecrackers in her body. It also feels like this when she sneezes; the nerve response is strong. She reported that it is not a constant hacking cough, not really a dry cough; the cough is in-between productive and dry cough and cough is a bit better now and worse towards the evening. She still has swelling in her feet and hands. It looks like it has gone down a bit. She has a history of neuropathy and that her fingers are going numb holding the phone now. She got the shot in her left arm and those fingers are going numb. She was so tired and feels like did not get enough sleep. The fatigue had a slight improvement. She is more awake than when she was in the hospital. However, it depends as the day goes on, she is wiped

VAERS\_ID RECVDDATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

out and has to go lay down. She stated that her nerve response is affected, and she had a difficult time with the neuro exam in Apr2021 with unknown results in the hospital. She was having an issue with her arms. She can't say anything about whether it affected her vision because she already has a hard time with her vision. She stated that she was throwing up pretty bad; the pain was really severe through her whole body while vomiting. After the vomiting stopped, the coughing got worse and she was coughing a little bit before the vomiting, but during the vomiting it was to the point she felt like she was drowning. She reported that she was vomiting through her nose and aspirating. After her MRI she started to get a really bad headache. Then when the nurse was coming to read the discharge information, she started to get sweats. She is not menopausal so she cannot blame the sweating on menopause, as reported. The patient also had arm soreness, but does not care about that long as it does not leave any scars. This was not a big deal for her at all. This started shortly after getting the vaccine. She waited for the observation time and no sensation out of the normal, then later towards the night started feeling like having really bad mensural cramps, like an achy feeling where have to go lie down. Then her lower half started to get worse. Her arms were affected and difficult time with the neuro testing. The patient stated she is now on the road to recovery. The clinical outcome of difficulty walking, difficulty with speech / slurred speech, body pain, achy and uncomfortable, nausea, sleepiness, fatigue, and stomach pain was recovering and of overall feeling badly, cognition was not there, problems with breathing, sweating, headache, vomiting, cough, feels like she is coming down with a respiratory illness, her nerve response is strong/affected, swelling in hands and feet, aspirating, had arm soreness, and fingers are going numb holding the phone was unknown.

1321254	5/15/2021	CA	17	M	5/15/2021	5/15/2021	At 1249, 17-year old male client was administered Pfizer COVID-19 vaccine 2nd dose (Lot # EW0182, expiring 08/2021) in the right arm by registered nurse (RN) vaccinator. Client accompanied by mother. RN vaccinator requested emergency medical technician (EMT) assistance due to client report of feeling sweaty, tingling in both hands, and client nearly falling forward. EMT responded and brought gravity chair to vaccinator table and assisted client into gravity chair. Vital signs at 1257: blood pressure 95/60, heart rate 50, oxygen saturation 97%. RN lead assessed client. Client reported feeling tired and tingling in both hands. Client reported not eating breakfast. Client's Mother reported that client closed eyes and put his head down immediately after vaccine administration, then opened his eyes after 3 seconds. Client's mother reported client does not have allergies or chronic conditions and had sore arm after 1st dose of Pfizer. Client denied any other side-effects to first dose. Client's mother reported client has aversion to needles. Client and client's mother were provided vaccine education, were encouraged to follow-up with client's primary care provider, and encouraged to report side-effects on website. Client was advised that he will be observed for at least 30 minutes. At 1300, client stood up from chair unassisted, walked to observation area unassisted with steady gait, and sat down in gravity chair. Client was provided one bottled water and two granola bar snacks. Vital signs at 1307: blood pressure 125/63, heart rate 62, oxygen saturation 96%. Client reported tingling was resolving. Vital signs at 1317: blood pressure 125/72, heart rate 57, oxygen saturation 97%. Client reported side-effects resolved and feeling better. Client reported driving to vaccine site and felt safe to drive. At 1325, client stood up from gravity chair unassisted and walked out of vaccine site unassisted with steady gait accompanied by mother.

1321111	5/15/2021	OH	20	M	5/15/2021	5/15/2021	Apx 10 minutes after vaccine administration, Patient became non-responsive, his eyes rolled back in his head, and appeared tonic. His mother said this has never happened to him before. When he recovered he was disorientated and complained of blurred vision. He later said he thought he fell asleep. It is unknown if this is related to the vaccine. We took his pulse (apx 50 bpm) and gave him water. We called 911 and the paramedics evaluated him in the ambulance.
1321119	5/15/2021	CA	14	M	5/15/2021	5/15/2021	At 0950, client requested assistance from emergency medical technician (EMT). EMT's responded and brought gravity-chair. Client reported feeling dizzy, nauseous, blurry vision, and hard of hearing. Client was assisted into gravity chair. EMT obtained vital signs at 0954: blood pressure 110/78, heart rate 67, oxygen saturation 97%, respiratory rate 18, alert & oriented x4, skin was warm and dry to touch. Registered Nurse (RN) was alerted and assessed client. Client's father accompanied client and reported client had no allergies or chronic conditions. Client is not taking any medications. Client reported eating cereal for breakfast. RN provided vaccination education and was encouraged to follow-up with primary care provider to report the reaction and to complete the survey on VSAFE. Vital signs at 1002: blood pressure 108/78, heart rate 71, oxygen saturation 99%, respiratory rate 20. Client reported symptoms decreased to a ?3/10? from a ?10/10?. Vital signs at 1007: blood pressure 112/68, heart rate 80, oxygen saturation 99%, respiratory rate 16. Client reported symptoms mostly resolved. Vital signs at 1014: blood pressure 108/70, heart rate 81, oxygen saturation 97%, respiratory rate 18. Vital signs at 1024: blood pressure 102/66, heart rate 65, oxygen saturation 99%, respiratory rate 18. At 1030, client stood up from gravity chair unassisted and walked out of vaccine site unassisted with steady gait.

1321132	5/15/2021	CA	14	M	5/15/2021	5/15/2021	Adverse event: RN called to vehicle by father who was yelling for help. Once RN arrived at vehicle opened passenger door to find patient fluttering eyes after father stated he had just passed out. Patient was clammy, pale, and diaphoretic. RN advised patient to take slow deep breaths. Patient followed instructions, stated his name and said he felt 'funny'. Pulse taken and was HR 58. Then vehicle was moved to the side and vital signs were taken at 1301. BP 82/42, HR 80, RR 13. Patient was alert, oriented and answered questions appropriately. Treatments: RN and Charge RN present and spoke to both Father and patient about potential contributing factors to episode. Patient given water and gatorade. Able to finish bottle of gatorade and stated his symptoms had improved. Second set of vitals taken at 1324. BP 116/72, HR 82, RR 16. Patient also stated he had a banana for breakfast. Advised patient to stay hydrated, eat lunch, and rest. Advised father to reach out to pediatrician if any further events or questions about today event
1321140	5/15/2021	CA	78	F	2/4/2021	2/12/2021	My mom, got her first Moderna shot on Feb. 4th, 2021 and developed thrombosis in the legs about a week later. She went to the doctor, who at first didn't want to see her and told her to elevate her leg. Pt. had a scheduled eye appointment on Feb. 12th with an other doctor and when she asked if she had any other issues, pt. showed her her leg. The eye doctor immediately told her to go to urgent care. When she did she received blood thinners and started injections in her stomach for 5 days. Feb. 18th pt. suffered a mini stroke and went to the hospital emergency room. She was transferred over to another facility in the afternoon and kept overnight. She had a phone appointment with the Dr. on Feb. 24th and on the 26th she received a heart monitor to wear for 2 weeks. She also had a check up about her leg, which was still swollen. On March 4, pt. received her second Moderna shot and she was feverish and very tired for days and weeks after. By March 18th her condition didn't improve at all and in fact she was feeling really bad over night, so on March 19th she was admitted again to the hospital. She was monitored and kept over night, but during the early morning she suffered a stroke and a heart attack and passed way the next day.

1321144	5/15/2021	CA	14	F	5/14/2021	5/14/2021	<p>Patient received the 1st COVID vaccine (Pfizer lot # EW0182 use by 5/15/2021) at 1455. The client had a history of fainting (x3) with intramuscular injections. The client reported eating lunch prior to arriving for her appointment. The client was vaccinated in the anti-gravity chair at 1455 by EMT. The client became very pale about 1 minute following the vaccination administration and she loss consciousness for 5 seconds, during this time she had 2 myoclonic contractions. RN and EMT immediately placed the patient in Fowler's position in the anti-gravity chair during the syncopal episode. The patient immediately regained consciousness and was alert and oriented to person, place, time, and situation. The patient remained in Fowler's position and vitals were taken at 1456: BP 125/95 (R arm), HR 45, RR 18, and oxygen saturation at 95%. The patient denied experiencing lightheadedness, shortness of breath, dizziness, nausea, headache, or blurry vision. The patient was given a juice box. The patient's color slowly returned. Vitals were retaken at 1505: BP 123/82 (R arm), RR 20, HR 50, oxygen saturation at 98%. The patient stated, "I usually feel really bad after I faint but this time I feel fine." Vitals at 1510 were as follows: BP 130/70, RR 18, HR 67, oxygen saturation at 100%. The patient was speaking in full sentences and laughing with her friend. Vitals taken at 1515: BP 125/ 68, RR 16, HR 68, oxygen saturation at 99%. The patient was positioned from a Fowler's position to sitting upright. The patient's color returned to her face and she denied any nausea, dizziness, blurred vision, double vision, or chest pain. Vitals were taken at 1520: BP 125/70, HR 82, RR 16, oxygen saturation at 99%. At 1524, the patient's blood pressure was 125/68 and HR was 58. The patient continued to deny any shortness of breath, dizziness, nausea, or vision changes. The patient's heart rate was taken at 1531, HR 55 and again at 1536, HR 62. The patient's mother stated her daughter was currently taking an antibiotic for acne (dosage and name unknown) and denied having any drug allergies or chronic medical conditions. RN instructed the patient and her mother about emergency precautions and to follow up with their primary care provider. RN, also educated the patient and her mother about the importance of informing the healthcare provider about her history of fainting with injections when receiving the second COVID Pfizer vaccine. Gave the patient's mother V-safe</p>

1320295	5/15/2021			U	4/21/2021	4/21/2021	Tunnel vision; Dizziness; Nausea; ringing in ears; Flushed face; chest pressure; my blood pressure up; fatigue; headache; fluctuation with blood pressure and heart rate; fluctuation with blood pressure and heart rate; chest pain; This is a spontaneous report from a contactable consumer (patient). A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 21Apr2021 (Batch/Lot number was not reported) as 2nd dose, single for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient also received first dose of BNT162B2 on 22Mar2021 for COVID-19 immunization and experienced fatigue, headache, ear ringing, and flushed face that lasted a couple days; and fluctuation with blood pressure and heart rate and chest pain which resulted to hospital admission. The patient mentioned that with the second dose, the patient had just typical reaction with the first one (such as fatigue, headache, fluctuation with blood pressure and heart rate, and chest pain) on unspecified dates in 2021. The patient also mentioned that immediately like within 20 minutes following second dose on 21Apr2021, the patient had like tunnel vision, dizziness, nausea, ringing in ears, and flush face. The patient further stated, "Well here is my problem, I am having this, it will go away for a day and then it'll come back worst, and today is the worst it's been. I was fine this morning but for 10 hours now, my heart rate is up, it's just in the 90s, I have chest pressure, my blood pressure up. This morning when I got up and I didn't have any symptoms, my pressure was 107 over". Outcome of the events was unknown. Information on the lot/batch number has been requested.

1320249	5/15/2021	TX	37	M	4/12/2021	4/13/2021	migraines; dizziness off and on; Severe chronic headaches; fatigue; little lethargic/feeling lethargic; sensitivity to light; balance is off/was going left and right trying to stay in balance; hypersomnia; not been able to work or drive since being vaccinated; vision impairment; This is a spontaneous report from contactable other HCP. A 37-years-old (current age of 37-38 when the reported events began) male patient received first dose of BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine, Formulation: Solution for injection, Batch/Lot Number: EW0I58; expiration: not reported), intramuscular, administered in arm right on 12Apr2021 16:00 as single for Covid-19 immunisation/covid precautions, not wanting to get covid at pharmacy or drug store. The patient medical history was none. Concomitant medication(s) included vortioxetine hydrobromide (TRINTELLIX; received within 2 weeks of vaccination). No additional vaccines administered on same date of the Pfizer suspect, no other prior vaccinations (within 4 weeks prior to the COVID vaccine), no relevant family medical history. The patient was not diagnosed with COVID-19 prior to vaccination and since the vaccination. No other products and no investigation assessment. On 13Apr2021, the patient had headache, sensitivity to light, was feeling lethargic, balance was off, fatigue, and hypersomnia. The headache and vision impairment (start date: 13Apr2021) were ongoing and began the very next day after the 1st dose of the Pfizer COVID Vaccine and at first the headache was very severe and now was just different and his headache kind of moved around and was always constant and persistent and got better and then boom it came back. The patient had been a little lethargic (start date: 13Apr2021) and that began the same day as the headache and vision impairment which was the very next day after the 1st dose of the vaccine. Dizziness (start date: 13Apr2021) began the very next day after the vaccine and was almost like an imbalance of whenever he was walking, he noticed he was kind of not walking a straight line almost and was going left and right trying to stay in balance (start date: 13Apr2021) and this was a little bit better. After the 1st dose the patient was getting a little concerned right now because he got the vaccine about three weeks ago and ever since he had been having severe chronic headaches and vision impairment that was ongoing and began the very next

day after the 1st dose of the vaccine; the patient was a little lethargic, kind of had dizziness off and on and went to his PCP, had an MRI, and was sent to a neurologist. The patient was taking Advil, Motrin and Tylenol that were not helping his migraines (start date: unspecified) and nothing from the bunch of medications the neurologist gave him were working to help and stated Nurtec ODT (lot 3990840, expiry date Oct2022 and NDC 72618-3001-1) 75mg once daily and Nortriptyline 10mg (orange pharmacy bottle with no lot, expiry date or NDC) supposed to be one capsule the 1st week and then two capsules after that by mouth. Motrin, Advil and Tylenol (no lot numbers, expiry dates or UPC numbers to provide because he ran out of those and threw the bottles away when he was done and has been meaning to get more but has not). Unspecified medicines, Toradol IV were given as therapeutic measure. The patient was not sure about the dates regarding his MRI (MRI was maybe a week and a half after this all started and then maybe a week after that he saw the neurologist). Headaches kept him up to night also and the patient had been to neurology, ophthalmology consultation, and received an MRI. The adverse events resulted in disability or permanent. The patient had not been able to work or drive since being vaccinated. The patient had no further treatment and had not gone to the ER but was under advisement that he was to go to the ER, but he could not afford to go to the ER. The patient had not had the 2nd dose of the Pfizer COVID Vaccine yet and his PCP and neurologist both agree that he would not be getting the 2nd dose of the vaccine due to the reactions he has had. The patient was calling to see if Pfizer offered help as he was without insurance and his PCP said he might need to send the patient to the hospital which might be out of the question and he was calling to see if Pfizer could help him with anything as he has not been at work for three weeks and the headache was not going away. The patient underwent lab tests and procedures which included magnetic resonance imaging with no results on unspecified date and nasal swab (sars-cov-2 test) was negative on 15Apr2021. The outcome for little lethargic/feeling lethargic was not recovered, severe chronic headaches was not recovered, sensitivity to light was not recovered, balance is off was not recovered, fatigue was not recovered, hypersomnia was not

1320321	5/15/2021	MO	54	M	1/19/2021	4/30/2021	I awoke with distorted vision in my Left eye.; a stroke; visual impairment; This is a spontaneous report from a contactable Other Health Professional (patient). A 54-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection) (at 54 years of age), via an unspecified route of administration, administered in arm left on 19 Jan 2021 at 19:00 (Batch/Lot Number: EL3302) as 2nd dose, single for COVID-19 immunization. The patient's medical history was not reported. Concomitant medications included omeprazole (PRILOSEC [OMEPRAZOLE]), rosuvastatin, metoprolol, and ezetimibe (ZETIA), all taken for an unspecified indication, start and stop date were not reported. Historical vaccine included BNT162B2 (lot number: EL1284) in the left arm on 29Dec2020 07:00 PM for COVID-19 immunization. The patient did not receive any other vaccine within four weeks prior to COVID-19 vaccine. He was not diagnosed with COVID-19 prior vaccination. It was reported that the patient awoke with distorted vision in his left eye. He went to the emergency room and was diagnosed with a stroke. He was subsequently transferred to the (hospital name) Level 1 Stroke Center. He continued to have visual impairment. The events started on 30Apr2021 07:00 AM. The patient was hospitalized for 5 days. The events was reported serious life-threatening, hospitalization and disabling/incapacitating. Therapeutic measures were taken as a result of the events with TPA. He had been tested for COVID-19 since the vaccination through rapid test (nasal swab) on 01May2021 with negative result. The outcome of the events was recovering. No follow-up attempts are needed. No further information is expected.

1320975	5/15/2021	WI	79	F	4/12/2021	5/14/2021	<p>Patient had been working all day in her flower gardens. At 4:30 p.m. she felt like she had double vision and difficulty talking. She does not remember much of what happened after that, but her husband said she had sudden onset of right arm weakness, leg weakness and drooping of the right side of her face. Denies having numbness. He immediately called 911 and EMS took her to the Hospital. She had a CT scan of the head that was negative. When she arrived at the emergency room her symptoms had resolved, but she had recurrent episode of her symptoms in the emergency room with an NIH score of 5 scoring a point for level of consciousness, best language, and dysarthria and 2 points for facial droop. She was given tPA and her symptoms resolved. A CT angio of her head and neck did not show any large thrombus. She was transferred for ongoing care and neurology evaluation. Neuro deficits resolved. Patient was discharged the second day after the event on Aspirin, Plavix and Lipitor. Hospitalist (Dr) asked me to file VAERS report given recent Janssen vaccine administration.</p>

1320324	5/15/2021	FL	51	F	4/15/2021	4/15/2021	Immunocompromised; patient is skinny/underweight; having a multiple sclerosis relapse/Multiple Sclerosis flared up after she got the vaccine; double vision that is intermittent and unilateral; had a funny feeling around the lips, tongue, and on the left side of her face; This is a spontaneous combined report from a contactable consumer (patient) via Pfizer. A 51-years-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, formulation: solution for injection, Batch/Lot Number: EN6199) (51 year at the time of vaccination) via an unspecified route of administration in arm left on 15Apr2021 at 10:30 as single dose for COVID-19 immunization. The patient did not receive any other vaccine within 4 weeks prior to the vaccine. Medical history included multiple sclerosis from 2000 and ongoing. The patient's concomitant medications were not reported. On 15Apr2021, after the first dose the patient started experiencing double vision and had funny feeling in her lip, tongue and left side of the face (started prior taking the vaccine). The patient said she might be relapsing from multiple sclerosis. The patient was confused whether she should take the second dose of the vaccine. The patient also received IV methylprednisolone (3gm) (to be administered over 2 hours for three days) and taking prednisone for her double vision which comes and goes. Patient stated she had been immunosuppressed due to being on prednisone for 7days. The patient went to the health care professional and the health care professional gave her a steroid and patient stated the steroid was not responding to the double vision. The patient reported that she does not remember having any issues with her eyes subsequent to taking the vaccine which could be coincidental or nothing to do with the vaccine, but she then developed double vision which was getting worse. The patient also reported that she was skinny and underweight. The patient took 3 grams of Solumedrol IV and it did not help her. Therapeutic measures were taken in response to the events and the patient also had to visit emergency room. The outcome of the event's multiple sclerosis relapse, double vision, immunocompromised and skinny/underweight was unknown while for the event funny feeling around the lips, tongue, and on the left side of her face it was reported as not recovered. Information on Lot/Batch number was available. Additional

1320380	5/15/2021		33	F	12/1/2020		<p>angioedema; hives; in lips tingling at times; itching; rash; This is a spontaneous report from a non-contactable other hcp. A 33-year-old female patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Formulation: Solution for injection, lot number: Unknown) dose 1 via an unspecified route of administration on Dec2020 (at the age of 32-year-old) as single, and dose 2 via an unspecified route of administration on Jan2021 as single for covid-19 immunization. The patient medical history and patient's concomitant medications were not reported. On 2021, Reporter's daughter had the first Pfizer vaccine in DEC 2020. The second in JAN 2021, 10 days after she broke out in hives and had some angioedema, in lips tingling at times, no throat closures. Eye angioedema was the first sign, around the eyes, that went away and was off and on. On day 10 she woke up with this and has had it ever since. angioedema of the lips on and off. Since Jan 21 she's been headed to toe with hives they never go away, some days her legs are just covered. On 2021, the reporter sated that, 5 days after 2nd vaccine angioedema around both eyes and that was gone now, she's been to dermatologist, immunologist and primary care physician and they've tried, prednisone, IV Benadryl, Zyrtec, Allegra, also done oatmeal baths for itching, dermatologist wanted to put her on cyclosporine, she didn't want to go on it because it's a strong antibiotic. They also gave her pepcid. Reporter asked to have anyone else had anything like this and why it is lasting so long. Reporter stated that everyone was saying, it's an immune response, and give it time and see if it goes away. her daughter woke up in a huge snowstorm the first time she had the angioedema with Mouth, she went to the Emergency Room, they gave her IV Benadryl, kept her there for a little while, sent her home on prednisone pack, not tapered, just 5 days of high dose prednisone. When the prednisone was finished, it came back with a vengeance. Then she went to her Primary Care Physician to see if she had any suggestions. They wanted her to go back on the Prednisone but on a tapered dose, but, she didn't want to take it because she was afraid it would come back worse than ever. It never got better, not even on the high dose prednisone. Other than put her on the prednisone, there wasn't really anything more. 4 Months later it hasn't settled down.</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

Reporter asked her daughter to come to where she lives and see Dermatologist, and he ordered a bunch of labs and got it back and it all looked fine. He wanted to start her on cyclosporine, she wanted to wait, didn't want to take it. Reporter stated, "It wipes the immune system out. They give it to transplant patients. they all say It's an immune response, it should settle down. Her daughter has been trying to change her diet, eating things low in histamines, cut out tomatoes, cut out cheeses, everything high in histamines, it doesn't make a difference. Reporter stated, One day they are not quite so bad and then she wake's up and she was covered. Her daughter can't walk, or swim cause hot and cold makes her break out, or makes it worse, because it never goes away. The following adverse reactions have been identified during post authorization use of Pfizer BioNTech COVID-19 Vaccine. Because these reactions are reported voluntarily, it is not always possible to reliably estimate their frequency or establish a causal relationship to vaccine exposure. Immune System Disorders: severe allergic reactions, including anaphylaxis, and other hypersensitivity reactions (e.g., rash, pruritus, urticaria, angioedema). The outcome of the events was reported as unknown. No follow up attempts are possible. Information about lot/batch number cannot be obtained.; Sender's Comments: As there is limited information in the case provided, the causal association between the events and the suspect vaccine BNT162B2 cannot be excluded. The case will be reassessed once new information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

1320448	5/15/2021	MN	14	M	5/14/2021	5/14/2021	<p>Patient is a 14 YO male with no previous medical history that received the Pfizer vaccine administered into his left Deltoid at 1406. He was sent to the observation area where the nurse noted him looking pale at 1410. His mother was present during this whole event. He was taken over to the medical tent for privacy and further evaluation. He was complaining of being light headed. He was given apple juice and crackers as he had stated that he had not eaten or drank anything all day. At 1430 his VS read BP 132/80, HR 145, O2 99%. At this time he was lying down and feet elevated, shaking, pale, and cold. Lung sounds clear. Nausea but not needing to throw up he was covered up to try and keep him warm. At 1440 his blood pressure was 130/82, HR 130, O2 98%. At this time he was lying flat with feet elevated, shaking, pale, and cold. His lung sounds clear. Nausea, but not needing to throw up. At 1450 BP 138/74, HR 120-135, O2 98%. Symptoms had not changed at this point except he mentioned his ears felt cold, although they were warm to touch. He was laid on his left side at this point to try and lower his HR, which did come down to 115-125 when on his L side. We did not take a BP at this point as we wanted him to be on his back when taking them. At 1515 he was laid back on his back to see how his HR would do and how his BP was. BP 138/60, HR 135, O2 98%. Again symptoms were the same except he was complaining of colors being more ?dull?, and his teeth being numb. At this point his pupils were noted to be +8, equal and reactive. 1521 VS read 138/50, HR 135, O2 98%. Vision still dull and pupils unchanged from 1515. He was laid on his R side to see if this would lower his HR. It was brought down to 120-130 on his R side. We gave him a cookie to snack on to see if that would help with any of the paleness, shakiness, and light headedness. He was able to take a few small bites. Hands pale and washed, with +1 bilateral radial pulses. 1529 he was sat up slowly to try to get him to hydrate, as it was apparent he needed fluids onboard. His BP read 142/80, HR 124, O2 98%. He was still complaining of lightheadedness. After sitting up and drinking half a bottle of water and some cookie, he stated that colors were becoming more vibrant. He noticed my eyes were very blue, which previously he had stated they were grey. He stated his lightheadedness had improved and that he was feeling better. We had him sit up for a while and his color started to come back,</p>

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

although his L arm was still pale, of note this was the Vaccinated arm. At 1546 his VS read 150/82, HR 117, O2 99% while sitting. His only complaint was feeling like the air he was breathing ?was cold?. At 1607 he was stood up and when doing so his HR went to 140. After standing for about 4 minutes his BP read 120/82, HR 114, O2 98%. His pupils +6 , equal, round, and reactive. He was feeling way better and his color in his L hand was back equal to his right. He was slowly walked around a chair just to see how he would do with activity. His HR was anywhere from 94-120 when walking around the chair, he complained of no dizziness, or other symptoms. At this point he had finished 2 apple juices, crackers, a cookie, and a bottle of water for a total of 1.5 L of fluid. He was sat back down in the chair to rest and see how things went for a while. His HR was anywhere from 109-120 when in the chair, although he did appear very anxious through this whole process. When he was given a task it appeared that his HR was a few points lower. His final HR was 109, BP 130/82, O2 98%. Of note he did complain of his feet and fingers feeling tingly a few times during this process. Sometimes his feet would be tingly when elevated and then when the garbage can holding them up was readjusted it resolved. These were intermittent complaints. At this point it is 1630. He has responded to fluids and is stable to go home with his mom. It was recommended for him to increase his fluids tonight, and to eat something. He was sent with a bottle of water. It was also recommended to get a pulse ox machine from a pharmacy so that his HR could be monitored and if it does not come down under 100 by tomorrow to make an appointment with his MD to follow up. If any of these symptoms were to come back or if his mom had any concern at all it was recommended to take him to the ED for observation. It was also recommended to follow up with his primary even though he left stable. Throughout this process, I considered administering Epinephrine. The problem was his BP was not low and we could not get his HR to come down. I did not want to increase his HR any more than it already was unless I was absolutely necessary. Given that he responded to fluids, it was decided not to administer it. Given that it took him 2.5 hours to recover from this vaccine, I strongly recommend that he does not get his second dose. I consider this to be an adverse reaction,

1320244	5/15/2021	IL	59	M	3/12/2021	3/1/2021	Rheumatoid arthritis flare up; Pain in joint involving hand; Injection site papule; Bruising; Sprain; Dizziness; Loss of balance; Sickness; Vision decreased / Bilateral abnormal vision; Blurring of eyes; fatigue; bumps from the injector pen; Pain in extremity / ARM PAIN; This is a solicited report from non-Pfizer sponsored program received from a contactable physician based upon information received by Pfizer from company (21K-163-3820459-00). A 59-year-old adult make received the first dose of intramuscular BNT162b2 (solution for injection; Lot EL3248 expiry information not provided) as a single dose on 12Mar2021 (at 59-years-old) for COVID-19 immunisation. The patient also started to receive subcutaneous adalimumab (HUMIRA, unspecified formulation) 40mg at an unspecified frequency from an unspecified date for arthritis. Relevant medical history included rheumatoid arthritis, inflammation, high blood pressure, red face, red skin, used cane for walking because he could not walk (before adalimumab), and a loss of hearing in the left ear (one month prior to starting adalimumab). It was unknown if patient was enrolled in a COVID-19 Vaccine Trial. Concomitant medications included sulfasalazine for inflammation; lisinopril for high blood pressure; and another [unspecified] medication for inflammation. The patient previously received treatment for inflammation with steroids which were not good enough. On an unspecified date in Mar2021, after receiving the vaccine, the patient developed arm pain, it made him tired, he had dizziness, fatigue almost every time, and a loss of balance. The patient had bumps from the injector pen/ Injection site papule, Pain in joint involving hand, bruising, sprain, and sickness. On an unspecified date in Apr2021 the patent experienced bilateral abnormal vision/vision decreased and blurring of eyes. On 09Apr2021, patient received second dose BNT162b2 (solution for injection; Lot EL3302 expiry information not provided) as a single dose. The action taken with adalimumab was unknown. The outcome of the event Sickness was recovered on an unspecified date. The outcome of the events bilateral abnormal vision/vision decreased, blurring of eyes, and fatigue, was not recovered. The outcome of the events pain in extremity / arm pain, bruising, sprain, dizziness, loss of balance, was recovering. The outcome of the events Pain in joint involving hand, Injection site papule, and

bumps from the injector pen was unknown. The reporter's assessment of the causal relationship of the event with the suspect product BNT162b2 was not provided at the time of this report. Since no determination has been received, the case is managed based on the company causality assessment. No follow-up attempts possible. No further information expected.; Sender's Comments: Based on available information, a possible contributory role of subject product, BNT162B2 vaccine cannot be excluded for the reported events of Injection site papule, Pain in joint involving hand, bruising, dizziness, loss of balance, fatigue and sickness, based on temporal relationship. Based on the information provided by the reporter, it appears unlikely that the subject product contributed to the RA flare and other reported events, which likely represent intercurrent medical conditions. There is very limited information provided in this report. This case will be reassessed upon receipt of follow-up information. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1320166	5/15/2021	IN	71	F	4/26/2021		Have some kind of bleeding issue I am on warfarin; Hard of hearing; leg started swelling a week; Eye pain, they hurt; Low grade fever with a 100; chills; This is a spontaneous report from a contactable consumer. A 71-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration, administered in Arm Left on 26Apr2021 (Batch/Lot Number: EW0161) as 2nd dose, single for COVID-19 immunization; warfarin, via an unspecified route of administration from an unspecified date (Batch/Lot number was not reported) to an unspecified date, at an unknown dose for bleeding issue. Concomitant medication included simvastatin; and furosemide (LASIX) taken for an unspecified indication from 26Apr2021 to an unspecified stop date. The patient previously took BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), 1st dose on 25Mar2021 (lot number: EN6199) for COVID-19 immunization and experienced leg swelling and hard of hearing. The patient mentioned she was hard of hearing. The patient had a reaction to both of the Pfizer shots. Her second one was on the 26Apr2021, her first one was on 25Mar2021. Her leg started swelling a week after and on 26Apr2021, she had her second and the same evening she started having eye pain, it's just they hurt, there was no redness, no swelling, no visual problems, they just hurt and they still hurt. And that night, she had low grade fever with a 100, chills and that lasted about, the fever and chills lasted about 10 hours but the eye pain was still there, it's just eye pain, no vision changes, no redness nothing it's just eye pain. She mentioned she was not tired or stressed, it was just there. The patient also reported that she had some kind of bleeding issue and she was on warfarin. The outcome of the event eye pain was not recovered, fever and chills was recovered while other events was unknown. The event bleeding issue was assessed as serious- medically significant.

1320021	5/15/2021	CO	29	M	4/28/2021	4/29/2021	<p>Fell unexpectedly; I injured my nose, tooth; I injured my nose, tooth; My arm pain is 7 out of 10; scared to get up.; This is a spontaneous report from a contactable consumer (patient). A 29-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; solution for injection) via an unspecified route of administration on 28Apr2021 at 16:15 (at the age of 29-years-old) as a single dose in the left arm for COVID-19 immunisation and ibuprofen (ADVIL) from an unspecified date to an unspecified date at an unspecified dose (2) and frequency for an unspecified indication. Medical history included anxiety/depression (mitigated with SSRl) from an unspecified date and unspecified if ongoing. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient had no known drug allergies. Concomitant medications (taken within 2 weeks of vaccination) included escitalopram orally taken for an unspecified indication from an unspecified date to an unspecified date at 10mg, daily. The patient did not receive any other vaccines within 4 weeks prior to the COVID-19 vaccine. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; solution for injection) via an unspecified route of administration an unspecified date as a single dose for COVID-19 immunisation. On 29Apr2021 at 03:00 the patient experienced fell unexpectedly, I injured my nose, tooth, my arm pain is 7 out of 10 and scared to get up. The course of events was reported as follows: "Got up at 3am in the morning to take some Advil. Took 2 Advil then fell unexpectedly. Partner was awake and stated that I did not trip on anything. I did not have any previous dizziness or indications that I was going to faint (no night sweats, no stars or blurry vision, no muscle weakness). I injured my nose, tooth (no significant damage), and was scared to get up. My arm pain is 7 out of 10. I have no previous medical history of fainting after a vaccine." No treatment was received for the adverse events. The clinical outcomes of the events fell unexpectedly, I injured my nose, tooth, my arm pain is 7 out of 10 and scared to get up were recovered/resolved on an unspecified date in 2021. Since the vaccination, the patient had not been tested for COVID-19. The lot number for the vaccine, BNT162B2, was not provided and will be requested</p>

1316589	5/14/2021	CT	46	F	3/28/2021	3/28/2021	3/28/2021 12:45pm Shot received as part of 1200 had gotten access to. It felt like fire in my arm at the point of the shot and moving down toward my wrist. It was cold and rainy, and I had taken my arm out of my sweater and the sleeve had gotten a little damp. I put my arm back in the sleeve and the cool damp sleeve made my arm feel better while I was observed and then drove home. 3/28 3pm I got home and the arm the shot had been given in was sore ? the aches seemed to move across my shoulders and all over my body. 3/28 10pm ? 7:30 am, Over the course of the evening, the aches seemed to get worse and I developed a headache, so, I took 2 tylenol and went to sleep. overnight I had severe chills. 3/29 7:30 am I took 2 Alkseltzer Cold & Sinus (tylenol and decongestant) and laid back down. Around 9am I had a glass of juice ? I was extremely thirsty and this helped. 3/29 11:30am The headache and body aches continued, but the chills seemed to break with a trade to cold sweat. I took 2 more Alkseltzer Cold & Sinus (tylenol and decongestant) and got up. 3/29 3:30pm The headache and aches continue, I took 2 aleve to manage the headache and body aches. 3/29 6:30pm the body aches and headache are better but not gone. Cold sweats starting again 7:30 ? 2 more tylenol. 3/29 11:30 2 tylenol for bed ? slept through the night no problem. 3/30 ? 8am: Woke up still achy, but the headache is significantly reduced, started feeling a little dizzy and periodic cold sweat 3/30 ? 6:30 pm still a little dizzy and marginally achy 3/31 ? 8am: mostly back to normal. The spot on my arm is still raised and tender, but in general, I feel like I did before the vaccine, suffering seasonal allergies sinus congestion and headaches. My eyes are very tired, I'm having a hard time pulling things into focus or looking at screens ? the headache on Monday was a migraine complete with severe light sensitivity. Wearing readers with blue light blocking helps my eyes feel better. 4/1 ? arm still sore at location of shot, going to continue using scar cream on bump where shot was given. Eyes still a little weak/tired. 4/3 ? arm finally quit hurting ? still sore, but not actively in pain at site of injection.

1316040	5/14/2021	NY	71	M	3/7/2021	3/1/2021	left side of his mouth went bonkers, it wound up being like when the shingles were acting up on the inside of his mouth it felt tingly and weird and it was confined to the left half of his face and nothing else; left side of his mouth went bonkers, it wound up being like when the shingles were acting up on the inside of his mouth it felt tingly and weird and it was confined to the left half of his face and nothing else; left side of his mouth went bonkers, it wound up being like when the shingles were acting up on the inside of his mouth it felt tingly and weird and it was confined to the left half of his face and nothing else; stress; nerve inflammation; His hand on the right is not doing the thing is his left thumb, it is being weird; stenosis, the cervical stenosis, the left is the main problem; he moved his thumb towards his forefinger, there was a couple inches between and it felt like there was a rubber band pulling his thumb back; This is a spontaneous report from a contactable consumer or other non-healthcare professional. A 71-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Formulation: Solution for injection, lot number: EN6203; Expiration Date: Jun2021) dose 2 via an unspecified route of administration on 07Mar2021 (at the age of 71-year-old) as single dose for covid-19 immunisation. The patient medical history included diabetes mellitus; he does not take medication for it. It was controlled by diet and exercise, high blood pressure, high lipids, herpes zoster from Oct2019, bell's palsy from Oct2019, herpes zoster oticus from Oct2019, paralysis, vertigo, ear disorder, paraesthesia oral and his tongue was tingly. Concomitant medications included alprazolam taken for sleep disorder, simvastatin taken for lipids increased, alprazolam (XANAX) taken for sleep disorder. The patient had his second shot last sunday and had a discussion had with his doctor's nurse this morning that centered around people taking the Moderna and had some issues with Bell's Palsy or some-thing like that and he wanted to call about what had happened. He has had overlapping stuff from cer-vical stenosis that manifests on the left side on his shoulder arm and hands and also about a year and half ago Oct2019 he had shingles in his ear and mouth on the left side of face. He had Bell's palsy and Ramsey Hunt syndrome number 2. He had paralysis, droopy mouth, eye wouldn't close, vertigo, ear issues, hearing drop and that recovered which was weird.

He went to physical therapy until early last year before COVID then he was steered away from that. About 10 months ago some of the symptoms came back in a odd way. His eye had the feeling like it couldn't close. His eyelids had at night the muscles in his face on the left side face felt taut. The inside of his gum felt like his skin was thicker, he was not sure it was the sensation and that never went away. With the shingles he had an issue where down the side of his tongue was tingly, these things overlap and it was either very little or really annoying. In last 10 months it had got quite a bit better until about 5-6 weeks ago it was back to where it was, it was just annoying on and off. Then he got the shot sunday, and it was weird at first, he was writing it off as both stress and relief and other things. He was not dizzy and that evening the left side of his mouth went bonkers, it wound up being like when the shingles were acting up on the inside of his mouth it felt tingly and weird, and it was confined to the left half of his face and nothing else. He did not have droopiness or any Bell's palsy kind of thing had gone away the Ramsey-Hunt syndrome, he says it was a series of things and he has number 2, he does not know what the other ones are, but it was something that comes along with the chicken pox or the herpes zoster virus. The stenosis, the cervical stenosis, the left is the main problem, but the right was not far behind with regard to nerve compression, the right does not bother him as much in the way of tingling and numbness. The weird thing is he had his hands sitting in his lap and he moved his thumb towards his forefinger, there was a couple inches between and it felt like there was a rubber band pulling his thumb back, it happened 2-3 times he was fooling around with it and it went away, the sensation was still there a little in the back ground, the rest of him the right side of him was fine and today is a lot better like he said things over lap so he is not saying anything has anything to do with the vaccine but he is operating under the as-sumption that if Moderna patients are having some issues with Bell's Palsy or something similar, if he has left over inflammation and in Nov2019, he had magnetic resonance imaging (MRI), when he first got sick and then he had another one done and his neurologist said on an unspecified date in Aug that he still sees some nerve inflammation particularly down jaw line, he saw inflammation from 2019 to 2020 he still seen

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

inflammation and the upper part of his eye, the brow seems to behave as if there may be some inflammation running through it. His hand on the right is not doing the thing is his left thumb, it is being weird and the thing sunday night with his mouth. He thinks the whole idea is that the vaccine wakes up the immune system and gets it to recognize the RNA for COVID and generate antibodies and if it is acting like inflammation gets the body's attention, he is not a biologist but maybe it also caught on to his nerve inflammation and took a look at his nerves and cause them to bounce around and have other things occur that were more intense and he was trying to report to let some-one know that the underlying things left over from his shingles, he does not know about the rest of it because sleeping wrong could affect his neck shoulders and arms, he was not sure if it could be an issue with the vaccine, there was no clear definite thing, but the thing sunday night with his mouth was definitely far more, he thought this was the way he felt in his mouth a couple weeks after he got the shingles diagnosis like he had hives on inside of his cheek and tongue, it was crazy with extra salivation but he did not have the hives. The last time he got a vaccine it was the Shingrix it was probably too late last year, he got pretty sick off of it with flu like symptoms but he doesn't ever want another run in with shingles. It was his second COVID 19 vaccine he got 07Mar and it was the same day that the thing with his mouth happened and that was the most noticeable aspect of it, if he had not had the vaccine he would be sitting here right now just thinking he was having a bad day it runs down the left side of his tongue and stops smack in middle of the front of it. It jumps over sometimes but he was not sure if the nerve endings go on both sides of the tip of tongue or not. It has improved since sunday there was a span there where it was pretty annoying and he commented that he feels like it did when he first had shingles and over a period of time when he went to bed, whenever that was, it abated a bit. His second dose was EN6203 and it is dated Jun2021. The patient was sure they were trained to draw up the exact correct amount in there but he did not ask to look at it, it did not even occur to him. The only other thing is he was diabetic, he takes no medications for that it was diet and exercise controlled both of which COVID has been horrible for, his weight has gone up because they have a

---

tough climate there, it has been cold for 2.5 months. It was finally starting to get a little better but the primary things he would have would be blood pressure, he takes medication for and the same for lipids he takes Simvastatin for that, the things many males his age are taking medication for. He also takes Alprazolam and Xanax to get to sleep at night, because his brain doesn't want to shut off, cost of being an engi-neer. He had one had case of sarcoidosis uncovered, there was only one node of it at the back of the trachea where it splits to go into the lungs. His pulmonologist was keeping track of it with X-ray and CT scans, the last time everyone looked in there, there was nothing left, the thing never changed since, it never showed up anywhere else. he does not know if that disappears but he never ended up getting it again. Apparently it shows up frequently in lungs but it did not with him. Those 2 things would be the top of the list type of things for him. He has never had cancer or blood disease, he had mononucleosis in college. The patient underwent lab tests and procedures which included computerized tomogram there was nothing left on. He had one case of sarcoidosis uncovered, there was only one node of it at the back of the trachea where it splits to go into the lungs. His pulmonologist was keeping track of it with X-ray and CT scans, the last time everyone looked in there, there was nothing left, magnetic res-onance imaging was an unknown results on Nov2019. He first got sick and then he had another one done , x-ray: there was nothing left on an unknown date. He had one had case of sarcoidosis uncov-ered, there was only one node of it at the back of the trachea where it splits to go into the lungs. His pulmonologist was keeping track of it with X-ray and CT scans, the last time everyone looked in there, there was nothing left. The outcome of the events was reported as unknown. No follow-up attempts are possible. No further information is expected.

1317107	5/14/2021	IL	39	M	3/16/2021	3/17/2021	I have had headaches every day since I received the vaccination that last most of the day. There is a constant pressure in my head that moves around all areas, from the back base of the head, to the sides, temples, forehead/sinus regions. It is from waking until sleeping. Not incredibly intense, but constant. I have difficulty sleeping through the night and have not slept well since, either. I have also experience blurred vision. I have also experience bruising on various parts of my body including my arm, abdomen, and toe nails. My quality of life has suffered tremendously and I wish I hadn't gotten the vaccine.
1316820	5/14/2021	MI	63	F	4/16/2021	5/4/2021	pt states on 5/4/21 her mouth was drooping and she couldn't shut her left eye. When she would drink, she would drool. Her condition did not improve so on 5/8/21 she went to Hospital. She had a CT, no stroke detected. No lab work. She was diagnosed w/ Bells Palsy. She was prescribed a valacyclovir hcl 1gm, 1 tab every 12rs. She was released to FU w/ PCP. She saw her PCP, on 5/12/21. She was evaluated and told to continue her meds and come back on 6/1/21. Pt still has these symptoms, wears a patch on her at night and is using artificial tears. The right side of her face is stronger than her left now.

1316068	5/14/2021	WI	67	M	3/1/2021	3/1/2021	shingles on his face and around his eye/ has shingles on his eye; eye irritation; This is a spontaneous report from a contactable consumer (patient) and via a Pfizer program. A 67-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration (at the age of 67-years-old), administered in Arm Left on 01Mar2021 09:00 (Lot Number: EN6202) as 1st dose, single for COVID-19 immunization; and ibuprofen, route of administration, start and stop date, batch/lot number and dose were not reported for pain. The patient medical history was not reported. There were no concomitant medications. The patient experienced shingles on his face and around his eye/ has shingles on his eye and eye irritation on Mar2021. The patient requested information on the use of OTC pain relievers like Ibuprofen and the Pfizer-BioNTech COVID-19 Vaccine because he read some articles on this topic and asked how far before would he need to wait to take ibuprofen, he stated: "I'm scheduled for second vaccine tomorrow (29Mar2021, confirmed it is second dose of Pfizer-BioNTech COVID-19 Vaccine. First dose was received on 01Mar2021). I don't take Ibuprofen on a regular basis, only take it when I need it because I have a medical condition causing some pain, last time I took it was the day before yesterday and I won't take any today. Stated he got his first dose of the vaccine on 01Mar2021. Patient stated that he was prescribed the eye drops for shingles on his face and around his eye. They are for the eye irritation. Diagnosed with shingles either this past Monday, Tuesday, or Wednesday; uncertain of which day (unspecified date in Mar2021). He is asking if he can take painkillers after the second dose that because he has shingles on his eye. The action taken in response to the events for ibuprofen was unknown. Therapeutic measures were taken as a result of the events. The outcome of the events was unknown. The events were considered as serious. The second dose scheduled for 29Mar2021. The patient wanted to know if he can take his shot while on these Fluorometholone eye drops. No Prior Vaccinations (within 4 weeks).

1315894	5/14/2021			F			<p>headache; eye dryness; having trouble with my eyes; soreness; This is a spontaneous report from a contactable consumer (patient) via Medical information Team. A female patient of an unspecified age received BNT162B2 (BNT162B2, Solution for injection), dose 1 via an unspecified route of administration on an unspecified date (Batch/lot number: Not Provided, NDC number of Pfizer COVID 19 vaccine: Not Provided, Reason for no lot number: of Pfizer COVID 19 vaccine: Caller unwilling to complete the report, Expiry Date of Pfizer COVID 19 vaccine: Not Provided) as 1st Dose, SINGLE for covid-19 immunisation. The patient medical history was not reported. The patient's concomitant medications were not reported. The patient experienced headache (non-serious) on an unspecified date, eye dryness (non-serious) on an unspecified date, having trouble with my eyes (non-serious) on an unspecified date, soreness (non-serious) on an unspecified date. Consumer was calling reporting AE after receiving her first dose of Pfizer-Biontech Covid19 vaccine. She stated that she got the headache and the soreness but those "didn't bother her" she was worried about "having trouble with my eyes" specifically eye dryness, was this normal. She was due for the second shot on 09Feb2021, should she still get it. Patient stated that HA soreness but that didn't bother me- "i've been having trouble with my eyes" due for 2nd shot 09Feb2021. Trouble with her eyes being dry- SE. Should I go ahead and get the second one. Headache lasting 2-3 days. Additional Context: Received call from consumer regarding the Pfizer Covid 19 vaccine which she received a few days ago. She had a slight headache for 2-3 days, which she thought was normal. She was also having trouble with her eyes being dry and she would like to know if that is normal. She did not wish to provide an address or email. She did not wish to complete report and requested to be transferred to have her question answered. No further details provided. For events, headache, outcome was recovered on an unspecified date, eye dryness, outcome was unknown, having trouble with my eyes, outcome was unknown, soreness, outcome was unknown. Information on lot and Batch number has been requested. Follow-up attempts are completed. No further information is expected.</p>

1315920	5/14/2021			F	2/10/2021	2/11/2021	feeling hot and cold and hot and cold; cough; sneeze; She had a little fever/behind her leg was 100.4F; a tiny hemorrhage in her eye; gigantic headache/very bad headache; wasn't feeling good; This is a spontaneous report from a contactable consumer. A 72-year-old female patient received the first dose of BNT162B2 Pfizer-BioNTech COVID-19 mRNA Vaccine via an unspecified route of administration on 10Feb2021 (Batch/Lot number was not reported) as single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient previously took diclofenac sodium. On an unspecified date in Feb2021, a couple of days before receiving her first vaccine dose, the patient took a dose of diclofenac (2 tablets, 15 mg each) and wanted to know if the vaccine will still work. Moreover she was going to receive Botox injections in between her two vaccine doses, her neurologist says that it's fine, but she wanted to have more information, if available. She also stated that she is due for her Botox injection but might postpone the shot so that it will not interfere with her COVID-19 vaccine. On an unspecified date she experienced a tiny hemorrhage in her eye that may have resulted from a cough or a sneeze; she had a rough night feeling hot and cold and hot and cold and she had a little fever stating that her infrared thermometer said that behind her leg temperature was 100.4 F (but her arm was different, along with her forehead). On 11Feb2021 the patient experienced gigantic headache/very bad headache, but she does not think the headache was caused by the vaccine, and wasn't feeling good. She wanted to know if she can take diclofenac for her headache. The patient underwent lab tests and procedures which included body temperature: 100.4 Fahrenheit on an unspecified date. At the time of the report the events outcome was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

1316035	5/14/2021	PA	64	F	2/23/2021	2/23/2021	urinary tract infection; the vaccine stung when it went in and the site was tender; shingles / shingles rash; the vaccine stung when it went in and the site was tender; This is a spontaneous report from a contactable consumer. A 64-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), via an unspecified route of administration, administered in the left arm on 23Feb2021 at 12:00 (Batch/Lot number: EL9269) as 1ST DOSE, SINGLE for COVID-19 immunization. Medical history included pain, eye condition, Prediabetes, immunosuppressive - she is also taking immunosuppressive medication that is lowering her immunity: Mycophenolate since Dec2020. She also had a pain in her lower back on about 19Feb2021. Concomitant medications included prednisone (PREDNISON) taken for eye condition from Aug2020 and ongoing-her immune system is attacking her retina, started a high dose in Aug2020 and has titrated down since then; mycophenolate mofetil (MYCOPHENOLATE) taken for eye condition and immunosuppressive from Dec2020 and ongoing; metformin (METFORMIN) taken for Prediabetes from an unspecified start date and ongoing and been on it about 6 years; and gabapentin for pain. The patient developed shingles on 03Mar2021. She is on prednisone, mycophenolate, and pain medications. She wants to know if it's ok to get the second dose since she is immunosuppressed. The patient was calling about the Covid-19 vaccine and reported that she got the first dose on 23Feb2021 and about 3.5 days later she got a shingles rash. She wanted to know if it is ok to get the second vaccine or if that is contraindicated. The patient said that she is also taking immunosuppressive medication that is lowering her immunity (Mycophenolate) and she has been on it since Dec2020. The patient said that she was on another immunosuppressive medication before this for a month that she had a reaction to. She said that was when she was switched to Mycophenolate. The doctor had her on an antiviral for shingles rash that she started on 03Mar2021. She clarified that it is Valacyclovir HCL 1 pill 3 times a day for 7 days, and she was given pain medicine called Gabapentin 100mg 1 pill 3 times a day by mouth. Her next dose of the Covid-19 Vaccine was scheduled for 16Mar2021. The patient said that the

1316176	5/14/2021	PA	61	F	4/22/2021	4/22/2021	By 12:50 hands were starting to swell; chest pain; heart palpitations; pulse felt like her heart was racing very hard; non specific interstitial disease in the right lower lobe that could represent atelectasis aspiration organomia; non specific interstitial disease in the right lower lobe that could represent atelectasis aspiration organomia; blood pressure was up; throat felt like it was starting to tighten; eyes itchy; eyes itching much worse; This is a spontaneous report from a contactable consumer (patient). A 61-year-old female patient received BNT162B2 (COMIRANTY; Solution for injection; Lot number and expiration date: unknown), via an unspecified route of administration in left upper arm on 22Apr2021 12:10 (at the age of 61-year-old) as unknown single for COVID-19 immunization. This report was not related to a study or programme. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Adverse events following prior vaccinations was first time had flu shot made her very ill, next year doctor suggested she should just have half of a shot instead of full shot to see if she tolerated it and she was able to tolerate that. She had not any other problems with flu vaccines in general. Some of the other vaccines, she was just supposed to take Benadryl with them because of some of the filler ingredients people put in things. She had previously had the 1 dose shingles vaccine, but she had gotten probably shingles probably a couple of months after that so they encouraged her to get the 2 part shingles vaccine at a later date and told her to do the pre-medicate routine like Benadryl day before, day of and at least 2 days after shingles vaccine doses and if any major problems call for help. She did not have a noticeable problem from the 2 part shingles vaccine. Some of the times depends on what filler ingredients people use. She was allergic to nutmeg which was used as an emollient oil or it's called Myristicin something or other oil; if something has too high a dose of mannitol it can cause a problem. She has a very long list of allergies and high sensitivities; if it was a high enough sensitivity it goes in allergies list, even though it may not be a true allergy. Family has lots of allergies. Regarding prescribed indication additional details: She had 3 doctors who initially advised her to get the vaccine including her primary care physician, oncologist and haematologist; this was because she was a high risk person because of

various health issues. Her haematologist 2-3 months ago when she had her last appointment with him he was saying to get the shot and prescribed the epi-pen at that time; no one was having it yet, but he expected she would have some sort of reaction to it not able to be covered by Benadryl alone. Medical history included ongoing platelet disorder Verbatim: Unidentified platelet disorder, Lots of allergies, cardiac murmur, ongoing asthma, osteoarthritis, glucose tolerance impaired, hypoglycaemia slow thyroid and back and neck pain. Concomitant medication(s) included diphenhydramine hydrochloride (BENADRYL) taken for hypersensitivity (50mg taken as needed), cetirizine hydrochloride (ZYRTEC [CETIRIZINE HYDROCHLORIDE]) taken for hypersensitivity (10mg daily), fluticasone propionate, salmeterol xinafoate (ADVAIR) taken for asthma (250/50 twice daily), levothyroxine sodium (SYNTHROID) taken for hypothyroidism (137mcg-1 tablet daily), methylphenidate hydrochloride (RITALIN) (20mg tablet twice daily), salsalate, colestyramine (QUESTRAN LIGHT) (2-500mg tablets 3 times daily), sucralfate (CARAFATE) (1mg tablet 4 times daily-dosage verified with caller as milligrams and captured as provided), loperamide hydrochloride (LOMOTIL [LOPERAMIDE HYDROCHLORIDE]) (2.5/0.25 takes 2 tablets of that 4 times daily), calcium carbonate (CALCIUM OYSTER SHELL [CALCIUM CARBONATE]) (Alternates dose of 500mg and 1000mg on days takes Vitamin D), vitamin c [ascorbic acid] (VITAMIN C [ASCORBIC ACID]) (250 mg), vitamin D (50,000 units every other day taken), vitamin B12 (1mg injection every 14 days), clonazepam (KLONOPIN) (2-1mg tablets at bedtime), montelukast sodium (SINGULAIR) taken for asthma (10mg tablets at bedtime) and cefixime (FLEXERIL [CEFIXIME]) taken for back pain, neck pain (10mg tablets 3 times daily as needed). On 22Apr2021, Onset time: She had a note saying her eyes itchy at 12:20, but they were itching before that because she waited long enough to report it; so onset time was less than 10 minutes when her eyes started itching. Then her pulse; she could feel chest pain; heart palpitations; pulse felt like her heart was racing very hard. They did check her pulse while she was in their initial observation and her pulse was only in the 70s, but oxygenation was at 96%.When at doctors office less than 1 hour before that reading, oxygenation was at

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

98%. Recorded at 12:30 eyes itching much worse, throat felt like it was starting to tighten, heart felt like it was starting to race. By 12:50 hands were starting to swell. She had already been pre-medicated with Benadryl before this before she went down to get the Pfizer Covid-19 Vaccine, she had Benadryl in her system. She had that same morning with her morning meds had taken Zyrtec and Benadryl in anticipation of getting the possibility of getting the Pfizer Covid-19 Vaccine because she has to pre-medicate for vaccines just in case she starts to react in anyway. History of all previous immunization with the Pfizer vaccine considered as suspect was none. Additional Vaccines was not administered on same date of the Pfizer Suspect. Emergency Room taken from the location where vaccine administered-they gave her Pfizer Covid-19 Vaccine shot had her sit for basic observation then sit for extended observation. In that time period telling them her symptoms were going on, increasing. They gave her another 50mg Benadryl even though she had already had 1 before and then called emergency room, took her down, left her in waiting area even though she had heart and chest palpitations. Physician Office seen prior to event on 20Apr2021, seen after event 27Apr2021. Primary Care Physician didn't hear anything in lungs either visit. Not admitted to hospital; seen in emergency room, theoretically she got treated; however her basic blood pressure and stuff even with what they were doing was higher than when she was triaged in the ER; blood pressure was up and something else, oxygenation level moderately reduced from when she came down to when she was just let go; however her symptoms were worse when she was leaving than when she got there. She knows what they gave her while she was there was IV of normal saline, solumedrol and IV Benadryl. Thinks they later gave her Tylenol tablets. Finally got them to do an EKG because kept saying her chest was getting worse but that was several hours after she was back there even though came there having chest pains. In her opinion this hospital was not taking reaction seriously. Not admitted to hospital even though symptoms were worse and blood pressure higher on discharge, well above her normal levels. Currently trying to get them to explain why they took so long to do anything for her. Finally did a chest x-ray on 22Apr2021: discharge papers say abnormal x-ray

VAERS\_ID RECVD STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

and they gave a couple of different possibilities as to what that might be so Primary Care Physician wrote a prescription to get a follow-up chest x-ray to make sure that everything is fine and back to normal and not ongoing or progressing or anything because they gave some strange things: what their impressions were: findings: there is non specific interstitial disease in the right lower lobe that could represent atelectasis aspiration organomia. It says the left lung appears clear; cardiomedialastinal silhouette is within normal limits; impression restates non specific right findings there is non specific interstitial disease in the right lower lobe that could represent atelectasis aspiration organomia. This was from front and lateral views of the chest x-ray at 19:00pm 22Apr2021. 2 ECGs: She guesses this is what they call EKG not, relevant point is that in the notes there for the records: Says abnormal ECG compared with blah blah blah, hard to find when exactly they wrote this, trying to get the exact wording for each of the two. Machine results CED, which caller explained is what they call themselves now instead of ER, notes for MD interpretation; one done at 17:53 , other at 21:32. They both say there was slightly different readings, however both say abnormal ECG. One of the wordings that is in both. She had no further details to provide regarding relevant testing/investigations. She had to be in the ER back in the room for several hours before they would do the EKG and that's only because she said I have chest pain and standard procedure is to do an EKG, had been back there for hours, they had done no tests, the only thing they did was basic blood panel, had not done a troponin or heart enzymes test, had not done EKG that's why she knows they were not taking her seriously at all; if someone says chest pains and you don't do anything in the standard protocol they are not taking you seriously. On this Monday, 2 days ago she had gone down to pick up the records from the ER to go to Primary Care Physician appointment 27Apr2021, finally actually got to speak to someone who said they would get back to her on 27Apr2021 to look into why the EKG tests were not done for someone having chest pains. That's one of the first things you do for someone having chest pain, no matter what the source. Frustrated with them because they're still not communicating back, they had not taken her seriously while she was there; unknown if they were

---

actually going to be reporting, as they were still trying to convince her to get the second dose of Pfizer Covid-19 Vaccine. If she reacted to the first dose in first 10 minutes, second dose could be much more of a reaction. With the amount of anti-histamines in her system with Benadryl and Zyrtec and she was still starting to react in under 10 minutes. It's possible to be one of the inactive ingredients but she doesn't see anything in the pamphlet provided that she could identify at first glance as being the culprit to the problem other than 2 possibilities: potassium chloride and other is monobasic potassium phosphate. There is a possibility of her having a reaction to those because she was known to react to certain potassium products; sometimes it was the inactive ingredients. She definitely would have wanted to get the second part of the Pfizer Covid-19 Vaccine series until after she was not getting the medical attention she needed after reaction to the first dose. Because ideally you're supposed to have it at the same location, that just made her very nervous at the prospect of worse reaction at location that did not take her serious the first time. She was a big fan of Pfizer thought they do a great job; she had not known it was a 2 parter, not that it should make much difference. When her Primary Care Physician was saying second dose of Pfizer Covid-19 Vaccine was out of the question and she had been saying to people that she did not think it would be prudent to take the second part, they kept trying to say oh you need to get the second part, talk to so and so so they can convince you to get it, and doctor is going no. She reacted to ringers lactate or lactated ringers whatever the name is, her retired nurse sister sat and watched her getting some ringers lactate prior to surgery for her tear duct and saw her starting to break out in red splotches, patient said she was itching. Action taken in response to the events was drug withdrawn. The outcome of the events was reported as unknown. No follow-up attempts are needed; information about lot/batch number cannot be obtained.

1316293	5/14/2021	WA	31	M	4/23/2021	4/26/2021	Woke up 2 days after vaccine and had tingling pins and needles throughout all my extremities. Massive tension headache and pressure behind eyes and sinus that has lasted so far for 3 weeks, tinnitus, blurred vision, joint pain, muscle weakness, muscle twitching in face and throughout body, numbness in all my limbs, burning sensations on my neck and back, stomach pain, and heart palpitations that sent me to the ER. When I walk and move my arms I feel weak. The vaccine has effected my nervous system in a terrible way. The ER doctor, ENT, PCP, Optometrist, and Opthamologist told me it was inflammation due to the vaccine. I was prescribed 6 days prednisone, 40mg for 2 days then taper down and they put me in a "let's wait and see" mode. All symptoms have persisted since. I follow-up with a cardiologist on 05/14/2021 and waiting appt for a neuro ophthalmologist.
1316329	5/14/2021	TX	50	F	4/13/2021	4/13/2021	Fever 102.7 for three days, chills, lethargy for a week, bad muscle aches, dry mouth and eyes, very bad headache, stuffy nose, cough, nausea, skin very sensitive like a sunburn, sharp pains at spine, , chest tightness, some symptoms continue today... a month later. I was way sicker from the vaccine than from actually having COVID.
1316338	5/14/2021	OH	30	F	5/10/2021	5/10/2021	102 degree fever, worst headache ever experienced, chills, nausea, inability to eat, fatigue. all occuring simultaneously from may 10 at 10pm to may 13 at 3pm at 3pm on may 13 symptoms shifted to extreme dizziness, nausea, and inability to sit, stand or raise arms in lying position without feeling overwhelming sensation of being about to faint or black out. vision tunnels from standing longer than one minute. this is ongoing as of writing this may 14th.

1315986	5/14/2021	CA	24	M	5/13/2021	5/13/2021	<p>headache was not reported. This report was non-serious.; Sender's Comments: V0: Medical assessment comments not required as per standard procedure as the case is assessed non serious.</p> <p>On Thursday May 13th, 2021, patient arrived to receive his first Pfizer vaccination. Patient was vaccinated and sent to the observation area. At 1342, the patient stated, "I feel dizzy, like I might pass out," to EMT observer. EMT observer immediately assisted the patient to the gravity chair. The patient's vital signs were taken: BP 110/72, HR 84, RR 15, oxygen saturation at 96% . The patient was alert and oriented to person, place, time, and situation. The patient was given water and stated, "I feel so much better after sitting in this chair." No loss of consciousness or syncope occurred. The patient was given a bottle of water. Co-lead, assessed the patient, who was alert and oriented to person, place, time, and situation, was in no apparent distress, and was speaking in full sentences. No pallor or diaphoresis was observed. Vitals were taken at 1347: BP 108/70, HR 63, RR 14, oxygen saturation at 99%. The patient took off his mask to reduce anxiety. Denied any history of fainting. or having any known drug allergies. Vitals were retaken at 1352: BP 120/68, HR 63, RR 14 ,oxygen saturation at 98%. The patient was offered a granola bar but denied it, as he ate around 1230. Patient denied any shortness of breath, blurry vision, lightheadedness, dizziness, itching, nausea, or facial flushing. The patient stated, "I feel totally fine." Vitals were retaken at 1357, BP 120/70, RR: 14, HR 63, and oxygen saturation at 98%. Notified patient to inform the vaccinator about his reaction when returning for his second Pfizer dose. Vital retaken at 1402, BP 125/ 68, RR 14, HR 63, 98% oxygen saturation. The patient felt comfortable to drive home and left the site at 1405. The patient left the site with an even and steady gait.</p>

1318574	5/14/2021	ME	18	M	5/14/2021	5/14/2021	The patient fainted approximately 3 minutes after receiving the vaccine. I caught him before he fell out of his chair, and he regained consciousness within about 5 seconds of me tapping on his shoulder. We got him some water immediately and he was able to speak to me, but he continued to nod off in his chair over the next couple minutes. We got him to lay on the floor with his legs elevated and a damp cloth across his face. As soon as he made it safely to the floor he had fully regained consciousness and held a conversation with me. I had him stay on the floor in that position for about 10 minutes. When he felt like he had his full strength back he went back to his chair and sat there for another approximately 10 minutes and continued to drink his water. At that point I let him walk around the area with my supervision and he still felt strong so he left the pharmacy.
1317831	5/14/2021	KS	15	F	5/13/2021	5/13/2021	Pt. sitting with mother and sister in observation area. Mother signed for assistance. Pt reported feeling hot and having blurred vision. Able to state name throughout event. Pupils dilated, skin hot. Pt instructed to remove mask and breath deeply, cool pack applied to back of neck. After several minutes patient reported vision retuning to normal. Patient incontinent during episode. Pt transferred to private room. Water, peanuts, and fruit snacks provided. Sister very tearful and anxious. Water and snacks provided. Family remained 30 minutes. Verbalized feeling okay, reported slight headache. Mother made appointment for patient to see pcp today, family left clinic.
1317840	5/14/2021	IL	16	F	5/14/2021	5/14/2021	Right after patient received the vaccine she turned very pale and told the technician she felt light headed. She remained seated in the room and closed her eyes a couple times but never appeared to lose consciousness. Her dad joined us in the room and confirmed she was really nervous before the vaccine. We kept her seated for several minutes and then she said she felt sick and vomited. After that she started to regain her color and was able to move to the waiting room. She sat there for about 5 more minutes and then felt well enough to leave with her dad.

1318016	5/14/2021	WI	32	M	5/14/2021	5/14/2021	Patient received a Johnson & Johnson vaccine today. Shortly afterwards while waiting in pharmacy area, we were alerted that the patient was unresponsive by his wife. Immediately responded to patient. Code white called and management responded. Tried to get him to wake up, he opened his eyes but immediately closed them again. I attempted to keep him alert and eyes open. This proceeded to go on for several minutes. Ice packs were placed on neck and wrists. Feet elevated. Once patient was alert and oriented, water was provided and patient was instructed to take small sips. Patient was kept in pharmacy area for additional 15 minutes once he was back to normal. Patient stated that when he passed out, he felt tired, couldn't see or hear.
1318046	5/14/2021	CO	65	M	4/5/2021	4/27/2021	Per report from family, pt had been feeling unwell for 3-4 weeks prior to event on 4/27 where he collapsed and suffered a cardiac arrest. No interventions were performed until EMS arrived 10-15 mins later (again, per family report). Pt was revived following CPR, and suffered a 2nd episode of cardiac arrest (possible in the ED). Pt was noted to have PEA at that time. Pt was intubated and vented in ICU. Pt was cooled x24 hours (unsure of protocol name) and rewarmed over 24 hours more. Pt was weaned from all paralytics, etc. Per RN reports, pt failed all neuro tests except R eye went from 3 > 2 mm (4/29 +). Pt was transitioned to comfort care on 4/30 and passed within 5 minutes.

1318057	5/14/2021	CA	57	F	4/7/2021	4/8/2021	The first thing that happened, 4:30 pm the following day, extremely nauseated and starting throwing up (I was driving and had to pull over) and felt super dizzy which was vertigo. Drove home, had severe diarrhea , chills, fever. My arm swelled up and hurt. My lower back was in severe pain. My upper right back thigh - between the buttocks and knee had a horrible pain in it. Very severe pain and it started radiating down my calf muscle and then to the front of shin. Stayed for days on the back of my thigh in my right leg. I continued having very severe vertigo. I would have to run and throw up if I tried to move or go back to bed. The nausea never went away. That was lasted for 8 days. I went to my doctor's office - I drove to the office - they moved all the doctor's across town for Sutter and I couldn't make it before they closed and I had to go home. I couldn't make it. Just driving there was impossible - It was really bad. Didn't have a doctor visit at all then. The dr. prescribed a medication for vertigo. The pharmacist said to buy the OTC medication for vertigo so I bought it but it didn't help. That made me doped up and sleepy but still nauseated. I got a spike behind my ear on the right hand side of head - in that little pocket - headaches would come there. I still have weird vertigo and dizziness - intermittently- although I always have a dull nauseous feeling. Every now and then I have to run and throw up - it's like my body is tired of feeling dizzy. Flying in the airplane - looking out the window - made me super nauseous - so I had to close my eyes and not look at anything. Still have the nausea and vertigo. I have mild dull headaches still. Did have golf ball size lump on arm and couldn't raise it but now it's gone.

1318162	5/14/2021	CT	37	F	4/12/2021	5/11/2021	Kaleidoscope vision twice, followed by 5-10 minutes of severe confusion and inability to remember words and son's date of birth. The fogginess with feelings of a headache coming on for about an hour afterwards. I was working out (as I do 3 times a week with weight training) when the kaleidoscope vision came on, but I didn't initially feel any other effects and since it went away within 5-10 minutes, I continued with my workout. When I was driving home, it returned and the episode of confusion occurred as soon as I reached my home. I went to the ER after looking up symptoms following the confusion and decided to get checked out since a mini-stroke seemed possible. I have no history of migraines or other health conditions. At the ER, they ran some bloodwork, but I have not received the results of those tests. They also performed a CT scan and said that looked clear, but I have not seen any official results for that either. I have also been advised by a physician that a CT scan won't show signs of a stroke and that I should have received an MRI. I will be following up with a PCP to request an MRI and will provide those results when I have them. I have had one other episode of the Kaleidoscope vision since the original event, and I was sitting down watching a movie at the time. It went away within the same 5-10 minutes and I had what felt like a mild headache coming on, but no other symptoms. And I have never had any migraines or regular headaches/vision events such as these before.
1317793	5/14/2021	NC	65	F	5/6/2021	5/6/2021	Eyes itching, throat swelling, tongue thickness, facial swelling & itching on 5/06/21 On 5/08/21, approx 4:30pm. Wave of pain top of neck spread over my head. Immediately throat swelling, tongue thickening, slurred speech, left side face numbness & tingling. Called 9-1-1. Approx 3:30 am, wave of heat over my head; face & left arm felt so heavy like I couldn't move. Numbness to left face, eye & my tongue. There has been and continues to be a metallic taste in my mouth.
1318529	5/14/2021	WA	26	F	5/14/2021	5/14/2021	Patient fainted in waiting area after receiving immunization. Patient experienced visual disturbances seeing black spots, left sided chest pain, and arm tingling. Checked patient blood pressure, elevated her legs, applied cold ice pack behind her neck. Called 911 and paramedics arrived on time.

1318245	5/14/2021	ME	14	F	5/14/2021	5/14/2021	After about a minute or so, Pt. felt pretty warm/hot in the room and started saying that she could not see/vision was blurry and she started turning pale/yellow. The room was stuffy so we moved from the vaccination room to the waiting room but the symptoms (vassalage syncope) seemed to progress so we brought her into the pharmacy where there was enough room for her to lie down. We had a fan run directly on her & within a few minutes the EMTs were present and they checked her out initially & they decided to bring her to the ambulance & checked her vitals. They asked her mom if she wanted to bring her to the hospital as her vitals were all normal. Mom decided to bring her just in case to make sure everything was okay and get her checked again as a safety precaution/parental concern.
1317249	5/14/2021	NJ	18	M	5/14/2021	5/14/2021	After the vaccine patient complained about change in vision not able to see things, sweating ,dizzy. As per patient request called 911.By the time ambulance came patient felt better and did not want to go to hospital . As per patient he felt okay after 20 minutes or so..
1317765	5/14/2021	MI	44	M	5/10/2021	5/10/2021	1 hour after shot started sweating along with blurred vision and light sensitivity from outdoor to indoor. 4 hours after chills and mild to medium headache with fever 101.5 along with joint and muscle aches. Also my chest felt heavy with no breathing problem. Headache lasted for about 24 hours. Fever and chills lasted for about 60 hours after shot. Joint and Muscle pain lasted 72 hours. Blurred vision last about 18 hours with sensitivity to light. Took tylenol fever reduces to 99.7 - 100.4 After 72 hours body felt normal
1317398	5/14/2021	CA	15	M	5/13/2021	5/13/2021	Blurry vision. BP 114/60; HR 78; RR 16. Pt stable & released from vaccination site
1317399	5/14/2021	PA	79	F	5/13/2021	5/13/2021	Patient became asphasic and was unable to keep her eyes open approximately 5 minutes after injection. Placed on stretcher, vital signs stable. Epi pen injected into her left thigh. Started to complain of chest pressure approximately 25 minutes after epi, ambulance called. Triaged by EMS and taken to ER

1317411	5/14/2021	WI	17	M	5/14/2021	5/14/2021	<p>Patient was the 4th person to receive today's vaccine of Pfizer. This was his second dose. He did fine the first dose. Patient sat down in the chair and rolled sleeve up. Chose L deltoid for injection site. He was talking with a friend and writer gave injection. Placed band aid. Patient was quiet and looked like he was going to get up but fell forward out of the chair. He hit his L forehead on side of wall. Writer caught patient and sat him up on the ground. Eye's were dilated, he was diaphoretic, zoned out and not responding initially to voice, but eyes were open. Eventually got patient up to a wheelchair and taken to office area to lay down and monitor. Father was notified and sat with us after he arrived at the school. Patient drank 1 full 120cc orange juice and approximately 6oz of water. Throughout monitoring patient gradually felt better. Pupils corrected to normal, wasn't diaphoretic anymore, and vitals improved. He stated this has happened before with lab draws and shots, but not this severe. Writer and colleagues informed him to notify people that are going to give him shots or lab draws about his history. Also informed him to notify his teachers if he feels anything out the ordinary for the rest of the day. Make sure he hydrates. Patient then sat up and walked in the room. He stated he felt fine like before getting the shot. Patient left stable and under his own power.</p>

1317414	5/14/2021	ID	17	M	5/9/2021	5/9/2021	<p>17yo otherwise healthy male presents to clinic for worsening cough, runny nose congestion, and sweats starting 4 days ago. He received the COVID vaccine 5 days ago in the afternoon and initially had what he expected to be normal side effects from the vaccine that evening. Symptoms included body aches, runny nose and general malaise. However, over the last few days he has felt worse and developed more congestion, cough, and sweating. He did improve a little bit 2 days ago but then started to feel worse yesterday and had a worsening cough that is resulting in some chest tightness. Cough is productive sounding. Mom describes it as barking. No appreciable wheezing but he sounds hoarse. He has some SOB after coughing repeatedly. He states it simply feels like it is hard to breathe for 10-20minutes after a coughing attack but then it resolves. He developed sweating yesterday as well. He states he will just start sweating for no reason. No measured fever. No chills. Today he has dried skin and cracked lips from blowing/wiping his nose all the time. No fevers. No vomiting. No diarrhea. No numbness/tingling. No redness/swelling at injection site. No rashes. No HA.</p> <p>EXPOSURE: No one at home is sick, No known exposures prior to vaccine</p> <p>CHRONIC: None, no hx of asthma or allergies, hx of eczema.</p> <p>PCP: None UTD on imms. Vitals: Wt 163.4, HR 60, RR 18, Temp 97.8, O2 sat % 98</p> <p>Past Results: Examination: GENERAL</p> <p>APPEARANCE: alert, no acute distress, non-toxic, mildly diaphoretic, talking and cooperating throughout exam, sitting comfortably on exam bed, able to talk in complete sentences.</p> <p>HEAD: no visible lesions or abnormalities.</p> <p>EYES: no eye, eyelid, or orbital abnormalities identified.</p> <p>EARS: BILATERAL TMs pearly gray without erythema, effusion, or purulence; EAC with normal amount of cerumen bilaterally, no mastoid erythema or tenderness.</p> <p>NOSE: patent nares, congested, clear rhinorrhea.</p> <p>MOUTH/THROAT: moist mucous membranes, uvula midline, mild pharyngeal erythema without tonsillar exudate, no soft palate lesions, no trismus, no soft palate swelling or erythema, no difficulty swallowing or drooling.</p> <p>NECK: supple, non-tender, FROM.</p> <p>CHEST: normal shape, good expansion, no visible lesions/abnormalities, no tenderness, no retractions, no</p>

----------	-------	-------	---------	-----	----------	------------	--------------

grunting, no stridor. HEART: no murmur, RRR. LUNGS: clear to auscultation, prior to administration of inhaler, diffuse wheezing and rhonchi throughout, post inhaler, improved air movement with focal rales in RIGHT poseterior middle lung field around T5. ABDOMEN: soft, no tenderness, no masses palpated, normoactive bowel sounds, non-distended. NEURO: alert, non-focal exam. SKIN: warm, dry without rash, petechiae, or purpura. Pneumonia of right middle lobe due to infectious organism Start Albuterol (Eqv-Proventil HFA) aerosol, 90 mcg/inh, 2 puff(s), inhaled, every 6 hours, 30 day(s), 1 Start amoxicillin tablet, 500 mg, 2 tab(s), orally, 3 times a day, 10 day(s), 60 Imaging:XR CHEST 2 VIEWS PA AND LAT Notes: History and exam are consistent with Community Acquired Pneumonia. CXR final read indicates RIGHT middle lobe bronchopneumonia. Suspect that pneumonia is unrelated to COVID vaccine. Pneumonia is an inflammation of the lungs caused by infection. Antibiotics are used to treat bacterial pneumonia. Other medications may help improve breathing and relieve symptoms in bacterial and viral pneumonia. Start and complete entire course of antibiotics. Increase fluids and rest as much as possible. Patient informed to return if not improved or go to ER if worsening symptoms, SOB, or increased chest pain. Should be rechecked in 2-3 days by PCP. Discussed side effects and risks of medications with the patient. Patient expressed understanding and a willingness to participate in the plan. Patient left the UC in a stable condition with all questions answered at this time. Cough Imaging:XR CHEST 2 VIEWS PA AND LAT Notes: Discussed cough in clinic. Will plan to treat with albuterol PRN cough/wheezing every 4-6hrs and Stiolto Respimat 2 inhalations QD after discussion with Dr. First dose of Stiolto given in clinic with improvement in symptoms and improved aeration. Focal findings now appreciable. Discussed close follow-up and when to return to clinic. Will report symptoms to VAERS. All questions and concerns answered and addressed.

1317648	5/14/2021	WA	16	F	5/6/2021	5/7/2021	12 hours post vaccine she had severe myalgia, rash on both arms and legs, headache, nausea, stomach pain, and mild swelling in legs. Over the next 48 hours the rash darkened and spread to the entire body causing pain in her skin. The myalgia became nearly unbearable and both Ibuprofen and Acetaminophen didn't put a dent in the pain. One side of her face swelled so that one eye could only partially open. The nausea and stomach pain worsened so that she couldn't eat. Headache became intense. By 48 hours post vaccine she became delirious - her speech was slurred and difficult to comprehend. She would fall asleep for a few minutes and wake up unaware of where she was or what was happening. She never got a fever but did have chills. Around this time I called a relative who is a doctor to seek advice and Diphenhydramine was recommended. Benedryl helped immensely. 30 minutes after taking it she could speak clearly, was more alert, pain became tolerable, and her appetite returned. Symptoms and swelling returned when the Benedryl wore off so she continued taking it every 4 hours for the next two days until it wasn't necessary any more. The myalgia, stomach pain and headache persisted for 7 days. At 8 days post vaccine (today) a mild headache, mild and intermittent stomach pain, and mild fatigue are her only remaining symptoms. Her pediatrician cannot see her until next week but we have an appt for the 22nd.
1317704	5/14/2021	WI	19	M	4/17/2021	4/20/2021	developed chest pressure, taken to ED via ambulance. D-dimer and troponin elevated. CT PE Angio = 5.0 x 3.4 cm soft tissue lesion in the anterior mediastinum which could represent residual thymic tissue although size and convex margins appear greater than expected for age. ECHO = There is mild left ventricular systolic dysfunction. There is mild global hypokinesis. The visually estimated LVEF is 46-51%. The quantitative LVEF based on modified Simpson's method is 51%. CT consulted, sent for bx of mass, on repeat imaging with MRI had decreased in size so bx canceled. Bx of L axillary node = benign.

1317588	5/14/2021	FL	36	F	5/14/2021	5/14/2021	Patient had a reaction immediately after the JJ vaccine. Patient passed out for 10-15seconds, her body stiffened up, she felt hot and then cold and started sweating excessively. Patients eyes closed briefly and then opened. Patient then became conscious and was unaware what had happened. Patient is not on any medication and had not eaten all morning. After administering the vaccine a small amount of blood came out. I gave her a cotton ball to apply on the area and to hold. After 20-30 seconds she said she felt faint and hot all of a sudden. Her body then went limp and her eyes began to close. Her body then stiffened up for a few seconds. After shouting her name a few times she regained consciousness and was able to talk. she didn't realize what had happened. Her body was fine again but she had urinated during the episode. Upon speaking to the patient I learnt that she was nervous about the vaccination and she had felt dizzy in the past when giving blood. I observed the patient over the next 45 minutes. Her speech was fine, she was still a little light headed. She was in her seat for 40 minutes, then I asked her to stand and to move a little to see how she was. She was able to walk a bit but then sat down as she still felt light headed. She than sipped on water and continued talking and seemed to get some energy back.
1317498	5/14/2021	FL	24	M	5/1/2021	5/2/2021	Tightness in chest and slight difficulty breathing hours before event. 1317497	5/14/2021	CA	56	F	3/3/2021	5/10/2021	Follow up report to first VAERS report (1248256) - Entire (all over) breast tenderness (the nipple tenderness has been there since within a couple day after the vaccine - and that hasn't gone away). Dr said I'm having an inflammatory response to vaccine and they have referred me to a rheumatologist (gave me a referral) - joint pain and itching hasn't gone away at all. (The really bad rash on my neck, upper chest and torso and back on day three - that rash is gone but that tingling and itching of having the rash hasn't gone away.) I'm working still but I'm working from home - so that has been okay - although some days I feel worse then others. I noticed yesterday that my breasts were swollen/lumpiness. Was born with fiber cystic breasts - since menopause that has gotten better but now this feels like it did back then - feels like it did when I was going to start my period. I haven't had a period since five years ago. Eye sensitivity: Normally have dry eyes but it's worsened. I have to put drops in multiple times of day. I literally wake up in the middle of the night with almost a sandpaper feeling in my eyes and have to put drops on them. I have been doing acupuncture - it will be my third time today - it helps with stress and the anxiety from these symptoms. They wanted me to take steroids - I'm trying not to do something like this because I am so sensitive to these types of things.
1317482	5/14/2021	CA	63	F	4/10/2021	4/14/2021	Patient was vaccinated on 4/10/2021, with the Johnson & Johnson (Janssen) Covid-19 Vaccine. On 4/14/2021, patient had a stroke and collapsed, falling on her head & face at approximately 3pm. No signs/symptoms prior to stroke & collapsing. Patient became hospitalized with internal bleeding in her brain and is still unresponsive. 'Unresponsive' in this case is defined as but not limited to: unable to be mobile / stationary in a reclined bed position since the incident / no movement of upper & lower extremities / minimal reactionary response in eyes / unable to ingest food by mouth

1317742	5/14/2021	WA	16	F	5/14/2021	5/14/2021	Adverse event: PT here for first dose of Pfizer COVID vaccine. PT reported feeling anxiety before vaccination, but indicated that she was ready for her vaccination. Immediately post-vaccination, PT experienced an apparent vasovagal response, presenting with palor, slumped posture. PT's eyes were open, but PT was unresponsive and later reported no memory of events. PT became responsive within 2 minutes, but remained "shakey" and pale. RN was in attendance and provided initial assessment/response. RN also responded to PT. Aid was called at 1251 and EMTs arrived at 1253. Aid assessed PT, took vital signs (1256: BP 104/56 laying, HR 70, SPO2 98% on room air, 1303 BP 110/62 laying, HR 87, SPO2 99% RA, 1307: BP 96/58 sitting, SPO2 99%RA, 1311: BP 106/62 sitting, SPO2 99% RA). Treatment: PT was assisted to lay down on cot, water and juice were provided and consumed, cool compress were provided. Psychosocial support provided. Education to PT and mother to monitor for further s/s and to seek out urgent care if more were noted. Outcome: PT's color improved soon after laying down, PT reported "feeling better" after consuming juice and water. PT sat at edge of cot without difficulty, walked down hallway without difficulty. PT medically cleared by EMS at 1223, exited facility with mother in private vehicle.

1316068	5/14/2021	WI	67	M	3/1/2021	3/1/2021	shingles on his face and around his eye/ has shingles on his eye; eye irritation; This is a spontaneous report from a contactable consumer (patient) and via a Pfizer program. A 67-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration (at the age of 67-years-old), administered in Arm Left on 01Mar2021 09:00 (Lot Number: EN6202) as 1st dose, single for COVID-19 immunization; and ibuprofen, route of administration, start and stop date, batch/lot number and dose were not reported for pain. The patient medical history was not reported. There were no concomitant medications. The patient experienced shingles on his face and around his eye/ has shingles on his eye and eye irritation on Mar2021. The patient requested information on the use of OTC pain relievers like Ibuprofen and the Pfizer-BioNTech COVID-19 Vaccine because he read some articles on this topic and asked how far before would he need to wait to take ibuprofen, he stated: "I'm scheduled for second vaccine tomorrow (29Mar2021, confirmed it is second dose of Pfizer-BioNTech COVID-19 Vaccine. First dose was received on 01Mar2021). I don't take Ibuprofen on a regular basis, only take it when I need it because I have a medical condition causing some pain, last time I took it was the day before yesterday and I won't take any today. Stated he got his first dose of the vaccine on 01Mar2021. Patient stated that he was prescribed the eye drops for shingles on his face and around his eye. They are for the eye irritation. Diagnosed with shingles either this past Monday, Tuesday, or Wednesday; uncertain of which day (unspecified date in Mar2021). He is asking if he can take painkillers after the second dose that because he has shingles on his eye. The action taken in response to the events for ibuprofen was unknown. Therapeutic measures were taken as a result of the events. The outcome of the events was unknown. The events were considered as serious. The second dose scheduled for 29Mar2021. The patient wanted to know if he can take his shot while on these Fluorometholone eye drops. No Prior Vaccinations (within 4 weeks).

1313062	5/13/2021	NV	68	F	4/8/2021	4/1/2021	<p>passing blood clots from her rectum; blood clots; deathly ill; the lymph nodes underneath the arm swell up / She swelled up on her right side; kind of in the breast/chest area, up a little higher than the breast and it was very uncomfortable; This is a spontaneous report received a contactable consumer, the patient. A 68-year-old elderly female received the first dose of intramuscular BNT162b2 (solution for injection; Lot ER8737 and expiry information not provided) as a single dose in the left arm on 08Apr2021 at 11:00 (at 68-years-old) for COVID-19 immunisation. Relevant medical history included ongoing back problems for which she takes medication. Concomitant medications included unspecified medication for back problems. The patient denied any other vaccines within four weeks prior to this vaccine. The patient reported that she generally gets the flu shot every year and has never had any adverse reactions. The patient also mentioned that she previously tramadol (for an unspecified indication) in the past but has not taken it for years. The patient reported that she received her first dose on 08Apr2021 at (Privacy). The patient explained that within six hours she was deathly ill. The patient reported that stayed very ill for quite a few days. The patient stated when she gets up in the morning, she gets up early and she always goes to the bathroom. The patient stated that on 13Apr2021, when she went to the bathroom, she started passing blood clots from her rectum which went on until 16Apr2021. When describing the blood clots, the patient stated 'envision sunny side up eggs, between six to eight of them, and in between that was all this webbing holding the clots together'. The patient stated while she was urinating, the clots were just pouring out of her rectum. The patient clarified that there was not blood in her stool. The patient explained that she took the opportunity to get some plastic gloves and look through her stool for blood and there was not any. The patient stated that her underwear and the toilet paper was stained. The patient also stated that she was reading that whichever arm you get the vaccine, the lymph nodes underneath the arm swell up. The patient explained that her lymph nodes did not swell up underneath her left arm where she got the shot. She swelled up on her right side. She clarifies she was swollen underneath her arm, kind of in the breast area and chest area, up a little higher than the breast. It was very uncomfortable. The patient</p>

1312768	5/13/2021	UT	65	M	4/5/2021		BLEEDING IN EYES; RETINAL TEAR OR DETACHED RETINA; RETINAL TEAR OR DETACHED RETINA; INCREDIBLY PAINFUL INJECTION; REALLY TIRED; This spontaneous report received from a patient concerned a 65 year old white not Hispanic or Latino male. The patient's height, and weight were not reported. The patient's pre-existing medical conditions included no eye problem in the past. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported and batch number: 042A21A expiry: UNKNOWN) dose was not reported, 1 total administered on 05-APR-2021 to left arm for prophylactic vaccination. No concomitant medications were reported. On 05-APR-2021, the patient experienced incredibly painful shot upon administration, immediately the patient was really tired. Three hours after the vaccination, his vision became cloudy and blurry. He then fell asleep. On 05-APR-2021, the patient experienced no peripheral vision. On 06-APR-2021, the patient woke up and had a little improvement in cloudiness but the patient stated that about 20 percent of his vision was still cloudy/blurry. The patient experienced pressure behind eyes, right eye distortion. The patient began to see bright flashes and round floaters. On 06-APR-2021, the patient experienced bleeding in eyes, retinal tear and detached retina that affected the patient's ability to work. On 07-APR-2021, morning, he was then referred to an eye specialist for ongoing eye issues. He went to see physician. He had been back to the eye specialist 2 additional times since then with ongoing eye issues. He had been told he has bleeding in his eyes, a retina tear or detached retina and still no peripheral vision. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from incredibly painful injection on 05-APR-2021, had not recovered from retinal tear or detached retina and bleeding in eyes and the outcome of really tired was not reported. This report was serious (Other Medically Important Condition).; Sender's Comments: V0:20210509138-Covid-19 vaccine ad26.cov2.s-Eye heamorrhage, Retinal tear ,Retinal detachment. These events are considered unassessable. The events has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the events

1312884	5/13/2021	IL		F	3/1/2020	3/1/2021	<p>Osteoarthritis aggravated; Recurred Intestinal tubing; This spontaneous case was reported by a physician (subsequently medically confirmed) and describes the occurrence of UNEVALUABLE EVENT (Recurred Intestinal tubing) and OSTEOARTHRITIS (Osteoarthritis aggravated) in a 62-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. Co-suspect product included non-company product ADALIMUMAB (HUMIRA) for Ulcerative colitis and Crohn's disease. Relevant history includes alcohol abstinence and non tobacco user. Osteoarthritis aggravated started at an unknown date in March 2020 and stopped at an unknown in 2020. The patient's past medical history included Gastric bypass in 2004 and Knee replacement in June 2020. Concurrent medical conditions included Osteoarthritis since 2019 and Gastrointestinal tube insertion since February 2020. In March 2020, the patient started ADALIMUMAB (HUMIRA) (unknown route) 40 milligram every two weeks. In March 2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. In March 2021, the patient experienced UNEVALUABLE EVENT (Recurred Intestinal tubing) (seriousness criterion hospitalization). On an unknown date, the patient experienced OSTEOARTHRITIS (Osteoarthritis aggravated) (seriousness criterion hospitalization). The patient was hospitalized for 2 days due to UNEVALUABLE EVENT. In March 2021, UNEVALUABLE EVENT (Recurred Intestinal tubing) had resolved. At the time of the report, OSTEOARTHRITIS (Osteoarthritis aggravated) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): In March 2021, Computerised tomogram: recurred intestinal tubing (abnormal) Recurred intestinal tubing. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. The patient was hospitalized for two days due to recurred intestinal tubing. She had a laparoscopic procedure to visualized the intestine and it there was no cramping or tumor that was found and the intestine was clear. She was told that it was resolved by itself and no additional treatment or procedure was needed at that time. She was</p>

1313060	5/13/2021	WV	50	F	4/8/2021	4/8/2021	twitches in her legs and then pain after; Face periodically twitches; eye twitches periodically especially after sneezing or coughing; twitches in her legs and then pain after; Face periodically twitches; eye twitches periodically especially after sneezing or coughing; Face periodically twitches; eye twitches periodically especially after sneezing or coughing; stinging in her legs and it went up to her waist and felt like a band around her waist; stinging in her legs and it went up to her waist and felt like a band around her waist; Unexpected weight loss; no appetite; Unexpected weight loss; no appetite; This is a spontaneous report received a contactable nurse, the patient. A 50-year-old adult female received the first dose of BNT162b2 (solution for injection; Lot EW0158 and expiry information not provided) as a single dose via unspecified route in the right arm on 08Apr2021 at 19:30 (at 50-years-old) for COVID-19 immunisation. Relevant medical history included COVID with insomnia (Nov2020). There were no concomitant medications or past drug history reported. The patient reported as soon as she got the shot, she did not feel sick or nauseated, maybe she had no appetite, but she has lost ten pounds three weeks. States before the vaccine she was 138 pounds. The patient reported that on 18Apr2021, reported as eight to ten days later she developed stinging in her legs and it went up to her waist and felt like a band around her waist. The patient reported that on 20Apr2021 she experienced twitches in her legs and then pain after, her face periodically twitches; eye twitches periodically especially after sneezing or coughing. The patient reported that she had COVID back in Nov2020 and she had some problems after and then recovered. States she just got the Pfizer COVID vaccine three weeks ago and she did really well with the first one; however eight to ten days later, she noticed stinging in her legs and it went up to her waist and felt like a band around her waist. Then she started having twitches in her legs, and then pain, states the twitches have remained, she cannot see them, but she can feel them. Caller states her face periodically twitches as well. Her eye will twitch periodically when she sneezes or coughs. The patient, a retired nurse, assessed the events as medically significant, because she needs to know if it is something more serious. The patient denied any visits to the emergency room or to any doctor's office for the events reported. The patient

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>

reported that she called a few neurologists to see if she could have gotten in but they are so booked up that she could not get an appointment until August. The patient stated that the neurology place said they are seeing some very strange things, so the patient believes she is not the only one. The reporter stated that maybe because she had COVID, she does not know if it is because of that, but maybe the first one acting is acting like the second dose for her. The patient inquired if it was okay to get the second dose. The outcome of the event stinging in her legs and it went up to her waist and felt like a band around her waist was recovered on 20Apr2021. The outcome of the event weight loss; no appetite, twitches in her legs and then pain after, and Face periodically twitches; eye twitches periodically especially after sneezing or coughing was not recovered.; Sender's Comments: Based on a compatible temporal association a causal relationship between reported events and BNT162B2 vaccine cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

It began on my scalp and then traveled down my forehead and into my eye; My eye became so swollen, it shut completely; fatigue; aches/ soreness; chills; This is a spontaneous report from a contactable consumer (patient). A 37-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE lot number: EL9267) dose 1, via an unspecified route of administration, administered on the left arm on 15Feb2021 05:00 AM as 1st dose, single for COVID-19 immunisation. Medical history included COVID-19 (prior vaccination), ulcerative Colitis and known allergies red food coloring. Concomitant medications included infliximab (INFLECTRA), vitamin c [ascorbic acid] (VITAMIN C [ASCORBIC ACID]); zinc and ergocalciferol (VITAMIN D). Upon receiving the vaccine, the patient initially had a typical reaction including soreness, fatigue, aches, and chills (Feb2021). On 19Feb2021 07:00 AM, patient developed shingles. It began on her scalp and then traveled down her forehead and into her eye. This was all on the left side of her scalp and face (the vaccine was given on my left side). Her eye became so swollen, it shut completely. She visited both the ER and urgent care as well as an ophthalmologist. She is now 12 days post vaccine and she still have shingles and extreme swelling of left eye. Currently taking Valtrex, oral steroids, steroid eyedrops, and using antibiotic ointment on her eye. The events resulted in a doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care. Treatment received for the events which included Valtrex, steroids, antibacterial ointment. Post vaccination, the patient has not been tested for COVID-19. Patient was not pregnant. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Outcome of the events fatigue, aches/ soreness and chills was unknown and not recovered for the other events. No follow-up attempts are possible. No further information is expected.; Sender's Comments: Based on the temporal relationship, the association between the event Ophthalmic Herpes zoster with BNT162b2 can not be fully excluded. A 45-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; solution for injection) via an unspecified route of administration on an unspecified date (at an unspecified age) as a single dose for COVID-19 immunisation. Medical history and concomitant medications were not reported. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; solution for injection) via an unspecified route of administration on an unspecified date (at an unspecified age) as a single dose for COVID-19 immunisation. On an unspecified date the patient experienced back of my head was tingly/a constant feeling of a tingling sensation in my head almost, my motor function was off, speech had an impediment, digestive issues, mucus eyes, I felt a little out of it, tired, headaches and legs are shaky. The patient called to report side effects from one of the shots and the course was reported as follows: "The side effects started mild and then went severe. The day after my shot I started experiencing digestive issues and mucus eyes. I felt a little out of it, not terrible. It lasted 5 days to a week. I felt fine for about a week and then I woke up almost two weeks after and the back of my head was tingly, my motor function was off, speech had an impediment, and I did not have control over my body, could not talk right for about 2 days. I lost control over my whole body for about 30 seconds. I still have a constant feeling of a tingling sensation in my head almost and something just is not right when I try to talk. There is a disconnect between my brain and my mouth. I am very tired, nowhere near the energy I used to have. I get random pounding headaches like someone hits me in the head with a bat, other days my legs are shaky. It is off and on. It is not constant, but it is consistent. I got rushed to the hospital but there was no sign of a stroke." The patient inquired as to how long should he expect these symptoms to last. The clinical outcomes of the events back of my head was tingly/a constant feeling of a tingling sensation in my head almost, my motor function was off, speech had an</p>

1313027	5/13/2021	AR	48	F	4/12/2021	4/1/2021	stiffness of joints; Didn't sleep at all last night.; Back pain; can't walk; Knee pain; right and left arm pain/legs hurt/hands were also hurting; not as hard of a pain but it is in the muscles below the knee and in the back of the calf.; neuropathy; whip lash in shoulders and neck; feel radiation or heat; uncomfortable; shoulders became sore; tired; Eyes hurt; vasculitis pain flare up; This is a spontaneous report from a contactable consumer (patient). A 48-year-old female patient received BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine), dose 2 via an unspecified route of administration, administered in right upper arm, at age 48 years, on 12Apr2021 13:00 (Batch/Lot Number: 9R8732) as second dose, single, for COVID-19 immunization. Relevant medical history includes two autoimmune diseases and two lung diseases further reported as ongoing Post-traumatic stress disorder (PTSD) diagnosed in 2017 because of trauma from vasculitis because both her arms looked like sleeves of nothing but broken blood vessels; Chronic obstructive pulmonary disease (COPD) from unspecified dates; ongoing bronchiolitis from unspecified date that does not go away; ongoing Hepatitis B contracted after vasculitis had gotten back together with her baby daddy and contracted it that way; ongoing small cell vasculitis (CSVV) from Oct2017 is her main disease; immune system weaker than her mom; body is weak; has weak muscles; generalized anxiety disorder; depression; she had fell on both arms, she's had a knee surgery; and she can barely walk because she pulled a back muscle before, her back and her having an injury from 2 years ago in 2019. Patient also usually gives blood at her primary care. Family history includes arthritis, her mom has it. Concomitant medications included tenofovir alafenamide fumarate (VEMLIDY) taken for antibiotic therapy from an unspecified start date and ongoing; meloxicam taken for joint swelling from an unspecified start date and ongoing; alprazolam (XANAX) taken for generalised anxiety disorder from an unspecified start date and ongoing; quetiapine fumarate (SEROQUEL) taken for post-traumatic stress disorder from an unspecified start date and ongoing; pantoprazole taken for ulcer from an unspecified start date and ongoing; sertraline taken for depression from an unspecified start date and ongoing; promethazine taken for prophylaxis of nausea and

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT

vomiting from an unspecified start date and ongoing; albuterol sulfate taken for an unspecified indication from an unspecified start date and ongoing; and budesonide taken for lung disorder, start and stop date were not reported. Patient historically took first dose of BNT162B2 (injection, Batch/lot number: EN6202) in the left upper arm at age 47 years on 19Mar2021 at 1:40pm at a clinic for COVID-19 immunization and experienced no adverse event; and an unspecified flu shot last Oct2020 (also reported as last winter). Patient has some 5 or 6 doctors there as specialists or prescribers. She has a liver specialist and a vasculitis specialist, whom she has not seen since the flare up because of her insurance, a main primary that saved her and brought her into remission is not covered with her insurance, and a GI doctor as well. She also reported that her immune system is probably weaker than her mom's because of her own 2 diseases. She also said that she was supposed to be in lung therapy but her body is weak. She stated that every time something hurts, it may be neuropathy. She has weak muscles and they haven't been this weak. She could move around and do things before. Patient was tired from the autoimmune and lung disease, she has had to stop and rest. Patient clarified that she had these prior to COVID coming. Patient wanted to get the vaccine to have more immunity so she could go out. She didn't want to get the Corona virus. The doctors said she wouldn't make it. It was her choice but the doctors recommended it. It was reported that patient has completed vaccination. About a week ago (13Apr2021), started experiencing a lot of pain from a vasculitis flare up. It is as if it just happened and was having a lot of pain in various parts of the body. Patient stated that it didn't start until like the second day (13Apr2021). Patient was not disgruntled, believes in the vaccine. She has an appointment with the tele doc this week and with another doctor at the same office since doctor was not in this week, because of her back and her having an injury from 2 years ago, X-rays, and can't walk right now, is in a lot of pain. She did not know if she can take pain pills, with all her other stuff. Patient stated that both her legs hurt and she can't walk. Her hands were also hurting with it in Apr2021. Patient had knee pain on 19Apr2021, leg pain was still there but getting better and was still hurting when she walks. It is not as hard of a pain but it is in the

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

muscles below the knee and in the back of the calf in Apr2021. On 21Apr2021 or 22Apr2021, right and left arm just hurts all the way down started. They are the same and are still hurting and staying persistent. On 26Apr2021, back pain was added and stated that she got it for complaining about her arm. It started About 3 days after the shot, around 14Apr2021 or 15Apr2021, patient had whiplash in shoulders and the neck. It started in the back of the head and was like she could feel radiation or heat. It would be so uncomfortable, her shoulders became sore. When she looked left or right, it felt like whip lash. It has gotten better. For her arm, she wanted to revert to ice/heat but she hasn't done anything yet. Patient called her primary in hopes that he would give her something for the pain, she was not in pain management but it is hurting so bad. Since the injection, she has been so tired, so she has not been taking her XANAX. She takes them as needed for generalized anxiety disorder and her anxiety has not been up. A lot of the time she does not have to take them. The diseases make her tired and fatigued. If her mind is too racy, she will take to keep as calm as possible, especially with the small cell vasculitis or then she could have a flare. Her main objective is to keep calm. She was already taking 1 XANAX a day when diagnosed with PTSD but they just raised it because then came her PTSD and depression from the vasculitis. Has muscle relaxer cyclobenzaprine hydrochloride (FLEXERIL) at 100mg once a day which she doesn't take. Did not normally take these but has been taking them since this happened. She is in so much pain. Does not generally have high tolerance for pain. Does not like taking opioids because they make her throw up. She can only take them with Phenergan. Does not take if she does not need them because they do not sit well with the liver. She has an inhaler that keeps the lungs dilated for 10 hours, is not Pulmicort but something else. Eyes hurt on Apr2021 and can't read the label because its so little. She has bronchiolitis which is another rare disease with the airways in her lung and medication keeps the lungs dilated. Haven't seen the doctor yet so no tests yet. Since this happened, she can't walk. On 26Apr2021, when she went back down she couldn't walk since. It is her lower back on the right side, above her hip. She had pulled it 2 years ago (2019), above the hip on the right side. She recognized this

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

feeling from a couple of years ago. It seems to be the place where she feels over winded. It may be neuropathy problems, wondering if it's not neuropathy since it's not her muscles (Apr2021). Everything that was wounded has come back and hurts as bad as it does. For can't walk, the pain just hurts. She didn't sleep at all last night (26Apr2021). Tries to turn and get up and if she is on either of her arms. Other than the neck, shoulders and back of her head, she never got a fever. When it started she thought that it was normal. Then, it started hitting in all of these other places and she was barely moving. Patient had the normal feeling like when she would breathe. On an unspecified date, she was having stiffness of the joints, as if they were traveling, then taking a vacation to every place that she has ever hurt itself. She had fell on both arms, she's had a knee surgery and its like going to that. The knee surgery was on the right knee. Like right now its in her back, and she can barely walk because she pulled a back muscle before. She stated that she will enjoy it if she can walk again and she just wanted to make it through this. The adverse events did not require emergency room visit or physician's office visit but was definitely at the point where she will go see the primary or go to the ER. The outcome of the event vasculitis pain flare up, right and left arm pain/legs hurt/hands were also hurting, and ?can't walk was not recovered; for knee pain, whip lash in shoulders and neck, feel radiation or heat, uncomfortable, and shoulders became sore, it was recovering at the time of report; for the other events, it was unknown. No follow-up attempts are needed. No further information is expected.

A 30-years-old male patient received bnt162b2 (unspecified trade name), dose 2 via an unspecified route of administration, administered in Arm Left on 21Apr2021 16:00 (Lot Number: EW0171) as single dose for covid-19 immunization. Facility where the most recent COVID-19 vaccine was administered was Public Health Clinic/facility. The patient medical history was not reported. No known allergies. The patient's concomitant medications were none. No other vaccine in four weeks. No other medication in two weeks. The patient previous received the first dose on 31Mar2021 11:00 (Lot number=ER8737) as single dose at Left arm for covid-19 immunization. The patient had no reaction on previous exposure to vaccine. Prior to vaccination, the patient was diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. The patient experienced Fever, chills, intense pressure behind eyes, headache, muscle weakness, fatigue, brain fog, intense body pains/aches - especially at joints (knees, wrists, ankles), arrhythmias/heart fluttering, heart pounding, insomnia, lack of appetite, migraine with aura, lethargy on 22Apr2021 13:00. The outcome of the events was recovering. No treatment received.; Sender's Comments: The contributory role of the suspect product bnt162b2 (unspecified trade name), dose 2 via an unspecified route of administration, administered in Arm Left on 21Apr2021 16:00 (Lot Number: EW0171) as single dose for covid-19 immunization to reported events is possible based on temporal association and known profile of the product.

1314722	5/13/2021	CA	50	F	4/7/2021	4/7/2021	<p>Within 5 minutes from receiving my J&amp;J vaccine, I went to sit down and I started feeling very hot in my body. My heart started to race, had chest discomfort and had trouble breathing, my trachea closed up, had blurry vision and pain in my chest. I felt like I could not breathe and when the nurse came over to ask me I could not speak to her, I went into a shock and I was placed on the floor and I could not hear anything nor could open my eyes, from my hips down to my feet I could not feel anything, my legs went completely numb and I had a syncope. What I was told from the nurse that I was given an Epi-pen to help with my reaction. When I came back my body was having convulsions, felt my head spinning, had pain in my chest that so very intense and the nurse got me up and took me to a nearby ambulance and the EMT staff placed like a heart monitor because my heart was racing super fast. I also felt heaviness in my chest and inside the ambulance I was given two injections on my left arm and when I slowly started coming back, I was already at the hospital. I was at the hospital from 2pm to 4:30pm more less being monitored. At the hospital x-ray of the chest was performed as well as lab work and I was discharged home. When I got home, I still did not feel good, I felt heaviness to my chest, still have trouble breathing and get chills during the night. I also could not stand up and have a nerve sensation to my body and the chest pain to my left side is still very present. I have blurry vision, dizziness, headaches, and my heart-beat continues to race very fast. I get headaches, have abdominal pain and I peed blood few times then that's when I was able to pee, my abdominal pain was painful like having a baby. On Friday 04-08-2021, I again went to the hospital because I had fallen to the floor on my kitchen floor and my daughter took me to the hospital. I let the nurse staff know that I still have continued chest pain and pressure, difficulty breathing and headaches, dizziness and they monitored and gave me three pills as medication. I was discharged home about 5pm with a referral to see a neurologist due to my chest pain, blurry vision, dizziness and fever which I had these past three weeks. I do not know why I felt all these symptoms after my J&amp;J vaccine.</p>

1314809	5/13/2021	IA	75	F	3/18/2021	3/20/2021	Patient presented to emergency department on 3/20/21 with symptoms of dizziness, nausea, and vomiting. She received the COVID vaccine 2 days prior. Patient has had similar episodes of vertigo in the past. Patient notes vertigo is much more severe than past experiences. During hospitalization patient continued to endorse severe dizziness and nausea. Vertigo increased with eye opening or changes in position. Horizontal nystagmus present. Patient was treated with ondansetron, metoclopramide, methylprednisolone and lorazepam for symptom control. Physical therapy also worked with patient. Patient discharged on 3/23/21 with new prescriptions for meclizine and ondansetron as needed.
1314822	5/13/2021	WI	13	M	5/13/2021	5/13/2021	I administered the Pfizer COVID vaccine to the patient at about 2pm. I completed the vaccine, put the used syringe into the sharps container, grabbed the bandage, and turned back toward the patient. As I did this, he started slumping over in the chair, and his eyes rolled back into his head. I immediately put my arms around him so he wouldn't fall out of the chair. The patient's father was in the room as well and knelt down in front of him. The patient's body spasmed for a few seconds, then he came to but was breathing heavily and starting to sweat. I called to technician in the pharmacy and asked him to call 911 at 2:03pm. I brought the patient a cool cloth and asked a technician to bring some water. The patient's breathing started to slow, but he was nauseous and dizzy. He dry-heaved once, and I put the garbage can in front of him. He slumped over the garbage can for a few minutes. Then he asked to lie on the floor. He seemed to do better lying on the floor. When the EMTs arrived, they attempted to have him sit in the chair again, but his dizziness returned, and he complained of being cold. The EMTs moved the patient to the gurney and transported him to the Hospital for further medical attention.

1314691	5/13/2021	WI	57	M	4/27/2021	5/8/2021	History of Present Illness: Patient has a history of sinus problems. He was scheduled for sinuplasty and had preoperative evaluation on 04/21/2021 with WBC 5.8, Hb 15.5, PLT 193,000. He had J&J covid vaccination on 04/27/2021. He underwent sinuplasty on 05/05/2021. Subsequent to his surgery he was having headache. He had some nasal discharge with blood. He took tramadol but had persistent pain. His symptoms were worsening up with some weakness of his right upper extremity. Was having generalized fatigue and weakness. He states he was getting short of breath with a flight of stairs. He had decreased appetite. He was given Vicodin for his headache with some improvement. He noted discoloration and bruising with pain in his left internal thigh area. Was noticing some changes in his vision but no loss of vision. He presented to the ED on 05/11/2021 and laboratory showed WBC 8.7 Hb15.2, PLT 6,000, segs 77%, lymphs 9%. He had no dark colored urine. INR 1.4 PTT 33, immature platelets 30.2. His bili was 2.1. He was treated with dexamethasone 40 mg. There is tiny focus of restricted diffusion in the both cerebellar hemispheres measuring up to 0.4 cm white matter left cerebellar hemisphere of left parietal junction measuring 0.5 cm compatible small lacunar infarcts. Chronic paranasal sinusitis. Patient described minimal blood with flushing his sinuses. Patient was ultimately transferred to Hospital after 3 days (on 5/11) for further acute care management given the multiple clots and bleeds associated with severe thrombocytopenia.

1315154	5/13/2021	IL	16	M	5/4/2021	5/5/2021	<p>Patient is a 16-year-old male patient admitted with seizure like activity. One day prior to admission patient received his second COVID vaccine, Pfizer brand. On the day of admission Patient woke at 0200 with pain in the left side of the chest, mid-axillary per patient's description it was cramp-like pain and he was able to go back to sleep. At 0500 he got up to use the restroom and went into the kitchen. He told his mom he didn't feel well and fell forward making a gurgling sound, arms rigid, was unresponsive, and this lasted 1.5minutes according to mom. Mom called EMS and when he awoke he stated he was nauseous. After EMS arrived it was 2-3 minutes and he did not feel well again, he stood up and head fell back, eyes open, he was shaking, and making a gurgling noise again, this episode lasted 30 seconds. Upon awaking he was disorientated for a few minutes then back to baseline, he was nauseous again and very tired. He came to the ED where EKG (pending), CBC (normal), PT/PTT/INR (slight elevation), CMP (normal), TSH (normal), Ethanol (None), Troponin (normal), Head CT (normal), and chest xray (normal) were done. He received a NS bolus was given. He was admitted to the pediatric hospitalist for further evaluation and management. This is where he had a 24hour Video EEG with normal EEG he was discharged home.</p>

periods), HYPERHIDROSIS (chopped her hair since she sweats a lot in her scalp), PAIN (Body aches), HEADACHE (Headache) and FATIGUE (Fatigue) outcome was unknown. Patient stated that her OBGYN told her she is going thru menopause for which she was prescribed estrogen and she started getting a period. Treatment included Tylenol. The patient received both scheduled doses of mRNA-1273 prior to the events, therefore action taken with the drug in response to the events was not applicable. Very limited information regarding this events has been provided at this time. The events are assessed unlikely related to product. This case was linked to MOD-2021-110270 (Patient Link). Most recent FOLLOW-UP information incorporated above includes: On 06-May-2021: New concomitant drugs (Black Cohosh, Estradiol/norethindrone, Clobetasol propionate, Estradiol cream) were added, New events (Bleeding, back hurts, had period, itchy in eyes, cannot think straight, confused, body aches, heavy period, anxiety increased and feels depressed) were added and Suspect vaccine dosing details were updated.; Sender's Comments: Very limited information regarding this events has been provided at this time. The events are assessed unlikely related to product.

1315868	5/13/2021	KY	62	M	3/17/2021	3/27/2021	Bell's palsy (a neurological condition where drooping of the eye lid and the face happens); This spontaneous case was reported by a physician assistant (subsequently medically confirmed) and describes the occurrence of BELL'S PALSY (Bell's palsy (a neurological condition where drooping of the eye lid and the face happens)) in a 62-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. Concomitant products included LISINOPRIL, LOVASTATIN, QUETIAPINE FUMARATE (SEROQUEL) and TRAZODONE for an unknown indication. On 17-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 27-Mar-2021, the patient experienced BELL'S PALSY (Bell's palsy (a neurological condition where drooping of the eye lid and the face happens)) (seriousness criterion medically significant). At the time of the report, BELL'S PALSY (Bell's palsy (a neurological condition where drooping of the eye lid and the face happens)) outcome was unknown. mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was withdrawn on an unknown date. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. No adverse event as Medical History was reported. Patient did not receive the second dose of the vaccine due to this condition. Treatment information not provided. Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.
1314167	5/13/2021	SC	62	M	3/13/2021	5/12/2021	Temporary partial blindness in the left eye. Event lasted 1 minute. One quarter of the top portion of sight in my left eye was blocked by what appeared to be a dark curtain, this went away after 1 minute. Had an exam by eye doctor the same day , no eye problems were found. Had an exam by cardiologist the following day. He prescribed a imaging order for a head scan and prescribed Clopidogrel 75 mg and to monitor a fib for 30n days with Apple Watch.

Chills Chief complaint ED Provider Notes Emergency Medicine Expand AllCollapse All HPI Chief Complaint Patient presents with ? Weakness - Generalized ? Chills HPI 79-year-old female, history of COPD for which she wears oxygen at night and as needed, also with a history of leukemia and obesity who presents to the ED complaining of generalized body aches, fevers up to 103, feeling generally unwell and weak, poor sleep, onset 3 to 4 days ago. Patient reports that she received her second COVID-19 vaccine approximately 1 week ago. Tolerated this without any particular symptoms. She has had 2 days of watery/nonbloody diarrhea. Does admit to nausea with several episodes of vomiting earlier today. She is denying any particular abdominal pain. Does believe she felt her urine burning earlier today but has had no gross hematuria. Denies any flank pain. No ill contacts although her husband has been at home with a slight cough. Patient does have a cough presently but it is nonproductive. She is denying any particular chest pain or subjective shortness of breath. No rash or unusual lower extremity pain, swelling, or redness. ED to Hosp-Admission Discharged 4/6/2021 - 4/17/2021 (11 days) Hospital Last attending ? Treatment team Severe sepsis (CMS/HCC) Principal problem Discharge Summary Internal Medicine Inpatient DeathSummary BRIEF OVERVIEW Admission Date: 4/6/2021 Discharge Date: 4/17/2021 DETAILS OF HOSPITAL STAY Presenting Problem/History of Present Illness/Reason for Admission Patient is an 79 y.o. female morbidly obese with past medical history of chronic lymphocytic leukemia follow-up that was initially scheduled oncology follow-up for April 7 now postponed to the next 2 weeks, COPD on 2 L oxygen support at home, GERD, depression and anxiety. She was recently seen in the ED on April 4, 2021 with complaint of shortness of breath, nonproductive cough, fever, chills, nonbloody diarrhea, vomiting and weakness and subsequently diagnosed with COVID-19. She had however received a second dose of COVID-19 a week before and was discharged home due to lack of significant findings on imaging chest x-ray and lack of

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

requirement for higher oxygen support. She presented to the emergency via EMS for evaluation of progressive shortness of breath with associated with fever, chills, headache, persistent shortness of breath, cough productive of thick clear sputum, nausea, vomiting and diarrhea. She denies abdominal pain, chest pain, or dizziness. Denies recent antibiotic usage or recent travel. Apparently, she thought she was getting better upon discharge after being kept for about 12 hours in the last ED visit, however she was not feeling well after going to bed last night and asked the husband to call 911. Upon EMS arrival patient was saturating in the 80s and in respiratory distress. She received 1 DuoNeb and was eventually placed on 10 L oxygen support. She was noted to be in significant respiratory distress during speech. Hospital Course Patient was admitted to hospital due to shortness of breath, and was found to have severe sepsis on presentation due to COVID-19 pneumonia. She had evidence of acute on chronic hypoxic respiratory failure as well. She was started on IV antibiotics, as well as remdesivir and Decadron at high dose. Unfortunately she continued to have clinical deterioration, and ultimately required high flow oxygen therapy. She was then transferred to the ICU, and ultimately required intubation due to severe profound ongoing hypoxia despite optimal medical treatment. She did not respond to remdesivir or steroids or antibiotics. Post intubation, she also developed acute renal failure during the course of her admission. Multiple discussions were had throughout the hospitalization regarding goals of care, and initially patient and family wish to be continually aggressive. She received full medical treatment, including life support, with minimal improvement. Despite being on ventilator for roughly 5 days, she continued to have severe hypoxia. She was prone, and was unable to sustain oxygen saturations when supine even for short period. Her renal function continued to decline as well, and at that point discussion was had with family regarding goals of care again. They were explained that symptoms continue to be persistent, and her illness continues to progress despite aggressive medical therapy. Ultimately decision was made to not pursue dialysis, and to allow the patient to be kept comfortable and pass away naturally from this infection. She was terminally extubated on 4/17 and passed away

1314974	5/13/2021	UT	32	F	3/19/2021	3/19/2021	About 2 minutes after receiving the vaccine, while parked, I started getting very light headed, felt dizzy, and my heart starting beating extremely fast, and then slowed down and started beating very very hard, and felt like it was going to pound out of my chest. I then had a warm sensation in my throat and started feeling like it was getting harder to breathe. I rolled down my Window, and looked for someone to wave over for assistance, but there were cars in the way, so I closed my eyes and focused on breathing deep and slowly to see if that would make it any better. After about 5 minutes my heart rate went back to normal, I felt I could breathe normally, and wasn't so light headed anymore. I should have reported this to someone when they told me I could leave, but I wasn't sure if it was an actual allergic reaction. Or if it was just a stress reaction. I felt like I should at least report it here, because I was completely fine before the injection, during the injection, and right after, until about 2 minutes after being parked.

1315885	5/13/2021	IL	31	M	10/14/2020		<p>grand mal seizure; vision changes; Feelings of pressure at the back of his neck radiating to right side of his head; This spontaneous case was reported by a physician (subsequently medically confirmed) and describes the occurrence of GENERALISED TONIC-CLONIC SEIZURE (grand mal seizure) in an adult male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Co-suspect product included non-company product ADALIMUMAB (HUMIRA) solution for injection for Crohn's disease. Concurrent medical conditions included Crohn's disease (moderate to severe). On 14-Oct-2020, the patient started ADALIMUMAB (HUMIRA) (Subcutaneous) dosage form. On an unknown date, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On an unknown date, the patient experienced GENERALISED TONIC-CLONIC SEIZURE (grand mal seizure) (seriousness criterion hospitalization), VISUAL IMPAIRMENT (vision changes) and NECK PAIN (Feelings of pressure at the back of his neck radiating to right side of his head). At the time of the report, GENERALISED TONIC-CLONIC SEIZURE (grand mal seizure) had resolved and VISUAL IMPAIRMENT (vision changes) and NECK PAIN (Feelings of pressure at the back of his neck radiating to right side of his head) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. The patient had a seizure three days after his first Moderna Covid vaccine and was hospitalized. CT scan was negative. The reporter's causality for co-suspect drug, adalimumab, was not provided. Concomitant product use was not provided. No treatment information was provided. This case concerns an adult male, with PMH of Crohn's disease, hospitalized with a serious unexpected event of generalized tonic-clonic seizure (grand mal seizure), and nonserious unexpected visual impairment and neck pain. Event onset with unknown latency after first dose mRNA-1273. Based on current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.; Sender's</p>

1314023	5/13/2021	WI	16	F	5/8/2021	5/8/2021	PATIENT LOST CONSCIOUSNESS, FELL FORWARD OUT OF CHAIR (WAS CAUGHT AND ASSISTED TO THE FLOOR), PATIENT REGAINED CONSCIOUSNESS, EMERGENCY SERVICES WERE CALLED, PULSE, BLOOD SUGAR, OXYGEN, AND VISION WERE FINE, PATIENT VERY LIGHT HEADED, BLOOD PRESSURE EXTREMELY LOW, WASN'T RETURNING TO NORMAL
1314077	5/13/2021	SD	19	F	5/13/2021	5/13/2021	Patient got really hot, blurred vision, dizzy and threw up once. Gave her water and a fan. Offered her crackers, but didn't want to eat anything. Symptoms lasted for about 5 to 10 minutes. Observed her for 50 minutes after and felt fine. Her aunt came to pick her up. Patient stated she has a history of adverse effects such as this with vaccines.
1314088	5/13/2021	OH	52	F	5/1/2021	5/7/2021	Given 12:20 pm. Extreme fatigue, eyes swollen/heavy 7:00 pm for about 2 days. New soreness at injection spot 3 days later for appx 24 hours (bearable). Extreme itchiness, splotchiness, and increasing rash on face and neck 7 days later. Currently on day 6 of rash and day 2 of Prednisone prescription with rash slowly lessening.
1314209	5/13/2021	DC	19	M	3/6/2021	3/6/2021	Aches and pains outside of arm 15 minutes afterwards. Subsided largely, but chills started and became more heightened after strenuous exercise later in the day. After 3 hours of sleep, awoke the next day with chest pain and difficulty moving. Heart rate (normally 60) spiked to 140 and could not see fit five seconds, had to call ambulance. Ambulance determined much of it was due to anxiety (multiple exams and significant work were due soon), and recommended medical supervision to ensure it did not escalate. Went to urgent care and was supervised until 1 pm, 24 hours after the vaccination, by which time symptoms had subsided

1314271	5/13/2021	FL	53	F	4/26/2021	5/8/2021	started seeing double out of left eye on evening of May 8. The morning of May 9 my eyelid was drooping and double vision out of left eye was a little bit worse. Went to emergency room on May 9. Tests included MRI, CAT scan, bloodwork, tested for stroke. All tests normal. I was sent home with a diagnosis of third nerve palsy. My double vision out of left eye has remained the same. No worse or better as of May 13. I have not had any pain associated with this. Just double vision out of left eye.
1314283	5/13/2021	MD	14	M	5/13/2021	5/13/2021	Pt had spent 10 mins in the observation hall when he w.. as reported to be feeling light-headed and his vision, blurry. Mother reported that he had nothing for breakfast b/4 the vaccination appointment. V/S taken was bp 98/57, rr 14, Hr 80, O2 96% RA, T. 95 degrees. When writer offered some drinks and snack, the Pt accepted the offer. 2 small packs of apple juice and 2small packs of crackers were consumed by the Pt. A recheck of the v/s showed the following readings. bp 98/64 , Hr 69, O2 99% RA .Pt and mother stayed for about 15 extra mins before the Pt verbalized feeling okay and ready to leave. He left in the company Of mom unassisted
1314306	5/13/2021	MI	16	F	5/12/2021	5/12/2021	The patient felt tired and describes her eyes going dark, then passed out a few minutes after vaccination. She was vaccinated and then left the immunization room to sit down for a 15 minute waiting period. When she went to sit down, she collapsed on the floor. Her mother assisted her into a chair. She continued to be incoherent and have her eyes rolling back into her head for a few minutes. We used a cool cloth on her forehead and the back of her neck. The parents requested that we call 911. EMS arrived shortly and evaluated her. Heart rate, blood pressure, pulse ox, blood sugar and chest sounds were all within normal range. The patient stated that her arm felt heavy and "funny". She then stated that her tongue felt funny. EMS evaluated her tongue and said it looked normal. To err on the side of caution, she was taken to the hospital to determine whether or not she was having a delayed onset anaphylactic reaction. This patient has no history of seizures.

1314108	5/13/2021	VA	18	M	5/12/2021	5/12/2021	Patient received his second dose of Pfizer Covid 19 vaccine around 5:50 pm and about few minutes later his mom notified us that he is about to pass out, I rush there and with mom help , we payed him on the floor, at his point he looked pale and was dehydrated, He sat down with our help after a minute or two and drank about 20 oz of cold water, by the time EMS team arrived and he was talking and sat back on the chair and walked out on his under supervision of EMS personnel. A follow up call was made today with his mother and he ate last night after getting home and went to bed and today went to school .
1314507	5/13/2021	MD	13	M	5/13/2021	5/13/2021	he had his vaccination at 2:18, sat down in observation and after one minute, he lost consciousness, caught by father, and began having tremors. Woke up after 30 seconds - 1 minute. Helped to wheelchair. Skin was pale, but pt. was alert and oriented x 3, he reported blurry vision prior to incident. Observed on cot for 30 minutes. Given water, vital signs checked, wnl. Pt. left with father, escorted in wheelchair.
1314482	5/13/2021	MD	14	F	5/13/2021	5/13/2021	Pt c/o of dizziness as the only symptom s/p vaccination. She denied any chest pain, shortness of breath, vision loss, or pain. Pt's mother stated that she previously gets dizzy after vaccinations, and seeing needles. Pt stated that she had a "fear" of needles, but wanted the vaccine anyway. The nurse moved the pt to the private area, and helped her onto the stretcher, where she laid down. After the pt was lying down, the nurse assessed her. The nurse then took vital signs every ten minutes, listened to her lung sounds, assessed the radial pulse, assessed her vision, and mentation. After 15 minutes the pt sat upright with her feet dangled. With the nurse and the mother ten minutes later, the pt was walked down the hall. No issues were noted and the pt was stable. All the vitals were within normal limits throughout the entire time. The previous dizziness was gone, and the mother stated that she looked great. Pt stated a total of 40 minutes and then was safely discharged.

clinical outcome of the events: dizziness, giddiness, lightheadedness was recovering. The batch/lot numbers for the vaccine, bnt162b2, were not provided and will be requested during follow up.; Sender's Comments: Based on a temporal association, a causal relationship between the reported events partial vision loss for a few seconds, unfocused spots in vision, double vision and dizziness, and the vaccine BNT162B2 cannot be completely excluded. The causality was confounded by the patients preexisting cardiovascular conditions including hypertension and atrial fibrillation and multiple concomitant medications. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1310081	5/12/2021	WY	37	F	4/27/2021	4/30/2021	On Friday I woke up with swelling around both eyes and in my forehead. Swelling increased progressively so that by Sunday my left eye was nearly swollen shut. I saw a nurse practitioner on Monday and she gave me some steroid eye drops. This helped reduce inflammation a little bit but the swelling and redness continues. The skin was stretched, red, thin, itchy, and crusty. It has now been 15 days since my vaccine. The worst of the swelling has subsided but my eyelid and the area under my eye are still puffy, itchy, and red. I am concerned based on the area of the reaction that this was related to an adverse interaction between the vaccine and dermal fillers I had injected in February of 2020. In addition to this reaction I had extreme fever, shakes, lethargy, and random superficial bruising. The bruising appeared in places where I had had no injuries 6-9 days after the vaccine and looked similar to those you see on people who do cupping - not round but like tiny red dots with pooled blood à stippled bruise with no pain.

1309531	5/12/2021	TX	39	F	2/4/2021	4/21/2021	blood pressure drop; nearly fainted; chest pain; jaw pain; loss of vision; Multiple bilateral pulmonary embolisms in my lungs; This is a spontaneous report from a contactable consumer (patient). A 40-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection) (at 39 years of age), via an unspecified route of administration, administered in arm left on 04Feb2021 (Batch/Lot Number: EN6202) as 2nd dose, single for COVID-19 immunisation. Medical history included MTHFR blood clotting gene mutation. Concomitant medications included citalopram, metoprolol, omeprazole and minastein fe24, all taken for an unspecified indication, start and stop date were not reported. Historical vaccine included BNT162B2 (lot number: EN9581) dose 1 on an unknown date (also reported as 04Feb2021) 01:00 PM in left arm for COVID-19 immunisation. The patient was not pregnant. The patient did not have any other vaccine within 4 weeks prior to the COVID vaccine. She was not diagnosed with COVID-19 prior to vaccination. She had not been tested for COVID-19 prior since vaccination. It was reported that 6 weeks after the second dose on 21Apr2021 12:00, the patient had a blood pressure drop, nearly fainted, chest pain, jaw pain, loss of vision. She went to emergency room (ER), they did tests and found multiple bilateral pulmonary embolisms in her lungs. The adverse events resulted in Emergency room/department or urgent care. Therapeutic measures were taken as a result of the events, Eliquis (reported as 'Eloquis') blood thinners given. The patient was hospitalized for the events for one day. The outcome of the events was not recovered. Information on the batch lot/batch number has been obtained.

1309374	5/12/2021		27	M	5/11/2021	5/11/2021	Patient has history of passing out when getting blood drawn. As patient was standing to get vaccination card filled out, he told associate to call RPH that he wasn't feeling well. I ran out to give my attention and patient was sweating and looked dizzy. His eyes started to shut while he was standing and as I was holding his arm and back to support him he started to fall to the ground. Patient gently went to the ground, I pushed him over to one side and he was out for about 3 seconds and woke back up. Patient was very hot and sweaty. He wanted to move to a more private area so I made an area with a privacy panel available to him. Patient stated to me that he has no history of seizure, but suffers from mild anxiety. Myself or one of the associates was with him for approximately 45 minutes just to make sure he was ok. His blood pressure was taken (twice) and water was given. His BP readings were normal. Patient was on his way. Moderna series completed.
1310328	5/12/2021	AR	42	F	5/11/2021	5/12/2021	Patient states she has severe blurry vision the next morning after receiving the vaccine.
1310098	5/12/2021	VA	16	M	5/12/2021	5/12/2021	Approximately 5 minutes post vaccine, mom alerts the pharmacist that patient is experience some visual disturbances. The patient states that he felt dizzy/eyes were "going black" in and out. Heavier breathing than normal. States it feels harder to breath, but no reports of swelling or itching. Also states that ears were ringing. Pharmacist attempted to check blood pressure on patients left arm with an automatic cuff, but the machine errored twice. Then attempted to check BP with a manual cuff. Reading was varied due to patient moving his arm and hard to hear. Seemed to be around 90/50, but not precise. After 10 minutes, patient stated he was starting to feel better, just felt thirsty. Pharmacist rechecked BP on right arm with a different automatic cuff and reading was 104/62, with a pulse of 101. Patient continued to improve, stating that visual disturbances were gone and hearing had returned to normal. Was able to stand and walk around without feeling dizzy. No difficulty breathing reported at that time. Patient and mom waited another 5 minutes to ensure he had no symptoms and then were able to leave approximately 25 minutes post vaccine.

1309404	5/12/2021	GA	34	M	5/4/2021	5/7/2021	Woke up with abdominal pain on the right side just below the ribs. I have had two other "events" that I assumed were gallbladder attacks but the pain subsided within a few hours. With this event, after a few hours and the pain was still high, I had to be driven to the ER. Just before leaving my house I started getting tunnel vision and my arms and legs went numb. I was able to walk on my own again once reaching the hospital. As of today, 5 days later, I am still in pain. I have taken out all fatty foods and things that are bad for gallbladder issues and still no change.
1309421	5/12/2021		48	F	5/10/2021	5/11/2021	PT presents with worsening frontal HA x this afternoon, denies visual changes. hx of migraines. reports chills and bodyaches last night onset 8 hrs after receiving JJ vaccine. reports hx of covid august 2020.
1309431	5/12/2021	CA	35	M	4/9/2021	4/10/2021	at around noon the day following my shot, I started feeling soreness all over my body. I took aleve. I felt some chills and a slight headache. These lasted until Sunday. Monday I started feeling very tired, very week, and still sore in my arms and a little in my legs. I took aleve. Tuesday I still felt lingering soreness but no headache. I started feeling anxiety towards the end of my workday. At around 4pm I started to feel my legs quivering as if I had just run several miles and my muscles were week. This gave me anxiety as I was still working and assisting clients. at around 4:15 I started feeling like I was going to break out in hives around my neck area, which does sometimes happen to me. I got home and around 7pm I took a Zyrtec, but by that point hives started forming on my neck and head. I felt my lip start to swell. I woke up at about 3am on Wednesday to find both of my lips swollen and I took a Benadryl and went back to bed. I woke up at about 7am and my eyes were both swollen almost completely shut and my lips were swollen. I could feel itchiness from incoming hives around my neck and shoulders. I took two Benadryl and rested all day. The swelling mostly went down by the end of the day and I continued to nurse the Benadryl. I saw my doctor on the 15th. He advised how to proceed and prepare with the second dose and referred me to an allergist.

by a physician who was seen on 23-Apr-2021. A 13-day prednisone taper was prescribed by an ENT (Ear, Nose, and Throat physician/ otolaryngologist) who was seen on 29-Apr-2021. The patient is currently still taking the antibiotic. Thursday 29Apr2021, she visited an ear, nose, and throat (ENT) specialist for her ear symptoms. The ENT specialist's examination found no infection and found no fluid in her left ear. The ENT told her that the antibiotic therapy would not have caused this type of reaction and told her the symptoms may be due to the Moderna Covid-19 vaccine dose. Based on the results of a hearing test which she was given which was ordered by the ENT because of the symptoms, the ENT told her that he believes that her symptoms are due to a nerve issue that is affecting the muscles on the left side of the face. The ENT told her that he has had other patients with similar symptoms after receiving a second dose of Covid-19 vaccine, which are referenced in the cross-linked case. The ENT prescribed a steroid, Prednisone 10 mg, for the symptoms. She started the Prednisone steroid taper on 29Apr2021, describing the Prednisone 10 mg taper to be decreasing by one tablet a day for 13 days. She is still currently taking the Prednisone taper. 1311464	5/12/2021	LA	24	M	5/11/2021	5/11/2021	Patient received J&J vaccine at 4:09pm on 5/11/2021. Within 3 to 4 minutes patient's girlfriend stated that the pt was having difficulty seeing. Pt evaluated and he described complete loss of vision (lasting approximately 10 seconds) that returned. Pt was seated and was instructed to move to floor and lean against wall. Pt described numbness and tingling in both legs that resolved within 5 to 10 minutes. Pt stated he was anxious, shaking was observed, and he was hot and sweating. Vasovagal episode with loss of consciousness was immediate assessment. BP was 98/62 within 20 minutes of AE. 911 was called and EMS evaluated pt. Pt did not go to hospital AMA per EMS and pt stated he felt better. Patient was contacted on 5/12/21 at 3:25pm and he stated "I'm all good no further issues. I got a fever 8 hours after the shot. Other than that I'm all good". Inquired about temperature and pt stated "I do not have a thermometer". Pt instructed to contact primary care but he has not seen them in 2 year (She is primary care). Pt then instructed to contact cardiologist that he sees for his heart palpitations and heart rate control. Patient is prescribed metoprolol for this and he missed a dose the night of 5/9/21, took dose night of 5/10/21, and had shot on 5/11/21. Patient's physician office was called and information reported to her.

1311989	5/12/2021	CA	26	M	5/12/2021	5/12/2021	About 2 minutes after injection patient became pale and he verbally says he is feeling dizzy. I quickly grabbed an ice pack and placed it behind his neck to keep him awake. He started leaning forward and told me he is loosing his vision. He leaned forward and I had to support his chest with my arm all the while trying to talk to him. He dropped his phone and wallet on the floor. He seemed to be loosing conciousness. I had an epinephrine 0.3 mg in my hand but because he was speaking I did not inject him. After about 20 seconds he started gaining his vision back but he said his vision is still fuzzy. After about 2 minutes he felt better so I asked him to position himself at the blood pressure machine. It was 86/65. He does not take any medications or has any health issues. After 10 minutes he took blood pressure again and it was around 129/91. He used the restaurant during the 10 m inute break.
1311972	5/12/2021	CA	65	M	5/11/2021	5/11/2021	About 2 minutes after vaccine injection patient became pale, hands became cold and purplish. Patient's head leaned to the left side, started slurring and became unconcious while his eyes were open. I tried to get the patient's attention but saying "hello, are you still with me?" loudly and he did not respond. His eyes were still open at the time. At that point I yelled for help and other colleagues were calling "911" immediately. Based on store protocol and knolwedge of CPR and CDC guidlines, I checked for pulse and respiration - did not have any. I grabbed epinephrine injection 0.3 mg and injected him on left thigh. He immediately gasped for air, then started to faint again. His face color turned pale. At this point he is still sitting upright and EMT has arrived. His blood pressure was lower than normal based on EMT report. I called the patient on 5/12/21 (one day post-event) and patient reported no adverse reaction from vaccine site, he also reported taking 1.5 hours nap. The injection site on epinephrine injection was somewhat painful.

1311288	5/12/2021	WI	36	M	5/11/2021	5/11/2021	Pt. requested and received the J&J / Jansen COVID 19 vaccination yesterday at 1317. While he was being monitored for any adverse reactions, Pt. asked if lightheadedness was a side effect of the shot. Writer advised that it could be and that everyone is different. Writer asked if he would like some water, and he declined. Pt. was advised to remove his mask so he could breathe better. Writer took his pulse while I gathered information. It was 96. Pt. reported that he did eat lunch, is drinking plenty of water and fluids. He relayed he is keeping food down and not having any other issues. Pt. is currently on opiate withdrawal protocol. Writer asked about his breathing and his chest. Pt. relayed he was not having difficulty breathing and denied any chest pain at all. Writer spoke with the Deputy to be sure that we kept an eye on him for a bit longer after his 15 minutes while he was in his cell, due to his lightheadedness. Pt. was talking with writer, answering questions with ease. Pt. was not diaphoretic and did have good color. His pulse was checked again, and it was 84. At 1333, when his 15-minute observation was done, writer went to assist pt. to his feet and informed him that I would escort him back to his cell because he was still feeling a bit uneasy. When he stood, pt.'s knees buckled, and he knelt to the ground. Writer helped pt. to lay down. It was a smooth transition, and he had no injuries to his head or body. Pt. had what appeared to be a short spell where his body completely tensed for a few seconds, then he relaxed. He was having a hard time keeping his eyes open, but when prompted, was able to open his eyes. The Deputy standing by was asked to call for the Public Health Nurses, who had moved on to the next POD to continue vaccinating. Once on the scene, pt.'s blood pressure was obtained. 142/80. His pulse was 82. During this time, it appeared that the tensing episodes became more frequent and a bit more severe. They were happening approximately every 30 seconds, and lasting between 5 and 10 seconds. EMS was activated at approximately 1340. Pt. was awake during these episodes, and communicated with the nurses attending to him. While attending to pt. and waiting for EMS, it was at that time that pt. admitted that this was not the first time this had happened. He admitted that about a week ago, the same thing happened. When that new information was

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							explored, pt. reported that his wife thought he had "Serotonin Syndrome". Writer asked what meds he was taking on the outside and he reported that he only takes methadone from the clinic. He denied any other medications or street drug usage. He does not take any mental health medications at our facility. Collectively, the nurses that attended to him after this episode agreed that this is an isolated incident and not related to receiving the COVID vaccine. EMS arrived at approximately 1347, and report was given. He was transported to the hospital for evaluation. Pt. was returned from the hospital at approximately 1600. The Officer that accompanied him reported to facility that the hospital also believed this was an isolated incident, most likely related to withdrawals. They did not believe that receiving the vaccine was a factor in today's events. Labs were drawn at the hospital, and were all WNL. Once back in custody, writer spoke briefly with pt.. He was feeling much better, and was sent back to his cell without further incident.
1311279	5/12/2021	WI	18	F	4/15/2021	4/21/2021	Went the following Wednesday for routine eye exam and found to have retinal hemorrhages in her left eye. She has since had multiple doctor visits with specialists and multiple tests and everything comes back as normal. She is a normally healthy and active teenage girl with no know health issues. The only variant during the time frame is the vaccine. Doctors say they cannot blame or r/o the vaccine as the cause so we are reporting so that it can be documented as a possibility.
1311275	5/12/2021	KS	56	F	3/23/2021	4/19/2021	Shortly after receiving the vaccine I experienced the flu like symptoms identified as typical. I also experienced tinnitus about two hours after the shot that is continuing to today. Related to the autoimmune flare that I believe is related to the vaccine, I first began experiencing bone/joint pain in my wrist (never had this before) and then over the days this has progressed to significant symptoms of flare of autoimmune today. Pain/ache in all joints now, muscle pain as well, along with vision blurriness at times, fatigue and autoimmune rash on my hands and in my groin.

1310703	5/12/2021	MA	38	M	4/28/2021	5/1/2021	description from patient: 1.. On Wed, Apr 28, I got the JnJ vaccine. Other than fatigue the following day no major issues. 2. On Sat, May 1, I had an afib episode in the morning. Reset to sinus rhythm the next morning around 2:30am. I spoke with you during the episode. 3. On Mon, May 3, I had brain fog. I?m usually tired after an afib episode. But this seemed different. I?ve never experienced something like this before. But I chalked it out to the after effects of the afib and moved on. 4. On Fri, May 7, I started having the stiffness in my right calf. I checked in with you that weekend to make sure it wasn?t a clot. After we spoke I think we ruled out a clot. 5. In addition, I?ve developed some added symptoms since then: (i) Sweaty feet. (ii) Pins and needles sensation in feet. (iii) Tightness in the arch of the right foot. (iv) Feet and hands feel sensitive to cold. (v) Burning sensation in feet and left hand. (vi) Mild headache mostly felt in the left temple. (vii) A pulling feeling on the left side of the face. (viii) A feeling that if I close my eyes, I may faint.

1310733	5/12/2021	CA	38	F	5/12/2021	5/12/2021	ID: 37yo F previously healthy radiology tech developed progressive muscle weakness and SOB after the 2nd dose of COVID vaccine. HPI: Patient was previously healthy and physically active prior to COVID vaccines. No prior COVID infection. No prior MSK pain, arthritis, arthralgias. No prior rash. No dry eye / dry mouth. She received the first dose of Pfizer COVID vaccine at the end of Dec 2020 and experienced achiness and fatigue that resolved after a few days. For the first time, her fingertips and toes also started turning white, numb and painful when cold. She received a second dose on Jan 12, 2021 and immediately experienced heart palpitations while at the vaccination site, and later heartburn and vomiting when she went back to work. The following week, she developed sore throat for 2 days, took leftover amoxicillin at home. All of these symptoms resolved after a few days. She However, she developed gradual SOB, muscle ache and fatigue, initially mild but worsened over a few weeks. She noticed feeling out of breath, arms giving out, legs burning when pushing stretchers to patient rooms. One morning while she was getting up for work, she couldn't lift up leg, but had to pick up her legs so she get into her car. She also had to pick up her leg with arms to get into shower. "It felt like waking up every morning having run a marathon." On 2/13 she went to ER, got admitted for CK 30,000 for rhabdo treatment for 4 days. She denied having done extreme sports or increased physical activity that might have caused rhabdo. On discharge home, she could barely walk and continued SOB. She also developed additional rash on left arm, chest and shoulders. A physician ordered lab work and found her CK to be 50K, so she was admitted again on March 6 for 8 days, discharged on 3/14/2021. Denies fever since COVID vaccination.

1311019	5/12/2021	OH	78	M	4/27/2021	5/1/2021	Husband began expressing "I'm tired" which was out of the ordinary on May 1, 2021. Again on May 2 and 3. On May 4 he was really weak, moving much more slowly than normal, complaining of sinus headache above left eye, sleeping longer and more than normal, brain fog and confusion, not able to do normal activities. This impairment has continued through May 11 with no improvement from one day to the next. Visited his Dr to get checked on May 11 due to our concern over how long this was lasting. He has had no fever but some chills here and there. Dr checked everything she could think of and requested blood tests which we have not heard about yet. Extreme fatigue was the major symptom. Today, May 12, he feels better, moving around faster and doing some normal activities but still tires easily and must rest.
1311066	5/12/2021	MI	33	F	4/9/2021	4/15/2021	Sts felt fine after vaccination but 1 week later started having severe debilitating fatigue lasting several days. then on the 16th started having SOB, dizziness, feeling out of it, shakiness, eye twitching. Went to Emergency room x3 and was given steroids which helped. Also given inhaler - QVAR which helps but needs it more than twice a day. Was placed on heart monitor and is being seen by pulmonary specialist.

1310576	5/12/2021	NJ	49	F	5/2/2021	5/3/2021	First I got my 1st shot Sunday morning I sat in the observation, and for a brief period I got dizzy, and nauseated. It was brief. Day two sore arm of course, and tired felt like flu symptoms Day 3 extremely tired, and couldn't keep my head up I was so lethargic. Felt like the Flu was coming on went to bed after work Thursday, Fri, and Sat my head was still feeling like I had a head cold. Fatigued still Sunday I was in dream state when I jolted from a spinning feeling in my sleep. I opened my eyes and I couldn't even function. I couldn't get out of bed nor move I was completely spinning. I tried to make it to the bathroom and threw up bile. Took a anti nausea pill Zofran, and didn't work. Nothing was working. I fell asleep and woke up just constantly dry heaving. The vertigo was so bad I felt faint It was then at the point I was passing out when we called 911. I couldn't move I was perspiring, and couldn't keep liquids down. I was shaking, clammy, and my body turned numb. Thought I was having a stroke. In the ambulance narapathy started up, and down my arms and hands,, and my fingers locked up. Chest was on firel, and my whole body tingled with fighting off whatever it was.. The hospital IV me with Zofran several times. Antivert and Ativan. EkG fine CT head Brain CT head neck. Ears were fine. No infection in ears. Blood Glucose was high 182 CO2 was slightly low 22 Lymphocytes low 21.6 low Neutrophils Absolute 7.7 high Nothing else to do but send me home to follow up with ENT and Nuero to make appts to follow up. I scheduled my primary qs well to look me over.

1306318	5/11/2021	MD	40	F	4/23/2021	4/23/2021	Went back to sleep and never woke up; Arm soreness; Feeling bad; very flushed/looked red; very tired/fatigue/nappy women taking a lot of naps; This spontaneous case was reported by a consumer and describes the occurrence of DEATH (Went back to sleep and never woke up) in a 40-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 009C2117) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Neurofibromatosis, type 2 (acoustic neurofibromatosis) (Diagnosed at age 11, had tumor on nerves and all over body.), Blindness (All blind in left eye), Allergy NOS (unspecified allergy), Walker user and Feeding tube user. On 23-Apr-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 23-Apr-2021, the patient experienced DEATH (Went back to sleep and never woke up) (seriousness criterion death), PAIN IN EXTREMITY (Arm soreness), VACCINATION COMPLICATION (Feeling bad), FLUSHING (very flushed/looked red) and FATIGUE (very tired/fatigue/nappy women taking a lot of naps). The patient died on 23-Apr-2021. The cause of death was not reported. It is unknown if an autopsy was performed. At the time of death, PAIN IN EXTREMITY (Arm soreness), VACCINATION COMPLICATION (Feeling bad), FLUSHING (very flushed/looked red) and FATIGUE (very tired/fatigue/nappy women taking a lot of naps) outcome was unknown. The patient was on a feeding tube, lived independently but had a caretaker who came in every day. The patient had long list of medications for her conditions but concomitant medications were not provided by the reporter. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not applicable. Regarding the events of Pain in extremity, Fatigue, Flushing, Vaccination related malaise, based on the current available information and temporal association between the use of the product and the start date of these events, a causal relationship cannot be excluded. However, regarding the event of Death, Very limited information regarding this event has been provided at this time. related malaise, based on the current available information and temporal association between the use of the product and the start date of these events, a causal relationship cannot be excluded. However, regarding the event of Death, Very limited information regarding this event has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: Unknown cause of death

STROKE; VISION LINGERING EFFECT/EYE SIGNAL NOT REACHING BRAIN/TROUBLE SEEING; HEADACHE; This spontaneous report received from a patient via a company representative concerned a male. The patient's height, and weight were not reported. The patient's concurrent conditions included atrial fibrillation. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: Unknown) dose, start therapy date were not reported for prophylactic vaccination. The batch number was not reported. Per procedure, no follow-up will be requested for this case. No concomitant medications were reported. On an unspecified date, the patient experienced stroke and was hospitalized (date unspecified). It was reported that, the patient had stroke just two day after the vaccine shot. On an unspecified date, around 17:00, the patient experienced headache and it was not remarkable. On an unspecified date, the patient experienced vision lingering effect/eye signal not reaching brain/trouble seeing monitors right side of the eye. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of the stroke, headache and vision lingering effect/eye signal not reaching brain/trouble seeing was not reported. This report was serious (Hospitalization Caused / Prolonged). This case, from the same reporter is linked to 20210417613.; Sender's Comments: V0:20210514127- covid-19 vaccine ad26.cov2.s - Stroke. This event(s) is considered not related. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There are other factors more likely to be associated with the event(s) than the drug. Specifically: MEDICAL HISTORY, UNDERLYING DISEASE.

1306540	5/11/2021		30	F	1/21/2021	1/22/2021	She received her second Covid vaccine and ended up passing out in her bathroom around 5:00 this morning. Patient was standing and believes she fell and hit her head on both the tub and floor. EMS came and checked her out and found no concerns on heart monitor. She was running low-grade fever. Recommended follow-up today in clinic. Prior to the fall and through the night she had body aches, chills, and upset stomach. Upon awakening this morning was mostly just experiencing body aches as well as neck pain. Has had mild headache for the last few days but there has been no worsening of symptoms since the fall. Denies any blurry vision.
1306544	5/11/2021	CA	43	F	5/7/2021	5/7/2021	Systemic: Allergic: Swelling of Face / Eyes / Mouth / Tongue-Mild, Additional Details: Patient received Pfizer covid vaccine, experienced some lip swelling on the way home and stopped by another pharmacy and was given 2 pills of benadryl 25mg. Swelling went down, patient is fine. Reported by pharmacy manager.
1306555	5/11/2021	PA	31	F	5/10/2021	5/10/2021	Systemic: Fainting / Unresponsive-Medium, Systemic: Total event time 3 minutes max-Medium, Systemic: Hyperventilation-Medium, Additional Details: Immediately after withdrawal of the vaccination needle, the patient began to hyperventilate, then became unresponsive without her eyes closing, and leaned into her mother (who was standing next to her) from a seated position. The patient's arms became straight and tense, and she made a snoring/snorting noise. Pharmacy staff called 911. The patient came to and started to speak per her mother, and requested us to cancel the emergency services call. She was fully aware, normal breath and speech.

1306216	5/11/2021	GA	59	F		4/1/2021	Mouth broke out; zit that broke out on the top of her eyebrow. There are hard little bumps; they were red and hard; Arm was sore; puffy/swollen; She had a breakout on her face, a couple of lesions, and her mouth broke out.; This is a spontaneous report from a contactable consumer (patient). A 59-year-old female patient received the first dose of BNT162B2, via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunisation. Medical history included allergic to Penicillin, crustaceans, shellfish, and mushrooms. Those were what she usually had a breakout for. The patient's concomitant medications were not reported. The patient previously took amoxicillin and experienced drug allergy and second degree burns. Her reaction to amoxicillin was probably 15 years before. The patient had a reaction to her first Covid-19 shot. She took the first shot last Tuesday. She had a breakout on her face, a couple of lesions, and her mouth broke out. It looked like a reaction. She took a couple of diphenhydramine hydrochloride (BENADRYL), and it was going away. Her second shot was scheduled for next Tuesday 11May2021. She needed to know if there was anything in the shot that would cause this. She was leery of taking it. She was okay with it, and the diphenhydramine hydrochloride was fine. She did contact her doctor. That was it, she had nothing else just the breakout. She thought it was maybe Thursday 22Apr2021 or Friday 23Apr2021 that she noticed the breakout on her face. She started trying to take some diphenhydramine hydrochloride. It was rapid when it happened, not slow. She saw these as almost like a reaction. She had welting on the skin similar to a reaction to dust mites. There was this thing she thought was just a zit that broke out on the top of her eyebrow. There were hard little bumps. One had gone away, and the other was still there. It was almost like when she had a breakout of zits was kind of what she would say. It was dissipating. She started taking rounds of diphenhydramine hydrochloride to stop the reaction, and it was working. She was concerned about the second shot. She didn't know if it was an allergic reaction to amoxicillin or any other type of medicine if it was in there. That was what she was concerned about. Before she got the second shot she needed an idea of what might have happened. The lesions came a day or so after the breakout on her

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							face. She would say Sunday 25Apr2021 was when she saw the lesions above her eyebrows. It was right at the beginning of her eyebrow. It was really hard at first. It was not itching, just like zits. Similarly, they were red and hard. Once again she started the diphenhydramine hydrochloride and saw a little bit of difference, but had to keep putting on topical Aquaphor and cocoa butter. She had to keep putting it on there, it was just swollen. The lesions were puffy and red. There was just one left, it was going down. Her mouth was the number one thing. She thought it was from wearing a mask. She had never had a breakout with a mask before. She took the shot on Tuesday, and her arm was sore just for 24 hours. She noticed her mouth broke out Thursday or Friday for sure when she woke up. At first she just kind of forgot about the shot and didn't put two and two together. She took diphenhydramine hydrochloride. It was the same type of reaction she would have if it was amoxicillin. She really needed to know if she should anticipate something with the second shot. Outcome of event a breakout on her face, a couple of lesions, and her mouth broke out was resolving, and of other events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

Approximately 10 minutes after the patient got her second moderna vaccine she became faint and dizzy. The patient was sitting at the time. A law enforcement officer witnessed her becoming faint and ran over to attend her. I was called over to assess her as well. The law enforcement officer called EMS. The patient stated that she felt faint, dizzy, she said she had a headache, blurry vision, and was nauseous. The patient appeared sweaty and she appeared to loose consciousness briefly twice. She did not show any signs of redness, rash, or swelling. After sitting for a few minutes, and before EMS arrived, the patient said she was improving. She did not lose consciousness anymore but she still had a headache, nausea, and blurry vision. When EMS arrived they recommended that she get checked out at the emergency room, but the patient refused stating that she did not want to go to the hospital and that she was feeling better. The patient called her parents and they came and picked her up.

1305051	5/11/2021	TX	72	F	1/28/2021	1/30/2021	Tiredness; Headache; Muscle pain; Joint pain; Chills; Fever; Feeling unwell; Cough; loss of appetite; Cataract; 'started feeling really ill'; painful injection site; A 72-years-old female patient who received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Batch/lot number: EL9265, Expiration date: unknown), via an unspecified route of administration on 28Jan2021 in left arm at a single dose for covid-19 immunization. The patient's medical history included asthma, nerve injury, chronic nerve damage and blood pressure measurement. Patients concomitant medications included losartan for blood pressure abnormal at the dose of 100 mg per day, atenolol for blood pressure abnormal, albuterol (SALBUTAMOL) for asthma at the dose of 1.25mg, esomeprazole sodium (NEXIUM) for gastroesophageal reflux disease. On 02Feb2021, she had a cataract implant on the right side. Which was the side her headaches were on. She didn't know if it was from the vaccine or not. Five days later after surgery, on an unspecified date in Feb2021, the patient experienced started feeling really ill. She was pending a procedure on her other eye as well. She got lots of symptoms. The patient experienced tiredness, headache muscle and joint pain, chills, fever, her injection site was painful, and she was feeling unwell. The patient underwent lab tests and procedures which included body temperature which was 101.2. A couple of days after the vaccine she felt well. On 05Feb2021, then all the sudden she just felt tired and couldn't do anything. She was laying and sitting all day. She had no appetite. It had persisted. She didn't have an appetite when she eats. She couldn't taste the food. She didn't feel as bad. She could feel herself getting better. She was taking more vitamin c and more vitamins. On same date, she had a cough. She had been taking Theraflu and lung support for her chest since she developed the cough. She had fever and which was up to 101.2. It kept fluctuating. This morning it was 96. She had muscle and joint every day, but this was triple the pain of her normal pain. She had been drinking a Gatorade. She took nexium for acid reflux, and she had been taking that for a while. That was why she thinks she couldn't taste as much. She got the vaccine because with everything going on, it was the right thing to do. The reporter assessed cataract as medically significant. The outcome

She was scheduled for her second dose on 18Feb2021.</p> <p>I started having parathesoas of bilateral lower extremities the evening of my second dose.; The next day I saw my pop and my pulse and blood pressure were elevated.; The next day I saw my pop and my pulse and blood pressure were elevated.; I am also having headaches; stuffy nose; sinus pressure; brain fog; my vision is blurry; tinnitus; This is a spontaneous report from a contactable Nurse (Patient). This 68-year-old non-pregnant female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Solution for injection, Batch/Lot number: Ec3302) via an unspecified route of administration, administered in left arm on 03Feb2021 at 08:15 AM (at the age of 68-years-old) as single dose for COVID-19 immunisation. Patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Solution for injection, Batch/Lot number: El8982) via an unspecified route of administration, administered in left arm on 15Jan2021 at 08:00 AM as single dose for COVID-19 immunisation. Patient received no other vaccine in four weeks prior vaccination and was not tested for COVID prior vaccination. The patient medical history included known allergies like airborne allergies, grasses, molds, trees, pollen, dust and had controlled hypertension. Concomitant medications included Losartin 50 mg. On 03Feb2021 (at evening, same day of vaccination), patient started having parathesias of bilateral lower extremities. Patient saw pop and pulse rate and blood pressure were elevated. This had continued for the past five days. Patient also had headaches, stuffy nose, sinus pressure, brain fog, vision was blurry and tinnitus. Patient not tested for COVID post vaccination. Outcome was not recovered for all the events.</p>

1305012	5/11/2021	FL	40	F	3/31/2021	4/29/2021	<p>Burst blood vessels in the left eye extending from iris to the outer edge of the eye ball; Fatigue; This spontaneous case was reported by a consumer and describes the occurrence of CONJUNCTIVAL HYPERAEMIA (Burst blood vessels in the left eye extending from iris to the outer edge of the eye ball) in a 40-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 039B21A and 006B21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included No adverse event (No medical history was reported.). On 31-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 28-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 29-Apr-2021, the patient experienced CONJUNCTIVAL HYPERAEMIA (Burst blood vessels in the left eye extending from iris to the outer edge of the eye ball) (seriousness criterion medically significant). On an unknown date, the patient experienced FATIGUE (Fatigue). At the time of the report, CONJUNCTIVAL HYPERAEMIA (Burst blood vessels in the left eye extending from iris to the outer edge of the eye ball) and FATIGUE (Fatigue) outcome was unknown. Concomitant medications were not reported. The patient reported that she experienced the adverse event in the left eye, 12 hours after the administration of the second dose of the vaccine. The right eye was completely fine. Company comment: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Treatment medication included Tylenol (acetaminophen). This case was linked to US-MODERNATX, INC.-MOD-2021-102880 (E2B Linked Report).; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.</p>

1306206	5/11/2021	NY	74	M	3/29/2021	3/29/2021	My vision disappeared in my right eye; This is a spontaneous report from a contactable consumer (patient). A 74-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration on 29Mar2021 at approximately 10 o' clock (Lot Number: ER8727) as 2nd dose, single for COVID-19 immunisation. Medical history included High Blood Pressure and Blood cholesterol abnormal, both from an unknown date. Concomitant medications included unspecified medication for High Blood Pressure, cholesterol, and a blood thinner. The patient previously received the first dose of bnt162b2 for COVID-19 immunization at the age of 74-year-old on 08Mar2021. Lot Number of the first shot was reported as "EN it looks like 6205". The patient stated he had an adverse reaction to the vaccine. The patient got the second shot at approximately 10 o' clock in the morning of 29Mar2021 and at 10 o' clock at night his vision disappeared in his right eye. The patient was in hospital for 3 days. The patient was told that his right eye was not going to work anymore, it was absolutely the same. The patient received treatment and stated they told him to go to an ophthalmologist and get the services and he told him that his right eye was gone. The patient underwent lab tests and procedures which included lab work was done with unknown results on unknown date. The outcome of events was not recovered. Follow-up attempts are needed. Further information is expected.

1305668	5/11/2021	NY	56	F	3/18/2021	3/18/2021	anaphylaxis; headache with numbness; headache with numbness; blurred vision and nausea from headache; blurred vision and nausea from headache; has been trapping food since in her throat; had irritation in her throat; coughing; coughing; off balance; couldn't see straight; This is a spontaneous report from a contactable consumer (patient). A 56-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Lot Number: EN6207), via an unspecified route of administration, administered in Left Arm on 18Mar2021 10:30 (at age of 56 years old) as single dose for COVID-19 immunisation. Relevant medical history included: Asthma, immune problems, upper respiratory stuff, all ongoing; Her Diagnosed allergies include iodine fish, Propofol, and preservatives, sleep apnea, had COVID in Jan2021, and had a cough (Jan2021) from that. There were no concomitant medications. The patient previously took iodine, propofol and had allergies. Patient took first dose on 18Mar for reason that patient has lost all allergies that cannot be detected by blood work. After first shot she was told to wait an extra 15 mins not vitals taken she can leave a felt like a specimen unpaid but paying with life. Patient started coughing while everyone watched her so she said she better take Benadryl cause she doesn't wanna die. Patient left had off balance couldn't see straight. She was the one that had all side effects from vaccine as well as COVID signs. She had research medicine/food that cause her to have anaphylaxis. Patient found same ingredients in vaccine but food and drug said it ok. Patient was an experiment. She need to no from your board it is ok for me to take 2nd vaccine. Patient should be getting paid. Her doctor making it seem it up to her she gotta go out and get and epi pen she cant afford. In running out of gloves and mask. The patient experienced Anaphylaxis, has been trapping food since in her throat, headache with numbness, Cough, blurred vision and nausea from headache, all on 18Mar2021. Caller has been coordinating with the CDC by email. Since day one she had a bad reaction to the COVID vaccine. This has been going on a month now. The CDC advised her not to get the second shot. She has went back and forth with the doctor. She had anaphylaxis from the vaccine. Her throat closed. She had irritation in her throat. She has been trapping food since in her throat.

This has been since the anaphylactic reaction. She has to chew her food as fine as possible. She tries not to eat that much. This is still the same. It hasn't improved or worsened. She has also had a headache with numbness that is pretty much 24 hours a day. This started right after. She really felt it the next day. She tried to take Tylenol for four days, three times a day, and nothing happened. It was not going away. Her doctor also put her on a migraine medication, but it didn't work either. The headache has worsened over time. No medication is helping, and the doctors are confused. The migraine medicine is not helping. Her pressure is going up and down. She is wondering if she needs an emergency echo to see what is going on. She is still having bad effects. No doctor knows what to do. She has been to a lung specialist. Her cough just keeps getting worse. The cough started to get worse after the vaccine. She had COVID in Jan2021, and had a cough from that, but the vaccine made it worse. It is a ruff cough. She is on cough suppressant medication. Caller did not have a prescribing doctor. She got it at the hospital. She figured that was the safest, and since she is a patient there they emailed her because she was eligible to get it. She is mostly calling because the doctors don't know how to help. She is about to pass out from this headache. She is even losing vision from the headache. She feels like she is going to have a heart attack before her time. They are trying to figure out why her head is hurting. They do not think it is a migraine. Her headache is a 9/11 or a 10/12. She feels like after the vaccine she has been chemically off balance. She wants to get her thyroid checked too. Mostly because her food is getting trapped in her throat. Her throat is irritated and hoarse. The headache has given her blurred vision, and a felling like she is going to throw up. She feels off balance from the blurred vision. Caller had difficulty seeing information on Tylenol and Nurtec. She asked her husband to help. They cannot read the lot on the Tylenol. She has been to so many specialists to try to find answers, and no one has a clue. She saw on Pfizer's paperwork that she needs to reach out to a immunologist. Her allergist had no clue. From the world trade centers falling she has ongoing issues from that. She has sleep apnea, allergies, asthma, etc. She spent 30 minutes being monitored at the hospital. She had started coughing. Her husband said she needed

water. She always carries Benadryl with her. Finally she felt like she needed to take her Benadryl. It saved her. She knows the Benadryl probably won't work forever, but she cannot afford an epi Pen. Time of Onset (24 hours clock): right after vaccine (18Mar2021). All events require a visit to Physician Office. She didn't have to go the ER. She was lucky with the Benadryl. She takes Benadryl with her everywhere even to restaurants. No Prior Vaccinations (within 4 weeks). Treatment received for coughing, headache with numbness, blurred vision and nausea from headache. The outcome of the event has been trapping food since in her throat, had irritation in her throat, headache with numbness, blurred vision and nausea from headache was not recovered, for other events was unknown.

If she rubbed her hand across her thigh she could feel crushing and throbbing; her heart is beating fast and she is nervous.; sharp pain in her thigh/pinching sensation on inner thigh; sick; throbbing; muscle pain; weird sensation; throbbing sensation to the left side of her belly button/It was like at her stomach; fever of 100.3F; had a feeling of heat on her neck, face, and ears; redness and itchiness at the injection site; redness and itchiness at the injection site; the injection was large, red, hot, and itchy; the injection was large/ the swelling went down; dizzy; This is a spontaneous report from a contactable consumer reported herself. A 56-years-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 22Apr2021 (Batch/Lot number was not reported) as 1st dose, single for covid-19 immunisation. Medical history included disability, obese, covid-19 when she was sick with COVID last year, she has never been that sick. she thinks she made it through because she owns a nebulizer and can say her lungs have never felt like they were full of fluid. If anything, they felt heavy. It was heavy in her back and chest. She also had a fever. She guesses she would be considered obese. Concomitant medications included paracetamol (TYLENOL). The patient received the first dose of the Pfizer COVID vaccine last week and she has experienced several side effects and is very anxious and nervous. She experienced redness and itchiness at the injection site, pinching sensation on inner thigh that she thinks may be blood clot or a muscle but not really sure, fever of 100.3F from 24Apr2021, burning sensation in her ear, tiredness, headache, heaviness on her back and chest on the left side, no appetite, nauseous, diarrhea, had a feeling of heat on her neck, face, and ears, throbbing sensation to the left side of her belly button from 26Apr2021 and she felt dizzy from 22Apr2021. The patient stated there was a bad connection and she was having difficulty hearing. The patient was a little nervous. Maybe this was a

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

psychosomatic issue and she was thinking of things too much. She was sick for 5 weeks. She was never in the hospital or intubated. The site where she had the injection was large, red, hot, and itchy. It was from 22Apr2021 (Thursday) for the next maybe 3 days. Now the color is diminishing, the color is going down more like to pink and smaller and it not itching anymore. Once in a while she got a pinching sensation on her inner thigh ever since she had the injection. In the last couple days, she has been feeling a that a little more. She wanted to make sure it was not a symptom of a blood clot. She doesn't feel short of breath. She was nervous talking the call handler so that is why she is talking fast. She doesn't want to feel so sick like she did last year when she had it in March or April. She wanted to know that it's not a symptom of a blood clot. It was a throbbing pinching pain that goes and doesn't come back for a little bit, but it might come back a little bit later. It happened when she woke up. She has no swelling in her legs or thighs or anything else. She says she would not be talking this fast, but her heart was beating fast and she was nervous. She tended to be an anxious and nervous person. The patient never had blood clot issues. She wanted to make sure with everything that she has heard about Pfizer she hasn't heard of anyone having blood clot issues. She had to read to calm herself down a bit. It is a sharp pain with throbbing that comes and goes. She didn't read where it could be a blot clot, she just wanted to know. She is horrible at running to the hospital when she feels something because she gets so nervous and she thinks knowing is better because she's a realist. It takes her a minute to go to the hospital to figure it out. If she continues to feel like this she and her daughter will go to the emergency room. It is 5 blocks away. It is a small little hospital and they will be able to ease her mind. It could be her nerves getting to her too. Her fever got up to 100.3 and that was only on Saturday, 48 hours after the vaccine. Once she took Tylenol it was gone and didn't return again. She took her temperature; it was a beeping one. She always says she would take like 2 out of 3, and every time she took it went up. She felt a weird sensation of burning in her ears, the same as when she first had Covid, feeling like a fever. It brought her back to a bad place and it freaked her out. She is on disability and has people go to the store for her. She did that for 3 to 4

VAERS\_ID RECVDDATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

months. She is not agoraphobic, but she hadn't gone out until she got the vaccine. It took her all day to get back home because she loves the outdoors. It is kind of sad, and she knows she is not the only one who experienced that. She was able to actually stay at home, and when she went out, she wanted to stay. She still has her second dose to take, not everyone in has this and she doesn't want to feel that sick again. Eventually she will perish away one day, from God knows what but a slow death of not being able to breathe she cannot picture for herself or anybody else. She tries not to watch the news, it was depressing, because it is all over the news, she tries to stay in the loop. She was tired and had a headache. She took Tylenol and slept for an hour or hour and half. When she woke up she felt heaviness on her back and chest on the left side, and as she moved around more it was on her back and less on her chest. It was the same as she felt when she had Covid. She didn't have any aches or pains. The other thing was she had no appetite for the next 3 days. Every time she woke up, she felt extremely nauseous but had nothing to vomit. For the next 3 days or 72 hours, she had diarrhea. If she ate anything, she was in the bathroom. On 24Apr2021 (Saturday) after 48 hours she started to feel the heat in her neck and face and ears like right on her ears. She was talking to her daughter and her daughter said these are normal. Where she got the injection was itchy and a little more red. She told herself not to scratch it in her sleep, she is one of those people if something itches, she scratches. What she would do is rub her arm up and down on the site. It was almost the size of an 8 ounce tomato sauce can or maybe the size of a baseball. Then the third day it got redder. In her sleep she was rubbing her arm because it got itchy. Today the swelling went down, the color is like a light pink, and the size is also minimized. The fever lasted that night. She took her temperature again the next day and it was 97.9. That is usually what it is when she wakes up. She is not just tired; she is exhausted and feels like she has to go to sleep. Her daughter came with her granddaughter who is a baby, and she didn't know how to tell them. She was happy to see them but so exhausted. She worries about the sharp pain in her thigh. The other thing is she started getting pain in the middle of her thigh, her inner thigh. A sharp pain with like a throbbing is almost like a band-aid

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

is too tight. If she rubbed her hand across her thigh, she could feel crushing and throbbing. She can feel it from touching the area. She had this before like when she is stretching. It started maybe 3 months ago and went away but then after she took the injection and heard about thing, she worried about a blood clot with Johnson & Johnson, not that she would know because she has never had a blood clot. It could be psychosomatic and all working in her head. It started the last 2 days when she woke up, she felt fine and as she was lying in bed, she started feeling a sharp throbbing pain that eventually goes away. She has no swelling of her legs or thighs, and her daughter said it looks fine. She is semi-terrified of hearing bad news. It takes her longer to go to the hospital. If she starts feeling worse, she will be there in no time. She does not want to wait until it is worse, but she does not want to spook herself into going. She suffers from anxiety. She definitely had the fever not like she was just tired it was like she was exhausted. She got up early and would take a little nap because she was doing a bunch of stuff. That hasn't happened, but that's her. It will be 2300 when she goes to sleep. She was doing a bunch of stuff and felt like she just needed to take a nap. Maybe it is part of that too, but usually she doesn't feel tired like this. After her daughter left, she read something on her phone and passed out. When she woke up, she saw she actually dropped her phone. Her thigh is now not a pinch but more a little bit of a muscle pain. Now it is not like the inner thigh, it is more behind the thigh now, but not below the knee, right behind the thigh, closest to the knee but not on the knee. It is the same thing as if the middle had gone behind her thigh a bit. The little pillow on her chair is not helping anything either. It feels like it maybe muscular, its deep feeling. It feels like it could be muscle, if she rubs it, she can feel it. When asked has it improved persisted or worsened, caller states it is there, but it is dull. She can say there is pain, but it is a little duller just because it is more in the muscle. It is hard to explain, it was not the same throbbing pain but there is a dull pain, it goes around the chunkier part of her thigh, like the inner thigh. When she rubs it there is pain but a dull pain. When she rubs it, it feels better but she can still feel the site where it hurts. When she rubs it, it is still located right in the lower middle going toward her knee but not at the knee, maybe

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

3 to 4 inches away from the fold of her knee, almost at the center of her thigh almost. Almost like a dull muscle ache, there is a bit of throbbing with it. She will go to the doctor if something weird happens and will call back when they have an idea of what happened to her. This will sound crazy. The next thing she felt was a light throbbing where her belly button is but more to the left side, but not at the belly button. It was like at her stomach, not right at the belly button but right on the same line as her belly button but more at her waist. It was a small throbbing started today about an hour ago. She is hoping it is gas. Her fever went away pretty fast. She was on the phone and took her temperature to tell what it was. The woman said to take some Tylenol. It went from 99.9 to 100 to 100.3. She thought oh no. That was the highest she saw. Then eventually it started going down to 99.4, and then by morning it was back to normal. She only took Tylenol the one time. She is thinking maybe it is from being nervous and causing her body to heat up. She doesn't know she is just thinking. She thinks the fever went away the same day within an hour to 2 hours. She also wasn't drinking enough water. When asked if her fever has recovered completely or with last effects, caller states that is fine now, her temperature today was 99.4 without the fan on, she says she thinks that was pretty normal. When she first wakes up it is 97.9 usually. There was also a 98.4. The redness and itching at the injection site started 3 hours after the injection. She took her 2 sons with her. She took it and then her son took it. They said to wait 15 minutes. As soon as she stepped out, she looked up and felt so dizzy. It looks like when in summer and it seems to be boiling hot, that is how it got for her. Things got blurry. It was not like she was going to black out, but she had to close her eyes because the room was going to spin. She knocked back on the door and took a seat, so she sat down because she was not feeling right. When she gets nervous, she chews gum as a coping mechanism. Her son got some gum for her. She felt better but kind of nervous waiting for 15 minutes to go by, what if she felt dizzy again. She let 20 minutes go by and she got up and was fine. She wanted to be out of there and in the cool air outside. That is the first reaction that she had. She is one of those people that feel so nervous she is sure that happens that they feel like, oh they are so nervous, and they read so

much, and it is in our faces everyday no matter what. Maybe it had nothing to do with the injection, maybe more that she was so nervous, but it was a weird sensation after. She knows when people first started getting the COVID vaccine, people were just like falling to the ground, she was like that would be terrible. She went with high expectations and was also nervous. Her heart was beating, and she could hear her own heartbeat. She still feels tired and like she can go take a nap now. She asks if that is normal. She would rather talk to Medical Information now. She is over this statistics part of it. She doesn't feel a release, she is just giving her information and she doesn't feel any better. Outcome of the event throbbing sensation to the left side of her belly button/it was like at her stomach was not recovered; of the event dizzy was recovered; of the events the injection was large, red, hot, and itchy/ the swelling went down, tiredness was recovering; of the other events was unknown. Information about lot/batch number has been requested.

1305822	5/11/2021	MI		F	4/21/2021	4/22/2021	visual hallucinations lasting 18 hrs; 102°-104° fever lasting 36 hrs; loss of sensation from waist down for 12 hrs; This is a spontaneous report from a non-contactable other hcp (patient). A 20-year-old female patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot Number: EW0170), intramuscular on 21Apr2021 12:45 PM as single dose for covid-19 immunisation. Medical history not reported. Patient not pregnant at the time of vaccination and not diagnosed with COVID-19 prior to vaccination, not receive any other vaccines within 4 weeks prior to the COVID vaccine. Patient intramuscular received first dose of bnt162b2 (Lot number= EW0150) on 31Mar2021 12:45 PM. On 22Apr2021 patient experienced 102°-104° fever lasting 36 hrs, visual hallucinations lasting 18 hrs, loss of sensation from waist down for 12 hrs. The outcome of events was recovered. Patient has not been tested for COVID-19 Since the vaccination. No follow-up attempts are possible. No further information is expected.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of event visual hallucinations cannot be excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1306113	5/11/2021	PA	49	F	5/1/2021	5/8/2021	I have had 4 terrible days after the vaccine that I had to spend in bed. I had horrific severe headaches at the front of my head and at the back starting in less than 24 hours after the vaccine. On the next day I had a fever added to these headaches. I couldn't open eyes and light hurt my eyes. I had a loss of appetite and huge weakness. I couldn't walk and had literally to crawl to the bathroom. When I stood up from my bed I almost fainted. After 96 hours after vaccine I still have nausea and headaches that diminished a bit. Fever disappeared only after 96 hours. Still I'm very weak, have nausea and can't really do anything except being in bed. I have never had anything like that in my life after a vaccine. and I'm in perfect health and don't smoke, don't drink any alcohol, doing regular gym and my BMI is normal

Patient is pleasant he has no active complaints other than some throat irritation bleeding in the throat and bruising that was nontraumatic to the legs. My physical examination reveals multiple rather large bruises to the bilateral lower extremities up to softball size worse on the right than left. Patient had some mild left upper quadrant discomfort. Very minimal bleeding in the posterior pharynx. I personally reviewed the labs and CBC revealed an anemia at 10.830.5 hemoglobin hematocrit respectively. Most notably a 9000 thrombocytopenia. CMP essentially unremarkable. INR 1.5 PTT normal. I added on Lyme disease and tick-borne illness as well as a Monospot type and screen. Patient did receive his 1st visor vaccine for COVID-19 on April 29, 2021. IV was established in the emergency department in consultation made to Pediatric Oncology. I spoke with pediatric oncology in regards to patient's history and present illness. He does agree that the patient should in fact be transferred under the pediatric care but recommended under the general hospitalist service. He did not advise to proceed with any active treatment in our emergency department such as gamma globulin, platelets or steroids. Awaited call back from pediatric hospitalist and spoke with Dr. She has agreed to accept the patient in transfer. Patient and family are comfortable disposition plan no further questions at this time. Impression: 1. ITP Disposition: Transfer ED on 5/10/2021

1307603	5/11/2021	IN	17	F	4/9/2021	4/9/2021	Immediate sever pain at injection site, immediately followed by flushed face, racing heartbeat, tingling and inching of face, watering eyes, itchy throat that felt like it was closing in, lump in throat, difficulty breathing, unable to speak. Was able to speak after a couple minutes and the other symptoms started to gradually improve at that point. Most of the above symptoms subsided within around forty minutes. The lump in the throat remained for weeks eventually coming and going.
1307702	5/11/2021	KY	17	M	4/30/2021	5/1/2021	Issues with vision, went to eye doctor, referred to retina specialist. Hemorrhaging in the back of left eye. Appointment with pediatrician and pediatric Cardiologist. blood work and EKG done. Follow up with retina doctor on 5/14/21
1307776	5/11/2021	VA	56	F	4/8/2021	4/10/2021	Blurry vision
1307800	5/11/2021	MA	15	M	5/11/2021	5/11/2021	pt found by ems crew incomapny of mother in vaccine booth after having recieved vaccine. pt appeared to have suffered a syncapo episode due to a vaso vagal response. pt mother had consented to all ems evaluation and treatment. pt was assessed on scene and pt wa then transfered to hall way for further evaluation. original vitals at vaccine booth was bp63/42 hr 46 rr 18 spo2 99 ra. pt had perspiration on forehead and pale skin and mild visual disturbances. pt improved once in hallw ay. vitals bp 87/59 hr 52 rr 18 spo2 99 RA. pt began to "feel better" PTs mother denied any allergies or pmhx. pt care was released and pt was escorted out of center by staff with mother
1307864	5/11/2021	NM	69	F	3/23/2021	3/24/2021	Received the shot on 3/23/21 and on 3/24//21 I experienced a terrible headache in the left temple area, pain behind my left eye and double vision. The headache and eye pain lasted approximately two and a half weeks and the double vision for approximately 5 weeks. I saw my eye doctor on 4/8/21, my regular doctor 4/16/21 and an eye specialist on 5/4/21. No conclusion determined, possibly related to an old eye injury or not, could be vaccine or not. Vision seems to have returned to normal at this time.
1307552	5/11/2021	MI	49	M	5/3/2021	5/4/2021	my vision got real blurry and i couldn't think straight

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1307923	5/11/2021	TX	44	M	4/6/2021	4/9/2021	Vision and gait disturbances began 4/9/21, progressively worsened and he began nausea/vomiting 4/11/21, requiring ER visit on 4/12/21 then hospitalization for 5 days. Comprehensive labs done. Follow-up advised with Dr. (has not occurred). Per Dr. (Neurology), do not get second dose of Covid-19 vaccine as there is a chance the vaccine contributed to development of these symptoms. Doctor said it could possibly be Guillain-Barre Syndrome. As of 5/11/21, significant vision impairment still exists and patient is unable to work. Patient is uninsured.
1308699	5/11/2021	OK	16	M	5/11/2021	5/11/2021	Patient was given first dose and was in waiting area for observation. About ten minutes after his shot our vaccine coordinator alerted me that he was having a reaction. When I went out to the patient his eyes were open but he was staring blankly. His father was shaking him and waving his hand in front of his face and asking him if he was okay and the patient was not responding. I also tried to get the patient to respond and he did not. Since the patient was not responsive to any questions we called 911. While waiting on the paramedics to arrive the patient came around and started to answer some simple questions. He was clammy and sweating and he threw up one time. When the paramedics arrived they took over. They checked all the patients vital signs and were with him for about 15 or 20 minutes assessing him. The patient walked out of the store on his own and was not taken by ambulance. I called the patient around 3:10pm to check on him and I spoke with him and he said he was doing fine.
1307998	5/11/2021		24	M	4/5/2021	4/14/2021	About week after shot, became extremely weak , fatigued , and am showing signs of vestibular neuritis (vertigo , feeling as though I would pass out, blurred vision , head ache , ear pain)

1308220	5/11/2021	NV	58	F	1/8/2021	1/17/2021	After the second dose I had fever, body aches and swollen lymph nodes. I went to the doctor and got antibiotics. Nine days after the vaccine I got Bells Palsy and I have not been able to work since then. I noticed when I gargled that night the water was coming out. The following day was a holiday and everything was closed. I was able to see my doctor. My left eye was not closing and I had difficulty eating because the left side of my face was effected. I had to tape my eye shut at night. It is very sad and upsetting because I don't know if it will get better. I have seen a Neurologist. It has been four months and I am still getting therapy for the Bells Palsy. Physical therapy since 04/19/2021 with electrical stimulation. My eye closes a little better and my smile is a little straighter.
1308490	5/11/2021	CA	34	M	5/11/2021	5/11/2021	Vaccine was administered at 2:54PM, patient began feeling dizziness, feeling faint, sweaty, blurred vision at 3:00PM. Ammonia Inhalant was stimulated and was held near patient's nasal passage. Doctor was notified and assessed patient. Vitals: BP: 90/60 mmHg Spo2: 100% Pulse: 72 Provided Gatorade for hydration. Per Dr. monitored patient for additional 30 minutes. After 30 minutes symptoms were resolved . Had patient walk around and per Doctor ok to release patient. patient advised may go to ER for follow up if symptoms returned and do not resolve. Also notified may contact his PCP for further assistance and/or our office for any further assistance
1308708	5/11/2021	NJ	23	F	4/6/2021	4/20/2021	Bell's palsy in right face: onset exactly 2 weeks following dose 2. Facial paralysis, hyperacusis, tongue numbness, blurred vision, no gag reflex, reduced hypoglossal activity, neck/ear/jaw pain
1306694	5/11/2021	MD	56	F	5/9/2021	5/9/2021	Patient had a subconjunctival hemorrhage in her left eye that was noticed after receiving the vaccine. There were not symptoms other than the redness in the left eye. It was not noticed before receiving the vaccine but was noticed right after.
1306750	5/11/2021	GA	28	M	4/9/2021	4/19/2021	Left bottom eyelid twitching/spasm on and off for 3 weeks now

1306864	5/11/2021	VA	85	F	4/9/2021	4/21/2021	<p>S/p pfizer vaccine 4/9/21. S/p fall. She presented last wk to the hospital in cardiogenic shock, anemia, acute RLE DVTs, AKI, and rib fractures. She was found to have a n intramuscular hematoma along her posterior right thigh and with an acute DVT in her leg - see imaging reports below. Her INR was in the 7 range. She was also found to be in cardiogenic shock as mentioned above, requiring pressors. Pressors were eventually weaned off. S/p PRBCs. Imaging studies were obtained. Findings are listed below. Her AKI resolved by day of discharge. Since hospital discharge: The swelling is improving along her right leg. She is not checking her weight on a daily basis. She has access to a scale. She needs a refill on iron and Fosamax. No bleeding. On day of discharge, her hemoglobin was 8.8. Her MCV was elevated at 100. Her platelet count was 132. Her INR was 1.4. Her calcium is mildly low at 8.3. Her coumadin is on hold at this time. 106/56 was her BP today. She's been resting well. She's doing some house chores. She has yet to schedule a follow-up visit with for an INR check and in office checkup apt since hospital discharge. 4/23/21 RLE CT: Postop changes from ACDF for right femoral neck fracture again noted with good alignment. Early healing process of the fracture noted. No acute osseous fracture or hardware fracture. Extensive muscular and subcutaneous edema in right thigh. Two elongated intramuscular hematomas also noted at the medial posterior right thigh as above. 4/23/21 CXR: Patchy bibasilar pleural parenchymal opacities and enlarged cardiac silhouette without interval change. Multiple thoracic compression deformities better characterize on recent CT. Postoperative changes as discussed. Stable hiatal hernia. 4/23/21 RUQ Ultrasound: Mild gallbladder prominence, nonspecific. Findings similar to reference CT. No gallbladder wall thickening. Negative sonographic Murphy sign. Trace ascites. Partially evaluated right pleural effusion. Increased renal echogenicity. Correlate for medical renal disease. -1.1 cm right renal cyst. 4/22/21 PVL Study: Acute non-occlusive deep vein thrombosis in the mid and distal femoral vein within the right lower extremity. Acute non-occlusive deep vein thrombosis in the distal femoral vein within the left lower extremity. 4/21/21 Chest/Abdomen/Pelvis CT: Age-indeterminate T1, T3, T8, and T9 compression deformities. Subacute or chronic right posterior 12th,</p>

1302096	5/10/2021	NJ	40	F	4/29/2021	4/29/2021	<p>Within 20 mins. I began profusely sweating, my vision was blurry, my eyes watering, nose running, hot/cold flashes/chills/fever, dizzy, stomach cramping-very painful, a sense of anxiety/dread came over me. loss of appetite, Everything smelled extremely intensely and "off" as well as tasted "off" even just water tasted very strange, things had a weird tensile effect and clothing felt very strange on me, i had extreme difficulty driving and was almost in a car accident. I felt like i was in extreme heroin withdrawals and/or a bad acid trip. I've had the flu several times, this did not feel like the flu. At one point i realized i was digging my nails into my skin, broke the skin and drew blood but did not feel it at all and only noticed as i looked down and saw the marks. I can home and took valium so to sleep through it and though the extreme horrible feeling was better about 4/5 hours later. I felt poorly for about 5/6 days after, very tired, things felt, tasted and smelled off and lost 6 pounds. two days after adverse reaction I felt what i had felt immediately after vaccination again for several hours and had to go home from a relatives soccer game to lie down for rest of day. My clothes felt like they were soaking wet and they weren't and the wind against my skin felt very very strange. I still do not feel 100% like i did before vaccine and it has been two weeks now. I DO NOT WANT TO GET THE SECOND SHOT BECAUSE OF THIS, AND THAT THEY SAY IT COULD BE WORSE EFFECTS. I still two weeks later have strange taste in my mouth either sweet or of metal, and food tastes different. I am still fatigued/low energy as well.</p>

1302103	5/10/2021	IN	51	F	5/7/2021	5/7/2021	She got her vaccine and immediately felt it going in the arm, and went up to her neck, and gone within the 15 minutes. Then she left, came home and around 7:00 she started getting really tired, could not keep her eyes open and fell asleep around 7:30. A couple of hours later her arm was in so much pain and her neck was in so much pain, pain up the left side of her neck, hot and cold chills, body aches. She had to put a heating pad on her neck due to pain and stiffness. Today she is having diarrhea, yesterday she had a cough, congestion, headache, and has flu-like symptoms. She has no appetite, she cannot taste anything, has not eaten in 2 days, is drinking water and holding that down, nausea as well. She has never had a vaccine in her life that she has gotten sick over like this. She has not taken anything for it.
1302106	5/10/2021	IN	38	F	4/27/2021	5/3/2021	On 4/28 had fever of 100.7, joint pain, tired and sick. On 5/3 began having a reaction on chest, chin line, eyes, and lips. I have itchy bumps on these areas of my body and some sores on my chest. My eyes are itchy and have dry patches around the eye. They are also red and swollen.
1302115	5/10/2021	IL	16	F	5/7/2021	5/7/2021	Patient complained of feeling dizzy and blurred vision, headache and eyes hurting. Denies any c/o nausea. BP 114/64 HR= 99 O2 Sat= 99% Patient/mom verbalized that she had a half of subway sandwich prior to her vaccination. Placed patient in supine position, took vital signs and instructed to remove her jacket since the observation area was warm. Gave her cold drinks, bar of candy and Tylenol 500 mg 1 tablet for headache. Continued to monitor patient then 30 minutes later RN walked her on the hallway. Still a little wobbly. Instructed to take some deep breaths. Mom did mention that her menstrual period is almost due. 10 minutes later she claims she is doing better but still have mild headache and sleepy. Discharged home with her mom and was instructed RN will follow up on her. Instructed if headache persists and start having dizziness to go to ER.

1302263	5/10/2021	OH	40	F	4/7/2021	4/8/2021	Later during the night after the vaccine I developed a high fever, body aches for about 24hrs which caused me to sleep the next day. 2 weeks later I developed a bacteria infection in my right eye and possibly bronchitis so I went to the Urgent Care and was treated with Z-Pack and steroids. I feel alot better but I still have a little lingering cough. This past Friday I woke up with a pain in the right side of my neck which got worse so I went to my PCP on Sat who diagnosed me with Carotidynia where he states my corotid artrery is inflammed and was prescribed an antiinflammitant Diclosenac with the intents of decreasing the inflammation.
1302214	5/10/2021		72	M	4/20/2021	5/5/2021	Bells palsy, right sided; ED Note: 72-year-old male who is presenting with 2 days of right facial droop, not sparing forehead and as such concerning for a peripheral CNS etiology. On exam, he is hemodynamically stable though slightly hypertensive, saturating well room air no acute distress. Cardiopulmonary exam is unremarkable, abdomen soft and nontender, lower extremity with very mild trace edema. On neurological exam, there is a right facial droop which does not spare the forehead, there is otherwise no other focal neurological symptoms, patient able to ambulate without any issues, no slurred speech or dysphagia. His presenting symptoms is somewhat associated with a COVID-19 vaccine which he received recently. Do not suspect a CNS pathology (no other symptoms except weakness, sensation intact), given that he has presented within the timeframe, will give patient prednisone 60 mg, artificial tears, eye patch and have recommended that he follow-up with an eye doctor.

1301921	5/10/2021	NY		M	3/7/2021	3/7/2021	Got pretty sick off of it; Flu like symptoms; Left side of his mouth went bonkers; His mouth it felt tingly and weird / it was confined to the left half of his face / tongue was tingly; The right doesn't bother him as much in the way of tingling and numbness; Left is the main problem / right is not far behind / regard to nerve compression; Moved his thumb / felt like there was a rubber band pulling his thumb back; Sleeping wrong / his brain doesn't want to shut off; With extra salivation; Thinking he was having a bad day / It was weird at first; 5-6 weeks ago it was back to where it was / eye / feeling like it couldn't close; 5-6 weeks ago it was back to where it was / left side face felt taut; 5-6 weeks ago it was back to where it was / gum felt like his skin was thicker; Either very little or really annoying / it was just annoying on and off; Stress; Still sees some nerve inflammation / jaw line / upper part of of his eye / brow; Has had overlapping stuff from cervical stenosis / manifests on the left side; This case was reported by a consumer via other manufacturer and described the occurrence of cervical spinal stenosis in a 71-year-old male patient who received Herpes zoster (Shingrix) for prophylaxis. Co-suspect products included TOZINAMERAN (COVID-19 VACCINE PFIZER) (batch number EN6203, expiry date June 2021) for prophylaxis. The patient's past medical history included shingles (had shingles in his ear and mouth on the left side of face in October 2019), bell's palsy, ramsay-hunt syndrome, paralysis, lagophthalmos, vertigo, hearing decreased, stiffness, tingling mouth, gingival discomfort, neuritis, sarcoidosis (case of sarcoidosis uncovered, there was only one node of it at the back of the trachea where it splits to go into the lungs) and mononucleosis. Previously administered products included Covid vaccine (received 1st dose on an unknown date, batch nub- EL9264 and expiration date- May 2021). Concurrent medical conditions included diabetes, blood pressure high and lipids increased. Concomitant products included simvastatin, alprazolam and alprazolam (Xanax). On an unknown date, the patient received Shingrix. On 7th March 2021, the patient received the 2nd dose of COVID-19 VACCINE PFIZER. On 7th March 2021, less than 6 months after receiving Shingrix, the patient experienced cervical spinal stenosis (serious criteria GSK medically significant), oral discomfort, tingling mouth, numbness, nerve compression, mobility decreased, restlessness,

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

increased salivation, feeling bad, lagophthalmos, stiffness, gingival discomfort, discomfort, stress and neuritis. On an unknown date, the patient experienced sickness and influenza-like symptoms. On an unknown date, the outcome of the cervical spinal stenosis, sickness, influenza-like symptoms, oral discomfort, tingling mouth, numbness, nerve compression, mobility decreased, restlessness, increased salivation, feeling bad, lagophthalmos, stiffness, gingival discomfort, discomfort, stress and neuritis were unknown. It was unknown if the reporter considered the cervical spinal stenosis, sickness, influenza-like symptoms, oral discomfort, tingling mouth, numbness, nerve compression, mobility decreased, restlessness, increased salivation, feeling bad, lagophthalmos, stiffness, gingival discomfort, discomfort, stress and neuritis to be related to Shingrix. Additional details were provided as follows: The age at vaccination was not reported but could be 70 or 71 years old for Shingrix vaccine. The patient received Shingrix vaccine too late last year and received 2nd dose of Covid vaccine on 7th March 2021. The patient had overlapping stuff from cervical stenosis that manifested on the left side on his shoulder arm and hands, droopy mouth, eye wouldn't close, vertigo, ear issues, hearing drop. His eye had the feeling like it couldn't close his eyelids at night the muscles in his face on the left side face felt taut. The inside of his gum felt like his skin was thicker, he was not sure it was or wasn't but that was the sensation and that never went away and down the side of his tongue was tingly. These things overlap and it was either very little or really annoying. it was just annoying on and off and after the shot on Sunday it was weird at first, he was writing it off as both stress and relief and other things. He wasn't dizzy, he waited for 15 minutes and went home and after that evening the left side of his mouth went bonkers, it wound up being like when the shingles were acting up on the inside of his mouth it felt tingly and weird and it was confined to the left half of his face and nothing else. The patient did not have droopiness or any Bells palsy kind of thing had gone away the Ramsey-Hunt syndrome. The patient experienced the stenosis, the cervical stenosis, the left was the main problem but the right is not far behind with regard to nerve compression, the right doesn't bother him as much in the way of tingling and

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
-----------------	--------------	--------------	----------------	------------	-----------------	-------------------	---------------------

numbness. The weird thing was he had his hands sitting in his lap and he moved his thumb towards his forefinger and there was a couple inches between and it felt like there was a rubber band pulling his thumb back, it happened 2-3 times he was fooling around with it and it went away but the sensation was still there a little in the back ground, the rest of him the right side of him was fine. The patient had MRI in November 2019 when he first got sick and then he had another one done and his neurologist said in August that he still had some nerve inflammation particularly down jaw line, he saw inflammation from 2019 to 2020 and the upper part of of his eye, the brow seemed to behave as if there may be some inflammation running through it. The patient had been thinking the whole idea was that the vaccine woke up the immune system and got it to recognize the RNA for COVID and generate antibodies and if it was acting like inflammation getting the body's attention. The patient had one had case of sarcoidosis uncovered, there was only one node of it at the back of the trachea where it splits to go into the lungs. His pulmonologist was keeping track of it with X-ray and CT scans, the last time everyone looked in there, there was nothing left, the thing never changed since, it never showed up anywhere else. The patient does not know if that disappeared but he never ended up getting it again. It was unknown if the reporter considered the cervical spinal stenosis, sickness, influenza-like symptoms, oral discomfort, tingling mouth, numbness, nerve compression, mobility decreased, restlessness, increased salivation, feeling bad, lagophthalmos, stiffness, gingival discomfort, discomfort, stress and neuritis to be related to Covid vaccine.

1301794	5/10/2021	PA	44	F	1/12/2021	1/12/2021	little bumps all over her face and body which are like measles; swollen eyes; watery eyes; Runny nose; Sneezing; Congestion on her chest; Dry eye socket; dry eye socket with crust on eyelashes; Headache; allergic reaction for a week/allergic reactions keep coming back; Ear feels full; This spontaneous case was reported by a non-health professional (subsequently medically confirmed) and describes the occurrence of PULMONARY CONGESTION (Congestion on her chest) in a 44-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 030L20A and 026L20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Food allergy. Concomitant products included LIRAGLUTIDE (VICTOZA), INSULIN GLARGINE (LANTUS), VENLAFAXINE HYDROCHLORIDE (EFFEXOR) and LOSARTAN for an unknown indication. On 12-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 09-Feb-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 12-Jan-2021, the patient experienced EAR DISCOMFORT (Ear feels full). On 21-Apr-2021, the patient experienced HYPERSENSITIVITY (allergic reaction for a week/allergic reactions keep coming back). On an unknown date, the patient experienced PULMONARY CONGESTION (Congestion on her chest) (seriousness criterion medically significant), RASH PAPULAR (little bumps all over her face and body which are like measles), EYE SWELLING (swollen eyes), LACRIMATION INCREASED (watery eyes), RHINORRHOEA (Runny nose), SNEEZING (Sneezing), DRY EYE (Dry eye socket), BLEPHARITIS (dry eye socket with crust on eyelashes) and HEADACHE (Headache). At the time of the report, PULMONARY CONGESTION (Congestion on her chest), HYPERSENSITIVITY (allergic reaction for a week/allergic reactions keep coming back), RASH PAPULAR (little bumps all over her face and body which are like measles), EYE SWELLING (swollen eyes), LACRIMATION INCREASED (watery eyes), RHINORRHOEA (Runny nose), SNEEZING (Sneezing), EAR DISCOMFORT (Ear feels full), DRY EYE (Dry eye

1301682	5/10/2021	CA	29	M	4/22/2021	5/7/2021	<p>socket), BLEPHARITIS (dry eye socket with crust on eyelashes) and HEADACHE (Headache) had not resolved. Treatments provided were 25mg diphenhydramine, 16mg Hydrocortisone cream, Metoprolol steroid, and Doxycycline for 7 days given by her HCP. Action taken with mRNA in respect to the events was not applicable. Based on the current available information and temporal association between the use of the product and the start date of the events. However, the patient's past medical history of food allergies remains a risk factor for these events. This case was linked to MOD-2021-095202 (Patient Link); Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events. However, the patient's past medical history of food allergies remains a risk factor for these events.</p> <p>On 07May21 at 11:00PM, I experienced an immense pain on both of my arms that I've never experienced before in my life. Every time I move my arms, fingers, or apply any amount of pressure on any part of my arms, I will get a surge of pain raining down on my arms and only my arms from the shoulder down. At the same time, I also felt a surge of energy/adrenaline flowing throughout my legs, from the pelvis down, urging me to move around. I tried to force myself to sleep (without medication, just forcefully closing my eyes and trying to sleep) to no avail, so I got up and walked around my room and did some leg squats exercises without moving my arms too much from 11:10PM till 3:10AM, (I think getting my blood pumping throughout my body helped ease the pain a bit). The intensity of the pain on my arms decreased about half at around 3:10AM and I was finally able to fall asleep at around 3:30AM. I woke up once at around 7:45AM to go to the bathroom and drink some water. During this time, I think the intensity of the pain had dropped to 1/3 from when I first experienced this pain. I fell back asleep again and woke up at around 11:20AM. Most of the pain is gone by now, I only felt the lingering stings of the dreadful night from before. I continued to feel this phantom pain on both of my arms throughout the day and it wasn't until the day afterwards on the morning of 09May21 that relief was finally bestowed upon me.</p>

1302196	5/10/2021	GA	67	F	5/7/2021	5/7/2021	A few minutes after receiving the shots I broke out into a sweat, the back of my neck was hurting, my vision was narrowing, I was having difficulty breathing, extremely nauseous, felt like I was passing out, trembling. Pharmacist helped me to lay down which took care of the nausea and relieved the passing out feeling. Still had difficulty breathing for several more minutes. BP was 100 over 80. About 30 minutes before I could get up and sit in a chair. Extremely weak. It was two hours before I was strong enough to drive home. Pharmacist offered several times to call an ambulance but since it was gradually improving, I declined.
1301740	5/10/2021			M			COULD NOT SEE FOR A FEW MINUTES; This spontaneous report received via social media from a patient via a company representative concerned a male of unspecified age. The patients weight, height, and medical history were not reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: Unknown) dose was not reported, frequency 1 total, administered on 2021 for prophylactic vaccination. The batch number was not reported. Per procedure, no follow-up will be requested for this case. No concomitant medications were reported. It was reported by consumer that his friend's son on unspecified date 2021, was experienced temporary blindness for few minutes after vaccination. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from temporary blindness for few minutes. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: 20210503255-covid-19 vaccine ad26.cov2.s-Could not see for a few minutes. 1302965	5/10/2021	MN	26	M	5/9/2021	5/9/2021	- a 26 yo male, received a Janssen vaccine at approximately 1:30pm on 5/9/21 - Prior to administration, I asked patient if he had any issue with vaccines prior and he stated no. His consent form did not indicate medication allergies or a history or reactions. - Less than 5 minutes after administration, the patients friend, who also received a vaccine, stated that he was having a seizure - I instructed her (pharmacy technician) to call 911. - I observed the patient laying on his side by the wall in the pharmacy waiting area; he was conscious with eyes open. I did not observe him seizing. He did have a red spot on his forehead where his head hit the wall. He was also sweating. His friend stated that he seized for less than 5 seconds. - I gave the patient a frozen water bottle for his head and a room temperature water bottle. - The patient stated he did not want to pay for an ambulance which I relayed to her. - The EMT did arrive anyway and checked on the patient. - The patient and his friend left the store together, without EMT support or transfer. - The EMT team did not communicate with me prior to leaving the store.

1303333	5/10/2021	WA	35	F	5/5/2021	5/7/2021	Left eyelid ptosis, left facial sensory deficit, possible left sided vision changes started morning of 5/7/2021. . Remote 2mm cerebellar stroke found on imaging.
1302456	5/10/2021	CA	36	F	4/5/2021	4/5/2021	Extremely dry eye and dry mouth for multiple months after the vaccine. Dry eye so bad I woke up in night to put more drops in. I had to begin taking Restasis for dry eye. I experienced chills, body aches, weakness, fatigue, confusion, anxiety, and a fever of 103 degrees F for the next day and elevated temperature (100 degrees F) for 10 days following the second dose.
1302962	5/10/2021	KS	17	F	5/6/2021	5/6/2021	Evening of 5/6 hives started. Father gave no medications, just watched and waited. Pt went to school on 5/7, came home around 1400, hives noted on neck, arms, legs, groin, back, stomach, all over per father. Father gave benedryl Friday around 10 am, then took to emergency room Saturday morning due to eyes being swollen shut, left arm was swollen hand and wrist. ER gave 2 injections - immediate reacting and long acting, along with 2 benedryl, pepcid. Pt was discharged from ER after about 1 hour. Hives persist today, May 10th. Pt is now on 40 mg 5/9 and 5/10. Hives remain persist on feet and hands today.
1302523	5/10/2021	TX	25	F	5/4/2021	5/4/2021	Night of vaccine had severe body aches, back pain, leg pain severe until legs went numb, then arm pain severe until also numb, chest pains/ trouble breathing. Following days had pains in arms and legs as if a tourniquet was left on and I cycled through severe pain and being numb. 5 days in I lost my vision (super blurry and seeing double) and lost complete control of arms and legs on top of headache and chest pains. Vision came back a couple hours later but the leg pains/ numbness continued even now. It feels as if my circulation has been cut off.
1302546	5/10/2021	CA	61	F	4/8/2021	4/10/2021	Eye infection started 2 days after the shot - 4/10/21. Styte developed and continued for over 2 weeks. Infection resolved without medication but small redness still present 5/10/21. Eye infection may not have been related to the vaccine but it was unusual. I have not had a styte for over 10 years.

1302850	5/10/2021	FL	58	M	4/20/2021	4/27/2021	4/28 H&P: HPI: Hx obtained from chart review and wife. 58 y/o male patient with history of B-cell lymphoblastic leukemia who was treated with hyper CVAD then dasatinib s/p allogenic stem cell transplant in 2018 on remission and cGVH 5/19/2020 requiring prednisone 5 mg daily on chronic acyclovir, bactrim and fluconazole who follows up at UM with Dr., also pt with hx of hypothyroidism, hyperlipidemia and hyponatremia presented today complaining of weakness for the last 2 days and headache the day prior to admission. Pt was taking Tylenol for the headache, and per wife he had a temp of 99 F. Denies any GI, urinary or abdominal symptom. Pt was being treated for a toe infection (ingrown toenail) with clindamycin. Pt travel during the weekend for 2 days where he did not have contact with any infected person. Pt is compliant with his medications and follows for his medical care. Today at the ED pt was having headache and during the afternoon started with AMS, became agitated, with upper extremity tremors and nuchal rigidity. Ct head did not showed any acute abnormality. However, pt developed a fever. LP was performed pending results. Started on empiric treatment for meningitis: vancomycin, acyclovir and ceftriaxone. MICU was called to admit patient due to worsening of mental status. PMH: hyperlipidemia, primary hypothyroidism, hx ALL s/p bone marrow transplant and cGVH. Allergies: denies. Medications: Acyclovir 800 mg BID, amlodipine 5 mg daily, fluconazole 200 mg BID, levothyroxine 175 mcg, pantoprazole, prednisone 5 mg daily, bactrim 1 tab 3 times a week, terbinafine cream and triamcinolone. Social: from Miami. No hx of alcohol, smoking. Physical Exam: Nursing note and vitals reviewed. Constitutional: Vital signs are normal. Pt lethargic, disoriented, no following commands w/o respiratory distress. HENT: Head: Normocephalic and atraumatic. Eyes: Conjunctivae and EOM are normal. Neck: No JVD present. Cardiovascular: Regular rhythm, normal heart sounds and intact distal pulses. Exam reveals no friction rub. No murmur heard. Pulmonary/Chest: Effort normal and breath sounds normal. No respiratory distress. He has no wheezes. He has no rales. He exhibits no tenderness. Abdominal: Bowel sounds are normal. There is no abdominal tenderness. There is no rebound and no guarding. Lymphadenopathy: He has no cervical adenopathy.

Neurological: Disoriented. Nuchal rigidity. Resting tremors. Hyperreflexia lower extremities. No clonus. Does not follow commands. Moves 4 extremities. Skin: Skin is warm. 4/29 ID note: 58yo M patient who comes with CC of 2 days of weakness and 1 day of headache. Progressive onset and no other associated symptoms, weakness referred as generalized by wife and headache really started on day of admission. He has an important history of B-cell lymphoblastic leukemia diagnosed 03/12/2018 ( + ), treated with 2 cycles of hyperCVAD, and dasatinib (latter stopped on 02/22/21 due to fluid retention), on remission. s/p allogeneic stem cell transplant on 08/21/18 (CMV +/-) from brother (10/10 donor), which engrafted 09/01/2018. And chronic graft vs host disease diagnosed on 05/19/20 due to scleroderma of bl upper extremities, elevated LFTs and swelling of upper and lower extremities with decreased ROM, started on steroid initially 40mg bid and eventually 5mg qd since 03/16/21 He was on prophylaxis with Acyclovir, Bactrim 1 tab 3 times a week, and Fluconazole. In the ED patient found to be initially alert and oriented, but during the day became more agitated, eventually having altered mental status and becoming non verbal. He also presented fever. On evaluation physical exam showed a patient making incoherent sounds, with tremors which stopped, increased muscle tone and some rigidity and increased reflexes, nystagmus, not following command but retracting extremities when touched or moved, with possible kernig and brudzinski signs. Started on Ceftriaxone, Vancomycin and Acyclovir and changed to Cefepime, Vancomycin, Ampicillin and Acyclovir by MICU team. Acyclovir changed to Ganciclovir by ID. CSF without pleocytosis, normal glucose and only mild elevated protein. CT and MRI without acute findings. Assessment: 58yo M patient with history of ALL in 2018 s/p Allo-SCT (CMV+/-) at UM 2018, and complicated by chronic GVHD, currently on prednisone 5mg daily and prophylaxis with Bactrim three times a week, Acyclovir and Fluconazole, who presented with headache, fever and generalized weakness for 2 days. Became encephalopathic and was admitted to MICU. 1. Meningoencephalitis in immunocompromised patient - No changes since yesterday, leukocytosis 15.22 and Tmax 100.2- Negative HIV, RPR, - Culture CSF NGTD, Blood culture negative day 1, respiratory panel negative-

laparotomy, ICG injection for evaluation of perfusion  
Indication and Consent Findings: . Findings: Even after the ICG injection. There was spotty tissue necrosis from mid jejunum all the way through sigmoid colon. Most areas were blackened with a foul smell. There was some highlighted areas secondary to the ICG but not a significant amount that would lend for an anastomosis. Black ascites was present throughout the abdomen. Unfortunately after much contemplation there was no surgical intervention. Procedure Procedure: Patient was placed in supine position. Was intubated in the emergency room so, we were able to proceed with resuscitation through our anesthesia team. Patient's abdomen was prepped and draped in usual fashion. Proceeded to make a midline incision. The blood supply in the subcutaneous tissues did not even bleed. Appeared to be darkened and almost coagulated. As we entered through the fascia we were able to open the peritoneum between 2 hemostats. The large rush of free air through from the abdomen. We then proceeded to open the abdomen for the length of her incision. This was done with electrocautery. From here there was a black ascites present within the abdomen. There was a large amount of dead intestine that we could immediately see. I worked my way to the ligament of Treitz. There was no adhesions so this was easily found. That intestine did appear to be pink. It lasted for about a foot. After that area everything was either black or purple in color with a few pink spots in between. This went all the way down to the terminal ileum where pneumatosis was visualized. We then looked at the colon from cecum through rectum. It appeared to be blackened as well. Not knowing whether all of this intestine was dead or not especially with patient being hypotensive I injected ICG dye approximately 2 cc. This was to evaluate perfusion. Unfortunately perfusion was no better than what I could visualize. I could not even find enough room of the colon or small intestine to make an anastomosis. Was very hard decision, however, we did not resect any bowel. I closed the patient's abdomen. Patient will be taken to ICU on ventilator. Discussed with daughter with pastor present.

1301192	5/9/2021	AZ	28	F	3/7/2021	3/28/2021	The week of 3/28/21 I began to feel numbness on the right side of my body, in my genital area. By 4/18/21, the numbness had spread into my right glute, which was completely numb. On Sunday, 4/25, I had a sudden onset of all of the following: the numbness had spread upward and downward and the right side of my body was partially numb; vision in my right eye was blurry; my right eye hurt, and felt swollen; my pupils were unequal; my neck was stiff; I was dizzy; and I could not speak properly. I felt very floaty. These symptoms waxed and waned, together, for several hours at a time, getting progressively worse each time. My lucid periods also got progressively worse. I went to my PCP who ran bloodwork and referred me to a neurologist, who I could not get an appointment with until July. On 5/3/21, I was admitted to the ER based on the recommendation of the triage nurse who heard my symptoms and their duration. The ER ran a bunch of tests and found nothing. I went home and over the next few days entered again into several nonlucid states. I believe my body was getting closer and closer to death. I began taking my temperature with a reliable thermometer, and found it was dropping to 93-95 during my symptomatic periods. I found help from alternative doctors who immediately intervened, and continue to monitor me. The doctor I listed on this form was my ER doctor.

1301168	5/9/2021	FL	64	M	3/26/2021	4/27/2021	My husband who is 64 years old, was a previously in good health. Only history was mild cardiomyopathy diagnosed 12 years ago. And elevated blood pressure, which was normal with medications. He was very active, maintained a demanding full time job and was a great husband of 2 children. He received his 2nd dose of Pfizer on approximately 4/1/21. He didn't complain of any side effect. However, on the morning of 4/27/21 he woke me up saying that he could not breath. We started driving to the hospital, however he got worse and we stopped at the fire station. They gave his oxygen and rushed him to the hospital. We came to hospital and when the fire truck was pulling in, I was told that my husband went into pulseless electrical activity. CPR was started and after approximately 5 minutes he regained pulse. He was taken to the ICU and therapeutic hypothermia protocol was completed. Since then, he is still requiring mechanical ventilation. He opens his eyes spontaneously, at times appears to obey small commands and is bedridden.

About 5-7 min after vaccine was given he had seizure like activity. He had cold sweats, low blood pressure, and was very pale. He complained of dizziness, nausea, tingling in hands, and blurred vision. 911 was called and he left with EMT
1300704	5/9/2021	CA	32	M	5/7/2021	5/7/2021	Approximately 8 hours after injection I began experiencing extreme fatigue. This was soon followed by uncontrollable shaking and chills. As this progressed I began to experience extreme aching pains all over my body, a headache, and dizziness. I fell asleep somewhere around 11pm or 2 hours after on set of symptoms. I awoke multiple times in the night to body aches and a head splitting migraine. During the night the chills and shaking turned into a fever and sweating. At 6am the next day I forced myself to take some painkillers and hydrate. The body aches had started to recede at that point but the migraine was extremely painful and It was nearly impossible to open my eyes with a hypersensitivity to light. I slept on-and-off through the next morning and nearly all symptoms stopped by 1pm on May 8 or 24 hours after the injection.
1301247	5/9/2021	VA	41	M	5/6/2021	5/8/2021	Cant move a Lot of the left side of face, almost seems like bell palsy., left eye waters a bit as i cant independently blink my left eye, unless i close them both...cant move left cheek (can only smile on one side) difficulty drinking since i cant curve my lip on the left..talking challenges (lisp) since it seems im speaking out of one side of my mouth. When eating, a little hard to feel it on the left side in jaw area.. I have zero pain, just unable to completely move all parts of the the left side of my face in general.. I had my shot on thursday, first felt this on saturday when i woke up.... hasnt gotten any worse, just the same (its 420pm on sunday now) - havent had any treatments, not sure if its temporary

1301301	5/9/2021	LA	69	F	4/6/2021	4/7/2021	The injection site felt "achey" immediately after the injection and this discomfort lasted several hours despite my gently massaging the band-aid site. My left arm felt "heavy" for the rest of the day. Within 18 hours of vaccination, I was awoken from sleep shaking violently. I thought that someone was shaking me violently. When I realized that my body was shaking so, I wrapped myself in a comforter; then I passed out or went back to sleep. When I was aware of myself again, I was too hot wrapped in the comforter and removed it. I was very concerned about what had happened to me so I moved slowly getting up and starting my day. I live alone so there was no one to help or advise me. For the next few days, I rested often, not sleeping, just feeling the need to lay about. By week 2 after the injection, I was "dragging" but not sleeping. When I laid down, my mind roamed about, when I tried to read or engage in meaningful activities were not successful. By week 3, I have full-blown insomnia. I go to bed at 4 am to be awake for hours while in bed, then being exhausted during the day. I am normally active, but I do not have the stamina to do what I love such as mowing my own lawn and working in garden. My heart rate jumps to 122 after 10-20 minutes of activities when in the past I could work steadily for 40 minutes and my heart rate never get above 90 beat per minute ( I wear a charge 2 watch that monitors exercise parameters.) I had to stop to rest up to 4 times to complete the yard work that I could normally complete in less than 40 minutes. Currently, I have "hay fever" symptoms: itchy runny nose, tickle in the throat with dry cough, tired, runny eyes and frontal headache; I take benadryl and other allergy medicines. I have poor sleep habits.

1301329	5/9/2021	FL	33	F	5/9/2021	5/9/2021	Patient was given her shot, she got up and sat down in the nearest observation chair, then immediately said she was dizzy and thought she was going to pass out. I went to her and she repeated that she was about to pass out. When her head started to roll back I was able to hold her by her shoulders. Her eyes rolled back and her head dropped back and she started convulsing. She lost consciousness for about 10 seconds. When she came to she didn't know what was happening. She was very sweaty by this time. I asked if she had a history of seizures or had ever fainted before and she answered no. EMS was called. I checked her BP and it was 84/41. The patient tried to stand to assist with finding her husband in the store but I told her she had to sit until EMS arrive. We offered her water and orange juice and she asked for both. When the husband got there we asked him if she has a history of fainting or seizures and he said this has happened multiple times, mostly as a result of seeing blood. He said she hasn't had seizures but she has had tremors when this has happened. I checked her BP again and it was 116/88. She was feeling a lot better. EMS arrived and she was stable by that point. They recommended that she go to the hospital, but patient opted not to go.
1301374	5/9/2021	AR	68	M	4/13/2021	4/15/2021	Pfizer-BioNTech COVID-19 Vaccine EUA was administered on 4-13-21 at about 10:45 A.M. Within 48 hours of receiving said vaccine, I had a Vitreous Detachment in my right eye causing severe floaters and flashes. This detachment was confirmed by my opthamologist . My opthamologist did not attribute the Vitreous Detachment to the vaccine, but I am making this report on the advice of the information given to me by the administering clinic.

1301470	5/9/2021	OH	49	F	4/6/2021	4/6/2021	<p>The adverse reactions of light headedness, throat irritation, heaviness in my chest and difficulty inhaling began about 20 min after my injection, It lasted 5 minutes. About 30 min afterwards the 2nd wave of reaction came on, with the same symptoms but was even harder to inhale and lasted twice as long. I took a combination of benadryl, motrin and pepcid which alleviated the worst of the symptoms after about an hour. To this day, I still cannot take a deep breath in. About 72 hours after the vaccine I began to have diarrhea (and still have it 20 days later), lethargy, nausea and shortness of breath. The next day I had a little more energy, but still had continued shortness of breath. My vision had become less clear and my thought process a bit fuzzy. This is still happening today. Seven days after the vaccine, I suddenly became extremely light headed just simply walking. To the extent that I needed to sit or lay down before I began to pass out. After the light headedness came on heavily, I also noticed a very heavy weight on my upper chest and found it quite difficult to inhale. These moments would come and go throughout the day. Regardless of whether I was just sitting and relaxing or walking around. These symptoms would last anywhere from a couple minutes to a couple of hours. I found it very hard to catch my breath and could feel my heart flushing often. Additionally I would wake in the middle of the night feeling that I needed to gasp for air. I sought medical assistance from a clinic, an ER and even my allergist and I am scheduled to see my family physician later this week. I am not an anxious person, but have experienced many episodes in the last 20 days that have truly made me feel that I was going to die (no exaggeration!) due to the inability to breathe or that I may have been having a heart attack. I began to have chest pain that would travel from the center of my chest to my left shoulder. The pain also would move to my right lung area. During this I also had heaviness in my chest and felt I could not breathe in or out easily. I am still very light headed and have difficulty walking very far without taking a break because I feel I cannot catch my breath. I still have all of the same symptoms that I experienced 20 minutes after my vaccine. These symptoms have varied in intensity. I have often commented to my family that I feel the symptoms of the chest heaviness and heart flushing seem to come in waves. I am a health conscious</p>

1299174	5/8/2021	WA	17	M	4/20/2021	4/20/2021	<p>felt like his throat was being to close up; appeared to be gasping for air; lose sensation in his extremities; extremities tense and contracting; respiratory distress; This is a spontaneous report from a contactable nurse, reporting for her son. A 17-year-old male patient received BNT162B2 ((PFIZER-BIONTECH COVID-19 MRNA VACCINE), dose 1 intramuscular, administered in the left arm on 20Apr2021 at 10:15 (Batch/Lot Number: EW0170) as a single dose (at the age of 17 years old) for covid-19 immunisation. Medical history included anxiety from an unknown date. There were no concomitant medications. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient did not receive any other vaccines within four weeks prior to the vaccination. Historical vaccine included anxious reaction to Hep B two years prior (2019). The patient experienced respiratory distress on 20Apr2021 at 10:21 with outcome of unknown, felt like his throat was being to close up on 20Apr2021 at 10:22 with outcome of unknown, appeared to be gasping for air on 20Apr2021 at 10:22 with outcome of unknown, lose sensation in his extremities on 20Apr2021 at 10:22 with outcome of unknown, and extremities tense and contracting on 20Apr2021 at 10:22 with outcome of unknown. Chronology of events was as follows: on 20Apr2021 at 1021: Patients mother alerted roving medic that son was experiencing respiratory distress. Medic immediately radioed and arrived at car at 10:22. At 10:22: Patient stated he felt like his throat was being to close up and appeared to be gasping for air. Patient also stated he was beginning to lose sensation in his extremities; extremities tense and contracting; denied changes in vision. At 10:25: 0.3 mg Epinephrine administer into left vastus lateralis. The patient underwent lab tests and procedures which included blood pressure measurement: 80/52 on 20Apr2021, blood pressure measurement: 111/57 on 20Apr2021 at 10:26, oxygen saturation: 89 % on 20Apr2021, and respiratory rate: 26 on 20Apr2021. The events resulted in Emergency room/department or urgent care. It was also reported that since the vaccination, the patient had not been tested for COVID-19; Sender's Comments: Based on current known drug safety profile, the reported events were assess as intercurrent medical events and thus assessed as not related to suspected drug BNT162B2 . Case will be reassessed pending new information. The</p>

1299142	5/8/2021	MO	67	F	3/16/2021		cardiac enzymes were extremely elevated; Weight from 223 pounds to 211 pounds in 2 months; No appetite; Sleep pattern is bad/she cannot fall asleep until 0400 and then wakes right back up around 0800; Feels rough with fine bumps at times; Feels rough with fine bumps at times; Itches at times; Rash on outer aspect of arm; Tightness, uneasiness in chest; Palpitations, Fluttering in Chest; Palpitations, Fluttering in Chest; Easily Winded; This is a spontaneous report from a contactable nurse (patient). A 67-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), the first dose on 16Mar2021 (Batch/Lot Number: EN6207; Expiration Date: 31Jul2021), then the second dose on 07Apr2021 (Batch/Lot Number: ER8730; Expiration Date: 31Jul2021), both via an unspecified route of administration, at the age of 67-years-old, administered in arm left as a single dose for COVID-19 immunisation. Medical history included chronic obstructive pulmonary disease (COPD) from 2002 and ongoing, ongoing diabetes mellitus, penicillin allergy from an unknown date and unknown if ongoing, became really sick, really fast, uncertain if was Covid 19 from Feb2020 to an unknown date and chest discomfort from an unknown date and unknown if ongoing. Concomitant medications included acetylsalicylic acid (ASPIRIN (E.C.)), glyceryl trinitrate (NITROGLYCERIN), both taken for chest discomfort; dulaglutide (TRULICITY) taken for an unspecified indication, all from an unspecified start date and ongoing. The patient previously took morphine and codeine and experienced drug allergy. The patient was at her eye doctor on 02Apr2021 and decided afterwards to have her grandson take her to the Emergency Room (ER) for some tightening and uneasiness she had been having in her chest over the preceding days. She also felt some palpitations, they were fast, then slowed down; did not feel labored. She went to the ER and was there for 8 hours. They told her that her cardiac enzymes were extremely elevated. After the cardiologist reviewed her results she was allowed to go home. She went to her regular cardiologist on 05Apr2021. That cardiologist went over her tests results and said that while it was not normal results for her he didn't find them too worrisome. He stated that just because her enzymes are elevated does not mean she is in trouble. He scheduled her for a Dobutamine Stress

----------	-------	-------	---------	-----	----------	------------	--------------

Test on 07Apr2021. She has been trying to get the results of this stress test from the doctor's office but has not been successful in doing so. Says that once she completed the Stress Test on 07Apr2021 she went to get her second dose of the Covid Vaccine. She was still having her symptoms when she got her second vaccine and they have continued since. She saw her endocrinologist who went over blood work with her. The endocrinologist told her that her blood glucose level was very good and her A1c was a 5.5. The endocrinologist was concerned because usually the A1c is between 6 and 7. Patient was 5 foot 6- and one-half inches.

Tightness, Uneasiness in chest: Stated it is not pain, just an uneasy, uncomfortable, fluttering feeling. Palpitations, Fluttering in chest: Not a labored feeling, goes fast, then slows down, not constant. Rash on outer aspect of arm: Extends from her wrist to about 2-3 inches below her elbow. Outside of arm, not on the inner part of her arm. Feels rough with fine bumps at times; then will feel smooth again. Itches at times. She uses calamine lotion, which does help to relieve the itching and smooth the skin. Stated it eventually does come back though. Easily Winded: She has had respiratory conditions all of her life. This winded feeling, she has been having is different than that she stated. She gets the fast heartbeat really quick, can almost hear it; becomes winded and sits down. The episodes last about 15 minutes. She has had no appetite; she has lost almost 15 pounds in 2 months. Her weight was 223 pounds 2 months ago and now weighs 211 pounds. She mentioned her sleep pattern is bad. Some days she cannot fall asleep until 0400 and then wakes right back up around 0800. The patient underwent lab tests and procedures which included blood glucose: 100 on 22Apr2021, blood pressure measurement: 128/62 on 21Apr2021, body temperature: 97 degrees fahrenheit on 21Apr2021, haemoglobin: 5.5 on Apr2021, heart rate: 78 on 21Apr2021, myocardial necrosis marker: extremely elevated on 02Apr2021, oxygen saturation: 98 % on 21Apr2021. Therapeutic measures were taken as a result of rash on outer aspect of arm, Feels rough with fine bumps at times and Itches at times. The outcome of the events Itches at times, Feels rough with fine bumps at times, Rash on outer aspect of arm, Easily Winded was not recovered; Palpitations, Fluttering in Chest and Tightness,

1299186	5/8/2021	MD	66	F	2/25/2021	2/28/2021	severe tinnitus; This is a spontaneous report from a contactable consumer (patient). A 66-year-old non-pregnant female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), first dose via an unspecified route of administration, administered in the right arm on 25Feb2021 12:30 (lot number and expiration date were not reported) as single dose (at the age of 66-years-old) for COVID-19 immunisation. The patient was administered in a pharmacy/drug store. Medical history included type 2 diabetes, gastroparesis, chronic headaches, fibromyalgia, dry eyes and inflammation, osteoarthritis, hypothyroidism, high blood pressure, high cholesterol, high triglycerides, urinary frequency, arteriosclerosis of the aorta, lactose intolerance, and allergies to sulfa drugs. The patient had concomitant medications included too many to list. The patient was not covid tested post vaccination. The patient previously took methyldopa (ALDOMET) and experienced allergies. Three days after her first COVID-19 vaccine (28Feb2021) she developed severe tinnitus and has remained ever since. The event resulted in a doctor visit. The event was considered a disability. The patient did not receive a treatment for the event. The patient has not recovered from the event. Information on the lot/batch number has been requested.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1299196	5/8/2021	NC	41	F	1/23/2021	1/26/2021	Increased intracranial pressure with vision loss requiring VP shunt placement; Increased intracranial pressure with vision loss requiring VP shunt placement; This is a spontaneous report from a contactable nurse (patient). A 41-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration, administered in arm right on 23Jan2021 at 12:00 (Lot Number: EK9231)(at the age of 41-year-old) as single dose for COVID-19 immunisation. The patient was not pregnant. Medical history included hypertension (HTN), obstructive sleep apnea syndrome (OSA) and hypothyroidism, all from an unknown date and unknown if ongoing. Known allergies: KEFLEX, LEVAQUIN, Penicillin. Concomitant medication included levothyroxine; lisinopril; trazodone and HCTZ, all concomitants were taken for an unspecified indication, start and stop date were not reported. The patient previously received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in arm right on 04Jan2021 at 15:00 (Lot Number: EL0140) (at the age of 40-year-old) as single dose for COVID-19 immunisation. On 26Jan2021 at 14:00, the patient experienced increased intracranial pressure with vision loss requiring VP shunt placement. The events required emergency room visit and physician office visit. The patient was hospitalized due to the events for 2 days. The patient underwent lab tests and procedures which included intracranial pressure (CSF pressure): increased on 26Jan2021, SARS-COV-2 test (Nasal Swab): negative on an unspecified date. Therapeutic measures were taken as a result of the events and included 3 lumbar punctures and surgery for VP shunt. The patient outcome of the events was recovering.; Sender's Comments: The 41-year-old patient had medical history included hypertension (HTN), obstructive sleep apnea syndrome (OSA) and hypothyroidism, and was on multiple concomitant medications. Intracranial pressure increased and blindness were most likely due to concurrent disease, and unlikely related to the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE). The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety

1298903	5/8/2021		76	F	4/5/2021	2/1/2021	Pain in face; Ophthalmic herpes zoster; Eye inflammation; Shingles; This spontaneous case was reported by a consumer and describes the occurrence of OPTHALMIC HERPES ZOSTER (Ophthalmic herpes zoster) in a 76-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Co-suspect product included non-company product ADALIMUMAB (HUMIRA) for Rheumatoid arthritis. No Medical History information was reported. On 05-Apr-2021, the patient received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On an unknown date, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form and ADALIMUMAB (HUMIRA) (Subcutaneous) 1. On 02-Feb-2021, the patient experienced EYE INFLAMMATION (Eye inflammation). In February 2021, the patient experienced HERPES ZOSTER (Shingles). In April 2021, the patient experienced OPTHALMIC HERPES ZOSTER (Ophthalmic herpes zoster) (seriousness criterion medically significant). On an unknown date, the patient experienced FACIAL PAIN (Pain in face). At the time of the report, OPTHALMIC HERPES ZOSTER (Ophthalmic herpes zoster), EYE INFLAMMATION (Eye inflammation), FACIAL PAIN (Pain in face) and HERPES ZOSTER (Shingles) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Treatment included prednisone. Very limited information regarding the events has been provided at this time. Additional information regarding date of vaccination and Humira infusion, and correct onset date for the events are required for further evaluation.; Sender's Comments: Very limited information regarding the events has been provided at this time. Additional information regarding date of vaccination and Humira infusion, and correct onset date for the events are required for further evaluation.

1300247	5/8/2021	CA	61	F	4/4/2021	4/4/2021	Immediately after my J&J vaccine, I experienced soreness to my left arm, fatigue , dizziness and a bad headache. In the middle of the night my headache kept getting worse, my eyes started to hurt really bad and I also broke out in hives. About 6 hours later my headache felt like it wanted to explode. I saw a doctor through Tele-health by who prescribed a 6pk of steroids. Then on Day 6, my headaches came back along with the hives and I felt really tired and the hives broke out all over my body including my crotch and ear canal. He prescribed a 6pk of steroids and I started to feel and get better. On Day9, all of my symptoms were resolved except for the fatigue. To this day I still continue to have fatigue.

1299201	5/8/2021	FL	33	M	4/17/2021	4/18/2021	severe headaches; strong pain in my head, my left arm and left eye; strong pain in my head, my left arm and left eye; light pressure during the morning in my head not as severe as the other days; whole body turned red; bumps; itchy; nausea; stomach ache; eyes were numb; left arm was numb; rash all over his body; chills; flu symptoms; Caller (male, age 33) spoke already to someone prior to Pfizer and gave information on his experience with the Pfizer covid vaccine. "I took the first dose of the Pfizer vaccine on Saturday 17APR2021. I got a severe reaction from the Pfizer vaccine. I got the normal chills the next day and flu symptoms. From the next day to day 5 I got severe headaches, strong pain in my head, my left arm and left eye. I took Tylenol and ibuprofen within those days. The Tylenol didn't help at all, ibuprofen 200mg didn't do much. Yesterday I went to the ER because I had light pressure during the morning in my head not as severe as the other days, in the afternoon I had a tight pressure in my head so I took 2 tablets of extra strength Tylenol, the headache went away but within an hour I had a bad reaction. My whole body turned red, bumps, itchy. It was bad. It was bizarre because I've never had reaction to Tylenol prior. I never had that before yesterday. It was the first time. They gave me a shot of steroids. The doctor didn't know if it was a bad reaction to the Pfizer reaction (said it would usually occur within 4 hours of getting the vaccine) or the mix of the Tylenol and the pfizer vaccine together. He had no clue. But he had not seen a reaction of the vaccine at 5 days later. He said I could have reacted late, or the Tylenol and Pfizer vaccine together had a bad reaction. I had covid late Jan of this year. The vaccine more interaction due to that if I had immunity to it. It was so bad I don't know if it's possible to wait 2 months for the 2nd shot. I heard the first dose 80-90 percent immunity or even more. With my body I never had this reaction. Today I'm a whole lot better (day 6). I am too putting too much, should I wait 90 days other say 4 weeks. What to do about the 2nd dose? How about using antihistamines during/after my second dose? What about Tylenol or Ibuprofen?" I had a side effect after the first dose of the vaccine. Should I get the second dose? e-transmitting potential duplicate AE. Caller said he didn't give PCP information to the safety agent. He did not have. Response: Spoke from EUA PI (Revised: 06 April 2021) under Post Authorization

Experience Fact Sheet for Recipients and Caregivers (Revised: 06 April 2021) under section WHAT ARE THE RISKS OF THE PFIZER-BIONTECH COVID-19 VACCINE? As noted in the Fact Sheet for Recipients, you should not get the Pfizer-BioNTech COVID-19 Vaccine if you had a severe allergic reaction after a previous dose of the vaccine or if you had a severe allergic reaction to any ingredient of the vaccine. The decision to receive the second dose for any other reason cannot be made by Pfizer. We refer you to speak to your healthcare provider about the risks of the vaccine compared to the risks of potentially not being fully protected against COVID-19 infection. Your healthcare provider knows your health situation and has access to information that can better help inform this decision.

Request Name: Product: PFIZER-BIONTECH COVID-19 VACCINE Caller (male, age 33) spoke already to someone prior to Pfizer MI and gave information on his experience with the Pfizer covid vaccine. Yes Pfizer Vaccine manufacturer: Unspecified Dates for Pfizer Vaccine: (Start: 17 Apr 2021 Stop: Unspecified) NDC number of Pfizer Vaccine: Unknown Expiry Date of Pfizer Vaccine: Unknown Why was the patient taking Pfizer Vaccine (Verbatim): just to get vaccinated for covid Other Products: No Patient History: No Investigation Assessment: No Additional Context: Caller states he is calling about the Pfizer Vaccine and has a couple of questions in his experience with this; states he had the 1st dose of the Pfizer Vaccine on 17Apr2021 and had a really severe reaction with it and basically through the next day he had normal things that are normal but the last 5 days he has had a massive severe headache and overnight had chills then his symptom was nausea and headache and everything else; states the following four days after that he had a little bit of a stomach ache and nausea which were not as bad but had a severe headache. States he had a severe body reaction on Thursday 22Apr2021 and today he is 100 percent better. HCP information: Caller declined to provide the HCP information as he does not have that with him at this time. States he took Tylenol yesterday and the whole week which is Tylenol Extra Strength 500mg and yesterday took two tablets and on the 2nd day Sunday 18Apr2021 he took about 5 tablets the whole day and the bottle has expiry date 2024 and lot ABC207. States the emergency room gave him a steroid shot he can't find the name of and has no dosage, lot number to provide. States the emergency room gave him a medication Prednisone that he is to take for the next 5 days and is required to take it this week and it is 5mg in an orange pharmacy bottle with no lot or expiry date because it is an orange pharmacy bottle. States he took Ibuprofen 200mg with expiry date Dec2022 and lot WJ02713. States the Tylenol and Ibuprofen were the two ones that

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

were recommended to take and he took them and the Tylenol and Ibuprofen gave him a severe headache and it was really really bad on the 5th day which was yesterday and the pressure from the headache he could feel and it was a slight pressure and was uncomfortable and the left side of his body and his eyes were numb and the left arm was numb; states after that the next day on the 5th day, he had a tight pressure in his head and in late afternoon the pain was starting to get tighter with a severe headache; states today is the 6th day. Caller states he took Tylenol again and a half hour later he had a severe body rash all over his body and had to go to the emergency room to get a steroid shot from it and the rash is not ongoing and he went to the ER yesterday and they have him the steroid shot at that time and a medication to take for the next 5 days which caller said is the Prednisone. States he had the really bad rash all over his body and it was really really red and itchy and he had bumps coming up so went to the emergency room and they could not tell if it was due to the Tylenol or part of the Pfizer Vaccine; states he had taken Tylenol a couple of times in 5 days and was fine and then took Tylenol yesterday and had the severe reaction. States he had been reading a lot and is really worried about taking the 2nd dose of the Pfizer vaccine and is debating on waiting two months before getting the 2nd one and his general practitioner can't find anything wrong and can't say the reported event is due to the Pfizer Vaccine; states a lot of people get a reaction in 6 days he has found in his reading; states his HCP has some patients that had reactions within 4 hours and not in 5 days after the vaccine and states he has no patient information or lot numbers for their vaccines to report. States he had covid in late January 2021 and that can react a lot with the Pfizer Vaccine and he understands that and does not know if this is actually an allergy of the vaccine in these few days of the last 7 days or if is the Tylenol reacting with the vaccine. States he realized that having had covid in late January could affect him a lot more with the vaccine. Caller states he only has the medication for Prednisone that he was given to take for the reaction from yesterday. 1300460	5/8/2021		64	F	3/30/2021	4/16/2021	This 64 year old white female received the Pfizer Covid shot on 3/30/21 and went to the ED on 4/16/21 and was admitted on 4/17/21 with the following diagnoses listed below. I63.9 - Acute CVA (cerebrovascular accident) BLURRED VISION SPEECH PROBLEM
1300419	5/8/2021	CA	64	F	12/23/2020	12/23/2020	This is my 7th report to VAERS and my number is 908013. I developed burning and numbness in my face and tongue as well as presyncope and high bp spike of 180/126, 30 minutes after receiving the Pfizer covid vaccine. I became severely ill after and have had persistent severe paresthesias in my face and scalp, tongue, limbs and tight constricting band around chest as well as fatigue, tremors, fasciculations, internal vibrations, dizziness, blurred vision and headaches for 19 weeks. I have seen many physicians and have been very ill. My case was presented to the CDC grand rounds and I have been evaluated by neurologists. I am on many meds and my severe agonizing paresthesia pain is better controlled now. I have been severely debilitated now for 19 weeks.
1300411	5/8/2021	WI	59	M	4/22/2021	5/2/2021	stroke on 5/2 8:45 am hospitalized 5 days no physiologiical explanation. 3/4 of right cerebellum is dead. at onset nausea vomiting vision loss, loss of balance and coordination BP bottomed out low heartrate while sleepiing
1300403	5/8/2021	VA	74	F	4/12/2021	4/12/2021	Headaches in eyes and head, extreme sensitivity to light non-stop!!! since April 12, PM until today May 8th. Just starting to diminish a little bit.
1300331	5/8/2021	FL	29	F	5/8/2021	5/8/2021	After about 10 mins patient was limp sweaty and eyes rolled back, after few minutes she fully came back stated she was fine
1299978	5/8/2021	TN	46	M	5/3/2021	5/5/2021	Chest pains started on 5/5/21 around 4pm and worsened through 9pm. The next morning chest pains continued to the point where I went to the Emergency Room. There, a cardio ultrasound, blood work and a cardio catheter were performed. Tests for all respiratory viruses all came back negative. I was taken to the Critical Care Unit and remained under supervision overnight and through the morning 5/7/201, when I was discharged. I was diagnosed with Myocarditis and Pericarditis.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1299771	5/8/2021	MN	36	F	5/6/2021	5/7/2021	about 19 hours after the vaccine was received, I saw floaters in my eyes so badly that my vision was reduced by more than 50% (it happens frequently where I see floaters, but never even remotely this bad). Became very disoriented & confused, had trouble processing things, had trouble talking, felt dizzy for about 30 minutes. After 30 minutes, it slowly diminished and I felt more myself within an hour. (although still had the typical affects from the vaccine: bad nausea & fatigue, slight fever & aches).
1299734	5/8/2021	MN	63	M	3/29/2021	4/17/2021	While this first vaccine gave no side effects other than a slightly sore arm, 17 days later on 4-17-2021 I suffered a TIA (Transient Ischemic Attack). That occurred at 5:15 pm and I immediately took 4-81 mg aspirin and headed for a nearby Emergency Room. They said it was a stroke (and it did show on an MRI the next day but sub-centimeter and I was told the size of a pinhead. AT the ER the double vision in my left eye and numbness in left lips, gum and tongue were already subsiding, but the DR there gave me a Plavix and within 5 minutes I was completely back to normal (or close). I am not sure IF that first dose of vaccine had anything to do with this TIA, but it might have? I had also stopped taking my 81mg aspirin several days before this TIA as I had a Periodontal appointment for insertion of an implant post and wanted to control the possible bleeding. The thoughts of my Doctor at Hospital as well as the Neurologists was that the omission of the aspirin PROBABLY was the main cause of the temporary clotting that caused this event HOWEVER I did not tell them that I was 17 days post-Covid Pfizer vax #1 and so the possibility remains that the vaccine could have been partially the cause of this event? As listed previously, Dr at Hospital was my Doctor and might shed some light on this and her thoughts. I felt it was important enough to report as I have heard stories of all of the vaccines possibly causing some clotting and this might fit.

1299287	5/8/2021		23	F	4/21/2021	4/22/2021	I got super nauseous.; I really wasn't feeling well; Then I got super hot and sweaty; Then I got super hot and sweaty; I passed out.; I had a fever of up to 103.5; This is a spontaneous report from a contactable consumer (patient). A 23-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), via an unspecified route of administration, administered in right arm on 21Apr2021 08:45 (Batch/Lot number was not reported) (at the age of 23 years old) as single dose for COVID-19 immunization. The patient medical history was not reported. The patient was not pregnant at the time of vaccination. Concomitant medication included ibuprofen. The patient previously took sepra and experienced allergies (known allergies); and first dose of BNT162B2 on 31Mar2021 08:45 at right arm for COVID-19 immunization. No other vaccine in four weeks. On 22Apr2021, the patient had a fever of up to 103.5 and was down to around 102 by the time of the incident (around 4:00). The patient woke up and was standing for about 3 minutes to refill water when she got super nauseous. She was making her way to the bathroom to throw up, and the next thing she knew she was on the floor. The patient was not sure how long she was passed out for though she had no reason to believe it was long. She tried to sit up, but she really wasn't feeling well, so she laid back down and closed her eyes for a bit. Then she got super hot and sweaty. Once that passed (maybe a few more minutes), she was able to check her temperature and she was down to around 101 and was able to get back to bed. No treatment for the events. No COVID prior vaccination. The patient had not been COVID tested post vaccination. The outcome of the events was recovered in Apr2021. Information about Batch/Lot number has been requested.

A 59-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection), via an unspecified route of administration on 15Apr2021 at 12:10 (at the age of 59-year-old) as a single dose for COVID-19 immunisation. The patient's medical history included fibromyalgia from an unspecified date in 2012, lupus psoriasis from an unspecified date in 2010, allergies, compromised immune status, genetic /chromosomal abnormalities, respiratory illness, endocrine abnormalities, diabetes from an unspecified date in 2015, chronic fatigue (chronic fatigue syndrome) from an unspecified date in 2012, obesity, psoriasis from an unspecified date in 2010, migraine, anxiety, and depression from an unspecified date in 1965. Concomitant medications included atenolol (Strength: 50 mg) from an unspecified date in 1988 at 50 mg, daily for migraine. The patient previously received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection), in left arm on 25Mar2021 (at the age of 59-year-old, Lot number: ER2613) as a single dose for COVID-19 immunisation and experienced left arm soreness and slept for 3 days on 25Mar2021. It was reported that the patient received first dose in left arm up very high in the muscle. The family history included glaucoma, anxiety, and depression from an unspecified date in 1965, diabetes from an unspecified date in 2015, heart disease. Prior vaccinations (within 4 weeks) was none. The patient did not develop adverse events prior vaccinations. Additional vaccines administered on same date of the Pfizer suspect was none. Caller was a consumer, enquired asking what she was supposed to do with this rash. Caller reports that she received her second vaccine dose on 15Apr2021 and 4 hours after getting her vaccination she became an "itchy hurting mess" on 19Apr2021. Her first vaccine dose was reportedly 3 weeks prior to her</p>

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

second. She reports that she was experiencing an awful rash described as "a wild rash on my chest, bright red itchy angry" on 19Apr2021. Caller reports that she has seen her healthcare professional twice her Dermatologist three times and her Psychiatrist twice with no improvement or guidance. Caller states "Pfizer was the one who made it they should know what do to about the side effects". Caller reports that she has tried numerous over the counter products and medicines to help with her rash, but nothing has helped. Caller reports that she has asked her doctor to give her a cortisone shot and was refused because it may interfere with the vaccine. Caller became audibly upset asking loudly, "what am I supposed to do?!" and "what happens to me" reporting that people get the shot, and they are "thrown to the wind" and no one knows what to do for me. Caller asks, "How many people total have had adverse reactions after getting the vaccine." During this call, caller threatened to go to the News and then stated, "I don't know what to do I may have to kill myself". Caller made no additional statements of harm to herself and no need to direct to suicide hotline was necessary. Caller was a consumer, asking "how do I get help to pay for the medicines I have had to use after getting the vaccine." Caller was a consumer, asking "what would be a contraindication to getting the vaccine." Caller was a consumer, asking, "did you have anyone with autoimmune problems get the vaccine". Caller reports that she has fibromyalgia, lupus Psoriasis and says, I have an autoimmune disease, I am not immunosuppressed. Received call from consumer regarding the Pfizer COVID vaccine. She has reported adverse events. There was no prescriber. The doctor's on site need more training. She should have never been allowed to have the vaccine. She had a swollen left eye and a rash around left eye when she went in and the doctor said it was ok. She wanted to know if there was any directive on who should not get the vaccine. Small rash around left eye started to spread. The rash was there before. It was hard to comb out what happened when. Rash was very itchy and very painful. Nobody knows what it was. She has been to 6 doctors. This was the second dose that she started having the issues with the rash. She later stated she had arm pain and slept for 3 days after the first dose. She has a growth that was there previous on the upper left arm and during the

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

second injection, she thinks it was given a little higher in the shoulder, closer to where that growth was. She was not sure that one was given in the muscle. The Effexor was increased at first due to titration up to full capacity or dose. Then titration down because of side effects and then titration down due to rash. She stated it was the same rash that we are talking about. It was in a pharmacy vial with no lot or expiration. If she ever had a regular vial it was thrown away. There were different bottles with different doses and different lots and expirations. She no longer has any of the bottles to provide a lot or expiration. She has the 150mg, count size was 90 tablets. This was the one she was taking when she was taking the shot. It was in a Pharmacy vial. Her current dose was 75 mg once daily. That was in a pharmacy vial with no lot or expiration. She has pictures of the rash and it is bright red and very angry. They did a biopsy of chest on 27Apr2021, and the results are not back yet. She went to dermatologist for the third time on 27Apr2021. For the first one, she only slept for 3 days and only had arm pain. She later stated she might have slept for 3,4 or 5 days, she does not remember. ER or physician's office required. Physician visits 16Apr2021, saw a dermatologist at withheld Dermatology, that she doesn't remember his name. He was a 50-year-old male doctor. Creams, ointments and later stated Hydrocortisone 1%. She has a bag full of creams and ointments. and was lucky she remembers what goes on what parts. Some do not go on face or near eye. This was the only one that went near her eye. Then on 20Apr2021, she saw Dr. at the same group with the same address and phone as last one. She does not remember what was given when. Maybe 2.5% cream was given then, but then said no, that was not during that visit. She does not remember when was given what. They just keep having her buy more lotion and buy more stuff. They have helped a little bit. Something inside of her body was causing it. The rash just keeps getting worse and they are a band aid, and nothing was getting rid of it. She does not wish to provide the names of those creams and ointments and did not wish to provide dose, lot, or expiration for any. She said they are not the issue. She then saw the same 50-year-old bald male, not Dr. the other guy, on 27Apr2021, she got a biopsy on her chest and does not have results. He prescribed a new

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

cream. She also saw Dr., primary care physician, 27Apr2021. She said she believes it was because of the vaccine but she did not want to give cortisone or prednisone because it might negate the vaccine. She directly faults Pfizer with her doctor not knowing what they could and could not use. She saw Dr. Psychiatrist, on 27Apr2021. She had already lowered her Effexor by phone. No additional treatment during that visit. She lowered the dosage on 22Apr2021 from 150 mg to 75 mg now. That doctor said she does not know if it was from the Effexor or the shot. The dermatologist does not know if it was from Psoriasis or the vaccine because the rash got worse in sun. Usually psoriasis gets better in the sun. Caller states she has done three reports so far and no one can help her. Says every idea they give her was one she has already done or can't do. States nobody knows why she has this rash, nor do they know what to do. She has been sleeping all day, every day, since 15Apr2021. She has lost 2 weeks of her life. She also wanted to know if Pfizer recommends giving the vaccine with autoimmune problems. She has not read anything about that. She lastly stated that the rash started in her upper arm and was now spreading to her lower right arm. This started 2 days ago (25Apr2021). Was there any clearing house for people with problems. She read there are like 400 people who have problems after the four hours. They did not count her and there are a probably a million other people. There was no specific information on those 400 people, and it was just a report. She did not have any further details to provide. Call handler asks caller if she was wanting to do a follow up report from the one this morning and if she has any new symptoms. The caller states that her rash has gotten worse. She states it was better in the morning, worse at night, better in the morning, worse at night. States her rash was a scratchy, hurty mess. She wants to know what to do about her rash. Caller says that the doctor won't give her steroid medications for the rash because she had the vaccine recently. Caller goes on about how she needs to speak with the people who developed the vaccine. States how can Pfizer just be out there telling everyone to get the vaccine, get the vaccine, get the vaccine; but then could not help them when they have a reaction. Caller randomly says that she has read about shingles after the vaccine. States why do they put polyethylene glycol in

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

things if they know some people are allergic? Caller did not specify that this was in the vaccine, she just stated it as things. Call handler asks caller if she was allergic to polyethylene glycol? Caller yells she doesn't know. States her rash itches and hurts and was driving her nuts. Again says better in the morning, worse at night, better in the morning, worse at night. The patient was tired and sleepy on 15Apr2021. No investigation assessment. The patient underwent lab test and procedure which included biopsy: Results are not back yet on 27Apr2021. The outcome of the events tired and sleepy was not recovered, recovering for the event rash, itchy and unknown for the other event. Description of Product Complaint: Description of complaint: Unspecified creams and ointments that were prescribed that are not helping her rash get any better. They just keep having her buy more lotion and buy more stuff. They have helped a little bit. Something inside of her body was causing it. The rash just keeps getting worse and they are a band aid, and nothing was getting rid of it. She has a bag full of them and did not wish to provide the names, manufacturer's, doses, lots, or expirations. She only stated name of Hydrocortisone 1%. She later stated one was changed to 2.5% but did not wish to provide details about which one. She did not wish to provide lot or expiration for any of them. Product strength and count size dispensed: Unknown. Additional lot numbers: None was a sample of the product available to be returned. Follow-up attempts are completed. No further information is expected.

1299327	5/8/2021	CT	75	F	2/18/2021	3/29/2021	rash on her scalp; flat macular rash; on her scalp the vesicles were breaking out basically; Pain in her throat one side, injection on the right side, just in the right peritonsillar fossa; very foggy; trouble sleeping; numbness; paresthesia; Shingles; Rash around her eye; Sore throat; Earache; This is a spontaneous report from a patient. A 75-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration, administered in Arm Left on 18Feb2021 (Batch/Lot Number: EN6201) as a single dose (at the age of 75 years) for covid-19 immunization. The patient's medical history included lung Cancer from Aug2010 to Oct2010 (lung cancer survivor and had 35 days of treatments, 20Sep2010 was her last day of treatment. She says the end date for this condition was mid Oct2010, she has inoperable lung scarring, it's not COPD, more like a seasonal allergy, when she runs into an URI they up the prednisone to stop the spasms. She clarifies that URI stands for upper respiratory infection; ongoing sleep obstructive sleep apnea (patient uses a CPAP. She says she has had this condition prior to 2010, since the early 2000's), polymyalgia rheumatica from 2019 and ongoing,ongoing hypothyroidism (had this condition for 30 years probably) , hypertension from Feb2021 and ongoing; gastrooesophageal reflux disease (since the 1990's), chemotherapy and radiation (chemotherapy and radiation 10 years ago), postmenopausal and inoperable lung scarring from an unknown date and unknown if ongoing. Concomitant medication included prednisone (PREDNISONE) taken for polymyalgia rheumatica from; budesonide, formoterol fumarate (SYMBICORT) taken for lung neoplasm malignant; salbutamol sulfate (ALBUTEROL [SALBUTAMOL SULFATE]) taken for lung neoplasm malignant; omeprazole (PROTONIX [OMEPRAZOLE]) taken for gastrooesophageal reflux disease; levothyroxine sodium (SYNTHROID) taken for hypothyroidism from an unspecified start date and ongoing; calcium carbonate, vitamin d nos (CALCIUM + VIT D) taken for postmenopause from an unspecified start date and ongoing; ascorbic acid (VIT C) taken for postmenopause; hydrochlorothiazide (HYDRODIURIL) taken for hypertension from Feb2021 to an unspecified stop date. The patient received the first dose of BNT162B2 (lot:EL9262) in the left arm on 21Jan2021 at

---

the age of 75 years for Covid-19 immunization. The patient experienced shingles, rash around her eye, sore throat, earache on 29Mar2021; numbness, paresthesia and trouble sleeping on 31Mar2021; very foggy on 03Apr2021; very foggy was reported as worsened/ trouble sleeping was reported as worsened, rash on her scalp, flat macular rash, on her scalp the vesicles were breaking out basically, pain in her throat one side, injection on the right side, just in the right peritonsillar fossa on an unspecified date. It was further reported that 5 and a half weeks later (after the vaccine) she developed shingles. She said it just recently came to her attention and might be related to the vaccine, but she was not sure if it was or not. She said she has not had the shingles vaccine, she had chemotherapy and radiation 10 years ago and never had any issues so she never got the vaccine for shingles. Patient is on a dose of gabapentin 800mg for the shingles, she has had a lot of difficulty with the dose and the shingles, She said she was little bit fuzzy, but that's probably because of the gabapentin, not the vaccine. Patient also mentioned she had a sore throat, it involves the right forehead, scalp, neck, she has an earache. She said the earache and the sore throat have passed but she still has the issue around her eye, a rash. She said the numbness and paresthesia started, she didn't pay much attention to it, then 2 days later she thought she should see the doctor. She says she saw a rash on her scalp, she didn't see the vesicles right away, she saw a flat macular rash. She says on her scalp the vesicles were breaking out basically. She says the sore throat has been interfering with her sleep, she can't use her CPAP, it got to disabling because she can't use her CPAP. She was very foggy. Trouble sleeping was medically significant moving into disabling because she was really foggy, more foggy as she goes along. She says the foggy is medically significant moving towards disabling, that up until today it was medically significant. She said for her throat she had to gargle a lot, it didn't go away with Tylenol. Tylenol NDC, lot, and expiration date not provided. She says the earache was there, it was annoying. She said the trouble sleeping was related to the shingles, she can't say the vaccine did it. The patient underwent lab tests and procedures included bloodwork on 02Apr2021 and everything came back normal. She said that was to test

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

her kidney function following the HydroDiuril. She said the HydroDiuril was changed from 25mg to 12.5mg. She says she also had a screen of her inflammation markers of her lungs and that that was normal. She says both tests were done on 02Apr2021, that was the last ones, not the first ones done. The patient went to her doctor and ophthalmologist and was prescribed Valtrex. She does not know the dose and frequency, she says it is an antiviral for shingles. She says the gabapentin was for the pain for the paresthesia. The gabapentin was fluctuating, they keep increasing it due to discomfort, and she was up to 800mg in divided doses. She said she also was given eye drops, triple antibiotic polymixin. She had neomycin and another one, that it was the same as the ointment triple antibiotic for abrasions. She used that 3 times a day in her right eye. She also took a cortisone preparation eye drops and that they are also 3 times a day in her right eye. She says her ophthalmologist put her on a second course of Valtrex, she does not know the dose or frequency, saying that it varies according to her primary care physician. She says the total is 800 mg in divided doses. She says she is doing 200, 200, 400, she is trying to get off of it but that doesn't work so they are going to be increasing it. The organ involvement included respiratory and Dermatological/Mucosal. The patient was recovering from the events shingles and rash around her eye, recovered from sore throat, earache on 19Apr2021, not recovered from the events numbness, paresthesia, very foggy, trouble sleeping, and unknown outcome for all the other events.

1299370	5/8/2021	MD		F			<p>Anaphylaxis After the Covid-19 Vaccine; This is a literature report. Authors reported a case of the first patient at the (Hospital), who had immediate anaphylaxis after administration of the Pfizer-BioNTech Covid-19 vaccine. Authors highlighted that the patient never had an episode of anaphylaxis previously and had nonreactive skin testing for polyethylene glycol, polysorbate-containing vaccines, as well as the Covid-19 vaccine itself. Importantly, she had an underlying condition that predisposed her to non-IgE-mediated anaphylaxis. The case is a 34-year-old female healthcare professional, who presented to the Allergy and Immunology clinic for evaluation of an anaphylaxis event that occurred after administration of the first dose of the Pfizer-BioNTech Covid-19 vaccine. The patient had negative SARS-CoV-2 nucleic acid tests 109 and 39 days before immunization. She noted in the interview to have been subjectively overheated while standing in line waiting to receive the first dose of the vaccine. Within 3 min of vaccine administration, she developed flushing, urticaria on her extremities and face, generalized pruritus, tongue swelling, nausea, light-headedness, racing pulse, and shortness of breath with absence of wheezing. Emergency medical personnel responded and administered intramuscular epinephrine and diphenhydramine. She noted substantial relief within minutes of administration of these medicines. The patient was transported to the emergency department for monitoring and had no further reaction. After discharge, she noted erythema and hives around the site of injection, which were nearly resolved by the time of our evaluation 2 days later. Two years earlier, she noted a large hive at the site of injection that took days to resolve after receiving preservative free quadrivalent influenza vaccine, Fluarix (GlaxoSmithKline) without associated systemic symptoms. Two months before the anaphylaxis event, she received Afluria (Seqirus), quadrivalent preservative-free influenza vaccine. Again, she noted a large local hive at the site of injection without a systemic reaction. She also described a history of childhood asthma and eczema but had never had an episode of anaphylaxis. She lastly described a greater than 10-year history of inducible episodes of pruritus, swelling, and hives that were most notable at times of sweating. She noted an inability to take warm showers as well as</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

limitations with exercise due to pruritus and hives in what was suspicious for cholinergic urticaria. Authors performed an examination, laboratory studies, and several procedures for evaluating her anaphylaxis episode. Laboratory evaluation showed elevation in C-reactive protein (CRP) (1.27 mg/dL) 2 days following immunization, negative chronic urticaria (CU) index (4.3), and IgE levels (74.98 IU/mL) within the reference range. Dermatographism was not present. Skin examination revealed no skin findings of cutaneous mastocytosis. Serum tryptase was 4.7 ug/L and 5.4 ug/L checked 7 and 26 days, respectively, after the event and was within reference range; tryptase was not checked before or during the event. The tryptase alpha/beta 1 (TPSAB1) copy number variation test did not reveal tandem duplication(s) of TPSAB1 by allele-specific PCR. Prick puncture skin testing for polyethylene glycol, Pevnar 23 (Merck), and Pfizer-BioNTech Covid-19 (Pfizer) was negative. She scored 11 of 21 on the cholinergic urticaria disease severity standardized scale, suggesting moderate level of the disease. Authors further confirmed cholinergic urticaria via exercise provocation challenge guided by a standardized protocol. Based on the history and findings, her systemic reaction after receiving the Covid-19 vaccine was most consistent with anaphylaxis from a severe episode of cholinergic urticaria. Cholinergic urticaria has a known association with anaphylaxis although most people usually have only cutaneous symptoms. Because of her newly diagnosed cholinergic urticaria and recent anaphylaxis episode, authors recommended she carry an epinephrine auto-injector. Authors also recommended non-sedating antihistamine therapy for prevention of urticaria during bathing and exercise once she was done breastfeeding. Lastly, authors recommended all vaccines including the second dose of the Covid-19 vaccine be administered under supervision in a cool room without excessive clothing. The protection data after a single dose of the vaccine was unclear at the time so administering a single dose was not considered ideal. Based on the evaluation and the patient's increased risk for SARS-CoV-2 exposure, she, after informed decision making, accepted a second dose of the Pfizer-BioNTech Covid-19 vaccine. Authors recommended against pre-medications since they were able to perform the challenge in a cool room and

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

confirm that she was not sweating or overheating. Authors also did not want to mask an IgE-mediated reaction in the event of false-negative skin testing. In addition, the patient did not want to use any antihistamines as her infant was not weaned and still breastfeeding. She tolerated her second dose, without premedication, exhibiting only transient, mild nausea and a sense of warmth, but without any objective findings. Vaccines have an overall excellent safety profile; this includes data from Covid-19 vaccine clinical trials. Authors highlighted that the patient showed propensity for allergic reactions even before administration of the Covid-19 vaccine based on her localized reaction to the influenza vaccines and her history of cholinergic urticaria. It was important for them to evaluate whether IgE-mediated anaphylaxis might underlie her case. Authors showed that the patient had nonreactive skin testing with both 1:1 epicutaneous and 1:100 and 1:10 intradermal Covid-19 vaccine and drugs containing polysorbate 80. However, more data are needed to determine skin testing's role in predicting IgE-mediated Covid-19 vaccine allergy. Likewise, evaluation of mast cell activation in addition to IgE-mediated allergy needs to be considered after any episode of anaphylaxis or potentially severe cutaneous reaction to Covid-19 vaccinations. Evaluations should include the evaluation of inducible urticaria disorders, hereditary alpha tryptasemia, mastocytosis, and idiopathic mast cell activation disorders. Assuming that immediate Covid-19 vaccine reactions correlate to an IgE-mediated allergy ignores other non-contraindicating etiologies and potentially erroneously denies patients the benefit of immunization. Thus, the general public should be aware of immune conditions that may place a person at risk of anaphylaxis, but that these may not be specific to the Covid-19 vaccine. Distinctly, CDC guidance notes "If you had an immediate allergic reaction after getting a shot of a Covid-19 vaccine, you should not get a second shot of that vaccine, even if your allergic reaction was not severe enough to require emergency care." The fact that the patient with a common mast cell disorder was able to safely receive the second dose of the Covid-19 vaccine following anaphylaxis suggests that anaphylaxis may not represent an absolute contraindication but validates the recommendation that these cases should be evaluated

1299267	5/8/2021	CA	18	M	4/23/2021	4/23/2021	extreme hallucinations; not feeling well; chills; aches and pains; headaches; slight numbness in his extremities; difficulty walking; he did not get much sleep; fever; This is a spontaneous report from contactable consumer (parent). An 18-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), dose 2 via an unspecified route of administration, administered in left arm on 23Apr2021 at 12:45 (Lot Number: Ew0153) at the age of 18 years, as a single dose for COVID-19 immunization. Medical history included autism spectrum disorder, ADHD (Attention deficit hyperactivity disorder) combined, learning disabilities. The patient had no known allergies. Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medication taken within two weeks of vaccination included alfetamine aspartate/alfetamine sulfate/dexamphetamine saccharate/dexamphetamine sulfate (ADDERALL) taken for an unspecified indication. Historical vaccine included BNT162B2, dose 1 in left arm, on 02Apr2021, lot # EK5730. The patient did not receive any other vaccines within four weeks prior to the vaccination. On 23Apr2021 at 21:00 the patient experienced extreme hallucinations, not feeling well, chills, aches and pains, headaches, slight numbness in his extremities, difficulty walking, he did not get much sleep, fever. The clinical course of events was reported as follows: My son reported to me at bedtime last night, the night of his second Pfizer vaccine dose, that he was not feeling well. I told him to take some Advil and go to bed. He had a very bad night with chills and aches and pains but most distressing was his description of having had extreme hallucinations. He said that he was aware they were hallucinations and not real during and after the experience, but it was nonetheless concerning. It is also concerning that he didn't wake me for help. At any rate, he did not get much sleep and I have to assume his fever went pretty high before morning. He described to me the need to hydrate during the night. He also relayed to me this morning an experience of headaches and slight numbness in his extremities, difficulty walking, but he is now feeling much better. He is dressed, has eaten, and is playing games on the computer. I am keeping a close eye on him today and should we return to that level of concern, we will take him to urgent care. The clinical outcome of the events was recovering. It was also reported that since the

He has not noticed any fevers but gets occasional nightsweats or sometimes feels flush and measures only a low grade temp that does not last (<100F). He has had slight decrease in wt but no change in appetite. No n/v/d. NO cough, sob, CT/CP, wheezes. No rash. He does have some sinus sx's which he thinks could be c/w seasonal allergies. Got covid vaccine, had 2nd dose on March 3rd. Had about 2 days of fevers, aches, night sweats and fatigue. About 1 1/2 weeks after the dose, he started to get significant fatigue. He started to sleep poorly. He developed arthralgias described as bilateral, distal joints (hip down, wrists mainly). He developed tingling sensations in his arms and legs. He has had mental fog. He had some HA and eye pain. He was dx w/ possible post-infectious polyneuropathy, and suggested f/u w/ neuro clinic for further eval. Pt reports his paresthesias lasted 2 days and has since resolved. He has not been seen by outpatient neuro clinic yet. He did have a post LP HA which he returned to the ED for. He reports that the HA has resolved. In the past 2-3 days he has had felt less fatigue. He still has arthralgias, continuous. They do not seem to be worse in AM or PM. He can do most activities and just tired working out this week. Activity does not seem to make it better or worse. The joints are not red or swollen but feel "tight". He has not noticed any fevers but gets occasional nightsweats or sometimes feels flush and measures only a low grade temp that does not last (<100F). He has had slight decrease in wt but no change in appetite. No n/v/d. NO cough, sob, CT/CP, wheezes. No rash. He does have some sinus sx's which he thinks could be c/w seasonal allergies. Now experiencing substantial disruption of the ability to conduct normal life functions, including the ability to work.

1294746	5/7/2021	CA	63	M	3/17/2021	4/1/2021	<p>blood clots; urinating blood; arm pain; fatigue; he started bleeding from the second one; This is a spontaneous report from a contactable consumer, the patient. This 63-year-old male patient reported that he received the second dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Lot Number: EN6206) on 17Mar2021 (at the age of 63-years-old) via unspecified route as a single dose for COVID-19 immunization. Medical history included enlarged prostate, urinary health issues (gets up in the middle of the night), has glasses as he had cataract surgery last year (2020) so he lost his close-up vision. Concomitant medications were not reported. The patient previously received the first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Batch/lot number: EL3249) on 18Feb2021 (also reported as 17Feb2021) (at the age of 63-years-old) via unspecified route as a single dose for COVID-19 immunization and experienced urinating blood and blood clots profusely, UTI, bleeding, arm pain, and fatigue. The patient received his second shot on 17Mar2021 and almost to the date three weeks later, had the same incident with urinating blood and passing blood clots. He waited an extra day because he could not go to the bathroom and then he went to the ER that same day so that they could flush him out. He also had an appointment on that same day with his urologist. A CT scan was done at the ER and then in the afternoon he went to the doctor. The doctor did a catheter flush. The patient was unclogged but he was passing blood. The patient also reported that he did have the normal arm pain and fatigue the second day or the day after the shot. He has no other adverse reactions at this time. The patient reported 11Apr2021 or 12Apr2021 was when he started bleeding from the second one (shot). He went to the hospital on 14Apr2021. The patient confirmed he was not admitted. The patient reported he is going to the doctor today (21Apr2021) to see the urologist but the urologist is going to do a scope in his bladder because that is the only thing that they cannot see. The clinical outcome of the events urinating blood, blood clots, bleeding, arm pain, and fatigue was unknown. The patient stated he does not know if this is an issue, however, it coincided with both of his shots. The patient was calling to see if this is something that has been seen or if it is in his head.; Sender's Comments: Linked</p>

1294744	5/7/2021	CA	63	M	2/18/2021	3/1/2021	<p>urinating blood; might be a UTI; arm pain; fatigue; blood clots; he started bleeding after the first shot; This is a spontaneous report from a contactable consumer, the patient. This 63-year-old male patient reported that he received the first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Lot Number: EL3249) on 18Feb2021 (also reported as 17Feb2021) (at the age of 63-years-old) via an unspecified route as a single dose for COVID-19 immunization. Medical history included enlarged prostate, urinary health issues (gets up in the middle of the night), and has glasses as he had cataract surgery last year (2020) so he lost his close-up vision. Concomitant medications were not reported. On 18Feb2021, the patient got his first shot. Three weeks later, he had an episode of urinating blood and blood clots profusely. The patient stated the amount of blood and blood clots was scary at best. The patient reached out to his daughter who is a nurse who advised him to go to the Emergency Room (ER). He reached out to the nurse hotline as well, which recommended that he go to the emergency room that day as well. He went to the ER (it was a Sunday). They did a blood test, a sonogram or some kind of sonogram, and a urine sample. They also flushed the patient's bladder out with a catheter. This emergency room visit determined that it might be a urinary tract infection (UTI) and started him on antibiotics. The patient confirmed he was not admitted to the hospital. The patient then made an appointment with his doctor because that was on a weekend. He saw his doctor who referred him to a urologist. The patient also reported that he did have the normal arm pain and fatigue the second day or the day after the shot. The patient reported 11Mar2021 or 12Mar2021 was when he started bleeding after the first shot, he was unsure of the exact date, and stated he went to the hospital on 14Mar2021. The patient reported he is going to the doctor today (21Apr2021), to see the urologist but the urologist is going to do a scope in his bladder because that is the only thing that they cannot see. The clinical outcome of events urinating blood, blood clots, UTI, bleeding, arm pain, and fatigue was unknown.; Sender's Comments: Linked Report(s) :PFIZER INC-2021471072 same patient/reporter, different AE/2nd dose</p>

1294717	5/7/2021		50	F	4/9/2021		<p>patient stated recent eye exam showed corneal ulcer; This is a spontaneous report from a contactable other health professional. A 50-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration on 09Apr2021 (Batch/Lot number was not reported) as single dose for COVID-19 immunization. Medical history included rheumatoid arthritis. The patient's concomitant medications were not reported. On an unspecified date, the patient stated recent eye exam showed corneal ulcer. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the available information and known product information, the causal relationship between the reported ulcerative keratitis and use of BNT162B2 cannot be fully excluded. However, the medical history of rheumatoid arthritis may confound the reported drug event pair. The limited information precludes a more meaningful assessment. The case will be assessed further upon receipt of additional information. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Committees and Investigators, as appropriate.</p>

1294713	5/7/2021	FL	52	F	4/13/2021		<p>24 hours later my neck started swelling up, my left lymph node; abnormal mass in my neck which was my lymph node; I developed a headache over the whole left side of my head; I could hardly move my neck; All of a sudden I kind of broke out in the sweat; Left side of my head just went totally numb; Started feeling tingling in my left hand; I went to eat some yoghurt and I could not swallow at all; Airway is being compromised by the swelling in my neck; I cannot walk my left leg is dragging, so I am lurking around having to hold on; My voice was like had to whisper; Right side of my body started shaking; Later that evening the numbness subsided. I could speak better my left lymph node was still sore; blood pressure went up; white blood cells count was really, really extremely high; This is a spontaneous report from a contactable consumer (patient). A 52-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), dose 1 via an unspecified route of administration, administered in left arm on 13Apr2021 (Lot Number: EW0153), at the age of 52 years, as single dose for COVID-19 immunization. Medical history included covid-19 in Sep2020. Concomitant medication was not reported. The patient experienced 24 hours later, after vaccination, her neck started swelling up, her left lymph node; abnormal mass in her neck which was her lymph node, which required hospitalization. The patient she developed a headache over the whole left side of her head. She could hardly move her neck. All of a sudden she kind of broke out in the sweat, left side of her head just went totally numb. Started feeling tingling in her left hand. She went to eat some yoghurt and she could not swallow at all, airway was being compromised by the swelling in her neck. She cannot walk her left leg was dragging, so she was lurking around having to hold on. Her voice was like had to whisper. Right side of her body started shaking, Later that evening the numbness subsided. She could speak better, her left lymph node was still sore. Blood pressure went up, white blood cells count was really, really extremely high. The patient was hospitalized from 14Apr2021 to 16Apr2021. The clinical course was reported by the patient as follows: When probed for the reason of hospitalization, consumer stated, "The symptoms I had was, I got the vaccination in my left arm, 24 hours after getting the COVID vaccination shot on 13Apr2021, almost exactly 24 hours later my</p>

VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

neck started swelling up, my left lymph node, which I was expecting to have that problem. And I could hardly move my neck and then I developed a headache over the whole left side of my head and behind my eye and it was hurting and then it hurt my ear. So, I was having ear ache too. So, that went on for about an hour and a half and then all of a sudden I kind of broke out in the sweat and the left side of my head just went totally numb and then I started feeling tingling in my left hand and so I went to the bathroom to see if my face was numb, to see if I had any paralysis of my face which I did not have any at all, it was just numb. So, then I am concerned, so I decide I am going to take an Aspirin and so before I took the Aspirin I wanted to eat something because I had not had anything to eat that day. I went to eat some yoghurt and I could not swallow at all, I couldn't swallow the yoghurt. So, then I am concerned my airway is being compromised by the swelling in my neck. So, I got to call # and then I cannot walk my left leg is dragging, so I am lurking around having to hold on and then when I called # my voice was like had to whisper and it was hard to get an information where I was at. Finally they arrived and I was taken into the ambulance and when I was in the ambulance my blood pressure went up and also the right side of my body started shaking, they took me to the hospital. I was in the hospital. I had MRI, a CT scan and all of those things and it was negative for a blood clot or anything, heart problems or brain bleed. So, they ruled all of that out, my white blood cells count was really, really extremely high that is what the doctor said and anyway so I was admitted in the hospital and now I can talk better and the numbness is going away on the 14th a day later which went on for the symptom. So, later that evening the numbness subsided. I could speak better my left lymph node was still sore and everything and of course they did noticed that in the scan, MRI stuff about the abnormal mass in my neck which was my lymph node.". The patient stated, "I was hospitalized on 14Apr2021 and I was released the evening of 16Apr2021. Treatment: the patient stated they did not treat her for anything except for the high blood pressure when out there and that is it. The clinical outcome of Lymph node pain was not recovered. The clinical outcome of the remaining events was unknown.

1294710	5/7/2021	IL	60	F	4/16/2021	4/16/2021	<p>Itching on her hands and her feet; Chills; Clammy; Sensitivity to light; inflammation; Under her eyes it is swollen; She was having severe diarrhea; having severe dry heaves; vomiting bile; It had dehydrated her/lead to dehydration; Her throat closing up and it being sore from vomiting and dry heaving; couldn't swallow to get any fluids in; Her throat closing up and it being sore from vomiting and dry heaving; she was struggling with having a dry mouth; puffiness; Headache; severe muscles aches/Muscles pain; feeling nauseous; Was a little warm on her arms/ it was warm to the touch; it just looked like a bee sting and it wasn't super sore; sensitive to the touch; It had big red spots; had a little tiredness; This is a spontaneous report from a contactable consumer (patient). A 60-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), via an unspecified route of administration, administered in left arm on 16Apr2021 at 10:00 (at age of 60 years old, Lot Number: EW01SO) as single dose for covid-19 immunization. Medical history included she had lupus, sjogren's syndrome. The patient's concomitant medications not reported. The patient previously took Pneumonia Vaccine on 04Mar2021 (Anatomical Location: Left arm); took the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), via an unspecified route of administration, administered in left arm on 26Mar2021 at 10:00 (at age of 60 years old, Lot Number: the lot number starts with ER something and then it ends with a 3) as single dose for covid-19 immunization; took azathioprine for lupus and had allergic reaction; took belimumab (BENLYSTA), subcutaneous from an unspecified date (Lot Number: PV7G; Expiration Date: Jun2023, NDC: 49401-088-01, Number on the side: 0147098) to an unspecified date, self injection once a week for lupus. She gets it through the VA and it is subcutaneous use and the manufacturer is company. she was immunocompromise, she had lupus, so she was off of her medication (BENLYSTA) for a month per the CDC guidelines. She wanted to let Pfizer know that as well. For her first COVID vaccine she was originally scheduled to go 6 to 7 days after she had her pneumonia shot and they told her that she would have to wait 2 weeks before having her COVID shot and she did. Other than that she had followed the guidelines and she had been able to</p>

*VAERS\_ID RECVDATE STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT*

---

take her regular medications but she had to stop her Benlysta because of her immune system and everything. She had been following through on what the CDC has said. Patient stated that she just did a follow up with her doctor because of what happened after her second Pfizer COVID vaccine and her doctor recommended her to let Pfizer know about the side effects that she was having. On Friday 16Apr2021 she had her shot at 10 AM and it was no big deal, it was a little warm on her arms. She stated that it just looked like a bee sting and it wasn't super sore, it was warm to the touch and sensitive to the touch. It had big red spots and there has really been no change since it began. It looks about the size of a bee sting and it was still there. She had a little tiredness and she was not hungry but when she woke up at 06:40 the next morning (17Apr2021) on Saturday she was having severe dry heaves and vomiting bile and she could not get it under control. It had dehydrated her and she was having severe muscles aches. She had the severe dry heaves and the vomiting that lead to dehydration and then she went to the emergency room and she got replenished and they had given her something for feeling nauseous and eventually she was released 3 to 4 hours later. They gave her pills as well so she was doing well now and she hasn't done anything since she went to the emergency room with the vomiting and feeling nauseous. She went there about 1030 to 1040. Before she went she couldn't stop and she told herself that if it didn't stop on the 5th time then she was going to go to the emergency room and it got really bad so she had to call 911 to come and get her. Then she was having severe diarrhea on Sunday (18Apr2021) and the only way she could stop that was for her husband to pick up antidiarrheal pills. That only went away because of the medicine from the pharmacy. She had the over the counter medicine and she took Imodium. She hasn't been eating a lot so she hasn't had a bowel movement since she took that medication. When she had diarrhea there was no substance, it was very watery. And now today (unspecified date) she was having another reaction that she was seeing and it was just itching on her hands and her feet. She had been continuing to take the Benadryl and something that they gave her in the emergency room and she had taken Tylenol for the little headache that she has had. She had a slight headache and she was still

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

taking Tylenol like they had recommended. This began the same time as she was vomiting on 17Apr2021 when she was going through all of that she had the slight headache. But her biggest concern was during this time when initially on Saturday (17Apr2021), her throat closing up and it being sore from vomiting and dry heaving, she was having the dry heaves her airway closed shut and she couldn't swallow to get any fluids in. Her concern was that the back of her throat was killing her and it was totally closed up so she had to go to the emergency room. She had recognized this because in the past she has had a medication where she had an allergic reaction (she thinks it is the medication that they gave her for lupus because she has been on several different things. She thinks azathioprine but she can't recall exactly but she thinks that might of been the one that did it to her) and it had closed her esophagus up the same way like this. This time it got worse to where she couldn't even swallow water no less a pill. This was on 17Apr2021. When she went to the emergency room they gave her the hydrocortisone to take it down and she actually had felt better while she was waiting for the saline drop. She was able to swallow when her airway was opened again by the time they treated it with the hydrocortisone. Around 16:00 she was better when she left the emergency room that same day 17Apr2021. She doesn't really have a sore throat, it is pretty fine. It seems to be okay she thinks that once the dry heaves and all that stopped it helped to relax that. She was a little raspy from the whole thing and she was struggling with having a dry mouth but that even had been resolved as far as her throat. She had no other reactions than what she explain but she also had a lot of muscles pain but that was to be excepted because it says that on all that she has read. She had had all of the reactions listed except for fever. She had had chills and then when clammy and then was clammy and had chills. She had all of those side effects listed on the sheet and when she went on Saturday following her vaccine to the emergency room most of the side effects were treated in emergency room. They gave her Pepcid, hydrocortisone through her IV and gave her Zofran for the vomiting and they said to keep taking acetaminophen. They gave her cetirizine for allergy or the itching or whatever and they also gave her famotidine which she thinks is Pepcid. Since being off the lupus drug she was getting her

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

symptoms again such as sensitivity to light, inflammation and the dry heaves didn't help so under her eyes it was swollen and she just takes it as it was because she was not on her medication and she had something else injected inside of her. Also, she had Sjogren's disease too so her eyes were already drier than normal and she had had puffiness since 17Apr2021 when she was vomiting. She just wanted to make sure that Pfizer got that information because she didn't see that listed. The only side effect she was related was the swollen glands and she has glands in her throat but she wanted to be sure that Pfizer had that data just in case if it could help someone else. Again, she wants to reiterate that with her first dosage she had no problems. She couldn't even see the mark and all of this is stemming from the second dose of the COVID vaccine. The outcome of the events "Dry heaves, Bilious vomiting, Dehydration, Her throat closing up and it being sore from vomiting and dry heaving, Unable to swallow, Dry mouth, Nauseous" was recovered on 17Apr2021. The outcome of events "Feeling of warmth, Vaccination site pain, Hyperaesthesia, Vaccination site erythema, Tiredness" not recovered. The outcome of the event "Headache" was recovering. The outcome of other events was unknown. No follow up attempts are needed. No further information is expected.

1294683	5/7/2021	NJ	64	M	3/18/2021	4/18/2021	ptosis of right eye; leg pain (both legs); This is a spontaneous report from a consumer. A 64 years old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), dose 2 via an unspecified route of administration on 18Mar2021 (Lot Number: EN6208) as SINGLE DOSE (at age of 64 years old) for covid-19 immunisation. Medical history included hypertension from an unknown date and unknown if ongoing , anxiety from an unknown date and unknown if ongoing, restless legs syndrome from an unknown date and unknown if ongoing, sleep disorder from an unknown date and unknown if ongoing, Neurological Disease from an unknown date and unknown if ongoing, spinal fusion from an unknown date and unknown if ongoing (had 2 spinal fusions. One spinal fusion was of the cervical spine with hardware, and the other spinal fusion was of the lumbar spine with hardware). Concomitant medications included amlodipine besilate, atorvastatin calcium (CADUET) strength 5mg/20mg taken for an unspecified indication, start and stop date were not reported; lisinopril taken for an unspecified indication, start and stop date were not reported; carvedilol taken for an unspecified indication, start and stop date were not reported; tadalafil 5 mg taken for enlarged prostate, start and stop date were not reported; alprazolam (XANAX) 0.5 mg taken for anxiety, start and stop date were not reported; ropinirole (ROPINIROLE) taken for restless leg syndrome, start and stop date were not reported; clonazepam taken for sleep disorder, start and stop date were not reported; carbidopa, levodopa 50mg/200mg taken for an unspecified indication, start and stop date were not reported. Historical vaccine information included BNT162B2, dose 1 on 28Feb2021 (Lot Number: EN6205) dose 1, for covid-19 immunization at age of 63 years old. He received second dose on 18Mar2021; 30 days later 18Apr2021 woke up at 5 A.M., noticed ptosis of right eye on 18Apr2021. Concerned she took him to the hospital where he was assessed for stroke, TIA, all tests were negative. Consumer states, "my fiance was hospitalized over the weekend, we do feel it was exactly 30 days after second dose of Pfizer dose, from what I read in medical articles. I see that there were some cases of Palsy experienced by people in clinical trial. He is currently at home. He was in the hospital (emergency room)from 7am on 18Apr2021 and

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT

left at 3:50pm that same day against medical advise due to they did not have a neurologist. They wanted to admit him and transfer him to another facility because they didn't have a neurologist available. She clarified her fiancé's adverse event as ptosis of his right eye. She said her fiancé had diagnostics and blood work performed while at the Emergency Room. She said she wasn't positive if the blood work performed was a CBC and basic blood chemistry, but the blood work results were normal. She said the hospital she brought her fiancé to did not have a neurologist on staff. She said the hospital wanted to admit and transfer her fiancé to a specialized hospital with a neurologist on the premises. She said her fiancé's condition did not worsen while at the Emergency Room, but she felt her fiancé was not being monitored closely, and was not getting any care. She said since her fiancé was not receiving anything at the Emergency Room, and the Emergency Room didn't have the bandwidth to address his issues, and nothing was done to transport him to another hospital, her fiancé left the Emergency Room against medical advice (AMA). She said her fiancé went to a neurologist on Monday (19Apr2021). Emergency Room Visit Treatment: Stated her fiancé was given Oxycodone while at the Emergency Room. She said she did not know the Oxycodone dose, NDC, Lot, and Expiration Date. She said the Oxycodone was administered for leg pain (both legs) caused by a pre-existing condition her fiancé had. She said her fiancé normally took Ropinirole for his leg pain. Consumer reported her fiancé had follow-up testing done at the neurologist on Monday (19Apr2021), and was waiting for the test results to come back. She clarified the neurologist was doing the follow-up testing to confirm or rule-out a diagnosis of Myasthenia Gravis. Consumer reported when she took her fiancé to the Emergency room she thought he was going to be assessed for a possible TIA or stroke, but when it was mentioned her fiancé may have Myasthenia Gravis, it was equally concerning. Neurologist Visit Treatment: She stated the neurologist prescribed Pyridostigmine 60mg on Monday (19Apr2021) for her fiancé to start taking while the doctor waited for the blood work and repetitive nerve conduction study results to come back. She said the doctor's logic was to take the Pyridostigmine 60mg, and see if the ptosis resolved, and if the ptosis resolved the doctor

would know the cause of the ptosis. She said her fiance's right eye ptosis had not improved, changed, or resolved since he started taking the Pyridostigmine 60mg. She said she did not have the Pyridostigmine 60mg NDC, Lot, and Expiration Date. The patient underwent lab tests and procedures which included blood gases (ABG): unknown on 18Apr2021, Vital capacity: normal on 18Apr2021, Blood test: unknown on 18Apr2021, COVID-19: negative on 18Apr2021; vital signs measurement: normal on 18Apr2021 . Therapeutic measures were taken as a result of ptosis of right eye. Outcome of the event ptosis of right eye was not recovered. Outcome of the event leg pain (both legs) was unknown.

1294658	5/7/2021	PA	34	M	4/16/2021	4/17/2021	<p>On the 3rd day I also woke up with left side of my face feeling a slight but noticeable cold burn mainly above my left eyebrow and left cheek bone; Arm is still sore; palms of my hands feeling as if they were on fire. The back of my neck and upper back felt like they had a really bad sunburn 8 days post vaccine; parasthesia/pins and needles in my left arm and legs; Felt lightheaded for 4 full days after the shot beginning 20 hours after the shot; facial numbness/my left arm became numb/the numbness moved to various parts of my body; Constant electrical buzz and vibration in my body for the first week which made it impossible to sleep; impossible to sleep; This is a spontaneous report from a contactable consumer (reporting for himself). A 34-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in Arm Left on 16Apr2021 at 11:30 (Batch/Lot Number: EP7533) as single dose for COVID-19 immunization. Medical history included allergy (cannot digest bananas or avocados). The patient's concomitant medications were not reported. On 17Apr2021 at 08:00, the patient felt very strong lightheaded for 4 full days, with some facial numbness, woke up with left side of his face feeling a slight but noticeable cold burn mainly above his left eyebrow and left cheek bone. After lightheadedness, his left arm became numb. The numbness moved to various parts of his body. It would leave the left arm, then move to my right arm, then it would move to my neck and throat (skin only). The patient had constant electrical buzz and vibration in my body for the first week which made it impossible to sleep. The electrical buzz in the front part of his head between his eyes. Along with the arm numbness (parasthesia), the patient woke up with palms of his hands feeling as if they were on fire. The back of his neck and upper back felt like they had a really bad sunburn on 24Apr2021 (reported as 8 days post vaccine). On an unspecified date, the patient's arm was still sore. The patient had doctor or other healthcare professional office/clinic visit. The patient also visited emergency room/department or urgent care. The patient was hospitalized for 1 day. The patient did not received treatment for the events. The patient was not diagnosed with COVID-19 prior to vaccination and has not been tested for COVID-19 since the vaccination. The outcome</p>

1297599	5/7/2021	OR	16	F	5/7/2021	5/7/2021	16yoF was accompanied with an adult who was present for the vaccination. The COVID-19 Vaccine Pfizer-BioNTech 0.3mL administered IM in right deltoid while patient was sitting. Patient remained sitting for 10 minutes after administered dose. Patient reported feeling well after the injection. Patient stood up while we continued to talk, after 2 more minutes passed out while standing. Suddenly, patient began to go limp and her eyes crossed and rolled back. Patient fell backwards into the privacy curtain and into aisle 13 of the store. Patient's head bounced off the floor. Immunizer knelt next to patient. Patient was unresponsive until immunizer placed cold hand on back of neck and front of chest to check if she was breathing, immunizer calmly guided patient to breath, slow deep breaths into the belly and patient's eyes fluttered open. She said her head hurt really bad. Immunizer offered to the accompanying adult to call EMS because patient should be evaluated after hitting her head so hard. The accompanying adult denied EMS, then stating that patient had previously fainted while walking and said that she would be fine. Immunizer advised patient to remain laying down while immunizer got some ice. Ice was then placed on the back of the head. Patient slowly stood up after laying for 10 minutes and was walked over to a sitting area to put feet up and continue with ice for another 5 minutes before the accomanying adult wanted to leave.
1295596	5/7/2021	AZ	42	F	4/9/2021	4/16/2021	The day of and the first week after I only felt a little lightheaded. Seven days after the vaccine I began having dizzy spells, extreme fatigue and nausea, blurred vision, extreme right head pressure, floaty sensation, numbness and tingling in my right arm and leg, muscle spasms, and extreme anxiety. All things I have never experienced before. And they have persisted daily since they began. My first period one week after the injection was a couple days late and very light and only lasted a few days, which is also not normal for me. I have short periods of relief and then the symptoms return. It is very scary and I need help. I have been to my pcp several times and the Dr. They can't explain my symptoms.

1295618	5/7/2021	VA	24	M	3/6/2021	3/15/2021	<p>A week and a half approximately after the initial vaccination of the J+J covid vaccine I started having a course of strange symptoms. Insomnia, inability to focus on things directly in front of me (a hand in front of my face would go out of focus automatically after a second), blurred vision, short term/long term memory loss, severe emotional issues, difficulty breathing, anxiety. Shortness of breath at a certain point was so bad I thought I was not going to make it. One very troublesome symptom that culminated after weeks of 4 hours of sleep was that my brain started feeling "funny". The best way to describe it was a brain "orgasm" which I have never experienced before. At the same time I experienced dry heaving for several minutes, and severe shortness of breath. After this experience my symptoms gradually improved over the next week or two. Prior to this it felt like my brain was not getting enough oxygen/blood, which could have been feeding my insomnia. When I would try to sleep, I would wake up at 4 am gasping for air, as I felt like my breathing was labored when sleeping. I could not focus on my computer screen to do my job at home. Large amounts of melatonin seemed to help my brain feel better and get some rest. I took hydroxyzine for unrelated reasons prior to the vaccine injection as needed, however not too often. During March I did not take it, as I had experienced disruptions in circadian rhythm due to the medication. I feel it is possible I had a blood clot that has been described in the news, although now there may be no way to know for sure. I talked with my primary care physician about this, and he did not think this was the case because I was male. However I have a BMI of 18.7 and some issues females have such as TMJ and inability gain weight/anorexia diagnosis when younger. I also was recently diagnosed with an only recently described actual medical issue called R-CPD, which is the complete inability to burp or belch. I felt like during the time when I experienced the side effects, that this condition was heightened (bloating/loss of appetite). I lost quite a bit of weight during March, I usually weigh 135-140, and was down to 115 at a certain point. I am now back up to 130. I now take sertraline at 1/4 pill dosage to treat the anxiety I experienced as a result of these symptoms as well as some other personal issues. I experienced severe side effects from the sertraline taking it at full dosage, and still experience some at 1/4 pill dosage.</p>

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1295819	5/7/2021	IN	25	F	1/13/2021	1/18/2021	I developed a "blurry spot" (later noted to be a scrotoma) in my vision of my right eye a few days after my vaccine. No pain was associated, just a small spot of blurred/rainbow vision. I did not initially connect it to the vaccine, and do not know for sure if it is connected, but it seems pertinent. I was first seen by my optometrist who did a retina scan and found a retinal hemorrhage. I subsequently saw my PCP, a neurologist and a retina specialist. After more scans, I was diagnosed with Acute nueromacular retinopathy. My doctor, who is a specialist in this specific disorder, noted there had been some connections to this very rare disorder and Covid-19, as well as vaccines. Not a lot is known about this disease, but I did have other potential risk factors, such as being on birth control. Hard to say what actually caused it. But the close connection to the vaccine in timing is suspicious. I am personally curious if there are other documented cases.
1295946	5/7/2021		19	F	5/5/2021	5/5/2021	Patient stated feeling dizzy after receiving the vaccine and fainted immediately afterward. Patient fell slowly from sitting position to the floor; hit her head on the left side of forehead leaving redness at the site. Patient reported blurry vision, pressure on ears, and nausea that went away after a few minutes. Patient fainted three (3) times. Patient was pale and had diaphoretic skin. Approximately 30 minutes post, patient stated feeling better and symptoms went away.
1296055	5/7/2021	IL	44	M	5/4/2021	5/4/2021	Patient approached pharmacy staff during 15 minute observation to report feeling of overheating and anxiousness. He was brought into the consultation room where blood pressure was taken which was normal. Patient was given water and a dose of Benadryl as well as provided direct cooling with table fan. He mentioned getting a taste in his mouth prior to the flushing and anxiety as well as blurred vision. He was observed for an additional 45 minutes with symptoms subsiding and was advised to seek medical attention if symptoms reappear as he refused any further medical intervention. Patient was called several hours after vaccine at home where he said he was feeling improvement but was resting.

1296178	5/7/2021		17	M	4/12/2005		Patient feeling lightheaded, sweat and blurred vision. He also reported numbness, tingling bilateral hands. dizziness and blurred vision subsided within 5 minute. Patient was encouraged to hydrate and wait full 15 minutes prior to leaving. Patient was feeling well enough to leave and mother was able to drive him home
1296197	5/7/2021	CT	90	M	3/30/2021	4/5/2021	Wife reports patient was vaccinated on 3/30/21. She stated patient only had blurred vision following vaccination which lasted a about 2 days. On 4/4 family members visited and it was noted that 1 member tested positive for Covid on 4/5/21 and her spouse was home sick on 4/4/21 and was later positive on 4/5/21. Around 4/5/21 patient began having more frequent episodes of delusion and confusion. Speech slurred and slouched in chair. Patient would be demanding when asking for water when water was in his hand. Talking to her but looking at the ceiling. She stated she thought he was having "mini strokes." Increased weakness with standing. Slid to floor multiple times from chair. She reports loss of appetite and trembling. Saw MD on 4/12. "Could hardly breathe." MD ordered doxycycline and an inhaler. Patient to Hospital on 4/13/21. Diagnosed with Covid on 4/13/21 via PCR. Discharged from hospital to Skilled Nursing Facility on 4/16/21. Sent back to Hospital on 4/18/21 and passed away on 5/1/21. Wife states that death certificate indicates "Utonic Hypercapnic respiratory failure, acute/chronic CHF, hypoxemic respiratory failure and HTN, DM, prostate CA and COVID PNA. No autopsy performed. Medical PCP.
1296211	5/7/2021	TX	77	M	4/24/2021	4/27/2021	Three days after vaccination developed symmetric weakness in both legs, myalgia, difficulty walking, dysarthria/dysphagia, along with shortness of breath and right eye drooping. Also recently (4/13/2021) treated with nivolumab/ipilimumab so immune checkpoint inhibitor toxicity is suspected.

1296245	5/7/2021		85	F	4/8/2021	4/23/2021	Patient is an 85-year-old female with a history of hypothyroidism, hypertension, and osteoarthritis who presented from home complaining of 4 days left shoulder pain that radiates into her left pectoral area. She states she was vaccinated with the Janssen Covid vaccine on 4/8/21 in her left shoulder and her pain started 4/23/21. She is not sure if these were related. It was initially intermittent, sharp, stabbing, however became fairly persistent. She has noted her blood pressure being elevated. On my evaluation her blood pressure is 185/64. Patient states she was recently started on lisinopril for hypertension. She has not taken her lisinopril yet today. Chest x-ray showed no obvious infiltrates. Clear lung fields. Normal cardiac dimensions. EKG shows sinus mechanism with normal axis, intervals, ST segments. Otherwise normal EKG. D dimer was elevated, and VQ scan was negative for PE. Patient was evaluated by Cardiology who recommended outpatient stress test. Echo showed LVEF 60-65%. Trace aortic valve regurgitation. Mild mitral regurgitation. Mild mitral leaflet calcification is visualized. Trace tricuspid regurgitation. The right ventricular systolic pressure is calculated at 28mmHg. Patient was found to have hyperlipidemia and was started on statin. Her pain resolved on the day of discharge. Her blood pressure was controlled with lisinopril and coreg. She is to follow up with Cardiology and her PCP.
1292209	5/6/2021	OR	61	F	3/17/2021	3/22/2021	3/18/21, Day after Vaccine, drowzy in the morning, around 12:00 p.m. I had a brief period of incoherent speech and a few moments of having trouble putting sentences together. Around 2:00 a moment of temporary blindness in my left eye. 03/19/21 -03/20/21, extreme fatigue, stayed in bed. 03/21/21, fatigue, light-headed, slightly dizzy 03/22/21, right side leg and arm became numb as if asleep. Went to Hospital Emergency. I had a stroke, had a Carotid Endarterectomy at medical center, was in the Hospital for 5 days, two weeks after surgery became seriously enemic and d_Dimers are still elevated THE CONTINUATION PAGE IS INOPT. AND WOULD HAVE LIKED TO EXPLAIN IN FURTHER DETAIL.

DIARRHOEA (severe non-stop diarrhea since the day she got her vaccine) had not resolved. Not Provided  
 The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. No concomitant medications were reported. Treatment medications include Pepto-Bismol (bismuth subsalicylate) for diarrhea for 1.5 days (unknown dose/frequency). Patient waited out 20 minutes post-vaccination and then went to the bathroom. When she came out of bathroom she fainted, paramedics were summoned. Mother took patient to Emergency Room(ER) 20 April 2021, after taking her first to urgent care (who directed mother to take patient to the ER), ER sent her home saying it was just a little stomach bug, but no one else in the family got this "bug". Patient's last test for Covid-19 was on Monday (26-Apr-2021) and results came back negative on 28-Apr-2021. Company comment: The event of faeces discolored is assessed as unlikely due to mRNA-1273 administration but due ingesting Pepto-Bismol. Based on the current available information and temporal association between the use of the product and the start date of the other events, a causal relationship cannot be excluded. Pyrexia and nausea are consistent with the product established safety profile.; Sender's Comments: The event of faeces discolored is assessed as unlikely due to mRNA-1273 administration but due ingesting Pepto-Bismol. Based on the current available information and temporal association between the use of the product and the start date of the other events, a causal relationship cannot be excluded. Pyrexia and nausea are consistent with the product established safety profile.

On 26-Apr-2021, the patient experienced SEIZURE (thinks it was a potential seizure) (seriousness criterion medically significant), PRESYNCOPE (vasovagal effect from the needle) (seriousness criterion medically significant), MUSCULOSKELETAL STIFFNESS (Patient fell off the bench onto the floor and became rigid and stiff and exhibited some rigid movement) and FALL (Patient fell off the bench onto the floor and became rigid and stiff and exhibited some rigid movement). At the time of the report, SEIZURE (thinks it was a potential seizure), PRESYNCOPE (vasovagal effect from the needle), MUSCULOSKELETAL STIFFNESS (Patient fell off the bench onto the floor and became rigid and stiff and exhibited some rigid movement) and FALL (Patient fell off the bench onto the floor and became rigid and stiff and exhibited some rigid movement) was resolving. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown), the reporter did not provide any causality assessments. Concomitant medications taken by the patient were not provided. The reporter reported that patient never had any allergic reactions to vaccines or medications before and had no past medical histories for vasovagal reactions. After receiving the vaccine, the patient waited in the pharmacy for 15 minutes - 20 minutes. The patient fell off the bench onto the floor and became rigid and stiff and exhibited some rigid movement. The patient was out of it for 15-30 seconds.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							The reporter stated that she called 911. The patient came to, his eyes were huge, but he was aware to self and surroundings. The emergency team came, took the patient's vitals which were stable and stated the patient likely experienced a vasovagal effect from the needle. However, the reporter thinks it was a potential seizure; more than a vasovagal response. Emergency team offered no treatment. The emergency team had encouraged the patient to follow up with a doctor but the patient did not want to make a big scene. Emergency team offered no treatment for the patient. 1291632	5/6/2021		38	F	5/4/2021	5/5/2021	Fever of 101.6, severe joint pain, dizziness, loss of vision, nausea, severe headache.
1291661	5/6/2021	MA	60	F	2/11/2021	2/11/2021	Headache started 12 hours after the 10 AM injection. Over the next 10 hours muscle aches and joint aches set in with severe chills and fatigue. Felt nauseated/ did not vomit. My eyes ached. I stayed in bed for 24 hours. Two days after the injection most of the symptoms had subsided but my vision was very blurry. I have experienced the same type of blurry vision after taking Nyquil, so I don't take it anymore. Now 3 days after the second Covid shot, my vision is clearing. I am developing a cold sore which I feel may be another reaction to the vaccine. I did not take any medication for the symptoms and did not report it to my doctor. I just wanted the fact of the symptoms to be included with the CDC data.

1291481	5/6/2021		54	M	4/27/2021	4/27/2021	In the afternoon, I experienced a nosebleed. The weather was not overly dry, I was well-hydrated, and I was confused why I would experience a nosebleed. The bleed was not excessive, and I considered coincidence. An hour or two later in the late afternoon, my wife noticed that I had a ruptured capillary in my left eye. She was very concerned since it appeared very bloody even though it did not cause me any significant pain. The affected eye was mildly itchy afterward. I was not hit in the eye or scratched it in any way. I associated the capillary bleeding events as related to each other and potentially related to my vaccination. However, both events were minor and passed, cleared up in 72 hours. I have a photo of my eye that is available upon request.

1294088	5/6/2021	CA	51	M	3/6/2021	3/7/2021	<p>Bell's Palsy; lethargic; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of BELL'S PALSY (Bell's Palsy) in a 51-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 025a21a) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 06-Mar-2021 at 11:30 AM, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 07-Mar-2021, the patient experienced LETHARGY (lethargic). On 07-Mar-2021 at 12:00 PM, the patient experienced BELL'S PALSY (Bell's Palsy) (seriousness criterion medically significant). On 08-Mar-2021, LETHARGY (lethargic) had resolved. At the time of the report, BELL'S PALSY (Bell's Palsy) had not resolved. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Patient began to experience paralysis of the facial muscles on the left side of his face along with lethargy that lasted one day. He was unable to blink his left eye and the left half of his tongue had no taste. He also reported blurry vision. He subsequently called 911 and was diagnosed with Bell's Palsy in the emergency room that evening. That week, the left side of his face was drooping. He reported that it had tightened up and was more symmetrical now, however, he was still unable to smile, frown or blink from the left side of his face. He was scheduled to receive his second dose of the vaccine on 06-Apr-2021, however, his neurologist stated that she could not guarantee that it would not make his Bell's Palsy worse, but she still recommended getting the second dose. The medical staff at the base didn't know if he should get the second dose and his civilian doctor wouldn't commit. The emergency room physician contacted an Infectious Disease doctor who felt it would be fine for him to get the second dose. Concomitant product use was not provided by the reporter. No treatment information was provided. Company comment: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.; Sender's Comments: Based on the current available information and temporal association between the use of the product</p>

1293581	5/6/2021	CA	60	M	4/6/2021	4/8/2021	As per patient 2 days post vaccination he develop blurry vision in his left eye, he went to local ER but they said they could not find anything wrong so they refer him to clinic for further evaluation. Their Doctor diagnose him with Retinal Detachment, left eye (Dx: H33.022). on 04/29/2021 pt had Pars plana vitrectomy, air-fluid exchange with internal drainage retinotomy.
1293641	5/6/2021	NH	26	M	5/6/2021	5/6/2021	I asked the patient how he felt after the injection and he said that he felt a little lightheaded and nauseous. He said he had a little too much to drink last night because his buddies were moving West. I asked him to lay on the floor but he refused. He said, "I just want to sit for a while". Within minutes the patient turned pale and started twitching. I asked another pharmacist to help to move him to the ground. 911 was called while patient was on the ground lying sideways because I was afraid that he may choke on his vomit. In a few minutes, patient sat up and asked for a bucket to throw up in. The Fire department came and took his blood pressure (BP120/?) and asked him some questions. They his blood pressure was good and advised him not to drive home. They helped him to get back on the chair. He stayed in the vaccination booth for us to keep an eye out until his friend showed up to take him home (30 minutes later). We had a male associate escort him out because he said he was still nauseous.
1293856	5/6/2021	PA	29	F	5/6/2021	5/6/2021	patient was light headed and blurred vision, this occurred almost immediately after the injection by, imz tech. Immunization tech called for me, rph. I took her BP AT 610PM, it was normal at 128/78 and immunization tech held an ice back on the back of her neck. She recovered quickly and we waited with her for the remainder of her 15 minute wait. Two people were with her. We got a motorized cart for her. She left after the 15 minutes and felt fine, stating no residual issues.

1293539	5/6/2021	IL	33	F	5/6/2021	5/6/2021	<p>Patient experienced sudden dizziness and nausea within 5 minutes of receiving Janssen COVID-19 immunization. Gave her water, crackers and cold/wet rags for her forehead as she felt hot. Took her temperature, returned normal. Gave her a trash can to keep near. Kept an eye on the patient and realized she was getting red in the face and more dizzy than she had been. Went out and stood next to patient, with her mom on her other side. Began to experience light sensitivity, feeling like the room was spinning. Patient almost fell out of the chair while sitting still. Mom used a personal pulse oximeter on patient, all results normal. Asked the patient about other symptoms, such as chest/abdominal/leg pain, headache, shortness of breath. Patient reported a headache, dizziness, nausea and leg numbness roughly 30 minutes following the vaccine. I recommended going to the ER, mom believed it would pass with time, but insisted she never responds this way to immunizations. Patient began to experience stabbing chest and abdominal pain around 45 minutes. Patient's mom was still hesitant to take her to the ER immediately on her own and asked us to call her PCP. He wanted the patient to go to the ER. Patient believed she would fall if she stood, offered to get a motorized cart, wheelchair or call an ambulance to transport her. Both patient and mom requested the ambulance. Asked a technician to check patient medications and allergies for EMTs, retook the patient's temperature which was normal again. Stayed with patient until EMTs arrived, reported all symptoms patient was experiencing.</p>

1294076	5/6/2021	IL	69	F	1/29/2021	3/15/2021	right eye is swollen; eye lid is swollen; bump underneath skin , it is raised; vision is blurry; painful; started having a discharge again; vaccine made her medication stop working because she started having a discharge; eye infection / infected eye gland / eye infection in right eye; Heavy left arm, could not lift; Left wrist was very red; Left wrist was very swollen; This spontaneous case was reported by a consumer and describes the occurrence of EYE INFECTION (eye infection / infected eye gland / eye infection in right eye) in a 70-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 010AZ1A and 026L20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included Cataracts (Patient states that she never had an eye problem other than cataract.) and Discharge (Patient states that she used to have a discharge a year ago and that is why she was put on Estrace.) in 2020. Concomitant products included ESTRADIOL (ESTRACE) for Discharge, VITAMINS NOS for an unknown indication. On 29-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 27-Feb-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 15-Mar-2021, the patient experienced LIMB DISCOMFORT (Heavy left arm, could not lift), ERYTHEMA (Left wrist was very red) and JOINT SWELLING (Left wrist was very swollen). On 21-Apr-2021, the patient experienced EYE INFECTION (eye infection / infected eye gland / eye infection in right eye) (seriousness criterion medically significant). On an unknown date, the patient experienced EYE SWELLING (right eye is swollen), SWELLING OF EYELID (eye lid is swollen), MASS (bump underneath skin , it is raised), VISION BLURRED (vision is blurry), PAIN (painful), DISCHARGE (started having a discharge again) and DRUG INTERACTION (vaccine made her medication stop working because she started having a discharge). On 18-Mar-2021, LIMB DISCOMFORT (Heavy left arm, could not lift), ERYTHEMA (Left wrist was very red) and JOINT SWELLING (Left wrist was very swollen) had resolved. At the time of the report, EYE INFECTION (eye infection / infected eye gland / eye infection in right eye), EYE SWELLING (right eye is swollen), SWELLING OF

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							EYELID (eye lid is swollen), MASS (bump underneath skin , it is raised), VISION BLURRED (vision is blurry), PAIN (painful) and DISCHARGE (started having a discharge again) had not resolved and DRUG INTERACTION (vaccine made her medication stop working because she started having a discharge) outcome was unknown. Treatment for the events included, ibuprofen, neomycin/poly/dexamethasone ointment, metronidazole. Based on current available information and the temporal association between product use and the start date of the events a causal relationship cannot be excluded. This case was linked (Linked Report). Most recent FOLLOW-UP information incorporated above includes: On 28-Apr-2021: patient history, concomitant medication information and events are updated. On 28-Apr-2021: no new information; Sender's Comments: Based on current available information and the temporal association between product use and the start date of the events a causal relationship cannot be excluded.
1292930	5/6/2021	WA	19	F	5/6/2021	5/6/2021	After about 6 minutes post-injection, she started feeling really dizzy and briefly passed out. After a couple minutes she was responsive, but still really weak and tired and said she had blurry vision. We called 911 and they came in and monitored blood pressure and heart rate, which was really low when they started, but did come back up into normal range and patient was feeling much better after about 15 minutes, but still tired.

1294252	5/6/2021	FL	70	F	3/13/2021	3/15/2021	On Mar 15 in the evening, patient developed left sided numbness initially in the chest, and then woke up the morning of Mar 16 with numbness on the left side of her face, left arm, and left leg. She also complained of a frontal headache that felt like a sinus infection. She went to the ER at 10am at Hospital. CT brain and CT angio head/neck were negative. MRI brain w/o contrast showed no stroke and MRI cervical w/o contrast showed mild cervical arthrosis. She had gradual improvement in her numbness. ECHO showed mild LVH, no shunt or PFO. She was started on lisinopril due to mildly elevated blood pressures during this admission- new diagnosis of hypertension. After discharge she continued to have episodes of left sided numbness and blurry vision nearly every day until she presented to my clinic to establish care on 04/22. At that time she was experiencing numbness on the left side of her face in a V2 distribution. She was sent to the ER at Medical Center and was admitted 4/22- 4/24. CT head was negative. Symptoms resolved after this hospitalization. MRI/MRV was ordered outpatient and performed 05/04. MRV showed Right transverse venous sinus filling defect probable thrombus, nonocclusive. She was started on Pradaxa 05/05 and has not had any neurologic symptoms since.
1293171	5/6/2021	CA	16	M	5/6/2021	5/6/2021	After 10 minutes receiving the 1st dose of Pfizer Covid-19 vaccine, patient experienced sweating, pale looking, eyes rolling back. He was still aware, and stated that he wants to lie down. We took his BP, all the numbers are within normal range. He rested for 15 more minutes, and said that he wants to go home and rest. We called to follow up later and talked to Mom. She said he is ok after eating and resting.
1293389	5/6/2021	WI	18	M	4/8/2021	4/8/2021	Patient received 1st dose of COVID-19 vaccination and immediately after became pale with upward eye deviation and loss of consciousness for approximately 10 seconds. Patient aroused and was noted by nurse to be nauseous, confused, sweating, and shivering. Patient's vitals were obtained and patient was given Gatorade and a snack. Patient was monitored for an additional 30 minutes and repeat vitals obtained. Patient was discharged in stable condition to mother.

1293311	5/6/2021	MA	89	F	3/10/2021	3/18/2021	She had her second dose of the covid vaccine approx 8 days ago, the day after she was very tired and slept all day. Then yesterday when she awoke she had a sense of discomfort in the left eye, and a friend who helps them at home noticed that her left eye was slightly bloodshot. Yesterday she went to see her eye doctor who dx her with an incidental small burst blood vessel but did not advise stopping eliquis and said it should resolve within weeks. She has no loss of vision. However, in the evening when at home she said she had difficulty forming words - husband did not particularly notice a problem - she ignored it basically and went to sleep . Then this morning went to the hairdresser, noticed the word finding/ speech 'garbled' slightly problem again and walked into her pcp office - she was eval'd there at approx 1140 am and sent to ER by ambulance. Code green not called given the initial deficit was last night, CT head suggested possible subacute infract. She had no chest pain or pressure, trop noted as slightly elevated at 129 , Platlets 84 Diagnosed with Bilateral punctate infarcts throughout the brain, in cerebellum, occiput, left temporal and parietal lobes

Essential hypertension 05/06/2021 Yes ? Pulmonary embolism on right (HCC) 05/05/2021 Yes ? Right flank pain 05/05/2021 Yes ? Hypokalemia 05/05/2021 Yes ? Uncomplicated alcohol dependence (HCC) 05/05/2021 Yes Resolved Hospital Problems No resolved problems to display. CONSULTS: None INPATIENT PROCEDURES: None DETAILS OF HOSPITAL STAY: PRESENTING PROBLEM: Patient is a 83 y.o. male with Hx of HTN who presents today with complaint of right sided flank pain, with radiations into the right side of his back and right side of his chest. The pain is worse with movement and deep inspiration. He denies palpitations and shortness of breath. He has no previous HX of VTE. He denies fever, chills, cough, nasal congestion, and sore throat. He denies abdominal pain, N/V, and changes in bowel movements. The patient is a limited historian. He is oriented x4 on admission, but states that he has had difficulty with his memory over the past 2-3 years. He lives alone in an apartment. In the emergency department the patient's vital signs were stable. Labs revealed a potassium of 3.3. AST was 52 and ALT 61. White blood cell count was 11.13. Troponin was negative and BNP was within normal limits. Lactic acid was 1.5. UA showed trace blood. EKG showed normal sinus rhythm with PACs. CTA the thorax abdomen and pelvis showed acute pulmonary emboli involving the segmental subsegmental arteries of the upper and lower lobes. There is no evidence of heart strain. He was admitted for observation due to severe pain, and was given IV fentanyl. Echocardiogram showed: The left ventricular ejection fraction is 67%. No regional wall motion abnormalities noted. The right ventricular size, thickness, and function are normal. The estimated right ventricular systolic pressure is 36 mmHg. The inferior vena cava was not visualized during the exam. There is no comparison study available. He was started on Eliquis 10 mg bid for 7 days, than 5 mg bid for total of 3 months. He should follow up with PCP in 1 week and should check CBC and BMP on 5/10/21. He should also follow up with pulmonologist in 2-3 months. He had Pfizer COVID-19 vaccine on 2/18/21 and 3/18/21. There is remote possibility that this PE could be</p>

4/1/2021

4/7/2021 From Physician H&P: Patient is a 59-year-old man multiple medical chronic conditions, including known protein S deficiency not on anticoagulation, sinus bradycardia, hypercholesterolemia, chronic neuropathy of the lower extremities, who presented to the emergency room at the recommendation of his primary care office for possible stroke and persistent headache. He reports that his history of present illness begins on 4/7/2021, for which after he had received the COVID-19 Johnson & Johnson vaccine he started to have throbbing headache. He stated that it was diffuse and pounding in quality, up to 10 out of 10 pain. However this resolved on its own, and since then and has been intermittent with this type of headache. He did report 2 weeks ago, that he had a brief episode of tunnel vision as he describes it, where his vision seemed to narrow while he was looking at his phone. This only lasted no more than 10-30 minutes, and this resolved on its own as well. He continues to have intermittent headaches, again otherwise nonspecific with pounding quality however the intensity is improved. Humidifier regarding the Johnson & Johnson vaccine to report any side effects, for which she had notified his primary care doctor who then decided to proceed with MRI of the brain to evaluate for possible etiology. The MRI was done with and without contrast at facility on 5/4/2021, for which there was concern for possible left temporal posterior stroke, and if there was any concern for venous thrombosis, further imaging was necessary. He was then recommended to go to the emergency room for evaluation. He otherwise is in his regular state of health. He denies any recent fever or chills or cough, no chest pain or shortness of breath, nausea, vomiting, abdominal pain. No changes in bowel or bladder habits.

1288393	5/5/2021	IN	68	F	2/22/2021	4/11/2021	Hearing loss due to nerve damage; sudden and unexpected hearing loss in her left ear; This is a spontaneous report from a contactable consumer, the patient. A 68-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot: EN6200), via an unspecified route of administration on 22Feb2021 (at the age of 68-years-old) as a single dose for COVID-19 immunization. Medical history was not reported. Concomitant medications were reported as none. There were no other vaccines administered within 4 weeks or on the same date as the COVID-19 vaccine. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot: EL9263) on 01Feb2021 (at the age of 68-years-old) for COVID-19 immunization. On 08Mar2021, the patient had a cataract extraction in both eyes after which she started taking prednisolone acetate USP 1% (UPC: 6075811910, Lot: T0557, Expiry: Jun2023) steroid eye drops on approximately 10Mar2021 for an unspecified length of treatment. On 11Apr2021, the patient experienced sudden and unexpected hearing loss in the left ear only, which worsened. Per the appointment with the ear, nose, and throat (ENT) doctor, there was no reason for the unexpected hearing loss in her left ear, and the hearing loss was not related to anything medical. The ENT doctor started the patient on a steroid treatment (prednisone) for 10 days. On 20Apr2021, the patient had an abnormal hearing test which showed left ear hearing loss due to nerve damage (as of an unspecified date). The events did not require an emergency room visit. The clinical outcome of sudden and unexpected hearing loss in her left ear was not resolved, while of hearing loss due to nerve damage was unknown.

1288423	5/5/2021			F			<p>Blood clots in her nose; Nose bleed; her arms are both numb on her; Couldn't move them; She feels lethargic; This is a spontaneous report from a contactable consumer (patient herself) via a medical information team. A female patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Formulation: Solution for injection), via an unspecified route of administration on an unspecified date as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that, enquired have people died from the vaccine or not. Enquired what do you know about the news in the media about reports of death in nursing home elderly patients. Response: Pfizer and BioNTech are aware of reported deaths following administration of Pfizer-BioNTech COVID-19 vaccine . We are working with the (withheld) to gather all the relevant information. (Withheld) Authorities have prioritized the immunization of residents in Nursing Homes, most of whom are very elderly with underlying medical conditions and some which are terminally ill. (Withheld) confirm the number of incidents so far was not alarming, and in line with expectations. All reported deaths would be thoroughly evaluated by (Withheld) to determine if these incidents are related to the vaccine. (Withheld) Health Authorities have now changed its recommendation in relation to vaccination of the terminally ill (Clinical Frailty Scale 8 or higher). Our immediate thoughts are with the bereaved families. The Global Advisory Committee on Vaccine Safety (GACVS) COVID-19 Vaccine Safety subcommittee met virtually on Tuesday, 19Jan2021, to review available information and data on deaths reported in frail, elderly individuals who had received the Pfizer BioNTech COVID-19 mRNA vaccine, BNT162b2 (hereafter, BNT162b2). Experts invited from the (Withheld) and the (Withheld) provided an overview of deaths reported in (Withheld) and in the WHO global database (VigiBase) following vaccination with BNT162b2." Based on a careful scientific review of the information made available, the subcommittee came to the following conclusions: The current reports do not suggest any unexpected or untoward increase in fatalities in frail, elderly individuals or any unusual characteristics of adverse events following administration of BNT162b2. Reports are in line with the expected, all-cause mortality</p>

---

rates and causes of death in the sub-population of frail, elderly individuals, and the available information does not confirm a contributory role for the vaccine in the reported fatal events. In view of this, the committee considers that the benefit-risk balance of BNT162b2 remains favourable in the elderly, and does not suggest any revision, at present, to the recommendations around the safety of this vaccine." Enquired what was the efficacy after one dose. Caller had a terrible experience after her first dose of the Pfizer BioNTech COVID19 vaccine. She had blood clots in her nose, every time she blew her nose, blood clots would come out. She never had a nose bleed before. She also added that her arms are both numb on her. She couldn't move them, she feels lethargic. She's supposed to get her second dose next Friday. Enquired do we have any information regarding blood clots or not. Caller was upset and disconnected the call before some of the answers were given. Caller also asked the following questions: Has there been deaths reported from the vaccine or not, what was the efficacy after 1 dose, any guidance on getting the second dose after having side effects after the first dose. Response: Proposed response : CONS-Blood clots. Caller said "this was ridiculous" when I tried providing her with a long website with more information. She feels like we are withholding information from the public. She thinks the deaths should have been on the media. Caller hung up. Enquired do you have any guidance on getting the second dose after having side effects with the first dose. I had a side effect after the first dose of the vaccine. Should I get the second dose or not. Caller disconnected before agent could provide response. Response: Proposed response: As noted in the Fact Sheet for Recipients, you should not get the Pfizer-BioNTech COVID-19 Vaccine if you had a severe allergic reaction after a previous dose of the vaccine or if you had a severe allergic reaction to any ingredient of the vaccine. The decision to receive the second dose for any other reason could not be made by Pfizer. We refer you to speak to your healthcare provider about the risks of the vaccine compared to the risks of potentially not being fully protected against COVID-19 infection. Your healthcare provider knows your health situation and has access to information that can better help inform this decision. The outcome of the events was unknown. No follow-up attempts are needed. Information

1288431	5/5/2021	IL		M	4/9/2021	4/1/2021	<p>about lot/batch number cannot be obtained.</p> <p>was unsure if the patient had COVID-19 virus; was unsure if the patient had COVID-19 virus; Inability to eat; Severe sweating; Stomach cramping/pain; Headaches that wouldn't go away; Diarrhea; A fever of 100 degrees or more; Felt like his eyes were going to pop out; Stomach burning; This is a spontaneous report from a contactable consumer reporting on behalf of the patient via a Pfizer sponsored program. A male patient of unspecified age (husband) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 09Apr2021 (Batch/Lot number was not reported) as a single dose for COVID-19 immunisation. Medical history included headache. The patient's concomitant medications were not reported. The reporter stated her husband got his first dose on 09Apr2021, and she (the reporter) received her second dose on 12Apr2021. The reporter is concerned about the patient because he began having severe sweating, stomach cramping/pain, headaches that wouldn't go away, diarrhea, inability to eat, a fever of 100 degrees or more and felt like his eyes were going to pop out along with stomach burning after receiving the first dose of COVID-19 vaccine (in Apr2021). The reporter stated the patient had a headache before his first dose and was unsure if the patient had COVID-19 virus or if it is side effects after his first dose of COVID-19 vaccine. The reporter clarified side effects several times. The reporter also stated she had no side effects with the COVID-19 vaccine. The patient had not yet recovered from headache, while unknown outcome for the remaining events. Information on the lot/batch number has been requested.</p>

1289333	5/5/2021	KY	80	F	3/2/2021	3/3/2021	<p>March 2 - second Moderna bruising appears March 3 - spontaneous bruising appears March 4 - visit with primary care doctor, blood work shows significant drop in platelets March 9 - first visit with oncologist/haematologist &amp; hospitalized March 9-19 - hospitalized for tests, treatment to increase platelets, &amp; many blood panels. No official diagnosis, treat as ITP. Follow up visits with oncologist/haematologist to keep an eye on platelets as they increase. March 30-Apr 4 - ER visit due to swelling of ankles, feet, and left arm. Tests show superficial blood clot, fluid on lungs, and pneumonia. Oncologist said that "we have no official diagnosis", that she's being treated for ITP. April 6-14 - follow up visit to oncologist/haematologist show elevated kidney enzymes, then later liver enzymes, low sodium. April 14 - decision to move to short term rehab for regular PT and OT. Continued swelling (fluid in third spaces.) April 21 - visit to cardiologist to perform cardioversion, successful (during first week of hospital stay, heart rhythm med had to stop). April 23 - facility nurse discovered significantly low Hemoglobin and a blood transfusion was ordered. April 24 - returned to short term rehab facility. April 25 - discovered my mother on O2 and state of health was different, extremely weak and not moving, arm hurting badly. I insisted that her oncologist is contacted. Transported to ER. Discovered her blood work abnormal. After stabilizing her, rushed to the hospital ICU. April 26 - Discussed with her ICU doctor the history of what you have read above. He explained that the covid-19 vaccination has a tendency to affect three proteins specifically that clot and thin blood. I begged him to "get it out of her system." Her bleeding was significant and platelets dropped, again. Still has her mental facilities. Responding well to aggressive treatment: albumin transfusion, plateletpheresis, and CRRT. Pleural catheter to remove fluid from the lungs. Mention of Sepsis. April 27 - Lifted her head up today, opened her eyes, making doctors very happy. Her cardiologist and the ICU doctor both said they were "confused" and everything happening to my mom was "a mystery." Though going in to the evening, her nurse expressed to me that she's worried. The ICU oncologist called me at home in the evening. He asked me if she had been having a fever on a regular basis. He said he thought it could be TTP or a rare disease called HTH, but both</p>

1288375	5/5/2021	FL	72	F	2/9/2021	2/23/2021	<p>The result came back positive for Sjogren's; This is a spontaneous report received from a contactable consumer (patient). A 72-year-old female patient received bnt162b2 (Pfizer/BioNTech COVID-19 Vaccine), dose 2 intramuscularly, administered in Arm Left at 72 years old on 09Feb2021 08:00 (Lot Number: EL9265) at single dose for covid-19 immunization. Medical history included pain joint and muscles, autoimmune inflammation. Family history was none. Concomitant medications included ibuprofen (ADVIL) taken for pain joint and muscles from 20Jan2021 to 15Mar2021 at 6 pills a day. No prior vaccine was administered within 4 weeks. The patient previously received the first dose of bnt162b2 (Lot number: EL1283) at 72 years old on 12Jan2021 8:00 AM intramuscularly in left arm for covid-19 immunization. Patient had major aches in muscles (legs &amp; arms) and hip joints-muscle pain, joint pain, tiredness after the first vaccination. Before her present health issue began after her first Pfizer vaccine shot, patient had never been tested for possible autoimmune problems. Within a week (I believe the timing), she began to feel migrating pain and stiffness around her body and was very lethargic. She had aches and often stiffness in her legs and arms, a dry cough, and night sweats. Her mouth became parched. Her eyes had suffered from dryness in the past and became even more acute. At night she had trouble sleeping because of the increasing pain. Again, the pain was strange in that it migrated around her body. At first, her primary care physician, Dr.(name) did not recognise her symptoms, didn't order any tests, and sent her to physical therapy. After a month (after the second vaccination), when the body pains and tiredness got worse, and her ankle swelled, she sent her for blood tests at (name) Diagnostic on 23Feb2021. The result came back positive for Sjogren's, a disease she had never heard of before. Later a Rheumatologist ran a confirmatory test with lab corp. With the same result in return. Dr. (Name withheld) Put her on Meloxicam for inflammation and the issues mostly have subsided except for continuing pain in her arms. Since mid-Jan, Dr. (Name withheld) had referred her to an ophthalmologist, gastroenterologist and rheumatologist. Patient had an appointment schedule with a pneumologist on 21Apr. The gastroenterologist did an endoscopy and has ordered a CT Scan to rule out</p>

1288056	5/5/2021	OR	61	F	4/28/2021	4/28/2021	I had the second Moderna shot that afternoon, scheduled for 4:15pm but it was about 4:30pm when I got it. I moved around as instructed by my doc, and after 15 minutes went back to my car. I noticed after another several minutes that my pulse was still elevated so opted to go back in and talk to a health care professional. Pulse was 120. Paramedic wanted me to lie down in waiting area but I didn't want to be in such a potentially germ environment, and the guy next to me who had fainted earlier was just getting up himself. She walked me back to my car, where I agreed to wait, listen to a stress relief hypnosis audio and see if my pulse rate would calm down. She came back out w/ a BP cuff and said my blood pressure was 210 over 130 (or some number over 100; I don't recall which) and she said I needed to get in an ambulance right away and go to the hospital. I said I would make my own decisions about my body and I wanted to try a couple of other things first, promised not to leave, contacted my doctor, naturopath. (Note: I did not have any other worrisome symptoms -- blurred vision, dizziness, etc. My head was a little buzzy, but whether out of fear or in reaction to the shot I didn't know. I was a little flushed). He asked me a bunch of questions, said my body hadn't had time to mount an immune response to the vaccine and that I had likely had a histamine reaction to a preservative in the vaccine (or similar), which a couple of his other patients had experienced. He asked if I'd been drinking fluids (yes, plenty), had eaten recently (no, so he suggested I have some food; I had some nuts, a little cheese and some Cheez-Its so had that), asked if I had an antihistamine around -- I did, but I don't do well with Benadryl and didn't have Claritin, but after looking through my bag found some Allervive, an herbal product he compounds. He said, "That's perfect." I took two of the three capsules and hung up. Staff were checking up on me in my car every ten minutes or so, by the way, very kind and professional as I had been quite upset at the whole "get in an ambulance" scenario. He thought some of my reaction was probably also stress-related, and I noticed before the shot that I was teary, not from anxiety but the kind you get when you feel relief after a long ordeal. I didn't feel anxiety, really, until the first blood pressure measurement. He also let me know that if the bottom number didn't drop below 100 they couldn't let me go.

							After eating, drinking some more water and taking the Allervive my BP was down to 138 over 75 in just a few minutes. I agreed to stick around and make sure it stuck. We re-tested again about 15 minutes later, perhaps longer, and it was the same. I had been a little flushed but that had gone away too. I left and went for a light walk and eventually drove home without incident. I had symptoms after the shot that could have been related to my body fighting off the allergic reaction or to the vaccine itself, but they were pretty mild (fatigue later that night; occasional heart rate elevation sometimes after eating or with very mild exertion -- not unusual for me if I'm "fighting off" something; sore, itchy, red blotch sized between a quarter and a half dollar at vaccination site -- it is still a little tender today and appears a bit bruised; a bit sinus headache-y for three days, especially when I bent down to tie my shoes or something like that - also not that unusual as I often seem to "cleanse" through my sinuses when I have a bug or am fighting something off). In hindsight, I think the symptoms I had after the first shot, which lasted about 9 hours, may have been fighting off the allergic reaction and not a reaction to the virus vaccine itself.

1288117	5/5/2021	PA	62	F	3/22/2021	4/20/2021	stroke at vision site; partial sight lost in left eye; feeling weak; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of CEREBROVASCULAR ACCIDENT (stroke at vision site) and BLINDNESS (partial sight lost in left eye) in a 62-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 036B21A and 012A21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient's past medical history included Implantable cardioverter defibrillator insertion. On 22-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 19-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 20-Apr-2021, the patient experienced CEREBROVASCULAR ACCIDENT (stroke at vision site) (seriousness criteria hospitalization and medically significant), BLINDNESS (partial sight lost in left eye) (seriousness criteria hospitalization, disability and medically significant) and ASTHENIA (feeling weak). The patient was hospitalized from 20-Apr-2021 to 21-Apr-2021 due to BLINDNESS and CEREBROVASCULAR ACCIDENT. At the time of the report, CEREBROVASCULAR ACCIDENT (stroke at vision site), BLINDNESS (partial sight lost in left eye) and ASTHENIA (feeling weak) had not resolved. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 20-Apr-2021, Computerised tomogram: (abnormal) Stroke at vision site. On 20-Apr-2021, Magnetic resonance imaging: (abnormal) Stroke at vision site. No concomitant medication were reported. The reporter stated that the patient was taking medicines but doctor changed her medication and she did not want to talk so she did not give names.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

1288141	5/5/2021	VA	37	F	1/26/2021	1/26/2021	Severe Hives; Severe swelling on eye and lip; Severe swelling on eye and lip; severe swelling arthritic feeling in hands; This is a spontaneous report from a contactable consumer or other non hcp. A 37-years-old non pregnant female patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: ENS318) via unspecified route administered in Arm Left on 26Jan2021 09:30 via an unspecified route of administration, as single dose for an unspecified indication. Historical vaccine included first dose of bnt162b2. Medical history included covid-19 from an unknown date and unknown if ongoing. Concomitant medications included colecalciferol (VITAMIN D COLECALCIFEROL). No other medication taken four weeks prior to vaccine. The patient underwent lab tests and procedures which included sars-cov-2 test with unknown date. The patient experienced severe hives on, severe swelling on eye, severe swelling on lip, Started roughly 10 hours after the vaccine and are still lasting 4 days later. Also severe swelling arthritic feeling in hands(could not grip anything on day 2) all these on 26Jan2021 19:00. The patient was currently using prednisone, Zyrtec, benedryl, and Pepcid AC and said nothing was helping. The patient said she had no known allergies and have never had hives before. She had to miss two days of work. The outcome of the event was not resolved. Follow-up (02Feb2021): This is a follow-up spontaneous report received in response to the mail trail sent regarding the confirmation below mentioned query. The response included: Query: Dear Manufacturer, Kindly see the attached document received by Pfizer Inc. containing a product in which you have been identified as the manufacturer. Response: Email received. Case created #. Dear Colleagues, Would you kindly address the query below and copy it to the mailbox with your reply.

1288364	5/5/2021	OH	27	M	4/16/2021	4/16/2021	lost my vision; lost my vision and hearing; essentially unresponsive; feel light-headed; This is a spontaneous report from a contactable consumer (patient). A 27-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number: EW0161), dose 1 via an unspecified route of administration, administered in the left arm on 16Apr2021 at 14:30 as SINGLE DOSE (at the age of 27 years-old) for covid-19 immunisation. Medical history included coarctation of the aorta from an unknown date and unknown if ongoing coarctation of aorta (age: 3 months), only requires bi-annual cardiologist visits, loss of consciousness from an unknown date and unknown if ongoing, covid-19 from an unknown date and unknown if ongoing. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient did not receive any concomitant medications. The patient had no know allergies. The patient did not receive any other vaccine within 4 weeks prior to the vaccine. The patient lost his vision and hearing, essentially unresponsive and light-headed on 16Apr2021 at 14:30. Circulation issues leading to a black out. Within 60 seconds of getting the shot, he began to feel light-headed. Within 30 seconds of that, he knew he needed help, so alerted the emergency medical technicians (EMTs) via car horn/flashers. By the time they arrived (120 seconds from the initial shot), he lost his vision and hearing and was essentially unresponsive. They woke him enough to unlock my car door, at which point they had him lay back to improve his circulation. That ultimately worked and got him back to normal within about 5 minutes. The patient had issues like this before relating to a coarctation of his aorta which he had done at 3 months of age. Over the years, he has "blacked out" like this from weight lifting and other high exertion things. This was the first time it was induced without him overexerting himself, and the onset of the "blackout" was much quicker than what he had experienced from weightlifting. Normally, he could tell 1-3 minutes in advance that he would black out. This time, it was about 30 seconds. Therapeutic measures were taken as a result of lost vision and hearing, essentially unresponsive and feel light-headed. EMTs did an electrocardiogram (EKG) and blood glucose check. The outcome of lost his vision and hearing, essentially unresponsive and light-headed was recovered on an

1288187	5/5/2021	GA	67	F	2/5/2021	2/5/2021	I felt hives on my forehead; With the 2nd shot my arm was definitely sore; I felt like I had a fever but it did not show on the thermometer; This is a spontaneous report from a contactable consumer(patient). A 67-years-old non pregnant female patient received second dose of bnt162b2 (BNT162B2, Formulation: solution for injection, Lot number: not reported) via an unspecified route of administration in Arm Right on 05Feb2021 at 08:00 as SINGLE DOSE for covid-19 immunization. Medical history included breast cancer survivor from an unknown date and unknown if ongoing, food allergy valium, strawberries, bananas, lobster, mahi, whiting fish from an unknown date and unknown if ongoing. The patient received other vaccines within 4 weeks prior to the COVID vaccine via right arm on 14Jan2021. There was no COVID prior vaccination. The patient was not tested post COVID-19 vaccination. Concomitant medications included turmeric [curcuma longa rhizome]; ergocalciferol (VIT D), vitamin c [ascorbic acid], collagen (collagen), olive oil (olive oil). The patient previously took bnt162b2, valium and experienced drug hypersensitivity. On 05Feb2021 at 15:00, The patient stated that, I got hives near my left eye with the first Pfizer shot but I wasn't sure if that was the cause as I do have food allergies. My arm was a little stiff but not significantly and I did not have any other side effects. On 5Feb21, With my second shot, I felt hives on my forehead which confirmed I did have a hive reaction from the first vaccine on 14Jan2021 shot, with the 2nd shot my arm was definitely sore, I wanted to just lay down and I felt like I had a fever but it did not show on the thermometer. However, it is a lot better 24 hours later. My hives have gone down and I feel fine. The patient underwent lab tests and procedures which included body temperature: fever but it did not show on the thermometer. Therapeutic measures were taken as a result of the 2nd shot my arm was definitely sore with Aleve to reduce the pain of the vaccine area on right arm. The events were considered as non-serious. The outcome of the events were reported as recovered. Information on the lot/batch number has been requested. ; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021122958 same patient, same product( different dose), similar events

1288202	5/5/2021	CT	73	F	2/12/2021	2/12/2021	one localized rash described as red with white lump; heart palpitations; Left breast hurt; Red rash; tingling of the left breast; Foggy different feeling; This is a spontaneous report from a contactable consumer (patient). A 73-years-old female patient received first dose of BNT162B2 (Pfizer COVID19, Solution for injection, Lot number EN6201) via an unspecified route of administration in the left arm on 12Feb2021 at 15:00 for Covid-19 immunisation. The patients medical history included Breast cancer, thyroid cancer, blood pressure and palpitations. The patient had allergic to Z-pak. The concomitant medication includes Synthroid 150mcg 1 tablet by mouth once a day for thyroid cancer. Relevant Family medical history included Shingles shot, she took one a long time ago, like 10 years ago, it gave her ringing in the ear. She had no other vaccines on the same day on in the 4 weeks prior to the first dose. On 12Feb2021, the patient experienced Foggy different feeling, on 13Feb2021 at 16:00, tingling of the left breast, on 14Feb2021 experienced Left breast hurt, heart palpitations and localized rash described as red with white lumps. She had no ER visit. The outcome of the event foggy different feeling, left breast hurt, and white lumps was recovered, whereas of red rash and heart palpitations it was recovering and for tingling of the left breast it was recovered with sequelae. The patient underwent lab test which included blood work whose results were unknown and TSH with results 0.57. She wanted to know if those AEs are from the vaccine and if she is ok to get the second shot. She felt lightheaded for 20 minutes, in the left breast is where she had cancer and it was in situ in the duct, it had not spread for which she received 8 weeks of radiation. She went to bed and noticed that her breast was hurting in the night, but she was too tired to get up at that point, when woke up and took a shower she lifted the left breast and saw a massive, bigger than pancake, rash. It was on the bottom of the breast and it ran down to the stomach, it also had white lumps on it, this just frightened her. There was severe redness before, but that has started to fade, it was still dark brown right now, like she can see outline, but it was going away. Before when there was redness, she could press the spot and it would turn white, it would be red again. When read the instruction that came it says there could be a side effect of a rash, but it would be all

VAERS\_ID RECVDDATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

over the body not localized. She does not know if the vaccine was responsible for it. Then just quickly she started having heart palpitations on Sunday, just a few, but on Monday it was like a 100 of them. She called doctor, at this point that she also has a history of thyroid cancer in 1982, they removed 2/3rds of her thyroid and since then she has been on Synthroid. When her thyroid was not working properly, she had a TSH done. She got lab work done just to see if it was the thyroid. The doctor said it could be from the shot. The Heart Palpitations were fading, she stopped taking Synthroid for 1 day and it went from 100 palpitations to 50, to like 6-7 now. The heart palpitations were going away and that was after stopping the Synthroid for 1 day. The Light headedness only lasted for 20 minutes but started 5 minutes after getting the shot. She clarified that it was not lightheadedness she means to say that she was a little foggy and had a different feeling. The tingling in the Left Breast began, it was for a couple hours, she thought it was different. Normally she doesn't have that. She has had 6 breast operations, so she has very little feeling in that breast normally. Her left breast began to hurt when she was sleeping, she was too tired to get up and look, she rolled over felt something was wrong. This was at 2-3AM on and it subsided when she took shower and patted all around, she dried it and kept an eye on it, the pain started to go away easily. She did notice that she started to feel a little bit of an itch, but that went away quickly too. She had the rash and lumps, it was during the shower she lifted the breast and saw it. She has a picture to provide. It is Not ongoing, it has started to fade, it is still dark reddish brown, but she can tell it was going away. The heart palpitations started late at 4 or 5 in the evening, she has not had that for years. She knows at one-point TSH was high, but they like to keep it low like this in which the 1/3 of thyroid stays dormant, this is intentional because if it gets too high.

A 49-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, lot number: EN6208) via unknown route of administration on unspecified date in 2021 at single dose in left arm for COVID-19 immunisation at vaccination site in drive through by medical. Medical history included donated left kidney in 2019, had Allergies to Latex. Patient previously had flu shot regularly, sick like she had the flu (20 years ago). Patient was not pregnant. Prior Vaccinations (within 4 weeks) were none. No other vaccine in four week. No covid prior vaccination. Covid tested post vaccination. Concomitant medications included ergocalciferol (VIT D) and ascorbic acid (VIT C). It was reported that patient started with chills and she was constantly cold on 13Mar2021 and will turn on the heater for that. States her eyes are burning on 13Mar2021 and she feels like she was coming down with a cold, has cold symptoms. Caller states she has a fever over 100 every night, and headaches on 13Mar2021. states she has been taking Tylenol and drinking tea and she was very disciplined with her diet and drinks lots of fluids. Caller clarified that these symptoms started on Saturday 13Mar2021 at night and that she was fine that day 12Mar2021. On 12Mar2021 that night she was a little sore in her left arm from the vaccine. States she felt the body aches on 13Mar2021 and chills and then it went from there with the fever and headache and she felt hot and was sweating and then was cold again and the next night just added, on 14Mar2021. Caller states all her symptoms she has listed are persisting. stated she did take Augmentin after she got the Covid 19 shot for 5 days because the lab found minimal trace E.coli in her urine in 2021, nothing alarming. states they wanted her to take 5 days to clear that. States it was 800mg twice a day. Then after the second week throat and thyroid pain in 2021. Doctor visit in week 3, labs, blood and urine culture showed no

infection in 2021 but an autoimmune reaction on 01Mar2021 04:00 due elevated ESR and T3 and T4 in 2021 which combined with the Thyroid pain and the fever indicated Thyroiditis in 2021. Labs in the second week after the first vaccine showed negative for COVID19 and Negative for COVID19 antibodies on 25Mar2021. The fever and throat pain continued until early on week 4 after the first vaccine when after the labs results doctor prescribed a Prednisone treatment 3days x20mg/day, 4days x10mg/day, 7days x5mg/day. The pain and fever disappeared after days 2 of the Prednisone treatment, but unfortunately the thyroid pain return 2days after the end of the 14 days treatment it's more subdued but the pain was back. No fever yet. Due back for labs in a couple of weeks. Adverse events resulted in Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care included throat, thyroid pain, autoimmune reaction, thyroiditis, fever, chills, body aches. Patient underwent lab tests and procedures included urine lab: minimal trace E.coli in her urine, nothing alarmin and showed no infection, blood test: showed no infection in 2021, COVID-19 Virus test: negative on 25Mar2021. The outcome of event pyrexia was recovered in 2021 the outcome of the event e-coli was unknown, while for other events was not recovered. No follow-up attempts are possible. No further information is expected.

1288330	5/5/2021	DE	65	F	2/26/2021	2/26/2021	<p>it sounded like a form of Bell's Palsy; left cheek tingle; my left forehead, cheek, side of lip and chin felt like I had razor burn.; My head itched; left eye felt dry; salivate more than usual from the left side of my mouth; left side of my face began to feel heavy, sometimes also my sinuses, but more often my lower jaw; left side of my face began to feel heavy, sometimes also my sinuses, but more often my lower jaw; left side of my face began to feel heavy, sometimes also my sinuses, but more often my lower jaw; feel pain in my left ear; My lymph nodes on the left side of my face became swollen; This is a spontaneous report from a contactable consumer. A 65-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in Arm Left on 26Feb2021 12:45 (Batch/Lot Number: EN6202), at the age of 65-years-old, as single dose for COVID-19 immunization. Medical history included allergy to Sulfa. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Concomitant medication included calcium; magnesium; colecalciferol, menadione (VITAMIN K+D); glutathione; all taken for an unspecified indication, start and stop date were not reported. Within 45 mins (also reported as 20-25 minutes) of receiving the shot, she began to feel her left cheek tingle. In the intervening days, her left forehead, cheek, side of lip and chin felt like she had razor burn. Her head itched. Her left eye felt dry, but that went away. She began to salivate more than usual from the left side of her mouth. The left side of her face began to feel heavy, sometimes also my sinuses, but more often my lower jaw. Sometimes, she would feel pain in her left ear. Her lymph nodes on the left side of my face became swollen. Her doctor on Zoom said it sounded like a form of Bell's Palsy (medically significant), though she does not have the drooping eye or mouth. She had an MRI of her left lymph node that did not reveal any issues. Her symptoms, while they have abated, are still present five weeks after the shot. The events started on 26Feb2021 13:30. No treatment was received for the events. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination the patient has not been tested for COVID-19. The outcome of the event left eye felt dry was recovered while other events was not recovered.</p>

1291216	5/5/2021	AL	59	F	3/26/2021		<p>cataract; This is a spontaneous report from a contactable consumer (patient) via a sponsored program. This 59-year-old female patient received the first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EN6205) via an unspecified route of administration in the left upper arm on 26Mar2021 09:30 (at the age of 59-year-old) as single dose for COVID-19 immunization. The patient did not receive any other vaccines within four weeks prior to the vaccination. She was not enrolled in the clinical trial. Medical history included ongoing diabetes mellitus for 2 years (2019), heart attack occurred 6 years ago (2015), and she has had the following conditions for probably about 5 or 6 years: ongoing blood cholesterol increased, ongoing blood potassium decreased, ongoing heartburn, and ongoing high blood pressure. Family Medical History included her mom died of cancer and her dad died of a massive heart attack. Concomitant medications included metformin (manufacturer unknown) taken for diabetes mellitus, metoprolol (manufacturer unknown) taken for heart attack, ezetimibe (manufacturer unknown) taken for blood cholesterol, prasugrel hydrochloride (EFFIENT) taken for stent placement, losartan (manufacturer unknown) taken for hypertension, potassium chloride (manufacturer unknown) taken for blood potassium decreased, omeprazole (PROTONIX) taken for heartburn; all ongoing from an unspecified start date. On an unspecified date in 2021, the patient developed cataract. As reported, the patient just had her eye cataracts removed, one at a time: she had one done 05Apr2021 for the left eye, and one done yesterday, 19Apr2021 for the right one. She had a scheduled second dose due last 16Apr2021, but she missed it, so she was asking how to re-schedule the second dose. The clinical outcome of the cataract was not reported.</p>

1291106	5/5/2021	FL	63	F	4/9/2021	4/1/2021	<p>she actually feels like she has covid; she actually feels like she has covid; felt like her head was in a tunnel/surround sound in her head; she was scared to death; ringing in her ears; diarrhea; nausea; ear aches that make it feel like her hearing is off; the vaccine may have poked her in the bone; temperature and it has been pretty normal for the most part and went up to 99.9 degrees Fahrenheit; felt like I wished I were dead; sick; tired; This is a spontaneous report from a contactable consumer (the patient). A 63-year-old female patient received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot number EN5318; Expiration Date: 2021), via an unspecified route of administration, on 09Apr2021 at 14:30 (at the age of 63-years-old) as a single dose in the right arm for COVID-19 immunization. The patient's medical history was not reported. Historical vaccinations included the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot number EP69556121) on 18Mar2021 (at the age of 63-years-old) as a single dose in the right arm for COVID-19 immunization. There were no concomitant medications. The reporter state that exactly seven (7) days after her second dose, she "felt like I wished I were dead." She reports having diarrhea and nausea that she is still struggling with, and also reports ear aches that make it feel like her hearing is off, describing it as an echo "like I'm in a tunnel or buried in the sand." She reports that this "head thing" was so severe in the beginning and reports that it is still ongoing. She states she couldn't even stand to hear the television and reports that it felt like there was a "surround sound" in her head. She also reports that she just wanted to lay in bed one afternoon and when she woke up the next morning, she was still tired. She reports now that she is progressively feeling "some better" and thinks in 3 days that it will be gone, but she also believes that she may have COVID-19 now and feels like the 2nd Pfizer Vaccine actually bred the disease in her for some reason and she wished she was dead for three days. She also stated that she has spoken with her HCP about this who suggested she visit an urgent care; however, the caller states she cannot drive and has no means of transportation to this appointment. She continued to say that the symptoms were horrible and she is still going through it; states last night she was scared to death and she does not drive or</p>

1291109	5/5/2021	TX	43	F	4/9/2021	4/10/2021	<p>A blood vessel burst in my right eye; headache; tired; This is a spontaneous report from a contactable nurse. A 43-years-old non-pregnant female patient received bnt162b2 (BNT162B2), dose 1 via an unspecified route of administration, administered in Arm Left on 09Apr2021 at 08:15 (Batch/Lot Number: 20921163) as a single dose for COVID-19 immunisation. Medical history included diagnosed allergies, compromised immune status, respiratory illness, genetic / chromosomal abnormalities, endocrine abnormalities (including diabetes) and obesity. The patient had not received any other vaccinations within 4 weeks. Concomitant medication(s) included chlorthalidone (CHLORTHALIDONE) taken for blood pressure measurement, start and stop date were not reported. The patient reported that a blood vessel burst in her right eye on 10Apr2021 at 0600, she also reported a headache and was tired. The patient states that she got her first dose of the Pfizer COVID vaccine on Friday 9Apr2021. Patient states that the next day a blood vessel burst in the right eye. Patient states that at first she was thinking she didn't know what to think. Patient states that she didn't know what to do. Patient looked online to see how long the eye would take to heal. Patient states that the redness has gone away, the side part of patient's eye looked like something happened. Patient states that it was a lot when it happened. Patient states that the following morning on the 10Apr2021 she had a headache in the morning. Patient states that on or around 6:00 AM or 7:00 AM on 10Apr2021 she woke up with the headache and noticed the burst blood vessel. Patient states that the headache woke her up. Patient states that she took something for the headache but it still kind of lingered and patient felt kind of off all day long. Patient states that it lasted then kind of gradually went away and she didn't feel that way after a couple of days. Patient states that was the first vaccination and she is set to get the second vaccination on 30Apr2021. Patient states that with having that reaction of the blood vessel in the eye, she wants to get on with her life. Patient states that she wants the other portion of the vaccination but is nervous about getting it. The outcome of the events for the blood vessel burst in her right eye was recovering and the remaining events was recovered on 10Apr2021. The patient was not tested for COVID-19 before or after vaccination.</p>

1291164	5/5/2021	KS		F	3/22/2021	4/19/2021	I had heart palpitation.; felt really chilly/I was cold; throat was sore and itchy; My throat was sore and itchy; felt so terrible; I had back pain, ear pain.; ear pain; insomnia/could not sleep; dizzy; might be allergic to amoxicillin; Headache; Cannot see clearly; I feel like there is something in my eye.; This is a spontaneous report from a contactable consumer (patient). A 49-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 22Mar2021 as single dose for covid-19 immunisation. Medical history included penicillin allergy 7 years ago, hyperthyroid, Graves diseases. The patient's concomitant medications were not reported. Patient got the first dose of the Pfizer BioNTech covid vaccine on 22Mar2021. For the first 2 weeks she felt really chilly. Her throat was sore and itchy. She was cold and her temperature was 96. She felt so terrible. She was seen at Immediate Care and tested for the flu and for covid. Both tests were negative. They tested her blood, CBC and thyroid and they were normal. They gave her amoxicillin. She still felt terrible and went back for her symptoms and it was also because 7 years ago she found out that she was allergic to penicillin. So she thought she might be allergic to amoxicillin. She had back pain, ear pain, could not sleep, had insomnia and was dizzy. When she went back they gave her a steroid injection. Since the steroid injection patient has been feeling much better. She has a little bit of a headache. But she is not chilly and she did not have back or ear pain. Her reading has been affected since getting the vaccine. She cannot see clearly and she did not have that trouble before the vaccine. She had just gotten new glasses in February. She feels like there is something in her eye. Last night she had heart palpitation (19Apr2021). Patient questioned symptoms associated with the vaccine and if she should get the second dose. She stated that she is scheduled to receive the second dose of the Pfizer BioNTech covid vaccine tomorrow (21Apr2021) and scheduled to see her eye doctor on Thursday. Patient was told that she should wait 90 days after taking amoxicillin and was wondering if it is true. Outcome of felt so terrible was recovering, outcome of felt really chilly/was cold and back pain, ear pain was recovered in 2021, outcome of other events was unknown. No follow-

1291209	5/5/2021	CT	43	M	4/10/2021	4/19/2021	<p>Bell's palsy; This is a spontaneous report from a contactable consumer, the patient. This 43-year-old male patient, height: 66.22 cm &amp; weight: 175 kg, received the first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: ER8734), via an unspecified route of administration in the left arm on 10Apr2021 17:00 (at the age of 43-year-old) as single dose for COVID-19 immunization. The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient was not enrolled in the clinical trial. Medical history included LASIK eye surgery. Concomitant medication(s) included prednisolone acetate (manufacturer unknown) and moxifloxacin (manufacturer unknown) both were taken after LASIK eye surgery. On 19Apr2021 12:30, the patient experienced Bell's palsy. The clinical course was described as follows: On 19Apr2021 at 12:30, the patient was eating lunch and he noticed the left side of his face was a little numb. The patient states he thought originally that he might be having an allergic reaction, but he was eating the same food that he always eats so it couldn't have been that and sort of ignored it. About 21:30, 22:00 at night (19Apr2021), he realized in the shower that he could not open his right eye, right eyelid, then his face was numb and he couldn't form his mouth to make a whistle, and he still can't, and he thought he was having a stroke because his face was all messed up. So that's when he went to the emergency room and they did a CAT scan that determined it was not a stroke, it is Bell's Palsy. The patient stated they prescribed him medications to take, and he was not hospitalized and discharged home. The patient stated his eyelids, they don't blink at the same rate and his left eye doesn't close all the way, he had to force it closed and it's very annoying. The patient verified that all his symptoms began on 19Apr2021 at 12:30 and all symptoms have worsened. The patient stated that he is perfectly healthy, not overweight and he's never had it before, and it came right out of the blue. The clinical outcome of the Bell's palsy was not resolved.</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1291316	5/5/2021		73	M	3/1/2021	3/2/2021	infection in ear lobe; ear infection/tissue inside his ear dried up and bleeding/infection started in his ear lobe that migrated to his whole left side of his face; Pain localised; Ear bleeding; Skin fissures; Shingles; Fluid discharge; Axillary abscess/substantial bubble of puss under arm; fever/Temp of 105; Chills; weakness; Swelling face; Eye swelling; This is a solicited report based on the information received by Pfizer. A 73-year-old male patient received bnt162b2 (Pfizer-BioNTech COVID-19 vaccine), dose 1 intramuscular on 01Mar2021 (Batch/Lot number was not reported) as a single dose for covid-19 vaccination; adalimumab (HUMIRA), subcutaneous from an unspecified date (Batch/Lot Number: 1132646) to an unspecified date, at unspecified dose, subcutaneous from an unspecified date (Batch/Lot Number: 1136949) to Mar2021, at unspecified dose for moderate to severe hidradenitis suppurativa. The patient medical history includes ear infection. Concomitant medications were not reported. On unknown dates, the patient experienced tissue inside ear dried up and had bleeding, second infection in ears/painful when touched, felt pain on top of head, skin was cracking up, minor infections in ears, possible shingles and whole left side of face and eye swollen. In 2021, the patient experienced infection in ear lobe, feeling low energy and whole left side of face and eye swollen. On 02Mar2021, the patient experienced felt weakness and chills. On 08Apr2021, the patient experienced substantial bubble of pus under arm. On 10Apr2021, the patient experienced thick white odorous liquid almost syrup came pouring out of armpit. In Apr2021, the substantial bubble of pus under arm resolved. On unknown dates, felt pain on top of head, minor infections in ears and whole left side of face and eye swollen resolved. Covid-19 vaccine was also considered suspect. In Feb2021, the patient saw his physician twice for an ear infection. On 01Mar2021, the patient got his first vaccine shot. The next day he had chills and fever and feeling of weakness the next day. He went away after a short time and he felts better. He went to the physician twice in the past two weeks for minor infections especially in his ears. The tissue inside his ear dried up and bleeding. On the first visit he had a fever due to the infection in the ear. His physician prescribed antibiotic for a week. He got another infection in the same ears. He was painful when touched it. He went back to

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

physician and physician prescribed another antibiotic. The physician said the infections were to be expected with Humira because Humira weakens immune system. Partly because of his age. His age may be a contributing factor as well. He agrees to have physician contacted. On 29Mar2021 to 1Apr2021, he was in the hospital his infection started in his ear lobe that migrated to his whole left side of his face. His eye was swollen and felt pain on top of his head. His Temp of 105 when he went in. The patient was given intravenous antibiotics. He was tested to make sure infection had not spread to blood or bones. The Humira might have played a role because it lowers the bodies resistance to infection. They asked him not to take the Humira for two Saturdays. He did not take Humira on 09Apr2021 or before. He was stable. His skin was cracking up. Thought it might be shingles. He was prescribed an oral antibiotic first time, but then a week and a half later, it acted up again and he went back and got a different antibiotic and that worked until it. He was feeling completely better since he got out of the hospital. He had more energy than he had in a while. He had been feeling low energy for a while due to the infection. His physician did not think he should stop taking Humira but if he got a fever he needs to investigate immediately to see if he needs to be hospitalized. In 08Apr2021, he had substantial bubble of puss under his arm. He gave him a steroid injection to control that. On 10Apr2021, he had thick white odorous liquid almost syrup came pouring out of his armpit and he thinks that was the end of it. On 11Apr2021, he had his second Covid vaccine manufactured by Moderna then after he was released from the hospital. He was no issues or reactions with either injection. He was careful when he went out around people. It was unknown if patient was enrolled in a COVID-19 Vaccine Trial. The action taken in response to the events adalimumab was not applicable. The outcome of event infection in ear lobe, eye swelling and swelling face recovered in 2021, weakness and chills and fever recovered in Mar2021, ear infection and pain localised recovered on unspecified date, Axillary abscess/substantial bubble of puss under arm recovered in Apr2021; event ear bleeding was recovering; event fluid discharge, skin fissures and shingles was unknown. The reporter's causality for adalimumab (Humira) on the events infection in ear lobe, tissue inside ear dried up

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

and had bleeding unknown onset, tissue inside ear dried up and had bleeding unknown onset, second infection in ears/painful when touched, felt pain on top of head, minor infections in ears, substantial bubble of puss under arm, whole left side of face and eye swollen onset in 2021 and whole left side of face and eye swollen unknown onset with Humira (Adalimumab) was a reasonable possibility. The reporter's causality for the event(s) of felt weakness and chills with Humira (Adalimumab) was no reasonable possibility. The reporter's causality for the event(s) of feeling low energy, thick white odorous liquid almost syrup came pouring out of armpit, skin was cracking up and possible shingles was not provided. Opinion is that there is a reasonable possibility that the events of infection in ear lobe, feeling low energy, thick white odorous liquid almost syrup came pouring out of armpit, second infection in ears/painful when touched, felt pain on top of head, skin was cracking up, minor infections in ears, possible shingles, substantial bubble of puss under arm, whole left side of face and eye swollen onset in 2021 and whole left side of face and eye swollen unknown onset are related to humira(adalimumab). Opinion is that there is no reasonable possibility that the events of felt weakness, chills, tissue inside ear dried up and had bleeding unknown onset and tissue inside ear dried up and had bleeding unknown onset are related to humira(adalimumab).; Sender's Comments: Pfizer comment: The serious events Ear lobe infection and Condition aggravated were considered as unlikely related to Pfizer BNT162b2 vaccine. A possible contributory role of BNT162b2 cannot be completely excluded for the non-serious asthenia, pyrexia and chills, which occurred in a close temporal relation, namely, one day after the first dose BNT162B2 injection. The other reported events were confirmed as non-serious, while the causality was confounded by ADALIMUMAB administration. The infectious events were to be expected with co-suspect due an immunosuppression activity with increased infection susceptibility, such as Herpes zoster and Ear lobe infection aggravated, in this case. Furthermore, swelling face and eye swollen with unknown onset in 2021 may be attributable to the co-suspect and unrelated to the vaccine. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as

							part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.
1291233	5/5/2021	CA	62	F	4/9/2021	4/15/2021	Severe case of pink eye, in left eye, and a swollen lymph node in front of left ear. Started mildly on 04/15 and became much worse by 04/16. Both lids were swollen, itchy, discharge and RED. Started to get better by 04/23 and was almost gone by 04/25. Called the doctors office on 04/17 and they subscribed antibiotic eyedrops that I used for 7 days.
1291292	5/5/2021	TX	72	M	2/26/2021	3/7/2021	On March 7 at 23:30 (11:30) I awakened to go to urinate and everything seemed darker. Went back to bed not realizing I was possibly having a stroke. I had a Diabetic Dr Appointment at 0800 on the 8th so I went to the appointment and informed Dr that I was partially blind in my right eye. She immediately had me hospitalized and the diagnosis of a stroke was confirmed by CAT Scan and x-ray and I think a MRI. I was discharged and returned 9 days later with worsening vision and balance. I had a severe fall on discharge and hit head kept me in a extra day and actually broke a rod on a low back fusion.
1289355	5/5/2021	NM	21	F	5/5/2021	5/5/2021	Dizzy, Sweaty, Lost Vision Temporarily, Hearing muffled, Sensation of needing to urinate, Chills, overwhelmed, numbness in hands
1291397	5/5/2021	OH	59	F	3/9/2021	3/19/2021	Severe headache from about day 3 after vaccine. Felt like a vice across back of head. On March 19 headache with with vomiting. Went to emergency room on March 20 on advice of primary care doctor. Diagnosed with a migraine. Given fluids, Toradol, Compazine and potassium. Headache was preceded by visual disturbance. Relief for 3 days. Fever on April 4. Migraine again on April 17. Also, developed tinnitus in left ear around week 2 after vaccine. Still have tinnitus. Have had vertigo off and on. Last episode was May 2.

1289692	5/5/2021	WA	32	F	4/28/2021	4/28/2021	<p>Patient is a 32-year-old female new patient 5 months post partum &amp; currently breastfeeding, with seasonal and perennial allergic rhinitis and history of childhood asthma, referred by the emergency department to discuss anaphylaxis like reaction to the Johnson Johnson COVID-19 vaccination on 4/28/21. She received her vaccine around 2:00 p.m. She began developing itchiness in her palms/soles of feet and scalp that quickly developed into a a welt like rash about 3-1/2 hours after receiving the vaccine while on a walk with her husband; this was shortly followed by facial swelling over her right eye. They made it home and she got in a cold shower to cool down, became dizzy, started seeing spots and had difficulty breathing. Her husband called EMS and she was hypotensive when they arrived. She was given 2 doses of epinephrine (0.2 mg each per ED note) and a dose of Benadryl which helped. Shortly after the 2nd dose, she began having difficulty swallowing, maintaining the ability to breathe through her nose. She was given a 3rd dose of epinephrine and transferred to the ED; during transport an IV was started with an epinephrine drip. She was seen at Emergency Department; she was given IV fluids, solu medrol, tryptase level and had a normal EKG. She was discharged with an epi pen prescription. Tryptase is still pending at the time of her visit. She started a new prenatal vitamin at 11 am 4/28/21. Otherwise, she reports no new foods, medications or topical products. She did eat before going on a walk, pepper jack cheese, wheat thins, and black bean hummus. She is pretty sure she was not stung by a bee prior to onset of symptoms yesterday. Interestingly she reports recent urticarial episodes that occurred in February of 2021. These occurred when she was visiting her in-laws and occurred in the middle of the night, 2 nights in a row during the middle of her visit. She has never had hives previously. She reports no family history of hives or anaphylaxis. She reports no use of new topical products or medications.</p>

1291655	5/5/2021	UT	44	F	4/2/2021	4/3/2021	Morning of April 03, 2021 I woke up with swollen, itchy, burning eyes and pain in hands. I took an Allegra and went to the vaccination center. The Head nurse sent me to the Urgent care. During the exam I developed tightness in chest and throat started to swell. Doctor determined it was a delayed anaphylactic reaction to the COVID vaccine. It was delayed due to taking the Allegra the previous day. He treated me with a benedryl shot and famotidine and prednisone in pill form. Observed for 1 hour and allowed to go home. As of April 5, 2021, still experiencing tightness in chest. Swelling in face has reduced
1291657	5/5/2021	GA	71	F	2/6/2021	2/6/2021	Started 2/6/21 at approximately 8pm and lasted for 5 days: Extreme weakness, light headed, nausea, migraines, burning in eyes, chills, ramped up back pain, extreme pain in left arm, unable to sleep.

1291184	5/5/2021	AZ	46	M	4/18/2021	4/19/2021	<p>This is a spontaneous report from a contactable consumer (patient's fiance). A 46-year-old male patient received the first dose bnt162b2 (BNT162B2), via an unspecified route of administration, administered in Arm Left on 18Apr2021 11:20 (Lot Number: EW0162) (received at the age of 46-years-old) as SINGLE DOSE for COVID-19 immunisation. Medical history included right knee pain. Concomitant medications were not reported. The patient received the Pfizer 1st shot 18Apr2021 11:20 am. On 19Apr2021, at midnight, he had low grade fever then swelling right leg. On the day of the report, 20Apr2021, he had swelling to both legs. The patient had taken ibuprofen as treatment beside propping legs up. The reporter wanted more information on the swelling and if it's related to taking ibuprofen. It was further reported that the patient experienced severe swelling from the knees down to the calves on both legs on 19Apr2021. He also experienced night sweats, fever, lightheadedness and dizziness on 19Apr2021. They want to know if there are any reports regarding the swelling side effects and if it is from the vaccine. The first dose of the vaccine was given 2 days ago (18Apr2021) and the second dose is due on 09May2021. The patient got his first shot on 18Apr2021 about 11:20am. After about 15 hours he developed swelling in one leg, she later clarified this to be his right leg, and now reports that both of his legs are swollen at the time of report (20Apr2021). She noted that patient told her his legs are not painful. She doesn't know if it's a blood clot or if they needed to go to the hospital. She also wanted to know if there is information about this as a side effects or if other people are having this too. She then reported that the patient started experiencing a fever, profuse sweating, and was spacey about 12 hours after the vaccine, a little after midnight 19Apr2021. She doesn't know if the dehydration made it worse. His fever was low-grade 99.8 degrees and lasted 4 and a half to 5 hours and has now resolved. When asked if patient received any treatment for fever, caller said it was so recent, and that was listed as a common side effect that goes away. Reported the patient drank fluids and she kept an eye on him. Leg swelling was about 15 hours after the vaccine, early morning 19Apr2021. She noted that the swelling in the right leg got bigger and didn't go down, but the left leg did. But today the left was more swollen and more</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							prominent today. She further clarified that the patient takes ibuprofen for pre-existing right knee pain. Caller also reported that the patient propped his legs to alleviate the swelling, it has improved some but the swelling did not go away. The adverse events did not require a visit to the physician office or emergency room. Outcome of the event fever was resolved on 19Apr2021 (lasted 4 and a half to 5 hours); outcome of the event "severe swelling from the knees down to the calves on both legs" was not resolved; outcome of the remaining events was unknown.
1289795	5/5/2021	CA	54	M	3/6/2021	3/8/2021	on 3/8/21 patient describes numbness which starts on left hip which goes down left leg. on 3/21/21 patient complains of 3 days of pain and swelling in left lower leg, calf, edema of the foot and ankle which is painful with movement. ultrasound negative. on 3/23/21 ultrasound shows Deep vein thrombosis is visualized in the left popliteal vein. progress note indicates no immobility or long car rides. No history of DVT or pulmonary embolus. Begin enoxaparin x5 days and then dabigatran.
1291424	5/5/2021	CA	60	F	1/21/2021	1/22/2021	Fatigue with whole body muscle spasms (legs, arms...). I have previous gotten muscle spasms like this when I had reactions to Remicade (used to treat neurosarcoidosis). Ever since I got this shot (2nd covid-19 moderna vaccine), my spasticity from my neurosarcoidosis has gotten worse. I am having chronic tightness and pain. The increase in pain initially lasted for 10 days. However, since then, the pain from spasticity in my muscles has resumed. And in April, I started seeing spots in my vision from the left side of my left eye. I don't know if it is related. I saw a neuro-ophthalmologist and he could not find a cause. He has been considering an MRI.

1289722	5/5/2021	CA	37	F	3/17/2021	3/18/2021	The evening I got headaches, chills, muscle, loss of smell and taste. The third day I woke up with swelling like hives and rash around my right eye. I took 10mg of Claritin. The hives spread around the back of my neck and the rest of my body over the course of the morning. Within a few hours it had spread to my chest and my throat felt like it was closing. I had taken Benadryl but it didn't seem to help. I was also fatigued but had no shortness of breath. I had not eaten anything before the hives started. It had been 48 hours after the shot that I was in the Emergency Room, the hives started around 36 hours. I was given Epinephrine 3mg, Prednisone and Famotidine and given steroids for a few days. I have not had any problems since the first three days after the ER visit.
1289804	5/5/2021	WA	53	M	4/3/2021	4/3/2021	That evening - 04:30 pm, I started feeling body aches and pains and fatigue. The aches getting worse in the night. Felt feverish but didn't have a fever overnight. The next day the same - general aches and pains and fatigue. Early afternoon, I took Tylenol and at night time I had headache and I took Tylenol again that evening (about 11:00P). Next morning, just fatigue - no more aches. Site of vaccination was more sore than initially. I had a sort of sinus headache - left side of face and head. My wife noticed I had bags under my eyes - very odd bags under eyes. I took Sudafed. Inside of my left nostril was aching. Tuesday morning, the bags weren't there but I got bad acne on the same nostril - my left nostril. It was like - I was worried that the acne was cystic (very deep - through the nose). I haven't gotten acne in a long time. I had the sinus headache and acne which lasted two to three days. I tried nasal saline - on that Wednesday and Thursday. The acne lasted into the next week - subsided beginning on the 12th or 13th. The bagginess in eyes had been gone by end of the 5th. Headaches didn't persist after the 7th or 8th or so. Had trouble getting a doctor appt because they didn't know what doctor to send me to.

1290723	5/5/2021	ME	27	F	5/5/2021	5/5/2021	<p>Patient administered Janssen vaccine on 5/5/21 at 1011AM by pharmacist on duty. Patient did not admit any anxiety surrounding vaccine during counseling prior to receiving the vaccine. After administration patient mentioned she has can get anxious sometimes and has tendency to create symptoms in her head. She asked what to be on the look out for for signs of syncope and described starting to feel nauseous, clammy, and tunnel vision. Within seconds she briefly lost consciousness and started to slump in chair within immunization room. Pharmacist prevented her from falling out of chair while opening door to waiting room and asked for assistance from patients boyfriend. Together we held patient in place on chair and propped feet up on another chair. Immediately patient regained consciousness enough to explain what she was feeling but then quickly lost consciousness again and started snoring as if she immediately fell asleep. Boyfriend said no history of sleep issues/narcolepsy, together we laid patient on floor of immunization room with feet slightly elevated and boyfriend at her head and again she immediately regained consciousness. Patient explained that she was immediately starting to feel better and felt dizzy and described having very odd dream like scenarios. She laid on floor for 10 min, Alert and orientedx4, moved to seated position for another 10 min, accepted offer for apple juice, moved to waiting area to sit for another 10min before OK leaving. MOD/PDM aware....Called patient at 6pm that same evening and patient reported feeling great.</p>

1290729	5/5/2021	CA	27	M	4/5/2021	4/15/2021	On day 1 (April 15) of noticing my body was very off after the vaccine I had Leg pain and severe headaches, I say severe because though I rarely get headaches and stay hydrated I could tell this headache really hurt and lasted the full day and several days after (something I have never had happen to me) Also on April 15, I had leg pain, If I took a step off a few inches curb or stair step I felt sharp pain shoot up my leg. On April 16th I still had the headaches and leg pain , but also while driving I began loosing my vision and started to pass out/faint. I Pulled over and waited at least a half hour. during that time I. noticed I couldn't type or read anything on my phone as I was trying to reach a friend to help me. eventually after time had passed I was able to drive myself to a friends where I thought the best thing would be to sleep it off. the headaches and leg pain lasted a couple more days and I thought it was going to go away, but it is now May 5th and today and last couple days the leg pain feels more like someone has been punching my left leg. five had chest pain and headaches return. I do not have medical insurance and have avoided going to the hospital or primary care because I am afraid. today the pain is so irritating and sore I wish I could escape my body.

1284728	5/4/2021	LA	66	F	3/2/2021	4/2/2021	shingles; Eyes swells a lot; headache; This spontaneous case was reported by a consumer and describes the occurrence of HERPES ZOSTER (shingles) in a 66-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 013A21A and 028A21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No medical history reported. Concurrent medical conditions included Drug allergy. Concomitant products included HYDRALAZINE, LOSARTAN, ATENOLOL, AMLODIPINE, OXYCODONE, FEXOFENADINE HYDROCHLORIDE (ALLEGRA), ESOMEPRAZOLE MAGNESIUM (NEXIUM [ESOMEPRAZOLE MAGNESIUM]) and Ibuprofen for an unknown indication. On 02-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 29-Mar-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 02-Apr-2021, the patient experienced HEADACHE (headache). On 05-Apr-2021, the patient experienced HERPES ZOSTER (shingles) (seriousness criterion medically significant) and EYE SWELLING (Eyes swells a lot). At the time of the report, HERPES ZOSTER (shingles) had not resolved and EYE SWELLING (Eyes swells a lot) and HEADACHE (headache) outcome was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown), the reporter did not provide any causality assessments. Patient could not see good due to swelling of eyes. Her face was itching, had rash and bumps on her face due to shingles. Treatment details include acyclovir tablet 800mg 5 times a day, acyclovir ointment. Company Comment:Based on the current available information which includes a temporal association between the use of the product and onset of the reported events, a causal relationship cannot be excluded. Some vaccines have been known to exacerbate latent herpes zoster. Patient has a history of shingles/. Headache is consistent with the product known safety profile. The patient received both scheduled doses of mRNA-1273 prior to the events; therefore, action taken with the mRNA-1273 in response to the events was not applicable.

squeezing her, chest felt heavy (severe chest pain hard to breath, felt as if being smothered, throat closing in severe chest heaviness). Severe brain fog. Potential anaphylactic reaction and difficulty breathing were reported. On an unspecified date, the patient experienced angioedema, shock, stridor, dry cough, hoarse voice, sneezing, rhinorrhea, dizzy, nausea, hypotension, weakness, generalized erythema, generalized pruritus with skin rash, diarrhoea and vomiting. Decrease level of consciousness and loss of consciousness were not reported. The patient underwent lab tests and procedures which included oxygen saturation: normal on 06Mar2021 and blood pressure measurement: 140/80, slightly elevated, heart rate: 99, respiratory rate: 20 on 07Mar2021. The patient was not hospitalized and was not admitted to an Intensive care unit. The patient did not have COVID prior to vaccination and the patient did not test COVID post vaccination. The patient recovered from throat constriction, chest heaviness, potential anaphylactic reaction and difficulty breathing. Clinical outcome of angioedema, shock, chest pain, stridor, dry cough, hoarse voice, sneezing, rhinorrhea, dizzy, nausea, hypotension, weakness, generalized erythema, generalized pruritus, skin rash, diarrhoea and vomiting was unknown. Outcome of the other events was reported as recovering. Follow up attempts are completed. No further information is expected. Follow up (26Mar2021): New information received from a contactable Health Care Professional includes: adverse events added, clinical course and case seriousness updated from non-serious to serious. Follow-up (20Apr2021): New information received from a contactable Health Care Professional includes: medical history, concomitant medications details and additional adverse events added (Potential anaphylactic reaction and difficulty breathing added as additional adverse events). Follow-up attempts are completed. No further information is expected.; Sender's Comments: Based on known safety profile and/or temporal association, the contribution of the suspect drug to the onset of serious events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of

1284760	5/4/2021	NJ	66	M	3/31/2021	4/1/2021	<p>pneumonia; temperature going up to 103 degrees/fever; tested positive for COVID19/COVID 19 positive; sore throat; cough; diarrhea; very bad headache; a little tired; high blood pressure; His Legs were a little wobbly from not using the muscles while in the hospital; get dehydrated; This is a spontaneous report from a contactable consumer(patient). A 66-year-old male patient received first dose BNT162B2 (Pfizer BioNTech Covid 19 vaccine, lot number ERO727), via an unspecified route of administration at Arm Right on 31-MAR-2021 09:30 at the 66 years old at single dose for COVID-19 immunisation. The medical history was none. The concomitant medications were none. On 07Apr2021, he started to develop symptoms: sore throat and cough. On 08Apr2021, he got a PCR and rapid test, and he tested positive for COVID19. On the weekend of 10Apr2021 and 11Apr2021, it started getting more severe. He had a very bad headache on the left side of his head, right next to his left eyeball on 07-APR-2021. The patient stated that he could not get any relief, tried to take Tylenol but nothing helped. He also had diarrhea on 07-APR-2021, "couldn't hold anything in", and started to get dehydrated in APR2021. The reporter states that then that weekend on the 10Apr2021 at night getting a high temperature going up to 103 degrees/fever. On 13Apr2021, his son told him that he better get to the ER. At the ER, he did a chest X-ray and another PCR test to confirm the COVID19 diagnosis. On the chest X-ray they found something unusual in his chest so they did a "contrast cat scan" and found pneumonia on 13-APR-2021. He was admitted the hospital on 13Apr2021 and was discharged on 16Apr2021. He is now scheduled for his second dose of the vaccine one 21Apr2021. He went to a clinic yesterday for a PCR test and it came out positive. He's getting conflicting information as to what needs to be done, some people are telling him he has to wait for 3 months, other are telling him to notify his PCP. He's wondering if he can get his second dose as planned on 21Apr2021. The patient stated that while he was in the hospital, they did a CAT scan. Caller reports that first they did an X-ray of his lungs and found something in lungs. The patient stated that they scheduled a CAT scan with contrast and was told he had pneumonia on top of having the COVID virus. The patient stayed in the hospital and they pumped him with fluids because he</p>

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

was pretty dehydrated because he couldn't hold anything in. The patient stated that he had diarrhea and everything else. The patient stated he had high blood pressure in APR-2021 and he just didn't want to take a risk of any fatalities. The patient stated that they gave him some type of medication to fight the COVID virus, "Repar" or something like that. 16Apr2021 in the afternoon, they released caller back home. The patient stated that his temperature went down, his blood pressure went down and everything seemed to be ready for him to go home. The patient stated that yesterday on 18Apr2021 he decided to get another PCR test because he wanted to see if he still had the COVID virus. The patient stated that he didn't have a follow up PCR at the hospital because the hospital doesn't normally do it. PCR test still came out positive yesterday 18Apr2021. Caller states that his big question is that he is scheduled to get the 2nd Pfizer COVID vaccine on 21Apr2021 and since he is still testing positive for the COVID virus, is he still required to get the second Pfizer COVID vaccine or does caller have to wait. The patient stated that he is getting conflicting answers, some say you can't get the second shot for at least 3 months but the caller doesn't know how true that is. The patient stated that he tested positive for the COVID virus on 8Apr2021, caller went to a testing center. The patient stated that it was getting annoying, it was not the COVID symptoms. The patient stated that he thinks only thing is he was feeling was a little tired and tired from being in the hospital for so many days in APR-2021, In APR-2021 his Legs were a little wobbly from not using the muscles while in the hospital. The patient stated he was walking around in the apartment to help build up the leg muscles. The patient stated that he does have an appetite and is drinking liquids. The patient stated that he was diagnosed with pneumonia on 13Apr2021 and he is not sure if it is ongoing or not. He asked the hospital before discharge about if they were going to check again for the pneumonia the answer was we normally don't test and that caller needs to go to his PCP doctor to see if the PCP will order another test for the pneumonia. The patient stated that it would have been easier for them to check again while caller was still in the hospital already. The events sore throat, fever, cough require a visit to Emergency Room. If applicable, there was not any other vaccinations within four weeks prior to the first

1284762	5/4/2021	FL	80	F	3/11/2021	3/11/2021	I had an allergic reaction to the Pfizer Covid vaccine; I fell; Passed Out Without Warning and Hit her Face on the Tile Floor; Busted Mouth; Stitches in Mouth; Right Knee Very Sore /Left Shoulder Very Sore and Can't Use It; Black Left Eye; states it was black, blue, purple, green and yellow; Tiredness; Left Hand Pinky Sore; This is a spontaneous report from a contactable consumer (patient). An 80-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), second dose via an unspecified route of administration, administered in Arm Right on 11Mar2021 14:00 at age of 80-year-old (Batch/lot Number: EN6205) at single dose for COVID-19 immunization. The vaccine was not administered at Military Facility. Medical history included she has hearing aides but it is hard to hear or understand sometimes. There were no concomitant medications. Prior Vaccinations (within 4 weeks) was the first dose of Pfizer COVID Vaccine (Batch/lot number: EL9267) on 18Feb2021 at age of 80-year-old administered in right arm and no adverse events following prior vaccinations. The patient reported she had an allergic reaction to the Pfizer COVID vaccine, she fell on 11Mar2021, not fainted. On 11Mar2021, the patient passed out without warning and hit her face on the tile floor, experienced busted mouth/stitches in mouth, right knee and left shoulder were very sore, black left eye/it was black, blue, purple, green and yellow, tiredness, left hand pinky sore. The patient was calling about the Pfizer COVID Second Shot; verified Pfizer COVID Vaccine. Her second shot was on 11Mar2021 and on the same day she passed out without any warning whatsoever, and she hit the tile floor and ended up in the hospital for five days. She passed out and didn't remember falling or feeling anything before falling. The patient also has a primary physician, but she had been seeing the plastic surgeon for this. The patient asked what does she do if she needs to get a booster. It scared her to death if she would have to take another shot. The patient asked (name) to hand her a pair of glasses to read the plastic surgeons name. She stated the printing is so small on there. She was supposed to see the doctor on 19Apr2021, but she didn't feel good enough to go see the doctor. For busted Mouth, they put in 3 layers of stitches. The stiches have been giving her a fit because sometimes they come undone and hang down. She had to go back into him and

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

get them cut out twice, and she had another one from last night (18Apr2021). It is very sore. States the stitches inside the lip have not resolved and it was still hard. One part of her lip is soft and one part is hard. It was all hard in the beginning. The stitches on the inside are supposed to dissolve. For right Knee it was very sore and she can't hardly use it. For left shoulder it is very sore and she can't hardly use it. It made it awkward to get in and out of bed when she can't use her left arm or her right knee. Her left shoulder was really bothering her and she may have to go have some more work done. It has been popping and went in and out of the joint. That would be back with her primary doctor. Sore pinky on left hand had recovered it didn't stay that long. Black left eye, it was black and blue purple green and yellow. It cleared up in the last couple of days. She was lucky she didn't break the bone around her eye. Treatment included stitches, hospitalization, given antibiotics and blood clotting shots so she didn't get blood clots, she had 3 of those in her belly. She wasn't allowed to get out of the bed when she was in the hospital. She had a terrible experience in the hospital. For the event onset time, it was at 20:00, they drove home from (place name), which is an hour and something, and they stopped at (place name), came home and set outside and she said she had to go lay down because she was tired. She woke up an hour and half to 2 hours later, got out of bed, sat on side, stood up and got herself together and walked to bottom of bed and went out flat. The events required a visit to emergency room and physician office. For emergency room visit, it was reported on 11Mar2021 at (hospital name); the patient should've called redacted number but didn't, they drove in. The patient was hospitalized from 11Mar2021 to 16Mar2021 at (hospital name). The outcome of passed out, tiredness were resolved on 11Mar2021, outcome of 'black left eye/it was black, blue, purple, green and yellow' was resolved on 17Apr2021, outcome of left hand pinky sore was resolved in 2021, the outcome of fell, allergic reaction to the Pfizer COVID vaccine were unknow, outcome of busted mouth, right knee/left shoulder very sore were not resolved.

1284767	5/4/2021	TX	29	F	4/12/2021	4/12/2021	<p>Hurts to move her arm; Felt like she had the flu; Congestion; Headache; Tiredness; lymph nodes in her underarm area are swollen, really achy; lymph nodes in her underarm area are swollen, really achy; Chest pain; Numbness in her face; Completely lost her vision; This is a spontaneous report from a contactable consumer (patient). A 29-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in Arm Left on 12Apr2021 (Batch/Lot Number: ER8729) as single dose for COVID-19 immunization. There were no medical history or concomitant medications. The patient experienced completely lost her vision on 12Apr2021 with outcome of recovered on 12Apr2021, congestion on 16Apr2021 with outcome of not recovered, chest pain on 12Apr2021 with outcome of recovered on 12Apr2021, numbness in her face on 12Apr2021 with outcome of recovered on 12Apr2021, felt like she had the flu on 17Apr2021 with outcome of recovering, lymph nodes in her underarm area are swollen, really achy on 13Apr2021 with outcome of not recovered, headache on 15Apr2021 with outcome of not recovered, tiredness on 13Apr2021 with outcome of not recovered, hurts to move her arm on an unspecified date with outcome of not recovered. lymph nodes in her underarm area are swollen, really achy was reported as worsened. Clinical course: the patient was asking for advice because she had the first dose of the Covid Vaccine 1 week ago and had a really bad reaction and had to go to the hospital. It has been a week now and the symptoms are continuously getting worse. It sounds like the side effects were all expected. She felt like she had the flu yesterday. She is really achy, her lymph nodes in her underarm area are really swollen, and it hurts to move her arm. She is familiar that these symptoms are expected, but it has been a week. She wants to know if she should see a physician or if there is something she should do. Event details: The flu like feeling was not until 6 days after she got the first shot. It is not as bad but she does have aches and congestion. Her lymph nodes are really swollen and she has a headache and tiredness. She had symptoms before, that was just the start of the flu like feeling. On the day of the shot she went to the hospital because she completely lost her vision and had chest pain. She got the shot on Monday, 12Apr2021. She had</p>

----------	-------	-------	---------	-----	----------	------------	--------------

numbness in her face, vision loss, and chest pain. From there she went to the hospital and that subsided. It was just like total exhaustion and body aches for the next couple of days. She lost her vision for 5 minutes total. The numbness to her face was right after the shot and is all gone now. The achiness is pretty bad now. It differs per day but her symptoms have probably gotten a little worse as time has gone on. She had slight pain in her lymph nodes and they weren't really swollen. It got progressively worse to now they are very swollen and it hurts to move her arm. It was the same arm where the shot was given. The headache is off and on. It started around Thursday 15Apr2021. It is sporadic when she gets it. It hasn't gone away. The tiredness has been the same since she got the shot. When she went to the hospital she went to the ER. She was not admitted. She spent 4 to 5 hours there. Treatment: In the ER she just had an IV (intravenous). Other than that they did a bunch of lab work. She had no medicine or anything. Investigations: They did a chest X-ray and lab work in the ER. Emergency Room Visit required for events completely lost her vision, chest pain, numbness in her face, felt like she had the flu.

1284822	5/4/2021	NC	69	F	4/6/2021	4/14/2021	A 69-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Formulation: Solution for injection, lot# EP7533), via unspecified route of administration in left arm on 6Apr2021 at 2:40PM at single dose for COVID-19 immunization. The patient was not administered with prior vaccine within four weeks. Patient had a history of ongoing high blood pressure. The patient's concomitant medication included ongoing Amlodipine Besylate at 5mg one tablet one time a day for high blood pressure and ongoing. On 14Apr2021, patient experienced her left eye got blurry. She doesn't know if her eye getting blurry is coming from the Covid-19 vaccine. She hasn't taken the second Covid-19 vaccine yet. She reports her eye might be blurry because of the Covid-19 vaccine. She reports the left eye blurriness started about 4 or 5 days ago on 14Apr2021. Her eye was getting blurry a little bit then it seemed to get worse, now it's staying about the same. It seems like there is something in her eye, just her left eye. When she tries to read, the letters are blurry but if she puts what she's reading up close to her face she can make the letters out. She reports her husband got his Covid 19 vaccine first and she was skeptical about getting the vaccine for herself. On 25Nov2020, when she went to the doctor on for a regular checkup, he changed one of her medications and she didn't notice the change. She doesn't know if she needs glasses. She doesn't wear glasses not even to read. She tried reading glasses but they gave her a headache. She has made an appointment to see an eye doctor. She reports it seems like there is something in her left eye. She might have cataracts. She has an eye appointment in about 3 weeks on 04May2021 or 05May2021. She can see fine out of her right eye and she can see out of her left eye she just has to put what she's reading close to her left eye to see it. No emergency Room/ Physician Office due to AE. Outcome of the events was not resolved.

On 06-APR-2021 at 12:10pm the patient was reacting to the vaccine and was hospitalized and received treatment for extreme Anaphylactic Shock ( had 3 bounceback reactions over the course of the next 24 hours. Patient was treated with Epinephrine (iv drip), Steroids and multiple Nebulizer treatments. Patient was in the ICU for 3days and a regular room for e additional days. Hospitalized from 6Apr through 11Apr.I was home for several days and was again hospitalized 19Apr through 22Apr for a severe headache, ringing in ears, numbness in left arm, leg, an leg. Also for blurry/double vision in right eye. On 19-APR-2021, the patient was again hospitalized for a severe headache, ringing in ears, numbness in left arm, and leg, blurry/double vision in right eye. It was determined to be Idiopathic Intracranial Hypertension and still being treated for it and will be attending Occupational and Physical therapy to get vision, arm and leg to work properly again. Patient was hospitalized for 3 days. The action taken with COVID-19 VACCINE AD26.COV2.S was not applicable. The patient had not recovered from idiopathic intracranial hypertension, and the outcome of recurrent anaphylactic shock was not reported. This report was serious (Hospitalization Caused / Prolonged).; Sender's Comments: 20210452704-Covid-19 vaccine ad26.cov2.s-Idiopathic intracranial hypertension. This event(s) is considered unassessable. The event(s) has an unknown/unclear temporal relationship, is unlabeled, and has unknown scientific plausibility. 1284651	5/4/2021		34	F		4/4/2021	<p>HEADACHE; BLURRY VISION; NECK STIFFNESS; NAUSEA; VOMITING; CEREBRAL VENOUS SINUS THROMBOSIS; DURAL VENOUS SINUS THROMBOSIS; RIGHT INTERNAL JUGULAR VEIN THROMBOSIS; INTRAPARENCHYMAL HEMORRHAGE; LOW PLATELET COUNT; This spontaneous report received from a patient via the VAERS (Vaccine Adverse Event Reporting System)(VAERS ID: 1224712) and concerned a 34-year-old white female. The patient's weight and height were not reported. The patient medical history included being 4 months post-partum. The patient had no drug, food or other product allergies, and had no chronic or long-standing conditions. The patient received COVID-19 vaccine Ad26.CoV2.S (suspension for injection, route of administration and batch number not reported), dose was not reported, administered on 23-MAR-2021 for prophylactic vaccination. No concomitant medications were reported. From an unspecified date, the patient had 2 weeks of headaches and blurry vision, 2 to 3 days of neck stiffness and nausea with 1 episode of vomiting and had been transferred to the current hospital from another. On 04-APR-2021 (12 days post-vaccination), the patient was diagnosed with dural venous sinus thrombosis (DVST), transverse/sigmoid (cerebral venous) sinus thrombus (CVST) with associated intraparenchymal hemorrhage in the right temporal lobe as well as thrombosis of the right internal jugular vein (thrombus). Magnetic resonance imaging (MRI) impressions showed there was a re-demonstrated of intraparenchymal hematoma in the right posterior temporal lobe measuring approximately 6.2 x 3.6 cm in maximal axial dimensions. There was surrounding edema and associated mass effect with effacement of the right temporal horn and right-to-left midline shift measuring 5 mm. There was medialization of the right uncus without transtentorial herniation. The basal cisterns were otherwise patent. There was dural thickening and hyperenhancement overlying the hemorrhage. There was prominent cortical veins along the right frontal temporoparietal convexity consistent with venous congestion. There was also a small are of vasogenic edema in the right anterior temporal lobe separate from the hematoma. There was a right mastoid effusion, but normal orbitals and the calvarium and skull base were unremarkable. Magnetic</p>

----------	-------	-------	---------	-----	----------	------------	--------------

resonance venography (MRV) results revealed non-opacification of the torcula, right transverse sinus, right sigmoid sinus and upper internal jugular vein compatible with occlusive thrombosis. A small amount of thrombus also extended into the left transverse sinus. The superior sagittal sinus, remainder of the left transverse sinus, left sigmoid sinus, left upper internal jugular vein, straight sinus, vein of Galen and bilateral internal cerebral veins demonstrated normal contrast opacification. The patient's platelet count was 126 upon admission (normal range [NR] not provided), with other workup laboratory test results reported as pending. The action taken with COVID-19 vaccine Ad26.CoV2.S was not applicable. The outcome of the right internal jugular thrombus, intraparenchymal hemorrhage, DVST, CVST, headache, blurry vision, neck stiffness, nausea and vomiting was reported as unknown. This report was serious (caused/prolonged hospitalization and other medically important condition).; Sender's Comments: V0: This case concerns a 34-year-old white female who experienced cerebral venous sinus thrombosis (CVST), dural venous sinus thrombosis, right internal jugular vein thrombosis, and cerebral hemorrhage 12 days after receiving covid-19 vaccine ad26.cov2.s for prevention of symptomatic SARS-CoV-2 virus infection. The patient was noted to be 4 months post-partum. She presented for medical assistance with a 2-week history of headaches, blurry vision, and neck stiffness for 2 to 3 days as well as nausea with 1 episode of vomiting. Magnetic resonance imaging showed a large hematoma in the right posterior temporal lobe with surrounding edema and associated mass effect resulting in effacement of the right temporal horn and right-to-left midline shift measuring 5 mm and occlusive thrombus within the torcula, right transverse sinus, right sigmoid sinus, and upper internal jugular vein. A small amount of thrombus extended into the medial aspect of the left transverse sinus. The platelet count on admission was 126,000. Although the post-partum status of the patient may have contributed, based on evolving knowledge of Thrombosis with Thrombocytopenia Syndrome (TTS, per definition from Brighton Collaboration) and considering the low platelet count and temporal relationship to vaccination, we consider the events to have a plausible relationship with vaccination.

1284528	5/4/2021	WI	36	M	4/14/2021	4/18/2021	<p>4 days after the first shot I was feeling very very dizzy. My ears felt full enough that I thought maybe they were just full of wax. I bought an over the counter ear cleaning kit. That didn't relieve any symptoms. I never get headaches, but a couple days later the front top of my head was throbbing. The area just above my forehead. It was not sinus pressure, my face didn't feel any pressure or pain. My throat also felt like I was being slightly choked. Not my airway, but just my jugulars. It began in the evenings. It would feel like I had been hanging upside down for a while. My head felt full of blood, like it was going to pop, like my eyes were bugging out. By a week to 10 days later, my upper arms felt weak, my toes were tingling, and my heart would flutter for just a few seconds occasionally. I was still dizzy, still felt like I was choking, except I was feeling this way all the time now. The symptoms only seemed to be staying the same or getting worse. I have NEVER gone to the doctor on my own in my life to get something checked, but this had me disconcerted enough to check in and see if I should get my second shot at all. My appointment was to see my doctor was the morning of the same day I was scheduled to get my second Pfizer shot. My doctor had not heard of these symptoms being associated with the Pfizer shot and chalked my symptoms up to stress. I am not a stressful person and very much err on the side of "waiting to see what happens" if I feel sick. I never feel sick. But I accepted the explanation and took the second shot that day anyway. It should be noted that the second shot made my left armpit swell up quite a bit. I did feel dizzy again, but not nearly as much. The other symptoms seemed to not be as bad either.</p>

1284500	5/4/2021	CA	64	F	4/6/2021	4/6/2021	April 6th, at approximately 10:55am, I received a Moderna Covid-19 vaccination at clinic. After the vaccination, I felt fine; no side effects for about 5 hours. At approximately 4:30pm, I got the chills, body, muscles and back aches, fever - 101.2, sore throat, my eye balls hurt and a sore scalp. All of these effects came one like a wave. My entire body ached and I felt as though I was run over by a steam roller. I took Tylenol, 500mg at 5:30am and the next day, April 7th at 11:30am and still had a fever. My entire body was in pain and discomfort and I could barely move and was unable to work for 4 days and laid up on the weekend. To-date, I am still feeling tired, achy and lethargic.
1284487	5/4/2021	CA	16	F	5/1/2021	5/1/2021	Patient reported feeling lightheaded status post first dose Pfizer COVID vaccine (Lot: EW0167, expiration date: 08/31/2021) to medic. Medic noted that the client was CAOx4, her skin was pale, warm and slightly moist, pupils were equal, round, reactive to light and accommodating (PEARRL), respiration rate (RR) was 20. The client's sister stated the client had a history of anxiety and that "she gets this way whenever she gets a shot". Medic walked patient to the zero gravity chair. The client was given water to sip on. At 1213 baseline vitals were taken with client sitting: Blood pressure (BP): 110/82, heartrate (HR): 98, RR: 20, PEARRL. Medic reports she coached the client on her breathing to help alleviate her complaint of feeling lightheaded, mild nausea and anxiety. Client reported she felt anxious prior to her vaccination and that her last oral intake was 15 minutes prior to vaccine. Client denied headache, blurry vision and chest pain. At 1220 a second set of vitals were taken while standing: BP 108/80, HR 86, RR 16, CAOx4. Client stated her symptoms were diminishing. Client's RR slowed down to normal rate and rhythm, vital signs were trending to normal and client was negative for orthostatic pressures. Client was advised to stay for additional 30 minute observation. Client's symptoms resolved completely and she was able to ambulate away from observation site without assistance and with a steady gait.

1284478	5/4/2021	AK	33	F	3/10/2021	3/10/2021	After first shot had a very severe dizzy spell that night. Then continued to have lower-grade vertigo (occasional major dizzy spells) and vision problems for about three weeks afterwards. Was seen by eye doctor and eyes looked normal. Got second dose, and it seemed to improve for a couple days then came back. After a few weeks of continued vertigo and vision problems (mostly depth perception and suddenly became extremely aware of pre-existing eye floaters because of the disorientation) went to an ENT and they were not able to find anything visibly wrong related to vaccine. Went on Ativan and symptoms have improved somewhat on it, but am very scared of them coming back when i go off of it. Seems to be improving very very slowly. This has been almost 2 months of symptoms now. Made it very hard to work or drive.
1284467	5/4/2021	IN	43	M	4/27/2021	4/29/2021	Day of 2nd dose of vaccine received: mild soreness in shoulder, neck and back, around the area where the shot was given. Day after vaccine: lower than normal energy, but otherwise fine. Two days after vaccine: low energy, body aching, occasional cough. Three days after vaccine: similar symptoms of the previous day. Four days after vaccine: lower energy, body aches, coughing, persistent headache, eyes feeling tired and burning, and congestion starting in my chest, all worsened in the evening. Five days after vaccine: congestion in chest, regular cough, sore throat, runny nose, eyes feeling dry and burning, shortness of breath. Was tested for Covid on the fifth day after the vaccine. Six days after vaccine, chest congestion, coughing, sore throat, runny nose, shortness of breath, and still low energy. Covid test result came back as negative.
1284466	5/4/2021	NY	36	F	5/1/2021	5/2/2021	Huge red welt at injection site that has continued to grow larger 2 days later. Hot to touch and starting to itch 2 days later. Nausea for 2 days that has now started to subside. Low grade fever. Fatigue. Brain fog. Minor congestion. Sever sever headache primarily behind both eyes constant.

1286818	5/4/2021	TX	41	F	4/16/2021	4/20/2021	Six hours after I received the second dose of the Covid vaccine from Moderna I experienced Covid like symptoms. I had tested positive for Covid 75 days prior to the vaccine, and my symptoms were similar or worse than when I had Covid. I had severe body aches, fever of 101F, headache, fatigue and confusion starting on 16 April. The fever and body aches subsided the morning of 19 April. I continued to have severe fatigue and headaches through 22 April. Starting the morning of 19 April small bumps begin to appear behind my ears mostly on the left side. On the morning of 21 April a rash appeared on the left side of my neck, it began to spread down my arm and up my face, unilaterally. It began to blister, itch and burning pain. The rash clearly followed dermatomes. By evening the rash spread into red bumps all over my body, bilaterally upper and lower extremities. Rash was not reactive to Benadryl. I went to the ER and was immediately admitted to the hospital with a dx of Shingles. My left eye and left ear were beginning to swell shut, with an increasing headache. Please note the afternoon of 20 April I did have Dysport injections to my upper forehead. I have had these injections several times before without any prior reaction. Also, severe Covid like symptoms were experienced with the first dose of the vaccine.
1284873	5/4/2021	TX	64	M	4/14/2021	4/16/2021	After the COVID vaccine, it started numbness in hand fingers while sleeping, slowly, slowly and day by day it become more. Last four days I could not able to sleep, whole body getting numb while sleeping, and it getting all blood to the hands, legs and hand figures, foot fingers are becoming numb. And also getting pains in the bone joints, specially in fingers. Getting Itchy, eye pain due to no sleep. Some one should call and provide remedy immediately, otherwise I may die, this responsible is control organization. This I am entering at May 4th 2:00AM CST. I already registered online, no responded.

1287981	5/4/2021	TX	49	F	3/8/2021	3/8/2021	<p>Shortly after getting the shot she reported feeling "off" as she was driving she started feeling short of breath and her heart was racing. When she got home around 5 PM she was still feeling short of breath and reported that her heart was racing. She was unable to speak clearly, but was stating that it was due to be being short of breath. She also reported feeling lethargic and fell asleep until the next morning. She slept until approximately 12 pm the next day. When she woke up she reported feeling right sided cheek tingling. At that time she thought she had just slept wrong. When she attempted to walk down stairs she was limping and reported just feeling very weak on her left side. On Wednesday she slept in late again complaining of lethargy. When she awoke that Wednesday (3/10) her speech was markedly slurred. She was also saying things that didn't make sense. She was dragging her left leg when she tried to walk. We immediately took her to the ER and she was worked up for stroke. When she was triaged in the ER we mentioned that she had just had her COVID vaccine and voiced concerned that maybe she had a reaction to her COVID vaccine. She was admitted to hospital on 3/10 for a possible stroke. Her MRI was done later on 3/11, Her MRI showed that she has strokes on both sides of her brain in the frontal, parietal and occipital lobes. The doctor referred to her stroke as being caused by a "showering of clots". The doctor said this usually only happens to someone with cardiac issues. My mom has no cardiac history. Her doctor ordered an 2D Echo of her heart and no abnormalities were found (3/12). She is still disabled from her stroke. She was hospitalized from 3/10 - 3/16. She was discharged to other care facility from 3/16-3/26. She is currently needing outpatient rehab in a day neuro program. She attends this at outpatient facility. She has to walk with a cane due to persistent left leg weakness. Her speech has a slight slur, and she suffers from short term memory loss. She intermittently has trouble with her equilibrium and reports feeling dizzy. She sometimes has a hard time swallowing or says that it doesn't feel right when she swallows. She also trouble with word retrieval. She has left-sided neglect which correlates left eye visual deficits. She currently requires care from a general physician, neurologist, physical therapist, occupational therapist, speech therapist, neuro ophthalmologist and neuro psychologist. She was started</p>

1286712	5/4/2021	FL	17	F	5/4/2021	5/4/2021	Patient became light headed and her head started to nod in post waiting area. Brought ice and gatorade and sat with her and mom for 20 minutes. She continued to nod and close her eyes but responded to verbal stimuli when prompted. She eventually became fully awake and mom and her decided she was well enough to go home.
1286668	5/4/2021	CA	34	M	3/31/2021	4/6/2021	After my J&J vaccine, I experienced fever, chills and a left sore arm and those symptoms resolved in 24 hours. On 04-06-2021 I experienced headaches on and off and on 04-07-2021, I had light headiness, an air-filled pressure sensation to my eyes, forehead, more like a sinus headache. On 04-14-2021, I went to see my PCP due to my headaches continuing, the doctor ran complete blood panel test were performed along with a D-dimmer test to rule out blood clots and he told me to take Advil as pain medication. My D-dimmer test was normal. I noticed when bending down my headaches became worse. On 04-20-2021, an MRI of the brain was performed. On 05-01-2021, I experienced muscle body aches, fever and continued with headaches. I went to a walk-in clinic, where a Covid-19 test was performed and it was negative. I started taking antibiotics and the fever and muscle bode aches started to go away. I still have to this day headaches and an air-filled pressure sensation around my eyes and eyebrows. As of today, my headaches are consistent, and they come and go.

1286511	5/4/2021	TX	52	F	1/29/2021	2/1/2021	MODERNA VACCINE - Began feeling very dizzy, off balance - this continued though out the first week 2/1 - 2/7/21. By Sunday Feb 7th my symptoms became worse more frequent. Monday Feb 8th. I could barely walk, so weak, ringing in my head, spinning, dizzy, could not form words; passed out. I was rushed to hospital where my blood pressure was so high. I was disoriented major brain pain - as if something popped in my head..Was admitted for 4 days could not walk. I am constantly feeling pain in my head. ringing, dizziness effecting my vision and balance and effecting my day to day life. It is effecting the vestibular part of my brain. Ear fullness, dizziness, balancing, vertigo and IT IS NOT GOING AWAY...I have never had high blood pressure nor dizzy/vestibular problems as soon as the vaccine was administered is when the problems began -- MY BIOLOGICAL SISTER HAD A MASSIVE STROKE (A VERY RARE TYPE OF STROKE 2 DAYS AFTER THE MODERNA VACCINE) THAT HIT HER BALANCE PART OF HER BRAIN. I WANT SOMEONE TO REVEIW ALL RECORDS ; aS OF TODAY i AM STILL HAVE DEBILITATING ISSUES. THAT IS EFFECTING MY DAILY LIFE WITH NO ANSWERS
1286457	5/4/2021	NY	100	F	4/8/2021	4/8/2021	Received first dose of Pfizer vaccine in left deltoid on 4/8/21 at 7:30 am. At 10:00 am, she called her niece and complained of extreme fatigue. At 12:00 pm, she complained of worsening fatigue and blurry vision. At 3:40 pm, she complained of loss of appetite but denied fever and chills. The niece was unable to reach her by phone after 4 pm, so she came over to the decedent?s residence at 6:15 pm to check on her. The niece found her lying face up in bed ?gasping for air.? She then became unresponsive and EMS was called. The decedent was pronounced at 8:11 pm after unsuccessful resuscitative efforts. Autopsy showed hypertensive and atherosclerotic cardiovascular disease with marked partially calcific coronary atherosclerosis; marked pulmonary edema; and pleural effusions. The brain was saved for neuropathology given the history of blurry vision.

The patient's weight, height, and medical history were not reported. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: Unknown) dose, start therapy date were not reported for prophylactic vaccination. The batch number was not reported. The Company is unable to perform follow-up to request batch/lot numbers. No concomitant medications were reported. On an unspecified date, the subject experienced heaviness in eye, abdominal pain / strange sensations in abdomen, left eye swollen and puffy, strange sensations in face, left arm painful, and nausea. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of the heaviness in eye, abdominal pain / strange sensations in abdomen, left arm painful, left eye swollen and puffy, strange sensations in face and nausea was not reported. This report was non-serious.
1287978	5/4/2021	UT	65	U	4/5/2021	4/5/2021	Within 3 hrs after receiving the vaccine my vision in what seemed to be both eyes was 80% cloudy and I was very exhausted. The following day most of the vision issued returned to normal but I had distortion and floating objects in my right eye along with bright flashes and pressure in my right eye. After following up with our prescribed online health care service twice I was told to contact a specialists. I was able to get into the eye ER Clinic and have had 3 visits including one with a Retina specialist. I still have lost part of my peripheral vision in my right eye and continue to have follow up care.

1285795	5/4/2021	WA	75	F	4/9/2021		o Patient with several complaints that started after receiving her Johnson&Johnson COVID vaccine 3 weeks ago. She has swelling in her medial malleolar area with negative calf tenderness or Homans' sign. Due to recent findings with Johnson&Johnson vaccine, will send patient for doppler testing to look for the presence of a clot. Her swelling could be due to mild injury while working in her garden or varicose veins. o Will obtain CBC to evaluate platelets due to patient's concerns for recent vaccine. o Other complaints that may be related to the vaccine (visual change and fluid area on shin) have now resolved. Discussed with patient that based on the vaccines being new, difficult to know what side effects may be seen, but she should continue to watch for changes and encouraged her to see an eye specialist for an eye check. o Last vitamin D was normal and advised that no check necessary at this time and that she can take Vitamin D 1000-2000 units daily.

1285963	5/4/2021	IL	53	F	3/25/2021	4/28/2021	I was sitting at my work computer and I experienced a vertigo sensation which lasted for 10 min. Next, I had tunnel vision with a bright light where I couldn't read the words on my computer screen. This lasted for about 20 min. Next, I saw Kaleidoscopic vision on the sides of both of my eyes. This lasted for 1/2 hour more. It then turned into a headache. I have NEVER had anything like this in my life and went to the emergency room. They did a CT scan and found no abnormal findings. My blood pressure and all labs were normal. They stated it was "probably" a migraine with aura. It happened again 2 days later and again yesterday. I have an appointment to see my GP on 5/6/21. Again, this is not normal and has never happened before in my life.

1281761	5/3/2021	MD	41	F	3/23/2021	4/4/2021	On April 4 (throughout the day) -- began to show symptoms of feeling abnormal / off-center (beginning around 10am). by 5pm -- became uncoordinated / unbalanced (couldn't access phone, put on clothes, etc.). Advised by Neurologist to seek ER treatment and directed to local hospital. Initially, diagnosed as showing symptoms of a Stroke. Upon further analysis, hospital determined it was a MS Flare Up. Since April 4 -- patient lost use of left side (hands, legs). Right Side brain also affected. Currently in acute rehab (Since April 17) to regain functionality. As of May 3 -- still unable to walk on her own or use left hand. Still experiencing visual issues. Acute Rehab facility believes recovery may take up to a year. Patient's normal Neurologist was puzzled by diagnosis because the symptoms as well as the duration and acuteness of the episode is inconsistent with her MS condition. Patient was originally diagnosed with MS in 2009 and there have no MS flare-ups since the initial diagnosis. The normal Neurologist noted that the symptoms are inconsistent with her history. Believe it was proper to notify, given the recent vaccination. Can provide full medical records, if helpful
1281759	5/3/2021	IL	75	M	3/27/2021	4/10/2021	Patient began complaining of visual disturbances and felt as though his house (specifically ceiling) was shaking. This happened on two occasions. Patient's blood pressure was consistently elevated e.g., ( 207/107), despite being on medication for HTN. Ultimately on 4/21/21, patient was admitted to the hospital due to right sided facial drooping/weakness and slurred speech. Patient was diagnosed with a T.I.A. Treatment was obtained and patient was discharged from hospital on 4/22/21.

1281725	5/3/2021	FL	62	F	4/29/2021	4/29/2021	<p>She got the vaccine, she's healthy. Within minutes they took her VS and showed no signs of anything happening at that point. She had a care ride. At approximately 4:00 PM the EMS was at the facility, she could not breath or talk and EMS was called and it got worse in the ride to the ER. She had a severe headache to the point that somebody grabbed her around the throat and her eyes were popping out of her head. She had chest pains, and given nitro for that, and had trouble breathing. She had no voice. The attempted to give her aspirin in applesauce. Her temp was taken and it was 97, by the time she was admitted it was elevated. In the car, EMS was trying to get her veins and 11 attempts were made and she was bruised. She has waited a year and a half for surgery as she needs right knee replacement, and has spine, joint issues and was not able to move due to extreme weakness. She was given Epinephrine in her leg and it did not do anything. She was admitted to the hospital and was there a couple of days until she was able to help her walk. She had no anxiety and had anger over the nursing staff, attending physician and the way she was treated. She is a licensed CNA and has worked in 3 hospitals and has a grievance due to the lack of care that she received while in the hospital. The ER nurses were good, but going to the 6th floor was another issue. Her Dr. on Saturday ordered a swallow test as they could not determine why she had no voice and could not swallow. It was done and she was still having difficulty getting food down, but it was slow and did go down. Since he has been back at ALF she is now better, able to walk, talk and go about her life. While in the hospital she was having a hard time getting her medications, and was given a breathing treatment in the ER, and was still having problems on the floor and was having problems with them getting her medications so that she could breath. She finally got their attention and told her that she was not okay with her and the lack of the nursing staff care. She fought to get her Flonase, and by the time she was ready to leave on Saturday she had been given one treatment of Symbicort. She did have blood tests done to the point that it was excessive, but she had veins that were blowing and there was no access points. On Friday she refused them as she had been stuck 11 times. On Saturday morning they came to get more blood and she refused on Saturday evening</p>

1281493	5/3/2021	VT	46	F	4/12/2021	4/12/2021	About 5 minutes after I received the shot, had a sudden burning sensation in the middle of my chest that radiated out. I thought that was it for me. Nausea, dizziness, numbness in my left cheek and arm, got a funny taste in my mouth. This got pretty intense and lasted about 10 minutes. They had me stay in observation for another 45 minutes as those symptoms came in waves but never as intense as the first time. They let me go and I went home to rest. On the way home my cheeks became flushed and it felt like my eyes and cheeks were swelling. I had a lot of other symptoms over the next several hours which I wrote down. Early Tuesday morning those symptoms went away and I was left with some flu like symptoms, dizziness and a brain fog like I have never had before.
1281386	5/3/2021	TX	27	F	4/12/2021	4/12/2021	NARRATIVEPATIENT WALKED IN TO FIRST AID AND COMPLAINED OF NUMBNESS TO THE LEFT SIDE OF HER FACE AND COMPLAINED OF TIGHTNESS TO HER THROAT. PATIENT PUT HERDISCOMFORT AS A 3/10. SHE SAID THAT SHE WAS BREATHING FINE BUT HER THROAT FELT SCRATCHY AND BOTHERSOME. PATIENT WAS GIVEN ROOM TEMPERATURE WATER ANDSHE DID NOT HAVE ANY DIFFICULTY SWALLOWING IT. DR. ARRIVED AND VISUALLY CHECKED THE PATIENT'S THROAT WITH A FLASHLIGHT. PATIENT WAS OFFEREDTRANSPORT BUT DENIED IT. SHE STATED THAT THE NUMBNESS RESOLVED BUT SHE STILL FELT THAT HER THROAT WAS TIGHT. PATIENT CALLED HER MOTHER WHO IS AN RN ANDSHE CAME AND PICKED UP THE PATIENT. AMA FORM WAS FILLED OUT AND PATIENT SIGNED THE AMA.
1281353	5/3/2021	MI	16	M	4/29/2021	4/29/2021	Pt in for covid vaccine. Immediately after pts dose pt stated he began to feel like his arm was on fire. Pt stated his ears were ringing and he became diaphoretic. Pt aslo states he feels like he loss vision for about 30 seconds. Pt had small amount of emesis as well. Vitals 110/67 hr 70 rr 20 temp 97.8 oxygen 98%. After about 5 minutes pt stated he felt so much better. Pt monitored for 30 minutes by nurse vitals q5 min. Last vitals 120/72 hr 72 respiratory rate 18 oxygen 98% t 97.8. Pt left facility accompanied by family. Educated to follow up with PCP.

1281053	5/3/2021			M	3/20/2021		ADVERSE EFFECT OF VACCINE; SHORTNESS OF BREATH; FATIGUE; HEADACHE; LOW PLATELETS; NIGHT SWEATS; DIAPHORESIS; BLURRED VISION; FEVER; BODY ACHES; This spontaneous report was received from a physician via a company representative and concerned a white nonhispanic or Latino 50 year old male. Initial information was received on 28-APR-2021, with additional information obtained via telephone follow up from a physician on 29-APR-2021. The patient's height was 73 inches and weighed 252 lbs; approximate body mass index was 32.68 kg/m2. Medical history included: lung infection in 2014 which led to aortic valve disease which required biologic aortic valve replacement (2014); prolapse of right coronary aortic valve cusp, severe aortic insufficiency. There was no history of hyperlipidemia and was positive for family history of cardiovascular disease. Concurrent conditions included attention deficit disorder (ADD), back and neck problem, other congenital anomaly of heart, hypertension, lumbago, shortness of breath and thyroid nodule. The patient received COVID-19 vaccine Ad26.CoV2.S (suspension for injection, intramuscular, batch number and expiry date unknown) on 19-MAR-2021 for prophylactic vaccination. The batch number was not reported and has been requested. Concomitant medications included: carvedilol, losartan and atorvastatin (all for aortic valve replacement). Also aspirin, Adderall (dextroamphetamine-amphetamine) both for unspecified indication. On 20-MAR-2021, the day after receiving the vaccine, the patient developed fevers, body aches and headache which resolved within 24 hours. Then a week on an unspecified date, he developed more symptoms which included fatigue, shortness of breath for the most part and some headaches. On 27-MAR-2021 the patient experienced a single episode of visual disturbance of blurred vision while driving. At a stoplight vision in both eyes were blurred and he had trouble see the road; he no longer could drive. The blurred vision resolved within a few minutes and not vertigo or headache occurred at that time; and there were no other reported visual changes. The patient visited his physician 28 days after receiving the vaccine on 16-APR-2021. He reported ongoing fatigue, body aches and headaches. No further visual changes or disturbances. He felt fatigue and shortness of

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

breath were the most noticeable. He denied chest pains and fevers but has been experiencing night sweats (unspecified start date); and generally feels unwell and described himself as "feeling off". No leg edema or leg pain currently. Also no coughing, wheezing or bruising. His concentration was stable and there was no loss of memory. No other neurological symptoms. Physical exam was positive for chills diaphoresis, fatigue, fever and shortness of breath; cardiovascular examine revealed a murmur present, and pulmonary examine was normal breath sounds, no decreased breath sounds, wheezing, rhonchi or rales. Vital signs: blood pressure 104/68, pulse 93, temperature 98. The physician's assessment also included an adverse effect of vaccine. Laboratory results form 16-APR-2021 included: Creatinine (normal range 0.50 - 1.30 mg/dl) 1.09, white blood count (WBC) (normal range 3.8 - 10.8) 3.4, red blood cell count (RBC) (normal range 4.20 - 5.8) 4.92, hemoglobin (normal range 13.2-17.1 g/dL) 13.9, glucose (normal range 71-99mg/dL) 109, D-Dimer elevated at 286 (normal range <230), elevated C-Reactive Protein (CRP) (normal range 0 - 5 mg/L) 32.3, fibrinogen (results not reported), Covid-19 Antigen Antibody negative, platelet count 123,000 (lower limit of normal <140,000). The patient has a baseline platelet count of 200,000 from JAN-2021 and for the past 9 years had ranged from 180,000 - 240,000. A heparin-induced thrombocytopenia (HIT) was negative anti-PF4 antibody. On 20-APR-2021, the patient received Computerized tomogram (CT) of the head with and without contrast which was normal - no acute hemorrhage, mass effect or abnormal enhancement. The patient also had a CT chest with contrast with no evidence of pulmonary embolism to the segmental level; a 16 by 16 mm nodule with small calcification was noted, this was nonspecific but could reflect primary lung cancer, correlation with PET/CT is indicated. Additional laboratory results on 20-APR-2021 concerning serotonin release stated as follows: Positive, 6%, 40%, 37%. HIT panel negative with less than 0.6 antibody On 27-APR-2021 additional laboratory results were as follows: WBC 4.1, RBC 4.95, hemoglobin 14.0 g/dL, D-Dimer 275, fibrinogen 427 and HIT panel negative with less than 0.6 antibody. A hematologist was consulted and a complete blood count and HIT panel were performed on 28-APR-2021. Results were platelet

----------	-------	-------	---------	-----	----------	------------	--------------

count of 159,000, D Dimer of 275, HIT negative anti-PF4 antibody screen and the SRA assay was pending. On 29-APR-2021 the duplex of left lower extremity was negative for deep vein thrombosis (DVT). Additional laboratory reports included a platelet factor 4 antibody test test methodology which used latex particle enhanced immunoassay to detect anti -pF4/heparin antibodies (reference range 0.0-9), with the patient's value was <0.6 (negative). A COVID PCR test was not performed. An enzyme-linked immunosorbent assay (ELISA) test was ordered for 30-APR-2021 for anti-PF4 antibodies. The action taken with COVID-19 vaccine Ad26.CoV2.S was not applicable. The outcome of the event blurred vision and fever were resolved; the outcome of low platelets, adverse event of vaccine, shortness of breath, fatigue, headache, body aches, night sweats and diaphoresis were not reported. This report was serious (other medically important condition).; Sender's Comments: V0.20210456790-COVID-19 vaccine Ad26.CoV2.S -Low platelet counts,blurred vision,adverse affect of vaccination. This event(s) is considered unassessable. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the event(s).

1280955	5/3/2021	CA	60	F	5/2/2021	5/2/2021	Patient was working in the traffic area of the parking lot. The patient was exiting the area after the 15 min observation period. She reported no symptoms or complications prior to leaving the area and no usual behavior was noted at this time. Patient was accompanied by her husband and son. Near the parking lot the patient was witnessed losing consciousness and falling to the ground. Patient immediately assisted the patient and also called for assistance. I was notified immediately and myself, the paramedics on sight, and NP responded to the patient incident. The patient was diaphoretic and had abnormal vital signs that were repeated multiple times. The set I obtained were 117 heart rate, 99% oxygen on room air, 167/94, 225/112, both taken lying down. Patient complained of severe headache, blurry vision, tinnitus, and dizziness over the past 2 days prior to days. Patient reports having only one medical condition, psoriasis, and takes a cream for it, but also reports she has not seen a doctor in "many years". No stroke symptoms were observed.
1280917	5/3/2021	AZ	32	F	4/28/2021	4/29/2021	After 2nd vaccine. Night 1 - woke up, hot/cold sweats. Flu-like symptoms. Very sick. Tired. Gassy. Slept a lot. Bloody nose. Day 2 - extremely tired. Hot/cold. Couldn't stay awake. Clammy. Gassy. Slept all day. Day 3 - eyelid swelling when I woke up. Put a hot towel on the eyes. low-grade fever. Extremely tired. Migraine all day. Body aches. Toe pain (not sure how that even happened). Night 3 - extreme neck pain. Hurt very bad to sleep on it. Eye swelling. Gassy. Tired. Slept a lot. Migraine. Inability to focus. Chest pain. Trouble breathing. Day 4 - mild neck pain. Semi-clammy. feeling much better.
1282130	5/3/2021	FL	60	M	4/27/2021	4/27/2021	Day 2 following the vaccine, patient began to experience flu-like symptoms (fatigue, head ache, body ache). Followed by a syncope episode, did not follow up with any emergency care. Did not contact primary care or go to the hospital, or take any medication to treat symptoms. Mentioned having eye soreness, eyes feeling fatigued which is not usual for the patient and coincide with timing of adverse effects.

1283993	5/3/2021	OR	67	M	5/3/2021	5/3/2021	Patient and wife stated that he has had many vasovagal syncope events when he has had vaccines administered, both more recently, and in the past. The patient was seated in a chair with arms. Within a couple of minutes of administering the vaccine, his eyes rolled back in his head, he broke out in a cold sweat, BP was 75/55, pulse 55. He never stopped breathing (was snoring); epinephrine for an anaphylactic reaction was not indicated. I offered to call 911 multiple times but his wife said this was the normal course of his reaction and held an icepack on his neck for the duration. After 5-10 minutes the patient was once again responsive. He sat for an additional 10 minutes and then said he was ready to leave. His wife walked him out of the store.

1283743	5/3/2021	FL	40	M	5/3/2021	5/3/2021	Got injected, didn't hurt much. Was told to wait 15 minutes in case of reaction. They walked away and left me sitting in a chair in a public space with everyone else who was waiting. I texted my wife to check in, when I started tearing up and crying for no real reason, then started feeling nauseous so I closed my eyes. Suddenly I felt like I had been given a shot of adrenaline out of nowhere so I'm just trying to figure out if it's nerves or a physiological response to something. I'm trying to control my breathing but having a hard time breathing. Then the fever hit. The most intense flash of heat. I was hyperventilating. I couldn't open my eyes or move or make a sound, I could just sit there struggling to breathe. My phone was in my hand and I couldn't lift it. I just simply didn't have the strength or energy to move. At some point I legit thought I was about to die. I managed to angle my wrist so I could check my heart rate with my watch. It was 47bpm. I was fading away but I made myself get control of my breathing and forced myself to take long deep slow breaths. It hurt, and I felt like passing out, but I kept doing it. Fever turned into chills and then I soaked through my jeans and T-shirt in under a minute. I was finally thinking clearly and breathing and getting oxygen. Everyone else near me was fine. Nobody checked on me the entire time including the 3 people who sat there and watched me suffer through this. I told the pharmacist about my reaction and asked if it was normal and didn't receive any indication that I should be concerned, so I went home since I felt better. It wasn't until my friend pointed out that this sounds like anaphylaxis that I thought I should report it. So here I am. Hopefully I'll be okay.
1283733	5/3/2021	NJ	60	M	3/18/2021	4/1/2021	on April 2nd patient woke up at around 4:30 am and complained of pain in his back. I rubbed his back and he wondered if it was just something he ate. He then tried to calm down and got back into bed. He was holding my hand when suddenly his hand felt cold. I turned on the light to find his eyes rolled back and he was gasping his last breath. This was about 5:20 AM. Patient was a healthy active man.

1283068	5/3/2021	AK	93	M	2/17/2021	2/18/2021	Hi, my name is, I'm a RN and am submitting this report about my grandpa. I took him into the VA to get his second covid vaccine on 2/17/21. At that time my grandp lived semi-independently in a house between my parents and my uncle . He didn't get out very much but with some help of grocery shopping and organizing his medication he was still able to live alone and function well independently. My mother reported to me on 2/18/21 that my grandpa was confused, weak and tired. My grandpa has never had any signs of dementia. At this time he developed a delerium that waxed and waned. He complained of headache, no appetite and extreme weakness. On 2/23/21 he fell down in his house and we decided to move him into my uncles spare bedroom to keep better eyes on him. The delerium persisted and on 3/5 he was taken to Hospital for a workup for his delerium and weakness. There he saw Dr. an internal medicine doctor at hospital. The workup showed an elevated BNP (probably baseline but I'd have to look at previous lab results) but nothing further. We opted not to do further imaging and instead take him home. It became obvious to me that this was the end of his life and so I requested a hospice referral from Dr. My grandpa died on 3/24/21.

1282902	5/3/2021	CA	62	F	3/31/2021	3/31/2021	After injection I too seat to wait 15-20 minutes. Immediately I started to lose peripheral vision and then my hearing....I called for help. They took me in a room to lay down and said my blood pressure had dropped vary low. After an out of doing better I just needed t get home. So another hour passes and I get home, go directly to bed and what seems like a bad flu begins. That night my temperature continues to climb, the aches and headache are horrible. I continue fevers for 3 nights. Feel a little better and then with 2 days it relapse and all starts again. I am in bed for 1 and 1/2 weeks, then stay home due to continued headache, dizziness. After 3 weeks the dizziness continues and I then start getting an aching pain in the back of my left leg. Seeing my doctor on May 11th and hope to discuss.
1282756	5/3/2021	LA	39	M	5/3/2021	5/3/2021	Almost vasovagal syncope. Vaccine administered at 11:00. Vasovagal symptoms present at 11:03. Profuse sweating, decreased ability to see (tunnel vision), ringing in the ears (subsequent hearing loss). Fainting did not present, and symptoms completely subsided at 11:08.
1282449	5/3/2021	CA	37	F	4/9/2021	4/17/2021	I woke up in the morning with a tiny bruise under neat my left eye. I do have a photo. It disappeared the day after.
1283212	5/3/2021	KS	47	F	5/1/2021	5/2/2021	At 7;30 am on May 2nd, I had blurry vision, dizziness, pressure on my chest and neck and difficulty breathing, ?blue? face color. My entire body was painful when moving. Difficulty breathing became extreme and I passed out. My husband called 911. I regained consciousness and was breathing with difficulty when paramedics arrived. Symptoms disappeared without treatment shortly after I was admitted to the ER around 8:20 am. After an additional day of fever and body aches, all symptoms have now disappeared.

1283712	5/3/2021	WV	31	M	5/3/2021	5/3/2021	Pt scheduled appointment for and received correct J&J Covid Vaccine that was requested. There were no issues with processing nor provision. PT advised RPH that he had a problem with needles and experienced low blood pressure every time he was vaccinated or had blood drawn in the past but had done better the last time and did not want to miss out on getting the vaccine. RPH was prepared and patient was cared for properly. Pt arrived at 1244 hrs and was provided vaccine at 1247 hours. Patient was fine for about 1 minute and then reported he was having trouble. Pt remained seated in booth in chair with room to get to floor if needed. RPH remained with patient, brought his significant other into the booth to help calm the patient as he was alert and orientated and continued to improve while removed mask and fanned with papers (pt stated the fanning was helping). Pt was improving slowly and moving/trying different positions as he felt he was improving. At approx 1325 hrs pt knew he needed to lie down and moved himself to floor with the assistance of his significant other and associate (did not fall nor did head impact the floor at any time). Code White was called. PT remained alert and orientated and was talking and stated that this was really helping. Code Team arrived and pt was continuously monitored until he gradually returned to his feet and was able to leave under his own power. Pt refused medical attention and refused Ambulance - never lost consciousness so no EMT was called. Pt's significant other was able to drive them home. Event concluded at approximate 1345hrs.

1279896	5/2/2021	IL	37	F	4/17/2021	4/19/2021	I had hives since getting the first dose that hadn't gone away. After getting my second dose, I still had the hives and I woke up in the middle of the night and they had spread; I had them on my upper legs, my butt, my stomach, my back, my arms.... I went back to bed and managed to fall asleep. I was then woken up by my husband who informed me that my eyes were a little swollen and my lips were quite swollen. I had been told when I got my second dose to go to the ER if I had any swelling on my face, so my husband drove me to the ER. They admitted me and gave me Prednisone, Pepcid and Benadryl intravenously; I was at the ER for about five hours before I was sent home with a nine day prescription for Prednisone and a prescription for an Epi-Pen; the doctor also told me to take one or two Benadryl every six hours for 24 hours. Two days later I had an appointment with an allergist who told me to start taking two Allegra in the morning and two Zyrtec in the evening. She also prescribed me Doxepin to help me sleep (I hadn't been sleeping well because the itching was keeping me awake). Two days after that I had a follow-up appointment with my GP. She was on board with everything the allergist said.

1279745	5/2/2021	NY	57	F	1/31/2021	2/7/2021	Headache, cold, eye lid got big with pain and not closing properly, pain in back of left ear with riggings, left face switch to right side, unable to hear properly, unable to talk properly on 3/4/2021 but left face switch still persiste on 5/2/2021 Treatment with Valacyclovir and prednisone
1279644	5/2/2021	NY	26	F	5/1/2021	5/1/2021	Immediately agter receiving the shot I broke out into a sweat and began to feel lightheaded. My eyes started to blur like I could pass out. The pharmacist/doctors at CVS gave me some water and told me to elevate ny legs. After 10 minutes they checked my temperature and blood pressure. I stabized somewhat and when home. I was sure it it was my nerves but something did feel right. I had a slight burning in my chest and felt queezy on/off throughout the day. Chills and hot flashes followed. I was anxious and paranoid about the possibility something serious could be wrong with me. I felt shooting pains in my lower left abdomen that nught and the next day. The following day I still felt very weak. My arm hurt. My muscles felt like jello and I?m unhappy. I wish I never got the shot and I?m worried about my body?s reaction to it.

1279406	5/2/2021	NC	47	U	3/26/2021	3/26/2021	scared; swollen face, neck, throat, eyes, lips; swollen face, neck, throat, eyes, lips; swollen face, neck, throat, eyes, lips; terrible headache pressure; terrible headache pressure; spread to face with eyes swelling shut, lips tingling; burning flush and itchy; spread to face with eyes swelling shut, lips tingling; burning flush and itchy; spread to face with eyes swelling shut, lips tingling; burning flush and itchy; Burning flush; flush; worse/symptoms worsen; delayed drug sensitive; itching limbs; took the first dose on 16Mar2021 and the second dose on 26Mar2021; took the first dose on 16Mar2021 and the second dose on 26Mar2021; This is a spontaneous report from a contactable consumer (patient). A 47-year-old patient of an unspecified gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), second dose via an unspecified route of administration, administered in the right arm on 26Mar2021 12:45 (lot number and expiration date were not reported) as single dose (at the age of 47-years-old) for COVID-19 immunisation, administered in a pharmacy/drug store. Medical history included epstein-barr virus infection (EBV infection), high blood pressure (BP), exercise induced asthma and allergies to penicillin; all from an unknown date and unknown if ongoing. Concomitant medications included metoprolol succinate at 25 mg and hydrochlorothiazide, losartan potassium (LOSARTAN/HYDROCHLOROTHIAZIDE); both taken for an unspecified indication, start and stop date were not reported. The patient previously took tetracycline, prednisone and methylprednisolone acetate (MEDROL) and experienced allergies. The patient had no other vaccine in four weeks. The patient did not have COVID prior to vaccination and has not tested for COVID post vaccination. The patient took the first dose of BNT162B2 first dose on the right arm, on 16Mar2021 12:00 (at the age of 47-years-old, unknown lot number and expiration date) for covid-19 immunisation. The patient took the first dose on 16Mar2021 and the second dose on 26Mar2021 (pending clarification). The patient was given the shot on Friday (26Mar2021) noon/pm. The patient experienced the events starting on 16Apr2021 at 6 pm itching limbs. Saturday morning (17Apr2021), worse known delayed drug sensitive. The patient took 2 BENADRYL, every 4 hours. On Sunday (18Apr2021), the patient felt okay and discontinued BENADRYL. "Urgi" med Monday evening (19Apr2021) spread to face with eyes swelling shut, lips

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							tingling; burning flush and itchy. The patient was given dexamethasone shot and given prednisone. The patient forgot that the patient was sensitive and called doctor for advice. The patient was advised to keep on with the BENADRYL at first sign of distress call. On Tuesday (20Apr2021), the patient was in distress and sent to ER because the patient felt there was no alternative treatment other than prednisone. "Urgi" doctor agreed to send the patient out of ER with MEDROL pack assuring it was fine. The patient took the first MEDROL with BENADRYL. The patient woke up Wednesday (21Apr2021) morning feeling okay. Took MEDROL without BENADRYL. By Thursday morning (22Apr2021), the patient was rushed to doctor with a swollen face, neck, throat, eyes, lips with terrible headache pressure. Another "dex shot" was given. Followed by oral "dex", ZYRTEK 2x BENADRYL as needed. Last pm, the patient was back at ER and was told that unless the patient had to inject themselves and called, the patient will not be admitted. On Friday (23Apr2021), day 7, BENADRYL wears and symptoms worsen. The patient was scared. The patient's adverse events resulted in a doctor clinic visit, emergency room and was considered a life-threatening illness by the reporter. The patient has not recovered from the events. Information on the lot/batch number has been requested.
1279968	5/2/2021	NJ	18	M	5/2/2021	5/2/2021	The patient received the vaccine and waited in the room while the parent received the vaccine. The patient then walked to sit in the waiting area, lost vision while walking, sat down, eyes began to roll, and the patient passed out momentarily (less than a minute). Was moved to an area to lie down and remained there for approximately 15 minutes.

1280794	5/2/2021	VA	16	M	5/2/2021	5/2/2021	Patient came into the immunization room for his shot along with his mom. He did state he hated needles, but was in good spirits. He got the shot, I filled out his card, and directed him and his mom to sit in the waiting area for 15 mins in case of dizziness or a reaction. They were walking out of the room to the waiting area and he almost immediately fainted. He fell and possibly hit his head on the chair/ floor when he went down. (This was maybe 2 mins post-injection). He almost looked like he was going to have a seizure (arms were tensed up, his eyes were not focused, was starting to shake) but then he suddenly came-to. He seemed to be pretty coherent after he woke back up but 911 was called since he was bleeding

1279431	5/2/2021	VA	60	F	1/15/2021	2/21/2021	Unspecified Cardiac Event; This is a spontaneous report from a contactable consumer (Patient's Daughter). A 60-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Solution for injection, Lot number: EK4176), via an unspecified route of administration on 15Jan2021 at single dose for COVID-19 immunization. The patient also received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Solution for injection, Lot number: EK4176), via an unspecified route of administration on 05Feb2021 at single dose for COVID-19 immunization. Medical history included chronic obstructive pulmonary disease from an unknown date to 21Feb2021, brain aneurysm, smoker. Family medical history included States her Grandfather had skin cancer, but it was benign, moles and then freeze them off. No cardiac events. Grandma passed away infection from knee surgery. The patient received a Prior Vaccinations within 4 weeks has received both doses of the Pfizer Covid Vaccine. Concomitant medication was not reported. On 21Feb2021, patient experienced unspecified cardiac event. Caller stated that she was calling in regards to her mother regarding the Covid19 vaccine. States she was instructed by the pathologist to call Pfizer directly, rather than just report on VAERS. States this was not the same pathologist as the one that did the autopsy. Caller states does have a copy of the autopsy. States she called several pathologist to get the autopsy done. Dr. called her back after it had been done, and the caller discussed with him, the patient passed away after some cardiac event. States it is not clear what cardiac event. States she passed away 16 days after receiving her second dose of the vaccine. States the patient's physician would be happy to talk to Pfizer about it. Reporter states her mom was an LPN there and they all know her. States anyone there is fully aware of who she is. States some people in the office are taking it hard, and they may get sentimental. States it helps if people get things business and not talk about feelings. Reporter states it was 8:50am when the EMTs arrived and she had already passed. Caller states was who did the autopsy. She has been speaking with a lady, but she goes by (university name). States (Hospital Name) is a hospital, it used to be (University name). Hospital. Reporter states (phone number) is a direct line to (university name).

---

Reporter states when the autopsy results came back she had the original and they are sending another because of the cause of death. Reporter states the autopsy showed no Pulmonary Obstruction, which made them question, well did she have COPD? States it was interesting because her mom was a smoker but her lungs were pink, and there was no fluid or obstruction in her lungs. States her mom taught her a little bit growing up. Reporter states she was going to be a nurse too but she lost her grant because she got married, now she doesn't qualify. Caller stats an autopsy was done; however they did not do a toxicology report. Caller states that patient was an organ donor. States she received a letter from them stating the patient will be helping a lot of people with skin grafts. Reporter adds, the patient was negative for Covid, she had to be tested for the autopsy. States she died from some type of cardiac event. States the patient did have COPD but on the autopsy, her lungs were clear and there were no pulmonary obstructions. States the liver showed possible hypertension, but the patient did not have hypertension. Reporter states there are some interesting things with her autopsy report and the patient's PCP could go over it medically if necessary. Reporter states this morning she saw several articles that state heart inflammation has been linked to the vaccine. Caller asks if she still needs to report it through VAERS? States she should have done it in the beginning but her mom was a big supporter of the vaccine. Reporter states her mom was on Facebook, and someone stated they weren't sure about getting the vaccine and her mom had commented, well she just got her second one, let's see what happens and then she died 16 days later. States that is why she was hesitated to report it. States the Pathologist encouraged her to call in and report it. Caller states she does not know if her mom had any other adverse events. States she will not say a word about things unless it gets really bad. Reporter states the only person that would know is Dr. meant a lot to her mom and she would be willing to tell her doctor, but not her daughter because she wouldn't want her to worry. Caller states the patient never used her inhaler, it is still full. States she took her mom's purse because her mom lived out of her purse, everything she needed was in there. Reporter states the patient had Tylenol, Sudafed, Advil, and Prednisone in her purse. Reporter states she knows

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							<p>she wasn't taking Prednisone. States the pill box is locked and it looks like it hasn't been open in a while. Reporter states she does not know if she was taking any medication, Dr. may have more information. Reporter states no, she didn't go to the doctor or the ER. States the patient's dog woke up her stepdad and she had already passed away. States they have her dog and he is going through a lot, when she first passed the dog had aggressive tendencies, and when she would lay with him, he would nudge her to get up. He doesn't like it when people go to sleep and that makes it harder. States the dog ended up getting an eye infection, because his tear ducts were clogged, states he did that a couple weeks, and now he is getting better, not as fearful or aggressive. Reporter states when her mom had the brain aneurysm, it takes a little bit longer for anesthesia to wear off. States it was an extremely strong anesthesia that she had never had before. States she wouldn't let anyone take care of her except for her. States when she was under anesthesia, she would call her mom. States they would know when she said mom, she was talking about her daughter. States her mom said she looks like her grandma when she was younger. Consumer adds the patient's husband's contact information, in case it is needed. On 21Feb2021, the patient died due to cardiac event secondary to COPD. Autopsy was performed. Autopsy details was available. The outcome of the event was fatal.; Reported Cause(s) of Death: Cardiac Event Secondary to COPD</p>

1280744	5/2/2021	MN	41	M	4/7/2021	4/13/2021	12 hours after injection, experienced normal side effects (e.g., muscle aches, chills, headache, fatigue) Within 1 week of receiving the vaccine, I began to experience blurriness in my left eye. After conferring with my primary care facility, it was recommended that I see an ophthalmologist. Confirmed that I had a Branch Retinal Vein Occlusion (BRVO) and recommended I meet with a retinal specialist. Dr. confirmed the BRVO was caused by a blood clot and commenced treatment via eye injection. I then met with my primary physician to discuss the situation. He recommend further tests to determine whether I had other clotting. In addition to blood work, he order MRIs of my brain, head and neck region and also recommended that I meet with a thrombosis specialist. I met with a Dr. who ordered additional blood work for additional testing. All tests performed to determine if I had additional clotting have come back negative.
1280553	5/2/2021	MD	60	F	4/5/2021	4/13/2021	Hives, swelling, pain at injection site eight days after injection; started taking Benadryl; went on to get hives on body 24 hours later then started with severe migraines; was sick for five days. Six days later I noticed a blind spot in my left eye field of vision which was diagnosed to be Optic Neuritis for which I have been hospitalized and treated for and have been very ill since.

1280492	5/2/2021	NY	16	F	5/2/2021	5/2/2021	16 y/o female with NO PMH and no h/o similar prior experiences/syncope c/o "feeling tired" ~3 min after receiving the 1st dose of pfizer vaccine. Pt LOC, "gently" falling onto the floor, landing on her face ~5 min after receiving the vaccine. Pt reported feeling tired before LOC, not associated with any other symptoms (dizziness, changes in vision/hearing). LOC lasted ~10 seconds, pt immediately returned to baseline. She was sat up with the help of her mother and nurse and the clinical lead was notified. Pt was laid down on a cot, VS were taken, ice was applied to her pressure points. Pt reported complete resolution of symptoms within ~5 min. Pt was progressively moved from lying down to sitting to standing. Pt denies eating or drinking anything today and was given fluids and snacks. Pt was monitored for a total duration of 45 min. Pt was driven home by parents. Pt was advised to eat and hydrate today and for the next dose. Pt and parents were advised to call PCP / 911 if symptoms return/persist/worsen or if pt develops concussive symptoms. Pt was instructed to inform the nurse that she fainted ater 1st dose and to prophylactically lay down prior to receiving prior to second dose vaccination.
1280173	5/2/2021	OR	43	M	4/30/2021	4/30/2021	I thought I was going to get the first shot of the Moderna vaccine, it wasn't until the needle was in my arm that I was told I had received the Janssen vaccine. At approximately 4:46pm I developed a strong pain at the injection site. At approximately 8pm I began to run a fever and feel extremely fatigued. My back and all my joints started to ache, I was sweating but also freezing cold. I had a dull, throbbing pain in my testes. I had pain in my scalp, my eyebrows, my ear lobes, my fingernails, my toes and toenails, the soles of my feet hurt. Least of all I also had a headache. I took 500mg Ibuprofen for the pain. Now, almost 48 hours later I still have a low grade fever, still have considerable pain at the injection site, still have a headache. The remaining symptoms dissipated on 5/2/21 at about 12pm. Took another 500mg Ibuprofen for breakfast, but otherwise have had no appetite since receiving the vaccine.

1280289	5/2/2021	TN	33	F	4/9/2021	4/9/2021	I was very ill on Friday night after receiving the vaccination. Flu-like symptoms, high fever, shortness of breath, pain in my abdomen, horrible headache, nausea, dizziness, loss of consciousness and leg pain (both legs). The flu-like symptoms passed on Saturday, but by Tuesday, April 13 I was continuing to have a terrible headache, abdominal pain and leg pain. I saw my primary doctor on the 13th and was sent over to the hospital for an ultrasound of my leg. No clots were found and I was told to continue trying to recover at home unless it got worse. I was seen at the emergency room on April 14th for abdominal pain, leg pain, dizziness and headache. The nurse told me I was probably hysterical over the vaccination being pulled, and I told him this was not the case. They performed CT (without contrast) on my abdomen and head, then released me with instructions to return if I was worse. By the 16th I was unable to walk as my left side was completely numb. I went back to the ER. I had a CT of my abdomen and head with and without contrast. I had a lumbar puncture and several labs. I was given IV antibiotics for some infection they found in my urine. I was given fluids and pain meds, and my BP was shooting up to 145/94 (which is very high for me), when standing. My vision was blurry and I was unable to remember much of the last week. I was admitted from the 16th through the 20th and had an MRV, 2 MRIs, more lab work and medicine for my headache. I was released on the 20th and the headache was unbearable and I was still numb on my left side, going back to my doctor on the 22nd. He suggested the ER, and the ER admitted me back to the stroke unit. I was released on the 22nd with a diagnosis of a hemiplegic migraine that could cause stroke-like symptoms (ZERO history of headaches previously). I was sent home with a walker and home health services. PT visited on April 30th and ordered two visits per week for the next month. I am unable to walk without a walker. I cannot shower or use the stairs without assistance. My memory is still foggy. I am unable to concentrate for long. I often stutter and can't remember basic words. I have also stopped and forgotten where I am at a given moment. I am on Depakote nightly for the headaches, and they have lessened slightly, but when they flare up it is debilitating and I often vomit. I have instructions to follow up with my primary tomorrow morning and see

							what the next steps are.
1280215	5/2/2021	TX	66	M	5/2/2021	5/2/2021	Patient was administered the Johnson and Johnson Janssen COVID-19 vaccine. Shortly after, a few seconds, the patient stated he felt flushed and head started to fall back. Staff member cradled his head and called another staff member over. Staff member called 9-1-1. Patient went unconscious and his eyes rolled back for approximately 30 seconds. When aware, we (staff members) transferred patient from the chair to the floor where staff member supported his back and fanned him due to his profuse sweating. Staff member continued talking to him when he became unconscious again, this time gasping for air and turning pale. We kept saying his name until he came to again and was somewhat aware of his surroundings. He fainted one last time. After this time, he sat up on his own and seemed to be very coherent. The EMS arrived shortly after and took over. They said they would take him out to check him out but he seemed to be doing better. An EMS personnel let us know the patient did tell him that he has fainted from vaccines before. However, he did not disclose this to us on the PQCF form or when asked verbally.
1280177	5/2/2021	NC	17	F	5/2/2021	5/2/2021	Patient said she was feeling dizzy, vision was blurry, sweeting. Was able to breath, asked for water which was given to her. She had some rash on the face, provided diphenhydramine liquid 50mg. She was feeling feverish, took tylenol.
1280345	5/2/2021	GA	48	M	4/10/2021	4/10/2021	Patient reports, on the afternoon after the vaccine, he started to feel weak, and had some discomfort with blurry vision in both eyes with pain and discomfort in his right eye. He continued to work. On 4-11-21, he went to work feeling weak with pain/discomfort in his right eye with blurry vision in both eyes. The pain was so much with blurry vision that he had asked someone else to take him to the airport to travel back home. He traveled back home via airplane. On 4-12-21, his condition did not change. He consulted with his Commander and unit staff, and would go see an eye doctor. He was seen by a civilian eye doctor on 4-15-21, 4-16-21, 4-27-21, and military doctor on 5-1-21. He was diagnosed with Anterior Uveitis, pupils unequal, pupil bound.

1277009	5/1/2021	NM	38	M	4/5/2021	4/8/2021	hives all over; This is a spontaneous report received from a contactable consumer (patient's wife). A 38-year-old male patient received the 2nd dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EP6955, expiration date: 30Jun2021) via an unspecified route of administration in the arm right on 05Apr2021 11:16 AM as a single dose for covid-19 immunisation. Medical history included ongoing asthma since he was born and eye surgery from 05Mar2021. Concomitant medications included prednisolone acetate from 05Mar2021 after eye surgery. The patient previously received (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN6202, expiration date: Jun2021) on 15Mar2021 11:16 AM at 38 years old for covid-19 immunisation. The patient received his second Covid 19 vaccine on 05Apr2021 and the hives started on 08Apr2021. The patient had hives all over. The hives did get worse overnight. The patient had gotten hives when he was younger but it was a reaction to a plant. The hives he had currently have not gone away even with a shower or taking Benadryl. He took 2 25mg tablets of Benadryl within an hour of each other yesterday, 08Apr2021. Then about 9 hours later he took 2 more 25mg tablets. He was going to sleep so he thought the Benadryl (lot number: SEF004, expiry date: Dec2021) would help with that. The patient had no questions except if her husband needed to go to the doctor. The AEs did not required a visit to Emergency Room, no physician office. The patient had no Prior Vaccinations (within 4 weeks). Outcome of the events was not recovered. No follow-up attempts are needed. No further information is expected.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1276916	5/1/2021	FL	72	M	2/17/2021		<p>eye swelling; he had an allergy to the Covid 19; This is spontaneous report received from contactable consumer (patient) reported for himself. A 72-year-old male patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot number: BUD1230, Expiry date: unknown) via an unspecified route of administration, administered in left arm on 17Feb2021 (age at vaccination was 72 years) at a single dose for COVID-19 immunisation. Medical history included high blood pressure. Concomitant medications included amlodipine (AMLODIPINE) and atenolol (ATENOLOL). The patient previously took first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot number: EL1284, Expiry date: unknown) via an unspecified route of administration, administered in left arm on 11Jan2021 (age at vaccination was 72 years) at a single dose for covid-19 immunisation. The patient has taken both doses. No additional vaccines were administered on same date with the Pfizer vaccine considered as suspect. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with any adverse event. In the original report caller stated that the patient reported he had an allergy to the Covid 19 vaccine 4 days after the first Covid 19 dose. He went to an allergist and the doctor asked him to wait 6 weeks until he took the second Covid 19 dose. After he received the second Covid 19 vaccine he had the same type of reaction as the first. The reaction was bumps on his scalp. Nothing major. He had taken Prednisone, Zyrtec at night, and Allegra in the morning. He recently has had bloodwork done and that bloodwork was sent to a lab. His concern was that lab results showed that he had a negative IGG serum so he doesn't have any Covid 19 antibodies. A culture was not performed. On an unspecified date, the patient also experienced eye swelling. The patient visited emergency room and physician office. The patient is a chemical engineer, not a biologist, but his theory is whether his immune system is keeping him from developing the antibodies. He doesn't know what to do now. He asked if he's protected. He asked if he should take a different type of Covid 19 vaccine that is not an mRNA vaccine. He was going to see his allergist again next Tuesday, 06Apr2021. He says there are people who</p>

---

developed the Covid 19 vaccine and he wants to call someone else and report his case. Someone who will pay attention to his case. None of the doctors that he visits have an answer about his allergy. He was taking the Prednisone after the first vaccine. He now takes Allegra in the morning and Zyrtec in the evening and that helps him. He also uses Cortisone10 cream where he has the bumps on his scalp. When he does that the number of bumps slowly disappear. No more swelling on the bumps. The bumps are on his scalp. He stopped using his shampoo and now uses baby shampoo. He reports after the first Covid 19 vaccine he didn't have a fever or felt tired, he didn't feel anything, just the bumps on his scalp appeared. He asked why he had no reaction right away after the first Covid 19 vaccine. He reported that it was 4-5 days after the first Covid 19 vaccine. He doesn't know if it's the allergies or his immune system. After he stopped taking Prednisone, he continued to take the Allegra and Zyrtec and the bumps went away but then they appear in a different location. The bumps don't hurt or itch. In his original report he states he had enquired if he should get the second Covid 19 vaccine and he never received an answer. He continued to do everything he did before getting the Covid 19 vaccine. He still exercises, he bikes, he plays tennis. He's not tired or anything. When probing concomitant medications, he reported that his doctor recently changed his blood pressure medication from Losartan 25 mg to Amlodipine 2.5 mg. As a chemical engineer, and he's not a biologist, but he did the antibody test and he thought, what is his immune system doing. Whether his immune system is protecting him from the mRNA. He doesn't know. He would like someone who has the knowledge to answer his question. The outcome of the events was unknown. No follow-up attempts are needed. No further information is expected.

1276879	5/1/2021	TX	33	F	3/27/2021	3/1/2021	hangover like headache; hangover like headache; right eye was swollen and painful; right eye was swollen and painful; This is a spontaneous report from a contactable physician, reporting for herself. A 33-year-old non-pregnant female patient received the second dose of the bnt162b2 (BNT162B2), via an unspecified route on 27Mar2021 at a single dose of administration for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. There were no allergies to medications, food, or other products. The patient previously received the first dose of the bnt162b2 on 06Mar2021 at a single dose for covid-19 immunisation. No other vaccines administered within 4 weeks prior to the immunization. In Mar2021 (reported as 01Mar2021), the patient experienced hangover like headache for one day and morning right eye was swollen and painful, which required physician office visit. The events were further described as: hangover like headache for one day, resolved by next day, Monday morning right eye was swollen and painful. Therapeutic measures were taken in response to the events. There was no covid-19 prior to or post vaccination. The clinical outcome of the events was recovering. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

1277295	5/1/2021	FL	68	M	2/19/2021		<p>brain fog; vicious chills; Really Hot; This is a spontaneous report from a contactable consumer (patient). A 68-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN6100 and expiration date not provided), via an unspecified route of administration, in arm right, on 19Feb2021 (at the age of 68-year-old), at single dose, for COVID-19 immunization. Medical history included ongoing asthma, brain injury, concussions (patient stated he had three. The most severe was three years ago. Patient stated he was knocked completely unconscious and was unconscious for a while), pneumonia from 1980 to 1983. Patient got pneumonia back in the 1980s, around 1983; and after that he had asthma. Patient was having issues seeing things as he went to the eye doctor today and they dilated his pupils. Concomitant medications were not reported. Patient previously took first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN5318 and expiration date not provided), via an unspecified route of administration, in arm right, on 29Jan2021 16:00 (at the age of 68-year-old), at single dose, for COVID-19 immunization; and experienced brain fog and tired. The patient experienced brain fog, vicious chills, and really hot. Patient stated that he also had 1-2 instances of vicious chills and 1-2 instances of being hot. Patient said the hot and chills definitely happened after the second vaccine. Patient stated it happened somewhere in the 7-10 days after the vaccine and then was gone. Patient had brain fog after first dose vaccine. It never went away completely. After the second injection the brain fog returned stronger again. Patient stated that if he was not able to function; at it's worst he would rate it as a 6. Patient said he could function but would be working and be in the middle of an email and typing and would get lost in the middle of a sentence. Patient said it had improved; as of now he would rate it as a 3-4 on the same scale. No additional vaccines administered on same date of the Pfizer suspect. The outcome of the event "brain fog" was recovering; of events "vicious chills", "really hot", was recovered on unknown date. No follow-up attempts are possible. No further information is expected.</p>

1277010	5/1/2021	TN	56	F	4/7/2021	4/8/2021	Left side face swelling; This is a spontaneous report from a contactable consumer reported for herself. This 56-year-old female patient received the 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN6207) via an unspecified route of administration in the left arm (reported as "left shoulder") on 07Apr2021 13:00 as a single dose for covid-19 immunisation. Medical history included asthma diagnosed as a child. The patient stated it's not ongoing, it's more during seasonal allergies. She took Singulair to help. Concomitant medications were unknown. The patient had Pfizer covid19 vaccine on Wednesday 07Apr2021 and left side face swelling yesterday on 08Apr2021. It's on the left side of the face. It started around the eye and currently she can feel it running down the side of the face. Left side face swelling was reported as worsened. The patient asked if she would be okay to get the second vaccine. She stated she was not in pain, but was concerned that she won't be able to get the second vaccine. She had not treated the swelling yet, and was not sure if she should see her doctor. She was scheduled for the second dose of the vaccine. The patient had no prior Vaccinations (within 4 weeks). Outcome of the events was not recovered. No follow-up attempts are needed. No further information is expected.
1275923	5/1/2021	CO	27	F	4/30/2021	4/30/2021	Immediately after the injection I felt light headed. Soon I could not see (very blurry vision) and I could not hear (like drowning in water). I then started to sweat profusely from every inch of my skin. I couldn't catch my breath. I was handed water and told to sip on it, which proved difficult when my throat started to feel like it was swelling up. After about a 15 minute ordeal, it was like nothing ever happened. The only symptom that remained, was sweat soaked clothes

1277209	5/1/2021	NJ	61	F	3/19/2021	3/19/2021	severe vertigo; fall down on the floor; nausea; horrible spinning; vomited; dizzy; generalized weakness; brain fog; a little tired; a little off; Fatigue; sore arm; couldn't eat; couldn't open her eyes; nystagmus; couldn't walk at all without help; This is a spontaneous report from a contactable consumer, reporting for herself. A 61-year-old female patient received the second dose of the bnt162b2 (BNT162B2; Lot Number: EN6208; Expiration Date: Jun2021), via an unspecified route of administration in the right arm on 19Mar2021 at 13:30 at a single dose for covid-19 immunisation. Medical history included ongoing celiac disease diagnosed in 2012 and has been gluten free ever since, allergies, and anxiety. Concomitant medications included zolpidem tartrate (AMBIEN) taken for sleep; cetirizine hydrochloride (ZYRTEC [CETIRIZINE HYDROCHLORIDE]) taken for allergies; alprazolam (MANUFACTURER UNKNOWN) taken for anxiety; vitamin d nos (MANUFACTURER UNKNOWN) taken for immune system health; and magnesium (MANUFACTURER UNKNOWN) taken for health. The patient previously received the first dose of the bnt162b2 (Lot number: EN6203) at 61 years of age on 26Feb2021 between 5:15PM and 5:30PM in the left arm at a single dose for covid-19 immunization and the flu vaccine (INFLUENZA) for immunization 15 years ago and experienced arm was sore. There were no other prior vaccinations within 4 weeks. On 19Mar2021, the patient experienced sore arm. On 21Mar2021, the patient experienced a little off, fatigue, brain fog, a little tired. On 31Mar2021, the patient experienced severe vertigo, fall down on the floor, nausea, vomited, horrible spinning, generalized weakness. In 2021, the patient experienced couldn't open her eyes, couldn't eat, nystagmus, could not walk at all without help. On an unknown date, the patient experienced dizzy. The events, severe vertigo, fall down on the floor, nausea, vomited, and horrible spinning, required emergency room and physician office (video) visits. The patient was hospitalized for severe vertigo, fall down on the floor, nausea, vomited, and horrible spinning from 31Mar2021 to 02Apr2021. The clinical course was as follows: the patient received the second dose on 19Mar2021 and she didn't really have any bad side effects, a sore arm, and a little tired on the second day, maybe a little off but was fine. 12 days later she was vacuuming and had severe vertigo, she was

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

down on the floor, just horrible spinning, horrible nausea and laid on floor and vomited all day. Her doctor told her to go to the ER. They did all kinds of tests with unknown results on an unknown date and she could not open her eyes for 2 days, she was so violently spinning with vertigo, they gave her fluids. She went in on Wednesday and by Friday she was a little better, she could open her eyes, still had spinning and vertigo. It was like nystagmus, her eyes were, she just really couldn't open her eyes for the doctor, had generalized weakness and couldn't walk at all without help in the hospital. The only time she moved from one position was to go to the bathroom with assistance. In the ER, she could not get up out of bed the first night they were trying all ways of catharizing her. She could not even get out of the bed with the help, they had to carry her to the CAT scan with negative result on 31Mar2021. She had slightly improved but still had vertigo and she was not vomiting anymore, that was only the first couple days. She was sent home with medications for dizziness and nausea but they didn't do anything. Two weeks later she was still dizzy, had vertigo, it was way better than it was, she can open the windows a little bit but she was basically in a dark room for like the first week and a half. Not violent like it was the first couple of days. The events were further described as: she was a little sore on 19Mar2021, 20Mar2021, 21Mar2021, and maybe the 22Mar2021 her arm was still sore. She clarified the sore arm pretty much ended on the 22Mar2021. She was surprised she felt fine on 19Mar2021 and 20Mar2021 and on the evening of 21Mar2021, in the middle of the night between 20Mar2021 and 21Mar2021 she felt a little off and a little more tired. On 21Mar2021, she didn't feel great, fatigued and brain fog but was fine after that. She began feeling a little off and a little tired early morning on the 21Mar2021. That was pretty much gone by the 22Mar2021. The feeling tired and a little off and the brain fog and fatigue went away 22Mar2021. She vomited constantly, started suddenly and violently and was incapable of moving, all she did was vomit and lay on the floor. It was a complete 360, she was fine vacuuming a minute before and then suddenly got dizzy and went down and could never get up. She had to be taken from upstairs in her house and transported to the hospital. She was not really experiencing the nausea now, she was not completely

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

herself but she can eat, she couldn't eat for the first couple of days and was on IV fluids and once she got out of the hospital was able to eat a little and now eating almost normally. It took a week to eat normally and she couldn't eat holiday dinner on 04Apr2021. From 31Mar2021 to 10Apr2021, every day the nausea has slightly been improving. She was not quite herself and still has vertigo and was making herself eat her meals. She vomited 30 times and in the hospital they gave her an IV to stop that and never vomited in hospital, maybe once in the ER. She confirmed the 31Mar2021 was the last time she vomited. She had not recovered completely from nausea. She used be running around all the time, she would walk 10 miles per week to exercise, yesterday she had a mammogram scheduled and she was just so wiped out for doing something for the first time and had to lie down for the whole rest of the day. She was hospitalized from 31Mar2021 until the evening of 02Apr2021 when they let her out. She was given medication for nausea and dizziness didn't do anything. She was given ondasetron (ZOFTRAN), 4 mg and meclizine. Because of her weakness, the patient was checked to see if there was any brain bleed or brain stem problems that would explain the vertigo and did not find anything. The tests were negative for any brain problems on an unknown date. Lab data included: blood levels: low on vitamin d (probably because she was not absorbing nutrients as well) on an unknown date, endoscopy: unknown results on an unknown date, and MRI: negative on 01Apr2021. Therapeutic measures were taken as a result of severe vertigo, fall down on the floor, nausea, horrible spinning, vomited, and dizzy. The clinical outcome of the events, severe vertigo, nausea, generalized weakness, could not open her eyes, nystagmus, could not walk at all without help, was recovering. The clinical outcome of the events, fall down on the floor, horrible spinning, dizzy, was unknown. The clinical outcome of the events, a little off, fatigue, sore arm, brain fog, and a little tired, was recovered on 22Mar2021. The clinical outcome of the event, vomited, was recovered on 31Mar2021. The clinical outcome of the event, could not eat, was recovered in 2021. No follow-up attempts are needed. No further information is expected.

1276726	5/1/2021	PA	74	M	4/1/2021	4/23/2021	Loss of vision in left eye; This spontaneous case was reported by a consumer and describes the occurrence of BLINDNESS UNILATERAL (Loss of vision in left eye) in a 74-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. No Medical History information was reported. In April 2021, the patient received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On an unknown date, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 23-Apr-2021, the patient experienced BLINDNESS UNILATERAL (Loss of vision in left eye) (seriousness criterion medically significant). At the time of the report, BLINDNESS UNILATERAL (Loss of vision in left eye) had not resolved. Not Provided On 23-Apr-2021 (2 weeks after receiving the second dose), patient had loss of vision in the left eye. Concomitant product use was not provided by the reporter. No treatment was received by the patient. The patient received both scheduled doses of mRNA-1273 prior to the events; therefore, action taken with the mRNA-1273 in response to the events was not applicable. Company comment: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded
1277398	5/1/2021	CA	47	F	4/30/2021	4/30/2021	Systemic: Dizziness / Lightheadness-Medium, Systemic: Hypotension-Mild, Additional Details: Patient reported feeling lightheaded/dizzy ~5 minutes after receiving vaccine. She was given water and placed her head down while her boyfriend held her so she wouldn't fall over. 1st BP reading was taken ~8 minutes after the vaccine was given (87/38 and HR 49). Patient stated that her BP tends to run low. Had patient stay under our supervision for an additional 30 minutes. At the 30-min mark 2nd BP reading was taken (91/53 and HR 56). Patient reported feeling much better with symptoms resolved.

1277610	5/1/2021	IL	17	F	4/28/2021	4/28/2021	After a few minutes of receiving vaccine, patient reported dizziness, light headedness, and blurry/dots in vision. She then became more upset leading to hyperventilation and crying. She then said she had tingling in her fingers, which progressed to difficulty moving her fingers/stiff fingers, and coldness and redness in tips of fingers. She then reported she was losing sensations in her feet and legs. 911 was called. We tried to have the patient take slow deep breaths. We offered an ice pack and water up front and a heat pack for her fingers. Paramedics arrived. Her blood pressure, heart rate, oxygen saturation, glucose were within normal limits. She was given oxygen and the paramedic was able to help her slow her breathing. Her fingers went back to normal and she felt fine before leaving. She did not feel the need to go with the paramedics.
1277701	5/1/2021	NY	72	M	4/16/2021	4/16/2021	This was the second Moderna shot. Taken at 12 in the afternoon on April 16. By 5 o'clock my temperature went up to 104.0. I threw up was talking gibberish, eyes rolling back in my head. Could not stand on my own. Was incoherent. Could not dress myself. An ambulance was called I was taken to hospital.

1277192	5/1/2021	VA	17	F	4/7/2021	4/7/2021	<p>nausea; headache; began having left eye twitches and they progressed to spasms and the nose and left side of her face. It then included both sides of her face; pinching in her left shoulder; began having left eye twitches and they progressed to spasms and the nose and left side of her face. It then included both sides of her face; patient could not open her eye or control her face; her left leg had goosebumps and chills; her left leg had goosebumps and chills; This is a spontaneous report from a contactable consumer (patient's mother). A 17-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; solution for injection; Lot Number: ER8731) via an unspecified route of administration on 07Apr2021 at 15:15 (at the age of 17-years-old) as a single dose in the left arm for COVID-19 immunisation. Medical history included asthma from an unspecified date and unspecified if ongoing. Family medical history relevant to the adverse event was reported as none. Concomitant mediations included ethinylestradiol/levonorgestrel (JOLESSA) taken "to decrease her periods" from 2019 ("about two years ago") and ongoing and at an unspecified dose, cyclic, for three months straight with no placebo. Then takes a placebo pill for one week straight and biotin taken "for hair and nail growth" from an unspecified date ("she began taking within the last 6 months") and ongoing. There was no history of previous immunization with the Pfizer vaccine, there were no additional vaccines administered on the same date as the COVID-19 vaccine and there were no prior vaccinations within 4 weeks. It was not provided whether there were adverse events following prior vaccinations. On 07Apr2021 the patient experienced began having left eye twitches and they progressed to spasms and the nose and left side of her face. It then included both sides of her face, patient could not open her eye or control her face, her left leg had goosebumps and chills, pinching in her left shoulder, nausea and headache. The reporter called to report that her daughter had a severe reaction to the first dose of the COVID-19 vaccine. The clinical course was reported as follows: The patient received the first dose of the COVID-19 vaccine in her left arm. Less than an hour after receiving the COVID-19 vaccine, the patient developed goosebumps and chills in her left leg. The reporter was not very concerned about it at the time.</p>

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

About 9:00PM that same night, the patient started complaining of pinching in her left shoulder. The reporter was not too terribly concerned. By 9:30PM, that same night, the patient started to have left eye twitches. Then they increased to eye spasms, then the patient could not open her eye or control her face. Then, it progressed to patients nose and left side of her face. At that point, the reporter tried to contact a nurse with the health insurance advice line. She waited for 30 minutes. The patient's symptoms continued to get worse, so the reporter took the patient to the emergency room. While the patient was in the emergency room triage, while hospital staff were getting her blood pressure and temperature, her symptoms also started to involve the right side of her face. Around 10:15PM, that same night, the patient started to get nauseous and a headache kicked in. The emergency department took patient straight back to a room. The patient was not admitted to the hospital. The emergency department started an IV on the patient, and they administered Reglan, Benadryl, and Toradol to treat her symptoms. The emergency department ran blood tests, preformed a urinalysis and a CT scan. The reporter did not know what all blood testing that was done revealed; however, the reporter did know that they told her that none of the testing revealed anything and were all normal. The patient was eventually discharged from the emergency department at about 1:50AM. She was sent home with Butalbital, for headache and was advised to take ibuprofen. She was still having the twitching but not as bad when discharged. On 08Apr2021, the patient's symptoms had not completely subsided, but were significantly better. On 08Apr2021, the patient woke up with nausea, chills and a headache. The reporter expected the patient to have these side effects. The side effects continued until very late in the day on 10Apr2021. The patient never vomited, was only very nauseous. The reporter also stated that when the woman was administering the first dose of the COVID-19 vaccine, the woman said "oops" and it was not explained what "oops" meant. The reporter asked if it was possible that the patient received the dose subcutaneously and that was why she had these side effects. The reporter also stated that the second dose was scheduled for 28Apr2021 and she asked if the patient should receive the second dose. The clinical outcomes of the events began having left eye

1276281	5/1/2021	KY		M	1/28/2021	4/1/2021	<p>Blood clot in the right eye; This is a spontaneous report from a contactable consumer(patient) based on information received by Pfizer, license party for apixaban (ELIQUIS). This spontaneous case was reported by a consumer and describes the occurrence of OPTHALMIC VEIN THROMBOSIS (Blood clot in the right eye) in male patient of an unknown age who received apixaban (Eliquis) for an unknown indication. CO-SUSPECT PRODUCTS included Covid-19 Vaccine for an unknown indication. On an unknown date, the patient started Eliquis (unknown route). On 07-Jan-2021, the patient started Covid-19 Vaccine (unknown route). In April 2021, the patient experienced OPTHALMIC VEIN THROMBOSIS (seriousness criterion medically significant). The action taken with Eliquis (Unknown) was unknown. At the time of the report, OPTHALMIC VEIN THROMBOSIS outcome was unknown. The consumer received his first Pfizer covid 19 shot on 07-Jan-2021 and the second one on 28-Jan- 2021, and 10 days prior to this report he got a blood clot in his right eye. He takes a blood thinner and remarks this should keep him from getting blood clots, should not it. Blood thinner provided was Eliquis. The event was related to covid 19 vaccine and causality with Eliquis was not provided. For Eliquis (Unknown), the reporter did not provide any causality assessments. This case was received via pfizer. BMS Medical Evaluation Comment: This patient had ophthalmic vein thrombosis while on therapy with apixaban and after taking covid 19 vaccine. Underlying thromboembolic risk as ascertained by the use of apixaban is a significant factor that likely predisposed the patient to develop ophthalmic vein thrombosis and considered not related to apixaban therapy. Causality Assessment: For apixaban: the causal relationship of the event Ophthalmic vein thrombosis with the suspect product apixaban was not provided Per Reporter; the causal relationship of the event Ophthalmic vein thrombosis with the suspect product apixaban was Not Related Per Company (Bristol-Myers Squibb)</p>

1276626	5/1/2021		49	M	4/19/2021		DEEP VEIN THROMBOSIS; This spontaneous report received from a consumer concerned a 49 year old male. The patient's weight was 80.3 kilograms, and height was 182.9 centimeters. The patient's past medical history included post-operative deep vein thrombosis (more than 30 years ago), depression, heart murmur, and back surgery, and his concurrent conditions included non-smoker, no alcohol use, and marijuana abuse. The patient had no history of known allergies. The patient's mother had a history of aneurysm. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: unknown, and expiry date: unknown) dose was not reported, administered on 08-APR-2021 for prophylactic vaccination. The batch number was not reported and has been requested. Concomitant medications included fexofenadine hydrochloride (Allegra) for allergy, rivaroxaban (Xarelto) for venous thromboembolism, and omeprazole (Prilosec) for unknown indication. About one and half weeks after vaccination, on 21-APR-2021, the patient was taken to the emergency department and was admitted with the complaints of leg pain since 2 days with suspected blood clot in leg. Over the last days, patient's left leg looked swollen compared to the right leg. The patient also had pain, initially started in groin area and radiated down across the anterior portion of the leg, then to posterior leg, and into toes. The patient also had some intermittent tingling in toes. The patient denied of weakness, numbness or persistent paresthesia. The patient was concerned regarding the pain as it felt similar to the post-operative deep vein thrombosis he had in the past. The patient had been anxious since vaccination when hearing about the development of blood clots. The patient also denied of fevers, chills, chest pain, shortness of breath abdominal pain, nausea, vomiting, diarrhea, and difficulty walking. On 21-APR-2021 16:25, the patient's laboratory data included: Blood pressure (148/66 mmHg), Body mass index (24), Body temperature (98.8 F), Oxygen saturation (100 %) Pulse rate (88), and Respiratory rate (16). On 21-APR-2021 16:32, laboratory data included: Blood pressure (148/66 mmHg), Body temperature (97.8 F), Oxygen saturation (100 %), Pulse rate (91), and Respiratory rate (15). Other general physical examinations included: General: Well-developed well-nourished in no acute distress. HEENT

----------	-------	-------	---------	-----	----------	------------	--------------

(Head, Eye, Ear, Nose, Throat) examination: normocephalic atraumatic extra ocular motions are intact. Neck examination: Supple without jugular vein distention or meningismus. Lung examination: Clear auscultation bilaterally without wheezes rales or rhonchi. Heart examination: Regular rate and rhythm without murmurs rubs or gallops. Abdomen examination: Soft no tender non-distended without rebound or guarding. Extremities: Without clubbing cyanosis edema, no lacerations or abrasions or ecchymosis noted, no appreciable size difference in the left leg compared to the right, the patient had some tenderness throughout palpation of the medial thigh on the left with radiation up into the left inguinal region, no calf tenderness or swelling, no erythema, palpable posterior tibialis pulse. Skin examination: Warm and dry and well perfused. Psych examination: Appropriate mood and affect. Neuro examination: Cranial nerves 2-12 are grossly intact, strength is 5/5 in upper and lower extremities, full distal sensation in the left lower extremity, full plantar and dorsiflexion of the left foot including the left great toe, sensation is grossly intact, awake, alert and oriented x3. On ultrasound Doppler venous lower extremity test, identified sub occlusive thrombus in the left superficial femoral veins, likely related to organizing/chronic thrombus, however no prior imaging was available at the institution for comparison, no evidence of occlusive deep vein thrombosis. The final diagnosis was made as Deep Vein Thrombosis (DVT). At no time the patient had ever endorsed any chest pain/pleuritic pain, shortness of breath or exertional dyspnea. Due to the nature of this clot, a course of anticoagulation was planned. Patient was prescribed with Xarelto at twice daily starting doses, with transition to 20 mg doses. During the initiation of treatment, the patient should be followed up by his primary care physician for further evaluation. The patient stated that he would call the primary care physician in the following morning for follow-up appointment. The patient was discharged from the hospital on APR-2021. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The outcome of deep vein thrombosis was not reported. This report was serious (Hospitalization Caused / Prolonged, and Other Medically Important Condition).; Sender's Comments: V0: 20210457179-Covid-19 vaccine ad26.cov2.s-deep vein thrombosis. ZOLMITRIPTAN (ZOMIG) for Migraine headache, PROMETHAZINE HYDROCHLORIDE (PHENERGAN [PROMETHAZINE HYDROCHLORIDE]) for Nausea and Gastroparesis, ZOLEDRONIC ACID (RECLAST) for Osteopenia, AZELASTINE HCL and FLUTICASONE PROPIONATE for Rhinitis. On 19-Mar-2021 at 2:40 PM, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 19-Mar-2021, the patient experienced PAIN IN EXTREMITY (sore arm). On 24-Mar-2021 at 6:30 AM, the patient experienced MECHANICAL URTICARIA (covered in hives/autoimmune condition came out of remission-dermatographism worse than ever) and CONDITION AGGRAVATED (autoimmune condition came out of remission-chronic hives, angioedema and dermatographism worse than ever). On 20-Apr-2021, the patient experienced ANGIOEDEMA (facial angioedema/angioedema worse than ever) (seriousness criterion medically significant). On an unknown date, the patient experienced INAPPROPRIATE SCHEDULE OF PRODUCT ADMINISTRATION (inappropriate schedule of product administration). On 21-Mar-2021, PAIN IN EXTREMITY (sore arm) had resolved. At the time of the report, ANGIOEDEMA (facial angioedema/angioedema worse than ever), MECHANICAL URTICARIA (covered in hives/autoimmune condition came out of remission-dermatographism worse than ever) and CONDITION AGGRAVATED (autoimmune condition came out of remission-chronic hives, angioedema and dermatographism worse than ever) had not resolved and INAPPROPRIATE SCHEDULE OF PRODUCT ADMINISTRATION (inappropriate schedule of product administration) had resolved. mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was temporarily withheld on an unknown date. The patient's autoimmune conditions of idiopathic chronic hives, angioedema, and dermatographism were diagnosed in approximately 2013 and took about a year to get under control. During 2018, it came back so she was treated with omalizumab, but it lost effectiveness, so she was switched to ciclosporin for a month in January 2019. Then the patient was taken off ciclosporin and "doubled up" on cetirizine hydrochloride, and hydroxyzine per her immunologist. This "surprisingly" kept her under control from 01 Feb 2021 until she got the first vaccination. She

---

noted she hadn't had an episode of angioedema since November 2020. Treatment included prednisone 60 mg on 20 Apr 2021 but the angioedema (which involved her eyes and lips) did not respond, although she said it had gone down somewhat. The patient was supposed to get her second dose of the vaccine on 22 Apr 2021 but that was cancelled per a nurse practitioner (NP) at the pharmacy because she took one dose of prednisone on 22 Apr 2021. The NP said that would make the vaccine less effective so she should wait until at least 27 Apr 2021 so that one dose of prednisone was out of her system. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Most recent FOLLOW-UP information incorporated above includes: On 23-Apr-2021: Major updates to multiple fields (medical history, concomitant medications, narrative); Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

1276715	5/1/2021	MN	61	M	3/14/2021	4/17/2021	<p>They are suspecting Dress Syndrome; erythema all over his body; broke out into a rash, started as a bulls eye rash in the arm; This spontaneous case was reported by a physician (subsequently medically confirmed) and describes the occurrence of DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (They are suspecting Dress Syndrome) in a 61-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Parkinson's disease, Drug allergy (penicillin) and Drug allergy (ampicillin). Concomitant products included CEFALOXIN, CARBIDOPA, SILDENAFIL (VIAGRA [SILDENAFIL]) and DILTIAZEM for an unknown indication. On 14-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 15-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 17-Apr-2021, after starting mRNA-1273 (Moderna COVID-19 Vaccine), the patient experienced DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (They are suspecting Dress Syndrome) (seriousness criterion medically significant), ERYTHEMA (erythema all over his body) and RASH (broke out into a rash, started as a bulls eye rash in the arm). At the time of the report, DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (They are suspecting Dress Syndrome), ERYTHEMA (erythema all over his body) and RASH (broke out into a rash, started as a bulls eye rash in the arm) outcome was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Reporter mentioned patient is a mostly healthy, active farmer. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.</p>

The occurrence of additional non-serious events is detailed below. No medical history was provided by the reporter. Concomitant products included LOSARTAN and MULTIVITAMINS [VITAMINS NOS] for an unknown indication. On 28-Feb-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 28-Mar-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 11-Apr-2021, the patient experienced HAEMORRHAGE (Bleeding profusely) (seriousness criterion medically significant), MUSCLE SPASMS (Horrible cramping) and OCULAR HYPERAEMIA (Blood red, vampire red eye). On an unknown date, the patient experienced SLEEP DISORDER (She did not get much sleep one night). At the time of the report, HAEMORRHAGE (Bleeding profusely), MUSCLE SPASMS (Horrible cramping) and SLEEP DISORDER (She did not get much sleep one night) outcome was unknown and OCULAR HYPERAEMIA (Blood red, vampire red eye) had not resolved. She is on HRT implant called BioTe and is scheduled for a Pap Smear After the first dose apart from fever she got all the flu like symptoms which lasted 6 days. 2 weeks after the second dose, she got horrible cramping and bled profusely for 7 days. She adds that her husband snores and she did not get much sleep one night and woke up the next day with some redness in her left eye which turned blood red, vampire red in the next few days. The eye is still red so she went to her retinologist to get her eye checked and he said there is no issue with the eye. She is concerned about her upcoming cataract surgery on Monday. 1279221	5/1/2021			F			<p>mental foggiess; blurred vision; Feverish/a fever of 102; Muscle ache; pins and needles in her upper arms and legs; Headache; This is a spontaneous report from a contactable healthcare professional (patient) received by Pfizer from Medical information Team. A female patient of an unspecified age received BNT162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration on an unspecified date (Batch/Lot number was not reported) as single dose for COVID-19 immunisation. The patient medical history was not reported. She had previously received the first dose of BNT162b2 for COVID-19 immunisation and experienced a little blurred vision. The patient's concomitant medications were not reported. A few hours after the second dose, the patient experienced a fever of 102. The fever went through the night and all though the next day and through the next night. She took tylenol and advil for the fever but the fever did not go away but did slightly reduce the fever. She had muscle aches when she had a fever. She had been feverish for two days and after that had blurred vision. She also experienced pins and needles in her upper arms and legs. She stated she had a mental foggiess that barely went away yesterday (unspecified date). At the time of reporting, the the blurred vision was still occurring. The patient went to an optometrist but they did not have an answer for her. The patient also reported a headache but said it could be due to trying to study with blurred vision. The event blurred vision was not resolved. The outcome of the other events was unknown. No Follow-up attempts are needed; information about lot/batch number cannot be obtained.; Sender's Comments: Based on chronological connection to the vaccine a causal relationship between reported event mental foggiess and BNT162b2 (PFIZER-BIONTECH COVID-19 VACCINE) cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p>

1278742	5/1/2021	MI	68	F	4/7/2021	4/8/2021	today she is off kilter again; feels a heaviness in her eyes; all that coughing like something is irritating her lungs and she can't stop; it was making her lungs hypersensitive.; all of a sudden she got really really hot, she runs about 97-97.4 and she got so hot and her face got really red like she had a high fever and she was 99.2; burning in her stomach and a stomach ache; burning in her stomach and a stomach ache; never has that much energy when she was normal/had tons of energy; woke up on day 4 in the middle of the night and her lungs were pinching, pinching, pinching, like an asthma attack and she couldn't stop it and she had to get her old fashioned inhaler to stop it; tired; had weakness with climbing stairs and with exertion/ zapping her energy; 2 inches below the injection site the muscle was hard and swollen and sore; 2 inches below the injection site the muscle was hard and swollen and sore; 2 inches below the injection site the muscle was hard; This is a spontaneous report received from a contactable consumer (patient). A 68-year-old female patient received the first dose of BNT162B2 (PFIZER- BIONTECH COVID-19 VACCINE) via an unspecified route of administration, administered in left arm on 07Apr2021 14:40 (lot number: EW0150) at age of 68 years as single dose for COVID-19 immunisation. Medical history included low vitamin D, lungs were working at 75% the capacity of an 84 year old and not 68 year old and asthma attacks. Concomitant medications included vitamin D2 and D3 and regular vitamins for low vitamin D, had been taking that for 6-7 weeks, tiotropium bromide (SPIRIVA RESPIMAT) 2.5mcg takes 2 inhalers a day in the morning and salbutamol sulfate (PROAIR) 2 puffs and a special medication because her lungs were working at 75% the capacity of an 84 year old and not 68 year old and put her on an asthma medication to open her lungs. Patient got a flu shot every year and got it in Jan2021 and nothing. Patient stated that her symptoms were mild. Patient stated on day 1 after she got the shot she had nothing, that was 07Apr2021. Stated the next day (08Apr2021) she did not have injection site soreness but 2 inches below the injection site the muscle was hard and swollen and sore and remained that way for days 2, 3 and about day 4 it started to recede and day 7 it was tender. Stated it was one muscle and it was below the injection site, not at the injection site. Stated it was a

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

lifting muscle, if she lifted her arm up it could only go so far and she would feel it and drop her arm down. Stated she got the injection in her left arm as she used it the least. Stated on days 2 (09Apr2021), 3 and 4 she had weakness with climbing stairs and with exertion, she could do it but she would notice it was more of a struggle. Stated that today she was off kilter again. Patient relayed that she looked all over online to see if she was sick with something. Stated she was tired on days 3 (10Apr2021) and 4 and that on days 5 (12Apr2021) and 6 she had tons of energy and she worked from dawn to dusk waxing floors and never has that much energy when she was normal. Stated that all of a sudden on day 5 and 6 she was perfect and then toward the evening of day 6 she thought it was her as she had to go to the Secretary of States and stand in line to renew her license and she did well and got home and started feeling tired. States she woke up last night of day 6 (13Apr2021) with a burning in her stomach and a stomach ache and it woke her and made her feel like she had food poisoning or something like that and nothing happened and she took 2 Tums and it kind of settled that down. Stated on day 7 (14Apr2021) she woke up and the stomach part was gone and all of a sudden she got really really hot, she runs about 97-97.4 and she got so hot and her face got really red like she had a high fever and she was 99.2, which is not much for most people but she feels and she took Motrin and after that she still feels a heaviness in her eyes and her temperature is 98.6 and she is normally in the 97's and was running a 2 degree fever and now maybe a 1 degree fever and she felt it in her eyes and didn't feel sick. Stated she felt fatigued like she want to take a nap but didn't feel ill. Stated whatever was going on was zapping her energy. Stated she woke up on day 4 (11Apr2021) in the middle of the night and her lungs were pinching, pinching, pinching, like an asthma attack and she couldn't stop it and she had to get her old fashioned inhaler to stop it. Stated this hadn't happened and she had been taking the special medication for 3 weeks now and it was very rare for her to get those attacks and this was worse than any. Patient relayed that today all day even with the special medication to open her lungs she can feel in her lungs that they were, she can't explain it, like they are gripping and releasing and gripping and releasing a little but. Stated she knew she

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

was having some kind of asthma thing going on, it was not making her cough it was making her lungs hypersensitive. Stated she was expecting everything and she did read and nobody had symptoms that last more than 7 days and she was expecting them to be gone tomorrow, or she hoped anyways. Stated the last 10 days had been easy-peasy and all of a sudden she was waking with all that coughing like something was irritating her lungs and she can't stop. Patient provided that it woke her husband up with her coughing for half an hour. States this lasted half an hour and was more than normal and something really irritated her lungs, shouldn't have happened as she is on the other thing every day and has not had an attack with that. Patient stated her provider didn't know as it was so relatively minor and was unusual but minor and she did not feel like it was life threatening. Stated her brother had Covid and she did not feel like she was trying to breathe and couldn't, or suffocating and dying. She did not feel that. The air irritated to even breathe and made her cough and couldn't stop and that was the first time she had to use an inhaler on top of on inhaler and something made her lungs respond to nothing there. Stated it may be her immune system thinking something was there, the headless thing in her lungs. Patient stated she thought she was over it and then got the fever not understanding if the fever was Covid related and she stayed at home and didn't go out until yesterday it was the 1st day out since Thursday and how could she have caught anything if she wasn't near anybody. Stated these were just thoughts in her head. Outcome of events was unknown.; Sender's Comments: The reported event of asthma aggravated was assessed as possibly related based on temporal association. The impact of this report on the benefit-risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for AE. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, ethics committees and investigators, as appropriate.

1278775	5/1/2021		28	F	4/18/2021	4/18/2021	fainted; dizzy; warm; arms had seized up and were twitching; leg and body had also briefly been shaking; eyes were dilated; vomiting; arm is sore; sweaty; This is a spontaneous report from a non-contactable consumer (patient). A 28-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), dose 2 via an unspecified route of administration, administered in Arm Left on 18Apr2021 11:00 (Batch/Lot Number: Unknown) as SINGLE DOSE for COVID-19 immunisation. The patient was not pregnant at time of vaccination. Medical history was reported as none. There were no concomitant medications. The patient previously had first dose of BNT162B2 (Lot number: ER8727) on 28Mar2021 01:00 PM in the left arm at 28 years old for COVID-19 immunisation and experienced fainting. On 18Apr2021 11:15 AM, the patient fainted about 10 minutes after second dose was vaccinated. The patient became dizzy and very warm and then woke up about 5-7 seconds after had fainted. The patient's arms had seized up and were twitching and leg and body had also briefly been shaking. The patient was very sweaty and warm. The patient's eyes were dilated when woke up according to the overseeing nurse. The patient said it was scary. Half hour after, the patient felt fine but then began vomiting when got home. The patient's arm is sore but nothing else has happened. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. The outcome of the events was recovering. No treatment was given to the patient for the events. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

A 46-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), second dose at the age of 46-years-old via an unspecified route of administration, administered in arm left on 02Apr2021 (Batch/Lot Number: ER8734) as single dose for covid-19 immunisation. There was no medical history reported. There were no concomitant medications. The patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 12Mar2021 (lot number: EN6202) at the age of 46-years-old for covid-19 immunisation and experienced If it is a blood clot in the back of his calf, Regular pain feeling, Headache, Muscle pain, Calf feels tight, stiff, it feels like dead weight, Pain running up the right arm up to the shoulder and Calf pain, started to feel tight. The patient reported that he has been feeling the regular pain feeling, a headache, muscle pain before, it comes and goes on 12Mar2021. However, he says that the last few days there had been, by his calf muscle in the back there, they've been tightening, like stiffening up on him when he's sleeping on an unspecified date. It wakes him up at times. He also reports pain running up the right arm up to the shoulder on an unspecified date. He says he is just curious in terms of what that might be. He asks if someone can tell him if it is a blood clot in the back of his calf on an unspecified date. The headache went away after 2-3 days. He says his eyes also hurt a little bit on 12Apr2021 and was the same time frame as the headache. He says those things were just mild, nothing major. He did not take anything for it. He confirmed he no longer has muscle pain. He just has pain behind the calf and right arm up to his shoulder. He says his calf pain, started to feel tight, started within the last 2- 3 weeks. The arm pain in right arm up to shoulder started maybe within the last 2 days. The outcome of the events was unknown. Follow-up attempts completed. No further information expected.</p>

1278862	5/1/2021	IL	88	F	2/19/2021	3/26/2021	throat closing, tongue swelling, face swelling and a hard time breathing/ diagnosed her symptoms as angioedema; potassium was low and sodium was low; potassium was low and sodium was low; This is a spontaneous report from a contactable consumer (patient). An 88-year-old female patient received her second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN6198) at the age of 88-years-old, via an unspecified route of administration in left deltoid on 19Feb2021 at single dose for COVID-19 immunization; losartan potassium (lot number: LJ5020047-A, expiration date: Aug2023), via an unspecified route of administration from 2011 to an unspecified date in 2021 at 50 mg, 1x/day for blood pressure high; diclofenac sodium modified-release tablet (lot number: PW6V5QFTAF61, expiration date: May2022), via an unspecified route of administration from an unspecified date to an unspecified date in 2021 at 75 mg, 1x/day for an unspecified indication; ibuprofen (ADVIL LIQUI GELS, 200 mg strength, lot number: CY1426, expiration date: Jun2022) capsule, via an unspecified route of administration from an unspecified date to an unspecified date in 2021 at 2-4 capsules, as needed (daily) for an unspecified indication; and aflibercept (EYLEA) injection, ophthalmic from an unspecified date to 11Mar2021 at 1 DF (injection), every 8 weeks in each eye for macular degeneration. Medical history included macular degeneration (the wet kind), blood pressure high, spinal stenosis, and thyroid disorder (reported as thyroid something) she provided that it was something like hypotrachea (as reported). The patient's concomitant medications were not reported. The patient previously received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL8982) at the age of 88-years-old, via an unspecified route of administration in right deltoid on 29Jan2021 at 0.3 mL, single for COVID-19 immunization. The patient was calling about the Pfizer COVID-19 vaccine and mentioned that she had a reaction but didn't think it was from the vaccine because it was 5 weeks to the date after the second shot. The reaction was very severe, and she had to visit the emergency room. The patient experienced throat closing, tongue swelling, face swelling and a hard time breathing. She saw her primary care provider after that, and she also saw her PMR doctor-

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

physical medicine and rehabilitation. The doctors recommended that she report this reaction to the COVID 19 vaccine five weeks later. Both doctors thought it might be from the vaccine and it was worth reporting. When asked about the symptoms and if they occurred at that same time, the patient stated yes, and they diagnosed her symptoms as angioedema in the emergency room. This happened on 26Mar2021. The patient was never admitted to the hospital. When asked if angioedema improved, worsened or was persisting, patient stated it was nonexistent now. The events happened after the second dose of the vaccine. The patient had to stop her medications because her primary care provider was unsure what may have caused this reaction, but it may be her medications. She has been taking losartan potassium for about ten years but now had to stop because angioedema could possibly be the result of that, even after ten years. She also had to stop diclofenac sodium because they may have caused that kind of reaction. Having to stop ibuprofen broke her heart as she has taken it for years. This too could have that type of reaction. For aflibercept, she mentioned that she gets the injections in both eyes every eight weeks. She had it 31 times in the right eye and 30 times in the left eye. The reaction she was speaking of, the emergency room, came exactly 2 weeks after she had her last injections, which was on 11Mar2021. Angioedema was an emergency situation, if the throat closes and they couldn't open it up, they may cut into the neck and windpipe. The description was enough to scare her. Both doctors suggested the Pfizer vaccine as just possibly a late reaction. The patient had a basic metabolic panel while in the emergency room. She reported that potassium and sodium was low. Chest Xray- the patient did not have a report on it. Nasal scan was fine. COVID nasal test was negative. Swab for many other kinds of viruses was negative. All of these tests were done on 26Mar2021. The action taken in response to the events for losartan potassium, diclofenac sodium, ibuprofen, and aflibercept was unknown. The outcome of the event "potassium was low and sodium was low" was unknown and recovered on an unspecified date in 2021 for the other event.

1278952	5/1/2021	MO	60	F	4/8/2021	4/8/2021	anaphylactic reaction; anti kell antibodies in her blood; nausea; her left and her right hips, both, had severe pain/her right knee joint is in severe pain; she could barely walk and she couldn't bend at all; really weak; had leg aches; she couldn't stay awake/she couldn't sleep again; diarrhea; severe pain at the back of her neck with a headache; severe pain at the back of her neck with a headache; had extreme fatigue; lightheadedness; upper back pain; bloody nose; she couldn't see out of her left eye for about 2 hours; she couldn't breathe; This is a spontaneous report from a contactable consumer. A 60-year-old female patient received her second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot Number: ER8731), via an unspecified route of administration, administered in Arm Right on 08Apr2021 10:41 as SINGLE DOSE for covid-19 immunisation (Age at vaccination: 60 years). Medical history included ongoing chronic obstructive pulmonary disease, ongoing chronic kidney disease and Positive ANA. The patient's concomitant medications were not reported. The patient received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: ER8727) on 18Mar2021 for covid-19 immunisation and experienced First dose: a little bit of soreness and swelling all on the site. The patient stated that during her second dose last Thursday on 08Apr2021, she had an anaphylactic reaction and she couldn't breathe and long story short she had to go to the emergency room and she was given all kinds of epi shots and treatment and stuff and eventually she had to be kept in the ICU unit. She is not sure why she had such a severe reaction. She wanted to report that since then she has kept track every day on how she has been and she actually thought yesterday was the first day that she had felt better. She had extreme fatigue, lightheadedness, upper back pain and even a bloody nose on 10Apr2021 and also she couldn't see out of her left eye for about 2 hours. Then on 11Apr2021, she had severe pain at the back of her neck with a headache that lasted about 20 minutes and she couldn't move her neck. She had diarrhea and the only temperature she had was on 12Apr2021, it was only 99.5 degrees Fahrenheit, which isn't bad, but she had really bad diarrhea on 12Apr2021 and she took Imodium. She had a headache and slight breathing difficulties and things like that. On 13Apr2021 she had a headache, was

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

really weak, had leg aches, fatigue that was really bad and she couldn't stay awake and her temperature that day was 98.7 degrees Fahrenheit which is normal. Then yesterday, 15Apr2021, she thought she was over all the things and that she was feeling better from the fatigue, nausea (occurred on an unspecified date), lightheadedness but she couldn't sleep again. She didn't sleep since Wednesday morning until last night finally and she only slept for an hour since Wednesday morning. She woke up on 15Apr2021 and had no symptoms except her left and her right hips, both, had severe pain and she could barely walk and she couldn't bend at all. All she could do it take Tylenol and she used a heating pad and the pain was excruciating. She went to bed last night and she did sleep for maybe a total of 2 hours and when she woke up this morning her left hip seemed to be a little better but her right hip is still in severe pain and now her right knee joint is in severe pain too. Other than that, she has no other symptoms just the joint pain. She didn't know it would go on for this long, it has been over a week now and she just wanted to let us know about this. The patient was hospitalized for the event anaphylactic reaction from 08Apr2021 to 08Apr2021. The patient underwent lab tests and procedures which included Blood typing: anti kell antibodies (doctor randomly decided to do a blood typing and they found anti kell antibodies in her blood) on an unspecified date, temperature: 99.5 degrees fahrenheit on 12Apr2021, temperature: 98.7 degrees fahrenheit on 13Apr2021. Therapeutic measures were taken as a result of anaphylactic reaction, dyspnoea, diarrhea and arthralgia. Outcome of the event anaphylactic reaction was recovered with sequelae on 09Apr2021 while outcome of the events nausea, dyspnea, arthralgia, sleep disorder and movement disorder was unknown. Outcome of the event vision impairment was recovered on 10Apr2021 while outcome of the event neck pain was recovered on 11Apr2021. Outcome of the remaining events was recovered on 15Apr2021.

1279058	5/1/2021	GA	85	M	2/9/2021		<p>bent over to look up and almost blacked out; swimmy headedness was really more noticeable after second shot; sensation in equilibrium or vision or whatever; weakness; felt different/really knew something was wrong/something is not right; This is a spontaneous report from a contactable consumer (patient). An 85-year-old male patient received the second dose of bnt162b2, via an unspecified route of administration, administered in Left arm on 09Feb2021 (Lot Number: EM9810) as single dose for covid-19 immunisation. The patient medical history and concomitant medications were not reported. The patient previously received the first dose of bnt162b2, at the age of 85-year-old, via an unspecified route of administration, administered in Left arm on 20Jan2021 (lot number: EL3302) as single dose for covid-19 immunization and experienced Vertigo, felt peculiar, nausea, dizziness/swimmy headed. The patient previously received the flu shot for immunization and experienced Sore arm. He is 85 and not familiar with all the goings on today but heard a report the other day and did not know there was such a thing as Vertigo. He thought that was just a movie. When he took the shot at (place name) in (county name) on 20Jan2021, soon thereafter, not that day but maybe next, he felt peculiar. It was just uneasiness and he did not feel right. That went on and on 09Feb2021, he got second shot and he got swimmy headed, but it has continued on since then and probably gotten worse, especially when he gets up in the morning. He has to hold on until he gets balanced or coordinated. It just doesn't seem right After he gets up and gets going, it is not as prevalent. But then sometimes it strikes him and he is just completely out of it. He later stated the peculiar feeling and swimmy headedness started the same day as the first injection, but he just did not really pay attention to it and thought it was just one of those things that you accept with getting older. Wife and he both went and he thought his feelings were merely from excitement or depletion or exhaustion. He felt like he had weakness and he just felt different. He got it at noon and waited for 15 minutes. Because of the events around him at the time, it did not register with him because it was the stress of driving 30 miles through expressway. Old people aren't used to driving that far. It got worse after the second shot and then he really knew something was wrong. When you are old, you have these</p>

feelings and pains and aches and all that stuff, and you just accept it as being old. It did not register with him until a couple of weeks ago when he heard it on TV about Vertigo and he said that is what he has. The swimmy headedness was really more noticeable after second shot, it brought it on stronger. He does not complain about things and thought it may just be getting old. He said it just kept on and getting a little worse and worse. Then he said something is not right and one day he bent over to look up and almost blacked out because of sensation in equilibrium or vision or whatever. He got scared and that was a couple of weeks ago. (name) was not cognizant of what was going on until he heard on television about Vertigo. One of the news channel mentioned or somebody mentioned it. It was just general things. He confirmed it was regarding someone who had gotten Vertigo after getting the vaccine but did not have a particular person to report on. NO ER or physician's office required. The outcome of the event dizziness aggravated and Weakness was not recovered, other events was unknown.

1279104	5/1/2021	CO	18	F	5/1/2021	5/1/2021	The patient was sitting in the waiting area following her vaccination when shortly after receiving the vaccine, her mother flagged us down and said that she lost her vision. She was describing feeling unwell. I had her lay down on the floor in the immunization booth and her mother elevated her legs. I asked her to describe her symptoms and she said that she just saw all white. I asked if she wanted me to check her blood pressure and I had her sit up on the floor and it was low around 75/53 with a pulse of 53 but not sure how accurate it was since she was sitting on the floor. She fluctuated from starting to feel better and feeling unwell again and her vision going out again. I asked if they wanted me to call 911 and her mother said she wasn't sure what to do, if she should take her to an urgent care. I said that it would be best if she was seen in an emergency room where they can better respond to this kind of situation. The patient was able to get up and walk with her mother's assistance. I was going to help walk her out but she said that she was okay walking out with her mother's help. About 10 minutes later, I called the patient to see how she was doing. Her mother said that she was doing okay and that they were on their way to the hospital just to make sure that she was checked and everything was okay.

1279286	5/1/2021	GA	48	M	4/14/2021	4/14/2021	coughing; loss of vision comes and goes; Chills; body and back pain; body and back pain; Fatigue: he has been in his bed and falling asleep in his chair for the past few days; This is a spontaneous report from a contactable consumer (patient). A 48-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot Number: ER8131), via an unspecified route of administration on 14Apr2021 at 09:20 (at the age of 48-years-old) as a single dose for COVID-19 immunisation. The patient's medical history was not reported. There were no concomitant medications. The first vaccine has been experiencing loss of vision, chills, body and back pain, and fatigue for the past 3 days, from 14Apr2021. He wanted to know if he should go to the ER. The patient was audibly coughing while on the call. He went to the appointment at 09:20 on 14Apr2021 and while driving back he noticed the loss of vision at about 10:15 on 14Apr2021. He said that the loss of vision comes and goes but is still persisting. On fatigue: Patient has been in his bed and falling asleep in his chair for the past few days. Chills, body and back pain and fatigue were reported as worsened. The outcome of the events loss of vision, chills, body and back pain, and fatigue was not recovered, while of coughing was unknown.

1279461	5/1/2021	CA	33	M	3/23/2021	3/23/2021	I got shingles about one month after the second dose. I had severe pain around my spine and back on Friday (4/23/2021) and by the next morning developed red bumps on the left side of my nose that I at first mistook for acne. They produced a very tiny amount of white liquid secretion. The bumps turned darker and I got a red rash on the left side of my nose. The left side of my face as well as the lymph nodes around my collar area swelled up. By Tuesday morning, it spread to my left eye, so I went to the ER where they started me on two new antibiotics. After none of the antibiotics worked, I started an antiviral (acyclovir) and antiviral eye drops and started to improve. The rash and swelling reduced and no new blisters have formed. The doctor and I both thought it likely I had shingles.

1278546	5/1/2021	OH	68	F	4/8/2021	4/10/2021	<p>confused/When talking to her she is talking out of her head/hought her condo was turned completely around; She is having headaches; muscle pain; chills; double vision; dizziness; her arm, and joint pain; her arm, and joint pain; extremely exhausted; This is a spontaneous report from a contactable consumer. A 68-year-old female patient (consumer's mother) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), first dose via an unspecified route of administration on 08Apr2021 (Batch/Lot number unknown as complainant does not have the product with them at the time of call) as SINGLE DOSE for covid-19 immunisation. The patient medical history and concomitant medications were not reported. Reporter was calling about her mother. The patient was fine before she got this shot and no one can seem to help her. They had the vaccine on 08Apr2021 and her mom (patient) started having severe reactions to it on 10Apr2021. Patient had the chills, muscle aches, muscle pain, headache, dizziness, her arm, and joint pain. She did not have fever, but had chills. She had double vision now. The symptoms are not going away. They are getting worse. They took her mom to the ER. The patient was confused. When talking to her she was talking out of her head. The severity of confusion is she thought her condo was turned completely around. Patient was not getting better. Went to the doctor and the doctor was at a lost. Patient was extremely exhausted. Caller stated they all took the same shot on the same day and her mom was the only one to have a reaction. Patient was literally out of her mind. Caller's dad had to take patient to the store with him because he didn't want to leave her by herself. They live in a condo on the second floor. Her mom thought the condo was reversed. Her dad was worried to leave her mom by herself because he didn't want her to go out the wrong door and go over the balcony. Her mom was not like that prior to receiving COVID19 Vaccine. Reporter was asked if there was an antidote. They were told patient should see her doctor and that she need treatment but no one could give they something to antidote the vaccine. The outcome of events was not recovered. No follow-up attempts are needed; information about lot/batch number cannot be obtained.</p>

1279193	5/1/2021		60	F	2/10/2021		<p>Back disorder; lower back issues; Feeling abnormal; felt fuzzy; Vaccination site pain; sore arm; Dizzy; Fatigue; Energy decreased; not feeling as much energy as before; Pain upon movement; walk about a block but then starts to hurt; This is a solicited report from a contactable consumer (patient) via a non-Pfizer sponsored program, based on the information received by Pfizer (Manufacturer Control No: 21K-163-3774842-00).</p> <p>Solicited report from a consumer of a 60 year old female with events of heart/atrial flutter, atrial fibrillation, eye surgery and arm surgery and non-serious weight gain due to attempting to stop smoking, lower back issues, felt fuzzy, got first dosage of covid-19 vaccine and experienced sore arm, fatigue and dizzy from the blood thinners after surgery, still not feeling as much energy as before and walk about a block but then starts to hurt with humira 40mg/0.4ml (adalimumab). The patient had a relevant medical history of tobacco use/four cigarette sticks per day, seropositive high titer rheumatoid arthritis, fingers swelling, joint pain, joint swelling and lost of blood flow in hands and legs. On unknown dates, the patient experienced eye surgery, arm surgery, lower back issues, felt fuzzy, got first dosage of covid-19 vaccine and experienced sore arm, fatigue and dizzy from the blood thinners after surgery, still not feeling as much energy as before and walk about a block but then starts to hurt. In 2020, the patient experienced heart/atrial flutter and atrial fibrillation. In Sep2020, the patient experienced weight gain due to attempting to stop smoking. On 24Feb2021, the heart/atrial flutter and atrial fibrillation resolved. Covid-19 vaccine was also considered suspect. The patient had eye and arm surgery in the past. On 24Feb2021, she underwent pulmonary vein cryoballoon ablation surgery for the atrial fibrillation and atrial flutter. She had a procedure done and went into her heart and froze the nerve endings that were causing the atrial fibrillation, and also fixed the flutter in her heart. The causality as per reporter for this procedure was reported as no reasonable possibility. She still recovering. She discontinued the Humira two weeks before the surgery and took her last injection on 10Feb2021 and was paused it for four weeks, but she started back it on 10Mar2021. She follows up with her surgeon at the end of the month and she hopes this helps got her off of the blood thinners and other medicines, she been on for this.</p>

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

She stated that this was not related Humira. She was advised by her physician to increase the exercise to lose some weight. With her lower back issues, she was hoping that when she got off of the blood thinners, she could do pain shots again and start exercise. She could walk about a block but then she started to hurt. She had been careful with her diet also, cut out the salt also. This had nothing to do with Humira and she did not want to be contacted about this again for this also. She felt fuzzy, it took her most of the morning to get woken up. Her Doctor thinks once she would off of the blood thinners she would be back to normal. Other than that she feels fine. She does not wanted to be contacted about this. It was unknown if patient was enrolled in a COVID-19 Vaccine Trial. On unknown date, patient received first dose COVID-19 Vaccine manufactured by Pfizer, lot number unknown. She agreed to have physician contacted. Blood thinner was also considered as co-suspect. Other medical history included abstains from alcohol, contrast dyes allergy manifested by scratch throat, allergy manifested by bowel movements (oral medications for rheumatoid arthritis; up to eight times a day and slept 15 hours per), prevent esophagus damage, heart, low thyroid, and attention-deficit/hyperactivity disorder. The patient's concomitant medications included pantoprazole to prevent esophagus damage, metoprolol for heart, levothyroxine for low thyroid, vortioxetine hydrobromide (TRINTELLIX) for depression, and dexamfetamine sulfate (DEXTROAMPHETAMINE) for attention-deficit/hyperactivity disorder. The patient underwent laboratory tests and procedures which included blood work: everything was fine in Jan2021; chemical stress test and treadmill stress test: confirmed atrial fibrillation and atrial flutter in Sep2020; body weight: gain in Sep2020; and X-ray: confirmed atrial fibrillation in Sep2020. The action taken in response to the events for adalimumab and apixaban was unknown. The patient recovered from atrial flutter and atrial fibrillation on 24Feb2021. Outcome of Feeling abnormal and Pain upon movement was unknown. The patient had not recovered from the remaining events. Change History: On 05Mar2021, received updates to patient demographics, medical history, event information, reporter opinion of causality, suspect drug information, concomitant drug information, past drug information,

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

laboratory/diagnostic procedures and narrative description. The events of "atrial flutter", "atrial fibrillation" and "weight gain due to attempting to stop smoking" were added. On 11Mar2021, received updates to patient demographics, medical history, event information, reporter opinion of causality, company opinion of causality, company alternative etiology, suspect drug information, laboratory/diagnostic procedures and narrative description. The events of "LOWER BACK ISSUES" and "WALK ABOUT A BLOCK BUT THEN STARTS TO HURT" were added. the event of "atrial flutter" was amended to "heart/atrial flutter". On 08Apr2021, received updates to event information, reporter opinion of causality, company opinion of causality, company alternative etiology, suspect drug information and narrative description. The events of "felt fuzzy", "got first dosage of covid-19 vaccine and experienced sore arm", "fatigue and dizzy from the blood thinners after surgery" and "still not feeling as much energy as before" were added. Causality for humira 40mg/0.4ml(adalimumab): The reporter's causality for the event(s) of heart/atrial flutter, atrial fibrillation, eye surgery, arm surgery, weight gain due to attempting to stop smoking, lower back issues, got first dosage of covid-19 vaccine and experienced sore arm, fatigue and dizzy from the blood THINNERS after surgery unknown onset and fatigue and dizzy from the blood thinners after surgery unknown onset with humira 40mg/0.4ml(adalimumab) was no reasonable possibility. The reporter's causality for the event(s) of felt fuzzy, still not feeling as much energy as before and walk about a block but then starts to hurt was not provided. Manufacturer opinion is that there is no reasonable possibility that the events of heart/atrial flutter, atrial fibrillation, eye surgery, arm surgery, weight gain due to attempting to stop smoking, lower back issues, felt fuzzy, got first dosage of covid-19 vaccine and experienced sore arm, fatigue and dizzy from the blood thinners after surgery unknown onset, fatigue and dizzy from the blood thinners after surgery unknown onset, still not feeling as much energy as before and walk about a block but then starts to hurt are related to humira 40mg/0.4ml(adalimumab). The reporter's assessment of the causal relationship of the events with BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) was not

provided at the time of this report. Since no determination has been received, the case is managed based on the company causality assessment. No follow-up attempts are possible; information about batch number cannot be obtained. No further information is expected.; Sender's Comments: Based on the current available information , the events of sore arm, fatigue and dizzy could be related to the suspected drug of BNT162B2. The other events are most likely related to an intercurrent or underlying condition which is not related to the suspected drug. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1278470	5/1/2021	MA	42	F	3/18/2021	3/18/2021	Palpitations; a weird feeling under her skin; Shortness of breath; the chest pressure was in the middle of her chest. She said the chest pressure felt like something sitting on her lungs; Dizziness; At the time she was given her COVID-19 Vaccine shot, she had a warmth that went down her left arm (the arm she received her COVID-19 Vaccine in) to her left fingertips & to her left back; dry eyes; she was coughing more; the increase in coughing had made her voice huskier sounding; This is a spontaneous report from a contactable consumer (patient). This 42-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 18Mar2021 08:45 Arm Left (Lot Number: EP6955, Expiration Date: 30Jun2021) single dose for covid-19 immunisation. Medical history included ongoing Crohn's disease from 1999, ongoing Hidradenitis suppurativa at the end of 2019, ongoing Small Fiber Peripheral Neuropathy diagnosed at the end of 2019. She said her doctor was not sure of the Small Fiber Peripheral Neuropathy's cause, or if the Small Fiber Peripheral Neuropathy was associated with any of her other medical conditions. She said she had symptoms for sometime, and was diagnosed with a lot of things at the end of 2019 because she was finally able to see a specialist. Concomitant medications included adalimumab (HUMIRA AC) from in Feb2020 at 40mg injection pen once a week for her Crohn's disease. Reported she has had no reactions to flu or pneumonia vaccines for immunisation in the past. She said she had her first COVID-19 Vaccine dose on Thursday, 18Mar2021. She said on Saturday morning (20Mar2021), she had shortness of breath, dizziness, and chest pressure. She said her shortness of breath, dizziness, and chest pressure has been lasting for 20-something days, and she doesn't know why. She said she had taken two (different) week long prescriptions of Prednisone. She said she had 2 EKGs, 2 chest x-rays, and blood work, which were all normal on 13Apr2021 and 2021. She said her doctors don't know why she was having the shortness of breath, dizziness, and chest pressure. She said she was using inhalers, medications, and everything, and still had her symptoms. She asked if what she was experiencing was a side effect of the COVID-19 Vaccine, or due to her 2 autoimmune

---

diseases because her doctors were grasping at straws at this point. Reported she had so many medical conditions, and was taking so many different medications. Reported she has had shortness of breath and chest pressure every day, but the dizziness wasn't constant, and had lessened. She said she has never had the shortness of breath and chest pressure before. She said she has never had anything last that long either. She said she was wondering if her shortness of breath and chest pressure were caused by the COVID-19 Vaccine. Clarified the chest pressure was in the middle of her chest. She said the chest pressure felt like something sitting on her lungs, saying it was an odd feeling. Reported she was coughing more, and she believed the increase in coughing had made her voice huskier sounding in 2021. She said she had a cough associated with outdoor allergies, but the cough she had now didn't feel like her normal allergy cough. She said she had no mucus. She said she was not sneezing, or coughing out anything. She said the cough she had now was different. Reported at the time she was given her COVID-19 Vaccine shot 18Mar2021, she had a warmth that went down her left arm (the arm she received her COVID-19 Vaccine in) to her fingertips. She said the warmth feeling also went to the left side of her back. She said she was kept longer after she got her COVID-19 Vaccine for monitoring. She said the warmth feeling in her left arm, left fingertips, and left back didn't last long, and went away. Reported she had gone to the Emergency Room on Tuesday, 13Apr2021, because she had palpitations, and a weird feeling under her skin. She said while at the Emergency Room, she had an EKG, chest x-ray, and blood work. She said the doctor was looking for a blood clot. She said all her testing came back negative for a blood clot. She said earlier that day (13Apr2021) was her 3rd visit to her doctor since her symptoms had started. Reported she had started Restasis on 19Mar2021, the day after her first COVID-19 Vaccine. She said she was prescribed Restasis for dry eyes, and didn't have the dose, NDC, Lot, and Expiration Date because she was not at home. AEs require a visit to Emergency Room and Physician Office. Treatment included Stated she had taken 2 different week long doses of Prednisone to treat her symptoms. She said she first took Prednisone 40mg, once a day, for 7 days. She said she was off the

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

Prednisone 40mg for 2 days, and had instructions to call her doctor if she wasn't feeling better. She said she went back to her doctor, and was prescribed Prednisone 60mg for 3 days, then Prednisone 40mg for 3 days, and then Prednisone 20mg for 3 days. She said she did not have the 2 Prednisone prescription NDC, Lot, and Expiration Dates. She said she was also put on a 10-day Azithromycin 250mg tablet prescription. She said she took a Azithromycin 500mg (2-250mg tablets) dose the first day, and then Azithromycin 250mg, once a day, for the next 9 days. She said she did not have the Azithromycin 250mg tablet NDC, Lot, and Expiration Date. She said she was also prescribed an Albuterol (90mcg per actuation) inhaler, providing: NDC Number: 66993-019-68, Lot Number: A63H, Expiration Date: Jan2022. She said she didn't feel like the Albuterol inhaler was doing the rescue part, and that she could take the Albuterol inhaler every half hour. Reported she was prescribed an Albuterol inhaler (90mcg per actuation) for shortness of breath. Outcome of the event Shortness of breath, the chest pressure was in the middle of her chest. She said the chest pressure felt like something sitting on her lungs, coughing more, the increase in coughing had made her voice huskier sounding was not recovered. Outcome of the event Palpitations, a weird feeling under her skin was unknown. Outcome of the event Dizziness was recovering. Outcome of the event had a warmth that went down her left arm (the arm she received her COVID-19 Vaccine in) to her left fingertips & to her left back was recovered on 18Mar2021. No follow-up attempts are needed. No further information is expected.

1277851	5/1/2021	IN	18	F	5/1/2021	5/1/2021	Administered vaccine at 12 noon. At roughly 12:03pm the patient started experiencing signs of syncope. She had pale blue lips, ringing in ears, changes in vision/blurry vision, she felt dizzy/light headed. The symptoms began improving at roughly 12:10 and had almost completely resolved by 12:15. I kept the patient for an additional 15 minutes for monitoring. I counseled patient on what to do if they felt as though they were going to pass out. I provided a cold compress for the back of the patient's neck, and had ammonia inhalant on standby but didn't have to use to help keep patient conscious. By 12:30 the patient was feeling completely normal again. Her mom/stepmom was with her and was able to drive her home. I asked them to reach out in case of any other symptoms developed.
1277900	5/1/2021	VA	64	M	1/28/2021	2/1/2021	2021-01-28 Received the 1st shot of COVID-19 vaccine Pfizer and noticed on or about February 1, my farsighted vision began to change for the better in that I was able to read fine print and view the computer screen without wearing prescription glasses. 2021-02-19 Receive the 2nd shot of COVID-19 vaccine Pfizer and subsequently my vision changed where my nearsightedness became worst and I began to see halos when looking at lighted objects, especially at night. **Later I researched and found the Pfizer vaccine can cause symptoms of illness that can lead to high glucose levels.
1278070	5/1/2021	OK	83	F	3/10/2021	3/22/2021	UTI 3/16/2021-3/20/2021. UTI 4/28/2021. Sensitivity to light 3/24/2021 - current. Blurry Vision 3/20/2021 - 3/24/2021. Partial blindness 4/04/2021 - current. Headaches 3/24/2021 - current. Doctor ruled not a stroke. Stroke of the eye due to blood clot or plaque build up is the highest suspected cause. 1278338	5/1/2021	NY	17	M	5/1/2021	5/1/2021	Patient given first dose of COVID vaccine today. After being vaccinated patient walked over where his brother was sitting. Soon after sitting he felt weak and fell to the floor, patient appeared to be shaking for 2 seconds, generalized, witnesses unsure if he hit his head. No eye rolling, no foaming of the mouth, no incontinence noted. Patient was monitored and assisted off the floor to a wheelchair. While being assessed at a nearby cot, while sitting, the patient's eyes rolled back, upper limb shaking for 2 seconds. Patient does not remember either episode. Vitals: 120/70, HR 88, RR14, Oxygen 100%, Glucose 113, exam: patient alert and oriented x3, PERRLA, heart RRR, normal S1 and S2, no murmur, lungs cleared. Due to second episode occurring, 911 was called. Mother was on site and full report given to her. Patient was getting up and heart rate noted to drop to 56, he felt dizzy at this point and sat down, then laid down. The patient was evaluated by EMT and was taken to hospital for further evaluation.

06Feb2021 and the only side effect she had was a sore arm. Stated on 20Feb2021 she had a stroke caused by a blood clot obviously, she ended up in the hospital. She didn't think at the time, doesn't fault the physicians that took care of her. She didn't think it was related and her eldest son thought it was related. The patient stated they thought it was a mild stroke and after they did the C scan the neurosurgeon, while she was lying in the hospital bed, looked at her assistant and said he couldn't believe that she was talking and walking. The patient stated part of it was ignorance on her part, everyone thought it was the left side that numbs, but hers was the right side. Stated she didn't fall, she dropped something and went down to get it and her right arm went completely numb and she couldn't get back up and she tried to push with legs and couldn't get up. Stated all of a sudden her eyes were blurry and then she never gets headaches and her head felt like somebody put a spike in it on the right side, stated it is supposed to affect the left side. stated she has a heart problem. The patient stated she had a sore arm for about a week, lasted for a few days. stated she gets a sore arm with the flu shot. stated when she would roll over to lay on her left side and roll over on that arm it was enough to wake her up. stated it lasted about 5 days. She couldn't figure out why it was lasting so long. Stated the second thing that happened was that she went to her son's home that night for dinner, hadn't told him about it and while she was eating dinner she asked am i leaning to the left and he said yes, she was and that her words were being slurred and only lasted for about 10 mins. Stated she didn't call and ignorance is unreal with this stuff. She went to urgent care the next day and they didn't call the ambulance. When she went to the doctor on 23 Feb2021 she was sent immediately to Hospital so she could go through the ER and that's when the neurosurgeon became involved. Stated right now her balance isn't quite right but she is driving and she was taking care of herself and they didn't send anyone home to help her. She was not having any problem talking. Stated she was not going to get into this and will beat it and get back to normal. She was tired a lot, which they said it's normal. Stated she was a real dynamite. Stated it is improving slowly, she was extremely tired and not taking her long walk like she was used to and has shortness of breath, she was not trying to over do it.

Stated she always gets a sore arm with the flu shot. Stated her pain level is lower than most people. The patient stated the sore arm started late evening but the next day was really hurting and the main thing was rolling over. The patient stated she didn't take anything for her sore arm, she won't even take an aspirin because some of these Advil medications will mix with the heart medications. Stated in the hospital they were giving her medications she had through an IV in her arm but doesn't know what was going through that. Stated they put her on a blood thinner and they were testing the blood thinner through the IV. She was so miserable, she just wanted to go home and get a good nights sleep. Stated they took all kinds of test, checked her oxygen and had to have a certain number before she could go home. The patient received treatment for event stroke caused by a blood clot and not received treatment for sore arm . The outcome of events stroke caused by a blood clot was resolving, of event sore arm was resolved on 12Feb2021, of other events was unknown.

1278689	5/1/2021	VA	17	F	4/12/2021	4/1/2021	<p>Not sleeping well at night due to pressure feeling in her chest up; Not sleeping well at night due to pressure feeling in her chest up; shivers; jaw got paralyzed; she got shaky; feeling bad/ brain fog; burning sensation in her body; She couldn't talk; slight elevated temp (99.7F max); She has been off balance this week since getting her vaccine; This is a spontaneous report from a contactable physician. A 17-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 12Apr2021 (batch/lot number was not reported) as a single dose for COVID-19 immunisation. Medical history included irritable bowel syndrome, panic attacks, migraines and acne. The patient was not pregnant at the time of vaccination. It was unknown if there were other vaccines in four weeks. The patient did not have Covid prior to vaccination and was not Covid tested post vaccination. Concomitant medications in two weeks included ondansetron hydrochloride (ZOFran) taken for anti-nausea, start and stop date were not reported; doxycycline taken for acne, start and stop date were not reported. The patient previously took glycerol (GLYCERIN) and experienced allergies. The patient got her vaccine on 12Apr2021. Two nights after her vaccine (14Apr2021), she got shaky and feeling bad and burning sensation in her body. No fever at that time, but slight elevated temp (99.7F max) the day after the vaccine (13Apr2021). Mother gave her anti-nausea medication (ondansetron hydrochloride 2 mg) and within 5 minutes her jaw got paralyzed. She couldn't talk. It lasted about 30 min. Mother called ambulance and patient was brought to ER. ER didn't do bloodwork or any evaluation. ER didn't know what happened per mother. She has been off balance this week since getting her vaccine (Apr2021). She feels better this morning but she still feels off balance. Not sleeping well at night due to pressure feeling in her chest up and she shivers to get the feeling away per patient (unspecified date). Slept better last night as of 17Apr2021. No facial drooping. She can smile and lift her eyebrows. Patient had "brain fog" this week as well after the vaccine. The adverse events "she got shaky", "feeling bad", "burning sensation in her body", "jaw got paralyzed" and "she couldn't talk" resulted in doctor or other healthcare professional office/clinic visit and emergency room/department or urgent care visit.</p>

1278492	5/1/2021	VA	49	F	4/6/2021	4/1/2021	Thyroid storm; Thyroid eye disease; Graves' disease; Trouble swallowing and eating; Trouble swallowing and eating; Throat is scratchy; mild symmetric ptosis; bilateral perinasal sinus disease/nasal problems like sneezing, running nose, and coughing; nasal problems like sneezing, running nose, and coughing; trouble sleeping; This is a spontaneous report from a contactable consumer reported for herself. This 50-years-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) at age of 49 years old on 06Apr2021 at around 16:50 in the top of her right arm (lot: ER8737) at single dose for COVID-19 immunisation (reported as to protect herself and others). Medical history included ruptured brain aneurysm, it was paraophthalmic from 12Sep2012, HELLP syndrome from 01Sep2012, allergies. Seasonal allergies. Mumps, chicken pox, tetanus, rubella, measles from 1989. She had a ruptured brain aneurysm on 12Sep2012. It was a direct result from pregnancy HELLP syndrome, like toxemia on steroids. On 27Aug2012 her daughter was born, then she was diagnosed with HELLP 5 days later. She was hospitalized for another week. She was released and on 12Sep2012 and had the ruptured brain aneurysm which they say in itself was hereditary, and her blood pressure went up so high that it burst. She was hospitalized for 40 days. She was paralyzed and everything. She went on physical therapy and got everything back, no deficits. Family history included hereditary in her family to have hyperthyroidism/thyroid problems on both sides (her father and mother). Concomitant medications included cetirizine hydrochloride for allergies, it was the generic antihistamine for Zyrtec. She had been taking them for about 20 years. The patient previously received first dose of BNT162B2 at age of 49 years old on 19Mar2021 in the top of her right arm (lot: ERU6208) for COVID-19 immunisation. The patient had an emergency reaction to the second dose of the Covid-19 vaccine. All events required a visit to Emergency Room and Physician Office, and received treatment. She walking into the ER with trouble breathing and swelling to her face after the second Covid shot. She had the second vaccine on 06Apr2021 at around 16:30, and everything went fine. She came home and felt fine. She went to bed that evening at around 23:00. She woke up on 07Apr2021 the

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

morning at around 05:00 and was having excessively rapid heart rate, which is called tachycardia. Her left eye swelled open, and her right eye swelled shut. She took herself to the emergency room. She said that she had a hard time seeing now and had vision loss, and they gave her Iohexol intravenously. They also gave her ketorolac and methylprednisolone sodium succinate. The first one, Iohexol, they told her was Iohexol (OMNIPAQUE) for a cerebral CT. They did an orbital CT with contrast. Her vitals were blood pressure 171/86, temperature 98.1, pulse 125, respirations 18, and oxygen saturation 97%. 9 years ago she had a ruptured brain aneurysm, it was paraophthalmic. She thought maybe the vaccine caused some type of brain bleed (Apr2021) because her eye was swelled out. That was the reason for the scan. After she left the ER, they sent her to an emergency ophthalmic appointment, and the ophthalmologist told her that she had to get glasses immediately. She had just had her eyes checked in February. Her vision in her left eye had deteriorated. She had to go and get glasses. Then they sent her to have thyroid lab work done. She had an appointment set up to be seen by her regular ophthalmologist that following Monday. Everything was on Wednesday, 07Apr2021. She was fine until Friday, drove to work and when she got to work at about 08:00 or 09:00 her body started shaking excessively. It was the tachycardia. She thought it was from the pain in her eye and took paracetamol (TYLENOL) but she still didn't feel well. On Monday she saw the regular ophthalmologist and he said that her neck was swollen with a goiter and she had thyroid eye disease and Grave's disease on 07Apr2021. He sent her to her primary care physician within an hour and he concluded the same thing. He immediately sent her to the pharmacy for a heart medication for tachycardia. It was propranolol (INDERAL) 20 mg, and she took it 3 times a day. He set her up with an emergency endocrinologist appointment and he spoke with the endocrinologist on Monday night and went over the charts with her. Everything that he diagnosed her with is at his office. He sent her to the endocrinologist for a final diagnosis. She went to the endocrinologist on Tuesday and she sent her for more lab work. They did a whole panel of labs. She definitely had Grave's disease with a goiter. They put her on methimazole 10 mg tablets, and she took them 2 times a day. That was only

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

temporary until her labs come back. On Monday afternoon her primary doctor sent her to have an ultrasound of her neck. Her neck was swollen and she was having trouble swallowing and eating on 07Apr2021. The radiologist report said that it was strictly thyroid and she had no polyps or lesions. Her doctor suspected, they don't know exactly, but they suspect this happened because it was hereditary in her family to have hyperthyroidism/thyroid problems on both sides, and it was dormant and when she got the vaccine it triggered it to activate. She had thyroid storm (on 07Apr2021), and if she had not gone to the ER it could have been fatal. They were able to see everything during the thyroid storm so they could treat it. She was in thyroid crisis and had thyroid eye disease. Her left eye is permanently disfigured. She has an extremely protruding left eye and a right lazy eye. She had to see an ocular plastic surgeon to get it fixed at some point. She lost so much weight this past week (Apr2021). She had lost 8 pounds since Sunday, and she didn't know how many before that. It hit her hard. Her adrenaline was going so fast. Her throat was scratchy (on 07Apr2021), and she had a lot of nasal problems like sneezing, running nose, and coughing (Apr2021). It was reported that even with medicine, it only kept her heart rate down for a little while. She didn't take Tylenol until Friday morning for eye pain. It wasn't from the pain though, it was from tachycardia. She can close her left eye but she had damaged muscles behind her eye in Apr2021. It was still protruding, but the swelling went down about 80% 2 days after leaving the hospital. Within 24 hours after they injected her eye the swelling went down 80%, but it was still protruding. Her right eye was a lazy eye. It was swollen shut. She couldn't get it moving, so it may have been out of fear. She put cold compresses on her eyes before she went to the hospital. She was able to open her right eye. She can close her left eye but not all the way. She had to keep using eye drops because it got dry (in Apr2021). Her vision has gotten worse since February, especially her left eye. Her doctor sent her to get prescription glasses. The vision center had to adjust them and tilt them because the muscle in her eye won't let her eye move to see through the lens. It is her distance vision, mostly in her left eye. Her right eye droops and her left eye popped out. The shaking made her look like she had Tourette's.

----------	-------	-------	---------	-----	----------	------------	--------------

After she got medicine at the hospital it went away and her body calmed down. On Thursday it seemed okay. Her doctor said it was because she still had the IV medicine in her body. On Friday the medicine wore off and her heart was racing and it was making her body shake. Doctor said her heart was beating so quickly because her thyroid was causing her to make so much adrenaline and it caused her body to shake. 20 minutes after she took the propranolol it completely stopped. On 07Apr2021 they suspected she had Grave's disease and Thyroid eye disease. The thyroid testing came back as unreadable. It came back as 0.01 UIU/mL. It was thyroid stimulating hormone. It was not a full panel, but that was enough to try to find out if it was her thyroid. The endocrinologist ordered full testing. The goiter was pressing on her throat and she had a hard time swallowing when she was eating. It was scratching her throat. She has gone to soft foods until it was easier to swallow. She can swallow on her own, but it was hard to swallow foods, it got stuck in her throat. They told her she would get better with the thyroid medication. She lost weight so fast and would start to lose muscle. She was losing weight because her adrenaline was up. It had made her weak on 10Apr2021. They gave her a list of supplements and protein drinks. In October she started to exercise and lost a couple pounds between then and January. She was just taking long walks and thought it was going great. She had only lost a couple of pounds. After Wednesday her weight started rapidly changing, and every time she got weighed she had 3 more pounds gone. She started feeling really weak by the weekend. Her heart was making her feel weak, and she hadn't had any medicines yet and felt tired on 10Apr2021. After Wednesday, she started having 2 bowel movements a day which is very strange. Her doctor said it is a symptom of hyperthyroid. Normally it is like clockwork in the morning and that's it. She noticed it on Thursday 08Apr2021. She became hypersensitive after Wednesday and paid attention to everything. She already had seasonal allergies. She stopped any kind of decongestant. She knew with heart palpitations to stay away from that. She just took cetirizine hydrochloride (ZYRTEC) and fluticasone propionate (FLONASE). Her doctor said her body was used to that to keep her sinuses down, and with her body making so much

adrenaline it could be excessive. Wearing a mask over her face was hard to breathe because the heart. She had trouble sleeping, which could be part of the fatigue because it was disturbing her sleep. They confirmed it was her thyroid on Monday and again Tuesday with more extensive labs for the correct level of methimazole. Investigations included: She had a CBC with differential on 07Apr2021. She had a CT orbit sella post fossa W contrast that showed facial swelling and periorbital edema of both eyes on 07Apr2021. The impression on the radiology digital imaging she can provide at a later time. She had mild symmetric ptosis on 07Apr2021 otherwise normal for appearance of orbital content. The impression for the CT scan on 07Apr2021 was bilateral perinasal sinus disease which was her allergies. The rest was stable coiling. She had vascular coiling directly behind her eye from the ruptured aneurysm. The outcome of events Thyroid storm, vaccine caused some type of brain bleed, hyperthyroid, pain in her eye, Lost so much weight, Dry eye, blood pressure 171/86, Hypersensitivity, trouble sleeping, facial swelling, mild symmetric ptosis, trouble breathing was unknown, outcome of events Eye swelling, Tired, Weak was recovering, outcome of event shaking was recovered on 07Apr2021, outcome of other events was not recovered.

A 28-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE Solution for injection, lot number and expiry date not reported), via an unspecified route of administration, in Mar2021 (reported as two weeks prior to her Botox injections), as single dose, for COVID-19 immunisation; and botulinum toxin type A (BOTOX COSMETIC Injection, lot number: C6548AC4; expiration date: Jul2023), via an unspecified route of administration, from 09Apr2021, for Glabella, frontalis and crow's feet, at dose "for glabella -12U total (3 injection locations), frontalis- 8 units , and crow's feet - 4 units in each side (2 injection sites of 2 units each on both sides)". Medical history included birth control. The patient was not pregnant and was not breastfeeding at the time of vaccination. Concomitant medication included ethinylestradiol, norethisterone (ALYACEN) taken for birth control, from 2011 (reported as 10 years ago) and ongoing. The patient previously took clindamycin and was allergic. The patient received her first dose of BNT162B2 two weeks prior to her Botox injections (Mar2021). On an unspecified date, the patient started having symptoms of muscle weakness, which she can feel but isn't visual, to the right eye and then a few days later in her right corner of her mouth which progressed into some jaw pain on the right. The patient's neuro assessment was her sensation on the side she was having all her symptoms, her right side did seem to be decreased compared to left. It was also reported that the patient received her first ever Botox treatment on 09Apr2021. On 10Apr2021, she experienced numbness in her right arm, pain in the jaw, radiating to the right arm, this was ongoing and progressing. The patient called her PCP went to the emergency room (ER) on an unspecified date because her tongue started to swell. ER did her blood work on an unspecified date (unknown result) and said to monitor

the patent. The patient was given ibuprofen every 8 hours for the events "some jaw pain on the right", "pain in the jaw, radiating to the right arm" and "mouth pain". It was reported that the patient has less arm, mouth and jaw pain probably due to ibuprofen. It was also reported that the patient can feel a slight droop but not visually and experienced muscle weakness on an unspecified date. The muscle weakness was minimal during the neuro assessment. The events did not result to hospitalization. The nurse wanted to know if the numbness in right arm; pain in the jaw, radiating to the right arm; and swelling of tongue has been experienced in the past. The patient was recovering from the events "some jaw pain on the right", "numbness in her right arm", "pain in the jaw, radiating to the right arm", and "mouth pain". The outcome of the event "can feel a slight droop but not visually" was unknown, while the outcome of the remaining events was not recovered. Information about batch/lot number has been requested.; Sender's Comments: Based on the limited information in the case report, a possible causal relationship between events Extraocular muscle paresis, facial paralysis and suspect drug BNT162B2 cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

1278674	5/1/2021	MI	49	F	3/25/2021	3/25/2021	<p>Allergic reaction; itching from head to toe; rash; broken vessels in cheeks, turned red; difficulty breathing; arm went numb; was not feeling good; blotchy; This is a spontaneous report from a contactable consumer (patient). A 49-years-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration administered in right arm on 25Mar2021 14:30 (Batch/Lot Number: EN6207) as single dose for COVID-19 immunisation. The patient medical history and concomitant medications were none. No prior vaccinations within 4 weeks. The patient experienced itching from head to toe on 25Mar2021 with outcome of not recovered, rash on 25Mar2021 with outcome of not recovered, broken vessels in cheeks, turned red on 25Mar2021 with outcome of not recovered, difficulty breathing on 25Mar2021 with outcome of recovering, allergic reaction, arm went numb, was not feeling good and blotchy on 25Mar2021 with outcome of unknown. The events itching from head to toe, rash, broken blood vessels in cheeks and difficulty breathing require a visit to Emergency Room. No relevant tests. Clinical course reported as follow: Patient received her first dose 25Mar2021 and within 3 hours she was in the Emergency Department. She had an allergic reaction. She has had itching and rash since receiving the shot. The allergic reaction wasn't even 5 minutes of getting the shot her arm went numb and she thought she's in trouble and was this normal. She asked people running the clinic and asked if this was normal and they said no never heard of that. After that itching started. Itching started at her head and moved to her face and then her entire body. She had a rash on her face, neck and chest. The blood vessels broke in her cheeks. She knew she should have some diphenhydramine hydrochloride (BENADRYL) and the emergency department didn't have any there. The staff made her wait for 30 minutes after her injection. She was not feeling good. It was hard for her to take a deep breath, and to catch her breath after 30 minutes of waiting there. Then she drove herself to store and got diphenhydramine hydrochloride, and drove herself home, she was not feeling any better and took the diphenhydramine hydrochloride. She called her doctor's office. It was like an hour after the shot and she told them at the doctor's office she was blotchy, itchy, and having</p>

trouble breathing. She talked to the nurse and was advised she must get to the Emergency Department. The nurse told her that the staff should not have let her leave the facility where had shot administered and should have called an ambulance and did not. The staff did not even have diphenhydramine hydrochloride. She went to the Emergency Department and she was still itchy. It had been since 25Mar2021. The rash was mainly on both sides of her neck and under her ears. It comes and goes. She confirmed outcome as persisting. The broken vessels, turned red, under her eyes were no better. She would get spells of difficulty breathing. She couldn't get a deep breath for about a week after the shot and it has gotten better. No follow-up attempts are needed. No further information is expected.

1278681	5/1/2021	NV	62	F	4/16/2021	4/1/2021	<p>blood pressure (BP) was usually 110/70 however 8 hours after shot BP was 145/85; really bad vertigo and dizziness; really bad vertigo and dizziness; facial palsy; vision in her right eye got fuzzy; face got numb on the right side; hot electrical nerve zinging entire right arm, right shoulder blade and right calf; sore arm; feel sick; hangover; vomiting; This is a spontaneous report from a contactable consumer (patient) via the medical information team. A 62-year-old non-pregnant female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), first dose via an unspecified route of administration, administered in the right arm on 16Apr2021 11:15 (Batch/Lot Number: EW0162) as single dose (at the age of 62-years-old) for COVID-19 immunisation. Medical history included anaphylaxis: carries an epi pen, and has allergies to wasps. The patient also took unspecified dietary supplements. The patient had no other vaccine in four weeks. The patient got her first vaccine dose on 16Apr2021 and reported having a history of anaphylaxis and carried an epi pen. She stayed at the vaccination facility for an hour and a half and she got facial palsy and her vision in her right eye got fuzzy. Then her face got numb on the right side. It took 4 hours for it to go away but by dinner she felt ok. She added that immediately after the shot (16Apr2021), she experienced hot electrical nerve zinging entire right arm, right shoulder blade and right calf that lasted 30 minutes; blurry vision right eye started 15 minutes after shot, recurred off and on for 6 hours; facial palsy on right side that started about 30 minutes after shot that lasted 4 1/2 hours; vertigo/dizziness that started 7 hours after the shot; and blood pressure (BP) was usually 110/70 however 8 hours after shot BP was 145/85. She filed a report online when her symptoms began to subside. A couple hours later, she began to feel sick again and went to bed. When she walked to her mailbox, she was feeling ok but when she bent over to get the mail, that made it all worse. She woke up feeling as if she had a hangover and reported vomiting right away after getting out of bed. She had really bad vertigo and dizziness. She also had a sore arm (unspecified which arm) and stated that she was "experiencing everything on the freaking list." The patient wanted to know if this was normal and asked if she should get the second dose. She was advised that if she had a severe allergic reaction after a previous dose of</p>

1278406	5/1/2021	TX	37	F	1/6/2021	1/6/2021	sleepy; tired; tested positive for covid-19 after receiving the first dose of the covid-19 vaccine; tested positive for covid-19 after receiving the first dose of the covid-19 vaccine; body ache; runny nose; left eye was throbbing; she couldn't swallow like her body forgot how to do it; feeling she had something in her throat; severe headache; tension on her neck that felt like a neck injury; neck pain; jaw was paralyzed; pain in arm; This is a spontaneous report from a contactable lactation registered nurse (patient). A 37-year-old patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number and expiration date unknown) via an unspecified route of administration on 06Jan2021 around 5 pm (at 37-year-old) at single dose for COVID-19 immunization. Medical history included migraine. Concomitant medication included amitriptyline since 2018 at 10 mg nightly, 20 mg and 30 mg for migraine and stopped after COVID, and she was feeling tired/ sleepy and that made it worse; riboflavin sodium phosphate (VITAMIN B), and magnesium. The next day on 07Jan2021 about 7:59 am (around 13 hours after receiving the vaccine), all of a sudden she was driving and her jaw was paralyzed, it's became hard, she couldn't move it and it was very painful. she never had that and she was driving with her two little kids and it freaked her out and she tried to park and she finally parked being it lasted for a couple of minutes. When she looked at the time again it was 8:03 am, it was gone. She needed to get her kids to safety because she was driving but then it went away. On 09Jan2021, she started to have all of a sudden this tension on her neck that felt like a neck injury, it was hard to move her neck to a certain side and started while she was working. It was progressing and she thought she hurt herself. The pain began to lead to a severe headache. The neck pain felt like an injury lasted for a couple of days, but headache persisted and was intense, it lasted for 2 weeks and her coworkers thought she had COVID. She worked on 09Jan2021 and 10Jan2021 and then called out after that. On 12Jan2021 and 13Jan2021 the pain was not just in her head but in the left eye, it was throbbing and severe pain deep inside. It lasted for a couple of days lasted for over a week, it was not as bad as the first couple of days, the pain was the most severe on the 12Jan2021 and 13Jan2021 and couldn't do anything and stayed in bed. It

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

felt like it was nerve pain and she never had that before, it was definitely different. She took daily anti migraine medicine and as long as she took it she doesn't have migraine headaches. For her Sumatriptan 50 mg, she took it twice on 12Jan2021, but because of the side effects it makes her nauseous and she couldn't take it anymore, she just has the prescription. She was only allowed to have 10 a month. It is sumatriptan and it didn't work either and she was supposed to take it to reverse the headache and it didn't work. For the amitriptyline, its 10 mg and had to triple to 30 mg. She took it at nighttime, but one of the side effects is that it made her sleepy but she didn't sleep. She has a 3 month supply and had plenty, if she needed to adjust but that was her first time she was taking that much, her doctor said she could up her dose to 20 mg, her gave her permission before because it can be used at higher doses if needed, she did try the 20 mg but that did not work so she had to triple to 30 mg. Once she realized that was not helping she just said forget it. She had to triple the dose of her migraine medicine and she was taking 3000-4000 mg of paracetamol (TYLENOL) even that couldn't take it down and even did cold compresses. The headaches lasted for a couple of weeks and then she finally got COVID. The headache after that was different, not as intense, and even taking paracetamol a couple times per day was dealing with this headache, the fever the body aches. It is not like the headache she got from the vaccine. It lasted for another week with COVID and was different and managing the headache. So currently she was good. She stopped taking amitriptyline, she was taking it for 3 years and was switched to Vitamin B2 and magnesium in the last month and had no headaches. She had to switch after getting COVID because she felt more tired and sleepy and felt that the amitriptyline would make it worse so she had to find something else. She was good with the new medications. She was cleared to go back to work on 03Feb2021. She was pretty much good by 03Feb2021. She was told by her MD not to get a second dose but her employer stated she could be terminated if she was not fully vaccinated. She was concerned and scared of having this reaction again. Her arm pain hurt for a few hours but because she has other pain she thought it was her left arm but she really couldn't recall. she did have pain in her arm, it was normal pain nothing

----------	-------	-------	---------	-----	----------	------------	--------------

significant. It started at 11 pm on 06Jan2021 and lasted until Saturday 09Jan2021 and remembered that she had a hard time helping at work because she has to use the arm but the arm soreness was just like with any other vaccine, nothing abnormal. From 10Jan2021 to 13Jan2021 she kept feeling she like had something in her throat in the morning, and when she would start drinking she couldn't swallow like her body forgot how to do it. She would hold it in her mouth and then 30 seconds later she would start swallowing and then it went away. It was just in the morning for like 4 days. It cleared by 14Jan2021, clarifies it ended then. Caller stated her husband took a test on 11Jan2021 and didn't get his results until 14Jan2021 and showed he was positive and he was already isolating and she was at home with the kids. States her husband was the one that brought it in. She did start to have COVID symptoms until 23Jan2021, she had fever, chills, body ache, runny nose, shortness of breath and diarrhea. She was prescribed a z pack, azithromycin, and it helped with cough, the congestive cough and nasal spray for her runny nose. It was water coming out of her nose, most runny she has ever felt. She got testing and kept going for testing because she felt so sick and it was negative (on 13Jan2021 and 18Jan2021). She finally tested positive on 25Jan2021. No additional therapies for COVID-19. No other test performed, they see patients that keep testing positive 3 months later after no symptoms and just want to wait for symptoms to go down. The patient was not hospitalized, not admitted to an Intensive Care Unit. The outcome of the event paralyzed jaw was resolved on 07Jan2021, neck pain/ tension was resolved on 11Jan2021, headache was resolved on 03Feb2021, throbbing eye was resolved on 19Jan2021, pain in arm was resolved on 09Jan2021, "feeling she had something in her throat" and swallowing impaired was resolved on 14Jan2021, of other events were unknown. Reporter seriousness for Jaw was paralyzed: unknown Reporter seriousness for headache: serious, affected her ability to perform and no one wanted to see her in person and only had virtual visits with the doctor Reporter seriousness for tested positive for COVID-19 after receiving the first dose of the COVID-19 vaccine: Unspecified Reporter seriousness for tension on her neck that felt like a neck injury: Not serious Reporter seriousness for left eye was throbbing:

1278679	5/1/2021	MO	60	F	3/27/2021	3/31/2021	<p>Bell's Palsy; I started to have sharp pain behind my ear; sinus congestion; deep sore throat; dry left eye; This is a spontaneous report from a contactable other healthcare professional (HCP; patient). A 60-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), via an unspecified route of administration, administered in left arm on 27Mar2021 at 16:00 (Lot Number: ER8733, expiry date not reported) at the age of 60-years-old at a single dose for COVID-19 immunisation. The patient was not pregnant at the time of vaccination. The vaccination facility type was facility. The patient received no other vaccine in four weeks. The patient had no COVID prior to vaccination and was not tested for COVID post vaccination. Medical history included penicillin-rash; high cholesterol being treated with Repatha; slightly high blood pressure being treated with lisinopril; cysts in pancreas, thyroid and kidneys-all benign. Concomitant medications included evolocumab (REPATHA) for high cholesterol; lisinopril for slightly high blood pressure; spironolactone for an unspecified indication and testosterone for an unspecified indication, all start and stop dates were not reported. The patient received the first dose of the Pfizer-BioNtech Covid-19 vaccine on 27Mar2021, 4 days later on 31Mar2021 20:30 she developed Bell's Palsy. She would like to know if in the clinical trials those who experienced this adverse event was after the first or the second dose of the vaccine. She already reported this adverse event to Safety, online and verbally. She would like to know if Pfizer recommends for people who develops Bell's Palsy after the first dose of the vaccine not to receive the second dose and if there's information about the cases of Bell's Palsy after receiving the vaccine during the vaccination to larger populations. She's also wondering if there is information about how long it takes to resolve. Patient reported that four days after vaccination on 31Mar2021 at 20:30, she started to have sharp pain behind her ear, sinus congestion, deep sore throat, and dry left eye, went to bed, next morning she woke up with Bell's palsy on left side of face (also reported to have occurred on 31Mar2021 20:30). These resulted in a doctor or other healthcare professional office/clinic visit. The patient was treated with high dose prednisone and Valtrex. The outcome of the events was not recovered.; Sender's Comments: Bell's palsy is not</p>

felt low blood pressure; weak; confused; When fell hit self on head, lip, nose, and eye; When fell hit self on head; bruises on face; had burst lip; diarrhea; leg pain; fainted; seizure; felt hot; chills/shaking.; This is a spontaneous report from a contactable consumer (patient herself). This 62-year-old female patient (not pregnant) received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Lot number not provided), via an unspecified route of administration in the left arm, on 13Apr2021 at 21:00 (at the age of 62-year-old) as single dose for COVID-19 immunisation. Historical vaccine includes the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Lot number EP6775 MS 389) administered via an unknown route in the left arm on 17Mar2021 (at 10:00 AM) for COVID-19 immunisation. No other vaccine was received in four weeks. Relevant medical history included gastritis and anxiety. Past drug history included allergy to mirtazapine (REMERON). Relevant concomitant medications included diazepam (VALIUM), vitamins and probiotics. On 13Apr2021 at 23:00 the patient had chills / shaking. On 14Apr2021 at 02:00 AM, she felt hot. She went to bathroom, felt low blood pressure, weak, and fainted. Woke up, felt disoriented, not know where she was, confused. When fell hit self on head, lip, nose, and eye. She suffered various bruises on face. May have had seizure, had burst lip and felt was biting. Then suffered diarrhea that day. She also experienced leg pain. She went to the doctor on 16Apr2021. On unknown date, blood work up was done and results were not provided. The patient was recovering from the events. Information on the lot/batch number has been requested.

1278636	5/1/2021	TX	16	F	4/16/2021	4/16/2021	fainted for a few seconds; I started seeing blurry; my ears were ringing; This is a spontaneous report from a contactable consumer (patient). A 16-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot Number: EW0161, expiry date not reported), via an unspecified route of administration, administered in the right arm on 16Apr2021 16:45 (age at vaccination was 16 years) as single dose for COVID-19 immunization. Medical history was none. The patient had no known allergies. The patient was not pregnant at the time of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was vaccinated at a pharmacy or drugstore. The patient was not diagnosed with COVID-19 prior to vaccination. Since the vaccination, the patient has not been tested for COVID-19. Concomitant medications were not reported. The patient reported that on 16Apr2021 17:00, "I started seeing blurry. I stood still so my vision would clear. Then I fainted for a few seconds. When I came to my ears were ringing." The events resulted to emergency room/department or urgent care. Therapeutic measure was taken as a result of the events that was seen by a doctor. Clinical outcome of the events was unknown. No follow-up attempts are required. No further information is expected.

1278634	5/1/2021	MS	49	F	4/1/2021	4/12/2021	Burst blood vessel in left eye; This is a spontaneous report from a contactable consumer (patient). A 49-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), second dose at the age of 49-years-old via an unspecified route of administration, administered in arm right on 01Apr2021 15:30 (Batch/Lot Number: Fp6955) as single dose for covid-19 immunisation. Medical history included diabetes mellitus from an unknown date and unknown if ongoing. Concomitant medication included canagliflozin (INVOKANA), metformin and rosuvastatin; taken for an unspecified indication, start and stop date were not reported. The patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) on 11Mar2021 (lot number: En6199) at the age of 49-years-old administered on the right arm for covid-19 immunisation. The patient experienced burst blood vessel in left eye on 12Apr2021. No treatment was received for the event. The patient was recovering from the event.
1278619	5/1/2021	WA	26	M	5/1/2021	5/1/2021	Patient got vaccine and sat down for observation. He reports that after 1 minute, he was shakey, sleepy, and very tired. Then he felt like he fell asleep until the person checking him called at him. He had some vision and hearing impairment at the beginning, then after 10 minutes he was better. His arm was hot, he was sweating, his skin was turning white color. His mom came (she was shopping) and said the patient is usually an anxious person, so it was overwhelming to be at department store and getting the shot. After another 10 minutes, he was drinking water, his senses were back, he was fine.

1278606	5/1/2021	ME	24	M	5/1/2021	5/1/2021	<p>Patient administered Janssen Covid vaccine at 0943AM on 5/1/21 by pharmacist on duty. Patient had no prior reactions to vaccines but did admit being needle adverse prior to administering vaccine. After administration patient sat in waiting area within direct view of pharmacist. No sooner than 2 minutes post administration patient spoke up to pharmacist assisting customer at consultation window about feeling nauseous, and vision fading. Patient comfortable being assisted in taking two steps to immunization room to lie flat on ground after removing outer jacket. Patient was visibly sweating profusely and described hands feeling cool, dizzy, and lacking peripheral vision slightly. Pharmacist remained in immunization room talking to patient for 10 minutes, patient never fully lost consciousness and within 10 minutes recovered from all visual disturbances. Patient moved to seated position within immunization room and accepted offer for juice box. Patient remained seated in immunization room for additional 10 minutes under supervision from pharmacist through window. Patient comfortable moving to waiting area again for additional 10 minutes, afterwards he described feeling still slightly nauseated but no other symptoms. He called his ride from the waiting area and told pharmacist he was recovered and comfortable leaving. Pharmacist agreed to call patient later in the day to check in again. Pharmacist left message at 5pm 5/1/21. Appropriate parties notified and VAERS completed.</p>

1278596	5/1/2021	FL		F			<p>patient had complaints of numbness and tingling in her right arm/numbness and tingling in both arms/and legs; patient had complaints of numbness and tingling in her right arm/numbness and tingling in both arms/and legs; This is a spontaneous report from a contactable nurse reported that a female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number was not reported), administered in arm left on an unspecified date then received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number was not reported) on 16Apr2021; both via an unspecified route of administration as a single dose for covid-19 immunisation. The vaccine was administered at the clinic. The patient's medical history and concomitant medications were not reported. The nurse reported that a patient received the 1st dose of the Pfizer covid vaccine approximately 21 days ago. It was given in her left arm. Within the 1st 15 minutes, the patient had complaints of numbness and tingling in her right arm. Her symptoms resolved by the next day. The patient has come back today for 2nd dose and has had an amplified response not just in 1 arm but in both arms within 15 minutes of observation. She did not report any other symptoms. Five minutes after, the patient said she had numbness and tingling in her legs. They kept her for about an hour eventually and she called someone to drive her home as a precaution. The nurse further reported that the patient who had numbness and tingling in the opposite arm from the arm that the first vaccine was administered in. The same patient came back for the second dose and felt numbness and tingling again. It has been said that the effects can be amplified on the second dose. This time, the numbness and tingling not only happened in one arm, but in both arms. Also had numbness and tingling in the legs. The patient did not experience any other side effects. No difficulty breathing, no swallowing issues, no dizziness or nausea, no vision changes, did not feel like she was going to pass out, and was not diaphoretic. Is a little concerning. Said she can find where she was spatially and can ambulate normally. Her concern was, is it going to increase, is it going to affect her breathing. The nurse asked the patient if she could drive home by herself and is she not going to be able to feel the pedals in the car. The nurse asked her to have someone to pick</p>

VAERS\_ID RECVD STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

her up. This patient was in the 30 minute observation area caller thought because of something in the past, being allergic to, but not to any kind of vaccine. They just take extra precaution. Usually people were in there if they have like an allergy even to like antibiotics or sulfa drugs, things that weren't even included in the ingredient list for Pfizer but just to be extra cautious they put them in the 30 minute observation area. If they start to develop any symptoms they ask them if they could please stay an additional 15 minutes. If symptoms persist or get worse then they keep them longer. Onset date of the reported numbness and tingling in arm was the date she was administered first dose of Pfizer Covid-19 Vaccination, unknown other than approximately 21 days ago. She was in the 30 minute observation and the nurse wanted to say within probably the first 15 minutes she started having symptoms of the numbness and tingling. It was like when you sleep on your arm and it kind of falls asleep, that's how patient described it. The duration of the events lasted the first time, by the next morning, it had resolved. She woke up and she was fine. She was vaccinated probably early to mid-afternoon. The clinic only does vaccines until probably 4:30pm. After the second dose she received today, 16Apr2021 they kept the patient for about an hour. She was still in there when the nurse came out to make this call. The nurse has been checking in on her intermittently and they have 3 nurses in the observation area so they're aware of what's going on with her to keep an extra eye on her in case she has any difficulty breathing, make sure she doesn't look like she's going to fall out of the chair. They were extra vigilant on observing her. Patient was still having the numbness and tingling, in the legs clarified she has been having numbness and tingling in all of the extremities. In the arms, it wasn't constant. It would come and go and radiated back and forth. Must be something was stimulating in the brain. The events were considered as serious - medically significant. The outcome of the events was recovered on an unspecified date. Information about lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a possible contributory role of the suspect drug in the reported serious events cannot be completely ruled out given the known suspect drug profile and/or implied temporal association. The impact of this report on the

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1276281	5/1/2021	KY		M	1/28/2021	4/1/2021	benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including  Blood clot in the right eye; This is a spontaneous report from a contactable consumer(patient) based on information received by Pfizer, license party for apixaban (ELIQUIS). This spontaneous case was reported by a consumer and describes the occurrence of OPTHALMIC VEIN THROMBOSIS (Blood clot in the right eye) in male patient of an unknown age who received apixaban (Eliquis) for an unknown indication. CO-SUSPECT PRODUCTS included Covid-19 Vaccine for an unknown indication. On an unknown date, the patient started Eliquis (unknown route). On 07-Jan-2021, the patient started Covid-19 Vaccine (unknown route). In April 2021, the patient experienced OPTHALMIC VEIN THROMBOSIS (seriousness criterion medically significant). The action taken with Eliquis (Unknown) was unknown. At the time of the report, OPTHALMIC VEIN THROMBOSIS outcome was unknown. The consumer received his first Pfizer covid 19 shot on 07-Jan-2021 and the second one on 28-Jan- 2021, and 10 days prior to this report he got a blood clot in his right eye. He takes a blood thinner and remarks this should keep him from getting blood clots, should not it. Blood thinner provided was Eliquis. The event was related to covid 19 vaccine and causality with Eliquis was not provided. For Eliquis (Unknown), the reporter did not provide any causality assessments. This case was received via pfizer. BMS Medical Evaluation Comment: This patient had ophthalmic vein thrombosis while on therapy with apixaban and after taking covid 19 vaccine. Underlying thromboembolic risk as ascertained by the use of apixaban is a significant factor that likely predisposed the patient to develop ophthalmic vein thrombosis and considered not related to apixaban therapy. Causality Assessment: For apixaban: the causal relationship of the event Ophthalmic vein thrombosis with the suspect product apixaban was not provided Per Reporter; the causal relationship of the event Ophthalmic vein thrombosis with the suspect product apixaban was Not Related Per Company (Bristol-Myers Squibb)

1279193	5/1/2021		60	F	2/10/2021		<p>Back disorder; lower back issues; Feeling abnormal; felt fuzzy; Vaccination site pain; sore arm; Dizzy; Fatigue; Energy decreased; not feeling as much energy as before; Pain upon movement; walk about a block but then starts to hurt; This is a solicited report from a contactable consumer (patient) via a non-Pfizer sponsored program, based on the information received by Pfizer (Manufacturer Control No: 21K-163-3774842-00).</p> <p>Solicited report from a consumer of a 60 year old female with events of heart/atrial flutter, atrial fibrillation, eye surgery and arm surgery and non-serious weight gain due to attempting to stop smoking, lower back issues, felt fuzzy, got first dosage of covid-19 vaccine and experienced sore arm, fatigue and dizzy from the blood thinners after surgery, still not feeling as much energy as before and walk about a block but then starts to hurt with humira 40mg/0.4ml (adalimumab). The patient had a relevant medical history of tobacco use/four cigarette sticks per day, seropositive high titer rheumatoid arthritis, fingers swelling, joint pain, joint swelling and lost of blood flow in hands and legs. On unknown dates, the patient experienced eye surgery, arm surgery, lower back issues, felt fuzzy, got first dosage of covid-19 vaccine and experienced sore arm, fatigue and dizzy from the blood thinners after surgery, still not feeling as much energy as before and walk about a block but then starts to hurt. In 2020, the patient experienced heart/atrial flutter and atrial fibrillation. In Sep2020, the patient experienced weight gain due to attempting to stop smoking. On 24Feb2021, the heart/atrial flutter and atrial fibrillation resolved. Covid-19 vaccine was also considered suspect. The patient had eye and arm surgery in the past. On 24Feb2021, she underwent pulmonary vein cryoballoon ablation surgery for the atrial fibrillation and atrial flutter. She had a procedure done and went into her heart and froze the nerve endings that were causing the atrial fibrillation, and also fixed the flutter in her heart. The causality as per reporter for this procedure was reported as no reasonable possibility. She still recovering. She discontinued the Humira two weeks before the surgery and took her last injection on 10Feb2021 and was paused it for four weeks, but she started back it on 10Mar2021. She follows up with her surgeon at the end of the month and she hopes this helps got her off of the blood thinners and other medicines, she been on for this.</p>

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

She stated that this was not related Humira. She was advised by her physician to increase the exercise to lose some weight. With her lower back issues, she was hoping that when she got off of the blood thinners, she could do pain shots again and start exercise. She could walk about a block but then she started to hurt. She had been careful with her diet also, cut out the salt also. This had nothing to do with Humira and she did not want to be contacted about this again for this also. She felt fuzzy, it took her most of the morning to get woken up. Her Doctor thinks once she would off of the blood thinners she would be back to normal. Other than that she feels fine. She does not wanted to be contacted about this. It was unknown if patient was enrolled in a COVID-19 Vaccine Trial. On unknown date, patient received first dose COVID-19 Vaccine manufactured by Pfizer, lot number unknown. She agreed to have physician contacted. Blood thinner was also considered as co-suspect. Other medical history included abstains from alcohol, contrast dyes allergy manifested by scratch throat, allergy manifested by bowel movements (oral medications for rheumatoid arthritis; up to eight times a day and slept 15 hours per), prevent esophagus damage, heart, low thyroid, and attention-deficit/hyperactivity disorder. The patient's concomitant medications included pantoprazole to prevent esophagus damage, metoprolol for heart, levothyroxine for low thyroid, vortioxetine hydrobromide (TRINTELLIX) for depression, and dexamfetamine sulfate (DEXTROAMPHETAMINE) for attention-deficit/hyperactivity disorder. The patient underwent laboratory tests and procedures which included blood work: everything was fine in Jan2021; chemical stress test and treadmill stress test: confirmed atrial fibrillation and atrial flutter in Sep2020; body weight: gain in Sep2020; and X-ray: confirmed atrial fibrillation in Sep2020. The action taken in response to the events for adalimumab and apixaban was unknown. The patient recovered from atrial flutter and atrial fibrillation on 24Feb2021. Outcome of Feeling abnormal and Pain upon movement was unknown. The patient had not recovered from the remaining events. Change History: On 05Mar2021, received updates to patient demographics, medical history, event information, reporter opinion of causality, suspect drug information, concomitant drug information, past drug information,

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

laboratory/diagnostic procedures and narrative description. The events of "atrial flutter", "atrial fibrillation" and "weight gain due to attempting to stop smoking" were added. On 11Mar2021, received updates to patient demographics, medical history, event information, reporter opinion of causality, company opinion of causality, company alternative etiology, suspect drug information, laboratory/diagnostic procedures and narrative description. The events of "LOWER BACK ISSUES" and "WALK ABOUT A BLOCK BUT THEN STARTS TO HURT" were added. the event of "atrial flutter" was amended to "heart/atrial flutter". On 08Apr2021, received updates to event information, reporter opinion of causality, company opinion of causality, company alternative etiology, suspect drug information and narrative description. The events of "felt fuzzy", "got first dosage of covid-19 vaccine and experienced sore arm", "fatigue and dizzy from the blood thinners after surgery" and "still not feeling as much energy as before" were added. Causality for humira 40mg/0.4ml(adalimumab): The reporter's causality for the event(s) of heart/atrial flutter, atrial fibrillation, eye surgery, arm surgery, weight gain due to attempting to stop smoking, lower back issues, got first dosage of covid-19 vaccine and experienced sore arm, fatigue and dizzy from the blood THINNERS after surgery unknown onset and fatigue and dizzy from the blood thinners after surgery unknown onset with humira 40mg/0.4ml(adalimumab) was no reasonable possibility. The reporter's causality for the event(s) of felt fuzzy, still not feeling as much energy as before and walk about a block but then starts to hurt was not provided. Manufacturer opinion is that there is no reasonable possibility that the events of heart/atrial flutter, atrial fibrillation, eye surgery, arm surgery, weight gain due to attempting to stop smoking, lower back issues, felt fuzzy, got first dosage of covid-19 vaccine and experienced sore arm, fatigue and dizzy from the blood thinners after surgery unknown onset, fatigue and dizzy from the blood thinners after surgery unknown onset, still not feeling as much energy as before and walk about a block but then starts to hurt are related to humira 40mg/0.4ml(adalimumab). The reporter's assessment of the causal relationship of the events with BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) was not

provided at the time of this report. Since no determination has been received, the case is managed based on the company causality assessment. No follow-up attempts are possible; information about batch number cannot be obtained. No further information is expected.; Sender's Comments: Based on the current available information , the events of sore arm, fatigue and dizzy could be related to the suspected drug of BNT162B2. The other events are most likely related to an intercurrent or underlying condition which is not related to the suspected drug. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1278862	5/1/2021	IL	88	F	2/19/2021	3/26/2021	throat closing, tongue swelling, face swelling and a hard time breathing/ diagnosed her symptoms as angioedema; potassium was low and sodium was low; potassium was low and sodium was low; This is a spontaneous report from a contactable consumer (patient). An 88-year-old female patient received her second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN6198) at the age of 88-years-old, via an unspecified route of administration in left deltoid on 19Feb2021 at single dose for COVID-19 immunization; losartan potassium (lot number: LJ5020047-A, expiration date: Aug2023), via an unspecified route of administration from 2011 to an unspecified date in 2021 at 50 mg, 1x/day for blood pressure high; diclofenac sodium modified-release tablet (lot number: PW6V5QFTAF61, expiration date: May2022), via an unspecified route of administration from an unspecified date to an unspecified date in 2021 at 75 mg, 1x/day for an unspecified indication; ibuprofen (ADVIL LIQUI GELS, 200 mg strength, lot number: CY1426, expiration date: Jun2022) capsule, via an unspecified route of administration from an unspecified date to an unspecified date in 2021 at 2-4 capsules, as needed (daily) for an unspecified indication; and aflibercept (EYLEA) injection, ophthalmic from an unspecified date to 11Mar2021 at 1 DF (injection), every 8 weeks in each eye for macular degeneration. Medical history included macular degeneration (the wet kind), blood pressure high, spinal stenosis, and thyroid disorder (reported as thyroid something) she provided that it was something like hypotrachea (as reported). The patient's concomitant medications were not reported. The patient previously received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL8982) at the age of 88-years-old, via an unspecified route of administration in right deltoid on 29Jan2021 at 0.3 mL, single for COVID-19 immunization. The patient was calling about the Pfizer COVID-19 vaccine and mentioned that she had a reaction but didn't think it was from the vaccine because it was 5 weeks to the date after the second shot. The reaction was very severe, and she had to visit the emergency room. The patient experienced throat closing, tongue swelling, face swelling and a hard time breathing. She saw her primary care provider after that, and she also saw her PMR doctor-

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

physical medicine and rehabilitation. The doctors recommended that she report this reaction to the COVID 19 vaccine five weeks later. Both doctors thought it might be from the vaccine and it was worth reporting. When asked about the symptoms and if they occurred at that same time, the patient stated yes, and they diagnosed her symptoms as angioedema in the emergency room. This happened on 26Mar2021. The patient was never admitted to the hospital. When asked if angioedema improved, worsened or was persisting, patient stated it was nonexistent now. The events happened after the second dose of the vaccine. The patient had to stop her medications because her primary care provider was unsure what may have caused this reaction, but it may be her medications. She has been taking losartan potassium for about ten years but now had to stop because angioedema could possibly be the result of that, even after ten years. She also had to stop diclofenac sodium because they may have caused that kind of reaction. Having to stop ibuprofen broke her heart as she has taken it for years. This too could have that type of reaction. For aflibercept, she mentioned that she gets the injections in both eyes every eight weeks. She had it 31 times in the right eye and 30 times in the left eye. The reaction she was speaking of, the emergency room, came exactly 2 weeks after she had her last injections, which was on 11Mar2021. Angioedema was an emergency situation, if the throat closes and they couldn't open it up, they may cut into the neck and windpipe. The description was enough to scare her. Both doctors suggested the Pfizer vaccine as just possibly a late reaction. The patient had a basic metabolic panel while in the emergency room. She reported that potassium and sodium was low. Chest Xray- the patient did not have a report on it. Nasal scan was fine. COVID nasal test was negative. Swab for many other kinds of viruses was negative. All of these tests were done on 26Mar2021. The action taken in response to the events for losartan potassium, diclofenac sodium, ibuprofen, and aflibercept was unknown. The outcome of the event "potassium was low and sodium was low" was unknown and recovered on an unspecified date in 2021 for the other event.

She had it 31 times in the right eye and 30 times in the left eye. The reaction she was speaking of, the emergency room, came exactly 2 weeks after she had her last injections, which was on 11Mar2021. Angioedema was an emergency situation, if the throat closes and they couldn't open it up, they may cut into the neck and windpipe. The description was enough to scare her. Both doctors suggested the Pfizer vaccine as just possibly a late reaction. The patient had a basic metabolic panel while in the emergency room. She reported that potassium and sodium was low. Chest Xray- the patient did not have a report on it. Nasal scan was fine. COVID nasal test was negative. Swab for many other kinds of viruses was negative. All of these tests were done on 26Mar2021. The action taken in response to the events for losartan potassium, diclofenac sodium, ibuprofen, and aflibercept was unknown. The outcome of the event "potassium was low and sodium was low" was unknown and recovered on an unspecified date in 2021 for the other event.

physical medicine and rehabilitation. The doctors recommended that she report this reaction to the COVID 19 vaccine five weeks later. Both doctors thought it might be from the vaccine and it was worth reporting. When asked about the symptoms and if they occurred at that same time, the patient stated yes, and they diagnosed her symptoms as angioedema in the emergency room. This happened on 26Mar2021. The patient was never admitted to the hospital. When asked if angioedema improved, worsened or was persisting, patient stated it was nonexistent now. The events happened after the second dose of the vaccine. The patient had to stop her medications because her primary care provider was unsure what may have caused this reaction, but it may be her medications. She has been taking losartan potassium for about ten years but now had to stop because angioedema could possibly be the result of that, even after ten years. She also had to stop diclofenac sodium because they may have caused that kind of reaction. Having to stop ibuprofen broke her heart as she has taken it for years. This too could have that type of reaction. For aflibercept, she mentioned that she gets the injections in both eyes every eight weeks. She had it 31 times in the right eye and 30 times in the left eye. The reaction she was speaking of, the emergency room, came exactly 2 weeks after she had her last injections, which was on 11Mar2021. Angioedema was an emergency situation, if the throat closes and they couldn't open it up, they may cut into the neck and windpipe. The description was enough to scare her. 1279193	5/1/2021		60	F	2/10/2021		<p>Back disorder; lower back issues; Feeling abnormal; felt fuzzy; Vaccination site pain; sore arm; Dizzy; Fatigue; Energy decreased; not feeling as much energy as before; Pain upon movement; walk about a block but then starts to hurt; This is a solicited report from a contactable consumer (patient) via a non-Pfizer sponsored program, based on the information received by Pfizer (Manufacturer Control No: 21K-163-3774842-00).</p> <p>Solicited report from a consumer of a 60 year old female with events of heart/atrial flutter, atrial fibrillation, eye surgery and arm surgery and non-serious weight gain due to attempting to stop smoking, lower back issues, felt fuzzy, got first dosage of covid-19 vaccine and experienced sore arm, fatigue and dizzy from the blood thinners after surgery, still not feeling as much energy as before and walk about a block but then starts to hurt with humira 40mg/0.4ml (adalimumab). The patient had a relevant medical history of tobacco use/four cigarette sticks per day, seropositive high titer rheumatoid arthritis, fingers swelling, joint pain, joint swelling and lost of blood flow in hands and legs. On unknown dates, the patient experienced eye surgery, arm surgery, lower back issues, felt fuzzy, got first dosage of covid-19 vaccine and experienced sore arm, fatigue and dizzy from the blood thinners after surgery, still not feeling as much energy as before and walk about a block but then starts to hurt. In 2020, the patient experienced heart/atrial flutter and atrial fibrillation. In Sep2020, the patient experienced weight gain due to attempting to stop smoking. On 24Feb2021, the heart/atrial flutter and atrial fibrillation resolved. Covid-19 vaccine was also considered suspect. The patient had eye and arm surgery in the past. On 24Feb2021, she underwent pulmonary vein cryoballoon ablation surgery for the atrial fibrillation and atrial flutter. She had a procedure done and went into her heart and froze the nerve endings that were causing the atrial fibrillation, and also fixed the flutter in her heart. The causality as per reporter for this procedure was reported as no reasonable possibility. She still recovering. She discontinued the Humira two weeks before the surgery and took her last injection on 10Feb2021 and was paused it for four weeks, but she started back it on 10Mar2021. She follows up with her surgeon at the end of the month and she hopes this helps got her off of the blood thinners and other medicines, she been on for this.</p>

----------	-------	-------	---------	-----	----------	------------	--------------

She stated that this was not related Humira. She was advised by her physician to increase the exercise to lose some weight. With her lower back issues, she was hoping that when she got off of the blood thinners, she could do pain shots again and start exercise. She could walk about a block but then she started to hurt. She had been careful with her diet also, cut out the salt also. This had nothing to do with Humira and she did not want to be contacted about this again for this also. She felt fuzzy, it took her most of the morning to get woken up. Her Doctor thinks once she would off of the blood thinners she would be back to normal. Other than that she feels fine. She does not wanted to be contacted about this. It was unknown if patient was enrolled in a COVID-19 Vaccine Trial. On unknown date, patient received first dose COVID-19 Vaccine manufactured by Pfizer, lot number unknown. She agreed to have physician contacted. Blood thinner was also considered as co-suspect. Other medical history included abstains from alcohol, contrast dyes allergy manifested by scratch throat, allergy manifested by bowel movements (oral medications for rheumatoid arthritis; up to eight times a day and slept 15 hours per), prevent esophagus damage, heart, low thyroid, and attention-deficit/hyperactivity disorder. The patient's concomitant medications included pantoprazole to prevent esophagus damage, metoprolol for heart, levothyroxine for low thyroid, vortioxetine hydrobromide (TRINTELLIX) for depression, and dexamfetamine sulfate (DEXTROAMPHETAMINE) for attention-deficit/hyperactivity disorder. The patient underwent laboratory tests and procedures which included blood work: everything was fine in Jan2021; chemical stress test and treadmill stress test: confirmed atrial fibrillation and atrial flutter in Sep2020; body weight: gain in Sep2020; and X-ray: confirmed atrial fibrillation in Sep2020. The action taken in response to the events for adalimumab and apixaban was unknown. The patient recovered from atrial flutter and atrial fibrillation on 24Feb2021. Outcome of Feeling abnormal and Pain upon movement was unknown. The patient had not recovered from the remaining events. Change History: On 05Mar2021, received updates to patient demographics, medical history, event information, reporter opinion of causality, suspect drug information, concomitant drug information, past drug information,

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

laboratory/diagnostic procedures and narrative description. The events of "atrial flutter", "atrial fibrillation" and "weight gain due to attempting to stop smoking" were added. On 11Mar2021, received updates to patient demographics, medical history, event information, reporter opinion of causality, company opinion of causality, company alternative etiology, suspect drug information, laboratory/diagnostic procedures and narrative description. The events of "LOWER BACK ISSUES" and "WALK ABOUT A BLOCK BUT THEN STARTS TO HURT" were added. the event of "atrial flutter" was amended to "heart/atrial flutter". On 08Apr2021, received updates to event information, reporter opinion of causality, company opinion of causality, company alternative etiology, suspect drug information and narrative description. The events of "felt fuzzy", "got first dosage of covid-19 vaccine and experienced sore arm", "fatigue and dizzy from the blood thinners after surgery" and "still not feeling as much energy as before" were added. Causality for humira 40mg/0.4ml(adalimumab): The reporter's causality for the event(s) of heart/atrial flutter, atrial fibrillation, eye surgery, arm surgery, weight gain due to attempting to stop smoking, lower back issues, got first dosage of covid-19 vaccine and experienced sore arm, fatigue and dizzy from the blood THINNERS after surgery unknown onset and fatigue and dizzy from the blood thinners after surgery unknown onset with humira 40mg/0.4ml(adalimumab) was no reasonable possibility. The reporter's causality for the event(s) of felt fuzzy, still not feeling as much energy as before and walk about a block but then starts to hurt was not provided. Manufacturer opinion is that there is no reasonable possibility that the events of heart/atrial flutter, atrial fibrillation, eye surgery, arm surgery, weight gain due to attempting to stop smoking, lower back issues, felt fuzzy, got first dosage of covid-19 vaccine and experienced sore arm, fatigue and dizzy from the blood thinners after surgery unknown onset, fatigue and dizzy from the blood thinners after surgery unknown onset, still not feeling as much energy as before and walk about a block but then starts to hurt are related to humira 40mg/0.4ml(adalimumab). The reporter's assessment of the causal relationship of the events with BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) was not

provided at the time of this report. Since no determination has been received, the case is managed based on the company causality assessment. No follow-up attempts are possible; information about batch number cannot be obtained. No further information is expected.; Sender's Comments: Based on the current available information , the events of sore arm, fatigue and dizzy could be related to the suspected drug of BNT162B2. The other events are most likely related to an intercurrent or underlying condition which is not related to the suspected drug. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1273324	4/30/2021	FL	73	F	2/18/2021	2/22/2021	The day before the first vaccine she was up and acting normal, laundry, housework and knew what to do. She has severe dementia but was doing OK and knew where she was. She got the first vaccine on 1/29/21, and the 3rd and 4th day they noticed she was having hallucinations and saying things that weren't there. She could hear baby's crying but there were no baby's present. Within 7 days she had what the son described as a stroke. He said that she was watching television and he was on a conference call and he noticed she walked into a wall and he asked if she was okay and starting stumbling across the room and when he touched her she felt very heavy and said that one side of her face was drooping. He got her back into the chair and called 9-1-1. She was so agitated at the hospital that the husband does not know what they gave her and they kept her for a week. They finally got her under control. They discharged her from there and she that was all that they could do with her. They brought her home with nurses assistance and her paranoia was evident, hallucinations were very evident. They said that they tried to do a CAT Scan and an MRI and they said that she did not have a stroke. Restless was very adamant, talking strange things and wanting to go to her son's house when she was there. Before that vaccination she knew where she was and after that she did not know where she was thinking she was at one location and just confusion. She then got her 2nd vaccine and then her husband went out of town and took her back home on 2/24/21 as he was able to get her in a car and travel and able to eat and knew somewhat what was going on. On 2/25/21 when he brought her home to a long term care facility. She was chanting constantly, had irritability, anger, cognition completely eroded. She was very agitated, very combative. Drugs would not calm her down, and tried to get CAT scans or MRI's but were unsuccessful due to her combativeness. She was screaming and yelling 24 hours a day to the top of her lungs and gave her Ativan which had the adverse effects of what they were supposed to do. Had biting, hallucinations, paranoia. She had a couple of falls, they had her in a wheelchair and tried to feed her and she would fall down. They took her to the hospital a few times and she progressively got worse. On 4/19/21 she shut down and quit eating, quit drinking, closed her eyes, and lasted a

							week like that and then she died on 4/24/21 @ 2:30 AM. None of her doctors could figure out what had happened. They were finally able to get a CAT scan and felt that she may have a stroke. Finally they memory care facility told them to come a take her to the hospital and they had moved their hospice patient's as she was screaming and disruptive and they could not handle her anymore. They thought she was suffering from Lewy body dementia at one point. They were going to have her tested for that and they could not do it on Saturday when she passed for genetics and missed those timelines and could not do it.

1272674	4/30/2021	CA	38	F	4/29/2021	4/29/2021	Started with itching eyes and then itching on the roof of the mouth followed by hives later in the day. Took Benadryl 50 mg and symptoms did not worsen but did not totally go away.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1275474	4/30/2021	ME	30	M	4/30/2021	4/30/2021	During the observation period, pt was seen trying to take off his jacket, and proceeded to pass out and fall out of his chair. Pharmacist rushed to help him up and he complained of feeling very hot and sweating profusely. He did not have any swelling/itching of throat/facial area. Patient was provided cold water, and told to remain seated. Pt was asked questions such as name, what day it is, to establish if patient was alert and oriented. Patient complained of experiencing tunnel vision while passing out. He proceeded to pass out once more, while seated, this time the pharmacist was able to support him in his chair. After the water and rest, patient said he felt much better and his girlfriend came to escort him home. He stayed for about 30 minutes before leaving and staff made sure he was feeling alright.
1274799	4/30/2021	CA	16	F	4/30/2021	4/30/2021	Patient fainted post-vaccination. Observed patient beginning to lean forward and RN was able to prevent her from falling. Patient's eyes observed to roll upward while patient became unresponsive to stimuli and diaphoretic. No incontinence. EMS called while patient assisted simultaneously to gurney by multiple staff. Upon lying down, patient awoke and become alert and oriented to person, place, time, and situation, though stayed pale and diaphoretic for several minutes. VS @ 12:55: BP 120/80, P 59, SAO2 99%, resp unlabored. VS @ 13:00: BP 138/83, P 62, R 20, SAO2 99% VS @ 13:04: BP 123/73, P 54, SAO2 99% VS @ 13:10: BP 100/69, P 78, SAO2 98% Sitting at edge of bed without symptoms at 13:05, alert and conversing with staff and mother. EMS arrived at 13:07 - their monitor showed NSR, random blood sugar = 93. Ate a snack and drank juice, symptoms completely resolved. Mother declined transport to ED. Discharged home with mother with post-vaccination instructions, will receive 2nd dose while lying down.

1275554	4/30/2021	MN	18	F	4/30/2021	4/30/2021	Patient reported to immunizer that she did not like needles. Following her vaccine, the patient walked around the pharmacy shopping during wait time. Once at POS counter, she collapsed (did not hit head) ~5pm. Patient thought she half fell and half sat down. She sat on floor leaning against cupboard. She reported reduced vision and hearing. BP ~100/60mmHg at ~5:05pm. She was provided water and cool cloth. Friend was brought into store from parking lot to be with her as well. She reported vision improving and was able to go back into vaccination room to rest. She reported not eating much that day - patient was provided with Hershey candy bar and sucker. ~5:15pm her BP was 100/62 and she continued to feel better/improve. 5:35pm patient reported felt well enough to go home (with friend). Throughout event, patient declined call parents or anyone else.

1274385	4/30/2021	CA	61	F	3/27/2021	3/31/2021	<p>~~Moderna COVID-19 Vaccine EUA" -- received 1st dose 3/27/2021 Received 1st Moderna vaccine in R arm on 3/27/21. Within first hour, she had a headache, R eye pain, and felt tired; symptoms subsided after she laid down. On 3/31 in early AM, felt sudden and more severe headache and same eye pain, and "electrical contractions down neck, back, and spine." Went to medical facility, then transferred to hospital, and transferred to another hospital via helicopter. 61-year-old female, generally very healthy, on no medications, here complaining of sudden onset right sided stabbing/electrical headache which began 30 minutes prior to arrival. She states she was standing at work when had sudden onset severe headache radiating into her right eye. Stating that it feels like my right eyeball is going to explode. She ranks the pain a 9 out of 10. She does have a history of migraine headaches which have never been evaluated with imaging or by neurology. They were normally frontal, and she has not had one in more than 2 years. She states that this headache is dramatically different than her prior migraines. Patient states associated with this sudden onset headache, she had bilateral neck pain, and substernal chest pain. Upon arrival to clinic, she points to her substernal region as the site of her chest pain. She denies associated shortness of breath, irregular heart rate/rhythm, presyncope. She does feel slightly weak. Of note, patient states she had a MODERNA COVID-19 vaccine on Saturday and subsequently had some right-sided shoulder pain. Her symptoms are on the same side. - 7:50 AM: BP 165/109 (R arm); pulse 86; no antihypertensives given, given a total of 100 mcg fentanyl over 1 hr - 9:04 AM: BP 150/92 (R arm); pulse 60; transferred to hospital and then to transfered to another hospital via helicopter for SAH 3/31/2021 ED - given nicardipine IV, dexamethasone IV, levetiracetam, and antiemetics. Nero noted that no associated trauma, LOC, or seizure with the HA, Neuro assessment - day 4 (plus possible re-rupture within last 24 hours) of good clinical grade HH2 low volume aSAH due to ruptured R ICA ANR 4/1/2021 - completed successful and uncomplicated RICA oblong aneurysm coiling (successful coil elimination &amp; preservation adjacent PcommA infundibulum). Patient was admitted to critical care for post procedure care, monitoring, and management of sodium, blood pressure, and headache.</p>

Then her fingers started to get numb and tingly. she was having a hard time seeing colors and she started having ringing in ears. Ambulance was called and they took over.
1273873	4/30/2021	AZ	81	M	2/15/2021	3/17/2021	right bell's palsy symptoms started on 3/17/2021, became severe on 3/18/2021, with severe right facial droop and inability to close right eye, minimal improvement over past 6 weeks. Younger sister also developed Bell's Palsy after her second Covid vaccination.
1273705	4/30/2021	TX	55	F	3/11/2021	3/30/2021	Early in the morning I started developing a headache. I typically have migraines and thought this was just what I was getting. I took Excedrin Migraine to try to keep it from getting worse, but it continued to get worse and worse and worse. About noon I found that I could not stand any light or sound - this is not typical for me as I can usually listen to things during a headache even if I can't open my eyes. I ended up spending all the rest of the day and the night alone in a dark noiseless room. I told my husband it was the worse headache I had ever had. It was only later that we found out the shot caused blood clots in the head. I did not correlate the two because it had been so long - almost 3 weeks - since my vaccination.

1269743	4/29/2021	PA	67	F	3/19/2021	3/1/2021	collapsed, head hit the tile floor of bathroom; collapsed, head hit the tile floor of bathroom; right arm was bruised; corner of her eye was purple/bruised; feeling nauseated; Headaches off and on; pain; This is a spontaneous report from a contactable consumer (patient). A 67-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; Lot Number: EN6208) intramuscular, administered in Arm Left, at the age of 67-year-old, on 19Mar2021 11:00, as SINGLE DOSE for covid-19 immunisation. Medical history included asthma and Allergies. The patient's concomitant medications were not reported. The patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; lot number EN6203) single dose, at the age of 67-year-old, on 26Feb2021, for covid-19 immunisation and experienced slight ache in her left arm, headaches, and mitral valve disease. On 20Mar2021, the patient had headaches off and on and the patient mostly woke up with them. The patient doesn't know if the headaches were from pollen in the air since it is Spring time or mold. On 24Mar2021 at 4am, the patient got out of bed because she had to use the restroom. As soon as the patient took the first step into the tile floor of the bathroom, the patient collapsed. The patient didn't fall, the patient collapsed on the file floor. Her head hit the floor. Her head was killing her when she was laying there. The patient used the restroom and went back to bed. The patient got out of bed because her head was killing her. The patient guesses she threw her right arm out to brace herself, because she noticed her right arm was bruised the morning of 24Mar2021 when she went to shower. The patient took Equate 500MG for the events head hit the tile floor of bathroom, headache, and right arm was bruised and used a wash cloth with cold water as a cold compress and applied it by her eyebrow, the corner of her eye was purple/bruised. It looked like she had eyeshadow on. On 24Mar2021, she was feeling nauseated. Thankfully, she had the next 2 days off (Thursday and Friday) because she didn't feel so hot. On 26Mar2021, the patient called her PCP and was asked if she wanted to come in/ make an appointment. Since, the caller was planning to meet with the surgeon about her upcoming surgery on 29Mar2021, it didn't really fit into her schedule. She was undergoing all these tests, etc. It

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

was determined her surgery was going to happen after receiving the second vaccine. The surgery is hopefully a mitral valve repair. The patient mentioned that her provider is aware of her experience with the COVID vaccine. The patient saw the surgeon on 29Mar2021, and she told him all about her experience. He advised the patient to call her PCP and schedule an appointment with them. She saw her PCP on 01Apr2021. She told her PCP what happened and her PCP asked why she didn't go to urgent care. The patient doesn't really know why she didn't, she just thought she was going to feel better. The patient thought she would work through the pain since Mar2021. Plus, she had everything going on with her surgery- like finding out she had to have the surgery and going under other tests. Her PCP wanted her to go to radiology to have a MRI of the head/brain done. She had the MRI done at 3:00PM on 06Apr2021 and the results were negative. Up until last weekend, she still felt "headachy". The patient has headaches too because of stress knowing her surgery was scheduled in a matter of 2 weeks, so she didn't know if the headaches she was experiencing was because of the COVID vaccine, stress, allergies, etc. The patient was certain the headache she experienced the day after she collapsed, was due to the collapse. The patient clarified that she knew it was more of a "collapse" instead of a fall because all the furniture leading to the bathroom, like the loveseat, lamp, cedar chest, etc, were all intact with no marks. It was like all of a sudden she collapsed. Her bruising is all gone, but there might be a slight mark that is like yellow and green (because the bruising changes colors) on her arm. Her eye was okay. The patient will have her planned surgery on 15Apr2021. The events required physician office visit. The patient underwent unspecified lab test and procedures relevant to her upcoming surgery but no other testing in regards to her symptoms after the COVID vaccine. Outcome of headache was not recovered, the events corner of her eye was purple/bruised and right arm was bruised recovered in 2021, while it was unknown for the other events.

1269746	4/29/2021	AZ	46	M	3/12/2021	3/12/2021	Regular pain feeling; Headache; Muscle pain; Calf feels tight, stiff, it feels like dead weight; Calf feels tight, stiff, it feels like dead weight; Pain running up the right arm up to the shoulder/Calf pain; He asked if someone can tell him if it is a blood clot in the back of his calf; This is a spontaneous report from a contactable consumer (patient). A 46-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 1 via an unspecified route of administration, administered in left arm (shoulder) on 12Mar2021 10:07 (Lot Number: EN6202) as single dose for covid-19 immunization. There were no medical history and concomitant medications. The patient has no prior vaccinations within 4 weeks. The patient was not sick at time of vaccination. The patient reported that on 12Mar2021, he has been feeling the regular pain feeling, a headache, muscle pain before, it comes and goes. However, he said that the last few days (2021), there had been, by his calf muscle in the back there, they've been tightening, like stiffening up on him when he's sleeping. His calf feels tight, stiff, it feels like dead weight. It wakes him up at times. He also reported pain running up the right arm up to the shoulder on unknown date in 2021. He was just curious in terms of what that might be. He asked if someone can tell him if it is a blood clot in the back of his calf. The headache went away after 2-3 days. He also reported that his eyes also hurt a little bit and was the same time frame as the headache (onset date reported as 12Apr2021: after the second dose, pending clarification). He stated that those things were just mild, nothing major. He did not take anything for these. He confirmed he no longer had muscle pain. He just has pain behind the calf and right arm up to his shoulder. His calf pain, started to feel tight, started within the last 2- 3 weeks (2021). The arm pain in right arm up to shoulder started maybe within 2 days. The patient received the second dose on 02Apr2021. Outcome of the events muscle pain and headache was recovered in Mar2021, events pain running up the right arm up to the shoulder/Calf pain was not recovered, and outcome of other events was unknown.

1269758	4/29/2021	VA	59	F	4/13/2021	4/14/2021	<p>Lost consciousness; dizzy like she was about to faint; twitching and shaking; eyes went to one side; she was about to faint; seizure; Diarrhea; chills; head hurting; eyes hurting; Muscle soreness; joint pain; Nausea; temperature of 99.3; This is a spontaneous report from a contactable consumer (daughter of patient) and another consumer. A 59-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), dose 2 via an unspecified route of administration, administered in Arm Left on 13Apr2021 16:21 (Lot Number: EW0164; Expiration Date: Aug2021) at vaccination age of 59 years old as single dose for covid-19 immunisation. Medical history included vertigo, antacid therapy. Concomitant medication included esomeprazole magnesium (NEXIUM 24HR) taken for antacid therapy from an unspecified start date and ongoing. No additional vaccines administered on same date of the Pfizer Suspect. The patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot EP7533), on 23Mar2021 at 17:38 PM at age of 59 years old in the right arm as single dose for covid-19 immunisation and only had a little bit of muscle soreness on her right arm on 23Mar2021 after the first dose and it went away the day after (24Mar2021). The patient took Tetanus shot about two weeks before the first dose of the Pfizer COVID 19 vaccine. Then received the second dose on 13Apr2021 16:21PM in the left arm. After the second dose she had chills; her head was hurting; her eyes were hurting; she had muscle soreness; she had joint pain all yesterday 14Apr2021. Then this morning 15Apr2021, after taking a Tylenol and getting a shower she felt dizzy like she was about to faint. Her mother had vertigo but this was not like her usual vertigo. Her mother sat on the bed and started to have what looked like a seizure with twitching and shaking; then she lost consciousness. Her mother's eyes were open and they saw her mother's eyes twisted, went to one side, and she fell back on the bed. They called at 05:30 AM and the ambulance arrived quickly but by the time they arrived she had regained consciousness. They recommended she follow up with HCP. They called the doctor who advised her to rest, and make an appointment to see the doctor tomorrow. Reporter clarified her mother had the chills from 10:00 AM today (15Apr2021) and had them day with a lot of headache,</p>

1269802	4/29/2021	HI	33	F	4/26/2021	4/26/2021	33 year old female with no significant past medical history presents to the ED with syncope s/p receiving first COVID-19 vaccination this evening at 1758. The patient states that she completed her 15 minutes of observation when she suddenly felt dizziness after standing and had a syncopal episode, waking up on the ground. Per the nurse at the scene, the patient hit the back of her head. The patient does not remember hitting the back of her head as she lost consciousness prior to falling. Since then, the patient has been experiencing symptoms of generalized weakness and intermittent nausea, but denies symptoms of headache, visual changes, vomiting, neck pain, back pain, shortness of breath, chest pain, or abdominal pain. The patient has had normal PO intake today. She reports that she has had three separate syncopal episodes s/p getting her blood drawn in the past, but denies syncopal episode s/p receiving vaccinations in the past. The patient is an otherwise healthy individual with no known drug allergies, taking no daily medications, and denies the use of alcohol, tobacco, or drugs. Her last normal menstrual period was completed recently and she denies any chance of pregnancy, recent pregnancies, or currently nursing.

1269551	4/29/2021	FL	24	M	4/14/2021	4/14/2021	<p>fell out completely; passed out/fell off at the store; feeling dizzy; had terrible headache; chills; weak with shilling; i started sweating; I'm still feeling very sick; This is a spontaneous report from a contactable consumer (patient). A 24-year-old male patient received first dose of bnt162b2 ((PFIZER-BIONTECH COVID-19 VACCINE; lot EW0158; Expiration Date: Jul2021), via an unspecified route of administration, administered in left arm on 14Apr2021 12:00 as single dose for COVID-19 immunisation. Medical history included eye allergy. Concomitant medication included amoxicillin sodium, clavulanate potassium (AMOXICILINA CLAV) taken for eye allergy from 12Apr2021. On 14Apr2021, he received the first dose of the vaccine about an hour ago and waited five minutes and went to the bathroom. He had a severe reaction while patient was in the bathroom, he started to feel dizzy, had a terrible headache and chills. He walked out of the bathroom at the store and fell out completely in front of the pharmacists. The patient also experienced weak with shilling (as reported) and started sweating. The pharmacists called 911 and the responders checked his vitals and blood pressure and all of that and everything was fine. Patient clarified he passed out completely for almost 5 minutes. Patient stayed there with everyone until, they were waiting to see how he was doing. He reported he was feeling much better now, still feel a bit dizzy, not 100% but not as bad as when it happened. It has improved and he definitely felt terrible at the time. He was monitoring himself at home to see if he notices something weird going on. He does not have a headache right now and was feeling much better. When he was having the effect, he was mentally sharp, and knew what was going on. He thought about letting himself walk outside the bathroom so he could be seen. He didn't lose track of what was going on and body reacted adversely. He remembered stuff and everything and he felt good. Patient stated the chills went away; however, would not say they went away completely, he was recovering. The events did not require a visit to emergency room or physician office and the paramedic said it was not necessary right now because all the vitals and everything else seemed fine. There was no therapy received for the events. There were no additional vaccines administered on same date of the vaccine and no other vaccines within 4 weeks prior</p>

1269535	4/29/2021	CO	59	F	4/5/2021	4/5/2021	blood clot under her eye; bright red bruise in the corner of the eye to the middle of the eye underneath; feeling crummy; she was down; headaches; couldn't move; arm hurt all the way below her arm pit into her breast; arm hurt all the way below her arm pit into her breast; arm hurt all the way below her arm pit into her breast; got very sick; This is a spontaneous report from a contactable consumer (patient). A 59-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot Number: ER8737), dose 1 via an unspecified route of administration, administered in Arm Left on 05Apr2021 08:30 (at the age of 59years) as single dose for Covid-19 immunization. Medical history included ongoing rheumatoid arthritis and osteoarthritis (not bad enough that she takes treatment, but she is diagnosed; she was diagnosed way back in 2006). Concomitant products: patient stated she takes some medications (not further specified). The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient reported that she had her first dose of the Pfizer Covid-19 vaccine on 05Apr2021 and got very sick. She was down for two days and after day 10 (as reported) she has a blood clot under her eye. She would like to know what would happen if does not get a second dose. She consulted if there is any talk on whether or not people should receive an additional dose of the Pfizer Covid-19 vaccine next year. The patient further reported that on 06Apr2021 she woke up feeling crummy right away and a couple of hours into that day she couldn't lift her arm, literally couldn't lift arm for 6 inches and stated it went on for 2 days. She further stated that her arm hurt all the way below her arm pit into her breast. She stated that it all ended on 08Apr2021 and she went back to work on 08Apr2021. The patient added that she was down for two days, had headaches, and stated she never knew what people meant when they said they got hit by train. She doesn't believe she had a fever and couldn't move. The patient further stated that she got pretty darn sick and this morning 14Apr2021, she woke up with a blood clot under her eye. She is an esthetician and is pretty good with skin. She stated that she doesn't know how she could get this overnight unless she injured herself in her sleep, but she is a light sleeper. She does not know if it is a clot. She also stated that she called a medical esthetician who told her to take a baby

aspirin and cold compress. The patient clarified that she didn't feel so good and today she feels better. She doesn't know that it is a blood clot, it is not raised and not hard, it looks like she has a bright red bruise in the corner of the eye to the middle of the eye underneath, not in the eye. She wants to make it clear she doesn't know if it is a blood clot. She feels like if she hurt herself, that would be the reason, but it would be painful, and it is not. She added that the bruise is about the same. Therapeutic measures were taken as a result of the events (except for feeling down and couldn't move). The outcome of events thrombosis and contusion was not recovered; the outcome of other events was recovered on 08Apr2021.

This other healthcare professional reported similar events for the same patient with each dose of the same product; this case refers to the second dose. A 44-year-old adult [non-pregnant] female received the second dose of BNT162b2 (solution for injection; Lot unknown expiry information not provided) in the right arm via unspecified route on 03Apr2021 (at 44-years-old), for COVID-19 immunisation. Relevant medical history included thyroid. Concomitant medications included levothyroxine sodium (TIROSINT) for thyroid. The patient previously received COVID-19 immunisation with the first dose of BNT162b2 (Lot unknown expiry information not provided) in the left arm on 13Mar2021 at 12:00 (at 44-years-old) and experienced face, head and ears started tingling, shortness of breath, numbness and weakness, severe burning all over her nerves of her body, and abnormal uterine bleeding. The patient denied any known allergies and being diagnosed with COVID-19 prior to the vaccine. The patient was not pregnant at the time of vaccination and the patient denied receiving any other vaccine within four weeks of this vaccine. The patient reported that on 03Apr2021 she received her second shot and within four hours her left leg went completely numb and she could not walk. The patient reported that she went to the emergency room three times since that time. The patient reported that she was told it was her immune system attacking her nerves. The patient reported that the shortness of breath is very bad, her pulse is high, and her blood pressure is low. The patient explained that she has major neurological symptoms now. The patient stated that she has had two magnetic resonance imaging (MRI), on computerized tomogram (CT) and two x-rays though no results were provided. The patient explained that she has appointments with neurologist and immunologist. She is unable to work since she has to be on video with

people and keep feeling my face and now her tongue and mouth go numb. The patient stated that she was scared to eat food, so she does not choke. The patient mentioned that her left eye is affected too and blurry. The patient exclaimed that she cannot function, it is scarring her little kids and has affected her entire family. The patient reported that events resulted in: Doctor or other healthcare professional office/clinic visit; Emergency room/department or urgent care, Hospitalization, Disability or permanent damage]; with hospitalization for three days. The patient has not been tested for COVID-19 since the vaccine. Treatment for the events included intravenous (IV) anti-inflammatory. The outcome of the events left leg went completely numb, could not walk, immune system attacking her nerves, shortness of breath, pulse is high, blood pressure is low, neurological symptoms, unable to work/ cannot function, feeling my face and now her tongue and mouth go numb, and left eye is affected too and blurry, was not recovered. The lot number for the vaccine, BNT162b2, was not provided and will be requested during follow up.; Sender's Comments: Based on the close temporal relationship, the association between the reported events with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.,Linked Report(s) :-PFIZER (Same reporter/patient/product, similar events with first dose)

1269544	4/29/2021	KS		F	4/3/2021		<p>She is forming a cataract; low grade fever; headaches; body aches; chills; felt miserable; anxiety; This is a spontaneous report from a contactable consumer from a Pfizer-sponsored program COVAX US Support. A female patient of an unspecified age (Age: 69; Unit: Unknown) received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot number was not reported), via an unspecified route of administration on 03Apr2021 at a SINGLE DOSE for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient received first dose of COVID vaccine BNT162B2 on 12Mar2021 for COVID-19 immunization and felt a little tired. The patient was scheduled to get an eye examination and her optometrist will be putting some solution to both of her eyes next Tuesday. She wanted to know if she should wait longer because she doesn't want to mess up the vaccine's efficacy. The patient stated that she will be dilated at the optometrist. She was forming a cataract and she did not know if the vaccine would cause the eye exam to be misleading. The patient stated that she read an article that said if you were having a mammogram that you needed to wait two weeks or four weeks. The patient stated she had a low grade fever, headaches, body aches and chills after the second dose of the vaccine. She stated she took Tylenol on the way home after the second dose. She stated that during the nighttime her temperature was creeping up to 100.9. She stated she felt miserable. She stated she took two pills two different times of 500mg each. She stated she took another pill four hours after the first pill because she was miserable and then the temperature started dropping. She stated the symptoms went away after three days. The patient stated that the anxiety was intense for the second dose due to the possible side effects. The patient underwent lab tests and procedures which included body temperature: 100.9 on an unspecified date. Therapeutic measures were taken as a result of low grade fever and felt miserable. The outcome of the events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.</p>

1269647	4/29/2021	VA	45	F	4/1/2021	4/1/2021	About five hours after the second dose, my eyelids became very itchy. This lasted for an hour or two. During the night, I woke up gasping for air and wheezing. This lasted approximately one hour. The next day I had shortness of breath off and on. I normally have mild seasonal allergies, but four days after vaccination I had the worst allergy attack in years, and it's recurred once or twice a week since then. I still have slight wheezing every day, and I have not been able to resume my regular running due to shallow breathing, which leads to high blood pressure. First dose, left arm: arm soreness, swollen lymph nodes, mild diarrhea

1269643	4/29/2021	NY	65	F	3/16/2021	3/21/2021	stroke; face sunk in and changed/Bells Palsy; This is a spontaneous report from a Pfizer-sponsored program. A contactable consumer (patient) reported that a 65-year-old female patient received the first dose of BNT162B2 (Pfizer-BioNTech COVID-19 vaccine, lot number: EN6202), via an unspecified route of administration, administered in the left arm on 16Mar2021 at 14:00 as a single dose for COVID-19 immunization. Medical history included a mild case of COVID-19, last year, on an unspecified date in 2020. There were no concomitant medications. The patient had no prior vaccinations within 4 weeks of the COVID vaccine. On 21Mar2021, the patient's face sunk in and changed. The patient's symptoms were not improving. Her eye and right side of her face are affected. She cannot close her right eye. She worked on it and is now able to close right eye not like the left eye closes, but it doesn't blink as the left eye does. She has been using eye drops for this. She said it was Bells Palsy. The patient added that it is hard to look in the mirror. She will not get the second dose. She was not interested in taking the vaccine now. She wanted to wait and see. It being so new and see. Her sister took it and encouraged her, and said it is necessary because they like to travel. She got Prednisone when she was at the hospital, they gave her 60mg Prednisone. Her physician didn't want to keep her on it too long and said it may cause other complications. Her physician cut her off, she weaned her down 50mg, 40mg, 30mg, 20mg, then 10mg. When the patient noticed her face start to turn, she went to the ER. She thought she was having a stroke. The patient was not admitted to the hospital. The outcome of the event face sunk in and changed/bells palsy was not recovered while the outcome of the event stroke was unknown.

1272203	4/29/2021	IN	60	F	4/14/2021	4/15/2021	<p>Bell's Palsy; Right Eye does not close; Sometimes she can not talk; Red Left Arm (from injection site all the way to elbow); This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of FACIAL PARALYSIS (Bell's Palsy) in a 60-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 017B21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 14-Apr-2021, the patient received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 15-Apr-2021, the patient experienced FACIAL PARALYSIS (Bell's Palsy) (seriousness criterion medically significant), EYE DISORDER (Right Eye does not close), SPEECH DISORDER (Sometimes she can not talk) and VACCINATION SITE ERYTHEMA (Red Left Arm (from injection site all the way to elbow)). At the time of the report, FACIAL PARALYSIS (Bell's Palsy), EYE DISORDER (Right Eye does not close), SPEECH DISORDER (Sometimes she can not talk) and VACCINATION SITE ERYTHEMA (Red Left Arm (from injection site all the way to elbow)) outcome was unknown. Not Provided On 21 Apr 2021, the patient was diagnosed with Bell's Palsy. Treatment information included unspecified oral antibiotics and steroids. This case concerns a 60-year-old female with a serious unexpected event of facial paralysis, and nonserious unexpected eye disorder and speech disorder and expected vaccination site erythema. Event onset 2 days after first dose mRNA-1273. Event outcomes unknown. Based on current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.; Sender's Comments: This case concerns a 60-year-old female with a serious unexpected event of facial paralysis, and nonserious unexpected eye disorder and speech disorder and expected vaccination site erythema. Pulmonary embolism without acute cor pulmonale, unspecified chronicity, unspecified pulmonary embolism type (HCC) 04/26/2021 Resolved Hospital Problems No resolved problems to display. CONSULTS: None INPATIENT PROCEDURES: None DETAILS OF HOSPITAL STAY: Patient is a 51 y.o. male with a past medical history of psoriasis, environmental allergies who presents today with sudden shortness of breath, left side pleuritic chest pain 7/10, worsened with deep inspiration. No recent travel, no family history, no history of malignancies, no immobilization or surgeries. He had his 2nd dose of Pfizer COVID vaccine on April 1. He does not have a history of COVID-19 infection, and COVID-19 PCR test was negative in ER. His blood pressure is a little high at 170 6/83 mm, pulse 76 per minute saturating 96% on room air, troponin less than 6, BNP 16, WBC 12.3,, EKG without any significant ST T-wave changes. CT angiogram of the chest shows nonocclusive thrombi in almost all the lobes, there is no saddle embolus noted. There is no evidence of right heart strain. Echo: The technical quality of the exam was limited due to suboptimal acoustic windows. The left ventricle is normal in size. There is normal left ventricular wall thickness. The left ventricular ejection fraction is 60%. Regional wall motion abnormalities cannot be excluded due to limited visualization. The right ventricular size, thickness, and function are normal. No significant valvular pathology identified with Doppler examination. There was insufficient tricuspid regurgitation envelope detected to calculate right ventricular systolic pressure. Injection of contrast documented no interatrial shunt. There is no comparison study available. He was started on Heparin gtt. And admitted for observation. He required no supplemental oxygen. He was discharged later pm on Eliquis 10 mg bid for 7 days, than 5 mg bid for 3 months. I am questioning did he had COVID-19 vaccine related bilateral PE. His hypercoagulable profile is pending. He has no sign of malignancy, no new symptoms, no weight loss. He had normal colonoscopy 2 yrs ago. He should follow up with his PCP. He was given work excuse from 4/26-5/3/21. She shouldn't take non steroidal anti-</p>

1272005	4/29/2021	WA	53	F	4/3/2021	4/4/2021	The first night I got the vaccine, and I had a fever of 103 degrees for about six hours and 101 degrees at the 24 hours. I had all over body aches for two days but my hands still ache after tree weeks. I woke up in the morning an noticed a big bulging blue vein in my right eyelid right above the outer part of my eye. One week later my thumb started to throb and then a big bulging blue vein in my left thumb. It felt like it had been injured but it looked better within hours. I called my doctor and he advised that I go to the ER. I also had trouble with my head throbbing for a week after the shot. My eye was painful and lasted a little over a week and my eyes were a little blurry. Both problems have resolved but I still have an ache in my hands after three and a half weeks. It is a deep bone ache which makes it difficult to work with my hands.

1272464	4/29/2021	CA	45	F	3/12/2021	3/26/2021	At three AM I woke up with the room spinning, I couldn't focus, felt like I was falling. I had horrible pain in my back. I was sweating and vomiting. My husband carried me to the car and brought me to the ER. At the Er I was given a patch for my back pain, medicine for the dizziness and nausea. The dizziness didn't subside. I couldn't walk. I told them I had gotten the vaccine two weeks before and they said it wasn't related. I was diagnosed with a bladder infection, high blood sugar, and vertigo. I was discharged in the evening but with no improvement. I was not able to focus or walk for days. I saw my OBGYN, he was the only doctor I could see right away and he referred me to an ENT. The ENT can't see me until the end of June. I wasn't able to drive for weeks. I am slowly regaining my balance but still feel waves of dizziness and my eyes can't focus well when I am reading. The back pain is gone. My OBGYN also doesn't feel the dizziness is related.

1272521	4/29/2021	MI	51	F	4/8/2021	4/13/2021	5 days after vaccination I had partial vision impairment in my right eye. I saw my eye doctor two days later who believed it was retinal vein occlusion. He referred me to an ophthalmologist who I saw the following monday. The ophthalmologist confirmed it was retinal vein occlusion. His treatment was to administer an injection of medicine.

1272575	4/29/2021	AL	18	F	4/29/2021	4/29/2021	Approximately 15 minutes after receiving the vaccine the patient reported feeling lightheaded. Patient reported no vision changes, no problems breathing or talking. She said she does not like needles and that could have been the issue. I asked her to remain seated in observation and got her a cup of water. She drank with no problems swallowing. Reported no other symptoms. After approximately 5 minutes patient reported feeling about the same. After an additional approximate 5 minutes patient reported feeling much better. She remained in observation for approximately 5 more minutes, totaling approximately 30 minutes and reported feeling good. I offered for her to remain in observation as she felt comfortable but at that point she said she felt good and would call the pharmacy with any questions or concerns.

1269934	4/29/2021	TN	64	M	4/8/2021		<p>BLOODSHOT IN EYE/EYES WERE RED; KNOT IN CENTER OF RIGHT ARCH OF FOOT; NECK HURTS/COULD NOT MOVE NECK; HEAD SWELLING AND TENDER; SLEEPY; HEADACHE; CHILLS; HEART ACHE; This spontaneous report received from a patient concerned a 64 year old African American, not Hispanic or Latino male. The patient's height, and weight were not reported. The patient's concurrent conditions included blood pressure. The patient received covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1805020, expiry: unknown) dose was not reported, 1 total administered on 08-APR-2021 between 09.30 and 09.40 to left arm for prophylactic vaccination. Concomitant medications included acetylsalicylic acid (Aspirin) for blood pressure. On 08-APR-2021, 20 minutes after vaccination, the patient started having symptoms. The patient's heart started aching and that lasted for 15-20 minutes and then went away. On 09-APR-2021, the patient had chills that had lasted for four hours. On 10-APR-2021, the patient could not move his neck left or right and back of his head felt like it was swelling and tender; he also had a headache, and he was extremely sleepy. The patient's neck and head tenderness lasted three to four days. On 11-APR-2021, the patient eyes had blood shot and were red and reported that he might had a stroke or blood clot. On 17-APR-2021, he had a knot came up in the center of right arch on foot. On 19-APR-2021, at the time of this report, the patient's eyes were still red and had a slight headache; the patient's neck still hurts, he was sleepy, and the knot was still there on his right arch of his foot. The patient took acetylsalicylic acid (Aspirin) but he was already taking that for his blood pressure. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The patient recovered from heart ache on 08-APR-2021, head swelling and tender on 14-APR-2021, and chills on 09-APR-2021, and had not recovered from neck hurts/could not move neck, bloodshot in eye/eyes were red, headache, sleepy, and knot in center of right arch of foot. This report was serious (Other Medically Important Condition).; Sender's Comments: V0: This 64-year-old African American (non-Hispanic/Latino) hypertensive male patient reported "heart aching" 20 minutes after receiving COVID-19 VACCINE AD26.COV2.S for the prevention of symptomatic SARS-</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							CoV-2 virus infection. The event lasted for 15-20 minutes. Other associated symptoms developed in the succeeding 3 days: chills that lasted for hours, could not move his neck and felt it was swelling and tender, headache, sleepiness, blood shot eyes. Nine days after vaccination, the patient reported he had a knot in the center of arch right foot. The patient took Aspirin. No other details was reported. The event is confounded by the underlying hypertension. The information available precludes a complete and meaningful assessment. However, considering the temporal relationship and recently evolving theories in the literature about COVID infections and vaccinations, potential vaccine contribution cannot be excluded. Additional information was requested.
1272052	4/29/2021	CO	16	F	4/29/2021	4/29/2021	Patient was a client at a drive-through COVID-19 clinic. Patients Father was driving and the patient was seated in the front passenger seat. After receiving vaccine, FOC drove forward and parked in an observation lot that was staffed by 3 RNs. FOC reported to an observation lot attendant that patient, Patient was losing vision (narrowing), shaking, and then stopped responding. The observation lot attendant noted loss of consciousness, reclined patient in the seat and elevated feet above the heart by placing them on the car dashboard. At 1535, 911 was notified by RN. When car door was opened by the attending observation lot worker, client began regaining consciousness. Client was given apple juice and crackers and vitals were taken. At 1540, Patient blood pressure measured 91/60, pulse oximeter reading of 96% saturation, and heart rate 72bpm. Paramedics arrived to the scene at 1545 and assessed the client; patient was not transported. Father was instructed by paramedics of warning signs and when to seek further care. FOC and patient were advised to inform PCP and to report this instance when receiving future vaccines. FOC and patient remained onsite for 15 minutes following Paramedic care and were dismissed when patient and FOC reported that they felt comfortable leaving.

1270306	4/29/2021	MA	33	M	4/9/2021	4/16/2021	33-year-old male without past medical history presenting with 10d of nausea and vomiting associated with dysequilibrium. Patient notes he received his second dose of Moderna on April 9. On April 16th, patient woke up and started to feel disequilibrium, unsteady on his feet. This was associated with nausea and vomiting. Patient will vomit about 2-3 times per day nonbloody nonbilious. He notes that the vomiting is associated with movements of his head. He went to urgent care where he was given prescription of meclizine. This did not work. Was also given prescription for prednisone and Augmentin for question of vestibular neuritis. This did not help either. Patient then went to see ENT today. He was told that his symptoms were not consistent with a vestibular process. He was recommended to go to emergency room for further evaluation. Patient has not been able to really hold down any food or liquids. He denies any fevers, chills, headache, vision changes, neck stiffness, abdominal pain, constipation or diarrhea, chest pain, dyspnea. In the ED, patient afebrile, HR 67, BP 135/97, RR 18, SpO2 96% on RA. Labs notable for Hb of 17.3. CT head -10 millimeter periventricular hypodensity in right parietal lobe chronicity.
1272159	4/29/2021	NC		F	4/7/2021		Hello Dr., I just wanted to log my information regarding my Johnson & Johnson COVID vaccine. I was fine no sickness or pain before injection. On April 7th 2021 I got the injection. Immediately my vision went a little dim. After getting home for about 3 hour felt pain lump in center of chest. The next day April 8th ,2021 woke up to center chest and complete rib case painful and swollen this went on for two days with flu symptoms, On fourth night April 10th, 2021 I had spasms down lower back of left leg all through the night hurt very bad by toke the prescribed Advil to help with pain. I also started taking Vapor Nyquil for flu and Cold, Therrraflu and Therflu sinus and pain hot tea med's, used Vicks Vapor Rub

1271389	4/29/2021	FL	31	F	3/14/2021	3/25/2021	<p>Began on 3/26/21 with numbness in face. Woke up on 3/27 with numbness in feet. Spread to my feet and up legs and arms through next couple days. Fatigue increased dramatically, though it was present prior. Dizziness, sharp pains in left ear in skull, nerve issues. The following is a log from when the symptoms became most intense, so significant I have not been able to drive myself and been working from home due to balance issues, no feeling in feet, and neurological symptoms. After different a week and a half,, i sought medical care and began logging daily as follows: Fri 4/9: fatigue was high, neuropathy present. Balance was off. Stabbing sharp pains into the left ear but behind the ear in head. Dizzy spells with static feeling rush in forehead lasting a few seconds and passing. Gate while walking feels awkward and difficult. Think walking after sprinting on a treadmill plus's stiffness Sat 4/10: couldn't eat. General malaise. Fatigue. Neuropathy and balance issues present. Gate slightly improved. Noted increase in joint pain and popping in wrists elbows hips and knees. Needed white noise to cover ear ringing to sleep. Sun 4/11: feeling a bit better. Able to eat. Gastric issues after eating. Slightly more energy but neuropathy and balance was frustrating like superglue on my fingers and areas of my feet with no feeling at all surrounded by pins and needles. Aching in wrists and pain shooting down through to heel of my foot. Ear ringing more noticeable. Two instances of ice pick ear pain. Monday 4/12: neuropathy present, balance improved. No digestive issues. Feeling more stable while walking. Still numb in hands and feet and part of my face but less pronounced. Ear ringing unbearably loud and constant. Tuesday 4/13: slightly less energy but neuropathy still seems improved and not losing balance as much. Ears obnoxious, joints popping and cracking constantly. Pain in wrists and hands. One instance of ice pick ear pain Wednesday: same as Tuesday, but no ear pains. Had to take a nap in the middle of the day due to worn out feeling. Laying in bed felt something in my back snap, then a stabbing pain into my lower right side of my back. Aching like the skin was hurting for hours. Thursday: other symptoms same as Tuesday. Ears ringing crazy loud, stiff in the hips more noticeably. Neuropathy present with dizzy waves/vertigo. Low back skin pain right side continue. Also right hip. Gate while walking is</p>

starting to feel like it did before after a few days of improvement. Friday: back still hurting. Neuropathy increased. More numbness than previous few days. Very stiff throughout lower back hips and legs. Low back pain. Gate while walking feels awkward and robotic. Ears ringing. Joints throughout cracking/popping. This is not historically common for me. While washing dishes got shooting pain down my left wrist back of hand almost shooting down the veins to in between my pointer finger and thumb. Painful to touch. Immediate strong increase in the pins and needles in my hand concentrated in finger tips but now radiating up forearm too. .numbness in feet and part of my face. Whole body aching. When trying to sleep kept getting head rush static attributed to Benadryl to sleep and staying up too late. Saturday: very tired. Back hurting in morning. Felt better after getting up. Kept feeling head rush like static in forehead continuing on and off throughout the day into the night with dizziness almost like I might pass out. Nausea and low appetite Fatigue higher than normal. Neuropathy still present. Ears ringing insanely loud and constant. Aching and stiffness in hands wrists and legs and feet in heel/sole. Chest pain in sternum. Had a few months ago almost daily for awhile. Went away til now. Sunday- neuropathy the same. Ears ringing the same. Stiffness throughout. Dizzy spells and static in forehead. Nausea and low appetite. Fatigue. Ice pick ear pain starting in evening a few times throughout the night. Monday. Neuropathy the same. Ears ringing the same. Slightly less pain and popping in joints. Fatigue high. No appetite. Ice pick ear pain starting in morning happening several times. PREDNISONE STARTED WEDNESDAY Wed April 21: feeling about the same. Ringing in ears, neuropathy same, fatigue high. Appetite improved. Ice pick ear pain a couple times. Neuropathy seemed to improve towards the end of the day, when it usually is worsening. Felt nauseas and sick to stomach before bed with digestive issues. Dizzy spells all evening with static feeling. Ears ringing constant. Thursday: neuropathy improved, still present and noticeable but I was able to walk normally and had more feeling than previous. Joints still cracking and popping. Not as nauseas or sick feeling throughout the day. No ear pain. Dizziness occasional, less than day before. Ears ringing constant. Friday: neuropathy still improved but present and noticeable, able to walk more

normally than previous. Joins still the same. Not as nauseas or sick feeling. Chest pains in sternum and stabbing ice pick ear pains on and off all day. Very painful in the ear. Light headed/easily motionsick, but better than Wednesday worse than thursday. Ears ringing constant. Saturday: Neuropathy still improved, joints are stiff but not in pain. Light headed easily, ears ringing constant. This is the worst day for the ice pick ear pain yet. Repetitive ?attacks? concentrated in the morning enough to make me have to drop and hold my head. It was very painful and higher frequency than ever seen previously. Sunday: Feeling sore in my hip joints. Ears ringing constantly. Ice pick ear pain only happened twice. Neuropathy slightly more than day previous but okay and balance still improved. Chest pains in sternum present. Episodes of blurred vision/double vision towards the end of the day.

1271152	4/29/2021	NJ	59	M	3/24/2021	3/24/2021	In a nutshell, patient was fine, got the first shot of the Moderna Vaccine on 3/24/21, then began to exhibit many covid-like symptoms starting around 4 hours later but 3 times nasal swap tested negative for COVID19 including before and after vaccination. Suffered with various attempts at treatments and tests for approximately a month and then was admitted to the ER at hospital on 4/28/21. Wife (former smoker who lives in same house and has lung problems) who took the vaccine at the same time from the same lot suffered minor arm pain, aches and pains and fatigue but was fine the next day. Patient (59) had normal blood pressure and clear lungs in good health, non-smoker, good weight, exercises regularly and strenuously, good diet, rarely gets ill. He works as a ship's captain and engineer and has worked in boatyards for years doing physical work. Has tinnitus and in one eye, glaucoma drops but is on no other prescription medicines. Details: March: had nasal congestion, cough and suspected bronchitis, aches and pains, no fever, PCR tested negative for COVID19, and was treated with antibiotics (azithromycin and then a run of amoxicillin), proair, advair discuss a couple of days, various vitamins/minerals, over the counter cold/flu medicines. Seemed to work with most symptoms going away prior to March 24, 2021. March 24, 2021 morning: Got first shot of the Moderna Vaccine at pharmacy. Lot 045A21A at same time as spouse. That morning had no cough and felt ok. Approximately 4 hours later, patient started to cough, felt congested, felt like flu/pneumonia, trouble breathing, aches and pains especially in joints, extreme fatigue, headache, (but suffered no loss of taste or smell throughout 3/24-present) took Theraflu and went to bed early, slept well. Following days, struggled with intensifying symptoms. Felt like the vaccine gave him covid symptoms without the loss of smell/taste. Spouse experienced minor pain at point of injection, some fatigue, aches and pains which went away by end of next day 3/25/21. Spouse had some lingering cough left over from earlier bronchitis before getting the vaccine which cough/congested breathing continued with no noticeable change. [Spouse was also not adversely impacted by the second shot of Moderna vaccine a month later.] Apr Wk1 & Wk2: Increasing difficulty sleeping due to lung congestion or suddenly waking up wide awake for no reason. At end of Wk2, had some minor tremors in

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

muscles for a couple of days. Suffered from extreme fatigue, congestion, trouble breathing, nightmares, aches and pains. Took azithromycin run then a run of amoxicillin, proair, prednisone, albuterol nebulizer, occasional Theraflu or over-the-counter cold/flu medicines, vitamins/minerals (including heavier doses of Vitamin D, Zinc, C, etc.), probiotic acidophilus, tonic water with quinine or Perrier, melatonin 10mg and magnesium 500mg at night, occasionally a Unisom sleeping pill. Started to lose appetite where rarely hungry. Would force himself to eat anyway, but occasionally vomited it up. Apr Wk3 4/13/21: Patient got another PCR covid test which was negative, chest xray, blood work done at Urgent Care. Showed some elevated liver/kidney enzymes and low red blood cell count/anemia, vague thickening of the plura, swollen lymphnode in the chest xray, no sign of cardiovascular issue. (Some yellow flags but nothing flashing red.) Dr. recommended followup tests and bloodwork and that he get GI/Cardio/pulmonary workups w/specialists. Patient continued to take antibiotics, pregnizone, albuterol nebulizer, vitamins/minerals, and occasional cold/flu/cough medicines, etc. Added SuperB Complex. One day he had hot/cold chills for a few hours. Apr Wk4: While lungs felt clearer, still coughing and now occasionally vomiting productively or dry heaves, insomnia grew into bigger issue with hallucinations not just with nightmares but occasionally during the day where it was difficult to separate reality from dream, trouble remembering, started to feel paranoid/irrational sometimes, trouble sleeping was not due to lung congestion but more due to panic-attack like heavy breathing or sudden central chest/sternum pain (maybe from coughs), aches in joints, but biggest problem was extreme fatigue and tiring when walking up a flight of stairs, etc. Took some Tramadol occasionally for pain relief (but never with aspirin, Tylenol or cold medicine). Could be sitting comfortably watching a mellow tv program but suddenly need to breathe really heavy, hyperventilating and felt need to standup and walk around until it eased. Extreme trouble sleeping. Most comfortable position was kneeling with body bent over a pillow on the bed. [He'd never had panic-attacks/heavy breathing issues before the Moderna shot and doesn't abuse substances.] Wk5: 4/24/21 feet swelled up and turned purple on the soles. Went for a walk around the

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

block and raised feet. No longer on antibiotics or pregnizone, only taking the albuterol nebulizer, vitamins/minerals/probiotics, melatonin and a OTC cough/flu medicine before bed. Knelt for hours while trying to sleep. 4/25/21, feet more swollen with fluid and more discolored. When searched online, they looked like "covid toes". Took no medicines except nebulizer and took only a couple of vitamins/calcium-vitaminD and before bed a beer, melatonin, magnesium & nyquil. 4/26/21, feet less swollen and no longer purple except a small line on the side of one foot. Patient indicated he had not knelt when trying to sleep prone during night. But only got a couple of hours of sleep, nighttime hallucinations and panic-breathing attacks. Daytime inability to focus, extreme fatigue, aches and pains, quick to tire on any exertion, vomiting food or dry heaves 2 or 3 times that day, panic-like-attacks with need to heavy breathe/hyperventilate. Wheezing with occasional rattle at end. Coughs sometimes productive, sometimes not but lungs didn't feel very congested and oxygenation/blood pressure was good. 4/27/21, went to work in morning and was able to perform but very tired. In early afternoon, came home, ate, took nyquil and nebulizer and tried to sleep. 4/28/21, felt much worse, feet and knees swollen, extreme exhaustion, felt miserable. Went to work anyway. Came home around 2pm, ate. Felt much worse so we went to the ER at Hospital. Spouse provided MMC with his medical conditions, medicines, the info on COVID IGG serology test and informed them of the chest xrays and bloodwork that had been done at the Urgent Care center 2 weeks prior. ER indicated he needed to stay overnight and they performed additional bloodwork, xrays, scans and MRIs. The ER doctor called in specialists in Nephrology and Cardiology to provide consultations.

1271042	4/29/2021	MI	87	M	4/1/2021	4/20/2021	BRIEF OVERVIEW: Discharge Provider: MD Primary Care Provider at Discharge: MD Admission Date: 4/22/2021; Discharge Date: 4/23/2021 Active Hospital Problems - Admitted for bilateral PE ? Acute pulmonary embolism without acute cor pulmonale, unspecified pulmonary embolism type (HCC) 04/22/2021 DETAILS OF HOSPITAL STAY: Patient is a 87 y.o. male with psoriatic arthritis, essential hypertension who presents today with right-sided chest pain. He reports onset starting yesterday. The pain radiated around to his back into the center of his chest. Thought he had pulled a muscle was having heartburn. Taking a deep breath made the pain worse. He tried Tums but no significant relief. It was not associated with shortness breath. Denied any, lower extremity swelling or calf pain. Today the pain was acutely worse so presented to the emergency department for evaluation. No prior DVT, PE, no FH of DVT/PE. No weight loss. No recent prolonged trip. On arrival to the emergency department his pulse was noted to be elevated to 120 but otherwise vitals unremarkable. CT angiogram thorax had significant findings of multiple bilateral pulmonary emboli involving segmental and subsegmental vessels. There was no evidence of right heart strain. He was started on heparin drip and transferred to another facility for ongoing care. He was switched to Eliquis 10 mg bid for 7 days, then 5 mg bid for 3 months. He has not sign of any malignancy, no weigh loss. He received Moderna COVID-19 vaccine on 3/4/21 and 4/1/21. It is conceivable that this PE could be complication of COVID-19 vaccine. He should follow up with PCP in 1 week. CTA also showed partial visualization of gas fluid collection within the right upper quadrant, likely reflecting a duodenal diverticulum which was present on 8/20/2012 CT abdomen, incompletely assessed. There is a small hiatal hernia. PCP to follow. Discussed with wife, and with daughter over the phone. Patient discharged home.
1270879	4/29/2021	MN	63	F	4/9/2021	4/12/2021	Visual disturbance in lateral visual field of right eye. Posterior vitreous detachment initially evaluated in the Emergency Room, on April 12, 2021 and subsequently diagnosed by Ophthalmology Department on April 13, 2021.

1266338	4/28/2021	SC	22	M	4/28/2021	4/28/2021	Patient was visibly nervous prior to receiving the vaccine. About 5 minutes after administration (during the 15 minute watch period), patient appeared to be slumped over in the chair. He had eyes closed and seemed to be shaking slightly. Pharmacist and tech grabbed the emergency kit and laid patient on the floor. After a few more seconds the patient woke up and was able to respond to questions. He was very pale, sweaty, reported feeling clammy and dizzy. Patient claimed he had not eaten since the morning. We gave him some water and a pb&j sandwich. Patient stated he felt better and he just gets very nervous around needles. The patient sat with us for another 30 minutes until his grandmother and cousin were able to come pick him up from the pharmacy.
1266655	4/28/2021	OH	22	F	4/2/2021	4/8/2021	4/2 vaccination 4/8 severe HA, leg, arm, lower back pain, chest pain, diarrhea, bad anxiety with shaking 4/9 PCM (NP) appt; CT scan of abdomen and blood panel 4/10 felt worse, nauseous. Diarrhea continued 4/11 At 11PM, pain right side of neck, to jaw, and toes turned purple. 4/13 PCM; vit D prescribed as they were extremely low, extra strength Tylenol release for leg and arm pain, ordered a D-dimer for possible blood clot. Doppler for right leg. COVID; neg 4/17 chest pain was extremely severe. Radiated to L arm. Went back to ER. EKG, CT Scan, BNP. All normal. Stated probably really bad heartburn. 4/19 Prilosec. I called my dr on 4/22 to follow up. They told me to keep eye on BP as been elevated thru this whole thing. 4/22 My chest, arm and leg pain with HA are still present despite Tylenol and Prilosec. My PCM said to come back in . She prescribed Prednisone and Pantropical and did a blood test to check for inflammation which was normal. I have been taking both medications since Tuesday. *My HA still present. My right side still has pain and I still have chest pain.

1266359	4/28/2021	MA	63	F	3/15/2021	4/21/2021	I now have mini little eczema patches on my face - two or three of them; I use Fluticasone (steroid) on them which I was using for the original adverse event with red patches on/below my neck. I had a health report today primarily related to a different health issue but I asked her if I should use the Fluticasone cream on them. She cautioned me to use the steroid cream minimally on my face. The eczema I have on my hand - that is what I always there in dry, bad weather - seems worse than it normally gets. The rash on my neck is gone. Also, two weeks after the Vaccine, I have noticed that my eye sight is different. I am going to the eye doctor tomorrow because of this.
1266394	4/28/2021	AZ	78	M	3/28/2021	4/18/2021	Patient on 4/18/21 experienced "chicken wire" vision (never before an issue), after vision issues patient said he lost vision on and off for the next 24 hours, accompanied with mental confusion, and was unable to get out of bed on the morning of 4/19/21. Next two days a continued decline in in ability to ambulate and demonstrated neurological deficits on 4/20/21 of impaired vision, cognition and experienced difficulty in moving limbs. Patient was in a car accident on 4/21/21, is now hospitalized, unable to ambulate, and has further neurological deficits with impaired speech, cognition, and movement as well as pneumonia.
1266158	4/28/2021	NC	29	M	4/27/2021	4/27/2021	Systemic: Dizziness / Lightheadness-Medium, Systemic: Fainting / Unresponsive-Medium, Systemic: Flushed / Sweating-Medium, Systemic: Visual Changes/Disturbances-Medium, Additional Details: Gave patient water, a snack, and had him sit in pharmacy for full 30 minutes before leaving. He said he felt perfectly fine and was having no other continuing symptoms.

1266417	4/28/2021	NY	54	M	3/20/2021	3/30/2021	<p>Patient is a lovely 54 year old- year old male initially seen 4/5/2021, kindly referred by Dr. History of COVID pneumonia in 4/2020 which was complicated by ARF and shingles, Ramsay Hunt Syndrome, with subsequent post-herpetic pain on right side of scalp.He recently received his COVID-19 Pfizer vaccine 3/20/2021 11 days prior to presentation to the hospital with shortness of breath, worsening dypnea on exertion which started 2 days after vaccine. Before this he was biking twice a week, and swimming nearly daily. He did report any medical problems before COVID, was on no meds. 3/31/2021- CT PE protocol showed multiple bilateral PEs without right heart strain. Pulmonary Vasculature: Bilateral filling defects consistent with pulmonary emboli are visualized involving the following: Distal right main pulmonary artery extending to the right lower lobar, segmental, and subsegmental branches, right middle lobar, segmental, and subsegmental branches and proximal right upper lobe artery. Left lower lobar, segmental, and subsegmental arteries. The right heart is not dilated.COVID/flu swab neg, trop x2 neg, BNP wnl. - Started on therapeutic lovenox then plan to transition on discharge to PO xarelto 15 mg bid x21 days then continue with xarelto 20 mg daily. He was seen by Dr. and referred to me for follow up. He had US 4/5/2021- which showed Right Lower Extremity: There is acute thrombus of the femoral proximal vein.Right Lower Extremity: There is no evidence of deep or superficial venous thrombosis in the common femoral, popliteal, posterior tibial, peroneal, GSV and SSV veins. Left Lower Extremity: There is no evidence of deep or superficial venous thrombosis.' 4/5/2021: Initial hematology visit Currently does not have any pain in legs, swelling. Reports that he still is not back to 100%, he got on peloton yesterday and was only able to go 5-6 miles at a slower pace. Denies fevers, chills, sweats. He has some intermittent pain where his previous zoster scalp lesions were. He has been undergoing facial PT. Thrombophilia workup sent which was grossly negative.</p>

1266769	4/28/2021	MA	53	F	2/24/2021	3/13/2021	On the morning of Saturday, March 13th my mother had a CARDIAC ARREST, luckily i was with her when this happened and called 911 immediately and followed an emergency/cpr protocol. She had no pulse when the emergency team arrived and they used the defibrillator on her three times in our house before they took her in the ambulance where they used the defibrillator another time. She was rushed to the Hospital where she was sedated and put on a breathing machine. It did not seem as if she would survive, the entire morning was a whirlwind and traumatizing. In the afternoon they transferred her to the ICU unit. Luckily after 24 hours they lowered sedation and she had no brain injury etc., we were all amazed she was alive. The doctors ran tests etc. to find out what caused this cardiac arrest event, they found NOTHING - no blood clot, no clogged arteries, nothing that could have caused this. My mother also has had not health conditions before this that would have caused this. She now has a defibrillator implanted and her life will never be the same, her families either, we will constantly worry. I have post traumatic stress from witnessing my mother turn purple and lifeless right in front of my eyes and the emergency team working on her all morning and in the ER. Thank gosh i was with her that morning and that the emergency team arrived within a few minutes or else my mother would not be here today. The only thing that changed leading up to her Cardiac Arrest was that she got the Pfizer Covid-19 vaccine on February 24th - we need answers, did the vaccine have anything to do with this?

1266095	4/28/2021	FL	41	F	4/10/2021	4/10/2021	As soon as I took the vaccine shot I had an immediate headache, after taking the vaccine I took Tylenol and slept in the rest of the day. The next day I woke up and my arm was red and swollen. I was running fever, still had the headache and now blurry vision. My entire body was hurting. My left side of my body felt numb and tingling. The next two days the pain became worse. I did not really have an appetite. When I did eat I could barely hold my food down. On Wednesday morning I could barely get out of bed, I also felt extreme pain in my lower legs, stabbing pain in stomach and right lower side. I also had ringing in my ears, more in the right ear. I then notice a bruise on my left leg, that it was not originally there, and was also tender to touch. I went to the emergency room on the same day and I was admitted. I was in there for 4 days, they tested my leg and stated it was not a blood clot, although it look and felt like one. They discharge me and advise me that it was a migraine that was causing all my pain. This was on Sunday, I had a follow up with my PCP on the Friday, however to being in so much pain and shortness of breath, and arm pain I was advise to go to the ER on the Thursday and was admitted again. I was told in the ER I had a blood clot in my right arm and it was most likely from the IV from the previous visit. My blood pressure and heart rate was so high that they put me on medication. No matter the pain medication they gave me, it would not completely take the pain away. They discharge me again on Monday and after me begging them to get run any and all test, they said they found nothing. I'm still in the same amount of pain and same symptoms, still having trouble keeping my food down. The only thing that changed is my left arm is not as sore, however I still have a huge knot and its still warm to touch. I don't know what else to do that is why im contacting the CDC for help. I'm in a extreme amount of pain and pounding headaches. Please help

1266768	4/28/2021	FL	75	M	3/20/2021	4/7/2021	75yo male developed Bell's possibly, possibly associated with administration of COVID-19 vaccine (Pfizer). Pt received dose #1 on 3/20/21 at local clinic. On 4/7, pt developed R-sided facial droop and eye weakness, prompting visit to ED and short one-night admission (Neurology service) at hospital. Hx of subdural hematoma in Sept 2020 in the setting of COVID. Imaging with probable small vessel disease but no acute infarct. Discharged on 7-day course of prednisone. Spoke to patient on 4/12. He received does #2 on 4/10 (external location) and tolerated well without any change in sx.
1265954	4/28/2021	MD		F	3/27/2021	3/27/2021	bleeding in the right eye, on the white part of the eye; headaches; This is a spontaneous report from a contactable consumer (patient). A 62-year-old female patient received the first dose of BNT162B2 (Pfizer-BioNTech COVID-19 vaccine, lot number and expiry date unknown), via an unspecified route of administration on 27Mar2021 as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient reported that she had a headache two hours after the vaccine on 27Mar2021. On 29Mar2021 (reported as two or two and a half days after getting the first shot), she had bleeding in the right eye, on the white part of the eye. She was scheduled to get the second dose on 17Apr2021 and she is afraid and hesitant. She noticed the bleeding when she woke up in the morning, so the bleeding probably started at night. The blood was in the lower part of the right side of the eye and it was frightening. She read that side effects can be similar to flu like symptoms, but she didn't get any of those. She is concerned and both her Ophthalmologist and Primary care doctors both think that it will go away. The patient was worried because it never happened ever. She is afraid that with the second vaccine, the effects, will probably be stronger and wanted to know how protected she will be if she only takes the first vaccine. The outcome of the events was unknown. Information on the lot/batch number has been requested.

1266898	4/28/2021		29	F	3/8/2021	3/8/2021	My first side effects were fatigue and feeling ?out of it?, which started about 2 hours after the injection. At 7 hours after my left leg became numb and a little sore. I started to notice a feverish, tingly feeling on my skin and this would last at least 24 hours. These symptoms quickly spread through my whole lower body. The chills and intense body aches started at 11 pm. I woke up at 2 am that night and had a low grade fever 99.9 F. I took 2 pills of Tylenol. The fever broke around 3:30 or 4 am and I slept through the rest of the night. The next morning 3/09, I felt fatigue, slow, and woozy. I still had chills and muscle aches, although the intensity was less. Halfway through the day the chills intensified, the muscle aches became more severe, and my eyeballs felt like they were burning in the back of my head. By that evening, the fever was back and I couldn?t think straight. My legs ached with a pain that I?ve never felt before. I did not have a severe headache, but I felt that if I exerted myself too much I would get one. My partner said I could barely form coherent sentences, and I was so weak I couldn?t sit up straight. I took 2 more Tylenol that night, went to bed and slept through the whole night. The morning of 3/10 I woke up feeling tired but my skin did not have that feverish feeling. I was no longer sick. On 3/11 I woke up and did my normal morning routine. I ate an egg, some of a Nutella stuffed scone, and drank coffee and water. I took my 3 pills, loratadine, omeprazole, and a probiotic, and I had a severe allergic reaction within 5 minutes of taking the pills. For the next 10 minutes my breathing became labored and wheezy. I experienced severe eosinophilic esophagitis symptoms. For the next week, my EoE symptoms were heightened. I had a reaction after drinking a seltzer water, which does not usually affect me. Within 2 weeks I was back to normal and to my knowledge have not experienced any other related side effects.

1265918	4/28/2021	CA	71	F	3/11/2021	3/13/2021	lost partial vision in my right eye which has been determined to be a AION; blood pressure elevated; weak; dizzy; nauseated; fever; headache; This is a spontaneous report from a contactable consumer (patient). This 71- year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE Lot number: EN6208), via an unspecified route of administration, on 11Mar2021 at 16:00 (at the age of 71-years-old) as a single dose for COVID-19 vaccination, in left arm. The facility where COVID-19 vaccine was administered was Public Health Clinic facility. Historical vaccine included: bnt162b2 (COMIRNATY, Solution for injection, Lot number EN6200) dose 1 on 18Feb2021 04:00 PM, for covid-19 immunization, left arm. No known allergies. The medical history included: Blood pressure abnormal. Concomitant medications included: Prozac, Inderal, Atorvastatin. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient did not receive any other vaccines within four weeks prior to the vaccination. On 13Mar2021 09:00 am, Day after 2nd injection, she felt weak, dizzy, nauseated, fever, blood pressure elevated and had an extremely severe headache. That evening I lost partial vision in my right eye, which has been determined to be AION. Vision has not returned at one month out. Event resulted in: Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care, Disability or permanent damage. Treatment included: Blood pressure monitoring and return 13Apr2021. The clinical outcome of the events was not recovered. The patient was not tested for COVID-19 after the vaccination. No follow-up attempts are possible. No further information is expected.

This spontaneous case was reported by a consumer and describes the occurrence of NEUROPATHY PERIPHERAL (neuropathy), CATARACT (cataract surgery) and GAIT DISTURBANCE (He has been on the walker for 8 months now) in 80-year-old male patient who received apixaban (Eliquis) tablet (batch no. 1708750) for DVT. The occurrence of additional non-serious events is detailed below CO-SUSPECT PRODUCTS included Covid-19 Vaccine for an unknown indication. Product or product use issues identified: DRUG INEFFECTIVE (The consumer reported he is on Eliquis for DVT behind his right knee that is still there) (seriousness criterion medically significant). The patient's past medical history included Pre-diabetic, Proctectomy, Sinus operation, Appendectomy and Drug allergy (sulfa). In 2018, the patient started Eliquis (batch no. 1708750) (Oral), 5 milligram twice a day. On an unknown date, the patient started Covid-19 Vaccine (unknown route). In 2020, the patient experienced MONOCLONAL GAMMOPATHY. In August 2020, the patient experienced GAIT DISTURBANCE (seriousness criterion disability). On an unknown date, the patient experienced NEUROPATHY PERIPHERAL (seriousness criterion medically significant), CATARACT (seriousness criterion medically significant), WEIGHT INCREASED (He has gained five pounds), INJECTION SITE ERYTHEMA (The first shot he took, his arm turned red), SOMNOLENCE (wanted to sleep a lot) and ABNORMAL DREAMS (weird dreams). The patient was treated with Surgery (cataract surgery) for Cataract. The action taken with Eliquis(Oral) was unknown. At the time of the report, NEUROPATHY PERIPHERAL, CATARACT, GAIT DISTURBANCE, MONOCLONAL GAMMOPATHY, WEIGHT INCREASED, INJECTION SITE ERYTHEMA, SOMNOLENCE and ABNORMAL DREAMS outcome was unknown. The patient received apixaban at a</p>

----------	-------	-------	---------	-----	----------	------------	--------------

strength of 5 mg. The consumer reported he was on apixaban, 5 mg twice daily by mouth for a DVT behind his right knee that was still there. He started the medication three years ago. He stated he had to get his glasses. He had cataract surgery three or four years ago. He has neuropathy and believed it was affecting his right eye. He has had the neuropathy for quite a while. He finally went to neurologist and figured out he has neuropathy. The neurologist did needles. The neurologist found he also has MGUS (Monoclonal gammopathy). He stated it was a protein that was formed in the bone marrow and goes into the blood stream. He stated he has had it for a while. It was over a year ago when he found he had it. He stated the neurologist gives the test to people over 70 years old. The neurologist said it was idiopathic or pre-diabetic that caused it. He has gained five pounds. He stated he has to get off the chocolate. He was walking every day. The patient uses a walker which he stated was driving him nuts. He has been on the walker for 8 months now (Aug-2020). He reported he had his COVID shot and would not go through it again. The first shot he took, his arm turned red and it bothered his thinking. He put something down and misplaced it. After the second shot, he felt really bad and wanted to sleep a lot. He did not feel like doing anything. That lasted for a day. It came back a week later. He stated he has been busy and working on taxes. He reported he had weird dreams right after having it. For Eliquis(Oral), the reporter considered NEUROPATHY PERIPHERAL to be not related. No further causality assessments were provided for CATARACT, GAIT DISTURBANCE, MONOCLONAL GAMMOPATHY, WEIGHT INCREASED, INJECTION SITE ERYTHEMA, SOMNOLENCE and ABNORMAL DREAMS. Case Assessment Drug: ELIQUIS Injection site redness, Sleepiness, Abnormal dreams, Monoclonal gammopathy, Drug ineffective, Cataract, Weight gain, Walking difficulty Per Reporter= Not related Per Company =Related Drug: ELIQUIS Neuropathy Per Reporter= Not Related Per Company = Not Related; Sender's Comments:Medical Evaluation Comment: This 80 -year-old patient had multiple events after receiving apixaban therapy. This patient also got vaccinated for COVID-19. Elderly age with medical history of pre-diabetes are likely the risk factors for the reported events peripheral neuropathy, cataract and gait disturbance;

A 26-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot Number: ER8734 and expiration date not provided), via an unspecified route of administration, administered in Deltoid Left (reported as left shoulder) first dose on 01Apr2021 10:00 at single dose for covid-19 immunisation. The patient medical history was not reported. The patient concomitant medication includes Multivitamin at 2 gummies once a day for immune support, bone support, and health reasons. The patient historical vaccine includes flu shot and experienced sore arm. On 03Apr2021, the patient stated that two days after the vaccine the patient experienced earache, went to the ED (emergency department) this Sunday diagnosed bell's palsy. On 11Apr2021, the patient experienced ear pain that she thought was an earache or ear infection, then she went to the ER because she woke up with half of her face numb. She says she was diagnosed with Bell's Palsy and she did some research. She says during the trials people did get Bell's palsy but they didn't know if it was connected to the vaccine. She says she is reporting it and she wants to get more information, she's due to get the second dose next Thursday. She says it was a mild case but she was concerned it will come back and come back worse. She says she has a meeting at 3 pm and it is currently 2:13 pm where she lives. The patient stated that now she was left with the face stuff, the face droopiness. The patient was still taking the Bell's Palsy medications every day, she thinks she is getting better. She says about her face being numb she woke up and felt it in her mouth, her lip, her right eye was not cooperating, there was a very noticeable difference between both of her eyes. She says she went to the ER where they did a couple of tests to see if it was a stroke or something else, they didn't do any imaging, with what they saw on her face and the way they were testing the</p>

conclusion was Bell's Palsy. She says she saw her primary care physician today because she needed to follow up and it looks like a mild case of Bell's Palsy. She says her face is getting better with medications. She says she is taking Prednisone 60 mg a day for 7 days. She is also taking Valacyclovir 1000 mg 3 times, she clarifies it says to take 1 tablet 1000 mg total 3 times a day by mouth. The events prompted the patient to Emergency room visit and physician office visit. The outcome of the event facial paralysis, hypoaesthesia was recovering. The outcome of the event ear pain was Recovered with Sequel on 11Apr2021. The outcome of the remaining events was unknown.

1265961	4/28/2021	FL	23	F	4/11/2021	4/11/2021	<p>This is a spontaneous report from a contactable consumer. A non-pregnant 23-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), dose 1 via an unspecified route of administration, administered on left arm on 11Apr2021 15:45 (Batch/Lot Number: ER8733) at single dose (at the age of 23 years old) for COVID-19 immunisation. Medical history included asthma. The patient had no known allergies. Concomitant medications included mometasone furoate (ASMANEX), levocetirizine and montelukast, all taken for an unspecified indication, start and stop date were not reported. The patient experienced wit in 10 min extreme weakness, loss of vision with complete pupil dilation not exceeding 5min and without losing complete consciousness. Once vision restored, profuse sweating, pressure cranial to thoracic inlet with moderate difficulty swallowing water. Paramedics arrived. Taken orally 25mg Benadryl. Cyanosis of nail beds and lips, poor perfusion to distal extremities, low temp, normal sinus rhythm, clear lungs, BP 137/89 and pulse 92, all on 11Apr2021. Seen at urgent care within the hour, deemed adverse reaction, ruling out allergic reaction Further concern for possible adverse reaction with second dose. Seeking consult with primary care physician, The patient had no COVID-19 prior vaccination and no COVID-19 test post vaccination. The outcome of the events was recovered on an unspecified date.</p>

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1265973	4/28/2021	CA	72	M	2/3/2021	2/1/2021	Blood clot in right lung; Sore left arm at injection site; Shortness of breath; This is a spontaneous report from a contactable consumer (patient). A 72-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), first dose intramuscular, administered in the left upper arm on 03Feb2021 at 09:00 (batch/lot number: EL3248) as a single dose for COVID-19 immunisation (prevention). Medical history included rheumatoid arthritis from Dec2009 to an unknown date (takes daily pills for rheumatoid arthritis), squamous cell lung cancer early stage from Aug2018 to an unknown date, lung surgery to remove small portion of that and went on chemo in Aug2018, skin cancers prior to getting the vaccine, reading glasses (he needed prior to getting vaccine), blood pressure (abnormal) (takes blood pressure medication; takes daily pills). Family medical history was reported as none. Concomitant medications included nivolumab (OPDIVO) taken for squamous cell lung cancer early stage from 17Jan2019 to an unspecified stop date (getting it every 4 weeks for 2 years and 3 months; the bag was 480 ml); and unspecified blood pressure medication and rheumatoid arthritis medication. The patient experienced blood clot in right lung on 25Feb2021, sore left arm at injection site on 03Feb2021 and shortness of breath on Feb2021. The patient had the first Pfizer COVID vaccine on 03Feb2021 and second one on 01Mar2021. He did not really have any special events but then he had a CT scan on 23Feb2021, which was about 20 days after first shot. When he went in for doctor's meeting a couple of days later, they said he had a blood clot in right lung. He later stated he was not positive it was in the right lung. He told his doctor that he just got the shot, but they said they had not heard of any reports from Pfizer of people getting blood clots in their lungs after getting it. He thought about reporting then, but did not. He has no evidence that the blood clot in his lung was related to the vaccine. He was also a lung cancer patient and was on an immune therapy drug nivolumab from (name). He has been on it for over 2 years and started Jan2019. He was diagnosed with cancer back in Aug2018. It was squamous cell lung cancer early stage. He had lung surgery to remove small portion of that in Aug2018 and went on chemo. On 17Jan2019, he started on nivolumab immune therapy drug. Fortunately, it worked extremely well. He

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

immediately started recovering and was feeling better. The last few CT scans indicated he had no sign of disease. It does not mean he was cured, but was healthy otherwise. The nivolumab spurred his immune system to eat the cancer cells. It stimulates your immune system. It has been a pretty successful drug and has been on the market for about 5-6 years. He and his wife both got shot on same date. The word on the street was that you should ask for Pfizer because it seems to have less side effects that people can get for vaccines. Pfizer's reputation has been known for having less common serious side effects. He had a sore arm and it went away about a day later. They prescribed rivaroxaban (XARELTO), a blood thinner, for his blood clot which he went on and got on a day or two later. He was hoping it was gone. He feels better. At the time, he did not know he had the blood clot. He visits his doctor for treatment for nivolumab every 4 weeks and every 4 months, they do a CT scan. At his last visit, he reported that he was still fine but lately experienced some shortness of breath. It was occasional and it comes and goes and was not all the time. He plays golf and noticed the shortness of breath during his game. He quit a couple of holes early and did not want to take any chances. The doctor later told him that a blood clot in your lung can contribute to shortness of breath. When he started rivaroxaban it was 2 pills a day for about 2-3 weeks and it was a starter dose. It was a little more in the beginning. He thinks it was 10 mg twice daily and then it went to 1 tablet a day for the last week at dinner and now it was 15 mg once daily. The two combined were greater to jump start you. It was not a special dose. He then corrected dose to 15 mg rivaroxaban twice daily for the starter dose for 2-3 weeks and one tablet daily for the last week of the starter. Then he switched to maintenance dose of 20 mg daily. He did not have a lot or expiration for the previous dose of 15 mg. The lot and expiration for the 20 mg was unknown because he believes the label was covering it. He stated he needed to get his glasses to read bottle. They were reading glasses and he needed prior to getting vaccine. Nothing has changed with his vision. He was hoping to get off of them and has never been on them. He hopes it was not a long term thing. Second dose was given 01Mar2021, Pfizer COVID vaccine, BNT162B2, expiration was unknown. Injected in left upper arm in the

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

muscle (intramuscularly). Second dose administered at 09:20-09:30. He takes blood pressure medication and did not see it was relevant. Takes daily pills for that and rheumatoid arthritis. In the past, he had a few skin cancers. All were prior to getting the vaccine. They were some squamous and basal cell. He has had nothing in quite a while. Nivolumab was helping skin issues. Squamous cell skin cancer was the same family as lung cancer. He did not have a lot of expiration for the nivolumab. He received it by IV infusion. Shortness of breath was mid Feb2021, on and off for a couple of weeks prior to doctor visit on 25Feb2021. He usually does not have much to report and mentioned it. It did not prevent him from doing anything and was not debilitating. One of his fellow golfers said he was huffing and puffing and he just poo poed it away. He had a flu vaccine in Oct2021 (as reported). No further details provided. Blood clots in right lung morning time, unknown time. Sore left arm at injection site noon - to late in the day of the shot. Shortness of breath - sometimes he feels it in the morning or midday if active. He cannot say a straight time. No emergency room (ER) or physician's office visit required. Vaccination facility type was clinic. Not a military facility. On 25Feb2021, normally scheduled office visit and did the CT scan on 23Feb2021. He went in separate for that. He had the treatment on Thursday. He has another CT scan scheduled in third week of May2021. They were doing it early because of the blood clot. Hopefully, it was gone by then. Prior vaccinations (within 4 weeks): 1st and 2nd Pfizer COVID vaccine as mentioned above. CT scan on 23Feb2021, positive for small blood clot in single vessel in what he thinks was his right lung. All of his previous trouble with the lung cancer was in his right lung. He has never heard of anyone else having blood clots related to the Pfizer COVID vaccine. He does not think he has heard of any and wanted to know if there were any. He knows there was something in the press about the (name) vaccine with blood clots. When you do 120 million and have a handful of people, you may have a few things. He did not have any information on the people for (name) to report on. He knows of others who have had the vaccine and no one had any symptoms. No further details provided. The outcome was recovered on 04Feb2021 for the event "sore left arm at injection site"; recovering for the event

A 33-year-old adult [non-pregnant] female received the second dose of BNT162b2 (solution for injection; Lot ER8729 and expiry information not reported) in the right arm via unspecified route on 06Apr2021 at 09:45 (at 33 years-old) for COVID-19 immunisation. Relevant medical history included asthma, allergies, penicillin and adhesive tape allergies, and high blood pressure. Concomitant medications included lisinopril. The patient previously received COVID-19 immunisation with the first dose of BNT162b2 (Lot ER7531) in the right arm on 16Mar2021 at 09:45 (at 32-years-old). The patient previously received treatment for an unspecified indication with hydrocodone bitartrate/paracetamol (NORCO) and experienced an allergy. The denied being diagnosed with COVID-19 prior to the vaccine. The patient was not pregnant at time of vaccination, and the patient denied receiving any other vaccine within four weeks of this vaccine. On 06Apr2021 at 20:00 the patient experienced fever of 103.7, diarrhea, nausea, dizzy, paralysis, partial paralysis, joint pain, migraine, throat swelling, nose swelling, eyes swelling, loss of consciousness plus all the normal symptoms. The patient reported as a result of the events the patient sought care with a doctor or other healthcare professional office/clinic visit, emergency room/department or urgent care. The patient was tested for COVID-19 since the vaccine with nasal swab test on 07Apr2021 and was negative. Treatment for the events received in the emergency room (ER) included diphenhydramine HCl (BENADRYL), ibuprofen, and acetaminophen (TYLENOL). The outcome of the events, fever of 103.7, diarrhea, nausea, dizzy, paralysis, partial paralysis, joint pain, migraine, throat swelling, nose swelling, eyes swelling, loss of consciousness plus all the normal symptoms, was not recovered.

1266044	4/28/2021	DC	30	F	4/12/2021	4/13/2021	lost consciousness for a brief period; doing something that looked like a small seizure; got tunnel vision; vasovagal response; feel faint, dizzy, and lightheaded; feel very weak; This is a spontaneous report from a contactable consumer (patient). A 30-year-old female consumer received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 12Apr2021 at 14:30 at single dose in left arm for COVID-19 immunisation at the age of 30-year-old. Lot number was EP7524. Medical history included periodontal surgery. Concomitant medications included spironolactone, adapalene, benzoyl peroxide (Epiduo Forte), azelaic acid (FINACEA), aciclovir, hydrocortisone (Xerese). The patient believed she experienced some kind of vasovagal response. On 13Apr2021 at 08:00, the patient got up from sleeping and went to the restroom, where she started to feel faint, dizzy, and lightheaded. The patient sat down and got tunnel vision and she started to feel very weak but regained her vision after sitting. The patient was helped back to bedroom but had to stop and sit in the floor where patient lost consciousness for a brief period, less than 10 seconds. Her partner said patient was doing something that looked like a small seizure. The patient had had this response before many times when giving blood and even after her periodontal surgery. The patient was recovering from the events.

1268352	4/28/2021	MO	35	F	4/16/2021	4/16/2021	Approximately 10 minutes after receiving the vaccine, the patient honked her horn to call a staff member over. RN approached vehicle and the patient stated she didn't feel well. Patient appeared pale. RN sent another staff member to get water, at which time the patient stopped responding to questions. The patient remained in her car, with the seat belt on - her eyes rolled into the back of her head and she began having jerky movements. 911 was called. HR was feint and BP was not able to be felt (too low, even with manual cuff). The patient came to, after about 45 seconds. RN asked the patient her children's names and the patient talked gibberish. About 1 minute later the patient began speaking in clear sentences. 0.5mL of epinephrine were administered. Blood glucose was 123. At 1:50 we were able to get a HR of 80 and a BP of 128/100. Oxygen was 100% with 2L via nasal canula. Patient was transported to Hospital.

1268664	4/28/2021	CA	59	F	4/6/2021	4/6/2021	Immediately that evening, I started to get headachy and nauseous. My arm in the injection site was very sore. The next morning, the other arm was sore. It was difficult for me to raise my arms above my head without feeling extremely weak. I couldn't lift anything above my head for the fear I would drop them. Knee replacement surgery on both knees about 4 years ago - I felt pain in my knees; all my joints; all of my teeth; my vision was blurry. My head hurt so badly. Tylenol dulled the headache and joint pain but it didn't help it to go away. My chest also hurt quite a bit. I felt extremely lethargic. I didn't feel like getting out of bed. I could only get the meals made (I'm a caregiver for my mom and mother-in-law) and then get back into bed. I usually walk five miles a day. I'm still not there yet (to walk that much) but I'm getting better. The nausea lasted until the 17th. The headache just left finally on April 23. The body aches, teeth ache and joints subsided around the 17th also. The blurry vision - I still have a little bit of that but it's starting to improve. The weakness in the arm - that is starting to improve - I do still feel kind of weak when I raise my arms above my head. The fatigue I still have but I'm feeling a bit of improvement. I have to keep checking my bed to see if I accidentally put the massage setting on (and I hadn't) because my body was shaking in entire body- That started on the second day after the vaccine and stopped about the 19th. I called to the advice nurse to register my health complaint and she had me come in for a full workup. And she asked me to go to ER. They kept me in the ER overnight.

1268689	4/28/2021	OK	18	F	4/25/2021	4/25/2021	18 yo female requests to have injection in supine position due to previous history of passing out with injections. Mom at pts side and sts pt first passed out at the age of 4 years old when she witnessed her father having blood drawn for a health screen. She also reportedly passed out after receiving a vaccine at Pharmacy in 2017. Due to her history of injection related syncopal episodes, pt is placed in a supine position on the cot as precaution. Approximately 30 seconds after receiving the injection, the pt was witnessed becoming unresponsive by this HCP. Pt was then witnessed having her eyes roll up and back followed by a few seconds of generalized seizure activity. HCP remains at pts side. The cot has a suspended cloth and is soft, therefore, pt is safe from harm on it. Seizure ends after seconds and pt awakens. She is initially confused but orients quickly. She remains AOX4 and has no complaints. Spoke with mom extensively about pts condition and presenting symptoms. VS- HR initially 52 but quickly improves to 77, BP 107/64, RR 16, sats 98%. Pt will follow up with pts pediatrician. Mother and pt do not want pt evaluated at the ER today and do not want an ambulance. VAERS info given.
1268977	4/28/2021	IL	16	F	4/1/2021	4/1/2021	Patient fainted while seated minutes after vaccine was given. Mother was next to her to prevent her from falling to floor. She complained of nausea and blurred vision. She was given water and Gatorade and began feeling better 5-10 minutes after fainting.

1267303	4/28/2021	MD	18	F	3/29/2021	4/21/2021	<p>symptom started 4/21, with pain and tightness in the left arm, progressively spreading up the arm over the following 48 hours, and then to the distal right arm, and legs. The leg symptom were present when seen 5 days ago, though were not discussed as Patient wasnt sure if thats what was really starting. This is associated with a feeling of "not being able to feel muc" and "doesn't feel right", as if it "feels foreign... body says this is weird," and feels heavy. Also notes that different extremities feel different - left is worse than right. Seen 5 days ago, and noted to have been advised by hematology to stop eliquis approximately 2 weeks prior to onset of symptom after PE/Renal artery embolism 1/2021. At that visit was referred to ER, where workup for repeat clot was normal (CTA, b/l upper extremities dopplers, head/neck CT, CXR). EKG was notable for Sinus tach and nonspecific T wave abnormalities. Discharged home with close follow up. Since then the intensity of the symptom as worsened and the leg symptoms have gotten more pronounced and consistent with the upper extremities symptom. Today notes new difficulty getting dressed on because clothes were getting stuck/he couldnt pull them down. Also notes when his left arm is touched it causes burning pain that shoots up the arm. Reports headache. 2-4/day, last 30 minutes, 5/10 in severity. Worse with movement of head. Frequent nausea, no emesis, but not specifically associated with headache. No waking from sleep. Since PE, has complains of intermittent left sided squeezing chest pain, which he wonders may be due to his anxiety. Lasts a few minutes Received Pfizer COVID vaccine 3/29, hasnt received 2nd dose yet ROS: general: no fevers or weight loss. CHRONICALLY C/O FATIGUE AND TROUBLE FOCUSING. has had evaluation for executive function difficulty in the past (interdynamics), now pursuing evaluation at Neurology and awaiting EEG with this. HEENT: no sore throat. + VISION CHANGES - TROUBLE FOCUSING, but not specifically blurry vision. CV: LEFT SIDED CP, NONSPECIFIC T WAVE CHANGES ON LAST EKG W/SINUS TACH. Pulm: SOB, with walking up and down stairs, since PE. not worsening. No Cough. GI: +NAUSEA, no vomiting, no abdominal pain. No current diarrhea. Neuro: + HEADACHES. + SENSORY CHANGES. + family h/o MS</p>

1269415	4/28/2021	GA	64	F	4/6/2021	4/8/2021	? Tuesday, April 6th ? Patient receives the 2nd Pfizer vaccine shot ? Thursday, April 8th ? Patient is sick with vomiting and diarrhea ? Friday, April 9th ? Patient is delirious and still sick with vomiting and diarrhea. She is also has pain in her stomach. An ambulance is called to take her to the hospital. The hospital determines her white blood count is elevated, indicating an infection. Blood sugar is very high ? approximately 400. Covid test is negative. She is restless upon arrival. She tries to climb out of bed continuously. She is restrained. o Saturday, April 10th ? Patient is running a fever and is in pain. She is also confused and doesn?t recognize her oldest sister. Meds are administered to handle both items. (Toradol?). Blood sugar around 200. She continuously counts and calls for Mother and Father. Patient continues to be restless o Sunday, April 11th - at request of family, a CT scan is done of her stomach and abdomen. Nothing is found. Potassium was at 3.2 (normal is 3.5) so she received an IV drip to help with potassium levels. Sugar ? 206. Later drops to 176. Patient calms down some. She is still confused and doesn?t recognize her oldest sister. ? Monday April 12th ? the hospital attempts to do an MRI, but patient panics. This is a closed MRI and her 1st husband died in one. The MRI isn?t done. ? Tuesday, April 13th ? she is asked by the doctor to state her name and wiggle her toes. She complies. Doctor orders speech therapy. She is sedated for an MRI and a CT scan. Both are successfully completed. She sleeps for the rest of the day. Blood sugar ? 274 @ 5:09pm. ? Wednesday, April 14th ? Patient was asleep all day. Most of the day she isn?t responsive when nurses come in and do things like take blood. She normally responds even if she is asleep. Around 5pm she starts to respond and make noises; she briefly opens her eyes then falls asleep. She continues to run a temperature. ? Thursday, April 15th ? Patient is asleep most of the day. She is responsive when nurses do things like take blood. A spinal tap is performed. There was mention of dementia. Hospital is sharing little information, varying from she is retreating into herself vs. something worth isolating is going on. Temp was 102.3 at 7:37, but later dropped to 99.3 without meds. Dr. (neurologist) provides an update to the family. Tests so far are negative. EEG showed sleeping brain (she was asleep during test). MRI showed

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							nothing. Spinal tap negative so far. No infection or anything has shown up. Orders another EEG and MRI ? Friday, April 16th ? Patient tried to open her eyes. ? Saturday, April 17th ? a met code was called on her and she was moved to ICU. A circulation issue was found in right leg. Occlusion was really bad. Initially the doctor was concerned about blood clots. None were found, just swelling. Pressure was relieved. Blood pressure issues. She was put on 2 blood pressure meds, at least. She was dehydrated and acidic. Diabetic ketoacidosis was mentioned. A cytokine storm was expected. ? Sunday, April 18th ? blood pressure not stable. She was put on dialysis. Peripheral circulation was worse. ? Monday, April 19th ? she coded around 5am. Doctors were trying to save her. She passed away about 30 minutes later .
1268261	4/28/2021	PA	33	M	3/31/2021	4/2/2021	Patient stated he did not get flu-like symptoms until 4 days after vaccination. He stated that 30 hours after his first Moderna dose he experienced increased heart rate and pulse. He felt as though he was going to pass out and his vision was altered and extremities were numb. He called 911 and went to hospital where he was admitted. He was told his blood work was normal except for elevated glucose and cholesterol. For 5 days after this episode he continued to experience tightness in his chest and pressure in the back of his head.

1267320	4/28/2021	CA	41	M	3/26/2021	4/4/2021	<p>3/26 @ 3:15pm ? Got the first dose of Pfizer COVID-19 vaccine for the 1:10pm appointment. However actual time received was around 3:15pm. No vaccine reaction was observed and drove back home. However did not eat or drink much from morning till 4:30pm due to the long line at the vaccination center 4/4 @ 9:00pm ? Experienced first sign of near-syncope at the dinner table upon picking up a glass of milk 4/6 @ 8:45am ? Experienced brain fog, to be exact head felt like it was filled with cotton candy, at the back and top of the head. Felt this way the entire day. Went to work as usual. Logged out at around 5:30pm 4/7 @ 9:00am ? dizziness started getting worse. Started feeling imbalance and started losing depth perception which climbing down staircase 4/8 @ 10:00am ? started to get easily startled by any unexpected trigger. Whole body would ?twitch? or ?startle? upon slightest unexpected event. For e.g., sound, touch, taste (hot/cold) 4/10 @ 12:00pm ? Went to ER. ER ordered series of blood tests, EKG, chest x-ray. Everything came out normal. ER doctor said to wait it out and after a week symptom may go away. ER doctor felt body?s immune response was over-working due to the vaccine immune response and possibly pollen allergy I may have experienced right after getting the vaccine. No prescription meds give. Advised to take Meclizine 25mg and Zyrtec. Below are the symptoms experienced on 4/10: ? Lightheadedness/Sudden Jerking body movements when triggered/passing out momentarily for a second when taking strain/not in my elements ? Feeling extremely fatigued. Did not sleep well at night on 4/8 and 4/9 ? Head feels Intoxicated, foggy, lightheaded, as if stuffed with cotton candy. Startled when unexpected things happen like a sudden jerking movement along with momentary passing out while anything unexpected happens. E.g., when I am pushing myself on the sofa to re-position, I feel my whole body is turning off for a second. Simply does not feel normal ? Rubbery legs ? Worsens after shower. I feel like I need to lay down as the foggy feeling worsens after shower ? Lightheadedness. Losing control sometimes. ? I am easily startled when climbing down the stairs - no Depth perception. ? Don?t have the strength to blow nose or cough. Feels like momentary fainting when doing these activities ? Dis-equilibrium. Whole body is twitching when something unexpected happens to my senses. ? Unable</p>

to control while laughing feels like momentary faint. I have felt like this when I was down with a fever. Ticked easily ? Difficulty pulling myself out of bed. Felt like muscle was giving away ? Tingling feeling in the right abdomen area ? Difficulty staying alert or focused and random rather unpleasant thoughts constantly coming to mind. Felt a bit of panic attack. 4/11 ? Went to PCP. Body weakness and fatigue got worse. PCP did blood sugar test and flushed out the left ear. Ordered Brain MRI to see if structurally anything was wrong. Brain MRI came out OK as well however noticed minor sinusitis. Prescribed Amoxicillin antibiotics and nasal spray. Referred me to Neurologist and Head and Neck Specialist. 4/11 ? 4/15 - Above symptoms progressively got worse. Especially weakness in the arms and shoulders. Arms quivered every time trying to stand up and felt like fainting. Hand-eye coordination progressively got worse. For e.g., could not pick up water bottle, hands were quivering badly 4/15 ? Neurologist conducted certain diagnostic tests and concluded that there are no neurological issues. Said with rest and plenty of fluids it should get better. Spinal tap was not recommended and said if symptoms got worse a spinal tap can be done during the next visit. Follow up visit with neurologist scheduled on 4/27 4/15 ? 4/27 ? Weakness in arms got better. Arm strength and coordination has improved however it's still not back to normal. Brain fog and dizziness still persists with no improvement. Left limb and arms are stronger than the left. Difficulty climbing up and down stairs. Dizziness worsens after shower. Not feeling myself. In addition, not able to multitask - getting startled and need to be deliberate about having to do everyday chores need to just focus on one task 100% completely and if something else comes up then my body just goes into a momentary shock. Mostly I can feel my head feeling heavy and my eyelids shutting down when something shocking happens ? a feeling like body is ?turning off?, almost a fainting or passing out feeling. Sometimes when I turn to one side and sleep, I can feel a flickering sensation in the ear. Still always feeling woozy and as if there is something in my head ? a medicated or intoxicated feeling in the head 4/27 ? Neurologist said she sees a lot of improvement and reiterated again that I don't have any neurological issues. She said I can go back to work starting 5/1. She said I may have

1267932	4/28/2021	MD	32	F	3/7/2021	3/7/2021	Day 1 (3/7/21): sever ice-pick like headache right back toward the left front of the head. Then sever flu-like symptoms including: fever, chills, fatigue, and body aches and pains. Flu symptoms lasted 3 days. Day 6 (3/12/21): severe head pain like an ice-pick in the back right radiated to the front left, heard a loud humming inside my head, it felt like my head was gyrating, AND my vision in my right eye became distorted and I couldn't move my legs I couldn't feel them - I thought I was having a seizure. After the Day6 event I have had persistent tremors, muscle twitches, weakness in legs, phantom sensations on my left side hand/arm or left leg, forgetfulness, memory problems, word retrieval problems, constant ringing in ears and nausea.
1267979	4/28/2021	VA	73	F	3/5/2021	3/6/2021	Loss of vision
1268256	4/28/2021	WA	18	M	4/28/2021	4/28/2021	Blurry to blackout vision, loss of orientation within 10 minutes of vaccination and lasting for 20 minutes.
1268008	4/28/2021	TX	55	F	4/8/2021	4/15/2021	Received Vaccine on the 4/8 that night I was very cold had 5 blankets, teeth shattering, severe headache, & knees like if they were breaking them. The following day slight headache, weakness, not feeling good. On the evening of 4/15, it hurt to breathe and I had a burning sensation on my rib cage going to my back. I thought I could handle it until Monday to see my Dr. but by the time I went to the ER it hurt to walk, talk, breathe and the burning sensation would not go away. I went to the ER on 4/17 he said I had a collapsed lung, gave me something for pain via IV. Did an EKG, Chest X-Ray, CT Scan, and Lab work. He let me go and said to take deep breaths every hour on the hour and to drink lots of water. I got in to see my regular Dr. on 4/22 and he said I had an allergic reaction to the vaccine. He gave me Gabapentin 100 mg 3 times a day and Tramadol q 6 hours for pain. I called him back because I still have the pain and now I am taking 300 mg Gabapentin in the am and 300 in the pm. It is still not working. I am constantly hurting the burning sensation on my rib cage and goes back to my back, it hurts to breathe, walk, talk, drive, I have blurred vision , dizziness and weakness. I have an appointment with Dr. again tomorrow.

1268231	4/28/2021	MN	16	M	4/23/2021	4/23/2021	had his injection at 12:15pm without incident and went to monitoring area and sat at table. lost consciousness and fell to the floor, staff alerted RN who came over to . regained consciousness right away. stated that he remembered leaning forward over the table looking at his phone and texting his sister and then he was on the floor. A wheel chair was brought over and was laid down on the cot where he stated he already felt better. PHN assessed for injuries. He denies pain, no injuries noted except for right eyebrow that is red and starting to swell. At 12:20pm BP 108/64, P-63, Os Sats 96% and R-18.
1267337	4/28/2021	CA	56	F	3/3/2021	3/5/2021	Patient tells me 2 days prior to vaccine on 3/3 (Pfizer) she had mild hives?not unusual for her in the spring. They typically occur along with seasonal allergies and she thinks the hives are unrelated to current rash. She went ahead and had the 1st Pfizer vaccine on 3/3. She developed a new circular rash at the injection site on the left arm and new rash over the left side of her back described as ?on fire?. she was seen for a telemedicine clinic visit diagnosed with possible shingles and was prescribed treatment. Did not improve significantly. She went ahead and had the second Pfizer jab on 3/24. She developed extreme tenderness at injection site. the rash that was on her back got much worse and spread. The rash occurs any place she scratches, has blood drawn or gets a band-aid placement. After that second shot she also noticed that her hip joints feel ?weak and unhinged". . Has also had similar symptoms of weakness in bilateral shoulders. Feels like her leg muscles are weak (points specifically to quadriceps). She has trouble repositioning herself and doing normal activities that she had been doing without difficulty just a few weeks ago. Her RN notes that she can get out of bed and walk to bathroom but is unsteady and shuffles. Has also noticed facial and periorbital swelling with purple discoloration and darkness around eyes. Had a faint pink rash extending from eyelids up over brows that has now decreased. Feels her legs are puffy and swollen.

1261736	4/27/2021	MO	71	F	4/10/2021	4/10/2021	<p>Blood was coming through; Slight bee stings all over and thigh; Scabs on me; my eyelids have been a little itchy too; that was the only way that I am able to get some sleep; was miserable; consumer was in pain; hives; the same day I started to itch, it was mild across my breast and my stomach but my thighs and my bottom legs were turning red, swelling; but my thighs and my bottom legs were turning red/Thighs/Legs turned red; but my thighs and my bottom legs were turning red, swelling; This is a spontaneous report from a contactable consumer (patient). A 71-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) at the age of 71-year-old, via an unspecified route of administration on 10Apr2021 13:30 (Lot Number: EN6207) as single dose for COVID-19 immunisation. The patient's medical history was not reported. Concomitant medications included apixaban (ELIQUIS), tamsulosin, and iron. The patient got her first injection on Saturday, 10Apr2021 at 1:30 pm in the afternoon around 7 o'clock the same day she started to itch, it was mild across her breast and stomach but her thighs and bottom legs were turning red, swelling, hives there too, and she rubbed alcohol (treatment) on this to stop the itch, that seems to helped a little bit, but the swelling was not that bad today but the redness was still there. She has scabs on her, blood was coming through, and slight bee stings all over and thigh on an unspecified date, she used hydrocortisone cream (treatment), she was lucky she have some of that here because she keep that when going or here but she rubbed that on last night and that was the only way that she was able to get some sleep. The patient doesn't think that she was going to get the second shot, she doesn't want to experience that again. It feels like that today it was not that bad itching today but at 71 that was miserable yesterday so probably she would not get the second shot. She hopes that the first one can protect her to a point, but she cannot subject herself to that again, that would be senseless for her to experience that again and get a second shot. The patient also stated that her eyelids have been a little itchy too so hopefully you all understand it was 71 years old was suffering from that kind of misery second time. The patient was unable to probe the more question, patient was in pain and not willing to proceed. The outcome of the events was unknown.</p>

1261709	4/27/2021			F			<p>This is a spontaneous report received from a contactable consumer (patient). A female patient of an unspecified age received BNT162B2, dose 2, via an unspecified route of administration on an unspecified date (Batch/Lot number was not reported) as single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. Have been to 5 doctors since receiving the Pfizer Covid vaccine series (2 shots). The patient stated she had a bad reaction to first dose and 'horrendous' reaction to second dose. She developed 'tremendous' ear pain and unable to see straight ahead. The patient stated this has been ongoing for over 3 weeks. Also reported that this is day 16 and still no change to her eyes and ears. Stated she developed a bad headache and was throwing up after the 2nd dose. She was unable to look straight without feeling dizzy. Had seen neurologists and had multiple scans; will be having an MRI today. Stated she has no bleeding in the brain. This had affected her daily life; she was unable to work or drive. Took migraine medicine initially. The patient underwent lab tests and procedures which included multiple scans: no bleeding in the brain on an unknown date. The outcome of the events ear pain and unable to see straight ahead was not recovered. The outcome of other event was unknown. The events were reported as non-serious by reporter. No follow-up attempts are possible; Information about lot/batch number cannot be obtained.</p>

1261696	4/27/2021	CT	47	F	3/23/2021	3/26/2021	Left eye pain/lacrimation 3 days after vaccination; left eye pain/lacrimation; This is a spontaneous report from a contactable physician (patient). A 47-year-old female patient received dose 1 of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) via an unspecified route of administration on 23Mar2021 at 15:00 (at the age of 47-years-old) as a single dose in the right arm for COVID-19 immunization. Medical history included rosacea. The patient was not pregnant at the time of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the vaccine. The patient was not diagnosed with COVID-19 prior to vaccination. The patient did not take any concomitant medications. The patient had no allergies to medications, food, or other products. On 26Mar2021 at 06:00 the patient experienced left eye pain and lacrimation. The patient did not receive any treatment for the events. The outcome of left eye pain and lacrimation was not recovered. It was also reported that since the vaccination the patient had not been tested for COVID-19. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up.
1261678	4/27/2021			F			suspected COVID-19 with symptoms; suspected COVID-19 with symptoms; burning eyes; dry mouth; Pink eye; This is a spontaneous report from a contactable consumer (Patient sister). A 60-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection Lot number was not reported) dose 2 via an unspecified route of administration on an unspecified date as single dose for covid-19 immunisation. The patient medical history and concomitant medications were not reported. Patient after she got the second dose of the vaccine, she was tired she could not get out of bed, had fever, chills, headache and aches. She was long hauler who had COVID. Periodically she had a pink eye, burning eyes, joint pain or dry mouth. Her symptoms were on and off. Sometimes she feels very sick and other times she was okay. After receiving the vaccine, she felt like she had COVID like around three. The outcome of the event was unknown. Follow-up attempts are completed. No further information is expected. Information on lot/ batch number has been requested.

1261542	4/27/2021	CA	68	F			<p>MS exacerbation; This spontaneous case was reported by an other and describes the occurrence of MULTIPLE SCLEROSIS RELAPSE (MS exacerbation) in a 68-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. The patient's past medical history included Blood pressure high, Headache, Malignant hyperthermia, Optic neuritis, Eye disorder, Memory deficit, Pain, Depression and Sleep difficult. Concurrent medical conditions included Relapsing-remitting multiple sclerosis. Concomitant products included METHYLPREDNISOLONE SODIUM SUCCINATE (SOLUMEDROL), LORATADINE (LORATAB), METOPROLOL, ZOLPIDEM, MEMANTINE, DIPHENHYDRAMINE HYDROCHLORIDE (BENADRYL [DIPHENHYDRAMINE HYDROCHLORIDE]), HYDROCODONE BITARTRATE, PARACETAMOL (NORCO), VENLAFAXINE HCL and MEMANTINE HCL for an unknown indication. On an unknown date, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On an unknown date, the patient experienced MULTIPLE SCLEROSIS RELAPSE (MS exacerbation) (seriousness criterion medically significant). At the time of the report, MULTIPLE SCLEROSIS RELAPSE (MS exacerbation) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. No treatment information was provided.; Sender's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.</p>

PERSONAL INDEPENDENCE IN DAILY ACTIVITIES (cant see close up, can't read, can't drive car, can't put tooth paste on toothbrush). At the time of the report, OPTIC NERVE DISORDER (either inflammation or same condition I had in my left eye due to lack of blood flow to optic nerve), HYPERMETROPIA (getting better but now I cant see details, cant see close up), IMPAIRED DRIVING ABILITY (can't drive car) and LOSS OF PERSONAL INDEPENDENCE IN DAILY ACTIVITIES (cant see close up, can't read, can't drive car, can't put tooth paste on toothbrush) had not resolved and VISUAL IMPAIRMENT (Five days after first shot, had a problem of vision in right eye, couldn't see, didn't loose complete vision) was resolving. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): In 2021, SARS-CoV-2 antibody test: negative (Negative) "I had an antibody test and came back negative.". The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Patient also reports taking an unspecified blood pressure medication, cholesterol medication, and blood thinner. Treatment for the events included high dose prednisone in case the event was due to inflammation. Patient reports 12 doses of prednisone 80 mg over three days. Patient expressed concern over receiving the second planned vaccine to fear of going blind in right eye.; Sender's Comments: Based on the information provided which includes a temporal association between the use of mRNA-1273 vaccine and onset of the reported events, a causal relationship cannot be excluded

1261741	4/27/2021	IL	73	M	3/2/2021	3/6/2021	<p>This is a spontaneous report from a contactable nurse. A 73-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), second dose via an unspecified route of administration on 02Mar2021 (batch/lot number was not reported) as a single dose for COVID-19 immunization. Medical history included migraine (diagnosed about 30 years ago), low hypotension, allergic to strawberries, gastroesophageal reflux disease (GERD). Concomitant medications included omeprazole taken for gastroesophageal reflux disease, sumatriptan taken for migraine and naproxen taken for migraine; start and stop dates were not reported. Historical vaccine included BNT162B2 first dose on 09Feb2021 for COVID-19 immunization. The patient experienced four days after his second shot (06Mar2021), his migraines got more pronounced than normal which they expected, but then the migraines got so severe that it had occurred every single day. The reporter seriousness for migraine was medically significant. Migraine was reported as worsened. The caller stated that she was a registered nurse as well, she was calling about the Pfizer Covid vaccine. She spoke with the CDC on Saturday. Her fiance, he has a history of getting migraines for like the past 33 years. After the first dose on 09Feb2021, he then had the second on 02Mar2021. 4 days after the second dose, he got a migraine headache that was more severe than his usual and then it went away, then the next day after, he got another migraine headache, and he has been getting them everyday since then. He gets the headache once a day, for like a 12 hour duration then 8. Made attempt to clarify with the caller, she stated that for the 30 something years his migraines would occur once a week or twice a month, but now after the second dose it was daily. Currently the span of the migraine headache was shorter, it has gone from 12 hours to 8 hours. He was on sumatriptan and naproxen for his migraines, but now it takes the medication 1.5 hours to make the headache go away. They did a CAT scan and the result was normal. Both the first and second dose took place in the morning at 10AM or 10:30AM. After the second vaccine on 02Mar2021, his first migraine was on Saturday 06Mar2021. After stating his age, she stated that he's not old like the typical 73 year old. He sees a doctor at the VA for primary care and also has another primary care</p>

doctor outside of the VA. He has seen both for the migraines, caller stated that she would like to skip this section as her fiance was not there right now and doesn't know if he wanted to provide that. Migraine, it's usually on the right side of the head, in the temple, eye, cheek bone area, as well as a little bit around the hairline area. It was now every 8 hours a day, that he experiences the migraine for and it's getting worse and worse. Seriousness criteria: his medication before would take half hour, but now it's taking hour to hour and a half. His migraines were so severe that she recalls one time being in the car with him, and he actually has to hold the left side of his face, and put his head down. His primary doctor gave a shot called Aimovig and she guesses it takes a while to start working, it can take a couple weeks, it was suppose to be a preventative medication but it hasn't done anything yet, it hasn't kicked in yet. An as ER nurse for 30 years, she can tell his level of pain was more than 10 on a pain scale. Lot number was unknown, the vaccine card was physically with her fiance, she does not have it at this moment. When queried anatomical location of vaccine, sounding unsure she stated that he got one on the right arm and one on the left arm. Caller stated that she will try calling him on the other phone and see if he can answer, he carries the vaccine card with him. Causality was related, because this started 4 days after the second shot and has not stopped. It's not like a typical migraine. He takes a medication on and off for GERD called omeprazole. He was diagnosed with low hypotension, they put him on metoprolol but the doctor said that he might as well not take it since his blood pressure goes low. The CAT scan was normal and was done 2 weeks ago at the end Mar2021. He gets blood work every 6 month, the last one was a couple months ago and it was fine. Lot and expiry for sumatriptan, naproxen, and Aimovig were unknown, they were not physically with her at the moment. Facility of vaccine administration: it's not a military facility, it's a grocery store with pharmacy inside. He has not had to go to the ER. He did have a physician appointment however, he did not specifically see the doctors for the migraine, it was an appointment that was already annually schedule as he see's the doctor every 6 months. At the doctor's appoint he did tell (name) how bad the migraines were. He was really highly ranked in the military so his pain
