1110391	3/18/2021	IN	61	M	2/25/2021	3/6/2021	Received vaccine, and no reactions. Nine days after the vaccine slowly had drooping on the right side of his face, numbness on the right side of his face, mainly around the mouth, a little on the eye, hard to close the right eye. General soreness around his mouth when he tries to eat or talk a lot. Limited movement of his face do to swelling, difficulty closing his eye, and headache. Went to the ER on 3/7/21 and admitted him as they believed he had a blood clot, diagnosed him with Bell's palsy on Monday 3/8/21. Was given corticosteroids for 9 days Prednisone 60 mg. The symptoms are slowly improving but still has the Bell's palsy.
1110367	3/18/2021	VT	67	M	3/6/2021	3/8/2021	Shingles, above my right eyebrow
1110362	3/18/2021	MI	54	F	3/17/2021	3/17/2021	Bodily itching, especially in the nose, mouth and arms. The itching started on my hand about 5 mins. after my shot. As the day progressed it began to itch on my legs, back, arms, face, eyes and nose.

1110360	3/18/2021	CA	87	M	2/4/2021	2/6/2021	he's imagining people are here and he is talking to them/wakes up screaming talking to people who aren't present; Tries to leave the house/ wakes up sometimes and acts as if he is eating and does all of the motions as if he is using a spoon and chewing but he hasn't ate anything; He doesn't recognize where he is; This is a spontaneous report from a contactable consumer. An 87-year-old male patient (also the age at vaccination) received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot: EM9809), first dose via an unspecified route of administration, administered in Arm Right on 04Feb2021 02:45 PM as SINGLE DOSE for covid-19 immunization. Medical history included remission from cancer, he has Hypertension (reported also as High Blood Pressure/Hypertension), thyroid disorder (reported as Thyroid), blood cholesterol abnormal (reported as Cholesterol), light symptoms about once or twice a month of disorientation, vision impaired, a PaceMaker and soft stool (reported as Stool: stool softener). The patient is not aware of any allergies to medications, food, or other products. The patient was vaccinated the most recent COVID-19 vaccine in a hospital. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination the patient was not diagnosed with COVID-19 and not been tested for COVID-19 since the vaccination. The patient had other medications the patient received within 2 weeks of vaccination for High Blood Pressure, Thyroid, Cholesterol, and Stool Softener. It was reported that the patient has had light symptoms about once or twice a month of disorientation. However since he's received the vaccine he has not had any fever with either dose but has throughout the day and night doesn't know where he is, he's imagining people are here and he is talking to them. He doesn't recognize where he is at, at times. He wakes up screaming talking to people who aren't present. Tries to leave the house even though he is vision impaired and has never tried to leave the house on his own. He wakes up sometimes and acts as if he is eating and and does all of the motions as if he is using a spoon and chewing but he hasn't ate anything and there isn't any food near him because he is in his bed. It was reported that the events occurred on 06Feb2021. The events were not considered as serious by the reporter (for any criteria). The outcome of the events was not

							recovered. No treatment was received for the adverse events.
1110490	3/18/2021	OH	61	M	3/16/2021	3/17/2021	Blurred - Double Vision
1112491	3/18/2021		33	F	3/11/2021	3/15/2021	On 3/15/2021 pt had redness below where injection given then on 3/16 (5 days after vaccine) had itchiness and hive on that arm then on face and red eyelid redness and facial puffiness (no lip/tongue swelling, no shortness of breath, no chest tightness, no wheezing, no lightheadedness)
1112555	3/18/2021	TX	49	F	2/5/2021	2/13/2021	Small blister- like rash around my right eye. It has been there since approximately 10 days after I received the 2nd dose of my vaccine
1112541	3/18/2021	TX	64	F	3/4/2021	3/4/2021	As soon as I walk 5 steps from the vaccination station everything became black and I got very dizzy. I sat immediately because I felt I was about to faint. I waited 20 min for the dizziness to diminish and was able to walk by myself. My vision was blurry and felt my eyes were moving rapidly side to side. My husband drove me home because I still felt too dizzy to drive back home. The dizziness continued the day of the 2nd dose administration and got less bothersome if I stayed in bed. The following day the dizziness was much less but I still stayed in bed. Monday March 15 I also experienced dizziness and stayed in bed. Since the first dose on Feb 09, 21 I have felt tired and not always being able to complete my physical therapy routine. The tiredness is not every day. It comes and goes.
1112524	3/18/2021	CA	48	F	3/16/2021	3/16/2021	Immediately after injection I had a weird taste in my mouth, and of course the sore arm from injection site. Within 2 hours I felt nausea and fatigue and body aches. Within 5 hours my injection arm was so painful I couldn't hold an empty water glass or pull up my pants. The arm pain increasingly worsened spreading to my hand and chest and prevented me from sleeping. 2 days after injection the arm pain , fatigue and constant nausea have not dissipated however the body aches have. I also have developed a sty in my right eye for which I was prescribed antibiotics.

Walking on his own. A & Ox3
1112510	3/18/2021	IL	48	M	3/16/2021	3/17/2021	Once, for a short time while performing a mild workout in the gym, and again a couple hours later, and for an extended duration (approximately 40 minutes), while checking out at Costco I experienced what I believe to have been aura migraines without headache (or ocular migraines) in my right eye. What initially appeared to be a slight glare, I later determined was an obscuration of the lower half of my vision in that eye which could be described as a clouding effect. While disorienting and concerning, with closing/covering that eye, the problem slowly resolved itself. Within about 20 minutes, I had enough vision to comfortably and safely drive home. Another 20 minutes after that and the event had ended as far as I could tell. I have never experienced anything like this in the past. Doing some (dangerous, I know) searching online, I discovered what it might be called and learned that there were some reports of similar events occurring with other vaccine recipients. Since I don't have a primary care physician, I'm hoping it is directly related to the vaccine and I hope it doesn't happen again with the second dose since my eyes are a critical part of my job.
1112343	3/18/2021	GA	36	F	3/16/2021	3/16/2021	7am-5:30pm (asleep for thr next 12 hours after that) I felt like all of my bones were swollen, my muscles hurt to use, had a searing headache, eyes wouldn't open all of the way, occasional stomach cramp, 1 bout of naseau, extreme fatigue and was freezing cold; muggy thoughts

1112711	3/18/2021	MD	58	F	3/12/2021	3/12/2021	Within 10 minutes of taking shot, I had an allergy attack - my nose became stuffy and was hard to breathe. Medic came to my car to assist. Told me to keep window down and take deep slow breathes. This worked, but maybe to minutes later it happened again. My blood pressure and oxygen level was taken. I was given a banana to eat. I ended up calling my husband to pick me up. On the evening of Sunday 3/14, I noticed a red patch on my chest. Monday, 3/15 when I woke up, red patches were on my arms, hands, neck and face. Tuesday, 3/16 the red patches had spread up my arm and my eyes were puffy. I went back to the vaccination site and reported it to a medic. I was told to take Benadryl. Wednesday, 3/17 my right eye was swollen more and puffiness under my eye. My left eye was swollen but not as much. I went to clinic and was given Benadryl and prednisone, and told to go to the emergency room if it gets worse. Today 3/18 blotches still on arms, hands, neck and chest. Swelling on right eye lid has gone down some.
1111580	3/18/2021	TX	19	F	3/18/2021	3/18/2021	Approx. 3min after administration pt became pale and light-headed. Pt reports feeling weak, blurred vision, and difficulty speaking. Denies SOB or LOC.

1111830	3/18/2021	WI	38	M	3/16/2021	3/16/2021	38-year-old male with past medical history of anxiety, sleep apnea presents to the emergency department with throat tightness. Patient received his first dose of vaccine at 130 on 3/16/21. He waited for approximately 20 minute without any symptoms. On the way to his car approximately 30 minutes after the vaccine he started having his throat tightness. When he got home he drank some water to see if it was a sore throat however he had no pain anywhere. He feels like he was having difficulty swallowing his saliva however he was able to do it. He also was able to drink fluids. He called the nursing hotline who told him to take Benadryl (50mg) and come into the emergency department. His symptoms are still present but have improved. He denies any headache, vision changes, neck stiffness or difficulty moving his neck, chest pain, shortness of breath, difficulty breathing, nausea, vomiting, diarrhea, abdominal pain, rash. Physical exam significant for mildly edematous uvula. He was given 10 mg of dexamethasone in the ED Patient was monitored in the ED for 5 hours after exposure. Symptoms resolving after Benadryl and dexamethasone. Mildly edematous uvula without other signs of edema or allergic reaction on reassessment. Patient without stridor or respiratory distress. He no longer has throat closing sensation. He was discharged with an EpiPen, prescription for 3 days of cetirizine, instructions to follow-up with his primary care provider for further workup and for discussing options for receiving his second COVID vaccine dose, and given ED return precautions

1111780	3/18/2021	IN	50	F	3/4/2021	3/4/2021	I got the vaccine last Thursday, March 4, 2021 and I am experiencing strange side effects. I wanted to be sure to send this along to you as well as, to the adverse effect website. It?s almost as if I?ve had a stroke. Initially (after the shot), I was a little lightheaded but as the rest of the day wore on, (say around 6 hours later), I started to get foggy in my brain - like I had to remember to even breathe - and tightness in my chest like asthma. There was a high pitch scream in my ears and I was more or less, kind of out of it. My hands and feet were sweating profusely. My tongue kind of reacted, too and got a little burned, like when I eat pineapple. It was then that I noticed difficulty swallowing. My sister (a medical professional) suggested Benadryl for the mouth and tongue sensation and she kept an eye on me the rest of the night. She also warned that I should not get a second shot (I totally agree). Being a trooper, I thought all of the weird stuff would blow over in a day or two, so I decided to power on and not report my issues. Today is day 6 post vaccine and I can now see a pattern to the symptoms or episodes which are still present, on and off: 1. The ringing in my ears will intensify, and then I stare off into space, my words get garbled (I have to really concentrate on being present), my tongue gets very dry and then the swallowing issue returns (it?s like slow motion swallowing, so I bite my tongue to stay in the moment). 2. The tightness in my chest intensifies and my breathing gets shallow. I must focus and breath through it despite discomfort. Note, since the shot, I keep a Benydryl and my inhaler with me, although I haven?t used Benadryl since day 3. I used my inhaler yesterday, day 5 because of discomfort and that seemed to help, but using it triggered an ear ringing/screaming episode that came and went the rest of the day. 3. I also have nasal constriction throughout the day. The nasal passage just inflames and then relaxes. I also have phantom smells and my sense of taste got a little off on day 1, but recovered._____ March 18, 2021 Update Saturday, 3/13 went to the ER because the cognitive issues had advanced. I found myself staring off into space, losing my train of thought, and unable to speak. When I did speak I stammered or stuttered. They wanted to make sure I did not have a stroke or that I was not in the middle of one, so they did some tests. They also recommended that I go ahead and take the prednisone.

							After my ER visit the cognitive issues continued, but began to be not-so-frequent by Sunday afternoon. I felt like I was on the road to recovery and so delayed again, taking the prednisone. On Tuesday (3/16), I had what I would call an asthma attack. I was having very strong bronchial spasms that would not abate. I used my rescue inhaler to try to mitigate the symptoms, but that did not work. At the same time, the cognitive issues sort of returned and the big loud ringing and whooshing in my ears was really really noticeable. I am having a protracted allergic reaction to the vaccine. I am not normally allergic to things, but I have noticed new allergies since this all began. Certain food items seem to bother me now and push me into the lung seizing, raw tongue, neurological, ear ringing event.
1111959	3/18/2021	TN	35	F	3/17/2021	3/18/2021	Severe chills (teeth chattering and shaking), temperatures ranging from 101.5-103.0 throughout the day (2 am - current time 2:45 pm), severe fatigue and body aches (trouble standing and opening eyes), bluish fingernail beds with numbness and tingling to knocking knuckles. 2x taken exceedrin which did break fever first time for temporary relief. Moving arms and fingers to encourage circulation.
1111761	3/18/2021	PR	63	M	3/17/2021	3/18/2021	The colors of my eyes change from brown to blue.
1111717	3/18/2021	MI	85	F	1/14/2021	1/14/2021	Client states about 4-6 hrs after her first Pfizer covid vaccine on her L arm , she developed raised red welts and then small blisters began to develop, which spread down her arm. She also added a few days later her vision became very blurred, her vision did come back to normal. She states on 02/14/2021, she returned to receive her second Pfizer Covid vaccine. She states she did tell the nurse and showed the rash on the L arm. The nurse consulted with other nurses at the clinic and it was decided to provide the vaccine on the other arm, which the client agreed to. She states a few hours later the red raised welts appeared on the her right arm and begin to spread down her arm. She states the red raised welts began to spread over her body including her legs, feet, and buttocks. The blistering rash then began to spread over her breasts, stomach and back. She did consult Dr. and was placed on prednisone. She states she has received the treatment for about 4 weeks

1111723	3/18/2021	OH	37	F	3/16/2021	3/16/2021	About 12 hours exactly after getting the 2nd dose I got extreme POTS flare up and a mild occular migraine. I had a fever that kept going from the mid 99s to the 101s for 36 hrs. Was freezing and burning and had lots of joint and body pain. Most people I know had all of that, but the reason I'm reporting is the tachycardia. My tachy has been fairly well controlled with meds and after my second dose it was so bad any time I sat up, I couldn't breath, my tachy got so bad, my heart rate would jump from up to 70bpms, just sitting up. My resting heart rate on meds has been 60-80, and for those 36 hours was 80-110. Anytime I did anything my heart rate would jump to 130-150 and I could NOT BREATHE. My SpO2 was fine, so I know that the issue was my POTS flaring up and that it was the tachy. I just want to report that it could cause issues with people with dysautonomia, so they don't freak out if it happens. My heart rate is still elevated, but is slowly going back down.

1112081	3/18/2021	OH	59	F	2/26/2021	2/27/2021	Woke on the morning after the shot 2/27/21 with a low grade fever (100), fatigue, headache, joint and muscle pain and slightly swollen lymph nodes in my neck. Within a few hours, my body was completely covered in large hives from head to toe. I rested or slept most of the day and by the afternoon, the fever had subsided. By the next day headache, joint/muscle pain and swollen lymph nodes diminished. I still felt fatigue and the hives were awful. Began taking Benadryl with no relief. Called my primary care doctor to report; increased Benadryl dosage to 2 every 4 hours. There was some relief during the day, but the large doses of benadryl were making me anxious/nervous, racing heart, shakes. Decreased following another call to Doctor and began taking Antronex; decreased side effects, but little affect on the hives during the evening/overnight hours. At times I would be completely covered in them, other times they were localized (bottoms of my feet, face, neck, eyes). Returned call to Doctor, again suggested Prednisone. (I typically have strong reactions to steroids and wanted to avoid if at all possible) Began first dose 3/18/2021. Experiencing some relief already.
1112013	3/18/2021	CA	34	M	3/18/2021	3/18/2021	1100 Patient noticed tingling in right jaw 5 mins after receiving vaccine. Upon assessment patient vital signs were BP: 146/98, O2: 97%, HR 81. Tingling in jaw doesn't radiate anywhere in his face. After assessment and sitting for a few minutes, tingling in face started to subside. Patient feels he is going to be ok. Doesn't need any other further supervision. Patient waited remainder of 15 mins and left with no further issues.

1107993	3/17/2021	MD	89	M	2/25/2021	3/16/2021	03/16/2021: Presented to the emergency department with intractable headache (last 3 days) and vision changes (last 6 months). The patient was admitted for uncontrolled hypertension and rule out meningitis. The patient is still currently admitted.
1108156	3/17/2021	WA	65	F	3/13/2021	3/13/2021	dizziness and blurred vision. Transferred to hospital for evaluation.
1108114	3/17/2021	MO	45	F	1/6/2021	1/7/2021	I can say that my symptoms actually started on my first dose 12-17-2020, experienced chills, muscle soreness, had fever of 99.4F and thought it was menopausal symptoms. After my second dose vaccine, my lymph nodes were visibly enlarged. I experienced muscle soreness, lymph nodes were enlarged, left side, had chills, sore throat, ear ache radiated towards my neck and had a viral pink eye. I felt very tired and had muscle aches. I had a fever of 99.4F, mostly chills and joint pain to my left shoulder, left hip and left knee. I also had 3 Covid swab testes which were all negative. I saw my doctor who performed a x-ray of the chest and has put off a mammogram test till April 2021. At this time I have not recovered there is something going on with my pelvis, form my iliac crest when bending down I feel a pinched lymph node on that area of iliac crest. I get a pinch on my pelvis that is painful.

1108082	3/17/2021	TN	44	F	2/16/2021	2/20/2021	I just wanted to pass along my vaccine experience. So, I got the first dose on 25 Jan. Within a day or two I developed a cold sore. I had not had one in years but it wasn't a big deal. I just figured the foreign vaccine had triggered it from being dormant. Well, I got my second dose on 16 Feb. Within days my eyes started feeling weird...specifically my left eye. It was achy all day, red when I woke up, watery, and it was difficult to focus when I first turned on the lights. This morning I went to the eye doctor and he told me that I had developed a blister (like a cold sore) in my eye. I had never ever ever experienced this. But like the first cold sore on my lip, he said it was dormant in my body and the vaccine just triggered it. There are only two eye drops that treat this and they are pretty expensive but he told me that if I had not come to see him, this virus would have just lingered in my eye. Just thought I would share my experience.

1108436	3/17/2021	MI	45	F	1/25/2021	1/25/2021	After shot was administered we drove to the next door parking lot. By the time we arrived the right side of my face was red like someone slapped me and started to swell on the right side of my face and eye area. I had red splotches on my neck. We called a nurse over to our vehicle and I was immediately given 50mg of Benadryl and some apple juice to take it with. I was asked to stay to be monitored a total of 1 hour. Although the swelling and redness did not go down in that hour, it did not progress and get any worse. It took another 1/2 and hour for the swelling to start to go down.
1108291	3/17/2021	CA	67	F	3/11/2021	3/11/2021	Immediately upon receiving the shot I felt pain behind my left ear. It continued throughout the next day whereupon I also started experiencing numbness on the left side of my face similar to getting a shot of Novocaine at the dentist. As each day passed, the symptoms kept progressing across my face until my mouth is permanently skewed to the right. It makes eating, drinking and speaking difficult. Coincidentally the day after my vaccination, I had an appointment on Friday, March 12 at 10:30am for my first appointment with my new doctor. I mentioned the ear pain (the numbness didn't start until that same afternoon) and she mentioned it wasn't uncommon for the lymph glands to be affected by the vaccination. I assumed my symptoms would go away in a few days. When they kept getting more pronounced, I sent her a couple of emails but she was out of the office until Tuesday, March 16. Her assistant contacted me on Tuesday the 16th and told me to call 911 and go to the emergency room. I drove myself to the Medical Group emergency room and was seen by the Dr. After examining me, she also consulted with a neurologist and they diagnosed me with bell's palsy and said it would take between six to eight months to self correct. She prescribed me Predisone 20mg dosage of three tablets once a day and Valacyclovir 1 gram dosage three times a day. She also suggested I get some eye ointment to use at night and eye drops to be used four times a day since my left eye doesn't close all the way now.

1107190	3/17/2021	NC	34	F	1/1/2021	2/13/2021	Vision loss; Balance issues; Tingling in Extremities; Fatigue; Chills; A spontaneous report was received from a consumer concerning a 34-year-old female patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced vision loss, tingling in extremities, paraesthesia, balance issues, fatigue and chills. The patient's medical history was not provided. No relevant concomitant medications were reported. The patient received her first of two planned doses of mRNA-1273 (Lot number: unknown) on an unspecified date in Jan 2021 intramuscularly. On 12-Feb-2021, prior to the onset of the events, the patient received her second of two planned doses of mRNA-1273 (Lot number: unknown) intramuscularly for prophylaxis of Covid-19 infection. On 13 Feb 2021, Patient experienced vision loss, tingling in extremities, paraesthesia, balance issues, fatigue and chills. Laboratory details included an increased white blood cell count..Treatment information was not provided. The patient received both scheduled doses of mRNA-1273 prior to the events. Therefore, action taken with the drug in response to the events is not applicable. The outcomes of the events of vision loss, tingling in extremities, balance issues, fatigue, and chills were considered as unknown.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events a causal relationship cannot be excluded.

1107198	3/17/2021	CA	80	F	2/1/2021	3/2/2021	<p>A spontaneous report was received from a consumer concerning a 80-year-old, female patient who suddenly felt weak (asthenia), vision started to flip (visual impairment), whole body started shaking (tremor), head fell forward and she was out for 20-30 seconds (loss of consciousness), rushing noise in left ear, drenched in perspiration, nauseated (nausea), cold (chills), low grade fever (pyrexia).</p> <p>The patient's medical history was not provided. Concomitant product use was not provided/unknown by the reporter. On 01-FEB-2021, the patient received the first of two planned doses of mRNA-1273 (Batch number: 007M20A) intramuscularly for prophylaxis of COVID-19 infection. On 01-MAR-2021, the patient received her 2nd dose of the Moderna COVID-19 vaccine (Batch number: 023M20A) in her left (dominant) arm. On 02-MAR-2021, she experienced a side effect which was not listed in the sheet she was given. She wanted to call and report the side effect. She said that she was at the stove cooking and suddenly felt very weak and felt that her vision started to flip. She called for her husband to come over who seated her on a chair. After that she says she doesn't remember what happened, but her husband told her that her whole body was shaking, her head fell forward and she was out for 20-30 seconds. When she came back, she could hear a rushing sound coming out of her left ear. She was also drenched in perspiration. She felt very nauseated and cold the whole afternoon. On 03-MAR-2021 she felt better. She had a low grade fever of 99.4 degrees Fahrenheit. Treatment for the event included paracetamol. The patient received both scheduled doses of mRNA-1273 prior to the events; therefore, action taken with the drug in response to the events is not applicable. The events, suddenly felt weak (asthenia), vision started to flip (visual impairment), whole body started shaking (tremor), rushing noise in left ear, drenched in perspiration, nauseated (nausea), cold (chills), low grade fever (pyrexia) was considered recovered/resolved on an unknown date. The out come of the event, head fell forward and she was out for 20-30 seconds (loss of consciousness), was considered unknown.; Reporter's Comments: Based on the current available information and temporal association between</p>

An 83-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; Lot Number: EK4176, expiry date Jul2022) via an unspecified route of administration in arm right, at the age of 83-year-old, on 26Jan2021 12:00PM, SINGLE DOSE for covid-19 immunisation. Medical history included ongoing chronic obstructive pulmonary disease (for 15 years or more), ongoing spinal stenosis in his lower back for about 15 years or more, and rotator cuff syndrome (left arm). Concomitant medication included ongoing sertraline hydrochloride (ZOLOFT). The patient did not receive other vaccines within 4 weeks. The patient experienced nausea on 28Jan2021 with outcome of not recovered, fever/ mild temperature on Jan2021 with outcome of not recovered, fatigue/ still very tired on 28Jan2021 with outcome of not recovered, he had chills on 28Jan2021 with outcome of not recovered, he has a congested cough that has increased recently on Feb2021 with outcome of not recovered. The patient went to his eye doctor for an eye exam, and he was not real comfortable because he was semi-nauseous. The patient had experienced fatigue, tiredness, and nausea since receiving his first COVID-19 Vaccine dose. The patient reported he also had chills. The patient had an increase in a congested cough recently. The patient continues to feel fatigued, tired, and nauseated. The patient felt like he should have gone to the Emergency Room, or seen his doctor when he experienced the side effects after the vaccine, but he didn't go. The patient has been taking cough medicine. The patient has COPD and takes the cough medicine at night before he goes to bed. The patient clarified that he started taking the cough medicine because he had an increase in a congested cough recently. The patient clarified he has a sticky, yellowish phlegm that he coughs up. The patient said recently the phlegm changed to a reddish-brown color. The patient said his phlegm will go back and forth from the yellowish color to a dark brown color. The patient said he started the cough medicine about a week or so ago. The patient said it was a 4 ounce bottle of cough medicine. The</p>

The patient just finished the 4 ounce bottle of cough medicine last night. The patient takes over-the-counter Tussin DM Max cough medicine. The patient is scheduled for his second COVID-19 Vaccine on 15Feb2021.</p> <p>Dizziness; feels unsteady at times; nearly passed out/totally passed out; This is a spontaneous report from a contactable consumer. A 79-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection; lot number: EN6198), via an unspecified route of administration, administered in Arm Left on 27Feb2021 as SINGLE DOSE for covid-19 immunisation. The patient's medical history was reported as none. There were no concomitant medications. It was reported that the patient received first COVID shot Saturday. She confirms the Pfizer COVID 19 Vaccine. She says 24 hours after she had the shot she nearly passed out, she got really dizzy and someone asked, are you okay, and she said no and they caught her before she totally passed out and she sat down. She is still having waves of dizziness and she feels unsteady at times, not every second but she is a little scared to drive a car. She just thought someone should know that. It was reported that dizziness began the next day on 28Feb2021 around 3pm. She closes her eyes and says she doesn't want to look at that. It is ongoing but it is not so bad after she gets up. It seems to have lessened after about 3 pm yesterday it is bothersome. She confirms it is ongoing but improved a little since it began. The outcome of the event dizziness was recovering, while unknown for the other events was unknown.</p>

1107722	3/17/2021	NC	70	F	3/16/2021	3/17/2021	I awoke this morning feeling feverish. I walked to the kitchen to take tea and a Curamin tablet since I had run out of Advil.. I began to feel as though I was going to vomit so walked slowly to the toilet, knelt in front, then made a quarter turn,, thinking this would not happen, and I fainted/blacked out. I found myself face down in front of toilet and a good bump on my right eyebrow....face turned inward. I stayed still long enough to feel safe to rise and so did. No more sense of vomiting, thank goodness. Just very very tired. I did make oatmeal with blueberries for breakfast and ate this slowly. Just wanted to ask if this is to be expected. It is now four hours fifteen minutes since this happened. As I walk carefully , I am trusting all will be well ...but when?
1107689	3/17/2021	MI	25	F	3/12/2021	3/15/2021	Pfizer-BioNTech COVID-19 Vaccine EUA Monday, March 15th around 9:30/10:00am I began to feel nauseous, had a headache, felt cold and overall tired. I had to stop working and I laid down to rest and slept for 4-5 hrs. Continued to feel weak with a loss of appetite for the remainder of the day and slept through the night. Tuesday, March 16th I began work around 8am and by 9:20am I had to stop due to a pounding headache and extreme nausea and muscle aches in my back. My eyes were sensitive to light, my head hurt and felt a lot of pressure in the front of my head and back of my neck and my ears were beginning to hurt and ring. I took acetaminophen and slept for 3-4hrs. When I woke up the nausea had subsided but I still had a lingering headache, just not as terrible, and took additional acetaminophen 500mg. This headache continued for the rest of the day into the night, waking me up to the point of needing another 500mg acetaminophen and waking up the next morning Wednesday, March 17th with still a slight lingering headache, slight sensitivity to light, light nausea, light muscle/body ache, and general feeling of weakness.
1107510	3/17/2021	PA	47	M	3/13/2021	3/14/2021	Swollen face, tongue feels fat, headache behind R ear, facial dropping, slurring words, eye doesn't close all the way. Started Sunday night to the morning went to ER. Did blood test for Lymes. Diagnosed with Right sided BELLS PALSY Gave prednisone and Valtrex in ER and discharged on those meds too.

1107570	3/17/2021		60	F	3/13/2021	3/13/2021	60 yo woman who 3-5 minutes post vaccination developed facial itching and erythema, initially in her eyes and nose. Administered 50 mg diphenhydramine PO. In the minutes thereafter, the pruritis spread to the upper lip, then face and scalp, and became more generalized (but mild) on limbs. She also reported a "dry throat" sensation, but denies throat tightness or itching and did not have any respiratory compromise for the hour that she remained under observation. Symptoms subsided and patient left the facility. Followed up with her later by phone to inform her that her immediate allergic reaction was a contraindication to her receiving the second Pfizer COVID-19 vaccine and that she should not return for a second appointment. Advised that she seek allergist consultation given her history of multiple allergies, and to determine whether there was a common substrate for any of them. Said that she could possibly consider the Johnson&Johnson vaccine thereafter, if she did not have any known allergies to components of it.

1107637	3/17/2021	SC	56	F	3/12/2021	3/12/2021	Shortly after receiving the vaccine I began experiencing symptoms. I first noticed abdominal cramping. Then I began to get itchy eyes, then tingling in my lips. After that my throat , tongue and the inside of my nose felt swollen and numb. I had a fast heartbeat and I began to get hoarse. My husband drove me to the emergency room. I was treated with a steroid injection and pepcid. Within fifteen minutes of receiving the treatment my symptoms began to subside.
1107635	3/17/2021	WV	50	M	3/17/2021	3/17/2021	Blurry vision 5 minutes after the first dose Light sensitive
1107629	3/17/2021	TX	48	M	3/10/2021	3/16/2021	Both eyes very swollen, watery and itching on evening of 3/16. Appeared pretty quickly. Could be 'normal' allergies, but was quite a bit more of a reaction than I would normally get. I don't believe I've had my eyes swell this much before that I can remember. During day of 3/16 did not do anything outside in or around normal triggers when doing something like yard work. Took Kroger brand max strength sinus relief pills and went to bed. Morning of 3/17 eyes still swollen but not as much...much less watering and itching. Still swollen some at the time of this submission.
1107592	3/17/2021	TX	53	F	3/12/2021	3/14/2021	Blurred vision, sensitivity to light

1107782	3/17/2021	MI	57	F	3/17/2021	3/17/2021	Patient was sitting in waiting area post vaccination. A pharmacist from the vaccination area was called over to her because she was not feeling well. As the pharmacist was speaking with her patient fainted. Pharmacist was holding on to her to keep her from falling. I went over and took her BP which was 65/44, pulse 53. After a few minutes patient regained consciousness and was able to give us her information. 911 was also called. Patient reports a history of severe reaction to Penicillin. Patient reports history of syncope at eye doctor's office. Her BP was taken again at 10:20am and was 98/72, pulse 70. 911 arrived and patient chose to be taken to hospital.
1107668	3/17/2021	MI	73	F	3/16/2021	3/16/2021	Patient received 2nd dose of Pfizer COVID-19 vaccine. She immediately developed diaphoresis and eye tearing. Diaphoresis worsened. Patient reported nausea. Epinephrine administered and transferred patient to emergency department. ED did not feel epinephrine helped. Patient observed and then discharged.
1109322	3/17/2021	NY	54	F	2/5/2021	3/15/2021	On March 16, I was sitting in a chair next to my kitchen counter when I felt like my body was being thrown. My head was thrown forward and I hit the counter hard and sustained a large contusion above my left eye. The room was spinning and I was dizzy for the next few hours. I never lost consciousness but had no control of my body for the few seconds of the episode. The episode was sudden and violent and I was just sitting when it happened. I spoke with my physician who diagnosed me with having experienced a Tumarkin otolithic crisis. He has instructed me to wear a helmet and not to leave my home. He is also recommending that I have a labyrinthectomy to treat the symptoms. While I have a history of vertigo, I have not had any dizziness for more than a year. I now feel dizzy on and off most of the day.
1109083	3/17/2021	CA	60	F	3/10/2021	3/12/2021	40 hours after COVID-19 mRNA vaccination patient awoke in the middle of the night with itch, swelling, rash on left eyebrow. Subsequent 6 days rash developed into typical herpes zoster (shingles) rash localized over left eyebrow.

1109338	3/17/2021	OK	42	F	3/15/2021	3/15/2021	Sore arm, joint pain, nausea, fever. But later that afternoon EXTREME fatigue set in. I have slept for the majority of the last 3 days. I wake up foggy and disoriented. Takes a while to focus and become alert. I use the restroom and maybe I'm able to be active for 15-20 minutes then I'm back asleep, or too tired to keep my eyes open. Today is the first day I have been able to stay awake more than an hour. I had energy for about an hour and then felt like I was unplugged I'm just too tired to function. All I can do is go back to bed.
1109482	3/17/2021	TX	41	F	3/13/2021	3/15/2021	3/13/2021 11pm chills, body aches 3/14/2021 fever, sweats, shaking chills 3/15/2021 midnight : swelling of face and eyes, chest pressure, shortness of breath 3/15/2021 3am : swelling of tongue 3/16/2021 11am EMS called : symptoms had improved per patient but face was still puffy; Patient notes SpO2 98%. She refused EMS transport to ER. 3/16/2021 6:45pm : I had a virtual visit for the patient's workman's comp case. She continues to have some chest pressure but noted improvement. I advised her to seek in-person evaluation and treatment for her continued symptoms. 3/17/21 I spoke with patient. She feels better but did not seek in-person treatment. Symptoms resolved.
1109324	3/17/2021	CA	41	F	3/12/2021	3/12/2021	Moderna COVID-19 Vaccine EUA Few minutes after receiving the vaccine, felt slight nausea and light-headed. Very soon after the vision went blurry. Takes about 3-4 seconds to refocus. Vision becomes blurry again when glancing around. Did not inform pharmacist and learned how to refocus. The second day the blurriness is still there but takes only half a second to refocus each time. By third day vision is back to normal.
1109496	3/17/2021	NJ	53	F	3/14/2021	3/14/2021	headache-numbness on left side of my face lip to my eye brow shot site of arm hurt all for 2 days.

1109302	3/17/2021	CO	26	F	1/11/2021	1/16/2021	Swollen lymph nodes under both arms, urgent care, referred to ultrasound tech, mammogram, referred to general surgeon (awaiting appointment). Lymph nodes stayed swollen after first dose, got worse after second dose, and have been swollen since. Swollen lymph nodes in neck, hard to breathe, went to hospital, told it was just the vaccine and to wait it out. Lymph nodes in neck went down in swelling after 2-3 days. Irregular menstrual cycle, started approximately 2 weeks after first dose. Have had a menstrual cycle for 5 days every 9-12 days since first dose. Hospitalized for stroke-like symptoms (lost vision, couldn't form sentences) on 5 Feb 21. Discharged after CT scan and MRI came back fine.
1109298	3/17/2021	DC	58	F	3/8/2021	3/9/2021	Severe eye pain - began day after vaccine (went to emergency at Hospital three days after vaccine because pain continued - diagnosed with cornea abrasion but said pain was in a different area - I'm unaware of how it could have occurred); severe pain in both shoulders with difficulty lifting both without pain- I have degenerative disc disease in my cervical spine so I assumed it was associated. However, the pain I'm experiencing is unusual and it's never occurred like this. This pain also began the day after the vaccine. I used the V-Safe system, but didn't report either problem because I assumed they weren't related to the vaccine. But the timing, severity, and unusual nature have me very concerned about a connection to the vaccine.
1109245	3/17/2021	OK	29	U	3/16/2021	3/16/2021	Client was given his Moderna vaccine and he had made it to the observation area and sat down. He then fell out of his chair onto the floor. At the time I saw the client he was laying face down on the floor, head twitching and body jerking slightly. Shortly after he roused and turned on left side. He was then examined an RN. His vitals were taken every 15 minutes until he was able to sit up. He stated that the left side of his face and eye started twitching and he blacked out. He then fell out of his chair. He had a 2cm raised area to his left forehead and was advised to seek medical treatment. He was examined by the emergency medical staff that was called. He refused to be transported to the er by ambulance. He was sent home with family after being able to sit up and eat

1109238	3/17/2021	CA	60	F	3/11/2021	3/11/2021	As I pulled up for the 15 minute wait period the symptoms started 5 minutes after I received my vaccine. A tingling feeling up my left arm to back of my neck. My neck stiffened and then my throat started to close. Not to where I can't swallow but just like when I eat food that I'm allergic too, it closes up. The nurse that was overseeing me was holding the umbrella over my car window with the rainfall. All of a sudden there was lightning & thunder. The nurse threw the umbrella because she was shocked from the lightning. She started to talk to all the other around her and forgot about me. Since I could still swallow I didn't get her attention. When she returned she asked me the time so I had to pull my phone out. She didn't know the time of my 15 minutes and sent me away. As soon as I got out of the parking area but still inside amusement park, I started to feel my cheeks becoming numb and my right eye was blurry. I quickly moved over to the side lane still inside of amusement park and waited. I called my husband and told him that with the heavy rain I didn't feel safe driving with my right eye being blurry. I waited another 15 minutes before driving home. That evening the blurriness came back, my eye's & forehead was tender to touch but no headache. Only pressure in my head. My symptoms of closed throat, swollen cheeks, pressure in my head and blurriness continued on Friday, March 12th, Saturday, March 13th, Sunday, March 14th and Monday, March 15th. As of today, no other systems other than feeling my body has inflammation.
1109223	3/17/2021	MI	57	F	3/17/2021	3/17/2021	About an hour and half after the shot I noticed a bruise on the lid of my right eye. Shortly after, my eye began to feel sore. It is now 3 hours later and my eye is still very sore and is now bloodshot in the one eye.

1109721	3/17/2021	NJ	34	F	3/17/2021	3/17/2021	I had some sort of reaction to the vaccine about 1-2 minutes after receiving it, and it was super scary and they had to call the paramedics. After the pharmacist injected me, I felt the arm pain right away. No big deal. I walked over to the chair to sit for my 15 minutes. I was happy to be vaccinated and kind of saw it as my mini booster for my immune system that already beat COVID-19. As I sat there, the only thing I could say is, I felt a tingling cold sensation moving from my arm through me. Almost like I could feel the vaccine moving through my system. The tingling kept moving and I thought to myself, okay cool. I guess it's working. Awesome. But then my head felt cold, I felt tingling in my head, my mouth tasted like metal, saliva started to build in my mouth, I started to sweat, I felt overly sweaty all over my body, but my head felt cold and tingly. I was staring straight ahead and everything started to go staticky, like a television set, and the static began to build and started to get starry. Everything in my vision started to fade. So I spoke out to say something weird was happening. A man came over to talk to me and hold me up. He kept saying stuff but then my ears started ringing and I couldn't hear him anymore. I began to fade out as the stars got more intense. Then, as if it was just a mini reboot, my brain started to come back online and the picture in front of me began to fade back into view. I felt nauseous and still had a super metal taste in my mouth. They called the paramedics to give me a checkup. The metal taste in my mouth stayed the longest, but after about 45 minutes I felt well enough to go home. On and off, I have this intense tingling inside my brain. It reminds me of a time when I was in the hospital on morphine. Just a tingling pins and needles sensation inside my head. Other than that, I am okay now. But I'm concerned it's some sort of reaction because I already had COVID-19.
1109478	3/17/2021	CA	69	F	2/24/2021	2/25/2021	2/25 woke up at 7:30 a.m. with fever, chills, and severe body aches all day 2/26 same as previous day plus lethargy 2/27 woke up at 3:30 a.m. with SEVERE headache and partial loss of vision Went to ER and they diagnosed me with a moderate stroke and mild cognitive issues with right hemisphere vision loss in both eyes.
1109706	3/17/2021	NY	81	F	3/8/2021	3/9/2021	erythema and swelling around eyes and lateral neck--slowly resolving --thus far 11 days out

1109566	3/17/2021	CA	73	F	3/17/2021	3/17/2021	3:56pm- 71/F in post vaccination area witnessed multiple episodes of vomiting yellow emesis. Appears diaphoretic, initial BP 220/110, HR 110. O2 95%, RR 22. Pt received the vaccine at 3:46pm. She denies blurred vision, no headache, no chest pain or SOB. Denies abdominal pain but her daughter states she recently had a hernia repair and has had issues with cyclic vomiting induced with certain foods or stress, which her doctors are monitoring her for. Her daughter states she was feeling sick before she got her vaccine. Patient states she took her morning medication at 7am, had some breakfast at 10am and states she feels it was some pineapple she ate that caused her to start feeling nauseous. She adds that she is taking several blood pressure medications but when she begins to vomiting her blood pressure "gets really high." Pt is AOx4, able to speak in clear complete sentences. 4:05pm- BP 210/120, HR 82, 97%, RR 24. Pt continues to vomit intermittently but states she is starting to feel better. Onsite nurse manager, lead and site lead aware. EMS services requested. 4:10pm- BP 191/100, HR 86, 96%. No vomiting witnessed. 4:14pm- Ems arrives on scene. BP sitting 156/91, standing 140/92. Pt states she feels better. Paramedic offers to transfer her to the hospital but patient declines. Her daughter is at side and she states she would rather her daughter take her home since she is feeling better. Educated regarding when to seek medical attention. Pt AOx4, resp even, skin warm and dry, not actively vomiting, speaks in clear complete sentences. Assisted to POV via wheelchair. Pt in no apparent distress.
1109554	3/17/2021	CO	69	M	2/26/2021	3/13/2021	On March 13, I woke with a headache, a sinus pain, and generally feeling exhausted and groggy. This persisted through Sunday. On Tuesday March 16 I awoke and could not focus my eyes: I was seeing double. This got better during the course of the day but I could not work on my computer. On Wednesday March 17, I woke with double vision again. During the day I gradually became able to focus if I looked at an object, but as soon as I move my eyes, it was back to double vision. I felt much better physically that day.

1109075	3/17/2021	NY	25	F	1/7/2021	1/15/2021	One week after vaccine, injection site became extremely swollen (approx. 2"x3" induration), burning hot to the touch, tender & itchy, arm became numb. General malaise, low grade fever. Site reaction spread down arm, went to urgent care & was told it may be cellulitis & was given antibiotics & told to go to ER if it continued to spread. It spread outside of line that was drawn the next day so I went to ER. They did nothing & told me remain on antibiotics & to see allergist & PCP. Reaction continued to spread, arm/hand numbness & general feeling of illness, slight fever continued for approx. 2 weeks following vaccine. Site reaction fully subsided visually by 1/26 (began 1/15). Allergist suggested it was severe immune reaction to vaccine. Felt generally unwell for approx. 5 weeks following vaccine. Was told I should not get second dose or any covid/flu vaccines in the future. I have history of poor reaction to vaccines/site reactions.
1108600	3/17/2021	GA	67	M	3/13/2021	3/15/2021	Blurred vision, severe dizziness (unable to stand or walk without assistance) unable to form words and sentences clearly.

1108614	3/17/2021	CO	51	F	2/4/2021	2/6/2021	<p>The following is the timeline of progression: First 48 hours: Immediately following the vaccine I felt I would vomit. That lasted 2 hours. The remainder of the 48 hours I had a growing headache that turned into a migraine level. Cognitively my husband would say I was out of it, not able to focus. The area around my eyes – my eyelids and below eyelids bright red – like I had put a bright red blush on them. Three to four days later: Saturday night my symptoms started to progress over a span of a few hours very drastically. I had symptoms of Diarrhea– crazy impact in my gut. Sunday I still had migraine level pain in a headache. I felt increased symptoms of nausea and diarrhea increased. Sunday I still had migraine level pain in a headache. I felt increased symptoms of nausea and diarrhea increased. By Sunday afternoon I had full blown symptoms of stomach flu. I had chills, extreme nausea that became debilitating. We do not have a thermometer that works, as a result I do not know if I had a fever. By Sunday night I was vomiting and symptoms progressed to tightness of chest, shortness of breath, vomiting, diarrhea, chills. My gut was literally moving in sharp pain, sounds, and cramping. It was severe diarrhea. I was achy and tired, but could not fall asleep due to nausea and vomiting. I was unable to stand up without the fear of passing out. I tried to manage the nausea with medicine that I have at home. It assisted but did not ultimate make an impact. By 4:30 a.m. I was scared by the lack of breath and asked my husband to call 911. The paramedic stated that I had an increased heart rate, but good blood pressure. I went to the hospital and received fluids, two different additional doses of nausea medicine, oxygen and a gut muscle relaxer. After 30 to 40 minutes I showed improvement and was able to go home. Still had pink color tone in skin around my eyes. On that Monday (2/8/2021), I was unable to go to work and called in for Covid PTO. I slept most of the day. Five days later: Still have a headache that can be managed with Tylenol. I still have diarrhea. I no longer have nausea, the pink color around my eyes seems to be gone. The nurse team and ambulance team all stated that the second shot was awful. Three folks stated they were in fetal position for two days. I was not able to ask what that meant due to my extreme nausea and trying to not dry heave. Note: I did not have any symptoms from the first vaccine – just a dull headache.</p>

1109019	3/17/2021	NY	42	M	3/15/2021	3/16/2021	I was driving on the highway and experienced numbness starting in my lips. This numbness then moved throughout my body into my limbs. I had some mobility and was able to pull off of the highway down an exit but at one point, I could not lift my legs or control my hands. I called 911 but it was very difficult to do so with the numbness. I then started to regain my mobility but had some continued numbness around the left side of my mouth. The paramedics tested my vitals and everything came back as normal. They recommended that I have someone come pick me up. So I had a neighbor come pick me up and someone drive my car home. I did not lose any vision or mental capacity throughout this. It was just a wave of numbness throughout my entire body. It lasted 5-10 minutes but felt like an eternity. I am lucky to be alive and to not have crashed my vehicle into someone or something.

1104658	3/16/2021	MD	72	F	2/24/2021	2/24/2021	I am reporting the below as everything written has NEVER happened to me before in my 72 years of living. This has all taken place since I have had the Vaccine Injection on Wednesday, February 24th. I am attributing all of this as a possible reaction to the vaccine or maybe coincidence. I wanted to report what has taken place so you all can assess if this is a possible adverse reaction, a direct effect from the vaccine or just coincidence. Please let me know if anything like this has been reported and what your thoughts about the matter. Wednesday, February 24th 11:15am Pfizer Vaccine right arm ?about an hour later discomfort on shot side that went from the shoulder up the right side of the neck. Was gone by next day. Thursday, February 25th Day seemed to be normal. When I went to bed that evening a pressure and pounding on the left top side of the head, on the part line. Lasted 5-6 hours and then went away for that episode. Friday, February 26th Day started off OK, walked 2 miles and then ran some errands. *3:00pm I bent down to pick up something and when I came up I had extreme light headedness like I have never had before. I was able to get myself collected and then continued to get ready to go out. *6:00pm I just sat in a chair in the restaurant and BAM the room started spinning at about 500 miles (that is the speed that it felt like) an hour. My arms were flailing as I was trying to grab something to hold onto. Just when I was about to fall off of the chair my husband walked up and grabbed me as he could see that something was going on and he said that I was white as a sheet. Once I got somewhat collected, I knew immediately that I had to throw up. My husband took me to the restroom. I had severe dry heaves that just would not stop. I wasn't breathing properly so my hands and feet were numb, tingly and very white in color. Then I had to have a bowel movement. We phoned for the ambulance to take me to the hospital just to make sure that I did not have a stroke, or it was my heart, or a vessel had burst in the head. The Paramedic tested me for a stroke and I passed the test. *8:00pm or so I had another episode with room going around at top speed and I started having dry heaves. Nurse gave me medicine in the IV for nausea. My Doctor said that everything was Benign. He said that the CT patient scan was negative and all other tests were OK. Saturday, February 27th I was released from the

VAERS\_ID RECVD STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

hospital and went home. I did very little that day. I slept that night from 10:00pm until 10:00am the next day. Sunday, February 28th I was lightheaded, had a headache, and ears ringing all day. I just did not feel myself at all. Tuesday, March 9th Around noon I had a severe lightheadedness/spinning episode, eyes felt like they were spinning. Laid down for about 2 hours and when I got up I was able to function and the spinning had gotten better. Headache all night long, ears ringing, feeling of lightheadedness. Wednesday, March 10th Not quite as dizzy, headache all day, back of neck and left side of head sore to touch. Pounding on left top side of head ? along the part line, where I had the same discomfort the 2nd day after the vaccine. Thursday, March 11th Having discomfort on left side of head. To the right of the left ear, going down to the neck. I can touch those areas and add to the discomfort. Friday, March 12th On Monday, March 7th I noticed a red spot on the right side behind where I was given the injection. I tried to treat it myself but my remedies were not helping. Contacted my Dermatologist on Thursday, March 11th. She saw me today, Friday, March 12th. She is not sure if it is a possible aftermath of the vaccine or something else. Had some bloodwork run to rule how Shingles. Prescribed some medication for Shingles to take until Monday when the bloodwork report is due for review. Blood work was negative for Shingles. Ever since the episode on February 26th I have NOT felt myself at all. Lightheaded, nausea, headache, pressure in head and feels heavy, not steady on my feet, discomfort in back of head near neckline, on/off discomfort in the top of the head with a pounding force. BLOOD PRESSURE IS NOW HIGHER THAN NORMAL ESPECIALLY WITH BOTTOM NUMBER BEING HIGH. I have never had a Blood Pressure problem, although as I have aged the top number has elevated but not enough to take medicine. However, the lower number is now elevated (high 80-'s, low mid range 90?'s) and Cardiologist is going to make a decision on whether I should start on a low dose medicine. I am to take my 2nd Pfizer shot tomorrow ? Wednesday, March 17th at 11:00am. Thank You for reviewing the above writings. I look forward to the conclusion VAERS makes on my situation.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1104803	3/16/2021	ID	42	F	2/4/2021	2/5/2021	10:00 am on the 5th, I woke up and felt not very good. Tired and achy. I had a fever that developed that day. I rested most of the day. Two days after that (about the 7th or so), I noticed that I had a rash on my right arm - elbow height (not injection site) - upper forearm. Not the bulls eye rash but just a rash and it itched super bad. I called the on-staff doctor because it was after hours. He said I could use cortisone cream on it to help with the itching. I also took some ibuprofen because I had the fever. The cream helped get rid of the rash within a couple of days. I still had the overall skin itchiness on my legs and stuff that I still had from the first vaccine - that overall itchiness had never gone away and I still had it. February 25, I woke up and I had some mild hives on my face and my eyelids were puffy and swollen and itchy (face was kind of itchy). I kept using the anti-itch lotion (from the first dose) and I quit taking my supplements to see if that would help. By the 26th, it was pretty bad. She prescribed me some steroids - methylprednisolone. She said if the hives left don't start it yet because she didn't want me to start it that night. So next morning, it wasn't horrible, so I didn't start taking them until March 1st and they are six day ones. It got pretty red and hived out and rashy for a few days and the steroids seems to clear that by the six days. So by the 7th it was almost gone and by the 8th was all gone. It feels like the other itchiness is gone, too. The lymph node under my left arm, I thought had gone away but now a couple of weeks ago it felt like it came back and it still is feeling a little swollen.

1104822	3/16/2021	PA		M	3/16/2021	3/16/2021	Skin around both my eyes are red and looks like an allergic reaction and it feels like a burning sensation. This happened only an hour after my second shot.
1104781	3/16/2021	PA	77	M	1/29/1921	2/15/2021	After a couple of weeks one or 2, I went to the gym in the morning and my vision seemed blurry, so I closed my eye and now the vision of my left eye was worse and the shark shape or fish shape that I started seeing before (the branch retinal occlusion), was now a big blob and it was in my opinion about 1/3 on the bottom of my left eye. I was seen by Dr. who checked it and said it was bigger than last time and closer to the central retinal artery.

1104711	3/16/2021		38	M	2/21/2021	2/22/2021	Approximately 12 hours after my second Moderna vaccine, I experienced the typical body aches, chills, headache, and tiredness expected in someone my age (38). I was initially happy that my immune system seemed to have a positive response to the second dose. About 24 hours after my second dose, I developed a severe headache and nerve pain all over the right side of my head. No over the counter medicine would relieve the pain. The next day, I developed a rash on my forehead. The rash quickly spread and consumed the right side of my face and my right eye. I was seen by medical staff, and received a diagnosis of severe shingles. I was given Valtrex and, eventually, gabapentin. My eye continued to get worse and I lost clear vision in my right eye. I saw an ophthalmologist and was told that the shingles had activated in the eye. My eye pressure was dangerously high. I was given steroid drops and drops to relieve eye pressure. Since February 22, I have battled shingles. My rash is gone and my eye has cleared. But, I still suffer from intense nerve pain in my head, forehead, and eye. All medical professionals opined that the moderna vaccine must have played a role given the timing. If shingles can be considered a side effect, it is one that has been intense and long-lasting.

1104709	3/16/2021	PA	77	M	1/9/2021	1/9/2021	Almost immediately felt swelling at the injection site, which I felt as being normal. Next day when I woke up felt a slight headache , abnormal vision issues that included sparkles, blurred vision and a general tiredness. Did not feel refreshed as I normally do when I wake up in the morning. As the day went on sparkles and vision issues remained and headache got worse. Went to bed earlier than normal and next day when woke up the symptoms got worse, I felt like I had a migraine. Vision issues persisted. Laid down around 11AM and took a nap and when I woke up I noticed a blotch in my left eye reminiscent of the shape of a fish (looked like a shark) and it had different colors. Bright yellow and black almost kind of an iridescent green and orange. The shape was still just the colors were different. I panicked and called the optometrist and explained what happened. They wanted to see me right away. I was able to be seen in the afternoon. They looked at it, did two tests and came with the diagnosis of a branch retinal artery occlusion. I visited my neuro- ophthalmologist on 01/28 and he confirmed the diagnosis had previously given. He then ordered fedrate and a couple of other tests. They also did a visual acuity in the left eye (20/30) and color vision (8/8 normal) and color plates and intraocular pressure (16 OS)
1104703	3/16/2021	CA	24	F	3/9/2021	3/9/2021	I have had floaters in my eyes since the vaccine. I started to use refreshing eye drops on Saturday March 13. I am not sure if the acne cream got in my eye the night before the vaccine. it is called Retin A cream 0.025%. I have also been feeling very weak. I got a B12 injection on my butt for energy(Friday, march 12). My legs feel like they are in pain and the hurt when I walk. I also had a lot of pelvic pain after the vitamin injection. I drank ibuprofen March 14 at night. I woke up feeling very weak. Before going to bed on March 15 I drank Tylenol. I still feel pain in my legs today and now I have lower back pain.
1104574	3/16/2021		59	F	3/14/2021	3/14/2021	Fever of 100 degrees, nausea, headache, soreness at injection site and all over body, pain behind eyes and brain fog

1104631	3/16/2021	UT	47	M	3/5/2021	3/6/2021	<p>Day 1: Saturday morning March 6 at 5:00am I was shaken out of my sleep with a nasty migraine, sour stomach, intense body aches, stuffy nose, fever (102f). Classic flu like symptoms. I was extremely sick all day Saturday (level of sick: 8/10). Day 2: Sunday morning March 7 I awoke again extremely sick, just as sick as Saturday. All same symptoms (level of sick: 7/10). Sunday night I was incredibly miserable, all flu symptoms, I did not sleep Sunday night, up all night and up all day the next day Monday. Day 3: Monday I continued to be sick, all same symptoms, all day long. This time the blood shot eyes &amp; bloody nose came on, fever was steady at 101f (level of sick: 6/10). Day 4: Tuesday woke up still sick, same flu like symptoms. I feel the headache has gotten worse, in fact way worse. Fever steady at 101f all day. Overall I'm not as sick except the headache and fever (level of sick: 6/10). Day 5: Wednesday I was really hoping I'd make a full recovery but still still sick, fever dropped for a few hours then came back, fever peaks and bounces around at 101f. Headache is absolutely nasty, I feel intense pain in the back of my neck and head, hard to sleep or lay down. (level of sick: 5/10). Day 6: Thursday I feel like I'm just about kick this sickness, feeling way better. I dont have a fever today but I still have an incredibly nasty headache, really intense, my eyes hurt, back of my neck hurts. (level of sick: 3/10). Day 7: Friday, no flu symptoms, finally!! But the headache continues, really bad. It sort of disables my ability to function with the headache. Back of my neck and back of head hurts, inside my brain hurts. Ugh! Day 8: Saturday, no flu, no fever, although still bad headache. I've been taking Advil all week to help reduce the headache. It helps, but after about 6 hours later the headache returns. Late in the evening Saturday my head was pounding. Day 9: Sunday headache not that bad, mild headache lingered throughout the day, tolerable. Day 10: Monday no headache!! Today was the first full day of full happiness!! *NOTE*: In July 2020 I got COVID extremely bad, spent 4 days in the ICU, couldnt breathe!! I had a fever of 103 for 6 days straight before calling 911 to come and get me. I was in bad shape, lost 30 lbs, had respiratory breathing issue for about 2 months after hospital stay. Most sick I've ever been, total game changer, I will never be the same. To this day I feel my respiratory is at 90%, fatigue still comes around every so</p>

1105229	3/16/2021	CA	31	F	2/13/2021	2/21/2021	<p>I was expecting to get the common side effects after my second dose, getting sick for a day about 12 hours after the 2nd dose. I did not get sick the next day, I just had the regular big red sore bump at the injection site. However, slightly more than a week after my 2nd dose, I started to experience double vision. Not blurry vision, but double vision, with one image on top of the other, both clear. At first it didn't bother me much, it was mostly happening in the mornings and in the evenings. Then suddenly, between the dates of 2/25 and 3/1, I started experiencing the double vision much more intensely and earlier in the day. It was not safe for me to drive, and it bothered me a lot, causing headaches and extreme nausea, I found myself going to bed at 6pm because I didn't want to be awake and deal with the side effects. I saw an Ophthalmologist (Dr.) about the problem (not realizing it was a COVID-19 vaccine side effect) who diagnosed me with cranial nerve 4 palsy in the left eye. I had to notify my job that I was unable to drive and that effected my work. Furthermore it was extremely stressful not knowing the cause or prognosis, and the worry over the medical costs for test and lab work. Since 3/2, the condition has been improving. There have been no other changes to my lifestyle or health that could account for this, other than receiving the COVID-19 vaccine. People need to know about the possibility of horrible side effects like this, it's worse when you don't know what's causing it or the prognosis.</p>

Heart regular rate and rhythm. Lungs: clear to auscultation bilaterally Patient was examined by EMS and informed that he could be transported to hospital via ambulance for immediate consultation with provider or can decline services and seek care at a later time. Patient opted to drive on his own to seek care at a later time. He was advised to contact his primary care provider regarding his adverse reaction, seizure and head injury. Note: MA called for PA on site when patient fell and hit head. PA told site manager to call 911 while attending to patient. When PA arrived to patient's side, he had regained consciousness and PA proceeded to provide care and investigate incident.

1104155	3/16/2021	IN	67	F	2/12/2021	2/17/2021	Five days after the vaccine she was on the phone, sitting in a chair and she lifted her arm up and it felt heavy and it just dropped. She then started to raise the arm and she was not able to do it. She then suddenly lost sensation in her left arm. She then could not control it, would raise when it wanted to but was not able to feel it or control it. (had the feeling that it was not connected to her body and it was just floating around). Then started having involuntary muscle spasms in her mid torso region. The same thing then happened again and the muscle spasms were more intense and she waited around and lasted for minutes. She never lost consciousness, but then it happened again and was spreading on her left side. It then encompassed from her hip up to her shoulder. The involuntary muscle spasms were moving from the side toward her chest to where she felt it would impact her breathing. She then went to the ER and they started doing testing, and she had more spasms, and then started having double vision. In talking with the doctor about all of this she had a CVA with complex partial epilepsy with recurrent seizures and that the double vision was related to the infarct in her brain and that the stroke triggered the seizure that she had. She did not lose any memory, loss of consciousness, no weakness or loss of sensation. These episodes only lasted minutes and a refractory time of minutes and when she got to the ER she the other episode when they were trying to test her. They were not able to do the EKG or EEG due to the involuntary movements and these resolved. She is now completely recovered other than the fatigue with no residual. She saw a neurologist on 2/24/21 who felt like that she had a stroke and put her on Keppra and is going to FU in 3 months at IU. It was ruled out that there was no relationship of her transplant to this reaction. She is now on Keppra, Atorvastatin for the swelling in her brain, and also put on aspirin 81 mg. Her blood tests that were done were all drawn and were all within normal limits except for kidney function, but is only a minor #s for her secondary to the transplant. She then had some titers drawn for CMV and that was also negative. Then she had a COVID test that was negative. Then she had spinal tap that came back normal results.

1105355	3/16/2021	OH	58	F	3/16/2021	3/16/2021	Patient received her MODERNA COVID-19 vaccination at 7::31 am and at 7:40 am the patient stated she was feeling like she was going to faint, she was currently sitting in a chair and she asked for some water. The patient was very pale and she broke out into a cold sweat. The patient was given a cold compress to advised too stay sitting until she no longer felt faint. After about 10 minutes, the patient stated she needed to lie down. The patient was escorted to a place where she was able to lay down with a cold compress on her forehead. The patient continue to lie down for about 10 minutes and then she stated she was starting to feel better and that point she asked if she could use the restroom. She was then escorted to the restroom and then back to a bench to remain seated for several for minutes. The patient remained seated for approximately an additional 15 minutes and her symptoms improved and the patient was able to leave. The patient then called back into the pharmacy at 11:10 am and stated that she was experiencing chills, swelling of her face (around her eyes) and a rash that was covering her arms and chest. The patient was advised to take Benadryl and seek medical attention if the swelling worsened or if she began to experience any difficulty breathing or other symptoms. The pharmacy called the patient at 2:50 pm and the patient stated she took the Benadryl and her swelling and rash were still present, but not progressing. Patient also stated that the chills were starting to resolve.

1104468	3/16/2021	MT	54	F	3/14/2021	3/15/2021	Started with nodal swelling within 10minutes of injection. Worsening fatigue as day progressed, developed runny nose and watery eyes, pain in my arm at injection site then spreading to the rest of my body. Took Sudafed for the cold like symptoms that evening and then in the morning. Went to sleep woke in the morning with severe fatigue, nausea, headache. At 11:00 noted that a bitter taste in my mouth that lead to loosing my sense of taste for 6 hours. I started getting a fever, which got up to 102 degrees, took Tylenol for this. At the same time my lips started swelling, then my hands, and approximately around 1900 my buccal lining of my mouth. Took 50mg of Benadryl which helped with swelling and went sleep. Woke up 6 to 7 hours later and took 50mg of Benadryl for good effect. Continue to have mild fatigue, headache and nausea this morning.

1104350	3/16/2021	GA	35	F	3/13/2021	3/13/2021	About 6 hours after injection, I felt incredibly exhausted. After 12 hours, nausea and headache set in. 13-14 hours, a terrible stomachache and diarrhea. My skin felt so sensitive that it hurt to touch. Zofran treated the nausea. The day after the injection I was exhausted, was nauseous and had a headache. 48 hours after injection I woke up with a strange headache. I could look to the right pain free, but if I looked to the left or left/up, I had a piercing pain near my right eye. Excedrin/Tylenol did not relieve this headache. On Hour 72, the headache is still present, though to a lesser degree.
1104335	3/16/2021	MD	54	F	3/8/2021	3/8/2021	Pain at injection site began at time of injection and continued. Joint pain, especially knees, began about 6:30 p.m. (two hours after injection). Flu type symptoms (all over body aches) began at 10:00 P.M. Headach and chills began at 12:00 A.M. and temperature was 100.6. Chills, shaking, and fever worsened, headache became severe, and temperature was 102.8 at 4:00 A.M. Tuesday, March 9th. Headache, body aches, and temperature varying between 100.0 - 101.3 , and continued through Wednesday night, March 10th. Wednesday afternoon, elevated heart rate and tinnitus were first noticed and fatigue continued. Checked watch and average heart rate had increased 10 beats per minute. First normal temperature of 98.6 was taken Thursday, March 11th at 8:00 A.M. On Thursday, eyes became noticeably red and face and upper chest area skin reddened (e.g. like sun exposure without sunscreen). Tinnitus continued and was very loud even with background noise. Loud tinnitus and overall fatigue continues today, Monday March 16th.

1104327	3/16/2021	FL	68	F	2/10/2021	2/12/2021	68 yo WF in excellent health with prior history of intermittent benign positional vertigo for seven years and a cerebral concussion two years ago from which she recovered uneventfully in 6 weeks with no residual neurologic or physical issues. Patient received first dose 1/19/2021 with only mild fatigue and arm soreness at injection site. 16 hours after the second dose, Patient developed a dull total cranial headache and fatigue , retiring to bed , taking no medicines. She had taken only her premarin 0.625 mg for the last week. Patient awoke at 4:30 am with severe headache, nausea and vertigo, being unable to stand without assistance. urinary incontinence also occurred, but most likely occurred as she was unable to get to the bathroom due to vertigo and pronounced vomiting of clear yellow fluid. incontinence never occurred again throughout the illness. examination at this time showed nystagmus on bilateral lateral gaze and vertical nystagmus. no other neurological signs or symptoms were present. On return to bed, Patient continued to have vertigo headache and nausea even supine with eyes closed. Vertigo and standing instability did not respond to epley maneuvers. Headache remained mild to moderate, along with persistent vertigo and nystagmus for 4 days, becoming slightly less each day. On the fifth day, Patient was able to ambulate unaided by holding onto walls furniture etc. vomiting did not reoccur after her initial bout. Headache abated on the fifth day. Patient remained "fuzzy" and imbalanced for the next 14 days with occasional mild posterior cranial headache. Rotary nystagmus abated on the 7th day. Note is made that no abnormalities of the tympanic membranes were noted. no cardiac symptoms or irregularities were noted HR 60 BP 110/70 several attempts at epley maneuvers only resulted in symptom worsening. Patient felt well enough to traveled by airplane day 8 post dose, having still some "fuzziness" and slight imbalance, being unable to walk briskly due to gait instability..symptoms worsened slightly after air flight, and on return to home, slight barotraumatic changes were noted in the tympanic membranes, slight fluid levels and some small streaky membrane hemorrhages noted. her gait became slightly more unstable, but she was able to walk unaided. symptoms improved daily and by day 14 symptoms seemed to be much lessened, no nystagmus being noted. vertigo was present only on

1104322	3/16/2021	NJ	36	F	3/15/2021	3/15/2021	<p>rapidly standing , position change and vertical looking up., vertigo abating quickly after each motion at rest. Patient traveled by plane on 3/4/21-3/8/21, vertigo escalated to mild to moderate..no response to epley maneuvers. Vertigo worsened daily and Patient again developed mild gait instability and nystagmus bilaterally and vertically. Ear exam was unchanged. no headache was present during this time. Patient was taken for balance training to a specially trained Physical therapist on 3/10/21 for evaluation , Patient being markedly symptomatic, examination showing both right and left ear abnormalities as well as vertical nystagmus. driving was prohibited. The constellation of symptoms for the even are most consistent with acute vestibular neuronitis or central vertigo.. Neuologic localizing signs suggestive of cerebral thrombosis, etc were not present , so MRI was not performed. Patient had Had a Notmal CT scan with here cerebral concussion two years prior. As the symptoms weer worsening and the result of the balance training session on 3/10/21 resulted on significant worsening on awakening on 3/11/21 with moderate gait instability, bilateral horizontal and vertical nystagmus, Prednisone 40MG po was administered. Approximately 8 hours after the prednisone dose, Patient was able to stand unaided, and vertigo was almost totally cleared. 30mg prdnisone was administered on 3/12/21 with Patient being totally asymptomatic. No nystagmus could be detected and epley maneuvers done by the physical therapist resulted in no symptions or evoked nystagmus. Predinsone dose was deescalated by 10 mg daily, Patient remaining totally asymptomatic. today 3/16/21 Patient will take 5mg of prednisone, still assymptomatic, prednisone to be discontinued tomorrow.</p> <p>Few hives (both eyes) starting at 7PM on 3/15/21. Took benadryl right away. Swollen and dry eyes (both eyes), also felt burning, when woke up at 8AM on 3/16/21.</p>

1106547	3/16/2021	CA	31	F	3/13/2021	3/13/2021	Developed hives on opposite arm shortly after shot (but idiopathic hives are normal for me and it was the wrong arm so I thought nothing of it). Full body aches, especially in legs, from about 6:30pm on 3/13 to midnight of 3/14. Location of shot was warm to the touch, sore, and slightly swollen. Temp was 98.6 F. After midnight the aches became centered on my legs and became more severe coming in waves every few seconds. Tachycardia. Muscle weakness. Nausea. Teeth began to hurt (from clenching?). Severe dizziness and vertigo starting from 7pm on 3/13 and peaking around midnight. Migraine with visual disturbances beginning at 7pm on 3/13 peaking at about 9pm and lasting at least several hours. Vertigo and migraine seemed related. Former worsened every time the pressure in my head did. Looked like the room lit up briefly every few seconds. My sense of touch felt off - textures felt different than normal and couldn't feel my back when I touched it. Leg pain began to lessen around 4am, and fully resolved around 7am. Dizziness began to improve around 6am but persisted, albeit to a milder degree, for most of 3/14. Brain fog and sinus pressure from around 7pm 3/13 persisting through the following day. Some nausea throughout 3/14 but less severe than on 3/13. Poor temperature regulation from about 6pm 3/13 to 3pm 3/14. Symptoms became tolerable around 3:30pm on 3/14 and had mostly resolved by evening. Muscle weakness resolved by evening of 3/15. Pressure headache resolved by late morning 3/16.
1106529	3/16/2021	AZ	66	F	1/26/2021	2/17/2021	I had no reaction after the 1st dose administered on January 26, 2021 other than a slightly sore arm. After the second dose on February 16, 2021, I experienced the following in the following order. I did not feel better/normal until March 12. 101 fever for 24 hours, headache for days, chills, slight nausea, pain and aches all over and in joint areas, pain under shot arm in gland areas, black eyes and eye aches, diverticulitis event, brain fog - not being able to have sharp recall, and hives last 7 days.

1106506	3/16/2021	TX	60	F	1/11/2021	1/16/2021	experienced chills and body pain on the 3rd day after receiving the 2nd dose vaccine . chills and body pain lasted for 2 days . on the fifth day felt like black curtain in front of my eyes and felt dizzy. checked my blood pressure was 170/90. Blood pressure went up to 200/100 . went to the hospital emergency and was admitted for observation overnight. CT, MRI , blood work done. BP controlled with medication Nefedine 60mg. discharge home next day. was still having very light headedness and BP will shoot up to 190/90. physician had to change the medications couple of time. felt very exhausted . could not go to work almost 3 weeks because of the symptoms like lightheadedness. lasted at least 4 weeks to get back to work normal. never experienced this before. I was taking Olmasartan 5mg for blood pressure and my Bp always stated 130/80s
1106505	3/16/2021	MI	74	F	2/25/2021	2/27/2021	Ocular stroke. A black curtain dropped down over right eye. Went to ER on the 28th, and was admitted. Had a blood clot in the right eye. Carotid artery right side did not have stenosis, they do not know why she had a stroke. Doctor can't say that it was caused by the vaccine. She now has a permanent blind spot in right eye.

1106180	3/16/2021			F	3/4/2021		<p> Syncope; Flushing; Blurred vision; Felt like is going to pass out; A spontaneous report was received from a pharmacist concerning a 67-year-old, female patient, and experienced syncope, flushing, blurred vision (vision blurred) and felt like she is going to pass out (presyncope). The patient's medical history, was diabetes type 2, high blood pressure and anxiety. Concomitant medications reported included non specified medications to diabetes type 2, high blood pressure and to anxiety. On 04 Mar 2021, prior to the onset of the events, the patient received the second of two planned doses of mRNA-1273 (Lot number: 016M20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On an unspecified date, the patient experienced syncope, she was flushing and had blurred vision. She felt like she is going to pass out. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not applicable. The outcome of the events, syncope, flushing, blurred vision (vision blurred) and felt like she is going to pass out (presyncope) were considered as unknown.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. </p>

1106370	3/16/2021	TX	28	F	3/6/2021	3/12/2021	About 7-8 minutes later I started feeling pressure in the right side of my head. It went away a bit. I was walking after the 15 minutes and started feeling weird in my face, I just sat in my car and waited because I had to drive. I started feeling numbness under my eye and down the rest of my face. The thing that worried me the most I had so much pressure under my eye like it was inside my brain. The numbness and pain caused me to freak out. I went to back to the convention center to let them know, they brought the Paramedic to me they started checking me and doing a work up. They told me I wasn't a life threatening emergency and my vitals were ok. They offered to take me to the ER and I declined and I decided to leave because I have been there for 1hr 45mins. I felt like my symptoms were at 70%. When I got home I freaked out again because the numbness didn't go away and my face looked like it was a little lower and had a panic attack and went to the ER. They checked on me and told me I didn't have a stroke. They told me It was a side effect to the vaccine. They told me to follow up with the Neurologist if I have any more symptoms, I have an appointment with them in a couple weeks. I'm a little concerned because there is a minor pain that I didn't have before on my right side and it worries me.
1106607	3/16/2021	NJ	64	M	3/2/2021	3/2/2021	Before the COVID vaccine, I had a very mild case of tinnitus in the left ear. There was no discernible ringing, except occasionally at night in bed when it was quiet. One hour after the 1st COVID vaccine shot on March 2nd, there was extremely loud ringing in the left ear, which scared me terribly. It lasted about a minute. While the ringing is not as loud, there is constant ringing which overcomes everyday sound. For instance, when talking to people or watching television, the ringing is still heard. In addition, the ringing is often pulsating, which is a new experience for me. Clearly, my tinnitus has gotten much worse as a result of the event. I AM CONCERNED THE 2ND DOSE WILL MAKE THE RINGING WORSE.

following first person account which was provided by reporter (the patient): "This is a chronological record of my experience after the Pfizer Vaccine 20Jan2021, I received my first shot of the Pfizer vaccine after my Remicade infusion in (hospital name) Wednesday, 10Feb2021, I received my second shot of the Pfizer vaccine at 9:30am at (hospital name). I started getting a headache before I went to bed at around 8pm. During the night, I got a severe headache and very bad chills. So bad my teeth were rattling and I had to pull an extra blanket over me. Thursday, 11Feb2021, I got up at 7.08am. I went into the bathroom and washed my face. I was very pale and I felt terrible. I went downstairs to the kitchen. I put the kettle on and took my temperature. I had three doctor appointments that morning in and I was worried I would not be able to get into them if my temperature was high. It was 100.1. I went into the ground floor bathroom. I left the bathroom when I heard the kettle was fully boiled. The next thing I remember was the feel of carpet on my left cheek. I knew the only floor in my house that had carpet, was the basement floor. I opened my eyes and to my horror, I was able to see the basement storage room. I had no recollection on how I got there. I knew straight away, that I had fainted or passed out, on the stairs landing and had fallen down the whole flight of stairs. I was afraid to move because I didn't know if I had broken my back or my neck. I was home alone. After laying there for a few minutes, I knew I had to try to get back up the stairs so I could get to a phone. If I didn't, I knew my husband would not find me there, until after 2:30pm. I tried to get up. I struggled but I got to my knees. The next thing I recall is waking up again on the carpeted floor. This time I was sprawled out in the opposite direction, this time my head was near the thread mill. I had obviously passed out again. Now this really frightened me, I was terrified to stand up in case I fell back down again. I literally crawled up the stairs on my hands and knees. I grabbed my cell phone and called my husband to come home from work. I made that call at 7.34am. I didn't move from the sofa until he came home. He made me a cup of tea. He then brought me into the bathroom to wash my teeth. When I was finished washing my teeth, I passed out again. I woke up this time to my husband tapping my face and calling my name. I had fainted again; he had caught me and had carried me

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

into the sofa. I was unable to sit or stand up by myself. I was so weak. I felt so sick, I couldn't even drink the tea. My husband brought me up to bed. He checked on me every hour. I came back downstairs at 4pm. I hurt all over. I had bruises all over my shins, knees, right elbow and 2 bumps on my head. My back was sore. My right thumb was very sore and I couldn't move my left shoulder or arm. I put ice on my shoulder and thumb all night. I took Tylenol pm to help me sleep. Friday, 12Feb2021, my husband helped me to get dressed. I came down the stairs with him. I was very weak. I was shaky and did not trust myself to walk down the stairs. He was having knee surgery that morning. His friend took him to the hospital as I was not fit to drive. I did not move from the sofa until he came home at around 2pm. We talked about going to the ER but I really didn't want to go because of Covid. I was not steady on my feet and I would have to be dropped outside the hospital on my own. I took pain killers all day and iced down my left shoulder and right thumb. Saturday, 13Feb2021: I was still in a lot of pain and my head was a little dizzy, especially when I lay down. I went to Urgent care at 9am. I was seen by Dr. (Name provided). She sent me for 4 x rays and took my blood. My back and right shin were x rayed, I had no broken bones. My shins and knees were badly bruised. The other 2 x rays showed I had a fracture on my right thumb and there was something wrong with my left shoulder. She suggested I go to see an orthopedic doctor on Monday. I forgot to tell her about the dizzy spells and my neck been sore. She did not examine my head or neck. She found no other reason for my fainting, except that I got the Pfizer vaccine the day before. Sunday, 14Feb2021, I continued with the pain killers and ice on my shoulder and thumb. I continued to have dizzy spells. I also felt unbalanced. My appetite was gone and I felt nauseous sometimes when I was eating. I had no energy and I hurt all over. Monday, 15Feb2021, I got an appointment with an Orthopedist at 4.30pm. My husband dropped me off. Nurse and his assistant looked after me before I saw the doctor. I was told I have a separated bone in my left shoulder. It's called acromioclavicular joint separation. AC (collar bone) separates from the scapula (shoulder blade). So, I will have to wear a sling for a few weeks. I will also have to wear a temporary cast on my right hand for a few weeks to heal the fracture on my

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

right thumb. No surgery is needed for either. They also put me on steroids for 2 weeks, Prednisone. Tuesday 16Feb2021, I rested all day. I was still having dizzy spells and I felt off balanced & very shaky. My husband, a close friend and a coworker thought I may have a concussion and advised me to get it checked out. I spent all day on the phone trying to get an appointment with a neurologist. I did get an appointment for the next day. Wednesday 17Feb2021, I still felt the same dizziness and I was lethargic. I had an appointment with the neurologist, Dr. (Name provided) at 2pm. I had a CAT scan and it was normal, no bleeding. The doctor said I had whiplash and a concussion. He did not find any other reason for my fainting, except for the side effects of the Pfizer vaccine. He told me, I just have to rest and the symptom from the concussion should subside in a few weeks. Wednesday 24Feb2021. The Dr.'s nurse called to see how I was. I told her there was not much improvement and that I was still having dizzy spells. She called me back after she related everything to the doctor He is concerned and wants to see me again on Monday 01Mar2021. He may do an MRI to see if there is anything else going on, other than the concussion. Friday 26Feb2021. I am still having dizzy spells. Monday 01Mar2021. I had another appointment with the neurologist at 9:30 am. I need to stay off work for another week and he will re-access me again next Monday. He says I have an imbalance in my inner ear from the fall and from the bangs I received on my head. He demonstrated some EPLEY exercise, that he wants me to do. The dizzy spells have not improved. I don't feel well at all. I cannot complete house hold tasks. I still cannot drive. I can" go to work. I have used over 40 hours of sick leave already. Now I have to be off work for another week and probably longer. I am worried and I have no idea when I will fully heal, or when I will be able to get back to normal activities. Prior to getting the vaccine, I was an ardent runner. I exercised every day and exercise is very important to me. I don't know how long it will be before I can go back to work or back to my exercise routine. I would never be in this situation, if I had not taken the Pfizer vaccine. I feel I was overdosed. I think one shot of the Pfizer vaccine would have been sufficient. I just went through 12 months without getting Covid. My immune system is suppressed so I am seriously careful about picking up germs. I have been

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

using sanitizer wipes and hand gel for years because of my immune system being suppressed. Long before the whole world heard about Covid, I was acutely aware of germs & viruses in public places. I am so sorry now that I got this Pfizer vaccine. I think I could have gone on living for the rest of my life, without catching Covid, because I am so careful. If I had to do it all again, I would not get this vaccine. The research was not completed. The trials were not long enough. The trials were conducted in a controlled setting. They do not know all the side effects. They do not know the extent of the adverse effect on anybody, never mind somebody with my suppressed immune system. They said the side effects could be chills, fever, flu symptoms, tiredness, joint pain, muscle pain and headache. Nobody told me I might pass out or faint. Nobody warned me. If I had known fainting was a possibility, I would not have been home on my own. The word needs to get out about this side effect. The media needs to know. The public needs to know. I do not want this to happen to anybody else. Since this happened to me, I heard or someone else, that also fainted. These vaccines need more research period." The patient underwent lab tests and procedures which included unspecified blood test on 13Feb2021 with unknown results, body temperature of 100.1 on 11Feb2021, computerised tomogram: normal on 17Feb2021, X-ray on 13Feb2021 had no broken bones but otherwise with unknown results. The clinical outcome of loss of consciousness, fall, joint dislocation, thumb fracture, concussion, dizzy spells, headache, chills, fever, being unwell, being pale, pain, contusions, decreased appetite, nausea, back pain, sickness, pain in arm, memory deficit, weakness, balance difficulty, fatigue, shaky, whiplash injury, lethargic, inner ear disorder and ADL impaired were unknown. Information on Lot/Batch number has been requested.

1106748	3/16/2021	UT	53	F	3/11/2021	3/11/2021	Within 30 minutes of vaccine entire left side had numbness and tingling from left toes to left eye with radiating pain in head and swelling of neck and throat. Numbness subsided within 24 hours followed by pain and sensitivities on entire left side for the next 24 hours. Swelling in throat continued for the next 24 hours following vaccine peaking the next day 36 hours after vaccine. Significant trouble swallowing liquids including saliva. Choking on solid foods the day following vaccine. Lips tingling continued for 48 hours after vaccine and subsided at end second day 3/12. Throat and esophagus swelling continues to this day - 6 days after vaccine with only slight improvement in swelling. Swallowing is still difficult as of 6 days following 1st vaccine. Spoke with EMT at vaccine site who recommended Benadryl. Benadryl started within 1.5 hours of vaccine administration. Contacted allergist who recommended 2-3 x dose of antihistamines for swelling. A dose of 3x was done for 4 days and decreased to 2x dose of antihistamines on Monday and continue at that level at time of report today.

1106683	3/16/2021	CO	41	F	3/16/2021	3/16/2021	<p>Patient felt faint nearly immediately after but said she wasn't having problems breathing. She was told to breath deeply and she quickly started feeling "a little better" so she was helped to a chair with arm rests in the room. She said she had an orange in her bag, so she started eating her orange. Just a minute later she said she was going to pass out, so the pharmacist caught her. He held her up in the chair and tried to revive her for a few moments but noticed that the blood was draining from her face and her lips were turning blue so yelled for one of his technicians to call 911 and the other to grab an epi pen. He then lowered her to the floor in case he needed to begin to resuscitate while the technician brought him the epipen. While lowering her she urinated on herself. As the pharmacist went to check her vitals before administering the epipen and beginning cpr if necessary the patient suddenly gasped once and her eyes opened widely, but not continue to breath. Upon inspection in her mouth there was a piece of orange near the bottom of the throat. The pharmacist asked if she was choking and she did not response at all, but did not start visibly breathing either. So the pharmacist swiped the piece of orange out quickly, in case it was either previously lodged or patient would have to be resuscitated. She did not seem to enjoy this and this seemed to wake her up and she quietly gasped not choking. She started to quickly improve and admitted that she was feeling better, and had passed out before after getting blood drawn but never after a shot so didn't mention this. While this was happening a police office was going through the drive through so the technician called him in for assistance and he arrived around this time. He asked her a few questions like "what's her name, who's president, how many quarters are in a dollar" which she was able to answer. She said she was mostly embarrassed and was feeling much better. She sat up in the chair again about the time the emts came in. The checked her out, but she didn't want to go to the Emergency Room. She was driven home by her father. I called her later around 6 pm that night and she said she was feeling totally fine and I advised her to please call her PCP and discuss this incident with him or her.</p>

1106667	3/16/2021	CA	67	M	3/12/2021	3/13/2021	Information here obtained from daughter: on Thursday patient had an uneventful fistulagram with angioplasty. Patient got vaccine at end of usual Friday am dialysis treatment. He was observed for about 30" and no untoward event noted, vitals usual. At home on Saturday morning, seemed not quite himself by wife as reported by daughter, from whom i got his information. He gets up late as hemodialysis starts at 515 am. No reported problems on Friday. On Saturday morning, he seemed not himself but sat down and ate breakfast around 9 am. On getting up from table he got suddenly weak, his head rolled back and his eyes rolled up. 911 called and he was given resuscitation efforts of unknown duration which were unsuccessful. He was pronounced dead at 11 am and the mortuary was called. No premortem labs, et al.
1106631	3/16/2021	TN	45	F	3/16/2021	3/16/2021	The patient reported itchy/puffy eyes about 15minutes after vaccination. I gave the patient a dose of liquid benadryl. The patient was monitored for an additional wait time before stating she felt okay and wanted to go home.
1106630	3/16/2021	CA	28	F	3/16/2021	3/13/2021	Unresponsiveness, glazed over eyes, unable to focus, this Payo tint
1106901	3/16/2021	NY	40	F	2/13/2021	2/17/2021	After the 1st vaccine on 2/13/21 I developed a round red itchy ring around the injection site and some hives and itchiness on my face. I used cortisone and benadryl to help. My dermatologist advised me that I should still get the 2nd dose. On 3/13 I had my 2nd dose and on 3/15 I developed that round ring at the injection site again and a bad case of hives on my face and left hand. My eyelids were also very swollen. I then went to a facility in where they treated me for an allergic reaction with a dose of dexamethasone in the office and an RX for prednisone which I haven't started yet. This reaction came on much faster than the 1st dose and benadryl wouldn't help much this time.

1106827	3/16/2021	CA	74	F	3/15/2021	3/15/2021	The patient began experiencing numbness on the right side of her face about 10 minutes after her vaccine was administered into her right arm. She reported that the right side of her face felt like it was red and swollen. She endorsed some drooping of her right eye. She was able to communicate fully, denied shortness of breath, difficulty breathing, and difficulty swallowing. She denied irritation at the vaccine site or any new rashes. Her only known allergy is to shellfish and iodine, which cause nausea and vomiting. The patient waited for about 25 minutes following the administration of the vaccine. Her symptoms did not begin to improve and it was recommended to contact EMS. The patient refused to call EMS and instead contacted her physician and left the facility.

1105587	3/16/2021	OR	27	F	3/12/2021	3/12/2021	I noticed a very mild headache and slight coldness within 2 hours of my vaccine. Onset of my severe symptoms began around 10PM on 03/12/2021 with a stabbing headache (Felt like someone took an air pump and kept 'blowing up' my head. My eyes felt achy and heavy and every time I looked in a different direction I would get a zapping/electric feeling throughout my head that would cause my head and neck to spasm (longer duration) or twitch (quick jolt). This also caused dizziness). I got really cold and had intense shivering and shaking. Around midnight, my skin started feeling bruised all over my body (very sensitive to touch, including my bed sheets against my spine felt like rubbing up against a wound). At the same time, my joints (especially my neck, hips, and knees) got hot to the touch and were incredibly painful (induced tears). My muscles developed a deep ache that also caused significant pain. I felt very weak and confused. I didn't take my temperature until the early morning, and it was 102.9 at that time. I alternated taking Tylenol and Ibuprofen throughout the day, but my temperature stayed between 102 and 103.1 for about 24 hours, as did the previously noted symptoms. I noticed a gradual improvement of my symptoms over the next two days. On the evening of 03/14/2021, my headache worsened some, and I had an unexpected episode where I nearly passed out (dropped to the floor but stayed conscious). I also had intermittent foot tingling (very noticeable, not mild) over the course of a few hours. For 3 full days (but by far the most severe within the first 24 hours), I experienced some strange sound processing. Things like the sound of a car driving by or the ceiling fan felt like it echoed throughout my whole body and gave me an uncomfortable shivering feeling. As of today (03/16/2021), I am mostly recovered. I am still experiencing fatigue, a very mild headache, and some mild pain. My nausea has completely resolved, though that was never a chief complaint of mine. I realize that some of my symptoms are to be expected with this vaccine. But especially the level of pain I experienced throughout my entire body was very concerning and not something that I was aware could happen as a result of the vaccine.

1105748	3/16/2021	MD	73	M	3/16/2021	3/16/2021	Thursday, March 11, 2021 (approximately 8:30 am) Patient experienced blurred vision, unbalance, and slurred speech and had an irregular heartbeat. March 11, 2021 (approximately 11:30 am) Patient was admitted to Hospital administered CT scan, MRI and multiple blood tests. Diagnosis - Ischemic Stroke
1105515	3/16/2021	OK	61	F	3/12/2021	3/13/2021	Approximately 12 hours after injection I experienced extreme body aches. Hands ached, hips ached, back aches, legs and feet ached. Hurt the balls of my feet when I walked. My eyes felt like they had sand paper in them. I did not run a fever but my body felt like I had. I had Flu B January of 2018, my symptoms after Janssen Shot were as severe as Flu B, but the duration was not as long! Approximately 24 hrs after injection I starting experiencing a headache, along with neck and shoulder aches. And I experienced fatigue for 3 days after injection along with the headache and neck, shoulder and back ache. On the fourth day following the injection I only feel tired. Aches, pains and headache are gone.
1105402	3/16/2021	IN	61	F	3/6/2021	3/13/2021	Itchy, warm, large lump under skin. As of the 15th could visually see outline of the lump. Checked out symptom online and I think it may be what they call "Covid Arm"?
1105488	3/16/2021	TX	56	M	3/2/2021	3/7/2021	Developed new onset unilateral facial drooping, difficulty with eyelid closure, loss of nasolabial fold, and loss of forehead furrow on 3/7/2021 diagnosed as Bell's palsy

1105465	3/16/2021	GA	50	M	3/1/2021	3/5/2021	Approximately 3 days after the injection I had a bad breakout of acne on my scalp and on my temples. I went to the dermatologist and this was treated with Doxycycline Hyclate. The bad breakout of acne cleared up in about 1-1.5 weeks. At the two week mark I started to have a burning sensation near my left eye that felt like a sunburn or some nerve tingling. I interpreted this to potentially be the early signals of shingles so I started taking Valtrex. I will take a 1,000 mg dosage of Valtrex twice a day for 7 days to treat this. I had the Shingrex vaccine on 12/19/19 and 4/29/20. I feel like both of these issues were potential side effects from the Covid vaccine.
1105413	3/16/2021	FL	43	F	3/11/2021	3/11/2021	Day 1 - Within 30 minutes of injection I felt dizzy and my vision was unfocused (almost blurry). Day 2 - The ocular disturbances continued and I had a huge headache. Almost felt as if my eyes were dilated. Day 3 - The back of my head and neck ached like whiplash from a car crash if I moved my head up and down; head felt stiff and heavy; ocular disturbances continue Day 4 - Same symptoms as Day 3 continue

1105392	3/16/2021	MD	28	F	2/26/2021	2/26/2021	The patient did report swelling, induration and pain at the injection site. The patient reports onset of headache, fever of 100.6, chills, body aches, night sweats, and malaise within a couple of hours of receiving dose 2 of her Covid 19 vaccine. Due to how she felt, she went to bed soon after, and slept until the next morning. Upon waking up she noticed resolution of all her symptoms except for night sweats, and malaise. She continued feeling hot and having night sweats but did not appreciate having a fever. She also reports the onset of significant facial swelling, periorbital swelling and swelling of her hands and feet, basically her entire body. She also reports an onset of "foul smelling" diarrhea. Her chronic eczematous areas which are her eyebrows, posterior neck, and scalp became more itchy and flaking and peeling. She developed new areas of eczema and itching over her torso located at her mid axillary areas from her bra line down to her waist area. She also reports the onset of brownish red/ amber colored urine since receiving the vaccine. She continued to flake and peel over her eyebrows and cheeks in continuously and in large amounts for the next 10 days. She reports taking no antihistamines, or antipyretics. She went to urgent care and was treated with 0.5% clobetasol cream which after 2 applications to her face caused a chemical, sun burn like reaction and more severe swelling over her cheeks and periorbital areas. A photo shows that her left eye was so swollen it was half closed and the skin color was purplish. She returned to urgent care on March 11, 2021 and was prescribed a medrol dose pak. She started it right away and her facial swelling improved. On March 13 she came to see me. with improvement in her swelling, peeling and flaking. She was noted to have a fever of 101.6, then it was 100.6 after recheck and finally 99.6 before the end of her appointment. It isn't clear whether her temp decreased because her medrol taken earlier that morning had kicked in or by removing her sweatshirt and being out of the sun allowed her to sweat and decrease her core body temperature to that level. She was asked to continue checking her temp which she reported as 99.8 on March 13, 100.6 on March 14, and 100.5 on March 15. She has been instructed to check her temp everyday for the next 14 days. Her urinedipstick showed 1+ bilirubin and ketones with trace blood and all other indicators were negative. Patient was

1105815	3/16/2021	SC	37	F	3/16/2021	3/16/2021	Scenario: Pharmacist administered immunization and patient had immediate reaction to imz. The patient has multiple health conditions such as lupus, cerebral palsy, and is currently on dialysis. She indicated on the PQCF that she had never had an adverse reaction after a vaccine but after the incident, her husband indicated this was normal and not uncommon. SIG: Pharmacist Administered Immunization What happened (Describe in detail, what occurred)? * The patient came in for a covid vaccine; this was the first of a 2 series of Pfizer. * The pharmacist injected the immunization and a few minutes afterwards the husband called for the pharmacist to come because his wife didn't feel well. She immediately became unresponsive and her eyes rolled back into her head but she came to. She was responding somewhat to questions but she was also slightly mentally impaired at baseline due to her co-morbidities. She never fell to the ground or wanted to lie down, so not a true faint. * The pharmacist offered to call 911 but they both declined. The patient was given water and a banana and taken to a private area to recover until she felt well enough to leave. How did it happen? * The Pharmacist administered an appropriate, routine vaccine per protocol. *Patient had an somewhat immediate reaction (~4 minutes) after the vaccine. *The pharmacist followed the adverse event protocol. CPR was not administered nor benadryl. Why did it happen (Root Causes)? * Unknown; patient has no known allergy to the vaccine but has had adverse reactions to different procedures in the past. Plan of Action * Make sure all pharmacists are refreshed and aware of the adverse reaction protocol. *Document reaction as a SCRT and with VAERS. What specific task will take place to prevent future recurrence? *N/A. Who: * Pharmacist Where: * clinic When: *All pharmacists at location must review by 3/20.

1105850	3/16/2021	IL	83	F	3/9/2021	3/13/2021	3/13/21 ER HPI: 83 y.o. female who presents to the Hospital Emergency Department by private auto with her daughter. The patient comes in because her blood pressure at home has been very high. It is actually not reading on her cuff. She has a very dull headache on the left side of her head, but states it is very mild. No chest pain. She might be a little bit short of breath, but not much more than normal. She denies any current neck pain. She states a few hours ago she had a little bit of pain in the left side of her neck that was just brief and then way. On my initial evaluation her systolic blood pressure was around 240. The patient does have a history of anxiety. She states she has had typical anxiety, but nothing new. 3/15 office followup note: Subjective: Patient is 83 y.o. year old female that is here for ER follow up. 2 ER visits over the weekend. BP was elevated into the systolic 200s. Has ringing in ears when BP was elevated. On Saturday: Left side of throat dry Left side of face "doesn't feel right", hard for patient to describe When she woke up on Saturday, couldn't see out of left eye, this has improved Says her voice doesn't sound the same, "gravely" She did not tell the ER doctor on Saturday about the neurologic symptoms. In her 1st ER visit she had a chest x-ray which showed no acute disease. Cardiac enzymes were negative. ER doctor increased her losartan dose and gave her p.r.n. clonidine. In the early morning hours on Sunday, she returned to the ER. Blood pressure was elevated again at 208/85. Patient was given sublingual nitro and a Norvasc 5 mg tablet. After the sublingual nitro, blood pressure was 144/84. ER doctor discharge patient with follow-up today.
1105921	3/16/2021	WA	70	F	3/13/2021	3/13/2021	Patient had first vaccine 4 weeks ago with no side effects. But after her second vaccine, patient said she immediately felt something was wrong with her vision, but did not tell vaccine provider. She waited 15 minutes as told to be monitored, then left. But after she got outside she realized her vision was really distorted. Unfortunately, she did not return to the pharmacy for help. She went to consult with her doctor today, (3 days after second vaccine) and was told she has fluid behind her retina of her right eye and was referred to eye specialist.

1105820	3/16/2021	WI	89	F	2/12/2021	2/14/2021	<p>Patient seen and evaluated by PA-C. with myself. We agreed on the clinical findings and implemented our plan together. Please see PA's note for details. All relevant procedures supervised. Patient arrived to the emergency department due to respiratory symptoms, hypoxic, reported that Wednesday he received his 2nd dose of COVID vaccine. His initial workup was concern for NSTEMI with elevated troponin and peaked T-waves, his chest x-ray concerning for COVID/pneumonia. Patient initially tolerated oxygen by nasal cannula and sepsis protocol was started including IV fluid resuscitation that was done cautiously due to the concern of COVID with respiratory failure. The biotics were given. PA-C readdressed code status with patient who confirmed that his DNR DNI, she so contacted his daughter. Patient had multiorgan failure including acute kidney injury, and pneumonia with respiratory failure +/- respiratory failure. Due to the concern of NSTEMI patient was initially going to be transfer to was hospital and transfer was started. Patient respiratory status started deteriorating and his blood pressure dropped slightly but improved after 500 cubic centimeters of IV fluid and he was also placed on a NIPPV. Around 6:00 p.m. patient has significantly desaturation and he discontinued himself NIPPV. Due to inability to intubate patient, he was ventilated with BVM, patient is slowly improved saturation levels and was opening his eyes, he was placed on a non-rebreather. At this point there is high concern of ARDS and due to inability to intubate or give for the respiratory support His daughter was at bedside and updated of current medical status and poor prognosis. Patient continued deteriorating and at this point he had agonal breathing. His daughter was at bedside and she was made aware of the futile prognosis of patient due to his respiratory failure. Patient rapidly became bradycardic and went into cardiac arrest. No CPR was done due to the DNI DNR status of the patient. Critical Care Procedure Note Authorized and Performed by: MD Total critical care time: Approximately 30 minutes Due to a high probability of clinically significant, life threatening deterioration, the patient required my highest level of preparedness to intervene emergently and I personally spent this critical care time directly and personally managing the patient. This critical care time included obtaining a history; examining the patient; pulse oximetry;</p>

1101508	3/15/2021	GA	29 F	3/12/2021	3/13/2021	<p>On the day following my second dose, I woke up with a headache around 6am (expected this may happen and took Tylenol). A little before noon my partner and I got in the car to run an errand. In the car I started to feel worse and I fainted. I was out for about 30 seconds according to my partner. I came to and had my vitals checked at an urgent care center (all vitals WNL). During this episode in the car I think I also had chills. The onslaught of symptoms in the car lasted only about an hour before resolving. I continued to have a off and on headache for the rest of the day but other symptoms resolved. By Sunday I was pretty much back to normal; any headache symptoms were pretty much resolved. I am not sure if the fainting episode was related to vaccine or not. I have had fainting episodes in the past (2-3x at dentist office and 1x at optometrist when having eye pressure checked).</p>

1101689	3/15/2021	NE	59	F	3/12/2021	3/13/2021	Eyes became extremely itchy, red, watering, swollen. I also began sneezing and runny nose. I took a Benedryl and within 20 minutes was feeling much better. I continued the Benedryl every four hours through the night (set alarms) and was fine in the morning. Reaction started in the afternoon (1:00 p.m.). Took Benedryl at 3:00 p.m., 7:00 p.m., 11:00 p.m., 4:00 a.m. (time changed). I did not need any more at 8:00 a.m.
1101692	3/15/2021	WI	67	M	3/13/2021	3/13/2021	?I recd the first moderna vaccine 2-13-2021 at 11 AM. Headache, right side only, started same day at 7:30 PM, sore shoulder at vaccine site about 10:30 PM same day. Both were gone the next morning. I recd the second dose of the moderna vaccine 3-13-2021 at 11 AM. By 2 PM I had a ranging head ache, again right side only. I drove four hours to the vaccination site, hospital. I was driving home when this started. I stopped to purchase Tylenol about 3 pm which it turns out had no effect. I was driving west into a setting sun, as the headache got worse, my eyes became more and more sensitive to the sun, I stopped a second time to purchase a second pair of sunglasses that I could wear over the first pair, that didn?t help, I ended up stopping at a rest area until the sun set. I got to my house at about 6 PM, by then I could no longer wear my prescription glasses, besides the headache I was now very dizzy. At about 9 PM the pain started, between my shoulder blades first, never at the injection site. From that time on, including today, the pain has constantly moved around my body, the worst pain is associated with areas that arthritis affects me, hips, knees, hands, ankles. I have had a mild fever, ranging from 100.9 Saturday night to 100.3 now at 11 AM 3-15-2021. Yesterday, 3-14, my head was swearing, my feet were ice cold. I had an electric blanket from my waist down and an ice pack on head. If I have ever felt worse in my life I don?t remember when that would have been. The pain has moderated today, I expect the worst is now over. If as the health specialists are suggesting a booster will be required this fall I will undoubtedly have incredibly significant reservations with this vaccine.

1101699	3/15/2021	WA	80	F	3/5/2021	3/7/2021	Client states her eyes swelled shut, her hands became swollen and she had noisy breathing(maybe wheezing) all started 2 days after vaccine and the symptoms didn't resolve until 8 days after they started. She did not obtain medical care. She doesn't speak English and didn't know she should've gone to the ER. Plans to now schedule to see her doctor to find out if she should get a different covid vaccine as she had a reaction to Moderna.
1101701	3/15/2021	RI	61	F	2/2/2021	2/2/2021	Developed a rash near my eye after a couple of days rash moved to my face and neck. After the second shot rash covered face, neck and face and eyes would be swollen
1100211	3/15/2021	HI		F	1/3/2021	1/3/2021	face looked droopy on the left side;; itchy; felt like my face had been punched on the left side; A spontaneous report was received from a consumer concerning a 60-year-old, female patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced pruritis, facial pain and facial paralysis. The patient's medical history, as provided by the reporter, included bell's palsy 20 years ago. Concomitant medications were not reported. On 03 Jan 2021 prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: 011L20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 03 Jan 2021, prior to receiving mRNA-1273, the patient felt itchy and like her face had been punched on the left side. On 06 Jan 2021 she felt her face looked droopy on the left side. Her dimple came back in her face. On 21 Jan 2021 her eyes was droopy and can see a line on one side, and other side doesn't have a line. It's gotten better with acupuncture. She gets acupuncture and electrostimulation; she had a horrible reaction to steroids. Her eye was stuck open for 3 months, she had a patch. Treatment for the events include 3 sessions of acupuncture. Action taken with mRNA-1273 in response to the events was not reported. The outcome of events, pruritis, facial pain and facial paralysis was unknown.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

1101419	3/15/2021	NH	44	F	2/23/2021	2/26/2021	I have had vision auras associated with headache/migraine in the past, but have not had one in over six years. Three days after my second COVID vaccine shot, I had an aura. The next day, I had another, and the following day, I had two. Over the following week, I continued to have auras whenever I was in a room with bright light/sunlight. The auras subsided after that week, and have not returned.
1101368	3/15/2021	NJ	96	M	3/12/2021	3/12/2021	3/12/21 Headache and soreness in eyes Extremely tired Soreness in arm
1101841	3/15/2021	AZ	51	F	3/9/2021	3/9/2021	To give context to the adverse event, in early November 2020 I was diagnosed with Bell's Palsy of unknown origin on the left side of my face. I was tested for COVID-19 and it came back negative. It resolved itself in about a month. About 8 hours after receiving the COVID-19 vaccine on 3/9/21 (about 6:30 p.m., I started to feel a slight headache. Because I had just had the vaccine, I was trying to avoid taking any pain medication, so I did not take anything for it. The headache got worse throughout the evening, and by 10 p.m. I would describe it as a moderate headache. It was primarily concentrated on the left side of my head towards the front, on my forehead and above the eyebrow. I went to bed without taking any pain medication. About 3 hours later, at about 1 p.m., I woke up, and the headache was much more intense. It felt like all the nerves around the left side of my face, including the nerve along my jaw line leading to the 7th cranial nerve that causes Bell's Palsy, were throbbing. I grew concerned about getting Bell's Palsy again, so at that time I took one ibuprofen Advil. After taking it, the headache subsided, although I continued to have a dull headache throughout the night and the next day.

1101819	3/15/2021	NY	50	F	3/9/2021	3/9/2021	Immediately after receiving the injection, I experienced a headache right behind my eyes (similar to sinus headache); after approximately 15 minutes, I experienced a ringing in my ears. I told the attending person, but she said it was probably due to being anxious about getting the shot. I left after being in the waiting area for 30 minutes and began driving home. My face felt very warm, so I opened the car window. I touched the side of my face and felt hives. My tongue felt thick, but I did not feel hives going down my throat. My torso started to itch and I had hives there as well. There was no raised area at the injection site. I became very itchy on my head, neck, and arms. When I arrived home, I took a dose of benadryl. Four hours later, I took a dose of zyrtec. My hives subsided and my tongue returned to normal, but I was still itchy. The next morning, I took a dose of claritin and called my doctor. In the afternoon, I took benadryl. In the evening, I took zyrtec. I continued this for 2 more days. The day after my vaccine, a node between my thumb and forefinger on my left hand was swollen and painful to the touch. My hand was swollen and my finger joints ached. I went to the doctor for an examination. The swelling and pain in my hand continued to worsen during the day and overnight. I kept ice packs on my hand and it felt better after 3 days.
1101794	3/15/2021	VA	45	M	3/13/2021	3/13/2021	Felt extremely warm, started feeling lightheaded, started sweating profusely, vision started blacking out, got very close to blacking out and fainting. I was seated at the time, waiting the 15 minutes for observation after the shot, symptoms happened about 10 minutes into the waiting period. I was given some cold water right away, over the next 10 minutes my vision started coming back and I stopped sweating. Was told I looked flush when they first came over but was looking much better after another 10 mins. I stayed an additional 30 minutes for observation after the event and had friends come take me home and get my car. I'm still feeling very slightly light headed and somewhat tired 2 days later, but otherwise feeling great.

A 58-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot number: EL0140) via unknown route of administration on 12Jan2021 14:00 PM at single dose in left arm for COVID-19 immunization at nursing home. Medical history included ongoing high blood pressure. Ongoing concomitant medication included metoprolol orally at 50 mg, once a day taking for 10 years and hydrochlorothiazide orally at 25 mg, once a day taking for 3 years both for high blood pressure, mecobalamin (B12) orally at 1000 ug, once a day taking 6 years for low b, colecalciferol (D3) orally at 100 ug, daily (50mcg; take two daily by mouth) taking for 6 years for low d. Patient received the first dose of the Pfizer covid vaccine on 12Jan2021 and her second dose was scheduled 02Feb2021. She had symptoms of shingles last Sunday on 29Jan2021 and was given famciclovir and was advised to not take the scheduled second dose of the vaccine. The next time that the vaccine will be given in their facility is on 22Feb2021-23Feb2021, and she wants to know if she can get the vaccine despite having shingles. However she came down with shingles. Adds she is being treated with Famciclovir 50mg; take three times daily by mouth. Her doctor recommended she not get the next dose of the Pfizer COVID 19 vaccine on 02Feb2021 so she stayed home and did not get it. Should she get the second dose? She noticed burning and tingling on the left side of her head in Jan2021 and then shingles on 29Jan2021 on the left eyebrow and hairline. Also shingles was reported as worsened in 2021. Adverse events required a visit to physician or ER was reported as Urgent care but not to the hospital. No Prior Vaccinations (within 4 weeks). The outcome of events shingles and condition worsened was not recovered, while for other events was unknown. No follow-up attempts are possible. No further information is expected.</p>

1100469	3/15/2021	NM	62	F	2/19/2021	2/1/2021	she felt something in her foot (right foot) under the toes like she had sept on something like the lymph node down there was inflamed; the lymph node under her arm got inflamed; armpit swelling; her eyes was runny, sort of hurting like salt in her eye; her eyes was runny, sort of hurting like salt in her eye; arm was hurting where she got the vaccine in the right arm; she had a mucus plug and was bleeding; This is a spontaneous report from a contactable consumer. This consumer (patient) reported that a 62-years-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) at the age of 62-years, via an unspecified route of administration in right arm on 19Feb2021 at single dose for COVID-19 immunization. Medical history included hadn't had her period for 8 years. Concomitant medications were not reported. The patient historically received first single dose of BNT162B2 at the age of 62-years for COVID-19 immunization. Patient received the 2nd dose of the vaccine last Friday 19Feb2021, when she was driving home her eyes was runny, sort of hurting like salt in her eye, it was like that all evening she had to put a patch on her eye to help it. That same evening my arm was hurting where she got the vaccine in the right arm, and the lymph node under her arm got inflamed. The next morning on 20Feb2021 when she woke up she felt something in her foot (right foot) under the toes like she had sept on something like the lymph node down there was inflamed, but that went away. The armpit swelling has continued since the day of the vaccine. Now this morning in Feb2021 she had a mucus plug and was bleeding she haven't had her period for 8 years, every two days she had something new. Patient wanted to know what had been woken up in her body. Consumer added that she read on line that patients should wait for 5months before going to their doctor about the swollen lymph nodes because they might send the person for a test, mammogram and it may say they have cancer, in the clinical trials apparently some patients has issues with their lymph nodes and when they did testing it was found they had cancer, but it was not cancer it was the vaccine. Outcome of the event she felt something in her foot (right foot) under the toes like she had sept on something like the lymph node down there was inflamed was recovered/resolved in Feb2021; of the armpit swelling was not recovered/not resolved; while of remain

---

parameters. The review of the manufacturing record confirmed that all in process checks, all line startup and end of batch challenges, and all line clearance and cleaning activities were completed satisfactorily. All raw materials used in the complaint batch were of the correct weight and identity. All the manufacturing temperatures mix speeds and mixing times were within acceptable ranges. In-process appearance and specific gravity test results were all within acceptable ranges. A review of the solution filtration documentation confirmed that all filters and Water for Injection (WFI) were used within their expiration dates, and that all the filtration times, pH results, and pressure specifications were met. The manufacturing processes of raw material usage, solution formulation and filtration were all found to be acceptable. All manufacturing parameters met established requirements. A log is maintained throughout the manufacturing process of the amount of elapsed time that the product is out of refrigeration. A review of the elapsed time tracking logs confirmed that all times were within allowable limits. PACKAGING BATCH RECORDS: Complete -Acceptable. The review of the packaging record confirmed that all in process checks, all line startup and end of batch challenges, and all line clearance and cleaning activities were completed satisfactorily. Audits are performed on the finished packaged units by Packaging Operations personnel at regular intervals throughout the final packaging process. This is done in order to ensure that all required labeling and packaging is present, complete, and meets all establishments requirements. During the audits, inspectors visually check the appearance of the finished product for defects. The Pfizer-BioNTech COVID-19 Vaccine vials are loaded into trays containing 195 vials each. Five trays are then banded together into a bundle. The vaccine requires ultra-low temperature freezer storage. Prior to loading, freezer temperatures were verified to between -67°C and -73°C. Freezer shelves were then loaded with bundles of product. During the freezing phase, which occurs 60 hours after loading, the temperature of the freezers is monitored. If the temperature is warmer than the previously recorded temperature, supervision is notified. Additionally, after the freezer temperature drops below -60°C, the temperature recorded may be warmer due to the freezer operation

							caused by the freezer cycling. This is acceptable. A review of the log for the reported batch confirmed that all freezer temperatures acceptable. Samples are then stored until the product is released for distribution. LOT HISTORY: Complete - Acceptable. The results of all tests and inspections met required specifications at the time of release for distribution on 31Jan2021 Reserve Sample Evaluation: Rsrv. Sample Evaluation Req?: No. Rsrv. Sample Eval. Rationale: Visual examination of a reserve sample would not be expected to indicate the potency of the drug product. A reserve sample was not sent to the QC-lab to determine the amount of active ingredient since the complaint was received within six months of the release date of the involved batch. The results of all analytical tests performed at the time of lot release were confirmed to be within registered specifications. All available stability results for this product were within registered specification and stability studies (including accelerated studies) are ongoing for this product. Confirmed Reserve Defect?: No. The complaint history for the reported PFIZER-BIONTECH COVID-19 VACCINE lot EL9266 was reviewed. As of 26Feb2021, there are a total of two complaints for this lot and classification. No lot specific trend was identified that would require additional investigation. Lot Trend Actions Taken: There were no lot trend actions taken as a result of this investigation.

1102901	3/15/2021	FL	37	F	3/3/2021	3/3/2021	Tongue, lips, face went numb at around the 5 min mark. Then hands and arms. I was dizzy and weak, had a hard time walking. I noticed my vision was blurred. I couldn't see freckles on my arms that I usually can see. After 40 mins the numbness improved. On the drive home I was swept with head-to-toe numbness for about a min with the feeling like I was going to throw up and chest pain. The chest pain continued to come and go a few times for the next 10-12 hours. I was very dizzy and very weak. My vision went back to normal about 5 hours later. But I remained dizzy and weak for about a week. I still have dizziness on and off throughout the day that I never had before though. All those symptoms I feel like are outside of what was expected and concern me but other than that I had symptoms that I expected as well like my arms was sore for maybe 3 hours total the day after, I was tired, and had an elevated temp around 100 degrees.
1102877	3/15/2021	NE	69	F	3/8/2021	3/9/2021	Patient received the Pfizer COVID-19 vaccine on 3/8/21 (first dose) in the left arm. She woke next morning with blisters on the left hand, then developed widespread pruritis that only involved the left side of the body. Had swelling around left eye. No frank hives, no SOB or dyspnea. Treated in ER with oral Benadryl. Now 1 week later, she still has itching throughout the entire left side, from scalp down to feet. Still taking Benadryl once daily now. Wondering about whether to get the second vaccine.

1102871	3/15/2021	NJ	47	F	12/30/2020	12/30/2020	With in 15 minutes I started burning up, my face turned purple. My eye lids felt like I had 10 pounds weights on them, I couldn't keep them open. I short episode of shortness of breathe and that went away. I got nausea, felling all of a sudden like crap. I felt like I was hypotensive for the rest of the day. I drove home I ate two eggs on rye bread. I took two Tylenols and took a nap. I woke up at noon with serve abdominal pain for about an hour. I got out of bed and just couldn't stay out of bed, I could stand up right, I felt hypotensive. I had to be laying down. The next morning I woke up with a slamming headache, I took two Tylenol and it went away. I was ok after that until about day 6 after the vaccine. I had chills and thought i maybe had Covid but tested negative. My arm started swelling up, my whole upper arm was swollen. It was hot to touch and itchy, they thought it was cellulites and put me on medication, after 5 days It wasn't doing anything and it was getting worse. I went back to the Urgent Care, he had me finish the medication and took Benadryl over the next two days and it started to get better. I was advised not to get the second shot.
1102817	3/15/2021	WI	79	M	3/11/2021	3/12/2021	Patient is an 79 year old male who had his 2nd Moderna vaccination in his dominant right arm Thursday afternoon. Upon awakening Friday morning, he had difficulty walking. His legs were strong enough to hold him, but he was unstable. He also had some numbness on the palmar surfaces of some index and middle fingers of his left hand. His speech was somewhat garbled, but when his wife would encourage him to repeat himself, he could enunciate more clearly. He had some nonspecific difficulty swallowing. He attributed this all to adverse reaction to the vaccination, which would pass... Friday mid day his wife took him to the barber, and on return home he was briefly nauseated and vomited. Later in the day on Friday they went for car ride, and on return home he was briefly nauseated and vomited. He had no other episodes of nausea. He had no fevers or chills. He had no visual disturbances. He had no other numbness or paresthesias. He was aware of no clear weakness. Finally today, the gait instability persisted and the numbness in the left hand, so he came to the ER for evaluation. Patient is currently recovering in the hospital

1102811	3/15/2021	NE	70	F	3/1/2021	3/6/2021	I got the Moderna on March 1st. On March 6th I woke up with red puffy eyes. Took Benadryl and got better. On March 8th woke up with swollen lower lip. Took Benadryl and was better by noon. On March started breaking out with a rash on right side of body. Took Benadryl and put Hydrocortisone on it. Rash kept getting worse with big spots and itching. On March 11th was worse so called the Medical Center and asked if the Moderna vaccine could have caused this? They said, no! If got worse come in. March 11th at 9:00 P.M. I could feel my upper lip swelling. Took Benadryl and thought it would be better by morning. It wasn't. Woke up with red puffy eyes and a swollen upper lip. Looked like I had been in a fight. Time to get medical help. Got into doctor at 9:30. They said it wasn't from the shot but I know it was. On Pednisone and cream for shots. Finally getting better!
1102809	3/15/2021		67	F	3/8/2021	3/9/2021	24 hours after second dose of Moderna vaccine, patient came down with a fever, aches and pains, and chills that lasted approx. 72 hours. After this time, patient reported a swollen red circle about two inches below injection site that went away after 48 hours. One week after second dose, patient is experiencing swollen, itchy eyelids and hives on face and chin.
1102794	3/15/2021	OH	72	F	3/2/2021	3/9/2021	Chills, Fever 100.5, muscle aches, head ache, sore eyes
1102932	3/15/2021		32	F	3/10/2021	3/10/2021	Immediately after the shot, Pt. felt clammy, had blurred vision and tingling of both hands, then lost consciousness. Fell to floor, hit forehead, left knuckle and left knee. Was assisted to supine position and symptoms improved. (Admits to feeling anxious and not eating enough before the shot and feels that was related to her reaction.) Left facility after observation, and got food before driving self home. Reports soreness and stiff neck from fall injuries. Reports soreness of injected arm and the same "clamminess and sweating" the following morning with fatigue, but without the tingling, lasting only a few hours, then resolved with no further sequelae.

1103324	3/15/2021	CA	51	F	3/12/2021	3/12/2021	My left arm felt like it was sleeping. 45 minutes after the shot both my arms felt very heavy, I was trying to lift them up and was having difficulty, I had pain in my arm muscles . That evening my eyes felt very droopy, I was having difficulty keeping them opened.. I had body aches, extreme fatigue syndrome, my neck and my head hurt, i felt nauseated, so far it has lasted for 3 days., the headache is improving, but still comes back after a few hours
1103661	3/15/2021	NC	29	F	3/12/2021	3/12/2021	Headache and eyes aching around 10:30pm on 3/12/21 I went to bed and started aching around 4:00am on 3/13/21 by 6:00am 3/13/21 I had a fever of 101.5 and my body aches. I took two pills of extra strength Tylenol and water and laid back down to break the fever and help with the aches and pains. I woke up around 9:30am on 3/13/21 and did not have and appetite all day. I was extremely fatigued all day and had no energy to get out of bed or do much. On 3/14/21 I began to develop an appetite again around noon. I was still fatigued. My arm was very tender and itchy at the injection site and hurt to the touch. My 5:00pm on 3/14/21 I had more energy and the aches were gone but my arm was still hurting and sore.

1103517	3/15/2021	AK	23	F	3/13/2021	3/13/2021	Moderna COVID-19 Vaccine EUA I received the vaccine on 3/13 at 3:45pm and began experiencing symptoms on the day at 5:30pm including dizziness, nausea, fatigue and wiped-out exhaustion, drunk-like dazed and confused, body heaviness, and developed soreness in the muscle of the right arm where the injection had been administered. The symptoms progressed at 6:30pm to include general muscle soreness, muscle twitching on the right side of the body especially on the right upper thigh, increased appetite, malaise, headache, and chills in addition to the aforementioned symptoms. At 7:30pm the nausea and increased appetite improved with food and fluid intake but sleepiness, yawning, confusion, chills, and fatigue worsened at 8:30pm. Temperature at 9:30pm was 95.7 degrees Fahrenheit and a pale, green-like, clammy appearance was visible on the general skin. At 10:30pm the sleepiness reversed to restlessness and insomnia to the point of hyperactivity, and the appetite increased four-fold along with rash up and down the injected arm, numbness and tingling in the injected arm, chest discomfort with palpitations, anxiety, headache, stomach pain, malaise, and general limb edema which all persisted until I was able to fall asleep at 6:30am on 3/14. Many of the aforementioned symptoms improved upon wakeup time at 4pm on 3/14, but extreme sleepiness with nausea, dizziness, fatigue, head pain and right eye pain, and palpitations with chest discomfort persisted until 10am on 3/15, during which time only the nausea, dizziness, and fatigue persisted.

1103515	3/15/2021	TX	38	F			Hives/rash developed within 15 minutes, was injected with 25mg of Benadryl. Another 15 minutes or so later it had become hard to swallow, I was given another 25mg dose of Benadryl. After the second dose it became hard to breathe, started coughing and chest started to hurt. I didn't realize but had broke out in sweat. Nurse checked my eyes. Called paramedics and had epi pen ready. I thought a third dose of Benadryl had been administered but that I am not certain of. Blood pressure was higher than my usual but still considered normal (113/82 I think?) pulse was 120 something, at rest I am usually at 70. I became lightheaded. Paramedics did an ekg, it was normal. They monitored me while I stabilized. Was released when pulse was in the 80's range. Residual chest pain after. 8 days after vaccination I broke out in sweat and became nauseous. Vomited. I then noticed below the vaccination injection (still bruised) and around where last dose of Benadryl was injected there was a large red welp, hot to the touch. The heat eventually went away but the welp remained a few days. 11 days after vaccination is when the cluster headache appeared. Shortness of breath was noticeable on day 12. Day 14 fever and nasal congestion with slight irritation in throat, occasional cough. Day 15 sore throat, coughing progressed (non productive) in to fits that led to vomiting. It is day 18 and shortness of breath is present at rest, chest pain, rash near injection site and bruise is still present. Temp has been low grade fever, hadn't gone above 100. Normal is 96.9/97.1 for me. Oddly day 13 (the day before fever became present) my temp was lower than usual 95.6/95.7 yet I wasn't cold.

1103351	3/15/2021	MI	57	M	3/10/2021	3/10/2021	<p>PRESENTING PROBLEM: Syncope and collapse [R55]</p> <p>HOSPITAL COURSE: History of Present Illness: 57-year-old man known to me for bilateral lung transplant for bronchoalveolar cell carcinoma complicated by bilateral pleural effusions of unknown etiology and mild decrease in pulmonary mechanics, DVT on Eliquis who came to the Emergency Room 3/12/21 with a chief complaint of near syncope. Patient and woke up in the early morning hours of 3/12/21 to use the restroom. While urinating, he became very dizzy and nauseated and had a sense like he needed to lay down to rest. Other than nausea he did not have any other symptoms. He returned to his bed and fell upon his wife and had decreased level of consciousness but without total loss of consciousness (he was able to hear his wife talking to him but was unable to respond). This lasted about a minute and slowly he came back to his senses. After this he felt quite cold and did have some shaking but is not clear whether these were true rigors. He did not have any preceding fevers nor did he have any fevers in the emergency room. After about 5-10 minutes he was feeling back to his normal self but want to come into the hospital to get checked out. He has never had anything like this before. The patient has had chest pressure since his COVID vaccine which he had on Wednesday. This is been intermittent, mostly positional and better with laying on his side and leaning forward, worse with recumbency. It is not pleuritic in nature. No associated shortness of breath. No other fevers chills sweats. No sick contacts. Evaluation in the emergency room was done and a CT scan was done and no pulmonary embolus was found. No parenchymal abnormalities. The patient's pleural effusions remain, and her mildly worsened, personally reviewed. Baseline labs were unremarkable for anemia, kidney injury. EKG personally reviewed, normal sinus rhythm. High sensitivity troponin was done and negative. Family otherwise feels well, no sick contacts, eating well no nausea vomiting diarrhea blood in his stool. Pt admitted for observation. Continued to feel well VSS, ekg stable, ECHO without acute findings (see below), UA neg, cardiac monitoring uneventful, orthostatics negative, walking in halls and eating well. Appears to have had vaso vagal episode. Will be getting routine head imaging in the coming month with cancer history See below testing Care plan upon discharge &gt; To call if any return</p>

of symptoms > To hold metformin until Monday due to recent dye load > Blood cultures Pending, low clinical suspicion > To change H2 blocker to PPI due to GERD on 3 month esophagram > Follow up in clinic when return from break > Dr discussing with pulmonary team most recent CT (see below) and treatment plan moving forward Brief exam: awake, alert, oriented, not in any distress. PERRL, EMOI, tongue midline. Upper and lower extremities at full strength 5/5 in the arms, hands, dorsi flex and flexion at the ankles, knees and legs. Sensation not tested. Brief history and medical decision making: s/p bilateral lung transplant for bronchoalveolar cell carcinoma complicated by bilateral loculated pleural effusion, DVT on eliquis presenting post syncopal event. Syncopal event without evidence of seizure like activity, fast recovery, and no sudden changes consistent with an acute cardiac event. Thus symptoms were likely due to vasovagal event possibly post COVID\_19 related side effect (headache, achy muscles, not feeling well overall). He has no neurologic deficit, CTA thorax without PE, negative EKG, troponin and echocardiogram. He is not on antihypertensives and blood pressures have been normal. Given his initial diagnosis of BAC, there may be concern for metastatic disease, though symptoms have not persisted and he has no focal deficit. He also received contrast for his CTA today, thus will defer further imaging for now. Syncope: - defer 2nd dose of COVID-19 vaccine as its effectiveness in transplant patient is not established and patient potentially had an adverse event. - oral hydration encouraged - monitor for additional ongoing neurologic symptoms such as headaches, vision changes, neck stiffness, fevers, night sweats, weight loss, weakness or paraesthesias - patient advised to avoid driving until further evaluation - consider MRI brain with and without contrast if any symptoms persist or reoccur Complex loculated pleural effusion

1103417	3/15/2021	CA	40	F	1/20/2021	1/23/2021	1) After 3 days of Moderna Dose 1, on 1/23/21, I developed visual disturbances for about 15 minutes, where i have a constant bright round spot in my field of vision (LEFT eye only) that stays even after blinking. (Like the residual bright spot that stays after a camera flashlight flashes you). It eventually resolved without any treatment after approx 15 to 20 min. 2) Also with looking from my left eye, I also see some ripples on my top left corner of my visual field. (like water ripples), and that also lasted about 15 min. I have not encountered any eye issues of this nature before, and i had my last optometrist check in 9/2020 and all was normal. 3) Dizziness was experienced when moving and turning my head ONLY while lying in supine position after both doses. With 1st dose, dizziness lasted about 1 week while lying down, and with 2nd dose, dizziness was experienced for about 1 day only. No dizziness with standing and turning head. 4) Axillary lymph node on left arm (arm that shot was administered) was swollen after both doses that lasted for few days, then resolved. Swelling of lymph node was palpable, about the size of a pea.

1102379	3/15/2021	AZ	36	F	3/11/2021	3/14/2021	This is a positive one, and I can hardly believe it. My irregular pupil dilation independent of each other, occurring for 12 years corrected itself! I swear this is not a joke. I'm flabbergasted. The longer explanation: Something I never talk about, partially because I am scared, is an issue with my eyes that started when I was 19. I am now 36. My right pupil will dilate quite irregularly from my left. A bright light will correct it, but then it will start again after. I've mentioned it to eye doctors, and they brushed it off. Research only has scary answers, with no help, so I have learned to live with it. It used to make me dizzy, nauseous, and I'd lay down. But over the years I've adjusted, and it doesn't bother me. I received the first dose of the Pfizer vaccine on 3/11. Last night, 3/14, I became dizzy and faint. Today, I still felt that way. I was splashing cold water on my face, when I realized, looking in the mirror, my pupils were exactly the same size! And maintained that same diameter. I keep checking, but, so far, it's consistent. I assume the dizziness, lack of balance, and slight faintness today is my body getting used to this, as it's been compensating for the difference for 12 years. So, is this a positive side effect? A coincidence? The vaccine is the only recent change, and nothing else has effected this issue over the years.

1102142	3/15/2021	FL	29	F	3/9/2021	3/9/2021	During the first fifteen minutes after receiving the vaccine, the right side of my face started tingling and became numb. The left side of my face was not affected and there was no respiratory involvement. In the following few hours, my right eye had transient pain and my cheek felt swollen. The next day, I had chills, arm soreness, mild headache at times, and while my facial symptoms were still present, they had improved. The second day I only had mild numbness and tingling on my face with some lip tingling. Day three, four, and five I had slight numbness of the right side of my face and tingling lips, no further symptoms. As of day 6, I have slight eye pressure around my right eye and mild lip tingling.

1103203	3/15/2021	NY	62	F	3/13/2021	3/14/2021	PT HAS BEEN ON DPXT FOR ABOUT 4 YEARS FOR ECZEMA & HAS CONTROLLED HER SX WELL. SHE RECEIVED J&J COVID VACCINE ON SATURDAY & HAD DOSE OF DPXT ON SUNDAY & IS HAVING BREAKTHRU IN ECZEMA SX NOW. PT STATES AFTER GETTING J&J VACCINE ON SATURDAY, SHE HAD NO FEVER, FELT LITTLE TIRED IN AFTERNOON, MAYBE SOME CHILLS (BUT WEATHER WAS COLD), & NOTHING ELSE TO NOTE OF. SUNDAY WAS HER DPXT DOSE. SHE TOOK IT IN THE AM & ABOUT 5 HOURS LATER SHE STARTED TO HAVE BREAKTHRU IN SX. HER MOST SEVERE TROUBLE SPOTS PRE-DPXT TX WAS AROUND HER EYES, CHEEKS, FACE AREA. SHE STARTED TO FEEL INFLAMMATION AROUND EYES & UPPER CHEEKS ON SUNDAY. THIS MORNING THE SX FELT VERY STRONG BUT SEEM TO BE DIMINISHING SOMEWHAT THROUGHOUT THE DAY. SHE IS HOPING THAT IT WILL CONTINUE TO IMPROVE & RESOLVE TOMORROW. SHE CAN FEEL THE INFLAMMATION UNDER THE SKIN - NO VISUAL SX YET. SHE FEELS LIKE THE COVID VACCINE SOMEHOW BLOCKED THE EFFECTS OF HER DPXT. PT HAS NEVER HAD THESE SX DURING HER TX OF DPXT. THE DPXT HAS CONTROLLED ALL HER SX WELL THROUGH THE PAST FEW YEARS. SHE WANTED TO INFORM US SO THAT WE CAN COLLECT DATA. ADV PT THAT IF SX DO NOT RESOLVE OR IF THEY GET WORSE, CONTACT MD FOR ADV. PT AGREED.

1102280	3/15/2021	NY	39	F	3/11/2021	3/14/2021	Redness, irritation and swelling around both eyes. Itching and burning sensation in both. Symptoms developed 3-4 days post vaccination. Fast onset. Consulted with Dr. via video visit. Advised to use tacrolimus topical cream, antihistamine eye drops and other regular medications for reaction. Also advised to use Vaseline to moisturize and protect swollen eyelids, use cold compresses and monitor the symptoms. Treated symptoms with advised solutions and symptoms gradually went away after 3-4 days. Same reaction with 2nd vaccine dose, redness, swelling, and irritation of eyelids developed 3-4 days post vaccine. Going about treatment in a similar manner, will again consult the Allergist office of the reaction.
1102630	3/15/2021	OK	63	M	3/8/2021	3/12/2021	intermittent headache and blood pressure is erratic sometimes going as high as 170/130. Eye floaters and eye flashes and high BP caused ER visit on Sunday 3/14/2021.

1102233	3/15/2021	MD	35	F	2/15/2021	2/22/2021	Experienced moderate headaches everyday for 7 days following first series of vaccine. (NDC el9263) On day 7, woke up in the middle of the night with intense nausea and headache. First thought to have food poisoning because husband who received the same vaccine also had similar symptoms. Both vomited multiple times and experienced severe headaches. After second series of vaccine (NDC en 6201), experienced headaches everyday again which required in taking multiple doses of ibuprofen. On day 7, woke up in the middle of the night with intense headache. Developed intense nausea, headache, neck pain, stiffness, light sensitivity, watery eyes, congestion and could not continue to work. Took multiple doses of advil and had to take off work. No vomiting occurred. Did not see a physician but consulted a coworker/neurologist friend who thought I fit the description of aseptic meningitis. No lumbar puncture or laboratory evaluation was done. Rechallenge was positive.

1102625	3/15/2021	MS	50	F	3/9/2021	3/13/2021	I was told by my doctor after talking with his office on the phone to report my reaction and that he is recommending that I NOT HAVE THE SECOND DOSE of this vaccine. On Tuesday March 9th I had my first dose of the Pfizer vaccine at our drive up site with the health department. I did not have any tylenol or claritin that morning and only took Tylenol that night. Starting the NIGHT of the 10th I started taking my usual Child's dose of Claritin for seasonal allergies. I took Claritin the nights of the 10th, 11th and 12th (thank goodness apparently). The only issue I had the 9th and 10th was REALLY SORE ARM. One the morn ing of Saturday the 13th I woke up and my neck was itching. Then my decollete area. Then my face and head and shoulders and the back of my arms. I felt like I was flushing after a steroid shot with the pin prickly itching and very very very slight pink color to my skin. Eventually by the evening the itch moved to my bra line. I called my local pharmacy (since the urgent care center was closed) and was told to take benedryl or claritin and keep an eye on it. The ADULT dose of Claritin really helped to calm the majority of the itching. I itched a little yesterday and still itch in spots today but the Claritin is helping as is topical Cortaid. The nurse said the claritin I had in my system probably prevented me from turning red. I have been told by two doctors that I should NOT take the second dose. ALL OF THE CONVERSATION WITH MY DOCTOR WAS DONE OVER THE PHONE.
1102613	3/15/2021	ND	71	F	2/18/2021	2/19/2021	Patient received one shot of COVID-19 vaccine (Moderna) and the next day had a raised red itchy rash on left leg from knee to ankle. The next day she experienced a headache beginning behind her left eye that then travelled down the back of her head, neck and into lower back. She had pain in lower back so much so that she couldn't sit comfortably. The next day she had bubbling and rolling stomach. The next two days she had severe diarrhea, then a spot on her face (cheek). The next day she had pain in her right foot and couldn't walk on it for a while. Her shot was administered in her right arm and she has a history of anaphylaxis with a Penicillin shot. She hasn't had anymore symptoms for about a week as of 3/15/2021.

1102499	3/15/2021	FL	19	F	3/9/2021	3/10/2021	Swelling of the face and eyes, high fever, loss of appetite, rapid heart rate. The swelling of the eyes has lasted 5 days now but the face swelling went away after 3 days. I still have a high fever on and off and the rapid heart rate went away a few hours after injections
1102444	3/15/2021	GA	41	F	3/9/2021	3/10/2021	A day after the second dose, vision in my right eye was impacted. It progressively got worse. I saw an eye doctor for an emergency visit on Saturday, 3/13. He did a full exam with dilation, and suspects it is an optic neuritis. Today, I had a visual field test, but I am unaware of the results yet. There has been no improvement in my vision since Saturday when I saw the doctor.
1102647	3/15/2021	FL	63	F	1/6/2021	1/6/2021	I started to experience a problem with my left eye about 6 hours after I received the vaccine. I could see small bolts of white light is the far outside corner of my eye. I first attributed it to an ocular migraine, but those usually only last maybe an hour. The next morning I could still see the bolts of light which were very distracting. I called in sick to work and went to see an eye doctor. He diagnosed me with a PVD (posterior vitreous detachment). It may have been coincidental, however since it occurred on the same day I received the first vaccine, I was advised to report it by V-safe who was doing periodic follow up through texts.
1102460	3/15/2021	TX	61	F	12/29/2020	1/12/2021	I started with a headache,nausea that progressively got worse on Tues. I went to ER exp sharp pain behind left eye ear, left jaw was tightening during pain of the headache.
1102510	3/15/2021	VA	75	F	3/12/2021	3/15/2021	Three days after my second shot (3/12/2021) I have a red rash under my arms and under my breasts. I also have some redness on the left side of my face near my eye. The rash does not itch. I have had a similar reaction to some medications when I have had a severe cold/infection.

1098469	3/14/2021	OH	61	F	3/9/2021	3/10/2021	Moderna COVID-19 Vaccine EUA Distortion of vision in both eyes but predominantly in the left eye. First noticed the morning after receiving the vaccine, and unchanged at this time (5 days after vaccination). The left-eye distortion is along vertical lines, such as when viewing an icon or a box on a computer screen. The distortion is very crisp and unwavering (not flashes or floaters) and forms a very clear half-circle that bends toward the left, as if the line is being pushed to the left by a ball. There are no dark spots or "missing" vision, just that what I'm looking at is pushed to the side at the point where I'm focusing. The right-eye distortion is much smaller but definitely present, and distorts to the right instead of the left.
1098376	3/14/2021	NY	67	F	3/9/2021	3/9/2021	3/9/21 PM headache, 3/10/21 AM fever, generalized achiness, 3/11/21 bilateral hand swelling and rash on hands, diffuse itching. 3/14/21AM swelling around eyes. continues itching. continued fever. swelling in hands improved.
1098477	3/14/2021	FL	56	F	3/13/2021	3/13/2021	Patient received vaccine, was in waiting area, and about 3 minutes later felt light headed and slid out of the chair onto the floor. Ice was placed on her head, she was breathing, and had a pulse. CPR was not necessary. She was laying on the ground for approximately 10 minutes. She opened her eyes at one point, and then her eyes rolled in the back of her head again. Blood pressure was normal at 119/78. Ambulance came and took her to the hospital.

1098162	3/14/2021	MN	36	F	3/13/2021	3/13/2021	First I felt lightheaded/dizzy, then became nauseous, and my feet and hands were numb and tingling, I felt like my tongue was getting bigger but the primary care dr at the clinic didn't think so. They eventually after monitoring me for awhile sent me down to ER, by then my voice was raspy and scratchy, my lower lip was big, my tongue still felt big. I still felt nauseous. The dr asked me if my eyes are usually swollen and red and I said no. My extremities were still numb and tingling. I got epi and other drugs, zofran, benadryl, pepcid, I think a dose of steroids. The symptoms continued so I ended up getting a 2nd dose of epi. I went home around 5pm. When I woke up that evening to do a neb treatment I was nauseous, my lower lip again big, my tongue felt thick and this time my upper throat felt swollen, I gave myself epi and took myself to ER, they monitored me for 3 hrs the dr was gonna hospitalize me if I got worse, I still felt nauseous and the numbness and tingling feeling in my hands and feet when I left but was not having any airway issues when I left. Not sure if the numbness/tingly is gonna go away in my hands and feet.

1098202	3/14/2021	TN	64	F	3/7/2021	3/13/2021	Saturday night around 9:45 my hands and arms began itching. Then i noticed they had broken out in a red rash with wheals beginning on my arms. It then began breaking out on my face and legs. I took 25 mg of benadryl. The rash continued to spread so I went to the ER. They administered prednisone, pepcid, and benadryl. After about 1 hour the itching was better and the rash began to fade but it didn't go away. The ER sent my home with a predisone dose pack for 6 days and to take 50 mg benadryl every 6 hours. When i awakened this morning I had the rash on other sites on my arms, legs and stomach and in my right eye, it was red and a little swollen. I took the first day's dose of prednisone and 50 mg benadryl and 20 mg of famotidine. After about 30 mins to 1 hour the itching and redness improved but has not completely gone.
1098205	3/14/2021	MA	58	F	3/6/2021	3/11/2021	Day of, severe arm pain which was gone the next day. However, on 3/11/2021 woke with headache, nausea, all over muscle and joint pain, weakness. By mid day, eyes were irritated and sensitive to light. By 5:00, fever, chills, muscle aches, headache, joint pain, nausea, rapid pulse rate when walking. Symptoms lasted 3 days. On 4th day, no fever or chills but still painful headache and some muscle/joint pain and weakness.
1098239	3/14/2021	FL	65	F	3/12/2021	3/13/2021	3/13/2021 migraine headache the following day, never had a migraine before, woke up at 5:00 A.M. the following morning with eyes feeling very heavy, headache and lightheaded, sunlight bothered me. Took Advil and stayed in a darkened room. Felt fine 3/14/21 when I woke up.
1098271	3/14/2021	MD	22	F	3/13/2021	3/13/2021	Rash and burning sensation on forehead, eye lids, under eye, cheeks, and under chin/neck area. I washed my face like regular night routine (cerave, vitamin e oil, and ointment cream for acne) and it seemed to irritate it more. Headaches; first time inthe for front of my head then moved to the back of my upper neck. Tylenol was the chosen treatment. No noted outcome yet.

1099097	3/14/2021	FL	52	F	3/3/2021	3/4/2021	<p>This is a report after my 2nd vaccine. I received my 1st vaccine on 2/10/21 [Lot # EL9265]. Both vaccines gave me a reaction, and both around the same time the next morning. My reaction to my 1st vaccine included slight fever, aches, and chills. Both doses were administered around 3:30pm and reaction was approximately 10:30-11am the next morning. On this 2nd dose, roughly 40 minutes after waking from sleep, I became mildly nauseas. I sensed I would vomit, so I sat down on the commode with a bucket in front. I started getting the sweats, got very cold, and my arms starting shaking. I started to feel the room spin, saw big black dots, and after banging on the wall to alert my husband something was happening, I fainted and passed out cold. My husband saw me fall face down, and after waking me, I was in a panic, did not know where I was, or how I was on the floor. I passed out a 2nd time, at which point, my husband was able to get me to the car and he took me to the local hospital. I was incoherent on the car ride, moaning, and not knowing what was happening. My eyes remained closed until I was wheeled into the emergency area and they asked me my name. I was taken to a private room, where they hooked up a blood pressure cuff, an oxygenator on my finger, and took several viles of blood. I was then taken to the cat scan room for a brain scan, and several hours later, was given a chest xray. I remained in the room for approx 6 hours, where I was becoming more and more aware of where I was. I had not eaten/drunk anything, except a cup of water. I had not used the lavatory. The PA came to me hours later stating all my tests came back negative, and they could not determine what happened, xrays and blood tests were good, and cat scan was good. He said that while they couldn't determine what happened, they would recommend a stay, so they can do more extensive testing. I contacted my husband via cell, told him what they said, and after another 1 1/2 hours, I made the decision to release myself as I was feeling more like myself again, albeit tired. I went home that evening, ate a small dinner, went to bed, and by 12 Noon the next day, I was fine again.</p>

1100592	3/14/2021	GA	58	M	3/13/2021	3/14/2021	~~Moderna COVID-19 Vaccine EUA" Injection day Saturday March 13th no problems at all, everything was good all day. I woke up on Sunday morning 8am March 14th with a pretty moderate headache. I didn't feel good all day and took several naps unable to lose my headache. About 3pm March 14th I had a slight pain in my left eye and developed "floaters", a lot of them. I decided to take a nap and woke up 1 hour later with less floaters but I had like marble streaks in my left eye vision and about 10 minutes of flashing lights in my left corner eye, not severe though. My eye looks normal looking in the mirror, nothing looks unusual. Tonight the same day March 14th, 11pm before bedtime less floaters, I can only see one. The marble streak in my vision appears to be a black streak now when I look down at a white counter top. I can make it move from left to right when looking at the counter top but I do not have any pain. I am not sure what to do but I just wanted to let someone know that I encountered a side effect from the vaccine or it could be a coincidence, I have never had this problem before though.
1100594	3/14/2021	ID	67	F	3/4/2021	3/7/2021	ongoing symptoms of headache, muscle aches, fatigue, insomnia, elevated temperature( no fever above 99 degrees) joint aches, swollen lymph nodes, sweats, scratchy throat, red irritated eyes, bowel cramps and nausea
1100611	3/14/2021	CA	68	F	2/5/2021	2/5/2021	2/05/21 6 hrs after injection my thigh muscles on both legs tightened up and I could not bend at the upper thigh. very painful. 2/09/21 woke up with foggy vision and eyes burned like fire all day. 2/11/21 At work and felt fine until n/v/d hit hard and had to leave work. Shaky. dizzy, lightheaded with chills Could not stop shaking until the next am. 2/13/21 Face was extremely blotchy and very swollen with eyes still red and small. Left eye smaller and more swollen than right. 2/18/21 Developed chest pain. No SOB tongue not swollen. Resp and spo2 down to 94% normally 98 or 99
1100630	3/14/2021	NV	47	F	2/9/2021	2/12/2021	Initially one week of eye allergies: itching, burning, swelling of eyelids. Then one week of hives on neck front and back. Now over a week of increasing hives at neck, elbows and knees, now itchy hives on trunk, back, knees and entire arms.

1099355	3/14/2021	PA	31	F	2/28/2021	2/28/2021	2 hours after receiving the vaccine on Sunday, I had significant fatigue and sensitivity to light with watery eyes and a headache and was in bed all day. The next morning on Monday I woke with a pressure headache that was kept at bay with Advil. The headache stayed the same on Tuesday and Wednesday. By Thursday the headache was so uncomfortable I was having trouble working. It stopped responding to Advil and the pressure continued to increase on both sides of my head with sharp, shooting pains throughout that would come and go with the constant pressure. By Friday, I couldn't go to work and ended up calling into my PCP and advising them that I had a migraine that was very different from my normal migraines that I get (pain on left side behind eye, very nauseous, sensitive to light, always responds to OTC meds) and it wouldn't respond to Advil and asked them to call in something. They called in generic version of Imitrex that evening; but since this migraine was so different than my normal pattern, I went to the ER on Saturday. They did a CT scan to make sure there were no brain bleeds and gave me IV magnesium and steroids. I declined the toradol and Benadryl. The headache was still there, but bearable finally when I left. It got worse again that evening and I ended up taking the imitrex at 3am and falling asleep, only to wake up at 7am with a skull splitting feeling. That feeling stayed for the next 4 days, slowly getting less intense. I was unable to workout any of these days (I workout for about an hour daily for the past 3 years) because it was extremely exacerbated by activity. I was not hungry. Finally on Thursday I felt more like my normal self but the headache remained slightly and now on Sunday all that is left is the sharp, shooting pains that come every so often and light sensitivity.

1098798	3/14/2021	CA	35	F	3/5/2021	3/11/2021	Six days after receiving vaccine, began feeling unwell. Symptoms are extreme fatigue, red eyes, sore eyes, body aches, joint pain, pain around back/ribs, shortness of breath on exertion. Unable to do usual household tasks and requiring bedrest for much of the day. The symptoms are very similar to the waves of symptoms I experienced early on in Post-Acute Covid-19 syndrome. I got sick in March and was experiencing waves like this through November. Since November, my physical symptoms had abated and I had not suffered a major relapse like this, besides a mild relapse at end of January. My shortness of breath issues, back pain/rib pain, eye soreness are very specific symptoms that I associate with early on in my long covid experience. The vaccine seems to have triggered a major relapse in my long covid symptoms.
1098743	3/14/2021	WI	31	M	3/14/2021	3/14/2021	Patient, Patient's wife, and Pharmacist were in immunization room talking post vaccination when after a few minutes the patient stated "I don't feel very good, it's happening." and his eyes rolled backwards. Patient was sitting and did not fall. Patient came to about 20 seconds later. Patient was helped to the ground and 911 was called. Patient was sweating, dizzy, and pale. EMT's arrived and took patient's vitals which were all normal. Patient told EMT's that this often happens post immunization and even when just visiting the doctor. Patient recovered and EMT's concluded patient did not need additional treatment. Patient left on his own accord with his wife.
1098746	3/14/2021	TN	43	F	3/13/2021	3/13/2021	Swollen, itchy, hot rash starting below eyes and continuing to spread down face. Swollen throat with mild discomfort.

Disturbance is in the same location when covering either eye, and is also present with eyes closed. It dissipates within about 15 minutes, and this has happened twice, the reported time, and once again at 2:00 PM 14 Mar.
1098808	3/14/2021	FL	65	F	3/1/2021	3/1/2021	The morning after the shot extreme pain above my temples that moved also to the upper part of the left side of my head. Only could ease the pain by keeping eyes closed for a day and a half. When got out of bed after very dizzy for a day.
1098815	3/14/2021	NY	74	F	2/4/2021	2/15/2021	floaters in both eyes after the first dose which went away in few days without any treatment 4 days after the second dose noticed more floaters again which still persists but getting fewer
1099075	3/14/2021	NM	74	F	2/18/2021	2/20/2021	Occipital Palsy in right eye : pain in right eye and restricted movement of eye lid and eye ball and blurry vision
1098848	3/14/2021	FL	46	F	3/8/2021	3/8/2021	I felt like my vision was changing and it felt like my pupils were very tiny. I felt a strange pressure in the top of my head. Not a typical headache but a weird pressure. I started feeling like I was clenching my teeth and my jaw. That night my arms were very jerky. I wasn't thinking right. And every day since I feel like I'm tense muscles I'm dizzy I'm just not mentally like I used to be.

1098774	3/14/2021	SC	25	F	3/5/2021	3/13/2021	When originally obtaining the vaccine, I had little side effect; the only thing I noticed was a slight fever for a few hours and a sore arm for a few days. 8 days after the shot was given, I developed a small swollen welt at the site of injection. I thought it may have been a mosquito bite, as I had spent the evening outside. That evening, I kept an eye on the swelling, and it was about the size of a half-dollar coin by the time I went to bed. When I woke up throughout the night (this is normal, as my sleeping patterns are irregular) I noticed more soreness in my arm. When I awoke for the day, the swelling had grown to be about the size of my hand. It is now sorer, and somewhat itchy, but I am managing with ibuprofen.
1096938	3/13/2021	CA	58	F	3/11/2021	3/12/2021	I have a slight head ache, my left eye is swollen and my eyes are blood shot. Soar at the injection site and a slight fever.. feeling a little dizzy.
1096911	3/13/2021	IN	59	F	2/17/2021	2/17/2021	Macular rash around eyes including eyelids, on cheeks and around mouth. Itching and tingling of lips. Treated with Benadryl 25mg x 2 doses. Duration of 1 day.
1096908	3/13/2021	WI	77	F	2/26/2021	3/11/2021	Sudden dizziness with some nausea and cold drenching sweat - no fever - extremely weak and fatigued and could barely stand and then severe headache came on about 10 minutes into episode. Dizziness lasted approximately 2 hours until I could safely move and then began to subside. I noticed my eyes did not want to focus well and was seeing spots when I tried writing down what happened. Chills began and I felt extremely cold, my head felt "foggy" and tight, ringing in ears started and headache moved to migraine level. Slight fever 99.8. Main dizziness did pass after about 2 hours but other things continue to linger on an off. I just feel "off". I have actually heard other seniors mention some of these very symptoms so am not super alarmed, however, I did not have any of these side effects before the vaccine for Covid-19. I did experience extreme fatigue and bad headaches since I received the first dose on January 27, 2021. I have not called my doctor regarding these side effects since I have heard many seniors complain of very similar reactions. I have rested as much as possible, tried to stay hydrated, and taken Tylenol when needed. For the dizziness I tried to stay as still as possible and put my head between my knees until it finally passed.

1096876	3/13/2021	MO	66	F	3/3/2021	3/10/2021	Developed Bells Palsy, distorted face, droopy mouth and eyelid, not able to fully close left eye and mouth not functioning correctly. Given Prednisone and ointment and lubricant for eye. Afraid to get second shot! Need recommendation!
1096874	3/13/2021	KY	29	M	3/5/2021	3/5/2021	Low blood pressure, sweating, low blood sugar, lowered heart rate, tunnel vision. On site EMS monitored blood pressure, heart rate and blood sugar. I ate some crackers/snacks and drank water. Lasted about 5 minutes until I was feeling better after a snack and water (I had eaten a normal lunch/breakfast, etc that day). Afterwards, I was lethargic for the evening and the next day. I also have a history with similar reactions to giving blood and other similar instances.
1096873	3/13/2021	TX	34	F	3/12/2021	3/13/2021	Woke up at night to go to bathroom, then quickly started feeling like I was about to pass out, very weak, had to sit down on the floor to try and wait it out, had trouble seeing, was able to get up finally and find way back to bedroom by touch. With lights on vision was patchy. Was given water & a granola bar and was able to recover within 5 min. Slept fine after that
1096864	3/13/2021	TN	60	F	3/11/2021	3/11/2021	Fever for 40 hours, chills, uncontrollable shaking for more than 3 hours, severe nausea for 36 hours, nausea continues now but at a much less severe amount, swollen glands around head and in right arm pit for more than 40 hours, pain in right eye started within 10 minutes of shot and continues now, pain in ankles started about 8 hours after shot and continues now but is becoming much more bearable, joints of toes and joints of a few fingers were painful for about 24 hours, sore arm started about 3 hours after shot and continues now, overall muscle aches started about 8 hours after shot - became much worse within 12-14 hours after shot and became less severe after 30 hours. Overall I felt as if I had a terrible case of the flu. It was very intense. I was unable to sleep the first night due to the severity of symptoms. The second night I sweated a tremendous amount and my fever broke. I am still not over all of my symptoms but I am feeling better.

1096725	3/13/2021	CO	30	F	12/18/2020	1/8/2021	4 days after my last vaccine I started getting really intense calf pain like a bad cramp. After the pain just kept getting worse I ended up going to the ER on January 15th 2021. They did an ultrasound and found out I had a dvt. I was also experiencing horrible migraines since the 1st shot I also started seeing black spots in my vision. I also was having fevers and chills
1096833	3/13/2021	CO	64	F	3/12/2021	3/12/2021	I received the first dose at approximately 11:45. I had no allergic reaction. I had lunch, then went home. As I drove, I started getting a sparkly effect in my vision (for me, this is usually a precursor to migraine), about 2 hours after the injection. After I got home, I started getting a minor headache, about 2.5 hours after injection. I sat for awhile, and the headache did not worsen and the sparkles dissipated. About 9 hours after the injection (and after preparing and eating dinner) I began to feel lightheaded, almost a feeling of inebriation. I quickly prepared for bed and went to sleep. About 2 hours later, I woke up with diarrhea. I continued to wake up twice more, about 2-2.5 hours apart, with diarrhea. I finally slept for about 4 hours and woke up feeling better.
1096940	3/13/2021	CO	75	M	2/27/2021	3/10/2021	lost total vision in left eye, took about 2 seconds from onset. Recovered within 30 minutes. Suspect small clot. No other symptoms. No detectable lasting vision impact.
1096961	3/13/2021	AZ	60	F	3/9/2021	3/10/2021	Systemic: Allergic: Itch (specify: facial area, extremities)-Severe, Systemic: Allergic: Itch Generalized-Severe, Systemic: Allergic: Rash (specify: facial area, extremities)-Severe, Systemic: Allergic: Rash Generalized-Severe, Systemic: Allergic: Swelling of Face / Eyes / Mouth / Tongue-Severe, Systemic: Flushed / Sweating-Severe, Systemic: Headache-Severe, Systemic: Tingling (specify: facial area, extremities)-Severe, Additional Details: Patient about 12-24 hours after shot started to develop a rash on arms/neck and hands. Her arms/hands started to swell and she developed blisters in the mouth and had blisters on her hands and neck as well. She had itching all over her arms and hands and swelling of the arms and hands too. She also felt a warming/hot and burning sensation in her arms and hands too. She has been putting clobetasol and hydrocortisone cream/ointment and Levicyn (compound by Dr.) on the blisters and rash.

1097047	3/13/2021	UT	68	F	2/21/2021	2/22/2021	Headache, aches within 8 hours. Within 20 hours developed severe vertigo and nausea. Movement caused room spinning and broke out in cold sweat. Severe vertigo continued through second day (Feb 22), but seemed to diminish somewhat toward evening. Day 3 still had moderate vertigo/nausea but better than previous day. Went on a long walk. Day 4 moderate vertigo/nausea continued. Tried doing Epley exercises for vertigo. Vertigo/nausea became severe again, so severe I vomited several times. After vomiting got the shakes and felt very cold. Checked blood pressure and it was very high (170/98), but pulse rate was in low 30s. After a few hours blood pressure and pulse rate became closer to normal. Almost decided to go to ER clinic, but decided to wait until my daughter came home from work because I was way too dizzy to drive. After I calmed down I decided it wasn't an emergency. Severe vertigo continued through evening of day 4. On day 4 I called primary care doctor to see if there was anything I could do for the vertigo. She prescribed meclizine, but hearing that it is an antihistamine, I declined it (antihistamines make my heart race and make me very anxious). Severe vertigo/nausea continued through day 5 and day 6. (Severe vertigo/nausea being that I could not move around at all other than to sit still staring forward without the room spinning.) All this period I also had a headache, a feeling of pressure through my whole head/sinus area, and my vision was blurred. I also felt as though I could not focus my eyes or concentration. I tried using some over-the-counter nasal decongestant spray for 2 days to relieve congestion in head, but they made me feel very anxious, so I stopped. I also tried taking some Aleve a couple of times. It helped a little, but made me feel woozy, so stopped. Day 6 the vertigo/nausea improved to moderate, but I could still not walk straight. I felt unsafe to drive. Day 7 continued to improve, but still moderate vertigo/nausea. Day 8 I noticed a lot of improvement in vertigo/nausea. Kept improving day 9. By evening on day 10 I was noticing a rawness and lump in the back of my throat. Called primary care office day 11 to see someone. Drove car, but felt marginally safe driving. Was diagnosed with a sinus infection and prescribed a 10 day course of Amoxicillin/Clavulanic Acid (875-125 mg for 2 pills a day for 10 days). Felt improvement in throat and sinus over next few days. Day 15 I felt greatly improved

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							<p>with head ?fog? and vertigo. Had an appointment with an ENT clinic on day 15 to see what was causing vertigo. All tests were good for hearing, and visual examination of ears. Was checked for BPV but that was ruled out. Said vertigo was probably caused by viral infection or inflammation of vestibular nerve or canals.</p> <p>Recommended waiting for improvement and coming back if it persisted. Began doing more normal activities even though I still had mild vertigo. Day 16 felt still better in morning, then in afternoon bent over quickly to catch something and got a terrible wave of spinning again. Moderate/severe vertigo continued that evening.</p> <p>Improved to moderate on day 17 and 18. All along, when vertigo was worse, so was the ?fog? (blurry vision, inability to focus mentally). At day 19 I feel like I did on day 15, but I have noticed the pressure/lump around my ear and on left side of head is improved. Brain ?fog? is improved too, very mild and the vertigo is mild. I finish my antibiotic tomorrow. At present vertigo is not gone. Its mild today, but this is only one of maybe 2 1/2 days in which its been this mild (out of almost three weeks since I was vaccinated). I have been drinking a lot of water every day, and ginger tea when I get nauseous. I had my 2nd dose of the COVID Pfizer vaccine scheduled for Mar 15. I?ve cancelled it and intend to wait to see how long it takes for vertigo to finally resolve before considering a 2nd dose.</p>
1097053	3/13/2021	CA	35	F	3/11/2021	3/11/2021	<p>Slight sharp burning pain "behind" left eye begin a few hours after I had shot. That pain was intermittent for a few hours and dissipated by early evening of the day of the shot. My left lip and left side of throat had minor feeling of tingly burn when I was driving home 30 minutes after I had the shot. Stiff muscles on left side of neck. Intermittent mild muscle pinching along left side of body but went away by Friday night.</p>

1097078	3/13/2021	CO	74	F	2/19/2021	2/20/2021	Pfizer-BioNTech COVID-19 Vaccine EUA: in clinic visit three days after vaccination patient reports fever one day after vaccination and two days after vaccination suddenly felt hot and fell to her knees holding onto a couch. Able to ambulate to bed afterwards. Patient also reports swollen lymph node in left axilla. Patient denies chills, headache, blurry vision, nausea, vomiting, abdominal pain, myalgias, or respiratory symptoms. Does not report loss of consciousness, rash, or injury after fall but does report not eating or drinking prior to fall. Vital signs within normal ranges except blood pressure 135/70 mmHg. Advised to keep hydrated and eat well.
1096686	3/13/2021	NV	31	F	3/9/2021	3/12/2021	Immediately passed out and hit head. Days later, right eye is puffy and droopy.
1097085	3/13/2021	TN	37	M	3/12/2021	3/12/2021	Patient had dark circles under their eyes and did discuss at the drop off window they had a needle phobia. Immediately after the immunization, he said he felt lightheaded. I, pharmacist, sat in the booth and talked to him for a couple minutes then asked if he felt he could finish his observation outside the booth. I notified technician to hand him off to her for observation, sharing by observation that the patient did not look well but he said he was doing a little better. He said he felt better and he did wait in the chairs outside the immunization booth. While I was in the pharmacy discussing this information with my pharmacy technician when I heard yelling and I stepped back out of the pharmacy to observe the patient was sliding out of his chair, stiff straight. My other technician came to my assistance and we both tried to get him to the floor and he was making incoherent noises and his arm was bent behind him and not relaxing to where we could get him to the floor. He then came to and startled a bit, with a bewildered look on his face. He asked what happened and said he felt he was dreaming. A witness waiting on her prescriptions for pickup said that it originally appeared he was having a seizure which was my concern as well. We called code white and 911 and store manager assisted us at the scene. Patient denied the ambulance.

March 3, slight burning with urination. 1X March 4 no burning until about 4:30 pm, and then also much blood. 15 minutes later, the same.
1096508	3/13/2021	PA	31	F	3/10/2021	3/12/2021	Adverse Event: Bell's Palsy on left hand side ~48H after 2nd dose of vaccine Treatment: Prednisone and Valacyclovir Description: I received the second dose of the Moderna vaccine on Wednesday morning. I did not feel any side effects until later that night which included chills and body aches. However, throughout that evening and Thursday I had twitching of my eyes. On the morning of Friday, 3/12 at around 9am (~48H after 2nd dose), I noticed it was weird to move my lips and remember that drinking coffee from the straw felt weird. It wasn't until 2:30pm when my husband and I were eating lunch that my husband noticed a drooping of the left side of my face. We went to Emergency Department at 5:30pm and were seen by doctor who confirmed that it was Bell's Palsy on the left side of the face, the same side as the injection site.

1097651	3/13/2021		56	F	3/9/2021	3/12/2021	At my OMT (Oestopathic Manipulative Therapy) Dr. appt on Wednesday, 3/10/21, my BP was 134/80. On 3/12/21, Friday afternoon around 2:30pm, I noticed my left eye didn't feel right. I looked in the mirror and my left eye was slightly red in the corner of my eye towards my nose. When I woke up this morning on 3/13/21, my eye was completely red in that same corner of my left eye. I went to the a walk-in clinic this morning to have it checked out. The doctor indicated that it was a burst blood vessel in my eye and that the redness should go away in about a week. My BP was 148/100. The doctor asked if I had a history of high blood pressure and I told him no and showed him 3 of my previous BP card records that I keep in my purse. He said I should monitor my blood pressure and follow up with my primary care doctor. I have had a blood vessel burst in my eye before a few years back. I do not remember which eye. I have had fibromyalgia for over 20 years. I was diagnosed with Occular Myesthesia Gravis in January 2017 which affects my left eye only.

1097533	3/13/2021	MO	37	F	3/13/2021	3/13/2021	Patient reported feeling dizzy. She asked for some water, which was provided. Went to check on patient a minute later and her eyes were fluttering and her breathing altered. She did not respond to me. Her pupils dilated dramatically and she slumped over. I called for a nurse and we lowered her to the floor together. Blood pressure was low (around 100/60) Her pupils started to return to normal and she was able to converse with us. Blood pressure increased slightly but was erratic. Emergency service responders made call to take to hospital because blood pressure would not stabilize
1097537	3/13/2021	CA	47	F	3/13/2021	3/13/2021	I discovered patient on the floor at approx. 3:03pm. She was lying face down on the floor next to the chair she was sitting on during her 15-minute observation post-covid19 vaccine. Unknown person turned patient over face-up, Face was clammy and warm/hot to the touch. Pulse was taken (weak). Sweating. Eyes were closed when EpiPen was injected on left thigh through pants. It was decided to inject patient as we did not know what exactly happened, why she was on the floor, and she was unconscious at the time we initially thought to give epi injection. 1 pen injected. Pharmacist called emergency services at 3:05pm. Patient eventually regained consciousness while waiting for the paramedics. She was able to talk and answer questions. She was taken outside the gym on stretcher, but her son met us at the school to pick her up. She declined going to the hospital for further treatment.
1097545	3/13/2021	LA	60	M	3/8/2021	3/9/2021	Pt stated experienced paralysis on left side. Stated his left eye was numb and vision blurry. Lasted about 8-12 hours starting about 3 hours after receiving covid vaccine.
1097562	3/13/2021	MN	31	M	3/13/2021	3/13/2021	Patient stated his heart rate was racing, he was visibly sweating, and had tunnel vision. He stated he felt like he was having an anxiety attack. This was 5-15 minutes post vaccination as he was being observed. We laid him on the ground and he immediately started to feel better. After a few minutes he sat up and drank some orange juice. Paramedics were called but patient was able to walk away on own accord. Called later and was doing fine.
1097563	3/13/2021	GA	54	M	3/11/2021	3/13/2021	Swollen in the lips, eyes, and forehead

1097476	3/13/2021	CA	64	F	3/13/2021	3/13/2021	Pt 64 y/o female found ambulatory at vaccination site. c/c Allergic reaction post COVID-19 vaccination. Pt received her first dose of Moderna vaccine at approximately 0900. Pt moved to the monitoring area where she was instructed to wait for 30 minutes due to her medical Hx and previous allergic reactions, Pt alerted a clinician stating she felt a tingling sensation around her mouth and minor swelling of her lips. Responded as well as fire department. Pt was given at 2 doses of EPI 1:1000 for a total of 1.0mg (0.5mg/dose) and 50mg of Benadryl. All medicine administered IM. Pt experienced relief post med administration. Pt denied any shortness of breath or chest pain. No headache/blurred vision or tinnitus. Pt denied any nausea or vomiting. Pt had equal grips and pushes. Skinsigns were warm and dry. No hives, redness or itching. Pt was transported to Hospital by fire department. Vital signs: BP 142/82, HR 78, RR 18 Hx: HTN, Thyroid issues, CA, Allergic reactions ALLERGIES: Sulfa, Seafood MEDS: UKN Conclusion Pt was identified as a "30 min monitoring" upon check-in. Pt was instructed to wait in the designated area. Upon feeling a reaction to the vaccine, pt promptly notified staff. Immediate response to the incident resulted in a successful pt outcome. System put in place worked as intended. Identified a pt with potential vaccine reaction prior to the administration of medicine. Staff instructed pt to wait in the appropriate area. A timely response, including rapid administration of appropriate medication prevented further swelling and potential airway involvement.

1097755	3/13/2021	CA	22	U	3/12/2021	3/12/2021	Pt. received 0.5 ML IM L deltoid of J&J COVID19 vaccine and ambulated independently to observation area. While in observation area pt. became lightheaded, dizzy, and flush and slipped out of his chair to his hands and knees. Bystander helped pt to the floor so he did not hit his head. BP immediately was 118/74, no blurry vision, no headache, no nausea, had not eaten since 1300. Pt sat up and vitals were taken: BP 126/82 HR80 RR18 A/Ox4, pupils equal and reactive. Pt was then assisted to the cot where he had a snack and juice and was feeling much better. Pt called a friend to drive him home.
1097825	3/13/2021	NJ	61	F	3/9/2021	3/9/2021	Immediately following the shot I became lightheaded and stayed longer than the mandatory 15 minutes. Later that evening My are was sore and I continued to be dizzy. By nighttime I felt achy and tired. About 6 hours after the shot a fever started and I took Tylenol. By 1am I had 101.3, the rigors and a headache and dizziness which I still have 4 days later. My fever ran for over 48 hours and would not respond to any ibuprofen or Tylenol. My joint and muscle pain was severe, my balance was off. I could barely move my arm. Today I am now nauseous. I was not this sick when I had Covid. My fever would at least relent. I?ve lost time from work and my life. I have heart palpitations and my resting heart rate has gone up. Pressure feels strange behind my eyes. My legs are sore. I called my doctor two days after my vaccine and she minimized my symptoms.
1097826	3/13/2021	WA	77	F	3/3/2021	3/5/2021	March 3, 2021-Sore injection site of right arm March 4th- Injection site slightly sore March 5th -sore left calf March 6th- Sore left calf a little more so March 7th- Outside left calf hot to touch & back of calf red and sore. March 8th- Same as above, and I put doterra Deep Blue ointment on it, and it relieved the heat and pain Redness is gone March 9th -Left side of body joints ached. left calf aches/applied Deep blue ointment and a Pain relief ointment . Feels a lot better March 10th- Redness gone, but still feels sore March 11th- Left leg Calf feels a lot better, I put on the ointment again. Deep Blue, and Frank Woods Pain Relief ointment. March 12- Left calf a little sore. No heat . Now my left eye has a light grey spot in it. I can see around it. March 13-Eye's don't feel right. I still have the light gray floater in the left eye.

1097874	3/13/2021	CA	38	F	3/11/2021	3/12/2021	Received vaccine Thursday at 1:23 pm. Friday at 10:30 am started getting chills and body aches. Throughout the day body aches continued to get worse and nausea began around 2:30 pm and continued all night. No appetite, and only slept 3.5 hours then awoke and began to throw up for several hours. (mostly dry heaving due to not being able to eat) Saturday all day was heavy and sore eyes, headache, nausea, sore throat but the body aches were getting better. Saturday at 8:23 pm still feeling nausea with a sore throat and very tired... To Be Continued
1097895	3/13/2021	OR	73	F	2/28/2021	3/2/2021	On 3/2 as I was driving I realized that the signs did not appear as clear as they did on the Day I received the vaccination. I verified that my vision had changed by sitting in front of my computer and doing several normal tasks that I had done on 3/1 during my normal work day. In all cases it was apparent that my distant vision had substantially changed. It was true for both eyes. I saw an ophthalmologist who said there was no organic problems but suggested cataracts. I asked if cataracts could change so dramatically and also asked how my cataracts compared to the last visit. Basically nada. Since I work on the computer every day as a CPA
1097105	3/13/2021	MO	59	F	3/8/2021	3/8/2021	After my first dose of J&J vaccine performed, I developed a cold, cough, runny nose, my eyes were red and nasal drainage, also had allergies. I called my doctor to get medicine. I also had a Covid test which was negative. I am recovering of my symptoms today.
1096945	3/13/2021	AZ	66	F	3/1/2021	3/1/2021	5 - 10 minutes after receiving vaccine, I had difficulty swallowing. I was fine 30 minutes later. On day 12 after receiving the vaccine, the injection site began to itch and was sore. I experienced some chills. The site was slightly red. Itching and soreness is continuing along with additional mild itching occurring on the front of the calves and eyes.

1097281	3/13/2021	OR	49	F	3/9/2021	3/9/2021	Bell's palsy symptoms within an hour after receiving vaccine injection: consisted of right-sided facial numbness, right-sided eyelid droop, right-sided mouth turn, right-sided tightness in neck muscle, pressure behind right eye, headache, loss of balance, difficulty speaking. The injection was at 3:15 pm and started with arm soreness and stinging, a slight headache, and some tingling in my right hand while waiting 15 minutes after the shot, I had also felt a sensation going up the right side of the back of my neck almost immediately after the injection. The Bell's palsy symptoms started by 4:00 pm. I had a low-grade temp that evening of 99.9. I emailed my neurologist who I see for migraines, of my symptoms. The following morning on 03-10-2021 I woke with a severe migraine, fullness in my right ear, more pressure behind my right eye and it is watery, with new ringing in both ears, louder in the right ear. Still residual numbness and drooping of right side of face and eye, tightness in right side neck muscle in front, and speaking better. Woke up on Thursday morning 03-11-2021 with flu symptoms and migraine gone. Eye pressure still there and now having significant pain moving my eye and now more feeling of fullness in my right ear. Eye pain was concerning. Dr advised me at this time if symptoms have continued or gotten worse to go to the emergency room. Today, Saturday 03-13-2021, I am still experiencing moderate eye pain behind/above my right eye with pressure. I am continuing to treat the pain with oxycodone prescribed by ER Physician.

1097180	3/13/2021	NC	30	F	2/13/2021	2/14/2021	After having the second Pfizer COVID 19 shot on 2/13 I noticed about a 1 inch swollen left cervical (neck) lymph node. It wasn't overly tender to the touch but it was mildly sensitive. I took a picture of it and contacted my OBGYN who thought since it was on the side my vaccine was given (left arm) and appeared one day after vaccination that it was likely due to the vaccine and to keep an eye on it, she was not concerned. I kept track of it for several days and the size started to decrease over the next 2-3 weeks approximately. It is now essentially gone. There may be very very small swelling noted if I side bend my head to the right to make the lymph node on the left side of my neck pop out but it is extremely mild. I've had no pain or issue in the area. At the time of the vaccine I was 21 weeks pregnant. My due date is approaching.

1097212	3/13/2021	PA	32	F	3/12/2021	3/12/2021	Patient had Pfizer vaccination around 1:30pm . On drive back to work she started feeling "foggy". around 3:00pm and started to get a headache and blurred vision. Patient stated never feeling this way in past. She then began to feel like she was going to pass out. Still had blurred vision and headache. Recommended she go to the ER since she felt like she was going to pass out each time she tried to stand. Patient wen to the ER at 4pm. Patient received shot in the Left arm
1097255	3/13/2021	CA	19	M	3/12/2021	3/12/2021	Patient received his first dose of Johnson & Johnson today, 03/21/2021 at 1100am, at COVID vaccination clinic. Patient had received his vaccine and was walking back to his vehicle when he told his mother that he "wasn't feeling well." Soon thereafter, patient stated that he was experiencing "tunnel vision" and light-headedness and proceeded to have a syncopal episode. He fell onto his mother who braced his fall. There was no head trauma. Patient was then seated in a chair. Patient stated that he had not eaten or drank anything that day. Patient states loss of consciousness. Patient states he has never had a similar experience in the past. He denied a presence of past medical history and denies allergies to medications, foods, and other vaccines. Upon exam, patient appeared pale and diaphoretic. Skin color improved to pink following patient sitting and consuming water/food. Radial pulse was strong, HR 62bpm. Bilateral lungs clear to auscultation. No audible wheezing or stridor. Respirations at 12 per minute. Initial sitting BP was 108/60. After 15 minutes, BP improved to 120/80. EMS was called to provide further resources that were not available onsite, to include a blood glucose level. Patient denied transport to the local hospital for further evaluation and treatment.

1094401	3/12/2021	AK	52	F	2/25/2021	3/5/2021	After receiving the first dose of the Moderna vaccine, I had a very minor, dull headache - pressure behind my eyes and left side of my head. My body felt fatigued and sore like I had a very intense workout where my muscles were burning from exertion. These all subsided after about a day and a half. Exactly 8 days later, my left arm (same injection arm but NOT at the injection site) felt itchy. When I looked at my arm, there was a huge, oval shaped, red, swollen, hard bump on the front of my shoulder. The skin also felt very leathery. I wasn't sure what was going on and it was Friday and my doctor's office had already closed. I spoke with a pharmacist where our family gets prescriptions and he asked if I had any other types of symptoms. I did not. He said had not heard of this type of reaction from the vaccine this many days later and directed me to call my primary care if it didn't clear up in a couple of days. It did clear up. First the leathery skin went away the next day, followed by the redness and swelling and then after a couple of days it still felt slightly itchy but visually, the location looked like my normal skin. I did not contact my doctor because coincidentally, that weekend, I saw an article pop up on my phone about Covid arm and the description was identical to what I experienced. I will mention it to my doctor when I go in for my second dose but figured I would report it on .

1094447	3/12/2021	KS	75	F	3/10/2021	3/10/2021	When I was outside leaving the facility, I noticed a tight knot in my chest.Less than a half an hour later,I had pulled over in the park and was trying to fix myself. Soon I realized breathing was not helping. It didn't seem to work. Exercise did not help. I started getting worse. I had difficulty getting back to my car I was fatigued my vision was getting blurry.My thinking was not sure. I couldn't figure out how to get my seat down in my car. Finally I got it down enough so I could recline. Then I decided to try to use my I watch pull up my Hart app.I measured over 155 bpm. I noticed that I was feeling better as my heart rate decreased to 141 bpm. I decided to drive home and left my car seat reclined. When I got h I stayed laying down in my bed for two hours because when I tried to get up I was way too dizzy. I've been unable to reach my primary care doctor when I got home. I left a voice messages. I called my sisters to tell them what was wrong and while on the phone St. Luke's was trying to call me and then my sister said she had to hang up because St. Luke's was trying to call her. I got up when I heard a knock on the door. It was the police. St. Luke's had called the police. My heart rate was normal before I got up Almost 3 hours after my shot. I spent the rest of the day and the next morning trying to find out what happened to me. I have spent days trying to get warnings about what to look out for. Finally I found this on your website as well as the handout I should've had before the vaccine because I would've known what was happening to me and what to do.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1094513	3/12/2021	KY	28	F	2/12/2021	2/20/2021	I am twenty-eight years old, young, healthy active girl. I have always been into fitness and yoga. I live a generally healthy lifestyle. I have been a singer, a dancer, and a flight attendant! I decided sign up for the COVID-19 vaccine in order to help our world fight against this pandemic. I wanted to protect my family and friends to eradicate this virus once and for all. It was with no hesitation did I jump at the opportunity to get this vaccine when it became available to me on February 12th, 2021 at the Convention Center. As soon as I received my shot I proudly posted my photo with tears in my eyes letting the world know that we were one human closer to a COVID-19 free world. I was Moderna proud. My entire family had already received their Moderna vaccines because I come from a family of nurses, but none of them had experienced any side effects. I was confident I would be in the clear after their clear symptom free vaccine. Immediately following my vaccine my arm was a little sore, as expected. However, I did experience fatigue and mild leg cramps in my calves. One very odd symptom was that I could taste the vaccine in my mouth, like a metallic, strange taste, which I reported to my family, but everyone just laughed it off. The leg cramps went away after a day or two as well as the taste, but the fatigue continued throughout the week. I felt these symptoms were pretty average. I signed up for the V-Safe reporting system and put in my report and thought nothing of my initial vaccine symptoms. Things took a very strange turn on the morning of February 20th, 2021 at about 10am. I woke up and my face was numb, tingling all over, twitching in different parts of my face pretty severely and uncontrollably. By 4pm the tingling moved into both of my arms and hands and by 5pm it moved into both of my legs. Shortly after the cramping and twitching began in both of my legs and I lost the ability to walk, lift my legs, and just the ability to feel my legs at all. I could not walk. Obviously concerning, I thought I was originally having a reaction to a medication I had been taking for over a year called, Topamax, a nerve pain medication which can cause numbness and tingling as a side effect. I called my prescribing physician and he immediately ruled out the possibility of a reaction to this medication due to the length of time I had been on this medication, that I had not missed a dose, I had not increased or decreased the dose, and I had not

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

experienced a reaction like this in the time that I had been taking the medication. He recommended I keep an eye on my symptoms and go to an emergency room if things worsen. Overnight, my symptoms remained the same. I woke up on Sunday, February 21st, 2021 and I still could not walk, I could not feel my legs. My legs were still twitching and cramping. My face was still numb and tingling, but the twitching had stopped in the face. My hands had stopped tingling. At this point my mother who is a nurse suggested that I call Moderna, the vaccine provider, to report a possible side effect of the vaccine. Upon contacting Moderna, the company thought that it could possibly be a reaction between the Topamax medication and the vaccine, but they had no current information about these two having any interactions. They thanked me for reporting and told me to go to an emergency room if my symptoms continued or worsen. Throughout the day on Sunday, February 21st, my symptoms remained. I was able to get to my feet, but I walking like a newborn baby giraffe or as my mother described, like a 105 year old woman. I was unable to feel my legs completely, lift them, move them without lifting them with physical help of my arms moving them. At this point on Sunday night I decided to contact my Primary Care Physician. She noted that this sounded similar to Guillain-Barre and that I sound immediately go to an Emergency Department before the symptoms get any worse. It was late on a Sunday night and I was unable to drive myself, so I waited. Overnight on Sunday into Monday I began experiencing light flashes in my eyes, heart races, lower back pain, and worsening cramping in my legs. I knew that I needed to seek treatment in an emergency room. On Monday, February 22nd, 2021 I was taken to the Emergency Room Department. They conducted blood work and a physical examination, but did not want to proceed with any MRI's or CAT scans. The ER the doctors were baffled. They could not figure out what was causing my paralysis other than the vaccine was the only new thing that had been introduced to my body, but they could not verify or diagnose anything. They let me go with a referral to neurology. While we were sitting in the ER my cousin, a nurse anesthetist at another local hospital, called my mother who was with me with some very alarming news. Her co-worker, had experienced the same symptoms

---

back in December and was just going through recovery after his first dose of the COVID-19 vaccine. He was told by the CDC there had been 19 reported cases through the CDC where after the first dose of the vaccine people have reported numbness, tingling, and the loss of the ability to walk after receiving the first dose of the mRNA vaccine, both Moderna and Pfizer. Her co-worker was also in the same age range as myself, very healthy, young, active. He was officially diagnosed with Transverse Myelitis. He has taken a full two months to regain the ability to walk and still has numb patches on his legs. He walks very slowly, but is walking. He returned to work, but cannot return to his normal life working out and being active because he does not have the strength. He was told not to get the second dose of the vaccine. There are unreported cases in this area by physicians who do not know where to turn with this information. It is hard to link these symptoms and cases because they are so obscure, but these same symptoms are occurring with those who have also had COVID-19. When I was being seen for an EMG test of my legs the physician performing the test said to us, "I have a patient who received the vaccine and has the symptoms, maybe I should report it!". My Grandmother's physician just last week just sent a patient of hers with the same symptoms to neurology. I think this uncommon side effect is more common than is being reported and no one knows where to turn with the information. I finally got into the head of Neurology. I was told, "it'll probably get better?", basically saying that they don't know what they can do and they are at a loss for knowing what this is and why this is happening to people after the first dose of the mRNA vaccine. Doctors don't have answers and the vaccine companies aren't offering information to help link these side effects together. The physician told me not to proceed with the second dose of the vaccine due to neurological side effect that I have had. I should benefit from the first dose and it is not safe for me to get the second dose from this side effect. I was unable to walk for weeks since this began on Feb. 20th. It is just now that this week I am slowly able to move my legs, but they are still very numb and heavy. I haven't been able to drive or live my normal life. I cannot use stairs, walk long distances, stand for very long periods of time. I am twenty-eight years old and I walk like an eighty year old

1094571	3/12/2021	RI	64	F	3/9/2021	3/12/2021	64 yo female with hx bipolar disorder on multiple psych meds, Htn, here for same day visit. Pt reports got her second covid vaccine on 3/9/2021 in the left arm, Pfizer. Yesterday (3/10/21) woke up with severe right knee pain, felt like she could not bear weight/ws going to fall. She went to son's apartment who is in same building and then went to lie down in bedroom. Because she drinks a lot of water, she had to get up to go to bathroom to urinate. She was about to sit down on toilet, when she felt both her legs go numb as well as her arms and her vision was blurred. She tried to grab the tub but fell forward on the floor. She states she urinated on the floor. She was on the floor for about 30 mins until her son got her up and back to bed. Later in the day she needed to urinate again and when she got up, she felt unsteady and fell on the bureau bruising the left arm. Since she feels a bit unsteady with gait and used a walker to come hre today. She denies feeling dizzy before her falls. She denies striking her head. She denies convulsions or hx of seizure disorder. She reports no new meds, only recent change an increase in her alprazolam dose. She does report a headache day after her vaccine.'She denies vomiting or diarrhea or antecedent illness. No longer has headache. She denies positional changes Of note she is on propranolol (prescribed by psych) as well as lisinopril-hydrochlorothiazide for HTN 64 yo female with bipolar disorder on multiple psych meds, htn on propranolol 20 mg bid and lisinopril-hydrochlorothiazide, s/p recent Pfizer covid vaccine, s/p presyncope episode after experiencing severe right knee pain and attempted micturition. Pt felt like her sight was affected and experienced numbness/weakness in legs and arms causing a fall. Did not hit head. The history is most suggestive of a vagovagal episode.

1094628	3/12/2021	AL	65	F	3/4/2021	3/4/2021	Within 5 hours, patient was awakened from her nap but found that her eyes were swollen shut, upper lip was swollen and her gums itched. Her head was hurting which is what awakened her. She went and looked in the mirror, she immediately took a Benadryl 25 mg oral gel cap. Within 20 minutes, the swelling and itching started to improve. The symptoms resolved after taking the Benadryl. The next day, she went to work. She took another Benadryl at 10 AM on Friday, slept all day. She ran errands on Saturday, took a Benadryl with her just in case. She also carried an Epi pen. Her feet began to swell, her hands swelled and she started itching all over. Her throat began to close. She took a Benadryl immediately (this is day 3). The symptoms did resolve. She returned home. On day four, she had some nausea. On day five (Monday), she went to work and her tonsils started throbbing. She ran her bus driver route. She was itching all over again. She took another Benadryl. She called Dr. on day 5 after vaccination because of the recurring symptoms. She also called her allergist. She had an appointment with her allergist on day 6. Family Doctor also called back on Day 5 and called a prescription in for Prednisone. She did not start the Prednisone. She did see the allergist on day 6. The allergist thinks her reaction might have been due to the preservative in the Moderna product. It was the only ingredient in both the flu shot (7 years ago) and the Moderna contents. She advised her to take the Prednisone dose pack (as prescribed by family doctor) to over-ride and she upped her Zyrtec to bid.
1094654	3/12/2021	CA	59	M	3/11/2021	3/12/2021	Woke up overnight with a black eye, a pretty good shiner. No trauma to the eye area. I feel great. Face was slightly puffy in the AM.

1094021	3/12/2021	FL	52	F	1/12/2021	1/12/2021	Around 4pm left arm was swelling (entire) and pain. my left eye closed completely,tears and right eye barely closed. I was very sleepy was driving home.The next day I exp fatigue,diarrhea, chills and headache(right side) for the remainder of the week. I took Tylenol for headache the pain wasn't going away.I went to ER did a test for Paralysis discharged with drops for eyes. I followed up with Ophthalmology clinic they put a light to my eyes due to both being completely closed and did some test. I was told to stop using the drops from the ER because it was toxic for my eyes.Upon my discharge given instructions to due warm compress on my eyes for swelling and blurred vision. As of today I'm still ex blurred vision (both eyes) to see, hard for me to see computer,cell phone, letters.

1094582	3/12/2021	DE	67	F	3/6/2021	3/6/2021	There was an itchy sensation on my eyelid and corner of my right eye, which I had thought was due to tears. That itchy irritation progressed to redness and the itchiness would be more prevalent in the evening, than the morning, after my shower. I tried a few otc items that I thought would help, but after six days, I went to my doctor's office and was treated by a Nurse Practitioner. She urged me to see my ophthalmologist, which I will do on Monday, March 15. She prescribed two oral medications (prednisone & hydroxyzine) and one topical medication (mometasone).

1093411	3/12/2021	IN	65	F	3/5/2021	3/5/2021	About 10 minutes after the shot I felt a warm sensation inside my arm running all the way down to my arm and my hand went numb . I waited a few more minutes then I was released. Then 1/2 hour later my eyes were very sensitive to light I wore sunglasses. Then five hours after the shot I had chest discomfort on left side of my chest which felt like I was having a heart attack pain subsided then every 2 hours it came and went until the middle of the night. Then next day still having same chest pain. Then I had difficulty swallowing was choking so I called my doctor. I also had trouble breathing. Dr. Advised to go to ER if I needed to. I rested and rested and monitored myself. Blood pressure fluctuated somewhat. Still had chest pain and discomfort 24 hours after the vaccine. I had never had chest pain or discomfort before. It was quite alarming. Not being able to swallow was alarming also. Several years ago I had an allergic reaction to a cleaning problem some of the same symptoms it was very scary no heart or chest pain with that allergic reaction to a cleaning product that had bleach in the product.

Medical history included chronic headaches, high cholesterol, high blood pressure and minor heart condition. Patient is not pregnant. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient hasn't been tested for COVID-19. Concomitant medications included candesartan, rosuvastatin, gabapentin, topiramate, amitriptyline and erenumab aooe (AIMOVIG), all from an unspecified date for an unspecified indication. It was reported that 2 days after second dose (reported as 24Feb2021), the patient experienced nausea, shivers, fever and dehydration which led to a fall (possible faint) that caused a head injury (bone chip above her eye). As a result, the patient had an ER visit and they provided her with fluids and stitches. The outcome of events was reported as 'recovering'. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

1093969	3/12/2021	AZ	76	M	2/1/2021	3/1/2021	New onset Myasthenia gravis. Patient initially presented in the ED on 2/23/2021 with complaint of left facial droop, slurred speech and double vision. His stroke score was 2, for left facial droop. nAChR antibody test this test has come back positive, making it likely that this patients symptoms are due to acute myasthenia gravis. The patient continued to experience double vision and eye weakness associated with trouble swallowing that has continued to worsen and was brought the hospital for re-assessment at the request of his wife.
1093657	3/12/2021			U			On day 2 and on day 12 after injection I got visual migraines - no headache. On day 12 + 13 a very low grade headache. On day 15, I had redness at site of injection, with some texture change I could feel with my fingers. By day 16 it had disappeared. I did take a CBD 25mg capsule and a turmeric capsule before going to bed which could have made it go away by morning. Nothing serious at all, just late reactions. I had typical tired and hurt arm reactions in the normal time frame in addition to what I am reporting. I have not contacted my doctor.
1093659	3/12/2021	FL		U			I'm not sure if this is an after effect of the Moderna shot. I developed a mild cough a day or so after receiving the shot. There didn't appear to be any other adverse effects. However, approximately 2 weeks after receiving the shot, I've begun running a low grade fever, a sore throat, fatigue, sneezing and running nose, swelling of eyes, etc. I have not sought medical attention.
1093702	3/12/2021	OH	63	F	3/9/2021	3/10/2021	The night I received the shot, I felt "achy" and took two Tylenol and went to bed. I woke up the next morning with a headache, chills, runny nose, fatigue, and nausea. I took an allergy medication and stayed in bed. This lasted all day. I woke up the next day feeling fine, except for the constant runny nose. Also, on that day, I started having "floaters" in my left eye that I never had before (probably unrelated but I want to let you know).

1093746	3/12/2021	NJ	61	F	3/10/2021	3/10/2021	Within 5 minutes I felt post-nasal drip, then my inner left ear started feeling swollen and clogged. Then the area from my left ear to my cheek and left side of nose felt numb. Almost like novocaine had been injected. After 10 minutes my chest started feeling a little tight. After 15 minutes I left the facility and used my inhaler (I have occasional asthma) and my chest opened right up. The numb feeling on left side of my face & ear persisted and I developed a headache around my left eye. I was very tired that afternoon, took tylenol and went to bed early. Woke up and the numbness was mostly gone.
1093758	3/12/2021	VA	66	F	3/12/2021	3/12/2021	Vaccine was given by trainee under the supervision of an experienced nurse. Trainee did not wipe the patients arm with alcohol prior to injection. Upon injection, vaccine sprayed from the injection site, spraying the supervising nurse in the eyes. The patient was not given an additional dose, and she was informed she could receive her 2nd dose in 3 weeks. The nurse immediately rinsed her eyes and reported to the nearest emergency room.
1093763	3/12/2021	NY	82	F	1/29/2021	1/30/2021	I had no effect until after i went to sleep.. After midnight i awoke to itching all over. By morning my eyes were closed to slits and beneath my eyes were bags as large as teabags, i also had a low grade fever, aches and pains and extreme fatigue. This lasted for a while so ,on Feb 2.. I went to the doctor who gave me a steroid shot. On the 4th i was not as achy though still tired and the bags under my eyes persisted ...My eyes were still itchy and almost closed... She gave me another steroid shot.. i was also advised not to get second steroid shot by several doctors, a doctor and a Immunologist.. also advised against getting second dose. The fatigue remains and the swelling under eyes remains though not as pronounced as it was at first. I would like to be safe. Is the johnson and johnson an option for me? I would not like after effects Please get back to me with some suggestions and advice as to my being fully safe. thank you.

1095560	3/12/2021	UT	31	F	3/11/2021	3/11/2021	I received my vaccine at 4:09 pm on Thursday, March 11th, 2021. At 4:45 pm I began to get visual abnormalities while driving home in the right quarter of my visual field. It started with perceived motion on the right quarter of my vision that I would compare to the visual effects that occur after staring at an optical illusion , and proceeded to reduced peripheral vision in that side that lasted for about 20 minutes. at 5:00 pm I noticed I was having difficulty reading and typing text messages in my phone, as it felt like I had extreme dyslexia and very low reading comprehension. At 5:35 pm I called my sister, a pharmacy student in Boston, to try to explain my symptoms, but found myself having extreme word aphasia. I could not describe what was happening to me and couldn't recall family members' names, descriptive words, or the name of my dog. I tried to stay calm while she looked things up and began cooking and listening to a podcast, since my comprehension of spoken words was fine. My headache got worse and I took an ibuprofen by 6:00pm. My boyfriend called me at 6:36 pm to check on me, and I found myself talking fluidly to him on the phone. I called my sister to reassure her and the visual abnormalities and reading and speaking issues were all resolved. I took my temperature at 6:36, and it read 99.9 degrees fahrenheit.
1095575	3/12/2021	FL	55	F	3/10/2021	3/10/2021	puffiness of eyes, especially left eye. Also bag and dark circle under left eye. Eye balls feel sore

1095577	3/12/2021	DC	20	F	3/12/2021	3/12/2021	Patient did not report any allergic reaction to any vaccine or medications when asked during consultation prior to administration. The pharmacist had administered the vaccine and patient was sent to the waiting area to wait the mandatory 15-20 minutes after receiving the shot. Patient was seated and after 5 minutes, patient disclosed with another patient in the waiting area that she was not feeling well. After a few min she lost consciousness for less than a minute, her eyes rolled back. Epinephrine was not administered. When she became conscious, she refused medical treatment. Patient was nauseous and vomited a few times. A pharmacist checked vitals and all were within normal limits and a neuro check was also performed which was normal. Patient was given water, gingerale, raw ginger, and ginger tablets for the nausea. Patient was also given saltine crackers. Patient's aunt arrived at the scene. Patient reported feeling chills and weakness. Patient did not feel comfortable standing/leaving. Pharmacist stayed with the patient for 90 min until patient was stable and walked the patient to the aunts car. At the end of the event patient reported having vasovagal syncope and has a history of fainting at the site of blood, too much stress, and anxiety, but never after vaccines. She reported she did not eat anything in the morning and just drank coffee.
1095583	3/12/2021	NY	23	F	3/3/2021	3/7/2021	The patient received her vaccine on Wednesday March 3. On Sunday March 7, she started to feel fatigue and had difficulty with her balance while walking. Then later that day, she developed double vision. When things did not improve, she sought medical care. She has nystagmus on examination, past-pointing in the left hand, and mild dysmetria on both legs.

1095594	3/12/2021	WI	86	F	2/19/2021	2/24/2021	Starts around 4 pm. Lot of pain right side of face like: 1. toothache, whole jaw aches 2. neck arthritis 3. sinus infection 4. ear infection all at the same time. Strong pain all through right side of face, sometimes up through eye. Worse lying down. Cause? Dental exam complete mouth x-rays indicated no problems with any teeth. Saw Dr. 3/3/2021, was checked for ear, sinus infections, felt all around my neck, no problems. Prescribed gabapentin, told to continue the Tylenol Arthritis I had been taking on my own. Symptoms continue today, only right side of face, head, temple area, sometimes up through right eye, teeth on right side ache. Only take the Tylenol once a day since that is all that I need it. More painful if I lie down in bed at night so sit upright until pain is gone; then sleep through the night. No problem all during the day when I'm up and around doing whatever. .no pain then. Someone in my dental office has the same symptoms along with Bells Palsy, was told by her doctor it's from the Covid shot and could last 3 months? Pharmacist also told me filling the gabapentin for several others with same symptoms (I live in a small town).
1095612	3/12/2021	CA	44	M	3/3/2021	3/12/2021	Patient reported a "tingling sensation" to his face 10 minutes post vaccine. Swelling under eyes were also noted. At 1410 patient reported symptoms subsided. By 1440 patient requested that he leave and another individual to drive was confirmed. Importance of following with PCP was enforced.
1095615	3/12/2021	MI	54	F	2/20/2021	2/20/2021	Cold sore, mouth sores, itchy burning eyes, abdominal rash, itchy skin head to toe, vertigo, dry cough, shortness of breath, traveling leg pain, development of ear infection, dizziness

1095759	3/12/2021	IL	37	F	2/5/2021	2/9/2021	Immediately after injection I felt a tingling in my back that went away within 25 minutes. My left arm started tingling/feeling numb in small areas starting days after injection from vaccine site up to my neck. Days later it spread down to my left hand. It has now been over a month straight of my entire left arm and left hand tingling/feeling numb, with my hand and fingertips being the worst. The symptoms affect me all day every. I've also had very bad headaches with the pain behind my eyes multiple times a week since the injection.
1095776	3/12/2021	OK	40	M	3/10/2021	3/10/2021	Patient felt to be in distress at the close of his observation time. He was complaining of trouble with focusing his eyes, left sided chest pain, and was diaphoretic. Pt appeared to be in moderate distress and very anxious. I examined the pt through the car window and listened to his heart and lungs. Pt was not in respiratory distress and heart rate and rhythm were regular. Reassurance was provided to the pt, but he was also told that to be safe I recommended that he be evaluated in the emergency department and that he be transported via ambulance. Pt expressed understanding and agreed to going to the ED but was refusing transport via EMS. Pt was the passenger in the vehicle and he said that the driver could just take him. I expressed that transport via EMS would be the safest but we could not make him go via EMS and that if they wanted to leave via private vehicle then they could but i still recommended that he be evaluated in the ED. He expressed understanding and that he would go directly to the ED via personal car.

1095878	3/12/2021	CA	19	F	3/10/2021	3/11/2021	Got second dose of vaccine the morning of March 10th. Had the "expected" symptoms of fatigue, headache, and chills the evening of March 10th. Woke up on March 11th around 6:50am and felt the same symptoms as the night before but also really hot and nauseous, stood up and began to slowly lose vision. Went to parents for help and they saw me pass out and collapse. Went to Emergency Room and they found I had a really high heart rate and I received an IV to help with rehydration. Was released after that and have continued to have the same symptoms plus muscle soreness but no longer feel as dizzy and haven't had any issues with vision or consciousness since.
1095894	3/12/2021	CO	71	F	2/12/2021	2/28/2021	This patient developed a severe, multisystem inflammatory syndrome after covid vaccination that necessitated hospitalization for 6 days. It involved skin (rash), liver (elevated bilirubin and asT/alt), bone marrow (leukopenia, thrombocytopenia), cns (hallucinations, visual disturbance), and musculoskeletal system (synovitis). Inflammatory markers were markedly elevated with ferritin over 1000 and CRP over 100. COVID infection was definitively excluded.
1095909	3/12/2021	WA	46	F	3/11/2021	3/12/2021	Blurred vision was the only weird one. I had aches and fatigue and arm pain that were normal reactions. I called and reported it to my doctor. No further treatment at this time.

1095958	3/12/2021	WA	82	M	3/12/2021	3/12/2021	Client is elderly and has reduced mobility status. Client was ushered up into the bleacher seating at the vaccination site following the dose administration, and upon sitting down was experiencing shortness of breath (reported by the client to be from walking up the stairs). Client pulled out personal inhaler (albuterol) and self-administered a dose. Responder noted pallor and increased difficulty with speaking for the client, but client's breathing returned to a regular rate and rhythm in the minutes following albuterol administration. Client's pallor resolved. The client refused emergency medical services twice, and refused having his vitals taken. The client was monitored visually by responder until deemed appropriate for discharge from the observation area. When the client ambulated down the stairs, Responder noted unsteadiness in gait. Once the client was safely at the bottom of the stairs, a wheelchair was retrieved for the client so that the client could safely exit the facility. Client accepted the wheelchair at this time. Client refused a vitals check a second time at the checkout station, per responder.

1094753	3/12/2021	CO	77	M	2/4/2021	2/6/2021	Neurological, including trigeminal neuralgia and one Bell's Palsy symptoms. Tried to complete online at library on 2/24/2021 but timed out at 20 minutes. Item #18: CDC asked to report any Bell's Palsy symptoms (also trigeminal neuralgia is related to BP). 48 hrs post vax, mid-afternoon Sat, Feb 6th: Suddenly unable to comprehend book I was reading; and there was a physical sensation of irritation just inside my skull, wrapping around my brain (meninges?) - it did not intrude into brain. Felt lack of 'presence' in room. Slightly unstable on my feet. Believed these were related to vaccine, would soon abate, but, also, that this would be no way to go through life! These lasted 2-3 hours. (I neither drink alcohol or take recreational drugs.) About that time, a 'twinging' precursor to trigeminal neuralgia began – uncertain whether it was TN? Recurred every 3 hrs. But then awakened at 6:30 a.m. by two painful TN jabs, repeated more strongly at 9:40 a.m. At about 12:30 pm, return of light 'twinging' sensation, then nothing – no recurrence. 3rd TN episode in 3 years, the briefest, the only one not requiring oxcarbazepine. Checked for Bell's Palsy symptoms (which I've never had): The left side of my mouth wasn't producing any saliva at all – none. This improved very slowly, continuing for 5 or 6 days; by far the longest lasting symptom. About Monday, the 8th, experienced an expanded time warp driving to library – took forever to reach two roundabouts. Lucid, alert, vision & reactions normal. Speed was a mile or two above limit. No euphoria or nystagmus. At library, conversation and work seemed normal. Around the same time I had about an 18 hour complete memory loss with regard to medications. Two dose periods in succession. On Monday, Feb 8th, I called our 4 day a week neurologist. He said the symptoms were an immune response to the vaccine but that he's never seen them together before. It was scary. I'm not going to take the second dose at this time. And will depend upon PCP. Filling out this form because you've asked about any adverse reaction related to Bell's Palsy (which TN is closely related to). I wonder how many others have experienced trigeminal neuralgia symptoms following vaccination? It's a cumulative disease and devastating in advanced forms. :-(

1093483	3/12/2021	PR	52	F	2/19/2021	3/3/2021	My eyes were swollen, rash on face and body, prednisone treatment 20 mg for 12 days and zyrtec
1095722	3/12/2021	IN	54	F	3/10/2021	3/10/2021	Around 5:55 I felt a numbing at the top of my leg while seated while waiting my 15 minute wait time. The numbing continued down the right side of my right leg. I didn't think much of it because I thought it was the way I was sitting. I didn't report it to anybody at that time. I got in my car and my three right toes started to numb. Then I felt it down my arm and the right three fingers. About 15 minutes later my jaw muscle, then up to my temple and across the fatty area of the eyebrow went numb. Several minutes later I noticed my nostril and right side of my tongue numb. It felt like my tongue and face were swollen but when looking in the mirror they were not and there was no drooping when I smiled and raised my eyebrows. It was a similar feeling that I have had when a shot has almost worn off from a dental procedure. The feeling and the movement is there but still tingly. The arm, leg, and toe numbness went away 2-3 hours later on the same day of the shot. I had no numbness on the left side. Two days later I still have the same numbness on my right two fingers, tongue, jaw, eyebrow area, and nostril.
1094915	3/12/2021	WI	27	M	3/11/2021	3/11/2021	Pt. was vaccinated by another pharmacist at our remote clinic at an elementary school at 11:35am 3/11/21. Within less than 3 minutes the patient informed a student that he did not feel well. He reported: itching, feeling hot, shortness of breath, dizziness, loss of vision, and thirst. The student alerted me and I assessed the pt. He was responsive, but felt "tired". He was sitting on the floor. I told the student to call 911. I continued talking with the pt. as I was preparing the epinephrine and placing a blood pressure cuff on his arm. He became less responsive and asked me for the epinephrine. I injected him with an EpiPen 0.3mg in his outer left thigh through his pants (at 11:43am). Within approximately 30s-1min the pt. became more responsive. I then took his pulse and BP shortly before EMS arrived (11:52am). They performed the second blood pressure reading and the pt. was transferred to their care at that point.

1094881	3/12/2021	NC	33	M	3/12/2021	3/12/2021	33 yo M with NKA, history of fainting in the past and anxiety about vaccines and needles was in the drive through clinic to receive COVID-19 Janssen vaccine on 3/12. After receiving the vaccine at 0943 (lot # 1802070) in right deltoid, the patient began to feel anxious. He had been or was watching EMS working with another patient who had experienced an ADR. He began to feel "floaty" and noted he was blinking uncontrollably. He reported some tunnel vision/blurred vision. He states he recalled a nurse rubbing on his chest and placing a cold pack on his neck and at this point he began to feel better. He states he was trying to "fight" the feeling and was tensing up his extremities but denied convulsions or any loss
1095469	3/12/2021	FL	64	F	3/6/2021	3/8/2021	Got a fever and chills which seemed expected on Sunday evening the day after the shot on 3/6/21. On Monday, I was fine but tired and went to bed about 11PM. I awoke to the feeling that the room was spinning even with my eyes closed and when I opened my eyes the room continued to spin around me. I could barely stand up when I tried. Felt nauseated but did not vomit. The vertigo continued off and on on Tuesday, Wednesday, and Thursday especially when I would lay flat either on my back or stomach if I turned my head. I went to my doctor this morning who ruled out an ear infection or wax build up. She encouraged me to contact her if it continued after a week. I have only had vertigo two times in my life, both after a physical trauma to my head (car accident when I as 30, and surprise tackle during touch football) when I was 53. This struck me as an unusual side effect from the vaccine since I have never had vertigo without a prior event like an accident. I am in good health otherwise.

1095349	3/12/2021	FL	67	F	2/12/2021	2/12/2021	Jan 14, 2021 1st Dose Moderna COVID19 vac-Rec'd in R-arm. Sore muscle-bearable lasted 4 days. Tiredness lasted 1 day. Vac site swollen, red and itchy-Bearable. Sore muscle and vac site reaction all done by 5th day. Did not take anything for the discomfort. Feb 12, 2021 2nd Dose Moderna COVID19 VAC-Rec'd in R-arm at 1:35p. 1. Feb 12 8:30pm my neck from the base of my skull down to top of my shoulders in pain and muscle spasms severe for a couple of hours. Felt faint until it was over. 2. Feb 12th and 13th The R-arm muscle ached with much pain coupled with soreness all night-no sleep. Did not take anything for this discomfort. No fever during the night. 3. Feb 13th Muscle left with little movement. Felt like it was going to break if I forced it past its abnormal limitation this morning. Took nothing for the muscle pain. Awoke with dull headache left side of head morning of the 13th. Fever of 99.1. My normal is 97.7. Took nothing for the fever. 4. Fever all day until approximately 6pm. Fluctuated all day long between 99.1 and 100.2; never going lower or higher. Fever broke on its own approx 6pm. 5. Feb 14 No Fever. Felt pretty good. No headache; muscle still very tight and sore but still working with it. Tiredness but went about my daily activities. Took nothing for the muscle pain. 6. Feb 15 No Fever. Over did it on the 14th. Did nothing all day. This is the day the injection site became very swollen red and extremely itchy. Started ice cold compresses to relieve that irritating itch. This reaction lasted thru day 7. By day 8 the extreme itchy and swelling was gone. First day to bed by 7pm. Slept all night until 5am. 7. Feb 16 Day 4 after vac. No fever. I picked up my activity slightly from the day before. Tired. To bed again at 7p. Slept until 5:40am. 8. Feb 17 Day 5 after vac. No fever. Felt real good. Energetic! Had pretty much a normal day yet careful to not over do. 9. Feb 18 & 19 Days 6 & 7 after vaccine. HORRIBLE. Woke up with a splitting headache both days! No fever! The following happened all on the left side of my head and face. a. Left eye left corner painful. No twitching. Tight. b. Left side of face on cheek above where my mandible has been deteriorating since 2016 with associated bone infection that has been subsided since Dec 9, 2020 a blemish appeared. Not a pimple. But a blemish that had opened sometime during the night bled a little and had scabbed over. There was nothing there before I went to bed. c. A BLISTER had formed on

							top of the left side of my scalp. It was extremely sore. 10. Feb 20 Day 8 after receiving vaccine EVERYTHING was gone as though nothing happened, the splitting 2 day headache, the 2 day painful left eye, and the 2 day painful blister on my scalp. The blemish on my cheek was clear in 3 days from appearing on Feb 18th. Please note that I had not taken any medicine to alleviate any of these side effects. I allowed it to run its course. Also, the last 2 days of side effects beginning on the 18th and 19th were so severe (to me) I felt compelled to report my side effects. End of side effect reporting.

1095287	3/12/2021	NV	30	M	3/12/2021	3/12/2021	<p>After getting the vaccine in my left arm, I walked to observation area and sat down in chair. Within a minute or so, I noticed my heart rate was slightly elevated and had a strange feeling of unease. Roughly 3-5 minutes later symptoms appeared and I noticed my palms were sweating and I had slightly blurred vision. At this point, I called for a paramedic and told them I wasn't feeling well. They arrived nearly 15 seconds later (paramedics were stationed all throughout observation area). Symptom severity dramatically increased (very blurred vision, feeling of something clearly being wrong) and was added by a ringing sound in both ears. I was helped into a wheel chair and rolled into an enclosed area with a curtain around for privacy. Gatorade was offered to me and I took a few sips and felt very mildly better. Paramedics reported that my blood pressure was extremely low (63/28). They asked if I wanted to go to the hospital. Symptoms were the same and starting to very slightly get better from the Gatorade so I said let's wait a few minutes to see how I feel. At this point they took my blood sugar measurement and found that it was also very low (53mg). They gave me some intravenous fluids and a glucose substance that was in a tube (sort of like toothpaste) and within another five minutes I felt considerably better. I received the IV treatment for roughly 20 minutes and symptoms progressively got better over the course of the treatment. My blood pressure went back up to 117/80 and my blood sugar went up to a more normal level as well (I believe they said somewhere in the 90s or low 100?s). After they removed the IV and blood pressure monitor, I rested for roughly 20 minutes before walking to my car and driving home.</p>

1095263	3/12/2021	CT	40	F	3/6/2021	3/6/2021	I did not feel well almost right away, but decided to go home and rest. I been having severe headaches, achy arm for two days, body aches/joints aches for three days, sore throat, fatigue, achy skin, ears hurt/ached, warm temp (low grade 99.5ish, some chills, eyes were watery, became very sensitive to light - any exposure to sun/light brings on more of a headache or worsens headache, my eyes feel like they are "bugging out." The symptoms have been consistent across the last week. Early in the week I became restless at night/not sleeping well, ansty/racy, out of my skin, dizzy, and loopy feeling. Then sore throat increased Tuesday and it became uncomfortable to swallow. I could feel sensations down my throat, sternum and across my chest. I had an overall tightness with subtle itch. My tongue started to ache with a bad taste in mouth, burning mouth syndrome like, along with red dots all over my tongue and clustered more heavily on the front/sides. I also had other mouth sores come and go all week. My left ear had some ringing a handful of times and occasional hot ears the last couple days.

1091348	3/11/2021	OH	45	F	12/31/2020	1/12/2021	5 minutes after receiving the vaccine I had a rapid heart rate, shortness of breath, tight chest, very jittery. I reported to EMT on site he said I was fine was probably due to not eating anything before vaccine. Left, got something to eat felt better. Arm soreness after injection that lasted 4 days, very cold feeling for 4 days after vaccine. Developed brain fog that still has not cleared up since vaccination. On 1/12/2021 I woke up for work, as I was combing my hair I noticed the lymph nodes on back of skull and neck were raised and very swollen. Started developing vision problems and stabbing pains in my eye. Immediately called my PCP, he had me come in thought it was shingles and gave me Valtrex to take. This did nothing for me, no rash, no symptoms ever appeared. I called again and he had me go in for an MRI and CT of my neck/head. I still have motor skill problems, dropping things, brain confusion, lymph nodes all over my body are swollen at random times, I have now developed muscle spasms in my legs and feet. Was sent to a Neurologist as they thought I might have a MS lesion after brain MRI. Still ongoing treatment for that issue. I have had no energy at all since this vaccine, having difficulty talking to patients at work, still get dislexic problems, symptoms seem to get worse with higher levels of stress.
1091264	3/11/2021	CT	33	F	3/11/2021	3/11/2021	Patient is 4 mos postpartum and is breast feeding Became lightheaded, dizziness and reported visual changes, Supine blood pressure 77/52 HR 100 / min Administered juice . 1091227	3/11/2021	MO	63	M	3/10/2021	3/10/2021	Patient passed out after receiving janssen covid-19 vaccine. There was no injection site reaction, no wheezing, or rash/hives. Patient had vision loss, dilated pupils, sweaty, unable focus or respond to use questions being asked, and was having trouble hearing-said he had ringing in his ears. We were able to lay him on the floor without injuries-he did not fall. I was fanning him and we were talking to him. He got a little worse but then got better. When he was better, he said that he had passed out before when having blood taken. He did not mention this to me before the vaccine was administered. I do not feel that the Janssen COVID shot was the cause, I think he just passes out from injections or needles. We did call 911 when he was getting worse. By the time they got here, he was better but they did check him.
1091194	3/11/2021	IN	72	F	3/9/2021	3/10/2021	Right eyelid sore, some swelling and itching.
1091161	3/11/2021	TX	60	F	1/8/2021	1/12/2021	1/8/2021 vaccination 1/12/2021 Woke up with intense back and neck pain. A really swollen face, nose, swollen 'everywhere'. I couldn't stand because of so much pain. Fever 101 which is very high for me, swollen eyes; went on for 4 days. The swelling went down after 3 days. The joint pain didn't resolve for 7 days. I had a teleconference with my Dr. He said if things get worse, call me or go to nearest ER. I took Tylenol, Advil. My doctor recommended that I only have the 1 vaccine. *I had very bad case of COVID in 03/2020. I didn't go to the hospital but I should have. My husband and I both were COVID + and bad cases. My O2 got down to 82. We had traveled a wedding. We didn't want to infect anyone.
1091119	3/11/2021	VA	48	F	3/10/2021	3/11/2021	Face swelling in eyes, shortness of breath, tight throat

1091676	3/11/2021	CA	74	F	1/28/2021		<p>optical neuritis; inability to move, chew, eat, etc.; inability to move, chew, eat, etc.; neurological damage; unable to speak; changes in her eyes; Her right eye was bulging; Neither eye looked in the same direction, or able to track objects; known allergies: Apparently the Covid Vaccine by Pfizer; This is a spontaneous report from a contactable consumer. The consumer reported two reports for two separate vaccine doses for the same patient. This is the first of two reports. A 74-year-old female patient (not pregnant) received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, lot/batch number and expiration date not provided), via an unspecified route of administration on 28Jan2021 at single dose for COVID-19 immunisation. Medical history included advanced stages of Multiple Sclerosis, Diabetes, depressant, covid prior vaccination. The patient's concomitant medications included diabetic meds (pills), anti-depressants, etc. The patient previously received the first dose of BNT162B2 in Dec2020 at age of 74 years old for COVID-19 immunization and experienced neurological setback and it wasn't terribly obvious at that time. Facility type vaccine was Nursing Home/Senior Living Facility. No other vaccine in four weeks. The patient (mother of the reporter) suffered a neurological setback following the first injection, although it wasn't terribly obvious at that time, in comparison to what occurred after she received the second vaccine. The patient suffered major neurological damage after the second vaccine; unable to speak, followed by an inability to move, chew, eat, etc. The reporter also noticed optical neuritis or changes in her eyes. Her right eye was bulging. Neither eye looked in the same direction, or able to track objects. The patient was currently in a long term acute hospital (pending clarification) with a tracheostomy and a food peg. She had advanced stages of Multiple Sclerosis. Reporter had since learned she had been advised by her MS doctors NOT to receive flu shots. The reporter had known this and would not have listened to the doctors at the nursing home, who recommended she receive the Covid Vaccine. This was serious. The reporter was awaiting medical records, which would provide exact dates, times, etc of the administration of the vaccines. Adverse events resulted in Disability or permanent damage. Known allergies: Apparently the Covid Vaccine by Pfizer. If</p>

							treatment adverse events: unknown. The outcome of the events was not recovered. The patient underwent lab tests and procedures which included unknown covid test: negative in Jan2021 (post vaccination). The outcome of the events was not recovered. Information on the lot/batch number has been requested.
1091053	3/11/2021	IN	67	F	3/7/2021	3/7/2021	Before i arrived at the waiting area, which had no attendant on duty though intake personnel were within sight range, i had an extreme pressure sensation on the right side of my head. I lessened the effect by holding my nostrils and blowing when reminded to do so by my husband when i returned to the car after 15 minutes. Sensations that reminded of bugs crawling beneath my scalp began shortly thereafter, and continue to a lesser degree to this day. I had lethargy, fatigue and brain fog.until Wednesday. My right eye remains challenged as i do have an ongoing eyelid issue for the last 8 years. No arm soreness.

1090966	3/11/2021	NM	56	F	2/9/2021	2/10/2021	The first vaccine my side effect was that my sinuses opened up. That could've been due to the anxiety and then relief of receiving the vaccination causing that effect. I had dry mouth and I was thirsty. The second vaccine EN 6201 I had a headache the next day. Throbbing headache. I read not to take Advil or anything right after. February 09= vaccine February 10=headache February 11= headache didn't go away. I took Advil in the evening. February 12=headache worsened. I took Advil in the afternoon. February 13=I woke up and couldn't see out of my left eye. There was a fog in central vision. About an hour later there was a strange aura. A tornado like tunnel in the central vision started and then shot out from the corner of my left eye. The aura lasted seconds and then the foggy center dissipated throughout the day. The headache throbbed and throbbed. I took Advil around the clock every four hours instead of just one a day. February 14= Full head-ache was gone but sinus throbbed above both eyes. February 16= Eye doctor visit. Know clue if the vaccine caused the ocular migraine or not. I've never had one before and it is super scary. My vision hasn't been clear since then and my dry stable MD turned into wet which I don't think has anything to do with the vaccine. Maybe the headache and the Ocular Migraine was caused by the vaccine. Who knows. I just thought I would report it in case other people have the same. Collecting data is a good thing.

1091579	3/11/2021		32	F	2/26/2021	2/28/2021	I received the vaccine on Friday, February 26th, 2021, around 10:20am. I was fine throughout the day. I was also fine all day on Saturday, February 27th, 2021. Sunday, February 28th, 2021 at 1:30am, I woke up from sleep with double vision, dizziness, and lightheadedness. I went to use my bathroom, and began to feel weak. I was still very lightheaded, and weak. I felt as though I was going to faint. My ears started to feel really warm, and I then vomited. I started feeling lightheaded and weak once again, and then suddenly had diarrhea. I was so dizzy, but managed to head to my bed to sleep. Every single day since, I have been dizzy and losing my balance. I wake up, walk around, and sleep dizzy. Then on Friday, March 5th, 2021 I developed a large lump directly under my armpit. I could not take the dizziness any longer and I went to the ER on Monday, March 8th. I was then diagnosed with vertigo and told that I most likely had lymphadenopathy. Till this day, I am still having dizziness and will be seeing an ENT doctor. I also still have the lump under my armpit. My next dose is, March 19th, 2021.

1091456	3/11/2021	CT	59	F	3/5/2021	3/7/2021	I woke up on Sunday feeling like my eyeballs were being ripped out of my face. Took Tylenol Sinus which helped. As the day went by, I began to have body aches, chills, joint pain, nausea. I took my temp at bedtime, it was 101.9. On Monday, things were much worse. My temp was 102.4 upon awakening & the pain level for my head was excruciating. Again, Taking Tylenol Sinus helped w/the headache & fever, not so much for the rest. On Tuesday, I woke & took my temp, it was normal. It is now Thursday, 3/11 & although I have no fever, it still feels as though I have one. Regular Tylenol helps but the head ache, body aches & fatigue remain.

1091637	3/11/2021	TX	34	F	2/23/2021	2/24/2021	On 02/24/21 & 02/25/21, I had body aches, fever, nasal drainage, and fatigue. On 02/25/21 I visited the pt care and was swabbed for covid - negative. On 02/26/21 I began to cough and felt fatigue. I visited an pt care - tested negative for covid again, & was diagnosed with bronchitis - given a Rocephin & steroid shot + oral antibiotics & an inhaler. On 02/28/21 my left eye broke out in hives. I took benadryl. On 03/01/21 I attempted to go back to work and became over heated, short of breath, and coughed, felt extreme fatigue. I left early and slept from 3pm - the next day. On 03/02/21 I visited my primary care dr and was diagnosed with an adverse reaction to the vaccine and lung inflammation. I was given oxygen in office due to it being low and me being short of breath. Still experiencing coughing, shortness of breath, pain in chest, nasal congestion, fatigue - I was given another steroid shot and a 7 day steroid pack. Chest xray was normal. On 03/09/21 I visited a pulmonologist and was started on breathing treatments, high dose steroid pack, antibiotics, and a different inhaler. Today, 03/11/21 I am experiencing chest pain, fatigue, shortness of breath at rest and on exertion, and extreme brain fog, I have been out of work since 02/24/21.

1090527	3/11/2021	NY	64	F	3/5/2021	3/5/2021	at injection, arm was not operable, too weak to pick up coat or purse. After about 15 minutes the full use of arm was back. The muscle is still affected and strained after 6 days. I waited a half hour at the site and got into my car at 3:45. On the drive home within 30 minutes my face started to itch and turn red, then my mouth inside started to itch, then my eyes started to itch. After that my throat started to feel gravelly, so I took 75 mgs of gel cap benedryl. This is what I feel and take upon getting stung by a bee. I also took my albuterol inhaler two puffs which I also always have on me because of my asthma. I was sleepy but had dinner and went to bed. I did not feel that I had to take more benedryl during the night.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1090234	3/11/2021	NJ	44	F	2/20/2021	2/20/2021	Headache; general weakness, in her legs especially; No energy; No appetite; Diarrhea; Green colored stools; Very faint/thought she was going to pass out; Eyes were watering; blotches on her neck and chest; tingly experience on her tongue and lips; Severely shaking; Overwhelming chills; Extreme nausea; This is a spontaneous report from a contactable consumer (patient). This 44-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot number: E19266) via intramuscular at single dose on 20Feb2021 09:30 for COVID-19 immunization. The first dose was on 30Jan2021 in left arm. Medical history included splenectomy from Feb2017; pancreatic surgery from Feb2017, they removed her spleen as part of that; soy allergy; poultry allergy. Patient confirmed she had splenectomy. The surgery was sort of emergency based so knowing most likely they were taking her spleen out; she was given 4 vaccinations. In the hospital, she did break out in what appeared to be like a chicken pox type rash. The rash lasted a month and then it started to fade. She did not have any breathing sort of symptoms. The doctors did attribute the rash to one of the vaccinations, she was not clear on what vaccine caused the reaction. Ideally, she was supposed to have 2 weeks prior to the surgery so her body had time to reabsorb but she did not have that kind of time, but she had nothing internally going on. She confirmed she had no names, NDC, Lot number or expiration dates for the vaccines she received at that point in time. Having the splenectomy was the biggest thing. In the past, she did not have any allergies to medications, but did have allergies to soy and poultry. She did break out from certain food and her skin develops those blotches. She did have an extra work up in Feb2020, where they tested a bunch of food sensitivities and allergies, and nothing came back. This was right before COVID hit so she did not really follow back up after that, but she was tested for all major foods and household things and nothing came up. In her late 20's, she definitely tested for a soy allergy and allergy to poultry. She did check off yes, she had a reaction previously when she was filling out the form at the COVID-19 vaccine site knowing that she had this prior experience. She was held 30 minutes each time for that reason. Concomitant medication was none. Prior

vaccinations (within 4 weeks) was no. On 20Feb2021, patient was very faint, thought she was going to pass out, eyes were watering, blotches on her neck and chest, tingly experience on her tongue and lips, severely shaking, overwhelming chills, extreme nausea. On an unspecified date, patient experienced headache, general weakness, in her legs especially, no energy, no appetite, chills that come and go, diarrhea and green colored stools. Patient received her second shot of Pfizer's vaccine on 20Feb2021. She had had symptoms ever since. She had a reaction on site at the vaccine center. She eventually had to go to the Emergency Room by ambulance. Her symptoms were still going on and tomorrow would mark a week since she received the second dose. The symptoms she experienced on site were different than what she was currently experiencing. She felt like she had a true reaction at the vaccine facility site. Within 6 minutes of receiving the second vaccine, she became very faint, her eyes were watering. She thought she was going to pass out for a bit. She was told she had blotches on her neck and chest. She had a tingly experience on her tongue and lips. She was severely shaking and had overwhelming chills. She stated this happened for a couple of hours. Basically, there were 3 waves of these symptoms kind of happening. The third wave happened probably a couple hours after receiving the vaccine. At that point, she had been given two pills of diphenhydramine hydrochloride (BENADRYL), taken orally. With the third wave, she thought she was going to pass out, which she thought multiple times before, but then with this particular wave, she experienced extreme nausea which was kind of a new symptom. The doctor on site said to the EMT that he wanted her to go to the Emergency Room. Patient confirmed she was taken to the ER via ambulance the day she received the vaccine, 20Feb2021. She was never admitted into the hospital; she was only seen in the Emergency Room for a couple of hours. She was given IV fluids, she had blood work done. She didn't have a copy of her labs but she was told they were okay. She was injected with diphenhydramine hydrochloride (BENADRYL) via IV before she was released. A lot more symptoms came after she was released from the hospital (ER). She came home and she had just a crazy headache that she really woke up with every single day until this morning. She had been

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

taking a lot of caffeine/paracetamol (EXCEDRIN, Lot#: H044G, Expiry Date: Jun2022) for her headaches. She experienced extreme weakness, nausea. She clarified she had weakness in her legs. She had this exhaustion, and she felt this general weakness sort of in her legs especially. She was still taking stuff for a headache, and she was taking nausea pills. She had been out of work all week. She had no energy, no appetite really. She had chills that come and go. She had diarrhea. She clarified she had more diarrhea in the beginning days after receiving the vaccine, but it was always been a green colored stool as well. The ER called and checked in and were very surprised she had been having the symptoms still so severely. They wanted her to go get an actual COVID test. She went to the Urgent Care to get COVID tested on 23Feb2021 and had a rapid and PCR test. The rapid test came back negative. She had not received the results for the PCR test yet. She was taking diphenhydramine hydrochloride but she stopped taking that. The hospital directed her stop taking the diphenhydramine hydrochloride earlier in the week. She clarified she was taking a generic version (Lot#: P113966, Expiry Date: Feb2021), coated mini tablets. She clarified the nausea pills she had been taking was the generic for ZOFTRAN, ondansetron 4 mg tablet, by mouth, every 8 hours. She confirmed this product was dispensed in a pharmacy bottle with no NDC, Lot number or expiry date on it. She clarified she also had been taking the generic version of TYLENOL EXTRA STRENGTH, it was the Up and Up Brand acetaminophen (Lot#: P122699, Expiry Date: Nov2022) gel caps, 500mg. COVID-19 rapid test was negative on 23Feb2021; COVID-19 PCR test on 23Feb2021 was unknown results. Patient asked if there was a hotline she can call or an information number where she can talk to somebody about her symptoms. She also reported this to her doctor but the doctor made it clear since it was a private practice, they had limited information. The doctor did take down similar information, she just did not know if there was any further information or a hotline she could call. The outcome of events was unknown.

1090776	3/11/2021	FL	71	F	2/23/2021	2/23/2021	beeps, noise in her ears; muscle and joint pain; muscle and joint pain; tongue was a little numb; face lips; felt paralyzed/Felt like I couldn't move it like paralyzed a little bit; whole left side of body started going numb/Left side was numb around 7 or 8 that night/all left side was numb; pains in all of her face; pain and soreness in arm/arm was painful; tachycard, high heart rate; very tired, sleepy; very tired, sleepy; headache, heavy in her head; pain in both ears; This is a spontaneous report from a contactable consumer (patient). This 71-years-Old female patient received the first dose of (Pfizer Biontech Covid 19 Vaccine, Lot No. EN6198) intramuscularly at single dose on 23Feb2021 for COVID-19 immunisation. Relevant history and concomitant drugs were unknown. Past dug included flu vaccine in Sep2020. The patient received her first dose of Covid 19 vaccine on 23Feb2021 at 3:30 in the afternoon. She came home and felt, not bad at any time but more or less towards 6:00 or 7:00 at night she started feeling bad. Her whole left side of body started going numb around 7 or 8 that night. Her arm was painful, face lips and all left side was numb. Felt like she couldn't move it like paralyzed a little bit. Clarified as whole left side, even her leg, her feet everything on that left side. She started feeling pains in bones of head, especially her face, clarified all of her face and her left side was numb even her lips on the left side were numb. Her tongue was a little numb. She had muscle and joint pain. The pain, of course, in the arm, but that was normal. Clarified pain in the arm as the injection site. She didn't feel any swell there. She did not take medication for anything. She used a lotion. The lotion was trivitol aloe vera arnica caleudula and helped to relive the pain. The arm was still a little painful but it's not bad but that feeling made her tachycard, clarified as high heart rate, feeling like boom boom boom, but she did not have any shortness of breath. The high heart rate was gone the same day. She had no fever or chills. She felt very tired and slept for about 10 hours but during the sleepy she started feeling a headache she couldn't get up because she was so tired and she felt pain in both ears. She had not been to the doctor in a while. She was still old fashioned so she carries everything in a little telephone book. While trying to read information caller states she had to change her eyes. She still felt numbness in left side of left leg but she thought it might be because she

1090959	3/11/2021	MO	69	F	3/5/2021	3/7/2021	<p>had not been exercising. When she was waking up around 9am in the morning, it was yesterday that she felt better in regards to the paralyzed feeling. When pains in her face came she felt and she thought what is this? It only lasted for a little while. It was during the night. The pain and soreness in arm at injection site is still there, she did not feel any swelling, or hot at that site. She confirmed she still felt a little tired, sleepy. It's getting better. She may feel a little heavy in her head and would like to go to sleep, but she was not sleeping. She had many things to do and knew she had to be up. The headache went away and was gone on 24Feb2021. It was persisting for a while, not too hard or heavy, but it resolved by 2 or 3 in the afternoon on the 24th. In regarding to pain in ears she mentioned she no longer had. She had beeps, noise in her ears even at the time she went to bed it was better. The outcome of events paralyzed, pain in arm, tired, sleepy, was recovering, the outcome of events tachycard, pains in all of her face, pain in both ears was resolved, the outcome of other events was unknown.</p> <p>pt states that a couple of days after taking the vax she developed dark purple circles under each eye. Her eyes are swollen with bags under them. The whites of her eyes are very red and burning. Pt still has these symptoms. Pt has not taken any meds or put any drops in her eyes since this started and she is waiting for a CB from her PCP.</p>

1090719	3/11/2021	GA	43	F	2/17/2021	2/17/2021	I am emailing you about filing a petition for the Moderna COVID-19 vaccination that I received on Wednesday February 17, 2021, at the Department. I went to my primary care providers for my annual physical and to address my concerns with the vaccination. I gave blood work. Later into my afternoon, I notice that I began to itch across my sternum and I thought it was an allergic reaction to some of my common allergies. I took some Benadryl to calm the itching to get rest. I was out of work from Wednesday February 17, 2021, @ 1300 to Friday February 19, 2021, without pay, returning on Monday February 22, 2021. On Monday February 22, 2021, I came into work and felt fatigue, light headed, headache, blurred vision, and some great deal of body pain. Approximately 2145, I notice that I was having trouble breathing and began itching profusely. I grabbed my epi pen and gave myself an injection. I laid back on the bed and I fell asleep. The following day Tuesday February 23, 2021, I barely had energy to get up and get ready for work. I prevailed because there is nothing set in place for people who experience an delayed allergic reaction to these vaccinations. I have literally been pushing myself through my workdays because I can not afford to be off. On Sunday February 28, 2021, I notice that the rash began to spread across my body parts. My arms, neck, shoulder, upper back, behind my ears, legs, and again I figured it related to my allergies. The condition continued to get worst throughout the next week. It was several occasions I almost lost control of my vehicle because the itching sensation had hit me instantly while driving. Once I was able to pull over, I just began to scratch every area of my body. Therefore, Friday March 5, 2021, I drove myself to Hospital too seek help. I explained my situation, I was checked in, and I showed how the rash had spread all over my body. It was nothing they could do but give me IV fluid, did some blood work and Prednisone 10mg (5 tablets) and send me home without relief. I continue to suffer from this vaccination and no one has any answers to give me. My scar-less skin now looks unattractive and dark spots where there was a rash that came and went but left awareness that I once had a rash in that spot. I am scheduled to see my dermatologist today, Thursday, March 11, 2021. My appointment time is 1615. I went my employer to file a notice of the outbreak and to see what if anything that

was called. No stridors. No wheezing. Reports continued tingling and the numbness in her mouth but no lip swelling or tongue swelling. Denies any difficulty swallowing at this time. No wheezing. No abdominal pain or nausea. No rash at this time. Of note, patient also notes left-sided facial, arm, and leg numbness starting about 10 minutes prior to arrival to the emergency department. She reports that she has had recurrent numbness on the left side in the past, which was thought to be due to migraine versus TIA. She has had extensive work-up and multiple hospitalization for this symptom. She reports that she is allergic to iodine and gadolinium containing contrast. Denies any headache at this time though she had a mild headache after receiving the vaccine. Denies any blurry vision. Denies any weakness in her bilateral upper and lower extremities. Assessment and Plan: Vital signs notable for O2 sat of 96 to 98% on room air without tachypnea. Patient is mildly hypertensive. Patient is well-appearing speaking full sentences without any dysarthria. Pupils are equal and reactive to light. Extraocular movement intact. She notes diminished sensation to her left face, left upper extremity, and left lower extremity. Tongue is midline. Hearing is intact bilaterally. No facial droop. She has 5 out of 5 strength in bilateral upper and lower extremities. No pronator drift. Normal gait. No tongue swelling or lip swelling. No stridors. No uvula swelling. No pharyngeal or erythema. Lungs are clear to auscultation bilaterally without wheezing or rhonchi. Cardiac exam without murmurs rubs or gallops. Regular rhythm. No abdominal distention or tenderness on palpation. No CVA tenderness. 51-year-old female who is presenting to the emergency department with improving lip swelling and numbness in her mouth, raising a concern for anaphylaxis related to her Covid vaccine. Reassuringly, status post EpiPen, her symptoms are improving. However, she has new onset left-sided numbness, with without any headache. She reports that she has had this numbness in the past the last time she had the numbness on the left side was approximately 10 years ago. Her neurologic exam is only notable for diffuse numbness on her left side including her face. Differential diagnosis include migraine headache and TIA. Stroke is possible though less likely given the patient has had the same symptoms in the past

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>

with negative work-up. Will defer code stroke at this time but will emergently consult neurology. Will get labs including BMP and CBC. We will continue to monitor her from the anaphylaxis perspective. We will also give her a dose of steroid. Prednisone 60 mg by mouth given 12:29 PM NEUROLOGY CONSULT NOTE Assessment: Formulation- Diagnosis is guarded. Localization structurally would suggest subcortical (thalamic) or small brain-stem in a sensory territory on the right. Etiologies could be stroke given her vascular risk factors but seems unlikely given there is stereotypy of earlier symptomatology. Demyelinating would be another possibility as well, but again, the stereotype. Seizure unlikely because of the timing of rush from toes to body was minutes and duration of some occasions being days. Complicated migraine possible, has some risk factors, but should be treated as dx of exclusion. She does make complaint of headache, which could support. Some FND elaboration on her anxiety-ridden allergic reaction is also possible, but no objective non-structural signs to support.

1092449	3/11/2021	FL	71	F	3/3/2021	3/4/2021	Received dose #2 at 6:00 pm on 3/3/21. Arm soreness began within 2 hours, increasing throughout the night; pain radiated to fingertips; iced it at 3:00 am with success. Sleep was restless, waking often, with onset of flu-like aches throughout entire body. No fever. Mid-morning headache began to increase with nausea. Difficult to keep eyes open (tiredness), eat or drink. As day progressed, so did the headache and nausea. Taken to Emergency Room at 8:00 pm. Administered Zofran IV for nausea and IV NSAID. Nausea ceased; headache dulled. Released 11:00 pm. Only headache remained through Saturday, 3/6/21.
1092416	3/11/2021	TX	32	F	3/10/2021	3/10/2021	4 hours after the vaccine, I started to get body aches and chills and they continued to worsen. I started to develop a low grade fever 8 hours after the shot. 13 hours after the shot, I had a 104.1 fever. Along with the fever, I experienced severe body aches and chills, nausea and a horrible headache. I couldn't walk as my body was so weak and my vision was blurry. About 15 hours after the vaccine, my fever went down to 102. I was able to get up and walk to my kitchen to take some Advil. My fever broke 20 hours after the vaccine with the medicine. I'm still experiencing severe body aches, headache, nausea and chills and it has been about 30 hours after vaccine. I did have covid 3 months ago, and the symptoms from the vaccine were much worse than the symptoms I had with actual covid.
1092560	3/11/2021	CA	33	F	1/5/2021	1/8/2021	Day of injection after I left the vaccination site I started to have a really bad headache and then sore arm (left arm where the injection was). Then about 7 hours after the injection I started to have a really bad stomach ache and cramps with nausea. This last all night long into the next day where it slowly went away. I was incredibly fatigued and the headache would not break. Then on the 3rd day Thursday January 7 I was feeling okay but not 100% myself. Then Friday January 08 I woke up and knew something was incredibly wrong because my stomach hurt way worse then before, i was so lethargic that I was falling asleep at my desk at work, I was shaking uncontrollably, blurred vision, diarrhea with blood in stool and one close episode of fainting. So at the point I ended up in the ER missing the rest of my work day. My symptoms didn't get better until the following Monday

1092915	3/11/2021	MI	61	M	3/9/2021	3/9/2021	Client reported being bothered by 'blurry vision' about 25 minutes after receiving the Moderna vaccine, accompanied by feeling dizzy and lightheaded. Speech was normal, grip strength equal and strong. Blood pressure was low (85/58), HR 94. Client drank 12 oz water over 5 minutes, BP improved to 95/60 w/ HR 86 (11:48). Client still c/o blurry vision and light headedness, but was talkative and making jokes. He started to stand (to test his balance) but was still unsteady. Gave him another bottle of water, explaining re: low BP and hydration. Reassessed after an additional 5 minutes (11:53) with BP further improved to 100/62. Denied improvement in vision or lightheadedness. Client sat for 30 more minutes. I attended to another client at 12:00, with another RN monitoring him. When I returned to check on him, she said he did not exhibit any signs of being in distress and got up to leave voluntarily.

1091750	3/11/2021	WA	73	F	2/1/2021	2/15/2021	Gross muscle and tendon and cartilage pain. I have bad side effects from taking motrin, ipuprofen, aspirin, etc. I did camomile, a couple of times did the colchicine in case the shot ingredients were making that click in.... but aspects of this was worse. And I did some CBD during the day sometimes. Still did the gaba and CBD at night. Sometimes the pain was so bad it burned. Bad heache that got worse with concentration, extremely dry eyes that eye drops didn't help, gastric problems worse than I'm used to, ate less. I worried about long term leftover inflammation. things are much better now, but still get the heache at a lower level off and on. From old injuries, my muscles are weaker because I've rested too much. My need to sleep was extreme and I was taking long naps during the day and sleeping at night. That happened even when I wasn't taking the daily time CBD. It has been three weeks now and the pain is 99% gone. I can concentrate better. Etc. I also want to report something many of my friends are reporting... and that is a sense of euphoria after the shot. I also had that. BUT I know that that can be caused by a kick into effect of hormones. And I think one or more of the ingredients are apt to cause that (like the hydrocarbons/plastics). they can serve as synthetic hormones. People are thinking that the euphoria was psychological because of relief. I know better and I want this explained to people. It is not ok to let them believe this.

1093043	3/11/2021	PA	64	M	2/19/2021	2/20/2021	The second shot was on February 19. On February 20 and 21, patient experienced a sore arm and flu-like symptoms. On February 28, he had a stroke. Hospital where the ambulance took him initially diagnosed it as Bells Palsy and prescribed prednisone and an anti-viral. After an MRI the next day on Monday, he was diagnosed correctly as a stroke. On Tuesday, he was airlifted to another hospital and was in the ICU for more than 2 days. Patient spent the next 7 days in the neuro-trauma step-down unit with the results of the debilitating stroke. He is unable to swallow and his entire left side is affected as well as vision and hearing.
1093026	3/11/2021	CA	50	F	3/3/2021	3/3/2021	Moderna COVID-19 Vaccine EUA About five minutes after the shot, I had a slight reaction. I had a hot flash, was light headed, and a little dizzy. I was checked out, given water, and was ok. Four hours after the shot, my teeth and gums were extremely sensitive. I tried to eat corn on the cob and could not finish it. I had to put it in the refrigerator and try again the next day. I had recently went to the dentist and nothing was wrong with my gums or teeth. I floss my teeth everyday but could not floss for approximately two days after the shot because of the pain. After about a day I would brush my teeth and my gums would bleed. This had not happened before getting the shot. After about 4 days, my gums went back to normal. I was able to eat, brush, and floss normally. If it had not gotten better, I was going to go to the dentist because it seemed something was really wrong. I have been on immune suppressants for over 10 years. I had not heard that sensitive gums was a side effect. So, I thought I should let you know. The other side effects I had were crohn's symptoms due to my immune system becoming more active. My eyes became sensitive and extremely dry. I was woken up one night because my eyes were burning. I had to put eye drops in my eyes to be able to go back to sleep. I am still having milder side effects one week after the shot. They are manageable. 7 days after the shot I had my depo and botox shot.

1091844	3/11/2021	NY	62	M	3/6/2021	3/6/2021	<p>Within 1 minute of vaccine being injected. I started to feel dizzy. I was wheeled in wheelchair to observation area. I kept feeling more dizzy and started to feel tingly in my fingers and legs (both sides equally) After 15 minute observation time was over, I tried to stand up and immediately sat down again as a wave of dizziness hit me. Doctor in observation area saw me and came over. I told him how I felt. He put his fingers to my wrist and felt my pulse. It was initially between 40 and 90, then steadied off around 90-100. He called for EMTs on duty to come over with a stretcher because he thought I should be laid flat. The EMT took my blood pressure and it was 155/94. The doctor said at one point my pulse was thready. By this point the dizziness was stronger and I felt tingly in my teeth as well as other areas. I was asked about my breathing and I said that it was okay. An ambulance was called for and arrived. I don't remember the exact time. The moved me from the wheelchair to a stretcher. I could not stand up on my own and lurched toward the stretcher. I am grateful strong people were there to get me on stretcher and strapped in. All throughout this my normally barely noticeable Atrial Fibrillation was quite apparent and more erratic. This was a major reason for ambulance call. Some of the stroke protocol was done including gripping EMT's fingers equally and following his finger with my eyes. I was very cold throughout. I was brought to the waiting ambulance outside and driven to Medical Center. The EMT took an EKG which showed atrial fibrillation and a line was put into my arm. When we got to the hospital, I was brought into the triage area and had all my vitals taken. Blood pressure was high, so was pulse then for a half hour, I was very hot and sweated a lot after being cold.</p>

1091831	3/11/2021	TX	26	F	3/4/2021	3/4/2021	Starting about 1 minute after vaccination I became extremely dizzy, blacked out/lost vision, had shortness of breath and a tight chest, lost feeling in my hand and fingers on my left side (the side I got the vaccine), was sweating but felt cold flowing through my body. These feelings lasted for about 30 minutes and my vision and feeling in my fingers and hand came back as the dizziness subsided and my body temp returned to normal. Around 40 minutes after the vaccine I started experiencing echoing in my left ear (the side I got the vaccine on) and soreness around the vaccination site. The echoing in my left ear lasted about 30 minutes and then subsided. The arm pain spread to the rest of my arm and I began to get a headache. About 4 hours after the vaccine I began to experience intense back, hip, foot and hand pain making me unable to do any regular activities. The back pain feels like intensely sharp pain in my spine and hurts to the gentle touch. I previously had no back pain prior to the vaccine. The muscles surrounding my spine up to my shoulders were also painful/sore. This pain subsided after 6 days. On about the 4th day after the vaccine I began experiencing underarm and breast pain on the side I got the vaccine. It is now exactly 1 week since my vaccination and I am still experiencing the underarm and breast pain. I have experienced lethargy since vaccination.
1091813	3/11/2021	OH	62	F	3/10/2021	3/10/2021	Patient arrived to the outpatient vaccine clinic for her scheduled appointment. Immediately after receiving the vaccine, the patient felt chest pain, dizziness, and passed out. She had swelling of the tongue, lips, eyes, and throat. Patient was admitted to the hospital and treated for anaphylaxis with epinephrine, benadryl, famotidine, methylprednisolone, Duoneb and tylenol. Patient is currently still in the hospital but her condition is stable.

PHN monitored client's VS @ 11:30-B/P 156/92 (RA); HR 92; RR 16; Temp. 96.0F; O2 Sat. 96-98%; per client request; Benadryl 50 mg cap taken by mouth; PHN instructed medication could possibly cause drowsiness, blurred vision, dry mouth, nose, and throat; advised to drink lots of water; @11:55, PHN noted rash diminishing in size and color; arms less flushed; B/P 133/82 (LA); HR 77, RR 16, O2 Sat. 96%; client reports dizziness, lightheadedness and tingling/numbness in left hand resolved. PHN reminded the client that Benadryl can cause drowsiness and reiterated the importance of drinking lots of water. Client stated she only lived 5 minutes away from the clinic and she was driving straight home. Client's condition appears stable at time of departure.
1092284	3/11/2021	VA	31	F	3/5/2021	3/5/2021	I am currently pregnant. This is my first pregnancy. My due date is August 29, 2021. My pregnancy has thus far been really easy with no complications. I had a low grade fever that I took Tylenol to treat. I had pretty bad muscle and joint pain, chills, and could not stop shaking. I just felt freezing. Once my fever broke I felt extremely hot all night. The next morning I was exhausted and had a lot of the muscle and joint pain still. I marked on my report that it would've stopped me from going about my normal daily activities, as I could not have gone to work and spent most of the day resting. For the next few days I was tired and my eyes ached. On Monday and Tuesday I had a headache in the afternoon. Yesterday afternoon my eyes finally stopped aching and everything seems to be back to normal.

1092276	3/11/2021	WA	31	F	3/10/2021	3/11/2021	Janssen COVID-19 Vaccine EUA At 7:00am on 3/11/2021 felt light headed as waking up along obvious soreness on the arm where I received the vaccine- left arm. Then later around 10:00am a feeling of tiredness came over my whole body. Around 12:00pm I felt even more tired, lightheaded and my eyeballs felt as if with high pressure in them and are feel sensitive to the sunlight. Also, at 12pm, I had lunch, which was my first meal of this day and felt the necessity to lay in bed and take a nap for 20 minutes before returning to work. While taking the nap I felt tingling on my feet, arms, hands and neck along with certain sudden muscle contractions on the same parts.
1092250	3/11/2021	NJ	69	F	3/5/2021	3/7/2021	On Sunday 3/7/21 9pm left eye started getting red & edematous. Monday morning 3/8 /21 Left eye was more swollen, red, crusting, yellow drainage. Sclera--white, no change in vision. Went to eye doctor @2pm Monday. Stated I have multiple infected sty's on left lower eye lid. Prescribed Keflex 500mg bid & eye drops with Tobramycin and Dexamethasone tid. Symptoms lessened in 36 hours. However Tues. 3_/9 I started developing a fever blister on my upper lip.
1092340	3/11/2021		25	M	3/7/2021	3/9/2021	No adverse reaction or allergic reaction in the 30 minutes following the vaccination. Also none in the 36 hours following the vaccination. Roughly 48 hours later, sensitivity to light and difficulty blinking one eye appeared along with severe headache. In the 24 hours following symptoms' first appearance, the entire left side of the face became numb and tingly with difficulty chewing, blinking, making any faces or smiling. Sound perceived from the left ear also changed. Subsequently diagnosed with Bell's Palsy on 03/10/2021.
1092212	3/11/2021	CA	77	F	3/3/2021	3/4/2021	Two visual hallucinations ( within a one hour time span) starting at approximately 4 am on March 4) each lasting three or four minutes, followed by a third hallucination identically to one of the two previous ones, on March 5 at approximately 2 pm.( twenty four hours after 2nd Moderna vaccination.) I called for an e visit with my physician and was referred to an on call doctor who questioned me about the events and decided that the hallucinations were probably not a reaction to the vaccination but to report it as a possible reaction.

According to eye witness statement she started to tilt forward and fell on the floor landing on her right shoulder. She did not witness her head connect to the floor. after 3 seconds she regained conscious and started shaking and vomiting. Medical attention was provided immediately, patient was stabilized and blood pressure checked. after vomiting pt state she immediately felt better. she was provided water and monitored for additional 30 min. she refused EMS or any additional medical treatment. Then event was also documented by store management.
1092181	3/11/2021	WA	83	M	3/9/2021	3/10/2021	Summary: dose exacerbated two of my allergic symptoms. Approx 33 hrs after receiving dose, noticed my eyes were "stinging", (symptom I have, spring and fall for a day or two each, controlled by Patanol 1 drop ea eye BID. (Did not use the med at this time), although I followed my usual routine of un educated "tears" in the eyes at bedtime and 2x in morning. Awakening next morning found eye surrounds (lids, ...) were quite puffy, perhaps 1/4 "swollen shut", eyes still stinging though still not terribly so. Also noted morning breath measurements (Peak flow, FEV1, on a hand-held device) were 5-10% lower than normal. No "sore arm" or other musculature symptoms. At ~ 50 hours post-vaccine, am "better", will now go use some Patanol.

1092098	3/11/2021	CA	33	M	12/29/2020	2/1/2021	I started having radicular tingling with neck flexion that ran down my left leg starting at the beginning of February. I noted it to a colleague and asked if anyone else who had received the vaccine at the same time as me had any similar effects. I was the only person noted. Slowly the tingling increased and began radiating the entire length of the left leg. It only last for a few seconds at the beginning of flexion then completely resolved. I did not think much of this at the time and figured that it would resolve. On February 27, I began having visual disturbances and symptoms similar to vertigo with a severe nystagmus with a gaze the the right. I attempted a round of azithromycin at this time thinking that there may be an ear infection and that was causing my visual/vertigo like symptoms. There was no improvement with this course of treatment and the visual issues were becoming more of a regular issue. It became hard for me to focus anytime that I would look to my right but was able to focus my eyes while looking forward and the the left. At this time, I opted to have a brain MRI done which was completed on March 9th as well as having basic labs run. I ended up with an elevated white count on my labs with a left shift. My MRI was read the same day showing a demyelinating process. Multiple neurologist were consulted on this and they believe that my symptoms are not related to MS as the radiologist listed as his top three on his differential but rather what they called post-covid vaccine syndrome, similar to what they are seeing with patients who actually had COVID. I have no medical history, I am not taking any medications and had no symptoms prior to the vaccine. My symptoms were acutely brought on unlike MS and I do not have any of the four most common male characteristics of MS. I do not currently have any muscle weakness, I am not fatigued, it has not progressed to my upper extremities, it does not have a stocking glove approach but rather shoots down, I have no sexual dysfunction. I have been started on a high dose prednisone taper as recommended by the neurologist. My biggest concern is that when I looked for information as a medical provider, I was unable to find anything related to neurological issues and the vaccine. Once, I was placed in contact with multiple neurologist, I was told that they are seen quite a few neurological adverse events.

1092094	3/11/2021	VA	60	F	2/5/2021	2/22/2021	I started feeling sick on February 19, developed ear pain behind my ear on February 19 and experienced Bells Palsy starting February 22. Slight droop of face beginning at 10 am, by noon 1/2 my face was completely paralyzed, with my left eye is frozen open.
1092202	3/11/2021	CA	17	F	3/11/2021	3/11/2021	Written by the patient and guardian: " 8-10 minutes after shot, complaints of light head an throat closing up. Removed mask for fresh air, no relief. Went to get up for water, immediately for light headed, pale face, checked-out look in eyes. Body went limp, set 17yo in chair, still was light headed and lethargic. Laid 17yo down on floor, administered water. Vision came back dizziness went away. remained seated for another 15minutes. Continued hydrating w/ water, other symptoms diminished." From Dr.: "Witnessed patient pass out in chair, within 10-20s was helping caregiver lower patient to the floor and patient had come to. Increasingly alert. Endorses above narrative, as well as not having eaten or drinking much today, "maybe an apple". She does not have a history of vasovagal syncope. Patient Pulse at 65, normal breathing, no distress, no signs of injury. Overall episode appears to be vasovagal syncope. Patient asked to drink water and remain at the vaccine center an additional 15-20 minutes for observation. After 15 min patient feeling back at baseline. No further medical intervention.
1092258	3/11/2021	CA	25	M	2/2/2021	2/4/2021	Moderna COVID-19 Vaccine EUA The day after I received the 2nd dose of the vaccine I had a headache. That same night I ran a fever and woke up the next morning feeling ok. I was taking a shower and it was reported to me by my fiancé I had passed out, started to seize, my eyes rolled to the back of my head. A few minutes later I woke up on the floor and asked what had happened. I was not sure what had happened. I felt fine when I woke up. When first responders arrived they asked me if I knew who I was, the date, the president, where I lived to all I was able to answer correctly. I went to the ER and they did a ECG, blood test, urine test, chest x-ray, CT of my head and they said everything came back normal. I was prescribed Keppra and have an MRI scheduled in the coming week.

1086891	3/10/2021	TN	52	F	1/4/2021	1/1/2021	she was diagnosed with COVID in between the first and second vaccine; she had headache; arm pain at the injection area; severe back spasms in the thoracic and lumbar; made a different in the vision, it was throbbing; back pain; This is a spontaneous report from a contactable nurse (patient). A 52-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot #: EL0140), intramuscular on 04Jan2021 at single dose at left arm for covid-19 immunization. Medical history included diabetes (diagnosed six years ago. Her last A1C was 6.1 in Dec2020), chronic edema since her last child was born 26 years ago. Concomitant medications included ongoing furosemide (LASIX), ongoing potassium, ongoing omeprazole (PRILOSEC), ongoing metformin, and paracetamol (TYLENOL). Caller received the Pfizer-BioNTech COVID-19 Vaccine first dose on 04Jan2021 and second dose on 27Jan2021. Caller reported to have experienced back pain 2-3 days after the first dose, and a sharp stabbing back pain with moist cough for almost a month now after the second dose. Caller was diagnosed with COVID-19 in between. With the first vaccine she had headache, arm pain at the injection area, back pain and severe back spasms in the thoracic and lumbar. It was sharp, stabbing, crushing pain then she would have spasms. She went to urgent care and was given diclofenac (VOLTAREN) and cefixime (FLEXERIL). She was taking 1 gram of paracetamol every 8 hours. That lasted two to three days. That started on the 06Jan2021. She thought she was doing great and then on the sixth was when it started. By the morning of the ninth it was over. Seriousness criteria for back pain, it was seven out of 10. It was disabling. She had to miss work and could barely walk across the floor; for event arm pain at the injection area, gripping was not easy and moving her arm was painful. She was left handed. Heat worked better than ice. Ice made things worse; for event headache, made a different in the vision, it was throbbing. She did a zoom call with her doctor because of COVID symptoms and because she took vaccine. She took 1000mg of paracetamol prior to receiving both doses and thought maybe it wouldn't hurt and would keep her from getting a fever. She had been taking 1000mg paracetamol three times a day and now she was taking it two times a day. She was taking cefixime at bedtime because she can't

1088545	3/10/2021	IN	57	M	2/26/2021	2/28/2021	Chills, body ache, swelling at injection site. Prolonged side effects that included several visits to Primary care physician's office: Chronic headache over left temple, forehead and left eye socket , pressure on left eye, blurred and double vision, continued soreness upper body, arm, neck and head., high blood pressure lasting now 11 days but as of today (Mar. 10, 2021) getting better but still existing. Seeing Ophthalmologist Thursday Mar. 11, 2021.
1088542	3/10/2021	NV	71	F	3/2/2021	3/2/2021	About 6 hours after the vaccine she felt really, really sleepy. Then she laid down and then her left hand started stinging all over. Both legs started getting a strange warm sensation, the size of a pea that kept getting warmer. She was not able to get up or open her eyes, doesn't know if she passed out but apparently went to sleep and slept for 3 hours and woke up and went to bed. She then had toe cramps on her left foot, then got up and walked around the bed and laid down again and fell asleep until the morning. She did not feel normal until 3/5/21. On Sunday, 3/7/21 had nausea, took something for that and the next day she was fine.
1088519	3/10/2021	WI	77	F	2/11/2021	2/12/2021	Experienced a retriggering of concussion symptoms: intense head pain, vision issues, nausea.

1088443	3/10/2021	MD	38	F	2/3/2021	2/10/2021	<p>***To continue off previous entries: VAERS E-REPORT 326730 AND E-REPORT*** I received the 1st dose of the Moderna Vaccine on January 6, 2021 at 01:49 pm. Approximately 4.5 hours later on January 6, 2021, I went outside in the cold temperatures. Upon returning inside to warmer air, the bilateral fingertips of both hands were pale white, numb, and painful. The time was 06:30 pm on January 6, 2021. At 06:47 pm, I felt a different feeling in the bilateral tips of my fingertips, and could see the color changing from pale white to a mixture of purple/black. January 6, 2021 at 06:32 pm was the first time I have ever had my hands respond in this manner to cold temperatures. I have felt one fingertip go numb and turn white for a split second, only one time in my life but it was not a repeat occurrence, and it only lasted for about a second when it occurred. This experience and reaction I currently have lasts from 15-30 minutes of bilateral fingertip numbness and discoloration with pain. The bilateral fingertips of both hands now respond in this manner every time they are exposed to cold temperatures. I signed up for V-Safe and did state that I was having this symptom through the Vaccine reporting system on V-Safe under other" multiple times. Treatment I received from a health provider are as follows; I had a telemedicine visit on January 14, 2021 at 12:51 pm to address my concern of ?reaction to Covid vaccine, fingertips were numb, lasting 30 mins?. On 1/14/2021, I received a primary diagnosis of Raynaud's Syndrome by my Primary Care Provider. On 1/28/2021, I was seen in person by my Primary Care Provider for a Well Visit to complete a physical with my primary care provider. I was provided with a referral to a Rheumatologist for further advice about receiving the additional second Covid vaccination in the series. I also was ordered to do lab work. On 2/2/2021, I was seen by a Rheumatologist for new diagnosis of Raynaud's Syndrome, and advised that risk outweighed the benefits in regards to receiving the second vaccination in the Moderna Covid-19 series. On 2/3/2021 at approximately 1:45 pm, I received the second Moderna Covid-19 vaccination. On 2//10/2021, small red, itchy bumps started to appear on both sides of my neck. On 2/15/2021, a bump appeared above my right eyebrow with what felt like a pimple. On 2/21/2021, the pimple had spread towards my inner eye and above my right eyebrow making my right eyelid swell. I received</p>

							<p>telemedicine care via an e-visit over telehealth with an urgent care and was provided an antibiotic for facial cellulitis. On 2/22/2021, I had one episode of emesis, and went in person to an urgent care. I received a different prescription of an antibiotic, and was provided with instructions of signs and symptoms of what to look for when to report to the emergency room. On 2/25/2021, my right eye started tearing up and the pain began to intensify. I was seen in an outpatient Ophthalmology Clinic and diagnosed with herpes zoster ophthalmicus and postherpetic trigeminal neuralgia. I was placed on a leave of absence from work as of 2/26/2021. 3/1/2021, I was seen in-person appointment with my primary care provider hoping to provide a work note, further assessment of shingles that have spread over neck and back of neck. Primary Care Provider noted diminished bilateral lower extremity muscle weakness and absent deep tendon reflexes. Primary Care Provider referred me to the Emergency room ASAP to rule out Guillain Barre and herpes zoster meningitis. Evaluated by the Neurology Consult team in the Emergency Room. Discharged with diagnosis of disseminated shingles and muscle weakness. Appointment made to Neurologist follow up on March 16, 2021 and for EMG/NCS. On 3/5/2021, seen in-person by Primary Care Provider for hospital follow up. I was feeling diminished sensation increasing in feet, muscle weakness and pain radiating up my back along my spine at times, and near my shoulder/neck. Primary Care Provider was unable to do anything for me. 3/5/2021, followed up with Neurology in person. An order placed for MRI with IV Contrast of Brain and Spine. 3/9/2021, MRI of brain and Spine with IV Contrast completed. 3/9/2021, a re-eruption of shingles started to appear on bilateral areas of my chin and middle of my forehead close to my eye where the nearly resolved shingles were on my eye. 3/10/2021- Order placed for lesions to be swabbed for HSV and VSV and Dermatology Consult placed for 3/15/2021.</p>

1086898	3/10/2021	TN	52	F	1/27/2021	1/1/2021	glands were swollen and when swallows; glands were swollen and when swallows, sharp pain on one side; vaccines were given in the left arm because she was left-handed; Back pain; spasms; fever; she felt like the inside of her eyes were on fire; She had a moist cough; spine pain; nausea; vomiting; She had numbness and tingling around the outside of mouth; She had numbness and tingling around the outside of mouth; She had pain in the arm at the injection site; knees would buckle; injection site was about a silver dollar size and was red and warm to touch; injection site was about a silver dollar size and was red and warm to touch; injection site was about a silver dollar size and was red and warm to touch; This is a spontaneous report from a contactable nurse (patient). This 52-year-old female patient received 2nd dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EL3302) at single dose on 27Jan2021 via an unknown route in left arm for Covid-19 immunization. She was diagnosed diabetes six years ago (as of 23Feb2021), and her last A1C was 6.1 in Dec2020, had chronic edema since her last child was born 26 years ago. Concomitant drugs included furosemide (LASIX) 400 mg twice daily, potassium 10 meg three times daily, omeprazole (PRILOSEC) 40 mg once daily, and metformin hydrochloride (METFORMIN ER) 1000 mg twice daily, all ongoing. She did not feel like the medication she takes are relevant because she had been taking them for a very long time. Historical Vaccine included 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number: EL0140) intramuscular injection in left arm on 04Jan2021 for Covid-19 immunization and experienced back pain, diagnosed with COVID in between the first and second vaccine, headache, arm pain at the injection area, severe back spasms in the thoracic and lumbar (AER 2021200627). Patient experienced back pain 2-3 days after the first dose, headache, arm pain at the injection area, back pain and severe back spasms in the thoracic and lumbar. It was sharp, stabbing, crushing pain then she would have spasms. She went to urgent care and was given Voltaren and Flexeril. She was taking 1 gram of Tylenol every 8 hours. That lasted two to three days. That started on the 06Jan2021. She thought she was doing great and then on the sixth was when it started. By the morning of the ninth it was over. The reporter

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

assessed headache, arm pain at the injection area, back pain, severe back spasms in the thoracic and lumbar were related to suspect vaccine. After the 2nd dose of the vaccine, patient experienced back pain in Jan2021, sharp, stabbing, crushing pain and spasms in Jan2021, fever for a couple of days in Jan2021, knees would buckle in Jan2021, glands were swollen and when swallows, sharp pain on one side on 09Feb2021, felt like the inside of her eyes were on fire in Jan2021, moist cough in Jan2021, spine pain in Jan2021, nausea and vomiting in Jan2021, numbness and tingling around the outside of mouth in Jan2021, pain in the arm at the injection site in Jan2021, injection site was about a silver dollar size and was red and warm to touch in Jan2021. The event clinical course was as follows: The second dose was given on 27Jan2021. She was getting over COVID and had to wait until the 27Jan2021 to get second dose. COVID symptoms started on 11Jan2021. She had PCR test on 12Jan2021 with results of her PCR test on 13Jan2021. She was diagnosed with COVID in between the first and second vaccine due to an exposure not the vaccine. At hour 25 after receiving the second dose symptoms started. Severe back pain in the entire spine. It was sharp, stabbing, crushing pain and spasms. When the back would spasm her knees would buckle. She had a fever for a couple of days. 102 fever and she felt like the inside of her eyes were on fire. She has never had that before. She had a moist cough and still has a moist cough. The spine pain was better, but it is not gone away yet. Normally she does not have back pain. At first the pain was an 8 out 10 now (as of 23Feb2021) it was 5 out of 10. Also had nausea and vomiting. She had numbness and tingling around the outside of mouth. That lasted for two days. She had pain in the arm at the injection site. The injection site was about a silver dollar size and was red and warm to touch. She had pain at the injection site and pain in the arm. Both vaccines were given in the left arm because she was left-handed. She thought she would be using that arm more. She did go to Urgent Care after the second dose as well. They gave her a shot of Toradol and another prescription for Voltaren twice a day and Flexeril at bedtime because she can't stay awake when she takes it. She has missed work because of this. The back pain and cough was almost a month now (as of 23Feb2021). She reported no matter

VAERS\_ID RECVD STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

what she did she did not get it to go away. She did a zoom call with her doctor because of COVID symptoms and because she took vaccine. She took 1000mg of Tylenol prior to receiving both doses and thought maybe it wouldn't hurt and would keep her from getting a fever. She has been taking 1000mg Tylenol three times a day and now she was taking it two times a day. She used Tylenol and generic, SunMark Acetaminophen (Lot number: OLE2349B, expiry: Sep2022). Regarding seriousness of headache, made a difference in the vision. It was throbbing. for back pain: it was seven out of 10. It was disabling. She had to miss work and could barely walk across the floor. for arm pain at the injection area: gripping was not easy and moving her arm was painful. She is left handed. Heat worked better than ice. Ice made things worse. for cough: it had not been disabling. it was irritating because it had been almost 30 days. She knows it was different than the COVID cough because it was moist and when she had COVID it was a dry cough. Regarding seriousness of nausea and vomiting: it was debilitating and she couldn't go anywhere because she was throwing up with every move she made. The pain made it worse. The reporter assessed moist cough, nausea and vomiting, arm pain at the injection area were related to suspect vaccine. No investigation assessment performed. Outcome of fever, inside of her eyes were on fire, pain in the arm at the injection site was resolved. Outcome of back pain, moist cough was not resolved. Outcome of spine pain was resolving. Outcome of the other events was unknown.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the back pain and other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including spine CT/MRI, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any

Symmetrical facial movements. Exam was consistent with conductive hearing loss. Was referred to ENT, started on corticosteroids. Outcome undetermined.
1087389	3/10/2021	OH	63	F	3/9/2021	3/9/2021	In the evening I started to feel aches in my eyes and joints. I was having trouble falling asleep. I woke up every 2 hours. My heart bpm went up to 102 in the middle of the night. I know this because my fit bit was vibrating and encouraging me to keep exercising and I was just laying in bed trying to sleep. I finally got up around 2:30 in the morning and took 1 Aleve. I also took my temperature with a forehead type and it was 98.5, so no high fever. I took another Aleve around 7:00 in the morning. Now I am feeling fine. It's now 8:22 a.m. and I am working from home. I just wanted to report that the aches in joints and 102 bpm and unable to fall asleep were my side effects. I feel fine now. I will continue to take Aleve as needed. I have never been tested for Covid. I have never had any symptoms to warrant testing for covid. Since March 13, 2020 I have been fortunate to work for a company that has us all working from home. We are still working from home. i am 63 years old. I shop around 6 a.m. in the morning for groceries to avoid people. I do not go out. I have been very careful.

A 66-year-old male received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date: unknown), via an unspecified route of administration on 06Feb2021 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. Patient reported that he was having some symptoms that has got worse and wanted to know if he should do something and wanted to know something what went with his eyes. His right eye was blood shot, it was red and daily amount of light that hits his eye was very painful so he had to keep his eyes closed to keep light from coming in so he won't be in pain. Patient was not able to give the lot number because it hurts too much when he tried to turn on the light to reach that (vaccine). Events started on Feb2021. Outcome of the events was unknown. Information on the Lot/Batch number has been requested.
1087423	3/10/2021	AZ	55	M	3/9/2021	3/9/2021	About 9:00 PM got chills. Finally broke around midnight and after that was hot and achy. Today body aches, head ache, and eyes hurt. This is a similar reaction to what I have with the flu vaccine. I no longer get the flu vaccine because of this.

1087049	3/10/2021	WI	44	F	2/5/2021	2/6/2021	Body aches; itching eyes & body; itching eyes & body; chills; headache; This is a spontaneous report from a contactable other health professional (Patient). A 44-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot number: EM9810), via an unspecified route of administration, Right arm on 05Feb2021 at single dose for covid-19 immunisation (Age at vaccination 44 years) at hospital. Patient was not pregnant at the time of vaccination. The patient didn't received any other vaccines within 4 weeks prior to the COVID vaccine. The patient didn't received other medications received within 2 weeks of vaccination. Medical history included ehlers-danlos syndrome (EDS), mast cell activation syndrome (MCAS), postural orthostatic tachycardia syndrome (POTS). Allergies to medications, food, or other products included Latex allergy. The patient's concomitant medications were not reported. Historical vaccine included first dose of BNT162B2 (COVID 19, Pfizer, PFIZER-BIONTECH COVID-19 VACCINE, Lot number: EL3249), via an unspecified route of administration, Right arm on 15Jan2021 at single dose for covid-19 immunization (Age at vaccination 44 years). On 06Feb2021, the patient experienced body aches, chills, headache, itching eyes & body. Prior to vaccination, the patient wasn't diagnosed with COVID-19. Since the vaccination, the patient hasn't been tested for COVID-19. No treatment was received for the events. The outcome of the event was not recovered. No follow-up attempts are possible. No further information is expected.
1087434	3/10/2021		23	F	3/9/2021	3/10/2021	Severe headache (to the point where it was affecting my vision), dehydration, sweats and chills as though I had a fever, muscle aches, and difficulty sleeping. All of these symptoms lasted for approximately 9 hours. They started 10 hours after the vaccine itself.

1087016	3/10/2021	FL	35	F	1/11/2021	2/1/2021	swollen eye; hives; This is a spontaneous report from a contactable Nurse, the patient. A 35-year-old non-pregnant female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot number EH9899), via an unspecified route of administration on 11Jan2021 at 15:30 (at the age of 35-years-old) as a single dose in the left arm for COVID-19 immunization. Medical history included insulin resistance, vitamin D deficiency, GERD (Gastrooesophageal reflux disease) and allergy to pollen and possible allergy to cilantro. Prior to the vaccination, it was unknown if the patient was not diagnosed with COVID-19. Concomitant medications included metformin, famotidine (PEPCID [FAMOTIDINE]), clarithromycin (CLARITIN [CLARITHROMYCIN]), topiramate, and diphenhydramine hydrochloride (BENADRYL); all for unknown indications from unknown dates and unknown if ongoing. The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient previously took pregabalin (LYRICA) from an unknown date for an unknown indication and experienced allergy. On 01Feb2021 at 06:00, the patient experienced hives and swollen eye. The patient reported that the first vaccine was administered and the patient was fine then the patient had hives and swollen eye on the day the second dose was to be administered. The second dose of the vaccine was delayed. The events resulted in an emergency room/urgent care visit and the patient received treatment for the events with solumedrol shot and prednisone oral with benadryl/pepcid/atarax. The patient received the second dose one week later, on Friday 05Feb2021, with prednisone on board. The clinical outcomes of the hives and swollen eye were recovering. It was also reported that since the vaccination, it was unknown if the patient had been tested for COVID-19.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Swollen eyes and Hives cannot be totally excluded. The case will be reassessed if additional information becomes available.

1086985	3/10/2021	GA	67	F	1/14/2021		This is a spontaneous report from a contactable Consumer(patient). This consumer reported similar events for the patient. This is the first of two reports. A 67-year-old female patient received first dose BNT162B2 (Pfizer BioNTech Covid 19 vaccine), via an unspecified route of administration at Arm Right on 14-JAN-2021 at the 67 years old at single dose for COVID-19 immunization. The medical history included breast cancer survivor, allergies to strawberries, bananas, lobster, mahi, whiting fish. The concomitant medications were cholecalciferol (VITAMIN D), ascorbic acid(VITAMIN C), collagen, curcuma longa(TURMERIC) , olive oil. The patient previously took VALIUM and experienced allergy. The patient got hives near her left eye with the first Pfizer shot in 2021 but wasn't sure if that was the cause as she did have food allergies. Her arm was a little stiff but not significantly and she did not have any other side effects in 2021. There was not treatment received for all the events. The patient had no Covid prior vaccination. There was no Covid tested post vaccination. The outcome of the events was recovered in 2021. The information on the batch number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021148988 same patient, same product(different dose), similar events

1086959	3/10/2021	TX	81	F	1/27/2021	1/27/2021	gained about 3 pounds now; The next day, her cheeks, face, and the part under her chin became swollen/her body also became swollen; she feels something in her throat which she can't describe; she feels something in her throat which she can't describe; her vision on her good eye became a little depleted; inside of her lips was swollen; This is a spontaneous report from a contactable consumer. This 81-year-old Female consumer reported for herself that she received the first dose of (PFIZER-BIONTECH COVID-19 VACCINE, Lot number unknown) at single dose on 27Jan2021 for COVID-19 immunisation. Relevant history included food allergy. Relevant concomitant drug was unknown. The patient received her 1st dose on 27Jan2021 and stated that she was feeling fine for about 10 minutes and when she got back home which was not very far from the vaccination site, she noticed that the inside of her lips was swollen. She mentioned that this was not strange for her since she was mostly allergic to food but usually it was the outer portion of her lips that became swollen and not the inner portion. The next day, her cheeks, face, and the part under her chin became swollen and she felt something in her throat which she could describe. She also noticed that her vision on her good eye became a little depleted which got her a little concerned and her body also became swollen and stated that she already gained about 3 pounds now. She wanted to know if anyone had reported the same reaction she had and if it was recommended for her to get the 2nd dose or not. Outcome of events was unknown. The information on the LOT/Batch number has been requested

1086894	3/10/2021	AR	43	F	2/23/2021	2/23/2021	tired; sore arm; Facial droop (left eye and mouth); This is a spontaneous report from a contactable consumer (patient). A 43-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL8982), via an unspecified route of administration at left arm 23Feb2021 08:00 at single dose for covid-19 immunisation. Medical history included Known allergies: Sulfa drugs, codeine, diastolic dysfunction type 1 from Jul2020, and anxiety depressive disorder (she took a medication for that and it had been diagnosed more than ten years). Concomitant medication included bupropion hydrochloride, naltrexone hydrochloride (CONTRAVE). The patient experienced facial droop (left eye and mouth) on 23Feb2021 14:30, tired and sore arm on an unspecified date. The clinical course was as following: She said her appointment for the vaccine was at 08:00AM, and around 02:30PM she was in a video meeting and her left side of her face started to droop and her coworker messaged her to ask if she was ok since she looked pretty funny with the eye and mouth droop. She said that this droop lasted about 4 hours and by 06:30PM it was mostly resolved, if she was not looking at it or trying to raise her eyebrows. She said that the only other side effects were she was tired and had a sore arm. She said doctor asked her to got to the emergency room (ER) to rule out a stroke or transient ischemic attack (TIA) so they did a couple of Computerised tomogram (CT) scans, one with contrast and one without, and a MRI and they did full blood lab work up, and did an Electrocardiogram (EKG) to rule out central nervous system events. She says that they didn't think it was a TIA, they felt it was a peripheral nervous event related to an autoimmune response and all the tests said that they did not thought she had TIA event. She said doctor said it was likely an auto immune response to receiving vaccine, since there were no intervening events between getting the vaccine and the droop, she has not been sick or had any dental events recently. the main reason she was calling was to see if she should get the second dose, since she wanted to get it but has heard the side effects can be stronger for the second dose. She says she would like to know can she or should she take it. The patient was tested was for a stroke but that test came back negative. The patient would like to know if it is contraindicated for her to

							receive the second dose after having this reaction. The outcome of the event Facial droop was recovering, and the outcome of the event tired and sore arm was unknown.
1086886	3/10/2021	TX	39	M	1/23/2021	1/25/2021	My blood pressure, which normally runs low, dipped very low (85/55); I had pretty severe brain fog. I never blacked out, but I was concerned I might.; This is a spontaneous report from a contactable consumer reporting for himself. A 39-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number: EL3246), via an unspecified route of administration on 23Jan2021 on right arm at single dose for COVID-19 immunization. Facility type vaccine was at hospital. Medical history included small fiber neuropathy, dysautonomia/vasovagal syncope, ineffective esophageal motility disorder, migraine, GERD, allergic to preservatives in many eye drops, but never a vaccine; allergic to dust mites. Concomitant medications included nadolol, midodrine, esomeprazole magnesium (NEXIUM), amitriptyline and other unspecified medications. The patient stated "My blood pressure, which normally runs low (I have dysautonomia/vasovagal syncope) dipped very low (85/55) and I had pretty severe brain fog. I never blacked out, but I was concerned I might." The reported events happened on 25Jan2021 18:00, and resulted in Doctor or other healthcare professional office/clinic visit. No treatment was received for the events. The outcome of the events were resolved in 2021.

1086879	3/10/2021	TX	61	F	2/8/2021	2/9/2021	<p>Bell's Palsy; diarrhoea; fever between 98-99 degree Fahrenheit; several headache; nausea; A spontaneous report was received from a consumer concerning a 61-years-old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced bell's palsy, diarrhea, fever between 98-99-degree Fahrenheit, several headache and nausea. The patient's medical history included: Covid-19 (start date 08-JAN-2021). No relevant concomitant medications were reported. On 8-FEB-2021, prior to the onset of the events, the patient received the first of two planned doses of mRNA-1273 (lot/batch:012M20A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. On 09-FEB-2021, the patient's symptoms had started. The patient mentioned a fever between 98°F - 99°F, headache, nausea, and diarrhea. Then on 15-FEB-2021, she had a (facial) paralysis, the left side of the mouth bent to the side and the eye fell. On 20-FEB-2021, the patient had visited the doctor's office and she was diagnosed with Bell's palsy. The patient was treated with, prednisone , valacyclovir, injection (unspecified) like a Cortisone. At the time of this report everything was coming back to normal, but it was not at 100%. The adverse event of ball's palsy was assessed as medically significant. Action taken with mRNA-1273 in response to the events was not reported. The outcome of event of bell's palsy, diarrhea, fever between 98-99-degree Fahrenheit, several headache and nausea was resolving.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.</p>

1088560	3/10/2021	CA	45	F	3/6/2021	3/6/2021	I felt fine for the 20+ minutes in waiting area after, and my 15 minute drive home. I noticed my cheeks were VERY flushed. I took my temperature. Though it was 98.5, that is higher than my personal 'normal' temp. I am typically 97.3-7. Checked again on my flushed cheeks to see that my face was swollen. I ran into a neighbor, though wearing a mask, she didn't see/say anything, and I felt okay enough not to bring it up. By the end of the day, swelling in my cheeks was less noticeable so I went to bed thinking I wasn't having more than a typical vaccine reaction. I woke up the next day with swollen eyelids. I've only become concerned after googling the general side effects and saw 'swelling of the face' and/or 'swollen eyelids' listed as both "common" and "when to call a doctor". My (non)fever is up and down over the past few days though I still feel flushed with more pink in my cheeks.

1087816	3/10/2021	MN	63	F	2/26/2021	2/26/2021	<p>Patient called via telephone at 4:53 p.m. on 2/26/2021. Patient reports that she was in for a 3:40 Covid-19 (Moderna) 1st dose shot appt. She waited her allotted 15 minutes post vaccine before leaving. Patient denied ever having any reaction to anything or vaccine in the past. Patient reports that once she was on her way home she started to experience nausea while driving home. She also started to experience a weird kind of numb feeling that in time moved down in to her left arm, up her to the left side of her neck, jaw and eye. She felt like her eyelid might be drooping but she looked in the mirror and it wasn't. She explained it as a "novacaine feeling" before it is fully numb. "It starts in a spot then spread." "Weird sensation, like going to the dentist. Patient reported that she also has "weird skin" on her arm so can't really tell if there is a local rash. Patient questioned if she can take Bendedryl and this PHN confirms that she can do that. PHN confirms that patient is not home alone and encouraged patient to follow up if she felt the need if her symptoms did not resolve or continue to spread or worsen. Patient reports understanding of this.</p> <p>1/26/2021: 6:30 p.m. call update from patient. This PHN called patient back and patient reports that she is lying low. She took some Bendryl and it helped some. Patient continues to have a little bit of numbness and it did go in to her left teeth a little bit but the numb feeling isn't as bad as it was. PHN recommended that patient try to verify with her doctor before dose 2 of what happened and verify that it is okay to get her 2nd dose. PHN also informs patient that the is diphenhydramine ("Benedryl") on site that we can give her if needed when she is here for her 2nd dose. PHN also recommends that if she comes in for her 2nd dose she would wait for 30 minutes post vaccination vs. the typical 15 minutes. 3/9/2021 telephone update from patient. Patient contacted this PHN to inform that she has had continued issues post Covid-19 vaccination. Patient reports that she continues to have some numbness in the left side of her face and her BP continues to fluctuate up and down ranging from 182-90 to 142/?. She has been in to doctor 2 times and has 1 more appointment scheduled. She also is considering doing a neuro consult. She did have testing done that ruled out a stroke. Patient is unsure if she wants to follow through with her 2nd. PHN did not recommend patient getting her 2nd dose but encouraged</p>

							her to have this discussion with her primary care provider
1087809	3/10/2021	TX	56	F	3/5/2021	3/6/2021	Headache started around 2 hours, 26 hrs later fever and chills started, following that intense muscle spasms and joint pain and swelling, stomach pain, dizziness, black spots in vision. I am on day 5 following vaccination and have the following symptoms. Chills with no fever, drenching sweats, dizziness, continued headache , neck pain, joint swelling, tingling in feet and hands, redness and rash at injection, stomach pain, sores in nose and mouth. I have been put on Prednisone for Lupus flare.
1087771	3/10/2021	WI	51	F	3/9/2021	3/9/2021	After the vaccination, I felt a little dizzy waiting in the parking lot and had a sore arm, but felt fine otherwise. (12:00-1:00 pm) After returning home, I felt increasingly tired and warm. I laid down and took my temperature after walking the dog around 3:00 pm. My temperature read 99 degrees. I drank a lot of pedialyte to hydrate. Throughout the afternoon, I felt sluggish and the glands seemed to swell up on the side of my neck. I also got a headache. My temperature dropped down to 98.7 before I went to bed, but this morning, my glands under my jawline are a bit more swollen and I still have a slight temperature; 98.9 degrees. My eyelids are puffy and I feel a little feverish, but it is tolerable.

1087769	3/10/2021	NJ	37	F	2/16/2021	2/17/2021	<p>Here is my story. Part 1: I had my second Moderna vaccine on 2/16. 36 hours later I was laying In bed when I all of a sudden felt very strange- sort of faint - like I was going to pass out. Then I started feeling like my Body was going numb. We called 911. I was taken to the ER. What followed was about 15-20 ?neurological? episodes (every ten minutes or so) where my entire body from head to toe became paralyzed- I couldn?t move any of my limbs. I also had no sight. I was not blacked out Bc I could hear everything that was happening. It was also accompanied by extreme chest pain, numbness, contracting of muscles in chest cavity that felt almost like a heart attack. Each individual episode lasted about 3-5 minutes and then slowly the paralysis would undo and I?d regain feeling. And then the full episodes would start over a few minutes later. This went on for a few hours repeatedly while in the ER. I was admitted for testing and monitoring for two days (EEG, EKG, MRI, Catscan) all clear. Once discharged I had lingering neurological symptoms but not the full paralysis episodes. Linger symptoms included severe chest pain, numbness/weaknesses predominant on the left side as well as other random areas. I was very weak and tired. I started to improve very slowly - by day 10 post hospitalization I was starting to feel like things were turning the corner and maybe I was on my way to recovery. Part 2: I started to finally feel more improved from the lingering neurological issues and then all of a sudden around 5:30PM I was in the kitchen making dinner for my kids on 3/2 and the episodes started again. Called 911. Again, every ten minutes or so they came on (maybe 15-18 episodes) of complete paralysis- this time accompanied by seizure like rapid eye movement from side to side and fluttering of the eyes. I was readmitted to the hospital where the episodes repeated to happen again, maybe 15-20 times. I was admitted. They did a 24 hour video EEG which ?caught? the episodes on video and sound but did not appear negatively on the EEG in terms of abnormal brain activity. I?ve been released as they say there is nothing to do. I have lingering muscle weakness in my eyes- I can?t focus my eyeballs or ?track? on an eye exam and continued muscular chest pain. I also have a lot of PTSD from the trauma of the events.</p>

1087522	3/10/2021	FL	40	F	3/6/2021	3/6/2021	this morning she noted a red blotch on her left eye sclera. her right eye is fine. she denies rubbing her eye, foreign body, or coughing or sneezing or force. instructed not likely related but asked to call back if worsening, vision loss, or blurred vision. wash hands well after touching face. call back prn. Followed up with patient today. She said that the red blotch in her eye is still there but not as red and can tell that it is going away. It doesn't bother her. She did contact her PCP and they told her that it is likely not related. She thanked me for my call. Will close case.
1087518	3/10/2021	NC	36	M	3/9/2021	3/9/2021	Patient fell from chair to floor hitting head and sustaining small laceration above left eye. He also experienced mild seizure activity that lasted approx 10 seconds. Patient quickly regained consciousness and was assisted to triage area. BP 140/86, HR 82, O2 sat 97%RA. EMT came and assessed client and cleared him to leave. Client ambulated out of facility without difficulty
1087502	3/10/2021	FL	70	M	2/21/2021	2/25/2021	eye dryness and itchiness. denies blurred vision or vision loss called md who recommended Claritin daily. Claritin has provided mild relief.
1087490	3/10/2021	OH	48	F	3/9/2021	3/9/2021	At 11:30pm on 3/9/2021 over 12 hours after my 1st COVID-19 vaccine , I awakened from my bed and went into my bathroom to urinate. As I was using the restroom, I noticed my arm where I got the vaccine was very sore, and raised it slightly. Immediately after raising my arm, I became very dizzy and passed out, fell off of the toilet and hit the left side of my temple and eye on the marble ledge of my shower. As I came to, my whole body had chills and I was shaking. I applied a cold compress and took 2 Tylenol. I alternated between sweating and chills for the rest of the night. The next morning I had a headache and felt fatigued, but the dizziness had subsided and I rested.

1089401	3/10/2021	OR	73	M	1/22/2021	1/22/2021	<p>Purkinje Tree and Covid-19 Vaccine. During the current COVID-19 pandemic and massively increased vaccinations, there have been few ocular side effects reported with the vaccine. 1) However conjunctivitis has occurred with Covid-19 infection and very rarely endophthalmitis has been reported. I wish to mention an otherwise unreported association with visualization of a Purkinje Tree and Pfizer Covid-19 second vaccine. I am a 73 year old otherwise healthy retired male. I had an entoptic experience after I received my second vaccine. With the first vaccine I had no visual side effects. The afternoon of my second dose I took an hour long nap, which was unusual for me. When I woke up and opened my eyes I noticed a bilateral arborizing, interlacing dark pattern that lasted less than a second. This was opaque but without a ghost image and otherwise the wall, sheet, and ceiling were seen clearly behind that network. I experimented with opening and shutting either and both eyes looking at a white sheet beneath me, and found that especially with my dominant left eye I saw a pattern resembling my left eye retinal vascular tree. The branches originated as single vessels superiorly and inferiorly that branched down to smaller vessels all on the right side of a disc type structure without duplication into an identifiable arteriolar and venous system. Even with a light source moving over my left shoulder, the image never lasted longer than a fraction of a second and fatigued quickly with repetition. I laid back down and repeated the experiment of opening and shutting either eye while looking at a white ceiling. Then the image changed to a horizontally oriented pattern with two single black vessel type structures coming off a disc type structure. The dark lines further branched and narrowed as they extended to the right and left off the disc type structure. Again this lasted less than a second. It faded away rather than floated away. The image always appeared in the same area of my field of vision. It was peri-central when I looked at the wall and inferior to fixation when I looked at the ceiling. The image would immediately move with eye movement, unlike a vitreous floater. Opening and shutting my left eye could refresh the image very briefly but that fatigued with repetition and could not be reproduced after 3-4 trials or without several hours between attempts. I did translations of Purkinje's description of the Tree (described here later.) and had</p>

---

short term partial success with his methods, except for pushing on my eye, and using galvanic current, which I did not attempt. I declined a full exam but did remember a lecture about Purkinje images. He had the residents hold pen lights to the side of their eyes and move the light back and forth while he described the Purkinje Tree. Afterwards he quizzed the residents about whether they could see it or not, with the "humorous" disclaimer that it was a means of IQ testing if they could see it. Half could. It was of interest to me that before I retired, occasionally patients would mention seeing the tree after an ophthalmoscopic exam. I hoped to delight those patients by telling them it was a form of IQ quiz and they had done well. Two weeks later I was disappointed that I could no longer see the tree, but again declined an exam. I am optically conversant, but physically adverse in seeking self care. Purkinje first described the "Tree" in his doctorate thesis in 1819. It was included in descriptions of other entoptic phenomena, performed mostly on himself. This was before the ophthalmoscope was discovered and before quality histological, serial sections were available. He described holding a candle or using galvanic illumination in front of his eyes individually and moving it around. He could see black lines in a network that came off a central pit structure. There were two lines inferiorly and superiorly with adjacent shadows and ultimately had size reducing branches. He recognized these branching lines as retinal blood vessels, but could not discern any blood flow. In 1825 he published a further volume 3) that dealt with experiments he subsequently had performed. He found that by holding a sheet of paper with a hole in it that he moved around, he could get a better view of the blood vessel pattern. He could discern the macula and described anastomosing blood vessels superior to inferior. A significant improvement in his discerning the blood vessel pattern was obtained with a safe amount of pressure on the superior lateral aspect of the eye. With this he could recognize blood corpuscles and flow patterns and then labeled the lines as veins. He did not describe arteriole patterns. So this leaves us with the question why this sudden awareness of the Purkinje Tree appeared in the time frame of a second Covid-19 vaccine. This will require further reports to determine coincidence versus cause-effect. This is a high stress

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							time with Covid-19 deaths so prevalent. I had immediate relief after my second shot with a reduction of tension and increase in awareness of my general physical status as in the feeling of being hot or cold, sleepy or just fatigued, improved calmness, and the pertinent Purkinje Tree. At sign in for the second series of Pfizer injections the RN on duty asked about side effects from the first shot. She asked us to send a report in of any potential side effect then of the second shot and notified us that people were having more problems with the second shot than the first. Arm soreness, swelling, fever, chills, headache, malaise, fatigue. She gave us a print out list of known side effects, mostly systemic and all mild, but nothing ophthalmic. With these things in mind I was especially vigilant of any thing new in my general health or condition. Most of the patients getting the shots were students and the congregating area was in a wing of a hospital. This brought back the pleasant memory of my time in training and my chief?s description of Purkinje?s Tree and perhaps enhanced the brief ability to see the entoptic image. In between times playing with this image my vision was normal and my general health remained good, without symptoms of vascular compromise.

1089789	3/10/2021	NJ	25	F	3/8/2021	3/8/2021	Within seconds of receiving the vaccine I began to feel slightly dizzy. By the time I walked across the room to the observation table I was feeling lightheaded. They sat me down, gave me water and a cookie, but about 2min after the injection the dizziness was so intense that I began to black out. I was unconscious for about 1-2min, then came to but my vision was still unclear. I was taken via wheelchair to the paramedics on the opposite end of the gymnasium, and at this point I was heavily perspiring and very pale but still coherent. I felt my vision and dizziness significantly improve after being able to lay down. I was transported to the hospital for observation but had much improved by the time I arrived. An EKG, bloodwork, and cardiac tests were recommended to discern possible underlying heart related conditions, but I declined because I already had a PAT for thyroid surgery scheduled the next day that would be running those same tests. This reaction was likely due to not having eaten for several hours prior to the vaccine. After about an hour I felt well enough to drive myself back home and dealt with mild aches and pains that evening, chills, and a low grade fever all of which resolved themselves by the next morning.
1087440	3/10/2021	FL	66	F	2/27/2021	3/5/2021	pt had been fine since vaccine 8 days ago until yesterday evening she noticed a small red bruise on her lt lower eyelid. she woke up today and noticed got larger to half inch sized. pt denies blurred vision, vision loss, or difficulty with extra ocular eye movements or trauma.

1089709	3/10/2021	AZ	64	M	3/10/2021	3/10/2021	After receiving the vaccine within minutes the patient's left arm began to swell and bruise. He began to become pale and his eyes rolled back into his head and passed out. He woke up a min later and had SOB. Very pale and almost threw up. Paramedics and Firefighters were called. They evaluated the patient and gave him a liter of sodium chloride. His Heart Rate was in the 30's. After several min and a liter of fluid, patient was alert. Once stable he was transported to Hospital.
1089679	3/10/2021	MD	32	F	3/8/2021	3/8/2021	I've never had an allergic reaction to anything before. Received the vaccine at around 9:55am on 03/08/21. Pain while the vaccine was being administered but it healed within a few minutes. I started getting a mild headache at around 3:30pm while at work. When I got home at around 6pm I started having severe chills, the headache became intense, my mouth and eyelids felt hot, my hands and feet felt very cold and when I checked temperature it was 102.4. By 9:00 pm the headache became excruciating like I've never had it before, as if my head was being squeezed or pressed. Eyes and the back of my jaw hurt too. Had light and sound sensitivity. Took 200mg of Advil but pain was still almost intolerable until I was finally able to fall asleep at around 4:00 am. Was still in pain the day after but not as bad as the night before. Only mild pain today but started feeling itchy tonight and noticed some rashes on my body.
1089671	3/10/2021	IL	30	F	2/20/2021	3/7/2021	Sunday night my eyes were a little swollen and hurt when I blink. Monday morning both eyes were very swollen and extremely red, no pain and vision was more effected.

1089655	3/10/2021	CO	72	F	2/27/2021	2/27/2021	Immediately upon leaving the COVID shot parking lot at Hospital, I began to feel pain shooting down my arm all the way to my fingertips. Then I started to feel disoriented. Then, as I was driving myself home, I felt constriction in my chest, like I was barely holding onto consciousness, then pain shooting up my shoulder into the left side of my neck, the left side of my face, my left eye and into the left side of my head. My heart was pounding, my head was hurting intensely and I wondered whether I was having a stroke while trapped in stop and go traffic. The intense pain continued while I drove, for about 30 minutes. Then it subsided somewhat -- but continued through the evening. I could not get to The pain continued in my arm, up the left side of my body and into my head all night. I could not sleep. My heart was pounding. Somehow I dozed off around 2 or 3am. The next day I felt groggy and tired, with the more moderate pain continuing in my arm and all the way to my hand. Finally, on Monday morning, I was able to reach my doctor's office. I was told to go the ER, which I did. They could find nothing "emergent." The pain, tiredness and headaches continued through Thursday. Friday I started to feel better -- a week after the shot on Saturday, 2/27.
1089631	3/10/2021	WI	55	F	3/9/2021	3/9/2021	Shot was given approximately at 4:50. I left the store after being watched at 5:15. Went to pick up food for supper. While waiting for the food, I was seeing spots (like when you have a photo taken with a flash). This lasted for about 20 minutes. This went away so I continued on my way home. As I was driving I notice that my face was tingling and my eyes seemed to be really dry. Both lasted about 30 minutes. Then I had the headache, arm soreness and light headedness that are "normal" side effects.

1089622	3/10/2021	MA	39	F	2/22/2021	2/24/2021	Pain in right ear and bump behind ear on Wednesday (less than 48 hours). Woke on Thursday with right ear swollen, went to urgent care and diagnosed with ear infection. Developed face paralysis on right side of face on Saturday. Sharp bolts of pains from ear intermittently radiating up to head. Went to Doctor who said both outer and middle ear were infected and perhaps swelling was pressing on nerve causing paralysis. Given medication. Returned to doctor on 3/8. Ear infection had cleared. Paralysis remained. Diagnosed with Bells Palsy. Eye will not close, prescribed eye drops. Cannot smile, frown, raise eyebrows, scrunch nose, etc. Began steroids and antiviral medications on 3/9.
1089801	3/10/2021	CA	58	M	3/7/2021	3/9/2021	Typical bells palsy flare for individual with severe headache , right side facial droop, right eye also crosses.
1088752	3/10/2021	NV	69	F	2/26/2021	2/26/2021	PT WAS DIAGNOSED WITH BELL'S PALSY AFTER THE SHOT, HER RIGHT SIDE MOUTH IS SAGGING, AND HER EYES CANT BE CLOSED FULLY
1089003	3/10/2021	TN	21	F	3/8/2021	3/8/2021	Congestion; swelling of face (especially around eyes) and neck/throat area; sore throat; fatigue; Benadryl taken (2 - 25mg pills)
1088970	3/10/2021	VA	48	F	3/10/2021	3/10/2021	Pt was feeling light headed and experiencing and blurry vision. Staff talked to the pt and took vitals. Vitals were as followed: P: 98, BP: 149/106, SPO2: unattainable. Pt reported having a history of hypertension and dextrocardia. Pt was breathing well and was able to speak clearly. Pt was AnOx4. Pt stated she has had no food or drink yet today and was nervous for the vaccination. Vaccination site was not raise, inflamed, or warm to touch. Staff concluded pt was most likely experiencing dehydration and anxiety. Staff told pt to monitor symptoms and if any were to return or worsen, to call insurance nursing hotline or 911.

1088889	3/10/2021	MO	32	F	3/5/2021	3/6/2021	3/6/21 2:30 am- stiffness in neck, headache, soreness around injection site- Subsided after 1 hours with ibuprofen(400mg ibuprofen) 9:30 am-pain (muscle cramps) down both legs and in arms. Headache- subsided after an 2 hours. I took 400mg of ibuprofen. 12:00pm- dizzy, started to get tunnel vision. I quickly sat down and vision began to come back. I had to sit for around 20 minutes before I know longer felt dizzy. Pain began to come back in both legs. Aching and fatigue. This lasted for around 2-3 hours. I stretched my legs and arms a lot during that time frame. I began to feel better around 4:30pm. Still mild aching in legs and arms. 8:00 pm-pain in legs and arms, headache, dizziness (400mg ibuprofen) I went to bed and when I would up the next morning all my muscle aches and pains were gone. My right arm was still sore for 3 days post vaccine. I noted a half dollar size redness around the injection site. by day 3 the redness was the size of a grape fruit. Day 4 post vaccine the soreness in the arm was gone and redness had began to fade.

2/16/2021

He received first dose of Pfizer COVID vaccine 1/15. Next day, he felt right axilla and trunk numbness after that which lasted 2-3 weeks and was resolving. After the second dose early Feb 5th, he started having difficulty swallowing and SOB and felt a little better after a course of steroids and antibiotics but got a lot worse after finishing the course and presented to ED 2/16 and was found to have supraglottic edema requiring intubation and treatment with IV steroids. Was extubated on 2/19, in ICU until 2/21. He did well with treatment and was discharged 2/22. Patient received a dose of influenza vaccine (FLULAVAL - GSK lot: 7N43B) on 2/22/21 3/2 he started having burning pain in the right midthoracic area, the next day he noticed right hand weakness/numbness (4th and 5th digits), gradually progressed. 3/4 noticed right facial weakness, initially was lower face, Unable to drink without drooling. MRI brain was done 3/5 and was normal. 3/5 facial weakness progressed to upper face. Unable to close right eye for the last 24 hrs. He also reports numbness left 5th digit. Presented to the ED on 3/6. Found to have elevated transaminase in ED. Hospitalization continues at this time. Etiology of symptoms is unknow, but includes vaccine reaction, shingles or early stages of autoimmune disease.

----------	-------	-------	---------	-----	----------	------------	--------------

Physical Exam Vitals and nursing note reviewed.  
 Constitutional: General: She is not in acute distress.  
 Appearance: She is not diaphoretic. Comments:  
 Flushed. Negative for diaphoresis Eyes: Extraocular  
 Movements: Extraocular movements intact.  
 Conjunctiva/sclera: Conjunctivae normal. Pupils:  
 Pupils are equal, round, and reactive to light.  
 Cardiovascular: Rate and Rhythm: Normal rate and  
 regular rhythm. Pulses: Normal pulses. Heart  
 sounds: Normal heart sounds. Pulmonary: Effort:  
 Pulmonary effort is normal. No respiratory distress.  
 Breath sounds: Normal breath sounds. No wheezing.  
 Skin: General: Skin is warm and dry. Coloration: Skin  
 is pale. Findings: No rash. Neurological: General:  
 No focal deficit present. Mental Status: She is alert and  
 oriented to person, place, and time. Gait: Gait normal.  
 Psychiatric: Mood and Affect: Mood normal.  
 Behavior: Behavior normal. Behavior is cooperative.  
 Thought Content: Thought content normal.  
 Judgment: Judgment normal. Assessment/Plan  
 Treatment included: water, snacks and reclined Follow  
 up response to treatment: good. Patient discharge:  
 Stable to go home and follow up with PCP. Differential  
 Diagnosis: Systemic reaction (hypoglycemia,  
 hypotension, generalized rash) Greatly improved after  
 water/snack/reclining. Pt observed for 45 minutes in the  
 bay. She feels comfortable going home. Her blood  
 pressure drop may be related to her taking two  
 medications that affect her bp as mentioned above. She's  
 improved with hydration and snack. Recommended that  
 she rest, monitor her bp at home. If symptoms worsen or  
 returns, recommend evaluation in ED. Otherwise follow  
 up with pcp office. Pt wheeled out with RN and  
 husband. Pt voices appreciation of her care today.

1088685	3/10/2021	PA	60	F	3/10/2021	3/10/2021	Within 15 minutes after 2nd COVID-19 mRNA vaccination (Pfizer) today, patient reported itching of left forearm (vaccine administered in left deltoid), which then also started in right arm and upper back. Slight redness noted on left forearm where patient had been scratching but no visible hives or rash. Patient denied any difficulty breathing, shortness of breath, throat tightness or itching. Diphenhydramine 25mg PO x1 dose administered. A few minutes after diphenhydramine administration, patient reported that her eyes had become itchy. 20 minutes after diphenhydramine dose, patient denied any worsening of symptoms, reported lessened itching and opted to leave clinic.

1088623	3/10/2021	KS	74	F	3/4/2021	3/4/2021	<p>Called patient to follow up on her reaction to the COVID vaccine administered on 3/4/21. She was transported by EMS to the ER after having anaphylaxis to her second Pfizer vaccine. She states she was hospitalized in the ICU overnight and was discharged home this afternoon. Patient feels she is doing much better. She does note feeling very tired from all the medications they gave her. She plans to call her PCP on Monday to schedule an appointment and has follow up scheduled with allergy specialist. She denies any further questions or concerns. Patient is appreciative of phone call. Progress Notes: 3/4/2021 Subjective Patient is a 74-year-old female who was seen at COVID Vaccine Clinic today for her second dose of the COVID 19 vaccination. She was given the Pfizer vaccination in the left deltoid muscle. During her 30-minute waiting period after the injection, the patient began to experience hoarse voice. She denied rash, difficulty breathing, difficulty swallowing, dizziness, facial swelling, lip swelling and tongue swelling. This provider was notified of patient reaction and she was then assessed in the emergency bay area. Monitored patient for severe reaction symptoms, including but not limited to rapid progression of symptoms. PMH of anaphylaxis x 3, with one hospitalization. ALLERGY REVIEW OF SYSTEMS: Patient complains of chest tightness (she later developed chest tightness when she was in the bay prior to epi-pen administration.) Patient denies chills, fever, malaise/fatigue, facial swelling, cough, shortness of breath, wheezing, rash, hives, eczema, itching of skin and abdominal pain Hoarse voice.: Negative for nausea: + lightheaded.: Previous Reactions: anaphylaxis to medications. Never to vaccines. Pt's husband with her today. He states she progresses rapidly with her anaphylaxis and wishes for her to get epi pen now based on her symptoms. She typically starts out this way. Vitals: 03/04/21 1135 03/04/21 1140 BP: (!) 187/100 (!) 163/95 Pulse: 93 95 Resp: 18 16 SpO2: 100% 100% Physical Exam Constitutional: Appearance: She is well-developed. She is not toxic-appearing or diaphoretic. Comments: flushed HENT: Mouth/Throat: Mouth: Mucous membranes are moist. Pharynx: Oropharynx is clear. Comments: Clear airway. Voice is hoarse. Eyes: Extraocular Movements: Extraocular movements intact.</p>

1089270	3/10/2021		63	F	3/5/2021	3/5/2021	Day 1 - received injection within a few minutes of administration I noticed a slight lightheadedness and feeling "off" within half hour slight nausea began and headache began within hour muscles aches began with joint pain. Above symptoms progressively worsened by midnight was in pain and could not sleep. no fever. took tylenol and only had moderate relief. Day 2 - entire day severe muscle and joint pain - worst headache of my life, severe nausea and chills - no fever. double vision and dizzy Day 3 - same as day 2 - in evening - around 7 pm headache lessened so that it was tolerable with tylenol - muscle aches joint pain the same Day 4 - headache tolerable, was able to eat. muscle pain better but joint pain still sharp Day 5 - headache sporadic and better - fatigue and muscle pain would come and go, joint pain not as sharp, extreme fatigue Day 6 - extreme fatigue - other symptoms much better
1089794	3/10/2021	NJ	25	F	3/8/2021	3/8/2021	Within seconds of receiving the vaccine I began to feel slightly dizzy. By the time I walked across the room to the observation table I was feeling lightheaded. They sat me down, gave me water and a cookie, but about 2min after the injection the dizziness was so intense that I began to black out. I was unconscious for about 1-2min, then came to but my vision was still unclear. I was taken via wheelchair to the paramedics on the opposite end of the gymnasium, and at this point I was heavily perspiring and very pale but still coherent. I felt my vision and dizziness significantly improve after being able to lay down. I was transported to the hospital for observation but had much improved by the time I arrived. An EKG, bloodwork, and cardiac tests were recommended to discern possible underlying heart related conditions, but I declined because I already had a PAT for thyroid surgery scheduled the next day that would be running those same tests. This reaction was likely due to not having eaten for several hours prior to the vaccine. After about an hour I felt well enough to drive myself back home and dealt with mild aches and pains that evening, chills, and a low grade fever all of which resolved themselves by the next morning.

1089174	3/10/2021	FL	65	F	1/19/2021	1/25/2021	First my bp my who life has been 130/80 I first noticed I was feeling very flushed, didn?t make much of it. I don?t take my bp,often, dr offices etc. 4 weeks ago, I felt pressure around eyes, in back of neck, weak, dizzy. My bp had spiked to 203/104, my husband called the ambulance. I went to ER. Bp went down, I came home, same thing happened the next day. Back in again.... Since then, I have had just about every test possible. I am perfectly healthy on paper. I just don?t know what to,do.... have now taken some bp meds and beta blocker. I can feel my bp spiking several times a day. 170/93 and then after a while back down again. I feel like I might be allergic to whatever is in my body. My hands and face tingle, I feel hot and then cold. I am praying this will ease it way out after the vaccine wears off. Needless to,say I am super concerned. I have ALWAYS been very healthy, fit and happy with a busy life.

1089013	3/10/2021	CA	52	F	3/8/2021	3/8/2021	1st Vaccine - I experienced mild numbing from my left cheek up and around my eye. It started just a few hours after my vaccine and it stayed that way for 48 hrs. I would still experience this mild sensation every now and then until I took my 2nd vaccine. My injection site was very sore for 2 days. No other symptoms to report.. 2nd Vaccine - I experienced a very sore injection site for 2 days and felt warm to the touch. Later in the evening i had mild achy sensations in my lower back, legs, calves, knees and shoulders. During the night I experienced chills and lots of tossing and turning. In the morning my lower back, shoulders, legs, knees and calves were extremely achy and sore. I was also very exhausted. I took some ibuprofen and drank lots of water and rested. Today, 10 March my lower back and thighs are still a little achy but much better than yesterday.
1089050	3/10/2021	IA	37	F	3/5/2021	3/10/2021	woke up with eye swelling. Now with jaw and chin numbness
1089015	3/10/2021	TX	53	M	3/4/2021	3/4/2021	About 7pm the same day I got my vaccine. My right eye started watering profusely. I didn't think much of it. at 10:30 I went outside to whistle for a dog and I could not whistle. The next morning I found that the right side of my face was completely drooped and I have no expression control.
1089084	3/10/2021	VA	54	F	3/6/2021	3/9/2021	I experienced severe vertigo. I visually saw the room spinning. I had to close my eyes but I still felt the spinning in my head. I used the wall to lean on to get down on the floor. Lasted about 1 1/2 - 2 minutes with nausea. I never had vertigo. When I went to bed I had an ache under my left breast. It eventually subsided.
1089011	3/10/2021	OR	68	F	3/7/2021	3/8/2021	Headache, nausea, heartburn, muscle pain, and chills. Passed out cold without any warning signs. Called urgent care twice. 1089100	3/10/2021	NC	36	M	3/2/2021	3/5/2021	Woke up on Friday morning (3/5) with severe neck pain and vertigo. Tried to walk to bathroom and was falling over to the right side and felt very nauseous. Starting throwing up. Arrived at ER around 9:30AM and was diagnosed with vertigo and discharged a few hours later. He slept most of the day but woke up for a few minutes to take medicine on Friday evening and told me his vision was blurry. He went back to sleep and slept until Saturday (3/6) morning around 9:30. He told me his vision was still really blurry so we went back to the ER. They did an MRI and MRA and saw that he had two strokes. The strokes have affected his vision and he still has blurry vision and is not able to see well peripherally.

1084552	3/9/2021	DC	65	F	3/4/2021	3/5/2021	I received the Moderna COVID-19 first shot vaccination at 11:00am on Thursday, 3/4/21. The next day, Friday, 3/5/21, at about 10:00am, I experienced chills and muscle fatigue that lasted until bedtime about 11:00pm. Life returned to normal until yesterday, 3/8/21, when, beginning around 11:00pm and lasting until 11:00pm bedtime, I experience body chills similar to 3/5/21. Today, Tuesday, 3/9/21, when I awoke at 6:00pm, my heart rate was noticeably elevated but stabilized within 15 minutes. And about 10:55am, as I was focusing on work (reviewing/editing an electronic document), I had an unusual blurry vision and mentally spacious experience that lasted for less than 2 minutes but required me to halt work and collect my thoughts. These experiences are completely new to me.
1084562	3/9/2021	MA	58	F	3/9/2021	3/9/2021	My skin around my eyes swelled about 45 mins after vaccine. I had a prickly itchy sensation on my back, the back of my neck & under my right arm pit. My throat felt itchy. I took benadryl & the swelling around my eyes went down considerably within a few hours. The itchiness persisted until my 2nd dose of benadryl. When I woke up this morning, I was fine.
1084506	3/9/2021	MI	62	F	3/5/2021	3/5/2021	Seven minutes after receiving the Pfizer Covid 19 vaccine the patient reported having the feeling of being high lasting 10 minutes, elevated heart rate, dizziness and weakness for 1-2 minutes length, blurred vision and "brain fog" lasting for about 24 hours

1085090	3/9/2021	OR	55	F	1/20/2021	1/21/2021	<p>Thirty hours in, I had joint aches in my spine (mainly neck and low back); low grade fever; nauseated; headache. I felt like everything was it was swollen and tight - I couldn't wear my watch on my wrist. Almost like lymph system - nothing tight in my arm pits; felt like my pants were too tight in my groin - my body was swollen by my lymph nodes. Developed all kinds of gas in my stomach. I was having chest pains - 3 or 4 times a month before the vaccine - after the vaccine - I'm having the chest pains daily. That lasted for about 12 hours. Next day, 22nd, I developed diarrhea for 24 hours. 9 days later - I got numbness and tingling started radiating down my wrist into my fingers; lower calf to my feet and I had to go see my orthopedic surgeon - it was radiating down into my feet. He sent me to a podiatrist and he doesn't know. Those symptoms still haven't resolved. When I wake up - it's a low level and by night time my feet would get so numb and tingly it drove me crazy and then it went into my hands. Went to my doctor on March 2nd - my doctor thought I was having a histamine response in my body. I took an antihistamine - and half my symptoms went away. My esophagus is going into spasms - and I am trying to see a GI specialist. I was taking Benadryl last week but I got too tired. So I take 2 Benadryl at night now and I'm taking a Zyrtec (generic) at the day - it takes the edge off but doesn't resolve the symptoms entirely. Eleven day - I developed a floaty in my right eye - a black spot. I went to my eye doctor - it looks like my eye is healthy -but floaty is not going away. So talking on the phone, My throat is starting to swell up and feels like something back there and the more I talk pretty soon I start losing my voice (happening now on the phone). They added to my meds: Pepsid, Viscus lidocaine; Mylanta after every meal; Pantoprazole; Sucralfate; gave me another one but I haven't taken it yet: Hyoscyamine - for really bad spasms and I haven't had another really bad one since I went to ER (besides taking the antihistamines). I have seen 5 specialists all together.</p>

1083887	3/9/2021	HI	35	F	2/8/2021	3/15/2021	After receiving the second dose of Pfizer covid 19 vaccine on Monday, February 8, I did experience muscle aches, low grade fever and headache 24 hrs after the shot. Those symptoms lasted for about 3-4 days. Then on Sunday morning February 14 I work up with sciatic pain on my left leg. Then on Monday February 15 my right eye was red after I woke up that morning. Gradually during the week my eye continued to be red, blurry, and eventually cloudy Friday morning February 19. Found an eye doctor who could see me that morning. He diagnose me having Iritis and prescribed me durezol eye drops. I had to put one drop every 2hr until it gradually got better. I'm still under his care.
1084348	3/9/2021	NY	50	F	3/7/2021	3/7/2021	after leaving facility, while driving home, my left facial cheek began to tingle, then burn. By the time I got home, both my hands and feet also were tingly, like pins and needles falling asleep. The following day, at about 4 PM the tingling, returned to the entire left side of my face, so Monday 03-08-2021 @ 4 PM, from hairline to jaw, tightness, burning and tingling including around my left eye. lasting until roughly 7 PM
1085063	3/9/2021	IN	57	F	3/6/2021	3/7/2021	I experienced body aches, headache, anxiety in my chest (once), tiredness. One other thing that happened that may not be related is that my secondary implant eye socket became very sore and swelled up. It could of been for another reason but the timing was uncanny. I am feeling fine now and none of my reactions were that troubling. I have experienced about 3 times a sudden feeling in my body that made me think I wonder if that was the vaccine but I am feeling great now and all is good. Thank you so very much for all the research and production of these life saving vaccines.
1084962	3/9/2021	IN	69	F	3/4/2021	3/5/2021	Strong allergy symptoms. Heavy nose drainage and aching eyes/cheekbones. Lasted one day took Benadryl and slept.

1084812	3/9/2021	CO	32	F	3/6/2021	3/7/2021	Janssen COVID-19 Vaccine EUA. Mid Saturday night I woke up to chills and was shaking so bad I couldn't fall back asleep even after adding another layer of clothes and blanket. Sunday morning I was still very cold and tired from not sleeping. I developed body aches but they were everywhere not just my arm. I was very fatigued and didn't have an appetite. The worst part was getting a migraine with extreme light sensitivity. I couldn't stand to be around any windows without blinds. I spent the day in my bedroom sleeping with the curtains closed and an eye mask on. By that night, the migraine had subsided but I was adding hot flashes to the problem list. Had a pretty restless night again on Sunday. Woke up Monday to the light sensitivity back but not as severe. I took the day off work because I couldn't handle looking at a computer screen all day. By about 1pm I was feeling mostly back to normal. My arm is still sore near the injection site and I'm a bit fatigued at times but those are the only things remaining.

1083807	3/9/2021	FL	83	F	1/16/2021	2/5/2021	Soft lump on left side clavicle. Very sore; Soft lump on left side clavicle. Very sore; This is a spontaneous report from a contactable consumer, the patient. A 83-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot EL5248, second dose) solution for injection intramuscular in the left arm on 16Jan2021 at 11:00 (at the age of 83-years-old) at single dose for COVID-19 vaccination. The patient was not pregnant at the time of vaccination. Medical history included macular degeneration, glaucoma, and allergies: dairy products, penicillin and sulfa antibiotics. Concomitant medications included ascorbic acid/betacarotene/cupric oxide/tocopheryl acetate/zinc oxide (PRESERVISION), calcium, fish oil and vitamin D. Historical vaccine included BNT162B2 (Lot EL0140, first dose) for COVID-19 vaccination on 26Dec2020 with no adverse effect reported. The patient did not receive any other vaccine within 4 weeks prior to the vaccine. Prior to the vaccination, the patient was not diagnosed with COVID-19. On 05Feb2021 at 10:00, the patient felt a soft lump on left side clavicle very sore. No treatment was provided for the events sore and lump. The outcome of the events sore and lump was recovering. Since the vaccination, the patient has not been tested for COVID-19.

1083802	3/9/2021	FL		F	1/25/2021	2/1/2021	more symptoms and her right eye is more closed; more pain in her head; shingles; This is spontaneous report from a Pfizer-sponsored program. A contactable consumer reported for a female patient (Wife) with unknown age (85; Unit: Unknown) received first dose of bnt162b2 (Pfizer-BioNTech COVID-19 mRNA vaccine, Lot Number and Expiration Date unknown) via an unspecified route of administration on 25Jan2021 at single dose for COVID-19 immunisation. The patient's medical history included shingles 4 years before unspecified date and since has neuropathy on head and right eye. The concomitant medications were not reported. Patient had the first dose of the vaccine on 25Jan2021 and are tentatively scheduled for the second dose 24Feb2021, 30 days apart. Patient may have had a reaction to the first dose but it may not be related. Patient experienced shingles in Feb2021. The vaccine seemed to more symptoms and her right eye is more closed and there is more pain in her head in Feb2021. The caller stated they are seriously considering cancelling their second dose. The outcome of events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of headache and eye disorder due to temporal relationship. Based on the information provided by the reporter, it appears unlikely that subject vaccine contributed to the event of shingles, which may likely represent intercurrent medical condition. There is limited information provided in this report. This case will be reassessed once additional information is available.

1083742	3/9/2021			M			<p>left side of his face is paralyzed and his left eye will not blink/ he thought he had a stroke/diagnosed with Bell's Palsy/had Bell's Palsy in the past several years ago; left side of his face is paralyzed and his left eye will not blink/ he thought he had a stroke/diagnosed with Bell's Palsy/had Bell's Palsy in the past several years ago; This is a spontaneous report from a contactable consumer (patient). A 67-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date: unknown), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. Medical history included that he had Bell's Palsy in the past several years ago. The patient's concomitant medications were not reported. The patient experienced Bell's Palsy after receiving the first dose of the Pfizer Covid 19 vaccine. He stated that the left side of his face is paralyzed and his left eye will not blink. He received the first dose of the vaccine on a Thursday and the following Wednesday he went to the ER because he thought he had a stroke. He was diagnosed with Bell's Palsy, was given medication, and its been a week and his eye still is not blinking. His doctor is uncertain if he should receive the second dose of the vaccine or not. He was asking if he should he get the second dose and how many people were in the study. He also asked if he gets the second dose, if it will make the Bell's palsy worse. Therapeutic measures were taken as a result of event. The outcome of the event was not recovered. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information provided, and on a positive drug-event temporal association, the Company assessed that a reasonable possibility could not be excluded that the suspect product BNT162B2 contributed to the occurrence of the reported events Bell's palsy and Disease recurrence. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p>

1083719	3/9/2021	FL	75	M	2/4/2021		AFib; Lightheaded; Pain in the right rear back and couldn't bend over to tie shoes; A spontaneous report was received from a male consumer 75-year-old who experienced, a sore Arm/Pain in Extremity, Afib and lightheadedness. The patient's medical history was not provided. Products known to be used by the patient within two weeks prior to the event was simvastatin, tadalafil, androgel, prevision, magnesium, vitamin D3, vitamin B12, calcium and fish oil. On 04-Feb-2021, prior to the onset of events, the patient received the second of two planned doses of mRNA-1273 Intramuscularly for prophylaxis of COVID-19. On unknown date, the patient experienced sore arm, lightheadness, lasted for 3-4 days and went away. On unknown date, the patients vitals were checked and the heart rate was elevated to 148 and was admitted to the hospital. EKG and pulse rate was irregular. The patient was diagnosed with A fib. Treatment included apixaban, metoprolol and fluids. The patient received both doses of mRNA-1273 prior to the events; therefore, action taken with the drug in response to the events is not applicable. The outcome for the events, sore arm, lightheadness and A-fib was considered resolved.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the onset date of the events, a causal relationship cannot be excluded.
1085115	3/9/2021	OH	58	M	3/9/2021	3/9/2021	felt like his eyes were burning from the inside out and lasted 3 days. Patient did not seek treatment

1086309	3/9/2021	NV	31	F	3/9/2021	3/9/2021	Patient fainted about 5 minutes after receiving the vaccine. She was in the monitoring area and fell over and hit her head on the ground. I went to her aid and monitored her until the paramedics showed up. She was unconscious for a 10-15 seconds with her eyes open before regaining consciousness. I She was not having breathing problems or other symptoms of anaphylaxis so i did not administer an epi-pen or benadryl to her. I rolled her on her side in case she became nauseas. Then the paramedics arrived and attended to her.
1086052	3/9/2021	PA	36	F	3/5/2021	3/5/2021	A few hours after receiving the vaccine I started to feel fatigue and started getting shooting pains through my back, injection site was slightly sore. Second day my whole body felt stiff. Third day I started getting shortness of breath. Fourth day I woke up with swollen itchy eyes and ears as well as a sore throat. It started to become even harder to breath. I took allergy medicine, Allegra and zertex and felt some immediate relief.

1086025	3/9/2021	WI		F	1/30/2021	2/9/2021	<p>Losing eyesight in one eye; Has scratched cornea; She developed Bell's Palsy; She developed shingles; A spontaneous report was received from a relative concerning a 91-year old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and developed shingles, Bell's Palsy, losing eyesight in one eye, and scratched cornea. The patient's medical history included blind in one eye after laser surgery. Concomitant medications include vitamin d, equate arthritis medicine, losartan potassium, and eye vitamins. On 30 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (lot/batch: 007M20A) intramuscularly for prophylaxis of COVID-19 infection. On 09 Feb 2021, the patient developed shingles and Bell's Palsy. The patient was in the process of losing eyesight in one eye, on the side affected by the Bell's Palsy. The patient also has a scratched cornea. The patient went to the emergency room on 12 Feb 2021. Action taken with mRNA-1273 in response to the events was not reported. The outcome of the events was unknown.; Reporter's Comments: Based on the current available information, a temporal association between the use of the product and the start date of the event and excluding all other etiologies, a causal relationship with the events of shingles Bell's Palsy cannot be excluded. However, causality with scratched cornea and losing eyesight in one eye is unlikely. The scratch is most likely due to a trauma and can impair vision. No further information is expected and follow up consent was denied.</p>

1086231	3/9/2021	NY	71	F	3/8/2021	3/8/2021	about two hours after injection, I experienced headache, then mild dizziness, then extreme dizziness, then sudden overwhelming fatigue, then swollen eyes and eyelids, then chills and elevated heart rate, with pounding. I had to cancel the class I was supposed to teach, because I would not have been safe to drive to campus. I slept from approximately 2:30 pm on March 8 until 8:30 am today, March 9, all symptoms continuing, with bathroom breaks, a couple of short reports to family members who were watching out for me, and one 2-hour window during which I ate a small meal, went back to bed, and read part of a book. During bathroom breaks I took more antronex, some milk thistle, and some glutathione, which seemed to at least temporarily reduce dizziness and eye/eyelid swelling. At one point I took some hawthorne tincture because I was concerned about the heart pounding. Today I woke up feeling symptom-free, but by 2 pm I was compelled by sudden fatigue to take a two-hour nap. After that I felt better, and I think I am now fine, at 7:45 pm on 3/9/21. I am happy to have gotten the Janssen vaccine, because it is one and done!

1085356	3/9/2021	CA	74	F	2/14/2021	2/22/2021	Feb. 22 – Red rash appeared on LEFT arm at vaccination site in the evening, just red, not itchy or bumpy, 3" diameter. Comes & goes, up to 4"x3". Feb. 25 – Woke up @ 5am with severe itching on inside of RIGHT elbow. There were hives which spread up to my shoulder, then appeared on LEFT arm in same locations. No antihistamine available; hives calmed down after an hour or so. Started up again that evening, took 2 Benadryl, and they calmed down. Feb. 26 – More hives in the morning, not as bad. Calmed down when I rubbed alcohol on them. Started Allerfex in the afternoon, but still got a few hives in the evening, same locations. Feb. 27 - Woke up with hives on both arms inside elbows and on right side of face and puffiness under right eye, gradually calmed down. One more hive @ 2:30, inside upper lip, took Allerfex a little early and it soon calmed down. Now taking Allerfex daily since hives continue to show up. March 4 - Saw allergist's physician assistant who advised continuing Allerfex daily until at least 2 weeks after second vaccine dose.
1085736	3/9/2021		37	F	3/9/2021	3/9/2021	VACCINE L ARM @0732. DURING CHECK OUT, AFTER 15 MINUTES, REPORTED RACING HEART, "HEAD WOOZY", AND FATIGUE. 1085707	3/9/2021	CA	61	F	2/10/2021	2/11/2021	By early the next morning, my mouth started developing sores & my tongue became increasingly swollen. I had a sore throat for about 15 days; at about one week past this dose, my right shoulder froze & the rotator joint was swollen & incredibly painful to the touch. I lost the use of my right arm entirely for about five days, then the swelling & pain slowly subsided. My eyes were burning & my arm was weak but I made a full recovery about 18 days after this dose. The last symptoms were severe headaches, accompanied by an inability to remain asleep. I took Tylenol & Tylenol PM to alleviate pain & regain some sleep & did report these symptoms to my doctor.
1085696	3/9/2021	MN	67	F	3/5/2021	3/6/2021	Began feeling feverish, achy with chills and blurry vision. Gradually worsening with light sensitivity (wore sunglasses indoors to reduce eye pain.) Temperature 99.5 at 15:00 and 100.2 at 20:15. Took two Ibuprofen and slept through to following morning. Awoke mostly symptom-free around 10 am. Continue to feel unusually cold. Treating this by wearing a warm sweater indoors. N.B. Light sensitivity may possibly be attributed to being under florescent lights (see Allergies and Reactions above) for more than an hour while waiting for shot and waiting to check for possible reaction to the shot.

1085682	3/9/2021	CA	33	F	3/5/2021	3/5/2021	About two hours after getting Covid vaccine (Moderna) (around 4 pm), she started having pressure in head and ears, which caused mild headache. Her eyes looked red without fever or chill. Otherwise, she did not have any other symptoms. The symptoms got worse on the two following days (Saturday and Sunday). She came to our pharmacy to report the adverse effects at 5:25 PM on Sunday (3/7/2021), and according to her report, Sunday was the worst. She took Tylenol for the past two days (Friday and Saturday) without improvement. We instructed her to take ibuprofen and to see her doctor on the day after (Monday 3/8/2021). We followed up with her on Monday, and she said her symptoms got improved with a tablet of ibuprofen.

1081584	3/8/2021	WI	69	F	2/23/2021	3/2/2021	I'm not sure this was from the vaccine, but it seems like the only likely cause: I had Pfizer Shot#2 on 2/23/21. I was feeling great for an entire week. Then, a week after the second shot, I got the worst fatigue I can ever remember, except maybe when I was pregnant, starting the evening of March 1. When I awoke on March 2, my body aches were so intense, I felt like I couldn't move out of bed. Then during the day, I tried to take my usual outdoor walk - usually ~ 5 miles/day. I had to turn around part-way because I was so exhausted and my legs felt both like concrete and like they were quaking from tiredness. Later that afternoon, I fell asleep sitting up in my chair SIX times, even though I almost NEVER take a nap! I kept doubting myself because I haven't read about delayed onset of symptoms, but we don't go anywhere indoors at all except for getting the shot at the pharmacy and an MD clinic appointment now and then. (I did have an annual MD appointment on March 2, so was in the clinic that very day, using all precautions. I don't imagine I could have gotten ill instantly from something at the clinic though?) In ensuing days, I continued to feel super-fatigued, but have had more energy each day, to the point where, now, 6 days later, I feel "almost" like myself. I'm still unsure of walking the full 5 miles without getting too tired, and certain body aches are still hanging on (knee, wrists, fingers), but I'm otherwise feeling good. If I had the symptoms right after the shot, I would have been sure it was from the shot, but since it was delayed a week, I was uneasy and it felt a bit scary because I felt so unlike my healthy, spry, active, motivated self. One other odd thing, that may be totally unrelated, but just in case - on the very day of the second shot, I got a huge stye on my left eye - something I haven't had in decades. It has still not gone away after 2 weeks. Just in case you get other reports, I am letting you know about this as well. The fatigue and body aches sound a lot like what is to be expected after the shot, but I do know there have been some eye-related issues as well.

1080212	3/8/2021	CA	75	F	2/2/2021	2/1/2021	<p>Cold sweat; Within 15 minutes, started itching really bad / Itchy in ears, scalp, neck, chest, arms; Headache; Diarrhea; Chills; Tenderness where the shot area is; Joint pain; Really bad flu; A little bit of a rash from it because my skin is all red from itching; A little bit of a rash from it because my skin is all red from itching; This is a spontaneous report from a contactable consumer, the patient. A 75-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot: EN5318), via an unspecified route of administration on 02Feb2021 (at the age of 75-years-old) as a single dose for COVID-19 immunization. Medical history included high cholesterol and eye disorder. Concomitant medication included atorvastatin, ubidecarenone (COQ-10), colecalciferol (VITAMIN D3), cyanocobalamin (VITAMIN B12), monascus purpureus (RED YEAST RICE) and unspecified OCUVITE for the eyes. On 02Feb2021 at 14:30, within 15 minutes of the vaccination, the patient was itching really bad (itchy in the ears, scalp, neck, chest, arms). The patient was kept in observation after the vaccination for an hour and was treated with diphenhydramine (BENADRYL) which did not seem to help. The patient drove home and went to bed. Her physician suggested that she see an allergist. The allergist was not sure what was in the vaccine and requested the patient ask her doctor for another referral. On 02Feb2021, the patient also experienced headache; diarrhea; chills; tenderness where the shot area was. On 03Feb2021, the patient woke up with cold sweats, like cold wet perspirations and chills again. On an unspecified date in Feb2021, the patient experienced joint pain and felt like she had a really bad flu, developed a little bit of a rash because the skin was all red from the itching, which she couldn't stop. The patient reported that she was treated for the events with diphenhydramine and paracetamol (TYLENOL). She questioned whether there were other reports of itchiness. The clinical outcome of "within 15 minutes, started itching really bad / Itchy in ears, scalp, neck, chest, arms", headache, diarrhea, chills, cold sweat was not resolved; while "tenderness where the shot area is", joint pain, really bad flu, "a little bit of a rash from it because my skin is all red from itching" was unknown.</p>

1082276	3/8/2021	MO	77	M	2/10/2021	2/17/2021	Following Dose 1, Right Arm became sore at injection site for 4 days, at which time Right armpit became very tender touch and was swollen about size of silver dollar, approx. 1/2 inch thick. Soreness at injection site subsided over the next 17 days, but tenderness in armpit only diminished slightly. Following Dose 2, Right Arm was once again sore at injection site for about 4 days, but tenderness to the right armpit became more pronounced, with swelling increasing to the size of a hockey puck. Size of swelling was easily visible to the eye. Armpit became more tender to the touch, and has diminished only slightly in size,, as of this reporting. Mass remains soft to the feel, but easily defined in size and location. I have taken OTC pain killers to help with the discomfort. Will continue to monitor its progress, unless notified otherwise. Do not anticipate seeing my physician at this point. Have consulted the Web, and have noted that this is a lesser side effect of this vaccine, if swelling remains localized to the injection site. Thought I should report this side effect only because of the size of the swelling that occurred.
1082296	3/8/2021	AZ	78	F	2/27/2021	3/3/2021	Extreme fatigue, lightheaded and dizziness, extreme joint pain, vision blurryness and sore eyes, starting Wednesday March 3rd and continuing through today Monday, March 8th. Also beginning Friday, March 5th woke up with right arm swollen just below the elbow. Not sure if any of this is related to the Covid shot or having other problems. Just noticed that my vaccine card shows Lot #EN6202 but the letter sent says Lot #EL9263, for the 2nd dose.
1082155	3/8/2021	NY	34	F	3/8/2021	3/8/2021	Pt with medical hx of PCOS and allergy to clindamycin and ciprofloxacin presented to vaccine site for vaccine. Pt received 1st dose of moderna and 10 minutes later reported SOB, blurry vision, chest tightness, chills, nausea. vitals were WNLs with hR of 83-88, oxygen saturation of 98-100. unable to obtain BP. 4 minutes later pt reported her vision had improved but continued to have chest tightness, SOB, nausea. EMS was called and pt was taken to lenox hill for further treatment. Through out the event pt was coherent and responded to questions appropriately.

1082150	3/8/2021	FL	57	F	3/8/2021	3/8/2021	Gave shot around 10:15am , chest felt tight around 10:40am not feeling well , 10:42 eyes rolled up called EMS 10:43am, transported at 10:49am.
1082090	3/8/2021	FL	64	F	2/25/2021	3/5/2021	Headache began early afternoon and gradually the pain increased through the remainder of Friday March 5,2021 and lasted through Saturday, March 6,2021 until about 6 PM where the pain subsided enough that I could function. As the pain intensified, I had throbbing pain in the temples and behind my eyes, the pain worsened even more if I bent forward, like to pick up something from the floor. My neck muscles were extremely tight. I couldn't concentrate on anything, like reading or working. I was feeling less than energetic,. Also, my left arm was red, not swollen at the injection site and hurt to touch, not as bad as the 2 days after receiving the vaccine, but I thought it was unusual that my arm was red & sore. This is what made me conclude it was a delayed reaction to the vaccine. I rarely have headaches and if I do taking 2 Ibuprofen will take care of it. Taking 2 Ibuprofen this time did absolutely nothing to ease the pain. I did increase to 800 mg of Ibuprofen late Friday and early Saturday which did help, used a cervical heating pad, hot shower to try to ease muscle tension. I was able to sleep and by Saturday evening with home remedies, the pain did subside and by Sunday March 7,2021 I felt back to normal with a slight, slight bit of headache but not much to worry about.

1081752	3/8/2021	FL	69	F	2/16/2021	2/16/2021	<p>Dermatomyositis rash flare up/ facial skin inflamed, bright red, and swollen; rash on her face; Dermatomyositis rash flare up/ facial skin inflamed, bright red, and swollen; rash on her face; headache; This is a spontaneous report from a contactable consumer (patient). A 69-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number: EL9265, expiration date: May2021) via unspecified route of administration in the left arm on 16Feb2021 14:00 at single dose for COVID-19 immunization. Medical history included dermatomyositis since 1993 and sinus problems (sinus disorder). Concomitant medications included immunoglobulin human normal (GAMUNEX) and methotrexate 2.5 mg tablets, both for dermatomyositis; and diphenhydramine hydrochloride (BENADRYL 50 mg) IV as premedication. It was reported that every 2 weeks, a nurse comes to her home and gives her a Gamunex 85gram infusion. She clarified she use 4-Gamunex 20gram vials, and 1 Gamunex 5gram vial to make up her Gamunex 85gram infusion. Product information: Gamunex 5gram Vial (uses 1 vial) (NDC Number: 13533-800-20, Lot Number: B36JE00393, Expiration Date: 20Jul2023) and Gamunex 20gram Vial (uses 4 vials) (NDC Number: 13533-800-24, Lot Number: B8GLE00933, Expiration Date: Aug2023). Reported she takes Methotrexate 2.5mg tablets three times a week. She stated she gets pre-medicated every 2 weeks with IV Benadryl prior to her Gamunex 85gram infusion. She provided the IV Benadryl 50mg product vial information as: (NDC Number: 0641-0376-21, Lot Number: 080010, Expiration Date: Aug2022). The patient previously took budesonide 3 mg capsule (taper dose) from 18Nov2020 to 13Feb2021 for microscopic colitis. On 16Feb2021, on the first day after vaccination, patient had a mild headache. The patient woke up on Saturday morning, 20Feb2021, with her facial skin inflamed, bright red, and swollen. She had a rash on her face as she could feel the unevenness of her facial skin when she placed her hand on her face. Patient reported that she called her neurologist to inform her of the adverse reaction, and her neurologist told her to report the reaction to manufacturer. She said what she experienced on Saturday (20Feb2021) was a Dermatomyositis rash flare up, which for her is very rare. She said she normally doesn't have any skin involvement when she has a</p>

							Dermatomyositis flare. As a treatment, she said she took generic diphenhydramine 25 mg on 20Feb2021 (lot number: Lot Number: P112026, Expiration Date: Sep2020); and took 2 more since then (She said she takes 1 Diphenhydramine 25mg at a time); and her facial redness is down, but she still has a rash, and her face is a little bit swollen. Her facial skin was still elevated a little bit. Her facial swelling has improved quite a bit from Saturday (20Feb2021), stated she does not have any swelling around her eyes now. She said her facial skin is not as red as it was on Saturday. Outcome of the event headache was recovered on unspecified date in Feb2021; while dermatomyositis rash flare up was recovering.
1081741	3/8/2021	FL	83	M	2/9/2021	2/9/2021	Lost all my vision; A spontaneous report was received from a consumer who was an 83-year-old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced lost all my vision (blindness). The patient's medical history, as provided by the reporter, included an eye transplant 9 or 10 years ago. Concomitant medication included acetylsalicylic acid, metformin, tamsulosin, ropinirole, Ramipril, and gabapentin. On 09 Feb 2021 at 10:00 AM, prior to the onset of the symptoms, the patient received the first of two planned doses of mRNA-1273 (Lot number: 031M20A) intramuscularly for prophylaxis of COVID-19 infection. On 09 FEB 2021, at exactly 10:00 PM, the patient "lost all my vision." He stated he had an adverse reaction to his first injection and said "my first shot messed up my vision." By 5 am, his vision was perfect. No treatment medication was reported. Action taken with mRNA-1273 in response to the event was unknown. The event of lost all my vision was considered resolved on 10 Feb 2021.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.

1080745	3/8/2021	NM	71	F	1/29/2021	3/3/2021	Four days after first dose, experienced inflammation of Left eye with pain and redness. Sought care at urgent care setting. Treated with artificial tears and erythromycin ophthalmic ointment. Symptoms subsided after 1 week. Three days after second dose, experienced same symptoms, but more intense. Sought care at ophthalmologist's office. Diagnosed with corneal abrasion. Treated with artificial tears and erythromycin ophthalmic ointment. Symptoms resolving 10 days after vaccine. Sibling experienced same symptoms after vaccine administration. Dx with corneal abrasion by ophthalmologist.
1081063	3/8/2021	CT	66	F	3/3/2021	3/7/2021	Pfizer shot on Sunday am - my father noticed my mother c/o not feeling well and unable to explain why she didn't feel well. She woke up feeling well and then quickly became disoriented and vomited. She was then unable to walk or communicate appropriately. Emergency services was called and she was transported to Emergency room. She was diagnosed with a posterior brain CVA and was treated with tpa and now remains hospitalized in the ICU with expressive aphasia and vision loss.
1080750	3/8/2021	IL	60	F	2/13/2021	2/13/2021	Since the week after the first Pfizer vaccine, I began struggling with symptoms of diabetes. I experienced extreme thirst, frequent urination and I lost 17 pounds in the 3 weeks following the first dose. I never associated it with the vaccine, initially, because I never heard of any side effects like increased glucose, and my dad and sister have type 2 diabetes, so I was altering my diet, but the symptoms did not subside. I proceeded to get the second vaccine and that's when I knew something was seriously wrong. That afternoon my blood sugar was 528, my vision was blurred, and I experienced a strange feeling in my heart. I was diagnosed by my GP with diabetes, and put on medication (Metformin and Glipizide). I proceeded to see an endocrinologist, I was put on insulin and after additional blood tests was diagnosed with Latent Autoimmune Diabetes , and Premature Atrial Complexes.

1083267	3/8/2021	AK	31	F	3/8/2021	3/8/2021	This patient reported she waited the recommended time after her injection and then left the facility. She stated as she got in to her car and began to drive away she felt her face become "numb and tingly" and returned to the facility right away. Upon entering the facility and reporting her concern, she was assisted to sit down in the side lobby area and VS assessed. She reported her face felt "numb and tingly." She denied any SOB or difficulty swallowing at that time. She reported her eyes "feel weird," but denied any vision changes. She also reported a scratchy throat and reported it sounded like she was "under water." At 1225 she reported her eyes to be "not that bad anymore." VS reassessed at 1230. She continued to report no SOB or other symptoms. At 1244 she reported her symptoms to be less or unchanged. Final assessed and this patient reported she felt good to go home. She was given Benadryl PO by pharmacy staff and denied any questions.
1083122	3/8/2021	CO	66	F	2/21/2021	2/22/2021	24 hours after the injection I started to flush on my face neck and ears. I itched all over especially my eyes and throat. I was very agitated and shaking. I took an allergy Med at 2 pm and again at 7pm. The 2 Nd dose calmed me enough to get to sleep around 11pm. I was very close to going to the ER. In the morning I had a stomach ache like I have experienced before with an allergic reaction. Cramping pain , it lasted all day there was no nausea. The 3 day a headache that seemed appropriate for the vaccine.

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
1083097	3/8/2021	AL	22	F	3/5/2021	3/6/2021	I received the vaccine at 4:30 PM and later that night, I had a headache and I felt very out of it. By the end of the day; however, I was feeling better. The next day, I woke up around 5 AM and my muscles were all tensing very strongly and I could not stop shaking. This went on for about 30 minutes, and then I stopped shaking and tensing so much, though my muscles still felt a bit tense. I can't really eat in the morning, so I drank two glasses of water over the course of a few hours and took 2 acetaminophen. I stayed in bed until around 10 AM. Then, I took a shower, but while taking it, I felt very lightheaded and my vision had some black spots, and I had to sit down several times. After I got out, I tried to eat something, but then I felt really nauseous and had acid reflux for at least 30 minutes. Afterwards, I drank a bit of water and went back to bed. My muscles started tensing and shaking again, though not quite as intensely as when I first woke up. I felt very cold, so I turned up the heat and put on warm clothes. I fell asleep for about 20 minutes around 12, and when I woke up I felt a little less nauseous and headache-y. I stayed in bed for an hour, and I ate some pudding over the course of an hour or two, but I thinking about eating much else made me feel nauseous. I fell asleep around 5:30 and woke up again around 7:30. I felt better after waking up, but still had a bit of a headache and my muscles were slightly tense. On Sunday and Monday (today) I felt about the same, physically tired but otherwise mostly ok.
1083084	3/8/2021	AL	49	F	3/6/2021	3/6/2021	Adverse reaction began 20 minutes of receiving injection. Began with a rash on throat and neck. Followed by swelling of throat, trouble breathing, O2 levels dropped, itching began, swelling in face, watery eyes, and other.
1083067	3/8/2021	AZ	55	F	3/2/2021	3/3/2021	Vertigo. Began around 11:00 am. Could not lay down of the world seemed to spin. Sometimes sitting up too. Husband said eyes were rapidly moving. Made me vomit. Stayed still as much as possible. No drugs, other than Acetaminophen taken. I went to bed at 8:30, propped up on 3 pillows. Woke up fine the next morning.

1082514	3/8/2021	IL	63	F	2/25/2021	2/27/2021	On the AM of 2/27 at 4 AM she woke up with eyes swollen shut. She describes this as it looked like she had been in a fight with no bruising, just very swollen. Since the weekend, she did not go to the MD, she just took Benadryl and iced with cold packs. Today on 3/8/21, she still feels that her eyes are still puffy. Does not interfere with her vision today. She states that by Monday on 3/1/21, swelling went down and she did not go to the MD.
1083819	3/8/2021	MN	29	F	3/8/2021	3/8/2021	At the time of injection, it was pretty painful and thus sent my body into a shock less than 5 mins after receiving my dose. My vision went white and I was very light-headed and hot/sweaty. A nurse came with me outside to monitor and I was feeling back to normal in 15 minutes. This is something that happens when I experience a high amount of pain, so just reporting for others who maybe have low blood pressure issues. At about 8pm, other side effects started to set in. I first experienced a headache, then experienced soreness/ache-y-ness in my back. Around 8:30, I started to feel light headed again and soon my whole body felt ache-y. I quickly developed chills where I felt so cold that I was uncontrollably shaking and felt very sore/stiff. I have been laying under a heated blanket for the last hour and a half and am finally feeling better with no more shaking or chills. I still have soreness throughout my body and a headache, but I took ibuprofen around 8:30pm.
1083553	3/8/2021	CA	40	F	3/8/2021	3/8/2021	Dizziness, blurry vision, took oral Tylenol. BPs 98/68 (pulse 58), 97/66 (pulse 59).
1083549	3/8/2021	LA	65	F	3/4/2021	3/4/2021	Bleeding and pain at injection site; Droopy left side of face, pain in upper left jaw, below left eye, upper left arm and left shoulder/neck; Transient headache and pain in left leg with ankle swelling.
1083492	3/8/2021	NY	29	M	3/6/2021	3/8/2021	developed redness on my face, surrounding my eyes (forehead, nose, cheeks). I assume it's from the vaccine because I hadn't had such a rash ever in the past.

1082334	3/8/2021	IL	60	F	3/5/2021	3/5/2021	<p>No rxn to dose 1. Dose 2: @10 min had tingling of lips; at 12 min had tingling of tongue [and anxiety from the tingling]; @ 15 min had some SOB and knew this was not just anxiety. Had zero intention of being taken to ER as I could easily tx myself. Took inhalers, extra cetirizine. Did not take epi, though have several pens. @4 hour started feeling weak, severe arm pain. At 6 hours, unbearable arm pain, extreme weakness [did not take BP or pulse ox--though I can and wish I had]. Exceeding thirst, could not get water down fast enough. Reactivation of arachnoiditis symptoms. Started unusual muscle fasciculations in arms, leg, and face [face not normal for me]-took valium and baclofen. Next 36 hours unable to get out of bed other than to get water. Severe HA upon waking [@16 H post injection]. Severe myalgias, but in areas of known arachnoiditis that have been quiescent for quite some time. Forgot to mention, as I find this strange: prior to going to sleep I had left eye conjunctivitis. Left eye only that still is slightly persistent and doesn't require any care [for me at least] I am currently 72 hours post. Still with HA and some fatigue, though worked today [I WAH for a population health company]. L arm is not as painful as the excruciating pain @ hour 4-16, and no need for additional acetaminophen. I have an exceedingly high pain tolerance due to the arachnoiditis, but this was the first time I took a narcotic in 5 years. 2 .5 mg oxycodone x1, then 600 mg ibuprofen x1, then 1 gm acetaminophen 2 over next 24 hours and nothing since, but it is still quite painful today. Different today than yesterday is the development of what feels like left shoulder bursitis. We'll have to see how this goes over time. There is extensive edema at the site, but not clear erythema [I'm dark skinned]. Still just can't seem to get enough water. Had my first meal last night [made chicken soup]. It's still pretty early on. I'm not even at the 72 hour mark yet, so hopefully things will settle down over the next weeks. I checked the box as life threatening because that was likely early anaphylaxis -- though at first I seriously thought at first I was just anxious because of the lip tingling. This is in defense of the fact I did not self administer epi when I became SOB. I likely should have, but know myself well and did fine without it and with asthma and allergy care. I didn't need extra albuterol</p>

1082544	3/8/2021		41	F	2/17/2021	2/18/2021	<p>o Complaint The patient is a 41 year(s) old Female complaining of allergic reaction, nausea. o Chief Complaint Quote Patient complained of allergic reaction that started about 45 mins ago. She got her 1st dose of Pfizer Covid vaccine yesterday morning. She complained of rash all over the body, swelling on the hands and face including eyes and lips. She denied chest pain, abdominal pain, fever, cough, vomiting and difficulty breathing. She complained of nausea that started 5 mins ago. She has not taken any meds yet for her symptoms. o Time Seen 02-18-2021 01:20 o Historian patient</p> <p>ADDITIONAL HPI: o Additional HPI Pt here with concerns of allergic reaction. Pt fell asleep on the couch approx 2200. She awoke 2 hours later with itching of her hands. Over the next hour she developed a full body rash, itching, and swelling of face. No wheezing, no difficulty swallowing. Upon arrival to ED pt started to feel nauseated. Pt had first dose of COVID vaccine approx 16 hours prior to onset of sx's. No h/o allergic reactions, no h/o asthma. Emergency Department Course and Clinical Decision Making: Patient presents with urticaria and swelling to her face eyes and lips. Shortly upon being roomed she started to feel very nauseated and started vomiting. No stridor or wheezing, no immediate airway compromise but given both cutaneous and GI symptoms, significant concern for anaphylaxis. Patient was immediately given epinephrine intramuscularly, 0.3 mg. An IV was placed and she was given Solu-Medrol, Benadryl, Pepcid, and Zofran. Patient's urticaria and swelling started to nearly immediately improved after the epinephrine. She is feeling much better though slightly anxious. To be reaction from the Pfizer vaccine, no other obvious triggers, patient has no history of allergic reactions or other sensitivities. We will observe in the emergency department in a monitored setting for several hours to assure no rebound symptoms, patient updated on plan. 0500 Pt has been resting. Urticaria resolved, swelling to face resolved. Discussed with pt reporting reaction to CDC, info provided. Also discussed the second dose of vaccine, recommended reaching out to Epi response team or PCP to get recommendations. Will give short course of prednisone, 4 days, Benadryl as needed, ED return precautions discussed, will dc home.</p>

E at 400 international units; one capsule once a day, ongoing ambozil for low testosterone, clonidine ongoing at 0.1 mg as needed for blood pressure measurement. History of all previous immunization with the Pfizer vaccine considered as suspect: None, this was the first dose. No other vaccine administered on the same date. The patient had no events prior vaccination within 4 weeks. In all his life. He had vaccines that received and had no adverse event or side effect whatsoever. He had had the regular flu vaccine early November. The patient experienced feeling anxiousness in the brain, Heaviness in the head, feeling weak in Feb2021, Localized soreness and pain in Jan2021, Goosebumps tingly sensation in head, Blood pressure and palpitation/heart rate/heartbeat is getting higher and higher on 04Feb2021. The patient could not take Benadryl as he cannot tolerate Benadryl. With Zytrec he does not have secondary effects like he does with Benadryl. The first week after getting the vaccine he only had kind of had localized soreness and pain in the area. He later clarified it was in the area where got the injection, vaccine. He just had pain soreness in that area. Other than that he had no side effects at that time. The third week, initially stated as, about 5-7 days ago he started to have a feeling of anxiousness in the brain. He could feel anxiousness and sensation in his brain that he did not feel before. It was like he had the flu kind of thing, but he did not have a temperature. However, the feeling is in his head. It is like heaviness feeling from the flu in his head. He has been having the heaviness in the head feeling for 4-5 days. He later further clarified and initially clarified the localized pain and soreness was noticed the second day, the day after getting the vaccine. This only lasted a few days. He does not remember exactly when this ended. He did not take anything for the localized pain and soreness in the same area as the injection. He confirmed he has recovered completely from this event. Caller further clarified the feeling of anxiousness started Thursday or Friday of last week, maybe 05Feb2021. Stated it was like this feeling is getting worse and worse. Stated it was hard to explain, but he started to feel a goosebumps tingly sensation in his brain in head, in scalp Thursday of last week first. It started with that and slowly over the past few days it has changed and transformed into this heaviness feeling that one would feel from the flu, but he has no

---

fever or anything; it is just in his head. Also, along with that feeling at the same time his blood pressure and palpitation/heart rate/heartbeat was getting higher and higher. His regular blood pressure medications won't work anymore to bring it down. His blood pressure typically ranges in the 130/85 or less range with all the blood pressure medications he was taking. Once he started having this tingling sensation in his head he had the higher blood pressure and higher heart rate. Now his blood pressure would average being about 170/110 to 180/115. This was like the upper and lower range. His heart rate was typically around 70-75 and now it goes about 80-85. Later during call, he also added, every six months or so his blood pressure may be elevated on these medications. Sometimes his blood pressure was not maintained by the three different blood pressure medications he takes. He was also prescribed two other medications for emergent use Clonidine and Xanax. Usually every six months he would have to take Clonidine and Xanax and typically in an hour to two hours the blood pressure would come down and it's good. However, this time, he took two Clonidine and Xanax starting last Thursday when had the high blood pressure episode and they were failing to bring the blood pressure down. He further explained it would bring it down for some time, but then it would go back high. The Clonidine is no longer working for the last six days. When probed for labs/testing he stated he could not work anymore due to the events reported. He was feeling weak. He could not really walk. He took time off from work. He went to see his primary care provider on Monday. On Monday the doctor doubled the dose of Carvedilol. Since then instead of taking 12.5 twice a day, he is now taking 25mg twice a day. On Tuesday, yesterday, he went to get blood work done. Blood was drawn but has no results yet. Localized pain and soreness time of onset didn't remember, stated he may have had a little pain right after getting the vaccine, but it was around 21:00 25Jan2021 he really noticed the soreness and pain. The following morning around 9 AM it woke him from his sleep and he could feel it more compared to the first day. Anxiousness in the brain around 16:00. The patient had no emergency visit. Stated he almost felt like going when his blood pressure was 182/116 on Saturday night of last week. He was about to go to the ER but decided not to. He ended

							up taking two Clonidine and one Xanax, laid down, and eventually his blood pressure came down a little. Therefore, he did not go. The patient had physicians office visit. After getting the vaccine he mentioned started to have a feeling of anxiousness in the brain that was getting worse. He could feel anxiousness and sensation in his brain that he did not feel before. Also, his blood pressure and palpitation/heart rate/heartbeat was getting higher and higher. His regular blood pressure medications won't work anymore to bring it down. Later during call, he also added, every six months or so his blood pressure may be elevated on these medications. Sometimes his blood pressure was not maintained by the three different blood pressure medications he takes. He was also prescribed two other medications for emergent use Clonidine and Xanax. Clonidine: 0.1mg only during times he has episodes of high blood pressure. Usually every six months he would have to take Clonidine and Xanax and typically in an hour to two hours the blood pressure would come down and it's good. However, this time, he took two Clonidine and Xanax starting last Thursday when had the high blood pressure episode and they were failing to bring the blood pressure down. It would bring it down for some time, but then it would go back high. The Clonidine was no longer working. The patient experienced side effects on the 3rd week after getting vaccinated and had already made a report. The patient's second dose was scheduled for 21Feb2021 which was 28 days after the first dose. The outcome of the event Feeling anxiousness in the brain was not recovered, Localized soreness and pain recovered in 2021 and outcome of other events was unknown. No follow-up attempts are possible. No further information is expected.;
1083009	3/8/2021	CA	51	M	3/6/2021	3/7/2021	51 y/o male SM received moderna vaccine dose 1 on 03/06/2021 @1135, on 03/07/2021 @1300 SM had started noticing blurred vision and left side of face muscles not working. Went to ED on 03/07/2020 and was told he could possibly have Bells palsy and was prescribed prednisone 20mg for 3 days and valacyclovir 1mg for 7 days. Having to wear eye patch at night on left eye. Symptoms are not getting worse but have not gotten better. Has follow up appt on 03/11/2021 with PCP.

1082997	3/8/2021	KY	66	M	3/8/2021	3/8/2021	Approximately ten minutes following vaccination patient decided to check his blood pressure at the automated machine because he didn't feel well. Patient passed out sitting at the machine and lost control of his bladder. Patient's eyes were open and he was making snoring noises. Upon checking pulse, it was faint. Patient was breathing. Team moved patient to lying position on the floor. Pulse became more prominent and patient woke up. EMS arrived and took patient to local hospital for precautionary testing. Patient discharge home 2 hours later.
1082985	3/8/2021	MI	86	M	2/25/2021	2/28/2021	Patient had been feeling dyspneic for 1.5 weeks to 1 month prior to his death on 2/28/21. He received vaccine on 2/25/21. On his family found him leaning on the couch with eyes rolled back and foaming at the mouth. He was making noises (like grunting sounds?). EMS was called. He had cardiac arrest while in ambulance enroute to EMS. Resuscitation efforts continued in ED. Family was informed about his status and resuscitation efforts were stopped.
1082486	3/8/2021	OK	52	F	3/3/2021	3/4/2021	Patient reported mild fatigue and arm soreness until the following afternoon when her left eye began to burn which progress to the right eye. Later in the evening the left upper eye lid began to swell extending into the lower lid along with right upper lid swelling. She contacted medical through our COVID hotline where I was notified around 9 pm Thursday night ( 03/04/2021). She denied an respiratory or cardiac symptoms and was mostly concerned about the periorbital edema. She did not feel she needed to go to the hospital. She was advised to take Benadryl 50 mg every 6-8 hours and apply cold packs. A follow up call was made by me at 07:30 am on Friday and was instructed to contact her PCP. Later that day she called me indicating she went to Urgent Care and was seen by Dr.

1082623	3/8/2021	CA	71	F	3/3/2021	3/4/2021	1st dose 1/29 reaction gave me little dime-sized red bumps all over my body and a lot of itchiness. I had 2 larger brown places on my body that were oval shaped about 1 inch across and it was crusty and had liquid and blood coming from it. One was under my left breast and at the base of my spine. I had to get a mammogram because I had brown and bloody discharge from my left nipple. It looked like someone had painted bright red paint around the nipple. Dermatologists said it was mild duct ectasia bilaterally benign, nipple dermatitis, left nipple bloody discharge, and an eczematatious rash. Right breast had a brown bump on the areola to the side of the nipple. 03/03/21 second dose: Sore arm, Fever of 100.9 next day that lasted all day. fatigue and a headache. I also had dizziness especially when I lie down or get up. fever went down and then I developed a rash on my body that made it look like I was sunburned all over my body. not spots, just redness all over. I felt pretty weird. it was an itchy rash that stayed about 24 hours, then changed into a spotty rash that traveled to my inner arms and inner thighs. The next day it traveled down my legs to my ankles. It went away mostly after a few days. I do still have spots that look like bites that are quarter-sized brown crusty spots. then I have eczema patches on my forehead. Its flaking and itching and is too sensitive to wash with soap. Also, my right eyelid has 3-4 places that has welt on it so much so that I cant see well from the eyelid, and under eye being swollen.

1079397	3/7/2021	CA	68	F	2/24/2021	2/24/2021	1st vaccine shot on 25jan ... no apparent side effects but looking back did notice a slightly burned feeling tongue & roof of mouth. 2nd Inoculation 24feb in morning-body aches by 9pm-progressed to body and head aches with hot/cold sweats & shakes by 230am-fatigue and head/body aches thru midday-then subsided- 2 days later started noticing tongue irritation but no trouble breathing , no swelling - followed by hives or histamine rash on scalp , face, scratchy nose, eyes got progressively more scratchy, red & swollen ... went to doctor on 5march, started taking D-Hist to help with itching & rash, flaky facial & scalp ... cold compresses on eyes ... very slowly becoming somewhat better ... have an appt with acupuncturist on Friday 12march
1079160	3/7/2021	PA		U			After 2 minutes my tongue started getting numb. Racing heart and standard sore arm. To date my tongue and roof of mouth are still numb (sensitive to touch), in addition... my lips feel full and on occasion my muzzle area of my face feels tingly. Slight headaches on a daily basis. Brain fog and some blurry vision on occasion. Right ear has a swishing (sounds like my heart beat) Constipation (need to take laxatives to go)... heavy feeling in my lower back and buttock. Leg muscle pain (as if I walked or climbed a ladder all day) this is ongoing all day - every day - even upon waking in the morning.
1079303	3/7/2021	PA	63	F	3/2/2021	3/2/2021	Uncontrollable shaking for hours, migraine, nausea, dizziness, chills, extreme joint, low back and muscle pain, pain at injection sight, a painful swelling /lump on the under arm area of the arm that received the injection. Extreme fatigue. Sinus pain and pressure around eyes, earache and felt in my teeth. Dry throat, runny nose, cough developed. The most of these adverse reactions last 2 days where I could not get out of bed. With 5 days in from vaccination date still experiencing much joint and back pain, fatigue and overall not feeling well but better than a 3 days ago for sure.
1078875	3/7/2021	NC	69	F	3/4/2021	3/5/2021	Beginning 18 hours after injection: slight fever, extreme fatigue, extreme head pressure, burning eyes, mild full-body muscle aches, injection site swelling and severe pain. Symptoms lasted 24 hours.

1079043	3/7/2021	NJ	27	M	3/2/2021	3/2/2021	Adverse events were more applicable in the second dose of this vaccination. At 22:00 a low-grade fever began. At 03:30 on 3/3 a fever of 102 degrees had been achieved. Left axillary lymph node swelled. Generalized body aches mostly in wrists and ankles occurred. For the duration of 3/3 102 fevers persisted while taking Tylenol and slept for duration of day. On 3/4 low grade fevers of 100 degrees were maintained. Nausea and diarrhea occurred, aches continued throughout body particularly in shoulders. Lethargy so severe couldn't stay awake for more than 20 minutes. On 3/5 fevers reduced down to 99 degrees. Vertigo occurred with dizzy spells and ataxia. Heart rate periodically elevating to 120-140s for hour long durations. Only able to sleep for 2 hours at at time because of waking up from tachycardic episodes. Panic attacks ensued due to tachycardic episodes. On 3/6 psychotic thoughts and hallucinations began. First, racing thoughts about irrational an uncontrollable events began. "Will I be able to father children?; I will sell my car tomorrow to sustain myself.; etc." Visions of insects crawling down a mountain side, flowers with eyeballs, etc. Panic so severe couldn't close eyes and mind always racing.

1080231	3/7/2021	FL	40	F	3/5/2021	3/5/2021	Dizzy, run down two hours after injection. Woke up 4 am then off and on with extreme body pain, sore neck , lower back, right hand and arm. Headache and fatigue at 6:45 am got up with two children (2 yrs and 10 months) ate small breakfast by 9 am I couldn?t get off the couch or stay awake. My head started aching and my eyes hurt, I felt extreme chills two thick blankets weren?t enough to warm me. Extreme fatigue, stomach pain and loss of appetite. I fell asleep and didnt have the energy to walk to my bed until 2:30 pm. It set off my stomach and I was vomiting off and on until around 9 pm. By then I could keep little bits of fluid and food down. Then I was hot. I felt flushed but had no fever. My usual heart rate is 52-54 bpm via Watch while laying down. My heart rate during this hot period laying in bed was 102 -101 bpm. Which is consistent for my workout heart rate. I went to sleep and woke up 7 am with my kids and was well enough to take care of them but not do all my usual chores. I couldn?t bend down or put my head lower than chest or the extreme throbbing headache was back. Still had body aches and fatigue but nowhere near yesterday. It is 11:22 pm Sunday and I feel spent.
1079980	3/7/2021	ID	76	F	2/11/2021	2/15/2021	Dizziness for month following Burning eyes for month following Skin rash below injection site - 7 days later; lasted week
1079982	3/7/2021	CA	84	M	3/4/2021	3/4/2021	I was doing light yard work in the sun, then in the 70s, became dizzy and could not stand, fell backward to the ground, tried to get up and became nauseated, had the dry heaves so I laid down on my side. Every time I opened my eyes the area began spinning again. I had a fever and sweated heavily for about 1 hour. I took two aspirin with a glass of water. I had a short nap, lying on the ground, when I woke up the fever was gone and I started having chills. After about 30 min, my dizziness was less, but I still could not walk. I started sitting up and scooting backward into the house, which took about 30 min to get into the house. I laid on the floor, was still having chills, so covered up with many blankets. About 8pm, 5 hours after first getting dizzy, the chills were gone and I was able to get up and get in bed. About 10 pm I took 2 asprins and went to sleep.I had to get up

1078895	3/7/2021	FL	65	M	2/26/2021	3/2/2021	Began feeling very weak with a constant headache that later led to blurry vision on March, 2, 2021. On the morning of March 4, 2021, I was still experiencing a right sided headache as well as double vision. I was no longer able to drive at that point. I took my blood pressure digitally at the local pharmacy twice where it was 200/104. I went home to call my physician and also have my wife take my blood pressure manually. My blood pressure at that time was 214/106. I went to the hospital where they examined me and then discharged me with a General Headache without a know cause. I contacted my PCP and he advised me to quadruple my Lisinopril until my BP came down to normal range and see him the morning. My visit the next day showed an elevated blood pressure, double vision, and a continuing headache. My meds were adjusted to Lisinopril 10 mg qd and an addition of Norvasc 5 mg qd. Later that day my blood pressure was down, but still not in the normal range. The following day, March 6, 2021, I was still having the same issues despite the changes in medication. I took my blood pressure at 6 pm and it was 199/104. I immediately went to another hospital where I was admitted as a "stroke alert" patient in hypertensive emergency. I am presently being followed as an inpatient in order to get these issues under control.
1079509	3/7/2021	NJ	37	M	3/6/2021	3/6/2021	after getting injected, patient complained on filling dizzy and lightheaded, wanted to lie down I asked him to sit down and put his head between his knees, also said that he feels pressure behind the eyes, was sweating and after 15-20 minutes said he feels nausea, he refused medical help (calling 911) , 40 minutes after the shot he said he is feeling ok and wants to leave. He had female companion with him. I just left him message 24 hours later but got no response yet

1079526	3/7/2021	NY	64	F	3/7/2021	3/7/2021	<p>Patient received her first Pfizer vaccine today at 12:24pm .She was sent to observation feeling well. About 10 to15 minutes later she began to complain to her son that her head felt "bloated", her eyes felt heavy and her head felt hot. The nurse removed the patient to the nurses station and took her vital signs, then notified the clinical lead PN. The patient Initial vital signs taken at 13:15 were BP 157/85 P 78 , O2 sat 99%,. R 18. Denies Shortness of breath, difficulty breathing or swallowing. No skin color changes noted. No rash or pruritis. Denies chest pain, pressure or palpitations. Consumed a bottle of water without difficulty. About 20 minutes after the vaccine was received she began to feel faint, but did not feel as though she was "going to pass out" . VS remained stable; BP 157/85/P78.O2sat 99% She continued to c/o head fullness, but now was reporting feeling chills, and flushing . Son administered an extra strength Tylenol at 13:10. Nurse acted as interpreter as well as her son. Paramedics were called initially at 12:56 and again at 13:21 Patient was able to get up and walk to the bathroom with attendants , voided under observation and return to her chair without complaints of instability or dizziness. Paramedics arrived at 13:45. Vs were noted to be 160/90 , pulse 75, O2sat 99% Patient continued to complain of head and eye fullness and vertigo( Paramedic looked like her was swaying). Patient appeared stable ,in no acute distress when she was escorted out of the building ambulance by paramedics at 13:55 to be taken to a Hospital for evaluation.</p>

1079669	3/7/2021	CT	29	M	3/6/2021	3/7/2021	Chills woke me up at 5am, kept me up for at least an hour. Headache, pain in eyes, fever continued through the day. Muscle pain in back significantly worse than previous days
1079691	3/7/2021	IN	67	F	2/24/2021	3/2/2021	Migraine headache 3 days, tired, rash at sight eye sensitivity Have never had a migraine before. All 7 days after vaccine
1079713	3/7/2021	NE	57	F	3/4/2021	3/4/2021	After getting the shot I felt light headed , nauseous, heart pounding. I became very tired approx. 1 hr later and slept 3 hrs. When I woke up my face was itchy and top of hands. I also had cold type symptoms such as stuffy nose, watery eyes, cough, chills, 99.8 temp. and a bad headache. Around 3 am on 3/5/21 ,I started having stomach pain then diarrhea until around 12 am on 3/6/21. Still had headache and low grade temp of 99.3. Approx 11:30 am started feeling better. No symptoms except mild headache.
1079759	3/7/2021	OR	71	F	3/4/2021	3/4/2021	Watery eyes, running itchy nose, sinus headache, partial loss of taste and smell, loss of appetite. Severe symptoms for 36 hours, less severe for another 2 days. No treatment.
1079784	3/7/2021	OH	67	M	2/11/2021	2/14/2021	He developed a pink tinge to vision, and at times violet. Due to holiday and snowstorm he was not seen until 3 days after it started. The ophthalmologist did exam and ordered vitamin A levels, which were all normal. By later that day it started to fade. No vision changes by 2 days after that.
1079785	3/7/2021	TX	42	M	3/7/2021	3/7/2021	Eye and facial swelling

1079791	3/7/2021	HI	48	F	3/3/2021	3/3/2021	Approximately five hours after the shot, I began to experience redness blotchy itchiness to my upper chest and eye areas, then swelling. My ears and scalp were also itchy. The vaccine clinic doctors checked my throat and listened to my breathing. They gave me 25mg of Benadryl and Tylenol. While being monitored, a bad headache began behind my eyes and base of skull, my throat became sore. The doctor asked if I ever did albuterol, to which I said I carried an inhaler in case my breathing became difficult due to berry allergies or if I got sick, as I am pre-disposed to pneumonia and bronchitis. I then took to puffs of the inhaler. I was driven home and went to sleep. By 9 pm, I had a severe, debilitating migraine headache, nausea, sensitivity to light and sound, which lasted until about 12:00 am, when through more ibuprofen, heat to my head, cool ac, and darkness, I fell asleep. Upon waking up at 10 am, I was feeling okay, with a dull headache, however fatigued. After resting the entire day, and taking Claritin and ibuprofen, I returned to work on Friday 3/5/2021. At about 4 pm on Friday, I experienced a flare up of itchiness to my eyes, scalp and puffiness to my face and eyes. I took another Claritin.
1079530	3/7/2021	NY	70	F	2/26/2021	3/5/2021	Same onset of symptoms as first dose, but different symptoms this time ( 7-8 days after shot developed symptoms). Trunk itches and belly fat feels like someone is squeezing it, swollen hands and feet. This time had puffy eyes and lips,with neck and genitals itching. Over my body an erythema that turns white when stroked. On my right arm, where I received the shot, very large splotch approximately 3 inches by two inches (red and swollen.) Feeling of malaise and dizzy. Stiff neck and swollen joints in fingers. Visited outpatient clinic for check up. Given Hydroxysine HCL 25mg x 3 per day. When I was in my early 30s had an anaphylactic reaction to something I ate??? Went to ER for shot of epinephrine. We never discovered what it was I was allergic to.

1077898	3/6/2021	NY	25	F	2/5/2021	2/21/2021	16 days post vaccination I broke out into truck hives with occasional spot of arms and legs. Hives stayed for 4 days start to finish and were unaffected by benedryl and other antihistamine drugs. Cortisone creams also had no effect. Hives were raised but not red and did not bother me other than visually.
1077677	3/6/2021	MD	76	F	3/3/2021	3/4/2021	18 hours after Moderna shot 2 my eyes swelled up and became itchy and red. My eyes are sill inflamed as of now 3/06/2021. Also I have been running a low grade fever, and have headaches. These symptoms are managed with Tylenol.
1077704	3/6/2021	MA	69	F	2/23/2021	3/4/2021	Hives and itching rash on both arms and chest, swollen face with hives, sore eyes
1077800	3/6/2021	IN	72	F	2/15/2021	2/16/2021	Skin red, swollen everywhere with tiny itchy hard bumps. Eyelids were red and swollen, hot and hard to open. Body aches and fingers partially numb.
1077845	3/6/2021	UT	59	M	3/5/2021	3/6/2021	Eyes burning, fatigue, soreness at injection site, muscle aches (not manifest until following day).
1077903	3/6/2021	MI	77	F	2/25/2021	2/25/2021	After 1st dose on 1/29/21, pain at shot site, some redness & swelling. Tired for 2 days. After 2nd dose on 2/25/21, pain at shot site, redness & swelling. On 2/26/21, heavy chills, short of breath, face flushed, temp 98. Pain in low back & right upper arm (torn ligaments). Pain more severe than previously. 2/27/21 Shot site sore, itchy, red, swollen, short of breath, headache. Heavy chills towards evening. 2/28/21, Light pain at shot site, site swollen, warm to touch, labored breathing. Shakey, anxious, doom & gloom, food seems tasteless. Evening feeling better, swelling down, flashes if left eye. 3/1/21 arm itchy, no swelling, arm aches slightly. Pain in low back severe, right arm pain. There was only 26 days between the two doses. The pain in back may be from scoliosis. Pain in right arm, torn ligaments. But after receiving vaccine, these pains increased tremendously, as well as the shortness of breath and extreme groin pain (maybe from fibroids?).

1077310	3/6/2021	TX	40	F	3/5/2021	3/5/2021	Patient stated after she sat down she began to hear ringing in her ears and had tunnel vision; didn't remember after that; medic and this nurse ran to patient where she was laying face down. Patient began to come around and skin was pale and clammy to the touch. VS taken: HR: 82; BP: 140/70/ O2 Sat RA: 78%. Patient was speaking coherently after she woke up, was out for about 25 seconds. Patient stated she had a hx of fainting w/labs or shots. Placed cool, wet towels behind neck, forehead and lower back - patient stated it helped her feel better. VS retaken: BP: 134/66; HR: 77; O2 Sat RA: 98%. Patient sat up in a wheelchair and began to have color to face and feeling less clammy. EMT sat with patient until she was feeling better. Patient was joking and stated she felt embarrassed. Patient discharged to home. This nurse contacted her after clinic, she stated she was doing well and would be seeing us again for her 2nd Moderna dose. This nurse encouraged her to notify the next vaccinator of her hx of fainting - She stated she would. Patient appreciative for call.
1077332	3/6/2021		48	F	1/30/2021	2/1/2021	Acute onset of fatigue approximately 48 hours after receiving the vaccine on 30/Jan/2021. Fatigue has worsened and persists to this day. Acute onset of palpitations 48 hours after vaccine and lasting approximately 20 min., headaches lasting 3 days and severe heartburn lasting 3 days. Coarse fasciculations of left pectoralis muscle onset 50 hours after vaccine. This progressed over ensuing days to involve other muscles both above and below the diaphragm including gluteals, gastronemius muscles, abductor hallucis longus, left first dorsal interosseous, deltoids, triceps, various abdominal and spinal muscles, and more recently the left masseter. The fasciculations persist to this day. Muscle pains started 2 days after onset of the fasciculations and are moderate-severe and worsened by exercise. I experienced tingling at the lower limbs on 6 occasions and transient disorientation one day on my way to work. My vision has been a bit blurry at times. i have been moody and short-tempered at times.

1077349	3/6/2021	WA	40	F	2/20/2021	2/20/2021	8 minutes after the administration of the vaccine (while in the observation area) I started to feel really off (dizzy, anxious, ringing in right ear). I ended up becoming unconscious with seizure like activity. They rushed me to the ER and kept me for 6 hours with lots of testing. XRay, blood test, CT of head, EKG, Urine test...all came back normal. Doctor said it was likely a reaction to the vaccine. I am 40 years old with no history of seizures or allergic reactions to vaccines. The week following I experienced confusion, migraines, dizziness, slow cognitive processing, eye strain, word finding difficulties, and exhaustion. I had to take a week off of work to recover. This is the second week and I am still experiencing headaches and occasional dizziness/eye strain.
1077556	3/6/2021	WI	45	F	3/3/2021	3/5/2021	Felt feverish and achey starting 12 hours after injection, lasting a total of 54 hours. At 36 hours after injection I felt like I was going to faint. I sat down and put my head on the table. According to my husband, my eyes briefly rolled back into my head and I was convulsing for a brief period of time (5 seconds). I then sat straight up, sweating profusely, white a sheet and with a terrified look on my face started hyperventilating for a short period of time. My husband said I never actually fainted, but I don't have memory of this incident. After this episode passed I continued to feel feverish and achey. Temp about 100.7. Started to feel a little better 54 hours after injection.
1077369	3/6/2021	TX	45	F	3/4/2021	3/4/2021	Body feels heavy like lead Very tired Minimal pain at injection site 2:18pm hands twitching and my right eye feels like it's swollen and burning closer to my cheek and then started twitching uncontrollably. Very dry mouth. Moments later body tremors and vomiting. Ended up being taken to the emergency room will elaborate later. Drink Sprite on the way home vomited it up as soon as I walked in the door. Not the feeling of nausea just the vomiting is coming. Took temperature have a fever of 101.0 DAY 2 Tremors while walking Headache Body aches Minimal taste Tingling around eye No real desire to eat Managed to keep some noodles down Today is Day 3 5:00am Still unsteady on feet when walking Still have headache and body aches

1077655	3/6/2021	IL	58	F	2/24/2021	2/25/2021	Severe body aches at joints, headache, fever of 103, BP 197/110, heart rate 100-110, dizzy, nausea, difficulty focusing eyes. Aches started at 6:30 am. High heart rate noted at 10:00 am. The rest came on in the afternoon. Took my vitals when I got home from work (7 pm). Chills, cold extremities through the night. By 5am, temp down to 100. By noon next day, BP and HR normal. Dizziness still comes and goes.
1077303	3/6/2021	AL	39	F	3/4/2021	3/4/2021	Not long after I got a quick dizzy spell that ended and I was fine About 7 minutes after I noticed a slight rash on my upper chest and person checking on me did as well. It was very mild (I had a much worse one with my mri contrast) but she wanted to keep an eye on me and said my 15 minutes wasn't up for seven minutes . She stayed with me and very close by. I cannot say enough good things about her. Everyone at this facility were great! I felt fine and told her that. I was not itchy. At the end of my 15 minutes she said I could pull to the side because I asked to use the restroom and wanted to see if I had it anywhere else. It was already looking better and I notice it also on my right upper leg. I had a thicker diarrhea without stomach cramps or anything. I didn't feel bad or great but just wanted to go home. She asked if I wanted to see someone inside and I declined and she suggested I follow up with my healthcare doctor after making sure I was okay. I took a Claritin I had on me before leaving. My mouth got extremely dry and I drank a large water. If I didn't not my throat kind of had a mild burn to it and cottonmouth. I didn't feel bad but I didn't feel as good as I did going into the first shot. After arriving home an hour and a half later it would come in waves of not feeling great and then feeling okay. I was very worn out and felt had I not tried to push though it would help. I took a Benadryl at 3 am and Advil . Day two just normal side effects. Fatigue headache nausea which I used zofran and Advil. My skin feels itching from time to time but no rash. Injection site clear with mild soreness. My left ear keeps feeling like pressure off and on. Nothing severe to me. .

1077559	3/6/2021	TX	59	F	3/5/2021	3/6/2021	I received the moderna COVID vaccine. 13 hours later I woke up with a leg cramp. While walking downstairs I became very dizzy and sweaty chills. I sat in a chair. My husband came down a minute later and I was passed out in the chair. He was saying my name and rubbing my arms to wake me. It took him about one minute to get me to open my eyes and then another minute before I could coherently respond. He said my chin was tucked into my neck and I was pale and making noises for less than a minute. He said then I relaxed and responded coherently. My temperature was 94-95 for about an hour while I had chills but also was drenched in sweat. I was also throwing up clear fluid for about two hours. I felt nauseous for about 3 more hours. After that I just felt tired.
1077565	3/6/2021	DC	42	F	2/26/2021	2/28/2021	Starting on Sunday Feb 28th I was very fatigued. I woke up on Monday after sleeping more than 12 hours with my head feeling tight and hot. My eyelids were burning, the skin around my neck felt irritated and my lymph nodes in my neck were swollen. The burning in my eyelids and neck pain went away by Monday evening. However on Tuesday I woke up with a visible rash on my neck. In the last few days it has stayed even though I have applied cortisone and neosporin on it. It is now warm to the touch and itchy. I also have a rash on my eyelids and my cheek which are hard to see in pictures because of my skin tone. I called my Primary for a virtual consult when I woke up this morning Saturday March 6 because I am feeling itchy all over especially on my back. Additionally, the skin of my elbows and knees (in the joint crease area) are now super warm like my eyelids were before the rash appeared. I also have neck pain again which started yesterday (March 5th) afternoon. It is not a muscular pain. It starts at the base of neck and radiates up to the crown of my head. It has not gone away with either Tylenol or Advil. My chest is also tight--not my lungs but my chest itself.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1077644	3/6/2021	TX	38	F	3/5/2021	3/6/2021	Visual Hallucinations (Hubble telescope stars and face in stars), inability to sleep, finger joint pain, toe pain, teeth pain, headache, chills and low body temp 97.1 Followed by 99.7 temp. It felt like I was dying and trapped in a nightmare or drug trip. (I have never done acid but I strongly believe that this is what a bad trip would have felt like)
1077653	3/6/2021	VA	71	F	3/4/2021	3/5/2021	On March 5th I woke up with low grade fever and headache, eyesight was like a veil over my eyes and I could not see well at all. It was as if cataracts had appeared over both eyes overnight. I slept off and on all day, drank lots of liquids and took Tylenol for the fever. The symptoms cleared up at 7:00 am on March 6th. I did not take any of my medications on March 5th except for my eyedrops, that seemed to help with my vision problems.
1077654	3/6/2021	AZ	71	F	3/3/2021	3/4/2021	This was the second shot in series of 2. First shot only gave me a sore arm at site & was administered on February 6, 2021. Second shot was administered on March 3, 2021. Started feeling these adverse effects about 9 or 10 am the following morning, 3/4/2021. Symptoms were soreness at site, in muscle that goes to the neck, headache, soreness across upper back/shoulder to shoulder. By 4 pm on 3/4, my entire body was reacting with extreme joint pain in all joints, extreme joint stiffness, skin was tender to the touch, temperature of 100.1, sore/stiff neck, and continuing headache. Temperature ceased around 11:30 pm but all other symptoms remained upon going to bed at 1 a.m., 3/5/2021. Upon waking at about 7:30 am 3/5/2021, all symptoms had diminished enough for me to go to an appointment at 10:45 am. However, by the time I headed back home at about 1:30 pm, I was so sleepy I could hardly keep my eyes open. More stiffness and achiness had returned too, especially a sore left underarm. Not the extent of night before, but enough to be uncomfortable. Today, 3/6/2021, I have noticed a sore muscle traveling from my left underarm down to my waist.
1077354	3/6/2021	AZ	35	M	3/3/2021	3/4/2021	Blurred vision. Migraines. Inability to sleep. Anxiety.

1078394	3/6/2021	NJ	45	F	3/5/2021	3/5/2021	Within 5 min got a tickle in throat that led to coughing and asthma tightness and dizziness. Took my Ventolin inhaler and my chest opened up. I continued to feel more and more dizzy and found myself finding it hard to speak. Felt very buzzy, like my body was feeling waves of tingles. My head started hurting and neck. This progressed at the vaccination site for a while. I don't know at what time they suggested N ambulance take me to the ER. By the time I was in ambulance my head and neck were hurting very bad. I was having trouble talking and any body movement felt like I was moving through mud. Very tingly and heavy feeling. I felt very drowsy and my eyes stayed closed. At the hospital they gave me an anti nausea, Benadryl and some migraine pain medicine. I think it was about a half hour or more I started being able to open my eyes again and see straight. The pain in my head and neck calmed down. I think I arrived at the ER around 3:45/4 and I was discharged at 7:45. I continued to have head and neck pain, body aches. My shooter and arm wheee shot was is very very sore. I slept ok but woke many times with my heart racing and feeling that buzzing sensation again like I was high. I've taken Advil for pain. Been resting all day today. Still having a bad headache and neck pain. Feeling very drowsy. Eyes hurting. I feel like I'm slowly coming out of whatever happened but still feeling like I've been hit by a truck.
1078398	3/6/2021	MN	69	M	2/20/2021	2/21/2021	The day after getting the 2nd shot I developed a sore arm and headache..the sore arm went away but the headache persisted every single day, 5 days after the shot I started having double vision and still have it and I feel unwell. I have nausea , dizziness, headache and just general feeling of being unwell..a bit of tightness in my chest

1078415	3/6/2021	NC	43	F	3/4/2021	3/4/2021	5 min after vaccine: nerve pain in upper right arm traveled in a line into right side of neck, up to just below the ear. Pain traveled directly from site of vaccine in arm and up through neck. 10 min after vaccine: Nerve pain down began in a line down right arm and into pinky and ring fingers of right hand. 20 min after vaccine: Tongue tingly (entire right side only, left side normal), pain in jaw, headache beginning in right temple. OTC Tylenol and then Ibuprofen taken 1 hour, 15 min after vaccine helped dull headache but not other symptoms. Nerve pain was intermittent until bedtime. The next morning, woke to right eye crusty from tearing, right eye tearing at corner (clear, like tears), consistently drippy right nostril (clear), loss of taste in tingly right side of tongue (could taste on left side of tongue), tingly right side of lips, slight drool right side mouth, outside of ear slight tingly. Headache returned, only in right temple extending to above right eye. Right side of face felt heavier than left side. Sensitivity to light, sound. Took Tylenol and Ibuprofen. Over 9 hour period (24-28 hours after vaccine given), most symptoms resolved, including taste. The next day (48 hours after shot), symptoms remaining are right eye has very slight tearing, right side of face feels a little "heavier" than left side, but drastically different from day before. I have NEVER had anything like this happen before after a vaccine or otherwise.
1078444	3/6/2021	WA	42	F	3/1/2021	3/3/2021	About two days after my vaccine, the area under my eyes significantly puffed up. About 6 months ago I had cosmetic fillers put under my eyes and the vaccine caused a reaction

1078464	3/6/2021	CA	91	M	2/18/2021	2/19/2021	My birthfather had an adverse reaction after he got his 1st Moderna COVID vaccine. He lives alone and was doing well with some underlying conditions. The day of the shot was fine. The next AM, he had vision changes and sudden numbness in his R arm/leg and fell after getting up. ?The numbness went away pretty quickly, but the visual changes remained. He refused to go to the ER/Dr. The next week and a half, he was weak, tired, and couldn't think as clearly. ?He was brought to the ER? on Wed, 3/3/21 at Hospital. He was found to have a low oxygen level, possible a-fib, fluid retention, emphysema, and aortic stenosis, in addition to his other health issues. ?The Dr said his symptoms the day after the vaccine were a mini-stroke.. He was released from the hospital on Friday, 3/5/21. On Saturday, Hospice came to see him, since nothing can be done for his medical conditions; however, they decided not to sign him up yet, since he I was told they didn't feel he needed to, at this time. One of my sisters is staying with him during the day until he builds his strength back up. Do you think his Mini stroke and health changes had anything to do with the vaccine? He will not be getting the second COVID shot. ?We're all caught between a rock and a hard place as far as what to do, esp for older folks.
1078353	3/6/2021	MI	68	F	2/16/2021	2/16/2021	Lightheaded, nausea, headache, eyes dry with itchiness and pain; joint and muscle discomfort; low grade temp, fatigue, hair and scalp hurt. Symptoms lasted about 36 to 48 hours.
1078521	3/6/2021	CA	65	F	2/27/2021	2/28/2021	Excruciating headache, 101.8 fever after 800 mg Advil. Fever did not break for 24 hours, then went up again two days later -3/1/21 at 3:30pm. Again 101.3. Headache lasted 24+ hours. Used ice packs on top, back and eyes for minimal relief. Advil did not lower temperature or aid in headache relief.

1078624	3/6/2021	AZ	30	M	3/6/2021	3/6/2021	Patient received his 1 dose of Pfizer vaccine and was waiting in our lobby for the recommended 15 minutes. He fainted after about 10 minutes. He fell from the bench to the floor where he landed on his stomach. When I ran over to him, his eyes were open but his body was limp. I tapped his back and asked if he was ok, and he was startled as if I woke him up from sleep. He was alert and was able to speak, he asked for water and I gave it to him. I asked if he wanted me to call emergency services but he declined. He then vomited in the waiting room trash can. His sister was with him and began to rub his back and fan him. I asked again if he needed to go to the hospital and again he declined. I told them to please wait in the lobby at least another 15 minutes before leaving and he did. I called to patient around 8pm to check on him and he said he was fine and had no more symptoms.
1078584	3/6/2021	CA	46	F	3/6/2021	3/6/2021	After waiting the 15 minute observation period, I left. While driving home my eyes started itching and my face felt strange. When I got home I looked in the mirror and didn't see a rash or any swelling in my face but then felt my tongue was swollen. I took a Benadryl and called the on call doctor from primary care physicians office and was directed to go to the ER since it was a potentially life threatening reaction.
1078601	3/6/2021	WA	28	F	3/5/2021	3/6/2021	No initial pain after injection. Body aches, headache and muscle soreness around midnight. Woke up around 4-5a.m. to neck/head pain, tense muscles on head/neck and notable pains in the jugular region. Very sensitive skin and muscle aches at this time. getting up to grab ibuprofen caused initial worsening of head pains that quickly subsided as blood pressure issue(?) symptoms came on (blotchy vision, lightheadedness, notably diminished hearing). took around 20 minutes to realize head/neck pain seemed to be caused by stiffness from an unusual amount of intense teeth grinding in my sleep. Waited around an hour and a half while drinking plenty of water and taking a single dose of ibuprofen along with a second dose of clonazepam before feeling comfortable/safe enough to go back to sleep.

1078611	3/6/2021	NM	57	F	2/24/2021	2/28/2021	Diagnosed with shingles on 3/4/2021. Had gone to urgent care on 3/2/2021, but at that time the diagnosis was neuromuscular. Pain increased severely by 3/4/2021 so I returned to urgent care (ibuprofen 600 was not addressing the pain after 2 hours). Had a classic shingles rash on the back of my neck (mostly right side, small bit just left of center) into my scalp wrapping around to right side, plus very faint rash on right cheek and inside part of right eye, and right ear is swollen. Ironically, I had postponed my Shingrix vaccine March 2020; was planning to get this a few weeks after the Pfizer vaccine second dose, once it was recommended to do so.
1078650	3/6/2021	WA	73	F	2/28/2021	2/28/2021	Please NOTE: The adverse reactions began with the first dosage on 1/31/21 that was Moderna / lot 007M20A / same location as the second dose listed above. Your format is not set-up to put two shot information well. So: on 1/31/2021 my wife received her first COVID-19 shot. a week after the injection she developed a large red rash at the injection site about 3 inches in diameter...it lasted a few days and dissipated. On 2/28/2021 my wife received her second COVID-19 shot. the evening of that vaccine she developed severe muscle aches and a very bad eye infection that swelled and itched. we are a week out and the symptoms ar just now beginning to subside.
1078096	3/6/2021	CA		F	10/7/1975	3/6/2021	15 min after vaccination, while leaving observation, patient felt midsternal chest pain with pain radiating below right shoulder blade. EKG NSR, BP 113/2 135/98, 66, 99%. 1142 BP 140/84, 64, 99%. Pt. appears quite anxious evidenced by pt. shaking leg and teary eyed. MD on side and can reproduce chest pain with palpitation. Pt. observed further for 15 min then released to home with spouse. Pt. denies any further discomfort before being released to home.

1075238	3/5/2021	CA	49	M	3/2/2021	3/4/2021	Swelling not at injection site. One day after the shot, my right finger swelled up for about 12 hours followed by swelling on the right side of my top and bottom lip. No treatment, just advised to keep an eye on it.
1075223	3/5/2021	FL	70	M	3/1/2021	3/2/2021	After an adverse reaction to the Covid 19 Vaccine, the emergency room Doctor suggested I contact you for a follow-up visit. Dateline and symptoms: 03/01 Received first Moderna Covid Vaccination at 3:45 p.m... 03/02 No symptoms until 6 p.m. When blood pressure started to go up from my normal level of 116/68 to 179/82 by 10 p.m.. During this time I had what felt like mild electric currents from the left side of my chest down my left arm and into my hand. These systems subsided around 11 p.m. and by midnight my blood pressure was almost back to normal. 03/03 Felt sluggish all day but no blood pressure problems. 03/04 Felt great all day then around 6 p.m. my blood pressure started to rise, by 9:30 p.m. it was 190/90. At this time I started to feel like my body was shutting down, my face felt flush, and experiencing long distant vision problems, so I had my wife take me to the emergency room. At 10:00 p.m. I went to the emergency room EKG showed no heart problems, the blood test showed no heart problems, and after 11:30 p.m. my blood pressure started going down and I was released at 1:30 a.m.. Blood test did show high levels of Blood Urea Nitrogen 26.0, Bun/Creatinine Ratio 33.0, Aspartate Amino Tranf (AST/SGOT) 43, Alanine Aminotransferase (ALT/SGPT) 59 and Alkaline Phosphatase 189, all of which are higher than my last blood test on 10/22/20. 03/05 As of 10:30 a.m. my blood pressure is 126/62. I feel fine except I'm very tired from not much sleep last night. 1p.m. Starting to feel some more chest and arm symptoms as described before, blood pressure now 146/66. Events happened twice, 2 days apart.

1075053	3/5/2021	NM	60	F	3/4/2021	3/4/2021	Received Pfizer COVID19 injection at 9:57 am on March 4 at the . As is usual for any shot or IV on me, I immediately tasted something weird in my mouth. It was not as metallic tasting as usual. More plasticity. Shot did not hurt. Was told to stay in 30 minutes waiting area.I did. The taste remained in my mouth. I left at 10:34 am feeling OK, except for weird taste. As I drove off the parking lot, I noticed that my mouth and tongue were tingling, with worst of it on my left side. My throat did not seem to be affected, so I continued driving. Some nasal congestion and coughing. The tingling turned into numbness in my mouth and tongue, all the way back to top of throat. I called my primary care doctor at 12:10 pm and left a message. I received a call back at 2:15 pm from nurse. She told me to take Benadryl and have someone take me to Urgent Care right away to get my vitals checked. I did not take Benadryl, as CDC said it could mask anaphylactic reaction. I called a friend and she took me . I noticed that my lymph nodes in my neck were swelling and painful. We arrived at 2:45 pm. My vitals were checked, heart and breathing listened to and was checked briefly for swelling in mouth and throat. There was no swelling. He said he had never heard of this tingling reaction and claimed it is just a side effect and not a serious reaction and that it would probably last a couple of days. He recommended that I watch for new symptoms and take Benadryl. That was \$30. We left at 3:10. We left. I noticed that the numbness was spreading to my lips and up the left side of face and I was getting super tired. Also, my mid to lower back started hurting a lot. I took a Benadryl. 4:30 pm still have same numbness. My eyes got super dry and itchy. My head started to hurt. Some coughing. 5:10 pm dry eye and numbness, more swollen lymph nodes and chills. Pain in calves, upper back, same on both sides. 6:38 weirdly, from the bottom of my thumb to halfway up my arm there is pain. Both arms simultaneously. Worse on the left. 8:11 pm after bundling up and using a heating pad, plus extra heat, chills are lessened. Lymph nodes very sore in neck. Eyes are not quite as dry. Everything else is the same. 8:48 pm jaw really aches. Intestinal discomfort. Going to bed. 10:39 pm pain from jaw extended up into left ear. Upper part of throat hurts. March 5, 2021 4:00 am. Body aches have lessened. Left arm sore at shot area. 5:45 am eyes definitely dry, but not nearly as dry

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							as yesterday. Numbness in mouth , tongue and face has lessened, but still uncomfortably present. Definitely worse on the left side. Little bit of tingling on the left, mostly on cheek from chin to ear. Headache gone. Lymph nodes sore and swollen . 7:00 am went on a walk. Noticed some achyness throughout body. Very tired. 10:51 am The tingling and numbness remain in my mouth, tongue and cheek up to my left eye. Very tired. Lymph nodes still swollen and sore.
1075406	3/5/2021	MA	78	F	2/26/2021	2/26/2021	Excessive shivering/shaking; weakening of lower legs; spiked high temp during the night into the next day. 102, finally lowered 48 hours later. Nausea; massive headache; complete body pain in muscles and joints, including jaws and eye sockets. exhaustion, fast hearbeat; no injection site swelling or pain. Reeccovery within 72 hours, fatigue and nausea for another 12 hours more or less. I do feel it was worth it.
1075408	3/5/2021	CA	70	F	2/4/2021	2/4/2021	Immediate severe headache lasting 8 hours. Lips and tongue had very mild/slight swelling for 4+ hours. Fingers felt swollen but nothing visually for 6 hours.
1075590	3/5/2021	CA	47	F	3/4/2021	3/4/2021	The entire left side of my body immediately felt mildly heavy and affected, but it was so minimal I thought it could be in my head. Throughout the evening after my shot I felt a bit of contracting of leg muscles and neck/shoulder muscles on the left side of my body. The left side of my face felt noticeably warmer than the right. This was all very mild, but just noticeable. In the middle of the night, I woke up with extreme night sweats but only on the left side of my body. The next morning (today) the left side of my face is still warmer but it feels droopy and bloated and slightly "Numbish". My left eyelid feels heavy. My left cheeks feel swollen and puffy and my left gums and lips feel slightly numb. I also have a very mild headache only on the left side. This is disturbing, while it is not debilitating or painful, it is strange and makes me think I should not get the next shot. Even as I type this, my left hand feels very fatigued. I don't know who to call or talk to about this. I do not have a health care provider.

1075618	3/5/2021	GA	46	F	2/26/2021	2/26/2021	2.5 hours after injection I started feeling weird, clammy cold sweats, nauseous and it felt like my eyes were bulging or like an intense pressure behind my eyes, blurry eyesight, extreme headache. I have not ever had any issues with my blood pressure only my diabetes. It had recently been slightly elevated but controlled mostly. I knew it was high and it suddenly just came on even after not eating at that time. I proceeded to flush with alot of water and some walking to bring it down. I wasn't exactly sure of how high it got because I don't normally have to bring my tester to work with me. However as soon as I got home I tested it and even after heavy flushing and exercise my glucose level was down to 500. It has never been that high ever. I continued to flush and monitor and not eating due to nausea and headache I was taken to the hospital. At that time my glucose reading was at 400. I was given 10 units of novolog as well as 1 full bag of fluid thru an IV. And before I was discharged it had come down to 192. I have only had to have insulin 1 time since 2008-9. Since then my sugar is refusing to come down below 250. My vision is still not clear and I am now attempting to keep it down with 15 units of a fast acting insulin multiple times a day. I will also be starting metformin again as of tomorrow morning to also help bring it down to a more healthy level due to the possibility of another life altering stroke.

1075738	3/5/2021	WI	25	F	1/7/2021	1/7/2021	<p>I made sure to hydrate and eat well the day of the vaccine. I have had no allergic reactions to any medications/ injections in the past and I was not worried about this one. I didn't take any meds beforehand besides my normal morning modafinil. I have no fear of needles. I received the vaccine in the auditorium about 1:25pm. The RN did a fantastic job, went through all of the information, no pain at all with the injection. As I was sitting in my chair for monitoring, a few minutes in I began to feel very uncomfortable. I felt clammy/sweaty and kept shifting my weight in my seat. I didn't want to make a big deal of it at first because I worried it was all in my head. But I became more and more uncomfortable. I laid my head down on the little desk, no help. I closed my eyes, no help. About 10 minutes or so in I decided to ask if they had water available. I slowly got up and walked to the back of the room. I couldn't even get the question out of my mouth before the nurse told me to sit down. Apparently I was white as a ghost. They got a wheelchair and wheeled me to the space behind the auditorium. By then I was starting to feel like my throat was closing and I saw spots in my peripheral vision. It was kind of a blur from there. I tried to take deep breaths. I drank a few sips of water and poured some on a paper towel to wet my forehead (and spilled all over my lap because I was a little disoriented at this point). My BP was 60s/40s and then 60s/30s. A rapid response was called. They moved me to a cart flat on my back with my legs elevated. My fingers and toes were starting to go numb and my lips were apparently blue/ white. After laying for a few minutes in Trendelenburg my BP began to resolve and my breathing started to ease a bit. No further intervention was done by the rapid team. I was taken by the Rapid RN to the ED for monitoring. They eventually pushed the cart into a room and took some vitals and an EKG. They had me stand and move to a wheelchair. I felt horrible but improved from before. They had me sit in a wheelchair in the lobby for a few hours before taking me back and placing an IV and drawing labs (I believe it was 3 hours from the initial reaction). I gave a urine sample. They then put me in a wheelchair and wheeled me back into the lobby for some more time. Then, they wheeled me back to a room where they gave some lactated ringers and a PA and MD saw me. By then my BP and breathing was completely resolved. The MD said he wasn't fully</p>

1075744	3/5/2021	IN	52	F	3/5/2021	3/5/2021	<p>convinced it was just a vasovagal episode because I haven't had issues with vaccines in the past and I was well hydrated and my HR was normal. It partly fit the picture for an allergic reaction/ severe immune response d/t the feeling of throat closing, the BP drop, and the elevated WBCs. They advised that I list the vaccine as an allergy and do not get the second dose, especially since I had COVID back in September.</p> <p>Patient rec'd vaccine at 1400. She went to wait her 15 minutes in the car and after about 10 minutes noticed eye sensitivity and headache. When symptoms did not pass after an additional 10 minutes she came back into the office. While waiting when her husband was checking her in, she "passed out." Episode lasted less than 1 minute. She was easily oriented to person, place and time. It was noted that she had some swelling to bilateral eyes. Patient was brought back to room, VS were checked and all were normal. She denied any chest pain, shortness of breath, wheezing, tongue swelling, itching, or tickling sensation to back of the throat. She was able to tolerate sips of water without difficulty. 50mg benadryl IM was given in the left deltoid. Approximately 5 minutes after IM injection patient again "passed out." She was seated at the time and slumped to her right, resting her head on her husband and did not fall from chair. She aroused after approx 2 minutes, and was a/ox4. VS were rechecked and were O2 99% on RA. HR 101, BP 124/88, RR20, temp 98.5/oral. Patient stayed at the clinic for an additional 45 minutes after which her eyesight was reported to be back to normal, her headache had improved and the lower eye edema had resolved. It should be noted that both the patient and the husband were not concerned with her "passing out." She states it happens because of pain and she was fearful of the injections. Patient also states that her neurologist told her that when "she is in too much pain, she will pass out.~~</p>

1074153	3/5/2021	OK	82	F	1/14/2021	2/18/2021	Bell's Palsy; A spontaneous report was received from a consumer concerning an 82-year-old, female patient who received Moderna's Covid-19 vaccine (mRNA1273) and developed Bell's palsy and experienced pain and burning in eyes and a severe headache. . The patient's medical history includes heart disease. Products known to have been used by the patient, within two weeks prior to the event, included clopidogrel bisulfate. The patient received first of two planned dose of mRNA-1273 (Batch Number 041L20A) intramuscularly on 14-JAN-2021 for prophylaxis of Covid-19 infection. On 18-FEB-2021, it was reported that the patient had eye pain and some symptoms of Bell's Palsy. On 19-FEB-2021, the symptoms worsened and so on 20-FEB-2021, the patient was taken to urgent care where she was diagnosed with Bell's palsy. The left side of the patient's face, according to her husband, was drooping and she was having trouble eating and drinking. The patient also had a severe headache. Treatment for the event included prednisone. Patient was also wearing a patch to help prevent pain. Action taken with mRNA-1273 in response to the events was not provided. The outcome of the events, Bell's palsy was considered unknown.; Reporter's Comments: Very limited information regarding the events has been provided at this time. Further information has been requested.

1074573	3/5/2021	PA	34	F	2/5/2021	3/5/2021	<p>First vaccine I could feel the vaccine go into my body and down into my legs. It was a very strange sensation. I felt very fatigued 30 min after the vaccine but ignored it because it was not normal to have symptoms after the first vaccine. That night i did feel a little bit of swelling in my lips that continued into the next day but it was not severe. The muscle aches, joint pain and allodynia the 2nd day were so severe I don't really remember any other symptoms i may have had. I took Benadryl and Tylenol and slept for 2 days straight. After the 1st vaccine I did have shortness of breath for about 3 days post. Then I received the 2nd vaccine, I did not feel it go in this time. About 30 min after the second vaccine I felt very fatigued. About an hour later I started to feel slight swelling in my lips that increased and around 2 1/2 hours my eyes and lips were noticeably swollen and I was flushed. My husband noticed my ears and cheeks were bright red. I felt my heart racing and took my pulse it was around 120. I felt dizzy and like there was a lump in my throat. I requested an appointment via video call from the emergency line. I didn't feel like I was having trouble breathing and stayed calm, my pulse went down to 100 after about 20 min. while waiting for my video call. I spoke to the doctor and they recommended going to the ER. I asked since the pulse went down and it felt like I was slowly reacting, if I could try taking Benadryl and see how I felt. She said that was ok but if I felt any difficulty breathing to go to the ER right away. I took 50 mg of Benadryl and felt better and rested. The next morning lips and eyes were swollen again but a little worse. Difficulty swallowing persisted as well as severe muscle pain, joint pain, and allodynia. The symptoms were worse with 2nd vaccine. Noticed shortness of breath just walking up and down steps. These symptoms lasted a little bit longer. 4 days after the vaccine I noticed the lip swelling was not getting better so I called my PCP. He recommended taking the next 2 days off, rest with benadryl and tylenol. I listened and felt good enough to go into work. It is now 4 weeks since i had the vaccine and i am still experiencing some symptoms that seem to be in relation to after i eat. That includes lip swelling, tightness in the muscles around my throat (feel as if they are strained), stomach burning, indigestion, heartburn. Called PCP again who recommended I see an allergist/immunologist.</p>

1074789	3/5/2021	CO	65	F	2/24/2021	2/24/2021	A few hours after receiving the first shot ... I felt Very Cold and tired~ went to sleep for a few hrs and lasted about 6 hrs after waking. Nest day was okay-just a little dizziness. Third day brought on more symptoms: eyes burning, little dizziness, neck hurt and I had a feeling like the flu ~ spaciness in my head and Very tired...stayed in bed all day. Next five days were normal. Then on following Wed (a week after the shot) a rash or hives formed around the injection area -was itchy. I felt sleepy & my head had a spaciness again. Stayed in bed all day, napped and this lasted about 10 hrs. This morning I feel better but very dizzy. And the 4' circle around injection is still noticeable.
1074802	3/5/2021	IL	38	F	3/3/2021	3/4/2021	6:30am 3/4/2021 She called for her husband, sat down on the toilet as she became dizzy, he reported that her eyes rolled back and her body became stiff. This lasted approximately 10 seconds. She does not remember what happened. She was weak the rest of the day. 3/4/21 She reports whole body chills without fever, aching, headache, vomiting, and dizziness. 3/5 she sent me a picture of "COVID arm". She is still slightly dizzy.

1074853	3/5/2021	LA	31	M	2/23/2021	3/4/2021	?Abnormal feeling? to his lateral, right upper and lower eyelids, and around the region of his right cheek bone, which he can best describe as tingling. He reports he has not had any symptoms to the right eye, itself. He states he has some mild facial drooping involving his right upper eyelid and his right cheek. He reports mild swelling under his right eye, as well as to his right cheek area. He also reports that he can?t fully open his right eye, which impairs his field of vision; otherwise, denies any vision changes. Instructed that the symptoms were suggestive of Bell?s Palsy, but to go straight to ER for further evaluation.

1074867	3/5/2021	WI	57	F	3/4/2021	3/4/2021	Patient received vaccine at 12:01, she stated that approximately 12:30 she noticed her right palm felt itchy and she noticed red bumps on the inside of her right wrist. She reported the symptoms to the onsite paramedics. She stated that she was placed on a stretcher and given 60 mg of liquid benadryl by the paramedics. She stated she started feeling dizzy, but after 3 minutes the dizziness resolved. She stated that soon after that the itchy right palm resolved, and the red spots on her right wrist diminished. She stated the paramedics took her blood pressure, 150/100 and placed her on oxygen. She stated she was monitored until 1:30 pm, then was discharged, at the time of discharge she had no dizziness, no itching, and only slight red bumps on her wrist. When she got home she stated her eyes felt itchy at about 5:30 pm, she took 2 OTC benadryl tablets, the symptoms resolved. She has been asymptomatic since that time.

1074926	3/5/2021	MN		F	2/25/2021		sepsis; surgery to put stent in; Blood pressure dropped to 70/20; kidney stone; A spontaneous report was received from a consumer who is an 80-years-old, female patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and who experienced sepsis, kidney stone, stent replacement and ended up in ICU and blood pressure dropped to 70/20. The patient's medical history included 6 months of chemo and cataracts surgery in both eyes (not specified). The concomitant product was not provided. On an unknown date prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 (Batch number: Unknown) in the right arm and patients second dose was scheduled on 25-Feb-2021 for prophylaxis of COVID-19 infection. On an unknown date, after vaccination patient experienced sepsis, put the stent in and ended up in ICU and blood pressure dropped to 70/20/ blood pressure low (18-Jan-2021) and kidney stone. The patient was hospitalized for sepsis, stent replacement and ended up in ICU and blood pressure dropped to 70/20/ blood pressure low. On 04-Mar-2021, she was going to have surgery to have kidney stone which was 9cm long removed and to have stent replaced. Treatment information was not provided. Action taken with respect to mRNA-1273 in response to the events. The outcome of the events was not reported for all events.; Reporter's Comments: Very limited information regarding these events has been provided at this time. Further information has been requested. However, the events of kidney stone and stent replacement are unlikely because the kidney stone was preexisting and the procedure of stent replacement was planned for a later date.

1077123	3/5/2021	AK	41	F	3/5/2021	3/5/2021	About 10 minutes after her vaccine she started feeling throat thickness and was able to swallow so she received 50mg of Benadryl PO. About 10 minutes later she said that she thought it was helping. About 20 minutes after the benadryl she started having dizziness/lightheadedness, visual field narrowing, worsening throat swelling with frequent throat clearing, and tingling in her hands, epinephrine pen given L thigh. After 5 minutes without improvement Epinephrine pen given R thigh. No rash/hives noted. Vitals were stable the entire time with SpO2 of 100%, RR 18-22, HR 84-98, BP 100-138/60-86.
1076847	3/5/2021	NC	40	F	3/4/2021	3/4/2021	After getting the shot, I walked over to the observation area a few yards away. I sat down and my vision went blurry and the room lights were too bright. I spoke with a dr about taking ibuprofen for my ankle, as I was told to only take Tylenol. The dr said that I was fine to take it. I didn't want to ask about my vision because I was embarrassed and didn't want to be stressing or panicking and that be the cause of my vision issues. But it didn't subside so I checked with a nurse before leaving, about 15 mins after the vaccination and asked if I was ok and she said yes, that she only had 1 other person tell her about blurred vision. I walked to my car and the sun was so bright I had to shield my eyes. I got in the car and took my mask off. I looked in the mirror and my cheeks and chin were flushed but my skin was pale. My husband sat with me for 10 mins and then went in for his shot. At this point it had been a little over 30 mins since getting vaccinated. I FaceTimed my mom so I wouldn't be alone. As we were talking she said my face was getting puffy and I was getting darker circles under my eyes. I got off of the phone with my mom and called my husband on FaceTime. I asked him to talk to the dr for me and let her see my face. She said my face was swollen and red and asked if I could breathe or felt like my throat was closing over or tongue was swollen. I told her no. Once again I was told I was ok and to take Benadryl. An hr or so after the 1st dose vaccination I was able to get Benadryl and Tylenol. In a 12hr period I took 2 doses of Benadryl and 2 doses of Tylenol. My face got better in 12-24hr but I still have blurred vision and light sensitivity.

1076888	3/5/2021	IN	65	F	1/31/2021	2/13/2021	<p>Bell's Palsy; This is a spontaneous report from a contactable consumer (patient). A 65-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EN5318, expiration date: May2021), via an unspecified route of administration in the left arm on 31Jan2021 at 12:30 at a single dose for COVID-19 immunization. The vaccination was done at a hospital. The patient's medical history included Reynold's syndrome (21 years old at diagnosis), Sjogren's (diagnosed at 30 years old), mixed connective tissue disease (diagnosed around 30 years old), and fibromyalgia (late 40s at diagnosis). There were no concomitant medications. The patient previously received a tetanus shot for immunization on an unspecified date and was allergic to the tetanus shot. This happened when she was 21 years old. The patient also got the new pneumonia shot on 12Jan2021 in her left arm for immunization at the age of 65 years old. The patient got her first dose of BNT162B2 on 31Jan2021. The patient stated she was supposed to get second vaccine 21Feb2021 but that she went to emergency room 13Feb2021 with extreme right eye pain and numbness in lip. She was diagnosed with Bell's palsy. The patient stated that she was not admitted to the hospital, and she just seen in the emergency room. It was reported that it initially worsened, that her eyes were definitely worse until a week later she was scheduled to see her physician and on Wednesday 17Feb2021 she started taking eye drops and now they have not gotten any worse. The doctor said it was not known if it was caused by the vaccine, and stated the patient has certain autoimmune problems Reynaud's, Sjorgen's and mixed connective tissue disorder, all diagnosed prior to vaccine. The patient had no family history relevant to the event. There were no relevant tests. The outcome of the event was not recovered.</p>

It is not clear; Not being as focused with is eyes; Breathing difficulty/breathing harder; This is a spontaneous report from a contactable consumer (patient). A 74-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number: EL9262 and expiry date: 21May2021) solution for injection, via an unspecified route of administration in arm on 17Feb2021 15:00 at a single dose for Covid-19 immunization. Medical history included muscle relaxer/pain therapy, accident at work (stated he taught college for many years. However, he was in (enforcement type) for the office of (County Name). He worked as an admin assistant for the state attorney. He was injured on the job because someone did not like him. He was injured real bad and taking these medications for pain. Concomitant medications included ongoing gabapentin (NEURONTIN) for pain, oxycodone hydrochloride, oxycodone terephthalate, paracetamol (PERCOCET [OXYCODONE HYDROCHLORIDE;OXYCODONE TEREPHTHALATE;PARACETAMOL]) for pain, ongoing tizanidine (TIZANIDINE) as muscle relaxer/for pain, and unspecified medications for pain. The first dose was administered on 27Jan2021 (Lot Number: EL1283, Expiry Date: 30Apr2021), in Left arm. The patient reported breathing difficulty/breathing harder, mind not clear/it was like he was kind of in a fog. It was not clear, not being as focused with his eyes, all on 18Feb2021. On 19Feb2021, the patient reported his blood pressure would drop and then go back up, very hot, flushed, everything started spinning, and had headache and was sick. The patient reported feeling passed, he was not thinking well, he was not talking as clear or loud on an unspecified date. On Friday around 1'clock he got very hot, flushed. He took off his shirt. He was washing dishes. He needed to cool down a bit. He went to the bathroom to shave and brush his teeth. However, things were getting out of focus. He sat down on the toilet for about 3-4 minutes and then the feeling passed. He got back up and walked into the family room. He made it in there and had to sit down. All of a sudden he felt like</p>

VAERS\_ID RECVD STATE AGE\_YRS SEX VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

everything was started to spin. Everything was really spinning. He was standing and had to sit down for a few minutes. While sitting he felt all of a sudden a super wave of feeling bad. He was sick. Everything was spinning. He could not stand it for another minute. The patient was hospitalized from 19Feb2021 to 21Feb2021 due to blood pressure would drop and then go back up. The fire department came and one of the things they did was check his blood pressure. Initially stated it was low and then it jumped up 20points when he stood up. They then threw him in the ambulance to take to the ER. He was going to the hospital because they thought he was having a stroke. He was seen by two different neurologist and other hospital doctors. The patient underwent lab tests and procedures which included blood pressure abnormal: it was low and then it jumped up 20points (Initially stated it was low and then it jumped up 20points when he stood up), blood pressure abnormal: believes it was like 140 was the high (he was unable to provide a true blood pressure reading at the time event occurred. Stated he was messed up in the head. He believes it was like 140 was the high. His was usually lower than that to begin with. Then it would go to 110. It would bounce from 110 to 140. It would change from sitting to standing), chest X-ray and electrocardiogram: test came back negative (He was in the ER and had a Chest -X Ray. He had an electrocardiogram, EKG, he had a scan that was dry without contrast and second one with contrast/iodine. He had an MRI of the brain to check for brain bleed. They thought he was in the process of having a stroke. They could not find anything. He had two CTs. Test came back negative. Neurologist determined it was not a stroke. Decided it must be inner ear situation), computerised tomogram: test came back negative (he was in the ER and had a Chest -X Ray. He had an electrocardiogram , EKG, he had a scan that was dry without contrast and second one with contrast/iodine. He had an MRI of the brain to check for brain bleed. They thought he was in the process of having a stroke. They could not find anything. He had two CTs. Test came back negative. Neurologist determined it was not a stroke. Decided it must be inner ear situation); test done on his heart, MRI of the brain, and two different scans: everything was negative (he had all kinds of test done on his heart, two different scans, MRI of the brain to see if had a brain bleed all that stuff.

1076916	3/5/2021		31	M	2/21/2021	2/22/2021	I was suffering from paralysis and numbness on the left side of my face. I went to the ER and was diagnosed with Bell's Palsy; This is a spontaneous report from a non-contactable consumer (the patient). A 31-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN6201) via an unspecified route of administration in left arm on 21Feb2021 11:30 a.m. at age of 31-year-old, at single dose for COVID-19 immunisation. The patient had history of frequent ear infections. Concomitant medication included fluticasone which was taken within 2 weeks of vaccination for an unspecified indication. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination. The patient had not been tested for COVID-19 since the vaccination. The patient reported when he woke up the next day after receiving the vaccine (22Feb2021), he found that he was suffering from paralysis and numbness on the left side of his face. He went to the emergency room (ER) and was diagnosed with Bell's Palsy. He had been experiencing some minor pain in his left ear beginning two days before he received the vaccine (i.e., three days before onset of facial paralysis), and this ear pain had continued as he continue to experience the palsy. Since visiting the ER, he had also seen a neurologist. The doctors he had seen do not necessarily think that the palsy resulted from receiving the vaccine. The onset date of the event "I was suffering from paralysis and numbness on the left side of my face. I went to the ER and was diagnosed with bell's palsy" was reported as 22Feb2021 09:00 a.m. The event result in doctor or other healthcare professional office/clinic visit and emergency room/department or urgent care. The event was non-serious (the event did not result in death, not life threatening, not caused/prolonged hospitalization, no disabling/Incapacitating, no congenital anomaly/birth defect). Oral steroid and antiviral drugs, eye ointment was received to treat the event. The outcome of the event was not recovered. No follow-up attempts are possible. No further information is expected.

1076944	3/5/2021	NJ	33	M	3/5/2021	3/5/2021	the patient, was given the vaccine at roughly 10:15am. At about 10:30am, after waiting 15 minutes after the shot, the patient stood up from his chair in the waiting area. He staggered over to the pharmacy drop off window and stated that he felt like he was going to pass out. His eyes rolled back and he collapsed. Another patient was approaching the counter at the same exact time and was able to catch him on his way down. By the time I ran from behind the pharmacy counter, he was awake, breathing heavy and confused. One of the pharmacy technicians called 911 immediately and started the emergency response. he was able to regain his composure and move himself back the chair. The EMTs arrived and took his vitals, and discussed what happened. They eventually determined that he was ok and was free to go. The patient did not go to the hospital.
1077000	3/5/2021	FL	39	F	2/9/2021	2/28/2021	19 days after the vaccine, I started to have some rash on the forehead, swollen left eye the next day. I thought it was allergies, but it didn't get better with antihistamines, triamcinolone, and antibiotic . I went to the urgent clinic on the third day and was diagnosed with Shingles. I am prescribed with acyclovir for treatment. I am not sure if it's related to the vaccine but something triggered it and I'm not in the normal age group that gets it.
1077050	3/5/2021	WA	70	F	3/4/2021	3/5/2021	2nd dose at 1615 on March 4, HA started morning of the 5th, pt called and spoke with triage RN at 1400, triaged per protocol and pt directed to ED for "worst HA of life". 1076830	3/5/2021	NY	81	F	2/21/2021	2/21/2021	<p>She is experiencing an Allergic reaction, rash; little coughing spell; Itching eyes/My eyes started itching; Multiple hives all around her right eye; Wheezing; didn't feel comfortable; her upper lip became puffy/bottom lip began to swell; This is a spontaneous report from a contactable nurse (patient) via Medical Information Team. An 81-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number: EN6201), intramuscular at upper left arm on 21Feb2021 at 08:30 at SINGLE DOSE for COVID-19 immunisation. The patient had no prior vaccination within 4 weeks. The patient had no additional vaccines administered on same date of bnt162b2. Medical history included seasonal asthma, allergy to class A antihistamines that started in her 20s, facial &amp; peripheral edema, blood pressure abnormal, and celiac disease. The patient had known allergy to Benadryl and when she takes it she gets peripheral and facial edema, lip swelling, top and bottom, hives around her whole right eye. The patient also has an allergy to Class A antihistamines that started in her 20s. She said the allergy started with Seldane &amp; Claritin. She said she had giant hives with Claritin. She said she was told there were 2 classes of antihistamines &amp; she couldn't use the Class A antihistamines. She said she previously reported her Seldane, Claritin &amp; Benadryl allergies, saying she has facial &amp; peripheral edema. She said she only uses the Class B antihistamine Cimetidine now. Concomitant medications included metoprolol, omeprazole, and pravastatin. On an unspecified date, the patient was experiencing an allergic reaction, rash. On 21Feb2021, the patient experienced "her upper lip became puffy/bottom lip began to swell," multiple hives all around her right eye, wheezing, and didn't feel comfortable. On 21Feb2021 at 14:00 (reported as about 2PM), the patient experienced "Itching eyes/My eyes started itching." On 21Feb2021 at 21:00 (reported as 9PM), the patient experienced little coughing spell. The reporter considered the events swelling lips, itching eyes, multiple hives all around her right eye, and wheezing as serious medically significant. The patient further reported that she felt fine after the shot, her arm was not sore, nothing. She said her arm was fine, and she had no problems, whatsoever, after receiving the COVID-19 Vaccine. She said she has had some weird allergic reactions in the past, but no</p>

anaphylaxis. About 12:00 to 12:30 PM (also reported as around midday), the patient's lip felt puffy. She said she had ate an apple and thought maybe something was on the skin of the apple. She said then her bottom lip began to swell, so she took 3 Cimetidine (NDC Number: 49035-820-72, lot number: 9AE2576A, expiry date: Dec2020). The patient stated that she was allergic to what she believe are class A antihistamines as they gave her facial and peripheral edema including Benadryl and everything on the list. About 2PM, the patient's eyes felt itchy, she took allergy eye drops (eye drops seasonal relief with tetrahydrozoline HCL 0.05% and zinc sulfate 0.25%. She said the product packaging reads it soothes eyes, and she said the eye drops worked. Lot number: AC8K275, expiration date: Sep2021). She said when she looked in the mirror, she saw a large hive on her eye (clarified as multiple hives all around her right eye). And about 4PM, she realized that her lips felt puffy, so she repeated the Cimetidine, it kept them from getting worse. At 7PM, her eye felt worse. She had this real hive that surrounded her right eye, she took a picture so she could report it to the doctor. The patient have an appointment on Wednesday. At 7:30PM, the patient's lips were puffy, she repeated the Cimetidine again and took of the 200 mg, she takes 3 at a time, she mentioned she could take 4, but she takes 3. She said she took more Cimetidine at 8:30PM, and talked to a pharmacist, who told her to call Pfizer to report her reaction. She said she attempted to call Pfizer last night, but it was too late, clarifying Pfizer Medical Information was already closed for the day. The patient also reported that she had a little coughing spell at about 9PM, so she stayed up with her husband till 10PM because she didn't feel comfortable. The patient told her husband to wake her up every once in a while. The patient felt a little wheezy, she used both of her inhalers, she could hear the wheezing, she used the serevent diskus (Serevent Diskus 50 mcg Inhaler. She said she has been using the Serevent Diskus Inhaler for seasonal allergies for years and the inhaler works. She said she occasionally uses the Serevent Diskus for colds during the winter. She said she realized she was wheezing last night and thought she should use the Serevent Diskus. NDC Number: 0173-0521-00, Lot Number: VV3E, Expiration Date: Sep2021) and Flovent (Flovent HFA 110mcg Inhaler, NDC Number: 0170719-20, Lot Number:

C47A, Expiration Date: Jul2021). That seemed to be okay, she went to bed, and had a good night no problems. She said she woke up this morning and felt better. She said she sounds a little gunky this morning, clarifying that was somewhat typical for her. The patient further reported that she got up at 6:30AM, she took a shower, she was having a rebound reaction, and wheezing, so she took 3 more Cimetidine and repeated the inhalers. She clarified while her symptoms worsened after the hot shower this morning, her symptoms are much less than yesterday (21Feb2021), saying she was aware of her symptoms today, and paying attention to them. She said her lips became puffy, and she was wheezy after the hot shower. She said she took Cimetidine and her inhalers again this morning to treat the rebound reaction. She decided to repeat again at about quarter to 10AM, she repeated again trying to keep it under control. In the meantime, she spoke to her doctors office, and they just said keep doing what she's doing, and if she get real bad, call 911 or go to emergency room (ER). The patient have an appointment, the patient's big concern was that she probably shouldn't get the second COVID shot. She read on (website), that there was a very rare, mild anaphylactic reactions. What caught her eye was that this takes place about 4 hours after the dose. This was when her symptoms began, lucky her. Her whole life has been allergy related. The patient don't know if celiac disease has anything with this. The patient wanted to know whether or not there was some way to take the shot without killing herself. She said she was not having breathing difficulty, she was just wheezy. She said she repeated the Cimetidine about a half hour before she called Pfizer today. She said she called her doctor's office this morning, and her doctor said for her to keep treating her symptoms as she had been doing. She said her doctor told her to call an ambulance or go to the emergency room if her symptoms happen to get worse. She said she read online that skin anaphylaxis (hives, itching, and swelling of the eyes, face, lips and throat) can occur with the COVID-19 Vaccine. She clarified she read the information about the COVID-19 Vaccine at (Website name). She said she read skin anaphylaxis was extremely rare and less than 1% of the population has the allergy, and those individuals should not get the COVID-19 Vaccine. She

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

said she was upset because what she read probably means she can't get the second COVID-19 Vaccine shot. She said she read the skin anaphylaxis appears within 4 hours after getting vaccinated with the COVID-19 Vaccine. She said her symptoms occurred in almost the same amount of time as to what she read about a skin anaphylaxis reaction to the COVID-19 Vaccine. She said she has a regular check-up on Wednesday (24Feb2021) with her doctor, and will speak further to her doctor about getting the second COVID-19 Vaccine. The reporter considered the events lip felt puffy, eyes started itching, hives, and wheezing as serious medically significant. The patient had no emergency visit. The patient had no relevant tests done. Therapeutic measures were taken as a result of the events swelling lips, itching eyes, multiple hives all around her right eye, and wheezing. The patient had not yet recovered from the events swelling lips, itching eyes, multiple hives all around her right eye, and wheezing while outcome of the events rash, little coughing spell, and didn't feel comfortable was unknown. The reporter considered the events swelling lips, itching eyes, hives, and wheezing as related to bnt162b2.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Patient self administered Benadryl at 2:40 and additional 50 mg of Benadryl at 3:53 PM. Patient is alert X3, speech at baseline, breath sounds clear to A&P no stridor, no wheeze noted. BP 130/80, HR 95, Temp 98.4, O2 Sat 99 %. Patient was refusing to have Epi Pen administered by RN X3 attempts. AIDE was called to assess. Patient alert, no visual swelling or difficulty breathing. 3:20 patient ambulated to the bathroom. 3:33 patient advised by medics to call a family member to drive her home. Patient agreed and called family. Reports her itching is improving and continues to be alert. VS are stable. 5 PM patient left with friend driving via private car. Patient was advised to consult with doctor prior to next vaccine.
1077102	3/5/2021	OR	54	F	3/1/2021	3/1/2021	Some pain in the arm itself a few hours after the shot, but beginning in the afternoon fatigue began to set in. At about 9:30pm I had chills and fever-like symptoms all night. Body aches, headache, blurred vision and my teeth really hurt (a common fever symptom for me) I was tossing and turning all night and woke up at 3:30am, shot up straight in bed and said, "Freedom!" (Ha, not sure if that was related to a dream? Weird for me! Hee.) I was feeling nauseous at that point and made myself some butter toast and was able to keep it down. Called in sick the next day and the symptoms started to dissapate around 3:30 pm the day after my shot. But, it was a rough time. Had a bit of stomach cramping and slight diahrrea the following day, as well.

Pt is A/Ox4, speaking clearly in complete sentences without increase in respiratory rate or effort, lungs clear and equal bilaterally, spo2 98% RA, blood sugar 189. Radial pulse strong and regular, skin PWD, BP hypertensive at 169/61. 12 lead shows paced rhythm at a rate in the 60s. Pt denies CP, SOB, abdominal pain, nausea, itchiness, difficulty speaking. Pt has no neurological deficits or visual disturbances. Orthostatics negative. Lightheadedness resolves on its own within 15 minutes and does not return. Blood pressures taken every five minutes remains about the same. After resolution of symptoms, pt demonstrates the ability to rise from seated position on her own and walk with steady gait. Her daughter states that she will stay with her for the remainder of the day and will seek medical attention if symptoms return or new ones arise.
1075954	3/5/2021	IN	48	F	1/13/2021	1/13/2021	It started out as an itchy area under the band aid. I took the band aid off and the itching got worse and went down my arm. A minute left after waiting 15 minutes I let the nurse know the reaction I was having ( bad itching), she looked at it and was red. She said it could be a site reaction and gave me an ice pack. Another nurse came to check on, and I told her I was really thirsty. By the time she got back my lips were feeling very heavy, lips itching and difficult to swallow, then my whole chest was covered in a red rash. With in a couple minutes there was a paramedic there and was more difficult to swallow, they tried to give me Benadryl thru an IV and blew my vein. So he asked me for a IM shot of Benadryl, I said yes and took me to the ER. By the time got there the Benadryl wore off and my lips got itchy and they took me right to the room and Dr gave me IV Solumedrol and Benadryl. They watched me for two hour sin the ER , they released me with 3 days of prednisone, EpiPen, Benadryl. I went to the pharmacy (15 minute drive from ER) and both my eyes starting swelling, so I took 50mg of Benadryl capsule and the next day I started the prednisone, I had to take Benadryl every 3 hours for the next couple days because my eyes would start swelling.

1076820	3/5/2021	AL	49	F	1/19/2021	1/22/2021	<p>She is worried it might be Bell's Palsy; had a knot at the injection site of her left arm; Tingling sensation on her upper back which went up to her neck and head/tingling in my neck, face, lips and eyes; Burning and tingling in my neck and in my face and in my lips and in my eyes; Burning and tingling in my neck and in my face and in my lips and in my eyes; This is a spontaneous report from a contactable consumer. A 49-year-old female patient received second dose of BNT162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot no: EH9899, Expiration date: not provided), intramuscular on the left arm on 19Jan2021 at a single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient previously took first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 VACCINE) at the age of 49-year-old for COVID-19 immunization. The patient was worried it might be bell's palsy (medically significant) on an unspecified date. she experienced side effects on 22Jan2021 after receiving the vaccine on 19Jan2021. She had a knot at the injection site of her left arm on the first day. After 3 days, she experienced a tingling sensation on her upper back which went up to her neck and head. It was not excruciating pain but had presence to be noticed. It had been there since that day and was not going away. She had been feeling it around her eyes and on her lips. She was worried it might be Bell's Palsy. She was asking for advice and if this had been reported. As soon as she get the second Covid Shot at the 19Jan it was about 2-3 days afterwards, it was on the Friday and it was about 2' O'clock, well she had the knot in my arm, her left arm where she received the IM (Intramuscular) vaccination (Covid Shot) and she had started having the symptoms of like burning and tingling in my neck and in my face and in my lips and in my eyes and that is not gone away and I still have that knot in my arm, I still have the burning and tingling. she had some blood work done like last Thursday to see if she had any kind of like rheumatoid problems to see arthritis or something but other than that no. Consumer stated, "Well I work in the doctor office and the Physician the one he told me to get the blood work and it goes to the doctor office because I work in one. For treatment consumer stated, she had only been taking an Advil and it did not seem to help her. The outcome of the events was not recovered.</p>

A 70-year-old non-pregnant female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19, Formulation: Solution for injection, Lot number: EN5318), via an unspecified route of administration on 25Jan2021 09:00 in left arm at single dose for covid-19 immunisation. Medical history included CAD (coronary artery disease), allergies: cosmetics, some topical meds, preservatives in eye drops and some perfume. Prior to vaccination, the patient was not diagnosed with COVID-19. Concomitant medication included atorvastatin (LIPITOR) at 40mg, acetylsalicylic acid (ASPIRIN) at 81mg and fexofenadine hydrochloride (ALLEGRA). The patient historical vaccine included varicella zoster vaccine rge (CHO) (SHINGRIX) and shingles vaccine (unspecified) for shingles, and previously took codeine and experienced allergies: Codeine. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 03Feb2021 22:00, the patient experienced shingles (on scalp). The patient has received both the Shingrix Vaccine and the earlier Shingles Vaccine. So, it doesn't make sense. The seriousness criteria were considered as non-serious. Since the vaccination, the patient has been not tested for COVID-19. Therapeutic measures were taken as a result of diagnosed with shingles (on scalp) included valaciclovir 21 tablets. The outcome of the event shingles was not recovered.

1071823	3/4/2021	IA	34	M	3/4/2021	3/4/2021	Received intramuscular injection in right arm at approximate 9:30am. Remained seated for 15 minutes per instructions from clinic personnel. Finished a conversation at left the facility after approximately 9:55am. While driving back to office (appx 5 minute drive total), experienced clammy skin, sweating at 3 minutes into drive. I considered pulling over, though I knew I should be around people where I could be monitored, so continued on. Experienced elevated temperature, blurriness of vision and my vision began to turn bright and white. As I pulled into the parking lot, I thought I may be passing out. I got out of the vehicle, sat down on the nearest bench and asked two individuals who where outside to stay with me, and I explained my symptoms to them. I remained seated for approximately 10 minutes, and when I felt the symptoms subside, went into my office and am now filing this report.
1071762	3/4/2021	MD	29	F	1/12/2021	1/13/2021	1/12 vaccination 1/13 I woke up, fatigue. Went to work. I could feel my HR increase. Pressure on my chest, upper right side. It progressed to neck and shoulder, pressure and sharp stabbing pain. Went to lay down in dark room. Vitals stable except pulse. ER; could not keep eyes open I was so fatigued. Fever; 100.4. BP 131/85. Tachycardia, body aches, extreme fatigue, dizzy. Tylenol, COVID test, blood work, chest xray, EKG; short of Toradol. EKG looked normal. Advised to come back if worsened after 48 hours.
1073046	3/4/2021	MO	54	F	3/4/2021	3/4/2021	Patient received vaccination at 1200. Had not adverse events during the first dose. After patient began to leave the clinic and drive away, she began to feel pressure and pain in the middle of her chest. She promptly turned around and returned to the clinic to be accessed by the nursing staff at 1300. Patient presented with chest pressure and pain in the middle of the chest and had blurry vision in her right eye. Heart rate was 112 with blood pressure of 162/102, 02 of 97. Emergency services were called and soon arrived. Patients heart rate had dropped to 103 and blood pressure down to 158/96 by the time EMS arrived on the scene. Patient had blood sugar taken as they are also diabetic and had a blood sugar reading of 286, denies having eaten anything for breakfast. EMS took patient from there.

1072537	3/4/2021	NJ	71	M	2/10/2021	2/1/2021	noticed diminished hearing in the right ear/couldn't hear a tick at all; he felt fullness in his right ear; sore left arm where he got injection; This is a spontaneous report from a contactable physician (patient). A 71-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EM9809, expiry date: unknown), via an unspecified route of administration on 10Feb2021 12:30 (at 71-year-old) at single dose (left arm) for COVID-19 immunization. Medical history included hypertension (mild hypertension and it is well controlled, it was diagnosed 5-6 years ago), hyperlipidemia (mild hyperlipidemia and it is well controlled, it was diagnosed 5-10 years ago). He stated in Aug, he tested positive for antibodies through Lab and was still positive a month later. He wondered how that might effect the decision of if he should get the second dose, if he is potentially immune. He had no symptoms but tested negative with PCR test. His girlfriend who he lives with tested negative for antibodies. Height was reported as 6 feet to 6 feet one inch tall. Weight was reported as 176-178lbs, he thought he may have gained a few pounds. There were no concomitant medications. The caller had the first dose of the vaccine 10Feb2021 12:30. 5 days later he felt fullness in his right ear (Feb2021) and noticed diminished hearing in the right ear (Feb2021), maybe 20-30% less. He was comparing how much he could hear the ticking of his watch in his left and right ear and couldn't hear a tick at all. He went to an ENT and they found that it was reduced in the right ear secondary to a nerve problem and wasn't secondary to anything else. The doctor read online on an ENT site, a couple of people had acute bouts of decreased hearing. They were treated with steroids and resolved. His provider prescribed him with a high dose of steroids, 70 mg. He was going to take it after dinner but all of the sudden he could hear the ticking better. He held off on taking the steroid and the next morning his hearing was fine. He went back and they retested and it was back to normal. He had taken Naprosyn and is not sure if that played a part in improving things. It resolved not even 24 hours after the initial symptoms. It resolved on its own. He asked, is this a side effect that has been reported? Are there any cases of this happening in one ear rather than 2? Could it be a contraindication getting the second dose? His doctor is researching it and he is supposed to

VAERS\_ID RECVD DATE STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

call early next week about this. He asked how many people were in the clinical trials that the side effect data is based on. The caller stated he heard someone report that he doesn't believe that people getting the vaccine necessarily need both doses of the vaccine. They are finding after a week after the first dose they have relative immunity and might not need the second dose. The caller asked how effective this vaccine might be on new variants, how effective just one dose of the vaccine is, if Pfizer is looking into mixing the vaccines- whether it will be something that can be interchanged with other Covid-19 vaccines, asked where he could find updates on medical information about this in the future. The caller stated he wanted to thank Pfizer for developing the vaccine as quickly as they did. Retired psychiatrist calling about Pfizer COVID-19 vaccine who says he got his first dose on 10Feb in (State name), and had a sore left arm where he got the injection (Feb2021) then 5 days later had fullness in his right ear with his hearing diminished. He says he called his otolaryngologist because he had had a hearing test a few months ago, and was tested again now and there was a moderate decrease of hearing in his right ear. He says he would like to know if this could be a possible side effect, since he has read of reports and his otolaryngologist knew of two reports where people did report hearing loss. He says that he was treated acutely with steroids at high dose of 70mg for which he filled the script, then called his internist who was ambivalent with him taking a high dose. Caller says then within a few hours, his hearing was better, and by the next morning it was normal, and he went back to the ENT and his hearing was the same as it was a few months ago. He says he did not take the steroid he was prescribed, the Prednisone, he took Naproxen, and since it may have been a nerve problem with hearing diminished related to auditory nerve, it seemed to get better in a number of hours. He says he has reported this already to VAERS. Caller says his right ear is better now, it got better within a few hours after he saw his doctor, then it was completely better by the next morning. He says that after they tested his hearing due to the fullness in his ear and hearing being diminished it got better on its own. He says on the next hearing test his hearing was exactly back to normal. He says he did take Naproxen once or twice during that time period, 20 or less hour

<u>VAERS_ID</u>	<u>RECVD</u>	<u>STATE</u>	<u>AGE_YRS</u>	<u>SEX</u>	<u>VAX_DATE</u>	<u>ONSET_DATE</u>	<u>SYMPTOM_TEXT</u>
							<p>period, more like 12 hours, one 220mg tablet each time, he doesn't know whether that contributed to helping. Naproxen (EXP Jan2022, LOT: ODRO445). He says that the reason he is calling is to see whether Pfizer has had similar reports. He says that he saw on a website that 12 people were reporting deafness or blindness, but it seemed to be an (name), so he took it with a grain of salt. He says he would like to know whether people have been reporting with issues for hearing, unilaterally or bilaterally, or what results have been with some people. Caller says unfortunately the website he mentioned was obviously anti vaccine and claimed to be with the (name) or version of the CDC and said that they were reporting they had 12 people reporting deafness and blindness from COVID vaccine and made it sound like the most dangerous vaccine in the world, but it was a conspiracy website that claimed it was with the equivalent of CDC. Caller does not have website addresses to provide or details about reports on that site. Caller says he looked at the (name) and it said nothing about this kind of possible side effect. He says he doesn't know if his could be related to getting the vaccine, or if he should still get a second dose of the vaccine. The outcome of the event "noticed diminished hearing in the right ear/couldn't hear a tick at all" and "he felt fullness in his right ear" was recovered in Feb2021, while for other event was unknown.; Sender's Comments: Based on available information the reported unilateral deafness was unlikely related to bnt162b2. This was an intercurrent medical condition. Case will be reassessed if additional information is received. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.</p>
1071918	3/4/2021	WI	69	F	3/2/2021	3/2/2021	<p>During the night after the vaccine my left eyelid became achy and slightly itchy. The ache remained all the next day and night. Morning of 3-04 the left eyelid was red and somewhat swollen. Ache remained.</p>

1072890	3/4/2021	KY	23	M	3/2/2021	3/3/2021	Nothing at time of injection. In the evening, soreness in the arm (strong but on par for what I would expect). Next morning, I starting feeling sick, with flu symptoms. Aching muscles, sensitive skin, mild headache, sore eyes, and in the evening, nausea. Temperature gradually rose. ~99.7 at 6pm, 100.1 at 7pm, 100.7 at 8pm, 101.7 at 9:30pm. I took some Tylenol around 7pm, and then some theraflu at 10pm. Fell asleep at 11pm. Periodically waking up every 30min from 1am onwards. Muscle discomfort, sweating, and nausea continued until 3:45 AM, at which point I was feeling better and was able to sleep continuously. Feeling much better in the morning on March 4th. Temperature was 99.9, then rose to 100.0 at 11am. Now, at 3pm, feeling fatigue, exhaustion. No headache. Normal sense of taste and smell. No cough. Taking another day off from work. Temperature is currently 100.0. Taking more theraflu now, have not taken Tylenol today.

1071166	3/4/2021			U		2/8/2021	<p>My eye, right eye, it started to blow up and a big black spot is coming in front of it, especially when I went to the bathroom and put on the light and that eye was totally blinded; It is happening every time I go to the bathroom or turn on the lights in the room or if I look up towards the ceiling, it starts showing me these two big black bubbles; This is a spontaneous report from a contactable consumer. A patient of unspecified age and gender received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) lot number and expiration date not provided, via an unspecified route of administration on 08Feb2021 at a single dose for COVID-19 immunisation. Medical history included ongoing macular degeneration (the patient had in the past, actually quite a number of years, macular degeneration on that same eye). Concomitant medications were not reported. The patient had the vaccine and on the 8th of this month (not clarified), that was five or six days ago the patient really went well for both the days and both injections. But on Friday, two days ago, it began a little bit on Thursday evening but on Friday the patient noticed that the right eye started to blow up and a big black spot is coming in front of it, especially when the patient went to the bathroom and put on the light and that eye was totally blinded and then when the patient dabbed it with water and things and dried it up, it started to come back. It was happening every time, going to the bathroom or turning on the lights in the room or looking up towards the ceiling, it started showing these two big black bubbles. The outcome of the event was unknown. Information on the lot/ batch number has been requested.</p>

1072900	3/4/2021	CA	77	M	2/10/2021	2/10/2021	He received the vaccine and after 2 hours he went home and was paralyzed from the waist down. He tried to stand up and then he passed out on the floor for about 10-15 minutes. He went to sleep and woke up around 5 hours later. He then tried it again and urinated on himself and he fell down on the floor, passed out without getting up until the morning. He did call his doctor who was not available, spoke to the nurse and advised to go to the hospital. He is weak and cannot drive so he did not go to the hospital. He slept the rest of that day and the following day. Then when he saw his doctor about 2 days ago, he described his reaction and told to report the reaction and that he would report it himself. He was advised not to take the 2nd vaccination. He is no longer having the heavy reaction, his muscles are aching and his vision is blurred, especially on his back and the shoulder. His doctor did do blood work at the office visit.

1072539	3/4/2021	IL	66	F	2/1/2021	2/3/2021	<p>Ischemic stroke; not hypertensive, but supposedly is now.; Visual disturbances; Headache; This is a spontaneous report from a contactable nurse (patient). A 66-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot: EM9810, expiry: unknown), via an unspecified route of administration in the left deltoid on 01Feb2021 14:15 at a single dose for covid-19 immunization at a Physician office. Medical history included asthma, irritable bowel syndrome, pneumonia and borderline high cholesterol. The patient's concomitant medications were not reported. The patient had no prior vaccinations within 4 weeks. The patient had her first COVID-19 vaccine on 01Feb2021 and second one is due on 22Feb2021. On 03Feb2021, the patient had a headache, but didn't think too much because it is a side effect. The headache lasted all through the weekend. Visual disturbances began 04Feb2021. She called her doctor on Monday and was seen by her doctor on Tuesday, 09Feb2021. The patient was referred to the eye center. Her headache was getting a little better. On 10Feb2021, the patient was seen at an institution, her retina and macula looked good, so she was referred to the ED. The patient was told she probably had a stroke. The patient was admitted to the hospital for an ischemic stroke. By looking at the MRI, the onset of the ischemic stroke would have been five to seven days prior, placing the onset on Wednesday, 03Feb2021, which was also the onset of her headache. There is no definitive cause of her ischemic stroke. The patient currently has an arrhythmia monitor on. MRI/MRA showed her vessels looked good. MRI showed evidence of the ischemic stroke. The patient has neurologists since being admitted to the hospital. It was thought that the headache was just because of the COVID-19 Vaccine. Causality was unknown, it was stated that they haven't found anything else as a cause. The patient's doctor stated she was borderline for high cholesterol. She was not hypertensive, but supposedly is now. The patient also had echocardiogram, EKG, manual neuro checks, and blood work but does not have the results. The outcome of the events was unknown. The has trouble reading now since the stroke.; Sender's Comments: Based on available information, the reported events are assessed as unrelated to the vaccine BNT162B2 and can be explained as intercurrent or underlying medical</p>

1071163	3/4/2021	MO	62	M	1/8/2021	1/1/2021	<p>fever at 100.4; Headache; Nausea; Sniffles; Chills; he was beated down with sweat; body aches; does not have an appetite; This is a spontaneous report from a contactable consumer (patient). A 62-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), lot number: EH9899, intramuscular in the left arm, on 08Jan2021 16:30 at 0.3 mL, single for COVID-19 immunization. Medical history included ongoing high blood pressure and spinal surgery in Jan2019. Patient's eyesight was not the greatest. Patient previously received flu vaccine on an unspecified date (the last couple of years). Concomitant medication included amlodipine besilate for blood pressure. He was scheduled to get second dose on 29Jan2021. The Saturday before he was scheduled to get the second dose (23Jan2021), he started feeling sniffles and stuff. He went to urgent care and he was tested for covid and the test came back negative. He then kept feeling bad. He clarified that on 24Jan2021, he had headache and nausea. He had chills and he was beated down with sweat; body aches which are constant and he would try to blame it on the position he was laying in while on the couch and it was not that; and does not have an appetite on an unspecified day in Jan2021. He has been in really bad shape for the last 9 or 10 days. When he went to go get his second shot, they would not give it to him due to his symptoms that he was experiencing since she had a fever at 100.4 the night before (28Jan2021). They scheduled him to get his second dose the following which was this Friday. He was asking if his side effects are totally normal. He cannot even sleep, reported that he will sleep an hour and then up for two or three hours. It really has him, and he feels miserable. The outcome of events Chills, nausea and fever at 100.4 was not recovered. Outcome of sniffles was recovered in Jan 2021 while the outcome of the remaining events was unknown. Therapeutic measures were taken as a result of sniffles; he went to urgent care and they gave him something like zyrtec, states it was an allergy medication and it wiped out the sniffles for fever, he will take Tylenol and it will break the fever for a few hours and then his fever comes right back. Follow-up attempts are completed. The information on the batch/lot number has been obtained.</p>

1072812	3/4/2021	MI	70	F	2/20/2021	2/28/2021	I received the 1st Pfizer dose on 1/30/21 and 2nd Pfizer dose on 2/20/21. After the 2nd dose, I developed mild fever (under 100)*F, a bad headache, blurred vision, nausea, joint pain and fatigue. I took Tylenol for the fever and headache and recovered after 2 days. However, on 2/28/21 I developed a SECOND SERIES OF SIDE EFFECTS starting 8 days after the 2nd dose. I developed a fever of 100.7°F, a bad headache, nausea, palpitations, and severe joint pains and strong fatigue. I consulted my PCP, who recommended I fill out this report. I took Advil on 2/28, improved after 2 days, and now have a slight headache and some fatigue but otherwise recovered.

1071167	3/4/2021	CA	27	M	1/8/2021	1/8/2021	Occipital neuralgia; anaphylaxis; feeling like passing out on and off for the next 2-3 hours; he felt lightheaded; little short of breath; fatigue; he had a lot of posterior lymph pain in the back of his head, for 2 weeks on and off; heaviness at the back of his head left side; chest tightness; he developed a sensation like he was going to lose control of his mind; This is a spontaneous report from a contactable Other Health Professional, the patient. A 27-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot number EL1283), via an unspecified route of administration on 08Jan2021 at 13:30 (at the age of 27-years-old) as a single dose in the left arm for COVID-19 vaccination. Medical history included asthma exacerbation, GERD, childhood anemia, a retinal tear in the right eye all from unspecified dates and unknown if ongoing. The patient also reported medical history three episodes (June 2019, August 2019 and October2019) of anaphylaxis due to "Exercise Induced Anaphylaxis." Historical vaccinations included the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number EH9899) on 21Dec2020 at 13:30 after which he experienced pain at the vaccination site which lasted twenty-four hours. The patient's past product use included adrenaline (EPIPEN), an unspecified corticosteroid and an unspecified antihistamine for past allergic reactions. The vaccine was administered in a hospital. Prior to the vaccination, the patient had not been diagnosed with COVID-19. Concomitant medications included ciclosporin (RESTASIS), azelastine (AZElastine), mometasone furoate (FLONASE), cetirizine hydrochloride (ZYRTEC) and omeprazole (PROTONIX) all for unknown indications from unknown dates and unknown if ongoing. Within four weeks prior to the vaccination the patient had received unspecified "allergy shots" He received "two shots" (one in each deltoid) on 15Dec2021 and "two shots" (one in each deltoid) on 05Jan2021. The patient reported that fifteen to thirty seconds after the second dose of the COVID-19 vaccination he felt lightheaded and a little short of breath. This lasted about eight minutes and then subsided. Approximately thirty to forty minutes (about 30 minutes after he left the facility) later the symptoms returned. He felt short of breath and he thought he was going to pass out. The symptoms included fatigue,

VAERS\_ID RECVD STATE      AGE\_YRS SEX      VAX\_DATE ONSET\_DATE SYMPTOM\_TEXT

---

shortness of breath lightheaded and feeling like passing out on and off for the next two to three hours. He stated he has completely recovered. He continued to say that he was feeling fine for three days then he began having bilateral cervical lymph pain greater on the left than right, a lot of posterior lymph pain in the back of his head (for two weeks on and off). These symptoms also resolved on their own. He also experienced ("a couple of days later") a sensation where he thought he was going to lose control of his muscles and lose consciousness. He also developed a sense that he was going to lose control of his mind with heaviness at the back of his head, left side. He went to the Emergency Room (date not provided) and they provided Valium. He also reports an Emergency Room visit on 13Jan2021 during which he underwent a CT scan of the head which was normal and a neuro consult suggesting occipital neuralgia and he was put on muscle relaxers. He also stated that experienced shortness of breath and chest tightness after his allergy shots on 26Jan2021 and he specified that he had never before had these reactions to his allergy shots. After that he had yet another possible allergic reaction after eating pizza on 30Jan which included throat swelling as well. He further stated that on 04Feb he had anaphylaxis vs asthma exacerbation. On the following day he developed a heaviness to his left occipital head with that same feeling of wanting to lose control of his muscles. He never had that before. He started Prilosec about one and one half weeks prior to the reporting date. In follow up the Other HCP reporter/patient answered "Yes" to the following questions (DCA) about symptoms experienced: Bilateral wheeze/bronchospasm, upper airway swelling, increased use of accessory respiratory muscles, dry cough, difficulty breathing (without wheeze or stridor, sensation of throat closure, tachycardia, nausea. These were reported without dates and without context with regard to the events reported initially. These were also reported as not requiring treatment and having recovered on unspecified dates. Lab data included three SARS COV 2 nasal swab tests (14Jan2021, 03Feb2021 and 11Feb2021) all of which were negative. Unspecified treatment was reported for the events anaphylactic reaction and mental impairment. The clinical outcomes of the events Anaphylaxis, loss of consciousness, dizziness, dyspnea, fatigue and lymph node pain were

1071269	3/4/2021	CA	51	F	3/3/2021	3/3/2021	Nothing initially 1-2 hours later, heart raced for 15-30 second (4 times within that time frame) then stopped 7 hours later- brain fog. Drove short distance and started hallucinating while driving. Saw black wind in street, design on my phone, car behind me appear completely different for few seconds than appear normal, green lights sticking in vision to hold to straight line. Brighter than normal street lights Right leg started shaking uncontrollably 30 seconds then stopped Hands started shaking for 15 second then stopped Arm sore where shot was No appetite Once back in apartment, hallucinations stopped but felt high. Wasn?t making lot of sense. Felt weird. 9 hrs later+ low fever 100 10 hours later hallucination started again. Scared me so turned lights on Chills started Tired but couldn?t sleep 11 hrs later trouble sleeping Appetite returning . Feeling less weird but still brain fog and strange
1071280	3/4/2021		51	M	2/19/2021	2/23/2021	On day 4 I experience a severe headache with visual auras in my right eye. The field defect was the medial field of vision from just my right eye and lasted at least 8 hrs. I went to sleep with it and woke up to find it resolved.
1071312	3/4/2021	CA	81	F	2/3/2021	2/3/2021	3/02 As the vaccine was given in my left arm, I felt it travel down inside my arm and toward my hand. i waited at Pharmacy for 20 minutes with no reaction. I returned home and within the hour I began to feel "very tired" and lay down in my bed. Within minutes, my left thump had spasms and painful cramping and "froze" I massaged my thump for about 5 minutes and the pain subsided. I then had painful cramping in my left calf and then the entire leg which then followed by Muscle pain and cramping in both legs. I was told that I should exercise, so I went for a long walk. When I returned home, i felt even worse so I went back to bed. Headaches began. I had flu-like symptoms (chills and discomfort) I covered my self with two blankets and drank lots of water and took an Aleve.which upset my stomach. 3/03 (the next morning), my usual sinus stuffiness was Gone! and I could breathe better than i have in a long time (by days end my sinusitis had returned) and so had my headache. Today 3/04 I still feel exhausted and I have swelling, puffs under my eyes (not usual) and occasional headaches. My Left Arm (area of the inoculation) Has Never Been Painful!!!!!!

1071694	3/4/2021	CT	49	F	2/22/2021	2/22/2021	I had my injection on a Monday, about 2:00pm, 5.5 hours after in the injection, I became aware that I had numbness in my face, arm and leg - more dominant on my left side. On my face, more intense around my eye, nose & ear. In my face, it was similar feeling to when one receives Novocain, and its beginning to wear off and give that pins & needle feeling. In my arm and leg it was a general lack of sensitivity. I knew I was touching my arm with a sharp object, but I could not feel or sense it. I could walk, breath normal and talk. I did not reach out for medical help at that point. This lasted into the next day in all mentioned areas, the 3rd day (Wednesday) the only numbness that I was still aware of with out tapping to generate a stimulus, was in my face. On Tuesday, 2/23/2021 - I had made a neurologist appointment to address the situation. I still feel as if I have not completely regained sensation in my face and left arm, however I do need to tap on them to generate a stimulus response which feels somewhat numb. (Today is Thursday 3/4/2021 - 10 days after the 1st injection).
1071684	3/4/2021	IL	47	M	2/22/2021	2/23/2021	Initial soreness in shoulder starting one hour after injection and continued for two days. Right eye pain started about 18 hours after injection. Chills and low grade fever (99.1) recorded 26.5 hours after injection. Body Aches, primarily back, and general weakness occurred 28 hours after injection 400mg of Advil taken 32 hours after injection and prior to bed time. No symptoms following morning/day.
1071636	3/4/2021	TN	62	M	3/3/2021	3/4/2021	Patient received Moderna Vaccine yesterday 03/03/2021 and woke this morning 03/04/2021 with swollen eye. Patient called the hospital and was advised to go to ER. Patient took Benadryl and called the health department to notify us of reaction Patient was advised to follow up with ER if swelling continues and if difficult breathing or tongue swelling occurs.

1071568	3/4/2021	GA	84	M	1/28/2021	2/1/2021	<p>loss of hearing/hearing completely gone in right ear; Ringing in left ear; probably vertigo; Extreme dizziness; blood pressure was 214/113; vomitng; Weakness; nasal drip; dry scaly rash on his temples, neck, shoulders, belt line, and back of his right knee; diminished hearing in left ear/sounds like listening through a drum; pressure in temples like a hammer on each side of head; headache in back of head; A spontaneous report was received from a consumer who was also an 84-year-old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced extreme dizziness, nausea ,vomiting, nasal drip, weakness, loss of hearing/hearing completely gone in right ear (deafness unilateral), diminished hearing in left ear/sounds like listening through a drum (hypoacusis), blood pressure was 214/113 (blood pressure increased), pressure in temples like a hammer on each side of head (head pressure), headache in back of head, and dry scaly rash on his temples, neck, shoulders, belt line, and back of his right knee. The patient's medical history was not provided. Concomitant product use was not provided. On 28 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (lot/batch: 020L20A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. The patient reported he felt fine for about one week after the vaccination. Then, in the early morning of 05 Feb 2021, right after midnight, he experienced extreme dizziness, vomiting, weakness, nasal drip, and loss of hearing including ringing in his left ear and no sound in his right ear. He also started to notice a dry scaly rash on his temples, neck, shoulders, belt line, and back of his right knee. The patient was taken by ambulance to the hospital. In the ambulance, he vomited and his blood pressure was 214/113. He was placed the COVID-19 wing of the emergency room (ER) and given tests including a COVID-19 test, sonogram, "echogram", MRI, and EKG (results not provided). The patient reported he was admitted to the hospital. He was told he probably had vertigo. After his ER visit, the patient had appointments with his general practitioner, an ear nose and throat specialist, and a hearing specialist. He was told his hearing was completely gone in his right ear and diminished in his left ear. The patient could still somewhat hear out of his left ear but it sounds like listening through a drum. He states</p>

1073886	3/4/2021	WI	26	F	3/2/2021	3/2/2021	Patient found unresponsive in recovery area at 6pm. Patient skin color gray, cool, unresponsive, no pulse noted by writer. Writer sternal rubbed patient and called name multiple times. Staff arrived to assist and writer sent one to call 911 and one staff member to get wheelchair to transport patient to recovery area. While waiting for wheelchair after about 2 minutes patient regained consciousness, but still gray and not fully responsive. Patient stated she could see me but vision very blurry. Writer and LPN transported patient to recovery and took vitals. Patient awake at this time. VS 110/80, 95%SpO2, pulse 76 at 6:06pm. Recheck of BP 132/110 at 6:14pm. Patient skin PWD. EMT's arrived assessed patient, took EKG-WNL, VSS stable, BP slightly elevated. EMT's offered to transport patient via amb to ER, patient declined. Writer released patient to boyfriend to drive her home.
1073884	3/4/2021	WA	75	F	3/2/2021	3/3/2021	Severe sweating, blurred vision and passing out
1073861	3/4/2021	CA	65	F	3/4/2021	3/4/2021	Patient received her COVID-19 Moderna vaccine this afternoon. She then started "feeling strange" a few minutes later, requesting fresh air. She was monitored outside for 30 minutes. Her O2sat remained >96%ile the entire time. Her HR remained in 60s-70s. Her initial blood pressure was elevated at 210s/140s and improved to 140s/110s with calming relaxation techniques. She did have brief jerking episodes of her lower extremities intermittently. They were suppressible. She remained conscious the entire time and maintained good eye contact. At minute ~20 post-vaccination, she endorsed not remembering why she was there, requesting to stand up. She stood up with support and then sat back down. Repeat BP was elevated to SBP 200s. Decision was made to continue observation in Urgent Care as her blood pressure was still elevated and she still appeared anxious. She was speaking in full sentences and was drinking water without assistance. She was placed into wheelchair and brought to Urgent Care. However, during UC triage, she reportedly informed nursing that she didn't want to be in the enclosed observation room in UC, that she wanted to go home. Her partner wheeled her outside to the patio. When nursing went to go find her, the patient had eloped.

1073654	3/4/2021	MO	67	F	2/16/2021	2/1/2021	Bell's palsy; She cannot talk real well right now; This is a spontaneous report from a contactable consumer reporting on behalf of the patient. A 67-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection, Lot number: EN6200, unknown expiration), via an unspecified route of administration in right arm on 16Feb2021 at 10:55 at a single dose for COVID-19 immunisation in a hospital. Medical history included chickenpox and measles (when she was a kid), COVID-19 in 2020 (last year), ongoing anxiety, ongoing blood pressure (abnormal), and ongoing insomnia. Concomitant medications included pregabalin (LYRICA), celecoxib (CELEXA), and ongoing unspecified anxiety, blood pressure and insomnia medications. The patient received her first dose of BNT162B2 (lot number: EJ1686, unknown expiration) on 20Jan2021 at 11:33 in right arm for COVID-19 immunization. The patient's friend called on behalf of the patient because she cannot talk real well right now (Feb2021). The patient's friend confirmed that the patient went to emergency department and was told that she has Bell's palsy on 18Feb2021 at 14:00 and she has never had it before, and they did not know if it was a side effect from the COVID-19 vaccine or not. The patient received prednisone 20mg 3 times a day, Valpex, antibiotic, and eye drops for right eye as treatments. Blood test was taken on 18Feb2021 with unknown result. The patient had not yet recovered from the events. No follow-up attempts are possible. No further information is expected.

1073821	3/4/2021	GA	36	M	3/4/2021	3/4/2021	Was administered the Pfizer COVID-19 vaccine in our drive-thru clinic on 3/4/21 at approximately 2:15pm. Was in the driver's seat of his SUV with his father in the passenger seat. Nothing in the PQCF gave us any reason to be concerned over this particular administration. After administration, was asked to pull forward and park in a spot on the right in order to sit for his required 15 minutes post-administration. became unresponsive as he was attempting to park and continue to turn the wheel causing him to drive in a U shape into a rock covered median. The SUV was able to clear the median and the car stopped at the APEX. When I saw the car heading towards the median, I started to head toward the site safely. I approached the car slowly asking him to stop. When I did not receive a response, I knew something was wrong. Once I felt the car was safe to approach, I ran to assist the patient. The patient was barely able to communicate but did say he was dizzy. 15 seconds later he was unable to communicate, I called a second pharmacist to run over with an epi pen just in case (this was NOT administered). I immediately called 911 at 2:21 pm. reached into the vehicle and got the vehicle into park, while I assessed his airway, breathing, and pulse from a seated position. The patient began to seize. I continued to hold the patient from outside of the vehicle to maintain the patient's airway and keep him from hurting himself on the steering wheel. The patient regained consciousness approximately 3 minutes later with no memory of what happened. EMS arrived on scene about 2 minutes after he regained the ability to communicate. While EMS assessed the patient, and I reached out to and division one store management per SOP. EMS determined that the patient had a seizure and was able to go home if they wanted. The father moved into the driver seat. We monitored the patient for 30 minutes and allowed them to leave. We followed up with the patient via phone 2 hours later with no concerns noted. No property damage or bodily harm occurred during this incident. If we are given approval to vaccinate this patient with a second dose, we will arrange for this patient to be taken care of in the pharmacy.

1073728	3/4/2021	TX	30	M	3/3/2021	3/3/2021	C/O nausea, vision started to blur, facial sweating, sweating on scalp and arms, dizziness ;,slow speech: no sign of stroke: Pt denies CP/Press,. Vision improved; sweating ceased .Pt provided with Gatorade to increase glucose level. Symptoms resolved with time,instructed to F/U with PCP.
1073712	3/4/2021	WA	74	F	3/4/2021	3/4/2021	Pt developed circumoral paresthesia (tingling of her lips and tongue) shortly after injection into right deltoid without shortness of breath, chest pain, rash, sore throat, hives, myalgias, nausea, or vision changes. She reports feeling anxious regarding the crowded atrium while getting her shot. Patient symptoms improved after monitoring for 30 minutes with stable vital signs without administration of medications.
1073688	3/4/2021		93	M	3/4/2021	3/4/2021	Another customer in the store called over to the technician and pharmacist on duty stating the patient looked sick. He had dropped his timer that was counting down his 15 min post dose wait time. Pharmacist approached patient and asked him how he was doing. He was initially non-responsive, eyes were slightly glazed over. I repeatedly asked him his name and how he was doing. He began to respond after prompting, saying he felt very hot and sweaty. He stated he was thirsty and he hadn't eaten anything before his dose. Technician obtained a glass of water and a granola bar for the patient. Patient began to improve just minutes after food and water. He stated he thought he had stood for too long while waiting for his shot and hadn't eaten that morning so he began to feel sick. Patient recovered enough to call his daughter to pick him up from the store. His daughter arrived to pick him up and patient was able to walk out of the store without issue.
1073687	3/4/2021	WI	45	F	3/4/2021	3/4/2021	Pt reported glossitis, "racing heart", and eye tearing 4 minutes after vaccine administration. Assessed HR at 121 initially; down to 74 after 20 minutes of rest.

1073669	3/4/2021	OH		F	2/17/2021	2/18/2021	Burst blood vessel in her eye; Really bad headache/Her head was throbbing; Chills; Sinus headache; Her ear hurt; This is a spontaneous report from a contactable consumer. A female patient of an unspecified age received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) lot number: EL9266, expiration date: 31May2021, via an unspecified route of administration at left arm on 17Feb2021 at a single dose for Covid-19 immunisation. Medical history included migraine diagnosed 35-40 years ago, aneurysm from 01Aug2018 and lung cancer. There were no concomitant medications. The patient reported that she had a really bad headache the next day on 18Feb2021, after getting her first dose of the vaccine on Wednesday, 17Feb2021. She sated that on the 18th she had chills and the really bad headache, and she has a history of migraines and also has an aneurysm in her brain which she doesn't know how long that has been there. She says she also looked in the mirror this morning 19Feb2021, while putting her make up on and saw that a blood vessel had burst in her eye, which could have been from the pressure she had from the headache. She says her second dose is scheduled on 10Mar2021. She says that she had a little headache the afternoon she got the vaccine that went away, then the next morning at 04:00 am her head was throbbing, and she suffers from migraines but this felt like a sinus headache. Her ear hurt and she thought it was more sinus then, and nothing she took for it would alleviate the pain. She says when she got up then she got chills. She says that nothing she did like she normally does helped, like she tried heat and cold it was not going to give. She says that she used ice packs then put heat on her shoulder, and also did a Neti pot, maybe that caused her eye have blood vessel burst in it, she doesn't know. She says that the blood vessel burst in her right eye, which seems to have gotten better since this morning, it is not quite as red. She says it could be that she rubbed it. She says her headache is gone now and her chills are gone. The patient recovered from the events really bad headache/Her head was throbbing and chills on 19Feb2021, for the event burst blood vessel in her eye was recovering. The outcome of the event Sinus headache was not recovered while the outcome of the event ear hurt was unknown.

1073658	3/4/2021	CA	66	F	2/15/2021	2/21/2021	break a blood vessel in her left eye; felt sick to her stomach; threw up; Half of the white in her left eye turned solid red; This is a spontaneous report from a contactable consumer (patient). A 66-year-old female patient (not pregnant) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, batch/lot number and expiration date were not provided), via an unspecified route of administration on right arm, at 66-year-old (not pregnant at vaccination), on 15Feb2021 at 15:00 as a single dose for COVID-19 immunization. The vaccine was received in hospital. Medical history included ongoing chronic back pain, high blood pressure. No known allergies were reported. The patient did not experience COVID-19 prior vaccination. Concomitant medications included hydrocodone bitartrate, paracetamol (NORCO), fluoxetine hydrochloride (PROZAC), triamterene, baclofen. No other vaccine was received in four weeks. On 21Feb2021 at 12:00 (reported as 6 days later) the patient felt sick to her stomach and threw up which caused her to break a blood vessel in her left eye. Half of the white in her left eye turned solid red. Later she felt fine and was able to eat dinner. The patient did not have COVID-19 test post vaccination. The patient did not receive treatment for the events. The outcome of the events was recovering. Information on the batch/lot number has been requested.
1073830	3/4/2021	FL	50	F	3/1/2021	3/1/2021	funny taste in mouth, felt buzzed, headache, confused, tunnel vision, pale, fainted, rash on torso
1074001	3/4/2021	TN	48	F	3/4/2021	3/4/2021	Patient was in chair waiting her 15 minutes after IMZ, when she begin to slid down and slump in her chair. She could not keep her eyes open. After calling her name she began to come to and the main complaint she had was that she had a sweet taste in her mouth. She continued to complain with sweet taste and then became hoarse. She denied being a diabetic and was not having trouble with her breathing or throat closing, Fire Department and Ambulance arrived and she wanted to go to hospital. She stood up to get on the stretcher.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1072786	3/4/2021	CT	53	F	1/12/2021	1/13/2021	I started to feel severe lethargy and fatigue. My eyes flared, double vision up with my usual autoimmune attack. I could not get out of bed for five days. Chills and back pain, joint swelling. It felt like a really flare up of my autoimmune condition. I also had similar problems with the first dose but not as bad. I was midway between my bi-weekly Cosentyx.
1073079	3/4/2021	KS	67	M	2/16/2021	2/16/2021	Arm sore, head aches, very tired, restless, lack of sleep, flu symptoms, fever, swollen leg left side, knee swollen and foot, made neuropathy worse, sweat a lot, hard to walk, knee giving out while standing, vision blurry, nose running more, been out of work 2 days a week since shot, body aches, just cough
1074222	3/4/2021	NC	61	F	2/16/2021	2/22/2021	I had the vaccine on 2/16. On 2/22 at 5:30 pm I suddenly started having double vision. I saw an eye doctor that evening. I had no face drooping. I had not headache or muscle weakness and my pupils were the same size. If I covered one eye (did not matter which one) the double vision was not present. The next morning 2/23 I woke up with no double vision but throughout the day it came back a few times but resolved each time. I went to Medical Center on 2/2 and had a complete exam. So far all labs have come back in normal range. I have tracked my blood pressure twice a day since this happened. BP is great I am a very healthy person. Exercise daily. The only thing different in my life is having the vaccine dose. It was my first dose. The double vision seems to be resolving more and more each day. Happening less and shorter episodes. My eyes have been check by medical extensively on 2/2. They cannot find a reason for the double vision. I would like to know if this has been reported by anyone else and if so did it resolve. Also if the person took the second dose and did they have problems. I am supposed to have my second dose on 2/16. I am not sure what I should do. I still have symptoms although they are much milder and seem to be resolving. I have never felt bad at all during any of it and have continued to exercise.
1074201	3/4/2021	CA	65	F	1/28/2020	1/29/2020	Mild Bells Palsey - Droopy left eye, weak left side of mouth

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1074054	3/4/2021	TN	32	M	3/2/2021	3/3/2021	Swollen, puffy eyelid. Never had anything like it before. Dull pain at outside of left eye. Eye feels depressed or sunken. Not as firm or protruding as right eye. Lower eyelid swollen. Painful to blink.
1074029	3/4/2021	TX	67	F	3/1/2021	3/1/2021	Immediately after medicine went in my arm I felt a warm flush from my neck all the way to my toes (the same as when I have had radioactive dye), during my 15 minutes of observation my hands and feet were cold and sweaty and I felt a little shaky. I waited 20 minutes and went to the restroom and had diarrhea (very rare for me). I went to my car and looked in the mirror and my face was bright red and the whites of my eyes were red and my eyes were glassy. I went back in to the observation area and was given oral Benadryl and monitored for 45 minutes. Right after I took the Benadryl my throat felt itchy (not sore - itchy). My blood pressure was 157/62 when I first sat down but came down to 130/60 by the time I was sent home. My bp is normally about 106/60. I was really tired at home for the rest of the day so went to be early. The next day I felt fine and my arm was only slightly sore. The doctor at the immunization clinic told me not to get the 2nd shot. I called my GP, and he too told me not to get the 2nd COVID shot and wait until more information has come out about adverse reactions to the vaccine. I did not have any difficulty breathing. I don't know if the redness on my face went down my neck to my chest. I didn't look. I did not have a fever.
1073897	3/4/2021	WI	51	F	3/3/2021	3/3/2021	Severe head ache in the sides of my head and behind my eyes. After 24 hours the headache is still very very intense. Tylenol didn't help, neither sumatriptan, my usual medicine for migraines.
1074018	3/4/2021	WA	42	F	3/4/2021	3/4/2021	Nausea, dizziness, heart racing, clammy/sweaty palms, vision changes, tingling and hot feeling face
1073908	3/4/2021	CA	27	F	3/3/2021	3/3/2021	Cough and eye redness (may have begun before vaccine dose). BP 138/93 (pulse 74), 98% O2 sat.
1073995	3/4/2021	NC	41	F	2/26/2021	2/27/2021	Fatigue, urinary incontinence, trouble walking hip pain, double vision. Patient express vaccine cause MS flare up. had these symptoms years ago from MS but had subsided until vaccine

1073653	3/4/2021	MI	56	F	2/20/2021		<p>Bell's Palsy; eye twitching; dizziness; This is a spontaneous report from contactable consumers (one was patient). A 56-year-old female patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, lot number: EN6200, expiry date not reported), via an unspecified route of administration at the right arm on 20Feb2021 at single dose for COVID-19 immunization. Medical history included food allergy (reported as allergy to walnuts). The patient was not pregnant at the time of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was vaccinated at a workplace clinic. The patient was not diagnosed with COVID-19 prior to vaccination. Since the vaccination, the patient has not been tested for COVID-19. Concomitant medications were not reported. Historical vaccine included first dose of bnt162b2 (lot number: EL9265, expiry date: not reported) in the right arm on 30Jan2021 10:30 at single dose for COVID-19 immunization but experienced face numbness and swelling throat/ear canal on right side. It was reported that the second dose was even worse than the first time and involved continued eye twitching and significant dizziness. The patient had not sought medical attention yet, but if it continued to get worse, she would call her doctor or (helpline number). The patient reported that it almost feels like Bell's Palsy on an unspecified date. It was unknown if treatment was received for Bell's palsy. Clinical outcome of Bell's palsy was not recovered, while for eye twitching and dizziness was unknown.</p>

1073101	3/4/2021	OH	48	F	2/12/2021	2/12/2021	<p>Moderna shot administered on 2/12/21 10 minutes after shot feeling of warmth, sweating, racing heart and feeling of uneasiness like something was wrong. Weird sensation in throat area. -went to nurses and EMT at vaccination site and described feeling that something was wrong EMT checked pulse, blood pressure, oxygen levels: heart rate was elevated and blood pressure was 150/?. EMT advised taking deep breaths and getting rechecked in 10 minutes. Heart rate and blood pressure went down to 130/?. EMT wanted to recheck in 15 minutes to make sure heart rate stayed down. When rechecked it was back to 150/?. EMT advised getting checked out at urgent care and advised that I not drive myself. Went to urgent care right after leaving the vaccination site. When nurse checked blood pressure it was 178/? And heart rate was 135 bpm. Nurse mentioned some swelling around injection site that I should keep an eye on. Temperature was 99.7 at urgent care. 10 minutes later when doctor rechecked it was down to 130/? And pulse was down to normal range. Doctor advised that it could be an allergic reaction and to make sure I had benadryl on hand in case reaction worsened. Over night after vaccine had chills and then a headache in the morning upon waking. Slight temperature no higher than 100 that morning. 2/13/21 the next day at around 12:30 pm began feeling like I did immediately after the vaccine but symptoms were more intense. Feeling of warmth and tingling sensation throat/face. Answering service for doctor's office advised taking benadryl and if still not feeling symptoms resolve or if worsening to go to ER. After taking 2 benadryl 50 mg. Symptoms were not resolving. Mentioned not feeling right to my husband and he said I had a big red welt under my chin toward throat area. Symptoms were not improving and felt tightness in throat and chest area. Voice was becoming hoarse so went to ER. Nurse took vitals and asked if I forgot to take blood pressure meds as pulse and blood pressure were both high 176/? Heart rate 140. I replied that I had never had high blood pressure before. They monitored blood pressure, pulse, oxygen levels for several hours. As benadryl wore off redness developed across entire back area and red welt appeared on front abdomen. Blood pressure and pulse were elevated for about 2 hours going up and down until finally staying in normal range. ER doctor prescribed</p>

1073607	3/4/2021		64	F	1/24/2021	1/1/2021	<p>skin is burning up, her arms, her face, her stomach, her back, and her chest are burning up/burning skin has probably gotten worse; Nausea; no appetite; Headache; bad sore throat; felt sick since she got it; This is a spontaneous report from a contactable consumer (patient). A 64-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection; lot: EL9262), via an unspecified route of administration on left arm (at the age of 64 years) on 24Jan2021 at single dose for covid-19 immunization. Medical history included type 2 diabetes (borderline about 15 years ago/started taking a medication a year ago for her high sugar numbers/had some blood tests, her A1C was normal, her diabetes was the same way it always has been); hypertension from 2012 (diagnosed about 9 years ago); sleep apnea from 2020 (uses a C-PAP machine/diagnosed approximately a year ago); Epstein Barr from 1995 (diagnosed when she was 39); high cholesterol (sometimes she didn't take her medication for that); cataract and cataract surgery in Jan2021 (had this last month/they used anesthesia/didn't know which type/had some eye drops for this). Concomitant medication included an unspecified high blood pressure medication (she thinks she tried a few times). The patient called about Pfizer COVID-19 vaccine and she had questions and side effects. She did get one shot, and was not due for her second for a couple weeks. The patient felt sick since she got it, some side effects have been less, some stayed the same or got worse. Her skin was burning up, her arms, her face, her stomach, her back, and her chest were burning up. She has done no treatment, because she didn't know what to do to treat it and it was difficult to be able to get in to see a doctor. The burning skin has probably gotten worse. She also had nausea and no appetite, though she has gotten a little better, it has been at least a full week or so. She had a headache and a bad sore throat also. She got home from getting the shot, probably maybe 5 or 6 hours after getting the shot. The patient's weight was 145-150lbs. The outcome of the event skin burning sensation was not recovered while for the remaining events was unknown.</p>

on 28Jan2021, but on 29Jan2021, the pain was worse, and she had difficulty lifting her right arm at 16:00. On 30Jan2021, she started noticing more pain when she lifted her arm, her arm pits, it was hurting under arm when she was lifting. She thought maybe there were swollen glands but did not feel it. her temperate was 100.8, and she took some paracetamol (TYLENOL), by the evening, her temperature was at 98.6 normal. On 31Jan2021, she noticed a lot of pain, itching and redness, redness moved from actual site down her arm about 6 to 7 inches at 14:00. The pain in her right arm was not as bad as it was, but the redness in the area and itching was there, it was hot to touch area on right arm, and she tried cold compresses and took paracetamol. Also, it was hurting under her arm when she was lifting. She experienced something like that before with a Flu vaccine. She noticed when she looked it up, the information states, yes. And it was still going on today, not so much pain, just swelling and redness, looked like what Moderna calls a covid arm. She had no temperature, a little headache on 31Jan2021 at the back of the head and tired, very tired, she was tired from 29Jan2021, and was better from 01Feb2021. She took paracetamol last night, and cold compress. she used to take baby aspirin; she didn't know if it would be a problem. She read not to take paracetamol or ibuprofen before vaccination. She felt tugging and redness when she raised her arm, it was not red its blotchy. She didn't feel any swelling. The last 7 to 8 months, she was running high blood counts, 12.3 (high) and she had no infection, her doctor was a little nervous, the last one on 15Jan2021, it was down to 10.2 within normal range. Her immune system was very active. She had a flu shot in Oct2018 at age of 72 y/o and by 08Jun months later, she got the flu. She went to the hospital and developed PNA. In 2019 and again this past Aug2020, she had a Colonoscopy where they removed polyps. She had a flat polyp that was a little more dangerous the first time and it was removed. It was non-cancerous. The doctor was just watching it. Last blood results were 2 weeks prior to having first shot on 15Jan2021. The only thing that showed was her Liver enzymes were a little elevated. She was told that if she hadn't gotten the vaccine, it would have been worse, her doctor gave me the zpack. They were calling it a subcutaneous sensitivity, she had

1073575	3/4/2021	OH	80	F	1/29/2021	1/29/2021	She did not feel good; Eyes were blurry/ she felt pressure in them; Bad head cold; she couldn't bend over; Aches all over; Back pain; Eyes were blurry/ she felt pressure in them; This is a spontaneous report from a contactable consumer from a Pfizer sponsored program. An 80-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EJ1687), via an unspecified route of administration on the left arm, at the age of 80 years, on 29Jan2021 17:00 at a SINGLE DOSE for covid-19 immunisation. Medical history included cataract, arthritis and seasonal allergy from an unknown date and unknown if ongoing. There were no concomitant medications. The patient stated that a couple of times she did not feel good and got very sore and could not bend over to pick things up and her eyes blurred up. After she got the shot, she gradually noticed aches all over and back pain. It was stated it hurt really bad in her back on the right side on the bone and she used the heating pad on it. Then the next day she was stiffer than ever and she couldn't bend over. She added her eyes were blurry, they felt like she had a cold in them, and she felt pressure in them. She added she always has this problem with her eyes but it got a little worse after the shot. All of that has gotten better now. It was stated they are telling her the second dose was worse and she was unsure about getting the second dose. Also mentioned they were saying you can wait a little longer and she was unsure if maybe she should wait. She wanted to ask about getting the second dose. She added she was scheduled to receive the second dose of the vaccine on 19Feb2021. The patient said it was right sided back pain. She said she applied heating pad and took ibuprofen. She also experienced "eye pressure" and "blurry eyes", "how you feel when you have a bad head cold". She said, "I have allergies-seasonal, so this isn't new to me". Therapeutic measures were taken as a result of back pain (back pain). The outcome of the events did not feel good, eyes were blurry/ she felt pressure in them and bad head cold was unknown while other events were recovered on 31Jan2021.

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
1073564	3/4/2021	LA	72	F	1/13/2021	1/13/2021	left eye felt tight and felt itchy/severe tightness in her left eye; intense itching in inner ear where you cannot scratch; severe tightness in her left eye that felt like it was going to swell up; hot skin for several hours; hot flashes; She has itching in ears and throat; Onset of burning and itching; Skin had feeling of about to break out in hives/full blown body hives all over; This is a spontaneous report from a contactable nurse. A 72-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number=EL3249), intramuscular on the right arm, at the age of 72 years, on 13Jan2021 09:45 at a SINGLE DOSE for covid-19 immunisation. Medical history included food allergy from an unknown date and unknown if ongoing. The patient's concomitant medications were not reported. The patient would like to know if the vaccine was derived from or does it have any products from Acacia. One of the reason's she was asking was because she knows it has Polyethylene Glycol in it. Her resources are limited. She was a retired healthcare provider and she taught graduate level nursing and has background in epidemiology and public health. The Polyethylene Glycol was in the vaccine, according to the prescribing information. Some forms of Polyethylene Glycol in some type of way are derived from gum acacia and she does not know if this is the case for the COVID vaccine. She did have 1st dose and waited 15 minutes. When her left eye felt tight and felt itchy, she took 2 Benadryl and then waited in car a little longer. She felt like she was going to go into what she has had in past 3-4 times relating to fish. She has had full blown facial swelling, intense itching in inner ear where you cannot scratch. Those times, if she had chopsticks, she would want to scratch inside her ear. She never had that with the COVID vaccine. They told her when she got the vaccine that if this develops further, she should go to her doctor or ER, but should not come back there. She did not want to go to the ER and sit there for 12 hours waiting to see if she was going to have a worse reaction, so she went home, took 2 more Benadryl, and went to bed. Eight hours later, she was fine and did not have hives. She then stated she completed report with Pfizer online and did not have a reference number for previous report. For those time when she had these episodes with the fish, she had extreme itching and hives. The worst

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

allergy she had, her fingers looked like they were webbed. She was treated with Adrenaline, Cortisone and Benadryl by injection and that would usually stop the reaction, but it usually takes 3-4 days for the swelling to go down. In later years, if there is a piece of fish mixed in with fried shrimp and she inadvertently eats it, she knows it immediately. She will take Benadryl immediately. She will have facial swelling and swelling around her eyes. The Benadryl will contain it. She will be disfigured for 2 weeks, with bags of fluid in her cheeks. She is going for her second shot tomorrow. She can self treat with Benadryl. In 1994, she had a very positive wheals from an intradermal scratch testing for Acacia and codfish. The patient had an onset of burning and itching, periorbital. She took 2 25 mg Benadryl tablets. She has itching in ears and throat. After my 15 minutes waiting, she left. She had various hot spots of burning skin, legs and arms. Left eye felt like past episodes of itching, about to swell. Her skin had feeling of about to break out in hives. Facility said to go to provider or ER if got worse. She chose not to go to ER, and wait and be miserable for hours on end, while waiting for full blown body hives all over. She took two more 25 mg Benadryl and went to bed. She had intermittent burning skin, various areas, for several hours. About 8 hours later, was resolved. The patient was about to receive 2nd dose of the Covid vaccine. After the 1st dose she experienced an itchy feeling in throat, rotating heat in arms and legs, slight bag fluid under left eye and it felt to her like she was going to have an allergic reaction but did not. She took some Benadryl and after 8 hours she was fine. The patient stated after the first dose of the vaccine she had itching, severe tightness in her left eye that felt like it was going to swell up, and hot skin for several hours. She took two Benadryl while she was still in the waiting period and perhaps that blunted the reaction. She had hot flashes on the drive home. She took two more Benadryl at her daughter house (100mg total after taking 4 that day). She didn't feel good and felt she was on the verge of getting hives. She had episodes of hot skin and itching and after 8 hours it was over and done with and she was fine. She stated she is nervous about the second dose but stated they have what they need if she has an immediate reaction and it is worth the risk of getting vaccinated. Therapeutic measures were taken as a result of left eye

his heart rate went up slightly but it did go down once he sat down but he felt woozy and had pressure in his head and pressure in his hands and feet like he could not move his feet. He was kind of like dizzy and light headed. He walked somewhere to sit down, he stayed 30 minutes and left after and sat 30 minutes in the car and he got a headache and his muscles tightened in his back and in his calf muscles and he felt like he was just not himself. He felt lethargic and felt like his lymph node on his left side was tight throughout his neck. He felt like his lymph node was getting tight and he just sat until he felt like his symptoms had dissipated. He also had lump on his throat. He had stuff going on with his stomach like cringing in his stomach muscles, it was kind of like a muscle spasm in his stomach. He didn't sleep that well last night (01Feb2021) as he felt some symptoms come on again, the tightness in his neck again and when he sat up, he got dizzy and wobbly, his back was hurting, his calf muscle was tight. He felt more muscle pain. He checked his blood pressure and it was good, but he just felt a little dizzy on 02Feb2021. The patient stated that all his symptoms have improved since 01Feb2021. The patient also mentioned that the girl looked really young (referring to the person who administered the vaccine), "maybe she jacked it up, he knows it supposed to be a very little bit, maybe she put more in him than she was supposed to". He went back to his doctor as he wants to come off of some of his medications because he is supposed to have another shot and he want to take the second shot. He wanted to stop taking all the medications around the second shot in case it was his medications that caused it. The patient asked since he had complications with the fist dose, should he still take the second dose. The patient was recovering from the events.

1073500	3/4/2021	MI	72	M	1/15/2021	1/22/2021	<p>first thought it was a rash, and after he went to the Dr., she confirmed that what he had was actually the shingles; This is a spontaneous report from a contactable consumer (patient). A 72-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; Batch/lot number: EL1283), via an unspecified route of administration on 15Jan2021 17:00 (at 72-year-old) at single dose (Left Arm) for COVID-19 immunization. Medical history included type 2 diabetes (he uses insulin for this), bladder cancer (he was a former bladder cancer patient). Concomitant medication included insulin for Type 2 diabetes. Patient had the first dose of the Pfizer BioNTech COVID-19 vaccine. A week later, he had developed a rash and it turned into shingles. It is currently clearing up and he is taking medications for it. He is due for his second shot of the vaccine on 05Feb2021 and was wondering if there are any recommendations for him not to take it. It was clarified that on 22Jan2021 a rash developed on his face which was found to be shingles. He saw a personal doctor, the doctor even put him on medication. All has gone well, once he started taking the medication the shingles didn't progress and dried up and is now in the late stage of drying up. He asked if he should be reporting this, he also would like to know if he should get the second covid vaccine. The Rash started on 22Jan2021 and was on the face, hair scalp region. He specified further that the rash was located in the upper right quadrant on his face, also being on the eye lid and hairline. He added that he actually had a second doctor check this as well, because the rash was on the eyelid. His Primary Care doctor had him see a ophthalmologist. Patient clarified that he first thought it was a rash, and after he went to the Dr., she confirmed that what he had was actually the shingles. Outcome described as still with a little bit of redness, but it is healing and it is dried up. Dr prescribed him Valtrex for the shingles. The patient underwent lab tests and procedures which included that he has had no positive covid tests. In Dec2020, he had the regular covid test and that was negative. In early Jan2021, he had the regular covid test as well as a covid-19 antibody test, and both were negative. Patient mentioned serology test, he then confirmed that he used the word serology inadvertently, and meant antibody. He has had no issues with vaccines in the past. The</p>

							outcome of the event was recovering.
1073479	3/4/2021	TX		F	2/20/2021	2/20/2021	second dose administered 16 days after the first dose; A spontaneous report was received from a consumer for a 78-year-old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and patient received second dose after sixteen days after receiving the first dose of vaccine. The patient's medical history was not provided. The patient is allergic rogain hair products, sulfur eyedrops, latex gloves and tape, ciprofloxacin hydrochloride (500mg), advil and cefalexin. Concurrent conditions included acid reflux, cholesterol, depression, glaucoma (both eyes), headache, hypertension, nausea, sinus disorder and sleep disorder. The concomitant medications included timolol maleate, latanoprost, atorvastatin, pantoprazole, trazodone, montelukast sodium, amlodipine, vitamin d3, acetylsalicylic acid and magnesium . On 04 Feb 2021, the patient received their first of two planned doses of mRNA-1273 (Lot number: 012M20A) intramuscularly for prophylaxis of COVID-19 infection. On 20 Feb 2021, sixteen days after receiving the first dose of vaccine, the patient's vaccination card was checked by the facility and mRNA-1273 (Lot number: 022M20A) was administered intramuscularly. Additionally, it was reported that the patient was registered to receive vaccine under County Group of Vaccination and County Public Health (CPH). Treatment information was not applicable. Action taken with mRNA-1273 was not applicable. The outcome of the event second dose administered 16 days after the first dose was considered resolved.; Reporter's Comments: This report refers to a case of Inappropriate schedule of vaccine administration for mRNA-1273, lot # 012M20A with no associated AEs.

1068755	3/3/2021	PA		F	1/28/2021	1/28/2021	Dose administered from a not fully thawed vial; A spontaneous report was received from a nurse, concerning a 67 years-old female patient, unknown race and ethnicity, who was administered Moderna's COVID-19 vaccine (mRNA-1273), which resulted in dose administered from a not fully thawed vial (incorrect dose administered). The patient's medical history was not reported. Concomitant medication reported was simvastatin. On 28 Jan 2021, prior to the onset of the event, the patient received female first of two planned doses of mRNA-1273 (lot/batch: unknown), intramuscularly in the left arm for prophylaxis of COVID-19 infection. It was reported that the vials were stored in the refrigerator. After that, one of the vials was punctured and a dose was administered to a patient. Also, syringes were pre-filled with doses of the same vial (vials still contain some doses). The healthcare professional visually observed the vials and noticed that the suspension was not fully thawed to the patient on 28 Jan 2021. No treatment information was provided. Action taken with second dose of mRNA-1273 in response to the event was not reported. The outcome of the even, dose administered from a not fully thawed vial was recovered on 28 Jan 2021.; Reporter's Comments: This report refers to a case of incorrect dose administered for mRNA-1273 (lot # unknown) with no associated AEs reported.

1067948	3/3/2021	CA	80	M	1/24/2021	1/26/2021	Moderate allergic reaction; itchy skin; itchy eyes; Headache; This is a spontaneous report from a contactable consumer. An 80-year-old male patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL 9263), via an unspecified route of administration in right arm on 24Jan2021 11:45 at a single dose for COVID-19 immunization. Medical history included Diabetes2, HiBloodPress and HiCholesterol. Concomitant medication included lisinopril, simvastatin, and unspecified diabetes medication. On 26Jan2021, the patient experienced moderate allergic reaction, itchy skin, itchy eyes and headache. The patient was taking antihistamines with some relief for moderate allergic reaction, itchy skin, itchy eyes. There was no treatment for headache. The outcome of the events was recovering. Prior and since the vaccination, the patient was not tested for COVID-19. The events were assessed as non-serious.
1069548	3/3/2021	MD	46	F	2/17/2021	2/18/2021	Swelling, burning, pain and rash at the injection site Delayed hypersensitivity reaction- angioedema of the eyes and nose, redness and rash, nausea and GI distress
1069542	3/3/2021		50	F	2/11/2021	2/11/2021	~~The shot itself was very unpleasant, the vaccine stung. The nurse was concerned about this since it shouldn't cause any discomfort at all. Other than immediate onset of a painful injection site no other symptoms occurred until later in the evening. I started feeling kind of yucky before I left work but nothing specific. By the early evening I was running a low grade fever and having muscle and joint pain. I didn't sleep very well due to body aches and severe organ pain. At one point I woke up because my heart was beating so hard and fast I could feel it in my forehead. My lips and eyes were swollen and my neck was visibly swollen as well, I think due to the lymph nodes in my neck. My throat was some swollen but not enough to cause a breathing issue. The heartbeat issue didn't last terribly long. I took a Benadryl to try and stop the reaction. I ran fever of a 102 give or take a few degrees either way for 2 ½ days. In addition, the injection site and whole shoulder area was swollen and hot with redness that wrapped around the front of my arm.~~

1069493	3/3/2021	TX	36	M	3/3/2021	3/3/2021	Patient was unresponsive with eyes open for a brief moment ( 5 seconds) after receiving the vaccine.
1069482	3/3/2021	MO	52	M	3/3/2021	3/3/2021	35 Minutes after receiving vaccine, itching on head, then body and face, including welt on chest, hives. 50 minutes later eye itchiness and swelling in left eye, throat felt weird (swelling), dizziness, change in voice, wheezing (not severe, but could tell breathing was more restricted than before shot). Almost went to ER, but symptoms subsided without any medication in 2 hours. Did not go to hospital or ER.
1069489	3/3/2021	CA	46	F	2/23/2021	2/28/2021	On Sunday I started with a severe headache. When I woke up on Monday morning I couldn't lift my head. The headache was intense. I could not open my left eye. I had facial paralysis on the right side of my face. I had slurring of speech. When I walked I was dizzy. I fell asleep all day long, and woke up each time completely disoriented.
1069315	3/3/2021	MI	47	F	3/3/2021	3/3/2021	redness in face an neck/chest. Mildly swollen/red eyes. Developed within 15 minutes. Improved with 50mg benadryl. Stayed an additional 30 minutes after benadryl and symptoms continued to improve.
1069203	3/3/2021	MD	65	F	3/1/2021	3/1/2021	that night i got up about 12:00 AM my face was swollen, red, eyes was red and sowllen , and felt sick all over. Call doctor in morning to let him know what was going on. Nurse said the it was a side effect and should going away. Call back on wed. becasue my face was still red and swollen go was still not felling good. Nurse said that it could go on for 3 to 6 day. If still not doing good call back on Friday.
1069303	3/3/2021	PA	38	F	2/24/2021	2/24/2021	I received the shot at 8am. By noon, the injection site was very sore. By 2pm, I could not move my arm without excruciating pain from my shoulder all the way down to my left ring and pinkie fingers. I was not able to lift my arm on my own, it was as if my muscles were not recognizing the brain signals. If I lifted my left arm using my right, I could move it about an inch. Anything more than that was so painful that it brought tears to my eyes. Pain relievers did not help. It took almost 5 days to regain function of my arm, and I am still experiencing muscle pain when I try to stretch my arm or lift a heavy weight.

1068237	3/3/2021	FL	86	F	2/12/2021	2/1/2021	delirious; incapable of sleeping, insomnia and inability to be awake and aware; high, over the top blood pressure; Sweating; on and off chills; she gets warm and cold, hot and cold; concerned about one kidney/ was dehydrated; affecting her kidney; incapable of sleeping, insomnia; she was weak; feeling like she would slip onto the floor; she is still not clear headed; she is woozy, like foggy; she is still not clear headed, she is woozy, like foggy; arm is still sore from second vaccine; This is a spontaneous report from a contactable consumer (patient). An 86-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; lot number EL9262 expiry date 21May2021), via an unspecified route of administration on 12Feb2021 (at the age of 86 years old) at single dose in right arm for COVID-19 immunisation. Historical vaccine included first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; lot number EL8982) on 22Jan2021 at single dose in upper right arm and on 22Jan2021 experienced severe headache and arm hurting. Relevant medical history includes ongoing compromised immune system diagnosed many years ago, and ongoing one kidney functioning. The patient received no concomitant medications. On 13Feb2021 the patient experienced high, over the top blood pressure, delirious incapable of sleeping, insomnia and inability to be awake and aware which both required hospitalization from 13Feb2021 to 14Feb2021. It was also reported they were concerned about one kidney/ was dehydrated in 13Feb2021. On 13Feb2021 unspecified blood labs showed kidney was extremely dehydrated and Chest X-ray was good. Clinical course was reported as follows: she was just released from hospital yesterday, she took the second Pfizer COVID shot, on 12Feb2021, and became so very very ill, she expected some side effects, the first shot wasn't bad, the first all she had was a severe headache and arm hurting, but that was 3 weeks ago, and the second one she can't say how horrible it was: she had to get the paramedics there, she was very very ill. It was the worst night she has had, and she is 86 years old, and has had a multitude of serious issues but that shot was the worst. It was a combination of high blood pressure, over the top, and insomnia like she couldn't budge and open her eyes, she couldn't see anything but squares, it was like a horrible, if there is such a thing as a trip, a horrible trip,

something she can't imagine wishing on anyone. The county administered it, she has several doctor, she initially provides her primary care doctor, for consent to contact, but says her nephrologist would be better, as she hasn't seen her primary care doctor in some time. Her primary care doctor doesn't know she had this, another doctor gave her permission, her nephrologist. States they were more concerned in the hospital about her kidney, she has one kidney functioning and, on mistake of the hospital, they didn't connect her to hydration, the night nurse didn't, and she was dehydrated and it was affecting her kidney. Her husband tried to call Saturday, when she had this reaction at like 06:30/07:00, but there was a huge long wait, he was calling to see about side effects, but they were beyond waiting, had to get the paramedics, her blood pressure was 178/113 and heart rate was 103. First shot was 3 weeks back. It looks like she had it on 22Jan2021, the headache and arm hurting started towards the evening, the shot was taken earlier in the day, and they started in the evening, her headache was quite severe, but with Tylenol it went away, the arm is still sore from the second vaccine, but is slightly better. Clarifies she was hospitalized for the blood pressure and delirium, like, it is best explained, like delirious: incapable of sleeping, insomnia and inability to be awake and aware, all she could see was, like if she talked about people who did LSD and trips, it was a bad trip, it was squares, she wanted to open her eyes, but could only see squares. She fell asleep Friday night about 11PM, and felt this at 04:00, and she pulled off her sleep apnea mask, she had to run to the restroom, she was weak, feeling like she would slip onto the floor, and had to get right in bed, and the insomnia continued until about 7AM, that was when she started to be able to focus on like words, she was able to say words in her mind, it was like a bad nightmare. She was admitted to the hospital, she was in the emergency room (ER), the paramedics took her there Saturday, about 07:30, took her to the hospital after immediate heart checking, an intravenous (IV) of some kind, and brought her to the hospital and she was in X-rays and what not, they did procedures in the ER, and they suggested her to be observed overnight, they watched her and things started to become more normal, but she is still not clear headed, she is woozy, like foggy. High, over the top blood

pressure outcome: It has been back to a good blood pressure. Insomnia is ok- she slept ok last night. What is left: the night she woke up, so early Sunday morning, in the hospital, she was profusely sweating like someone came to her room and showered her bed with water, her sheets and blankets were soaked and this morning she woke, she got up, was still very woozy, and asked her husband to help get her out of bed, and she changed her nightgown and after an hour she got in the shower, as she was sweating again, not sweating, but occasionally on and off chills, she is taking off her nightshirt and putting on a bed jacket, she gets warm and cold, hot and cold. She had blood labs a chest X-ray, heart monitor the whole time until she was discharged, and everything was good except the kidney was extremely dehydrated. This was all on Saturday as well. On her first visit to get the vaccine, at that time, the facility was a big mall, and they handed her what to look for after the injection, and she didn't notice until this morning, it says if you have an immune system that is compromised, it could affect it, and she has immune system that is compromised diagnosed many years ago. Over the top blood pressure and insomnia had resolved, arm sore was resolving, dehydrated and affecting kidney had not resolved, final outcome of the remaining events was unknown.

---

low grade fever. She had muscle and joint aches. She had no rash, but a little nausea. She had breathing problems. She had asthma issues and wheezing after the vaccine. That is how she described her breathing issues. She had a rapid heart rate. It went up to 130. It could of been because of fever, her breathing, or pain. There was a period of days then it resolved. On 15Feb2021, she feels almost human. She had routine arthritis lab drawn on 15Feb2021. They showed a CRP level of 11.5 which shows inflammation. She normally was below 0.29 which was within normal limits. That was an extreme difference. That was a lot of inflammation. The patient had to get her nebulizer out to breathe. She has taken Tylenol a couple of times. Her lab work was essentially normal. The CBC and chemical panel was okay. The patient thoughts the fever was important because she has been immunocompromised for years by Methotrexate. She has had pneumonia before with no fevers. Her eyes were also really sore. They bothered her. She already had to use eye drops. That was 11Feb2021 it was gone on 15Feb2021 but it kind of lasted a few days. Her muscles were better, but her joints still hurt some. But her joints always hurt some. She has had multiple joint replacements. The muscles in her legs were severe Friday and Saturday. Her muscles aren't hurting now, but her joints were but that was kind of normal. Her peak flow was way down on 14Feb2021. It was at 250. She did finally get it up to 350 by using her nebulizer. Her best effort normally is 450. Her peak flow was down quite a bit. She has been having breathing changes for a year. They were not sure what it was about. It could be an acute episode of something. On unknown date (next morning as reported), her pulse was 90-100. Now her heart rate was only elevated with activity. Her heart rate was down in the 70s, but when moving it was in the low 100s. With activity it was still up. It was hanging out in the 70s except exercising. She considers walking across the room exercising. All her other labs were in within normal limits. The patient wanted to know if the inflammatory response was secondary to the vaccine.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of serious events cannot be excluded. The

1068204	3/3/2021	GA	78	M	1/11/2021	1/11/2021	Right arm was barely sore where injection administered; This is a spontaneous report from a contactable consumer (patient). A 78-year-old male patient received first dose of BNT162B2 (Lot number: EL0142), via an unspecified route of administration on 11Jan2021 17:05 at single dose in the right arm for vaccination. Medical history included eye vitamin/To maintain good eye health, eye disorder, Heart supplement, heart disorder and he had his last annual physical with Pneumocystis pneumonia (PCP) in Oct2020. He had his flu shot in Sep2020. Concomitant medication included ramipril taken for probably at least 15 years, started in his 60s; atorvastatin taken for probably at least 15 years, started in his 60s. He believes this is the generic product for Pfizer Lipitor; acetylsalicylic acid (ASPIRIN CHILDREN) taken for probably at least 15 years, started in his 60s; ascorbic acid, tocopheryl acetate, xantofyl, zeaxanthin, zinc (AREDS) (also reported as "Advanced Retinol Eye Study Disease") for eye vitamin/To maintain good eye health; bioflavonoids nos, lecithin, quercetin, ubiquinol (CO-Q-10 PLUS) taken for probably at least 15 years, started in his 60s for Heart supplement; and unspecified multivitamin taken daily and probably taken all his life, all ongoing. This patient reported he was administered his first dose of Pfizer COVID-19 vaccine on 11Jan2021. There were no side effects; his right arm was barely sore where injection administered on 11Jan2021. Onset probably about 19:05-20:05 and he had recovered completely by the next morning when he woke. He had no discomfort during the night, no pain or throbbing, he felt very normal the next morning. He clarified that he has no medical conditions, no flu or illnesses of any other kind. He had his last annual physical with PCP in Oct2020; he has a twice yearly check-up with the Cardiologist that will be coming up soon. Stated that today is the 21st day and he is scheduled to get his second dose at 3:00pm. He asked how the incremental immunity builds up percentage wise after getting the first and second dose of Pfizer COVID-19 vaccine. He asked if there is any restriction or limitation on taking products like Tylenol, Advil or Aspirin before getting the Pfizer COVID-19 Vaccine; and if those products are ok to use to potentially treat side effects from the Pfizer COVID-19 Vaccine such as if patient has sore arm or something; and how soon after the second

dose side effects can kick in-he believes the briefing documents he was given for the Pfizer COVID-19 Vaccine said 2-14 days. He asked this particularly because he has an hour drive home after this second dose and wanted to know what to anticipate before attempting to drive home. His wife thought someone told her not to take any Tylenol, Advil or Aspirin before getting the Pfizer COVID-19 Vaccine which they had not heard of elsewhere, and saw no mention of that in the briefing documents given for the Pfizer COVID-19 Vaccine. The with outcome of the event was recovered on 12Jan2021.

1068193	3/3/2021	TX	68	F	1/29/2021	1/29/2021	she has a cold sweat or something right now; She has not eaten anything.; her right arm felt like it was going to fall off it hurt so bad; she has ran a temperature and that finally broke but the highest was 102.4; She has been so weak she hasn't been out of bed hardly.; tired; This is a spontaneous report from a contactable consumer (patient). A 68-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL9265), via an unspecified route of administration from 29Jan2021 14:45 (2:45 PM) at single dose on right arm (as she was left handed) for COVID-19 immunization. Medical history included COVID (recovered) on an unspecified date. There were no concomitant medications. No additional vaccines administered on same date of Pfizer suspect. Patient previously got her flu and shingles shot at the end of "October". Patient took the vaccine last Friday (29Jan2021) at the age of 68 years old (reported as "68 and a half"). She does not know if that makes a "different" but her right arm felt like it was going to fall off it hurt so bad, on a scale of 1-10 it was about a 20. It was really tender she put a heating pad on it, she has been sleeping on the heating pad and it was mild now. It was only about a 3 now and it has come down, but it hurt like the dickens. Also she has ran a temperature and that finally broke but the highest was 102.4. Patient has slept around the clock and she has not been out of bed but like 30 minutes out of the last 24 hours (hrs) just to go the potty or drink something. Patient stated "almost gave up holding it was so long". She has been so weak she has not been out of bed hardly. Patient said that she has eaten since, "lets see Saturday night, Sunday, Monday". Patient has not eaten since Saturday night (30Jan2021) or gotten out of bed. She has not eaten anything. Patient has had COVID and recovered so she did not want to catch that again. She confirmed that she had COVID prior to received the vaccine. She called her primary care and she has a viral phone call tomorrow or visual phone call, whatever its called, she was trying to get over this mess, she feels warm, she was not registering a temperature right now but she had a cold sweat or something right now (01Feb2021). Patient has a call with him tomorrow so he will know about this incase Pfizer calls. Patient stated that she knows with a normal vaccine she might have an ache or something but this

one hurt bad, maybe they pushed it in too hard or something she does not know. When asked for vaccination facility type, the patient answered that they had a vaccine clinic they had set up there in a conference room, they had an elaborate set up, go through certain places and there were several steps. Vaccine was not administered at facility (reported as "No hospital"). Patient further reported that her arm on 29Jan2021 (Friday evening) was tender. Patient lives by herself, she came home and does not know if she event ate. All she knows was she was real tired that Friday evening, it was tender and it got worse. Events did not require emergency room and physician room visit, reported as "Not to date but tomorrow she does not know if he will have her come in unless she spikes another fever or if he will do anything she may just ride it out". When asked for adverse events prior vaccinations, the patient answered "no none that she can remember. Sometimes she will have a sore arm that is why she gets it in the right arm because she is left handed thinkin her dominant hand will not have any problems but this one hurt really bad. Have they had many calls where this is really effecting arms really bad?". Patient also reported that her sister had the shot the same day and her arm was a little sore but that was all, she does not have NDC lot expiration for her sisters dose of the vaccine. She went to a different facility in a different location. Outcome of "her right arm felt like it was going to fall off it hurt so bad" was recovering, while for other events was unknown.

1068171	3/3/2021	PA	56	M	1/5/2021	1/1/2021	Mild palpitation; faint feeling; Arm soreness; This is a spontaneous report from a contactable consumer (patient). A 56-year-old male patient received first single dose of BNT162B2 (Pfizer, lot number: EL0140, exp date not reported), via an unspecified route of administration (vaccine location: right arm) on 05Jan2021 for COVID-19 immunization. Facility type vaccine: Hospital. The patient's medical history and concomitant medications were not reported. The patient had no Covid prior to vaccination. On 05Jan2021, 30 min after injection, felt a mild palpitation-stronger than any previous mild ones but not as strong as the strong one he experienced after the first injection, and he had to close his eyes due to the faint feeling. This was followed by a mild one 3 min later. In the next few days, he had several additional mild to weak palpitations. The strong one that he experienced was 12-14 hours after receiving the first dose, did not show. The patient also experienced arm soreness after the first dose (Jan2021). The patient was not Covid tested post vaccination. The patient recovered from the events on an unspecified date in Jan2021.

1068079	3/3/2021	NY	66	F	1/30/2021	1/30/2021	migraine with flashes of light in left eye; migraine with flashes of light in left eye; gets IBS stuff; has had diarrhea; diarrhea, had a mild version of the diarrhea that seemed to get worse after the vaccine and still ongoing; vessels in hands really dilated and dark blue; This is a spontaneous report from a contactable consumer (patient). A 66-year-old female patient received the first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot number EL9264), via an unspecified route of administration (arm left) on 30Jan2021 14:00 at SINGLE DOSE for to have some protection against COVID, at 66 years old. Medical history included connective tissue disorder and anti-cardiac lipid antibody problem; she is prone to blood clots from 2001. At that time, she was sent to the hospital and no one could figure out what it was. She was seeing the Rheumatologist and another person, and they knew something was going on and was given Prednisone (from 2001) because her tissues in the joints were swelling and she had trouble with speech. Patient also reported this as some weird connective tissue disorders already and some anti-cardiac lipid antibody problem. It was really weird and had not changed a bit since so she was kind of checking to see if anyone has reported anything like this. She reported that with this weird antibody problem, she is more prone to blood clots and has to be careful with medications with her blood she knows that some breast cancer medicines can do that. She stated this immune thing was never diagnosed. She also had migraine with globes of flashes of light, left eye (does not typically get migraines and has only had 1 in her life and she saw globes of lights in both eyes and had to go to the emergency room and was told it was an ocular migraine and this was also only in the left eye. This was long ago) from an unspecified date. Concomitant medication included low dose steroid (unspecified). The patient previously received flu vaccine on Sep2020 (AE none). No other vaccines were administered on the same day. On 30Jan2021, the patient experienced vessels in hands were really dilated and dark blue 5 hours after vaccination. On 30Jan2021, the patient also experienced IBS stuff and has had diarrhea the last couple of days after getting the COVID vaccine. She took Pepto Bismol to help and had a mild version of the diarrhea that seemed to get worse after the vaccine and still ongoing.

On 01Feb2021, the patient experienced migraine with flashes of light in left eye. It was further described as having a weird migraine with flashes of light in the left eye and she got the shot in her left arm and not sure if that makes any difference. She does not typically get migraines and has only had 1 in her life. The migraines started in the morning and lasted about an hour (as reported) and now they are gone and hopes they stay gone (reported as recovering). She wanted to know if she can take TYLENOL or ibuprofen for vaccine. She heard about people getting symptoms after the second dose not the first dose. Events did not require visits to the emergency room or physician office, but stated that if her vision become worse, she would go to the eye infirmary close by. The outcome of the events diarrhea and vessels in hands really dilated and dark blue, gets IBS stuff was not recovered. Outcome of the events migraine with flashes of light in left eye was reported as recovering.

1068265	3/3/2021	FL	69	M	1/29/2021	2/3/2021	Loss of taste and partial smell; Loss of taste and partial smell; Hard to talk or eat or drink; Hard to talk or eat or drink; Hard to talk or eat or drink; Bells Palsy; Blurry vision; Fever; Felt achy; This is a spontaneous report from a contactable consumer (patient). This 69-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EL9261), via an unknown route, on 29Jan2021 (at 10:00 AM) at a single dose in the left arm for COVID-19 immunisation. Relevant medical history includes diabetes, arteriolosclerosis, blocked carotid artery, gastroesophageal reflux disease (GERD) and chronic prostatitis. Past drug history included allergy to penicillin and cefixime (FLEXERIL). Relevant concomitant medications included doxazosin mesylate (CARDURA), lisinopril, metformin, omeprazole, repaglinide (PRANDIN) and other unspecified medications. He had fever and felt achy for a couple of day. On 03Feb2021 (at 08:00), the patient had total paralyzed on right side of his face, right eye will not close, mouth paralyzed on right side. Hard to talk or eat or drink. Blurry vision in right eye due to not closing. On 04Feb2021, the patient has loss of taste and partial smell. The patient performed physician office visit. Then, he went to the emergency room (ER) and Bells Palsy was confirmed on 06Feb2021. He stated that his blood work is currently fine. He was given prednisone and acyclovir for Bells Palsy and for hard to talk or eat or drink. The patient was not treated for the remaining events. Pre and post vaccination COVID test were not performed. All events were considered serious for disability except of fever and felt achy. The outcome of the events fever and felt achy was unknown while the outcome of the remaining events was not recovered.

1068465	3/3/2021	AR	26	F	1/26/2021	2/7/2021	I developed a large ring around my injection site on 2/7/21 12 days after my first covid moderna vaccine dose. It was exactly 12 hours after I administered my monthly ajovy injection for migraine treatment ( a monoclonal antibody medication ) in my right arm. My vaccine site is my left arm. Before this time, I had little to no reaction to the vaccine. My arm was a little red at the injection site on day 2 but swiftly went away. The large red rash type reaction was hot it was not painful. It began to radiate out like a bulls eye rash would look after Lyme infection. It was a bullseye ring rash for about 4 days and then subsided. I felt tired during that time but no other symptoms like fever.

1068407	3/3/2021	CA	67	F	1/26/2021	1/26/2021	<p>blood pressure went up/blood pressure was 156/81/her blood pressure was 180 over 80 something; This is a spontaneous report from a contactable consumer who reported for herself, a 67-year-old female patient who received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot number: EL9263), intramuscular in left arm, on 26Jan2021 at 11:00, at the age of 67 years, at a single dose for COVID-19 immunization. Medical history included ongoing high cholesterol, ongoing high blood pressure, and eyeglasses wearer. Ongoing concomitant medications included nebivolol hydrochloride (BYSTOLIC Tablet) for high blood pressure, bumetanide tablet taken as diuretic, rosuvastatin calcium (ROSUVASTIN Tablet) for high cholesterol, and acetylsalicylic acid (BABY ASPIRIN Tablet) to keep healthy. The patient reported that her blood pressure went up and is still up since last Tuesday (as reported). She received the first dose of the COVID vaccine at 11 am. She was okay until that evening around 5 pm, her blood pressure started going up, her blood pressure shot up. She called her doctor. Her doctor and her did not know if her blood pressure going up could be from the vaccine. Her doctor told her to take more of her already prescribed blood pressure medication. The next day, she went to see her doctor due to blood pressure still being high and he gave her more blood pressure medications. Her doctor prescribed a different kind of blood pressure medication to take along with her existing blood pressure medication (BYSTOLIC). She is concerned and asked if her elevated blood pressure will go back to normal, her blood pressure is still high. Her doctor told her when someone has a reaction to a vaccine, it usually takes days or up to two weeks to recover from the reaction. Her blood pressure is still high and her doctor is puzzled and prescribed her more medications to control her blood pressure. Today, 01Feb2021, at the doctors office her blood pressure was 156/81. Yesterday, 31Jan2021, her blood pressure was 180 over 80 something. She puts her glasses on to read the card. Patient would like to know how long will her symptoms last and if she is going to die from this. She is getting nervous and requests to be transferred to address her question. She thought she was the first person this has happened to but she read online that one person has had the same symptoms with high blood</p>

A 77-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE Lot number en5318, Expiry date not reported) via an unspecified route of administration to left arm on 26Jan2021 08:15 at single dose for covid-19 immunization. Medical history included UTI (urinary tract infection), rosacea, severe breathing problems, no sense of taste or smell, severe bronchitis, pneumonia, productive cough (productive cough that lasted for 2 months) and known allergies: some eye drops; some pain killers (nausea). The patient became totally nauseous, light headed, very chilled, extremely tired, very cold, fell asleep under warm down quilt until 2:00pm (total 13 hours sleep) all on 31Jan2021. The events were reported as non-serious. Reporter states she Woke up 8:00 am and dressed. Felt fine until 9:00. Had some milk tea and 2 morning pills and became totally nauseous and light headed. Went back to bed immediately. Became very chilled, and extremely tired. Checked temperature at 97.5 and was very cold. Fell asleep under warm down quilt until 2:00pm (total 13 hours sleep). Felt better, but ate little and wore a coat inside. After a light dinner, nausea mostly gone, but still tired. Reporter added that she almost certainly had a serious case of Covid in early February, 2020. Nobody knew the symptoms, so both urgent care and the ER sent her home with minimal treatment. She had severe breathing problems, no sense of taste or smell, severe bronchitis with some pneumonia (X-ray), and a productive cough that lasted for 2 months. The patient underwent lab tests and procedures which included body temperature: 97.5 (Unit unspecified) on 31Jan2021 and x-ray: some pneumonia on an unspecified date. No treatment was received for the adverse event. It was unknown if the patient was diagnosed with COVID-19 prior to vaccination. The patient has not been tested for COVID-19 since the vaccination. Outcome of the events was recovering.

1070802	3/3/2021	WA	56	F	2/7/2021	2/8/2021	On February 8th, 2021 patient came home early from work around noon due to not feeling well. She was feeling tired, slightly nauseous and very low energy. At about 4:50 PM that day, patient got up to walk to the pantry after eating some peanut butter toast. She suddenly stopped and shut her eyes and froze and then she began having a seizure (and she has never had a seizure before and seizures do not run in her family). After the shaking from the seizure ceased, her body tensed up and she fell flat backwards and she hit her head on the refrigerator. She then was going in and out of consciousness, she had a big laceration on her forehead and was bleeding rapidly. I, her daughter, witnessed this and then at 4:54 PM I called emergency services and paramedics arrived and took her to the hospital. Later that evening, the family was notified that the patient had bleeding in her brain, a concussion, a forehead laceration that received 15 stitches and a broken neck (C2 fracture). She was taken to the hospital that evening on February 8, 2021. Patient experienced a second seizure while at the hospital during a CT scan. Patient later was able to come home February 11, 2021 in the afternoon. Patient now has to wear a neck brace for up to 12 weeks, cannot drive, cannot work for up to 12 weeks, and is still recovering cognitively from the concussion.

A 79-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection lot number: EN6201), intramuscular at upper left arm on 17Feb2021 10:15 at a single dose for COVID-19 immunization. Medical history included ongoing Rheumatoid arthritis (arthritis in right shoulder and arm gets inflamed and sore; rheumatoid arthritis in right shoulder and arm. It sometimes flares up and gets sore) diagnosed in late 2019, ongoing Autoimmune deficiency disease diagnosed in late 2019 and lower left eyelid which was inverted. There were no concomitant medications. No prior vaccinations (within 4 weeks). The patient previously took Shingrix vaccine (Shingles vaccine) at left arm last year-2020 and she felt soreness and achiness in right shoulder and arm. The patient received the first dose of the Pfizer COVID-19 vaccine yesterday on 17Feb2021 at her left arm. A few hours later her right shoulder and right arm felt sore and achy. On 18Feb2021, the patient's right arm and shoulder were aching. The patient mentioned that this has also happened last year when she had a Shingrix vaccine. She was also injected in her left arm but her right arm got sore and achy. She felt soreness and achiness in right shoulder and arm. She wanted to know if this is a normal reaction from the vaccine. The patient stated that it was weird. On unspecified date, when she lifts her arm up high it hurts, she stated that she does have an inflamed shoulder. She did have an inflamed shoulder prior, it has been pretty good lately but flared up after the vaccine. During the night it was very bad. She does have rheumatoid arthritis in right shoulder and arm. It sometimes flares up and gets sore. She was wondering if there is a relationship with the COVID 19 vaccine because she felt like she got the COVID 19 vaccine in the right arm, she asked if she's reacting to the medication. No treatment was administered for right shoulder. Routine lab work done on 02Feb2021 but it has</p>

nothing to do with this. The events did not require a visit to Emergency Room or Physician Office. The patient is also scheduled to have Botox in her lower eyelid for her left eye to release the nerve muscle. She asked if it is ok since she just had the Pfizer COVID-19 vaccine. She is scheduled to get botox injection next week for lower left eyelid which is inverted, it was bothering her. They have to release the muscle by getting an injection of botox. She was receiving conflicting information from her PCP, who says wait a month and her ophthalmologist who says its ok to get the COVID 19 vaccine. She thought she heard something about not mixing botox with the vaccine. The outcome of the event "She did have an inflamed shoulder prior, it has been pretty good lately but flared up after the vaccine/She does have rheumatoid arthritis in right shoulder and arm" was unknown; and other events was recovering.

1070682	3/3/2021	SC	43	F	2/11/2021	2/11/2021	<p>Red flat itchy rash on torso, face, arms, legs; Red flat itchy rash on torso, face, arms, legs; facial swelling; eyes swollen; itchy throat; cotton mouth; Received first dose on 25Jan2021 and second dose on 11Feb2021; Received first dose on 25Jan2021 and second dose on 11Feb2021; This is a spontaneous report from a contactable Other Health Professional. A 43-year-old non-pregnant female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot number: EL9266), intramuscularly in Left arm on 11Feb2021 17:15 at single dose for covid-19 immunisation. Medical history included allergy to dairy products. Prior to vaccination, the patient was not diagnosed with COVID-19. The patient's concomitant medications were not reported. The patient previously took first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number: EL9262) at the age of 43 years old and Intramuscularly in Left arm on 25Jan2021 17:00 for COVID-19 immunization. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced Red flat itchy rash on torso, face, arms, legs; facial swelling; eyes swollen; itchy throat; cotton mouth on 12Feb2021 12:00. The adverse event result in Doctor or other healthcare professional office/clinic visit and Emergency room/department or urgent care. Since the vaccination, the patient has been tested for COVID-19 via Nasal Swab on 02Feb2021 with result Negative. Therapeutic measures (reported as 'IV Epinephrine, Solumedrol, 'Pepcid', 'Benadryl', prednisone) were taken as a result of red flat itchy rash on torso, face, arms, legs, facial swelling, eyes swollen, itchy throat, cotton mouth. The outcome of the events was not recovered. This case reported as non-serious.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation and known safety profile of suspect drug. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.</p>

1070839	3/3/2021	AZ	66	F	2/11/2021	2/11/2021	Bad, strong chemical taste in mouth from approximately 10 minutes after vaccination for about 6 days after. Slight confusion from about 15 minutes after vaccination, lasting about 15 minutes. Second morning after vaccination woke up seeing a greenish tint to my vision. That cleared in about 5 minutes after drinking a cup of water. Besides these more unusual reactions, my vaccinated arm was sore for several days and I had a runny nose for about 30 -60 minutes on the 4th day afterward and some queasiness and upset stomach also for a day on the 4th day with some fatigue.

1069954	3/3/2021	AR	59	F	1/12/2021	1/12/2021	It felt like I was shot with a shot gun in my left arm with immediate soreness and feverish for 4 or 5 days. I had 48 hours of body aching all over, stomach pain that lasted for 3 or 4 days that was intermittent. I had left side of the neck and left eye pain.
1069940	3/3/2021	CA	33	M	2/18/2021	2/22/2021	Developed iritis form of uveitis shortly after getting vaccine. Felt feverish and very fatigued and sore the day after the vaccine (3/19/21), which was unexpected as I am generally healthy and do not recall having an adverse reaction to a vaccine before. Noticed prominent symptoms of iritis by around 2/22/21, but they may have been occurring earlier as I did not know what was happening to me. Symptoms started off as occasional aching of my right eye, but it eventually got inflamed and extra sensitive to light, and I experienced worse redness and aching/pain and photosensitivity by 2/26/21 when I scheduled an appointment with an optometrist. Pain/sensitivity was intermittent from 2/26/21 to 3/1/21, but redness remained. On 3/1/21, my optometrist tentatively diagnosed me with mild iritis and referred me to an ophthalmologist. On 3/1/21, an ophthalmologist diagnosed me with iritis/anterior uveitis, and I began a treatment of prednisolone acetate 1% drops. thought my development of iritis may have been related to me getting my first dose of the Covid-19 Moderna vaccine shortly before getting symptoms. Hoping to recover within a few weeks. Have a follow-up appointment scheduled for 3/10/21.
1069577	3/3/2021		67	F	1/27/2021	2/1/2021	6 days after receiving the vaccine patient started having mouth problems, loss of taste and smell. Also had vision changes.

1069986	3/3/2021	AK	44	F	2/25/2021	2/25/2021	2/25/21 11:36 AM Patient states that her symptoms (swollen around left eye to her throat, right side of her face feels fine, tight through, light bumpy rash on her chin) increased over the last hour and now do not seem to be getting worse. She is able to breathe without difficulty. She will take 50 mg Benadryl and if symptoms progress she will go to the ER for further treatment and evaluation of an allergic reaction to COVID vaccine. She will call Dr. back later and may need note for work. 2/26 11:30 AM Received text message from patient. "I woke up with trouble breathing, hives on my neck and jaw and swollen face. Nausea and diarrhea. Trouble swallowing so I took Benadryl. Swelling went down on face but still tight in throat. . Dr. "instructed her to go to ER if symptoms worsen and told her I would check on her on Monday. I asked her if her symptoms were not changed, worse, or improved. She answered: "They got worse this am from 5 to 10 and feeling better now. As far as swelling and breathing feels better. 3/1 10:21 AM Dr. Spoke with patient 10:21 am. She states that she is feeling much better and no longer has difficulty breathing or feeling of throat tightness. She does still have nausea, with occasional vomiting, and diarrhea. She felt well enough to return to work today. 3/3 11:09 AM Dr. spoke with patient. She stated that she is finally feeling "back to normal". We discussed severity of side effects and recommendation to defer 2nd Pfizer vaccination. She stated that at one point she was "close to going to the ER".

1069806	3/3/2021	OR	41	F	2/18/2021	2/21/2021	Patient received her second covid 19 vaccine on the 18th of February - about four hours after she developed some soreness, fatigue and had a hard time moving her arm. Continued for a couple of days. Sunday 2/21 patient woke up without taste and her tongue was numb. That evening she began having some neck pain, below her ear, she massaged and didn't help all that well. At around 3 am that night, the pain was entirely on the right side of her neck and face, she took ibuprofen which mildly helped at night it was the entire neck. Monday 2/22 patient massaged area and it helped a little. She continued to have pain Tuesday 2/23 - Around 9am that morning patient noticed right sided facial drooping and her tongue was not working properly. She also noticed that her eye would not respond like her left eye. It was sluggish. When she went to brush her teeth, she noticed that the water would not stay in her mouth and it came out. At around 7pm that evening she went to the emergency room
1069994	3/3/2021	LA	53	F	3/2/2021	3/2/2021	Body aches, fatigue, mild headache, eyes hurt. Feel feverish but have no fever
1070543	3/3/2021	NY	38	F	2/2/2021	2/3/2021	2/2/2021 vaccination 2/3/2021 24 hours later, I was getting really fatigue at work. Got to the point where hard time keeping eyes open, muscle stiffness, HA, chills, temp 100.5 was the highest. 3 days i felt run down, terrible body aches, HA. *other symptoms have subsided EXCEPT the HA. I wake up daily with HA. I try to alternate between Excedrin, Tylenol and hot compress. **1st vaccine; 'Covid arm'
1070538	3/3/2021	MP	33	F	1/11/2021	1/11/2021	I started feeling sick 7 hrs after the vaccine I developed chills, fevers, fatigue. My fever went up to 102.9, my eyes started to swell, I felt congestion. I went to the ER on 1/11/2021 at around 11pm they gave me medications. The next day I also had diarrhea. The fevers resolved by the following day the body aches & the chills lasted for 1 week & the diarrhea lasted for 1 day. Fatigue is still going on & off it has not completely resolved.

1070000	3/3/2021	NJ	63	F	2/27/2021	3/3/2021	4 days after getting the vaccine feeling extremely tired in the afternoon and like I was zoning out, and have had that feeling when my blood pressure has spiked before, but this was even worse--could barely keep my eyes open and felt weird, so measured my BP, and it initially read 190/151 which could not be right, but I know it was high. I took it again a little while after, and it was down to 140/90, but usually is not that high when I've taken my full medication in the morning, which I did. I then took my Spironolactone. BP was high for about an hour and then came down. Don't know if it's related to the vaccine, but I haven't had it spike in quite a while, especially if I have taken my full amount of Losartan (which is 50mg), and while it may not have been 190, I know it was higher than it's ever spiked because I felt worse, and I can always feel when my BP goes up. (There are days when my BP is too low to take the full pill, so I take half, but this day, I had taken the full pill.) So, as I said, not sure if it's related to the vaccine or not, but was the worst I felt during a BP spike and lasted longer than ever did as well, but then came down without having to take any more medication except the Spironolactone, but it had come down a bit before that kicked in.
1070062	3/3/2021	WA	54	F	3/2/2021	3/2/2021	Rash, hives, swelling face, mouth tongue, nose, ears, eyes. Beet red face. Blood pressure normally low 110/70 but went from 166/86 at 1333 HR 80 O2 100%, then BP 163/88 at 1404 HR 74 O2 100%, then at 1409 HR 68 BP 175/110 RR24 O2 100% 1405 - 911 called took benadryll at 1330 (25 mg) then again 1349 took 2nd dose of benadryll 25 mg liquid capsules. PT has adverse reactions to epinephrine. 1412 tongue swelling. by 330 pm patient went home prepared to go to ER if anything changed. She walked around in cool air and had hives move around her body. Not shot in upper right arm. It was tasted during injection. Then after the shot reactions kicked in at 20 minutes moving up the right side primarily same as shot side. Arms, chest, and face flush off and on. Swelling moved around.

1070537	3/3/2021	MO	49	M	3/2/2021	3/2/2021	Administered Moderna vaccination at 1746 and patient stated that he has experienced vagal responses to injections in the past. Patient remained in the vaccination chair for 5 minutes after injection and he reported feeling well and moved to the observation chair without any problems [~10ft]. After being the observation chair patient stood up and took 4-5 steps toward the wall and sat down on the floor. The patient stated he felt dizzy and then became limp & slumped to the right side, eyes remained open with dilation of pupil fixed at 2mm with no blinking noted. Patient's breathing pattern became shallow & snoring sounds noted. Patient did not respond when spoken to nor did he respond to soft shaking of shoulders. Patient began to demonstrate large jerky body movements similar to seizure activity. The seizure like activity continued for 3-4 minutes before the patient was able to become aware of surroundings and answer orientation questions. BP 120/72, HR 64, O2 sats 99%, RR 20. Patient was diaphoretic, pale, shaking of hands and arms, restlessness of lower limbs with frequent repositioning/twitching of legs. EMS arrived to find the patient regaining stability. Patient reported to EMS that his is familiar with this type of response and declined to be taken to
1070024	3/3/2021	MS	69	F	1/25/2021	2/9/2021	After 2nd dose, malaise day after shot. No fever. No trouble breathing. No loss of vision. Did have 2nd cataract surgery between 1st and 2nd dose. Developed numbness on left side toward eye on or about 2 week prior to 2nd dose (on 2/29/21). Additional numbing sensation started across the face (around the mouth and across the eye area) the night after the 2nd dose. Still there. Doesn't seem to have worsened or improved at the time of this report. Had eye Dr. appointment today (3/3/21) and he stated he didn't have any answers as to why this was occurring. Patient didn't report until today thinking it was related to eye surgeries. 1st dose 1/25/2021 2nd dose 2/22/21

1066201	3/2/2021	FL	69	F	2/24/2021	2/24/2021	About one hour post inoculation my speech became jibberish. Cognitively, I could organize my thoughts and knew exactly what I wanted to express to my husband and our waitress, but when I opened my mouth to speak, only jibberish came out. I couldn't say anything meaningful. It lasted about 2+ hours and hasn't reoccured. That night when I went to bed I was extremely light sensitive. We had the usual degree of light in our bedroom but with my eyes closed it felt like all the overhead lights in the room were on. I had to block out the alarm clock, but that was the only adjustment that could be made. Drapes were closed and no other lights of any kind were on. That was bothersome for the first couple of nights. I'm still having a difficult time falling asleep when I go to bed and staying asleep all night. My "fight or flight" response is highly charged.

1066166	3/2/2021	NE	80	M	2/12/2021	3/1/2021	Patient is an 80-year-old male that is admitted for observation status for recent TIA symptoms and bradycardia. He was seen in the emergency room this morning at approximately for complaints of posterior head and neck pressure, right arm numbness and tingling as well as a mild blurry vision in his right eye. Patient states that the symptoms from the right arm and eye blurriness lasted less than 1 hour. And has completely resolved at this time. Patient states that he still does have some posterior neck tightness. But most of this is on the left side at this point. Patient denies any increase in physical activity that he could attribute to the onset of the neck pain. Patient states that it does feel tight when he turns his head from side to side. Patient states that he no longer has a headache. He does have a history of a possible mini stroke approximately 10 years ago. He has had no other recent cardiac problems, or any other strokelike symptoms since that time. Patient takes medications for his cholesterol and a baby aspirin daily. Patient is fairly active and continues to drive a semi-5 days a week. TIA Neurochecks every 4 hours Carotid Dopplers 3/2 Bradycardia Echocardiogram 3/2 Last echo 1/4/2019, EF 60% Discharged home 3/2/21.

1066278	3/2/2021	MO	55	F	2/19/2021	2/19/2021	Per patient's report: She received her first dose of Pfizer COVID-19 vaccine and developed soreness at localized injection site and felt sleepy, otherwise no adverse reaction signs or symptoms patient reported. On 2-19-21 at 2:30 PM she received her second dose of the Pfizer COVID-19 vaccine at a mall. She reports the lot number of the vaccine was EL9269. She was monitored for 15 minutes after receiving the second dose. She and her husband left and took the car to a car wash where she fell asleep on her way home and her husband woke her up when they got home. At about 320 or 3:25 PM, she noticed that her face felt puffy and she had a sensation that her face was sliding down, she developed tongue swelling, blurry vision, dizziness, and she reports that she was talking funny/slurring her words. Her husband got a flashlight and looked in her throat and said that her throat was swelling. She felt like falling asleep. Her husband used her EpiPen on her. The EpiPen worked right away to improve the symptoms. She took no other treatments at home. Her husband drove her to the hospital where she slept the entire way. She never developed rash, flushing, skin itching, wheezing, coughing, chest tightness, shortness of breath, nausea, vomiting, diarrhea, fevers, chills, or joint pains. She does not know if she passed out, she states it was hard to stay awake. She reports having some abdominal cramping and churning for the following 2 to 3 days afterwards. She was discharged from the hospital ED where she was never admitted. They gave her an albuterol inhaler to use every 4 hours for 6 days after she left the ED. She went home at about 10:00 PM and went to bed about 10:30 PM. She woke up at 3:00 AM crying and then fell back asleep and woke up again around 7:30 AM. She did not develop any local injection site reactions on her arm this time.

1066284	3/2/2021	WA	68	F	2/26/2021	2/26/2021	In the clinic, patient received second dose of Moderna vaccine at 1630. At 16:40 c/o difficulty breathing, feeling light headed, tingling lips, eyes puffy. BP 187/77, HR 84, O2 Sat=84. Rapid Response Team (RRT) activated, patient took Benadryl 25mg PO, symptoms not improving, transported to the ED via stretcher with the RRT. In the ED, patient presented afebrile, hemodynamically stable, no acute distress. Physical exam overall unrevealing. No apparent hives, facial swelling, oropharyngeal swelling or wheeze. Patient stated the symptoms feel significantly better. Patient given 25 mg Benadryl and 20 mg famotidine via IV. Observed in the emergency department for almost 3 hours. No resurgence of symptoms, no rash, no wheeze, no nausea or vomiting. Patient discharged home, advised to take another dose of Benadryl later at night, and reevaluate symptoms in the morning. Advised to follow-up promptly with primary care. Strict return precautions given.
1066309	3/2/2021	VA	56	F	2/9/2021	2/14/2021	On February 14, five days after second Covid shot, patient woke up with ulcer in corner of left eye and growing pain in eye itself. Eye was watering and red and very painful. Symptoms persisted. On February 24, patient went to Urgent Care who found ulcerations on cornea and referred to ophthalmologist, Dr., who suspected herpes sores, perhaps due to an immune system reaction to the second Covid shot. Treated with eye drops (Moxifloxacin, 0.5% 4 times daily), and oral antiviral (Valacyclovir HCL, 500 mg 2 tablets three times daily). Eye is MUCH improved, but the ulceration has not entirely disappeared. It is to be hoped that completing the Moxifloxacin and Valcyclovir regimen will completely clear the damage, but there is some concern that there may be permanent scarring. A fourth examination is scheduled for March 10.

1065082	3/2/2021	NM	56	M	1/28/2021	1/28/2021	Anaphylactic reaction; A spontaneous report was received from a physician concerning a 56-year-old, male patient, who received their first of two planned doses of mRNA-1273, and who developed anaphylactic reaction. The patient's medical history included blindness and severe allergies to shellfish. Products known to have been used by the patient, within two weeks prior to the event, included Losartan and Melatonin. On 28 JAN 2021, approximately 15 minutes prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 (Batch number: 032L20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. Patient's wife called to indicate that her husband had an anaphylactic reaction to the mRNA-1273 vaccine. Patient received the vaccine on 28 JAN 2021 in his left arm. Patient's wife indicated that her husband texted her at 3.21 pm to let her know that he has gotten the shot, indicating that he must have received it around 3.19 pm. Patient's wife indicated that around 3.34 pm, patient said he'd had an anaphylactic reaction, that he had administered a shot of epinephrine and that an ambulance was on its way. The patient's wife noted that the reaction happened within 15 minutes or so. Once in the hospital, the patient was administered Pepcid and Steroid orally. Additional treatment medication for the event included the previously epinephrine and a shot of Benadryl. Action taken with mRNA-1273 in response to the event(s) was not provided/unknown. The outcome of the event was unknown.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the onset date of the event, a causal relationship cannot be excluded. Patient's significant medical history included severe allergies to shellfish.

1065125	3/2/2021	NJ	43	F	2/10/2021	2/14/2021	heart rate jumped up; thought she was going to pass out; eyes were blurry; This is a spontaneous report from a contactable consumer. A 43-year-old female consumer received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EL9264) on 10Feb2021 at single dose via an unspecified route of administration on left arm for COVID-19 immunization. Relevant medical history included autoimmune issues diagnosed in 2006-2007. Concomitant medications were not reported. After 4 days from vaccination on 14Feb2021 the patient experienced blurred vision, increased heart rate, and feeling that she will pass out (as such) . She went to the Emergency Room and they did two EKGs, two COVID tests, and blood work to check the enzymes in her blood for her cardiac muscle, but there was no reason, nothing they could find about why her heart rate spiked. Patient also reported that her heart rate went up from about 03:00PM up thru midnight last night, and was still not down completely, it was a little erratic, but it was better than it was. She was prescribed treatment at the hospital to bring her heart rate down, but they didn't want to give her more and risk lowering her blood pressure. Patient was monitored through the night, and she was supposed to see a cardiologist there but they didn't show up, so she put a phone call in to hers. She was admitted to the hospital overnight. The patient recovered from the events on an unspecified date.

1065129	3/2/2021	WA	54	M	2/12/2021	2/12/2021	tunnel vision; warm sensation travel from the left shoulder area to my chest/upper stomach; eyes burned; could taste something; heart rate became rapid at a steadily increase amount (113 bpm)/pulse stayed at 92-94 BPM for approximately two hours; felt dizzy; lost speed sensation in the car I was driving; This is a spontaneous report from a contactable consumer (patient himself). A 54-year-old male patient received the first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EN6201), via an unknown route, on 12Feb2021 (at 12:45) at a single dose in the left arm for COVID-19 immunisation. No other vaccine was received in four weeks. Relevant medical history included atrial fibrillation from Jun2020, ablation surgery for atrial fibrillation on unknown date, ongoing atrial tachycardia, and ongoing premature ventricular contractions (PVCs). Past drug history included allergy to penicillin. Relevant concomitant medications included vitamin NOS, mineral NOS (MEGA MEN) and amino acids NOS, carotenoids NOS, herbal NOS, hyaluronic acid, methylsulfonylmethane, minerals NOS, vitamins NOS (GNC MEGA MEN SPORT). Within approximately two minutes of receiving the shot, he felt a warm sensation travel from the left shoulder area to his chest/upper stomach, his eyes burned, he could taste something, and his heart rate became rapid at a steadily increase amount. He watched his heart rate tick up on her watch to approximately 113 BPM. His normal resting heart rate was upper 60s. He felt dizzy and out of it for about 30 minutes. He felt like he had tunnel vision and lost speed sensation in the car he was driving. His pulse stayed at 92-94 BPM for approximately two hours. He wasn't anxious about getting the shot and had actually been looking forward to it. The patient was not treated for the events. The patient had recovered from 'felt dizzy' on 12Feb2021 while the remaining events resolved in Feb2021.

1065155	3/2/2021	IL	60	F	1/6/2021	1/7/2021	Heart attack; Myocarditis; Chills; didn't check her temperature but is sure she had one/She didn't check her temperature but she is sure she had a fever; was soaking wet when she woke up like her fever had broken and then she was fine/She woke up and was very sweaty; achy right side; Headache; This is a spontaneous report from a contactable consumer who reported for herself, a 60-year-old female patient who received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot number: EL3246), via an unspecified route of administration in the right arm, on 06Jan2021 at 18:00 at the age of 60 years, at a single dose for Covid Prevention/COVID-19 immunization. The patient's medical history was not reported. There were no concomitant medications. The patient previously received the first dose of Covid-19 vaccine (Manufacturer: Pfizer, with Lot Number: EK5730) in the right arm, on 18Dec2020 at the age of 60 years for COVID-19 immunization. The patient reported that 13 days after the last dose of the vaccine, on 19Jan2021, she had a heart attack. She has no heart issues whatsoever. She had diagnostic testing such as a cardiac catheterization, echocardiogram, both on 19Jan2021; and a heart MRI with contrast on 20Jan2021. The test results indicated that she had myocarditis caused by a virus. The cardiac catheterization and echocardiogram also revealed heart attack because of myocarditis. She did not have any other issues with her heart. The patient asked if they would they let her know if anything comes up as far as information. The patient has recovered with lasting effects. She would be on medication for the next 3 years supposedly. The heart attack was caused by myocarditis which was caused by a virus. There were no other issues with her heart, arteries or anything. These events required a visit to the emergency room. She first went to a hospital in the city and was transferred via ambulance to another hospital in another city on the same day. Patient was hospitalized for the heart attack and myocarditis from 19Jan2021 to 22Jan2021. She had a lot of other symptoms the next day after receiving the vaccine on 07Jan2021. She also experienced chills. She didn't take her temperature but is sure she had one. She was achy on her whole right side and she had a headache. She started having chills at 1:30 PM (13:30) while at an eye doctors appointment. She laid down and

1065157	3/2/2021			F	2/12/2021	2/12/2021	overly dehydrated; high blood pressure/ blood pressure was 178/122; could not sleep entirely/she was in a semi-sleep state/having insomnia feeling like really bad; could not move or open her eyes; her head felt like exploding; her heart pounding/ heart rate 102; extreme fatigue; This is a spontaneous report from a contactable consumer (the patient). A female patient of an unspecified age received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number not provided), via an unspecified route of administration on 12Jan2021 (age at vaccination unknown) as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number not provided), via an unspecified route of administration on an unspecified date (age at vaccination unknown) as a single dose for COVID-19 immunization, and experienced: arm soreness, nausea, and headache, on an unspecified date. After 1 hour 30 minutes of getting the second dose on 12Feb2021, the patient felt an extreme fatigue and went to sleep. She could not sleep entirely (from an unspecified date) and woke up and went to the bathroom several times after midnight and she tried to wake up at 4 am, but she was in a semi-sleep state half aware and could not move or open her eyes no matter how hard she tried. She described this state as she couldn't move and having insomnia feeling like really bad. When she managed to pull this up, she took her pulse and blood pressure and she was having high blood pressure, her head felt like exploding and also her heart pounding. Her blood pressure was 178/122 and her heart rate 102. She stated that her husband tried to call Pfizer that moment, but they could not get a hold of someone after 30 minutes, so they contacted 911. She was taken to the hospital, and her chest X-ray and EKG were normal (to discard a heart attack). Then they noted that she was overly dehydrated, so they prepared some IV (intravenous) solution for her. The clinical outcome of the events was unknown. Information on Lot /Batch Number has been requested.

1065728	3/2/2021	OH	71	F	2/9/2021	2/9/2021	About 1 hour and 15 minutes after receiving the vaccine I became dizzy. 3 1/5 hours later I developed chills which lasted briefly. The next day I had huge area on my left eye on my pupil which lasted for 5 days. I have blue eyes and right at toward the end of the blue I have white deposits. On 2/24/2021 I went see an eye doctor Dr. He diagnosed me with "whiss" ring around both of my eyes, and seen spot on my lenses on my left eye. I started starburst with my left eye, this did not develop until after I received the vaccine. I have a dot on my right eye now. On 02/26/2021 see another eye doctor Dr., he also said I have deposits around my cornea, acknowledged the starburst effect on the left eye, and noticed the "whiss" ring. Since I took the vaccine my eyes have become very light sensitive. The doctors have told me this conditions are permanent, if it gets worse they will have to scrape the eye and have a laser surgery. I do not remember when it started but it 2inches by 3 inches, red patch which started at the injection site and went diagonal.
1065729	3/2/2021	MI	60	F	2/17/2021	2/27/2021	She received Moderna COVID-19 vaccine 2/17/21 and developed symptoms of left ear discomfort followed by left sided facial and eye droop on 2/27/21. She was seen by MD on 2/27/21 and was confirmed to have Bell's Palsy. She was given prednisone with taper and valacyclovir for 7 days. Also advised to wear an eye patch.

1065745	3/2/2021	FL	66	F	1/5/2021	1/5/2021	<p>She received first dose of Moderna vaccination on 1/5/2021 into left deltoid. It was painless. Approximately half an hour after injection, she began to feel tingling in the left arm, hand, and fingers. It resolved on its own and she was fatigued that evening and went to bed early. The next day she had soreness of the arm, fatigue coming through the day in waves. On 1/7, low grade fever of 99.1, headache, and fatigue. She slept for 14 hours. From 1/8-11 she had no significant issues although she did feel slightly off balance. On 1/12, she noticed left axillae lymphadenopathy and had soreness at the injection site again, which worsened the next day. On 1/14, arm was red, swollen, and tender to touch. These symptoms persisted the next day and she began to have numbness and pins and needles of the left hand. She was given 7 days of dexamethadone and cephalexin by her PCP. She slept very poorly. The next day, the numbness, swelling, and redness were all improved. On 1/17, she continued to gradually improve and there was no swelling and only slight numbness. She did have fatigue, headaches, and insomnia. On 1/21, she had visit with an allergist to discuss preventative measure for second dose. A delayed reaction was theorized and a preventative course of premedications was outlined. The next day, the numbness in the hand worsened and headache returned. On 1/23, she felt headache, confusoin, anger, imbalance, pins and needles in the hand, difficulty holding a glass with one hand. On 1/24 pain at the injection site recurred. She felt there was change in her vision and hearing, nausea, vibration throughout the body, mouth numbness, and heart racing. On 1/25 all these symptoms persisted other than improvement in confusion. On 1/26-27, she had continued pins and needles in hands and feet. Still felt vision and hearing were "off". She was fatigued and body felt "like jello". On 1/28, she was prescribed a second course of dexamethasone as well as citalopram 20mg and diazepam. With citalopram, she had nausea, hot/cold sensations, dizziness, insomnia. She also had itching of the arm, back, leg; tremor, thirst, and pallaor. She reported symptoms to PCP and citalopram was discontinued next day. On 1/30-31 she felt disoriented at times, intermittent arm soreness, noted small abnormal bruising, hot/cold, off balance, headache, and fatigue. Since that time, predominant symptoms have been daily</p>

1065780	3/2/2021	NC	73	F	2/28/2021	2/28/2021	Patient presented today for second dose of COVID vaccine. She tolerated her first dose well. She has h/o elevated BP and "flushed" feeling with various meds including once when she was doing a bowel prep for a colonoscopy. We decided to monitor her for 30 minutes and she felt fine throughout. As she was walking to her car she felt "flushed" and a bit light headed so she returned to the monitoring area. Initial BP was 189/77, pulse 110, O2 sat 100%. We brought her to the back room so she could sit in a recliner and remove her mask. Subsequent BP 186/77, pulse 86 then 184/69, pulse 80 about 20 minutes later. O2 sat remained upper 90s to 100%. She continued to report feeling "flushed" and noted pressure/pain behind her left eye so we elected to call EMS (and this was also patient request to go to the ED) so she could be evaluated. She drove herself to appointment. Her plan was to call her son to have him meet her at the ED. She left via ambulance in stable condition.

1065911	3/2/2021	IL		M	1/21/2021	1/22/2021	Double vision; FATIGUED; A spontaneous report was received from a consumer concerning a 65-year-old, male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced double vision and fatigue. The patient's medical history, as provided by the reporter included cancer, diabetes, hypertension, celiac disease and whipple's operation. No concomitant medications were reported. On 21 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: 029K20A) intramuscularly for prophylaxis of COVID-19 infection. On 22 Jan 2021, the patient experienced double vision and fatigue. The patient was advised by the eye doctor to go into the emergency room (ER) if the symptoms didn't subside. However, it was reported that the vision did get better. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not provided. The event, double vision, was considered resolved on an unknown date. The outcome for the event fatigue was unknown.; Reporter's Comments: Based on the current available information, a strong temporal association between the use of the product and the onset of the reported event, a causal relationship cannot be excluded. Fatigue is consistent with the known safety profile of the mRNA-1273 vaccine.

1065675	3/2/2021	FL	59	F	2/27/2021	2/28/2021	Body aches, fever (101.5), swollen eye lids and beneath eyes, headache, upper back aches, chills
1067297	3/2/2021	NV	71	F	1/26/2021	1/29/2021	On 1/29, my vision blurred and I could not read the computer e-mails and there were wavy lines in my peripheral left side vision. My blood pressure sky rocketed to 190/82 and I am always in the 120s over 70s or so. I went to the ER where I was given an EKG, a head CT scan, blood work was also done. Next day I had an MRI of my head. All was done to rule out a TIA. Final diagnosis was probably an Ocular Migraine which I have never had. I followed up with an eye doctor who said my eyes were fine. Whether this was coincidental or a reaction to the Covid shot, no one could tell me. I felt fine next day and have not had any other ocular migraines.
1067053	3/2/2021		43	F	3/2/2021	3/2/2021	Lightheaded, blurred vision, flushed feeling, shaky, tightness in neck, diaphoretic. Evaluated by EMS. 1:09PM -Jaw slightly tight. 1:20 pm pain, stiffness traveling to mid back. 1:25 pm neck feeling better, no nausea, tinling in hands, no change in sensation in legs. 1:30pm remains lightheaded, vision remains blurry, c/o left sided chest discomfort when pressure applied, pain and stiffness in neck returning. 1:42 pm transported to Hospital by rescue squad.
1067101	3/2/2021	NY	59	F	1/28/2021	2/28/2021	viral conjunctivitis in left eye - for this diagnosis, I went to Vision Care

1067033	3/2/2021	NV	81	M	2/27/2021	2/28/2021	Raised Bump on face similar to a small lentil bean. Then got bigger then more on face then on neck and scalp then on back now chest also. They vary in size and redness. Some are near the eyes. He took Benadryl then after urgent care started doxycycline by late 100 mg. March 1st they are getting worse. They would not run blood work though he asked for some.
1067294	3/2/2021	IL	69	M	3/1/2021	3/2/2021	Began feeling poorly at 1:30pm as if physically drained; pain in every joint and large muscle group; excruciating light sensitivity/pain in eyes; approx 5:30pm upper back muscles in great pain; then pain in lower body including backs of thighs, scrotum, and anus; approx 6pm stiffness and pain shifted to fingers and toes; by 6:30pm entire body feels dull heaviness/pain/extreme fatigue. Slept less than 2 hours, now 6:45pm.
1067339	3/2/2021	CA	51	F	2/27/2021	2/27/2021	Pt. is a 51 y/o female reporting feeling she would pass out 15" into her 30" post-covid 19 first vaccine observation period. Reports felt dizzy slightly immediately after vaccine injection then progressed in observation area. Scheduled for 30" observation due to reported anaphylactic reaction per patient to Tylenol. When first observed by physician in observation at 4:10, nursing staff was holding her upright in chair, eyes were closed, face flushed markedly and a few myoclonic movements were noted in both arms. She did open eyes to command but stated she was going to pass out and wanted to lie down. A Emergency responders call was immediately placed, she was transferred into wheelchair with continued nursing support and brought into office where placed in supine position. First vitals were as stated below. 4:15PM supine vitals: BP 106/68, HR 95, O2 sat 99% Emergency responders was called at 4:28pm
1067310	3/2/2021	TX	60	F	2/19/2021	2/27/2021	At first I didn't feel anything or any different. I started to get a weird sensation behind my eyes like before with the first vaccine. The muscles of my eyes and eye lids feel weak and difficult to focus. I started having extreme nausea and could not go to work. No appetite either. I now have Oscillopsia and feel sick.

1067317	3/2/2021	OH	66	F	2/25/2021	2/25/2021	An estimation of about five minutes after receiving the Covid19 (Moderna) vaccine, my heartrate increased to around 100 beats a minute (as told to me by Dr. ). My breathing felt a little different but it could have been from wearing two masks for a longer period of time than usual. After ten or fifteen minutes, I felt sort of dizziness and it didn't feel quite normal around my eyes and forehead. The staff were extremely attentive to me. I probably was there after the shot for 30-45 minutes. Dr. suggested my symptoms was due to anxiety and out of an abundance of caution, the emergency squad was called and I was taken to Hospital Emergency Department.
1067363	3/2/2021		90	F	2/19/2021	2/19/2021	Outbreak of rash all over body, causing rough, flaky skin; itchy, burning eyes. Neither antihistimine tablets nor eye drops provided any relief.
1067409	3/2/2021	TN	30	M	2/13/2021	2/13/2021	Hours after vaccination I began to have a fever. Woke up with body aches and a fever of 104.00 Fahrenheit. Fever lasted 24 hours, body aches lasted a full week including severe headache. I started experiencing severe pain on my left eye by day three post vaccination. I had to seek medical attention and was diagnosed with scleritis. Doctor encouraged me to file a report on my symptoms. I also got mouth sores and pain in my throat. Tonsils were inflamed and red.
1067420	3/2/2021	VA	79	F	2/7/2021	2/17/2021	Second dose of Covid vaccine given on 2/7/21. Administered at central location. Taken to hospital for possible stroke like symptoms with drooping to right eye and mouth, difficulty swallowing, and feeling odd. Admitted and treated from 2/18/21 thru 2/22/21.
1067453	3/2/2021	CT	54	F	3/2/2021	3/2/2021	Post vaccination and while in recovery experienced itchy eyes, proceeded by swelling of upper lip, itchy throat and coughing. Remained alert and oriented to person, place and time. Rapid Response Team called, vaccine recipient transported to Emergency Room. Release to home post recovery.

1068429	3/2/2021	UT	65	F	3/2/2021	3/2/2021	patient started feeling dizzy and sweaty about 5 minutes after vaccine given and was sitting in chair and falling to the side. I tried talking to her and getting her attention and she would look at me and then close her eyes like she was going to pass out. She started talking to me and after a couple minutes then began to complain about a sick stomach and started vomiting and diarrhea on and off for about an hour. Patient would seem to feel better but then vomit again. After about an hour she had us call her daughter to come get her to take her home. Daughter came to get her and she was still complaining her stomach hurt. I called patients daughter a few hours later and she said her mom was still feeling sick and I told her to call her doctor or take her to the ER if she didn't start feeling better soon.
1068432	3/2/2021	TX	38	F	2/10/2021	2/10/2021	Very painful arm and back pain for 2 days. The day after the vaccine I had very bad headache and my eyes were hurting so much. The second day, I also had body aches. It's been about 3 weeks and I have some pain on my back and chest. I'm not sure if it's related. I seemed to have it after the vaccine. I also feel out of breath often. I am now fearful of getting the second vaccine, since the first one was so bad for me.

1066479	3/2/2021	MS	58	F	12/30/2020	12/31/2020	It was 24hrs after chills Temp 101 for 24b hours, body aches headache fatigue 48 hours after diarrhea and very sore left arm. Diarrhea lasted 48 hours. At 72 hours my right eye was sore on the lower eyelid and underneath the eye was sore. I developed a Sty on the right eye. I got drops for my eye and it got better Later on that night I had hot flashes and night sweats. I am still having hot flashes. Start about 4am. No symptoms after 2nd dose took Tylenol after shot and only a little arm soreness.
1067284	3/2/2021	CA	73	F	2/12/2021	2/22/2021	About ten days after vaccination, hives began to show up on my lower abdomen . Since then, hives appeared in many areas of my body as well as itching where there are no hives. My eyes are also itchy. The hives and itching become worse when my body heats up during exercise or when covered by warm clothing or blankets. I'm taking 2 Benadryl every six hours, which provides relief but not entirely. This has been going on for 9 days now. I eliminated eggs and Teeccino Dandelion Dark Roast from my diet several days ago and cut my probiotic dosage in half, thinking these might be the culprits, but so far I continue to itch and have hives.
1066637	3/2/2021		67	F	3/2/2021	3/2/2021	Lightheaded, woozy, no nausea, no tunnel vision.
1066458	3/2/2021	AK	35	F	2/15/2021	2/26/2021	Sudden decrease in vision in my right eye. I went to the eye doctor. He said I was having a viral response in my eye. The only exposure to anything viral in the last month was the vaccine. No history of eye issues or other viral exposures.

Notable PMHx: CHF, morbid obesity, diabetes, Patient is 3 weeks out from hospitalization for COVID-19 pneumonia. She has been more confused over the couple of days before admission. Because of altered mental status, patient was transferred to the emergency room. Patient also had some shortness of breath. In the ER, she had a chest x-ray which showed moderate interstitial infiltrate secondary to pulmonary edema or pneumonia. Lab work did show a UTI. BNP was normal at 45. Creatinine was near her baseline at 1.8. She did have elevated alkaline phosphatase at 452. White count was elevated at 14.7. Patient was difficult to arouse in the ER. On my exam, patient is difficult to arouse. After shaking her shoulder and yelling at her, she did open her eyes and say to me "I'm ok" before closing her eyes again. She is satting well on nasal canula oxygen.

2/27/2021

2/27/2021

My skin turned red immediately after the injection. The EMT Staff examined me and my pulse, temperature and blood pressure were normal. After 45 minutes the redness abated and I came home, 1 March 2021 I came down with COVID symptoms with dizziness, blurry vision, redness, ringing in the ear and flu like symptoms of body aches. Then the neuralgia in the dextral ulnar nerve increased and clawing started. Then same happened on the sinistral ulnar nerve and Carpal tunnel in the other finders. I feared going to sleep for fear of awaking with paralysis. I drank vodka to calm myself down and Xanax to sleep (I know it is a dangerous combination). 2 March the red skin continues and when I awoke at 13:30 today I was still extreme and I called 911. The EMS visited and determined my blood pressure and pulse were normal. The dextral ulnar nerve problems continue,

1066924	3/2/2021		78	F	2/6/2021	2/10/2021	Neurology consult 2/13/21: This is a 78-year-old female we were consulted by Dr. for possible guillian barre s/p COVID vaccine. The patient tells me that she was in her normal state of health, and she received her 1st dose of the COVID-19 vaccine seen 7 days ago. Subsequent to that, the next day she developed chills, fatigue that continued for approximately 2 days. She states that 3 days ago, she woke up and was unable to lift her legs or get herself out of bed on her own. She felt weak in her proximal lower extremities and her trunk. She denied any bandlike sensations or paresthesias. She cannot tell me that she developed any distal lower extremity weakness initially but felt that it was the acute onset. She needed some help her out of bed when she was upright, she was able to use her walker to slowly get to the factor. She may have had some urinary incontinence, she does complain of diarrhea now. Denies any tingling sensation, no bulbar symptoms. This is a 78-year-old female who we were asked to evaluate for possible Guillain-Barre syndrome. She had acute onset of lower much greater than upper extremity weakness without any definite ascending features, of relevance, is that she received the COVID-19 vaccine 3 days prior to the onset of her symptoms. She did exhibit flu-like symptoms prior to this. Given that she does not have any specific area of intrathecal enhancement to suggest Guillain-Barre or other areas of radiculitis, I think it is reasonable to proceed with lumbar puncture to look for any other source. --Given the findings on the MRI cervical and lumbar spine including enhancement of the bilateral sacral S1 region, I would like Neurosurgery to further evaluate. -- would likely benefit from CT chest abdomen pelvis to rule out any underlying occult malignancy particularly if workup remains unremarkable. -- continue supportive care, monitor for shortness of breath, new vital capacities Patient remains admitted to the hospital with continued weakness at the time of this report

1066930	3/2/2021	CA	35	F	2/23/2021	2/23/2021	After covid vaccine 2/23/21 started blurred vision and lightheadedness. No itching rash. Provided juice crackers and monitored x 1 hour. Next day, hives and swollen at home. Face swollen Took Benadryl and that relieved those symptoms Called in sick.. Also had body aches and chills lasted x a few hours . 2/25 and 2/26 went to work and was fatigued but okay. Daughter got sick on 2/26 she is asthmatic PND, seasonal allergies and is testing later today. Employee is getting evaluated today at Urgent care. Today 3/2 ee has sore throat and runny nose now is going for testing today.
1066835	3/2/2021	MI	54	F	2/27/2021	2/28/2021	I had my 2nd does of the Pfizer vaccine on February 27, 2021. The next morning I awoke with a very bad headache. I took and Advil. My husband was making breakfast. I came downstairs, ate, had a cup of coffee, then got a glass of water and an ice pack and sat on a recliner in the living room. I don't remember much of the rest. It was like a dream. My husband said I let out a yell, my arms flailed and my eyes were very strange. I lost muscle strength in my left side mimicking a stroke. He called 911. I was taken to Emergency facility where I gained consciousness. I was then transferred to Hospital. So far every test has come back negative. I have an EEG scheduled for this Thursday.
1066819	3/2/2021	AL	73	F	2/22/2021	2/23/2021	Patient reports at 2 AM the morning after the injection she began to have itching and some swelling that morning, she states her right eye became matted as well. Patient applied warm compressed to the eye and was had a telehealth visit with her MD. Patient was told it was not caused by the vaccine. Patient was given Antibiotic eye drops to apply 4 times daily (2 drops each eye). At this time her right eye is better, there is still some redness in the lower eye lid at this time.
1066816	3/2/2021	CA	75	F	2/17/2021	2/18/2021	For 1st injection, itching on frontal edge of both armpits. Noticed day after injection. Still present as of 3-2-21. Cortisone cream, Diphenhydramine Hydrochloride cream 2%; after second injection Benadryl seemed to help. For 2nd injection, itching all over body beginning day after injection, worse day later. Benadryl for 3 days. After that some tolerable itching for 3 days (didn't take Benadryl beyond this time because dried eyes.)

1062704	3/1/2021	OH	67	F	2/15/2021	2/24/2021	<p>Patient called in and reported a side effect to her COVID-19 vaccine. This patient states that she received her first dose of the vaccine on 2/15/2021 and on 2/24/2021 @ approx. 4:30p she began to feel pain in the arm where her injection was given. The patient reports that within 2 hours she had excessive swelling and redness in her arm. She called in and spoke to CNP about her symptoms. The patient also states that this morning she followed up with her PCP and was told that she was having a reaction to two stabilizers in the vaccine, Thromethamine and Thomethamine Hydrochloride. At this time her arm was excessively swollen and the Dr. could visualize it through her clothing as well as excessive redness. The patient denies any numbness, tingling, or skin changes (color/temp) in her arm. The patient is allergic to steroids so her the treatment regimen from her Dr. is Ibuprofen by day and Benadryl by night until the symptoms subside. The patient was also told not to take her second dose of the vaccine and wishes to cancel that appointment. Upon looking in the chart it appears that she was scheduled for her second dose of the vaccine on two separate days. I left the chart as is and will wait for further instructions. The patient gave verbal permission to contact/speak with her PCP regarding this matter.</p>

1062678	3/1/2021	CT	60	F	2/9/2021	2/9/2021	<p>About an hour after receiving the vaccine my arm was very sore, it felt like someone punched me in my arm. That night I couldn't lift my arm. I took Tylenol and put on ice on it. The next morning, I was going to the bathroom and I almost passed out. I was able to catch myself before I passed out. I felt nauseous and dizzy, I felt like I was going to throw up but I couldn't. I had chills. I went downstairs to try and drink some orange juice, I sat here and was gasping to catch my breathe. I kept thinking it was just my anxiety and kept trying to catch my breathe. I kept drinking the orange juice and the dizziness seemed to go away. I went to work, I was tired, chills and this lasted for 2 days. on Friday the 12th the rash (the rash which I developed from the 1st dose) seemed to get worse, when I took a shower, the heat from the water seemed to make the rash redder. I continued Hydrocortisone cream and then switched to Lubiderm. Neither seemed to help much so I kept switching between the two, eventually the rash did get lighter, it went away under my breast area but it is still there on my stomach. I filed a VAERS report for the first dose as well. About 8 days after receiving the vaccine, I have a tattoo on my right thigh and a red bump appeared on my tattoo, it was hurt. It was a bump and the next day the bump burst, it was hard and crusty. Then a rash developed around the tattoo. I have also had on and off fluttering of my eyelid since receiving the vaccine. I had made a dermatology appointment but I canceled it because it seems like the rash is going away and my deductible is to high. 2/26/2021 My right arm from the shoulder from down to fingers, is numb and hurting. Yesterday 02/28/2021, I got up in the morning and felt like I was going to pass out, I came downstairs and I got some orange juice. I got dizzy and couldn't catch my breathe, I told my husband to call 911, because I thought I was having a stroke. My husband said I passed out, my eye and my mouth were open, he shook my shoulders and called my name no response this lasted for about 3-5 seconds, then I take a deep gasp and came back. I was sweating profusely and pale. EMS arrived, transported me to hospital. My blood pressure was high while I was sitting and it was low when I tried to stand. I went to hospital 02/28/2021. The ER diagnosed with my syncope and wanted me to follow with a cardiologist. They believe since it was 2 weeks out since the vaccine,</p>

1062671	3/1/2021	TN	61	F	2/27/2021	2/27/2021	COVID19 (moderna) Shot was taken at 11:00 in the left arm on Saturday Feb 27 At 5:00 PM On Feb 27 my left eye began having black swirlies. They were like black strings. I have NEVER had swirlies in my life. At 8:00 PM Feb 27 on top of the swirlies that had moved to my peripheral vision left side of the left eye, I began having bright flashes like lightening. On Sunday Feb 28 the swirlies stayed just as peripheral vision and the bright flashes were noticed more in the late evening. Today March 1 they are still there and were more noticeable as I was driving to work. As I am typing this the swirlie moves from the center to the left side of the eye.
1062713	3/1/2021	IL	44	F	2/26/2021	2/27/2021	About 12 hours after the shot, I started running a fever and was very achy. It got progressively worse. Around 4:15 am I got up to use the restroom and I passed out. My husband was able to get me to regain consciousness. I then passed out again after about 10 minutes. We then went to the ER because I had a laceration on my eye, and head pain from hitting my night stand, wall, and floor.

1063076	3/1/2021	OH	67	F	2/12/2021	2/12/2021	RN was staffing a Covid clinic at HS. One of our other nurses gave her the 1st Moderna vaccine at 1:45 PM on 2/12/21. At 1:55 PM, the nurse who had given her shot noticed that patient was pale, and said she was not feeling well. Her BP was 179/110, and she said she usually has low BP. She c/o of "feeling hot and was having difficulty breathing." She was seen by our medical director. After 30 minutes, her BP was 120/82. She said she ?felt a little better and called her sister to pick her up.? Later that evening, patient texted me saying I didn?t feel well when I got home, had trouble focusing literally and had a crying jag and felt shaky on the inside. I kept hydrating, took 25 of Benadryl and slept for 2 hrs., now feel close to normal. It was definitely a reaction to the shot-just weird!?! Patient texted me on 2/13/21 that ?the FDA thinks one vaccine may be enough for 80?90% effectiveness, so I might not get the 2nd dose? On 2/15/21 patient texted, ?My PCP thinks what I had was a side effect & recommends taking Benadryl, Zyrtec, or Tylenol before the 2nd injection, and doesn?t seem to be worried about it!?! On 2/19/21, I received a text from patient at 5:28 AM as she was scheduled to staff a Covid clinic that day, beginning at 7:30 AM. She said, ?I have been up for a couple hrs w/severe eye pain and can?t hardly open my eye but it hurts to close it too! At 10:37 AM she texted, ?I just got home from eye doctor and was prescribed drops 4X/day. Apparently, there are pin holes in my sclera & cornea which hurt so bad I had lavender cold pack on all day & couldn?t stand the light. It is a corneal abrasion & I have no idea why that would happen suddenly?!. The following day, she texted me a picture of her L arm injection site which she said was ?very itchy and hot! Not painful-? It was about 6 inches in diameter, red, inflamed, delayed cutaneous rx.
1062857	3/1/2021	IL	43	F	2/25/2021	2/25/2021	Patient stated eyes were itchy and throat itchy. Stated she felt funny. Given 25mg oral Benadryl. Resolution of symptoms before leaving vaccine site

1063020	3/1/2021	MI	69	F	2/21/2021	2/27/2021	Day1- headache in nasal sinus area and between eyes, Day 2- muscle aches, joint pain, dizziness, nausea, lack of appetite. That evening, awoke out of sleep at 3 am with extreme abdominal pain, walked to bathroom and almost passed out, had to lay on the floor for 15 minutes.. After a half our it happened again. No diarrhea but had 2 soft formed stools (very unusual for me). A lot of nausea, weakness and abdominal pain. Chills for 2 days.
1062936	3/1/2021	AL	66	F	2/27/2021	2/27/2021	Patient stated on Saturday afternoon she could feel the vaccine traveling to her head. Described the Headache as a severe Hangover feeling. She reported she stayed in bed all day Sunday. On Sunday the HA moved over her right eye, described as a "dull pain" She also reported her arm to be "very" sore.
1062896	3/1/2021		49	M	1/11/2021	2/15/2021	Feb 15, 2021 Monday, I started feeling pain on the right portion of my neck; Feb 16, 2021 Tuesday, I felt the pain radiating inside my right ear and had a mild headache. Tuesday evening, my wife noticed that I am not fully blinking/closing my right eye; Feb 17, 2021 Wednesday, I didn't have the same pain but there's numbness on my right cheek extending to my right lips. Wednesday afternoon around 2pm, I went to my dentist thinking it was due to my Invisalign which I started on Jan 25, 2021. The dentist told me it is most likely Bell's palsy so I decided to go to Emergency.
1062889	3/1/2021	OH	51	F	2/24/2021	2/25/2021	Received my second dose at 2:00 pm and woke up at 3:00 am with severe muscle/bone pain thruout my hips, buttox, legs, knees and ankles. Had constant headache from 3:00 am till 5:00 pm. Constant chills throughout the day and into the evening. Was unable to rest/sleep do to pain lasting 20 hours. Had blurred farsighted vision throughout the day. Had mild headache lasting 5 hours the second morning after the shot.

Pt states she has a history of fainting after getting blood drawn. Pt denies any head or neck pain. Pt denies any dizziness or blurry vision. Pts pupils are equal and reactive. Pt is moved to the exam room and seated on a cot. Pts vitals are stable. Pt states she is feeling better after laying down for 20 minutes. EMS advised that she should go to the hospital for an evaluation. Pt refused transport to hospital. Pt was walked out to her car/ Pts husband drove her home.
1062863	3/1/2021	PA	52	F	2/24/2021	2/26/2021	I suffered what seemed to be a seizure on Friday 2/24. It was witnessed by my adult daughter. I was seated on a sofa, my eyes closed and I lost consciousness. My daughter reported that my arms went back and forth as did my head. I woke back up and felt dizzy but fine otherwise. I have never had a seizure or anything like that happen to me on the past. I did have all flu like symptoms (fever, chills, body aches, headache) 12 hours post vaccine which I expected to happen. All of these flu like symptoms occurred 2/23 and were essentially gone by 2/24. I am not reporting the flu like symptoms as ?adverse ?. I am simply reporting the seizure like activity that occurred approximately 1:00 pm on 2/24. I did not seek medical attention but I am following up with my doctor. No more seizures have occurred.

1061937	3/1/2021	FL	69	F	1/26/2021	1/26/2021	<p>Feeling numbness in her face around her cheeks and mouth/Her face was really tingling and numb; Feeling numbness in her face around her cheeks and mouth/Her face was really tingling and numb; Difficulty swallowing; Throat started to feel like it was closing up; Tongue got thick; Little blurred vision; This is a spontaneous report from a contactable consumer (the patient). A 69-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot number: UNKNOWN), via an unspecified route of administration, in the right arm on 26Jan2021 at 15:46 PM, (at the age of 69-year) as a single dose for COVID-19 immunization. Medical history included hypertension, pacemaker insertion. Concomitant medication was not reported, however, the patient reported that she takes medicines for hypertension, and is on blood thinners. The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient reported that on 26Jan2021, after receiving the vaccination she did wait a half hour and the only symptoms she thought at the vaccination visit was a little blurred vision, which was temporary and went away. At 16:30, about 45 minutes to 1 hour after she left the vaccination center, as she was driving home, she informed that she was feeling numbness in her face around her cheeks and mouth/face was really tingling and numb, and she had difficulty swallowing; her throat started to feel like it was closing up and her tongue was really thick. She stated she tried to stay calm and forced herself to drink a bottle of water. She had no idea where there was any emergency area since she was not familiar with the area and tried to calm herself down and took sips of water and made sure she was breathing okay and it all went away. The reaction lasted 10-15 minutes and seem to resolve when she was able to calm herself down. She stated it was scary, and once she calmed down it all went away. She was concerned about receiving the second dose. She did not go to a physician or emergency room, but says she probably should have. The clinical outcome of little blurred vision, feeling numbness in her face around her cheeks and mouth/her face was really tingling and numb, difficulty swallowing, throat started to feel like it was closing up, and tongue got thick was recovered. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.</p>

Expiration Date, since the epidural was given at the orthopedist's office. She said she received a notice from her orthopedist, who administered the epidural on 13Jan2021, stating that Pfizer recommended not to have an epidural when having the COVID-19 Vaccine because the epidural may not be as effective. She said she is not going to go back for her second epidural with the orthopedist, but plans to have her second COVID-19 Vaccine dose. She clarified that the letter from her orthopedist stated she can schedule her next epidural a week after receiving the COVID-19 Vaccine. The patient stated she was more concerned about getting her second dose of the COVID-19 Vaccine than getting a second epidural with her orthopedist. The patient reported she still had a half dollar sized red mark at the COVID-19 Vaccine injection site. The clinical outcomes of the vaccine injection site was a little itchy, red, and hot were recovering. The outcome of the event she has been shrinking was unknown.

experiencing now after getting the COVID-19 Vaccine. She reported that her mild headache turned severe over the weekend, and she had to wrap a towel around the back of her head, so she could lay down. She said the headache pain was a sharp pain at the bottom of the back of her head and neck. She clarified she had migraines when she was 12 or 13 years old, but the headache pain she had now is nothing like the migraines she had then. She further clarified that her severe headache feels like a knife in the back of her head and neck. She said the pain is more severe on the right side of her head than the left. She said right now she has pressure in the front of her head with a slight headache. She additionally clarified that the swelling in her left eye comes and goes and is persisting. She said her left eye didn't swell close, but her granddaughter told her it looks like something is wrong with her left eye. She added that she had dizziness this morning when she was going to work. She said she stumbled when she was walking this morning but drove to work anyway. She said when she got to work, she wasn't feeling well on an unspecified date, so she decided to go back home. She said when she was walking to her car, she stumbled again, and fell against her car. She reported when she first got the COVID-19 Vaccine (19Jan2021), she was driving in a bad way. She said after she got her COVID-19 Vaccine, she picked up an elderly lady she sits with, and the elderly lady told her she wasn't normal. She said the elderly lady told her she was too relaxed while she was driving, like she was in a daze. She said the elderly lady said she was scared for her and herself when she was driving. She said the elderly lady asked her to call her when she got home, and she forgot, saying her mind wasn't there. She mentioned that she had to wait 15 minutes after receiving her COVID-19 Vaccine (19Jan2021), and when she was driving home, she had to pull over and get out of her car to vomit. She said she had an acid reflux taste in mouth before she threw up. She said she threw up a little bit last night when she had a severe headache. Clarified her eyes are constantly blurry now. She said she has to put her glasses on to see but has to turn her head sideways in order to see anything past her blurriness. She said her blurry eyes are worse at night. She stated that she was sweating something fierce under her arms, she said she has to

take 3 showers a day now to get rid of the sweating and smell under her arms. She said she has never sweated like that before. She reported her left arm is sore too. She said the left arm pain started immediately after receiving the COVID-19 Vaccine (19Jan2021). She said she has swelling too, and has been rubbing her left arm with alcohol, but the left arm soreness is still there. She reported that she tasted the COVID-19 Vaccine shot when it was administered. She has blown off calling her doctor when she first experienced her side effects, but then her headache got worse. She said she so spoke to doctor 30 minutes before calling Pfizer. She said she told her doctor if her headache comes back, she is going to the emergency room when she gets off work after tonight. She stated that she has been experiencing headaches/muscle spasms that have been getting worse. She says they last 15-20 minutes and then it stops. The headache is above her ear and the pain is "past 10". Yesterday night (unspecified date), the headache was so severe that she wanted to go to the ER but was too tired. The patient reported that she was taking ibuprofen (ADVIL) for her slight headache. She said she took the Advil for a couple days and nights, and her headache eased up some with the Advil. She reported that 2 days ago she bought aspirin, caffeine, acetaminophen (EXCEDRIN MIGRAINE). She also reported that she started taking Ibuprofen when her headaches became severe. She said the Ibuprofen eased the headache, but the headache comes back. Reported she took pain medicine prescribed from a doctor way back, and the prescription pain medication doesn't ease her headache pain. She clarified that the medication was dispensed in a pharmacy was oxycodone, acetaminophen (PERCOCET). She called her doctor when she returned home from work this morning, and her doctor told her to call Pfizer to report her side effects. She reported when she went to work this morning, she got lightheaded. She took Percocet and other medications, but it hasn't relieved it. She says it's not a migraine. She recalled experiencing "swelling around her eyes" and "had some swelling" after the first dose of the Pfizer-Biontech COVID19 vaccine on 19Jan2021. She reported on 02Feb2021 that she was calling back today to report that her headaches were worse. She said her headaches are not a migraine, but

more like a muscle spasm in the right side of her head, above her ear. She said the pain is between her neck and ear on the right side of her head. She said the headache pain feels like it is as big as a golf ball. She said her headache pain is so severe, the headache pain wakes her up in a cry. She said the headache pain lasts 15-20 minutes, and then eases up slightly. She said the headaches have been happening twice at night, and twice during the daytime. She said the headache pain doesn't last long. She mentioned that she has been doing self-remedies. She said she ate a spoonful of mustard to ease the headache, and the spoonful of mustard did ease her headache. The patient inquired if she should get the second COVID-19 Vaccine if she is continuing to experience headaches after receiving the first COVID-19 Vaccine. The outcome of the events headache, eye swelling, blurry vision, frequency urinary were not recovered, as for the events dizziness, vomiting, vaccination site pain and vaccination site swelling were recovering, while the outcome of the other events was unknown.

An 84-year-old male patient received BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine, lot number: EL3246), via an unspecified route of administration on the upper right arm, first dose at age 84 years on 15Jan2021, at single dose for COVID-19 vaccination. The patient's medical history and concomitant medications were not reported. Patient had the COVID Vaccination on the 15Jan2021 and he had minor soreness in his arm for 2 days and it went away, it was gone by the 18Jan2021. On 23Jan2021, he started with the symptoms similar to the thrush of the mouth and he went to the doctor 27Jan2021 and they told him it was not thrush because he did not have the white coating in his mouth, and thought it was reaction to the Covid-19 Vaccination (Covid-19 Vaccine by Pfizer) and he has a sore throat and all inside his mouth is sore, his tongue is sore he has headache and his eyes are sore. Patient's doctor told him to take Vitamin C and Vitamin D and Zinc, and he took his first dose this morning 27Jan2021, after breakfast which are Vitamin C and Vitamin D, but he haven't taken the Zinc yet. The outcome of the event soreness in arm was recovered on 18Jan2021, while for the rest of the events, it was unknown.

1061918	3/1/2021	FL		F	1/16/2021	1/26/2021	Blood in right eye; A spontaneous report was received from a consumer concerning a 74 year old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and developed blood in her right eye. The patient's medical history was not provided. Concomitant product use was not provided by the reporter. The patient received their first of two planned doses of mRNA-1273 (Batch number:01312o8) on 16 JAN 2021 for prophylaxis of COVID-19 infection. Patient woke up on 26 JAN 2021, ten days after initial dose of vaccine, with blood in her right eye. She called to ask if this was a normal side effect of the COVID vaccine. Patient scheduled an appointment with an eye doctor for evaluation and reached out to her PCP. Treatment information was not provided. Action taken with mRNA-1273 in response to the event was not provided. The outcome of the event, blood in right eye, was considered not resolved.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.

1061915	3/1/2021	FL	71	F	1/13/2021	2/11/2021	Anaphylactic reaction; swollen throat; eyes itching; eyes swollen; swollen lips; She had hives all around her waistband, back, arms, chest, and her hair; Palms were red; palms were very itchy; her arm was tender; A spontaneous report was received from a consumer concerning a 71-Year-Old female patient, who was administered Moderna's COVID-19 vaccine second dose and her arm was tender, palms were itchy, palms were very red, hives all around waistband, back, arms, chest and hair, swollen throat, swollen lips, eyes swollen and eyes itching and anaphylactic reaction. The patient's medical history was not provided. No relevant concomitant medications were reported. On 13-Jan-2021 the patient received their first of two planned doses of mRNA-1273 (Lot Number:012L20A) Intramuscularly in the left arm. On 11-Feb-2021 prior to the onset of the events, the patient received their second of two planned doses of mRNA-1273 (Lot number: 039K20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 11-Feb-2021, patient stated her arm was tender, but she was able to sleep on her side. On 12-Feb-2021 night, her palms were very itchy. On 13-Feb-2021, approximately at 04:30 am patient stated it was like someone had a blowtorched on her palms. Her palms were very red, "as red can be" and itching tremendously. When she used the bathroom, she had hives all around her waistband, back, arms, chest and her hair. Patient went to ER. Since her ER visit, patient stated some of her spots on her chest lighten up and her hands were not as bad. Patient denies ever having trouble of difficulty breathing. Patient called again and reported new adverse events from previous one. Patient went to ER for second time on 13 Feb 2021 night and experienced unbearable itching and burning. Patient felt okay until 15-Feb-2021 and went bed and woke up 1:30 am in the morning with swollen throat and lips and she thought she was experiencing anaphylactic reaction. Her eyes were swollen, itchy and needed help. Treatment for the event included patient put an ice pack between her hands for an hour on 13-Feb-2021. The ER gave her diphenhydramine and famotidine and patient was sent home with same medications. Patient also used arnicare gel for her whole waistband, which she stated was very cooling and helped with the burning and itching. Patient received 5 doses of steroids, diphenhydramine and

1061907	3/1/2021	FL	75	M	1/30/2021	1/31/2021	Double vision; Chills; Low graded fever (99.8); A spontaneous report was received from a consumer, concerning a 75-year-old male patient, who received Moderna's COVID-19 Vaccine (mRNA-1273) and experienced double vision, chills and low graded fever (99.8). The patient's medical history was not provided. Concomitant product use was not provided by the reporter. On 30 JAN 2021, the patient received their second of two planned doses of mRNA-1273 (Batch number 012M20A) intramuscularly for prophylaxis of COVID-19 infection. On 31JAN2021, after the vaccine administration, the patient developed chills and low-grade fever of 99.8, hence he was given with acetaminophen to alleviate these symptoms. On 01 FEB 2021, the patient started experiencing double vision, hence, on 05 FEB 2021, the patient went to their eye doctor who instructed the patient to go to the emergency room (ER). The ER doctor admitted the patient to the hospital to run some tests and labs. The patient was tested for stroke, tumor, and bell palsy and all these tests were negative. The hospital conducted several CT and MRI and they were all negative. The neurologists did not know what was going on with the patient. Hence, he was discharged from the hospital on 07 FEB 2021. The patient was still having symptoms. Treatment information was not provided. Action taken with mRNA-1273 in response to the events were not applicable. The outcome of the events double vision, chills and low graded fever (99.8) were considered not resolved at the time of this report.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. Further information has been requested.
1061664	3/1/2021	CA	77	F	2/25/2021	2/27/2021	2 days after vaccination I noticed that I had a blood red bruise just under my left eye, close to nostril; I noticed blood in left nostril on 3rd day, and that evening noticed that I had redness in corner of my left eye with a red spot in very corner, which led me to reporting it here. I have not yet had contact with my doctor, but plan to call him and/or ophthalmologist tomorrow, Monday.

1061649	3/1/2021	CA	52	M	1/27/2021	1/27/2021	About 4 hours following the 1st part of the vaccination (i.e. around 8:30 pm), I felt the skin of both my cheekbones swelling and flaring up. By the following morning, I felt that skin area, as well as the area around both of my eyes to feel as if I had sustained second degree burns. Additionally, the skin around my eyes particularly, presented with extreme dryness and geriatric symptoms, such as wrinkling and stretched thinned skin, as if I were an elderly person (over 75 years old, and not 52). The flaring/burning subsided after 4-5 days. However, the skin dryness around the eyes has persisted to this day (i.e. 5 weeks past the 1st vaccination). A day after the 2nd part of the vaccination, I felt moderate dizziness and headache, which lasted for about 24 hours. Also, light soreness and skin stiffening were experienced at the arm location where the shot was administered.
1062405	3/1/2021	NY	51	F	2/27/2021	2/27/2021	11 hours after the shot I got intense chills. My entire body was in pain, I had a headache, my eyes hurt and were on fire. After Tylenol, I was soaking wet but the body aches, joint pain, exhaustion continued. My left arm (injection site) was hard to lift and the injection point very sore. The following day 2/28- I was depleted of energy, my body was achy. I still had chills but to a much lesser degree. Throughout the night of 2/28-3/1 I had on and off chill/sweats. This morning, 3/1, My chills and headache are gone. I still have injection site pain with a red circle and the arm is hard to lift. The body aches have lessened. I am still very lethargic.

1062164	3/1/2021	IN	49	F	1/19/2021	1/1/2021	dull achiness on the right side of temple area/headaches; head was sensitive; really bad migraine; turn off the lights in the office/has to have the lights low, still sensitive; arm hurt worse with second dose; This is a spontaneous report from a contactable consumer (patient). A 49-years-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Solution for injection, lot EK9231, expiry date Apr2021), via an unspecified route of administration on 19Jan2021 at a single dose, administered left arm at 4:10-4:15pm, as a coworker came down with Covid (COVID-19 immunization). The patient's medical history and concomitant medications were not reported. It was reported that the patient's arm hurt with first dose of bnt162b2 given intramuscularly in the left arm (Lot number EL1284) on 29Dec2020 for COVID-19 immunization. Patient had her second Covid vaccine last Tuesday, 19Jan2021. She had a really bad migraine Friday, 22Jan2021 and had to turn off the lights in the office. On Saturday, 23Jan2021, her head was sensitive, but on Sunday, 24Jan2021, later in the evening she had this dull achiness on the right side of temple area that went down behind the right eye down to the temple. The dull and achiness was just enough to where she couldn't function and been like that ever since. She was prone to headaches and migraines, this was just different and so she took Tylenol and Aleve (both with believed dose was 200mg, 2 tablets by mouth since Jan2021), and another medication for migraines, Ubrelvy (lot number: 1084537, expiry Jan2022, dosage text: 100mg, 1 by mouth at first sign of headache, started in Jan2021). She took the Tylenol and it maybe of help, but the migraines/headaches are almost constant all day long. She took the Tylenol early Friday and when the migraine got really bad that was when she took the Ubrelvy. She took the Aleve only yesterday, but she still has to have the lights low, still sensitive. Patient knew that the headaches are a sign of Covid, but when she had her first dose her arm hurt. This second arm hurt worse, arm hurt worse with second dose (Jan2021), and she did fine the first few days and Friday was when all of a sudden she had the migraine and had to turn off the lights in the office. She sits at a computer. The events did not require emergency room or physician office visits. Therapeutic measures were taken as a result of really bad migraine,

with outcome of recovered. She said the nurse suggested she talk to a medic located in the back area where the COVID-19 Vaccines were being administered. She said she talked to medic. She said at that point it was probably about 25 minutes after she received the COVID-19 Vaccine. She said she never had allergies, and had no problem with the flu vaccine. She said she has had issues with anesthesia in the past, and if she is given the wrong type of anesthesia, she can get nauseous. She said the medic took her heart rate, and her heart rate was 154-ish. She said her heart rate was high, but sometimes for her, that is the case. She said the medic asked her how her breathing was. She said her breathing was OK, and could swallow fine. She said when the medic rechecked her heart rate, her heart rate was still the same. The medic said she has two things he can do: she can go to get Benadryl, or she can get checked out by a doctor. She said she wanted to see a doctor. She said she was brought to an Urgent Care to see a doctor. She said her heart rate was still elevated. She said the urgent care staff did a finger prick test (clarified as a blood sugar finger stick test), and she was told the finger prick test was fine. She said the doctor did an EKG, and her EKG was fine. She said the Urgent Care doctor eventually gave her Benadryl. She said after she took the Benadryl, her top lip was not numb, and her legs were fine. She said that was about 3 hours after receiving the COVID-19 Vaccine. She said the doctor felt she had a panic attack. She said she has had one panic attack in the past, and knows what a panic attack feels like. She said she maybe had some anxiety. She said her symptoms didn't seem like a panic attack because she wasn't having difficulty breathing and she wasn't short of breath, but she was somewhat nervous. She said she was not sure what to do, so she contacted her family doctor to see what she should do when she goes for her second COVID-19 Vaccine dose. She said the Urgent Care doctor gave her a prescription for Hydroxyzine Pamoate 25mg capsule, 1 capsule three times daily, as needed, for anxiety. She said her doctor told her the Hydroxyzine Pamoate is used for allergic reactions, as well. She clarified when she was at the urgent care her heart rate went down, and the nurse at the urgent care gave her 2 Benadryl pink capsules. Reported she took Benadryl when she got home because she was afraid

she was having an allergic reaction to the COVID-19 Vaccine. Outcome of possible allergic reaction was unknown. She said she had a great night sleep, and the next morning took her first dose of the Hydroxyzine Pamoate 25mg. She said her primary care doctor suggested she take the Hydroxyzine Pamoate 25mg an hour before she gets the second COVID-19 Vaccine dose. The patient underwent lab tests and procedures which included blood sugar finger stick test: 117 on 25Jan2021, electrocardiogram: normal on 25Jan2021 said the doctor did an EKG, and her EKG was fine, heart rate: 154-ish on said her heart rate was high. She said her heart rate was still elevated. Therapeutic measures were taken as a result of a cool, tingling sensation in her legs, she numbness in her top lip, she had a tingling at the top of her head.

1062223	3/1/2021	VA	67	F	2/7/2021	2/1/2021	not thinking straight; very very intense headache; felt an ungodly pressure in my head; My vision was off; foggy; confused; coughing; felt severe tightness in left side of my chest and that moved to the center of my chest and started to like move up higher, more towards my throat and then it stopped; severe tightness in left side of my chest and that moved to the center of my chest and started to like move up higher you know more towards my throat; rapid heart rate, 100bpm and 102bpm and lasted for couple of days.; my head was more clear but still had some pressure and woozy; Trouble concentrating; ALT High; Test: Cholesterol; Result: Little High/Cholesterol 207 was high; This is a spontaneous report from a contactable consumer, the patient. A 67-years-old female received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number: EL9269), via an unspecified route of administration on 07Feb2021 (at the age of 67-years-old) as a SINGLE DOSE for Covid-19 Vaccination. Medical history included ongoing asthma, type 2 diabetes mellitus, seasonal allergy (told to take Zyrtec for seasonal allergies prophylactically). Facility in which the vaccine was received was a clinic at a high school through the local hospital. Concomitant medication included fluticasone propionate, salmeterol (WIXELA INHUB), glipizide (GLIPIZIDE). On 07Feb2021, the patient received the first dose and while walking to the observation area (about two minute after receiving the vaccine) the patient experienced very very intense headache, felt an ungodly pressure in my head, vision was off, and trouble concentrating. When she sat down got real foggy, confused and was not thinking straight, was coughing and experienced severe tightness in left side of my chest and that moved to the center of my chest and started to like move up higher, more towards my throat and then it stopped. Patient began taking deep breath. It went back over to left side of my chest and the tightness (stayed in my left chest for probably 3 days but not to the same degree). The foggiess and the intense pressure in my head, it was bad to the point she thought she would not be able to drive home, waiting for 30 minutes, and because she was not thinking clearly she didn't even ask anybody for help. When she got to the car she waited 15 minutes more before driving home. Patient stayed like this for 2 days. When she reached

----------	-------	-------	---------	-----	----------	------------	--------------

home, she experienced a rapid heart rate, 100bpm and 102bpm and lasted for couple of days. Each day got gradually better, her head was clearer but still had some pressure and woozy. The patient did visit the physician, he did an EKG and other test. The doctor did not think what I had was an anaphylaxis reaction. Physician recommended she make sure to take her inhalers, for asthma and told me to take Zyrtec (for seasonal allergies) ahead of time. Consumer inquired if she should receive the second dose. The patient underwent lab tests and procedures which included blood cholesterol: little high 207 on Feb2021, blood thyroid stimulating hormone: normal on Feb2021, electrocardiogram: normal on Feb2021, full blood count: normal on Feb2021, hemoglobin: 6.9 on Feb2021, heart rate: 100 bpm on Feb2021, heart rate: 102 bpm on Feb2021, metabolic function test: Alt high on Feb2021. No treatment was given for the events. The clinical outcome of the events not thinking straight, pressure in my head, foggy, confused, coughing, tightness in the left side of my chest , it then moved to the center of my chest then moved up towards throat, rapid heart rate, Woozy, intense headache, vision was off and trouble concentrating was recovering while ALT High, and Cholesterol; Result: Little High was unknown.

A 41-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot number EL1283), via an unspecified route of administration on 14Jan2021 at 01:15 (at the age of 41-years-old) as a single dose in the left arm for COVID-19 vaccination. Medical history included spontaneous coronary artery dissection with stenting (reported as "five years ago") and complex migraines from an unspecified date. The patient is allergic to Tramadol, Codeine and Novocaine. The patient's historical vaccinations included the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot number EH9899) on 23Dec2020 at 01:15 AM as a single dose in the left arm for COVID-19 immunization. The patient was not pregnant at the time of vaccination. The vaccination was administered in a hospital. Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medications included diltiazem (MANUFACTURER UNKNOWN), acetylsalicylic acid (ASPIRIN). The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient reported the development of double vision on 25Jan2021 at 06:00. She was hospitalized and remained hospitalized for three days. She reports having had an MRI (date not specified) which showed an inflammatory lesion of the Pons. She further described the events as follows: Initially mild chills and headache "the day after" developing into significant diarrhea for four days and on and off diarrhea for several weeks. One week after vaccine vision noted to be off but no official work up developing into double vision with right gaze and head turning three weeks after vaccine. She also stated that there was a single lesion appearing inflammatory in nature found in the Pons at origin of Cranial Nerve 6. Treatment received included Solumedrol and Pepcid infusion. Lab data included an MRI on an unspecified date which showed inflammatory</p>

lesion of the Pons and COVID-19 testing as follows:  
SARS-CoV-2 Nasal Swab PCR test on 20Jan2021 and on 11Feb2021 both of which were negative. The clinical outcomes of brain inflammation, double vision, chills, headache, diarrhea, vision decreased and cranial nerve disorder were reported as recovering. No follow-up attempts are possible. No further information expected.;  
Sender's Comments: Based on vaccine-event chronological association, a causal relationship between reported events and BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1062210	3/1/2021	TN	80	F	2/11/2021	2/1/2021	Feet felt stiff and bone in right leg felt strange; Feeling dizzy and faint like; tired; Sinuses started to drain; itching on the right shoulder (where she had the vaccine); Itching on right side of arm near elbow, middle part of stomach and neck; pain in the shoulder; This is a spontaneous report from a contactable consumer, the patient. AN 80-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot number: EN6201, Expiry date: 30Jun2021) intramuscularly in the right arm on 11Feb2021 at 13:00 (at the age of 80-years-old) as a single dose for COVID-19 immunization. Medical history included highly sensitive and highly allergic to everything from food to medicine; had been through near death with allergies; allergic to penicillin, iodine and shellfish; high blood pressure, eye disorder (unspecified), allergies with her sinuses. Concomitant medications were not reported, but the patient took unspecified high blood pressure and eye medication. The patient previously took dextropropoxyphene hydrochloride (DARVON), ether and castor oil and experienced allergies; sulfamethoxazole and trimethoprim (BACTRIM) for severe acute sinusitis on Jan2021 (about a month ago). On 11Feb2021 at 13:20, the patient start feeling dizzy and faint like, and felt a little tired. She came home and went to bed and on 11Feb2021, had itching on the right shoulder (where she had the vaccine) and on the right side of the arm near the elbow, the middle part of the stomach and the neck (itching came and went) and later, her sinuses started to drain. On 12Feb2021, the patient's feet felt stiff and the bone in the right leg felt strange. On an unspecified date in Feb2021, the patient had pain in the shoulder. The patient queried if she can take aspirin for the pain in the shoulder and diphenhydramine (BENADRYL) if the itching comes back. The clinical outcome of pain in the shoulder was unknown, of "itching on right side of arm near elbow, middle part of stomach and neck", "feeling dizzy and faint like", tired, sinuses started to drain, "feet felt stiff and bone in right leg felt strange" and "itching on the right shoulder (where she had the vaccine)" was resolving.

A 33-year-old female patient received the first dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number: EL9264 and Expiration Date: May2021), via an unspecified route of administration in the left arm on 02Feb2021 at 17:45 at 33-years-old at a single dose for COVID-19 immunization; with no other vaccines administered within four weeks of the bnt162b2 administration. Medical history included anxiety from an unknown date and unknown if ongoing. Concomitant medications included alprazolam (XANAX) taken for an unspecified indication from an unspecified date to an unspecified date, prednisone (MANUFACTURER UNKNOWN) taken for an unspecified indication from an unspecified date to 16Feb2021. The patient experienced the following events and outcomes: Bell's palsy on left side of face (medically significant) on 06Feb2021 12:00 with outcome of recovering, vision has been off/ vision is blurry (medically significant) on 06Feb2021 12:00 with outcome of recovering, numbness and tingly/burning sensation in right leg (medically significant) on 06Feb2021 12:00 with outcome of recovering, brain fog (medically significant) on an unspecified date with outcome of unknown; all of which required a physician office visit. The clinical course was reported as follows: The patient received the first dose of the Pfizer COVID 19 vaccine, she began having symptoms on the following Saturday and was seen by her doctor and diagnosed with Bell's Palsy. The patient stated she has reported this via VSafe and the Pfizer website. The patient also reported other symptoms that have not been reported as follows: had tingling in both legs, brain fog, and vision has been off. The patient was not sure if it was related to the vaccine or steroids. The patient wanted to know if she should get the second dose. The patient had been on a steroid, so she did not know if she should wait to get the second dose. The patient just stopped the steroid on 16Feb2021, and the second dose was scheduled for 23Feb2021. The patient also said she had other symptoms that she had not reported and she said she</p>

had tingling that started in one leg now in both legs, brain fog and her vision was off and she was not sure if that was related to the vaccine or the steroid (later clarified as prednisone). The patient was not taking the steroids at the time of diagnosis. "Correct I mean it started after the vaccine, but I was also on medication (Clarified as Prednisone) so I am not really sure what the difference is at this time." Treatment in response to event: the patient stated, "No I mean for the tingling in my leg I have been just putting heat and Ice on it but I have not done anything actual big treatment and then for my eyes no, my doctor is not sure what is related to the Bell's Palsy and what is to medication." The patient underwent lab tests and procedures which included lab work: unknown result on an unspecified date (patient stated, "Yes, I have many"). Therapeutic measures were taken as a result of facial paralysis, hypoaesthesia, burning sensation, and paraesthesia; which included steroids and anti-viral and anti-nausea medicine. The patient did not have COVID prior to the vaccination. The patient was not tested for COVID post vaccination.

1064222	3/1/2021	AK	24	F	2/25/2021	2/26/2021	The patient presents today with a history of recurrent urticaria and angioedema. She received a dose of the Pfizer COVID-19 vaccine on Thursday Feb 25th (lot number EN 6206). She felt fine after her shot, but the next day felt fatigued, had chills, body aches, and left arm soreness (at the site of the injection)--she attributed her symptoms to her vaccination. Friday evening, prior to bed, she noticed the onset of several scattered hives. The next day, she noted that she had more extensive hives over her body, including her eyelids, and she said that she has been having dyspnea; she presented to the ER and was treated with steroids and antihistamines. The symptoms of urticaria returned the next day with significant angioedema of the lips, and the patient had dyspnea and nausea/abdominal discomfort, and the patient went back to the ER. With antihistamines and steroids, her symptoms improved significantly and she was sent home. Her symptoms returned today, now accompanied by throat globus as well as abdominal discomfort--she self administered an EpiPen, which she said significantly helped her symptoms.
1064218	3/1/2021	IN	68	F	2/25/2021	2/25/2021	Approximately 15 minutes after receiving vaccine, patient noticed she was having double vision. She was trying to focus on a sign we had in the waiting room, and the words started blurring and doubling. BP was normal, heart rate was slightly elevated. With time (about 10 minutes), patient reported it was improving. We got patient to her feet first to ensure balance wasn't effected and then patient reported she was ok to leave.
1064129	3/1/2021	WV	78	M	2/26/2021	2/27/2021	Appox. 16 hours after injection I started shivering and cold sweats. was weak. and just out of it. Went to bed and by mid afternoon shivers were gone as well as sweating. Slept all day and into the evening, by 10pm or so all seemed back to normal. Mid afternoon I sat up on the edge of the bed to go to the bathroom and passed out falling on my left knee (bad one) and hit my forehead on the bathroom door scraping and bruising same above left eye brow. Walking with pain in left knee but getting better daily.

1063984	3/1/2021	WI	80	F	2/20/2021	2/21/2021	<p>Patient had her second COVID vaccine on 2/20/21. The next day she developed diffuse body aches. She went on to develop worsening dyspnea and fever to 103°F on February 23. She had a fever again on February 24. The patient also experienced a few episodes of vomiting and diarrhea but no abdominal pain and had pain of the legs, right greater than left. Blotchy red patches of the hands and arms developed. She therefore presented to the ER on 2/25/21. See full history below from infectious disease note on 3/1/21: Patient is an 80 year old female who has a past medical history notable for hypertension, dyslipidemia, and hypothyroidism. The patient was diagnosed with a high-grade lymphoma of the retroperitoneum in 2004 and completed 4 cycles of multi-chemotherapy (Cytoxan, Adriamycin, vincristine, methotrexate, and IT chemotherapy (Magrath-like regimen)). She completed 4 cycles with complete remission on PET scan. The biopsy of a left cervical lymph node in 2007 revealed follicular lymphoma and she completed radiation therapy to the neck with complete remission. A left axillary lymph node biopsy in 2016 revealed grade-3 follicular lymphoma with mixed follicular and diffuse histology. Chemotherapy was pursued. The biopsy of a pelvic lymph node in 2019 was consistent with G1-2 follicular lymphoma. She completed radiation to the pelvis in May of 2019. She developed progressive pelvic adenopathy in April of 2020 and received 5 cycles of chemotherapy. Subsequent CT showed improvement in the adenopathy. Her course was complicated by pulmonary emboli (September 2020). In November of 2020 she was started on maintenance Rituxan every 2 months. She received the 2-dose Pfizer COVID vaccine series on 1/29/21 and 2/20/21. With the above background, the patient presented to the emergency room on February 25, 2021 with complaints of diffuse body aches, which had developed that day after receiving her second dose of COVID-19 (SARS-CoV-2) vaccine. She went on to develop worsening dyspnea and fever to 103°F on February 23. She had a fever again on February 24. The patient also experienced a few episodes of vomiting and diarrhea but no abdominal pain and had pain of the legs, right greater than left. Blotchy red patches of the hands and arms developed. She called Oncology on February 20 and it was recommended that she go to the</p>

----------	-------	-------	---------	-----	----------	------------	--------------

emergency room for evaluation. She was afebrile on presentation to the emergency room. She was tachycardic, however, with a pulse rate of 117 bpm. She was breathing at 48 breaths per minute. Blood pressure was 105/80 mmHg. Oxygen saturation by pulse oximetry was 96%. Examination was notable for paraspinal muscle tenderness, tachypnea, mild respiratory distress, and a mildly distended abdomen. Mild erythematous patches of the feet and forearm were noted, as well as evidence of edema of the right leg from the knee to the lower leg. The peripheral blood leukocyte count measured  $0.8 \times 10^3/\mu\text{L}$ . ANC was  $0.48 \times 10^3/\mu\text{L}$ . Platelets measured  $96 \times 10^3/\mu\text{L}$ . Creatinine was 0.97 mg/dL. AST was 86 and ALT 20 U/L. The lactic acid level of the venous blood was 3.6 mmol/L. The procalcitonin level of the blood measured 28.37 ng/mL. The C-reactive protein level was 313.7 mg/dL. The creatine kinase (CK) level was 4023 U/L. LDH measured 314 U/L. Troponin was 3.22 ng/mL. Urinalysis showed 6-10 wbc/s, 0-2 rbc/s/hpf, 3+ blood, negative nitrites, hyaline and granular casts as well as amorphous crystals. A chest radiograph showed possible, but not definite, mild atelectasis or infiltrate at the left lung base. A radiograph of the right tibia/fibula showed circumferential soft tissue edema seen within the knee and upper to mid aspect of the lower leg. EKG showed sinus tachycardia but no evidence of arrhythmia or ischemia. Cultures of specimens of the blood were obtained. The patient was started empirically on vancomycin and cefepime and was admitted. Faint erythema and ecchymosis of the right leg extending to the dorsal right foot and right wrist erythema were noted following the patient's admission. Her condition subsequently destabilized with increased respiratory rate, worsening pain, and hypotension, so she was transferred to the ICU. An abdominopelvic CT on February 25 revealed a small amount of free fluid in the abdomen around the liver, cholelithiasis with no evidence of acute cholecystitis or biliary dilatation, a nonobstructing 5-mm stone of the mid pole of the left kidney, coronary artery calcifications, mild infiltration of the fat in the inferior retroperitoneum and along the right common iliac region with small nodes in this region, similar compared with September 24, 2020, but improved compared with April 30, 2020, and consistent with response of lymphoma to chemotherapy; a myomatous

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

uterus. A CT scan of the right lower extremity showed extensive edema about the subcutaneous tissues of the right lower leg and infiltration of the fat about the muscles of the right lower leg, likely representing cellulitis and fasciitis, and possible myositis. However, there was no air within the subcutaneous tissues or muscles to suggest necrotizing fasciitis and no evidence of abscess.

The patient's antibiotic treatment was later changed to vancomycin, piperacillin-tazobactam and clindamycin. Cultures of specimens of the blood were later reported as being positive for methicillin-susceptible Staphylococcus aureus on 2/2 sets. Repeat blood cultures (February 26) were positive as well. Her antibiotics were modified to cefazolin monotherapy. Repeat blood cultures on Feb 27 and 28 were negative. TTE completed 2/27/21 without obvious vegetation. TODAY (3/1/21): Cultures negative 2/27 and 2/28. Remains on IVIG. Afebrile. She complains of continued pain in the Right leg and swelling at that left arm. Exam GENERAL: NAD EYES: Sclera and conjunctiva clear NECK: no adenopathy LUNGS: Breath sounds normal and symmetric. No rales or wheezes. HEART: regular rhythm, no murmur appreciated ABDOMEN: Soft without mass, tenderness, organomegaly or hernia. EXTREMITIES: RLE with ecchymosis, slight overlying erythema and anterior blister: blistering more pronounced today. left foot with plantar erythema, some tenderness today. LUE fullness with some heat/tenderness SKIN: No other rashes or other abnormalities are noted. NEUROLOGICAL: alert, appropriate Assessment 1. MSSA septicemia with shock. Positive blood cultures 2/25 and 2/26 thus far. Negative since 2/27. 2. Multifocal cellulitis and interstitial infective myositis of LE- suspect related to above. CT scan was negative for apparent necrotizing infection. 3. Elevated CK due to above- improving 4. Recurrent lymphoma- has been on maintenance rituximab (11/2020). Immunocompromised state. 5. Low immunoglobulins- remains on IVIG 6. Positive urine cultures with Staph aureus- this is typically secondary seeding from bacteremia rather than primary staph uti. CT abd/pelvis negative for nidus of infection along GU track (no renal abscess for example) 7. LUE swelling/tenderness. Plan 1. Cont Cefazolin without change: goal dosing 8gm/24hr 2. Following repeat blood cultures, negative thus far (tentative D0= 2/27/21) 3.

1064312	3/1/2021	MI	77	M	2/26/2021	2/27/2021	Reported via Nurse Triage / PCP: Fainted earlier, eyes rolled back, mouth was drooping. Nausea, weakness, and chills. BP was 107/75, HR in the 70s. Currently alert and resting. States that patient had his 2nd covid vaccine yesterday AM and then develop chills and clammy skin last night. Symptoms worsened today and patient became weak and fainted. Was unconscious for about 5 minutes and while unconscious, mouth was open and drooling and became incontinent and eyes rolled back in head. Is awake and alert now, but still weak and only able to take 1 or 2 steps. No chest pain or breathing difficulty and no fever. Feeling very nauseous. Caller requesting prescription for zofran. Yesterday AM 2nd vaccine. Last night chills. This AM feeling weak. Today at 11am he felt weak with ambulation. He fainted. Was unconscious for 5 min. Had drooping of the face. He was unresponsive during this time. Had incontinence of urine. Then became awake but very weak still. Only able to walk a few steps. He is communicating. No chest pain. No current fever. No shortness of breath. BP 107/75 with HR 70. He has been very nauseated. He is drinking only small sips of water. Does not seem like a usually COVID-19 vaccine reaction. Given the LOC with urinary incontinence and sustained weakness, I advised ER evaluation to rule out neurological issues. Pt's daughter in agreement. They will go to ER. From Emergency Department: Patient presenting with chief complaint of syncopal episode which was witnessed by his wife. He reported the got dizzy and lightheaded and then passed out while seated. The reported duration of his loss of consciousness was somewhat inconsistent, unclear how long he passed out for, there was however no postictal state. He was not noted have any shaking or seizure activity, he did have an episode of urinary incontinence. He has not been feeling well ever since receiving his 2nd COVID-19 vaccine. By the time of my exam patient states that he is completely asymptomatic, he states he is feeling much better after receiving IV fluids. His lab work is remarkable for a slightly low sodium, compared to his previous levels which were many months ago. Unclear of the acuity of this, although upon further discussion with the patient he has been drinking large amounts of water since his vaccine trying to stay hydrated. I advised him to substitute to some electrolyte balanced fluids and to have his sodium rechecked by his

1064017	3/1/2021	CA	66	F	3/1/2021	3/1/2021	Complaint of dizziness. Denies shortness of breath, chest pain, difficulty breathing and pain. No blurred vision. Patient did not eat or take prescribed medications prior to vaccination. Patient alert and oriented x3. Vitals: BP 120/78, T 97.9, P 89, R 18, O2 95%. Vitals prior to discharge BP 122/80, T 97.4, P 91, R 20, O2 95%. Patient discharged from clinic.
1064005	3/1/2021	MI	23	F	2/27/2021	2/27/2021	Within the first 10 minutes of receiving the vaccine I felt extremely lightheaded, eyes were blurry for 5-10 minutes, and extreme sweating all over my body. These symptoms subsided after 25 minutes. I then became on and off light headed through the remainder of the day. The day after receiving the vaccine I felt a lot of brain fog, forgetfulness, and fatigue. The night of day two I had a sudden onset of nausea and headache which only lasted 20 minutes. During this time I was massaging the injection site because it was sore.

1063999	3/1/2021	AZ	73	F	2/27/2021	2/27/2021	Individual reports that 2 hours post vaccination with dose #2 of Covid19 Moderna vaccine, she experienced the sensation that her throat was swelling and her eyes swelled almost closed. She states that she took one 25mg tablet of Benadryl PO at immediate onset of symptoms and within 20 minutes she felt the symptoms start to subside. She states the symptoms did not fully clear up until several hours later. She also reports that her legs felt "very heavy" and she was very lethargic. She also reports having a very sore arm still. Individual reported feeling the throat swelling sensation following a CT scan with use of contrast dye. She states she did not seek emergency help or visit a provider for the incident.
1063991	3/1/2021	NY	57	F	2/27/2021	2/27/2021	Face (cheeks from under eye to jaw line on both sides of face) turned very red and blotchy. At one point, strange sensation in the throat then went away. Face redness lasted approximately 3 hours. Was also fatigued. Felt back to normal after 3 hours.
1064111	3/1/2021	MT	53	F	2/17/2021	3/17/2021	Large cold sore/lesion on top left lip - open - treated at home with abreva/hydrogen peroxide. Pain from top of lip to left eye, pain bottom lip, gland swollen under left side of mouth. Lips became very dry. Has not totally gone away, still treating at home no pain from lip to eye or mouth anymore gland not swollen. However intense pain lasted four days.
1064376	3/1/2021	OR	74	F	2/26/2021	2/26/2021	The evening of vaccine, I turned on TV. I immediately was aware that I was not seeing the full face of the reporter, I could not focus into view the whole picture. I then began having peripheral flashing lights of all colors going every which way around my vision. I rested for a few minutes and then checked it by attempting to read but could not keep the letters and words in order,. This continued for 45 minutes. When I called my dr. They told me to go to the ED and get checked out. ED Dr. checked for signs of stroke, which there were none. He felt it was related to vaccine.

1064414	3/1/2021	KY	53	F	1/28/2021	1/29/2021	I woke up in horrible pain all over my body and couldn't straighten my fingers for approximately 2 hours. It took me 3 hours to get the strength to get off couch to pee. Felt as I was being beaten in my lower back, hips and legs. Also, hurt in my neck and eyes were painful. My face and eyes were also swollen. It also felt as if a hot ice pick was being stabbed in the sides of my hips, back and thighs. I hurt all over my body, including a headache. I had hoped to die. I have had 3 children and one was a natural birth and I have never experienced so much pain and exhaustion together. Took Tylenol and Turmeric and didn't get any relief. The injection sight was very swollen and was painful, could but lay on my left side. I was down for 3 days with the 3rd day finally able to take shower and dress. I had diarrhea the 2nd day. The sides of my hips hurt to touch for weeks and are still sore. I have had a lot of breathing difficulties and asthma flares. I related the asthma issues to having a new dog but now I wonder if it was due to vaccines?? I have rehomed the dog and asthma isn't getting any better. I had to miss a day of work after the 1st vaccine due to flu-like symptoms and was prepared to have a reaction to the 2nd. However, I was not prepared the severity of a reaction I had.

1063563	3/1/2021	SC	41	M	2/25/2021	2/26/2021	Patient stated that the day after receiving the Moderna vaccine he started having issues with his vision and issues seeing color. Patient also states he felt like his body was locking up and aching all over. Pt started having rash on his arm today (4 days post injection).
1063556	3/1/2021	NC	67	M	2/26/2021	2/26/2021	Patient got up from the seat where he received his vaccine and was walking to the back to be seated and monitored. He past out once he got to the back. He hit the right side of his head. As he came too he reported mild nausea. He denied any pain or vision changes. He then reported a history of diabetes. He stated he had dialysis this morning and took insulin prior to coming to vaccine clinic but did not eat anything. He took a few sips of juice. He was diaphoretic and clammy. Pulse was 46, SPO2 was 96%. He had a mild audible murmur. Lung sounds: wheezing and crackles. There was a small area of swelling noted to the right side of his head. EMS was called for transport due to hitting his head and history of taking blood thinners.
1063541	3/1/2021	NC	44	F	2/26/2021	2/27/2021	Sat 5pm eyeballs began to hurt. The entire eyeball was painfully sore. At night I woke up with tongue that felt thick or swollen. Then the next am woke up with aches, headache, chills, hot (suspected fever but did not get up and check) tiredness. Spit up yellow fluid (thought it might be from GERD) and laided around all day. Did not eat as stomach felt nauseated. At 3 pm I ate half a sandwich and at 4 ate half a banana and drank some water and 1/4 of cup of sweet tea. By 6pm I was really sick to my stomach got up and threw up sandwich and banana. I thought I saw some blood but was not sure. I continued to throw up and it became all blood (bright red) mixed with water. This occured twice and then I called doctors office and the dr on call advised me to go to ER since urgent cares were closed. I went to ER about 8:30pm with continued headache, nausea, lightheadedness. I tried to tell ER dr that I was there mainly for throwing up blood. I sat in waiting room. ER dr saw me at 3am and gave me Zofran for nausea as i thought I was going to be sick and gave me EKG, Blood panel and Blood Pressure readings. Told me I was mildly dehydrated. My BP was higher than I think I have ever seen it.

1063372	3/1/2021	GA	42	M	2/26/2021	2/26/2021	He first reported feeling dizzy and that his lips were tingling. His vital signs were monitored every 5 minutes, and he was given 20 mL (50 mg) liquid Diphenhydramine. At 11:50 A.M., his heart rate dropped from 99 to 51, and he experienced a brief loss of consciousness for about 3 seconds. He also became diaphoretic and very pale at the same time. His pulse was weak but present, and his eyes rolled back in his head. 911 was immediately called, and a sternal rub was provided to help patient regain consciousness. EMS arrived at 11:56 A.M. and transported patient to the hospital for further evaluation. Patient was alert and talking upon transport.
1063375	3/1/2021	CA	43	F	2/27/2021	2/28/2021	On 2/28 around 6pm. I started feeling some flu like symptoms start. Mild headache, fatigue, chills, slight runny nose, mild sore throat. My left eye suddenly felt awful. I told my husband my eye is stuck (open). It was very scary and I felt like I had to hold my hand against it tightly. Meanwhile my right eye just wanted to stay closed, so then I couldn't see at all. My husband guided me into the kitchen and I tried to flush my eye with water to see if that would help whatever was going on with my eye lid. My husband gently rubbed the skin above my eye. He couldn't see my eye lid at all. All that was visible to him was the tip of my eyelashes. He was able to grab the tip of my eyelash and release my eyelid. It was very uncomfortable and scary. After the eyelid was released the eye was very sore. I called the nurse line and they recommended I be seen within 24 hours. I saw the doctor this morning not related at all to the vaccination facility. She said it sounded like an ocular muscle spasm. She said she didn't see anything in the vaccine literature about this type of response but recommended I report it in case it's a rare response. I have never had that happen before and I hope to never have it happen again.

1063402	3/1/2021	WA	45	F	1/9/2021	1/9/2021	Constricted throat. I was given Zyrtec. Observed for an hour. Got discharged. Throat constriction didn't go away until 2 hours afterwards. Puffy, itchy eyes (both eyes) with rash came and lasted about two weeks. Monday or Tuesday, I noticed a rash all over my body - red and blotchy. That went away in a day. I got chills, fever, weakness, nausea, vomiting, diarrhea and that lasted 48 hours (16th in pm-17th and got better evening of 18th). When I had the rash was all over the body, I took a Zyrtec. The weekend I was really sick I didn't take any medication. Phone visit with Doctor - January 15th - allergist - I followed up with him about the throat constriction. He just was monitoring symptoms. After the weekend that I was really sick, I told him and he ordered bloodwork.
1063825	3/1/2021	MD	71	F	2/25/2021	2/25/2021	Day 1: egg-sized red raised area at sight of injection with a good deal of pain in upper left arm Day 2 am: fever of 101.1 (normal 97.7F); collapsed in kitchen with no dizziness; extreme feeling of brain fog; swollen lymph nodes under both arms; chills; headache; fairly extreme pain at every joint with prior injury--left knee, L4-L5 high right, 4th finger of right hand; extreme fatigue, but inability to sleep though in bed all day Day 3 fever of 100; chills; swollen glands in both sides of neck; still in bed with extreme fatigue and unable to sleep; up for a couple of hours in early evening; double vision; slept for two hours Day 4 am still with extreme fatigue and unable to sleep; 5am visual hallucinations while in bed and sitting on the side of bed; still with double vision; continuing large hot red area around injection site with upper arm pain To now as I am writing this, continued fatigue and general malaise, double vision now gone.
1063309	3/1/2021	FL	66	F	1/13/2021	1/14/2021	The day after my first vaccination at 3:15 PM I started getting visual auras and then migraine which lasted about 4 hours. I have had up 7 more since then and after my 2nd vaccine. Dr. thought it might be related since I have no history of chronic migraines. All past were over 16 years ago and related to hormonal changes.

1063822	3/1/2021	VA	25	F	2/25/2021	2/25/2021	pt stated that 10 minutes after receiving the covid vax her throat started closing so she went to the ER. She had hives, chest tightness, and unable to breath. They injected epi-pen and administered steroids, Pepcid and Benadryl. She was released to go home after 5 hours. The next day she had really bad sternum chest pain, back pain, neck pain and fatigue so she went back to the ER. They did chest XRAY that came back clear, did an EKG w/ normal results, and blood work w/ high white blood count. New RX for Naproxen 500mg, lidocaine patches, Zofran and has an EPI pen on order. Pt states since leaving the ER she still has fatigue, pain in neck, arm, back, and now in the face. She states her face is numb and has bad pain and blurred vision in both eyes, more so on the right side. The ER told her to come back if she needed to FU.
1063819	3/1/2021	TX		U			Skin started itching on Saturday night (2/27/21), and by Sunday morning hives had started forming on legs. Hives kept getting worse and spreading to groin, hip, arms, armpit, shoulder, and neck. When the hives reached my neck at 3pm CST, my voice started getting hoarse and I was taken to urgent care. Symptoms continued to increase to include abdominal pain and throat swelling while in urgent care. Vital signs at urgent care: Temperature 98.4. Blood pressure 98/70. Heart rate 109. Pulse Oxygen 98%. At urgent care I was given a shot of epinephrine, where the hives and redness decreased and throat opened. After an hour, I was discharged to go home. (Time now about 6:15pm CST) Upon arriving at home, the hives started coming back and spread across my arms and entire stomach. My eyelids had hives too. I went to the ER at about 7pm CST and received Benadryl, Steroids, and Pepcid while getting IV fluids. I was discharged with a prescription to take prednisone 50mg qd, as well as pepcid qd and benadryl as needed.

1063815	3/1/2021	OH	49	F	1/4/2021	1/5/2021	On January 5th, the day after my first COVID vaccine, I awoke to a small rash on my forehead. I also had a bad headache. Knowing I'm prone to migraines, I ignored it at first. The headache and rash got worse, and the rash started to be very painful. The rash was bumpy and weepy - almost like poison ivy. The inflammation in the rash made it bulge out about 1/2 inch high bump and I got periorbital edema in both eyes for about 4 days - almost to the point where I couldn't see because my eyes were so swollen. I went to the doctor on January 11th and he and two other doctors diagnosed it as Shingles. Their best opinion was that while it wasn't caused by the COVID vaccine, the stress on my body from getting the vaccine triggered the shingles virus and made it active. I was given Valtrex to take for 10 days. I also got some CBD pills and oil to help lessen the rash. I went back for a recheck on January 26th. The rash was going down by that point and had stopped being painful. As of this writing (3/1/2021), while the main inflammation I still have discoloration and pockmarks on my forehead where the rash was.
1063792	3/1/2021	OH	30	F	2/2/2021	2/2/2021	For the entire night after getting the vaccine I was the most sick I have EVER been. Fever of 103, vomiting profusely, diarrhea, chills. It was terrible. Then for the next week I had a headache that felt like someone hit me with a hammer between my eyes. I get tested weekly for corona and have always tested negative... I had a negative result the same day I got the second dose of the vaccine as well. All I know is that I NEVER want to feel like that again ?? my lungs still bother me and it's a month later
1063632	3/1/2021	DE	75	M	2/27/2021	2/28/2021	This second dose resulted in a slight headache; joint pain; fatigue; nausea but no vomiting. Please note: I previously reported AFTER MY FIRST DOSE that my right eyelid is drooping. This condition is still a problem and causing me to have double vision.

1063731	3/1/2021	IN	62	F	2/24/2021	2/24/2021	Onset approx 45 min after injection--swollen eyelids and face, moderate throat constriction and hoarseness, severe fatigue, headache, brain fog for first 20 hrs, then intermittent eyelid and face swelling, hoarseness, fatigue and brain fog for the next 3 days, followed by mast cell activation symptoms of fatigue, puritis, and mild racing heart in the evening for the last two days. For the past 3 years I have been medication free and virtually symptom free. The symptoms of the last few days are consistent with those I had during the years when my MCAD was active. I am concerned that the vaccine has reactivated the hyper-sensitivity of my mast cells.
1063697	3/1/2021	AL	64	F	2/10/2021	2/10/2021	Twenty minutes after receiving the vaccine I noticed my ears began to feel odd as I was driving home. Within the hour after the vaccine I had significant tinnitus in both ears and felt pressure/discomfort in both ears and had trouble hearing at normal volume. I expected this to be temporary and was not initially concerned. About 90 minutes after the injection I developed a strong headache. It lasted several hours and then was intermittent but ended at about 24 hours. The morning after the vaccination I was surprised to still have tinnitus upon waking, along with pressure that at times was painful. I also realized that I was having even more trouble hearing. For example I had to turn my car radio, my television, and my other electronic devices up several levels and had a hard time understanding conversations in person. It has now been 19 days and the ear symptoms have continued.
1063661	3/1/2021	KS	51	M	2/12/2021	2/12/2021	onset started as itchy around armpits around 10:15pm. Then hands, eyes and feet started to itch. Then feet and fingers started swelling, and about five minutes after swelling started, he states he was swollen all over. Nose, ears, eyes were all swollen. He states that after the swelling he started developing hives all over and redness all over. About 30 minutes later he became short of breath and went to the ER at around 1145 pm.

1060802	2/28/2021	OH	46	F	2/17/2021	2/25/2021	Two weeks after my first covid vaccine, I experienced weak muscles., light headedness, brain fog and general malaise. It was alarming due to being so far after the foretold reaction time. I tested negative for covid twice because the symptoms lasted two weeks right up to my second dose. My doctor stated that this far of a delayed response was uncommon but hoped it wasn't unusual and to keep hydrated. On 2/25, one week after my second dose which was administered 2/17, I experienced acute blurred vision followed by memory loss. Events that I participated in had to be told to me with my having no recollection of them. I was told that I spoke of feeling dizzy "like being on a boat" and feeling brain fog before falling asleep for hours. I wake up with no memory of any of the events. This has happened three times since. 2/25, 2/26 and 2/28 so far. It is very alarming and concerning and I wonder if it is normal to have these side effects although they are not mentioned on any website I have visited when researching side effects. I have once again contacted my doctor for further advice.
1060811	2/28/2021	NJ	76	M	2/9/2021	2/13/2021	on 2/13, noticed red band across eyelid of right eye and eye looked a little off. Didn't think much of it. Week of 2/21 noticed rash on forehead on right side. 2/28 rash had spread to top of head and right forehead and right eye is now swelling.
1060633	2/28/2021	OR	49	F	2/27/2021	2/27/2021	Headache, eyes sensitive to the light, nausea, soar arm.

1060515	2/28/2021	CT	66	M	2/23/2021	2/25/2021	I had very severe cf starting in 1996. It remained severe for approximately 5 years after which it was semi acute for another 5 years. After that i would have periodic relapses several times a year for varying lengths of time. For the last 10 years irt has been much better with occasional symptoms. However i received my second dose of the Moderna vaccine on february 23, 2021 and had a strong flu like response. I am now experiencing a mild to moderate relapse of my cf. brain fog, difficulty tracking with my vision, chills, etc. when i had severe cf i had this symptom where my scalp would feellike it was in a spasm. That has returned. I have dealt with tcf long enough to know when it occurs and this is definitely a response to the covid vaccine.
1060512	2/28/2021	FL	82	F	2/22/2021	2/24/2021	The next day I had fatigue, headache, sore arm. The following day I felt ok but my left eye. Same side as shot became red an d swollen. Emer Room diagnosis is Chemosis of left conjunctiva
1060460	2/28/2021	MI	51	F	2/16/2021	2/24/2021	10 days after vaccine I all of a sudden developed extremely high blood pressure of 175/100. Went to doctor and he also took blood pressures and still was in the 178-180 range. Never had high blood pressure in my life. Also experienced a broken blood vessel in my eye in between first shot and second shot.

1060822	2/28/2021	OH	39	F	2/26/2021	2/26/2021	I experienced some slight tingling in my left eye after I left from the site I received the vaccine from. I had waited my 15 minutes to make sure that I wouldn't have an allergic reaction to it and felt fine but soon after I left I started to feel tingling around my eyes and was not sure if that was a sign of an allergic reaction to the vaccine? I did reach out to my family doctors office and was told that it could of been a slight reaction to it. I am concerned if I can still get my 2nd shot when I am available to receive it or if I should not with the feeling that I got.

1060464	2/28/2021	MA	69	F	2/27/2021	2/27/2021	Within 10 seconds I began to feel that something was wrong. A full body response of a swirling congestion, extreme weakness. very blurry vision and couldn't think straight. I had trouble walking to recovery room, felt nauseous and weak and had a very fast heartrate. I had to stay in private recovery room for 45 min. I was still very ill and nervous at this point. I left with a family member and asked to be driven to the nearby hospital emergency room. For a precaution . We parked across from ER entrance for another 1 hour till I slowly regained strength to 50% normalcy. I went home afterwards and had to go to bed. I was unable to drive my own vehicle home. Day 2, still feel weak, shaky and not normal. I consider this a serious adverse reaction that did not receive medical intervention but will prevent me from getting the second Pfizer shot. After 5 hours post injection I felt 60% normal . Day 2, 70 per cent normal. The vaccination facility was not able to do blood pressure monitoring ( which is a problem for anyone experiencing reactions.) They said their protocol was to call 911/ambulance. My blood pressure was checked by a certified PA with professional equipment at the 3 hour post injection time and the diastolic pressure was still below 50. And heart rate above normal. Still weak and nauseous.

1061213	2/28/2021	MD	38	F	1/6/2021	1/6/2021	I received the 1st dose of the Moderna Vaccine on January 6, 2021 at 01:49 pm. Approximately 4.5 hours later on January 6, 2021, I went outside in the cold temperatures. Upon returning inside to warmer air, the bilateral fingertips of both hands were pale white, numb, and painful. The time was 06:30 pm on January 6, 2021. At 06:47 pm, I felt a different feeling in the bilateral tips of my fingertips, and could see the color changing from pale white to a mixture of purple/black. January 6, 2021 at 06:32 pm was the first time I have ever had my hands respond in this manner to cold temperatures. I have felt one fingertip go numb and turn white for a split second, only one time in my life but it was not a repeat occurrence, and it only lasted for about a second when it occurred. This experience and reaction I currently have lasts from 15-30 minutes of bilateral fingertip numbness and discoloration with pain. The bilateral fingertips of both hands now respond in this manner every time they are exposed to cold temperatures. I signed up for a health checker and did state that I was having this symptom through the Vaccine reporting system on a health checker under "other" multiple times. Treatment I received from a health provider are as follows; I had a telemedicine visit on January 14, 2021 at 12:51 pm to address my concern of "reaction to Covid vaccine, fingertips were numb, lasting 30 mins?". On 1/14/2021, I received a primary diagnosis of Raynaud's Syndrome by my Primary Care Provider. On 1/28/2021, I was seen in person by my Primary Care Provider for a Well Visit to complete a physical with my primary care provider. I was provided with a referral to a Rheumatologist for further advice about receiving the additional second Covid vaccination in the series. I also was ordered to do lab work. On 2/2/2021, I was seen by a Rheumatologist for new diagnosis of Raynaud's Syndrome, and advised that risk outweighed the benefits in regards to receiving the second vaccination in the Moderna Covid-19 series. On 2/3/2021 at approximately 1:45 pm, I received the second Moderna Covid-19 vaccination. On 2/10/2021, small red, itchy bumps started to appear on both sides of my neck. On 2/15/2021, a bump appeared above my right eyebrow with what felt like a pimple. On 2/21/2021, the "pimple" had spread towards my inner eye and above my right eyebrow making my right eyelid swell. I received telemedicine care via an e-visit over telehealth

1059437	2/27/2021	IL	37	F	2/27/2021	2/27/2021	Patient states 30 seconds after the injection, she began to feel nauseated. She stated the following symptoms came on "Like a wave": Dizziness, light headedness, ears ringing, sound pulsing, and her vision began to go black. She described the field of vision closing like that of a loony toons show ending (coming from the outside in). Patient was found to have her eyes closed, hyperventilating at a rate of 28 breaths per minute. Ice pack placed on her neck. She was coached to slow her breathing, instructed to hold her breath for 10 seconds, then to release it slowly. She did this for 3 minutes. She related her body felt tingly all over. Encouraged patient to continue the slow breathing. As patient began to feel better, she related that she has a known needle phobia. She expressed that she becomes anxious even when she is not the one receiving a shot, and this fear stems from a traumatic experience of her son having a seizure after a shot. She works at a school and when they do first aid training and cover the diabetes section, the pictures of needles make her anxious. Patient provided with therapeutic communication, encouraged to discuss fears with her counselor. Patient remained seated in clinic until she felt well enough for her husband to drive her home.
1059400	2/27/2021	OH	60	F	1/19/2021	1/20/2021	Immediately after the injection - fever within 24 hours, chills, achy, fatigue. Fever for 4 day and fatigue and achy/joint pain lasted for at least a couple weeks. On February 11/12, 2021 started with double vision, progressively getting worse and constant starting on 2/17. Sought medical treatment on 2/18 with emergent MRI ordered and completed on 2/18. MRI results showed swelling/inflammation in the brain, specifically on the left side. Treatment thus far has been antiviral medication, seeing specialists - Ophthalmologist and Neurologist on 2/24 and 2/25 respectively. Further treatment is ongoing but will include ongoing lab work, IVIG infusions starting 3/1 for 3 consecutive days, repeat MRI, potential LP and Quarantine for a minimum of 30 days following the first IVIG treatment. Neurologist diagnosis is ADEM at this time.

1059407	2/27/2021	IL	30	F	2/27/2021	2/27/2021	Patient states approximately 5 minutes after her vaccination, she started to feel like her vision was slightly blurry, then experienced tunnel vision. Pt states felt almost like an "out of body" experience, but she did feel pressure to the left side of her head as she fell off of her chair and her head hit the floor. This fall was witnessed by another patient, who flagged the medical staff for help. A medical assistant notified me of the incident and I went to examine the patient, who was sitting on the floor, alert and conscious. I asked the staff to get the patient an ice pack, which was placed to patient's forehead and back of neck, and glass of water. Patient is able to swallow. A&O x 3, HR 81 and O2 sat 98% on room air. EOMI, PERRLA. Auscultation of heart & lungs was normal. No bony step-offs palpated. No tenderness upon palpation to patient's head, face and neck/c-spine. No visible contusions, abrasions noted. Normal ROM of all extremities and normal sensation. Observed patient over the course of 15 minutes and patient states she is feeling much better.
1059292	2/27/2021	GA	37	F	2/15/2021	2/19/2021	I first had a typical reaction to the vaccine, including soreness at site, fatigue, aches, and chills. On the fourth day after the shot, I developed shingles on my left side (the same side as where I received the vaccine). It began on the left side of my scalp and progressed down my forehead and to my left eye. My left eye also became very swollen, to the point of being shut. I am 12 days post vaccine now, and I still have shingles and my eye is still very swollen. I have been seen at both the ER and urgent care. I am currently taking Valtrex, oral steroids, and have antibiotic ointment for my eye as well as steroid eye drops.
1059263	2/27/2021	MA	67	M	2/26/2021	2/26/2021	Systemic: Fainting / Unresponsive-Severe, Systemic: Seizure-Severe, Systemic: Shakiness-Severe, Additional Details: Patient was sitting in observation and his head and eyes rolled back. He was observed to go into a shock state, possibly seizure for a few minutes. After a few minutes, patient regain orientation and was alert and was able to answer questions before the ambulance arrived. Patient left with the ambulance to the emergency room.

1059242	2/27/2021	CO	46	F	2/11/2021	2/11/2021	Severe meningitis starting 30 min after vaccine. Stiff neck; headache; nausea; eye pain; light sensitivity; altered consciousness; blacking out; dizziness. Still sick after two weeks later.
1059757	2/27/2021	AL	64	F	2/25/2021	2/25/2021	In order: March 26,2021 at 2.05pm, 2nd injection of Moderna : 30min. after injection, left eyeball, then left temple; then right eyeball and then right temple; then moved to top of my head and all was aching and starting to throb. Then moved to all my cervical neck bones. This all took place within 30 min after injection. Once home started to ache all over. Started with low grade fever of 99.7 and eventually till it got to 101.4 I did not take any medication. Just let it run its course. Upon waking up this morning my left eyeball has a busted blood vessel in it and looks bad. But as day goes on, it is slightly fading. I am no feeling fine.
1059309	2/27/2021	KY	57	F	2/25/2021	2/25/2021	The symptoms that I am experiencing that are worthy of reporting since they are not listed on the Fact Sheet are: earaches, eye pain, sore throat, bloody nose upon blowing and sore nasal cavities (such as when I'd had severe sinus infections). These are still occurring, even though the general symptoms as listed below are subsiding. Before receiving my vaccine, I was careful to drink a lot of fluid. Eight hours after receiving my second dose, intense body aches began including headache. It was a fitful night of sleep as I remember moving around in an attempt to stretch out the muscles that seemed to be tightening. The next morning as I arose I felt weak and chilled. Highest temperature recorded was 99.0. Muscle aches, headache, joint pain (especially in my knees) persisted throughout the day. Rest and tylenol helped somewhat.

1060304	2/27/2021	VA	64	F	2/25/2021	2/26/2021	Left arm extremity sore, sore knees, fever, fever blisters, extremely sleepy, extreme fatigue, annoying headache, glossy eyes, blurred vision, aching bones all over, I exercised mildly by walking after 2pm on Thursday shot by visiting memorial park and shopping. At 2am on Friday I awoke to headache and achy bones I took Tylenol 2 tablets and felt okay but at 9 am was feeling worse. And extremely sleepy. Took some dose of Tylenol and slept for 5 hours straight. Drank ginger ale for mild nausea. No appetite until Saturday. Felt good all day but achy at night. Especially knees.
1059767	2/27/2021	IL	63	F	2/25/2021	2/25/2021	Starting a couple hours after vaccination, I began to feel unwell, overall poorly, nothing specific. Went to be early at 9:30 and awoke at one a.m. on February 26 with splitting headache. Could not get back to sleep well and felt terrible all that day with headache, nausea, and foggy thinking, not functional after about 2:30 p.m. Took Ibuprofen at 3 p.m., called doctor and went to ER at Medical Center. Was seen at ER a few hours later. Slept some in waiting room. Had sore throat, the worst splitting migraine type headache ever, and was extremely foggy headed, couldn't process thoughts, eyes had difficulty focusing, nausea. My temperature was a little high for me, I am normally low and it was 99. My blood pressure is usually low and it was 105/59, pulse was 82 and respiration was 16 with 96 % Oxygen Saturation. They did tests and had an ophthalmologist give me an exam also. They said I could go home with the same meds they were giving me in the hospital since they were working to alleviate my painful headache, 600 mg of ibuprofen, reglan and benadryl. Before I left they gave me the potassium chloride. I am continuing my medications today, two days after my vaccine.
1060263	2/27/2021	OR	39	M	2/26/2021	2/27/2021	Pain the arm during and since the shot yesterday (2/26), tiredness and fever since noon today (2/27), slept 4 hours, body aches, sore back, headache, eye pain, little bit of a sore throat, arm was a little warm around the injections site a slight swelling.

1059859	2/27/2021	NV	53	F	12/22/2020	2/16/2021	Numbing on left side of the face, unable to close left eye all the way no control on left side of the lips; sharp pain on neck and jaw
1059784	2/27/2021	ME	51	F	2/18/2021	2/19/2021	24 hours after receiving the vaccine, I woke up feeling tired, with chills, joints, and muscle aches. It started to get better 3 days after, but it didn't go completely back to my normal, and I am already on the 10th day after the vaccine. Today I woke up again with chills, joint, and muscle aches, and I am having cough, sniffle, watery eyes, and sneezing. Since I have asthma and allergies in this period of the year, it wouldn't be a surprise, but the fatigue, chills, feeling sleepy, and body aches, make me wonder if this is still related to the vaccination, or it could be that I was unfortunately infected with COVID roughly at the same time I got the shot? I had to stay for 15 minutes at the vaccine place, there were other people, we were 6 feet apart, but the room was not well ventilated, so who knows.
1059994	2/27/2021	CA	50	F	1/8/2021	1/8/2021	I noticed a cold sensation throughout my body within 5 minutes. It occurred suddenly and then stopped quickly. About 25 minutes after the shot, I saw "electric stars" in my vision. This has happened before (at times) so I was aware but did not worry. It lasted less than a minute. After waiting 45 mins at the facility, I left. 15 mins later (an hour after my shot), I began to cough. This typically happens to me when I begin to react allergically. I was driving so I pulled over to the side of the road and used my rescue inhaler (2 puffs). Meanwhile, my doctor (also my boss) called me. He met me at our office (allergy office) and checked on me. I ended up having a nebulizer treatment, benadryl, allegra and prednisone. I felt itchy about an hour after my coughing started but no visible hives.
1060025	2/27/2021	CA	22	F	2/27/2021	2/27/2021	1335 Patient states her vision became blurry and she felt lightheaded and dizzy after vaccination. Patient assessed. 1057550	2/26/2021	TN	79	F	2/6/2021	2/6/2021	has sporadic a-fib (at baseline); She stated she was in real bad stroke territory; she felt like she was going to faint; Her blood pressure was 220/97; tingling in her hands and feet; felt like brain sizzling like it was frying/going to faint; This is a spontaneous report from a contactable consumer, the patient. A 79-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot EN9581, first dose) solution for injection intramuscular in the left arm on 06Feb2021 at 09:30 (at the age of 79-years-old) as a single dose for COVID-19 vaccination. Medical history included ongoing sporadic A fib (atrial fibrillation) for 6 years know about; allergy to polyethylene glycol in 1985 (she had difficulty taking birth, control pills and they found out it was the coating PEG in); cerebrovascular accident prophylaxis; in 1985 She had difficulty taking birth control pills and they found out it was the coating PEG in it. She had an allergy to this where she broke out in bumps on her fingers and mouth and had itchy eyes, a full blown allergy; and when she was 45 going through menopause. Concomitant medication included apixaban (ELIQUIS) for A fib and cerebrovascular accident prophylaxis. The patient did not receive any other vaccine within 4 weeks prior to the vaccine. On 06Feb2021, the patient had sporadic a-fib (at baseline) then put in a medical van requiring emergency room visit. The patient stated, She stated she was in real bad stroke territory, felt like she was going to faint (6 minutes after vaccination), blood pressure was 220/97, tingling in her hands (6 minutes after vaccination) and feet and felt like brain sizzling like it was frying/going to faint (6 minutes after vaccination) on 06Feb2021. Lab tests included blood pressure on an unknown date high 150s and never lower than 187, then on 06Feb2021 was 220/97, on 09Feb2021 was systolic blood pressure 180, then on 10Feb2021 had gone down. The outcome of the events atrial fibrillation and feeling unwell was recovered on 06Feb2021, after 3 hours. The outcome of the events stroke, faint and tingling of extremity was unknown. The outcome of the event blood pressure was 220/97 was recovered on 10Feb2021.

1057765	2/26/2021	AZ		M	2/17/2021	2/17/2021	<p>Completely out/eyes were closed; looked like he wasn't breathing; Began to shake, patient's head and arm shocked; Weak; little confused; A spontaneous report was received from a consumer concerning a 69 years-old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced began to shake (MedDRA PT: tremor), head and arm shocked (MedDRA PT: tremor), completely out/eyes were closed (MedDRA PT: loss of consciousness), looked like he wasn't breathing (MedDRA PT: respiratory arrest), weak (MedDRA PT: asthenia), and little confused (MedDRA PT: confusional state). The patient's medical history included stroke. Concomitant product use included unspecified blood pressure pills, cholesterol pills, vitamins, and a drug for the patient's brain due to the stroke. On 17 Feb 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (lot #: 031M20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 17 Feb 2021, ten minutes after receiving the vaccination, the patient began to shake, patient's head and arm shocked and patient was completely out with eyes closed. The reporter stated it looked like the patient wasn't breathing. Seven minutes later, the patient was given an epi shot and oxygen. The patient was transported via ambulance to the emergency room (ER). At that time, a scan was performed - nothing was detected in patient's brain. Patient remained in ER from 0830 to 1500. Patient subsequently left ER very weak and a little confused. It was recommended for patient not to receive second vaccination dose. Treatment information included epi shot and oxygen. Action taken with mRNA-1273 in response to the events was not reported. The events began to shake, head and arm shocked, completely out/eyes were closed, and looked like he wasn't breathing were considered resolved on 17 Feb 2021. The events very weak and little confused were not resolved.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.</p>

1056626	2/26/2021	NC	94	F	1/23/2021	1/23/2021	Vertigo last week that stayed for five days; pain at the injection site; 2 stroke like symptoms/ like she was having a TIA (Reporter confirmed TIA as Transient ischemic attack); Blood Pressure 170/130; Fatigue; Joint ache; Nausea; Vomiting; Fever 100.1; Stress; 2 stroke like symptoms/numbness in her lip; Pervasive aching; Momentary confusion; , like she was having a TIA; Not able to answer questions; she still has not recovered her strength; This is a spontaneous report from a contactable consumer (patient's daughter). A 94-year-old female patient (mother) received 1st dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) (Lot# EL1283), via an unspecified route of administration on 23Jan2021 13:00 at a single dose for COVID-19 immunisation. The patient's medical history included ischaemic stroke, haemorrhagic stroke in Aug2019, pulmonary embolism, deep vein thrombosis (DVT), cholesterol, myalgia condition, blood pressure, thyroid, sleep and vertigo. The patient concomitant medications included amlodipine for blood pressure, calcium carbonate/colecalciferol (CALCIUM + VITAMIN D), rosuvastatin calcium (CRESTOR) for cholesterol, levothyroxine for thyroid, eszopiclone (LUNESTA) for sleep medication, ascorbic acid, cupric oxide, dl-alpha tocopheryl acetate, xantofyl, zeaxanthin, zinc oxide (PRESERVISION AREDS 2), prednisone for myalgia condition, and escitalopram. The patient experienced fatigue, joint ache, nausea, vomiting, blood pressure 170/130, fever 100.1, stress, stroke like symptoms, numbness in her lip, momentary confusion; like she was having a TIA; not able to answer questions, tired, pervasive aching, all on 23Jan2021 19:00. Events reported as follow: patient had the Pfizer vaccine on Saturday around 1 pm and Saturday (Clarified 23Jan2021) night she had severe side effects for about 4 hours. When probed for side effects, the reporter stated it increased gradually over time. So, first patient had joint achiness and then she experienced nausea and vomiting. The reporter took her blood pressure. It was 170/130 and so reporter called EMS and they came up and her blood pressure had gone back down to normal and they recorded she had a fever of 100.1. EMS believed that the combination of the 'violence' of the onset and the fever caused her blood pressure to spike but she had a history of ischemic and hemorrhagic stroke. So, the reporter was concerned that the stress

VAERS_ID	RECVD	STATE	AGE_YRS	SEX	VAX_DATE	ONSET_DATE	SYMPTOM_TEXT
----------	-------	-------	---------	-----	----------	------------	--------------

and whatever that was going on the reaction, the reporter was concerned that it was going to cause her a stroke. Patient had 2 stroke like symptoms, one was that she had numbness in her lip and the second was that she had momentary confusion, like she was having a TIA (reporter confirmed TIA as Transient ischemic attack). The only symptom of that was when the reporter asked her the name of her children she gave the names of her grandchildren but that confusion cleared up quickly and she was fine for a while but not able to answer questions, sharply. By the time that EMS got there patient was sharp again, no problem. For treatment, the reporter gave patient aspirin. The reporter put some Salonpas patches on her joints. It was like the analgesic patch. It was an external patch that patient put on. Patient usually does not need them that was why she was taking the prednisone to treat that kind of pervasive aching. The reporter also gave her the fluids, Gatorade kind of stuff to replace her fluids from throwing up and that kind of stuff. One more thing, it all started with an extreme fatigue but that seem normal but it seemed to lead into the other symptoms. Like it was a big day to go out and get the vaccine. So, she was a little bit tired. This was a very deep fatigue that was part of it too. Reporter stated only 81 aspirin (later clarified as treatment) as she could not go back on blood thinners because she had the hemorrhagic stroke. As of 11Feb2021, it was reported that patient still has not recovered her strength since 23Jan2021 19:00 and was reported as ongoing but improved. On 03Feb2021, the patient had vertigo that stayed for five days and was now improved. The patient was scheduled for the second dose on 13Feb2021. The immediate effects her mother had after the first dose of the vaccine were pain at the injection site; fatigue; fever; nausea. Mentions she also had some confusion and they were worried that the patient might be having another stroke. But all of this cleared up; all of this in a violent episode that lasted about four hours. Today she wants to report that her it took her a week for her mother to recover. Adds her mother could walk for half an hour before the vaccine but since the vaccine she still has not recovered her strength. Adds her mother has only been able to walk about 15 minutes with a walker and resting a lot, for a couple time in three weeks and this was their main way of maintaining her health. Adds her mother

<i>VAERS_ID</i>	<i>RECVD</i>	<i>STATE</i>	<i>AGE_YRS</i>	<i>SEX</i>	<i>VAX_DATE</i>	<i>ONSET_DATE</i>	<i>SYMPTOM_TEXT</i>
							also had some vertigo last week that stayed for five days but she has had that in the past. Adds actually she still has the vertigo a little and she can tell when her mother bends her head. Outcome of blood pressure 170/130, she still has not recovered her strength and vertigo was recovering, outcome of events pain at the injection site, fatigue, fever, nausea and confusion was recovered on 23Jan2021 23:00; other events was unknown. No investigation assessment. Follow-up (11Feb2021): New information received from the same contactable consumer (patient's daughter) includes: reporter details, medical history, reaction data and course of events.
1056036	2/26/2021	CA	54	F	2/23/2021	2/23/2021	Throat felt like it was closing and had difficulty swallowing (that subsided quickly) 45 minutes after the shot, the right side of my face felt numb and tingly (Felt like when novocaine is wearing off.) Continued for 48 hours and worsened with slight drooping when smiling. Clearing my throat a lot and my right eye keeps tearing up. The doctor confirmed it was "Bell's Palsy" this morning and I have been put on Prednisone.
1056358	2/26/2021	PR	40	F	1/12/2021	1/15/2021	Paresthesias, on lower extremities and tingling on right arm all day; intermittent numbness; right eye twitching daily; This is a spontaneous report from a contactable healthcare professional (patient). A 40-year-old female patient received the second dose of BNT162B2 (lot number: EG686), intramuscularly in left arm on 12Jan2021 at single dose for COVID-19 immunisation. The patient medical history was not reported. There were no concomitant medications. The patient previously took tramadol and experienced drug allergy, and the first dose of BNT162B2 (lot number: GK5730) in left arm for COVID-19 immunisation. The patient experienced paresthesias, on lower extremities and tingling on right arm all day, intermittent numbness, right eye twitching daily on 15Jan2021. The patient underwent lab tests and procedures which included nasal swab, COVID test result: Negative on an unspecified date. AE resulted in: Doctor or other healthcare professional office/clinic visit. No treatment received for these events. Patient was not recovered.

1056447	2/26/2021	NC		F	1/5/2021	1/5/2021	worsening bilateral infraorbital perioral edema; worsening bilateral infraorbital perioral edema; generalized myalgias; fever of 101.6F; A spontaneous report was received from a literature article regarding, a 36-year-old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced Circumoral edema, Orbital Edema, myalgia, and fever/pyrexia. The patient's medical history was not included, other than that she was considered a healthy female. Concomitant medications known to have been used by the patient were not included. In November 2019, prior to the vaccination, the patient received hyaluronic acid injections in the tear troughs and in both the upper and lower lip. On 05 Jan 2021, prior to the onset of the events, the patient received the first of two doses of mRNA-1273 (Lot number: unknown) intramuscularly for prophylaxis of COVID-19 infection. On 05 Jan 2021, about 12 hours after the vaccine was administered, the patient presented with a fever of 101.6 Fahrenheit and had generalized myalgia. Treatment included acetaminophen. On 06 Jan 2021, the fever and myalgia were resolved. As the day continued, the patient noticed pain and swelling in the right tear trough and increasing swelling around her mouth. On 07 Jan 2021, approximately 36 hours after vaccination, the patient was administered 10 mg of cetirizine. At 48 hours the patient reported that the swelling was at it's peak and she was unable to open her right eye. The patient then took 20 milligrams of cetirizine. Throughout the morning, the left tear trough began to increase, and the rest of her face remained persistently swollen. The patient was administered 5mg lisinopril. Within about 5 hours of dose of lisinopril, the patient reported that swelling had stopped and was decreasing. Over the next 24 hours, edema was improved, and patient returned to baseline. Action taken with mRNA-1273 was not provided. The outcome of the events, circumoral edema, periorbital edema, myalgia and fever, was considered resolved.; Reporter's Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.

1056467	2/26/2021	TX	34	M	2/10/2021	2/10/2021	lost 70-80% of sight; dizzy; ringing in ear; all sounds were coming down a tunnel; A spontaneous report was received from a consumer concerning a 34-year-old old, male patient who experienced 70-80% blindness, dizziness, and ringing in his ear. The patient's medical history was not provided. Concomitant product use was not provided/unknown by the reporter. On 10FEB2021, prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 (Batch number not provided) intramuscularly in the left arm for prophylaxis of COVID-19 infection. Patient got first dose of Moderna vaccine on 10FEB2021 in left non dominant arm. Patient notes he has always had a reaction to anything external going in his body. After receiving vaccine, he felt fine for about 5 seconds then felt dizzy, lost 70-80% of sight and had ringing in his ear. Patient said all sounds were coming down a tunnel. Patient asked for a place to lie down and symptoms resolved about 2 minutes later. Patient wants to know if it is safe to get second dose. Also wants to know if he can change vaccination facility for second dose. Treatment information was not provided/unknown. The events resolved on same day.; Reporter's Comments: This case concerns a 34 year old, male patient, who experienced a serious unexpected event of blindness transient, among other non-serious events, after receiving first dose mRNA-1273 (Lot# unknown). Very limited information regarding this event has been provided at this time. Further information has been requested.

1056476	2/26/2021	WV	73	M	1/14/2021	2/10/2021	Seizures; Mini stroke; Tired; A spontaneous report was received from a consumer concerning a 73-year-old male who received Moderna Covid-19 vaccine and experienced seizures, mini stroke, confused, agitated, eyes were abnormal, memory impairment, and tired. The patient's medical history included heart attack and stent placement in 2011. His relevant concomitant medications include acetylsalicylic acid, candesartan cilexetil, clopidogrel bisulfate, diltiazem hydrochloride, ezetimibe, adenosine, gabapentin, metoprolol tartrate and rosuvastatin calcium. The patient received their first of two planned doses of mRNA-1273 on 14 Jan 2021. On 10 Feb 2021, 30 minutes prior to the onset of the events, the patient received his second of two planned doses of mRNA-1273 (Lot#010M20A) intramuscularly in left deltoid for the prophylaxis of COVID-19 infection. On 10 Feb 2021, With in 30 minutes of receiving the vaccination, the patient had a seizure. They took him to the hospital, where he had a computerized tomography (CT) scan, blood work and had a consult. After consult, they said, it's a mini stroke. They released him and told her if it happens again call 911. He felt so tired and went to sleep at home. Around 17:00 dinner time, he woke up looked very blankly, and his wife reported knowing he had another seizure. She reported he ran to his keys saying, "I have to go", seemed confused, agitated and didn't know where he was. She called 911 and he was transported to the hospital in an ambulance. Around 19:00 the same day, he was admitted to do scans overnight. Around 21:00, patient's eyes were abnormal, he became agitated again and nurses confirmed he was having another seizure. 30 minutes later, he was talking to his wife and daughter as if he didn't remember anything. He mentioned some metallic taste in his mouth. On 11 Feb 2021, they did an electroencephalogram (EEG) and confirmed that he was having seizure. He was prescribed seizure medication and released him from hospital. However, the patient and his wife reported not wanting him to take the medication as they believe the events were due to the vaccine. Treatment information was not provided. Action taken with vaccine is not applicable as the patient received both the doses. The outcomes of the events, seizures, mini stroke, and tired, were recovered.; Reporter's Comments: Very limited information regarding this event

The patient's medical history was not provided. Patient's concomitant was not provided. On 12-FEB-2021, the patient received their first of two planned doses of mRNA-1273 in her right arm (Batch #: 024M20A) intramuscularly for prophylaxis of COVID-19 infection. On 12Feb2021 patient experienced itchy eyes, redness on the face, and a rash just below her neck and above her chest. There was "blotchiness but no hives". She had the same type of reaction as she does to orange peels. She had no trouble breathing. She took some diphenhydramine hydrochloride to help. The nurse also re-administered the vaccine to the patient thinking the first vial was empty and as the patient felt the needle go in but didn't feel the liquid. Action taken with mRNA-1273 in response to the events were not provided. The outcome of events itchy eyes, redness on the face, rash just below her neck and above her chest were unknown at the time of this report. The outcome of events the patient felt the needle go in but didn't feel the liquid was considered resolved on 12-Feb-2021 and readministered the vaccine to the patient thinking the first vial was empty were considered resolved on an unspecified date in Feb-2021.; Reporter's Comments: This case concerns a 66 year old, female patient, who experienced a non-serious unexpected event of eye pruritus, erythema, rash macular, after receiving first dose mRNA-1273. This report refers to a case of overdose for mRNA-1273 (lot # 024M20A), with no associated AEs. Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. Further information has been requested.</p>

1056482	2/26/2021	FL	74	F	2/10/2021	2/11/2021	Severe flu symptoms; feeling incapacitated; Gagging; Feeling like humming and buzzing (motor-like); Throat constriction/contraction; Eye/vision distorted and were constricted; Felt like head would explode; forehead and headache; Forehead/head constriction; Constriction/contraction of chest; A spontaneous report was received from a consumer, a 74-year-old female patient, unknown race and ethnicity, who received Moderna's COVID-19 vaccine (mRNA-1273), and experienced, feeling like humming and buzzing (motor-like), throat constriction/contraction, eye/vision distorted and were constricted, felt like head would explode, forehead/head constriction, constriction/contraction of chest, severe flu symptoms, feeling incapacitated, and gagging. The patient's medical history was not reported. No concomitant medications were reported. On 10 Feb 2021, prior to the onset of events, the patient received their second planned doses of mRNA-1273 (batch number: 030M20A), intramuscular for the prophylaxis of COVID-19 infection. The patient reported that she had adverse reactions after administering the vaccine around 2:00 on 10 Feb 2021. Later, the patient went to bed. On 11 Feb 2021, at midnight, the patient started feeling like that she was humming and buzzing from the waist up; throat was constricted and contracted; gagged a few times; vision/eyes were constricted and vision was distorted; forehead, and head ache felt constricted and felt like it was going to take off and was so tight. Later, it moved to chest, the constriction/contraction was so tight that and felt like someone was standing on it. The patient stated that these feelings were all above the waist and lasted for about an hour and ten minutes and just stopped on the same day. The next day on 12 Feb 2021, about six hours later, the patient had regular side effects which started about 10 hours after the shot. The patient was fine for about six hours then had severe flu symptoms and was feeling just incapacitated. The patient just got rid of these flu symptoms around 1 pm on the same day. The patient wanted to know if these were allergy symptoms. No treatment medication information was provided. Action taken with second dose of mRNA-1273 in response to the events was not applicable. The outcome of the events, feeling like humming and buzzing (motor-like), throat constriction/contraction, eye/vision distorted and were constricted, felt like head would

No medications could touch the pain and it felt like my brain and eyeballs were going to explor; This is a spontaneous report from a contactable self-reporting other health professional. A 36-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot number EJ1686), intramuscularly on an unspecified date in Jan2021 at 13:00 (at the age of 36-years-old) as a single dose in the left arm for COVID-19 vaccination. Medical history included anaphylactic reactions to penicillin and pistachios. The patient was not pregnant at the time of vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medications were not reported. The patient did not receive any other vaccines within four weeks prior to the vaccination. The vaccine was administered to the patient in a hospital. The patient reported that twenty-four hours after administration she developed a searing migraine that lasted for approximately fifteen hours. She stated that "no medications could touch the pain" and it felt like her brain and eyeballs were going to explode. The patient specified that she did not receive any treatment for the events. The clinical outcomes of migraine, sensation of pressure and eye discomfort were reported as recovering. It was also reported that since the vaccination, the patient had not been tested for COVID-19. No follow-up attempts are possible. No further information is expected.

1056572	2/26/2021	CO	71	M	1/21/2021	1/1/2021	diarrhea; He supposed that he is dehydrated; nausea; feeling unwell; chills; This is a spontaneous report from a contactable consumer (patient). A 71-years-old male patient received the first dose BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), lot EL3246 , unspecified route of administration on 21Jan2021 13:10 (at the age of 71-years old) as a SINGLE DOSE given in left arm for COVID-19 vaccination. Medical history included ongoing vertigo, ongoing dizziness, ongoing balance problems, ongoing vision problems, ongoing stomach problems, he lost 80lbs in a year, but his weight is starting to go back up. He has had bad health for the last 3 years. He goes to the doctors all the time. In fact, he just went to the ear, nose and throat (ENT) to find out what was going on. He has had dizziness quite often, so there are days where he just don't feel good but, he thinks it has something to do with his eyes. When he feels bad, he will lay down and close his eyes, and all of his problems go away. He went to see a retina specialist because of his continuing vision problems. The ENT doctor told him he can't help him. Concomitant medications included 6 different medications. The patient experienced side effects after getting the first dose of the vaccine. He got the first dose a week ago and he said that he experienced nausea, feeling unwell, chills and diarrhea. The patient experienced nausea, feeling unwell, chills in Jan2021 and diarrhea on 26Jan2021. He had his shot a week ago tomorrow. He was up all night last night with diarrhea, he was up probably up 10 times. He was supposed to go in to get his teeth pulled today, but he just can't do it. He does have some chills and nausea. He is feeling unwell. He supposed that he is dehydrated in Jan2021. The diarrhea just started last night, 26Jan2021. He got up about 6:15 this morning and that was the last time he had diarrhea. He still has nausea, but he hasn't had any other diarrhea. He has some nausea from the time to time. He doesn't have any COVID symptoms that he can tell. He is feeling unwell, and has the nausea and chills, but he does not have any fever. He hasn't had a fever and he can still smell and taste and all of that stuff. One thing he did notice after he got his COVID-19 shot was that he did not have any symptoms of any kind. He never had pain in his arm, nothing. He received the vaccine on 21Jan2021, and he never felt a thing or anything that would associate with

intestinal symptoms. The patient received her first dose of the Pfizer COVID vaccine on 08Jan2021 and felt a metallic taste in her mouth (said that the metallic taste lasted about three hours; ate to get rid of the metallic taste). On 29Jan2021, the patient received her second dose; after 10 minutes her face went numb; her nose, forehead, and under her eyes all the way up felt numb. Also, the patient's systolic blood pressure was at 150. The patient reported that she also tasted rubber band taste in her mouth. The patient's neighbor that was there with her getting the vaccine told the nurse and they called the paramedics. The paramedics stated that they thought she had a stroke. She said that her blood pressure was 150 systolic (usually 107-110/79). The patient had diastolic heart failure which was diagnosed about 5 years prior. The numbness stayed with her until about 22:00 on 29Jan2021. The patient had a history of "migraines and gets abdominal pains, numbness in her nose, foot", and she experienced "nausea and vomiting and stuff with her migraines." The patient thought the vaccine just gave her a big migraine. The patient took sumatriptan succinate (IMITREX) and it did nothing. The patient said that on 31Jan2021 her eye felt weird. The patient blew a blood vessel under her eye lid. The patient's eye looked like a blood clot in the corner of her eye then it dispersed throughout the eye and then now it was just below the pupil of her eye. The patient called the doctor on 01Feb2021, but they were out because of the snow. On 02Feb2021, the patient received a call from the doctor's office saying that the physician assistant would call her back, but the patient had not heard anything yet. The blood circulated around her eye and now it was just only under her pupil. The patient said that her daughter sent her something that said that some people have gotten Bell's palsy after getting the vaccine. The patient said that she was concerned about this with the facial numbness. The patient said that every once in a while, her face felt weird; her cheeks feel weird and her nose. The patient said that it comes and goes. The day after she got the second shot, she felt like she got run over by a truck and like someone beat her up. The patient's migraines were under control with magnesium. The migraine came on so quick it was like a boom. The patient said that was why she was concerned. The patient said that she declined going to the hospital; and

1056641	2/26/2021	OH	93	M	1/22/2021	1/25/2021	cranial nerve 3 palsy. Ptosis of the left eye, it was completely shut; cannot hear; This is a spontaneous report from a contactable physician. A 93-years-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 22Jan2021 at a single dose for COVID-19 immunization. Medical history included atrial fibrillation, hypertension, hyperlipidaemia, diabetes, and chronic kidney disease. Concomitant medications were not reported. No additional vaccines administered on the same date of the vaccine and no prior vaccinations within 4 weeks. The reporter is the family's physician, who stated that the patient received the first dose of the Pfizer COVID vaccine on 22Jan2021 and three days later (25Jan2021), his left eye had ptosis - he was unable to open his left eye and it was completely shut. The patient came to him and when he would try to lift the eyelid up, it would just drop down. He then called a neuro ophthalmologist, he thought to himself that the patient could be having a stroke. The patient was sent to the Emergency Room and kept overnight to do CT of brain, MRI of brain, CT of orbits and MRI of neck. All tests came back normal, there was no stroke. The patient was discharged and was told to go see an ophthalmologist; the eye doctor diagnosed him with Cranial Nerve 3 Palsy. The reporter had read the consultation notes; the eye doctor "wrote 1-2 days after he had COVID and had this happen". The reporter clarified that the patient never had COVID, maybe this was a misunderstanding or typo with the doctor, but the patient just had the vaccine. The point is that the patient was diagnosed. The reporter further added that the patient can't hear, and so he will provide the patient's son's phone number. The reporter would like to know if this is a possible side effect of the vaccine and if he should receive the second dose of the vaccine as he is due in two days (Friday at 8:30AM on 12Feb2021). It was also reported that the ptosis has not gotten worse and has not resolved. The reporter added that the patient was admitted to the hospital for a full day. The patient underwent lab tests and procedures which included computerized tomography (CT) of the brain, CT of the neck, magnetic resonance imaging (MRI) of the brain and MRI of the orbits-all of which resulted normal in Feb2021. The events cranial nerve 3 palsy and 'Ptosis of the left eye, it was completely shut' had not resolved

while the outcome of the rest of the events was unknown. Information on the batch/lot number has been requested.; Sender's Comments: By close temporal relationship, the company cannot completely exclude that the reported cranial nerve 3 palsy' is related to BNT162b2 administration, even though medical history including atrial fibrillation, hypertension, hyperlipidemia, diabetes, and chronic kidney disease, in the setting of elderly age, can be considered confounding factors in the overall clinical evaluation of this event occurred three days after the vaccination. Conversely, even though cannot be excluded as reportable event based on the information provided, the company deems there is not a reasonable possibility that the reported deafness is related to BNT162b2 administration, but, at the present time, evaluated as an intercurrent condition that cannot be also excluded as already present before the vaccination. The impacts of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

1056708	2/26/2021	CT	55	F	2/17/2021	2/17/2021	<p>Reaction to 2nd Dose Pfizer covid19 vaccine I had second dose of the experimental Pfizer vaccine February 17, 2021. 1st dose was on January 27, 2021 I had reactions both times. I already reported on this site, on my 1/27/2021 reaction Received through a pharmacy clinic set up at my work. Lot# EL9263 Received dose #2 about 10:30am on Wednesday 2/17/2021 during my work hours. (7-4pm) Paid closer attention to how I felt during the day, I could feel, I was going to be foggy in my head again. I was getting tired quickly. My left arm was not sore this time. Got home about 4pm (left a little early). Very tired, went to bed by 5:30pm. Slept, woke up to heat soup and eat. 7pm: Back to sleep. Very exhausted, my eyes were hurting (a sign I have a fever) I did not care enough to take my temp. Seemed to hard to try and find the thermometer. 7:30pm: Back to bed. Sleep. I'm very warm in my bed, sweating under arms and chest, I don't care, I can sleep thru that. Smells funny (sweat has a distinct odor) 11pm: wake up. I want to go pee, but I'm too cold to leave my warm covers. as soon as I uncover to get up, I have violent chills. I don't have chills if I stay covered. This was the exact same symptom I had on May 11, 2021 when I had the covid19 and came home sick from work. Violent chills, barely able to stand and walk alone. After midnight: I wait for someone to come upstairs to help me get up, with a blanket ready to throw over me and help me to toilet. I was too weak to call for him or to care, I just slept and waited for him to check on me. someone helped me to toilet, chills are under control if I have a blanket on me. The house is not cold, someone has the wood stove cranking that night, it's 70 in my bedroom. I sleep all night Wednesday. 6:30am: Thursday My eyes still hurt, I'm still hot. I don't care what my temp is. No more chills. I'm smelly from sweating all night. I'm motivated to shower, I think maybe I can do stuff today, I try to plan some things for the day. I shower and eat some oatmeal. I'm exhausted from doing those two things. My lower back/hips and neck are and shoulders are tight and sore, aches all over, especially neck. It's hard to think, brain fog, finding the right words. The injection site is not really sore though (last time it was). I have to just go back to bed. I sleep all day Thursday. Get up late afternoon to eat a little bit (soup and crackers) I try to watch TV. I can't focus on the show. I go back to bed by 5:30pm. I</p>

1056721	2/26/2021	IN	76	F	2/24/2021	2/24/2021	Patient was here for her 2nd dose vaccine and during her wait time her tongue started to feel funny and swell slightly. Staff was notified as they were talking with her that her voice sounded a little funny and thick. She also started to cough on a regular interval. As staff continued talking with her she stated her throat started to feel funny and tight. Staff notified other healthcare personal and moved her to the private treatment area. She continued to complain of thick tongue and continued to speak different then her baseline. We elected to give 50 mg Benadryl IM. She was also placed on the ECG showing sinus rhythm with O2 stats of 100 % and her blood pressure was 149/61, After the Benadryl, she stated she started to feel somewhat better. After about 10 minutes her tongue started to swell again and when she turned her head to speak to a staff member her airway shut off due to swelling. Staff quickly turned her head back to forward she was able to breath again. She advised that she needed to be transported and was going to get 0.3 epi IM in her left arm. She did state prior to Epi being given she was now also having trouble focusing visually. Dr arrive to assess her and agreed that she needed transported. EMS arrived and care was turned over to Hometown EMS to transport the patient to Medical Center.

1056916	2/26/2021	FL	74	F	2/22/2021	2/23/2021	I was fine the first day. The 2nd day I wasn't feeling well, my stomach was bothering me. At 8:30 PM I went to bed because I didn't feel good, I laid in bed for a few minutes and then jumped up because I began to violently vomit. After I vomited I felt weak, I was sitting with my back against the wall my husband came to check on me. He walked away and when he came back I was unresponsive, laying on the floor and he said my eyes rolled in the back in of head. He called 911. I was unresponsive for about a 1-2 minutes. EMS arrived, by the time they had arrived I had crawled into bed, and they took my vitals and they were fine, they asked me if I wanted to go to the hospital but I declined as I was afraid to go. I went to sleep. The next day I felt weak and tired, I had a burning feeling in my stomach, I took some TUMS, I didn't much that day. I rested most of the next day. Yesterday I felt a little better and today I am fine. I have a doctor's appointment 2/26/2021 at 2PM to see the ARNP at my doctor's office.

This consumer reported for 2 patients. This is the first of 2 reports. A 52-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date unknown), via an unspecified route of administration on the left arm at the age of 52 years, on 07Jan2021 15:00 at a SINGLE DOSE for covid-19 immunisation. Medical history included ongoing breast cancer stage ii , mastectomy from Jun2018 to an unknown date. Concomitant medication included anastrozole (ANASTROZOLE), escitalopram oxalate (LEXAPRO) and atenolol (ATENOLOL). The patient previously took taxol and experienced drug hypersensitivity. The patient stated that this past Sunday (24Jan2021) that her daughter woke up with both eyes swollen, red, watery and itching. It was stated that they took her to the clinic and was told that this was the second one that they had seen like this. It was also stated that they gave her a prescription for eye drops. It was stated that she woke up this morning and one eye was swollen shut and wanted to know what to do or the course of action. It was stated that she was supposed to get her second shot Thursday and wanted to know if she should get her second dose or not. It was also stated that her eyes were swollen and red which were better yesterday and today are worst than they have ever been. It was stated that the left eye is more swollen than the right. It was also stated that she soaked tea bags and put them on her eyes Sunday and stated that she does not know the name of the prescription eye drops. On 17Jan2021, it was reported that the patient's eyes got very puffy and very red. Her eyes were itchy and painful with minimal discharge. Her vision was also blurry. The patient underwent lab tests and procedures which included sars-cov-2 test: negative on 12Jan2021, sars-cov-2 test: negative on 19Jan2021 and sars-cov-2 test: negative on 25Jan2021. Therapeutic measures (Eye drops; Prednisone; Polymixin) were taken as a result of both eyes swollen/ one eye was swollen shut (eye swelling), both eyes red/eyes got very puffy and very red

1058861	2/26/2021	WA	50	F	2/24/2021	2/25/2021	The morning after the shot I woke up with a puffy/swollen right eye. Eventually I experienced itching in the area, and today (two days later, both eyes are slightly swollen and I have areas of itching on my face and neck. I'm not experiencing any throat swelling or trouble breathing, but I thought this was a bit unusual and might be something to report. I took Benadryl on the night of the 25th and it helped some. I'm not particularly concerned, but would be interested to know if others have experienced similar symptoms and if it might be worse if I were to receive a booster some day. I did not experience any symptoms with the first dose, apart from a sore arm.

1059086	2/26/2021	CA	24	M	2/26/2021	2/26/2021	On Friday morning 2/26/21, we had a 24 yo male patient who had an anaphylactic reaction after his first dose of Pfizer COVID vaccine. He was instructed to wait on the chair, but had stood up at some point but was still in the pharmacy waiting area. A team member noticed he had fainted and called for help. The pharmacist on duty and immunizing tech came immediately to help him to a chair. At that point, he was conscious and talking. Then within a few seconds he started convulsing on the chair and lost consciousness. His eyes were open and head tilted back. A team member immediately called 911 and pharmacist administered 0.3mg Epipen to the thigh. We removed his face mask to check his breathing and also to allow him to breathe more easily. We also adjusted his head more forward and he started coughing. After about 15 seconds, he regained consciousness and could answer questions. EMT arrived soon after and took over. Patient does not have allergies or any history of anaphylaxis/ severe reaction from vaccinations. He did express some fear of needles and did not eat breakfast yet.

1059125	2/26/2021	VA	40	F	2/19/2021	2/21/2021	A day or so after injection, severe fatigue, chills, feverish, and slept almost all day and night. Fatigue, severe muscle aches, joint pain, headache, nausea, vomiting, upset stomach, chills to point shaking still come in waves. This is day 7 and I could barely put one foot in front other after work to get in bed but vomited first. Today, odd pressure in my face developed and headache came and went and again, the fatigue, muscle and joint pain are intense. I'm still working, but have had to take time off, go in late, etc. Brain fog is a thing. It feels like it did when I "didn't have COVID-19" before but had every symptoms and I was going to die, but in waves. I was dizzy, saw stars and black spots in my right eye today on and off and vision in my right eye honestly seems to have significantly decline. I'm really just concerned that it is day 7.
1059136	2/26/2021	CA	60	F	2/3/2021	2/3/2021	Approx 30 minutes after my 1st Moderna vaccination, I noticed that I was having difficulty swallowing water. I soon began to not feel very well. Sort of light headed. My heart was racing. When I looked at my watch it recorded my heart rate at 160 beats per minute!! I started taking deep breaths and a technique called EFT tapping to calm me down. Eventually it worked, but I felt extreme tiredness after that. When I woke up in the morning my entire face was swollen. I also noticed on the 2nd day after vaccine shot I had dark purple circles under my eyes. None of those things have ever happened to me before in my life.

1057952	2/26/2021	CA	71	F	2/18/2021	2/22/2021	<p>Patient is being seen today due to a rash that developed after receiving first dose of her Pfizer vaccine 2/18/21. Rash appeared on 2/22/21, mostly on the tops of her feet and her face. A few very mild patches on her body. She has been taking Benadryl and has used Cortisone 10 on the itchy areas. She says what alarmed her was that her eyes felt dry and tight. Nose was also puffed up and felt a slight sensation in her ears and teeth. No tightness in throat or difficulty breathing. No swelling in lips or tongue or throat. She has no redness at the injection site.</p>
1057967	2/26/2021	NC	72	M	2/24/2021	2/26/2021	<p>2/26/2021 woke up with swelling of left eye after shot. Contacted cancer center to report this. Used cold compress, 2 Benadryl followed 45 minutes later with one decadron. Swelling went down and contacted cancer center to let them know. I have had a few reactions when I was getting chemo ,vidaza, and after getting platelets. The have used the same treatment I did today.</p>

1057988	2/26/2021	AZ	75	F	2/20/2021	2/21/2021	Vaccinated on Saturday, woke up Sunday with ringing ears, general malaise, dizziness, stuffed up sinuses, red burning eyes, constant sneezing and dripping nose, weak and shaky on my feet. Lose of appetite, constipation and nausea.. It lasted for 4 days and on Wednesday I called my medical care giver and she said that I probably had an allergic reaction to the vaccine and to not take the next dose, as this had been my first. I am still, periodically weak and dizzy, and still have little appetite.
1057999	2/26/2021	KY	39	F	2/26/2021	2/26/2021	She was given the vaccine at 12:00. At 12:07 she (she is an RN employee here at the hospital) reported feeling as if she had lump in her throat and asked for some benadryl. Rapid response team was called at 12:08 as she became diaphoretic, flushed and reported blurred vision. MD ordered an IV to be started and a NS bolus x 1 liter. She broke out in hives on bilateral upper extremities. Benadryl, solumedrol, albuterol inhaler, zofran, scopolamine patch were all ordered and given to the patient. She reported that she felt some better and was transferred to the ER at 1245 for further monitoring.
1058052	2/26/2021	NM	19	F	2/19/2021	2/19/2021	1530: Approximately 10 minutes after receiving vaccine patient reported having itching to throat, and hands. Patient stated she did have a Depo-Provera Injection after 1st vaccine approximately 3 weeks ago. Pt did state she pre-medicated herself with Benadryl 50mg orally at approximately 1300hrs today. Mom was present with patient while covering physicians and EMS on duty assessed patient. VS:112/82-B/P, 123-HR, 18-RR, SaO2 98% on RA. Allergies: Steroids, fish FMHx: Sports induced asthma and gallstones. 1550: Patient had notable facial swelling eye redness and flushing. 0.15 Epinephrine IM via home Epi-Pen self delivered by patient's mother for increase SOB, and tightness in chest. EMS transport called to transport patient to location. VS:118/86-B/P, 100-HR, 18-RR, SaO2 96% on RA. 1600:Transfer of care to EMS staff assisting in transfer of the patient.

1058189	2/26/2021	CA	81	F	2/25/2021	2/26/2021	pt stated after she received the vax she got a strange taste in her mouth. At 1 AM pt woke up with a heavy feeling in her left arm. Her left arm, hand and fingers started to swell. At 3 AM her head felt warm and the entire left side of her face was swollen, including lips, gums, nose and eyelids. Her teeth felt strange. At 5AM she could feel a sensation going down the left inside of her body moving from her neck to her toe. Then the right side of her face started to swell from the neck to the top of her head. Pt woke up at 7 AM next day and the swelling was starting to go down on the right side. On 2/26/2021 she is noticing the swelling is going down out of her left side. She never really had any pain or discomfort just swelling. Pt. has not contacted her PCP at this time.
1058193	2/26/2021	TX	76	F	2/24/2021	2/25/2021	Left side of face pain including eye inside mouth and throat. Felt like bad sinus infection. Still have some throat pain
1058222	2/26/2021	CA	74	F	2/23/2021	2/23/2021	Following the vaccine, within 3 minutes her bottom lip got numb, then her tongue swelled and then her eyes got fluttery uncontrollably, dizziness and weak. They had her lie down in a recliner. Her BP was 190/110. She did not need an EPI pen and within 15 minutes her lip became unnumb, and her tongue swelling receded, was still a little thick, and her face was swollen, was red and flushed. So they waited 30 minutes, her BP was not coming down, sent to the ER and observed for 3 hours and slowly her BP came down, all her other symptoms subsided and she was able to drive herself home. Last night 2/25/21 she had great itching on her chest, which has since stopped. Her tongue is still a little swollen, about 20% still feels thick. When she left the hospital her BP was 146/86. She has not taken anything for the symptoms just her regular routine medications. She did feel tired and spacy feeling, and has been off of work since Wednesday as she could not focus to go to work.

1058531	2/26/2021	WA	20	F	2/26/2021	2/26/2021	<p>Patient reported symptoms of: tachycardia, shakiness, vision changes, tongue numbness and shortness of breath following the first dose of the COVID19 Pfizer-BioNTech Vaccine on 2/5/2021. Patient said that historically has experienced tachycardia and shakiness after getting a flu shot or booster a few years ago. Symptoms reported by patient were enough to suspect potential anaphylaxis, and patient consented pharmacist to administer epinephrine. Patient was then advised by the pharmacist to follow-up with her primary care doctor as soon as possible to report the incident and to discuss the risk versus benefit of the vaccine, whether receiving the second dose would be appropriate for her. Patient returned to assisted living facility for her second dose of the COVID19 Pfizer-BioNTech vaccine on 2/26/2021. Patient said that she discussed the incident with her doctor, was told it would be appropriate to get the second dose despite her reaction and was advised to take "cautious measures". Pharmacist reviewed the patient information and screening questions, discussed the potential side effects and reiterated her risk of experiencing the same reaction with the second dose. Patient stated that she decided on getting the second dose because "her boyfriend is high risk and I'm doing this for him". Patient stated that she decided on getting the second dose because "her boyfriend is high risk and I'm doing this for him". Pharmacist asked patient if she had any questions/concerns or additional information to add prior to getting her vaccine, and patient denied having any at that time. After administering her second dose, pharmacist instructed patient to stay in the observation area for at least 30 minutes and to ask the staff for water given her experience with the first dose. Patient asked pharmacist how common it was for someone to get a reaction from the vaccine, and then mentioned that her family member had to drive her to the emergency room after her first dose because her throat was "burning", and was told that her throat was "a little swollen" and received a second dose of epinephrine at the emergency room. Patient included this information after the fact her second dose was already administered. Approximately 5 minutes after receiving her vaccine, the patient reported similar symptoms that she experienced on 2/5/2021: tachycardia, vision changes, shortness of breath and chest tightness. After monitoring patient with</p>

1054492	2/25/2021	OK	59	F	2/19/2021	2/21/2021	I received my vaccination on Friday, February 19th. On Sunday, February 21st, my tongue felt like I had scalded it with a hot drink, and my taste buds were very sensitive. My tongue also felt thick and there were bumps on the sides of it. On Tuesday, February 23rd, I noticed I couldn't whistle, and I couldn't spit correctly when I brushed my teeth. On Wednesday, February 24th, I noticed my right eyebrow was lower than my left, and my mouth was drooping on the right side. I couldn't put my lips together to put my chapstick on, and my smile was very crooked. Additionally I felt my eyelid twitching and the right side of my face felt very strange in general. So I contacted the nurse who administered the vaccine. She said that Bell's Palsey could be symptom from the vaccine, and that I should contact my physician. So I called Dr. office and they did a virtual appointment with me on Wednesday afternoon. He immediately told me I have Bell's Palsey as a result of the vaccine and sent in some prescriptions for me to take. They are Toradol Oral, Prednisone, and Erythromycin Ointment for my eye because it won't close all the way, and it doesn't blink properly.
1054504	2/25/2021	LA	68	F	2/22/2021	2/23/2021	Symptoms: chills, joint pain, severe headache with blurry vision, injection site soreness, muscle pain, feeling unwell - very sick, fatigue. I woke up 2/23/2021, Tuesday, with injection site tenderness upper left arm. Tuesday midday the headache began. By evening, I had chills, pronounced joint and muscle soreness, with further progression of headache to severe with vision changes, and a general malaise and feeling very ill. Like having the flu without fever or congestion. I did not seek medical treatment. Symptoms were treated with over the counter medicines and perscriptions medicines on hand, plus bedrest.
1054513	2/25/2021	FL	21	F	1/6/2021	1/6/2021	States about 3 hours after administration she felt nauseous, dizzy, cold, clammy, blurry vision, ringing ears, near syncope, visited ED.
